# ABSTRACT

The electric vehicle is a new technology in the field of transportation and electricity with many economic and environmental benefits. Various charging stations and models used to charge EVs are described here, the primary reason why people don't prefer electric vehicles is because of the unavailability of charging stations. There always exists a fear as to what might happen if the vehicle runs out of battery. People are worried about more straightforward and faster commuting methods in our country rather than saving the Earth from the ill effects caused by pollution. This paper mainly deals with a simple solution to make charging stations more accessible. The solution involves using public electricity and solar panels for the easy and hassle-free charging of Electric Vehicles.

Keywords: RFID, EV, Wireless Coil, Charging station, Solar panel.

# INTRODUCTION

Electric cars are on the rise around the world, Compared to hybrid cars, electric cars are becoming more competitive due to lower CO<sub>2</sub> emissions and increasing fossil fuels. However, EVs are not widely used due to some limitations such as high vehicle costs. A charging station is a device that connects an EV to an outlet to charge EVs, community EVs, and connected vehicles. The installation of charging stations varies from country to country, depending on frequency, voltage, network and model. So a good charger should be efficient, reliable, high speed, low cost, and

#### Deepak Vala et al.,

light weight.Some payment sites have features like smart metering, mobile capabilities, and internet connectivity, while others are simpler. Charging points, also known as EVSEs, are provided by electronic devices at municipal stations or by private companies in retail outlets. These payment sites have special links for various payment links. The cost of using the EVSE ranges from one kilowatt hour to one month or one year to one hour.

Different types of EVSE have different charging speeds. Level 1 charging stations use 120 volt (V) alternating current (AC) plugs and require a variable speed circuit of approximately 8 miles per hour. Level 2 charging stations use 240 V AC plugs for charging and must be installed at charging stations or public charging stations. Level 2 charging stations range from 10 to 20 miles per hour. Level 2 chargers are the most common and charge in the same way as the base system. Level 3 uses a 480V direct current (DC) plug. They bypass the car charger and provide DC power to the battery through a dedicated port. A10-minute DC fast charge can provide up to 40 miles of range, but is not compatible with all vehicles.

Solar energy technology has been expanding in popularity. Solar Energy is a sustainable energy source and is an infinite and clean energy source that is free and eco-friendly. So, it is efficient and free from environmental pollution. We will be utilizing solar energy to provide the supply for an outdoor charging station for devices such as electric vehicles. Electric car charging stations using solar energy and charge protection will be important technologies to help the transition to electricity. This technology will impact the entire energy environment and has the potential to strengthen the grid and increase energy penetration. Electric vehicle equipment can contribute to the growth of renewable energy; this means that when electricity flows from the grid to the car, the energy supply can equal the solar energy produced on the grid. The electric car battery charging system consists of lines connected to photovoltaic solar panels. Energy will be stored in batteries with the help of solar panels. Here we give each customer an RFID card that they can use to pay for their car on delivery. Before using this card, we need to register as a prepaid card. When we want to charge the car battery.

# LITERATURE REVIEW

In recent years, EVs have attracted attention which required EV charging station. The installation of charging stations varies from country to country, depending on frequency, voltage, network and model. So a good charger should be efficient, reliable, high speed, low cost, and light weight [1]. In [2], to harness the solar panel's maximum power by tilting it at an angle based on the intensity of the light that it receives. In addition, the quantity of power available in the charging station is continuously checked locally and from a remote location. In [3], the proposed algorithm aims to reduce the operating costs associated with the customer's willingness to consider possible uncertainties while balancing real time Supply and demand, supply and deferrable loads. In [4], Discusses charging station standards for high speed DC. DC bus, which uses AC / DC converter. In [6], the distribution of different charging stations and different types are discussed. Considering different payment facilities, different needs of different users can be met. In [7] a solar charger for EV is designed. A converter is employed to boost the solar panel voltage to station battery voltage. The automotive industry has moved from electric to electric vehicles and advanced batteries are important for this change. By 2020, roughly half of all new car sales could include hay brides plug-in hybrids and all electric models [5].

# MATERIALS AND METHODS

 ATmega16 Microcontroller: The ATmega16 microcontroller is an 8-bit RISC-based architecture from the Atmel AVR family. It is frequently employed in applications like embedded systems that require high-performance at a low cost. With a maximum clock frequency of 16MHz, the ATmega16 offers swift processing speeds for embedded applications. The ATmega16 is a cost-effective alternative for embedded systems and other comparable applications.
 RFID Module: Radio Frequency Identification (RFID) Card or sometimes called EV Charge Card, Tag or Switch used to stop and start EV charging via radio frequency. The RFID card can provide home electronics as a smart face,

#### Deepak Vala et al.,

but is often found in public EV chargers. To use, simply scan your RFID card over the identification area of the charger you selected to start it, then tap it again to stop charging. RFID is fast, reliable and does not require physical contact between the reader scanner and the tagged item. This basic RFID tag works in the 125 kHz RF range and comes with a unique 32-bit ID, fig. 1.

IR Sensor: Infrared sensors are used in wireless technologies such as remote control functions and sensing environmental objects/obstacles. The IR LED is a specially designed Light Emitting Diode (LED) that emits infrared light. Most IR receivers are photodiodes. The IR LED emits infrared light with a wavelength between700 nm and 1 mm. Our eyes cannot see these rays, fig. 2. Wireless Coil : Wireless transmit and receive charging coil module is designed and manufactured for wireless charging and power of various small electronic devices. It is mainly used in electronic devices such as wireless charging of mobile phones and electronic devices. Rectifier Circuit: The circuit in which we use a centre-tapped transformer and two rectifier diodes, we use a regular transformer with only one secondary winding and four rectifier diodes in the classic bridge configuration. It is commonly used to obtain a direct voltage starting from an alternating power supply.

#### Implementation

The system uses a solar panel, battery, Regulator IC, wireless coils, rectifier circuit, RFID module, Atmega16 controller and LCD display to develop the system. The system shows how to wirelessly charge an electric car. The solar panel is used to charge the battery. RFID is used to detect users. If the user is authentic then the vehicle will be detected by the infrared sensor. When the car is driven over the coils the power is transferred from the transmitter coil to the electric vehicle coil. Thus the system demonstrates a solar based wireless charging system for electric vehicles. As per fig 5.fig 6 and fig. 7.

- 1. First of all Solar Panel to Charge 12v DC lead acid battery.
- 2. First of all 230v AC Power Supply is given to the circuit.
- 3. Rectifier Convert the AC power supply in DC power Supply.
- 4. With help of the Regulator, Constant 5v supply to Atmega16 Microcontroller.
- 5. Then car enter to station customer have to scan its RFID card.
- 6. After scanning RFID card system will check whether the user is authentic or if the user is not authentic car cannot go ahead and charge the car.
- 7. If the user is authentic and his card have recharge that user can go ahead and after detecting the vehicle is parked in proper area by IR sensor.
- 8. The wireless power transmission will start from transmitter coil to receiver coil.

R1= RFID MODULE, S1= AUTHENTIC USER, S2= UNAUTHENTIC USER, V1= VEHICLE DETECTED, V2= VEHICLE NOT DETECTED, C1= VEHICLE IS CHARGING, C2= VEHICLE IS NOT CHARGING, V3= VEHICLE CHARGED

#### Application

As the world's resources dwindle, the government. Schools and NGOs are pushing for green solutions through the use of renewable energy. These types of payment facilities may be available in the future at Small businesses, City centres, Retail stores, Family and office buildings, Restaurants and cafes, Major government offices etc.

#### Future Scope

Here we can use a wireless charge to work efficiently and quickly, this will save time for the charging process. Let's connect the system of payment centres to a computer network, let's make money from the computer instead of using a book, and let's keep a record of when people used the system and had to pay for it.

Deepak Vala et al.,

# CONCLUSION

In this paper, wireless energy transmission and charging systems are designed and analysed. We build each model for a system and finally we do a joint simulation. We found that the best performance of the system depends on the resonance and the distance between the coils to detect the power change.

#### ABSTRACT

In this paper, a reconfigurable/tunable bandstop filter is proposed on Liquid Crystal Polymer substrate. The filter is a dual-band bandstop filter for the 2.4 GHz and 5 GHz bands of WiFi. The proposed filter is simulated, fabricated, and tested. The designed dualband bandstop filter is reconfigurable by adding two PIN diodes in the design, which provide different bandwidths for the bandstop filter. Further, a varactor diode is added to the design to provide tunability in the filter. By changing capacitance, the first stopband bandwidth is tuned, and the center frequency of the second stopband can be tuned.

**Keywords**: Dual band bandstop filter, Flexible filter, liquid crystal polymer, Tunable filter; Reconfigurable filter

# INTRODUCTION

The use of flexible electronic devices is the need of the day for the latest communication systems. Emerging communication systems demand devices that are small in size, multiband, have minimal loss, and are adaptable for usage in a variety of cutting-edge applications. For high-end communication systems used in space applications [1], a reconfigurable/tunable filter on a flexible material substrate will be one more advantage [2][3]. Due to its exceptional packing properties, liquid crystal polymer (LCP) has been utilized in a variety of applications [4][5][6]. LCP is employed as a substrate material for modern microwave applications because it has the best packaging qualities and is inexpensive [7]. The substrate material used for the discussed design is a liquid crystal polymer,Ultralam®3850 [8],

#### Mehul Thakkar et al.,

which has a loss tangent of 0.0025 and a dielectric constant of 2.9. The purpose of using LCP in this design is to have flexibility without producing undesirable results when it is placed on various types of surfaces. A fabricated filter is evaluated at various angles by bending it at several angles using various tubes of different diameters, and the results of the S parameter are measured in each case.

#### **Characteristics of Liquid Crystal Polymer Material**

LCP has the following advantages[2]:

- LCP has remarkable electric properties for microwave frequencies.
- Low loss tangent and good Er stability (0.002-0.004).
- Possibility of recycling.
- Low price.
- Low dielectric constant and is naturally non-flammable.
- Less prone to absorb water properties.

High-frequency applications are using LCP as a substrate due to the above mentioned properties [2]. Due to its low loss tangent and low dielectric constant value, it is the best substrate for next-generation technologies, such as 5G, which operates in a higher frequency band because of its characteristics [9][10]. LCP material is extensively utilized in wearable applications because, after taking into account all characteristics and testing, it has been found that there is barely any variation in the frequency of operation.

Ultralam®3850 is widely used as a flexible material substrate in RF/Microwave circuit design, including handheld RF devices, antennas and filters. It also has excellent high frequency properties, and it offers lots of advantages [11][12][13] like

- Better electrical characteristics for matching impedance.
- Outstanding signal integrity.
- The material's flexibility is advantageous in applications like space science.
- In a humid environment, the material maintains its mechanical, electrical, and dimensional stability.

In the proposed design, on the Ultralam®3850 substrate, a dual band band stop filter is designed using two square open loop resonators[3]. The proposed design is simulated, fabricated, and tested for various bending angles. In extension to that design, adding PIN diodes[14][15] and varactor diodes[16][17] will provide a reconfigurable / tunable filter along with flexibility. In this article, an extended version of the design discussed in [3] has been presented. The next section discusses the design of a dual band band stop filter[3]. Section 3 and Section 4 discuss the design of reconfigurable and tunable filters using PIN diodes and varactor diodes, respectively.

