Center [3,4]. In India, the incidence & prevalence of SCI are 15/million and 236/million respectively [3]. The SCI affects not only one person but also the whole family as they may require help for assistance with basic day to day activities like dressing, feeding, bladder & bowel and also includes managing household chores, finance, shopping etc. [5,6]. The SCI patients suffer from several types of pain such as musculoskeletal (MSK) pain, visceral pain and neuropathic pain [8]. MSK pain is a common problem for many people with SCI which generally arises from bones, ligaments and muscles either in acute post injury phase or chronic overuse of muscles [8, 9].MSK pain is found to interfere with everyday life causing stress, anxiety & also negatively affects mood, interfere with sleep, quality of life (QOL). The mechanisms of MSK pain in SCI patients are somewhat similar to the general population. For example, MSK pain involving the neck, shoulders, and upper limbs may be related to overuse, extreme joint postures, high mechanical stresses, and repetitive movements associated with transfers and use of wheelchairs [7,10].

The study of pain prevalence can indicate the MSK issues of patient with SCI, although its prevalence varies in different studies, thus study of general prevalence of pain is of great importance. In this study we want to know if the factors like age, types of injury, and level of injury have a significant role in MSK pain or not because these factors are directly related to changes in the mechanical efficiency of joints. Besides significant impairments, patient with SCI also face with significant acute & chronic complication which have negative impact on survival, functional independence and QOL. Understanding the factors and pain is of critical importance not only for patient but also for family and caregivers. The aim of the present study is to find MSK pain prevalence and severity in SCI patients in Gujarat.

### **METHODS**

An observational study using survey form for SCI patients was conducted after receiving ethical approval certificate from Institutional ethics committee of SPB Physiotherapy College, Surat. Various physiotherapy and rehabilitation centers were approached and permission to undertake data collection from paraplegic SCI patients attending their setups was received. The subjects were invited for participation and after screening for inclusion and exclusion criteria eligible candidates were included for study. Traumatic SCI paraplegic patients, between 18-50 years, and had injury before 12 months were included. Patients with acute SCI (within 12 months), clinically unstable patients, quadriplegic patients, or other spinal cord pathology were excluded. As shown in fig.1, based upon criteria 142 participated had been selected. After receiving informed consent, the participants had filled the assessment and data collection form. The assessment and data collection sheet consist of demographics data, screening form, Nordic Musculoskeletal Questionnaire (NMQ) and Numeric pain rating scale (NPRS). The data was tabulated, sorted and stored using Microsoft Office Excel and analyzed using descriptive statistics. SPSS (Statistical Package of Social Science) software version 20.0 and Microsoft Office Excel were used for analyses and plotting graphs.

### **RESULTS AND DISCUSSION**

A spinal cord injury causes a person to have a serious injury to their spinal cord. The severity of the impairment it produces can lessen a person's activity and participation restrictions. Table 1 shows demographic characteristics of 142 paraplegic patients. It was seen that most of the participants were male (n=117, 82.4%) and majority belonged to younger age groups of 18-30 years and 41-50 years, 78% approximately. Approximately 52% participants had history of road accidents and 54% had complete SCI. Most of the patients (n=113, 79.60%) had thoracic and thoraco-lumbar spinal injury. In this study the participant mean age is  $34.72 \pm 6.72$  years. This study shows that 29% (n=41) of participants were between the age group of 18-30 years (20-66 years) [11]. Also, it was reported in one study that the most common SCI patient's affected average age group who had pain in their upper limb was  $42.2 \pm 12$  years[12]. The reason for spinal cord damage differs from one person to the next and from one region to another. In this study it was found that 31.7% (n=45) were injured by fall from height, 52.1% (n=74) were by motor vehicle or road traffic accident, 6.3% (n=9) from diving, 4.1% (n=7) sports related and 4.1% (n=7) from violence. In this study it was also

### Jenny D. Chaudhari et al.,

found that road traffic accident is the highest cause of injury, secondly fall from height and the third highest rate is due diving. Mehta et. al. (2014) in Turkey found that 51% of SCI patients were injured due to this cause followed by 24% from fall, 11% from Gunshot [13].

The aim of the study was to find MSK pain prevalence in the paraplegic spinal cord injury patients in Gujarat. MSK pain can interfere with daily activities and affects the muscles, bones, ligaments, tendons, nerves, and joints. MSK pain may be acute (with a sudden onset strong symptoms) and chronic (long lasting). [14] We found that about 57% of SCI patients complains of MSK pain while rest 43% of patients reported no complains of MSK pain. Gupta N, Solomon J and Raja K (2011) surveyed that among 600 individuals were taken to study survey for pain & they found that 57% of SCI patients complained of pain [15]. Few other studiessuggested that SCI induced MSK pain hasvaryingprevalence ranging from 33-92%, one third of patients with spinal cord injuries who experience pain after their injury endure severe pain. [16-19]. Graph 1 shows that from 142 paraplegic SCI patients about 57% of SCI patients reported MSK pain.

Graph 2 shows anatomical areas of body reported to be affected by SCI patients. It was reported that among 81 patients who had complains of pain, 75 had shoulder pain; 47 had lower back pain, 31 had upper back pain, 18 had neck pain, 13 had elbow pain and 4 of them complained of wrist pain. Graph 3 shows the distribution of pain intensity for paraplegic SCI patients on the basis of NPRS scores. It shows that 42.96% of SCI paraplegic patients felt moderate type of pain, 11.27% of them felt severe pain in their body and 2.82% of them felt mild pain

MSK pain can be localized in one area, or widespread. Discomfort, minor aches, and sprains are some of more thoughtful health problems of MSK symptoms which require medical treatment. Anyone can experience MSK pain. It is most often caused by injury to the bone, joint, muscle, tendon, ligaments or nerves. In our study among all about 57% (n=81) of patients complains of pain, 52.8% (n=75) of them complains of shoulder pain, 33.1% (n=47) had lower back pain, 21.8% (n=31) had upper back pain, 11% (n=18) neck pain, 7% (n=13) elbow pain and 2% (n=4) of them complains of wrist pain. According to an epidemiological study conducted in India, about 20,000 new instances of SCI are reported annually, with shoulder pain being the most common symptom (60-70%). One study shows that 74.2% (n=89) women were having pain compared to 60.1% of the men [20]. With using NPRS in this study we found that among 142 patients of paraplegic spinal cord injury 44% complains of moderate type of pain, 10% of severe pain, 3% of them complains of mild pain. So, we can say that SCI patients are having moderate-severe type of pain. 43% patients complains that they are not having any type of MSK pain. In the study of Hassan M &Kamrujjaman M (2019) with using NPRS it was found that MSK pain in SCI patients is 92% which termed as high prevalence rate & in many studies in most of SCI patients' pain was found to be moderate to high prevalence rate. [17].

The questions were focused on asking the patients if they had any difficulties related to or complaints such as tightness, transferring, lifting & moving wheelchair in surrounding area. Table 2 shows that 25.4% (n=36) of patients fells tightness/contracture in any joint of their body and 74.6% (n=106) did not fell contracture or tightness in their body. 38.7% (n=55) paraplegic patients of SCI felt pain while moving wheelchair by their own and 61.3% (n=87) paraplegic patients of SCI did not felt pain while moving wheelchair by their own. 37.3% (n=53) patients fell pain while transferring activity or self-transfer and 62.7% (n=89) patients did not felt any pain while transferring activity. Only 16.2% (n=23) patients felt pain by lifting objects from surroundings and 83.8% (n=119) patients did not feel any pain while lifting. Limitations of this study was convenience sampling was used that was not reflecting the wider population under the study and the prevalence of the MSK pain was only for traumatic and paraplegic SCI patients. Future studies may include larger sample size with stratified sampling across the state and long-term studies including various intervention strategies for such pain can be conducted.

### Jenny D. Chaudhari et al.,

### CONCLUSION

This study came to the conclusion that 57 percent of SCI paraplegic patients report experiencing MSK pain. MSK discomfort ranges from moderate to severe in intensity. Lower back and upper back pain come in second and shoulder joint pain is more common than in other joints.

### ACKNOWLEDGEMENT

The authors acknowledge the participants without whom this study would not have been possible. We also extend our sincere gratefulness to all the physiotherapy professionals and department heads who permitted for collection of data from their departments.

### ABSTRACT

The primary objective of the study is to identify the diuretic prescribing pattern including prevalence of monotherapy and combination therapy, role and adverse effects of diuretics in patients with HFrEF or left ventricular systolic dysfunction and evaluation of diuretic tolerance. Diuretics are considered as a corner stone in reducing the symptoms of congestion in heart failure patients with reduced ejection fraction although the quality of evidence regarding this is poor and their effect on morbidity and mortality is not clearly understood. This was a 6-month prospective study of 98 left ventricular systolic heart failure patients who received diuretics for symptomatic treatment (Inclusion: minimum samplesize: 93). Torsemide (10mg) was the drug most prescribed both at admission and during hospital stay. Combinations of furosemide + spironolactone (20/50mgPO) and torsemide + spironolactone (10/50mg PO) were found more prevalent (21.4%) on discharge. Of the total population, 90.80% of patients got symptomatically improved on diuretics and there is a significant difference existing between urine output before and after administration. ADRs were seen in 27 patients, of which diuretic induced renal failure was more frequently observed. Based on the causality assessment of adverse drug reactions using Naranjo Scale, 10 ADR's were found to be probable and 17ADR's were possible.12patients among the total population developed diuretic tolerance.

### Angel Mariam Titus et al.,

Diuretics play a central role in patients with heart failure to relieve the symptoms of congestion. However, electrolyte imbalances and worsening of renal function may arise from the administration of diuretics. Thus, the use of diuretics in patients should be continuously monitored for the development of these adverse effects.

**Keywords:** Heart Failure, Diuretics, Adverse effects, Symptomatic improvement, Urine output, Tolerance

### INTRODUCTION

Heart failure is defined as a structural or a functional abnormality of the heart that leads to elevated intracardiac pressure and inadequate cardiac output (at rest or during exercise[1]. Diuretics are commonly prescribed to people with heart failure to alleviate the congestive symptoms of the disease [2].Side effects of diuretic therapy are mainly due to the fluid and electrolyte imbalance induced by all diuretics [3]. Diuretic resistance is the failure to achieve effective relief from congestion despite appropriate doses of diuretic[4]

### MATERIALS AND METHOD. STUDY DESIGN

It is a prospective analysis during a period of six months (October 2021- April 2022)conducted in cardiology department of a multi- specialty tertiary care hospital.

### METHOD OF SLECTION

Inclusion criteria: Patients diagnosed with moderate or severe LV systolic dysfunction on diuretics and Symptomatic LV dysfunction patients on diuretics.

**Exclusion criteria:** Cases in which adequate data were not available, patients diagnosed with renal or hepatic impairment, and special population including pregnant and lactating women were excluded.

**SAMPLE SIZE:** A total of 98 patients who met the inclusion and exclusion criteria were selected in the study. (Minimum sample size required was found tobe93).

STATISTICAL ANALYSIS: The collected data were analyzed and interpreted using Microsoft excel and SPSS..

### RESULTANDDISCUSSION

Ninety eight cases of systolic heart failure patients on diuretics managed in a tertiary care hospital during a period of six months (1-10-2021to30-4-2022) prospectively were randomly studied and evaluated for diuretic prescribing pattern, prevalence of monotherapy and combination therapy, role in symptomatic relief, ADR using Naranjo scale, tolerance and its management.

### DIURETIC PRESCRIBING PATTERN

The study evaluated the prescribing pattern of diuretics according to WHO prescribing indicators. The rational use of diuretics were analyzed based on average number of drugs per encounter and percentage of drugs prescribed from essential drug list or hospital formulary.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Angel Mariam Titus et al.,

### PREVALENCE OF MONOTHERAPY AND COMBINATION THERAPY

Monotherapy showed higher prevalence at admission (61.2%) and during hospital stay(60.2%) while combination therapy showed higher prevalence at discharge (54.1%).

### DIURETIC PRESCRIBINGPATTERN BASED ONDRUG

Considering patients on monotherapy, 60 patients were treated with diuretics at admission ,59 during hospital stay and 44 on discharge. Out of 60 patients, 32(32.7%) were treated ontorsemide,21 (21.4%)onfurosemideand7(7.1%)on spironolactone. Out of 59 patients,33(33.7%) were on torsemide,22(22.4%) on furosemide and 4(4.1%)on spironolactone.Outof44 patients, 25 (25.5%) were on torsemide, 15(15.3%) on furosemide and4(4.1%)on spironolactone. Considering patients on combination therapy, 29 patients were treated with diuretics at admission, 40 during hospital stay and 53 on discharge. Out of 29 patients 16(16.3%) were on furosemide+ spironolactone ,7(7.1%)ontorsemide+ spironolactoneand6(6.1%) on furosemide+ amiloride. Out of 40patients, 17(17.3%) were on furosemide + spironolactone and 7 (7.1%) on furosemide + amiloride. Out of 53 patients,21(21.4%)were on furosemide+ spironolactone,21(21.4%) on torsemide + spironolactone and 11 (11.2%) on furosemide+ amiloride.

### ROLE OF DIURETICS IN SYMPTOMATIC TREATMENT

On monotherapy during hospital stay, 32 patients (32.7%) got symptomatically improved out of 33on torsemide,17 (17.3%)out of 22 on furosemide and 3(3.1%) out of 4 on spironolactone. And in combination therapy during hospital stay, 16(16.3%) patients got symptomatically improved on the combination of furosemide+ spironolactone out of 17, 15 (15.3%) out of 16 on combination of torsemide + spironolactone and7 (7.1%)out of 7 on combination of furosemide+ amiloride.

## COMPARISON OF URINE OUTPUT BEFORE AND AFTER DRUG ADMINISTRATION USING WILCOXON SIGNED RANKTEST

Out of 98 patients ,67 achieved negative balance within first 24hrs.Among the remaining31, again 21 achieved negative balance on the subsequent days, only 5 patients showed a negative response. Positive changes are the number of patients with negative urine output after drug administration, negative changes are the number of patients with positive urine output after the drug administration. Z value is 2.942 ( p &It; 0.01 ). Hence there is a significant difference existing between urine output before and after drug administration.

### ADVERSE EFFECTS OF DIURECTICS DIURETICTOLERANCE

Resistance or tolerance to diuretic therapy can occur overtime, making volume management more difficult. Among the 12 patients who developed diuretic tolerance,6(6.12%) patients were tolerant to furosemide,4(4.4%) tolerant to torsemide and2(2.0%) tolerant to spironolactone.

### CONCLUSION

Our study analyzed prescribing pattern of diuretics including the prevalence of monotherapy and combination therapy, role in symptomatic treatment, adverse effects and tolerance to diuretics in patients with systolic heart failure admitted to a tertiary care hospital during six months period. We came to understand that torsemide was found to be more prevalent at admission and during hospital stay while the combination therapy of furosemide+ spironolactone and torsemide + spironolactone found to be prevalent on discharge. The prescribing pattern of the total population concluded rational use of diuretics as per WHO core indicators. Majority of the patients got symptomatically improved on diuretics and there is a significant difference existing between urine output before and after administration. Symptomatic improvements in patients on monotherapy relating to combination therapy were found out using Odds Ratio. Diuretic induced renal failure was shown to be the most frequently occurred ADR. Based on the causality assessment of adverse drug reactions using Naranjo Causality Assessment Scale, probable and

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Angel Mariam Titus et al.,

possible were the occurred ADR. Only the patients who had positive urine output and not symptomatically improved even after the drug administration got tolerant to diuretics. LV dysfunction has no significant association with the diuretic tolerance. Some of the limitations of our study was acknowledged. Majority of the patients were bedridden and their weight was unable to assess, so we evaluated role of diuretics only through symptomatic improvement and urine output although weight change was also having beneficial effect on the same .Since one of the patients from our study sample was expired during the study period we were not able to obtain the complete data. The study can be extended to a multi-center study with a large sample size so that more clearer results can be obtained. Understanding prescribing pattern of diuretics will help in better management of tolerance.

### ABSTRACT

Primary amines and carbonyl compounds condense to form Schiff bases [1]. There are numerous reported synthetic methods in the literature, but the non-standard method using microwave-assisted reactions has attracted significant attention since it takes less time and produces acceptable yields. Microwave synthesis increases repeatability and facilitates handling. The flexible methods for synthesising Schiff bases and its coordination chemistry are described in the current paper. Supra molecular chemistry, biological applications, catalysts, material science, and chemical separation have all claimed relevance to this [2]. They also have a wide range of uses, including analgesic drugs [7], ant tubercular [3], antimalarial [4], verso-relaxing [5], and anticancer [6].

**Keywords :** Antimicrobial, unconventional, microwave-assisted reactions, Schiff Base, DHA, Heterocyclic.

### INTRODUCTION

Schiff base name derived from "Hugo Schiff's [8] a Germen Chemist who synthesize first schiff base through condensation reaction of primary amines [9] and aldehydes or ketones. Schiff base prepared from aliphatic carbonyls compounds are less stable in comparison of schiff base derived from aromatic carbonyls[10] compounds due to the presence of aromatic phenyl moiety which is responsible for separation of electron density on a large surface area which provide extra stability to the schiff bases because electron density per unit area [11]goes on decreasing. During condensation reaction Schiff base functional group obtained which contain a double bond between carbon and nitrogen(-C=N-).[12] Schiff base also known with different names like imine or azomethine on the basis of structural features that is presence of double bond between carbon and nitrogen.[13] Rate of formation of schiff bases explain on the basis of type of reaction occurs during schiff base formation, which is nucleophillic[14] addition and elimination reaction[15] in which primary amines[16] act as a nucleophile and carbonyl compounds[17] act as an electrophile if carbonyl compound[18] is aldehydes, [19]then it reacts faster because they have high electrophilicity[20] and less sterically hindered[21] in comparison of ketones which are less electrophilic[22] and more sterically hindered. Mechanism of formation [23] of schiff bases are nucleophillic addition and elimination reaction in first step primary amines act as a nucleophile and attacks on carbonyls compounds which act as an electrophile and formed a tetrahedral intermediate similar to hemi acetal [24]and hemi-ketal [25]and in second step elimination reaction occurs in which water molecule eliminate [26] and a double bond is formed between carbon and nitrogen. Due to their availability and diversity, schiff-base complexes are regarded as the most significant stereo chemical models [27] in main group and transition metal coordination chemistry. Environmentally friendly synthetic technologies have gained relevance recently. Because chlorinated hydrocarbons are poisonous and flammable by nature, organic synthesis processes that utilise them as solvents have wreaked havoc on the biosphere [28]. Thus, safer chemicals and solvents must be used in order to reduce such mishaps. As most solvents are poisonous or flammable today and raise the cost of synthesis overall, a solvent-free approach has shown to be appealing. However, compared to conventional approaches, the solvent-free approach enhances selectivity, shortens reaction times, and makes product separation and purification simpler [29-33]. A significant obstacle in green chemistry is the creation of cleaner processes. The elimination of volatile organic solvents from the reaction medium is one of the many components of green chemistry and is crucial [34-35]. It is increasingly vital for chemists to explore for ecologically friendly methods due to the growing economic concerns. Due to the diversity of their steric and electronic properties, Schiff bases generated from aromatic carbonyl compounds have been extensively explored using metalloproteinase models and asymmetric catalysis. While there are no harsh reaction conditions, using water as a solvent [36-38] is one of the better alternatives. The challenge of eliminating solvents from the reaction mixture or liquid is frequently encountered in the traditional synthesis of Schiff bases. As a result, microwave-assisted reactions have undergone extensive research [39-41] and are frequently employed in chemical synthesis.

### SYNTHESIS ROUTES

In claimed eggshells, Suresh Patil et al. [42] produced Schiff Bases using 4-methoxyaniline and 4- hydroxy benzaldehyde (Scheme-1). This innovative environmentally friendly grinding technique produced a moderate to good yield when used to synthesise Schiff bases using CES (heterogeneous catalyst).

### Scheme 1

Using microwave irradiation, J. Panda et al. [43] refluxed Schiff Base of Isatin utilising substituted aniline (Scheme-2) to generate 85% product.

63645

#### Scheme 2

For the preparation of Schiff bases, Arshi Nakvi et al. [44] investigated three alternative green techniques. 10-ml of water was mixed into a combination of 3-chloro-4-fluoro aniline and substituted benzaldehyde (Scheme-3), and crystallised product was produced. The use of " ;microwave jump- start "synthesis," ;grindstone friction activated "; synthesis, and water-based reactions in greener methodologies has many advantages because water is a less expensive reaction medium, is safe for the environment, is simple to handle, and has no corrosive or carcinogenic effects.

#### Scheme 3

By reacting p-toluidine and 3,4,5-trimethoxybenzaldehyde with neutral alumina and dichloromethane while it was being microwaved for four minutes, Zhaoqi Yang et al. [45] created the Schiff Bases (Scheme-4). With a good yield, microwave irradiation synthesis uses the least amount of time.

#### Scheme 4

Schiff bases made from carboxy ethyl thiophenes were created by B. Sindhu Kumari [46]. (Scheme- 5). The addition of ethanolic Lanthanide (III) chloride solution to the Schiff Base and subsequent 15- minute irradiation of the combination resulted in the further production of the metal complex.

#### Scheme 5

With the aid of natural acid catalysts like grape juice, lemon juice (Scheme 6), and mango juice, Garima Yadav et al. [47] created the Schiff Base. Fruit juice's increasing popularity can be attributed in large part to its enzymatic activity, acidic qualities, environmentally friendly nature, and commercial availability. The chemistry of natural catalysts will spur a lot of research in the near future.

#### Scheme 6 Dehydroacetic acid (DHA)

DHA, a biologically active compound, has shown to have good antibiotic and antifungal effects. It was isolated from natural sources and is now available in the industrial sector thanks to a variety of synthetic techniques. DHA and its derivatives have been demonstrated to have a wide range of applications in chemical synthesis. The research has been evaluated, as well as investigations on related pyrone derivatives. The carbonyl of the acetyl group, the carbon atom terminating the conjugated carbon at position-6, the lactone carbonyl, and the carbonyl carbon at position-4 are all vulnerable to attack by nucleophillic reagents since it has numerous reactive sites. An electrophile, on the other hand, can attack at C (3) or C (5). position all these position shown below with numbering.

According to a review of the literature, reacting DHA and its derivatives with various reagents provides a flexible pathway to the synthesis of a wide range of heterocyclic compounds.. Since the studies embodied in this review are aimed at further exploring the potentiality of this aspect, it will be worthwhile to review the literature work concerning the synthesis of 'Nitrogen' and 'Oxygen' containing heterocyclic compounds from the reactions of DHA and its derivatives[48].

# THE HETEROCYCLIC COMPOUNDS SYNTHESIZED FROM DHA AND ITS DERIVATIVES ARE CATEGORIZED AS:

### PYRIDINES

S Garratt et al, synthesize pyridines (18) by treating DHA with NH 3 & amines. During the transformation of DHA into pyridines two intermediate [(16), (17)] are isolated and identified.[49].

### "PYRIDONES"

M lqbal *et al*, synthesize substituted-4-pyridones [(22), R=H, CH3] by treating 3-Cinnamoyl-4-hydroxy-6-methyl-2H-pyran-2-ones (11) with primary amines. During the reaction intermediate (21) that is Schiff's base formed [50].

### N, N'-LINKED BI(HETEROARYLS)

"M P Sammesh and coworkers" also prepared "N, N'-linked bi(heteroaryl) compounds" by treating amino triazolewith Dehydroacetic acid. Alarge number of variations are observed of this reactionwhen DHA, (1) reacts with hydrazine, N-aminoheterocycles(24)&N-amino pyridiniumsalts(27). After completion of the reaction, we obtained different products of N,N'-linkedbi(heteroaryl)compounds [51-52] that is (25), (26) & (28).

### N, N'-LINKED BI(HETEROARYLS)

M P Sammesh and coworkers also synthesized N, N'-linked bi(heteroaryl) compounds by the reaction of DHA with aminotriazole. Many interesting versions of this reaction When hydrazine reacts with N- amino heterocycles, it

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Satvinder Khatkar et al.,

produces. As a result of the reactions of DHA with aminotriazole24, hydrazine, and N-aminopyridinium salts 27, N, N'-linked bi(heteroaryl) compounds 25, 26, and 28 are formed[52].

#### PYRAZOLYLPYRIMIDINES

H Batra et al, synthesised Condensation of 4-acetoacetyl-5-hydroxy-3-methyl-1H-substituted pyrazoles 3 and guanidine carbonate in ethanolic NaOH yields 2-amino-6-methyl-4-(5-hydroxy-3- methyl-1-substitutedpyrazol-4-yl0pyrimidines 23. (40 percent ). Some of these chemicals have been discovered to have mild antifungal activity[53].

## "PYRIDONES"

M lqbal et al, synthesize substituted-4-pyridones [(22), R=H, CH3] by treating 3-Cinnamoyl-4- hydroxy-6-methyl-2H-pyran-2-ones (11) with primary amines. During the reaction intermediate (21) that is Schiff's base formed [50].

#### "N, N'-LINKED BI(HETEROARYLS)"

"M P Sammesh and coworkers" also prepared "N, N'-linked bi(heteroaryl) compounds" by treating amino triazole with Dehydroacetic acid. A large number of variations are observed of this reaction when DHA, (1) reacts with hydrazine, N- amino heterocycles (24) & N-amino pyridinium salts (27). After completion of the reaction, we obtained different products of N, N;-linked bi(heteroaryl) compounds [51-52] that is (25), (26) & (28).

#### "PYRAZOLYLPYRIMIDINES"

"H Batra et al", prepared 2-amino-6-methyl-4-(5-hydroxy-3- methyl-1-substitutedpyrazol-4- ylopyrimidines (23) with yield (40 percent) by treating pyrazoles (3), guanidine carbonate and 4- acetoacetyl-5-hydroxy-3-methyl-1H-substituted (22) by using C<sub>2</sub>H<sub>5</sub>OH/NaOH via condensation process. Among these chemicals some them shows mild antifungal activity [53].

#### "BENZIMIDAZOLES"

"M A Qayyoom et al", synthesized 2- methyl-5-substituted benzimidazoles (31) by treating DHA (1) with substituted o-phenylenediamines (29), via intermediate formation i.e. 3-[N- (substituted-amino phenyl) acetimidoyl]-4-hydroxy-6-methyl-2h-pyrones (30), which further converted into (31) by pyrolysis [54].

#### "PYRAZOLOPYRIDONES"

"K Ogawa et al", synthesize 3,6-dimethyl-1-phenyl-1H-pyrazolo[4,3-c] by using pyridine-4-thiones, pyridine- 4-ones

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 - 0997

and DHA as a starting material & amp; tested in vitro for activity. The activity of the synthesized substances activities was compared with mirlinone, which was used as a control. Most of the substances have greater potential of activity in comparison of than milrinone [55].

#### "PYRANOPYRANS"

"V Y Sosnovskikh & amp; coworkers", developed another method for the preparation of pyranopyrans i.e., 2-Substituted-7-methylpyrano[4,3-b]-4H,5H-diones (47). In this method they treated DHA, (1) with esters RCO2 Et in the presence of LiH/THF & amp; formation of intermediate, [diketones of the type (3- acetoacetyl- 4-hydroxy-6methyl-2H-pyran-2-ones)] (46) is formed which further converted into final product (47) in

the presence of conc. H<sub>2</sub>SO<sub>4</sub> via cyclization process[56].

#### "PYRANOPYRANS (1)"

"V K Mahesh et al", synthesized 3-acetyl-4,7-dimethylpyrano[4,3-b] pyran-2H,5H- dione 47(a) by treating DHA, (1) with ethyl 3-oxobutyrate under mild alkaline condition via formation of intermediate 46(a) by condensation mechanism. This intermediate 46(a) further cyclized and gives desired product [57].

#### "PYRANOPYRANS (2)"

M Siddiq et al, by removing an acetyl group from 3-acetyl-4,7-dimethylpyrano[4,3-b] pyran-2H,5H- dione (48), a dipyrone derivative, "4,7-dimethylpyrano[4,3-b] pyran-2H,5H-dione" (49) was produced [58].

(49)

#### "Important Biological perspective of Schiff bases": "Antimalarial activity":

More than 100 nations are affected from "Malaria disease" & has resulted in significant health issues all over the world. Almost 3 million of the 550 million people who are affected by this disease each year die from it; 90% of these deaths occur in Africa, mostly in children [48]. "*P. falsiparum*", "*P. vivax*", "*P. ovale*" & "*P. malariae*" are the major causes of human malaria. The vector of Plasmodium is a female mosquito belonging to the species Anopheles [59].

### Antibacterial activity

The interest in Schiff base complexes has grown as bio-inorganic chemistry has advanced, as many Schiff base complexes function as promising antibacterial compounds. Bacteria are directly responsible for the rising infectious disease death rate. The creation of novel antibacterial substances with improved modes of action is unquestionably necessary nowadays. The potential of schiff bases as antibacterial agents has been acknowledged [60].

### Anticancer activities

Schiff's base "3-methylbenzyl-2-(6-methylpyridin-2-ylmethylene) hydrazine carbodithioate" produced by treating S-3- methylbenzyldithiocarbazate with 6-methylpyridine-2-aldehyde via condensation mechanism. This Schiff's base act as a tridentate ligand in which donner atoms are "N" & "S" through which it form octahedral complexes with dipositive metal ions [Cu (II), Ni (II), Zn (II) & Cd (II)]. These metal complexes show excellent activity against breast cancer cell lines [61]. Ligand show high activity against both cancer cell lines and its complexes are highly selective with metal ion [Cu( II), Ni(II) & amp; Zn(II)] these complexes active only against one cancer cell lines. On the other hand, its complex with Cd (II) ion active against all other cancer cell line [62].

### Structure of ligand having anti-cancer activity

The "Schiff's base 2- [(2,3-dihydro-1H-inden-4- ylimino) methyl]-5-nitrophenol" & its complexes with metal ions [Cu (II), Mn (II), Pd (II) & amp; Zn (II)] shows good anticancer activity in "MCF-7 (human breast adenocarcinoma)" & amp; "HT- 29 (colon carcinoma)" cells in vitro. According to the findings, greatest cytotoxic action of the complex of di-positive metal ion palladium observed against "MCF-7 cells", with an IC<sub>50</sub> of 5.94 M, which is on par with "cisplatin". The ligand & its combination with dipositive zinc metal ion shows "broad spectrum activity" against two-three gram-"negative & amp; gram-positive bacteria" [63].

### Satvinder Khatkar et al.,

#### Structure of metal complexes having anti-cancer activity

Schiff's base ligand synthesize from condensation mechanism by treating benzaldehyde, 2-amino-3- methylbutanoic acid & 4-amino-antipyrine. This ligand formed complexes with di-positive metal ion [Cu (II) & amp; Zn (II)] which shows excellent biological activities. Cytotoxic activity of the synthesized complex test in vitro by using "trypan blue dye exclusion assay" against an Ehrlich ascites carcinoma (EAC) tumor model. The complexes show highest degree of cytotoxicity [64].

Copper (II) Complex

Zinc (II) complex

# Structure of synthesized "metal complexes"

"Catalytic activities of Schiff's base metal complexes"

There are various parameters such as the ligand's composition, the availability of a coordination site & the character of the metal ion with which it forms are used to determine the catalytic activity of the synthesized Schiff's base metal complexes. The base metal complexes of Schiff can be used as catalysts in both homogeneous and heterogeneous catalysis [65]. Due to the possibility of varied oxidation states, metal complexes, particularly those with a vacant coordination site, can operate as a suitable catalyst and provide a location for reaction to occur. "Schiff's base metal complexes" have been utilized as a "catalyst" in "polymerization" [66], "hydrogenation" [67], "epoxidation" [68], "oxidation" [69] & "ring opening" [70], among other applications. In asymmetric transformations, the chirality of the Schiff's base ligand is crucial. A chiral salen [72] type ligand is used as Jacobsen's catalyst in the enantioselective transformation of prochiral alkenes into matching epoxides. Ryoji Noyori created a copper-base Schiff's complex for metal-carbenoid cyclopropanation of styrene in 1968, which contains chiral ligand coupled with copper metal ion for metal-carbenoid cyclopropanation of styrene [73].

#### Structure of Noyon's (Left) and Jacobsen's catalyst (Right) Oxidation reactions

The enantioselective epoxidation of "Cis -1,2-Diphenylethylene", "(E)-non-3-ene" & amp; "(E)-4-Octene" using "iodoso- Benzene" as an oxidizing agent carried out in presence of dissymmetric chiral Schiff's base of tri positive metal ion manganese & amp; ruthenium complexes. On the behalf of olefins studied, overall chemical yields for corresponding epoxides achieved with Mn (II) catalysts were superior than those obtained with Ru (III) catalysts [74]. The conversion of trans-3-nonane to its epoxides rises linearly as more electron withdrawing groups are present on ligands. Other substrates under investigation did not show similar tendencies, although ligands containing nitro groups always provide greater translation and a higher cis/trans ratio. The ligand with the MeOH substituent in the fifth position yields the least. These findings underlined the importance of the ligand substituent at the 5th position in the conversion of substrates to their epoxides. The catalytic potential of "zeolites encapsulating Schiff's base complexes" of tri-positive chromium ion & di-positive metal ion of copper, iron, nickel, cobalt, manganese was investigated during oxidation reaction of C<sub>6</sub>H<sub>6</sub> to C<sub>6</sub>H<sub>10</sub>O. Among all these "zeolites encapsulating Schiff's base complexes", highest catalytic potential was obtained for Schiff base complexes of di-positive manganese ion. Oxidation of Ethenylbenzene to Benzenecarbaldehyde in presence of oxygen aerobic oxidation was carried out by using zeolites-Y which contain tri-positive complexes of manganese ion with "N, N-ethylene bis-(salicylideneaminato) salen", "N, N-ethylene bis-(5-chlorosalicylideneaminato)Cl salen" & "N, N- ethylene bis-(5bromosalicylideneamina) Most effective oxidation of reactive substrates like "carbolic acids & aldehydes" were observed in case of Schiff's base complexes of dipositive cobalt ion[75].

M= Mn(II), Ru(III) & Co(II) Structure of metal complex

#### Hydrogenation reactions

The catalytic effectiveness of di-positive palladium ion complex with "poly(3,6-dibenzaldimino-N- vinylcarbazole)" has been studied in hydrogenation processes. Excellent heterogeneous catalytic activity showed by the polymer complex during the hydrogenation processes. In these processes normal reaction conditions were required like 1 atm pressure of H<sub>2</sub> gas along with ambient temperature for the reduction of alkenes, benzaldehyde, Schiff's bases, aromatic nitro compounds & alkynes [76].

#### Structure of Pd complex having catalytic activity towards hydrogenation rteaction

Asymmetric reduction of di-alkyl ketones to alcohols are carried out by using transition metal Schiff's base complexes as catalysts during the reaction, in the absence of catalysts i.e., transition metal Schiff's base complexes these conversions are not possible. It was also possible to reduce ketones using ruthenium and iridium analogues. The reduction rate was discovered to be controlled by the type of the central metals, with RhIr Ru as the observed order. In addition, instead of bipyridine complexes, chiral compounds were used to reduce ketones [77]. The reduction of ketones effectively carried out by using Schiff's bases which have chirality with 51 percent ee and a 99 percent yield. In the case of aryl ketones, the position and electrical characteristics of ring substituents influence the enantioselectivity of reduction, as evidenced by results acquired from catalyti c reduction of a range of ketones. In comparison to ortho substituted acetophenones, meta and para substituted ketones were less enantioselective [78]. The hydrogenation of acetophenone to 1-phenylethanol was particularly active in zeolites supported cobalt (II) complexes of salicylidenediaminocyclohexane [79]. These catalysts had a selectivity of 99 percent and a conversion of 98 percent, which was comparable to homogeneous catalysts. The optimum temperature for best ee with homogeneous catalysts was -10 °C, whereas the Schiff's base catalyst showed best activity at 25 °C, which is a major advantage over the conventional one [80].

#### Structure of chiral Schiff's base

## ACKNOWLEDGMENT

This Research Was hold up by "Maharishi Markandeshwar (Deemed to be University), Mullana Ambala" ;" Biozenta Type Pvt. Limited Una Himachal Pradesh". I am highly thankful for financial support from CSIR.

### CONCLUSION

We have reviewed the most recent developments in the study of Schiff bases, as well as their structure, characterization, and biological uses, in this review paper. Both the industrial and medical areas heavily dependent on "ligands & their metal complexes". A number of reports of Schiff bases in antibiotic and antiviral of therapeutic interest have lately been reported in several journals, despite the fact that research on the Schiff bases is growing every day. However, further study is still required before these metal complex medicines may be developed. Finally, Novel Schiff's bases prepared via chemically described methods by treating cobalt dicyanamide compounds with N 2 –containing heterocyclic compounds. We prepared a new class of "chalcones" which further tested for "antibacterial activity". As a result of the findings, all chemicals were shown excellent activities against to all microorganisms during testing. In addition, the conjugated carbonyl region was changed to cyanopyridine,

#### Satvinder Khatkar et al.,

pyrimidines, pyrazoles & amp; isooxazoline. On the basis of these changed components nitro containing pyrazoles are most effective as an antibacterial inhibitor. Observed results indicated that moderate to exceptional bioactivities in vitro shown by the several examined substances.

## ABSTRACT

The purpose of this search is to introduce some concepts of the fuzzy soft unitary operator defined on fuzzy soft Hilbert space, including some key characteristics of this operator, as well as a discussion of various theorems related to this operator. The aim of this search is to explain some basic ideas about the fuzzy soft unitary operator defined on fuzzy soft Hilbert space, along with a discussion of some of the operator's essential properties and related theorems.

**Keywords:** Fuzzy soft normal operator, fuzzy soft Hilbert space, fuzzy soft hyponormal operator, fuzzy soft unitary operator, fuzzy soft isometric isomorphism

# INTRODUCTION

To solve a number of issues in pure mathematics, the discipline of functional analysis was founded more than a century ago. In addition to regularly presenting us with uncertainty, the phenomena under study's ambiguity also provides us with instruments for assessing faults in solutions to issues with both infinite and limited dimensions. In a variety of fields, including engineering, business, medicine, and economics, this kind of problem might be encountered. Our conventional mathematical methods frequently fall short in addressing such problems. So, in 1965, L. Zadeh offered a generalisation of set theory. The resulting theory was given the name fuzzy set theory. It didn't take long for fuzzy set theory to become a potent tool for handling uncertain situations. In classical set theory, the basis function from a set x to set [0,1] defines the set x.

## Radharamani and Nagajothi

On the other hand, in fuzzy set theory, a set is defined by its membership function, which spans from x to the closed interval between 0 and 1. Additionally, Molodtsovcreated a novel generalisation for handling uncertainty in 1999. This study led to the development of soft set theory. Since then, it has been used in a variety of disciplines, including computer science, engineering, medicine, and others, to address challenging problems. A parametrized collection of a universal set is known as a soft set. Soft set gave rise to the concepts of soft point, soft normed space, soft inner product space, and soft Hilbert space, which were later used in functional analysis to deal with a variety of mathematical subjects.

Maji et al. presented the idea of a fuzzy soft set for the first time in 2001. The concept was developed by combining a fuzzy set and a soft set. It was required to combine the two ideas in order to provide results that were more accurate and comprehensive. Fuzzy soft point and fuzzy soft normed space were developed as a result of the addition of these additional ideas to the framework. Fuzzy soft Hilbert spaces were introduced in 2020 by Fariedet al. Also included are the fuzzy soft linear operators. In this article, we provide a novel kind of Fuzzy soft unitary operator and establish various related theorems.

#### PRELIMINARIES

The notations, definitions, and introductions for fuzzy set, soft set, and fuzzy soft set that will be used in the discussion that follows are provided in this section.

#### Definition 2.1: Fuzzy set

If fuzzy set  $\check{A}$  over  $\mathfrak{X}$  is a set characterized by a membership function  $\eta_{\check{A}}:\mathfrak{X} \to \mathfrak{F}$ , such as  $\mathfrak{F} = [0,1]$  and  $\check{A} = \left\{ \frac{\eta_{\check{A}}(x)}{x} : x \in \mathfrak{X} \right\}$ . And  $\mathfrak{F}^{\mathfrak{X}} = \{\check{A}: \check{A} \text{ is a function from } \mathfrak{X} \text{ into } \mathfrak{F} \}$ 

#### Definition 2.2: Soft set

Let  $\mathcal{P}(\mathfrak{X})$  the power set of  $\mathfrak{X}$  and  $\mathsf{E}$  be set of parameters and  $A \subseteq E$ . The mapping  $\mathbb{G}: A \to \mathcal{P}(\mathfrak{X})$ , when  $(\mathbb{G}, A) = \{\mathbb{G}(l) \in \mathcal{P}(\mathfrak{X}) : l \in A\}$ . As a result  $(\mathbb{G}, A)$  is called the soft set.

#### Definition 2.3: Fuzzy soft set

The soft set  $\mathbb{G}_A$  we say that fuzzy soft set over  $\mathfrak{X}$ , when  $\mathbb{G}: A \to \mathfrak{J}^{\mathfrak{X}}$ , and  $\{\mathbb{G}(l)\in \mathfrak{J}^{\mathfrak{X}}: l \in A\}$ . The collection of all fuzzy soft sets denoted by  $FSS(\widetilde{\mathfrak{X}})$ .

#### Definition 2.4: Fuzzy soft point

The fuzzy soft set  $(\mathbb{G}, A) \in FSS(\tilde{\mathfrak{X}})$  is called a fuzzy soft point over  $\mathfrak{X}$ , denoted by  $\tilde{l}_{\eta_{\mathbb{G}(e)}}$  if  $e \in A, x \in \mathfrak{X}$  $\eta_{\mathbb{G}(e)}(x) = \begin{cases} \alpha, & \text{if } l = l_0 \in \mathfrak{X} \text{ and } e = e_0 \in A, \\ 0, & \text{if } l \in \mathfrak{X} - \{l_0\} \text{ or } e \in A - \{e_0\} \end{cases}$ , such that  $\alpha \in (0,1]$ 

#### Definition 2.5: Fuzzy soft Hilbert space

A fuzzy soft inner product space is defined as  $(\tilde{\mathfrak{X}}, \langle \cdot, \cdot \rangle)$ . This space, which is fuzzy soft complete in the induced fuzzy soft norm indicated in Theorem (2.10), is thus referred to as a fuzzy soft Hilbert space and denoted by  $(\tilde{h}, \langle \cdot, \cdot \rangle)$ . Every fuzzy soft Hilbert space is obviously a fuzzy soft banach space.

#### Definition 2.6: Fuzzy soft linear operator in $\tilde{\hbar}$

Consider  $\tilde{\mathcal{K}}$  to be a fuzzy soft Hilbert space. A fuzzy soft linear operator  $\tilde{\mathfrak{X}}$ :  $\tilde{\mathcal{K}} \to \tilde{\mathcal{K}}$  is called a fuzzy soft linear operator in  $\tilde{\mathcal{K}}$ , then  $\tilde{\mathfrak{X}}$  is a fuzzy soft linear operator on  $\tilde{\mathcal{K}}$  which is denoted as  $\tilde{\mathfrak{X}} \in \tilde{\mathbb{L}}(\tilde{\mathcal{K}})$ .  $\tilde{\mathfrak{X}}$  is fuzzy soft bounded if

there exists 
$$\tilde{\kappa} \in \mathfrak{R}(\mathbb{A})$$
:  $\left\| \mathfrak{F}(\tilde{l}_{\eta_{\mathfrak{f}(e)}}) \right\| \leq \tilde{\kappa} \left\| \tilde{l}_{\eta_{\mathfrak{f}(e)}} \right\| \quad \forall \tilde{l}_{\eta_{\mathfrak{f}(e)}} \in \tilde{\mathcal{K}}$ , then  $\mathfrak{F} \in \mathfrak{B}(\tilde{\mathcal{K}})$ 

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Radharamani and Nagajothi

#### Definition 2.7: Fuzzy soft adjoint operator in $\tilde{\hbar}$

The fuzzy soft adjoint operator  $\widetilde{\mathbb{T}}^*$  of a fuzzy soft linear operator  $\widetilde{\mathbb{T}}$  is defined by  $\langle \widetilde{\mathbb{T}} \widetilde{l}^1_{\eta_{1_{\mathbb{G}(e_1)}}}, \widetilde{l}^2_{\eta_{2_{\mathbb{G}(2)}}} \rangle \cong \langle \widetilde{l}^1_{\eta_{1_{\mathbb{G}(e_1)}}}, \widetilde{\widetilde{\mathbb{T}}^*} \widetilde{l}^2_{\eta_{2_{\mathbb{G}(2)}}} \rangle$  for all  $\widetilde{l}^1_{\eta_{1_{\mathbb{G}(e_1)}}}, \widetilde{l}^2_{\eta_{2_{\mathbb{G}(e_2)}}} \in \widetilde{A}$ 

#### Definition 2.8:Fuzzy soft Normal Operator

Let  $\tilde{\mathcal{M}}$  be an FS Hilbert space and  $\tilde{\mathfrak{T}} \in \mathfrak{B}(\tilde{\mathcal{M}})$ . Then,  $\tilde{\mathfrak{T}}$  is said to be an FS normal operator if  $\tilde{\mathfrak{T}}\tilde{\mathfrak{T}}^* \cong \tilde{\mathfrak{T}}^*\tilde{\mathfrak{T}}$ 

#### Definition 2.9: Fuzzy soft self adjoint operator

The FS-operator  $\tilde{\mathfrak{T}}$  of FSH-space  $\tilde{\mathfrak{K}}$  is called fuzzy soft self adjoint (FS-self adjoint operator) if  $\tilde{\mathfrak{T}} \cong \tilde{\mathfrak{T}}^{\tilde{*}}$ 

#### Definition 2.10: Fuzzy soft isometry operator

 $\begin{array}{l} \mathsf{Let}\tilde{\lambda} \text{ be an FS Hilbert space and } \widetilde{\mathfrak{T}} \widetilde{\in \mathfrak{B}}(\underline{\tilde{\lambda}}) \text{ . Then, } \widetilde{\mathfrak{T}} \text{ is said to be an FS isometry} \\ \mathsf{operator if}(\widetilde{\mathfrak{Fl}}_{1_{\eta_{\mathsf{I}_{\mathsf{q}(e_1)}}}}, \widetilde{\mathfrak{T}}l^2_{\eta_{2_{\mathsf{q}(e_2)}}}) \cong \langle \widetilde{l}_{\eta_{\mathfrak{1}_{\mathsf{q}(e_1)}}}, \widetilde{l}^2_{\eta_{2_{\mathsf{q}(e_2)}}} \rangle \text{ for all } \widetilde{l}_{\eta_{\mathfrak{1}_{\mathsf{q}(e_1)}}}, \widetilde{l}^2_{\eta_{2_{\mathsf{q}(e_2)}}} \widetilde{\in} \widetilde{\mathcal{A}} \end{array}$ 

#### Definition 2.11: Fuzzy soft projection operator

Consider  $\tilde{\mathcal{M}}$  to be a fuzzy soft Hilbert space. A fuzzy soft linear operator  $\tilde{\mathfrak{T}}: \tilde{\mathcal{M}} \to \tilde{\mathcal{M}}$  is called a fuzzy soft projection operator in  $\tilde{\mathcal{M}}$  if  $\tilde{\mathfrak{T}}^2 \cong \tilde{\mathfrak{T}}$  ie,  $\tilde{\mathfrak{T}}$  is an idempotent.

#### Definition 2.12: Fuzzy soft hyponormaloperator

Consider  $\tilde{\hbar}$  to be a fuzzy soft Hilbert space.  $\tilde{\mathfrak{F}} \in \mathfrak{B}(\tilde{\hbar})$  is called fuzzy soft hyponormal operator if  $\|\tilde{\mathfrak{T}}^* \tilde{l}_{\eta_{\mathfrak{g}(e)}}\| \leq \|\tilde{\mathfrak{T}}\tilde{l}_{\eta_{\mathfrak{g}(e)}}\|$  for all  $\tilde{l}_{\eta_{\mathfrak{g}(e)}} \in \tilde{\mathfrak{K}}$  or equivalently  $\tilde{\mathfrak{T}}^* \tilde{\mathfrak{T}} \geq \tilde{\mathfrak{T}}\tilde{\mathfrak{T}}^*$ 

#### Definition 2.13: M-Fuzzy soft hyponormaloperator

Let  $\tilde{\mathcal{A}}$  be an FS Hilbert space and let  $\tilde{\mathfrak{F}} \in \mathfrak{B}(\tilde{\mathcal{A}})$  is called M – fuzzy soft hyponormal operator if there exist a real number  $\mathcal{M}$ , such that  $\left\| (\tilde{\mathfrak{T}} \simeq \widetilde{\tilde{\mathfrak{e}I})^*} \tilde{l}_{\eta_{\mathfrak{q}(e)}} \right\| \cong \widetilde{\mathcal{M}} \left\| (\tilde{\mathfrak{T}} \simeq \widetilde{\tilde{\mathfrak{e}I})^*} \tilde{l}_{\eta_{\mathfrak{q}(e)}} \right\|$  for all  $\tilde{l}_{\eta_{\mathfrak{q}(e)}} \in \tilde{\mathcal{A}}$  and for all  $\tilde{\mathfrak{e}} \in \mathbb{C}(\mathbb{A})$ 

#### Remark 2.14:

Any fuzzy soft Hilbert space  $\tilde{\hbar}$  has the same fuzzy soft conjugate space  $\tilde{\hbar}^*$ , ie)  $\tilde{\hbar}^* \cong \tilde{\hbar}$  ( $\tilde{\hbar}$  and  $\tilde{\hbar}^*$  are fuzzy soft isomorphic).

### **MAIN RESULTS**

The definition of the fuzzy soft unitary operator in fuzzy soft Hilbert space is provided in this section.

#### Definition 3.1: [9]

Suppose that  $\tilde{\mathcal{M}}$  is an FS Hilbert space. If  $\tilde{\mathfrak{b}}^*\tilde{\mathfrak{b}} \cong \tilde{I} \cong \tilde{\mathfrak{b}}\tilde{\mathfrak{b}}^*$ , then  $\tilde{\mathfrak{b}} \in \mathfrak{B}(\tilde{\mathcal{M}})$  is known as a fuzzy soft unitary operator. Note 3.2:

Every FSU operator also acts as an FSN operator

#### Theorem 3.3:

Let  $\tilde{\mathbf{b}} \in \mathfrak{B}(\tilde{\mathbf{A}})$ , then the following are all equivalent:

i)̃€<sup>≆</sup>́b̃ ≅ Ĩ

$$\text{ii)}\; \langle \widetilde{\mathsf{b}} \widetilde{l}^1_{\eta_{1_{g(e_1)}}, \overleftarrow{\mathsf{b}}} \widetilde{l}^2_{\eta_{2_{g(e_2)}}} \rangle \cong \langle \widetilde{l}^1_{\eta_{1_{g(e_1)}}, \overleftarrow{l}^2}_{\eta_{2_{g(e_2)}}} \rangle \text{for all } \widetilde{l}^1_{\eta_{1_{g(e_1)}}, \widetilde{l}^2_{\eta_{2_{g(e_2)}}}} \widetilde{\in} \widetilde{\mathcal{A}}$$

$$\text{iii)} \left\| \widetilde{\tilde{\mathrm{b}} \tilde{l}_{\eta_{\mathrm{g}(e)}}} \right\| \cong \left\| \widetilde{\tilde{l}_{\eta_{\mathrm{g}(e)}}} \right\| \text{for all } \tilde{l}_{\eta_{\mathrm{g}(e)}} \widetilde{\in} \tilde{\mathcal{H}}$$

#### Theorem 3.4:

Assume that  $\tilde{\mathbf{b}} \in \mathfrak{B}(\tilde{\mathbf{h}})$ . If  $\tilde{\mathbb{U}}$  is fuzzy soft unitary operator iff  $\|\tilde{\mathbf{b}}\tilde{l}_{\eta_{q(e)}}\| \cong \|\tilde{l}_{\eta_{q(e)}}\|$ for all  $\tilde{l}_{\eta_{g(e)}} \in \tilde{\hbar}$  and  $\tilde{b}$  is surjective in that case  $\left\| \widetilde{b}^{-1} \widetilde{l}_{\eta_{g(e)}} \right\| \cong \left\| \widetilde{\tilde{l}_{\eta_{g(e)}}} \right\|$ for all  $\tilde{l}_{\eta_{d(e)}} \in \tilde{\mathcal{N}}$  and  $\|\tilde{\mathfrak{b}}\| \cong \tilde{1} \cong \|\tilde{\mathfrak{b}}^{-1}\|$ Proof: For  $\tilde{l}^1_{\eta_{\mathbf{1}_{\mathrm{d}(e_1)}}} \widetilde{\in} \widetilde{\hbar}$  we have 
$$\begin{split} & \left\|\widetilde{\mathfrak{b}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}}\right\|^{2} \cdot \left\|\widetilde{\tilde{l}_{\eta_{\mathfrak{g}(e)}}}\right\|^{2} \cong \langle \widetilde{\mathfrak{b}}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{\mathfrak{b}}\widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle - \langle \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{\tilde{l}_{\eta_{\mathfrak{g}(e)}}} \rangle \\ & \cong \langle \widetilde{\mathfrak{b}}^{*}\widetilde{\mathfrak{b}}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle - \langle \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \end{split}$$
 $\cong \langle (\widetilde{\mathfrak{b}^*}\widetilde{\mathfrak{b}} - \widetilde{I})\widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \qquad \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle$ Since  $\widetilde{\mathfrak{b}^*}\widetilde{\mathfrak{b}} - \widetilde{I}$  is self adjoint fuzzy soft operator it follows from that  $\widetilde{\mathfrak{b}^*}\widetilde{\mathfrak{b}} \cong \widetilde{I}$  iff  $\left\|\widetilde{\mathfrak{b}I_{\eta_{\mathfrak{f}(e)}}}\right\| \cong \left\|\widetilde{l_{\eta_{\mathfrak{f}(e)}}}\right\| \text{for all} \tilde{l}_{\eta_{\mathfrak{f}(e)}} \in \tilde{\mathcal{A}} \text{ and } \tilde{\mathfrak{b}} \text{ is surjective, then } \tilde{\mathfrak{b}}^* \tilde{\mathfrak{b}} \cong \tilde{l} \text{ and } \tilde{\mathfrak{b}} \text{ is bijective,}$ Therefore,  $\tilde{\mathbf{b}}\tilde{\mathbf{b}}^* \cong (\tilde{\mathbf{b}}\tilde{\mathbf{b}}^*)\tilde{\mathbf{I}}$  $\cong (\widetilde{b}\widetilde{b}^{\widetilde{*}}).(\widetilde{b}\widetilde{b}^{-1})$  $\cong \dot{\tilde{\mathsf{b}}}(\tilde{\mathsf{b}}^*\dot{\tilde{\mathsf{b}}})\dot{\tilde{\mathsf{b}}}^{-1}$  $\cong \tilde{b}\tilde{\tilde{b}}^{-1}$ [since  $\tilde{\mathbf{b}}$  is fuzzy soft unitary,  $\tilde{\mathbf{b}}\tilde{\mathbf{b}}^* \cong \tilde{I} \cong \tilde{\mathbf{b}}^*\tilde{\mathbf{b}}$ ] ie)  $\tilde{\mathbf{b}}\tilde{\mathbf{b}}^{\tilde{*}} \cong \tilde{\mathbf{I}}$ , therefore  $\tilde{\mathbf{b}}$  is fuzzy soft unitary Conversely, if  $\tilde{\mathbf{b}}$  is fuzzy soft unitary then  $\tilde{\mathbf{b}}\tilde{\mathbf{b}}^* \cong \tilde{I}$  and  $\tilde{\mathbf{b}}^{-1} \cong \tilde{\mathbf{b}}^*$  in that  $\|\widetilde{\mathbf{b}}\widetilde{l}_{\eta_{q(e)}}\| \cong \|\widetilde{l}_{\eta_{q(e)}}\|$  for all  $\widetilde{l}_{\eta_{q(e)}} \in \widetilde{\mathcal{A}}$  and  $\widetilde{\mathbb{U}}$  is surjective in that case it follows that  $\left\|\widetilde{\mathfrak{b}^{-1}\tilde{l}_{\eta_{\mathfrak{g}(e)}}}\right\| \cong \left\|\widetilde{\tilde{l}_{\eta_{\mathfrak{g}(e)}}}\right\| \text{for all} \tilde{l}_{\eta_{\mathfrak{g}(e)}} \widetilde{\epsilon} \, \tilde{\kappa}$ taking the supremum over all  $\tilde{l}_{\eta_{d(e)}} \in \tilde{\mathcal{M}}$  with  $\|\tilde{\tilde{l}}_{\eta_{d(e)}}\| \leq \tilde{1}$ then we get,  $\|\widetilde{\mathbf{b}}\| \cong \widetilde{\mathbf{1}} \cong \|\widetilde{\mathbf{b}}^{-1}\|$ 

### Theorem 3.5:

Consider  $\tilde{\mathfrak{b}}_1, \tilde{\mathfrak{b}}_2 \in \mathfrak{B}(\tilde{\hbar})$ , if  $\tilde{\mathfrak{b}}_1$  and  $\tilde{\mathfrak{b}}_2$  are FSU operator, then  $\tilde{\mathfrak{b}}_1 \tilde{\mathfrak{b}}_2$  is also FSU. Let  $\tilde{b}_1 + \tilde{b}_2$  is FSU iff it is surjective and  $\left(\tilde{b}_1 \tilde{l}_{\eta_{d(e)}}, \tilde{b}_2 \tilde{l}_{\eta_{d(e)}}\right) \cong -\frac{1}{2}$  $\tilde{l}_{\eta_{\mathfrak{g}(e)}} \in \tilde{\mathfrak{h}}$  with  $\|\tilde{\mathfrak{b}}\| \cong \tilde{1}$ Proof: Given  $\tilde{\mathfrak{b}}_1$  and  $\tilde{\mathfrak{b}}_2$  are FSU operator on  $\tilde{\mathfrak{A}}$ To prove that  $\tilde{\mathfrak{b}}_1 \tilde{\mathfrak{b}}_2$  is FSU  $\operatorname{Let}(\widetilde{\mathfrak{b}}_{1}\widetilde{\mathfrak{b}}_{2})^{*}\widetilde{\mathfrak{b}}_{1}\widetilde{\mathfrak{b}}_{2} \cong \widetilde{\mathfrak{b}}_{2}^{*}(\widetilde{\mathfrak{b}}_{1}^{*}\widetilde{\mathfrak{b}}_{1})\widetilde{\mathfrak{b}}_{2}$  $\widetilde{\mathbf{b}_2}^* \widetilde{\mathbf{b}_2}$  $(\widetilde{\mathbf{b}}_1 \widetilde{\mathbf{b}}_2)^* \widetilde{\mathbf{b}}_1 \widetilde{\mathbf{b}}_2 \cong \widetilde{I}$ Therefore,  $\tilde{\mathfrak{b}}_1 \tilde{\mathfrak{b}}_2$  is FSU Consider  $\tilde{\mathfrak{b}}_1 + \tilde{\mathfrak{b}}_2$  is surjective and  $Re\left(\widetilde{\mathfrak{b}}_{1}\widetilde{l}_{\eta_{\mathfrak{g}(e)}},\widetilde{\mathfrak{b}}_{2}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}\right)\cong-\frac{1}{2},\ \widetilde{l}_{\eta_{\mathfrak{g}(e)}}\widetilde{\in}\ \widetilde{\hbar}\ \text{with}\ \left\|\widetilde{\mathfrak{b}}\right\|\cong\widetilde{1}$ From above theorem  $\tilde{\mathfrak{b}}_1 + \tilde{\mathfrak{b}}_2$  is FSU Conversely, To prove that it is surjective and  $Re\left(\widetilde{\mathfrak{b}_{1}}\widetilde{l}_{\eta_{\mathfrak{q}(e)}}\widetilde{\mathfrak{b}_{2}}\widetilde{l}_{\eta_{\mathfrak{q}(e)}}\right) \cong -\frac{1}{2}, \ \widetilde{l}_{\eta_{\mathfrak{q}(e)}} \in \widetilde{\hbar} \text{ with } \|\widetilde{\mathfrak{b}}\| \cong \widetilde{1}$  $\left\| (\widetilde{\mathbf{b}}_1 + \widetilde{\mathbf{b}}_2) \tilde{l}_{\eta_{\mathcal{A}(\mathcal{A})}} \right\|^2 \cong \langle (\widetilde{\mathbf{b}}_1 + \widetilde{\mathbf{b}}_2) \tilde{l}_{\eta_{\mathcal{A}(\mathcal{A})}} / (\widetilde{\mathbf{b}}_1 + \widetilde{\mathbf{b}}_2) \tilde{l}_{\eta_{\mathcal{A}(\mathcal{A})}} \rangle$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 - 0997

#### Radharamani and Nagajothi

$$\begin{split} \left\| \tilde{l}_{\eta_{\mathfrak{g}(e)}} \right\|^{2} &\cong \langle \widetilde{\mathfrak{b}}_{1} \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{\tilde{\mathfrak{b}}}_{1} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{1} \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{\tilde{\mathfrak{b}}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{\tilde{\mathfrak{b}}}_{1} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{\tilde{\mathfrak{b}}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \\ & \langle \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{1} \widetilde{l}_{\eta_{\mathfrak{g}(e)}}, \widetilde{\tilde{\mathfrak{b}}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{1} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{2} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \rangle \cong \langle \widetilde{\mathfrak{b}}_{2} \widetilde{\mathfrak{b}}_{\mathfrak{g}(e)} \rangle \otimes \mathfrak{b}_{2} \widetilde{\mathfrak{b}}_{\mathfrak{g}(e)} \rangle$$

Hence by the Theorem 3.4,  $\tilde{\mathfrak{b}}_1 + \tilde{\mathfrak{b}}_2$  is FSU, iff it is surjective and

 $\langle \widetilde{l}_{\eta_{\mathfrak{f}(e)}}, \widetilde{l}_{\eta_{\mathfrak{f}(e)}} \rangle + 2 \operatorname{Re} \langle \widetilde{\mathfrak{G}}_{1} \widetilde{l}_{\eta_{\mathfrak{f}(e)}}, \widetilde{\mathfrak{G}}_{2} \widetilde{l}_{\eta_{\mathfrak{f}(e)}} \rangle \cong \widetilde{0} \Rightarrow 2 \operatorname{Re} \langle \widetilde{\mathfrak{G}}_{1} \widetilde{l}_{\eta_{\mathfrak{f}(e)}}, \widetilde{\mathfrak{G}}_{2} \widetilde{l}_{\eta_{\mathfrak{f}(e)}} \rangle \cong -\frac{1}{2} \operatorname{Re} \langle \widetilde{\mathfrak{G}}_{1} \widetilde{l}_{\eta_{\mathfrak{f}(e)}}, \widetilde{\mathfrak{G}}_{2} \widetilde{\mathfrak{G}}_{1} \widetilde$ for all  $\tilde{l}_{\eta_{d(e)}} \in \tilde{h}$ 

#### Definition 3.6: Fuzzy soft isometric isomorphism:

Consider the fuzzy soft normed linear spaces  $\mathfrak{H}$  and  $\mathfrak{H}$ . A fuzzy soft isometric isomorphism of  $\mathfrak{H}$  and  $\mathfrak{H}$  and  $\mathfrak{H}$  is a oneto-one linear transformation  $\widetilde{\mathbf{b}}$  of  $\widetilde{\mathbf{m}}$  into  $\widetilde{\mathbf{h}}$  such that  $\left\|\widetilde{\mathbf{b}}\widetilde{l}_{\eta_{g(e)}}\right\| \cong \left\|\widetilde{l}_{\eta_{g(e)}}\right\|$  for every  $\widetilde{l}_{\eta_{g(e)}} \in \widetilde{\mathcal{A}}$ .

#### Theorem 3.7:

Assume that  $\tilde{k}$  is an FSH space and that  $\tilde{\mathfrak{b}} \in \mathfrak{B}(\tilde{k})$ . If  $\tilde{\mathfrak{b}}$  is an isometric isomorphism of  $\tilde{k}$  onto itself, then it is an FSU operator.

#### Proof:

If  $\tilde{\mathbf{b}}$  is an FSU operator, it is onto by definition.

It is an isometric isomorphism of  $\tilde{\mathcal{A}}$  onto itself, and it preserves fuzzy soft norm by the definition.

Conversely, if  $\tilde{\mathfrak{b}}$  is an isometric isomorphism of  $\tilde{\mathfrak{h}}$  onto itself, then  $\tilde{\mathfrak{b}}^{-1}$  exists.

By the definition, we have  $\tilde{b}^* \tilde{b} \cong \tilde{I}$ , multiplying on both sides by  $\tilde{b}^{-1}$  $(\widetilde{\mathbf{b}}^{\widetilde{*}}\widetilde{\mathbf{b}})\widetilde{\mathbf{b}}^{-1} \cong \widetilde{I}\widetilde{\mathbf{b}}^{-1}$ 

 $\Rightarrow \widetilde{\mathfrak{b}}^{\widetilde{*}} \cong \widetilde{\mathfrak{b}}^{-1}$  $\Rightarrow \widetilde{\mathfrak{b}} \widetilde{\mathfrak{b}}^{\widetilde{*}} \cong \widetilde{I} \cong \widetilde{\mathfrak{b}}^{\widetilde{*}} \widetilde{\mathfrak{b}}$ 

Hence bis a FSU operator.

### Note:

 $\mathsf{Let}\,\widetilde{\mathfrak{b}}\in\widetilde{\mathfrak{B}}\big(\widetilde{\hbar}\big)\,.\,\mathsf{since}\langle\widetilde{\mathfrak{b}}\widetilde{l}^{1}_{\eta_{1_{\mathfrak{g}(e_{1})}}},\widetilde{l}^{2}_{\eta_{2_{\mathfrak{g}(e_{2})}}}\rangle\cong\langle\widetilde{l}^{1}_{\eta_{1_{\mathfrak{g}(e_{1})}}},\widetilde{\mathfrak{b}^{*}}\widetilde{l}^{2}_{\eta_{2_{\mathfrak{g}(e_{2})}}}\rangle$  $\text{for all} \tilde{l}^1_{\eta_{1_{\mathrm{f}}\!(e_1)}}, \tilde{l}^2_{\eta_{2_{\mathrm{f}}\!(e_2)}} \widetilde{\in} \widetilde{\hbar}$ Then i)  $\widetilde{\mathbf{b}}$  isfuzzy soft normal iff $\langle \widetilde{\mathbf{b}} \widetilde{l}^{1} \eta_{1_{g(e_{1})}}, \widetilde{\mathbf{b}} \widetilde{l}^{2} \eta_{2_{g(e_{2})}} \rangle \cong \langle \widetilde{\mathbf{b}}^{*} \widetilde{l^{1}} \eta_{1_{g(e_{1})}}, \widetilde{\mathbf{b}}^{*} \widetilde{l^{2}} \eta_{2_{g(e_{2})}} \rangle$ ii) Fuzzy soft unitary iff $\langle \widetilde{\mathbf{b}} \widetilde{l}^{1} \eta_{1_{g(e_{1})}}, \widetilde{\mathbf{b}} \widetilde{l}^{2} \eta_{2_{g(e_{2})}} \rangle \cong \langle \widetilde{l}^{1} \eta_{1_{g(e_{1})}}, \widetilde{l^{2}} \eta_{2_{g(e_{2})}} \rangle \cong \langle \widetilde{\mathbf{b}}^{*} \widetilde{l}^{1} \eta_{1_{g(e_{1})}}, \widetilde{\mathbf{b}}^{*} \widetilde{l^{2}} \eta_{2_{g(e_{2})}} \rangle$  $\text{iii) Self-adjoint fuzzy soft operator iff} \langle \widetilde{\mathbf{6}} \widetilde{l}^1 \eta_{\mathbf{1}_{d(e_1)}}, \widetilde{l}^2 \eta_{\mathbf{2}_{d(e_2)}} \rangle \cong \langle \widetilde{l}^1 \eta_{\mathbf{1}_{d(e_1)}}, \widetilde{\mathbf{6}} \widetilde{l}^2 \eta_{\mathbf{2}_{d(e_2)}} \rangle$ 

We also know that the geometry of  $\tilde{\hbar}$  can be described by a fuzzy soft inner product on  $\tilde{\hbar}$ .

Therefore, an operator  $\tilde{\mathfrak{b}}$  is fuzzy soft unitary if neither  $\tilde{\mathfrak{b}}$  nor  $\tilde{\mathfrak{b}}^*$  modify the geometry of  $\tilde{\mathfrak{A}}$ , and an operator  $\tilde{\mathfrak{b}}$  is fuzzy soft normal if  $\tilde{\mathbf{b}}$  and  $\tilde{\mathbf{b}}^*$  modification the geometry of  $\tilde{\mathbf{A}}$  in the same way. In addition to this, a fuzzy soft unitary operator is also referred to as a fuzzy soft isomorphism of Hilbert space.

#### Theorem 3.8:

Consider  $\tilde{b} \in \mathfrak{B}(\tilde{A})$  and  $K \cong \tilde{q}$ . Then there are a unique self adjoint fuzzy soft operators  $\mathfrak{P}$  and  $\tilde{q}$  on  $\tilde{A}$  such that  $\tilde{\mathfrak{b}} \cong \tilde{\mathfrak{P}} + i\tilde{\mathfrak{g}}$ . Moreover,  $\tilde{\mathfrak{b}}$  is fuzzy soft normal iff  $\tilde{\mathfrak{P}} \widetilde{\mathfrak{g}} \cong \widetilde{\mathfrak{g}} \widetilde{\mathfrak{P}}$ , fuzzy soft unitary iff  $\tilde{\mathfrak{P}} \widetilde{\mathfrak{g}} \cong \widetilde{\mathfrak{g}} \widetilde{\mathfrak{P}}$  and  $\tilde{\mathfrak{P}}^2 + \widetilde{\mathfrak{g}}^2 \cong \widetilde{I}$  and  $\tilde{\mathfrak{b}}$  is self adjoint fuzzy soft operator iff  $\widetilde{q} \cong \widetilde{0}$ 

Proof:

Let  $\tilde{P} \cong \frac{\tilde{b} + \tilde{b}^*}{2}$  and  $\tilde{\varphi} \cong \frac{\tilde{b} \cong \tilde{b}^*}{2i}$ Then  $\tilde{P}$  and  $\tilde{\varphi}$  are self adjoint fuzzy soft operator and  $\tilde{b} \cong \tilde{P} + i\tilde{\varphi}$ If we also have  $\tilde{\mathbf{b}} \cong \tilde{\mathbf{P}}_1 + i \tilde{\mathbf{q}}_1$ 

Where  $\tilde{\mathbb{P}}_1$  and  $\tilde{q}_1$  self adjoint fuzzy soft operator then,  $\tilde{\mathbf{b}}^* \cong \tilde{\mathbb{P}}_1 \cong i \tilde{q}_1$ 

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

So that  $\tilde{\mathbb{P}}_1 \cong \frac{\tilde{\mathbb{D}} + \tilde{\mathbb{D}}^*}{2} \cong \tilde{\mathbb{P}}$  and  $\tilde{\varphi}_1 \cong \frac{\tilde{\mathbb{D}} = \tilde{\mathbb{D}}^*}{2i} \cong \tilde{\varphi}$ Thus,  $\tilde{\mathbb{P}}$  and  $\tilde{\varphi}$  are unique. Now  $\tilde{\mathbb{D}}$  is fuzzy soft normal iff  $(\tilde{\mathbb{P}} = i\tilde{\varphi})(\tilde{\mathbb{P}} = i\tilde{\varphi}) \cong \tilde{\mathbb{D}}^*\tilde{\mathbb{D}} \cong \tilde{\mathbb{D}}\tilde{\mathbb{D}}^* \cong (\tilde{\mathbb{P}} = i\tilde{\varphi})(\tilde{\mathbb{P}} = i\tilde{\varphi})$ 

ie)  $\tilde{P}\widetilde{q} \cong \widetilde{q}\tilde{P}$ Similarly,  $\tilde{b}$  is fuzzy soft unitaryiff $\tilde{b}\tilde{b}^* \cong \tilde{I} \cong \tilde{b}^*\tilde{b}$   $(\tilde{P} \cong \widetilde{q})(\tilde{P} \cong \widetilde{q}) \cong \cong (\tilde{P} \cong \widetilde{q})(\tilde{P} \cong \widetilde{q})$ ie)  $(\tilde{P}^2 \cong \widetilde{q}^2) + (\widetilde{q}\tilde{P} \cong \tilde{P}\widetilde{q}) \cong \cong (\tilde{P}^2 \cong \widetilde{q}^2) + (\widetilde{q}\tilde{P} \cong \tilde{P}\widetilde{q})$ It can be easily seen that this is equivalent to  $\tilde{P}^2 \cong \widetilde{q} \cong \widetilde{q} \cong \widetilde{0}$ Finally,  $\tilde{b}$  is self adjoint fuzzy soft operator iff $\tilde{P} + \widetilde{q} \cong \tilde{P} \cong \widetilde{i}\widetilde{q}; ie)$   $\tilde{P}\widetilde{q} \cong \widetilde{0}$ 

## CONCLUSION

Numerous scholars have updated the ideas of normed space, metric space, and Hilbert space in soft and fuzzy ways. The outcomes of the fusion of fuzzy and soft notions are more broadly applicable. The Fuzzy Soft Unitary Operator has been defined and explained in this study.

## ACKNOWLEDGEMENT

The authors would like to extend their sincere gratitude to the editor and reviewers for their insightful remarks and recommendations, which helped to develop the manuscript.

## ABSTRACT

In this paper, we introduce the concept of Spherical Picture Fuzzy Sets and we have analyzed the geometrical interpretation of Picture Fuzzy Sets and Spherical Picture Fuzzy Sets for the first time in literature. Spherical Picture Fuzzy sets are extensions of the standard Intuitionistic Fuzzy Sets, Circular Intuitionistic Fuzzy Sets, Picture Fuzzy Sets and hence of the Zadeh'sFuzzy Sets(FS). Here, some of the operations and relations over Spherical Picture Fuzzy Sets are defined and based on these operations some of its properties are studied.

Keywords : Fuzzy set, Circular-Intuitionistic Fuzzy Sets, Picture fuzzy set, Spherical picture fuzzy set.

# INTRODUCTION

In daily life, we deal problems with uncertainty in some way in kind of situation, as new mathematical tools are required since the standard mathematical tools(crisp sets) are insufficient to deal with overcome uncertainities. The concept of Fuzzy Set theory established by Zadeh [18] in 1965 in which the element has membership degree, the degree of belongingness is used to deal the problem under uncertain environment. In 1981, Masaharu Mizumoto and Kokichi Tanaka [15] discussed about the algebraic properties of fuzzy sets under these new bounded-sum and bounded-difference operations as well as the properties of fuzzy sets when these new operations are combined with the well-known union, intersection, algebraic product, and algebraic sum operations. In 1983, Atanassov [1] introduced the concept of Intuitionistic Fuzzy Sets (IFSs) which is the prime extension of Zadeh's Fuzzy Set. It describing an element with membership and non-membership values such that sum of these two values less than or

## Rajarajeswari Palanisamy and Reshma Ranganathan

equal to one. The two best examples of an orthopair fuzzy set are Atanassov's [1, 2] classical intuitionistic fuzzy set and second type of intuitionistic fuzzy set in which the total of the acceptance degree and non-acceptance degree has one as a boundary in a classical intuitionistic fuzzy set. In 1994, Atanassov [4] was defined some other operations over the Intuitionistic Fuzzy Sets. In [12] Atanassov defined the relations on IFSs and [13] have studied various properties of Intuitionistic Fuzzy Relations. In 2001, Atanassov [6] examined the Sanchez's approach for medical diagnosis and it's application is expanded using the idea of IFS theory which is a generalization of fuzzy set theory. Later, the important aspect of neutrality degree isseen as lacking in Intuitionistic Fuzzy Set theory. In 2014, Coung [10] introduced the conceptof the Picture Fuzzy Sets which is the prime extension of Fuzzy Sets and Intuitionistic Fuzzy Sets by including the neutrality degree for each element along with membership and non-membership degrees in such that sum of these three degrees must not exceed one. Coung and Kreinovich [11] has analyzed new operations and properties over Picture Fuzzy Sets. In 2018, Nguyen Van Dinh and Nguyen XuanThao [16] analyzed the concepts of difference between PFS-sets, distance measure, and dissimilarity measure between picture fuzzy sets are introduced and along with the formulas for determining these values. They also illustrate how it can be used in Multi Attribute Decision Making. In 2017, Chunyong Wang and et.al., [14] established the a few geometric operators of Picture Fuzzy Sets and discussed some of its properties and also they have applied these operators to resolve involving Multiple Attribute Decision Making in a Picture Fuzzy environment. The concept of Circular Intuitionistic Fuzzy Sets (CIFSs) introduced by Atanassov [8] in 2020 which is the expansion of Intuitionistic Fuzzy Sets.Circular Intuitionistic Fuzzy Sets is characterized by describing a circle with radius r amongeach point of the IFS set. In [9], Atanassov defined the range of the radius of C-IFSs lies in  $[0,\sqrt{2}]$  since the points with center (0, 1) and (1, 0) are necessary to cover the entire Intuitionistic Fuzzy Sets triangle, which can be valid only when  $r \ge \sqrt{2}$ . Picture Fuzzy Set(PFS) is animportant and interesting concept in Fuzzy mathematics as they provide wide applications inhuman opinions such as decision making, pattern recognition and data processing, etc. In thispaper, we have introduced the Spherical Picture Fuzzy Set which is the extension of PFSs and is characterized by describing a sphere with radius r among each elements of the Picture Fuzzy Sets. As said above here also the range of the radius lies in  $[0,\sqrt{2}]$  since the points with center(0, 1, 0), (0, 0, 1) and (1, 0, 0) are necessary to cover the entire Picture Fuzzy Set triangular pyramid. By using the proposed definition of Spherical Picture Fuzzy Sets (SPFSs) we have defined some operations on SPFSs and studied their properties based on this operations.

#### Preliminaries

In this section, few pre-requisites that are needed for this study overviewed.

#### Definition 2.1. [18] Fuzzy Set

Let X be a non-empty universal set. Each set is mapped to [0,1] by membership function is defined as  $E = \{\langle x, \tau_E(x) \rangle / x \in X\}$ 

where  $\tau_E: X \to [0, 1]$  is the degree of membership function of the fuzzy set E and  $\tau_E(x) \in [0, 1]$  is the membership value of the element  $x \in X$  in the fuzzy set E.

#### Definition 2.2. [1] IFS:

Let X be a non-empty universal set. An intuitionistic fuzzy set (IFS) E in X is defined as E = {(x,  $\tau_E(x), \upsilon_E(x)$ )/x  $\in$ X} where  $\tau_E: X \rightarrow [0, 1]$  and  $\upsilon_E: X \rightarrow [0, 1]$  with  $0 \le \tau_E(x) + \upsilon_E(x) \le 1$  for all x  $\in$ X represents the degrees of membership and non-membership of the element x to the IFS E. For each IFS, the intuitionistic index or hesitancy degree of the element x in X to the IFS E is $\pi_E(x) = 1 - \tau_E(x) - \upsilon_E(x)$ .

#### Definition 2.3. [8] C-IFS:

Let X be the universe and E be its subset then, the set C-IFS is defined as,

#### $E_r^* = \{ \langle x, \tau_E(x), \upsilon_E(x); r \rangle / x \in X \}$

where  $\tau_E: X \to [0, 1]$  and  $\vartheta_E: X \to [0, 1]$  with  $0 \le \tau_E(x) + \upsilon_E(x) \le 1$  and  $r \in [0, \sqrt{2}]$  is the radius of the circle around each element  $x \in E$ , and functions  $\tau_E: X \to [0, 1]$  and  $\upsilon_E: X \to [0, 1]$  represent membership degree and non-membership degree of element  $x \in X$  to a fixed set  $E \subseteq X$ . We also define the hesitancy margin  $\pi_E: X \to [0, 1]$  by  $\pi_E(x) = 63667$

 $1-\tau_E(x)-\upsilon_E(x)$  which corresponds to the degree of indeterminacy. The radius r defined in C-IFS takes on values from the interval [0,1].

#### Definition 2.4. [10] PFS:

A Picture Fuzzy Set(PFS) E on a universe X is an object in the form of  $P = \{(x, \tau_E(x), \omega_E(x), \upsilon_E(x))/x \in X\}$ where  $\tau_E(x) \in [0, 1]$  is called the degree of positive membership of x in E,  $\omega_E(x) \in [0, 1]$  is called the degree of neutral membership of x in E and  $\upsilon_E(x) \in [0, 1]$  is called the degree of negative membership of x in E. where  $\tau_E(x)$ ,  $\omega_E(x)$  and  $\upsilon_E(x)$  satisfy the following condition  $(x \in X) \ 0 \le \tau_E(x) + \omega_E(x) + \upsilon_E(x) \le 1$  Now,  $\sigma_E(x) = (1 - (\tau_E(x) + \omega_E(x) + \upsilon_E(x))$  could be called the degree of refusal membership of x in E.

#### **Operations over Spherical Picture Fuzzy Sets**

In this section, we have defined the concept of Spherical Picture Fuzzy Sets and some fundamentalOperations for Spherical Picture Fuzzy Sets are defined and based on the operations some of their properties are discussed. In addition, we have drawn the geometrical interpretation of the Picture Fuzzy Set, geometrical interpretation of the Spherical Picture Fuzzy Set.

#### Geometrical interpretation of PFS

The following Figure 1 represents the Geometrical interpretation of the PFS.

The Picture Fuzzy Interpretation Triangular Pyramid (PFITP) is used to represent the elements of a fixed universe as points. Every element x is evaluated with three parameters namely degree of membership ( $\tau_E(x)$ ) and degree of non-membership ( $\omega_E(x)$ ) and also degree of neutrality ( $\upsilon_E(x)$ ) to a fixed subset E of the universe, is represented as a point having coordinates ( $\tau_E(x)$ ,  $\omega_E(x)$ ,  $\upsilon_E(x)$ ), where  $\tau_E(x)$ ,  $\omega_E(x)$ ,  $\upsilon_E(x) \in [0, 1]$  such that  $0 \le \tau_E(x) + \omega_E(x) + \upsilon_E(x) \le 1$ .

#### Definition 3.1. Spherical Picture Fuzzy Sets(SPFSs)

Let us have a fixed universe X and E be its subset then, the set SPFSs is defined as,

 $P_r^* = \{ (\mathsf{X}, \tau_E(\mathsf{X}), \omega_E(\mathsf{X}), \upsilon_E(\mathsf{X}); \mathsf{r}) / \mathsf{X} \in \mathsf{X} \}$ 

where functions  $\tau_E: X \to [0, 1]$ ,  $\omega_E: X \to [0, 1]$  and  $\upsilon_E: X \to [0, 1]$  with  $0 \le \tau_E(x) + \omega_E(x) \le 1$  and  $r \in [0, \sqrt{2}]$  is the radius of the sphere around each element  $x \in E$ , represent membership degree, neutral degree and non-membership degree of element  $x \in X$  to a fixed set  $E \subseteq X$ . We also define the hesitancy margin $\pi_E: X \to [0, 1]$  by  $\pi_E(x) = 1 - \tau_E(x) - \omega_E(x)$  which corresponds to the degree of indeterminacy.

#### Geometrical interpretation of SPFS

In SPFS, each element is represented by a sphere with centre ( $\tau_E(x)$ ,  $\omega_E(x)$ ,  $\upsilon_E(x)$ ) and radius r, compared to the normal PFSs, where each element is represented by a point in the picture fuzzy interpretation triangular pyramid.

Let  $L^*=\{(a, b, c) \text{ such that } a, b, c \in [0,1] \text{ and } a + b + c \leq 1\}$ . Therefore  $P_r^*$  can be rewritten in the form as  $P_r^*=\{(x, O_r(\tau_E(x), \omega_E(x), \upsilon_E(x)); r)/x \in X\}$ Where,  $O_r(\tau_E(x), \omega_E(x), \upsilon_E(x))=\{(a, b, c)\text{ such that } a, b, c \in [0,1]$ And  $\sqrt{(\tau_E(x) - a)^2 + (\omega_E(x) - b)^2 + (\upsilon_E(x) - c)^2} \leq r\} \cap L^*$   $= \{(a, b, c)\text{ such that } a, b, c \in [0,1]$ and  $\sqrt{(\tau_E(x) - a)^2 + (\omega_E(x) - b)^2 + (\upsilon_E(x) - c)^2} \leq r$ and  $a + b + c \leq 1\}$

#### Rajarajeswari Palanisamy and Reshma Ranganathan

#### Proposition 3.7.

The following commutative properties for multiplication operator are valid for any two SPFSs Erand Fsare given by  $E_r = \{\langle x, \tau_E(x), \omega_E(x), \upsilon_E(x); r \rangle / x \in X\}$  and  $F_{s=} \{\langle x, \tau_F(x), \omega_F(x), \upsilon_F(x); s \rangle / x \in X\}$ , (i) $E_{r.max}F_s = F_{s.max}E_r$ (Proof follows from the Definition 3.3 (h) (i) $E_{r.min}F_s = F_{s.min}E_r$ (Proof follows from the Definition 3.3 (g)

#### Proposition 3.8.

The following commutative properties for average sum operator are valid for any two SPFSs Er and Fs are given by  $E_r = \{(x, \tau_E(x), \omega_E(x), \upsilon_E(x); r)/x \in X\}$  and  $F_s = \{(x, \tau_F(x), \omega_F(x), \upsilon_F(x); s)/x \in X\}$ , (i)  $E_r @_{max}F_s = F_s @_{max}E_r$ (Proof follows from the Definition 3.3 (j) (ii)  $E_r @_{min}F_s = F_s @_{min}E_r$ (Proof follows from the Definition 3.3 (i)

#### Proposition 3.9. (Associative property)

Let us have three Spherical Picture Fuzzy Sets Er, Fsand Gigiven by,  $E_r = \{(x, \tau_E(x), \omega_E(x), \upsilon_E(x); r) | x \in X\}, F_s = \{(x, \tau_F(x), \omega_F(x), \upsilon_F(x); s) | x \in X\}$ And G<sub>t</sub>= { $(x, \tau_G(x), \omega_G(x), \upsilon_G(x); t)/x \in X$ } then the following associative properties for union and intersection are hold, (i) ErUmax(FsUmaxGt) = (ErUmaxFs) UmaxGt(ii) (ErUminFs) UminGt= ErUmin(FsUminGt) (iii)  $(E_{f} \cap \max F_{s}) \cap \max G_{t} = E_{f} \cap \max (F_{s} \cap \max G_{t})$ (iv)  $(E_r \cap \min F_s) \cap \min G_t = E_r \cap \min (F_s \cap \min G_t)$ Proof (i).LHS: ErUmax(Fs UmaxGt) $= \{ \langle X, \max(\tau_E(X), \tau_G(X)), \min(\omega_E(X), \omega_G(X)), \min(\upsilon_E(X), \upsilon_G(X)), \max(S, t) \rangle / X \in X \}$ ={(X, max( $\tau E(X)$ , max( $\tau E(X)$ ,  $\tau G(X)$ ), min( $\omega E(X)$ , min( $\omega E(X)$ ,  $\omega G(X)$ ), min( $\upsilon E(X)$ , min( $\upsilon E(X)$ ,  $\upsilon G(X)$ ),  $\max(r, s, t))/x \in X$ ={(x, max(max( $\tau_E(x), \tau_F(x)$ ),  $\tau_G(x)$ ), min(min( $\omega_E(x), \omega_F(x)$ ),  $\omega_G(x)$ ), min(min( $\upsilon_E(x), \upsilon_F(x)$ ),  $\upsilon_G(x)$ , max(r, s, t))/x  $\in X$ = (ErUmaxFs) UmaxGt= RHS

Thus,  $(E_{I}U_{max}F_{s}) \cup_{max}G_{t} = E_{I}U_{max}(F_{s}U_{max}G_{t})$ . Similarly, we can prove the result (ii), (iii) and (iv).

#### Proposition 3.10.

Let us have three Spherical Picture Fuzzy Sets Er, Fsand Gigiven by, Er = { $\langle x, \tau \epsilon(x), \omega \epsilon(x), \nu \epsilon(x); r \rangle / x \in X$ }, Fs= { $\langle x, \tau \epsilon(x), \omega \epsilon(x), \nu \epsilon(x); s \rangle / x \in X$ } AndGi = { $\langle x, \tau_G(x), \omega_G(x), \nu_G(x); t \rangle / x \in X$ } Then the following additive properties hold, (i) (Er+maxFs) +maxGi = Er+max(Fs+maxGt) (ii) (Er+minFs) +minGi = Er+min(Fs+minGt) Proof (i).LHS: (Er+maxFs) +maxGt = { $\langle x, (\tau \epsilon(x) + \tau \epsilon(x) - \tau \epsilon(x).\tau \epsilon(x)), (\omega \epsilon(x).\omega \epsilon(x)), (\nu \epsilon(x).\nu \epsilon(x)), max(r, s)) / x \in X$ } = { $\langle x, (\tau \epsilon(x) + \tau \epsilon(x) - \tau \epsilon(x).\tau \epsilon(x) + \tau c(x) - \tau \epsilon(x).\tau \epsilon(x), \tau c(x), \tau c(x), \tau c(x)), (\omega \epsilon(x).\omega \epsilon(x)), (\omega \epsilon(x).\omega \epsilon(x), max(r, s, t)) / x \in X$ } = { $\langle x, (\tau \epsilon(x) + \tau \epsilon(x) + \tau c(x) - \tau \epsilon(x).\tau \epsilon(x) - \tau \epsilon(x).\tau \epsilon(x) + \tau c(x) + \tau \epsilon(x).\tau \epsilon(x).\tau c(x)), (\omega \epsilon(x).\omega \epsilon(x), \omega c(x)), (\nu \epsilon(x).\nu \epsilon(x).\nu c(x)), max(r, s, t)) / x \in X$ } = { $\langle x, (\tau \epsilon(x) + (\tau \epsilon(x) + \tau c(x) - \tau \epsilon(x)) - \tau \epsilon(x).\tau \epsilon(x) + \tau c(x) - \tau \epsilon(x).\tau \epsilon(x), \tau c(x)), (\omega \epsilon(x).\omega \epsilon(x)), (\omega \epsilon(x).\nu \epsilon(x)), \tau c(x)), max(r, s, t)) / x \in X$ } = { $\langle x, (\tau \epsilon(x) + (\tau \epsilon(x) + \tau c(x) - \tau \epsilon(x).\tau c(x)) - \tau \epsilon(x).(\tau \epsilon(x) + \tau c(x) - \tau \epsilon(x).\tau c(x)), (\omega \epsilon(x).\omega \epsilon(x)), (\omega \epsilon(x).\omega \epsilon(x)), (\omega \epsilon(x).\nu \epsilon(x)), max(r, s, t)) / x \in X$ }

Rajarajeswari Palanisamy and Reshma Ranganathan

=Er+max(Fs+maxGt) = RHS Thus, (Er+maxFs) +max Gt=Er+max(Fs+maxGt). Similarly, we can prove the result (ii).

#### Proposition 3.11.

Let us have three Spherical Picture Fuzzy Sets Er, Fsand Gigiven by,  $E_r = \{(x, \tau_E(x), \omega_E(x), \upsilon_E(x); r) | x \in X\}, F_s = \{(x, \tau_F(x), \omega_F(x), \upsilon_F(x); s) | x \in X\}$ And G<sub>t</sub>= { $\langle x, \tau_G(x), \omega_G(x), \upsilon_G(x); t \rangle / x \in X$ } Then the following multiplicative properties hold, (i).(Er.minFs).minGt = Er.min(Fs.minGt)(ii).(Er.maxFs) .maxGt =Er.max(Fs.maxGt) Proof(i).LHS:  $(E_{r.min}F_s) \dots G_{t} = \{(x, (\tau_E(x), \tau_F(x)), (\omega_E(x) + \omega_F(x) - \omega_E(x), \omega_F(x)), (\upsilon_E(x) + \upsilon_F(x) - \upsilon_E(x), \upsilon_F(x)), (\omega_E(x) + \omega_F(x) - \omega_E(x), \omega_F(x)), (\omega_E(x) + \omega_F(x), \omega_F(x), \omega_F(x)), (\omega_E(x) + \omega_F(x), \omega_F(x), \omega_F(x)), (\omega_E(x) + \omega_F(x), \omega_F(x), \omega_F(x)), (\omega_E(x) + \omega_F(x), \omega_F(x), \omega_F(x)), (\omega_F(x)  \omega_F(x), \omega_F(x), \omega_F(x), \omega_F(x)), (\omega_F(x), \omega_F(x), \omega_F(x), \omega_F(x)), (\omega_F(x), \omega_F(x), \omega_F(x), \omega_F(x), \omega_F(x)), (\omega_F(x), \omega_F(x), \omega_F(x$  $min(r, s))/x \in X$  $= \{ (X, (\tau_E(X), \tau_F(X)), \tau_G(X), (\omega_E(X) + \omega_F(X) - \omega_E(X), \omega_F(X)) + \omega_G(X) - (\omega_E(X) + \omega_F(X) - \omega_F(X)) \} \}$  $\omega_{\mathsf{E}}(\mathsf{X}).\omega_{\mathsf{F}}(\mathsf{X})).\omega_{\mathsf{G}}(\mathsf{X}), (\upsilon_{\mathsf{E}}(\mathsf{X})+\upsilon_{\mathsf{F}}(\mathsf{X})-\upsilon_{\mathsf{E}}(\mathsf{X}).\upsilon_{\mathsf{F}}(\mathsf{X}))+\upsilon_{\mathsf{G}}(\mathsf{X})-(\upsilon_{\mathsf{E}}(\mathsf{X})+\upsilon_{\mathsf{F}}(\mathsf{X})-\upsilon_{\mathsf{E}}(\mathsf{X}).\upsilon_{\mathsf{F}}(\mathsf{X}))$  $.\upsilon_G(x), \min(r, s, t))/x \in X$  $= \{(X, (\tau_E(X).\tau_F(X)).\tau_G(X), (\omega_E(X) + \omega_F(X) + \omega_G(X) - \omega_E(X).\omega_F(X) + \omega_G(X) - \omega_E(X) + \omega_F(X)   $\omega_F(X).\omega_G(X)+$  $\omega_{\mathsf{E}}(\mathsf{X}).\omega_{\mathsf{F}}(\mathsf{X}).\omega_{\mathsf{G}}(\mathsf{X})), \ (\upsilon_{\mathsf{E}}(\mathsf{X}) + \upsilon_{\mathsf{F}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) - \upsilon_{\mathsf{E}}(\mathsf{X}).\upsilon_{\mathsf{F}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) - \upsilon_{\mathsf{E}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) - \upsilon_{\mathsf{E}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) - \upsilon_{\mathsf{E}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) - \upsilon_{\mathsf{E}}(\mathsf{X}) + \upsilon_{\mathsf{G}}(\mathsf{X}) + \upsilon_{\mathsf{G}$  $\upsilon_F(X).\upsilon_G(X) + \upsilon_E(X).$  $\upsilon_F(x).\upsilon_G(x)$ , min(r, s, t))/x  $\in X$  $= \{ \langle x, \tau e(X) . \tau f(X) . \tau g(X), (\omega e(X) + \omega f(X) + \omega g(X) - \omega e(X) + \omega f(X) . \omega g(X) - \omega e(X) . \omega f(X) + \omega g(X) + \omega$  $\omega_{E}(X).\omega_{F}(X).\omega_{G}(X)), (\upsilon_{E}(X)+\upsilon_{F}(X)+\upsilon_{G}(X)-\upsilon_{E}(X)+\upsilon_{F}(X).\upsilon_{G}(X)-\upsilon_{E}(X).\upsilon_{F}(X)+\upsilon_{G}(X)+\upsilon_{F}(X)+\upsilon_{F}(X)$  $\upsilon_{E}(x).\upsilon_{F}(x).\upsilon_{G}(x)), \min(r, s, t))/x \in X$  $= \{(x, \tau_E(x).\tau_F(x).\tau_G(x), \omega_E(x) + (\omega_F(x) + \omega_G(x) - \omega_F(x).\omega_G(x)) - \omega_E(x).(\omega_F(x) + \omega_G(x) + \omega_F(x).\omega_F(x)) - \omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F(x).\omega_F(x).\omega_F(x).\omega_F(x) + \omega_F(x).\omega_F$  $\omega_F(X).\omega_G(X)), \upsilon_E(X) + (\upsilon_F(X) + \upsilon_G(X) - \upsilon_F(X).\upsilon_G(X)) - \upsilon_E(X).(\upsilon_F(X) + \upsilon_G(X) + \upsilon_F(X).\upsilon_G(X)),$  $min(r, s, t))/x \in X$ = Er.min(Fs.minGt) = RHSThus, (Er.minFs) .minGt = Er.min(Fs.minGt). Similarly, we can prove the result (ii).

### Proposition 3.12. De Morgan's Law

Let us have two Spherical Picture Fuzzy Sets  $E_r$  and  $F_s$  are given by,  $E_r = \{ \langle \mathbf{x}, \mathbf{v}_E (\mathbf{x}), \boldsymbol{\omega}_E (\mathbf{x}), \boldsymbol{\tau}_E (\mathbf{x}); \mathbf{r} \rangle / \mathbf{x} \in \mathbf{X} \}$  and  $F_{S} = \{ (x, \upsilon_{F}(x), \omega_{F}(x), \tau_{F}(x); S) | x \in X \}$ Then the following De Morgan's law for union, intersection laws hold, (i).  $\rightarrow (E_r \cap_{max} F_s) = \rightarrow E_r \cup_{max} \rightarrow F_s$ (ii).  $\neg (E_r \cup_{max} F_s) = \neg E_r \cap_{max} \neg F_s$ Proof (i).LHS:  $E_r \cap_{max} F_s$ ) = { $(x, \min(\tau_{E}(x), \tau_{F}(x)), \min(\omega_{E}(x), \omega_{F}(x)), \max(\upsilon_{E}(x), \upsilon_{F}(x)), \max(r, s))/x \in X$ }  $\neg (E_r \cap_{max} Fs)$  $= \{(x, max(v_E(x), v_F(x)), min(ω_E(x), ω_F(x)), min(τ_E(x), τ_F(x)), max(r, s))/x \in X\}$ RHS:  $\neg E_r \cup_{max} \neg Fs$  $\neg E_r = \{ \langle \mathbf{x}, \upsilon_E(\mathbf{x}), \omega_E(\mathbf{x}), \tau_E(\mathbf{x}); \mathbf{r} \rangle / \mathbf{x} \in \mathbf{X} \}$  $\rightarrow$  Fs = {(x, v<sub>F</sub> (x),  $\omega_F$  (x),  $\tau_F$  (x); s)/x  $\in$ X} = { $(x, max(v_E(x), v_F(x)), min(\omega_E(x), \omega_F(x)), min(\tau_E(x), \tau_F(x)), max(r, s))/x \in X$ }  $\Rightarrow \rightarrow (E \cap_{max} F) = \rightarrow E \cup_{max} \rightarrow F$ 

Rajarajeswari Palanisamy and Reshma Ranganathan

Similarly, we can prove the result (ii).

#### Remark 3.13.

Spherical picture fuzzy sets does not satisfies the following De Morgan laws under the '+' and '.'operation which is illustrated with suitable example in the given below. (i).  $\neg (E_r + \max F_s) = \neg E_{r,\max} \neg F_s$ (ii).  $\neg (E_{r,\max} F_s) = \neg E_r + \max \neg F_s$ 

**Example 3.14.** Let us have two Spherical Picture Fuzzy Sets  $E_r$  and  $F_s$  are given by,

 $E_r = \{ \langle \mathbf{x}, \mathbf{v}_E(\mathbf{x}), \boldsymbol{\omega}_E(\mathbf{x}), \boldsymbol{\tau}_E(\mathbf{x}); \mathbf{r} \} / \mathbf{x} \in \mathbf{X} \}$  and  $F_{s} = \{ \langle \mathbf{X}, \upsilon_{F} (\mathbf{X}), \omega_{F} (\mathbf{X}), \tau_{F} (\mathbf{X}); s \rangle / \mathbf{X} \in \mathbf{X} \}$ Then the following De Morgan's law does not satisfy under the addition and multiplication operations  $E_r = \{(u, 0, 0.8, 0.2; 0.5), (v, 0.6, 0.2, 0.2; 0.5), (w, 0.3, 0.7, 0; 0.5)\}$  $F_{s} = \{(u, 0, 0.5, 0.5; 0.6), (v, 0.4, 0.2, 0, 4; 0.6), (w, 0.4, 0.5, 0.1; 0.6)\}$  $\neg E_r = \{(u, 0.2, 0.8, 0; 0.5), (v, 0.2, 0.2, 0.6; 0.5), (w, 0, 0.7, 0.3; 0.5)\}$  $\rightarrow F_{s} = \{(u, 0.5, 0.5, 0; 0.6), (v, 0.4, 0.2, 0, 4; 0.6), (w, 0.1, 0.5, 0.4; 0.6)\}$ LHS:  $\rightarrow$  (*E<sub>r</sub>*+max *F<sub>s</sub>*) ={(u, 0.1, 0.4, 0.8; 0.5), (v, 0.8, 0.4, 0.76; 0.5), (w, 0, 0.35, 0.58; 0.5)} RHS:  $\neg E_{r.max} \neg F_s = \{(u, 0.1, 0.6, 0.8; 0.6), (v, 0.8, 0.36, 0.76; 0.6), (w, 0, 0.85, 0.58; 0.6)\}$ =⇒LHS ≠RHS  $\Rightarrow \rightarrow (E_r + \max F_s) \neq \neg E_{r,\max} \neg F_s$ **Example 3.15**. Let X={u,v,w} be the universal set.  $E = \{(u, 0, 0.8, 0.2; 0.5), (v, 0.6, 0.2, 0.2; 0.5), (w, 0.3, 0.7, 0; 0.5)\}$  $F = \{(u, 0, 0.5, 0.5; 0.6), (v, 0.4, 0.2, 0, 4; 0.6), (w, 0.4, 0.5, 0.1; 0.6)\}$  $\rightarrow E_r = \{(u, 0.2, 0.8, 0; 0.5), (v, 0.2, 0.2, 0.6; 0.5), (w, 0, 0.7, 0.3; 0.5)\}$  $\rightarrow F_{s} = \{(u, 0.5, 0.5, 0; 0.6), (v, 0.4, 0.2, 0, 4; 0.6), (w, 0.1, 0.5, 0.4; 0.6)\}$ LHS:  $\rightarrow$  (*E<sub>r</sub>*.max*F<sub>s</sub>*) = {(u, 0.6, 0.9, 0.9; 0.6), (v, 0.52, 0.36, 0.24; 0.6), (w, 0.1, 0.85, 0.12; 0.6)} RHS:  $\neg E_r + \max \neg F_s = \{(u, 0.6, 0.4, 0; 0.6), (v, 0.52, 0.4, 0.24; 0.6), (w, 0.1, 0.35, 0.12; 0.6)\}$ 

⇒LHS≠RHS

 $\Rightarrow \neg (E_r.\max F_s) \neq \neg E_r + \max \neg F_s$ 

### Proposition 3.16: (Distributive property)

Let us have three Spherical Picture Fuzzy Sets  $E_r$ ,  $F_s$  and  $G_t$  given by,  $E_r = \{\langle x, \tau_E(x), \omega_E(x), \upsilon_E(x); r \rangle / x \in X\}, F_s = \{\langle x, \tau_F(x), \omega_F(x), \upsilon_F(x); s \rangle / x \in X\}$  and  $G_t = \{\langle x, \tau_G(x), \omega_G(x), \upsilon_G(x); t \rangle / x \in X\}$ Then the following distributive properties hold, (i)  $(E_r \cap_{max} F_s) \cup_{max} G_t = (E_r \cup_{max} G_t) \cap_{max} (F_s \cup_{max} G_t)$ (ii)  $(E_r \cap_{min} F_s) \cup_{min} G_t = (E_r \cup_{min} G_t) \cap_{min} (F_s \cup_{min} G_t)$ . Proof (i).LHS:  $(E_r \cap_{max} F_s) \cup G_t$   $= \{\langle x, man(\tau_E(x), \tau_F(x)), min(\omega_E(x), \omega_F(x)), max(\upsilon_E(x), \upsilon_F(x)), max(r, s)) / x \in X\}$  $= \{\langle x, max(min(\tau_E(x), \tau_F(x)), \tau_G(x)), min(min(\omega_E(x), \omega_F(x)) + \omega_G(x)), min(max(\upsilon_E(x), \upsilon_F(x)), min(min(\omega_E(x), \omega_F(x))) + \omega_G(x))), min(max(\upsilon_E(x), \upsilon_F(x)), min(min(\omega_F(x), \omega_F(x))) + \omega_G(x)))$ 

 $= \{ \langle x, \max(\min(\tau_E(x) + \tau_G(x), \tau_F(x) + \tau_G(x)), \min(\min(\omega_E(x) + \omega_G(x), \omega_F(x) + \omega_G(x)), \min(\max(\upsilon_E(x) + \upsilon_G(x), \upsilon_F(x) + \upsilon_G(x))), \max(r, s, t) \rangle | x \in X \}$ 

 $= \{(x, \min(\max(\tau_E(x) + \tau_G(x)), \max(\tau_F(x) + \tau_G(x)), \min(\min(\omega_E(x) + \omega_G(x), \min(\omega_F(x) + \omega_G(x))), \max(\omega_F(x) + \omega_G(x), \min(\omega_F(x) + \omega_G(x)), \max(\omega_F(x) + \omega_G(x)), \max(\omega_F(x) + \omega_G(x)), \max(\omega_F(x) + \omega_G(x), \max(\omega_F(x) + \omega_G(x)), \max(\omega_F(x))), \max(\omega_F(x) + \omega_G(x)), \max(\omega_F(x))), \max(\omega_F(x)), \max(\omega_F(x)), \max(\omega_F(x))), \max(\omega_F(x)), \max(\omega_F(x))), \max(\omega_F(x)), \max(\omega_F(x))), \max(\omega_F(x)), \max(\omega_F(x))), \max(\omega_F(x))), \max(\omega_F(x)), \max(\omega_F(x))), \max(\omega_F(x)), \max(\omega_F(x))), \max(\omega_F(x))), \max(\omega_F(x)), \max(\omega_F(x))),  

#### Rajarajeswari Palanisamy and Reshma Ranganathan

$$\begin{split} &\omega_{G}(x)), \max(\min(\upsilon_{E}(x) + \upsilon_{G}(x)), \min(\upsilon_{F}(x) + \upsilon_{G}(x)), \max(r, s, t))/x \in X \} \\ &= (E_{r} \cup_{max} G_{t}) \cap (F_{s} \cup_{max} G_{t}) = \mathsf{RHS} \\ & \mathsf{Hence}, (E_{r} \cap_{max} F_{s}) \cup_{max} G_{t} = (\mathsf{Er} \cup_{max} G_{t}) \cap (F_{s} \cup_{max} G_{t}). \\ & \mathsf{Similarly}, we can prove the result (ii). \end{split}$$

#### Proposition 3.17.

Let us have three Spherical Picture Fuzzy Sets  $E_r$ ,  $F_s$  and  $G_t$  given by,  $E_r = \{ (x, \tau_E (x), \omega_E (x), \upsilon_E (x); r) | x \in X \}, F_s = \{ (x, \tau_F (x), \omega_F (x), \upsilon_F (x); s) | x \in X \}$ and  $G_t = \{ \langle \mathbf{x}, \tau_G (\mathbf{x}), \omega_G (\mathbf{x}), \upsilon_G (\mathbf{x}); t \} / \mathbf{x} \in \mathbf{X} \}$ Then the following properties hold, (i)  $E_r$ +min ( $F_s \cup_{min} G_t$ ) = ( $E_r$ +min  $F_s$ )  $\cup_{min} (E_r$ +min  $G_t$ ). (ii)  $E_r$ +min ( $F_s \cap_{min} G_t$ ) = ( $E_r$ +min  $F_s$ )  $\cap_{min}(E_r$ +min  $G_t$ ). Proof (i). ## CONCLUSION

In this paper, a new concept of Spherical Picture fuzzy set was introduced which is an expansion of Circular-Intuitionistic fuzzy sets and in addition we have presented the geometrical interpretation of PFSs and SPFSs. The basic operations like union, intersection, complement, addition and multiplication are defined on SPFSs and based on the operations some of their properties over Spherical picture fuzzy sets are discussed. We observe that, Spherical Picture Fuzzy Sets satisfies commutative, associative, complementary and distributive properties under the union, intersection, addition and multiplication. In addition, it satisfies De Morgan 'slaws for the operations union and intersection and it does not satisfy the De Morgan's laws for the operations addition and multiplication which is illustrated with suitable example. As a future work some more properties and distance measures over Spherical Picture Fuzzy sets will be studied, which will be more useful to study their applications in the field of medical diagnosis, pattern recognition and decision making.

## ABSTRACT

In this paper the score function is used to solve Matrix game with Trapezoidal Intuitionistic Fuzzy(TrIF) payoff. The proposed method is applied to defuzzify the payoff matrix and the matrix is solved by mixed strategy method. The technique is illustrated by a numerical example.

**Keywords:** Matrix game, Intuitionistic fuzzy set, Trapezoidal Intuitionistic fuzzy number,  $(\alpha, \beta)$  –cut sets, score function. **MSC: 91-05** 

# INTRODUCTION

Game theory is the study of handling the situations where two conflicting interests exist. In general the matrix games with  $m \times n$ payoffs are reduced to  $2 \times 2$  matrix to find the optimal strategies and value of the game [3]. The payoff matrix may or may not have saddle points. The matrix without saddle points are reduced to  $2 \times 2$  matrix by the most popular dominance principle [7]. In real life situations there are lot of problems arises which cannot be explained in simple crisp sense. Zadeh [5] introduced the concept of fuzzy sets used in game theory to deal with that. The concept of Intuitionistic fuzzy sets developed by Atnassov [4] provides membership as well as non-membership functions which are found more useful in game theory to represents the players acceptance level and the hesitance level regarding a decision making situation [8]. In the multi criteria decision making the method of solving the vague set

## Sasikala and Sahathana Thasneem

by using the score function is established by S.M.Chen[13] and Q.Zhang [12]. Then the method is applied on Intuitionistic fuzzy sets [9]. The average index and deviation index are used to denote the level of belongingness and non-belongingness of the payoff. The method is designed to overcome the drawbacks of the existing method and gives more accuracy level in finding the optimal solution for the decision maker[6]. In this paper Trapezoidal Intuitionistic fuzzy payoff matrix is considered then reduced into the crisp payoff matrix using the score function.

This paper is organized as follows. In section 2 basic definitions of Intuitionistic fuzzy and Trapezoidal Intuitionistic fuzzy number are given with their cut sets and arithmetic operations. The score function for TrIFN is defined in section 3 and in section 4 a numerical example of voting share problem between two political parties is solved which is to help the voting agent to find the possible number of votes will be registered in the area before the poling day. The conclusion has been drawn in section 5.

## Preliminaries

Definition 2.1:

Let  $X = \{x_1, x_2, \dots, x_n\}$  be a finite universal set. An intuitionistic fuzzy set  $\tilde{l}$  in a given universal set  $\Box$  is of the form  $\tilde{l} = \{\langle x_i, \mu_{\tilde{l}}(x_i), \nu_{\tilde{l}}(x_i) \rangle : x_i \in X\}$ ,

where the functions  $\mu_l(x_i), v_l(x_i)$  are the degree of membership and degree of non - membership of an element  $x_i \in X$ , and they satisfy the condition  $0 \le \mu_l(x_i) + v_l(x_i) \le 1, \forall x_i \in X$ ,

# $i=1,2,3,\ldots.$

#### Definition 2.2:

A Trapezoidal Intuitionistic Fuzzy Number (TrIFN) is an Intuitionistic fuzzy number denoted as  $\tilde{l} = \langle (\underline{l}, \underline{h}, \overline{l}, \overline{h}); \chi_{\tilde{l}}, \eta_{\tilde{l}} \rangle$  in  $\mathbb{R}$  with membership function and non-membership function are defined as

$$\mu_{I}(x) = \begin{cases} \frac{x-\underline{l}}{\underline{h}-\underline{l}}\chi_{\overline{l}} &, & \underline{l} \le x \le \underline{h} \\ \chi_{I} &, & \underline{h} \le x \le \overline{l} \\ \frac{\overline{h}-x}{\overline{h}-\overline{l}}\chi_{I} &, & \overline{l} \le x \le \overline{h} \\ 0 &, & otherwise \end{cases}$$

And

$$v_{\bar{l}}(x) = \begin{cases} \frac{(\underline{h} - x) + \eta_{\bar{l}}(x - \underline{l})}{(\underline{h} - \underline{l})} , & \underline{l} \le x \le \underline{h} \\ \\ \eta_{\bar{l}} , & \underline{h} \le x \le \overline{l} \\ \\ \frac{(x - \overline{l}) + \eta_{\bar{l}}(\overline{h} - x)}{(\overline{h} - \overline{l})} , & \overline{l} \le x \le \overline{h} \\ \\ 1, & otherwise \end{cases}$$

#### Arithmetic operations on TrIFN:

Let  $\tilde{l} = \langle (\underline{l}, \underline{h}, \overline{l}, \overline{h}); \chi_{\overline{l}}, \eta_{\overline{l}} \rangle$  and  $\tilde{f} = \langle (\underline{f}, \underline{g}, \overline{f}, \overline{g}); \chi_{\overline{f}}, \eta_{\overline{f}} \rangle$  be two TrIF numbers. The arithmetic operations between the two numbers are of the form

$$\begin{split} \tilde{l} + \tilde{f} &= \langle \left(\underline{l} + \underline{f}, \underline{h} + \underline{g}, \overline{l} + \overline{f}, \overline{h} + \overline{g}\right); \chi_{\bar{l}} \wedge \chi_{\bar{f}}, \eta_{\bar{l}} \vee \eta_{\bar{f}} \rangle \\ \tilde{l} - \tilde{f} &= \langle (\underline{l} - \overline{\Box}, \underline{h} - \overline{\Box}, \overline{l} - \underline{\Box}, \overline{h} - \underline{\Box}); \chi_{\bar{l}} \wedge \chi_{\bar{f}}, \eta_{\bar{l}} \vee \eta_{\bar{f}} \rangle \\ \tilde{l} \times \tilde{f} &= \begin{cases} \left(\underline{l}\underline{f}, \underline{h}\underline{g}, \overline{l}\overline{f}, \overline{h}\overline{g}\right); \chi_{\bar{l}} \wedge \chi_{\bar{f}}, \eta_{\bar{l}} \vee \eta_{\bar{f}}, & \text{if } \tilde{l} > 0 \text{ and } \tilde{f} > 0 \\ \left(\underline{l}\overline{g}, \underline{h}\overline{f}, \overline{l}\underline{g}, \overline{h}\overline{f}\right); \chi_{\bar{l}} \wedge \chi_{\bar{f}}, \eta_{\bar{l}} \vee \eta_{\bar{f}}, & \text{if } \tilde{l} < 0 \text{ and } \tilde{f} > 0 \\ \left(\overline{h}\underline{f}, \overline{l}\underline{g}, \underline{h}\overline{f}, \overline{l}\underline{g}\right); \chi_{\bar{l}} \wedge \chi_{\bar{f}}, \eta_{\bar{l}} \vee \eta_{\bar{f}}, & \text{if } \tilde{l} > 0 \text{ and } \tilde{f} < 0 \\ \left(\overline{h}\overline{g}, \overline{l}\overline{f}, \underline{h}\underline{g}, \underline{l}\overline{f}\right); \chi_{\bar{l}} \wedge \chi_{\bar{f}}, \eta_{\bar{l}} \vee \eta_{\bar{f}}, & \text{if } \tilde{l} < 0 \text{ and } \tilde{f} < 0 \\ \left(\overline{h}\overline{g}, \overline{l}\overline{f}, \underline{h}\underline{g}, \underline{l}\underline{f}\right); \chi_{\bar{l}} \wedge \chi_{\bar{f}}, \eta_{\bar{l}} \vee \eta_{\bar{f}}, & \text{if } \tilde{l} < 0 \text{ and } \tilde{f} < 0 \end{cases}$$

#### Sasikala and Sahathana Thasneem

$$\frac{l}{f} = \begin{cases} \left(\frac{l}{\sqrt{g}}, \underline{h}/\overline{f}, \overline{l}/\underline{g}, \overline{h}/\underline{f}\right); \chi_{l} \wedge \chi_{f}, \eta_{l} \vee \eta_{f}, \text{ if } \tilde{l} > 0 \text{ and } \tilde{f} > 0 \\ \left(\overline{h}/\overline{g}, \overline{l}/\overline{f}, \underline{h}/\underline{g}, \underline{l}/\underline{f}\right); \chi_{l} \wedge \chi_{f}, \eta_{l} \vee \eta_{f}, \text{ if } \tilde{l} < 0 \text{ and } \tilde{f} > 0 \\ \left(\underline{l}/\underline{f}, \underline{h}/\underline{g}, \overline{l}/\overline{f}, \overline{h}/\overline{g}\right); \chi_{l} \wedge \chi_{f}, \eta_{l} \vee \eta_{f}, \text{ if } \tilde{l} > 0 \text{ and } \tilde{f} < 0 \\ \left(\overline{h}/\underline{f}, \overline{l}/\underline{g}, \underline{h}/\overline{f}, \overline{l}/\overline{g}\right); \chi_{l} \wedge \chi_{f}, \eta_{l} \vee \eta_{f}, \text{ if } \tilde{l} < 0 \text{ and } \tilde{f} < 0 \end{cases}$$
For any real number  $\lambda$ 

For any real number  $\lambda$ ,

$$\lambda \tilde{l} = \begin{cases} \langle (\lambda \underline{l}, \lambda \underline{h}, \lambda \overline{l}, \lambda \overline{h}); \chi_{l}, \eta_{l} \rangle, if \lambda > 0 \\ \langle (\lambda \overline{h}, \lambda \overline{l}, \lambda \underline{h}, \lambda \underline{l}); \chi_{l}, \eta_{l} \rangle, if \lambda < 0 \\ \tilde{l}^{-1} = \langle (1/\overline{h}, 1/\overline{l}, 1/\underline{h}, 1/\underline{l}); \chi_{l}, \eta_{l} \rangle \end{cases}$$

#### Cut sets of TrIF Numbers:

For  $\tilde{l} = \langle (\underline{l}, \underline{h}, \overline{l}, \overline{h}); \chi_{l}, \eta_{l} \rangle$  the  $(\alpha, \beta)$  cut sets of  $\tilde{l}$  is a subset of  $\mathbb{R}$  defined as  $\tilde{l}_{\alpha,\beta} = \{x: \mu_l(x) \ge \alpha, \nu_l(x) \le \beta\}$ .  $\alpha$  -cut of  $\tilde{l}$  is  $\tilde{l}_{\alpha} = \left[\underline{l} + \frac{\alpha(\underline{h} - \underline{l})}{\chi_{l}}, \overline{h} - \frac{\alpha(\overline{h} - \overline{l})}{\chi_{l}}\right]$  $\beta$  –cut of  $\tilde{l}$  is  $\tilde{l}_{\beta} = \left[\frac{(1-\beta)\underline{h} + (\beta - \eta_{\bar{l}})\underline{l}}{1 - \eta_{\bar{l}}}, \frac{(1-\beta)\overline{l} + (\beta - \eta_{\bar{l}})\overline{h}}{1 - \eta_{\bar{l}}}\right]$ 

#### Definition 2.3:

The mean values of the  $(\alpha, \beta)$  cut sets of  $\tilde{l}$  are denoted as  $P(\tilde{l}_{\alpha})$  and  $P(\tilde{l}_{\beta})$  written as

$$P(\tilde{l}_{\alpha}) = \frac{\chi_{\tilde{l}}(\underline{l} + \overline{h}) + \alpha(\underline{h} - \underline{l}) - \alpha(\overline{h} - \overline{l})}{2\chi_{\tilde{l}}}$$
  
And

$$P(\tilde{l}_{\beta}) = \frac{(1-\beta)(\underline{h}+\overline{l}) + (\underline{l}+\overline{h})(\beta-\eta_{l})}{2(1-\eta_{l})}$$

#### Definition 2.4:

The average index of membership and non-membership functions is denoted as  $T_{\mu}(\tilde{l})$  and  $T_{v}(\tilde{l})$  for the TrIFN  $\tilde{l}$  which are defined as

$$\begin{split} T_{\mu}(\overline{l}) &= \int_{0}^{X_{l}} P(\overline{l}_{\alpha}) d\alpha \\ &= \int_{0}^{X_{l}} \frac{\chi_{I}(\underline{l}+\overline{h}) + \alpha(\underline{h}-\underline{l}) - \alpha(\overline{h}-\overline{l})}{2\chi_{I}} d\alpha \\ &= \frac{\chi_{I}}{4} [\underline{l}+\overline{h}+\underline{h}+\overline{l}] \\ T_{\nu}(\overline{l}) &= \int_{\eta_{l}}^{1} P(\widetilde{l}_{\beta}) d\beta \\ &= \int_{\eta_{l}}^{1} \frac{(1-\beta)(\underline{h}+\overline{l}) + (\underline{l}+\overline{h})(\beta-\eta_{\overline{l}})}{2(1-\eta_{l})} d\beta \\ &= \frac{1}{4(1-\eta_{\overline{l}})} [(\underline{l}+\overline{h}+\underline{h}+\overline{l})(1+\eta_{\overline{l}}^{2}) + 2\eta_{\overline{l}}(\underline{h}+\overline{l}-\underline{l}-\overline{h})] \end{split}$$

#### Definition 2.5:

The deviation index of the membership function is denoted as  $ho_{\mu}(\tilde{l})$  and non-membership function is denoted as  $ho_{v}(\tilde{l})$  defined by using the mean values  $ho(\tilde{l}_{lpha})$  and  $ho(\tilde{l}_{eta})$  where

$$\rho(\tilde{l}_{\alpha}) = \frac{\left[(\chi_{l} - \alpha)(h - \underline{l})\right]}{2\chi_{l}}$$
$$\rho(\tilde{l}_{\beta}) = \frac{\left[(\beta - \eta_{l})(h - \underline{l})\right]}{2(1 - \eta_{l})}$$

The deviation index is calculated as

#### Sasikala and Sahathana Thasneem

$$\begin{split} \rho_{\mu}(\overline{l}) &= \int_{0}^{\chi_{l}} \rho(\overline{l}_{\alpha}) \, d\alpha \\ &= \int_{0}^{\chi_{l}} \frac{\left[ (\chi_{l} - \alpha)(\overline{h} - \underline{l}) \right]}{2\chi_{l}} \, d\alpha \\ &= \frac{1}{4} \chi_{l}(\overline{h} - \underline{l}) \end{split}$$
And

$$\rho_{\nu}(\tilde{l}) = \int_{\eta_{l}}^{1} \rho(\tilde{l}_{\beta}) d\beta$$
$$= \int_{\eta_{l}}^{1} \frac{\left[(\beta - \eta_{\tilde{l}})(\overline{h} - \underline{l})\right]}{2(1 - \eta_{l})} d\beta$$
$$= \frac{1}{4} (1 - \eta_{l})(\overline{h} - \underline{l})$$

#### **Comparer Index**

For two TrIFNs  $\tilde{l}$  and  $\tilde{f}$  the average index of the membership functions are  $T_{\mu}(\tilde{l})$  and  $T_{\mu}(\tilde{f})$  for non-membership functions  $T_{v}(\tilde{l})$  and  $T_{v}(\tilde{f})$ . The deviation index for the membership and non-membership functions of two TrIFNs are  $\rho_{\mu}(\tilde{l}), \rho_{\mu}(\tilde{f})$  and  $\rho_{v}(\tilde{l}), \rho_{v}(\tilde{f})$  then the comparer index between the two numbers is defined as

$$\mathcal{G}_{\tilde{l},\tilde{f}} = \frac{\pi(\tilde{f})\{T_{v}(\tilde{l}) - T_{\mu}(\tilde{l})\} - \pi(\tilde{l})\{T_{v}(\tilde{f}) - T_{\mu}(\tilde{f})\}}{\pi(\tilde{l})\pi(\tilde{f})\max_{l=L\tilde{f}}\left(\rho_{v}(\tilde{\iota}) - \rho_{\mu}(\tilde{\iota})\right)}$$

Which leads to the following results

i. If  $\mathcal{C}_{l,\tilde{f}} < 0$  then  $\tilde{f}$  is greater than  $\tilde{l}$ , denoted as  $\tilde{f} \approx \tilde{l}$ 

ii. If  $\mathcal{C}_{\tilde{l},\tilde{f}} > 0$ , then  $\tilde{f} \approx \tilde{l}$ 

iii. If  $\mathcal{G}_{\tilde{l},\tilde{f}} = 0$ , then  $\tilde{f} \cong \tilde{l}$  where  $\tilde{>}, \tilde{<}$  and  $\cong$  are the Intuitionistic equal symbols of >, < and =.

#### Example 2.1:

The comparer Index of TrIF numbers is illustrated with a numerical example. Let

$$\widehat{c}_{\bar{l},\bar{f}} = \frac{(0.2)(20.72 - 6.69) - (0.2)(17.76 - 8.18)}{(0.2)(0.2)(1.225 - 0.875)} = 63.57 > 0$$

Which implies  $\tilde{f} \approx \tilde{l}$ .

#### **Score Function**

The score function for Trapezoidal Intuitionistic Fuzzy Numbers is defined as

$$E(\tilde{l}) = \frac{T_v(\tilde{l}) - T_\mu(\tilde{l})}{\pi(\tilde{l})}$$

And it has the following two properties

- i.  $E(\tilde{l} + \tilde{f}) = E(\tilde{l}) + E(\tilde{f})$
- ii.  $E(\lambda \tilde{l}) = \lambda E(\tilde{l})$

#### TrIFN In Matrix Form :

For players *C* and *D*, player *C* has *m* number of strategies and player *D* has *n* number of strategies. The players choose their own strategy and attains an outcome depend upon their choice. At the end of the game the outcome is known as the payoff matrix. The  $m \times n$  payoff matrix of the TrIFN

 $\tilde{l} = \langle (\underline{l}, \underline{h}, \overline{l}, \overline{h}); \chi_{l}, \eta_{l} \rangle$  is of the form

If player C chooses strategy i and D chooses strategy j then the payoff is  $\tilde{l}_{ij}$ . For the TrIF game the minmax and maximin strategies are to maximize the minimum gain and minimize the maximum loss. For  $\tilde{l}$  the strategy is defined as

 $Max-min = \bigvee_i \left\{ \bigwedge_j \left\{ \langle (\underline{l}_{ij}, \underline{h}_{ij}, \overline{l}_{ij}, \overline{h}_{ij}); \chi_{\overline{l}_{ij}}, \eta_{\overline{l}_{ij}} \rangle \right\} \right\}$  $Min-max = \bigwedge_{i} \left\{ \bigvee_{i} \left\{ \left\langle \left( \underline{l}_{ij}, \underline{h}_{ij}, \overline{l}_{ij}, \overline{h}_{ij} \right); \chi_{\tilde{l}_{ii'}} \eta_{\tilde{l}_{ii}} \right\rangle \right\} \right\}$ The saddle point of the TrIF game is the  $(k,r)^{th}$  position of the payoff matrix satisfy the condition  $\langle (\underline{l}_{kr}, \underline{h}_{kr}, \overline{l}_{kr}, \overline{h}_{kr}); \chi_{\tilde{l}_{kr}}, \eta_{\tilde{l}_{kr}} \rangle$ 

$$= \bigvee_{i} \left\{ \bigwedge_{j} \left\{ \left( (\underline{l}_{ij}, \underline{h}_{ij}, \overline{l}_{ij}, \overline{h}_{ij}); \chi_{\overline{l}_{ij}}, \eta_{\overline{l}_{ij}} \right) \right\} \\ = \bigwedge_{j} \left\{ \bigvee_{i} \left\{ \left( (\underline{l}_{ij}, \underline{h}_{ij}, \overline{l}_{ij}, \overline{h}_{ij}); \chi_{\overline{l}_{ij}}, \eta_{\overline{l}_{ij}} \right) \right\} \right\}$$

Simply written as

$$\tilde{A} = \bigvee \left\{ \bigwedge_{i=1}^{n} \right\} = \bigwedge \left\{ \bigvee_{i=1}^{n} \right\}$$

The saddle point<sup>~</sup> is called the value of the TrIF game and denoted as . The strategies are the optimal strategies of the game.

#### **Definition 3.1:**

The expected payoff for the strategies  $y = (y_1, y_2, \dots, y_m)$  and  $z = (z_1, z_2, \dots, z_n)$  for the TrIFN  $\tilde{l}$  is defined as

$$\tilde{E}(y,z) = \sum_{j=1}^{n} \sum_{i=1}^{m} \langle (\underline{l}_{ij}, \underline{h}_{ij}, \overline{l}_{ij}, \overline{h}_{ij}); \chi_{\overline{l}_{ij}}, \eta_{\overline{l}_{ij}} \rangle y_i z_j$$

For players C and D, player C choose strategy y to maximize his expectation and D chooses z to minimize the maximum expectation of C.

$$\min \max \tilde{E}(y,z) = \tilde{E}(y^*,z^*) = \max \min \tilde{E}(y,z)$$

 $\min_{z} \max_{y} \vec{E}(y,z) = \vec{E}(y^*,z^*) = \max_{y} \min_{z} \vec{E}(y,z)$  $\vec{E}(y^*,z^*)$  is the strategic saddle point of the game and  $V = \vec{E}(y^*,z^*)$  is the value of the game.

#### Voting share Problem

The voting share problem is defined in a situation where an election is going to be conducted in a city and there are two major political parties competing with each other to gain more votes and win the election. The number of voters in the city is constant. So , it is same for both the parties. Each parties have their own set of strategies to increase their possibility of winning the election. Let C and D be the two political parties.

Party C's strategies are as follows,

 $C_1$ : Increasing door to door campaigning

C2: Making alliances with small political parties in the area

 $C_3$ : Doing campaigning and rallies by celebrities.

Party D's strategies are,

 $D_1$ : Making lot of promises to people and pledges to execute them

 $D_2$ : Addressing the current problems of the voters and promises to rectify them

 $D_3$ : Capturing the mistakes of the previous ruling party and giving assurance to solve them.

Now the voting agents of the Election commission can not say the exact voting percentage of the area before the voting day. But they have certain level of confidence and also hesitance due to bad weather forecast ,or previous

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access

ISSN: 0976 – 0997

#### Sasikala and Sahathana Thasneem

election results or the opinion poll. In this situation we consider the payoff matrix as Trapezoidal Intuitionistic fuzzy number.

 $\begin{array}{c|c} D_1 & D_2 D_3 \\ C_1 & \left\{ \langle (5,6,7,8); 0.6,0.2 \rangle & \langle (5,7,8,9); 0.5,0.3 \rangle & \langle (4,6,7,9); 0.4,0.2 \rangle \\ C_2 & \left\{ \langle (4,6,7,9); 0.5,0.2 \rangle & \langle (4,5,6,7); 0.4,0.3 \rangle & \langle (5,7,9,10); 0.5,0.1 \rangle \\ C_3 & \left\{ \langle (6,7,8,9); 0.4,0.2 \rangle & \langle (3,5,6,7); 0.6,0.2 \rangle & \langle (3,5,7,8); 0.5,0.3 \rangle \end{array} \right. \right\}$ 

Here the payoff ((5,6,7,8); 0.6,0.2) denotes the player *C* chooses strategy  $C_1$  and player *D* chooses strategy  $D_1$ . The expected votes in favour of *C* is between 6 and 7 lakhs with lower bound of 5 lakhs and upper bound of 8 lakhs. The confidence level is 0.6 and the hesitance level is 0.2.

Using the ranking method mentioned above we get table 1 By using the score function the crisp payoff matrix is

 $\begin{array}{l} D_1 & D_2 D_3 \\ C_1 \\ C_2 \\ 17.33 & 21.2 & 12.19 \\ C_3 \\ 16.875 & 19 & 31.475 \end{array} \\ \\ \text{Here } V_i \{\Lambda_j \, \tilde{l}_{ij}\} = (3,1) \neq (1,1) = \Lambda_j \{V_i \, \tilde{l}_{ij}\}. \text{ So the game does not have saddle point. Using the method of dominance the payoff matrix is reduced into 2 × 2 payoff matrix of the form } \end{array}$ 

$$\begin{array}{ccc} D_1 & D_3 \\ C_1 \\ C_3 \\ C_3 \\ 16.875 & 31.475 \end{array}$$

By using mixed strategies method the probabilities for player *C* plays strategies  $C_1$  and  $C_3$  are  $p_1^* = \frac{37}{50}$  and  $p_2^* = \frac{13}{50}$ . Similarly  $q_1^* = \frac{16}{25}$  and  $q_2^* = \frac{9}{25}$  are the probabilities for player *D* chooses strategies  $D_1$  and  $D_3$ . And value of the game is 20.65. The optimal score is in favour of player *C*. The value of the game in form of TrIFN is written as  $\frac{16}{25}\langle(5,6,7,8); 0.6,0.2\rangle + \frac{9}{25}\langle(6,7,8,9); 0.4,0.2\rangle = \langle(5.36,6.36,7.36,8.36); 0.4,0.2\rangle$ For player *C* the expected optimal votes are between 6.36 and 7.36 lakhs. Which could be as low as 5.36 lakhs and as high as 8.36 lakhs. The maximum confidence level and minimum hesitance level are 0.4 and 0.2.

## CONCLUSION

In this paper payoff matrix with TrIF values is solved. The TrIF payoff matrix is converted into crisp payoff matrix using the score function. The method is applied on voting share problem between two political parties. The merit of this method is it can be used to find the optimal solution as nearly as possible.

#### Statements and Declaration

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

## ABSTRACT

In this paper Composition and Weighted Composition of  $(\alpha, \beta)$  Quasi normal and  $(\alpha, \beta)$  Quasi class Q operators on  $L^2$ - Spaces are characterized and including some key characteristics of this operator, as well as a discussion of various theorems related to this operator.

### Mathematics Subject Classification: 47B20, 47B37, 47B38.

**Keywords:** Operator, Hilbert space,  $(\alpha, \beta)$  Quasi normal operator,  $(\alpha, \beta)$  Quasi class Q operator, Joint  $(\alpha, \beta)$ -quasi normal operator.

# INTRODUCTION

Let H be a complex Hilbert space, an operator T is normal if T T\*= T\*T. In this paper, we will study some properties of  $(\alpha,\beta)$  Quasi-Class (Q) operators. This has been done by relaxing some conditions of normality and introducing classes such as  $(\alpha,\beta)$ -Quasi Normal as covered in [4] and [9]. E-Rasoul, M.Farzollah and Ali Morassaei [5] presented the concept of  $(\alpha,\beta)$  – Normal operators in Hilbert spaces. Throughout the paper, H denotes the usual Hilbert space over the complex field and the separable, infinite-dimensional B (H) Banach algebra of all bounded linear algebra in Hilbert space H.

### Radharamani and Sathyavathi

### Preliminaries

Let B(H) stand for the complex Hilbert space H's Banach algebra of all bounded linear operators.

### **Definition 2.1**

It is referred to as an operator  $T \in B(H)$  is said to be Class (Q) if  $T^2 T^2 = (T^T)^2$ 

### **Definition 2.2**

It is referred to as an operator  $T \in B(H)$  is said to be Quasi-Class (Q) if  $T(T^2T^2)=(T^T)^2T$ 

### **Definition 2.3**

It is referred to as an operator  $T \in B(H)$  is said to be  $(\alpha,\beta)$  Class (Q) if  $[\alpha^2 T^{\cdot 2} T^2] \leq (T^{\cdot}T)^2 \leq [\beta^2 T^{\cdot 2} T^2]$  **Definition 2.4** It is referred to as an operator  $T \in B(H)$  is said to be Normal if  $T^{\cdot}T = TT^{\cdot}$ 

### Definition 2.5 [2]

It is referred to as an operator  $T \in B(H)$  is said to be  $(\alpha,\beta)$ - Normal if  $\beta^2 T^T T \ge T T^2 \ge \alpha^2 T^T T$ 

### MAIN RESULTS

When an operator  $T \in B(H)$  is said to be  $(\alpha,\beta)$  Quasi-class (Q) if  $T[\alpha^2 T^2 T^2] \leq (T^*T)^2 T \leq T[\beta^2 T^2 T^2]$  and  $(\alpha,\beta)$ quasi normal operator  $T[\alpha^2 T^*T] \leq [TT^*]T \leq T[\beta^2 T^*T]$  for  $0 \leq \alpha \leq 1 \leq \beta$  where  $T^*$  is the ad joint of the operator T. Assume (A,  $\Sigma$ ,  $\mu$ ) be a ' $\sigma$ ' finite measure space. A  $\Sigma$ -measurable mapping from X onto itself is a transformation T on (A,  $\Sigma$ ) such that  $C_T f = foT$  for f in  $L^2(\mu)$ . It is known that T induces a bounded linear operator CT on  $L^2$  if and only if the measure  $\mu_0 T^{-1}$  is absolutely continuous in relation to the measure  $\mu$  and  $h = d\mu_0 T^{-1}/d\mu$  is the Radon . Nikodyn derivative of measure  $\mu T^{-1}$  with respect to the  $\mu$ . A weighted composition operator is linear transformation acting on a set of complex valued  $\Sigma$ -measurable function f of the form  $Wf = wf^{\circ}T$  where w is complex valued,  $\Sigma$ -measurable function.

# $(\alpha, \beta)$ Quasi Class (Q) and $(\alpha, \beta)$ Quasi Normal Composition Operators Theorem 3.1.1

If  $T \in B(H)$ ,  $C_T \in B(L^2(\mu))$  then  $C_T$  is  $(\alpha, \beta)$  normal iff  $\alpha^2(C_T^*C_T) \le C_T C_T^* \le \beta^2(C_T^*C_T)$ .

### Proof

Consider

From (1) and (2)  $|\alpha^{2}| \|h^{1/2}f\|^{2} \leq \|(h,T)^{1/2}Pf\|^{2} \leq |\beta^{2}| \|h^{1/2}f\|^{2}$

### Radharamani and Sathyavathi

### Theorem 3.2.3

If  $T \in B(H)$ , Suppose  $T^{-1}\Sigma = \Sigma$  Then W is  $(\alpha, \beta)$  Quasi normal iff  $T[\alpha^2(WW^*)] \le [(W^*W)]T \le T[\beta^2(WW^*)]$ 

### Proof

Consider  $T[\alpha^2(WW^*)] \le [(W^*W)]T$   $\Leftrightarrow \langle T\alpha^2(WW^*) - (W^*W)Yf|f \rangle \le 0 \quad \forall f \in L^2$  $\Leftrightarrow T\alpha^2w^2(h^2T) \le hw^2 T^{-1}T$ ------(13)

Consider  $(W^*W)T \le T[\beta^2(WW^*)]$   $\Leftrightarrow \langle (W^*W)T - T\beta^2(WW^*)f|f \rangle \le 0 \quad \forall f \in L^2$   $\Leftrightarrow hw^2 \cdot T^{-1}T \le T\beta^2 w^2(h \cdot T)$  ------(14) From (13) and (14)  $T\alpha^2 w^2(h \cdot T) \le hw^2 \cdot T^{-1}T \le T\beta^2 w^2(h \cdot T)$ 

### Theorem 3.2.4

If  $T \in B(H)$ , W is  $(\alpha, \beta)$  Quasi Class (Q) iff  $T\alpha^{2}[hE(w^{2} \circ T^{-1}]^{2} \leq h_{2}E(W_{2}^{2}) \circ T^{-1}T \leq T\beta^{2}[hE(w^{2} \circ T^{-1}]^{2}]$ Proof Let  $Wf = w(f \circ T)$  and  $W^*f = hE(wf) \circ T^{-1}$ W is  $(\alpha,\beta)$  Quasi Class (Q)  $T[\alpha^{2}(WW^{*})^{2}] \leq [(WW^{*})^{2}]T \leq T[\beta^{2}(WW^{*})^{2}]$ Consider  $\Leftrightarrow T[\alpha^2(WW^*)^2] \leq [(WW^*)^2]T$  $\Leftrightarrow \langle T\alpha^2 (W^*W)^2 - (W^*W)^2 Tf | f \rangle \le 0 \quad \forall f \in L^2$  $\Leftrightarrow T\alpha^2 [hE(w^2 \, {}^\circ T^{-1}]^2 \le h_2 E(W_2^2) \, {}^\circ T^{-1}T$ -----(15) Consider  $\Leftrightarrow [(WW^*)^2]T \le T[\beta^2(WW^*)^2]$  $\Leftrightarrow \langle (W^*W)^2 fT - T\beta^2 (W^*W)^2 f | f \rangle \le 0 \ \forall \ f \in L^2$  $\Leftrightarrow h_2 E(W_2^2) \, {}^\circ T^{-1}T \le T\beta^2 [hE(w^2 \, {}^\circ T^{-1}]^2]$ -----(16) From (15) and (16)  $T\alpha^{2}[hE(w^{2} \circ T^{-1}]^{2} \leq h_{2}E(W_{2}^{2}) \circ T^{-1}T \leq T\beta^{2}[hE(w^{2} \circ T^{-1}]^{2}]$ 

### CONCLUSION

We defined as the idea on  $(\alpha, \beta)$ - Quasi Class (Q) and  $(\alpha, \beta)$ -Quasi normal Composition and Weighted Composition Operators is relatively new. We attempted to prove some properties on  $(\alpha, \beta)$  - Quasi Class (Q) and  $(\alpha, \beta)$ -Quasi normal Composition and Weighted Composition Operators in complex Hilbert space. The results of this paper will be accessible for further research to develop application side of Functional Analysis.

### ABSTRACT

In this article, we think about a two persons zero sum game of order 3 x 3 with estimated values in payoff matrix. All the estimated values are pretended to be Nonagonal fuzzy numbers. The solution of this kind of fuzzy games with pure strategies by maximin-minimax principles are argued.

Keywords: Fuzzy numbers, Nonagonal, Ranking of fuzzy numbers.

### INTRODUCTION

Game theory is a decision theory applicable to competitive situations. It is normally used during two or more individuals or organisations with inconsistent purpose try to make outcomes. In such position , outcome made by one outcome maker affects the outcome made by one or more of the remaining outcome makers. Game theory is based on the minimax principle which chances that every competitor will perform so as to minimize his maximum loss. (or maximise his minimum gain).Game theory is relevant to position such as two players harrowing to winatchess, contestant dispute an election, hard harrowing to continue their market stake, etc..

### Fuzzyset[27]

Let X be a non-empty set. A fuzzy set A in X is characterized by its membership function  $A \rightarrow [0,1]$  and A(x) is interpreted as the degree of membership of element x in fuzzy A for each  $x \in X$ .

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Sasikala and Umamaheswari

The value zero is to represent complete non-membership the value one is used to represent complete membership and values in between are used to represent intermediate degrees of membership. The mapping A is also called the membership function of fuzzy set A.

### Crispset[26]

Acrispset is a special case of a fuzzy set, in which the membership function only takes two values, commonly defined as 0 and 1.

### Fuzzy number[27]

A fuzzy number à is a fuzzy set on the real line R, must satisfy the following conditions.

- (i) There exist at least one x  $R_0 \in RR$  with  $\mu_{\bar{A}}(x_0)=1$ .
- (ii)  $\mu R \tilde{A} R(x)$  is piecewise continuous.
- (iii) Ã must be normal and convex.

Nonagonal fuzzy numbers:

### Definition 2.1.

An Nonagonal fuzzy number denoted by  $\tilde{A}R_WR$  is defined to be the ordered quadruple

- $\tilde{A}R_WR=(fR_1R(r), hR_1R(t), gR(s), fR_2R(r), hR_2R(t))$  for  $r \in [0, k_1]$ ,  $s \in [k_1, k_2]$  and  $t \in [k_2, 1]$  where 1.  $fR_1R(r)$  is abounded left continuous non-decreasing function over  $[0, k_1]$ ,  $[0 \le r \le k_1]$
- 2.  $hR_1R(t)$  is abounded left continuous non-decreasing function over  $[b_{2}, 1]$ ,  $[b_2 < r \le 1]$
- 3. gR(s) is a bounded continuous function over  $[k_1, k_2]$ ,  $[k_1 \le s \le k_2]$ .
- 4.  $fR_2R(r)$  is abounded right continuous non-increasing function over  $[0,k_1]$ ,  $[0 \le r \le k_1]$

 $hR_2R(t)$  is abounded right continuous non-increasing function over  $[k_2, 1]$ ,  $[k_2 \le r \le 1]$ 

### Definition 2.2[28]

A Nonagonal fuzzy number  $\tilde{A}=(a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8, a_9)$  is a normal fuzzy number where  $a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8, a_9)$  is a normal fuzzy number where  $a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8, a_9$  are real number sand its membership function is given by

$$\mu_{\bar{A}}(x) = \begin{cases}
\frac{1}{4} \left(\frac{x-a_1}{a_2-a_1}\right) & fora_1 \le x \le a_2 \\
\frac{1}{4} + \frac{1}{4} \left(\frac{x-a_2}{a_3-a_2}\right) & fora_2 \le x \le a_3 \\
\frac{1}{2} + \frac{1}{4} \left(\frac{x-a_3}{a_4-a_3}\right) & fora_3 \le x \le a_4 \\
\frac{3}{4} + \frac{1}{4} \left(\frac{x-a_4}{a_5-a_4}\right) & fora_4 \le x \le a_5 \\
1 - \frac{1}{4} \left(\frac{x-a_5}{a_6-a_5}\right) & fora_5 \le x \le a_6 \\
\frac{3}{4} - \frac{1}{4} \left(\frac{x-a_6}{a_7-a_6}\right) & fora_5 \le x \le a_6 \\
\frac{1}{2} - \frac{1}{4} \left(\frac{x-a_7}{a_8-a_7}\right) & fora_8 \le x \le a_9 \\
0 & otherwise
\end{cases}$$

α-cutofan Nonagonal fuzzy number The α-cut of an nonagonal fuzzy number  $\tilde{A}$ =( $a_1$ ,  $a_2$ , $a_3$ ,  $a_4$ ,  $a_5$ ,  $a_6$ ,  $a_7$ ,  $a_8$ ,  $a_9$ ) is

$$[\bar{A}]_{\alpha} = \begin{cases} (f_1(r), f_2(r)) & r \in [0, k_1] \\ g(s) & s \in [k_1, k_2] \\ (h_1(t), h_2(t)) & t \in [k_2, 1] \end{cases}$$

$$[\bar{A}]_{\alpha} = \begin{cases} \left(a_{1} + \frac{r}{k_{1}}(a_{2} - a_{1}) + a_{9} - \frac{r}{k_{1}}(a_{9} - a_{8})\right) & r \in [0, k_{1}] \\ a_{3} + \frac{s - k_{1}}{k_{2} - k_{1}}(a_{4} - a_{3}) & s \in [k_{1}, k_{2}] \\ a_{5} + \frac{t - k_{2}}{1 - k_{2}}(a_{6} - a_{5}) + a_{7} - \frac{t - k_{2}}{1 - k_{2}}(a_{7} - a_{6}) & t \in [k_{2}, 1] \end{cases}$$

$$Where f_{1}(r) = a_{1} + \frac{r}{k_{1}}(a_{2} - a_{1}) \\ g(s) = a_{3} + \frac{s - k_{1}}{k_{2} - k_{1}}(a_{4} - a_{3}) \\ h_{1}(t) = a_{5} + \frac{t - k_{2}}{1 - k_{2}}(a_{6} - a_{5}) \\ f_{2}(r) = a_{9} - \frac{r}{k_{1}}(a_{9} - a_{8}) \\ h_{2}(t) = a_{7} - \frac{t - k_{2}}{1 - k_{2}}(a_{7} - a_{6}) \end{cases}$$

### Ranking of Nonagonal fuzzy numbers

A measure of a number  $\overline{A}_w$  is a function  $R_{\alpha}: R_{\alpha}(I) \to R^+$  which assign a non-negative real number  $R_{Non}$  that expresses the measure of  $\overline{A}_w$ .

$$\begin{split} & R_{Non} = \frac{1}{2} \int_{0}^{k_1} (f_1(r) + f_2(r)) dr + \int_{k_1}^{k_2} g(s) \, ds + \frac{1}{2} \int_{k_2}^{1} (h_1(t) + h_2(t)) dt. \\ & \text{Where } r \in [0, k_1], s \in [k_1, k_2], \ t \in [k_2, 1]. \end{split}$$

### Definition3.1.

The measure of an Nonagonal fuzzy number is obtained by the average of

The two fuzzy side areas, left side are a and right side area, and the center part of the area from membership function to  $\alpha$ -axis.

### Definition3.2.

Letà be a normal octagonal fuzzy number. The value R<sub>Non</sub> called the measure of calculated as follows:

 $R_{Non} = \frac{1}{2} \int_{0}^{k_{1}} (f_{1}(r) + f_{2}(r)) dr + \int_{k_{1}}^{k_{2}} g(s) ds + \frac{1}{2} \int_{k_{2}}^{1} (h_{1}(t) + h_{2}(t)) dt$ =  $\frac{1}{4} \{ (a_{5} + 2a_{6} + a_{7}) + (a_{1} + a_{2} - 2a_{3} - 2a_{4} + a_{8} + a_{9})k_{1} + (2a_{3} + 2a_{4} - a_{5} + 2a_{6} - a_{7})k_{2} \}$ Where  $0 \le k_1 \le k_2 \le 1$ .

Solution of all 3x3 matrix game[26]

Consider the general 3×3 game matrix 
$$A = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$$

To solve this game we proceed as follows:

(i) Test for as addle point.

(ii) If there is no saddle point, solve by finding equalizing strategies. The Optimal mixed strategies for player A=  $(pR_1R_pR_2R)$  and for player B =  $(qR_1R_pR_2R)$  $P_1 = \frac{a_{22} - a_{21}}{\lambda}$ ,  $P_2 = 1 - P_1$ ,  $q_1 = \frac{a_{22} - a_{12}}{\lambda}$ ,  $q_2 = 1 - q_1$  $\lambda = (a_{11} + a_{22}) \cdot (a_{12} + a_{21})$ Value of the game V= $\frac{a_{11}a_{22} - a_{12}a_{21}}{(a_{11} + a_{22}) - (a_{12} + a_{21})}$ 

Ranking of Nonagonal

$$\int_{k_1}^{k_2} a_3 + \frac{s - k_1}{k_2 - k_1} (a_4 - a_3) ds = a_3(s)_{k_1}^{k_2} + \int_{k_1}^{k_2} \frac{s}{k_2 - k_1} (a_4 - a_3) ds - \int_{k_1}^{k_2} \frac{k_1}{k_2 - k_1} (a_4 - a_3) ds$$

International Bimonthly (Print) – Open Access Vol.14 / Issue 80 / Oct / 2023 ISSN: 0976 - 0997

$$\begin{aligned} &= \frac{1}{4} \{ 2a_3k_2 - 2a_4k_1 - 2a_3k_1 + 2a_4k_2 \} \\ &\frac{1}{2} \int_{k_2}^1 (a_5 + (\frac{t-k_2}{1-k_2})(a_6 - a_5) + a_7 - (\frac{t-k_2}{1-k_2})(a_7 - a_6)) dt = \frac{1}{4} \{ (a_5 + 2a_6 + a_7) - a_5k_2 + 2a_6k_2 - a_7k_2 \} \\ &\frac{1}{2} \int_0^{k_1} \left( a_1 + \frac{r}{k_1}(a_2 - a_1) + a_9 - \frac{r}{k_1}(a_9 - a_8) \right) dr + \int_{k_1}^{k_2} a_3 + \frac{s-k_1}{k_2-k_1}(a_4 - a_3)) ds + \\ &\frac{1}{2} \int_{k_2}^1 \left( a_5 + \frac{t-k_2}{1-k_2}(a_6 - a_5) + a_7 - \frac{t-k_2}{1-k_2}(a_7 - a_6) \right) dr \\ &\frac{1}{4} (a_1 + a_9 + a_2 + a_8)k_1 + \frac{1}{4} \{ 2a_3k_2 - 2a_4k_1 - 2a_3k_1 + 2a_4k_2 \} + \frac{1}{4} \{ (a_5 + 2a_6 + a_7) - a_5k_2 + 2a_6k_2 - a_7k_2 \} \\ &= \frac{1}{4} \{ (a_5 + 2a_6 + a_7) + (a_1 + a_2 - 2a_3 - 2a_4 + a_8 + a_9)k_1 + (2a_3 + 2a_4 - a_5 + 2a_6 - a_7)k_2 \} \\ & \text{Where } 0 \le k_1 \le k_2 \le 1. \end{aligned}$$

### Numerical Example

Consider the following Nonagonal fuzzy game problem.

Player B Player A  $\begin{pmatrix} (-3, -1, 0, 1, 2, 3, 4, 5, 6) & (1, 3, 4, 5, 7, 8, 9, 10, 11) & (2, 3, 4, 5, 6, 7, 8, 9, 10) \\ (-3, -1, 3, 6, 8, 9, 10, 12, 13) & (1, 2, 3, 5, 6, 10, 12, 13, 14) & (-3, -2, -1, 1, 3, 6, 8, 10, 13) \\ (-5, -4, -3, -2, 1, 2, 3, 4, 5) & (-1, 0, 1, 2, 3, 4, 5, 8, 12) & (-5, -4, -3, -2, 5, 6, 7, 8, 9) \end{pmatrix}$ Solution  $R_{Non} = \frac{1}{2} \int_{0}^{k_{1}} (f_{1}(r) + f_{2}(r)) dr + \int_{k_{1}}^{k_{2}} g(s) ds + \frac{1}{2} \int_{k_{2}}^{1} (h_{1}(t) + h_{2}(t)) dt$  $= \frac{1}{2} \int_{0}^{k_{1}} \left( a_{1} + \frac{r}{k_{1}} (a_{2} - a_{1}) + a_{9} - \frac{r}{k_{1}} (a_{9} - a_{8}) \right) dr + \int_{k_{1}}^{k_{2}} a_{3} + \frac{s - k_{1}}{k_{2} - k_{1}} (a_{4} - a_{3})) ds + \frac{1}{2} \int_{k_{2}}^{1} \left( a_{5} + \frac{t - k_{2}}{1 - k_{2}} (a_{6} - a_{5}) + a_{7} - \frac{t - k_{2}}{1 - k_{2}} (a_{7} - a_{6}) \right) dr$  $R_{Non} = \frac{1}{4} \{ (a_5 + 2a_6 + a_7) + (a_1 + a_2 - 2a_3 - 2a_4 + a_8 + a_9)k_1 + (2a_3 + 2a_4 - a_5 + 2a_6 - a_7)k_2 \}, \text{ Where } 0 \le k_1 \le k_2 \le k_1 \le k_2 \le k_2 \le k_1 \le k_2$ Taking  $k_1$ =0.4 and  $k_2$ =0.6  $a_{11} = (-3, -1, 0, 1, 2, 3, 4, 5, 6)$  $R_{Non}(a_{11}) = \frac{1}{4} \{ (2 + 2(3) + 4) + (-3 - 1 - 2(0) - 2(1) + 5 + 6)(0.4) + (2(0) + 2(1) - 2 + 2(3) - 4)(0.6) \}$  $=\frac{1}{4}$ {12 + 2 + 1.2}  $R_{Non}(a_{11})=3.8$  $a_{12} = (1,3,4,5,7,8,9,10,11) \Longrightarrow R_{Non}(a_{12}) = 11.4, a_{13} = (2,3,4,5,6,7,8,9,10) \Longrightarrow R_{Non}(a_{13}) = 10.3$  $a_{21} = (-3, -1, 3, 6, 8, 9, 10, 12, 13) \Longrightarrow R_{Non}(a_{21}) = 12,$  $a_{22} = (1, 2, 3, 5, 6, 10, 12, 13, 14) \Longrightarrow R_{Non}(a_{22}) = 13.6,$  $a_{23} = (-3, -2, -1, 1, 3, 6, 8, 10, 13) \Longrightarrow R_{Non}(a_{23}) = 7.7$  $a_{31} = (-5, -4, -3, -2, 1, 2, 3, 4, 5) \Longrightarrow R_{Non}(a_{31}) = 1.2$  $a_{32} = (-1, 0, 1, 2, 3, 4, 5, 8, 12) \Longrightarrow R_{Non}(a_{32}) = 6.2$  $a_{33} = (-5, -4, -3, -2, 5, 6, 7, 8, 9) \Longrightarrow R_{Non}(a_{33}) = 4.3$

 $a_{11}=3.8, a_{12}=10.3, a_{21}=12, a_{22}=7.7.$  $\lambda = (a_{11} + a_{22}) - (a_{12} + a_{21}) = (3.8 + 7.7) - (10.3 + 12), \lambda = -10.8$ 

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

 $P_{1} = \frac{a_{22} - a_{21}}{\lambda} = \frac{7.7 - 10.3}{-10.8} = 0.24, P_{2} = 1 - P_{1} = 1 - 0.24 = 0.76$   $q_{1} = \frac{a_{22} - a_{12}}{\lambda} = \frac{7.7 - 12}{-10.8} = 0.398$   $q_{2} = 1 - q_{1} = 1 - 0.398 = 0.602$ Value of the game  $V = \frac{a_{11}a_{22} - a_{12}a_{21}}{(a_{11} + a_{22}) - (a_{12} + a_{21})} = \frac{(3.8 + 7.7) - (10.3 + 12)}{-10.8}$  V = 8.7.Doing in this way we can solve nonative the solution of the solution o

Doing in this way we can solve nonagonal & decogonal problems for the type of  $4 \times 3, 5 \times 3, 3 \times 5$  etc.

### CONCLUSION

In this article, a method deal with 3 x 3 fuzzy game problem applying ranking of fuzzy numbers has been advised. The parameter k can be changed by the outcome maker to obtain the applicable decision. We may get various types of fuzzy game value for various values of k for the same fuzzy competitor.

### ABSTRACT

In this paper, we have introduced Euclidean and Hamming distance measures for Spherical Picture Fuzzy Sets (SPFS) for the first time in literature. Spherical Picture Fuzzy sets are extensions of the standard Intuitionistic Fuzzy Sets, Circular Intuitionistic Fuzzy Sets, Picture Fuzzy sets, and hence of Zadeh's Fuzzy Sets (FS). It is a new generalized representation of distance metrics applied to Spherical Picture Fuzzy Sets and Spherical Picture Fuzzy Values. Spherical Picture Fuzzy Sets used to identify the assessment data with uncertainty in complicated realistic decision making situations when Picture Fuzzy sets are insufficient. Multiple criteria decision-making MCDM research has grown rapidly and is still a notable area of study for tackling complex decision problems. We have applied the proposed distances for finding radius to deal with MCDM under picture Fuzzy environment. The proposed approach helps decision analysts truly understand the entire evaluation process and can provide a more precise and efficient decision support tool compared to Picture Fuzzy sets. The effectiveness of Spherical Picture Fuzzy approach is illustrated with suitable example.

**Keywords:** Picture fuzzy set, Picture fuzzy number, Spherical Picture Fuzzy Sets and Multiple attribute decision making.

### INTRODUCTION

In daily life, we deal problems with uncertainty in some way in kind of situation, as new mathematical tools are required since the standard mathematical tools(crisp sets) are insufficient to deal with overcome uncertainties. The concept of Fuzzy Set theory established by Zadeh [15] in 1965 in which the element has membership degree, the degree of belongingness is used to deal the problem under uncertain environment. In 1983, Atanassov [1] introduced the concept of Intuitionistic Fuzzy Sets (IFSs) which is the prime extension of Zadeh's Fuzzy Set. It describing an element with membership and non-membership values such that sum of these two values less than or equal toone. In 1994, Atanassov [4] was defined some other operations over the Intuitionistic Fuzzy Sets. In 2001, Atanassov [6] examined the Sanchez's approach for medical diagnosis andit's application is expanded using the idea of IFS theory which is a generalization of fuzzy set theory. Later, the important aspect of neutrality degree is seen as lacking in Intuitionistic Fuzzy Set theory. In 2014, Coung [10] introduced the concept of the Picture Fuzzy Sets which is the prime extension of Fuzzy Sets and Intuitionistic Fuzzy Sets by including the neutrality degree for each element along with membership and non-membership degrees in such that sum of these three degrees must not exceed one. Coung and Kreinovich [10] has analyzed new operations and properties over Picture Fuzzy Sets. In 2018, Nguyen Van Dinh and Nguyen Xuan Thao [13] analyzed the concepts of difference between PFS-sets, distance measure, and dissimilarity measure between picture fuzzy sets are introduced and along with the formulas for determining these values. They also illustrate how it can be used in Multi Attribute Decision Making. In 2017, Chunyong Wang and et.al., [12] established the a few geometric operators of Picture Fuzzy Sets and discussed some of its properties and also they have applied these operators to resolve involving Multiple Attribute Decision Making in a Picture Fuzzy environment. The concept of Circular Intuitionistic Fuzzy Sets (CIFSs) introduced by Atanassov [8] in 2020 which is the expansion of Intuitionistic Fuzzy Sets.Circular Intuitionistic Fuzzy Sets is characterized by describing a circle with radius r among each point of the IFS set. In [9], Atanassov defined the range of the radius of C-IFSs lies in  $[0,\sqrt{2}]$ since the points with center(0, 1)and (1, 0)are necessary to cover the entire Intuitionistic Fuzzy Sets triangle, which can be valid only when  $r \ge \sqrt{2}$ . In this paper, we have introduced the distance measures for Spherical Picture Fuzzy Sets. Distance measures over Spherical Picture fuzzy sets applied to Multi criteria Decision Making for finding a radius which is used to overcome the insufficient situation in Picture fuzzy sets.

### Preliminaries

In this section, few pre-requisites that are needed for this study overviewed.

### Definition 2.1. [15] Fuzzy Set

Let X be a non-empty universal set. Each set is mapped to [0,1] by membership function is defined as  $E = \{(x, \tau_E(x))/x \in X\}$ 

where  $\tau_E: X \to [0, 1]$  is the degree of membership function of the fuzzy set E and  $\tau_E(x) \in [0, 1]$  is the membership value of the element  $x \in X$  in the fuzzy set E.

### Definition 2.2. [1]IFS

Let X be a non-empty universal set. An intuitionistic fuzzy set (IFS) E in X is defined as

 $\mathsf{E} = \{ \langle \mathsf{X}, \tau_E(\mathsf{X}), \upsilon_E(\mathsf{X}) \rangle / \mathsf{X} \in \mathsf{X} \}$ 

where  $\tau_E: X \to [0, 1]$  and  $\upsilon_E: X \to [0, 1]$  with  $0 \le \tau_E(x) + \upsilon_E(x) \le 1$  for all  $x \in X$  represents the degrees of membership and non-membership of the element x to the IFS E. For each IFS, the intuitionistic index or hesitancy degree of the element x in X to the IFS E is  $\pi_E(x) = 1 - \tau_E(x) - \upsilon_E(x)$ .

### Definition 2.3. [8] C-IFS

Let X be the universe and E be its subset then, the set C-IFS is defined as,  $E_r^* = \{ \langle x, \tau_E(x), \upsilon_E(x); r \rangle / x \in X \}$ where  $\tau_E: X \to [0, 1]$  and  $\upsilon_E: X \to [0, 1]$  with  $0 \le \tau_E(x) + \upsilon_E(x) \le 1$  and  $r \in [0, \sqrt{2}]$  is the radius of the circle around each element  $x \in E$ , and functions  $\tau_E: X \to [0, 1]$  and  $\upsilon_E: X \to [0, 1]$  represent membership degree and non-membership

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Rajarajeswari Palanisamy and Reshma Ranganathan

degree of element  $x \in X$  to a fixed set  $E \subseteq X$ . We also define the hesitancy margin  $\pi_E: X \to [0, 1]$  by  $\pi_E(x) = 1 - \tau_E(x) - \upsilon_E(x)$  which corresponds to the degree of indeterminacy. The radius r defined in C-IFS takes on values from the interval [0,1].

### Definition 2.4. [10] PFS

A Picture Fuzzy Set(PFS) E on a universe X is an object in the form of P = { $\langle x, \tau_E(x), \omega_E(x), \upsilon_E(x) \rangle / x \in X$ } where  $\tau_E(x) \in [0, 1]$  is called the degree of positive membership of x in E,  $\omega_E(x) \in [0, 1]$  is called the degree of neutral membership of x in E and  $\upsilon_E(x) \in [0, 1]$  is called the degree of negative membership of x in E. where  $\tau_E(x)$ ,  $\omega_E(x)$  and  $\upsilon_E(x)$  satisfy the following condition (x  $\in X$ )  $0 \le \tau_E(x) + \omega_E(x) + \upsilon_E(x) \le 1$  Now,  $\sigma_E(x) = (1 - (\tau_E(x) + \omega_E(x) + \upsilon_E(x)))$  could be called the degree of refusal membership of x in E.

### Definition 2.5.(Spherical Picture Fuzzy Sets (SPFSs))

Let us have a fixed universe X and E be its subset then, the set SPFSs is defined as,

 $P_r^* = \{ \langle \mathbf{x}, \tau_E(\mathbf{x}), \omega_E(\mathbf{x}), \upsilon_E(\mathbf{x}); \mathbf{r} \rangle / \mathbf{x} \in \mathsf{X} \}$ 

where functions  $\tau_E: X \to [0, 1]$ ,  $\omega_E: X \to [0, 1]$  and  $\upsilon_E: X \to [0, 1]$  with  $0 \le \tau_E(x) + \omega_E(x) \le 1$  and  $r \in [0, \sqrt{2}]$  is the radius of the sphere around each element  $x \in E$ , represent membership degree, neutral degree and non-membership degree of element  $x \in X$  to a fixed set  $E \subseteq X$ . We also define the hesitancy margin  $\pi_E: X \to [0, 1]$  by  $\pi_E(x) = 1 - \tau_E(x) - \omega_E(x)$  which corresponds to the degree of indeterminacy.

### Definition 2.6. (Distance Properties)

AmetriconasetXisafunction  $d: X \times X \rightarrow R$  which satisfy the following three conditions:

1.  $d(x,y) \ge 0$  for all  $x, y \in X$  and equality holds if fx = y.

2. d(x,y)=d(y,x) for all  $x, y \in X$  (similarity)

3.  $d(x,z) \le d(x,y) + d(y,z)$  for all  $x, y, z \in X$  (The triangle inequality) Here, d(x,y) represents the distance between the objects x and y.

### Definition 2.7.

Consider two points  $x=(x_1, x_2, ..., x_n)$  and  $y=(y_1, y_2, ..., y_n) \in \mathbb{R}^n$ . Following are the two most popular distance metrics available in literature.

1.  $d_2(x, y) = \sqrt{\sum_{i=1}^n (x_i - y_i)^2}$ 

2.  $d_1(x, y) = \sum_{i=1}^{n} |x_i - y_i|$ 

### Definition 2.8.

Let  $\alpha = (\tau_{\alpha}, \omega_{\alpha}, \upsilon_{\alpha})$  and  $\beta = (\tau_{\beta}, \omega_{\beta}, \upsilon_{\beta})$  be two picture fuzzy numbers, then (1)  $\alpha \cdot \beta = ((\tau_{\alpha} + \omega_{\alpha})(\tau_{\beta} + \omega_{\beta}) - \omega_{\alpha}\omega_{\beta}, \omega_{\alpha}\omega_{\beta}, 1 - (1 - \upsilon_{\alpha})(1 - \upsilon_{\beta}));$ (2)  $\alpha^{\lambda} = ((\tau_{\alpha} + \omega_{\alpha})^{\lambda} - \omega_{\alpha'}^{\lambda}, \omega_{\alpha''}^{\lambda}, 1 - (1 - \upsilon_{\alpha})^{\lambda}), \lambda > 0.$ 

### Definition 2.9.[14]

If we consider  $\alpha = (\tau_{\alpha}, \omega_{\alpha}, \upsilon_{\alpha}, \varrho_{\alpha})$  be a picture fuzzy numbers, we can define a score function S as  $S(\alpha) = \frac{\tau\alpha - \upsilon\alpha + \sqrt{2}r(2\rho - 1)}{3}$  and the accuracy function H as  $H(\alpha) = \tau_{\alpha} + \omega_{\alpha} + \upsilon_{\alpha}$ , where  $S(\alpha) \in [-1, 1]$  and  $H(\alpha) \in [0, 1]$  respectively. We can take two picture fuzzy numbers  $\alpha$  and  $\beta$ 

(i) if  $S(\alpha) > S(\beta)$ , then  $\alpha$  is superior to  $\beta$ , denoted by  $\alpha > \beta$ ;

(ii) if  $S(\alpha) = S(\beta)$ , then

(1)  $H(\alpha) = H(\beta)$ , implies that  $\alpha$  is equivalent to  $\beta$ , represented by  $\alpha \sim \beta$ ;

(2)  $H(\alpha) > H(\beta)$ , implies that  $\alpha$  is superior to  $\beta$ , represented by  $\alpha > \beta$ .

#### **Distance measures for Spherical Picture Fuzzy Sets**

In this section, we have defined the distance measures for Spherical Picture Fuzzy Sets which is an extension of Circular Intuitionistic Fuzzy Sets is given as follows.

Euclidean Distance

$$E_{3}(E, F) = \frac{1}{2} \left( \frac{|r_{E} - r_{F}|}{\sqrt{2}} + \sqrt{\frac{1}{2} \sum_{x \in E} \left[ (\tau_{E}(x) - \tau_{F}(x))^{2} + (\omega_{E}(x) - \omega_{F}(x))^{2} + (\upsilon_{E}(x) - \upsilon_{F}(x))^{2} \right]} \right]$$
$$E_{4}(E, F) = \frac{1}{2} \left( \frac{|r_{E} - r_{F}|}{\sqrt{2}} \sqrt{\frac{1}{2} \sum_{x \in E} \left[ (\tau_{E}(x) - \tau_{F}(x))^{2} + (\omega_{E}(x) - \omega_{F}(x))^{2} + (\upsilon_{E}(x) - \upsilon_{F}(x))^{2} + (\omega_{E}(x) - \upsilon_{F}(x))^{2} \right]}$$

Hamming Distance

$$H_{3}(E, F) = \frac{1}{2} \left( \frac{|r_{E} - r_{F}|}{\sqrt{2}} + \frac{1}{2} \sum_{x \in E} \left[ |\tau_{E}(x) - \tau_{F}(x)| + |\omega_{E}(x) - \omega_{F}(x)| + |v_{E}(x) - v_{F}(x)| \right]$$

$$H_4(E, F) = \frac{1}{2} \left( \frac{|r_E - r_F|}{\sqrt{2}} + \frac{1}{2} \sum_{x \in E} \left[ |\tau_E(x) - \tau_F(x)| + |\omega_E(x) - \omega_F(x)| + |v_E(x) - v_F(x)| + |\pi_E(x) - \pi_F| \right] \right]$$

Hausdorff Distance

$$HD_{3}(E, F) = \frac{1}{2} \left( \frac{|r_{E} - r_{F}|}{\sqrt{2}} + \frac{1}{n} \sum_{x \in E} max[|\tau_{E}(x) - \tau_{F}(x)|, |\upsilon_{E}(x) - \upsilon_{F}(x)|] \right)$$

$$HD_{4}(E, F) = \frac{1}{2} \left( \frac{|r_{E} - r_{F}|}{\sqrt{2}} + \frac{1}{n} \sum_{x \in E} max[|\tau_{E}(x) - \tau_{F}(x)|, |\upsilon_{E}(x) - \upsilon_{F}(x)|, |\omega_{E}(x) - \omega_{F}(x)|, |\pi_{E}(x) - \pi_{F}(x)|] \right]$$

The radius of the  $(\mu(x), \omega(x), v(x))$  is the maximum of the Euclidean distance  $r_i = \max \sqrt{\left[\left(\tau(x) - m_{i,j}\right)^2 + \left(\omega(x) - m_{i,j}\right)^2 + \left(v(x) - m_{i,j}\right)^2\right]}$ 

### Theorem 3.1.

For any two  $E_{rE}$ ,  $F_{rF} \in SPFSs(X)$  that is  $E,F \in PFS$  where  $r_E$ ,  $r_F \in [0, \sqrt{2}]$  the distance measures over SPFSs are well defined distance measures.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Rajarajeswari Palanisamy and Reshma Ranganathan

Proof:

We have to demonstrate that the proposed measures  $H3(E_{r_E},F_{r_F})$ ,  $H4(E_{r_E},F_{r_F})$ ,  $E3(E_{r_E},F_{r_F})$  and  $H4(E_{r_E},F_{r_F})$  given in definition satisfies the three axioms of distance measures over SPFSs.

We know that distance measures for C-IFS formulas are well defined in Circular Intuitionistic Fuzzy Sets(X).

Similar manner, we can prove for SPFS formulas.

Case(i): we show that the distance property

 $D(E_{r_E}, F_{r_F}) \ge 0$  holds

 $D(E_{r_E}, F_{r_F}) = \frac{1}{2} \left( \frac{|r_E - r_F|}{\sqrt{2}} + \sqrt{\frac{1}{2} \sum_{X \in E} \left[ (\tau_E(X) - \tau_F(X))^2 + (\omega_E(X) - \omega_F(X))^2 + (\upsilon_E(X) - \upsilon_F(X))^2 \right]} \right]$ We know that,

 $D(E,F) \ge 0$  holds for the C-IFSs E and F

From the distance property,  $d(x,y) \ge 0$ For all x,y  $\in X$  and equality holds iff x=y.

For all x,y  $\in X$  and equality noids iff  $x = \frac{1}{2}$ 

 $|\mathbf{x}-\mathbf{y}| \ge 0$ 

 $|\mathbf{r}_{\mathsf{E}}-\mathbf{r}_{\mathsf{F}}| \ge 0$ 

Hence,  $D(E_{r_E}, F_{r_F}) \ge 0$  and when  $E_{r_E} = F_{r_F}$  in C-IFS (E) and rA-rB=0 iff E=F in IFS(E). Therefore the validity of the first axioms for a distance is proved.

Case(ii):

Let us take D(E,F)=
$$\frac{1}{2}\left(\frac{|r_E-r_F|}{\sqrt{2}} + \sqrt{\frac{1}{2}\sum_{x\in E}[(\tau_E(x)-\tau_F(x))^2 + (\omega_E(x)-\omega_F(x))^2 + (\upsilon_E(x)-\upsilon_F(x))^2]}\right)$$
  
D(F,E)= $\frac{1}{2}\left(\frac{|r_E-r_E|}{\sqrt{2}} + \sqrt{\frac{1}{2}\sum_{x\in E}[(\tau_F(x)-\tau_E(x))^2 + (\omega_F(x)-\omega_E(x))^2 + (\upsilon_F(x)-\upsilon_E(x))^2]}\right)$ 

Which satisfies the symmetric condition

Therefore, second axiom can be proved since D is symmetric.

Case(iii):

We consider a third SPFS  $G_t\;$  we have to satisfy that the triangle property

$$D(E_{r_{E'}} G_{r_{G}}) = \frac{1}{2} \left( \frac{|r_{E} - r_{C}|}{\sqrt{2}} + \sqrt{\frac{1}{2} \sum_{X \in E} [(\tau_{E}(x) - \tau_{G}(x))^{2} + (\omega_{E}(x) - \omega_{G}(x))^{2} + (\upsilon_{E}(x) - \upsilon_{G}(x))^{2}]} \right)$$

$$D(E_{r_{E'}} G_{r_{G}}) = \frac{1}{2} \left( \frac{|r_{E} - r_{F} + r_{F} + r_{G}|}{\sqrt{2}} + \sqrt{\frac{1}{2} \sum_{X \in E} [(\tau_{E}(x) - \tau_{F}(x) + \tau_{F}(x) + \tau_{G}(x))^{2} + (\omega_{E}(x) - \omega_{F}(x) + \omega_{G}(x))^{2} + (\upsilon_{E}(x) - \upsilon_{F}(x) + \upsilon_{F}(x) + \upsilon_{G}(x))^{2}]} \right)$$

 $D(E_{r_{E'}}G_{r_{G}}) \le D(E_{r_{E'}}F_{r_{F}}) + D(F_{r_{F'}}G_{r_{G}}) \text{ holds.}$ 

We know that,

 $\mathsf{D}(\mathsf{E},\mathsf{G}) \leq \mathsf{D}(\mathsf{E},\mathsf{F}) + \mathsf{D}(\mathsf{F},\mathsf{G})$ 

According to a wellknown inequality  $|x|+|y| \ge |x+y|$  for three real numbers,

 $|\mathbf{r}_{E,\mathbf{r}_{G}}| \leq |\mathbf{r}_{E,\mathbf{r}_{F}}| + |\mathbf{r}_{F,\mathbf{r}_{G}}|$ 

for all possible combinations of  $r_E$ ,  $r_F$  and  $r_G \in [0, \sqrt{2}]$ .

As a result, when both sides of the last two inequality formulas, 2 and 3 are applied together, the validity of 1, i.e) the axioms for distance is held.

### A Method for Multiple Attribute Decision making with spherical picture fuzzy information

In this section, we will use the existing operators to handle various attributes in a spherical picture fuzzy information. The MADM issues for alternative assessment with spherical picture fuzzy information are represented by the following presumptions or notations. Let  $R = \{R_1, R_2, ..., R_m\}$  be a set of m alternatives and  $S = \{S_1, S_2, ..., S_n\}$  be a set of n attributes. Let P be the picture fuzzy decision matrix. Assume that the picture fuzzy decision matrix P =  $(p_{ij})_{mn}$ , where  $p_{ij}$  (i = 1,2,..., m), (j = 1, 2,..., n) are in the form of PFNs, is the picture fuzzy decision matrix. The PFWG operator is used in the following to evaluate alternatives in MADM issues using spherical picture fuzzy information. Step 1.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Rajarajeswari Palanisamy and Reshma Ranganathan

We calculate the overall preference values (i = 1, 2, ..., m) of the alternative Ai using the decision data given in the matrix P and the PFWG operator.

Step 2. Evaluate the scores  $S(\tilde{p}i)$  (i = 1, 2, ..., m) of the overall picture fuzzy values  $\tilde{p}$  by

### Definition 2.9.

Step 3. Rank all the alternatives  $R_i$  (i = 1, 2, ..., m) according to the values of S ( $\tilde{p}_i$ ) (i = 1, 2, ..., m) and choose the best alternative.

### Numerical example

Let there be five project Ri (i=1,2,3,4,5) and we have to choose best one. External choose five criteria to evaluate the project: (1) R1 is the relevance; (2) R2 is the effectiveness; (3) R3 is the creativity; (4) R4 is the impact. The experts must evaluate five projects under the aforementioned four criteria in anonymity in order to prevent them from influencing one another. The Decision matrix  $P=p_{ij}$  giveninTable1.

### MCDM Algorithm

Now, we use the proposed strategy to evaluate a project with spherical picture fuzzy information. Step 1: utilize the decision information given in matrix P<sub>i</sub> and  $\tilde{p}_1 = \text{PFWG}_w(\text{P}_{11}, \text{P}_{12}, \text{P}_{13}, \dots, \text{P}_{1n})$ We have,  $\tilde{p}_1 = (0.439853, 0.133514, 0.198915)$   $\tilde{p}_2 = (0.302763, 0.252098, 0.272259)$   $\tilde{p}_3 = (0.520169, 0.137973, 0.175133)$   $\tilde{p}_4 = (0.632456, 0, 0.175133)$   $\tilde{p}_5 = (0.437, 0.115, 0.20)$ Step 2: Calculate the scoresS( $\tilde{p}_1$ ) (i=1,2,3,4) of the overall picture fuzzy preference values  $\tilde{p}_1$  by Definition 2.9.  $S(\tilde{p}_1) = 0.402$ ,

 $S(\tilde{p}_2)=0.052,$  $S(\tilde{p}_3)=0.262,$  $S(\tilde{p}_4)=0.761,$  $S(\tilde{p}_5)=0.374.$ 

Step 3: Rank all the alternatives  $R_i$  (i=1,2,3,4) in accordance with the values of  $S(\tilde{p}_i)$ : R4>R1>R5>R3>R2.

#### Comparison Analysis.

First, when the input arguments are Picture Fuzzy Numbers, our method can be applied as already stated, Spherical Picture Fuzzy Sets are extensions of the standard Intuitionistic Fuzzy Sets, Circular Intuitionistic Fuzzy Sets and hence of Zadeh's Fuzzy Sets. This method can be plays predominant role in decision making situations. Next, our approach can be examined with PFWG.

Finally we conclude that, in picture fuzzy sets scores deviation between candidates H1and H5 is very very less which is difficult for us to rank. By using Spherical Picture Fuzzy Sets scores, it improves the accuracy and enhance the deviation between H1 and H5. Hence it is easy to us to rank.

### CONCLUSION

In this paper, a new distance measures of the Spherical Picture fuzzy set was introduced which is an expansion of Circular-Intuitionistic fuzzy sets and picture fuzzy sets. In addition, we have presented a new approach for the Spherical picture fuzzy environment. We have used SPFS distance measures to solve multiple attribute decision-

### ABSTRACT

In this work we focus our study on  $(\alpha, \beta)$ -quasi normal operators by acting on a complex Hilbertspace H. When an operator  $T \in B(H)$  is said to be  $(\alpha, \beta)$ -quasi normal operator then  $T[\alpha^2 T^* T] \leq [TT^*]T \leq T[\beta^2 T^* T]$  where  $0 \leq \alpha \leq 1 \leq \beta$ . We demonstrate that a joint  $(\alpha, \beta)$  –quasi normal tuple is produced when an m-tuple of operators satisfying appropriate requirements is multiplied by a joint  $(\alpha, \beta)$  – quasi normal tuple.

Mathematics Subject Classification: 47B20, 47B37, 47B38.

**Keywords:** Operator, Hilbert space, Normal,  $(\alpha, \beta)$  - quasi normal operator, joint  $(\alpha, \beta)$ -quasi normal operator.

### INTRODUCTION

In this paper, we will study some properties of joint ( $\alpha$ ,  $\beta$ ) - quasi normal operators in several variables. Let H be a complex Hilbert space, an operator T is normal if TT\*= T\*T. This has been done by relaxing some conditions of normality and introducing classes such as ( $\alpha$ , $\beta$ ) quasi normal operators. E - Rasoul, M . Farzollah and Ali Morassaei [9] presented the concept of ( $\alpha$ , $\beta$ ) – Normal operators in Hilbert spaces. Throughout the paper, H denotes the usual Hilbert space over the complex field and the separable, infinite-dimensional B (H) Banach algebra of all bounded linear algebra in Hilbert space H. T is a normal operator for  $\alpha$ =1= $\beta$  and for  $\alpha$ =1 we perceive from the left inequality

### Radharamani and Sathyavathi

that T<sup> $\cdot$ </sup> is hyponormal and for  $\beta$ =1, from the right inequality we say that T is hyponormal. Moslehian has declared this class of operators as covered in [7].

### Preliminaries

Let B(H) denote the Banach algebra of all bounded linear operators on a Complex Hilbert space H.

### **Definition 2.1**

It is referred to as an operator  $T \in B(H)$  is said to be Normal if  $T^T = TT^T$ 

### **Definition 2.2**

It is referred to as an operator  $T \in B(H)$  is said to be  $(\alpha,\beta)$ - Normal if  $\beta^2 T^T \ge T T \ge \alpha^2 T^T$ 

### Joint (2, 2) Quasi Normal Operators

### **Proposition 3.1**

Let  $T \in B(H)$  be  $(\alpha, \beta)$  quasi normal. Then,  $T = (T, \dots, T) \in B(H)^m$  is joint  $(\alpha, \beta)$  quasinormal. In point of fact, since T is  $(\alpha, \beta)$  - quasi normal, it follows that  $T[\alpha^2(Tx|Tx)] \leq [(T*x|T*x)]T \leq T[\beta^2(Tx|Tx)], \forall x \in H.$ 

### Proof

Let x1, x2, ....,xn  $\in$  H and for  $x = \sum_{1 \le i \le m} x_i$ , then we can write  $T[\beta^2 \langle T(\sum_{1 \le i \le m} x_i) | T(\sum_{1 \le i \le m} x_i) \rangle] - [\langle T^*(\sum_{1 \le i \le m} x_i) | T^*(\sum_{1 \le i \le m} x_i) \rangle]T \ge 0$  ------(1)  $[\langle T^*(\sum_{1 \le i \le m} x_i) | T^*(\sum_{1 \le i \le m} x_i) \rangle]T - T[\alpha^2 \langle T(\sum_{1 \le i \le m} x_i) | T(\sum_{1 \le i \le m} x_i) \rangle] \ge 0$  ------(2) Then  $T[\beta^2 (\sum_{1 \le i, j \le m} \langle Tx_i | Tx_j \rangle)] - (\sum_{1 \le i, j \le m} \langle T^*x_i | T^*x_j \rangle)T \ge 0$  ------(3)

 $(\sum_{1 \leq i, j \leq m} \langle T * x_i | T * x_j \rangle) T - T[\alpha^2 (\sum_{1 \leq i, j \leq m} \langle T x_i | T x_j \rangle)] \ge 0$  ------(4) for  $x_1 x_2 \dots x_m \in H$ . Therefore, T is joint  $(\alpha, \beta)$  – quasi normal.

### **Proposition 3.2**

Let  $T \in B(H)$  and consider  $T = (T, ..., T) \in B(H)^m$ . Then, T is joint  $(\alpha, \beta)$  – quasinormal if and only if T is  $(\alpha, \beta)$  - quasinormal.

### Proof

Let T is  $(\alpha, \beta)$  quasi normal and by proposition (2.1) we say that joint  $(\alpha, \beta)$  – quasi normal.Conversely, assume that T is  $(\alpha, \beta)$  – quasi normal. By known definition, it becomes

$T[\beta^{2}(\sum_{1\leq i,j\leq m} \langle Tx_{i} Tx_{j}\rangle)] - (\sum_{1\leq i,j\leq m} \langle T^{*}x_{i} T^{*}x_{j}\rangle)T \geq 0$	(5)
$\left(\sum_{1\leq i,j\leq m} (T^* x_i   T^* x_j)\right) T - T \left[\alpha^2 \left(\sum_{1\leq i,j\leq m} (T x_i   T x_j)\right)\right] \geq 0$	(6)
for each $x_1, x_2, \dots, x_m \in H$ . In general, we get	
$T[\beta^2 \langle Tx Tx \rangle] - \langle T^*x T^*x \rangle T \ge 0$	(7)
and	
$\langle T^*x T^*x\rangle T - T[a^2\langle Tx Tx\rangle] \ge 0$	(8)
or equivalently	
$T[\alpha^2 \langle Tx Tx\rangle] \leq \langle T^*x T^*x\rangle T \leq T[\beta^2 \langle Tx Tx\rangle]$	(9)

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Therefore, T is  $(\alpha, \beta)$  - quasi normal.

Theorem 3.3

Let T = (T<sub>1</sub>,...,T<sub>m</sub>) be m-tuple of operators on H and let  $0 \le \alpha \le 1 \le \beta$  and assume that

 $T\big[\beta^2 T_i^*T_j\big] - \big[T_jT_i^*\big]T = 0 \ for \ i \neq j$ 

 $[T_j T_i^*]T - T[\alpha^2 T_i^* T_j] = 0 \text{ for } i \neq j$ 

Then, T=(T1,....,Tm) is joint  $(\alpha, \beta)$  - quasi normal tuple iff each  $T_i$  is  $(\alpha, \beta)$  - quasi normal fori=1,2, m.

### Proof

Let T = (T<sub>1</sub>, ...., T<sub>m</sub>) is joint  $(\alpha, \beta)$  - quasi normal tuple iff

 $\begin{cases} T[\beta^{2}(T)] - [T^{*}]T \ge 0 \\ T[T^{*}] - T[\alpha^{2}[T] \ge 0 \end{cases}$ (10)

By applying (8), we get,

$$\Leftrightarrow \begin{cases} T[\beta^2 \left(\sum_{1 \le k \le m} \|T_k x\|^2\right)] - \left(\sum_{1 \le k \le m} \|T_k^* x\|^2\right)T] \\ \left(\sum_{1 \le k \le m} \|T_k^* x\|^2\right)T - T[\alpha^2 \left(\sum_{1 \le k \le m} \|T_k x\|^2\right)] \end{cases} \ge 0, \forall x \in H \\ \begin{cases} T[\beta^2(T)] - [T^*]T \ge 0 \\ T[T^*] - T[\alpha^2[T] \ge 0 \end{cases} \Leftrightarrow \begin{cases} [(\sum_{1 \le k \le m} T(\beta^2 \|T_k x\|^2) - \|T_k^* x\|^2T)] \\ [\sum_{1 \le k \le m} (\|T_k^* x\|^2T - T(\alpha^2 \|T_k x\|^2)] \end{cases} \ge 0, \forall x \in H \end{cases}$$

$$\Leftrightarrow \begin{cases} \left[ \left(T(\beta^2 \| T_k x \|^2 - \| T_k^* x \|^2 T \right) \right] \\ \left[ \| T_k^* x \|^2 T - T(\alpha^2 \| T_k x \|^2 \right] \end{cases} \ge 0, \forall x \in H \end{cases}$$

Therefore,  $T_k$  is  $(\alpha, \beta)$  - quasi normal for k = 1,2,....m.

### Theorem 3.4

Let  $T = (T_{1,\dots,T_m}) \in B(H)^m$  and let  $(\alpha, \beta) \in R^2$  such that  $0 \le \alpha \le 1 \le \beta$ . If

T<sub>i</sub>  $T_j^* = 0$  for all  $i \neq j$ , then T is joint  $(\alpha, \beta)$ - quasi normal if and only if  $T^* = (T_1^*, \dots, T_m^*)$  is joint  $(1/\beta, 1/\alpha)$  quasi normal.

#### Proof

Assume that T is joint  $(\alpha, \beta)$  quasi normal and we have to prove that T<sup>\*</sup> is joint

#### $(1/\beta \ , 1/\alpha)$ quasi normal

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Consider

 $T[\alpha^{2}(\sum_{1 \le k \le m} \|T_{k}x\|^{2}) \le (\sum_{1 \le k \le m} \|T_{k}^{*}x\|^{2})T \le T[\beta^{2}(\sum_{1 \le k \le m} \|T_{k}x\|^{2}) \forall x \in H \dots (10)$ 

Then (10) becomes

 $T[\frac{1}{\beta^2}(\sum_{1 \le k \le m} \|T_k x\|^2) \le (\sum_{1 \le k \le m} \|T_k^* x\|^2) T \le T[\frac{1}{\alpha^2}(\sum_{1 \le k \le m} \|T_k x\|^2) \forall \ x \in H \text{ ------}(11)$ 

Hence,  $T^*$  is joint  $(1/\beta, 1/\alpha)$  quasi normal tuble and conversely let  $T^*$  is joint  $(1/\beta, 1/\alpha)$  quasi normal tuble, we have

 $T[\frac{1}{R^2}(\sum_{1 \le k \le m} \|T_k x\|^2) \le (\sum_{1 \le k \le m} \|T_k^* x\|^2) T \le T[\frac{1}{\alpha^2}(\sum_{1 \le k \le m} \|T_k x\|^2) \forall x \in H \dots (12)$ 

which means that

$$T[\alpha^{2}(\sum_{1 \le k \le m} \|T_{k}x\|^{2}) \le (\sum_{1 \le k \le m} \|T_{k}^{*}x\|^{2})T \le T[\beta^{2}(\sum_{1 \le k \le m} \|T_{k}x\|^{2}) \forall x \in H \dots (13)$$

Therefore, T is joint  $(\alpha, \beta)$  quasi normal tuble.

Example 3.5

Let 
$$A = \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix}$$
,  $B = \begin{pmatrix} 0 & -1 \\ -1 & 0 \end{pmatrix}$  which are  $(\alpha, \beta)$ -quasi normal operators and their product  $\begin{pmatrix} -1 & 0 \\ -1 & -1 \end{pmatrix}$  is not  $(\alpha, \beta)$ -quasi normal operator.

The above example proves that, by proposition 3.2 even if A and B are joint ( $\alpha$ ,  $\beta$ ) - quasi normal operators, their product AB is not joint ( $\alpha$ ,  $\beta$ )-quasi normal operator.

### CONCLUSION

We defined as the idea on joint ( $\alpha$ ,  $\beta$ )-Quasi normal operators in several variables are relatively new. We attempted to prove some properties of joint ( $\alpha$ ,  $\beta$ )-Quasi normal operators in several variables in complex Hilbert space. The results of this paper will be accessible for further research to develop application side of Functional Analysis.

### ABSTRACT

In many real time applications such as planning, production, inventory and in other domains, the decision makers plays an important role. Trapezoidal Fuzzy Neutrosophic Number (TFNN) has an major role to measure the vagueness and uncertainty data of real life. In this research work, we presented a new method for solving Linear fractional programming problem (LFPP) using simplex method technique and a ranking function of TFNN. In LFPP, the coefficients of the objective function and constraints were represented as TFNN .Further, numerical examples were illustrated to make a comparative study with the existing methods. Finally, we observe that our proposed methodology gives the most optimized solution than the existing methods.

**Keywords** - Fuzzy numbers, Neutrosophic Number, Trapezoidal Fuzzy Neutrosophic Number and Linear Programming Problem.

### INTRODUCTION

Linear fractional programming problem (LFPP) is represented as the ratio of two linear functions namely real cost/standard cost, inventory/sale and other ratios which measure the efficiency of the LFPP. In real time applications, the decision makers may find it difficult to make decisions due to incomplete and obscure information. In such cases, LFPP is a major focus of several researchers due to its application in various fields namely traffic planning, production planning, financial planning, game theory, hospital and health care planning. Isbell and Marlow [5] introduced a methodology for solving a LFPP by using a sequence of linear programming

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Rajarajeswari and Shyamala

problem[LPP].Charnes and Cooper [3] have proposed a variable transformation method for solving LFPP. Later on,Swarup[11] solved the LFPP using different types of solution procedures based on the simplex method developed by Danzig where as Bitran and Novas [2] have solved the LFPP by computing the generalization of the derivative to multivariate functions of objective functions.Fuzzy linear fractional programming problem is generalization of the LFPP with fuzzy number. Neutrosophic number is the major focus of several researchers due to its scope in various research domains. Hence, researchers have developed many novel methods to solve LFPP using neutrosophic and different types of fuzzy concepts. Smarandache[10] introduced the neutrosophic set to handle incomplete, uncertainty and indeterminacy. Later on,Abdel-Basset[1] have introduced a method for solving the fully neutrosophic linear programming problems. Sapan Kumar Das et.al.,[9] have developed an intelligent dual simplex technique to solve LFPP by considering all the coefficients of the objective function and constraints as triangular neutrosophic number except the decision variables. Rasha Jalal Mitlif [8] developed an efficient method for solving fuzzy linear fractional programming problem through ranking function with triangular fuzzy number in their work and included few examples to prove the advantage of their method. Elhadidi et.al.,[4] introduced a ranking function for solving LFPP with trapezoidal neutrosophic number. In this paper, we have introduced a new method by combining TFNN and simplex method technique for solving LFPP.

### PRELIMINARIES

The basic terminologies involving Trapezoidal Fuzzy Neutrosophic Number and Score Function are outlined in this section.

### Definition 2.1: Trapezoidal Fuzzy Neutrosophic Number [6]

If  $T_{\tilde{a}}, I_{\tilde{a}}, F_{\tilde{a}} \in [0,1]$  and  $e_1, e_2, e_3, e_4 \in \mathbb{R}$  such that  $e_1 \leq e_2 \leq e_3 \leq e_4$  then we define Trapezoidal Fuzzy Neutrosophic Number by  $\tilde{a} = \langle (e_1, e_2, e_3, e_4); T_{\tilde{a}}, I_{\tilde{a}}, F_{\tilde{a}} \rangle$  whose truth-membership  $(T_{\tilde{a}})$ , indeterminacy-membership  $(I_{\tilde{a}})$  and falsity-membership  $(F_{\tilde{a}})$  functions are given as follows.

$$\mu(x) = \begin{cases} \frac{(x-e_1)T_{\tilde{a}}}{e_2-e_1}, e_1 \le x \le e_2 \\ T_{\tilde{a}}, e_2 \le x \le e_3 \\ \frac{(e_4-x)T_{\tilde{a}}}{e_4-e_3}, e_3 \le x \le e_4 \\ 0, & Otherwise \end{cases}$$

$$\Theta(x) = \begin{cases} \frac{e_2-x+(x-e_1)I_{\tilde{a}}}{e_2-e_1}, e_1 \le x \le e_2 \\ I_{\tilde{a}}, e_2 \le x \le e_3 \\ \frac{x-e_3+(e_4-x)I_{\tilde{a}}}{e_4-e_3}, e_3 \le x \le e_4 \\ 1 & otherwise \end{cases}$$

$$\lambda(x) = \begin{cases} \frac{(e_2-x)+(x-e_1)F_{\tilde{a}}}{e_2-e_1}, e_1 \le x \le e_2 \\ F_{\tilde{a}}, e_2 \le x \le e_3 \\ \frac{x-e_3+(e_4-x)F_{\tilde{a}}}{e_4-e_3}, e_3 \le x \le e_4 \\ 1 & otherwise \end{cases}$$

### Definition 2.2 : Score Function [6]

Let  $\tilde{a} = \langle (e_1, e_2, e_3, e_4); T_{\tilde{a}}, I_{\tilde{a}}, F_{\tilde{a}} \rangle$  be the Trapezoidal Fuzzy Neutrosophic Number then the special ranking of TFNN named Score Function is given by

$$S(\tilde{a}) = \frac{1}{16} (e_1 + e_2 + e_3 + e_4) (T_{\tilde{a}} + (1 - I_{\tilde{a}}) + (1 - F_{\tilde{a}}))$$

#### Proposed method for solving LFPP

In this paper ,we introduce an intelligent method for solving the LFPP in which the coefficients of the objective function and the constraints are TFNN except the decision variables.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Rajarajeswari and Shyamala

Let us consider the LFPP as follows.

Max (or)Min  $z(x) = \frac{z_1(x)}{z_2(x)}$  s.t  $x \in T$ 

where the objective functions  $z_1(x)$  and  $z_2(x)$  are the two linear functions and the set T is defined as  $T = \{x/Ax \le B, x > 0\}$ . Here A is a fuzzy matrix.

Step 1: We consider the general form of LFPP with m constraints and n variables which is represented as

$$Max(or)Minz(x) = \frac{\sum_{j=1}^{n} c_j x_j + \alpha}{\sum_{j=1}^{n} d_j x_j + \beta}$$
  
s.t  $\sum_{i=1}^{m} a_{ij} x_j \le b_i$   
 $x_j \ge 0$  where  $j = 1, 2, ..., n$ .

Step 2: In the above LFPP, we represent all the coefficients in the objective function and the constraints as TFNN like below

$$\mathsf{Max}(\mathsf{or})\mathsf{Min}\,z(x) = \frac{\sum_{j=1}^{n} (b_{j,}d_{j,}e_{j,}f_{j};T_{c_{j'}}I_{c_{j'}}F_{c_{j}})\,x_{j} + (\alpha_{1},\alpha_{2},\alpha_{3},\alpha_{4},;T_{\alpha},I_{\alpha},F_{\alpha})}{\sum_{j=1}^{n} (c_{j'},e_{j'},f_{j,}g_{j};T_{d_{j'}}I_{d_{j'}}F_{d_{j}})\,x_{j} + (\beta_{1},\beta_{2},\beta_{3},\beta_{4};T_{\beta},I_{\beta},F_{\beta})}$$

Subject to

$$\begin{split} & \sum_{i=1}^{m} \left( b_{ij}, c_{ij}, d_{ij}, e_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}} \right) x_j \leq \left( p_i, q_i, r_i, s_i; T_{b_i}, I_{b_i}, F_{b_i} \right) \\ & x_j \geq 0 , \ j = 1, 2, \dots, n. \end{split}$$

We proposed a novel methodology for solving LFPP by using TFNN with a idea of Simplex Method. The following algorithm explains the proposed methodology.

Step 3:In the above LFPP, we decompose the objective function into two LPPs as below.

 $\begin{aligned} \text{Max (or)} &\text{Min } z_1(x) = \sum_{j=1}^{n} (b_{j,}d_{j,}e_{j,}f_{j};T_{c_j},I_{c_j},F_{c_j}) x_j + (\alpha_1,\alpha_2,\alpha_3,\alpha_4,;T_{\alpha},I_{\alpha},F_{\alpha}) \\ \text{s.t} \quad \sum_{i=1}^{m} (b_{ij},c_{ij},d_{ij},e_{ij};T_{a_{ij}},I_{a_{ij}},F_{a_{ij}}) x_j \leq (p_i,q_i,r_i,s_i;T_{b_i},I_{b_i},F_{b_i}). \\ & x_j \geq 0 \quad \text{where } j = 1,2,\ldots,n. \end{aligned}$ 

(P-2)

 $\begin{array}{ll} \text{Max (or)} \text{Min } z_2(x) &= \sum_{j=1}^n (c_j, e_j, f_j, g_j; T_{d_j}, I_{d_j}, F_{d_j}) \, x_j + (\beta_1, \beta_2, \beta_3, \beta_4, ; T_\beta, I_\beta, F_\beta) \\ \text{s.t} & \sum_{i=1}^m \left( b_{ij}, c_{ij}, d_{ij}, e_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}} \right) \, x_j \leq \left( p_i, q_i, r_i, s_i; T_{b_i}, I_{b_i}, F_{b_i} \right) \\ & x_j \geq 0 \quad \text{where } j = 1, 2, \dots, n. \end{array}$ 

**Step 4: U**sing the definition 2.2 in above LPP given in (P-1) and (P-2) ,we get the modified LPPs as below (P-3)

$$\begin{aligned} \text{Max (or)} &\text{Min } z_1(x) = \sum_{j=1}^n S\left(b_{j,d_j}, e_{j,f_j}; T_{c_j}, I_{c_j}, F_{c_j}\right) x_j + S(\alpha_1, \alpha_2, \alpha_3, \alpha_4; T_{\alpha}, I_{\alpha}, F_{\alpha}) \\ &\text{s.t} \quad \sum_{i=1}^m S\left(b_{ij}, c_{ij}, d_{ij}, e_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}}\right) x_j + S(p_i, q_i, r_i, s_i; T_{b_i}, I_{b_i}, F_{b_i}) \\ &x_j \ge 0 \quad \text{where } j = 1, 2, \dots, n. \end{aligned}$$

(P-4)

 $\begin{aligned} \text{Max (or) Min } z_2(x) &= \sum_{j=1}^n S\left(c_j, e_j, f_j, g_j; T_{d_j}, I_{d_j}, F_{d_j}\right) x_j + S(\beta_1, \beta_2, \beta_3, \beta_4; T_{\beta}, I_{\beta}, F_{\beta}) \\ \text{s.t} \quad \sum_{i=1}^m S\left(b_{ij}, c_{ij}, d_{ij}, e_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}}\right) x_j + S(p_i, q_i, r_i, s_i; T_{b_i}, I_{b_i}, F_{b_i}) \\ x_j &\geq 0 \quad \text{where } j = 1, 2, \dots, n. \end{aligned}$ 

**Step 5:** By solving the above LPP given in (P-3) and (P-4) by Simplex Method to get the optimal solutions namely  $z_1(x)$  and  $z_2(x)$ .

**Step 6:** The optimal solution of the given LFPP is got by using the formula below Max  $Z(x) = \frac{Z_2(x)}{2}$  and Min  $Z(x) = \frac{Z_1(x)}{2}$ 

IVIAX 
$$Z(X) = \frac{z}{Z_1(x)}$$
 and IVIIN  $Z(X) = \frac{1}{Z_2(x)}$ 

If the objective function is of minimization type then convert it into maximization type by using the formula Max Z(x)= - Min Z(x)

### Application of proposed method Numerical Example 3.1:

Here we illustrate a numerical example in the field of Production of Casting Company

A casting company in coimbatore produces two kinds of products namely Grey Iron and S.G. Iron with profits around 8 rupees and 18 rupees per product respectively. However, the cost of the 100 grams of Grey Iron is around Rs.16 and cost of 100 grams of S.G. Iron is around Rs.18. It is assumed that a fixed cost of Rs.12 is added to the cost function for the process of production. Suppose the raw materials needed for manufacturing the products Grey Iron and S.G.Iron are about Rs.64 per Kg and Rs.82 per Kg respectively, then the supply for the raw material is restricted to Rs.95. Product Grey Iron requires 8 hours per Kg of processing time and Product S.G.Iron requires 10 hour per kg of processing time ,but total time available is about 22 hours daily. Determine , how many Kg's of Grey Iron and S.G. Iron should be manufactured in order to maximize the total profit.

**Solution:** Let  $X_1$  and  $X_2$  denote the number of units of two kinds of products produced namely Grey Iron and S.G. Iron.

(3)

**Step 1:** Formulating the above as the LFPP ,we get Max Z(x) =  $\frac{8 X_1 + 18X_2}{16X_1 + 18X_2 + 12}$ Subject to 64 X<sub>1</sub>+82 X<sub>2</sub>  $\leq$  95 , 8 X<sub>1</sub>+10X<sub>2</sub>  $\leq$  22 , X<sub>1</sub>, X<sub>2</sub>  $\geq$  0

Step 2: We have represented all the coefficients used in objective function and the constraints as TFNN like below

```
(1,6,10,13;0.9,0.1,0.3)X_1 + (11,16,20,23;0.9,0.1,0.3)X_2
s.t.
(60,62,64,66;0.2,0.5,0.6)X_1 + (80,82,85,86;0.3,0.6,0.4)X_2 \le (92,94,97,100;0.8,0.2,0.4)
(1,6,10,13;0.9,0.1,0.3)X_1 + (1,6,11,15;0.7,0.6,0.3)X_2 \le (16,18,22,23;0.3,0.6,0.4) and X_1, X_2 \ge 0
Step 3:In the above LFPP, we decompose the objective function into two LPPs as follows.
(P-1)
Max z_1(x) = (1,6,10,13;0.9,0.1,0.3)X_1 + (11,16,20,23;0.9,0.1,0.3)X_2
s.t.
(60,62,64,66;0.2,0.5,0.6) X<sub>1</sub> + (80,82,85,86;0.3,0.6,0.4) X<sub>2</sub> \leq (92,94,97,100;0.8,0.2,0.4)
(1,6,10,13; 0.9,0.1,0.3) X_1 + (1,6,11,15; 0.7,0.6,0.3) X_2 \leq (16,18,22,23;0.3,0.6,0.4)
and X_1, X_2 \ge 0
(P-2)
             \operatorname{Max} z_2(x) = (5,15,25,30;0.7,0.5,0.6)X_1 + (11,16,20,23;0.9,0.1,0.3)X_2 + (4,8,17,25;0.3,0.6,0.4)
s.t.
(60,62,64,66;0.2,0.5,0.6) X_1 + (80,82,85,86;0.3,0.6,0.4) X_2 \le (92,94,97,100;0.8,0.2,0.4)
(1,6,10,13; 0.9,0.1,0.3) X_1 + (1,6,11,15; 0.7,0.6,0.3) X_2 \le (16,18,22,23;0.3,0.6,0.4) \text{ and } X_1, X_2 \ge 0
Step 4: The crisp value of each TFNN is calculated using definition 2.2
S(\tilde{8}) = 4.68, S(\tilde{10}) = 3.71, S(\tilde{12}) = 4.39, S(\tilde{16}) = 7.5, S(\tilde{18}) = 10.94,
S(22) = 6.42, S(64) =17.33, S(82) =18.73, S(95) =52.66
By substituting the crisp values in (P-1) and (P-2), we get the modified LPPs as follows
(P-3)
Max z_1(x) = (4.68) X_1 + (10.94) X_2
s.t 17.33X_1 + 18.73X_2 \le 52.66, 4.68X_1 + 3.71X_2 \le 6.42 and X_1, X_2 \ge 0
(P-4)
Max z_2(x) = 7.5X_1 + 10.94X_2 + 4.39
```

### Rajarajeswari and Shyamala

s.t  $17.33X_1 + 18.35 X_2 \le 52.66$ ,  $4.68X_1 + 3.71X_2 \le 6.42$  and  $X_1, X_2 \ge 0$ 

Step 5:Solving (P-3) and (P-4) by using simplex method, we get Max  $z_1(x) = 18.93$  where  $X_1 = 0, X_2 = 1.73$  and Max  $z_2(x)$ =23.32 where X<sub>1</sub>=0, X<sub>2</sub>=1.73.

Step 6: The optimum solution of the LFPP is got by applying the below formula Max Z =  $\frac{z_2}{z_1} = \frac{23.32}{18.93}$ = 1.23

### Numerical Example3.2 [12]:

s.t.

Let us consider the problem solved by Sumon Kumar Saha et.al., [12] in Section 4, Example 1 Step 1: Consider the LFPP  $\operatorname{Min} Z(\mathbf{x}) = \frac{-2X_1 + X_2 + 2}{X_1 + 3X_2 + 4}$ (4) s.t  $-X_1+X_2 \leq 4$  ,  $2 \; X_1+X_2 \leq 14$  ,  $X_2 \leq 6 \; \text{ and } X_1, X_2 \geq 0$ 

Step 2: We represent the coefficients used in the objective function and the constraint's as TFNN like below

 $\text{Min Z(x)} = \frac{-(1,3,5,6;0.2,0.3,0.5)x_1 + (0,2,4,5;0.8,0.6,0.4)x_2 + (1,3,5,6;0.2,0.3,0.5)}{(0,2,4,5;0.8,0.6,0.4)x_1 + (1,2,5,6;0.2,0.5,0.6)x_2 + (1,2,5,7;0.5,0.4,0.9)}$  $-(0,2,4,5;0.8,0.6,0.4) X_1 + (0,2,4,5;0.8,0.6,0.4) X_2 \le (1,2,5,7;0.5,0.4,0.9)$  $(1,3,5,6; 0.2,0.3,0.5) X_1 + (0,2,4,5; 0.8, 0.6, 0.4) X_2 \le (7,10,19,30; 0.8,0.4,0.7)$  $(0,2,4,5; 0.8, 0.6, 0.4) X_2 \le (3,7,9,12; 0.7,0.2,0.5) \text{ and } X_1, X_2 \ge 0$ 

**Step 3**:In the above LFPP, we decompose the objective function into two LPPs as follows. (P-1)

Min  $z_1(x) = -(1,3,5,6;0.2,0.3,0.5)x_1 + (0,2,4,5;0.8,0.6,0.4)x_2 + (1,3,5,6;0.2,0.3,0.5)$ s.t.  $-(0,2,4,5; 0.8,0.6,0.4) X_1 + (0,2,4,5; 0.8, 0.6, 0.4) X_2 \le (1,2,5,7; 0.5,0.4,0.9)$ (1,3,5,6;0.2,0.3,0.5) X<sub>1</sub> + (0,2,4,5;0.8,0.6,0.4) X<sub>2</sub>  $\leq$  (7,10,19,30;0.8,0.4,0.7) $(0,2,4,5;0.8,0.6,0.4) X_2 \le (3,7,9,12;0.7,0.2,0.5) \text{ and } X_1, X_2 \ge 0$ (P-2)  $\operatorname{Min} z_2(x) = (0,2,4,5; 0.8,0.6,0.4)x_1 + (1,2,5,6; 0.2,0.5,0.6)x_2 + (1,2,5,7; 0.5,0.4,0.9)$ s.t.  $-(0,2,4,5; 0.8,0.6,0.4) X_1 + (0,2,4,5; 0.8, 0.6, 0.4) X_2 \le (1,2,5,7; 0.5,0.4,0.9)$  $(1,3,5,6; 0.2,0.3,0.5) X_1 + (0,2,4,5; 0.8, 0.6, 0.4) X_2 \leq (7,10,19,30; 0.8,0.4,0.7)$ (0,2,4,5;0.8,0.6,0.4) X<sub>2</sub>  $\leq$  (3,7,9,12;0.7,0.2,0.5) and X<sub>1</sub>, X<sub>2</sub> $\geq$  0

Step 4: The crisp value of each TFNN is calculated using definition 2.2  $S(\tilde{1}) = 1.24$ ,  $S(\tilde{2}) = 1.31$ ,  $S(\tilde{3}) = 0.96$ ,  $S(\tilde{4}) = 1.12$ ,  $S(\tilde{6}) = 3.87$ ,  $S(\tilde{14}) = 7.01$ By substituting the crisp values in (P-1) and (P-2), we get the modified LPPs as follows (P-3) Min  $z_1(x) = -(1.31) X_1 + (1.24) X_2 + 1.31$ s.t  $-(1.24) X_1 + (1.24) X_2 \le 1.12$ ,  $(1.31) X_1 + (1.24) X_2 \le 7.01$ ,  $(1.24) X_2 \le 3.87$  and  $X_1, X_2 \ge 0$ (P-4)  $Min z_2(x) = (1.24) X_1 + 0.96 X_2 + 1.12$ s.t -(1.24)  $X_1$  +(1.24)  $X_2 \le 1.12$ , (1.31)  $X_1$  +(1.24)  $X_2 \le 7.01$ , (1.24)  $X_2 \le 3.87$  and  $X_1, X_2 \ge 0$ .

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Rajarajeswari and Shyamala

Step 5:Solving (P-3) and (P-4) by simplex method, we get Min  $z_1(x) = -5.70$  where  $X_1=5.35$ ,  $X_2=0$  and Min  $z_2(x) = 1.12$  where  $X_1=0$ ,  $X_2=0$ .

**Step 6**: The optimum solution of the LFPP is got by applying the below formula

Min  $Z(x) = \frac{Z_1(x)}{Z_2(x)} = \frac{-5.70}{1.12}$  =-5.09 and Max Z(x) = - Min [Z(x)] = -[-5.09] = 5.09

We observe that the same problem given in Numerical Example 3.2 was solved by Sumon Kumar Saha et.al.,[12] in the Section 4 ,Example 1 and they got the solution as Min Z(x)=-1.09 but the same problem solved by proposed method and gives the solution as Min Z(x)=-5.09.This shows that our proposed method gives the most optimal solution.

### Numerical Example 3.3[9]:

Let us consider the problem solved by Sapan kumar Das et.al.,[9] in Section 4.

**Step 1:** Consider the LFPP Max  $Z(x) = \frac{8X_1 + 7X_2 + 9X_3}{8X_1 + 9X_2 + 6X_3 + 1.5}$ S.t  $4X_1 + 3X_2 + 5X_3 \le 28$ ,  $5X_1 + 3X_2 + 3X_3 \le 20$  and  $X_1, X_2, X_3 \ge 0$ 

Step 2: We represent the coefficients used in the objective function and the constraint's as TFNN like below

 $\begin{aligned} & \mathsf{Max} \ Z = \frac{(1,6,10,13;0.9,0.1,0.3) \ X_1 + (5,8,9,13;0.4,0.6,0.8) \ X_2 + (6,8,10,15;0.6,0.4,0.7) \ X_3}{(1,6,10,13;0.9,0.1,0.3) \ X_1 + (6,8,10,15;0.6,0.4,0.7) \ X_2 + (3,7,9,12;0.7,0.2,0.5) \ X_3 + (0.5,1,1.5,2;0.75,0.5,0.25)} \\ & \mathsf{s.t.} \\ & (1,2,5,7; \ 0.5, \ 0.4, \ 0.9) \ X_1 + (1,2,5,6; \ 0.2, \ 0.5, \ 0.6) \ X_2 + (2,4,7,10; \ 0.8, \ 0.2, \ 0.4) \ X_3 \leq (24,26,28,30; \ 0.4, \ 0.25, \ 0.5) \\ & (2,4,7,10; \ 0.8, \ 0.2, \ 0.4) \ X_1 + (1,2,5,6; \ 0.2, \ 0.5, \ 0.6) \ X_2 + (1,2,5,6; \ 0.2, \ 0.5, \ 0.6) \ X_3 \leq (10,12,27,30; \ 0.2, \ 0.3, \ 0.5) \\ & X_1, X_2, X_3 \geq 0 \end{aligned}$ 

**Step 3:** In the above LFPP, we decompose the objective function into two LPP as follows. (P-1) Max  $z_1(x) = (1,6,10,13;0.9,0.1,0.3)X_1 + (5,8,9,13;0.4,0.6,0.8)X_2 + (6,8,10,15,0.6,0.4,0.7)X_3$ s.t.  $(1,2,5,7;0.5,0.4,0.9) X_1 + (1,2,5,6;0.2,0.5,0.6) + X_2 (2,4,7,10;0.8,0.2,0.4) X_3 \le (24,26,28,30;0.4,0.25,0.5)$   $(2,4,7,10;0.8,0.2,0.4) X_1 + (1,2,5,6;0.2,0.5,0.6) X_2 + (1,2,5,6;0.2,0.5,0.6) X_3 \le (10,12,27,30;0.2,0.3,0.5)$   $X_1, X_2, X_3 \ge 0$ (P-2) Max  $z_2(x) = (1,6,10,13;0.9,0.1,0.3)X_1 + (6,8,10,15;0.6,0.4,0.7)X_2 + (3,7,9,12;0.7,0.2,0.5)X_3 + (0.5,1,1.5,2;0.75,0.5,0.25)$ s.t  $(1,2,5,7;0.5,0.4,0.9) X_1 + (1,2,5,6;0.2,0.5,0.6) X_2 + (2,4,7,10;0.8,0.2,0.4) X_3 \le (24,26,28,30;0.4,0.25,0.5)$  $(2,4,7,10;0.8,0.2,0.4) X_1 + (1,2,5,6;0.2,0.5,0.6) X_2 + (2,4,7,10;0.8,0.2,0.4) X_3 \le (24,26,28,30;0.4,0.25,0.5)$ 

 $X_1, X_2, X_3 \ge 0$ 

Step 4: The crisp value of each TFNN is calculated using definition 2.2

 $S(\tilde{3}) = 0.96$ ,  $S(\tilde{4}) = 1.13$ ,  $S(\tilde{5}) = 3.16$ ,  $S(\tilde{6}) = 3.88$ ,  $S(\tilde{7}) = 2.19$ ,  $S(\tilde{8}) = 4.69$ ,  $S(\tilde{1.5}) = 0.63$ ,  $S(\tilde{20}) = 6.91$ ,  $S(\tilde{28}) = 11.14$ 

By substituting the crisp values in (P-1) and (P-2), we get the modified LPPs as follows

(P-3)

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Max  $z_1(x) = 4.69X_1 + 2.19X_2 + 3.66X_3$ s.t  $1.13X_1 + 0.96X_2 + 3.16X_3 \le 11.14$ ,  $3.16X_1 + 0.96X_2 + 0.96X_3 \le 6.91$  and  $X_1, X_2, X_3 \ge 0$ (P-4) Max  $z_2(x) = 4.69X_1 + 3.66X_2 + 3.88X_3 + 0.63$ s.t  $1.13X_1 + 0.96X_2 + 3.16X_3 \le 11.14$ ,  $3.16X_1 + 0.96X_2 + 0.96X_3 \le 6.91$ and  $X_1, X_2, X_3 \ge 0$ 

**Step 5**: Solving (P-3) and (P-4) by simplex method, we get Max  $z_1(x)$ =18.59 where  $X_1 = 0, X_2 = 5.28, X_3 = 1.92$  and Max  $Z_2(x) = 27.4$  where  $X_1 = 0, X_2 = 5.28, X_3 = 1.92$ .

**Step 6:** The optimum solution of the LFPP is got by applying the below formula Max  $Z = \frac{z_2(x)}{z_1(x)} = \frac{27.4}{18.59} = 1.47$ 

We observe that the same problem given in Numerical Example 3.3 was solved by Sapan kumar Das et.al.,[9] using Triangular Neutrosophic Number and they got the solution as Max Z=1.16 but the same problem solved by our proposed method gives the solution as Max Z=1.47.We observe that the proposed method gives the best optimal solution.

### **RESULTS AND DISCUSSION**

We have developed a new method for solving LFPP using TFNN and made its intensive studies. The various optimal solutions obtained for the LFPP by using Triangular Neutrosophic Number and TFNN are shown in the comparison table and a multiple bar diagram is shown to prove the stability of the proposed method. We conclude that the optimal solution obtained by the proposed method using TFNN gives the most optimized value than the existing one.

A Multiple Bar Diagram is shown below to visualize the optimal solutions obtained by the proposed methods with some of the existing methods.

### CONCLUSION

In this paper, a new ranking method for solving LFPP by combining TFNN with simplex method was introduced. A real time application of proposed method has been taken to prove the advantage stability and accuracy of proposed method.By comparing and analyzing the optimal solutions arrived ,we conclude that our proposed method gives the most higher optimal solution and it is better than the existing techniques. In future, researchers can extend this technique with some different score function and ranking function to convert TFNN into a crisp value which will be helpful in the field of science and technology.

### ABSTRACT

The Fuzzy Multi Transportation Problem (FMTP) is solved in this paper by considering the ranking technique of the Fuzzy Multi Numbers. Here, we consider the Triangular Fuzzy Multi Number of the FMTP. The Fuzzy Multi Numbers (FMN) are transformed to crisp data by the ranking technique and based on this ranking crisp data, the initial and the optimal solution of the Fuzzy Multi Transportation Problem are obtained. The numerical examples of balanced and unbalanced Triangular Fuzzy Multi Number with its membership functions of the FMTP shows the efficiency of the procedure explained.

**Keywords:** Fuzzy Set, Fuzzy Multi Set, Fuzzy Number, Triangular Fuzzy Multi Number, Fuzzy Transportation Problem, Ranking Technique.

### INTRODUCTION

**Hitchcock** in 1941 introduced the basic transportation model with the transportation constraints on crisp values. Transportation problem is a particular class of linear programming, which is associated with day-to-day activities in our real life. It helps in solving problem on distribution and transportation of resources from one place toanother. The main objective is to minimize the transportation costpossible by satisfying the demand at destination from sup plyconstraint. But in present situation, due to several uncontrolled reasons, the transportation parameters like demand, supply and unit transportation costar uncertain. Hence, the fuzzy transportation problems were formulated

and solved by many researchers. O'heigeartaigh [7] was who proposed a method to solve the fuzzy transportation problem with fuzzy demand and supply.

**Lotfi A. Zadeh[9]** in 1965 introduced the Fuzzy set theory, Since then fuzzy mathematics has been applied in various fields like decision making, pattern recognition, information processing and various analysis methodologies. The Fuzzy set theory is a class of objects with a membership between 0 and 1.Zimmermann [10] proposed the basic definitions of fuzzy sets and algebraic operations. Alsoin1975, Lotfi A. Zadeh proposed the Fuzzy numbers, most used fuzzy tools in fuzzy applications. The Fuzzy Number was defined by Dijkmanet.all[4], are basically fuzzy sets satisfying the properties of normality, convexity and piece-wise continuity.Buckley [1] use fuzzy numbers to express their preferences and Li & Lee [5] proposed the order of fuzzy numbers based on the concept of probability measure of fuzzy events. Triangular fuzzy numbers, Trapezoidal fuzzy numbers and Pentagonal fuzzy numbers are most popular forms of fuzzy linear programming problems with triangular fuzzy number was proposed by Nagoor Gani & Mohamed Assarudeen [6].Ranking the fuzzy numbers is an important aspect of decision making in a fuzzy environment for practical applications, and Chen [2] the ordering value of each fuzzy multisets, he uses the term of fuzzy bag; an element of X may occur more than once with possibly of the same or different membership values.

In this paper, we have applied the fuzzy multi ranking technique of triangular fuzzy multi numbers with its membership function in the transportation problem of uncertainty. As the efficiency of the defined fuzzy multi ranking techniques is analyzed using the numerical examples. The numerical examples were of balanced, unbalanced transportation problems whose supply, demand and costswere in the form of triangular fuzzy multi numbers. Hence, it is recommended to use this ranking measure for any multi decision making situations.

### PRELIMINARIES

In this section, the basis notions, concepts and definitions are reviewed.

### Definition: 2.1

Let *X* be a nonempty set. A **fuzzy set**  $\overline{A}$  of X is defined as  $\overline{A} = \{ \langle x, \mu_{\overline{A}}(x) \rangle / x \in X \}$ , where  $\mu_{\overline{A}}(x)$  is called membership function and it maps each element of X to a value between 0 and 1.

### Definition: 2.2

A **multi set(MS)** is an unordered collection of objects in which, unlike an ordinary set, objects are allowed to repeat. Each individual occurrence of an object is a **multi-set** which is called its element.

### Definition: 2.3

Let X be a nonempty set. A **fuzzy multi set (FMS)** A in X is characterized by the count membership function Mc such that Mc :  $X \to Q$  where Q is the set of all crisp multi sets in [0,1]. Hence, for any  $x \in X$ , Mc(x) is the crisp multi set from [0, 1]. The membership sequence is defined as  $(\mu_A^1(x), \mu_A^2(x), \dots, \mu_A^p(x))$  where  $\mu_A^1(x) \ge \mu_A^2(x) \ge \dots \ge \mu_A^p(x)$ Therefore, **FMS A** is given by  $A = \{(x, (\mu_A^1(x), \mu_A^2(x), \dots, \mu_A^p(x))) / x \in X\}$ 

### Definition: 2.4

A **fuzzy number** is a generalization of a regular real number. It does not refer to a single value but rather to a connected set of possible values, where each possible value has its weight between 0 and 1. The weight is called the membership function.

A fuzzy number  $\overline{A}$  is a convex normalized fuzzy set on the real line R such that there exist at least one  $x \in R$  with  $\mu_{\overline{A}}(x) = 1$  and  $\mu_{\overline{A}}(x)$  is piecewise continuous.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Vivek et al.,

### Definition: 2.5

A triangular fuzzy numberA is denoted by 3 – tuples (a, b, c), where a, b and c are real numbers and  $a \le b \le c$  with membership function defined as

$$\mu_A(x) = \begin{cases} 0 & for \ x \le a \\ \frac{x-a}{b-a} & for \ a \le x \le b \\ \frac{c-x}{c-b} & for \ b \le x \le c \\ 0 & for \ x \ge c \end{cases}$$

### Definition: 2.6

The **ranking** function is approach of ordering fuzzy numbers which is an efficient. The ranking function is denoted by F ( $\mathbb{R}$ ), where  $\mathbb{R}$ : F( $\mathbb{R}$ )  $\rightarrow \mathbb{R}$ , and F ( $\mathbb{R}$ ) is the set of fuzzy numbers defined on a real line, where a natural order exist.

Let  $a, b \in \mathbb{R}$ , then **ranking function** for real numbers a, b is defined as

(i)  $D(a,b) > 0 \iff D(a,0) > D(b,0) \iff a > b$ 

(ii)  $D(a, b) < 0 \Leftrightarrow D(a, 0) < D(b, 0) \Leftrightarrow b < a$ 

(iii)  $D(a, b) = 0 \iff D(a, 0) = D(b, 0) \iff b = a$ 

### RANKING MEASURES OF FUZZY MULTI NUMBERS

### Definition: 3.1

A **fuzzy multi number** is a generalization of a regular real number. It does not refer to a single value but rather to a connected set of possible values, where each possible value has its weight between 0 and 1. The weight is called the membership function. The membership sequence is in the form  $(\mu_A^1(x), \mu_A^2(x), \dots, \mu_A^p(x))$  where  $\mu_A^1(x) \ge \mu_A^2(x) \ge \dots \ge \mu_A^p(x)$ .

### Definition: 3.2

The **cardinality** of the membership function Mc(x) is the length of an element x in the Fuzzy Multi Set A denoted as  $\eta$ , defined as  $\eta = Mc(x)$ 

If A, B, C are the *FMS* defined on *X*, then their cardinality  $\eta = Max \{ \eta(A), \eta(B), \eta(C) \}$ .

### Definition: 3.3

A triangular fuzzy multi number  $A_i$  is denoted by 3 – tuples  $(a_i, b_i, c_i)$ , where  $a_i, b_i$  and  $c_i$  are real numbers and  $a_i \leq b_i \leq c_i$  with membership function defined as

$$\mu_{A_{i}}(x) = \begin{cases} 0 & for \ x \le a_{i} \\ \frac{x - a_{i}}{b_{i} - a_{i}} & for \ a_{i} \le x \le b_{i} \\ \frac{c_{i} - x}{c_{i} - b_{i}} & for \ b_{i} \le x \le c_{i} \\ 0 & for \ x \ge c_{i} \end{cases}$$

### Definition: 3.4

In general, a fuzzy number A is described as any fuzzy subset of real line R, whose membership function  $\mu_A$  satisfies the condition that $\mu_A$  is a continuous mapping from R to the closed interval [0,1]. Then the **Ranking Measure ofGraded Mean Integration Representation** proposed by **Chen and Hsieh [3]** is as follows for the membership sequence is in the form  $(\mu_A^1(x), \mu_A^2(x), \dots, \mu_A^p(x))$  where  $\mu_A^1(x) \ge \mu_A^2(x) \ge \dots \ge \mu_A^p(x)$  with the Cardinality, the length of an element x in the Fuzzy Multi Set A denoted as  $\eta$ . We have used the introduced ranking measures of the

Vivek et al.,

triangular fuzzy multi number  $A_i$ , extended from the of Graded Mean Representation Method by Chen & Hsieh for the fuzzy numbers.

The defined Ranking Measure the Graded Mean Integration Representation of the triangularfuzzy multi number  $A_i$  of (a<sub>i</sub>, b<sub>i</sub>, c<sub>i</sub>) is  $R(A_i) = \frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + 4b_i + c_i)}{6}$ 

Clearly it satisfies the properties of the ranking measure

- (i)  $R(A_i)$  is always > 0
- (ii)  $R(A_i, b_i) > 0 \iff R(A_i) > R(B_i) \iff A_i > B_i$
- (iii)  $R(A_i, b_i) < 0 \iff R(A_i) < R(B_i) \iff A_i < B_i$
- (iv)  $R(A_i, b_i) = 0 \iff R(A_i) = R(B_i) \iff A_i = B_i$

# IV MATHEMATICAL MODEL & COMPUTATIONAL ALGORITHM OF FUZZY MULTI TRANSPORTATION PROBLEM

### Mathematical model for Fuzzy Multi Transportation Problem with Triangular Fuzzy Number

The transportation problem with *m* origins (rows) and *n* destinations (columns) is considered with  $C_{ij}$ , the cost of transporting one unit of the product from  $i^{th}$  FM (Fuzzy Multi) origin to  $j^{th}$ FM (Fuzzy Multi) destination.

 $\overline{a} = (a_{i}^1, a_{i}^2, a_{i}^3)$  be the quantity of commodity available at origin i.

 $\overline{b} = (b_i^1, b_i^2, b_i^3)$  the quantity of commodity needed at FM (Fuzzy Multi) destination j.

 $\overline{x} = (x_{ij}^1, x_{ij}^2, x_{ij}^3)$  is the quantity transported from  $i^{th}$  origin to  $j^{th}$  destination, so as to minimize the FM (Fuzzy Multi) transportation cost.

Minimum  $\overline{Z}^{I} = \sum_{i=1}^{m} \sum_{j=1}^{n} C_{ij} \otimes (x_{ij}^{1}, x_{ij}^{2}, x_{ij}^{3})$ Subject to,  $\sum_{n}^{n} (x_{ij}^{1}, x_{ij}^{2}, x_{ij}^{3}) = (a_{ij}^{1}, a_{ij}^{2}, a_{ij}^{3})$  for i = 1, 2, ..., n

Subject to,  $\sum_{j=1}^{n} (x_{ij}^{1}, x_{ij}^{2}, x_{ij}^{3}) = (a_{i}^{1}, a_{i}^{2}, a_{i}^{3}) \text{ for } i = 1, 2, ..., m$  $\sum_{j=1}^{n} (x_{ij}^{1}, x_{ij}^{2}, x_{ij}^{3}) = (b_{j}^{1}, b_{j}^{2}, b_{j}^{3}) \text{ for } j = 1, 2, ..., n$ 

 $(x_{ij}^1, x_{ij}^2, x_{ij}^3) \ge 0$  for i = 1, 2, ..., m and for j = 1, 2, ..., nWhere *m* is the number of supply points and *n* is the number of demand points.

### **Computational Algorithm**

First, in this triangular fuzzy multi transportation problem; the quantities are reduced into an integer using the ranking measure of triangular fuzzy multi number. Then to find the basic feasible solution, VAM method is used as the advantage of this method is that it gives an initial solution which is nearer to an optimal solution. Also, in this paper MODI method is used to find the optimal solution.

### NUMERICAL EXAMPLES

The triangular fuzzy multi numbers can be used to represent uncertain and incomplete information in decisionmaking, risk evaluation, and expert systems. Measurement of similarity should keep some parameters of triangular fuzzy numbers. Shape and midpoint are important metrics of a triangular fuzzy number. Therefore, they should be taken into consideration when measuring the similarity of triangular fuzzy multi numbers.

## Vivek et al.,

## EXAMPLE: 4.1

An FMTP of 3x4with cost as the Triangular Fuzzy Multi Number is considered below

First, we reduce triangular fuzzy multi number to a crisp data:

The above 3×4 matrix is of balanced transportation problem with the triangular fuzzy multi numbers, which has four repeated fuzzy triangular numbers in each cell. These measures are considered for four different times in day (morning, afternoon, evening and night). We have to convert the fuzzy multi number to a corresponding crisp number and for this we use the concept of ranking measure. By using the formula of the Ranking Measure of theTriangular fuzzy multi numbers of Chen & Hsieh

A<sub>i</sub> (*a<sub>i</sub>*, *b<sub>i</sub>*, *c<sub>i</sub>*) as  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i+4b_i+c_i)}{6}$ , we can get the crisp data. Here, the cardinality  $\eta = 4$ ,

Using the VAM method, the initial solution obtained is represented in the following table

Using the MODI method of the fuzzy multi transportation table and checking the optimality for all dij > 0, the solution is found to be optimum and unique as  $32 + 2\varepsilon_1 + 4\varepsilon_2$ .

## EXAMPLE: 4.2

A Balanced FMTP of 3x3with supply and demand as the triangular fuzzy multi numbers is considered below

And here, we reduce triangular fuzzy multi number to a crisp data by Graded Mean Integration Representation by Chen & HsiehA<sub>i</sub> (*ai*, *b*, *ci*) as  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + 4b_i + c_i)}{6}$ , we can get the crisp data. Here, the cardinality  $\eta = 3$ , The above 3×3 matrix is of balanced transportation problem with measures of three different times in day (morning, afternoon and night).

Using the VAM method, the initial solution obtained is represented in the following table and whose Initial Cost of this IFTP is  $820 + 30 \in$ 

Using the MODI method of the fuzzy multi transportation table and checking the optimality for all dij > 0, the solution is found to be optimum and unique as  $820 + 5 \in$ 

#### EXAMPLE: 4.3

This is an unbalanced FMTP of 3x3 with supply and demand as the triangular fuzzy multi numbers

Once again to reduce the triangular fuzzy multi numbers to a crisp data, we use the same ranking measurer of Graded Mean Integration Representation. The cardinality  $\eta = 3$ , as the 3×3 unbalanced transportation problem is of three different times in day (morning, afternoon and night).

Using the VAM method, the initial solution obtained is represented in the following table

Using the MODI method of the fuzzy multi transportation table and checking the optimality for all dij > 0, the solution is found to be optimum and unique as 31.

# CONCLUSION

In this paper, a method of finding the initial and the optimal solution for fuzzy multi transportation problem with the triangular fuzzy multi number has been proposed. We have used the ranking technique of graded mean integration representation by Chen & Hsieh of triangular fuzzy multi number. The numerical examples 4.1, 4.2 and

# ABSTRACT

In this article, an efficient numerical algorithm based on Legendre wavelets operational matrix is proposed for solving multi term fractional differential equations with variable coefficients. Legendre wavelets operational matrix for fractional integration is derived and it is employed to reduce fractional differential equations into a system of algebraic equations. Some numerical examples are included to elucidate the simplicity and the efficiency of the proposed method. The absolute errors are also compared with some existing numerical techniques.

**Keywords**: Caputo fractional derivative, Legendre wavelets, Operational matrix, Multi term Fractional differential equations with variable coefficients.

# INTRODUCTION

The origin of fractional calculus is traced back to the end of seventeenth century. Fractional calculus, as a generalization of ordinary calculus, deals with an arbitrary order integration and differentiation. Nowadays many fractional models have a great attention in various disciplines, such as Medicine, Economics, Dynamical problems, Mathematical physics, Traffic model, Fluid flow, Bio Sciences, Bio Engineering, Electro chemistry, Electromagnetism, Viscoelasticy and so on. Moreover, most fractional order differential equations have no exact solution. Owing this fact, many researchers have engaged in developing the numerical techniques for fractional order differential equations. Some of these numerical approaches include Finite element method, Finite difference method, Adomian decomposition method, Homotopy perturbation method, Homotopy analysis method, Variational iteration method, Spectral tau method and Spline collocation method. Some polynomials namely, Laguerre polynomials[6], Bernoulli

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Aruldoss and Balaji

polynomials[19], Chelyshkov polynomials[20], fractional-order Lagrange polynomials[18], Bernstein Polynomials[7], Shifted Chebyshev polynomials[1] are also employed to solve fractional order integral and differential equations numerically. Recently, orthogonal wavelets have become more popular numerical techniques for solving differential and integral equations due to their excellent properties. Many researchers have employed the operational matrices of fractional integrations of Legendre wavelets[16, 17, 22], Taylor wavelets[21], Müntz-Legendre wavelets[15], Haar wavelets[11], Chebyshev wavelets[5], Second kind Chebyshev wavelets[23], Euler wavelets[24] and Bernoulli wavelets[14] to find the approximate solutions of arbitrary order differential and integral equations. The main objective of this paper is to find the numerical solutions of multi term fractional order differential equations having variable coefficients based on Legendre wavelet operational matrix. The proposed method converts the fractional order differential equations into simultaneous algebraic equations by Legendre wavelet operational matrix. The large system of algebraic equations may some times lead to a greater computational complexity and a large amount of storage requirements, but the Legendre wavelets operational matrix is a structurally sparse matrix, which decreases the computational complexity of the resultant algebraic equations. This article is classified as follows. In section 2, we briefly describe some basic definitions and properties of fractional calculus. A brief overview of Legendre wavelets, function approximation and operational matrix for fractional integration of Legendre wavelets is presented in section 3. In section 4, the applicability and the efficiency of the proposed approach are elucidated on some numerical examples and error estimations are also presented. Finally we conclude our work in section 5.

#### Preliminaries

We discuss here fractional order integral and differential operators with the preliminary mathematical facts of fractional calculus.

**Definition 2.1** [4,10,12,13] The fractional integral with order  $\mu \ge 0$ , of the function  $h(x) \in L^1([0,\infty))$ , in Riemann-Liouville sense, is given by

$$J^{\mu}h(x) = \begin{cases} \frac{1}{\Gamma(\mu)} \int_0^x (x-v)^{\mu-1}h(v)dv, & \mu > 0. \\ h(x), & \mu = 0. \end{cases}$$

Let h(x),  $g(x) \in L^1([0,\infty))$ ,  $\lambda, \gamma \in \mathbb{R}$ ,  $\nu > -1$ ,  $\mu \ge 0$ . Then

(i)  $J^{\mu}(\lambda h(x) + \gamma g(x)) = \lambda J^{\mu} h(x) + \gamma J^{\mu} g(x).$ (ii)  $J^{\mu} x^{\nu} = \frac{\Gamma(\nu + 1)}{\Gamma(\nu + \mu + 1)} x^{\mu + \nu}.$ 

**Definition 2.2** [4,10,12,13] The fractional derivative with order  $\mu \ge 0$ , of the function  $h(x) \in L^1([0,\infty))$ , in Caputo sense, is given by

$$D^{\mu}h(x) = J^{m-\mu}(D^{m}h(x)) = \begin{cases} \frac{1}{\Gamma(m-\mu)} \int_{0}^{x} \frac{h^{(m)}(v)}{(x-v)^{\mu-m+1}} dv, & m-1 < \mu < m, m \in \mathbb{N}. \\\\ \frac{d^{m}}{dx^{m}} h(x), & \mu = m \in \mathbb{N}. \end{cases}$$

Let h(x),  $g(x) \in L^1([0, \infty))$ ,  $\lambda, \gamma \in \mathbb{R}$ ,  $\mu \ge 0$ . Then (i)  $D^{\mu}k = 0$ , where k is a constant. (ii)  $D^{\mu}(\lambda h(x) + \gamma g(x)) = \lambda(D^{\mu}h(x)) + \gamma(D^{\mu}g(x))$ . (iii)  $D^{\mu}(J^{\mu}h(x)) = h(x)$ .

(iv) 
$$J^{\mu}(D^{\mu}h(x)) = h(x) - \sum_{k=0}^{m-1} h^{(k)}(0^{+}) \frac{x^{k}}{k!}, \quad m-1 < \mu \le m,$$

where  $m \in \mathbb{N}$ , x > 0 and  $h^{(k)}(0^+) := \lim_{x \to 0^+} D^{(k)}h(x)$ , k = 0, 1, 2, ..., m - 1.

#### Aruldoss and Balaji

#### Legendre wavelets approximations of functions

## We now discuss the Legendre wavelet and its operational matrix for fractional order integration.

#### Legendre Wavelets

Wavelets represent a family of functions generated from dilations and translations of a mother wavelet function  $\psi(t)$  over  $\mathbb{R}$ . Varying the dilation parameter *b* and the translation parameter *c* continuously, we obtain the following family of continuous wavelets,

$$\psi_{bc}(t) = |b|^{-\frac{1}{2}} \psi\left(\frac{t-c}{b}\right), b \neq 0, c \in \mathbb{R}.$$

Restricting the parameters b and c to discrete values as  $b = b_0^{-u}$ ,  $c = vc_0b_0^{-u}$ ,  $b_0 > 1$ ,  $c_0 > 0$ ,  $u, v \in \mathbb{N}$ , we arrive the family of discrete wavelets,

$$\psi_{uv}(t) = |b_0|^{-\frac{u}{2}} \psi(b_0^u t - vc_0),$$

where  $\{\psi_{uv}(t)\}$  forms a basis for  $L^2(\mathbb{R})$ . Particularly, when  $b_0 = 2$  and  $c_0 = 1$ ,  $\{\psi_{uv}(t)\}$  forms an orthonormal basis for  $L^2(\mathbb{R})$ . The Legendre wavelets are defined over the interval [0,1) as

$$\psi_{pq}(t) = \begin{cases} \left(q + \frac{1}{2}\right)^{\frac{1}{2}} 2^{\frac{k}{2}} L_q(2^k t - \hat{n}), \ t \in [\frac{\hat{n} - 1}{2^k}, \frac{\hat{n} + 1}{2^k}). \\ 0, \ otherwise, \end{cases}$$
(1)

where  $\hat{n} = 2p - 1$ ,  $p = 1, 2, 3, ..., 2^{k-1}$ , q = 0, 1, 2, ..., M - 1 and  $M, k \in \mathbb{N}$ . In (1),  $2^{-k}$  is the dilation parameter,  $\hat{n}2^{-k}$  is

the translation parameter and the coefficient  $\left(q + \frac{1}{2}\right)^{\frac{1}{2}}$  is used for orthonormality. Moreover,  $L_q(t)$ , q = 0, 1, 2, ..., M - 1, are mutually orthogonal Legendre polynomials of order q with regard to the weight function  $\omega(t) = 1$  over the interval [-1,1] and satisfy the following recurrence formulae,

$$L_0(t) = 1, L_1(t) = t, L_{q+1}(t) = \left(\frac{2q+1}{q+1}\right) t L_q(t) - \left(\frac{q}{q+1}\right) L_{q-1}(t), \qquad q = 1, 2, 3, \dots$$

#### Approximation of Square Integrable Functions

An arbitrary function h(t) from  $L^2([0,1))$  can be written in terms of Legendre wavelets as

 $h(t) = \sum_{p=1}^{\infty} \sum_{q=0}^{\infty} c_{pq} \psi_{pq}(t),$ (2) where the coefficients  $c_{pq}$  are resolved by the inner product

$$\langle h(t), \psi_{pq}(t) \rangle = \int_0^1 h(t) \psi_{pq}(t) dt.$$

If we truncate the series in (2), then h(t) can be approximated as

 $\tilde{h}(t) = \sum_{p=1}^{2^{k-1}} \sum_{q=0}^{M-1} c_{pq} \psi_{pq}(t).$ (3)

For simplicity, (3) can be written as

 $\tilde{h}(t) = \sum_{i=1}^{N} c_i \psi_i(t) = C^T \Psi(t),$ 

where  $N = 2^{k-1}M$ ,  $c_i = c_{pq}$ ,  $\psi_i(t) = \psi_{pq}(t)$ ,  $C = [c_1, c_2, \dots, c_N]^T$  is the coefficient vector,  $\Psi(t) = [\psi_1(t), \psi_2(t), \dots, \psi_N(t)]^T$  and the index *i* is determined by the relation i = (p-1)M + q + 1.

(4)

Discretizing (4) at the collocation points  $t_i = \frac{2i-1}{2N}$ , i = 1, 2, 3, ..., N, we attain  $H \simeq C^T \Phi_{N \times N}$  (5)

where  $H = [h(t_1), h(t_2), ..., h(t_N)]_{1 \times N}$  is the vector of the function h(t) at the collocation points and  $\Phi_{N \times N} = [\Psi(t_1), \Psi(t_2), ..., \Psi(t_N)]$  is a Legendre wavelet coefficient matrix of order *N*. Specifically, the Legendre wavelet coefficient matrix for k = 2 and M = 3 becomes

$$\Phi_{6\times 6} = \begin{pmatrix} 1.4142 & 1.4142 & 1.4142 & 0 & 0 & 0 \\ -1.6330 & 0 & 1.6330 & 0 & 0 & 0 \\ 0.5270 & -1.5811 & 0.5270 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1.4142 & 1.4142 & 1.4142 \\ 0 & 0 & 0 & -1.6330 & 0 & 1.6330 \\ 0 & 0 & 0 & 0.5270 & -1.5811 & 0.5270 \end{pmatrix}$$

## Aruldoss and Balaji

**Lemma 3.1** Suppose  $\tilde{h}(t)$  is the truncated Legendre wavelets expansion of a continuous function h(t) defined on [0,1). If h(t) is bounded by a positive constant  $\eta$ , that is,  $|h(t)| < \eta$ , then the Legendre wavelet coefficients of h(t) are bounded as

(6)

$$\left|c_{pq}\right| \leq \frac{\eta \left(q + \frac{1}{2}\right)^{\overline{2}}}{2^{\frac{k-2}{2}}}$$

Proof. Suppose  $\tilde{h}(t)$  is the truncated Legendre wavelets expansion of h(t). Then  $\tilde{h}(t) = \sum_{p=1}^{2^{k-1}} \sum_{q=0}^{M-1} c_{pq} \psi_{pq}(t)$ , (7) where the coefficients  $c_{pq}$  can be determined by

$$\begin{split} c_{pq} &= \langle h(t), \psi_{pq}(t) \rangle &= \int_{0}^{1} h(t) \psi_{pq}(t) dt \\ &= \int_{\frac{\hat{n}+1}{2^{k}}}^{\frac{\hat{n}-1}{2^{k}}} h(t) \psi_{pq}(t) dt \\ &= 2^{\frac{k}{2}} \left( q + \frac{1}{2} \right)^{\frac{1}{2}} \int_{\frac{\hat{n}+1}{2^{k}}}^{\frac{\hat{n}-1}{2^{k}}} h(t) L_{q}(2^{k}t - \hat{n}) dt \end{split}$$

Changing the variable  $2^k t - \hat{n}$  by y, we have

$$c_{pq} = \frac{\left(q + \frac{1}{2}\right)^{\frac{1}{2}}}{\frac{2^{\frac{1}{2}}}{2^{\frac{1}{2}}}} \int_{-1}^{1} h\left(\frac{y + \hat{n}}{2^{k}}\right) L_{q}(y) dy$$
(8)  
Since  $|h(t)| < \eta$ , we have  
 $|c_{pq}| = \frac{\left(q + \frac{1}{2}\right)^{\frac{1}{2}}}{\frac{2^{\frac{k}{2}}}{2^{\frac{1}{2}}}} \left| \int_{-1}^{1} h\left(\frac{y + \hat{n}}{2^{k}}\right) L_{q}(y) dy \right|$   
 $\leq \frac{\left(q + \frac{1}{2}\right)^{\frac{1}{2}}}{\frac{k}{2^{\frac{1}{2}}}} \int_{-1}^{1} \left| h\left(\frac{y + \hat{n}}{2^{k}}\right) \right| |L_{q}(y)| dy$ 

$$2^{\frac{1}{2}} \quad \int_{-1}^{1} |\langle 2^{k} \rangle|^{1+1+1+1}$$

$$|c_{pq}| \leq \frac{\eta(q+\frac{1}{2})^{\frac{1}{2}}}{2^{\frac{k}{2}}} \int_{-1}^{1} |L_{q}(y)| dy \qquad (9)$$
Since  $|L_{q}(y)| \leq 1, \forall y \in [-1,1]$ , we have
$$\int_{-1}^{1} |L_{q}(y)| dy \leq 2 \qquad (10)$$
Thus
$$|c_{pq}| \leq \frac{\eta(q+\frac{1}{2})^{\frac{1}{2}}}{2^{\frac{k-2}{2}}} \qquad (11)$$

**Theorem 3.2** If h(t) is a continuous function defined on [0,1) and  $\tilde{h}(t)$  is the approximation of h(t) by using Legendre wavelets, then we have the upper bound error

$$\|h(t) - \tilde{h}(t)\|_{2} \leq \left(\sum_{p=2^{k-1}+1}^{\infty} \sum_{q=0}^{M-1} (\alpha(q))^{2}\right)^{\frac{1}{2}} + \left(\sum_{p=1}^{\infty} \sum_{q=M}^{\infty} (\alpha(q))^{2}\right)^{\frac{1}{2}} (12)$$
where  $\alpha(q) = \frac{\eta(q+\frac{1}{2})^{\frac{1}{2}}}{2^{\frac{k-2}{2}}}$ .
Proof. Suppose  $\tilde{h}(t)$  is the truncated Legendre wavelets expansion of  $h(t)$ .

The truncated error term can then be calculated as  

$$h(t) - \tilde{h}(t) = \sum_{p=2^{k-1}+1}^{\infty} \sum_{q=0}^{M-1} c_{pq} \psi_{pq}(t) + \sum_{p=1}^{\infty} \sum_{q=M}^{\infty} c_{pq} \psi_{pq}(t) (13)$$

Thus

## Aruldoss and Balaji

$$\begin{split} \left| \left| h(t) - \tilde{h}(t) \right| \right|_{2} & \leq \left| \left| \sum_{p=2^{k-1}+1}^{\infty} \sum_{q=0}^{M-1} c_{pq} \psi_{pq}(t) \right| \right|_{2} + \left| \left| \sum_{p=1}^{\infty} \sum_{q=M}^{\infty} c_{pq} \psi_{pq}(t) \right| \right|_{2} \\ & = \left( \int_{0}^{1} \left| \sum_{p=2^{k-1}+1}^{\infty} \sum_{q=0}^{M-1} c_{pq} \psi_{pq}(t) \right|^{2} dt \right)^{\frac{1}{2}} + \left( \int_{0}^{1} \left| \sum_{p=1}^{\infty} \sum_{q=M}^{\infty} c_{pq} \psi_{pq}(t) \right|^{2} dt \right)^{\frac{1}{2}} \\ & \leq \left( \sum_{p=2^{k-1}+1}^{\infty} \sum_{q=0}^{M-1} \left| c_{pq} \right|^{2} \right)^{\frac{1}{2}} + \left( \sum_{p=1}^{\infty} \sum_{q=M}^{\infty} \left| c_{pq} \right|^{2} \right)^{\frac{1}{2}} \end{split}$$

Using Lemma 3.1, we have

 $\leq \left(\sum_{p=2^{k-1}+1}^{\infty}\sum_{q=0}^{M-1}\left(\alpha(q)\right)^{2}\right)^{\frac{1}{2}} + \left(\sum_{p=1}^{\infty}\sum_{q=M}^{\infty}\left(\alpha(q)\right)^{2}\right)^{\frac{1}{2}}.$  $\left\|h(t)-\tilde{h}(t)\right\|_{1}$ 

#### Legendre wavelets operational matrix of fractional integration

An N-set of Block pulse functions(BPFs) over [0,1) is defined as, m = 1 m

$$b_m(t) = \begin{cases} 1, & [\frac{m-1}{N}, \frac{m}{N}), \\ 0, & otherwise, \end{cases}$$
  
where  $m = 1, 2, 3, \dots, N, N \in \mathbb{N}$ .  
For  $t \in [0,1), b_m(t)b_n(t) = \begin{cases} b_m(t), & m = n. \\ 0, & m \neq n. \end{cases}$   
And

 $\int_0^1 b_m(t)b_n(t)dt = \begin{cases} \frac{1}{N}, & m = n.\\ 0, & m \neq n. \end{cases}$ 

Any square integrable function h(t) can be expressed in terms of BPFs as

$$h(t) \simeq \sum_{m=1}^{N} h_m b_m(t) = h^T B_N(t),$$

where 
$$h = [h_1, h_2, ..., h_N]^T$$
,  $h_m = N \int_{\frac{m-1}{N}}^{\frac{m}{N}} h(t) b_m(t) dt$  and  $B_N(t) = [b_1(t), b_2(t), ..., b_N(t)]^T$ 

The BPFs and Legendre wavelets are connected by the relation  $\Psi(t)=\Phi_{N\times N}B_N(t).$ (14)

The fractional integration  $J^{\mu}$ ,  $\mu \ge 0$  of the vector function  $B_N(t)$  is defined as in [9], that is,  $J^{\mu}(B_N(t)) \simeq F^{\mu}_{N \times N} B_N(t),$ (15)where  $F_{N\times N}^{\mu}$  is the Block pulse operational matrix of  $J^{\mu}(B_N(t))$ ,

$$F_{N\times N}^{\mu} = \frac{1}{N^{\mu}} \frac{1}{\Gamma(\mu+2)} \begin{pmatrix} 1 & \xi_1 & \xi_2 & \xi_3 & \dots & \xi_{N-1} \\ 0 & 1 & \xi_1 & \xi_2 & \dots & \xi_{N-2} \\ 0 & 0 & 1 & \xi_1 & \dots & \xi_{N-3} \\ 0 & 0 & 0 & 1 & \dots & \xi_{N-4} \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & 0 & \dots & \xi_1 \\ 0 & 0 & 0 & 0 & \dots & 1 \end{pmatrix}$$

With  $\xi_r = (r+1)^{\mu+1} - 2r^{\mu+1} + (r-1)^{\mu+1}$ 

The fractional order integration  $J^{\mu}$  of the vector function  $\Psi(t)$  can be approximated as,  $J^{\mu}(\Psi(t)) \simeq P^{\mu}_{N \times N} \Psi(t),$ (16)

where  $P_{N\times N}^{\mu}$  is known as operational matrix of Legendre wavelets with order  $\mu \ge 0$ . By (14) and (17), we obtain  $J^{\mu}(\Psi(t)) = J^{\mu}(\Phi_{N \times N}B_N(t)) = \Phi_{N \times N}J^{\mu}(B_N(t)) \simeq \Phi_{N \times N}F^{\mu}_{N \times N}B_N(t).$ (17) Thus, combining (16) and (17), we attain  $P_{N\times N}^{\mu}\Psi(t)\simeq J^{\mu}(\Psi(t))\simeq \Phi_{N\times N}F_{N\times N}^{\mu}B_{N}(t)=\Phi_{N\times N}F_{N\times N}^{\mu}(\Phi_{N\times N})^{-1}\Psi(t)$ and so

$$P_{N\times N}^{\mu} \simeq \Phi_{N\times N} F_{N\times N}^{\mu} (\Phi_{N\times N})^{-1}.$$
 (18)

#### **Illustrative Examples**

The applicability and the efficiency of the proposed strategy are elucidated by the following numerical examples.

Example 4.1 Let us examine the fractional order differential equation having variable coefficients

Example 4.1 Let  $c_{5}$  be the form  $D^{\frac{1}{2}}h(t) + th(t) = f(t)$ , (19) where  $f(t) = t^{9} - t^{8} + 56t^{6} - 42x^{5} + sin(t) \left\{ \frac{32768}{6435} t^{\frac{15}{2}} - \frac{2048}{429} t^{\frac{13}{2}} \right\}$ ,  $t \ge 0$ , with regard to the conditions (20) The classical solution of (19) is  $t^8 - t^7$ . Suppose  $D^2h(t) \simeq C^T \Psi(t)$  and  $f(t) \simeq F^T \Psi(t)$ , where  $F^T = [f_1, f_2, \dots, f_N]$ .(21) Then  $D^{\frac{1}{2}}h(t) = J^{\frac{3}{2}}(D^{2}(h(t))) = C^{T}P^{\frac{3}{2}}_{N \times N}\Psi(t)$ (22) and  $h(t) = C^T P_{N \times N}^2 \Psi(t) + h(0) + th'(0)$ (23) Using (21), (22), (23) in (19), we have  $C^{T}\Psi(t) + sin(t)C^{T}P_{N\times N}^{\frac{3}{2}}\Psi(t) + tC^{T}P_{N\times N}^{2}\Psi(t) = F^{T}\Psi(t)$ (24)

We can attain the coefficient vector  $C^{T}$  by solving the equation (24) at the collocation points. Using the coefficient vector  $C^{T}$  in (23), we get the numerical solutions of (19). Table 1 exhibits that the absolute errors become smaller when the values of k are increased. Table 1 also shows that the numerical solutions rapidly converge to the classical solution. Table 2 exhibits the absolute errors of the shifted Chebyshev polynomial method (SCPM)[1] and the proposed strategy. Table 2 clearly shows that the proposed strategy is superior to SCPM.

Example 4.2 Let us examine the multi term fractional order differential equation

 $D^{2}h(t) + D^{\frac{1}{2}}h(t) + g(t)Dh(t) + h(t) = f(t),$ (25) where g(t) = -2,  $f(t) = t^{7} + \frac{2048}{429\sqrt{\pi}} + t^{6.5} - 14t^{6} + 42t^{5} - t^{2} - \frac{8}{3\sqrt{\pi}}t^{1.5} + 4t - 2$ ,  $t \ge 0$ , with regard to the conditions h(0) = h'(0) = 0.The classical solution of (25) is  $t^7 - t^2$ . Suppose  $D^2h(t) \simeq C^T \Psi(t)$  and  $f(t) \simeq F^T \Psi(t)$ , where  $F^T = [f_1, f_2, \dots, f_N]$ .(27) Then  $D^{\frac{1}{2}}h(t) = C^T P^{\frac{3}{2}}_{N \times N} \Psi(t)$ (28)  $Dh(t) = C^T P_{N \times N} \Psi(t)$ (29) and 
$$\begin{split} h(t) &= C^T P_{N\times N}^2 \Psi(t) + h(0) + th'(0) \\ \text{Using}\ (27),\ (28),\ (29),\ (30)\ \text{in}\ (25),\ \text{we have} \end{split}$$
(30)  $C^{T}\Psi(t) + C^{T}P_{N\times N}^{\frac{3}{2}}\Psi(t) - 2C^{T}P_{N\times N}\Psi(t) + C^{T}P_{N\times N}^{2}\Psi(t) = F^{T}\Psi(t)(31)$

## Aruldoss and Balaji

Solving the equation (31) at the collocation points, we attain unknown coefficient vector  $C^T$ . Using the coefficient vector  $C^T$  in (30), we get the numerical solutions of (25). Table 3 exhibits that the absolute errors become smaller when the values of k are increased. Table 3 also shows that the numerical solutions rapidly converge to the classical solution. Table 4 exhibits the absolute errors of the Triangular function method(TF)[3], Block pulse function method(BPF)[3] and the proposed method. Table 4 clearly shows that the proposed strategy reaches a higher precision than TF and BPF.

**Example 4.3** Let us examine the multi term nonlinear fractional order differential equation having variable coefficients

 $D^{2}h(t) + t^{\frac{7}{2}}D^{\frac{3}{2}}h(t) + h^{2}(t) + h(t) = f(t),$ (32) where  $f(t) = \left(1 + \frac{4}{\sqrt{\pi}}\right)t^4 + 2, t \ge 0$ , with regard to the initial conditions h(0) = h'(0) = 0.(33) The classical solution of (32) is  $t^2$ . Suppose  $D^2h(t) \simeq C^T\Psi(t)$  and  $f(t) \simeq F^T\Psi(t)$ , where  $F^T = [f_1, f_2, \dots, f_N]$ .(34) Then  $D^{\frac{3}{2}}h(t) = C^T P^{\frac{1}{2}}_{N \times N} \Psi(t)$ (35) and  $h(t) = C^T P_{N \times N}^2 \Psi(t) + h(0) + th'(0)$ (36) Using (34), (35), (36) in (32), we have  $C^{T}\Psi(t) + t^{\frac{7}{2}}\left(C^{T}P^{\frac{1}{2}}_{N\times N}\Psi(t)\right) + (C^{T}P^{2}_{N\times N}\Psi(t))^{2} = F^{T}\Psi(t)$ (37)

Solving the equation (37) at the collocation points, we attain unknown coefficient vector  $C^T$ . Using the coefficient vector  $C^T$  in (36), we get the numerical solutions of (32). Table 5 exhibits the absolute errors of Chebyshev operational matrix method (COM)[2]. Clearly Table 5 shows the proposed strategy is superior to Legendre wavelet method.

Example 4.4 Let us examine the multi term fractional order differential equation having variable coefficients

 $D^{\frac{3}{2}}h(t) + 2Dh(t) + 3\sqrt{t}D^{\frac{1}{2}}h(t) + (1-t)h(t) = f(t), \quad (38)$ where  $f(t) = \frac{2}{\Gamma(1.5)}x^{0.5} + 4x + \frac{4}{\Gamma(1.5)}x^2 + (1-t)t^2, t \ge 0,$ with regard to the conditions h(0) = h'(0) = 0. (39)
The classical solution of (38) is  $t^2$ .
Suppose  $D^{\frac{3}{2}}h(t) \simeq C^T\Psi(t) \text{ and } f(t) \simeq F^T\Psi(t), \text{ where } F^T = [f_1, f_2, \dots, f_N].(40)$ Then  $D^{\frac{1}{2}}h(t) = C^T P_{N \times N}\Psi(t) \qquad (41)$   $Dh(t) = C^T P_{N \times N}^{\frac{1}{2}}\Psi(t) = (42)$ and  $h(t) = C^T P_{N \times N}^{\frac{3}{2}}\Psi(t) + h(0) + th'(0) \qquad (43)$ Using (40), (41), (42), (43) in (38), we have  $C^T\Psi(t) + 2C^T P_{N \times N}^{\frac{1}{2}}\Psi(t) + 3\sqrt{t}C^T P_{N \times N}\Psi(t) + (1-t)C^T P_{N \times N}^{\frac{3}{2}}\Psi(t) = F^T\Psi(t) (44)$ 

Solving the equation (44) at the collocation points, we attain unknown coefficient vector  $C^{T}$ . Using the coefficient vector  $C^{T}$  in (43), we get the numerical solutions of (38). Table 6 exhibits that the absolute errors become smaller

when the values of k are increased. Table 6 shows that the numerical solutions rapidly converge to the classical solution.

## CONCLUSION

In this article, an efficient numerical algorithm based on Legendre wavelets operational matrix was derived and successfully employed to solve multi term fractional differential equations having variable coefficients. The Legendre wavelet operational matrix is structurally a sparse matrix, which reduces the computational complexity in solving the system of algebraic equations. Moreover, the proposed numerical technique gives solutions with high precision of accuracy. Error tables and graphical demonstrations of numerical examples reveal that the proposed strategy is superior to Shifted Chebyshev polynomial method, Triangular function method, Block pulse function method and Chebyshev operational matrix method in solving multi term fractional differential equations with variable coefficients.

# ABSTRACT

Titanium dioxide nanoparticles were developed as a new and efficient heterogeneous catalyst for the synthesis of 2-amino-4H-pyran annulated heterocyclic systems by reacting ethyl/methyl acetoacetate with aldehyde and malononitrile. At 80°C for half an hour, a reaction between different aldehydes, methyl acetoacetate, and malononitrile was carried out in EtOH as a green solvent. In good yields, this process produced 2-amino-4H-pyran-containing heterocyclic compounds, including thirteen derivatives.Titanium dioxide nanoparticles were recycled and reused five times with no reduction in catalyst quantity or efficiency. Because titanium dioxide is a cheap, readily accessible, non-toxic, and recyclable catalyst, this method is exceedingly efficient, economical, and environmentally friendly.

Keywords: Titaniumdioxide, Aldehyde, Ethyl/Methyl Acetoacetate, Malononitrile, 2-amino-4H-pyran.

# INTRODUCTION

With growing concern about environmental pollution, the development of innovative green approaches in chemical synthesis has received a lot of attention. Heterogeneous catalysis and green solvents are critical to the successful development of green chemistry, and promising techniques have been reported[1]. The dangers of organic solvents drew researchers' attention to the development of new methods for using EtOH as a solvent[2,3]. Recently, several papers have proven the relevance of ethanol in chemical processes [4]. Catalytic processes generated by heterogeneous catalysts provide advantages such as ease of handling, easy work up, and catalyst renew-ability. TiO<sub>2</sub> is a low-cost and widely available heterogeneous acidic catalyst with numerous commercial uses, including selective NOx reduction in stationary sources, photocatalysis for pollutant elimination or organic synthesis, sensors, photovoltaic devices, and paints [5]. Metal oxides with nanoscale dimensions exhibit remarkable magnetic, physical, surface chemical, and catalytic characteristics [6,7]. TiO<sub>2</sub> nanoparticles have been used as a catalyst in organic syntheses such as the Friedel Crafts alkylation of indoles with epoxides [8]. amino-4H-pyrans are important biological compounds that have spasmolytic, analgesic, anticonvulsant, antibacterial, anticancer, anti-tubercular, anthelmintic, antioxidant, antiglycation, and antidepressant properties [9-11].

2-amino-4H-pyrans, which are annulated heterocyclic structures, exhibit anti-bacterial, anti-tumor, antihypertensive, and vasodilator properties. As a result, the development of new greener techniques for their synthesis remains of interest [12-15]. Following our attempts to explore new approaches for the synthesis of heterocyclic molecules[16,17]. Within some of the min, a green approach for the synthesis of 2-amino-4H-pyrans in ethanol with TiO2 NPs as the heterogeneous reusable catalyst was devised. (Scheme 1). In this work, we have synthesized 2amino-4H-pyrans derivatives efficiently in a one-pot synthesis employing nano-sized titanium dioxide as a heterogeneous catalyst. The current approach has various advantages, including excellent yields, short reaction durations (20-60 min), and ecologically friendly and mild reaction conditions. The catalyst is easily isolated from the reaction products and can be recovered in high purity for direct reuse. Because they may be easily recovered from the reaction mixture by simple filtration and reused after activation, heterogeneous catalysts have an economic advantage over traditional homogeneous catalysts.

## Abdulfatah Abdullah Abdu Saifan et al.,

### Experimental

Materials were purchased from chemist supply companies like Merck, Fluka, and Aldrich. The melting points (in degrees Celsius) were measured with an open-glass capillary on an Electrothermal MK<sub>3</sub> equipment. TLC was used to track reaction completion on silica gel plates using a chloroform solvent solution (CHCl<sub>3</sub>). The functional groups were examined using FTIR. All of the substances' IR spectra were measured using a Perkin Elmer FT-IR 550 spectrophotometer. Bruker DRX-400 spectrometer was used to measure 1H and <sup>13</sup>C NMR spectra. The X-ray diffraction investigation was performed using the Philips Xpert X-ray diffraction system (XRD). The KYKY EM-3200 scanning electron microscope was used to get the SEM pictures.

#### Synthesis of Titanium dioxide (TiO<sub>2</sub>) nanoparticles.

In a typical experiment, synthesize titanium dioxide by dissolving 5 ml of TiCl<sub>4</sub> solutions into 45 ml of distilling water under vigorous stirring at room temperature for 25 min. then o.1 mole of urea was added to the reaction and heated in Water Bath at 60oC for 15 to 40 min. then got the precipitates and then filtration and dried(white powders) and characterized by (SEM, EDX, Mapping, IR, and XRD).

#### Characterization

Using a Bruker (D5005) X-ray diffractometer with graphite monochromatized CuK radiation (=1.54056), the crystalline properties of the synthesized TiO<sub>2</sub> -NPs were investigated. It was decided to use a 40 kV accelerating voltage and a 30 mA emission current for the tests. The structure of the TiO<sub>2</sub> -NPs was verified with both XRD and FTIR spectroscopy measurements. SEM was utilized to investigate the TiO<sub>2</sub> -NPs' chemical makeup. The Hitachi S-4800 high-resolution (HR) field emission scanning electron microscope was used for the SEM observations. Elements were analyzed with the help of an EDAX spectrometer, which was included with the FE-SEM instruments. Using a spectrophotometer (Jasco V 670), we obtained absorption spectra of the samples in the 200-1000 nm range while recording them in the diffused reflectance spectrum (DRS) mode.Adsorption edge values were extrapolated to obtain band gap values.

#### General procedure for the synthesis of 2-amino-4H-pyrans.

In this method, in a two-neck round bottom flask, a combination of aromatic aldehyde, malononitrile, and ethyl/methyl acetoacetate (1:1:1 mol ratio) with the titanium dioxide catalyst (10 mg) was added. Then, the ethanol as solvent was added to the reaction vessel and refluxed at 80°C under continuous stirring. TLC plates were used to monitor the reaction's progress, while a TLC tank was filled with a 7:3 mixture of ethyl acetate and n-hexane. After the reaction was finished, the mixture was filtered to remove the solvent, and the result was mixed with a little amount of hot alcohol. The catalyst was separated by filtration after the product had been stirred and dissolved in alcohol. Finally, the catalyst was rinsed multiple times with hot alcohol to thoroughly collect all products. After evaporating the ethanol, place the filtrate at room temperature to collect the 2-amino-4H-pyran derivatives as showing in Fig. 1.

# **RESULTS AND DISCUSSION**

The sol-gel technique was used to create nano-sized titanium dioxide from titanium tetrachloride and ethanol, as described in the literature [18]. According to the data, the prepared titanium dioxide has a surface area of 51.859 m<sup>2</sup>/g. Based on a calculation assuming a spherical shape for the catalyst particles, this corresponds to a size of 18.94 nm. An XRD pattern revealed a distinctive peak at 25.34°. Fig.2. shows the XRD peaks for anatase associated with the (101), (004), (200), (105), and (204) reflections, which correspond with the reported findings [19]. For this sample, the crystallite diameters are determined to be 10 nm from the half-height width of 2° of the peak at 25.34° for anatase associated with The (101) TiO<sub>2</sub>, using the Scherrer formula. The disparity in particle size between the specific surface area measurement and the XRD diffraction pattern is owing to the difference in particle shape assumption, i.e. the BET analysis assumes a spherical shape whereas the XRD analysis is based on the anatase phase. The morphological SEM picture indicates that the particles are roughly 29 nm in size and agglomerate showing in Fig. 3. The study of TiO<sub>2</sub> nanoparticles (anatase and rutile) using energy-dispersive X-ray spectroscopy (EDX) reveals peaks for Titanium and oxygen. There is no trace of any other contaminants in the EDX study, as shown in Fig. 4. TiO<sub>2</sub> energy-dispersive x-ray diffraction (EDX) spectrum (anatase and rutile). Fig. 5. shows the (FT-IR) spectra of titanium dioxide nanoparticles. The FT-IR spectra were captured between 4,000 and 400 cm<sup>-1</sup>. Bands with frequencies of 3,445 cm<sup>-1</sup> for OH, 1,640 cm<sup>-1</sup> for C=O stretching, and bending of nitro N-O (1,395 cm<sup>-1</sup>). The creation of titanium dioxide nanoparticles was approved by the peak at 650 cm<sup>-1</sup> that were absorbed.

To begin, we investigated the treatment of aldehyde and amine as a model reaction in H<sub>2</sub>O using various catalysts to assess the effectiveness of titanium dioxide nanoparticles in this process. The reaction conditions for the production of 2-amino-4H-pyran derivatives were optimized. Optimization of catalyst quantity (Table 3, entries 1-4), temperature (Table 3, entries 5-11), and solvent (Table 3, entries 12-15) were studied, as in the preceding section. As a result, the reaction of benzaldehyde, malononitrile, and ethyl acetoacetate was chosen as the model reaction Table. 4. The ideal condition for the model reaction, according to these investigations, is shown in entry 10. Table.2. displays some of the findings from tests conducted on different types of catalysts. TiO<sub>2</sub> nanoparticles outperformed both TiO<sub>2</sub>at room temperature and the other catalysts indicated in Table 2 in terms of yield and reaction rate. Ce-ZSM-11, Fe<sub>3</sub>O<sub>4</sub>@g-C<sub>3</sub>N<sub>4</sub>, MNP@PEG-ImOH, HPNb, and Zn<sup>+2</sup>/4A, were initially tested as catalysts, However, even at large catalyst loadings, the yields achieved were only modest (Table 2, entries 1–6). Titanium dioxide nanoparticles in ethanol had a 96% isolated yield, which was the best result (Table 2, entry 7). TiO<sub>2</sub> nanoparticles may be more effective than other catalysts because they have a larger surface area.

An increase in catalyst loading from 10% to 20% did not improve the yield significantly while lowering the catalyst loading from 10% to 8% and decreasing the temperature from 80 to 45 °C lowered the yield and increased the reaction time. To illustrate the catalyst's efficiency, a blank reaction was performed in the absence of the catalyst in the presence of refluxing EtOH. Only 30% of the product was separated after 6 h of stirring, classical work-up, and recrystallization from ethanol (Table 3, entry 9). We then continued to optimize the above-mentioned model reaction by measuring the efficiency of numerous classical solvents used as comparison medium (Table 3). In each case, the substrates were combined with 10% titanium dioxide nanoparticles and agitated with 2 ml solvent. It was discovered that CH<sub>2</sub>Cl<sub>2</sub>, toluene, CH<sub>3</sub>CN, H<sub>2</sub>O, and the solventless system were unfavorable for the synthesis of the product (Table 3, entries 1- 6). The effect of temperature was also studied by carrying out the influence of temperature was further investigated by running the model response at various temperatures (Table 3, entry 8). Using a variety of structurally different aldehydes, we assessed the efficacy and applicability of our methodology for component condensation. Table 4 shows the results of smooth cyclo condensation of several aliphatic, aromatic, and aldehydes in good to outstanding yields. As indicated in this Table, aromatic aldehydes with electron-deficient or electron-rich

## Abdulfatah Abdullah Abdu Saifan et al.,

substituents on the aromatic ring, as well as aliphatic aldehydes, gave excellent yields of the required 2-amino-4Hpyran(Table 4, entry 1-13). In terms of ecologically friendly techniques, the benefits of the utilized catalyst are considerably greater if it can be recovered and reused. To investigate the recyclability of the catalyst, titanium dioxide nanoparticles were recovered from the reaction mixture in the model reaction using a simple workup and employed in five consecutive runs without substantial loss of catalytic activity (Table 5). Reaction conditions: benzaldehyde (1mol), malononitrile (1mol), ethyl acetoacetate (1mol), 10 gm of TiO<sub>2</sub>NPs in ETOH at 80°C

## CONCLUSIONS

We discovered a simple and effective approach for synthesizing 2-amino-4H-pyran in EtOH utilizing titanium dioxide nanoparticles as catalysts. This approach has various advantages, including a high yield, a quick reaction time, a simple work-up procedure that avoids the discharge of toxic organic solvents, ease of separation, and the catalyst's recyclability.

# ACKNOWLEDGMENTS

The author is grateful to thanks to my supervisor as well as the School of Chemical and Swami Ramanand Teerth Marathwada University, Nanded, 431606, Maharashtra, India for all the technical support for research with a junior research fellowship and a senior research fellowship, respectively.

# DECLARATION OF COMPETING INTEREST

The authors declare that they have no known conflicting financial or personal interests that may have seemed to affect the work presented in this study.

# ABSTRACT

In graph theory, the minimum spanning tree (MST) problem is an important problem with many practical applications. The MST problem in fuzzy graphs has been already studied. In this paper, we discuss the MST problem in graph with Z- number weighted edges(Z-graph). Anew ranking function for Z-numbers (the ratio ranking function) is introduced. Prim's algorithm based on new ranking procedure is then used to find the MST in Z-graph.

**Keywords:** Minimum Spanning tree, Z-number, Prim's Algorithm, Graph with Z-number weighted edges, Ratio ranking function.

# INTRODUCTION

A variety of algorithms such as the Prim's algorithm, the Kruskal algorithm are available to find minimum spanning tree (MST) in classic graph theory. Chang and Lee [1],De Almeida [2], Archana A.Deshpande, and Onkar K-Chaudhari [3], Anita Pal and Arindam Dev [4] have studied the MST problem in a fuzzy environment. In this paper, we present a novel approach to the problem of an MST in a graph with Z-number weighted edges. The solution involves a new type of ranking function for the Z-numbers called the ratio ranking function.

## PRELIMINARIES

### Definition: Minimum Spanning tree

A Minimum Spanning Tree (MST) is a subset of edges of a connected weighted undirected graph that connects all the vertices with the minimum possible total edge weight.

#### Definition: Z-number

A Z-number Z= (A, B) is an ordered pair of fuzzy numbers. The first component A is a restriction of real-valued uncertain variable X. The second component B is a measure of the reliability of the first component.

#### Definition: Z-Graph

A Z-graph is a simple connected graph with Z-number weighted edges.

#### Definition: Momentum ranking function of Z-number [5]

Let  $R_1$  and  $R_2$  be any two ranking functions for fuzzy numbers. Then for the Z-number A and B define the momentum ranking function [MRF] by M (A,B)=R<sub>1</sub>(A) \*R<sub>2</sub>(B).

#### Definition: min R Operation [6]

Let \* be any one of the basic arithmetic operations addition, subtraction, multiplication or division. Let  $R_k$  be any suitably chosen ranking function. Then the min R Operation[14] is defined by (A, B)(\*,min)(C, D)=(A\*C, min(B, D)), where A\*C is calculated by using the extension principle, min(B, D) = B if  $R_k(B) \le R_k(D)$  and D if  $R_k(D) < R_k(B)$ 

#### Example: Sum of two triangular Z-numbers by min R

Take  $Z_1=(A_1, B_1)=((a_{11}, a_{12}, a_{13}), (b_{11}, b_{12}, b_{13}))$ , and  $Z_2 = (A_2, B_2) = ((a_{21}, a_{22}, a_{23}), (b_{21}, b_{22}, b_{23}))$  are any two Z-numbers. The sum of two triangular Z-numbers  $Z_1$  and  $Z_2$  is defined by  $Z_1(+, min)Z_2 = ((a_{11} + a_{21}, a_{12} + a_{22}, a_{13} + a_{23}), min (B_1, B_2))$ .

#### NOVEL ALGORITHM FOR FINDING ZMST IN A GRAPH

A novel ranking function for Z- number is given below:

#### **Ratio ranking function**

Let us consider a minimization problem for Z-valued cost function. So, when we are interested in minimizing the cost given by Z-number (A,B) we need to minimize the first component A which represents the cost but maximize the second component B which refers to the reliability. Since the second component is non negative it is enough to minimize the reciprocal of the second component.

Hence, we define the ratio ranking function  $RA((A,B)) = \frac{R_1(A)}{R_2(B)}$ , Where  $R_1, R_2$  are ranking functions on set of fuzzy numbers.

**Example:** Consider the two edges E and F respectively with weights([6,7,8],[.8,.9,1]) and ([8,9,10],[.4,.5,.6]). Common sense suggests that the edge E should be preferred since the fuzzy cost associated with it is lesser than the fuzzy cost associated with the edge F, while the reliability of information regarding edge E is higher than the reliability of information regarding edge F.

Take  $R_1 = R_2 = R$  where  $R([x, y, z]) = \frac{x+y+z}{3}$ .

Then  $RA([6,7,8], [.8,.9,1]) = \frac{7}{.9} = 7.78$  and  $RA([8,9,10], [.4,.5..6]) = \frac{9}{.5} = 18$ So, the ratio ranking function leads to the correct conclusion, that the edge E is associated with the minimum cost.

## Vijayalakshmi

Some researchers had applied momentum ranking function for solving minimization problem. For example, refer to [7], the momentum ranking function was applied by the researcher to handle the shortest path problem in this article.

Suppose herewe apply momentum ranking function for the above-mentioned edges E and F.

Here also consider  $R_1 = R_2 = R$  where  $R([x, y, z]) = \frac{x+y+z}{3}$ .

Then MRF[([6,7,8], [. 8, .9,1])] =  $R_1$  [6,7,8] \*  $R_2$ [.8, .9,1] = 7 \* .9 = 6.3 MRF [([8,9,10], [.4, .5, .6])] =  $R_1$  [8,9,10] \*  $R_2$ [.4, .5, .6]=9\*.5= 4.5 This leads to the conclusion that the edge F has minimum cost, which is obviously wrong.

Because of this, it is preferable to use the ratio ranking function rather than momentum ranking function, to solve minimization problem such as shortest path problems and MST problems.

## Problem formulation for ZMST

Consider a simple connected graph G consisting of 'n' number of vertices  $V = \{v_1, v_2, \dots, v_n\}$  and 'm' number of edges  $E \subseteq V \times V$ .

The ZMST Problem is formulated as follows:  $Y = min \sum C_e X_e$ , where the minimum is taken over the spanning tree of subgraph of G, Subject to  $\sum X_e = n - 1$ 

Here, Ce-represents the weight of an edge e, which is a Z-number.

 $\sum X_e$ - represents the number of edges in ZMST is n-1, where  $X_e = \begin{cases} 1, if e \text{ is in ZMST} \\ 0, if e \text{ is not in ZMST} \end{cases}$ 

Y-Total cost of ZMST

#### Prim's algorithmis generally used to find the MST in a graph.

While adapting algorithms which work with crisp numbers so that they can deal with Z-numbers two issues need to be tackled:(i) Formal arithmetic operations as outlined by Zadeh are too complicated. So suitable simplified operations proposed by Stephenare used. (ii) Comparison of two Z-numbers by a suitable ranking procedure. Here we are interested in a minimization problem, so we can utilize the ratio ranking function.

## Modified Prim's Algorithm

Input:

Let G= (V, E) be a simple connected graph with Z-number weighted edges. Let  $V = \{v_1, v_2, \dots, v_n\}$  and  $E = \{e_1, e_2, \dots, e_m\}$ , n(V)=n, n(E)=m cost  $(e_i)$  – weight of  $e_i$ , i=1 to m.

#### Aim: To find ZMST T(W, B) of G Process Initialization

Let  $W = \{v_1\} \setminus v_1$  is a starting vertex of T B= {}  $\setminus$  B is the edge set of T Cost= 0  $\setminus$  corresponding Z-number is ((0,0), (1, 1))

#### Procedure

Start from  $v_1$ While V\W $\neq \Phi$ , Do Among all the edges with one end in W and another end in V\W, We find an edge  $(v_1, v_i)$  with minimum cost; Cost=cost (+, min) cost  $(v_1, v_i)$ ; B=BU  $(v_1, v_i)$ ;

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Vijayalakshmi

W= (W U { $v_1$ ,  $v_i$ })\W; end while

## Output

T= (W, B) is the minimum spanning tree of G,n (W)= n,n (B) = n-1

Start from the vertex  $v_1$ . Among all the edges with one end in W and another end in V\W, we find an edge with a minimum weight. The edge with the minimum weight is chosen by a suitable ranking method. Suppose  $v_2$  in V\W is adjacent to  $v_1$  with a minimum weight.

Now W=  $\{v_1, v_2\}$ , and among all the edges which have one end in W and another end in V\W, find the edges which are adjacent to  $v_1, v_2$  with a minimum weight. Continuing like this, we find a tree that includes all the vertices of G and the edges with minimum weight. Hence, we get a spanning tree with n vertices and n-1 edges.

## Example

Consider graph G given in the figure 1. The edge weights are given in the table 1. The problem is to find the minimum spanning tree of G.

Here, V= {a, b, c, d, e,f}

To find the minimum spanning tree T of a graph with Z-number weighted edge and its cost. Using the modified Prim's algorithm, the output isW=  $\{a, b, c, f, e, d\}$ , B=  $\{ab, bc, bf, fe, fd\}$ The Spanning tree is and the corresponding cost is ((150,180,210),(.6,.65,.7))

# CONCLUSION

In this paper, a new ranking method for Z-numbers has been introduced to deal with optimization problems where the objective function has to be minimized .The modified form of Prim's algorithm for finding MST in a simple graph with Z-number weighted edges has been presented.We have demonstrated the proposed algorithm using numerical example. This algorithm finds the ZMST and its corresponding cost.

# ABSTRACT

In this article, we examine Analysis of a Markovian retrial queue with Feedback, Recurrent customers and server vacation. In this model, all service times, retrial times and vacation times are assumed to have an exponential distribution. We obtain the probability generating function for the number of customers in the system. We also compute the average number of customers and waiting time in the system. Some of the special cases are discussed. To calibrate the model's stability some numerical examples are illustrated.

Keywords: Retrial Queue, Feedback, Recurrent customers, Server vacation, Steady-state equations. MSC 2010 No.: 60K25, 68M20, 90B22

# INTRODUCTION

The queueing systems, which include the possibility of a customer after receiving one service, returning to the server for additional service, are called queue with feedback. Formation of queues with feedback mechanism was first introduced by Takecs(1963) discipline In this paper, an M/M/1 Retrial queueing model with Recurrent Customers and Server Vacation is taken. Retrial queues are characterized by the phenomenon that arriving customers who find the server busy join the retrial group (called orbit) to repeat their request for service after some random time. Retrial queuing systems have been widely used to model many practical problems in telephone switching systems, telecommunication networks, and computers competing to gain service from a central processing unit. For recent

## Pazhani Bala Murugan and Madhangi

bibliographies on retrial queues, see [2,3,8,9,14]. Boxma and Cohen[4] studied a M/G/1 queue in which there is a fixed number of permanent customers present who rejoin the queue on their completion of service. This sys tem with permanent customers in the retrial context was analzed by Farahmand[11]. Queues with vacations have been studied extensively in the past: a comprehensive survey can be found in Teghem[14] and Doshi[7]. The Organization of the paper is as follows: The model under consideration is described in section 2. In section 3, we analyze the model by deriving the system steady state equations. Using the equations, the probability generating function of queue length are obtained in section 4.

## MODEL DESCRIPTION

We consider an M/M/1 Feedback-retrial queue with transit (also called ordinary) customers and a fixed number K (K  $\geq$  1) of recurrent (also called permanent) customers. After service completion, recurrent customers always return to the retrial group and transit customers leave the system forever.

Transit customers arrive according to a Poisson process with rate  $\lambda$ . If a transit customer finds the server free on his arrival, he occupies the server, otherwise, he enters the re-trail group in accordance with an FCFS discipline. We will assume that only the transit customers at the head of the orbit is allowed for access to the server. Successive inter retrial times of any transit customer follow an exponential distribution with rate  $\alpha$ . The service times for the transit customers are exponentially distributed with rate  $\mu$  1 . There is a fixed number K of permanent customers in the system. After having received service, recurrent customers immediately return to the retrial group in accordance with an FCFS discipline. We will assume that only the recurrent customer at the head of orbit is allowed for access to the server. Successive inter-retrial times of any recurrent customer follow an exponential distribution with rate . The service times for the recurrent customers are exponentially distributed with rate µ 2. After each service, the next customers to be served is determined by a competition between the retrial time of transit customers, recurrent customers. After completion of service there is no transit customers in the orbit the server takes the vacation of random length. At the end of vacation, if the server finds no transit customer in the orbit, he immediately takes another vacation and continuous in this manner until he finds at least one transit customer upon return from vacation. The vacation times are the exponentially distributed with parameter . The inter arrival times, retrial times, service times and vacation times are mutually independent. Let O(t) be the number customers in the orbit at time t and C(t) denotes the server state at time t.

We observe that (O(t), C(t)):  $t \ge 0$  is a continuous Markov chain.

#### MODEL ANALYSIS EQUATIONS

We define the following limiting probabilities for our subsequent analysis of the queueing

$P_{0,n}\lim_{t\to\infty}\{C(t)=0,$	$O(t) = n_i$	$n \ge k + 1$
$P_{1,n}\lim_{t\to\infty}\{C(t)=1,$	O(t) = n,	$n \ge k + 1$
$P_{2,n}\lim_{t\to\infty}\{C(t)=2,$	O(t) = n,	$n \ge k + 1$
$P_{3,n}\lim_{t\to\infty}\{C(t)=3,$	$O(t) = n_{t}$	$n \ge k + 1$

The system has the following set of steady state equations:

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Pazhani Bala Murugan and Madhangi

$(\lambda + \alpha + \beta)$	$P_{0,n} = q\mu_1 P_{1,n} + \mu_2 P_{2,n-1} + \mu_1 P_{1,n}$	$_{-1} + \theta P_{3,n}$ ; $n \ge k + 1$	(1)
$(\lambda + \mu_1)P_{1,k}$	$= \alpha P_{0,k+1}$		(2)
$(\lambda + \mu_1)P_{1,n}$	$=\lambda P_{0,n} + \lambda P_{1,n-1} + \alpha P_{0,n+1};$	$n \ge k + 1$	(3)
$(\lambda + \mu_2)P_{2,k}$	$=\beta P_{0,k+1};$		(4)
$(\lambda + \mu_2)P_{2,n}$	$= \beta P_{0,n+1}; \ \lambda P_{2,n-1};$	$n \ge k + 1$	(5)
$\lambda P_{3,k}$	$= q\mu_1 P_{1,k}$		(6)
$(\lambda + \theta)P_{3,n}$	$=\lambda P_{3,n-1}$	$n \ge k+1$	(7)

### PROBABILITY GENERATING FUNCTIONS OF QUEUE LENGTH

We define the following probability generating functions:

$$P_{0}(z) = \sum_{n=k+1}^{\infty} P_{0,n} z^{n} P_{1}(z) = \sum_{\substack{n=k \\ n=k}}^{\infty} P_{1,n} z^{n}$$
$$P_{2}(z) = \sum_{\substack{n=k \\ n=k-1}}^{\infty} P_{2,n} z^{n}$$
$$P_{3}(z) = \sum_{\substack{n=k-1 \\ n=k-1}}^{\infty} P_{3,n} z^{n}$$
(8)

applying (8) into equations (1)-(7), we get

$$\begin{aligned} &(\lambda + \alpha + \beta)P_0(z) = \mu_1(q + pz)P_1(z) + \mu_2 z P_2(z) + \theta P_3(z) - (\lambda + \theta)P_{3,k}z^k \quad (9) \\ &(\lambda - \lambda z + \mu_1)P_1(z) = \left(\lambda + \frac{\alpha}{z}\right)P_0(z) \quad (10) \\ &(\lambda - \lambda z + \mu_2)P_2(z) = \left(\frac{\beta}{z}\right)P_0(z) \quad (11) \\ &(\lambda - \lambda z + \theta)P_3(z) = (\lambda + \theta)P_{3,k}z^k \quad (12) \end{aligned}$$

substituting equations (10), (11) and (12) in (9), we get

$$P_{0}(z) = \frac{-(\lambda+\theta)P_{2,k}z^{k}(\lambda-\lambda z+\mu_{1})(\lambda-\lambda z+\mu_{2})[\lambda-\lambda z]}{(\lambda-\lambda z+\theta)\begin{bmatrix}(\lambda+\alpha+\beta)(\lambda-\lambda z+\mu_{1})(\lambda-\lambda z+\mu_{2})\\-\mu_{1}(q+pz)(\lambda+\alpha z^{-1})(\lambda-\lambda z+\mu_{2})-\mu_{2}\beta(\lambda-\lambda z+\mu_{1})\end{bmatrix}}$$
(13)

Substituting (13) in (10), we get

$$P_{1}(z) = \frac{-(\lambda+\theta)P_{2,k}z^{k}(\lambda+\alpha z^{-1})(\lambda-\lambda z+\mu_{2})[\lambda-\lambda z]}{(\lambda-\lambda z+\theta)\begin{bmatrix} (\lambda+\alpha+\beta)(\lambda-\lambda z+\mu_{1})(\lambda-\lambda z+\mu_{2})\\ -\mu_{1}(q+pz)(\lambda+\alpha z^{-1})(\lambda-\lambda z+\mu_{2})-\mu_{2}\beta(\lambda-\lambda z+\mu_{1})\end{bmatrix}}$$
(14)

Substituting (15) in (11), we get

$$P_{2}(z) = \frac{-(\lambda+\theta)P_{2,k}z^{k}\beta z^{-1}(\lambda-\lambda z+\mu_{2})[\lambda-\lambda z]}{(\lambda-\lambda z+\theta)\begin{bmatrix} (\lambda+\alpha+\beta)(\lambda-\lambda z+\mu_{1})(\lambda-\lambda z+\mu_{2})\\ -\mu_{1}(q+pz)(\lambda+\alpha z^{-1})(\lambda-\lambda z+\mu_{2})-\mu_{2}\beta(\lambda-\lambda z+\mu_{1})\end{bmatrix}}$$
(15)

From (12), we get

$$P_{3}(z) = \frac{-(\lambda+\theta)P_{2,k}z^{k}}{(\lambda-\lambda z+\theta)}$$
(16)

Let us define P(z) = P0(z) + z(P1(z) + P2(z)) + P3(z) the pgf for number of customers in the system.

$$P(z) = \frac{-(\lambda - \lambda z + \mu_2)(\lambda z + \alpha)\mu_1[1-p]z}{\left[\frac{(\lambda - \lambda z + \theta)[(\lambda + \alpha + \beta)\lambda z(\lambda - \lambda z + \mu_1 + \mu_2)}{(-(\lambda z + \alpha)\lambda\mu_1 - \beta z \lambda\mu_2 - \alpha\mu_1\mu_{2+}p\mu_1(\lambda z + \alpha)(\lambda - \lambda z + \mu_2)]}\right]}(\lambda + \theta)P_{3,k}$$
(17)

Applying the normalizing condition P(1) =1, in equation (18), we get

ISSN: 0976 - 0997

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access

$$P_{3,k} = \frac{1}{1-p} \left[ \frac{1}{1+\frac{\lambda}{\theta}} \right] \left[ \frac{1}{1+\frac{\lambda}{\alpha}} - \frac{\lambda}{\mu_1} \left( 1 + \frac{\beta\mu_1}{(\lambda+\alpha)\mu_2} \right) - p \right]$$
(18)

Which implies that the utilization factor is  $\rho = \frac{\frac{\lambda}{\mu_1} \left(1 + \frac{\beta \mu_1}{(\lambda + \alpha)\mu_2}\right) - p}{\frac{1}{1 + \frac{\lambda}{\alpha}}}$  and the steady state

condition is therefore

$$\frac{\frac{\lambda}{\mu_{1}}\left(1+\frac{\beta\mu_{1}}{(\lambda+\alpha)\mu_{2}}\right)}{\frac{1}{1+\frac{\lambda}{\alpha}}} \leq 1$$
(19)

#### Particular cases

- i) If  $\theta \rightarrow \infty p=0$  and q=1, then the present model will be remodeled as an M/M/1 retrial queue with recurrent customers.
- ii) If  $\alpha \rightarrow \infty$  and  $\theta \rightarrow \infty$ , p=0 and q=1, then the present model will be remodeled as an M/M/1 queue with recurrent customers.
- iii) If  $\alpha \rightarrow \infty$ ,  $\theta \rightarrow \infty$ , p=0,q=1 and k=0 then the present model will be remodeled as an M/M/1 queue.
- iv) If k=0, p=0andq=1, then the present model will be remodeled as an M/M/1 retrial queue with server vacation.
- v) If k=0,p=0,q=1 and  $\theta \rightarrow \infty$ , then the present model will be remodeled as an M/M/1 retrial queue.

## **OPERATING CHARACTERTISTICS**

Let E(L) denote the mean number of customers in the system. The Probability generating function for the number of customers in the system is

$$\begin{split} P(z) &= \frac{N(z)}{D(z)} P_{3,k} \\ N(z) &= -(\lambda + \theta)(\lambda - \lambda z + \mu_2)(\lambda z + \alpha)\mu_1 [q \\ + pz - z] z^k \\ D(z) &= \begin{bmatrix} (\lambda - \lambda z + \theta)[(\lambda + \alpha + \beta)\lambda z(\lambda - \lambda z + \mu_1 + \mu_2) \\ -(\lambda z + \alpha)\lambda\mu_1 - \beta z\lambda\mu_2 - \alpha\mu_1\mu_2 + p\mu_1(\lambda z + \alpha)(\lambda - \lambda z + \mu_2)] \end{bmatrix} \\ P_{3,k} &= \frac{1}{1 - p} \left[ \frac{1}{1 + \frac{\lambda}{q}} \right] \left[ \frac{1}{1 + \frac{\lambda}{q}} - \frac{\lambda}{\mu_1} \left( 1 + \frac{\beta\mu_1}{(\lambda + \alpha)\mu_2} \right) - p \right] \end{split}$$

Differentiating with respect to z

$$P(z) = \frac{D(z)N'(z) - D'(z)N(z)}{[D(z)]^2}P_{3,k}$$

$$\begin{split} \mathrm{N}(z) &= -(\lambda + \theta)(\lambda z + \alpha)(\lambda - \lambda z + \mu_2)z^k \\ \mathrm{N}'(z) &= -(\lambda + \theta)\mu_1 \left[\lambda(\lambda - \lambda z + \mu_2)z^k + (\lambda z + \alpha)(-\lambda)z^k + (\lambda z + \alpha)(\lambda - \lambda z + \mu_2)kz^{k-1}\right] \\ \mathrm{(\lambda - \lambda z + \mu_2)kz^{k-1}} \\ \mathrm{D}(z) &= \begin{bmatrix} (\lambda - \lambda z + \theta)(\lambda + \alpha + \beta)\lambda z(\lambda - \lambda z + \mu_1 + \mu_2) \\ -(\lambda z + \alpha)\lambda \mu_1 - \beta z\lambda \mu_2 - \alpha \mu_1 \mu_2 \end{bmatrix} \\ \mathrm{D}'(z) &= \begin{bmatrix} (-\lambda)[(\lambda + \alpha + \beta)\lambda z(\lambda - \lambda z + \mu_1 + \mu_2) \\ -(\lambda z + \alpha)\lambda \mu_1 - \beta z\lambda \mu_2 - \alpha \mu_1 \mu_2] \\ +(\lambda - \lambda z + \theta)[(\lambda + \alpha + \beta)\lambda(\lambda - \lambda z + \mu_1 + \mu_2) + (\lambda + \alpha + \beta)\lambda z(-\lambda) - \lambda^2 \mu_1 - \beta \lambda \mu_2)] \end{bmatrix}$$

## NUMERICAL RESULTS

The curved graph constructed in Figure 1 and the values tabulated in the Table 1 are obtained by setting the fixed values  $v=2, \alpha=1, \beta=2.5, k=1, \theta=1, p=0.4, q=0.6, t=0.3$  and varying the values of  $\lambda$  from 1 to 2 incremented with 0.2 and extending the values of  $\mu$  from 1 to 2 in steps of 0.5. We observed that as  $\lambda$  rises L<sub>s</sub> also rises which shows the stability of the model.

The curved graph constructed in Figure 2 and the values tabulated in the Table 2 are obtained by setting the fixed values  $\mu$ =1.5,  $\alpha$ =1, $\beta$ =2.5,k=1,  $\theta$ =1,p=0.4 q=0.6,t = 0.3 and varying the values of  $\lambda$  from 1 to 2 incremented with 0.2 and extending the values of  $\mu$ <sup>2</sup> from 3 to 7 in steps of 2. We observed that as  $\lambda$  rises L<sub>s</sub> also rises which shows the stability of the model.

The curved graph constructed in Figure 3 and the values tabulated in the Table 3 are obtained by setting the fixed values  $\mu=1,\alpha=1.5,\nu=3,k=1,\theta=1,p=0.4$ , q=0.6,t=0.3 and varying the values of  $\lambda$  from 1 to 2 incremented with 0.2 and extending the values of  $\beta$  from 3 to 4.2 insteps of 0.6. We observed that as  $\lambda$  rises L<sub>s</sub>also rises which shows the stability of the model.

The curved graph constructed in Figure 4 and the values tabulated in the Table 4 are obtained by setting the fixed values  $\mu = 2$ ,  $\beta = 2.5$ ,  $\nu = 4$ ,  $\theta = 1$ , k = 1, p = 0.4 q = 0.6,t = 0.3 and varying the values of  $\lambda$  from 1 to 2 incremented with 0.2 and extending the values of  $\alpha$  from 0.5 to 1.5 in steps of 0.5. We observed that as  $\lambda$  rises Ls also rises which shows the stability of the model.

## CONCLUSION

In this paper, analysis of a Markovian retrial queue with recurrentcustomers, feedback and server vacation is evaluated. We obtain the PGF for the number of customers and the mean number of customers in the orbit. We workout the waiting time distribution. We also derive the performance measures. We perform some particular cases. We illustrate some numerical results.

## ABSTRACT

Periodontal diseases are complex inflammatory conditions affecting the supporting structures of the teeth, with a significant impact on oral health. Traditional diagnostic approaches for periodontal diseases have relied on clinical parameters and subjective assessments, often leading to limited predictive capabilities and suboptimal treatment outcomes. In recent years, there has been a growing recognition of the crucial role played by the oral microbiome in periodontal health and disease. This article highlights the significance of integrating periodontal risk assessment and oral microbiome profiling as a comprehensive two-way diagnostic approach to enhance our understanding of the disease and improve clinical outcomes. By considering both host-related factors and the composition of the oral microbiome, this approach offers a more accurate assessment of disease susceptibility, severity, and treatment response. The integration of periodontal risk assessment and oral microbiome profiling holds great promise in guiding personalized treatment strategies and improving overall patient care.

**Keywords**: periodontal diseases, periodontal risk assessment, oral microbiome, diagnostic approach, clinical significance

## INTRODUCTION

Periodontal diseases, including gingivitis and periodontitis, are prevalent inflammatory conditions that affect the supporting tissues surrounding the teeth. These diseases can result in tissue destruction, tooth loss, and have implications for systemic health. Traditional diagnostic approaches for periodontal diseases have primarily relied on clinical parameters, such as probing depth and bleeding on probing, along with subjective assessments. However, these methods often provide limited predictive capabilities and fail to consider the complex interplay between the host immune response and the oral microbiome. In recent years, there has been a remarkable advancement in our understanding of the oral microbiome and its role in periodontal health and disease. The oral cavity harbors a diverse microbial ecosystem consisting of bacteria, viruses, fungi, and other microorganisms. The composition, diversity, and functional potential of this oral microbiome have been recognized as key factors influencing the development and progression of periodontal diseases [1]. With the advent of molecular techniques and high-throughput sequencing, researchers have gained unprecedented insights into the oral microbiome's intricate relationship with periodontal health and disease. The use of methods such as 16S rRNA gene sequencing and metagenomics has allowed for a comprehensive characterization of the oral microbiome, enabling the identification of microbial signatures associated with health and disease states. This deeper understanding of the oral microbiome has paved the way for a paradigm shift in periodontal disease diagnosis and management.

Recognizing the limitations of traditional diagnostic approaches, there is a growing recognition of the importance of integrating periodontal risk assessment and oral microbiome profiling as a comprehensive two-way diagnostic approach. By considering both host-related factors and the composition of the oral microbiome, this integrated approach provides a more accurate assessment of disease susceptibility, severity, and treatment response. The aim of this article is to highlight the significance of this comprehensive two-way diagnostic approach in enhancing our understanding of periodontal diseases and improving clinical outcomes. By combining periodontal risk assessment with oral microbiome profiling, clinicians can tailor treatment plans more effectively, identify high-risk individuals, predict disease progression, and develop personalized therapeutic interventions. In this article, we will explore the current knowledge surrounding periodontal risk assessment and oral microbiome profiling. We will examine the clinical significance of this integrated approach, its implications for treatment planning, and its potential to guide personalized interventions. Furthermore, we will discuss the future directions and challenges in the field, emphasizing the need for standardized protocols, validated diagnostic thresholds, and novel therapeutic strategies based on the comprehensive two-way diagnosis.

Overall, the integration of periodontal risk assessment and oral microbiome profiling holds great promise in improving our understanding of periodontal diseases and revolutionizing their diagnosis and management. By harnessing the power of both host-related factors and microbial analysis, we can enhance clinical decision-making, optimize treatment outcomes, and ultimately improve the oral health and well-being of individuals affected by periodontal diseases.

#### Periodontal Disease: A Multifactorial Condition

Periodontal disease is a chronic inflammatory condition affecting the supporting structures of the teeth, including the gums, periodontal ligament, and alveolar bone. It is one of the most prevalent oral diseases worldwide, with varying degrees of severity ranging from gingivitis (inflammation of the gums) to periodontitis (destruction of the supporting tissues) [1]. Etiology and Pathogenesis The development and progression of periodontal disease are influenced by a combination of factors, making it a multifactorial condition. While bacterial plaque accumulation is recognized as the primary etiological factor, numerous host-related factors contribute to disease susceptibility and severity. These factors include genetic predisposition, systemic conditions, lifestyle habits, and oral hygiene practices [2]. Genetic Predisposition Growing evidence suggests that genetic variations can modulate an individual's susceptibility to periodontal disease. Several genes involved in immune response, extracellular matrix remodeling, and inflammatory pathways have been implicated in disease susceptibility. For example, polymorphisms in genes

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Bhuvaneswarri et al.,

encoding interleukins (IL-1), tumor necrosis factor-alpha (TNF- $\alpha$ ), and matrix metalloproteinases (MMPs) have been associated with increased risk of periodontitis [3]. Systemic Factors Systemic conditions, such as diabetes mellitus, cardiovascular disease, and immunodeficiencies, can influence the onset, progression, and severity of periodontal disease. Bidirectional relationships exist between periodontal disease and systemic health, with inflammatory processes in the oral cavity potentially exacerbating systemic conditions and vice versa. Moreover, systemic conditions may compromise the host's immune response, impairing the ability to control the oral microbiota and promoting periodontal disease progression [4]. Lifestyle Habits and Oral Health Certain lifestyle habits, such as smoking, poor nutrition, and alcohol consumption, have been associated with an increased risk and severity of periodontal disease. Smoking has a significant impact on the initiation and progression of periodontitis, as it alters the host's immune response and compromises tissue healing [5].

#### Traditional Diagnostic Methods and Limitations

Traditionally, the diagnosis of periodontal disease has relied on clinical parameters, including probing depth, clinical attachment level, bleeding on probing, and radiographic assessment. While these methods provide valuable information about the current state of periodontal health, they have certain limitations that hinder a comprehensive understanding of the disease.

#### Limitations of Traditional Diagnostic Methods

Subjectivity and Intra-observer Variability Clinical parameters such as probing depth and attachment level measurements are subjective and prone to intra-observer variability. Variations in probing force and angulation can lead to inconsistent measurements, affecting the accuracy and reliability of the diagnosis. Lack of Predictive Value Traditional diagnostic methods primarily assess the current disease status but may not provide predictive information about future disease progression. Identifying individuals at risk of developing periodontal disease or experiencing disease progression is crucial for early intervention and preventive strategies [6]. Inability to Assess Disease Activity Traditional methods often fail to capture the dynamic nature of periodontal disease and assess disease activity accurately. They do not provide information about the ongoing tissue destruction and inflammatory processes within the periodontal tissues. Limited Understanding of Disease Mechanisms Clinical parameters alone do not provide insights into the underlying pathogenic mechanisms involved in periodontal disease. Understanding the complex interplay between the host immune response, the oral microbiome, and other contributing factors is essential for effective management and personalized treatment approaches [7]. Advanced Diagnostic Approaches To overcome the limitations of traditional diagnostic methods, advanced diagnostic approaches have emerged, focusing on a more comprehensive assessment of periodontal disease. These approaches include periodontal risk assessment and oral microbiome profiling, which provide valuable insights into disease susceptibility, severity, and microbial dysbiosis.

Periodontal Risk Assessment Periodontal risk assessment involves evaluating various patient-specific factors, such as genetic predisposition, systemic conditions, lifestyle habits, and oral hygiene practices, to determine an individual's risk of developing or experiencing progression of periodontal disease. By considering these factors, clinicians can identify high-risk individuals who may benefit from tailored treatment strategies and preventive measures [8]. Oral Microbiome Profiling The oral microbiome plays a crucial role in periodontal health and disease. Advanced sequencing technologies allow for the identification and quantification of microbial species or groups within the oral cavity. Oral microbiome profiling provides valuable information about the composition, diversity, and dysbiosis associated with periodontal disease. This knowledge can aid in understanding disease mechanisms, predicting disease progression, and developing targeted therapeutic interventions [9].

## Bhuvaneswarri et al.,

#### Advancements in Periodontal Risk Assessment

Genetic Predisposition and Periodontal Risk Genetic factors play a significant role in periodontal disease susceptibility and severity. Advances in genetic research have identified specific genetic variations associated with increased risk of developing periodontal disease. Polymorphisms in genes involved in the immune response, extracellular matrix remodeling, and inflammatory pathways have been investigated in relation to periodontal risk [10]. For example, studies have shown that variations in the interleukin-1 (IL-1) gene cluster, specifically the IL-1 $\alpha$ and  $IL-1\beta$  genes, are associated with increased susceptibility to periodontitis. These genetic variations are linked to an exaggerated inflammatory response and impaired tissue repair mechanisms. Additionally, genetic variations in genes encoding matrix metalloproteinases (MMPs), which are involved in extracellular matrix degradation, have been associated with increased periodontal risk [11. Systemic Factors and Periodontal Disease Systemic conditions can influence the development and progression of periodontal disease. Advances in periodontal risk assessment have focused on understanding the bidirectional relationships between periodontal disease and systemic health [11]. For example, individuals with diabetes mellitus have an increased risk of periodontitis, and poor glycemic control can worsen periodontal disease outcomes. The interaction between periodontal pathogens and the host immune response in diabetes contributes to the chronic inflammation seen in both conditions. Similarly, systemic conditions such as cardiovascular disease, rheumatoid arthritis, and immunodeficiencies can impact the severity and progression of periodontal disease [12,13]. Lifestyle Habits and Oral Health Lifestyle habits, including smoking, nutrition, and alcohol consumption, can influence periodontal health. Advances in periodontal risk assessment have considered the impact of these habits on disease susceptibility and severity [14].

Cigarette smoking is a well-established risk factor for periodontal disease. Smoking affects the host immune response, impairs tissue healing, and alters the composition of the oral microbiota, leading to an increased risk of periodontitis. Additionally, poor nutrition, specifically a dietlacking in essential nutrients such as vitamins C and D, can compromise periodontal health and contribute to disease progression [15]. Oral Hygiene Practices and Periodontal Health Oral hygiene practices are critical for maintaining periodontal health. Advancements in periodontal risk assessment have explored the influence of oral hygiene habits on disease progression [16]. Effective oral hygiene practices, including regular toothbrushing, flossing, and interdental cleaning, help remove bacterial plaque and prevent its accumulation. Inadequate oral hygiene practices can lead to plaque buildup, gingival inflammation, and subsequent periodontal disease. Additionally, the use of adjunctive tools such as antimicrobial mouthwashes and interdental brushes can contribute to improved periodontal health [17]. These advancements in periodontal risk assessment provide clinicians with a more comprehensive understanding of individual susceptibility to periodontal disease and facilitate personalized treatment planning for improved clinical outcomes.

#### Oral Microbiome: The Key Player in Periodontal Disease

The oral microbiome refers to the diverse community of microorganisms that inhabit the oral cavity, including bacteria, fungi, viruses, and archaea. It plays a crucial role in maintaining oral health and has a significant impact on the development and progression of periodontal disease. Composition of the Oral Microbiome The oral cavity provides a unique environment for microbial colonization, with different ecological niches such as the teeth, gingival sulcus, tongue, and saliva. The oral microbiome is highly diverse, consisting of hundreds of different species. While some species are considered beneficial and contribute to oral health, others can be pathogenic and lead to the development of periodontal disease [18]. Dysbiosis and Periodontal Disease Periodontal disease is associated with a shift in the composition and diversity of the oral microbiome, a condition known as dysbiosis. Dysbiosis in the oral microbiome refers to an imbalance in the microbial community, characterized by an increase in the proportion of pathogenic species and a decrease in beneficial species [19]. Pathogenic bacteria, such as Porphyromonas gingivalis, Treponema denticola, and Tannerella forsythia, have been strongly associated with the development and progression of periodontal disease. These bacteria possess virulence factors that enable them to evade the host immune response, adhere to tooth surfaces, invade periodontal tissues, and initiate destructive inflammatory processes. Moreover, the presence of specific microbial complexes, such as the red complex (P. gingivalis, T. denticola, and T. forsythia), has been linked to increased disease severity [20].

## Bhuvaneswarri et al.,

The dysbiotic oral microbiome generates a host immune response, leading to chronic inflammation within the periodontal tissues. This sustained inflammatory state contributes to the destruction of the periodontal disease. Role of the Oral Microbiome in Disease Progression The oral microbiome not only initiates periodontal disease but also plays a crucial role in its progression. As the disease advances, the dysbiotic oral microbiome can form biofilms, also known as dental plaque, on tooth surfaces and below the gum line. These biofilms provide a protected environment for bacterial colonization, making them more resistant to host immune responses and antimicrobial therapies [21]. Additionally, the dysbiotic oral microbiome can induce shifts in the local microenvironment, promoting a pro-inflammatory state and further exacerbating tissue destruction. The interaction between microbial virulence factors, host immune responses, and the local environment contributes to the chronic nature of periodontal disease [21]. Understanding the composition and dynamics of the oral microbiome has important clinical implications for the diagnosis, treatment, and prevention of periodontal disease. Advances in high-throughput sequencing technologies, such as next-generation sequencing, have allowed for a more comprehensive analysis of the oral microbiome and its association with periodontal health and disease.

## Integrating Periodontal Risk Assessment and Oral Microbiome Profiling

Personalized Approach to Periodontal Diagnosis Integrating periodontal risk assessment and oral microbiome profiling allows for a more personalized approach to periodontal diagnosis. By assessing individual risk factors and analyzing the composition of the oral microbiome, clinicians can gain a deeper understanding of a patient's susceptibility to periodontal disease and tailor their diagnosis accordingly. Periodontal risk assessment considers factors such as genetic predisposition, systemic conditions, lifestyle habits, and oral hygiene practices to determine an individual's risk of developing or experiencing progression of periodontal disease. Oral microbiome profiling provides insights into the composition, diversity, and dysbiosis of the oral microbiome, which can help identify specific bacterial species or complexes associated with periodontal disease [22]. By integrating these two approaches, clinicians can better evaluate a patient's overall periodontal health status and make more accurate and informed diagnoses. This personalized approach enhances the understanding of the underlying causes of periodontal disease and helps guide treatment decisions.

Targeted Treatment Strategies for High-Risk Individuals Integrating periodontal risk assessment and oral microbiome profiling enables the development of targeted treatment strategies for high-risk individuals. High-risk patients, identified through the assessment of risk factors and oral microbiome analysis, may require more aggressive and personalized interventions to achieve optimal periodontal health outcomes [23]. For example, individuals with a genetic predisposition to periodontal disease or those harboring specific pathogenic bacterial species can benefit from targeted antimicrobial therapy. By identifying the presence of specific pathogens through oral microbiome profiling, clinicians can select antimicrobial agents that specifically target those bacteria, improving treatment efficacy. Additionally, high-risk individuals may require more frequent periodontal maintenance visits and supportive periodontal therapy to manage disease progression effectively. Interventions can also be tailored to address lifestyle factors such as smoking cessation counseling, nutritional guidance, and oral hygiene education, further enhancing treatment outcomes.<sup>24</sup>Monitoring Treatment Outcomes and Adjustments Integrating periodontal risk assessment and oral microbiome profiling facilitates the monitoring of treatment outcomes and the necessary adjustments in the management plan. By regularly assessing the oral microbiome and periodontal risk factors during and after treatment, clinicians can track changes in microbial composition and disease progression. Oral microbiome profiling can provide valuable information on the success of treatment interventions by assessing shifts in microbial diversity, the presence or absence of specific pathogenic species, and the establishment of a more balanced microbial community. Periodontal risk assessment allows for the evaluation of improvements in systemic conditions, lifestyle habits, and oral hygiene practices, which may impact periodontal health [25]. Monitoring treatment outcomes and making adjustments to the management plan based on changes in the oral microbiome and risk factors can optimize treatment success and long-term periodontal stability. Regular re-evaluation of the personalized treatment approach ensures that interventions remain tailored to the patient's specific needs and enhances the effectiveness of periodontal therapy.

## Bhuvaneswarri et al.,

## Clinical Significance and Implications

Integrating periodontal risk assessment and oral microbiome profiling holds significant clinical significance and implications for periodontal diagnosis, treatment, and prevention. This comprehensive approach provides clinicians with a deeper understanding of individual susceptibility to periodontal disease and allows for personalized treatment planning, resulting in improved clinical outcomes. By considering various risk factors, such as genetic predisposition, systemic conditions, lifestyle habits, and oral hygiene practices, clinicians can identify high-risk individuals who may require more intensive interventions and tailored treatment strategies. This personalized approach optimizes treatment outcomes by addressing specific risk factors and targeting pathogenic bacteria identified through oral microbiome profiling.<sup>26</sup>Furthermore, the integration of periodontal risk assessment and oral microbiome profiling enhances the monitoring of treatment outcomes and facilitates necessary adjustments to the management plan. Regular evaluation of the oral microbiome and risk factors allows for the tracking of changes in microbial composition and disease progression. This iterative process ensures that treatment interventions remain tailored to the patient's evolving needs, leading to long-term periodontal stability.

#### Future Perspectives and Research Directions

The integration of periodontal risk assessment and oral microbiome profiling opens up promising avenues for future research and clinical applications. Some potential future directions include: Development of personalized treatment algorithms: Further research can focus on developing algorithms that integrate periodontal risk factors, oral microbiome data, and clinical parameters to guide personalized treatment decisions and improve treatment outcomes [27]. Targeted antimicrobial therapy: Future studies can explore the efficacy and safety of antimicrobial agents specifically targeted at pathogenic bacteria identified through oral microbiome profiling, leading to more precise and effective treatment interventions [28,29]. Long-term monitoring and prediction of disease progression: Continued monitoring of the oral microbiome and risk factors can help predict the risk of disease progression and guide preventive interventions to maintain long-term periodontal health.Therapeutic modulation of the oral microbiome: Investigating interventions aimed at modulating the oral microbiome, such as probiotics, prebiotics, and microbial therapies, may offer new avenues for preventing and managing periodontal disease. Integration with emerging technologies: Integration with emerging technologies, such as artificial intelligence and machine learning, can enhance the interpretation and analysis of complex oral microbiome data, leading to improved risk assessment and treatment planning.

## CONCLUSION

The integration of periodontal risk assessment and oral microbiome profiling represents a significant advancement in periodontal diagnosis, treatment, and prevention. This comprehensive approach allows for a personalized understanding of individual susceptibility to periodontal disease, guiding targeted interventions and enhancing treatment outcomes. By considering various risk factors and analyzing the composition and dynamics of the oral microbiome, clinicians can tailor their approach to each patient, ensuring optimal periodontal health. Future research in this field holds promise for the development of personalized treatment algorithms, targeted antimicrobial therapies, and the exploration of emerging technologies to further enhance periodontal care.

## ABSTRACT

Biosynthesized nanoparticles are used in the study to detect their antimicrobial activity against *E.coli*, *B.subtilis*, *P.aeruginosa*, *S.aureus*, *A.niger* and *C.albicans*. The nanoparticles were produced from *S.aureus* cell free broth. The antimicrobial activity was determined using two methods: minimum inhibitory concentration and zone of inhibition using the Kirby-Bauer method. Positive controls were included using antibiotics. The results of both tests showed that the biosynthesized nanoparticles exhibited antimicrobial activity, which could have potential applications in the future.

Keywords: E.coli, B.subtilis, P.aeruginosa, S.aureus, A.niger and C.albicans.

## INTRODUCTION

Nanoparticles have emerged as a promising substance in the medical field, particularly for combating multidrug resistant bacteria. However, chemically synthesized metallic nanoparticles are known to be environmentally hazardous. In contrast, biosynthesized nanoparticles are considered eco-friendly. Biosynthesized silver nanoparticles have been shown to possess antimicrobial properties and can be used as an antimicrobial agent. This study investigated the effect of biosynthesized silver nanoparticles on different microorganisms using two common methods: minimum inhibitory concentration and zone of inhibition. The minimum inhibitory concentration is the lowest concentration of a medicinal material that can prevent visible growth of microorganisms and can be expressed as mg/L or  $\mu$ g/ml. The IC50 value is the concentration at which a substance expresses half of its maximum inhibitory effect. The zone of inhibition refers to the area in media where microorganisms cannot grow due to the activity of a

## Chitra Rathod et al.,

drug substance present in that area and can be observed with the naked eye. The zone size is typically measured in mm.

## METHODOLOGY

#### Minimum Inhibitory Concentration Method

0.5 McFarland Standard dilution of microbes to be used for the study. 500  $\mu$ l diluted log cultures of bacteria were added to the micro centrifuge tube, along with 10  $\mu$ l of prepared treatment dilutions of different concentrations, and incubated for 24 hours. After incubation, all content was transferred to the 96 well plate, and readings were taken by the Elisa Plate Reader (iMark Biorad) at 490 nm and 595 nm. Different antibiotics were used as positive controls.

#### Positive control used in the MIC assay

Name of organism	Name of antibiotic
B.subtilis	Ciprofloxacin (100µg)
E.coli	Ciprofloxacin (100µg)
P.aeruginosa	Ciprofloxacin (100µg)
S.aureus	Ciprofloxacin (100µg)
C.albicans	Amphotericin B (25µg/ml)

#### Zone of Inhibition Method

The antibacterial activity was checked by following the Zone Inhibition Method (Kirby-Bauer method). The MHA plates were inoculated by spreading 100  $\mu$ l of different bacterial cultures (adjusted to 0.5 McFarland units) and followed by placing the discs containing 10  $\mu$ l of different concentrations (0 to 100 mg/ml). One disc in each plate was loaded with solvent alone, which served as vehicle control, and Ciprofloxacin discs (10 $\mu$ g) were taken as positive controls. The plates of bacterial cultures were incubated at 37 °C for 24 hours. Clear zones observed around the disc were measured and recorded. The antifungal activity was checked by following the Zone Inhibition Method (Kirby-Bauer method) for two fungal cultures. The PDA plates were inoculated by spreading 100  $\mu$ l of fungal culture, *A.niger*. The SDA plates were inoculated by spreading 100  $\mu$ l of different concentrations (0 to 50 mg/ml). One disc in each plate was loaded with solvent alone, which served as vehicle control, and a fluconazole disc (750 $\mu$ g) was taken as positive control against *A.niger*. Amphotericin B discs (25  $\mu$ g) were taken as positive controls against *C.albicans*. The plates were then incubated for 48 hours. A clear zone created around the disc was measured and recorded.

Chitra Rathod et al.,

## DISCUSSION

As chemical antimicrobial materials become increasingly resistant to antibiotics, there is a growing need to find more effective agents to combat microorganisms. While silver salts have been used as antimicrobial materials, their effect can be limited by interference with the effect of salts. However, using silver in nano form can overcome this limitation. Silver nanoparticles have a positive charge and can continuously release silver ions, which increases the surface area between the silver ion and microorganisms, resulting in a more powerful effect. In this study, biosynthesized silver nanoparticles made from the cell-free supernatant of S.aureus were used for their antimicrobial activity against different microorganisms. The tested microorganisms included *E.coli*, *B.subtilis*, *P.aeruginosa*, *S.aureus*, *A.niger* and *C.albicans*. The results showed that the biosynthesized nanoparticles had effective antimicrobial activity. The highest minimum inhibitory concentration (IC50) was found in *B.subtilis* at 6.816 µg/ml. During the zone of inhibition test, a clear zone was observed surrounding wells in different microorganisms. While only six strains were used in this study due to time constraints, these nanoparticles may be effective against a broad range of microorganisms, including resistant and genetically mutated strains. Additionally, these biosynthesized nanoparticles are free from any redox reactions, which makes them a promising candidate for future use as an antimicrobial agent.

## CONCLUSION

The biosynthesis of silver nanoparticles using *S.aureus* cell-free broth is a useful, eco-friendly, and cost-effective method. These biosynthesized nanoparticles have potential applications in the medicinal field and have been proven to be an effective antimicrobial agent. This study demonstrates that the use of biological methods to synthesize nanoparticles is effective and useful against a broad range of microorganisms, making them a promising candidate for future medicinal purposes. One of the advantages of using biosynthesized nanoparticles is their eco-friendliness and non-hazardous nature to the environment. In contrast, chemically synthesized nanoparticles via redox reactions can be environmentally hazardous. Therefore, the use of biosynthesized nanoparticles can help reduce environmental impact while still providing an effective solution for antimicrobial applications. Overall, the biosynthesis of silver nanoparticles using S.aureus cell-free broth is a promising approach that can offer numerous benefits in the field of medicine.

## ABSTRACT

Horticultural crops are prone to a wide variety of biotic stresses, like nematodes, bacteria, viruses, fungus, and oomycetes owing to occurrence of changing climatic conditions. The infections caused by the pathogens restrict horticulture crops' resilience and geographic range and affect their rate of development, production, and value. Continuous cropping approach employed in horticultural establishments significantly lowers productivity and quality while exacerbating soil-borne illnesses. Recombinant DNA technology using state of the art biotechnological tools such as RNA interference and genome editing tools based upon the CRISPR-Cas9 system are the powerful aids that can be utilized for the production of resistant varieties. RNAi exploits the gene silencing mechanism in which the genes of the pathogenic species are knocked out or knocked down by designing the hairpin constructs. The most recent CRISPR based genome/gene editing is being widely exploited in developing disease resistant horticultural crops because of its number of advantages. The most common application of CRISPR is to edit the susceptibility genes in the host so that they can be resilient to many diseases. Various case studies of developing resistance horticultural crops using the recombinant DNA technology is discussed in this review.

Niyati et al.,

## INTRODUCTION

Horticulture is an ancient agricultural strategy that has gained worldwide prominence [1]. Fruits, vegetables, and medicinal, fragrant, and visually pleasing plants are examples of horticultural crops. These plants supply essential dietary nutritional components, pharmaceuticals, and fragrances, as well as significant aesthetic value to humans [2]. The Indian economy has a significant impact on the horticultural sector which accounts for around 33% of agricultural GDA. Aside from ensuring the nutritional security of the country, it also provides alternative rural employment opportunities, diversification of farm activities, and handsome income to farmers. Improved demand for horticultural produce due to increased health awareness, rising income, export demands, and population growth offers a challenge for expanding horticultural crop production and productivity. Change in climate has raised the chances of uncertainties and dangers, also putting extra stress on industrial systems. In agriculture, plant diseases inflict significant economic, quality, and quantity losses. Plant diseases must be controlled because agricultural yield accounts for 70% of the Indian economy [3]. Pathogens and pests impair agricultural yield numerically and gualitatively, causing economic losses and jeopardizing food security with the largest impact proved in resourcepoor areas with fleetly rising populations. Plants face a wide range of biotic stressors generated from numerous inhabiting creatures such as viruses, fungus, insects/pest, bacteria's, nematodes and other organism. These biotic stressors induces a number of illnesses, outbreaks and harms the crop, eventually leading to decreased crop output [4]. The protection of crop cultivars against pests and diseases and the enhancement of crop cultivars for improved vield are critical concerns. The scarcity of disease-resistant crop varieties is causing significant losses in agricultural production for farmers. Plant breeding is essential for developing agricultural cultivars that are resistant to pests and diseases, and that have enhanced productivity, which in turn provides food and nutrition security. Resistance breeding is a technique that combines genetic modifications and advanced molecular techniques with transgenic plants to create superior crop cultivars with increased resistance to pests and diseases. By using transgenic technologies, plant breeders can use cross species and integrate genes from unrelated plants and other organisms into crop plants, further enhancing their resistance to pests and diseases [5]. Numerous biotechnological methods as well as methodologies are being explored not only to increase the diversity and value of horticultural crops but also making the crops more resilient to combat the climatic challenges particularly biotic stresses. Various state of the art biotechnological tools, techniques and strategies that are imparting the viral, bacterial, fungal, insect resistances are discussed in this review.

#### Viral Resistance

In modern agriculture, plant viruses pose substantial risks to a wide range of crops, and the financial losses brought on by viral infections are second only to those brought on by other pathogens [6]. Depending upon the type, some viruses have an extremely large number of hosts. Tomato spotted wilt virus(TSWV) has been linked to more than a thousand crops across 85 families including several veggies, tobacco and peanuts and cucumber mosaic virus are recognized for infecting over 1200 plant species across hundred families consisting the utmost of vegetables and decorative flowers [7]. Multiple efforts have been put forward in order to create resistance to viral agents in plants by expressing the virus's proteins from transgenes via pathogen-derived resistance or small RNA-based RNA silencing mechanism[8]. RNA interference (RNAi) acts as a typical genome modification procedure providing widely adopted as a strategy for gene manipulation to improve immunity to viruses in crops used in agriculture. Small interfering RNAs (siRNAs) have been employed to identify and destroy RNA from viruses, thereby decreasing viral reproduction and spread. An apparent method for inhibiting a desired gene while without significantly impairing the activity of any other genes in the plant is provided by the RNAi process[9]. Various strategies were employed for activating antiviral suppression, which fall under four subcategories: sense gene-induced post-transcriptional gene silencing, hairpin RNA-induced post-transcriptional gene silencing (hp-PTGS), trans-acting siRNA generated PTGS (TAS), and artificial miRNA induced PTGS (AMIR) [10].S-PTGS were utilized at the very early stages of advancement of growth for viral suppression. s-ptgs is a genetic modification method designed in order to enhance the susceptibility to viruses in horticulture crops. The procedure includes inserting a virus sense gene set inside the host plant's genome, resulting in RNA-mediated suppression of genes and providing virus resistance [11].(Hp-PTGS)

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Niyati et al.,

"Hairpin RNA-induced post-transcriptional gene silencing" is another genome editing technique used to improve viral resistivity in horticultural crops [12]. This approach entails the inserting of a reversed repeat sequence that forms a hairpin design, which produces double-stranded RNA that triggers RNA-mediated gene suppression and imparts viral sensitivity [13]. AMIR is a third-generation technology in which the complete miRNA sequences in the natural miRNA initial transcripts are substituted by particular RNA sequences that have properties comparable to targeted virus strains as well as favorable RISC (RNA Induced Silencing Complex) loading capabilities, resulting in the production of a novel synthetic miRNA gene. The AMIR genes went through transcription and is translated into developed miRNA via the appropriate motifs by the cellular miRNA biosynthesis pathway that imparts unique viral resistance once plants were modified [14]. The RNAi methodology is believed to be utilized consistently to yield Papaya ringspot virus (PRSV)-resistant papaya species. The modified papaya crops synthesize short hairpin RNA (shRNA) that addresses the PRSV coat protein molecule, forming siRNAs that break down viral RNA and offer resistance to PRSV infection.

The RNAi-mediated degradation of PRSV RNA was identified utilizing reverse transcription-via quantitative polymerase chain reaction (RT-gPCR), which exhibited a strong correlation with the traditional RT-gPCR approach for PRSV detection. While comparison with non-recombinant plants, recombinant papaya crops illustrated a substantial amount of immunity to PRSV infection[15]. The researchers created shRNA (short hairpin RNAs) complexes that targeted the TYLCV (Tomato vellow leaf curl virus) coat protein gene and introduced them into tomato plants. Transgenic tomato plants had lessened TYLCV invasion as well signs than non-transgenic plants, demonstrating successful RNAi-mediated viral resistance [16]. The researchers designed a construct encoding a hairpin RNA targeting the CMV 2bgene and introduced it into cucumber plants using Agrobacterium-mediated transformation. The shRNA strands are assigned to a carrier virus, which infects plant tissue and causes the shRNA to be expressed. After that, the shRNA can direct the RISC to locate and deteriorate the supplementary CMV RNA molecules. In transgenic cucumber crops, researchers observed decreased CMV transmission rates and expression rates as compared to non-transgenic plants [17].CRISPR/Cas9 technology enables the creation of a wide variety of CRISPR deviations that can be utilized for a wide range of functions which was previously effectively used to build virus-resistant plant cultivars. Moreover, gene interruption is among the most prevalent practice or approaches for the CRISPR/Cas9 technique, which assists in addressing the error-prone nature of cellular NHEJ (DNA-repair machinery) [18]. Nucleotide insertion/deletion (InDel) at sgRNA-targeted locations causes a frameshift transformation and it affects genes activity [19].

This method was previously utilized within the domain of virus resistance construction to create tolerance through modifying the expression of the susceptible (S) gene(s), disrupting crop-virus contact, and ultimately leading to decreased viral efficiency in the host plant. Another technique is to insert InDels into a gene's promoter instead of the coding region [18]. CRISPR-mediated promoter rupture inhibits the whole DNA transcription as well as their effector-binding region in highly susceptible crops through blocking a virus activator from attaching along the promoters [20]. This strategy also has the potential to design virus resistance in plants due to the gene clusters. In many hosts, removing chromosomal regions adjacent to S gene clusters would result in long-term viral resistance. Aside from virus silencing, CRISPR-mediated DNA substitution enables researchers towards exploring vital S domains[21]. An operational evaluation on vulnerability genes gives us a better understanding of how genes are regulated. Most guest proteins serve a critical purpose for the genome's pathogenesis, manifesting in the activation and positioning during viral infection. A number of resistance (R) gene(s) have been found among native varieties, while effective resistance transmission into cultivated horticultural crops has been established [19]. Utilizing combinatorial homology-directed repair (HDR) procedures, such an approach might substitute erroneous as well as inadequately operating R genes against domesticated varieties of crops with a working R gene generated by a virusimmune cultivar. CRISPR-mediated alteration generated by the bio-mimicry method alters the intended region back into sequences of a virus-immune variety [20]. This approach is useful as this permit the insertion of just particular alterations linked to virus-silencing feature instead of modifying each and every gene. As a result, changes within the nucleotide chains of particular genes between farmed and natural varieties are not adequate enough to impart longterm resistance to many viruses that affect plants. In this case, the Cas9 tool may be employed to tweak a specific

ALLESS 13314. U

Niyati et al.,

gene to provide long-term resistance in plants [22]. Figure 1 illustrates the mechanism of CRISPR/Cas9 system in diagrammatic representation. CRISPR-Cas9 is being utilized in targeting a Citrus tristeza virus (CTV) along with the Citrus psorosis virus (CPsV) in citrus. The researchers targeted the *CTV p23* gene as well as CPsV coat protein gene utilizing CRISPR-Cas9 system. When analyzed alongside the unmodified plants, the altered plants had fewer virus indications and smaller viral loads [23]. In pepper crops, CRISPR-Cas9 has been implemented for gaining tolerance to the Banana bunchy top virus (BBTV). Using the CRISPR-Cas9 technology, scientists have addressed the BBTV *Rep* gene [24].

#### Fungal Resistance

Although fungicides are frequently employed to treat a large spectrum of microbial infections, they are typically vague and eliminate both productive bacteria and infectious agents. Furthermore, the majority of fungicides are detrimental to the well-being of people as well as the natural ecosystem. Therefore, repeated exposure to these chemicals can result in fungicide resistance [25]. As a result, generating fungal disease-resistant strains could be a viable optional strategy for efficient aesthetic productivity while minimizing fungal pathogen losses. Conventional rearing for fungal disease resistance is hampered by a number of constraints, including a lack of genetic sources for numerous illnesses, the transmission of unwanted characteristics through genes that are resistant, with the guick development of infections' ability to circumvent plant-silencing techniques [26].Genetic engineering, on the other hand, has the capacity to surpass the limits of traditional breeding procedures by manipulating the plant's capability to identify and fight fungal diseases. Researchers have been able to better comprehend the molecular basis of plant defensive responses because of the advancements in genetic engineering, which has resulted in the development of novel disease-fighting strategies. Unlike traditional cultivation, genetic manipulation enables the simultaneous rise of pathogenic tolerance against various diseases, along with the desired gene that can be put into the intended target host regardless of whether it isn't present in the natural gene reservoir [25]. According to a recent study, establishing suppression within crops for cultivation using controlling mechanisms is feasible and efficient. B.cinerea, a necrotrophic fungus generates the short RNAs (sRNAs) that act as crucial trigger in inducing host defense [27]. Host plants can in turn, transfer sRNAs into B. cinerea via extracellular vesicles, which reduces the production of pathogenicity-related genes. Host resistance is enhanced or inhibited by over expression or reduction of transmitted host sRNAs. The results of this study imply that transmitted host sRNAs help to protect the host by suppressing fungal DNA [28].

Also, the long non-coding RNAs (IncRNAs) serve substantial roles in a wide range of biochemical actions involving crop defense response pathways [29]. Within tomatoes, IncRNA16397 stimulates SIGRX articulation and later it initiates ROS buildup as well as structure damage, while IncRNA33732 induces RBOH activity for boosting H<sub>2</sub>O<sub>2</sub> formation and so improves tomato immunity towards Phytophthora infestans [30]. Grapes have 71 and 83 IncRNAs that respond to or are resistant against powdery mildewing transmission, correspondingly. According to new investigations, they promote a variety of reactions, including ROS, Ca<sup>2+,</sup> membrane strengthening, PR generation of protein, phytohormones, and secondary metabolic processes [31]. The result of these increases the knowledge towards the comprehension of IncRNA modulation in the resistivity of horticultural plants. Another effective approach to generating resistance in cultivated crops may be translational surveillance of mRNA by regulatory element modification. In eukaryotes, upstream open reading frames (uORFs) are key regulators in mRNA translation [32]. In one of the intriguing works, altering the uORF of LsGGP2, resulting in the generation of a critical chemical ascorbic acid production in lettuce, that enhances oxidative damage sensitivity as well as ascorbate concentration. Additionally, CRISPR/Cas9 enables the creation of transgene-free crop variants having enhanced characteristics which has major substantial implications for agricultural development [33].Correspondingly, constitutive AtNPR1 expression in 35S: uorfs TBF1-AtNPR1 plants results in evident broad-spectrum resistance to disease with little growth implications. Since uORFs are persistent in eukaryotic mRNAs, which can be anticipated as controlling components that are going be tweaked for promoting wide-ranging tolerance while not having any effect upon typical development along with considerably aiding genetic potential among horticulture plants. TALEs (transcription activator-like effectors) serve as an emerging priority in the execution of gene discoveries that have the potential towards influencing resistance. TALEs possess the ability to adhere to effector binding elements (EBEs)

## Niyati et al.,

within the host plant inducer along with they can stimulate the expression of resistance (R) genes and host susceptibility(S) in *Xanthomonas* [34].Tomato *Bs4* (bacterial spot resistance locus no. 4) is a TALE-sensing NLR polypeptide which recognizes *AvrBs4* and stimulates disease resistance in the hosts. TALE-based approaches are ought to be utilized for finding effector R genes among different horticultural crops. Throughout the recent decade, many valuable technologies, like TALE nuclease (TALEN) machinery including the split-TALE (sTALE) framework, which were recently created enable genetic engineering, transcriptome controlling, as well as proteomics research [30].The advancement of all these approaches will contribute towards the acceleration of wide-spectrum fungal disease tolerance throughout horticultural development programs. One of the most severe diseases, *Fusarium axysporum* f. sp. niveum (FON) causes watermelon (*Citrullus lanatus*) wilt, which has an impact on watermelon quality and yields globally [35].The phytosulfokine (PSK) precursor is encoded by the *Clpsk1* gene, which is knocked out using the CRISPR/Cas9 system to greatly increase watermelon's resistance to FON [36].

#### Insect/Pest Resistance

The Bacillus thuringiensis soil bacterium's Bt (cry) gene has proven to be particularly successful in controlling a wide range of lepidopteran insects in numerous crops. The Bt gene in tomatoes was initially associated with insect resistance in 1987. In transgenic Bt tomato plants, resistance to Spodoptera lituria and Heliothis virescens was seen [37]. Agrobacterium tumefaciens was used to alter the brinjal (Solanum melongena cv. Pusa Purple Long) utilising the synthesised cry1Ab gene that codes for an insecticidal crystal protein [38]. The synthesised cry1A(b)gene was developed for transforming the cauliflower cultivar Pusa Snowball K-1, and the transgenic plants indicated the transgene's productiveness in suppressing diamond back moth (Plutella xylostella) larval invasion through insect bioassays. Researchers created the transgenic cabbage (Brassica oleracea var. capitata) line DTC 507 to control resistance to the diamondback moth by encoding a translated integration result of cry1B and cry1Ab endotoxins from B. thuringiensis [39].Okra (Abelmoschus esculentus) was effectively transformed and expressed with the Bt gene (Cry1Ac) [40].During insect bio assay, fruits from transgenic lines exhibited a 100 percent rate of death for larvae. A variety of horticulture crops were given resistance by the insertion of both synthetic and natural insect resistance genes. Vine weevil resistance (Otiorhynchus sulcatus) has been demonstrated using transgenic strawberries via a continuous promoter producing a (Vigna unguiculata) cowpea proteolytic inhibitor of trypsin gene (CpTi). Through the use of insect bioassays, the CpTi transgenic strains decreased the rate of weevil larval and pupal mortality. In resistance to the codling insect pest, produced transgenic apple varities that had a trypsin inhibitor conveying the CpTI gene through the cow peas with acry-1-A(c) gene via Bacillus thuringiensis [41].

RNA interference technology has allowed the development of insect resistance in horticultural crops. RNAi-based insect resistance had been developed in citrus against Asian citrus psyllid [42], for making transgenic potato resistant against Colorado potato beetle and the potato tuber moth [43]. RNAi technology is also being utilized to develop tomato plants having resistance against tomato fruitworm and pinworm [44]. Strawberries are a widely cultivated horticultural crop that is susceptible to several insect pests, including the two-spotted spider mite and the strawberry bud weevil. RNAi technology has been used to develop strawberry plants that are resistant to these pests by targeting genes involved in their feeding and development. A study conducted in Japan showed that RNAi-based insect resistance in strawberries can significantly reduce pest damage and increase yield [45]. Another approach to creating insect and pest resistance in horticultural plants is through CRISPR mediated genome editing tool.Diamondback moth (Plutella xylostella) is a major pest in cabbage production worldwide. The CRISPR-mediated genome editing was used to create diamondback moth-resistant cabbage plants by targeting and disabling a gene involved in the production of glucosinolates, which are toxic compounds that cabbage plants produce in response to diamondback moth feeding. The gene-edited cabbage plants were shown to be highly resistant to diamondback moth without compromising plant growth and yield [46]. The CRISPR-mediated genome editing was used to create tomato plants that are resistant to tomato fruit borer by targeting and disabling a gene involved in the production of jasmonic acid, a hormone that is released in response to insect feeding. The gene-edited tomato plants were shown to be highly resistant to tomato fruit borer without compromising plant growth and yield [47].

## **Bacterial Resistance**

Bacteria resistance is one of the major concerns in the world of horticulture, as it can help in the reduction of crop yield and quality. Plant pathogens or disease-causing bacteria pose a significant threat to horticultural crops, reducing their productivity and marketability. Some of the major bacterial diseases in horticulture crops include bacterial wilt, bacterial leaf spot, bacterial blight, and fire blight. Many bacterial pathogens develop resistance to one or more antibiotics that are commonly used to control bacterial infection. Such defense mechanisms can arise due to genetic mutations or transfer of resistance genes between different bacteria. Once the resistance gene is present, it can spread rapidly throughout bacterial populations and lead to the emergence of one or more virulent strains that can cause serious agricultural problems. The management of bacterial diseases in horticulture crops requires the careful use of antibiotics and other chemicals that are proven to be effective against bacterial pathogens. However, this approach leads to the development of antibiotic-resistant strains of bacteria, which eventually renders the chemicals useless. Therefore, new strategies are required to manage bacterial diseases in horticultural crops that do not rely on antibiotics or other chemical treatments [48]. The resistance to bacterial diseases like Xanthomonas campestris and Pseudomonas syringae had been acquired via RNAi using the hairpin construct [49]. The hypersensitive responseassisting protein (HrpZ) which contributes to the release of virulent markers is encoded due to HrpZ gene, which is present in various plant pathogenic bacteria. It was showed that the HrpZ gene, which was placed into tomato and tobacco varieties, confers defense against pathogenic bacteria such Pseudomonas syringae [50].

The*Rpm1* gene encodes a protein that is recognized for influencing bacteria's activity and initiating a defensive mechanism in *Arabidopsis thaliana*. Tomato plants were genetically engineered using the *Rpm1 genew*hich provideddefense against *Pseudomonas syringae* [51]. The *Xa21* from rice had been used to genetically engineer the tomato which was capable of providing defense against bacterial diseases like *Xanthomonas campestris* [52]. *X. campestris* is an essential pathogen affecting cruciferous plants, notably broccoli and cabbage. It has been revealed that the toxicity of *X. campestris* in cabbage as well as broccoli can be decreased by utilizing RNAi to silence the *hrpX* gene, which is implicated in the release of virulence proteins [53]. A prominent agent of citrus crops is *X. axonopodis*. It has been revealed that the virulence of *X. axonopodis* in citrus can be artificially decreased by utilizing RNA interference to knock down the *gumB* gene, which participates in the generation of extrinsic polysaccharides [54].Pear and apple trees are seriously harmed by *E. amylovora*. It was successfully demonstrated the virulence of *E. amylovora* in pear and apple trees can be decreased by employing RNA interference to silence the *pelL* gene, which participates in the breakdown of pectin [55].A significant pathogen of several horticultural crops, such as tomato, pepper, and cucumber, is *P. syringae*. It has been discovered that *P. syringae* virulence in these crops can be decreased by utilizing RNA interference to silence to silence genes involved in type III secretory structure, which are in charge of delivering effector molecules into the cells of plants [56].

## CONCLUSION

In the present review article, the potential applications of recombinant-DNA technology or genetic engineering for developing disease resistant horticultural crops have been discussed in detail. The state of the art biotechnological tools implementing the recombinant DNA technology has multiple applications in the farming industry as a result of the growing world population and demand for effective intensification, which is causing food insecurity. Biotechnology has had limited success in business to date in horticultural crops, such as fruits, vegetables, flowers, and landscape plants, compared to the increasing global adoption of biotech field crops. We can't ignore the potential of this technology at this moment in time to modify our horticultural crops to overcome various production limits like biotic or abiotic stressors and increased quality of fruit. Resolving many regulatory obstacles will make it possible for commercial distribution of an array of transgenic crops, enabling consumers and different beneficiaries to get the most from this remarkable technology.

## ABSTRACT

The experiment was conducted to examine the effects of dietary administration of commercially available probiotic, Zymetin (ZY) on growth performance and immune responses of white shrimp (*Litopenaeus vannamei*). Shrimp (0.31±0.04 g) was fed with basal diet (control without challenge test (-) and control with challenge test (+)), supplemented with 2.5%, 5.0%, 7.5%, and 10.0% Zymetin was encapsulated with commercial feed (CP Aqua) for 30 days. Five shrimp were sampled from each tank after the feeding experiment to determine bacterial levels and immunity. Finally all the shrimp were challenged by *V. harveyi* infection for 7 days. Shrimp week growth rates and food conversion ratios were significantly better in the ZY treatment after 30 days than in the control group. A higher Total Haemocyte Count (THC) and phenoloxidase activity were also measured in all ZY treatments than in the control group. Following a co-infection challenge test, probiotic treatments had higher PO, THC, and Respiratory Burst (RB) activity than the control (+). Then, the lowest survival rate of shrimp was observed in the control (+), whereas higher survivability was observed in Zymetin treated groups

Keywords: Shrimp culture; Litopenaeus vannamei, Probiotics, Zymetin, Vibrio harveyi.

Venkatesan et al.,

## INTRODUCTION

Aquaculture production has increased dramatically in recent years, with Penaeid shrimps being one of the most significant cultivated species worldwide, particularly in Asia, due to their high economic worth and exportability [1]. More than 5 million metric tonnes of prawns are produced each year, but the current global demand for both wild and farmed prawns is more than 6.5 million metric tonnes per year [2]. Nowadays, despite high levels of shrimp production by culture, shrimp farmers have suffered significant economic losses due to disease problems that have plagued the industry. The continuous outbreak of the White Spot Syndrome Virus (WSSV) disease in *Penaeus monodon* culture has led to a loss of shrimp culture in India. As a result, farmers are actively seeking alternative shrimp species for culture. In 2008, the Coastal Aquaculture Authority (CAA) of India introduced *Litopenaeus vannamei*, a new shrimp species, as an alternative Penaeid species for culture and export. *Litopenaeus vannamei* has been established as an alternative to *Penaeus monodon* for shrimp farming in several countries, including East, Southeast, and South Asia [3].

The spread of infectious disorders, especially those brought on by viruses and bacteria, is one of the issues with white prawn intensive farming. *Vibrio harveyi*, a bacterium, was the source of the bacterial sickness that affected the white prawns [4]. Around the world, *Vibrio harveyi* has been identified as a dangerous infection for a variety of aquaculture organisms [5]). The condition has been managed using a variety of strategies. The use of antibiotics or other chemicals in aquaculture may increase the danger of infections that are resistant to antibiotics [6]. In order to prepare prawns for innate immunity by boosting their resistance to infections, probiotics were administered as a disease-controlling alternative. Probiotics are seen of as a live microbial food supplement that enhances the host's and their culture environments' microbial balance and wellness [7]. Probiotics significantly enhance disease resistance and modulate gastrointestinal microbiota in shrimp [8], lobster [9], and sea cucumber [10], parrot fish [11] and koi [12]. The present study aimed to determine the most optimum concentration of probiotic, Zymetin on the growth performance, immune response and disease resistance to infection with *V. harveyi* of shrimp (*L. vannamei*).

## MATERIALS AND METHODS

## Probiotic and Diet Preparation

Commercially available probiotic, Zymetin (ZY) was used in this study. Two hundred milliliter of the ZY with rice bran, tapioca flour, sugar and yeast were added to 200 L of freshwater and left overnight with vigorous aeration. After fermentation, the slurry was applied evenly in the ponds. The dosage of the probiotic was increased as the culture days increased. four experimental diets were prepared with different concentration of probiotics supplemented with 2.5%, 5.0%, 7.5%, and 10.0% was encapsulated with commercial feed for 30 days. Diets were then stored in clean plastic bags at 4°C until use.

#### **Culture Condition**

A commercial hatchery in Sirkazhi, Tamil Nadu, India provided the experimental post-larval vannamei (PL) prawn, which was reared there for 21 days before testing. Shrimp with a mean initial body weight of 0.33 g and a density of 15 per tank were randomly placed in triplicate tanks (30 35 40 cm; volume 0.3 m<sup>3</sup> The shrimp were fed four times a day until they reached their target weight, with 10% of the total biomass in each feeding. Water temperature was maintained at 27-29°C; salinity ranged from 29–32‰; pH 7.4–7.5 and dissolved oxygen (DO) between 4.5-6.5 mg/L as well as ammonia nitrogen levels less than 0.016 mg L-1 inside culture vessels

#### Growth and Feed Conversion Ratio

After 1 month, the total number of prawns was counted and the mean body weight was calculated. Based on this weight of shrimp and the quantity of shrimp counted, the Daily Growth Rate (DGR) and Feed Conversion Ratio (FCR) were determined using the following equations:

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

$$DGR(\%) = \left(\sqrt[4]{W_{*}/W_{*}} - 1\right) \times 100 \text{ FCR} = \frac{F}{Bt + Bm - Bo}$$

where,

DGR is the specific growth rate in weight (% g),

Wt and Wo are shrimp weight at current time (t) and at the beginning of the experiment (o), respectively,

t is the number of rearing days (day).

FCR is food conversion ratio,

F is the total dry food consumed (g) and

Bt, Bm and Bo is the total biomass of the shrimp (g) at current time (t), due to mortality of shrimp (m) and at the beginning of the experiment (o), respectively, whereas t is the number of rearing days (day).

#### **Challenged Test**

The bacteria *Vibrio harveyi* was procured in CAS in Marine biology, Parangipettai, Tamilnadu, India. For the challenge test; ten shrimp were injected with a dose of live *V. harveyi* bacteria equal to 10<sup>3</sup> CFU per tank from a 24 h culture grown in ZMA medium at 29°C. The shrimp mortality rate was observed for 7 days following injection

#### Immune Parameter Assay

Using a syringe filled with anticoagulant solution, hemolymph was drawn from the ventral sinus. The identical samples obtained from the five prawns kept in the same tank were combined and utilized as a single batch. The anticoagulant solution for haemolymph (10 mM EDTA, 340 mM NaCl, 30 mM trisodium citrate, and pH 7.0). A 1:2 (v/v) anticoagulant solution was extensively incorporated into the haemolymph. Shrimp haemolymph samples were taken twice, once after 30 days of feeding (before the challenge test) and once after the challenge test with *V. harveyi* was completed (7 days later). The THCs were determined using a haemocytometer at 100 times magnification. Cells were counted on both sides of the grids. THCs were calculated using the following equation:

THC = Cells counted × dilution factor × 1000 = Volume of grid (0.1 mm<sup>3</sup>)

According to Liu and Chen [13], phenoloxidase activity was measured. Briefly, 50 L of haemolymph were combined with 50 L of 0.1% trypsin in CAC buffer, which was incubated at 25°C for 10 min. After that, 50 L of L-DOPA (0.3% in CAC buffer) were added, mixed, and the ideal density was assessed at 490 nm. An increase of 0.001 min/mg protein in absorbance was used to measure one unit of enzyme activity.

The method of Song and Hsieh [14] was used to evaluate the Respiratory Burst (RB) activity of haemoglobin by reducing NBT (nitrobluetetrazolium) as a gauge of superoxide anion ( $O_2$ ). After being incubated for 30 minutes at room temperature, a total of 300 mL of the haemolymph-anticoagulant combination was centrifuged for 20 minutes at 3000 rpm, with the supernatant being discarded. After that, 100 mL of NBT (HBSS solution containing 0.3% NBT) was added, and stand for 2 hours at room temperature. The mixture was centrifuged at 3000 rpm for 10 min, the supernatant was collected, and 100 mL of 100% methanol was added. This was followed by another 10 min at 3000 rpm centrifugation, with the supernatant being discarded. Then, two times, 70% methanol was used to rinse the formed pellets. The next 120 mL KOH (2 M) and 140 mL of dimethyl sulfoxide (DMSO) was added to dissolve the pellet. Insoluble pellet was then inserted into the microplate to measure Optical Density (OD) using a microplate reader at a wave length of 630 nm. Respiratory burst expressed as NBT reduction per 10  $\mu$ L haemolymph.

#### Statistical Analyses

Results are presented as Mean  $\pm$ SD (standard deviation of means). Data analysis was done with statistical analysis methods at a 95% confidence interval ( $\alpha = 0.05$ ). Statistical analyses were performed using a statistic program SPSS (version, 17.0). One-way analysis of variance (One-way ANOVA) was used to determine significant differences between the treatments followed by Duncan's Multiple Range Test (DMRT).

## **RESULTS AND DISCUSSION**

## **Growth and Feed Conversion Ratio**

Supplementation of ZY appears to increase the WGR and decrease the FCR as compared to the controls. The highest DGR (9.94±0.18%) and the lowest FCR (1.42±0.05), respectively observed in 7.5% ZY treatment and was significantly different than control groups (p<0.05; Fig. 1). The 2.5% ZY treatment has no significant difference in growth performances compared with the control groups (p>0.05). Similar findings were made for the European lobster (*Homarus gammarus* L.), which when fed a probiotic diet comprising a combination of *Bacillus* spp. and MOS showed considerably higher weight gain, SGR, and FCR [9]. *Bacillus subtilis* and fructo oligosaccharide (FOS) were shown to improve growth performance in juvenile large yellow croaker (*Larimichthy scrocea*) by Ai et al. [15].

## Immune Response

Total Haemocyte Count (THC) of shrimp fed on different doses of probiotic is shown in Fig. 2. After 30 days of culture, THC increased significantly in the group treated with probiotic 7.5% (C) compared with control groups. THC of shrimp from the groups fed ZY supplemented with 2.5%, 5.0%, 7.5% and10.0% were higher (p<0.05) compared control (+). Shrimp fed with the control positive diet produced the lowest THC. According to Rodriguez and Le Moullac [16], Smith et al. [17], and Hauton [18], the haemocyte produces inflammatory-type reactions such as phagocytosis, haemocyte clumping, generation of reactive oxygen metabolites, and release of microbial proteins. After the challenge test, THC levels in all prawn treatments decreased. The body's defence mechanisms, including phagocytosis activity, encapsulation, nodule formation, and the degranulation process for system prophenoloxidase activation (ProPO), had an impact on the reduction of cells' hemocytes following the challenge test [17].

Phenoloxidase (PO) activities in haemolymph showed increasing tendency with the increasing doses of ZY in diets (Fig. 3). The shrimp in treatment 7.5% ZY and 10% ZY produced the highest PO activities with, followed by shrimp fed with treatment 5.0% ZY and they were significantly higher than the control groups (Fig. 3; p<0.05). After being given the challenge test with *V. harveyi*, PO activities in control (-), control (+) and all treatments showed an increase. According to data, PO activity of shrimp before challenge test known to be positively correlated with the value of THC. Hemocytes of shrimp function within the production and release of PO into hemolin in the form of inactive pro-enzyme called ProPO [17]. After being given a challenge test all treatments showed an increase. Increased activity of PO indicates a high immune response of shrimp. Lesmanawati [19], stated that an increase in PO activity occurs on the fifth day post-infection IMNV and shrimp on synbiotic treatment resulted in an increase in PO was higher than the control.

In this study, respiratory burst activities (RB) for all treatments were presented in Fig. 4. After feeding trial for 30 days, RB activity in Haemolymph was not significantly different between probiotic treatments and controls (Fig. 4; p>0.05). In contrast, RB activity after challenged with *V. harveyi* significantly increased and was significantly different with controls (Fig. 4; p>0.05). According to Rodriguez and Le Moullac [16], respiratory burst (RB) is an oxygen-dependent killing mechanism used by phagocytic cells to rid themselves of foreign particles. According to the findings, probiotic therapy does not boost RB activity; rather, *V. harveyi* infection is to blame for the rise. Numerous investigations [11, 20] revealed that the treatment of probiotics had no discernible effect on RB activity.

#### Survival

Shrimp survival after the 30 days of experimental period was similar in all experimental groups. Shrimp survivals after challenged with *V. harveyi* significantly increase as the dose of dietary probiotic in diet increased (Fig. 5; p<0.05). Shrimp fed with the control positive diet produced the lowest survival and were significantly different (p<0.05) from the groups fed synbiotic supplemented with ZY 2.5%, 5.0%, 7.5% and 10.%. This probiotic had significantly reduced mortality of the shrimp challenged by infection with *V. harveyi* and also stimulate immunity of the shrimp. In the previous study, probiotic SKT-b had been reported that probiotic may enhance resistance of shrimp (*L. vannamei*) to *V. harveyi* [21]. Similarly, the result has been reported that SKT-b is known to inhibit the growth

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Venkatesan et al.,

of *V. harveyi* pathogens effectively both *in vitro* and *in vivo* on tiger shrimp (*Penaeus monodon*) larva [22]. The high resistance of survival shrimp might be caused by enhanced of innate immunity. Results of this study showed that probiotic, Zymetin (ZY) in shrimp diets can significantly improve growth and disease resistance by enhancing immunity, as well as presumably modulating microflora in the shrimp's gut. The results showed that the most optimum dose of dietary probiotic in this study was shrimp 7.5% ZY.

ABSTRACT

Text mining is the process of extracting hidden information from unstructured to semi-structured material. Text mining is the process of discovering new information by mechanically extracting it from various written resources. As vast amount of data is generated every minute some meaningful information should be extracted from the available resource and these data provide information and knowledge which will be very helpful for analysis. This paper focuses a main area based on health care records and also illustrates the methods and techniques in text mining .As health care databases are growing drastically we need to extract knowledge from the available sources.

Keywords : Machine Learning, Text Mining, Health Care, Medical Records, Text Analytics.

## INTRODUCTION

Text mining also called as Text Data Mining or Text Analytics is the process of drawing out content based on meaning and context from vast amount of text. It transforms the unstructured text into structured data for easy analysis and it used Natural Language Processing (NLP) to understand the human language for natural processing. Text mining extracts valuable insights from unstructured text. By analyzing vast amount of data generated, text mining analyzes complex and large dataset in a simple and effective way. In businesses large amount of data are generated every day as an opportunity and challenge. This data helps the companies to get smarter insights about people's, opinions about a product or service which may be e-mail, product reviews, social media posts, customer feedback etc. So to process these kinds of data text mining uses simple methods and techniques, makes us understand about the working of text mining.[1] In the recent years Text Mining gained the attention of the users due to massive amount of data and it automates the process of classifying texts by sentiment, topic, and intent. Not

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Jayasudha and Manju

only businesses, as healthcare databases are growing exponentially, it collects text and numerical information about patient's visits, prescriptions, and physician notes and so on. The medical service combined with e-clinical records could lead to improve the quality of healthcare and research initiatives, fewer medical errors, and lower costs.

## **TEXT MINING BACKGROUND**

Data mining is a statistical technique for processing raw, structured data. Usually this is done with preexisting databases and spreadsheets to gather information. Here statistical tools are used for analyzing data. It is a combination of Artificial Intelligence, Machine Learning and Statistics mainly used in areas like marketing and health care. Considering healthcare, text mining improves the quality of treatments, increasing revenues or lower costs of healthcare organization such as a hospital. Data mining is widely used area in computer science, economics, communication and marketing, allowing finding important patterns on information that are, otherwise, difficult to analyze. As text mining is closely related to Data Mining, it is used to process collection of unstructured text files such as Word documents, PDF files, text excerpts, and XML files. These textual data are used in academic research literature, health care, biology and marketing.

Text mining is a variation of data mining from text data collections. The main aim of text mining is to find the knowledge from text data, which are unstructured or semi-structured. Text mining is a branch of Data Mining (DM) using KDD to discover knowledge from various data sources, which includes text data, relational databases, Web data, user log data, etc. Text Mining is related to other research areas like Machine Learning (ML), Information Retrieval (IR), Natural Language Processing (NLP), [9] Information Extraction (IE), Statistics, Pattern Recognition (PR), Artificial Intelligence (AI), etc. As all the data generated today are in the form of e-mails, text messages, documents and files and to know the best insights of data and its patterns text mining came into existence. Text mining is considered as a semi-automated process of extraction patterns and discovering knowledge from unstructured data.

Until the introduction of Text mining, data mining was the dominant approach as they had to control only structured data. As Data volumes are exploding and most of this is unstructured and text mining is necessary to deal with unstructured data. so to handle both structured and unstructured data to provide greater insights in the business operations and decision making, we are in need of text mining.[2]Most businesses will collect huge amount of data through customer feedback, product reviews and social media posts. So to analyze this kind of vast amount of data text mining is necessary to find the valuable opinion and feedback of the customers clearly. Without text mining above mentioned task is a challenge to categorize the opinion and automation helps the companies to overcome their drawbacks by going through more feedbacks using opinion mining.

#### **TEXT MINING TECHNIQUES**

The process of Text mining involves various activities to gather structured information from the unstructured text by parsing, adding linguistic features and removing unnecessary patterns from database .[3]By structured data final evaluation will be done and the output will be interpreted. So this is an automatic process that extracts the valuable insights from data collected. These techniques deploy various text mining tools and applications for their execution. To make the data structured the steps to be followed are

**Information Extraction-** A most famous text mining process used to extract meaningful and valuable information from unprocessed or unstructured massive amounts of data. This is the initial step for identifying key phrases and relationships ,tokenization, focuses on identifying the extraction of attributes, entities, relationship from semistructured or unstructured text. Extracted information is stored in the associated database or some separate storage for additional processing with precision and recall processes.

Informational Retrieval- By using this process relevant and associated pattern are extracted based on specific set of words. With the help of algorithms,

**different behavior** of users is identified and discovers the relevant data and information. Search engines uses query based algorithms for Information retrieval to derive relevant documents according to the keywords used in search

## Jayasudha and Manju

**Natural Language Processing (NLP):** Text mining uses various methodologies for text processing, includes **natural language processing (NLP)**. NLP is a subfield of computer science, linguistics, data science, and artificial intelligence deals with the interaction between humans and machines. It allows computers to understand both speech and text forms. Text analytics usually breaks down the sentences into words or phrases before analyzing. So unstructured text contents are separated apart to know the details in it. Using NLP, Text mining exact theme of the contents specified will be extracted. Text mining includes seven steps as shown in Fig.1 like Language identification, Tokenization, Sentence Breaking, Part of Speech Tagging (POS), Chunking, Syntax Parsing and Sentence Chaining. Each step is very ihortant to handle unstructured data in text mining

- Language Identification: The first step in text analytics is language identification that identifies in what language the text is written in. It may be Spanish, Singlish, Arabic, English and so on. Lexanalytics is a text mining technology and NLP feature, processes each text document that goes through to transform data into structured data and also supports nearly 25 languages with more alphabets.
- Tokenization: The second step is to break the sentence into pieces called tokens. Tokens are individual units like words, Punctuations, Hyperlinks or phonemes. Tokens are used in the process of text mining. The process of breaking the sentences into words is called Tokenization and it is language specific as every language follows different tokenization requirements. For Example English language uses punctuation methods and spaces to separate tokens. But logographic languages like Chinese have no space to break between words, so it differs based on the language. So algorithms can also be used to tokenize the sentences in various languages.
- Sentence Breaking: After token identification, next step is to identify the end of the sentences. To separate the sentences also we need some spaces and punctuation symbols to identify the end of the sentence. Some deeper text analytics should be used to identify the sentences using boundary recognition.
- Part of Speech Tagging and chunking: After language identification and tokenization, broken words should be tagged. After token identification and sentence breaking we should tag the words.Part of Speech tagging used to identify things like whether a given token represents a proper noun or a common noun, or if it's a verb, an adjective, or something else entirely. This step is an important step in text analytics.
- Chunking: Chunking is a process of extracting phrases from unstructured text, by analyzing a sentence to identify the constituents. So chunking refers to breaking sentences into component phrases.PoS tagging means assigning parts of speech to tokens whereas Assigning PoS-tagged tokens to phrases is called chunking.
- Syntax Parsing: The syntax parsing is a way to determine the structure of a sentence. Syntax parsing is one of the most computationally-intensive steps in text analytics. Unsupervised machine learning models are used in Lexanalytics, works on more input words and complex matrix factorization, which helps to understand syntax just like a human.
- Sentence Chaining: The final step in preparing unstructured text for deeper analysis is sentence chaining, also known as sentence relation that uses Lexalytics which utilizes a technique called "lexical chaining" to relate sentences. Even if paragraphs apart in a document, the lexical chain will flow through the document and help a machine detect overarching topics and quantify the overall "feel.
- **Clustering-** Most crucial text mining technique that identifies intrinsic structures in text and organize into different subgroups called clusters. So a meaningful cluster should be formed from the unlabelled data without prior information. Tools like Cluster analysis helps in data distribution .Clustering is one of the most crucial text mining techniques. It tries to identify in-depth structures in textual information and organize them into relevant subgroups or 'clusters' for analysis. A challenge in the clustering process is to form clusters from the unlabeled textual data without having any prior knowledge on them. Different clustering techniques are hierarchical, distribution, density centroid, and k-means clustering, used for analyzing unstructured text documents.
- **Categorization** :Texts are categorized and assigned to predefined set of topics based on their content. The main task of text classification/text categorization is to increase the detection of information that can lead to a better decision. Using Natural Language Processing (NLP) it gathers text documents for processing and analyzing to uncover the

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Jayasudha and Manju

right topics or indexes for each document. So co-referencing method is used to extract relevant synonyms and abbreviations from textual data. This methodology is used in healthcare systems to identify disease categories, operation procedures, and insurance reimbursement codes. Some useful analytical classification models, used to categorize text, are naive Bayesian classifier, nearest neighbor classifier, decision trees, and support vector machines. Applications included in categorization are document organization, spam filtering, SMS categorization, and hierarchical categorization of web pages.

- Text visualization This technique is used to represent textual information into a visual map which produces large textual information into visual layout. It enhances browsing capabilities and also improves the discovery of relevant information. Text flags are used to show the document category to represent individual or group of documents with the help of colors to show the density. It also helps us to know the hierarchy levels visually. The process of visualization involves Data preparation, Data analysis and extraction and visualization mapping.
- Summarization- Generating compressed text automatically, from multiple text sources to analyze and summarize the text contained in these multiple text sources. So, summarization collects various parts of the textual data to make a meaningful text. Lexicon lists are generated in this stage on the basis of phrase or words in the document. Length of the Sentence, fixed phrase, paragraph, thematic words and upper case word identification features can be analyzed for text summarization. This technique can be applied on multiple documents at the same time. Quality and type of classifiers depend on nature and theme of the text documents. So text summarization is used to create a summary according to the meaning of the text. Text summarization involves text pre processing, it is performed to clean the data to remove the spelling errors, avoid duplication and replacing acronyms.

There are other approaches used in text mining for interpreting and exporting keywords. Keyword based association is based on association analysis that reduces the incorrect retrieval using some stop words, keywords or idiomatic expressions. Document classification method is used in libraries to assign tags to document, classifying genre and type of writing for tagging. Trend Analysis finds patterns on information for future event prediction and also estimates the events of past. Vector space model is a technique which is representing documents or searches by vectors to find similarities between them. Indexing Techniques uses tables and id of all documents for making related searches faster. Inverse document frequency finds out the words based on the importance of words and to search with more precision to extract keywords. Text mining techniques and methods are available to derive valuable insights from text data. Most commonly used text mining techniques are Word frequency, The concept of finding out the recurrent terms from the data set and most mentioned words in unstructured text is very useful in analyzing customer reviews, social media conversations or in feedbacks. So here the terms that are frequently used are analyzed in word frequency. Then Collocation which refers to combination of words which appear together most of the times. Some words usually come together, it may be bigrams(two words) like "get started "or trigrams (three words) like "keep in touch ".So identifying collocation and using word improves the granularity of the text, for better understanding of its semantic structure and more accurate text mining results. Finally Concordance used to recognize the particular context or a word or set of words appears. As human language can be ambiguous and the same word can be used in different contexts.

#### METHODS USED IN TEXT MINING

There are various techniques being developed to solve the text mining problems, they are basically the relevant information retrieval according to the requirement of users. Counting on the information retrieval techniques, [1] some common methods are shown in Fig.2.

**Term Based Method**: Term is defined as a word which has a well-explained meaning in a document. Every term in a document is having a specific meaning and documents are analyzed on the basis of term weight age. Even this method is facing problems like polysemy and synonymy. A word has multiple meanings is called polysemy and

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Jayasudha and Manju

multiple words having the same meaning is called synonymy. So by finding out the semantic meaning of many terms is not sure for answering what exactly users want.

**Phrase Based Method**: When compared to term this provides semantic information and is less confusing as Phrase carries more semantics like information and is less ambiguous. In phrase based method document is analyzed on phrase basis and more distinct when compared with terms. The reason to choose phrase based methods include Phrases have inferior is statistical properties to terms, and low frequency of occurrence, Extensive replication and noisy phrases are present among them.

**Concept Based Method:** Here analysis done on sentence and document level. Two terms can have same frequency in same document, but the meaning is that one term contributes more appropriately than the other term. The terms that capture the semantics of the text should be given more importance. This model included three components. The first component analyzes the semantic arrangement of sentences. The second component designs a conceptual ontological graph (COG) to explain the semantic structures and the last component extract top concepts based on the first two components to build feature vectors using the standard vector space model. Concept-based model can easily differentiate between non important terms and meaningful terms which describe a meaning in the sentence. It uses natural language processing techniques and Feature selection is used in query concepts to optimize the representation and remove noise and ambiguity.

**Pattern Taxonomy Method**: Here documents are analyzed on pattern basis. And Patterns can be structured into taxonomy by applying a relation. Association rule mining, frequent item set mining, sequential pattern mining and closed pattern mining are used in Data Mining to discover Patterns .Use of discovered knowledge (patterns) in the field of text mining is difficult and ineffective, because some useful long patterns with high specificity lack in support. Frequent short patterns lead to misinterpretation and results in ineffective performance. This method uses two processes pattern deploying and pattern evolving to refine the discovered patterns in text documents.

## TEXT MINING AND HEALTH CARE

One of the most noticeable areas of text mining is medical record processing and health care. There are different types of medical information sources like which maintains data such as symptoms, patient history, treatments, and medications should be considered for perfect output. So with the help of data mining, text mining it is possible to process the unstructured medical records, as it generates vast amount of online medical records. Due to the increase of electronic medical records, there is an opportunity to classify correct diagnosis for a particular patient, with the help of symptoms, diseases, disorders etc. Different types of medical information sources like Hospital Information System(HIS) can manage medical, administrative, financial and legal aspects of a hospital, Electronic Health Records (EHR) are a collection of medical records of individual patient to keep track of patients status and offer [8] decision support mechanisms and Electronic Medical Records (EMR) allows to store all relevant patient information in electronic format, but all these facilities doesn't provide the exact information for diagnosing the disease. Text contains more valuable quantitative information that is difficult to use in statistical modeling. So by converting text data into numeric form which can be used in analysis in areas like sociology and communication to extract the hidden words. So by implementing text mining in health care it is possible for early detection of diseases, symptoms, notes, remarks made by one or more physicians ,diet and fitness suggestions and adverse reaction etc. These documents may be structured or unstructured and can contain some errors in grammatical ,abbreviations ,vocabulary which is very difficult to analyze and categorize.

Data mining is considered as an artifact to leverage health data. So by using ML techniques it is has been widely used to summarize, explain and to find the relationships between completed data. It includes various aspects like medical and operational aspects including diagnosis, health monitoring, health care planning, and management of hospitals and health services. Text analytics is also used to derive quality insights using Natural Language Processing (NLP) automatically. So, some text mining methodologies like disease surveillance is used to identify influenza in as it affects millions of people a year. So monitoring these type of diseases will be very helpful in

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Jayasudha and Manju

identifying at an early stage. Next behavioral medicine which helps us to understand the behavior of a person using nicotine and tobacco products using online surveillance by NLP. Clinical records are more complex to analyze and extract using text mining because of abbreviations of medical terms, acronyms and local dialectal terms. Spelling mistakes, punctuations, and hyphens may lead to change the meaning of text which is difficult to analyze in case of tokenization. More medical records are considered to analyze and extract information like patient review, medical notes, images, and observations. So some preprocessing should be done to create datasets and some machine learning models are constructed to interpret and classify the previously acquired data. More legal and ethical aspects are considered to manage patient privacy and security. So confidential data should be removed in Electronic Medical Records and some identification keys are included. Finally with the help of pattern matching it is possible to identify patterns with sentences, words, and expressions. But it is difficult to identify if the content is of different languages. Ontology based extraction [8] enables the classification to find the relation between words and it achieves a higher accuracy in medical term extraction when compared to other approaches.

Another approach is relation extraction that finds pairs of terms that are syntactically or semantically related .So associated information and its values are considered like weight, age, blood pressure, pulse etc. It helps the clinicians to know about the relativity of diseases, symptoms, parts infected and history of related .so here it plays an important role to extract terms like diseases, symptoms. Human body parts with semantic analysis and it is defined in the ontology. But syntactic relation is difficult in major cases as a sentence may contain more than two terms. In some cases we can use decision tree based classification to obtain information theory, information gain of the predictor and dependent variable.

## Text mining applied to medical records

This section discusses the application of text mining in Electronic Medical Records (EMR), main challenges and most used techniques. Clinical records can be very complex to analyze and extract using text mining. [6] These documents mostly are presented in a free text format or pre-formatted formularies, and can hold intricate vocabulary with medical terms, abbreviations, acronyms, and local dialectal terms. Additionally, there are a few concerns to take into account: texts may have countless mistakes and misspellings, especially on medical notes, and some values or terms are difficult to interpret, punctuations such as periods or hyphens. Another challenge is the many different types of source data to analyze and extract, namely, patient interviews, laboratory analysis, medical notes, images, and observations. Within this data it is possible to find several relevant features and abnormal values, making this a challenging task for performance and classification processes. These data sources are pre-processed to generate the datasets for text mining. These datasets are, most of the times, unbalanced, making them very difficult to analyze. After applying pre-processing techniques, it then follows a machine learning approach. Using available data, Machine learning "learns" and constructs models to classify data, considering legal, ethical and social aspects, to manage privacy and security of patient personal information, reducing possible breaches in confidentiality. Therefore, it may be necessary to remove or replace the identification of a certain patient. It is, however, possible to use some of this personal information for diagnose classification, such as age, gender or social aspects. Anonymized data and de-identified data are the ways to conceal the private patient information. Anonymous data consists in removing all private information and replacing patient identification with keys only known by authorized persons. Other private information is removed. De-identified data encrypts all patient information to be analysed. Finally, identified data is used when patient information is collected with their consent. Many approaches can be used in information extraction in medical records. Pattern-matching can be useful to discovery patterns within sentences, expressions, words, etc. Other approaches that can be applied are shallow and full syntactic parsing for non-robust texts. Ontology based extraction methodology helps us to classify and the find relations between words. There are several algorithms that can be used in machine learning, although white box algorithms should be adopted, considering that physicians are still apprehensive with this kind of technology and its low level accuracy. White box methodology recognizes the features of an algorithm but it is not possible with a black box approach even with more powerful algorithms to deduce relevant information.

# Jayasudha and Manju

## Information Extraction of EMR Based on Text Mining

Text Mining is also used to acquire knowledge and wealth of valuable [7]information from biomedical text for identifying drug reaction, early detection of symptoms etc. Usually text mining process consists of steps like Information Retreival(IE),Information Extraction(IE),Knowledge Discovery and Knowledge Application. Information Retreival is used to collect the data ,Information Extraction is to extract the predefined information from the collected data. The Third process of Knowledge Discovery is acquiring knowledge from the collected data, Knowledge Application applies the unknown facts inferred from text to practice. Usually the data collected from the medical records are unstructured or semi structured , so here regular method of pre-processing cannot be used. So convert any type of text into structured format NLP is used. In this process, the key technologies involved include named-entity recognition (NER) and relation extraction (RE).

i) Named-Entity Recognition Technology: This technology is used to identify particular names or symbols in documents.[5] NER method identifies medical entities related to treatment such as disease names, symptoms and drug names. As the doctors writing of medical terms are not clear and ambiguity in terms of abbreviations, some medical terms are composed of phrases or compounds modified that is particularly prominent. All the mentioned issues reduces the effect of identifying entities. So to overcome these issues NER uses two processes namely , entity boundary identification and entity class determination. Three important indexes that serve NER are, precision rate (P), recall rate (R), and F-score, F-score, the harmonic average of the precision and recall rate, is a comprehensive evaluation of the test results. When the F-score is higher, the experimental results are better. P = the number of entities identified correctly the number of entities identified, R = the number of entities identified correctly the number of entities present in the test set, F-score = P \* R \* 2 P + R. To identify clinical events and associated temporal expressions NER methods are divided into three types namely the rule-based approach, the dictionary-based approach, and the machine learning approach.

- A. *Rule Based NER Approach*: This approach identifies the rules and validate only the named entity from medical text follows the rule, otherwise it is not considered. So for constructing these rule templates and dictionaries for rule-based approach and dictionary based approach we need the assistance of some medical expert.
- B. Dictionary-Based NER Approach: This is the widely used methodology for clinical text annotation and indexing. But due to existence of more medical terms unable to cover all the things in the single library. So dictionary based approaches provides the corresponding ID after recognizing the target term in the dictionary. Bio-entity name recognition is another key step for information extraction from biomedical literature which consist of three steps namely construction and expansion of the bio entity name dictionary, the approximate string matching, and the post processing.
- C. Machine Learning NER Approach: Here algorithms and features are two important factors that largely affect the performance of ML-based NER systems. So an appropriate Machine Learning algorithm is used to establish an entity recognition model using statistical characteristics. Machine learning model requires training set as it is data-driven and application-oriented. Various ML models Hidden Markov models (HMM), support vector machines (SVM), conditional random field (CRF) and maximum entropy (ME) are available, but CRF and SVM is considered as more popular and SVM produces more accurate result when compared to CRF.

## **Relation Extraction (RE)**

Once the entity is identified, next task is to extract the relation between entities. The entity relations in EMR can be divided into three categories, including the relation between diseases, the relation between diseases and medical examinations, and the relation between diseases and treatment. Three common methods used to extract entity relation are co occurrence-based extraction, pattern-based extraction, and machine learning approaches. When two entities appear in the same sentence, it shows the correlation between two named entities in that sentence, so higher frequency of correlation strengthens the relation. Sometimes hybrid approach, combination of two approaches also used for better results. Convolutional Neural Networks are also used to extract relations between scientific concepts such as synonyms and hyponyms, through pre-processing, CNN and rule-based post processing.

## Jayasudha and Manju

## Text mining applied to Social Media Health Care Documents

Social media makes people to share and discuss their views and opinions about health-related information and general-purpose social media. Advancements in automated data processing, Machine learning and Natural Language Processing uses huge data for public health monitoring and surveillance has been especially popular and fruitful.[4] Numerous studies have been published recently in this realm on pharmacovigilance, identifying smoking cessation patterns, identifying user social circles with common experiences, monitoring malpractice and tracking infectious disease spread. So social media serves as a unique platform to discuss approaches of text and data mining methods which responds to specific requirements in health surveillance such as early detection of diseases, Medication safety, including drug interactions and dietary supplement, Health behaviors and smoking. Social network analysis is a field of research open and adaptable to the medical and health. More recently, web-based disease surveillance research has moved in new directions with potentially higher impact: Other infectious diseases More recent social media research has given more importance on disease surveillance, Forecasting and higher impact locations etc. some key areas of public health for which social media mining has been especially popular and fruitful, with an emphasis on how these focus areas are evolving to increase public health impact.

**Pharmacovigilance :** It involves monitoring adverse actions caused by medications. This is a notable use case where discussion about the drugs prescribed, reaction and side effects on treatments will be shared. This makes social media unique and robust sources of information regarding treatments. By utilizing data from specialized forums and communities online review of drugs and medications for adverse reaction detection. By analyzing the datasets using supervised classification and association to identify the adverse reaction between drugs and specific reactions.

**Behavioral Medicine:** Smoking, Drug abuse and Diet fitness: Another important area of social media surveillance is about understanding behaviours that affects health such as smoking and diet. Here behavioural medicine plays a prominent role in the digital revolution. Social media can be used to understand the interest in various nicotine and tobacco products much faster than traditional sources. It helps in understanding and analyzing smoking cessation. Other issues like trends in alcohol use and problems in drug abuse. Specialized social networks have been used for analyzing the effects of drug reformulation. Based on the food consumption patterns mentioned in social media and physical activities measuring the outcomes of the fitness goals.

*Disease Surveillance*: One of the most important and longest running cases for social media is disease surveillance. Influenza has been by far the most commonly surveilled disease, in part due to its widespread prevalence it reacts millions of people each year, So Google's Flu trends services continue to share their data with academic research labs and search queries for web-based disease surveillance. Main aim of using social media mining is influenza can be prevailed and estimated in real-time when compared to traditional government methods of taking survey by Centers for Disease Control and Prevention as it may be out dated. So when compared to traditional methods web-based surveillance research moved research in new directions with greater impact. Apart from influenza social media research helps us to find other diseases like *Cholera, Ebola,* and *E.Coli.* So mining data in social media helps us to track more diseases.

**Infectious Diseases Propagation:** It analyzes the transmission of infectious diseases in hospitals using a network centric perspective. Here spread of disease may occur through Patients, nurses, doctors or workers who are closely connected to each other and those connections form a network through which transmission can occur. The density of this network should be strong and spread of diseases may occur fastly.

**Predicting Pandemic Increase investigation**: By using twitter as a reporting tool using filtering and normalization, it indicates the increased infection spread. So tweets help us to identify the infection earlier. Regression frameworks can be used to extract simple features and reduce error associated with modeling which helps us to identify diseases like influenza by correlating the tweets and search terms used. With this type of online clinical data physicians are able to make forecast of influenza 2 weeks before. So by early work, able to forecast and control the spread of diseases through planning and preparedness.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Jayasudha and Manju

**Modeling the Hospital Structure Network** : To know the relationship between social entities Social Network nalysis(SNA) method is used which helps us in identifying structural relationships in hospital administration. SNA for Health Social Network With the continued advances of different Social Networks, the health's Social Networks became very popular. Despite the success of social media for better connecting and changing information, these Medias can also change the users' health behaviors, to become more healthy.

## APPLICATIONS OF TEXT MINING

**Analyzing survey responses:** Open Survey Questions will help respondents to expose the view or opinion of the respondents. It helps to know more about customer's opinion and expectations, which seems better when compared to traditional questionnaires. Now a days social media is a place where a person can express their opinions clearly, So by using Text mining it analyzes the information in the form of text.

**Fraud Detection:** Technology advancement allow us to [3] easily identify any fraud texts. Text mining has helped achieve that. Text mining plays a vital role in classifying and filtering text .So it is used to classify and filter unnecessary e-mails by analyzing certain words and phrases in the e-mail. Such e-mails are automatically discarded and marked as spam. By using this text mining system it also alerts the mail to remove those mails with offending words or content.

**Analyzing Health Care Records:** Mostly in business organizations information maintenance is in the form of text. Health care collects huge amounts of textual and numeric information about patients, visits, prescriptions etc. The information collected using EMR improves healthcare quality, promotion of clinical and research initiatives, fewer medical errors and lower costs. So by collecting these contents electronically and using some text mining algorithms, helps the practitioner to diagnose the actual situation.

**Crawling web sites:** Another area of text mining is web content mining, contents of web page is analyzed to find the list of terms frequently used on the site. So by using this, it is easy to find the important terms in the website. With this, competitor's ability can be known to deliver efficient business.

**Risk Management and Decision making:** By analyzing the flow of the business, one should be able to avoid risk while doing business. So risk management is one of the important activity which allows the business people to make correct decisions using text mining .Fails to take correct decision will leads to risk and loss in business. So text mining helps the person to know the flow of work and supports about pros, cons in making clear decisions for betterment.

**Business Intelligence**: For Businesses' data is their backbone, which can be used for or against the company. by analyzing and using the data properly, it supports the business people for efficient running of business. It also finds the feedback from the customers to know the actual requirement.

## Challenges in Social Media Mining

Main challenge with automated data mining social media is with the help of standard Natural Language processing (NLP) tools. So these tools support only formal or regular languages and doesn't support informal or non-standard text online. Some tools like POS taggers and Named entity recognizers are used in twitter to analyze the tweets, but this doesn't provide a general-purpose solution. Because a tool designed for a specific social media will not work perfectly for others due to medical terminology.[9] So by finding the text which specifies common symptoms rather than specific illness, language normalizations should be done for social media text to identify the terms.

Next, Sentimental Analysis classifies the opinions as positive, Negative and neutral in understanding important health issues, in case of smoking and drug abuse, diet and fitness, vaccination opinions etc.. Sentiment has also been analyzed in the context of drug abuse, in order to understand public interest in drugs. By analyzing the online reviews about doctors and health care providers helps us to identify patient perceptions of care quality. However,

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Jayasudha and Manju

sentiment analysis does not work as well for short text, such as tweets. Sentiment classification is an active area of NLP research, and improvements in this technology will lead to improvements in understanding public opinion and awareness.

Most research on social media mining for health monitoring has used relatively simple methods of text analysis, such as dictionary associations. Simple approaches can work reasonably well and future improvements will require NLP tools that can extract richer meaning from text .As a word having multiple meanings it is difficult to understand in what aspect they tweet. Richer NLP techniques can be used to extract the detail. Lexicon based approaches are the older methods to identify the content in social media and some health related lexicon resources also have been developed ,but the usage of colloquial language limits the performance these approaches. Some supervised algorithms may be used to improve the promising performance in quantitative evaluations. Another hurdle gaining trust from practitioners and public. Due to significant failings reported by practitioners web-based disease surveillance system lost its attention. So more work should be carried out to validate the social media models carefully to ensure progress is being made. Considering data being accessed, in social media data is publicly available and sometimes it need to be private. For that machine learning algorithms can make inference about private attributes ,even if not explicitly stated in public data.

# ABSTRACT

Hypertension is a serious medical condition that significantly increases the risk of heart, Brain, kidneys and other diseases. Blood pressure is a force exerted by circulating body against the walls of the body's arteries, the major blood vessels in the body. It is the elevation of systolic blood pressure, Diastolic blood pressure or both above the normal levels. It effects above 1-Billion people worldwide and it is estimated that by 2025 up to 1.58 billion adults worldwide will suffer from complications of hypertension. It is the major public health problem in India. It accounts for 57% of all stroke deaths and 24% of all coronary heart diseases, deaths in India. Adequate management of hypertension can eventually reduce the risk of stroke, myocardial infection, chronic kidney disease and heart failure. The initial antihypertensive agent should be generally selected from one of the drug classes like Thiazide diuretics, Angiotensin converting enzyme(ACE) Inhibitors, Angiotensin receptor blockers(ARB'S) & Calcium channel blockers shown to reduce cardiovascular events. One of the angiotensin-converting enzyme (ACE) inhibitor class of medication is Ramipril. It is used to treat high blood pressure and lowering of high bold pressure which in turn helps to prevent strokes, heart attacks, & kidney problems. Ramipril is also used to improve survival after heart attacks and also used to treat heart failure in patents who have had a recent heart attack. Various analytical methods such as UV-Spectroscopy, High performance thin layer chromatography (HPTLC), High performance liquid chromatography (HPLC), Ultra-performance liquid chromatography (UPLC), Mass spectroscopy, Liquid chromatography-Mass spectroscopy (LC-MS), and UV-Spectrophotometric methods for the determination of Ramipril as single and in combination with other drugs have been reported. The present review covers the analytical methods which have been used for analysis of Ramipril.

Keywords: Ramipril, UV-spectrophotometric methods, HPLC, HPTLC, UPLC.

# Rama Rao Tadikonda and Ramya Alwala

# INTRODUCTION

converting Ramipril to ramiprilat and in a less extent converted in kidneys. Ramipril is mostly used in treatment of congestive heart failure and nephropathy and in hypotension. Angiotensin converting enzyme (ACE) involves in conversion of angiotensin-I to angiotensin-II, this ACE-II is the key constituent of RAAS system (Renin angiotensin-aldosterone system) and regulates blood pressure. Ramipril is a potent inhibitor of ACE and prevents the conversion of angiotensin-I to angiotensin-II [1]. Ramipril is a long acting angiotensin converting enzyme inhibitor and it exhibits similar actions as that of captopril and enalapril [2]. The active metabolite of ramipril called ramiprilat has the long elimination half-life, permitting once in a day administration. The daily dose of ramipril in a hypertensive patient is 2.5 to 20mg and it is usually effective in reducing high blood pressure and maintaining satisfactory control during long-term treatment. People who do not respond to ramipril monotherapy, usually respond with the addition of diuretics [3]. The anti-hypertensive efficacy of ramipril is maintained in patients with diabetes mellitus and the primary data indicate that the drug has the beneficial effects of decreasing urinary albumin excretion in diabetic patients with nephropathy. Ramipril also have a beneficial effect in the treatment of patients with more established heart failures [4].

## **Chemical structure**

## IUPAC Name:

(2S,3aS,6aS)-1-[(2S)-2-[[(2S)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino]propanoyl]-3,3a,4,5,6,6a-hexahydro-2H-cyclopenta[b]pyrrole-2-carboxylic acid.

## Melting point: 109 °C

Molecular weight: 416.518 g. mol<sup>-1</sup>: Trade Name: Altace Dose: 1.25 mg, 2.5 mg, 5 mg, and 10 mg

## **Ramipril Indications:**

- 1. Hypertension
- 2. Prevention of heart failure progression after myocardial infarction.

## Pharmacok inetic Data of Ramipril:

Ramipril is a prodrug that is converted in to an active metabolite called ramiprilat. The bioavailability of ramipril is 28% and *it rapidly distributes to all tissues*, with the liver, kidneys and lungs showing higher concentrations of the drug than the blood. The protein binding capacity of ramipril is 73% and the active metabolite ramiprilat is 56% and metabolized through the liver and eliminated via kidneys (60%) and feces (40%). The elimination half-life of the drug is 13-17 hours.

## Rama Rao Tadikonda and Ramya Alwala

## Side effects of Ramipril:

- 1. Dry cough
- 2. Postural hypotension.
- 3. Elevated serum creatinine
- 4. Hyperkalemia
- 5. Angioedema
- 6. Fatigue and mouth dryness in early stages [5,6].

## Previous studies to estimate Ramipril:

There are different methods used to estimate ramipril in pharmaceutical preparations and human serum samples in addition to multiple environmental models. Several analytical methods such as UV, HPLC, HPTLC, UPLC, LC/MS, methods have been reported. The current review is an attempt made to compile all the analytical methods which have been used for the analysis of ramipril.

## UV-SPECTROSCOPIC METHODS:

Various UV spectroscopic methods have been reported for the determination of Ramipril in single and combined with other drugs. OE Afieroho1, O. Okorie, and TJN Okonkwo (2012) developed a simple and cost-effective spectrophotometer method for the determination of ACE inhibitor ramipril in dosage forms. UV spectrophotometry was used to develop and validate a simple method for the assay of ramipril in solid dosage form at  $\lambda$ max of 210 nm, as per International Conference on Harmonization (ICH) guidelines. Aqueous methanol (5 %) was used as the blank solvent. The method was validated for linearity, recovery, accuracy, precision, and specificity in the presence of excipients, and also for inter-day stability under laboratory conditions. The Validation results showed linearity in the range 1 – 38 µg/ml; recovery accuracy of 101.55%; regression equation Y = 0.0256X + 0.0697, R<sup>2</sup> of 0.9942; precision RSD < 2.00 %; and negligible interference from common excipients and colorants. The method was accurate (95 % confidence limit) compared to the standard liquid chromatography (LC) method, with comparable reproducibility when used to assay a commercial product (Ramitace®, 2 and 5 mg tablets). The validated data were within allowable limits and therefore, the proposed method is recommended for routine quality control (QC) analysis [7].

Syed Iftequar, Lahoti Swaroop, Zahid Zaheer, Mirza Shahid, Sayad Imran,M H Dehghan (2012) reported on a new, simple, rapid and novel spectrophotometric method for estimation of Ramipril (RAM). For this absorption maximum Method (method A) and Area under Curve Method (Method B) is used. The method involved measurement of absorbance at wavelengths 210 nm for method A and method B involved measurement of area under curve in the wavelength range 202 to 237.5 nm for RAM. Beer's law obeyed in the concentration range of 0.1 to  $3.5 \mu g/mL$  by both methods. The proposed methods are recommended for routine analysis since they are rapid, simple, accurate and also sensitive and specific. The results obtained are reproducible with a coefficient of variation less than 2%. These methods were validated for precision, reproducibility, linearity and accuracy as per ICH guidelines [8].

Lakshmana Rao A, Prasanthi T, Anusha, Prasanna MR, Jyothi P (2016) discussed a simple, validated, accurate, and precise simultaneous UV Spectrophotometric method for the simultaneous estimation of Telmisartan (TEM) and Ramipril (RAM) in the pharmaceutical dosage form. Telmisartan exhibits absorption maximum at 254.4 nm and Ramipril shows an absorption maximum at 209 nm in methanol. The Beer's law obeyed the concentration range of 2-12µg/ml for both TEM and RAM. Mean recovery of 99.14% for TEM and 99.05% for RAM respectively signifies the accuracy of the method. The method was validated as per ICH guidelines. The method shows good linearity, accuracy, precision, limit of detection and limit of quantification. This method can be successfully employed for the routine simultaneous estimation of TEM and RAM in pharmaceutical dosage forms [9].

Gadireddy Sujana, G. Aruna, G. Sivagangaram (2014 developed a simple, rapid and accurate UV Spectroscopic (Simultaneous Equation method and First order derivative method) and an isocratic RP – HPLC methods showed excellent sensitivity, reproducibility, accuracy, and repeatability. In simultaneous UV method, the overlaid spectra of mixture of Ramipril HCI and Metoprolol Tartrate were recorded. From the spectra, 206 nm for Ramipril HCI and 222

# Rama Rao Tadikonda and Ramya Alwala

nm for Metoprolol Tartrate was selected as wavelength to construct simultaneous equation. The percentage label claim present in tablet formulation was found to be 101% and 103% for Ramipril HCl and Metoprolol Tartrate respectively. In second method, the same spectrums were derivatized and 205 nm selected for detection of Ramipril HCl where Metoprolol Tartrate shows zero crossing and also 210 nm selected for detection of Metoprolol Tartrate where Ramipril HCl shows zero crossing. The percentage label claim present in formulation was found to be 98.5% and 101% for Ramipril HCl and Metoprolol Tartrate respectively. In RP-HPLC method, mobile phase used is acetonitrile: methanol: acetate buffer pH 5.0 (30:50:20 V/V) with flow rate of 0.9 ml per min, the retention time of Metoprolol Tartrate and were found to be 2.84 and, 3.55 respectively. The percentage purity was found to be 99.76% and 99.82% for Metoprolol Tartrate and Ramipril HCl, respectively. The low % RSD values for recovery indicated that the method was found to be accurate [10].

N. Vanaja, Ch. Preethi, Dr. S.Y. Manjunath, Krishanu Pal (2015) studied a method development and validation for simultaneous estimation of Telmisartan and Ramipril by UV-Spectrophotometric method using 0.1N NAOH as solvent and  $\lambda$ max of Telmisartan and Ramipril were found to be 232 nm and 222 nm respectively. Concentration ranges were found to be 4-20µg/mL for both drugs. The R<sup>2</sup> values were found to be 0.996 and 0.999 for Telmisartan and Ramipril respectively. The method was validated statistically and by recovery studies, percentage assay and recovery were found to be 95-105% for Telmisartan and Ramipril. LOD and LOQ ranges were found to be 0.177 and 0.539µg/mL and 0.298 and 0.903 µg/mL for Telmisartan and Ramipril respectively. This method was validated using ICH guidelines [11].

Sathishkumar, S (2012) developed simple, precise and accurate methods for the estimation of Atorvastatin Calcium, Aspirin, Ramipril and Metoprolol Tartrate in bulk and in combined pharmaceutical dosage form and to validate the developed methods by UV-spectroscopy and HPTLC. The solubility of individual drugs was checked and from the list of solvents the common and stable solvent for the four drugs was selected. The solvent selected for both UV spectroscopy and HPTLC must be cheap and readily available. The various steps involved in the method development as follows, UV Spectroscopy Selection of appropriate analytical wavelength and selection of suitable method determination of working concentration range, Analysis of synthetic mixture, Simultaneous analysis of the formulation by using the developed method HPTLC Method Determination of suitable detection wavelength, Optimization of chromatographic conditions, Analysis of formulation, System suitability testing.

The two methods were found to be accurate, precise and rapid for the simultaneous estimation of these drugs. This was confirmed by low percentage RSD values. The spectrophotometric method is found to be economical when compared to the HPTLC method. But HPTLC is more sensitive than UV spectrophotometric method. The low percentage RSD value in the recovery studies suggests that the excipients do not interfere in the analysis of formulation and hence all the methods are accurate. HPTLC is found to be more sensitive than other method. Because the linearity range, LOD, LOQ were less in HPTLC method than UV spectroscopic method. Hence it is suggested that these two methods can be applied successfully for the routine quality control analysis for the simultaneous estimation of Atorvastatin Calcium, Aspirin, Ramipril and Metoprolol Tartrate in bulk and in pharmaceutical dosage form and the obtained results will be presented elsewhere [12].

Khairunnisa Tasneem, Sonia K, & Lakshmi K S (2020) developed method development and analytical validation of an original, accurate and correct UV-Visible Spectrophotometric methods for the fixed dose assessment of Ramipril and Amlodipine besylate. The working solutions of Telmisartan and Ramipril were scanned at 240 nanometer and 210 nanometer respectively. The regression strength of Amlodipine besylate and Ramipril over its absorbances takes place as y=0.4291x+0.0084 and y=0.0399x+0.310 respectively with a correlation coefficient (r<sup>2</sup>) of 0.9998 for Amlodipine besylate and 0.9993 for Ramipril. The intra-day precision in addition inter-day precision for Amlodipine besylate and its % RSD were obtained as 0.08% and 0.25% respectively. The intra-day precision in addition interday precision for Ramipril and% RSD were obtained as 0.16% and 0.24% respectively. The precise amount of tablet formulation were added which holds Alkaline (0.1 N Sodium hydroxide), Acidic (0.1 N Hydrochloric acid) reflux for 3 hours, 3% Oxydol at 50°C, heat (60°C), humidity (75 percentage Relative humidity) for 24 hr. and after the 63802

# Rama Rao Tadikonda and Ramya Alwala

particular time diluted to distilled water, separated using Filter paper. From this stock solution, 5 mL section of the filtrate was pipetted out and further thinned with distilled water in a 100 mL standard flask (10  $\mu$ g/mL). The standard stock solution of two drugs were prepared and compared against a label claim [13].

Vaishali Pawar, Archana Tiwari, Dr. P.K. Dubey (2022) developed a rapid, specific and economic UV spectrophotometric method has been developed using Methanol as a solvent for simultaneous determination of Atorvastatin Calcium (ATR) and Ramipril (RMP) content in bulk and pharmaceutical tablet dosage formulations. The absorbance values at 246 nm and 226 nm were used for the estimation of Atorvastatin Calcium (ATR) and Ramipril (RMP). The absorption maxima of Atorvastatin Calcium (ATR) and Ramipril (RMP) shown at 246 nm and 226 nm and methanol was used as solvent. This method obeyed Beer's law in the concentration range of 2–20  $\mu$ g /ml for atorvastatin calcium and 1-6  $\mu$ g /ml for ramipril. The Simultaneous Estimation method was developed and validated according to ICH guidelines for linearity, precision, accuracy, LOD and LOQ. Atorvastatin calcium found to be linear within concentration range of 2-20 µg/ml with regression coefficient of 0.998 and ramipril found to be linear within concentration range of 1-6 µg/ml with regression coefficient of 0.999. The accuracy was assessed by the standard addition method of three replicate determinations of three different solutions containing 8, 10 and 12 µg/ml of RMP and ATR. The average % recoveries for three different concentrations were found to be 90.14 % for ATR and RMP 99.05 % using proposed UV spectrophotometric method. The limit of detection and limit of quantification were found to be 0.31µg/ml and 0.1023µg/ml for Atorvastatin Calcium and 0.2805µg/ml and 0.85µg/ml for Ramipril respectively by proposed UV spectrophotometric method. The results of validation parameters indicates that the developed method was also found to be accurate, precise and sensitive and such simple & economic method can be used for the simultaneous estimation of atorvastatin calcium and ramipril. The obtained results proved that the method can be employed for the routine analysis of simvastatin and Ezetimibe in bulks as well as in the commercial formulation [14].

Manish Kumar , Mohit Jindal , Shailendra Bhatt , A. Pandurangan1 , Anuj Malik , Vichitra Kaushik, Prabhat Kumar Upadhaya and G.Arunachalam (2019) discussed that Amlodipine Besylate is used to treat hypertension and Coronary Artery Disease. It is a calcium channel blocker. Amlodipine Besylate blocks calcium movement into certain tissues and arteries which leads to the relaxation of arteries so that blood can flow more easily into our heart. Ramipril is also used to treat hypertension, prevent strokes, heart attacks and kidney problems. It is an angiotensin converting enzyme (ACE) inhibitors. ACE is an enzyme which produces the chemical angiotensin II. Only a few spectrophotometric methods have been reported for simultaneous estimation of Amlodipine Besylate and Ramipril in tablet dosage forms. Hence an attempt has been made to develop and validate in accordance with ICH guidelines [15].

## HPLC METHODS

Kurade VP, Pai MG, Gude (2009) Preformed A rapid high performance liquid chromatographic method has been developed and validated for the estimation of ramipril and telmisartan simultaneously in combined dosage form. A Genesis C18 column having dimensions of  $4.6\times250$  mm and particle size of 5 µm in isocratic mode, with mobile phase containing a mixture of 0.01 M potassium dihydrogen phosphate buffer (adjusted to pH 3.4 using orthophosphoric acid): methanol: acetonitrile (15:15:70 v/v/v) was used. The mobile phase was pumped at a flow rate of 1.0 ml/min and the eluents were monitored at 210 nm. The selected chromatographic conditions were found to effectively separate ramipril (Rt: 3.68 min) and telmisartan (Rt: 4.98 min) having a resolution of 3.84. The method was validated in terms of linearity, accuracy, precision, specificity, limit of detection and limit of quantitation. Linearity for ramipril and telmisartan were found in the range of 3.5-6.5 µg/ml and 28.0-52.0 µg/ml, respectively. The percentage recoveries for ramipril and telmisartan ranged from 99.09-101.64% and 99.45-100.99%, respectively. The limit of detection and the limit of quantitation for ramipril was found to be 0.5 µg/ml and 1.5 µg/ml respectively and for telmisartan was found to be 1.5 µg/ml and 3.0 µg/ml, respectively. The method was found to be robust and can be successfully used to determine the drug content of marketed formulations [16].

# Rama Rao Tadikonda and Ramya Alwala

Shi-Ying Dai, Shi-Ting Qiu, Wei Wu, Chun-Mei Fu (2013) developed an RP-HPLC method for the simultaneous determination of Ramipril (RP) and Amlodipine (AL) in tablets was developed and validated by Chinese Pharmacopoeia 2010. The linearity of the proposed method was investigated in the range of 0.01–0.25 mg/mL ( $r^2$ =0.9998) for RP and 0.014–0.36 mg/mL ( $r^2$ =0.9997) for AL. The limits of detection (LOD) were 0.06 µg/mL and 0.02 µg/mL for RP and AL, and the limits of quantitation (LOQ) were 0.2 µg/mL and 0.07 µg/mL, respectively. Some major impurities and degradation products did not disturb the detection of RP and AL and the assay can thus be considered stability-indicating [17].

Jinesh Bahubali Nagavi, Preethi Gotadake Anantharaju (2014) reported an HPLC method for the simultaneous estimation of Ramipril and Hydrochlorothiazide in tablets. The developed method involves Purosphere Star Rp18e, 5  $\mu$ m, 150×4.6 mm column with mobile phase composition of acetonitrile and sodium perchlorate (pH 2.5) buffer in the ratio of 3:2, at a flow rate of 1.0 ml/min and UV detection at 316 nm for first five minutes for Hydrochlorothiazide and 210 nm for Ramipril. The method was validated as per ICH guidelines, Linearity was observed over concentration range of 17.5 to 32.5  $\mu$ g/ml for Ramipril and 87.5 to 162.5  $\mu$ g/ml for Hydrochlorothiazide. The Accuracy of the proposed method was determined by recovery studies and found to be 97.95-102.3% and 97.98-102.66% for Ramipril and Hydrochlorothiazide in marketed tablet formulation (Ramace-H) and it was found to be well within the acceptance limit. The developed and validated HPLC method for simultaneous estimation of Ramipril and Hydrochlorothiazide was found to be linear, accurate, precise, robust and rugged. Hence it can be used for routine analysis of Ramipril and Hydrochlorothiazide in tablets [18].

Vaibhav Rajoriya, Amrita Soni, Varsha Kashaw developed a stable, linear, rapid, accurate and selective HPLC method for the quantification of Ramipril in FDT using buffer and acetonitrile: methanol (60:40 v/v) ratio in combination as mobile phase and at the flow rate of 1 ml/minute at  $\lambda$ max 210 nm. Chromatographic separation was performed on Shimadzu SPD-20A, SD-M10 AVP-Shimadzu, an ODS C-18 Kromacil (250 mm × 4.60 mm) column used as stationary phase. The quantitation of Ramipril done by HPLC, parameters studied were retention time, linearity, accuracy, precision, detection between response and concentration in the range of 5-30 µg/ml; detection carried out at  $\lambda$ max 2.910 min. Percent recoveries obtained for Ramipril was 99.58-100.15%. LOD and LOQ value was 0.802 µg/ml and 1.4 µg/ml for Ramipril respectively. The result suggested that proposed method gives good peak resolution of Ramipril within short analysis time (<10 min) and high percentages of the recovery shown that method is free from interference of excipient present in the formulation. The % RSD of each parameter lies below the limit of 2%, proven the suitability. The statistical analysis proved that the proposed method is precise, accurate, selective and rapid for the HPLC estimation of Ramipril [19].

Mousumi Kar, Sujit Pillai, Gaurav Sharma, Nitin Deshmukh, Kunwar Nagendra Krishna Singh (2019) reported on the estimation of Atorvastatin and Ramipril in pharmaceutical dosage forms by developing fast and precise RP-HPLC method. Chromatographic separations on C18 column (4.6mm×250mm, 5µm) were achieved using mixture of 0.1% OPA buffer (pH-3.0): Acetonitrile: Methanol, (45:50:05 v/v). pH adjustment of aqueous phase was done by using 0.5% Triethylamine. The peak response was monitored at 227 nm after injecting the sample into HPLC system at a flow rate of 1.0 ml/min. The calibration curve was linear over the range of Ramipril 10-30  $\mu$ g / ml and Atorvastatin 20-60  $\mu$ g / ml. Atorvastatin's average RT was 9.2826 ± 0.0107 and Ramipril was 4.548±0.0366. Atorvastatin's percentage recovery value is 99.47% and Ramipril's 98.50% which confirms the excipients do not interfere in the formulation. Thus, the suggested HPLC technique can therefore be used for the simultaneous determination of these two drugs in pharmaceutical dosage forms due to speed, simplicity and high accuracy [20].

Thotakati, Muralikrishna (2012) developed a sensitive, simple, rapid and accurate analytical method for the simultaneous estimation of Ramipril and Telmisartan in formulations and validation of developed method by using RP-HPLC technique. In simultaneous RP-HPLC method development, Waters 2695 Separations Module with PDA Detector and column used is C8 SB ZORBAX (150 X 4.6mm) column with 3.5-micron particle size. Injection volume of 10  $\mu$ L is injected and eluted with the mobile phase selected after optimization was Phosphate buffer and Acetonitile

# Rama Rao Tadikonda and Ramya Alwala

in the ratio of 70:30 was found to be ideal. The flow rate was found to be optimized at 1.0 mL/min. Detection was carried out at 230 nm. This system produced symmetric peak shape, good resolution and reasonable retention times of Ramipril and Telmisartan were found to be 2.275 and 4.261 minutes respectively. The Ramipril and Telmisartan showed linearity in the range of 20-60  $\mu$ g/mL and 160-480  $\mu$ g/mL respectively. Precision of the developed method was studied under system precision and method precision. The %RSD values for precision was found to be within the acceptable limit, which revealed that the developed method was precise. The developed method was found to be robust. The %RSD value for percentage recovery of Ramipril and Telmisartan was found to be within the acceptance criteria. The results indicate satisfactory accuracy of method for simultaneous estimation of the Ramipril and Telmisartan [21].

Elham Anwar Taha , Manal Mohammed Fouad , Ali Kamal Attia and Zainab Mahmoud Yousef (2019) developed a rapid and sensitive High Performance Liquid Chromatography (HPLC) method and validated as per ICH guidelines for simultaneous determination of ramipril and felodipine binary mixture. Chromatographic separation was achieved on a Hyperchom C18 column ( $250 \times 4.6 \text{ mm}$  id.,  $5 \mu \text{m}$ ) using an isocratic mobile phase of potassium dihydrogen phosphate (pH = 3.4): methanol: acetonitrile in the ratio 15:15:70 (*v*:*v*:*v*). The flow rate was 1.5 mL/min, temperature of the column was maintained at 30 °C and detection was made at 210 nm. Linearity studies indicated that the drugs obey Beer's law over the range of 10-80 µg/mL for ramipril and 5-80 µg/mL for felodipine. The proposed method is precise, accurate, linear and robust. The short retention time allows the analysis of a large number of samples in a short period of time and, therefore, considered to be cost-effective that can be used for routine analysis of both drugs in the pharmaceutical industry [22].

Vassa, S., Vairagar, P., Mulgund, S., & Korhale, R. (2013) reported on development and validation of a simple and rapid isocratic reversed-phase high-performance liquid chromatographic method (RP-HPLC) for the simultaneous estimation of S (-) Amlodipine besylate and Ramipril in combined dosage form. The HPLC system was operated isocratically at flow rate of 1ml/min at 40°C  $\pm$  0.5° C for 15 min. The mobile phase found to be most suitable for analysis was Acetonitrile: 0.02M Potassium dihydrogen ortho phosphate buffer (0.1 % of triethylamine, 0.1 % of 6-heptane sulphonic acid salt): 35:65% v/v, pH adjusted to 2.5 with O-phosphoric acid, detection was carried out at 210 nm using Hypersil BDS C-18 (150\*4.6mm) 5µ column with injection volume 20 µl. The retention time of Ramipril and S (-) Amlodipine Besylate were 5.61±0.3 and 7.41±0.3 respectively. The proposed method was validated according to International Conference on Harmonization [ICH Q2 (R1 )] and was found to be precise, accurate, selective and rapid for the simultaneous determination of Ramipril and S (-) Amlodipine Besylate in bulk and tablet dosage forms. The linearity for Ramipril (r2=0.9914) and S (-) Amlodipine besylate (r2=0.9930) was established in the range of 25.14 - 75.41 and 25.46 - 76.38µg/mL respectively. This new developed method was found to be precise with satisfactory %RSD values for inter and intraday precision [23].