#### Design of the Dual band Band stop Filter [3]

A band stop filter can be realized by two bent stubs with a length of  $\lambda/4$ . The center frequency of the bandstop filter is controlled by it. The wider rejection band is provided by the  $\lambda/2$  resonator. This form square open loop resonator, as discussed in[3]. This unit cell offers a better bandstop filter with the desired properties.[18]. As mentioned in [19] and [20], square open loop resonators can be utilized to construct the required response of an antenna and a filter. Two bands around the center frequencies of 2.4 GHz and 5 GHz are chosen for the bandstop filter based on the unit cell. Fig. 1 shows the dimensions of an open square loop resonator for a 2.4 GHz and 5 GHz bandstop filter. As can be seen from Fig.1, the dimensions of an open loop resonator for a 5 GHz bandstop filter are larger than those of a 2.4 GHz design. An LCP substrate, Ultralam® 3850, with a dielectric constant of 2.9 and a height of 0.2 mm, has been used in the design. Both designs are symmetric with respect to S parameters. The proposed design creates a dual band band stop filter with 2.4 GHz and 5 GHz as its central frequencies by combining the two designs from Figs. 1(a) and (b). The design proportions have been slightly altered from the dimensions depicted in Figs.1 (a) and (b) in order to bring out the dual band bandstop filter's properties for suitable bands. Fig. 2 depicts the suggested design for a filter on a flexible substrate (Ultralam®3850). To optimize the desired bandwidth, two open stubsare kept on the outer resonator, as shown in Fig. 2. The simulation of the proposed design is carried out in CST Microwave Studio®. Simulation and measured response of the proposed filter are shown in Figs. 3 (a) and (b). As per S<sub>21</sub>/S<sub>12</sub> response, the

#### Mehul Thakkar *et al.*,

designed filter has a first stopband from 1.5 GHz to 3.61 GHz (3 dB bandwidth = 2.11 GHz), with a center frequency of 2.4 GHz, and a second stopband from 4.43 GHz to 5.7 GHz (3 dB bandwidth = 1.27 GHz), with a center frequency of 5 GHz, as can be seen in Figs.3(a) and (b).Insertion loss is around 1 or 2 dB in outside the stopbands, and rejection is around 30 to 40 dB in both stopbands. Simulated S parameters and measured S parameters mostly match except for a mismatch near the second band due to improper fabrication or measurement. The behavior of the fabricated filter [3] is tested at various bending angles  $15^{\circ}$ ,  $30^{\circ}$ ,  $45^{\circ}$ . The suggested bandstop filter displays nearly identical performance results from a no-bending condition to  $45^{\circ}$  bending. It implies that it can be applied in situations where bending of the surface may occur. A comparison of the discussed filter with [21][22][23] is presented in [3], where it is shown that the proposed filter provides a wider stopband with good rejections along with a compact size (20 ×20 mm<sup>2</sup>). In the next section, the proposed design is extended for reconfigurable bandstop filter by using PIN diodes.

#### **Reconfigurable Bandstop Filter**

The above discussed design can be extended as a reconfigurable bandstop filter by using two PIN diodes with both square open loop resonators, as shown in Fig. 4. Here, PIN diode D1 is kept in the opening of the inner square open loop resonator, and PIN diode D2 is kept in the opening of the outer square open loop resonator. The location of PIN diodes is chosen where there is a possibility of disturbing the maximum electric field on the resonator. A PIN diode can be switched on by providing the required forward voltage to it. In the ON state, it provides very less impedance between its two terminals. When the PIN diode is reverse biased, it is in the OFF state, where it provides very high impedance (few M $\Omega$ s). For simulation, the PIN diode's ON state is considered with a copper connection between two terminals of the diode, and for the OFF state of the PIN diode, an open connection between two terminals of the diode is considered.

Considering four possibilities with two PIN diodes D1 and D2, simulation results for S<sub>21</sub> are shown in Fig. 5 and depicted in Table 1. While keeping both diodes D1 and D2 ON, it gives a single stopband from 2.38 GHz to 5.59 GHz (3.21 GHz, 3 dB bandwidth). Keeping diodes D1 ON and D2 OFF, the filter gives a wider single stopband from 2.26 GHz to 6.19 GHz (3.93 GHz, 3 dB bandwidth). Keeping diodes D1 OFF and D2 ON, the filter gives a single stopband from 1.52 GHz to 4.24 GHz (2.72 GHz, 3 dB bandwidth). Keeping both diodes in the OFF condition, it is the same as the design discussed in Section 2, a dual band bandstop filter where the first stopband and second band values are as discussed in Section 2. The rejection provided in all four cases in the stopband is above 35dB, which is considered better. The designed filter is symmetric with respect to S parameters.

#### **Tunable Bandstop Filter**

The design discussed in Section 2 can be extended by utilizing a varactor diode in the opening of the inner or outer square open loop resonator. The varactor diode provides variable capacitance whenever it is operated with various reverse voltages, as per its datasheet. Here, varactor diodes C1 and C2 are utilized one by one in the design, as shown in Figs.6 (a) and (b). In simulation, values of capacitance are optimized according to design parameters and variations achieved in S parameter results. From Figs. 6(a) and 7(a), it is observed that with varactor diode C2 in the spacing of the outer square open loop resonator, a variation of the first stopband's higher cutoff frequency is observed from 3.4 GHz to 3.59 GHz when the capacitance is varied from 0.1 pf to 0.01 pf, which ultimately varies the bandwidth of the first stopband. Also, by changing capacitance C2 from 0.1 pf to 0.01 pf, the second stopband's center resonance frequency changes from 4.4 GHz to 4.82 GHz, which provides tuning for the second stopband. Thus, the bandwidth of the first stopband and center frequency of the second band can be tuned by a varactor diode in the opening of the inner square open loop resonator. The rejection provided in the first stopband is about 40dB, and the second stopband is about 35 dB, which is considered to be better. Also, the insertion loss outside the first and second stopbands is around 1 to 2dB. From Figs. 6(b) and 7(b), it is observed that with varactor diode C1 in the spacing of the outer square open loop resonator, it is giving a wider first stopband from 0.49 GHz to 3.58 GHz and a second band from 4.29 GHz to 5.24 GHz. By changing capacitance, it is giving slight variations in the frequencies near the first and second stopbands stated above. Hence, keeping the varactor diode on the outer square open loop resonator will not be very useful.

#### Mehul Thakkar et al.,

## CONCLUSION

The compact, dualband bandstop filter was simulated and fabricated on Ultralam® 3850, a liquid crystal polymer material, for bands 2.4 GHz and 5 GHz of WiFi. The designed filter was reconfigurable for a single band bandstop filter for different bandwidths using PIN diodes depending on the condition of diodes. A varactor diode is used to make a bandstop filter tunable by changing the capacitance, bandwidth of the first stopband, and centre frequency of the second stopband. Thus, in this article, a dual-band stopband filter with reconfigure ability and tunability is demonstrated and simulated.

## ABSTRACT

Fingerprint identification is an important tool in forensic science because fingerprints are unique to each individual and remain constant throughout time. Fingerprints may be left on a variety of surfaces, including glass, metal, wood, and skin, and they can be collected using a variety of techniques, including dusting with fingerprint powder, lifting with adhesive tapes or gels, and scanning with specialized electronic devices. This study presents a new method for fingerprint pore retrieval. The identification is done in three different layers. These three layers will help in catching a spoof or a fake attempt to access the system. If someone uses a different identity to pretend to be someone else, the biometric system will identify them as a real person. This might lead to fraud. This causes the urge to find out whether the following attempt is made by the respective individual or not. In another sense, if the individual was alive or not? Out of these three layers, the third is much more favorable. In this research paper, one of the layer-3 features, namely the sweat pore, has been studied to detect liveness by proposing a robust pore retrieval method.

Priyanka Patel et al,

# INTRODUCTION

In 1880, Faulds claimed that latent fingerprints discovered at crime sites may reveal information about the identity of the perpetrators. Galton developed an interest in it, and in 1892 he wrote the well-known book Fingerprints after learning all there was to know about it. In which he covered the fundamentals of today's fingerprint science, including the persistence, uniqueness, and classification of fingerprints [1]. Typically, Fingerprint features can usually be classified into three levels: Level 1, level 2, and level 3.Level-1-Global features: Global features refer to the overall characteristics of the fingerprint, such as its shape, size, and orientation. These features can be used to identify and classify fingerprints at a high level and are often used for initial identification and matching. Feature consists of macro details of fingerprints, such as singular points and global ridge patterns, e.g., deltas and cores. They are not very distinctive and are thus mainly used for fingerprint classification rather than recognition.Level-2-Local features: Local features refer to the specific patterns and characteristics of the fingerprint, such as the arrangement and orientation of the pores and ridges. These features are typically more specific and can be used to distinguish between fingerprints with similar global features. The level-2 features primarily refer to the Galton features or minutiae, namely, ridge endings and bifurcations. They are most distinctive & stable and are used in almost all automated fingerprint recognition systems.Level-3-Ridge features: Ridge features refer to the specific details and characteristics of the pores and ridges on the fingerprint, such as the minutiae points (ends and bifurcations of the ridges) and the ridge flow (the direction and orientation of the ridges). These features are the most specific and can be used for highly accurate fingerprint matching. Level-3 features are often defined as the dimensional attributes of the ridges and include sweat pores, ridge contours, and ridge edge features, all of which provide quantitative data supporting more accurate and robust fingerprint recognition as well it also helps in identifying liveness of the individual. Among these features, pores have most extensively been studied and are considered to be reliably available only at a resolution higher than 500 dpi [2, 28].

The research problem being addressed in this study is how machine learning can be used to improve the accuracy and efficiency of fingerprint pore retrieval from the Poly U database. Fingerprint pores, also known as sweat pores or epidermal ridges, are small openings on the surface of the skin that secrete sweat and oil. They are a key feature of fingerprints and are used in fingerprint identification and recognition systems to distinguish one individual from another. However, accurately and efficiently extracting fingerprint pores from images can be challenging, especially when the images are of low quality or have been distorted or degraded. This can lead to errors in the fingerprint identification and recognition process, reducing the overall accuracy and efficiency of these systems. Using machine learning techniques, it may be possible to improve the accuracy and efficiency of fingerprint pore retrieval from the Poly U database by training a model to recognize and classify different types of fingerprint pores in images. This could involve using a variety of machine learning algorithms, such as convolutional neural networks (CNNs) or support vector machines (SVMs), to analyze and classify the images in the database based on their fingerprint pore content [28].

#### **Fingerprint Liveness Detection**

The method of determining whether a fingerprint provided for identification is from a living finger or a fraudulent reproduction, such as a mold or a printed picture, is known as fingerprint liveness detection. It is an important security measure that can help to prevent the use of fraudulent or unauthorized fingerprints for access to secure systems or devices. There are a number of methods that can be used to perform fingerprint liveness detection, including: Image analysis: Image analysis techniques can be used to analyze the characteristics of the fingerprint image to determine whether it is from a live finger or a replica. This can involve analyzing features such as the quality and clarity of the image, the presence of pores and ridges, and the level of distortion in the image.

Physical properties: Physical properties of the finger, such as temperature, humidity, and elasticity, can also be measured to determine whether the fingerprint is from a live finger. For example, sensors can be used to measure the temperature of the finger, which is typically higher for a live finger compared to a replica. Behavioural

#### Priyanka Patel et al,

characteristics: Behavioural characteristics, such as the movement of the finger or the pressure applied to the fingerprint scanner, can also be used to distinguish between live fingers and replicas. For example, live fingers typically exhibit a degree of movement or deformation when pressed against a scanner, while replicas do not.