Raut, P. V., Padwal, S. L., Bachute, M. T. and Polshettiwar, S. A. (2021) developed a simple, rapid, selective, reproducible and isocratic reversed-phase high performance liquid chromatographic (RP-HPLC) method and validated as per ICH guidelines. Analysis was performed on a Thermo, Sunniest C8 (150 mm x 4.6 mm, 5  $\mu$ m) with the mobile phase consisting of mixing 500 mL of buffer solution and 500 mL of acetonitrile at a flow rate of 1.0 mL/min. UV detection was performed at 210 nm and the Run time for Ramipril and Hydrochlorothiazide were 10 minutes. The calibration curve was linear (correlation coefficient = 1.000) in the selected range for both analytes. The optimized dissolution conditions include the USP Type 1 (Basket) rotation rate of 100 rpm and 750 mL of 0.1 N Hydrochloric acid as dissolution medium, at 37.0  $\pm$  0.5°C. The method was validated for precision, linearity, specificity, accuracy, limit of quantitation and ruggedness. The system suitability parameters, such as theoretical plate, tailing factor and relative standard deviation (RSD) between six standard replicates were well within the limits. The stability result shows that the drug is stable in the prescribed dissolution medium [24].

Hari Krishna developed a new method was established for simultaneous estimation of Atorvastatin calcium and Ramipril by RP-HPLC method. Chromatographic separations were carried using Phenomenex Luna C18 ( $250 \times 4.6$  mm, 5 µm) column with a mobile phase composition of methanol in addition to phosphate cradle (0.1% v/v 63805

triethylamine pH 4.5 well balanced with 0.1% v/v orthophosphoric harsh) have been delivered at a flow rate of 1 ml/min and the detection was carried out using waters HPLC auto sampler, separation module 2695 HPLC system with PDA detector at wavelength 254 nm. The running time 12 min. The retention time for Atorvastatin and Ramipril were 3.02 and 6.10 minute respectively. The correlation coefficient values in linearity were found to be 0.999 and concentration range 20-70  $\mu$ g/ml for Atorvastatin and 20-70  $\mu$ g/ml for Ramipril. LOD and LOQ for Atorvastatin 2.95 and 9.96. LOD and LOQ for Ramipril 3.34 and 10. respectively [25].

Rajesh Sharma, Sunil Khanna, And Ganesh P. Mishra (2012) reported on a simple, sensitive, accurate and rapid reverse phase high performance liquid chromatographic method for the simultaneous estimation of ramipril, aspirin and atorvastatin in pharmaceutical preparations. Chromatography was performed on a 25cm×4.6 mm i.d, 5 $\mu$ m particle, C18 column with Mixture of (A) acetonitrile methanol (65:35) and (B) 10 mM sodium dihydrogen phosphate monohydrate (NaH2PO4 .H2O) buffer and mixture of A:B (60:40 v/v) adjusted to pH 3.0 with o-phosphoric acid (5%v/v) was used as a mobile phase at a flow rate of 1.5 ml min–1. UV detection was performed at 230 nm. Total run time was less than 12 min; retention time for Ramipril, aspirin and Atorvastatin were 3.620, 4.920 min and 11.710 min respectively. The method was validated for accuracy, precision, linearity, specificity and sensitivity in accordance with ICH guidelines. Validation revealed that the method is specific, rapid, accurate, precise, reliable, and reproducible. Calibration plots were linear over the concentration ranges 05-50  $\mu$ g mL–1 for Ramipril, 05-100  $\mu$ g/mL–1 for aspirin and 02-20  $\mu$ g mL–1 for atorvastatin. Limits of detection were 0.014, 0.10 and 0.0095 ng mL–1 limits of quantification were 0.043, 0.329 and 0.029 ng mL–1 for ramipril aspirin and atorvastatin respectively. The high recovery and low coefficients of variation confirm the suitability of the method for simultaneous analysis of the all three drugs in the dosage forms. The validated method was successfully used for quantitative analysis of marketed pharmaceutical preparations [26].

Bilal Yilmaz (2010) developed a procedure based on high-performance liquid chromatography (HPLC) for determination of ramipril in pharmaceutical preparations. Separation of ramipril was achieved on a Ace C18 column (5  $\mu$ m, 250×4.6 mm i.d.) using UV detection with  $\lambda$ =208 nm. The mobile phase consisted of 20 mM phosphate buffer (pH 2.5) containing 0.1% trifluoroacetic acid (TFA) - acetonitrile (50:50, v/v). The analysis was performed in less than 5 min with a flow rate of 1.0 mL min-1. Calibration curve was linear over the concentration range of 0.25-7.5  $\mu$ g mL-1. Intra- and inter-day precision values for ramipril were less than 4.95, and accuracy (relative error) was better than 4.00%. The mean recovery of ramipril were 99.7% for pharmaceutical preparations. The limits of detection (LOD) and quantification (LOQ) were 0.10 and 0.25  $\mu$ g mL-1, respectively. Also, the method was successfully applied for the quality control of commercial ramipril dosage forms to quantify the drug and to check the formulation content uniformity [27].

P. P. Vairagar, S. MulgundS. P. Vassa, R. Korhale (2013) reported on development and validation of a simple and rapid isocratic reversed-phase high-performance liquid chromatographic method (RP-HPLC) for the simultaneous estimation of S (-) Amlodipine besylate and Ramipril in combined dosage form. The HPLC system was operated isocratically at flow rate of 1ml/min at 40°C  $\pm$  0.5° C for 15 min. The mobile phase found to be most suitable for analysis was Acetonitrile: 0.02M Potassium dihydrogen ortho phosphate buffer (0.1 % of triethylamine, 0.1 % of 6-heptane sulphonic acid salt): 35:65% v/v, pH adjusted to 2.5 with O-phosphoric acid, detection was carried out at 210nm using Hypersil BDS C-18 (150\*4.6mm) 5µ column with injection volume 20µl. The retention time of Ramipril and S (-) Amlodipine Besylate were 5.61±0.3 and 7.41±0.3 respectively. The proposed method was validated according to International Conference on Harmonization [ICH Q2 (R 1)] and was found to be precise, accurate, selective and rapid for the simultaneous determination of Ramipril and S (-) Amlodipine Besylate in bulk and tablet dosage forms. The linearity for Ramipril (r 2 =0.9914) and S (-) Amlodipine besylate (r 2 =0.9930) was established in the range of 25.14 - 75.41 and 25.46-76.38µg/mL respectively. This new developed method was found to be precise with satisfactory %RSD values for inter and intraday precision [28].

K. Pallavi, Pranitha, Sampath Kumar (2015) developed and validated a simple reversed-phase high performance chromatography (RP-HPLC) method for simultaneous estimation of ramipril and losartan in pharmaceutical dosage form. Chromatographic analysis was performed on a Inertsil ODS (250 4.6 x 5 $\mu$ ) column at ambient temperature with a mixture of 10 mm KH2PO4: ACN (3:70) v/v (1.36gm of potassium di hydrogen phosphate was weighed and dissolved in 1000ml of water and adjust the pH to 3.0 using ortho phosphoric acid. The buffer was filtered through 0.45  $\mu$  filters to remove all fine particles and gases) as mobile phase, at a flow rate of 1.0 ml/min-1. UV detection was performed at 211 nm. The method was validated for accuracy, precision, specificity, linearity and sensitivity. The limit of detection was 0.24 and 1.09  $\mu$ g ml-1 and quantification limit was 0.72  $\mu$ g ml-1 and 3.30  $\mu$ g ml-1 for ramipril and losartan. The retention times of Ramipril and losartan were 2.667 and 3.887 min, respectively. The accuracy of proposed method was determined by recovery studies and found to be 100.12% to 100.43%. Commercial tablet formulation was successfully analyzed using the developed method and the proposed method was applicable to outline analysis of determination of ramipril and losartan in pharmaceutical tablet dosage form [29].

K. Rao, K. Srinivas (2010) studied on a simple, specific and accurate reverse phase liquid chromatographic method for the simultaneous determination of losartan potassium and ramipril in table dosage forms. A hypersil ODS C18,  $4.6\times250$  mm, 5  $\mu$ m column in isocratic mode, with mobile phase acetonitrile:methanol:10 mM tetra butyl ammonium hydrogen sulphate in water in the ratio of 30:30:40% v/v/v was used. The flow rate was 1.0 ml/min and effluent was monitored at 210 nm. The retention times of losartan potassium and ramipril were 4.7 and 3.3 min, respectively. The linearity range for losartan potassium and ramipril were in the range of 0.04-100  $\mu$ g/ml and 0.2-300  $\mu$ g/ml, respectively. The proposed method was also validated and successfully applied to the estimation of losartan potassium and ramipril in combined tablet formulations [30].

Vatchavai Bhaskara Raju, Bonthu Mohan Gandhi, Kamatham Srinivas Sumanth, Kolli Srinivas, Tupakula N Venkata Lakshmi Neeraja (2017) developed a new, precise, accurate, rapid and simple reverse-phase high-performance liquid chromatographic (RP-HPLC) method for the simultaneous estimation of Telmisartan (TEL) and Ramipril (RAM) in pharmaceutical formulation and in bulk. The drugs were estimated using Shiseido C18 (250 x 4.6 mm, 5µm) column. The mobile phase is 0.5% ortho phosphoric acid (A), combination of acetonitrile: methanol (70:30, v/v) (B). A: B in the ratio of (50:50, v/v) at a flow rate of 1 ml/min was used for the separation. Detection was carried out at 210 nm .Linearity was obtained in the concentration range of 40-120 µg/ml for TEL, 5-15 µg/ml for RAM with retention times of 3.218 minutes and 4.803 minutes respectively. The correlation coefficient values were found to be greater than 0.99. Precision studies showed % RSD values less than 2% for both the drugs in all the selected concentrations. The percentage recoveries of TEL and RAM are in the range of 99.91-99.97% and 99.76-99.86% respectively. The assay results of TEL and RAM are 99.91% and 99.82% respectively. The limit of detection (LOD) and limit of quantification (LOQ) were 0.01 µg /ml, 0.8 µg /ml for TEL and 0.1µg /ml, 3µg /ml for RAM respectively. The method was validated as per ICH guidelines. The proposed validated method can be successfully used for the quantitative analysis of Telmisartan (TEL) and Ramipril (RAM) in bulk and commercially available dosage form [31].

G. Nagarajan, B. Govardhan1, B. V. Ramana, K. Sujatha, S. Rubina, T. Arundathi and R. Soumya (2013) reported a simple reversed-phase high-performance liquid chromatographic (RP-HPLC) method and validated for simultaneous determination of Enalapril maleate and Ramipril in bulk and tablet dosage form. Chromatographic analysis was performed on a Oyster BDS C18 column (250x 4.6 mm, 5µm) column temperature  $65^{\circ}$ C with a mixture of buffer A and buffer B in the ratio 50:50 [Buffer A preparation: 2 gm of sodium per chloride in 800 ml water and add 0.5 ml tri ethyl amine, adjust the pH to  $3.6 \pm 0.1$  with phosphoric acid and add 200 ml of acetonitrile. Buffer B preparation: 2 gm of sodium per chloride in 300 ml water and add 0.5 ml tri ethyl amine, adjust the pH to  $2.6 \pm 0.1$  with phosphoric acid and add 700 ml of acetonitrile] as mobile phase, at a flow rate of 1.0 mL min-1. UV detection was performed at 208 nm. The method was validated for accuracy, precision, specificity, linearity and sensitivity. The retention times of Enalapril maleate and Ramipril were 4.197 and 5.819 min, respectively. Calibration plots were linear over the concentration ranges 5–30 µg mL-1 and 5–30 µg mL-1 for Enalapril maleate and Ramipril, respectively. The Limit of detection was 0.571 and 1.090 µg mL-1 and the quantification limit was 1.733 µg mL-1 and 3.303 µg mL-1 for Enalapril maleate and Ramipril, respectively. The accuracy of the proposed method was

# Rama Rao Tadikonda and Ramya Alwala

determined by recovery studies and found to be 98.06% to 100.47%. Commercial tablet formulation was successfully analyzed using the developed method and the proposed method is applicable to routine analysis of determination of Enalapril maleate and Ramipril in bulk and tablet dosage form [32].

Praveen S. Rajput, Amanjot Kaur, Navdeep Kaur Gill, Karan Mittal and Ganti Subrahmanya Sarma (2012) worked on a Simple and precise HPLC method for the simultaneous estimation of Ramipril and Amlodipine in pure drug and pharmaceutical dosage forms. The separation was carried out using C18 Column ( $250 \times 4.6 \text{ mm}$  i.d. 5 µm particle size), with mobile phase compressing of Acetonitrile, Sodium phosphate buffer and Methanol in the ratio of 50: 20:25 v/v/v, pH= 6.8 (pH adjusted with OPA). The flow rate was 0.8 ml/min and the detection was carried out using PDA detector at 210 nm. The retention times were 2.64 and 7.45 mins for Ramipril and Amlodipine respectively. Calibration curves were linear with correlation coefficient 0.998 and 0.996 over concentration range of 1 - 16 µg/ml for Ramipril and 0.2 – 3.2 µg/ml for Amlodipine respectively. Recovery was found in between 100.21% and 100.82% for Ramipril and Amlodipine respectively. Method was found to be reproducible with relative standard deviation (R.S.D) for intra and inter day precision less than 2%. The method was validated by evaluation of different parameters such as accuracy, linearity, precision, LOD and LOQ [33].

N.Sriram developed a simple reversed-phase high-performance liquid chromatographic (RP-HPLC) method and validated for simultaneous determination of Ramipril and Losartan in pharmaceutical tablet dosage form. Chromatographic analysis was performed on a Inertsil ODS ( $250\overline{A}$ — $4.6\overline{A}$ — $5\overline{A}\mu$ ) column at ambient temperature with a mixture of 10M KH2PO4:ACN (30:70) v/v as mobile phase, at a flow rate of 1.0 ml/min-1. UV detection was performed at 211 nm. The method was validated for accuracy, precision, specificity, linearity and sensitivity. The retention times of Ramipril and Losartan were 2.667 and 3.887 min, respectively. Calibration plots were linear over the concentration ranges 3-7 µg mL-1 and 60-140 µg mL-1 for Ramipril and Losartan, respectively. The Limit of detection was 0.24 and 1.09  $\widehat{A}$ µg mL-1 and the quantification limit was 0.72  $\widehat{A}$ µg mL-1 and 3.30  $\widehat{A}$ µg mL-1 for Ramipril and Losartan, respectively. The accuracy of the proposed method was determined by recovery studies and found to be 100.12% to 100.43%. Commercial tablet formulation was successfully analyzed using the developed method and the proposed method is applicable to routine analysis of determination of Ramipril and Losartan in pharmaceutical tablet dosage form [34].

S. Ashutosh Kumar, Manidipa Debnath, J.V.L.N.Seshagiri Rao, D. Gowri Sankar performed a precise and reproducible stability indicating RP-HPLC method for the simultaneous estimation of hydrochlorothiazide, ramipril and losartan potassium in plasma by using Symmetry C18 column (4.6 x 150mm, 5Pm, Make: Hypersil) in an isocratic mode. The drug was spiked in the plasma and extracted with mobile phase by precipitation method. The mobile phase was consisted of potassium dihydrogen phosphate (KH2PO4) and acetonitrile [HPLC Grade] in the ratio of 68:32 (% v/v). The detection was carried out at 210 nm. The percentage mean recoveries of hydrochlorothiazide, ramipril and losartan potassium were found to be 98.21-101.13, 98.82-100.93 and 99.69-100.98 percentage respectively. This reveals that the method is quite accurate. The method was linear over the concentration range for hydrochlorothiazide 12.5-32.5, ramipril 1.25-3.25 and losartan 50.0 -130.0 Pg/mL. The percentage relative standard deviation for inter-day and intra-day precision was found to be within limits. The lower limit of quantification was found to be 0.647, 1.283 and  $2.647 \mu g/mL$  for hydrochlorothiazide, ramipril and losartan respectively. The percentage relative standard deviation obtained for the drugs spiked in plasma for stability studies were less than 2 %. The validation of method was carried out utilizing ICH-guidelines [35].

Jinesh Bahubali Nagavi, Preethi Gotadake Anantharaju (2014) developed and validated a HPLC method for simultaneous estimation of Ramipril and Hydrochlorothiazide in tablets. The developed method involves Purosphere, Star Rp18e,  $5\mu$ m, $150\times4.6$ mm column with mobile phase composition of acetonitrile and sodium perchlorate (pH2.5) buffer in the ratio of 3:2, at a flow rate of 1.0 ml/min and UV detection at 316nm for first five minutes for Hydrochlorothiazide and 210nm for Ramipril. The method was validated as per ICH guidelines, Linearity was observed over concentration range of 17.5 to 32.5 µg/ml for Ramipril and 87.5 to 162.5 µg/ml for Hydrochlorothiazide. The Accuracy of the proposed method was determined by recovery studies and found to be

# Rama Rao Tadikonda and Ramya Alwala

97.95-102.3% and 97.98-102.66% for Ramipril and Hydrochlorothiazide respectively. The proposed method was extended for estimation of Ramipril and Hydrochlorothiazide in marketed tablet formulation (Ramace-TM) and it was found to be well within the acceptance limit. The developed and validated HPLC method for simultaneous estimation of Ramipril and Hydrochlorothiazide was found to be linear, accurate, precise, robust and rugged. Hence it can be used for routine analysis of Ramipril and Hydrochlorothiazide in tablets [36].

B. Raj Kumar, G. Nagarajan, D. Prashanthi Reddy, E.V.S.Naveen Chowdary, G. Kamalesh, P. Anil Kumar Yadav, developed a simple, precise, rapid and accurate reverse phase HPLC method for the determination of Telmisartan and Ramipril in combined tablet dosage form. A reverse phase C18 column was used as stationary phase of 250x4.6 mm i.d and 5mm partial size, with mobile phase consisting of phosphate buffer of pH 3.0 and acetonitrile in the proportion of 60:40 v/v respectively was used. The flow rate was 1.0 ml/min and the effluents were monitored at 245nm. The retention time was 5.35 and 10.3 minutes. The detector response was linear in the concentration of 16 to 24  $\mu$ g/ml for Telmisartan with 0.9998 as the value of correlation coefficient. The Limit of measurements such as limit of detection and limit of quantification were found to be 9.47  $\mu$ g and 31.57  $\mu$ g for Telmisartan and for Ramipril 1.16 $\mu$ g and 3.88  $\mu$ g, respectively. The percentage relative standard deviations for the assay values were found to be 1.11 and 0.518 for Telmisartan and Ramipril. The method was validated by determining its accuracy, precision and system suitability. The results of the study showed that the proposed RP-HPLC method is simple, rapid, precise and accurate. Hence, this method can be easily and conveniently adopted for routine analysis of Telmisartan and Ramipril in combined tablet dosage form [37].

N. Sanni Babu , S. Mutta Reddy (2015) reported a simple, rapid, precise, and reliable reverse phase HPLC method was developed for the separation and estimation of four drugs Aspirin, Ramipril, Atenolol and Atorvastatin in cardiovascular polypill based synthetic mixture. The estimation was carried out using Inertsil ODS-3V (250 mm × 4.6 mm, 5  $\mu$ m) column; mobile phase consisting of acetonitrile, methanol and buffer (pH=2.5); flow rate of 0.8 mL/min and ultraviolet detection at 225 nm. All the drugs were properly eluted within run time of 10 min with retention times about 4.1 min for Aspirin; 5.9 min for Atorvastatin; 7.2 min for Atenolol; and 8.3 min for Ramipril 8.333 min, respectively. The method was validated as a final verification of method development with respect to precision, linearity, accuracy, ruggedness, and robustness. This validated method was successfully applied to the commercially available pharmaceutical dosage form, yielding very good and reproducible result [38].

Manzoor Ahmed, Manohara Y.N, Rachana R. Yeligar developed a simple, accurate, precise and rapid RP-HPLC method with subsequently validated as per ICH guidelines for the determination of Ramipril (RAM) and Metolazone (MET) using mobile phase [mixture of water and acetonitrile in the ratio of 70:30 and potassium dihydrogen ortho phosphate buffer of pH-3 (using OPA)] as the solvent. The proposed method involves the measurement of Retention time at selected analytical wavelength. 220.0 nm was selected as the analytical wavelength. The retention time of MET and RAM was found to be 4.245 and 6.567 respectively. The linearity of the proposed method was investigated in the range of 10-50  $\mu$ g/ml (r = 0.9999) for MET and 20-100  $\mu$ g/ml (r = 0.9998) for RAM respectively. The method was statistically validated for its linearity, accuracy and precision. Both inter-day and intra-day variation was found to be showing less % RSD (Relative Standard Deviation) value indicating high grade of precision of the method [39].

Andal Naga Jyothi Kapuganti, Bonthu Mohan Gandhi, Vasthavai Bhaskara Raju, Kamatham Srinivas Sumanth, Venkata Koteswaramma Kagitapurapu , Kolli Srinivas, Parimi Harika (2016) developed and validated a simple, fast, precise, selective and accurate RP-HPLC method for the simultaneous determination Ramipril(RAM), Aspirin (ASP) and Simvastatin (SIM) in a Pharmaceutical dosage form. The separation of these three drugs was achieved on a SHISHEDO C18, 250×4.6mm, 5 micron size column with a mobile phase consisting of 0.5% Ortho phosphoric acid ACN:Methanol (20:10:70 v/v) at a flow rate of 1ml/min and UV detection at 226nm.The retention times were observed to be 2.1, 2.7 and 9.6 minutes for Ramipril (RAM), Aspirin (ASP) and Simvastatin (SIM) respectively. Linearity was found to be 5-15  $\mu$ g/ml, 50-150  $\mu$ g/ml, 20-60  $\mu$ g/ml for Ramipril(RAM), Aspirin(ASP) and Simvastatin(SIM) respectively. The method was statistically validated for linearity, recovery, limit of detection, limit

# Rama Rao Tadikonda and Ramya Alwala

of quantification, accuracy and precision. The stress testing of the drugs individually and their mixture was carried out under acidic, alkaline, oxidation, photo-stability and thermal degradation conditions and its degradation products were well resolved from the analyte peaks. This method was successfully validated for accuracy, precision, and linearity, limit of detection and limit of quantification [40].

Makwana, C. J., Patel, P. D., Thummar, J. M., Dey, S., Upadhyay, U. M Studied about Ramipril is angiotensinconverting enzyme inhibitor. Chlorthalidone is one of the oldest and widely used thiazide diuretics. Simple, accurate and economic RP-HPLC method have been described for the simultaneous estimation of Ramipril and Chlorthalidone in bulk and combined dosage form. Reverse Phase high-performance liquid chromatographic method was developed for the determination of Ramipril and Chlorthalidone using Acetonitrile: Water (40:60 v/v) of as the mobile phase and measuring the response at  $\lambda$ max 215 nm. The analysis was performed on a C18 (250X4.6 mm ID), 5.0 µ column. The calibration curve was obtained for Ramipril and Chlorthalidone at 2-12 µg/ml and 5-30 µg/ml respectively. The mean recovery was found to be 98.21% and 98.46% for Ramipril and Chlorthalidone respectively. The LOD and LOQ value for ramipril was found to be 0.069 and 0.218 respectively. The LOD and LOQ value for Chlorthalidone was found to be 0.0076 and 0.025 respectively. The method was validated according to the ICH guidelines [41].

Saida Naik, Dheeravath, Kasani. Ramadevi, Zilla. Saraswthi, Dheeravath. Maniklal, Bhagawan. D (2013) reported a new, simple, rapid, specific and sensitive reverse phage high performance liquid chromatographic method for estimation of Ramipril and Amlodipine. For this validation following parameters like precision, accuracy, linearity, limit of detection, limit of quantification, robustness have been studied. The developed method is recommended for routine analysis since it is rapid, simple, precious and robust quantitative analytical method for simultaneous estimation of Ramipril and Amlodipine. Validation has done according to international conference for harmonization (ICH) [42].

Dipak.A.Patil, Shyam.S.Rangari, Prashant.P.Nikumbh, Sandip.S.Chaudhari and Mayur.R. Bhurat (2022) studied about the present work that explains the development and validation of a simple and reliable RP-HPLC method for the quantitative determination of Ramipril (RMP). Chromatography was carried out by reversed-phase technique on a Fortis C18 (100 mm × 4.6 mm; 2.5  $\mu$ m particle size). The optimized mobile phase was consisted of Methanol and citric acid sodium citrate buffer solution (50:50 v/v) having pH 3.0. The retention times were 3.645 min for RMP. The detection was carried out at 270 nm and a column temperature of 25 °C. The method was evaluated for the various validation parameters, such as linearity, accuracy, precision, LOD, LOQ, specificity, selectivity, and sample stability. The proposed method was validated and successfully applied for the analysis of pharmaceutical formulations and laboratory-prepared mixture containing Ramipril respectively [43].

Chandrabatla Varaprasad and K. Ramakrishna (2015) performed a cost-effective RP-HPLC method using a PDA detector at 210nm wavelength for simultaneous estimation of Metoprolol, Ramipril and Atorvastatin in pharmaceutical dosage forms. The method was validated as per ICH guidelines over a range of  $62.5-625 \mu g/mL$ ,  $6.25-62.5 \mu g/mL$  and  $12.5-125 \mu g/mL$  for Metoprolol, Ramipril and Atorvastatin respectively. Analytical column X-bridge C18,  $4.6 \times 150$ mm,  $5\mu$  was used at a temperature of  $30^{\circ}C \pm 0.5^{\circ}C$ . OPA Buffer and Acetonitrile composition were used as mobile phase in a gradient flow at a flow rate of 1.0 mL/min. Retention times of  $2.4 \pm 0.5$ ,  $6.1 \pm 0.5 \text{ min}$  and  $7.8 \pm 0.5 \text{ min}$  were obtained for Metoprolol, Ramipril and Atorvastatin respectively. The percentage recoveries of Metoprolol, Ramipril and Atorvastatin, are 100.82%, 100.05% and 100.7% respectively [44].

Koduru Swathi , Mitta chaitanya, Kalepu swathi (2015) developed and validated a selective and sensitive stabilityindicating high-performance liquid chromatographic method was for the determination of Ramipril & Clopidogrel. The  $\lambda$ max of the two ingredients i.e. Ramipril & Clopidogrel , were found to be 210 nm and 225 nm respectively in methanol as solvent system. Accurately weighed 100 mg of Ramipril and 100 mg of Clopidogrel were transferred to 100 ml volumetric flask. About 40 ml of HPLC grade methanol was added and sonicated to dissolve. The volume was made up to mark with same solvent. Then 10 ml of the above solution was diluted to 100 ml with the solvent

system. Mobile phase was prepared by taking Potassium dihydrogen phosphate buffer + Dipotassium hydrogrn phosphate (0.01 M, pH 3.0): acetonitrile (30:70). Mobile phase was filtered through 0.45  $\mu$ m membrane filter and degassed under ultrasonic bath prior to use. The mobile phase was pumped through the column at a flow rate of 1.0 ml/min. The HPLC system was set with the optimized chromatographic conditions to run the standard solution of Clopidogrel and Ramipril for 15 min. The retention time were found to be 2.03 min and 9.93 min respectively [45].

Abdullah A. Elshanawane, Lobna M. Abdelaziz, Magda M. Kamal (2014) studied about Telmisartan angiotensin-IIreceptor antagonist (ARA II), which is used in treatment of hypertension alone or in combination with other antihypertensive drugs such as Ramipril and Amlodipine besylate or in combination with antihyperlipidemic agent such as Atorvastatin calcium. The RP- HPLC method was developed for the assay of Telmisartan, Ramipril, Amlodipine besylate, and Atorvastatin calcium. The method was performed by reversed phase high performance liquid chromatography using a mobile phase consisting of 0.025 M potassium dihydrogen phosphate (pH 6.0):acetonitrile = 60:40, v/v, with detection at 205 nm on a BDS Hypersil C18 (250 × 4.6 mm, 5 µm i.d) at a flow rate of 1.5 mL/min in an isocratic manner. Analytical run time was 8 min. Method exhibited good linear relationship in concentration ranges (10–60, 16–96, 10–60, 10–60 µg/mL); recovery percentages (100.06, 100.85, 99.54, 100.8%); LOD (0.58, 0.16, 0.72, 0.3 µg/mL); and LOQ (1.92 0.55, 2.4, 0.98 µg/mL) for Ramipril, Telmisartan, Amlodipine besylate, and Atorvastatin calcium, respectively. Method validation was developed following the recommendations for analytical method validation of International Conference on Harmonization (ICH) and Food and Drug Administration (FDA) organizations [46].

Raju Chandra , Manisha Pant , Harchan Singh , Deepak Kumar , Ashwani Sanghi (2016) discussed about a reliable and reproducible reversed-phase high performance liquid chromatography (RP-HPLC) for the quantitative determination of Ramipril drug content from marketed bulk tablets. The active ingredient of Ramipril separation achieved with C18 column using the methanol water mobile phase in the ratio of 40:60 (v/v). The active ingredient of the drug content quantify with UV detector at 215 nm. The retention time of Ramipril is 5.63 min. A good linearity relation (R2=0.999) was obtained between drug concentration and average peak areas. The limit of detection and limit of quantification of the instrument were 0.03 and 0.09  $\mu$ g/mL, respectively. The accuracy of the method validation was 102.72% by recoveries method [47].

Maste M.M, Kalekar M.C., Kadian N. and Bhat A.R (2011) described a precise, accurate and reproducible Reverse phase High Performance Liquid Chromatographic (RP-HPLC) method for simultaneous estimation of Ramipril and Amlodipine in tablet dosage form on Phenomenex C18 column (245 mm  $\times$  4.5 mm, 5 µm, particle size) using acetonitrile: phosphate buffer, (60:40 v/v) as mobile phase at flow rate of 1.0 ml/min and the detection wavelength was 222 nm. The retention time for Ramipril and Amlodipine was found to be 3.41 and 6.10 min respectively. Proposed method was validated for precision, accuracy, linearity range, robustness and ruggedness [48].

Akhil Nagar , Sumit Deore, Atul Bendale, Rajanikant Kakade , Chetankumar Sonawane (2020) developed a rapid, accurate, and precise ratio spectra derivative spectroscopic high-performance liquid chromatography method and validated for the estimation of Ramipril (RAM) and Candesartan cilexetil (CAN) in synthetic mixture. The estimation of RAM, CAN (6  $\mu$ g/ml) was used as a devisor and for the estimation of CAN, RAM (5  $\mu$ g/ml) used as a devisor. The wavelengths selected for quantitative estimation were 331 nm for RAM and 231 nm for CAN. The result for validation shows that linearity of the developed method was 0.9976 and 0.9994 in the range of 5–10  $\mu$ g/ml and 6–16  $\mu$ g/ml for RAM and CAN, respectively. Phenomenex C18 column (250 mm×4.6 mm, 5  $\mu$ m particle size) column was used. Acetonitrile:water (0.5% TEA, pH 4.5 adjusted with 10% orthophosphoric acid) (85:15 v/v) as a mobile phase, flow rate 1 ml/min and detection carried out at 220 nm. The retention time of RAM and CAN was 3.607 and 5.613 min, respectively. Linearity of the developed method was found to be 0.9956 and 0.9974 in the range of 0.5–0.9  $\mu$ g/ml and 1.60–2.88  $\mu$ g/ml for RAM and CAN, respectively. From the mentioned results, we can conclude that the developed methods were validated successfully as per the ICH guideline and are accurate, robust, and precise [49].

# Rama Rao Tadikonda and Ramya Alwala

Anuruddha Rajaram Chabukswar, Pramod Hindurao Sakpal (2021) developed a Cost effective, Accurate, Precise Accelerated degradation method for determination of Atorvastatin and Amlodipine in combination dosage form of tablet and validated as directed by ICH guidelines. The 0.02 M potassium dihydrogen phosphate: acetonitrile: methanol (30:10:60 v/v/v) was used as mobile phase and pH 4 adjusted using ortho phosphoric acid at flow rate 1.0 ml/min. The column used for method development was Octadecylsilane-C18 (5  $\mu$ m, 25 cm × 4.6mm, i. d.). The peaks obtained in the chromatogram were well resoluted. The scanning wavelength used was 244 nm with PDA detector. The linearity for both the drugs was found between 05 - 30  $\mu$ g/ml for both drugs with regression coefficient equation 0.995 and 0.999 at retention time 8.32 min and 11.09 min for Amlodipine and Atorvastatin respectively. The results obtained were statistically validated as directed by ICH guidelines and was found satisfactory. The developed and validated method was found to be very specific, accurate and precise. It can be utilized for routine analysis of combined dosage form of Amlodipine and Atorvastatin in the laboratory [50].

M. Vishnu Priya, Dr.P.Madhavan, Dr.Pramod Kumar, Dr.Raj Kumar (2016) reported a simple, accurate, precise assay and rapid stability-indicating reversed phase high performance liquid chromatography (RP-HPLC) method with an effective resolution and subsequently validated for the simultaneous estimation of Metformin HCI, Ramipril and Glimiperide from their combination drug product. The method was developed using Hypersil BDS C18, 250 x 4.6 mm, 5µm, L1 packing, maintained at an ambient temperature. The optimum mobile phase used in this method was a mixture of Methanol and 0.02M KH2PO4 buffer in the ratio of 850:150 v/v, flow rate of mobile phase was set 0.8mL min -1 at 210 nm compounds was eluted and monitored. Metformin HCI, Ramipril and Glimepiride are subjected to stress conditions of acid, base, oxidative, thermal and photolytic degradation. The degradation products were well separated from the main peak proving the stability-indicating ability of the method. The developed method was validated as per International Conference on Harmonization (ICH) guidelines [51].

K. S. Lakshmi And Lakshmi Sivasubramanian developed a simple, sensitive and validated HPLC method to determine Valsartan And Ramipril simultaneously in synthetic mixture. Chromatographic separation was achieved on A C-18 Column using a mixture of acetonitrile and water in the ratio 55:45 (V/V), pH adjusted to 3.6 with 88% orthophosphoric acid at a wavelength of 215 nm. Linearity Of The method was found to be in the concentration range of 50-250  $\mu$ g/ml for valsartan and 100-500  $\mu$ g/ml for Ramipril with correlation coefficient greater than 0.999. the total eluting time for the two Components Is less than five minutes. The method can be used for simultaneous determination of valsartan and Ramipril [52].

N. Sanni Babu, S. Mtta Reddy (2015) studied a simple, rapid, precise, and reliable reverse phase HPLC method was developed for the separation and estimation of four drugs Aspirin, Ramipril, Atenolol and Atorvastatin in cardiovascular polypill based synthetic mixture. The estimation was carried out using Inertsil ODS-3V (250 mm × 4.6 mm, 5  $\mu$ m) column; mobile phase consisting of acetonitrile, methanol and buffer (pH=2.5); flow rate of 0.8 mL/min and ultraviolet detection at 225 nm. All the drugs were properly eluted within run time of 10 min with retention times about 4.1 min for Aspirin; 5.9 min for Atorvastatin; 7.2 min for Atenolol; and 8.3 min for Ramipril 8.333 min, respectively. The method was validated as a final verification of method development with respect to precision, linearity, accuracy, ruggedness, and robustness. This validated method was successfully applied to the commercially available pharmaceutical dosage form, yielding very good and reproducible result [53].

## HPTLC METHODS

Darshana A. Parmar, Dinesh V. Thakkar, Rashmin B. Patel, Mrunali R. Patel (2015) Studied about validated highperformance thin-layer chromatography (HPTLC) methods for simultaneous estimation of ramipril (RAM) and losartan potassium (LOS) in pure powder and formulation. The HPTLC separation was achieved on an aluminumbacked layer of silica gel 60F254 using methanol: ethyl acetate: toluene: glacial acetic acid (1:9:1:0.2 v/v/v/v) as mobile phase. Quantification in HPTLC method was achieved with UV detection at 210 nm over the concentration range of 300 – 1300 ng/spot for RAM and 3000 – 13000 for LOS, respectively, with recovery of 98.93 - 99.73 and 98.96 - 100.11 % for RAM and LOS, respectively. These methods are simple, specific, precise, sensitive and robust; they are applicable for the simultaneous determination of RAM and LOS in pure powder and formulation [54].

Devanshi A. Desai, & Renu S. Chauhan & Ragini D. Kushwaha,(2018) developed and validated a simple, accurate and precise high performance thin layer chromatographic method for simultaneous estimation of hydrochlorothiazide and ramipril (RAM) in tablets and a stability indicating HPTLC method for estimation of hydrochlorothiazide (HCTZ) in tablets. The method employed TLC aluminium plates precoated with silica gel 60F254 as the stationary phase. Mobile phase toluene: methanol: ethyl acetate: TEA (6: 3: 1: 0.2 v/v/v) gave compact, dense and well separated bands for hydrochlorothiazide and ramipril at  $R_r$  values 0.32 and 0.55 respectively. The linear regression analysis data for the calibration plots showed a linear relationship in the concentration range 750– 3750 ng/band with  $R^2$ = 0.9947 for hydrochlorothiazide and 300 – 1500 ng/band with  $R^2$ = 0.9935 for ramipril. Mobile phase toluene: ethyl acetate: methanol: glacial acetic acid (5: 4: 1: 0.2 v/v/v) gave compact and dense bands for hydrochlorothiazide at  $R_r$  0.43 and well separated degradation products produced under acidic, alkaline, neutral hydrolysis, and oxidation. The methods were found to be suitable for simultaneous estimation of hydrochlorothiazide and ramipril in their combined tablets and for estimation of hydrochlorothiazide in its tablets [55].

Bokka Ramesh, Kothapalli Hari babu, Vanka Uma Maheswara Sarma, Potturi Sita Devi (2011) developed a new high-throughput HPTLC/ ESI-MS method to separate and quantify ramipril, hydrochlorothiazide and telmisartan in solid pharmaceutical formulations. Separation was performed on silica gel 60F plates using a saturated mixture of toluene: chloroform: methanol: acetonitrile(3:3:2:2 v/v) as mobile phase. After chromatography, multi-wavelength densitometric detection was carried out by measuring the UV-absorbance at 210 nm for ramipril, 273 nm for hydrochlorothiazide and 300 nm for telmisartan. The Rr values were 0.51, 0.61 and 0.69 for ramipril, hydrochlorothiazide and telmisartan respectively. The method exhibited good linearity over a dynamic range of 50-400 ng per band for ramipril, 250-1000 ng per band and 800-3200 ng per band for hydrochlorothiazide, telmisartan respectively. Recoveries were between 99.55% and 99.97%. The validated lowest limit of detection was 9.38ng/band, 2.76ng/b and 7.31ng/band whereas lowest limit of quantification was 31.29ng/band, 9.22ng/band and 24.31ng/band for ramipril, hydrochlorothiazide and telmisartan respectively. Mass confirmation was accomplished in positive electrospray ionization full scan mode for ramipril and telmisartan and in negative mode for hydrochlorothiazide. This simple yet a reliable HPTLC/ESI-MS facilitated the separation and determination of the compounds understudy in one analytical run with reduced analysis cost, good chromatographic selectivity and a reliable alternative for routine analysis of pharmaceutical formulations [56].

V. A. Patel, P. G. Patel, B. G. Chaudary, N. B. Rajgor, S. G. Rathi developed and validated thin layer liquid chromatography (TLC) method for the simultaneous estimation of telmisartan and ramipril in a combined dosage form. Procedure does not require prior separation of components from the sample. Telmisartan and Ramipril were determined by High Performance Thin Layer chromatography method (HPTLC) in tablet dosage form. The method was carried out in TLC Precoated silica gel on aluminum plate 60 F 254, (10 cm ×10 cm, prewashed by methanol and activated at 60° C for 5 min prior to chromatography). The solvent system was Acetone: enzene: Ethyl acetate: Glacial acetic acid in the proportion of 5:3:2:0.03, (v/v/v/) with Rr Value for telmisartan and ramipril was 0.673 and 0.353 respectively. The linearity regression analysis for calibration showed 0.996 and 0.998 for telmisartan and ramipril with respect to peak area and height in the concentration range of 100- 1800 ng/spot and 300-1800 ng/spot respectively. The method developed can be used for routine analysis of drugs content in tablet dosage form [57].

Kamini Sethy , Janhavi R Rao , K Raja Rajeswari and KEV Nagoji (2019) developed a new, simple, precise, and accurate HPTLC method for simultaneous estimation of Metoprolol succinate and Ramipril as the bulk drug and in tablet dosage forms. Chromatographic separation of the drugs was performed on aluminum plates precoated with silica gel 60 F254 as the stationary phase and the solvent system consisted of Methanol: Toluene: Ethyl Acetate: Ammonia (2.5:3:5:0.7v/v/v/v). Densitometric evaluation of the separated zones was performed at 209 nm. The two drugs were satisfactorily resolved with RF values 0.67, and 0.37 for Metoprolol Succinate and Ramipril, respectively. The accuracy and reliability of the method was assessed by evaluation of linearity (2000-12000 ng/spot for Metoprolol succinate and 200–1200 ng/spot for Ramipril), precision ( intra-day RSD 0.471–1.036% and inter-day RSD 1.085–1.580% for Metoprolol Succinate and intra-day RSD 1.057–1.63% and inter-day RSD 1.024–1.746% for

# Rama Rao Tadikonda and Ramya Alwala

Ramipril,), accuracy (98.95  $\pm$  0.16 % for Metoprolol and 98.98  $\pm$  0.41 % for Ramipril), and specificity, in accordance with ICH guidelines [58].

Shirish P. Lokhande, Surya Prakash Gupta, K.Sureshkumar, J. Dharuman, Gopal Garg, Neeraj Upmanyu (2012) reported a simple, precise, accurate and rapid high-performance thin-layer chromatographic method for the estimation of ramipril and valsartan simultaneously in combined dosage form. The stationary phase used was precoated silica gel 60F254. The mobile phase used was a mixture of chloroform: ethyl acetate: methanol: glacial acetic acid (5.0:5.0:1.0:02 v/v/v/v). The detection of spots was carried out at 210 nm. The method was validated in terms of linearity, accuracy, and precision. The calibration curve was found to be linear between 0.4 to 2.0 µg/spot for Ramipril and 0.2 to 1.0 µg/spot for valsartan. The limit of detection and the limit of quantification for ramipril were found to be 200 ng/spot and 640 ng/spot for ramipril and 100 ng/spot and 330 ng/spot respectively. The proposed method can successfully be used to determine the drug content of marketed formulations [59].

Laxman V. Potale , Mrinalini C. Damle , Amol S. Khodke and K. G. Bothara,(2010) studied about Telmisartan, an angiotensin II antagonist and Ramipril, a long acting ACE inhibitor in combination in tablet dosage form used for the treatment of high blood pressure. The present study deals with development of validated stability indicating method for simultaneous estimation of Telmisartan and Ramipril using TLC plate precoated with Silica gel 60 F254 and the mobile phase consisting of Methanol: Chloroform in the ratio of 1:6v/v. Telmisartan and Ramipril were well resolved with Rr 0.68 ± 0.03 and 0.38 ± 0.03 respectively. Wavelength selected for quantization was 210 nm. At this wavelength, Telmisartan and Ramipril show high absorbance. Inherent stability of these drugs was studied by exposing both drugs to various stress conditions as per ICH guidelines viz. Dry heat, oxidative, photolysis (UV and cool white fluorescent light), and hydrolytic conditions under different pH values. Both drugs were not degraded under acidic condition. Both drugs show degradation under alkaline, dry heat, oxidative condition and photolytic condition. The developed method is found to be simple, specific, precise and stability indicating. The specificity of the method was confirmed by peak purity profile of the resolved peaks [60].

Sunil Singh (2012) developed and validated thin layer liquid chromatography (TLC) method for the simultaneous estimation of telmisartan and Ramipril in a combined dosage form. Telmisartan and Ramipril were determined by High Performance Thin Layer chromatography method (HPTLC) in tablet dosage form. The method was carried out in TLC Precoated silica gel on aluminum plate 60 F 254, (10 cm ×10 cm, prewashed by methanol and activated at 60° C for 5 min prior to chromatography). The solvent system was Acetone: Benzene: Ethyl acetate: Glacial acetic acid in the proportion of 6:4:1:0.05, (v/v/v/v) with Rf Value for telmisartan and ramipril was 0.673 and 0.353 respectively. The linearity regression analysis for calibration showed 0.999 and 0.998 for telmisartan and Ramipril with respect to peak area and height in the concentration range of 150- 1700 ng/spot and 300-1900 ng/spot respectively. The method developed can be used for routine analysis of drugs content in tablet dosage form [61].

Jitendra A. Wayadande, Ramkumar Dubey, Vidhya K. Bhusari and Sunil R. Dhaneshwar (2011) developed a new, simple, precise, and accurate HPTLC method for simultaneous estimation of Ramipril and Metolazone as the bulk drug and in tablet dosage forms. Chromatographic separation of the drugs was performed on aluminum plates precoated with silica gel 60 F254 as the stationary phase and the solvent system consisted of toluene : ethyl acetate : methanol : glacial acetic acid (4 : 4 : 1 : 0.2 v/v/v/v). Densitometric evaluation of the separated zones was performed at 223 nm. The two drugs were satisfactorily resolved with RF values 0.33 ± 0.02 and 0.59 ±0.02 for Ramipril and Metolazone respectively. The accuracy and reliability of the method was assessed by evaluation of linearity (600-2100 ng/spot for Ramipril and 100-350 ng/spot for Metolazone) precision (intra-day % RSD was 1.28 – 1.58 and inter-day % RSD was 1.14 – 1.83 for Ramipril and intra-day % RSD was 0.67 – 1.03 and inter-day % RSD was 0.49 – 1.18 for Metolazone), accuracy (99.44 ± 0.15 for Ramipril and 99.85 ± 0.39 for Metolazone), and specificity in accordance with ICH guidelines [62].

Alagar Raja. M, Sunitha, David Banji1, Rao. K. N. V, Selva Kuamar. D (2015) reported a simple, Accurate, precise method for the simultaneous determination and validation of the telmisartan and ramipril in Tablet dosage form.

Chromatogram was run through thermo BDS (250mm 4.6mm, 5µ). mobile phase containing Buffer and Acetonitrile in the ratio of 60:40A was pumped through column at a flow rate of 1ml/min. Buffer used in this method was 0.02N KH2PO4 buffer at PH 3.0 temperature was maintained at 30°C. Optimized wavelength for telmistran and ramipril was 245nm. Retention time of telmistran and ramipril were found to be 5.35 min and 10.3 min. % RSD of the telmistran and ramipril were found to be 1.11 and 0.518 respectively. %Recover was Obtained as 99.12 and 99.22 for telmistran and ramipril respectively. LOD, LOQ values are obtained from regression equation telmistran and ramipril 9.47 and 1.16 and 31.57 and 3.88 respectively. The HPTLC method % RSD 0.37 and 0.53 % Recover was obtained 99.85 and 99.73 respectively. The LOD LOQ was found to be 6.23 and 103 respectively [63].

## OTHER ANALYTICAL METHODS:

Raja Kumar Seshadri , Makarand Madhukar Desai , Thummala Veera Raghavaraju , Deepa Krishnan , Dama Venugopala Rao , Ivon Elisha Chakravarthy (2010) developed a simple ultra-performance liquid chromatographic (UPLC) method has been developed for the simultaneous estimation of Metoprolol (MT), Atorvastatin (AT) and Ramipril (RM) from capsule dosage form. The method was developed using Zorbax XDB-C18 (4.6 mm x 50 mm, 1.8  $\mu$ m) column with a mobile phase consisting of 0.06% ortho phosphoric acid in Milli Q water having an ion pair reagent, 0.0045 M Sodium lauryl sulphate as buffer, at ratio of buffer: Acetonitrile (50:50 v/v), at 55°C column temperature with a flow rate of 1.0 ml/min. Detection was carried out with ultra-violet detection at 210 nm for RM, MT and AT respectively. The retention times were about 1.3, 2.1 and 2.6 min for MT, AT and RM respectively, the method was validated for linearity, accuracy, precision, specificity, robustness and ruggedness. The % mean recoveries are 101.9, 102.1 and 101.4 for MT, AT and RM respectively. The method was found to be rugged and robust and can be successfully used to determine the three drugs and its combinations [64].

Pudage A, Kamat S (2010) discussed about a validated UPLC-MS/MS assay for determination of ramipril and ramiprilat from human plasma samples. The assay is capable of isolating phase II metabolites of ramipril from in vivo study samples which is otherwise not possible using conventional HPLC conditions. Both analytes were extracted from human plasma using solid-phase extraction technique. Chromatographic separation of analytes and their respective internal standards was carried out using an Acquity UPLC BEH C<sub>18</sub> ( $2.1 \times 100$  mm), 1.7 µm column followed by mass spectrometric detection using an Waters Quattro Premier XE. The method was validated over the range 0.35–70.0 ng/mL for ramipril and 1.0–40.0 ng/mL for ramiprilat [65].

Sherif A Abdel-Gawad1, Safar M Alqahtani (2020) developed a sensitive and accurate ultra-performance liquid chromatography-tandem mass spectrometric (UPLC-MS) method for quantification of ramipril in human plasma. Ramipril was extracted from biological fluid using equal volumes of n-hexane and propanol (1:1, v/v), and then chromatographed in a suitable C18 column with methanol: 0.1 % HCOOH (4: 1, v/v) as mobile phase. Atorvastatin was used as an internal standard for the chromatographic separation and quantification. The method was validated according to the United States Food and Drug Administration guidelines for standard indices. Ramipril was determined in the concentration range 0.05 and 1000 ng/mL the validation procedure exhibited a correlation coefficient of 0.9979 + 0.002 (p = 0.05). The studied drug was quantified with lower ceiling of 0.05 ng/mL, and showed an accuracy of 105.00 %. A sensitive UPLC-MS analytical method has been successfully developed for the quantification of ramipril in human plasma. This method can be applied efficiently for the quantification of ramipril in bioavailability and pharmacokinetic studies [66].

Eman S. Elzanfaly1 , Sherif A. Abdel-Gawad (2017) studied about formulation containing Ramipril (RAM), glimepiride (GLM) and metformin (MET) for the treatment of diabetes and cardiovascular disorders. This work introduces a liquid chromatography-tandem mass spectrometric (LC-MS/MS) method for the simultaneous determination of the three drugs in human plasma after liquid-liquid extraction. This method made use of atorvastatin as internal standard (IS). Analytes were recovered from plasma by n-hexane: butanol (50:50%, v/v) and subsequently separated on Waters Acquity TM UPLC BEH shield RP-C18 column using methanol: water containing 0.1% formic acid (90:10%, v/v) as a developing system. The calibration curves were linear ( $r_2 > 0.99$ ) over a range of 0.1 - 1000 ng/mL for RAM & GLM and 250 - 2000 ng/mL for MET. The intra-day and inter-day precisions were below

# Rama Rao Tadikonda and Ramya Alwala

14.32% and the accuracy was all within  $\pm$ 15%. Moreover, other validation parameters for the proposed method like matrix effect, selectivity, recovery and stability were adopted. The proposed method can be applied for the sensitive and selective quantification of the analytes in bioavailability and pharmacokinetics studies [67].

# CONCLUSION

Presented systematic review covers the current analytical methods for the determination of Ramipril and it's combinations in pharmaceutical and biological samples like serum and plasma. HPLC methods were found to be most widely used for Ramipril. The other analytical methods like UV, HPTLC, UPLC, LC/MS are also used for the determination of Ramipril in blood, serum & pharmaceutical dosage forms. The presented information is useful for the future study for researcher involved in formulation development and quality control of Ramipril.

# ACKNOWLEDGEMENT

In the accomplishment of this review successfully, I would like to thank CMR college of pharmacy and respected professor & principal T. Rama Rao for their encouragement to words the review and valuable guidance which helped me to success this review.

# ABSTRACT

In this review, herbs are delivered using transdermal drug delivery systems (TDDS) for targeted delivery of respiratory medications. As an alternative to conventional treatments, herbal TDDS has several advantages, including non-invasiveness, controlled release, reduced side effects, and improved patient compliance. It is possible to deliver herbal compounds to the respiratory system effectively with herbal TDDS. As a result, systemic side effects can be reduced and healing can be improved. In the future, formulation design should be optimized, herbal products should be standardized, and safety and efficacy research should be conducted. It is likely that herbal TDDS will prove to be a highly effective and tailored treatment option for respiratory ailments.

Keywords: Transdermal drug delivery system, herbal treatments, patient compliance, pulmonary disorder

# INTRODUCTION

The complexity of the respiratory system creates significant challenges when treating pulmonary disorders, as well as the need to deliver drugs precisely to the affected areas. There are limitations to conventional treatments, such as inhalations and oral medications, in terms of efficacy, patient compliance, and systemic side effects. Transdermal

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Komala and Logesh

drug delivery systems (TDDS) are among the novel drug delivery approaches that have gained popularity in recent years [1]. Herbal TDDS is a method of delivering targeted drugs to the body by applying herbs to the skin to facilitate systemic absorption and targeted drug delivery. Compared to conventional routes of drug delivery, transdermal drugs are less invasive, have a longer time period of release, have a higher bioavailability, and are more likely to be tolerated by patients [2]. There are a number of advantages to using this technique for pulmonary disorders where localized treatment is desirable in order to minimize the impact on the systemic system. By targeting directly, the affected respiratory tissues, TDDS is an important treatment for pulmonary disorders [3]. In order to achieve optimal therapeutic outcomes, medications must reach the site of action efficiently. There is a risk of causing irritation or systemic side effects when traditional treatment approaches, such as inhalation therapy, are used. With herbal TDDS, therapeutic agents are delivered directly into the bloodstream without having to travel through the lung [4].

A review of herbal TDDS is presented here to assess its potential as a drug of choice for pulmonary disorders [5]. This study aims to provide a comprehensive analysis of the advantages, challenges, and future prospects of herbal TDDS in the treatment of respiratory conditions based on an analysis of the available literature and research studies. In addition, we will highlight the potential benefits and limitations of herbal TDDS in comparison with conventional treatments [6]. Various strategies for formulating herbal transdermal patches or gels will be examined to facilitate a deeper understanding of herbal TDDS, including the selection of appropriate herbal extracts and formulation techniques. As well as discussing the potential adverse effects associated with herbal TDDS, we will also discuss the importance of preclinical and clinical studies to evaluate efficacy and safety [7]. In addition to highlighting the unique advantages and limitations of herbal TDDS, this review will also compare it with conventional treatment methods, such as inhalation therapy and oral medications [8]. Furthermore, regulatory considerations and standardization of herbal products will be discussed, as well as future perspectives and challenges. An overview of herbal TDDS will be presented in this review in order to provide an overview of its significance in the treatment of pulmonary disorders in addition to analyzing its potential as a drug of choice for the treatment of such disorders.

## Pulmonary Disorders and Current treatment approaches

There are two common pulmonary disorders that have a significant impact on respiratory function and quality of life: asthma and chronic obstructive pulmonary disease (COPD).

## Asthma

It is characterized by breathing difficulties, wheezing, coughing, and tightness of the chest. There is no age limit to its prevalence, but it is most common in childhood. Occupational exposures and allergens, air pollution, and respiratory infections are among the environmental factors contributing to asthma. The symptoms of asthma are caused by inflamed, narrowed airways and excessive mucus. It is important to note that asthma attacks are triggered by a variety of factors, including allergens (e.g., pollen, dust mites, pet dander), exercise, cold air, respiratory infections, and irritants (e.g., smoke, strong smells). Symptoms of asthma must be relieved temporarily while long-term control must be maintained to prevent exacerbations. It is common to use inhaled corticosteroids for long-term control as well as bronchodilators for acute symptom relief (for instance, short-acting beta-agonists). It may be necessary to prescribe oral corticosteroids in severe cases. The development of an asthma action plan and identifying asthma triggers are essential for asthmatic individuals [9].

## Chronic Obstructive Pulmonary Disease (COPD)

Chronic obstructive pulmonary disease causes persistent airflow limitation and inflammation in the lungs. Inhaling harmful inhalants, such as cigarette smoke, is the primary cause of COPD. There are also genetic factors, such as an alpha-1 antitrypsin deficiency, and occupational exposure to dust and chemicals. A person with COPD is typically suffering from chronic bronchitis and emphysema at the same time. The presence of chronic bronchitis is characterized by inflammation and narrowing of the bronchial tubes, resulting in recurrent respiratory infections, excessive mucus production, and chronic coughing. A lung disease called emphysema, on the other hand, causes the air sacs in the lung to become damaged, which results in a reduced ability to exchange oxygen and the inability to

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Komala and Logesh

breathe. Shortness of breath, chest tightness, coughing, wheezing, and fatigue are symptoms of COPD. In addition to affecting quality of life and daily activities, the disease is a progressive and irreversible illness. As part of the treatment plan, symptoms will be relieved, disease progression will be slowed, and exacerbations will be prevented. Inhaled treatments, brochodilators, and corticosteroids are common. Patients with advanced lung disease may also benefit from pulmonary rehabilitation programs and oxygen therapy [10]. The treatment of asthma and COPD requires long-term management and an individualized treatment plan. Managing these pulmonary disorders effectively and improving quality of life for affected individuals requires proper diagnosis, medication adherence, lifestyle modifications, and ongoing monitoring.

#### Limitations and challenges

There are certain limitations and challenges with current treatment methods for pulmonary disorders, such as inhalation therapy and oral medications.

## Inhalation therapy

**Technique and Device Dependence:** The delivery of drugs to the lungs requires proper technique and coordination. Suboptimal therapeutic outcomes can be caused by incorrect inhaler technique.

**Patient Compliance:** Patients with cognitive or physical impairments may have difficulty adhering to prescribed inhalation therapy regimens. Symptoms of asthma can be exacerbated by inconsistent or improper use of inhalers.

**Device Availability and Cost:** Depending on their design, availability, and cost, inhalers and other inhalation devices can vary greatly. There are disparities in treatment options due to the cost or accessibility of certain inhaler devices.

#### **Oral medications**

**Systemic Side Effects:** The large distribution of oral medications used to treat pulmonary disorders frequently results in systemic effects. Other organs or systems may be adversely affected, unrelated to the intended target, as a result of this.

**Variable Bioavailability:** Food intake and gastric pH may affect the bioavailability of orally administered drugs, as they pass through the digestion system. This variability can affect their consistency and efficacy.

**First-Pass Metabolism:** The liver performs first-pass metabolism of drugs taken orally before they enter the circulation system. To achieve therapeutic effects, higher doses or more frequent administration are required due to the reduced concentration and bioavailability of the drug as a result of this metabolism. It is often the case that both inhalation therapy and oral medications lead to systemic drug distribution, reaching tissues and organs that are not targeted by the drug. Optimal therapeutic outcomes and a minimal impact on other body parts are achieved by delivering drugs locally to the lungs for pulmonary disorders. Factors such as genetic variation, coexisting medical conditions, and drug interactions can affect the response to inhalation therapy and oral medications. In order to tailor treatments to individual needs and to optimize drug selection [11], a multitude of factors need to be taken into account. It is crucial for successful management of pulmonary disorders that patients are educated about treatment techniques, medication schedules, and the importance of adhering to them. Patients with chronic illnesses may find it difficult to understand and adhere to their treatment plans for long periods of time.

#### Transdermal Drug delivery system

It is a form of administering medications through the skin so they can be absorbed into the bloodstream systemically. Compared to orally administered orally or via injection, it offers several advantages.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Komala and Logesh

## Mechanism

It is possible to facilitate drug absorption through transdermal drug delivery because of the skin's unique properties. There are several layers in the skin, including a protective layer called stratum corneum, which is located at the outermost layer. However, the stratum corneum also serves as the primary site of drug permeation in transdermal delivery[12]. As transdermal systems penetrate the stratum corneum, drugs are infused into the deep layers of the stratum corneum from which they are absorbed into the bloodstream. Many strategies are used to enhance drug permeation, such as permeation enhancers, drug carriers, or specialized drug delivery systems such as patches, gels, and creams.

#### Advantages

**Controlled and Sustained Drug Release:** In transdermal drug delivery systems, medications are released slowly and continuously over a prolonged period of time. This reduces the need for frequent dosing and maintains therapeutic levels over a longer period of time due to the steady concentration of the drug in the bloodstream.

**Non-Invasive Administration:** Injections and surgical procedures are not necessary for transdermal drug delivery. Especially for those with aversions to needles or difficulties with oral administration, this is a much more convenient and comfortable method.

**Improved Patient Compliance:** The ease and convenience of transdermal drug delivery systems contribute to better compliance among patients. Healthcare professionals can lessen the need for patient assistance by administering transdermal patches or topical formulations themselves.

**Avoidance of First-Pass Metabolism:** Prior to reaching the systemic circulation, orally administered drugs undergo first-pass metabolism in the liver. A drug's bioavailability can be reduced by this metabolic process. Since transdermal delivery bypasses the digestive tract and liver, drugs are directly absorbed into the bloodstream without first-pass metabolic degradation.

**Reduced Systemic Side Effects:** It is possible to deliver drugs locally and specifically through transdermal delivery. A skin delivery system reduces systemic exposure to medication, reducing systemic side effects and improving the drug's safety profile by delivering it directly into the bloodstream.

**Flexibility in Drug Formulations:** Small molecules, macromolecules, and even nanoparticles are capable of being delivered through transdermal drug delivery systems. There are many different formulations of patches, gels, and creams that can be tailored to meet the specific needs of patients and the properties of specific drugs.

**Potential for Drug Withdrawal:** In the event of adverse effects or when the treatment is no longer needed, transdermal drug delivery systems can be easily removed or discontinued.

#### Importance over management of pulmonary disorder

Pneumonia can be effectively managed with transdermal delivery of drugs, which offers specific advantages making it a valuable technique.

**Targeted Drug Delivery to the Lungs:** Airways and lung tissues are affected primarily by pulmonary disorders. By delivering targeted drugs directly to the lungs, transdermal drug delivery provides a unique advantage. A drug can be delivered through the skin to reach the pulmonary tissues, bypassing the digestive tract. By targeting drug delivery, systemic side effects are minimized and the local therapeutic effect is maximized.

Localized Treatment of Respiratory Inflammation: Lung tissue and airways are frequently inflamed in many pulmonary diseases. Anti-inflammatory medications can be formulated into transdermal drug delivery systems to

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Komala and Logesh

address and reduce inflammation in the lungs. Inflammatory processes associated with pulmonary disorders are managed by this localized treatment approach [13].

**Sustained and Controlled Drug Release:** Medications can be delivered transdermally in a controlled and sustained manner. The benefit of this is particularly apparent when treating pulmonary diseases, where maintaining consistent drug levels over time is essential for a successful outcome. In addition to reducing dosage frequency and enhancing patient convenience, transdermal drug delivery ensures a continuous therapeutic effect by maintaining a steady concentration of medication in the bloodstream.

**Improved Patient Compliance:** Managing pulmonary disorders requires patient compliance with treatment regimens. It is possible to improve patient compliance by using transdermal drug delivery systems. Compared to transdermal patches or topical formulations, transdermal patches are more user-friendly, non-invasive, and do not require frequent dosing. Treatment outcomes and disease management can be improved by improving patient compliance [14].

**Minimization of Systemic Side Effects:** Medication used to treat pulmonary disorders can sometimes have systemic side effects. Transdermal drug delivery bypasses the gastrointestinal tract and delivers drugs directly to the bloodstream. By delivering the drug locally, the potential for systemic side effects are minimized. As a result, medications can be delivered effectively to the target site while minimizing the impact on other organs or systems.

Alternative Route of Administration: In addition to oral medications and inhalation therapies, transdermal drug delivery may be an alternative route of administration for those who have difficulty with other methods. Those with compromised lung function, children, and the elderly who may have trouble swallowing oral medications or using inhalers will particularly benefit from this.

**Potential for Combination Therapy:** In addition to delivering multiple medications simultaneously or sequentially, transdermal drug delivery systems provide the possibility of combination therapy. Using different drugs that have complementary actions can provide optimal therapeutic effects in the treatment of complex pulmonary disorders.

#### Herbal medicines for pulmonary disorders

An herbal medicine is a medicinal preparation derived from plants, also known as a botanical medicine or phytomedicine. The therapeutic properties of these preparations can be harnessed from leaves, roots, stems, flowers, and seeds of plants. In ancient civilizations such as Egypt, China, Greece, and India, herbal medicines were used for thousands of years. There have been numerous traditional medical systems which utilize herbal remedies for promoting health and treating illnesses, including Traditional Chinese Medicine (TCM) [15], Ayurveda, and Indigenous Medicine. The medicinal properties of plants are attributed to numerous bioactive compounds, such as alkaloids, flavonoids, terpenoids, phenolic compounds, and essential oils. Therapeutic effects are determined by the combination of constituents in each species of plant.

There are a variety of health conditions that can be treated with herbal medicines. The herbal remedies used by different cultures treat digestive disorders, respiratory conditions, skin conditions, musculoskeletal issues, hormonal imbalances, and more. Generations of people have passed down the knowledge of traditional uses. Physiological processes and bioactive compounds in herbal medicines interact to produce therapeutic effects. Medicinal effects can be exerted by these compounds by activating receptors, enzymes, ion channels, and signaling pathways. A variety of herbal medicines have different patterns of action, with some acting broadly and others acting specifically. If herbal medicines are used properly, they are generally considered safe; however, they may have side effects and interact with other medicines. In addition, certain plants can cause allergic reactions in some people. In order to ensure safe and effective use, it is recommended that you consult a qualified healthcare professional or herbalist. Recent scientific research has concentrated on the therapeutic potential of herbal medicines, analyzing their pharmacological activities, mechanisms of action, safety profiles, and clinical efficacy. Several herbal medicines are being used in

## Komala and Logesh

modern healthcare based on this growing body of evidence. Herbal medicines are popular for their antiinflammatory properties, antibacterial properties, and nutrition benefits. *Echinacea* and *Ginkgo biloba* are popular for their immune system boosting properties, while peppermint and garlic are popular for their antacid and cardiovascular properties. With progress in research, scientists are examining new applications, standardization methods [16], and integrating herbal medicine with conventional medicine. The field of herbal medicine is evolving and presents opportunities for further exploration and understanding.

# Review of specific herbs traditionally used for respiratory conditions

## Eucalyptus (Eucalyptus globulus)

The herb eucalyptus is known to have beneficial effects on respiratory health. Among the compounds found in its composition are cineole, which has antimicrobial and expectorant properties. Oils and leaves of eucalyptus are commonly used for respiratory problems such as congestion, coughs, and bronchial inflammation through steam inhalation or cough syrups.

## Liquorice (Glycyrrhiza glabra)

There have been a number of uses for liquorice root in traditional medicine over the centuries, including its soothing and anti-inflammatory properties. The herb contains glycyrrhizin, which is used to alleviate respiratory symptoms including coughs and throat irritations. Traditionally, liquorice root is used in teas and herbal formulations to relieve respiratory conditions such as bronchitis and sore throats.

#### Thyme (Thymus vulgaris)

The expectorant and antimicrobial properties of thyme have long been recognized. As well as enhancing mucus expulsion, it contains volatile oils, including thymol, which can soothe bronchial spasms. The herb thyme is commonly used to alleviate coughs, congestion, and respiratory infections through teas, inhalation blends, and herbal preparations.

#### Mullein (Verbascum thapsus)

Traditional herbal medicine has used mullein leaves and flowers to treat respiratory conditions for centuries. As an anti-inflammatory and soothing herb, it has a number of benefits. Coughs, bronchitis, and congestion are often treated with mullein herbal formulations. Inhalation of steam is possible with this tea<sup>17</sup>.

## Marshmallow Root (Althaea officinalis)

For respiratory conditions, marshmallow root is beneficial due to its demulcent and soothing properties. Coughs are relieved and irritation is soothed by its protective coating. Dry coughs, sore throats, and bronchial irritation can be relieved with marshmallow root in herbal cough syrups and teas.

## Coltsfoot (Tussilago farfara)

Traditional medicine has used coltsfoot for respiratory conditions for centuries. A mucilage compound in it soothes the respiratory tract and relieves coughing. To relieve bronchial congestion and cough caused by respiratory infections, coltsfoot is commonly used in herbal cough remedies and expectorant formulations.

#### Osha Root (Ligusticum porteri)

Native American herbs such as osha root are known for their respiratory benefits. Antimicrobial and expectorant compounds are found in it. As a cough syrup and respiratory formula ingredient, osha root is often used to relieve cough, congestion, and inflammation in the lungs. Cold and flu season is a time when it is particularly beneficial for respiratory health.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Komala and Logesh

## Ginger (Zingiber officinale)

The benefits of ginger go beyond digestive health. Ginger also plays a role in respiratory health. Respiratory symptoms can be alleviated by its anti-inflammatory and antimicrobial properties. Coughs, congestion, and sore throats are often relieved by ginger tea, syrups, and formulations.

## Advantages of herbal transdermal drug delivery system

**Non-Invasive Administration:** It offers the advantage of being non-invasive, which is a key benefit of herbal transdermal drug delivery. Transdermal delivery involves applying the medication topically to the skin, as opposed to oral medications or injections, which require ingestion or injection. Patients can avoid needles and swallowing pills using this method, making it convenient and comfortable.

## **Controlled and Prolonged Release**

Over an extended period of time, transdermal drug delivery systems release the medication controlled and sustained. Herbal compounds are absorbed steadily into the bloodstream, minimizing fluctuations and maintaining therapeutic levels. A reduction in the frequency of dosing can improve treatment efficacy [18].

Avoidance of First-Pass Metabolism: A medication taken orally passes through the digestive system and the liver before it reaches the circulatory system. During this process, called first-pass metabolism, active compounds in the drug can be broken down or altered. The herbal compounds are delivered transdermally without passing through the liver, resulting in greater bioavailability.

**Reduced Systemic Side Effects**: By delivering herbal compounds transdermally, side effects can be reduced by targeting local delivery rather than systemic distribution. In this way, medication can be directly applied to the affected area to optimize its concentration, while minimizing its exposure to other tissues. The application of this technique can be particularly useful when treating localized conditions, such as skin disorders or pain.

**Improved Patient Compliance**: Transdermal drug delivery improves patient compliance with medication regimens because it is convenient and easy to use. With the patches or gels, patients are less likely to forget to take their medication or skip doses because they can be applied once or a few times a day. As a result of transdermal delivery, medication schedules are simplified since there is no need for multiple daily administrations.

**Enhanced Stability of Herbal Compounds:** In the GI tract and in the stomach, some herbal compounds are susceptible to degradation. Unlike oral drugs, transdermal drugs bypass the digestive system, helping to preserve their stability. In this way, active ingredients remain intact in the bloodstream, maintaining their therapeutic properties.

**Flexibility and Ease of Dose Adjustment**: It is possible to adjust the dosage based on the individual needs of patients with transdermal drug delivery systems. The dosage can easily be customized by healthcare professionals by modifying its size or frequency. When treating patients with varying needs, this adaptability can be especially useful.

**Improved Absorption for Poorly Absorbed Compounds:** Because they are poorly absorbed or rapidly metabolized, some herbal compounds are not as bioavailable as others. This limitation is overcome by transdermal drug delivery, which delivers active ingredients directly into the bloodstream. By doing so, poorly absorbed compounds can be better absorbed, resulting in improved therapeutic outcomes.

## Strategies for herbal transdermal drug delivery system

**Selection of Appropriate Herbal Compounds:** A transdermal drug delivery system using herbal compounds begins with the selection of suitable herbal compounds. The best compounds are those that can penetrate the skin barrier

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Komala and Logesh

effectively and have the desired therapeutic effects. A variety of factors should be considered during the selection of a compound, including its molecular weight, lipophilicity, and solubility in skin-compatible vehicles.

#### Enhancement of Skin Permeation:

Drugs are not absorbed through the stratum corneum, the outermost layer of the skin. Permeation of the skin can be enhanced by the following strategies:

**Use of Penetration Enhancers:** It is possible for herbal compounds to penetrate the stratum corneum by disrupting it with penetration enhancers, like fatty acids, surfactants, and chemical permeation enhancers, such as surfactants.

**Physical Enhancement Techniques:** Herbal compounds can be better absorbed through the skin by physical methods like microneedling, ultrasound, and iontophoresis.

**Nanoparticles and Liposomes:** Due to their small size and ability to bind with skin lipids, nanoparticles and liposomes are effective at enhancing the penetration of herbal compounds through the skin.

#### Formulation Design:

To ensure optimal drug delivery and skin penetration, the formulation of a transdermal drug delivery system is crucial. The following considerations should be taken into account when designing formulations:

**Selection of Suitable Vehicles:** A vehicle for solubilizing herbal compounds and controlling their release, such as gels, creams, ointments, patches, is critical.

**Optimization of Drug Concentration:** The formulation must contain the optimal concentration of herbal compounds so that therapeutic efficacy can be achieved while minimizing local irritations or systemic side effects.

**Use of Skin Penetration Enhancers:** Permeation enhancers are incorporated in the formulation to ensure herbs penetrate the skin barrier more effectively.

**Delivery System Design:** Transdermal drug delivery systems must be designed in a way that ensures proper release and adhesion to the skin. For the design of delivery systems, the following considerations need to be taken into account:

**Patch or Patchless Systems:** There are old-fashioned adhesive patches available as well as newer technologies such as microemulsions or hydrogels that don't require a patch to apply.

**Control of Drug Release:** Controlled-release mechanisms, such as reservoirs, matrix systems, or nanoparticles loaded with drugs, are employed to guarantee sustained and controlled release of herbal compounds.

**Skin Adhesion and Comfort:** Achieving effective skin retention and comfort, as well as preventing irritations and allergic reactions.

**Safety and Stability Considerations:** Transdermal drug delivery systems based on herbal materials should be thoroughly tested for safety and stability. The following factors should be considered

Skin Irritation and Sensitization: In order to ensure that the delivery system does not cause adverse skin reactions, skin irritation and sensitization studies are conducted.

**Stability of Herbal Compounds:** The formulation and shelf life of the product should maintain the stability of the herbal compounds.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Komala and Logesh

Preservative Systems: Maintaining formulation integrity by incorporating appropriate preservatives.

**Preclinical and Clinical Evaluation:** An assessment of the efficacy and safety of the herbal transdermal drug delivery system requires preclinical and clinical trials. To assess drug release, skin permeation, therapeutic efficacy, and potential side effects, we conduct *in vitro* and animal studies as well as clinical trials.

#### Comparison with conventional treatment methods

Herbal transdermal drug delivery versus conventional treatments both have their own strengths and limitations, and it is important to note that both have some similarities but also some differences. As a patient, you may have a wide range of preferences when it comes to the type of treatment method you choose [19]. This is due to multiple factors, including the specific condition being treated, the properties of the herbal compound, your preferences, and the advice of your healthcare provider. There are a number of factors that need to be considered when choosing the most suitable treatment approach for an individual patient, including consulting with healthcare professionals.

#### Future perspectives and challenges

#### **Potential Future Developments and Advancements**

Nano-based Delivery Systems: The skin can deliver and target herbal compounds more effectively when compounds are delivered through nanoparticles, liposomes, and other nanotechnology-based approaches. A controlled release system can improve the bioavailability, stability, and bioavailability of herbal active ingredients. Microneedle Technology: Herbal compounds penetrate better through micropores created by microneedles. In the future, microneedle delivery systems may provide a painless, efficient, and convenient method of delivering medication to the skin.

**Hybrid Systems:** Combined transdermal delivery with oral or inhalation delivery can improve therapeutic outcomes and synergistic effects. Personalized treatments could be provided by these hybrid systems according to a patient's needs and conditions.

#### **Regulatory Considerations and Standardization of Herbal Products**

Safety and Efficacy Assessment: It is imperative that herbal transdermal drug delivery systems be evaluated using standardized methods. As herbal products have unique characteristics and potential interactions, regulatory authorities need to develop specific guidelines. Quality Control and Standardization: Integrating herbal compounds into transdermal formulations requires ensuring consistency in quality and potency. Keeping product consistency and patient safety can be achieved by implementing rigorous quality control measures and standardization processes. Registration and Certification: It will be easier to incorporate herb transdermal drug delivery systems into mainstream health care practices if clear regulations and procedures are developed for their registration and certification. In addition, criteria for safety, efficacy, and quality assurance need to be established.

#### Research on Herb-Drug Interactions and Safety

Herb-Drug Interactions: Herbal compounds delivered via transdermal systems may interact with conventional medications, but further research is needed to clarify these interactions. As a result, healthcare professionals and patients will be able to make informed decisions regarding concurrent use in order to prevent adverse effects and reduced efficacy. Long-term Safety Assessment: Studying the risks and benefits of herbal transdermal drug delivery systems for long periods of time will provide comprehensive data. Identifying rare or delayed adverse effects can be accomplished by monitoring patients over an extended period.

#### **Education and Awareness**

Healthcare Provider Training: In order for herbal transdermal drug delivery systems to become more widely used in clinical practices, healthcare providers must be educated and aware of their benefits and limitations. Curriculums in medicine and pharmacy must incorporate herbal medicine education.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Komala and Logesh

Patient Education: The more information patients have about herbal transdermal drug delivery systems, their benefits, and the proper way to use them, the more likely they are to accept them. Making sure that patients are informed about indications, dosing, application methods, and possible side effects will enable them to make informed choices.

#### Sustainability and Ethical Considerations

Sustainable Sourcing: It is important to prioritize sustainable sourcing of herbal ingredients, cultivate and conserve herbs, and ensure fair trade in order to support ethical production and environmental preservation. Cultural Preservation: It is important to respect and protect traditional herbal medicine knowledge and practices. It is possible to bridge the gap between traditional wisdom and modern science by collaborating between traditional healers, scientists, and regulatory bodies.

#### CONCLUSION

A key finding of this review of herbal transdermal drug delivery systems (TDDS) is that they are effective at delivering targeted medications. TDDS herbals are advantageous because they are non-invasive, controlled, prolonged release, resistant to first-pass metabolism, have a reduced systemic side effect profile, can be tailored to patients' needs, and can enhance patient compliance. As a result of these advantages, herbal TDDS offers a promising alternative to conventional methods of treating respiratory conditions. In the treatment of pulmonary disorders, herbal TDDS can be an effective alternative. Herbal compounds can be delivered directly to the respiratory system to create targeted therapeutic effects, thereby reducing systemic side effects and improving treatment results. Herbal compounds release controlled and sustained amounts of compounds, which can increase their efficacy when treating respiratory symptoms like coughs, congestion, and bronchitis. Chronic respiratory conditions can benefit greatly from herbal TDDS, especially if long-term treatment is necessary. There are several areas in which herbal TDDS can be applied in the future for research and clinical applications. A further study is needed to optimize formulation design, increase skin permeation, and increase the efficiency in which herbal compounds are delivered to the skin. Nanoparticles, microneedles, and hybrid systems are just a few of the technologies that can be explored. Secondly, herbal products must be regulated and standardized in order to ensure their quality, safety, and efficacy. As part of this process, guidelines and safety assessments will be developed, and registration and certification procedures will be established that are specific to herbal TDDS. Additionally, further research is needed to determine the long-term safety, efficacy, and interaction between herbal TDDS and other drugs.

# ABSTRACT

The nickel sulphide (NiS), graphene oxide (GO) and nickel sulphide with grapheme oxide (NiS/GO) have been synthesized. The graphene oxide (GO) was synthesized by modified Hummer's method and pure NiS, NiS/GO nanocomposite have been prepared by simple hydrothermal method. The nature of nanocomposite (NiS/GO) Viz., structural, morphological and physical properties were analyzed by TG-DTA, XRD, UV-DRS, FE-SEM/EDX, FT- RAMAN, PL and XPS analysis. FE-SEM measurements showed the presence of surface attachment of the NiS nanoparticles onto the graphene oxide. The NiS/GO nanocomposite integrates the high conductivity of GO and electrocatalytic activity of NiS in a single material. The effect of GO with NiS on degradation performance has been investigated. The effective photocatalytic degradation (86%) of organic dye malachite green (MG) was examined and reported. The degradation of MG with nanocomposite was found to be happening within 110 min.

Keywords: Nickel sulfide/ Graphene oxide, nanocomposite, photodegradation.

Priyadharshini et al.,

# INTRODUCTION

Water pollution is the major environmental problem because it seriously endangers human health. In the recent years, emerging organic contaminants (EOC) will pollute the water resources that involve medicinal drugs, industrial wastes, personal care products and so on [1]. There are many kind of process that is available to purify the contaminated water bodies. The main process viz., physical process and chemical process which includes ultrafiltration, reverse osmosis, flocculation, ion- exchange and adsorption process, etc., Photocatalysis is one of the easier and low expense methods for purifying contaminated water bodies. Advanced Oxidation Process (AOP) will produce functional hydroxyl radicals which will be rapidly oxidizing carbon included dyes. On considering the metal sulphide nanocomposite in recent years; it has unique optical, magnetic, electronic and catalytic properties , hence researchers are performing their best in many tasks to enrich the photocatalytic behaviour of various semiconductors and metal oxides/ sulfides like ZnS, CdS, FeS, CuS, CoS, MnS, ZnO, SnO 2 , CrS, MgS and so on[2] . Among them, nickel sulfide catalyst is a well-known industrial application in hydrogenation reactions. It has efficient ionic conductivity due to oxygen vacancies . Nickel sulfide has wide bandgap (3.12 eV) which is lowering its catalytic process in the presence of natural sunlight irradiation; this is the most significant disadvantage for its photosensitivity . To overcome this issue the hybrid nanostructures of metal sulphide with conductive GO is chosen to enrich the degradation process .

Graphene oxide exhibits both P-type and n-type conductivity, in P- type it has oxygen high electro negativity compared to carbon, in n-type, the graphene covalent bond to electron donating nitrogen containing functional groups . GO that contains highest oxidation degree level has increased the energy of band gap and limiting the absorption level of the light and lowest photocatalytic activity with lower oxidation degree [3]. The photo degradation is attractive as it has a highest active radicals which is unsystematically and quickly decompose organic pollutants that will resulting in the production of hazardless products such as carbon dioxide and water molecules. On the surface of photocatalysts dye compounds will first adsorbed in which common reaction like oxidation and reduction will occur . This redox reaction happens due to the forced vibration activity of photogenerated holes in the valence band (VB) and electrons in the conduction band (CB) . Since, grapheme is an electron acceptor and transporter which can reduce the recombination rate of light that excite the electrons and donors in NiS . NiS/GO nanocomposite contains high activity and stability, graphene based metals have theoretical and experimental guidance. Also sulfide- graphene based materials are more potential than the oxide-graphene based transition metals [4]. In this paper, GO, NiS and NiS/GO nanocomposites were prepared and their photo degradation on organic dye malachite green (MG) under natural sunlight was investigated and the results were reported.

# EXPERIMENTAL DETAILS MATERIALS AND METHODS

The chemicals purchased from Sigma Aldrich Scientific company and are utilized without any further purification process. The chemicals purchased are graphite powder, nickel nitrate hexahydrate, thiourea, hydrogen peroxide, hydrochloric acid, potassium permanganate and so on.

#### Synthesis of NiS Nanoparticles

In a typical procedure, 1 mol of nickel nitrate hexahydrate and 3 mmol of sulfur were dissolved into 50 ml deionized water. The reaction mixture was stirred for about 2 hours to form an aqueous solution. Then the homogeneous mixture was kept in an autoclave at 180°C for about 12 hours to obtain a precipitate. Further, the above solution was cleaned with deionized water and ethanol to separate impurities. Then the above filtered sample was dried in a vacuum hot air oven at 45°C about 1 hour to obtain NiS nanoparticles. The concentration ratio is 1:1, 1:2 and 1:3 of nickel and sulfur source. When concentration of sulfur increases, new phase of nickel sulfide (Ni<sub>7</sub>S<sub>3</sub>) was occurred ue to more number of sulfur ions.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Priyadharshini et al.,

#### Synthesis of graphene oxide

Graphene oxide was prepared by modified Hummers method. First 10 ml of sulfuric acid ( $H_2SO_4$ ) and 2ml of phosphoric acid ( $H_3PO_4$ ) in the volume ratio of 7:1 was mixed and stirred for an hours, while stirring 0.1g of graphite powder was added and then 1.2g of potassium permanganate ( $KMnO_4$ ) was included pinch by pinch into the solution while stirring. After the solution became dark green, to eliminate excess  $KMnO_4$ , hydrogen peroxide ( $H_2O_2$ ) was added dropwise, exothermic reaction occurs and the solution is said to cool down. Then 5ml of hydrochloric acid and 10 ml of deionized water was added for 8 hours the solution is centrifuged and kept in oven for dry(2 hours) at 80 and the powder sample is obtained.

#### Synthesis of NiS/GO nanocomposites

Nickel nitrate hexahydrate of 1 mol was mixed with 2 mol of sulfur source of thiourea in 50 ml of deionized water. After the GO was sonicated by distilled water, 60mg of GO was included into the above suspension. The above homogeneous mixture was allowed to stir for about 2 hours. After stirring, the above suspension was kept in an autoclave heated at 130 o C for about 18 hours. The obtained black precipitate was centrifuged and filtered. Finally, the composite NiS/GO was allowed to dry in a hot air oven at 60 o C for about 2 hours.

#### Characterization

The thermal analysis of the sample was studied by TG-DTA using thermal analyser NETZSCH-STA 449F3 Jupiter. The crystal structure was made by Xpert pro-PAnalytic instrument. The morphology of the sample was observed by FESEM/EDAX (model CARL ZEISS-SIGMA 300). The optical nature of the samples were analysed by UV-DRS and PL. FT-Raman was taken by imaging spectrograph STR 500mm Focal length laser Raman spectrometer to find the Raman spectra of the sample. The chemical composition of the sample was characterised using Thermo fisher instrument for XPS analysis.

#### Photocatalytic measurement

The photocatalytic degradation examination of NiS/GO nanocomposites was determined on malachite green. The concentration was fixed to be 10 -4 M, which is mixed in 400ml distilled water for the process of degradation [5]. In a 100ml beaker of a dye solution, 50ml of dye solution was taken and about 2 mg of catalyst was added into it to make a photocatalytic process. The dye solution made are stirred continuously for about 60 minutes and the collected test solutions of malachite green dye was analyzed by the UV- Visible.

# **RESULT AND DISCUSSION**

#### Thermogravimetric study (TG-DTA)

To know the phase transformation/weight loss of the nanoparticles, thermogravimetric differential thermal analysis (TG-DTA) was performed. First weight loss of about 5.6% was observed below 120° C represents the evaporation of water in the prepared sample and endothermic reaction exhibits the dehydration of the sample. The second weight loss of about 5.6% between 120° C and 300° C indicates the excess sulfur, combustion of carbon, and other impurity elements that are excluded from the precursor. The third weight loss about 5.5% in the TGA curve at 300° C to 420°C resulting the removal of sulfur. From the TG-DTA curve, the weight loss of 2.2% including the range of temperature about 400°C to 500°C is recognized. A weight loss of about 1.1% is concluded from a TG-DTA curve at a temperature range below 420 o C [6]. The NiS is converted to NiO at a temperature weight loss of above 500 o C at 15.3% which is an oxidation state of NiS. The molecular weight for NiS is 90.75 g mol -1 and for NiO is 74.69 g mol -1. This shows that at certain temperature (& 500°C) sulfur is converted to oxide form. The change in mass of a sample in a fractional second converts the NiS to NiO around 17.8%. The mass change from the figure strongly denotes the change of nickel sulfide to nickel oxide.

#### Structural analysis (XRD)

To analyse the phase structure of the prepared pure nickel sulfide (NiS),grapheme oxide(GO) and nickel sulfide/graphene oxide (NiS/GO) nanocomposite, the X-ray diffraction analysis technique was adopted and presented in Fig 3.(a to c) . Fig. 3(a) confirms the graphene oxide,3(b) confirms the nickel sulfide nanostructures and 3(c) shows that the nanostructures of composite nickel sulfide/graphene oxide(NiS/GO)[7]. A strong diffraction peak at (001) corresponds to GO which is located at 11.5 o shows the formation of GO [8]. The diffraction peaks at 2 values 29 o , 34 o , 45 o , 53 o are assigned to the plane values (015), (303), (306), (330) (JCPDS Card no:76-2306) for pure NiS and composite NiS/GO respectively. Cornflake like structure (NiS and NiS/GO) of nanoparticles were observed. The crystallite size of the sample is calculated by Debye Scherrer formula. The average crystallite size was 30nm.Due to the low crystallinity and low content of GO, there are no obvious diffraction peaks corresponding to GO observed in the XRD spectra of the NiS/GO nanocomposite.

Thus, the Raman spectra of the NiS/GO nanocomposite were collected because Raman spectroscopy is vital technique for investigating carbon-based materials. The Raman spectra of the NiS/GO nanocomposites and pure GO were collected, shown in Fig.3. Two characteristic peaks corresponding to the carbon based material can be observed in all of the Raman spectra, which are designated as the D (1357 cm -1) and G (1589 cm -1) peaks. The D peak originates from the degree of defects and disorder in the carbon based materials, while the G peak is mainly related to the internal vibrations of the carbon atom.

#### Morphological analysis (FE-SEM)

The surface morphology of NiS/GO nanocomposite was evaluated through FESEM. Fig. 4(a) shows the cornflake like structure of NiS nanoparticles, the grain size was about 80 nm[9]. Fig 4(b) shows the FESEM image of cornflake like shape with 60 nm size for NiS/GO nanocomposite FESEM image shows a thick and rough structure indicating the high degradable activity. The powder sample were adhered on carbon tape and a stub was exposed to plasma coating inside a sputter chamber for coating. The coating material contains gold and palladium in 80:20 ratios. After coating, a 20kV potential was used to excite electrons from the surface of samples. An average 45mm area was used to get FE-SEM image of materials. NiS/GO illustrate bit intensified patches which could have been localized because of Ni 3d 8 of NiS/GO as there is no proper split of 3d 3/2 and 3d 5/2 electrons. Hence these electronic energies might have induced the localized activities which are expressed in the FESEM images. The cloudy flasky surfaces with a larger magnification infer anchoring of NiS/GO nanocomposites with grain size of 60nm.

#### Elemental analysis (EDX)

The electron dispersive X-ray spectroscopy (EDX) for NiS and NiS/GO are given in Fig. 4(a) and (b). An elemental composition of (Ni=64.70%) and (S=35.30%) peaks and (Ni=36.46%), (S=23.26%), (C=21.49%) and (O=18.79%) peaks reveals the presence of pure NiS and NiS/GO nanocomposite respectively [10].

#### Absorption studies (UV-Vis DRS)

Fig. 5(a to d) shows UV-DRS absorption spectra of NiS/GO. The samples were dispersed in water by sonication @ 3 KHz. Fig. 5(b) depicts a higher absorption for NiS/GO due to stronger interactions of unengaged electrons of groups of GO with UV-Vis light. The interaction of sp 2 and lone pair electrons of groups and of GO both accommodate the NiS nanoparticles within the GO exfoliated sheets. Excess lone pair electrons of –OH, -O, -C, =O and –COOH are comparatively engaged and interact with photons at a lower energy. The h from UV strikes sp 2 electrons to excite them to a high energy state causing positive holes (oxidation state) with h + (positive hole) charge at it's native orbital and negative charge (reduced state) or negative holes (e - ) at excited states, which may reduces dye molecule. The catalysis by creating positive hole by exciting electron e - , to negative holes a conduction band attains a higher energy level compared to valance band with lower energy level [11]. The main principle of UV-DRS is that some of the light will undergoes specular reflections at the powder surface of the sample [12]. The sample has a strong absorption of light that has visible ranges from 390 and 700 nm for pure NiS and for NiS/GO composite same 390 and 700 nm have a strong absorption of light that is showed in the figure [13]. The band gap energy for UV-DRS can be

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Priyadharshini et al.,

calculated by a kubelka-munk model. The band gap energy for pure Nis is about 2.3eV and for composite NiS/GO is about 2.9eV. The below figures shows the UV-DRS spectrum and energy band gap for pure nickel sulfide (NiS) and nickel sulfide/graphene oxide (NiS/GO) nanocomposite.

#### Emission studies (PL)

The photoluminescence study room temperature shows the excitation wavelength at 362 nm. The broad peak appeared at 351 to 372 nm which indicates that the recombination of photogenerated electron-hole pairs[14]. For NiS/GO nanocomposite the excitation wavelength is at 360 nm and the broad peak appeared at 350 to 380 nm[15]. Interestingly, the emission intensity was gradually decreases after adding graphene oxide(GO) denoting the recombination of photogenerated electron-hole pairs are covered by GO. This may enhance the catalytic performance. The low brightness of the peaks are occurred in the infrared region that are due to the gap present in between the localized states of impurities and the imperfections. It is one of the non-contact and non-destructive methods for the probing materials.

#### FT-RAMAN analysis

Raman spectroscopy is one of the main characterization technique used to determine the organic based compounds like carbon, graphene and its hybrid. Figure 7(a) represents the presence of nickel, sulfide peaks and Figure7(b) denotes the presence of nickel, sulfide, carbon and oxygen peaks [16]. But the peak at 1400 cm -1 to 1581 cm -1 will represent the charge transfer between carbon and nickel sulfide [17]. FT-RAMAN analysis shows the D and G bands of characteristic peaks appears at 1105.2 and 1418.3 cm -1 [18]. The I D /I G value is 1.02 for NiS/GO nanocomposite which is greater than pure NiS.

#### X-ray photoelectron spectroscopy

XPS spectra determine chemical composition and oxidation states of NiS/GO nanocomposite having Ni, S, C and O infer an authenticity of NiS/GO synthesis.

#### **XPS for NiS**

The doublet peaks of two spin orbits of nickel (Ni2p<sub>3</sub>) has a binding energy of 854.19ev were obtained for Ni2p spectrum. For sulfur (S<sub>2</sub>p) the peak is obtained at 163.2ev for pure NiS. This shows that XPS analyses denote the NiS formation for photocatalytic property [19]. The below figures for XPS denotes that for pure NiS, elements like Nickel and sulfur are present.

#### XPS for NiS/GO

The peaks for NiS/GO XPS spectrum includes some elements such as nickel (Ni2p), sulfur (S2p), carbon (C1s) and oxygen (O1s). The binding energy for NiS/GO nanocomposite corresponds to 854.10 eV for nickel (Ni2p), 532.31 eV for sulfur (S2p), 284.92 eV for carbon (C1s) and 162.27 eV for oxygen (O1s). While NiS on GO, changes in D, G bands and 2D intensity infer variable exfoliations of nanomaterials. Also the (-COOH, -OH, -O, and =CO) could be replaced with other groups to dope GO to study pattern of binding energies. Binding energy and electron spin of 3p of Ni is at 75 eV. The Ni2p binding energy is at 854.10eV. A lowering intensity of C1s for C and O1s for O atoms was observed.

#### Photocatalytic studies

To evaluate the degradation efficiency time of malachite green dye, 5mg of catalyst sample was added into the 0.1g solution of MG dye, the setup was kept under natural sunlight and was stirred continuously . The degradation time for MG dye was fixed for about 2 hours. The UV-VIS absorbance peaks for malachite green dye in the absence of catalyst was 320,427 nm. For UV analysis, 10 ml of dye sample with catalyst was collected for every 15 minutes. The absorption and absorbance plots peaks from 625 to 695 nm shows the 86% degradation of dye solution by lowering the concentration (Fig. 9(a) and (b))[20]. The  $\pi$ - $\pi$  electrostatic interactions affect reduction by GO and NiS/GO as GO has several hydrophilic groups that faster MG reduction. The –COOH groups exist at edges of GO layers and –O and –OH groups are incorporated in layer, which results in a slightly acidic or negatively charged surfaces to faster reduction rate of positively charged MG molecule. The interaction of MG and GO occurs due to stronger electrostatic

#### Priyadharshini et al.,

forces which are neutralized by h + and e - holes. The main components of NiS-GO are C-C and C=C bonds which contribute to abundant  $\pi$  electron clouds to NiS-GO, considering O-C=O and –OH. A double bond of NiS (Ni=S) interacts with C-C and C=C bonds of GO to conjugate and stabilize a resultant structure for MG reduction. MG and NiS-GO both adjoin together due to their  $\pi$ - $\pi$  interactions. Thus a consumption of energy of a molecules induces stronger reduction activities which could be extended to their  $\pi$  conjugated rings.

Photocatalyst (NiS/GO) +  $h\mathbf{y} \rightarrow h^+ VB$  +e<sup>-</sup> CB h<sup>+</sup> VB + e<sup>-</sup> CB  $\rightarrow$  energy (heat) H<sub>2</sub>O + h<sup>+</sup> VB  $\rightarrow$  OH (hydroxyl radical + H<sup>+</sup> O<sub>2</sub> +e<sup>-</sup> CB  $\rightarrow$  O<sub>2</sub>/ Super oxide radical OH + pollutant  $\rightarrow$  intermediate  $\rightarrow$  H<sub>2</sub>O + CO<sub>2</sub> O<sub>2</sub> + pollutant  $\rightarrow$  intermediate  $\rightarrow$  H<sub>2</sub>O + CO<sub>2</sub>

### CONCLUSION

Ecofriendly stoichiometry of oxidizing mixture using simple methodology to prepare GO and NiS/GO were adopted. NiS/GO nanocomposite were synthesized by hydrothermal route successfully and the corresponding structural behaviour are confirmed from TG-DTA, XRD, UV-Vis, FESEM/EDX and XPS techniques. The XRD and FESEM studies revealed that well crystalline cornlike shape of NiS/GO with average size of about 30 nm by XRD and 60nm from FE-SEM, which is uniformly distributed over the surface of GO. The synthesized highly active sites structures of NiS and incorporating with excellent electrical conductivity (graphene oxide) can provide the fast electron transport matrix. The photodegradation result of NiS/GO on organic dye malachite green (MG) in the uniform reaction condition was observed 86% with 110 minutes. Based on the observed results it may be concluded that the prepared NiS/GO nanocomposite have large amount of charge separation and high surface area. Further more, the proposed method could be a favourable approach to the synthesis of other metal sulfides with graphene oxide.

#### **Conflict of interest**

The author mentions there is no conflict of interest in this research paper and agreed to publish this manuscript in this journal.

#### ACKNOWLEDGEMENT

# ABSTRACT

This qualitative study explored the impact of Hindu religious teachings on older adults' well-being and transitions. In-depth interviews were conducted with 20 religiously practicing participants aged 60 and above. Thematic analysis identified key themes, revealing that religious teachings provided guidance and support during life transitions. Participants found solace and purpose in teachings emphasizing acceptance, resilience, and finding meaning in changes. Religious practices positively impacted their spiritual well-being, overall health, and mental well-being. Personal religious experiences deepened faith and fostered compassion and empathy. Participants anticipated continued guidance from their religious beliefs in future challenges. The findings highlight the transformative power of religious teachings, contributing to understanding the role of Hinduism in older adults' well-being and transitions.

**Keywords:** Hinduism, religious teachings, older adults, life transitions, well-being, coping strategies, thematic analysis.

### INTRODUCTION

Aging is a transformative phase of life that presents individuals with unique challenges and opportunities. As people grow older, they experience physical, cognitive, social, and emotional changes that require adaptation and resilience. In the face of these transitions, many individuals turn to religious teachings for guidance, support, and a sense of purpose. This study aims to explore the impact of religious teachings on the transition experiences and well-being of older adults. Religion has long been recognized as a fundamental aspect of human existence, providing individuals

### Dakshita Pandey and Rajat Kanti Mitra

with spiritual beliefs, practices, and values that shape their worldview. Religious teachings encompass a wide range of subjects, including the nature of the divine, the meaning and purpose of life, moral values, and rituals that express and strengthen religious beliefs. These teachings often serve as a compass, guiding individuals through life's challenges and helping them find direction, meaning, and a sense of community. Scholars and psychologists have approached religion from various perspectives, offering insights into its significance in the lives of individuals. Some view religion as a source of solace and comfort, providing a framework for coping with existential fears and uncertainties. Others see it as a way to explore one's psyche and spiritual nature, offering a path to self-realization and transcendence. Religion is also regarded as fulfilling basic human needs for belonging, purpose, and connection with something greater than oneself.

In the context of aging, religious teachings can play a crucial role in helping older adults navigate the transitions and challenges they encounter. The process of aging often involves physical health changes, cognitive decline, social isolation, financial constraints, and care giving responsibilities. Older adults may grapple with questions of purpose, existential concerns, and the search for meaning as they face their own mortality. Religious teachings have the potential to address these issues by providing guidance on health and wellness, offering a sense of belonging and community, fostering spiritual growth and self-realization, and instilling values of service and care giving. Within the realm of religious teachings, Hinduism stands as one of the world's oldest and most diverse religions. Hinduism encompasses a broad spectrum of beliefs, practices, and rituals that embrace various aspects of an individual's social and personal existence. Central to Hinduism is the quest for spiritual freedom, achieved through the practice of righteousness (dharma), the pursuit of prosperity (artha), the fulfillment of desires (kama), and ultimately, liberation (moksha). Hinduism acknowledges the existence of multiple deities as representations of the supreme reality known as Brahman. The religion encompasses rituals, ceremonies, and practices such as yoga, meditation, and acts of worship and sacrifice.

Given the multifaceted nature of Hindu religious teachings and their potential relevance to aging and transition, it is essential to explore their impact on the well-being of older adults. This study aims to investigate how Hindu religious teachings influence the transition experiences and well-being of older adults. We will examine the ways in which religious teachings are incorporated into the lives of older Hindus, their effects on physical and mental well-being, the role of religious communities and support networks, and the ways in which religious teachings on transition and well-being among older adults, this study aims to contribute to a deeper understanding of the role of religion in the lives of individuals as they age. The findings may have implications for healthcare providers, policymakers, and religious communities in supporting older adults through the challenges and opportunities of aging. Ultimately, this research endeavors to enhance our knowledge of the complex interplay between religion, aging, and well-being, and pave the way for more holistic and culturally sensitive approaches to supporting older adults in their transitions.

Several studies have examined various aspects of the relationship between religion, spirituality, and the well-being of older adults. For instance, Zheng, Chan, & Zhang (2023) investigated the influence of personal value, motivation, transformation, and behavioral intention on spiritual tourism, finding positive associations with spiritual tourism in their study on Tibet. Similarly, Kenkmann & Burkard (2022) explored the experiences of older individuals during the Covid-19 pandemic, highlighting how alternative formats, such as the cemetery as a meeting point, provided solace for churchgoers. Kim, Ng, & Kim (2021) found that religious activities promoted social integration and emotional well-being among older Korean immigrants in the United States. Additionally, Eschler, Edwards & Gruenewald (2021) conducted a systematic review, underscoring the role of religion and spirituality in successful aging by providing purpose, social connectedness, and coping mechanisms during life transitions. Ano &Vasconcelles (2021) conducted a meta-analysis, revealing that positive religious coping strategies were associated with better mental health outcomes for older adults. Furthermore, studies by Kim, Pargament& Chen (2021), Jadhav& Mali (2021), Bhattacharya & Kar (2021), DeKoekkoek, Lindholm, Jansen, &Postmus (2021), and Holley, Frye, Wilson, & Vail (2021) demonstrated the positive effects of religious involvement and practices on well-being, social support, resilience, mental health, loneliness reduction, and physical function among older adults. These studies collectively

### Dakshita Pandey and Rajat Kanti Mitra

contribute to our understanding of how religion and spirituality play a significant role in the lives of older individuals, fostering well-being and enhancing various aspects of their lives. Overall, the review of literature on the impact of religious experiences in causing transitions among older adults suggests that religious involvement can have positive effects on well-being outcomes, such as social support, health, life satisfaction, and resilience to stress. The exact mechanisms by which religious involvement promotes these outcomes may differ by cultural context, race, and individual differences in religious expression. Moreover, the literature highlights the importance of considering spirituality more broadly, beyond traditional religious practices, in understanding its impact on well-being in older adults. Further research is needed to better understand the complex relationship between religious experiences and transitions in later life.

During 2022 and 2023researches on religion were impacted by onset of covid-19. Pre-COVID religious-based research studies primarily focused on the impact of religious beliefs, practices, and participation on various aspects of well-being, including mental health, physical health, social support, and coping mechanisms. These studies aimed to understand the role of religion in promoting positive outcomes among older adults. With the onset of the COVID-19 pandemic, religious communities around the world faced significant disruptions. Places of worship were temporarily closed, religious gatherings and events were cancelled or moved online, and religious practices were modified to adhere to social distancing guidelines. The impact of the pandemic on religious practices and the well-being of older adults has likely influenced the direction of religious-based research. Post-COVID studies may have started exploring topics such as the effects of religious coping strategies during the pandemic, the role of online religious practices during lockdowns, and the psychological and social implications of the temporary suspension of religious services.

### METHODOLOGY

#### AIM

The aim of the study was to explore the impact of Hindu religious teachings on older adults.

#### OBJECTIVE

- 1. To identify the themes that explains the impact of religious teachings on the well-being of older adults.
- 2. To develop a framework that captures the complex and nuanced ways in which older adults use religious teachings to cope with transitions.

#### RATIONALEOF STUDY

This study highlights the potential benefits of religion teachings for older individuals, including improved health, coping skills, social support, and societal engagement. However, there are limitations in the existing literature that call for further research. The current literature predominantly relies on quantitative analysis, while a qualitative approach could provide deeper insights into religion, spirituality, belief, and positive aging. Additionally, there is a lack of studies focusing on Hinduism, despite its prevalence in India. Furthermore, the link between religion teachings and transitions in aging has not been extensively explored. Given the aging population and healthcare challenges, understanding the role of religion, spirituality, and belief in healthy aging becomes increasingly important. This research aims to qualitatively investigate this topic in the lives of older individuals in India and provide recommendations for future action and research based on the findings.

#### LOCALE OF THE STUDY

The study took place in Delhi's parks and a yoga and meditation center, focusing on older adults practicing Hinduism. Interviews were conducted in a private room at the center, ensuring confidentiality. Participants were selected through personal outreach to eligible community members.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Dakshita Pandey and Rajat Kanti Mitra

#### DESIGN

The study employed a qualitative research design with open-ended questions to explore the impact of Hindu religious teachings on transitions among older adults. Data was collected through semi-structured interviews with participants, using open-ended questions that allow for in-depth exploration of their experiences, perceptions, and attitudes towards religious teachings and transitions. The interviews was conducted face-to-face or via telephone, and was audio-recorded with participants' consent. The study would recruit a purposive sample of older adults (aged 60 and above) who self-identify as practicing members of a religious community. The analysis of the study involved qualitative content analysis. The analysis was divided into three parts- organization of data, analysis of data and interpretation of data.

#### SAMPLE

The study aimed to recruit 20 older adults aged 60 and above who self-identified as practicing members of a religious community. Inclusion criteria required participants to have experienced a significant life transition in the past ten years, be willing to participate in a semi-structured interview in English or Hindi, and able to provide informed consent. Exclusion criteria included the inability to provide informed consent, communicate effectively in English or Hindi, or currently experiencing a mental or physical health condition that could hinder participation. Participants were recruited through outreach to religious organizations, community centres, advertising, and referrals. Confidentiality was maintained by assigning case numbers. The study included 8 females and 12 males, with ages ranging from 60 to 75.

#### TOOL USED

The data collected from the interviews with older adults were transcribed verbatim and subjected to thematic analysis. This involved identifying and coding themes and sub-themes that emerged from the data, and developing a coding framework to capture the key dimensions of the participants' experiences. The analysis was carried out by the researcher and a second coder to ensure credibility. Ethical guidelines were followed, including obtaining informed consent, maintaining confidentiality and anonymity, and obtaining ethical approval from the institutional review board.

An interview schedule was constructed to gather qualitative data, consisting of 10 open-ended questions divided into two sections, the first section being "Introduction and their changes in religious beliefs/ practices during transition" and the second section focused on "Transition experiences and coping up with challenges of old age". The questions aimed to explore participants' experiences and perceptions of how religious teachings influenced their transitions and coping with challenges in old age. The interview schedule underwent expert review (expert rating was done under 4 experts) and feedback from professionals in gerontology and religious studies, resulting in modifications to improve clarity and relevance. Thematic analysis was used to analyze the interview transcripts, identifying patterns, themes, and categories in the data, enhancing the credibility of the findings.

#### PROCEDURE

The research began with determining the aim, objectives of the study. Immediately after that it was determined what the target population would be for the study. Potential participants were identified through purposive sampling techniques, such as contacting religious organizations or community centres that serve older adults. Participants who express interest in the study were screened for eligibility criteria, such as age and self-identification as a practicing member of a religious community. Prior to data collection, participants were provided with an informed consent form that outlines the purpose of the study, the procedures involved, and their rights as research participants. Participants had the opportunity to ask questions and to withdraw their consent at any time. Semi-structured interviews were conducted with participants, either in person or via telephone, depending on their preference and accessibility. The interviews were audio-recorded with participants' consent and will last from 6 minutes to 30 minutes. The interviews followed a flexible, conversational format that allows participants to share their experiences and perceptions of religious teachings and transitions. The audio recordings will be transcribed verbatim, and the data will be analyzed using thematic analysis. The analysis will involve identifying and coding themes and sub-

themes that emerge from the data, using both inductive and deductive approaches. The analysis will be conducted by the researcher and a second coder to ensure credibility.

#### QUALITATIVE ANALYSIS METHODS

Thematic analysis is a qualitative research method used to identify and analyze patterns or themes in interview data. The process involves transcribing the interviews, familiarizing oneself with the data, assigning codes to capture key ideas, collating codes into broader themes, reviewing and refining the themes, and finally writing up the results. It is a subjective approach that relies on the researcher's interpretation of the data to uncover meaningful insights.

#### ANALYSIS OF RESULTS

This study explored the impact of Hindu religious teachings on the transition process of older adults. Thematic analysis of interviews with 20 religious participants aged 60 and above identified ten key themes.

TABLE 2 indicates all the themes along with the sub- themes and the frequency that particular sub theme was stated amongst all the individuals.

Themes & Sub-themes extracted from the interview responses

#### **RELIGIOUS PRACTICES**

The significance of religious practices in the transition process of older adults was emphasized by participants in this study. Practices such as chanting mantras, practicing yoga, engaging in meditation, worshiping, and fasting were seen as providing structure, guidance, and a connection to faith. Participants assigned scores to each practice, indicating their frequency or importance. Yoga and meditation received high scores, highlighting their role in physical and mental well-being and spiritual connection. Worshipping/praying received the highest score, underlining its significance in religious practices. Other practices mentioned included fasting, attending spiritual discourses, celebrating festivals, and undertaking pilgrimages. These scores provide an overview of the prominence of each practice in the participants' lives, demonstrating their role in navigating life transitions.

#### **RELIGIOUS BELIEF**

The religious beliefs of the participants played a significant role in shaping their transition experiences. Beliefs related to the Bhagavad Gita, Sanatan Dharma, karma, Kabir teachings, Arya Samaj, devotion towards Hindu gods, Parmanand teachings, the cycle of life/reincarnation, belief in impermanence, Vedanta, and Ayurveda were identified as influential in participants' religious worldviews. Participants assigned frequencies to each belief, indicating how frequently they mentioned or emphasized them. The beliefs in Sanatan Dharma and karma received high frequencies, highlighting their prominence in participants' religious beliefs. The Bhagavad Gita and devotion towards Hindu gods were also mentioned frequently. Some participants mentioned being influenced by teachings of Kabir, the principles of Arya Samaj, Parmanand, and Vedanta philosophy. Beliefs in the cycle of life/reincarnation, belief in impermanence, and Ayurveda were also acknowledged by participants. These beliefs provided a framework for understanding the purpose of life, the consequences of actions, and the importance of moral conduct, ultimately shaping the participants' perspectives on transitions and providing guidance in navigating them.

#### **EMOTIONAL WELL-BEING**

The impact of religious teachings on emotional well-being was evident among participants. Their faith provided solace, hope, and a sense of peace during emotional distress. Themes related to emotional well-being were identified, with varying frequencies indicating the prominence of each theme. Participants often reported feeling calm, composed, and centered, while also experiencing happiness, positive thinking, and mental resilience. Their religious teachings instilled mental strength, focus, and willpower, reducing stress and anger levels. Participants felt motivated and energized, experiencing satisfaction and contentment in life. The teachings brought comfort, relaxation, and a profound sense of inner peace. Overall, religious teachings played a significant role in shaping participants' emotional well-being, providing them with emotional stability and a positive outlook on life.

Dakshita Pandey and Rajat Kanti Mitra

#### PHYSICAL WELL BEIN

Participants highlighted the impact of religious teachings on their physical well-being. They reported a reduction in physical limitations and improved capabilities, along with feelings of relaxation and tranquility. Participants attributed their religious teachings to being physically active, engaging in regular exercise or yoga. They also perceived a decrease in illness occurrence and severity, as well as a reduced dependency on medication. Overall, religious teachings played a role in enhancing participants' physical health and well-being, empowering them to lead more active and fulfilling lives.

#### LIFESTYLE CHANGES

Participants reported that their religious teachings influenced positive lifestyle changes, promoting physical wellbeing. These changes included adopting early rising routines, maintaining a healthy diet aligned with religious beliefs, prioritizing adequate sleep, and cultivating a disciplined and consistent lifestyle. The integration of religious teachings into their daily lives encouraged participants to lead healthier lifestyles, emphasizing self-discipline, productivity, and adherence to moral and ethical guidelines. These lifestyle changes fostered physical well-being, enabling participants to experience the benefits of improved routines and habits influenced by their religious teachings.

#### WISDOM

Participants acknowledged the profound impact of religious teachings in imparting wisdom and guidance. They drew upon religious texts, teachings, and spiritual leaders' wisdom to navigate life transitions, gain insights into aging, and make decisions. The themes of wisdom that emerged highlighted the transformative influence of religious teachings on participants' perspectives and attitudes. Participants emphasized the importance of acceptance, groundedness, open-mindedness, and seeking new knowledge. They found meaning and purpose in life through their religious teachings encouraged them to appreciate the beauty in the world, fostering a sense of awe and gratitude. Overall, religious teachings provided participants with profound wisdom and shaped their outlook on life.

#### SOCIAL SUPPORT

Religious communities played a vital role as sources of social support during life transitions. Participants highlighted the importance of their religious community in providing emotional support, practical assistance, and a sense of belonging. Within the theme of social support, several subthemes emerged, reflecting the impact of religious teachings on participants' interactions and community engagement. They engaged in acts of charity and selfless service, embodying the teachings of their faith. Their religious teachings encouraged helpful behavior and fostered strong bonds and increased social connections. Participants developed understanding, empathy, and a culture of compassion and kindness. They also emphasized respect, equality, and being role models to positively influence others. Ultimately, their religious teachings promoted a sense of community and active participation in society.

#### SPIRITUAL GROWTH AND ENLIGHTENMENT

Religious teachings had a profound impact on participants' spiritual growth and enlightenment during life transitions. Within the theme of spiritual growth and enlightenment, several subthemes emerged. Participants embraced mindfulness, being fully present in the moment, and deepening their connection to the divine. They engaged in self-discovery and self-reflection, exploring their inner selves and spiritual paths. Participants developed a strong connection with a higher power or divine authority, finding guidance, purpose, and meaning in their lives. They practiced gratitude, pursued a quality life, and cultivated a sense of detachment from worldly attachments. Their religious teachings also emphasized the interconnectedness of all beings and facilitated a higher level of consciousness, expanding their understanding of reality.

#### PERSONAL IDENTITY

Participants reported that their religious teachings had a profound impact on their personal spiritual growth and enlightenment during life transitions. They experienced deepened spirituality, increased self-awareness, and a sense

#### Dakshita Pandey and Rajat Kanti Mitra

of connection to the divine. Several subthemes emerged within the theme of spiritual growth and enlightenment. Participants practiced mindfulness, engaged in spiritual exploration, and embarked on a journey of self-discovery. They emphasized living in the present moment, engaging in introspection, and developing a strong connection with a higher power or divine authority. Their religious teachings helped them find meaning in life, cultivate gratitude, and strive for a quality life. Participants also embraced a sense of detachment, recognized the interconnectedness of all beings, and attained a higher level of consciousness.

#### CHALLENGES FACED WHILE APPLYING RELIGIOUS TEACHING

Participants encountered various challenges when applying their religious practices and beliefs in their daily lives. These challenges included difficulties in remaining consistent and motivated, understanding and fully applying certain teachings, physical limitations, memorization without printed books, sacrificing family time, and for some, no significant challenges. These challenges highlight the complexities individuals face in integrating religious practices, and further exploration can provide insights into strategies for overcoming them. It's important to consider individual circumstances and interpretations when understanding the presence or absence of challenges in incorporating religious practices into one's lifestyle.

### **DISSCUSION AND ANALYSIS**

The study aimed to explore the impact of Hindu religious teachings on older adults and had two objectives. The first objective was to identify the theme explaining the influence of religious teachings on the well-being of older adults. The second objective was to develop a framework capturing how older adults utilize religious teachings to cope with transitions. The qualitative research design employed open-ended questions in semi-structured interviews with older adults in parks and spiritual centers in Delhi. Interviews were audio-recorded, transcribed, and thematically analyzed. Ten key themes emerged, including religious practices, beliefs, well-being, lifestyle changes, wisdom, social support, spiritual growth, personal identity, and challenges faced in applying religion.

#### **Research Question 1.**

How has your religious faith affected the way you look at life's changes and transitions? What religious practices or beliefs did you have?

The participants in the study expressed a deep connection to their Hindu faith and practices, which have influenced their perspectives on life's changes and transitions. They find guidance, strength, and purpose in their religious beliefs, relying on practices like worship, fasting, yoga, and meditation. Hindu teachings on impermanence, karma, and dharma help them navigate life's ups and downs. They feel supported by a higher power, believe in the importance of virtuous living, and cherish the sense of community and cultural traditions associated with their religious beliefs have brought personal growth, self-awareness, and gratitude, enabling them to face challenges with resilience and acceptance. Overall, their faith has had a profound impact on their well-being and outlook on life's transitions.

**Research Question 2.**What specific religious teachings or beliefs have helped guide you through life transitions? If so, how can you describe them?

The participants in the study expressed how Hindu religious teachings and beliefs have profoundly impacted their lives during life transitions. Concepts such as karma, dharma, interconnectedness, and self-discovery have guided them in making mindful choices, finding purpose, and staying grounded. Meditation and yoga have provided them with inner peace and well-being. They value the wisdom of saints and spiritual figures and find solace in practices like satsangs and devotional rituals. The understanding of cyclical time and impermanence has helped them cope with challenges and maintain a positive outlook. Overall, Hindu religious teachings have brought them focus, direction, resilience, and a sense of compassion and acceptance in navigating life transitions.

#### Dakshita Pandey and Rajat Kanti Mitra

**Research Question 3**. How have your religious practices/actions changed since old age? Has being involved in religious practices impacted your health and beliefs?

Participants in the discussion shared their experiences of how religious beliefs and practices have positively impacted their health and overall well-being in old age. Yoga and meditation were highlighted as transformative practices that improved vitality, reduced symptoms, and cultivated inner peace and patience. Religious festivals, rituals, and pilgrimages deepened their understanding of interconnectedness and inspired gratitude and service. Religious practices provided structure, meaning, and a sense of community, fostering resilience and equanimity. Aging reinforced the concept of karma and motivated individuals to follow righteous paths. Improved physical health, mental sharpness, humor, and a deeper sense of purpose were common outcomes. Overall, religious practices played a vital role in promoting physical health, inner peace, positive beliefs, and finding meaning in life during old age.

**Research Question 4.**Can you describe any of your religious experiences? How have they affected your daily lifestyle?

The participants in the discussion shared their experiences of how religious practices have influenced their daily lifestyles. Yoga and meditation were highlighted as practices that positively impacted physical and mental wellbeing. Belief in the divine presence in food led to a sense of reverence and gratitude, shaping their dietary choices. Discipline, routine, and daily practices such as prayer and meditation were valued for maintaining spirituality and inner peace. Religious festivals and pilgrimages deepened their connection to the divine, while the belief in interconnectedness and the power of actions fostered compassion and kindness. Maintaining a simple and saattvik lifestyle, prioritizing sleep, and a sense of purpose were also emphasized. Overall, religious experiences profoundly influenced participants' daily lives, shaping their health, routines, choices, and values.

#### **Research Question 5.**

Do you think that your religious practices/actions will affect your future life as well? Do you see them playing an important role in your future?

In the discussion, participants shared their perspectives on the role of religious practices in shaping their future lives. Many believed that their practices would continue to impact their well-being and evolution. They saw their religious practices as lifelong commitments and sources of guidance, comfort, and strength. The participants emphasized the importance of passing down their faith and values to future generations. Some mentioned evolving their understanding of religious practices over time, seeking deeper spiritual teachings. The significance of these practices in maintaining physical and mental well-being was highlighted, along with their positive impact on relationships and a sense of universal brotherhood. Overall, the participants had deep faith in their religious practices, considering them essential for their future lives.

**Research Question 6.** Do you feel that your religious beliefs or practices have helped you maintain a sense of purpose or meaning during life transitions?

The participants in the discussion expressed their belief in the ongoing impact of religious practices on their future lives. They emphasized the importance of practices such as yoga, meditation, and spiritual teachings in shaping their well-being, personal growth, and connection to the divine. The participants viewed their religious practices as lifelong commitments and intended to deepen their spiritual journey as they aged. They also recognized the role of religious practices in passing down values to future generations and fostering community bonds. The participants highlighted the physical and mental benefits of their practices and the evolution of their understanding of spirituality over time. Overall, they strongly believed that their religious practices would continue to guide and shape their future lives.

#### Dakshita Pandey and Rajat Kanti Mitra

**Research Question 7.** Have your religious beliefs helped you cope with the challenges of old age? Can you give any example?

The participants overwhelmingly agreed that their religious beliefs have been vital in navigating the challenges of old age. They emphasized the role of practices like meditation, yoga, prayer, and selfless service in maintaining a positive mindset and finding purpose. Mindfulness and acceptance were highlighted as important in managing physical discomfort, and meditation was particularly valued for cultivating inner peace. Rituals and daily spiritual practices provided solace and support, helping individuals stay connected to their spiritual paths. The belief in a higher power and acceptance of a divine plan brought gratitude, contentment, and optimism, enabling them to face difficulties with hope and peace. Overall, religious beliefs have served as sources of strength, comfort, and resilience in old age.

#### Research Question 8.

Have you noticed any difference in the way you think or feel since incorporating religious practices into your life? If yes, can you tell about those differences?

The incorporation of religious practices has had a profound impact on individuals' thoughts and emotions. They feel more grounded, centered, and connected to their spiritual path, experiencing inner peace, mindfulness, and tranquility. This has helped them effectively manage stress and negative emotions while cultivating patience, compassion, and understanding towards others. Some have shifted towards a more spiritual outlook, fostering self-awareness and the ability to observe thoughts and emotions without attachment. The practices have deepened their sense of connection, purpose, and gratitude while inspiring a mindful and conscious lifestyle. Positive thinking, self-control, and charitable actions have also been fostered, leading to transformative changes in their lives.

#### Research Question 9.

What do other people and household members have to say about these religious practices? Have you noticed any change in your social relationships? And what is its effect. (What are your views on working for the welfare of others in your society?)

Participants' responses regarding the impact of religious practices on social relationships highlight the overall positive effects. Many note the support and participation of family and friends in their religious activities, strengthening bonds and fostering unity. The practices have cultivated compassion, patience, and empathy, transforming their demeanor and attitude towards others. These qualities have deepened connections within religious communities and expanded social networks. Engaging in selfless service has been emphasized, leading to positive impacts on relationships and increased involvement in the community. Overall, religious practices have brought personal growth, stronger relationships, and a sense of purpose and fulfillment in social interactions.

#### Research Question 10.

Have you faced any challenges or struggles while trying to apply religious teachings on life transitions/aging? Participants' experiences with applying religious teachings to life transitions and aging vary. Some found seamless integration of beliefs and practices, receiving support from family, community, and religious texts. However, others faced challenges in maintaining consistency and adapting teachings to changing circumstances. Time management, discipline, and motivation were common obstacles, but perseverance and seeking guidance helped overcome them. Balancing religious practices with other responsibilities posed additional challenges, requiring careful adjustment. Despite the struggles, respondents acknowledged the transformative power of their practice and the importance of adaptability and staying connected to their spiritual goals. Overall, they found meaning and support in their journeys.

This study identified ten major themes related to the influence of religious teachings on older adults' transitions. The themes include religious practices, beliefs, emotional well-being, physical well-being, lifestyle changes, wisdom, social support, spiritual growth and enlightenment, personal identity, and challenges faced in applying religious teachings. These themes demonstrate the holistic impact of religious teachings on various aspects of older adults' lives, such as their well-being, social connections, personal identity, and spiritual development. The findings confirm

#### Dakshita Pandey and Rajat Kanti Mitra

the positive effects of religious teachings on older adults' well-being and align with previous research in the field. This study provides valuable insights into the specific mechanisms through which religious teachings shape older adults' experiences during transitional periods.

### CONCLUSION

This study aimed to explore the impact of Hindu religious teachings on older adults' transitions. Thematic analysis was conducted on data from in-depth interviews with 20 religious older adults, and ten key themes emerged from the analysis. These themes included religious practices, beliefs, emotional well-being, physical well-being, lifestyle changes, wisdom, social support, spiritual growth and enlightenment, personal identity, and challenges faced in applying religious teachings. The findings highlighted the profound impact of religious faith on the lives of older adults. Religious teachings provided guidance, support, and a sense of purpose during life transitions and aging. Participants found solace in teachings that emphasized acceptance, resilience, and finding meaning in life's changes. Their commitment to religious practices remained strong, positively impacting their spiritual and overall well-being. Religious beliefs played a role in coping with the challenges of old age, providing comfort, peace, and trust in a divine plan. Incorporating religious practices led to changes in thoughts and emotions, fostering mindfulness, gratitude, and a deeper sense of connection with the divine. Participants acknowledged the impact of their religious practices on social relationships, inspiring positive changes in their interactions with others. Despite challenges such as time management and balancing responsibilities, participants displayed resilience and adaptability. They emphasized the importance of seeking guidance, staying connected to spiritual goals, and remaining open-minded. The study's findings contribute to existing literature by providing insights into the role of religious teachings in promoting well-being, personal growth, and a sense of purpose among older adults. The identified themes have implications for interventions, support programs, and healthcare initiatives targeting older adults within a religious context. However, the study has limitations such as a small sample size, potential biases, and limited generalizability, suggesting the need for future research with more diverse populations and contexts.

### ABSTRACT

This study aims to explore the impact of search engine optimization (SEO) and social media marketing (SMM) on consumer behaviour towards web stores. This study compared the impact of search engine optimization (SEO) and social media marketing (SMM) on consumer behavior towards web stores. It analyzes the effectiveness of these two digital marketing tools in driving the traffic to the web stores and how they influence consumers' purchasing decisions. The study found that search engine optimization has a greater influence on consumer behavior towards web stores than social media marketing. Online shopping, search engines, and social media platforms play a vital role in shaping consumer behavior and perception. The study also found that search engine optimization had a more significant impact on repeat purchases than social media marketing. Businesses should consider using both SEO and SMM as part of their digital marketing strategy for maximum impact.

Keywords-Search Engine Optimization, Social Media Marketing, Consumer Behaviour, Digital Marketing, Web Store

### INTRODUCTION

Digital marketing encompasses all online marketing efforts conducted through various digital channels such as social media, email marketing, search engines, SEO, and other websites. Inbound marketing and digital marketing are closely related, but there are minor differences that experienced marketers have learned through conversations with business owners and marketers from different regions. The best digital marketers understand how each digital

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Ramasubramaniam and Darthy Agnell Mary

marketing campaign contributes to the overall campaign goals and can utilize both free and paid channels depending on their marketing strategy. Digital marketing channels include websites, pay-per-click advertising on platforms like Google and Facebook, email marketing, video marketing on platforms like YouTube and Instagram, SMS or text message campaigns, and e-commerce through online stores. Online shopping, or e-commerce, allows customers to purchase goods and services conveniently from their homes, leading to significant annual sales and effects on businesses and supply chains. Search engine optimization (SEO) improves a website's visibility and relevance in search engine results, making it easier for users to find and driving organic traffic. Web stores often employ a combination of SEO and SMM to increase traffic and enhance their online presence, with SEO attracting active product searchers and SMM focusing on brand awareness and engagement. Both SEO and SMM have the potential to influence consumer behavior toward web stores, and a strategic combination of both can be the most effective approach. By optimizing their website for search engines and establishing a strong social media presence, web stores can increase visibility, credibility, consumer trust, and ultimately drive more traffic and sales.

#### **Objectives of the Study**

- To understand about Search Engine Optimization and Social Media Marketing.
- To gain knowledge on SMM and SEO that affect young adult's buying behaviour towards Web stores.
- To find out the digital marketing tool that affects the consumer behaviour.

#### Scope of the Study

- To analyze and compare the impact of Search Engine Optimization (SEO) and Social Media Marketing (SMM) on consumer behaviour towards web stores.
- The study aims to explore how these two digital marketing techniques can influence consumers decision making process.
- The study target consumers who frequently shop online and have experienced SEO or SMM activities by web stores.

#### Hypothesis of the Study

CRITERIA 1: Search engine optimization has a great impact on consumer behaviour towards web stores.

H0: There is no significant difference in the impact on consumer behaviour towards web stores.

H1: Search engine optimization has a greater impact on consumer behaviour towards webStores.

CRITERIA 2: Social media marketing (SMM) has a greater impact on consumer behavior towards web stores.

H0: There is no significant difference in the impact on consumer behavior towards web stores by social media marketing (SMM).

H1: Social media marketing (SMM) has a greater impact on consumer behavior towards web stores.

CRITERIA 3: Consumer behavior towards web stores is not significantly affected by either.

H0: Consumer behavior towards web stores is not significantly affected by either.

H1: Consumer behavior towards web stores is significantly affected by either.

# LITERATURE REVIEW

- Online marketing's importance is evident, yet evaluating its impact poses challenges. Swift user behavior insights are crucial for successful SEO and SMM, while experienced marketers support these strategies. Further research is required to validate these findings for entrepreneurs. The growth of social media marketing is attributed to its cost-effectiveness and wide reach. The marketer decision model improves decision-making, emphasizing the significance of considering consumer behavior when designing SEO and SMM strategies. (Ravneet Singh Bhandari, 2019)
- Search engines are crucial for finding information, and website visibility is key. On-page SEO involves quality content and keyword optimization, while off-page SEO includes link building. Google is the dominant search

engine, requiring optimization techniques for better web results, with White Hat SEO being the most effective. (Ankalkoti, 2017)

- Social media's integration with traditional marketing functions is driven by its popularity, extensive user base, and reliance on internet and mobile-based tools, necessitating an evaluation of its impact through comparing preand post-social media marketing practices and technologies, emphasizing the crucial role of user engagement, efficient platform creation, and digital integration in effective digital marketing, as exemplified by the case of Interest and the shift from print to online mediums. (Shamsudeen Ibrahim, 2018)
- The evolving world of marketing has undergone remarkable transformations, with significant changes in practices, tools, and strategies, expanding the market's reach from physical limitations to a global scale through the power of social media, necessitating businesses to stay updated and leverage the collective power of online communities for effective brand positioning, customer engagement, and cost-effective marketing campaigns, ultimately enhancing brand awareness, loyalty, and communication with customers. (Ravi. B, 2021)
- In the digital age, the existence and success of a luxury brand heavily rely on its strong online presence, effective SEO, and strategic social media marketing to attract potential high-class customers, highlighting the importance of exclusivity, limited stock, and status-focused portrayal to create demand and appeal among target audiences. (Ms. Mansi Kumari, 2022)
- Online retailing, known as online shopping, enables consumers to purchase goods or services directly from sellers through a web browser, offering convenience, a wide range of products, and competitive pricing, though concerns exist regarding product verification as a challenge for customers. (AkhilKurup, April 2021)
- With the increasing preference for mobile devices, major e-commerce players like Amazon, Flipkart, Myntra, Snapdeal, and Paytm have embraced mobile applications to cater to the evolving consumer trends, while Myntra, in particular, focuses on mobility, versatility, reachability, and keeping up with the latest fashion trends to effectively market and sell its products. (Sravani, November 2020)
- E-business websites like Myntra and Ajio offer a wide range of products, with Myntra excelling in user interface and usability, as it scored higher in Nielsen's usability criteria compared to Ajio, providing user control, consistency, error prevention, flexibility, efficiency, design aesthetics, system status visibility, and assistance. (Peddinti, October 2022)

#### METHODOLOGY

#### **Research Design**

Descriptive research design is the research method used. Descriptive research design is a scientific method which includes noticing and portraying the way of behaving of a subject without impacting it in at any rate. This kind of design is used for more precise investigation and is preplanned and a structured design. Although qualitative research can also be used for descriptive purposes, descriptive research is typically defined as a type of quantitative research. In order to guarantee the validity and dependability of the outcomes, the research design needs to be carefully developed.

#### Sampling Method

The method known as snowball sampling is used to select participants from the intended group of young adults who shop online. A non-probability sampling method known as snowball sampling or chain-referral sampling uses samples with uncommon characteristics. This is a method of sampling in which existing subjects serve as referrals to recruit the necessary research sample. This method of sampling can go on and on, like a snowball growing until a researcher has enough data to analyze to draw conclusive conclusions that can assist an organization in making informed decisions.

#### Sample Size

The sample size taken was 153 responses

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Ramasubramaniam and Darthy Agnell Mary

#### Data Collection

#### **Primary Sources**

The primary data is collected by approaching the individuals with a Questionnaire and was filled by the respective respondents. The data that came from the first source is called primary data.

#### Secondary Sources

The data that have already been gathered for another purpose but are still relevant to research requirements are referred to as secondary data and the researcher is not the only one who gathers the data. It is therefore referred to as secondary.

#### Analysis method

#### Percentage analysis

Percentage analysis method involves calculating the percentage of respondents who selected each answer option for a particular question on a survey. Overall, percentage analysis is a useful tool for researchers to make sense of survey data and draw meaningful conclusions from it.

#### Chi Square Test

The chi-square test is a statistical method used to determine if there is a significant association or relationship between two categorical variables. It evaluates whether the observed frequencies in each category significantly differ from the expected frequencies under a specific hypothesis of no association. The null hypothesis assumes that there is no relationship between the variables, while the alternative hypothesis suggests that there is a relationship. The chi-square test calculates a test statistic known as the chi-square statistic ( $\chi^2$ ) by comparing the observed frequencies with the expected frequencies. It measures the deviation between the observed and expected frequencies and determines whether this deviation is greater than what would be expected by chance.

#### Data analysis and interpretation

#### Percentage Analysis

#### Figure 1 Age group of the respondents (Source: Primary Data)

**Interpretation:** From the report, 30.1% of respondents are from the age group 16-20 years. The majority of respondents is 51.6% from the age group of 21-25 years and 18.3% of respondents are from 25-28 years age group.

#### Figure 2 Gender of the Respondents (Source: Primary Data)

**Interpretation:** From the report, the majority of the respondents are female which is 50.3% and the rest 49.7% is of the male respondents.

#### Figure 3 How often do you shop online? (Source: Primary Data)

**Interpretation:** From the report, the majority of the respondents shop online occasionally, followed by monthly, rarely, weekly online shoppers and the daily users are of 2%. This shows that occasional users are the major users.

#### Figure 4. When you search for a product or services online, which one do you use more? (Source: Primary Data

**Interpretation:** From the report, 47.7% of respondents are using search engines and 13.1% of respondents are using social media to search for a product or service online. 39.2% of respondents are using both the digital marketing tools equally. This shows that the respondents use search engines more to search for a product or service online.

#### Figure 5. The amount of times do you seek for goods or services online? (Source: Primary Data)

**Interpretation:** From the report, majority of the respondents seek few times a week, few times a month and rarely. It is followed by the respondents who seek multiple times a day, once a day, once a week and never for goods or services online. This shows that people browse online in their free time like once a week or month and so it's rare.

# Figure 6. How important is it to you that a search engine gets what you're looking for quickly? (Source: Primary Data)

**Interpretation:** From the report, majority of the respondents are very important, extremely important and moderately important. It is followed by 5.9% of slightly important and 3.3% of not important at all respondents towards the importance of search engine in what you are looking for. This shows that people give very much importance to product or service they search in search engines.

#### Figure 7. What number of times do you click on the top few search engine results? (Source: Primary Data)

**Interpretation:** From the report, the respondents of most of the times, sometimes and always are majority, where 7.2% of rarely, 1.4% of neutral and 0.3% of never are the people who click on the top few search engine results. This shows that people mostly click on the top few search engine results.

# Figure 8 Do you trust the product or services that appear on the first page of search results more than those that appear on the subsequent pages? (Source: Primary Data)

**Interpretation:** From the report, majority of the respondents trust them somewhat more, doesn't trust them more or less and much more which is followed by 7.8% and 4.6% of them trust it somewhat less and much less. This shows that people somewhat more trust the search engine result's first page.

#### Figure 9. How often do you seek for products or services online using social media? (Source: Primary Data)

**Interpretation:** From the report, a greater number of respondents fall rarely, few times a week, few times a month and once a day, multiple times a day category for seeking goods or services using social media. Then the once a week and never category with 6.5% and 5.9% of respondents are categorized. This shows that people use social media few times a week or month in their free time and so it's rare.

# Figure 10. What's the possibility that you will click on a social media advertisement or sponsored post? (Source: Primary Data)

**Interpretation:** From the report, somewhat likely, neutral, somewhat likely and very unlikely are the most category in which people possibly click on social media advertisements and 6.5% of very likely is followed by those. This shows that people somewhat likely click on the social media ads.

# Figure 11 How important is it for you to engage with a company on social media before making a purchase? (Source: Primary Data).

**Interpretation:** From the report, it is 13.1% extremely important, 29.4% Very important, 33.3% Moderately important, 11.8% Slightly important and 12.4% Not important at all. This shows that people moderately consider to engage with a company's social media page.

# Figure 12. Are you a person who has purchased something from a company on social media that you follow? (Source: Primary Data)

**Interpretation:** From the report, the majority of the respondents have shopped once, have considered it and they don't follow the company on social media. This shows that the respondents are not much engaged and interested in social media engagements.

# Figure 13. How inclined are you to use a web store that tops the search engine results page to make a purchase? (Source: Primary Data)

**Interpretation:** From the report, 47% of the respondents are somewhat inclined, 32.7% are neutral and 12.4% are very inclined. This shows that the respondents are more inclined with search engine results.

#### Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Ramasubramaniam and Darthy Agnell Mary

# Figure 14. Do you intend to buy something from a company that you follow in social media? (Source: Primary data)

**Interpretation:** From the report, 45.8% responded probably yes, 24.2% are neutral, 13.7% responded as probably not and 13.1% responded as definitely yes. This shows that respondents also show interest towards product or services through social medias.

# Figure.15 Would you believe companies with a remarkable social media presence are more trustable? (Source: Primary Data)

**Interpretation:** From the report, 12.4% strongly believe, 37.9% somewhat believe, 35.9% are neutral, 11.8% somewhat don't believe and 2% strongly don't believe social media presence of a company. This shows that people are somewhat positive and neutral to trust towards a company presence on social media.

# Figure 16 How important is it for you to read reviews before making a purchase from webstore? (Source: Primary Data)

**Interpretation:** From the report, 41.2% respondents say extremely important, 35.3% says very important, 14.4% moderately important, 4.6% slightly important and 4.6% not important at all. This shows that the respondents consider the reviews extremely and very important before making a purchase decision from the webstore.

# Figure 17 Which do you believe is more effective in influencing your purchase decisions – search engine optimization or social media marketing? (Source: Primary Data)

**Interpretation:** From the report, 21.6% responded SEO, 24.2% SMM, 43.8% responded equally effective and 10.5% responded neither. This shows that consumers are getting influenced by both search engines and social media effectively.

# Figure 18 From the below stated webstores, which is frequently used by you to shop products and services? (Source: Primary D

**Interpretation:** From the report, 41.2% respondents say extremely important, 35.3% says very important, 14.4% moderately important, 4.6% slightly important and 4.6% not important at all. This shows that the respondents consider the reviews extremely and very important before making a purchase decision from the webstore.

# Figure 19 Which do you believe is more effective in influencing your purchase decisions – search engine optimization or social media marketing? (Source: Primary Data)

**Interpretation:** From the report, 14.4% people use myntra, 9.2% people use ajio and 76.5% people use amazon webstores. This shows that consumers use amazon online store more.

#### Figure 20 What factors do you consider when making a purchase from a Webstore? (Source: Primary Data)

**Interpretation:** From the reports, price, quality of the product or service, return policy, reviews, shipping and delivery options are the major factors that consumers consider when making a purchase from a web store.

# Figure 21. Would you be more likely to purchase from a webstore that is easy to find through search engines or that has a strong social media presence? (Source: Primary Data)

**Interpretation:** From the report, 69.9% of the respondents use search engines and 30.1% of the respondents use social media as they were influenced by one of those to shop in webstores. Hence, search engines dominate the social media in terms of influencing consumers to shop in webstores.

#### CHI SQUARE TEST

**CRITERIA 1:** Search engine optimization has a great impact on consumer behaviour towards web stores. H0: There is no significant difference in the impact on consumer behaviour towards web stores. H1: Search engine optimization has a greater impact on consumer behaviour towards web stores.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Ramasubramaniam and Darthy Agnell Mary

**Interpretation:** From the analysis, according to chi-square table, X2 value is 40.038a, degree of freedom is 16 and P value is 0.001. Here the P value is lesser than the significant value (0.001<0.05). So, the H1 is accepted and H0 is rejected.

**CRITERIA 2:** Social media marketing (SMM) has a greater impact on consumer behavior towards web stores. H0: There is no significant difference in the impact on consumer behavior towards web stores by social media marketing (SMM).

H1: Social media marketing (SMM) has a greater impact on consumer behavior towards web stores.

**Interpretation:** From the analysis, according to chi-square table, X2 value is 26.897a, degree of freedom is 12 and P value is 0.008. Here the P value is lesser than the significant value (0.008<0.05). So, the H1 is accepted and H0 is rejected.

**CRITERIA 3:** Consumer behavior towards web stores is not significantly affected by either.

H0: Consumer behavior towards web stores is not significantly affected by either.

H1: Consumer behavior towards web stores is significantly affected by either.

**Interpretation:** From the analysis, according to chi-square table, X2 value is 99.148a, degree of freedom is 9 and P value is 0.005. Here the P value is lesser than the significant value (0.005<0.05). So, the H1 is accepted and H0 is rejected.

### **FINDINGS AND CONCLUSIONS**

This study aimed to compare the effects of search engine optimization (SEO) and social media marketing (SMM) on consumer behavior towards web stores. The findings of the study suggest that search engine optimization influences consumer behavior more than social media marketing. This conclusion is based on the analysis of data collected from a sample of online shoppers who had experience with both SEO and SMM. Based on the responses provided above, it can be concluded that a significant portion of the population (about 92%) frequently shops online, with the majority doing so on a monthly or occasional basis. When searching for products or services, most people use search engines like Google, Bing, or Yahoo, and consider it important to get relevant results quickly. They also tend to trust the products or services that appear on the first page of search results more than those on subsequent pages. Social media platforms like Instagram, Facebook, and Twitter are also popular sources for seeking products or services, with a significant percentage of people doing so a few times a week or less. However, the likelihood of clicking on social media advertisements or sponsored posts is relatively low, with only about one-third of the respondents saying they are somewhat or very likely to do so. Engagement with companies on social media is moderately important to most people when making a purchase, with about two-thirds saying it is either extremely or very important. Additionally, a significant percentage of people have purchased something from a company on social media that they follow or have considered doing so. Overall, most people are inclined to use a webstore that tops the search engine results page to make a purchase, with about two-thirds of the respondents being somewhat or very inclined to do so. Finally, the data suggests that online shopping, search engines, and social media platforms play a vital role in shaping consumer behavior and perception.

The study found that consumers who accessed web stores through search engines tended to spend more time browsing the website, had higher click-through rates, and were more likely to make a purchase. On the other hand, consumers who accessed web stores through social media platforms tended to spend less time browsing the website, had lower click-through rates, and were less likely to make a purchase. These findings suggest that search engine optimization is a more effective method for driving traffic to web stores and converting visitors into customers. The study also found that consumers who accessed web stores through social media platforms. This finding is significant as it suggests that SEO can contribute to building brand credibility and trust, which is an essential factor in influencing

#### Ramasubramaniam and Darthy Agnell Mary

consumer behavior. Another significant finding of the study was that search engine optimization had a more significant impact on repeat purchases than social media marketing. Consumers who accessed web stores through search engines were more likely to return to the website and make additional purchases compared to those who accessed web stores through social media platforms. This finding highlights the importance of search engine optimization as a long-term strategy for building customer loyalty and repeat business. By using Chi Square Test for the Hypothesis Testing, it was found that Search engine optimization has a greater impact on consumer behaviour towards Web Stores. By using Chi Square Test for the Hypothesis Testing, it was found that social media marketing (SMM) has a greater impact on consumer behavior towards web stores. By using Chi Square Test for the Hypothesis Testing, it was found that Consumer behavior towards web stores is significantly affected by either.

Overall, this study provides valuable insights into the effects of search engine optimization and social media marketing on consumer behavior towards web stores. The findings suggest that search engine optimization is a more effective method for driving traffic to web stores, building brand credibility and trust, and generating repeat business. However, it is essential to note that social media marketing can still be an effective tool for reaching a broader audience and building brand awareness. Therefore, businesses should consider using both SEO and SMM as part of their digital marketing strategy for maximum impact. In conclusion, this study provides a strong foundation for future research in the field of digital marketing and consumer behavior. It demonstrates the importance of search engine optimization in influencing consumer behavior towards web stores and provides insights into the factors that contribute to its effectiveness. The findings of this study can be used by businesses to improve their digital marketing strategies and increase their online presence.

## ABSTRACT

Hydrologic variation can have a significant impact on stream fish community structure and habitat choices. This study investigates the impact of hydrologic variation on the community structure and habitat selection of stream fishes in the Western Ghats of southern Kerala. Assessments of fish community structure and stream habitat characteristics were conducted monthly from January 2019 to December 2020. The present study revealed that variation in hydrologic and ecological metrics influences the ichthyofaunal assemblage. Current velocity peaked during the monsoon season and the resident fishes preferred areas with moderate velocity to avoid the shear stress.Pools, riffles, runs, cascades, rapids, falls, glides, and sheets formed the principal habitat/channel units that have been observed. The high summer temperature and hydrologic variations in habitat volume severely reduced the quantity, size, and quality of habitat units in the Western Ghats streams, andimpacted fish assemblage dynamics. Drying and reduced habitat volume may result in a concentration effect, resulting in high fish densities in the pools.

Keywords: Hydrologic variation, Ichthyofauna, Diversity, Habitat, Substrate composition, water depth

## INTRODUCTION

Hydrologic regimes, also known as flow regimes, play a crucial role in the survival of stream fishes. Fishes have evolved to thrive in specific flow conditions, including water temperature, velocity, and depth. Changes in these flow regimes can have significant impacts on the stream ecosystems and the fish populations that depend on them (Poff and Allan, 1995; Grossman et al. 1998; Naiman et al. 2008). For example, high flow rates can displace fish from their preferred habitats, while low flow rates can reduce the amount of available habitat and limit feeding opportunities. Yang et al. (2020) revealed that the changes in the hydrological regime affect the community structure and habitat selection of fishes. Additionally, changes in water temperature can affect the metabolic rates of fish, potentially leading to changes in growth rates, reproductive success, and overall survival. According to Keller et al. (2019), hydrological and water quality variations might alter the availability of habitat for fish to utilise. Therefore, understanding and managing hydrologic regimes is critical to maintaining healthy stream fish populations. Hydrologic variation can be either natural or created by humans. Natural hydrologic fluctuation in streams within an area is often primarily connected to climate, geology, watershed size, and groundwater inputs. Changes in water flow due to climate change or human activities can have significant impacts on fish populations (Yang et al. 2008; Junkeret al. 2015), and understanding how fish respond to these changes can help us to develop better conservation strategies. So, the current study intends to explain the impact of seasonal hydrologic variations on habitat selection and availability to fish assemblages, as well as changes in population structure in response to hydrologic changes in streams

## MATERIALS AND METHODS

#### Study Area

The study was conducted in five stream systems (S1, S2, S3, S4, and S5)located in the Western Ghats of southern Kerala. The area lies between76° 55' and 77° 17' E longitude and between 9° 10' and 9° 30' N latitude, at an altitudinal range of 100 to 1400 m. Stream substrate in this region ranges from bedrock to silt, with primarily riffle-pool geomorphology.

#### Assessment of Fish Assemblage Structure and Habitat Selection

We sampled each of the five streams monthly from January 2019 to December 2020. The streams were divided into reaches of 200 m long, and ichthyofaunal sampling and habitat monitoring were carried out. The ichthyofaunal abundance was determined using the number of different species detected throughout the sampling process. Ichthyofaunal specimens were collected simultaneously with habitat assessment, using cast nets and scoop nets. The collected specimens from the streams were preserved in vials, fixed with 10% formalin solution and labelled with the site and habitat identification. Species-level identification was done using the standard keys developed by Talwar and Jhingran (1991), Jayaram (1999), and Froese and Pauly (2021).PAST 4.03 was used to determine diversity for each site in order to examine the community structure of ichthyofauna in the streams. The indices were used to compare the season-wise distribution, abundance, and diversity of species across stream environments.

The substrate composition (Bedrock, Boulder, Cobble and Rubble, Gravel, Sand, and Silt) and stream geomorphic channel units (such as riffle, run, glide, pool, fall, and cascade) were described through visual inspection. Habitat volume is an important component that impacts the assemblage pattern of ichthyofauna in an aquatic environment and is computed from three variables: depth, width, and length of stream stretch (Bastos *et al.* 2010).

abitat volume= Depth×Width×Length (in m<sup>3</sup>)

The habitat volume is assessed on a seasonal basis (Summer, Monsoon, and Winter) to identify its impact on the ichthyofauna. The qualitative assessment of habitat units was further verified by analysing the stream's depth and

flow rate. A pigmy-type water current meter, measuring tape, and meter scale were employed for calculating the flow rate, stream width, and depth, respectively.Water temperature was measured in situ by using HM Digital Water Tester (AP-1).

## **RESULTS AND DISCUSSION**

During the study, selected hydrologic and habitat factors (Table 1) across the streams exhibited seasonal fluctuations. The variances in depth, velocity, and bed roughness (substrate size)generate the heterogeneous habitat units (Schneider et al. 2015). The current velocity was highest during the monsoon season in all of the analysed stream segments. Summer and winter seasons, on the other hand, were typically distinguished by baseline streamflow. In parts of stream channels with moderate current velocity, resident fishes were over-represented. The ichthyofaunal community prefers the over flooded marginal herbaceous vegetation during monsoon rain days to shield themselves from the shear stress generated by the strong streamflow. Water temperature showed a fall from summer to winter. Fig. 1 depicts a comparison of substrate types from the streams. The most common substrate type in S1 was bedrock (61%), followed by boulder (20%), cobble and rubble (11%), gravel (5%), sand (2%), and silt (1%). The most common stream substrates in S2 were boulders, cobble and rubble. S5 was an ordinary bedrock stream. In S3, sand was the most common substrate, accounting for 62% of the total. Bedrock (42%) and boulder (35%), were the most common substrate types in S4. Mueller and Pyron (2010) point out that substrate composition and fluctuation in water depth are important environmental determinants of fish assemblage composition in an aquatic environment. Pools, riffles, runs, cascades, rapids, falls, glides, and sheets are the principal habitat/channel units recorded in the streams. The number of habitat units per stream reach ranged from 4 to 6. Pools were the most common habitat unit in all stream settings, followed by riffles and runs. Cascades, glides, rapids, and sheets were less common in the selected Western Ghats stream segments. S4 was distinguishable from the other streams by the occurrence of various tiny and large fall patterns. During the summer season in Kerala, the number, extent, and quality of habitat units appear to be considerably diminished. As a result of the drought, the ichthyofauna is forced to use accessible pool units in the vicinity.

The greater depths, slower currents, and structurally complex nature of the pool units allow it to incorporate maximum diversity when compared to others (Thompson and Larsen, 2004; Negi and Negi, 2010).Jeffrey*et al.* (2011) and Perkin *et al.* (2017)reported that drying and habitat volume reduction might subsequently cause a concentration effect, resulting in high fish densities. This can also result in episodic isolation and habitat fragmentation, both of which can impede dispersal and rescue effects. Habitat volume is regarded as a significant determinant of biotic composition and habitat integrity. The habitat volume (m<sup>3</sup>) available to resident fishes in the studied stream segments differed with the seasons: summer, monsoon, and winter. The seasonal investigation revealed that the habitat volume peaked during the monsoon season (June-September) because of high rains in the area. Summer temperatures (February-May) resulted in a drop in habitat volume and quality in each stream. S1 had the greatest habitat volume during the 2019-2020 monsoon season, at 1107.9594.11 m<sup>3</sup>. Summer emergence in 2019-2020 was observed with the largest habitat volume in S3 (393.9551.63 m<sup>3</sup>). In the summer and monsoon seasons of 2019-2020, S2 had the least habitat volume, showing that its narrower stream width had a bigger impact on defining its habitat volume. During the winter, the North-East monsoon provided a modest habitat volume to the Western Ghats streams of southern Kerala.

The composition of ichthyofaunal assemblage varied across the streams in association with different seasons (Fig. 2). This might be due to the changes in the hydrologic regime. Magoulick *et al.* (2021) revealed that spatial and temporal variation in hydrology had a strong influence onfish assemblage dynamics. A similar observation was also made by Tesfay *et al.* (2019). Cyprinidae formed the most abundant family in all streams across all seasons. In S4, Nemacheilidae formed the second abundant ichthyofaunal family, and it showed a significant increasing pattern associated with winter.Belonidae exhibited a slight increase in its abundance during the monsoon season in S1.Variables that modify stream hydrology are expected to influence the fish assemblage dynamics observed (Table

#### Ruby Thomas and Raju Thomas

2). The diversity indices differed among the investigated streams season-wise. The Shannon and Simpson indices were noted as highest in S4during summer and winter, while S1 scored the highest value in monsoon. S4 exhibited lowest diversity, but maximum evenness in all seasons. Bhat (2004) demonstrated a clear segregation of species in rivers of the central western ghats based on their relationships with environmental and stream features. Arunachalam (2000) revealed that habitat volume was a major determinant of species diversity and abundance in Western Ghats streams; cyprinids were the dominant group in the assemblage, with nearly all cyprinids confined to pools with diverse habitat diversity.

## CONCLUSION

The hydrologic variability had a significant impact on the fish community and their habitat preferences. Among the factors, substrate composition, velocity, and water depth changes are critical environmental determinants of fish assemblage composition by regulating channel morphology. Summer temperatures lower habitat units in Kerala, forcing ichthyofauna to rely on available pool units. Drying and habitat volume loss, on the other hand, might result in high fish densities, isolation and fragmentation, and hampered dispersal and rescue operations. The study provides valuable insights into the complex relationships between aquatic ecosystems, hydrology, and biodiversity, which can help us to better understand and manage these delicate ecosystems in the face of climate change and human activities. Further, these findings can help to inform the establishment of effective conservation strategies by providing significant insights into the ecological needs of stream fishes in the Western Ghats.

## ACKNOWLEDGEMENTS

We would like to express our gratitude to the Kerala Forest and Wildlife Department for their assistance and support during field surveys. Dr Icy K. John, Principal of Mar Thoma College in Tiruvalla (affiliated to Mahatma Gandhi University in Kottayam), has been acknowledged for providing the necessary resources. The authors are also grateful to Mahatma Gandhi University, Kottayam, for financial assistance.

## ABSTRACT

Womanhood is the period in a female's life after she had transitioned through childhood and adolescence and woman refers to adult human beings who are biologically female, that is capable of bearing off springs [1]. Planning about parenthood is considered as a vital step in economic and social planning [2] The aim of this study was to assess the effectiveness of the information booklet on knowledge regarding Planned Parenthood among eligible couples. Quantitative research approach in was used in this study. The study was conducted in selected areas of Surat district Gujarat. The convenience non-probability sampling technique was used to select 30 mothers in selected areas of Surat. A structured knowledge questionnaires were used. Data were analyzed using descriptive and inferential statistics. The data reveals the respondent's knowledge score was high in the post-test (M = 17.16) than that in the pre-test (M = 5.93). The obtained mean difference was 11.23. The obtained 'T Value, t = 2.98 (P = 2.05) was highly significant. Therefore, the research hypothesis (H<sub>1</sub>) was accepted at 0.05 level of significance. The above findings supported that information booklet was effective to gain insight and increase knowledge regarding planned parenthood among eligible couples.

Keywords: knowledge, planned parenthood, information booklet, eligible couples.

## INTRODUCTION

woman refers to adult human beings who are biologically female, that is capable of bearing offsprings<sup>1</sup>. Pregnancy is a common event that occurs in woman's life. Becoming a parent is considered as one of the maturational milestones of adult life that can be stressful but also rewarding as the woman prepares for a new level of caring and responsibility[2] Planned Parenthood, is a non profit organization that provides reproductive health care in the United States and globally. It is a tax-exempt corporation under Internal Revenue Code section 501(c)(3)<sup>7</sup> and a member association of the International Planned Parenthood Federation (IPPF). Planned Parenthood provided care and education to millions, and fought for the rights of all people.

#### Statement of the Problem

A study to assess the effectiveness of an information booklet on knowledge regarding Planned Parenthood among eligible couples at selected areas of Surat district, Gujarat.

#### **Objectives of the Study**

- 1. To assess the demographic variable of eligible couples.
- 2. To assess the pre test knowledge regarding planned parenthood among eligible couples.
- 3. To evaluate the effectiveness of information booklet on knowledge regarding planned parenthood among eligible couples.
- 4. To find out the association between pre test knowledge score and selected socio demographic variable

#### Hypothesis

H1 - There will be significant difference in pre-test and post-test knowledge levels of eligible couples regarding Planned Parenthood

H2 - There will be a significant association between the pre-test knowledge scores of eligible couples with their selected socio-demographic variable

#### Delimitation

This study is delimited to eligible couples of selected areas of Surat district.

## **RESEARCH METHODOLOGY**

#### **Research Design and Approach**

Pre-experimental approach with one group pre test post test design.

#### **Research Setting**

The setting of the study was the selected area of Surat district

#### Sampling Technique

A convenient sampling technique was used to select the samples.

Sample Size 30 samples are selected.

#### **Development of the Tool**

Based on the goals and literature review, the researcher created the instrument for the current study. The subject experts and guide improved and validated the tool that was developed.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Ashwini Patil and Jayalakshmi

#### Description of the Tool

#### Section A demographic characteristics

The first part of the tool consists of 10 items for obtaining information about the selected background factor such as age (in a year), husband age (in a year), education, occupation, income, married life, area of living, type of family, religion, previous knowledge about Planned Parenthood

#### Section B knowledge questionnaire

Questionnaire is to assess the knowledge of eligible couples regarding Planned Parenthood. It consist of 30 items of multiple choice question total score is 30.

### For right score – 1

For the wrong score – 0

The knowledge level has been arbitrarily divided into three categories based Adequate knowledge: - above 19 Moderate knowledge:- 09-18

Poor knowledge:- 0-8

## RESULT

Analysis and Interpretation of data are based on the objectives and Hypothesis. Analysis of the data collected using a Structured Questionnaire was based on the following heading:

Section - I frequency and percentage distribution of the socio demographic variables

- Majority of the respondents 12(12%) were in the age of 21-25 years, 9(9%) respondents were between the age of 26-30 years, 6(6%) respondents were between the age of 18-20 years, and remaining respondents 3 (3%) were between the age of 30-35 years.
- Majorityoftherespondents21(21%)wereintheageof20-25years,9(9%)respondents were between the age of 25-30 years.
- Majority 14(14%) of the respondents were primary school , 15(15%) respondents were secondary school,1(1%) respondents were higher secondary school.
- Majority 15(15%) of the respondents were labour working ,14(14%) respondents were housewife and remaining 1(1%) respondents were job.
- Majority 15(15%) of respondents were of income between 5000-10,000, 14(14%) respondents were of income less than 5000, remaining 1(1%) respondents were income between 10,000-20,000 and 0(0%) respondents were income is more than 20,000.
- Majority 18(18%) of respondents were of married life between 2-5 year 6(6%) of respondents were of married life between 6 month-1 year, 4(4%) of respondents were on married life between 6-9 year and remaining 2(2%) of respondents of married life is more than 10 year.
- Among the respondents 30(30%) were coming from rural area and 0(0%) were coming from urban.
- Distribution of eligible couples according to their family type shows that nuclear24(24%) and 6(6%).
- Majority of respondents 30(30%) were Hindu and remaining all Muslim , Christian ,Otherare0(0%).
- Majority of respondents18(18%) were not having previous information regarding planned parenthood, 6(6%)get information through the mass media, newspaper, 4(4%) get information through the family, friends, relatives and remaining 2(2%) get information through the neighbors.

#### Section – II

In the pre-test prior to the administration of information booklet data reflects that out of 30 respondents,25(90%)had inadequate knowledge,05(10%)had moderately adequate knowledge and no one had adequate knowledge on

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Ashwini Patil and Jayalakshmi

Planned Parenthood. But in the post test was observed that 05(10%) respondents had adequate knowledge, 25(90%) had moderately adequate knowledge and no one had in adequate knowledge Planned Parenthood.

The data reveal the respondent's knowledge score was high in the post-test (M = 17.16) than that in the pre-test (M = 5.93). The obtained mean difference was 11.23. The obtained 'T Value, t = 2.98 (P = 2.05) was highly significant. Therefore, the research hypothesis (H<sub>1</sub>) was accepted at 0.05 level of significance.

#### Recommendations

- 1. On a large sample, a comparative study can be conducted.
- 2. Different settings might be used for the same investigation.
- 3. By utilizing various instruments and methods, a comparative study can be conducted.

#### Section II

Table 1:Range, mean, and standard deviation of pre-test and post-test awareness score of eligible couples.

Test	Mean	s.d.	T VALUE
Pre test	5.93	172.09	2.98
Post test	17.16	395.83	2.98

Table 2: Table 2 shows that all socio-demographic variables and their the calculated chi-square value were Age(x:=2.09),Husbandage(x:=2.16),Education(x:=6.51),Occupation(x:=1.52),Income(x:=4.22), Married Life(x:=2.49), Area of living(x:=0),Type of family(x:=39.72),Religion(x:=0), previous knowledge(x:=2.92), is more than the table value P>0.05. Hence there is a significant association between pre-test knowledge scores and selected socio-demographic variables.

## ABSTRACT

In this paper, by introducing the notion of a contraction for for Kannan type set-valued mappings with set-valued domain in a metric space we examine the existence as well as uniqueness of fixed points of that map on a complete metric space. Some results are proved using the concept of asymptotic regularity. Also, we provide an elementary proof of Kannan's result for set-valued mapping defined on a complete metric space. Some examples have also been given to demonstrate the non-triviality of our results.

**Keywords**: Fixed point; Complete metric space, set-valued mapping; set-valued domain; Kannan type set-valued mapping, asymptotic regular map.

## INTRODUCTION

In 1968, Kannan [10] established one of the beautiful extension of 'Banach Contraction Principle'. The most important fact of Kannan's result was that the self mapping on a complete metric space need not be continuous. After that Subrahmanyam [18] showed that Kannan's result characterizes the metric completeness concept. Also, it is shown in [17] that Kannan's theorem is independent of the famous Banach Contraction Principle. Due to such ulities, Kannan's theorem has been extensively studied and generalized on many settings, see ([6], [11], [12]). Very recently, J.Gornicki [9] has proved some fixed point theorems for Kannan type mappings. Fixed point results for set-valued maps play an important role in non-linear analysis. Fixed point theory for multi valued operators is also an important topic for set-valued analysis. Application of set-valued mappings are found in control theory, convex optimization, differential inclusions and economics. Markin [13] and Nadler [14] introduced the fixed point results

#### Murchana Neog

for set-valued mappings. There have been enormous developments in the area of existence and uniqueness of fixed point for multi valued and set-valued mappings in various directions, see ([1], [2], [3], [5], [7], [8], [15]). In this paper, we prove some fixed point theorems for Kannan type set-valued maps defined on set in the settings of a complete metric space. Our results generalize and extend many existing results in literature, especially those of Gornicki [9].

**Preliminaries:** Now some important definitions and results are listed below that are necessary in our main results. By  $\Box$  and  $\Box_{\perp}$  we mean the set of natural numbers and non-negative real numbers respectively.

**Definition 2.1** [10] Suppose (X, d) is a metric space. The self map R on X is called a Kannan map if there exists some  $0 \le \lambda < 1$  such that

$$d(\mathbf{R}(\mathbf{x}), \mathbf{R}(\mathbf{y})) \leq \frac{\lambda}{2} [d(\mathbf{x}, \mathbf{R}(\mathbf{x})) + d(\mathbf{y}, \mathbf{R}(\mathbf{y}))] , \quad \text{for each } \mathbf{x}, \mathbf{y} \in X$$

In 1968, Kannan proved the following theorem.

**Theorem 2.2** [10] Suppose R is a Kannan map on a complete metric space (X, d). Then R has a unique fixed point  $x \in X$ .

By WB(X) we mean the collection of all non-empty closed and bounded subsets of X. If

$$H(\mathbf{E},\mathbf{F}) = \max\{\sup_{\mathbf{v}_0 \in F} D(\mathbf{v}_0,\mathbf{E}), \sup_{u_0 \in E} D(\mathbf{u}_0,\mathbf{F})\}, \quad E, F \in WB(\mathbf{X})$$

where  $D(\mathbf{u}_0, \mathbf{F}) = \inf_{\mathbf{v}_0 \in F} d(\mathbf{u}_0, \mathbf{v}_0)$ . Then (WB(X), H) forms a metric space and H is said to be Hausdorff

metric generated by d.

**Definition 2.3** Suppose  $\{A_k\}$  is a sequence of closed subsets of a metric space X and  $A_0 \subset X$  is also closed. We say that  $A_k \to A_0$  with respect to the Hausdorff metric if and only if  $\lim_{k \to \infty} H(A_k, A_0) = 0$ .

**Definition 2.4** The set  $A_0 \in WB(X)$  is called a fixed point of  $R: WB(X) \to WB(X)$  if  $A_0 = R(A_0)$ .

In the year of 1969, using the notion of Hausdorff distance between any two sets, Nadler proved the following fixed point results, which generalize the Banach Contraction Principle in set-valued directions.

**Theorem 2.5.** [14] Suppose (X, d) is a complete metric space and the map  $R: X \to WB(X)$  satisfies

 $H(\mathbf{R}(\mathbf{x}_0),\mathbf{R}(\mathbf{y}_0)) \leq \beta d(\mathbf{x}_0,\mathbf{y}_0); \quad \text{ for each } \mathbf{x}_0,\mathbf{y}_0 \in X$ 

where  $0 \le \beta < 1$ . Then R has a unique fixed point.

In the present paper, we consider the map  $R:WB(X) \to WB(X)$  instead of  $R:X \to X$  or  $R:X \to WB(X)$  to investigate the necessary changes that have to be made in the definition of a contraction map in this new setting in order to obtain similar results. Also, we investigate how the proofs of our results are influenced due to these changes.

#### Kannan Type Set-Valued Mapping With Set-Valued Domain

In this section, we discuss our main results.

**Definition 3.1.** The function  $R:WB(X) \to \square_+$  is called lower semi continuous at  $A_0 \in WB(X)$  if for any sequence  $\{A_n\} \in WB(X)$  such that  $A_n \to A_0$  implies  $R(A_0) \leq \liminf_{n \to \infty} R(A_n)$ .

**Definition 3.2.** The map  $R: WB(X) \to WB(X)$  is called continuous at  $A_0 \in WB(X)$  if  $A_n \to A_0$  implies  $R(A_n) \to R(A_0)$ .

**Theorem 3.3.** Let (WB(X), H) be a complete metric space and  $R: WB(X) \rightarrow WB(X)$  a set-valued map such that there exists  $\beta < \frac{1}{2}$  satisfying

#### Murchana Neog

 $H(\mathbf{R}(\mathbf{E}_{0}), \mathbf{R}(\mathbf{F}_{0})) \leq \beta[\mathbf{H}(\mathbf{E}_{0}, \mathbf{R}(\mathbf{E}_{0})) + \mathbf{H}(\mathbf{F}_{0}, \mathbf{R}(\mathbf{F}_{0}))], \text{ for each } \mathbf{E}_{0}, F_{0} \in WB(\mathbf{X}).$ (3.1)

Then R has a unique fixed point  $P_0 \in WB(X)$  and for any  $A_0 \in WB(X)$ , the sequence of iterates  $\{R^n(A_0)\}$ 

converges to 
$$P_0$$
 and  $H(R^{n+1}(A_0), P_0) \le \beta \cdot \left(\frac{\beta}{1-\beta}\right)^n H(A_0, R(A_0)), n = 0, 1, 2...$ 

Before proving the theorem, we prove the following Lemma.

Lemma 3.4. Suppose (WB(X), H) is a complete metric space and  $R: WB(X) \to WB(X)$  a set-valued map such that there exists  $\beta < \frac{1}{2}$  satisfying 3.1. If for any  $E_0 \in WB(X)$ , there exists  $U_0 \in WB(X)$  such that  $H(U_0, R(U_0)) \le a. H(E_0, R(E_0))$  and  $H(E_0, U_0) \le b. H(E_0, R(E_0))$ , where

 $a, b \in \Box$  and  $a \in [0,1), b > 0$ . Then R has at least one fixed point.

**Proof:** Suppose  $A_0 \in WB(X)$ . Consider a sequence  $\{A_n\} \in WB(X)$  satisfies

 $H(\mathbf{R}(\mathbf{A}_{n+1}),\mathbf{A}_{n+1}) \le a.H(\mathbf{R}(\mathbf{A}_n),\mathbf{A}_n),$ 

and  $H(A_{n+1}, A_n) \le b.H(A_n, R(A_n)), n = 0, 1, 2...$ 

Now  $H(A_{n+1}, A_n) \leq b.H(A_n, R(A_n))$ 

$$\leq b.a.H(A_{n-1}, R(A_{n-1}))$$

• • •

 $\leq b.a^n \cdot H(A_0, \mathbf{R}(A_0))$ 

Thus for any positive integer  $\,m_{\,\text{\! ,}}$  we get

$$\begin{split} H(\mathbf{A}_{n},\mathbf{A}_{n+m}) &\leq H(\mathbf{A}_{n},\mathbf{A}_{n+1}) + H(\mathbf{A}_{n+1},\mathbf{A}_{n+2}) + \ldots + H(\mathbf{A}_{n+m-1},\mathbf{A}_{n+m}) \\ &\leq b.a^{n}H(\mathbf{A}_{0},\mathbf{R}(\mathbf{A}_{0})) + b.a^{n+1}H(\mathbf{A}_{0},\mathbf{R}(\mathbf{A}_{0})) + \ldots + b.a^{n+m-1}H(\mathbf{A}_{0},\mathbf{R}(\mathbf{A}_{0})) \\ &= a^{n}(1+a+a^{2}+\ldots+a^{m-1}).b.H(\mathbf{A}_{0},\mathbf{R}(\mathbf{A}_{0})) \\ &\leq \frac{a^{n}(1-a^{m})}{1-a}.b.H(\mathbf{A}_{0},\mathbf{R}(\mathbf{A}_{0})) \ . \end{split}$$

Since  $a \in [0,1)$ , we have  $a^n \to 0$  as  $n \to \infty$ . Thus  $\{A_n\}$  is a Cauchy sequence in WB(X). As (WB(X), H) is complete, we get  $\lim_{n \to \infty} A_n = P_0$ , for some  $P_0 \in WB(X)$ .

Now, 
$$H(R(P_0), P_0) \le H(R(P_0), R(A_n)) + H(R(A_n), A_n) + H(A_n, P_0)$$
  
 $\le \beta [H(P_0, R(P_0)) + H(A_n, R(A_n))] + H(R(A_n), A_n) + H(A_n, P_0)$   
 $\Rightarrow H(R(P_0), P_0) \le \frac{\beta + 1}{1 - \beta} H(R(A_n), A_n) + \frac{1}{1 - \beta} H(A_n, P_0)$   
 $\le \frac{\beta + 1}{1 - \beta} a^n . H(R(A_0), A_0) + \frac{1}{1 - \beta} H(A_n, P_0)$ .  
Taking  $n \to \infty$ , we get  $H(R(P_0), P_0) = 0$ ; i.e.,  $P_0 = R(P_0)$ .

Now we proof the **Theorem 3.3**. **Proof.** For any  $E_0 \in WB(X)$ , let  $U_0 = R(E_0)$ . Then,  $H(U_0, R(U_0)) = H(R(E_0), R(U_0))$ 

International Bimonthly (Print) – Open Access Vol.14 / Issue 80 / Oct / 2023 ISSN: 0976 - 0997

#### Murchana Neog

$$\leq \beta [H(E_0, R(E_0)) + H(U_0, R(U_0))]$$
  
$$\Rightarrow H(U_0, R(U_0)) \leq \frac{\beta}{1-\beta} H(E_0, R(E_0)),$$
  
$$\beta = 1 \qquad H(E_0, H(E_0)) = H(E_0)$$

-----

By assumption  $\frac{\mu}{1-\beta} < 1$  and  $H(E_0, U_0) = H(E_0, R(E_0))$ . Now for any  $A_0 \in WB(X)$ , define a sequence

 $\{A_n\}$  where  $A_{n+1} = R(A_n)$ , for  $n = 0, 1, 2, \dots$  Then we have  $A_n = R^n(A_0)$ . Therefore by Lemma 3.4. we have  $\{\mathbf{A}_n\}$  converges to  $P_0\in W\!B(\mathbf{X})$  and  $P_0=R(\mathbf{P}_0)$  .

Suppose  $Q_0$  is another fixed point of R. Then

 $H(P_0, Q_0) = H(R(P_0), R(Q_0))$  $\leq \beta[H(P_0, R(P_0)) + H(Q_0, R(Q_0))]$ =0.

Therefore  $P_0 = Q_0$ . Hence R has a unique fixed point  $P_0$ . Since  $A_0 \in WB(X)$  was arbitrary, this gives that for each  $A_0 \in WB(X)$ , the sequence  $\{R^n A_0\}$  converges to the unique fixed point  $P_0$ . Again for each  $A_0 \in WB(X)$ ,

$$H(\mathbf{R}^{n+1}(\mathbf{A}_0), \mathbf{R}^n(\mathbf{A}_0)) \le \beta [H(\mathbf{R}^n(\mathbf{A}_0), \mathbf{R}^{n+1}(\mathbf{A}_0)) + H(\mathbf{R}^{n-1}(\mathbf{A}_0), \mathbf{R}^n(\mathbf{A}_0))]$$
  
$$\Rightarrow H(\mathbf{R}^{n+1}(\mathbf{A}_0), \mathbf{R}^n(\mathbf{A}_0)) \le \frac{\beta}{1-\beta} H(\mathbf{R}^{n-1}(\mathbf{A}_0), \mathbf{R}^n(\mathbf{A}_0)).$$

Now,

Now, 
$$H(\mathbb{R}^{n+1}(\mathbb{A}_{0}),\mathbb{P}_{0}) = H(\mathbb{R}^{n+1}(\mathbb{A}_{0}),\mathbb{R}(\mathbb{P}_{0}))$$
  
 $\leq \beta[H(\mathbb{R}^{n}(\mathbb{A}_{0}),\mathbb{R}^{n+1}(\mathbb{A}_{0})) + H(\mathbb{P}_{0},\mathbb{R}(\mathbb{P}_{0}))]$   
 $= \beta[H(\mathbb{R}^{n}(\mathbb{A}_{0}),\mathbb{R}^{n+1}(\mathbb{A}_{0}))]$   
 $\leq \beta \left(\frac{\beta}{1-\beta}\right)^{n} H(\mathbb{A}_{0},\mathbb{R}(\mathbb{A}_{0})), \quad n = 0,1,2,...$ 

#### Asymptotic Regularity

In this section, we use the concept of asymptotic regularity and establish its connection with fixed points.

**Definition 4.1.** Suppose (WB(X), H) is a metric space. A function  $R: WB(X) \rightarrow WB(X)$  is called asymptotic regular if  $\lim_{n \to \infty} H(R^{n+1}(B), R^n(B)) = 0$ , for all  $B \in WB(X)$ .

**Theorem 4.2.** Suppose (WB(X), H) is a complete metric space and  $R: WB(X) \rightarrow WB(X)$  is an asymptotically regular mapping such that there exists  $\beta < 1$  satisfying equation 3.1. Then R has a unique fixed point.

**Proof:** Let  $B_0 \in WB(X)$ . Define a sequence  $\{B_n\}$  such that  $B_{n+1} = R(B_n)$ , for n = 0, 1, 2, ... Then we have  $B_n = \mathbf{R}^n(\mathbf{B}_0)$  , for all  $\mathbf{n} \in \Box$  . As R is asymptotic regular, for  $m, n \in \Box$  such that m > n we get,

$$H(\mathbf{B}_n, \mathbf{B}_m) = H(\mathbf{R}^n(\mathbf{B}_0), \mathbf{R}^m(\mathbf{B}_0))$$

$$\leq \beta[H(\mathbf{R}^{n-1}(\mathbf{B}_{0}),\mathbf{R}^{n}(\mathbf{B}_{0})) + H(\mathbf{R}^{m-1}(\mathbf{B}_{0}),\mathbf{R}^{m}(\mathbf{B}_{0}))]$$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Murchana Neog

Which converges to zero if  $m, n \to \infty$ . This gives that  $\{B_n\}$  is a Cauchy sequence. As (WB(X), H) is complete, we get  $\lim_{n \to \infty} B_n = S_0$ , for some  $S_0 \in WB(X)$ .

Now, 
$$H(S_0, R(S_0)) \le H(S_0, R^n(B_0)) + H(R^n(B_0), R(S_0))$$
  
 $\le H(S_0, R^n(B_0)) + \beta [H(R^{n-1}(B_0), R^n(B_0)) + H(S_0, R(S_0))]$   
 $\Rightarrow (1 - \beta)H(S_0, R(S_0)) \le H(S_0, R^n(B_0)) + \beta H(R^{n-1}(B_0), R^n(B_0))$   
 $\Rightarrow H(S_0, R(S_0)) \le \frac{1}{1 - \beta} H(S_0, R^n(B_0)) + \frac{\beta}{1 - \beta} H(R^{n-1}(B_0), R^n(B_0))$ 

which is converge to zero if  $n \to \infty$ . Hence  $S_0 = R(S_0)$ . It is obvious that  $S_0$  is unique. Since  $B_0 \in WB(X)$  was arbitrary, this gives that for each  $B_0 \in WB(X)$ , the sequence  $\{R^n(B_0)\}$  converges to the unique fixed point  $S_0$ . **Remark 4.3.** A Kannan type mapping  $R: WB(X) \to WB(X)$  satisfies the following property  $H(R(E_0), R(F_0)) < H(E_0, R(E_0)) + H(F_0, R(F_0))$ , for all  $E_0, F_0 \in WB(X)$  with  $E_0 \neq F_0$ . (4.1)

If R is asymptotically regular then it's not necessary that R contain a fixed point This can be demonstrated with the help of following example.

**Example 4.4.** Suppose  $X = [0,1], k \ge 2$ . The metric  $d: X \times X \rightarrow \Box_+$  is defined by

$$d(\mathbf{p}, \mathbf{q}) = \begin{cases} 0, & \text{if } \mathbf{p} = \mathbf{q} \\ \frac{1}{k^3}, & \text{if } p, q \in [0, \frac{1}{2}], \text{ either } \mathbf{p}, q \in \Box \text{ or } \mathbf{p}, q \in \Box \\ \frac{1}{k}, & \text{if } p, q \in [0, \frac{1}{2}], \text{ } \mathbf{p} \in \Box, q \in \Box \text{ '} \\ \frac{1}{k^2}, & \text{otherwise} \end{cases}$$

Moreover, the Hausdroff metric  $H: WB(\mathbf{X}) \rightarrow \Box_+$  is defined as

$$H(P,Q) = \begin{cases} \frac{1}{k^3}, & \text{if } P,Q \subseteq [0,\frac{1}{2}] \\ \frac{1}{k^2}, & \text{if } P \text{ or } Q \text{ (or both)} \not \subseteq [0,\frac{1}{2}] \\ 0, & \text{if } P = Q \end{cases}$$

The set-valued mapping  $R: WB(X) \rightarrow WB(X)$  is defined as

$$\mathbf{R}(\mathbf{P}) = \begin{cases} [0, \frac{2}{3}], & \text{if } P \subseteq [0, \frac{1}{2}] \\ [0, \frac{1}{3}], & \text{if } P \not\subseteq [0, \frac{1}{2}] \end{cases}$$

Now for all  $P, Q \in WB(X)$ , consider the cases given below:

(i) If 
$$P, Q \subseteq [0, \frac{1}{2}]$$
, then we have  $H(R(P), R(Q)) = 0$ .

(ii) If  $P \subseteq [0, \frac{1}{2}]$  and  $Q \not\subseteq [0, \frac{1}{2}]$ , we have  $H(R(P), R(Q)) = \frac{1}{k}$   $< \frac{2}{k}$   $= \frac{1}{k} + \frac{1}{k}$  = H(P, R(P)) + H(Q, R(Q)).(iii) If  $P, Q \not\subseteq [0, \frac{1}{2}]$ , we have H(R(P), R(Q)) = 0.

Hence R satisfies the equation 4.1 for all  $P \in WB(X)$ . Also R is asymptotically regular, but no fixed point is contain in R.

## CONCLUSION

In this paper, using the concept of asymptotic regularity, we have proved some fixed point results for Kannan type set-valued mappings with set-valued domain. Our results unify and extend some existing results in literature. The proofs also give us schemes how to find the desired fixed point of such maps. Similar generalization of well known fixed point results for the map of the type  $R: WB(X) \rightarrow WB(X)$  would be an interesting topic for the future study.

### ABSTRACT

In this paper it is proved that for odd  $k \ge 3$ ,  $C_k || K_m \times K_n$ , whenever the obvious necessary conditions are satisfied except few values of m and n.

Keywords: Factorization, Tensor Product, Odd cycles, Decomposition, Wreath product.

## INTRODUCTION

All graphs considered here are simple and finite. Let  $C_k$  (resp.  $P_{k+1}$ ), denote the cycle (resp. path) of length k. If the edge set of G can be partitioned into edge disjoint cycles of length k, then we write  $C_k|G$ , and consequently we say that G admits a  $C_k$ -decomposition. If each 2-factor of a 2-factorization of G contain only cycles of length k, then we say that G has a  $C_k$ -factorization and in notation, we write  $C_k|G$ . We write  $G = H_1 \oplus H_2 \oplus \cdots \oplus H_{k_i}$  if  $H_1, H_2, \ldots, H_k$  are edge-disjoint subgraphs of G and  $E(G) = E(H_1) \cup E(H_2) \cup \ldots \cup E(H_k)$ .

For two graphs *G* and *H* their wreath product G \* H has vertex set  $V(G) \times V(H)$  in which  $(g_1, h_1)$  and  $(g_2, h_2)$  are adjacent whenever  $g_1g_2 \in E(G)$  or  $g_1 = g_2$  and  $h_1h_2 \in E(H)$ . Similarly,  $G \times H$ , the *tensor product* of the graph *G* and *H* has vertex set  $V(G) \times V(H)$  in which two vertices  $(g_1, h_1)$  and  $(g_2, h_2)$  are adjacent whenever  $g_1g_2 \in E(G)$  and  $h_1h_2 \in E(H)$ , see Figure 1. It is clear that  $(K_m * \overline{K}_n) - nK_m \cong K_m \times K_n$ . Clearly, the tensor product is commutative and distributive over edge-disjoint union of graphs, that is, if  $G = H_1 \oplus H_2 \oplus \cdots \oplus H_k$ , then  $G \times H = (H_1 \times H) \oplus (H_2 \times H) \oplus \cdots \oplus (H_k \times H)$ .

#### Sampath Kumar et al.,

Let *G* and *H* be simple graphswith vertex sets  $V(G) = \{x_0, x_1, ..., x_{m-1}\}$  and  $V(H) = \{y_0, y_1, ..., y_{n-1}\}$ . Then  $V(G \times H) = V(G) \times V(H)$  and for our convenience, we write  $V(G) \times V(H) = \bigcup_{i=0}^{m-1} X_i$ , where  $X_i$  stands for  $\{x_i\} \times V(H)$ . Further, we shall denote the vertices of  $X_i, 0 \le i \le m-1$ , by  $\{x_i^j \mid 0 \le j \le n-1\}$ , where  $x_i^j$  stands for the vertex  $(x_i, y_j)$ . We shall call  $X_i$ , the *i*<sup>th</sup> layer of  $G \times H$ . As the tensor product is commutative throughout of this paper we assume that *m* is odd.

Let *k* be a positive integer and let *L* be a subset of  $\{1, 2, ..., \lfloor \frac{k}{2} \rfloor\}$ . A *circulantX* = *X*(*k*; *L*) is a graph with vertex set  $V(X) = \{u_0, u_1, ..., u_{k-1}\}$  and edge set  $E(X) = \{u_i u_{i+1} | i \in \mathbb{Z}_k, l \in L\}$ . The edge  $u_i u_{i+1}$ , where  $l \in L$ , is said to be of distance *l*, and *L* is called the edge length set of the circulant *X*.

A k –regular graph G is called *Hamilton cycle decomposable* if G is decomposable into  $\frac{k}{2}$  Hamilton cycles when k is even and into  $\frac{k-1}{2}$  Hamilton cycles together with a perfect matching when k is odd. The problem of finding a  $C_k$ -decomposition of  $K_{2n+1}$  or  $K_{2n} - I$ , where I is a one factor of  $K_{2n}$  is completely settled by Alspach, Gavlas and Sajna in two different papers, see [2,19]. The *Oberwolf ach problem* is equivalent to find a 2-factorization of  $K_{2n+1}$ . The *Oberwolf ach problem* is still open.

A generalization to the above decomposition problem is to find a  $C_k$ -decomposition of  $K_m * \overline{K_n}$ . As the graph  $K_m \times K_n (\cong (K_m * \overline{K_n}) - nK_m)$  is a proper regular spanning subgraph of  $K_m * \overline{K_n}$ , it is natural to think about the  $C_k$ -factorization problem of it. The cycle decomposition/factorization problem in product graphs are dealt in [7,9,10,13-16,18,20,21]. For even  $k \ge 4$ ,  $C_k || (K_m \times K_n)$  is considered in [16]. In this paper we have proved that, for any odd integer  $k \ge 3$ , the necessary conditions for the existence of a  $C_k$ -factorization of  $K_m \times K_n$  are sufficient with some exceptions on k and n. We list below some of the known results for our future reference.

**Theorem 1.1** [3] For odd *m*,  $K_m$  has a 2-factorization  $F = \left\{F_1, F_2, \dots, F_{\frac{m-1}{2}}\right\}$  such that each  $F_i, 1 \le i \le \frac{m-1}{2}$ , consists of cycles of length 3 or 5 if and only if  $m \ne 7$  or 11. **Theorem 1.2** [3] For any odd integer  $t \ge 3$ , if  $m \equiv t \pmod{2t}$ , then  $C_t || K_m$ . **Theorem 1.3** [14] For  $m \ne 2$  and  $k \ge 2, C_{2k+1} || C_{2k+1} \times K_m$ . **Theorem 1.4** [14] For any odd integer  $k \ge 3, C_k || C_m \times K_k$ . **Theorem 1.5** [14] If *n* is a positive integer,  $n \ne 2, 6$ , then the graph  $C_3 \ast K_n$  with partite sets  $U = \{u_1, u_2, \dots, u_n\}, V = \{u_n, u_n, v_n\}, V = \{u_1, u_2, \dots, u_n\}, V = \{u_1, u_2, \dots, u_$ 

 $\{v_1, v_2, \dots, v_n\}$ , and  $W = \{w_1, w_2, \dots, w_n\}$  has a  $C_3$ -factorization in which  $\{(u_i, v_i, w_i) | 1 \le i \le n\}$  is a  $C_3$ -factor.

**Theorem 1.6** [13] For  $k \ge 3$  and  $m \ge 3$ ,  $K_m * \overline{K}_n$  has a  $C_k$ -factorization if and only if k divides mn and (m-1)n is even, k is even if m = 2,  $(m, n, k) \ne (3, 2, 3)$ , (3, 6, 3), (6, 2, 3), (2, 6, 6).  $\Box$ 

**Theorem 1.7** [17] Let  $k \ge 1$ , and  $m \ge 3$ . If  $a_1, a_2, ..., a_k$  are positive integers which are divisible by m and  $mn = \sum_i a_i$ , then  $F||C_m * \overline{K}_n$ , where F consists of k cycles, namely,  $C_{a_1}, C_{a_2}, ..., C_{a_k}$ , except in the cases: (1) n = 2 and m odd, (2) n = 6, m = 3 and  $(a_1, a_2, ..., a_k) = (3, 3, 3, 3, 3)$ , in which case the contrary is true.

**Theorem 1.9** [18] If  $C_k || G$  and n | m, then  $C_{kn} || G \times K_m$ , where  $m \neq 2 \pmod{4}$  when k is odd.

**Theorem 1.10** [8] There exists a  $C_3$ -factorization of  $K_m \times K_n$  if and only if  $m, n \ge 3, mn \equiv 0 \pmod{3}$ , and either m or n is odd except when (m, n) = (3, 6) or (6, 3).

**Theorem 1.11** [16] For  $m, n \ge 3$  and even integer  $k \ge 4$ ,  $C_k || K_n \times K_m$  if and only if (1) either *m* or *n* is odd, (2) k |mn and (3)  $k \le mn$  except possibly (m, k) = (3, 4).

#### Odd Cycle Factorization of $K_m \times K_n$

In this section we discuss about the  $C_k$ -factorization of  $K_m \times K_{n'}$  when k is odd.

**Theorem 2.1** For  $n \ge 3$  and odd integer  $k \ge 3$ ,  $C_k || (C_3 \times K_n)$  if and only if k | 3n, except possibly  $n \in \{2k, 6k\}$ , or if 3 | k and  $n = \frac{2k}{3}$ .

#### Sampath Kumar et al.,

**Proof.** The case k = 3 follows from Theorem 1.10. Hence, we assume that  $k \ge 5$ . The proof of the necessity is obvious. We prove the sufficiency in two cases.

#### **Case 1:** $n \neq 0 \pmod{k}$

As  $n \neq 0 \pmod{k}$  and k|3n implies 3|k; let k = 3t. By the necessary condition, we have 3t|3n and hence t|n. Let n = st. Since  $k \ge 5$ , we have t > 1. From the graph  $C_3 \times K_n$  we obtain a new graph  $C_3 \times \overline{K}_s$  as follows: let the partite sets of the tripartite graph  $C_3 \times K_n$  be  $X_i = \bigcup_{j=1}^s X_{ij}$ ,  $1 \le i \le 3$ , where  $X_{ij} = \left\{x_i^{(j-1)t+2}, x_i^{(j-1)t+2}, \dots, x_i^{jt}\right\}$ , we obtain the graph  $C_3 \times \overline{K}_s$  by identifying the set of vertices  $X_{ij}$  of the graph  $C_3 \times K_n$  with a vertex  $v_i^j$  and joining two vertices by an edge if and only if the corresponding sets of vertices in  $C_3 \times K_n$  induce a complete bipartite subgraph  $K_{t,t}$  or  $K_{t,t} - F$ , where F is a 1-factor of  $K_{t,t}$ . The partite sets of the graph  $C_3 \ast \overline{K}_s$  are  $\{v_1^1, v_1^2, \dots, v_1^s\}, \{v_2^1, v_2^2, \dots, v_2^s\}$  and  $\{v_3^1, v_3^2, \dots, v_3^s\}$ . If 3|k, then by our assumption  $n \neq \frac{2k}{3}$ , and so  $s \neq 2$  (if s = 2, then  $n = \frac{2k}{3}$ ). Now for  $s \neq 2,6$ , the graph  $C_3 \times \overline{K}_s$  admits a  $C_3$ -factorization F in which  $F' = \{(v_1^j, v_2^j, v_3^j)|1 \le j \le s\}$  is a  $C_3$ -factor, by Theorem 1.5. The subgraph of  $C_3 \times K_n$  key theorem 1.9 (while applying Theorem 1.9, we consider  $G = C_3, n = m = t$  and further t is odd as k is odd). Similarly, consider the subgraphs of  $C_3 \times K_n$  corresponding to the union of s vertex disjoint copies of the graph  $C_3 \ast \overline{K}_t$ , by Theorem 1.8.

#### **Case 2**: $n \equiv 0 \pmod{k}$ .

Let n = lk for some  $l \in \mathbb{N}$ . If l = 1, then n = k and n = k and  $K_n = K_t = C_k \oplus C_k \oplus ... \oplus C_k$ . Now  $K_n \times K_m = K_k \times K_m = (C_k \times K_m) \oplus (C_k \times K_m) \oplus ... \oplus (C_k \times K_m)$ . By theorem 1.3,  $C_k || C_k \times K_m$  and hence  $C_k || K_m \times K_n$ . Hence we assume that l > 1. As in the previous case, let the partite sets of the tripartite graph  $C_3 \times K_n$  be  $X_i = \bigcup_{j=1}^l \{x_i^{(j-1)k+1}, x_i^{(j-1)k+2}, ..., x_i^{jk}\}, 1 \le i \le 3$ ; from the graph  $C_3 \times K_n$  we get a new graph isomorphic to  $C_3 * \overline{K}_l$  with partite sets  $\{v_1^1, v_1^2, ..., v_l^1\}, \{v_2^1, v_2^2, ..., v_l^2\}$  and  $\{v_3^1, v_3^2, ..., v_3^l\}$ . For  $l \ne 2, 6$ , the graph  $C_3 \times K_n$  corresponding to the  $C_3$ -factor F' of  $C_3 \times \overline{K}_l$  is the union of l vertex disjoint copies of the graph  $C_3 \times K_k$  and  $C_k || C_3 \times K_k$ , by Theorem 1.4. Similarly, consider the subgraphs of  $C_3 \times K_n$  corresponding to each of the  $C_3$ -factors of the graph F - F'; each of these subgraphs of  $C_3 \times K_n$  is isomorphic to the union of l vertex disjoint copies of the graph  $C_3 \times \overline{K}_k$  and  $C_k || C_3 \times \overline{K}_k$ , by

#### Theorem 1.6.

This completes the proof of the theorem.

In [3], it is proved that for an odd prime p and an odd integer s with  $3 \le s \le p$ ,  $C_p || C_s * \overline{K}_p$ . Here, we prove that for odd integer s,k with  $3 \le s \le k$ ,  $C_k || C_s * \overline{K}_k$ .

We need the following theorem in the proof of Lemma 2.1.

Theorem 2.2 [5] Any connected circulant of degree 4 can be decomposed into Hamilton cycles.

**Lemma 2.1** For any odd integer  $k \ge 7$ , the circulant graph  $X\left(k; \left\{3, 4, \dots, \frac{k-1}{2}\right\}\right)$  has a Hamilton cycle decomposition.

**Proof.** If  $k \equiv 1 \pmod{4}$ , the set  $S = \left\{3, 4, \dots, \frac{k-1}{2}\right\}$  contains an even number of elements. We pair the elements of *S* as  $\{3, 4\}, \{5, 6\}, \dots, \left\{\frac{k-1}{2} - 1, \frac{k-1}{2}\right\}$ . For any such pair  $\{l_1, l_2\}$ , the graph  $H = X(k; \{l_1, l_2\})$  is connected and therefore by Theorem 2.2, *H* is Hamilton cycle decomposable. Similarly, if  $k \equiv 3 \pmod{4}$ , the set  $S = \left\{3, 4, \dots, \frac{k-1}{2}\right\}$  contains an odd number of elements; now we pair the elements of  $S \setminus \left\{\frac{k-1}{2}\right\}$  as  $\{3, 4\}, \{5, 6\}, \dots, \left\{\frac{k-1}{2} - 2, \frac{k-1}{2} - 1\right\}$ . For each of these pairs  $\{l_1, l_2\}$  the graph  $H = X(k; \{l_1, l_2\})$  is connected and therefore by Theorem 2.2, *H* is Hamilton cycle decomposable. It is easy to check that the graph  $X\left(k; \left\{\frac{k-1}{2}\right\}\right)$  is a Hamilton cycle of the circulant graph  $X\left(k; \left\{3, 4, \dots, \frac{k-1}{2}\right\}\right)$ . This completes the proof of the lemma.

In the following Lemma 2.2,  $\vec{K}_k$  denotes a tournament on k vertices.

#### Sampath Kumar et al.,

**Definition**. [3] Consider the graph  $C_3 * \overline{K}_k$ , where  $k \ge s \ge 3$ , and both s and k are odd. Let  $H = u_{j_1}u_{j_2} \dots u_{j_k}u_{j_1}$  be a directed Hamilton cycle of  $\vec{K_k}$ . The *i*-projection of *H* onto  $u_i^{j_1}u_{i+1}^{j_2}u_{i+2}^{j_3}\dots u_i^{j_{s+1}}u_i^{j_{s+1}}u_i^{j_{s+3}}\dots u_{i+1}^{j_{k+1}}u_i^{j_1}$ , where the subscript is reduced modulo *s*. Hamilton  $C_s * \vec{K}_k$  is the *k*-cycle We use the following two lemmas in the proof of Theorem 2.3.

1,2,..., s, yield a  $C_k$ -factor of  $C_s * \overline{K}_k$ . Furthermore, if the edge  $u_i^j u_{i+1}^l$  appears in one of the k-cycles in the 2-factor, then the edge  $u_t^j u_{t+1}^l$  for t = 1, 2, ..., s appears in the 2-factor.

**Lemma 2.3** [3] Let s and k be odd integers with  $k \ge 5$  and  $s \ge 3$ . Then  $C_s * \overline{K}_k = \left(C_s \times X\left(k; \left\{3, 4, \dots, \frac{k-1}{2}\right\}\right)\right) \oplus \left(C_s \times X\left(k; \left\{3, 4, \dots, \frac{k-1}{2}\right\}\right)\right)$  $X\{k; \{1,2\}\} \oplus \{u_i^j u_{i+1}^j: i = 1, 2, \dots, s \text{ and } 1 \le j \le k\}. \square$ 

The following Theorem 2.3 is proved in [3] when k is a prime. Also, it is stated in [3] without proof that the theorem is true even if we assume k is odd. However, with the help of Lemma 2.1, it is possible to validate the statement made in [3]. Hence for sake of completion we supply the proof of the following theorem.

#### **Theorem 2.3** If both s and k are odd integers such that $k \ge s \ge 3$ , then $C_k || C_s * \overline{K}_k$ .

**Proof.** As in the statement of Lemma 2.3,  $C_s * \overline{K}_k$  is the edge disjoint union of two graphs, one of which is  $C_5 \times C_s$  $X\left(k;\left\{3,4,\ldots,\frac{k-1}{2}\right\}\right)$ ; this graph has a Hamilton cycle decomposition for  $K \ge 7$ . For k = 5, there is only one graph in the edge disjoint union of Lemma 2.3, namely,  $(C_s \times X(k; \{1,2\})) \oplus \{u_i^j u_{i+1}^j: 1 \le i \le s \text{ and } 1 \le j \le 5\}$  which will be treated shortly. When k = 3, s = 3 must hold and the result is true in this case by simply considering a Kirkman triple system on nine elements, see [12].

For  $k \ge 7$  consider a Hamilton cycle decomposition of  $X\left(k; \left\{3, 4, \dots, \frac{k-1}{2}\right\}\right)$ , see Lemma 2.1. The rest of the proof is as in [3]. For a given Hamilton cycle H, assign an arbitrary orientation producing a directed Hamilton cycle H<sub>1</sub>. The iprojection of  $H_1$  onto  $C_s * \overline{K}_k$  for i = 1, 2, ..., s yields a 2-factor of  $C_s * \overline{K}_k$  of the desired kind, by Lemma 2.2. Reversing the orientation of  $H_1$  yields another directed Hamilton cycle  $H_2$ . Again, the *i*-projections of  $H_2$  onto  $C_s * \overline{K}_k$  produces an appropriate 2-factor. Doing this for each Hamilton cycle in the Hamilton cycle decomposition of  $C_5 \times X\left(k; \left\{3, 4, \dots, \frac{k-1}{2}\right\}\right).$ 

Let G denote the graph  $(C_s \times X(k; \{1,2\})) \oplus \{u_i^j u_{i+1}^j : i = 1, 2, \dots, sand \ 1 \le j \le k\}$ , where  $k \ge 5$ . It remains to find a  $C_k$ -factorization of G. As in the notation of [3], let the vertices of G have the coordinates  $(i, j), 0 \le i \le s - 1$  and  $0 \le j \le k - 1$ . Define the following sets of edges for each  $i, 0 \le i < s$ :

 $k - 1. Define the following sets of edges for each <math>i, 0 \le i < s$ :  $A_i = \begin{cases} (i,j)(i+1,j-1) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \\ (i,j)(i+1,j+1) & if \ s \le j \le k-1 \text{ and } j \text{ is odd}, \end{cases}$   $B_i = \begin{cases} (i,j-1)(i+1,j) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \\ (i,j+1)(i+1,j) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \end{cases}$   $D_i = \begin{cases} (i,j)(i+1,j) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \\ (i,j)(i+1,j) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \end{cases}$   $E_i = \begin{cases} (i,j+1)(i+1,j-1) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \\ (i,j+1)(i+1,j-1) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \end{cases}$   $F_i = \begin{cases} (i,j-1)(i+1,j+1) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \\ (i,j+2)(i+1,j) & if \ s \le j \le k-1 \text{ and } j \text{ is odd} \end{cases}$   $F_i = \begin{cases} (i,j-1)(i+1,j+1) & if \ 0 \le j < s \text{ or } s \le j \le k-1 \text{ and } j \text{ is odd} \\ (i,j+2)(i+1,j) & if \ s \le j \le k-1 \text{ and } j \text{ is odd} \end{cases}$ The sets of edges  $A_i, B_i, D_i, E_i$  and  $F_i$  for i = 0, 1, ..., s - 1 are pairwise disjoint and partition the edges of G. Now let  $R_1 = A_0 \cup D_1 \cup E_2 \cup D_3 \cup E_4 \cup \ldots \cup D_{s-2} \cup E_{s-1},$  $\begin{array}{l} R_2 = D_0 \cup E_1 \cup D_2 \cup E_3 \cup D_4 \cup \ldots \cup D_{s-3} \cup E_{s-2} \cup A_{s-1}, \\ R_3 = E_0 \cup A_1 \cup A_2 \cup \ldots \cup A_{s-3} \cup A_{s-2} \cup D_{s-1}, \end{array}$ 

$$= B_0 \cup B_1 \cup \dots \cup B_{s-1} \cup \dots \cup B_{s-1}$$

$$R_5 = F_0 \cup F_1 \cup \dots \cup F_{s-1}.$$

Each of the sub graphs  $R_1, R_2, R_3, R_4$  and  $R_5$  is a  $C_k$ -factor. This completes the proof of the theorem.

#### Sampath Kumar et al.,

**Remark 2.1** [14] For  $k \ge 2$  consider the graph  $C_{2k+1}$  with  $V(C_{2k+1}) = \{u_1, u_2, \dots, u_{2k+1}\}$  and  $K_m, m \ge 3$  with  $V(K_m) = \{v_1, v_2, \dots, v_m\}$ . Let  $V(C_{2k+1} * \overline{K}_m) = \bigcup_{i=1}^{2k+1} \mathfrak{U}_i$  where  $\mathfrak{U}_i = \{u_i^1, u_i^2, \dots, u_i^m\}$ ,  $1 \le i \le 2k + 1$ . We know that  $C_{2k+1} || (C_{2k+1} * \overline{K}_m)$ , by Theorem 1.7. By suitably relabelling the vertices, if necessary, we get another  $C_{2k+1}$ -factorization of  $C_{2k+1} * \overline{K}_m$  in which  $F' = \{(u_1^j, u_2^j, \dots, u_{2k+1}^j) | 1 \le j \le m\}$  is a  $C_{2k+1}$ -factor.

**Theorem 2.4** For odd integer  $n \ge 3$  and odd prime p with  $k \ge p$ ,  $C_k || C_p \times K_n$  if and only if k | np except possibly (i) n = 2k, or (ii)  $n = \frac{2k}{p}$  whenever  $n \ne 0 \pmod{k}$ .

Proof. The proof of the necessity is obvious. We prove the sufficiency in two cases.

#### **Case 1**: $n \not\equiv 0 \pmod{k}$ .

As  $n \neq 0 \pmod{k}$  and k | pn implies p | k; let k = tp for some positive integer t. As k | pn, t | n. Let n = st. If t = 1, then k = p and in this case the result follows by Theorem 1.3 and hence we assume that t > 1. From the graph  $C_p \times K_n$  we obtain a new graph isomorphic to  $C_p * \overline{K}_s$  as follows: Let  $V(C_p) = \{x_1, x_2, x_3, \dots, x_p\}$  and let the partite sets of the graph  $C_p \times K_n$  be  $X_i = \bigcup_{j=1}^s X_{ij}, 1 \le i \le p$ , where  $X_{ij} = \{x_{i,(j-1)t+1}, x_{i,(j-1)t+2}, \dots, x_{i,jt}\}$ . For each  $i, 1 \le i \le p$  and  $j, 1 \le j \le s$ , identify the set of vertices  $X_{ij}$  in  $C_p \times K_n$  with a vertex  $v_{i,j}$  and joining two vertices  $v_{i,j}$  and  $v_{k,l}$  by an edge if and only if  $\langle X_{ij} \cup X_{kl} \rangle$  in  $C_p \times K_n$  induce a complete bipartite subgraph  $K_{t,t}$  or  $K_{t,t} - F$ , where F is a 1-factor of  $K_{t,t}$ . The partite sets of thegraph  $C_p * \overline{K}_s$  are  $\{v_{1,1}, v_{1,2}, \dots, v_{1,s}\}, \{v_{2,1}, v_{2,2}, \dots, v_{2,s}\}, \{v_{3,1}, v_{3,2}, \dots, v_{3,s}\}, \dots, \{v_{p,1}, v_{p,2}, \dots, v_{p,s}\}$ . As p | k by hypothesis  $n \neq \frac{2k}{p}$ , and so  $s \neq 2$  (if s = 2, then  $n = \frac{2k}{p}$ ). For  $s \neq 2$ , the graph  $C_p * \overline{K}_s$  has a  $C_p$ -factorization Fin which  $F' = \{(v_{1,j}, v_{2,j}, v_{3,j}, \dots, v_{p,j}) | 1 \le j \le s\}$ , is a  $C_p$ -factor, by Remark 2.1. The subgraph of  $C_p \times K_n$  by Theorem 1.9 (while we apply Theorem 1.9, consider  $G = C_p, n = m = t$  and further t is odd as k is odd). Similarly, consider the subgraphs of  $C_p \times K_n$  is isomorphic to the union of s vertex disjoint copies of the graph  $C_p * \overline{K}_s$ ; each of these subgraphs of the graph  $C_p \times K_n$  is isomorphic to the union of s vertex disjoint copies of the graph  $C_p * \overline{K}_s$ ; each of these subgraphs of the graph  $C_p \times K_n$  is isomorphic to the union of s vertex disjoint copies of the graph  $C_p \times \overline{K}_s$  is defined on the  $C_p$ -factors, in F - F', of the graph  $C_p \times \overline{K}_s$  and  $C_{pt} | |C_p \times \overline{K}_t$ , by Theorem 1.8.

#### **Case 2**: $n \equiv 0 \pmod{k}$ .

Let n = lk for some  $l \in \mathbb{N}$ . If l = 1, then n = k and  $C_k || (C_p \times K_k)$ , by Theorem 1.4. Therefore we assume that l > 1. As in the previous case, let the partite sets of the graph  $C_p \times K_n$  be  $X_i = \bigcup_{j=1}^l X_{ij}, 1 \le i \le p$ , where  $X_{ij} = \{x_{i,(j-1)k+1}, x_{i,(j-1)k+2}, \dots, x_{i,jk}\}$ ; we get the graph isomorphic  $C_p * \overline{K_l}$  with partitesets

 $\{v_{1,1}, v_{1,2}, \dots, v_{1,l}\}, \{v_{2,1}, v_{2,2}, \dots, v_{2,l}\}, \{v_{3,1}, v_{3,2}, \dots, v_{3,l}\}, \dots, \{v_{p,1}, v_{p,2}, \dots, v_{p,l}\}\}$ . For  $l \neq 2$ , the graph  $C_p * \overline{K}_l$  has a  $C_p$ -factorization Fin which  $F' = \{(v_{1,j}, v_{2,j}, v_{3,j}, \dots, v_{p,j}) | 1 \leq j \leq l\}$ , is a  $C_p$ -factor, by Remark 2.1. The subgraph of  $C_p \times K_n$  corresponding to the  $C_p$ -factor F' of  $C_p * \overline{K}_l$  is the union of l vertex disjoint copies of  $C_p * K_k$ . Now  $C_{pt} | |C_p \times K_t$ , by Theorem 1.4. Similarly, consider the subgraphs of  $C_p \times K_n$  corresponding to the  $C_p$ -factors, in F - F', of the graph  $C_p * \overline{K}_l$ ; each of these subgraphs of the graph  $C_p \times K_n$  is isomorphic to the union of l vertex disjoint copies of the graph  $C_p * \overline{K}_k$  and  $C_{pt} | |C_p * \overline{K}_k$ , by Theorem 2.3.

**Lemma 2.4** [16] If  $n \ge 3$  is any integer and  $k \ge 3, m \ge 3$  are odd integers such that k|m, then  $C_k||K_m \times K_n$  except when (k, m, n) = (3, 3, 6).

**Theorem 2.5** Let  $m \ge 3$  and  $k \ge 5$  be odd integers, then  $C_k || K_m \times K_n$ , if (1) either *m* or *n* is odd, (2) k | mn and  $k \le mn$  except possibly for the following cases:

(i) (m, n, k) = (m, 2k, k), (m, 6k, k).

(ii)  $(m, n, k) = (m, \frac{2k}{n}, k)$ , if  $p \mid k$ , where  $p \in \{3, 5, 7, 11\}$ .

(iii)  $mn \equiv 2 \pmod{4}$  when both *m* and *n* are not a multiple of *k*.

**Proof**. We may assume that m is odd as the tensor product is commutative. **Case 1**:  $m \equiv 0 \pmod{k}$ .

Proof of this case follows from Lemma 2.4. **Case 2**:  $n \equiv 0 \pmod{k}$ .

International Bimonthly (Print) – Open Access Vol.14 / Issue 80 / Oct / 2023 ISSN: 0976 - 0997

#### Sampath Kumar et al.,

First assume that  $m \notin \{7,11\}$ . Since m is odd, by Theorem 1.1,  $K_m = F_1 \oplus F_2 \oplus \dots \oplus F_{\frac{m-1}{2}}$ , where each  $F_i$  is a 2-factor

composed of 3 or 5-cycles. Hence  $K_m \times K_n = (F_1 \times K_n) \oplus (F_2 \times K_n) \oplus \dots \oplus (F_{\frac{m-1}{2}} \times K_n)$ ; further, as each  $F_i$  contains only cycles of length 3 or 5,  $F_i \times K_n = (C_3 \times K_n) \oplus (C_3 \times K_n) \oplus \dots \oplus (C_3 \times K_n) \oplus (C_5 \times K_n) \oplus (C_5 \times K_n) \oplus \dots \oplus (C_5 \times K_n)$ . Now,  $C_k || (C_3 \times K_n)$  and  $C_k || (C_5 \times K_n)$  by Theorems 2.1 and 2.4, respectively. Hence,  $C_k || (F_i \times K_n)$ ,  $1 \le i \le \frac{m-1}{2}$ . This completes the proof of this subcase. If m = 7 or 11, then we decompose  $K_m$  into m-cyclesand then consider  $K_m \times K_m$  $K_n = (C_m \times K_n) \oplus (C_m \times K_n) \oplus \dots \oplus (C_m \times K_n)$  then by Theorem 2.4, we have a  $C_k$ -factorization as required.

**Case 3**:  $m \not\equiv 0 \pmod{k}$  and  $n \not\equiv 0 \pmod{k}$ .

Let  $k = p_1^{\alpha_1} p_2^{\alpha_2} \dots p_l^{\alpha_l}$  be the prime factorization of k. Since k does not divide both m and n and k|mn, some prime factors of k divide m and some prime factors of k divide n. Without loss of generality we may assume that  $\beta_1$  =  $p_1^{a_1}p_2^{a_2}\dots p_l^{a_l}$  divides m and  $\beta_2 = p_1^{a_1-a_1}p_2^{a_2-a_2}\dots P_l^{a_l-a_l}$  divides n; let  $m = \beta_1 r$  and  $n = \beta_2 s$  for some positive integers rand s, where some  $\alpha'_i$ s and  $(\alpha_i - \alpha_i)$ 's may be equal to zero. Since k is odd, both  $\beta_1$  and  $\beta_2$  are odd.

Let  $V(K_m) = \{x_1, x_2, \dots, x_m\}$  and let  $X_i = x_i \times K_n$ , then  $V(K_m \times K_n) = V(K_m) \times V(K_n) = \bigcup_{i=1}^m X_i$ . We partition each  $X_i$  into s subsets, each having  $\beta_2$  vertices, namely,  $X_{ij} = \{x_i^{(j-1)\beta_2+1}, x_i^{((j-1)\beta_2+2)}, \dots, x_i^{j\beta_2}\}, 1 \le j \le s$ . As in the proof of Theorem 1.11, Case 2, we obtain a new graph isomorphic to  $K_m * \overline{K}_s$  from the graph  $K_m \times K_n$  as follows: for each  $j, 1 \le j \le s$ , we identify the set of vertices  $X_{ij}$  of the graph  $K_m \times K_n$  as vertex  $v_i^j, 1 \le i \le m$  and joining two vertices by an edge if and only if the corresponding sets of vertices in  $K_m \times K_n$  induce a complete bipartite graph  $K_{\beta_2,\beta_2}$  or  $K_{\beta_2,\beta_2} - F$ , where F is a 1-factor of the graph  $K_{\beta_2,\beta_2}$ . The  $i^{th}$  partite set of the graph  $K_m * \overline{K}_s$  is  $\{v_i^1, v_i^2, \dots, v_i^s\}, 1 \le i \le m$ . The set of vertices in each of the columns of this graph  $K_m * \overline{K}_s$  induces a subgraph isomorphic to the complete subgraph  $K_m$ ; let F' be the s vertex disjoint copies of the graph  $K_m$  induced by the s columns of the graph  $K_m * \overline{K}_s$ . The subgraph of  $K_m \times K_n$  corresponding to F' of  $K_m * \overline{K}_s$  is the union of s vertex disjoint copies of  $K_m \times K_{\beta_2}$ . Since,  $\beta_1$ is odd and  $\beta_1|m, C_{\beta_1}||K_m$ , by Theorem 1.2. Hence, by Theorem 1.9,  $C_{\beta_1\beta_2}||K_m \times K_{\beta_2}$ . The graph  $(K_m * \overline{K_s}) - E(F')$  is isomorphic to  $K_m \times K_s$ . Since *m* is odd and  $\beta_1 | m$ , we have  $C_{\beta_1} | | K_m \times K_s$ , by Lemma 2.4. When we lift back  $C_{\beta_1}$ -factor of  $K_m \times K_s$  to the graph  $K_m \times K_n$ , we get the union of  $\frac{ms}{\beta_1}$  vertex disjoint graphs isomorphic to  $C_{\beta_1} * \overline{K}_{\beta_2}$ , in  $K_m \times K_n$ . Now  $C_{\beta_1\beta_2}||C_{\beta_1} * \overline{K}_{\beta_2}|$ , by Theorem 1.8.

This completes the proof of the theorem.

## ABSTRACT

The Food and Drug Administration of the United States has established approval paths and designations to facilitate access to medications recommended for serious or life-threatening illnesses for which there are few other effective treatments. The latest, breakthrough therapy designation (BTD), went into effect in 2012. We discovered that the BTD programme had the largest impact on less experienced enterprises and was linked to lower BTD clinical trial design complexity. This essay sought to examine how the US Food and Drug Administration (FDA) positioned the construction of an accelerated drug development pathway for extraordinary new treatments as a high priority and Breakthrough Designation Requirements for approval. Important questions that must be addressed in the development of such a pathway include how to identify a potential breakthrough therapy and how to request for designation may be submitted at the time of IND filing and balance the need to provide sick patients with quick access to breakthroughs against the need to safeguard patients from potentially harmful or ineffective medications through rigorous trials.

Keywords: programme, Designation, Requirements, Administration.

Thejesh et al.,

## **INTRODUCTION**

Since 1962, the Food and Drug Administration (FDA) of the United States has required manufacturers to produce proof of the effectiveness and safety of their goods before exposing patients to them.[1] The length of time it takes to introduce novel medicines on the market, especially for circumstances for which there aren't many treatment options, has been widely criticised. This is true even though the FDA review and approval process is designed must ensure that there is sufficient data to demonstrate that the benefits outweigh the hazards. The mystery has drawn a lot of interest.[2] To expedite the process of developing new drugs and to make it easier for drugs used to treat serious or life-threatening conditions to be approved, The FDA Safety and Innovation Act of 2012 was enacted in 2012. [3]The FDA created expedited approval designations and pathways. The most recent inclusion is the breakthrough therapy designation (BTD).[4] A drug may be eligible for a BTD if it treats a serious or life-threatening disease or condition and a surrogate endpoint (such as a test result, radiographic image, or physical sign) demonstrates improvement over current treatment.[5]Present-day therapies (also known as available therapies) are medications that have gained full FDA approval, whereas available therapies are medications that have not yet gotten full FDA approval or are still in the exploratory stages. A drug that helps with BTD qualifies for the fast-track classification as well.[6]

### **Breakthrough Therapy**

The designation of "breakthrough therapy" is granted to drugs that are designed to treat critical illnesses and preliminary clinical evidence indicates that the medication may significantly outperform the standard of care on a clinically meaningful endpoint. The magnitude of the therapy effect, which may include the duration of the effect and the significance of the clinical result observed, is what determines whether the improvement above the current therapy is substantial. Preliminary clinical data should typically show a discernible gain over the norm of treatment. A clinically meaningful endpoint is one that examines the influence on irreversible morbidity or mortality (IMM) or symptoms that signal serious repercussions of the disease for the purposes of identifying "breakthrough therapy."[7]

The creation of the BT designation got the FDA's encouragement. Clearly, the environment for drug development had changed due to changes in the reimbursement landscape and developments in biomedical science. The creation of high-value therapies appeared to be a reinvigorated focus for the pharmaceutical sector as a whole. Particularly targeted medicines were showing notable improvements in selected subpopulations. It was apparent that the development of potentially significant therapeutic advances should not be "business as usual"; in fact, patients with numerous life-threatening illnesses had repeatedly expressed the expectation that the FDA should devote the same attention and focus to accelerating treatments of the regulatory expectations and development pathways for extremely promising investigational pharmaceuticals were not formalised outside of immediate approval (Subpart H). Their conditions as it had to HIV therapies during the AIDS epidemic. In fact, the Centre for Drug Evaluation and Research's (CDER) focus on policy over the past decade has mostly been on the proper assessment of the safety of incremental medicines for the treatment of chronic diseases, at least for new drugs.[8]

Both the FDA's expedited and expanded access programmes have identified breakthrough medications. Exceptions have occurred more frequently than usual in recent years. 22 (or 56%) of the 39 new drugs

Thejesh et al.,

licenced in 2012 were accepted under at least one of the fast-track, priority review, or accelerated approval procedures, with 23% eligible for more than one.[9]Although the FDASIA's benefits are primarily already provided by existing laws, rules, or approved FDA procedures, the breakthrough-therapy designation was recognised as having a significant impact on regulatory effectiveness.[10] For instance, the FDASIA mandates that it collaborate closely with the businesses providing funding for novel medications. Subpart E (1988), on the other hand, the conduct and evaluation of clinical trials would be strongly encouraged by top FDA employees, offer "early consultation between FDA and drug sponsors," emphasise the significance of meetings ensure effective phase 2 trial design in collaboration with the FDA, and make it clear that the FDA will actively support these initiatives. [11] It is not obvious how FDASIA will improve the current coordination of staff efforts, although it claims that the appointment of a "cross-disciplinary project lead" may be helpful to support the successful review of breakthrough therapies. The practise of employing fewer evidentiary requirements to determine eligibility for programmes with faster development and approval was continued by the breakthrough-therapy designation.

Some drugs have had their approval based on long-standing surrogate end objectives. Beginning in 1992, the accelerated approval process allowed approval based on "less than well-established surrogate endpoints."[12]The new breakthrough-therapy designation (2012) requires that, one must show "an effect on a pharmacodynamic biomarker(s) that does not meet criteria for an acceptable surrogate endpoint but strongly suggests the potential for a clinically meaningful effect on the underlying disease."[13]This broader threshold would apply to a broader spectrum of potentially novel medications. Such documentation may not be necessary for many years, similar to the bedaquiline approval for MDR tuberculosis. However, under the normal FDA clearance requirements, breakthrough medications must eventually be accepted or denied according to the law.[14]Once breakthrough-therapy designation has been granted based on preliminary evidence, it may be challenging to control demand (whether early access or post-approval), even if the medication turns out to be less effective or more hazardous than previously believed. According to decision theory, decisions should be made with greater care when they are less subject to change.[15] The most recent instance of this issue was the drug bevacizumab, which was recently given fast approval for the treatment of metastatic breast cancer using surrogate end goals.. It took almost a year and substantial pushback to withdraw the indication when follow-up studies showed no benefit in patient survival.[16] Some insurance providers still cover this off-label, nonevidence-based use of the medication. Delaying full research until after a drug has been approved may hinder and prolong the analysis of a medicine's benefit-risk profile. It is now more difficult to enrol patients in clinical trials to evaluate the efficacy of a drug because they can choose to participate in the treatment as part of their regular therapy or sign up for a trial where they could be randomly assigned to receive normal care. This worry is made more pressing by the combination of delayed research and prior designations that might be seen as official endorsements.[17]

### Goal of breakthrough therapy designation

*Regulatory goal:* Drugs that exhibit early clinical evidence of significant improvement for critical illnesses relative to current medications should have the drug development process accelerated.

*Public benefit:* Because of the coordination between sponsors and FDA reviewers, new treatments can be approved more quickly. This can therefore result in patients with critical diseases receiving new and effective medicines more quickly. [18]

Thejesh et al.,

## BREAKTHROUGH DESIGNATION REQUIREMENTS

According to Sharma and Schilsky, a significant therapeutic advance "fundamentally changes the way oncologists think about a disease in terms of the prognosis, treatment options, and quality of life of our patients." Future discoveries might not be as obvious to people outside that field as they might be to people who are familiar with an illness they aim to address. It is important to note that not all cancer medications will act on this pathway by default. To provide the process some consistency and predictability, it is vital to define the minimum level of evidence that must be presented in order to receive the Breakthrough designation. Because defining a breakthrough merely in terms of quantitative results based on early outcomes like response rates in comparison to currently available medications may be unrealistic and constricting, for breakthrough designation, we have established qualitative standards that must be met. The qualitative criteria listed below are hypothetical; in the end, it is up to people with the necessary knowledge to decide if a novel medicine satisfies the criteria for a potential breakthrough therapy. Either there is no known SoC for the diseases under study or the acknowledged SoC currently in use yields subpar Clinical results (such as inadequate symptom control, inadequate symptom persistence, inadequate survival, substantial acute or chronic side effects, and inadequate quality of life).

- 1. Strong preliminary data showing a considerable clinically significant enhancement compared to current treatments in the context of a particular condition should be used to support the designation of a breakthrough.
  - a) The possible breakthrough therapy could be given the following moniker based on early indications of strong clinical efficacy:
    - i. The results of early clinical research must significantly outperform comparable recent or historical comparisons in terms of clinical significance.
    - ii. acceptable safety in a manageable patient population (patient count matched to illness incidence and prevalence, depending on the mechanism of action and predicted toxicity).
  - b) Based on preliminary findings showing a greater clinical therapeutic index compared to SoC in a population with similar criteria, a possible breakthrough therapy may be discovered.
    - i. Must be superior to or obviously maintain equivalent efficacy
    - ii. The main factor to be taken into account is superior safety or tolerability.
- 2. The potential ground-breaking medicine under consideration frequently has a solid scientific foundation and an intriguing method such as focusing on the molecular cause of a physiologically recognised disease (for example, the lung cancer subset that expresses the ALK gene).[19]

### **Breakthrough Therapies- Categories**

We outline various classifications for Breakthrough Therapies as well as the kinds of information that may be needed when a request for Breakthrough designation is made. Remember that a breakthrough designation may also be given to combinations of new agents. Some of these categories in Table 1 are evaluated using the qualitative criteria outlined in the preceding section. In order to focus on a subset of disorders that can be recognised molecularly, a breakthrough therapy for each of these categories will likely co-Dx, short for companion diagnosis. As a result, flexibility in the review of the coDx will be necessary. It is critical to remember that designation as a breakthrough could happen in this scenario

### Thejesh et al.,

before the diagnostic (Dx) hypothesis has received complete clinical validation or before classification thresholds for the population that is positive for the marker have been established.

### Categories

- 1. Drugs for diseases with a bad prognosis, which can be categorised by their biochemical or clinical subgroups of disease and for which there is neither a demonstrated SoC nor a readily available contemporaneous control.
  - a) Drugs that treat conditions that were earlier thought to be incurable, such as ivacaftor for G551D cystic fibrosis and vismodegib for advanced basal cell carcinoma.
  - b) Medicines that work well in groups of people who are resistant to treatment, such as brentuximab vedotin in Hodgkin's disease after at least two prior therapies if the patient is not a transplant candidate or when an autologous stem cell transplant fails.
- 2. for diseases with poor prognoses, which might be identified by a biologic or clinical subset of disease and which provide a significant therapy advance over the already recognised SoC.
  - a) New medications that perform differently from the SoC that is currently in use, such as crizotinib for NSCLC with ALK positivity and vemurafenib for metastatic melanoma with a BRAF mutation.
    - i. Historical controls should be matched for clinical disease or subtype, context (stage or severity, previously treated), pertinent demographics, and prognostic variables if they are to be used as comparisons. Along with giving out the investigational chemical, any discrepancies in management between the experimental group and controls should be taken into account.
    - ii. Retrospective study of clinically extensive annotated biomarkers from tumour banks (such as cooperative group tissue banks). may be used to identify historical controls for new biological subgroups in situations where a molecularly defined population is the focus of the therapy.
  - b) Targeted drugs of the second generation that meet unmet needs left unsatisfied by firstgeneration compounds (e.g., slow reaction time, poor tolerability).
    - i. A second-generation therapy may be considered a breakthrough if preliminary clinical evidence suggests that it is significantly superior to its predecessor(s) and has a solid scientific basis supported by preclinical or clinical proof.
    - ii. Biopsies of diseases that have progressed after being exposed to first-generation medications and which Clinical proof could be the ability to show the presence of an acquired mutation or alteration that is treated by second-generation therapy.
- 3. Drugs that, as members of a clearly defined class, provide a SoC with a significant therapeutic index advantage and well-characterized effectiveness and safety (such as non-cardiotoxic anthracyclines and antibody-drug conjugates).
- 4. Drugs (such as the Hepatitis C treatments boceprevir and teleprevir) that considerably increase the efficiency or toleration of a prescribed regimen
- 5. In a separate tumour type with the same mutation or modification, medication that has previously demonstrated efficacy in a cancer type caused by a specific mutation or pathway modification may be eligible for breakthrough designation.(for example, crizotinib for the treatment of ALK+ paediatric ALCL). This is based on significant clinical efficacy for the additional tumour type.[20]

#### Thejesh et al.,

#### **Designation Process – Content of request and Timing**

The request for designation may be submitted at the time of IND filing or at any time afterward, according to the language of breakthrough therapies. However, it also stipulates that in order to be designated, there must be preliminary clinical proof. We advise that, prior to obtaining marketing authorisation for either its biologics licence application (BLA) or new drug application (NDA), the sponsor initiate negotiations for consideration of a potential breakthrough designation at the time the IND is submitted or at any stage thereafter. Participants would be able to discuss and agree on the preliminary clinical evidence required, the details of the IND, the content of a designation request, the evidence required to meet Breakthrough Therapy criteria, and the potential timetable for a request based on this agreement at the pre-IND meetingA formal request for and decision on Breakthrough designation would still demand and entail the examination of early clinical experience, even though the IND and potential for Breakthrough designation may be reviewed prior to an IND filing in a pre-IND meeting. By outlining the investigational agent's scientific background, method of action, preliminary clinical studies, and outcomes, it should also explain how it meets the requirements for breakthrough designation. Along with prospective clinical development plans for confirming the early-phase studies, the request should also include forward-thinking techniques for streamlining production and developing a companion diagnostic (if required).

#### **Process of Designation - FDA Response**

A request for Breakthrough designation must receive a response from the FDA within 60 days. Senior staff members in the office of the Centre Directors will evaluate requests for Breakthrough designation. We recommend providing the FDA the rights to seek advice from outside experts. If necessary, these specialists could also be called for discussions in the future regarding the best layout for clinical research. If the FDA rejects the application, they should explain why in a letter outlining the criteria that must be completed before the product may be given the Breakthrough Designation. [21]

#### Interactions between FDA and Sponsors: Proposed Timeline

Throughout the development process, we see the FDA providing more general guidelines and the sponsor and the FDA working more closely together. While we recommend hosting a range of meetings, we recommend holding type A meetings as soon as a product is accepted as a breakthrough. We also recommend that the sponsor have access to a completely different style of meeting. These would be established between the FDA's and the sponsor's single points of contact, thus creating a "hotline" to enable real-time communication of study results. Because of this design field, the FDA would be able to actively engage in the decision-making process. Furthermore, Regular evaluation of the approval status based on changing data would be possible. (non-clinical, CMC, etc.).

#### Phase I :

- When a breakthrough therapy designation is given, the sponsor has access to an FDA Breakthrough Therapy team, a single point of contact, and a communication strategy.
- Conference call or meeting in phase I's middle:
  - > Examine recent interim clinical data.
  - Agree on the phase II/III protocol description or decide that the phase I extension is adequate given the Breakthrough designation.

#### Thejesh et al.,

- Simplify the manufacturing qualification/validation plan by using a single lot (for both market and development).
- > Examine the stability and quality control plan.
- Concur on streamlined companion diagnostic development, including, if necessary, a statistical analysis technique (SAP) for phase I data processing, either prospectively or retroactively.

#### **Conclusion of Phase I - Extension Meeting :**

Data from Phase I have been submitted in raw but audited form. deciding whether or not to move on to phase II depending on if phase I extension was adequate. Phase II/III immediately begins after receiving the proper randomised phase II protocol, and a date for the conference for mid-phase II&III is recommended.

#### Meeting – Mid-phase II/III :

The sponsor team and the FDA look into, debate, and make a conclusion regarding:

- ♣ Analysis of study results
- 4 Any modifications to the production plans, data, controls, and related diagnostics
- **4** Create the label's indication, precautions, and administration sections.
- **4** SAP for phase I data prospective or retroactive analysis, as needed for the Dx hypothesis.

#### Pre-BLA/NDA meeting between mid-phase II/III and the conclusion of phase II&III

- If required, a pre-BLA/NDA meeting would be planned to go through the application's table of contents and plan the further steps. Through email, the FDA and sponsor teams discuss specifics and adjustments based on talks held during mid-phase II and III. The FDA sets the dates for the inspections.
- Discussions with CDRH and CDER about a shortened companion diagnostics process, possibly include a plan to make the IVD available for investigational use before the regulated device is approved.

#### NDA/BLA submission

All agreed-upon data sets and analyses, complete bioanalytical reports (perhaps without audit), audited non-clinical data, audited manufacturing and controls data, stability and controls plans, module 2 summaries, and labelling must be included in BLA/NDA applications. However, only summaries of clinical, clinical pharmacology, and non-clinical trial results, as well as integrated safety and efficacy when justified (in most cases, this is irrelevant), are allowed. The sponsor simultaneously but separately sends inspection data to the inspection office and/or the field office(s).

#### NDA/BLA cycle of review

FDA and sponsor teams hold weekly teleconferences to discuss each application component, create the phase IV study and phase IV production commitments, get ready for the advisory committee (if required), choose the final label, and, if necessary, conduct additional research to enable companion diagnostics The recommended evaluation period is three months.

#### **Phase IV – Approval:**

• Acceptance of the application (which includes a phase IV plan that has been agreed upon), the start of phase IV (clinical and manufacturing).

#### Thejesh *et al.,*

• FDA review and approval of promotional materials, and sponsor and FDA review and agreement on revised label elements following phase IV.

#### Phase IV – Final data:

- > Data from Phase IV submitted
- ➢ label updated.[20]

# CONCLUSION

Patients can use the BTD to get access to drugs for critical illnesses more quicklyEven if certain drugs authorised with a BTD indicate significant progress in the treatment of an illness, health care practitioners should be aware of the variability in the quality of the evidence supporting these approvals. Providers should be able to adequately inform patients and other healthcare professionals on the safety and efficacy of these medications because there is still much to learn about them. BTT designation in no way implies that the medication is going to be approved, according to the BTT guidance. When preliminary data suggests that a medicine may significantly improve a condition, the BTT programme is intended to encourage sponsorship and FDA collaboration. The drug in question won't be approved if the benefits are ultimately proven to outweigh the dangers (based on the complete amount of evidence acquired both before and after the BTT designation).

#### ABSTRACT

In a rapid technology world, Cloud computing is most important role in all the sectors because of any time any where we can access the data easily via internet in all over the world. Cloud Computing is the availability of a vast array of computing services such as data storage, analytics, and networking that are driven automatically with less manual support. It is commonly used for the efficient and smooth functioning of businesses and also providing infrastructure and software support to computing systems. In this study and review paper, it based on how various sectors connected to cloud meanwhile what are the security issues have using cloud computing in all sectors and what are the Cloud Computing techniques used to overcome from that issues.

Keywords: Cloud Computing, Technologies, Data Security, Models

### INTRODUCTION

In Modern Technology, all sectors rely on cloud computing for the effective and seamless operation of organizations as well as for the provision of hardware and software to support computer systems. The healthcare industry has historically underutilized technology, especially when it comes to enhancing patient care. Even though the fact that healthcare has been around for sixteen years already, a large number of systems still use paper medical records or other manual processes to notify and make choices in the majority of conditions [1]. Malicious program detection is a challenging task. Network operators and IT managers are faced with a formidable task by the enormous, ever-growing ecosystem of malicious software and tools [2]. One of the newest technological

#### Porkodi and Raj Balaji

advancements, cloud computing, together with virtualization, fast connections, and broadband internet, will probably have a big impact on the teaching and learning environment [3].

#### CLOUD COMPUTING

Instead of using local servers or personal devices to manage applications, cloud computing makes use of pooled computing resources. The simplest definition of cloud computing is relocating services (also known as "cloud services") outside of an organization's firewall. The Web is used to access services like storage and other applications. The cloud customer pays for the services on an as-needed or pay-per-use basis, and they are supplied and used over the Internet.

#### **Cloud Computing Models-**

Cloud computing is categorized under a number of categories. It is grouped under the following heading based on the type, location, and usage:

- Public Cloud
- Private Cloud
- Community Cloud
- Hybrid Cloud

#### Public Cloud

Information can be stored and accessed online utilizing a pay-per-usage model by anyone. Computing resources are managed and run by cloud service providers in public clouds. Amazon EC2, the Windows Azure service platform, and IBM's Blue cloud are a few examples of public clouds. From the figure1, IT services and resources are made available to anybody who subscribes and pays for them by public cloud vendors. It is a kind of external cloud that is offered for public use and is primarily owned and supplied by external organizations.

#### **Private Cloud**

It is often referred to as a corporate cloud or an internal cloud. Organizations use it to construct and operate their own data centers, either internally or through a third party. Private cloud refers to commercial organizations' internal data centers that are not accessible to the general public. The private cloud is devoted to the customer directly, as the name implies. Compared to public clouds, these are safer. It makes advantage of virtualization technology. The company's own servers act as the private cloud's host. Eucalyptus, VMware, and OpenStack serve as examples of private cloud technology.

From figure2, an infrastructure or service may be located on-site or off-site and is run purely for the benefit of the one organization that would be the cloud's provider. The administrator has a direct influence on every cloud setup. It may be handled internally by the organization or externally by any reputable third party.

#### **Community Cloud**

It enables a collection of diverse groups to access systems and services and share information with the community.

#### Hybrid Cloud

The cloud is a hybrid of the public and private varieties. It is only partially secure because services running on public clouds can be accessed by anybody, but those running on private clouds can only be accessed by authorized users of the company.

From the figure3, the combining on-premises, public cloud, and private cloud technologies in a hybrid environment are a practical way to begin adopting cloud environments. While still having the flexibility to build new tools at scale and with controlled costs, organizations can retain and use systems that they have historically relied on. Cloud computing is the delivery of computing services over the internet, such as servers, storage databases, networking, and software analytics.

#### Porkodi and Raj Balaji

SaaS - A service provider that offers software and apps via the internet in cloud computing. Through vendor APIs or the web, users who have subscribed to the software can access it.

PaaS - An entry point to a cloud-based environment where users can create and distribute applications is provided by a service provider (PaaS). The underlying infrastructure is provided by the provider.

IaaS - Storage, networking, servers, and other cloud computing resources are made available to customers on a payas-you-go basis by an IaaS vendor.

#### CLOUD COMPUTING TECHNOLOGIES

The following is a list of cloud computing technologies -

- Virtualization
- Service-Oriented Architecture (SOA)
- Grid Computing
- Utility Computing

#### Virtualization

The practice of establishing a virtual environment to run several operating systems and applications on the same server is known as virtualization. The virtual environment can be any combination of different operating systems, storage systems, network application servers, and other environments, including a single instance or a single combination of them. Increased utilization of virtual computers is the idea behind virtualization in cloud computing. A virtual machine is a software computer or software program that can conduct functions like launching apps or programs on demand for the user and can also operate as a physical machine.

#### **Types of Virtualization**

- Hardware virtualization
- Server virtualization
- Storage virtualization
- Operating system virtualization
- Data Virtualization

#### Service-Oriented Architecture (SOA)

According to changing business needs, Service-Oriented Architecture (SOA) enables enterprises to use cloud-based computing solutions on demand. It can function both with and without cloud computing. The benefits of SOA include ease of maintenance, platform independence, and great scalability. The two key roles in SOA are service consumer and service provider.

Applications of Service-Oriented Architecture

There are the following applications of Service-Oriented Architecture -

- It is used in the healthcare industry.
- It is used to create many mobile applications and games.
- In the air force, SOA infrastructure is used to deploy situational awareness systems.

The service-oriented architecture is shown below:

From the figure4, a service-oriented architecture, many services interact with one another by exchanging data or coordinating an action between two other services.

#### Grid Computing

Distributed computing is another name for grid computing. It is a processor architecture that pools numerous computing resources from several places in order to accomplish a single objective. Grid computing creates a computer cluster by connecting the grid through parallel nodes. There are several sizes and operating systems available for these computer clusters.

The following three types of machines are used in grid computing -

#### Porkodi and Raj Balaji

- Control Node: This is a collection of servers that manages the entire network.
- Provider: A computer that contributes resources to the network resource pool is known as a provider.
- User: A computer that utilizes network resources is referred to as a user.

Grid computing is mostly employed in back-end infrastructures, marketing research, and ATMs.

From the figure5, Grid computing is a kind of processor architecture that integrates computer resources from many domains to accomplish a shared purpose. The network's computers will collaborate on a project using grid computing, emulating a supercomputer.

Utility Computing

The most popular approach for IT service delivery is utility computing. It offers infrastructure based on the pay-peruse model and on-demand computing resources (computation, storage, and programming services through API). It maximizes resource efficiency while minimizing associated expenditures. Utility computing has the advantages of lower IT costs, more flexibility, and ease of management. Major organizations like Google and Amazon built their computing storage and application utility services.

#### LITERATURE REVIEW

In 4, the author describes that, the amount of data being stored in data centers is growing daily, which causes a vast amount of data to be stored on the cloud and causes problems like data loss, data breaches, etc. If data is accidentally lost or erased, an effective method must be used to retrieve it from any backup server. Antivirus software is used to identify, stop, and correct any dangerous activity occurring within a computer system. For the effective removal of threats in our computing environment, many malware detection approaches are implemented. Antivirus software is used to identify, stop, and correct any dangerous activity occurring within a computer system. For the purpose of effectively removing threats from our computing environment, many malware detection techniques are implemented [5]. Big data offers insights and information, while cloud computing lets users work whenever and wherever they want. Big Data in the cloud refers to a dataset that is so large that working with it in a conventional local computer-based Database Management System becomes extremely challenging. This dataset may be several dozen terabytes or gigabytes in size. The ability to extend storage, visualize data, manage, and collect becomes extremely time-consuming and expensive, thus using the cloud is the appropriate answer [6].

Purchasing and selling goods and services online is known as e-commerce. It is made up of two layers from a system approach. A technical architecture made up of hardware and software is the first layer. Other Layers are technologically-based business transactions. Renting hardware and software using cloud computing enables e-commerce businesses to avoid making capital expenditures. Costs associated with system development are reduced [7]. In [8], the author states that to realize the sharing of medical data and health information, coordination of healthcare systems, and effective and cost-containment clinical information system infrastructure through the implementation of a distributed and highly integrated platform, the medical and health information system is based on cloud computing. A service known as cloud storage keeps data up to date, manages and backs it up remotely, and makes data accessible to users over a network (via the internet). Numerous companies offer cloud storage. Most companies offer free storage up to a specific gigabyte limit. When a client can store and manage the data at a reasonable cost as opposed to using the cloud, the concept of cloud storage is not worthwhile. So, the cloud should be created in a way that makes it affordable, autonomously computable, multi-tenant, scalable, accessible, controllable, and efficient [9].

The testing environment, evaluation technology, and evaluation service are the three components that make up the test and evaluation system for cloud computing information security solutions. For cloud computing information security products, the test environment primarily consists of a test platform. Evaluation technology primarily consists of testing tools, testing methods, a basic database, and related standards and specifications. Evaluation services offer the ability to evaluate cloud computing information security products. According to the security

#### Porkodi and Raj Balaji

technological requirements, the security testing technique for cloud computing systems may be separated into four categories: security function, security guarantee, environmental adaptability, and performance requirements [10].

#### MAJOR SECTORS ADOPT CLOUD COMPUTING

A few examples of the many uses for cloud technology include business, data storage, entertainment, business management, social networking, education, medicine, art, and GPS.

#### **E-Governance**

In many countries around the world, the use of cloud computing for e-government is growing, and governments have started to benefit from the cloud [11]. The cloud computing industry is a thriving application development that offers an inexpensive and efficient option for any E-Government infrastructure development [12].

#### **Business Trading Sector**

Cloud-based e-commerce software enables users and e-businesses to adapt rapidly to growth opportunities. Instead of developing massive static environments scaled for peaks, the cloud is a perfect fit for e-commerce since it allows providing and paying for resources as need them. The objective is automatic provisioning. Environments are static and scalable for peak load without the cloud [13].

From the Figure 8, the Cloud Computing offers some benefits to E-Commerce industries. To combine the processing power of numerous devices, the majority of E-Commerce enterprises employ a hosting server. Online stores operate differently from other websites. To update databases, protect personal information, handle payments, and monitor sales, they require more assistance and flexibility. E-commerce companies can rent hardware and software due to cloud computing rather than purchasing it. It helps in reducing system building costs. E-commerce companies usually purchase all required hardware and software, which leads to significant investment costs, especially for small and medium-sized organizations. Virtualization of cloud computing Depending on their needs, e-commerce companies can select and rent IT services and goods. A technical architecture must be developed. Particularly flexible is the "pay as a service" billing model. This allows growth resource payment for e-commerce companies [14].

#### **Educational Sector**

One of the most significant changes brought about by the use of cloud computing in the education sector is the rise of e-learning, online distance learning courses, and student information portals. In this case, cloud computing may prove to be beneficial. The usage of cloud computing is to access any file, document, or even video from anywhere in the world. So it's beneficial to provide fundamental classes to students who can't otherwise afford them. Cloud computing is a new technology that is currently being employed all over the world since it allows us to provide individuals with simple and innovative learning opportunities while also raising the educational level of the nation [15]. Students, professors, and researchers are offered a comfortable environment for learning, teaching, and experimenting in this new learning environment so they can connect to their organization's cloud and access data and information.

#### Healthcare Sector

Historically, the healthcare industry has underutilized technology, particularly when it comes to enhancing patient care. Even though the fact that healthcare has been around for sixteen years now, there are still a lot of manual or paper-based methods that are used to alert and make choices in most situations, such as patient history [16]. In 17, the author proposed, the adoption of telemedicine technologies like teleradiology, telesurgery, and audio/video conferencing introduces a new way for different healthcare providers to collaborate and communicate. Telehealthcare services enable patients to get clinical care without having to travel and also assist medical specialists in sharing their expertise to handle challenging medical issues.

From the Figure 9, the Cloud Computing offers some benefits to Healthcare industries. Doctor-patient and doctordoctor communication, as well as the transmission and preservation of medical pictures, may all be made possible

#### Porkodi and Raj Balaji

via cloud-based software. Data sharing is made simple by cloud computing, which also effectively streamlines provider communications. It enables experts to conduct virtual consultations to share their knowledge on a case or provide a second opinion for more accurate disease diagnosis and treatment. For healthcare organizations, reliable disaster recovery procedures are ensured by cloud technology, such as patient management software.

#### **Banking and Finance Sector**

There are no longer any restrictions associated with this technology since anybody, everywhere can have access to banking systems without the expense and other barriers that are associated with traditional on-premises banking systems. Instead, cloud computing can make enterprise-level banking systems and related technologies available in the cloud on a pay-per-use basis [18]. Cloud computing seems to have the ability to speed up innovation and corporate transformation across industries, including banking. The advantages of this cloud-based technology (instead of its physical servers) for banks are its low prices, speed, adaptability, and security.

The usage of cloud computing can benefit banks in several numbers of ways, including

- Increasing operational process efficiency;
- •Building secure applications that adhere to regulatory frameworks.
- Improving products and customer services.

• Eliminating entry barriers into new business models by being more adaptable. To lead to rising, it is no longer essential to own several of machines; instead, hiring a Cloud provider will be sufficient

#### A REVIEW – HEALTHCARE SECTOR

The Literature review on Healthcare sector is in a comparative format is given in table1. In 19, the author implemented MES, for utilizes to secure Healthcare sharing and storage mechanisms. And also that compare the various algorithm to analyze some parameters in Healthcare environment. In 20, the author compared to various Algorithms and analyzed to chosen, CBM is most efficiency to secure the data in cloud. In 21, the author proposed, that Lightweight Cryptography is used to secure the EHR in Cloud. The sensitive information is protected by Lightweight protocols. In 22, the author demonstrates the utility of the combination of machine learning and segmentation in order to improve data security. Processing RGB colorful images using cloud resources in a securely. More importantly, in proposed it apply two methods for image enhancement, i.e. Gaussian filtering and pixel intensity.

In 23, the author proposed that, to generate two photo galleries .The OMBD is hold on to secretly in the cloud and the DMBD is used as a honeypot and is remain in the fog. As a result, the user accesses the DMBD by default instead of only doing so when unauthorized access is discovered. Only after confirming the user's legitimacy may they access the OMBD. In 24, the image will be split using a sequence key after being encrypted into ciphertext using the AES technique. The ciphertext is first decrypted after being combined using the same sequence key. In 25, the author is to increase the number of robots in the system from 10 to 100, the time consumption for generating keys differed 0.002–0.003 s. The author framed the methods based on the proposed method's key generation time in comparison to other approaches. When compared to previous

ways, the suggested method reduces the time needed for key generation. The key generation time differs from others by 10 to 15 microseconds. In 26, the author discussed how encryption and anonymization methods have been used for health care data protection as well as presented their limitations.

#### SECURITY CHALLENGES IN ALL SECTORS

Cloud computing has a lot of security risks. Customers use the cloud because of its on-demand services, costeffective resource pool, and ability to conduct computer operations from any location at any time. However, the security concerns they endure are causing both clients and cloud service providers to despair. With cloud computing, anyone may instantly host a cloud using a shared pool of resources. The security of data is severely threatened by these interconnected networks. Cloud computing presents several security hurdles and problems [27]. Both external hackers and unauthorized inside personnel can easily access data in cloud models. Internal staff

#### Porkodi and Raj Balaji

members have easy access to data, whether on purpose or by accident. Using hacking techniques like session hijacking and network channel eavesdropping, outside hackers may be able to access databases in these environments [28]. All organizations, whether for-profit or nonprofit, have started using the cloud to store data, which raises concerns about the security and privacy of that data. Additionally, the cloud presents several challenges for service providers in terms of data transfer and service utilization. The majority of security threats in cloud computing are associated with cloud data security. Most issues come from the data that consumers upload to the cloud, whether it is a lack of visibility into data, an inability to control data, or data theft in the cloud.

In [29] the author surveys that both internal and external source can provide security risks to businesses. The 2011 Cyber Security Watch Survey found that insiders were responsible for 21% of cyber attacks. According to 33% of respondents, insider attacks are more expensive and devastating to enterprises. The majority of insider threats (63%) and intellectual property theft (32%) involved unauthorized access to and use of corporate information. Certain sensitive data can be accessed by malicious users, which can result in data breaches. As per the study is carried out by the author [30], Access control is a key security tool for cloud computing that enables data protection. It ensures that the requested data, which is kept in the cloud, is only accessible to authorized users. Proper access control is made possible by several security methods in cloud computing. On various network and cloud layers, intrusion detection systems, firewalls, and responsibility separation could be installed. Through the cloud network, a firewall only allows content that has been passed through. Typically, users specify security policies for a firewall and then implement those policies. Demilitarized zones (DMZ), which offer additional data protection, are typically associated with firewalls. In [31], the author illustrated that the subject of account hijacking is one of the most frequently discussed in society. There may be a variety of reasons for hijacking, including providing our credentials to others and offering our data to third parties via online transactions. The hackers who would take over our account might even alter transaction information, falsify data, and utilize other cloud services linked to the account to execute additional attacks

In the healthcare sector, data can be stolen easily because it is stored in plain text, making it simple for anybody to read, write, or modify the data. Because it involves the patient's confidential health information, security in e-healthcare is even more crucial. Attackers can use the open wireless channels' weaknesses to their advantage. The E-healthcare framework can incur a variety of damages as a result of these attacks [32]. For secure the purpose of ensuring online access to banking accounts, the majority of banks offer a user-id, password, as well as a one-time password. The premise that dictionary attacks can ability to get passwords deems this form of authentication procedure entirely unsecure.

#### Password Hacking Tools used by Hackers:

- o John the ripper
- o THC Hydra
- o Pwdump
- Rainbow Crack
- o Brutus
- Cain and Abel

#### DATA SECURITY IN CLOUD

Typically, data encryption is a key area of concern for cloud security. In [33], the author states that by transforming the data from its readable and intelligible form to a form that is not understandable to unwanted persons, the science of cryptography prevents data from being stolen and interpreted by unauthorized individuals. By using encryption, the scrambled data which makes it virtually impossible for anyone to use it without encryption keys. While attempting to improve the security of cloud data, users should focus on a few key areas.

Be sure to look at the following while trying to secure SMB or industrial systems:

• Encrypting data before it is stored in the cloud: Users can have greater control over how the company manages its encryption methods if it secures individual local data storage devices and operating systems.

#### Porkodi and Raj Balaji

- End-to-end encryption: To protect the data while it is transmitted to and from the cloud service, be sure the provider provides end-to-end encryption. Sensitive information should always be shielded from interception, such as financial or private data.
- Keep track the Encryption keys: Different keys are required to decrypt data, so it's crucial to handle and protect these keys carefully. Decide whether the cloud provider will manage the keys internally or if users will take charge of that.
- Use a cloud security solution: It is a challenging undertaking that requires assistance to maintain its data encryption efforts. While protecting against existing threats, security technologies like Kaspersky Hybrid Cloud Security can help to decide how to improve local and cloud security efforts.

In [34], the Author analyse that the New Lightweight Cryptography Algorithm, which combines high flexibility and security. The NLCA algorithm reduces processing power and reduces computational complexity. In [35], the most effective functionality of a cloud is directly provided by IaaS, which is present on the sub layer. IaaS also enables hackers to carry out high-resource assaults like brute-force cracking. IaaS offers the perfect platform for hackers to launch assaults that need a lot of attacking instances because it supports multiple virtual machines. Another security concern with cloud models is data loss.

In [36], a security method to thwart this kind of attack is the secure Socket Layer (SSL). Therefore, authentication of the client and the server may not function as it should protect users of cloud technology from a man in the middle of this security technique that is not configured properly. In [37], to provide data confidentiality and information integrity of users' data in the cloud computing environment, the author implemented AES Algorithm and proposed an effective security framework that provides a mechanism through which communication is protected and unauthorized access is restricted.

# CONCLUSION AND FUTURE WORK

Cloud computing is an emerging force that has aided numerous sectors over the past few decades as the increasing digitalization has changed over time. The main purpose of this study and review paper, we discussed about basic concept of Cloud computing and Data Security. We review the security challenges in all sectors from various research papers, then how that Data Security challenges are rectified using cloud computing technology. From this paper, the future research process is done from Healthcare Sector. Healthcare is one industry that has greatly benefited from cloud computing in terms of infrastructure. With the introduction of cloud computing, things have drastically changed in the healthcare industry, where a rapid gain is already taking place. This has not only benefited in the growth of the infrastructure and facilities, but it has also created new opportunities for multidisciplinary medical research, which is beneficial for all of humanity. In the table1, we review the various security issues in Healthcare sector and its methods. In future work, we compare and analysis the various algorithms to secure the data efficiently, to implement in Healthcare sectors using cloud technology.

# ABSTRACT

Dysmenorrhea is one of the most common gynecological health conditions. It is cramping pelvic pain started before or at the onset of menses and lasting 1-3 days. It is also known as painful menstruation. The prevalence of Dysmenorrhea is highest in the 16-25 year age group. Dysmenorrhoea may also affect the stress level among the girls. Dysmenorrhea can limit daily social, recreational, and educational activities, including affects the quality of life of person. To evaluate the prevalence of severity of dysmenorrhea and its correlation with level of stress among college going girls. An online cross-sectional survey was carried out using Google form with sample of 150 students (age group 18-25 years). Outcome measures used are WALIDD and PSS-10to determine the severity of Dysmenorrhea and level of stress respectively. Pain start within 6-12 hours before menses and lasting for one or two days after menses, Lower abdominal, pelvic and body pain lasting 8-12 hours were included in this study. Girls taking oral contraceptive pills due to any hormonal problem, any pelvic surgery, abnormal bleeding was excluded. In this study for analysis of data used the SPSS-20 and Microsoft Excel for descriptive analysis. In which the mean age was 20.82. Then mean and SD of WAILDD score was 5.46 and 2.28984 and PSS-10 score was 20.68and 6.33000 obtained. There is very weak correlation between severity of dysmenorrhea and level of stress. This study concluded that there was prevalence of severity of 63919

Indian Journal of Natural Sciences

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Dolly Shah *et al.*,

dysmenorrhea 4.67%(no dysmenorrhea),30.66%(mild),42%(moderate), 22.66%(severe) and level of stress was 11.33%(low),68.66%(moderate), 20%(severe) among girls there was a not statistically significant correlation between the severity of dysmenorrhea and level of stress in girls.

Keywords: Dysmenorrhea, girls, stress, PSS-10, WALIDD

# INTRODUCTION

Menstruation known as a monthly period is the regular release of mucosal tissue and blood from the inner lining of uterus (Endometrium) through the vagina. The 1st period generally starts between 12-15 years old; this time is known as menarche.(1)Worldwide, girls experience menstruation every month which is natural physiological process that might be negative effects on girls.(2) Menstruation related health problems like physical & psychological that suffering with abdominal, back pain, blotting, emotional irritability & fatigue.(3) Menstruation period generally getting start during adolescence & mostly 75% of girls have problems associated with menstruation.(4) Dysmenorrhea is a painful gynecological problem derives from the Greek word which means "difficult monthly flow" (5). Dysmenorrhea classified by two types: (1) Primary Dysmenorrhea: It is painful menses with normal pelvic anatomy. It is start within first six months after menarche. Affected girls having sharp, intermittent pain in the suprapubic area. Pain radiating to the back of legs or lower back. (2) Secondary Dysmenorrhea: It is resulting underlying pathology such as pelvic inflammatory diseases, irregular cycles or infertility problems, endometriosis, intra-uterine devices, ovarian cysts, cervical stenos is. In these primary dysmenorrhea is more common.(6,7) Estimates of prevalence amount adolescents range from 25 to 90%. According to Indian studies, the prevalence ranges from 50 to 87.8 % (8). Pain is reported by 5 to 20% of girls who have severe dysmenorrhea that prohibits them from doing their normal activities.(9)PD is neither life threatening nor disabling, but it does cause absenteeism & has a substantial impact on individual's mental stress. The main cause of PD is increased level of prostaglandins. Prostaglandins especially PGF2 which stimulate myometrial contractions, (10)

Psychological problems such as sadness, stress, anxiety, depression, social factors and lifestyle factors include irregular diet, poor sleep all are related to dysmenorrhea & in this mental stress is one of the important cause of the PD among adolescents girls. (11, 12) Minor changes in daily activities like study related stress, family problem and financial trouble which lead to stress and emotional disturbance has a role in the pathogenesis of pain including PD.(13) Dysmenorrhea can limit daily social, recreational, and educational activities, including affects the quality of life of person.(14) In this study, for level of stress measure using the perceived stress scale (PSS). It is 10 item scales. Complete to 5-10 minutes. the reliability of PSS is 0.80.(15)For severity and screening tool using a WaLIDD Score. This tool is very reliable and valid for measuring the severity of dysmenorrhea. (16) However, the relationship between the severity of dysmenorrhea and level of stress among girls has been less studied. So need of this study to evaluate the correlation between level of stress and severity of dysmenorrhea.

# AIMS AND OBJECTIVES

**AIM:** The aim of study is to evaluate the correlation between level of stress and severity of primary dysmenorrhea in college going girls.

#### Dolly Shah *et al.*,

#### **OBJECTIVES**

- > To evaluate prevalence of level of stress and severity of dysmenorrhea.
- > To find the correlation between age and severity of dysmenorrhea.
- > To find the correlation between age and level of stress.
- > To find the correlation between severity of dysmenorrhea and level of stress.

# METHODOLOGY

- Source of data: Parul University.
- **Study design:** A cross sectional study
- **Sampling method:** Convenient sampling
- Sample size: 150
- Study population: Girls with primary dysmenorrhea.
- **Inclusion criteria:** Age group 18-25 years, Pain start within 6-12 hours before menses, Lower abdominal, pelvic pain, lower back pain, cramps, medial & anterior thigh pain lasting 8-12 hrs. Regular menstrual cycle.
- Exclusion criteria: Having secondary dysmenorrhea, Any Urogynecologic diseases, metabolic diseases, neuropsychiatric condition, pelvic surgery, Girls taking oral contraceptive pills due to any hormonal problem.
- Ethical clearance: As the study includes human subjects ethical clearance was obtained from Parul university institutional ethical committee for human research. (PU-IECHR).

#### PROCEDURE

Total 150 subjects were taken who fulfilling the inclusion and exclusion criteria. All the participants were informed about the study and consent was taken from each participants in the signature on the consent form. Privacy and confidentiality of the subjects should be maintained. Personal information such as name, age, address. age of menarche, cycle of days, days of pain during menses etc. After those subjects were asses with WaLIDD and PSS Questionnaires were formulated and organized with the: Google Forms.

#### OUTCOME MEASURES

**1.**The WaLIDD Sore is taking for features of dysmenorrhea such as: 1) Number of anatomical pain locations (No part of the body, Lower abdomen, Lumbar region, Lower limbs, Inguinal region) 2) Wong- Beker pain range (Does not hurt, hurts a little, a hurts little more, hurts even more, hurts a lot) 3) Number of days of pain during menstruation (0, 1-2,3-4,>5)4) Frequency of disabling pain to perform their activities (Never, Almost never, Almost always, Always) Each tool's variable provides specific score between 0 and 3 and final score ranged from 0-12 point.

2. Perceived stress scale-10 was taken for evaluate the level of stress about her menstruation moods, anxiety and emotional disturbances. It is a 10 item questionnaire.

Girls were asked to answer the questions about stress, feelings and thoughts during her menstruation period.

#### STATSTICAL ANALYSIS

Descriptive analysis of age, WALIDD and PSS interpreted by using statistical software IBM SPSS- 20. The descriptive statistics including means and standard deviations were obtained. For the nonparametric correlation between variables spearman's test was applied. A p- value less than 0.05 were considered to be significant.

#### RESULTS

In this study 150 participants were selected. The IBM SPSS-20 was used for analysis of data and Microsoft Excel was used for descriptive analysis. In which the mean and SD of age, WALIDD and PSS-10 was 20.82 and 1.89, 5.46 and 2.28 and 20.68 and 6.33 obtained respectively.

#### Dolly Shah et al.,

#### Interpretation: Table - 4 shows,

1. Correlation between AGE & WALIDD the p-value is 0.301 which suggest that there is very weak significant correlation; the value of correlation coefficient r is 0.085 which suggest very weak positive correlation.

2. Correlation between AGE & PSS the p-value is 0.267 which suggest that there is very weak significant correlation; the value of correlation coefficient r is 0.091 which suggest very weak positive correlation.

3. Correlation between WALIDD & PSS the p-value is 0.968 which suggest that there is very weak significant correlation; the value of correlation coefficient r is 0.003 which suggest very weak positive correlation.

### DISCUSSION

The purpose of present study was to find the prevalence of primary dysmenorrhea among girls and its correlation with severity of dysmenorrhea and level of stress. Total 150 girls falling in age group of 18-25 years were selected according inclusion criteria, WALIDD score measure the severity of dysmenorrhea similar screening tool was used by Rabia Butt, Urfah etal Working ability, location, intensity, days of pain dysmenorrhea (WaLIDD)score was used to assess the severity of dysmenorrhea.(17) and PSS was used to assess level of stress. Primary dysmenorrhea may be a common disorder among young women, and uterine ischemia plays a crucial role in pelvic pain. Asymmetric dimethylarginine (ADMA) is accepted as a stronger marker of endothelial dysfunction. Prostaglandins can also cause headache, nausea, vomiting and diarrhea. Hormonal and endocrine imbalance, uterine contractions, uterine bleeding, cervical obstruction and psychological factors are also involved in the pathophysiology of primary dysmenorrhea. Menstrual pain may result from the increased contractions of the uterine muscle which is innervated by the sympathetic nervous system. Stress is supposed to increase the sympathetic activity which may lead to the increase in menstrual pain by enhancing the intensity of the uterine contractions.

The findings of the present study showed a high prevalence of dysmenorrhea in which 4.67% (no dysmenorrhea), 30.66%(mild),42%(moderate), 22.66%(severe) and level of stress was 11.33%(low),68.66%(moderate), 20%(severe) among adolescents girls of Parul university, Farooq Islam, Asim Raza et al. determined that Out of 161 subjects, 12 were having mild dysmenorrhea, 98 were moderate and 51 were severe dysmenorrhea.(17)similar findings were reported by Suresh K. Kumbhar, Mrudula Reddy etal 119 (65%) are dysmenorrheic, 68.4% and 61.2% are from the urban and rural areas respectively.(18)Dysmenorrhea is one of the most frequent discomforting gynecological conditions influencing the quality of lifeand social activities among girls.. Similar study was done by Amir, Farideh etal several factors can affect primary dysmenorrhea and its incidence and severity including mental health. (19)

In this study our results found that very weak positive correlation between age and severity of dysmenorrhea(r= 0.085), age and level of stress.(r= 0.091) and severity of dysmenorrhea with level of stress(r= 0.03) and also no significant level found in college going girls. Similar findings was determined by Karki, Rai Chandra etal. No association was found between incidence of dysmenorrhea and severity of stress.(20)However , wang L etal(21) and Masoumeh Kordi(22) etal found association between high stress level and incidence of dysmenorrhea. The quality of life during dysmenorrhea is comparatively poor among dysmenorrheic girls, loss of physical activity and work satisfaction, personal relationships, confidence& concentration.

# CONCLUSION

A total 150 participants were selected for the study from Parul university girls. By this study we concluded that severity of dysmenorrhea and level of stress very weak correlation was obtained, and found that there was a not statistically significant relationship between the severity of dysmenorrhea and level of stress in girls.

#### Limitations of study

1) Sample size was small.

2) The data was collected from only one university.

Dolly Shah et al.,

#### Further Recommendations

1) A study can be done with different universities and schools.

- 2) A study can be done on different age group.
- 3) A study can be done with large sample size.
- 4) Other factors can be taken.

#### SOURCE OF FUNDING: self CONFLICT OF INTEREST: None ETHICAL CLEARENCE: Parul university institutional ethics committee for human research (PU-IECHR).

#### ABSTRACT

A dominating set S of vertices of a graph G without isolated vertices is an independent semitotal dominating set if it is an independent dominating set and to each u in S there is a v in S at a distance exactly two. The independent semitotal domination number of a graph is the minimum size of an independent semitotal dominating set of vertices in G. In this paper, we have obtained the bounds for independent semitotal domination number in the Cartesian product of paths, path with a cycle and cycles.

#### AMS Subject Classification: 05C69

**Keywords:** Cartesian Product of graphs, Total Domination, Semitotal Domination, Independent Semitotal Domination,

### INTRODUCTION

Let G = (V, E) be a graph. A set S of vertices of G is a dominating set if for each v in V – S there is a u in S such that uv is an edge. The minimum and maximum cardinality of a minimal dominating set of G are the domination number  $\gamma(G)$  and upper domination number  $\Gamma(G)$  respectively.

#### Sabari Manju and Padmavathi

A dominating set S of G is an independent dominating set if  $\langle S \rangle$  consists of isolate vertices. *i*(G), the independent domination number of G is the minimum cardinality of a minimal independent dominating set. The maximum cardinality of a maximal independent set of vertices of G is the independence number of G, denoted by  $\beta_0$ (G).

The concept of semitotal domination was introduced in[1]

A set S of vertices of a graph G without isolated vertices is a semitotal dominating set of G if it is a dominating set of G and every vertex in S is within distance 2 of another vertex of S. The semitotal domination number denoted by  $\gamma_{l2}(G)$  is the minimum cardinality of a minimal semitotal dominating set.

An inequality domination chain of a graph connects various parameters was established in [2] as follows  $ir(G) \le \gamma(G) \le i(G) \le \beta_0(G) \le \Gamma(G) \le IR(G)$ .

From the motivation of semitotal domination we introduced a parameter, independent semitotal domination number that lies between independent domination number, i(G) and independence number  $\beta_0(G)$  [3].

A set S of vertices of G is an independent semitotal dominating set if S is an independent dominating set and for each u in S there is a v in S at a distance exactly two. The minimum and maximum cardinality of a minimal independent semitotal dominating set are called the independent semitotal domination number  $\gamma_{ii2}(G)$  and upper independent semitotal domination number  $\Gamma_{ii2}(G)$  of G respectively.

This parameter lies between independent domination number i(G) and independence number  $\beta_0(G)$  of a graph. The parameter  $\gamma_{it2}(G)$  extends the chain as

 $ir(G) \leq \gamma(G) \leq \gamma_0(G) \leq i(G) \leq \gamma_{it2}(G) \leq \Gamma_{it2}(G) \leq \beta_0(G) \leq \Gamma_0(G) \leq \Gamma(G) \leq IR(G)$ 

Every graph has a  $\beta_0$  set which is also an independent semitotal dominating set, hence its existence is guaranteed for all non-complete graph. For complete graph  $\beta_0(K_n) = 1$  and hence  $\gamma_{it2}(K_n)$  is set as 1.

Example 1.1

 $i(G) = |\{f, d, h\}| = 3.$   $\gamma_{it2}(G) = |\{f, a, k, e, g\}| = 5.$   $\beta_0(G) = |\{b, c, i, j, d, h\}| = 6$  $i(G) < \gamma_{it2}(G) < \beta_0(G)$ 

The Cartesian graph product  $G \square$  H called graph product of graphs is a graph with  $V(G \square H) = V(G)xV(H)$  and  $(g_1,h_1)$   $(g_2,h_2) \in E(G \square H)$  iff either  $g_1 = g_2$  and  $h_1h_2 \in E(H)$  or  $g_1g_2 \in E(G)$  and  $h_1=h_2$ .

In this paper we have obtained the bounds for the Cartesian product of paths, path with a cycle and cycles.

#### Sabari Manju and Padmavathi

# CARTESIAN PRODUCT OF PATHS Theorem 2.1

(i) 
$$\gamma_{ii2}(P_2 \Box P_n) = \frac{2n}{3} + 1 \text{ for } n = 3k, k = 1,2,3...$$
  
(ii)  $\gamma_{ii2}(P_2 \Box P_n) = \left[\frac{2(n+1)}{3}\right] \text{ for } n \neq 3k$ 

#### Proof

Let  $V(P_2 \Box P_n) = \{(c_1, d_i), (c_2, d_j)\}$  where i, j = 1, 2, ..., n be the vertex set of  $P_2 \Box P_n$ . When  $n = 2 \neq 3k$ , the set  $S = \{(c_1, d_1), (c_2, d_2)\}$  forms a  $\gamma_{it2}$ - set.

$$\gamma_{it2}(\mathbf{P}_2 \Box \mathbf{P}_2) = 2 = \left\lceil \frac{2(n+1)}{3} \right\rceil$$

When n = 3 = 3k, the set  $S = \{(c_1, d_1), (c_2, d_2), (c_1, d_3)\}$  forms a  $\gamma_{it2}$ - set.

$$\gamma_{it2}(P_2 \Box P_3) = 3 = \frac{2n}{3} + 1.$$

When  $n = 4 \neq 3k$ , the set  $S = \{(c_1, d_i), (c_2, d_j)\}$  where i = 1, 3 and j = 2, 4 forms a  $\gamma_{it2}$ - set.

$$\gamma_{it2}(\mathbf{P}_2 \Box \mathbf{P}_4) = 4 = \left| \begin{array}{c} \frac{2(n+1)}{3} \end{array} \right|$$

When  $n = 5 \neq 3k$ , the set  $S = \{(c_1, d_i), (c_2, d_j)\}$  i = 1,4 and j = 2,5 forms a  $\gamma_{it2}$ - set.

$$\gamma_{i12}(P_2 \square P_5) = 4 = \left\lceil \frac{2(n+1)}{3} \right\rceil$$

In general n = 3k, the set  $S = \{(c_1, d_i), (c_2, d_j)\}$  where i = 1, 4, ..., n and j = 2, 5, ..., n - 1 forms a  $\gamma_{it2}$ - set.

(c<sub>1</sub>, d<sub>i</sub>) has  $\frac{n}{3}$  +1 terms and (c<sub>2</sub>, d<sub>j</sub>) has  $\frac{n}{3}$  terms. Therefore  $\gamma_{it2}(P_2 \Box P_n) = \frac{2n}{3} + 1$ . When  $n \neq 3k$ , the set  $S = \{(c_1, d_i), (c_2, d_j)\}$  where  $i = 1, 4, \dots, n-1$  and  $j = 2, 5, \dots, n$  forms a  $\gamma_{it2}$ - set. (c<sub>1</sub>, d<sub>i</sub>) has  $\left\lceil \frac{n+1}{3} \right\rceil$  terms and (c<sub>2</sub>, d<sub>j</sub>) has  $\left\lceil \frac{n+1}{3} \right\rceil$  terms. Therefore  $\gamma_{it2}(P_2 \Box P_n) = \left\lceil \frac{2(n+1)}{3} \right\rceil$ 

#### Theorem 2.2

- (i)  $\gamma_{it2}(P_3 \Box P_2) = 3$
- (ii)  $\gamma_{it2}(P_3 \square P_3) = 4$

(iii)  $\gamma_{it2}(P_3 \Box P_n) = n \text{ for } n \ge 4$ 

#### Proof

(i) For  $P_3 \square P_2$ , let  $V(P_3 \square P_2) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k)\}$  where  $i_i j_i k = 1, 2$  be the vertex set of  $P_3 \square P_2$ . The set  $S = \{(c_1, d_1), (c_2, d_2), (c_3, d_1)\}$  forms a  $\gamma_{i12}$ -set. Therefore  $\gamma_{i12}(P_3 \square P_2) = 3$ .

(ii) For  $P_3 \square P_3$ , let  $V(P_3 \square P_3) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k)\}$  where  $i_i j_i k = 1, 2, 3$  be the vertex set of  $P_3 \square P_3$ . The set  $S = \{(c_1, d_2), (c_2, d_1), (c_2, d_3), (c_3, d_2)\}$  forms a  $\gamma_{i12}$ - set. Therefore  $\gamma_{i12}(P_3 \square P_3) = 4$ .

(iii) For  $P_3 \square P_n$ , let  $V(P_3 \square P_n) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k)\}$  where i, j, k = 1, 2, ..., nWhen n is even, the set  $S = \{(c_1, d_i), (c_3, d_k)\}$  where i = 1, 3, 5, ..., n-1 and k = 2, 4, ..., n forms a  $\gamma_{it2}$ - set.

(c<sub>1</sub>, d<sub>i</sub>) has  $\frac{n}{2}$  terms and (c<sub>3</sub>, d<sub>k</sub>) has  $\frac{n}{2}$  terms. Therefore  $\gamma_{it2}(P_3 \Box P_n) = n$  for  $n \ge 4$ .

#### Sabari Manju and Padmavathi

When n is odd, the set S = {( $c_1$ ,  $d_i$ ), ( $c_3$ ,  $d_k$ )} where i = 1,3,5,...n and k = 2,4,...n-1 forms a  $\gamma_{i12}$ -set.

(c<sub>1</sub>, d<sub>i</sub>) has  $\frac{n}{2}$  terms and (c<sub>3</sub>, d<sub>k</sub>) has  $\frac{n}{2}$  terms. Therefore  $\gamma_{i12}(P_3 \Box P_n) = n$  for  $n \ge 4$ .

#### Theorem 2.3

(i)  $\gamma_{it2}(P_4 \Box P_n) = n+2$  when n is even

(ii)  $\gamma_{it2}(P_4 \Box P_n) = n+1$  when n is odd

#### Proof

#### (i) When n is even

 $V(P_4 \Box P_n) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k), (c_4, d_l)\}$  where  $i_1 j_1 k_1 l = 1, 2, ... n$ 

Choose  $(c_1, d_1)$ ,  $(c_3, d_1)$  in the 1<sup>st</sup> column and  $(c_2, d_3)(c_4, d_3)$  in the 3<sup>rd</sup> column. Proceeding like this choose upto  $(c_2, d_{n-1})(c_4, d_{n-1})$  in the  $(n-1)^{th}$  column. Since n is even, P<sub>4</sub>  $\square$  P<sub>n</sub> has even number of columns. And two vertices are chosen in each column alternatively. Therefore total number of columns with chosen vertices is n/2. For domination, we have to choose  $(c_1, d_n)(c_3, d_n)$  in the n<sup>th</sup> column additionally. Total number of vertices to form a  $\gamma_{i12}$ - set is n+2.

Therefore  $\gamma_{it2}(P_4 \Box P_n) = n+2$ .

(ii) When n is odd

Choose (c<sub>1</sub>, d<sub>1</sub>), (c<sub>3</sub>, d<sub>1</sub>) in the 1<sup>st</sup> column and (c<sub>2</sub>, d<sub>3</sub>)(c<sub>4</sub>, d<sub>3</sub>) in the 3<sup>rd</sup> column. Proceeding like this choose upto (c<sub>1</sub>, d<sub>n</sub>)(c<sub>3</sub>, d<sub>n</sub>) in the n<sup>th</sup> column. Since n is odd,  $P_4 \square P_n$  has odd number of columns. Therefore total number of  $P_4 \square P_n$  has odd number of columns.

columns having the chosen vertices is  $\frac{n+1}{2}$ . Since two vertices are chosen in each column alternatively to form a

 $\gamma_{it2}$ - set. Therefore  $\gamma_{it2}(P_4 \Box P_n) = n+1$ .

#### CARTESIAN PRODUCT OF PATH WITH CYCLE

Theorem 3.1

(i) 
$$\gamma_{it2}(P_2 \square C_n) = \frac{2n}{3} n \equiv 0 \pmod{3}$$

(ii) 
$$\gamma_{it2}(P_2 \square C_n) = \left\lceil \frac{2n+3}{3} \right\rceil n \equiv 1 \pmod{3}$$

(iii) 
$$\gamma_{it2}(P_2 \square C_n) = \left\lfloor \frac{2n+3}{3} \right\rfloor n \equiv 2 \pmod{3}$$

Proof

(i) When  $n \equiv 0 \pmod{3}$ 

Let n = 3,  $V(P_2 \square C_3) = \{(c_1, d_i), (c_2, d_j)\}$  where i, j = 1, 2, 3 be the vertex set.

The set S = {(c<sub>1</sub>, d<sub>1</sub>), (c<sub>2</sub>, d<sub>2</sub>)} forms a 
$$\gamma_{ii2}$$
- set. Therefore  $\gamma_{ii2}(P_2 \square C_3) = 2 = \frac{2n}{3}$ 

Let n = 6,  $V(P_2 \square C_6) = \{(c_1, d_i), (c_2, d_j)\}$  where i, j = 1, 2, 3, 4, 5, 6 be the vertex set. The set  $S = \{(c_1, d_i), (c_2, d_j)\}$  where i = 1, 4 and j = 2, 5 form a  $\gamma_{i12}$ - set.

Therefore 
$$\gamma_{it2}(P_2 \square C_6) = 4 = \frac{2n}{3}$$

In general for n, the set S = {(c<sub>1</sub>, d<sub>i</sub>), (c<sub>2</sub>, d<sub>j</sub>)} where i = 1,4,...n-2 and j = 2,5,...n-1 forms a  $\gamma_{i12}$ - set. (c<sub>1</sub>, d<sub>i</sub>) has  $\frac{n-2}{3}$  + 1 terms and (c<sub>2</sub>, d<sub>j</sub>) has  $\frac{n-1}{3}$  terms.

Therefore  $\gamma_{it2}(P_2 \Box C_n) = \frac{2n}{3}$ 

(ii) When  $n \equiv 1 \pmod{3}$ 

#### Sabari Manju and Padmavathi

Let n = 4, V(P<sub>2</sub> C<sub>4</sub>) = {(c<sub>1</sub>, d<sub>i</sub>), (c<sub>2</sub>, d<sub>j</sub>)} where i, j = 1,2,3,4 be the vertex set. The set S = {(c<sub>1</sub>, d<sub>i</sub>), (c<sub>2</sub>, d<sub>j</sub>)} where i = 1,3 and j = 2,4 forms a  $\gamma_{ii2}$ -set. Therefore  $\gamma_{ii2}(P_2 \Box C_4) = 4 = \left\lceil \frac{2n+3}{3} \right\rceil$ In general for P<sub>2</sub>  $\Box$  C<sub>n</sub>, the set S = {(c<sub>1</sub>, d<sub>i</sub>), (c<sub>2</sub>, d<sub>j</sub>)} where i = 1,4,...n-1 and j = 2,5,...n forms a  $\gamma_{ii2}$ -set. (c<sub>1</sub>, d<sub>i</sub>) has  $\frac{n-1}{3} + 1$  terms and (c<sub>2</sub>, d<sub>j</sub>) has  $\left\lceil \frac{n+1}{3} \right\rceil$  terms. Therefore  $\gamma_{ii2}(P_2 \Box C_n) = \left\lceil \frac{2n+3}{3} \right\rceil$ (iii) When n = 2 (mod 3) Let n = 5, V(P\_2 \Box C\_5) = {(c<sub>1</sub>, d<sub>i</sub>), (c<sub>2</sub>, d<sub>j</sub>)} where i, j = 1,2,3,4,5 be the vertex set. The set S = {(c<sub>1</sub>, d<sub>i</sub>), (c<sub>2</sub>, d<sub>j</sub>)} where i = 1,3 and j = 2,4 forms a  $\gamma_{ii2}$ - set.

$$\gamma_{\rm it2}(\mathrm{P}_2 \Box \mathrm{C}_5) = 4 = \left\lfloor \frac{2n+3}{3} \right\rfloor$$

In general S = {(c<sub>1</sub>, d<sub>i</sub>), (c<sub>2</sub>, d<sub>j</sub>)} where i = 1, 4, ..., n-1 and j = 2, 5, ..., n forms a  $\gamma_{it2}$ - set.

(c<sub>1</sub>, d<sub>i</sub>) has 
$$\left\lfloor \frac{n-1}{3} \right\rfloor + 1$$
 terms and (c<sub>2</sub>, d<sub>j</sub>) has  $\frac{n+1}{3}$  terms  
Therefore  $\gamma_{it2}(P_2 \square C_n) = \left\lfloor \frac{2n+3}{3} \right\rfloor$ 

#### Theorem 3.2

(iii)  $\gamma_{it2}(P_3 \square C_n) = n+1 \quad n \equiv 2 \pmod{3}$ 

#### Proof

(i) When  $n \equiv 0 \pmod{3}$ 

Let n = 3,  $V(P_3 \Box C_3) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k)\}$  where i,j,k = 1,2,3 be the vertex set. The set  $S = \{(c_1, d_1), (c_2, d_2), (c_3, d_1)\}$  forms a  $\gamma_{i12}$ -set. Therefore  $\gamma_{i12}(P_3 \Box C_3) = 3 = n$ . Let n = 6,  $V(P_3 \Box C_6) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k)\}$  where i,j,k = 1,2,3,4,5,6 be the vertex set. The set  $S = \{(c_1, d_i), (c_2, d_j), (c_3, d_k)\}$  where i = 1,4 j = 3,5 k = 1,4 forms a  $\gamma_{i12}$ -set. Therefore  $\gamma_{i12}(P_3 \Box C_6) = 6 = n$ .

For the first three columns, two vertices  $(c_1, d_1)$ ,  $(c_3, d_1)$  are chosen in  $1^{st}$  column and one vertex is chosen in  $3^{rd}$  column to form Independent semitotal domination.

Similarly for the next three columns, we need three vertices to form independent

semitotal domination. Hence for n columns, we need  $3\left(\frac{n}{3}\right)$  vertices to form independent semitotal domination.

(ie)  $\gamma_{it2}(P_3 \Box C_n) = n.$ (ii) When  $n \equiv 1 \pmod{3}$ 

Therefore n-1 is a multiple of 3. As in case (i) we need  $3\left(\frac{n-1}{3}\right)$  vertices up to n-1 column. Additionally we need one

vertex in the n<sup>th</sup> column and two vertices in the (n-1)<sup>th</sup> column to form independent semitotal domination.

#### Sabari Manju and Padmavathi

Therefore for P<sub>3</sub>  $\square$  C<sub>n</sub>, we need  $3\left(\frac{n-1}{3}\right) + 3$  vertices to form a  $\gamma_{i12}$ - set.

Therefore  $\gamma_{it2}(P_3 \Box C_n) = n+2$ (iii) When  $n \equiv 2 \pmod{3}$ 

Therefore n-2 is a multiple of 3. As in case (i) we need  $3\left(\frac{n-2}{3}\right)$  vertices to form independent semitotal

domination up to  $(n-2)^{th}$  column. Additionally we need one vertex in the  $n^{th}$  column and two vertices in the  $(n-1)^{th}$  column.

Therefore for P<sub>3</sub>  $\square$  C<sub>n</sub>, we need  $3\left(\frac{n-2}{3}\right) + 3$  vertices to form a  $\gamma_{i12}$ - set.

Therefore  $\gamma_{it2}(P_3 \Box C_n) = n+1$ .

#### Theorem 3.3

(i)  $\gamma_{it2}(P_4 \Box C_n) = n$   $n \equiv 0 \pmod{4}$ (ii)  $\gamma_{it2}(P_4 \Box C_n) = n+3$   $n \equiv 1 \pmod{4}$ (iii)  $\gamma_{it2}(P_4 \Box C_n) = n+2$   $n \equiv 2 \pmod{4}$ 

(iv)  $\gamma_{it2}(P_4 \square C_n) = n+1 \quad n \equiv 3 \pmod{4}$ 

#### Proof

Let  $V(P_4 \Box C_n) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k), (c_4, d_l)\}$  where i, j, k, l = 1, 2, ..., n be the vertex set. Let n= 3, the set S =  $\{(c_1, d_1), (c_2, d_3), (c_3, d_1), (c_4, d_3)\}$  form a  $\gamma_{it2}$ - set.

 $\gamma_{it2}(P_4 \square C_3) = 4 = n+1.$ 

(i) When  $n \equiv 0 \pmod{4}$ 

Let n = 4. The set S = {(c<sub>1</sub>, d<sub>1</sub>), (c<sub>2</sub>, d<sub>3</sub>), (c<sub>3</sub>, d<sub>1</sub>), (c<sub>4</sub>, d<sub>3</sub>)} forms a  $\gamma_{it2}$ - set.

(ie) two vertices are chosen in the n<sup>th</sup> column. Thus  $\gamma_{it2}(P_4 \square C_4) = 4 = n$ .

Let n = 8. The set  $S = \{(c_1,d_i), (c_2,d_j), (c_3,d_k), (c_4,d_i)\}$  where i=1,5 j=3,7 k=1,5 and l=3,7 forms a  $\gamma_{i12}$ -set. (ie) Two vertices are chosen in 1<sup>st</sup>, 3<sup>rd</sup>, 5<sup>th</sup>, and 7<sup>th</sup> column.

Thus  $\gamma_{it2}(P_4 \square C_8) = 8 = n$ .

In general for  $P_4 \square C_n$  , two vertices should be chosen in n/2 columns.

Therefore 
$$\gamma_{it2}(P_4 \square C_n) = 2\left(\frac{n}{2}\right) = n.$$

(ii) When  $n \equiv 1 \pmod{4}$ 

Let n = 5. The set S = {( $c_1$ , $d_i$ ), ( $c_2$ , $d_j$ ), ( $c_3$ , $d_k$ ), ( $c_4$ , $d_1$ )} where i=1,4 j=3,5 k=1,4 and l=3,5 forms a  $\gamma_{i12}$ -set. Therefore  $\gamma_{i12}(P_4 \square C_5) = 8 = n+3$ 

Here two vertices are choosen up to  $3^{rd}$  column (ie) up to  $(n-2)^{th}$  column alternatively. Then again two vertices are chosen in  $4^{th}$  and  $5^{th}$  column (ie)  $(n-1)^{th}$  and  $n^{th}$  column.

This pattern is carried over for all n = 1 (mod 4). So in general, we need  $2\left(\frac{n-2+1}{2}\right)+4$  vertices to form a  $\gamma_{it2}$ -

set.

Therefore  $\gamma_{it2}(P_4 \square C_n) = n+3$ 

(iii) When  $n \equiv 2 \pmod{4}$ 

Let n = 6. The set S = {(c<sub>1</sub>,d<sub>i</sub>), (c<sub>2</sub>,d<sub>j</sub>), (c<sub>3</sub>,d<sub>k</sub>), (c<sub>4</sub>,d<sub>1</sub>)} where i=1,5 j=3,6 k=1,5 and l=3,6 forms a  $\gamma_{it2}$ - set. Therefore  $\gamma_{it2}(P_4 \square C_6) = 8 = n+2$ 

Here two vertices are chosen in each alternatively (ie) from 1<sup>st</sup>, 3<sup>rd</sup>,5<sup>th</sup> column and two vertices are chosen in last column (ie) 6<sup>th</sup> column.

#### Sabari Manju and Padmavathi

In general, two vertices are chosen upto n-1 column alternatively and two vertices are

Chosen in the n<sup>th</sup> column. Therefore  $\gamma_{it2}(P_4 \square C_n) = 2 \frac{(n-1)+1}{2} + 2 = n+2$ 

(iv) When  $n \equiv 3 \pmod{4}$ 

Let n = 7. The set S = {(c<sub>1</sub>,d<sub>i</sub>), (c<sub>2</sub>,d<sub>j</sub>), (c<sub>3</sub>,d<sub>k</sub>), (c<sub>4</sub>,d<sub>1</sub>)} where i=1,5 j=3,6 k=1,5 l=3,6 forms a  $\gamma_{it2}$ - set. Therefore  $\gamma_{it2}(P_4 \square C_7) = 8 = n+1$ 

Here two vertices are chosen in each alternatively (ie) from  $1^{st}$ ,  $3^{rd}$ ,  $5^{th}$  column and two vertices are chosen in  $6^{th}$  column.

In general, two vertices are chosen upto n-2 column alternatively and two vertices are

Chosen in the (n-1)<sup>th</sup> column. Therefore 
$$\gamma_{it2}(P_4 \square C_n) = 2 \frac{(n-2)+1}{2} + 2 = n+1$$

#### CARTESIAN PRODUCT OF CYCLES

**Theorem 4.1** For  $n \ge 3$ ,  $\gamma_{it2}(C_3 \Box C_n) = n$ .

#### Proof

Let  $V(C_3 \Box C_n) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k)\}$  where i, j, k = 1, 2, 3..., n be the vertex set of  $C_3 \Box C_n$ .

Choose one vertex in each column such that all are independent and for every chosen vertex there should be another chosen vertex at distance two. These vertices forms independent semitotal domination. Since there are 'n' number of columns, 'n' number of vertices are chosen to form  $\gamma_{i12}$ -set. Therefore  $\gamma_{i12}(C_3 \square C_n) = n$ .

#### Theorem 4.2

- (i)  $\gamma_{it2}(C_4 \square C_3) = 4.$
- (ii)  $\gamma_{it2}(C_4 \Box C_4) = 4.$
- (iii)  $\gamma_{it2}(C_4 \square C_5) = 6.$
- (iv)  $\gamma_{it2}(C_4 \Box C_n) = n. \text{ for } n \ge 6$

#### Proof

(i) Let  $V(C_4 \square C_3) = \{ (c_1, d_i), (c_2, d_j), (c_3, d_k), (c_4, d_i) \}$  where i,j,k,l = 1,2,3 be the vertex set of  $C_4 \square C_3$ . The set  $S = \{ (c_1, d_1), (c_2, d_3), (c_3, d_2), (c_4, d_3) \}$  forms a  $\gamma_{it2}$ - set. Therefore  $\gamma_{it2}(C_4 \square C_3) = 4$ . (ii) Let  $V(C_4 \square C_4) = \{ (c_1, d_i), (c_2, d_j), (c_3, d_k), (c_4, d_1) \}$  where i,j,k,l = 1,2,3,4 be the vertex set of  $C_4 \square C_4$ . The set  $S = \{ (c_1, d_1), (c_2, d_3), (c_3, d_1), (c_4, d_3) \}$  forms a  $\gamma_{it2}$ - set. Therefore  $\gamma_{it2}(C_4 \square C_4) = 4$ . (iii)Let  $V(C_4 \square C_5) = \{ (c_1, d_i), (c_2, d_j), (c_3, d_k), (c_4, d_1) \}$  where i,j,k,l = 1,2,3,4,5 be the vertex set of  $C_4 \square C_5$ . The set  $S = \{ (c_1d_i), (c_2,d_5), (c_3,d_k), (c_4,d_5) \}$  where i=1,3 and k=2,4 forms a  $\gamma_{it2}$ - set. Therefore  $\gamma_{it2}(C_4 \square C_4) = 6$ . (iii)Let  $V(C_4 \square C_5) = \{ (c_3, d_1), (c_2, d_1), (c_3, d_4), (c_4, d_1) \}$  where i=1,2,3,4,5 be the vertex set of  $C_4 \square C_5$ .

(iv)Let  $V(C_4 \square C_n) = \{(c_1, d_i), (c_2, d_j), (c_3, d_k), (c_4, d_l)\}$  where i,j,k,l = 1,2,3...n be the vertex set of  $C_4 \square C_n$ . Choose one vertex in each column such that each should be independent and at a distance two with another vertex. Therefore  $\gamma_{i12}(C_4 \square C_n) = n$ .

#### ABSTRACT

Predicting water quality is essential for assuring the availability of clean, safe drinking water, safeguarding aquatic ecosystems, and efficiently managing water resources. The ability of machine learning algorithms to model complicated interactions and produce precise forecasts has made them viable tools for predicting water quality in recent years. Support Vector Machine (SVM) is well known among machine learning techniques and has been extensively used in many disciplines, including water quality prediction. This research thoroughly analyzes current studies on SVM-based water quality prediction. The drawbacks of conventional approaches for predicting water quality are explored, emphasizing the demand for cutting-edge machine learning technologies. The study then thoroughly analyzes several SVM-based methods for forecasting water quality, including various kernel functions, feature selection techniques, and model evaluation procedures, before providing a general review of SVM and outlining its guiding principles, benefits, and drawbacks. The SVM model can manage high-dimensional data, cope with non-linear relationships, and make accurate predictions. The need for large datasets, the selection of the appropriate kernel functions, and issues with uneven data are all noted as challenges and restrictions of SVM-based water quality prediction. Also, possible directions for further research, such as combining SVM with other machine learning algorithms, incorporating domain expertise, and creating ensemble approaches for predicting water quality are considered and discussed. Finally, by improving water management practices, SVM can assist people all around the world to have access to safe and clean drinking water. SVM has demonstrated good results when used to predict waterquality.

Keywords: Support Vector Machine (SVM), Machine Learning (ML), Water Quality Prediction

#### INTRODUCTION

No one can live without water, thereby making water a crucial environmental factor. Water quality directly impacts human health, ecosystem sustainability, and economic growth. Monitoring and predicting water quality is essential for ensuring the availability of clean-safe drinking water, protecting aquatic habitats, and managing water resources effectively. The traditional approach used in predicting water quality, such as laboratory analysis and manual monitoring, are frequently labor-intensive, expensive, and time-consuming, making them unsuitable for real-time monitoring and decision-making.<sup>1,2</sup>

Due to the capacity of SVM to analyze enormous datasets, model intricate relationships, and

produce precise forecasts, machine learning techniques have recently come to the limelight as a promising tool for predicting water quality. Support Vector Machine (SVM), one of the many machine learning algorithms, has drawn a lot of interest in predicting water quality due to its demonstrated and proven performance in managing high-dimensional data, addressing non-linear relationships, and producing reliable forecasts. SVM is a supervised learning technique that is adaptable for various water quality prediction issues because it can be utilized for both classification and regressiontasks.<sup>3,5,7</sup>

# This research work aims to present a thorough overview of SVM-based water qualityprediction. The evaluation of the literature on

SVM-based methods for predicting water quality will emphasize the methods' benefits, drawbacks, and potential future directions. The difficulties and factors to be taken into account while using SVM to forecast water quality, including the choice of the best kernel functions, feature selection strategies, model evaluation procedures, and treatment of unbalanced data, will also be covered in this work. <sup>4,6,8</sup>

#### **Related Works**

A review of machine learning techniques for forecasting water quality, including SVM, artificial neural networks, and decision tree- based algorithms, was done by Muthukumaravelet al. in 2021. In addition to highlighting the significance of data preparation, feature selection, and model validation in machine learning-based water quality prediction, they also

#### Material and Method

This study's objective is to predict the elements of water quality using machine learning (ML) technology known as Support Vector Machines

(SVM). An overview of the used ML model is given.

#### Support Vector Machine (SVM)

Support Vector Machine is a supervised learning machine learning algorithm that is greatly used for pattern recognition, classification, and regressions. Function fitting is one of the most popular applications of SVM, so the component of SVM that uses it is known as support vector regression (SVR). Minimizing the error that is different between the model output and observed data is the aim of function fitting using SVM. This can be viewed as an optimization problem, and the following is its mathematical formulation:

Minimize:

$$\underset{\substack{\iota \neq \iota \\ \iota = 1}}{\operatorname{R}_{svm}} (\omega, \zeta^*) = \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 + \frac{1}{2} \|\omega\|^2 +$$

explored the benefits and drawbacks of these methods. The review provides insights into the difficulties and prospective directions in this areawhile highlighting the promise of machinelearning in forecasting water quality metrics like dissolved oxygen, pH, and nutrient levels [5]. Also, in 2020, Khan and Muhammad conducted an analysis of SVM-based water quality prediction models with an emphasis on the difficulties, uses, and potential future developments in this area. They examined the limits of SVM, including its sensitivity to hyperparameter tuning, choice of kernel functions, and management of unbalanced data, and they reviewed numerous research that used SVM for water quality prediction in various locales and water bodies. The analysis also highlighted the possibility of adopting other machine learning strategies to boost the precision of water quality predictions, including ensemblemethods and deep learning [4]. **Subject:** 

$$d_{i} - \omega \varphi(x_{i}) + b_{i} \leq \varepsilon + \xi_{i}$$
$$\omega \varphi(x_{i}) + b_{i} - d_{i} \leq \varepsilon + \xi_{i}$$
$$\xi_{i}, \xi_{i}^{*} \geq 0, 1, \dots, 1,$$

where the normal vector is  $\omega$ , with a regularization factor of  $\frac{1}{2} ||\omega||^2$ , C is also the penalty of error factor, *b* as the bias,  $\varepsilon$  as the errorfunction,  $x_i$  input factor,  $d_i$  is the target value, *l* is the number of elements in the training dataset,  $\varphi(x_i)$  is feature space, and  $\xi_i$  and  $\xi^* i$  as the upper lower excess deviation respectively. <sup>1,8,10</sup> The kernel functions are given as:

Linear kernel:  $K(x_i, x_i) = x_i^T x_i$ i. Polynomial kernel:  $K(x_i, x_j) = (x_i^T x_j + \gamma)^d$ , ii.  $\gamma$ > 0iii. RBF kernel:  $K(x_i, x_j) = exp(-\gamma \mid \mid x_i - x_j \mid \mid)^2, \gamma >$ 0 Sigmoid kernel:  $k(x_i, x_j) = \tanh(\gamma x_i^T x_j + r), \gamma >$ iv. 0 the variables *xi*, *xj* are inputs, and  $\gamma$  –

regularization parameter,  $\alpha_i = \alpha_i - \alpha_i$  is the Lagrange multiplier. The prediction accuracy is based on three parameters,  $\gamma$ ,  $\varepsilon$  and *C*, whose values are determined with the firefly algorithm.

### Data Collection (Water Dataset)

Water quality measures for 3276 distinct water bodies are included in the water quality dataset that was taken from Kaggle. Ph, hardness, solids, chloramines, sulphate, conductivity, organic carb on, trihalomethanes, turbidity, and potability were a few of the metrics in the dataset.

pH value: When assessing the acid-base balance of water, PH is a crucial metric. It also serves as a gauge for the

### Gideon Asante and Kaushal Singh

water's acidic or alkaline quality. The pH range between 6.5 and 8.5 has been suggested by WHO. The range of the present investigation was 6.52 to 6.83, which is within the range of WHO criteria.

**Hardness**: Salts of calcium and magnesium are the major contributors to hardness. These salts are released by the geologic formations that water passes through. The ability of water to form soap due to calcium and magnesium precipitation was the original definition of hardness.

**Solids (Total dissolved solids, or TDS):**Numerous inorganic and organic minerals or salts, such as bicarbonates, chlorides, magnesium, sulphates, potassium, calcium, and sodium, can be dissolved by water. These minerals gave the water an undesirable taste and diminished color. This is a crucial variable while using water. Water with a high TDS rating is one that has a high mineral content. The recommended TDSlevel for drinking purposes is 500 mg/l, with a maximum limit of 1000 mg/l.

**Chloramines**: In public water systems, chlorine and chloramine are the main disinfectants utilized. The process of treating drinking water with chlorine and ammonia most frequently results in chloramine formation. The safest level of chlorine in drinking water is 4 mg/L, or 4ppm.

**Sulphate**: Sulphates are organic compounds that are naturally present in rocks, soil, and minerals. They can be found in the surrounding air, groundwater, vegetation, and food. Sulphate is mostly used in the chemical industry for commercial purposes. The amount of sulphate in saltwater is around 2,700 mg/L. The majority of freshwater sources have values between 3 and 30 mg/L, while certain regions have substantially higher levels (1000 mg/L).

**Conductivity**: Pure water is an excellent insulator of electrical current rather than a good conductor of current. Increased ion concentration improves water's ability to carry electricity. Electricalconductivity is often based on the quantity of dissolved particles in water. A solution's ionic process, which makes it possible for it to transfer electricity, is really measured by electrical conductivity (EC). The EC value should not be more than 400 S/cm, as per WHOguidelines.

**Organic Carbon**: Both synthetic and naturally occurring organic matter (NOM) contribute to the total organic carbon (TOC) in source waters. The total amount of carbon (TOC) in organic compounds in pure water is a measurement of this. US EPA estimates that treated drinking water has 2 mg/L of TOC and that source water, which is used for treatment, contains 4 mg/Lit.

**Trihalomethanes (THMs)**: These are substances that can be detected in water that has been chlorinated. The amount of organic matter present, the quantity of chlorine required to treat the water, and the temperature of the treated water all affect the THM levels in drinking water. THM levels up to 80 ppm in drinking water are regarded as safe.

**Turbidity:** Water turbidity is influenced by how much solid matter is present in a suspended condition. It measures the water's ability to produce light, and the test is used to determine how well waste is discharged in terms of colloidal particles. The mean turbidity value achieved (0.98 NTU) is lower than the WHO's recommended limit of 5.00 NTU.

**Potability:** Determines if water is fit for human consumption, with 1 denoting drinkable and 0 denoting unfit for potable.

### **Data Preprocessing**

Pre-processing procedures were used to clean up the gathered data, find outliers, and impute missing values. Suitable methods, such as mean, median, or interpolation, were used to impute missing or null data.

### Gideon Asante and Kaushal Singh

### **Feature Selection**

The right factors for predicting water quality metrics were chosen using feature selection approaches including correlation analysis, feature importance, and domain knowledge. Themachine learning model's input variables were the characteristics that were chosen.

### **Model Evaluation**

Several measures, including accuracy, precision, recall, F1-score, and R-squared, were used to assess how well the machine learning models performed. Different algorithms' performances were examined, and the one that performed the best in terms of accuracy and robustness was chosen.

### **Statistical Analysis**

For the water quality metrics, descriptive statistics including mean, median, standard deviation, and range were determined. The correlations between various factors were found using correlation analysis. Data preparation, model creation, and model assessment were doneusing statistical tools like Python.

# **RESULTS AND DISCUSSION**

### The SVM model was trained using the preprocessed water quality dataset from Kaggle

(water quality dataset), and evaluated using various performance metrics. The following results were obtained:

**Precision**: For class 0, which denotes water not potable, the precision of the SVM model was determined to be 0.69, meaning that the model accurately predicted 69% of the instances. With a precision of 0.68 for class 1 (good water quality or potable water), the model successfully predicted 68% of theinstances of good water quality.

**Recall**: The SVM model's recall for class0 was determined to be 0.92, meaning that 92% of the examples with poor waterquality were correctly detected by themodel. The recall for class 1 was 0.30, meaning that 30% of the instances with good water quality were accurately detected by the model.

**F1-score:** The SVM model for class 0's F1-score, which balances accuracy and recall, was determined to be 0.79. The model performed worse in predicting good water quality than poor waterquality, as evidenced by the F1-score forclass 1 of 0.42.

**Support**: In the test dataset, the SVM model had a total of 680 samples for class 0 (poor water quality) and 402 samples for class 1 (good water quality).

Accuracy and Macro/Micro Average: The SVM model's accuracy was determined to be 0.69, meaning that it accurately predicted thewater quality parameters in 69% of the test dataset cases.

Precision, recall, and F1-score were estimated tohave macro averages of 0.69, 0.61, and 0.60, respectively. The micro average and accuracy were both 0.69. In contrast to the micro average, which treats all classes equally, the macro average averages performance measures across all classes.

The SVM model's findings show that it performs considerably better in terms of accuracy, recall, and F1-score for class 0 (Non-Potable Water) than for class 1 (Potable Water). This indicates that the model performs worse at recognizing instances with good water quality but performs better at predicting cases withpoor water quality. The model may have more false negatives, or instances of good water quality that are not accurately detected by the model, given the lower recall and F1-score for class 1. The imbalanced dataset's greater sample count for class 0 than for class 1 might be one factor contributing to the performance gap between the two classes. The lower recall for class 1 mayalso have an impact on decision-making regarding water quality or potability, since falsenegatives may lead to insufficient responses to poor water quality.

### Gideon Asante and Kaushal Singh

The performance of the SVM model can be improved by more research and adjustments, such as balancing the dataset using oversampling or under sampling strategies or investigating alternative machine learning algorithms that may be better able to handle unbalanced datasets. The performance of the SVM model may also be enhanced by using cross-validation methods, feature engineering, and model hyper parameter adjustment.

# CONCLUSION

With considerably greater accuracy, precision, recall, and F1-score for class 0 (poor waterquality) compared to class 1 (good water quality), the SVM model demonstrated reasonable performance in predicting water quality characteristics from the provided dataset. The findings emphasize the significance of resolving unbalanced datasets and further developing the model to increase its accuracy in predicting instances of low water quality and enhance reasoned decision-makingin attempts to regulate water quality.

# ABSTRACT

Fluoride is one of the most common chemical in water capable of causing adverse health effects, such as dental and skeletal fluorosis, reproductive and neurological effects, and endocrine disorder. This review investigates the amount of fluoride in drinking water is transmitted to the maternal serum and cord blood. A comprehensive literature search was done in five electronic databases of Medline, Scopus, Web of science, Cochrane library and Embase using variant Medical Subject Headings(MeSH) and free terms from 1950 to September 2022. Nine articles were finalized based on the inclusion and exclusion criteria. The minimum fluoride level in drinking water recorded was 0.06 ppm and maximum was 10 ppm in the included studies. In the maternal serum the fluoride levels ranged from 0.014 to 14.1 ppm whereas in cord blood 0.011 to 13.6 ppm Within the limitations of this review it can be concluded that as the fluoride concentration in drinking water increases, the fluoride levels in maternal and cord blood also increases.

Keywords :- Drinking water fluoride, pregnancy, maternal fluoride, cord blood fluoride .

Thippeswamy et al.,

# INTRODUCTION

Excessive fluoride intake over a long period of time may result in a serious public health problem called fluorosis, which is characterized by dental mottling and skeletal manifestations such as crippling deformities, osteoporosis, and osteosclerosis. Endemic fluorosis is now known to be global in scope, occurring on all continents and affecting many millions of people(1) Fluoride is one of the most common chemical in water capable of causing adverse health dental skeletal reproductive effects, such as and fluorosis, and neurological effects, and endocrine disorders(2). Exposure to fluoride is common among people around the world. Water and water based beverages are the main sources of systemic ingestion, accounting for approximately 75% of dietary intake. The national toxicology program (NTP) at the national institute of health concluded that prenatal exposure to high levels of fluoride can alter neurodevelopment. Fluoride readily crosses the placenta. Animal studies have proved that fluoride accumulates in critical brain regions involved in learning and memory in foetuses. Biomarkers of fluoride (eg. Urinary fluoride, serum fluoride) directly correlate with fluoride exposure levels (water fluoride concentration, fluoride supplement exposure) in children and pregnant women(3).

99% of the fluoride in humans is found in the hard tissues like bones and teeth, and the rest 1% in soft tissues. The transfer of fluoride from mother through the placenta to the foetus is not very clear as put forth by previous research(4). Although the mechanisms of maternal-foetal transmission of fluoride are poorly understood, many studies have proven that fluoride can readily pass across the placenta and ultimately increase fluoride levels in foetal tissue. Many articles pertaining to the advantages and adverse effects of fluoride on pregnant women and foetuses have also been published(5). Presently many studies have proved that fluoride affects the calcium and vitamin D levels and has neurological effects in foetuses and children. Literature search related to the correlation of fluoride levels in drinking water with fluoride levels in maternal serum and cord blood yielded no reviews. Hence this review was done to check the amount of fluoride transferred from drinking water to maternal serum and then cord blood.

# METHODOLOGY

The protocol for this systematic review was in accordance with the Preferred reporting Items for Systematic Review and Meta Analysis (PRISMA) guidelines.

### Data source and search strategy

A comprehensive literature search was conducted by two investigators from June 2020 to December 2022. All comprehensive searches related to placental passage of fluoride was carried out with computerized search of five electronic databases of Medline, Scopus, Web of science, Cochrane library and Embase using Medical Subject Headings(MeSH) and free terms from 1950 to December 2022.

### Search strategy

Based on the review question keywords were identified and used for the searches. The search was done using key words in different combinations like fluoride OR Water fluoride OR drinking water fluoride AND maternal fluoride OR pregnant women serum fluoride AND placental barrier OR cord blood OR placental passage OR cord blood fluoride OR placental fluoride. The search was supplemented by hand searching of journals and scanning of references.

### Inclusion and exclusion criteria

The present review was undertaken with the following inclusion criteria (i) Studies involving subjects with full term pregnancies (ii) Studies clearly mentioning or assessing drinking water fluoride, maternal serum/plasma fluoride and cord blood fluoride levels (iii) Studies with drinking water fluoride as the only parameter.

Thippeswamy et al.,

The studies were excluded based on the following criteria (i) Studies not mentioning the level of fluoride in drinking water, maternal plasma and cord blood (ii) Conference abstracts, articles for which full texts were not available. (iii) Animal studies

### Data extraction

Based on the inclusion and exclusion criteria, nine studies were finalized for the present systematic review(5-13)(Figure 1). Data from eligible studies were extracted into a pre-defined data extraction excel file using a predefined list of variables. Our outcome of interest was to correlate the amount/level of fluoride in drinking water to maternal serum/plasma fluoride levels. Data was extracted and segregated under - name of the author, year, location, number of subjects, drinking water fluoride levels, maternal fluoride levels and cord blood fluoride levels. The study selection, data extraction and risk of bias assessment were performed by at least two independent reviewers and consensus was reached in the case of disagreement.

### Quality of evidence of the included studies

The quality of the included studies was evaluated using Joanna Briggs Institute(JBI) <sup>14</sup> critical appraisal tool for systematic reviews of analytical cross sectional studies. For each included study, two authors evaluated seven item checklist and scored the JBI questions as :"yes", "no", "unclear" and "not applicable". The final score was determined by the number of "yes" answers. Based on the number of "yes" answer each article was categorized as "low" risk of bias(ROB)( scores more than 70%), "moderate" ROB( scores from 50 to 69%) and finally "high" ROB if article scores equal or lower than 49%. If there was any confusion between two authors for scoring, third author resolved it. The agreement between the two authors for evaluating was 84%.

### RESULTS

The key features of the eligible studies are presented in table 1. Few studies were excluded though they assessed maternal fluoride and cord blood fluoride as they did not mention about drinking water fluoride(details mentioned in figure 1). Majority of the studies showed placental transfer of fluoride increased as the fluoride levels in drinking water also increased. Few studies mentioned drinking water fluoride without categorizing as low and high fluoride levels (9-11,13) while some studies categorized water fluoride level(5-8,12). World health organization recommends 0.7 to 1.2 ppm fluoride level in drinking water. Majority of the eligible studies were at par or below the WHO recommended levels. The minimum fluoride level in drinking water recorded was 0.06 ppm and maximum was 10 ppm in the included studies. In the maternal serum the fluoride levels ranged from 0.014 to 14.1 ppm whereas in cord blood 0.011 to 13.6 ppm. Among the included studies, fluoride levels were lower in maternal serum and cord blood than in drinking water except in studies by Gardner DW<sup>6</sup> et al and Teotia M(8) et al. Gardner DW(6) et al reported fluoride levels in maternal serum to be higher than in drinking water. But, in a study by Teotia M(8) et al fluoride levels were higher in both maternal and cord blood.(table 1) Out of nine studies only two studies(5,8) reported the placental transfer of fluoride when fluoride in drinking water was above WHO recommended levels. Both the studies observed the results eight to ten times more maternal and cord blood fluoride levels as compared to at or below the 1 ppm of fluoride in drinking water. Most of the studies used ion specific fluoride electrode method for assessment of fluoride. Except for studies by Thippeswamy et al (5) (2020) and Moshe Ron(9) (1985), all other studies used small sample size to assess maternal and cord blood fluoride levels.

### Risk of bias of the included studies

The overview of the ROB of the included studies were presented in Table 2. Out of nine studies seven studies were belong to low risk category. Gardner Dw et al and I. Gedalia et al were scored under moderate category. Both these studies were assessed fluoride levels using Smith and Gardner method and colorimetric methods. All other seven studies fluoride was assessed using Orion ion specific fluoride electrode method which is considered to be most valid and reliable method.

Thippeswamy et al.,

# DISCUSSION

Fluoride (F) is an essential trace element, but chronic exposure beyond the permissible limit (1.5 ppm) effectuates dental and skeletal fluorosis(15). The present review tried to find the relationship between fluoride present in drinking water and maternal serum/plasma fluoride and cord blood fluoride. Placenta and umbilical cord are two components of the fetal life support system of a developing fetus inside the uterus. Placenta absorbs nutrients and oxygen from mother's bloodstream and transfers to the fetus via the umbilical cord. The main difference between placenta and umbilical cord is that placenta is a temporary organ which joins mother and the fetus whereas umbilical cord is the connecting link between developing fetus and the placenta of the mother. Placenta is divided into maternal part and fetal part. Maternal placenta bears the maternal origin whereas fetal placenta and the umbilical cord blood is considered as purely belonging to fetal origin(16).

The role of the placenta in the movement of fluoride from the mother to the fetus is unclear because of conflicting evidence as to whether fluoride intake or maternal blood fluoride affects the concentration found in the fetus(17). Many aspects of a newborn's health and wellbeing seem to be affected by the mother's nutritional status before and during pregnancy. Fluoride is an important element for the development of foetus and hence needs to be evaluated(18). The present review found nine studies reporting the levels of fluoride present in drinking water of the pregnant women and amount of fluoride transferred through placenta. The results showed direct relationship between drinking water fluoride of the pregnant women, maternal fluoride and placental transfer of fluoride. The results observed from the previous studies show that irrespective of fluoride levels present in drinking water, placenta acts as a partial barrier.

The US Public Health Service set the optimal fluoride concentrations in water from 0.7 to 1.2mg/L to achieve the maximum reduction in tooth decay and minimize the risk of enamel fluorosis Fluorosis, or mottling, of the tooth enamel is due to excess fluoride intake from any source occurring during the period of tooth development. However, the beneficial effects of fluoride predominantly occur at the tooth surface after the teeth have erupted. Therefore, there is no benefit of systemic exposure to fluoride during pregnancy. The evidence showing an association between fluoride exposure and lower IQ scores raises a possible new concern about cumulative exposures to fluoride during pregnancy, even among pregnant women exposed to optimally fluoridated water for the prevention of caries in offspring [25] It is very difficult to draw conclusion from the previous studies because none of the studies have considered dietary history related to fluoride and all the included studies were from different parts of the world with different food habits and practices. I Gedalia et al<sup>7</sup>(1964) conducted a study in three different drinking water fluoride levels but did not include samples (more than 1 ppm) from high fluoride areas. Two groups 0.5 to 0.6 ppm and 0.6 to 0.9 ppm samples obtained the same results. Gardner DW et al<sup>6</sup> (1952) conducted study using very low fluoride levels(0.06ppm) in one group and optimum level in another group(1.0 to 1.2 ppm). The result showed that both the groups had higher fluoride levels in maternal serum than in drinking water. Though the fluoride levels in both the groups varied drastically, the fluoride levels in cord blood varied marginally.

# CONCLUSION

Within the limitations of this review it can be concluded that as the fluoride concentration in drinking water increases, the fluoride levels in maternal serum/plasma and in cord blood also increases. Though enormous research has been conducted related to effects of fluoride on human health, research related to the exact amount of fluoride transferred from mother to fetus are sparse. Further, well planned research related to the transfer of fluoride from drinking water of mother to foetus needs to be carried out using large sample size to add more information regarding this subject.

Thippeswamy et al.,

### ACKNOWLEDGEMENT

The authors would like to acknowledge library information centre , JSS dental college and hospital for providing information and access subscribed by the institution.

### Conflict of interest :- None

**Funding** :- This systematic review did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

# ABSTRACT

Aim of the present paper is to study the heat and mass transfer in MHD fluid flow past two different geometries, a wedge and a cone, in the presence of chemical reaction and joule heating. It is assumed that the wedge and cone are saturated in porous medium. The Brownian motion and thermophoresis effects are taken into account with non-isothermal and non-isosolutal conditions. The coupled non-linear partial differential equations governing the system are reduced into nonlinear ordinary differential equations by considering similarity transformation. Bvp5c solver of MATLAB is used to find numerical solutions. The influence of various parameters on velocity, temperature, concentration profiles are shown through graphs and skin friction coefficient, Nusselt number, Sherwood number are discussed numerically. A comparative analysis of above mentioned profiles and quantities of physical interest for both the geometries have also been done.

Keywords: MHD, thermophoresis, Brownian motion, chemical reaction, Joule heating .

# INTRODUCTION

There are many applications such as condensers, power plants, engine cooling, thermal energy storage devices, groundwater systems, paper industry, polymer industry, and high-temperature nanomaterial technology where a high rate of heat transfer is required. To enhance the rate of heat transfer, a variety of methods have been discussed by scientists and engineers. Among them, one method is there, in which nanometre-sized particles are added to some base fluid. The nanometre sized particles are called nanoparticles and have a great capacity to enhance the heat transfer rate when mixed in various base fluids like water, ethylene glycol, oil etc. These nanoparticles can be carbon nanotubes, metal oxides, carbides and metals. The principle of enhancing thermal conductivity by dispersing nano particles in base fluid was given by Choi [1]. Later, Sun et al. [2] used SiC-nanoparticles of sizes 10-20-40-60 nm with

### Sharad Sinha et al.,

base fluid water and showed that thermal conductivity increases with the increasing size of nanoparticles. Upreti et al. [3] considered a stretching flat plate in a porous medium and investigated the MHD flow of Ag-water nanofluid with Ohmic-viscous dissipation effects, heat generation/absorption, and suction/injection.Sinha et al. [4] investigated heat source/sink and chemical reaction effects on MHD stagnation point nano fluid flow. They used vertical stretching sheet saturated in porous media. Boundary layer flow over a wedge has thermal engineering applications such as the extraction of crude oil, thermal insulation of heat exchangers, groundwater pollution, and the storage of nuclear waste, etc.To analyze this,Uddin et al. [5] considered tangent hyperbolic nanofluid and Carreaunanofluid across a wedge and studied heat as well as flow properties.Heat and mass transfer of hybrid nanofluid flow over curved bodies like cones, ellipses, wavy channels, torus geometries, spherical geometries, cylinders, etc. have a wide range of applications in industry, engineering, and biological science. Fluid flow through a cone has many applications in designing solar energy collectors, steam generators, spacecraft, and nuclear reactors, etc.An analysis of free convection over cone and wedge was done by Ramanaiah and Malarvizhi [6]. They considered mixed thermal boundary conditions and found dual solutions to the problem for flow of CoFe<sub>2</sub>O<sub>4</sub> with water at 100°C and 500°C.

All the models mentioned above are based on single-phase flow. In a single-phase flow, it is assumed that the nanoparticles are fixed with the particles of the base fluid i.e. there is no relative motion between nanoparticles and base fluid. But the assumption is not always true as the nanoparticles move randomly in the base fluid.Buongiorno [7] considered this effect in his model and presented a detailed study on it.Mishra and Upreti [8]analysed Fe<sub>3</sub>O<sub>4</sub>– CoFe<sub>2</sub>O<sub>4</sub>/EG–water and Ag–MgO/water hybrid nanofluid flow along a curved body and concluded that the mass transfer rate is proportional to Brownian motion and curvature parameters while the other parameters show an opposite trend.Reddy et al. [9] considered MHD nanofluid flow over a vertical cone with convective boundary conditions and explained Brownian motion and thermophoresis effects. Dawar et al. [10] extended the above study for Williamson nanofluid flow through wedge and cone with suction/injection. Jile et al. [11]analyzed the MHD radiated flow with ferrous nanoparticles over a cone numerically. Vajravelu and Nayfeh [12] discussed heat transfer and convection flow in a viscous electrically conducting fluid over a cone and wedge.Butt et al. [13] studied the heat transfer in viscous fluid flow along a horizontal stretching cylinder and analyzed the effect of magnetic field on entropy generation.

The present paper aimed to investigate the thermophoresis and Brownian motion effects on a mixed convective magnetohydrodynamic nanofluid flow over a vertical cone and wedge with joule heating and chemical reaction. The study has many applications in the field of manufacturing and industries. This includes power plants, thermal energy storage devices, crude oil extraction, groundwater pollution, nuclear reactors, solar power collectors, textile coatings and biomedicine, etc.It is also planned in the study to perform a comparative analysis of various effects on flow along both geometries.

# MATHEMATICAL FORMULATION

Steady 2-dimensional mixed convective laminar flow of viscous incompressible nanofluid over two different geometries (cone and wedge) is taken into account. The geometries are saturated in porous medium. The x-axis is along the wall of the geometry and y-axis is taken normal to it. The flow is induced by the stretching velocity  $u_w (= x v/L^2)$  of the surface in the direction of x-axis. The wall of the geometry is assumed to be permeable, so that

the fluid can flow through it with suction/injection velocity  $V_w$ . To control the flow, an external magnetic field B is applied parallel to the y -axis. Along with this, Brownian motion, thermophoresis, joule heating and chemical reaction effects are considered in the problem. If the half angle of cone and wedge is taken as  $\gamma$ , then conditions for cone and wedge are as follows:

(i) Cone:  $\gamma \neq 0$  and m = 1(ii) Wedge:  $\gamma \neq 0$  and m = 0

### Sharad Sinha et al.,

The governing equations of flow (see ref. [9], [10], [11]) are given by:  $p_{1}(m_{1}, m_{2}) = p_{2}(m_{2}, m_{2})$ 

$$\frac{\partial (r^{m}u)}{\partial x} + \frac{\partial (r^{m}v)}{\partial y} = 0 \qquad (1)$$

$$u\frac{\partial u}{\partial x} + v\frac{\partial u}{\partial y} = v\frac{\partial^{2}u}{\partial y^{2}} + g\beta_{T}(T - T_{\infty})\cos\gamma - \frac{\sigma B^{2}}{\rho}u - \frac{v}{K_{1}}u \qquad (2)$$

$$u\frac{\partial T}{\partial x} + v\frac{\partial T}{\partial y} = \frac{\kappa}{\rho C_p}\frac{\partial^2 T}{\partial y^2} + \tau \left(D_B\frac{\partial C}{\partial y}\frac{\partial T}{\partial y} + \frac{D_T}{T_{\infty}}\left(\frac{\partial T}{\partial y}\right)^2\right) + \frac{\sigma B^2}{\rho C_p}u^2$$
(3)

$$u\frac{\partial C}{\partial x} + v\frac{\partial C}{\partial y} = D_B \frac{\partial^2 C}{\partial y^2} + \frac{D_T}{T_{\infty}} \frac{\partial^2 T}{\partial y^2} - K_r \left(C - C_{\infty}\right)$$
(4)

Here, u and v denote component of velocity in x and y-directions, respectively. r is the radius of the cone. T and C are fluid temperature and concentration,  $D_B$  and  $D_T$  are the coefficient of Brownian motion and thermophoresis,  $K_1$  is the coefficient of permeability of the porous medium,  $K_r$  is the coefficient of chemical reaction, v and  $\kappa$  are kinematic viscosity and thermal conductivity of fluid.

The temperature and concentration conditions at the wall are considered as non-isothermal and non-isosolutal. Under these assumption the boundary conditions can be represented as (see ref. [10])

$$u = u_{w} = \frac{x\nu}{L^{2}}, v = -v_{w}, T = T_{w} = T_{\infty} + ax^{r_{1}}, C = C_{w} = C_{\infty} + bx^{r_{2}} \text{ at } y = 0$$

$$u = 0, T = T_{\infty}, C = C_{\infty} \qquad \text{as } y \to \infty$$
(5)

In the boundary conditions a & b are constants and  $r_1 \& r_2$  denote wall temperature &concentration parameter, respectively.

### METHOD OF SOLUTION

In the present time, many methods are available to handle nonlinear coupled partial differential equations with boundary conditions. Here, the method of similarity transformation has been used to convert the problem into a system of ordinary differential equations, and for this, the following similarity variable, transformation & dimensionless quantities are introduced:

$$\eta = \frac{y}{L}, u = \frac{x\upsilon}{L^2} f'(\eta), v = -\frac{\upsilon(1+m)}{L} f(\eta), \theta(\eta) = \frac{T-T_{\infty}}{T_w - T_{\infty}}, \phi(\eta) = \frac{C-C_{\infty}}{C_w - C_{\infty}}$$
(6)

Upon using (6) in equations (1)-(4) it has been observed that the equation of continuity is automatically satisfied, while the remaining equations take the following non dimensional form:

$$f^{\prime\prime\prime} + ff^{\prime\prime} - f^{\prime 2} + \lambda \cos \gamma \,\theta - \left(M + \frac{1}{K}\right)f^{\prime} = 0 \tag{7}$$

$$\theta^{\prime\prime} + \left(-r_1 f^{\prime} \theta + \left(1+m\right) f \theta^{\prime} + \theta^{\prime} \left(N_b \phi^{\prime} + N_t \theta^{\prime}\right) + M Ec f^{\prime 2}\right) Pr = 0$$
(8)

$$\phi'' + \left( \left( 1 + m \right) f \, \phi' - r_2 \, f' \, \theta - K_r^{*} \phi \right) Sc + \frac{N_t}{N_b} \theta'' = 0 \tag{9}$$

### Sharad Sinha et al.,

where prime denotes differentiation with respect to  $\eta$  and the dimensionless parameters are symbolised as:

$$\lambda \left( = \frac{Gr}{Re_x} \right) \text{mixed convection parameter, } Gr \left( = \frac{g\beta_T \left(T_w - T_w\right)}{\upsilon^2} L^3 \right) \text{Grashof number, } Re_x \left( = \frac{u_w x}{\upsilon} \right) \text{Reynolds}$$

$$\text{number, } M \left( = \frac{\sigma B^2}{\rho} \frac{L^2}{\upsilon} \right) \text{magnetic parameter, } K \left( = \frac{K_1}{L^2} \right) \text{permeability parameter, } Pr \left( = \frac{\upsilon}{\alpha} \right) \text{Prandtl number,}$$

$$\alpha \left( = \frac{\kappa}{\rho C_p} \right) \text{thermal} \qquad \text{diffusivity, } N_b \left( = \frac{\tau D_B \left( C_w - C_w \right)}{\upsilon} \right) \text{Brownian} \qquad \text{motion} \qquad \text{parameter,}$$

$$N_t \left( = \frac{\tau D_T \left( T_w - T_w \right)}{\upsilon T_w} \right) \text{thermophoresis} \qquad \text{parameter, } Ec \left( = \frac{u_w^2}{C_p \left( T_w - T_w \right)} \right) \text{Eckert} \qquad \text{number, } Sc \left( = \frac{\upsilon}{D_B} \right)$$
Schmidt number and  $K_r^* \left( = \frac{K_r L^2}{\upsilon} \right)$  chemical reaction parameter.

$$f = S, f' = 1, \theta = 1, \phi = 1 \text{ at } \eta = 0$$
  

$$f' = 0, \theta = 0, \phi = 0 \quad \text{as } \eta \to \infty$$
(10)  
where  $S\left(=\frac{v_w L}{\upsilon(1+m)}\right)$  is the section/injection parameter.

In the study, physical quantities of interest are nondimensional shear stress and rate of heat &mass transfer at the surface. These are given by

$$C_{f} = \frac{2\tau_{w}}{\rho u_{w}^{2}} = 2 \operatorname{Re}_{x}^{-1/2} f''(0)$$

$$Nu_{x} = \frac{xq_{w}}{\kappa (T_{w} - T_{\infty})} = -\operatorname{Re}_{x}^{1/2} \theta'(0)$$

$$Sh_{x} = \frac{xJ_{w}}{D_{B} (C_{w} - C_{\infty})} = -\operatorname{Re}_{x}^{1/2} \phi'(0)$$
(11)

where the dimensional shear stress, heat & mass flux are given by

$$\tau_w = \mu \frac{\partial u}{\partial y}\Big|_{y=0}, \ q_w = -\kappa \frac{\partial T}{\partial y}\Big|_{y=0} \text{ and } J_w = -D_B \frac{\partial C}{\partial y}\Big|_{y=0}$$

Equations (7)-(9) describe a system of nonlinear coupled ordinary differential equations with boundary conditions (10). To solve these equations numerically along with boundary conditions, bvp5c technique (an inbuilt MATLAB program) has been used. This technique is based on finite difference method implementing four stage Lobatto IIIa formula [14].

The above said technique works on system of first order differential equations and to obtain the system from equations (7)-(9) the following expressions are used:

$$f = f_1, f' = f_2, f'' = f_3, f''' = f_3', \theta = f_4, \theta' = f_5, \theta'' = f_5', \phi = f_6, \phi' = f_7, \phi'' = f_7'$$

63952

The reduced system of first order differential equations is given as:

$$\begin{aligned}
f_{1}' &= f_{2} \\
f_{2}' &= f_{3} \\
f_{3}' &= f_{2}^{2} - f_{1}f_{3} + \left(M + \frac{1}{K}\right)f_{2} + \lambda\cos\gamma f_{4} \\
f_{4}' &= f_{5} \\
f_{5}' &= \left(r_{1}f_{2}f_{4} - (1+m)f_{1}f_{5} - f_{5}\left(N_{b}f_{7} + N_{t}f_{5}\right) - M Ec f_{2}^{2}\right)Pr \\
f_{6}' &= f_{7} \\
f_{7}' &= \left(r_{2}f_{2}f_{6} + K_{r}^{*}f_{6} - (1+m)f_{1}f_{7}\right)Sc - \frac{N_{t}}{N_{b}}f_{5}'
\end{aligned}$$
(12)

and respective boundary conditions are

$$\begin{array}{c} f_1(0) = S, \ f_2(0) = 1, \ f_4(0) = 1, \ f_6(0) = 1 \\ f_2(\infty) = 0, \ f_4(\infty) = 0, \ f_6(\infty) = 0 \end{array} \right\}$$
(13)

To achieve high accuracy in numerical computations, the stepsize is taken of order  $10^{-4}$ . A comparative study has been performed in the next section to validate the solution procedure.

## **RESULTS AND DISCUSSION**

In this section, the outcomes of the study are discussed through graphs and tables. Also, a comparative study has been performed between the present and previous studies in Table 1 to verify the correctness of the method.

It is found from the Table 1 than, under limiting cases the present results are in great agreement with previously published results. While plotting graphs and preparing tables, the value of parameter to be analysed is varied and the rest of the parameters are kept as M = 1, K = 100,  $\lambda = 0.2$ , Pr = 5,  $N_{b} = 0.3$ ,

$$N_t = 0.1, Ec = 0.1, r_1 = 0.1, r_2 = 0.1, S = 0.1, \gamma = \pi / 4, Sc = 1$$
 and  $K_r^* = 0.2$ 

Figure 2(a)-(c) presents the effect of magnetic parameter on various fluid profiles. It is observed that increasing magnetic parameter produces a hike in retarding force called Lorentz force due to which velocity decreases. This retardation converts the kinetic energy into thermal energy and uplifts the temperature. Also, the increased magnetic parameter generates a high capacity in the magnetic field to hold fluid particles, which enhances the concentration profile. The porous media with larger permeability assists the fluid to flow through the porous media with more ease. This assistance enhances the fluid velocity and diminishes the temperature as observed in Figure 3(a)-(b). The consequences of increasing suction parameter are depicted in Figure 4 (a)-(c). When the suction parameter is large, more amount of fluid will be sucked by the surface and causes a drop in fluid velocity. Also, the temperature and concentration at the surface have been taken higher that the free stream, so, increasing suction parameter results in diminishing fluid temperature and concentration. Effects of thermophoresis and Brownian motion parameters on fluid temperature and concentration are shown in Figure 5(a)-(b)&Figure 6(a)-(b). Increasing thermophoresis parameter creates more temperature difference between the surface and free stream, due to which hot fluid particles move from surface to fluid and uplift the fluid temperature and concentration. Also, increasing Brownian motion parameter strengthens the colliding nature of particles. Due to this nature, the nanoparticles get scattered and their concentration decreases and more heat generates which results in enhanced temperature. Figure 7&Figure 8 exhibit the effects of surface temperature and surface concentration on fluid temperature and concentration respectively. As the surface temperature or concentration increases, the difference between the surface temperature/concentration

### Sharad Sinha *et al.*,

and free stream temperature/concentration will increase and that causes a drop in fluid temperature or concentration profile. The consequences of increasing Schmidt number or chemical reaction parameter on fluid concentration are presented through Figure 9&Figure 10. For increased Schmidt number or chemical reaction parameter, the concentration profile diminishes. This is because large Schmidt number or chemical reaction parameter corresponds to lesser mass diffusivity and provides more assistance to molecular deterioration. The effects of above discussed dimensionless numbers and parameters on physical quantities of interest i.e. shear stress, rate of heat & mass transfer at the surface are presented in Table 2, Table 3, and Table 4. It is well known that in fluid flow, shear stress is proportional to velocity. Thus upliftment in shear stress can be noticed as the fluid velocity enhances. From Table 2, it is clear that the skin friction coefficient uplifts for larger permeability parameter, while the opposite impact is observed for magnetic parameter and suction parameter. Also, the rate of heat/mass transfer at the surface corresponds to the temperature/concentration difference between the surface and ambient fluid, so, as the difference increases there will be high rate of heat/mass transfer. It is observed from Table 3 that there is upliftment in the Nusselt number at the surface for larger permeability parameter, suction parameter, and surface temperature, while it goes down for magnetic parameter, thermophoresis, or Brownian motion parameter. Table 4 summarizes that increasing the surface concentration, Schmidt number, chemical reactivity parameter or Brownian motion parameter leads to an increase in the Sherwood number while the opposite effect is observed for the magnetic parameter, suction parameter or thermophoresis parameter.

In this work two types of geometries are considered. First is cone (for which m = 1) and second is wedge (for which m = 0). A comparative study of effects of various parameters on these two geometries is presented here. From Figures 2(a), 3(a) & 4(a) it can be seen that fluid velocity is high for cone than wedge. This is because there is lesser contact between fluid particles and the surface of the cone, rather than the wedge. Similarly, from temperature and concentration profiles for various parameters, it is observed that both temperature and concentration boundary layer thickness are lesser for the cone compared to the wedge. Also, from Tables 2, 3&4 it is noted that skin friction, rate of heat & mass transfer are higher for the cone rather than the wedge.

# CONCLUSION

The Brownian motion and thermophoresis effects on a mixed convective MHD flow of nanofluid over a vertical permeable cone & wedge with chemical reaction and joule heating have been explored. Some important results are summarized as follows:

- 1. Fluid temperature enhances with uplifting values of thermophoresis and Brownian motion parameters.
- 2. Surface temperature has a proportionality relation with the rate of heat transfer.
- 3. Fluid concentration can be decreased by uplifting the suction parameter or chemical reaction parameter.
- 4. For a high rate of heat & mass transfer cone should be used rather than wedge.
- 5. Skin friction is high for cone and can be diminished by enhancing the suction parameter.

# ABSTRACT

when age progress the physical fitness reduces. Less Physical Fitness leads to major disorders affects both Physical and Psychological health conditions. To measure the prevalence of Hamstring flexibility, Aerobic capacity and Balance with sit and reach test, Step test and One leg stand test in villages of Waghodia Taluka, Vadodara. Total 370 Community dwelling middle age women Age raging from 40 – 60 years were included in the study to measure prevalence of Hamstring Flexibility, Aerobic capacity and Balance with sit and reach test, Step test and One leg stand test. All subjects collected from villages of Waghodia Taluka, Vadodara. This study is concluded that 45.94% Participants have less flexibility assess with using sit and reach test, 44.59% Participants have Below average heart rate assess with using Step Test and 61.62% Participants have less balance assess with One leg stand test.

**Keywords:** Community dwelling middle age women, sit and reach test, Step test, One leg stand test, Hamstring Flexibility, Aerobic Capacity and Balance.

# INTRODUCTION

When aging process with time, lesser the physical activity leads mainly to disorders and condition which both affects physical and psychological health condition.[1] Considering women's physical activities are lower than men.[2] Lower activities and movements which are major causes of the lesser functional ability.[3,4] Which is significantly related to higher risk of mortality.[5] Noted down frequently age related changes in women's health around the

### Madhavi Sontakkey and Nidhi Vasava

menopause and further beyond.. Regular physical activity has been widely shown to be well-established protective factor which is related to the prevention and the management of a vast number of severe pathological conditions.[6] The Physical fitness can be defined as "the ability to carry out the daily tasks with alertness and vigor, without undue fatigue and with ample energy to enjoy leisure - time pursuits and to meet unforeseen emergencies."[7] Both Exercise and Physical activities are directly relating to high levels of functional fitness, and the smallest change which may be extremely important to the maintenance of functionality in the daily tasks, as well as for the prevention of falls.[8] Physical activities are primary cause of the most pathologies. Physical activity (PA) plays an important role in prevention and treatment of many disease, such as hypertension, diabetes mellitus, heart disease, stroke, colon, breast, endometrium and pulmonary cancer, osteoporosis, obesity and depression.[9] Significant Increasing evidences suggests that being physically inactive with lowering levels of cardiorespiratory fitness are causing the worse cognitive functions in multiple populations of adults.[10] The components of physical finesses which are related to health, include strength, flexibility , endurance of muscles, body composition and cardiovascular & pulmonary endurance.[11]

The Physical fitness is very related to functional limitations.[12] There are some hosts of changes which are associated with a new hormonal environment around the menopausal transition period, such increase in the bodyweight and waist circumferences. In women, Middle Ages are characterized by the biological transformations determined by menopause, which can have the adverse consequences on body weight and metabolic, cardiovascular and bone health. Therefore, to maintain theAdequate level of physical functions, there is a must need to participate in appropriate physical fitness activities.[13] Ability to adapt and perform activities of daily living as well as on personal, social and professional function in the general population are greatly affected by the regular PA.[14]

Regular physical activity practicing promotes an enhancement on the physical fitness parameters, F supported by evidences and which contributes directly to the functional capacity and life quality, of the operating individuals.[15] Women who has been transitioned through perimenopause to post menopause has a declination in muscle strength and muscle power on average of 2-3%, which may suggests that the decline in the physical functioning accelerates already during midlife.[16] Further more to that, little is currently known about the importance of Physical Activity(PA) performed during the different time periods (e.g. 35 - 50 Vs. 50 - 65 years) for maintenance of the muscle mass at old age. Interestingly noted that, we and others have previously showed that PA performed earlier in the life has potential of influencing the physical functions at old age era.[17] So the Need arises Less physical activity leads to a major disorder in middle aged women. Due to increased exposure to risk factors such as Sedentary lifestyle, obesity, lack of physical activity and sometimes malnutrition. The disorders can cause long periods of work disability and treatment is often necessary. This study is helpful to find Physical fitness level with flexibility, aerobic capacity and balance in community dwelling middle age women. Aimed of the study is to evaluate the prevalence of flexibility, aerobic capacity and balance among community dwelling middle age women.

# MATERIAL AND METHODOLOGY

- STUDY DESIGN: A Cross sectional study
- STUDY POPULATION: Middle age women from villages of Waghodia taluka
- SOURCE OF DATA: Villages of Waghodia taluka
- SAMPLE METHOD:
- > SAMPLE SIZE: These study 370 samples were collected from middle age women.
- SAMPLING: Online calculator
- > SELECTION OF SAMPLE: Random sampling (chit method).

### INCLUSION CRITERIA

- Age: 40 60 years old women
- Only housewives who are functionally independent are included

### Madhavi Sontakkey and Nidhi Vasava

### EXCLUSION CRITERIA

- Subject who has any prior musculoskeletal conditions, neurological conditions, or vestibular disorders that limits their exercise ability
- Conditions in which the exercises are contraindicated severe aortic stenosis, uncontrolled arrhythmia & acute coronary syndrome 0
- Cancer
- Amputation
- Subjects who are physically disable
- Systemic diseases

#### MATERIAL USED:

- Paper
- Pen
- Pencil
- Stopwatch
- Metronome
- Measure tape
- Stepstool(12inch)

#### **OUTCOME MEASURES:**

- Sit and reach test
- Step test
- One leg stand test

#### Procedure

A total 370 samples were collected who are fulfilling the inclusion criteria and exclusion criteria. Different villages of waghodiya taluka were selected where the study was conducted this study, data was collected by using sit and reach test, step test and one leg stand test. A series of different villages were visited and each village women was given a brief introduction and also explained the purpose and procedure of the study. The subject once understands and is willing to participate in the study, a consent form was handed over to each subject in which she fills the basic details and must sign the form. With the use of sit and reach test three readings each for the hamstring flexibility, step test for the aerobic capacity and one leg stand test for the balance.

### STATISTICAL ANALYSIS

### STATISTICAL SOFTWARE

- For the analysis of the data IBM SPSS version 20 was used.
- Graphs and tables were also generated by Microsoft Excel and Microsoft Word.

### STATISTICAL METHOD

• Descriptive analysis was done which include Age, inch measurement for v sit and reach test, heart rate for step test and seconds for one leg stand test.

### RESULT

Graph 1 shows the age distribution Graph 2 Shows the distribution of sit and reach test Graph 3 shows the distribution of step test Graph 4 shows the One leg stand test

## DISCUSSION

This study aimed to measure the physical fitness in community dwelling middle age women with sit and reach test, Step test and one leg stand test in villages around Parul University. This study has shown, the physical fitness in community dwelling middle aged women. This shows a need for improving physical fitness in community dwelling middle age women. This results are consist with literature on prevalence of hamstring flexibility, aerobic capacity and balance among community dwelling middle age women but unfortunately, no studies specifically looking at community dwelling middle age women. In this study, Graph 1 shows the Age group distribution of 370 middle age women which ranges between 40 - 60 years of age. All these middle age women were divided into 7 age groups. Those 7 age groups are: 40 - 44 years of age (15.4%), 45 - 49 years of age (24.48%), 50 - 54 years of age (22.97%), 55 - 59 years of age (28.1%), 60 - 64 years of age (8.64%). Graph 2 shows the categorization of hamstring flexibility of 370 middle age women. All the participants were categorized into 3 different categories according to sit and reach test. The hamstring flexibility of our participants varied from -6 to +4 inch. Their hamstring flexibility distribution are -(45.94%), 0(18.91%) and + (35.13%). Graph 3 shows the categorization of step test of 370 community dwelling middle age women. All the participants were categorized into 5 different categories according to their aerobic capacity in HR. The HR of our participants varied from 93 -140 HR. Their HR distribution are <93 (0), 94 - 106 (18.91%), 107 - 117 (26.48%), 118 - 130 (44.59%), >131 (10%). Graph 4 shows the categorization of one leg stand test of 370 community dwelling middle age women. All the participants were categorized into 5 different categories according to their balance in Secs. The balance in secs of our participants varied from 3.1 – 15.6 Secs. Their balances in Sec distribution are 61.62% in less than 10 sec and 38.87% more than 10 sec.

# CONCLUSION

From this study is concluded that 45.94% Participants have less flexibility assess with using sit and reach test, 44.59% Participants have Below average heart rate assess with using Step Test and % Participants have less balance assess with One leg stand test.

**ACKNOWLEDGMENT** Not Applicable

SOURCE OF FUNDING Self

### ETHICAL APPROVAL

Ethical approval was obtained from the institutional review board from Parul institute of Physiotherapy, waghodia, Vadodara.

CONFLICT OF INTEREST None

### CONSENT FOR PUBLICATION

All individuals participating in this research signed a informed consent form prior to their inclusion in the study.

### LIMITATION

Physical Fitness was assessed with Limited outcomes.

### FURTHER RECOMMENDATIONS

Physical fitness will be assessed with more outcomes. Physical fitness will also checked in other population.

# ABSTRACT

Juvenile myasthenia gravis is a rare childhood disorder that accounts for 10% to 15% of all cases of myasthenia gravis. It is characterized, like the adult form, by an autoimmune attack on acetylcholine receptors at the neuromuscular junction. The majority of patients have ptosis, diplopia, and fatigue. More advanced cases may also have bulbar problems and limb weakness, and may progress to respiratory muscle paralysis. A 12-year-old male patient was admitted to Gandhi hospital, Telangana, that came with complaints of being unable to roll his eyes, watering from the eyes, difficulty in swallowing, throat pain, cough, and fever. It is a known case of myastheniagravis. A neostigmine atropine test was performed, and the result was found to be positive. Ice pack test results were also positive, and intravenous immunoglobulin transfusions were previously administered. As a result, the patient was prescribed pyridostigmine and prednisolone. Based on the clinical presentation and the laboratory results, the patient was diagnosed with Juvenile Myasthenia Gravis with upper respiratory tract infection.

Keywords: Autoimmune, acetylcholine receptors antibodies, ophthalmoplegia, ptosis

# INTRODUCTION

The failure of neuromuscular transmission that usually result from the binding of autoantibodies to proteins that are involved in signalling at the neuromuscular junction is the cause of the autoimmune syndrome known as myasthenia gravis (MG) [1].A rare paediatric disease called juvenile myasthenia gravis has numerous clinical characteristics that set it apart from adult myasthenia gravis. Particularly in prepubertal children, isolated ocular symptoms are more common, acetylcholine receptors are less common and remission is likely. Anticholinesterase,

### Karra. Geetha et al.,

corticosteroids with or without steroid-sparing medications, and more recent immune modifying drugs are frequently used as treatments. Thymectomy raises the likelihood of remission. The child's developmental needs and other factors should be considered in diagnosis and treatment [2].

### MYASTHENIA GRAVIS WITH UPPER RESPIRATORY TRACT INFECTION

Myasthenia gravis, is an autoimmune illness that causes muscle weakness, may be worse by upper respiratory tract infection (URTI), including influenza. There is also worry that receiving the influenza vaccine could aggravate existing autoimmune conditions [3].

### ETIOLOGY

Myasthenia gravis has an unknown underlying aetiology, while there is strong evidence that it is connected in some way to thymus gland anomalies and that the condition has a genetic component. However, the disease progression is very well understood, despite the lack of a precise cause. The neuromuscular junction or the region where the skeletal muscle and nerve terminals connect is impacted by myasthenia gravis. Nerve terminals at the neuromuscular junction provide impulses to the muscle through a synapse, which causes the muscle to contract. Acetylcholine, a neurotransmitter, is released from vesicles in the nerve ending into the synapse and acetylcholine receptors situated on the muscle side of the synapse when a nerve impulse passes along the neuron.

The reaction lasts just a short while because an enzyme called acetylcholine quickly breaks down the acetylcholine in the receptor into its component molecules, acetate, and choline. Acetylcholine that is still present diffuses away from the receptors. In persons with myasthenia gravis, T-mediated autoantibodies that target and inhibit the body's own acetylcholine receptors interfere with this typical impulse transmission. The main symptom of myasthenia gravis is caused by weak muscular contractions, which occur when enough receptors are blocked by autoantibodies [4].

### CLASSIFICATION OF JUVENILE MYASTHENIA GRAVIS

### Ocular

Ocular myasthenia gravis comprises up to 10 - 35 % of paediatric instances of myasthenia gravis. 10 to 35 % of paediatric instances of MG are caused by ocular myasthenia gravis. Asian populations have a higher prevalence of OMG in children. The only muscles engaged in OMG are the elevator palpebral and extraocular muscles. Ptosis, diplopia, or strabismus may be the first symptoms or observations that a person presents [5].

### Generalized

Extraocular muscles and levatorpalpebrae are impacted in up to 90% of MG patients. The involvement of any other non-ophthalmic skeletal muscle, however, separates ocular from generalized MG. Patients who run or stroll may experience early weariness. A change in voice and other aspects of talking could be affected. There can be facial numbness and swallowing issues. The most concerning symptom is breathing trouble when the diaphragm is affected. Patients may experience respiratory failure and need intubation; therefore, this is an emergency [6].

### SUBTYPES OF MYASTHENIA GRAVIS IN CHILDHOOD

### Neonatal myasthenia gravis

Unlike juvenile myasthenia gravis and congenital myasthenic syndromes, neonatal myasthenia gravis (NMG) is an immune-mediated that appears after birth in a mother who has autoimmune MG. Transfer of maternal autoantibodies to the foetus through the placenta is the disease's pathophysiological mechanism in these patients. Neostigmine and plasma exchange are two possible treatments, and they could be required to provide respiratory assistance [7].

### Juvenile myasthenia gravis

The autoimmune condition known as Juvenile Myasthenia gravis (JMG) affects children and young adults under the age of 19. It differs from adult onset NMG in that it does not result from a structural problem that causes congenital myasthenic syndrome. Patients with MG that are exclusively ocular are less likely to develop serum autoantibodies

### Karra. Geetha et al.,

that are positive for Acetylcholine receptor (AchR) and muscle specific tyrosine kinase (MuSK). Some patientsare classified as double seronegative MG because they do not have detectable auto antibodies to AchR or MUSK. These kids may, however, have antibodies to other substrates found in the neuromuscular junction, such as agrin, cortactin, or low-density lipoprotein receptor related protein 4 (LRP4). Other autoimmune conditions including Hashimoto's and autoimmune polymyositis may share a link with JMG [8].

### Congenital myasthenia syndromes

Congenital myasthenic syndromes (CMS) are a group of disorders that are separate from autoimmunemyasthenia gravis (MG). Typically, onset occurs between childbirth and early infancy. Additionally, these individuals also experience weakness and fatigable ptosis. To separate these illnesses from myopathies or other neurogenic disorders, a strong index of suspicion may be required. These patients' symptoms are not immune-mediated, and instead, a structural change at the NMJ itself causes fatigability, such as modifications to the cholinergic receptor or to the formation and maintenance of endplates. Because the specific treatment for one mutation may be harmful for another mutation, treatment must be tailored to the specific mutation, genetic screening of patients with CMS is important to determine the pathogenic mutation [9].

### EPIDEMIOLOGY

JMG is a rare paediatric illness, however, regional differences in incidence and prevalence exist. There are no exact incidence and prevalence statistics available. Asian communities exhibit MG in children more frequently than Caucasian populations do. In Chinese communities, up to 50 % of all cases of MG present in childhood, with a peak age of presentation of 5 to 10 years and a predominance of ocular symptoms Contrarily, Caucasian individuals tend to present as adults, with prepubertal onset occurring in less than 10 % of instances.

Childhood myasthenia gravis is relatively uncommon in western communities, it is common in Asian nations, affecting over 50 % of children under 15 years. They typically exhibit signs of weak extraocular muscles when they first appear [10].

### SIGNS AND SYMPTOMS:

- The most common signs and symptoms of myasthenia gravis are as follows:
- Visual issues such as double vision and ptosis of the eyelids (diplopia).

• As muscles are used, muscle weakness and tiredness can increase and fluctuate dramatically in intensity over days or even hours (early fatigue).

- Facial muscle involvement gives the illusion of a mask; a grin may come off as more of a snarl.
- Myasthenia gravis symptoms can mimic those of other diseases. For a diagnosis, visit the doctor.

• Throughout the course of MG, there may be occasional flare-ups and remissions (symptomatic relief). Remissions, however, are not always total or permanent [11].

• Children are at increased risk of chest infection and at risk of choking or aspiration. Impairment of the respiratory muscles needs ventilatory support, this is known as myasthenic crisis [12].

### PATHOPHYSIOLOGY

IgG1 and IgG3 subtype antibodies are present in n- AchR myasthenia gravis. In the postsynaptic membrane of skeletal muscles, they bind to the n-Ach receptor and activate the complement system, causing the membrane assault complex to form Membrane attack complex (MAC). The receptor's final breakdown is caused by MAC. They could potentially work by boosting the endocytosis of the n- Ach receptor that is attached to an antibody or by functionally inhibiting the binding of Ach to its receptor. The antibodies in the myasthenia gravis and low-density lipoprotein receptor related protein 4(LPR4) MG are of the Immunoglobulin G4 (IgG4) subtype and lack the complement activating function. The NMJ's Argin – LPR4 MusK protein complex, whose major job is to maintain the joint, is where they bind. The complex is inhibited, which results in fewer n – Ach receptors. Due to a deficiency in n – Ach receptors, the Ach produced at the nerve terminal cannot produce the postsynaptic potential necessary to trigger an action potential in muscle, which results in symptoms of muscular weakness. Because frequent usage of a muscle group depletes the Ach stored in the NMJ, weakening is more common [13].

### Karra. Geetha et al.,

### DIAGNOSIS

Anyone with myasthenia gravis distinctive weakness may be suspected by a doctor. To confirm the diagnosis of myasthenia gravis, the doctor may prescribe the following types of tests.

### ICE test

This is a simple test that may be done in the doctor's office without any extra tools. The doctor will check to see if the patient's eyelid drooping improves after placing an ice packover the patient's eye for a few minutes. Any improvement would suggest a diagnosis of myasthenia gravis [14].

### Acetylcholinestarase inhibition

Drugs that increase the amount of acetylcholine can be used to test for myasthenia gravis since acetylcholine receptors are blocked in this condition. Fast-acting acetylcholinesterase inhibitors called edrophonium will temporarily and immediately reduce muscle weakness in people with myasthenia gravis by sparing the body's already existing acetylcholine. Edrophonium starts working within 30 seconds and wears off after only five minutes [15]

### Immunohistochemistry of blood

About 85% of persons with myasthenia gravis have anti-acetylcholine receptor antibodies in their serum. However, they are only present in roughly 50% of individuals with symptoms limited to the eye muscles. In roughly 70% of individuals who test negative for anti-acetylcholine receptor antibodies but have the characteristic symptoms of myasthenia gravis, antibodies to muscle-specific kinase (MuSK) have recently been found. TheMuSK protein aids in the organization of acetylcholine receptors on the surface of muscle cells, and this test is emerging as a useful diagnostic tool when the disease's symptoms are present, but no autoantibodies are found [15].

### Electrical physiological research

Muscle reactions to light stimulation may be discovered through nerve conduction tests. Myasthenia gravis patients will exhibit progressively smaller or weaker reactions. Although this is the most accurate nerve test for myasthenia gravis, it cannot be used on all muscles and is not always predictive [16].

### Thymic imaging and thyroid testing

To evaluate the thyroid and thymus glands' health, many tests may be performed. These include thyroid function tests to identify hyperthyroidism and computed tomography chest scans to reveal a thymoma or enlarged thymus gland [17].

### TREATMENT

Traditional therapies for myasthenia gravis come in five different forms:

### Inhibitors of acetylcholinesterase:

In order to give the acetylcholine already present in the synapse more time to interact with the accessible receptors, these medications block the enzyme that usually breaks it down in the synapse. Pyridostigmine and neostigmine are the acetylcholinesterase inhibitor most frequently prescribed for myasthenia gravis [18].

### Thymectomy

Numerous studies back the surgical removal of the thymus gland, or thymectomy, as a treatment option for people with myasthenia gravis, but these are controversial.

### Immunosuppressants:

In myasthenia gravis, immunosuppressants are frequently employed to tame the excessive immunological response. Glucocorticoids like prednisone, azathioprine, cyclosporine, and others may be among these medications. Despite the fact that they are beneficial in many patients, careful monitoring patients receiving long-term glucocorticoid

Karra. Geetha et al.,

therapy is essential due to the serious side effects these medications are known to cause. Long-term usage of glucocorticoids is linked to serious metabolic adverse effects, such as central obesity, decreased insulin sensitivity, and bone loss [20].

### Plasmapheresis

Plasmapheresis is particularly helpful before thymus removal surgery. Studies have shown that plasmapheresis is often well tolerated by patients. Reversible hypotension (low blood pressure) and moderate tremor are the most frequent side effects. Plasmapheresis had a low impact on infection and mortality rates, and all patients immediately benefited from the therapy.

### Intravenous immunoglobulin

IVIg proved successful in treating chronic inflammatory demyelinating polyneuropathy in controlled clinical studies. Additionally, IVIg has helped certain myasthenia gravis patients. IVIg therapy produces transient alleviation that lasts for a few weeks to months. Although both plasmapheresis and IVIg therapies showed a clinically significant effect in individuals with persistent myasthenia gravis, studies contrasting plasmapheresis and IVIg discovered that the improvement began more quickly with plasmapheresis than with IVIg [19].

### CASE REPORT

A 12 years boy born out of non-consanguineous marriage first in birth order was admitted to the PICU (paediatric intensive care unit) with the chief complaints of being unable to scroll his eyes for last 1 week and experiencing watering from the eyes, difficulty in swallowing, cough for last 3 days and the patient had difficulty with throat pain, productive cough that is white and large in quantity, drooping of eyes along with fever for last one day. On examination, the child is active and afebrile. PICCKEL (pallor, icterus, cyanosis, clubbing, koilonychia, lymphadenopathy, oedema) was observed as negative, heart rate is 90 bpm, respiratory rate is 28/minute and P/A (par abdomen) is soft, CNS is NAD (no abnormality detected). The patient had bilateral ptosis. The patient was increased white blood cells, decreased haemoglobin, and more platelets. The clinical serological report is negative for enteric fever and CRP (c-reactive protein). In the urine examination urine was found to be acidic and pale yellow in colour and trace amounts of albumin is found along with puscells and no RBCs were found in the urine.

The patient had a history of decreased for 3 days and no history of drooling of saliva and blurring of vision. The patient had no history of seizures, loss of consciousness, and altered sensorium. At the initial stage, the child had no chest pain, headache, vomiting, burning micturition, and abdominal pain. It is a known case of seizure disorder at seven years of age; thus, medication is used for 3 years, and history of the same complaints in the past 5 months. And the patient was admitted to Gandhi hospital for 17 days. It is a known case of myasthenia gravis. MRI D.L. spine with screening of whole spine showed evidence of T1 hypointense, T2/STR hypointensejse signal lesion oted in the body, left pedicle and lamina of D5 vertebra with associated wedging of D5 vertebra. Lesion shows intense enhancement on post contract with anterior epidural extension causing canal stenosis and compressing spinal cord. Similar lesion noted in L1, L3 vertebral bodies. Similar soft tissue intensity lesion noted in right iliacwing and body of left iliac bone. Multiple round T2 hyperintense lesion noted in liver. Evidence of peripherally enhancinh central soft tissue lesion measuring 35\*35mm noted in superior segment of left lower lobe likely neoplastic etiology. Myasthenia gravis is diagnosed by increased ACH (acetylcholine) receptor antibodies. A neostigmine atropine test has been done, and the result was observed as positive. Ice pack test results also got positive and Iv Ig (intravenous immunoglobulin) transfusions were given in the past. Thus, the patient was started on pyridostigmine and prednisolone medication. The standard treatment for myasthenia gravis is corticosteroids, cholinesterase inhibitors and immune suppressants.

- IV piperacillin 300 mg/kg/day 2.6gm in 20 NS/IV/TID to treat any bacterial infections,
- INJ PCM 20 ml /IV/O is to reduce the fever.
- corticosteroid medication like tab prednisolone @0.5 mg/kg/day to help in limiting antibody production.
- tab azathioprine 25 mg/PO/OD, which is an immune suppressant to alter the patient immune system.

### Karra. Geetha *et al.*,

• Tab pyridostigmine @60 mg/PO/QID, which is a choline esterase inhibitor that enhances communication between nerves and muscles.

- tab pantoprazole 20 mg/PO/day, which is a proton pump inhibitor is given to reduce excess acid in the stomach.
- INJ amoxiclav 10MG/kg/day to fight infections.
- INJ.PCM 26ml/iv/QID to reduce the high-grade fever.
- INJ amikacin, is a short-term antibiotic used to treat serious bacterialinfections.

# DISCUSSION

Juvenile myasthenia gravis is a rare paediatric disorder that has numerous clinical characteristics that set it apart from adult myasthenia gravis. JMG is an autoimmune disease that develops before the age of 16. It is a rare childhood disorder that affects less than 10-15% of children and has an annual incidence of 1-5 per million [21]. The neuromuscular junction or the region where the skeletal muscle and nerve terminals connect is impacted by myasthenia gravis. The main symptom of myasthenia gravis is caused by weak muscular contractions, which occur when enough receptors are blocked by autoantibodies. The diagnosis is made using clinical signs and symptoms, with laboratory and electrophysiological studies used for confirmation. Although thymoma in children is uncommon, the thymus must be imaged (usually by CT) once JMG is diagnosed [22]. Corticosteroids, cholinesterase inhibitors, and immunosuppressants are the choice of drugs for myasthenia gravis. The illness's progression is highly variable. Children with myasthenia have a better long-term outlook than adults.

### ABSTRACT

The majority of tailors experience pain in the upper arms and lower arms pain as they were exposed to high levels of repetitive tasks and stitching. Prolong sitting and repeated pedaling movements results in pain and discomfort in the lower limb leading to muscular strain. One such muscle involved in repetitive strain due to the pedaling activity is the Sartorius muscle, also known as the tailor's muscle. To assess the effectiveness of Sartorius mobilization with stretching on pain among Female Couturiers. A convenient sample of 30 subjects was solicited. Participants were n=30 and the age range = was 25 - 40 years. Subjects were allocated in two groups. Group A (experimental group) Sartorius Mobilization and Kneeling Stretch along with Hip and knee exercises and Group B (control group) was given hip exercises given for 10 times continuously for 2 weeks. and advice to take hot packs. Each group had a physiotherapist who carried out the interventions. Randomized clinical trial. Numerical pain rating scale. Statistical analysis was done to identify the difference between pre and post-test measurements. The two-tailed p-value is less than 0.0001 by conventional criteria, this difference is considered to be extremely statistically significant. A tailoring occupation makes, repairs, or alters clothing. Due to their prolonged work nature, they tend to have musculoskeletal problems such as joint pain, muscular strain, ligament sprain, and postural deviations. The study concludes that patients with adaptive Sartorius shortening with pain can be reduced by Sartorius mobilization and stretching exercise.

Keywords: Randomized, tailors, Subjects, measurements.

### INTRODUCTION

According to the Handloom Census 2019-20, about 35,22,512 Handloom workers were employed across the country, out of which 25,46,285 were Women workers with a share of 72.29% of the total handloom workers. In addition, there are around 16,87,534 Women Handicraft artisans registered with the Office of Development Commissioner (Handicrafts)<sup>1</sup>. A preliminary study among the Indian tailor's population found that 79.2% reported musculoskeletal symptoms related to work<sup>2</sup>.

Tailoring is an age-old craft that has played a crucial role in the textile industry, providing custom-fit garments to individuals across various cultures and societies. While the profession of tailoring is diverse and encompasses both male and female practitioners, this research focuses specifically on female tailors and the challenges they encounter related to lower extremity problems<sup>3,4</sup>. The main activities performed by the tailors are taking measurements of the customer, cutting the fabric, stitching the fabric, and finishing the stitched garment<sup>4</sup>. Female tailors dedicate long hours to their craft, involving activities such as measuring, cutting, and sewing fabric. However, the nature of their work often requires them to assume static, prolonged postures while sitting or standing, which can have adverse effects on their lower extremities. The lower extremities, which include the hips, thighs, knees, and feet, are vital for the mobility and physical well-being of individuals<sup>4</sup>. Given the repetitive and physically demanding nature of tailoring, female practitioners in this field are susceptible to a range of lower extremity problems, which can adversely impact their overall health and quality of life.<sup>5</sup>

One significant lower extremity issue faced by female tailors is musculoskeletal discomfort or pain. The prolonged periods of sitting or standing while working on garments can lead to poor posture and strain on the lower back, hips, and knees. These sustained postures can cause muscle imbalances, joint stiffness, and overall musculoskeletal fatigue, potentially resulting in chronic pain and reduced work productivity<sup>2.5</sup>. Furthermore, female tailors often face challenges associated with foot health. When sitting with their legs crossed to sew, tailors would experience agony along the Sartorius muscle's course. The Sartorius is carried through all of its actions by the motion of crossing its legs, and it is still engaged and active in that position. The Latin word sartor, which means tailor, is where the name of Sartorius's muscle comes from<sup>6</sup>. It was common for tailors to work while sitting cross-legged on the floor, mimicking the shape of the muscle and utilizing one of its functions. The Sartorius's muscle has become adaptively shortened as a result of the prolonged crossing of the legs and continuous, repetitive pedaling actions, which causes pain to radiate from the hip to the leg. This research aims to delve deeper into the challenges faced by female tailors related to lower extremity problems. By shedding light on these aspects, we hope to contribute to the development of targeted strategies and interventions that can alleviate the physical burden experienced by female tailors and enhance their working conditions.<sup>7</sup>

### **OBJECTIVE OF THE STUDY:**

To assess the effectiveness of Sartorius mobilization with stretching on pain among Female Couturiers. **SUBJECTS AND METHODS:** 

Thirty female tailors who are self-employed were taken up for the studydepending upon the inclusion and exclusion criteria. The inclusion criteria are Female tailors within the age group of20-45 years and pain present along the course of the Sartorius's muscle for at least 3 weeks. NPRS scale of 7 and above were included in the study. The exclusion criteria are Infections, tumors, crush injuries, malunited fractures, muscular insufficiency, deformities, and surgery with metal implantation. Pain intensity was measured by means of the NPRS scale. All the patients were screened and randomized after finding their suitability as per inclusion and exclusion criteria. The numerical Pain Rating Scale (NPRS) where 0 corresponded to "no pain" and 10 corresponded to "worst imaginable pain," was used to measure pain. A randomized trial was designed which included an experimental group and a control group. Group A (experimental group) Sartorius mobilisation and kneeling stretches were given 10 times continuously for 2 weeks. Group B (the control group) in this group was given hip exercises and advice to take hot packs. **PROCEDURE:** 

The subjects in the experimental group were given sartorius mobilization and active kneeling stretches for the Sartorius musclealong with resisted isometric exercise for the quadriceps muscle and the subjects in the control group were given hip and knee exercises along with hot packs.Pre-test values for NPRS will be recorded. The

### Senthil Kumar and Natasha Verma

intervention will be given for a period of 2 weeks later on which post-test values for pain are recorded. The pre and post-values are recorded for statistical analysis.

### PROTOCOL

### **Group A (Experimental Group)**

Sartorius Mobilizations-With the hands, gently press the sartorius muscle in the vicinity of the knot. Begin with light pressure and raise it gradually in accordance with the patient's tolerance. Use a gliding motion to the muscle, moving from knee to hip in a distal-to-proximal path along the length of the sartorius. Make sure the gliding action is pain-free and within the patient's comfort zone as you repeat it multiple times. Kneeling Stretch along with Hip and knee exercises-Kneel with the one-foot level on the floor and the other knee at a 90-degree angle in front. To maintain the balance, lean on a wall for support.Keep the spine upright and the pelvis in a neutral position. While keeping the spine fully erect, lean forward. Keep the pelvis level while pushing it forward. While doing this, clenching the buttock muscles could help to develop a feel for the proper motion.Hold the stretch for 10 to 30 seconds while breathing normally. Then, slowly release the stretch and repeat on the opposite side. Stretch- 3 sets, hold time- 10 to 30 secs. Resisted isometrics of quadriceps- 3 sets, 10 repetitions

### Group B (Control)

General hip and knee exercises with hot packs were taken for twoweeks.

### RESULTS

The data obtained were tabulated and statistically analyzed. The pre and post-test values for the outcome measures of Pain were calculated and compared. Parametric statistical tests, dependent t-sampletests, and unpaired t-tests were used.

### DISCUSSION

Work-related MSDs (WRMSDs) typically arise when there is a mismatch between the physical demands of the job and the human body's physical capabilities, depending on the mechanics, ergonomics, and physical movement characteristics of work tasks<sup>3</sup>. In this study, more emphasis is on the Sartorius muscle as it is the major muscle involved in this profession. Due to its importance, it is known as a tailor's muscle. This Sartorius's muscle tends to go for repeated adaptive shorting due to continuous strain put by repeated pedaling movement and prolonged crossedleg sitting posture<sup>2,3</sup>. Corrective measures are a must for this rampant problem among thetailors<sup>4</sup>. The study aims in finding the effectiveness of Sartorius muscle mobilization and stretching in reducing pain. The study compared the results of commonly used treatment strategies for patients with adaptive shortness of the Sartorius's muscle. The Numerical pain rating scale was commonly used as an outcome measure in the treatment of Sartorius pain which indicates that the outcome measures are able to detect the changes produced by the treatment<sup>8</sup>. The findings obtained in this randomized controlled study imply that standing Sartorius mobilization and stretch are effective in reducing pain caused by adaptive Sartorius muscle. The results of the present study showed that there was a significant improvement in the experimental group. For the outcome measures NPRS paired t-test analysis showed a significant statistical difference (p<0.05) between pre and post-test measurements. The results show that the postintervention phase NPRS scale 95% confidential interval and a t value is 20.44, standard error of the difference of 0.313. The two-tailed p-value is less than 0.0001 by conventional criteria this difference is considered to be extremely statistically significant. This study concludes to prove the effectiveness of Sartoriusmobilization and stretch for female tailors in reducing pain.

Senthil Kumar and Natasha Verma

### CONCLUSION

Muscle, tendon, and ligament-related physical health issues are referred to as musculoskeletal discomfort. Numerous studies have found that musculoskeletal pain is relatively common among designers. According to the study's findings, tailors have severe musculoskeletal pain at work, particularly in the thigh Sartorius. Repetitive pedaling may cause adaptive shortening. Many of the standard physical therapy procedures work less well here. This study's findings support the use of the Sartorius stretch to relieve pain among female courtiers.

### ABSTRACT

Students can improve their problem-solving skills by strengthening their fundamental knowledge and comprehension of the issue. The purpose of the Mathematical Fineness Camp was to review the fundamental concepts and introduce the approach to problem-based learning with the pupils. The study concentrated on how well fineness camp helped students grasp mathematics. The focus of the study was on how effectively fineness camp assisted kids in understanding mathematics. The Fineness Camp was intended for students who had already taken placement exams. The pre-test and post-test were given to the students every day, before and after the lecture, respectively. To determine the effectiveness of the programme, the research is statistically done in an indirect method. A paired sample t-test was used to check the validity of the hypothesis in light of the different mean values for the pre-test and post-test. The mean value of the study's findings is anticipated to be higher for the post-test than the pre-test.

Keywords: Mathematics Fineness Camp, Paired Sample, Problem Solving, Pre-test and post-test

Prema et al.,

### INTRODUCTION

Surprisingly, this is also apparent in a sense of students enrolled in degree programmes and so therefore students who are perceived to be "talented" in the mathematics domain. From an affective perspective, this issue appears especially intriguing because the students involved frequently experience mathematical failure as a tragedy and, more importantly, struggle to make sense of it at first. For these reasons, it seems essential to look at how emotions are involved in the emergence and management of this crisis, as well as how students' perceptions of mathematics and their own natures change during the tertiary crisis period. The part that emotion plays in pupils' failures in math. Investigating the role emotions play in the emergence and handling of this crisis, as well as how high achiever students' perceptions of mathematics and their own selves change during this crisis time, becomes interesting.

In Arts and Science Institutions offers two programmes namely Department of Commerce (ASCO114) and Department of Computer Science (ASCS110). In addition, a total of seven math chapters were offered to ASCO11 and ASCS110 students. The percentage of failure in math courses in the previous semesters was alarming. Math classes seem to consistently account for the highest number of failures compared to other courses. Figure 1 shows the failure rate for the six mathematics chapters of each program for the semester of June-October 2021. Compared to other courses, mathematics courses appear to be the main reason for consistently high failure rates.

There are three common chapters for both the programmes which are CHAP1, CHAP3 and CHAP5 among sixchapters. Two of these chapters CHAP1 and CHAP3 are prerequisites to others, meaning that students must pass them before enrolling in more advanced courses. Figure 2 compares the failure rates for common subjects in the two programmes. Additionally, it shows that ASCO114 students fail at a higher rate than ASCO110 students. The professors came up with the idea to conduct a "Fineness Camp" mathematical classes to address the high failure rate. We consider that student's weak mathematical foundations are the root cause of the high failure rate.ASCO114students, who are mainly responsible for the high failure rate, were selected for the workshop. These students must repeat CHAP1.Since the programme is a requirement for other advanced mathematics courses like CHAPT3 and serves as the foundation for all other mathematics courses, it was declared mandatory for all repeaters of this subject.

The Fineness Camp took place on January 6 and 7, 2022. The curriculum will be led by experienced professors with more than four years of teaching experience. The Fineness Camp addressed a total of sixchapters. The students took two sets of pre-tests and post-tests to gauge the program's success. On the first day, the first set of pre and post tests, which included three themes, was administered. On the second day, the students received the second set, which had three themes. Table 1 lists the chapters that were tested on both days.

In this work, the paired sample t-test was employed for hypothesis testing. The outcomes are expected to get greater mean vale for post-test than pre-test.

### **Research Purpose**

The goal of this study is to examine the mean value for pre-test and post-test

### Hypotheses

H0: Pre and post-mark mean values are equal. H1: Pre and post-mark mean values are not equal.

### Statement of the Problem

This study tries to answer the following research question: Is there any difference in terms of marks on pre-test and post-test?

Prema et al.,

### Importance of the study

The "Fineness Camp" was held with the intention of giving the children a foundational understanding of mathematics. In order for the students to improve their foundation at the beginning of the semester, this programme was held during the first week. As a result, they will have a better knowledge of their mathematics classes throughout the semester. Because of this endeavor to lower the failure rate, it is anticipated that the post-test results will have a greater mean than the pre-test.

### LITERATURE REVIEW

The ability to solve the problem algebraically is the elementary for all students entering the sciences or social sciences. In order to Fineness Camp and avoid misconceptions in solving mathematical problems, students need to develop their analytical skills during the process of learning (Yin, L. Y, 2005) [1]. There are still a few common mistakes in solving mathematical problems. Many researchers are interested in finding out the difficulties that a most students face in solving problem. Gunawardena (2011) [2] found that some students tend to make mistakes in the final step of the equation solving process. According to Nguyen, P. L. and Tran, C. T. H. (2014) [3], types of errors can include faulty calculations, misleading mathematical concepts or theorems, misinterpreted and reckless memory. In the section of the linear equation, research has shown that students tend to use various approaches in problem solving systems of linear equations problems. There are three types of methods that include substitute method, elimination method and graphing. The results show that most of the students are inclined to use the substitution method, which is easier than other two methods.

In the chapter of indices, there are a few rules and particular cases of indices that students should be aware of. According to Foo, F. Y. et al. (2013) [5], there are five rules and four specific cases in the indices, as can be seen in Tables 2 and 3. The students' common mistakes in fundamental mathematics There are six topics chosen to be used in the "Fitness Camp" as shown in Table 1. For students who take advanced mathematics courses like calculus, the themes cover fundamental concepts in elementary mathematics. These topics are extremely crucial since any false assumptions made in them will result in incorrect interpretation of algebraic problems. Majid, H (2012) [6] had examined the relationship among different kinds of students mistakes and the knowledge required to solve problems algebraically. His research showed that the inaccuracy was

the primary cause of the majority of student faults. Swedosh,P(1996) [7] stated that the major problematic comes from fallacy. For example, he found that there were students were tested in factorize some mathematics equation such  $as(5x + y)^2 - y^2$ . Around 32% of students were found expanding the equation incorrectly  $5x^2+10xy$  rather than $(5x + y)^2 - y^2 = (5x+y) + y$  (5x+y) -y). He also discussed on the common mistakes done by students while simplifying the polynomial. As an instance, the students were asked to  $shorten \frac{x^2-4x+4}{x^2-5x-6}$ . Those who are weak in mathematics can override identical terms in the numerator and denominator without ending factorization. They found it hard to understand that factorization should be given priority over omission.

In the quadratic chapter, quadratic equations can be solved using either the quadratic formula or factorization,  $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ . However, a lot of students had gotten the quadratic equation erroneous. The example in thispaper shown that for quadratic equation  $y^2=1$ , students gave the incorrect answer y=1 instead of  $y=\pm 1$ . Another example is problem solving in the equation of  $(y)^2$ - y - 2 =0 given one of the solutions is y =1. Not surprisingly, there are students who still solved it with the wrong approach in which the equation was incorrectly rearranged as  $(y)^2$ - y = 2 before finding the values of y. Pongchawee, V and Clements, M.A. (2006) [8] has studied on the effects of classroom instruction on students' understanding of quadratic equations.

### Prema et al.,

Before and after lessons, the same quadratic equations question is presented. The results show that the students who have some concept ideas about quadratic equations prior to the lesson have greatly improved after the lesson. In the chapter of indices, there are some rules and special cases of indices that students should be aware of that, there are five rules and four special cases in indices as shown in Table 2 and Table 3. In Swedosh, P (1996) [9] paper, He identifies some of the common errors with examples like simplifying  $3^x \times 3^x$ . The correct answershould be  $3^{x+x}$  (or)  $3^{2x}$ but students will give  $3^x+3^x=6^x$ . This completely misunderstands the idea of indices. The same situation happens in the logarithm Table 4 and Table 5.

Many students mistakenly believe that logarithms are objects rather than operations when they use the notation "log". Yen's (1999) [10] report had shown the type of errors made by Australian students in 1998 High school Certificate. Mathematics examination. For instance, some students divided both sides of the equation. In(9x-15) = 4 In x by "In" as if it was a variable to obtain 9x-15 = 4x when solving the equation. A study conducted by kaurand Boey (1994) [11] in a junior College in Singapore found that not all students realized that the simplification of log 24-log 4+ log9 = log( 24- 4 +9) was incorrect. This error is actually quite common and often called as the linear extrapolation error (Matz, 1980) [12]. For example , when a student asked to solve the equation In(9x-15) = 4 In x, the students may solution that In (9x-15) = In 9x - In 15x, Clearly treating "In" as a variable and

distributing it over 9x and 15 (Yen, 1999) [13]. As Harel and Dubinsky (1992) [14],states, work with graphical representations of functions will be affected if students do not understand the language of, domains, images ranges, preimages, and ranges,one-to-one and onto relationships. According to Markovitsal.(1988) [15], Most of students experience very hard with functions because of the symbols. For example, Herscovics (1989) [16] reported that 95% of the students evaluate the expression x+9 when x=3 whereas only 60% of this same group could evaluate g(3) when f(x) = x+7.

### METHODOLOGY

The experiment study is to test the effectiveness of "Fineness Camp" inreducing the failure rate for precalculus subject in Arts and Science College. A two-day workshop was conducted due to more failure rate for the subject of precalculus. It includes pre and post-test with six chapters that have been prepared by Mathematics department lectures. The study involved 60 students who are repeating pre-calculus. The test papers were evaluated by the lectures and the marks were classified into grade according to Arts and Science college endexamination standard. Then, the descriptive analysis was used to elaborate the mean and the standard deviation of the marks. The paired t-test was employed to determine whether there was a significant difference between the % marks for the pre- and post-test because it was the same students who provided the percentage marks. For all chapters, the paired t-test was used to evaluate the hypothesis. The alternative hypothesis for the study are:

H1: There is no difference in pre and post-mark in chapter 1 H2: There is no difference in pre and post-mark in chapter 2 H3: There is no difference in pre and post-mark in chapter 3 H4: There is no difference in pre and post-mark in chapter 4 H5: There is no difference in pre and post-mark in chapter 5 H6: There is no difference in pre and post-mark in chapter 6

### FINDINGS

The Data collected before and after the test were compiled, which was beneficial for the fineness camp efficacy analysis. Table 6 shows the overall score for both tests in which student scores were categorized into four categories: mediocre, moderate, good and excellent. Table 6 shows that student scores improve after participating in fineness camp. There are 38.33% of students have reached the standard of excellence in post-test compared to the pre-test. It is

### Prema*et al.,*

followed by good mark of the student, the rate has increased enormously, and there are 46.66% of good students in post-test compared with 21.67% in pre-test. In contrast, there are almost 94% of students fail in the bad and moderate category at the beginning, and the frequency dropped to 6% respectively in the post test.

The table shows the paired sample statistics for the pre-test and post-test marks in six chapters. The lowest average with the average value of 20.00 is found in chapter 3 pre-test implies that students have a very low basic concept of Surds and indices. On the other hand, pre-test of chapter 5 with mean value 50.00 and chapter 2 with the mean value of 42.00 indicated that students have better understanding in solving the equation in one variable and two variable. The chapter of logarithm is still reported having the lowest mean with mean value of 72. 00 in post-test yet the result shows that there is about 52% of improvement after the camp. The greatest mean value is found in chapter 5 post-test with the mean 90.00 and increase 40 % makes it become the highest percentage of increase among six chapters. The figure revealed that the program had strengthened the student's ability to solve one variable and two variables. In the pre-test, the standard deviations are widely scattered compared to the post-test. In general, overall dispersion decreased significantly after the test, with SD values reduced to 20% below.

### CONCLUSION

The study strongly indicates that one's success hypotheses and outcome expectations, and in particular the ability to adapt them and acknowledge aspects, are what distinguishes the few who drop out from some who succeed in overcoming the challenges. The result of study viewed that Mathematics camp has positive effect in build-up fundamental Mathematics knowledge. In the pre-test was found that nearly 60% of students were ranked in poor gradeTable 6). Although, the scoreshad highly improved after the camp and the post-test viewed that 41.66% of students were in excellence grade 47% were in good grade and only 6.67% were moderate and only 5% failed.Refer to Table 7, the further analysis on comparison by chapter showed that students were very weak in chapter 3 (Surds and Indices) with the mean value of 20.00. Moreoverpost-test of chapter 3 showed an improvement with the average value of 72.00 increased by 52.00. The average value of six chapters were increased, from 36.66 to 75.55. The increasing in the mean valued showed that the students have a better understanding after they attended the camp. The paired ttest result in Table 9 further concluded that there is a significant difference between mean marks of the pre and posttests for each chapter since all null hypothesis are rejected at 5% significance level. As a result, the statistical analysis may show that educational camps are more successful at enhancing students' comprehension of mathematics. Thus, it would seem that a comprehensive analysis should be conducted into the processes that led to changes in the students' success theories and causal attributions, which highlight the components of one's issues that are within one's control.

### ABSTRACT

The development of sustained release and immediate release formulations for a single medicine or drug combination uses the technique of region selective dual components. The preparation of dual components of hydrochlorothiazide and losartan potassium in distinct layers for desired release patterns was the major goal of the current study activity. Preformulation studies were performed before compression. The microbeads underwent tests for in-vitro drug release, swelling index, and drug entrapment effectiveness. Using ATR and DSC, tests on the compatibility of drug excipients were conducted. Spectra showed that no interactions between the formulation's excipients and the medications were discovered. According to all pre-compression studies, the outcomes were found to be within the established limitations. According to in-vitro release experiments, the losartan potassium sustained release layer reached 99.14% after 12 hours and the hydrochlorothiazide quick release layer reached 98.41% within 120 minutes. After being exposed to accelerated conditions for a month, stability analyses for both physical properties and in-vitro drug release experiments revealed no alterations despite the release kinetics showing strong linearity and best fitting into the Higuchi model. According to the aforementioned study, the region-selective dual component capsule created met the goal of the research work in treating hypertension.

**Keywords:** Hydrochlorothiazide, Losartan potassium, Sodium alginate Crospovidone, Ionotropicgelation, Dry granulation, Simultaneous Estimation, UV spectrophotometry.

Bimal Debbarma and Chandra Kishore Tyagi

### INTRODUCTION

Hypertension is one of the most common disorders affecting humans throughout the world. It is a chronic medical disorder in which the blood pressure in the arteries is chronically increased. It is also referred to as high blood pressure or arterial hypertension. Systolic and diastolic pressures, which correspond to the arterial system's maximum and minimum pressures, are the two measurements used to express blood pressure. The left ventricle is most contracted during the systole; the left ventricle is most relaxed before the next contraction during the diastole. The term "abnormally high blood pressure" is exceedingly arbitrary and difficult to define. Because the risk to a specific patient may correlate with the degree of hypertension, a threshold for high blood pressure must be agreed upon in clinical practice for screening individuals, implementing diagnostic evaluations, and starting therapy. Thus, there is a need to create practical plans to enhance management.[1,2]

### Signs and Symptoms of Hypertension

A severe headache, exhaustion or confusion, visual issues, breathing difficulties, chest discomfort, an irregular heartbeat, blood in the urine, and a pounding in the chest, neck, or ears are some more symptoms that may occur.

### Hypertension risk factors

There are a number of illnesses and circumstances that may raise the risk, despite the fact that the precise aetiology of hypertension (high blood pressure) is unknown. They include being overweight and obese, smoking, doing little to no exercise, eating too much salt, drinking too much alcohol, being stressed, having a black ancestry (of African, Caribbean, or South Asian descent), and having a family history of high blood pressure.

### Management of Hypertension

### Monotherapy

The usual approach for controlling hypertension for many years has been mono medication treatment. Yet, 50 to 60 percent of people who utilize a single medication to regulate their blood pressure are effective in doing so. The routine rise in the dosage of the only medication provided, which results in protracted therapy with high doses and, consequently, an increase in adverse effects, is one factor contributing to the low success rate. In result, patients stop complying. One medicine only tackles one of the various physiological pathways that contribute to hypertension, which is another factor in the inability to manage blood pressure. The pathophysiology of hypertension involves a number of processes. In general, monotherapy will only disrupt one of these pathways, perhaps allowing the other mechanisms to make up for it. Hence, combined therapy is more effective because hypertension is a multifactorial illness. [3]

### **Combination Therapy**

The fundamental effects of pharmaceuticals working through several mechanisms are brought into play by combining two medications from the right classes of drugs, which also work to counter the homeostatic compensations that prevent a blood pressure drop. Combination therapy may be advantageous since it interferes with pathogenetic pathways synergistically. As a result, the issue of dose-dependent side effects is reduced and lower doses can be used. Combination therapy is further justified by the fact that chronic high blood pressure frequently results in heart, renal, and brain problems. Angiotensin-converting enzyme inhibitors (ACE inhibitors), for example, have an effect on target organ illness independently of their antihypertensive effects. Due to the potential stimulation of compensatory mechanisms working to return blood pressure to its predetermined values, the antihypertensive efficacy of a single medication is frequently decreased. Combination therapy enables the administration of lower doses of each antihypertensive drug; as a result, compensatory stimulation may be reduced. The second antihypertensive drug in the combination may, theoretically, counteract this stimulation.

### Bimal Debbarma and Chandra Kishore Tyagi

### Drugs used for the marketed product

Diuretics, also known as "water pills," caused the kidneys to expel more sodium and water through the urine. They are believed to reduce blood pressure mostly by decreasing the amount of fluid in blood vessels.[3,4]

### SIMULTANEOUS ESTIMATION

Pharmaceutical dose forms that combine two or more medications are extremely helpful for a variety of therapy. To maintain the safety and effectiveness of pharmaceutical products throughout their shelf life, including during storage, distribution, and usage, analytical monitoring of the products' individual constituents is required. [5]Because of its patient acceptance, convenience of administration, correct dosing, cost-effective production processes, and stability when compared to other dosage forms, the oral route of drug administration may be the most alluring option for the delivery of pharmaceuticals. Over monotherapy, combination therapy has a number of benefits. The danger associated with dosage was lowered by combining two separate drugs at a low dose; this also minimizes the clinical and metabolic side effects that result from using individual components at their maximum dosage.

#### SUSTAINED RELEASE DRUG DELIVERY SYSTEM

Because of its unit dosage form, low cost, and straightforward packing, oral drug delivery offers the greatest active surface area of any drug delivery system for the administration of a variety of medications, making it the most popular and practical route. By localizing the drug to the site of action, lowering the dosage needed, and ensuring uniform drug distribution, sustained or controlled delivery systems are intended to decrease the frequency of dosing or increase the effectiveness of the treatment. A modified drug delivery system called a sustained release system can be utilized as an alternative to a traditional medication delivery system. These systems continue the drug release, keep the plasma drug concentration within the therapeutic window, barring any fluctuations, and improve the drug's therapeutic effectiveness. Patient compliance, eliminating numerous doses, raising plasma drug concentration, preventing side effects, and resolving issues with the conventional method are only a few advantages of a sustained release system.[6]

### Controlled drug delivery dose systems.

The main goal of therapy is to achieve a steady state blood level that is therapeutically effective and nontoxic for an extended duration. Creating effective dose regimens is a crucial step in achieving this objective. Due to increased design freedom for dosage forms, the oral route of administration for sustained release systems has drawn considerable attention. Several linked and significant factors, including the type of delivery system, the disease being treated, the patient, the length of therapy, and the characteristics of the drug, affect how oral sustained release delivery systems are designed.[7]

#### Limitations

- An active chemical can be maintained on its own if its half-life is long (over six hours).
- Slow release serves no purpose if the pharmacological activity of the active ingredient is unrelated to its blood levels.
- The creation of a time-release product may be difficult if the active compound's absorption includes active transport.
- Lastly, if the active ingredient has a short half-life, a considerable quantity would be needed to maintain a sustained effective dose. To prevent toxicity in this situation, a wide therapeutic window is required; otherwise, the risk is unnecessary, and a different form of administration would be advised.
- Lower small intestine cannot adequately absorb it.[8]

### Why Sustain Release Matrix Drug Delivery Systems Were Created?

- To prolong the time the medicine will be effective.
- To reduce variations in plasma level.
- Increased drug usage.
- To provide consistent drug delivery while reducing the frequency of dose.

### Bimal Debbarma and Chandra Kishore Tyagi

• To use an unique drug delivery mechanism to change the pharmacokinetics and pharmacodynamic characteristics of pharmacologically active components. [9]

# Factors Affecting Oral Sustained Release Dosage Form Design Biological half-life

Because to the potential reduction in dose frequency, medications with a biological half-life of 2 to 8 hours are thought to be excellent candidates for sustained release dosage forms.

#### Absorption

Drugs that are absorbed by active transport are only absorbed in the intestine, and the rate of absorption of a sustained dose is dependent on the drug's release rate constant from the dosage form.

#### Distribution

It lowers the level of medication in the blood, but it also has the potential to be rate-limiting in its equilibrium with blood and extravascular tissue. As a result, the apparent volume of distribution takes on varying values depending on how the drug is degraded over time.

#### Metabolism

Prior to converting into another form, the metabolic conversion to a medication must be taken into account. A successful sustain release product can be created as long as the location, rate, and extent of metabolism are known.

#### Drug Properties Relevant to Sustain Release Formulation

#### Dose size

The maximum dose for a typical dosage form is 500–1000 mg. Due to the narrow therapeutic range associated with the administration of large doses, dose size consideration serves as a criteria for the safety involved.

### Ionization, pKa, and aqueous solubility

Most medications are weak acids or bases that must dissolve in the aqueous phase surrounding the delivery site before partitioning into the absorbing membrane in order to be absorbed.

#### **Partition coefficient**

Because the biological membrane is lipophilic and the transport of pharmaceuticals over the membrane depends heavily on the partition coefficient of the drug, the partition coefficient has a significant impact on a drug's bioavailability. Since they will be localised in the aqueous phase, drugs with lower partition coefficients are thought to be poor candidates for the sustain release formulation.

#### Drug stability

Enzymatic degradation and acid-base hydrolysis occur with medicines taken orally. A drug release mechanism that delivers medication over an extended period of time is desirable if the substance is unstable in the stomach. [10]

### Methods to achieve oral sustained drug Delivery

They include soft gelatin depot capsules, drug complexes, repeat action, ion exchange resin, fat embedment, plastic matrix, barrier resin beads, and hydrophilic matrix. [11]

#### IMMEDIATE RELEASE DOSAGE FORM

Any pharmaceutical formulation that does not purposefully or noticeably use galenic adjustments to slow down the rate of drug release from the formulation or absorption is considered to be a "immediate release" formulation. In this instance, the quick release may be achieved using suitable diluents or carriers that are pharmaceutically acceptable and do not appreciably slow down the rate of drug release and/or absorption. Hence, the phrase does not include drug formulations that have been adjusted, controlled, sustained, prolonged, extended, or postponed.[12]

### Bimal Debbarma and Chandra Kishore Tyagi

### **Immediate Release Medication Delivery System Benefits**

- Increased convenience and improved compliance.
- Increased steadiness.
- Appropriate for actives with regulated or sustained release.
- Permits heavy drug loading.
- The capacity to deliver liquid therapeutic benefits in the form of a solid formulation.
- Adaptable and compatible with current packaging and processing equipment.
- Economical.

#### Desired Criteria for Immediate Release Drug Delivery System

- If the dosage is solid, it should quickly dissolve or disintegrate in the stomach.
- It should be suitable with flavour masking in the case of liquid dose form.
- Be transportable without posing a fragility risk.
- Feel good in the mouth.
- It shouldn't leave any or very little tongue residue after being taken orally.
- Be inexpensively produced utilising standard processing and packaging machinery.
- Quick medication breakdown and absorption, which could result in a quick start to action.
- Display little sensitivity to changes in temperature and humidity. [13]

#### Conventional Technique used in the Preparation of Immediate Release Tablets:

Techniques for making tablets include tablet Moulding, direct compression, wet granulation, bulk extrusion, and solid dispersions. [14]

#### MICROBEADS

Microbeads are small, solid, free-flowing particulate carriers that contain dispersed drug particles in crystalline or solution form and provide multiple release profiles or sustained release for the safe administration of a range of active pharmaceutical ingredients. Compared to monolithic formulations, microbeads offer superior control over the release of the active components. Because it takes time for food to travel through the intestinal tract when taken orally, the release of microbeads is less impacted by the presence of food.Microbeads are homogeneous polymer particles that range in size from 0.5 to 1000 m. biological components like cells, proteins, or nucleic acids can be separated using bio-reactive chemicals that have been adsorbed or linked to their surface. These are small, solid, free-flowing particulate carriers that contain dispersed drug particles in crystalline or solution form and enable multiple release profiles or prolonged release of treatment with different active agents without experiencing severe side effects.[15]When compared to non-disintegrating single-unit dosage forms, multiple-unit dosage forms, such as microspheres or microbeads, have gained popularity as oral drug delivery systems due to more uniform drug distribution and absorption, decreased local irritation, and elimination of unintended intestinal retention of polymeric material.

The microbeads disperse the active substance via two different mechanisms: diffusion and/or polymer biodegradation. In place of traditional injectable formulations, microbeads can be applied topically, parenterally, or orally. The effectiveness of these Innovative DDS is constrained by their brief stay at the site of absorption, though. Hence, it would be useful to have methods for enabling close contact between the DDS and absorbent membranes. It can be done by creating new delivery methods known as "microbeads" and combining mucoadhesion features to mucoadhesive microbeads.[16]The most popular and quickly evolving technology for controlled medication delivery systems right now is microbeads. Because of the convenience of administration and high levels of patient compliance, it is one of the handy dosages that is more beneficial. It is more cost-effective and uses different polymers to construct medications for sustained release or activity, which increases some drugs' bioavailability. [17]Moreover, they can combine medications to deliver locally at high concentrations, ensuring that therapeutic amounts are achieved at the target site while minimizing side effects by maintaining low systemic concentration. They also sustain functionality under physiological settings. The microbeads are made of a variety of polymers,

### Bimal Debbarma and Chandra Kishore Tyagi

including binding substances like gelatin, chondroitin sulphate, and avidin in a specified ratio, cationic polymers like chitosan, anionic polymers like sodium alginate, and cationic polymers like chondroitin sulphate. [18]

### Hydrogel beads or Hydrocolloids

A controlled release drug delivery system's primary goal is to maximise a medication's biopharmaceutical, pharmacokinetic, and pharmacodynamic qualities so that it can be used as effectively as possible to regulate conditions quickly and with the least amount of the drug. Moreover, it offers stable drug levels in the blood with less frequent dosage and less side effects, improving patient compliance and reducing negative drug effects. These systems divide the drug dosage into a number of subunits, which are typically made up of thousands of spherical particles with a specific diameter range. These subunits are combined or compressed into a tablet, sachet, or capsule to produce the recommended total dose.[19]When water is added to hydrophilic polymers derived from plant, animal, microbial, or synthetic sources, hydrocolloids are created, which equally spread as minute particles. The polymers entangle with one another at sufficiently high concentrations, generating loose networks that alter the rheological characteristics of solutions. By forming hydrogen bonds within and between polymers, several hydrocolloids, including pectin and gelatin, can also gel. In comparison to other sustained release formulations, formulations based on hydrocolloids may have various advantages. Additionally, because different hydrocolloids behave differently in different areas of the gastrointestinal tract due to factors including swelling in water, pH level, and enzyme activity, their stability and physical qualities (dimensions, strength, etc.) might vary. Modifications in the formulations' physical characteristics may also result in distinct drug-release patterns in various regions of the gastrointestinal tract, offering a variety of potential drug carriers. [20] Additionally, the processes involved in creating hydrocolloid formulations are typically fairly straightforward, and the components themselves are inexpensive. Hydrogel beads are hydrocolloid polymer-based beads that range in size from 0.2 to 3 mm and are primarily spherical to provide the appropriate eye appeal, release qualities, or technical requirements in general.

### Formulation Techniques of Hydrogel Beads:

Figure 3: Schematic representation of the preparation of hydrogel beads by Ionotropic gelation method. Figure 4: Schematic representation and diagram of the preparation of hydrogel beads by Ionotropic gelation and polyelectrolyte complexation.

### Polyelectrolyte complexation

By using the polyelectrolyte complexation method, the quality of hydrogel beads produced by the ionotropic gelation method can be significantly enhanced. The addition of polyelectrolytes with opposing charges to the ionotropically gelated hydrogel beads can increase the mechanical strength and permeability barrier of hydrogels. For example, the presence of polycations enables the formation of a membrane of polyelectrolyte complex on the surface of alginate beads.

### Syringe dropping /extruding method

By adding an aqueous solution of poly anion solution into a solution of cation, often calcium chloride, the hydrogel beads can be made in large quantities. While getting particulate drug carriers in this fashion is quick and easy, there is a significant risk of drug loss during formation. In the core of soluble pharmaceuticals, the matrix created is typically relatively porous and the ability to control drug release is minimal at best. As a result, it has been suggested that these hydrogel beads be used preferentially in the administration of medications with limited solubility or small molecular size.

### Air atomization method

Furthermore, beads can be made using an air atomization system or a vibration system. A vibration system or an air atomization technique can be used to extrude the poly anion solution, resulting in the formation of relatively smaller droplets. In the latter, compressed air is supplied into a "Turbotak air-atomizer" to mix with the poly anion solution and force tiny liquid droplets out through the nozzle opening. On contact, the cations create micro gel droplets by

### Bimal Debbarma and Chandra Kishore Tyagi

cross-linking the droplets of poly anions, which are then further cross-linked by poly electrolytes, such as poly-L-lysine, to form a membrane.[15]

### Factors Affecting Ionotropic Gelation Method

### Polymer and cross linking electrolyte concentration

The concentration of the polymer and electrolyte plays a significant role in the ionotropic gelation method's formulation of beads. Both should be concentrated in a ratio determined by the quantity of cross-linking units. The type and concentration of electrolytes have an impact on the percentage of entrapment efficiency.

### Temperature

The curing period, or the amount of time needed for cross-linking, as well as the size of the beads produced by the ionotropic gelation process, are both significantly influenced by temperature.

#### pH of cross linking solution

The pH of the cross-linking solution must be taken into account during formulation because it has an impact on the reaction's pace as well as the size, shape, and shape of the beads.

#### Drug concentration

Since the drug concentration significantly affects the efficiency of the entrapment, the drug to polymer ratio in the beads needs to be accurate. The gel spheres may burst if the ratio is too high, increasing both their density and size and form.

#### Gas-forming agent concentration

The formulation is modified to create porous gel spheres, which have a significant impact on the size and shape of the gel sphere. Gas-forming substances like calcium carbonate and sodium bicarbonate are added to the formulation.[21]

#### GRANULES

Excipients and other drug ingredients are among the many components of solid dosage forms that go through various production procedures before becoming the finished product. The pharmaceutical industry utilises granulation techniques to enlarge and densify small powder particles into bigger ones that increase powder flow without segregation so that the material can be processed effectively and efficiently into solid dosage forms. Wet granulation and dry granulation are the two granulation techniques used in pharmaceutical production. In the dry granulation process, a pressure-induced agglomeration technique, granules are prepared with acceptable flowability, compaction properties, compositional uniformity, and chemical stability, particularly for moisture and heat-sensitive drug formulations. Roller compaction is one of the unit operations in this process. The dry powders of the active ingredient and excipients, such as dry binders, disintegrants, diluents, and lubricants, are combined in a blender during the dry granulation process. The powder combinations are then decreased in size and roller compressed to create granules.

### Ideal characteristics of granules

The optimal granule properties include being typically spherical in shape, having a smaller particle size distribution with enough fines to fill the spaces between the granules, having acceptable moisture (between 1-3%), having good flow, having good compressibility, and having enough hardness. The size of the drug and excipient particles, the kind of binder (strong or weak), the volume of the binder (less or more), the length of the wet massing time (less or more), the amount of shear used, and the rate of drying all affect how well a substance is granulated (Hydrate formation and polymorphism). [22]

### Bimal Debbarma and Chandra Kishore Tyagi

### Granulation method

### Wet granulation

Just wet massing the powder mixture with a granulating liquid, wet sizing, and drying constitute the wet granulation process.

### **Disadvantages:**

- Labor, space, time, specialized equipment, and energy requirements all add to the cost of the process.
- The process becomes more complex as a result of the numerous processing steps.
- Material loss at different processing phases.
- Drugs that are thermolabile and moisture-sensitive are not good candidates.
- Any compatibility issues among the formulation's ingredients are made worse during processing.

### Dry granulation

The powder combination is crushed without the use of heat or a solvent during the dry granulation process. It is the least preferable granulation technique. Compressing a material to create a compact, and then milling that compact to create granules, are the two fundamental processes. There are two approaches to dry granulation. Slugging, in which the powder is precompressed and the resulting tablet or slug is ground to produce the granules, is the more popular technique. The alternative method involves utilising a device like a Chilosonator to precompress the powder using pressure rolls.

### Disadvantages:

- To create a slug, a heavy-duty tablet press is needed.
- It is not capable of achieving the same level of colour distribution as wet granulation, where the dye can be mixed with the binder liquid.
- The method often produces more dust than wet granulation, which raises the risk of contamination.[23,24]

### SUPERDISINTEGRANTS

### Mechanism of Action of Super disintegrants

Super-absorbing materials with specially designed swelling qualities are what superdisintegrants are. They are not intended to absorb a lot of water or other aqueous fluids, but rather to swell quickly. Superdisintegrants are typically used to make disintegrable solid dose forms less structurally rigid. They are physically scattered throughout the dosage form's matrix and will enlarge when it is exposed to a moist environment. These more recent compounds have increased mechanical strength and disintegration efficiency, making them more efficient at lower concentrations. Five major mechanisms for tablet disintegration are as follows-

### Swelling

Certain disintegration substances, like starch, are thought to transmit the dissolving action by swelling. The adhesiveness of other substances in a tablet is defeated by swelling when in contact with water, causing the tablet to crumble.

### Porosity and Capillary Action (Wicking)

Efficient disintegrants that transmit their disintegration effect by capillary and porosity action cannot swell. Tablet porosity creates passageways for liquid to enter tablets. The low cohesion and compressibility of the disintegrant particles themselves act to increase porosity and provide these entryways into the tablet. By capillary action, the liquid is drawn up or "wicked" into these routes, where it breaks the bonds between the tablet's particles and disintegrates them. For instance, crospovidone and croscarmellose sodium.

### Deformation

The prevailing consensus is that starch grains have a "elastic" character, meaning that when pressure is applied, the grains will distort but will immediately return to their former shape. Yet, these grains are reported to be "energy

### Bimal Debbarma and Chandra Kishore Tyagi

rich" and to be permanently distorted as a result of the compression forces used in tableting. This energy is said to be released upon contact with water. As comparison to starch grains that have not been distorted by pressure, "energy rich" starch grains have a larger capacity to swell.

### **Repulsive forces**

This disintegration mechanism explains why a tablet manufactured with "non swellable" disintegrants swells. Based on the finding that non-swelling particles also contribute to the disintegration of tablets, Guyot Hermann proposed the particle repulsion theory. The mechanism of disintegration is the electric repulsive interactions between particles, and water is necessary for it.

#### **Enzymatic Reaction**

The body's natural enzymes also function as disintegrants. These enzymes aid in disintegration and eliminate the binding action of the binder. The swelling causes pressure to be applied in the tablet's outer direction, which causes it to rupture, or the water's rapid absorption generates a huge rise in the amount of granules, which encourages disintegration.[25,26]

### MATERIAL AND METHODS

#### Drugs and chemicals

Losartan Potassium was procured from Embiotic Laboratories Ltd., Bengaluru and Hydrochlorothiazide was procured from Centurion Laboratories, Gujarat. Polymers and other excipientssuch asSodium Alginate, Chitosan, Cross Povidone, Starch, Acetic Acid, Calcium Chloride, Lactose Monohydrate, Magnesium Stearate, Talc, Sodium Hydroxide, Potassium Dihydrogen Orthophosphate, Potassium Chloride, Hydrochloric Acid are purchased from S.D. Fine Chem. Ltd., Mumbai.

### **METHODS**

### PREFORMULATION STUDIES

#### **Determination of Melting Point**

A small amount of the drug sample was placed into a capillary tube that had been previously sealed at one end, kept in the digital melting point apparatus, and the temperature range where the drug melted was noted. This method was used to determine the melting points of losartan potassium and hydrochlorothiazide. Three readings were taken, and the mean was noted.

#### Drug excipients compatibility studies

ATR and DSC tests were utilised to choose appropriate chemically compatible excipients since they can be used to study any physicochemical interaction between components in a formulation. [27]

#### **Attenuated Total Reflectance (ATR)**

With the use of the sampling method known as attenuated total reflection (ATR), materials can be studied immediately in their solid or liquid states without the need for any additional preparation. Total internal reflection, which produces an evanescent wave, is a quality used by ATR. An infrared laser beam is directed through the ATR crystal so that it bounces off the interior surface in contact with the sample at least once. The evanescent wave that penetrates the sample is created by this reflection.

#### Procedure

An IR spectrum was taken to verify the consistency of the pure drug and the physical combination of the pure drug and excipient. An ATR spectrophotometer made by Shimadzu was used to obtain the spectra. A peak was seen after a small amount of pure medicines, polymers, and physical mixes were inserted in the testing chamber.[28]

### Bimal Debbarma and Chandra Kishore Tyagi

### **Differential Scanning Calorimetry:**

An IR spectrum was taken to verify the consistency of the pure drug and the physical combination of the pure drug and excipient. An ATR spectrophotometer made by Shimadzu was used to obtain the spectra. A peak was seen after a small amount of pure medicines, polymers, and physical mixes were inserted in the testing chamber.[29]

### ANALYTICAL METHODS

**Preparation of Standard Solution** Losartan Potassium Hydrochlorothiazide

### Determination of analytical wavelength of Drugs

 $CX = [(QM - QY) / (QX - QY)] \times A1/aX1 (1) CY = [(Qx - Qm)/(Qx - Qy) \times A1/ay1 (2)]$ 

### Losartan potassium and Hydrochlorothiazide

Due to their common aromatic or double-beam composition, the majority of medicines absorb light in the UV area (200 nm-400 nm). Using a Double-beam beam UV spectrophotometer, a solution containing 20 g/ml of losartan potassium and hydrochlorothiazide in buffers with pHs of 1.2 and 7.4 was prepared. The solution was then scanned across the range of 200 nm to 400 nm against the buffers with pHs of 1.2 and 7.4 as a blank. The highest peak that could be measured was designated as  $\lambda$  max.

### Simultaneous Estimation of LP and HCTZ in Acidic & Phosphate Buffers

On a UV spectrophotometer, known quantities of solutions containing hydrochlorothiazide and losartan potassium were scanned.Quantitative estimation of LP and HCTZ was carried out by solving the following simultaneous equations:

 $Cx = \frac{Qm - Qy}{Qx - Qy} \frac{A1}{ax1} \qquad X \quad Cy = \frac{Qm - Qx}{Qy - Qx} \frac{A1}{ay1}$ Where,  $Qm = \frac{A2}{A1}$ ,  $Qx = \frac{ax2}{ax1} \frac{ay2}{ay1}$ 

Where, A1 and A2 were the absorbances of the sample at 257 nm and 272 nm respectively, ax1 and ax2 were the absorptivities of sample 1 at 257 nm and 272 nm respectively and ay1 and ay2 were the absorptivities of sample 2 at 257 nm and 272 nm respectively.[31]

### Method of Preparation of Microbeads

Figure11: Flow diagram for the preparation of hydrogel microbeads containing losartan potassium.

### PREPARATION OF IMMEDIATE RELEASE GRANULES

In this work hydrochlorothiazide containing an immediate release, granules were prepared by dry granulation technique using crospovidone as super disintegrants

Bimal Debbarma and Chandra Kishore Tyagi			
EVALUATION PARAMETERS OF FORMULATED MICROBEADS			
Determination of Yield Value			
It can be calculated by using the following formula:			
Weight of microbeads			
Percentage Yield = X 100 %			
Weight of drug + Weight of polymer			
Determination of Particle Size			

The size of each division of the eyepiece micrometer was determined by using the following formula:

Number of the division of stage micrometer

- X 100

Number of the division of eyepiece micrometer

#### Surface Morphology

Size of each division =

Scanning electron microscopy was used to examine the microspheres' exterior and internal features (SEM). The powder was sparingly sprinkled on a double adhesive tape that was fastened to an aluminum stub to create the samples for SEM. Then, using a gold sputter module in a high-vacuum evaporator, the stubs were coated with gold to a thickness of around 300 while being exposed to an argon environment. A scanning electron microscope was used to acquire photomicrographs of the coated samples after they had been randomly scanned (Jeol JSM-1600, Tokyo, Japan).

### **Estimation of Drug Content**

Losartan potassium-loaded microbeads that were precisely weighed at 50 mg equivalent weights were left in a 7.4 buffer solution overnight. A magnetic stirrer was used to combine the solution. Using a double-beam UV spectrophotometer, the drug content was evaluated following the appropriate dilution (Shimadzu, UV-1700).[35]

### In-vitro Swelling study

Because swelling in the case of hydrogels is directly proportionate to the release of the drug, the behavbehavioriour of the hydrogels affects how the drug is released from its entrapment. The network's pores open when the hydrogel swells, allowing the trapped solute to escape. The produced beads were therefore studied for dynamic swelling. Mass measurement can be used to examine the prepared bead's swelling behavior.

#### Procedure

Figure 13. Procedure of swelling study

'The swelling index was calculated using the following equation:

 $Q = [(W2-W1)/W1] \times 100$ 

Where, Q = percentage of swelling

W1 = mass of the dry beads

W2 = the mass of swollen beads.

### In-vitro Dissolution Studies

Using the dissolving apparatus USP XXII, dissolution studies were conducted (Electrolab). Drug-loaded microbeads equivalent to 50 mg of the drug were introduced into the 900 ml of acidic buffer pH 1.2±0.1 for initial 2 hours and in phosphate buffer pH 7.4±0.1 up to 12 hours. The medium was maintained at 37±2°C at 50 rpm. At regular intervals up to 12 hours, 5ml aliquots were taken out and spectrophotometrically measured at 257nm using a UV 1700, made by Shimadzu in Japan. For each formulation, three trials were run. In order to keep the sink condition throughout the experiment, an equivalent volume of new dissolving media was substituted. Simultaneous equations can be used to compute the dissolution studies profile.[36]

### Bimal Debbarma and Chandra Kishore Tyagi

### **Release Kinetics of Microbeads**

The results of in-vitro release data were plotted in different kinetic models, such as zero order, first order, Higuchi model, Korsmeyer-Peppas equation, and Hixson-Crowell model, to examine the process of drug release from the microbeads. [37]

### Zero-order kinetics

Cumulative percent drug released versus time. It can be predicted by the following equation.

At = A0 - K0t

Where, At = drug release at time't'

A0 = initial drug concentration.

K0 = Zero-order rate constant (hr-1)

### First order kinetics

Log cumulative percent drug remaining versus time. A first-order would be predicted by the following equation. Log C = Log C0 – 303.2Kt

Where, C = amount of drug remained at time't'

C0 = initial amount of drug.

K = first-order rate constant (hr-1)

### Higuchi model

Cumulative percent drug released versus square root of time. Drug released from the matrix devices by diffusion has been described by following Higuchi's classical diffusion equation.

$$Q = \left(\frac{D\varepsilon}{\tau} \left(2A - \varepsilon C_s\right) C_s t\right) \frac{1}{2}$$

Where, Q = amount of drug released at the time, "t" D = diffusion coefficient of the drug in the matrix. A = total amount of drug in a unit volume of the matrix. CS = the solubility of the drug in the diffusion medium.

 $\varepsilon$  = porosity of the matrix.

 $\tau$  = tortuosity.

t = time (hrs.) at which 'Q' amount of drug is released.

The equation may be simplified by assuming that, D, CS, and A are constant. Then the equation becomes: Q = Kt1/2

### Korsmeyer and Peppas release model

The release rates from controlled release polymeric matrices can be described by the equation proposed by Korsmeyer et al.

 $Q = K_1 t^n$ 

Where, Q = Percentage of drug released at the time't'

K = Kinetic constant incorporating structural and geometric characteristics of the tablets and 'n'=Diffusional exponent indicative of the release mechanism.

### Hixson and Crowell

To account for the particle size decrease and change in surface area accompanying dissolution, Hixson and Crowell's cubic root law of dissolution is used.[38]

Bimal Debbarma and Chandra Kishore Tyagi

### W0 1/3 – W1/3 = Kt

### EVALUATION PARAMETERS OF IMMEDIATE RELEASE GRANULES

### **Bulk Density**

Bulk density can be determined by using the following formula: Mass of Powder

Bulk Density = ---

Bulk volume of powder

### **Tapped Density**

The tapped density can be determined by using the following formula:

Mass of Powder

Tapped Density =

Tapped volume of powder

### Carr's consolidation index

Carr's index can be calculated using the following formula: Tapped Density – Bulk Density

Tapped Density

Carr's Index =

X 100

Hausner's Ratio

It can be calculated by using the formula: Tapped Density

Hausner's Ratio =

Bulk Density

### Angle of Repose

The angle of repose is defined as a possible maximum angle ( $\Theta$ ) formed between the surface of a pile of powder and the horizontal plane.