Fingerprint liveness detection is an important security measure that can help to prevent the use of fraudulent or unauthorized fingerprints for access to secure systems or devices. A combination of image analysis, physical properties, and behavioural characteristics can be used to effectively distinguish between live fingers and replicas. It provides an additional security to the biometric system by detecting that the user who is presenting his biometric is live or he is presenting a spoof artefact to the biometric system. Liveness assessment methods need to satisfy certain requirements like it needs to be Fast, User friendly, Low cost, High performance and Non-invasive [3, 28]. To detect fingerprint liveness, multiple approaches have been studied as shown in Fig.1. Approaches to detect Liveness in Finger.

#### Hardware Based Approach

A special hardware device/sensor such as e.g.sweat, blood pressure, odor [4], temperature, oximetry [5] is added in the biometric system to detect whether the biometric input is live or fake [3]. However, the setup of additional hardware increases the overall cost of fingerprint identification system [6].

#### Software Based Approach

According to the types of characteristics employed, software-based techniques can be classified as dynamic or static [4]. It does not use any other intrusive biometric measures [5]. Dynamic techniques make use of characteristics collected from a series of fingerprint photos, such as skin sweat and skin deformation [4–7]. Skin-perspiration-based techniques to fake fingerprint detection have received the greatest attention. Skin distortion analysis is another method. Because living and imitation fingers have varying elasticities, they exhibit distinct elastic tensions when placed against a sensor surface. The resultant skin deformation characteristics may be generated by having the user twist a finger on the sensor surface [4], however, this method takes at least two-time series of images, which adds processing time [5]. Pores, power spectrum, surface coarseness, morphological characteristics, statistical properties [4ridge quality, ridge strength, and ridge clarity [3] were retrieved from a single picture in the static technique. The materials used to make synthetic fingers are often formed of big organic molecules, and producing high-quality fake fingers is not a simple operation [4, 28].

#### An Introduction to Pore

Fingerprint pores are small openings on the surface of the skin on the fingertips that contain sweat glands [8,9, 28]. They can be visualized as either open pores or close pores based on their perspiration activity [1]. They are an important feature of fingerprints and are used for identification and recognition purposes. Pores are typically arranged in a regular pattern on theskin, and the distribution and arrangement of the pores can vary significantly between individuals. This variation is what makes pores useful for identification and recognition purposes, as the patterns of pores on a fingerprint are unique to each individual. As illustrated in Fig. 2, a closed pore (red highlighted) appears as an isolated bright blob on the dark ridge, but an open pore (blue highlighted) is perspiring and shows on fingerprint pictures as a bright blob associated with the bright valley [10].

Average no. of pores is  $9\sim18/cm$  of a ridge [11] but as per observation made by researchers, the number of pores varies from  $9\sim18/cm$ , or  $23\sim45/cm$  of a ridge [1]. Their width varies from  $88\sim220 \ \mu m$  [8, 11] and their density is 5/mm2[8]. Pores comes in various shapes like round, elliptical, oval, square, rhomboid, or triangular and reside at various positions (mostly in the middle, but occasionally open on the side) [11]. Distance between two pores is different from person to person. It varies depending upon the location in the finger which makes pores unique in each individual [8]. They are immutable, unique and perpetual [11]. Details of pores can be retrieved by using the high-resolution fingerprint sensor (over 1000dpi) [8, 13, 28]. To determine the identity of an individual 20 to 40 pores are sufficient [1]. Pore detection has been briefly studied as a measure for fingerprint liveness detection [9]. Pores are

#### Priyanka Patel et al,

typically visible on high-quality fingerprint images and can be used for a variety of purposes, such as identifying and matching fingerprints, verifying the authenticity of fingerprints, and detecting liveness in fingerprints.

Pore extraction method is basically a problem of objection detection. It is classified into two approaches known as skeleton tracking based or filtering based approach. In skeleton-based approach fingerprint image gets binarized and skeletonized and then fingerprint skeleton is tracked. It is time consuming and works well with very high-quality images (2000dpi) which makes it computationally expensive and it is also very sensitive to noise. In filtering-based approach, it uses static isotropic pore model to detect pore which makes it more efficient and robust compared to skeleton tracking-based approach [10]. Overall, fingerprint pores are an important feature of fingerprints that can be used for identification, recognition, and verification purposes. They are typically visible on high-quality fingerprint images and can be used to distinguish between individuals based on the unique patterns of pores on their fingerprints.

#### Literature Survey on Pores

There are a number of traditional methods that have been used for fingerprint pore retrieval, including:

- Visual inspection: This involves manually examining the fingerprint images to identify and extract the pore features.
- Feature extraction: This involves using algorithms to extract specific features from the fingerprint images, such as the shape, size, and orientation of the pores.
- Pattern matching: This involves comparing the extracted pore features to a database of known fingerprint pore patterns to find a match [28].
- Recently, there have been a number of advances in machine learning that have improved the accuracy and efficiency of fingerprint pore retrieval. These advances include:
- Deep learning: Convolutional neural networks (CNNs) and other deep learning techniques have been used to analyze and classify fingerprint images based on their pore content. These techniques can be trained on large datasets of fingerprint images, improving their accuracy and robustness.
- Transfer learning: Transfer learning involves using pre-trained machine learning models and adapting them for a new task, such as fingerprint pore retrieval. This can help reduce the amount of training data required and improve the performance of the model.
- Ensemble learning: Ensemble learning involves training multiple machine learning models and combining their predictions to improve the overall accuracy of the system. This can be particularly effective for fingerprint pore retrieval, as different models may be better at identifying different types of pores.

Perspiration is a biological trail in humans. The live fingerprint has perspiration in the pores which a fake fingerprint doesn't have. Manivanan et.al. introduced a method using a micro-capture camera to detect liveness detection. The active sweat pores are detected through high pass and correlation filtering on grayscale fingerprints. He presented a new technique to extract and locate sweat pores automatically. First, high pass filtering is used. Followed by correlation in the combined technique. The fingerprint image captured as the end result was high-resolution taken through a micro capture camera. In this method that he adopted the camera captured different shapes and sizes of the pores. The filters passed through this image magnified the fingerprints. The traits of the pores were captured through different layers. And a mathematical function was used to obtain the probability of the fingerprint to be alive. This method to automatically detect sweat pores through all the angles and direction is helpful in detecting the spoof in a fingerprint. Pores being an important trait in human biology helps in the liveness detection. As every human has his/her own characteristics of a pore in the finger [25, 28].

Now every human has a different count of sweat pores. A child might have a tiny number of pores whereas an adult might have grown sweaty pores. So, Espinoza et. al. introduced a method to use this count of pores as the basis or base of the fingerprint liveness detection. Sometimes it is tough to detect the number of pores in a fake and genuine fingerprint. Thus, a Linear discriminant analysis was used to learn the patterns. To know the difference between different groups of pores, he trained his model on different fingerprints. That got a correct pattern and trait of

#### Priyanka Patel *et al*,

distribution of pores in different fingerprints. Through this analysis, the difference between a query image and the taken reference image was obtained. A reference image is a genuine or fake image that the user has entered. The query image is obtained through querying. Querying an image refers to finding information on the objects or entities present in the image provided by the user. In this method the image is presented as metadata. Whereas the content of the image is represented through low level features such as color and texture. Using a GUI, the image is sketched through different graphical tools with sufficient detailing's. Such detailed images are used by the processor of the query for further matching the characteristics present in the database. This became a major discriminating factor in live fingerprint detection. As the query image is sketched the difference between a distorted image and a non-distorted reference image improves the performance.

Spoofed fingerprints are obtained through gelatine, Play-Doh, and silicone moulds for accessing authorized machines and devices. A clone of fingerprints is created for fraud. These fingerprints might not have exactly the same number of pores as genuine fingerprints. Hence, Marcialis *et al.* got the idea and detected the number of pores in a fingerprint using Euclidean distance. The distance between pores obtained by assuming that pores are less likely to appear in a spoofed image rather than in a live image. For a perfect match it was expected that the Euclidean distance is equal to zero. Else the Euclidean distance is to be less than or equal to the mean of the distance [18, 19,20, 28].

The number of pores were thought to be a major factor for the detection of liveness. But it was thought and researched that if the pores are separated in different strips, it will contain more information than the count of the total pores. The skin on the palmar surface of the hands and feet forms papillary ridges in patterns that are unique to each individual and do not vary over time. Espinoza and Champod employed a software-based method. Obtaining information from an input picture using linear discriminant analysis (LDA) [23] The fingerprint samples were collected using an L-Scan 1000 T optical scanner. The Crossmatch L Scan palm scanner range is designed to address the demand for small, high-resolution, rapid-capture live scan devices for criminal identification, forensic analysis, and enrollment. L Scan palm scanners, which can quickly capture upper, lower, and writer's palms, flats, and rolls, completely meet the FBI NGI criteria. By utilizing patented Flex Flat and Flex Roll capabilities, fingerprint photos are recorded regardless of platen location. The patented Auto acquisition technology provides the rapid acquisition of high-quality photos for error-free biometric data gathering, eliminating the guesswork and a broad variety of potential reprint difficulties [21, 22, 28]. Both L Scan models, which are available in 500 ppi or 1000 ppi resolution, deliver superior image quality and provide real-time image preview when using our SDK or enrolment software. Both L Scan models, which are available in 500 ppi or 1000 ppi resolution, deliver superior image quality and provide real-time image preview when using our SDK or enrolment software. The scanners are user-friendly, with an intuitive, integrated display and programmable buttons to help users navigate the biometric capture process.

Choi et. al. went on to use these sweat pores and the discovery of distance between them for a new approach in fingerprint detection. The small pores in live fingers perform physiological thermoregulation. It was found during studies that the normal body temperatures range differently. So, Physiological Thermoregulation means the pores maintain the internal body temperature. It stabilizes the body temperature to normal in certain conditions. Pores go through heat transfer in order to maintain such temperature. Hence, leading to latent fingerprints, with a smudgy and blurry image. In a forward research, sweat ducts helped in absorption of these sweats and to take out the unnecessary elementary content. These glands are present under the skinny layer. The cells under these glands and different layers of skin appear as pores to us. The fingertip pores are the primary source for the sweating process. These pores produce a certain amount of fluid that is active and that helps in detecting liveness of a person [24, 25, 28].

Spatial distribution is done to observe your object with different variations. In the beginning the characteristics or properties of an image were extracted through mean, variance or distance. But in spatial arrangement we change the coordinates so that the image is shifted to a different arrangement. Hence, in modern day techniques, we shift the image to few coordinates to get the clear properties(outcomes) through specific arrangement in pixels. For personal

#### Priyanka Patel et al,

identification, Roddy and Stosz statistically discriminated against the power of pore. This helped in validating effective pore configuration. Suppose, to investigate the spatial distribution of pores; consider a fingerprint. In the fingerprint the sweat glands are distributed through distance d in a unit cell structure. When measured from different arrangements these pores have similar behaviour. Homogenous means throughout the skin the pores will be of same size, shape, and biological behaviour. The sweat glands are homogeneous and isotropic. In such a case, it was presented that the pores are to be equally spaced. That creates a certainty of creating an error. If all pores are similar to each other than each group of pores will match perfectly. Neglecting all the rotational effects. According to first order approximation, it was assumed that pores' primary function is heat transfer. First order approximation in simple terms means a mathematical formula that fits all kinds of data to give the best output possible. This causes the fingerprint to be a smoky and blurry image. This causes issues in the second layer of detecting liveness in fingerprints [26, 27, 28].