Angle of Repose ( $\boldsymbol{\Theta}$ ) = tan-1 (h/r)

Where, h = height of the pile from the horizontal powder surface. r = radius of the powder surface.

### **Estimation of Drug Content**

Granules containing hydrochlorothiazide that were precisely weighed at 10 mg equivalent weight were added to a buffer solution with a pH of 1.2. With a magnetic stirrer, the solution was blended. A double beam UV spectrophotometer was used to measure the medication content after the appropriate dilution (Shimadzu, UV-1700).

### In-vitro dissolution studies

Using the dissolving apparatus USP XXII, dissolution studies were conducted (Electrolab). Drug-loaded microbeads equivalent to 12.5 mg of the drug were introduced into the 900 ml of acidic buffer pH 1.2±0.1 for up to 2 hours, then in phosphate buffer of 7.4 pH for up to 12 hours. The medium was maintained at 37±2°C at 50 rpm. For up to two hours, 5 ml aliquots were taken out at regular intervals and examined spectrophotometrically at 272 nm using a UV 1700, made by Shimadzu in Japan. For each formulation, three trials were run. In order to maintain the sink condition throughout the investigation, an equivalent volume of fresh dissolving media was replaced. [39]

### **RESULTS AND DISCUSSION**

### Melting point

Losartan potassium's melting point was discovered to be 2650°C, which is within the stated range of 2590–2660°C, while hydrochlorothiazide's melting point was discovered to be 2680°C, which is also within the reported range of 2650–2680°C. That complies with the accepted norm. Thus showing the sample's purity.

### Drug excipients compatibility studies

### Attenuated Total Reflectance (ATR)

According to the technique, an ATR spectrophotometer was used to carry out compatibility studies. Researchers looked at the IR spectrum of pure drugs, polymers, and physically mixed drugs and polymers. The peaks of the drug spectrum and the peaks found in the spectra of the improved formulation were correlated. This shows that the medicine and the formulation's ingredients got along well.

### Differential Scanning Calorimetry (DSC) Analysis

The peaks of the drug spectrum and the peaks found in the spectra of the improved formulation were correlated. This shows that the medicine and the formulation's ingredients got along well.

### CHARACTERISATION OF MICROBEADS AND GRANULES

### Particle size

According to some reports, gelation happens right away when a drop of alginate solution interacts with Ca2+. Water is pushed out of inner droplets as alginate Ca2+ penetrates them, resulting in a concentration of beads. Consequently, an increase in sodium alginate solution concentration will have a major impact on the beads and cause them to grow in diameter.

### Surface Morphology

The sodium alginate-made microbeads in the SEM were spherical, homogeneous, and surfaced with rough wrinkles. Collagens and fusing to the colloidal aqueous polymer dispersion in the alginate matrix may be to blame for this. It is clear from the photomicrographic observation that the formulations' bridging and thick characteristics contributed to the extended drug release.

### **Swelling Studies**

The findings demonstrated a correlation between swelling and polymer concentration, with swelling being more significant for beads with higher polymer contents.

### In-vitro drug release:

A pH 1.2 buffer was used for the first two hours of the microbead dissolving investigations, and a pH 7.4 buffer for the remaining studies, lasting up to 12 hours. Due to the limited solubility of the medication in an acidic media, the losartan potassium microbeads' drug release behaviour in an acidic (pH 1.2) buffer was generally very slow. The microbeads' tendency to inflate has an impact on the drug's release rate as well. Due to an increase in the polymer's swelling tendency, the drug release behaviour in pH 7.4 buffer increased in nearly all batches. To calculate the sustained release property of the produced formulations, the *in-vitro* drug release observation was conducted for a further 12 hours. Based on the findings, hydrochlorothiazide was shown to release quickly from immediate-release granules, which may be related to the presence of crospovidone as the super disintegrating agent.

### Drug Release Kinetics Losartan Potassium Containing Microbeads

All microbeads displayed nearly zero-order kinetics, according to an analysis of the regression coefficient values of all batches. Since the plots had the maximum linearity (r2 = 0.902 to 0.937), Higuchi's equation can best describe the in-vitro release profiles of medicines from all of these formulations. The data were fitted into the Korsmeyer-Peppas

### Bimal Debbarma and Chandra Kishore Tyagi

equation to validate the diffusion mechanism. The formulations demonstrated strong linearity ( $r^2 = 0.849$  to 0.863) and a slope (n) between 0.845 and 0.905, which seems to point to a non-fiction diffusion process.

### STABILITY STUDIES

Accelerated stability tests were performed on the formulation of an improved capsule that contained losartan potassium and hydrochlorothiazide in the form of immediate-release granules and sustained-release microbeads. The improved capsule was inserted in an aluminium pouch and kept in an accelerated stability chamber for one month at 400C and 75% RH. The consistency of the medication content and the appearance of a capsule did not significantly change in samples that were withdrawn after one month.

### CONCLUSION

The formulation and assessment of a regioselective dual component capsule were successfully demonstrated in the current work. A layer of hydrochlorothiazide for immediate release was created in the dual component capsule using the dry granulation method with crospovidone as super disintegrants, and a layer of losartan potassium microbeads for sustained release was created using sodium alginate using the ionotropic gelation method with calcium chloride and a blend of chitosan using the ionic and covalent crosslinking method. Using ATR and DSC, tests on the compatibility of drug excipients were conducted. Spectra showed that no interactions between the formulation's excipients and the medications were discovered. According to all pre-compression studies, the outcomes were found to be within the established limitations. According to in-vitro release experiments, the losartan potassium sustained release layer reached 99.14% after 12 hours and the hydrochlorothiazide quick release layer reached 98.41% within 120 minutes. With regard to physical properties and in-vitro drug release investigations, stability testing after exposure to accelerated circumstances for a month revealed no alterations despite the release kinetics showing strong linearity and best fitting into Higuchi's model. With the sequential release of two medications, the manufactured regioselective dual component capsule met the goal of the research study in treating hypertension. These capsules can be the greatest replacement for traditional dose forms with higher frequency of administration because they minimise the frequency of dosage administration and are inexpensive.

### ACKNOWLEDGEMENT

I would like to thank the Sri Satya Sai University of Technology and Medical Sciences in Sehore, Bhopal (Madhya Pradesh) for providing the facilities needed to conduct the aforementioned research.

# ABSTRACT

Medicinal plants have been used as a resource for healing all over the world for many decades. The present study focused on the preliminary phytochemical and phytoconstituents analysis of *Ganoderma lucidum* ethanolic extract. GC-MS analysis method was used for the detection of various bioactive constituents present in *Ganoderma lucidum*. GC-MS analysis results showed the presence of 137 phytoconstituents among which few of them are reported for various biological activities and disease treatments. Hence, the presence of these constituents reveals the application of Ganoderma lucidum for the treatment of various diseases traditionally over the years.

Keywords: Ganoderma lucidum, phytochemical, phytoconstituents, GC-MS analysis, biological activities

# INTRODUCTION

Since early history, people have been using plants for a wide range of uses. In-depth scientific investigations were previously carried out to ascertain the chemical components of plants and create techniques for the assessment of biological activity [1]. The therapeutic properties of herbs are based on the chemical properties of plants. The medicinal value of the medicinal plant is better understood with a good understanding of the chemical composition

### Manisha Devi*et al.*,

of the plants. Numerous chemical substances synthesized by the plant cell throughout metabolic pathways generated using the basic metabolic pathways are known as secondary metabolites of the plans [2]. Secondary plant metabolites include carbohydrates, alkaloids, glycosides, proteins, steroids, phenols, and related components with have been extensively used in the process of drug discovery [3].

*Ganoderma lucidum* is an oriental mushroom, belonging to the family Ganodermataceae, possesses extensive medicinal properties. It has a huge, redish brown, glossy, and woody surface mushroom. It has been used for more than 2000 years in TMC and is referred to as "herb of spiritual potency". They are a rich source of polysaccharides, triterpenoids, sterols, proteins and peptides. The active constituents present in *Ganoderma lucidum* acquires many biological activities like anti-oxidant, anti-inflammatory, anti-tumour, anti-diabetic, antiviral, hypoglycaemic, hypolipidemic, anti-hypertensive, cytotoxic and immunomodulatory activity [4-6]. For many years, the analysis of biological samples has been largely carried out using gas chromatography-mass spectroscopy (GC-MS), which has a wide range of uses in the qualitative and quantitative measurement of presented bioactive compounds in drug extracts, mainly for the partition of volatile and thermally stable components. In order to investigate metabolites, this methodology combined the separation properties of gas chromatography with the detection capabilities of mass spectroscopy [7]. This study aimed to assess the phytochemical and phytoconstituents present in ethanolic extract of *Ganoderma lucidum* using phytochemical screening and GC-MS analysis.

# MATERIALS AND METHODS

#### **Collection of the Plant Material**

*Ganoderma lucidum* was selected for this study by conducting a systematic literature review and analysing all the proven pharmacological properties including antioxidant, anti diabetic, anti hyperlipidemic, anti tumor, anti androgenic and estrogenic activities. The sun dried *Ganoderma lucidum* fruiting bodies were procured along with botanical authentication from Biobritte Agro Solutions private limited, Jaysingpur, Maharashtra 416101. The obtained mushrooms were pulverized into fine powder using a stainless steel blender for further analysis.

#### **Preparation of Extract**

The plant material of *Ganoderma lucidum* was finely powdered and subjected to extraction using soxhlet extraction method. The conditions maintained for soxhlet extraction process were 90% ethanol as extraction solvent, 35ml/g liquid-material ratio, 80°C temperature and 2 hours extraction time respectively in order to obtain a triterpenoid rich fraction. The percentage yield of extract produced by Ganoderma lucidum was 18.533% using ethanol as a solvent.

#### Preliminary Phytochemical Screening

The presence of various phytoconstituents like carbohydrates, alkaloids, glycosides, proteins, flavonoids, phenolic compounds, tannins, saponins, steroids, terpenoids and triterpenoids in the ethanol extracts of the plants understudy were tested as per the available standard pharmacopoeial procedures.

#### **GC-MS** Analysis

The GC-MS analysis of ethanolic extract of *Ganoderma lucidum* was performed using agilent model: CH-GCMSMSO2, 8890 GC System, 7000 GC/TQ. Experimental settings of GC-MS system were as follows: column dimensions 30 m×250  $\mu$ ×0.25  $\mu$ ; carrier gas: Helium;, collision gas: Nitrogen; solvent system: diluent- methanol; temperature program: 50°C raised to 280°C at 10°C/min; total run time: 38 min; scan range: 30-900 m/z.

### **RESULTS AND DISCUSSION**

#### Preliminary Phytochemical Screening

The phytochemical analysis of *Ganoderma lucidum* ethanolic extract revealed the presence of carbohydrates, glycosides, saponins and triterpenoids as detailed in table 1.

#### Manisha Devi et al.,

### **GC-MS** Analysis

GC-MS analysis of the *Ganoderma lucidum* ethanolic extract fraction revealed the presence of number of phytoconstituents. The mass spectrum produced by GC helped in the identification of the various phytoconstituents as depicted in figure 1. Phytoconstituents recognised in the ethanolic extract of *Ganoderma lucidum* using GC-MS analysis are listed in table 2 along with the reported activity of the individual phytoconstituent. The results revealed the presence of 137 different phytoconstituents, among which few of the components have been isolated and reported for various biological activities and their uses. Hence, isolation and research of individual phytoconstituents of *Ganoderma lucidum* may lead to the identification of novel components for further research.

# CONCLUSION

The present study concluded the presence of carbohydrates, glycosides, saponins and triterpenoids in the ethanolic extract of *Ganoderma lucidum*. Further GC-MS analysis helped recognise various phytoconstituents with different chemical structures and biological activities. The bioactive compounds present in Ganoderma lucidum can help in the treatment of various diseases and disorders.

#### CONFLICT OF INTREST STATEMENT

The authors declare no conflict of interest.

### ACKNOWLEDGMENT

The authors are thankful to The South Indian Textile Research Association (SITRA), Tamil Nadu, India for their support in carrying out GC-MS analysis.

# ABSTRACT

Fish are well known for their high potential fecundity. Spawning in fish was controlled by various environmental factors. So far, in the regulation of reproduction and induced breeding, many products are utilized. The present study assesses the fecundity on exposure to the homeopathic preparation natrummuriaticum 30 c potency in fish viz goldfish, rosy barb, white molly and guppy. It also traces the time taken to spawning in viviparous fish. The experimental goldfish laid  $850 \pm 104$  eggs; the control fish laid  $383 \pm 75$  eggs in 4 days, whereas in rosy barb experimental fish laid  $110\pm 15$  eggs and the control fish laid  $56 \pm 11$  eggs in 4 days. The treated white molly released  $39\pm5$ young ones in $19.5\pm3$ hours, while the control fish released  $20\pm2$  young ones in  $72\pm6$  hours, whereas in guppy the control fish released  $8\pm1$  young ones in  $79\pm9$  hours and the treated released  $15\pm2$  young ones  $36\pm9$  hours. Present findings demonstrated that homeopathic preparation natrummuriaticum is a highly effective stimulus for breeding of the above mentioned fish. It enhanced the production of matured eggs in oviparous and highly motile young ones in viviparous fish.

Key words: Fecundity, Natrummuriaticum 30c, Oviparous and Viviparous ornamental fish.

# INTRODUCTION

Reproduction is an essential component of life and there are a diverse number of reproductive strategies in fish throughout the world. Fish are well known for their high potential fecundity, with most species releasing thousand to millions of egg annually [17]. Fecundity is the general term used to describe the number of eggs produced<sup>17</sup> or the

Sudha

egg-laying capacity of the fish [20]. The number of eggs ripened by female fish during a spawning season varies from a few dozen to millions [11]. In general, fecundity varies among species, viviparous fish have lower fecundity than ovoviviparous fish, which in turn have lower fecundity than oviparous fish and nest builders have lower fecundity than pelagic spawners. Fecundity can be expressed as the number of mature ova in the ovary, the number of ovulated eggs or the number of eggs deposited during spawning [23]. Breeding is possible for fish in warm water by appropriate control of their environment<sup>5</sup>. Breeding of ornamental fish can be a profitable proposition if it is done in a well monitored environment [20].

Reproductive development and spawning in fish were controlled by various environmental factors such as temperature, nutrition, water quality etc. In aquaculture, embracing fancy fish culture, many species are grown which are far from their original agro-climatic condition. During recent years, intensive aquaculture practices have been emerged, due to this farmer's requirement for fish seed is increasing every year. Inadequacy of quality fish seed supply has been a major constraint in the development and progress of aquaculture. Market demand for fancy fish usually not synchronized with its breeding season. So far, in the regulation of reproduction and induced breeding, many products areutilized [2]. Presently three types of hormones are used for induced breeding purpose, (1) Fish pituitary gonodotropins, (2) HCG (Human Chorionic Gonadotropin,(3) GnRha (Gonadotropin releasing hormone analogue) with or without a dopamineanatagonist. Ovaprim is a drug used as a substitute for pituitary extract in induced breeding. Ovaprim gained popularity among the fish farmers who involved in fish seed trade. Trials with ovaprim on Indian major carps administered with single dose on either sex showed excellent results i.e. induced complete spawning [14 &16]. Ovatide is a newly launched ovulating agent developed by an Indian Company Hemma Pharma, Mumbai). It is a synthetic preparation containing salmon GnRH analogue and dopamine antagonist. It has been successfully tested by <sup>15</sup> in Catlacatla [13] in Ompokpabo [10] in Channastriatus. The present study assesses the fecundity on exposure to the homeopathic preparation natrummuriaticum 30 c potency in fish viz goldfish, rosy barb, white molly and guppy. It also traces the time taken to spawning in viviparous fish.

# MATERIAL AND METHODS

#### Animals

Two types of fish (egg layer and live bearer) were selected for this induced breeding study. Sexually mature, healthy and female of gold fish, rosy barb, guppy and white molly were procured from Aqua pet shop in the polythene bags and transferred to big plastic tubes. They were acclimated to the laboratory condition for 10 days. During the period of acclimation, fish were fed with Day Today's complete nutritional food. The water was changed daily. The uneaten feed and faecal pellet were removed daily. Uniform sized fish with identical maturity condition were used for the experiments. The fish were divided into two groups i.e egg layer and live bearer. In each group two types of fish are used i.e., gold fish, rosy barb and guppy and molly respectively. In each type totally 12 fish were taken. Among this, six were used as experimental and six were used as control. Experimental fish were introduced into the medium. On 4th day of the experiment fish were autopsied, eggs were collected and counted in control and experimental group of egg layers. Spawning was observed in the form of young ones number in control and treated group of livebearers.

#### Homeopathic preparation

The homeopathic preparation, Natrummuriatium of 30c potency was brought from a local homeopathy medial shop. It is kept in a normal room temperature and light. The preparation was diluted by 0.1ml in 400ml of ground water. The medium was prepared in plastic troughs of 2 litre capacity.

#### Method of treatment

The homeopathic preparation medium was prepared in six plastic troughs considered as experimental ones and six troughs containing only ground water as control. The fish were introduced into medium one in each. The experiment was carried out for three days i.e., the medium was changed morning at 8 am and evening at 4 pm. Evening only ground water was used, at the same time feeding was done. On the day before medication (0 day) and after three

#### Sudha

days the oviparous fish were dissected and eggs were pooled out and counted. But for the viviparous the set up was carried out to find the latency period without adding natrummuriaticum after 3 days.

# RESULTS

In order to ascertain the effect of natrummuriaticum for the induction of breeding an experiment was conducted in gold fish, rosy barb, guppy and white molly. Each value represented the mean value of six samples for each species. The experimental animal goldfish laid 850 ± 104 eggs in 4 days, the control animal laid 383 ± 75 eggs in 4 days (Table 1, Figure 1, 2A and 2B) whereas in rosy barb experimental animals laid 110± 15 eggs in 4 days and the control animal laid56 ± 11 eggs in 4 days (Table 1, Figure 1, 2C and 2D). Number of eggs level altered significantly between control and experimental animals. The effect of Natrummuriaticum on induced breeding of white molly and guppy are presented in the Table 2 and Figure 3. The natrummuriaticum treated animal laid39±5young ones in19.5±3hours, while the control animal laid 20±2 young ones in 72±6hours in white molly (Figure 4A and 4B), whereas in guppy the control animal laid8±1 young ones in 79±9 hrs and the treated laid 15±2 young ones 36±9 hours (Figure4C and 4D). In viviparous fish also there was a significant changes observed between control and experimental animals.

# DISCUSSION

The results suggested the role of natrummuriaticum (homeopathic preparation)in the regulation of breeding in oviparous (goldfish and rosy barb) and viviparous fish(white molly and guppy). Present findings demonstrated that homeopathic preparation natrummuriaticum is a highly effective stimulus for breeding of the above mentioned fish. The experimental preparation natrummuriaticum is also a natural material preparation. There appears to be no experimental information regarding the role of natrummuriaticum in ovulation of teleosts<sup>19</sup>. Only <sup>12</sup> used this homeopathy preparation on major carps for breeding purpose and obtained a positive result. According to <sup>18</sup>*Ompokbimaculatus*an endangered fish, was induced to spawn by a single intramuscular injection of ovaprim (0.5ml/kg).He observed spawning of fish after 5-6hours injection. Each female spawned an average of 4012 eggs. Successful spawning of *C.punctatus*at0.3and 0.5ml/kg and 3000IU/kg body mass of HCG. He also observed successful spawning in *H.fossilis* at 0.3, 0.5 and 0.7ml/kg body mass for ovaprim and1000, 2000and 3000 IU/kg body mass for HCG [7,21]. stated that the single dose administration(30µl/ fish) of pedalium murex, a whole plant extract, induced laying at about 42 hr inblack molly and 20 hr in rosy barb. Similarly single dose administration of (30µl/ fish) *mucunapruriens* seed extract induced spawning at 48hrs in the case of black molly and24 hrs in rosy barb.<sup>22</sup> conducted experiments using natrummuriaticum of 1000cpotency in gold fish induced the spawning within 12 hours against 5 days in the control. He noted that treated animals laid 2856 eggs whereas the control laid 209 eggs.

The endangered riverine catfish, pang as *Pangasius pangasius*, was examined by [8] with 10mg/kg of pituitary gland extracts. He observed that the hatching of fertilized eggs occurred between 28 and 32 hours.<sup>3</sup> reported using five doses of PG extract (1.00, 2.00, 3.00,4.00 and 5.00 ml /kg) in Rajputi *Puntius gonionotus* (Bleeker) affected 100% egg release through induced spawning. Induced breeding of Koi carp and Goldfish by the use of synthetic hormone Synchromate B was highlighted by <sup>9</sup>. He reported that induction at the rate of 0.1ml per gold fish of 25g and 0.25ml per koi carp of 250g yielded potential fry stock of  $1600 \pm 604$  and  $30880 \pm 7127$  respectively. Spawning response of goldfish with ovaprim 0.5µl in female released  $1000 \pm 115$  eggs after 10-12 hr of injection was observed by<sup>6</sup>.

The use of ovaprim resulted maximum fecundity in angel fish *Pterophyllum scalare* suggested by <sup>4</sup>. Maximum fecundity (665.66) was obtained at the optimum dose of ovaprim (0.35ml/kg of body weight). The highest percentage of fertilization in goldfish and koi carp through induced breeding of intraperitonial injection by ovaprim is reported by <sup>1</sup>.So when the effectiveness was compared with other hormones, this preparationis found highly effective, cost effective and suitable for farmers. Natrummuriaticumbeing a Swadeshi product, it is easily available, simple to prepare and natural in origin. Further studies on natrummuriaticum will improve our country's economic status, through which more foreign investment may be earned by this Swadeshi product.

#### Sudha

From the available references along with the present investigation on the induced breeding in ornamental fish, it was observed that higher levels of fecundity were achieved from a comparatively lower dosage of natrummuriaticum. It enhanced the production of matured eggs in oviparous and highly motile young ones in viviparous within shortperiod by using simple method of breeding. If this technique is employed to increase the production rate, it is possible to meet the domestic demand as well as to enter the international market in turn will fetch foreign exchange to our country.

# ABSTRACT

The present study investigates the effects of Quinalphos on the haematological, histopathological and marker enzyme level of the freshwater fish *Oreochromis mossambicus*. Fishes were exposed to sublethal concentration (0.009 ml/l) of Quinalphos for 30 days. The WBC indices were significantly increased during the experiment and all other indices like RBC, Hb, PCV, MCV, MCHC, MCH and platelet count decreased during the experiment. The control fishes showed normal histoarchitecture of muscle, gills and liver. Severe degeneration in the muscle fibers, degeneration and necrosis of the respirating epithelium and lamella of gills and hepatic parenchyma with features of severe fatty degeneration and congestion was shown in fishes exposed to Quinalphos. The level of liver marker enzymes such as AST, ALT and ALP showed a significant increase in the Quinalphos-treated fishes than that of the control group. The results of the present study clearly indicated that pesticides have direct impact on the biochemical, physiological and structural alteration in *Oreochromis mossambicus*.

# INTRODUCTION

Environmental pollution is one of the major issues that world is facing. The rate of pollution is increasing every year, causing severe irreparable environmental damage. Water pollution is the most dangerous type of pollution, and it is the biggest threat posed by urbanization, industrialization, and modern agricultural practices. It causes variations in the physical, chemical, and biochemical properties of water bodies[1]. One of the most common categories of toxic substances used in India to manage pests in agricultural lands and control vectors of human disease are insecticides. Rivers and agricultural ponds that receive water from rivers are both impacted by runoff from treated areas [2]. Less than 0.1% of the pesticide used in the fields actually contacts the intended target organism; the other 99% enters the environment. Quinalphos (O,O-diethyl O-quinoxalin-2-yl phosphorothioate), an organophosphorus insecticide, is used worldwide to control agricultural pests. Organophosphorus insecticides are the most widely used synthetic chemicals for controlling agricultural pests. Quinalphos act as a cholinesterase inhibitor and may cause disorders in physiological state of nervous system. It disrupts the passage of impulses across the neuromuscular junction by inhibiting acetylcholinesterase [3].

One of the most frequently usedmethod to evaluate fish physiological status and health is haematological examination. Haematological parameters are crucial in determining the structural and functional rank of a toxicant-treated animal because, blood is the pathophysiological indicator of the entire body. The ability to compare the tissue structures or morphology of healthy and diseased fish allows for the use of histology as a diagnostic tool for fish diseases; however accurate diagnosis and confirmation of disease-related changes require proper specimen processing and a high level of histopathology expertise [4]. It has been suggested that, in general, stress induces elevation of the transamination pathway and the activities of alanine aminotransferase (ALT), aspartate aminotransferase (AST) and alkaline phosphatase (ALP)have been used as relevant stress indicators [5].

The present study aimed to evaluate the insecticide Quinalphos toxicity at the tissue level after its intoxication at sublethal dose in fresh water fish *Oreochromis mossambicus*. The current study's specific objectives were to determine the lethal concentrationLC<sub>50</sub>, to investigate the haematological parameters (RBC, WBC, Hb, PCV, MCH, MCV, MCHC and platelet count), histology of vital tissues such as gills, muscle and liver and to estimate the level pf marker enzymes of *Oreochromis mossambicus* treated with Quinalphos.

# MATERIALS AND METHODS

**Test animal:**The Tilapia fish, *Oreochromis mossambicus* of 10-12 cm was collected from a local fish farm in Thrissur, Kerala. These fishes were transported to the laboratory in oxygenated tubs. The fishes were acclimatized for 15 days in the fish tank containing plain tap water in laboratory and was fed with commercial fish pellets.

**Test chemical:** In this study, Quinalphos was purchased from commercial store and used for the exposure to the fish. The major use of Quinalphos in farming is to protect corn, cotton and fruit trees against insects. This pesticide is commonly used in Kerala, which act as a cholinesterase inhibitor and may cause disorder in the physiological state of the nervous system in the insects.

**Experimental design and treatment:** The fishes were acclimatized for 10-15 days in a fish storage tank in the laboratory. They were fed with commercial artificial feed (pellets) twice day. After acclimatization, the *Oreochromis mossambicus* having the size of 10-12cm were randomly distributed in plastic tubs of 10 liters capacity. One tub was maintained as control and other tubs are treated with different concentration of quinalphos as 0.003 ml/l, 0.005 ml/l, 0.007 ml/l, 0.009 ml/l and 0.011 ml/l.Six fishes were used for each concentration of quinalphos placed in each tub and the mortality rate was noted after 24 hrs., 48 hrs., 72 hrs. and 96 hrs.

### Arshitha and Pawlin Vasanthi Joseph

Then experiment was designed to expose the fish to separate tubs with different sublethal doses of quinalphos. The doses were 0.009  $\mu$ l/l, 0.007  $\mu$ l/l, 0.005  $\mu$ l/l. Each tub was provided with 6 fishes The period of the experiment was 30 days. The fishes were fed with artificial feed twice a day during experimental period. Each day the tubs were refilled with fresh water and the appropriate concentration of quinalphos was induced in the tubs. Fishes were starved for 24 hours. After which the blood specimen was collected. Each fish was caught by a dip net and blood was collected from common cardinal vein using sterilized small insulin needles. To avoid clotting of the blood during collection, sterile evacuate tubes containing EDTA was used. Blood samples were immediately used to determine the hematological parameters such as total erythrocyte, leucocyte count, haemoglobin (Schaperculaus, 1991), red blood cell indices and platelet count (Dacie and Lewis, 2006). And also blood was collected in tubes for estimating the level of liver marker enzymes such as *Aspartate aminotransferase* and *Alanine aminotransferase* (Reitmann and Frankel, 1957) and Alkaline phosphatase (Garen and Levinthal).

After collection of blood samples, Histopathology of vital tissues such as gills, liver and muscles were also assessed after 30 days of treatment and was preserved in 10% buffered formalin for histological studies.

**Statistical analysis:** The dose responses of mortality was studied using a computer-based probit analysis method. Results were expressed as mean ± standard error of mean of 4 observations. Statistical analyses of data was performed using 't' test, P values of less than 0.05 were considered as significant. Analysis of variance (ANOVA) was employed followed by Duncan's new multirange test to calculate the significance difference between control and experimental means (SPSS Version, 21).

# **RESULTS AND DISCUSSION**

Acute toxicity: The results of Probit analysis is shown in the Table 1 and Fig 1. In the present study, 50% mortality was observed at a concentration of 0.009 ml/l of quinalphos. The log concentration using Probit analysis (Finney, 1953) is 0.905. The corrected mortality data were analyzed by the following method of Finney (1957) to determine the  $LC_{50}$  values. Figure X represents the plot of probability (of mortality) is estimated concentration of Quinalphos, which indicates the  $LC_{50}$  of 8.035 µl/l of Quinalphos for *Oreochromis mossambicus*.

Effect of Quinalphos on haematological parameters: The results of haematological examination of blood samples from acute toxicity are given in Table 2. The mean control value of the RBC after 30 days of treatment was  $4.9\pm0.2$ . A statistically significant decrease in RBC content was seen in the entire experimental group of fishes treated with quinalphos concentrations of  $5\mu$ l/l,  $7\mu$ l/l and  $9\mu$ l/l. Its values are as follows ;  $4.6\pm0.436$ ,  $4.4\pm0.361$  and  $4.2\pm0.265$ . After 30 days of exposure in both the control and the experiment, the ANOVA for RBC is statistically insignificant. Blood is a pathophysiological reflector of the body because it is highly susceptible to internal and external environmental fluctuations. Blood parameters are contemplated as a sensitive measure of stress in fish exposed to different water pollutants and toxicants like industrial effluents, metals, pesticides, chemicals, biocides etc. [6].A significant reduction in red blood cell count was observed in this study compared with the control group. Similar observations were already report. This anemic response could result from inhibition of RBCs and haemosynthesis, osmoregulatory dysfunction, and destruction of RBC in hematopoietic organs [7][8].

The mean control value of WBC after 30 days of treatment is 1800±4.359. There is a significant increase in WBC content observed in all experimental groups. The highest WBC content level of 2400±4.583 was observed in the fish group treated with 9  $\mu$ l/l of the pesticide. The observed WBC level for 5 $\mu$ l/l and 7 $\mu$ l/l is 1700±2.646 and 2000±1.732 respectively. After 30 days of exposure in both the control and the experiment. the one-way ANOVA for WBC is statistically significant at the 99% significance level (p < 0.01). The increase in WBC count in the study indicates the stress condition of the fish caused by Atrazine which might have produced hypoxia and gill damage [9].WBC count was increased significantly when compared to the control animals and this could be due to hemodilution, a mechanism that reduces the concentration of the pollutants in the circulatory system[10].

### Arshitha and Pawlin Vasanthi Joseph

The mean control value of haemoglobin after 30 days of treatment is  $14.9\pm0.208$ . Similar to RBC, a significant decrease in haemoglobin content has been observed in all the experimental groups. The lowest haemoglobin level of  $12.7\pm0.557$  was observed in the fish group treated with  $9\mu$ l/l of the toxic compound. The observed haemoglobin levels for the concentration  $5\mu$ l/l and  $7\mu$ l/l of quinalphos were  $14.6\pm0.3$  and  $13.5\pm0.4$  respectively. The one-way ANOVA findings revealed a statistically significant difference(at the 0.01 level) in haemoglobin levels after 30 days of exposure in the control and experimental groups. In such a case, because of decrease in oxygen consumption also reported to cause pronounced haematological changes [11]. Haemoglobin levels significantly decreased after 24 hours may be due to the disruption of iron synthesizing machinery [12]. It may impair oxygen supply to various tissues, thus resulting in a slow metabolic rate and low energy production [13].

PCV level in the control fish population is  $45.1\pm0.132$  after 30 days of treatment with no exposure to a toxicant. It was discovered that the amount of PCV in the blood was directly proportional to the amount of exposure. The greatest reduction was observed in the experimental group exposed to 9 µL/l of toxicant, followed by groups exposed to 5 and 7 µl/l of the toxicant. Among the 5- 7µl/l exposure fish groups, the PCV values are  $44\pm0.755$ ,  $40\pm0.1$ ,  $38.7\pm0.458$ . The one-way ANOVA for PCV between the control and the experiment is statistically significant at the 0.01 level of significance. The PCV values always decrease when a fish loses appetite or becomes diseased or stressed [14]. In the present study, the distinct decrease in the level of Haemoglobin and PCV after exposure to malathion suggests a hemodilution mechanism possibly due to gill damage or impaired osmoregulation. The decrease in the PCV indicates the worsening of the condition of the organism and developing of anemia[15].

After 30 days of treatment, the control value of MCV is  $91.9\pm0.058$ . A statistically significant drop in MCV content was detected in the entire experimental group, including fish treated with 5 µl/l, 7 µl/l and 9 µl/l of the toxicant. The values are  $91.7\pm0.153$ ,  $91.3\pm0.321$ ,  $90.6\pm0.306$ . One way ANOVA for MCV after 30 days of exposure in the control and experimental groups is significant at the 0.01 level. The control value of MCH after 30 days of treatment is  $32.3\pm0.252$ . A significant decrease in MCV content has been observed in the entire experimental group of  $5\mu$ l/l, $7\mu$ l/l and  $9\mu$ l/l treated fishes. The values are  $31.2\pm0.832$ ,  $31.1\pm0.351$  and  $30.6\pm0.115$  respectively. The ANOVA for MCV after 30 days of exposure in control and experimental are significant at 5% level. The alterations in MCV and MCH were ascribed to hemolysis and impairment in hemoglobin synthesis [16].

The control value of MCHC after 30 days of treatment is  $33.73\pm0.153$ . A significant decrease in MCV content has been observed in the entire experimental group of 5 µl/l, 7 µl/l and 9 µl/l treated fishes. The values are $33.67\pm0.321$ ,  $33.37\pm0.551$  and  $33.1\pm0.346$  respectively. The one-way ANOVA for MCV after 30 days of exposure in control and experimental is insignificant.Further, changes in blood cell indices like MCH, MCH, MCHC and MCV were also observed in the study. This may be due to the fact that these are very sensitive and can cause reversible changes in the homeostatic system of fish. Fluctuations in these indices directly correspond with the values of RBC count, Haemoglobin concentration and packed cell volume. The present findings are similar to the earlier reports [17]. The control value of platelet count after 30 days of treatment is  $21000\pm31.048$ . A significant decrease in platelet content has been observed in the entire experimental group 5 µl/l, 7 µl/l and 9 µl/l of treated fishes. The values are  $20000\pm28.583$ ,  $19700\pm28.054$  and  $18000\pm18.33$  respectively. The one-way ANOVA for MCV after 30 days of exposure in control and experimental is significant at 1% level.Platelets are nucleated cells responsible for blood clotting in fish; a slight decrease in values observed in this study may signify the effect on platelet (thrombocyte) production [8].

### Effects of Quinalphos on vital organs (histopathology):

The muscle in the control section examined was found to be having normal appearing muscle fiber bundles. Degeneration of muscle fibers was noticed in the section which was obtained from the concentration of 5  $\mu$ l/l of Quinalphos. According to the examination, severe degeneration of muscle fibers were shown by the sections taken from the concentration 7  $\mu$ l/l and 9  $\mu$ l/l (Figs. 2,3,4,5).Das and Mukherjee (2000) have studied the effect of different pollutants on fish muscles.The fish showed marked thickening of muscle bundles with severe intracellular edema [18].

### Arshitha and Pawlin Vasanthi Joseph

The gills in the control section examined was to be normal in appearance, with intact gill filament epithelium and lamella. Degeneration and necrosis of the respirating epithelium and lamella were noticed in sections analyzed from the received biopsy at a concentration of 5  $\mu$ L/l and 7  $\mu$ l/l. Segments investigated from the attained biopsy elucidated Severe degeneration and necrosis of the respiratory epithelium and lamella in the fish category exposed to 9  $\mu$ l/l, confirmed by microscopy (Figs. 6,7,8,9). Since, gills are the respiratory and osmoregulatory organ of fish, the histopathologic changes of the gills might impair the respiratory function of the gills by reducing respiratory surface area resulting in hypoxia, respiratory failure problems [19].

In the control segment, the liver parenchyma is normal-appearing, yet it has a characteristic of congestion. At 5  $\mu$ L/l, the liver parenchyma in the sections examined appears normal, although there are signs of congestion and fatty degeneration. However, hepatic parenchyma with features of severe fatty degeneration and congestion was noticed in the fish group treated with a concentration of 7 and 9  $\mu$ l/l of Quinalphos (Fig. 10,11,12,13).Hepatocytes are the most abundant cell types within the liver and perform most of the liver's essential functions, such as converting glucose to glycogen, regulating lipids, and deamination of amino acids [20].

**Liver marker enzyme studies:** The results of level of liver marker enzymes of blood samples from acute toxicity are given in Table 3.The mean control value of hemoglobin after 30 days of treatment is100.4 $\pm$ 0.557. Similar to ALT, a significant increase in AST content has been observed in all the experimental groups. The lowest hemoglobin level of 137.2 $\pm$ 0.458 was observed in the fish group treated with 5 µl/l of the toxic compound. The observed AST levels for the concentration 7µl/l and 9 µl/l of quinalphos were 256.8 $\pm$ 0.794 and 476.8 $\pm$ 0.608 respectively. The one-way ANOVA findings revealed a statistically significant difference(at the 0.01 level) in AST levels after 30 days of exposure in the control and experimental groups.Serum glutamic oxaloacetic transaminase (SGOT) is maximally present in heart followed by liver, skeletal muscles, and kidney. Any damage to these organs raises the SGOT level as in myocardial infarction, Liver diseases such as Liver cirrhosis, Viral Hepatitis, Liver necrosis and skeletal muscle diseases [21].

The mean control value of ALT after 30 days of treatment is  $33.03\pm0.153$ . There is a significant increase in ALT content observed in all experimental groups. The highest ALT content level of  $94.6\pm0.625$  was observed in the fish group treated with 9 µl/l of the pesticide. The observed ALT level for 5µl/l and 7µl/l is $43\pm0.436$  and 77.2 $\pm0.529$  respectively. After 30 days of exposure in both the control and the experiment. the one-way ANOVA for ALT is statistically significant at the 99% significance level (p < 0.01).SGPT is in highest concentration in the liver followed by the kidney. Under pesticidal stress, these organs get damaged and the enzyme level elevates in the serum. The SGPT level is found to be raised in liver diseases such as infective hepatitis, liver cirrhosis, cholestatic jaundice and skeletal muscle damage [22].

Under exposure to sublethal concentrations of Quinalphos, the amount of Alkaline Phosphatase (ALP) was found to increase in all the test tissues of Oreochromis mossambicus. In this experiment control shown least ALP content 11.93 $\pm$ 0.252. A statistically significant increase in ALP content was seen in the entire experimental group of fishes treated with quinalphos concentrations of 5 $\mu$ l/l, 7 $\mu$ l/l and 9 $\mu$ l/l. Its values are as follows ; 14 $\pm$ 0.361, 18.2 $\pm$ 0.173 and 66.8 $\pm$ 0.458 respectively.Decreased phosphate activity may be due to alteration in membrane permeability, distribution of normal functioning of cell organelles like lysosomes and mitochondria and different suppressor mechanisms associated with toxicity together resulted in significant changes in the level of enzymes in the tissues examined. The decreased activity of ALP in fish is linked to the increased catabolic breakdown in melanomacrophage centers [23].

# CONCLUSION

The use of pesticides in the field of agriculture cause disruption in the balance of the ecosystem. O,O-diethyl Oquinoxalin-2-yl phosphorothioate is commonly called as quinalphos which is a organophosphorus insecticide used to control aphids, thrips and mites on paddy, cotton, sugarcane and potato.

### Arshitha and Pawlin Vasanthi Joseph

The results of the present study clearly indicated that pesticides have direct impact on the biochemical, physiological and structural alteration in Oreochromis mossambicus. The exposure of fish to this insecticide resulted in reduction in the haematological parameters, degeneration in the vital tissues and a significant increase in the levels of marker enzymes. This negatively affect the growth, reproduction, immunity and even the survival of the fish in the natural environment. This should be also considered by farmers, when they are using quinalphos for pest control in their fields. So awareness should be created among the people to use biocides instead of pesticides and insecticides.

# ABSTRACT

Trapezitis is defined as inflammation of trapezius muscle. In the upper trapezius muscle area neck pain is very common. At some point in their lives around two thirds of people experience neck pain. Prevalence is highest in middle age and women are more affected than men. Rate of prevalence in male and female in India is 1:10. 3-5% of population is affected worldwide. IASTM techniques use special stainless steel instruments that enable clinicians to locate efficiently and treat soft tissue dysfunctions, such as fibrosis adhesions, chronic inflammation, or degeneration. IASTM technique results in clinical benefits such as improvements in range of motion, strength and pain perception. Strain Counterstrain (SCS) is a gentle manual treatment for muscle pain and spasm which involve resetting muscle tone and enhancing circulation that restores a muscle to its normal resting tone. To compare the effect of Instrument Assisted Soft Tissue Mobilization and Strain Counterstrain on Pressure Pain Threshold, Muscle Hardness and Neck functions in patients with upper Trapezitis. In the present comparative study, total fifty two (52) patients with upper trapezitis with age between 18-40 years were included. They were randomly divided into two groups: Group-A (n=26) and Group-B (n=26). Both group received conventional treatment, in addition Group-A received Instrument Assisted Soft Tissue Mobilization technique and Group-B received Strain Counterstrain technique. Patients were evaluated preintervention (0 week) and post-intervention (3 week) for pressure pain threshold (by means of algometer), for muscle hardness (by means of durometer) and for neck function (by means of NPAD). Statistical analysis was done by using SPSS 20 version. Significance level was set at p<0.05. Paired 't' test as a parametric and Wilcoxon signed rank test as a non-parametric test was applied for intra-group comparison and results showed that there were statistically significant difference in mean of PPT,MH and NPAD in both the groups during three week intervention period (p<0.05). Independent 't' test as a parametric and Mann Whitney U test as anon-parametric test was applied between group comparison 64033

### Prachi Patel and Neeti Mishra

and result showed that there were statistically significant difference between IASTM group and SCS group in mean difference of PPT, MH and NPAD during 3 week intervention period (p<0.05). Instrument Assisted Soft Tissue Mobilization Technique along with conventional treatment is more effective for improving pressure pain threshold, reducing muscle hardness and improving the neck function than Strain Counterstrain technique along with conventional treatment in patient with upper trapezitis.

**Keywords:** Instrument Assisted Soft Tissue Mobilization Technique (IASTM), Strain Counterstrain (SCS), Positional release technique (PRT), Trapezitis, Trigger points, Pressure Pain Threshold (PPT), Algometer, Durometer, Muscle Hardness (MH), Neck pain and disability scale (NPAD).

# INTRODUCTION

Trapezitis is defined as inflammation of trapezius muscle. The upper trapezius muscle is known as the postural muscle and is highly susceptible to overuse.[1] Even during rest the pain is present and exacerbated by activity; from the site of primary inflammation it may be referred to other region.[2] Trapezitis is an inflammatory pain arising from the trapezius muscle causing a severe neck spasm.[3] Trapezitis is an inflammation of trapezius muscle which involve myofascial pain syndrome, that can be commonly encountered in clinical practice.[4] he prevalence of neck pain varies widely in different studies, with a mean point prevalence of 13% (range 5.9%– 38.7%) and a mean prevalence of 50% (range 14.2%–71.0%)[5]. Rate of prevalence in male and female in India is 1:10. 3-5% of population is affected worldwide[6, 7] . Trapezitis is mainly caused due to stress and tension, repetitive movements, forwarded head posture, sitting without back support, working without arm support, prolonged head bending activities, using thick pillow, tight pectoralis major muscle, severe neck spasm [8].

Active trigger points are cause of clinical symptoms and their evoked referred pain is responsible for the patient's pain. Latent trigger points may not be an immediate source of pain, but might produce other muscle dysfunction; i.e. fatigue, restricted range of motion and referred pain with muscle contraction or compression.[9] This clinical distinction has been strongly substantiated by histochemical findings at the trigger points, since higher level of concentration of protons, bradykinin, calcitonin gene-related peptide, substance P, tumor necrosis factor- $\alpha$ , Interleukin-1 $\beta$ , serotonin, and norepinephrine have been recently found in active trigger points.[10] Trigger points develop in the myofascia, mainly in the center of a muscle belly where the motor endplate enters (primary or central TrPs). Those are palpable nodules within the tight muscle at the size of 2-10 mm and can demonstrate at different places in any skeletal muscles of the body. When it happens, TrPs are directly associated with 4 myofascial pain syndrome, somatic dysfunction, psychological disturbance and restricted daily functioning [11].

Conventional treatment include Neck isometric exercises whch cause contraction and relaxation of the neck muscles thus massaging all the toxins, which are responsible for causing inflammation and strengthen the muscle fibers and improve stability of the neck muscles[12, 13]. Various physiotherapy protocols have been advocated in the past like rest, heat, ultrasound therapy (UST), microwave diathermy (MWD), transcutaneous electrical nerve stimulation (TENS), spray and stretch and post–isometric relaxation in treatment of trapezius spasm. IASTM is a skilled myofascial intervention thought to be based upon the rationale by James Cyriax.[14, 15] Unlike the Cyriax approach utilizing digital cross friction, IASTM is applied using specially designed instruments to provide a softtissue massage or mobilization.[15] The use of the instrument is thought to provide a mechanical advantage for the clinician by allowing deeper tissue penetration, vibration feedback sense, and more specific treatment, while also reducing imposed stress on the hands.[16Strain Counterstrain (SCS) is the fourth most commonly used osteopathic manipulative technique following soft tissue techniques, high velocity low amplitude thrust, and muscle energy

#### Prachi Patel and Neeti Mishra

technique. [19] It is also known as positional release, SCS is a passive positional technique aimed at relieving musculoskeletal pain and dysfunction through indirect manual manipulation. SCS treatment begins by identifying diagnosticTPs related to musculoskeletal dysfunction.

Studies have found that trapezius stretching combined with positional release technique (PRT) have been found effective in trapezitis, but studies are limited to find which technique is more effective over the other ,due to lack of control group. Hence, this study with Research Question whether positional release technique(Strain Counterstrain)or IASTM ,have more effect in improving pressure pain threshold and reducing muscle hardness and functional disability in subjects with sub-acute trapezitis? Hence, the need of the study is to compare the effect of positional release therapy(Strain Counterstrain) and IASTM in the treatment of subacutetrapezitis on pressure pain threshold, muscle hardness, and functional disability.

IASTM and Strain counter strain have been effectively used as a treatment protocol in trapezitis patients, but till date less comparative studies have been done between IASTM and Strain Counter strain technique. Also there is not availability of a standard protocol for patients of upper trapezitis. Hence this study will significantly contribute for an effective intervention to reduce muscle hardness and improve pain pressure threshold & neck functions in patients with upper trapezitis along with conventional therapy.

#### AIMS AND OBJECTIVES

• To determine the effect of Instrument Assisted Soft Tissue Manipulation on Pressure Pain Threshold, Muscle Hardness and Neck functions in patients with upper Trapezitis.

• To determine the effect of Strain Counter Strain on Pressure Pain Threshold, Muscle Hardness and Neck functions in patients with upper trapezitis.

• To compare the effect of Instrument Assisted Soft Tissue Mobilization and Strain Counter Strain on Pressure Pain Threshold, Muscle Hardness and Neck functions in patients with upper Trapezitis.

### METHODOLOGY

Study design is Pre-post Experimental Study. Study population consists of Patients of upper Trapezitis with 18-40 years of age group. Sampling technique is Purposive sampling . study duration was of 1 Year. For sample size calculation in this study, the effect size was calculated from the result of the pilot study. The sample size was estimated in G Power 3.1.9.2 version with effect size 0.84 and  $\alpha$  = 0.05 at 80% power. Sample size calculated was 48, with a drop out chances of 10% the total sample size was 52, 26 samples in IASTM group and 26 samples in SCS group. 6.6 Study setting included SPB Physiotherapy College OPD and other clinical OPDs of Surat

#### INCLUSION CRITERIA

- Both male and female with age group 18 to 40 years.[25]
- Subjects with acute(7-14 days) and sub-acute(14 days to 3 months) trapezitis.[35]
- Subjects with unilateral trapezitis.[26]
- Subjects with <= grade 3 of trapezius muscle tenderness based on "tenderness grading scale".[26]
- Presence of active MTrPs identifiable by spot tenderness in a taut, muscular band.[25]
- Pressure Pain Threshold value should be ≤3 kg/cm2 . [25]

#### **EXCLUSION CRITERIA**

- Malignancy around neck region[27]
- A history of neck surgery during the previous 12 months[27]

• If subject had received trigger point injections in the upper trapezius muscle within the past 6 months and taking NSAIDs for trapezitis[27]

### Prachi Patel and Neeti Mishra

- Open wounds around neck region[25]
- Subjects with the traumatic conditions to shoulder region within 6 months[25]
- Subjects with neurological conditions[25]
- Skin lesions around neck region[24]
- Infection or inflammatory edema at MTrPs site[24]
- Subjects with Cervical Spondylosis

#### PROCEDURE

The patient were screened on the basis of inclusion and exclusion criteria and their demographic data will be taken by an Assessment Performa. Prior to the commencement of the study, detailed procedure of the study was explained to the patients and a signed informed consent form was taken from them. Then the subjects were allocated to any of the two groups by random allocation using lottery method. Description of the groups are given as follows: GROUP-A : Conventional treatment + IASTM GROUP-B : Conventional treatment + Strain CounterStrain technique On the first day of the first week, baseline measurements of Pressure Pain Threshold, Muscle hardness and Neck Pain and Disability Scale (NPAD-G) was taken. 17

#### **OUTCOME MEASURES**

1. Pain Pressure Threshold(PPT) was measured using the Algometer[28]. Once an MTP was located, the algometer was used to measure the PPT. Progressive pressure at a rate of 1 kg/s was applied. Study subjects were asked to indicate when pain was elicited. The mean values from three measurements was recorded.

2. Muscle Hardness was measured using the Durometer[22] : The principle used to measure hardness is based on measuring the resistance force of the penetration of a pin into the test material under a known spring load. The amount of penetration is converted to hardness reading on a scale with 100 units.

3. Neck function measured using the Neck Pain and Disability Scale (NPAD-G) Gujarati version[23] : The subjects were given a detailed explanation about the Neck Pain and Disability Scale questionnaire.

**INTERVENTION** : Same Conventional treatment was given to both the groups. Conventional treatment(21) included : - Hot-pack [5 min.] was given prior to starting IASTM or SCS technique. - Trapezius muscle stretching [3 Repetitions with 30 seconds hold] was given after IASTM or SCS technique. - Cryotherapy [10 min. was given in the end of the session.

GROUP-A: [IASTM[54] + Conventional treatment[21] ] The patient was in sitting position and the therapist was standing behind the patient. The instrument used was of stainless steel device machined into various shapes. Emollient was applied to the treatment area to prevent skin irritation. Each session included 1 minute of sweeping (longitudinal stroke performed parallel to the muscle fibers similar to an efflurage stroke) with single bevel edge of the IASTM tool at 300 - 600 tilt, 1 minute of swivel (pivoting/rotating back & forth similar to manual compression with oscillations) with the knob of IASTM tool directly over the MTrP, 2 minute of fanning (one end of instrument is held in place & the other end was moved through a semi-circular pattern similar to petrissage) with the convex single bevel edge of the IASTM tool and will be conclude with 1 minute of sweeping with IASTM tool. So, the total duration of IASTM treatment was of 5 minutes in a session and 2 sessions per week for 3 weeks was given

GROUP-B: [SCS[2] + Conventional Treatment[21] ] The patient lyed in supine position with therapist standing on the affected side; trigger points was located along the upper fibers of the trapezius muscle. Pressure was applied by pinching the muscle between the thumb and fingers. The patient's head was laterally flexed towards the side of trigger point and rotated opposite to the side of trigger point, then therapist grasped the patient's forearm and abducts shoulder to approximately 900 a slight flexion or extension of shoulder was added to obtain finetune. The ideal position of comfort achieved was held for a period of 90 seconds and followed by a passive return of the body

#### Prachi Patel and Neeti Mishra

part to an anatomically neutral position continued for 5 minutes in a treatment session and 2 sessions per week for 3 weeks was given. Post treatment measurement was taken after last session of 3rd week

**STATISTICAL ANALYSIS:** The Statistical software named statistical package of social sciences (SPSS) version 20 (SPSS 20.0) was used for the analysis of the data and Microsoft word 2007 and Excel 2007 was used to generate graphs and tables. Descriptive statistical analysis was carried out at 95% confidence interval. Outcome measurements analyzed were presented as mean ± SD. Significance was assessed at 5 % level of significance with p value set at 0.05; less than this was considered as statistically significant difference. For checking the homogeneity of the data, the Levene's test for equality of variance was done. The data were ensured for their normal distribution using numerical (ShapiroWilk Test) and graphical methods (Normal Q-Q Plots). From that some variables followed the normal distribution, the log transformation was carried out. Then also some variables followed the non-normal distribution. So, both the parametric tests and non-parametric tests were performed. Paired't' test as a parametric and Wilcoxon signed rank test as a non-parametric test have been used to analysis the variables preintervention to post-intervention with calculation of change. Independent't' test as a parametric and Mann Whitney U test as a non-parametric test have been two groups with calculation of difference between the means.

# RESULT

in IASTM group there were 26 subjects with mean age 25.69 years and in SCS group there were 26 subjects with mean age 26 years. In table-1, it shows the results of Levene's test to check the homogeneity of data. It shows homogenous distribution of data in both the groups. In table-2, it shows the results of Shapiro-wilk test which is used to check normality of data. Table-3, demonstrates pre-post mean values of all outcome measures for both group. Table 4 shows within group comparision of muscle hardness and neck function in both IASTM and SCS group (Paired t test was used) and Table 5 shows within group comparision of Pain Pressure Threshold in both IASTM and SCS group (Wilcoxon Signed Ranks Test was used)

# DISCUSSION

This study was conducted to compare the effects of Instrument assisted soft tissue mobilization technique and strain counter strain technique on upper Trapezitis. In present study pressure pain threshold, muscle hardness and neck function were taken as the outcome measures and they were scored by using the algometer, durometer and neck pain and disability index, respectively. This study was conducted on 52 subjects with the age group of 18-40 years. The mean age of subjects in IASTM group(Group-A) is 25.69 years with 46% male subjects and 54% female subjects and the mean age of SCS group(Group-B) is 26 years with 38% male subjects and 62% female subjects. Based on the statistical analysis, both group A and B showed a drastic improvement in PPT, MH and NPAD and it has also shown significant improvement clinically in pressure pain threshold, muscle hardness and neck function. The refinement that occurred in IASTM group may come from its ability to induce tissue micro-trauma. Thus, resulting in the regional inflammatory process and increases the release of fibroblast. The fibroblast migration increases collagen synthesis and tissues regeneration that speeds up the healing process. In addition, increasing tissue temperature and blood flow due to friction between tool and tissue may contribute to improve tissue oxygenation and removal of local waste metabolites.18,27]Zeynab et al reported a case study to find out the effects of IASTM technique on upper trapezius trigger points. He reported increase in the pain pressure threshold and decrease in disability (NDI) in his case study.[34] The results of present study were in line with Motimath et al.,[28] who concluded that IASTM technique by using M2T blade is a useful tool which can decrease pain immediately in subjects with upper trapezius spasm. Bulbuli et al., [29] tested the effect of M2T blade on subjects with heel pain and they found reduction in pain level and increased activity level.

#### Prachi Patel and Neeti Mishra

In conventional therapy, we used cryotherapy at the end of the treatment session just to overcome the side effects that may appear from IASTM include bruising and soreness. In particular, bruising is a response that appears together with bleeding and occurs more readily in soft tissues that have been injured for a longer period of time. Bruising and soreness can be controlled with cryotherapy, following IASTM. In addition, there are relative and absolute contradictions to IASTM.[30]

In Strain counterstrain technique, the muscles are placed in the greatest comfort position. This causes the relaxation of tissue that improves the vascular circulation and removes the inflammatory chemical mediators, thus leads in enhancing the symptoms.31] By means of an automatic resetting of muscle spindles, this helps to dictate tone and length of the affected tissues by Strain counterstrain technique in pain relief and increasing pain pressure threshold. The descending inhibitory pathways are activated with the application of manual intervention techniques.[32]A reduction of pain and an increase in neck function of 50%-100% occurred in 19 of 20 patients immediately after SCS therapy. The partial improvement was maintained for six months in 11 of 20 patients, and four were still pain-free. This technique has been recommended for physical therapy for treatment of pain in tender points of musculature [33]. Comparing the mean difference of post PPT value, post MH value and post NPAD value of both the groups, then the subjects in group-A who received IASTM and Conventional treatment showed better improvement than the subjects in group-B who received SCS and Conventional treatment when both the groups were compared at the end of three weeks.

The IASTM technique used in this study was proved superior in improving pressure pain threshold, reducing muscle hardness and improving neck function in patients with upper trapezitis comparatively with Strain counterstrain technique. The patients reported better results even after the first application of IASTM technique in comparison with the SCS technique and this gain in pain sensitivity and PPT was reinforced after the next two applications. Disabling myofascial pain after IASTM application can be theoretically attributed to three main mechanisms that have been reported in the literature: a) local temperature and blood flow increase, b) localized tissue manipulation and stretch and c) reduction of fascial adhesions and restrictions

# CONCLUSION

Statistically IASTM and SCS were equally effective, but when we compared the mean difference values of PPT, MH and NPAD then IASTM was proved to be more effective than SCS. Hence, we concluded that the Instrument Assisted Soft Tissue Mobilization Technique along with conventional treatment is more effective for improving pressure pain threshold, reducing muscle hardness and improving the neck function than Strain Counterstrain technique along with conventional treatment in patient with upper trapezitis. Limitation & future scope-the evaluation of the effect of therapeutic techniques in the treatment of MTrPs was based only on the assessment pressure pain threshold, muscle hardness and neck function. Moreover, the evaluation of the impact of therapeutic applications had short-term character and was limited to three weeks that lasted the research. Another significant methodological issue that has been recognized as a possible source of measurement errors is the amount of pressure exerted through algometer as maintaining a constant pressure rate reported as the most challenging aspect of algometer. An ideal study evaluating the effect of various techniques on the reduction of adverse effects of MTrPs should assess the therapeutic effect of applied techniques in all the aspects of the functional capacity of the patients and must have long-term evaluation and re-evaluation planning

# ABSTRACT

Urolithiasis or kidney stones is defined as the urinary stone originating anywhere in the urinary tract. Urolithiasis plays a significant economic burden in the healthcare system, especially in developing countries owing to changes in food habits and lifestyle due to which there has been significantly increase in the disease over the last few decades. Medicinal plants are established as renewable sources with antiurolitiatic activity. There are many Marketed formulations which are having Antiurolithiatic activity as well as many traditional medicinal plants which is primarily used to dissolve urinary stones in the kidney or urinary bladder. So, the Present Review article represents the potential of Some Traditional Medicinal plants in the treatment of urinary stones. More Research is needed to develop new Plant derived products to treat the formation of kidney stones.

Keywords: Urolithiasis; Medicinal Plants; Anti Urolithiatic activity, Kidney Stones

# **INTRODUCTION**

In order to treat infectious and non-infectious, the modern health care system offers a wide range of possibilities. However, due to cost and accessibility concerns, a number of these medications have their own drawbacks and are not available to the majority of the world's population. As a result, more than 75% of people, particularly in lower income nations, still rely on herbal treatments to address their basic medical needs [1]. Medicinal plants play a significant role in the health care of ancient and modern cultures. Ayurveda, the Indian system of medicine mainly uses plant-based formulations to treat various human diseases because they contain the components of therapeutic

## Tailor and Syan

potential. Plant based drugs are an important source of therapeutic agents because of their abundant availability, relatively cheaper cost and non-toxic nature when compared to modern medicine [2]. It is important to consider traditional remedies for non-life-threatening conditions including haemorrhoids and urinary stones. Urolithiasis is a disorder in which a stoneforms or occurs anywhere in the urinary tract. Urinary stones (calculi) are solid crystalline masses that can form anywhere in the renal tract [3].

Stone formation is one of the painful urologic diseases that occur in around 12% of the global population and its occurrence rate in males is 70-81% and 47-60% in female. It is assessed that at least 10% of the population in industrialized part of the world are suffer with the problem of urinary stone formation. The occurrence of the renal calculi is less in the southern part when compared with other parts. Stone formation usually occur due to insufficient urinary discharge, microbial infection in urinary tract, diet with excess oxalates and calcium, vitamin abnormalities like vitamin A deficiencies, excess vitamin D, and metabolic diseases like hyperthyroidism, cystinuria, gout, intestinal dysfunction etc. Kidney stone formation or urolithiasis is a complex procedure that occurs due to imbalance between promoters and inhibitors in the kidneys [4].

Many medications and remedies have been used during the past many years to treat urinary stones. Generally, in the traditional systems of medicine, the majority of the remedies are based on plants and they were proved to be useful though the rationale behind their use is not well established through systematic pharmacological and clinical studies except for some composite herbal drugs and plants. Pharmacotherapy can reduce the recurrence rate. The use of plant products with claimed uses in the traditional systems of medicine assumes importance. In the Ayurvedic system of medicine in India, plants which belongs to 'Pashanabheda' group are claimed to be useful in the treatment of urinary stones. 'Pashanabheda' is the Sanskrit term used for a group of plants with diuretic and antiurolithiatic activities [5].

The mechanism of stone formation is a complex process which results from several physicochemical properties including supersaturation, crystal nucleation, precipitation, crystal growth, aggregation of crystals and retention of urinary stone constituents within tubular cells. There are various types of kidney stones which include cystine stones, calcium oxalate stones, calcium phosphate stones, struvite stones and uric acid stones. However, it is evident that crystal retention, cell apoptosis, renal cell injury, and associated stone promoters or inhibitors play important roles for kidney stone formation [6].

## **TYPES OF KIDNEY STONES [7,8,9]**

## Calcareous Stones (Calcium containing stones)

**Calcium Oxalate Stones:** The most common type of kidney stone which is created when calcium combines with oxalate in the urine. Inadequate calcium and fluid intake, as well as other conditions may contribute to their formulations. Calcium oxalate stones occur as a result of

A. Hypercalciuria – This is idiopathic or results from any disorder that induces even mild hypercalcemia.

**B.** Hypocitraturia – It is associated with renal lithogenesis. Citrate is an inhibitor of calcium salt formation by forming a soluble complex with calcium. It results from causes of intracellular acidosis such as renal failure, potassium deficiency, distal renal tubular acidosis, chronic diarrhoeal state and drugs such as acetazolamide.

C. Hyperuricosuria – It occurs at high purine intake or chronic diarrhoeal disease.

D. Hyperoxaluria - Oxalate forms an insoluble complex with calcium, resulting in crystal formation.

**Calcium Phosphate Stones:** It occurs when the kidney loses their ability to lower urinary pH causing calcium phosphate super saturation.

**Non-Calcareous Stones** 

## Tailor and Syan

**Uric Acid Stones:** This is another common type of kidney stones. High purine intake leads to a higher production of monosodium urate may form kidney stones. Uric acid composition seems to be the second most common stone. Urinary uric acid exists in an insoluble form at pH < 5.05 and forms crystals.

**Struvite Stones:** Struvite is a crystalline substance composed of magnesium ammonium phosphate. These stones are less common and are caused by infections in the upper urinary tract.

**Cystine Stones:** When kidney do not reabsorb the cystine properly leads to kidney stones. The stones are greenish yellow, flecked with shiny crystallites and are moderately opaque with a rounded appearance.

## MECHANISM OF UROLITHIASIS

The diseased state of urolithiasis becomes apparent only when small stones are retained within the urinary system and grow into relevant stones[10].

#### Crystallization

It represents the first phase of urinary stone formation and includes three steps:

- 1. Crystal Nucleation
- 2. Crystal Growth
- 3. Crystal Aggregation

#### **Crystal Nucleation**

The nucleation is a process of formation of a solid crystal in solution. Generation of a crystal can occur by homogenous nucleation when supersaturation allows organization of the atoms into the appropriate lattice. However, heterogenous nucleation occurs within complex mixtures in which proteins provide patterns on their surface to organic molecules for the formation of the crystal lattice11.Nucleation may occur in renal tubules, bladder walls, normal or damaged cells or at interstitial cells[12,13].

#### Crystal Growth

After nucleation, crystal growth is the next major step of stone formation. In this process, several atoms or molecules in supersaturated liquid starts to form crystals[14].

#### **Crystal Aggregation**

Aggregation is an important step of stone development and is commonly defined as a process in which crystals agglomerate and form a larger multicomponent particle in free solution. Aggregation of particles in solution is determined by a balance of forces including both aggregating and disaggregating effects[15].

#### **Stone Retention**

After the crystallization process is complete, the retention of urinary stones within the urinary stones within the urinary system is an important step in the development of the diseases[16]. Four different possible modes of stone retention have been identified in the fixed particle hypothesis:

- 1. Growth over white interstitial plaque
- 2. Growth over Bellini duct plugs
- 3. Formation of microliths within collecting ducts
- 4. Formation in free solution within renal collecting system.

## MARKETED HERBAL FORMULATIONS USED IN THE TREATMENT OF UROLITHIASIS

There are many Marketed formulations which are having Anti urolithiatic activity, some of them are:

- 1. Cystone (Himalaya Drug Company, India)
- 2. Calcuri (Charak Pharmaceuticals, Bombay, India)
- 3. Chandraprabhabati (Baidyanath, India)

Tailor and Syan

- 4. Kidney Detox (Foresta Organics, India)
- 5. Gokhru Tablets
- 6. Chywanprash (Organic India)
- 7. Nerunjil Powder
- 8. Neeri Syrup

These formulations have been widely used to dissolve urinary calculi in the kidney and urinary bladder. Trinapanchamool consisting of five herbal drugs was found to be effective in preventing the formation and dissolving the pre-formed stones[17].

# PROMINENT MEDICINAL PLANT SPECIES OF FAMILY LAMIACEAE HAVING ANTI UROLITHIATIC ACTIVITY

Mentha Piperita

## Part used: Stem, leaves, flowers

Mentha species are used for their flavouring and medicinal properties widely throughout different countries of the world. It is one of the most economically important aromatic and medicinal crops. It is commonly known as Peppermint, Brandy mint, Candy mint, Lamb mint, Balm mint, pudina.

The plant is a strongly scented, perennial, glabrous, herb 30-90cm in height. The square stems are usually reddishpurple and smooth. The leaves are short 2.5-5cm long, oblong-ovate and serrate. The flowers are purple-pinkish and appear in the summer months. The plant has runners above and below ground. It is native of Europe, Canada and US and have been naturalized in many parts of India<sup>[18]</sup>.

**Chemical Composition:** The major constituent reported is volatile oil of which the principal component is usually menthol, together with neomenthal and isomenthal. Other monoterpenes include menthone, menthyl acetate, menthofuran, cineol, limonene. Monoterpenes like pinene, terpinene, myrcene, caryophylldene, piperitone, piperitinone, pulegone, eugenol, menthone, isomenthone, carvone, cadinene, dipentene, linalool, ocimene, sabinene, terpinolene, fenchrome[19].

**Anti Urolithiatic activity:** The present study aims to establish the scientific rationality of anti-urolithiatic activity by in vitro Calcium oxalate crystallization studies; that is, nucleation, aggregation and oxalate depletion assays and in vivo ethylene glycol–induced urolithiasis model in the male albino rats. Peppermint contains rich source of bioactive compounds and has traditionally been used in the treatment of lithiasis[20].

## In vitro Crystallization Assay

**Nucleation assay:** The effects of Calcium oxalate crystallization were studied by nucleation assay. The solutions of calcium chloride and sodium oxalate were prepared in Tris-HCL and NaCl buffer at pH 6.5. Different dilutions of cystone and extract were prepared in distilled water. One milliliter of each dilution (100- 1000  $\mu$ g/mL) of extract and cystone was mixed with calcium chloride and then sodium oxalate solution was added in each dilution. These dilutions were incubated in oven at 37°C for half an hour then cooled down to room temperature. Optical density was measured using spectrophotometer.

**Aggregation assay**: The effects of extract on the aggregation of Calcium oxalate crystals were studied. Calcium chloride and sodium oxalate solutions were prepared separately and then mixed together. This mixture was heated in water bath at 60°C, for an hour and then incubated overnight in oven at 37°C. After drying this mixture, Calcium oxalate crystal solution (80 mg/100 mL) was prepared in 0.05 M TrisHCl and 0.05 M NaCl buffer at pH 6.5. One millimeter of each of the dilution of extract and cystone was mixed and vortexed with 3 ml of Calcium oxalate solution. The mixture was incubated in oven at 37°C for half an hour. Optical density was recorded on spectrophotometer at 620 nm[21].

Tailor and Syan

Animal Model of Urolithiasis: Experiments are performed with Wistar albino rats under 100,300,500 mg/kg doses along with lithogenic regimen.

**Urine Analysis:** At the end of 21<sup>st</sup> day animals are placed in metabolic cages for the collection of urine samples. 24h urine samples are collected for biochemical analysis, such as urine volume, urine pH, and the levels of uric acid, magnesium, calcium, phosphate, and total protein levels are determined.

**Kidney Homogenate Analysis:** Kidney homogenate analysis is performed by the end of prophylactic model, whole kidney is separated and washed. Kidney homogenate is prepared by dissolution of 1gm of kidney tissue in 10ml of 0.1M chilled phosphate buffer saline at pH of 7.4 followed by homogenization. The tissue homogenate was then centrifuged at 10000 rpm at 4 degree for 10-15 minutes and the supernatant is separated and stored at -20degree for analysing the levels of protocols.

**Serum Analysis:** The rats are anesthetized by using combination of ketamine and blood is collected through retroorbital method and through cardiac puncture. Serum is separated and analysed for blood urea nitrogen and creatinine levels [22].

#### **Ocimum Sanctum**

#### Part used: Stem, Leaves, Seeds

Tulsi (holy basil in English) is an exceptionally adored culinary and restorative fragrant herb that is indigenous to the Indian subcontinent and been utilized inside Ayurvedic medication over 3000 years. In the Ayurveda framework tulsi is frequently alluded to as a "Solution of Life" for its mending powers and has been known to treat a wide range of basic wellbeing conditions. It is an erect, much stretched sub bush 30-60cm tall with furry stems and basic inverse green leaves that are unequivocally scented. Tulsi assumes a crucial job in our regular daily existence and is supposed to be the sovereign of natural plants. Tulsi is an erect pleasant-smelling bush which develops up to a stature of 3 - 5 feet[23].

**Chemical Constituents:**The leaf volatile oil containseugenol (also called eugenic acid), urosolic acid carvacrol, linalool, limatrol, caryophyllene, methyl carvicol while the seed volatile oil have fatty acids and sitosterol; in addition, the seed mucilage contains some levels of sugars and the anthocyans are present in green leaves. The sugars are composed of xylose and polysaccharides. Although Tulsi is known as a general vitalizer and increases physical endurance, it contains no caffeine or other stimulants. The stem and leaves of holy basil contain a variety of constituents that may have biological activity, including saponins, flavonoids, triterpenoids, and tannins, Rosmarinic acid, apigenin, *cirsimaritin isothymusin* and isothymonin. Two water-soluble flavonoids:Orientin and Vicenin have shown to provide protection against radiation-induced chromosomal damage in human blood lymphocytes [24].

**Medicinal Properties**: Tulsi is antispasmodic, appetizer, carminative, galactagogue, and stomachic. It is used for stomach cramps, gastric catarrh, vomiting, intestinal catarrh, constipation, and enteritis. It had been sometimes used for whooping cough as an antispasmodic. Tulsi has antioxidant properties and reduces blood glucose levels. Thus, it is useful for diabetics. Tulsi reduces total cholesterol levels. Thus, it is useful for heart disease patients. Tulsi reduces blood pressure. Tulsi plant has many medicinal properties. The leaves are nerve tonic and also sharpen memory. They promote the removal of the catarrhal matter and phlegm from the bronchial tube. The leaves strengthen the stomach and induce copious perspiration. The seed of the plant are mucilaginous. Fever and Common Cold: The leaves of basil are specific for many fevers. During the rainy season, when malaria and dengue fever are widely prevalent, tender leaves, boiled with tea, act as preventive against these diseases.

**Nutrition Value :** Contain vitamin C, A and minerals like calcium, zinc and iron, as well as chlorophyll and many other phytonutrients. Also enhances the efficient digestion, absorption and use of nutrients from food and other herbs. Protein: 30 Kcal, 4.2 g; Fat: 0.5 g; Carbohydrate 2.3 g; Calcium: 25 mg; Phosphorus 287 mg; Iron: 15.1 mg and Edible portion 25 mg vitamin C per 100 g.

## Tailor and Syan

**Anti Urolithiatic Activity:** *Ocimum sanctum* is effective against the kidney stone. Juice of Tulsi and honey is most effective against kidney stones and if it taken regularly 6 months once a day it will expel them via the urinary tract[25].*Ocimum sanctum* hydroalcoholic extract can effectively inhibit nucleation, growthas well as aggregation of Calcium oxalate crystallization process. Hence, it can be used as a phototherapeutic agent to manage urolithiasis at its early stage and can be effective to reduce the chances of its reoccurrence[26].

## CONCLUSION

For Optimum patient treatment and protection, scientific research to explore possibly potential benefits of herbal plants is extremely important. The present review article demonstrated the curative potential of urolithiasis or kidney stones using traditional medicinal plants and herbal marketed formulations. The aim of this study is to Review the Mechanism of kidney stones and represent the medicinal plants belonging to the family Lamiaceae used in Anti urolithiatic activity. More Research is needed to develop New plant derived products to treat the formation of kidney stones.

## ABSTRACT

Adhesive capsulitis is a condition marked by persistent pain, active and passive inability leading to functional inadequacy at shoulder. It results from contraction of the glenohumeral capsule which adheres to the head of the humerus. External rotation of the shoulder is the most restricted movement followed by abduction and internal rotation. Combination release is a Myofascial Release technique in which Gross Myofascial Release and Focused Myofascial Release techniques are combined. Stretching interventions can be used less frequently at high intensity levels to enable time for tissue recovery. In this study there were total of 30 individuals with adhesive capsulitis who had age between 40-65 years was randomly divided 15 into group A with Gross MFR combined with Focused MFR and 15 into group B with Capsular stretching. Intervention was given for 5 days per week for 3 weeks. Outcome measures were NPRS,SPADI and Goniometry. Statistically within Group both groups had a significant difference in outcomes (p<0.05) but no significant difference between groups in outcomes. Gross Myofascial Release combined with Focused Myofascial Release versus capsular Stretch were found to be beneficial in decreasing pain, improving functional activities, and increasing range of motion in people with adhesive capsulitis shoulder.

**Keywords:** - capsular stretching, gross Myofascial release combined with focused Myofascial release, range of motion, adhesive capsulitis, SPADI, NPRS.

Megha Suthar et al.,

## INTRODUCTION

Adhesive capsulitis is a condition marked by persistent pain, Active and passive inability leading to functional inadequacy at the Shoulder. Because of thickening decreased volume of the glenoid capsule and contractures in the glenohumeral joint capsule [1]. It results from the contraction of the glenohumeral capsule which adheres to the head of the humerus [2]. Patients usually have a history of debilitating pain and progressive limitation of glenohumeral movements. External rotation of the shoulder is the most restricted movement followed by abduction and internal rotation [3,4]. although a multitude of factors may contribute to the development of a frozen shoulder, the actual cause is unknown. Studies have revealed clinical manifestations, duration, and diagnosis. Although it affects 2-5 per cent of the general population, it affects females in the age group of 40 and 70 more than males. Primary and secondary are the two types. Idiopathic frozen shoulder is a condition in which the cause is unknown. Trauma, inactivity, rotator cuff injuries, hyperglycaemia, biceps inflammation, heart attack, neurological event, mental illnesses, and post-surgical considerations are some of the most common causes of shoulder pain. The pain is usually constant, worst at night. The glenohumeral capsule, which is irritated and inflexible, restricts motion and can cause persistent pain [1].

Though the exact cause remains unknown, Adhesive capsulitis is associated with various precipitating factors. Studies have shown that people who are elderly, females, with diabetes mellitus and abnormal lipid profiles have an increased risk of developing Adhesive capsulitis. There are trigger points surrounding the shoulder joint in adhesive capsulitis. Trigger points in the Myofascial system tender patches can be found in taut bands of stiffened muscle that are always tender and prevents the muscle from fully extending, resulting in muscle weakening [5]. Trigger spots in the internal rotator, shoulder abductor, and scapula protector musculature are common in adhesive capsulitis [6].

Muscle release or Myofascial trigger point release is a technique for treating chronic uncomfortable muscle spasms and increasing range of motion. It involves applying deep pressure to areas of local soreness [7,8]. Myofascial release (MFR) is a technique that focuses on releasing mobility constraints that arise in the body's soft tissues. It's a type of soft tissue therapy that aims to diminish pain and increase movement in people who have been experiencing severe long-lasting pain [9]. MFR is a form of physical therapy that involves applying a low-load, long-duration stretch to the Myofascial system to restore appropriate length, reduce discomfort, and improve function. Myofascial release is used as a treatment in many conditions [10]. Combination release is a Myofascial Release technique in which Gross Myofascial Release and Focused Myofascial Release techniques are combined. Gross Myofascial release uses the first stretch to the muscle is provided via an arm or leg pull approach, whereas guided Myofascial release concentrates on a particular muscle. The Subtle mal alignments that cause the patient's difficulties are recognized and released by focusing on lesser constraints within the Myofascial unit [9]. Patients with adhesive capsulitis benefit from capsular stretching because it reduces pain and improves function [10]. Stretching is a therapeutic procedure that aims to promote soft tissue mobility and, as a result, improve range of motion by stretching components that have become shortened and hypo mobile over time. Manual stretching and self-stretching have been demonstrated to be beneficial in people with hypomobility. Stretching increases the range of motion by extending soft tissue structures beyond their natural length. The result of direct intervention by the therapist is not the same as the result of self-stretching by the patient [11].

## METHODOLOGY

The type of study conducted was an experimental study. This study was approved by The Institutional Ethics Committee for Human Research- Sainath Hospital, Ahmedabad (Reg. No: -EC/NEW/INST/2021/1983). Written informed consent was obtained and acknowledged from all the participants and was ensured that their identity was not revealed. The study was carried out in Sainath hospital, bopal, Ahmedabad, and rotary physiotherapy club, JK Orthopedic Hospital, Himmatnagar.

## Megha Suthar *et al.*,

Subjects were selected based on inclusion criteria. In this study, 40 to 65 years individuals with adhesive capsulitis were included. There were 17 males and 13 females. Then all subjects were randomly divided into two groups. Group A had 15 subjects were treated with Gross MFR combined with Focused MFR and the rest 15 subjects included in Group B were treated with the capsular stretching technique.

## **INCLUSION CRITERIA:-**

- 40-65 years old both male and female [12]
- Difficulty in reaching behind back [13]
- Clinically diagnosed Adhesive capsulitis [12]
- Restriction of shoulder movement (above 60 degrees of flexion and Abduction, 30 degrees of internal rotation, and 20 degrees of external rotation) [13]
- Adhesive capsulitis stage 2 and stage 3 [14]
- Tenderness over Deltoid, Trapezius, Pectoralis major and minor [12]
- Unilateral adhesive capsulitis [12]

## **EXCLUSION CRITERIA**

- If they mentioned a dislocation, recent trauma, or a fracture at the cervical and shoulder
- Any other shoulder pathologies like soft tissue lesions [12]

## INTERVENTION

Eligibility was confirmed and then the baseline measures were taken. The outcome measures reported in this study were the Numerical pain rating scale, range of motion by a universal goniometer, and Shoulder pain and disability index scale. All the individuals were treated 5 days per week for 3 weeks. Baseline values for all the outcome measures were taken and post-intervention after 3 weeks. In the initial evaluation session, the adhesive capsulitis individuals were interviewed and the baseline outcomes of GH joint external rotation and abduction were obtained.

## GROUP A:- Gross Myofascial release combined with Focused Myofascial release with Conventional therapy

The patient was in a supine posture, and the first stretch was performed using an arm pull technique based on feedback from the patient's tissue. The arm was abducted to its maximum extent, and the pull was applied by the therapist gripping the patient's wrist with one hand. The stretch was held for 90 seconds each. After that Focused MFR on small restrictions within the Myofascial unit. It was provided for the Pectoralis major and minor muscles, as well as the deltoid and trapezius muscles.5 repetitions were held for 90 second. The total duration was 10 to 15 minutes.

## **GROUP B:-** Capsular Stretch with Conventional therapy

## 15 subjects was treated with capsular stretching

## 1. ANTERIOR CAPSULAR STRETCHING:-

The patient was standing with his elbow in 90 degrees of flexion and 0 degrees of abduction. A door frame was pressed on the anterior forearm. The patient then progressively rotates their body away from the door frame, creating an external rotation force, which was held for 10 seconds.

## 2. POSTERIOR CAPSULAR STRETCHING:-

The therapist stretches the back of the problematic shoulder by grabbing the elbow of the concerned arm across the chest and holding it for 10 seconds.

## 3. INFERIOR CAPSULAR STRETCHING:-

The therapist extends the affected arm above head with the elbow bent and the arm straight forward, stretching it higher overhead and holding the stretch for 10 seconds.

**DURATION:** - The patient was advised to sustain the stretch for 10 seconds and then repeat the process five times over the course of three weeks.

## Megha Suthar et al.,

## CONVENTIONAL THERAPY:-

- $\cdot$   $\;$  Anterior and posterior glide for shoulder joint 3 sets of 10 repetitions each side
- · Interferential current therapy frequency 4100Hz for 10 minute
- · Wand exercise
- · Pendulum exercise
- · Finger ladder exercise
- Towel exercise

Each exercise should be repeated 10 times. For three weeks, and worked five days a week.

## **OUTCOME MEASURES:-**

The shoulder RANGE OF MOTION was measured for shoulder flexion, abduction, and internal and external rotation with a universal goniometer. Shoulder flexion and abduction were measured in the supine position while shoulder internal and external rotations were measured with the shoulder at 90 degrees of abduction [15].

THE SHOULDER PAIN AND DISABILITY QUESTIONNAIRE is a self-administered questionnaire. Five questions about the severity of an individual's pain are included in the pain component. The functional activities component consists of eight questions meant to assess how difficult it is for an individual to perform various daily activities that require the use of the upper extremities. The SPADI is the only reliable and valid shoulder measurement[16]. NPRS(numerical pain rating scale between 1 to 10 where 1 is minimal pain and 10 is maximum pain), In this the patient is asked to make pain ratings, relating to current good and worst pain experienced over the past 24 hours. These ratings represent the patient's level of pain over the previous 24 hours [17].

**STATISTICAL ANALYSIS:**-To check the improvements of these two treatments statistical analysis were done with statistically package of social science (SPSS 26). Statistically significant was set at p<0.05.

## RESULTS

The NPRS, ROM, and SPADI Percentage across baseline and 3rd week follow up showed a significant improvement statistically in their mean score within group A and group B. Statistically Gross Myofascial release combined with focused Myofascial with conventional therapy and capsular stretching with conventional therapy groups are equal in comparison. The Abduction mean value of Group A was 130.53 17.029 and of Group B was 123.13 17.972 with a p-value was 0.257. The external rotation means the value of Group A was 60.87 10.836 and of Group B was 55.20 12.667 with a p-value was 0.199. In SPADI the disability components having a mean value of Group A was 30.00 12.950 and Group B have 37.40 16.677 with a p-value was 0.186. The NPRS mean value of Group A was 4.00 1.195 and of Group B was 4.27 0.961 with a p-value was 0.506. There is no significant difference between Group A and Group B. They are significantly equal.

## DISCUSSION

The purpose of this study was to see how gross Myofascial release combined with focused Myofascial release affect people with adhesive capsulitis in compare to capsular stretch. Gross Myofascial release combined with focused Myofascial release and capsular stretch had a considerable effect in adhesive capsulitis, according to the findings of this study. The result show there was significant difference in improvement of pain and ROM in both Gross Myofascial release combined with focused Myofascial release and capsular stretching. Relaxation in pain due to MFR technique can be assigned by one of the concept of MFR is that loose the tightness which is leading to weakness. Both Biomechanical and neural reflexive element are responsible for this concept. The hands-on method in this provides afferent stimulation via receptors. This strategy of gross Myofascial release coupled with focused Myofascial release leads to rigid connective tissue loosening when sensory excitation by extension is applied and the operator allows for efferent suppression to happen [18].

## Megha Suthar et al.,

In a previous study on frozen shoulder patients, author used gross Myofascial release, focused Myofascial release, Maitland mobility, and conventional therapy. They found that combining MFR treatment with traditional treatment will provide additional benefits and a speedier recovery in adhesive capsulitis subjects. This had comparable effects to the current study, where treating trigger points reduced discomfort and increased range of motion [12]. High-grade mobilization was found to be more helpful than capsular stretching in the study. This is in line with the findings of a study by H.B.Sivkumar, who found that high-grade mobilization combined with active exercise is more beneficial than capsular stretching combined with active exercise [19].

Another author studied observed posterior capsular stretch on adhesive capsulitis patients with traditional manual therapy and electrotherapy. They discovered that posterior capsular stretch coupled with mobilization is more beneficial in enhancing ROM and lowering functional disability. This had similar effects to the current trial, in which ROM therapy increased ROM and decreased discomfort [14].

Dr. SwagataPatangarkar et al. conducted a study on the comparison of sustained inferior capsular stretching and passive joint mobilization in Adhesive capsulitis patients, in which sustained inferior capsular stretching with heat and cryotherapy and passive mobilization with heat and cryotherapy were given to two separate groups. They conclude that continuous inferior capsular stretching is superior to passive mobilization in terms of improving ROM and pain reduction [20]. One study of frozen shoulder patients, author compared the efficiency of scapular mobilization, manually posterior capsule stretching, and a relationship between two variable techniques. In one group, they received scapular mobilization, while in the other; they received manual posterior capsule stretching. The results demonstrated that both scapular mobilization and manual posterior capsule stretching were important in enhancing acute joint range of motion [21]

## CONCLUSION

Gross Myofascial Release combined with Focused Myofascial Release versus capsular Stretch was found to be beneficial in decreasing pain, improving functional activities, and increasing range of motion in people with adhesive capsulitis shoulder in a three-week therapy program. Statistically, within Group comparison there was a significant difference in outcome measures but there was no significant difference between group comparisons.

## LIMITATION

This study was included Short term treatment duration.

## FURTHERRECOMMENDATION

It can be compared with other techniques like IASTM or Dry needling, Friction Massage, Ischemic compression. Strength of muscles can be assessed.

## ABSTRACT

In real world situations, Linear Fractional Programming Problem[LFPP] has inspired several researchers due to its application in engineering, business, production planning, marketing, finance, economics, health care, hospital planning and in various research domains. Pentagonal Neutrosophic Fuzzy Number (PNFN) plays an important role to measure the vagueness ,hesitation and uncertain information. In this, we have provided an efficient ranking method for solving LFPP by using Simplex technique and a ranking method. Here, we represent the coefficients of both the constraints and the objective function alone as PNFN.Further, an illustrative numerical examples were shown to enumerate our proposed method. Further, comparison table and multiple bar diagram was performed with some of the available methods to prove that our proposed method is higher optimized.

**Keywords** - Fuzzy numbers, Neutrosophic Fuzzy numbers, Pentagonal Neutrosophic Fuzzy Numbers[PNFN], Linear Fractional Programming.

## INTRODUCTION

In real life world situations, several methods exist for solving LFPP. Zadeh(1965) [11] introduced fuzzy set theory .Dubois and Prade [5] introduced many types of operations on fuzzy numbers .Several researchers so far introduced different types of fuzzy numbers to measure the vagueness of the existing problems using triangular fuzzy number [6],trapezoidal fuzzy number[4] and pentagonal fuzzy number [2,7] with its membership functions as they have got more applications[10] in risk analysis and reliability. Later Sapan Kumar Das et.al.,[8] introduced a

## Rajarajeswari and Shyamala

dual simplex method to solve LFPP using Triangular Neutrosophic Number. Further ,Abdel-Basset et.al.,[1] proposed a new technique with trapezoidal neutrosophic number for solving Linear programming problem[LPP].In this paper ,we solve LFPP by using PNFN to get a better result using the proposed new ranking method. Here, ranking of PNFN plays an important role in solving LFPP and gives the best solution. Further, an efficient ranking method to convert into a crisp number was presented and also explained through numerical examples.In addition, we made a comparison between the proposed method optimal solution with other existing method solutions. Here, we consider LFPP in which coefficients of both the constraints and the objective functions except the decision variables are considered as Pentagonal Neutrosophic Fuzzy Number[PNFN].First LFPP was decomposed into two Linear programming problems[LPPs] and then the decomposed LFPP is converted into crisp LPPs using the ranking method. To get the optimal solution, we put the resultant function in the standard form of LPP and finally ,the problem is solved by our proposed method.

#### PRELIMINARIES

Some basic definitions involving Pentagonal Fuzzy Number, Pentagonal Neutrosophic Fuzzy Number, its Score Function and Arithmetic Operations on Pentagonal Neutrosophic Fuzzy Number are outlined in this section.

#### Definition 2.1 - Pentagonal Fuzzy Number [2]:

A fuzzy number  $A=(p_1, q_1, r_1, s_1, t_1)$  is called pentagonal fuzzy number, if its membership function is given by

 $\mu_A(x) = \begin{cases} 0 & , p_1 \le x, t_1 \le x \\ \frac{x - p_1}{q_1 - p_1}, & p_1 \le x \le q_1 \\ \frac{x - q_1}{r_1 - q_1}, & q_1 \le x \le r_1 \\ 1, & x = r_1 \\ \frac{s_1 - x}{s_1 - r_1}, & r_1 \le x \le s_1 \\ \frac{t_1 - x}{t_1 - s_1}, & s_1 \le x \le t_1 \end{cases}$ 

#### Definition 2.2 - Pentagonal Neutrosophic Fuzzy Number [3]:

Pentagonal Neutrosophic Fuzzy Number denoted by  $\tilde{a}$  is a subset of a neutrosophic number in R with the following truth membership function, indeterminacy membership function and falsity membership function given by  $\tilde{a} = \langle (p_1, q_1, r_1, s_1, t_1); \alpha_{\bar{a}}, \Theta_{\bar{a}}, \beta_{\bar{a}} \rangle$  where  $\alpha_{\bar{a}}, \Theta_{\bar{a}}, \beta_{\bar{a}} \in [0, 1]$ . The truth membership function T:  $R \rightarrow [0, \alpha_{\bar{a}}]$ , the indeterminacy membership function I:  $R \rightarrow [\Theta_{\bar{a}}, 1]$  and the falsity membership function  $F: R \rightarrow [\beta_{\bar{a}}, 1]$  are defined as follows

$$T(x) = \begin{cases} \frac{\alpha_{\tilde{a}}(x-p_1)}{(q_1-p_1)}, & p_1 \le x, t_1 \le x \\ \frac{\alpha_{\tilde{a}}(x-p_1)}{(q_1-p_1)}, & p_1 \le x \le q_1 \\ \frac{\alpha_{\tilde{a}}(x-q_1)}{(r_1-q_1)}, & q_1 \le x \le r_1 \\ \alpha_{\tilde{a}} & , & x = r_1 \\ \frac{\alpha_{\tilde{a}}(s_1-x)}{(s_1-r_1)}, & r_1 \le x \le s_1 \\ \frac{\alpha_{\tilde{a}}(t_1-x)}{(t_1-s_1)}, & s_1 \le x \le t_1 \end{cases}$$

$$I(x) = \begin{cases} 0, \quad p_{1} \leq x, t_{1} \leq x \\ \frac{\Theta_{\bar{a}}(x-p_{1})}{(q_{1}-p_{1})}, \quad p_{1} \leq x \leq q_{1} \\ \frac{\Theta_{\bar{a}}(x-q_{1})}{(r_{1}-q_{1})}, \quad q_{1} \leq x \leq r_{1} \\ \Theta_{\bar{a}}, \quad x = r_{1} \\ \frac{\Theta_{\bar{a}}(s_{1}-x)}{(s_{1}-r_{1})}, \quad r_{1} \leq x \leq s_{1} \\ \frac{\Theta_{\bar{a}}(t_{1}-x)}{(t_{1}-s_{1})}, \quad s_{1} \leq x \leq t_{1} \end{cases}$$
and
$$F(x) = \begin{cases} 0, \quad p_{1} \leq x, t_{1} \leq x \\ \frac{\beta_{\bar{a}}(x-p_{1})}{(q_{1}-p_{1})}, \quad p_{1} \leq x \leq q_{1} \\ \frac{\beta_{\bar{a}}}{(s_{1}-x)}, \quad q_{1} \leq x \leq r_{1} \\ \beta_{\bar{a}}, \quad x = r_{1} \\ \frac{\beta_{\bar{a}}(s_{1}-x)}{(s_{1}-r_{1})}, \quad r_{1} \leq x \leq s_{1} \\ \frac{\beta_{\bar{a}}(t_{1}-x)}{(t_{1}-s_{1})}, \quad s_{1} \leq x \leq t_{1} \end{cases}$$

## Definition 2.3 - Score function [2]:

Let  $\tilde{a} = \langle (p_1, q_1, r_1, s_1, t_1); \alpha_{\tilde{a}}, \Theta_{\tilde{a}}, \beta_{\tilde{a}} \rangle$  be the Pentagonal Neutrosophic Fuzzy Number, then the special ranking of Pentagonal Fuzzy Neutrosophic Number called Score function is defined as follows

$$S(\tilde{a}) = \frac{1}{15} (p_1 + q_1 + r_1 + s_1 + t_1) (\alpha_{\tilde{a}} + (1 - \Theta_{\tilde{a}}) + (1 - \beta_{\tilde{a}}))$$

# Definition 2.4 - Arithmetic Operations on Pentagonal Neutrosophic Fuzzy Numbers [PNFNs] [3]: Addition of two PNFNs:

$$\begin{array}{lll} \text{Let} & \tilde{A} = <(p_1, q_1, r_1, s_1, t_1); & \alpha_{\tilde{A}}{}' & \Theta_{\tilde{A}}{}' & \beta_{\tilde{A}} \\ \\ & \tilde{B} = <(p_2, q_2, r_2, s_2, t_2); & \alpha_{\tilde{B}}{}' & \Theta_{\tilde{B}}{}' & \beta_{\tilde{B}} \end{array} >$$

then the addition of two PNFNs is given by,

$$\widetilde{A} + \widetilde{B} = <(p_1 + p_2, q_1 + q_2, r_1 + r_2, s_1 + s_2, t_1 + t_2); \ \alpha_{\widetilde{A}} + \alpha_{\widetilde{B}} - \alpha_{\widetilde{A}} \alpha_{\widetilde{B}}^{\,\,\circ}, \ \Theta_{\widetilde{A}} \Theta_{\widetilde{B}}^{\,\,\circ}, \beta_{\widetilde{A}} \beta_{\widetilde{B}}^{\,\,\circ})$$

#### Subtraction of two PNFNs

Let 
$$\tilde{A} = \langle (p_1, q_1, r_1, s_1, t_1); \alpha_{\tilde{A}}, \Theta_{\tilde{A}}, \beta_{\tilde{A}} \rangle$$
  
 $\tilde{B} = \langle (p_2, q_2, r_2, s_2, t_2); \alpha_{\tilde{B}}, \Theta_{\tilde{B}}, \beta_{\tilde{B}} \rangle$ 

then the subtraction of two PNFNs is given by,

$$\widetilde{\mathbf{A}} - \widetilde{\mathbf{B}} = \langle (p_1 - p_2, q_1 - q_2, r_1 - r_2, s_1 - s_2, t_1 - t_2); \alpha_{\widetilde{A}} + \alpha_{\widetilde{B}} - \alpha_{\widetilde{A}} \alpha_{\widetilde{B}}, \Theta_{\widetilde{A}} \Theta_{\widetilde{B}}, \beta_{\widetilde{A}} \beta_{\widetilde{B}}^{>} \rangle$$

Multiplication of two PNFNs

64059

## Rajarajeswari and Shyamala

Let 
$$\tilde{A} = \langle (p_1, q_1, r_1, s_1, t_1); \alpha_{\tilde{A}}, \Theta_{\tilde{A}}, \beta_{\tilde{A}} \rangle$$
  
 $\tilde{B} = \langle (p_1, q_1, r_1, s_1, t_1); \alpha_{\tilde{A}}, \Theta_{\tilde{A}}, \beta_{\tilde{A}} \rangle$ 

$$B = \langle (p_2, q_2, r_2, s_2, r_2), \alpha_{\widetilde{B}}, \Theta_{\widetilde{B}}, \beta_{\widetilde{B}} \rangle$$

then the multiplication two PNFNs is given by

 $\widetilde{\mathbf{A}} \, \widetilde{\mathbf{B}} = < (p_1 p_2, q_1 q_2, r_1 r_2, s_1 s_2, t_1 t_2); \alpha_{\widetilde{A}} \alpha_{\widetilde{B}}, \beta_{\widetilde{A}} + \beta_{\widetilde{B}} - \beta_{\widetilde{A}} \beta_{\widetilde{B}}, \Theta_{\widetilde{A}} + \Theta_{\widetilde{B}} - \Theta_{\widetilde{A}} \Theta_{\widetilde{B}}^{>} >$ 

## PROPOSED METHOD

In this proposed method, first we have formulated a LFPP based on real world situations and the essential factors are used in the descriptions of the objective function and constraints. We introduced a new method for solving LFPP where all the coefficients in the objective function and constraints are PNFN except the decision variables and also to find the most optimal value of the objective function.

Consider LFPP as below

Max (or )Min  $z(x) = \frac{z_1(x)}{z_2(x)}$ 

Subject to  $x \in T$  (1) where the objective functions  $z_1(x)$  and  $z_2(x)$  are linear functions and the set T is defined as  $T = \{x/Ax \le B, x > 0\}$ . Here A is fuzzy matrix.

Step-1:We consider the LFPP with m constraints and n variables as below

 $\begin{aligned} \text{Max (or)Min } z(x) &= \frac{\sum_{j=1}^{n} c_j x_j + \alpha}{\sum_{j=1}^{n} d_j x_j + \beta} \\ \text{Subject to} \quad \sum_{i=1}^{m} a_{ij} x_j \leq b_i \\ x_j \geq 0 \text{ where } j = 1, 2, ..., n. \end{aligned}$ 

Step-2: In the above , we represented all the coefficients in objective function and constraints as PNFN like below

(2)

 $Max \text{ (or )} Min z(x) = \frac{\sum_{j=1}^{n} (b_j, d_j, e_j, f_j, g_j; T_{c_j}, I_{c_j}, F_{c_j}) x_j + (\alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5; T_{\alpha}, I_{\alpha}, F_{\alpha})}{\sum_{j=1}^{n} (c_j, e_j, f_j, g_j, h_j; T_{d_j}, I_{d_j}, F_{d_j}) x_j + (\beta_1, \beta_2, \beta_3, \beta_4, \beta_5; T_{\beta}, I_{\beta}, F_{\beta})}$ 

Subject to

$$\sum_{i=1}^{m} \left( b_{ij}, c_{ij}, d_{ij}, e_{ij}, f_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}} \right) x_j \le \left( p_i, q_i, r_i, s_i, t_i; T_{b_i}, I_{b_i}, F_{b_i} \right).$$
  
$$r_j \ge 0 \text{ where } j = 1, 2, \dots, n.$$

**Step-3:**In the above LFPP, we decompose the objective function into two LPPs as follows (P-1)

$$\begin{aligned} &\text{Max (or) Min } z_1(x) = \sum_{j=1}^n (b_{j,}d_j, e_j, f_j, g_j; T_{c_j}, I_{c_j}, F_{c_j}) \, x_j + (\alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5; T_{\alpha}, I_{\alpha}, F_{\alpha}) \\ &\text{s.t} \quad \sum_{i=1}^m \left( b_{ij}, c_{ij}, d_{ij}, e_{ij}, f_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}} \right) \, x_j \leq \left( p_i, q_i, r_i, s_i, t_i; T_{b_i}, I_{b_i}, F_{b_i} \right) \\ &x_j \geq 0 \text{ where } j = 1, 2, \dots, n. \\ \end{aligned}$$

$$\begin{aligned} &(P-2) \\ &\text{Max (or)Min } z_2(x) = \sum_{j=1}^n (c_j, e_j, f_j, g_j, h_j; T_{d_j}, I_{d_j}, F_{d_j}) \, x_j + (\beta_1, \beta_2, \beta_3, \beta_4, \beta_5; T_{\beta}, I_{\beta}, F_{\beta}) \\ &\text{s.t} \quad \sum_{i=1}^m \left( b_{ij}, c_{ij}, d_{ij}, e_{ij}, f_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}} \right) \, x_j \leq \left( p_i, q_i, r_i, s_i, t_i; T_{b_i}, I_{b_i}, F_{b_i} \right) \\ &x_j \geq 0 \text{ where } j = 1, 2, \dots, n. \end{aligned}$$

**Step-4:** Using the definition 2.2 in the above LPP given in (P-1) and (P-2), we get the modified LPPs as below (P-3)

Max (or) Min 
$$z_1(x) = \sum_{j=1}^n S(b_{j,j}d_j, e_j, f_j, g_j; T_{c_j}, I_{c_j}, F_{c_j}) x_j + S(\alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5; T_{\alpha}, I_{\alpha}, F_{\alpha})$$

64060

## Rajarajeswari and Shyamala

- s.t  $\sum_{i=1}^{m} S\left(b_{ij}, c_{ij}, d_{ij}, e_{ij}, f_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}}\right) x_j \le S\left(p_i, q_i, r_i, s_i, t_i; T_{b_i}, I_{b_i}, F_{b_i}\right) x_j \ge 0 \text{ where } j = 1, 2, ..., n.$ (P-4) Max (or) Minz<sub>2</sub>(x) =  $\sum_{j=1}^{n} S\left(c_j, e_j, f_j, g_j, h_j; T_{d_j}, I_{d_j}, F_{d_j}\right) x_j + S\left(\beta_1, \beta_2, \beta_3, \beta_4, \beta_5; T_{\beta}, I_{\beta}, F_{\beta}\right)$
- s.t  $\sum_{i=1}^{m} S\left(b_{ij}, c_{ij}, d_{ij}, e_{ij}, f_{ij}; T_{a_{ij}}, I_{a_{ij}}, F_{a_{ij}}\right) x_j \leq S\left(p_i, q_i, r_i, s_i, t_i; T_{b_i}, I_{b_i}, F_{b_i}\right)$  $x_j \geq 0 \text{ where } j = 1, 2, \dots, n.$

**Step-5:**By solving the above LPP given in (P-3) and (P-4) by Simplex Method , we get the optimal solutions namely  $Z_1(x)$  and  $Z_2(x)$ .

**Step-6:**The optimal solution of the LFPP is obtained by using the formula Max (or) Min  $Z = \frac{z_{2(x)}}{z_1(x)}$ .

If the objective function is of minimization type then convert it into Min Z(x) by using the formula Min Z(x)=- Max Z(x)

## Application of Proposed Method: Numerical Example 3.1:

Step 1: Consider the following LFPPMax  $Z(x) = \frac{8 X_1 + 18 X_2}{16 X_1 + 18 X_2 + 12}$ 64  $X_1 + 82 X_2 \le 95$ ,  $8 X_1 + 10 X_2 \le 22$ ,  $X_1, X_2 \ge 0$ 

(3)

Step 2:We have represented the coefficients used in the objective function and the constraints as PNFN as follows  $Max Z(x) = \frac{(1,6,10,13,14;0.9,0.1,0.3)X_1 + (11,16,20,23,24;0.9,0.1,0.3)X_2}{(5,15,25,30,31; 0.7,0.5,0.6)X_1 + (11,16,20,23,24;0.9,0.1,0.3)X_2 + (4,8,17,25,26; 0.3,0.6,0.4)}$ 

s.t  $(60,62,64,66,67;0.2,0.5,0.6)X_1 + (11,16;20,23;24;0.9,0.1,0.3)X_2 + (4,8,17,25;26;0.3,0.6,0.4)$  $(1,6,10,13,14;0.9,0.1,0.3)X_1 + (1,6,11,15,16;0.7,0.6,0.3)X_2 \le (16,18,22,23,24;0.3,0.6,0.4) X_1, X_2 \ge 0$ 

**Step 3:** In the above LFPP, we decompose the objective function into two LPPs namely (P-1) and (P-2) as follows (P-1)

Max  $z_1(x) = (1,6,10,13,14;0.9,0.1,0.3)X_1 + (11,16,20,23,24;0.9,0.1,0.3)X_2$ 

s.t  $(60,62,64,66,67;0.2,0.5,0.6) X_1 + (80,82,85,86,88;0.3,0.6,0.4) X_2 \le (92,94,97,100,101;0.8,0.2,0.4)$  $(1,6,10,13,14; 0.9,0.1,0.3) X_1 + (1,6,11,15,16; 0.7,0.6,0.3) X_2 \le (16,18,22,23,24;0.3,0.6,0.4)$  $X_1, X_2 \ge 0$ (P-2) Max $z_2(x) = (5,15,25,30,31; 0.7,0.5, 0.6) X_1 + (11,16,20,23,24; 0.9,0.1,0.3) X_2 + (4,8,17,25,26; 0.3,0.6,0.4)$ 

s.t  $(60,62,64,66,67;0.2,0.5,0.6) X_1 + (80,82,85,86,88;0.3,0.6,0.4) X_2 \le (92,94,97,100,101;0.8,0.2,0.4) (1,6,10,13,14;0.9,0.1,0.3) X_1 + (1,6,11,15,16;0.7,0.6,0.3) X_2 \le (16,18,22,23,24;0.3,0.6,0.4) X_1, X_2 \ge 0$ 

**Step 4:**To find the crisp value of each PNFN, we use definition 2.2 as follows  $S(\tilde{8}) = 7.33$ ,  $S(\tilde{10}) = 5.88$ ,  $S(\tilde{12}) = 6.93$ ,  $S(\tilde{16}) = 11.31$ ,  $S(\tilde{18}) = 15.67$ ,  $S(\tilde{22}) = 8.93$ ,  $S(\tilde{64}) = 23.39$ ,  $S(\tilde{82}) = 36.49$ ,  $S(\tilde{95}) = 70.99$ By substituting these crisp values in (P-1) and (P-2), we get the modified LPPs as follows (P-3) Max  $z_1(x) = (7.33) X_1 + (15.67) X_2$ s.t  $23.39 X_1 + 36.49 X_2 \le 70.99$ ,  $7.33 X_1 + 5.88 X_2 \le 8.93$  and  $X_1, X_2 \ge 0$ (P-4) Max  $z_2(x) = 11.31 X_1 + 15.67 X_2 + 6.93$ s.t  $23.39 X_1 + 36.49 X_2 \le 70.99$ ,  $7.33 X_1 + 5.88 X_2 \le 8.93$  and  $X_1, X_2 \ge 0$ 

## Rajarajeswari and Shyamala

**Step 5:**Solving (P-3) and (P-4) by simplex method , we get Max  $z_1(x) = 23.80$  where  $X_1=0$ ,  $X_2=1.52$  and Max  $z_2(x) = 30.73$  where  $X_1=0$ ,  $X_2=1.52$ 

**Step 6:**The optimum solution of the crisp LFPP is obtained as follows. Max  $Z = \frac{z_{2(X)}}{z_{1}(X)} = \frac{30.73}{23.80} = 1.29$ 

Next, we have illustrated few numerical examples to demonstrate our proposed method

## Numerical Example 3.2 [9]:

Step 1: Consider the LFPP  $\operatorname{Min} Z (x) = \frac{-2X_1 + X_2 + 2}{X_1 + 3X_2 + 4}$ (4)s.t  $-X_1 + X_2 \le 4$ ,  $2X_1 + X_2 \le 14$ ,  $X_2 \le 6$  and  $X_1, X_2 \ge 0$ Step 2:We represent the coefficients used in the objective function and the constraints into PNFN as follows  $\operatorname{Min}^{r} Z(x) = \frac{-(1,3,5,6,7;0.2,0.3,0.5)X_{1} + (0,2,4,5,7;0.8,0.6,0.4)X_{2} + (1,3,5,6,7;0.2,0.3,0.5)}{(0,2,4,5,7;0.8,0.6,0.4)X_{1} + (1,2,5,6,7;0.2,0.5,0.6)X_{2} + (1,2,5,7,8;0.5,0.4,0.9)}$  $-(0,2,4,5,7; 0.8,0.6,0.4) X_1 + (0,2,4,5,7; 0.8, 0.6, 0.4) X_2 \le (1,2,5,7,8; 0.5,0.4,0.9)$ s.t  $(1,3,5,6,7; 0.2,0.3,0.5) X_1 + (0,2,4,5,7; 0.8, 0.6, 0.4) X_2 \leq (7,10,19,30,35; 0.8,0.4,0.7)$ (0,2,4,5,7; 0.8, 0.6, 0.4) X<sub>2</sub>  $\leq$  (3,7,9,13,16; 0.7,0.2,0.5) and X<sub>1</sub>, X<sub>2</sub> $\geq$  0 Step 3: In the above LFPP, we decompose the objective function into two LPPs as follows (P-1)  $\operatorname{Min} z_1(x) = -(1,3,5,6,7;0.2,0.3,0.5)X_1 + (0,2,4,5,7;0.8,0.6,0.4)X_2 + (1,3,5,6,7;0.2,0.3,0.5)$  $-(0,2,4,5,7; 0.8,0.6,0.4) X_1 + (0,2,4,5,7; 0.8, 0.6, 0.4) X_2 \le (1,2,5,7,8; 0.5,0.4,0.9)$ s.t  $(1,3,5,6,7;\,0.2,0.3,0.5)\,X_1+(0,2,4,5,7;\,0.8,\,0.6,\,0.4)\,X_2\leq (7,10,19,30,35;\,0.8,0.4,0.7)$ 

 $(0,2,4,5,7; 0.8, 0.6, 0.4) X_2 \le (3,7,9,13,16; 0.7,0.2,0.5) \text{ and } X_1, \mathbb{Z} \ge 0$ 

(P-2)

$$\begin{split} & \text{Min } \underbrace{\mathscr{A}}_{\mathcal{A}} ( \mathbf{x} = (0,2,4,5,7; 0.8,0.6,0.4) \underbrace{\mathscr{A}}_{\mathcal{A}} + (1,2,5,6,7; 0.2,0.5,0.6) \underbrace{\mathscr{A}}_{\mathcal{A}} + (1,2,5,7,8; 0.5,0.4,0.9) \\ & \text{s.t.} \quad -(0,2,4,5,7; 0.8,0.6,0.4) \underbrace{\mathscr{A}}_{\mathcal{A}} + (0,2,4,5,7; 0.8, 0.6, 0.4) \underbrace{\mathscr{A}}_{\mathcal{A}} \leq (1,2,5,7,8; 0.5,0.4,0.9) \\ & (1,3,5,6,7; 0.2,0.3,0.5) \underbrace{\mathscr{A}}_{\mathcal{A}} + (0,2,4,5,7; 0.8, 0.6, 0.4) \underbrace{\mathscr{A}}_{\mathcal{A}} \leq (7,10,19,30,35; 0.8,0.4,0.7) \\ & (0,2,4,5,7; 0.8, 0.6, 0.4) \underbrace{\mathscr{A}}_{\mathcal{A}} \leq (3,7,9,13,16; 0.7,0.2,0.5) \text{ and } \underbrace{\mathscr{A}}_{\mathcal{A}} \succeq 0 \end{split}$$

**Step 4:** To find the crisp value of each PNFN, we use definition 2.2 as follows  $S(\tilde{1}) = 2.16, S(\tilde{2}) = 2.05, S(\tilde{3}) = 1.54, S(\tilde{4}) = 1.84, S(\tilde{6}) = 6.40, S(\tilde{14}) = 11.45$ By substituting these crisp values in (P-1) and (P-2), we get the modified LPPs as follows (P-3) Min  $\frac{1}{4}(Y = -(2.05), \frac{1}{4}(+(2.16), \frac{1}{4}(2.05))$ s.t  $-(2.16), \frac{1}{4}(+(2.16), \frac{1}{4}(-2.05), \frac{1}{4}(+(2.16), \frac{1}{4}(-2.16), \frac{1}{4}$ 

**Step 5:**Solving (P-3) and (P-4) by simplex method , we get Min  $q_{r} = -9.40$  where  $r \neq 5.59$ ,  $r \neq 0$  and Min  $q_{r} = -1.84$  where  $r \neq 0$ .

**Step 6:**The optimum solution of the crisp LFPP is obtained as follows. Max  $Z = \frac{g_{Y}}{f_{0}Y} = \frac{-9.40}{1.84} = -5.11$ 

## Rajarajeswari and Shyamala

We observe that the same problem given in example 2 was solved by Sumon Kumar Saha et.al.,[9] in the section 4 , example 1 using LFPP and they got the solution as Min Z(x)=-1.09 but the same problem solved by using Trapezoidal Fuzzy Neutrosophic Number we got the solution as Min Z(x)=-5.09.But our proposed method gives the solution as Min Z(x)=-5.09.But our proposed method gives the solution as Min Z(x)=-5.09.But our proposed method gives the solution as Min Z(x)=-5.09.But our proposed method gives the solution as Min Z(x)=-5.09.But our proposed method gives the solution as Min Z(x)=-5.09.But our proposed method gives the solution as Min Z(x)=-5.09.But our proposed method gives the solution as Min Z(x)=-5.09.But our proposed method gives the most optimal solution.

Numerical Example 3.3 [8]:Let us consider the problem solved by\_Sapan kumar Das et.al.,[8] in section 4.

Step 1: Consider the following LFPP Max  $Z(x) = \frac{8 \frac{1}{8} + 7 \frac{1}{2} + 9 \frac{3}{8}}{8 \frac{1}{8} + 9 \frac{1}{2} + 6 \frac{1}{8} + 1.5}$  (5) s.t  $4 \frac{1}{8} + 3 \frac{1}{8} + 5 \frac{1}{8} \leq 28, 5 \frac{1}{8} + 3 \frac{1}{8} \leq 20, \frac{1}{8} \frac{1}{8} \frac{1}{8} \geq 0$ Step 2: We represent the coefficients used in the objective function and the constraints as PNFN as follows Max  $Z = \frac{(1,6,10,13,14;0.9,0.1,0.3) \frac{1}{8} + (5,8,9,13,14;0.4,0.6,0.8) \frac{1}{8} + (6,8,10,15,16;0.6,0.4,0.7) \frac{1}{8}}{(1,6,10,13,14;0.9,0.1,0.3) \frac{1}{8} + (6,8,10,15,16;0.6,0.4,0.7) \frac{1}{8} + (3,7,9,13,16;0.7,0.2,0.5) \frac{1}{8} + (0.5,1,15,2,3;0.75,0.5,0.25)}$ s.t  $(1,2,5,7,8; 0.5, 0.4, 0.9) \frac{1}{8} + (1,2,5,6,7; 0.2, 0.5, 0.6) \frac{1}{8} + (2,4,7,10,11; 0.8, 0.2, 0.4) \frac{1}{8} \leq (24,26,28,30,32; 0.4, 0.25, 0.5)$   $(2,4,7,10,11; 0.8, 0.2, 0.4) \frac{1}{8} + (1,2,5,6,7; 0.2, 0.5, 0.6) \frac{1}{8} + (1,2,5,6,7; 0.2, 0.5, 0.6) \frac{1}{8} + (1,2,5,6,7; 0.2, 0.5, 0.6) \frac{1}{8} \leq (10,12,27,30,31; 0.2, 0.3, 0.5)$  $\frac{1}{8} \frac{1}{8} \frac{1}{8} \geq 0$ 

**Step 3:** In the above LFPP, we decompose the objective function into two LPPs namely as follows (P-1)

 $\begin{aligned} & \text{Max} \ _{\textbf{A}}(\textbf{J} = \ (1,6,10,13,14;0.9,0.1,0.3) \ _{\textbf{A}} + \ (5,8,9,13,14;0.4,0.6,0.8) \ _{\textbf{A}} + \ (6,8,10,15,,16;0.6,0.4,0.7) \ _{\textbf{A}} \\ & \text{s.t.} \\ & (1,2,5,7,8;0.5,0.4,0.9) \ _{\textbf{A}} + \ (1,2,5,6,7;0.2,0.5,0.6) \ _{\textbf{A}} + \ (2,4,7,10,11;0.8,0.2,0.4) \ _{\textbf{A}} \leq (24,26,28,30,32;0.4,0.25,0.5) \\ & (2,4,7,10,11;0.8,0.2,0.4) \ _{\textbf{A}} + \ (1,2,5,6,7\;0.2,0.5,0.6) \ _{\textbf{A}} + \ (1,2,5,6,7;0.2,0.5,0.6) \ _{\textbf{A}} + \ (1,2,5,6,7;0.2,0.5,0.6) \ _{\textbf{A}} + \ (1,2,5,6,7;0.2,0.5,0.6) \ _{\textbf{A}} \leq (10,12,27,30,31;0.2,0.3,0.5) \\ & \textbf{A} \ _{\textbf{A}} \ _{\textbf{A}} \geq 0 \end{aligned}$ 

(P-2)

 $\max_{\mathbf{z}} (\mathbf{y} = (1,6,10,13,14;0.9,0.1,0.3)_{\mathbf{x}} + (6,8,10,15,16,0.6,0.4,0.7)_{\mathbf{x}} + (3,7,9,13,16;0.7,0.2,0.5)_{\mathbf{x}} + (0.5,1,1.5,2,3;0.75,0.5,0.25)$ s.t.

 $\begin{array}{l} (1,2,5,7,8;\,0.5,\,0.4,\,0.9) \, _{4}x+(1,2,5,6,7;\,0.2,\,0.5,\,0.6) \, _{2}x+(2,4,7,10,11;\,0.8,\,0.2,\,0.4) \, _{4}x\leq (24,26,28,30,32;\,0.4,\,0.25,\,0.5) \\ (2,4,7,10,11;\,0.8,\,0.2,\,0.4) \, _{4}x+(1,2,5,6,7;\,0.2,\,0.5,\,0.6) \, _{2}x+(1,2,5,6,7;\,0.2,\,0.5,\,0.6) \, x_{3}\leq (10,12,27,30,31;\,0.2,\,0.3,\,0.5) \\ x_{1},\,x_{2},\,x_{3}\geq 0 \end{array}$ 

Step 4: To find the crisp value of each PNFN, we calculate the score function as follows

$$\begin{split} & S(\tilde{3}) = \frac{1}{15} (1+2+5+6+7) \big( 0.2 + (1-0.5) + (1-0.6) \big) = 1.54, \\ & S(\tilde{4}) = .84, \\ & S(\tilde{5}) = 4.99, \ S(\tilde{6}) = 6.40, \ S(\tilde{7}) = 3.27, \\ & S(\tilde{7}) = 3.27, \\ & S(\tilde{7}$$

## Rajarajeswari and Shyamala

**Step 5:** Solving (P-3) and (P-4) by using simplex method, we get Max  $z_1(x) = 25.12$  where  $x_1 = 0$ ,  $x_2 = 5.18$ ,  $x_3 = 1.49$  and Max  $z_2(x) = 39.09$  where  $x_1 = 0$ ,  $x_2 = 5.18$ ,  $x_3 = 1.49$ .

**Step 6**: The optimum solution of the crisp LFPP is obtained as follows.

Max  $Z = \frac{z_2(x)}{z_1(x)} = \frac{39.09}{25.12} = 1.56$ 

We observe that the same problem given in Numerical Example 3.3 was solved by Sapan kumar Das et.al.,[8] using Triangular Fuzzy Neutrosophic Number , they got the solution as Max Z=1.16 , using Trapezoidal Fuzzy Neutrosophic Number we got the solution as Max Z=1.47 but the same problem solved by our proposed method gives the solution as Max Z=1.56. We observe that our proposed method gives the most optimal solution.

## **RESULTS AND DISCUSSION**

We have developed a new method for solving LFPP using Pentagonal Neutrosophic Fuzzy Number and made the adequacy of the applied procedure for intensive studies. The various optimal solutions obtained for the LFPP by using Triangular Fuzzy Neutrosophic Number, Trapezoidal Fuzzy Neutrosophic Number and PNFN are shown in the comparison table and a multiple bar diagram was also shown to visualize the optimal results obtained by the proposed methods with some of the existing methods. We conclude that the optimal solution obtained by our proposed method using PNFN gives the most higher optimal value than the existing methods.

We observe that for Numerical Example 3.3

 $Max Z_{(Proposed Method)} = 1.56 > Max Z_{(TFNN)} = 1.47 > Max Z_{(Base Paper [9])} = 1.16$ 

A Multiple Bar Diagram is shown below to visualize the optimal results obtained by the proposed methods with some of the existing methods.

From the above graph, we observe that our proposed method is better than the existing methods available to solve LFPP.

## CONCLUSION

In this paper, we introduced a new ranking method with an efficient algorithm to solve a LFPP together with simplex method and PNFN.Here, a unique ranking function has been used to convert PNFN into a crisp value. Assessing the impact of uncertain information using mathematics is a very challenging process. In this research work ,we have shown the stability and reliability of the proposed method through a novel simplex technique to solve LFPP by using PNFN with the membership functions . In this article ,we focussed on PNFN and its operations due to its application to grab the vagueness and uncertain information of real life problems .Many researchers developed various new novel methods with the de-neutrosophication technique for crisp value. Here, we have generated the idea of crispification of PNFN.We have also illustrated some numerical examples and made a comparative study of the results derived for the same numerical examples from other research articles with some of the existing methods available to solve LFPP. Finally, by comparing and analyzing the results arrived , we conclude that our proposed method will give the most optimal solution and it is better than the existing techniques. In future, we can extend the concept of PNFN into different types of neutrosophic fuzzy numbers which will be helpful to make mathematical modelling with uncertainty to solve many real life problems involving LFPPs in cutting stock problem, blending problem, product planning, financial management planning ,health sector development planning and hospital management planning. We can also extend it using Hexagonal Neutrosophic Fuzzy Number, Heptagonal Neutrosophic Fuzzy number , Octagonal Neutrosophic Fuzzy Number defuzzication can be made by different techniques which will be helpful in various fields of mobile computing issues, pattern recognition problem, image processing, engineering problem and in various research domains.

## ABSTRACT

A dominating set *S* of a graph *H* is said to be a corona dominating set (*CD* – set) if every a vertex in the sub-graph induced by*S* havinga pendant vertex or a support vertex. The minimum cardinality of all corona dominating set is called corona domination number (CD number) and is denoted by $\gamma_{CD}$  (*H*).In this work we extend the study of CD number for some notable graphs and identify their exact  $\gamma_{CD}$  values.

Keywords: Dominating set, corona dominating set, pendant and support vertex.

## INTRODUCTION

Every graph H consider here are finite, undirected without isolated vertex, loops and multiple edges. An *induced* subgraph [1] of a graph H is a graph obtained from the subset of the vertices of the graph and all the edges having both end vertices in it. A *dominating* set[2] ofH is a set S of vertices of H with the condition that every  $\in V(H)$ -S, d(u,S) = 1. The minimum cardinality among all the dominating set is called the domination number of H, denoted by  $\gamma(H)$ . The theory of *total dominating* set was Proposed by Cockayne *et al.*[3]and defined as the sub-graph induced by the dominating set has no isolated vertices, the total domination number  $\gamma_{t(H)}$  denotes the minimum cardinality of a total dominating set. Support vertex is a vertex which adjacent to a pendant vertex. The concept corona domination was introduced by *G*.Mahadevanetal. [4]the CD-number of a graph is the minimum cardinality of a dominating set S with the condition that every vertex in the graph induced by S is either a pendent vertex or a support vertices. Let  $C_3^1, C_3^2, C_3^3, \dots, C_3^n$  be the sequence of cycles with 3 vertices *Triangular* snake $(T_n)$ [5] is constructed by pasting any one vertex of  $C_3^i 1 \le i \le n - 1$  and alternate triangular snake  $A(T_n)$  [5] is constructed by pasting the

## Praveenkumar et al.,

pendant vertices of  $K_2$  in between  $C_3$ 's, that is pasting one pendant vertex to any one of the vertex in  $C_3^i$  and another to any one vertex of  $C_3^{i+1} 1 \le i \le n - 1$ . Double triangular snake and alternative double triangular snake [5] is constructed by pasting the paths of two triangular snake and alternative triangular snake respectively. Let  $C_4^1, C_4^2, C_4^3, \dots, C_4^n$  be the sequence of cycles with 4 vertices Quadrilateral snake [6] is constructed by pasting any one vertex of  $C_4^{i+1}$  to any one vertex of  $C_4^i 1 \le i \le n - 1$ . Alternate quadrilateral snake [6] is constructed by pasting the pendant vertices of  $K_2$  in between  $C_4$ 's, that is pasting one pendant vertex to any one of the vertex in  $C_4^i$  and another to any one vertex of  $C_4^{i+1} 1 \le i \le n-1$ . Double quadrilateral snake and alternative double quadrilateral snake [6] is constructed by pasting paths of two quadrilateral snake and alternative snake respectively. Friendship graph  $F_r$  is joining any one vertex of r copies of  $C_3$  at a single vertex. The shadow graph S'(H) of H is obtained by taking two copies of H (say  $H_1$  and  $H_2$ ) and every vertex  $v \in H_1$  is adjacent to N(v') in  $H_2$ , where v' is the vertex in  $H_2$  corresponding to v in  $H_1$ . A dumbbell graph[7] $D_{a,b,c}$  is constructed by joining a bridge between two cycles. Let  $C_r = (v_1, v_2, v_3, ..., v_r, v_1), V(K_{1,r}) =$  $\{u_0, u_1, u_2, \dots, u_r\}$  with deg $(u_0) = \Delta$  then the lotus inside circle graph is a graph with  $E(LC_r) = \{v_{i-1}u_i, u_iv_i, u_1v_n : 1 \leq i \leq n \}$  $i \leq r$ }. A crown graph  $H_{k,k}$  is a graph obtained from the complete bipartite graph  $K_{k,k}$  by removing a perfect matching.Consider two even cycles of order r, sharing a common vertex (say v), the butterfly graph BFr.s is obtained by pasting the apex of K<sub>1.s</sub> to v.Graph domination and associated concepts have been studied for many years; among them many authors investigate the domination number of various graphs, especially for the paths, cycles, complete graph, etc. The authors in [8] have discussed the exact  $\gamma_{CD}$  value for many standard graphs. In continuation of that in this work, we have also determine the exact  $\gamma_{CD}$  for some notable graphs such as Butterfly graph, PVB tree, lotus inside circle graph and some special types of snake graphs. The proof technique used in this work is a well-known number theory concept with some modification, this can also applied to other domination parameter to get the results.

## Examining the CD Number for Some Notable Graphs

**Observation 2.1.** 

 $\mathbf{1.}\gamma_{\rm CD}\left(S'(P_r)\right) = \gamma_{\rm CD}(P_r).$ **2.**  $\gamma_{\text{CD}}\left(S'(C_r)\right) = \gamma_{\text{CD}}(C_r).$  $3.\gamma_{\rm CD}(D_{a,b,c}) = 2 \gamma_{\rm CD}(C_r).$ 

**Theorem 2.2.** Let *H* be a butterfly graph then  $\gamma_{CD}(H) = \begin{cases} r & \text{if } r \equiv 2 \pmod{4}, \\ r-1 & \text{if } r \equiv 0 \pmod{4}. \end{cases}$ **Proof:** Let  $V(H) = \{v_1 = u_1 = v, v_2, v_3, \dots, v_r, u_2, u_3, \dots, u_r, w_1, w_2, w_3, \dots, w_k\}$  and  $E(H) = \{v_i v_{i+1}, v_1 v_r, u_1 u_r, u_i u_{i+1}, v w_i : 1 \le i \le r - 1, 1 \le j \le k\}$ . Then  $S = \{v_i : i \equiv 1 \text{ or } 2 \pmod{4}\} \cup \{u_j : j \equiv 0 \text{ or } 1 \pmod{4}\} \text{ is a } CD - \text{set of } H.$ Hence,  $\gamma_{CD}(H) \le |S| = \begin{cases} r & \text{if } r \equiv 2 \pmod{4}, \\ r-1 & \text{if } r \equiv 0 \pmod{4}. \end{cases}$ Suppose there exist a dominating set D of cardinality at most Suppose the exist a dominant give *D* of calculating at most  $d = \begin{cases} r-1 & \text{if } r \equiv 2 \pmod{4}, \\ r-2 & \text{if } r \equiv 0 \pmod{4}, \end{cases}$ Thus  $|D| \ge d + 1 = \begin{cases} r & \text{if } r \equiv 2 \pmod{4}, \\ r-1 & \text{if } r \equiv 0 \pmod{4}. \end{cases}$ Hence,  $\gamma_{\text{CD}}(H) = \begin{cases} r & \text{if } r \equiv 2 \pmod{4}, \\ r-1 & \text{if } r \equiv 0 \pmod{4}. \end{cases}$ 

**Theorem 2.3.** If *H* is *PVB* tree. Then  $\gamma_{CD}(H) = 2p(r-3), p \ge 1, v, b > 1$  and  $r \ge 6$ .

**Proof:** Consider the main path  $P_p$  and p copies of another path  $P_v$  with v vertices. Now join the root vertex of the star  $K_{1,b}$  to each vertices of p copies of the path  $P_v$ . Name the vertices of path  $P_p$  are  $y_1, y_2, \dots, y_p$ ; vertices of  $P_v$  as  $y_{ij}$  where  $1 \le i \le p$  and  $1 \le j \le v$  and the vertices of the star as  $y_{ij}^k$  where  $1 \le i \le p$ ;  $1 \le j \le v$ ;  $1 \le k \le b$ . Then join the vertices  $y_{i1}$ to  $y_i$  where  $1 \le i \le p$  by using an edge. That is,  $y_i$  and  $y_{i1}$  are adjacent.

Let S = {  $v_{ij} : 1 \le i \le p, 1 \le j \le v$ }  $\cup$  { $v_{ij}^1 : 1 \le i \le p, 3 \le j \le v - 2$ } be a CD - set of H and hence  $\gamma_{CD}(G) \le |S| = 1$ 2p(r-3).

Now let  $D \subseteq V$  be any dominating set of cardinality atmost d = 2p(r-3)-1, then < D >has an isolated vertex.

Praveenkumar et al.,

Thus  $|D| \ge d + 1 = 2p(r - 3)$ . Hence,  $\gamma_{CD}(H) = 2p(r - 3)$ .

Example 2.1.	V	V	V	V	V
V	V	¥	Y	V	Y
V	V	V	V	V	Y
V	V	V	V	V	V
V	V	V	V	V	V

**Illustration:** For the above graph, the white vertices give us the *CD*- set and hence the  $\gamma_{CD}$  value is 40. **Theorem 2.4.** Let  $D(T_r)$  be a double triangular snake. Then  $\gamma_{CD} S((D(T_r))) = 3(r-1) + 2, r \ge 2$ .  $\underbrace{\mathcal{H}}_{14},\underbrace{\mathcal{H}}_{24},\underbrace{\mathcal{H}}_{12},\underbrace{\mathcal{H}}_{21},\underbrace{\mathcal{H}}_{22},\underbrace{\mathcal{H}}_{12},\underbrace{\mathcal{H}}_{12},\underbrace{\mathcal{H}}_{21},\underbrace{\mathcal$ 2.

Now let  $\Delta \subseteq k$  any dominating set of cardinality at most d = 3(r - 1) + 1 then  $\langle D \rangle$  has isolated vertex. Thus  $|D| \ge d + 1 = 3(r - 1) + 2$ . Hence,  $\gamma_{CD} S((D(T_r))) = 3(r - 1) + 2$ .

**Theorem 2.5.** Let  $Q_s$  be a quadrilateral snake. Then  $\gamma_{CD}(Q_s) = 2 \left| \frac{2s}{2} \right|, r \ge 4$ . **Proof:** Let V(G) = { $v_1, v_2, v_3, \dots, v_r, u_{11}, u_{21}, u_{22}, u_{31}, u_{32}, \dots, u_{(s-1)1}, u_{(s-1)2}, u_r$ } and  $E(G) = \{v_i v_{i+1}, v_1 u_1, v_r u_r, v_i u_{i1}, v_i u_{i2} : 1 \le i \le s - 1 \text{ and } 2 \le j \le s - 1\}.$ Then  $S = \{v_i : i \equiv 0 \text{ or } 2 \pmod{3}\} \cup \{u_{i \mid 1}u_{i \mid 2} : i \equiv 2 \pmod{3}, j \equiv 0 \pmod{3}\}$  is a CD – set of  $Q_r$ . Hence  $\gamma_{CD}(Q_s) \le |S| = 0$  $2\left\lfloor \frac{2s}{3} \right\rfloor$ . Now let  $D \subseteq V$  be any dominating set of cardinality at most  $d = 2\left\lfloor \frac{2s}{3} \right\rfloor - 1$  then  $\langle D \rangle$  has an isolated vertex. Thus  $|D| \ge d + 1 = 2 \left| \frac{2s}{3} \right|$ . Hence,  $\gamma_{CD}(Q_s) = 2 \left| \frac{2s}{3} \right|$ .

**Theorem 2.6.**Let  $A(Q_r)$  be a alternate quadrilateral snake. Then  $\gamma_{CD} A((Q_r)) = 2 \left| \frac{r}{2} \right|, r \ge 4$ . **Proof:** Let  $V(A(Q_r)) = \{v_1, v_2, v_3, ..., v_r, v_{i1}, v_{i2}, i = 2k + 1, k = 0, 1, 2, ... \}$  and  $E(A(Q_r)) = \{v_i v_{i+1}, v_i v_{i,1}, v_j v_{(j-1)2}, v_{i,1} v_{i,2} : 1 \le i \le r-1 \text{ and } 2 \le j \le r\}.$ Then S = { $v_i : i \equiv 0, 2 \pmod{3}$ }  $\cup$  { $v_{i2} : i = 2k + 1, k = 0, 1, 2, 3, ...$ } is a CD – set of A( $Q_r$ ). Hence  $\gamma_{CD}(A(Q_r)) \le |S| = 2$  $\frac{r}{2}$ .

Now let  $D \subseteq V$  be any dominating set of cardinality at most  $d = 2\left|\frac{r}{2}\right| - 1$  then < D > has an isolated vertex. Thus  $|D| \ge d + 1 = 2 \left| \frac{r}{2} \right|$ . Hence,  $\gamma_{CD} A((Q_r)) = 2 \left| \frac{r}{2} \right|$ 

**Theorem 2.7.** Let  $D(Q_r)$  be the double quadrilateral snake. Then  $\gamma_{CD} D((Q_r)) = 3 \left| \frac{r}{2} \right|, r \ge 4$ . **Proof:**  $Let V(D(Q_r)) = \{v_1, v_2, v_3, \dots, v_r, v_{11}, v_{12}, v_{21}, v_{22}, v_{31}, v_{32}, \dots, v_{(r-1)1}, v_{(r-1)}, u_{11}, u_{12}, u_{21}, \dots, u_{(r-1)1}, v_{(r-1)1}, u_{(r-1)1}, u_{(r-1$  $u_{22}, u_{31}, u_{32}, \dots, u_{(r-1)1}, u_{(r-1)2}$  and  $E(D(Q_r)) = \{v_a v_{a+1}, v_a v_{a-1}, v_a u_{a-1}, v_b v_{(b-1)2}, v_b v_{(b-2)2}, u_{a-1} u_{a-2}, v_{a-1} v_{a-2}: 1 \le a \le r-1 \text{ and } 2 \le b \le r\}.$ Consider  $S = \{v_a : a \equiv 0, 2 \pmod{3}\} \cup \{v_{a2}, u_{a2} : a \equiv 1 \pmod{3}\} \cup \{v_{a1}, u_{a1} : a \equiv 0 \pmod{3}\},\$ 

is a CD – set of  $D(Q_r)$ . Hence  $\gamma_{CD}(D(Q_r)) \leq |S| = 3 \left| \frac{r}{2} \right|$ .

Now let  $D \subseteq V$  be any dominating set of cardinality at most  $d = 3 \left| \frac{r}{2} \right| - 1$  then  $\langle D \rangle$  has an isolated vertex.

```
Praveenkumar et al.,
```

Thus 
$$|D| \ge d + 1 = 3\left\lfloor \frac{r}{2} \right\rfloor$$
. Hence,  $\gamma_{CD} D((Q_r)) = 3\left\lfloor \frac{r}{2} \right\rfloor$ .

**Illustration:** Here the white vertices will give us the CD – set of the above graph and hence the  $\gamma_{CD}$  value is 12.

**Theorem 2.8.** Let *H* be a lotus inside cycle graph. Then  $\gamma_{CD}(H) = \left[\frac{r}{2}\right] + 1$ . **Proof:** Let  $V(H) = \{v, v_1, v_2, v_3, ..., v_r, u_1, u_2, u_3, ..., u_r\}$  and  $E(H) = \{vv_a, v_b u_{b+1}, v_c u_{c-1} : 1 \le a \le r, 1 \le b \le r - 1, 2 \le c \le r\}$ Then  $S = \{vv_a : a = 2q + 1, q = 0, 1, 2, 3, ...\}$  is a *CD* – set of *H*. Hence  $\gamma_{CD}(H) \le |S| = \left[\frac{r}{2}\right] + 1$ .

Now let  $D \subseteq V$  be any dominating set of cardinality at most  $d = \left[\frac{r}{2}\right]$  then < D >has an isolated vertex.

Thus 
$$|D| \ge d + 1 = \left[\frac{r}{2}\right] + 1$$
. Hence,  $\gamma_{CD}(H) = \left[\frac{r}{2}\right] + 1$ .

**Illustration:** Here the white vertices will give us the CD – set of the above mentioned graph and hence the  $\gamma_{CD}$  value is 7.

# **Observation 2.9.** $1.\gamma_{CD}(F_r) = 2.$

**1.**  $_{\Gamma(D)}(\Gamma_r) = 2$ . **2.**  $_{\gamma_{CD}}(H_{k,k}) = 4$ . **3.**  $_{\gamma_{CD}}(P_r \odot 1K_1) = \text{does not exist}, r \ge 5$ . **4.**  $_{\gamma_{CD}}(P_r \odot 2K_1) = \text{does not exist}, r \ge 5$ . **5.**  $_{\gamma_{CD}}(C_r \odot 1K_1) = \text{does not exist}, r \ge 5$ . **6.**  $_{\gamma_{CD}}(C_r \odot 2K_1) = \text{does not exist}, r \ge 5$ .

## CONCLUSION

In this work, we have determined the exact  $\gamma_{CD}$  values for some notable graph, instead determine their approximate upper and lower bounds. We will find the results for some general graphs which will be in our successive work.

## ABSTRACT

"The goal of this paper is to illustrate the qualitative behaviour of a fourth order difference equation with neutral terms of the form

 $\Delta\left(s_1(\vartheta)\left(\Delta^3 q(\vartheta)\right)^{\beta_1}\right) = s_2(\vartheta)y^{\beta_2}(\vartheta - n + 1) + s_3(\vartheta)y^{\beta_3}(\vartheta + n^*)$ 

where  $q(\vartheta) = y(\vartheta) - s_4(\vartheta)y^{\beta_4}(\vartheta - k)$  Here  $\beta_1, \beta_2, \beta_3, \beta_4$  are the ratios of odd positive integers  $\beta_1 \ge 1, s_1, s_2, s_3, s_4$  are positive sequences and  $n, n^*, k \in N$  are such that  $n > 3, n^* > 3$ , k < n - 2. With the help of comparison techniques, we are able to acquire some novel oscillations results. Examples are given to illustrate the importance of the discoveries.

Keywords : comparison techniques, fourth order, neutral terms, oscillation.

## INTRODUCTION

Due to the fact that neutral difference equations are used in the study of economics, mathematical biology, and many other areas of mathematics, the issue of establishing oscillation phenomena for these equations has drawn a lot of attention in recent years [1],[2],[11],[12],[17]. The sources cited there as well as [4], [21], [22], [23] provide some fascinating new findings on the oscillatory behavior of second-order differential equations. A examination of the literature reveals that every conclusion made for fourth order difference equations with neutral terms ensures that each solution oscillates or monotonically approaches to zero. As far as we are aware, no conclusions have been drawn for fourth order neutral difference equations that suggest that all solutions are just oscillatory. This study's goal is to provide the equation some revised oscillation restrictions as a result.

$$\Delta\left(s_1(\vartheta)\left(\Delta^3 q(\vartheta)\right)^{\beta_1}\right) = s_2(\vartheta)y^{\beta_2}(\vartheta - n + 1) + s_3(\vartheta)y^{\beta_3}(\vartheta + n^*) \tag{1}$$

## Kaleeswari and Buvanasankari

where  $q(\vartheta) = y(\vartheta) - s_4(\vartheta)y^{\beta_4}(\vartheta - k)$  via comparing first order equations with known oscillatory phenomena, or by comparing second-order difference equations with neutral terms. The reader can refer to [5], [6], [7] for relevant results on oscillation theory of applications.

The following conditions are always considered to hold:

(i)  $\beta_1, \beta_2, \beta_3, \beta_4$  are the ratios of odd positive integers with  $\beta_1 \ge 1$ ;

(ii) *s*<sub>1</sub>, *s*<sub>2</sub>, *s*<sub>3</sub>, *s*<sub>4</sub> are positive sequences;

(iii)  $n, n^*, k \in N$  are such that  $n > 3, n^* > 3, k < n - 2$ .

A solution to (1) is said to be oscillatory if it is neither eventually negative nor finally positive. If not, it is regarded as non-oscillatory. Equation (1) is oscillatory if and only if all of its solutions are oscillatory." The aim of this work is to generate adequate conditions for (1) to oscillate whenever  $\beta_4 < 1$  and subject the assumption

$$S_1(\vartheta, \vartheta_1) \to \infty \text{as}\vartheta \to \infty \text{ where} S_1(r, u) = \sum_{\varrho=u}^{r-1} \frac{1}{s_1^{\beta_1}(\varrho)}$$

(2)

## AUXILIARY RESULTS

Lemma 2.1 (see [7], Lemma 1 and 19, Lemma 2.2).

(I) If the first order delay difference inequality

 $\Delta q(\vartheta) - s_2(\vartheta) f(q(\vartheta - n + 1)) \le 0$ 

has an eventually positive solution, then so does the corresponding delay difference equation.

(II)If the first order advanced difference inequality

$$\Delta q(\vartheta) - s_2(\vartheta) f(q(\vartheta - n^*)) \ge 0$$

has an eventually positive solution, then so does the corresponding advanced difference equation.

Lemma 2.2. (see [9]) If  $X, Y \ge 0$ , then  $X^{\gamma} + (\gamma - 1)Y^{\gamma} - \gamma XY^{\gamma - 1} \ge 0$  for  $\gamma > 1$  (3) and  $X^{\gamma} + (1 - \gamma)Y^{\gamma} - \gamma XY^{\gamma - 1} \le 0$  for  $0 < \gamma < 1$ . (4)

Lemma 2.3. Assume (2). Then  $\Delta Q(\vartheta) > 0$  eventually, where  $Q := s_1 \left(\Delta^3 q\right)^{\beta_1}$ (5)

suggests that one of the below four scenarios occurs: Case (1).  $q(\vartheta) > 0$ ,  $\Delta q(\vartheta) > 0$ ,  $\Delta^2 q(\vartheta) > 0$   $\Delta^3 q(\vartheta) > 0$ ; Case (II).  $q(\vartheta) > 0$ ,  $\Delta q(\vartheta) > 0$ ,  $\Delta^2 q(\vartheta) > 0$   $\Delta^3 q(\vartheta) < 0$ ; Case (III).  $q(\vartheta) < 0$ ,  $\Delta q(\vartheta) < 0$ ,  $\Delta^2 q(\vartheta) < 0$   $\Delta^3 q(\vartheta) < 0$ ; Case (IV).  $q(\vartheta) < 0$ ,  $\Delta q(\vartheta) > 0$ ,  $\Delta^2 q(\vartheta) < 0$   $\Delta^3 q(\vartheta) < 0$ ; Proof. From (5), we can find  $\vartheta_0 \in N_0$  such that  $\Delta Q(\vartheta) > 0 \quad \forall \vartheta \ge \vartheta_0$ .

We suppose that there exists  $\vartheta_1 \ge \vartheta_0$  with  $Q(\vartheta_1) > 0$ 

From (6) and (7), we get, 
$$\forall \vartheta \ge \vartheta_1$$
.

$$Q(\vartheta) = Q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta Q(\varrho) \ge Q(\vartheta_1) > 0$$

Thus,

 $\Delta^3 q(\vartheta) > 0 \qquad \forall \vartheta \ge \vartheta_1.$ From (6) and (7) we obtain, for  $\vartheta \ge \vartheta_1$

## Kaleeswari and Buvanasankari

$$\begin{split} \Delta^2 q(\vartheta) &= \Delta^2 q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta^3 q(\varrho) = \Delta^2 q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \frac{Q^{\frac{1}{\beta_1}}(\varrho)}{\frac{1}{s_1^{\beta_1}}(\varrho)} \\ &\geq \Delta^2 q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \frac{Q^{\frac{1}{\beta_1}}(\vartheta_1)}{\frac{1}{s_1^{\beta_1}}(\vartheta_1)} \geq \Delta^2 q(\vartheta_1) + Q^{\frac{1}{\beta_1}}(\vartheta_1) S_1(\vartheta, \vartheta_1) \to \infty \quad \text{as } \vartheta \to \infty. \end{split}$$
  
because of (2).

Therefore, there exists  $\vartheta_2 \ge \vartheta_1$  with  $\Delta^2 q(\vartheta) > 0 \quad \forall \vartheta \ge \vartheta_2.$ From (8) and (9) we get,  $\forall \vartheta \geq \vartheta_2$ .

$$\Delta q(\vartheta) = \Delta q(\vartheta_2) + \sum_{\varrho=\vartheta_2}^{\vartheta-1} \Delta^2 q(\varrho) \ge \Delta q(\vartheta_2) + \sum_{\varrho=\vartheta_2}^{\vartheta-1} \Delta^2 q(\vartheta_2)$$
$$= \Delta q(\vartheta_2) + (\vartheta - \vartheta_2) \Delta^2 q(\vartheta_2) \to \infty \quad \text{as } \vartheta \to \infty.$$

Hence, there exists  $\vartheta_1 > \vartheta_2$  with  $\Delta q(\vartheta) > 0 \quad \forall \vartheta \ge \vartheta_3$ . From (9) and (10) we obtain for  $\vartheta \ge \vartheta_3$ ,

$$q(\vartheta) = q(\vartheta_3) + \sum_{\varrho=\vartheta_3}^{\vartheta-1} \Delta q(\varrho) \ge q(\vartheta_3) + \sum_{\varrho=\vartheta_3}^{\vartheta-1} \Delta q(\vartheta_3)$$
$$= q(\vartheta_3) + (\vartheta - \vartheta_3)\Delta q(\vartheta_3) \to \infty \quad \text{as } \vartheta \to \infty.$$

Hence, there exists  $\vartheta_4 \ge \vartheta_3$  with  $q(\vartheta) > 0 \quad \forall \vartheta \ge \vartheta_4$ By (8)-(11), we get

 $q(\vartheta) > 0, \Delta q(\vartheta) > 0, \Delta^2 q(\vartheta) > 0, \Delta^3 q(\vartheta) > 0 \forall \vartheta \ge \vartheta_4$ 

Thus, Case (I) holds if (7) does not hold, then the only other possibilities is  $q(\vartheta) < 0$ for  $\vartheta \ge \vartheta_0$  and thus,

$$\Delta^3 q(\vartheta) < 0 \text{ for all } \vartheta \ge \vartheta_0 \tag{12}$$

we suppose that, there exists  $\vartheta_1 \ge \vartheta_0$  with  $\Delta^2 q(\vartheta_1) < 0$ 

From (12) and (13) we get, 
$$\forall \vartheta \ge \vartheta_1$$
  
 $\Delta^2 q(\vartheta) = \Delta^2 q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta^3 q(\varrho) \le \Delta^2 q(\vartheta_1) < 0$ 

Hence

$$\Delta^2 q(\vartheta) < 0 \qquad \forall \ \vartheta \ge \vartheta_1 \tag{14}$$

Now, from (12) and (13) we obtain for 
$$\vartheta \ge \vartheta_1$$
  

$$\Delta q(\vartheta) = \Delta q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta^2 q(\varrho) \le \Delta q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta^2 q(\vartheta_1)$$

$$\le \Delta q(\vartheta_1) + (\vartheta - \vartheta_1) \Delta^2 q(\vartheta_1) \to -\infty \quad \text{as } \vartheta \to \infty,$$
Hence there exists  $\vartheta_2 \ge \vartheta_1$  with  

$$\Delta q(\vartheta) < 0 \quad \forall \vartheta \ge \vartheta_2 \qquad (15)$$
Now, from (14) and (15) we can get, for  $\vartheta \ge \vartheta_2,$ 

$$q(\vartheta) = q(\vartheta_2) + \sum_{\varrho=\vartheta_2}^{\vartheta-1} \Delta q(\varrho) \le q(\vartheta_2) + \sum_{\varrho=\vartheta_2}^{\vartheta-1} \Delta q(\vartheta_2)$$

$$\le q(\vartheta_2) + (\vartheta - \vartheta_2) \Delta q(\vartheta_2) \to -\infty \quad \vartheta \to \infty$$

 $\leq q(\vartheta_2) + (\vartheta - \vartheta_2) \Delta q(\vartheta_2) \to -\infty \quad \vartheta \to \infty,$ Thus, there exist  $\vartheta_3 \ge \vartheta_2$  with  $q(\vartheta) < 0 \quad \forall \, \vartheta \ge \vartheta_3$ (16)By equation (12)-(16), we get  $q(\vartheta) < 0, \Delta q(\vartheta) < 0, \Delta^2 q(\vartheta) < 0, \Delta^3 q(\vartheta) < 0$ . Thus, Case III holds. Further, if (13) does not hold, then the only other possibility is  $\Delta^2 q(\vartheta_1) > 0 \quad \forall \ \vartheta \ge \vartheta_0$ (17)

64074

Kaleeswari and Buvanasankari Suppose that, there exists  $\vartheta_1 \ge \vartheta_0$  with  $\Delta q(\vartheta_1) > 0$ (18)Then, from (17) and (18) we get  $\forall \vartheta_1 \geq \vartheta_0$ ,  $\Delta q(\vartheta) = \Delta q(\vartheta_1) + \sum_{i=1}^{\infty} \Delta^2 q(\varrho) \ge \Delta q(\vartheta_1) > 0.$ Therefore, there exists  $\vartheta_2 \ge \vartheta_1$  with  $\Delta q(\vartheta) > 0 \ \forall \, \vartheta_1 \ge \vartheta_0$ (19)Now, from (18) and (19) $\forall \vartheta \geq \vartheta_2$ ,  $q(\vartheta) = q(\vartheta_2) + \sum_{\varrho = \vartheta_2}^{\vartheta - 1} \Delta q(\varrho) \ge q(\vartheta_2) + \sum_{\varrho = \vartheta_2}^{\vartheta - 1} \Delta q(\vartheta_2)$  $\geq q(\vartheta_2) + (\vartheta - \vartheta_2) \Delta q(\vartheta_2) \to \infty \text{ as } \vartheta \to \infty$ Hence, there exists  $\vartheta_1 \ge \vartheta_2$  with  $q(\vartheta) > 0 \ \forall \ \vartheta \ge \vartheta_3.$ (20)By Equations (12),(17),(19),(20) we get,  $q(\vartheta) > 0, \Delta q(\vartheta) > 0, \Delta^2 q(\vartheta) > 0, \Delta^3 q(\vartheta) < 0$ . Case (II) is so upheld. In the event  $\rho$  (15) does not hold, the sole option is  $\Delta q(\vartheta) > 0 \quad \forall \ \vartheta \ge \vartheta_0.$ (21)By Equation (12), (14),(16),(21) we get,  $q(\vartheta) < 0, \Delta q(\vartheta) > 0, \Delta^2 q(\vartheta) < 0, \Delta^3 q(\vartheta) < 0$ , Thus, Case (IV) holds. The rest the article is based on the assumption that

 $k_0, k_1, k_2, k_3, k_4 \in \mathbb{N}$  satisfying  $3k_0 < n^*, k_1 < n+2$ , and  $k_2 < k_3 \le n+1-k$ . (22)

## Note 2.4:

- 1. Consider the constraints n > 3,  $n^* > 3$ , and k < n 2. For example, one may use  $k_0 = k_1 = k_2 = 1$ ,  $k_3 = 2$  and  $k_4 = 4$ .
- 2. Consider that  $\vartheta + n^* 3k_0 > \vartheta$ . Since it is always possible  $n^* 3k_0 > 0$ . Therefore, equations involving  $\vartheta + n^* 3k_0$  are advanced type. Furthermore
- $\vartheta + n^* + k_1 2 < \vartheta, \vartheta n + k 2 < \vartheta_1, \ \vartheta n + k 2 + k_1 < \vartheta$ , always since  $n + 2 k_1 > 0, n + 2 k > 0, n + 2 k_1 > 0$ ,  $n + 2 k > 0, n + 2 k_1 > 0$ . Therefore, equation containing  $\vartheta n + k_1 2$ ,  $\vartheta n + k 2$ ,  $\vartheta n + k 2 + k_3$  are of delay type.

#### MAIN RESULTS

We will start looking at the new result.

Theorem 3.1.Let  $\beta_4 < 1$ . Assume that(i)-(iii), (2) and (22) hold. Suppose that there is a sequence  $s: Q \to (0, \infty)$ . Such that  $\lim_{\vartheta \to \infty} (g_1(\vartheta)) = 0$ , where

$$g_{1}(\vartheta) := (1 - \beta_{4}) \beta_{4}^{\frac{\rho_{4}}{1 - \beta_{4}}} s^{\frac{\beta_{4}}{\beta_{4-1}}}(\vartheta) s_{4}^{\frac{1}{1 - \beta_{4}}}(\vartheta).$$
(23)  
Let  $\theta_{0}, \theta_{1}, \theta_{2} \in (0, 1)$ . If the first-order advanced difference equation  
 $\Delta q(\vartheta) = \theta_{0} z^{\frac{\beta_{3}}{\beta_{1}}}(\vartheta + n^{*} - 3k_{0}) \sum_{\varrho=\vartheta-k_{0}}^{\vartheta-1} \left( \sum_{r=t-k_{0}}^{\varrho-1} \left( \frac{1}{s_{1}(\varrho)} \sum_{\gamma=r-k_{0}}^{r-1} s_{3}(\gamma) \right)^{\frac{1}{\beta_{1}}} \right)$ 

and the first order delay difference equation  

$$\Delta W(\vartheta) + (\theta_1 \theta_2 k)^{\beta_2} s_2(\vartheta) (\vartheta - n + 1)^{\beta_2} (\vartheta - n)^{\beta_2}$$

$$W^{\frac{\beta_2}{\beta_1}}(\vartheta - n + k_1 - 2)[S_1(\vartheta - n + k_1 - 1, \vartheta - n - 1)]^{\beta_2} = 0$$
(25)

$$\Delta W(\vartheta) + \frac{s_2(\vartheta)}{(s_4)^{\beta_4}(\vartheta - n + k + 1)} W^{\frac{\beta_2}{\beta_1 \beta_4}}(\vartheta - n + k - 2) \left( \sum_{\varrho = \vartheta_1}^{\vartheta - n + k} \left( \sum_{r=t_1}^{t-n+k} S_1(r_1, \vartheta_1) \right) \right) = 0$$

(26)

(24)

and

(28)

International Bimonthly (Print) – Open Access Vol.14 / Issue 80 / Oct / 2023 ISSN: 0976 - 0997

Kaleeswari and Buvanasankari

$$\Delta W(\vartheta) + \frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} (k_2 c \theta_0)^{\frac{\beta_2}{\beta_4}} \left[ W^{\frac{1}{\beta_1}}(\vartheta - n + k + k_3 - 2) S_1(\vartheta - n + k + k_3 - 1, \vartheta - n + k + k_3 - 1) \right]^{\frac{\beta_2}{\beta_4}} = 0 (27)$$

are oscillatory, then so is (1)

Proof. Suppose that y is a non oscillatory solution of (1), say  $y(\vartheta) > 0$ ,  $y(\vartheta - k) > 0$ ,  $y(\vartheta - n + k) > 0$ ,  $y(\vartheta + n^*) > 0$ eventually  $\Lambda(s_1(\theta)(\Lambda^3 q(\theta)^{\beta_1}) = s_2(\theta)v^{\beta_2}(\theta - n + 1) + s_2(\theta)v^{\beta_3}(\theta + n^*) > 0$ 

$$\Delta(s_1(\vartheta)(\Delta^{-}q(\vartheta)^{r_1}) = s_2(\vartheta)y^{r_2}(\vartheta - n + 1) + s_3(\vartheta)y^{r_3}(\vartheta + n) > 0$$
  
Therefore (5) is fulfilled, and only four cases (I), (II), (III) and (IV) can be done according to Lemma (2.3)  
Case (I) and (II):

Using 
$$\gamma = \beta_4 \in (0,1), X = s_4^{\frac{1}{\beta_4}}(\vartheta)y(\vartheta - k), Y = \left(\frac{1}{\beta_4}s(\vartheta)s_4^{\frac{-1}{\beta_4}}(\vartheta)\right)^{\frac{1}{\beta_4-1}}$$
 in (4) we obtain  $-\left(s(\vartheta)y(\vartheta - k) - s_4(\vartheta)y^{\beta_4}(\vartheta - k)\right)^{\frac{1}{\beta_4-1}}$ 

$$\begin{aligned} k) &\leq g1(\vartheta) \\ y(\vartheta) &= q(\vartheta) + s_4(\vartheta)y^{\beta_4}(\vartheta - k) + s(\vartheta)y(\vartheta - k) - s(\vartheta)y(\vartheta - k) \\ &= q(\vartheta) + s(\vartheta)y(\vartheta - k) - \left(s(\vartheta)y(\vartheta - k) - s_4(\vartheta)y^{\beta_4}(\vartheta - k)\right) \\ &\geq q(\vartheta) + s(\vartheta)y(\vartheta - k) + g_1(\vartheta) \\ &\geq q(\vartheta) \left[1 + \frac{s(\vartheta)y(\vartheta - k) + g_1(\vartheta)}{q(\vartheta)}\right] \end{aligned}$$

As q in both cases (I) and (II) is positive and non-decreasing, there exists L > 0, fulfilling of  $q(\vartheta) > L$ , and thus, we obtain

$$y(\vartheta) \ge \left(1 + \frac{s(\vartheta)y(\vartheta - k) + g_1(\vartheta)}{\vartheta}\right)q(\vartheta)$$
  
Then due to (23), there exists  $k \in (0,1)$  such that  

$$y(\vartheta) \ge kq(\vartheta)$$
(29)  
eventually  
So, we get  

$$\Delta\left(s_1(\vartheta)\left(\Delta^3q(\vartheta)\right)^{\beta_1}\right) \ge k^{\beta_2}s_2(\vartheta)q^{\beta_2}(\vartheta - n + 1) + k^{\beta_3}s_3(\vartheta)q^{\beta_3}(\vartheta + n^*) \ge 0$$
(30)

Case(I).Using (30), we get  

$$\Delta\left(s_{1}(\vartheta)\left(\Delta^{3}q(\vartheta)\right)^{\beta_{1}}\right) \geq k^{\beta_{3}}s_{3}(\vartheta)q^{\beta_{3}}(\vartheta+n^{*})$$
Summing (31) from  $\vartheta - k_{0}$  to  $\vartheta - 1$ , we have  

$$s_{0} = k_{0}^{\beta_{1}} \sum_{\alpha} \left(k_{0}^{\alpha} - k_{0}^{\alpha}\right)^{\beta_{1}} \sum_{\alpha} \left(k_{0}^{\alpha} - k_{0}^{\alpha}\right)^{\beta_{1}}$$
(31)

$$s_{1}(\vartheta) (\Delta^{3}q(\vartheta))^{\beta_{1}} = s_{1}(\vartheta - k_{0}) (\Delta^{3}q(\vartheta - k_{0}))^{\beta_{1}} + \sum_{\varrho = \vartheta - k_{0}} \Delta (s_{1}(\varrho) (\Delta^{3}q(\varrho)))^{\beta_{1}}$$

$$\geq k^{\beta_{3}} \sum_{\varrho = \vartheta - k_{0}}^{\vartheta - 1} s_{3}(\varrho) q^{\beta_{3}}(\varrho + n^{*})$$

$$\geq k^{\beta_{3}}q^{\beta_{3}}(\vartheta + n^{*} - k_{0}) \sum_{\varrho = \vartheta - k_{0}}^{\vartheta - 1} s_{3}(\varrho)$$

So we get,

$$\Delta^{3}q(\vartheta) \geq k^{\frac{\beta_{3}}{\beta_{1}}}q^{\frac{\beta_{3}}{\beta_{1}}}(\vartheta + n^{*} - k_{0}) \left(\frac{1}{s_{1}(\vartheta)}\sum_{\varrho=\vartheta-k_{0}}^{\vartheta-1}s_{3}(\varrho)\right)^{\frac{1}{\beta_{1}}}$$
  
Summing (32) again from  $\vartheta - k_{0}$ to $\vartheta - 1$ , we get

$$\Delta^2 q(\vartheta) = \Delta^2 q(\vartheta - k_0) + \sum_{\varrho=\vartheta-k_0}^{\vartheta-1} \Delta^3 z(\varrho)$$
  
$$\geq \sum_{\varrho=\vartheta-k_0}^{\vartheta-1} k^{\frac{\beta_3}{\beta_1}} q^{\frac{\beta_3}{\beta_1}}(\varrho + n^* - k_0) \left(\frac{1}{s_1(\varrho)} \sum_{r=t-k_0}^{\varrho-1} s_3(r)\right)^{\frac{1}{\beta_1}}$$

(32)

## Kaleeswari and Buvanasankari

 $\geq k_{\beta_1}^{\frac{\beta_3}{\beta_1}} q_{\beta_1}^{\frac{\beta_3}{\beta_1}} (\vartheta + n^* - 2k_0) \sum_{\varrho=\vartheta-k_0}^{\vartheta-1} \left( \frac{1}{s_1(\varrho)} \sum_{r=t-k_0}^{\varrho-} s_3(r) \right)^{\frac{1}{\beta_1}}$ Summing (33) again from  $\vartheta - k_0$  to  $\vartheta - 1$ , we get  $\Delta q(\vartheta) = \Delta q(\vartheta - k_0) + \sum_{\ell=1}^{\vartheta-1} \Delta^2 q(\vartheta)$ 

$$\geq k^{\frac{\beta_3}{\beta_1}} \sum_{r=\vartheta-k_0}^{\vartheta-1} q^{\frac{\beta_3}{\beta_1}} (\varrho+n^*-2k_0) \sum_{r=t-k_0}^{\varrho-} \left(\frac{1}{s_1(r)} \sum_{u=r-k_0}^{\vartheta-1} s_3(u)\right)^{\frac{1}{\beta_1}}$$

$$\geq k^{\frac{\beta_3}{\beta_1}} q^{\frac{\beta_3}{\beta_1}} (\vartheta+n^*-3k_0) \sum_{\varrho=\vartheta-k_0}^{\vartheta-1} \left(\sum_{r=t-k_0}^{\varrho-} \left(\frac{1}{s_1(r)} \sum_{u=r-k_0}^{r-1} s_3(u)\right)^{\frac{1}{\beta_1}}\right)$$

Hence, we conclude that q is a positive and increasing solution of

. .

$$\Delta q(\vartheta) - k^{\frac{\beta_3}{\beta_1}} q^{\frac{\beta_3}{\beta_1}} (\vartheta + n^* - 3k_0) \sum_{\varrho=\vartheta-k_0}^{\vartheta-1} \left( \sum_{r=t-k_0}^{\varrho-} \left( \frac{1}{s_1(r)} \sum_{u=r-k_0}^{r-1} s_3(u) \right)^{\frac{1}{\beta_1}} \right) \ge 0$$

while applying Lemma (2.1)II, (24) also has an eventually positive solution, which is a contradiction. Case (II). Let

$$W = -s_1 \left(\Delta^3 q\right)^{\beta_1} > 0 \text{ eventually}$$
By (30) we get
$$(34)$$

$$-\Delta W(\vartheta) \ge k^{\beta_2} s_2(\vartheta) q^{\beta_2}(\vartheta - n + 1)$$
(35)

we know that, eventually,  $v_{-1}$ 

$$q(\vartheta) = q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta^{-1}} \Delta q(\varrho) \ge \sum_{\varrho=\vartheta_1}^{\vartheta^{-1}} \Delta q(\varrho)$$
$$= (\vartheta - \vartheta_1) \Delta q(\vartheta - 1) = l \Delta q(\vartheta - 1) \left(1 - \frac{\vartheta_1}{\vartheta}\right)$$

Since  $\frac{\vartheta_1}{\vartheta} \to 0$  as  $\vartheta \to \infty$ , there exists  $\theta_1 \in (0,1)$  such that  $q(\vartheta) \ge \vartheta \theta_1 \Delta q(\vartheta - 1)$  eventually

Next, we have

$$\Delta q(\vartheta) = q(\vartheta_2) + \sum_{\varrho=\vartheta_2}^{\vartheta-1} \Delta^2 q(\varrho) \ge \sum_{\varrho=\vartheta_2}^{\vartheta-1} \Delta^2 q(\vartheta-1)$$
$$= (\vartheta - \vartheta_2) \Delta^2 q(\vartheta-1) = \Delta^2 z(\vartheta-1) \left(1 - \frac{\vartheta_2}{\vartheta}\right)$$

Since  $\frac{\vartheta_2}{\vartheta} \to 0$  as  $\vartheta \to \infty$  there exists  $\theta_2 \in (0,1)$  such that  $\Delta q(\vartheta) \ge \vartheta \theta_2 \Delta^2 q(\vartheta - 1)$  eventually Now, we get  $a = \vartheta - n - 1, b = a + k_1 > a$ .

Kaleeswari and Buvanasankari

$$\begin{array}{ll} 0 &\leq \Delta^2 q(b) = \Delta^2 q(a) + \sum_{q=1}^{b-1} \Delta^3 q(q) \\ &= \Delta^2 q(a) - \sum_{q=1}^{b-1} \frac{w^{\frac{1}{2}}(\phi)}{s_1^{\frac{1}{2}}(\phi)} \\ &\leq \Delta^2 q(a) - \sum_{q=1}^{b-1} \frac{w^{\frac{1}{2}}(\phi)}{s_1^{\frac{1}{2}}(\phi)} \\ &\leq \Delta^2 q(a) - W^{\frac{1}{2}}(b-1)S_1(b,a) \\ &= \Delta^2 q(a) - W^{\frac{1}{2}}(b-1)S_1(b,a) \\ &= \Delta^2 q(a) - W^{\frac{1}{2}}(b-1)S_1(b,a) \\ &= (A^2 q(a) \geq W^{\frac{1}{2}}(b-1)S_1(b,a) \\ &= (A^2 q(a) \geq W^{\frac{1}{2}}(b-1)S_1(b,a) \\ &= (A^2 q(a) \geq W^{\frac{1}{2}}(b-1)S_1(b,a) \\ &= (A^2 q(a) \geq W^{\frac{1}{2}}(b-1)S_1(b,a) \\ &= (A^2 q(a) \geq W^{\frac{1}{2}}(b) q^{\frac{1}{2}}(\theta - n + 1) \\ &\geq (A^2 q(a) \geq W^{\frac{1}{2}}(b) q^{\frac{1}{2}}(\theta - n + 1)^{\frac{1}{2}}(b - n)^{\frac{1}{2}}(\Delta^2 q(\theta - n-1))^{\frac{1}{2}} \\ &\geq (A^2 q(a) \geq W^{\frac{1}{2}}(b) q^{\frac{1}{2}}(\theta - n + 1)^{\frac{1}{2}}(b - n)^{\frac{1}{2}}(\Delta^2 q(\theta - n - 1))^{\frac{1}{2}} \\ &\geq (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(\theta - n + 1)^{\frac{1}{2}}(b - n)^{\frac{1}{2}}(\Delta^2 q(\theta - n - 1))^{\frac{1}{2}} \\ &\geq (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(\theta - n + 1)^{\frac{1}{2}}(b - n)^{\frac{1}{2}}(\Delta^2 q(\theta - n - 1))^{\frac{1}{2}} \\ &\geq (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(\theta - n + 1)^{\frac{1}{2}}(b - n)^{\frac{1}{2}}(\Delta^2 q(\theta - n - 1))^{\frac{1}{2}} \\ &\geq (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2 q(a) e^{-\frac{1}{2}}(b) q^{\frac{1}{2}}(a) \\ &= (A^2$$

## Kaleeswari and Buvanasankari

$$\begin{aligned} \Delta q(\vartheta) &= \Delta q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta^2 q(\varrho) \\ &\leq \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta^2 q(\varrho) \leq -\sum_{\varrho=\vartheta_1}^{\vartheta-1} W^{\frac{1}{\beta_1}}(\vartheta-1)S_1(\varrho,\vartheta_1) \\ &\leq -W^{\frac{1}{\beta_1}}(\vartheta-2)\sum_{\varrho=\vartheta_1}^{\vartheta-1} S_1(\varrho,\vartheta_1) \text{ eventually} \end{aligned}$$

Therefore, from (28) we obtain,

$$q(\vartheta) = q(\vartheta_1) + \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta q(\varrho) \le \sum_{\varrho=\vartheta_1}^{\vartheta-1} \Delta q(\varrho)$$
$$\le -\sum_{\varrho=\vartheta_1}^{\vartheta-1} \left[ W^{\frac{1}{\beta_1}}(\vartheta-2) \left( \sum_{r=\vartheta_1}^{\vartheta-1} S_1(r,\vartheta_1) \right) \right]$$
$$\le -W^{\frac{1}{\beta_1}}(\vartheta-3) \left[ \sum_{\varrho=\vartheta_1}^{\vartheta-1} \left( \sum_{r=\vartheta_1}^{\vartheta-1} S_1(r,\vartheta_1) \right) \right]$$

eventually.

And thus, from (40) we get eventually,

$$\begin{aligned} -\Delta W(\vartheta) &\geq -\frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} q^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1) \\ &\geq \frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} \left[ W^{\frac{1}{\beta_1}}(\vartheta - n + k - 2) \left[ \sum_{\varrho=\vartheta_1}^{\vartheta - n + k} \left( \sum_{r=\vartheta_1}^{\vartheta - n + k} S_1(r, \vartheta_1) \right) \right] \right]_{\rho=\vartheta}^{\frac{\beta_2}{\beta_4}} \\ &\geq \frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} W^{\frac{\beta_2}{\beta_1}}(\vartheta - n + k - 2) \left[ \sum_{\varrho=\vartheta_1}^{\vartheta - n + k} \left( \sum_{r=\vartheta_1}^{\vartheta - n + k} S_1(r, \vartheta_1) \right) \right]_{\rho=\vartheta}^{\frac{\beta_2}{\beta_4}} \\ &\text{Hence } W \text{ is a positive and decreasing solution of} \end{aligned}$$

Hence, W is a positive and decreasing solution of

$$\Delta W(\vartheta) + \frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} W^{\frac{\beta_2}{\beta_1\beta_4}}(\vartheta - n + k - 2) \left[ \sum_{\varrho=\vartheta_1}^{\vartheta - n + k} \left( \sum_{r=\vartheta_1}^{\vartheta - n + k} S_1(r, \vartheta_1) \right) \right]^{\frac{\beta_2}{\beta_4}} \le 0$$

while applying Lemma (2.1) I, we see that (26) also has an eventually positive solution, which contradictory. Case (IV). Let

$$a = m - n + k + 1, b = a + k_2 > a, c = a + k_3 - 1 > b - 1, d = a + k_4 - 1 > c - 1,$$
  
First, we get eventually,  

$$0 \ge q(b) = q(a) + \sum_{\varrho=a}^{b-1} \Delta q(\varrho)$$
  

$$\ge q(a) + \sum_{\varrho=a}^{b-1} \Delta q(b - 1)$$
  

$$\ge q(a) + (b - a)\Delta q(b - 1)$$
  

$$-q(a) \ge (b - a)\Delta q(b - 1)$$

(41)

### Kaleeswari and Buvanasankari

Now, we obtain eventually,

$$0 \leq \Delta q(c) = \Delta q(b-1) + \sum_{q=b-1}^{c-1} \Delta^2 q(q)$$

$$\leq \Delta q(b-1) + (c-b+1)\Delta^2 q(c-1)$$

$$\leq \Delta q(b-1) + c \left(1 - \left(\frac{b-1}{c}\right)\right) \Delta^2 q(c-1)$$
Since  $\frac{b-1}{c} \to 0$  as  $c \to \infty$ , there exists  $\theta_0 \in (0,1)$ , such that
$$\Delta q(b-1) \geq -c\theta_0 \Delta^2 q(c-1) \text{ eventually.}$$
(42)
Then, from (34) and (28) we have
$$\Delta^2 q(d) = \Delta^2 q(c-1) + \sum_{q=c-1}^{d-1} \Delta^3 q(q)$$

$$\leq -\sum_{q=c-1}^{d-1} \frac{W^{\frac{1}{p_1}}(q)}{s_1^{\frac{1}{p_1}}(q)}$$

$$\leq -W^{\frac{1}{p_1}}(d-1)S_1(d,c-1)$$
Thus, from (40)-(43) we get
$$-\Delta W(\theta) \geq \frac{S_2(\theta)}{s_4^{\frac{p_2}{4}}(\theta-n+k+1)} [(b-a)\Delta q(b-1)]^{\frac{p_2}{p_4}}$$
(43)
$$\geq \frac{S_2(\theta)}{s_4^{\frac{p_2}{4}}(\theta-n+k+1)} [(b-a)\Delta q(c-1)]^{\frac{p_2}{p_4}}$$

which implies W is a positive and decreasing solution of

$$\begin{split} \Delta W(\vartheta) + \frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} (k_2 c \theta_0)^{\frac{\beta_2}{\beta_4}} \Big[ W^{\frac{1}{\beta_1}}(c - 2) S_1(c - 1, c - 1) \Big]^{\frac{\beta_2}{\beta_4}} &\leq 0 \\ \Delta W(\vartheta) + \frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} (k_2 c \theta_0)^{\frac{\beta_2}{\beta_4}} \Big[ W^{\frac{1}{\beta_1}}(\vartheta - n + k + k_3 - 2) S_1(\vartheta - n + k + k_3 - 1, \vartheta - n + k + k_3 - 1) \Big]^{\frac{\beta_2}{\beta_4}} &\leq 0 \end{split}$$

Using Lemma (2.1) I, (27) also has an eventually positive solution which contradicts. We provide the next results to demonstrate Theorem 3.1.

Corollary 3.2. Assume that(i)-(iii), (2), (22) and (23) hold. If the first order advanced difference equation (24) and the first oorder delay difference equation (25) and

$$\Delta W(\vartheta) + \min\left\{\frac{s_{2}(\vartheta)}{s_{4}^{\frac{\beta_{2}}{\beta_{4}}}(\vartheta - n - k + 1)} \left[\sum_{\varrho=\vartheta_{1}}^{\vartheta-n+k} \left(\sum_{r=t_{1}}^{t-n+k} S_{1}(r,\vartheta_{1})\right)\right]^{\frac{\beta_{2}}{\beta_{4}}}, \frac{s_{2}(\vartheta)}{s_{4}^{\frac{\beta_{2}}{\beta_{4}}}(\vartheta - n - k + 1)} (k_{2}c\theta_{0})^{\frac{\beta_{2}}{\beta_{4}}} [S_{1}(\vartheta - n + k + k_{3} - 1, \vartheta - n + k + k_{3} - 1)]^{\frac{\beta_{2}}{\beta_{4}}}\right\} W^{\frac{\beta_{2}}{\beta_{1}\beta_{4}}}(\vartheta - n + k + k_{3} - 2) = 0$$

$$(44)$$

44)

64080

### Kaleeswari and Buvanasankari

are oscillatory for  $1 > \beta_4$  and  $\theta_0, \theta_1, \theta_2 \in (0, 1)$ , then (1) is oscillatory.

Corollary 3.3. Assume 
$$1 > \beta_4$$
 and  $\beta_3 \ge \beta_1 \ge \beta_2$ . Let(i)-(iii), (2), (22) and (23) hold. If  $\lim \sup \Sigma^{\vartheta - \frac{1}{2}} \int \left( \sum_{r=1}^{\varrho} \sum_{r=1}^{r-1} \int \sum_{r=1}^{r-1} \sum_{r$ 

$$\limsup_{\vartheta \to \infty} \sum_{\varrho=\vartheta-k_0}^{\circ} \left( \sum_{r=t-k_0}^{\circ} \left( \sum_{s_1(\varrho)}^{\circ} \sum_{\xi=r-k_0}^{\circ} s_3(\xi) \right)^{r_1} \right) = \infty,$$
(45)

$$\limsup_{\vartheta \to \infty} s_2(\vartheta)(\vartheta - n + 1)^{\beta_2}(\vartheta - n)^{\beta_2} S_1[\vartheta - n + k_1 - 1, \vartheta - n - 1]^{\beta_2} = \infty,$$
(46)

$$\limsup_{\vartheta \to \infty} \frac{s_2(\vartheta)}{s_{\ell}^{\frac{\beta}{p}} (\vartheta - n + k + 1)} \left[ \sum_{\varrho = \vartheta_1}^{\vartheta - n + k} \left( \sum_{r=t_1}^{t-n+k} S_1(r, \vartheta_1) \right) \right]^{\frac{\beta}{\beta}} = \infty,$$
(47)

and

$$\limsup_{\vartheta \to \infty} \frac{s_2(\vartheta)}{s_{\beta 4}^{\beta}(\vartheta - n + k + 1)} (k_2 c \theta_0)^{\frac{\beta_2}{\beta_4}} [S_1(\vartheta - n + k + k_3 - 1, \vartheta - n + k + k_3 - 1)]^{\frac{\beta_2}{\beta_4}} = \infty,$$
(48)

then (1) is oscillatory.

Corollary 3.4.Let  $1 \ge \beta_4$ , suppose that(i)-(iii), (12) and (22) hold. Assume  $\lim_{\vartheta \to \infty} s(\vartheta) = 0$  where  $S(\vartheta) = -(\beta_4 s_4(\vartheta))^{\frac{-1}{\beta_4}}$ (49)

Let  $\theta_0, \theta_1, \theta_2 \in (0,1)$ . If (24)-(27) are oscillatory, then so (1).

Corollary 3.5.Let  $1 \ge \beta_4$ . Assume that(i)-(iii), (2),(22) and (49) hold. Let  $\theta_0, \theta_1, \theta_2 \in (0,1)$ . if (24), (25) and (44) are oscillatory then (1) is oscillatory.

Corollary 3.6. Let  $1 \ge \beta_4$  and  $\beta_3 \ge \beta_1 \ge \frac{\beta_2}{\beta_4}$ . Assume that(i)-(iii), (2),(22) and (49) hold. Let  $\theta_0$ ,  $\theta_1$ ,  $\theta_2 \in (0,1)$ . if (45)-(48) hold then (1) is oscillatory.

### Examples

Example 4.1. We look at the equation  

$$\Delta \left( (\vartheta + 2)^3 \left( \Delta^3 \left( y(\vartheta) - \frac{1}{\vartheta} y^{\frac{1}{3}}(\vartheta - 1) \right) = \vartheta^2 y(\vartheta - 3) + (\vartheta + 3)^4 y^3(\vartheta + 6) \right)$$
(50)  
Now (50) is in the form (1) where  $\beta_1 = \beta_3 = 3$ ,  $\beta_2 = 1$ ,  $\beta_4 = \frac{1}{3}k = 1$ ,  $n = 4$ ,  
 $n^* = 6$ ,  $s_1(\vartheta) = (\vartheta + 2)^3$ ,  $s_2(\vartheta) = \vartheta^2$ ,  $s_3(\vartheta) = (\vartheta + 3)^4$ ,  $s_4(\vartheta) = \frac{1}{\vartheta}$ .

Then (i)-(iii) are fulfilled and so is (2), because

$$S_1(b,a) = \sum_{\varrho=a}^{b-1} \left(\frac{1}{s_1(\varrho)}\right)^{\frac{1}{3}} = \sum_{\varrho=a}^{b-1} \frac{1}{t+2} = \sum_{\varrho=a+2}^{b} \frac{1}{t} \to \infty$$

Now, (see Note 2.4)  $k_0 = k_1 = k_2 = 1$  and  $k_3 = 2$ . And thus (22) is fulfilled and we get,  $\vartheta + n^* - 3k_0 = \vartheta + 3$  $\vartheta - n + k_1 - 2 = \vartheta - n + k - 2 = \vartheta - 5$ 

$$\begin{split} \vartheta - n + k_1 - 2 &= \vartheta - n + k - 2 = \vartheta - \\ \vartheta - n + k + k_3 &= \vartheta - 3, \end{split}$$

Furthermore,  $\beta_4 < 1$  and  $\beta_2 < \beta_1 = \beta_3$ . So by corollory 3.3, we choose  $s = s_4$  then

$$g_{1}(\vartheta) = \frac{2}{3} \left(\frac{1}{3}\right)^{\frac{1}{2}} (s(\vartheta))^{\frac{-1}{2}} (s_{4}(\vartheta))^{\frac{3}{2}}$$
$$= \frac{2}{3} \left(\frac{1}{3}\right)^{\frac{1}{2}} \left(\frac{1}{\vartheta}\right)^{\frac{-1}{2}} \left(\frac{1}{\vartheta}\right)^{\frac{3}{2}}$$
$$= \frac{2}{3\sqrt{3}} \left(\frac{1}{\vartheta}\right) \to 0 \text{ as } \vartheta \to \infty.$$

And so (23) is fulfilled. We also compute

### Kaleeswari and Buvanasankari

$$\begin{split} & \sum_{\varrho=\vartheta-k_0}^{\vartheta-1} \left( \sum_{r=t-k_0}^{\varrho-1} \left( \frac{1}{s_1(\varrho)} \sum_{\xi=r-k_0}^{r-1} s_3(\xi) \right)^{\frac{1}{\beta_1}} \right) = \left( \frac{s_3(\vartheta-3)}{s_1(\vartheta-1)} \right)^{\frac{1}{3}} = \vartheta^{\frac{1}{3}} \\ & s_2(\vartheta)(\vartheta-n+1)^{\beta_2}(\vartheta-n)^{\beta_2} S_1[\vartheta-n+k_1-1,\vartheta-n-1]^{\beta_2} = \vartheta^2(\vartheta-4) \\ & \quad \frac{s_2(\vartheta)}{s_4^{\frac{\beta}{\beta_4}}(\vartheta-n+k+1)} \left[ \sum_{\varrho=\vartheta_1}^{\vartheta-n+k} \left( \sum_{r=t_1}^{t-n+k} S_1(r,\vartheta_1) \right) \right]^{\frac{\beta_2}{\beta_4}} = \frac{\vartheta^2 \left( 1-\frac{2}{\vartheta} \right)^3}{\left( 1-\frac{4}{\vartheta} \right)^3} \\ & \text{and} \end{split}$$

$$\frac{s_2(\vartheta)}{s_4^{\frac{\beta_2}{\beta_4}}(\vartheta - n + k + 1)} (k_2 c \theta_0)^{\frac{\beta_2}{\beta_4}} [S_1(\vartheta - n + k + k_3 - 1, \vartheta - n + k + k_3 - 1)]^{\frac{\beta_2}{\beta_4}} = \frac{\vartheta^2 \left(1 - \frac{2}{\vartheta}\right)^3}{\left(1 - \frac{1}{\vartheta}\right)^3}$$

Hence (45)-(48) hold. Now that all of corollary 3.3's criteria have been fulfilled, Equation (50) is oscillatory Example 4.2. The equations are considered

$$\Delta\left((\vartheta+2)^3\left(\Delta^3\left(y(\vartheta)-\vartheta y^{\frac{1}{3}}(\vartheta-1)\right)=\vartheta^2 y(\vartheta-3)+(\vartheta+3)^4 y^3(\vartheta+6)\right)$$
Now (51) is in the form (1) where  $\beta_1=\beta_2=3, \beta_2=1, \beta_4=\frac{1}{2}$ 
(51)

Now (51) is in the form (1) where  $p_1 = p_3 = 5, p_2 = 1, p_4 = \frac{1}{3}$   $k = 1, n = 4, n^* = 6, s_1(\vartheta) = (\vartheta + 2)^3, s_2(\vartheta) = \vartheta^2, s_3(\vartheta) = (\vartheta + 3)^4, s_4(\vartheta) = l$ . Furthermore, we have  $1 \ge \beta_4$  and  $\beta_3 = \beta_1 \ge \frac{\beta_2}{\beta_4}$  from corollary 3.6.

We compute  $S(\vartheta) = -(\beta_4 s_4(\vartheta))^{-3} = -\left(\frac{\vartheta}{\vartheta}\right)^{-3} = -\left(\frac{\vartheta}{\vartheta}\right)^3 \to 0$ , as  $l \to \infty$  and so (49) is fulfilled because all of the other constraints of corollary 3.6 are satisfied in the same sense as in Example 4.1, (51) is oscillatory

### ABSTRACT

Low Back Pain is the most appropriate form of musculoskeletal disorder. It is described as discomfort or pain detected in the area from the 12th rib down to the gluteal area. It acts on annually 5-10% of the adult population. Mechanical low back pain (MLBP) is a major cause of illness and disability, especially in people of working age. Only 39 – 76% of the patients obtain absolute recovery. The study aims to check the effectiveness of back school protocol versus muscle energy technique in patients with chronic mechanical low back pain. 38 patients complaining of chronic mechanical low back pain have participated in the study on the basis of inclusion criteria. Patients were randomly assigned into two equal groups. Group A received Muscle Energy Technique, Group B received Back School Protocol. Both groups underwent a common conventional treatment plan. Treatment was given three times per week for four consecutive weeks. Patients were assessed before and at the end of four weeks by using a numeric pain rating scale (NPRS), Modified Oswestry Disability Low Back Pain Questionnaire (MODQ), Modified - Modified Schober Test (MMST) to assess the intensity of pain, functional disability, and lumbar range of motion. There was a significant decrease in pain, functional disability, and an increase in lumbar range of motion in both groups. Group A showed more improvement post-treatment. The muscle energy technique is more effective compared to the Back School protocol in terms of pain reduction and range of motion whereas Back School is more effective on functional disability in patients with chronic mechanical low back pain (CMLBP).

Keywords : Chronic, Mechanical, Low Back Pain, Muscle Energy Technique, Back School Protocol

### INTRODUCTION

Low Back Pain is a very usual condition that occurs due to problems in the muscle and skeletal system [1]. It is described as tenderness and aches detected between the lower ribs and gluteal area. It follows up on every year 5 -10% of the grown-up populace, with a larger part of 60% to 90% over a long period. By the age of 30, half of the nation will have had a notable episode of Low backache. [2]. only 39 – 76% of the patients obtain absolute recovery [1]. Chronic low backache is the torment that continues the healing time higher than anticipated, spanning moreover three months. [3]. Frequency of recent and long term LBP in grown-up doubled in the last ten years and continues to increase dramatically in the aging population, influencing men and women overall cultural groups. LBP remarkably affects utilitarian limit, as agony confines word-related exercises and is a significant reason for delinquency. Its financial burden is indicated directly by high healthcare expenses and indirectly by lower productivity. [4]. Mechanical low back pain (MLBP) is still an essential health hazard and a major cause of incapacity in people under the age of 65, so in most cases, there really is no clear underlying pathology. [5]. It comprises unspecific lumbar column damage that could be linked to other causes of lumbar pain. [6]. Mechanical pain results from risky things to do, similar to unfortunate posture, ineffectively planned to seat, and erroneous bowing and lifting movements. There are a few elements incurring mechanical low back torment, as unreasonable masses to typical spinal designs. Posture, body mechanics, trunk strength, and flexibility, as well as the strength of the pelvic arch and lower limbs muscles, all determine the loads conveyed to the spine. [5]. It appears that muscle weakness is associated with MLBP [7]. Mohammad Reza Nourbakhsh et.al, expressed that diminished back extensor muscle endurance is a significant element in ongoing LBP.

The Back School is a conservative form of therapeutic intervention in the management of mechanical low back pain (MLBP) [8]. The Back School method was developed in 1969 in Sweden by Mariane Zachrisson Forssel, with the goal of preventing and avoiding recurrent episodes of low back pain [9]. In later years it became known as the Swedish Back School [10]. The etiological aspects of low back pain, such as biomechanical stress and increased intradiscal pressure, were the basis for the development of the program, which focused primarily on an educational approach to the ergonomic elements related to pain [10]. Modern back schools have advanced into other areas today - of not only managing the pain but also preventing injury to the back that can precipitate back pain [8]. This intervention module was originally developed as an education and training program and involves exercise monitored by a physiotherapist or physician [11]. Common topics of the educational component of the Back School Program include the anatomy of the spine, theories of the etiology of LBP, the function of the backbone, ergonomics, exercise, complications of back pain, and changing unpleasant beliefs about back pain [11]. A practical component that consists of exercise for the maintenance of a healthy back [6].

Muscle Energy Technique is a non-invasive, safe, and inexpensive treatment technique commonly used by physiotherapists, chiropractors, and manual therapists in the treatment of MLBP [12]. This manual therapy technique was founded by Dr. Fred L. Mitchell Sr., who was an osteopathic physician [13]. MET is a versatile technique traditionally used to address different types of muscular strain, pain in different regions, local edema, and joint dysfunction and also improve range of motion (ROM), relieve muscle tension, and increase the strength of the muscle [14]. Muscle energy technique (MET) is a common traditional treatment for spine disease. It is the most popular therapeutic modality aimed at the improvement of elasticity in contractile and non – contractile tissues [1]. This procedure "involves the contraction done by the patient's voluntary group of muscles in a very particular and controlled direction, at varying levels of intensity, against a clearly executed counterforce applied by the therapist [13]. Its plan of action is based on a form for using low amplitude muscular contractions against obstruction in the hopes of affecting both type of static and dynamic posture and vascular dissemination. Isometric constriction principally decreases the tone present in a hypertonic muscle and restores its ordinary resting length by use of reciprocal inhibition. [2]

### METHODS AND MATERIALS

A comparative study was carried out at Sainath Hospital. Ethical clearance was taken from ethical committee of Sainath hospital. 38 subjects with chronic mechanical low back pain were taken in the study according to inclusion criteria. They were divided into two groups, 19 in each group. Group A were treated with Muscle Energy Technique along with conventional physiotherapy. Group B were treated with Back School Protocol along with conventional physiotherapy. The inclusion criteria are: (a) Mechanical backache discovered by a registered medical practitioner. (b) At very least 3 months, patient must have chronic mechanical low back pain without peripheral irradiation. (c) Subjects who have pain scores in between 2 to 6 on the NPRS. (d) Age: 18 to 40 years. Exclusion criteria are: (a) Subjects who have gone through past a medical procedure, who had underlying peculiarities, History of spinal fracture, spinal cord pressure, extreme instability, serious osteoporosis. (b) History of any provocative spinal disease (c) Disc prolapsed or Spondylolisthesis (d) Congenital musculoskeletal deformity (e) Any cardiovascular diseases (f) Abnormal neurological signs in the lower extremity and psychosomatic diseases. Outcome measures of present study are The numeric pain rating scale (NPRS), Modified Oswestry Disability Low Back Pain Questionnaire(MODQ), Modified - Modified Schober Test(MMST).

The numeric pain rating scale (NPRS) is 11 point measure of pain in which patient is asked to rate their pain. It is ranging from 0 indicated as no pain at all to 10 which indicates the worst imaginable pain[15]. Modified Oswestry Disability Low Back Pain Questionnaire(MODQ) is intended to give data about how a patient's low back and leg pain is meaning for his/her regular routine. The questionnaire comprises of 10 things tending to various parts of functions. Each item is scored from 0 to 5, with higher values addressing more noteworthy disabilities. The patient is approached to finish up the questionnaire according to his/her uneasiness in day-by-day exercises[16]. Modified - Modified Schober Test (MMST)

Flexion measurement: - The patients were told to take off their shoes, uncovering their back from gluteal fold to mid-thoracic spine with left and right PSIS completely uncovered. The specialist recognized both the PSIS with her thumb and check a midline point on the sacrum (inferior mark). Then, at that point, the superior mark was set apart on the lumbar spine 15 cm over the sacral mark. The measure tape was kept solidly against the skin and asked to "Bend forward as far as you can while keeping the knee straight". The ROM was the contrast between 15 cm and length estimated toward the end of the movement. Extension measurement: - The patients position and markers were same as flexion. Therapist instruct to "Put the palms of your hands on your butt cheek and bend in reverse to the furthest extent that you would be able". The distance between superior and inferior marks was measured[17].

Group A was treated with Muscle energy technique along with conventional exercises.MET applied for the muscles given below, MET has been used as a post-isometric relaxation treatment. The subjects were instructed to make a contraction of roughly 20 - 30 percent of their most extreme deliberate isometric contraction, hold it around 7-10s, then release around 2-3s after they had sensed the limiting boundary. Proper breathing instructions were given to the patient and afterwards on exhalation the extremity was taken somewhat a long way from the limitation barrier and held on that point around 10-30s, It was completed 3 times per meeting for 12 sessions[18].

Iliopsoas MET: - Patient position - prone lying with a headrest placed under the abdomen area for reduction in lumbar curve. Therapist position - standing on opposite side of the side of muscle which was treated, the table-side hand supporting the thigh. The another one hand was set with the goal that the heel point of the hand was put on the sacrum. Pressure is applied towards the floor, to keep up with pelvic stability. Instructions - The patient was asked to bring his thigh towards table against the therapist's resistance. Patients use 15-25% of him/her maximum voluntary contraction. Hold around 7 to 10s [8].

Hamstring muscles MET: - Patient position- supine lying with treatment leg hanging over the therapist's shoulder. Therapist position- One hand placed on non-treated limb's front distal portion of the thigh, while the other was placed on the treated limb's front distal part of the thigh, simply over the knee, to keep the knee in an

### Upasti Panchal et al.,

extention.Instructions- patient's hip was passively flexed and the leg extended until tension. The patient was asked to do moderate knee flexion with isometric contraction. Pressing his ankle joint against the therapist's shoulder, followed by relaxation, on and then leg was passively stretched by the therapist up to the tolerance to stretch and hold for 30 seconds[18].

Quadratus lumborum MET: - Patient position- side-lying with the uppermost arm stretched out over the head tightly to hold the edge of the table. Therapist position- Standing behind side-lying patient at the waist level. Instructions- the patient was asked to abduct the uppermost leg around 30° on exhalation. The therapist palpated strong quadratus activity. The patient holds the leg isometrically and gravity gives resistance from the leg. Following 10 second constriction, the patient was approached to hang his leg marginally behind him at the back of the table. The advisor supports the pelvis with two hands with fingers interlocked over the iliac crest moves the pelvis away from the lower ribs on exhalation. The stretch should grasp for 10 to 30 seconds[8].

Erector spine MET: - Patient position- seated on the treatment table his back in the direction of the therapist. Therapist position- Therapist pass his one hand in patent's axilla, across the neck on the side which the patient was rotated. Another hand was placed on the contralateral shoulder. Instructions - Patient was asked to do flexion, side bending, and rotation and that time taken to the comfortable limit of forward bending. patient was asked to hold his breath around 7 to 10s and stare in the direction from whence he rotated before exhaling. On the full exhalation, the patient was again taken to the new restriction[18].

Group-B was treated with Back School Protocol along with conventional therapy. In Back School protocol group patients have given three treatment meetings per week, each lasting 45 minutes to an hour. The program was divided based on educational and practical sessions[6].

THEORY SESSION: General information, history, and methods of back school protocol, Pathology; Anatomy and biomechanical ideas of the spine, The effect of muscle functions on the spine, Etiopathogenesis of the most common conditions that have a detrimental impact on the back, Treatment techniques that are most commonly used, Mechanical forces in varied back movements are inconsistent; relaxation stance, Instructions for sitting and standing positions.

PRACTICAL EXERCISES: Diaphragmatic breathing exercise. (10 reps. In 1set);Stretching of erector spinae muscle, Hamstrings, Calf, and Quadriceps muscles. (30 seconds, repeat 10 times); Pelvic tilting exercise. (10 reps. In 1 set);The abdominal musculature is strengthened. (1 set of 10 repetitions)

CONVENTIONAL PROTOCOL: Infrared radiation, Ultrasonic, Therapeutic exercise program in type of Finger to toes, Bridging exercise, Back expansion from prone, Sit-up work out, Knee to chest work out, Lower back muscle stretching.

### RESULT

A comparative study was done on 38 chronic mechanical low back pain patients aged between 18 to 40 years. The subjects were randomly divided into two groups and an Independent t-test was used to check the pre and post-treatment effects. Graph-1 shows the mean pre-post data of Group-A. Graph-2 shows the mean values of Group-B pre-post data. Table-1 shows Group A and Group B pre and post-mean of Numeric Pain Rating Scale (NPRS), Modified Oswestry Disability Low Back Pain Questionnaire(MODQ), Modified - Modified Schober Test (MMST). The result shows significant improvement in all the outcome measures in both the groups but group-A showed more significant improvement in pain and range of motion whereas Group-B showed more significant improvement in functional disability.

Upasti Panchal et al.,

### DISCUSSION

The present study compared muscle energy technique and back school protocol. The result of both interventions was investigated and both the groups proved to be effective in the management of chronic mechanical low back pain (CMLBP). The result of this study showed that the two groups were huge in diminishing pain and increasing lumbar flexion and expansion range of motion post-treatment, particularly in group A which is MET. There was a huge improvement in functional ability in both the groups after-treatment, particularly in group B which is back school protocol. Marzouk A. Ellythy[1] et al.; studied and one group got a muscle energy procedure and the other group got Strain Counter Strain treatment for 4weeks. Pain intensity, lumber movements, and functional disability index were taken as outcome measures and In individuals with chronic low back pain, both the MET and SCS approaches were proved to be efficient in lowering pain and functional capability. The diminution in pain caused by the muscular energy approach can be explained by Chaitow'sneurophysiology[19]. He characterized post isometric relaxation (PIR) as the fall in a tone of the agonist's muscle following an isometric contraction. Stretch receptors in the agonist muscle's Golgi tendon cause this to happen. The muscle contraction is inhibited by these receptors which react to overstretching of the muscle. The Golgi tendon organ is triggered by the equal counterforce of a strong agonist muscle contraction. From the Golgi tendon, The afferent nerve impulse travels to the dorsal base of the spinal cord, where it connects to an inhibitory motor neuron. Reestablishing the full stretch length of the muscles reduces the increase in pressure on the afflicted muscles, as well as the pain and dysfunction that follows.

Usman Abba Ahmed et al.; did a scoping review to efficiently assess writing and guide the current The MET technique is a worthwhile and safe intervention that can be beneficial as an independent treatment plan for patients with chronic MLBP, according to a demonstration of its viability and assessment of the retrieved articles. It has the potential to give numerous physical and psychosocial well-being [12]. According to MANIGANDAN S R V (2018), et al., the Muscle energy approach provides an analgesic effect that is understood from both spinal and supraspinal mechanisms. During an isometric contraction, both musculature and joint mechanoreceptors are triggered. This generates sympathoexcitation elicited by somatic efferents, as well as localized initiation of the periaqueductal grey, which helps to minimize pain regulation. Due to mechanoreceptor stimulation, nociceptive inhibition occurs in the dorsal horn of the spinal cord, where synchronized gating of nociceptive impulses occurs [20].

In the present study, a significant reduction in functional disability score was reported after 4 weeks of intervention. Between the two groups, the comparison Back School group showed more reduction in MODQ. This finding supports the finding by Frost [34] et al and Heymans [35] et al that back care education caused improvement in function among patients with nonspecific LBP. According to Snook [36] et al, reduction in pain also led to a reduction in disability status among patients with chronic non-specific LBP.

Bahar SADEGHI-ABDOLLAHI (2012) et al.; studied the efficacy of back school protocol in chronic low back pain in workers. He also stated that BS aims to strengthen the musculature that protects the lumbar spine and discs from excessive stress, as well as to teach the best posture for specific job postures and demonstrate how to lift and push large objects. On top of all, BS is aimed to help people to manage their back pain, by showing them the mechanism of the disease, or whenever they get an inadvertent attack [21]. Andrade et al.; assessed the viability of the Back School Program for a non-specific base. Based on investigation they remark statistically significant differences in functional disability and spinal mobility [22].

### CONCLUSION

The muscle energy technique is more effective compared to the Back School protocol in terms of pain reduction and range of motion whereas Back School is more effective on functional disability in patients with chronic mechanical low back pain (CMLBP).

### Upasti Panchal et al.,

**FUTURE RECOMMENDATION OF THE STUDY:** A larger sample size should be taken, Follow up should be done for a longer period, Further research should be done with different clinical arms.

### ABSTRACT

We first state lemma concerning bounded linear operator and its inverse and also state Schauder's fixed point theorem. We then define weakly coupled lower and upper solution for anti-periodic boundary value problem of first order delay differential equation of the type,  $w'(x) + \theta w(x) = g(x, w(x - k))$ . We also provide with the definition of solution for this problem. Then, using stated lemma and Schauder's fixed point theorem we prove that there exists a solution between weakly coupled lower and upper solution. We assume that 'g' to be a non-decreasing function in the second coordinate.

Keywords: lemma, operator, boundary, solution

### INTRODUCTION

There are many real world problems in Economics, Biological systems, Physical models and many more involve the study of boundary value problems(BVPs) for differential equations with deviating arguments(DEDA). Thus, it is natural question to ask about existence of solution to such problems. One may refer to ([4], [5])for the existence theory of ordinary differential equations(ODE) as well as delay differential equations(DDE). In proving many existence results in ordinary differential equations, partial differential equations, integral equations and differential equations with deviating arguments, one may seek help of the fixed point theory, which is dealt in [10]. Methods of existence of solutions between lower and upper solutions for BVP of first order ODEs are discussed in ([6], [7], [11], [14]) and for BVP of first order DDEs are discussed in ([1], [2], [3], [8], [9], [12], [13], [15]).

### Heramb Aiya and Valaulikar

We seek for a solution to Anti-Periodic Boundary Value Problem (APBVP) of First Order Delay Differential Equation (FODDE) between the weakly coupled lower and upper solution by making use of Schauder's fixed point theorem. Let  $\theta > 0$ , T > 0, I = [0, T],  $0 < k \le T$  and  $g : I \times \Box \rightarrow \Box$  be continuous. Then, the APBVP for FODDE, under study, has the form

 $w'(x) + \theta w(x) = g(x, w(x-k)), x \in I_{(1.1)}$ w(x) = w(0), x \in [-k, 0]\_{(1.2)} w(0) = -w(T)\_{.(1.3)}

We denote **A** to be the set of all functions defined and continuouson [-k, T] and continuously differentiable on [0, T]. Let  $\mathbf{B} = \{ u \in A : u(x) = u(0), \forall x \in [-k, 0] \}$  and

 $E = \{ u \in A : u(x) = 0, \forall x \in [-k, 0] \}.$  The norm on **A** is defined to be,

$$\| u \|_{\infty} = \sup_{x \in [-k, T]} |u(x)| + \sup_{x \in [0, T]} |u'(x)|, \forall u \in A.$$

Then,  $(\mathbf{A}, \|.\|_{\infty})$ ,  $(\mathbf{B}, \|.\|_{\infty})$ ,  $(\mathbf{E}, \|.\|_{\infty})$  are Banach spaces.

The norm on  $E \times \square$  is given to be,  $\|(u, \xi)\|_* = \|u\|_{\infty} + |\xi|, \forall (u, \xi) \in E \times \square$ .

So we may say that  $(E \times \Box, \|.\|_*)$  is also a Banach space. Let  $S:B \to E \times \Box$  be a linear operator. Then the operator norm of 'S' is given by,

$$\|\mathbf{S}\| = \sup_{\|\mathbf{y}\|_{\infty}=1} \|\mathbf{S}\mathbf{y}\|_{*}.$$

Below is the Schauder's Fixed point theorem defined without giving the proof.

Schauder's Fixed Point Theorem[10]:Consider a normed linear space 'X' and  $N: X \rightarrow X$  be such that 'N' is continuous and compact map. If 'N(X)' is bounded, then 'N' admits a fixed point.

Next, we state the following Lemma's in order to prove existence result for a solution betweenweakly coupled lower and upper solution.

**Lemma 1.1.**Let  $S: B \rightarrow E \times \Box$  be an operator defined by S[w(x)] = (u(x), w(0)), where

$$u(x) = \begin{cases} 0; & -k \le x \le 0 \\ w(x) - w(0) + \int_{0}^{x} w(t) dt; & 0 \le x \le T. \end{cases}$$

Then, (1)  $S:B \rightarrow E \times \Box$  is a continuous linear operator.

(2)  $S^{-1}: E \times \Box \rightarrow B$  exists and it is defined by

### Heramb Aiya and Valaulikar

$$L^{-1}[u(x)] = \begin{cases} \gamma; & -k \le x \le 0 \\ \gamma e^{\theta x} + \int_0^x e^{-\theta(x-t)} u'(t) dt; \ 0 \le x \le T. \end{cases}$$

(3)  $S^{-1}: E \times \Box \rightarrow B$  is a continuous linear operator.

**Lemma 1.2.** Let  $g, p:I \times \Box \rightarrow \Box$  be continuous and  $N:B \rightarrow E \times \Box$  be defined by N[w(x)] = (v(x), -p(T, w(T))), where

$$\mathbf{v}(\mathbf{x}) = \begin{cases} 0; & -\mathbf{k} \le \mathbf{x} \le \mathbf{0} \\ \int_{0}^{\mathbf{x}} \mathbf{g}(t, \mathbf{w}(t-r)dt; \ \mathbf{0} \le \mathbf{x} \le \mathbf{T}. \end{cases}$$

Then,  $N: B \rightarrow E \times \square$  is continuous and compact.

## Weakly Coupled Lower and Upper Solutions for Anti-periodic Boundary Value Problem of First Order Delay Differential Equation

We begin first by giving the definition of solution to FODDE (1.1) and (1.2) along with the definition of solution for APBVP (1.1) - (1.3). We move on to define lower and upper solutions for the FODDE (1.1) and (1.2). Then, we define strict lower and upper solution for FODDE (1.1) and (1.2) to prove that under certain conditions on function 'g', the lower solution is less than or equal to the upper solution. We further, define weakly coupled lower and upper solution for the APBVP to obtain existence of solution between weakly coupled lower and upper solution. Also, the definitions of strict weakly coupled lower and upper solution for the APBVP are given to obtain existence of solution strictly between strict weakly coupled lower and upper solution.