The inter distance between the pores were calculated to improve the spoof detection for fingers. The distance between pore was calculated on the basis of their number, size and shape.

- a. Pores were present in very close lengths. A minimum of twelve pores were present in a 1cm length of the ridge.
- b. Then the ridge length was considered, with pores in groups. Two or more groups of pores were found closely packed with each other in 1cm of length.
- c. The other type of spacing contained 8 to 11 pores in a centimetre of length with a comparatively bigger gap.
- d. Another configuration of pores contained a chain-like structure with no interspacing between them.

The majority of the pores on a ridge were discovered to be one behind the other, forming a row with almost uniform space, but other types of arrangements were also observed where pores were lying side by side. The side on the ridge's periphery with very little space between However, the earlier arrangement has been found to be more common. A less common type of pore arrangement was also discovered. It was observed that where pores were interconnected with no interspacing and formed a chain-like pattern When connected pores are open, this arrangement becomes more visible. Lying on the ridge's periphery, in this case, the ridge resembles a cross stitch. Stosz and Alyea used minutiae and pores to identify a person. Another automated fingerprint detection algorithm from all the information regarding the pores. Detection through live scanned images is presented. The fingerprint was divided into different strips. The position of these pores in different arrangements provide useful information for an individual. A developed multilevel verification technique is based on ridge and pore features. The main advantage of these systems over the systems that use only ridge information. For persistent information about the fingerprint an optical or electronic method is used. For which a high-resolution image is needed. Making it unlikely that the scanned fingerprints contain adequate data. That is consistent for use in authentication. A system that gives secure access to a computer. This gives a level of feasibility of the system used. This system was as such, it has low false rejection and zero false accept of error rates. The results came out positive after preliminary testing the verification prototype.

Comparing fingerprint fragments is a common task in forensic science. After extensive analysis of a fingerprint fragment, it is possible to determine the identity based on the ridge shape, even if no level 2 features are present, a scenario where a minutiae-based automated system would fail. We hypothesize that the undistorted fragment of a partially distorted fingerprint contains at least the same amount of distinctive information as the entire fingerprint. We also anticipate that using level 3 features will improve recognition accuracy, particularly when comparing fragmentary fingerprints. Kryszczuk analysed this contribution of pores through fragmentary fingerprint recognition. He found that the smaller the fingerprint, the greater the benefit [28].

A set of algorithms for extracting the structure of pore networks were brought to light. This algorithm had high resolution three-dimensional synchrotron microtomography pictures. Pictures of unconsolidated porous medium systems. These techniques are based on three-dimensional skeletonization. That reduces pore space to networks of nodes that are linked through routes. To depict the network's pore-bodies and pore-throats, dilation algorithms were devised to construct inscribed spheres on the nodes and routes of the medial axis. The final result is a

#### Priyanka Patel et al,

physically realistic pore network structure. That includes a three-dimensional spatial distribution with x,y and z coordinates of pore bodies. Along with dimensions of pore-throats, pore-body size distribution, connection and pore-throat size distribution. This study looked at numerous glass bead systems along with natural marine sand. The size of the media ranged from 0.123 to 1.0 mm, while the volume of the pictures ranged from 7.7 to 108.9 mm^3. The porosity, specific surface area and representative elementary volume were computed for recovering the pore network structure. Examination of the spatial correlation of pore-body sizes in the network, through semi variograms and integral scale concepts. The effect of resolution on the computed attribute was also studied. Microtomography is a powerful technology for non-destructively extracting the structure of numerous systems. The quality of the datasets is determined by photon energy, photon flux, sample size, kind of sample, and sample size 'features. The results revealed that the devised pore network structure extraction approach is suitable to both ideal and natural points media systems. The influence of resolution on the qualification of network structure and its attributes varies depending on the feature size and the properties being computed. To identify the degree of inaccuracy associated with a system photographed at a certain resolution, a complete sensitive study should be performed.

The authors provide the results of a pore-network analysis of high-resolution synchrotron microtomographic images of the Fontainebleau and Berea Sandstones. The grayscale pictures of the rocks are divided into constituent phases, and the geometry of the pore network is analysed. The network is made up of pores at grain corners that serve as connectors for extended throats that run along grain edges. According to our findings, when porosity increases, so does the number of pores, their median coordination number, and the fraction of connected pore space. When total porosity rises, however, throat breadth and length decrease. Throat breadth and length, on the other hand, decrease as overall porosity increases. The number of coordinating pores in each sample is directly proportional to the radius of the pores, and the length of the throats is also positively connected to the radius of the throats. The observed permeability increases with the total connected porosity of the samples, while the modelled permeability varies with flow direction for each sample. In all samples, the dimensionless coefficient of variation of neck lengths is nearly constant, hovering around an average value of 0.64. The coefficient of variation of throat radii is frequently greater than the coefficient of variation of pore radius. Jain *et al.* employ a fingerprint identification method that incorporates characteristics from all three levels[10].

Hong *et al.* utilize fingerprint enhancement methods, whereas Jain *et al.* use wavelet transform and Gabor filters to improve fingerprints so that pores may be extracted, but Zhao *et al.* use an anisotropic filter that is tailored to each block, making Zhao's approach superior to Jain's [14]. Derakhshani *et al.* observes perspiration patterns only in live fingerprint sequences acquired in between 0 to 5 seconds [8]. Fingerprint scanners are vulnerable to spoofing with artificial materials or, in the worst-case scenario, dismembered fingers. For use in fingerprint scanners, an antispoofing method based on liveness detection has been developed. This method quantifies a specific temporal perspiration pattern found in live claimant fingerprints. The improved perspiration detection algorithm presented here improves on our previous work by incorporating other fingerprint scanner technologies, employing a larger, more diverse data set, and operating within a shorter time window. Several classification methods were tried to distinguish between live and spoof fingerprint images. Fingerprint images from 33 live subjects, 33 spoofs made with dental material and Play-Doh, and fourteen cadaver fingers were included in the dataset. Each method performed differently depending on the scanner and time window.

Labati *et al.* use a specially designed and trained CNN to estimate and refine the centroid of each pore with the accuracy of a touch-based sensor, a touchless sensor, or a latent print. Obtaining pore coordinates from heterogeneous fingerprint pictures collected with diverse instruments [15]. They are particularly interested in touch-based, touchless, and latent image-based approaches. We present a strategy based on convolutional neural networks (CNN) to develop resilience to various forms of noise. The method's steps are as follows:

• Preprocessing: Preprocessing the fingerprint images can help to remove noise and artifacts and improve the quality of the images. This may involve techniques such as image denoising, image enhancement, and image normalization.

#### Priyanka Patel et al,

- Data augmentation: Data augmentation involves generating additional training data by applying transformations to the existing training data. This can help to improve the robustness of the CNN to various types of noise by providing the model with more diverse and representative training data. Create pores map and calculate pores coordination's.
- Feature extraction: Carefully selecting and extracting relevant and discriminative features from the fingerprint images can help to improve the robustness of the CNN to noise. This may involve techniques such as principal component analysis (PCA) or linear discriminant analysis (LDA) to identify the most relevant features. Obtain features from the immediate vicinity of the estimated pores.
- Regularization: Regularization techniques, such as weight decay or dropout, can help to prevent overfitting and improve the generalization of the CNN to new, unseen data. This can help to improve the robustness of the model to various types of noise.
- Ensemble learning: Ensemble learning involves training multiple models and combining their predictions to improve the overall performance of the system. This can help to improve the robustness of the CNN to noise by leveraging the strengths of multiple models.

Rather than analyzing the entire group, P Johnson *et al.* discovered small pores. The perspiration activity of each pore was then evaluated. The datasets LivDet 2011 and 2013 were used to generate the results. This reduced the average classification error to about 12%, which is inapplicable at the same time. The Liveness Detection (LivDet) competitions use a standardized testing protocol and a large number of spoof and live tests to compare software-based fingerprint liveness detection and artifact detection algorithms (Part 1), as well as fingerprint systems with liveness detection or artifact detection capabilities (Part 2). To compete, all academic and industrial institutions must have a solution for either software-based or system-based fingerprint liveness detection. The LivDet competitions, which were held in 2009, 2011, 2013, and 2015, have proven to be an important source of information about the current state of the art in liveness detection schemes. There has been a noticeable increase in the number of participants in LivDet competitions, as well as a noticeable decrease in error rates across competitions.

Sometimes the data collected by the standard verification system can be a bit different or missed by the hardware algorithm. In many cases it would have accepted a false print. In order to prevent liveness detection is done. It helps getting additional information gathered above and beyond the machine. We can also monitor the data processed by the machines every day. This data can be used to authenticate the fingerprint obtained through the verification system. Security is obtained in these systems by employing either hardware or software-based systems with the authentication programs. In this field of automation many different sensors are being built for liveness detection. Many hardware-based systems use sensors that measure outside of the fingerprint image itself. There are many software-based systems that use image processing algorithms. They collect information directly from the collected fingerprint. These systems then categorize images as real or fake.

#### Database

The Poly U High Resolution Fingerprint database is a collection of fingerprint images that was created as part of a research project at the Hong Kong Polytechnic University (Poly U). The database is intended to be used for the development and evaluation of fingerprint recognition algorithms. It consists of a set of high-resolution fingerprint images that were captured using a specialized fingerprint scanner. The database includes images of both rolled and flat fingerprints, and it covers a wide range of variations in fingerprint quality, including fingerprints that are damaged, distorted, or degraded due to age, wear, or other factors. The Poly U High Resolution Fingerprint database is a widely used benchmark in the field of fingerprint recognition research, and it has been used in many published studies.

#### **Retrieval of Pores**

Pseudo code to retrieve close pore is given below.

- 1. Select any fingerprint image from database.
- 2. If selected image is RGB then convert it into binary image

#### Priyanka Patel et al,

- 3. Identify the edges from binary images with the help of edge function.
- 4. Use bwareaopen() to removes all connected objects that have fewer than 30 pixels from the binary image.
- 5. Apply xor operation between step no. 3 and 4 to retrieve pores as well as small ridges.
- 6. If the output image detects small ridge borders, then clear it and also fill the holes of output image, so that close pores can be retrieved.
- 7. Apply xor operation between step no. 5 and 6 to retrieve close pores.
- 8. Calculate number of pores from step no. 7 output,
  - i. If the number of pores are less than 40 then don't consider input image and ask user to retry.
  - ii. Else circle pores and show them with respect to fingerprint image.
- 9. Generate scatter plot by considering pores (x, y) coordinates.

Input image on which above written pseudocode will get executed is shown in Fig.4 & 5 from which you can see the presence of different sizes and shapes of pores. And after executing pseudocode retrieved pores can be seen in Fig.4 highlighted with red filled circle. Stepwise output of above written pseudocode is shown in Fig.5. In step-9, scatter plot is retrieved during execution so that distance and angle between each pore can provide additional knowledge in identifying an individual. Researchers employed the Hong Kong Polytechnique University (PolyU) High-Resolution Fingerprint Database to put the suggested pore retrieval method to the test. Each finger in this database was recorded using a custom-built sensor with a resolution of 1200 dpi and a size of 320 × 240 pixels. Because of non-linear distortion, rotation, and translation, the database employed here is extremely difficult to work with. Figure 6 depicts some of the photos from the PolyU HRF DBI training set. Table 1 contains size of database and count of fingerprint images which are capable enough to take part in liveness detection having pore count greater or equal to 40.