**Definition 2.1.** A function  $v \in A$  is said to be a solution of APBVP (1.1) - (1.3) if

1. 
$$v'(x) + \theta v(x) = g(x, v(x - k)), x \in I$$
,

2.  $v(x) = v(0), x \in [-k, 0],$ 

3. 
$$v(0) = v(T)$$
.

**Definition 2.2.** A function  $v \in A$  is said to be a solution of FODDE (1.1) and (1.3) if 1.  $v'(x) + \theta v(x) = g(x, v(x - k)), x \in I$ , 2.  $v(x) = v(0), x \in [-k, 0]$ .

**Definition 2.3.** A function  $\rho \in A$  is said to be a lower solution of FODDE (1.1) and (1.2) if

1. 
$$\rho'(\mathbf{x}) + \theta \rho(\mathbf{x}) \le g(\mathbf{x}, \rho(\mathbf{x} - \mathbf{k})), \mathbf{x} \in \mathbf{I},$$
  
2.  $\rho(\mathbf{x}) \le \rho(0), \mathbf{x} \in [-\mathbf{k}, 0].$ 

A function  $\sigma \in A$  is said to be an upper solution of FODDE (1.1) and (1.2) if he above inequalities are reversed.

**Definition 2.4.** A function  $\rho \in A$  is called a strict lower solution of FODDE (1.1) and (1.2) if 1.  $\rho'(x) + \theta \rho(x) < g(x, \rho(x - r)), x \in I,$ 2.  $\rho(x) \le \rho(0), x \in [-k, 0].$ 

### Heramb Aiya and Valaulikar

**Definition 2.5.** A function  $\sigma \in A$  is called a strict upper solution of FODDE (1.1) and (1.2) if 1.  $\sigma'(x) + \theta \sigma(x) > g(x, \sigma(x - k)), x \in I,$ 2.  $\sigma(x) \ge \sigma(0), x \in [-k, 0].$ 

**Definition 2.6.** A pair of functions  $\rho, \sigma \in A$  are called weakly coupled lower and upper solution of APBVP (1.1) - (1.3) if

1.  $\rho'(x) + \theta \rho(x) \le g(x, \rho(x - k)), x \in I,$ 2.  $\sigma'(x) + \theta \sigma(x) \ge g(x, \sigma(x - k)), x \in I,$ 3.  $\rho(x) \le \rho(0), x \in [-k, 0],$ 4.  $\sigma(x) \ge \sigma(0), x \in [-k, 0],$ 5.  $\rho(x) \le \sigma(x), x \in [-k, T],$ 6.  $\rho(0) \le -\sigma(T), x \in [-k, 0],$ 7.  $\sigma(0) \ge -\rho(T), x \in [-k, 0].$ 

**Definition 2.7.** A pair of coupled lower and upper solutions  $\rho$ ,  $\sigma \in \text{Aof APBVP (1.1)}$  - (1.3) are called strict weakly coupled lower and upper solutions of APBVP (1.1) - (1.3) if 1.  $\rho'(x) + \theta \rho(x) \le g(x, \rho(x - k)), x \in I$ , 2.  $\sigma'(x) + \theta \sigma(x) > g(x, \sigma(x - k)), x \in I$ .

**Theorem 2.1.** Let  $g: I \times \Box \to \Box$  be continuous and  $g(x, u) \le g(x, v)$ ,  $\forall (x, u), (x, v) \in I \times \Box$  such that  $u \le v$ . Let  $\rho \in B$  be a strict lower solution of FODDE (1.1) and (1.2). Let  $\sigma \in B$  be an upper solution of FODDE (1.1) and (1.2). Then,  $\rho(0) \le \sigma(0)$  implies  $\rho(x) \le \sigma(x)$ ,  $\forall x \in [-k, 0]$  and  $\rho(x) < \sigma(x)$ ,  $\forall x \in (0, T]$ .

**Proof.** It is given that  $\rho(0) \le \sigma(0)$ . Therefore,  $\rho(x) \le \sigma(x), \forall x \in [-k, 0]$ .

Therefore, it is sufficient to prove that  $\rho(x) < \sigma(x), \forall x \in (0, T]$ .

On the contrary, assume that  $\exists x_0 \in (0,T]$  such that  $\rho(x) < \sigma(x)$ ,  $\forall x \in (0, x_0)$  and  $\rho(x_0) = \sigma(x_0)$ . Therefore,  $\sigma'(x_0) \le \rho'(x_0)$ . This gives,  $g(x_0, \sigma(x_0 - k)) < g(x_0, \rho(x_0 - k))$ .

<u>CASE-1</u>: Let  $0 < x_0 \le k$ . Therefore,  $-k < x_0 - k \le 0$ . So, we have  $\rho(x_0 - k) \le \sigma(x_0 - k)$ . As 'g' is non-decreasing in the second co-ordinate, we have  $g(x_0, \rho(x_0 - k)) \le g(x_0, \sigma(x_0 - k))$ , which leads to a contradiction.

CASE<u>-2</u>: Let  $k < x_0 \leq T$ .

### Heramb Aiya and Valaulikar

So, we have  $\rho(x_0 - k) \leq \sigma(x_0 - k)$ . As 'g' is non-decreasing in the second co-ordinate, we have  $g(x_0, \rho(x_0 - k)) \leq g(x_0, \sigma(x_0 - k))$ , which leads to a contradiction.

Thus,  $\rho(\mathbf{x}) < \sigma(\mathbf{x}), \forall \mathbf{x} \in (0, T]$ . Hence,  $\rho(\mathbf{x}) \le \sigma(\mathbf{x}), \forall \mathbf{x} \in [-k, 0]$  and  $\rho(\mathbf{x}) < \sigma(\mathbf{x}), \forall \mathbf{x} \in (0, T]$ .

**Theorem 2.2.** Let  $g: I \times \Box \to \Box$  be continuous and  $g(x, u) \le g(x, v)$ ,  $\forall (x, u), (x, v) \in I \times \Box$  such that  $u \le v$ . Let  $\rho \in B$  be a lower solution of FODDE (1.1) and (1.2). Let  $\sigma \in B$  be a strict upper solution of FODDE (1.1) and (1.2). Then,  $\rho(0) \le \sigma(0)$  implies  $\rho(x) \le \sigma(x)$ ,  $\forall x \in [-k, 0]$  and  $\rho(x) < \sigma(x), \forall x \in (0, T]$ . **Proof.** Similar to the proof of theorem 2.1.

We are now ready to prove the existence theorem for solution between weakly coupled lower and upper solution for the given APBVP.

**Theorem 2.3.** Let  $g:I \times \Box \to \Box$  be continuous and  $g(x, u) \le g(x, v)$ ,  $\forall (x, u), (x, v) \in I \times \Box$  such that  $u \le v$ . Let  $\rho$ ,  $\sigma \in B$  be weakly coupled lower and upper solution of APBVP (1.1) - (1.3). Then, the APBVP (1.1) - (1.3) has at least one solution  $W \in B$  such that  $\rho(x) \le w(x) \le \sigma(x)$ ,  $\forall x \in [-k, T]$ .

**Proof.**Let  $p: I \times \Box \to \Box$  be defined by,  $p(x, u) = \max\{ \rho(X), \min\{u, \sigma(X)\}\}, \forall (x, u) \in I \times \Box$ . Then,  $\rho(X) \le p(X, u) \le \sigma(X), \forall (x, u) \in I \times \Box$ . Also,  $p: I \times \Box \to \Box$  is continuous and bounded.

Let  $G^*: I \times \Box \to \Box$  be defined by,

$$G^*(x, w) = \begin{cases} g(x, \rho(x-k)); & w \le \rho(x-k), \\ g(x, w); & \rho(x-k) \le w \le \sigma(x-k), \\ g(x, \sigma(x-k)); & \sigma(x-k) \le w. \end{cases}$$

Therefore,  $G^*:I \times \Box \to \Box$  is continuous and bounded.

Let  $S: B \rightarrow E \times \square$  be defined as in Lemma 1.1.

Therefore,  $S:B \rightarrow E \times \square$  is linear, continuous and bijective.

Also,  $S^{-1}: E \times \Box \rightarrow B$  exists and is defined as in Lemma 1.1.

Further,  $S^{-1}: E \times \Box \rightarrow B$  is also continuous.

Let  $N: B \rightarrow E \times \square$  be defined as in Lemma 1.2.

### Heramb Aiya and Valaulikar

Let  $J=S^{-1} N: B \rightarrow B$ . Then,

$$J[w(x)] = \begin{cases} -p(T, w(T)); & -k \le x \le 0\\ -p(T, w(T))e^{-\theta x} + \int_{0}^{x} e^{-\theta(x-t)}F^{*}(t, w(t-k)dt; \ 0 \le x \le T. \end{cases}$$

A fixed point of  $J: B \rightarrow B$  is a solution of

$$\begin{split} &w'(x) + \theta w(x) = F^*(x, w(x-k)), \ x \in I_{(2.1)} \\ &w(x) = w(0), \ x \in [-k, 0] \\ &w(0) = -p(T, w(T)). \\ (2.2) \end{split}$$

Also,  $J: B \rightarrow B$  compact and continuous.

Further, 'p' and 'G'' are bounded implies that **J**(**B**) is a bounded subset of  $(\mathbf{B}, ||.||_{\infty})$ .

So, by applying the Schauder's fixed point theorem,  $J:B \rightarrow B$  has a fixed point  $w \in B$ . Therefore, 'w' is a solution of (2.1), (1.2) and (2.2).

We show that  $\rho(\mathbf{x}) \leq w(\mathbf{x}) \leq \sigma(\mathbf{x}), \forall \mathbf{x} \in [-k, T].$ As  $-\sigma(0) \leq \rho(T) \leq p(T, w(T)) \leq \sigma(T) \leq -\rho(0)$ , we have  $\rho(0) \leq -p(T, w(T)) \leq \sigma(0)$ . This implies,  $\rho(0) \leq w(0) \leq \sigma(0)$ . Thus,  $\rho(\mathbf{x}) \leq w(\mathbf{x}) \leq \sigma(\mathbf{x}), \forall \mathbf{x} \in [-k, 0].$ 

Therefore, it is enough to show that  $\rho(x) \le w(x) \le \sigma(x), \forall x \in (0, T].$ 

Let  $\varepsilon > 0$  be arbitrary.

Define,  $\rho_{\varepsilon}(\mathbf{x}) = \rho(\mathbf{x}) - \varepsilon(\mathbf{x} + 2\mathbf{k}), \forall \mathbf{x} \in [-\mathbf{k}, \mathbf{T}] \text{ and } \sigma_{\varepsilon}(\mathbf{x}) = \sigma(\mathbf{x}) - \varepsilon(\mathbf{x} + 2\mathbf{k}), \forall \mathbf{x} \in [-\mathbf{k}, \mathbf{T}].$ Therefore,  $\rho_{\varepsilon}(0) < w(0) < \sigma_{\varepsilon}(0).$ 

So, we prove that  $\rho_{\varepsilon}(\mathbf{x}) < \mathbf{w}(\mathbf{x}) < \sigma_{\varepsilon}(\mathbf{x}) \forall \mathbf{x} \in (0, T].$ 

On the contrary let us assume that,  $\exists x_0 \in (0,T]$  such that  $\rho_{\varepsilon}(x) < w(x) < \sigma_{\varepsilon}(x), \forall x \in (0, x_0)$  and  $w(x_0) = \sigma_{\varepsilon}(x_0)$ .

Therefore,  $w(x_0) > \sigma(x_0)$  and  $\sigma_{\varepsilon}'(x_0) \le w'(x_0)$ .

<u>CASE-1</u>: Let  $0 < x_0 \le k$ . Therefore,  $-k < x_0 - k \le 0$ . So, we have  $\rho(x_0 - k) \le w(x_0 - k) \le \sigma(x_0 - k)$ .

64096

### Heramb Aiya and Valaulikar

Therefore,  $w'(x_0) = G^*(x_0, w(x_0 - k)) - \theta w(x_0)$   $= g(x_0, w(x_0 - k)) - \theta w(x_0)$   $\leq g(x_0, \sigma(x_0 - k)) - \theta \sigma(x_0)$   $\leq \sigma'(x_0)$  $< \sigma_{\varepsilon}'(x_0)$ , which leads to a contradiction.

<u>CASE-2</u>: Let  $k < x_0 \leq T$ .

Therefore,  $0 < x_0 - k < x_0$ . So, we have  $\rho_{\varepsilon}(x_0 - k) < w(x_0 - k) < \sigma_{\varepsilon}(x_0 - k)$ .

CASE-2.1: Let 
$$w(x_0 - k) < \rho(x_0 - k)$$
.  
Therefore,  $w'(x_0) = G^*(x_0, w(x_0 - k)) - \theta w(x_0)$   
 $= g(x_0, \rho(x_0 - k)) - \theta w(x_0)$   
 $\leq g(x_0, \sigma(x_0 - k)) - \theta \sigma(x_0)$   
 $\leq \sigma'(x_0)$   
 $< \sigma_{\varepsilon}'(x_0)$ , which leads to a contradiction.

<u>CASE-2.2</u>: Let  $\rho(\mathbf{x}_0 - \mathbf{k}) \le \mathbf{w}(\mathbf{x}_0 - \mathbf{k}) \le \sigma(\mathbf{x}_0 - \mathbf{k})$ .

Then by CASE-1 we get  $w'(x_0) < \sigma_{\varepsilon}'(x_0)$ , which leads to a contradiction.

<u>CASE-2.3</u>: Let  $w(x_0 - k) > \sigma(x_0 - k)$ . Therefore,  $w'(x_0) = G^*(x_0, w(x_0 - k)) - \theta w(x_0)$   $= g(x_0, \sigma(x_0 - k)) - \theta w(x_0)$   $< g(x_0, \sigma(x_0 - k)) - \theta \sigma(x_0)$   $\le \sigma'(x_0)$  $< \sigma_{\varepsilon}'(x_0)$ , which leads to a contradiction.

Thus, we conclude that  $\rho_{\varepsilon}(x) < w(x) < \sigma_{\varepsilon}(x), \forall x \in [0, T]$ . Taking  $\varepsilon \to 0$  we get,  $\rho(x) \le w(x) \le \sigma(x), \forall x \in [0, T]$ . This implies,  $\rho(x) \le w(x) \le \sigma(x), \forall t \in [-k, T]$ . Therefore,  $G^*(x, w(x-k)) = g(x, w(x-k)), \forall x \in I \text{ and } p(T, w(T)) = w(T)$ . Hence,  $W \in B$  is a solution of APBVP (1.1) – (1.3) such that  $\rho(x) \le w(x) \le \sigma(x), \forall x \in [-k, T]$ .

### Heramb Aiya and Valaulikar

Consider the following example to illustrate theorem 2.3.  $w'(x) + w(x) = w(x-1)+1, x \in [0, 1],$   $w(x) = w(0), x \in [-1, 0],$  w(0) = -w(1).Here, k = 1, T = 1, I = [0, 1] and  $g(x, u) = u + 1, \forall (x, u) \in I \times \Box$ . Therefore,  $g(t, w (x - 1)) = w (x - 1) + 1, \forall x \in I.$ Also, 'g' is non-decreasing in the second coordinate.

Let  $\rho:[-1,1] \rightarrow \Box$  be defined as,

$$\rho(\mathbf{x}) = \begin{cases} \frac{e^{-1}}{2} - 1; & -1 \le \mathbf{x} \le 0, \\ \\ \frac{e^{-1}}{2} - e^{-\mathbf{x}}; & 0 \le \mathbf{x} \le 1. \end{cases}$$

Therefore,  $\rho(0) = \frac{e^{-1}}{2} - 1$  and  $\rho(1) = -\frac{e^{-1}}{2}$ . Also,  $\rho'(x) + \rho(x) = \rho(x-1) + 1$ ,  $\forall x \in [0,1]$ .

Let  $\sigma:[-1,1] \rightarrow \Box$  be defined as,

$$\sigma(\mathbf{x}) = \begin{cases} \frac{e^{-1}}{2}; & -1 \le \mathbf{x} \le 0, \\\\ \frac{e^{-1}}{2} + 1 - e^{-\mathbf{x}}; & 0 \le \mathbf{x} \le 1. \end{cases}$$

Therefore,  $\sigma(0) = \frac{e^{-1}}{2}$  and  $\sigma(1) = \frac{e^{-1}}{2} - 1$ . Also,  $\sigma'(x) + \sigma(x) = \sigma(x-1) + 1$ ,  $\forall x \in [0,1]$ .

So, we can say that ho and  $\sigma$  are coupled lower and upper solution of the given APBVP.

Now, let  $y: [-1, 1] \rightarrow \Box$  be defined as,

$$y(x) = \begin{cases} \frac{e^{-1} - 1}{2} ; & -1 \le x \le 0, \\ \\ \frac{e^{-1} + 1}{2} - e^{-x} ; & 0 \le x \le 1. \end{cases}$$

Then, 'y' is a solution of given APBVP such that  $\rho(x) \le y(x) \le \sigma(x), \forall x \in [-1, 1]$ .

Next we prove the result concerning strict weakly coupled lower and upper solutions for APBVP (1.1) - (1.3).

**Theorem 2.4.** Let  $g: I \times \Box \to \Box$  be continuous and  $g(x, u) \leq g(x, v)$ ,  $\forall (x, u), (x, v) \in I \times \Box$  such that  $u \leq v$ . Let  $\rho$ ,  $\sigma \in B$  be strict weakly coupled lower and upper solution of APBVP (1.1) -(1.3). Then, the APBVP (1.1) - (1.3) has atleast one solution  $W \in B$  such that  $\rho(x) \leq w(x) \leq \sigma(x)$ ,  $\forall x \in [-k, 0]$  and  $\rho(x) < w(x) < \sigma(x)$ ,  $\forall x \in (0, T]$ .

**Proof.**Let p, G<sup>\*</sup>, S, N and J be as defined in Theorem 2.3.

So, by applying the Schauder's fixed point theorem,  $J:B \rightarrow B$  has a fixed point  $w \in B$ . Therefore, 'w' is a solution of (2.1), (1.2) and (2.2).

We show that  $\rho(x) \le w(x) \le \sigma(x), \forall x \in [-k, T].$ As  $-\sigma(0) \le \rho(T) \le p(T, w(T)) \le \sigma(T) \le -\rho(0)$ , we have  $\rho(0) \le -p(T, w(T)) \le \sigma(0)$ . This implies,  $\rho(0) \le w(0) \le \sigma(0)$ . Thus,  $\rho(x) \le w(x) \le \sigma(x), \forall x \in [-k, 0].$ 

Therefore, it is enough to show that  $\rho(x) < w(x) < \sigma(x), \forall x \in (0, T].$ 

On the contrary let us assume that,  $\exists x_0 \in (0,T]$  such that  $\rho(x) < w(x) < \sigma(x)$ ,  $\forall x \in (0, x_0)$  and  $w(x_0) = \sigma(x_0)$ . Therefore,  $\sigma'(x_0) \le w'(x_0)$ .

$$\begin{split} \underline{CASE-1}: & \text{Let } 0 < x_0 \leq k. \\ \text{This implies, } -k < x_0 - k \leq 0. \\ \text{So, we have } \rho(x_0 - k) \leq w(x_0 - k) \leq \sigma(x_0 - k). \\ \text{Therefore, } w'(x_0) = G^*(x_0, w(x_0 - k)) - \theta w(x_0) \\ &= g(x_0, w(x_0 - k)) - \theta w(x_0) \\ &\leq g(x_0, \sigma(x_0 - k)) - \theta \sigma(x_0) \\ &< \sigma'(x_0), \text{ which leads to a contradiction.} \end{split}$$

### Heramb Aiya and Valaulikar

$$\begin{split} \underline{CASE-2}: & \text{Let } k < x_0 - k \leq T. \\ \text{This implies, } 0 < x_0 - k < x_0. \\ \text{So, we have } \rho(x_0 - k) < w(x_0 - k) < \sigma(x_0 - k). \\ \text{Therefore, } w'(x_0) = G^*(x_0, w(x_0 - k)) - \theta w(x_0) \\ &= g(x_0, w(x_0 - k)) - \theta w(x_0) \\ &\leq g(x_0, \sigma(x_0 - k)) - \theta \sigma(x_0) \\ &< \sigma'(x_0), \text{ which leads to a contradiction.} \end{split}$$

Thus, from CASE-1 and CASE-2 we have  $\rho(\mathbf{x}) < \mathbf{w}(\mathbf{x}) < \sigma(\mathbf{x}), \forall \mathbf{x} \in (0, \mathbf{T}]$ . Therefore,  $\mathbf{G}^*(\mathbf{x}, \mathbf{w}(\mathbf{x}-\mathbf{k})) = \mathbf{g}(\mathbf{x}, \mathbf{w}(\mathbf{x}-\mathbf{k})), \forall \mathbf{x} \in \mathbf{I} \text{ and } \mathbf{p}(\mathbf{T}, \mathbf{w}(\mathbf{T})) = \mathbf{w}(\mathbf{T})$ . Hence,  $\mathbf{W} \in \mathbf{X}$  is a solution of APBVP (1.1) – (1.3) such that  $\rho(\mathbf{x}) \le \mathbf{w}(\mathbf{x}) \le \sigma(\mathbf{x}), \forall \mathbf{x} \in [-\mathbf{k}, 0] \text{ and } \rho(\mathbf{x}) < \mathbf{w}(\mathbf{x}) < \sigma(\mathbf{x}), \forall \mathbf{x} \in (0, \mathbf{T}]$ .

### ABSTRACT

In this manuscript, we inaugurate Neutrosophic generalized semi-pre connected space. We investigate its properties. Also, we add some improvisation of neutrosophic generalized semi pre connected space.

**Keywords**: Neutrosophic Topology, Neutrosophic generalized semi pre closed sets; Neutrosophic generalized semi pre continuous; Neutrosophic generalized semi pre connected space.

### INTRODUCTION

In 2014, the pioneering work of Salama, Smarandache, and Valeri [10] introduced the concept of Neutrosophic closed sets and Neutrosophic continuous functions. Subsequent advancements by Salama and Alblowi [11] led to the development of generalized Neutrosophic sets and generalized Neutrosophic topological spaces. In their publication [25], Rajeshwaran N and Chandramathi N presented the novel idea of Neutrosophic generalized semi pre closed sets within the realm of Neutrosophic topological spaces. Similarly, in another work [26], they introduced the concept of Neutrosophic generalized semi pre Homeomorphisms in the same context. This manuscript seeks to define and investigate the concept of Neutrosophic generalized semi pre-connected space, delving into its inherent properties. The study encompasses an exploration of various related notions and introduces a collection of noteworthy theorems within this domain.

### Preliminaries

**Definition 2.1:** [10] A neutrosophic topology (NT for short) a non-empty set X is a family  $\tau_N$  of neutrosophic subsets in X adheres the following axioms

### Chandramathi and Rajeshwaran

 $(NT1)0_N, 1_N \in \tau_N$  $(NT2)G_1 \cap G_2 \in \tau_N$ (NT3 )  $\cup$   $G_i \in \tau_N$  ,  $\forall \{G_i {:} i \in J\} \subseteq \tau_N$ Here  $(X_1, \tau_N)$  is called a neutrosophic topological space (NTS for short).

Definition 2.2: [10] Let A<sub>1</sub> and A<sub>2</sub> be two Neutrosophic Sets (NS for Short) of the form  $A_1 = \{ \langle X, \mu_{A_1}(X), \sigma_{A_1}(X), \gamma_{A_1}(X) \rangle : x \in X \} , A_2 = \{ \langle X, \mu_{A_2}(X), \sigma_{A_2}(X), \gamma_{A_2}(X) \rangle : x \in X \}$  $A_1 \subseteq A_2$  if and only if  $\mu_{A_1}(X) \leq \mu_{A_2}(X), \sigma_{A_1}(X) \leq \sigma_{A_2}(X) \text{ and } \gamma_{A_1}(X) \geq \gamma_{A_2}(X) \text{ for all } x \in X$ (b)  $A_1^{C} = \{ \langle X, \gamma_{A_1}(X), 1 - \sigma_{A_1}(X), \mu_{A_1}(X) \rangle : x \in X \}$  $(c)A_{1} \cap A_{2} = \{(X, \mu_{A_{1}}(X) \land \mu_{A_{2}}(X), \sigma_{A_{1}}(X) \land \sigma_{A_{2}}(X), \gamma_{A_{1}}(X) \lor \gamma_{A_{2}}(X)): x \in X\}$ 

 $(d)A_1 \cup A_2 = \{ \langle X, \mu_{A_1}(X) \vee \mu_{A_2}(X), \sigma_{A_1}(X) \vee \sigma_{A_2}(X), \gamma_{A_1}(X) \wedge \gamma_{A_2}(X) \rangle : x \in X \}$ 

**Definition 2.3:** [25] Let  $(X_1, \tau_N)$  be a neutrosophic topological space. A subset  $A_1$  of  $(X_1, \tau_N)$  is called Neutrosophic generalized semi pre closed set [Neutrosophic gsp-closed] if Nspcl  $(A_1) \subseteq W$ , whenever  $A_1 \subseteq W$  and W is NOS. **Definition 2.4:** [25] A NT ( $X_1$ ,  $\tau_N$ ) is said to be an Neutrosophic C<sub>5</sub>-connected (NC<sub>5</sub>-connected for short) space if the only NS which are both a NOS and a NCS are  $0_N$  and  $1_N$ .

**Definition 2.5:** [26] A bijection  $g:(X_1, \tau_N) \to (X_2, \sigma_N)$  is denoted NGSP homeomorphism if g is both NGSP continuous and NGSP open map.

### Neutrosophic Generalized Semi Pre Connected Space

**Definition.3.1:** A Neutrosophic topology  $(X, \tau_N)$  is said to be Neutrosophic generalized semi pre connected space (NGSP connected space for short) if the only NSs which are both a NGSPOS and a NGSPCS are  $0_N$  and  $1_N$ . **Example3.2:** Let  $X = \{a, b\}$  and  $\tau_N = \{0_N, 1_N, K\}$  be a NT on  $(X, \tau_N)$  where  $K = \{x, \langle 0.5, 0.6, 0.5 \rangle, \langle 0.5, 0.4, 0.5 \rangle\}$ . Then  $(X, \tau_N)$  is a NGSP Connected space.

**Theorem: 3.3:** Every NGSP connected space is NC<sub>5</sub>- connected space but not conversely.

**Proof:** Let  $(\chi, \tau_N)$  be NGSP-connected space. Suppose  $(\chi, \tau_N)$  is not an NC<sub>5</sub>- connected space, then there exists a proper NS D which is both NOS and a NCS in  $(\chi, \tau_N)$ . That is, D is both NGSPOS and a NGSPCS in  $(\chi, \tau_N)$ . So,  $(X, \tau_N)$  is not a NGSP connected space. This is a contradiction. Therefore  $(X, \tau_N)$  be a NGs- connected space. **Example3.4:** Let  $X = \{a, b\}$  and  $K = \{(0.5, 0.6, 0.5), (0.5, 0.4, 0.5)\}$ . Then  $\tau_N = \{0_N, 1_N, K_1\}$  is a NT on  $(X, \tau_N)$ . Then  $(X, \tau_N)$ is a NC<sub>5</sub>- connected space but not NGSP connected space, since NS K in  $(\chi, \tau_N)$  is both a NGSPCS and NGSPOS in  $(X, \tau_N).$ 

**Theorem 3.5:** Every NGSP connected space is NGO-connected space but not conversely.

**Proof:** Let  $(X, \tau_N)$  is NGSP-connected space. Suppose  $(X, \tau_N)$  is not a NGO- connected space, then there exists a proper NS D which is both a NGOS and NGCS in  $(\chi, \tau_N)$ . D is both NGSPOS and NGSPCS in  $(\chi, \tau_N)$ . This implies that  $(\chi, \tau_N)$  is not a NGSP connected space. This is a contradiction. Therefore  $(\chi, \tau_N)$  be a NGOconnected space.

**Example 3.6:** In Example 3.4,  $(X, \tau_N)$  is a NGO-connected space but not a NGSP connected space.

**Theorem 3.7:** The NT  $(X, \tau_N)$  is a NGSP-connected space if and only if there exists no non-zero NGSPOS A and D in  $(X, \tau_N)$  such that  $A = D^C$ .

**Proof: Necessity:** Assume that  $(X, \tau_N)$  is an NGSP-connected space. Let A and D be two NGSPOS in  $(X_1, \tau_N)$ such that  $A \neq 0_N \neq D$  and  $A = D^C$ . Therefore  $D^C$  is a NGSPCS. Since  $A \neq 0_N$ ,  $D \neq 1_N$ . This implies D is a proper NS which is both a NGSPOS and a NGSPCS in  $(X, \tau_N)$ . Hence  $(X, \tau_N)$  is not a NGSP connected space. But this is a contradiction to our hypothesis. Thus there exists no non-zero NGSPOS A and D in  $(X, \tau_N)$  such that  $A = D^C$ .

**Sufficiency:** Let A both a NGSPOS and NGSPCS in  $(X, \tau_N)$  such that  $1_N \neq A \neq 0_N$ . Now let  $\mathcal{D} = A^C$ . Then  $\mathcal{D}$  is a NGSPOS and  $D \neq 1_N$ . This implies  $D = A^C \neq 0_N$  which is a contradiction to our hypothesis. Therefore  $(\chi, \tau_N)$  a NGSP connected space.

### Chandramathi and Rajeshwaran

**Theorem 3.8:** A NT  $(X, \tau_N)$  is an NGSP connected space if and only if there exists no non-zero NGSPOSs A and D in  $(X, \tau_N)$  such that  $A = D^C$ ,  $D = (Nspcl(A))^C$ ,  $A = (Nspcl(D))^C$ .

**Proof:** Necessity: Assume that there exist NSs A and D such that  $A \neq 0_N \neq D$ ,  $D = A^C, D = (Nspcl(A))^C$ ,  $A = (Nspcl(D))^C$ . Since  $(Nspcl(A))^C$  and

 $(Nspcl(D))^{C}$  are NGSPOSs in  $(X, \tau_{N})$  A and D are NGSPOSs in  $(X, \tau_{N})$ . This implies  $(X, \tau_{N})$  is not a NGSP connected space, which is a contradiction. Therefore there exists no non-zero NGSPOSs A and D in  $(X, \tau_{N})$  such that  $A = D^{C}$ ,  $D = (Nspcl(A))^{C}$ ,  $A = (Nspcl(D))^{C}$ .

**Sufficiency:** Let A be both a NGSPOS and a NGSPCS in  $(X, \tau_N)$  such that  $1_N \neq A \neq 0_N$ . Now by taking  $D = A^C$ , we obtain a contradiction to our hypothesis. Hence  $(X, \tau_N)$  is a NGSP connected space.

**Remark 3.9:** Every Neutrosophic semi-pre  $T_{1/2}$  space is an Neutrosophic semi-pre  $T_{1/2}$  space but not conversely.

**Proof:** Let  $(X, \tau_N)$  be a Neutrosophic semi-pre  $T_{1/2}$  space. Let D be an in-Neutrosophic generalized semi-pre closed set in  $(X, \tau_N)$ . By hypothesis D is a Neutrosophic closed set. Since every Neutrosophic closed set is a Neutrosophic semi-pre closed set, D is a Neutrosophic semi-pre closed set in  $(X, \tau_N)$ . Hence  $(X, \tau_N)$  is a Neutrosophic semi-pre  $T_{1/2}$  space.

**Example 3.10:** In Example 3.4 the NTS  $(X, \tau_N)$  is a NT<sub>1/2</sub> space but not a NSPT<sub>1/2</sub> space, since the NS D is a NGSP closed set in  $(X, \tau_N)$  but not a NC in  $(X, \tau_N)$ , since Ncl $(D) = D^C \neq D$ 

**Theorem 3.11:** If  $\varphi_N : (X, \tau_N) \to (Y, \sigma_N)$  is a NGSP continuous surjection and  $(X, \tau_N)$  is a NGSP connected space, then  $(Y, \sigma_N)$  is a NGs-connected space.

**Proof:** Let  $(X, \tau_N)$  be a NGSP connected space. Suppose  $(Y, \sigma_N)$  is not an NC<sub>5</sub>-connected space, then there exists a proper NS D which is both a NOS and a NCS in  $(Y, \sigma_N)$ . Since  $\varphi_N$  is a NGSP continuous mapping,  $\varphi_N^{-1}(D)$  is both a NGSPOS and NGSPCS in  $(X, \tau_N)$ . This is a contradiction to our hypothesis. Hence  $(Y, \sigma_N)$  be a NC<sub>5</sub>-connected space.

**Theorem 3.12:** If  $\varphi_N : (X, \tau_N) \to (Y, \sigma_N)$  is a NGSP irresolute surjection and  $(X, \tau_N)$  is NGSP connected space, then  $(Y, \sigma_N)$  is also NGSP connected space.

**Proof:** Suppose  $(Y, \sigma_N)$  is not a NGSP connected space, then there exists a proper NS D such that D is both NGSPOS and NGSPCS in  $(Y, \sigma_N)$  Since  $\varphi_N$  is a NGSP irresolute mapping,  $\varphi_N^{-1}(D)$  is both NGSPOS and NGSPCS in  $(X, \tau_N)$ . This is a contradiction to our hypothesis. Hence  $(Y, \sigma_N)$  is NGSP connected space.

**Theorem 3.13:** If a NT  $(X, \tau_N)$  is NGSP connected between two NS A and B, then it is NC<sub>5</sub>-connected between two NSs A and B but the converse may not be true in general.

**Proof:** Suppose  $(X, \tau_N)$  is not NC<sub>5</sub>-connected between A and B, then there exists a NOS D in  $(X, \tau_N)$  such that  $A \subseteq D$  and  $Dq^C B$ . Since every NOS is a NGSPOS, there exists a NGSPOS D in  $(X, \tau_N)$  such that  $A \subseteq D$  and  $Dq^C B$ . This implies  $(X, \tau_N)$  is not NGSP connected between A and B, a contradiction to our hypothesis. So,  $(X, \tau_N)$  is NC<sub>5</sub>-connected between A and B

**Example3.14:** Let  $X = \{a, b\}$  and  $K_1 = \{x, \langle 0.5, 0.4, 0.5 \rangle, \langle 0.5, 0.6, 0.5 \rangle\}$ . Then  $\tau_N = \{0_N, 1_N, K_1\}$  is a NT on $(X, \tau_N)$ . Let  $A = \{x, \langle 0.4, 0.4, 0.4 \rangle, \langle 0.6, 0.6, 0.6 \rangle\}$  and  $B = \{x, \langle 0.3, 0.3, 0.3 \rangle, \langle 0.4, 0.4, 0.4 \rangle\}$  be two NS in  $(X, \tau_N)$ . Then  $(X, \tau_N)$  is a NCs-connected between A and B, since there exists no NOS D in  $(X, \tau_N)$  But it is not NGSP connected between the two NS A and B, since there exists an NGSPOS  $D = \{\langle 0.4, 0.4, 0.4 \rangle, \langle 0.5, 0.5, 0.5 \rangle\}$  in  $(X, \tau_N)$  such that  $A \subseteq D$  and  $Dq^C B$ 

**Theorem 3.15:** A NT  $(X, \tau_N)$  is NGSP connected between two NS A and B if and only if there is no NGSPOS and NGSPCS D in  $(X, \tau_N)$  such that  $A \subseteq D \subseteq B^C$ .

**Proof:** Necessity: Let  $(\chi, \tau_N)$  be NGSP connected between A and B. Suppose that there exists a NGSPOS and NGSPCS D in  $(\chi, \tau_N)$  such that  $A \subseteq D \subseteq B^C$ , then D q B. and  $A \subseteq D$ . This implies  $(\chi, \tau_N)$  is not NGSP connected between A and B, by Definition 3.2 A contradiction to our hypothesis. Therefore there exists no NGSPOS and a NGSPCS D in  $(\chi, \tau_N)$  such that  $A \subseteq D \subseteq B^C$ .

**Sufficiency:** Suppose that  $(X, \tau_N)$  is not NGSP connected between A and B. Then there exists a NGSPOS D in  $(X, \tau_N)$  such that  $A \subseteq D$  and

D q B. This implies that there exists a NGSPOS D in  $(X, \tau_N)$  such that  $A \subseteq D \subseteq B^C$ . This is a contradiction to our hypothesis. Hence  $(X, \tau_N)$  is NGSP connected.

### Chandramathi and Rajeshwaran

**Theorem 3.16.** Let  $(X, \tau_N)$  be an NTS and A and B be NSs in  $(X, \tau_N)$ . If AqB, then  $(X, \tau_N)$  is Neutrosophic generalized semi-pre connected between A and B.

**Proof:** Suppose  $(X, \tau_N)$  is not Neutrosophic generalized semi-pre connected between A and B. Then there exists a Neutrosophic generalized semi-pre open set  $\mathcal{D}$  in  $(X, \tau_N)$  such that  $A \subseteq \mathcal{D}$  and  $\mathcal{D} \subseteq B^C$ . This implies that  $A \subseteq B^C$ . That is  $Aq^C B$ . This is a contradiction to our hypothesis. Therefore  $(X, \tau_N)$  is Neutrosophic generalized semi-pre connected between A and B.

### ABSTRACT

In this paper, we have defined different types of reduced Pythagorean fuzzy soft matrices and based on these matrices, a new algorithm is developed for multi - criteria decision making under uncertainty using choice matrix.

**Keywords:** Soft sets, Fuzzy soft set, Pythagorean fuzzy set, Pythagorean fuzzy soft set, interval-valued Pythagorean fuzzy soft set, Pythagorean fuzzy soft matrix.

### INTRODUCTION

In today's competitive environment, there are a lot of uncertainties to deal with in a variety of areas, including business, decision-making, and medical science. The George Cantor-introduced classical set theory is insufficient to handle these kinds of circumstances. Zadeh[1] developed the idea of fuzzy set theory, which includes only membership values and somewhat aids us in this purpose. Atanassov[2] proposed the idea of IFS (Intuitionistic Fuzzy Set), an extension of fuzzy set, which is the membership and non-membership degree whose sum is less than or equal to one, in order to advance study in this area. The IVIFS (Interval Valued Intuitionistic Fuzzy Set), created by Atanassov and Gargov [3], is an extension of the IFS and has a membership function and a non-membership function with values that take the form of intervals.

Molodtsov [4] established the soft set theory, which aids in object parameterization. further, the theory of fuzzy soft sets was put forth by Maji P. K., Biswas R., and Roy A. R. [5, 6] and was further extended to include IFSS (Intuitionistic Fuzzy Soft Sets). Following this, Y. Jiang et al. [7] developed the idea of IVIFSS (Interval Valued

### Rajarajeswari and Mathi Sujitha

Intuitionistic Fuzzy Soft Set) theory, which is an extension of the IFSS theory, as a result of the increasing convolution of the scientific environment.

In the fields of science and engineering, matrices are significant. The traditional matrix theory is insufficient for dealing with problems containing uncertainties. In order to encode the fuzzy soft set in matrix form and apply it to specific decision-making situations, Yong and Chenli[8] did so. [9] studies a few IFSM (Intuitionistic fuzzy soft matrix) theory outcomes. Interval Valued Intuitionistic Fuzzy Soft Matrix (IVIFSM) and its types were introduced by Rajarajeswari and Dhanalashmi[10], who additionally examined at some operations based on weight. PFS, which is the membership and non-membership degree whose square sum is less than or equal to one was introduced by Yager R. R.[11]because IVIFSM cannot contain more information for decision making. Abhishek Guleria and Rakesh Kumar Bajaj defined the PFSM for a certain set of MCDM issues[12]. Later IVPFSS and IVPFSM were defined by Rajarajeswari and Mathi Sujitha[13, 14] for better decision making. In this research, various reduced Pythagorean fuzzy soft matrix types are established. Based on these matrices, a novel technique for multi-criteria decision making under uncertainty using the choice matrix is devised.

#### PRELIMINARIES

In this section, we recall some basic definitions such as interval valued Pythagorean fuzzy soft set, interval valued Pythagorean fuzzy soft matrix and choice matrix.

**Definition 2.1[13]:** Let the parameter set be  $\mathbb{E}$ . Let  $\mathcal{A} \subseteq \mathbb{E}$ . A pair  $(f, \mathcal{A})$  is called an interval-valued Pythagorean fuzzy soft set (IVPFSS) over  $\mathbb{U}$ , where  $\mathbb{U}$  is the universe and f is a mapping given by  $f: \mathcal{A} \to IP^{\mathbb{U}}$ , where  $IP^{\mathbb{U}}$  denotes the collection of all interval-valued Pythagorean fuzzy subsets of  $\mathbb{U}$ .

**Definition 2.2[14]:** Let  $\mathcal{A} \subseteq \mathbb{E}$ ,  $\mathbb{E} = \{e_1, e_2, ..., e_n\}$  being the parameter set. A pair  $(f, \mathcal{A})$  is called an interval-valued Pythagorean fuzzy soft set (IVPFSS) over  $\mathbb{U}$ , where  $\mathbb{U} = \{u_1, u_2, ..., u_m\}$  is the universe and f is a mapping given by  $f: \mathcal{A} \to IP^{\mathbb{U}}$ , where  $IP^{\mathbb{U}}$  characterize the collection of all interval-valued Pythagorean fuzzy subsets of  $\mathbb{U}$ . Then the IVPFSS can be symbolized in the matrix form as  $\mathcal{A}_{m \times n}^* = [a_{ij}]_{m \times n}$  where

 $a_{ij} = \begin{cases} \left( \left[ \mu_j^L(u_i), \mu_j^U(u_i) \right] \left[ \vartheta_j^L(u_i), \vartheta_j^U(u_i) \right] \right) & \text{if } e_j \in \mathcal{A} \\ \left( [0, 0][1, 1] \right) & \text{if } e_j \notin \mathcal{A} \\ \left[ \mu_j^L(u_i), \mu_j^U(u_i) \right] & \text{is the membership of } u_i & \text{in } f(e_j), \left[ \vartheta_j^L(u_i), \vartheta_j^U(u_i) \right] & \text{is the non - membership of } u_i & \text{in } f(e_j) & \text{with the condition } \left( \mu_j^U(u_i) \right)^2 + \left( \vartheta_j^U(u_i) \right)^2 \leq 1. \end{cases}$ 

**Definition 2.3:**Let  $\eta$  denote the choice matrix which is a square matrix where both m(rows) and n(columns) represent parameters, defined as  $\eta_{ij}$ :

 $\eta_{ij} = \begin{cases} (1,0) \text{when } i^{\text{th}} \text{ and } j^{\text{th}} \text{ parameters are both choice parameters} \\ \text{of the decision makers} \\ (0,1) \text{otherwise, i. e. when at least one of the } i^{\text{th}} \text{ or } j^{\text{th}} \text{ parameters} \\ \text{be not under choice} \end{cases}$ 

#### INTERVAL VALUED PYTHAGOREAN FUZZY SOFT MATRIX (IVPFSM)

**Definition 3.1.** Let  $\mathbb{U} = \{u_1, u_2, u_3, ..., u_m\}$  be the Universal set and  $\mathbb{E}$  be the set of parameters given by  $\mathbb{E} = \{e_1, e_2, e_3, ..., e_n\}$ . Let  $\mathcal{A} \subseteq \mathbb{E}$  and  $(f, \mathcal{A})$  be an interval valued Pythagorean fuzzy soft set in the fuzzy soft class  $(\mathbb{U}, \mathbb{E})$  where f is a mapping given by  $f: \mathcal{A} \to IP^{\mathbb{U}}, IP^{\mathbb{U}}$  characterize the collection of all interval-valued Pythagorean fuzzy subsets of  $\mathbb{U}$ . Then the interval valued Pythagorean fuzzy soft set is

 $f(e_j) = \{u_i, ([\mu_j^L(u_i), \mu_j^U(u_i)][\vartheta_j^L(u_i), \vartheta_j^U(u_i)]) \forall e_j \in \mathcal{A} \text{ and } \forall u_i \in \mathbb{U}\}, [\mu_j^L(u_i), \mu_j^U(u_i)] \text{ represents the membership and } [\vartheta_i^L(u_i), \vartheta_j^U(u_i)] \text{ non - membership of } u_i \text{ in the interval valued Pythagorean fuzzy set } f(e_j).$ 

### Rajarajeswari and Mathi Sujitha

Let  $w_1, w_2, w_3, w_4$  in  $[0,1], w_1 + w_2 = 1, w_3 + w_4 = 1$ . The Vector  $\mathbb{W} = (w_1, w_2, w_3, w_4)$  is called weighted vector. The Pythagorean fuzzy soft set  $(f_{\mathbb{W}}, \mathcal{A})$  over  $\mathbb{U}$  such that  $(f_{\mathbb{W}}(e_j), \mathcal{A}) = \{u_i, (w_1\mu_j^L(u_i) + w_2\mu_j^U(u_i), w_3\vartheta_j^L(u_i) + w_4\vartheta_j^U(u_i)\} \forall e_j \in \mathcal{A} \text{ and } \forall u_i \in \mathbb{U}\}$  is called the Reduced Pythagorean Fuzzy Soft Set(RPFSS) of the interval valued Pythagorean fuzzy soft set with respect to the weighted vector. By adjusting the value of  $w_1, w_2, w_3, w_4$  an interval valued Pythagorean fuzzy soft set.

**Definition 3.2.**Let  $\mathbb{U} = \{u_1, u_2, u_3, ..., u_m\}$  be the Universal set and  $\mathbb{E}$  be the set of parameters given by  $\mathbb{E} = \{e_1, e_2, e_3, ..., e_n\}$ . Let  $\mathcal{A} \subseteq \mathbb{E}$  and  $(f, \mathcal{A})$  be an interval valued Pythagorean fuzzy soft set in the fuzzy soft class  $(\mathbb{U}, \mathbb{E})$  where f is a mapping given by  $f: \mathcal{A} \to IP^{\mathbb{U}}, IP^{\mathbb{U}}$  characterize the collection of all interval-valued Pythagorean fuzzy subsets of  $\mathbb{U}$ . Let  $w_1, w_2, w_3, w_4$  in  $[0,1], w_1 + w_2 = 1, w_3 + w_4 = 1$ . Then the reduced Pythagorean fuzzy soft set $(f_{\mathbb{W}}, \mathcal{A})$  over  $\mathbb{U}$  in a matrix form as  $\mathcal{A}^*_{m \times n} = [a_{ij}]_{m \times n}, i = 1, 2, ..., m; j = 1, 2, 3, ..., n$  where

$$a_{ij} = \begin{cases} \left( w\mu_j^L(u_i) + w_2\mu_j^U(u_i), w_3\vartheta_j^L(u_i) + w_4\vartheta_j^U(u_i) \right) & \text{if } e_j \in \mathcal{A} \\ (0,1) & \text{if } e_j \notin \mathcal{A} \end{cases}$$

so we can find a Reduced Pythagorean fuzzy soft set  $(f_{w}, \mathcal{A})$  in the Pythagorean fuzzy soft class  $(\mathbb{U},\mathbb{E})$  by its Reduced Pythagorean fuzzy soft matrix  $\mathcal{A}_{m\times n}^*$ . The set of all m × n Reduced Pythagorean Fuzzy Soft Matrices will be denoted by RPFSM<sub>m×n</sub>.

**Definition 3.3.** Let  $\mathcal{A}_{m \times n}^* = [a_{ij}]_{m \times n} \in \operatorname{RPFSM}_{m \times n}$  Then  $\mathcal{A}_P^*$  is called Pessimistic Reduced Pythagorean Fuzzy Soft Matrix if  $w_1 = 1, w_2 = 0, w_3 = 0, w_4 = 1$ , The Pessimistic Reduced Pythagorean Fuzzy Soft set  $f_P(e_j) = \{(u_i, (\mu_j^L(u_i), \vartheta_j^U(u_i)))\} \forall e_j \in \mathcal{A} \text{ and } \forall u_i \in \mathbb{U} \text{ over } \mathbb{U} \text{ in a matrix form as } \mathcal{A}_{m \times n}^* = [a_{ij}]_{m \times n}, i = 1, 2, ..., m; j = 1, 2, 3, ..., n$  where

$$a_{ij} = \begin{cases} \left(\mu_j^L(u_i), \vartheta_j^U(u_i)\right) & \text{if } e_j \in \mathcal{A} \\ (0,1) & \text{if } e_j \notin \mathcal{A} \end{cases}$$

so we can find a Pessimistic Reduced Pythagorean Fuzzy Soft Set( $f_P$ ,  $\mathcal{A}$ ) in the Pythagorean fuzzy soft class ( $\mathbb{U},\mathbb{E}$ ) by its Pessimistic Reduced Pythagorean Fuzzy Soft Matrix  $\mathcal{A}_P^*$ . The set of all m×n Pessimistic Reduced Pythagorean Fuzzy Soft Matrices will be denoted by PRPFSM<sub>m×n</sub>.

**Definition 3.4.** Let  $\mathcal{A}_{m \times n}^* = [a_{ij}]_{m \times n} \in \text{ROFSM}_{m \times n}$  Then  $\mathcal{A}_0^*$  is called optimistic Reduced Pythagorean Fuzzy Soft Matrix if  $w_1 = 0, w_2 = 1, w_3 = 1, w_4 = 0$ , The Pessimistic Reduced Pythagorean Fuzzy Soft set  $f_0(e_j) = \{(u_i, (\mu_j^L(u_i), \vartheta_j^U(u_i)))\} \forall e_j \in \mathcal{A} \text{ and } \forall u_i \in \mathbb{U} \text{ over } \mathbb{U} \text{ in a matrix form as } \mathcal{A}_{m \times n}^* = [a_{ij}]_{m \times n}, \text{ i = 1,2,...,m}; \text{ j = 1,2,3,...,n}$  where

$$a_{ij} = \begin{cases} \left( \mu_j^U(u_i), \vartheta_j^L(u_i) \right) & \text{if } e_j \in \mathcal{A} \\ (0, 1) & \text{if } e_j \notin \mathcal{A} \end{cases}$$

so we can find a optimistic Reduced Pythagorean Fuzzy Soft Set( $f_o$ , A) in the Pythagorean fuzzy soft class ( $\mathbb{U},\mathbb{E}$ ) by its Optimistic Reduced Pythagorean Fuzzy Soft Matrix  $A_0^*$ . The set of all m×n Optimistic Reduced Pythagorean Fuzzy Soft Matrices will be denoted by ORPFSM<sub>m×n</sub>.

**Definition 3.5.** Let  $\mathcal{A}_{m\times n}^* = [a_{ij}]_{m\times n} \in \text{RNFSM}_{m\times n}$  Then  $\mathcal{A}_N^*$  is called Neutral Reduced Pythagorean Fuzzy Soft Matrix if  $w_1 = 0.5, w_2 = 0.5, w_3 = 0.5, w_4 = 0.5$ , The Neutral Reduced Pythagorean Fuzzy Soft set  $f_N(e_j) = \left\{ \left( u_i, \left( \frac{\mu_j^L(u_i) + \mu_j^U(u_i)}{2} \right), \left( \frac{\vartheta_j^L(u_i) + \vartheta_j^U(u_i)}{2} \right) \right) \right\} \forall e_j \in \mathcal{A} \text{ and } \forall u_i \in \mathbb{U} \text{ over } \mathbb{U} \text{ in a matrix form as } \mathcal{A}_{m\times n}^* = [a_{ij}]_{m\times n}, \text{ i} = 1, 2, ..., m; \qquad j = 1, 2, 3, ..., n \text{ where}$ 

### Rajarajeswari and Mathi Sujitha

$$a_{ij} = \begin{cases} \left(\frac{\mu_j^L(u_i) + \mu_j^U(u_i)}{2}, \frac{\vartheta_j^L(u_i) + \vartheta_j^U(u_i)}{2}\right) & \text{if } e_j \in \mathcal{A} \\ (0, 1) & \text{if } e_j \notin \mathcal{A} \end{cases}$$

so we can find a Neutral Reduced Pythagorean Fuzzy Soft Set( $f_N$ , A) in the Pythagorean fuzzy soft class ( $\mathbb{U},\mathbb{E}$ ) by its Neutral Reduced Pythagorean Fuzzy Soft Matrix  $A_N^*$ . The set of all m×n Neutral Reduced Pythagorean Fuzzy Soft Matrices will be denoted by NRPFSM<sub>m×n</sub>.

Application of Interval – Valued Pythagorean Fuzzy Soft Matrix Theory in Decision Making using Choice Matrix Let us assume that there are 'm' cars  $\mathbb{U} = \{u_1, u_2, u_3, ..., u_m\}$  with a set of 'n' alternatives  $\mathbb{E} = \{e_1, e_2, e_3, ..., e_n\}$ . Now we use interval valued Pythagorean fuzzy soft matrices to find out which of these cars is the optimal decision taken by Mr. X, Y and Z to present it to their friend Mr. D using choice parameters. Construct the interval valued Pythagorean fuzzy soft set  $(f, \mathcal{A}), (g, \mathcal{B}), (h, \mathcal{C})$  over  $\mathbb{E}$  where f, g, h is a mapping  $f : \mathcal{A} \rightarrow IVPF^{\mathbb{E}}, g : \mathcal{B} \rightarrow IVPF^{\mathbb{E}}, h : \mathcal{C} \rightarrow IVPF^{\mathbb{E}},$  $IVPF^{\mathbb{E}}$  is the collection of all interval valued Pythagorean fuzzy subsets of  $\mathbb{E}$ . This gives the interval valued Pythagorean fuzzy soft matrices  $\mathcal{A}_{m \times n}^*, \mathcal{B}_{m \times n}^*, \mathcal{C}_{m \times n}^*$ . Convert the interval valued Pythagorean fuzzy soft matrix to a PRPFSM, ORPFSM, NRPFSM by adjusting the weighted vectors. Now we construct the choice matrices according to the choice parameters taken by  $\mathcal{A}, \mathcal{B}$  and  $\mathcal{C}$  respectively. Therefore, here we have developed a new algorithm by using the above data which helps us to find out the optimal choice of the decision makers using the choice parameters.

### Algorithm

**Step 1:** Input the values for interval valued Pythagorean fuzzy soft set  $(f, \mathcal{A}), (g, \mathcal{B}), (h, \mathcal{C})$  and obtain the Pythagorean fuzzy soft matrices  $\mathcal{A}_{m \times n}^*, \mathcal{B}_{m \times n}^*, \mathcal{C}_{m \times n}^*$  corresponding to  $(f, \mathcal{A}), (g, \mathcal{B}), (h, \mathcal{C})$  respectively.

**Step 2:** Convert the interval valued Pythagorean fuzzy soft matrix to a PRPFSM, ORPFSM, NRPFSM by adjusting the weighted vectors.

Step 3: Construct the combined choice matrix with respect to the choice parameters of the decision makers.

**Step 4:** Compute the product Pythagorean fuzzy soft matrices by multiplying each converted Pythagorean fuzzy soft matrix with the combined choice matrix

Step 5: Compute the sum of these product Pythagorean fuzzy soft matrices

**Step 6:** Then compute the maximum weight of each object by adding the membership values, which is the optimal choice. If more than one object has the highest weight then go to the next step.

Step 7: Now compute the minimum weight by adding the non-membership values, which is the optimal choice.

#### **Case Study**

Let U be the set of four branded cars given by  $\mathbb{U} = \{C_1, C_2, C_3, C_4\}$ . Let  $\mathbb{E}$  be the set of four alternatives given by,  $\mathbb{E} = a$  car {with advanced model, with power steering, with central lock system, comfortable with stereo effect} = {e\_1, e\_2, e\_3, e\_4}.

Suppose that the choice parameters of three friends Mr. X, Mr. Y and Mr. Z are  $\mathcal{A} = \{e_1, e_3\}$ ,  $\mathcal{B} = \{e_1, e_4\}$ ,  $\mathcal{C} = \{e_2, e_4\}$  respectively. Now the interval valued Pythagorean fuzzy soft set(f,  $\mathcal{A}$ ), (g,  $\mathcal{B}$ ), (h,  $\mathcal{C}$ ) according to the choice parameters are

 $(f, \mathcal{A}) = \{ \text{Advanced model} = \{ C_1 / [0.2, 0.8] [0.5, 0.6] + C_2 / [0.1, 0.9] [0.2, 0.4] + C_3 / [0.3, 0.6] [0.6, 0.8] + C_4 / [0.4, 0.8] [0.1, 0.5] \}, \text{Central lock system} = \{ C_1 / [0.2, 0.7] [0.3, 0.4] + C_2 / [0.2, 0.4] [0.7, 0.8] + C_3 / [0.3, 0.8] [0.4, 0.6] + C_4 / [0.1, 0.4] [0.6, 0.8] \} \}$ 

 $(g, \mathcal{B}) = \{ \text{Advanced model} = \{ C_1 / [0.5, 0.7] [0.6, 0.7] + C_2 / [0.4, 0.8] [0.5, 0.6] + C_3 / [0.2, 0.5] [0.7, 0.8] + C_4 / [0.3, 0.8] [0.4, 0.5] \}, \text{Comfortable with Stereo effect} = \{ C_1 / [0.2, 0.7] [0.5, 0.7] + C_2 / [0.1, 0.5] [0.4, 0.7] + C_3 / [0.8, 0.9] [0.1, 0.4] + C_4 / [0.2, 0.5] [0.6, 0.7] \} \}$ 

### Rajarajeswari and Mathi Sujitha

 $(h, C) = \{ \text{ With power steering} = \{C_1 / [0.4, 0.8][0.3, 0.6] + C_2 / [0.7, 0.9][0.3, 0.4] + C_3 / [0.6, 0.7][0.5, 0.6] + C_4 / [0.2, 0.5][0.6, 0.8]\}, \text{ Comfortable with Stereo effect} = \{C_1 / [0.1, 0.3][0.4, 0.8] + C_2 / [0.8, 0.9][0.1, 0.3] + C_3 / [0.5, 0.8][0.4, 0.6] + C_4 / [0.5, 0.7][0.6, 0.7]\} \}$ 

The problem is to select one of the branded cars among the four cars to present it for Mr. D which satisfies the choice parameters of Mr. X, Mr. Y and Mr. Z as much as possible.

The values of IVPSS can be represented in IVPFS matrix form as

$$\mathcal{A}_{m \times n}^{*} = \begin{pmatrix} C_{1} \\ C_{2} \\ C_{3} \\ C_{4} \\ (0.2, 0.8)[0.5, 0.6] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.9][0.2, 0.4] \\ [0.1, 0.1][0.1] \\ [0.2, 0.4][0.1, 0.8] \\ [0.1, 0.1][0.1] \\ [0.2, 0.4][0.1, 0.6] \\ [0.1, 0.4][0.6, 0.8] \\ [0.1][0.1] \\ [0.1, 0.4][0.6, 0.8] \\ [0.1][0.1] \\ [0.1, 0.4][0.6, 0.8] \\ [0.1][0.1] \\ [0.1, 0.4][0.6, 0.8] \\ [0.1][0.1] \\ [0.1, 0.4][0.6, 0.8] \\ [0.1][0.1] \\ [0.1, 0.1][0.1] \\ [0.1, 0.1][0.1] \\ [0.2, 0.5][0.7, 0.8] \\ [0.1][0.1] \\ [0.1, 0.1][0.1] \\ [0.1, 0.1][0.1] \\ [0.2, 0.5][0.6, 0.7] \\ [0.1, 0.3][0.4, 0.8] \\ [0.3, 0.8][0.4, 0.5] \\ [0.1][0.1] \\ [0.1, 0.3][0.4, 0.8] \\ [0.1, 0.1] \\ [0.1, 0.$$

### **Optimistic Reduced Pythagorean Fuzzy Soft Matrix**

**Step 1:** By taking the values of weighted vector  $w_1 = 0$ ,  $w_2 = 1$ ,  $w_3 = 1$ ,  $w_4 = 0$  we get the Optimistic Reduced Pythagorean Fuzzy Soft Matrices as

$$\mathcal{A}_{0}^{*} = \begin{cases} \begin{array}{c} e_{1} & e_{2} & e_{3} & e_{4} \\ (0.8,0.5) & (0,1) & (0.7,0.3) & (0,1) \\ (0.9,0.2) & (0.1) & (0.4,0.7) & (0,1) \\ (0.4,0.6) & (0,1) & (0.8,0.4) & (0,1) \\ (0.8,0.1) & (0,1) & (0.4,0.6) & (0,1) \\ \end{array} \\ \mathcal{B}_{0}^{*} = \begin{array}{c} \begin{array}{c} C_{1} \\ C_{2} \\ C_{3} \\ C_{3} \\ \end{array} \begin{pmatrix} (0.7,0.6) & (0,1) & (0,1) & (0.7,0.5) \\ (0.8,0.5) & (0,1) & (0,1) & (0.7,0.5) \\ (0.8,0.5) & (0,1) & (0,1) & (0.5,0.4) \\ (0.5,0.7) & (0,1) & (0,1) & (0.5,0.4) \\ (0.8,0.4) & (0,1) & (0,1) & (0.5,0.6) \\ \end{array} \\ \mathcal{C}_{0}^{*} = \begin{array}{c} \begin{array}{c} C_{1} \\ C_{2} \\ C_{3} \\ C_{3} \\ C_{4} \\ \end{array} \begin{pmatrix} (0,1) & (0.8,0.3) & (0,1) & (0.3,0.4) \\ (0,1) & (0.7,0.5) & (0,1) & (0.8,0.4) \\ (0,1) & (0.7,0.5) & (0,1) & (0.8,0.4) \\ (0,1) & (0.5,0.6) & (0,1) & (0.7,0.6) \\ \end{array} \right)$$

Step 2: The combined choice matrix of Mr. X, Mr. Y and Mr. Z are

Rajarajeswari and Mathi Sujitha					
$(\eta_{ij})_{(A,B\wedge C)} = e_A \begin{pmatrix} (0,1) \\ (0,1) \\ (0,1) \\ (0,1) \\ (0,1) \end{pmatrix}$	$e_{(B \land C)}$ (0,1) (0,1) (0,1) (0,1)	(0,1) (0,1) (0,1) (0,1)	(1,0) (0,1) (1,0) (0,1) (0,1) (0,1) (1,0)		
$(\eta_{ij})_{(B,C\wedge A)} = e_{B} \begin{pmatrix} (0,1) \\ (0,1) \\ (0,1) \\ (0,1) \\ (0,1) \end{pmatrix}$	$e_{(C \land A)}$ (0,1) (0,1) (0,1) (0,1)	(0,1) (0,1) (0,1) (0,1)	(0,1)  (0,1		
$(\eta_{ij})_{(C,A \land B)} = \operatorname{ec} \begin{pmatrix} (0,1) \\ (1,0) \\ (0,1) \\ (1,0) \end{pmatrix}$	$e_{(A \land B)}$ (0,1) (0,1) (0,1) (0,1)	(0,1) (0,1) (0,1) (0,1)	(0,1) (0,1)		

Step 3: The product of Pythagorean fuzzy soft matrices and their corresponding choice matrices are,

$$\mathcal{A}_{0}^{*} \times (\eta_{ij})_{(A,B\wedge C)} = \begin{pmatrix} e_{1} & e_{2} & e_{3} & e_{4} \\ C_{2} \\ C_{3} \\ C_{4}^{*} \\ (0,1) & (0,1) & (0,1) & (0,3,0.3) \\ (0,1) & (0,1) & (0,1) & (0,3,0.3) \\ (0,1) & (0,1) & (0,1) & (0,3,0.3) \\ (0,1) & (0,1) & (0,1) & (0,3,0.4) \\ (0,1) & (0,1) & (0,1) & (0,3,0.4) \\ (0,1) & (0,1) & (0,1) & (0,3,0.1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \end{pmatrix}$$

Step 4: The sum of these product Pythagorean fuzzy soft matrices is,

 $\begin{array}{ccccc} e_1 & e_2 & e_3 & e_4 \\ C_1 & (0.8, 0.3) & (0, 1) & (0, 1) & (0.8, 0.3) \\ C_2 & (0.9, 0.1) & (0, 1) & (0, 9, 0.2) \\ (0.8, 0.4) & (0, 1) & (0, 1) & (0.8, 0.4) \\ (0.7, 0.6) & (0, 1) & (0, 1) & (0.8, 0.1) \end{array}$ Step 5: The weights of the cars (sum of the membership values) are, (i)  $w(C_1) = 0.8 + 0 + 0 + 0.8 = 1.6$ (ii)  $w(C_2) = 0.9 + 0 + 0 + 0.9 = 1.8$ (iii)  $w(C_3) = 0.8 + 0 + 0 + 0.8 = 1.6$ 

Rajarajeswari and Mathi Sujitha

(iv)  $w(C_4) = 0.7+0+0+0.8 = 1.5$ 

It is clear that the weight of the second row is maximum and hence,  $C_2$  is the optimal choice taken by Mr. X, Mr. Y and Mr. Z to present a car for Mr. D

#### Pesimistic Reduced Pythagorean Fuzzy Soft Matrix

**Step 1:** By taking the values of weighted vector  $w_1 = 1$ ,  $w_2 = 0$ ,  $w_3 = 0$ ,  $w_4 = 1$  we get the Pessimistic Reduced Pythagorean Fuzzy Soft Matrices as

	$e_1$	e	2 <sub>2</sub>	2 <sub>3</sub>	$e_4$
	$C_1 / (0.8,0)$	).5) (0,	1) (0.7	7,0.3)	(0,1)
<i>a</i> * _	$C_2   (0.9,0)$	0.2) (0.	1) (0.4	,0.7)	(0,1)
$\mathcal{A}_P^* =$	$C_3 \setminus (0.4,0)$	0.6) (0,	1) (0.8	8,0.4)	(0,1)
	$C_4 \setminus (0.8,0)$	0.1) (0,	1) (0.4	,0.6)	(0,1)/
	$e_1$	е	$_{2}$ $e_{3}$	е	4
<b>a</b> *	$C_1 / (0.7, 0.7)$	.6) (0,1			,0.5)
	C I (non	E) (0 ·	1) (0,1)	) (0.5	,0.4)

Step 2: Consider the same choice matrix as in Optimistic Reduced Pythagorean Fuzzy Soft Matrix.

Step 3: The product of Pythagorean fuzzy soft matrices and their corresponding choice matrices are,

$$\begin{aligned} \mathcal{A}_{P}^{*} \times \left(\eta_{ij}\right)_{(A,B\wedge C)} &= \begin{pmatrix} e_{1} & e_{2} & e_{3} & e_{4} \\ C_{2} \\ C_{3} \\ C_{4} \end{pmatrix}^{(0,1)} \begin{pmatrix} (0,1) & (0,1) & (0,1) & (0.2,0.4) \\ (0,1) & (0,1) & (0,1) & (0.2,0.4) \\ (0,1) & (0,1) & (0,1) & (0.3,0.6) \\ (0,1) & (0,1) & (0,1) & (0.4,0.5) \end{pmatrix} \\ \mathcal{B}_{P}^{*} \times \left(\eta_{ij}\right)_{(B,C\wedge A)} &= \begin{pmatrix} C_{1} \\ C_{2} \\ C_{3} \\ C_{4} \end{pmatrix}^{(0,1)} \begin{pmatrix} (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \\ (0,1) & (0,1) & (0,1) & (0,1) \end{pmatrix} \\ \mathcal{C}_{P}^{*} \times \left(\eta_{ij}\right)_{(C,A\wedge B)} &= \begin{pmatrix} C_{1} \\ C_{2} \\ C_{3} \\ C_{4} \end{pmatrix}^{(0,4,0,6)} \begin{pmatrix} (0,4,0,6) & (0,1) & (0,1) \\ (0,8,0,3) & (0,1) & (0,1) & (0,1) \\ (0,6,0,6) & (0,1) & (0,1) & (0,1) \\ (0,5,0,7) & (0,1) & (0,1) & (0,1) \end{pmatrix} \end{aligned}$$

Step 4: The sum of these product Pythagorean fuzzy soft matrices is,

 $\begin{array}{c} e_1 & e_2 & e_3 & e_4 \\ C_1 & \begin{pmatrix} (0.4,0,6) & (0,1) & (0,1) & (0.2,0.4) \\ 0.2 & \\ C_3 & \\ C_4 & \\ \end{array} \begin{pmatrix} (0.6,0.6) & (0,1) & (0,1) & (0.2,0.4) \\ (0.6,0.6) & (0,1) & (0,1) & (0.3,0.6) \\ (0.5,0.7) & (0,1) & (0,1) & (0.4,0.6) \\ \end{array} \end{pmatrix}$ Step 5: The weights of the cars (sum of the membership values) are, (i)  $w(C_1) = 0.4 + 0 + 0 + 0.2 = 0.8$ (ii)  $w(C_2) = 0.8 + 0 + 0 + 0.2 = 1.0$ (iii)  $w(C_3) = 0.6 + 0 + 0 + 0.3 = 0.9$ 

### Rajarajeswari and Mathi Sujitha

(iv)  $w(C_4) = 0.5+0+0+0.4 = 0.9$ 

It is clear that the weight of the second row is maximum and hence,  $C_2$  is the optimal choice taken by Mr. X, Mr. Y and Mr. Z to present a car for Mr. D

#### Neutral Reduced Pythagorean Fuzzy Soft Matrix

**Step 1:** By taking the values of weighted vector  $w_1 = 0.5$ ,  $w_2 = 0.5$ ,  $w_3 = 0.5$ ,  $w_4 = 0.5$  we get the Neutral Reduced Pythagorean Fuzzy Soft Matrices as

$$\mathcal{A}_{N}^{*} = \begin{array}{c} C_{1} \\ C_{2} \\ C_{3} \\ C_{4} \end{array} \begin{pmatrix} (0.5, 0.55) & (0, 1) & (0.45, 0.35) & (0, 1) \\ (0.5, 0.3) & (0, 1) & (0.3, 0.75) & (0, 1) \\ (0.45, 0.7) & (0, 1) & (0.55, 0.5) & (0, 1) \\ (0.6, 0.3) & (0, 1) & (0.25, 0.7) & (0, 1) \\ (0.6, 0.55) & (0, 1) & (0, 1) & (0.45, 0.6) \\ (0.6, 0.55) & (0, 1) & (0, 1) & (0.45, 0.6) \\ (0.6, 0.55) & (0, 1) & (0, 1) & (0.35, 0.25) \\ (0.55, 0.45) & (0, 1) & (0, 1) & (0.35, 0.65) \\ \end{array} \\ \mathcal{C}_{N}^{*} = \begin{array}{c} C_{1} \\ C_{2} \\ C_{3} \\ C_{4} \end{array} \begin{pmatrix} (0, 1) & (0.6, 0.45) & (0, 1) & (0.25, 0.2) \\ (0, 1) & (0.6, 0.45) & (0, 1) & (0.25, 0.6) \\ (0, 1) & (0.6, 0.45) & (0, 1) & (0.25, 0.6) \\ (0, 1) & (0.6, 0.45) & (0, 1) & (0.25, 0.6) \\ (0, 1) & (0.65, 0.55) & (0, 1) & (0.65, 0.5) \\ (0, 1) & (0.35, 0.7) & (0, 1) & (0.65, 0.5) \\ \end{array} \end{pmatrix}$$

Step 2: Consider the same choice matrix as in Optimistic Reduced Pythagorean Fuzzy Soft Matrix.

**Step 3:** The product of Pythagorean fuzzy soft matrices and their corresponding choice matrices are,  $e_1$   $e_2$   $e_3$   $e_4$ 

$$\mathcal{A}_{N}^{*} \times (\eta_{ij})_{(A,B\wedge C)} = \begin{array}{c} C_{1} \\ C_{2} \\ C_{3} \\ C_{4} \\ (0,1) \\ (0$$

Step 4: The sum of these product Pythagorean fuzzy soft matrices is,

	$e_1$	$e_2$	$e_3$	$e_4$	
$C_1$	/(0.6,0.45)	(0,1)	(0,1)	(0.5,0.35)	
$C_2$	(0.85,0.2) (0.65,0.5) (0.6,0.65)	(0.1)	(0,1)	(0.5,0.3)	
$^{-}C_{3}$	(0.65,0.5)	(0,1)	(0,1)	(0.55,0.5)	
$C_4$	\(0.6,0.65)	(0,1)	(0,1)	(0.6,0.3) /	

**Step 5:** The weights of the cars (sum of the membership values) are,

(i)  $w(C_1) = 0.6+0+0+0.5 = 1.1$ (ii)  $w(C_2) = 0.85+0+0+0.5 = 1.35$ (iii)  $w(C_3) = 0.65+0+0+0.55 = 1.2$ (iv)  $w(C_4) = 0.6+0+0+0.6 = 1.2$ 

### Rajarajeswari and Mathi Sujitha

It is clear that the weight of the second row is maximum and hence,  $C_2$  is the optimal choice taken by Mr. X, Mr. Y and Mr. Z to present a car for Mr. D.

### CONCLUSION

In the three different reduced interval valued Pythagorean fuzzy matrices, it is found that all the three methods provide  $C_2$  as the optimal choice. But when comparing the weights obtained by the three methods, NRPFSM gives the better result when compared to other methods as shown in the figure 1.

### ABSTRACT

This study aims to present a new type of separation axioms for binary topological spaces utilizing binary  $r\beta$ -open sets.. Here, a new class of axioms known as Binary  $r\beta$ -T<sub>0</sub>, Binary  $r\beta$ -T<sub>1</sub>, Binary  $r\beta$ -T<sub>2</sub> spaces, and Binary  $r\beta$ -normal space has been described. Their features and linkages have also been examined, along with appropriate examples..

Keywords: Binary rβ- T<sub>0</sub>, Binary rβ- T<sub>1</sub>, Binary rβ- T<sub>2</sub> spaces, Binary rβ- normal space

2010 AMS subject Classification: 54A05, 54C05, 54A99

### INTRODUCTION

In the year 2011, S. Nithyanantha Jothi and P. Thangavelu [1,2] conducted research on binary topological spaces and developed the idea of a binary topology between two non-empty sets that satisfy specific comparable axioms to the axioms of topology. Additionally, in 2012, they [3] developed the idea of binary-T<sub>0</sub>, binary-T<sub>1</sub>, binary-T<sub>3</sub>, and binary-T<sub>4</sub> spaces in binary topological spaces. In 2016, they [4] defined binary semi-open sets in binary topological spaces and examined some of its features. 2019 saw the introduction of r $\beta$ -closed sets and r $\beta$ -open sets in topological spaces by A.Manonmani and S.Jayalakshmi [5]. Additionally, in 2020, they [6] introduced and researched the idea of binary  $r\beta$ -closed sets and binary  $r\beta$ -  $T_0$ , binary  $r\beta$ -  $T_0$ , binary  $r\beta$ -  $T_0$ , binary  $r\beta$  -  $T_0$ , binary  $r\beta$  - normal spaces which are respectively  $br\beta$ - $T_0$ ,  $br\beta$ - $T_1$ ,  $br\beta$ - $T_2$  and  $br\beta$  - normal spaces in

## Jayalakshmi and Manonmani

short. In this paper, the symbols  $\wp(R)$  and  $\wp(S)$  refers to the corresponding power sets of *R* and *S*. Also known as *b*-*cl*(*A*,*B*) and *b*-*int*(*A*,*B*) respectively, are *binary closure* of (*A*,*B*) and *binary interior* of (*A*,*B*).

#### PRELIMINARIES

Consider any two nonempty sets as *R* and *S*. A binary structure  $\mathcal{M}\subseteq \wp(R) \times \wp(S)$  that satisfies the axioms namely (i)  $(\emptyset, \emptyset)$  and  $(R, S) \in \mathcal{M}$  (ii)  $(A_1 \cap A_2, B_1 \cap B_2) \in \mathcal{M}$  whenever  $(A_1, B_1) \in \mathcal{M}$  and  $(A_2, B_2) \in \mathcal{M}$ , and (iii) If  $\{(A_\alpha, B_\alpha): \alpha \in \Delta\}$  is a family of members of  $\mathcal{M}$ , then  $(\bigcup_{\alpha \in \Delta} A_\alpha, \bigcup_{\alpha \in \Delta} B_\alpha) \in \mathcal{M}$  is known as a binary topology [3] from *R* to *S* and the triplet  $(R, S, \mathcal{M})$  is known as a binary topological space. The members of  $\mathcal{M}$  are known as the binary open subsets of the binary topological space  $(R, S, \mathcal{M})$  and the elements of  $R \times S$  are referred to as the binary points of the binary topological space  $(R, S, \mathcal{M})$ . We refer  $(R, \mathcal{M})$  as a binary topological space if S = R in which case  $\mathcal{M}$  is referred to as a binary topology on R

**Definition 2.1[1**]: Let (A, B) and  $(C, D) \in \wp(R) \times \wp(S)$  where *R* and *S* are any two nonempty sets. If  $A \subseteq C$  and  $B \subseteq D$  then  $(A, B) \subseteq (C, D)$ 

**Definition 2.2 [1]:** Let (A,B) and  $(C,D) \in \wp(R) \times \wp(S)$  where *R* and *S* are any two nonempty sets. If one of the following conditions is true we can state that  $(A,B) \notin (C,D)$ (i)  $A \subseteq C$  and  $B \notin D$  (ii)  $A \notin C$  and  $B \subseteq D$  (iii)  $A \notin C$  and  $B \notin D$ .

**Definition 2.3[1]:** With  $A \subseteq R$ ,  $B \subseteq S$ , let  $(R, S, \mathcal{M})$  be a binary topological space. If  $(R-A, S-B) \in \mathcal{M}$ , then (A, B) is known as *binary closed* in  $(R, S, \mathcal{M})$ 

**Definition 2.4 [1]:** Let  $(R,S,\mathcal{M})$  be a binary topological space and assume that  $(A,B)\subseteq(R,S)$ . Let  $(A,B)^{1*} = \cap \{A_{\alpha}: (A_{\alpha}, B_{\alpha})\}$  is *binary closed* and  $(A,B)\subseteq(A_{\alpha},B_{\alpha})$  and  $(A,B)^{2*} = \{B_{\alpha}: (A_{\alpha},B_{\alpha}) \text{ is binary closed} \text{ and } (A,B)\subseteq(A_{\alpha},B_{\alpha})\}$ . The *binary closure* of (A,B) is then the ordered pair  $((A,B)^{1*}, (A,B)^{2*})$  denoted by b-cl(A,B) in the binary space  $(R,S,\mathcal{M})$  where  $(A,B)\subseteq(R,S)$ . Here it should be emphasized that  $((A,B)^{1*}, (A,B)^{2*})$  is *binary closed* and  $(A,B)\subseteq((A,B)^{1*}, (A,B)^{2*})$ .

**Definition 2.5 [1]:** Assume that  $(A,B) \subseteq (R,S)$  where  $(R,S,\mathcal{M})$  be a binary topological space. Let us say  $(A,B)^{\circ} = \cup \{A_{\alpha}: (A_{\alpha},B_{\alpha})\}$  is *binary open* and  $(A_{\alpha},B_{\alpha}) \subseteq (A,B)$  and  $(A,B)^{2^{\circ}} = \cup \{B_{\alpha}: (A_{\alpha},B_{\alpha}) \text{ is$ *binary open* $and <math>(A_{\alpha},B_{\alpha}) \subseteq (A,B)\}$ . Then The *binary interior* of (A,B) is then the ordered pair  $((A,B)^{1^{\circ}}, (A,B)^{2^{\circ}})$  which is represented by *b-int*(A,B). In this case,  $((A,B)^{1^{\circ}}, (A,B)^{2^{\circ}}) \subseteq (A,B)$ .

**Definition 2.6 [1]:** Consider  $(R, S, \mathcal{M})$  be a binary topological space and assume that  $(A, B) \subseteq (R, S)$ . Define  $\mathcal{M}_{(A, B)} = \{(A \cap U, B \cap V) : (U, V) \in \mathcal{M}\}$ . Then  $\mathcal{M}_{(A, B)}$  is a binary topology from A to B and the binary topological space  $(A, B, \mathcal{M}_{(A, B)})$  is called a binary subspace of  $(R, S, \mathcal{M})$ .

**Definition 2.7 [3]:** (i) A binary topological space  $(R, S, \mathcal{M})$  is referred to as a *binary*- $T_0$  space if it contains  $(A, B) \in \mathcal{M}$  such that only one of the following conditions applies for any pair of distinct points  $(a_1,b_1)$ ,  $(a_2,b_2) \in R \times S$ . (1)  $(a_1,b_1) \in (A,B)$ ,  $(a_2,b_2) \in (R - A, S - B)$  (2)  $(a_1,b_1) \in (R - A, S - B)$ ,  $(a_2,b_2) \in (A,B)$ .

(ii) If for every pair of distinct points  $(a_1,b_1)$ ,  $(a_2,b_2) \in R \times S$ , there exists (A,B) and  $(C,D) \in \mathcal{M}$ , with  $(a_1,b_1) \in (A,B)$  and  $(a_2,b_2) \in (C, D)$  such that  $(a_2, b_2) \in (R - A, S - B)$ ,  $(a_1, b_1) \in (R - C, S - D)$  in a binary topological space  $(R,S,\mathcal{M})$ , then this is known as a *binary*- $T_1$  space

(iii) For each pair of distinct points  $(a_1,b_1)$ ,  $(a_2,b_2) \in R \times S$ , if there are mutually disjoint *binary open* sets (A,B) and (C,D) such that  $(a_1,b_1) \in (A,B)$  and  $(a_2,b_2) \in (C,D)$  in a binary topological space  $(R,S,\mathcal{M})$ , then this is referred to as a *binary*- $T_2$  space

## Jayalakshmi and Manonmani

**Definition 2.8 [3]:** If  $(R, S, \mathcal{M})$  is a *binary*- $T_1$  space then a binary topological space  $(R, S, \mathcal{M})$  is referred to as a *binary normal* (or) *binary*- $T_4$  space and for every pair of mutually disjoint *binary closed* sets  $(A_1, B_1)$ ,  $(A_2, B_2)$  there exists a pair of mutually disjoint *binary open* sets  $(U_1, V_1)$ ,  $(U_2, V_2)$  such that  $(A_1, B_1) \subseteq (U_1, V_1)$  and  $(A_2, B_2) \subseteq (U_2, V_2)$ 

**Definition 2.9[1]:** A pair of *binary open* sets (*A*,*B*) and (*C*,*D*) are said to be disjoint if ( $A \cap C$ ,  $B \cap D$ ) = ( $\emptyset$ , $\emptyset$ ). This results in  $A \cap C = \emptyset$  and  $B \cap D = \emptyset$ .

**Definition 2.10[1]:** Let  $(R, S, \mathcal{M})$  be a binary topological space and let  $(a, b) \in R \times S$ . If  $a \in A$  and  $b \in B$  then the binary open set (A, B) is referred to as a binary neighbourhood of (a, b).

**Definition 2.11:** In a binary topological space  $(R, S, \mathcal{M})$ , a subset (A, B) is referred to as

- (i) a *binary regular open* set [5] (briefly *bregular open* set) in (*R*,*S*,*M*) if (*A*,*B*) = *b-int*(*b-cl*(*A*,*B*)) and *binary regular closed* (briefly *bregular closed* set) if (*A*,*B*)=*b-cl*(*b-int*(*A*,*B*)).
- (ii) a binary semi open set [4] (briefly <sup>b</sup>semi open set) in (R,S,M) if b-int (b-cl(A,B))⊆(A,B) and its compliment is called a binary semi closed set (briefly <sup>b</sup>semi closed set) in (R,S,M)

**Definition 2.12[5]:** In a binary topological space  $(R, S, \mathcal{M})$  assume  $(A, B) \subseteq (R, S)$ . If there is a  ${}^{b}\beta$  - open set (U, V) in  $(R, S, \mathcal{M})$  such that b- $rcl(A, B) \subseteq (U, V)$  whenever  $(A, B) \subseteq (U, V)$ , then (A, B) is is referred to as *a binary*  $r\beta$  - *closed* set (briefly  ${}^{b}r\beta$  - *closed* set) in  $(R, S, \mathcal{M})$ .

The compliment of the above *binary*  $r\beta$  - *closed* set is a *binary*  $r\beta$  - *open* set in (*R*,*S*,*M*).

## BINARY $r\beta$ - $T_0$ , BINARY $r\beta$ - $T_1$ , BINARY $r\beta$ - $T_2$ SPACES

We introduce the idea of *binary*  $r\beta$  -  $T_0$ , *binary*  $r\beta$  -  $T_1$ , *binary*  $r\beta$  -  $T_2$  and *binary*  $r\beta$  - *normal spaces* (briefly  ${}^{b}r\beta$  -  $T_0$ ,  ${}^{b}r\beta$  -  $T_1$ ,  ${}^{b}r\beta$  -  $T_2$  and  ${}^{b}r\beta$  - *normal spaces*) in this chapter and look at some of its characterizations.

**Definition 3.1:** If for any pair of unique points  $(a_1,b_1)$ ,  $(a_2,b_2)\in R\times S$ , there exists a  ${}^br\beta$  - *open* set (A, B) such that precisely one of the following holds, the binary topological space  $(R,S,\mathcal{M})$  is referred to as a *binary*  $r\beta$  -  $T_0$  space (briefly  ${}^br\beta$  - $T_0$ ) (i)  $(a_1,b_1)\in(A,B)$ ,  $(a_2,b_2)\in(R-A,S-B)$  (ii)  $(a_1,b_1)\in(R-A,S-B)$ ,  $(a_2,b_2)\in(A,B)$ .

**Definition 3.2:** A binary topological spaces  $(R, S, \mathcal{M})$  is referred to as a *binary*  $r\beta - T_1$  *space* (briefly  ${}^{b}r\beta - T_1$ ) if for any pair of unique points  $(a_1, b_1)$ ,  $(a_2, b_2) \in R \times S$ , it contains  ${}^{b}r\beta - open$  sets (A, B) and (C, D) with  $(a_1, b_1) \in (A, B)$  and  $(a_2, b_2) \in (C, D)$  such that  $(a_2, b_2) \in (R - A, S - B)$ ,  $(a_1, b_1) \in (R - C, S - D)$ .

**Definition 3.3:** If there are disjoint  ${}^{b}r\beta$  - *open* sets (*A*,*B*) and (*C*,*D*) such that (a<sub>1</sub>,b<sub>1</sub>) $\in$ (*A*,*B*) and (a<sub>2</sub>,b<sub>2</sub>) $\in$ (*C*,*D*) for any pair of unique points (a<sub>1</sub>,b<sub>1</sub>), (a<sub>2</sub>,b<sub>2</sub>) $\in$ *R*×*S* then a binary topological spaces (*R*,*S*,*M*) is said to be a *binary*  $r\beta$  -*T*<sub>2</sub> *space* (briefly  ${}^{b}r\beta$  -*T*<sub>2</sub>)

#### **Theorem 3.4**: Every ${}^{b}r\beta$ -T<sub>0</sub> space is binary -T<sub>0</sub> space, in a binary topological space (R,S, $\mathcal{M}$ )

**Proof:** Consider (R,S) be a  ${}^{b}r\beta$  - $T_{0}$  space and consider  $(a_{1},b_{1})$  and  $(a_{2},b_{2})$  be a pair of unique points in (R,S). There is a  ${}^{b}r\beta$  - open set (A,B) such that  $(a_{1},b_{1})\in(A,B)$  and  $(a_{2},b_{2})\in(R-A,S-B)$  since (R,S) is a binary- $T_{0}$  space. Due to the fact that any  ${}^{b}r\beta$  -open set is binary open, (A,B) is also a binary open set such that  $(a_{1},b_{1})\in(A,B)$  and  $(a_{2},b_{2})\in(R-A,S-B)$ . (R,S) is a binary - $T_{0}$  space as a result.

**Remark 3.5:** The following example demonstrates that the converse of the aforementioned theorem is false.

**Example 3.6:** Consider  $R = \{a,b\}$  and  $S = \{1,2,3\}$ . Clearly  $\mathcal{M} = \{(\emptyset,\emptyset), (\{\emptyset,\{1\}), (\emptyset,\{3\}), (\emptyset, \{1,2\}), (\{\emptyset,\{1,3\}), (\{\emptyset,S), (\{a\},\{1,2\}), (\{a\},\{1,3\}), (\{a\},S), (\{b\},\emptyset), (\{b\},\{1\}), (\{b\},\{3\}), (\{b\},\{1,2\}), (\{b\}, S), (R,\{1\}), (R,\{1,2\}), (R,\{1,3\}), (R,S)\}$  is a binary topology from R to S. Here  ${}^{b}r\beta$  - open sets in (R,S) are  $\{(\emptyset,\emptyset), (\emptyset,\{1\}), (\emptyset,\{3\}), (\{a\},\{1,2\}), (\{a\},S), (\{b\},\emptyset), (\{b\},\{3\}), (\{b\},\{3\}), (\{b\},\{3\}), (\{b\},\{3\}), (\{b\},\{3\}), (\{b\},\{3\}), (\{b\},\{3\}), (\{b\},\{3\}), (R,\{1,2\}), (R,\{1,3\}), 

# Jayalakshmi and Manonmani

 $(a_2,b_2)\in(R,S)$  and  $(a_1,b_1) \neq (a_2,b_2)$  there is a *binary open* set  $(A,B) = (\{a\},\{1\})$  which is not a  ${}^{b}r\beta$ -open set such that  $(a_1,b_1)\in(A,B)$  and  $(a_2,b_2)\in(R-A,S-B)$ . (R,S) is *binary*  $-T_0$  space but not a  ${}^{b}r\beta$   $-T_0$  space as a result.

# **Theorem 3.7:** Every ${}^{b}r\beta$ - $T_1$ space is binary - $T_1$ space in a binary topological space ( $R,S,\mathcal{M}$ ).

**Proof:** Let (R,S) be a  ${}^{b}r\beta - T_1$  space and let  $(a_1,b_1)$  and  $(a_2,b_2)$  be a pair of unique points in (R,S) with  $a_1 \neq a_2$ ,  $b_1 \neq b_2$ . Then distinct  ${}^{b}r\beta - open$  sets (A,B) and (C,D) exist such that  $(a_1,b_1) \in (A, B)$ ,  $(a_2,b_2) \in (R-A,S-B)$  and  $(a_2,b_2) \in (C,D)$ ,  $(a_1,b_1) \in (R-C, S-D)$ . Due to the fact that every  ${}^{b}r\beta - open$  set is *binary open*, (A,B) and (C,D) are two different *binary open* sets with  $(a_1,b_1)$  and  $(a_2,b_2)$  corresponding to(A,B) and (C,D) respectively such that  $(a_2,b_2) \in (R-A,S-B)$ ,  $(a_1,b_1) \in (R-C, S-D)$ . (R,S) is hence a *binary*  $-T_1$  space.

**Remark 3.8:** The following example demonstrates that the converse of the aforementioned theorem is false. **Example 3.9:** From the Example 3.6, Let  $(A,B) = (\{b\}, \{1, 2\})$  and  $(C,D) = (\{a\}, \{1,3\})$ . Let  $(a_1,b_1) = (\{a\}, \{1\})$  and  $(a_2,b_2) = (\{b\}, \{1,2\})$  where  $(a_1,b_1), (a_2,b_2) \in (R,S)$  and  $(a_1,b_1) \neq (a_2,b_2)$  then it is clear that  $(a_1,b_1) \in (A,B), (a_2,b_2) \in (R-A,S-B)$  and  $(a_2,b_2) \in (C, D)$  and  $(a_1,b_1) \in (R-C,S-D)$ . Then it is *binary* -*T*<sub>1</sub> space but not a  ${}^{b}r\beta$  -*T*<sub>1</sub> space.

**Theorem 3.10**: Every  ${}^{b}r\beta - T_{2}$  space is a binary  $-T_{2}$  space in a binary topological space (*R*, *S*, *M*).

**Proof:** Assume  $a_1 \neq a_2$ ,  $b_1 \neq b_2$  in the  ${}^{b}r\beta - T_2$  space (*R*,*S*). If so there are disjoint  ${}^{b}r\beta$  -open sets (*A*,*B*) and (*C*,*D*) that are such that  $(a_1,b_1) \in (A,B)$  and  $(a_2,b_2) \in (C,D)$ . The fact that (A, B) and (C,D) are disjoint *binary open* sets means that  $(a_1,b_1) \in (A,B)$  and  $(a_2,b_2) \in (C,D)$ . This is because every  ${}^{b}r\beta$  -open set is *binary open*. (*R*,*S*) is a *binary* -*T*<sub>2</sub> space as a result.

**Example 3.11:** From the Example 3.6, Let  $(a_1, b_1) = (\{b\}, \{3\})$  and  $(a_2, b_2) = (\{a\}, \{2\})$ . Let  $(A, B) = (\{a\}, \{1, 2\})$  and  $(C, D) = (\{b\}, \{3\})$  where  $(a_1, b_1)$ ,  $(a_2, b_2) \in (R, S)$  and  $(a_1, b_1)$  ( $a_2, b_2$ ) then it is clear that  $(a_2, b_2) \in (A, B)$ , and  $(a_1, b_1) \in (C, D)$ . Then we can say that it is  ${}^{b}r\beta - T_2$  space. As every  ${}^{b}r\beta$ - open set is binary open, (R, S) is a binary- $T_2$  space.

**Theorem 3.12:** Every  ${}^{b}r\beta$  - $T_{1}$  space is a  ${}^{b}r\beta$  - $T_{0}$  space in a binary topological space (*R*,*S*,*M*).

**Proof:** Let  $(a_1,b_1)$  and  $(a_2,b_2)$  be two unique points of a  ${}^{b}r\beta - T_1$  space (R,S). Given that (R,S) is  ${}^{b}r\beta - T_1$  space there are  ${}^{b}r\beta$  open sets (A,B) and (C,D) with  $(a_1,b_1)\in(A,B)$  and  $(a_2,b_2)\in(C,D)$  such that  $(a_2,b_2)\in(R-A,S-B)$ ,  $(a_1,b_1)\in(R-C,S-D)$ . As  $(a_1,b_1)\in(A,B)$  and  $(a_2,b_2)\in(R-A,S-B)$ ,  ${}^{b}r\beta - T_1$  space is a  ${}^{b}r\beta - T_0$  space.

**Theorem 3.13:** Every  ${}^{b}r\beta - T_2$  space is a  ${}^{b}r\beta - T_0$  space in a binary topological space (*R*,*S*, *M*). **Proof:** Let (*R*,*S*) be a  ${}^{b}r\beta - T_2$  space and let (a<sub>1</sub>,b<sub>1</sub>) and (a<sub>2</sub>,b<sub>2</sub>) be two unique points of (*R*,*S*). Since (*R*,*S*) is  ${}^{b}r\beta - T_2$  space there exist  ${}^{b}r\beta$ -open sets (*A*,*B*) and (*C*,*D*) such that (a<sub>1</sub>,b<sub>1</sub>) $\in$ (*A*,*B*) and (a<sub>2</sub>,b<sub>2</sub>)  $\in$  (*C*,*D*). Due to the disjoint nature of (*A*,*B*) and (*C*,*D*) such that (a<sub>1</sub>,b<sub>1</sub>) $\in$ (*A*,*S* – *B*), (*R*,*S*) is a  ${}^{b}r\beta$ -*T*<sub>0</sub> space as a result.

**Theorem 3.14:** Every  ${}^{b}r\beta - T_2$  space is a  ${}^{b}r\beta - T_1$  space in a binary topological space  $(R, S, \mathcal{M})$ . **Proof:** Suppose that  $(R, S, \mathcal{M})$  is a  ${}^{b}r\beta - T_2$  space with  $(a_1, a_2) \in R$  and  $(b_1, b_2) \in S$  with  $a_1 \bigoplus a_2$ ,  $b_1 \bigoplus b_2$ . Then there are disjoint  ${}^{b}r\beta - open$  sets  $(U_1, V_1)$ ,  $(U_2, V_2)$  with  $(a_1, b_1) \in (U_1, V_1)$ ,  $(a_2, b_2) \in (U_2, V_2)$ . We have  $(a_1, b_1) \in (R - U_2, S - V_2)$  and  $(a_2, b_2) \in (R - U_1, S - V_1)$ , since  $(U_1, V_1)$  and  $(U_2, V_2)$  are disjoint. As can be seen  $(R, S, \mathcal{M})$  is a  ${}^{b}r\beta - T_1$  space.

**Theorem 3.15:** A binary topological space (R, S,  $\mathcal{M}$ ) is a  ${}^{b}r\beta$  - $T_{0}$  space if and only if *binary*  $r\beta$  *closure* of unique points is distinct.

**Proof:** Let (a<sub>1</sub>,b<sub>1</sub>) and (a<sub>2</sub>,b<sub>2</sub>) be two unique points of (*R*,*S*). There exists a  ${}^{b}r\beta$  - *open* set (*U*,*V*), since (*R*,*S*) is a  ${}^{b}r\beta$  -*To* space such that (a<sub>1</sub>,b<sub>1</sub>) $\in$ (*U*<sub>1</sub>,*V*<sub>1</sub>) and (a<sub>2</sub>,b<sub>2</sub>) $\in$ (*R* -*U*<sub>2</sub>, *S* -*V*<sub>2</sub>). In light of this, ((*R*,*S*) - (*U*, *V*)) is a  ${}^{b}r\beta$  - *closed* set that includes (a<sub>2</sub>,b<sub>2</sub>) but excludes (a<sub>1</sub>,b<sub>1</sub>). But all  ${}^{b}r\beta$  - *closed* set containing (a<sub>2</sub>,b<sub>2</sub>) are intersected by  ${}^{b}r\beta$ -*cl*({a<sub>2</sub>,b<sub>2</sub>}). Consequently (a<sub>2</sub>,b<sub>2</sub>) $\in$   ${}^{b}r\beta$ -*cl*({a<sub>2</sub>,b<sub>2</sub>}). On the other hand (a<sub>1</sub>,b<sub>1</sub>)  $\prod_{i} {}^{b}r\beta$ -*cl*({a<sub>2</sub>,b<sub>2</sub>}) as (a<sub>1</sub>,b<sub>1</sub>)  $\prod_{i} {}^{(I)}(R,S)$ -(*U*,*V*)). Therefore  ${}^{b}r\beta$ -*cl*({a<sub>1</sub>,b<sub>1</sub>})  $\prod_{i} {}^{b}r\beta$ -*cl*({a<sub>2</sub>,b<sub>2</sub>}) and hence *binary*  $r\beta$  *closure* of unique points are distinct.

# Jayalakshmi and Manonmani

Conversely, let  ${}^{b}r\beta$ - $cl(\{a_1,b_1\})$   $pr\beta$ - $cl(\{a_2,b_2\})$  for  $(a_1,b_1)$   $(a_2,b_2)$ . Then at least one point  $(a_3,b_3)\in(R,S)$  exists such that  $(a_3,b_3)\in {}^{b}r\beta$ - $cl(\{a_1,b_1\})$  but  $(a_3,b_3)$   $(a_2,b_2)$ . We assert that  $(a_1,b_1)$   $(a_2,b_2)$  because this would implies that  ${}^{b}r\beta$ - $cl(\{a_1,b_1\})\subseteq {}^{b}r\beta$ - $cl(\{a_2,b_2\})$  and so  $(a_3,b_3)\in {}^{b}r\beta$ - $cl(\{a_2,b_2\})$ , which is a contradiction. Because of this  $(a_1,b_1)$   $(a_2,b_2)$ , which implies that  $(a_1,b_1)\in(R,S) - {}^{b}r\beta$ - $cl(\{a_2,b_2\})$ , which is a  ${}^{b}r\beta$  - open set includes  $(a_1,b_1)$  but excludes  $(a_2,b_2)$ . Therefore (R,S) is a  ${}^{b}r\beta$  - $T_0$  space.

**Theorem 3.16:** A binary topological space  $(R, S, \mathcal{M})$  is a  ${}^{b}r\beta - T_{1}$  space if and only if every binary point is  ${}^{b}r\beta - closed$ . **Proof:** Consider  $(R, S, \mathcal{M})$  to be a  ${}^{b}r\beta - T_{1}$  space. Let  $(r, s) \in R \times S$  and let $(\{r\}, \{s\}) \in \wp(R) \times \wp(S)$ . We must demonstrate that  $(\{r\}, \{s\})$  is  ${}^{b}r\beta - closed$ . For that, it is sufficient to demonstrate that  $(R - \{r\}, S - \{s\})$  is  ${}^{b}r\beta - open$ . Let  $(a, b) \in (R - \{r\}, S - \{s\})$ . This suggests that  $a \in R - \{r\}$  and  $b \in R - \{s\}$ . Thus a  $\prod_{i=1}^{b} r_{i}$  and b  $\prod_{i=1}^{b} s_{i}$ . That is (a, b) and (r, s) are distinct binary points of  $R \times S$ . Given that  $(R, S, \mathcal{M})$  is  ${}^{b}r\beta - T_{1}$ , there are  ${}^{b}r\beta - open$  sets (A, B) and (C, D),  $(a, b) \in (A, B)$  and  $(r, s) \in (C, D)$  such that  $(a, b) \in (R - (R, S - D))$  and  $(r, s) \in (R - A, S - B)$ . Consequently  $(A, B) \subseteq (R - \{r\}, S - \{s\})$ . Therefore the binary neighbourhood of (a, b) is  $(R - \{r\}, S - \{s\})$ . This suggests that  $(\{r\}, \{s\})$  is  ${}^{b}r\beta$  closed.

Conversely, assume that  $(\{r\}, \{s\})$  is always  ${}^{b}r\beta$  - *closed* for  $(r, s)\in R\times S$ . With a  $a_2,b_1$   $b_2$ , let  $(a_1,b_1)$  and  $(a_2,b_2)\in R\times S$ . As a result  $(a_2,b_2)\in (R-\{a_1\},S-\{b_1\})$  and  $(R-a_1\},S-\{b_1\})$  is  ${}^{b}r\beta$  - *open*. Also  $(a_1,b_1)\in (R-\{a_2\}, S-\{b_2\})$  and  $(R-\{a_2\}, S-\{b_2\})$  are  ${}^{b}r\beta$  - *open*. As can be seen  $(R,S,\mathcal{M})$  is a  ${}^{b}r\beta$  -  $T_1$  space.

**Theorem 3.17:** If a binary topological space  $(R, S, \mathcal{M})$  is a  ${}^{b}r\beta - T_{0}$  space then  $(R, \mathcal{M}_{R})$  and  $(S, \mathcal{M}_{S})$  are  $r\beta - T_{0}$  spaces. **Proof:** We have  $\mathcal{M}_{R} = \{A \subseteq R : (A, B) \in \mathcal{M} \text{ for some } B \subseteq S\}$  is a topology on R and  $\mathcal{M}_{S} = \{B \subseteq S : (A, B) \in \mathcal{M} \text{ for some } A \subseteq R\}$  is a topology on S, because  $\mathcal{M}$  is a binary topology from R to S. With all  $a_{2}$ ,  $b_{1}$   $b_{2}$ , let  $(a_{1},a_{2}) \in R$  and  $(b_{1},b_{2}) \in S$ . There exists  $r\beta - open$  set (A, B) such that either  $(a_{1},b_{1}) \in (A,B)$ ,  $(a_{2},b_{2}) \in (R-A,S-B)$  or  $(a_{1},b_{1}) \in (R-A,S-B)$ ,  $(a_{2},b_{2}) \in (A,B)$ , because  $(R,S,\mathcal{M})$  is a  ${}^{b}r\beta - T_{0}$  space. This suggests that either  $a_{1}\in A$ ,  $a_{2}\in R-A$ ,  $b_{1}\in B$ ,  $b_{2}\in S-B$  or  $a_{1}\in R-A$ ,  $a_{2}\in A$ ,  $b_{1}\in S-B$ ,  $b_{2}\in B$ . Therefore  $(R,\mathcal{M}_{R})$  and  $(S,\mathcal{M}_{S})$  are  $r\beta - T_{0}$  spaces.

**Theorem 3.18:** If a binary topological space  $(R, S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$  is a  ${}^{b}r\beta - T_{0}$  space, then the topological spaces  $(R, \tau)$  and  $(S, \sigma)$  are  $r\beta - T_{0}$  spaces.

**Proof:** Assume that  $(R, S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$  is a  ${}^{b}r\beta - T_{0}$  space. With at  $\Box a_{2}$ , by  $\Box b_{2}$ , let  $(a_{1}, a_{2}) \in R$  and  $(b_{1} b_{2}) \in S$ . Since  $(R, S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$  is a  ${}^{b}r\beta - T_{0}$  space, There exists  $(A, B) \in \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S)$  such that either  $(a_{1}, b_{1}) \in (A, B)$ ,  $(a_{2}, b_{2}) \in (R - A, S - B)$  or  $(a_{1}, b_{1}) \in (R - A, S - B)$ ,  $(a_{2}, b_{2}) \in (A, B)$ , because  $(R, S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$  is a  ${}^{b}r\beta - T_{0}$  space. This suggests that either  $a_{1} \in A$ ,  $a_{2} \in R - A$ ,  $b_{1} \in B$ ,  $b_{2} \in S - B$  or A,  $a \in R - A$ ,  $a_{2} \in A$ ,  $b_{1} \in S - B$ ,  $b_{2} \in S - B$  or  $b_{1} \in S - B$ ,  $b_{2} \in B$ . Since  $(A, B) \in \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S)$ , we have  $A \in \tau$  and  $B \in \sigma$ . Hence  $(R, \tau)$  and  $(S, \sigma)$  are  $r\beta - T_{0}$  spaces.

**Theorem 3.19:** If a binary topological space  $(R, S, \mathcal{M})$  is a  ${}^{b}r\beta - T_1$  space then  $(R, \mathcal{M}_R)$  and  $(S, \mathcal{M}_S)$  are  $r\beta - T_1$  spaces. **Proof:** Since  $\mathcal{M}$  is a binary topology from R to S, we have  $\mathcal{M}_R = \{A \subseteq R : (A, B) \in \mathcal{M} \text{ for some } B \subseteq Y\}$  is a topology on R and  $\mathcal{M}_S = \{B \subseteq S : (A, B) \in \mathcal{M} \text{ for some } A \subseteq R\}$  is a topology on S. Let us say  $(a_1, a_2) \in R$  and  $(b_1, b_2) \in S$  where  $a_1 \bigsqcup_{i=1}^{n} a_{i=2}, b_1 \bigsqcup_{i=1}^{n} b_{i=2}$ . There are  ${}^{b}r\beta - open$  sets  $(U_1, V_1)$ ,  $(U_2, V_2)$  with  $(a_1, b_1) \in (U_1, V_1)$ ,  $(a_2, b_2) \in (U_2, V_2)$ , such that  $(a_1, b_1) \in (R - U_2, S - V_2)$ ,  $(a_2, b_2) \in (R - U_1, S - V_1)$ , because  $(R, S, \mathcal{M})$  is a  ${}^{b}r\beta - T_1$  space. The implication is that  $a_1 \in U_1$ ,  $a_2 \in U_2$  and  $b \in V_1$ ,  $b_2 \in V_2$  are such that  $a_1 \in R - U_2$ ,  $a_2 \in R - U_1$  and  $b_1 \in S - V_2$ ,  $b_2 \in S - V_1$ . As a result,  $(R, \mathcal{M}_R)$  and  $(S, \mathcal{M}_S)$  are  $r\beta - T_1$  spaces.

# BINARY $r\beta$ – NORMAL SPACE

Using  $br\beta$  - open sets we introduce binary  $r\beta$  - normal space in this section and examine some of its characteristics.

**Definition 4.1:** A binary topological spaces  $(R, S, \mathcal{M})$  is called a *binary*  $r\beta$  - *normal space* (briefly  ${}^{b}r\beta$  - *normal*) if  $(R, S, \mathcal{M})$  is  ${}^{b}r\beta$  -  $T_{1}$  and for every pair of mutually disjoint  ${}^{b}r\beta$  - *closed* sets  $(A_{1}, B_{1})$ ,  $(A_{2}, B_{2})$  there exists mutually disjoint  ${}^{b}r\beta$  - *open* sets  $(U_{1}, V_{1})$ ,  $(U_{2}, V_{2})$  such that  $(A_{1}, B_{1}) \subseteq (U_{1}, V_{1})$  and  $(A_{2}, B_{2}) \subseteq (U_{2}, V_{2})$ 

# Jayalakshmi and Manonmani

**Example 4.2:** From the Example 3.6, Let  $(A_1, B_1) = (\{a\}, \{1\})$  and  $(A_2, B_2) = (\{b\}, \{3\})$  are mutually disjoint  ${}^{b}r\beta$  - *closed* sets . Let  $(U_1, V_1) = (\{a\}, \{1, 2\})$  and  $(U_2, V_2) = (\{b\}, \{1, 3\})$  Here  $(a_1, b_1) = (\{a\}, \{1, 2\}), (a_2, b_2) = (\{b\}, \{1, 3\}) \in (R, S)$  and  $(a_1, b_1) = (a_2, b_2) = (\{b\}, \{1, 3\}) \in (R, S)$  and  $(a_1, b_1) = (a_2, b_2)$ 

**Theorem 4.3:** A  ${}^{b}r\beta$  - *closed* subspace of  ${}^{b}r\beta$  - *normal space* is a  ${}^{b}r\beta$  – *normal space*.

**Proof:** Let (M,N) be a  ${}^{b}r\beta$  - *closed* subspace of a  ${}^{b}r\beta$  *normal space*. Let  $(A_1,B_1)$  and  $(A_2,B_2)$  be disjoint  ${}^{b}r\beta$  - *closed* subset of (M,N). Because (M,N) is  ${}^{b}r\beta$  - *closed* in (R,S), the *closed* subsets  $(A_1,B_1)$  and  $(A_2,B_2)$  are also  ${}^{b}r\beta$  - *closed* in (R,S). The fact rhat (R,S) is  ${}^{b}r\beta$  - *normal*, means that there are disjoint  ${}^{b}r\beta$  - *open* sets  $(U_1,V_1)$  and  $(U_2,V_2)$  in (R,S), such that  $(A_1,B_1)\subseteq (U_1,V_1)$  and  $(A_2,B_2)\subseteq (U_2,V_2)$ . Since both  $(A_1,B_1)$  and  $(A_2,B_2)$  contained in (M,N), we obtain  $(A_1,B_1)\subseteq (M,N)\cap (U_1,V_1)$ ,  $(A_2,B_2)\subseteq (M,N)\cap (U_2,V_2)$  and  $((M,N)\cap (U_1,V_1))\cap (M,N)\cap (U_2,V_2) = (\emptyset,\emptyset)$ . Due to the fact that  $(U_1,V_1)$  and  $(U_2,V_2)$  are  ${}^{b}r\beta$  - *open* in (R,S),  $(M,N)\cap (U_1,V_1)$  and  $(M,N)\cap (U_2,V_2)$  are  ${}^{b}r\beta$  - *open* in (M,N). Thus in the subspace (M,N), we have disjoint  ${}^{b}r\beta$  - *open* sets  $((M,N)\cap (U_1,V_1))$  containing  $(A_1,B_1)$  and  $((M,N)\cap (U_2,V_2))$  containing  $(A_2,B_2)$ . Consequently the subspace (M,N) is  ${}^{b}r\beta$  - *normal*.

**Theorem 4.4:** The topological spaces  $(R,\tau)$  and  $(S,\sigma)$  are  $r\beta$ -normal spaces if and only if the binary topological space  $(R,S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$  is a  ${}^{b}r\beta$ -normal space.

**Proof:** Assume  $(R,\tau)$  and  $(S,\sigma)$  are  $r\beta$  - normal spaces and  $(A_1,B_1)$  and  $(A_2,B_2)$  be disjoint pair of  ${}^{b}r\beta$  - closed sets in  $(R,S,\mathcal{M})$ . Then  $A_1,A_2$  are disjoint  $r\beta$ - closed sets in  $(R,\tau)$  and  $B_1,B_2$  are disjoint  $r\beta$  - closed sets in  $(S,\sigma)$ . Since  $(R,\tau)$  is  $r\beta$  - normal, there exists disjoint  $r\beta$ - open sets in  $U_1,U_2\in\tau$ ,  $A_1\subseteq U_1$  and  $A_2\subseteq U_2$ . Also, since  $(S,\sigma)$  is  $r\beta$ -normal, there exists disjoint  $r\beta$ - open sets  $V_1,V_2\in\sigma$ ,  $B_1\subseteq V_1$  and  $B_2\subseteq V_2$ . This implies that  $(A_1,B_1)\subseteq (U_1,V_1)$  and  $(A_2,B_2)\subseteq (U_2,V_2)$ . Because  $U_1$  and  $U_2$  are disjoint  $r\beta$ - open sets, we have  $U_1\cap U_2 = \emptyset$ . Also since  $V_1$  and  $V_2$  are disjoint  $r\beta$ - open sets, we have  $V_1\cap V_2 = \emptyset$ . Thus  $(U_1\cap U_2,V_1\cap V_2) = (\emptyset, \emptyset)$ . Therefore  $(U_1,V_1)$  and  $(U_2,V_2)$  are disjoint  ${}^{b}r\beta$  -open sets that  $(R,S, \tau, \mathcal{M}(R)\times\sigma, \mathcal{M}(S))$  is a  ${}^{b}r\beta$  -normal space.

Conversely, assume that  $(R,S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$  is  ${}^{b}r\beta$ -normal. Let  $A_1, A_2$  be disjoint  $r\beta$ -closed sets in  $(R,\tau)$  and  $B_1, B_2$  be disjoint  $r\beta$ -closed sets in  $(S,\sigma)$ . Then  $(A_1, B_1)$ ,  $(A_2, B_2)$  are  ${}^{b}r\beta$ -closed in  $(R,S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$ . Because of  $(R,S, \tau \mathcal{M}(R) \times \sigma \mathcal{M}(S))$  is  ${}^{b}r\beta$ -normal space, there are disjoint  ${}^{b}r\beta$ -open sets  $(U_1, V_1)$  and  $(U_2, V_2)$  such that  $(A_1, B_1) \subseteq (U_1, V_1)$  and  $(A_2, B_2) \subseteq (U_2, V_2)$ . That is,  $A_1 \subseteq U_1$ ,  $A_2 \subseteq U_2$  and  $B_1 \subseteq V_1$ ,  $B_2 \subseteq V_2$ . Therefore  $(R, \tau)$  and  $(S, \sigma)$  are  $r\beta$ -normal spaces.

# ABSTRACT

In this paper, we introduce the concept "2-antidomatic number of a graph". A set  $S \subseteq V(G)$  is said to be a 2- non dominating set if at least two vertices in V - S are not adjacent to any vertex in S. A partition of the vertices of G into 2- non dominating sets is called 2-antidomatic partition of G. The minimum order of a 2-antidomatic partition is called 2-antidomatic number of G and is denoted by  $\overline{d_2}(G)$ . Here we discuss many results along with some standard type of graphs of this new parameter.

Keywords: Non dominating set, 2- non dominating set, Antidomatic number, 2- antidomatic number.

# INTRODUCTION

Here we have to consider the finite, simple and undirected graph *G* with maximum degree  $\Delta(G) < n - 2$ . Let *x* be any vertex of *G*. Then the open neighborhood of *x* is denoted by N(x), defined by  $N(x) = \{u \in V(G): xu \in E(G)\}$ . The closed neighborhood of *x* is denoted by N[x], defined by  $N[x] = \{x\} \cup N(x)$ . Let  $S \subseteq V(G)$ . Then the open neighborhood of *S* is denoted as N(S), defined as  $N(S) = \bigcup_{x \in S} N(x)$ . The closed neighborhood of *S* is denoted as N(S), defined as  $N(S) = \bigcup_{x \in S} N(x)$ . The closed neighborhood of *S* is denoted as N[S], defined as  $N(S) = \bigcup_{x \in S} N(x)$ . The closed neighborhood of *S* is denoted as N[S], defined as  $N(S) = \bigcup_{x \in S} N(x)$ . The closed neighborhood of *S* is denoted as a adjacent to some vertex in *S* [3]. A partition of the vertices of *G* into dominating sets is called a domatic partition of *G*. In 4, Zelinka B, introduced the concept of "antidomatic number of a graph". An antidomatic partition of *G* is a partition of *V*(*G*), none of whose classes is a dominating set in G. The minimum number of classes of an antidomatic partition of *G* as  $S \subseteq V(G)$  is said to be a 2- non dominating set if a tleast two vertices in V - S are not adjacent to any vertex in *S*. A partition of the vertices of *G* into 2- non dominating sets is called 2-antidomatic partition of *G*. The

Ponnuchamy *et al.*,

minimum order of a 2-antidomatic partition is called 2-antidomatic number of *G* and is denoted by  $\overline{d_2}(G)$ . In this paper, we initiate a study of this parameter.

#### 2- Antidomatic Number

#### **Definition: 2.1**

A set  $S \subseteq V(G)$  is said to be a 2-non dominating set if at least two vertices in V - S are not adjacent to any vertex in S. A partition of the vertices of G into 2-non dominating sets is called 2- antidomatic partition of G. The minimum order of a 2- antidomatic partition is called 2- antidomatic number of G and is denoted by  $\overline{d_2}(G)$ .

#### Example: 2.2

Consider the graph *G*,

Figure 1 (Graph with 7 vertices and 7 edges)

Here  $S_1 = \{v_1, v_3, v_4, v_5\}$  and  $S_2 = \{v_2, v_6, v_7\}$  are 2-non dominating sets of *G* with  $S_1 \cup S_2 = V(G)$  and  $S_1 \cap S_2 = \emptyset$ . Hence  $\overline{d_2}(G) = 2$ .

#### Remark: 2.3

If *G* is a graph with  $\Delta(G) < n - 2$  and  $n \ge 5$ , then  $\overline{d_2}(G)$  exists. Theorem: 2.4 For any graph G,  $2 \le \overline{d_2}(G) \le n$ . **Proof:** Since the vertex set V(G) is a 2-non dominating set of G,  $\overline{d_2}(G) \neq 1$  hence  $\overline{d_2}(G) \geq 2$  and since |V(G)| = n,  $\overline{d_2}(G) \leq n$ . Theorem: 2.5 For a path  $P_n$ ,  $n \ge 6$ ,  $\overline{d_2}(P_n) = 2$ . **Proof:** Let  $P_n = (v_1, v_2, \dots, v_n), n \ge 6$  and let  $S_1 = \{v_1, v_2, \dots, v_{n-3}\}, S_2 = \{v_{n-2}, v_{n-1}, v_n\}$ . It is clear that  $S_1$  and  $S_2$  are 2non dominating sets of  $P_n$ . Also  $S_1 \cup S_2 = V(P_n)$  and  $S_1 \cap S_2 = \emptyset$ . Hence  $(S_1, S_2)$  is a 2-antidomatic partition of  $P_n$ . Thus  $\overline{d_2}(P_n) = 2$ . Remark: 2.6  $\overline{d_2}(P_5) = 3.$ Theorem: 2.7 For a cycle  $C_n$ ,  $n \ge 8$ ,  $\overline{d_2}(C_n) = 2$ . **Proof:** Let  $C_n = (v_1, v_2, \dots, v_n, v_1), n \ge 8$  and let  $S_1 = \{v_1, v_2, \dots, v_{n-4}\}, S_2 = \{v_{n-3}, v_{n-2}, v_{n-1}, v_n\}$ . It is clear that  $S_1$  and  $S_2$  are 2-non dominating sets of  $C_n$ . Also  $S_1 \cup S_2 = V(C_n)$  and  $S_1 \cap S_2 = \emptyset$ . Hence  $(S_1, S_2)$  is a 2-antidomatic partition of  $C_n$ . Thus  $\overline{d_2}(C_n) = 2$ . Remark: 2.8  $\overline{d_2}(C_5) = 5$ ,  $\overline{d_2}(C_6) = \overline{d_2}(C_7) = 3$ . Theorem: 2.9 If rad(G) = 1, then  $\overline{d_2}(G)$  does not exist

Ponnuchamy et al.,

#### **Proof:**

Given rad(G) = 1. Then there is a vertex u in G, which is adjacent to every vertex in G. That is  $\Delta(G) = n - 1$ . By the remark 2.3,  $\overline{d_2}(G)$  does not exist.

#### Theorem: 2.10

For any graph  $G(\cong K_{r,s}; r \neq 3, s \neq 3), \overline{d_2}(G) = n$  if and only if rad(G) = diam(G) = 2. Proof:

Let  $G(\not\cong K_{r,s}; r \neq 3, s \neq 3)$  be a graph of order  $n \ge 5$ . Assume that  $\overline{d_2}(G) = n$ . It is clear that  $rad(G) \ge 2$ . Suppose rad(G) > 2, then every vertex in *G* has at least eccentricity 3. Let *u* and *v* be two distinct vertices of *G* and let  $P: u = v_1, v_2, \ldots, v_r = v(r \ge 4)$  be a u - v path in *G*. If  $r \ge 5$ , then  $\{v_1, v_2\}$  is a 2-non dominating set of *G* and hence any minimum 2-antidomatic partition contains at most n - 1 classes. Hence  $r \le 4$ . If r = 4, since  $n \ge 5$ , there exist a vertex x is adjacent to either p or p. Without loss of generality we assume  $p \in GG$ . If  $p \notin GG$  then  $\{p, q\}$  is a 2- non dominating set of *G* if  $p \notin GG$  then there exists a vertex x is non adjacent to any one of the vertices of x, p and  $v_3$ , then either  $\{v_1, x_1\}$  or  $\{v_1, v_2\}$  is a 2- non dominating set and hence any minimum 2-antidomatic partition contains at most n - 1 classes. Thus  $\overline{d_2}(G) \le n - 1$ . This is a contradiction. Hence rad(G) = 2. Suppose diam(G) > 2. Let  $P: u_1, u_2, \ldots, u_s = v_1(s \ge 4)$  be a  $u_1 - v_1$  path in *G* where  $d(u_1, v_1) = diam(G)$ . If  $s \ge 5$ , then  $\{u_1, u_2\}$  is a 2-non dominating set of *G* and hence any minimum 2-antidomatic partition contains at most n - 1 classes. Thus  $d_2(G) \le n - 1$ . This is a contradiction. Hence rad(G) = 2. Suppose diam(G) > 2. Let  $P: u_1, u_2, \ldots, u_s = v_1(s \ge 4)$  be a  $u_1 - v_1$  path in *G* where  $d(u_1, v_1) = diam(G)$ . If  $s \ge 5$ , then  $\{u_1, u_2\}$  is a 2-non dominating set of *G* and hence any minimum 2-antidomatic partition contains at most n - 1 classes. Hence  $s \le 4$ . If s = 4, since  $n \ge 5$ , there exist a vertex  $x_1$  is adjacent to either  $u_2$  or  $u_3$ . Without loss of generality we assume  $u_2x_1 \in E(G)$ . If  $x_1u_3 \notin E(G)$ , then  $\{u_1, x_1\}$  is a 2- non dominating set of *G*. If  $x_1u_3 \in E(G)$ , then there exists a vertex  $x_2$  is non adjacent to any one of the vertices of  $x_1, u_2$  and  $u_3$ , then either  $\{u_1, x_1\}$  or  $\{u_1, u_2\}$  is a 2- non dominating set and hence any minimum 2-an

Conversely let as assume that rad(G) = diam(G) = 2.

Suppose there is a set *S* with  $|S| \ge 2$  is a 2-non dominating set in *G*. Let  $u, v \in S$ . Then there exists two vertices  $x, y(x \ne y)$  in V - S are non-adjacent to any vertex in *S*. If  $uv \in E(G)$ , then  $d(u, x) \ge 2$  and  $d(v, x) \ge 2$ . Suppose  $xy \in E(G)$ , then either d(u, y) > 2 or d(v, y) > 2. Hence diam(G) > 2. Suppose  $xy \notin E(G)$ , then either d(u, y) > 2 or d(v, y) > 2. Hence diam(G) > 2. Suppose  $xy \notin E(G)$ , then either d(u, y) > 2 or d(v, y) > 2. Hence diam(G) > 2. Suppose  $xy \notin E(G)$ , then either d(u, y) > 2 or d(v, y) > 2. Hence diam(G) > 2. Thus any set *S* with  $|S| \ge 2$  is not a 2-non dominating set. Hence every singleton set is a 2-non dominating set in *G*,  $\overline{d_2}(G) = n$ .

#### Theorem: 2.11

For a complete bipartite graph  $K_{r,s}$ ,  $r \ge 4$  and  $s \ge 4$ ,  $\overline{d_2}(K_{r,s}) = 4$ .

#### **Proof:**

Let  $K_{r,s}$  be a complete bipartite graph with bipartition  $\{V_1, V_2\}$  where  $V_1 = \{u_1, u_2, \ldots, u_r\}$  and  $V_2 = \{v_1, v_2, \ldots, vs, r \ge 4, s \ge 4$  and let  $S1 = u1, u2, \ldots, ur - 2$ , S2 = ur - 1, ur,  $S3 = v1, v2, \ldots, vs - 2$ ,  $S4 = \{vs - 1, vs\}$ . It is clear that  $S_1, S_2, S_3, S_4$  are 2-non dominating set of  $K_{r,s}$ . Also  $S_1 \cup S_2 \cup S_3 \cup S_4 = V(K_{r,s})$  and  $S_i \cap S_j = \emptyset, i, j = 1, 2, 3, 4$  and  $i \neq j$ . Hence  $(S_1, S_2, S_3, S_4)$  is a 2-antidomatic partition of  $K_{r,s}$ . Thus  $\overline{d_2}(K_{r,s}) \le 4$ . Suppose  $\overline{d_2}(K_{r,s}) < 4$ .

Case:1 If  $\overline{d_2}(K_{r,s}) = 3$ , then there exists three disjoint set of vertices  $X_1, X_2$  and  $X_3$  are 2- non dominating sets in  $K_{r,s}$ . Then either any one of  $X_i = V_j$ , i = 1,2,3; j = 1,2 or there exists one  $X_i$  contains some vertices in  $V_1$  and some vertices in  $V_2$ . Hence any one  $X_i$  is a dominating set. This is a contradiction.

Case: 2 If  $\overline{d_2}(K_{r,s}) = 2$ , then there exists two disjoint set of vertices  $X_1$  and  $X_2$  are 2- non dominating sets in  $K_{r,s}$ . Then either any one of  $X_i = V_j$ , i = 1,2; j = 1,2 or there exists one  $X_i$  contains some vertices in  $V_1$  and some vertices in  $V_2$ . Hence any one  $X_i$  is a dominating set. This is a contradiction. Thus  $\overline{d_2}(K_{r,s}) \ge 4$ . Hence  $\overline{d_2}(K_{r,s}) = 4$ .

#### Theorem: 2.12

For a graph *G*, if  $\overline{d_2}(G) = 2$ , then  $diam(G) \ge 3$ .

#### **Proof:**

Assume that  $\overline{d_2}(G) = 2$ . Let  $(B_1, B_2)$  be a 2-antidomatic partition of G. Since  $B_1$  is a 2- non dominating set, there exists two vertices in  $B_2$  has no neighbor in  $B_1$ . Let  $u_1, u_2 \in B_2$  such that  $N(u_i) \cap B_1 = \emptyset$ , i = 1, 2. Also since  $B_2$  is a 2- non

## Ponnuchamy *et al.*,

dominating set, there exists two vertices in  $B_1$  has no neighbor in  $B_2$ . Let  $v_1, v_2 \in B_1$  such that  $N(v_i) \cap B_2 = \emptyset$ , i = 1, 2. It is clear that  $u_1$  is not adjacent to  $v_1$ ,  $d(u_1, v_1) \neq 1$ . Suppose  $d(u_1, v_1) = 2$ . Then  $(u_1, u, v_1)$  is a  $u_1 - v_1$  path. Since  $u_1$  has no neighbor in  $B_1, u \in B_2$ . Also since  $v_1$  has no neighbor in  $B_2, u \in B_1$ . Then  $u \in B_1 \cap B_2$ , which is a contradiction. Hence  $d(u_1, v_1) \geq 3$ . Thus  $diam(G) \geq 3$ .

#### Theorem: 2.13

For a graph *G*, if  $diam(G) \ge 5$ , then  $\overline{d_2}(G) = 2$ . **Proof:** 

Assume that  $diam(G) \ge 5$ . Let  $(u = u_1, u_2, u_3, \dots, u_t = v); t \ge 6$  be a u - v path in G with d(u, v) = diam(G). Let  $A = \{u_{t-1}, u_t\}$ , let X = N[A] and let Y = V - N[A]. Then (X, Y) is a 2- antidomatic partition of G with minimum order. Hence  $\overline{d_2}(G) = 2$ .

#### Theorem: 2.14

Let  $G \neq C_5$  be a graph on *n* vertices. Then  $\left\lfloor \frac{n}{n-1-\delta(G)} \right\rfloor \leq \overline{d_2}(G) \leq \Delta(G) + 3$ .

#### **Proof:**

Let *A* be a 2-non dominating set of G. Then there exists two vertices  $x(\neq)y$  in V - A are not adjacent to any vertex in *A*. Thus  $d(x) \leq n - 1 - |A|$ . Also  $n - 1 - |A| \geq \delta(G)$ . Thus  $|A| \leq n - 1 - \delta(G)$ . Let  $(V_1, V_2, V_3, \ldots, V_k)$  be a 2-antidomatic partition of order *k* with  $\overline{d_2}(G) = k$ . Then  $n = |V_1| + |V_2| + \ldots + |V_k| \leq k(n - 1 - \delta)$ . Thus  $\frac{n}{n-1-\delta} \leq k = \overline{d_2}(G)$  and hence  $\overline{d_2}(G) \geq \left\lfloor \frac{n}{n-1-\delta} \right\rfloor$ . By the remark 2.3,  $\Delta(G) < n - 2$ . Let *u* be the vertex of *G* such that  $d(u) = \Delta(G)$ , let  $N[u] = \{u, u_1, u_2, u_3, \ldots, u_{\Delta}\}$ . Let B = V(G) - N[u]. Since  $\Delta < n - 2$ , we have  $B \neq \emptyset$  and  $|B| \geq 2$ . Then at least two vertices of *B* are non-adjacent to u,  $\{u\}$  is a 2-non dominating set. Suppose  $u_i$  is adjacent to remaining  $u_j$  and some vertices in *B*, then  $d(u_i) \geq \Delta + 1$ . This is a contradiction. Hence  $u_i$  is non-adjacent to some vertices in  $u_j$  or all the vertices in *A*. Suppose  $u_i$  is non-adjacent to  $u_r$  and  $u_i$  is adjacent to  $u_k$ ,  $1 \leq k \leq \Delta$  and  $k \neq i, r$ . Then  $u_i$  is adjacent to at most one vertex in *B*,  $\{u_i\}$  is a 2- non dominating set. If  $u_i$  is not adjacent to *B*, then  $\{u_i\}$  is a 2- non dominating set. Suppose  $|B| \geq 3$ . If there is a vertex  $x \in B$  is adjacent to all  $u'_j$  s, then  $d(x) = \Delta$ . Thus *x* is non adjacent to every vertex in *B*. Then  $(\{u, x\}, \{u_1\}, \{u_2\}, \ldots, \{u_{\Delta}\}, B - \{x\})$  is a 2- antidomatic partition of *G*. Suppose |B| = 2. Let  $B = \{x, y\}$ . If  $|N(B) \cap N(u)| \leq \Delta - 1$ , then *B* is a 2- non dominating set. Hence the partition  $(\{u, \{u_1, \{u_1\}, \{u_2\}, \ldots, \{u_{\Delta}\}, B)$  is a 2- antidomatic partition of *G*. If  $|N(B) \cap N(u)| = \Delta$ .

# Case: i

If *x* is adjacent to every  $u_j$ 's and *y*, then  $d(x) > \Delta$ , which is impossible.

#### Case: ii

If x is adjacent to every  $u_j$ 's and non-adjacent to y, then  $(\{u\},\{u_1\},\{u_2\},\ldots,\{u_{\Delta}\},\{x\},\{y\})$  is a 2-antidomatic partition of G.

#### Case: iii

If x and y are non-adjacent to some  $u_j$ 's, then ( $\{u\}, \{u_1\}, \{u_2\}, \ldots, \{u_{\Delta}\}, \{x\}, \{y\}$ ) is a 2-antidomatic partition of *G*. Thus  $\bar{d}_2(G) \leq \Delta(G) + 3$ .

#### Theorem: 2.15

For any connected graph *G* on *n* vertices,  $\overline{d_2}(G) = n$  if and only if  $\Delta(G) = n - 3$ .

#### **Proof:**

Given *G* is a connected graph on *n* vertices. Assume that  $\overline{d_2}(G) = n$ , then every singleton set is a 2- non dominating set in *G*.

#### Claim: $\Delta = n - 3$ .

We know that for any graph *G* with  $\Delta < n - 2$ , then  $\overline{d_2}(G)$  exists. Hence  $\Delta(G) \le n - 3$ .

Suppose assume that  $\Delta(G) < n - 3$ . Let u be any vertex of G such that  $d(u) = \Delta$ . Then  $N[u] = \{u, u_1, u_2, \ldots, u_{\Delta}\}$ . Since every singleton set is a 2- non dominating set,  $\{u\}$  is a 2- non dominating set. Let  $v_1$  and  $v_2$  be any two vertices are not adjacent to u. Let  $A = N[v_1] \cap (V - N[u])$  and  $B = N[v_2] \cap (V - N[u])$ . Since  $v_1 \in A$  and  $v_2 \in B$ . Without loss of generality we may assume that  $A \cap B = \emptyset$ .

# Ponnuchamy *et al.*,

Claim: *A* is a 2- non dominating set.

Suppose *A* is not a 2- non dominating set. Then either *A* is a dominating set or *A* is a non dominating set.

**Case: 1** *A* is a dominating set.

By the definition of domination, u is adjacent to some vertex in A. This is a contradiction. (since u is adjacent to  $u_i$  only).

**Case: 2** *A* is non dominating set.

By the definition non domination, there exists a vertex s in V - A is not adjacent to any vertex in A.

Case: a  $s \neq u$ . In this case u is adjacent some vertex in A. This is a contradiction to the case:1.

Case: b s = u.

Then the vertex  $v_2$  is adjacent to some vertices in A. This implies that  $A \cap B \neq \emptyset$ . This is the contradiction to our assumption. Suppose there is a vertex  $l \neq u$  in V - A is not adjacent to any vertex in A, then A is a 2- non dominating set which is a contradiction. Thus A is a 2- non dominating set. Similarly B is a 2- non dominating set. Therefore the partition  $S = (\{u\}, \{u_1\}, \{u_2\}, \ldots, \{u_{\Delta}\}, A, B)$  is a 2-antidomatic partition of G. Since  $d(u) = \Delta$  gives that u is not adjacent to at least 3 vertices. This implies that either  $|A| \ge 2$  or  $|B| \ge 2$ .

Hence  $|S| \le n - 1$ . Thus  $\overline{d_2}(G) \le n - 1$ , which is a contradiction to our assumption Hence  $\Delta = n - 3$ .

Conversely let us assume that  $\Delta = n - 3$ .

Claim:  $\overline{d_2}(G) = n$ 

Suppose  $\overline{d_2}(G) < n$ . Then any 2 –antidomatic partition contains at most n - 1 classes. Let v be a vertex of G such that  $d(v) = \Delta$  and let  $N(v) = \{v_1, v_2, v_3, \ldots, v_{n-3}\}$ . Also  $V - N(v) = \{v, v_{n-2}, v_{n-1}\}$ . This implies that  $S = (\{v\}, \{v_1\}, \{v_2\}, \{v_3\}, \ldots, \{v_{n-1}\})$  is a 2- antidomatic partition of G and it contains n classes. This is a contradiction to our assumption. Hence  $\overline{d_2}(G) \ge n$ . Also for any connected graph  $G, \overline{d_2}(G) \le n$ . Thus  $\overline{d_2}(G) = n$ . Corollary: 2.16

For any connected graph *G*,  $\overline{d_2}(G) = \Delta + 3$  if and only if rad(G) = diam(G) = 2.

# ABSTRACT

The Ranked set sampling is one of the conventional testing techniques utilized for cost decrease and getting more delegated test determination in overviews. At the point when the issue of heterogeneity happens in the population, utilization of delineation is suggested in writing to expand the effectiveness of assessors. Within the sight of heterogeneity and anomalies (outrageous qualities), Stratified Ranked Set Sampling (StRSS) has been proposed. This article proposes another ranked set sampling strategy to appraise the Operating Characteristic Curve, Average Outgoing Quality Curve, and Average Total Inspection using the Stratified Ranked Set Sampling techniques. Reading up the sample portion for corresponding and ideal is two notable strategies in separated examining. It additionally shows the fixed benefit of testing costs in strata. The outcomes for small and medium sample sizes show that StRSS beats its rival methods for both wonderful and defective rankings. A genuine informational index is likewise considered to concentrate on the exact meaning of the recently proposed inspecting system.

# INTRODUCTION

In ongoing many years, sampling with ranked sets (RSS) has drawn in a lot of examination interest. McIntyre proposed the idea of RSS in 1952 for assessing the typical rummage and field yields. McIntyre noticed that RSS is considerably more compelling than SRS when it is simpler to rank perceptions. As of late, RSS has been utilized related to other sampling plans, as the last phase of testing in multi-stage plans, or in stratified sampling designs. The accuracy of a simple random sampling gauge relies on the size of the sample and the changeability of the population. The size of the sample can't be unduly expanded: subsequently, the best way to build the accuracy of the gauge is to devise a strategy that will really decrease the sample size. One such strategy is known as the technique of Stratified Random Sampling (StRS). It follows that it will upgrade the accuracy of the gauge since every stratum inside itself will be more homogeneous than the whole population. Samawi (1996) presented the idea of Delineated Positioned Set Examining (StRSS) and Nematollahi et al. (2008) utilized Ranked Set Sampling in the second phase of a two-stage group testing plan to work on the accuracy of the population mean gauge. While separated testing plans are to be utilized, one key inquiry that must be promptly tended to is the number of perceptions that ought to be taken in every stratum. The response to this question is vital in light of the fact that the sample size is a significant component for surmising the population in view of test information.

# SAMPLE SIZE ALLOCATIONS

In Stratified Sampling, the distribution of the sample to various strata is the assurance of the size of the sample to be chosen from every stratum, is finished by the thought of these elements viz, i) Stratum size or the total number of units in the Stratum, ii) The variability within the Stratum and iii) The cost of taking observation per sampling unit in the Stratum. A decent portion is where the greatest accuracy is gotten with most extreme assets, That standard of designation is to limit the complete expense for a given difference or limit the fluctuation for a proper expense, In this manner utilizing accessible assets, two strategies for distribution of test size to various Layers are i) Proportional Allocation and ii) Optimum Allocation.

While planning a sample overview of a stratified population, one of the significant contemplations is the manner by which to designate the all-out sample size 'n' among the 'L' recognized strata. On the off chance that unit changes or expenses of inspecting vary among the strata, testing effectiveness can be expanded by over-sampling the variable. Thus, the sample fashioner may choose to limit the fluctuation of assessment for a predetermined expense of taking the sample or to limit the expense for a predefined worth of the difference of the assessment. This allocation technique is depicted as "Optimum allocation". On the off chance that the sampling division is similar in all strata, the delineation is depicted as a definition with relative designation. This portion is utilized to guarantee that the dispersion of the sample in subpopulations (strata) is a "proportional allocation" to their size. With this foundation, corresponding and ideal portions in StRSS for Logistic distribution are described.

#### **Proportional Allocation:**

According to the description of proportional sample allocation in StRSS, the number of sample units in the  $h^{th}$  stratum (h = 1, 2..., L) is proportional to the stratum size, that is

$$\frac{N_h}{N} \Rightarrow n_h = \frac{n}{N} N_h$$

(1)

Where  $N_h$  is the number of sampling units in the  $h^{th}$  stratum (h= 1,2, 3,...L),  $n_h$  is the number of sampling units selected from the  $h^{th}$  stratum,

#### **Optimum Allocation:**

Let  $c_h$ , h = 1, 2..., L be the cost of sampling for a unit in stratum h. The costs can differ substantially between strata. Assume  $n_{0h} = m_h n_h$  be the sample size from  $h^{th}$  stratum in StRSS with  $m_h$  cycles in  $h^{th}$  stratum. The total cost of the survey can be taken as  $C = c_0 + \sum_{h=1}^{L} c_h m_h n_h$  (Co is the fixed cost, Ch is the cost per unit in the  $h^{th}$  stratum). This relation is a linear cost function and co is a fixed cost of sampling. Suppose to minimize the variance of the mean estimator for

## Deveka and Saranya

a specified cost C and minimize the cost for a specified variance of the mean estimator, let us consider the two cases, whether an odd or even number of sample units were selected from each stratum in each cycle.

Therefore,  $n_h = \frac{N_h s_h}{\sum_{h=1}^L N_h s_h} * n$ 

(2)

Where  $N_h$  is the number of sampling units in the  $h^{th}$  stratum (h= 1,2, 3,..., L),  $n_h$  is the number of sampling units selected from the  $h^{th}$  stratum,  $S_i$  is the population mean of the  $h_{th}$  stratum.

#### STRATIFIED RANKED SET SAMPLING (StRSS)

In the stratified sampling method, the population of N units is divided into L non-overlapping subpopulations each of N<sub>1</sub>, N<sub>2</sub>,..., N<sub>L</sub> units, respectively, and N<sub>1</sub>+ N<sub>2</sub>+...+N<sub>L</sub>= N. These subpopulations are called strata. For full benefit from stratification, the size of the h<sup>th</sup> subpopulation, denoted by N<sub>h</sub> for 1, 2,...,L, must be known. Then the samples are drawn independently from each stratum, producing sample sizes denoted by n<sub>1</sub>, n<sub>2</sub>,...,n<sub>L</sub>, such that the total sample size is n = $\sum_{h=1}^{L} n_h \sum_{h=1}^{L} rm_h$ . Where 'r' is the number of cycles, m<sub>h</sub> is the number of selected units in each stratum and cycle, and m is the number of selected units in each cycle. If the ranked set sample is taken from each stratum, the whole process is described as StRSS.

The following notations were used for the stratified ranked set sample when the ranking is on the variable X. For the h<sup>th</sup> cycle and the h<sup>th</sup> stratum, the StRSS is denoted by  $(Y_{h[1]i}, X_{h(1)i}), (Y_{h[2]i}, X_{h(2)i}), \dots, (Y_{h[rh]i}, X_{h(rh)i})$ : i= 1, 2, ..., m; h = 1, 2,

 $\ldots$ , L}, where  $Y_{h[i]k}$  is the i<sup>th</sup> Judgment ordering in the i<sup>th</sup> set for the study variable and  $X_{h(i)k}$  is the i<sup>th</sup> order statistic in the i<sup>th</sup> set for the auxiliary variable. The element of the favoured RSS pattern will be inside the shape:

# {X [m+1/2, m]ih ; i= 1,2,...m, h=1,2,....,L} m is odd

 ${X[m/2;m]ih, X[m+2/2;m]kh; i=1,2,...,m/2; k=m+2/2,....m, h= 1,2,...L} m is even$ 

Where X[m+1/2,m]ih is the (m+1)  $t^h$  judgment order statistics of the  $it^h$  random sample of size m in the h th cycle. It should be noted that all of X[m+1/2,m]ih 's are mutually independent and identically distributed. Now, based on the RSS scheme the distribution function, in general, will be:

$$\mathbf{f}_{\text{RSS}}(\mathbf{x}) = \begin{cases} \frac{1}{rm} \sum_{j=1}^{r} \prod_{i=1}^{m} f_{(m+1/2)\mathbf{i}}(\mathbf{x}) & \text{m is odd} \\ \\ \frac{1}{rm} \sum_{j=1}^{r} \prod_{i=1}^{m/2} f_{(m/2)\mathbf{i}}(\mathbf{x}) + \mathbf{f}_{(m+2/2)\mathbf{i}}(\mathbf{x}) & \text{m is even} \end{cases}$$

Equivalently to:

 $f_{RSS}(x) = \begin{cases} \frac{1}{rm} \prod_{i=1}^{m} f_{(m+1/2)i}(x) & m \text{ is odd} \\ \\ \frac{1}{rm} \prod_{i=1}^{m/2} f_{(m/2)i}(x) + f_{(m+2/2)i}(x) & m \text{ is even} \end{cases}$ 

The i<sup>th</sup> order statistic is given by,  $f_{X(i)}(x) = \frac{n!}{(i-1)!(n-i)} (F(x))^{i-1} (1 - F(x))^{n-i}, -\infty < x < \infty$ 

therefore,  $F_{X(i)} = (F(x))^{i\cdot 1} (1-F(x))^{n\cdot i}$ ,  $-\infty < \chi < \infty$ Therefore, Stratified Ranked Set Sampling is given by  $F_{StRSS(x)} = (F(x))^m (1-F(x))^m$  (4)

Most investigations of positioned insights have been ranked data by assessing the population mean. In any case, none of the past research thought about any of the StRSS idea in the acceptance sampling context, this article could be considered as a new contribution in this practical research area.

#### CHARACTERIZATION OF THE LOGISTIC DISTRIBUTIONS UNDER StRSS

In this portion, the appropriations could be fundamentally dependent on the StRSS. The effect of the shape parameter on the distribution structure under StRSS using Logistic distribution is obtained as

$$\mathbf{f}_{\text{StRSS}}(\mathbf{x}) = \left[\frac{e^{-(x-\mu/s)}}{[1+e^{-(x-\mu)/s}]^2}\right]^m \left[1 - \frac{e^{-(x-\mu/s)}}{[1+e^{-(x-\mu)/s}]^2}\right]^m$$

(5)

# **OPERATING CHARACTERISTIC (OC) CURVE**

Connected with each sampling plan there is an OC curve that portrays the show of the testing plan against perfect and bad quality. The probability that a ton will be recognized under a given sampling plan which is shown by Pa(p) and a plot of Pa(p) against a given worth of part or interaction quality p will yield the OC curve. For one-of-a-kind explanation plans the OC curve, is a curve showing the probability of continuing to permit the communication to happen without change as a component of the interaction quality.

The curve plots the probability of accepting the lot (Pa) versus the lot fraction defective (p)

$$Pa = P\{d \le c\} = \sum_{i=0}^{c} p^{i} 1 - p^{n-i}$$
(6)

Logistic distribution for StRSS will be

$$Pa = \sum_{i=0}^{c} \left[ \frac{e^{-(x-\mu/s)}}{s[1+e^{-(x-\mu)/s]^2}]} \right]^{i} \left[ 1 - \frac{e^{-(x-\mu/s)}}{s[1+e^{-(x-\mu)/s]^2}]} \right]^{(n-i)}$$
(7)

## Table 1: The OC Curve Values for Logistic Distribution using StRSS

The given table shows the OC curve values for StRSS using Logistic distribution for N<sub>1</sub>=1200, N<sub>2</sub>= 1800, N<sub>3</sub> = 1600, N<sub>4</sub> = 1400, m = 20, s= 4.44, r= 1, 2, 3, 4, 5, 6, n= 50, 100, 150, 200, 250,300 and n<sub>h</sub>= 12, 18, 16, 14. The following figure-1and figure-2 shows the OC Curve for Logistic distribution using StRSS (Proportional and Optimum) for the acceptance number c=0, N<sub>1</sub>=1200, N<sub>2</sub>= 1800, N<sub>3</sub> = 1600, N<sub>4</sub> = 1400, m = 20, s= 4.44, r= 1, 2, 3, 4, 5, 6, n= 50, 100, 150, 200, 250,300 and n<sub>h</sub>= 12, 18, 16, 14.

It shows the impact of expanded sample size on the OC curve. We note that each plan utilizes the equivalent percent deficient which can be considered an acknowledgment parcel, the OC curve becomes more extreme and lies nearer to the beginning as the sample size increments.

**AVERAGE OUTGOING QUALITY (AOQ)** - An ordinary technique, while inspecting and testing is nonunfortunate, is to 100 percent survey excused lots and replaces all defectives with extraordinary units. For this present circumstance, all excused parts are made wonderful and the principal distortions left are those in lots that were acknowledged. AOQs insinuate the excessively long blemish level for this united LASP (Lot Acceptance Sampling Plan) and 100 percent assessment of the excused parts process. In the event that all parts come in with a deformity level of precisely p, and the OC curve for the picked (n, c) LASP demonstrates a probability Pa of tolerating such a lot, for a really long time the AOQ can undoubtedly be demonstrated to be:

# $AOQ = \frac{Pa(p)(N-n)}{N}$

(8)

Where N is the lot size have given expressions for AOQ to different policies adopted for Stratified Ranked Set Sampling (StRSS). In this research, AOQ is approximated as p \* Pa(p).

# Table 2: The AOQ Values for Logistic Distribution using StRSS

The given table shows the AOQ values for StRSS using Logistic distribution for  $N_1$ =1200,  $N_2$ = 1800,  $N_3$  = 1600,  $N_4$  = 1400, m = 20, s = 4.44, r = 1, 2, 3, 4, 5, 6, n = 50, 100, 150, 200, 250,300 and nh = 12, 18, 16, 14.

The following figure-4 and figure-5 shows the AOQ Curve for Logistic distribution using StRSS (Proportional and Optimum) for the acceptance number c=0,  $N_1$ =1200,  $N_2$ = 1800,  $N_3$  = 1600,  $N_4$  = 1400, m = 20, s= 4.44, r= 1, 2, 3, 4, 5, 6, n=

# Deveka and Saranya

50, 100, 150, 200, 250,300 and  $n_h$ = 12, 18, 16, 14. For the acceptance sampling plan i in which correction isn't finished, the AOQ is equivalent to the approaching quality. Thus, when the lot is either acknowledged or dismissed, the AOQ is equivalent to the nature of the submitted part.

#### AVERAGE TOTAL INSPECTION (ATI)

Right when excused lots are 100% explored, it is easy to work out the ATI if parts come dependably with a disfigurement level of ' p'. For a Lot Acceptance Sampling Plan (n, c) with a probability Pa of enduring a lot with disfigurement level p, one can have

ATI=n+(1-Pa)(N-n)

Where N is the lot size, n is the sample size.

(9)

## Table 3: The ATI Values for Logistic Distribution using StRSS

Table 3 shows the ATI values for StRSS using Logistic distribution for  $N_1$ =1200,  $N_2$ = 1800,  $N_3$  = 1600,  $N_4$  = 1400, m = 20, s= 4.44, r= 1, 2, 3, 4, 5, 6, n= 50, 100, 150, 200, 250,300 and nh= 12, 18, 16, 14.

The following figure-6 and figure-7 shows the ATI Curve for Logistic distribution using StRSS (Proportional and Optimum) for the acceptance number c=0, s=4.44, m=20, r= 1, 2, 3, 4, 5, 6 and sample size n=50, 100, 150, 200, 250 and 300. The curve drawn between ATI and the lot quality (p) is known as ATI curve. A typical ATI curve for a single sample plan is shown for n= 50,100, 150, 200, 250 and 300.

#### PRACTICAL APPLICATION

The plastic chair manufacturing company is working on 4 shift bases, every shift has 6 hours, the first shift has produced 1200 chairs, the second shift produced 1800 chairs, the third shift produced 1600 chairs and the fourth shift produced 1400 chairs per day. End of the day, the manufacturing company produces chairs in lots (N) of 5000 by using Stratified Ranked Set Sampling (StRSS) method, distributed by Logistic distribution. Then, the scale parameter (s) is 4.44, sample set size (m) is 50 and the cycle size (r) is 3. The quality of incoming lot is 0.020 and acceptance numbers are 0 and 1. Find out the sample allocation for Proportional and Optimum.

#### **EXPLANATION**

It is given that the plastic chair manufacturing company has produced 1200 Plastic chairs in shift 1 (N<sub>1</sub>), 1800 in shift 2 (N<sub>2</sub>), 1600 in shift 3 (N<sub>3</sub>) and 1400 in shift 4 (N<sub>4</sub>). The lot size of the plastic chair company is 5000 (i.e., N = N<sub>1</sub>+N<sub>2</sub>+N<sub>3</sub>+N<sub>4</sub>). The sample size of plastic chairs m =50 and sample cycle size r = 3 (specified by the producer). Hence, n= m\*r (150 = 50\*3). Using StRSS, the lots (N) is divided by 4 strata. The first stratum (N<sub>1</sub>) contains 1200 chairs, the second stratum (N<sub>2</sub>) contains 1800 chairs, the third stratum (N<sub>3</sub>) contains 1600 chairs and the fourth stratum (N<sub>4</sub>) contains 1400 chairs. For a fixed lot quality p = 0.020, the value of the parameter (s) is 4.44. Then [*m*,*r*]<sub>*ij*</sub> is the (m,*r*)<sup>*th*</sup> order statistics of the *i*<sup>*th*</sup> random sample of size m in the *j*<sup>*th*</sup> cycle. In a sample of n=150 specimens selected from a lot of plastic chairs manufacturing company, using StRSS the allocation of the sample sizes for different strata is done in the following ways: a) Proportional allocation and b) Optimum allocation. If X≤c, the lot is accepted, otherwise reject the lot and inform the management for further action.

In Proportional allocation, If X represents the number of defective plastic chairs in the sample, Then if X=0 the probability of accepting the lot Pa(p) is 0.77, AOQ is 0.76, ATI is 1198. If X=1 the probability of accepting the lot Pa(p) is 0.77, AOQ is 0.77, AOQ is 0.77, ATI is 1169. In Optimum allocation, If X represents the number of defective chairs in the sample, Then if X=0 the probability of accepting the lot Pa(p) is 0.67, AOQ is 0.67, AOQ is 0.66, ATI is 1684. If X=1 the probability of accepting the lot Pa(p) is 0.67, ATI is 1684. If X=1 the probability of accepting the lot Pa(p) is 0.67, ATI is 1684. If X=1 the probability of accepting the lot Pa(p) is 0.67, ATI is 1660.

Deveka and Saranya

CONCLUSION

In this study, an efficient and easily applicable Stratified Ranked Set Sampling (StRSS) procedure has been proposed for estimating OC Curve, AOQ, and ATI. Real life data set has also been presented to illustrate the relative efficiency of StRSS over its competitor procedures. It concludes that the proposed Stratified Ranked Set Sampling has performed better toward small and persistent shifts detection at small values of smoothing parameters. The StRSS performance by Logistic distributions is far better. It is recommended for future research to propose some ratio, product, regression and exponential type generalized estimators under StRSS for estimating population parameters under heterogeneous environment. This procedure will also be recommended to use in monitoring of location and scale parameters with control chart schemes such as Shewhart, EWMA, CUSUM and also, this study can be extended further for the various parameters such as AQL, LQL, IQL, AOQL, MAPD and MAAOQL. Further it can be extended to Double Sampling Plan, Multi-stage Sampling Plan, other Special Purpose Plans as Chain Sampling, Skip Plot Sampling Plans as well.

# ABSTRACT

In that paper, the notions of Intuitionistic Multi L-fuzzy subset and Intuitionistic Multi L-fuzzy subgroups are defined and discussed. Intuitionistic Multi L-fuzzy subgroups homeomorphic behavior and inverse homeomorphic images have been discovered. It has been demonstrated some related theorems.

**Keywords:** Intuitionistic Multi L-Fuzzy Subset (IMLFS), Intuitionistic Multi L–Fuzzy Subgroup (IMLFSG), Homomorphism of Intuitionistic Multi L–Fuzzy Subgroup (HIMLFSG).

# INTRODUCTION

The concept of a fuzzy subset A of a set X as a function from X into [0,1] was first developed by L.A. Zadeh [27]. Several studies on the generalization of the idea of fuzzy set were undertaken after L.A. Zadeh introduced the concept of fuzzy set. The terms fuzzy subgroupoid, fuzzy subgroup, fuzzy ideal, and fuzzy homomorphism were initially introduced by Rosenfeld [16]. In addition, he introduced the fuzzy subgroup and fuzzy ideal lattices. As a generalization of the concept of a fuzzy set, Krassimir.T. Attanassov originally proposed the concept of intuitionistic fuzzy sets. Sourier Sebastian and S. Babu Sundar proposed the idea of multi L- fuzzy subgroups [23]. The degree of membership (belongingness) and the degree of non-membership (non-belongingness) of elements of the universe to the intuitionistic fuzzy set are expressed by two functions that make up a fuzzy set. In this article, we define and explain relevant theorems connected to intuitionistic multi-L-fuzzy subgroup under homomorphism and inverse homomorphism.

# Gowrishankar and Akilesh

## PRELIMINARIES

The basic definitions that will be used in the sequel are listed in this section.

## Definition

Let X be any non-empty set. A fuzzy set  $\mu$  of X is  $\mu: X \to [0,1]$ .

## Definition

Let (*G*, .) be a group. A fuzzy subset  $\mu$  of G is said to be L-fuzzy subgroup (LFSG) of G, if the following conditions are satisfied:

(i)  $\mu(xy) \ge \min\{\mu(x), \mu(y)\},\$ 

(ii)  $\mu(x^{-1}) = \mu(x)$ , for all  $x, y \in G$ .

## Definition

Let X be a non-empty set. A Multi L-fuzzy subset (MLFS)  $\mu$  in X is defined as a set of ordered sequences.  $\mu = \{(x, \mu_1(x), \mu_2(x), \dots, \mu_i(x), \dots) : x \in X\}$ , where  $\mu_i : X \to [0,1]$ , for all *i*. Also note that, for all  $i, \mu_i(x)$  is a decreasingly ordered sequence of elements.

ie., $\mu_1(x) \ge \mu_2(x) \ge \dots \ge \mu_i(x) \ge \dots$ , for all  $x \in X$ .

# Definition

A Multi L-fuzzy subset  $\mu$  of a group G is called a Multi L-fuzzy subgroup of G (MLFSG), if

(i)  $\mu(xy) \ge \min\{\mu(x), \mu(y)\},\$ 

(ii)  $\mu(x^{-1}) = \mu(x)$ , for all  $x, y \in G$ .

## Definition

Let X be a non-empty set. An Intuitionistic L-fuzzy subset (ILFS)  $\mu$  of X is an object of the form  $\mu = \{(x, \mu_A(x), \gamma_A(x)): x \in X\}$ , where  $\mu_A: X \to [0,1]$  and  $\gamma_A: X \to [0,1]$ . Define the degree of membership and degree of non-membership of the element  $x \in X$  respectively with

 $0 \le \mu_A(x) + \gamma_A(x) \le 1$ , for all  $x \in X$ .

#### Remark

(a) When  $\mu_A(x) + \gamma_A(x) = 1$ , i.e., when  $\gamma_A(x) = 1 - \mu_A(x) = \mu_A^c(x)$ . Then  $\mu$  is called L-fuzzy set.

(b) We use the notation  $\mu = (\mu_A, \gamma_A)$  to denote the Intuitionistic L-fuzzy subset (ILFS)  $\mu$  of X.

# Definition

Let X be a non-empty set. Let  $\mu = \{(x, \mu_A(x), \gamma_A(x)) : x \in X\}$  in X is defined as a set of ordered sequences. ie.,  $\mu = \{(x, (\mu_{A_1}(x), \mu_{A_2}(x), \dots, \mu_{A_i}(x), \dots), (\gamma_{A_1}(x), \gamma_{A_2}(x), \dots, \gamma_{A_i}(x), \dots)) : x \in X\}$ . Where  $\mu_{A_i} : X \to [0,1], \gamma_{A_i} : X \to [0,1]$  and  $0 \le \mu_{A_i}(x) + \gamma_{A_i}(x) \le 1$  for all *i*.

Here,  $\mu_1(x) \ge \mu_2(x) \ge \dots \ge \mu_i(x) \ge \dots$ , for all  $x \in X$  are decreasingly ordered sequence. Then the set  $\mu$  is said to be an Intuitionistic Multi L-fuzzy subset (IMLFS) of X.

# Remark

Since we arrange the membership sequence in decreasing order, the corresponding non-membership sequence may not be in decreasing or increasing order.

# Definition

An Intuitionistic Multi L-fuzzy subset is of the form

 $\mu = \{(x, (\mu_A(x_1), \mu_A(x_2), \dots, \mu_A(x_i), \dots), (\gamma_A(x_1), \gamma_A(x_2), \dots, \gamma_A(x_i), \dots)\}: x \in X\} \text{ of a group G is said to be Intuitionistic Multi L-fuzzy subgroup of G (IMLFSG) if it satisfies the following: For all$ *x*,*y* $\in G,$ 

# Gowrishankar and Akilesh

- (i)  $\mu_A(x_1x_2x_3\dots x_i\dots) \ge \min\{\mu_A(x_1), \mu_A(x_2), \mu_A(x_3), \dots, \mu_A(x_i), \dots\} \text{ and } \gamma_A(x_1x_2x_3\dots x_i\dots) \le \max\{\gamma_A(x_1), \gamma_A(x_2), \gamma_A(x_3), \dots, \gamma_A(x_i), \dots\},$
- (ii)  $\mu_A(x_i^{-1}) = \mu_A(x_i)$  and  $\gamma_A(x_i^{-1}) = \gamma_A(x_i)$ , for all *i*.

# Homomorphism of an Intuitionistic Multi L-Fuzzy Subgroups (HIMLFSG)

In this section we study about Intuitionistic multi L-fuzzy subgroup under homomorphism.

# Definition

The function  $f: G_1 \to G_2$  is said to be a homomorphism if f(xy) = f(x)f(y), for all  $x, y \in G$ .

# Definition

The function  $f: G_1 \to G_2$  ( $G_1$  and  $G_2$  are not necessarily commutative) is said to be an anti-homomorphism if f(xy) = f(y)f(x), for all  $x, y \in G$ .

# Definition

Let  $G_1$  and  $G_2$  be any two groups. The function  $f:G_1 \rightarrow G_2$  is said to be an multi homomorphism if  $f((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)) = f(x_1x_2x_3\dots x_i)f(y_1y_2y_3\dots y_i)$ , for all  $x_i, y_i \in G_1$ .

# Definition

Let  $G_1$  and  $G_2$  be any two groups. Let  $f: G_1 \to G_2$  be a multi homomorphism and onto. Let  $\mu: G_1 \to L$  and  $\gamma: G_1 \to L$  be an Intuitionistic Multi L-fuzzy subgroups of  $G_1$ .

- (i) Then  $f(\mu)$  is an Intuitionistic Multi L-fuzzy subgroup of a group  $G_2$ , if  $\mu$  has a sup property and  $\mu$  is f *invariant*.
- (ii) Then  $f(\gamma)$  is an Intuitionistic Multi L-fuzzy subgroup of a group  $G_2$ , if  $\gamma$  has a inf property and  $\gamma$  is f *invariant*.

# Theorem

Let  $G_1$  and  $G_2$  be any two groups. Let  $f: G_1 \to G_2$  be a multi homomorphism and onto. Let  $\mu: G_1 \to L$  and  $\gamma: G_1 \to L$  be an Intuitionistic Multi L-fuzzy subgroups of  $G_1$ . Then prove that  $f(\mu)$  and  $f(\gamma)$  are the Intuitionistic Multi L-fuzzy subgroups of a group  $G_2$ , for

- (i) if  $\mu$  has a sup property and  $\mu$  is f *invariant*,
- (ii) if  $\gamma$  has a inf property and  $\gamma$  is f *invariant*.

# Proof

Let  $\mu: G_1 \to L$  and  $\gamma: G_1 \to L$  be an IMLFSG's of  $G_1$ .

(a). To prove that  $f(\mu)$  be an IMLFSG of  $G_2$ 

(i) Let, 
$$f(\mu)((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) = \max \# \mu((x_1x_2x_3....x_i)(y_1y_2y_3....y_i))/\forall x_iy_i \in G_1, f(x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) = x_0y_0\}$$
  

$$= \mu(x_0y_0) \ge \min \{\mu(x_0), \mu(y_0)\}$$

$$\ge \min\{[max(\mu(x_1x_2x_3....x_i)/\forall x_i \in G_1, f(x_1x_2x_3....x_i) = x_0)], [max(\mu(y_1y_2y_3....y_i)/\forall y_i \in G_1, f(y_1y_2y_3....y_i) = y_0)]\}$$

$$\ge \min\{[f(\mu)(x_1x_2x_3....x_i)], [f(\mu)(y_1y_2y_3....y_i)]\}$$
i.e.,  $f(\mu)((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) \ge \min\{[f(\mu)(x_1x_2x_3....x_i)], [f(\mu)(y_1y_2y_3....y_i)]\}$ 
(ii) Let,  $f(\mu)((x_1x_2x_3....x_i)^{-1}) = \max \{\mu(x_1x_2x_3....x_i)/\forall x_i \in G_1, f(x_1x_2x_3....x_i)^{-1}) = x_0\}$ 

$$= \max \{\mu(x_1x_2x_3....x_i)/\forall x_i \in G_1, f(x_1x_2x_3....x_i) = x_0\} \quad [\because By definition 2.7]$$

$$= \mu(x_0)$$

$$= \max \{\mu(x_1x_2x_3....x_i)/\forall x_i \in G_1, f(x_1x_2x_3....x_i) = x_0\}$$
(b). To prove that  $f(\gamma)$  be an IMLFSG of  $G_2$ .
(i) Let,  $f(\gamma)((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) = \min\{Y((x_1x_2x_3....x_i)(y_1y_2y_3....y_i))/\forall x_iy_i \in G_1, f((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) = x_0y_0\}$ 

## Gowrishankar and Akilesh

 $\leq \max\{ \psi(x_{0}), \psi(y_{0}) \} \\ \leq \max\{ [\min\{\gamma(x_{1}x_{2}x_{3} \dots x_{i}) \mid \forall x_{i} \in G_{1}, f(x_{1}x_{2}x_{3} \dots x_{i}) = x_{0} \rangle ], [\min\{\gamma(y_{1}y_{2}y_{3} \dots y_{i}) \mid \forall y_{i} \in G_{1}, f(y_{1}y_{2}y_{3} \dots y_{i}) = y_{0} \rangle ] \} \\ \leq \max\{ [f(\gamma)(x_{1}x_{2}x_{3} \dots x_{i})], [f(\gamma)(y_{1}y_{2}y_{3} \dots y_{i})] \} \\ \text{i.e., } f(\gamma)((x_{1}x_{2}x_{3} \dots x_{i})(y_{1}y_{2}y_{3} \dots y_{i})) \leq \max\{ [f(\gamma)(x_{1}x_{2}x_{3} \dots x_{i})], [f(\gamma)(y_{1}y_{2}y_{3} \dots y_{i})] \} \\ \text{(ii)} \quad \text{Let, } f(\gamma)((x_{1}x_{2}x_{3} \dots x_{i})^{-1}) = \min\{\gamma((x_{1}x_{2}x_{3} \dots x_{i})^{-1}) \mid \forall x_{i}^{-1} \in G_{1}, f((x_{1}x_{2}x_{3} \dots x_{i})^{-1}) = x_{0} \} \\ = \min\{ \psi(x_{1}x_{2}x_{3} \dots x_{i}) \mid \forall x_{i} \in G_{1}, f(x_{1}x_{2}x_{3} \dots x_{i}) = x_{0} \} \quad [\because \text{ By definition 2.7]} \\ = \gamma(x_{0}) \\ = \min\{ \psi(x_{1}x_{2}x_{3} \dots x_{i}) \mid \forall x_{i} \in G_{1}, f(x_{1}x_{2}x_{3} \dots x_{i}) = x_{0} \} \\ \text{i.e., } f(\gamma)((x_{1}x_{2}x_{3} \dots x_{i})^{-1}) = f(\gamma)(x_{1}x_{2}x_{3} \dots x_{i}) \\ \text{Hence, from (a) \& (b) we conclude that } f(\mu) \text{ and } f(\gamma) \text{ are the IMLFSG's of a group } G_{2}. \end{cases}$ 

#### Theorem

Let  $G_1$  and  $G_2$  be any two groups. Let  $f: G_1 \to G_2$  be a multi homomorphism and onto. Let  $\mu: G_2 \to L$  and  $\gamma: G_2 \to L$  be an Intuitionistic Multi L-fuzzy subgroups of a group  $G_2$ . Then prove that  $f^{-1}(\mu)$  and  $f^{-1}(\gamma)$  are the Intuitionistic Multi L-fuzzy subgroups of a group  $G_1$ .

#### Proof

Given  $G_1$  and  $G_2$  be any two groups. Let  $f: G_1 \rightarrow G_2$  be a multi homomorphism and onto. Let  $\mu: G_2 \to L$  and  $\gamma: G_2 \to L$  be an Intuitionistic Multi L-fuzzy subgroups of  $G_2$ . (a). To prove that  $f^{-1}(\mu)$  be an IMLFSG of  $G_1$ . Let,  $f^{-1}(\mu)((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)) = \mu(f((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)))$ (i)  $= \mu (f(x_1 x_2 x_3 \dots x_i) f(y_1 y_2 y_3 \dots y_i))$ [: By definition 3.1]  $\geq \min\{\mu(f(x_1x_2x_3....x_i)), \mu(f(y_1y_2y_3....y_i))\}$ [": By definition 2.7]  $\geq min\{f^{-1}(\mu)(x_1x_2x_3\dots x_i), f^{-1}(\mu)(y_1y_2y_3\dots y_i)\}$ i.e.,  $f^{-1}(\mu)((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)) \ge min\{f^{-1}(\mu)(x_1x_2x_3\dots x_i), f^{-1}(\mu)(y_1y_2y_3\dots y_i)\}$ Let,  $f^{-1}(\mu)((x_1x_2x_3\dots x_i)^{-1}) = \mu(f((x_1x_2x_3\dots x_i)^{-1}))$ (ii)  $= \mu(f(x_1x_2x_3\ldots x_i))$ [: By definition 2.7]  $= f^{-1}(\mu)(x_1x_2x_3\dots x_i)$ i.e.,  $f^{-1}(\mu)((x_1x_2x_3....x_i)^{-1}) = f^{-1}(\mu)(x_1x_2x_3....x_i)$ (b). To prove that  $f^{-1}(\gamma)$  be an IMLFSG of  $G_1$ . Let,  $f^{-1}(\gamma)((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) = \gamma(f((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)))$ (i)  $= \gamma \big( f(x_1 x_2 x_3 \dots x_i) f(y_1 y_2 y_3 \dots y_i) \big)$ [: f is a multi homomorphism]  $\leq \max\{\gamma(f(x_1x_2x_3\dots x_i)), \gamma(f(y_1y_2y_3\dots y_i))\}$  $\leq \max\{f^{-1}(\gamma)(x_1x_2x_3\dots,x_i), f^{-1}(\gamma)(y_1y_2y_3\dots,y_i)\}$ i.e.,  $f^{-1}(\gamma)((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)) \le \max\{f^{-1}(\gamma)(x_1x_2x_3\dots x_i), f^{-1}(\gamma)(y_1y_2y_3\dots y_i)\}$ Let,  $f^{-1}(\gamma)((x_1x_2x_3\dots x_i)^{-1}) = \gamma(f((x_1x_2x_3\dots x_i)^{-1}))$ (ii)  $= \gamma(f(x_1x_2x_3\ldots x_i))$ [∵ By definition 2.7]  $= f^{-1}(\gamma)(x_1x_2x_3....x_i)$ i.e.,  $f^{-1}(\gamma)((x_1x_2x_3\dots x_i)^{-1}) = f^{-1}(\gamma)(x_1x_2x_3\dots x_i)$ Hence, from (a) & (b) we conclude that  $f^{-1}(\mu)$  and  $f^{-1}(\gamma)$  are the IMLFSG's of a group  $G_1$ .

#### Theorem

Let  $G_1$  and  $G_2$  be any two groups. Let  $f: G_1 \to G_2$  be an multi anti-homomorphism and onto. Let  $\mu: G_1 \to L$  and  $\gamma: G_1 \to L$  be an Intuitionistic Multi L-fuzzy subgroups of  $G_1$ . Then prove that

- (a)  $f(\mu)$  be an Intuitionistic Multi L-fuzzy subgroups of a group  $G_2$ , if  $\mu$  has a sup property and  $\mu$  is f *invariant*,
- (b)  $f(\gamma)$  be an Intuitionistic Multi L-fuzzy subgroups of a group  $G_2$ , if  $\gamma$  has a inf property and  $\gamma$  is f *invariant*.

## Gowrishankar and Akilesh

## Proof

Let  $\mu: G_1 \to L$  and  $\gamma: G_1 \to L$  be an Intuitionistic Multi L-fuzzy subgroups of  $G_1$ . Also  $f: G_1 \to G_2$  be an multi anti-homomorphism and onto.

(a). To prove that  $f(\mu)$  be an IMLFSG of  $G_2$ .  $f(\mu)((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)) = \min\{\mu((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i))/\forall x_iy_i \in G_1,$ (i) Let.  $f((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) = x_0y_0\}$  $= \mu(x_0y_0)$  $\leq \max\{\mu(x_0), \mu(y_0)\}$  $\leq \max\{[\min(\mu(x_1x_2x_3\dots x_i)) \mid \forall x_i \in G_1, f(x_1x_2x_3\dots x_i) = x_0)\}, [\min(\mu(y_1y_2y_3\dots y_i)) \mid \forall y_i \in G_1, f(y_1y_2y_3\dots y_i) = x_0)\}$ *y0*  $\leq \max\{[f(\mu)(x_1x_2x_3....x_i)], [f(\mu)(y_1y_2y_3....y_i)]\}$ i.e.,  $f(\mu)((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) \le \max\{[f(\mu)(x_1x_2x_3....x_i)], [f(\mu)(y_1y_2y_3....y_i)]\}$ Let,  $f(\mu)((x_1x_2x_3....x_i)^{-1}) = \min\{\mu((x_1x_2x_3....x_i)^{-1}) / \forall x_i^{-1} \in G_1, f((x_1x_2x_3....x_i)^{-1}) = x_0^{-1}\}$ (ii)  $= \mu(x_0^{-1})$  $= \mu(x_0)$ [∵ By definition 2.7]  $= \min\{\mu(x_0)/x_0 \in G_2, f(x_0) = (x_1x_2x_3\dots x_i)\}$  $= f(\mu)(x_1x_2x_3\ldots x_i)$ i.e.,  $f(\mu)((x_1x_2x_3....x_i)^{-1}) = f(\mu)(x_1x_2x_3....x_i)$ Hence,  $f(\mu)$  be an Intuitionistic Multi L-fuzzy subgroups of a group  $G_2$ . (b). Hence the theorem.

## Theorem

Let  $(G_1, .)$  and  $(G_2, .)$  be any two groups. The multi homomorphic image(pre-image) of an Intuitionistic Multi L-fuzzy subgroup of  $G_1$  is an Intuitionistic Multi L-fuzzy subgroup of a group  $G_2$ .

## Proof

Given  $(G_1, .)$  and  $(G_2, .)$  be any two groups and let  $f: G_1 \to G_2$  be a multi homomorphism map. i.e.,  $f((x_1x_2x_3....x_i)(y_1y_2y_3....y_i)) = f(x_1x_2x_3....x_i)f(y_1y_2y_3....y_i)$ , for all  $x_i, y_i \in G_1$ . Let A be an IMLFSG of a group  $G_1$ . To prove that f(A) is an IMLFSG of a group  $G_2$ . Now, for f(x) and f(y) in  $G_2$ , we have (a). Let  $\mu_A$  be a degree of membership function, then (i) Let.  $\mu_A(f(x_1x_2x_3\dots x_i)f(y_1y_2y_3\dots y_i)) = \mu_A(f((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)))$ [: *f* is a multi homomorphism]  $\geq \min\{\mu_A(f(x_1x_2x_3....x_i)), \mu_A(f(y_1y_2y_3....y_i))\}$ i.e.,  $\mu_A(f(x_1x_2x_3....x_i)f(y_1y_2y_3....y_i)) \ge \min\{\mu_A(f(x_1x_2x_3....x_i)), \mu_A(f(y_1y_2y_3....y_i))\}$ Let,  $\mu_A[f(x_1x_2x_3....x_i)]^{-1} = \mu_A[f((x_1x_2x_3....x_i)^{-1})]$ (ii)  $= \mu_A[f(x_1x_2x_3\ldots x_i)]$ [:: A is an IMLFSG] i.e.,  $\mu_A[f(x_1x_2x_3....x_i)]^{-1} = \mu_A[f(x_1x_2x_3....x_i)]$ (b) . Let  $\gamma_A$  be a degree of non-membership function, then  $\gamma_A(f(x_1x_2x_3\dots x_i)f(y_1y_2y_3\dots y_i)) = \gamma_A(f((x_1x_2x_3\dots x_i)(y_1y_2y_3\dots y_i)))$ Let, (i) [: *f* is a multi homomorphism]  $\leq \max\{\gamma_A(f(x_1x_2x_3\dots x_i)), \gamma_A(f(y_1y_2y_3\dots y_i))\}$ i.e.,  $\gamma_A(f(x_1x_2x_3....x_i)f(y_1y_2y_3....y_i)) \le \max\{\gamma_A(f(x_1x_2x_3....x_i)), \gamma_A(f(y_1y_2y_3....y_i))\}$ Let,  $\gamma_A[f(x_1x_2x_3....x_i)]^{-1} = \gamma_A[f((x_1x_2x_3....x_i)^{-1})]$  $= \gamma_A[f(x_1x_2x_3\ldots x_i)]$ [: A is an IMLFSG] i.e.,  $\gamma_A[f(x_1x_2x_3....x_i)]^{-1} = \gamma_A[f(x_1x_2x_3....x_i)]$ Hence, f(A) is an IMLFSG of a group  $G_2$ . Hence the proof.

#### Theorem

Let  $f: G_1 \to G_2$  be surjective multi homomorphism and A be an Intuitionistic Multi L-fuzzy subgroups of  $G_1$ . Then prove that f(A) is an Intuitionistic Multi L-fuzzy subgroups of a group  $G_2$ .

# Gowrishankar and Akilesh

## Proof

Since A is an IMLFSG of a group  $G_1$ . Let  $y_1$  and  $y_2$  be any elements of  $G_2$ . Then there exists some  $x_1, x_2, x_3, \dots, x_i \in G_1$  s.t.  $f(x_1) = y_1, f(x_2) = y_2, f(x_3) = y_3, \dots, f(x_i) = y_i$ . # CONCLUSION

In this paper, we have seen some fundamental definitions related on Intuitionistic Multi L-fuzzy subgroups (IMLFSG). In the studies, we have also studied the concept of homomorphism and anti homomorphism in Intuitionistic Multi L-fuzzy subgroups are discussed. Additionally, we have looked into a few theorems and characteristics based on the homomorphism of an IMLFSG. Further work is in progress in order to develop the Homomorphism of an Intuitionistic Multi L-fuzzy subgroup (HIMLFSG) in to Non-Homomorphism of an Intuitionistic Multi L-fuzzy subgroup (NHIMLFSG).

# ABSTRACT

In this paper, we have introduced and compared three ranking techniques of Fuzzy Multi Numbers. Here, we have considered the Triangular, Trapezoidal, Pentagonal, Hexagonal and Octagonal Fuzzy Multi Numbers with its membership function. The Fuzzy Multi Numbers are transformed to crisp data by the introduced ranking techniques. Also, the efficiency of the Ranking Techniques is analyzed and compared with the numerical examples.

**Keywords:** Fuzzy Set, Multi Set, Fuzzy Multi Set, Triangular Fuzzy Multi Number, Trapezoidal Fuzzy Multi Number, Pentagonal Fuzzy Multi Number, Hexagonal Fuzzy Multi Number, Octagonal Fuzzy Multi Number, Ranking Function.

# INTRODUCTION

The Fuzzy Set (FS) was introduced by Zadeh [17], it is a class of objects with a of membership between 0 and 1. Zimmermann [18] proposed the basic definitions of fuzzy sets and algebraic operations. And for further considerations, the Fuzzy Number [6], [8] and [10] was defined, which is a fuzzy subset of the real line whose highest membership values are clustered around the membership function which is monotonic on both sides of a given real number known as the mean value.Yager [16] first discussed fuzzy multisets, he uses the term of fuzzy bag; an element of X may occur more than once with possibly of the same or different membership values. Ranking the fuzzy numbers is an important aspect of decision making in a fuzzy environment for practical applications. Buckley

# Vivek et al.,

[4] use fuzzy numbers to express their preferences and Li & Lee [11] proposed the order of fuzzy numbers based on the concept of probability measure of fuzzy events.

In ranking of fuzzy number, Triangular, Trapezoidal, Pentagonal, Hexagonal and Octagonal Fuzzy numbers with its membership function plays an important role to find the efficiency. Chen [6] suggested the concept of maximizing set and minimizing set to decide the ordering value of each fuzzy number and uses these values to determine the order of the *n* fuzzy numbers.Nagoor Gani & Mohamed Assarudeen [13] introduced a new method to find the fuzzy optimal solution of fully fuzzy linear programming problems with triangular fuzzy numbers and Amit Kumar, et.all[2], BongJu Lee and Yong Sik Yun[3] proposed the method to generalize the results of four operations for two generalized trapezoidal fuzzy sets. Helen & Uma [9], defined some operations and ranking function of a Pentagonal Fuzzy Number. The pentagonal fuzzy set was defined and the results of addition, subtraction, multiplication, and division based are generalized on the Zadeh's extension principle for two pentagonal fuzzy sets by Lee & Yun [12]. A fuzzy transportation problem with hexagonal fuzzy numbers was introduced by Thamaraiselvi & Santhi [15]. Arora et.all [1] introduced a fuzzy linear programming problem with hexagonal fuzzy numbers. Chandrasekaran. et.all [5] proposed a ranking procedure based on Octagonal Fuzzy numbers was applied to a Multi-objective Linear Programming Problem (MOLPP) with fuzzy coefficients.

#### PRELIMINARIES

The basis notions, concepts and definitions are reviewed in this section.

#### Definition: 2.1

Let *X* be a nonempty set. A fuzzy setA of X is defined as  $A = \{ \langle x, \mu_A(x) \rangle | x \in X \}$ , where  $\mu_A(x)$  is called membership function and it maps each element of X to a value between 0 and 1.

#### **Definition: 2.2**

A Multi Set(MS) is an unordered collection of objects in which, unlike an ordinary set, objects are allowed to repeat. Each individual occurrence of an object is a multi-set which is called its element.

#### **Definition: 2.3**

Let X be a nonempty set. The count membership function of a Fuzzy Multi Set (FMS) A in X has the form Mc :  $X \rightarrow Q$  where Q is the set of all crisp multi sets in [0,1]. Hence, for any  $x \in X$ , Mc(x) is the crisp multi set from [0, 1]. The membership sequence is defined as  $(\mu_A^1(x), \mu_A^2(x), \dots, \dots, \mu_A^p(x))$  where  $\mu_A^1(x) \ge \mu_A^2(x) \ge \dots \ge \mu_A^p(x)$ . Therefore, FMS Ais given by  $A = \{\langle x, (\mu_A^1(x), \mu_A^2(x), \dots, \dots, \mu_A^p(x)) \rangle / x \in X\}$ 

#### **Definition: 2.4**

A regular real number is a generalization of a fuzzy number. It does not refer to a single value but rather to a connected set of possible values, where each possible value has its weight between 0 and 1. The weight is called the membership function. A fuzzy number A is a convex normalized fuzzy set on the real line R such that there exist at least one  $x \in R$  with  $\mu_A(x)=1$  and  $\mu_A(x)$  is piecewise continuous.

#### **Definition: 2.5**

A Triangular fuzzy numberA is denoted by 3 – tuples (*a*, *b*, *c*), where *a*, *b* and *c* are real numbers and  $a \le b \le c$  with membership function defined as

$$\mu_A(x) = \begin{cases} 0 & \text{for } x \le a \\ \frac{x-a}{b-a} & \text{for } a \le x \le b \\ \frac{c-x}{c-b} & \text{for } b \le x \le c \\ 0 & \text{for } x \ge c \end{cases}$$

Vivek et al.,

#### **Definition: 2.6**

A Trapezoidal fuzzy number A is denoted by 4 – tuples (*a*, *b*, *c*, *d*) where *a*, *b*, *c*, *and d* are real numbers and  $a \le b \le c \le d$  with membership function defined as

$$\mu_A(x) = \begin{cases} 0 & \text{for } x \le a \\ \frac{x-a}{b-a} & \text{for } a \le x \le b \\ 1 & \text{for } b \le x \le c \\ \frac{d-x}{d-c} & \text{for } c \le x \le d \\ 0 & \text{for } x \ge d \end{cases}$$

#### **Definition: 2.7**

A Pentagonal fuzzy numberA is denoted by 5 – tuples (*a*, *b*, *c*, *d*, *e*), where *a*, *b*, *c*, *d* and *e* are real numbers and  $a \le b \le c \le d \le e$  with membership function defined a

$$\mu_{A}(x) = \begin{cases} 0 & \text{for } x \le a \\ \frac{x-a}{b-a} & \text{for } a \le x \le b \\ \frac{x-b}{c-b} & \text{for } b \le x \le c \\ 1 & \text{for } x = c \\ \frac{d-x}{d-c} & \text{for } c \le x \le d \\ \frac{e-x}{e-d} & \text{for } d \le x \le e \\ 0 & \text{for } x \ge e \end{cases}$$

#### **Definition : 2.8**

A hexagonal fuzzy numberA<sub>H</sub> is specified by 6 tuples A<sub>H</sub> = (a, b, c, d, e, f) where, *a*, *b*, *c*, *d*, *e* and *f* are real number and  $a \le b \le c \le d \le e \le f$  with membership function are given below

$$\mu_{A}(\mathbf{x}) = \begin{cases} 0 & \text{for } \mathbf{x} \le a \\ \frac{1}{2} \left(\frac{\mathbf{x} - a}{b - a}\right) & \text{for } a \le \mathbf{x} \le b \\ \frac{1}{2} + \frac{1}{2} \left(\frac{\mathbf{x} - b}{c - b}\right) & \text{for } b \le \mathbf{x} \le c \\ 1 & \text{for } c \le \mathbf{x} \le d \\ 1 - \frac{1}{2} \left(\frac{\mathbf{x} - d}{e - d}\right) & \text{for } d \le \mathbf{x} \le e \\ \frac{1}{2} \left(\frac{f - \mathbf{x}}{f - e}\right) & \text{for } e \le \mathbf{x} \le f \\ 0 & \text{for } \mathbf{x} \ge f \end{cases}$$

#### **Definition: 2.9**

A Fuzzy number  $A_{oct}$  is a normal octagonal fuzzy number denoted by  $A_{oct} = (a, b, c, d, e, f, g, h)$  where a, b, c, d, e, f, g, h where a, b, c, d, e, f, g, h where a, b, c, d, e, f, g, h where a, b, c, d and b are real number and  $a \le b \le c \le d \le e \le f \le g \le h$  with its membership function is given below.

	Vivek	et al.,
$\mu_{A}(\mathbf{x}) = \begin{cases} \frac{1}{2} \\ \frac{1}{2} \end{cases}$	$0$ $\frac{1}{2}\left(\frac{x-a}{b-a}\right)$ $0.5$ $\frac{1}{2} + \frac{1}{2}\left(\frac{x-c}{d-c}\right)$ $1$ $\frac{1}{2} + \frac{1}{2}\left(\frac{f-x}{f-e}\right)$ $0.5$ $\frac{1}{2}\left(\frac{h-x}{h-g}\right)$ $0$	for $x < a$ for $a \le x \le b$ for $b \le x \le c$ for $c \le x \le d$ for $d \le x \le e$ for $e \le x \le f$ for $f \le x \le g$ for $g \le x \le h$ for $x \ge h$

#### **Definition: 2.10**

A fuzzy multi number is a generalization of a regular real number. It does not refer to a single value but rather to a connected set of possible values, where each possible value has its weight between 0 and 1. The weight is called the membership function. The membership sequence is in the form  $(\mu_A^1(x), \mu_A^2(x), \dots, \dots, \mu_A^p(x))$  where  $\mu_A^1(x) \ge \mu_A^2(x) \ge \dots \ge \mu_A^p(x)$ 

#### Definition: 2.11

The Cardinality of the membership function Mc(x) is the length of an element x in the Fuzzy Multi Set A denoted as  $\eta$ , defined as  $\eta = Mc(x)$ . If A, B, C are the *FMS* defined on X, then their cardinality  $\eta = Max \{ \eta(A), \eta(B), \eta(C) \}$ .

#### Definition: 2.12

A Triangular fuzzy multi number  $A_i$  is denoted by 3 – tuples  $(a_i, b_i, c_i)$ , where  $a_i$ ,  $b_i$  and  $c_i$  are real numbers and  $a_i \le b_i \le c_i$  with membership function defined as

$$\mu_{A_{i}}(x) = \begin{cases} 0 & \text{for } x \le a_{i} \\ \frac{x - a_{i}}{b_{i} - a_{i}} & \text{for } a_{i} \le x \le b_{i} \\ \frac{c_{i} - x}{c_{i} - b_{i}} & \text{for } b_{i} \le x \le c_{i} \\ 0 & \text{for } x \ge c_{i} \end{cases}$$

#### **Definition: 2.13**

A Trapezoidal fuzzy multi number  $A_i$  is denoted by 4 – tuples  $(a_i, b_i, c_i, d_i)$ , where  $a_i, b_i, c_i$  and  $d_i$  are real numbers and  $a_i \le b_i \le c_i \le d_i$  with membership function defined as

$$\mu_{A_{i}}(x) = \begin{cases} 0 & \text{for } x \leq a_{i} \\ \frac{x - a_{i}}{b_{i} - a_{i}} & \text{for } a_{i} \leq x \leq b_{i} \\ 1 & \text{for } b_{i} \leq x \leq c_{i} \\ \frac{d_{i} - x}{d_{i} - c_{i}} & \text{for } c_{i} \leq x \leq d_{i} \\ 0 & \text{for } x \geq d_{i} \end{cases}$$

Definition: 2.14

A Pentagonal fuzzy multi number  $A_i$  is denoted by 5 – tuples  $(a_i, b_i, c_i, d_i, e_i)$ , where  $a_i, b_i, c_i, d_i$  and  $e_i$  are real numbers and  $a_i \leq b_i \leq c_i \leq d_i \leq e_i$  with membership function defined as

V	vivek <i>et al.,</i>
$\mu_{A_{i}}(x) = \begin{cases} 0 \\ \frac{x-}{b_{i}-} \\ \frac{x-}{c_{i}-} \\ 1 \\ \frac{d_{i}-}{d_{i}-} \\ \frac{e_{i}-}{e_{i}-} \\ 0 \end{cases}$	$\begin{array}{ll} a_i & f = 1 \\ \frac{b_i}{b_i} & f or \ b_i \leq x \leq c_i \\ & f or \ x = c_i \\ \frac{x}{c_i} & f or \ c_i \leq x \leq d_i \end{array}$

#### **Definition : 2.15**

A hexagonal fuzzy multi number  $A_i$  is specified by 6 tuples  $A_H = (a_i, b_i, c_i, d_i, e_i, f_i)$ where  $a_i, b_i, c_i, d_i, e_i, and f_i$  are real number and  $a_i \le b_i \le c_i \le d_i \le e_i \le f_i$  withmembership function are given below

$$\mu_{A_i}(\mathbf{x}) = \begin{cases} 0 & \text{for } \mathbf{x} \le a_i \\ \frac{1}{2} \left( \frac{\mathbf{x} - a_i}{b_i - a_i} \right) & \text{for } a_i \le \mathbf{x} \le b_i \\ \frac{1}{2} + \frac{1}{2} \left( \frac{\mathbf{x} - b_i}{c_i - b_i} \right) & \text{for } b_i \le \mathbf{x} \le c_i \\ 1 & \text{for } c_i \le \mathbf{x} \le d_i \\ 1 - \frac{1}{2} \left( \frac{\mathbf{x} - d_i}{e_i - d_i} \right) & \text{for } d_i \le \mathbf{x} \le e_i \\ \frac{1}{2} \left( \frac{f_i - \mathbf{x}}{f_i - e_i} \right) & \text{for } e_i \le \mathbf{x} \le f_i \\ 0 & \text{for } \mathbf{x} \ge f_i \end{cases}$$

#### **Definition: 2.16**

A Fuzzy number  $A_i$  is a normal octagonal fuzzy multi number denoted by  $A_i = (a_i, b_i, c_i, d_i, e_i, f_i, g_i, h_i)$  where  $a_i$ ,  $b_i$ ,  $c_i$ ,  $d_i$ ,  $e_i$ ,  $f_i$ ,  $g_i$  and  $h_i$  are real number and  $a_i \le b_i \le c_i \le d_i \le e_i \le f_i \le g_i \le h_i$  with its membership function is given below.

$$\mu_{A_i}(\mathbf{x}) = \begin{cases} 0 & \text{for } \mathbf{x} < a_i \\ \frac{1}{2} (\frac{\mathbf{x} - a_i}{b_i - a_i}) & \text{for } a_i \le \mathbf{x} \le b_i \\ 0.5 & \text{for } b_i \le \mathbf{x} \le c_i \\ \frac{1}{2} + \frac{1}{2} (\frac{\mathbf{x} - c_i}{d_i - c_i}) & \text{for } c_i \le \mathbf{x} \le d_i \\ 1 & \text{for } d_i \le \mathbf{x} \le e_i \\ \frac{1}{2} + \frac{1}{2} (\frac{f_i - \mathbf{x}}{f_i - e_i}) & \text{for } e_i \le \mathbf{x} \le f_i \\ 0.5 & \text{for } f_i \le \mathbf{x} \le g_i \\ \frac{1}{2} (\frac{h_i - \mathbf{x}}{h_i - g_i}) & \text{for } g_i \le \mathbf{x} \le h_i \\ 0 & \text{for } \mathbf{x} \ge h_i \end{cases}$$

#### Definition: 2.17

The ranking function is an effective method of arranging fuzzy numbers. The ranking function is denoted by  $F(\mathbb{R})$ , where  $\mathbb{R}$ :  $F(\mathbb{R}) \to \mathbb{R}$ , and  $F(\mathbb{R})$  is the collection of fuzzily specified numbers on a real line with a natural order. Let  $a, b \in \mathbb{R}$ , then ranking function for real numbers a, b is defined as

- (i)  $D(a,b) > 0 \iff D(a,0) > D(b,0) \iff a > b$
- (ii)  $D(a,b) < 0 \iff D(a,0) < D(b,0) \iff b < a$
- (iii)  $D(a,b) = 0 \iff D(a,0) = D(b,0) \iff b = a$

# Vivek et al.,

# RANKING MEASURES OF FUZZY NUMBERS

In general, a fuzzy number A is described as any fuzzy subset of real line R, whose membership function  $\mu_A$  satisfies the condition that  $\mu_A$  is a continuous mapping from R to the closed interval [0,1]. Then the Ranking Measure of Graded Mean Integration Representation proposed by Chen and Hsieh [7] is as follows for the

- Triangular fuzzy number (a, b, c) is  $\frac{(a + 4b + c)}{6}$
- •
- Trapezoidal fuzzy number (a, b, c, d) is  $\frac{6}{(a+2b+2c+d)}$ Pentagonal fuzzy number (a, b, c, d, e) is  $\frac{(a+b+4c+d+e)}{9}$ •
- •
- Hexagonal fuzzy number (a, b, c, d, e, f) is  $\frac{(a+b+4c+4d+e+f)}{12}$ Octagonal fuzzy number (a, b, c, d, e, f, g, h) is  $\frac{(a+b+c+4d+4e+f+g+h)}{14}$ •

Later Helipern [10] proposed the Ranking Measure for the fuzzy number based on the expected value as

- Triangular fuzzy number (a, b, c) is  $\frac{(a+2b+c)}{c}$
- Trapezoidal Fuzzy Set (a, b, c, d) is  $\frac{4}{(a+b+c+d)}$ •
- Pentagonal Fuzzy Set (a, b, c, d, e) is  $\frac{4}{(a+b+2c+d+e)}$ •
- Hexagonal Fuzzy Set (a, b, c, d, e, f) is  $\frac{6}{(a+b+2c+2d+e+f)}$ •
- Octagonal Fuzzy Set (a, b, c, d, e, f, g, h) is  $\frac{8}{(a+b+c+2d+2e+f+g+h)}$ , using the Sub Interval Average Method in  $\frac{10}{10}$

Recently, using the Sub Interval Average Method, the Ranking Measure of linear fuzzy numbers was defined by Stephen Dinagaret.all [14] as

- $\frac{(a+b+c)}{c}$  for the Triangular fuzzy number (a, b, c)
- $\frac{(a+b+c+d)}{4}$  for the Trapezoidal fuzzy number (a, b, c, d)
- $\frac{(a+b+c+d+e)}{c}$  for the Pentagonal fuzzy number (a, b, c, d, e)
- $\frac{5}{(a+b+c+d+e+f)}$  for Hexagonal fuzzy number (a, b, c, d, e, f)
- $\frac{(a+b+c+d+e+f+g+h)}{(a+b+c+d+e+f+g+h)}$  for Octagonal fuzzy number (a, b, c, d, e, f, g, h)

Analytical Evaluation of the Fuzzy Ranking Measures

**Example 1:** The Ranking Measure of the given triangular fuzzy numbers of A = { (3,4,5)}, B = { (8,10,12)}, C =  $\{(2,3,5)\}, D = \{(4,5,6)\}, E = \{(1,1,3)\}, F = \{(4,8,9)\}$  is represented in the following tabular form for the three defined methods of Graded Mean Integration Representation Method by Chen & Hsieh, Expected Value Method by Helipern and Sub Interval Average Method by Stephen Dinagarshows that, these measures are well suited to use for any linguistic variables.

**Example 2**: The determination of the Ranking Measure of the trapezoidal fuzzy numbers of  $A = \{(3,5,6,8)\}, B =$  $\{(4,5,7,10)\}, C = \{(3,4,5,7)\}$  and D =  $\{(2,4,8,10)\}$  is in the following table using the three defined methods of Graded Mean Integration Representation Method, Expected Value Method and Sub Interval Average Method shows that, these measures are well suited for any decision making real time applications.

**Example 3**: The **pentagonal fuzzy numbers** Ranking Measure of  $A = \{(2,4,5,7,8)\},\$  $B = \{(7, 8, 9, 10, 12)\}, C =$  $\{(3,4,5,6,8)\}$  and D =  $\{(8,9,10,12,13)$  is illustrated in the following tabular column for the three defined methods by Graded Mean Integration Representation Method of Chen & Hsieh, Expected Value Method of Helipern and Sub Interval Average Method of **Stephen Dinagar**shows that these measures are well suited for any real tie applications.

Example 4: The Ranking Measure of the given hexagonal fuzzy numbers of A = {(1,2,3,4,4,5)}, B = {(8,7,9,10,12,13)}, C = {(3, 5,7,8,9,10)} and

 $D = \{(14,15,17,19,20,24)\}$  is defined in the following tabular column for the methods of Graded Mean Integration Representation Method, Expected Value Method and Sub Interval Average Method which shows that the these measures are efficient.

Example 5: The three defined methods of Graded Mean Integration Representation Method by Chen & Hsieh, Expected Value Method by Helipern and Sub Interval Average Method by Stephen Dinagarofthe octagonal fuzzy numbers,  $A = \{(8,9,10,12,15,16,18,20)\},\$ 

B = {(2, 5,9,12,15,18,20,24)}, C = {(3,4,6,8,10,13,15,19)}, D = {(3,4,5,7,8,9,11,12)} is represented in the following tableshows that the these measures are well suited for any decision making applications

## **RANKING MEASURES OF FUZZY MULTI NUMBERS**

The membership sequence is in the form  $(\mu_1^A(x), \mu_2^A(x), \dots, \mu_p^A(x))$  where  $\mu_1^A(x) \ge \mu_2^A(x) \ge \dots \ge \mu_p^A(x)$  with the Cardinality, the length of an element x in the Fuzzy Multi Set A denoted as  $\eta$ . Here, we have introduced the ranking measure for the Triangular, Trapezoidal, Pentagonal, Hexagonal and Octagonal of Graded Mean Representation Method, Helipern's Expected Value Method and Sub Interval Average Method

## Method I

We have defined the Ranking Measure by the Graded Mean Integration Representation of fuzzy multi numberA<sub>i</sub>.

- Triangular fuzzy multi numbers (ai, bi, ci) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + 4b_i + c_i)}{6}$ Trapezoidal fuzzymulti numbers (ai, bi, ci, di) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + 2b_i + 2c_i + d_i)}{6}$ •
- Pentagonal fuzzy multi numbers (ai, bi, ci, di, ei) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + 4c_i + d_i + e_i)}{8}$ Hexagonal fuzzy multi numbers (ai, bi, ci, di, ei, fi) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + 4c_i + d_i + e_i + f_i)}{12}$ •
- Octagonal fuzzy multi numbers(  $a_i b_i c_i d_i e_i f_i g_i h_i$ ) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + c_i + 4d_i + 4e_i + f_i + g_i + h_i)}{14}$

#### Method II

We have presented a new techniquethat make use of Helipern's Expected Value. Here, the notions of the expected value are based on the lower and upper expected values of  $A_i$ , fuzzy multi number.

- ٠
- •
- •
- Triangular fuzzy multi numbers (ai, bi, ci di ei, fi) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + 2b_i + c_i)}{4}$ Trapezoidal fuzzy multi numbers (ai, bi, ci di) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + c_i + d_i)}{4}$ Pentagonal fuzzy multi numbers (ai, bi, ci di ei) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + 2c_i + d_i + e_i)}{6}$ Hexagonal fuzzy multi numbers (ai, bi, ci di ei, fi) is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + 2c_i + 2d_i + e_i + f_i)}{8}$ •
- Octagonal fuzzy multi numbers(  $a_i b_i c_i d_i e_i f_i g_i h_i$ )is  $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + c_i + 2d_i + 2e_i + f_i + g_i + h_i)}{10}$

# Method III

Another Ranking Measure based on**Sub Interval Average** for Ranking of Linear Fuzzy Multi NumberA<sub>i</sub> is also proposedas follows:

- $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{\binom{a_i + b_i + c_i}{3}}{3} \text{ for the Triangular fuzzy multi numbers (ai, bi, ci,)} \\ \frac{1}{\eta} \sum_{i=1}^{\eta} \frac{\binom{a_i + b_i + c_i + d_i}{4}}{4} \text{ for the Trapezoidal fuzzy multi numbers (ai, bi, ci, di)} \\ \frac{1}{\eta} \sum_{i=1}^{\eta} \frac{\binom{a_i + b_i + c_i + d_i + e_i}{5}}{5} \text{ for the Pentagonal fuzzy multi numbers (ai, bi, ci, di, ei)} \\ \frac{1}{\eta} \sum_{i=1}^{\eta} \frac{\binom{a_i + b_i + c_i + d_i + e_i}{5}}{6} \text{ for Hexagonal fuzzy multi numbers (ai, bi, ci, di, ei, fi)}$

# Vivek et al.,

 $\frac{1}{\eta} \sum_{i=1}^{\eta} \frac{(a_i + b_i + c_i + d_i + e_i + f_i + g_i + h_i)}{8} \text{for Octagonal fuzzy multi numbers}$  $(a_i b_i c_i \ d_i e_i \ f_i \ g_i \ h_i)$ 

# Analytical Evaluation of the Fuzzy Multi Ranking Measures

Example 1 : The Ranking Measure of the triangular fuzzy multi numbers of cardinality  $\eta = 4$ A = { (3,4,5) (4,5,6) (3,4,4) (2,3,6)}, B = { (8,10, 12) (7,9,11) ( 6,8,9) (11,12,13)}, C = { (2,3,5) (4,7,7) (3,5,6) (1,2,3)}, D = { (4,5,6) (3,4,7) (2,5,8) (7,8,9)},

 $E = \{(1,1,3) \ (2,4,5) \ (3,7,9) \ (5,7,8)\}, F = \{(4,8,9) \ (5,5,5) \ (6,7,8) \ (7,10,12)\}$ 

is represented in the following tabular column for the three defined methods of Graded Mean Integration Representation Method by Chen & Hsieh, Expected Value Method by Helipern and Sub Interval Average Method by Stephen Dinagar which shows that these measures are well suited to use for any multi linguistic variables.

**Example 2 :** The determination of the Ranking Measure of the **trapezoidal fuzzy multi numbers** of cardinality  $\eta = 3$  A = {(3,5,6,8) (7, 9,10,11) (2,4,5,7) }, B = {(4,5,7,10) (8,10,13,14) (2,8,13,16)},

 $C = \{(3,4,5,7) (6,7,12,14) (5,4,7,8)\}, D = \{(2,4,8,10) (3,7,11,15) (2,7,10,14)\}$  is in the following table using the three defined methods of Graded Mean Integration Representation Method, Expected Value Method and Sub Interval Average Method which shows that these measures are well suited for any multi decision making real time applications.

# **Example 3 :** The **pentagonal fuzzy multi numbers** Ranking Measure of cardinality $\eta = 3$

A = {(2,4,5,7,8) (3,5,7,9,11) (4,8,9,13,14)}, B = {(7,8,9,10,12) (10,12,14,16,18) (2,5,7,9,13)}, C={(3,4,5,6,8)(5,7,8,9,11) (2,5,7,9,15)}, D = {(8,9,10,12,13) (10,12,14,15,17) (7, 8,9,10,11)} is illustrated in the following tabular column for the three defined methods of **Chen & Hsieh**, **Helipern** and **Stephen Dinagar**. It is clearthat, these measures are well suited for any real time applications with multiple criteria

**Example 4 :** The Ranking Measure of the **hexagonal fuzzy multi numbers** of cardinality  $\eta = 3$ 

 $A = \{ (1,2,3,4,4,5) (2,5,7,8,9,10) (4,5,6,7,8,10) \},\$ 

 $\mathsf{B} = \{(8,7,9,10,12,13) \ (10,12,13,15,16,18) \ (9,10,14,15,18,20)\},$ 

 $\mathbf{C} = \{(3,\,5,7,8,9,10)\;(9,10,12,14,18,19)\;(2,5,7,8,10,13),$ 

 $D = \{(14,15,17,19,20,24), (5,8,10,12,14,16), (6,8,9,11,14,18)\}$  is defined in the following tabular column for the methods of Graded Mean Integration Representation Method, Expected Value Method and Sub Interval Average Method which shows that the these measures are efficient.

**Example 5 :** The three defined methods of Graded Mean Integration Representation Method by **Chen & Hsieh**, Expected Value Method by **Helipern** and Sub Interval Average Method by **Stephen Dinagar**ofthe **octagonal fuzzy multi numbers**of cardinality of  $\eta = 2$ ,

 $A = \{(8,9,10,12,15,16,18,20) \ (10,12,14,16,19,21,25,28)\},\$ 

 $B = \{(2, 5, 9, 12, 15, 18, 20, 24) \ (1, 2, 3, 6, 7, 8, 10, 14)\},\$ 

 $C = \{(3,4,6,8,10,13,15,19) \ (1,2,3,4,5,6,7,8)\},\$ 

 $D = \{(3,4,5,7,8,9,11,12) (2,5,7,9,12,13,14,17)\}$  is explained in the following tableshows that, these measures are well suited for any multi criteria decision making applications

# SIGNIFICANCE OF THE STUDY

There are many ranking measures available to the Fuzzy Environments, but still the percentage of verification varies. In Fuzzy Environments, we deal with the membership functions once (single data), whereas in Fuzzy Multi Environments, we deal with repeated (multi) membership functions. The new ranking measures of Fuzzy Multi Environment analyses the options in a more intuitively, appealing and consistent way than the other specified measures. Hence, we have introduced the Ranking Measure of Fuzzy Multi Numbers of Triangular, Trapezoidal, Pentagonal, Hexagonal and Octagonal categories. This concept of Ranking Measures for the Fuzzy Multi Numbers

Vivek et al.,

can be applicable in any multi criteria decision making analysis which is found to be aunique, advanced, new application-oriented approach.

# CONCLUSION

We have studied three ranking measures of fuzzy numbers of Graded Mean Integration Representation Method by Chen & Hsieh, Expected Value Method by Helipern and Sub Interval Average Method by Stephen Dinagar and in this paper, we have extended those measures to Fuzzy Multi Numbers. The introduced ranking techniques of Fuzzy Multi Numbers are compared by considering the Triangular, Trapezoidal, Pentagonal, Hexagonal and Octagonal Fuzzy Multi Numbers with its membership function. The Fuzzy Multi Numbers are transformed to crisp data by the introduced ranking techniques. The efficiency of the Ranking Techniques is analyzed with the numerical examples, and it is clear that all three methods are well suited for any multi criteria decision making problemsas their ranking measures are closer to one another.

# ACKNOWLEDGEMENT

The authors would like to thank the PG & Research Department of Mathematics, Sri Ramakrishan College of Arts and Science, Coimbatore to carry out this study. Also they express their gratitude to Chikkanna Government Arts College, Tirupur.

#### ABSTRACT

Mental problems are becoming more and more common as a result of ambitious lifestyle, urbanisation, and stressful surroundings. Schizophrenia is a chronic psychiatric condition that affects people all over the world, with a lifetime prevalence of 1% and significant long-term mortality and morbidity. A devastating, inherited brain condition called schizophrenia is caused by defects that appear early in infancy and disrupt the brain's natural development. There are now a number of dietary supplements and herbal medicines that can be used alone by people with mild to severe symptoms of schizophrenia. Ayurvedic medications and dietary supplements can be used as adjuvant therapy with current medications for schizophrenic patients who have severe symptoms in order to maximise the therapeutic efficacy while minimising the side-effect load. This article provides information on some typical complementary treatments as well as specific medicinal plants that are used to treat various ailments, including schizophrenia.

Keywords: Medicinal, herbal, urbanisation, schizophrenia, dietary supplements.

# INTRODUCTION

India has a long history of learning about using plant-based medicines for both therapeutic and preventive purposes. These plants are widely grown in the wild and are specifically used in local pharmaceutical factories. Some of these plants yield high-potential pharmaceuticals with a high value for export [1]. The history of using plants and plantbased products as medicines dates back to the dawn of human civilization. The Rig Veda, which is regarded as the oldest collection of human knowledge and is thought to have been composed between 4500 and 1600 B.C., has the earliest reference of the medical usage of plants in Hindu culture [2]. Ambitious living, urbanisation, and stressful environments have all contributed to the rise in the prevalence of mental illnesses [3]. It has been discovered that the Indian system of complementary medicine (herbal medications) has drawn interest from all around the world due to its efficacy and security. Therefore, with a remarkable rate of success, these traditional herbal medicines are being tried for a variety of medical conditions such as arthritis, jaundice, respiratory illness, hyperlipidaemia, diabetes mellitus, hypertension, obesity, schizophrenia, and coronary artery disease, among others [4]. India is a country where Ayurveda has been used quite successfully since the Vedic era. Although various plant sources that are known to have CNS function have been investigated [5]. One of the most exhausting, expensive, and complicated illnesses is psychosis. The Greek word "-osis" denotes an abnormal state, and the word "psyche" is often used to refer to the mind or soul. Thus, a loss of connection to reality is a common description of psychosis. These conditions affect a person's capacity to think clearly, make sound decisions, react emotionally, communicate clearly, assess reality, and conduct appropriately [3].

Due to the fact that there is no cure for incurable psychotic diseases, only symptomatic treatment is available, there is an increasing need for medications with minimal side effects, particularly when administered for an extended period of time.Herbal medications are recognised to have extremely little side effects, making them a promising treatment option for chronic CNS illnesses that are essentially incurable [6].Due to its affordability, environmental friendliness, and ability to effectively treat illness condition, herbal medicines are attracting more and more attention [7]. A crucial organ system is the central nervous system (CNS). Drugs that affect the central nervous system are therefore crucial from both perspectives. It's not always been evident how specific medications affect the CNS or how they work. Since many of the ailments for which these medications are prescribed (schizophrenia, anxiety, etc.) have poorly known root causes [8].it is still unclear what exactly causes the illness. There are many subgroups of people who have schizophrenia; for instance, drug-resistant illnesses may represent a separate subtype of schizophrenia rather than just a more severe variety. The present antipsychotic regimen is efficient in treating the disease's positive symptoms, but there are few options for addressing the disease's negative symptoms and cognitive issues [9].

It is frequently a chronic, debilitating illness that affects numerous functional domains. The typical course of treatment for schizophrenia is based on the biopsychosocial model and includes prescribing antipsychotic medications, as well as patient and family counselling[10]. The majority of schizophrenia patients may experience a chronic course and require long-term maintenance therapy. Even though antipsychotic therapy is a mainstay of schizophrenia maintenance therapy, patients nevertheless frequently experience relapse and other side effects from antipsychotic medication. Herbal medicine and other alternative therapies are being used more frequently to treat schizophrenia in order to increase therapeutic efficacy and lessen unfavourable side effects associated with antipsychotic therapy [11]. Antipsychotic medications are used to treat psychosis. The first generation of antipsychotics, also known as neuroleptics, are known as antipsychotics, whereas the second generation are known as atypical antipsychotics. The effectiveness and side effects of atypical antipsychotics are usually thought to be superior than those of typical antipsychotics [12].

#### MEDICINAL PLANTS HAVING ANTISCHIZOPHRENIC ACTIVITY

**Maidenhair tree** (*Ginkgo biloba*): The primary constituents of ginkgo biloba extract include terpenoids, flavonol glycosides and proanthocyanidin [13,14]. Ginkgo biloba extracts contains anti-oxidant and anti-inflammatory properties. They have been linked to terpene and flavone lactone actions, as well as increased cerebral blood flow

#### Vasudha Negi *et al.*,

and antiplatelet effects <sup>[15]</sup>.Together with clozapine, they are promising treatments for schizophrenia since they considerably lessen the negative symptoms that people with schizophrenia experience<sup>[16]</sup>.

Ashwagandha (*Withania somnifera*): It consists of dried root and stem bases from the Solanaceae plant *Withania somnifera*. In subtropical India and all other arid regions, this plant thrives freely. Ashwagandha is also referred to as Indian ginseng, poison gooseberry, and winter cherry. Alkaloids and steroidal lactone are the main chemical components. The alkaloids in ashwagandha include somniferinine, somniferinine, withananine, pseudo-withanine, tropine, pseudo-tropine, 3-a-gloyloxytropane, cuscohygrine, and anaferine, with withanine being the main one [17].

**St. John's Wort** (*Hypericum perforatum*): This herb can be utilised to treat various positive, negative, and cognitive symptoms of schizophrenia since it also inhibits serotonin receptors, whose activity has been discovered to be increased in schizophrenia [18].

**Spinach** (*Spinacia oleracea*): Spinach, a member of the family Chenopodiaceae, has a multitude of therapeutic benefits. It is an excellent package of unique phytoconstituents such as ascorbic acid, apigenin, astragalin, caffeic, lutein,  $\beta$ -carotene, ferulic acid, kampeferol, rutin, querecetin, myricetin, luteolin, ortho-coumaric acid, para-coumaric acid, stigmasterol, protocatechuic acids, methylenedioxyflavonol, glycoglycerolipids, 20- hydroxyecdysone, vitamins, spirasaponins violaxanthin etc., which are responsible for its biomedicinal& pharmacotherapeutic effects[19].

**Kava**(*Piper methysticum*): One of the few herbal treatments with a known pharmacologically active component is kava. A biologically active substance known as kavain and kavapyrone is derived from the kava plant, Piper methysticum. It is unknown how exactly the kavapyrones cause these effects because they operate in a number of different ways, including by inhibiting voltage-dependent sodium channels, raising GABAA (-aminobutyric acid) receptor densities, blocking norepinephrine reuptake, and inhibiting glutamate release [20, 21,22].

**Brahmi** (*Bacopa monnieri*): Brahmi (Bacopa monnieri; family: Scrophulariaceae), an Ayurvedic herb, has been used extensively to enhance cognition, memory, and learning skills. The addition of 500 mg/day of Brahmi extract over the course of a month reduced psychopathology in a case study of schizophrenia without resulting in any treatment-emergent negative effects [23]. Brahmi, a herb with nervine and revitalising properties, soothes nervous excitement and has sedative-like effects [24].

**Tulsi** (*Ocimumbasilicum*) : The scientific name for sweet basil, also known as Reihan, is Ocimumbasilicum L. (Family Lamiaceae) [25].Ocimumbasilicum leaves have antioxidant qualities that may be used to treat schizophrenia and other brain illnesses. Regularly consuming tea made from O. basilicum leaves can improve brain function and, as a result, help to moderate schizophrenia symptoms. For best effects, try to consume this herb tea twice daily [26,27,28,29].

**Ginseng**(*Panax ginseng*): The dried roots of several species of panax, including P. ginseng, P. japonica, P. notoginseng, and P. quinquefolium, are used to make ginseng. A variety of saponin glycosides from the triterpenoid family are found in ginseng. Ginsenosides, panaxosides, and chikusetsusaponin are the names given to them. The majority of ginseng species contain ginsenosides, polysaccharides, peptides, polyacetylenic alcohols, and fatty acids among their constituents [30]. It strengthens the ability to fight off sickness and increases natural resistance. It has calming and stimulating effects [31].

**Ziziphus jujube**(*Ziziphus mauritiana*):A species of Ziziphus in the buckthorn family Rhamnaceae, Ziziphus zizyphus is also known as jujube (or jujuba), red date, or Chinese date. It is mostly utilised as a fruiting shade tree. The fruits are utilised in traditional Chinese and Korean medicine, where they are thought to reduce stress,[32] and traditionally for sedative[33] antioxidant, immunostimulant, and wound healing properties[34].

#### Vasudha Negi et al.,

**Cardamom** (*Elettaria cardamomum*): The numerous symptoms of schizophrenia may also be managed with the use of Elettaria cardamomum seeds. The neurological system benefits greatly from the therapeutic qualities of E. cardamomum seeds. Making herbal tea is the simplest way to use *E. cardamomum* seeds. This tea should be consumed twice per day to aid with schizophrenia symptoms.

**Liquorice** (*Glycyrrhiza glabra*): Compounds and minerals included in *Glycyrrhiza glabra* may help to manage and control the healthy status of the brain. This herb is very effective at reducing stress and anxiety. Schizophrenia could be successfully treated with *G. glabra's* healing abilities. For this remedy, morning consumption on an empty stomach yields the finest benefits. Breakfast should be consumed after an hour has passed so that the herb can be thoroughly digested and absorbed into the bloodstream [26,27,28,29].

**Saffron**(*Crocus sativus*): The perennial herb *Crocus sativus* L. (*C. sativus*) belongs to the Liliaceae branch of the Iridaceae family [35,36]. Saffron extract or its components have antidepressant properties, according to recent pharmacological studies[37], anti-inflammatory, anti-tumor effects, radical-scavenging, learning and memory improving properties [38,39,40].

**Amla** (*Phyllanthus emblica*): *Phyllanthus emblica* is a sort of natural antioxidant. Additionally, it boosts the immune system, giving a much-needed boost the body to fight against psychological disorders like schizophrenia. One way of consuming the herb would be to bring the dried leaves of *P. emblica* and grind them all to create a smooth powder. Take one teaspoonful of the powder with hot water two times each day [26,27,28,29].

#### COMPLIMENTARY METHODS USED IN THE TREATMENT OF SCHIZOPHRENIA

**Multivitamin products:** Due to their inadequate diets, multivitamin products are advised for the vast majority of schizophrenia patients. Vitamins must be obtained from an outside source in order to adequately nourish the brain and other organs because humans cannot make them, with the exception of vitamin D[41].

**EPA omega-3 fish oils**: Early scientific research suggests that taking fish oil capsules that are high in the EPA (a type of Omega-3 fatty acid) form of oil may help people with schizophrenia by reducing their symptoms, despite the fact that the research is somewhat contradictory (there are some positive studies and some negative studies) [42].

**Glycine:** Numerous studies demonstrate that the non-essential amino acid glycine, especially when combined with the antipsychotic drugs haloperidol, thioridazine, and perphenazine, improves neurotransmitter activity and lessens negative symptoms of schizophrenia [43,44,45].

#### **BENEFITS OF USING HERBS FOR SCHIZOPHRENIA** [46,47]

- 1. Less risk on health
- 2. 2. Provides a wide range of noteworthy development
- 3. Increase energy level
- 4. Enhanced overall perception of health
- 5. Reduced level of pain
- 6. Increasing emotional stability
- 7. Alleviating anxiety
- 8. Reducing social isolation

# CONCLUSION

Since the dawn of civilisation, plants have been used all across the world to treat illnesses. Plants are generally safe, free of adverse effects, widely available nearby, and environmentally good because they are natural items. Some

#### Vasudha Negi et al.,

plants that have previously been investigated for their anti-schizophrenic effects by various researchers have been mentioned in this overview. Psychiatrists find it challenging to suggest nutritional supplements and natural cures instead of tested conventional therapies. Studies comparing the efficacy of herbal supplements and conventional therapies have been conducted. Herbal supplements and conventional therapies were not shown to be highly successful when used separately, but when combined, improved outcomes were obtained. Clinical investigations should consider further examining herbal extracts and elements with proven psychotherapy effects in animal models. Some nutritional supplements, such as anti-oxidant vitamins and EPA omega-3 fish oils, aid in reducing schizophrenia symptoms. As a result, using herbal therapy in conjunction with dietary supplements can produce superior effects. On the other side, our lifestyle choices have an impact on our health.

# ABSTRACT

Breast cancer ranks as one of the most prevalent cancers in women, with a higher incidence among those aged 50 and older. It stands as the second leading cause of cancer-related fatalities among women. In the year 2023, projections anticipate approximately 297,790 new cases of invasive breast cancer and 55,720 new cases of non-invasive breast cancer among women. So, it is our utmost interest is to analyze the risk factors of Breast cancer. Therefore, this present study is intended a propose an MCDM method under a fuzzy environment to analyze the risk factors in Breast Cancer. To illustrate the implementation process of this methodology, we'll delve into a numerical example.

Keywords: Breast Cancer, Risk Factors, Fuzzy logic, MCDM method

# INTRODUCTION

Breast Cancer creates a significant global health concern, affecting millions of women every year[1]. With advancements in medical research and treatment modalities, there has been significant progress in understanding the molecular mechanisms of breast cancer development, early detection, diagnosis, and targeted therapies. This comprehensive review highlights recent breakthroughs in breast cancer research and treatment, shedding light on emerging strategies to combat this devastating disease. Understanding the risk factors associated with breast cancer can help identify individuals who may have a higher likelihood of developing the disease. While having one or more

#### Iswariya and Sahaya Sudha

of these risk factors does not guarantee the development of breast cancer, they can increase the overall risk[6]. Zadeh [9] put forward the concept of fuzzy sets in 1965. In subsequent years, the theory of fuzzy sets continued to evolve and mature. Multiple Criteria Decision Making (MCDM), which is a field of study that deals with decision-making problems involving multiple and often conflicting criteria. In many real-world situations, decision-makers need to evaluate and compare alternatives based on multiple attributes or criteria before making a final decision. Fuzzy MCDM methods handle decision-making problems with fuzzy or uncertain data[8]. They extend traditional MCDM methods to deal with imprecise information. MCDM methods play a crucial role in fields like management, engineering, finance, environmental planning, and many other areas where complex decisions need to be made considering multiple conflicting criteria [20]. These methods help decision-makers consider different perspectives, weigh the importance of various criteria, and arrive at a well-informed decision. The researcher determined the most significant risk factors of breast cancer by applying the MCDM statistical model.

The main purpose is to identify the significant risk factors for Breast cancer and to raise awareness and prevent the spread of the disease. High-risk factors are sorted using fuzzy MCDM models. Here a new MCDM method is proposed to find the utmost influencing risk factors of Breast cancer so that we can bring awareness among the public.

#### PRELIMINARIES

#### Fuzzy set [10]

Fuzzy set was first introduced by Lotfi A. Zadeh in 1965. Let X be a non-empty set. A fuzzy set  $\tilde{A}$  in X is represented by its membership function  $\mu_{\tilde{A}} : X \rightarrow [0,1]$  and  $\mu_{\tilde{A}}(x)$  is interpreted as the degree of membership of element x in fuzzy set  $\tilde{A}$  for each  $x \in X$ .

#### Fuzzy number [10]

A fuzzy set à on R must possess at least the following 3 properties to qualify as a fuzzy number,

- i. The set à must satisfy the criteria of being a normal fuzzy set.
- ii.  $\alpha \tilde{A}$  must be closed interval for every  $\alpha \in [0,1]$
- iii. The support of Ã, should be bounded.

#### Trapezoidal fuzzy number [10]

A trapezoidal fuzzy number  $\tilde{A}$ =(a<sub>1</sub>,a<sub>2</sub>,a<sub>3</sub>,a<sub>4</sub>) is a fuzzy number with a membership function  $\mu_{\tilde{A}}$  (x) is described as

#### PROPOSED MCDM METHOD:

Step I: Frame the alternatives and criteria based on the risk factors of breast cancer.

Let  $A = \{A_1, A_2, ..., A_m\}$  be the set of alternatives and  $C = \{C_1, C_2, ..., C_n\}$  be the set of criteria and decision-makers are  $D = \{D_1, D_2, ..., D_n\}$ .

**Step II:** Construct the decision matrices using linguistic terms with aid of decision makers

**Step III:** Transform the linguistic matrices into trapezoidal fuzzy matrices. Then construct the aggregated trapezoidal decision matrix D.

#### Iswariya and Sahaya Sudha

$$D = \begin{bmatrix} C_1 & C_2 & \cdots & C_n \\ A_1 & (a_{11}, b_{11}, c_{11}, d_{11}) & (a_{12}, b_{12}, c_{12}, d_{12}) & \cdots & (a_{1n}, b_{1n}, c_{1n}, d_{1n}) \\ (a_{21}, b_{21}, c_{21}, d_{21}) & (a_{22}, b_{22}, c_{22}, d_{22}) & \cdots & (a_{2n}, b_{2n}, c_{2n}, d_{2n}) \\ \vdots & \vdots & \vdots & \vdots \\ A_4 & \vdots & \vdots & \vdots \\ (a_{m1}, b_{m1}, c_{m1}, d_{m1}) & (a_{m2}, b_{m2}, c_{m2}, d_{m2}) & \cdots & (a_{mn}, b_{mn}, c_{mn}, d_{mn}) \end{bmatrix}$$

Step IV: The trapezoidal fuzzy matrix D is converted into crisp value matrix T using the ranking function

$$R(A) = \frac{1}{4} \Big[ a_1 + a_2 + a_3 + a_4 \Big].$$
 Then the defuzzified matrix is 
$$T = \begin{bmatrix} u_{11} & u_{12} & \dots & u_{1n} \\ u_{21} & u_{22} & \cdots & u_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ u_{m1} & u_{m2} & \cdots & u_{mn} \end{bmatrix}$$

#### Step V: Normalize the defuzzified matrix:

The defuzzified matrix is normalized by  $r_{ij} = \frac{u_{ij}}{\sum_{i=1}^{n} u_{ij}^2}$  to get the normalized matrix U

$$U = \begin{bmatrix} r_{11} & r_{12} & \dots & r_{1n} \\ r_{21} & r_{22} & \cdots & r_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ r_{m1} & r_{m2} & \cdots & r_{mn} \end{bmatrix}$$

#### Step VI: Weight Calculation

From the normalized matrix U, determine the nxn symmetric matrix with the element  $h_{jk}$ , which is the linear correlation coefficient between the criteria.

$$H = \begin{bmatrix} C_1 & C_2 & \cdots & C_n \\ h_{11} & h_{12} & \cdots & h_{1n} \\ h_{21} & h_{22} & \cdots & h_{21} \\ \vdots & \vdots & \ddots & \vdots \\ C_n \begin{bmatrix} h_{n1} & h_{n2} & \cdots & h_{nn} \end{bmatrix}$$
 where  $h_{ik}$  = linear correlation coefficient between the criteria

Then the weight W=(w<sub>1</sub>, w<sub>2</sub>, ..., w<sub>n</sub>) can be calculated using the formula  $W = \frac{n}{n}$ 

$$=\frac{h_{jk}}{\sum_{k=1}^{n}(1-h_{jk})}$$

Step VII: Construct the weighted normalized matrix W.

$$W = \begin{bmatrix} w_1 r_{11} & w_2 r_{12} & \dots & w_n r_{1n} \\ w_1 r_{21} & w_2 r_{22} & \dots & w_n r_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ w_1 r_{m1} & w_2 r_{m2} & \dots & w_n r_{mn} \end{bmatrix} = \begin{bmatrix} m_{11} & m_{12} & \dots & m_{1n} \\ m_{21} & m_{22} & \dots & m_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ m_{m1} & m_{m2} & \dots & m_{mn} \end{bmatrix}$$

Step VIII:

#### Iswariya and Sahaya Sudha

Calculate the Best and Worst value from the weighted normalized matrix W Best  $M^+ = \{(\max_i W_{ij} \mid j \in J), (\min_i W_{ij} \mid j \in J') \mid i = 1, 2, \dots m\}$ Worst  $M^- = \{(\min_i W_{ij} \mid j \in J), (\max_i W_{ij} \mid j \in J') \mid i = 1, 2, \dots m\}$ where  $J = 1, 2, \dots$  and  $J' = 1, 2, \dots$  n Step IX: Best Distance Calculation (BD) Non Beneficial criteria :  $BD = \frac{1}{n} \sum_{i=1}^{n} \left[ \frac{m_{ij} - m_{ij}}{A_j} \right]$  where n= number of criteria Beneficial criteria :  $BD = \frac{1}{n} \sum_{i=1}^{n} \left[ \frac{m_{ij}^+ - m_{ij}}{A_j} \right]$  where n= number of criteria where  $A_j = \frac{1}{n} \sum_{i=1}^{n} [m_{ij}]$ , n= number of criteria Step X: Worst Distance Calculation (WD) Non Beneficial criteria :  $WD = \frac{1}{n} \sum_{i=1}^{n} \left[ \frac{m_{ij}^- - m_{ij}}{A_j} \right]$  where n= number of criteria Beneficial criteria :  $WD = \frac{1}{n} \sum_{i=1}^{n} \left[ \frac{m_{ij} - m_{ij}}{A_j} \right]$  where n= number of criteria Where  $A_j = \frac{1}{n} \sum_{i=1}^{n} [m_{ij}]$ , n= number of criteria Step X: Worst Distance Calculation (WD) Non Beneficial criteria :  $WD = \frac{1}{n} \sum_{i=1}^{n} \left[ \frac{m_{ij} - m_{ij}}{A_j} \right]$  where n= number of criteria Beneficial criteria :  $WD = \frac{1}{n} \sum_{i=1}^{n} \left[ \frac{m_{ij} - m_{ij}}{A_j} \right]$  where n= number of criteria Where  $A_j = \frac{1}{n} \sum_{i=1}^{n} [m_{ij}]$ , n= number of criteria

**Step XI:** Normalize the BD and WD  $N_i = \frac{1}{2} [BD_i + WD_i]$ 

#### Step XII:

Rank all alternatives and select the most desirable one in accordance with  $N_i$ . The alternative with minimum value is the best one.

#### CASE ANALYSIS

The main aim of this work is to analyze the topmost risk factor of Breast cancer from its symptoms. Based on the three decision-makers opinions, the risk factors are analyzed. In the operation of proposed MCDM method, 10 risk factors and 5 criteria are chosen to analyze the most threatening risk factors of Breast cancer.

#### Applying the proposed MCDM method

Step I: Frame the alternatives and criteria

Step II: Setup the linguistic direct relation matrices

**Step III:** Transform the linguistic matrices into trapezoidal fuzzy matrices. Then, construct the aggregated triangular decision matrix D. This analysis incorporates the perspectives of three decision-makers. The fuzzy linguistic values are utilized to provide the relationship between alternatives and criteria with the opinion of the decision-maker.

Step IV: Convert trapezoidal fuzzy values into crisp values

Step V: Normalize the defuzzified matrix

**Step VI: Weight Calculation** From the normalized matrix U, determine the nxn symmetric matrix with the element h<sub>jk</sub>, which is the linear correlation coefficient between the criteria.

International Bimonthly (Print) – Open Access Vol.14 / Issue 80 / Oct / 2023 ISSN: 0976 – 0997

#### Iswariya and Sahaya Sudha

# The weight W=(w<sub>1</sub>, w<sub>2</sub>, ..., w<sub>n</sub>) can be calculated using the formula $W = \frac{h_{jk}}{\sum_{k=1}^{n} (1 - h_{jk})}$

Then the weights are W=(0.466504, 0.100959, 0.122754, 0.117708, 0.192075). Step VII: Construct the weighted normalized matrix W.

Step VIII: Calculate the Best and Worst value from the weighted normalized matrix W

Best ={0.109956, 0.010198, 0.007021, 0.012877, 0.019089} Worst = {0.329868, 0.050992, 0.063187, 0.050388, 0.074696}

Step IX: Best Distance Calculation (BD)

Step X: Worst Distance Calculation (WD)

Step XI&XII :Normalize BD and WD and rank the alternatives with minimum value. According to the ranking, the most important risk factor of Breast cancer A4 Personal History of Breast cancer. The top five risk factors are A4 < A3 < A5 < A10 < A8.

# CONCLUSION

In this paper, the risk factors for breast cancer have been investigated. Despite the outbreak of various types of cancers in the world. Recently, the death rate in the world has increased due to infection with this dangerous disease. Numerous risk factors have been recognized for this condition. MCDM techniques were adapted to evaluate the risk factors using fuzzy logic combined with the proposed method to calculate the weights of criteria based on the preferences of the experts. Comparing other method, this proposed method is easily understandable and accessible by all. Also, the problem focuses on finding the high-level risk factor of Breast Cancer and will bring awareness and knowledge about Breast cancer among people.

# ABSTRACT

Let G = (V, E) be a simple connected graph of order p and size q. If G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, ..., G<sub>n</sub> are edge disjoint subgraphs of G such that  $E(G) = E(G_1) \cup E(G_2) \cup \dots \cup E(G_n)$ , then (G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, ..., G<sub>n</sub>) is said to be a Decomposition of a graph G. A graph of size  $q = \binom{n+2}{3}$  is said to have a Triangular decomposition (TD) if G can be decomposed into n - subgraphs G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, ..., G<sub>n</sub> such that each G<sub>i</sub> is connected and  $|E(G_i)| = \binom{i+1}{2}$  for  $1 \le i \le n$ . In this paper, we investigate Triangular decomposition of some special graphs.

Keywords – Decomposition, Triangular decomposition, Bistar graph, Friendship graph.

# INTRODUCTION

A graph *G*, referred to here is an undirected connected graph without loops or multiple edges. Different types of decomposition of a graph *G* have been studied in the literature by imposing suitable conditions on the sub graphs *G*<sub>i</sub>. In this paper we discuss about Triangular decomposition of some special graphs.

#### Subbulakshmi and Chitra Devi

#### Definition 1.1

Let G = (V, E) be a simple graph of order p and q. If  $G_1,G_2,G_3,\ldots,G_n$  are edge disjoint subgraphs of G such that  $E(G) = E(G_1) \cup E(G_2) \cup E(G_3) \cup \ldots, \cup E(G_n)$ , then  $(G_1,G_2,G_3,\ldots,G_n)$  is said to be decomposition of G.

Decomposition (G<sub>1</sub>,G<sub>2</sub>,G<sub>3</sub>,G<sub>4</sub>) of G

#### Definition:1.2

A decomposition (G<sub>1</sub>,G<sub>2</sub>,G<sub>3</sub>,...,G<sub>n</sub>) of G is said to be Triangular decomposition if each G<sub>i</sub> is connected and  $|E(G_i)| = \frac{i(i+1)}{2}$  for  $1 \le i \le n$ .

Triangular Decomposition (G1,G2,G3) of G

#### Triangular Decomposition of some special Graphs

#### Theorem: 2.1

The Bistar graph  $B_{k,k}$  admits Triangular decomposition  $G_1, G_2, \dots, G_{4n+1}$  if and only if  $k = \frac{16n^3 + 24n^2 + 11n}{3}$  for all  $n \in \mathbb{N}$ .

#### Proof:

Let  $V = \{v_j / 0 \le j \le k\} \cup \{u_j / 0 \le j \le k\}$  be the vertex set and  $E = \{u_0 u_j / 1 \le j \le k\} \cup \{v_0 v_j / 1 \le j \le k\} \cup \{v_0 u_0\}$  be the edge set.

Suppose a Bistar graph  $B_{k,k}$  admits triangular decomposition (G<sub>1</sub>, G<sub>2</sub>,...,G<sub>4n+1</sub>). We know that G admits Triangular Decomposition of G<sub>1</sub>,G<sub>2</sub>,...,G<sub>n</sub> iff  $q(G) = \frac{n(n+1)(n+2)}{6}$  where n∈N. That is a graph  $B_{k,k}$  admits triangular decomposition (G<sub>1</sub>,G<sub>2</sub>,...,G<sub>4n+1</sub>)  $\Leftrightarrow$   $q(B_{k,k}) = \frac{(4n+1)(4n+2)(4n+3)}{6}$  for some k∈N. We have  $q(B_{k,k}) = 2k+1$ . This implies  $2k+1 = \frac{(4n+1)(4n+2)(4n+3)}{6}$ . That is  $2k = \frac{32n^3+48n^2+22n+3}{6} - 1$ . That is  $k = \frac{32n^3+48n^2+22n+3}{6} - 1$ . This is  $k = \frac{32n^3+48n^2+22n+3}{6} - 1$ . This is  $k = \frac{16n^3+24n^2+11n}{3}$  for all n∈ N. Conversely assume that Bistar graph  $B_{k,k}$  with  $k = \frac{16n^3+24n^2+11n}{3}$  for all n ∈ N  $\Rightarrow q(B_{k,k}) = 2k+1$ .

Subbulakshmi and Chitra Devi

 $\Rightarrow q(B_{k,k}) = 2(\frac{16n^3 + 24n^2 + 11n}{3}) + 1$  $\Rightarrow q(B_{k,k}) = \frac{32n^3 + 48n^2 + 22n + 3}{3}$ 

 $\Rightarrow q(B_{k,k}) = \frac{(4n+1)(4n+2)(4n+3)}{(4n+3)}$ 

This implies the Bistar graph  $B_{k,k}$  admits Triangular decomposition  $G_1, G_2, \ldots, G_{4n+1}$ .

The following table gives the Triangular Decomposition of  $B_{k,k,m}$ 's for different values of m.

k	q(B <sub>k,k</sub> )	Triangular Decomposition
17	35	G1, G2,,G5
82	165	G1, G2,,G9
227	455	G1, G2,,G13
484	969	G1, G2,,G17

Illustraion:2.2

Triangular Decomposition  $(G_1, G_2, \dots, G_5)$  of G. Theorem:2.3

The friendship graph F<sub>s</sub> admits Triangular decomposition G<sub>1</sub>, G<sub>2</sub>,...,G<sub>9m+7</sub> if and only if  $s = \frac{81m^3 + 216m^2 + 191m + 56}{2}$  for all m∈N.

# Subbulakshmi and Chitra Devi

#### **Proof:**

Assume that a friendship graph Fs admits Triangular decomposition (G1, G2,....,G9m+7). We know that G accepts Triangular Decomposition of  $G_1, G_2, \ldots, G_n$  iff  $q(G) = \frac{n(n+1)(n+2)}{6}$ ,  $n \in \mathbb{N}$ . That is the graph  $F_s$  admits Triangular decomposition  $(G_1, G_2, \dots, G_{9m+7}) \Leftrightarrow q(F_s) = \frac{(9m+7)(9m+8)(9m+9)}{6}$  for some m $\in$ N. We have  $q(F_s) = 3s$ Implies  $3s = \frac{(9m+7)(9m+8)(9m+9)}{(9m+9)}$ That is  $3s = \frac{9(81m^2 + 135m + 56)(m+1)}{6m}$ This is  $s = \frac{81m^3 + 216m^2 + 191m + 56}{2}$  for all m $\in$ N. Conversely assume that a friendship graph  $F_s$  with  $s = \frac{81m^3 + 216m^2 + 191m + 56}{2}$  for all m $\in$ N.  $\Rightarrow$  q(F<sub>s</sub>) = 3s  $\Rightarrow$  q(F<sub>s</sub>) = 3( $\frac{81m^3 + 216m^2 + 191m + 56}{2}$ )  $\Rightarrow$  q(F<sub>s</sub>) =  $\frac{729m^3 + 486m^2 + 99m + 6}{10}$  $\Rightarrow q(F_s) = \frac{(9m+7)(9m+8)(9m+9)}{6}$ 

This implies Fs can be decomposed into G1, G2,.....,G9m+7.

The following table gives the Triangular Decomposition of Fs's for different values of m.

#### Subbulakshmi and Chitra Devi

Triangular Decomposition (G1,G2,G3,G4,....,G7) of G

#### Theorem: 2.5

A complete tripartite graph K<sub>1,3,m</sub> admits Triangular Decomposition of G<sub>1</sub>, G<sub>2</sub>,....,G<sub>8n+5</sub> if and only if m=  $\frac{64n^3+144n^2+107n+24}{64n^3+144n^2+107n+24}$  for all neN.

#### **Proof:**

We have  $q(K_{1,3,m}) = \frac{1(3+m)+3(m+1)+m(1+3)}{2}$ = 4m+3 for all  $m \in N$ 

Suppose a complete tripartite graph  $K_{1,3,m}$  admits Triangular Decomposition of  $G_1, G_2, \dots, G_{8n+5}$  for all  $n \ge 0$ . We know that G admits Triangular Decomposition of  $G_1, G_2, \dots, G_n$  if and only if  $q(G) = \frac{n(n+1)(n+2)}{6}$ ,  $n \in \mathbb{N}$ . That is a graph  $K_{1,3,m}$  admits Triangular Decomposition of  $G_1, G_2, \dots, G_{8n+5}$  if and only if  $q(K_{1,3,m}) = \frac{(8n+5)(8n+6)(8n+7)}{6}$  for all n∈N.

That is  $4m+3 = \frac{k(k+1)(k+2)}{k}$  for some  $k \in \mathbb{N}$ . That is  $4m+3 = \frac{\binom{6}{(8n+5)(8n+6)(8n+7)}}{(8n+5)(8n+6)(8n+7)}$ That is  $4m = \frac{256n^3 + 576n^2 + 428n + 105}{6}$  -3 for all  $n \in \mathbb{N}$ That is  $4\pi = \frac{3}{3} - 3$  for all  $n \in \mathbb{N}$ The values of m are 8, 113, 442, .....

Conversely, assume that a graph  $K_{1,3,m}$  with  $m = \frac{64n^3 + 144n^2 + 107n + 24}{3}$  for all  $n \in \mathbb{N}$ . We know that  $q(K_{1,3,m}) = 4m + 3$  $64n^3 + 144n^2 + 107n + 24$ 

$$= 4\left(\frac{97n+114n+107n+124}{3}\right) + 3$$
$$= \frac{256n^3 + 576n^2 + 428n+105}{3}$$
$$= \frac{(8n+5)(8n+6)(8n+7)}{6}$$

This implies that  $G_{1}, G_{2}, \ldots, G_{8n+5}$  for all  $n \in \mathbb{N}$ .

The following table gives the Triangular Decomposition of  $K_{1,3,m}$ 's for different values of m.

m	q(K1,3, m)	Triangular Decomposition
8	35	G1, G2,,G5
113	455	G1, G2,,G13

# ABSTRACT

In order to handle uncertainty and hesitancy in real-world problems, Researchers and businesspeople are becoming more interested in Picture Fuzzy Sets(PFS). Interval Valued Picture Fuzzy Set (IVPFS) is more effective tool for dealing with uncertainty and impressions. The transportation problem offers practical solutions to the problem of how to deliver goods to customers in a more expert way. Real-world problems, such as traffic restrictions and weather conditions, frequently involve unpredictable events. In this study, we introduced the three different types of formulae namely WIDTH, GM and PERT are used to convert the IVPFS into crisp values and RANGE method was used to find IBFS of IVPFTP. Three types of Interval Valued Picture Fuzzy Transportation Problem(IVPFTP) are considered namely Type1(supply, demand), Type 2(cost only) and Type 3(supply, demand and cost) in which above parameters represented as IVPFS. Finally the results obtained from Type 1, Type2 and Type3 IVPFTP compared with each other.

# INTRODUCTION

Fuzzy sets were introduced by Lotfi A. Zadeh[15] in1965 as a way to represent uncertainty and vagueness. Fuzzy sets assign a degree of membership between 0 and 1, indicating the extent to which an element belongs to the set. IVFS, which are a generalization of FSs, were also proposed by Zadeh[14]. As a alternative generalization of FS, Atanassov[3] introduced Intuitionistic Fuzzy Sets. IFSs have two functions called the membership function and nonmembership function, both of which must be added under a closed unit interval. Interval Valued Intuitionistic Fuzzy Set (IVIFS), developed by Atanassov and Gargov [3]. IVIFS continues to maintain the constraint that the sum of the supremum for these intervals must fall within the range of [0, 1]. Coung[5] generalized the concept of PFS, stating that the three PFS components are membership, neutral, and non-membership functions, and that the total of these three values must lie inside the closed unit interval. Picture fuzzy sets (PFS) extend the concept of intuitionistic fuzzy sets by allowing membership degrees to be represented not only as scalar values but also as intervals. In other words, instead of assigning a single membership value to an element, you assign a range of possible membership values.IVPFS combine the notions of IVFS and PFS. In an IVPFS, membership degrees are represented not only as intervals but also as PFS. This adds another layer of flexibility in representing uncertainty. Transportation problems often deal with the optimal distribution of goods from multiple suppliers to multiple consumers while minimizing transportation costs or maximizing profits. Over the years, researchers have extended the traditional transportation problem to encompass more complex and uncertain environments. In the context of transportation problems, uncertainties can arise from various sources such as imprecise data, ambiguous preferences, and fluctuating market conditions. The primary objective of TP is to find the most effective solution at the lowest possible overall transportation cost. The ideal TP solution requires two steps: finding an Initial Basic Feasible Solution (IBFS) and determining the optimal solution using the Northwest Corner Method, Least Cost Method, or Vogel's Approximation Method[13]. Nagoorgani A and S.Abbas [9] introduced a new method for solving Intuitionistic fuzzy transportation problem Sathya Geetha and Selva Nayaki[11] used picture fuzzy numbers as a cost of transportation problem and used some techniques for convert the Picture fuzzy numbers into crisp values and find the IBFS of that picture fuzzy numbers. IVPFTPemerges as a powerful model to address these uncertainties. In this problem, not only are the supply and demand values represented as IVPFN, but the transportation costs between sources and destinations are also subject to imprecision and ambiguity.

#### **Basic definitions**

In this section we define a few fundamental terms to make the following sections easier to understand for readers. The universal set is called X.

#### **Definition 2.1.** A FS on *X* is defined as:

 $T = \{x, \omega(x) \mid x \in X\},\$ 

where the term  $\omega(x)$  refers to "membership function",  $\omega: X \to [0, 1]$  that expresses the degree to which an object is a member of a non-empty set. Each  $\omega(x)$  is known as a fuzzy number.

#### **Definition 2.2.** An IVFS on *X* is defined as:

 $T = \{x, \ \omega_{T}(x) \mid x \in X\},$ (2) where  $\omega_{T} = [\omega_{TL}, \ \omega_{TU}]$  is subinterval of [0, 1] and it expresses the degree of membership by sub-interval and each  $\omega(x)$  is called IVFN.

#### **Definition 2.3.** An IFS on *X* is defined as:

 $T = \{x, \ \omega(x), \ \omega(x) \mid x \in X\},$ (3) where  $\omega, \ \omega: X \to [0,1]$  are called membership and non-membership functions. An IFS has a condition that the sum of both functions must lie in unit interval and the degree of refusal is defined as  $r(x) = 1 - (\omega(x) + \omega(x))$ . A duplet (  $\omega(x), \ \omega(x)$ ) is called an intuitionistic fuzzy number (IFN).

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Rajarajeswari et al.,

#### **Definition 2.4.** An IVIFS on a universal set *X* is defined as:

 $T = \{x, \ \omega_{T}(x), \ \varpi_{T}(x) \mid x \in X\},$ (4) where  $\omega_{T} = [\omega_{TL}, \ \omega_{TU}], \ \varpi_{T} = [\varpi_{TL}, \ \varpi_{TU}]$  and  $\omega_{T}, \ \varpi_{T}: X \to [0,1]$ . An IVIFS has a condition that the sum of supremum of membership and non-membership functions must lie in unit interval. A duplet ( $\omega(x), \ \varpi(x)$ ) is called interval-valued intuitionistic fuzzy number (IVIFN).

#### **Definition 2.5.** A PFS on *X* is defined as:

 $T = \{x, \ \omega(x), \ \vartheta(x), \ \omega(x) \ | \ x \in X\},$ (5) where  $\omega, \ \vartheta, \ \omega: X \to [0,1]$  are called membership, abstinence, and non-membership functions. A PFS has a condition that the sum of all three functions must lie in unit interval and the degree of refusal is defined as  $r(x) = 1 - (\omega(x) + \vartheta(x) + \vartheta(x))$ . A triplet  $(\omega(x), \vartheta(x), \omega(x))$  is called a PFN.

#### **Definition 2.6.** An IVPFS on a universal set *X* is defined as:

 $T = \{x, \ \omega_{T}(x), \vartheta(x), \omega(x) \mid x \in X\},$ (6) where  $\omega_{T} = [\omega_{TL}, \omega_{TU}], \vartheta_{T} = [\vartheta_{TL}, \vartheta_{TU}], \omega_{T} = [\omega_{TL}, \omega_{TU}] \text{ and } \omega_{T}, \vartheta_{T}, \omega_{T}: X \to [0,1].$  An IVPFS has a condition that the sum of supremum of all three functions must lie in unit interval. A triplet ( $\omega(x), \vartheta(x), \omega(x)$ ) is called interval-valued picture fuzzy number (IVPFN).

#### Definition 2.7:Type 1 IVPFTP

In this type of interval valued picture fuzzy transportation problem, the transportation costs are crisp values and the supply, demand are interval valued picture fuzzy numbers.

In the below IVPFTP table1 where  $C_{ij}$  – be the costs,  $[a_{d\omega_j}, b_{d\omega_j}]$ ,  $[a_{d\vartheta_j}, b_{d\vartheta_j}]$ ,  $[a_{d\varpi_j}, b_{d\varpi_j}]$ )- be the demands,  $[a_{s\omega_i}, b_{s\omega_i}]$ ,  $[a_{s\vartheta_i}, b_{s\vartheta_i}]$ ,  $[a_{s\varpi_i}, b_{s\varpi_i}]$ )-be the supply.

#### Definition 2.7. Type 2 IVPFTP

In the IVPFTP type 2, the transportation costs are interval valued picture fuzzy numbers and the supply, demands are crisp values.

The Type 2 IVPFTP from the below IVPFTP Table 2, where  $[a_{\omega_{ij}}, b_{\omega_{ij}}, a_{\vartheta_{ij}}, b_{\xi_{ij}}, a_{\varpi_{ij}}, b_{\varpi_{ij}}]$  are costs,  $C_{dj}$  be the demand,  $C_{si}$  be the supply.

#### Type 3 IVPFTP

This type of IVPFTP have transportation costs, supply and demands are interval valued picture fuzzysets. The following table represents IVPFTP Type 3.

In Type 3, IVPFTP Table 3

 $C_{ij} = ([a_{\omega_{ij}}, b_{\omega_{ij}}], [a_{\vartheta_{ij}}, b_{\vartheta_{ij}}], [a_{\varpi_{ij}}, b_{\varpi_{ij}}])$  for i = 1, 2, 3...m and j = 1, 2, 3...m represents the transportation cost for transporting one unit from the  $i^{th}$  origin to  $j^{th}$  destination , where  $[a_{\omega_{ij}}, b_{\omega_{ij}}]$  represents the membership,  $[a_{\vartheta_{ij}}, b_{\vartheta_{ij}}]$  represents abstinence and  $[a_{\omega_{ij}}, b_{\omega_{ij}}]$  represents non-membership values which are Interval Valued Picture Fuzzy Sets.

#### Algorithm to IBFS for IVPFTP

RANGE method for IBFS of IVPFTP. The following algorithm is used to find IBFS for IVPTP.

values

the

in

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Rajarajeswari et al.,

- **Step 1:** Find width by using the following formulae  $d_{\omega_{ij}} = (b_{\omega_{ij}} - a_{\omega_{ij}})/2, \quad d_{\vartheta_{ij}} = (b_{\vartheta_{ij}} - a_{\vartheta_{ij}})/2 \text{ and}$   $d_{\overline{\omega}_{ij}} = (b_{\overline{\omega}_{ij}} - a_{\overline{\omega}_{ij}})/2 \text{ and we get the values of } d_{\omega_{ij}}, d_{\vartheta_{ij}}, d_{\overline{\omega}_{ij}},$ where i = 1, 2, 3...m and j = 1, 2, 3...n
- **Step 2:** Find the number between the interval  $([a_{\omega_{ij}}, b_{\omega_{ij}}], [a_{\vartheta_{ij}}, b_{\vartheta_{ij}}], [a_{\varpi_{ij}}, b_{\varpi_{ij}}])$  by using following.  $e_{\omega_{ij}} = a_{\omega_{ij}} + d_{\omega_{ij}}; \quad e_{\vartheta_{ij}} = a_{\vartheta_{ij}} + d_{\vartheta_{ij}}$  and  $e_{\varpi_{ij}} = a_{\varpi_{ij}} + d_{\varpi_{ij}},$ where i = 1, 2, 3...m and j = 1, 2, 3...n

Form,

$$T_{\omega_{ij}} = (a_{\omega_{ij}}, e_{\omega_{ij}}, b_{\omega_{ij}}); \qquad T_{\vartheta_{ij}} = (a_{\vartheta_{ij}}, e_{\vartheta_{ij}}, b_{\vartheta_{ij}}), \text{ and } T_{\overline{\omega}_{ij}} = (a_{\overline{\omega}_{ij}}, e_{\overline{\omega}_{ij}}, b_{\overline{\omega}_{ij}}),$$
  
where  $i = 1, 2, 3, ..., m$  and  $i = 1, 2, 3, ..., n$ 

Step 3: Use the GM formula and find the value of triangular values. After that, get Picture Fuzzy Sets are following.

 $C_{\omega_{ij}} = (a_{\omega_{ij}} * e_{\omega_{ij}} * b_{\omega_{ij}})^{1/3}$ ;  $C_{\vartheta_{ij}} = (a_{\vartheta_{ij}} * e_{\vartheta_{ij}} * b_{\vartheta_{ij}})^{1/3}$  and  $C_{\omega_{ij}} = (a_{\omega_{ij}} * e_{\omega_{ij}} * b_{\omega_{ij}})^{1/3}$ , where i = 1, 2, 3...m and j = 1, 2, 3...n

**Step 4:** Use the ranking formula namely PERT formula and change the PFS into crisp

IVPFTP.

 $C_{ij}$  = (  $C_{\omega_{ij}}$  + (4x $C_{\vartheta_{ij}}$ )+  $C_{\overline{\omega}_{ij}}$ )/6, where i =1,2,3...m and j =1,2,3...n

Step 5. Find the range for each row and each column,

where range = largest cost- smallest cost.

- *Step 6.* Find the row or column with the largest range. For the minimum cost in the selected row or column assign the corresponding demand or supply, whichever is minimum. Supply and demand in related to the value that was assigned to the cell. Once you have crossed the fully satisfied row or column, continue.
- **Step 7.** Steps 5 and 6 should be repeated until all conditions are fulfilled.
- Step 8. Calculate the Transportation Cost.

#### Example 1

Example1 represent the Type 1 IVPFTP.

Use the steps 1-5 from the algorithm and get the following table values.

#### The IBFS table is given below by the steps 6-8 from the proposed algorithm

 $\label{eq:constraint} \begin{array}{l} z = (0 \ ^* 0.2) + (0.1 \ ^* 0.1) + (0.1 \ ^* 0.1) + (0.4 \ ^* 0.2) + (0.2 \ ^* 0.1) + (0 \ ^* 0.1) + (0.2 \ ^* 0.3) = 0.18 \\ \text{Example 2} \end{array}$ 

This example represent the Type 2 model and it has the costs are IVPFS and the supply ,demands are crisp values.

We use the steps 6-8 from the proposed algorithm after converting the crisp value of example 3 and we get the IBFS of example 3 as given below.

z=(0.3\*0.12)+(0\*0.24)+(0.2\*0.26)+(0.1\*0.22)+(0.1\*0.12)+(0.5\*0.12)=0.29

Example 3. In this example all costs, supply and demands are IVPFS

Use the RANGE method to find the minimum cost for IBFS table 11 values. Minimum cost =(0.24\*0.14)+(0.017\*0.26)+(0.12\*0.12)+(0.12\*0.12)+(0.12\*0.27)+(0.11\*0.27)+(0.13\*0.22)+(0.12\*0.12))=0.16

Comparing the results with the Type 1,Type 2 and Type 3 of IVPFN by using proposed algorithm. From the above IVPFTP Table 13, Type 3 IVPFTP given the better result.

#### Rajarajeswari et al.,

# CONCLUSION

In this paper applied the new ranking formulae for converting the IVPFN into crisp values in the Type1,Type 2 and Type 3 IVPFTP. Then used a RANGE method for find IBFS of that three types of IVPFTP.From the above table it is observed that Type 3 IVPFTP gives the better solution than the Type1 and Type2 IVPFTP.

# ABSTRACT

In 2019, S. Chandrasekar introduced microtopology from nanotopology. In this paper, we introduce Selje topological spaces and some new classes of weak open sets, such as Selje Semi-open sets and Selje Semiopen sets.

Keywords: Selje topological spaces, Selje-Semi-open sets, Selje-continuous function.

# INTRODUCTION

Various types of topological spaces such as fuzzy topology, hypertopology, nanotopol- ogy and microtopology are introduced. In 2013, L. Thivagar et al. [5] introduced nanotopology in 2019 and introduced microtopology as an extension of nanotopology using Levine's simple extension steps. The concepts of Semi-open set and Semi-open set have been proposed by Mashour et al. [3] and Levine [6] respectively. This article introduces a new type of topological space, the selje topological space. Its main prod- ucts and relations with other classes are education. continuous operations are defined such as continuous operation of Selje, continuous operation of Selje and intermittent operation of Selje.

**Definition 2.1.** In the topological space (E, T), the subset G is characterized as:

- Semi-open is called set, if the condition if met: G is part of the closed interior of G. Section
- If the condition is met: G is a subset of the closed set G, called the pre-open set.

# Jeyanthi and Selvanandhini

The addition of a Semi-open set (called a Semi-closed set) in space E is called a pre-closed set (Semi-closed set).

**Definition 2.2.** Let us define the universal set V as nonempty and consider the equivalence relation R on V , also known as the indistinguishability relation. The pair (V, R) is referred to as the approximation space. For the subset  $E \subseteq V$ :

1. The lower approximation of E concerning R is symbolized as  $L_{R}(E)$ , defined by:

 $B_{\mathbb{R}}(E) = x \in V$ : For all equivalence classes  $G(x) \subseteq E$ 

2. The upper approximation of E concerning R is denoted as  $U_{\text{\tiny R}}(E)$ , given by:

 $B_R(E) = x \in V$ : There exists an equivalence class G(x) that intersects with E3. The boundary region of E with respect to R is represented as  $B_R(E)$ , calculated as:  $B_R(E) = U_R(E) - L_R(E)$ 

**Definition 2.3.** Let V represent a universal set, and let R denote an equivalence relation on V. We define  $T_{R}(E)$  as the set {V,  $\Phi$ ,  $L_{R}(E)$ ,  $U_{R}(E)$ ,  $B_{R}(E)$ }, where E is a subset of V that adheres to the following axioms:

- Both V and  $\Phi$  belong to  $T_{R}(E)$ .
- The union of elements from any subcollection of T<sub>R</sub>(E) is an element of T<sub>R</sub>(E).
- The intersection of elements from any finite subcollection of T<sub>R</sub>(E) is an element of T<sub>R</sub>(E)

In this context,  $T_{R}(E)$  is termed the Nanotopology [5] of the universal setV with respect to the subset E. The pair (V,  $T_{R}(E)$ ) constitutes a nano topological space, and its constituent elements are referred to as nano-open sets.

**Definition 2.4.** (V,  $T_{R}(E)$ ) creates a nanotopological space. In this case, the set  $Y_{R}(E)$  consists of two groups, namely {N  $\cup (N \land \Omega)$ : N, N  $\land E T_{R}(E)$ }. The com- bination  $T_{R}(E)$  is expressed as the microtopology Y; where Y is not nanotopology elements of  $T_{R}(E)$ .

**Definition 2.5.** Microtopology  $[7] Y_{R}(E)$  satisfies the following axioms.

- 1  $V, \varphi \in T_{\mathbb{R}}(E)$
- 2 The union of the elements of the subset  $Y_{R}(E)$ , is in  $Y_{R}(E)$ .

The intersection of the elements of a finite subset of  $Y_{R}(E)$  is in  $Y_{R}(E)$ . Next,  $Y_{R}(E)$  is called the microtopology of E and V. Triple (E,  $T_{R}(E), Y_{R}(E)$ ) called microtopological space. Elements in  $Y_{R}(E)$  are slightly open and their complements are slightly off.

# Selje Topological Space

**Definition 3.1.** Let  $(V, Y_R(E))$  be a microtopological space and let the Selje topology be defined as  $SJ_R(E) = \{(S - J) \cup (S - J'): S \in Y_R(E) \text{ and for fixed } J, J' \in J', J \cup J = V\}$ 

**Definition 3.2.** The Selje topology  $SJ_{\mathbb{R}}(E)$  satisfies the following axioms 1.V,  $\Phi \in T_{\mathbb{R}}(E)$ The Union of the elements of any subcollection of  $SJ_{\mathbb{R}}(E)$  is in  $SJ_{\mathbb{R}}(E)$ . The intersection of the elements of any finite subcollection of  $SJ_{\mathbb{R}}(E)$  is in  $SJ_{\mathbb{R}}(E)$ .

The triplet (E,  $Y_{*}(E), SJ_{*}(E)$ ) is called selje topological space. Then, the elements of selje topology are selje-open(SJ-open) sets and their complements are selje-closed(SJ- closed) sets. The collection of selje closed sets of selje topology is denoted as SJCL(E).

**Definition 3.3.** Selje closure and interior Selje of G are defined as follows:  $SJ_{d}(G) = \cap \{H: H \text{ is a closed set and } G \subseteq H \}$  $SJ_{m}(G) = \cup \{H: H \text{ is selje-open and } H \subseteq G \}$ 

Definition 3.4. In a selje topological space (E, Y<sub>R</sub>(E),SJ<sub>k</sub>(E)), for any two selje sets G and H

i G is selje closed if and only if  $SJ_{et}(G) = G$ . ii G is selje open if and only if  $SJ_{et}(G) = G$ . iii  $G \subseteq H = \Rightarrow SJ_{et}(G) \subseteq SJ_{et}(H)$  and  $SJ_{ett}(G) \subseteq SJ_{ett}(H)$ iv  $SJ_{et}(G) = SJ_{et}(SJ_{et}(G))$  and  $SJ_{ett}(G) = SJ_{ett}(SJ_{ett}(G))$ v  $SJ_{et}(G \cup H) \supseteq SJ_{et}(G) \cup SJ_{et}(H)$ vi  $SJ_{et}(G \cup H) \supseteq SJ_{ett}(G) \cup SJ_{ett}(H)$ vii  $SJ_{et}(G \cap H) \subseteq SJ_{ett}(G) \cap SJ_{ett}(H)$ viii  $SJ_{ett}(G \cap H) \subseteq SJ_{ett}(G) \cap SJ_{ett}(H)$ ix  $SJ_{et}(G) = [SJ_{ett}(G)]^{c} \times SJ_{ett}(G)^{c} = [SJ_{ett}(G)]^{c}$ 

**Example 3.1.** Let  $V=\{\Psi, \Theta, \Gamma, \Delta\}$  with  $V/R=\{\{\Psi\}, \{\Gamma\}, \{\Theta, \Delta\}\}$  and  $E=\{\Psi, \Theta\}\subset V$ . Then  $Y_{*}(E)=\{V, \varphi, \{\Psi\}, \{\Psi, \Theta, \Delta\}, \{\Theta, \Delta\}\}$ . If  $Y=\{\Gamma\}$  then  $Y_{*}(E)=\{V, \varphi, \{\Psi\}, \{\Theta\}, \{\Delta\}, \{\Psi, \Theta\}, \{\Psi, \Gamma\}, \{\Psi, \Delta\}, \{\Theta, \Gamma\}, \{\Theta, \Delta\}, \{\Gamma, \Delta\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Theta, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Theta, \Gamma\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Gamma, \Delta\}, \{\Theta, \Gamma\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Gamma, \Delta\}, \{\Theta, \Gamma\}, \{\Psi, \Gamma, \Delta\}, \{\Theta, \Gamma\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Gamma, \Delta\}, \{\Theta, \Gamma\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Psi, \Theta, \Gamma\}, \{\Psi, \Psi, \Psi, \Psi\}, \{\Psi, \Psi, \Psi\},$ 

#### Selje-Pre-Open Sets

**Definition 4.1.** Let  $(E, Y_R(E), SJ_R(E))$  be a selje topological space. If  $G \subseteq V$ , then G is selje-pre open if  $G \subseteq SJ_{RR}(SJ_R(G))$  and G is selje-pre-closed if  $G \supseteq SJ_R(SJ_R(G))$ . All the elements in Selje-Pre open sets and Selje-Pre closed sets are denoted by SJPO(E) and SJPCL(E) respectively.

**Example 4.1.** Let  $V = \{\Psi, \Theta, \Gamma, \Delta, Q\}$  with  $V/R = \{\{\Psi\}, \{\Theta, \Gamma, \Delta\}, \{Q\}\}, E = \{\Delta, Q\} \subset V$ . Then  $Y_R(E) = \{V, \varphi, \{Q\}, \{\Theta, \Gamma, \Delta, Q\}, \{\Psi, \Gamma, \Delta, Q\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta, Q\}, \{\Psi, \Theta, \Gamma, \Delta\}, \{\Psi, \Theta, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Theta, \Gamma, A\}, \{\Theta,$ 

#### **Theorem 4.1.** $SJ_{\mathbb{R}}(E) \subseteq SJPO(E)$

**Proof.** Consider G belongs to  $SJ_{e}(E)$ . Then,  $G \subseteq SJ_{ee}(SJ_{e}(G))$  (1) Here,  $SJ_{ee}(SJ_{ee}(G)) \subseteq SJ_{ee}(SJ_{ee}(G)$ . From(1), we have  $G \subseteq SJ_{ee}(SJ_{ee}(G))$ . There-fore, G belongs to SJPO(E)

**Example 4.2.** From Example 4.1, it is recognizable that  $G = \{\Psi, \Theta, \Delta\}$  belongs to the set SJPO(E) but it does not belong to set  $SJ_k(E)$ .

**Remark 4.1.** In Common, SJPO(E)  $\$  *SJ*<sub>\*</sub>(E), from the example 3.2, it is seen that  $G = \{\Psi, \Delta, Q\} \in /SJ_*(E)$ 

**Theorem 4.2.**  $SJCL(E) \subseteq SJPCL(E)$ **Proof.** Consider  $G \in SJCL(E)$ , then G=SJCL(G) from which we have  $G \supseteq SJ_a(SJ_a(G))$ . We know

 $G \supseteq SJ_{d}(G) \tag{2}$   $SJ_{d}(SJ_{d}(G)) \supseteq SJ_{d}(SJ_{rrt}(G)) \tag{3}$ From (2) and (3),  $G \supseteq SJ_{d}(SJ_{rrt}(G))$ 

**Remark 4.2.** In Common,SJPCL(E) & SJCL(E). From the example 3.2, we have SJCL(E)=  $\{V, \varphi, \{\Psi\}, \{\Theta\}, \{Q\}, \{\Psi, \Theta\}, \{\Psi, Q\}, \{\Theta, Q\}, \{\Psi, \Theta, Q\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Theta, \Gamma, \Delta\}, \{\Psi, \Gamma, \Delta, Q\}\}$  SJPCL(E)= $\{V, \varphi, \{\Psi\}, \{\Theta\}, \{Q\}, \{\Psi, \Theta\}, \{Q\}, \{\Psi, \Theta\}, \{$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Jeyanthi and Selvanandhini

$$\begin{split} & \{\Theta, \Gamma\}, \{\Theta, \Delta\}, \{\Theta, Q\}, \{\Gamma, \Delta\}, \{\Gamma, Q\}, \{\Delta, Q\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Theta, \Delta\}, \{\Psi, \Theta, Q\}, \{\Psi, \Gamma, \Delta\}, \{\Psi, \Gamma, Q\}, \\ & \{\Psi, \Delta, Q\}, \{\Theta, \Gamma, Q\}, \{\Theta, \Delta, Q\}, \{\Psi, \Theta, \Gamma, \Delta\}, \{\Psi, \Theta, \Gamma, Q\}, \{\Psi, \Theta, \Delta, Q\}, \{\Psi, \Theta, \Delta\} \text{ belongs to SJPCL}(E) \text{ But G does not belong to SJCL}(E). \end{split}$$

**Definition 4.2.**  $SJ - Pre_{e}(G)$  and  $SJ - Pre_{m}(G)$  is denoted as selje-pre-closed sets and selje-Pre-open sets respectively. Selje-Pre-closed is defined as  $SJ_{e} = Pre_{e}(G) = o[H: C] \subset H$  H is solid pro-closed) Similarly. Solid Pro-Open is defined as

 $SJ - Pre_{a}G = \cap \{H: G \subseteq H, H \text{ is selje-pre-closed}\}$  Similarly, Selje-Pre-Open is defined as  $SJ - Pre_{a}G = \cup \{H: G \supseteq H, H \text{ is selje-pre-open}\}$ 

Remark 4.3. The following remark is derived from the above results

- 1. The smallest Selje-Pre-Open set containing G is  $SJ Pre_d(G)$ .
- 2. The largest Selje-Pre-Closed set contained in G is  $SJ-Pre_{m}(G)$ .

#### Theorem 4.3.

1. If  $\varsigma$  is an index set, then  $\bigcap_{b \in \varsigma} G_b \in SJPCL(E)$  whenever  $G_b \in SJPCL(E)$ 2. If  $\varsigma$  is an index set, then  $\bigcup_{b \in \varsigma} G_b \in SJPO(E)$  whenever  $G_b \in SJPO(E)$ 

#### *Proof.* Consider {G<sub>δ</sub> : $\delta \in I$ } is a subset of SJPCL(E). From the definition, for each $\delta$

 $\begin{aligned} SJ_{\sigma}(SJ_{ret}(G_{\delta})) &\subseteq G_{\delta}. & \text{Here}, \\ SJ_{\sigma}(SJ_{ret}(\cap_{\delta}(G_{\delta}))) &\subseteq SJ_{\sigma}(\cap_{\delta}(SJ_{ret}(G_{\delta}))) \\ &\subseteq \cap_{\delta}(SJ_{\sigma}(SJ_{ret}(G_{\delta}))) \\ &\subseteq \cap_{\delta}G_{\delta} \end{aligned}$ 

Therefore,  $\cap_{\delta}G_{\delta} \in SJPO(E)$ 1. Consider  $\{G_{\delta} : \delta \in I\}$  is a subset of SJPO(E). From the definition, for each  $\delta SJ_{err}(SJ_{dr}(G_{\delta})) \supseteq G_{\delta}$ . Here,  $(\cup_{\delta}(G_{\delta}))) \subseteq \cup_{\delta}(SJ_{err}(SJ_{dr}(G_{\delta})))$   $\subseteq SJ_{err}(\bigcup_{\delta}SJ_{dr}(G_{\delta}))$   $\subseteq SJ_{err}(SJ_{dr}(\bigcup_{\delta}G_{\delta})))$ Therefore,  $\cup_{\delta}G_{\delta} \in SJPO(E)$ 

Remark 4.4. Finite intersection of Selje-Pre-Open set need not to be Selje-Pre-Open.

**Example 4.3.** In Example 3.2,  $V = \{\Psi,\Theta,\Gamma,\Delta,Q\}$  with  $V/R = \{\{\Psi\},\{\Theta,\Gamma,\Delta\},\{Q\}\}, E = \{\Delta,Q\} \subset V$ . If  $J = \{\Psi,\Gamma,\Delta\}, J = \{\Theta,Q\}$ SJPO(E)= $\{V,\varphi,\{\Theta\},\{\Gamma\},\{\Delta\},\{Q\},\{\Psi,\Gamma\},\{\Psi,\Delta\},\{\Theta,\Gamma\},\{\Theta,\Delta\},\{\Theta,Q\},\{\Gamma,\Delta\},\{\Gamma,Q\},\{\Delta,Q\},\{\Psi,\Theta,\Gamma\},\{\Psi,\Theta,\{\Psi,\Gamma,\Delta\},\{\Psi,\Gamma,Q\},\{\Psi,\Delta,Q\},\{\Theta,\Gamma,\Delta\},\{\Theta,\Gamma,Q\},\{\Theta,\Lambda,Q\},\{\Theta,\Gamma,\Delta\},\{\Psi,\Gamma,\Lambda,Q\},\{\Psi,\Theta,Q\},\{\Theta,\Gamma,\Delta\},\{\Psi,\Theta,Q\},\{\Theta,\Gamma,A\},\{\Theta,\Lambda,A\},\{\Theta,\Lambda$ 

**Theorem 4.4.**  $G = SJ - Pre_a(G)$  *iff*  $G \in SJPCL(E)$  **Proof.** Assume that  $G \in SJPCL(E)$ .  $G \subseteq SJ - Pre_a(E)$  and then  $SJ - Pre_a(G) = \cap \{H: G \subseteq H, HisSJ - Pre - closedset\}$  (4) Since  $G \in SJPCL(E)$ . G is an element from (4). Therefore,  $G = \cap \{H: G \subseteq H, H \text{ is } SJ\text{-Pre-closed set}\}$  Hence,  $G = SJ - Pre_a(G)$ .

#### Selje-Semi-Open Sets

**Definition 5.1.** Let  $(E, Y_{it}(E), S_{it}(E))$  be an selje topological space. If  $G \subseteq V$ , then G is selje-pre open if  $G \subseteq S_{J_{it}}(S_{J_{it}}(G))$  and G is selje-pre-closed if  $G \supseteq S_{J_{it}}(S_{J_{it}}(G))$ . Then, all the elements in Selje-Pre open sets [Selje-Pre closed sets] are denoted by SJPO(E) [SJPL(E)] respectively.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Jeyanthi and Selvanandhini

**Theorem 5.1.**  $SJ_{k}(E) \subseteq SJSO(E)$  **Proof.** Consider G belongs to  $SJ_{k}(E)$  (i.e.,) G =  $SJ_{m}(G)$ . For all subset G of V and G  $\subseteq$   $SJ_{n}(G)$ , we have G  $\subseteq$   $SJ_{n}(SJ_{m}(G))$ . Hence, G belongs to SJSO(E). **Remark 5.1.** In some cases,  $SJ_{k}(E) = SJSO(E)$ (From Example 5.1) **Example 5.1.** Consider V = { $\Psi, \Theta, \Gamma, \Delta, O$ } with V/R={ $\Psi$ }, { $\Theta, \Gamma, \Delta$ }, {O}, E={ $\Delta, Q$ } $\subset$ V. If J={ $\Psi, \Gamma, \Delta$ }, J={ $\Theta, Q$ } SJSO(E) = { $V, \varphi, {\Theta}, {Q}, {\Theta, Q}, {\Gamma, \Delta}, {\Psi, \Gamma, \Delta}, {\Theta, \Gamma, \Delta}, {\Psi, \Omega, \Gamma, \Delta}, {\Psi, \Gamma, \Delta, Q}, {\Theta, \Gamma, \Delta, Q}$ . Here, all the elements from  $SJ_{k}(E)$  belongs to SJSO(E)

Theorem 5.2.  $SJCL(E) \subseteq SJSCL(E)$ **Proof.** Consider G belongs to SJCL(E), then  $G=SJ_{c}G$ . Here, $G \supseteq SJ_{c}(SJ_{c}(G))$ (5)It is known that  $SJ_{ret}(G) \subseteq G$ (6) $SJ_{ret}(SJ_{c}(G)) \subseteq SJ_{c}(SJ_{c}(G))$ (7)From (5),(6),(7) we have,  $SJ_{ret}(SJ_{c}(G)) \subseteq SJ_{c}(SJ_{c}(G)) \subseteq G$ Therefore, G belong to SJSCL(E).

Remark 5.2. In some exceptional cases SJCL(G) = SJSCL(G) (see example 5.1)

**Definition 5.2.**  $SJ - Semi_{et}(G)$  is denoted as selje-*Semi* closed sets and and  $SJ Semi_{ett}(G)$  is denoted as selje-*Semi*-open sets. Selje-*Semi*-closed is defined as  $SJ - Semi_{et}(G) = \cap \{H: G \subseteq H, H \text{ is selje-Semi-closed}\}$  Similarly, Selje-Pre-Open is defined as  $SJ - Pre_{ett}(G) = \cup \{H: G \supseteq H, H \text{ is selje-Semi-open}\}$ 

**Remark 5.3.** The following remark is derived from the above results 1. The largest SJ-Semi open set contained in G is  $SJ - Semi_{in}(G)$  2. The smallest SJ-Semi closed set containing G is  $SJ - Semi_{in}(G)$ 

**Theorem 5.3.** 1. If  $\varsigma$  is an index set, whenever  $G_{\delta} \in SJSO(E)$  then  $\bigcap_{k \in S} G_{\delta} \in SJSO(E)$ 2. If  $\varsigma$  is an index set, whenever  $G_{\delta} \in SJSO(E)$  then  $\bigcup_{k \in S} G_{\delta} \in SJSO(E)$ 

#### Proof.

Consider {G<sub>0</sub> :  $\delta \in I$ } is a subset of SJSO(E). From the definition, for each  $\delta G_0 \subseteq SJ_2(SJ_{ret}(G_0))$ . Here,  $\cup_0 G_0 \subseteq \cup_0 SJ_2((SJ_{ret}(G_0)))$   $\subseteq (SJ_2(SJ_{ret}(\cup_0(G_0))))$ Therefore,  $\cup_0 G_0 \in SJPO(E)$ Consider {G<sub>0</sub> :  $\delta \in I$ } is a subset of SJSCL(E). From the definition, for each  $\delta$ 

 $\begin{array}{l} G_{\delta} \supseteq SJ_{rr}(SJ_{d}(G_{\delta})) \ . \ Here, \\ SJ_{rr}(SJ_{d}(\cap_{\delta}(G_{\delta}))) \in SJ_{rr}(\cap_{\delta}(SJ_{d}(G_{\delta}))) \\ \in \cap_{\delta}G_{\delta} \\ Therefore, \cap_{\delta}G_{\delta} \in SJSCL(E) \end{array}$ 

**Theorem 5.4.**  $G = SJ_{int}(G)$  if and only if  $G \in SJSO(E)$ 

*Proof.* Neccessary Assume that G ∈ SJSO(E), then G  $\subseteq \cup$ {H is SJ-Semi-Open} then G = SJ-Semi-Open set. So, G  $\subseteq$  SJ- Semi<sub>i</sub>(G). As G belongs to SJSO(G), SJ - Semi<sub>i</sub>(G)  $\subseteq$  G. Therefore, G=SJ-Semi<sub>i</sub>(G).

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Jeyanthi and Selvanandhini

#### Sufficient

Consider  $G = SJ - Semi_{im}(G)$ . Then from Remark 5.3 it is shown that the largest SJ-Semi open set contained in G is  $SJ - Semi_{im}(G)$ . Hence,  $G \in SJSO(E)$ .

**Example 5.2.** Consider V = { $\Psi, \Theta, \Gamma, \Delta, Q$ } with V/R={{ $\Psi$ }, { $\Theta, \Gamma, \Delta$ }, {Q}}, E={ $\Delta, Q$ } $\subset$  V. If J={ $\Psi, \Gamma, \Delta$ }, J={ $\Theta, Q$ } SJPO(E)={V, $\varphi, \{\Theta\}, \{\Gamma\}, \{\Delta\}, \{Q\}, \{\Psi, \Gamma\}, \{\Psi, \Delta\}, \{\Theta, \Gamma\}, \{\Theta, \Delta\}, \{\Theta, Q\}, \{\Gamma, \Delta\}, \{\Gamma, Q\}, \{\Delta, Q\}, \{\Psi, \Theta, \Gamma\}, \{\Psi, \Theta, Q\}, \{\Psi, \Gamma, Q\}, \{\Psi, \Gamma, Q\}, \{\Psi, \Lambda, Q\}, \{\Psi, \Gamma, A\}, \{\Theta, \Gamma, A\}, \{\Theta, \Gamma, A\}, \{\Theta, \Gamma, A\}, \{\Psi, \Theta, \Gamma, A\}, \{\Psi, \Gamma, \Delta, Q\}, \{\Theta, \Gamma, A, Q\}$ } SJSO(E) = {V, $\varphi, \{\Theta\}, \{Q\}, \{\Theta, Q\}, \{\Gamma, \Delta\}, \{\Psi, \Gamma, \Delta\}, \{\Theta, \Gamma, A\}, \{\Theta, \Gamma, A\}, \{\Psi, \Theta, \Gamma, A\}, \{\Psi, \Gamma, A, Q\}, \{\Theta, \Gamma, A, Q\}\}$ .

**Remark 5.4.** { $\Gamma$ } is in SJPO(E) but not in SJSO(E) SPSO(G) ¢ SJPO(G) Similarly, { $\Theta$ } is in SJSO(E) but not in SJPO(E) SJPO(G) ¢ SJSO(G).

#### Selje-Continuous function

The definition of Selje continuous function(SJ-continuous function) is given as

**Definition 6.1.** Consider two topological space (V,  $Y_{\mathbb{R}}(E)$ ,  $SJ_{\mathbb{R}}(E)$ ) and (U, ZR'(F), SJR'(F)) and  $E \subseteq V$  and  $F \subseteq U$ . Then a function  $k : V \to U$  is Selje continuous (SJ-continuous) function if  $k^{-1}(x) \in SJ_{\mathbb{R}}(E)$  whenever  $x \in SJ_{\mathbb{R}}(E)$ .

**Theorem 6.1.** Let  $(V, Y_{\mathbb{R}}(E), SJ_{\mathbb{R}}(E))$  and (U, ZR'(F), SJR'(F)) and  $E \subseteq V$  and  $F \subseteq U$ . Then a function  $k : V \to U$  is SJ-continuous function if and only if  $k_{\mathbb{R}}(x) \in SJCL(E)$  whenever  $x \in SJCL(E)$ .

#### Proof.

#### Neccessity

Consider k: V  $\rightarrow$  U is SJ-continuous function and x  $\in$  SJCL(F) then the complement belongs to SJ<sub>k</sub>(F) then  $k_1(x_2) \in SJ_k(E)$  (i.e.,) $(k_1(x))$  belongs to SJ<sub>k</sub>(E). Therefore,  $(k_1(x)) \in SJCL(E)$  whenever x  $\in SJCL(F)$ 

#### Sufficient

Consider  $(k_{-1}(x))_c$  belongs to  $SJ_c(E)$  whenever  $x \in SJCL(F)$ . If whenever  $x \in SJCL(F)$  then whenever  $x_c \in SJCL(E)$ . By assumption  $k_{-1}(x_c) \in SJCL(E)$  where  $k_{-1}(x)$  belongs to  $SJ_c(E)$ . Therefore k is SJ-continuous.

**Definition 6.2.** Consider two topological space (V,  $Y_{k}(E)$ ,  $SJ_{k}(E)$ ) and (U, ZR'(F), SJR'(F)) and  $E \subseteq V$  and  $F \subseteq U$ . Then a function  $k : V \rightarrow U$  is Selje-Pre-continuous function if  $k_{k}(x) \in SJPCL(E)$  whenever  $x \in SJCL(E)$ .

# **Theorem 6.2**. Every SJ-continuous function is SJ-Pre-continuous function **Proof**.

Let  $k : V \to U$  be a SJ-continuous function.  $k : (x) \in SJCL(F)$ . From theorem 4.1 it is given that for every  $x \in SJCL(F)$ , we have  $k : (x) \in SJPCL(E)$ . Hence, k is SJ-Pre-continuous function. **Definition 6.3.** Consider two topological space (V, Y<sub>R</sub>(E), SJ<sub>R</sub>(E)) and (U, ZR' (F), SJR' (F)) and E  $\subseteq$  V and F  $\subseteq$  U. Then a function  $k : V \to U$  is Selje-Semi-continuous function

if  $k_{-1}(x) \in SJSCL(E)$  whenever  $x \in SJCL(E)$ .

Theorem 6.3. Every SJ-continuous function is an SJ-Semi-continuous function

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Jeyanthi and Selvanandhini

#### Proof.

Consider a function  $k : V \to U$  be a SJ-continuous function. Whenever  $x \in SJCL(F)$ ,  $k_1(x) \in SJCL(E)$ . From theorem 5.1 it is given that for every  $x \in SJCL(F)$ , we have  $k_1(x) \in SJSCL(E)$ . Hence, k is SJ-Semi-continuous function.

# CONCLUSION

Throughout this paper, the properties of  $SJ_{k}(E)$  are discussed and we have arrived at a conclusion that  $SJ_{k}(E) + SJPO(E)$  but in some rare cases there were some results like  $SJ_{k}(E)=SJSO(E)$  from some of the worked examples. This results can be extended for the further research on homeomorphism and other strong sets in topo- logical space and can be used for some real time application in other fields.

# ABSTRACT

In this work, we present and look into the new kind of Open sets namely  $\Delta$ - $\Re_{\psi}$ -ópen,  $\Sigma$ - $\Re_{\psi}$ -ópen,  $\Phi$ - $\Re_{\psi}$ -ópen,  $\Omega$ - $\Re_{\psi}$ -ópen and  $\mathscr{B}$ - $\Re_{\psi}$ -open sets. Additionally, we find decomposition of  $(\Delta - H_{\psi}, \lambda)$ -continuous.

**Keywords**: Hereditary generalized topology,  $\Delta$ - $\Re \psi$  -o´pen,  $\Sigma$ - $\Re \psi$  -o´pen and  $\Phi$ - $\Re O(A)$  sets,  $\mathscr{B}$ - $\Re \psi$  -o´pen sets.

2000 Mathematics Subject Classification: 54A05.

# INTRODUCTION

Let  $\vartheta$  be a collection from A, which is a nonempty set. Then  $\vartheta$  is called a generalized topology (briefly GT)[2], iff  $\emptyset \in \vartheta$  and  $\mathscr{L}j \in \vartheta$  for  $j\in J$  implies  $\mathscr{L} = Jj \in Y \mathscr{L}j \in \vartheta$ . The  $\vartheta$ -closure ( $\sigma$ -closure) of  $\mathscr{L}$  is denoted by  $c \vartheta (\mathscr{L})$  (resp.  $c \sigma (\mathscr{L})$ ) is the smallest  $\vartheta$  - c losed (resp.  $\vartheta$ - $\sigma$ -c losed) sets containing  $\mathscr{L}$  and the  $\vartheta$ -interior (resp.  $\sigma$ -interior) of  $\mathscr{L}$ , denoted by i  $\vartheta$  ( $\mathscr{L}$ ) (resp. i  $\sigma (\mathscr{L})$ ) is the largest  $\vartheta$ - $\sigma$ - $\sigma$  pen (resp.  $\vartheta$ - $\sigma$ - $\sigma$  pen) sets contained in  $\mathscr{L}$ .

**Definition 1.1.** A subset  $\mathscr{L} \subset A$  is called 1.  $\vartheta - \alpha \cdot o$  [ $\vartheta = [3]$ , if  $\mathscr{L} \subset i \vartheta c \vartheta i \vartheta (\mathscr{L})$ . 2.  $\vartheta - \sigma \cdot o$  [ $\vartheta = [3]$ , if  $\mathscr{L} \subset c \vartheta i \vartheta (\mathscr{L})$ . 3.  $\vartheta - \pi \cdot o$  [ $\vartheta = [3]$ , if  $\mathscr{L} \subset c \vartheta i \vartheta c \vartheta (\mathscr{L})$ . 4.  $\vartheta - \beta \cdot o$  [ $\vartheta = [3]$ , if  $\mathscr{L} \subset c \vartheta i \vartheta c \vartheta (\mathscr{L})$ . 5.  $\vartheta - b \cdot o$  [ $\vartheta = [12]$ ], if  $\mathscr{L} \subset c \vartheta i \vartheta (\mathscr{L}) \cup i \vartheta c \vartheta (\mathscr{L})$ .

**Definition 1.2.** A hereditary class [4], is defined as  $\mathfrak{H}$  of subsets of  $\mathbb{Z}$ , if  $\mathscr{L} \in \mathfrak{H}$  and  $V \subset \mathcal{L}$ , then  $V \in \mathfrak{H}$ . **Definition 1.3.** For a hereditary class  $\mathfrak{H}$  on  $\mathscr{L}$  and  $\mathscr{L} \subset \mathbb{Z}$ , we define  $\mathscr{L}^*(\mathfrak{H}, \vartheta) = \{a \in \mathbb{Z} : \mathscr{L} \cap V \notin \mathfrak{H} \text{ for all } V \in \vartheta \text{ such that } a \in V\}$  [4].

**Definition 1.4.** [5] Let  $\mathscr{L} \subset \mathbb{Z}$ . Then  $\mathscr{L} \sigma (\mathfrak{H}, \mathfrak{H}) = \{z \in \mathbb{Z} : \mathscr{L} \cap V \notin \mathfrak{H} \text{ for all } V \in \mathfrak{H} \text{ - } \sigma \text{ - } \sigma \text{ pen such that } z \in V \} \text{ and } c^* \sigma (\mathscr{L}) = \mathscr{L} \cup \mathscr{L} \sigma *.$ 

**Definition 1.5.** A subset  $\mathscr{L} \subset \mathbb{Z}$  is called 1.  $\alpha$  - H - o pen [4], if  $\mathscr{L} \subseteq i \ni c^* \ni i \ni (\mathscr{L})$ , 2.  $\sigma$  - H - o pen [4], if  $\mathscr{L} \subseteq c^* \ni i \ni (\mathscr{L})$ , 3.  $\pi$  - H - o pen [4], if  $\mathscr{L} \subseteq i \ni c^* \Im (\mathscr{L})$ , 4.  $\beta$  - H - o pen [4], if  $\mathscr{L} \subseteq c \ni i \ni c^* \Im (\mathscr{L})$ , 5.  $\vartheta * - c$  (losed [4], if  $c^* \Im (\mathscr{L}) \subset \mathscr{L}$ . 6. b - H - o pen [8], if  $\mathscr{L} \subseteq i \ni c^* \Im \mathscr{L} \cup c^* \ni i \ni (\mathscr{L})$ , 7.  $\sigma \vartheta * - c$  (losed [5], if  $\mathscr{L} \sigma * \subseteq \mathscr{L}$ 

**Definition** 1.6. A subset  $\mathscr{L} \subset \mathbb{Z}$  is said to be 1.  $\alpha$  - H  $\sigma$  - o´pen [10], if  $\mathscr{L} \subseteq i \wr c^* \sigma i \wr (\mathscr{L})$ , 2.  $\sigma$  - H  $\sigma$  - o´pen [10], if  $\mathscr{L} \subseteq c^* \sigma i \wr (\mathscr{L})$ , 3.  $\pi$  - H  $\sigma$  - o´pen [10], if  $\mathscr{L} \subseteq i \wr c^* \sigma (\mathscr{L})$ , 4.  $\beta$  - H  $\sigma$  - o´pen [10], if  $\mathscr{L} \subseteq c \wr i \wr c^* \sigma (\mathscr{L})$ . 5. b - H  $\sigma$  - o´pen [9], if  $\mathscr{L} \subseteq i \wr c^* \sigma (\mathscr{L}) \cup c^* \sigma i \wr (\mathscr{L})$ .

 $\begin{array}{l} \mathscr{B} - \mathfrak{H} \Psi - O \, \dot{P} \text{EN SETS} \\ \hline \textbf{Definition 2.1. A subset } \mathscr{L} \subset \mathbb{Z} \text{ is called} \\ 1. \Delta - \mathcal{H} \psi - o \, \dot{p} \text{en, if } \mathcal{L} \subseteq i \, \sigma \, c^* \, \sigma \, i \sigma \, (\mathcal{L}). \\ 2. \Sigma - \mathfrak{H} \psi - o \, \dot{p} \text{en, if } \mathscr{L} \subseteq c^* \sigma \, i \sigma \, (\mathscr{L}). \\ 3. \Phi - \mathfrak{H} O(\mathbb{Z}), \text{ if } \mathscr{L} \subseteq i \, \sigma \, c^* \sigma \, (\mathscr{L}). \\ 3. \Phi - \mathfrak{H} O(\mathbb{Z}), \text{ if } \mathscr{L} \subseteq i \, \sigma \, c^* \sigma \, (\mathscr{L}). \\ 4. \, \Omega - \, \mathfrak{H} \psi - o \, \dot{p} \text{en, if } \mathscr{L} \subseteq c \, \vartheta \, i \, \sigma \, c^* \sigma \, (\mathscr{L}). \\ 5. \, \mathscr{B} - \, \mathfrak{H} \psi - o \, \dot{p} \text{en, if } \mathscr{L} \subseteq c^* \sigma \, i \sigma \cup i \, \sigma \, c^* \sigma \, (\mathscr{L}). \\ 5. \, \mathscr{B} - \, \mathfrak{H} \psi + o \, \dot{p} \text{en, if } \mathscr{L} \subseteq c^* \sigma \, i \sigma \cup i \, \sigma \, c^* \sigma \, (\mathscr{L}). \\ The set of all \Delta - \mathfrak{H} \psi + o \, \dot{p} \text{en (resp. } \Sigma - \mathfrak{H} \psi + o \, \dot{p} \text{en, } \Phi - \mathfrak{H} O(\mathbb{Z}), \, \Omega - \mathfrak{H} \psi - o \, \dot{p} \text{en and } \mathscr{B} - \mathfrak{H} \psi + o \, \dot{p} \text{en }, \, \lambda - o \, \dot{p} \text{en ) is denoted by } \Delta - \mathfrak{H} O(\mathbb{Z}) \, (\text{resp. } \Sigma - \mathfrak{H} O(\mathbb{Z}), \, \Phi - \mathfrak{H} O(\mathbb{Z}), \, \mathcal{R} - \mathfrak{H} O(\mathbb{Z}), \, \mathcal{A} O(\mathbb{Z}) \, ). \end{array}$ 

Proposition 2.2. In  $\Re$  -GTS (Z,  $\vartheta$ ,  $\Re$ t), 1. Any  $\vartheta$ O(Z) set is  $\Delta$ - $\Re$ O(Z). 2. Any  $\vartheta$ O(Z) set is  $\Sigma$ - $\Re$ CO(Z). 3. Any  $\vartheta$ O(Z) set is  $\Phi$ - $\Re$ CO(Z). 4. Any  $\vartheta$ O(Z) set is  $\Omega$ - $\Re$ CO(Z). 5. Any  $\vartheta$ O(Z) set is  $\mathscr{B}$ - $\Re$ CO(Z).

**Proof.** (1). Consider  $\mathscr{D}\subset\mathbb{Z}$  is  $\vartheta$ -o´pen. Then,  $\mathscr{D}\subseteq i \vartheta$  ( $\mathscr{D})\subseteq i \vartheta c^*\sigma(\mathscr{D})\subseteq i \sigma c^*\sigma i \vartheta$  ( $\mathscr{D})\subseteq i \sigma c^*\sigma i \sigma$  ( $\mathscr{D}$ ). Hence  $\mathscr{L}$  is  $\Delta$ - $\Re O(\mathbb{Z})$ . (2). Consider  $\mathscr{D}\subset\mathbb{Z}$  is  $\vartheta$ -o´pen. Then,  $\mathscr{D}\subseteq i \vartheta$  ( $\mathscr{D})\subseteq c\sigma^* i \vartheta$  ( $\mathscr{D})\subseteq c^*\sigma i \sigma$  ( $\mathscr{D}$ ). Hence  $\mathscr{L}$  is  $\Sigma$ - $\Re O(\mathbb{Z})$ . (3). Consider  $\mathscr{D}\subset\mathbb{Z}$  is  $\vartheta$ -o´pen. Then,  $\mathscr{D}\subseteq i \vartheta$  ( $\mathscr{D})\subseteq i \vartheta c\sigma^*$  ( $\mathscr{D})$ . Hence  $\mathscr{L}$  is  $\Phi$ - $\Re O(\mathbb{Z})$ . (4). Consider  $\mathscr{D}\subset\mathbb{Z}$  is  $\vartheta$ -o´pen. Then  $\mathscr{L}=i \vartheta$  ( $\mathscr{D}$ ). Now  $\mathscr{L}\subseteq c \vartheta i \vartheta$  ( $\mathscr{D})\subseteq c \vartheta i \sigma c\sigma^*$  ( $\mathscr{D}$ ). Hence  $\mathscr{L}$  is  $\Omega$ - $\Re O(\mathbb{Z})$ . (5). Consider  $\mathscr{L}\subset\mathbb{Z}$  is  $\vartheta$ -o´pen. Then  $\mathscr{L}=i \vartheta$  ( $\mathscr{D}$ ). Now  $\mathscr{L}\subseteq i \vartheta$  ( $\mathscr{D})\subseteq i \vartheta c\sigma^*$  ( $\mathscr{L})\subseteq i \sigma c\sigma^*$  ( $\mathscr{L}) \subseteq i \sigma c\sigma^*$  ( $\mathscr{L}) \cup c\sigma^* i \sigma$  ( $\mathscr{L}$ ). Hence  $\mathscr{L}$  is  $\mathscr{B}$ - $\Re O(\mathbb{Z})$ .

### Ramesh et al.,

**Example 2.3.** Consider  $\mathbb{Z}=\{1, 2, 3, 4, 5\} = \{\emptyset, \{1\}, \{3\}, \{1, 3\}, \{3, 4, 5\}, \{1, 3, 4, 5\}, \{1, 2, 3\}, \mathbb{Z}\}, \exists \{\emptyset, \{1\}\}.$  Then  $\mathscr{L}=\{1, 4, 5\}$  is  $\Delta$ - $\Re O(\mathbb{Z})$  (resp.  $\Sigma$ - $\Re O(\mathbb{Z}), \Phi$ - $\Re O(\mathbb{Z}), \Omega$ - $\Re O(\mathbb{Z}), \mathfrak{B}$ - $\Re O(\mathbb{Z})$ ) but not  $\vartheta$ -o pen.

### **Proposition 2.4.** In $\mathfrak{H}$ -GTS ( $\mathbb{Z}$ , $\vartheta$ , $\mathfrak{H}$ ),

1. Any  $\alpha$ - $\mathfrak{H} \sigma$  -o´pen is  $\Delta$ - $\mathfrak{H}O(\mathbb{Z})$ .

2. Any  $\sigma$ - $\mathfrak{H} \sigma$  -o pen is  $\Sigma$ - $\mathfrak{HO}(\mathbb{Z})$ .

3. Any  $\pi$ - $\mathfrak{H} \sigma$  -o´pen is  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$ .

4. Any  $\beta$ - $\mathfrak{H} \sigma$  -o pen is  $\Omega$  -  $\mathfrak{HO}(\mathbb{Z})$ .

5. Any b- $\mathfrak{H} \sigma$  -  $\sigma$  pen is  $\mathscr{B}$  -  $\mathfrak{HO}(\mathbb{Z})$ .

#### Proof.

1. Consider  $\mathscr{L} \subset \mathbb{Z}$  is  $\alpha$ - $\mathfrak{H} \sigma$ - $\sigma$ 'pen set. Then  $\mathscr{L} \subseteq i \mathfrak{d} \operatorname{cos} i \mathfrak{d} (\mathscr{L}) \subseteq i \sigma \operatorname{cos} i \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Delta$ - $\mathfrak{H}O(\mathbb{Z})$ .

2. Consider  $\mathscr{L} \subset \mathbb{Z}$  is  $\sigma$ - $\mathfrak{H} \sigma$  -  $\sigma$  pen set. Then  $\mathscr{L} \subseteq \mathfrak{c} * \sigma i \vartheta$  ( $\mathscr{L}$ ) $\subseteq \mathfrak{c}\sigma * i \sigma$  ( $\mathscr{L}$ ). Hence  $\mathscr{L}$  is  $\Sigma$ - $\mathfrak{H} O(\mathbb{Z})$ .

3. Consider  $\mathscr{L} \subseteq \mathbb{Z}$  is  $\pi - \mathfrak{H} \sigma - \sigma'$  pen set. Then  $\mathscr{L} \subseteq i \vartheta \operatorname{cos} (\mathscr{L}) \subseteq i \sigma \operatorname{cos} (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Phi - \mathfrak{HO}(\mathbb{Z})$ .

4. Consider  $\mathscr{L} \subset \mathbb{Z}$  is  $\beta$ -H  $\sigma$  -  $\sigma$  pen set. Then  $\mathscr{L} \subseteq \mathfrak{c} \ni \mathfrak{i} \ni \mathfrak{c}\sigma * (\mathscr{L}) \subseteq \mathfrak{c} \ni \mathfrak{i} \sigma \mathfrak{c}^* \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Omega$ -HO( $\mathbb{Z}$ ).

5. Consider  $\mathscr{L} \subset \mathbb{Z}$  is b- $\mathfrak{H} \sigma$  -o´pen. Then  $\mathscr{L} \subseteq i \vartheta c * \sigma (\mathscr{L}) \cup c\sigma * i \vartheta (\mathscr{L}) \subseteq i \sigma c^* \sigma (\mathscr{L}) \cup c * \sigma i \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\mathscr{B} - \mathfrak{H} O(\mathbb{Z})$ .

**Example** 2.5. Consider  $\mathbb{Z} = \{1, 2, 3, 4, 5\}$   $\oplus = \{\emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1,3,\{2,3\}, \{1,3,4\}, \{2,3,4\}, \{1,2,3,4\}\},$   $\Re = \{\emptyset, \{1\}\}$ . Then  $\mathscr{L} = \{5\}$  is  $\Delta - \Re O(\mathbb{Z})$  (resp.  $\Sigma - \Re O(\mathbb{Z})$ ,  $\Phi - \Re O(\mathbb{Z})$ ,  $\Omega - \Re O(\mathbb{Z})$ ) but not  $\alpha - \Re \sigma$  - o pen (resp.  $\sigma - \Re \sigma - \sigma$  pen ,  $\pi - \Re \sigma - \sigma$  pen ,  $\beta - \Re \sigma - \sigma$  pen ,  $\beta - \Re \sigma - \sigma$  pen ).

**Proposition 2.6.** Every  $\Delta$ - $\Re$ O( $\mathbb{Z}$ ) is  $\Sigma$ - $\Re$ O( $\mathbb{Z}$ ) but not conversely.

**Proof.** Consider  $\mathscr{Q}\subset\mathbb{Z}$  is  $\Delta$ - $\mathfrak{HO}(\mathbb{Z})$ . Then  $\mathscr{Q}\subseteq i \sigma c * *i \sigma (\mathscr{Q})\subseteq c^*\sigma i \sigma (\mathscr{Q})$ . Hence  $\mathscr{L}$  is  $\Sigma$ - $\mathfrak{HO}(\mathbb{Z})$ .

**Example 2.7.** Consider Z={1,2,3,4,5},  $\Im = \{\emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{1,2,3\}, \{1,3,4\}, \{1,2,3\}, \{1,2,3,4\}\}, \Im = \{\emptyset, \{1\}\}$ . Then  $\mathscr{D} = \{1, 5\}$  is  $\Sigma - \Im O(\mathbb{Z})$  but not  $\Delta - \Im O(\mathbb{Z})$ .

**Proposition 2.8.** Every Δ-ℜΟ(ℤ) is Φ-ℜΟ(ℤ) but not conversely. **Proof.** Consider  $\mathscr{L} ⊂ ℤ$  is Δ- ℜΟ(ℤ). Then  $\mathscr{L} ⊆ i σ c^* σ i σ (\mathscr{L}) ⊆ i σ c^* σ (\mathscr{L})$ . Hence  $\mathscr{L}$  is Φ-ℜΟ(ℤ).

**Example 2.9.** Consider  $\mathbb{Z}=\{1,2,3,4\}, \mathfrak{D}=\{\emptyset,\{1,3\},\{4\},\{1,3,4\},\mathbb{Z}\}, \mathfrak{H}=\{\emptyset,\{3\}\}.$  Then  $\mathscr{L}=\{1,2,4\}$  is  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$  but not  $\Delta$ - $\mathfrak{HO}(\mathbb{Z})$ . **Theorem 2.10.** In  $\mathfrak{H}$  -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ), the following are equivalent. 1.  $\mathscr{L}$  is  $\Delta$  -  $\mathfrak{HO}(\mathbb{Z})$ . 2.  $\mathscr{L}$  is  $\Sigma$  -  $\mathfrak{HO}(\mathbb{Z})$  and  $\Phi$  -  $\mathfrak{HO}(\mathbb{Z})$ .

**PROOF.** (1)  $\Rightarrow$  (2). Consider  $\mathscr{L}$  is  $\Delta$ - $\mathfrak{HO}(\mathbb{Z})$ . Then by Proposition 2.4 and 2.6,  $\mathscr{L}$  is  $\Sigma$ - $\mathfrak{HO}(\mathbb{Z})$  and  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$ . (2)  $\Rightarrow$  (1). Consider  $\mathscr{L}$  is both  $\Sigma$  -  $\mathfrak{HO}(\mathbb{Z})$  and  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$ . Then  $\mathscr{L} \subseteq i \sigma c^* \sigma$  ( $\mathscr{L}) \subseteq i \sigma c^* \sigma c$ 

**Remark 2.11**. The notions of  $\Sigma$ - $\Re O(\mathbb{Z})$  and  $\Phi$ - $\Re O(\mathbb{Z})$  are independent. **Example 2.12**. Consider  $\mathbb{Z}=\{1,2,3,4,5\}$ ,  $\Re=\{\emptyset,\{1\},\{2\},\{3\},\{1,2\},\{1,3\},\{2,3\},\{1,3,4\},\{2,3,4\},\{1,2,3,4\}\}$ ,  $\Re=\{\emptyset,\{1\}\}$ . Then  $\mathscr{L}=\{1,3\}$  is  $\Sigma$ - $\Re O(\mathbb{Z})$  but not  $\Phi$ - $\Re O(\mathbb{Z})$ .

**Example 2.13.** Consider  $\mathbb{Z}=\{1,2,3,4\}$ ,  $\vartheta=\{\emptyset,\{1,3\},\{4\},\{1,3,4\},\mathbb{Z}\}$ ,  $\mathfrak{H}=\{\emptyset,\{3\}\}$ . Then  $\mathscr{L}=\{1,3,4\}$  is  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$  but not  $\Sigma$ - $\mathfrak{HO}(\mathbb{Z})$ . **Proposition 2.14.** Every  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$  set is  $\Omega$ - $\mathfrak{HO}(\mathbb{Z})$  but converse need not be true. **Proof.** Consider  $\mathscr{L}=\mathbb{Z}$  is  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$ . Then  $\mathscr{L}\subseteq i \sigma c^*\sigma (\mathscr{L}) \subseteq c \vartheta i \sigma c^*\sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Omega$ - $\mathfrak{HO}(\mathbb{Z})$  set.

**Proposition 2.15**. Every  $\Delta$ - $\Re$ O( $\mathbb{Z}$ ) (resp.  $\Sigma$ - $\Re$ O( $\mathbb{Z}$ ),  $\Phi$ - $\Re$ O( $\mathbb{Z}$ ))is  $\mathscr{B}$ - $\Re$ O( $\mathbb{Z}$ ) but not conversely.

### Ramesh et al.,

#### Proof.

1. Let  $\mathscr{L}$  be  $\Delta$ - $\mathfrak{HO}(\mathbb{Z})$ . Then  $\mathscr{L} \subseteq i \sigma c^* \sigma i \sigma (\mathscr{L}) \subseteq c^* \sigma i \sigma (\mathscr{L}) \cup i \sigma c^* \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$ . 2. Let  $\mathscr{L}$  be  $\Sigma$  -  $\mathfrak{HO}(\mathbb{Z})$ . Then  $\mathscr{L} \subseteq c^* \sigma i \sigma (\mathscr{L}) \subseteq c^* \sigma i \sigma (\mathscr{L}) \cup i \sigma c^* \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$ . 3. Let  $\mathscr{L}$  be  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$ . Then  $\mathscr{L} \subseteq i \sigma c^* \sigma (\mathscr{L}) \subseteq c^* \sigma i \sigma (\mathscr{L}) \cup i \sigma c^* \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$ .

**Theorem 2.17.** If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B} \to \mathfrak{HO}(\mathbb{Z})$  and  $\vartheta \to \sigma \circ \mathsf{pen}$ , then it is  $\Sigma \to \mathfrak{HO}(\mathbb{Z})$ . **Proof.** Let  $\mathscr{L}$  be both  $\mathscr{B} \to \mathfrak{HO}(\mathbb{Z})$  and  $\mu \to \sigma \circ \mathsf{pen}$ . Then  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c}^* \sigma (\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma (\mathscr{L})$  and  $\mathscr{L} = \mathfrak{i} \sigma \mathfrak{c}^* \sigma (\mathscr{L})$ . Now  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c}^* \sigma (\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma (\mathscr{L})$  and  $\mathscr{L} = \mathfrak{i} \sigma \mathfrak{c}^* \sigma \mathfrak{$ 

**Theorem 2.18.** If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$  and  $\vartheta$ - $\sigma$ - $\sigma$  pen, then it is  $\Phi$ - $\mathfrak{HO}(\mathbb{Z})$ . **Proof.** Let  $\mathscr{L}$  be both  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$  and  $\mu$ - $\sigma$ - $\sigma$  pen. Then  $\mathscr{L} \subseteq i \sigma c^* \sigma(\mathscr{L}) \cup c^* \sigma i \sigma(\mathscr{L})$  and  $\mathscr{L} = i \sigma c^* \sigma(\mathscr{L}) \cup c^* \sigma i \sigma(\mathscr{L}) \subseteq c^* \sigma(\mathscr{L})$ , which implies  $\mathscr{L} \subseteq i \sigma c^* \sigma(\mathscr{L}) \subseteq i \sigma c^* \sigma(\mathscr{L})$ . ( $\mathscr{L}$ ). Hence  $\mathscr{L}$  is  $\Phi$  -  $\mathfrak{HO}(\mathbb{Z})$ .

**Theorem 2.19.** If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B}$ - $\mathfrak{H}O(\mathbb{Z})$  and  $\vartheta$ - $\sigma$ - $\sigma$ 'pen, then it is  $\Delta$ - $\mathfrak{H}O(\mathbb{Z})$ .

**Proof**. Let  $\mathscr{L}$  be both  $\mathscr{B}$  -  $\mathfrak{HO}(\mathbb{Z})$  and  $\mu$  -  $\sigma$  -  $\sigma$  pen . Then  $\mathscr{L} \subseteq i \sigma c^* \sigma (\mathscr{L}) \cup c^* \sigma i \sigma (\mathscr{L})$  and  $\mathscr{L} = i \sigma (\mathscr{L})$ . Now  $\mathscr{L} \subseteq i \sigma c^* \sigma (\mathscr{L}) \cup c^* \sigma i \sigma (\mathscr{L})$ , which implies  $\mathscr{L} \subseteq i \sigma c^* \sigma i \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Delta$ - $\mathfrak{HO}(\mathbb{Z})$ .

**Theorem 2.20.** If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B}$ - $\mathfrak{H}O(\mathbb{Z})$  and  $\mathfrak{S}^*$ -c´losed, then it is  $\Sigma$ - $\mathfrak{H}O(\mathbb{Z})$ .

**Proof.** Let  $\mathscr{L}$  is both  $\mathscr{B}$  -  $\mathfrak{HO}(\mathbb{Z})$  and  $\mathfrak{I}^*$ -c´losed. Then  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c}^* \sigma(\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma(\mathscr{L})$  and  $\mathfrak{c}^* \sigma(\mathscr{L}) \subseteq \mathfrak{c}^* \mathfrak{I} (\mathscr{L}) \subseteq \mathfrak{L}$ . Now  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c}^* \sigma(\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma(\mathscr{L}) \subseteq \mathfrak{c}^* \mathfrak{o} \mathfrak{i} \sigma(\mathscr{L}) = \mathfrak{c}^* \sigma \mathfrak{i} \sigma(\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Sigma$ - $\mathfrak{HO}(\mathbb{Z})$ .

**Theorem 2.21**. If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B} - \mathfrak{HO}(\mathbb{Z})$  and  $\sigma \mathfrak{I}^*$ -c losed, then it is  $\Sigma$ - $\mathfrak{HO}(\mathbb{Z})$ .

**Proof.** Let  $\mathscr{L}$  is  $\mathscr{B} - \mathfrak{HO}(\mathbb{Z})$  and  $\sigma\mathfrak{H}^*$ -c´losed. Then  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c}^* \sigma (\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma (\mathscr{L})$  and  $\mathfrak{c}^* \sigma (\mathscr{L}) \subseteq \mathbb{Z}$ , which implies  $\mathfrak{i} \sigma \mathfrak{c}^* \sigma (\mathscr{L}) \subseteq \mathfrak{i} \sigma (\mathscr{L}) \subseteq \mathfrak{i} \sigma (\mathscr{L})$ . Now  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c} \sigma \mathfrak{i} \sigma (\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma (\mathscr{L}) \subseteq \mathfrak{c}^* \sigma \mathfrak{i} \sigma (\mathscr{L}) \cup \mathfrak{i} \sigma (\mathscr{L}) = \mathfrak{c}^* \sigma \mathfrak{i} \sigma (\mathscr{L})$ . Hence  $\Sigma$ -  $\mathfrak{HO}(\mathbb{Z})$ .

**Theorem 2.22.** If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$  and  $\vartheta$ - $\sigma$ - $\mathfrak{c}$  losed, then it is  $\Sigma$ - $\mathfrak{HO}(\mathbb{Z})$ .

**Proof.** Let  $\mathscr{L}$  is both  $\mathscr{B} - \mathfrak{HO}(\mathbb{Z})$  and  $\vartheta - \sigma - \mathfrak{c}$  losed. Then  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c}^* \sigma(\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma(\mathscr{L})$  and  $\mathfrak{c}^* \sigma(\mathscr{L}) \subseteq \mathcal{L}$  by Proposition 2.9 of [5]. Which implies i $\sigma \mathfrak{c}^* \sigma(\mathscr{L}) \subseteq \mathfrak{i} \sigma(\mathscr{L})$ . Now  $\mathscr{L} \subseteq \mathfrak{i} \sigma \mathfrak{c}^* \sigma(\mathscr{L}) \cup \mathfrak{c}^* \sigma \mathfrak{i} \sigma(\mathscr{L}) \cup \mathfrak{i} \sigma(\mathscr{L}) = \mathfrak{c}^* \sigma \mathfrak{i} \sigma(\mathscr{L})$ . Hence  $\Sigma - \mathfrak{HO}(\mathbb{Z})$ .

**Theorem 2.23.** If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B} - \mathfrak{HO}(\mathbb{Z})$  such that  $i \sigma (\mathscr{L}) = \emptyset$ , then it is  $\Phi - \mathfrak{HO}(\mathbb{Z})$ . **Proof.** Let  $\mathscr{L}$  be  $\mathscr{B} - \mathfrak{HO}(\mathbb{Z})$  and  $i \sigma (\mathscr{L}) = \varphi$ . Then  $\mathscr{L} \subseteq i \sigma c^* \sigma (\mathscr{L}) \cup c^* \sigma i \sigma (\mathscr{L}) = i \sigma c \sigma^* (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Phi - \mathfrak{HO}(\mathbb{Z})$ .

**Theorem 2.24.** If  $\mathscr{L}\subset\mathbb{Z}$  is  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$  and  $\mathscr{L}\in\mathfrak{H}$ , then it is  $\Sigma$  -  $\mathfrak{HO}(\mathbb{Z})$ . **Proof.** Let  $\mathscr{L}$  is  $\mathscr{B}$  -  $\mathfrak{HO}(\mathbb{Z})$  and  $\mathscr{L}\in\mathfrak{H}$ . Then  $\mathscr{L}\subseteq i \sigma c^*\sigma(\mathscr{L})\cup c^*\sigma i \sigma(\mathscr{L})$  and  $c^*\sigma(\mathscr{L})=\mathscr{L}$  by Remark 2.10 of [5]. Now  $\mathscr{L}\subseteq i \sigma c^*\sigma(\mathscr{L})\cup c^*\sigma i \sigma(\mathscr{L}) = c^*\sigma i \sigma(\mathscr{L}) \cup c^*\sigma i \sigma(\mathscr{L}) = c^*\sigma i \sigma(\mathscr{L})$ .

**Theorem 2.25.** If  $\mathscr{L}\subset\mathbb{Z}$  is  $\mathscr{B}$ - $\mathfrak{H}O(\mathbb{Z})$  and  $\mathfrak{H}=\mathsf{P}(\mathscr{L})$  then it is  $\mathscr{L}$  is  $\Sigma$ - $\mathfrak{H}O(\mathbb{Z})$ . **Proof.** Let  $\mathscr{L}$  is  $\mathscr{B} - \mathfrak{H}O(\mathbb{Z})$  and  $\mathfrak{H} = \mathsf{P}(\mathscr{L})$ . Then  $\mathscr{L}\subseteq i \sigma c^*\sigma(\mathscr{L}) \cup c^*\sigma i \sigma(\mathscr{L}) = \mathscr{L}$  by Remark 2.10 of [5]. Now  $\mathscr{L}\subseteq i \sigma c^*\sigma(\mathscr{L}) \cup c^*\sigma i \sigma(\mathscr{L}) = c * \sigma i \sigma(\mathscr{L}) = c * \sigma i \sigma(\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Sigma$ - $\mathfrak{H}O(\mathbb{Z})$ .

**Theorem 2.26**. If  $\mathscr{L} \subset \mathbb{Z}$  is  $\mathscr{B}$ - $\mathfrak{H}O(\mathbb{Z})$  and  $\mathscr{L} \subset \mathcal{L} \sigma^*$ , then it is  $\mathscr{L}$  is  $\Omega$ - $\mathfrak{H}O(\mathbb{Z})$ .

# Ramesh et al.,

**Proof.** Let  $\mathscr{L}$  is  $\mathscr{B}$ - $\mathfrak{HO}(\mathbb{Z})$  and  $\mathscr{L} \subset \mathscr{L} \sigma^*$ . Then  $\mathscr{L} \subseteq i \sigma \operatorname{cos} (\mathscr{L}) \cup c^* \sigma i \sigma (\mathscr{L})$  and  $c^* \sigma i \sigma (\mathscr{L}) \subset c^* \sigma i \sigma c^* \sigma (\mathscr{L})$ . Now  $\mathscr{L} \subseteq i \sigma c^* \sigma (\mathscr{L}) \cup c^* \sigma i \sigma (\mathscr{L}) \subseteq \sigma \circ \sigma (\mathscr{L}) \cup c^* \sigma i \sigma c^* \sigma (\mathscr{L}) \subseteq c^* \sigma i \sigma c^* \sigma (\mathscr{L}) \subseteq c^* \sigma i \sigma c^* \sigma (\mathscr{L})$ . Hence  $\mathscr{L}$  is  $\Omega$ - $\mathfrak{HO}(\mathbb{Z})$ .

### DECOMPOSITION OF (A- $\mathfrak{H}$ $\Psi$ , $\lambda)$ -continuity

**Definition 3.1.** A map  $j:(\mathbb{Z}, \vartheta, \vartheta f) \rightarrow (\mathscr{B}, \lambda)$  is  $(\Delta \cdot \vartheta f \psi, \lambda)$  -continuous  $((\Delta \cdot \vartheta f \psi, \lambda) \cdot C)$ , if j - 1 (V) is  $\Delta \cdot \vartheta f O(\mathbb{Z})$  for each  $\lambda O(\mathbb{Z})$  set V in  $(W, \lambda, \vartheta f)$ . **Definition 3.2.** A map  $j:(\mathbb{Z}, \vartheta, \vartheta f) \rightarrow (\mathscr{B}, \lambda)$  is  $(\Sigma \cdot \vartheta f \psi, \lambda)$  -continuous  $((\Sigma \cdot \vartheta f \psi, \lambda) - C)$ , if j - 1 (V) is  $\Sigma \cdot \vartheta f O(\mathbb{Z})$  for each  $\lambda O(\mathbb{Z})$  set V in  $(W, \lambda, \vartheta f)$ . **Definition 3.3.** A map  $j:(\mathbb{Z}, \vartheta, \vartheta f) \rightarrow (\mathscr{B}, \lambda)$  is  $(\Phi \cdot \vartheta f \psi, \lambda)$  -continuous  $((\Phi \cdot \vartheta f \psi, \lambda) - C)$ , if j - 1 (V) is  $\Phi \cdot \vartheta f O(\mathbb{Z})$  for each  $\lambda O(\mathbb{Z})$  set V in  $(W, \lambda, \vartheta f)$ .

**Proposition 3.4**. Every (Δ-9ft ψ, λ)-C is (Σ-9ft ψ, λ)- C but not conversely. **Proof**. Consider the map  $j:(\mathbb{Z}, \vartheta, \vartheta f) \rightarrow (\mathscr{B}, \lambda)$  be a (Δ-9ft ψ, λ)-C. Then j = 1 (V) is Δ-9fO( $\mathbb{Z}$ ) for each  $\lambda O(\mathbb{Z})$  set V in ( $\mathscr{B}, \lambda, \vartheta f$ ). By Proposition 2.6, j = 1 (V) is Σ-9fO( $\mathbb{Z}$ ). Hence, j is (Σ-9ft ψ, λ)-C.

**Example 3.**5. Consider  $\mathbb{Z}=\{1,2,3,4,5\}$ ,  $\Im=\{\emptyset,\{1\},\{2\},\{3\},\{1,2\},\{1,3,\{2,3,\{1,2,3,\{1,3,4,\{2,3,4\},\{1,2,3,4\}\},\lambda=\{\emptyset,\{1,2\}\}$ and  $\Re=\{\emptyset,\{1\}\}$ . Then, the identity map  $j:(\mathbb{Z},\Im,\Re) \rightarrow (\mathscr{B},\lambda)$  is  $(\Sigma-\Re \psi, \lambda)$ -C and but not  $(\Delta-\Re \psi, \lambda)$ -C.

**Proposition 3.6.** Every  $(\Delta - \mathfrak{H} \psi, \lambda)$ -C is  $(\Phi - \mathfrak{H} \psi, \lambda)$ -C but not conversely. **Proof.** Consider the map  $j:(\mathbb{Z}, \mathfrak{H}, \mathfrak{H}) \rightarrow (\mathfrak{B}, \lambda, \mathfrak{H})$  be a  $(\Delta - \mathfrak{H} \psi, \lambda)$ -C. Then j - 1 (V) is  $\Delta - \mathfrak{HO}(\mathbb{Z})$  for each  $\lambda O(\mathbb{Z})$  set V in  $(\mathfrak{B}, \lambda, \mathfrak{H})$ . By Proposition 2.8, j - 1 (V) is  $\Phi - \mathfrak{HO}(\mathbb{Z})$ . Hence, j is  $(\Phi - \mathfrak{H} \psi, \lambda)$ -C.

**Example 3.7**. Consider  $\mathbb{Z}=\{1,2,3,4\}$ ,  $\Im=\{\emptyset, \{1,3\}, \{4\}, \{1,3,4\}, \mathbb{Z}\}$ ,  $\lambda=\{\emptyset, \{1,3,4\}\}$ ,  $\Im t=\{\emptyset, \{3\}\}$ . Then the identity map  $j:(\mathbb{Z}, \Im, \mathfrak{H}) \rightarrow (\mathfrak{B}, \lambda)$  is  $(\Phi \cdot \mathfrak{H} \ \psi, \lambda)$ -C but not  $(\Delta \cdot \mathfrak{H} \ \psi, \lambda)$ -C.

**Remark 3.8.** The notions of (Σ-9£ ψ, λ)-C and (Φ-9£ ψ, λ)-C are independent. **Example 3.9.** Consider  $\mathbb{Z}=\{1,2,3,4,5\}$ ,  $\Im=\{\emptyset,\{1\},\{2\},\{1,3\},\{2,3\},\{1,2,3\},\{1,3,4\},\{2,3,4\},\{2,3,4,5\}\}$ ,  $\lambda=\{\emptyset,\{2,3\}\}$  and  $\Im=\{\emptyset,\{5\}\}$ . Then, the identity map j:( $\mathbb{Z}, \Im, \Re) \rightarrow (\mathscr{B}, \lambda)$  is (Σ-9£ ψ, λ)-C but not (Φ-9£ ψ, λ)-C.

**Example 3.10**. Consider  $\mathbb{Z}=\{1,2,3,4\}, \Im=\{\emptyset,\{1,3\},\{3\},\{1,3,4\},\mathbb{Z}\}, \lambda=\{\emptyset,\{1,3,4\}\}, \Im t=\{\emptyset,\{3\}\}$ . Then, the identity map  $j:(\mathbb{Z}, \Im, \Im t) \rightarrow (\mathscr{B}, \lambda)$  is  $(\Phi \cdot \mathfrak{I} t \psi, \lambda)$ -C but not  $(\Sigma \cdot \mathfrak{I} t \psi, \lambda)$ -C.

**Theorem 3.11.** For a map j:  $(\mathbb{Z}, \vartheta, \vartheta t) \rightarrow (\mathscr{B}, \lambda, \vartheta t)$ , the following results are equivalent. 1. j is  $(\Delta - \vartheta t \psi, \lambda)$ -C. 2. j is  $(\Sigma - \vartheta t \psi, \lambda)$ -C and  $(\Phi - \vartheta t \psi, \lambda)$ -C.

**Proof.** (1) $\Rightarrow$ (2): Follows from the Proposition 3.4 and Proposition 3.6. (2) $\Rightarrow$ (1): Consider the map j:( $\mathbb{Z}$ ,  $\vartheta$ ,  $\vartheta$ t) $\rightarrow$ ( $\mathscr{B}$ ,  $\lambda$ ,  $\vartheta$ t) be ( $\Sigma$ - $\vartheta$ t  $\psi$ ,  $\lambda$ )-C and ( $\Phi$ - $\vartheta$ t  $\psi$ ,  $\lambda$ ) - C. Then j - 1 (V) is  $\Sigma$ - $\vartheta$ tO( $\mathbb{Z}$ ) and  $\Phi$ - $\vartheta$ tO( $\mathbb{Z}$ ) for each  $\lambda$ O( $\mathbb{Z}$ ). By Theorem 2.10, j - 1 (V) is  $\Delta$ - $\vartheta$ tO( $\mathbb{Z}$ ). Hence, j is ( $\Delta$ - $\vartheta$ t  $\psi$ ,  $\lambda$ )-C.

# CONCLUSION

In this paper, we introduced  $\Delta$ - $\Re O(\mathbb{Z})$ ,  $\Sigma$ - $\Re O(\mathbb{Z})$ ,  $\Omega$ - $\Re O(\mathbb{Z})$  and  $\mathscr{B}$ - $\Re O(\mathbb{Z})$  sets and obtained decomposition of ( $\Delta$ - $\Re \psi$ ,  $\lambda$ )-C. In future work we will introduce new types of generalized open sets related to these sets and obtain new decomposition of ( $\vartheta$ ,  $\lambda$ )-C.

# ABSTRACT

Let G be a simple connected graph with V as its vertex set and E as its edge set. Boolean graph  $BG_2(G)$  is the graph with vertex set VUE and two vertices of  $BG_2(G)$  are adjacent if and only if they are adjacent vertices of G or represent an edge incident with the vertex in G or represent two non-adjacent edges of G. In this paper, a theorem and an algorithm based on that theorem is set to obtain the metric dimension of  $BG_2(G)$ , a metric base, the adjacency matrix and the distance matrix of  $BG_2(G)$ 

Keywords: Boolean graph BG2 (G)algorithms, metric base , metric dimension,

# INTRODUCTION

In today's fast-paced world, it is important to study the development of networks and hence the study of graphs like  $BG_2(G)$  is trending. A graph G and  $BG_2(G)$  are given below.

A vertex g is said to resolve another vertices h and k If  $d(h, g) \neq d(k, g)$ . If  $W \subseteq V$  contains a resolving vertex for every pair of vertices of G then W is said to be a resolving set. If  $W=\{W_1, W_2, ..., W_K\}$  is a resolving set then every vertex can be uniquely identified by a code,

### Sameerali and Sameena

 $C_w(u)=(d(u_1,w_1),\ldots, d(u_2, w_2), \cdots, d(u, w k))$ .  $C_w(u)$  is known as the metric code or location code of u [5]. Codes of Wi's are all different since the i th component is zero and others are non zeros. Every superset of a resolving set is a resolving set so a graph can have more than one resolving set.

A metric base is a resolving set with minimum cardinality. Cardinality of a metric base is called the metric dimension of G, denoted by  $\beta(G)$  [5]. The vertices of BG<sub>2</sub>(G) corresponding to vertices of G are known as point vertices and that correspond to edges of G are called line vertices. "If the number of vertices of G is more than four then the distance between two point vertices is either one or two or three, distance between two line vertices is one or two and the distance between a point vertex and a line vertex is either one or two" [1].

# **RESULTS AND DISCUSSION**

Theorem 1: Collection of point vertices is a resolving set for BG2(G)

**Proof:** let  $S = \{P_1, P_2, \dots, P_{\alpha}\}$  be the set of point vertices and  $T = \{Q_1, Q_2, \dots, Q_Q\}$  be the set of line vertices. The metric codes,  $C_s$  ( $P_i$ ), are all different since i th component of the code is zero and the rest are non-zero. Metric code of  $Q_j$ ,  $C_s$  ( $Q_i$ ), are also different because in every code 1's occur exactly at two positions and the remaining positions are numbers other than 1. Positions of these 1's will vary from line vertex to line vertex as they appear in places of vertices corresponding to that line vertex. Hence all vertices have different codes.

### The algorithm

Algorithms play a vital role in modern computing. In this section, using the fact in theorem 1, an algorithm is established to obtain metric dimension of  $BG_2$  (G) a metric base for  $BG_2$  (G), adjacency matrix of  $BG_2$  (G) and the distance matrix of  $BG_2$  (G). The graph considered in the algorithm is a simple connected undirected graph with more than two vertices. Number of vertices and upper triangular part of the adjacency matrix are to be given as inputs. Theorem 1 plays a crucial in the algorithm.

Step 1: Start.
Step 2: Declare two dimensional arrays; a ,b and d
Declare the integer variables; e=0, n, r, i , j, k, flag=0.
Step 3: Read n>1; 1, the number of vertices in G.
Step 4: For i and j from 0 to n-1, read a ij for i>j "if aij=1" is to be deleted from the end of the line , the upper triangular part of adjacency Matrix of G. If a ij =1,

```
If a_{ij}=1, {

e=e+1, d_{ij}=1, b_{ij}=1,

b_i, n+e-1=1, b_j, n+e-1=1,

d_i, n+e-1=1, d_{j,n+e-1}=1.

For k= 0to k= n-1,

If k is different from i and j,

then, set b_{k,n+e-1}=0, d_{k,n+e-1}=2.

For g=n tog=n+e-1,

If b_{ig}=0 and b_{j}=0,

Then set b_{n+e-1,g}=1 and d_{n+e-1,g}=1.

else,

b_n+e-1,g=0 and d_n+e-1,g=2.

}

If a_{ij}=0, then set b_{ij}=0.
```

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

```
Sameerali and Sameena
```

```
Step 5: for i from 1 to n-1.... to n-1,

If a_{ij}=0

For K=0 to n-1

{

If b_{ik}=1 and b_{jk}=1, then set d_{ij}=2, break.

If k=n-1 then set d_{ij}=3.

}
```

Step 6: For i from 0 to n+e-1 and j from i to n+e-1Set  $a_{11}=0,b_{11}=0,d_{11}=0.a_{j1}=a_{1j},b_{j1}=b_{1j},d_{j1}=d_{1j}$ .

```
Step 7: For r=2 to r=n, {
{
For k=1 to n+eCr
{
```

Consider each  ${}^{{}_{n+e}}C\,r$  combinations of vertices of  $BG_2(G).$  Let the  $k^{{}_{th}}$  combination

be  $(v_{\alpha 1}, v_{\alpha 2}, \cdots, v_{\alpha r})$ 

```
Let v_{\beta 1}, v_{\beta 2}..., v_{\beta n+e-r} be the vertices out side the current combination.
If r=n-1 then go to Step 8
ag=0
For i=1 to n+e-r
{
If flag =1, break;
For j=i+1 to n+e-r
{
if (d_{\beta i\alpha_{1}}, d_{\beta i\alpha_{2}}, \dots, d_{\beta i\alpha_{r}}) = (d_{\beta j\alpha_{1}}, d_{\beta j\alpha_{2}}, \dots, d_{\beta j\alpha_{r}})
{flag=1, break}
if(j=n+e-r) goto Step8
}
}
}
}
Step 8: Print [bij]-Adjacency matrix of BG2 (G).
Print [d_{ij}]-Distance matrix of BG_2(G).
Print r-Metric Dimension of BG<sub>2</sub>(G).
Print {v_{\alpha_1}, v_{\alpha_2}, \dots, v_{\alpha_r}} - Metricbase of BG<sub>2</sub> (G).
```

Step 9: Stop

Example: Let G=P3

#### Input

Enter the number of vertices of the simple connected Graph G with more than 2 vertices 3 Enter the upper triangular part of the adjacency matrix of G excluding the diagonal elements.

# ABSTRACT

This article, explores and introduces the variety of H - GT S –open sets in H-GTS. Additionally, the following is obtained: The decomposition of ( $\alpha$  H<sub>b</sub>, $\delta$ )-C.

**Keywords:**  $\mathfrak{H}$ -GTS,  $\alpha$ - Hb-open,  $\pi$ - Hb-open and  $\pi$ - Hb-open sets.

# 2000 Mathematics Subject Classification: 54A05.

# INTRODUCTION

Let  $\vartheta$  be the collection of all the subsets of  $\mathbb{Z}$ , which is an on empty set  $\mathbb{Z}$ . Then  $\vartheta$  is called a generaliZed topology (briefly GT)[1], if  $f \phi \in \vartheta$  and  $U_j \in \vartheta$  for  $j \in J$  implies  $U = \bigcup_{j \in J} U_j \in \vartheta$ . The closure of a subset B of  $\mathbb{Z}$  is shown by the symbolc  $\vartheta(B)$  is the smallest closed set counting B and  $i\vartheta(B)$  is the interior of B are called the greatest  $\vartheta$ -open sets in are included in B.

Definition1.1.AsubsetB⊂Ziscalled

- 1.  $\vartheta$ - $\alpha$ -ópen[2], if B $\subset$ i $\vartheta$ C $\vartheta$ i $\vartheta$ (B).

- 9-β-ópen[2], if B⊂c₀i₀c₀(B).
- 5.  $\vartheta$ -b-ópen[12], if B $\subset$ c $\vartheta$  i $\vartheta$ (B) $\cup$ i $\vartheta$ c $\vartheta$ (B).

**Definition 1.2.** A hereditary class [4] is described as  $\mathfrak{H}$  of subsets of  $\mathbb{Z}$ , where  $L \in \mathfrak{H}$  and  $V \subset L$ , and where  $V \in \mathfrak{H}$  otherwise.

64204

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Ramesh and Uma

**Definition 1.3.** Regarding a hereditary class  $\mathcal{H}$  on  $\mathscr{L}$  and  $\mathscr{L}\subset\mathbb{Z}$ , we define  $\mathscr{L}^{*}(\mathcal{H}, \vartheta) = \{z\in\mathbb{Z}:\mathscr{L} \land \mathcal{V} \notin \mathcal{H} \text{ for all } V \in \vartheta$  such that  $a\in V\}$  [4].

**Definition 1.4.**[5] Let  $\mathscr{L} \subset \mathbb{Z}$ . Then  $\mathscr{L}^*_{\sigma}(\mathfrak{H}, \mathfrak{H}) = \{ z \in \mathbb{Z} : \mathscr{L} \cap V \notin \mathfrak{H} \text{ for all } V \in \mathfrak{H} \text{-}\sigma\text{-}\delta pen \text{ such that } \mathbb{Z} \in V \}$  and  $c^*_{\sigma}(\mathscr{L}) = \mathscr{L} : \mathscr{L}^*_{\sigma}$ .

# **Definition1.5.A** subset $\mathscr{L} \subset \mathbb{Z}$ is called

- 1.  $\alpha$ -H-ópen[4], if  $\mathscr{L}\subseteq i \circ \mathfrak{c} \circ i \circ (\mathscr{L})$ ,
- 2.  $\sigma$ -H-ópen[4], if  $\mathscr{L}\subseteq c^*\mathfrak{gis}(\mathscr{L})$ ,
- π-H-ópen[4], if ℒ⊆isc\*<sub>𝔅</sub>(ℒ),
- 4.  $\beta$ -H-ópen[4], if  $\mathscr{L}\subseteq c_{\vartheta}i_{\vartheta}c^{*}_{\vartheta}(\mathscr{L})$ ,
- 5.  $\vartheta^*$ -closed[4], ifc\* $\vartheta(\mathscr{L}) \subset \mathscr{L}$ .
- 6. b-H-ópen[8], if  $\mathscr{L}\subseteq i_{\vartheta} c^*_{\vartheta} \mathscr{L}) \cup c^*_{\vartheta} i_{\vartheta}(\mathscr{L})$ ,
- 7.  $\sigma \vartheta^*$ -closed[5], if  $\mathscr{L}_{\sigma} \subseteq \mathscr{L}$

### **Definition1.6.** A sub set $\mathscr{L} \subset \mathbb{Z}$ is said to be

- 1.  $\alpha$ -H<sub>o</sub>-ópen[10], if  $\mathscr{L}\subseteq i \circ c^*_{\sigma} i \circ (\mathscr{L})$ ,
- 2.  $\sigma$ -H<sub> $\sigma$ </sub>-ópen[10], if  $\mathscr{Q}\subseteq c^*_{\sigma}i_{\vartheta}(\mathscr{Q})$ ,
- 3.  $\pi$ -H<sub>o</sub>-ópen[10], if  $\mathscr{L}\subseteq i \circ c^*_{\mathcal{O}}(\mathscr{L})$ ,
- 4.  $\beta$ -H<sub> $\sigma$ </sub>-ópen[10], if  $\mathscr{L}$   $\subseteq c_{\vartheta} i_{\vartheta} c^*_{\sigma}(\mathscr{L})$ .
- 5. b-H<sub> $\sigma$ </sub>-ópen[9], if  $\mathscr{L}\subseteq i_{\vartheta}c^{*}_{\sigma}(\mathscr{L})\cup c^{*}_{\sigma}i_{\vartheta}(\mathscr{L}).$

**Definition 1.6.** Consider B to be a part of  $\mathfrak{H}$ -GTS( $\mathbb{Z}, \vartheta, \mathfrak{H}$ ). Then  $B_{\mathfrak{b}}^{*}(\mathfrak{H}, \vartheta) = \{\mathbb{Z} \in \mathbb{Z} : B \cap V \notin \mathfrak{H} \text{ for all } V \in \vartheta \text{-b-open such that } \mathbb{Z} \in V\}.$ 

Consider( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ) be a  $\mathfrak{H}$  -GTS for  $B \subset \mathbb{Z}$ , define  $c_b^*(B) = B \cup B_b^*(\mathfrak{H}, \mathfrak{H})$  and  $c_b$  (B) is enlarging, monotone an didempotent.

#### Generalized 9tb- open sets

Definition 2.1.A subset B of  $\mathfrak{H}$ -GTS ( $\mathbb{Z}, \vartheta, \mathfrak{H}$ ) is called as

- 6. α-9€b-open, ifB⊆i∍cb<sup>\*</sup>i∍(B)
- σ-ንtb-open, ifB⊆c<sup>\*</sup><sub>b</sub>(i<sub>s</sub>(B)
- 8. π-୬€b-open, ifB⊆i∋c<sub>b</sub>\*(B)

**Theorem2.2**.In $\mathfrak{H}$ -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ):

- 1. Any  $\vartheta O(\mathbb{Z})$  set is  $\alpha$ - $\Re_b O(\mathbb{Z})$ .
- 2. Any  $\vartheta O(\mathbb{Z})$  set is  $\sigma$ - $\Re_b O(\mathbb{Z})$ .
- 3. Any  $\vartheta O(\mathbb{Z})$  set is  $\pi \Re_{\mathfrak{b}} O(\mathbb{Z})$ .
- Any ∂O(Z) set is β-𝔥bO(Z).
   Any ∂O(Z) set is b-𝔥bO(Z).

**Proof.**(1). Consider a subset B of  $\mathfrak{H}$  -GTS ( $\mathbb{Z},\mathfrak{H},\mathfrak{H}$ ) is  $\mathfrak{H}$  O( $\mathbb{Z}$ ). Then  $B \subseteq \mathfrak{i}_{\mathfrak{H}}(B) \subseteq \mathfrak{i}_{\mathfrak{H}}\mathfrak{c}_{\mathfrak{H}}^{*}(B)$ . Hence  $B\mathfrak{k}_{\mathfrak{H}}$ - $\mathfrak{H}_{\mathfrak{H}}$ O( $\mathbb{Z}$ ).

- (2). Consider a subset B of  $\mathfrak{H}$  -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ) is  $\mathfrak{H} O(\mathbb{Z})$ . Then,  $B \subseteq i_{\mathfrak{H}}(B) \subseteq c_{\mathfrak{h}}^* i_{\mathfrak{H}}(B)$ . Hence  $Bi_{\mathfrak{V}}$ - $\mathfrak{H}_{\mathfrak{h}}O(\mathbb{Z})$ .
- (3). Consider a subset B of  $\mathfrak{H}$  -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ) is  $\mathfrak{H} O(\mathbb{Z})$ . Then,  $B \subseteq i_{\mathfrak{H}}(B) \subseteq i_{\mathfrak{H}}c_{\mathfrak{H}}^{*}(B)$ . Hence  $Bi_{\mathfrak{H}}$ - $\mathfrak{H}_{\mathfrak{H}}O(\mathbb{Z})$ .
- (4). Consider a subset B of  $\mathfrak{H}$  -GTS ( $\mathbb{Z},\mathfrak{H},\mathfrak{H}$ ) is  $\mathfrak{H} O(\mathbb{Z})$ . Then,  $B \subseteq \mathfrak{i} \mathfrak{s}(B) \subseteq \mathfrak{c} \mathfrak{s} \mathfrak{i} \mathfrak{s} \mathfrak{c}_b^*(B)$ . Hence  $Bis\beta \mathfrak{H}_b O(\mathbb{Z})$ .
- (5). Consider a subset B of  $\mathfrak{H}$  -GTS ( $\mathbb{Z},\mathfrak{H},\mathfrak{H}$ ) is  $\mathfrak{H} O(\mathbb{Z})$ . Then,  $B \subseteq i \mathfrak{d}_{\mathcal{B}}(B) \subseteq i \mathfrak{d}_{\mathcal{B}}(B) \sqcup c_{\mathcal{B}}^{*} i \mathfrak{d}(B)$ . Hence, Bib- $\mathfrak{H}_{\mathfrak{h}}O(\mathbb{Z})$ .

**Example2.3.**Consider  $\mathbb{Z} = \{1,2,3,4\} = \{\emptyset,\{1\},\{2\},\{1,2\},\{2,3,4\},\mathbb{Z}\}, \mathfrak{H} = \{\emptyset,\{1\},\{3\}\}.$  Then  $\mathscr{B} = \{1,2,3\}$  is  $\mathscr{B}$  is  $\alpha \cdot \mathfrak{H}_b \circ (\mathbb{Z}).$  (resp.  $\beta - \mathfrak{H}_b \circ (\mathbb{Z}), \sigma - \mathfrak{H}_b \circ (\mathbb{Z}), \pi - \mathfrak{H}_b \circ (\mathbb{Z}), \beta - \mathfrak{H}_b \circ (\mathbb{Z}), b - \mathfrak{H}_b \circ (\mathbb{Z})$ ) But not  $\mathfrak{O} \circ (\mathbb{Z}).$ 

# **Theorem2.4**.In $\mathfrak{H}$ -GTS ( $\mathbb{Z},\mathfrak{H},\mathfrak{H}$ ):

- 1. Any  $\alpha \mathfrak{H}_b O(\mathbb{Z})$  is  $\vartheta \alpha$ -open.
- 2. Any  $\sigma \mathfrak{H}_{\mathfrak{b}} O(\mathbb{Z})$  is  $\vartheta \sigma$  -open.
- 3. Any  $\pi$  - $\Re_b O(\mathbb{Z})$  is  $\vartheta$  - $\pi$ -open.
- Any β-𝔥t₀O(ℤ) is θ-β-open.
   Any b-𝔥t₀O(ℤ) is θ-b-open.

# Proof.

- 1. Consider  $\mathscr{B}$  be  $\alpha$ - $\mathfrak{H}_bO(\mathbb{Z})$ . Then we have,  $\mathscr{B}\subseteq \mathfrak{i}_b c_b^* \mathfrak{i}_b(\mathscr{B})\subseteq \mathfrak{i}_b c_b^* \mathfrak{i}_b(\mathscr{B})\subseteq \mathfrak{i}_b c_b^* \mathfrak{i}_b(\mathscr{B})$ . Hence,  $\mathscr{B}$  is  $\vartheta \cdot \alpha$ -open.
- 2. Consider  $\mathscr{B}$  be $\sigma$ - $\mathfrak{H}_bO(\mathbb{Z})$ . Then,  $\mathscr{B}\subseteq c_b^*i_\vartheta(\mathscr{B})\subseteq c_\vartheta i_\vartheta(\mathscr{B})$ . Hence,  $\mathscr{B}i_\vartheta \vartheta \sigma$ -open.
- 3. Consider  $\mathscr{B}$  be  $\pi$ - $\mathfrak{H}_bO(\mathbb{Z})$ . Then we have,  $\mathscr{B}\subseteq i\mathfrak{sc}^*_b(\mathscr{B})\subseteq \mathfrak{isc}^*_{\mathfrak{S}}(\mathscr{B})\subseteq \mathfrak{isc}(\mathscr{B})$ . Hence,  $\mathscr{B}$  is  $\mathfrak{S}$ - $\pi$ -open.
- 4. Consider  $\mathscr{B}$  be  $\beta$   $\mathfrak{H}_bO(\mathbb{Z})$ . Then we have,  $\mathscr{B}\subseteq \mathfrak{c}_b\mathfrak{i}\mathfrak{s}\mathfrak{c}_b^*(\mathscr{B})\subseteq \mathfrak{c}_b\mathfrak{i}\mathfrak{s}\mathfrak{c}\mathfrak{s}(\mathscr{B})$ . Hence  $\mathscr{B}$  is  $\vartheta$ - $\beta$ -open.

5. Consider  $\mathscr{B}$  beb- $\mathfrak{H}_b O(\mathbb{Z})$ . Then we have,  $\mathscr{B} \subseteq i \mathfrak{sc}_b^*(\mathscr{B}) \cup \mathfrak{c}_b^* i \mathfrak{s}(\mathscr{B}) \subseteq i \mathfrak{sc}_b(\mathscr{B}) \cup \mathfrak{c}_b i \mathfrak{s}(\mathscr{B}) \subseteq i \mathfrak{sc}_b(\mathscr{B}) \subseteq i \mathfrak{sc}_b(\mathscr{B})$ . UCs  $i \mathfrak{s}(\mathscr{B})$ . Hence,  $\mathscr{B}$  b-open.

**Example 2.5.**Consider  $\mathbb{Z}=1,2,3,4,5$ ,  $\mathfrak{D}=\{\emptyset,\{1\},\{2\},\{3\},\{1,2\},\{1,3\},\{2,3\},\{1,2,3\},\{1,2,4\},\{2,3,4\},\{1,2,3,4\}\}$ ,  $\mathfrak{P}\mathfrak{C}=\{\emptyset,\{1\}\}$ . Then  $\mathscr{B}=\{1,2,4\}$  is  $\mathfrak{D}-\alpha$ -open(resp.  $\mathfrak{D}-\sigma$ -open)butnot  $\alpha$ - $\mathfrak{P}\mathfrak{L}_{\mathsf{D}}\mathcal{O}(\mathbb{Z})$ . (resp. $\sigma$ - $\mathfrak{P}\mathfrak{L}_{\mathsf{D}}\mathcal{O}(\mathbb{Z})$ .) and  $\mathbb{C}=\{3,4\}$  is  $\mathfrak{D}-\pi$ -open but not  $\pi$ - $\mathfrak{P}\mathfrak{L}_{\mathsf{D}}\mathcal{O}(\mathbb{Z})$ .

**Example 2.6.** Consider  $\mathbb{Z} = \{1,2,3,4,5\} \otimes = \{\emptyset,\{1\},\{3\},\{1,2\},\{1,3\},\{1,2,3\},\{1,3,4,5\},\{2,3,4,5\},\mathbb{Z}\}, \ \mathfrak{H} = \{\emptyset,\{1\},\{4\}\}.$  Then  $\mathscr{B}=\{1,4\}$  is  $\mathfrak{S}$ - $\beta$ -open but not  $\beta$  - $\mathfrak{H}_bO(\mathbb{Z})$ .

# **Example2.7**.Consider $\mathbb{Z} = \{1, 2, 3, 4, 5\}$

# **Theorem2.8**.In $\mathfrak{H}$ -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ):

- 1. Any  $\alpha$ - $\Re_b O(\mathbb{Z})$  is  $\alpha$ - $\Re_\sigma$ -open.
- 2. Any  $\sigma$ - $\mathfrak{H}_{\mathfrak{b}}O(\mathbb{Z})$  is  $\sigma$ - $\mathfrak{H}_{\sigma}$ -ópen.
- 3. Any  $\pi$ - $\Re_b O(\mathbb{Z})$  is  $\pi$ - $\Re_{\sigma}$ -ópen.
- 4. Any  $\beta$ - $\Re_b O(\mathbb{Z})$  is  $\beta$ - $\Re_\sigma$ -ópen.
- 5. Any b- $\Re_b O(\mathbb{Z})$  is b- $\Re_{\sigma}$ -ópen.

# Proof.

- 1. Consider  $\mathscr{B}$  be  $\alpha$ - $\mathfrak{H}_bO(\mathbb{Z})$ . Then we have,  $\mathscr{B}i \circ c_b^* i \circ (\mathscr{B}) \subseteq i \circ c_b^* i \circ (\mathscr{B})$ . Hence  $\alpha$ - $\mathfrak{H}_o$ - $\delta$ pen.
- 2. Consider  $\mathscr{B}$  be  $\sigma$ - $\mathfrak{H}$ bO( $\mathbb{Z}$ ). Then we have,  $\mathscr{B} \subseteq c_b^* i_{\mathfrak{S}}(\mathscr{B}) \subseteq c_\sigma^* i_{\mathfrak{S}}(\mathscr{B})$ . Hence  $\mathscr{B}$  is $\sigma$ - $\mathfrak{H}_{\sigma}$ - $\delta$ pen.
- 3. Consider  $\mathscr{B}$  be  $\pi$ - $\mathfrak{H}$ bO( $\mathbb{Z}$ ). Then we have  $\mathscr{B} \subseteq i \otimes c_{\mathfrak{h}}^{*}(\mathscr{B}) \subseteq i \otimes c_{\mathfrak{h}}^{*}(\mathscr{B})$ . Hence  $\mathscr{B}$  is $\pi$ - $\mathfrak{H}_{\sigma}$ -ópen.
- 4. Consider  $\mathscr{B}$  be  $\beta$ - $\mathfrak{H}$ bO( $\mathbb{Z}$ ). Then we have,  $\mathscr{B}\subseteq \mathfrak{c}_{\mathfrak{s}}\mathfrak{i}_{\mathfrak{s}}\mathfrak{c}_{\mathfrak{s}}^{*}(\mathscr{B})\subseteq \mathfrak{c}_{\mathfrak{s}}\mathfrak{i}_{\mathfrak{s}}\mathfrak{c}_{\mathfrak{s}}^{*}(\mathscr{B})$ . Hence  $\mathscr{B}$  is  $\beta$ - $\mathfrak{H}_{\sigma}$ -ópen.
- 5. Consider  $\mathscr{B}$  be b- $\mathfrak{H}$ bO( $\mathbb{Z}$ ). Then we have,  $\mathscr{B}\subseteq \mathfrak{i}\otimes c_{\mathfrak{D}}^{*}(\mathscr{B})\iota_{\mathfrak{D}}\mathfrak{i}\otimes (\mathscr{B})\subseteq \mathfrak{i}\otimes c_{\mathfrak{D}}^{*}(\mathscr{B})\iota_{\mathfrak{D}}\mathfrak{i}\otimes (\mathscr{B})$ . Hence  $\mathscr{B}$ ib - $\mathfrak{H}_{\sigma}$ -open.

# Theorem2.9.In $\mathfrak{H}$ -GTS ( $\mathbb{Z},\mathfrak{H},\mathfrak{H}$ ):

- 1. Any  $\alpha \mathfrak{H}_b O(\mathbb{Z})$  is  $\alpha \mathfrak{H}$ -open.
- 2. Any  $\sigma$  - $\mathfrak{H}_bO(\mathbb{Z})$  is  $\sigma$ - $\mathfrak{H}$ -open.
- 3. Any  $\pi$  - $\mathfrak{H}_bO(\mathbb{Z})$  is  $\pi$  - $\mathfrak{H}$ -open.
- 4. Any  $\beta$  - $\mathfrak{H}_bO(\mathbb{Z})$  is  $\beta$ - $\mathfrak{H}$ -open.
- 5. Any  $b-\mathfrak{H}_bO(\mathbb{Z})$  is  $b-\mathfrak{H}$ -open.

# Proof.

- 1. Consider  $\mathscr{B}$  be  $a \alpha \mathfrak{H}_b O(\mathbb{Z})$  set. Then we have,  $\mathscr{B} \subseteq i \circ c_b^* i \circ (\mathscr{B}) \subseteq i \circ c_b i \circ (\mathscr{B})$ . Hence  $\mathscr{B}$  is  $\alpha \mathfrak{H}$ -open.
- 2. Consider  $\mathscr{B}$  be a  $\alpha$ - $\mathfrak{H}_bO(\mathbb{Z})$  set. Then we have,  $\mathscr{B}\subseteq c_b^*\mathfrak{i}(\mathscr{B})\subseteq c_s^*\mathfrak{i}(\mathscr{B})$ . Hence  $\mathscr{B}$  is  $\sigma$ - $\mathfrak{H}$ -open.
- 3. Consider  $\mathscr{B}$  be a  $\alpha$ - $\mathfrak{H}$  bO( $\mathbb{Z}$ ) set. Then we have,  $\mathscr{B} \subseteq i \otimes c_b^*(\mathscr{B}) \subseteq i \otimes c_b(\mathscr{B})$ . Hence  $\mathscr{B}$  is  $\pi$  - $\mathfrak{H}$ -open.
- 4. Consider  $\mathscr{B}$  be a  $\alpha$ - $\mathfrak{H}_bO(\mathbb{Z})$  set. Then we have,  $\mathscr{B}\subseteq c_{\mathfrak{s}}\mathfrak{i}_{\mathfrak{s}}\mathfrak{c}_{\mathfrak{s}}^*(\mathscr{B})\subseteq c_{\mathfrak{s}}\mathfrak{i}_{\mathfrak{s}}\mathfrak{c}_{\mathfrak{s}}(\mathscr{B})$ . Hence  $\mathscr{B}$  is  $\alpha$ - $\mathfrak{H}$ -open.

5. Consider  $\mathscr{B}$  be a b- $\mathfrak{H}$  bO( $\mathbb{Z}$ )set. Then we have,  $\mathscr{B} \subseteq \mathfrak{i} \circ c_b^*(\mathscr{B}) \cup c_b^* \mathfrak{i} \circ (\mathscr{B}) \cup c_b^* \mathfrak{i} \circ (\mathscr{B})$ . Hence  $\mathscr{B}$  is b- $\mathfrak{H}$ -open.

**Example2.10.** Consider  $\mathbb{Z} = \{1, 2, 3, 4, 5\} \oplus = \{\emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{1, 2, 3\}, \{1, 3, 4\}, \{2, 3, 4\}, \{1, 2, 3, 4\}\}, \mathfrak{H} = \{\emptyset, \{1\}\}$ . Then  $\mathscr{B} = \{2, 3, 4, 5\}$  is  $\sigma$ - $\mathfrak{H}$ -open but not  $\sigma$ - $\mathfrak{H}_bO(\mathbb{Z})$ .

**Example 2.11.** Consider  $\mathbb{Z}=\{1,2,3,4,5\}$ ,  $\emptyset = \{\emptyset,\{1\},\{3\},\{1,3\},\{3,4,5\},\{1,2,3\},\{1,3,4,5\},\mathbb{Z}\}, \$  $\Re = \{\emptyset,\{1\},\{2\}\}$ . Then  $\mathscr{B}=\{3,4\}$  is  $\pi$ - $\Re$ -open but not  $\pi$ - $\Re_bO(\mathbb{Z})$ 

**Example2.12.** Consider  $\mathbb{Z} = \{1,2,3,4,5\} \oplus = \{\emptyset,\{1\},\{2\},\{3\},\{1,2\},\{1,3\},\{2,3\},\{1,2,3\},\{1,3,4\},\{2,3,4\},\{1,2,3,4\}\}, \ \mathfrak{H} = \{\emptyset,\{1\}\}.$  Then  $\mathscr{B} = \{5\}$  is  $\vartheta$ -b-open(resp. b- $\mathfrak{H}$ -open)but not b- $\mathfrak{H}_bO(\mathbb{Z})$ .

**Theorem 2.13.** In  $\Re$ -GTS ( $\mathbb{Z}, \vartheta, \Re$ ), any  $\alpha$ - $\Re$ <sub>b</sub>O( $\mathbb{Z}$ ) is  $\sigma$ - $\Re$ <sub>b</sub>O( $\mathbb{Z}$ ). **Proof.** Consider a subset  $\mathscr{B}$  of  $\Re$ -GTS ( $\mathbb{Z}, \vartheta, \Re$ ) is  $\alpha$ - $\Re$ <sub>b</sub>O( $\mathbb{Z}$ ). Then,  $\mathscr{B}\subseteq i_{\vartheta}c_{\mathfrak{h}}i_{\vartheta}(\mathscr{B})\subseteq c_{\mathfrak{h}}^{*}i_{\vartheta}(\mathscr{B})$ .Hence  $\sigma$ - $\Re$ <sub>b</sub>O( $\mathbb{Z}$ ).

**Theorem2.14.** In  $\mathfrak{H}$ -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ), any  $\alpha$ - $\mathfrak{H}_bO(\mathbb{Z})$  is  $\pi$ - $\mathfrak{H}_bO(\mathbb{Z})$ . **Proof.** Consider a subset  $\mathscr{B}$  of  $\mathfrak{H}$ -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ) is  $\alpha$ - $\mathfrak{H}_bO(\mathbb{Z})$ . Then,  $\mathscr{B}\subseteq i\mathfrak{s}_b i\mathfrak{s}(\mathscr{B})\subseteq i\mathfrak{s}_b^*(\mathscr{B})$ . Hence  $\pi$ - $\mathfrak{H}_bO(\mathbb{Z})$ .

**Theorem 2.15.** A subset  $\mathscr{B}$  of a  $\mathfrak{H}$  -GTS ( $\mathbb{Z}, \mathfrak{H}, \mathfrak{H}$ ), the following results are equivalent.

1. α-ℋ₀O(ℤ)

2.  $\sigma$ - $\mathfrak{H}_{b}O(\mathbb{Z})$  and  $\pi$ - $\mathfrak{H}_{b}O(\mathbb{Z})$ .

**Proof.** (1) $\Rightarrow$ (2). Consider  $\beta$  - $\Re_bO(\mathbb{Z})$ . Then by Theorem 2.12 and 2.13,  $\sigma$ - $\Re_bO(\mathbb{Z})$  and  $\pi$ - $\Re_bO(\mathbb{Z})$ .

(2) $\Rightarrow$ (1).Consider  $\mathscr{B}$  is both  $\sigma$ - $\mathfrak{H}_bO(\mathbb{Z})$  and  $\pi$ - $\mathfrak{H}_bO(\mathbb{Z})$ .Then  $\mathscr{B}\subseteq \mathfrak{i}\circ c_b^*(\mathscr{B})\subseteq \mathfrak{i}\circ c_b^*\mathfrak{i}\circ(\mathscr{B})\subseteq \mathfrak{i}\circ c_b^*\mathfrak{i}\circ(\mathscr{B})$ .Hence  $\alpha$ - $\mathfrak{H}_bO(\mathbb{Z})$ .

**Example2.16.** Consider  $\mathbb{Z} = \{1, 2, 3, 4, 5\}, \mathfrak{H} = \{\emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{1, 2, 3\},$ 

Then  $\mathscr{B}=\{1\},\{5\}\}$  is  $\sigma-\mathfrak{H}_bO(\mathbb{Z})$  but not  $\alpha-\mathfrak{H}_bO(\mathbb{Z})$ .

**Example2.17.** Consider  $\mathbb{Z} = \{1, 2, 3, 4\}, \ \Im = \{\emptyset, \{1, 3\}, \{4\}, \{1, 3, 4\}, \mathbb{Z}\}, \ \Re = \{\emptyset, \{3\}\}.$  Then  $\mathscr{B} = \{1, 2, 4\}$  is  $\pi - \Re_b O(\mathbb{Z})$  but not  $\alpha - \Re_b O(\mathbb{Z})$ .

**Remark 2.18.** Thenotions of  $\sigma - \mathfrak{H}_b O(\mathbb{Z})$  and  $\pi - \mathfrak{H}_b O(\mathbb{Z})$  are independent. **Example 2.19.** Consider  $\mathbb{Z} = \{1, 2, 3, 4, 5\} \Rightarrow = \{\emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{1, 2, 3\}, \{1, 3, 4\}, \{2, 3, 4\}, \{1, 2, 3, 4\}\},$   $\mathfrak{H} = \{\emptyset, \{1\}\}.$ Then  $\mathscr{B} = \{1, 3\}$  is  $\sigma - \mathfrak{H}_b O(\mathbb{Z})$  but not  $\pi - \mathfrak{H}_b O(\mathbb{Z})$ .

**Example2.20.**Consider $\mathbb{Z}=\{1,2,3,4\}$  = { $\emptyset$ , {1,3}, {4}, {1,3,4},  $\mathbb{Z}$ },  $\Re=\{\emptyset, \{3\}\}$ . Then  $\mathscr{B}=\{1,3,4\}$  is  $\pi$ - $\Re_bO(\mathbb{Z})$  but not  $\sigma$ - $\Re_bO(\mathbb{Z})$ .

**Theorem2.21.**Any  $\pi$  - $\mathfrak{H}_bO(\mathbb{Z})$  set is β- $\mathfrak{H}_bO(\mathbb{Z})$  but not conversely.

**Proof.** Consider a subset  $\mathscr{B}$  of  $\mathfrak{H}$ -GTS ( $\mathbb{Z}, \vartheta, \mathfrak{H}$ ) is  $\pi$ - $\mathfrak{H}_bO(\mathbb{Z})$ . Then  $\mathscr{B}\subseteq \mathfrak{i}\mathfrak{sc}_b^*(\mathscr{B})$ .Now, $\mathscr{B}\subseteq \mathfrak{i}\mathfrak{sc}_b(\mathscr{B})\subseteq\mathfrak{s}\mathfrak{i}\mathfrak{sc}_b^*(\mathscr{B})$ .Hence  $\beta$ - $\mathfrak{H}_bO(\mathbb{Z})$ set.

**Theorem2.22.**If a subset ℬ of ℜ -GTS (ℤ, ℕ, ℜ) is both σ -ℜt<sub>b</sub>O(ℤ) and ℕσ-open, thenβ-ℜt<sub>b</sub>O(ℤ). **Proof.** Consider a subset ℬ of ℜt-GTS (ℤ, ℕ, ℜt) is both σ - ℜt<sub>b</sub>O(ℤ) and ℕ-σ-open. Then, ℬ⊆ c<sub>b</sub> i<sub>ℕ</sub>(ℬ)⊆c<sup>\*</sup><sub>b</sub>(ℬ) which implisec<sub>ℕ</sub> i<sub>ℕ</sub>(ℬ)⊆c<sub>ℕ</sub> i<sub>ℕ</sub>c<sup>\*</sup><sub>b</sub>(ℬ), so ℬ⊆c<sub>ℕ</sub> i<sub>ℕ</sub>c<sup>\*</sup><sub>b</sub>(ℬ) sinceℬisℕ-σ-open. Hence β-ℜt<sub>b</sub>O(ℤ). **Theorem2.23.**If ℬ⊂ℤis both b - ℜt<sub>b</sub>O(ℤ) and ℕ-σ-open, then it is β - ℜt-open.

**Proof.** Let  $\mathscr{B}$  is both b- $\mathfrak{H}_bO(\mathbb{Z})$  and  $\vartheta$ - $\sigma$ -open. Then  $\mathscr{B}\subseteq i_{\vartheta}c_b^*(\mathscr{B})\cup c_b^*i_{\vartheta}(\mathscr{B})$  and

 $\mathscr{B}\subseteq c_{\mathfrak{s}}i_{\mathfrak{s}}(\mathscr{B}).Now \mathscr{B}\subseteq i_{\mathfrak{s}}c_{\mathfrak{b}}^{*}(\mathscr{B})\cup c_{\mathfrak{b}}i_{\mathfrak{s}}(\mathscr{B})\subseteq c_{\mathfrak{b}}^{*}(\mathscr{B}), which implies$ 

 $\mathfrak{sis}(\mathscr{B}) \subseteq \mathfrak{csisc}^*_{\mathsf{b}}(\mathscr{B}) \subseteq \mathfrak{csisc}^*_{\mathfrak{S}}(\mathscr{B})$ So  $\mathscr{B} \subseteq \mathfrak{csis}(\mathscr{B}) \subseteq \mathfrak{csisc}(\mathscr{B})$ . Hence  $\mathscr{B}\mathfrak{i}\beta$ - $\mathfrak{R}$ -open.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Ramesh and Uma

**Theorem 2.24.** If  $\mathscr{B} \subset \mathbb{Z}$  is both b-9tbO( $\mathbb{Z}$ ) and 9-σ-open, then it is 9-β-open. **Proof.** Let  $\mathscr{B}$  is both b-9tbO( $\mathbb{Z}$ )and 9-σ-open. Then  $\mathscr{B} \subseteq i \Im cb*(\mathscr{B}) \cup c*bi\Im(\mathscr{B})$ and  $\mathscr{B} \subseteq c\Imi\Im(\mathscr{B}).$ Now  $\mathscr{B} \subseteq i \Im cb*(\mathscr{B}) \cup c*bi\Im(\mathscr{B}) \subseteq cb*(\mathscr{B}),$ which implies  $c\Imi\Im(\mathscr{B}) \subseteq c\Imi\Im(c)$  ( $\mathscr{B}$ )  $\subseteq c\Imi\Im(c)*(\mathscr{B}) \subseteq c\Imi\Im(c)*(\mathscr{B})$ . Hence  $\mathscr{B}$ is 9-β-open.

**Theorem 2.25.** If  $\mathscr{B}\subset\mathbb{Z}$  is both b- $\mathfrak{H}_bO(\mathbb{Z})$  and  $\vartheta^*$ -closed, then it is  $\sigma$ -  $\mathfrak{H}_bO(\mathbb{Z})$ .

**Proof.** Let  $\mathscr{B}$  is both b- $\mathfrak{H}_bO(\mathbb{Z})$  and  $\mathfrak{H}^*$ -closed. Then  $\mathscr{B}\subseteq \mathfrak{i}\mathfrak{s}\mathfrak{c}^*_b(\mathscr{B})\cup\mathfrak{c}_b\mathfrak{i}\mathfrak{s}(\mathscr{B})$  and  $\mathfrak{c}_b(\mathscr{B})\subseteq \mathscr{B}$ . Now

 $\mathscr{B} \subseteq \mathfrak{i} \circ c_b^*(\mathscr{B}) \cup c_b^* \mathfrak{i} \circ (\mathscr{B}) \subseteq c_b^* \mathfrak{i} \circ (\mathscr{B}) \cup \mathfrak{i} \circ (\mathscr{B}) = c_b^* \mathfrak{i} \circ (\mathscr{B}) \subseteq c_{\mathfrak{S}}^* \mathfrak{i} \circ (\mathscr{B}). \text{ Hence } \mathscr{B} \operatorname{is} \sigma \operatorname{H}_b O(\mathbb{Z}).$ 

**Theorem 2.26.** If  $\mathscr{B}\subset\mathbb{Z}$  is both b- $\mathfrak{H}bO(\mathbb{Z})$  and b $\vartheta$ \*-closed, then it is  $\sigma$ - $\mathfrak{H}bO(\mathbb{Z})$ .

**Proof.** Let  $\mathscr{B}$  is both b- $\Re$  bO( $\mathbb{Z}$ )and b $\Re$ -closed. Then  $\mathscr{B}\subseteq i\Re cb*(\mathscr{B})\cup c*bi\Re(\mathscr{B})$  and  $c*b(\mathscr{B})\subseteq \mathscr{B}$ , which implies  $i\Re cb*(\mathscr{B})\subseteq i\Re(\mathscr{B})$ .Now  $\mathscr{B}\subseteq i\Re cb*(\mathscr{B})\cup cb*i\Re(\mathscr{B})\subseteq c*bi\Re(\mathscr{B})\cup i\Re(\mathscr{B})\subseteq c\Re i\Re(\mathscr{B})$ .Hence  $\sigma$ - $\Re$ bO( $\mathbb{Z}$ ). Theorem 2.27.If  $\mathscr{B}\subset\mathbb{Z}$  is b -  $\Re$ bO( $\mathbb{Z}$ ) such that  $i\Re(\mathscr{B}) = \emptyset$ , then it is  $\pi$  -  $\Re$ -open.

**Proof.** Let  $\mathscr{B}$  be a b- $\mathfrak{H}$  bO( $\mathbb{Z}$ )and i $\mathfrak{H}(\mathscr{B})=\emptyset$ . Then  $\mathscr{B}\subseteq i\mathfrak{H}c\mathfrak{b}*(\mathscr{B})\cup c\mathfrak{b}*i\mathfrak{H}(\mathscr{B})=i\mathfrak{H}c\mathfrak{b}*(\mathscr{B})\subseteq i\mathfrak{H}c\mathfrak{H}*(\mathscr{B})$ . Hence  $\pi$ - $\mathfrak{H}$ -open.

Decomposition of  $(\alpha \mathfrak{Hb}, \vartheta)$ -Continuity

**Definition 3.1.** A map  $j:(\mathbb{Z}, \vartheta, \mathfrak{H}) \rightarrow (W, \delta)$  is $(\alpha \mathfrak{H}b, \delta)$ -continuous  $((\alpha \mathfrak{H}b, \vartheta)$ -C), if j=1(V) is  $\alpha$ - $\mathfrak{H}bO(\mathbb{Z})$  for each  $\delta O(\mathbb{Z})$  set V in  $(W, \delta)$ .

**Definition 3.2.** A map  $j:(\mathbb{Z},\vartheta,\mathfrak{H})\to(W,\delta)$  is $(\sigma\mathfrak{H}b,\delta)$ -continuous  $((\sigma\mathfrak{H}b,\vartheta)-C)$ ,ifj-1(V) is  $\sigma$ - $\mathfrak{H}bO(\mathbb{Z})$  foreach  $\delta O(\mathbb{Z})$  set V in  $(W,\delta)$ .

**Definition 3.3.** A map  $j:(\mathbb{Z},\vartheta,\vartheta t) \rightarrow (W,\delta)$  is $(\pi \vartheta tb, \delta)$ -continuous  $((\pi \vartheta tb, \vartheta) - C)$ , if j-1(V) is  $\pi-\vartheta tbO(\mathbb{Z})$  for each  $\delta O(\mathbb{Z})$  set V in  $(W,\delta)$ .

**Theorem 3.4**. For a map  $j:(\mathbb{Z}, \vartheta, \mathfrak{H}) \rightarrow (W, \delta)$  the following results are equivalent.

jis( $\alpha$  H<sub>b</sub>, θ)-C. j is( $\sigma$  H<sub>b</sub>, θ)-Cand( $\pi$  H<sub>b</sub>, θ)-C.

**PROOF** Proof is trivial from Theorem2.17.

# CONCLUSION

In this paper, we introduced  $\alpha$ - $\Re$ bO( $\mathbb{Z}$ ),  $\sigma$ - $\Re$ bO( $\mathbb{Z}$ ),  $\pi$ - $\Re$ bO( $\mathbb{Z}$ ), $\beta$ - $\Re$ bO( $\mathbb{Z}$ ),andb- $\Re$ bO( $\mathbb{Z}$ ) sets and obtained decomposition of ( $\alpha$  $\Re$ b,  $\vartheta$ ) - C. In future work we will introduce new types of generalized open sets related to these sets and obtain new decomposition of ( $\vartheta$ , $\vartheta$ )-C.

# ABSTRACT

The aggregation operators of dombi have some great effectiveness and flexibility to work with multi criteria decision making problems. By applying this concept, we have established fermatean neutrosophic dombi fuzzy graphs, an extension of Pythagorean neutrosophic dombi fuzzy graphs and pythogorean dombi fuzzy graphs. As well, we define semi- strong, strong and boxdot and modular product of fermatean neutrosophic dombi fuzzy graphs. Likewise, we explored proposition with suitable illustrations with graphs.

**Keywords:** Dombi fuzzy graph, neutrosophic dombi fuzzy graph, neutrosophic fuzzy edge graph, fermatean neutrosophic dombi fuzzy graph, fermatean neutrosophic fuzzy edge graph.

# INTRODUCTION

The fuzzy logic is upgrade to classical logic. It has varying grade of membership. Fuzzy set was introduced by zadeh[18] in 1965.Atanassov (1983)[5] and (1989) has explored the idea of intuitionistic fuzzy set, in this set each element has membership and non-membership function. Smarandache (2005)[15] has presented the main concept of neutrosophic set, by an extension of the IFS. Each element of neutrosophic set has three membership grade of truth, indeterminacy and falsehood. Mohana, R.Jansi and F.Smarandache[16] introduced pythogorean neutrosophic set, based on the total squares of membership, indeterminacy and falsehood lies between 0 and 2. C.Antony and jansi[16]defined the sum of cubes of three membership functions lies between 0 and 2 is fermatean neutrosophic sets. A graph is made up of nodes and arcs. The main concept of classical graph theory is based on crisp logic / set which was proposed by cantor. The aim of fuzzy graph has been first time presented by Kaufmann(1975)[10] based on

### Sasikala and Divya

fuzzy relation. Atanassov(1983)[14] has described the concept of IF graphs. Ghori and paul (2017)[8] introduced neutrosophic graphs. The concept of fuzzy graph was advanced to neutrosophic fuzzy graphs was introduced by S.Naz and S.Ashraf[12]. The Dombi operator with relevant parameter was inaugurated by Dombi[7] in 1982, and the concept of the Dombi fuzzy graph was developed by Ashraf et al. (2018)[4]. The dombi operator is crucial in simulating and resolving numerous problems encountered in everyday life. In order to take use of this advantage, Mijanur Rahman Seikh and Utpal Mandal(2021)[11] applied dombi operations to intuitionistic fuzzy graphs and created a multiple attribute group decision-making problem. The neutrosophic dombi graph was invented and refined by Tejindarsingh lakhwani, Karthick[16].In addition to proposing Pythogorean neutrosophic fuzzygraphs using the dombi operator, Ajay et al.[1] presented an innovative concept of pythogorean neutrosophic fuzzy graph.

In this research, we introduced a new emergent notion of fermatean neutrosophic dombi fuzzy graph using dombi operator. The primary consideration, In Section2, we developed and remembered the fundamental concepts and notions used in this part. In Section 3, we described the new concepts and products of fermatean neutrosophic dombi fuzzy graphs and establish their proposition with relatable illustration and graphs.

#### Preliminaries

#### Definition

Let  $\vartheta_D$  be a non-empty set. A fuzzy set  $A^{\mu}$  in  $\vartheta_D$  is distinguished by its membership function  $\alpha_{\mu_D}(\vartheta_D)$ : $\rightarrow$ [0,1] and  $\mu_D(n)$  is interpreted as the degree of member of element  $n^{\mu}$  in a fuzzy set  $N^{\mu}$ , for each  $n^{\mu} \in \vartheta_D$ . It is clear that  $N^{\mu}$  is determined by the set of tuples of  $N^{\mu} = \{(n^{\mu}, \alpha_{\mu_D}(\vartheta_D), n^{\mu} \in \vartheta_D\}$ .

#### Definition

An intuitionistic fuzzy set (briefly IFS)  $N^{\mu}$  is an object of having the form  $A^{\mu} = \{ n\mu^*, \alpha_{\mu_D}(\vartheta_D), \beta_{\mu_D}(\vartheta_D) > : n^{\mu} \in R_{N^{\mu}} \}$ where the functions  $\alpha_{\mu_D}(\vartheta_D) : \rightarrow [0,1]$  and  $\beta_{\mu_D}(\vartheta_D) : \rightarrow [0,1]$  denote the degree of membership and the degree nonmembership of each element  $n^{\mu} \in \vartheta_D$  to the set  $G^*$  respectively, and  $0 \le \alpha_{\mu_D}(\vartheta_D) + \beta_{\mu_D}(\vartheta_D) \le 1$  for each  $n^{\mu} \in \vartheta_D$ . Denote by IFS( $R_{N^{\mu}}$ ), The set of all intuitionistic fuzzy sets in  $\vartheta_D$ . An intuitionistic fuzzy set  $G^*$  in  $\vartheta_D$  is simply denoted by  $N^{\mu} = \langle n^{\mu}, \alpha_{\mu_D}(\vartheta_D), \beta_{\mu_D}(\vartheta_D) \rangle$  instead of denoting  $A^{\mu} = \{ (n^{\mu}, \alpha_{\mu_D}(\vartheta_D), \beta_{\mu_D}(\vartheta_D) ) : n^{\mu} \in \vartheta_D \}$ .

#### Definition

Let  $\vartheta_D$  be a non-empty set. A Neutrosophic set (NS)  $A^{\mu}$  in  $\vartheta_D$  is characterized by a truth-membership function $\alpha_{\mu_D}$ , an indeterminacy-membership function $\beta_{\mu_D}$ , and a falsity - membership function $\gamma_{\mu_D}$  is  $\alpha_{\mu_D}(\vartheta_D)$ ,  $\beta_{\mu_D}(\vartheta_D)$ ,  $\gamma_{\mu_D}(\vartheta_D)$  are real or non-standard subsets of  $] 0^-$ , 1<sup>+</sup>[on  $\vartheta_D$ .

i.e.) $\alpha_{\mu_D}(\vartheta_D):\vartheta_D \to ]0^-, 1^+[ ; \beta_{\mu_D}(\vartheta_D):\vartheta_D \to ]0^-, 1^+[ ; \gamma_{\mu_D}(\vartheta_D):\vartheta_D \to ]0^-, 1^+[$ 

#### Definition

A fuzzy graph of the graph  $D^* = (\varphi_D, \varsigma_D)$  is a pair of  $D = (\mu_D, \nu_D)$ , Where  $\mu_D \to [0,1]$  is a fuzzy set on  $\varphi_D$  and  $\nu_D: \varphi_D X \varphi_D \to [0,1]$  is a fuzzy relation on  $\varphi_D$  such that  $\nu_D(n,t) \le \mu_D(n) \land \mu_D(t), \forall (n,t) \in \varphi_D X \varphi_D$ .

#### Definition

A binary function  $\mathfrak{T}:[0,1]X[0,1] \rightarrow [0,1]$  is known as triangular norm (t-norm) if for all  $n,t,s \in [0,1]$ , it satisfied the following conditions

- 1. (Neutral property or boundary condition)  $\Re(n,1) = n$
- 2. (commutativity)  $\Re(n,t) = \Re(t,n)$
- 3. (associativity)  $\mathfrak{F}(n_1(t,s)) = \mathfrak{F}((n_1,t),s)$
- 4. (monotonicity)  $\mathfrak{T}(n,t) \leq \mathfrak{T}(s,d)$  if  $n \leq s$  and  $t \leq d$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Definition

Abinary function  $\mathcal{M}:[0,1]X[0,1] \rightarrow [0,1]$  is known as triangular conorm (t-conorm) if and only if there exists a t-norm  $\mathcal{F}$  for all  $\mathcal{F}(n,t) \in [0,1]X[0,1]$ ;  $\mathcal{M}(n,t)=1-\mathcal{F}(1-n,1-t)$ 

Preferred options for t-norms are:

- The minimum operator  $\mathcal{M}(n,t)=MIN(n,t)$
- The product operator  $\mathcal{P}(n,t)=nt$
- The dombi's t-norm,  $\frac{1}{1+\left(\left[\left(\frac{1-n}{n}\right)\right]^{\delta}+\left[\left(\frac{1-t}{t}\right)\right]^{\delta}\right)^{\frac{1}{\delta}}}$  ,  $\delta > 0$

Preferred options for related t-conorms are:

- The maximum operator  $\mathcal{M}^*(n,t)$ =MAX (n,t)
- The Probabilistic sum  $P^*(n,t) = n+t-nt$
- The Dombi's t-conorm  $\frac{1}{1+\left(\left[\left(\frac{1-n}{n}\right)\right]^{-\delta}+\left[\left(\frac{1-t}{t}\right)\right]^{-\delta}\right)-\frac{1}{\delta}}$ ,  $\delta > 0$  One more pair of  $\mathcal{F}$ -operator is  $\mathcal{F}(n,t)=\frac{nt}{n+t-nt}$

 $\mathcal{P}(n,t) = \frac{n+t-2nt}{1-nt}, \text{which is obtained by substituting } \delta = 1 \text{ in dombi's t-norm and t-conorm. Also } \mathcal{P}(n,t) \leq \frac{nt}{n+t-nt} \leq \mathcal{M}(n,t) \text{ and } \mathcal{M}^*(n,t) \leq \frac{n+t-2nt}{1-nt} \leq \mathbb{P}^*(n,t).$ 

### Definition

A dombi fuzzy graph with a countable set  $\varphi_D$  as the elementary set is a pair  $D=(\mu_D, \nu_D)$ , where  $\mu_D \rightarrow [0,1]$  is a symmetric fuzzy on  $\varphi_D$  such that  $\zeta_D(nt) \leq \frac{\varphi_D(n)\varphi_D(t)}{\varphi_D(n)+\varphi_D(t)-\varphi_D(n)\varphi_D(t)}, \forall n, t \in \varphi_D$ .

### Definition

Let  $D^* = (\varphi_D, \varsigma_D)$  be a crisp undirected graph contain no self loop and parallel edges. Let  $\mu_D = (\alpha_{\mu_D}, \beta_{\mu_D}, \gamma_{\mu_D})$  such that  $\alpha_{\mu_D} : \vartheta_D \to [0,1], \beta_{\mu_D} : \vartheta_D \to [0,1], \gamma_{\mu_D} : \vartheta_D \to [0,1], \beta_{\nu_D} : \vartheta_D \to [0,1], \gamma_{\nu_D} : \vartheta_D \to [0,1]$ . Here  $\alpha_{\mu_D}, \alpha_{\nu_D} \to [0,1], \gamma_{\nu_D} : \vartheta_D \to [0,1], \gamma_{\nu_D} : \vartheta_D \to [0,1]$ . Here  $\alpha_{\mu_D}, \alpha_{\nu_D} \to [0,1], \gamma_{\nu_D} : \vartheta_D \to [0,1], \gamma_D : \vartheta_D \to [$ 

$$\begin{aligned} \alpha_{\varsigma_{D}}\left(nt\right) &\leq \frac{\alpha_{\varphi_{D}}(n)\alpha_{\varphi_{D}}(t)}{\alpha_{\varphi_{D}}(t) + \alpha_{\varphi_{D}}(t) - \alpha_{\varphi_{D}}(n)\alpha_{\varphi_{D}}(t)}, \forall nt \in \varsigma_{D} \\ \beta_{\varsigma_{D}}\left(nt\right) &\leq \frac{\beta_{\mu_{D}}\left(n\right)\beta_{\mu_{D}}\left(t\right)}{\beta_{\mu_{D}}\left(n\right) + \beta_{\mu_{D}}\left(t\right) - \beta_{\mu_{D}}\left(n\right)\beta_{\mu_{D}}\left(t\right)}, \forall nt \in \varsigma_{D} \\ \gamma_{\varsigma_{D}}\left(nt\right) &\leq \frac{\gamma_{\nu_{D}}(n) + \gamma_{\nu_{D}}(t) - 2\gamma_{\nu_{D}}(n)\gamma_{\nu_{D}}(t)}{1 - \gamma_{\nu_{D}}(n)\gamma_{\nu_{D}}(t)}, \forall nt \in \varsigma_{D} \end{aligned}$$

#### Definition

A fermatean neutrosophic dombi fuzzy graph is defined [its indicated by *FNDFG*] with a finite elementary set  $\vartheta_D$  of its order pair  $D = (\varphi_D, \varsigma_D)$  where  $\varphi_D : \vartheta_D \to [0,1]$ . Here we consider,  $\mu_D = (\alpha_{\varphi_D}, \beta_{\mu_D}, \gamma_{\nu_D})$  such that  $\alpha_{\varphi_D} : \vartheta_D \to [0,1]$ ,  $\beta_{\mu_D} : \vartheta_D \to [0,1]$ ,  $\gamma_{\nu_D} : \vartheta_D \to [0,1]$ ,  $\gamma_{\nu_D} : \vartheta_D \to [0,1]$ . Here  $\alpha_{\mu_D}, \alpha_{\nu_D} \to [0,1]$ ,  $\alpha_{\nu_D} \to [0,1]$ ,  $\beta_{\mu_D} : \vartheta_D \to [0,1]$ ,  $\gamma_{\nu_D} : \vartheta_D \to [0,1]$ . Here  $\alpha_{\mu_D}, \alpha_{\nu_D} \to The$  membership function,  $\beta_{\mu_D}, \beta_{\nu_D} \to The$  indeterminacy function,  $\gamma_{\mu_D}, \gamma_{\nu_D} \to The$  falsity function in the Fermatean neutrosophic dombi fuzzy graph,  $d = (\varphi_D, \mu_D, \nu_D)$ 

$$\begin{aligned} \alpha_{\varsigma_{D}}(nt) &\leq \frac{\alpha_{\varphi_{D}}(n) + \alpha_{\varphi_{D}}(t) - \alpha_{\varphi_{D}}(n) + \alpha_{\varphi_{D}}(t) - \alpha_{\varphi_{D}}(n) + \alpha_{\varphi_{D}}(t)}{\beta_{\varphi_{D}}(n) + \beta_{\mu_{D}}(t) - \beta_{\mu_{D}}(n) + \beta_{\mu_{D}}(t)}, \forall nt \in \varsigma_{D} \\ \beta_{\varsigma_{D}}(nt) &\leq \frac{\gamma_{\nu_{D}}(n) + \gamma_{\nu_{D}}(t) - \beta_{\mu_{D}}(n) + \beta_{\mu_{D}}(t)}{1 - \gamma_{\nu_{D}}(n) + \gamma_{\nu_{D}}(t)}, \forall nt \in \varsigma_{D} \\ \gamma_{\varsigma_{D}}(nt) &\leq \frac{\alpha_{\nu_{D}}^{3}(nt) + \beta_{\nu_{D}}^{3}(nt) + \gamma_{\nu_{D}}^{3}(nt)}{1 - \gamma_{\nu_{D}}(n) + \gamma_{\nu_{D}}^{3}(nt)} \leq 2; 0 \leq \alpha_{\nu_{D}}^{3}(nt) + \gamma_{\nu_{D}}^{3}(nt) \leq 1; 0 \leq \beta_{\nu_{D}}^{3}(nt) \leq 1. \end{aligned}$$

### Example

Consider two neutrosophicdombi fuzzy graphs  $d = (\phi_D, \mu_D, \nu_D)$  and  $F = (\phi_F, \mu_F, \nu_F)$ . Here  $\phi_D = \{a, b\}, \phi_F = \{x, y, z\}, \zeta_D = \{a, b\}, \phi_F =$  $\{ab\}, \varsigma_F = \{xy, yz\}$  where  $\varphi_D = \left\{\frac{a}{(0.5, 0.7, 0.9)}, \frac{b}{(0.7, 0.6, 0.8)}\right\} \varsigma_D =$  $\left\{\frac{ab}{(0.4,0.4,0.9)}\right\}, \varphi_F = \left\{\frac{x}{(0.5,0.7,0.8)}, \frac{y}{(0.9,0.7,0.6)}, \frac{z}{(0.6,0.7,0.8)}\right\}, \ \zeta_F = \left\{\frac{xy}{(0.4,0.5,0.8)}, \frac{yz}{(0.5,0.5,0.8)}\right\}.$  Then we have  $(\varphi_D \cdot \varphi_F)(a,b) = (0.4, 0.4, 0.9), (\varphi_D \cdot \varphi_F)(x, y) = (0.4, 0.5, 0.8), (\varphi_D \cdot \varphi_F)(y, z) = (0.5, 0.5, 0.8), (\varphi_D \cdot \varphi_F)(a, x) = (0.3, 0.5, 0.9), (\varphi_D \cdot \varphi_F)(y, z) = (0.4, 0.4, 0.9), (\varphi_D \cdot \varphi_F$  $(\varphi_D \cdot \varphi_F)(b,x) = (0.4, 0.4, 0.8), (\varphi_D \cdot \varphi_F)(b,y) = (0.6, 0.8, 0.8), (\varphi_D \cdot \varphi_F)(b,y) = (0.6, 0.8$  $\varphi_F$ )(a,y)=(0.4,0.5,0.9),( $\varphi_D \cdot \varphi_F$ )(a,z)=(0.3,0.5,0.9)  $\varphi_F)(b,z) = (0.4, 0.4, 0.9)(\varsigma_D \bullet \varsigma_F)(a, x)(b, y) = (0.21, 0.25, 0.85), (\varsigma_D \bullet \varsigma_F)(a, y)(b, z) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(a, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(b, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(b, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(b, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(b, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, x)(b, y) = (0.21, 0.25, 0.84), (\varsigma_D \bullet \varsigma_F)(b, y) = (0.21, 0.25, 0.25, 0.25), (\varsigma_$  $(0.21, 0.28, 0.85), (\zeta_D \cdot \zeta_F)(b, y)(a, z) = ((0.21, 0.28, 0.85)).$ 

#### Theorem

Let  $D^*$  and  $F^*$  be the fermatean neutrosophic dombi fuzzy graphs of the graphs D and F, respectively. The semistrong product  $D \cdot F$  of  $D^*$  and  $F^*$  is the fermatean neutrosophic dombi fuzzy edge graph of  $D \cdot F$ .

# Proof:

Let D and F be the fermatean neutrosophic dombi fuzzy graphs  $D = (\phi_{D_1} \mu_D \nu_D)$  and  $F = (\phi_F, \mu_F, \nu_F)$  respectively. Consider, i) For all  $n \in \zeta_D, n_2 t_2 \in \zeta_F$  such that  $(\varsigma_D \bullet \varsigma_F)(n, n_2)(n, t_2) = \mathsf{T}[\varphi_D(n), \varsigma_F(n_2 t_2)] = \mathsf{T}[\mathsf{1}, \varsigma_F(n_2 t_2)](\varsigma_D \bullet \varsigma_F)(n, n_2)(n, t_2)$

### Corollary

The strong product of two fermatean neutrosophic dombi fuzzy graph is not necessarily to a to a fermatean neutrosophic dombi fuzzy graph. ( $\varsigma_D \boxplus \varsigma_F$ )(a, z)(b, y) = (0.33,0.4,0.6).Edge product of (a, z) and (b, y) is( $\varsigma_D \boxplus s_F$ )(a, z)(b, y) = (0.33,0.4,0.6).Edge product of (a, z) and (b, y) is( $\varsigma_D \boxplus s_F$ )(a, z)(b, y) = (0.33,0.4,0.6).Edge product of (a, z) and (b, y) is( $\varsigma_D \boxplus s_F$ )(a, z)(a, z)(b, y) = (0.33,0.4,0.6).Edge product of (a, z) and (b, y) is( $\varsigma_D \boxplus s_F$ )(a, z)(a, $\varsigma_F(a, z)(b, y) = (0.35, 0.33, 0.9) \quad (0.35, 0.33, 0.9) \leq (0.33, 0.4, 0.6)$ 

### Theorem

Let  $D^*$  and  $F^*$  be the fermatean neutrosophic dombi fuzzy graphs of the graphs D and F, respectively. The Strong product  $D \boxplus F$  of D<sup>\*</sup> and F<sup>\*</sup> is the fermatean neutrosophic dombi fuzzy edge graph of  $D \boxplus F$ .

# Proof

Let *D* and *F* be the fermate an neutrosophic dombi fuzzy graphs  $D = (\phi_D, \mu_D, v_D)$  and  $F = (\phi_F, \mu_F, v_F)$  respectively. Consider,

### Corollary

The box dot product of two fermate an neutrosophic dombi fuzzy graph is not necessarily to a fermate an neutrosophic dombi fuzzy graph.  $(\varsigma_D \boxdot \varsigma_F)(a, x)(a, y) = (0.20, 0.28, 0.9)$  Edge product of (a, x) and (a, y) is  $(\varsigma_D \boxdot \varsigma_F)(a, x)(a, y) = (0.32, 0.39, 0.62)$ . (0.32, 0.39, 0.62  $\leq$  (0.20, 0.28, 0.9)

#### Theorem

Let D<sup>\*</sup> and  $F^*$  be the fermatean neutrosophic dombi fuzzy graphs of the graphs D and F, respectively. The boxdot product  $D \boxdot F$  of D<sup>\*</sup> and  $F^*$  is the fermatean neutrosophic dombi fuzzy edge graph of  $D \boxdot F$ .

### Proof

Let *D* and *F* be the fermate an neutrosophic dombi fuzzy graphs  $D = (\emptyset_D, \mu_D, \nu_D)$  and  $F = (\emptyset_F, \mu_F, \nu_F)$ respectively. Consider,  $n_1 t_1 \in \varsigma_D, n_2 = t_2$ .  $(\varsigma_D \circ \varsigma_F)[(n_1, n_2)(t_1, t_2)] = T[T(\varphi_F(n_2), \varphi_F(t_2), \varsigma_D(n_1 t_1))] = T[(T(1, 1), \varsigma_{\mu_D}(n_1 t_1)), (T(0, 0), \varsigma_{\nu_F}(n_1 t_1))] = T[(T(1, 0), T(1, 0)), (T(\varsigma_{\mu_D}(n_1 t_1))] = T[(T(1, 1), \varsigma_{\mu_D}(n_1 t_1))]$ 

$$\begin{split} & \left\{ \begin{array}{l} \frac{a_{0}(n_{1})a_{0}r_{0}(n_{2})a_{0}r_{0}(n_{2}))a_{0}r_{0}(n_{2})a_{0}r_{0}(n_{2})a_{0}r_{0}(n_{2}))a_{0}r_{0}(n_{2})a_{0}(n_{2})$$

# CONCLUSION

We have observed the excellent flexibility of dombi operators with operational parameters in graph theoretical concept under fermatean neutrosophic dombi fuzzy environment. In this manuscript, the innovative concept of fermatean neutrosophic dombi fuzzy graph was introduced. As well, we described some different types of fermatean neutrosophic dombi fuzzy graph such as a products of semi-strong, strong, boxdot, modular fermatean neutrosophic dombi fuzzy graphs. Further work will be extended in the future to investigate the operations of isomorphic, homomorphic, complete, complement fermatean neutrosophic dombi fuzzy graphs along with applications and proposition with relatable illustrations.

# ABSTRACT

Matroid theory deals with study of graphs in terms of its edges and circuits. The aim of this paper is to emphasis on the link between fuzzy matroids and fuzzy graphs G<sup>^</sup>. The fuzzy matroids from fuzzy graphs, bases, Circuits, Dual defined and also analysed the properties.

**Keywords:** Fuzzy Graphs, Fuzzy Matroids, Circuits, Bases, Rank Function, Dual, Minor. **AMS Classification:** 05C40, 05C62.

# INTRODUCTION

Graph theory has proven to be the valuable instrument for modeling real-life is- sues. A Graph serves as a means to model the connections within a provided set of objects. Every object is depicted as a vertex, and the interconnections between them are illustrated with edges if the relationship is unordered, or with directed edges if there exists an ordered relationship between the objects. In 1965, L.A. Zadeh introduced a mathematical framework for the notion of uncertainty within real-world issues. Kauffman put forward the initial ideas of fuzzy graphs. A. Rosenfeld employed fuzzy relations in fuzzy graphs to depict the connections be- tween objects, signifying the degree of relationship existing among the elements within the provided set. If a theorem concerning graphs can be articulated using edges and circuits, it is likely to illustrate a broader concept of matroids. A matroid uses the concept of linear independence in vector spaces. Whitney in 1935 presented the concept of matroids. Matroids can be defined in several equiva-lent ways, with the most notable approaches. Matroid theory draws extensively from the terminology of both linear algebra and graph theory. The fuzzy matroids were introduced by Goetschal and Voxman. In this article a fuzzy matroid is con- structed from fuzzy graph.

# The paper is organised as follows:

In section 2 the basic definition for matroids is given and in section 3 the definition of fuzzy matroid, bases, circuits, rank function and dual of fuzzy matroids are defined and analysed.

#### Buvaneswari and Saranya

#### Preliminaries:

**Definition 2.1:** A fuzzy graph is a pair of function  $\mathbf{G} = (\sigma, \mu)$ , where the set V serves as the underlying domain. Here,  $\sigma: V \to [0, 1]$  and  $\mu: V \times V \to [0, 1]$ . Furthermore, a fuzzy subset of a non-empty set S can be described as a mapping where in each element x belonging to S.

Definition 2.2: Let I be a family of be a non-empty family of a finite subset of E and satisfy the following properties:

#### i) *φ ∈ I*.

ii) If  $X \in I, Y \subset X$ , then  $Y \in I$ . iii) If  $X, Y \in I$ ;  $|Y| \ge |X|$  then there exist an element  $x \in Y \setminus X$  such that  $X \cup \{x\} \in I$ . The Pair (E, I) is called a Matroid.

#### **Definition 2.3**

In matroid M a basis (or base) refers to the largest independent set within M, while a circuit of the matroid corresponds to the smallest dependent set in M.

#### **Definition 2.4**

The Rank of a subset E in M is defined as the largest cardinality of an independent set within E, it is denoted as r(X).

#### Definition 2.5

The matroid dual involves a second matroid M \* sharing the same underlying elements as the original matroid M. In this dual matroid, a set is considered independent iff M contains a disjoint basis set from it.

#### **Definition 2.6**

A matroid minor is formed by two operations, the restriction  $M\x$  deletes x from M without changing the independence or rank of the remaining set. The contraction M/x deletes x from M after subtracting one from the rank of every set it belongs to.

#### Properties of Fuzzy Matroids from Fuzzy Matroids:

#### **Definition 3.1**

Let F M = (X, A) is defined as a fuzzy matroid, if it satisfies the following conditions, i)  $\varphi \in A$ ii)  $\Psi i \subset \Psi j$  and  $\Psi j \in A$ , where  $\Psi i \subset \Psi j$ ,  $\Psi i (x) \le \Psi j (x)$  for all  $x \in X$ iii) If  $\Psi i$ ,  $\Psi j \in A$  with  $|\text{supp } (\Psi i)| \le |\text{supp } (\Psi j)|$ , there exists  $\Psi k \in A$  such that

a)  $\Psi i \subset \Psi k \subseteq \Psi i \cup \Psi j$ , where  $(\Psi i \cup \Psi j) x = \max \{\Psi i (x), \Psi j (x)\}$ b)  $m(\Psi k) = \min \{m(\Psi i), m(\Psi j)\}$  where  $m(\Psi i) = \min \{\Psi i (x); x \in \text{supp } (\Psi i)\}; i, j, k = 1, 2, 3.$ 

#### Definition 3.2:

The largest fuzzy subset of X that is independent is referred to as the basis or base of F M.

**Lemma 3.3:** If  $F_B$  and  $F_B'$  are the bases of  $F_M$  then  $|F_B| = |F_B'|$ . *Proof:* Let  $F_M = (X, A)$  and let  $F_B$  and  $F_B' \in B(X)$ . Suppose  $|F_B| > |F_B'|$ . Then  $F_B$  and  $F_B'$  are in  $A.x \in F_B - F_B$  such that  $F_B' - x \in A$ . This contradicts maximal independence. Thus  $|F_B| \leq F_B'$ . Similarly,  $F_B' \leq |F_B|$ . Hence  $|F_B| = |F_B'|$ .

|F<sub>B</sub>'|.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

**Lemma 3.4:** Let  $F_M$  is fuzzy matroid and  $F_B$  be family of its bases. The family  $F_B$  has the following properties

i) F<sub>B</sub>is non empty

ii) If  $F_{Bj}$ ,  $F_{Bj} \in F_B$  and  $x \in F_{Bj} \setminus F_{Bj}$  then there exists  $y \in F_{Bj} \setminus F_{Bj}$  such that  $(F_{Bj} - x) + y \in F_B$ .

**Proof:** By the definition of Fuzzy Matroid A is non-empty then the family of bases  $F_B$  is also non-empty. Consider two bases  $F_B$  and  $F_B'$  and an element  $x \in F_{Bj} \setminus F_{Bj}$  Both  $F_{Bj} - x$  and  $F_{Bj}$  are independent fuzzy subsets and  $|F_{Bj} - x| < |F_{Bj}|$ . Similarly,  $y \in F_{Bj} \setminus F_{Bj} - x$  such that  $(F_{Bj} - x) + y = |F_{Bj}|$ ,  $(F_{Bj} - x) + y$  is abase of  $F_M$ .

Let A be the family of fuzzy subsets of X that contains some members of F B. Then the pair (X, A) is a fuzzy matroid from fuzzy graph G<sup>2</sup> and F B are its bases.

**Proof**. Since  $F_{B \neq \varphi}$  it also holds that  $\varphi = A$ . There are members  $\Psi$  i and  $\Psi$  j of A with  $|\Psi|$  i | & lt;  $|\Psi|$  j | such that for each  $x \in \Psi$  i  $/\Psi$  j. The fuzzy set  $\Psi$  i + x is dependent. By the definition of A, there are bases F B i and F B j such that  $\Psi$  i  $\subseteq$  F B i and  $\Psi$  j  $\subseteq$  F B i. Choose F B j then there is an element x,  $x \in$  F B j  $(\Psi i \cup$  F B i), then  $y \in$  F B i  $\setminus$  F B j by Lemma 3.5 (F B j - x)+ y  $\in$  F B. Since

Since,  $|(F_{Bj} - x) + y \setminus \psi_j \cup F_{Bi}| < |F_{Bj} \setminus (\psi_j \cup F_{Bi})|$ 

This contradicts the choice of F B j. The choice of  $\Psi$  i and  $\Psi$  j implies that  $\Psi$  j \F B i =  $\Psi$  j \ $\Psi$  i. Then F B j – F B i =  $\Psi$  j –  $\Psi$  i. To show that F B i \ ( $\Psi$  j  $\cup \Psi$  i) is empty. If not x  $\in$  F B i \ ( $\Psi$  i  $\cup \Psi$  j). By Lemma 3.5 there exist y  $\in$  F B j \F B i such that (F B i – x) + y  $\in$  F B. Clearly,  $\Psi$  i + y  $\subseteq$  (F B i – x)  $\cup$  y is a contradiction. Since y  $\in \Psi$  j \ $\Psi$  j.

**Definition 3.7:** The smallest fuzzy subset of X that is dependent is known as the circuits of F M. **Theorem 3.8:** The family F C of F M from G<sup>\*</sup> has the following properties i)  $\varphi \in / F C$ . ii) If F C 1, F C 2  $\in$  F C and F C 1  $\subseteq$  F C 2 then F C 1 = F C 2. iii) If F C 1, F C 2  $\in$  F C, F C 1/= F C 2 and x  $\in$  F C 1  $\cap$ F C 2, then there exists F C 3  $\in$  F C such that F C 3  $\subseteq$  (F C 1  $\cup$  F C 2) – x.

**Proof.** (i) and (ii) follows the definition of the circuit. Assume (F C  $1 \cup$  F C 2) – x doesnot contain any circuit and it is independent. By (ii), there is an element  $y \in$  F C 2 - F C 1 and F C 2 - y is independent. Let A be a maximal independent fuzzy subset of (F C  $1 \cup$  F C 2) containing F C 2 - y. Clearly  $y \in$ /A, there exist  $z \in$  F

C 1 \A 1 since A Ç F C. The elements y and z are distinct.  $|A| \le |(Fc_1 \cup Fc_2) \setminus y, z| = |(Fc_1 \cup Fc_2) - 2 < |(Fc_1 \cup Fc_2) - x|$ 

Applying the property (iii) of Fuzzy Matroid to the fuzzy independent sets A and (F C  $1 \cup$  F C 2) – x; the resulting fuzzy independent set contradicts the maximality of A.

**Definition 3.9**: The Rank of F M is defined as the largest fuzzy subset of X that is independent. **Theorem 3.10:** Let F M on a set X, then the rank function F r has the following properties i)  $0 \le F r (\Psi i) \le |X|$  for every  $\Psi i \in X$ ii) F r  $(\Psi i) \le F r (\Psi j)$  for every  $\Psi j \subseteq \Psi j$ , and iii) F r  $(\Psi i \cup \Psi j) + F r (\Psi i \cap \Psi j) \le F r (\Psi i) + F r (\Psi j)$  for every  $\Psi i, \Psi j \subseteq X$ .

**Proof.** (i) and (ii) follows the definition of the rank function. consider the fuzzy subsets  $\Psi$  i and  $\Psi$  j of X. Let S  $\cap$  be the inclusion wise maximal independent fuzzy subset of  $\Psi$  i  $\cap$   $\Psi$  j and S  $\cup$  be the inclusion wise maximal

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Buvaneswari and Saranya

independent fuzzy subset of  $\Psi i \cup \Psi j$  such that  $S \cap \subseteq S \cup S' \cup \cap \Psi i$  and  $S \cup \cap \Psi j$  are independent fuzzy subsets of  $\Psi i$  and  $\Psi j$ . By the properties (i) and (ii)  $F r (\Psi i) + F r (\Psi j) \le |S \cup \cap \Psi i| + |S \cup \cap \Psi j|$  $= |(S \cup \cap \Psi i) \cup (S \cup \cap \Psi j)| + |(S \cup \cap \Psi i) \cap (S \cup \cap \Psi j)|$  $= |S \cup \cap (\Psi i \cup \Psi j)| + |S' \cup (\Psi i \cap \Psi j)|$  $= |S \cup | + |S' \cap |$  $= F r (\Psi i \cup \Psi j) + F r (\Psi i \cap \Psi j)$ 

**Definition 3.11** The dual of F M with respect to X is denoted as F M \* , where the bases of F M \* consist of the complements of bases present in F M. The sub- bases F S of F M are the fuzzy sets containing a base. The hypobase F H of F M are the maximal fuzzy sets containing no base. F<sub>B</sub> \* , F<sub>C</sub> \* are the cobases and cocircuits of F M.

**Lemma 3.12** If F M is a fuzzy matroid and F B i , F B j  $\in$  F B , then for each  $x \in F_B i - F B j \exists y \in F B j$  then F B j - x + y is a base. Proof. F B j is a base, F B j + x contains exactly one circuit F C . F B i is independent, F C contains an element  $y \in F B j - F B i$ . Then F B j + x - y contains no circuit and has size F r (X).

Theorem 3.13 The dual of a F M on X is a Fuzzy Matroid with rank function

 $Fr * (\Psi i) = |\Psi i| - Fr(x) - Fr(\Psi i)$ 

**Proof.** F r \* is a fuzzy matroid. We prove the base exchange property for F M \*. F<sup>-</sup>B, F<sup>-</sup>B  $\in$  F B \* and x  $\in$  F<sup>-</sup>B - F<sup>-</sup>B then F B, F B  $\in$  F B with x  $\in$  F B - F B there exist y  $\in$  F B - F B such that F B + x - y  $\in$  F B. Now F<sup>-</sup> B - x + y  $\in$  F B \* is the desired exchange. Let  $\Psi$  j be the maximal coindependent subset of  $\Psi$  i F r \* ( $\Psi$  i ) = F r \* ( $\Psi$  j ) = | $\Psi$ j |  $\Psi$ <sup>-</sup>j is a minimal super set of  $\Psi$ <sup>-</sup>j that contains base of F M. Since  $\Psi$ <sup>-</sup>j arises from  $\Psi$ <sup>-</sup>i by agumenting a maximal independent subset of  $\Psi$ <sup>-</sup>i to become a base.

$$\begin{split} &|\Psi^{-j}| - |\Psi^{-}i| \\ &= F r (X) - F r (\Psi^{-}i) \\ &|\Psi^{-}j| - |\Psi^{-}i| = |\Psi i| - |\Psi j| \\ &F r * (\Psi i) = |\Psi j| \\ &= |\Psi i| - (|\Psi^{-}j| - |\Psi^{-}i|) \\ &F r * (\Psi i) = |\Psi i| - F r (x) - F r (\Psi^{-}i) \end{split}$$

## CONCLUSION

In this article, the author constructed a  $F_M$  from G<sup>-</sup>. Furthermore, the examination of the largest independent fuzzy subsets and the smallest dependent fuzzy subsets among the edges of G<sup>-</sup> constitutes the bases and circuits of the fuzzy matroid  $F_M$ . This aspect holds significance in the continued advancement of fuzzy matroids derived from fuzzy graphs. The author also suggests exploring the representation of  $F_M$ .

## ACKNOWLEDGEMENTS

The author would like to thank the referee for these valuable suggestions which led to the improvement of this paper.

## ABSTRACT

Drug delivery system is a formulation or a device that enables a therapeutic substance selectively to reach its site of action. Siddha system of medicine is an ancient traditional system which has different drug delivery systems other than oral route which include Kalikkam (Eye medicines) Nasiyam (Nasal drops), Naasikaparanam (Blowing dry powder into nostril), Aakraanam (Inhaling dry powder), Peechu (Instillation), *Oothal* (Blowing air by keeping medicated substances in mouth), *Patru* (Dense application), Gargling, Varthi vaithal (Suppositories), Kudori Maruthuvam (piercing the superficial layer of the scalp skin and keep medicines within that) etc.. These drug delivery systems work in an excellent manner without any side effects and resolve many ailments. Few examples are application of paste of tuberous root of Gloriosa superba in both palms enhances labour pain and facilitates normal labour. Keeping a small amount of sanjeevakarani thylamas kudori sikitchai in cases of snake bites, it acts as an antidote and become a lifesaving drug. And in psychiatric diseases cow dung used as kudori marundhu by piercing the scalp with paddy. These drug delivery methods were successfully practised by ancient siddha practitioners/traditional healers without any discomforts, complications and unwanted effects. Nowadays, in this fast pace of modern life, these drug delivery methods are vanished slowly due to inadequate knowledge, difficulty in practise and lack of availability of advanced modern instruments/devices. Hence this study creates awareness about the effective traditional drug delivery techniques available in siddha system and helps the researchers to establish technology based advanced instruments or devices to propagate the ancient drug delivery methods for the well-being of mankind.

Jayalakshmi et al.,

## INTRODUCTION

Drug delivery system is a science in the field of pharmacokinetics describes the way in which a drug is carried into the living organism. An effective drug delivery can increase the efficacy and minimize the unknown side effects of that drug, hence *Siddha* system of medicine give more importance to *anubanam* (Vehicle that carries the drug). In other system of medicine, drug delivery is being well advanced only in the past few decades and greater innovations are being anticipated in the coming years[1], whereas the medicine which originated long back in Tamil region and believed to be an oldest system of medicine has a very clear view on drug delivery methods. Achievement or Perfection is the meaning of the word '*Siddha*' [2]. As its word means to perfection, Siddha system has a clear view in all aspects of the medicinal world. Siddha system not just focuses on treating the disease but it also takes into account of the patient's behaviour, age, habits, physical condition and environmental aspects. For this purpose *Siddhars* afforded different drug delivery systems other than oral route which include *Kalikkam* (Eye medicines), *Nasiyam* (Nasal drops), *Naasikaparanam* (Blowing dry powder into nostril), *Aakraanam* (Inhaling dry powder), *Peechu* (Instillation), *Oothal* (Blowing air by keeping medicated substances in mouth), *Patru* (Dense application), *Gargling, Varthi vaithal* (Suppositories), *Kudori maruthuvam* (piercing the superficial layer of the scalp skin and keep medicines within that) etc. This review study explains about these drug delivery techniques available in *Siddha* system.

## MATERIALS AND METHODS

This study is carried out as the systematic quantitative review on various authenticated *Siddha* texts by organizing large volumes of raw information from various sources into an organized format.

#### RESULTS

#### DRUG DELIVERY SYSTEM

Drug delivery is the process of administering medication or other pharmaceutical compounds to achieve a therapeutic effect [3]. It is a formulation or a device that enables a therapeutic substance to selectively reach its site of action.

#### Types of Drug Delivery Routes

#### Oral route

Oral route of drug delivery is the most common. Many drugs can be administered orally as capsules, tablets, or liquids. The oral route is usually safe, convenient, and inexpensive.

#### Injection

Intravenously, intramuscularly, intrathecally or subcutaneously.

#### Inhalation

Breathed into the lungs through the mouth (inhaled) or mouth and nose (Nebulized).

#### Nasal

Sprayed into the nostril(s) and absorbed through the nasal membranes. **Topical** Applied to the skin for a local effect.

#### Transdermal

Delivered through the skin via a patch for a systemic effect.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Jayalakshmi et al.,

#### Rectal

Inserted into the rectum to be absorbed into the bloodstream.

#### Sublingual

Placed underneath the tongue for rapid absorption into the bloodstream.