#### Analysis

To find some concluding remarks, one experiment has been carried out. Accordingly, the original image as shown in Fig.7(a) is provided as an input image and retrieved 98 pores as shown in Fig.7(b)(Note: stepwise output is shown in Fig.5) filled with red color. Here Fig.7(c) has 3 highlighted circles which states manually added pores. We provided it as an input image and retrieved 55 pores as shown in Fig.7(d). pores which were not retrieve from updated image is shown in Fig.7(b) and in Fig. 7(c) with orange outlined circle. One of the key benefits of using CNNs for fingerprint pore retrieval is their ability to learn from large datasets of annotated fingerprint images and automatically extract and classify the pores. This can significantly reduce the time and effort required for manual annotation and can lead to more accurate and robust models. However, there are also some limitations and challenges associated with using CNNs for this task. One of the main challenges is the availability and quality of the training data, as the performance of the CNNs will depend on the diversity and representativeness of the data. Ensuring that the training data is of high quality and represents the types of images that the models will encounter in real-world scenarios is crucial for the accuracy and robustness of the models.

#### CONCLUSION

The proposed pore retrieval method can be an effective and efficient approach that can achieve high levels of accuracy and robustness. However, the specific performance of the CNNs on the Poly U dataset for liveness detection of fingerprints will depend on a variety of factors, such as the quality and diversity of the training data, the choice of CNN architecture and training algorithms, and the evaluation metrics and methods used., we can retrieve pores but after adding manual pores what makes this un-identification of pores in the same method is still questionable. But if we focus on only pore count then it cannot always help you because as per literature 20 to 40 pores are enough for liveness detection and as per Espinoza *et al.* change in pore count results in liveness detection. But in this approach change in pore count is due to manual alteration in original image but it does not allow other objects to get selected apart from pores which allows average classification error rates as not applicable measure. It is important to carefully consider these factors and to address any limitations and challenges that may arise when

#### Priyanka Patel et al,

using CNNs for this task. Additionally, it is important to compare the performance of the CNNs with other methods and techniques and to consider the specific requirements and constraints of the liveness detection task when selecting the most appropriate approach.

# ABSTRACT

In Power system voltage, frequency and current are main parameters of supply. If any changes in all any parameters then pollution are created in power system. This problem may damage or distroy the power supply system. This types of pollution created by main use of power electronics circuit in the power system. The Harmonics are produce by electronics devices. The Shunt active filter with P-Q theory to reduce the harmonics level in both balance as well unbalance 3 phase three wire system. All the analysis is done on simulation software tool.

Keywords: P-Q Theory , Shunt Filter , Total Harmonics Distortion , FFT analysis, Voltage controller

# INTRODUCTION

Harmonics refer to the distortion of sinusoidal frequency waveforms that are integer multiples of the fundamental frequency. Fundamental frequency is a desired frequency that generate in at 50Hz AC power system. Harmonics are created when nonlinear loads draw current from power supply in a unsinusoidal manner.

#### Harmonics consider following points:

#### **Effect of Harmonics**

Voltage Distortion: Harmonics lead to voltage distortion, that result irregular sinusoidal waveform. This cause issue with power electronics tool and may lead to malfunctioning or failure.[1]

Increased Currents :Harmonics currents can significantly higher than fundamental current, leading to extra stress on conductors, x' mers and other system components.

#### Pankaj.C.Patel and Hansa. H.Patel

**Power Quality problem and overheating :** Harmonics can affect negatively on over all power system and lead to low P.F. ,voltage unbalance and effect of performance of electrical instruments. Due to harmonics increase heating in equipment and reduce the life of instruments.[3]

**Total Harmonics Distortion :** This measure harmonics content in current or voltage in power system. It present ratio of total sum of harmonics components to power of fundamental frequency. Total Harmonics distortion present percentage and commonly used assess the level of distortion in power system.

**Harmonics Reduction :** Reduction of harmonics and their problem by use of passive filters. But the passive filters some draw back. So implementation of Active filters in latest era.[8]

**Research Method:** The Active filter are used to reduction of Harmonics pollution in power system. The simulation/Matlab software is used for the research methodology.

Shunt Active Filters

The Series and shunt active filters are more efficient then passive filters. The basic diagram of shunt active filters are shown below figure 1 :

In basic block of shunt filter ha important component and control system. The main function of shunt active filter to reduce the harmonics current generated by nonlinear loads.

In shunt active filter first current is sensed by current transformers and then sensed current is fed to a current controllers VSC. The first block calculate the active and reactive power of the nonlinear load by use of P-Q Theory. The second block measure the behavior of active filters. In P-Q theory using of clerk transformation transform abc to  $\alpha\beta0$  co ordinates. The dc voltage regulator determine the extreme amount of active power. The active power ploss is added to the compensating active power with together reactive power.

In Power circuit of shunt active filter has a 3 phase VSC made by IGBTs and diode. The PWM current controller forces the VSC to role of controller current source.

Calculation of reference current for compensator

The reference current of compensator in  $\alpha\beta$  domain wich calculate :[5]

 $i\alpha i\beta = 1\Delta V\alpha V\beta V\beta V\alpha pq$  .....(1)

In a-b-c domain currents become: ica icb icc = $\sqrt{231} \ 0 \ -12 \ -\sqrt{32} \ -12 \ \sqrt{32} \ i\alpha \ i\beta$  .....(2)

The detail of reference current calculation are given in below block diagram 2:

In below block diagram the clerk transformation is convert abc to  $\alpha\beta0$  then given to p-q theory they convert in p-q form. The p-q and Ploss according require add then reference compensating current is generated that inverse clerk transformation convert  $\alpha\beta$  compensating current in to abc compensating current.

#### **Simulation Figure of Shunt Active Filter**

Above figure:3 is a simulation of the shunt active filter in 30 three wire system. The THDv and THDi are produce when nonlinear load is connected. The nonlinear load is a three phase full wave rectifier. The all results are shown in below FFT analysis.

#### **Simulation Results Analysis**

The research FFT analysis of the 3Ø system has been carried out by simulation. The components rating used in simulation are given below table:1 The Unbalance waveform in waveform 1 and Phase A with filter and without filter waveform are given below FFT analysis. Also Filter and DC voltage waveform are given below waveform 4 and 5. The shunt active filter work on balance and unbalance three phase three wire system. The results shown in above waveform are only unbalance supply system. The FFT analysis carried out on Phase A, Phase B and Phase C. Here shown only Phase A FFT analysis. From this results when unbalance three phase supply is connect to the

#### Pankaj.C.Patel and Hansa. H.Patel

nonlinear load the THDi without filter in Phase a is 27.47%, phase B is 29.38 and phase c is 31.41%. When connect with the filter THDi is Phase A is 4.55%, phase B is 4.60% and phase c is 4.57%. The results shown in Phase A in waveform figure 2 and 3.

# CONCLUSION

This Research conclude that when balance as well unbalance 3Ø supply connect with nonlinear load the THDi without filter in Phase A is 27.47% ,phase B 29.38% and phase C 31.41%. Then connect to the filter the THDi in phase A 4.55%,phase B 4.60% and phase C 4.57%.so conclude that using shunt active filter with p-q theory is capable to mitigate the THD in current balance and unbalance three phase three wire supply system. that level is below 5% well defined by power quality standard.

## ABSTRACT

Solvents play a significant role in environmentally sustainable frameworks. In order to be considered a greener medium, these solvents have meet a wide range of criteria, such as availability, quasidegradability, composability, ignitability and affordability, along with other factors. Regrettably, the current selection of sustainable solvents is limited. In this study, the authors aimed to investigate a novel category of ionic fluids known as Deep Eutectic Solvents (DES), which have gained considerable attention in the scientific community. DES typically consists of two or three cost-effective and non-toxic constituents that have the ability to self-assemble, commonly through hydrogen bonding interactions. This self-assembly results in the formation of an eutectic mixture, which exhibits a melting point lower than that of each individual component. The aforementioned DESs exhibit comparable physicochemical properties to conventionally utilised ionic liquids while also offering significant cost advantages and

#### Jigesh Mehta *et al.,*

environmental sustainability. Deep Eutectic solvents (DESs) are increasingly gaining traction across various academic disciplines due to their numerous advantageous features. This article presents a comprehensive examination of the categorization of deep eutectic solvents, along with an analysis of their physical and chemical properties, encompassing the properties of ionic conductivity, polarity, velocity, density, and surface tension. Furthermore, numerous domains have identified promising prospects for the future utilisation of these solvents.

**Keywords**: Deep eutectic solvents, Hydrogen bond acceptor, Hydrogen bond donor, Physicochemical properties, Green Solvents.

# INTRODUCTION

In the last 20 years, there has been a lot of interest in room-temperature ionic liquids, first in the fields of material chemistry, catalysis, and electrochemistry, and more recently in biomass processing[1,2]. Mostly, ionic liquids can be put into two groups: those made from eutectic mixtures of halides and aromatic ions, and those made with specific types of ions [3]. Scientists have recently getting interested in Deep eutectic solvents (DESs). DESs are alternative to ionic liquids that were first proposed in 2003 as a way to deal with the growing need for natural solvents and the high cost of ionic liquids [4]. These DESs are easily made by combining two innocuous chemicals that could form a eutectic mixture; often, these materials are cheap, renewable, and biodegradable [5, 6]. Because of this feature, DES always have a lower melting point than all of its components put together. Most DESs have a low melting point, which means that they turn into liquids at temperatures below 150 °C. It's important to remember that most of them are liquids at temperatures between 0 and 70 °C [7, 8]. Choline Chloride (ChCl) is a common component of several DESs. Easily retrieved from biomass or generated from geological deposits (million metric tonnes), Choline Chlorine is a cheap, sustainable, quasi-ammonium sulphate salt with a very high atom efficiency [9]. Choline chloride (ChCl) can swiftly generate a DES when used in conjunction with a number of other safe hydrogen bond donors. Despite the fact that ChCl (the ionic species from which most DESs are derived) is a key ingredient, DESs are not ILs [10–12]. Researchers provided broad criteria for defining DESs in 2007 [13]. To distinguish between various eutectics, deep eutectic solvents were categorized into four kinds based on their general formula. Cat+XzY is a Lewis base, often a halide anion, and Cat+ may be ammonium, phosphonium, or sulfonium. Y stands for a Lewis or Bronsted acid, and z stands for the quantity of times one molecule of Y binds to its anion counterpart [14]. In DES, the hydroxyl group between molecules is really quite persistent. The relationship and formulation of each component have a significant impact on the chemical and physical properties of the solvent (such as ionic conductivity, polarity, density, viscosity, surface tension, etc.). Modifying the structure and makeup of HBD or HBA and their ratios enables tailoring such properties for use in a number of significant industries, including chemical synthesis, electrodynamics, biofuel catalysis transformation, biofuel generation, extraction, isolation, and gas absorption. Thus, it is essential to comprehend the interconnections between DES component components in order to effectively design and synthesize solvents for specific uses. Improved workplace use of DESs will be feasible only after a deep inspection of the "structure-function" link of DESs systems, as well as the influence of DESs characteristics and structure.

#### **Physicochemical properties of DESs**

DESs can be functionalized in the same way that ILs can, by combining and balancing quaternary ammonium salts with other donors of chemical bonds (HBD). After that, DESs can be made to fit specific uses by changing their melting point, viscosity, conductivity, and pH values, among other physical and chemical properties. These enable DESs to more effectively serve the needs of the application. Because of the potential applications of the results, a considerable amount of time and energy has indeed been expended in the research of the chemical and physical properties of DES. In the following, the physicochemical characteristics of DESs that are regarded as the most significant will be thoroughly investigated.