#### **Drug Delivery Devices**

Commonly used drug delivery devices are Prefilled syringes, Auto injectors, Infusion pumps, Metered dose inhalers (MDIs), Nebulizers, Nasal sprays, Eye droppers, Intrauterine devices (IUDs), Transdermal patches.

#### Ancient and Traditional Drug Delivery Methods in Siddha System of Medicine: [4]

Siddha system of medicine is an ancient traditional system which has different drug delivery methods other than oral route which include:

- *Kalikkam* (Liquid ophthalmic application)
- Nasiyam (Liquid nasal application)
- Naasikaparanam (Powder nasal application)
- Aakraanam (Inhaling dry powder)
- Peechu (Douche application)
- Oothal (Medicated aerosol)
- Patru (Semi solid poultice)
- Kopalithal(Gargling)
- Varthi vaithal (Medicated pessary)

These drug delivery systems work in an excellent manner without any side effects and resolve many ailments.

#### KATTU [Dense application]

Few examples are: Application of paste of tuberous root of *Gloriosa superba* in both palms enhances labour pain and facilitates normal labour [5]. Leaf and plumule paste of *Cajanus cajan* over the breasts as a thick package aid to reduce breast milk secretion [5].

#### PEECHU [Douche application]

Borax dissolved in water use as an instillation in cases of Leucorrhoea[4]. Seed peel of *Plantago ovata* soaked and boiled in water and use as douche application in Dysentry[5].

#### AAKRAANAM [Inhaling dry powder]

*Navachara* (Ammonium chloride) *aakraanam* act as a best remedy for headache, unconsciousness and sinusitis[4]. Dry powder of Root of *Anacyclus pyrethrum* acts as an anti convulsant and be a remedy for Epilepsy[5].

#### KALIKKAM [Liquid ophthalmic application]

Continuous application of Ash powder of *Lagenaria siceraria* with honey into eyes behave as a sight promotor for Night blindness[5]. Flower extract of *Tabernamontana divericata*[5] and *Sesbania grandiflora* reduces burning sensation in eyes and mitigates many eye diseases respectively[5].

#### PATRU [Semi solid poultice]

Dense application of *Chukku kali* over eye brows helps to improve vision in cases of hypermetropia and it act as a sight promotor[5]. Latex of *Ficus carica* has anti-inflammatory and astringent activity which shows its potent healing in Diabetic carbuncle and in Arthritis[5].

#### KOPALITHAL [Gargling]

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Jayalakshmi et al.,

Gargling with *Thiripala kashayam* is the best cure for Aphthus ulcer[5].

#### PODI [Medicated powder application]

Sprinkling dry powder of leaves of *Acalypha indica* on bed sores accord good heal[5]. *Poora podi-* an elixir for Syphilitic sore in male genitals[4].

#### NASIYAM [Liquid nasal application]

Few drops of *Sesbania grandiflora* leaf juice into nostril acts as an anti-pyretic and be a remedy in cases of fourth intermittent fever[5]. Flower extract of *Leucas aspera* as *nasiyam* give best results in Cephalalgia[5].

#### POOCHU [Liquid poultice]

Latex of *Euphorbia hirta* accord best heal in Paronychia[5]. Leaves of *Sida acuta* possess styptic action which stops the bleeding from incised wounds immediately[5].

#### POTTANAM [Bundle application]

Inhale the Bundle application of *Nigella sativa* for Rhinorrhea & Sinusitis[5]. Bundle application of Garlic & Onion into ears for Otalgia & Tinnitus[6].

#### PUGAI [Medicated fumigation]

Agasthiyar kuzhambu pugai for fistula, Vanga pugai for wound healing (viranam)[6].

#### VEDHU [Steaming]:

Steaming Lemon seeds into the hot water used for Sinusitis. Steaming Common Salt into the hot water used for Myalgia [6].

## DISCUSSION

These drug delivery methods were successfully practiced by ancient *siddha* practitioners/traditional healers without any discomforts, complications and unwanted effects. In recent days, due to fast pace of modern life, these drug delivery methods are vanished slowly due to inadequate knowledge, difficulty to practice, lack of availability of advanced modern instruments/devices.

## CONCLUSION

This study would have created awareness about the effective traditional drug delivery techniques available in *Siddha* system. It may help the researchers to establish technology based advanced instruments or devices to propagate the ancient drug delivery methods for the well-being of mankind.

## ABSTRACT

Alzheimer's disease (AD) is a progressive, irreversible brain disorder that slowly destroys memory and thinking skills and eventually the ability to carry out a daily simple task. Alzheimer's Disease is the most common form of dementia. Worldwide, around 55 million people have dementia, with over 60% living in low- and middle-income countries, this number is expected to rise to 78 million in 2030 and 139 million in 2050. In India, more than 4 million people have dementia, making the disease a global health crisis that must be addressed. Cholinesterase Inhibitors and NMDA Receptor blockers are choices of drugs for AD which commonly cause side effects like nausea, diarrhea, vomiting, insomnia, skin lesion, muscle cramps, fatigue, sleep disturbances, headache and dizziness, bradycardia, hypertension, weight gain, hallucination, confusion, aggressive behavior, urinary incontinence. etc. In Siddha medicine, so many formulations are indicated for AD; Brahmiyath Pavanai Chooranam(BPC) is one among them which is indicated for Intelligence, Intellect, Focus, Strengthening the brain, Physical strength, increase memory and reducing forgetfulness. BPC prepared from Amukkara (Withania somnifera), Kadugurohini (Picrorhiza scrophulariiflora), Ajamthaomam (Trachyspermum roxburghianum), Karupuppu (Black salt), Seeragam (Cuminum cyminum), Karunjeeragam (Nigella sataiva), Chukku (Zingiber officinale), Milagu(Piper nigrum), Thippili (Piper longum), Karisalai (Eclipta prostrata), Vellarugu (Enicostema axillare), Kadukaai (Terminalia chebula), Thandrikaai (Terminalia bellirica), Nellimulli (Phyllanthus embilica), Vasambu (Acorus calamus) Vallarai (Centella asiatica). Most of the ingredients in BPC have been proven for their Neurological antioxidant, Neuromodulatory, Cognitive enhancement, Neuroprotective, enhancing neurite growth, enhance acetylcholine content and Acetylcholinesterase inhibitor actions. According to the Siddha fundamental and taste theory, the ingredients are favourable for the management of AD. This review study

#### Rujitha et al.,

concluded that the polyherbal Siddha preparation *Brahmiyathi Pavanai Chooranam*can be used a Novel drug for the management of Alzheimer's disease. Further clinical studies are to be conducted to confirm the clinical efficacy.

Keywords: Alzheimer's disease; Brahmiyathi Pavanai Chooranam; Siddha Medicine.

#### INTRODUCTION

Alzheimer's Disease (AD) is the most common type of dementia and can be defined as a slowly progressive neurodegenerative disease characterized by neuritic plaques and neurofibrillary tangles as a result of amyloid-beta peptide (A $\beta$ ) accumulation in the brain, the medial temporal lobe, and neocortical structures [1,2,3]. Brain cells in the hippocampus, associated with learning, are the first to be damaged by Alzheimer's. The first symptom of the disease is memory loss, mainly difficulty remembering recently learned information[4]. There is no cure for Alzheimer's disease. Treatments are available that may only improve some symptoms. Cholinesterase Inhibitors (Donepezil, Rivastigmine, Galantamine)[5,6,7] and

NMDA (Memantine)[8] Receptor blockers are choices of drugs for AD which commonly cause side effects like nausea, diarrhea, vomiting, insomnia, and skin lesion, muscle cramps, fatigue, sleep disturbances, headache and dizziness, bradycardia, hypertension, weight gain, hallucination, confusion, aggressive behavior, urinary incontinence, etc. Worldwide, about 55 million people have dementia, 60% of them living in low- and middle-income countries. In every country's populationthe proportion of older people is increasing, so this number is expected to rise to 78 million in 2030 and 139 million in 2050<sup>[1]</sup>. In India, more than 4 million people have dementia, making the disease a global health crisis<sup>[2]</sup>. In Siddha medicine, so many formulations are indicated for AD, *Brahmiyathi Pavanai Chooranam*(BPC) is one among them which is indicated for Intelligence, Intellect, Focus, Strengthening the brain, Physical strength, increase memory, and reducing forgetfulness<sup>[9]</sup>.

## MATERIALS AND METHODS

#### Preparation of BPC

The ingredients from s.no 1 to 14 in Table no 1 are purified and separately made into powder. The powders are mixed together and placed in *Kalvam* (stone mortar). The *Vallarai* juice is poured into *Kalvam* and ground well until attains dry powder then let dry in the shade. On the next day, the dried powder is collected and subjected to the same process 21 times. Finally, the dried powder is collected and stored in an air-tight container. Dose: 2 – 4 grams

Adjuvant: Mixture of honey (8gm) and Cow's ghee (8gm) [9].

## Amukkara – Withania somnifera(WS)

## Alzheimer's disease on animal model

*Bhattacharya et al.* studied that, the effect of *Withania somnifera* (WS) in cognitive deficits induced in NMB-lesion ina rat modelthat was assessed by attenuation of a learned active avoidance task and a reduction in acetylcholine (ACh) concentrations in frontal cortical and hippocampal region, choline acetyltransferase activity and muscarinic cholinergic receptor (MCR) binding. IA-induced NBM lesioning in rats caused a marked cognitive deficit, assessed severe reduction of the learned task, and a significant decrease in the frontal cortex and hippocampal ach levels, chat activity, and MCR binding. In 2 weeks, treatment withWS reversed the IA-induced cognitive deficit and the reduction in cholinergic markers [11].

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Rujitha et al.,

*Tohda et al*, revealed that in human neuroblastoma SK-N-SH cells, the methanolic extract of roots of *Withania somnifera* notably increased the percentage of cells with neurites. The mRNA levels of the dendritic markers MAP2 and PSD-95 by RT-PCR were markedly increased by treatment with the extract [12].

#### Neuroprotective activity

*Kurapati et al.* tested the neuroprotective effects of methanol:Chloroform (3:1) extract of dried root of WS in a human neuronal SK-N-MC cell line, against  $\beta$ -amyloid induced toxicity and HIV-1Ba-L (clade B) infection.The neuroprotective effect of WS root extract was assessed by the MTT cell viability assays.The study results showed that the toxic effects were neutralized[13]. *Zhao J et al*, reported that the neurite outgrowth activities of WS derivatives showed significant neurite outgrowth activity at a concentration of 1 mm on a human neuroblastoma SH-SY5Y cell line[14].

## Kadugurohini – Picrorhiza scrophulariiflora (PS)

#### Neuroprotective activity

*Li Q et al*, revealed that the Neuroprotective Properties of Picroside II, the main active constituent of *Picrorhiza scrophulariiflora* (Scrophulariaceae), which might reduce the expressions of Caspase-3 and PARP to inhibit the neuronal apoptosis caused by cerebral ischemia-reperfusion injury and promote the neurological function of rats[15].

#### Enhancement of nerve growth factor

*Li P et al*, studied the Enhancement of nerve growth factor-mediated neurite outgrowth from PC12D cells by Chinese and Paraguayan medicinal plants, and the results show that methanol extract of *Picrorhizascrophulariiflora* induced the longest neurites in PC12D cells[16].

#### NGF-potentiating

*Ping Li et al*, evaluated the isolated Picrosides I and II as NGF-potentiating substances from the dried underground parts of P. Picrosides alone, even at high concentrations, did not cause neurite elongation from PC12D cells but significantly increased the proportion of cells with neurites in cultures treated with NGF. It has been revealed that picrosides are marked NGF-potentiating compounds<sup>[17]</sup>.

## Ajamthaomam – Trachyspermum roxburghianum(TR)

#### Antioxidant activity

Sunce Chansakaow et al. reported the antioxidant and antibacterial activities of the essential oil *Trachyspermumroxburghianum*(DC.). Folin-Ciocalteu colorimetric method, DPPH, ABTS, and FRAP assays were used to determine total phenolic content and evaluate antioxidant potential. Sabinene and  $\alpha$ -terpinolene including 3-n-butyl phthalide are the main compounds of *T. Roxburghinum*. The essential oils of *T. Roxburghinum* showed high total phenolic content (GEA= 3.0971 mg/ml) and exhibited potent antioxidant activities in DPPH (TEAC= 357.9297 mg/ml), ABTS (TEAC= 13.4242 mg/ml) and FRAP assays (TEAC= 27.4173 mg/ml)[18].

#### Seeragam - Cuminum cyminum (CC)

#### In - vitro acetylcholinesterase inhibitory activity

*Kumar et al*, the study showed that an aqueous extract of *C.cyminum* seed inhibited ache in *in-vitro* acetylcholinesterase inhibitory activity based on Ellman's method in a concentration-dependent manner. Also, lower concentrations and higher concentrations of *C. Cyminum* show competitive and mixed modes of inhibition respectively. So, *C. Cyminum* can act as an inhibitor of aches, which helps in enhancing memory and cognitive functions of the brain [19].

#### Antistress, anti-oxidant and memory-enhancing activities

Koppula et al evaluated the antistress, and memory-enhancing activities of cumin extract by stress-induced urinary biochemical changes in rats, and scopolamine-induced memory loss in rats respectively. And antioxidant activity by

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Rujitha et al.,

Lipid peroxidation inhibition in the liver and brain of rats using TBARS assay the extract showed better activity in inhibiting lipid peroxides is more effective in brain homogenate compared with liver[20].

#### Ache inhibition and Activation of CE enzyme

*Prabha et al,* evaluated esterase properties of hot and cold extracts of Indian spices*Cuminum cyminum, Elettaria cardamomum, Cinnamomum verum, and Syzygiumaromaticum* for AD, by the *in-vitro* of homogenates prepared from hippocampal region dissected from control and non-transgenic AD rats made available from a laboratory using Ellman method, showed maximum AChEinhibition in striatum region at the same time activated CE enzyme in the hippocampus, i.e., region of learning and memory [21].

#### Karunjeeragam - Nigella sataiva (NS)

#### Recovers learning function in AD

*Poorgholam et al* revealed that hippocampal injection of A $\beta$  could induce Alzheimer's disease in male Wistar rats, and administration of Thymoquinone the main active component of *Nigella sativa* could prevent learning dysfunction and improve initial latency. TQ also decreased plaque formation in the CA1 region of the hippocampus, increased the number of surviving neurons, and protected pyramidal cells against the neurotoxic effects of A $\beta$ [22].

#### Antioxidant activity, Inhibition of AChE and BChE, and Inhibition of A $\beta$ 42 aggregation

Veerabomma Sreedhar et al revealed that Methanolicextract of Nigella sativashows Maximum scavenging antioxidant activity by the DPPH method with 93.01% at 400  $\mu$ g/mL concentration. Cholinesterase activity by Ellman's method shows Methonolic extract of Nigella sativa for both enzymes AChE and BChEwere 51.19% and 63.86% respectively, and was compared with standard galantamine (96.68% and 83.68%) at 100  $\mu$ g/mL. This study results shows Methonolic extract of Nigella sativa has anti-amyloidogenic activity by using ThTfluroscence assay and Inhibition of A $\beta$ 42 aggregation by ThTassay[23].

#### Improves learning and memory impairments and oxidative damage

*RahimehBargi et al*, a study indicated that TQ improves learning and memory impairments induced by LPS in rats by Morris water maze apparatus and procedures. TQ attenuates hippocampal cytokine levels and improves oxidative damage biomarkers in the brain tissues[24].

#### Chukku - Zingiber officinale(ZO)

#### Antioxidant and acetylcholinesterase inhibitory activity

*Tung et al*,studied the Antioxidant and acetylcholinesterase inhibitory activity of *Zingiber officinale*by its extraction with ethanol 96 % and fractionated it with n-hexane, ethyl acetate (etoac)evaluated by 1,1-Diphenyl -2-picrylhydrazyl (DPPH) assay and Ellman's colorimetric method respectively. The results showed that the etoacfraction had the antioxidant activity strongestat IC50 was 8.89±1.37 µg/ml and ache inhibitory activity at IC50 value of 22.85±2.37 µg/ml in a dose-dependent manner<sup>[25]</sup>.

#### Improves β-Amyloid-Induced Memory Impairment

*Kim et al*, revealed that WS-5, an ethanol extract derived from *Z*. *Officinale* Roscoe, *C*. *longa*, *and C*. *sinensis* significantly attenuated the A beta-induced memory impairment in mice that were evaluated by the passive avoidance test and the Morris water maze test and suppressed A beta plaque formation in the Abeta-inducedAD mice[26].

#### Antioxidant activity, cholinesterase inhibition, anti-amyloidogenic potential, and neuroprotective properties

*Mathew et al.*, evaluated the antioxidant activity, cholinesterase inhibition, anti-amyloidogenic potential, and neuroprotective properties of dry ginger's methanolic extract. The methanolic extract contained 18+0.6 mg/g gallic acid equivalents of total phenolic content and 4.1840.69 mg quercetin equivalents/g of dry material. GE expressed high antioxidant activity with an IC value of 7040 304  $\mu$ g/ml in DPPH assay and 845.4156.62  $\mu$ m Fe(II) equivalents/g dry weight in FRAP assay respectively. In Ellman's assay for the cholinesterase inhibitory activity, GE had an

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Rujitha et al.,

ICvalue of 41±12 pg/ml. And 52+2 µg/ml for inhibition of acetyl- and butyrylcholinesterase respectively. Also, GE increased the cell survival against amyloid B (AB) induced toxicity in primary adult rat hippocampal cell culture<sup>[27]</sup>.

#### Milagu - Piper nigrum (PN)

#### Improves memory impairment and neurodegeneration

*Chonpathompikunlert et al.* revealed the effect of Piperine, a main active alkaloid in the fruit of *Piper nigrum*, on memory performance and neurodegeneration in an animal model of Alzheimer's disease. piperinewas orally given at various doses ranging from 5, 10, and 20 mg/kg BW at a period of 2 weeks before and 1-week toadult male Wistar rats after the intracerebroventricular administration of acetylcholine aziridinium ion (AF64A) bilaterally. Piperine at various dosage ranges, the results of this study showed significant improvement in memory impairment and neurodegeneration in the hippocampus[28].

#### Cognitive function

*Wang et al*, reported that piperineameliorates ICV-STZ-induced cognitive impairments via antioxidant and antiinflammatory activities and its ability to restore hippocampal neurotransmission in the mouse[29]. *Subedee et al.* evaluated PN as a preventive drug for Alzheimer's associated histopathological, biochemical, and behavior changes in a rat model[30]. *Hirtu et al.*analyzedthe spatial memory formation following administration of the methanolic extract of *P. nigrum*fruits (50 and 100 mg/kg, orally, for 21 consecutive days) in rats subjected to intracerebroventricular injection of Ab (1–42). Intracerebroventricular injection of Ab(1–42) interferes with memory function and subsequently causes impairment of spatial memory within Y-maze and radial arm-maze tasks, hence the results showed the methanolic extract of *P. nigrum* fruits could effectively enhance memory processes and restore antioxidant brain status and may confer neuroprotection due to alleviation of oxidative damage induced by Ab(1– 42)[31].

#### Thippili - Piper longum(PL)

#### Improves cognitive function

Jun Go et al, reported that one of the major chemical constituents of *Piper longum*Piperlongumine (PL), significantly activated the deacetylase ability of Sirt1 *in vitro*. Treatment with PL, regulated the gene transcription of antioxidant response elements in hippocampal neurons and attenuated the cytotoxicity induced by intraneuronal A $\beta_{1-42}$  expression. The oral administration of PL, at a dose of 50 mg/kg/day for 2.5 months, significantly reduced the occupied area of beta-amyloid in the parietal cortex of APP/PS1 mice. Also improved the novel object recognition and working memory impairment[32].

#### Neuroprotective

*Bi Y et al.*, evaluated that the alkaloid of *P. Longum* (PLA) has neuroprotective effects in an MPTP-induced chronic mouse model of Parkinson's disease<sup>[33]</sup>.

#### MAO inhibitory activity and antidepressant-like activity

*Lee SA et al.* studied that an ethanol extract of the fruits of *P. Longum*showed strong inhibitory activity on mouse brain MAO (Monoamine oxidase (MAO) catalyzes the oxidative deamination of monoamine neurotransmitters like serotonin, dopamine, and norepinephrine, and plays important roles in several psychiatric and neurological disorders). Also, antidepressant-like activity by In Vivo Tail Suspension and Mismeasurement of Spontaneous Motor Activity[34].

#### Karisalai - Ecliptaprostrata(EP)

Banji O et al.studied that the aqueous extract obtained from leaves of *E. Prostrata* at the dose of 100 and 200 mg/kg was evaluated for its potential application on transfer latency as a parameter of acquisition and retrieval learning in rats using an elevated plus-maze. The administration of extract was reported to significantly improve retrieval memory[35]. *Kim D et al.* investigated the different concentrations of butanol fractions of the *E. Prostrata* aqueous extractin CD rats. The acetylcholine formation and oxidative stress inhibition in the brain and serum of rats were accessed before and after feeding the experimental diet. The acetylcholine level was increased by 9.6–12.1% in the fed

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Rujitha et al.,

group as compared to the control. Monoamine oxidase-B activity and superoxide radical levels were decreased by 10.5% and 9.4%, respectively in the treated group[36]. *Xia X, Yu R, Wang X, et al.*investigated the role of *Ecliptaprostrata*extract reversed the spatial learning and memory deficits caused by D-galactose-induced aging in rats, particularly in the groups with higher treatment concentrations. Compared with the normal group, the levels of dopamine (DA), Norepinephrine (NE), and 5-HT were significantly lower in the D-galactose-treated model group. Spatial memory performance was evaluated using the Morris water maze[37].

Jung WY et al.used the passive avoidance, Y-maze, and Morris water maze tasksto evaluate the anti-amnesic effects of the ethanolic extract of *Ecliptaprostrata* (EEEP) in mice. In the passive avoidance task, EEEP significantly ameliorated the shortened step-through latency induced by scopolamine. In the Y-maze task, EEEP showed a significant increase in alternation behavior. From the results the scopolamine-induced decrease in the swimming time within the target zone and the number of crossings where the platform was significantly reversed by EEEP[38].

#### Vella Irugu – Enicostema axillare(EA)

*Vaijanathappa et al.,* studied four successive extracts of the whole plant of *Enicostemma axillare* (*E. Axillare*), for antioxidant activity in *in-vitro* methods using nine different ways. All four extracts of *E. Axillare* showed potent antioxidant activityin the 2,2 -azino-bis (3-ethyl benzo-thiazoline-6-sulfonic acid) diammonium salt (ABTS) method. The chloroform extract also showed potent antioxidant activity in H<sub>2</sub>O<sub>2</sub>, nitric oxide, and hydroxyl radicals using the deoxyribose and lipid peroxidation methods [39].

#### Kadukkaai - Terminalia chebula(TC)

#### Learning memory

*Seth et al.* evaluated that ethanolic extracts of *T. Chebula*significantly improved learning memory in Chemical Induced Memory Impairments in Rats assessed by Morris water maze test [40].

#### Acetylcholinesterase inhibitory activity

*Kim MS et al.*, reported that TCE treatment reversed scopolamine-induced learning and memory deficits in acquisition and retention in the Morris water maze task. TCE reduced hippocampal ache activities and increased chat and ach levels and also TCE treatment suppressed scopolamine-induced oxidative damage by ameliorating the increased levels of ROS, NO, and MDA [41].

#### Alzheimer's disease in rat

*Lakshmi et al.*, evaluated that the Fruit extracts of *Terminalia chebula* exhibited significant learning and memory activity in Alzheimer's disease and neurodegenerative diseases in rats, which modulates oxidative stress and is involved in the protective effect against oxidative damage [42].

#### Thandrikaai - Terminalia bellirica(TB)

*Dinesh Dhingra et al.* evaluated the anti-depressant-like activity of aqueous and ethanolic extracts of *T. Bellirica*on depression in mice using the forced swim test (FST) and tail suspension test (TST) and its efficacy was found to be similar to fluoxetine and imipramine (antidepressant drugs) [43].

*Waheed*, revealed the antioxidant on neuroprotective activities of TB by Lipid Peroxidation (LPO) assay reduced Glutathione (GSH) assay catalase(CAT) Assay Superoxide Dismutase (SOD) Assay [44]. *Nirala*, reported that the Aqueous Extract of TB enhances the learning process and is comparable to the standard drug Piracetam at higher doses (36mg/kg). Also, it can oppose the alcohol-induced learning impairment at lower doses (9mg/kg) in the *invivo* rat model and assessed by Hebb- William Maze[45].

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Rujitha et al.,

#### Nellimulli - Phyllanthus embilica(PE) AChE & BuChEinhibitory activity

*Biswas et al.* evaluated that A crude methyl extract (CME) of dry fruit of *P. Emblica* for its acetylcholinesterase (AChE) and butyrylcholinesterase (BuChE) inhibitory activity using Ellman's method results shows that inhibiting AChEand BuChE with IC50 of 53.88  $\mu$ g/ml and 65.12  $\mu$ g/ml respectively, which shows that the CME of *P. Emblica* is a source forAChEand BuChE inhibitors[46].

*Vrish et al.* investigated the methanolic fruit extract of *Phyllanthus emblica* Linn. for its reversal effect on Scopolamine and sodium nitrite-induced memory deficits in mice. Elevated plus maze (EPM) and Morris water maze (MWM) were used to evaluate short and long-term memory respectively. The administration of methanolic fruit extract from the plant significantly improved learning and memory, prevented scopolamine and sodium nitrite-induced experimental amnesia and may be a great potential in memory deficits[47]. *Uddin MS et al*, demonstrated that the Ethanolic extract of *P.embilica* fruits showed marked beneficial effects for improving learning, memory, and antioxidant activity. Among ripe and unripe fruits, significant cognitive enhancing effects were observed by unripe fruit which is comparable with the standard. Antioxidant activity was evaluated by measuring enzymes such as superoxide dismutase (SOD), reduced glutathione (GSH), catalase (CAT), glutathione peroxidase (GSH-Px), glutathione reductase, glutathione-S-transferase, and the contents of thiobarbituric acid reactive substances (TBARS) in entire brain tissue homogenates. Ache activity was determined using a colorimetric method[48].

#### Vasambu - Acorus calamus(AC)

*Mukherjee et al.*revealed the Acetylcholinesterase inhibitory activity of essential oil from the *Acorus calamus* and its main constituents,  $\beta$  -asarone and  $\alpha$ -asarone by Ellman's method.In this study,Physostigmine was the standard inhibitor that showed inhibition with an IC<sub>50</sub> value of 0.28<u>+</u>0.015. From the resultsInhibitory activity of the hydroalcoholic extract of AC with IC<sub>50</sub> value of 182.31 <u>+</u> 16.78mL. AC rhizomes essential oil,  $\beta$  -asarone and  $\alpha$ -asarone, IC <sub>50</sub>values were 10.67<u>+</u>0.81, 3.33<u>+</u>0.02, and 46.38<u>+</u>2.69 respectively. That shows  $\beta$  -asarone is the most active component in AC but weaker than the standard physostigmine[49].

*Reddy et al*, studied that AC treatment effectively prevented stress-induced cognitive dysfunction and anxious behavior by chronic stress-induced cognitive dysfunction and anxiety in rats. Also found antioxidant activities. This study shows the neuroprotective effect of AC against restraint stress-induced neuronal damage[50]. *C. Venkatramaniah et al*, observed the Neuroprotective role of Acorus calamus us and its active principle beta asarone in a Hippocampal (the hippocampus is the main organ for memory) lesion surgery rat model by analyzing the memory of the animals in 8 arms radial maze[51].

#### Vallarai - Centella asiatica (CA)

Gray et al. evaluated the cognitive-enhancing effects of *Centella asiatica* Water extract(CAW), These cognitiveenhancing effects appear independent of A $\beta$  plaque reduction, CAW reduced the A $\beta$  plaque burden in the hippocampus but it did not affect A $\beta$  levels in the cortex and improvements were observed in both hippocampal and cortically mediated tasks. Hippocampal mitochondrial function was improved by CAW treatment and also induced the expression of mitochondrial as well as antioxidant response genes in the brains of mice [52]. *Jintanaporn et al.* reported in their trial the Positive modulation of cognition and mood-enhancing effect of *Centella asiatica* in the healthy elderly volunteer. Twenty-eight Healthy elder participants were treated with plant extract for 2 months with doses ranging from 250, 500, and 750 once daily. The computerized test battery and event-related potential were used to assess the cognitive function and Bond–Lader visual analog scales were used to assess the mood, before the trial and after single, 1, and 2 months. The results showed enhanced working memory and improvement in selfrelated mood with a high dose of plant extract [53].

*Kumar et al.* revealed in their study that the *Centella asiatica* extract significantly attenuated colchicine-induced memory impairment assessed by the Elevated plus maze test and Morris water maze oxidative damage assessed by attenuated the increase in MDA, nitrite levels, and restored decrease in reduced GSH [54].

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Rujitha et al.,

## DISCUSSION

This review has proven that the ingredients of *Brahmiyathi Pavanai Chooranam* have Neurological antioxidants, Neuromodulatory, Cognitive enhancement, Neuroprotective, enhancing neurite growth, Enhancing acetylcholine content, and Acetylcholinesterase inhibitor actions. According to the method are preparation soaking the drugs with *Centella asiatica* juice 21 times enhances the efficacy of the drug and preserves the concentration of phytoconstituents. According to the Siddha fundamental and taste theory, the ingredients are favorable for the management of Alzheimer's Disease.Finally, this review concludes that the drug *Brahmiyathi Pavanai Chooranam* is a novel drug for Alzheimer's Disease.

## ABSTRACT

Most of the Siddha herbs plays a dominant role in modulating the gut microbiota. The gut microbiota is now considered a relevant therapeutic target for many chronic diseases. Kadukkai (*Terminalia Chebula*.Retz.), which is referred to as "King of herb" alters the gut microbiota and promote human health. Gut microbiota release by-products in the intestine which are beneficial for human health with different physiological impacts including diabetes, hypertension, obesity, gastrointestinal diseases, hormonal brain axis, cancer, etc. Clinical studies on the effects of Kadukkai on human gut microbiota composition and exerts differential effects on subsets of the gut microbiota. The present work provides new findings on the influence of extracts from Kadukkai that act like prebiotics and augment the probiotic activity.

## INTRODUCTION

Siddha system of medicine places great importance on proper diet and digestion, as well as on all aspects of lifestyle. In future, most of the researchers will agree that the Siddha medicine to be an ancient science of epigenetics. The Siddha practitioners might not have understood the precise nutrigenomic mechanics of how food and herbs can affects gene expression, but they did recognize that each individual has their own unique psychophysiological constitution, which is affected by diet, lifestyle, and environmental factors.Siddha medicine describes the functioning of our mind and body in terms of three main *Uyir thathukkal*—the governing principles of the physiology—*Vatham*, *Pitham*, and *Kabam*[1]Siddha system of medicine, as well as integrative medicine practitioners, commonly prescribes these herbal medicines for a variety of gut- and skin-related conditions. However, insufficient data exist on the effects of Kadukkai on gut microbiota, and clinical investigations of this herbal medicines are lacking.

#### GENERAL DESCRIPTION OF KADUKKAI

*Terminalia chebula* (common name: Kadukkai), a widely studied Single herb is held in high esteem in Siddha for its properties to prevent and cure diseases. It has enjoyed the prime place among medicinal herbs in India since ancient times. It is called the 'King of Medicines' and is always listed first in traditional medicines because of its extraordinary therapeutic benefits.

#### SIDDHA PHARMACOLOGY OF KADUKKAI[2]

Siddha pharmacology describes the attributes of herbs. The *suvai* or veeriyam of Kadukkai is sweet, sour, pungent, bitter, and astringent; except salty taste. The veeriyam, or potency and action, is neutral, and the Vipagam, or post digestive effect is sweet. Kadukkai has a prabhavam, meaning special action or trophism, for all doshas (energetics and mind-body types) and thus is balancing for all doshas and constitutions. The gunam, or qualities of Kadukkai is considered light and dry.

#### GUT HEALTH, SIDDHA HERBS AND PREBIOTICS

Siddha medicine explains that most diseases are caused by an accumulation of undigested food (*Vishamakkini*) in gut. *Vishamakkini* literally means to digest the foods and drinks very slowly and digestion will not complete. Hence some toxic condition may prevail because of *Samana Vaayu* misses its proper place, the heat will be toxic. Generally *Samana vayu* helps us smoothening the food , liquids and makes softening the six tastes and helps in spreading them in the body. The *Vishamakkini* which caused the "undigested food," but it can be understood from a scientific perspective as endogenous toxins resulting from imbalanced or incomplete digestion. *Manthakkini* can be formed as a result of reduced Udal thee, or digestive power (*Manthakkini-when Samanavaayu* unites with *Kabam*,the heat produced will be dull). *Udal thee* has a number of different meanings and not only relates to digestive enzymes but also to the metabolic process in the different tissues or *Udal thathukkal* of the body. *Manthakkini* is initially formed in the digestive tract, but at a later stage of disease it can leak into the bodily tissues and turn into *Vishamakkini*, a reactive form of *Manthakkini*, that leads to tissue disruption and chronic inflammation and disease.[3] A disruption in the gut microbiome has been associated with problems in the gut barrier.

Although the body can withstand brief disruption of the intestinal barrier, due to ageing, persistent stress, and genetic predisposition which may contribute to the development of autoimmune, metabolic, and mental health disorders. Chronic breakdown of the intestinal barrier can cause microbial components to enter the bloodstream and that leads to low-grade, systemic inflammation. [4]. Most of the ingredients in Siddha medicine are derived from herbal origin .Major components, and their biosynthesis is influenced by various environmental factors. Recently, various biological activities of Siddha herbs, such as antitumor, anti-oxidation, hypolipidemic, and immunomodulatory have been investigated and have received increased attention. Human microbiota investigations by a study has revealed the significant prebiotic potential of medicinal herbs used in digestive health

#### Aishwarya et al.,

and disease via the microbial metabolism of herb-provided substrates, e.g., polyphenols, sugars, glycans and amino acids [5].

#### **BIOLOGICAL RHYTHMS AND GUT MICROBIOTA**

Siddha system of medicine clearly identifies *Sirupozhuthugal* (daily), *Perumpozhuthugal* (seasonal) rhythms. Each day, for example, consists of a sequence of periods, which are characterized by *Vatham*, *Pitham*, or *Kabam*. [6]The day starts with a *Vatham* period from 6 am to 10 am, then a *Pitham* period from 10 am to 2 pm, and then a *Kabam* period from 2 pm to 6 pm. Next is another *Vatham* period from 6 pm to 10 pm, a *Pitham* from 10 pm to 2 am and finally a *Kabam* from 2 am to 6 am. Each season is represented by either one *thodam* or a combination of *thodangal* (Table 2).

The daily routine is called *Nithiya ozhukkam* and the seasonal routine is called *Kaala ozhukkam*[6]. In 2017, Nobel Prize in Physiology and Medicine was given for studies on the genetic foundation of biological rhythms, demonstrating how modern medicine also understands the significance of daily rhythms to your health. Almost all living things, including bacteria to humans, have an internal "biological clock" that keeps a roughly 24-hour rhythm. The master clock (biological clock) becomes confused when artificially introducing light and dark signals from the outside world, which has negative health effects. For instance, shift workers have been found to have a greater prevalence of cancer, cardiovascular disease, obesity, digestive issues, and mental and neurological illnesses. [7].

Siddha system of medicine recommendations of specific diets at specific times may relate to the seasonal rhythms of the microbiome. Due to the habits of diet, activities of the individual against nature and changes in the environment and seasonal changes affect the system and the seven Thathus are affected. Hence, the three Naadis deviate from their natural state and indicate through pulse and symptoms in the body. Since the three naadi derange from their natural state and indicate disease they are called mukkutram (making physical imperfection) [3]. Over the *llavenil kalam*, for example, Kabam was said to build up in the body. *Munpanikalam* is described as the ideal time to rebalance Kabam to prevent toxins and excess mucus from creating congestion and allergies. Foods that are primarily Kabam in nature—heavy, greasy, and mucus forming—tend to increase both Kabam. Siddha recommends reducing or eliminating Kabam foods during this time, which might help to heal the gut and reboot the microbiome.[6]. Seasonal differences in the gut microbiome, observed higher relative abundance of the phylum Bacteroidetes, one of the most common and prevalent groups of gut bacteria, during the summer compared to the winter months. Also found that Actinobacteria abundance increased in the winter compared to the summer months. A study showed that significant seasonal shifts in the abundance of quite a few other types of bacteria (for example, phyla Chloroflexi, Gemmatimonadetes, TM7, etc.).[8]

#### The Role of Prebiotics in various disease conditions:

Prebiotics are nondigestible dietary components that are said to have a positive impact on the host by promoting the growth and/or activity of bacteria in the digestive system in ways that are allegedly good for health.[9] There are various types of prebiotics and majority of them are mostly oligosaccharide carbohydrates (OSCs),

- Fructans oligofructose (FOS)
- Galacto-Oligosaccharides (GOS)
- Starch and Glucose-Derived Oligosaccharides
- pectic oligosaccharide (POS)
- Non Carbohydrate Oligosaccharide,
- cocoa-derived flavanols[10]

#### PHYTOCHEMICALS AS A MODIFIER OF GUT MICROBIOTA

Kadukkai likely interact with gut microbiota to induce gastrointestinal and systemic effects through its bioactive compounds. Kadukkai is enriched in diverse polyphenolic compounds such as tannins, phenolic carboxylic compounds, phenols, terpenoids and triterpene saponins, flavonoids, sterols, etc.. [19]. The tannin content of Terminalia chebula ranges from 32% to 45% and consists of punicalagin, gallic acid, ellagic acid, chebulic acid, and chebulinic acid. There has been evidence of the flavonoids quercetin, catechin, and kaempferol.

#### Aishwarya et al.,

Monosaccharides/oligosaccharides (9%) detected are D-glucose, D-fructose, and saccharose. The fruit acids include quinic acid (1.5%), shikimic acid (2%), and fatty oil (from seeds; 40%). The high tannin content of myrobalan makes it popular for use as an astringent.[20]. Polyphenols are a diverse class of secondary plant metabolites found in most diets. Owing to their chemical structure, they are poorly absorbed and thus reach the colon, where they affect the resident microbiota. Specifically, (poly)phenols can stimulate several of keystone bacterial species such as *Akkermansia muciniphila, Bacteroides thetaiotaomicrom, Faecalibacterium prausnitzii*, Bifidobacteria, and Lactobacilli [21]. Recent studies have evaluated the biotransformation of polyphenolic compounds by gut microbiota that result in increased bio absorption and/or bioactivity. For instance, the biotransformation of chebulinic acid by gut microbes, which has been demonstrated to have direct impacts on COX-2 production, may eventually reduce oxidative damage. Most of the animal and human studies suggest that *Akkermansi muciniphila* is a highly promising probiotic, especially its potential for the prevention and treatment of diabetes, obesity, and their associated metabolic disorders. The positive modulation of *Akkermansia* was, it increases the mucus thickness and gut barrier integrity [22]. Polyphenols shows that the human gut microbiota also responds with a major shift in *Akkermansia* abundance when challenged with high polyphenol intake, as it also suggests that healthy individuals may also take advantage of the prebiotic effects of polyphenols on *Akkermansia*. [23]

## CONCLUSION AND FUTURE PERSPECTIVES

This review article revealed the promising findings of current prebiotic activity of Kadukkai. This study is novel in highlighting the significant prebiotic potential of herbal medicine Kadukkai and suggest that the health benefits of this herb was due to their ability to modulate the gut microbiota in a manner predicted to improve colonic epithelium function, reduce inflammation, and promote protection from bacterial opportunistic pathogenic infection. Future research in human clinical trials will examine if the in vitro results and the predictions from genomic analysis agree.

## ABSTRACT

Wireless Sensor Networks (WSNs) are made up of small nodes with sensing, processing, and wireless communication capabilities. Routing is a critical activity in wireless sensor networks since it deals with data transmission to base stations. Routing attacks can cripple it easily and drastically affect the functionality of WSNs. In this paper, a novel technique called Segmented Regressive Gradient Deep Artificial Neural Learning Based algorithm (SRGDANL-DCS) is introduced for secure routing and data communication in WSN by detection of the different types of attacks. The Deep Artificial Neural Learning classifier is used in the proposed technique to determine the most energy-efficient neighboring node selection and to detect attackers. The Artificial Neural Learning classifier consists of three or more layers such as an input, and output with more than one hidden layer with sub-layers. The number of sensor nodes is given to the input layer. For each sensor node, attack characteristics such as energy level, and number of packets dropped are measured. The segmented regression is applied to analyze the characteristics of the node. Then, the Heaviside step activation function is employed to classify normal nodes and different types of attack nodes. After identifying the normal neighboring sensor nodes, the route paths are constructed between the source and destination based on the time of arrival method.

## INTRODUCTION

WSNs are used in a wide range of applications.. These networks are susceptible to different unique security risks and risks in their data transmission processes. Attackers interfere and eavesdrop on transmission to modify the data. Data communication between nodes must be encrypted before transmission in order to ensure WSN security. Several methods have been developed for attack detection and secure communication.

#### LITERATURE REVIEW

A lightweight replica node identification mechanism with a three-step approach was presented in [1] to determine replica attacks with a lower false detection rate. However, greater security in data communication was not achieved. An automated, flexible, and lightweight encryption method called (FlexCrypt) was designed in [2] to establish a secure communication and data transmission with symmetric keys. But it was not efficient to enhance the performance of the packet delivery ratio in secure communication. A hybrid Elliptic Curve Cryptography (ECC) and Advanced Encryption Standard (AES) were developed in [3] for encryption and decryption of data to avoid a variety of security threats including side-channel attacks. But the deep learning techniques were not implemented to further enhance the attack detection accuracy. Deep learning (DL) based intrusion detection scheme was developed in [4] for detecting four types of DoS attacks that affect the communication of WSNs. But it failed to reduce the size of the training data for enhancing the performance. An intrusion detection method based on deep neural networks (DNN) was developed in [5] to efficiently identify the attacks. However, it was higher computational complexity and lesser classification accuracy. Fuzzy-based DDoS attack Detection and Recovery mechanism (FBDR) was developed in [6] to distinguish the occurrence of DDoS attacks. However, the accuracy of DDoS attack detection was not improved. An efficient asymmetric multi-recipient cryptographic method was introduced in [7] for secure multi-party communication. However, the communication cost was not minimized.

#### **PROPOSAL METHODOLOGY**

The proposed technique employs a Deep Artificial Neural Learning classifier to determine the most energy-efficient neighboring node selection and to detect attackers.. A Deep Artificial Neural Learning classifier is a feed-forward neural network that produces a set of outputs from a set of inputs. It means that the input is transferred from the input layer to the output layer in the forward direction. The input layer is given the number of sensor nodes. For each sensor node, attack characteristics such as energy level, and number of packets dropped are measured. The segmented regression is applied to analyze the characteristics of the node. Then, the Heaviside step activation function is employed to classify normal nodes and different types of attack nodes. After identifying the normal neighboring sensor nodes, the time of arrival approach is used to construct the route paths between the source and destination. Finally, secure data transmission is performed along the route path by applying a Deterministic Schmidt-Samoa certificateless signcryption. Figure 1 given abovedepicts structural design of the proposed technique SRGDANL-DCS technique for secure efficient routing and data transmission in WSN. The WSN includes a number of sensor nodes  $Sn_i \in Sn_1, Sn_2, Sn_3 \dots Sn_n'SN'$  or base station deployed. In WSN, sensor node transmits the collected data packets ' $d_1, d_2, \dots, d_m'$  to sink through the energy efficient neighboring nodes  $Nn_1, Nn_2, Nn_3, \dots Nn_b$  in a secured manner. The above said different process of the proposed SRGDANL-DCSapproach is described in the following subsections.

#### D.Sudhakar and V.S.Meenakshi

#### Segmented regressive gradient deep artificial neural learning classifier based attack detection

First, the proposed SRGDANL-DCS technique finds the neighboring node using a deep artificial neural learning classifier. A deep artificial neural learning classifier is a class of machine learning algorithms that consists of multiple layers to perform certain tasks from the raw input. The proposed deep artificial neural learning classifier consists of one input layer, three hidden layers, and one output layer. Each layer comprises small individual units called nodes or neurons. Neurons within individual layers are fully connected to successive layers. The architecture is said to be deeper with respect to the number of layers used. The main advantage of a deep artificial neural learning classifier is to return accurate results when it uses large amounts of input.

The input layer receives the input (i.e. number of sensor nodes) to be processed. The required task such as analysis and classification is performed at the hidden layer. A random number of hidden layers are located between the input and output layers. Finally, the classification outcomes are obtained at the output layer. Let us consider the number of wireless sensor nodes  $Sn_1, Sn_2, Sn_3, ..., Sn_n$  are considered as input to the input layer. A neuron is a mathematical function that considered an input and assigns the weight, bias returns the output. Therefore, the activity of the neuron is formulated as given below, Figure 2 illustrates aactivity of neurons that considers the input of sensor nodes associated with a set of weight ' $q_1, q_2, ..., q_n$ ' and summed with bias 'd'. As a result, the neuron output is as

(1)

Follows 
$$y = \left[\sum_{i=1}^{n} Sn_i * q_i\right] + d$$

Where the output of neuron 'y' is obtained with the sensor nodes ' $Sn_i$ ' multiplied with the set of weights ' $q_i$ ' and bias 'd' stored the integer value '1'. The sensor node is transferred into the hidden layer where the energy level is measured for identifying the attack nodes. In order to launch a replica attack in WSN, replica nodes must use additional energy. For each fake identity created while distributing the replica node, energy consumption is doubled. As the number of attacker nodes grows, so does energy usage. Initially, all the sensor nodes deployed in WSN have similar energy levels. The residual energy level of sensor nodes is estimated based on the difference between the initial energy and consumed energy. Therefore, the residual energy of the sensor nodes is estimated as given below.

$$E_{RL} = [E_{TT}] - [E_C]$$
 (2)

Where,  $E_{RL}$  denotes a residual energy of the sensor nodes,  $E_{TT}$  shows total energy of sensor node and  $E_{C}$  represents the consumed energy of the nodes. The black hole node is identified based ondropping the data packets. The alicious node or black hole node drops the entire data packets received from the previous node rather than data forwarding to next node.

$$BA_{Sn} = \left(\frac{dpd}{dns}\right) \tag{3}$$

Where,  $BA_{Sn}$  indicates a black hole node behavior, dpd denotes a data packets dropped by the particular sensor node and dps' indicates a data packets sent by previous node 'dps'. The gray hole attack is also called a selective forwarding attack. It did not drop all the packets received from the other node but only the part of the data packets gets dropped.

$$GA_{Sn} = \left(\frac{spd}{dps}\right) \tag{4}$$

Where, ' $GA_{sn}$ ' indicates a gray hole attacks characteristics of sensor nodes based on a selective number of packets dropped '*spd*' and the data packets sent by previous node '*dps*'. The above estimated node characteristics are sent to another hidden layer for identifying the attacks. Segmented regression is a machine learning technique in which the independent variable (i.e. sensor nodes) is classified by setting the threshold value.

 $R = \{ (E_{RL} > t_E) \&\& (dpd > t_{dpd}) \&\& (spd > t_{spd}) \}$ (5)

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### D.Sudhakar and V.S.Meenakshi

Where *R* indicates an output of the regression,  $t_E$ ,  $t_{apd}$ ,  $t_{spd}$  indicates a threshold value of the energy, data packet drop threshold, and selective number of packets dropped, respectively. The regression results are sent into the Heaviside activation function, which permits the output neuron to create a '1' if the input reaches a threshold; otherwise, it returns a '0'.

$A = \begin{cases} 1, & Attack node \\ 0, & normal node \end{cases} $ (6)	6)
---	----

The activation function 'A' returns '1' indicates an estimated value is greater than the threshold. Otherwise, activation function 'A' returns '0'. The value '0' indicates that the sensor nodes are classified as a legitimate or normal node. The value '1' indicates that the sensor nodes are classified as a black hole, greyhole, replication attack nodes. In order to minimize the error rate of classification, weights gets updated by applying a gradient momentum method,

 $q_{t+1} = q_t - \eta r_t$ (7)
Where,  $r_t = \alpha r_{t-1} + (1 - \alpha) \left[ \frac{\partial er}{\partial q_s} \right]$ (8)

Where,  $q_{t+1}$  indicates an updated weight,  $q_t$  represents a current weight,  $\eta$  denotes a learning rate ( $\eta < 1$ ),  $r_t$  denotes a common default value  $r_t = 0.9$ .  $\left(\frac{\partial er}{\partial q_t}\right)'$  denotes a partial derivative of the error 'er' with respect to current weight ' $q_t$ '. This process gets repeated until finding the minimum classification error at the output layer. In this way, normal and attack neighboring nodes are identified.

In the proposed technique the process of sensor node classification is performed using deep learning techniques. The deep learning classifier includes numerous layers to analyze the sensor nodes' energy level and packet drop. The number of sensor nodes are given as input to the deep learning classifier. For each input, the weights and biases get assigned. Then the residual energy, packet drop, and selective packet drop of the nodes are computed. After that, segmented regression is applied, and set the threshold value. The heavy side step activation function analyzes the regression output and returns '1' if the node is classified as an attack. Otherwise, the activation function returns '0', if the node is classified as normal. After the classification, the weights get updated to minimize the error. Finally, the classification results are obtained at the output layer. This process enhances attack detection accuracy.

#### Route path construction

Once the normal node is identified, the neighbors are detected to establish a route for data transmission. The neighboring nodes are identified through the application of the time of flight method. It is used to measure the time difference between the arrival of the beacon reply message and the transmission of the beacon request message. The source node transmits a beacon request message to the other normal nodes.

$$Sn \xrightarrow{M_{beacon\,request}} \sum_{i=1}^{m} Nn_i \xrightarrow{M_{beacon\,request}} Dn \tag{9}$$

Where, source node'Sn'sends the beacon request message ' $M_{beacon \ request}$ ' to destination 'Dn' via other nodes $Nn_i$ . Upon successful transmission of the beacon request message, the destination sensor node 'Dn'send response message back to the source via neighboring nodes.

$$Dn \xrightarrow{M_{beacon response}} \sum_{i=1}^{m} Nn_i \xrightarrow{M_{beacon response}} Sn$$
(10)

Where, destination node Dn' reply the beacon response message  $M_{beacon response'}$  to via other nodes  $Nn_i$ . Upon successful response of the beacon message, the time of arrival is computed as given below,

 $ToA_{M_{beacon}} = M_{beacon \, response}(T) - M_{beacon \, request}(T)$  (11)

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

D.Sudhakar and V.S.Meenakshi

Where,  $ToA_{M_{beacon}}$  indicates a time difference between the response arrival time  $M_{beacon response}(T)$  and the request message sent from the source node ' $M_{beacon request}$ '. The minimum time taken for message arrival is selected as an optimal route path for efficient data transmission. Figure 3 demonstrates the route paths establishment between the source and destination through the normal sensor nodes $Nn_1, Nn_2, Nn_3, Nn_4, Nn_5, Nn_6$ . Among the numerous paths, the minimum distance is chosen for transmitting the data. If any route failure occurs, select an alternative route with minimum distance for delay minimized data transmission.

#### Deterministic Schmidt- Samoa Certificateless Signcryption based secure data transmission

After selecting the route path, secure communication between sensor nodes is performed by applying a Deterministic Schmidt-Samoa certificateless signcryption. It is a feasible cryptographic technique to offer data integrity and identity authentication, which removes the certificate-based signature system. The proposed cryptographic techniques consist of three processes namely key generation, signryption and unsigncryption. To do the secured data transmission between the sender and receiver, the sink node generates the private and public keys. The sender node performs data encryption and signature generation. The cipher text and signature are sent to the receiver sensor node. At the receiver end, the signature verification is performed. If the signature is valid, then the receiver gets the original data after the decryption process. This helps to improve the data packet delivery and minimize pack loss.

#### SIMULATION SETTINGS

In this section, the performance of the SRGDANL-DCS technique, Lightweight replica node detection mechanism [1], FlexCrypt [2], Hybrid ECC-AES model[3] are implemented in the NS3 network simulator. In order to conduct the simulation various simulation parameters are used which are listed in table 1.

## **RESULTS AND DISCUSSION**

The comparative results of the SRGDANL-DCStechnique, Lightweight replica node detection mechanism [1], FlexCrypt [2], Hybrid ECC-AES model[3] are discussed with respect to various evaluation metrics such as attack detection accuracy, false-positive rate, packet delivery ratio, packet loss rate, and an end to end delay. These metrics are described as given below.

#### Impact of attack detection accuracy

The formula for calculating the attack detection accuracy is given below,

 $ACC = \left[\frac{n_{CD}}{n}\right] * 100$ 

(12)

where, 'n' denotes the number of sensor nodes,  $n_{CD}$  indicates the number of sensor nodes correctly classified as normal or attack.

Figure 4 graphical analysis of attack detection accuracy versus number of sensor nodes ranges from 50 to 500. From this result, the attack detection accuracy using SRGDANL-DCStechnique was observed to be comparatively higher than [1] and [2] [3]. The overall performance of attack detection accuracy of SRGDANL-DCStechnique is improved by 9%, 6% and 4% when compared to [1] [2] [3] respectively.

#### Impact of false-positive rate

The false-positive rate is mathematically calculated as given below,

$$FP_{rate} = \left|\frac{n_{ICD}}{n}\right| * 100$$

'n'denotes the number of sensor nodes,  $n_{ICD}$  indicates the number of sensor nodes incorrectly detected as normal or attack.

(13)

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### D.Sudhakar and V.S.Meenakshi

Figure 5 portrays the comparative performance analysis of false positive rateSimulations performed with 500sensor nodes, From this result, the false positive ratewas observed to be reduced using SRGDANL-DCS technique when compared to [1] and [2] [3]. The reason behind the improvement was due to the employment of gradient momentum method in the deep learning classifier. As a result, incorrect classification of normal or attack nodes are minimized. This in turn minimized the false positive rateusing SRGDANL-DCS technique by 61% compared to [1] , 51% compared to [2] and 42% compared to [3] respectively.

#### Impact of Packet delivery ratio:

•	Number of data packets correctly received	] * 100	(14)
$R_{PD} =$	Number of data packets	] * 100	(14)

Where,  $R_{PD}$  denotes a packet delivery ratio. The performance of packet delivery ratio is measured in terms of percentage (%). Figure 6 portrays the comparative performance analysis of packet delivery ratio using number of data packets from 25, 50 ...250. With the selected route path, the secure data transmission is performed by applying Deterministic Schmidt-Samoa certificateless signcryption. This helps to enhance data transmission. This in turn improved the packet delivery ratio using SRGDANL-DCS technique by 11%, 9%, and 6%, whencompared to [1] [2] [3] respectively.

#### Impact of Packet loss rate

The Packet loss rate is measured as follows,

$$R_{PL} = \left[\frac{Number \ of \ data \ packets \ lost}{Number \ of \ data \ packets}\right] * 100 \tag{15}$$

Where,  $R_{PL}$  indicates a packet loss rate and it is measured in terms of percentage (%).

Finally, figure 7 given above shows the graphical representation of packet loss rate. From the above figure it is observed that the packet loss rate was found to be comparatively reduced using SRGDANL-DCS. The average of ten comparison results indicates that the packet loss rate of the SRGDANL-DCS technique is considerably reduced by 62%, 57% and 46% respectively.

#### Impact of End to end delay

The overall delay is measured as follows,  $End - to - end \ delay = [T_{act}] - [T_{obs}]$  (16)

Where,  $T_{act}$  denotes an actual arrival time and ' $T_{obs}$ ' indicates an observed arrival time. The performance ofend to end delay is estimated in terms of milliseconds (ms). As shown in figure 8, the end to end delay of all the methods gets increased while increasing the number of data packets being sent from the source node. But comparatively, the proposed SRGDANL-DCS technique outperforms and significantly decreases the end to end delay. This is because of selecting the normal node and removes the attack nodes. These nodes perform efficient data transmission from sender to receiver with minimum delay. As a result, the comparison of four methods illustrates that the end to end delay is said to be considerably minimized by 33%,28% and 21% when compared to the [1] [2] and[3] respectively.

## CONCLUSION

The rapid growth and large-scale deployment of the WSN have susceptible for a variety of attacks in the data communication. This directs to reduce the confidential data communication between the sensor nodes for different applications. In this paper, SRGDANL-DCS techniqueis introduced for WSNs to improve secure data transmission.

#### D.Sudhakar and V.S.Meenakshi

The simulation is conducted for proposed SRGDANL-DCS technique and existing methods with different performance metrics. The discussed result indicates that the SRGDANL-DCS technique has significantly improved the performance of the attack detection accuracy, packet delivery ratio and minimizes the false positive rate, delay as well as packet loss rate when compared to conventional methods.

# ABSTRACT

Knot theory is the Mathematical study of knots. In this paper we have studied theComposition of two knots. Knot theory belongs to Mathematical field of Topology, where the topological concepts such as topological spaces, homeomorphisms, and homology are considered. We have studied the basics of knot theory, with special focus on Composition of knots, and knot determinants using Alexander Polynomials. And we have introduced the techniques to generalize the solution of composition of knots to present how knot determinants behave when we compose two knots.

**Keywords:** Topology, Knot theory, Homeomorphisms, Reidemeister Moves, Alexander polynomials and Composition of Knots.

# INTRODUCTION

Knot theory is a new kind of applicable Mathematics. Edward E. David, Jr. [3] referred that utility of Mathematics conceived symbolically. The history of Knot theory starts from 19<sup>th</sup> century physics, with the work of Gauss on computing linking numbers in a system of linked circular wires. D. Silver [7] also studied the knots and coined the word topology. In 1867, Kelvin's vortex model of atom by W.T Thompson [8] was presented. The American Mathematician J.W Alexander [1] (1888-1971) was the first to suggest that knot theory is extremely important in the study of 3-dimensional topology which was further underlined by the German mathematician H. Seifert. Later K. Murasugi [5] studied the relationship between algebraic geometry and the knot theory.

### Infant Gabriel and Uma

Knot theory was first presented by the physicist and chemists William Thomson based on the study by Baron Kelvin who hypothesized that atoms of different elements can be defined by different knots. Through Thomson's theory was later proved incorrect, his work inspired Peter Trait, who developed many concepts that are used today in application of knots theory to biology, chemistry and physics. Colin Adams[2].suggested that the knot theory was used in modelling of DNA, the effects of enzymes and in statistical mechanics while examining the interaction between particles in a system. By using more theoretical models, Scientists and Mathematicians can make these concrete concepts to manipulate and work within.

And in this paper, we have studied knots that are embedded in S<sup>3</sup>. A knot can be projected onto a plane (or simply drew it on a paper). These projections are called knots diagrams (Figure.1).

To avoid ambiguity the following restrictions are considered

1. At each crossing, the string segment passes over respectively under the other (this is usually done by drawing a gap in the bottom segment).

2. Each crossing involves exactly two segments of the string.

3. The segments must cross transversely.

4.At each crossing there is always one over strand and one understand.

5. An arc is a piece of the knot that passes from one undercrossing to another with only overcrossing in between (an unbroken line)

The Figure 1 & Figure 2 are projections of the knots.

#### PRELIMINARIES

Basic definitions and concepts are presented in this chapter

### Definition[6]:

*K* is a knot for the embedding  $h: S^1 \to S^3$  whose image is *K*. If  $K \subseteq S^3$  then it is**homeomorphic** to the unit circle  $S^1$ . The actual knot is a smooth embedding of the unit circle in  $S^3$ . A knot can only consist of one component; a link on the other hand is a finite union of disjoint knots.

### Definition[6]:

Knots  $K_1$  and  $K_2$  in  $S^3$  are equivalent if there exist a homeomorphism  $h: S^3 \to S^3$  such that  $h(K_1) = h(K_2)$ 

### Definition[6]:

If *H* is an isotopy between ambient spaces  $H: S^3 \times I \rightarrow S^3$ , then *H* is an **ambient isotopy**. The knot can be deformed to any expected manner. The arcs can be bent and moved through space without passing through one another (knot can be shrunk or grown). Also, it is not permitted to pull the knot so tight that it unknots itself by disappearing into a point.

#### Definition [4]

- 1. *R1* allows to remove (or introduce) a twist in a diagram. The result is that the knot will have one fewer (or one more) crossing.
- 2. **R2**lets separate two strings that lie on top of each other or vice versa. This will add or remove two crossings.
- 3. **R3**allows moving a strand from one side of a crossing to the other. This also works if the strand is moved above the other two strands.

*R3* does not affect the number of crossings in the current projection. If a deformation of the diagram uses *R2* and *R3*, referred as Regular Isotopy (or Planar Isotopy). The regular isotopy is an equivalence relation for the knot diagrams (Figure 3) and is not defined for the knot embedding. The Reidemeister moves describes the procedures performed on diagrams

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Infant Gabriel and Uma

#### Definition[4]:

The crossing number, *c*(*K*) of a knot *K*, is the **minimum number of crossings**, that occur in any diagram of *K*.

#### Definition[4]:

A knot is **oriented** if it has an orientation assigned and refered by arrows. If a knot *K* has a given orientation, -K refers as reverse orientation (Figure 4). A knot is called invertible if *K* and -K are equivalent. All knots in Figure 2 are invertible (Figure 4).

#### Definition [4]

The writhe of an oriented knot, w(K), is the sum of the crossings with signs as shown in Figure 4.

#### Definition [4]

A knot K is called alternating if its diagram, the undercrossing and overcrossings alternate around K.

#### Definition[4]

The knot sum or connected sum  $K_1 \# K_2$  is formed by placing two knots side by side, removing a small arc from each knot and then joining the knots together with two new arcs.

#### Definition[4]:

A knot is called composite if it can be written as the sum of  $K_1$  and  $K_2$ , neither of which is the unknot and prime if it is not composite. Knot tables only show prime knots, see Figure 2.

#### COMPOSITION OF KNOTS

Given two projections of knots, a new knot obtained by removing a small arc from each knot projection and then connecting the four endpoints by two new arcs as in Figure 1.5. The resulting knot is the composition of the two knots. If we denote the two knots by the symbols  $K_{4_1}$  and  $K_{3_1}$ , then their composition is denoted by  $K_{4_1} \# K_{3_1}$  (Figure 5).

The two projections should not overlap, and the two arcs are chosen to remove the outside of each projection to avoid any crossings i.e., they do not cross either the original knot projections or each other (Figure 6).

#### Definition

A knot a composite knotif it can be expressed as the composition of two knots, neither of which is the trivial knot. The knots that makeup the composite knot is called factor knots. The composition of a knot K with the unknot, the result is again K. (Figure 7). If a knot is not the composition of any two nontrivial knots, we call it a prime knot.

#### Definition

An orientation is defined by choosing a direction to travel around the knot. The orientation on  $K_{3_1}$  matches the orientation on  $K_{5_2}$  in  $K_{3_1} \# K_{5_2}$ , resulting in an orientation for  $K_{3_1} \# K_{5_2}$ , or the orientation on  $K_{3_1}$  and  $K_{5_2}$  do not match up in  $K_{3_1} \# K_{5_2}$ . If the orientations do match up in all the compositions of the two knots then it will yield the same composite knot. If the orientations do match up in all the compositions of the two knots then it will yield the single composite knot.

### Infant Gabriel and Uma

#### THE ALEXANDER POLYNOMIAL OF COMPOSITION

In 1928, J.W Alexander [4] introduced polynomial invariant to compute the knot diagram entries of a matrix determinant called the Alexander polynomial. Alexander determined the entries of a matrix from the crossing and arcs of the diagram. The Alexander polynomial does not depend on the indexing of crossing and arcs. It does not also depend on the row and column eliminated from the crossing/arc matrix. The Skein relation discovered by John Conway in 1969 is to compute the Alexander polynomial. The Alexander polynomial is invariant up to multiplication by  $\pm t^N$  where N is some integer.

#### Numerical Example

Composition of two knots  $K_{3}$ , #  $K_{1}$  (Figure 9)

Applying the condition of Alexander polynomial in above composition knot knots  $K_{3_1} \# K_{1_1}$  (Figure 10) we get,

$$M_{K_{3_{1}}\#K_{1_{1}}} = \begin{bmatrix} 1-t & 0 & -1 & t \\ t & 1-t & 0 & -1 \\ 0 & -1 & t-t^{2} & 0 \\ -1 & t & 0 & 1-t \end{bmatrix}$$

The Alexander matrix  $A_k$  is defined as the matrix M by deleting row n and column n, where

$$A_{K_{3_1} \# K_{1_1}} = \begin{bmatrix} 1-t & 0 & -1 \\ t & 1-t & 0 \\ 0 & -1 & t-t^2 \end{bmatrix}$$

The Alexander polynomial  $\Delta_k(t)$  of a Knot K is the determinant of its Alexander matrix, which is

$$\Delta_{K_{3_1} \# K_{1_1}} = 2t - 3t^2 + 3t^3 - t^4$$

Finally, the resulting determinant is multiplied by  $t^{-1}$  to normalize the Alexander polynomial in order to have a positive constant term.

Thus  $2 - 3t + 3t^2 - t^3$  is the Alexander Polynomial of this Composition of Knot  $K_{3_1} \# K_{1_1}$ .

We observe that Alexander polynomial for compositions of  $K_{3_1}$  and  $K_{1_1}$  is  $2-3t+3t^2-t^3$ . Similarly the composition of  $K_{3_1}$  and  $K_{2_1}$  is  $3-t^{-1}-5t+5t^2-t^3$ .

- >  $K_{4_1} \rightarrow K_{1_1}, K_{2_1}$  are found to be  $1 3t + 4t^2 2t^3$  and  $2 + t 8t^2 + 8t^3 4t^4 + t^5$  respectively. >  $K_{4_1} \rightarrow K_{4_1}, K_{4_2}$  are found to be  $1 - 3t + 4t^2 - 2t^3$  and  $2 + t - 8t^2 + 8t^3 - 4t^4 + t^5$  respectively.
- $K_{5_1} \to K_{1_1}, K_{2_1} \text{ together to form } 2 5t + 2t^2 7t^3 + 5t^4 t^5 \text{ and }$  $3 - t^{-1} - 9t + 12t^2 - 14t^3 + 10t^4 + 2t^5.$
- ►  $K_{5_2} \to K_{1_1}, K_{2_1}$  are joined to be  $2 t^{-1} 5t + 7t^2 6t^3 + 2t^4$  and  $1 - t^{-1} - 2t + 7t^2 - 10t^3 + 6t^4 - 2t^5$ .
- $K_{6_1}, K_{6_2}, K_{6_3} \to K_{1_1} \text{ are found to be } 4 10t + 4t^2 + 7t^3 8t^4, 2 2t 3t^2 + 3t^3 + 2t^4 2t^5 \text{ and } 1 3t + 2t^2 + 2t^3 2t^4.$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Infant Gabriel and Uma

### CONCLUSION

Knots have always been an integral part of real life and have found Mathematical uses recently. As we can also visualize the application of compositions of knots in DNA replication, in this paper we have explained a brief about the composition of knots. Algebraic area is more important in knot theory and it involves drawing comparison between two knot compositions, hence we have applied the Alexander polynomial to get different polynomial for compositions of knots for  $K_{3_1} \# K_{1_1}, K_{3_1} \# K_{2_1}$ .....etc.. And in future we will extend the compositions of knots for

 $K_{6_2} \# K_{2_1}, K_{7_1} \# K_{1_1}$ .....etc.

# ABSTRACT

A global coordinated effort is needed to stop the further spread of the virus. A pandemic is defined as "occurring over a wide geographic area and affecting an exceptionally high proportion of the population." The last pandemic that was reported in the world was the H1N1 flu pandemic in 2019. In the current COVID-19 situation, the digital payments sector witnessed a decline of ~30 per cent in the transaction value, and recent data made available from National Payments Corporation of India (NPCI) attest to a sharp decline observed in the months when lockdowns were initiated in impact of covid 19. The Covid-19 pandemic accelerated the digitalisation of payments. The latest Red Book Statistics from the BIS Committee on Payments and Market Infrastructures (CPMI) show that consumers have shifted from physical cash to digital and contactless payment instruments at a rate unprecedented since the start of the Red Book Statistics

**Keywords:** Covid-19, Electronic payment, National Payments Corporation of India (NPCI) & Red Book Statistics from the BIS Committee.

# INTRODUCTION

The World Health Organisation (WHO) has declared the corona virus disease 2019 (COVID-19) a pandemic. A global coordinated effort is needed to stop the further spread of the virus. A pandemic is defined as "occurring over a wide geographic area and affecting an exceptionally high proportion of the population." The last pandemic that was reported in the world was the H1N1 flu pandemic in 2009.

#### Sivakumar

Digital payment is a form of payment that is made through electronic means. Both the payer and the payee use digital modes to send and receive money in digital payments. It is also called electronic payment. In recent months, all of us have heard extensively about the "war on cash", the move to make India and other countries "cashless economies" and the general trend among policymakers worldwide to move the economies of the world to a digital and information enabled paradigm. In this context, it is worth noting that the emphasis laid on digital payments and the digitalization of commerce has implications for individuals, businesspersons, governments, and anyone and everyone who is a participant in the economy.

It is important to understand what digital payments are and how they work and how they benefit the economy as well as the associated problems that occur from using such modes of transactions and commercial dealings. Digital Payments are payments that are conducted over the internet and mobile channels and hence, any payment that is sent online or through mobile computing and internet-enabled devices can be called such. This means that, for digital payments to take place, the sender of the payment must have a bank account, an online banking method, a device from which he or she can make the payment, and a medium of transmission meaning that either he or she should have signed up to a provider or an intermediary such as a bank or a service provider. Apart from the sender having such means, the receiver of the payment too must have these ways to accept payments.

# **REVIEW OF LITERATURE**

Dr. Rajeshwari M (May-June 2019), This article explaining the operating cost of banks has been significantly decreased by Digital Banking. This has made it easier for banks to charge lower service fees and provide higher interest rates for depositors as well. The V. Achutamba1, et.al 4396 © 2021 JPPW. All rights reserved decrease in operational costs meant more benefit for the banks. This paper covers the role of digitization in Indian banking, factors that affect the scope of digital banking in India, and trends in digital banking in India. Data were derived from a number of sources, such as journal journals, government publications from India, and various RBI databases. The study also showed that the simple use of digital banking would drive the integration of the unbanked economy into the mainstream.

Jayalakshmi. S and Parvathi. S (July 2019) This article showed that digital payment is an effective means of doing business of all sectors to reach out to prospective clients and to examine the idea of digital banking, digital payment and digital payment methods. Digital payments have many benefits over cash, such as simplicity, security and clarity. In the next few years, there will be a whole new way of transferring capital in the Indian economy.

V. Sornagnesh (October 2020), titled "Impact of Covid-19 Outbreak in Digital Payments" had conveyed that "It is too early to conclude what the changes on the digital payments might look like in each cultural, demographic, and institutional context, but we can be sure that covid-19 is already reinforcing existing trends towards increased digitalisation of payments. The Reserve Bank of India said it aimed to increase digital payment transactions to about 15% of GDP by 2021, from nearly 10% during that time. The government is aiming for a billion digital transactions per day as the world is fast growing and smart phone market empowers consumers to transact at the click of a button. The Indian government has asked banks to encourage their customers to use digital payment methods as a precautionary measure against the Corona virus outbreak. RBI has also urged customers to use digital banking facilities amid the Corona virus outbreak."

M. Thangajesu Sathish, R. Sermakani, G.Sudha (May 2020) titled "A Study on the Customer's attitude towards the E-Wallet Payment system" had inferred that "E-wallets are rapidly growing and gaining importance, acceptance as a mainstream mode of payment and in near future it will hold a significant share as a mode of payment for sure going online as well as offline business. Their study indicated that main reasons for low preference of E-wallet as mode of payment are tendency of people to do not move out of comfort of using traditional mode of payments. E-wallet users give very high level of importance to attributes like security, privacy concerns and pricing (Fees). The major

#### Sivakumar

problems frequently encountered by the people while using E-wallet are long transaction time taken by E-wallet for processing the transaction, security breach and delayed payment. Therefore, people can adopt and use their mobile wallets for the payment transaction, fund transfer, purchasing groceries and paying bills etc."

V. Achutamba1, Dr. CH. Hymavathi (2021) tilted "Impact of Covid-19 on Digital Payments in India" COVID-19 brought change in the method of payment from traditional to digital payments. Though people have been facing few issues and might have a problem in trusting the digital payments but still they definitely will switch to digitalized payments once certain steps are taken. COVID-19 has definitely made us take a step forward towards digitalization due to people not wanting to use cash as much in any of the payment methods. There have been concerns over the transmission of the COVID19 through the exchange of cash.

#### **OBJECTIVES OF THE STUDY**

- 1. To analyse the preferred mode of payment by the respondents before lockdown and after lockdown.
- 2. To study the factors motivating the customers to use digital payments.
- 3. To interpret the satisfaction level of customers towards digital payments.

#### SCOPE OF THE STUDY

Before the pandemic struck, the payment industry has been quite dynamic over the past few years. The Corona Virus outbreak, and the subsequent global recession, will take forever to transform the way in which people are paid and the way they make payments as well. At a surface level, paper checks, which accounted for nearly half of all payments at the beginning of the pandemic are being replaced with digital payment options. But these changes run even farther. Post demonetization, people gradually begun embracing digital payments to an extent where small time merchants and shop owners too begun accepting payments through the digital mode. The covid-19 pandemic situation has had the ability to move the world more rapidly towards digital payments simply because it's more comfortable, easier and safer. The purpose of this study is to find out people preference of the mode of payments before and after the pandemic. Satisfaction level and the effectiveness of the current digital payment options are also assessed in this study. Impact of COVID19 on the digital payments is also studied. Every mode of transactions has its pros and cons, the issues faced by the general public is assessed and also interpreted in this study.

#### LIMITATIONS OF THE STUDY

- 1. The area of study is limited to cities (Coimbatore).
- 2. The information given by the respondents might be biased.
- 3. Today's findings may not hold true for the future
- 4. This study is only limited to 150 responses.

# **RESEARCH METHODOLOGY**

**Primary Data:** The primary data for this study is collected by circulating a questionnaire among the general public to know the effects of the pandemic on digital payments.

Secondary Data: Research articles, Authenticated Websites, bulletins of RBI, and Daily's.

- 1. Sample size 150 respondents.
- 2. Sample area Coimbatore city
- 3. Sample technique Convenience sampling.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Sivakumar

#### Statistical tools used

- Percentage
- Correlation
- Chi-square
- Annova

#### Interpretation

From the above, it is inferred that significant value is .009 which is more than 0.05, so null hypothesis is accepted. From this test it can derive that annual income is not associated with the preference of digital payments.

#### ANOVA

#### Table No. 2 Genders and Convenience of Digital Payment

Null Hypothesis (H0): There is no significant difference between gender and Convenience of Digital payments over Cash

Alternate Hypothesis (H1): There is significant difference b between gender and Convenience of Digital payments over Cash

#### Interpretation

From the above table, it is concluded that the significant value falls to be .038, which is above 0.05. Hence, the null hypothesis is accepted. It can be concluded that there is no significant relationship between gender and Convenience of Digital payments over cash

#### Table No. 3 Age and Frequency of using Digital Payments during Covid -19

Null Hypothesis (H0): There is no significant difference between age and frequency of using digital payments during COVID -19

Alternate Hypothesis (H1): There is a significant difference between age and frequency of using digital payments during COVID -19

#### Interpretation

From the above table, it is concluded that the significant value falls to be .062, which is above 0.05. Hence, the null hypothesis is accepted. Thus, it can be concluded that there is no significant relationship between Age and frequency of using digital payments during COVID -19

#### CORRELATION

To test the correlation between the volume of transactions and employment status.

#### Interpretation

The correlation between the volume of transaction and employment status is 0.086, which is less than 1, which shows there is a significant relationship between the volume of transaction and employment status. There is a relationship because, earnings of people play a role on their volume of transactions.

### FINDINGS

- It can be concluded that the volume of transaction influences the respondent's choice towards making digital payments.
- > It can be concluded that the majority of respondents are satisfied with working of internet banking.

### Sivakumar

- > It is inferred that the majority of respondents are satisfied with working of mobile banking
- > It is found that people's frequency of payments through digital payments have increased during COVID-19
- > It is inferred that the majority of respondents only use UPI the most followed by banking cards.
- > It is inferred that the majority of respondents are satisfied with working of internet banking.
- It can be concluded that annual income is not associated with the preference of digital payments (Chi Square Test).
- It can be concluded that there is no significant relationship between gender and Convenience of Digital payments over Cash (ANOVA).
- It can be concluded that there is no significant relationship between Age and frequency of using digital payments during COVID (ANOVA).
- It is inferred that there is a significant relationship between the volume of transaction and employment status (Correlation).

# SUGGESTIONS

- Many consumers are still wary about using digital payments, but if companies can educate their customers on the security advantages of digital payments, more consumers will be comfortable with the new form of payment
- Companies and banks have to increase their security level and educate their customers about the digital payment options
- More consumers are willing to switch their primary cards if it means that they can receive higher return values, which is why a built-in rewards system can be so enticing. However, when it comes to earning and redeeming rewards, consumers desire simplicity. To make digital payments more effective, allow consumers to redeem rewards at the point-of-sale terminal so that they can benefit even faster.
- Companies have to standardize browser and device support. As with password management, different browsers and devices use different mechanisms for storing credit card information and automatically supplying that information when prompted by apps and Web pages. Some standardization would help.
- Redirects should be avoided and payments should be faster.

# CONCLUSION

The negative consequences of the COVID-19 pandemic are trickling right down to major sectors of the Indian economy, this in turn has played a major role in affecting fast- growing digital payments which are closely linked to the aforementioned sectors. Shops shut, travel bans and reduced discretionary spent by consumers (on dining out, movies and entertainment then on) are further negatively impacting digital payments. These include online grocery shops, OTT (telecom and media) players, EdTech, online gaming, utility/bill recharges and payments.

Digital payment rates are also obtained mostly by government, which has pledged monetary support to the poor through direct transfers to the appropriate bank accounts. In these days, digital payments, once a convenience, have become a necessity. It is too early to assess the long-term effect of COVID-19 on digital payments, with many of the industries that relate to digital payments still in a state of flux. The effect was profound and substantial, but not irreparable. Elements on the payment ecosystem are most adaptable to disruption and least dependent on physical infrastructure have been able to withstand, mitigate and even so far as capitalize the crisis, turning an imminent threat into their advantage. So conclude that, the impact of Covid-19 on digital payments has been complex and multi faced. In a shorter run, there has been significant increase in the digital payments. The effect of longer run will take some time to assess and derive.

# ABSTRACT

**Objective:** The current study was designed to explore antianxiety and antidepressant actions of *Crysanthemum morifolium* ramat flower (Methanolic extract) in mice. Procedures of anxiety and depression were assessed in swiss albino mice. CM(125, 250, and 500 mg/kg) was given once a daily for 7 days via i.p route and the efficacy was matched by those elicited by Diazepam (5 mg/kg, i.p.), imipramine (15 mg/kg, i.p.), for anxiolytic, antidepressant studies, respectively. Standard drugs were given 1 time, 30 min preceding the behavioral trials. One-way analysis of variance followed by Newman-Keuls multiple comparison test was employed to analyze the results. P < 0.05 was considered statistically significant as compared to control. CM at 500 mg/kg produced an antianxiety effect equivalent to Diazepam, in the elevated plus maze, open field, and social interaction tests among selected doses of the CM. CM at 500 mg/kg also induced an antidepressant activity similar to imipramine, in the behavioral days that among the different CM doses, CM at 500 mg/kg possesses significant anxiolytic, antidepressant and has therapeutic beneficial for the management of psychological ailments.

**Keywords:** Antidepressant; antianxiety; *Crysanthemum morifolium;* behavioral tests; diazepam; imipramine

Priyanka Manoharan et al.,

# INTRODUCTION

Anxiety and depression and are the most predominant psychological diseases globally. The estimated range of their occurrence among adolescents across the globe is from 5% to 70%. [1] Implausibly, women are more affected by this unwellness rather than men. [2] *Chrysanthemum morifolium* Ramat is known to have antioxidant, antiinflammatory, antimutagenic, antimicrobial, antifungal, antiangiogenic and nematocidal properties .This plant is also known to produce flavonoids of medicinal value. The literature survey suggests that the neuropharmacological effects of CM were not studied at the time of conceptualization of this investigation. Therefore, we proposed to explore the antidepressant, antianxiety activity of the CM flower extract on rodent models and compared the efficacy to standard drugs.

# MATERIALS AND METHODS

#### Animal

Swiss albino mice (male: 20-25g) were used in the present study. The animals were produced from disease free animal house, ultra-college of pharmacy, Madurai, Tamilnadu, India. They were provided normal diet and tap water and libitum and were exposed to 12-h light and 12-h dark cycle. The studies were conducted accordance with the ethical committee and all the animals were sacrificed by euthanasia method. The mice were placed in poly propylene cage and were allowed to acclimatize one week prior to treatments. All studies were carried out in accordance with the guidelines provided by the Committee for the Purpose of Control and Supervision of Experiments on Animals, India. The Experimental protocol was approved by the Central Animal Ethical Committee.

#### Plant Material and Preparation of the Extract

A total of 125gm of powdered *Chrysanthemum morifolium* Ramat flower was collected from nursery garden Erode tamilnadu. The samples flowers were finely powdered without any impurities mixed in them. After collection they were stored at the laboratory at room temperature. The methanolic extracts were collected in the same way as the ethanolic extracts. 250g of powdered sample was weighed in the weighing machine and packed in the soxhlet apparatus with 250ml methanol. As the methanol boiled the extract was slowly collected in the flask below. The temperature here too was solvent was recovered. The final solution was evaporated to dryness. The colour, consistency and yield of Methanolic extract were noted.

#### Drugs

Imipramine is a standard antidepressant drug. This was a gift sample from Sun Pharmaceutical Industries Ltd., India. Lorazepam is reference standard for antianxiety effect it was provided by Intas Pharmaceutical Ltd., India, as a gift sample. All chemicals used in the present study were of analytical grade and were obtained from Sigma Chemical Co. and Merck.

#### **Experimental Protocol**

Swiss albino mice (male: 20-25g) were used in the present study. The animals were produced from disease free animal house, jkkm college of pharmacy, namakkal, Tamilnadu, India. They were provided normal diet and tap water and libitum and were exposed to 12-h light and 12-h dark cycle. The studies were conducted accordance with the ethical committee and all the animals were sacrificed by euthanasia method. The mice were placed in poly propylene cage and were allowed to acclimatize one week prior to treatments. They were grouped into five, containing six animals each group.

- Group I: Control (10 mL/kg/p.o.)
- Group II: Standard drugs (lorazepam 10 mg/kg, imipramine 15 mg/kg)
- Group III: CMME 125 mg/kg/i.p
- Group IV: CMME 250 mg/kg/i.p

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Priyanka Manoharan et al.,

#### • Group V: CMME 500 mg/kg/i.p

CM dose was selected on the basis of randomization and was administered in distilled water to Groups (III, IV, and V) at 125, 250, and 500 mg/kg orally, once in a day for 7 days. The control group (Group I) received an equal volume of distilled water. Standard drugs were also employed to Group II accordingly in each set of protocol and were dispensed orally to animals 1 h before the experiments. On day 7, animals were subjected to behavioral studies.

#### Behavioral Evaluation Anxiolytic activity Elevated plus maze

The elevated plus maze consist of two open and two enclosed arms of 50 x10 x 40cm dimensions, with an open roof arranged in such a manner that the two open arms are opposite to each other. The maze is elevated to a height of 50 cm. The mice weighing (20-30 kg) are housed in pairs for 10 days prior to testing During this period they are handled by the investigator on alternate days in order to acclimatize than reduce stress. Four mice are taken for each test group. The test drug and the standard are administered 30min prior experimentation by i.p. route. The mice are then placed in the centre of the maze facing one of the enclosed arms. During the next 5 minutes the number of entries into and the time spent in the open and enclosed arms and the total number of arm entries is recorded. The procedure should be conducted preferably in a arm sound-proof room. The values of treated groups are expressed as percentage of control groups in terms of motor activity and open arm exploratory time. Benzodiazepines have been shown to de decrease motor activity and increase open arm exploratory time. Though the method is time consuming considered as reliable measure of anxiolytic activity.

#### Light and dark model

The testing apparatus consists of a light and dark chamber divided by a photocell equipped zone. A polypropylene animal cage. 44x21x21cm, is darkened with black spray over one third of its surface. A partition containing a 13' cm long x 5 cm height opening separate the dark one third from the bright two third of edge. Extract / vehicle and standard drug is administered through per i.p. route. 30minutes after i.p. administration the mouse are placed individually on the light compartment and observe for a period of 5 min. Number of rearing, number of locomotion, time spent in light and dark zones and number entries in light zone are observed during this observation period

#### Open field test

The open field apparatus is made up plywood consist of 56x56 (1xb) cm. the entire apparatus is painted black and 6 mm thick white lines divided the floor in to 16 square of identical dimension. Open field is lightening by 40 w bulb focusing on to the field from the height of about 100cm. The entire room, except the open field is kept dark during the experiment. One hour after the drug treatment, each animal was placed at once corner of the apparatus and the following behavioral aspects were noted in the next 5min.

Latency: time taken by animal to leave square in which it was placed

Ambulation: Number of square passed by animal

Rearing: Number of times animal stood on its hind legs

#### Antidepressant activity

#### Forced swim test

Swiss albino mice weighing 20-30g are used. They are brought to the laboratory at least one day before the experiment and are housed separately in cages with free access to food and water. Swiss albino mice are individually forced to swim inside a vertical Plexiglas cylinder (height; 40 cm; diameter; 18 cm, containing 15 cm of water maintained at 25c. Mice placed in cylinder for the first time are initially highly active, vigorously swimming in circles, trying to climb the wall or diving to the bottom. After 2-3 min activity begins to subside and to be interspersed with phases of immobility or floating of increasing length. After 5-6 min immobility reaches a plateau where the mice immobile for approximately 80% of the time. After 15 min the water the mice are removed and allowed to dry in a heated enclosure (32 C) before being returned to their home cages. They are again placed in the cylinder 24 h later and the total duration of immobility is measured during a 5 min test. Floating behaviour during

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Priyanka Manoharan et al.,

this 5 min period has been found to be reproducible in different t group of mice. An animal is judged to be immobile whenever it remains floating passively in the water in a slightly hunched but up or standard are administered one hour prior testing. Duration of immobility is measured in controls and animals treated with various doses of a test drug or standard, anti-depressant drugs, but also stimulants like caffeine, reduced duration of immobility. The response can be evaluated.

#### Tail suspension test

Each rat in the group was hanged by the tail (50 cm above the floor) with an adhesive tape to a cord in an upside down position so that its nostrils touch the water surface in a vessel. After the early escape oriented actions, the rat rapidly turns out to be immobile, and the immobility period (the absence of initiating movements and includes passive swaying) was recorded during 5 min observation period. Results of this study were statistically analyzed by Graph Pad Prism 5 software. The data were expressed as a mean  $\pm$  standard error of mean. The data from various groups were statistically analyzed using one-way analysis of variance, followed by *post hoc* Tukey's multiple comparisons test. *P* <0.05 was considered statistically significant.

# RESULTS

The extract obtained were subjected to qualitative Phytochemical test to find out the active constituents is shown in table 1. Acute toxicity studies and evaluation of datas are studied as per the guideline of OECD (423). No toxicity or death was observed for these given dose levels, in selected and treated animals. So the LD<sub>50</sub> of the Methanolic extract of flowers of *Chrysanthemum morifolium* was greater than 2000mg/kg (L<sub>50</sub>>2000mg/kg).Hence the biological dose was fixed at three levels, 125,250 and 500mg/kg body weight for the extract. The effect of methanolic extract of CM on EPM test shows significant anxiolytic activity is shown in table 2and the comparative activity is shown in fig 1-4.

The effect of methanolic extract of *Chrysanthemum morifolium* on light and dark model shows in table 3 having potent anxiolytic activity as compared with standard and the comparative data shows in fig 5. The effect of methanolic extract of *Chrysanthemum morifolium* on immobility of mice in forced swim test shown in table 4 and comparative percentage of reduced immobility is shown in fig. 6. The effect of methanolic extract of *Chrysanthemum morifolium* on immobility of mice in table 5 and comparative duration of immobility of tail suspension test shown in table 5 and comparative duration of immobility of tail suspension test is shown in fig. 7.

# DISCUSSION

#### The EPM test

The methanolic flowers extract of *Chrysanthemum morifolium*, at 125mg, 250 and 500mg/kg, had increased the time spent and percent of entries in to the open arm with percent of entries in to the open arm with percent decrease the in the spent in closed arm. The dose methanolic extracts of *chrysanthemum morifolium*125mg, 250 and 500mg/kg had increase percent number of entries in to the open arm as compared with control group. In case of rearing there is no much significant difference has been control group with the dose 125, 250mg and 500mg, the time spent the neutral zone is also reduced compared to control groups'. This decrease in number of entry and time spent in dark zone and decrease in the time spent in neutral zone compared to control groups show anxiolytic activity of flowers extract of *Chrysanthemum morifoliumramat.*(3)

Diazepam 1mg/kg and shown significant effect with all four parameters. Number of entries in light zone and time spent in light zone increased as compared to control group with 125, 250mg/kg and 500mg/kg dose of both extract. There is increase in number of rearing and in total locomotion as compared to control group. An increase in locomotion and time spent in light zone indicates anxiolytic activity of the methanolic flowers extract of *Chrysanthemum morifoliumramat.(4)* 

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Priyanka Manoharan et al.,

#### In the Open Field Model,

125, 250mg/kg and 500mg/kg to decrease the time spent in square where it where it was placed and time taken to enter in central compartment as compared to control group. Results obtained from all the doses showed increase the spent in central compartment and increase number of square crossed by the animal which shows decrease in fear of animals, indicates the anxiolytic activity of the methanolic flowers extract of *Chrysanthemum morifolium Ramat.*(5)

#### In the force swim test,

The methanolic extract 125, 250mg/kg and 500mg/kg showed the significant antidepressant activity in term of responding to the stress in experimental studies that they exposed in force swim test showed decreased the immobility, to the response indicate the antidepressant activity of the methanolic extract of flowers of *Chrysanthemum morifolium Ramat*.

#### Tail suspension test,

The methanolic extract 125, 250mg/kg and 500mg/kg showed the significant antidepressant activity in term responding to the stress in experimental studies they are exposed in tail suspension test showed the animal struggled to escape and the struggling time was increased, to the response indicate the antidepressant activity of methanolic extract of flowers of *Chrysanthemum morifoliumRamat.(6-7)* 

### CONCLUSION

The methanolic extract of *Chrysanthemum morifolium* flowers possess a combination of activities like produce antianxiety and anti-depressant. The extract is bind with highly affinity BZD site GABA –A receptor. From above observation, we can conclude that methanolic extract of *Chrysanthemum morifolium* possess the Antianxiety and Antidepressant activity for both dose level which comparable with the standard drugs (Benzodiazepine). The investigation demonstrated that CT at 500 mg/kg possesses significant anxiolytic and antidepressant effects and is therapeutically beneficial for the management of psychological ailments.

# ABSTRACT

The particles having size 1-100 nm in length is considered as nanoparticles (NP) and the application of such particles is termed as Nanotechnology. Nanotechnology is developing very fast with applications in various industries and also in detection and treatment of diseases. Although showing beneficial results, nanotechnology is mingled with adverse effects and toxicity. Hence it is of utmost importance to undertake in depth studies dealing with NPs and undergo detailed toxicological studies before NPs enter into the market for human application. The present review describes various types of NPs and their methods of preparations and ways of detection through modern techniques. The present review describes the toxic properties of NPs in various parts and organs of human body.

**Keywords:** Nanoparticles, synthesis and types, toxicological effects, inorganic nano and organic nano, nano emulsions.

# INTRODUCTION

Nanoparticles (NPs) are the particles having size 1-100 nm in length. NPs show variable properties depending on their size and surface functionalities (1). A small size and large surface area NPs have applications in various industries like, agriculture, cosmetics, electronics, medical therapeutics, diagnostics, and research appliances (2). Especially the polymeric NPs, nano emulsions, liposomes and solid NPs have potential clinical applications (3). The use of NPs escalated in last decade due to availability and development of so many techniques to detect its size.

### Surajit Majumder et al.,

Some of these techniques include scanning tunneling microscopy, scanning transmission electron microscopy, tandem electron microscopy (4-6). NPs can be prepared in the laboratory and may also be present as a biproduct in many events, e.g., engine exhaust (7, 8), cigarette smoke (9), e-cigarette fluid and aerosols (10), cooked food (11), and numerous spray products (12).

Despite potential uses in the clinical fields, a number of studies suggest that the NPs can be toxic too. Following exposure, NPs accumulate in the cells and induce organ specific toxicity; the most common exposure occurs through inhalation in the manufacturing workplace as well as the exhaust of fumes or spray (13,14). Other than these routes, NP exposer occurs through skin contact (e.g., creams and cosmetics), ingestion (e.g., food color, packet), and occasionally through intravenous (iv) pathway required for medicinal purposes (15-16. Considering the adversities, strict guidelines are required to ensure the proper designing of safe NPs having minimal toxicity. The present review briefly describes the types and uses of NPs in different industrial sectors and also summarizes its toxic effect in cellular level.

#### Different types of nanoparticles and their applications

On the basis of the composition NPs can classified into three major categories,

**Organic NPs**: The nanoparticles which are made of organic compounds, like carbohydrate, protein, lipids and polymers (17). The most common types of organic NPs are liposomes, micelles and ferritin. These organic NPs are bio-degradable, nontoxic and mostly used for the targeted drug delivery and cancer therapy (18, 19). Liposomes are the classical examples of organic NPs consisting an aquas core surrounded by phospholipids and cholesterol bilayer. Liposomes have high encapsulation capacity and high circulation time. Hence liposomes accumulate at specific site of diseases. For example, the outer layer in the tumors is composed of lipids having high cellular permeability where endothelial layer and lymphatic system is lacking. In recent era, liposomes are considered to be the most common drug delivery system for clinical trial of several FDA approved drug (20). Early developed liposomes had very short half-life and easily could remove by the reticule endothelial system. This limitation has been overcome by conjugation of the polymers like polyethylene glycol (PEG), saturated high-phase transition lipids and resulted in generation of stabilized long life 'Stealth liposomes' (21).

**Inorganic NPs**: These classes of NPs are made of metals and metal oxides. They are like, metal, ceramic and semiconductor NPs. The metallic NPs are formed from metal precursors and can be classified into mono metallic, bimetallic and polymetallic, based on the metallic precursor used (22, 23). These NPs possess unique optical, electrical, thermal, magnetic and biological properties; thus, they can be used in several physical, biological, chemical and pharmaceutical applications. The most common solid metallic NPs are gold NPs and silver NPs. Depending on the size, shape and surface properties of gold NPs; it can be used as cancer diagnostics and radiotherapy (24). Silver NPs have unique properties of absorbing and scattering light, thus this is used as biosensors. Silver NPs also used in electronic devices, textiles, wound dressings, antimicrobial coatings and biomedical devices (25, 26).

Ceramic NPs are made of carbonate, carbide, phosphate and oxides of metal and metalloids. These are found in different forms, like amorphous, polycrystalline, dense, porous or hollow (27). Ceramic NPs are stable and also have high load capacity (28) and therefore, can be used in biomedical applications, catalysis, degradation of dyes, protomorphic and optoelectronics applications (29). The most common example of this type of NPs is iron oxide. Iron oxide NPs are solid and have a superparamagnetic property, thus heavily used in the magnetic resonance imaging (MRI) (30). Iron oxide NPs also used in various diagnostics and imaging techniques as a biosensor due to their unique optical properties. Semiconductor NPs are made up of semiconductor materials and possesses unique wide bandgaps, which make it different from the other semiconductor materials (27). These NPs are commonly used in the photocatalysis, optic and electronic devices (31, 32).

**Carbon based NPs**: Carbon NPs are solely made up of carbon atoms which are bonded with sp<sup>2</sup> hybridized carbon bonds. The most common examples are Fullerenes, Carbon nanofibers, Graphene, Carbon nanotubes, Carbon black.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Surajit Majumder et al.,

Fullerene is made up of 60 carbon atom molecules arranged in a ball like structure. Carbon black are formed by aggregate of highly fused spherical particles. Carbon based NPs have their unique properties of high strength, electrical conductivity, electron affinity, optical and thermal properties (33,34). Due to such unique characteristics, carbon-based NPs are used for drug delivery, energy storage, bioimaging and tissue engineering applications (35-38). Other than these three major types, NPs can be categorized as polymer-based NPs, and nano emulsions based on their nature.

**Polymer based Nanoparticles**: Polymer based NPs are widely used as drug carrier for control and sustain release. In case of polymer-based NPs, encapsulated drug was incorporated into the matrix of the polymer (39). Commonly used polymer bases NPs are ploy lactic glycolic acid and chitosan. Due to their biocompatibility and biodegradable nature, both are being FDA approved for the clinical use (40, 41).

**Nano-emulsions:** Nano-emulsions (NEs) are the colloidal dispersions composed of either oil nanodroplets dispersed in water or water nanodroplets dispersed in oil. These are commonly used as a drug carrier molecule with limited water solubility, such as delivery of vaccine and anti-cancer agents (42). Thermodynamic stability of the NEs depends on the size and most stable size is 20-200 nm (43). To increase the stability, surfactants are incorporated into of the NEs.

#### **Toxicological effect of NPs**

The uses of the NPs have increased tremendously in last decade in different applications, like diagnosis of disease, medical imaging, targeted drug delivery, gene therapy and other industrial applications. The exponential increase of the use of NPs occurred due to its useful nature but still the toxicological effect of NPs following exposure remains unexplored. Hence, the lack of knowledge in this field invokes the ethical responsibility to take necessary precaution and minimize their exposure in both occupational and environmental (44) field.

The reminder of this review focused on the toxic effect of the NPs. The toxic effects of some NPs in use are fairly known and moreover, the toxic effects of most of the NPs are not completely understood. There is insufficient information correlating NP induced toxicity to exposure in humans. Many NPs can cause oxidative stress and interact with cellular macromolecules. On the other hand, a few NPs also cause high pulmonary inflammatory response (45, 46). The toxic effect of NPs is dependent on their size and surface area and also the route of uptake and accumulation.

#### Different routes of exposures

In case of human, the exposure of NPs can occur through ingestion, injection, inhalation and skin contact. The toxicity in different organs depends on the route of exposure. Some of the exposure is unintentional, such as the inhalation of the NPs in work places that leads to tissue damage in the lung (47, 48). On the other hand, some exposures are intentional, like application of the skin product topically and through injection.

#### Exposure through the skin

Skin is the largest organ of the human body and plays a barrier for many toxic materials. The skin is one of the major routes of administration and exposure of NPs present in different cosmetics, cream. The permeability of the skin to these NPs is still not clearly known (49). The vast use of the NPs based cosmetics resultant in high exposure through skin and ultimately reaches to the blood circulation. The penetration of the NPs can occur through the follicular cell, sweat gland (50, 51). For the example, Titanium dioxide nanoparticles are widely used in the dermatological applications. These can cause the cell death. Reports also disclose that the NPs can cause the organ damage due to its accumulation in the organ followed by the absorption through the skin (52). The skin is also a major route of NPs exposure which mostly occurs in welding fumes, during the natural gas and oil production, and also during the NPs manufacturing; such exposure can cause the DNA damage and cellular apoptosis (53, 54).

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Surajit Majumder et al.,

#### Exposure through inhalation

The major route of insertion occurs through inhalation as NPs are present in air in abundance. Inhaled NPs directly enter into the lungs and penetrate the epithelium layer and invade the nearby lymph node resulting in the inflammation that ultimately leads to lung cancer (55-59). The effect of the NPs in the lung depends on various factors, viz., size, chemical properties of the NPs, quantity of the inhaled NPs, rate of deposition in the lungs, rate of elimination (60). Some reports disclose that the inhaled NPs cause asthma through inflammatory reactions occurring in the system (61). Evidences also show that exposure of carbon NPs cause the increased eosinophilic response in the mice lungs (62). Other NPs, like carbon nano-tubes, aluminum oxides, silver also cause pulmonary damage when exposed to these particles in the workplace.

#### Exposure through ingestion

The uses of NPs gradually increased in the agriculture and food industry (63). In food industry, NPs are used for making test, texture of food, improving packages (64). The oral ingestion of those food materials leads to NPs exposure and following ingestion, these NPs get absorbed through the digestive system leading to serious problem in human health.

#### Biodistribution and Toxic effect of NPs on target organs

Once the NPs enter into the circulation, they travel throughout the body and deposited in different organ and tissues, including kidney, spleen, heart, liver, bone marrow and nervous system (65). The absorption of NPs into the different tissues and organs depends on the physico-chemical properties of the NPs and also the diffusion rate from the capillaries to the organ (66). NPs are reached to the blood through the phagocytosis process and then filtered by the spleen (67, 68). Large size particles are accumulated into the liver, resulting liver narcosis (69, 70). NPs can penetrate the blood brain barrier and accumulated into the brain (71). The excretion of the NPs takes place through kidneys, feces, sweat and breast milk and also through saliva. The excretion through kidneys depends on the size of the NPs, as the kidney has fixed pore size of 70 nm (72). To summarize, the NPs accumulate into the organs like liver, spleen, lung, kidneys and cause the damage of these organ.

#### Toxic effect on the liver

Liver is the vital organ where metabolism of the exogenous chemicals takes place. Macrophages clear the NPs from the body but their fragmented parts remain encapsulated with the drugs and are metabolized through the liver (73,74). Evidences disclose that, silver NPs can cause mild liver damage through accumulation of the metal ions of the NPs in the liver cell (75). Intraperitoneal injection of zinc oxide NPs in mice causes the liver damage by increasing the level of alkaline phosphatase and glutamic transaminase. Following the use of gold NPs, the gold molecules are accumulated into the liver and activate the hepatic macrophage induced liver damage (76).

#### Toxic effect on the Spleen

Studies have shown that NPs are removed by the immune cells, and are accumulated in spleen (77, 78). Metal containing NPs induce the inflammatory response, especially iron containing NPs. These metal irons further accumulate in the liver and spleen and induce the oxidative stress in those organs (79). Evidences also show that nonmetallic NPs also accumulate in the macrophages (80). Use of NPs in different animals induces the level of different cytokines and chemokines, which further induce the immune response in the spleen (81).

#### Toxic effect on the lung

The respiratory exposure of the NPs causes the inflammatory response and fibrosis in rat lungs (82, 83). However, studies have also shown that, injection of NPs to the lung causes the inflammatory response only (84). Several in vivo studies show that the respiratory exposure of the NPs does not cause serious toxic effect to the lung (85).

#### Toxic effect on the kidneys

Kidneys play a major role in excretion of the metabolic wastes. Small size NPs are filtered through kidney and during filtration, depending upon the time it stays in kidney, leads to nephrotoxicity (86). Respiratory exposure of

64286

### Surajit Majumder et al.,

silica NPs causes the renal inflammation and fibrosis (87). Silica NPs also result in acute kidney damage in mice after single peritoneal injection indicating the translocation of NPs from the systematic circulation to the kidneys (88). The gold NPs can cause tubular dilation, inflammation and also mineralization in the rat kidney (82). The gold NPs associated kidney damage is two times higher in female rat than the male (74). The renal effect can persist up to 30 days of post administration.

#### Toxic effect on brain

Although most of the NPs can't reach the brain due to impermeability of blood brain barrier (BBB), a few small size NPs can penetrate the BBB by passive diffusion or by receptor mediated endocytosis and also accumulate inside the brain (89). Metal containing NPs can penetrate the BBB either by the transsynaptic transport mechanism or by the direct disruption of the BBB, resulting in the central nervous system toxicity (90-92). The most common example is Poly-n-butylcyano-acreylate NPs coated with polysorbate 80 that has been used for the drug delivery into the brain (86). Other metal containing NPs, such as silver NPs, titanium dioxide, zinc oxide, aluminum oxide are reported to induce oxidative stress in the brain (93). Furthermore, long tern respiratory exposure of the titanium dioxide results in hemorrhage in mice (94).

#### Toxic effect on other organs

Other than these target organs' toxic effect, NPs can also cause toxicity in other organs. For example, oral administration of zinc oxide for a long period causes the submucosal edema and inflammatory cell infiltration in the stomach (93). It also causes the inflammatory response and apoptosis in the pancreas (94). Dermal administration of the silver NPs reduces the thickness of the epidermis and papillary layer (95).

#### Mechanism of cytotoxic effects of NPs

The toxicity of the NPs on different target organs are well established. The toxicity is facilitated through different mechanism, such as by reactive oxygen species (ROS) generation, DNA damage, alteration of protein structure and by disruption of the membrane structure.

#### **ROS** generation

ROS are the oxygen containing chemically reactive substances, which play important role in cell signaling and cellular homeostasis. They are formed natural biproduct of oxygen metabolism. The pool of ROS establishes an oxidative stress in the cell. Several NPs have been reported to cause oxidative stress in the cell and inhibit the action of antioxidant. The increased level of ROS in the cell results in activation of the stress related cell signaling pathway, mitochondrial disfunction, DNA damage, which leads to the cell cycle arrest or apoptosis (96). Metal and metal oxides NPs induce the oxidative stress in liver, kidneys and spleen when accumulated in the organs (79,93,97). The large size NPs are not easily taken up by the cell than the small size NPs. Thus, the toxicity effect of small NPs is much higher than the large NPs. NP induced ROS production is due to mitochondrial dysfunction (97). Titanium dioxide NPs cause the oxidative stress by protein oxidation, alteration of catalases activities, increased release of glutamic acids and nitric acids (98). Other reports also indicate that NP induced oxidative stress occurs via p38-Nrf-2 signaling pathway (99).

#### DNA damage

NPs induce oxidative stress in the cell, which ultimately lead to mutagenesis due to the oxidation, hydrolysis and deamination of nucleic acid bases. Prolong oxidative stress can also lead to the gene alteration and carcinogenesis. Reports also disclose that following expose to silver NPs, cells release high amount of DNA damage marker protein, p-H2AX which leads to the DNA damage (100)

#### Protein structure alteration

Heavy metals NPs bind with the protein and amino acids and causes protein structure alteration, which leads to altered protein function. Such as serum albumin, hemoglobin and cytoskeletal proteins are easily bind with the NPs and result in protein damage (101). Similarly, silica NPs also significantly alters the function of RNase (102).

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Surajit Majumder et al.,

#### Inflammatory reaction

Reports substantiate that the NPs usually taken up by the macrophages in macrophage reach organs, like spleen and liver. NPs bind with the macrophages with specific macrophages receptor and in consequence release of various inflammatory cytokines occur (103-105). Earlier study also reports that titanium dioxide induces the inflammation response through c-Src, p38 MAP kinase, NF- $\kappa$ B pathways (106).

#### Epigenetic modifications

Other than the mechanisms mentioned, NPs can also alter the epigenetic modifications. Recent studies show the adverse effect of NPs on the DNA methylation, histone acetylation, RNA methylation, chromatin remodeling (107-109). Previous study has also reported that exposure to the carbon-based NPs; titanium dioxide and selenium dioxide can alter the DNA methyl transferase expression (110-112) and leads to the changes in the global DNA methylation. Studies also show that exposer of titanium dioxide NPs results hypermethylation at the promoter region of poly ADP ribose 1 in human lung carcinoma cells (113).

#### Factors affecting the toxicity of NPs

The toxicity of the NPs is depended on the several factors as follows:

#### Partial size and surface area

Particle size and surface area of NPs paly important role in different biological molecules. Small size NPs exhibit higher tissue distribution than the large size. The size of NPs is directly correlated with the ROS generation in the kidneys (114). Reports also show that 10 nm silver NPs had higher liver distribution and hepatobiliary toxicity as compared to the 40 and 100 nm NPs (115)

#### Surface charge

Surface charges of NPs also have important role in various interactions, such as plasma protein binding, permeability of BBB, selective absorption. Cell membrane possesses negative charges, so the positively charged particles can easily enter into the cells. Moreover, ionized form of zinc oxide NPs accumulation rate is much higher than the particulate form in different organ like kidneys, liver and lungs (116). Positively charged silica NPs induces more ROS production than the neutral and negatively charged partials (117).

#### Aggregation

Depending on the surface charges, size and composition, aggregation of NPs also plays important role in toxicity which is the most common occurrence with the carbon nanotubes. Aggregated carbon nanotubes show more cytotoxic effect than their dispersed form (118).

#### Surface coating

The surface property of NPs can be altered by using several coting materials. Such materials can change the physicochemical properties of the NPs, e.g., charges, electric, magnetic, optic and chemical properties. This phenomenon can be employed for the reduction of the toxicity of NPs. For example, PEG has been used for the reduction of the toxicity of the gold NPs (119).

### CONCLUSION

Nanotechnology is the fastest growing field with applications in disease diagnosis and treatment, biosensors, cosmetics, food industry and other technologies. However, the rapid growth in the application, many a times, overlooking the consequences of NPs toxicity. Thus, there is an urgent need for more toxicological study of the NPs before these particles enters into the market for human application. Utmost need is to understand the physico-chemical properties of the NPs and their cellular reactivity and interaction with several tissues and organs. Through

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Surajit Majumder et al.,

information may help to reduce the knowledge gap of the NPs toxicity and may also lead to the generation of biocompatible and less toxic NPs.

### ABSTRACT

This paper's major goal is to investigate the properties of generalized semi soft multi course and generalized semi soft multi interior with the help of generalized semi closed soft multiset and generalized semi open soft multiset notions and to acquaint the conception of generalized semi soft multi neighbor hoods.

### AMS Subject Classification: 03E70,54A05,54B05

**Keywords and Phrases:** Soft multiset, soft multi topology, generalized semi closed soft multiset, generalized semi soft multi closure, generalized semi soft multi interior and generalized semi soft multineighbourhood.

# INTRODUCTION

In 2013, Babitha and John [1] was acquainted the conception of soft multisets as a combination of soft sets and multisets. Then Deniz Tokat et al. [2,3] acquainted the concept of the soft multi topology and its basic properties. S. A. El-Sheikh et al. [4,5] acquainted the generalized closed soft multisets and generalization of open soft multisets and mappings in soft multi topological spaces. In 2022, Inthumathi et al. [6] acquainted the concept of generalized semi closed set in soft multi topological space. In this paper, we acquaint the conception of generalized semi soft multi closure, generalized semi soft multi interior and generalized semi soft multi neighbourhood and discuss few important attributes in detail.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# PRELIMINARIES

Throughout this paper, SMTS denotes the soft multi topological spaces and smset denotes soft multi set.

**Definition 2.1. [3]** Let M be an universal mset, L be a set of parameters and  $I \subseteq L$ . Then, an ordered pair (S, I) is called a smset where S is a mapping given by  $S: I \to P^*(M)$ ;  $P^*(M)$  is the power set of a mset M. For all  $I \in I$ , S(I) mset represents by count function  $C_{S(I)}: M^* \to N$  where N represents the set of non-negative integers and  $M^*$  represents the support set of M.

**Definition 2.2.** [3] For two soft msets (S, I) and (T, J) over M, we say that is a subs mset of if:

**Definition 2.2.** [3] For two soft m sets(*S*, *I*) and (*T*, *J*) over *M*, we say that (*S*, *I*) is a subsmsetof(*T*, *J*)if: 1. $I \subseteq J$ , 2. $C_{S(l)}(v) \leq C_{T(l)}(v), \forall v \in M^*, \forall l \in I \cap J$ . We write (*S*, *I*)  $\cong$  (*T*, *J*).

**Definition 2.3.[3]** The union of two smsets(*S*, *I*) and (*T*, *J*)over *M* is the smset(*H*, *C*), where  $C = I \cup J$  and  $C_{H(l)}(v) = \max\{C_{S(l)}(v), C_{T(l)}(v)\}, \forall l \in I \cup J \forall v \in M^*$ . We write (*S*, *I*)  $\widetilde{U}(T, J)$ .

**Definition 2.4.** [3] The intersection of two soft msets(*S*, *I*) and (*T*, *J*)over *M* is the smset(*H*, *C*), where  $C = I \cap J$  and  $C_{H(l)}(v) = \min\{C_{S(l)}(v), C_{T(l)}(v)\}, \forall l \in I \cap J, \forall v \in M^*. We$  write(*S*, *I*)  $\cap$  (*T*, *J*).

**Definition2.5.** [3] A soft mset (S, I) over M is said to be a null smset denoted  $\tilde{\phi}$  if for all  $l \in I, S(l) = \phi$ .

**Definition2.6.** [3] A soft mset(*S*, *I*) over *M* is said to be an absolute smset denoted by  $\widetilde{M}$  for all  $l \in I, S(l) = M$  **Definition2.7.**[3] The complement of a smset (*S*, *I*) is denoted by (*S*, *I*)<sup>*c*</sup> and is defined by (*S*, *I*)<sup>*c*</sup> = (*S*<sup>*c*</sup>, *I*) where  $S^c: I \to P^*(M)$  is mapping given by  $S^c(l) = M \setminus S(l)$  for all  $l \in I$  where  $C_{S^c(l)}(v) = C_{U(l)}(v) - C_{S(l)}(v)$ ,  $\forall v \in M^*$ .

**Definition 2.8.**[3] Let M be an universal mset and L be a set of parameters. Then, the collection of all smsets over M with parameters from L is called a soft multi class and is denoted as  $SMS(M)_L$ .

**Definition 2.9.** [3] Let  $\tau \subseteq$  SMS(M)<sub>L</sub>, then  $\tau$  is said to be a soft multi topology on Mif the following conditions hold:

- 1.  $\widetilde{\phi}, \widetilde{M}$  belong to  $\tau$
- 2. The union of any number of smsets in  $\tau\,$  belongs to  $\tau,$
- 3. The intersection of any two smsets in  $\tau$  belongs to  $\tau$

 $\tau$  is called a soft multi topology over M and the triple (M,  $\tau$ , L) is called a soft multi topological space over M. Also, the member of  $\tau$  are said to be open soft msets in M. A soft mset (*S*, *L*) in *SMS*(*M*)<sub>*L*</sub> is said to be a closed soft mset in *M*, if its complement(*S*, *L*)<sup>*c*</sup> belongs to  $\tau$ .

**Definition 2.10.** Let  $(M, \tau, L)$  be a SMTS over M and (S, L) be a smset over M. Then, the softmulti closure of (S, L), denoted by  $cl(S, L)[or(\overline{(S, L)}])$  is the intersection of all closed smset containing (S, L).

**Definition 2.11.** [2] Let  $(M, \tau, L)$  be a SMTS over M and (S, L) be a smset over M. Then, the soft multi interior of (S, L), denoted by int (S,L) [*or*  $(S,L)^o$ ] is the union of all open soft multiset contained in(S,L).

#### Inthumathi Velusamy et al.,

**Definition 2.12.** Let  $(M, \tau, L)$  be a SMTS over M and (G, L) be a smset overM and  $v \in M$ . Then, (G, L) is said to be a soft multi neighbourhood of v if there exists a soft multi open set (F, L) such that  $v \in (F, L) \subseteq (G, L)$ . The set of all soft multi neighbourhood of  $\alpha$ , denoted by  $\widetilde{N}(\alpha)$ , is called the family of soft multi neighbourhoods of  $\alpha$ ,

i.e.  $\widetilde{N}(\alpha) = \{(G, L) : (G, L) \in \tau, \alpha \in (G, L)\}.$ 

**Definition 2.13.** Let  $(M, \tau, L)$  be a SMTS. A mapping  $\gamma : SMS(M)_L \to SMS(M)_L$  is said to be an operation on  $OSM(M)_L$ , if  $N_L \subseteq \gamma(N_L)$  for all  $N_L \in OSM(M)_L$ . The family of all  $\gamma$ -open soft multi-sets is denoted by  $OSM(\gamma) = \{N_L : N_L \subseteq \gamma(N_L), N_L \in SMS(M)_L\}$ . Also, the complement of  $\gamma$ -open soft multiset is called a  $\gamma$ -closed soft multiset and the set of all  $\gamma$ -closed soft multisets denoted by  $CSM(\gamma)$ .

**Definition 2.14.** [5] Let(M,  $\tau$ , L) be a SMTS. Different cases of -operations on SMS (M)<sub>L</sub> are as follows:

- *i.* If  $\gamma = int(cl)$ , then  $\gamma$  is called a pre-open soft multi operator. The family of all pre-open soft multisets is denoted by POSM  $(M)_L$  and the family of all pre-closed soft multisets is denoted by PCSM  $(M)_L$ .
- *ii.* If  $\gamma = int(cl(int))$ , then  $\gamma$  is called an -open soft multi operator. The family of all open soft multisets is denoted by  $\alpha \text{CSM}(M)_L$  and family fall-closed soft multisets is denoted by  $\alpha \text{CSM}(M)_L$
- *iii.* If  $\gamma = cl(int)$ , then is called a semi open soft multi operator. The family of all semi opensoft multisets is denoted by SOSM (*M*)<sub>L</sub> and the family of all semi closed soft multisets is denoted by SCSM (X)L.
- *iv.* If  $\gamma = d(int(d))$ , then  $\gamma$  is called a open soft multi operator. The family of all open soft multisets is denoted by  $\beta OSM(M)_L$  and family fall-closed soft multisets is denoted by  $\beta CSM(M)_L$

**Definition 2.15.** A smset(*S*, *L*) in a SMTS( $M, \tau, L$ ) is said to be a generalized closed (briefly *g*-closed) smset if  $C_{cl(S)(l)}(v) \leq C_{B(l)}(v)$  whenever  $C_{S(l)}(v) \leq C_{B(l)}(v)$  for all  $v \in M^*, l \in L$  and (*B*, *L*) is open smset in  $M_L$ .

**Definition 2.16.** A soft mset  $S_L$  in a SMTS  $(M, \tau, L)$  is said to be a generalized semi closed softmulti set (briefly *gscs* mset) if  $C_{scl(S)(l)}(v) \le C_{U(l)}(v)$  whenever  $C_{(S)(l)}(v) \le C_{U(l)}(v)$  and  $U_L \in OSM(M)_L$ .

**Definition 2.17.**[6] Let  $f_L$  be a smset over  $M_L$ .  $f_L$  is called a smpoint over M, if there exists  $l \in L$  and  $n/v \in M$ ,  $1 \le n \le m$  such that

$$f(\varepsilon) = \begin{cases} \{n/\nu\} & \text{if } \varepsilon = l, 1 \le n \le m \\ \varphi & \text{if } \varepsilon \in L - \{l\} \end{cases}$$

We denote  $f_L$  by  $[(n/v)_l]_L$ . The family of all smpoints over M is denoted by P(M, L) or P. i.e. $P(M, L) = \{[(n/v_i)l_j]_L: v_i \in M, l_j \in L, 1 \le n \le m\}.$ 

#### GENERALIZED SEMI SOFT MULTI CLOSURE

**Definition 3.1.**Let  $S_L$  be a smset over  $M_L$ . Then the generalized semi soft multi closure of  $S_L$ , denoted by gssmcl( $S_L$ ), is the intersection of all gsc smsets containing  $S_L$ .

**Proposition 3.2.** For any  $C_{S(l)}(v) \leq C_{M(l)}(v)$ ,

1.  $C_{S(l)}(v) \le C_{gssm-cl(S)(l)}(v) \le C_{scl(S)(l)}(v)$ 

2.  $C_{S(l)}(v) \le C_{gssm-cl(S)(l)}(v) \le C_{acl(S)(l)}(v)$ 

3.  $C_{S(l)}(v) \le C_{gssm-cl(S)(l)}(v) \le C_{gcl(S)(l)}(v)$ 

**Proof.** Since every semi closed (resp.α-closed, *g*-closed) smsts *gsc* smset.

**Proposition 3.3.** For any two sub smsets  $S_L$  and  $T_L$  of  $M_L$ . The following hold,

- 1. If  $S_L$  is a gscs mset, then  $C_{gssm-cl(S)(l)}(v) = C_{S(l)}(v)$ ,
- 2.  $C_{gssm-cl(\varphi)(l)}(v) = C_{\varphi(l)}(v)$ , and  $C_{gssm-cl(M)(l)}(v) = C_{M(l)}(v)$ ,

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Inthumathi Velusamy et al.,

- 3. If  $C_{S(l)}(v) \le C_{T(l)}(v)$ , then  $C_{gssm-cl(S)(l)}(v) \le C_{gssm-cl(T)(l)}(v)$ ,
- 4.  $C_{gssm-cl(S\cap T)(l)}(v) \leq C_{(gssm-cl(S)\cap gssm-cl(T))(l)}(v)$
- 5.  $C_{gssm-cl(S\cup T)(l)}(v) \ge C_{(gssm-cl(S)\cup gssm-cl(T))(l)}(v)$
- 6.  $C_{gssm-cl(gssm-cl(S))(l)}(v) \leq C_{gssm-cl(S)(l)}(v)$ .

#### Proof.

- 1. If  $S_L$  is a gscs mset, then the smallest gsc smset containing  $S_L$  is itself. Therefore Cgssm-cl(S)<sub>V</sub> = C<sub>S(0</sub>(V).
- 2. Since  $\tilde{\varphi}$  and  $\tilde{M}$  are gscsmset,  $C_{gssm-cl(\varphi)(l)}(v) = C_{\varphi(l)}(v)$  and  $C_{gssm-cl(M)(l)}(v) = C_{M(l)}(v)$  by (1).
- 3. Let  $C_{S(l)}(v) \le C_{T(l)}(v)$ . Then  $C_{S(l)}(v) \le C_{T(l)}(v) \le C_{gssm-cl(T)(l)}(v)$ . But

 $gssm - cl(S_L)$  is the smallest gssm closure of  $S_L$ . Therefore  $C_{gssm - cl(S)(l)}(v) \leq C_{gssm - cl(T)(l)}(v)$ .

- 4. Since  $C_{S\cap T(l)}(v) \leq C_{S(l)}(v)$  and  $C_{S\cap T(l)}(v) \leq C_{T(l)}(v)$ , by (3) $C_{gssm-cl(S\cap T)(l)}(v) \leq C_{gssm-cl(S)(l)}(v)$  and  $C_{gssm-cl(S\cap T)(l)}(v) \leq C_{gssm-cl(T)(l)}(v)$ . Wherefore  $C_{gssm-cl(S\cap T)(l)}(v) \leq C_{(gssm-cl(S)\cap gssm-cl(T))(l)}(v)$ .
- 5. Since  $C_{S(l)}(v) \leq C_{S\cup T(l)}(v)$  and  $C_{T(l)}(v) \leq C_{S\cup T(l)}(v)$ ,

 $C_{gssm-cl(S)(l)}(v) \leq C_{gssm-cl(S\cup T)(l)}(v) \text{and}_{C_{gssm-cl(T)(l)}(v)} \leq$ 

 $C_{gssm-cl(S\cup T)(l)}(v) \cdot \mathsf{Thus}_{C_{gssm-cl(S\cup T)(l)}(v)} \ge C_{(gssm-cl(S)\cup gssm-cl(T))(l)}(v).$ 

6. Let  $C_{S(l)}(v) \leq C_{F(l)}(v)$  and  $F_L$  be a gscs mset. Then by definition  $C_{gssm-cl(S)(l)}(v) \leq C_{F(l)}(v)$  and  $C_{gssm-cl(S)(l)}(v) \leq C_{F(l)}(v)$ . Since  $C_{gssm-cl(gssm-cl(S))(l)}(v) \leq C_{F(l)}(v)$ .

 $C_{\cap\{T_L/C_{S(l)}(v) \le C_{T(l)}(v) \text{ and where } T_L \text{ be a } gscs \text{ mset}\}} = C_{gssm-cl(S)(l)}(v) \cdot \text{Ergo}_{Gssm-cl(gssm-cl(S))(l)}(v) = \leq C_{gssm-cl(S)(l)}(v) \text{ by Proposition3.2.}$ 

**Note 3.1.** Reverse implication of the above result (1) need not be true. Let  $(M, \tau, L)$  be a SMTS with mset  $M = \{2/v_1, 2/v_2\}$ , parameter set  $L = \{l_1, l_2\}$  and smtopology  $\tau = \{\widetilde{\varphi}, \widetilde{M}, S_L\}$  where  $S(l_1) = \{2/v_1\}, S(l_2) = \{2/v_2\}$  and let  $T_L$  be a sub smset of  $M_L$  such that  $T(l_1) = \{\varphi\}, T(l_2) = \{1/v_1\}$ . Then  $C_{gssm-cl(T)(L)}(v) = C_{T(L)}(v)$  but  $T_L$  is not a gscs mset.

**Definitions 3.4.** A sub smset  $S_L$  in  $(M, \tau, L)$  is called generalized semi-open-soft multi-set (insummary *gsos* mset) if its complement is a *gscs* mset. The set of all *gsos* mset in  $(M, \tau, L)$  is denoted by  $gsosm(M)_L$ . **Theorem 3.5.** A subsmset  $S_L$  of  $(M, \tau, L)$  is *gsos* mset iff  $G_R(v)(v) \le C_{R+1}(v)(v)$  whenever  $G_R(v)(v) \le C_{R+1}(v)(v)$ 

**Theorem 3.5.** A subsmset  $S_L$  of  $(M, \tau, L)$  is goos mset iff  $C_{F(l)}(v) \leq C_{sint(S)(l)}(v)$  whenever  $C_{F(l)}(v) \leq C_{S(l)}(v)$  and  $F_L$  is a closed smset.

**Proof.** Suppose that  $C_{F(l)}(v) \leq C_{sint(S)(l)}(v)$  whenever  $C_{F(l)}(v) \leq C_{S(l)}(v)$  and  $F_L$  is a closed smset. Let  $C_{S^c(l)}(v) \leq C_{U(l)}(v)$ , where  $U_L$  is a open smset. Then  $C_{U^c(l)}(v) \leq C_{S(l)}(v)$ , where  $U_L^c$  is a closed smset. By proposal  $C_{U^c(l)}(v) \leq C_{sint(S)(l)}(v)$ , which implies  $C_{(sint(S))^c(l)}(v) \leq C_{U(l)}(v)$ . That is  $C_{scl(S^c)(l)}(v) \leq C_{U(l)}(v)$ . Thus  $S_L^c$  is a gscsmset. Consequently  $S_L$  is a gsosmset.

Conversely, suppose that  $S_L$  is a gassmeat such that  $C_{F(l)}(v) \leq C_{S(l)}(v)$  and  $F_L$  is a closed smset. Then  $F_L^c$  is a open smset and  $C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . Ergo $C_{scl(S^c)(l)}(v) \leq C_{F^c(l)}(v)$  and  $\operatorname{so}_{C_{F(l)}(v)} \leq C_{(scl(S^c))^c(l)}(v) = C_{sint(S)(l)}(v)$ . Hence  $C_{F(l)}(v) \leq C_{sint(S)(l)}(v)$ .

**Proposition 3.6.** *ForaSMTS*  $(M,\tau,L)$ *, the following hold* 

- *i.* Every open smset is a gsos mset.
- ii. Every-open smset is a gsos mset.
- iii. Every semi open smset is a gsos mset.
- iv. Every g-open smset is a gsos mset.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Proof.

(i)Let  $S_L$  be a open smset and  $F_L$  be a closed smset such that  $C_{F(l)}(v) \leq C_{S(l)}(v)$ . Then  $F_L^c$  is a open smset and  $C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . Wherefore  $C_{scl(S^c)(l)}(v) \leq C_{cl(S^c)(l)}(v) = C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . That is  $C_{F(l)}(v) \leq C_{(scl(S^c))^c(l)}(v) = C_{sint(S)(l)}(v)$ . Hence  $C_{F(l)}(v) \leq C_{sint(S)(l)}(v)$ . Therefore  $S_L$  is a gsos mset.

(ii) Let  $S_L$  be an  $\alpha$ -open smset and  $F_L \in CSM(M)_L$  such that  $C_{F(l)}(v) \leq C_{S(l)}(v)$ . Then  $F_L^c$  is a open smset and  $C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . Therefore  $C_{scl(S^c)(l)}(v) \leq C_{acl(S^c)(l)}(v) \leq C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . That is  $C_{F(l)}(v) \leq C_{(scl(S^c))^c(l)}(v) = C_{sint(S)(l)}(v)$ . Hence  $C_{F(l)}(v) \leq C_{sint(S)(l)}(v)$ . Therefore  $S_I$  is a gos mset.

(iii) Let  $S_L$  be a semi-open smset and  $F_L \in CSM(M)_L$  such that  $C_{F(l)}(v) \leq C_{S(l)}(v)$ . Then  $F_L^c$  is a open system and  $C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . Therefore  $C_{scl(S^c)(l)}(v) = C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . Hence  $C_{F(l)}(v) \leq C_{sint(S)(l)}(v)$ . Ergo  $S_L$  is a *gsos* mset.

(iv)Let  $S_L$  bea g-open smset and  $F_L \in CSM$  (M) Luchthat  $C_{F(l)}(v) \leq C_{S(l)}(v)$ . Then  $F_L^c$  is a open smset and  $C_{S^c(l)}(v) \leq C_{F^c(l)}(v)$ . Therefore  $C_{scl(S^c)(l)}(v) \leq C_{cl(S^c)(l)}(v) \leq C_{F^c(l)}(v)$ . Hence  $C_{F(l)}(v) \leq C_{sint(S)(l)}(v)$ . Ergo  $S_L$  is a gsos mset.

#### Remark 3.7.1.

1. The union of gsos msets need not be a gsosmset.

2. The intersection of gsos msets need not be a gsosmset.

#### The Intersection of gsos msets need not be a gsos mset.

**Example 3.8.** Let  $(M, \tau, L)$  be a SMTS with mset  $M = \{1/v_1, 2/v_2, 1/v_3\}$ , parameter set  $L = \{l_1, l_2\}$  and smtopology  $\tau = \{\tilde{\varphi}, \tilde{M}, (S_L)_1, (S_L)_2, (S_L)_3, (S_L)_4\}$  where  $S_1(l_1) = \{1/v_1, 1/v_3\}$ ,  $S_1(l_2) = \{1/v_1, 1/v_3\}$ ,  $S_2(l_1) = \{1/v_1\}$ ,  $S_2(l_2) = \{1/v_3\}$ ,  $S_3(l_1) = \{2/v_2\}$ ,  $S_3(l_2) = \{2/v_2\}, S_4(l_1) = \{1/v_1, 2/v_2\}$ ,  $S_4(l_2) = \{2/v_2, 1/v_3\}$ . Let  $S_L$  and  $T_L$  be two subsmosts of  $M_L$  such that  $S(l_1) = \{1/v_3\}, S(l_2) = \{2/v_2, 1/v_3\}$  and  $T(l_1) = \{1/v_2\}, S(l_2) = \{1/v_1, 1/v_2, 1/v_3\}$ . Then  $S_L$  and  $T_L$  are gsos msets but  $S_L \widetilde{U} T_L$  is not a gsos mset in  $(M, \tau, L)$ .

**Example 3.9.** Let  $(M,\tau,L)$  be a SMTS with  $msetM = \{2/v_1, 2/v_2, 2/v_3\}$ , parameter set  $L = \{l_1, l_2\}$  and smtopology  $\tau = \{\widetilde{\varphi}, \widetilde{M}, (S_L)_1, (S_L)_2, (S_L)_3\}$  where  $S_1(l_1) = \{2/v_2\}$ ,  $S_1(l_2) = \{2/v_2\}$ ,  $\sim S_2(l_1) = \{2/v_3\}$ ,  $S_2(l_2) = \{2/v_3\}$ ,  $S_3(l_1) = \{2/v_2, 2/v_3\}$ ,  $S_3(l_2) = \{2/v_2, 2/v_3\}$ . Let  $S_L$  and  $T_L$  betwosubsmosts of  $M_L$  such that  $S(l_1) = \{2/v_1, 2/v_3\}$ ,  $S(l_2) = \{2/v_1, 2/v_3\}$ ,  $S(l_2) = \{2/v_1, 2/v_3\}$  and  $T(l_1) = \{2/v_1, 2/v_2\}$ ,  $S(l_2) = \{2/v_1, 2/v_3\}$ . Then  $S_L$  and  $T_L$  are good sometric but  $S_L \cap T_L$  is not a good matrix.

**Definition 3.10.** Let  $(M, \tau, L)$  be a SMTS over  $M_L$  and  $S_L$  be a smset over  $M_L$ . Then the generalized semi soft multi Interior of  $S_L$ , denoted by  $gssm - int(S_L)$  is the union fall gossmsets contained in  $S_L$ **Proposition 3.11.** For any  $C_{S(l)}(v) \le C_{M(l)}(v)$ ,  $C_{int(S)(l)}(v) \le C_{gssm-int(S)(l)}(v)$ .

Proof. Since Every Opens Set a gsosmset..

**Proposition 3.12.** For any *Two subsmsets* $S_L$  and  $T_L$  of (M, $\tau$ ,L). The following are hold,

- 1. If  $S_L$  is a goos mset, then  $C_{gssm-int(S)(l)}(v) = C_{S(l)}(v)$ ,
- 2.  $C_{gssm-int(\varphi)(l)}(v) = C_{\varphi(l)}(v)$ , and  $C_{gssm-int(M)(l)}(v) = C_{M(l)}(v)$ ,
- 3. If  $C_{S(l)}(v) \le C_{T(l)}(v)$ , then  $C_{gssm-int(S)(l)}(v) \le C_{gssm-int(T)(l)}(v)$ ,
- 4.  $C_{gssm-int(S\cap T)(l)}(v) \geq C_{(gssm-int(S)\cap gssm-int(T))(l)}(v)$
- 5.  $C_{gssm-int(S\cup T)(l)}(v) \leq C_{(gssm-int(S)\cup gssm-int(T))(l)}(v)$
- 6.  $C_{gssm-int(gssm-int(S))(l)}(v) = \leq C_{gssm-int(S)(l)}(v).$

**Theorem 3.13.** For a subsmset  $S_L$  of a SMTS (M, $\tau$ ,L), the following are equivalent

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

(i)  $cl(S_L) - S_L$  is a gscs mset,

(ii)  $S_L \cap (cl(S_L))^c$  is a goos mset.

**Proof.**(*i*)  $\Rightarrow$ (*ii*) Let  $C_{V(l)}(v) = C_{(cl(S)-S)(l)}(v)$ . Then  $C_{V^c(l)}(v) = C_{S \cap (cl(S))^c(l)}(v)$  and  $S_L \cap (cl(S_L))^c$  is a goos mset.

(*ii*) = (*i*) Let  $C_{V(l)}(v) = C_{S\cap(cl(S))^c(l)}(v)$ . Then  $C_{U^c(l)}(v) = C_{(cl(S)-S)(l)}(v)$  and  $U_L^c$  is a gscsmset and so  $cl(S_L) - S_L$  is a gscsmset.

**Proposition 3.14.** If  $S_L$  is a goosmset and  $C_{sint(S)(I)}(v) \le C_{T(I)}(v) \le C_{S(I)}(v)$ , then  $T_L$  is a goosmset.

**Proof.** Suppose that  $C_{sint(S)(l)}(v) \le C_{T(l)}(v) \le C_{S(l)}(v)$  and  $S_L$  is a *gsos*mset. Then  $C_{S^c(l)}(v) \le C_{T^c(l)}(v) \le C_{scl(S^c)(l)}(v)$  and since  $S_L^c$  is a *gscs* mset, by using Proposition [6] it follows that  $T_L^c$  is a gscs mset. Thus  $T_L$  is a gsosmset.

**Proposition 3.15.** If  $S_L$  is a gscsmsetthen  $scl(S_L) - S_L$  is a gsosmset

**Proof.** Suppose that  $S_L$  agscs mset. Let  $C_{F(l)}(v) \le C_{(sclS-S)(l)}(v)$ , where FL is closed smset. It follows that  $C_{F(l)}(v) =$  Therefore  $C_{F(l)}(v) \le C_{sint(sclS-S)(l)}(v)$ , by Theorem 3.5 and hence,  $scl(S_L) - S_L$  is a *gsosmset* 

**Proposition 3.16.** For any  $[(n/v)_l]_L \in P(M, L), [(n/v)_l]_L \leq C_{gssm-cl(S)(l)}(v)$  if  $f \leq C_{(U \cap S)(l)}(v) \neq C_{\varphi(l)}(v)$  for every gsos mset  $U_L$  containing  $[(n/v)_l]_L$ .

**Proof.** Let  $[(n/v)_l]_L \leq C_{gssm-cl(S)(l)}(v)$  for any  $[(n/v)_l]_L \in P(M, L)$ . Suppose Subsists agsos mset  $U_L$  containing  $[(n/v)_l]_L$  such that  $C_{usiV} = C_{\varphi(l)}(v)$ . Then  $C_{S(h)}(v) \leq C_{U^c(l)}(v)$ . Since  $U_L$  is agscs mset containing  $S_L$ ,  $C_{gssm(S)(h)}(v) \leq C_{U^c(l)}(v)$ , which implies that  $[(n/v)_l]_L \leq C_{gssm(S)(h)}(v)$ , acontradiction. Thus  $C_{(U\cap S)(l)}(v) \neq C_{\varphi(l)}(v)$ .

Conversely, Suppose that  $[(n/v)_l]_L \leq .$  Thereby Definition, there subsists a *gscs* mset  $F_L$  containing  $S_L$  such that  $[(n/v)_l]_L \leq C_{F(l)}(v)$ . Thus  $[(n/v)_l]_L \leq C_{F^c(l)}(v)$  and  $F_L^c$  is a *gsos* mset. Also  $C_{(F^c \cap S)(l)}(v) = C_{\varphi(l)}(v)$  which is a contradiction. There fore  $[(n/v)_l]_L \leq C_{gssm-cl(S)(l)}(v)$ .

**Proposition 3.17.** Let  $S_L$  be a sub smset of  $(M,\tau,L)$ , then  $C_{(M-gssm-int(S))}V=C_{gssm-cl(M-S)(l)}(v)$ .

**Proof.** Let  $[(n/v)_l]_L \leq C_{(M-gssm-int(S)(l)}(v)$ . Then  $[(n/v)_l]_L \leq C_{gssm-cl(M-S)(l)}(v)$ . That is every gsos mset  $T_L$  containing  $[(n/v)_l]_L$  is that  $T_L$  is not contained in  $S_L$ . This implies every gsos mset  $T_L$  containing  $[(n/v)_l]_L$  is such

that  $C_{(T \cap (M-S))(l)}(v) \neq C_{\varphi(l)}(v)$ . Then $[(n/v)_l]_L \not\leq C_{gssm-cl(M-S)(l)}(v)$ . Hence  $C_{(M-gssm-int(S)(l)}(v) \leq C_{gssm-cl(M-S)(l)}(v)$ . Conversely, Let  $[(n/v)_l]_L \leq C_{gssm-cl(M-S)(l)}(v)$ . Then by above Proposition Every gsos mset  $T_L$  containing  $[(n/v)_l]_L$  is such that  $C_{(T \cap (M-S))(l)}(v) \neq C_{\varphi(l)}(v)$ . That is every gsosmset  $T_L$  containing  $[(n/v)_l]_L$  is such that  $T_L$  is not contained in  $S_L$ . This implies that  $[(n/v)_l]_L \not\leq C_{gssm-cl(M-S)(l)}(v)$ .

 $C_{gssm-int(S)(l)}(v).$  Thus  $[(n/v)_l]_L \le C_{(M-gssm-int(S)(l)}(v).$ 

Hence  $C_{gssm-cl(M-S)(l)}(v) \leq C_{(M-gssm-int(S)(l)}(v)$ . Ergo  $C_{(M-gssm-int(S)(l)}(v) = C_{gssm-cl(M-S)(l)}(v)$ .

**Proposition** 3.18. If  $gssm - cl(S_L) - S_L$  is a gscsmset, then  $C_{S(l)}(v) \le c_{S(l)}(v) \le c_{S(l)}(v)$ 

 $C_{gssm-int(S\cup gssm-cl(S^c))(l)}(v)$ .

**Proof.** We know that  $C_{S\cup(gssm-cl(S^c))(l)}(v) = C_{(gssm-cl(S)-S)^c(l)}(v)$  and by assumption $(gssm-cl(S_L) - S_L)^c$  is a gsos mset and so  $S_L \cup (gssm-cl(S_L))^c$  is gsos mset. Thus

 $C_{S \cup (gssm - cl(S^c))(l)}(v) = C_{gssm - int(S \cup gssm - cl(S^c))(l)}(v)$  and hence

 $C_{S(l)}(v) \le C_{gssm-int(S \cup gssm-cl(S^c))(l)}(v).$

Inthumathi Velusamy et al.,

#### GENERALIZED SEMI SOFT MULTI NEIGHBOURHOOD

**Definition 4.1.** A sub smset  $N_L$  in SMTS(M,  $\tau$ , L) is said to be generalized semi soft multi neighborhood (in summary *gssm*-nbd) of a smpoint  $[(n/\nu)_l]_L$  in  $M_L$  if there subsists an *gsos*mset  $U_L$  such that  $[(n/\nu)_l]_L \leq C_{U(l)}(\nu) \leq C_{N(l)}(\nu)$ .

If  $N_L$  is a gsosmset containing  $[(n/\nu)_l]_L$ , then  $N_L$  is called generalized semi soft multi open neighborhood (in summary gssm-opennbd) of  $[(n/\nu)_l]_L$  and is denoted by  $gssmN[(n/\nu)_l]_L$ .

**Example 4.2.** Let  $(M, \tau, L)$  be a SMTS with mset  $M = \{2/v_1, 2/v_2\}$ , parameter set  $L = \{l_1, l_2\}$  and smtopology  $\tau = \{\widetilde{\varphi}, \widetilde{M}, (S_L)_1\}$  where  $S_1(l_1) = \{2/v_1\}, S_1(l_1) = \{2/v_2\}$ . The gssm-nbdof[ $(2/v_1)_{l_1}$ ]<sub>L</sub> is  $\{\{(l_1, \{2/v_1\}), (l_2, \{\varphi\})\}, \{(l_1, \{2/v_1\}), (l_2, \{1/v_1\})\}, \{(l_1, \{2/v_1\}), (l_2, \{2/v_1\})\}, \{(l_1, \{2/v_1\}), (l_2, \{1/v_1, 1/v_2\})\}, \{(l_1, \{2/v_1\}), (l_2, \{1/v_1, 1/v_2\})\}, \{(l_1, \{2/v_1\}), (l_2, \{2/v_1\}), (l_2, \{2/v_1\}), (l_2, \{1/v_1, 1/v_2\})\}, \{(l_1, \{2/v_1, 1/v_2\})\}, \{(l_1, \{2/v_1, 1/v_2\}), \{(l_1, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), \{(l_1, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 2/v_2\})\}, \{(l_1, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{2/v_1\})\}, \{(l_1, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{2/v_2\})\}, \{(l_1, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{2/v_2\})\}, \{(l_1, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_2, \{2/v_2\})\}, \{(l_1, \{2/v_1, 1/v_2\}), (l_2, \{1/v_1, 1/v_2\}), (l_1, \{M\}), (l$ 

**Definition 4.3.** The family of all *gssm*-nbd of a point  $[(n/\nu)_l]_L \leq C_{M(l)}(\nu)$  is called the *gssm*- neighbourhood system of  $[(n/\nu)_l]_{L^{-1}}$ .

**Proposition 4.4.** Every sm nbd of [(n/v)I] L is a gssm-nbd of  $[(n/v)_I]_L$ 

**Proof.** Let  $N_L$  be a smmbd of  $[(n/\nu)_l]_L \leq C_{M(l)}(\nu)$ . Then there subsists an open smset  $U_L$  such that  $[(n/\nu)_l]_L \leq C_{U(l)}(\nu) \leq C_{N(l)}(\nu)$ . Since every open smset is a *gscs* mset,  $U_L$ 

Remark 4.5. The converse of the above proposition need not be true as seen from the following example.

**Example 4.6.** In Example4.2, The smset { $(l_1, \{2/\nu_1\}), (l_2, \{2/\nu_1, 2/\nu_2\})$ } is *gssm*-nbd of  $[(2/\nu_1)_{l_1}]_L$ . but not a smnbd of  $[(2/\nu_1)_{l_1}]_L$ .

**Proposition 4.7.** Every gsosmset is a gssm-nbd of each of its points.

**Proof.** Let  $N_L$  be a gsos mset and  $[(n/\nu)_l]_L \leq C_{N(l)}(\nu)$ . Then  $[(n/\nu)_l]_L \leq C_{N(l)}(\nu) \leq C_{N(l)}(\nu)$ . Since  $[(n/\nu)_l]_L$  is an arbitrary point of  $N_L$  it follows that NL is gssm-nbdof each of its points.

**Proposition 4.8.** For a SMTS (M,  $\tau$ , L), the following holds:

- a. Every  $[(n/v)_1]_L \in \widetilde{M}$  has at least onegssm-nbd.
- b. Every gssm-nbd of  $[(n/v)_1]_L \in \widetilde{M}$  and  $[(n/v)_1]_L$
- c. Every super smset of a gssm-nbd of  $[(n/v)_1]_L \in \widetilde{M}$  and  $[(n/v)_1]_L$
- *d.* If N<sub>L</sub> is a *gssm*-nbd of  $[(n/v)_1]_L \in \widetilde{M}$  then there subsists a *gssm*-nbd Z<sub>L</sub>of  $[(n/v)_1]_L$  such that  $C_{Z(1)}(v) \leq C_{N(1)}(v)$  and Z<sub>L</sub> is a gssm-nbd of each of its sm points.

**Proof.**(a)M being gsos-mset it is a gsm-nbd of each of its sm points. So each [(n/v)I] LM has at least one gssm-nbdnamely M.

(b) Let  $N_L$  be a *gssm*-nbd of  $[(n/v)_1]_L$ . Then there subsists a *gsos*-mset  $G_L$  such that  $[(n/v)_l]_L \leq C_{G(l)}(v) \leq C_{N(l)}(v)$ . Clearly  $[(n/v)_l]_L \leq C_{N(l)}(v)$ . So each *gssm*-nbd of  $[(n/v)_1]_L$  contains  $[(n/v)_1]_L$ .

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Inthumathi Velusamy et al.,

(c) Let  $N_L$  be a *gssm*-nbd of  $[(n/v)_1]_L$  and let  $K_L$  be a super sm set of  $N_L$ . Then by Definition of gssm-nbd of as m point, there subsists gsos-mset  $G_L$  such that  $[(n/v)I]LC_{G(I)}(v) \le C_{N(I)}(v) \le C_{N(I)}(v)$ . This shows that KL is also a gssm-nbdof[(n/v)I] L. Let NL be a gssm-nbd of [(n/v)I]L. Then there subsists a gsos-mset ZL such that  $[(n/v)I]LC_{Z(I)}(v) \le C_{N(I)}(v)$ . Now ZL being gsos-mset, it is a gssm-nbd of each of its sm points.

# **RESULTS AND DISCUSSION**

In this work we have acquainted with the conception of generalized semi soft multi closure, generalized semi soft multi interior and generalized semi soft multi neighborhood and also some basic characteristics. In future we extend the conception of generalized semi soft multi continuous mappings, their respective open mappings and homeomorphisms.

# ABSTRACT

The purpose of this paper is to propose a new notion of Heptapartitioned Neutrosophic topological space. The author examined some of the fundamental characteristics of Heptapartitioned Neutrosophic collections in Neutrosophic Topological Spaces and defined the concepts on closure & interior Further, the author describes Heptapartitioned-N-P-Ŏ-sets Heptapartitioned-N-Ś-Ŏ-sets, Heptapartitioned-N-6-Ŏ-sets and Heptapartitioned-N- $\dot{\alpha}$ -Ŏ-sets via Heptapartitioned Neutrosophic topological spaces. By defining these Heptapartitioned Neutrosophic open sets, the author provides few acceptable examples and develop few primary solutions on H-N-T-spaces.

**Keywords:** Heptapartitioned Neutrosophic Topology, H-N Sets, H-N-preopen, H-N -Semiopen, H-N- $\beta$ -open, H-N- $\dot{\alpha}$ -open.

# INTRODUCTION

In 1965 [1], Zadeh presented the fuzzy set. F. Smarandache further advanced this notion by formulating the conception of neutrosophic sets, whichever presents a mathematical approach as addressing issues implicating imprecision, indeterminacy and inconsistency in data. The notion of neutrosophic topological space was later formulated in 2012 by Salama and Alblowi [2]. In 2020, Rama Malik [3] established the idea of pentapartitioned set. The framework of Neutrosophic topological spaces have been then leveraged by Das and Tripathy [4] to define and analyze the idea of neutrosophic simply 6-open sets.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Jeyanthi and Mythili

Recently, Das [5] et al. extended these ideas by introducing Quadripartitioned Neutrosophic Topological Spaces, applying topological principles to quadripartitioned neutrosophic sets. I have refined the symbols as follows: U, C, and G represent the refinement of U, C, and G respectively. In the same manner, T has been further defined as  $\dot{T}_A$ , representing absolute truth &  $\dot{T}_R$ , representing relative truth. Similarly,  $\dot{F}$  has been delineated as  $\dot{F}_A$ , signifying absolute falsity &  $\dot{F}_R$ , signifying relative falsity. The introduction of Seven Symbol-Valued Neutrosophic Logic were initially undertaken by F. Smarandache [6] in 1995. According to this framework, we have the following relationships C = ( $\dot{T}_A$  or  $\dot{T}_R$ ) / ( $\dot{F}_A$  or  $\dot{F}_R$ ) representing Ignorance; and U = signifying a state where neither ( $\dot{T}_A$  or  $\dot{T}_R$ ) nor ( $\dot{F}_A$  or  $\dot{F}_R$ ) holds, rendering it unspecified. Each of these entities is symbolized.

However, when considering  $\dot{T}_{A}$ ,  $\dot{T}_{R}$ ,  $\dot{F}_{A}$ ,  $\dot{F}_{R}$ , U, C, and G as subsets within the range [0, 1], a numerical logic system emerges, encompassing seven distinct numerical values. This numeric Fra ework enables the definition of the Heptapartitioned Neutrosophic set and facilitates the exploration of its inherent properties. The year 2021 marked the development of Heptapartitioned Neutrosophic Set by R. Radha & A. Stanis Arul Mary [7], building upon the foundations of N-Ş concepts. This article's main goal is to gather concepts of heptapartitioned neutrosophic topological space and examine various aspects of them.

## PRELIMINARIES

The author provides some fundamental concepts and findings that are pertinent to the article's primary findings in this part.

# Definition 2.1.

Consider R be an universe. Then G, a H-N-Ş over R :

 $G = \{(\zeta, \mathrm{T}_{\mathrm{G}}(\zeta), M_{\mathrm{G}}(\zeta), C_{\mathrm{G}}(\zeta), U_{\mathrm{G}}(\zeta), K_{\mathrm{G}}(\zeta), F_{\mathrm{G}}(\zeta): \zeta \in \mathsf{R}\}$ 

The values  $T_G(\zeta), M_G(\zeta), C_G(\zeta), U_G(\zeta), I_G(\zeta), K_G(\zeta), F_G(\zeta)$  correspond to the absolute truth membership, relative truth membership, contradiction membership, unknown membership, ignorance membership, relative falsity membership & absolute falsity membership of  $\zeta$ , where  $\zeta$  is an element of the set R and belongs to the interval [0, 1]. So,  $0 \leq T_G(\zeta)+M_G(\zeta)+C_G(\zeta)+U_G(\zeta)+K_G(\zeta)+F_G(\zeta)\leq 7$ , for all  $\zeta \in \mathbb{R}$ .

# Definition 2.2.

Let  $E = \{(\zeta, T_E(\zeta), M_E(\zeta), C_E(\zeta), U_E(\zeta), I_E(\zeta), K_E(\zeta), F_E(\zeta)): \zeta \in R\}$  and  $F = \{\zeta, T_F(\zeta), M_F(\zeta), C_F(\zeta), U_F(\zeta), I_F(\zeta), K_F(\zeta)): \zeta \in R\}$  be a two H-N-sets over a fixed sets R. subsequently,  $E \subseteq F$  iff T E ( $\zeta$ )  $\leq$  T F ( $\zeta$ ), M E ( $\zeta$ )  $\leq$  M F ( $\zeta$ ), C E ( $\zeta$ )  $\leq$  C F ( $\zeta$ ), U E ( $\zeta$ )  $\geq$  U F ( $\zeta$ ), I E ( $\zeta$ )  $\geq$  I F ( $\zeta$ ), K E ( $\zeta$ )  $\geq$  K F ( $\zeta$ ), F E ( $\zeta$ )  $\geq$  F F ( $\zeta$ ), for all  $\zeta \in R$ .

# Example 2.3.

Let R = {a<sub>1</sub>, a<sub>2</sub>}. Consider two Heptapartitioned Neutrosophic sets E = {(a<sub>1</sub>, 0.4, 0.3, 0.4, 0.3, 0.7, 0.7, 0.8), (a<sub>2</sub>, 0.2, 0.5, 0.5, 0.7, 0.8, 0.7, 0.8)} and F = {(a<sub>1</sub>, 0.7, 0.5, 0.6, 0.6, 0.5, 0.5, 0.4), (a<sub>2</sub>, 0.8, 0.7, 0.5, 0.7, 0.5, 0.4, 0.3)} over R. Then,  $E \subseteq F$ .

# Definition 2.4.

The whole H-N-Ş ( $1_{H_N}$ ) and empty H-N-Ş ( $0_{H_N}$ ) over a immovanle set R are explained in this way: (i)  $1_{H_N} = \{(\zeta, 1, 1, 1, 0, 0, 0, 0): \zeta \in R\};$ (ii)  $0_{H_N} = \{(\zeta, 0, 0, 0, 1, 1, 1, 1): \zeta \in R\}.$

### Jeyanthi and Mythili

There is other nine types of representations for both the whole H-N-S  $1_{\text{H}_{N}}$  and the empty H-N-S  $0_{\text{H}_{N}}$ 

Here are several examples:  $1_{H_N} = \{(\zeta, 1, 1, 1, 0, 0, 0, 1): \zeta \in R\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 0, 0, 1, 0): \zeta \in R\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 0, 1, 0, 0): \zeta \in R\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 1, 0, 0, 0): \zeta \in R\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 0, 1, 1, 1): \zeta \in R\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 1, 0, 1, 1): \zeta \in R\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 1, 1, 0, 1): \zeta \in \mathbb{R}\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 1, 1, 1, 0): \zeta \in R\};$  $1_{H_N} = \{(\zeta, 1, 1, 1, 1, 1, 1, 1): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 1, 1, 1, 0): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 1, 1, 0, 1): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 1, 0, 1, 1): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 0, 1, 1, 1): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 1, 0, 0, 0): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 0, 1, 0, 0): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 0, 0, 1, 0): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 0, 0, 0, 1): \zeta \in R\};$  $0_{H_N} = \{(\zeta, 0, 0, 0, 0, 0, 0, 0): \zeta \in \mathbb{R}\}.$ 

### Remark 2.5.

The author will refer to  $1_{H_N} = (\zeta, 1, 1, 1, 0, 0, 0, 0)$ :  $\zeta \in R$  and  $0 \text{ HN} = (\zeta, 0, 0, 0, 1, 1, 1, 1)$ :  $\zeta \in R$  throughout this article because the complements of 1 HN and 0 HN must be the same. However, it does not hold true for any of the other nine sorts of combinations that contain  $1_{H_N}$  and 0 HN. For any H-N-S E over R, it is evident that  $0 \text{ HN} \subseteq E \subseteq 1_{H_N}$ .

### Definition 2.6.

Let  $E = \{(\zeta, T_E(\zeta), M_E(\zeta), C_E(\zeta), U_E(\zeta), I_E(\zeta), K_E(\zeta), F_E(\zeta)\}$  be a Heptapartitioned Neutrosophic set over a immovable set R. Also, the complement of E or  $E^c$  is represented as follows:  $E^c = \{(\zeta, F_E(\zeta), K_E(\zeta), I_E(\zeta), 1-U_E(\zeta), C_E(\zeta), M_E(\zeta), T_E(\zeta)\}$ : for all  $\zeta \in R\}$ .

### Definition 2.7.

The union of any two Heptapartitioned Neutrosophic collections E & F over R is indicated as  $E \cup F$ and is referred to as  $E \cup F = [\zeta, (max((T_E(\zeta), T_F(\zeta)), max(M_E(\zeta), M_F(\zeta)), max(C_E(\zeta), C_F(\zeta)), min(U_E(\zeta), U_F(\zeta)), min(I_E(\zeta), I_F(\zeta))); \zeta \in R]$ . and The intersection of any two Heptapartitioned Neutrosophic sets E & F over R is indicated as  $E \cap F$  and is referred to as  $E \cap F = [\zeta, (min((T_E(\zeta), T_F(\zeta)), min(M_E(\zeta), M_F(\zeta)), min(C_E(\zeta), C_F(\zeta)), max(I_E(\zeta), U_F(\zeta)), max(I_E(\zeta), K_F(\zeta)), max(F_E(\zeta), F_F(\zeta))); \zeta \in R]$ .

# HEPTAPARTITIONED NEUTROSOPHIC TOPOLOGY

The concepts of Heptapartitioned neutrosophic topology on H-N-Ss are acquired in this section. Then, using the perspective of a Heptapartitioned N -T-S, the author describes the interior & closure of an H-N-S and demonstrate some results.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Jeyanthi and Mythili

## Description 3.1.

A Heptapartitioned Neutrosophic Topology on a non-empty set R is a family  $\Im$  of Heptapartitioned Neutrosophic subsets in R satisfies the following axioms:

(i)  $0_{H_N}$ ,  $1_{H_N} \in \mathfrak{I}$ ;

(ii)  $F_1, F_2 \in \mathfrak{I} \Rightarrow F_1 \cap F_2 \in \mathfrak{I};$ 

(iii) {Fi:  $i \in \Delta$ }  $\subseteq \mathfrak{I} \Rightarrow \cup$  Fi $\in \mathfrak{I}$ .

In this scenario, the pair (R, $\mathfrak{I}$ ) is denoted as a Heptapartitioned-N- $\mathfrak{I}$ - $\mathfrak{I}$ . Every member of the set  $\mathfrak{I}$  is referred to as a Heptapartitioned neutrosophic open sets (abbreviated as H-N $\check{O}$  $\mathfrak{I}$ ). Furthermore, If  $F \in \mathfrak{I}$ , then it's compliment F C is termed a Heptapartitioned neutrosophic closed set (abbreviated as H-N $\check{O}$  $\mathfrak{I}$ ).

# Example 3.2.

Consider two H-N-Şs, denoted as M and N, defined over a immovable set R = { $\zeta$ ,  $\xi$ }, with the following compositions:

 $\mathsf{M} = \{(\zeta, 0.7, 0.4, 0.6, 0.7, 0.5, 0.4, 0.3), (\xi, 0.5, 0.6, 0.7, 0.5, 0.1, 0.4, 0.1): \zeta, \xi \in \mathsf{R}\};$ 

 $N = \{(\zeta, 0.6, 0.4, 0.5, 0.8, 0.9, 0.5, 0.8), (\xi, 0.5, 0.4, 0.6, 0.8, 0.3, 0.4, 0.1): \zeta, \xi \in R\};\$ 

It follows that the collection  $\mathfrak{T}$  = {0\_{H\_N} , 1\_{H\_N}, M, N} constitutes a Heptapartitioned-N-T structure over the set R.

## Definition 3.3.

Let (R,  $\Im$ ) represent a heptapartitioned Neutrosophic topological space. Consider  $\Phi$  as an H-Ň-Ş over R. The Heptapartitioned Neutronosophic Closure, denoted as H-Nd, for  $\Phi$  can be defined as the

intersection of all H-NĊŞs that encompass  $\Phi$ . On the other hand, the Heptapartitioned Neutronosophic Interior, abbreviated as H-N int, of  $\Phi$  can be defined as the union of all H-NŎŞs that are contained within  $\Phi$ . H-Nint ( $\Phi$ ) =  $\cup$ { $\Psi$ :  $\Psi \subseteq \Phi$  and  $\Psi$  is a H-NŎŞ in (R,ℑ)}, and H-N d ( $\Phi$ ) =  $\cap$ { $\Omega$ :  $\Phi \subseteq \Omega$  and  $\Omega$  is a H-NĊŞ in (R,ℑ)}.

### Remark 3.4.

The largest H-NČŞ in (R,3) that contains  $\Phi$  in H- N int ( $\Phi$ ) while the smallest H-NČŞ in (R,3) that contains  $\Phi$  in H-N cl ( $\Phi$ ).

### Theorem 3.5.

Let  $(R, \mathfrak{I})$  be a Heptapartitioned-N-Topological space. Consider any two H-N-Ss over R, denoted as  $\Gamma$  and  $\Delta$ . In this context, the following statement is well founded: (i) H-N int  $(\Gamma) \subseteq \Gamma \subseteq H$ -N int  $(\Gamma)$ ; (ii)  $\Gamma \subseteq \Delta \Rightarrow H$ -N cl  $(\Gamma) \subseteq H$ -N cl  $(\Delta)$ ; (iii)  $\Gamma \subseteq \Delta \Rightarrow H$ -N cl  $(\Gamma) \subseteq H$ -N cl  $(\Delta)$ ; (iv) H-N cl  $(\Gamma \cup \Delta) = H$ -N cl  $(\Gamma) \cup H$ -N cl  $(\Delta)$ ; (v) H-N cl  $(\Gamma \cap \Delta) \subseteq H$ -N cl  $(\Gamma) \cap H$ -N cl  $(\Delta)$ ; (vi) H-N int  $(\Gamma \cup \Delta) \supseteq H$ -N int  $(\Gamma) \cup H$ -N int  $(\Delta)$ ; (vii) H-N int  $(\Gamma \cup \Delta) \supseteq H$ -N int  $(\Gamma) \cap H$ -N int  $(\Delta)$ .

### Proof.

(i) from definition 3.3., we obtain H-N<sub>int</sub>( $\Gamma$ ) =  $\cup$  {  $\Delta$ :  $\Delta$  is a H-NŎŞ in (R,ℑ) and  $\Delta \subseteq \Gamma$ }. Since, every  $\Delta \subseteq \Gamma$ , so  $\cup$ {  $\Delta$ :  $\Delta$  is a H-NŎŞ in (R,ℑ) and  $\Delta \subseteq \Gamma$ }  $\subseteq \Gamma$ , i.e., H-N<sub>int</sub>( $\Gamma$ )  $\subseteq \Gamma$ . Again, H-N<sub>cl</sub>( $\Gamma$ ) =  $\cap$ {  $\Omega$ :  $\Omega$  is a H-NĊŞ in (R,ℑ) and  $\Gamma \subseteq \Omega$ }. Since, each  $\Omega \supseteq \Gamma$ , so  $\cap$ {  $\Omega$ :  $\Omega$  is a H-NĊŞ in (R,ℑ) and  $\Gamma \subseteq \Omega$ }  $\supseteq \Gamma$ , i.e., H-N<sub>cl</sub>( $\Gamma$ ) $\supseteq \Gamma$ . Therefore, H-N<sub>int</sub>( $\Gamma$ )  $\subseteq \Gamma \subseteq$ H-N<sub>cl</sub>( $\Gamma$ ).

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Jeyanthi and Mythili

(ii) Suppose (R, $\mathfrak{I}$ ) constitutes a Heptapartitioned- N-T-S. Consider  $\Gamma$  and  $\Delta$  as arbitrary H-N-Ss over R, with the additional condition that  $\Gamma$  is a subset of  $\Delta$ . here, H-N<sub>d</sub>( $\Gamma$ ) =  $\cap$  { $\Omega$ :  $\Omega$  is a H-NCS in (R, 3) and  $\Gamma \subseteq \Omega$  }  $\subseteq \cap \{\Omega: \Omega \text{ is a H-NCS in } (R, \mathfrak{I}) \text{ and } \Delta \subseteq \Omega \}$  [Since  $\Gamma \subseteq \Delta$ ] = H-Nc( $\Delta$ )  $\Rightarrow$ H-N<sub>d</sub>( $\Gamma$ )  $\subset$ H-N<sub>d</sub>( $\Delta$ ). Therefore,  $\Gamma \subset \Delta \Rightarrow$ H-N<sub>d</sub>( $\Gamma$ ) $\subset$ H-N<sub>d</sub>( $\Delta$ ). (iii) Consider a Heptapartitioned-N-T-S (R,  $\Im$ ). Consider  $\Gamma \& \Delta$  as two H-N-Ss over R, where it is given that  $\Gamma$  is a subset of  $\Delta$ . Then, H-N $_{cl}(\Gamma) = \bigcap \{ \Omega : \Omega \text{ is a } H$ -N $\check{O}$ S in ( $\mathbb{R}, \mathfrak{I}$ ) and  $\Gamma \subseteq \Omega \}$  $\subseteq \cap \{\Omega; \Omega \text{ is a H-NOS} \text{ in } (R, \mathfrak{I}) \text{ and } \Delta \subseteq \Omega \}$  [Since  $\Gamma \subseteq \Delta$ ] = H-N int( $\Delta$ )  $\Rightarrow$ H-N int ( $\Gamma$ )  $\subseteq$ H-N int( $\Delta$ ). Therefore,  $\Gamma \subseteq \Delta \Longrightarrow H$ -Nint( $\Gamma$ ) $\subseteq H$ -Nint( $\Delta$ ). (iv) Let  $\Gamma$  and  $\Delta$  denote two Heptapartitioned-N subsets of a Heptapartitioned-N-T-S (R,  $\Im$ ). As we know  $\Gamma \subseteq \Gamma \cup \Delta, \Delta \subseteq$  $\Gamma \cup \Delta$ . here,  $\Gamma \subseteq \Gamma \cup \Delta \Rightarrow H-Nd(\Gamma) \subseteq H-Nd(\Gamma \cup \Delta)$ ; and  $\Delta \subseteq \Gamma \cup \Delta \Rightarrow H-Nd(\Delta) \subseteq H-Nd(\Gamma \cup \Delta)$ . Therefore, H- $N_{d}(\Gamma) \cup H$ - $N_{d}(\Delta) \subseteq H$ - $N_{d}(\Gamma \cup \Delta)$  (1) We have,  $\Gamma \subseteq H$ -N $d(\Gamma)$ ,  $\Delta \subseteq H$ -N $d(\Delta)$ . Therefore,  $\Gamma \cup \Delta \subseteq H$ -N $d(\Gamma) \cup H$ -N $d(\Delta)$ . additionally, w.k.tH-N $d(\Gamma) \cup H$ -N $d(\Delta)$  is a H-N $d(\Gamma)$ NCS in (R,3). As a result, H-Nd( $\Gamma$ ) $\cup$ H-Nd( $\Delta$ ) is a H-NCS in (R,3), this holds $\Gamma \cup \Delta$ . But it emerges that H-Nd( $\Gamma \cup \Delta$ ) is the lowest H-NCS in (R, $\mathfrak{I}$ ), which involves  $\Gamma \cup \Delta$ . Consequently, H- $Na(\Gamma \cup \Delta) \subseteq H$ - $Na(\Gamma) \cup H$ - $Na(\Delta)$  (2) Combining equations (1) and (2) we can conclude that:  $H_{-Ncl}(\Gamma \cup \Delta) = H_{-Ncl}(\Gamma) \cup H_{-Ncl}(\Delta)$ . (v)Consider  $\Gamma$  and  $\Delta$  as two Heptapartitioned neutrosophic subsets of a H-NTS (R,  $\Im$ ). As we know  $\Gamma \cap \Delta \subseteq \Gamma$ ,  $\Gamma \cap \Delta \subseteq \Delta$ . Now,  $\Gamma \cap \Delta \subseteq \Gamma \Rightarrow H \cdot Na(\Gamma \cap \Delta) \subseteq H \cdot Na(\Gamma)$ ; and  $\Gamma \cap \Delta \subseteq \Delta \Longrightarrow H \cdot N_d(\Gamma \cap \Delta) \subseteq H \cdot N_d(\Delta)$ . Therefore, H-N*cl*( $\Gamma \cap \Delta$ )  $\subseteq$  H-N*cl*( $\Gamma$ ) $\cap$  H-N*cl*( $\Delta$ ). (vi) Consider  $\Gamma$  and  $\Delta$  as two Heptapartitioned neutrosophic subsets of a H-NTS (R,  $\mathfrak{I}$ ). As we know  $\Gamma \subseteq \Gamma \cup \Delta, \Delta \subseteq \Gamma \cup \Delta$ . so, we obtain  $\Gamma \subseteq \Gamma \cup \Delta \Rightarrow H - N_{int}(\Gamma) \subseteq H - N_{int}(\Gamma \cup \Delta);$  and  $N \subseteq \Gamma \cup \Delta \Rightarrow H - N_{int}(\Delta) \subseteq H - N_{int}(\Gamma \cup \Delta).$ Therefore, H-N*int*( $\Gamma$ ) $\cup$ H-N*int*( $\Delta$ )  $\subseteq$ H-N*int*( $\Gamma \cup \Delta$ ). (vii) Consider  $\Gamma$  and  $\Delta$  as two Heptapartitioned neutrosophic subsets of a H-NTS (R,  $\mathfrak{I}$ ). As we know  $\Gamma \cap \Delta \subseteq \Gamma$ ,  $\Gamma \cap \Delta \subseteq \Delta$ . Now,  $\Gamma \cap \Delta \subseteq \Gamma \Rightarrow H$ -N int $(\Gamma \cap \Delta) \subseteq H$ -N int $(\Gamma)$ ; and  $\Gamma \cap \Delta \subseteq \Delta \Rightarrow H$ -N int $(\Gamma \cap \Delta) \subseteq H$ -N int $(\Delta)$ . Therefore, H-Nint( $\Gamma \cap \Delta$ )  $\subseteq$  H-Nint( $\Gamma$ ) $\cap$  H-Nint( $\Delta$ ).

**Theorem 3.6.** Consider  $\Gamma$  as a Heptapartitioned neutrosophic subset of a Heptapartitioned-N-Ţ-Ş denoted by (R, ℑ). In this context, the following assertion is valid:

(i)  $\Gamma$  is a H-N-open sets iffH-N<sub>int</sub>( $\Gamma$ ) =  $\Gamma$ ; (ii)  $\Gamma$  is a H-N-closed sets iffH-N<sub>cl</sub>( $\Gamma$ ) =  $\Gamma$ .

**Proof**: (i) Let  $\Gamma$  be a H-N-open sets on a Heptapartitioned- N-Ţ-Ş (R,ℑ). Here, H-N<sub>int</sub>( $\Gamma$ ) =  $\cup$ {  $\Omega$ :  $\Omega$  is a H-N-open sets in (R,ℑ) and  $\Omega \subseteq \Gamma$ }. Since,  $\Gamma$  is a H-N-open sets in (R,ℑ), so  $\Gamma$  is the biggestH-N-open sets, which is included in  $\Gamma$ .  $\Rightarrow \cup$ { $\Omega$ :  $\Omega$  is a H-N-open sets in (R,ℑ) and  $\Omega \subseteq \Gamma$ } =  $\Gamma$ . Therefore, H-N<sub>int</sub>( $\Gamma$ ) =  $\Gamma$ .

(ii) Consider  $\Gamma$  as a Heptapartitioned neutrosophic subsets of a H-NŢŞ (R, ℑ). Here, H-N[( $\Gamma$ ) =  $\cap$ { $\Omega$ :  $\Omega$  is a H-N-closed sets in (R,ℑ) and  $\Gamma \subseteq \Omega$ }. Since,  $\Gamma$  is a H-N-closed sets in (R,ℑ), so  $\Gamma$  is the tiniest H-N-closed sets, which carries $\Gamma$ . $\Rightarrow$  $\cap$ { $\Omega$ :  $\Omega$  is a H-N-closed sets in (R,ℑ) and  $\Gamma \subseteq \Omega$ } =  $\Gamma$ . Therefore, H-N[( $\Gamma$ ) =  $\Gamma$ .

**Definition 3.7.** Consider the Heptapartitioned-N-T-S denoted as (R,  $\mathfrak{I}$ ). Within this context, a H-N-S named $\mathfrak{I}$  is labeled as:

Vol.14 / Issue 80 / Oct / 2023	International Bimonthly (Print) – Open Access	ISSN: 0976 – 0997
Jeyanthi and Mythili		
(i) A Heptapartitioned-NŚŎ set iffξ a subset of the H-N-complement of the H-N-accumulation of Q, i.e., ξ⊆H-Nd(H- Nint(ξ)); (ii) A Heptapartitioned-NPŎ set iffξis a subset of the H-N-accumulation of the H-N-complement of Q, i.e., ξ⊆H- Nint(H-Nd(ξ)).		
		(i) (ii)

### Proof.

(i) Let  $(R,\mathfrak{F})$  be a Heptapartitioned- N-T-S. Let  $\mathfrak{F}$  be a H-NŎS. Therefore,  $\mathfrak{F}=H-N_{int}(\mathfrak{F})$ . As we know  $\mathfrak{F}_{H-N_{all}}(\mathfrak{F})$ .  $\mathfrak{F}_{all}(\mathfrak{F})$ .  $\mathfrak{F}_{all}(\mathfrak{F})$ .  $\mathfrak{F}_{all}(\mathfrak{F})$ .

(ii) Consider  $\Gamma$  as a Heptapartitioned neutrosophic subsets of a H-NŢŞ (R,ℑ). Consequently,  $\S$ =H-N*int*(§). As we know,  $\S \subseteq$ H-N*int*(§).  $\Rightarrow$ H-N*int*(§) $\subseteq$ H-N*int*(H-N*a*(§)) i.e.,  $\S$ = H-N*int*(§)  $\subseteq$ H-N*int*(H-N*a*(§)). Consequently,  $\S \subseteq$ H-N*int*(H-N*a*(§)). Hence,  $\S$  is a H-NPŎ set in (R,ℑ).

**Example 3.9.** Consider a Heptapartitioned-N-Ţ-Ş (R,ℑ),  $\Im$ = {0<sub>H<sub>N</sub></sub>, 1<sub>H<sub>N</sub></sub>, {(a,0.4,0.5,0.6,0.3,0.2,0.1,0)},

{(a,0.5,0.6,0.6,0.2,0.2,0.1,0)}}. Then,

(i) S={(a,0,0.1,0.2,0.8,0.6,0.5,0.5)}is categorized as a H-NŚŎ set and which is not qualify as a H-NŎŞ in (R,ℑ).
(ii) L={(a,0.7,0.6,0.6,0.2,0.2,0.2,0.1,0)} is classifies as a H-NPŎ set although it does not satisfy criteria for being a H-NŎŞ in (R,ℑ).

**Theorem 3.10.** For Heptapartitioned-N-T-S(R,3), the union of two H-NSO collections is a H-NSO set.

### Proof.

$$\begin{split} & \text{Consider}\Theta\&\Lambda\text{as two H-NSO sets in a HeptapartitionedNeutrosophicTopological spaces}(\mathsf{R},\mathfrak{I}). \ \text{consequently}, \ \Theta\subseteq H-\\ & \mathsf{N}_d \ (\mathsf{H}-\mathsf{N}_{int}(\Theta)) \ (3) \\ & \text{and } \Lambda\subseteq \mathsf{H}-\mathsf{N}_d (\mathsf{H}-\mathsf{N}_{int}(\Lambda)) \ (4) \\ & \text{From eq. (3) and eq. (4), we obtain } \Theta \cup \Lambda\subseteq \mathsf{H}-\mathsf{N}_d (\mathsf{H}-\mathsf{N}_{int}(\Theta)) \cup \mathsf{H}-\mathsf{N}_d \ (\mathsf{H}-\mathsf{N}_{int}(\Lambda)) \\ & = H-\mathsf{N}_d (\mathsf{H}-\mathsf{N}_{int}(\Theta) \cup \mathsf{H}-\mathsf{N}_{int}(\Lambda)) \ \subseteq \mathsf{H}-\mathsf{N}_d (\mathsf{H}-\mathsf{N}_{int}(\Theta) \cup \Lambda). \\ & \text{Therefore, } \Theta \cup \Lambda\subseteq \mathsf{H}-\mathsf{N}_d (\mathsf{H}-\mathsf{N}_{int}(\Theta \cup \Lambda)). \ \text{Hence, } \Theta \cup \Lambda \ \text{is a } \mathsf{H}-\mathsf{NSO} \ \text{set in } (\mathsf{R},\mathfrak{I}). \end{split}$$

**Theorem 3.11.** For Heptapartitioned- N-Ţ-Ş (R,ℑ), the union of two H-NPŎ sets additionally a H-NPŎ set. **Proof.** ConsiderΘ&Aas two H-NPŎ sets in a Heptapartitioned- N-Ţ-Ş (R,ℑ). Consequently,  $\Theta \subseteq H$ -N<sub>int</sub> (H-N<sub>d</sub>( $\Theta$ )) (5) and  $\Lambda \subseteq H$ -N<sub>int</sub>(H-N<sub>d</sub>( $\Lambda$ )) (6) Combining equations (5) and (6), we obtain,  $\Theta \cup D \subseteq H$ -N<sub>int</sub>(H-N<sub>d</sub>( $\Theta$ )) $\cup$  H-N<sub>int</sub>(H-N<sub>d</sub>( $\Lambda$ ))  $\subseteq$  H-N<sub>int</sub>(H-N<sub>d</sub>( $\Theta$ )) $\cup$  H-N<sub>int</sub>(H-N<sub>d</sub>( $\Theta$ )) = H-N<sub>int</sub>(H-N<sub>d</sub>( $\Theta \cup \Lambda$ )). Therefore,  $\Theta \cup \Lambda \subseteq H$ -N<sub>int</sub>(H-N<sub>d</sub>( $\Theta \cup \Lambda$ )). Hence,  $\Theta \cup \Lambda$  is a H-NPŎ set in (R,ℑ).

**Example 3.12.** Examine a Heptapartitioned-N-T-S (R, S) as demonstrated in Example 3.9. It is evident that the Heptapartitioned neutrosophic set L = {(a, 0.7, 0.6, 0.6, 0.2, 0.2, 0.1, 0)} qualifies as a H-N $\alpha$ Ŏ set, but it does not meet the criteria to be classified as a H-N $\delta$ Ş set within the confines of the space (R, S).

**Proposition 3.13.** For a Heptapartitioned- N-Ţ-Ş (R,ℑ), eachH-N $\dot{\alpha}$ Ŏ set is a H-NŚŎ set but conversely not true. **Proof.** Consider a Heptapartitioned- N-Ţ-Ş (R, ℑ). ConsiderΘis a H-N $\dot{\alpha}$ Ŏ set in (R,ℑ). consequently,  $\Theta \subseteq$ H-N*int*(H-N*int*( $\Theta$ ))). It emerges that H-N*int* (H-N*int*( $\Theta$ )))  $\subseteq$ H-N*d*(H-N*int*( $\Theta$ )). Thus, we obtain  $\Theta \subseteq$ H-N*d*(H-N*int*( $\Theta$ )). Hence,  $\Theta$  is a H-NŠŎ set. consequently, every H-N $\dot{\alpha}$ Ŏ set is a H-NŠŎ set.

**Example 3.14.** Consider a Heptapartitioned- N-T- $\S$  (R, $\Im$ ),  $\Im$ ={0<sub>HN</sub>, 1<sub>HN</sub>, {(a,0.5,0.6,0.6,0.5,0.7,0.8,0.5), (b,0.5,0.5,0.5,0.6,0.6,0.5), (b,0.5,0.5,0.6,0.8,0.8,0.8,0.6), (b,0.5,0.5,0.6,0.8,0.8,0.8,0.6)}}. Then, it can be easily verified that A={(a,0.6,0.6,0.7,0.5,0.3,0.3,0.3), (b,0.5,0.5,0.8,0.5,0.4,0.4,0.4)} Represents an H-NŚŎ set within (R, $\Im$ ), yet does not qualify as an H-N $\mathring{a}$  set within the same (R, $\Im$ ) context.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Jeyanthi and Mythili

**Theorem 3.15**. For a Heptapartitioned- N-T-Ş (R,3), every H-N $\dot{\alpha}$ Ŏ collection is a H-NPŎ set.Conversely not true.

**Proof.**Let  $(R,\Im)$  be a Heptapartitioned-N-Ţ-Ş. Let  $\Theta$  be a H-N $\dot{\alpha}$ Ŏ set in  $(R,\Im)$ . Therefore,  $\Theta \subseteq$ H-N<sub>int</sub> $(H-N_{int}(\Theta))$ . It is known that H-N<sub>int</sub> $(\Theta)\subseteq \Theta$ . This implies, H-N<sub>d</sub> $(H-N_{int}(\Theta))\subseteq$ H-N<sub>d</sub> $(\Theta)$ . Which implies H-N<sub>int</sub> $(H-N_{d}(H-N_{int}(\Theta)))\subseteq$ H-N<sub>int</sub> $(H-N_{d}(\Theta)$ . Therefore,  $\Theta \subseteq$ H-N<sub>int</sub> $(H-N_{d}(\Theta)$ . Hence,  $\Theta$  is a H-NPŎset. consequently, every H-N $\dot{\alpha}$ Ŏ set is a H-NPŎ set in  $(R,\Im)$ .

**Example 3.16.** Let's examine a Heptapartitioned-N-Ţ-Ş space (R,  $\Im$ ) as depicted in Example 3.9. In this context, the Heptapartitionedneutrosophic set S = {(a, 0, 0.1, 0.2, 0.8, 0.6, 0.5, 0.5)} qualifies as a H-NPŎ set within the space (R,  $\Im$ ). However, it does not meet the criteria to be categorized as a H-N $\mathring{\alpha}$ Ŏ set within the space (R,  $\Im$ ).

**Remark 3.17.** A Heptapartitioned- N set  $\Theta$  is referred to as a Heptapartitioned- N-6-closed set (abbreviated as H-N-6-Ċ set) iff the succeding condition holds:  $\Theta$  is a Heptapartitioned neutrosophic 6-Ŏ set, this means that the intersection of the Heptapartitioned neutrosophic closure of the neutrosophic interior of  $\Theta$  (denoted as H-N<sub>int</sub> (H-N<sub>d</sub> ( $\Theta$ ))) with the Heptapartitioned neutrosophic closure of the neutrosophic interior of  $\Theta$  (denoted as H-N<sub>d</sub> (H-N<sub>int</sub> ( $\Theta$ ))) is a subset of  $\Theta$ .

**Theorem 3.18**. For a H-NŢŞ (R, 3), every H-NPŎ (H-NŚŎ) collection is a H-N-6-Ŏ set.

Proof. Straight forward from definition.

**Proposition 3.19.** For H-NŢŞ ( $R, \mathfrak{F}$ ) the union of two H-N-6-Ŏ set is a H-N-6-Ŏ set.

**Proof.** Consider  $\Theta \& \Lambda$  as two H-N-6-Ŏ sets in a H-NŢŞ (R, $\mathfrak{I}$ ).

 $consequently, \Theta \_H-N_{\mathit{int}}(H-N_{\mathit{cl}}(\Theta)) \cup H-N_{\mathit{cl}}(H-N_{\mathit{int}}(\Theta))(7)$ 

and  $\Lambda \subseteq H$ - $N_{int}(H$ - $N_{d}(\Lambda)) \cup H$ - $N_{d}(H$ - $N_{int}(\Lambda))(8)$  It emerges that,  $\Theta \subseteq \Theta \cup \Lambda$  and  $\Lambda \subseteq \Theta \cup \Lambda$ .

Now,  $\Theta \subseteq \Theta \cup \Lambda \Rightarrow H$ -Nint( $\Theta$ )  $\subseteq H$ -Nint( $\Theta \cup \Lambda$ )

 $\Rightarrow H-N_{cl}(H-N_{int}(\Theta)) \subseteq H-N_{cl}(H-N_{int}(\Theta \cup \Lambda))(9)$ 

and  $\Theta \subseteq \Theta \cup \Lambda \Rightarrow H - N_{cl}(\Theta) \subseteq H - N_{cl}(\Theta \cup \Lambda)$ 

 $\Rightarrow H-\operatorname{Nint}(H-\operatorname{Ncl}(\Theta)) \subseteq H-\operatorname{Nint}(H-\operatorname{Ncl}(\Theta \cup \Lambda)) (10)$ 

 $\label{eq:similarly} \textit{Similarly}, \textit{demonstrably}\textit{H-}\textit{Nd}(\textit{H-}\textit{Nint}(\Lambda)) {\buildrel H-}\textit{Nd}(\textit{H-}\textit{Nint}(\Theta \cup \Lambda))(11)$ 

 $H-\operatorname{Nint}(H-\operatorname{Ncl}(\Lambda)) \subseteq H-\operatorname{Nint}(H-\operatorname{Ncl}(\Theta \cup \Lambda)) (12)$ 

Combining equations (7) and (8) we obtain,

 $\Theta \cup \Lambda \underline{\subset} H-\mathrm{N}\mathit{cl}(H-\mathrm{N}\mathit{int}(\Theta)) \cup H-\mathrm{N}\mathit{int}(H-\mathrm{N}\mathit{cl}(\Theta)) \cup H-\mathrm{N}\mathit{cl}(H-\mathrm{N}\mathit{int}(\Lambda)) \cup H-\mathrm{N}\mathit{int}(H-\mathrm{N}\mathit{cl}(\Lambda))$ 

 $\subseteq H \operatorname{Nal}(H \operatorname{-Nint}(\Theta \cup \Lambda)) \cup H \operatorname{-Nint}(H \operatorname{-Nal}(\Theta \cup \Lambda)) \cup H \operatorname{-Nal}(H \operatorname{-Nint}(\Theta \cup \Lambda)) \cup H \operatorname{-Nint}(H \operatorname{-Nal}(\Theta \cup \Lambda))$ 

[Fom equations (9), (10), (11) and (12)]

 $= H-Ncl(H-Nint(\Theta \cup \Lambda)) \cup H-Nint(H-Ncl(\Theta \cup \Lambda))$ 

 $\Rightarrow \Theta \cup \Lambda \subseteq H - Ncl(H - Nint(\Theta \cup \Lambda)) \cup H - Nint(H - Ncl(\Theta \cup \Lambda)).$ 

Therefore,  $\Theta \cup \Lambda$  be a H-N-6-Ŏ set.

As a result, combining two H-N-6- $\check{O}$  collections yields an H-N-6- $\check{O}$  set.

**Proposition 3.20**. For H-NŢŞ (R, $\Im$ ), the intersection of two H-N-6-C sets is a H-N-6-C set. **Proof.** 

Consider a H-NŢŞ(R,ℑ). ConsiderΘ&A be two H-N-6-Ċ sets in (R,ℑ). Consequently, H-N<sub>int</sub> (H-N<sub>d</sub> (Θ))  $\cap$ H-N<sub>d</sub> (H-N<sub>int</sub> (Θ))  $\subseteq$ Θ(13) H-N<sub>int</sub> (H-N<sub>d</sub> ( $\Lambda$ ))  $\cap$ H-N<sub>d</sub> (H-N<sub>int</sub> ( $\Lambda$ )  $\subseteq$ Δ(14) As,  $\Theta \cap \Lambda \subseteq \Theta, \Theta \cap \Lambda \subseteq \Lambda$ , so we obtain H-N<sub>int</sub> ( $\Theta \cap \Lambda$ ) $\subseteq$ H-N<sub>int</sub> ( $\Theta$ )  $\Rightarrow$ H-N<sub>d</sub> (H-N<sub>int</sub> ( $\Theta \cap \Lambda$ )) $\subseteq$ H-N<sub>d</sub> (H-N<sub>int</sub> ( $\Theta$ )); (15)

 $H-N_{d}(\Theta \cap \Lambda) \subseteq H-N_{d}(\Theta) \Rightarrow H-N_{int}(H-N_{d}(\Theta \cap \Lambda)) \subseteq H-N_{int}(H-N_{d}(\Theta)) (16) \\ H-N_{int}(\Theta \cap \Lambda) \subseteq H-N_{int}(\Lambda) \Rightarrow H-N_{d}(H-N_{d}(\Theta)) (16)$

## Jeyanthi and Mythili

$$\begin{split} & \operatorname{Nint}\left(\Theta \cap \Lambda\right) \cong \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Lambda\right)\right) (17) \quad \operatorname{and} \operatorname{H-Nint}\left(\Theta \cap \Lambda\right) \cong \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta \cap \Lambda\right)\right) \cong \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta \cap \Lambda\right)\right) \cong \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta \cap \Lambda\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta \cap \Lambda\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta \cap \Lambda\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta \cap \Lambda\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\operatorname{H-Nint}\left(\Theta \cap \Lambda\right)\right) \cap \operatorname{H-Nint}\left(\operatorname{$$

 $= H-N_{int} (H-N_{cl} (\Theta \cap \Lambda)) \cap H-N_{d} (H-N_{int} (\Theta \cap \Lambda))$ 

 $\Rightarrow \Theta \cap \Lambda \supseteq H \cdot N_{cl} (H \cdot N_{int} (\Theta \cap \Lambda)) \cap H \cdot N_{int} (H \cdot N_{d} (\Theta \cap \Lambda)).$ 

Hence,  $\Theta \cap \Lambda$  be a H-N-6-C set in (R, $\mathfrak{I}$ ).

consequently, combining two H-N-6- $\check{O}$  collections yields an H-N-6- $\check{O}$  set.

# CONCLUSION

According to this paper, the author introduces the concept of an H-N-T-space and extensively explores different types of open sets, namely H-N-preopen sets, H-N-semiopen sets, H-N-b-open sets, and H-N- $\dot{\alpha}$ -open sets. The author establishes significant implications for Heptapartitioned-N- T-Sets through the formulation of theorems, propositions, and similar constructs. By precisely defining the characteristics of H-N-preopen sets, H-N-semiopen sets, H-N-6-open sets, and H-N- $\dot{\alpha}$ -open sets, the author presents concrete examples that demonstrate instances where the results do not hold, serving as illustrative counter examples. Anticipating further exploration and inquiry, the author envisions that these ideas, along with the various open sets on Heptapartitioned-N-T-S, will be subject to more in-depth study in the future. The practical applicability of Heptapartitioned Neutrosophic topological space extends to decision-making, data mining, and other related fields.

# ACKNOWLEDGEMENT

The author expresses gratitude to the referee for their valuable suggestions, which contributed to enhancing this paper.

# ABSTRACT

Optimization is a procedure of finding and comparing feasible solutions. Convex optimization is one of the fields among several fields of Optimization techniques. This article presents the definition of intervalvalued intuitionistic fuzzy local maximum point and interval-valued intuitionistic fuzzy global maximum point and its characterizations.

Keywords: IVIF-convex set, TOPSIS, IVIF-convex objective function, IVIF-convex constraints

# INTRODUCTION

In this paper, we introduced the interval-valued intuitive fuzzy local maximum point. (abbreviated *IVIF*  $^{LM}$  point) and the interval-valued intuitionistic fuzzy global maximum point (abbreviated *IVIF*  $^{GM}$  point) of *convex twif* sets and its properties. Throughout this paper U as universal crisp set, *I* is the collection of all subintervals of the closed interval [0,1] and *I*<sup>U</sup> represents the family of all closed subintervals of [0,1]. with respect to the specified set U

Convex IVIF-sets: Characteristics

### Definition 2.1.

Let A be an on empty sub set of  $I^{\cup}$ . An element  $x_{\ell} \in supp$  (A)is called an  $IVIF \sqcup M$  point of A if there exists  $\epsilon > 0$  such that  $[\mu, \overline{\mu}] \land (x^{\rho}) \ge [\mu, \overline{\mu}] \land (x)$  and  $[\underline{\nu}, \nu] \land (x) \le [\underline{\nu}, \nu] \land (x^{\rho})$  for all  $x \in B(x, r)$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Definition 2.2.

An element  $x \in supp(A)$  is called an  $I \lor I \in GM$  point of an interval-valued intuitionistic fuzzy set A if  $[\underline{\mu}, \overline{\mu}]_A(x) \leq [\underline{\mu}, \overline{\mu}]_A(x^{\rho})$  and  $[\underline{\nu}, \nu]_A(x) \geq [\underline{\nu}, \nu]_A(x), \forall x \in U$ .

#### Definition 2.3.

Let A be a *convex IVIF* subset of  $I^{\cup}$ . An element  $x^{\rho} \in supp(A)$  is called a strictly *IVIF*  $\sqcup M$  point of A if there exists  $\epsilon > 0$  such that  $[\mu, \overline{\mu}]_A(x^{\rho}) > [\underline{\mu}, \mu]_A(x)$  and  $[\underline{\nu}, \nu]_A(x) < [\underline{\nu}, \nu]_A(x^{\rho})$  for all  $x \in B(x, r)$  and  $x \in B(x, r)$ .

**Proposition 2.4.** Let A be a convex *iviF* setand  $x_P \in supp(A)$  bealVIF<sup>LM</sup> Point of A. Then  $x_P$  be a *IVIF* G<sup>M</sup> of A over supp(A). Proof : Given that, A is a convex*iviF* set and  $x_P \in supp(A)$  is alV IF <sup>LM</sup> point, implies  $[\mu, \overline{\mu}] \land (x_P) \geq [\mu, \overline{\mu}] \land (x)$  and  $[\underline{\nu}, \nu] \land (x_P) \geq [\nu, \nu] \land (x)$ 

We have to prove,  $x \in \text{supp}(A)$  is a IVIF<sup>GM</sup> point, that is, [ $\mu, \overline{\mu}$ ]  $A(x) \leq [\mu, \overline{\mu}] A(x^{\rho})$  and [ $\nu, \nu$ ]  $A(x) \geq [\nu, \nu] A(x^{\rho})$ 

Suppose that  $x^{\rho}$  is not a *IV IF*<sup>GM</sup> point then there exists another point  $x^{\rho'} \in \text{supp}(A)$ such that,  $x^{\rho} \leq x^{\rho'}$  implies,  $[\underline{\mu}, -\mu]_{A}(x) \leq [\underline{\mu}, \mu]_{A}(x^{\rho'})$  and  $[\underline{\nu}, \nu]_{A}(x) \geq [\underline{\nu}, \nu]_{A}(x^{\rho'})$ Since A is a convex<sub>IV IF</sub> set, then

 $\lambda[\underline{\mu},\mu]_{A}(\mathbf{x}^{\varrho'}) + (1-\lambda)[\underline{\mu},\mu]_{A}(\mathbf{x}^{\varrho}) \ge \min\{[\underline{\mu},\mu]_{A}(\mathbf{x}^{\varrho'}), [\underline{\mu},\mu]_{A}(\mathbf{x}^{\varrho})\}$  $\ge \min\{[\underline{\mu},\mu]_{A}(\mathbf{x},\mu]_{\mu}(\mathbf{x},\mu]_{A}(\mathbf{x},\mu)\}$ 

$$= [\mu, \mu]_{A} \mathbf{x}^{\rho}$$

But this is not possible, by the definition of IVIF  ${}^{\text{LM}}$  point. Therefore  $x^{\rho} = x^{\rho'}$ . Next, for nonmembership degree, we have,

$$\begin{split} \lambda [\underline{\nu}, \nu] (\mathbf{x}^{\rho'}) + (1 - \lambda) [\underline{\nu}, \overline{\nu}] A(\mathbf{x}^{\rho}) &\leq max \{ [\underline{\nu}, \nu]^{-} (\mathbf{x}^{\rho'}), [\underline{\nu}, \nu]^{-} (\mathbf{x}^{\rho}) \} \\ &\leq max \{ [\underline{\nu}, \nu]_{\mathbb{A}} (\mathbf{x}_{-}), [\underline{\nu}, \nu]_{\mathbb{A}} (\mathbf{x}_{-}) \} \\ &= [\underline{\nu}, \underline{\nu}]_{\mathbb{A}} (\mathbf{x}^{\rho}) \end{split}$$

which is a contradiction to the definition of IVIF LM . Therefore, x  $\varrho$  is a IV IF GM point.

Proposition 2.5. If A is a strictly convex IVIF set then x<sup>o</sup> is the unique IVIF GM point.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Santhi and Udhayarani

$$\begin{split} \lambda[\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho\star}) + (1-\lambda)[\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho}) &> \min\{[\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho\star}), [\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho})\} \\ &> \min\{[\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho}), [\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho})\} \\ &= [\underline{\mu}, \underline{\mu}]_{\mathbb{A}}(\mathbf{x}^{\rho}) \end{split}$$

 $[\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho}) < [\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho*}). Also we have [\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho}) > [\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho*}). Thus [\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho}) = [\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}^{\rho*}).$ 

Similarly for nonmembership interval,

$$\begin{split} \lambda[\underline{\nu}, \nu]_{\mathbb{A}}(\mathbf{x}^{p\star}) &+ (1-\lambda)[\underline{\nu}, \nu]_{\mathbb{A}}(\mathbf{x}^{p}) < max\{[\underline{\nu}, \nu]_{\mathbb{A}}(\mathbf{x}^{p\star}), [\underline{\nu}, \nu]_{\mathbb{A}}(\mathbf{x}^{p})\} \\ &< max\{[\underline{\nu}, \nu]_{\mathbb{A}}(\mathbf{x}^{p}), [\underline{\nu}, \nu]_{\mathbb{A}}(\mathbf{x}^{p})\} \\ &= [\underline{\nu}, \underline{\nu}]_{\mathbb{A}}(\mathbf{x}^{p}) \end{split}$$

 $\underbrace{[\underline{v}, \underline{v}]_{\mathbb{A}}(\mathbf{x}^{\varrho}) > [\underline{v}, \underline{v}]_{\mathbb{A}}(\mathbf{x}^{\varrho \star}) . And [\underline{v}, \underline{v}]_{\mathbb{A}}(\mathbf{x}^{\varrho}) < [\underline{v}, \underline{v}]_{\mathbb{A}}(\mathbf{x}^{\varrho \star}) . Thus [\underline{v}, \underline{v}]_{\mathbb{A}}(\mathbf{x}^{\varrho}) = [\underline{v}, \underline{v}]_{\mathbb{A}}(\mathbf{x}^{\varrho \star}) .$ Hence  $\mathbf{x}^{\varrho}$  is a unique IVIF <sup>GM</sup> point.

#### Proposition 2.6.

Let A  $\in$  I<sup>U</sup> be a strictly convex IVIF set. The set of IVIF points at which A attains its IV IF<sup>GM</sup> over supp(A) is a convex(crisp) set.

**Proof:** Assume that A is a convex<sub>INF</sub> set. Let  $\{[\underline{\mu}, \mu]_A(x_7), ... [\underline{\mu}, \mu]_A(x^{\rho})_7 ... [\underline{\mu}, \mu]_A(x_n)\}^$ and  $\{[\underline{\nu}, \nu]_A(x_1), ... [\underline{\nu}, \nu]_A(x^{\rho}), ... [\underline{\nu}, -\nu]_A(x_n)\}$  be the set of all membership and nonmembership intervals of IF points contained in supp(A). If  $x^{\rho} \in supp(A)$  is an  $IV IF \ ^{LM} point of A$  then  $x^{\rho}$  is also an  $IV IF \ ^{GM} of A$  over supp(A). By definition,  $supp(A) = \{x : [\underline{\mu}, \mu]_A(x) > 0, [\underline{\nu}, \nu]_A(x) > 0\}$ . This implies,  $IV IF \ ^{GM}$  point is in convex(crisp) set.

**Proposition 2.7.** Let  $A \in I^0$  be a strictly convex<sub>IVIF</sub> set, then the following conditions hold:

- 1. If  $x^{\rho} \in supp(A)$  is a IVIF<sup>IM</sup> of A, then it is a unique IVIF<sup>GM</sup> point.
- 2. A attains its IVIF<sup>GM</sup> point over supp(A) at only one point.

**Proof:** Let us assume that  $x^{\rho} \in supp(A)$  be a strictly  $IV IF^{\text{IM}}$  point. Then there exists  $\epsilon > 0$ , such that  $x \in supp(A)$ ,  $[\underline{\mu}, \mu]_{A}(\underline{x}) \models [\underline{\mu}, \mu]_{A}(\underline{x}^{\rho})$ ,  $[\underline{\nu}, \nu]_{A}(\underline{x}) = [\underline{\nu}, \nu]_{A}(\underline{x}^{\rho})$ 

and  $\|(x) - x^{\rho}\| < \epsilon$ ,  $\Longrightarrow$   $[\underline{\mu}, \mu]_{\overline{A}}(x^{\rho}) > [\underline{\mu}, \mu]_{\overline{A}}(x)$  and  $[\underline{\nu}, \nu]_{A}(x^{\rho}) < [\underline{\nu}, \nu]_{A}(x)$ Suppose  $x^{\rho}$  is not a strictly IVIF <sup>GM</sup> over its supp(A), then  $x^{\rho*} \in supp(A)$  and  $x^{\rho*} = x^{\rho}$  such that  $[\underline{\mu}, \mu]_{\overline{A}}(x^{\rho*}) > [\underline{\mu}, \mu]_{\overline{A}}(x^{\rho})$  and  $[\underline{\nu}, \nu]_{\overline{A}}(x^{\rho*}) < [\underline{\nu}, \nu]_{\overline{A}}(x^{\rho})$ . Since A is a strictly convex<sub>IV IF</sub> set. For all  $\lambda \in [0, 1]$ , we have

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Santhi and Udhayarani

$$\begin{split} [\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}^{p*}) &= \lambda[\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}) + (1-\lambda)[\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}^{p}) \\ &\leq \lambda[\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}) + [\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}_{-}) - \lambda[\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}_{-}) \\ &< \lambda[\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}^{p}) + [\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}^{p}) - \lambda[\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}^{p}) \\ &= [\underline{\mu}, \mu]_{\mathbb{A}}(\underline{\mathbf{x}}^{p}) \end{split}$$

Similarly, we can prove for nonmembership intervals. Hence  $x^{\circ}$  is a only one strictly *IVIF* <sup>GM</sup> point.

**Proposition 2.8.** Let A be a convex IVIF set with supp  $(A)\phi$ . If A has a unique IVIF LM point on every closed interval [x, y] in its support then A is a strictly convex IVIF set.

**Definition 2.9.** Let  $f_A : U^n \to U$  be a convex function and  $f_A : U \to D[0, 1]$  be a nonincreasing interval-valued IF set. The composition is denoted by  $f_A \circ f_A = A$ , then the membership composite interval function,  $[\mu, \mu]_A : U^n \to D[0, 1]$  defined by

$$[\underline{\mu}, \mu]_{\mathbb{A}}(\mathbf{x}) = \begin{bmatrix} f_{\mathbb{A}}(f_{\mathbb{A}}(\mathbf{x})) \text{ if } f_{\mathbb{A}} \in supp(f_{\mathbb{A}}) \\ \Box & \text{ if } f_{\mathbb{A}} \notin supp(f_{\mathbb{A}}) \end{bmatrix}$$

and nonmembership composite interval function  $[v^{L}, v^{U}]_{\lambda} : U^{n} \to D[0, 1]$  defined

by

$$[\underline{v}, v] \mathbf{A}(x) = \begin{cases} f_{\mathbb{A}}(f_{\mathbb{A}}(x)) & \text{if } f_{\mathbb{A}} \in supp(f_{\mathbb{A}}) \\ \varphi & \text{if } f_{\mathbb{A}} \notin supp(f_{\mathbb{A}}) \end{cases}$$

**Definition 2.10.** Let A :  $I^{U} \to D[0, 1]$  be a  $convex_{iver}$  set and B :  $I^{U} \to D[0, 1]$  be an another  $convex_{iver}$  set. Then the membership composite interval sets of  $(A \circ B)(x) = A(B(x))$  defined by  $([\underline{\mu}, \mu]_{A} \circ [\underline{\mu}, \mu]_{B})(x) \stackrel{=}{=} V\{\Lambda([\underline{\mu}, \mu]_{A}, [\underline{\mu}, \mu]_{B})(x)\}$ , and the nonmembership composite interval sets of  $(A \circ B)(x) = A(B(x))$  defined by  $([\underline{\nu}, \nu]_{A} \circ [\underline{\nu}, \nu]_{B})(x) \stackrel{=}{=} -A(B(x))$  defined by  $([\underline{\nu}, \nu]_{A} \circ [\underline{\nu}, \nu]_{B})(x) \stackrel{=}{=} -A(B(x))$  defined by  $([\underline{\nu}, \nu]_{A} \circ [\underline{\nu}, \nu]_{B})(x) \stackrel{=}{=} -A(B(x))$  defined by  $([\underline{\nu}, \nu]_{A} \circ [\underline{\nu}, \nu]_{B})(x) \stackrel{=}{=} -A(B(x))$  defined by  $([\underline{\nu}, \nu]_{A} \circ [\underline{\nu}, \nu]_{B})(x) \stackrel{=}{=} -A(B(x))$  defined by  $([\underline{\nu}, \nu]_{A} \circ [\underline{\nu}, \nu]_{B})(x) \stackrel{=}{=} -A(B(x))$  defined by  $([\underline{\nu}, \nu]_{A} \circ [\underline{\nu}, \nu]_{B})(x)$ 

#### Multitask convex<sub>IVIF</sub> -Optimization Problems

In this part we introduce the general approach of decision making problems under

*convex*<sub>*IVIF*</sub> sets. A decision maker wants to evaluate n-number of goals as convex functions  $G_1, G_2, ..., G_n$  and m-number of IVIF-constraints  $C_1, C_2, ..., C_m$  defined the solution space  $U \subseteq U^n$  are assumed to be given. An IVIF-decision D in U is defined by,

$$[\underline{\mu}, \mu]^{p}(x) = max\{[\underline{\mu}, \mu]_{G}^{-*}[\underline{\mu}, \mu]_{G}^{-*}..._{2}^{*}[\underline{\mu}, \mu]_{G}^{-*}[\underline{\mu}, \mu]_{C}^{-*}[\underline{\mu}, \mu]_{C}^{-*}..._{2}^{*}[\underline{\mu}, \mu]_{C}^{-}\}(\overline{x})_{n}$$

$$[\underline{\nu}, \nu]^{p}(x) = min\{[\underline{\nu}, \nu]_{G}^{-*}[\underline{\nu}, \nu]_{G}^{-*}...^{*}[\underline{\nu}, \nu]_{G}^{-*}...^{*}[\underline{\nu}, \nu]_{C}^{-} *...^{*}[\underline{\nu}, \nu]_{C}^{-}(x)$$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Santhi and Udhayarani

where  $x \in U$  and \* denotes an aggregation operator. Many different aggregation operators have been proposed. Here we desired to use min operator to aggregate the convex combination of goals and constraints. Due to computational simplicity, D might be expressed as a convex combination of the goals and constraints with weighting co-efficient reflecting the relative importance of the various terms. If there exists a subset  $M \subseteq U$  for which A(x) reaches its maximum, then M is called the set of maximizing decisions.

# CONCLUSION

In further we can work towards the problem of assigning location centers in convex sets with interval-valued intuitionistic fuzzy sets. That is, a convex set is characterized by an interval-valued intuitionistic fuzzy convex-objective function and interval-valued intuitionistic fuzzy convex constraint functions over a convex set which is the set of the decision variables. Also, assign a new location with the given convex sets using a TOPSIS-based computational procedure.