Jigesh Mehta et al.,

#### Viscosity

When two solids that can join together on their own through hydrogen bonds and make new water molecules that can put together to make a DES. A fluid's viscosity is a measure of its internal friction, or how much it struggles to move. Due to their higher viscosity compared to organic solvents, working with DESs in these processes can be hard in a number of ways. The capacity of a liquid to transfer material inside itself has a major impact on its viscosity and, by extension, on the chemical processes that take place in the liquid. Many different models have been used in an effort to better understand the flow properties of DESs and map them experimentally. The two most common ways to talk about DESs are the Arrhenius model and the VFT model. The hydroxyl group, van der Waals interactions, and surface tension all have a big effect on the viscosity of binary eutectic mixtures. Table 1 lists the viscosity characteristics of typical DESs at various temperatures. It is clear that the characteristics of HBD have a significant impact on the viscosity of ChCl-based DESs. ChCl/EG (1:2) DES, for example, has the lowest viscosity of DES formulations (36 cP at 20 °C). Still, DESs with derived sugars (like xylitol and sorbitol) as HBDs had high viscosities (for example, 12730 cP at 30 °C for ChCl and sorbitol) because they had a stronger 3D intramolecular hydrogen network. Surprisingly, as the ChCl/glycerol stoichiometric ratio tends to go up, the viscosity of a ChCl/glycerol DES tends to go down. For example, at 20 °C, the viscosity values of ChCl-glycerol solutions with a 1:3 molar ratio were 450 cP, and a 1:2 molar ratio was 376 cP. Glycerol has a lot of hydrogen bonds between its molecules, which gives it a lot of cohesive energy. When ChCl was added, this network of hydrogen bonds broke down a lot, which made the viscosity of glycerol drop by a huge amount [21].

#### **Freezing Point**

To generate deep eutectic solvents (DESs), it is necessary to combine two solid materials that possess the ability to undergo self-association through hydrogen bonding, resulting in the formation of a novel liquid phase. In many instances, the freezing point of a novel phase tends to be lower in comparison to the freezing points of its constituent components. A eutectic mixture was prepared by combining ChCl and urea in a molar ratio of 1:2, resulting in a point of freezing of 12 °C. The observed temperature is significantly below the individual freezing points of the components, which are 302 and 133 °C, respectively. Moreover, the halide anion exhibits an interaction with urea, a compound that facilitates hydrogen bonding, resulting in a significant reduction in the freezing point. All differential scanning calorimeters (DSCs) have documented freezing points that are lower than 150 °C. Despite their ability to function as a limited and partially effective solvent in various scenarios, it is advisable to use deep eutectic solvents (DESs) with a freezing point below 50 °C. Various types of DES have been identified, and their respective freezing points are documented in Table 2 within the scientific literature. Several compounds, such as urea and 2,2,2-trifluoroacetamide, have the ability to form a liquid deep eutectic solvent (DES) with ChCl at room temperature due to the strong hydrogen bonding interactions they exhibit with ChCl. This observation highlights the significance of selecting appropriate hydrogen bond donors (HBDs) in the development of a desiccant material that effectively lowers the freezing point of choline chloride (ChCl).

#### **Ionic Conductivity**

Due to its high density, the ionic conductivity of DES is typically observed to be low, measuring above 2 mS/cm at ambient temperature. Table 6 displays the ionic conductivities of various deep eutectic solvents (DESs) as a function of temperature. When the temperature goes up, the viscosity of deep eutectic solvents (DESs) goes down. This makes the DESs conduct electricity better than they did before. Consequently, the conductive properties of a deep eutectic solvent (DES) can also be approximated by employing an equation similar to the Arrhenius equation. The impact of organic salt concentration in HBD on the conductivity of DESs suggests a plausible correlation with their thickness. [26]. An increased concentration of ChCl in deep eutectic solvents (DES) leads to an elevated level of conductivity. The ChCl-glycerol deep eutectic solvent (DES) exhibits a conductivity value of 0.85 millisiemens per centimetre (mS cm1) upon increasing the molar fraction of ChCl to 25%. The ChCl/glycerol-based deep eutectic solvents (DESs) exhibit comparable viscosity (>400 cP) and conductivity (>1 mS/cm) to that of an ionic liquid (IL) when exposed to higher levels of salinity. [27]

Jigesh Mehta et al.,

#### Density

In the realm of chemistry, density stands as the fundamental physical characteristic. Specific gravity metres are capable of being utilised to measure the value. The densities of various frequently used DESs are listed below; you'll notice that the overwhelming majority of these compounds are denser than water. The density of DESs varies when one adjusts the mole ratios and characteristics of the various components. Densities of hydroxyl-produced DESs Caused considerable increases as more hydroxyl radicals were introduced, but fell as aromatic groups were included. As the alkyl chain structure of the DESs component is extended, the densities decrease too [34]. Density decreases with increasing temperature. This is because the mole fraction of DES increases as a consequence of heating, leading to a decline in density [35, 36]. At low temperatures, the average pore size gets smaller, which makes the molar volume of DESs smaller and makes them denser [37]. The number of moles of organic salt and HBD also has an impact on DES densities. Fig. 3 depicts the density of a glycerol/ChCl DES as a function of the molar content. The density of DES is reduced when ChCl is mixed with glycerol [38]. It might be hard to get good experimental estimates of DES density as a function of temperature. Thus, technological advances that could provide these data as precisely as possible were prioritised for research. Using a modified version of the Rackett equation, Spencer and Danner reported that researchers could predict DES density with an accuracy of 1.9%. [39].

#### **Surface Tension**

Even though the properties of interfaces are important for understanding how mass moves, many studies have correctly found the parameters of DESs' surface tension. Solvents have surface tension because their component molecules are clustered together. The stalagmometer is used to measure the surface tension of the given liquid. Research suggests that DESs have a surface tension that is equivalent to imidazolium-based ILs but higher than that of molecular solvents [46–48]. The main things that affect DES's surface tension are its hydrogen bonds, its ionic nature, and its molecular weight. The hydrogen bond in the cation, which can form more h-bonds, causes the surface tension to be higher [49–51]. DESs made from glucose have a higher surface tension than those made from carboxylic acids because they have more hydroxyl. Temperature causes a big drop in surface tension because molecules with more kinetic energy and less cohesion are less likely to stick together. This makes the bonds between molecules weaker [52, 53]. Even though the strength of the interactions between molecules has a big effect on how DESs are made, surface tension is thought to act like viscosity. No matter what the first step was, the surface tension of ChCl/glycerol DESs got better as the temperature went up. As the concentration of ChCl goes up in the ChCl/glycerol DES, the surface tension goes down for the same reason that the viscosity goes down. There are more signs that adding ChCl to glycerol messes up the huge structure of hydrogen atoms in glycerol [54–55].

#### Polarity

Polarity has a big effect on how quickly DESs dissolve and how well they mix with other solvents. The standard method is to use solvatochromic variables, which look at the UV-vis bands to figure out the polarity of the solvent [60]. In general, the intensity of the interaction among molecules increases as the polarisation of the molecule does. It involves the chemical composition primarily. DESs that are made from carbohydrates are much more polar than short-chain alcohols like ethanol and 2-propanol and certain polar solvents like dimethylformamide (DMF) and dimethyl sulfoxide (DMS) [61-62]. Moreover, researchers analysed ChCl-glycerol DESs with differing mole ratios and reported that the polarities decreased with increasing ChCl content [63]. When temperature increases, the hydrogen-bonding network that lends DES their polarity starts to break down, and the polarity of the DESs decreases significantly [64]. It is also obvious that the water added changes the polarity of eutectic mixtures. Liu and his team found that when a small amount of a moderator is added to DES, the hydrogen bonds between its parts break. This makes the molecule very polar. [65].

# CONCLUSION

From the above review, researcher team observed that DESs and traditional ILs have many of the same rheological Based on the aforementioned review, it was observed by the research team that both deep eutectic solvents (DESs)

#### Jigesh Mehta et al.,

and traditional ionic liquids (ILs) exhibit similar rheological characteristics, including rigidity, its thickness, and conductance. It is also possible to generate enterprise deep eutectic solvents (DESs) through the modification of the the quaternary ammonium salts and the hydrogen-bond donor, analogous to the manner in which the physical and chemical characteristics of ionic liquids (ILs) can be altered indefinitely. However, it is important to note that deep eutectic solvents (DESs) possess several notable advantages over ionic liquids (ILs). Firstly, DESs can be easily synthesised with a particle efficiency of 100%. Secondly, DESs are considerably more cost-effective due to their ability to be generated from readily accessible chemicals. Lastly, DESs, especially those derived from ChCl and regenerating chemicals, exhibit low cytotoxicity. The significant financial and environmental advantages associated with DESs undoubtedly offer novel opportunities for the advancement of various types of ionic fluids. Furthermore, it is important to emphasise that although the chemical components of deep eutectic solvents (DESs) possess reactivity, their reactivity is significantly diminished through auto-association facilitated by hydrogen bonding. This reduction in reactivity allows for their application in various fields of study. While it is evident that DESs cannot fully substitute ILs in all environmental uses, scholars remain optimistic that the amalgamation of affordability and minimal environmental footprint will contribute to the future commercial viability of this emerging medium.

# ACKNOWLEDGEMENTS

The authors would like to express their gratitude to P P Savani University, CVM University, Lovely Professional University, and V V P Engineering College for granting permission to publish this review article.

#### Author Contributions

All the authors make substantial contributions to this manuscript and discussed the results and implications of the manuscript at all stages.

**Funding** Not applicable.

#### Availability of Data and Material

All relevant data and material are presented in the paper.

#### **Conflict of Interest**

The authors declare that they have no competing interests

### ABSTRACT

Organizations are increasingly relying on machine learning (ML) to derive valuable insights from their data. AWS cloud computing environments offer a cost-effective and scalable platform for ML model development and deployment. This review explores a range of ML techniques applicable in AWS, including supervised, unsupervised, reinforcement, and deep learning. We illustrate how these techniques can be effectively implemented within AWS, utilizing services such as Amazon Tensor flow, AWS Deep Learning AMIs, and Amazon Rekognition, highlighting their distinctive features and benefits. Additionally, we delve into the challenges of using ML in AWS, particularly pertaining to data security and privacy concerns, while proposing potential solutions. Lastly, we discuss future research directions and opportunities for ML in AWS cloud computing environments. This review provides a comprehensive overview of ML techniques, their applications in AWS, and insights into the current state and future prospects of ML in the cloud.

**Keywords**: ML techniques, Cloud Computing Environments, Cloud computing, Scalability, Costeffectiveness, Future Research Directions.

Anjuman Ranavadiya et al.,

### INTRODUCTION

Machine learning (ML) is a subfield of artificial intelligence (AI) that focuses on the development of algorithms and statistical models that enable computer systems to automatically learn and improve from experience without being explicitly programmed. ML algorithms can analyze large datasets and identify patterns, trends, and anomalies that may not be immediately apparent to human analysts. With ML, organizations can gain a better understanding of their data, make more informed decisions, and automate various tasks. Cloud computing is the delivery of computing services, including storage, computing power, and software applications, over the internet. Instead of relying on physical servers and hardware, cloud computing services are accessed through a network of remote servers hosted on the internet. Cloud computing services can be used to store and process large amounts of data, build and deploy applications, and run complex workloads at scale.

Amazon Web Services (AWS) is a cloud computing platform that provides a wide range of services, including storage, computing, networking, and analytics. AWS provides a scalable and cost-effective platform for building and deploying ML models. AWS offers pre-built ML services, such as Amazon tensor flow, which can help organizations build, train, and deploy ML models quickly and easily. AWS also offers tools for managing and optimizing the cost of compute resources, making it easier for organizations to control their ML-related expenses. By combining machine learning and cloud computing by AWS, organizations can take advantage of the scalability and flexibility of cloud computing to build and deploy machine learning models at scale. With AWS's pre-built ML services and tools for cost optimization, organizations can build and deploy machine learning models more quickly and cost-effectively than would be possible with traditional on premise infrastructure. Machine learning (ML) is a subfield of artificial intelligence (AI) that focuses on the development of algorithms and statistical models that enable computer systems to automatically learn and improve from experience without being explicitly programmed. With the exponential growth of data in recent years, organizations are turning to machine learning as a way to extract valuable insights from their data. ML algorithms can be used to analyze large datasets and identify patterns, trends, and anomalies that may not be immediately apparent to human analysts. By leveraging the power of ML, organizations can gain a better understanding of their customers, improve their operations, and make more informed decisions. For example, ML algorithms can be used to:

- Predict customer behavior: By analyzing customer data, ML algorithms can identify patterns and trends that can be used to predict future behavior. This information can be used to tailor marketing campaigns, improve customer retention, and increase revenue.
- Optimize operations: ML algorithms can be used to optimize processes and identify bottlenecks in operations. This can help organizations reduce costs, improve efficiency, and increase productivity.
- Fraud detection: ML algorithms can be used to detect and prevent fraud in financial transactions. By analyzing large datasets, ML algorithms can identify patterns of fraudulent activity and alert organizations to potential risks.
- Machine learning has become an essential tool for organizations that want to stay competitive in today's datadriven world. By leveraging the power of ML, organizations can gain insights that can help them make better decisions, improve their operations, and ultimately achieve their business goals.
- AWS (Amazon Web Services) is a cloud computing platform that offers various services, including storage, computing, networking, and analytics. It provides several advantages for machine learning (ML) applications:

**Scalability:** AWS allows for easy scalability of ML models, enabling users to adjust resources based on demand. Auto-scaling features and the ability to scale up or down as needed ensure efficient resource utilization.

**Cost-effectiveness:** AWS follows a pay-as-you-go pricing model, allowing users to pay only for the resources they use. This eliminates the need for upfront hardware investments and offers cost optimization tools, such as spot instances, to further reduce expenses.

### Anjuman Ranavadiya et al.,

**Pre-built ML services:** AWS provides pre-built ML services like Amazon tensor flow, which simplifies the process of building, training, and deploying ML models. These services are designed for ease of use, making it accessible to users with varying levels of ML expertise.

**Integration with other services:** AWS offers a wide range of services, including data storage and analytics, that can be seamlessly integrated with ML models. This enables the creation of end-to-end ML pipelines, encompassing everything from data ingestion to model deployment.

AWS's powerful and flexible platform, along with its scalability, cost-effectiveness, pre-built ML services, and integration capabilities, make it an appealing choice for organizations seeking to leverage ML effectively. By harnessing the advantages of AWS, businesses can accelerate their ML initiatives and drive innovation.

### LITERATURE REVIEW

Paper Title	Authors	Year	Summary	Contribution in the Field
A review of machine learning techniques in AWS cloud computing environments	Kumar, P. & Kumar, R.	20 21	Provides a comprehensive review of various machine learning techniques used in AWS cloud computing environments. Discusses the importance and benefits of machine learning in the cloud, highlights different techniques, and addresses challenges and potential solutions.	Offers a comprehensive overview and insights into the use of machine learning techniques in AWS cloud computing environments.
Comparative analysis of machine learning algorithms in AWS cloud computing environment	Kuznetsov, M. & Kuznetsova , E.	20 21	Presents a comparative analysis of different machine learning algorithms in the AWS cloud computing environment. Discusses AWS services and tools for building machine learning models, compares various algorithms, and provides recommendations for algorithm selection based on specific use cases.	Contributes to the understanding of the performance and selection of machine learning algorithms in the AWS cloud computing environment.
Analysis of various machine learning algorithms in AWS cloud computing environment	Ilyas, M. & Ullah, F.	20 21	Focuses on analyzing the performance of various machine learning algorithms in the AWS cloud computing environment. Evaluates supervised and unsupervised learning, deep learning, and reinforcement learning algorithms based on performance metrics. Provides recommendations for algorithm selection.	Provides insights into the performance evaluation and selection of machine learning algorithms in the AWS cloud computing environment.
Evaluating the performance of machine learning models in AWS	Abrahim, M. T. & Shahin, A. S.	20 21	Focuses on evaluating the performance of machine learning models in the AWS cloud computing environment. Examines logistic regression, decision trees, random forests,	Contributestotheunderstandingandevaluationofmachinelearningmodel

### Research Gap, Scope, Advantage & Disadvantages of the Study

**Research gap:** Research gap in machine learning in AWS cloud computing environments include optimizing models for specific cloud environments, assessing the impact of pre-built services on model performance, securing sensitive data, and minimizing costs. Addressing these gaps is crucial for enhancing the effectiveness and efficiency of machine learning applications in the cloud.

**Scope:** The scope of the covers a wide range of machine learning techniques that can be used in AWS cloud computing environments. This includes supervised learning, unsupervised learning, and reinforcement learning. The topic also covers the pre-built machine learning services offered by AWS, as well as best practices for building and deploying machine learning models in AWS cloud computing environments.

Advantages& Dis-advantages: Using machine learning in AWS cloud computing environments offers advantages such as scalability, cost-effectiveness, pre-built services like Amazon Tensor flow, and seamless integration with other services. However, it requires expertise in both machine learning and cloud computing, data security measures, and limited control over infrastructure customization.

#### **Objectives and Aim of the Study**

The objectives of this study are to review machine learning techniques in AWS cloud computing environments, evaluate the benefits and limitations of using AWS for machine learning, explore pre-built ML services, investigate integration with other AWS services, and discuss best practices for building and deploying ML models in the cloud.

### **RESULTS AND DISCUSSION**

#### Various ML Techniques that can be used in AWS Cloud Computing Environments

In AWS cloud computing environments, various machine learning techniques can be utilized, including supervised learning, unsupervised learning, reinforcement learning, deep learning, transfer learning, online learning, and semisupervised learning. These techniques find applications in image and speech recognition, natural language processing, predictive maintenance, fraud detection, personalized recommendations, and more.

# Key Concepts Of Supervised, Unsupervised, And Reinforcement Learning, As Well As Deep Learning With Examples Of How These Techniques Can Be Applied In AWS

In AWS, supervised learning, unsupervised learning, reinforcement learning, and deep learning are used to create intelligent applications. Amazon Rekognition applies deep learning for image and video analysis. Amazon Tensor flow provides algorithms for unsupervised learning tasks like clustering and anomaly detection. AWS RoboMaker facilitates the development of robotics applications using reinforcement learning. Deep learning in AWS is used for image recognition and natural language processing. AWS offers a suite of services and tools to support machine learning applications such as object identification, data clustering, autonomous agent training, and speech processing.

Anjuman Ranavadiya et al.,

# Discuss popular AWS services for ML, such as Amazon Tensor flow, AWS Deep Learning AMIs, and Amazon Rekognition, and their features and benefits.

Some popular AWS services for ML include Amazon Tensor flow, AWS Deep Learning AMIs, and Amazon Rekognition. Amazon Tensor flow is a fully-managed service that enables developers and data scientists to build, train, and deploy ML models at scale. It offers features such as automatic model tuning, pre-built algorithms, and integration with Jupyter notebooks, making it easier to develop and deploy ML models. AWS Deep Learning AMIs provide pre-configured virtual machine images with popular deep learning frameworks and libraries, simplifying the setup of a deep learning environment. It allows researchers and developers to quickly start working on ML projects without the hassle of manual installations. Amazon Rekognition is a service that utilizes deep learning technology for image and video analysis. It offers features like object detection, facial analysis, and text recognition, enabling developers to extract meaningful information from images and videos. These services provide a range of capabilities for ML development and analysis, offering convenience, scalability, and integration with other AWS services.

# Explore challenges in using ML in AWS, such as data security and privacy concerns, and how these challenges can be addressed

Using machine learning (ML) in AWS offers benefits like improved decision-making and automation, but challenges such as data security, privacy, explainability, and scalability must be addressed. ML algorithms rely on sensitive data, and AWS provides encryption, access control, and monitoring tools to ensure data security. Privacy features like data masking and anonymization aid compliance with regulations. Explainability is addressed through interpretability and fairness assessment. Scalability is tackled through auto-scaling and optimization of ML workflows. By implementing AWS's security, privacy, explainability, and scaling features, users can ensure robust, compliant ML systems.

#### Discuss future directions and opportunities for research in ML in AWS cloud computing environments

ML in AWS cloud computing environments offers research opportunities in federated learning, edge computing, explainable AI, AutoML, and quantum computing. Federated learning enables collaborative model training without sharing data, with potential applications in healthcare, finance, and energy. Edge computing deploys ML on devices near data sources, reducing latency and privacy risks, applicable to autonomous vehicles and smart cities. Explainable AI aims for transparent and interpretable models, benefiting domains like healthcare and finance. AutoML automates model development and can improve efficiency in NLP, computer vision, and recommendation systems. Quantum computing has potential for quantum algorithms in ML and ML models on quantum hardware, impacting fields like drug discovery. These research areas offer exciting possibilities in AWS, requiring interdisciplinary collaboration to address challenges and harness their potential. The resulting insights and technologies can profoundly impact society and industry.

### CONCLUSION

Based on the review of research papers related to machine learning applications in AWS cloud computing environments, it can be concluded that AWS provides a scalable and cost-effective platform for building, training, and deploying machine learning models. The use of machine learning in the cloud can bring numerous benefits, such as improved accuracy, better performance, and faster processing times. However, selecting the appropriate machine learning algorithms and models, as well as evaluating and optimizing their performance, is critical for achieving the best results. The papers reviewed also highlighted the importance of data privacy and security in machine learning applications in the cloud, and the need for specialized expertise in building and deploying machine learning models in AWS. Organizations must carefully consider these challenges and implement appropriate measures to address them. The reviewed papers demonstrate the growing importance of machine learning in AWS cloud computing environments and its potential to revolutionize various industries. By leveraging the power of machine learning in the cloud, organizations can gain valuable insights from their data and make data-driven decisions, ultimately leading to better business outcomes.

### ABSTRACT

In the present study, newly developed double basin solar still is connected with an evacuated tube and the absorber plate of the upper basin is made corrugated to enhance the heat transfer. The double basin solar still developed here has been extensively tested in the local environment of Ahmedabad (23.0225° N, 72.57° E), Gujarat from May, 2022 to June, 2022. Gravel and pebbles have been used as heat storage materials to increase distillate output. In the upper basin of the developed double basin solar still, using gravel and pebble as heat storage material, distillate outputs of 4.905 and 3.655 liters are obtained, respectively. Total distillate output in both basins 8.540 liters and 7.685 liters respectively; Available with gravel and pebbles. Life cycle cost analysis shows an expected payback period of 108 days. An annual cost per liter of distillate output obtained is Rs. 0.407 for the developed solar still.

### INTRODUCTION

Due to urbanization and industrialization, the availability of fresh water is being a key problem around the globe. Earth's almost 2/3rd part is covered with water. Most of it is stored in the sea or in glaciers, and only a small amount of fresh potable water is available for humans. This small amount is enough for all the species living on the earth to satisfy their needs. But due to urbanization & industrial growth the need of fresh water increases greatly. [1-2] solar desalination provides a great solution for getting potable water, but a major issue with it is lower productivity. The distillate output produced of solar stills can be improved by various integrations like evacuated tubes, flat plate collectors, parabolic troughs, photovoltaic panels, fins, heat storage materials, and design modifications (multi basin,

### Kamlesh Pansal and Bharat Ramani

multi wick, stepped basin, double slope, hemispherical, pyramid, and corrugated absorber). [3-32]. the main problem with solar is its lower productivity. A double or multi-basin arrangement improves distillate output and makes it commercially viable. Al-Karaghouli et al. [33] have analyzed the performance of solar stills with & without insulation at the sides. It has been seen that DBSS gives 40% higher production with respect to solar still with single basin. For a solar still with double basin, the highest daily distillate output obtained was 3.9 liters/m2 and 3.13 liters/m2 with & without insulation respectively. For a solar still with single basin, the highest distillate yield obtained was 2.84 liters/m2 and 2.455 liters/m2 with and without insulation. Bapeshvarroa et al. [34] analyzed a double-basin solar still with cooling of condensing cover of upper basin by flowing water over it. A numerical model was developed and analyzed. Dutt et al. [35] analyzed transient behavior of DBSS using dye. A numerical model was developed and analyzed; it has been found numerically that a DBSS using dye gives a higher output. The daily distillate productivity of solar still with double basins improves by 2 liters/m2 by adding dye as compared to not adding dye. Patrick Gnanaraj et al. [36] fabricated and examined DBSS with different modifications, like a reflector with a FPC and a mini solar pond. The performance of DBSS with external modification was compared with that of single basin solar still. The daily distillate productivity for a DBSS integrated with a reflector and FPC was found to be 5650 milliliters, and with a mini solar pond, 6249 milliliters. The daily distillate output for a DBSS with no modifications was 4333 milliliters, and it was 2745 milliliters for a single-basin solar still. Modi et al. [37] fabricated and examined a DBSS piled with black cotton wick and jute cloth for local climate conditions, experiments were performed for water depths of 20 cm and 10 cm. It was found that jute cloth at a water depth of 10 cm and 20 cm gives 18.03% and 21.46% higher daily productivity, respectively, with respect to black cotton wick. Panchal [38] has reviewed the performance of a novel DBSS assisted with vacuum tubes in the lower basin. Performance was evaluated at different water depth of 30 mm, 40 mm, and 50 mm, respectively. Higher distillate was obtained with a lower depth of water. The highest productivity of 11.064 liters was obtained at 0.03 m. Panchal [39] has integrated evacuated tubes with a DBSS and tested it. He has evaluated the performance of a developed solar still with black granite gravel. It was seen that the integration of evacuated tubes alone and evacuated tubes and black granite gravel increases productivity by 56% and 65%, likewise. Panchal et al. [40] fabricated a double-basin solar desalination unit assisted with evacuated tubes in the lower basin as and mild still fins were integrated to increase productivity. Productivity increased by 25% due to the incorporation of solid fins.

Rajaseenivasan et al. [41] developed solar stills with single and double basin. They have compared the performance of a both the stills for different water depths with mild still pieces and wick material. They have found higher distillate productivity at a lower water depth in the basin. He discovered that for single basin daily distillate output with cotton waste, black cotton, jute fabric, and mild still trashes as storage material was 1650 milliliters, 1850 milliliters, 1775 milliliters, 1940 milliliters, respectively. For solar still with double basin daily distillate output with cotton waste, black cotton, jute fabric, and mild still trashes as storage material were 3065 milliliters, 3510 milliliters, 3320 milliliters, and 3580 milliliters, respectively. Rajaseenivasan et al. [42] carried out performance analysis for a solar still with double basin with cotton waste, jute fabric, black cotton fabric, and mild still trashes in the basin. Exergy efficiency was found with cotton waste, black cotton cloth, jute cloth, and mild still pieces in basins of 1.013%, 1.282%, 1.314%, and 1.412%, respectively, for a single basin solar still and 1.538%, 1.659%, 1.954%, and 2.072%, respectively, for a solar still with double basin. Raj Kamal et al. [43] has evaluated experimentally the performance solar stills with single and double basin with heat storage material and an external heater. Daily distillate output solar still with single and double basin was obtained 6720 milliliters and 5780 milliliters, each with an external heater. Sodha et al. [44] carried out numerical and performance analysis of a solar still with double basin. It was found that a solar still with double basin gives 36% higher distillate output with regard solar still with single basin for the same basin area. G.N. Tiwari [45] has presented a transient analysis of a solar still with double basin. For higher distillate, he has connected a flat plate collector with the lower basin. For a higher temperature difference across the condensing cover and basin, water produces a better yield. Water is flowed over condensing cover to lower the temperature of condensing cover. Yadav [46] has presented a parametric study of solar still with double basin. He has obtained accurate expressions for temperature and other parameters by taking energy balances at various components of a solar still with double basin. Yadav [47] has developed a transient model of solar still with

### Kamlesh Pansal and Bharat Ramani

double basin integrated with flat-plate collection. Analytical results were matched with numerical results and agreement was observed.

#### Experimental Setup

Figure 1 a&b depicts photo graph and perspective view of newly developed double basin solar still with evacuated tube collector. The setup was fabricated with a two-millimeter-thick galvanized iron sheet. The total area of the basin assembly is 1.365 x 0.75 square meters.5 mm thick toughened glass is used as the condensing cover of the upper basin. The condensing cover is placed at an angle of 23 ° which is exactly the latitude of the experimental work site and inclined towards the south direction so that maximum benefit of solar intensity can be taken. Condensing glass cover is placed over the basin and properly sealed with silicone sealant to prevent vapor leaks. The solar still is insulated with 5 cm thick polyurethane foam to prevent heat loss from the sides and bottom. Polyurethane foam has a thermal conductivity of 0.024 watts per square meter making it an excellent heat insulating material. On either side of the solar still, there are jars to collect the condensate from the upper and lower basins. A corrugated absorber plate made of galvanized iron is inserted between the upper and lower basins to act as a condensing cover for the lower basins.16 vacuum tubes having outer diameter 52 mm, inner diameter 48 mm and length 1.8 m are attached to the lower basin. A selective sputtered aluminum nickel aluminum coating is applied to the inside of the vacuum tube as it has an absorbance of 93% and an emittance of 6%. The ends of the concentric tubes are fused together in the vacuum tube and air is evacuated from the annulus space to reduce conductive and convective heat loss. So that the end of the vacuum tube does not break, it is secured in a plastic cap and connected to the frame. The open end of the vacuum tube is fitted securely with a rubber gasket into a hole made in the lower basin of the double basin solar still. The vacuum tube is tilted at an angle of  $45^{\circ}$  to get the maximum benefit of the solar intensity.

In the case of the double basin solar still developed here, the solar radiation passes through the toughened glass cover and reaches the saline/brackish water in the upper basin. The sun's radiation heats the water in the basin causing it to evaporate. The resulting vapor condenses on the inside of the glass cover. Condensed water particles due to the gradient collect in the distillate trough from where they are collected in the jar. Evacuated tubes connected to the lower basin absorb solar radiation and heat the water inside. Then the hot water reaches the lower basin by thermo siphon (natural convection) effect, the resulting vapor condenses downwards inside the corrugated condensing cover of the lower basin which collects in two distillate channels placed in the lower basin. The latent heat of vaporization helps to heat the water in the upper basin which is already heated by the solar intensity. A higher distillate output is obtained as a result. Although a small amount of heat passing from the lower basin increases significantly. The distillate output obtained in a double basin solar still is equal to the sum of the distillate output obtained in a double basin solar still is equal to the sum of the distillate output obtained.

### **RESULTS AND DISCUSSION**

Various heat storage materials such as gravels and pebbles were added to the upper basin to increase the distillate output in the developed double basin solar still connected with evacuated tubes. Extensive experiments were conducted in Ahmedabad Gujarat environment from May 2022 to June 2022 from 7 am to 6 pm. For the experiment, 10 kg of gravel and pebbles were added to the upper basin. During the experiment, hourly water temperature of upper basin, water temperature of lower basin, temperature of condensing glass cover of upper basin, temperature of condensing cover of lower basin, ambient temperature, solar intensity, distillate output were recorded.

#### Hourly variation in ambient temperature and solar intensity

Figure 2 shows hourly change in ambient temperature and solar intensity. Ambient temperature depends on solar intensity as shown in figure. Solar intensity increases from morning to noon and then gradually; it decreases. A maximum solar intensity of 905 watts per square meter was recorded at 1 PM on the day of observation, 16 May 2023. The maximum ambient temperature observed on the day of observation is 45° C recorded at 2 pm. The time lag observed in the increase in ambient temperature relative to solar intensity is due to the thermal capacity of the

#### Kamlesh Pansal and Bharat Ramani

ambient air. The slope of the solar still is kept at 23° same as the latitude of the local site and the slope of the evacuated tube is kept at 45°. So that the maximum benefit of the incident solar radiation can be obtained in the summer season. Since the difference in relative solar intensity on the still and the collector is minimal, the solar intensity on the still is recorded here. Solar intensity increases from morning to noon and then gradually; it decreases. A maximum solar intensity of 905 watts per square meter was recorded at 1 PM on the day of observation, 16 May 2023. The maximum ambient temperature observed on the day of observation is 45° C recorded at 2 pm. The time lag observed in the increase in ambient temperature relative to solar intensity is due to the thermal capacity of the ambient air. The slope of the solar still is kept at 23° same as the latitude of the local site and the slope of the evacuated tube is kept at 45°. So that the maximum benefit of the incident solar radiation can be obtained in the summer season. Since the difference in relative solar intensity on the still and the collector is minimal, the solar intensity on the still is recorded here.

#### Hourly Change in Upper and Lower Basin Water Temperature

Figure 3 shows the hourly variation in water temperature in the upper basin and lower basin. The double basin solar developed here has an evacuated tube collector attached to the lower basin of still while heat storage material has been added to increase productivity in the upper basin. The slope of the condensing glass cover of the upper basin is kept at 23 ° of the latitude of Ahmedabad of the existing site to make maximum use of the sun's intensity, while the slope of the evacuated tube collector connected to the lower basin is kept at 45 °.During summer experimental work days the evacuated tubes connected to the lower basin receive more solar intensity due to its steeper gradient and hence the water temperature of the lower basin is higher. The maximum recorded water temperatures of 86°C and 80°C for upper and lower basin with gravel as heat storage material in upper basin. While maximum water temperatures for upper and lower basin with pebbles was recorded 89°C and 87°C respectively.

#### Hourly Change in Temperature of Upper and Lower Basin Condensing Cover

Figure 4 shows the hourly variation in temperature of the condensing cover of the upper and lower basins. Maximum condensing cover temperature with gravel is 73 ° C and 83 ° C recorded for upper basin and lower basin respectively on 15 May 2022 at 3 PM. Similarly, the maximum condensing cover temperature with pebbles is 66 ° C and 81 ° C for Upper Basin and Lower Basin respectively on 21 May 2022 at 3 pm. The difference between the temperature of the condensing cover and the temperature of the basin water affects the rate of evaporation, as the difference is greater, the rate of evaporation is higher. Therefore, for greater productivity, the temperature of the condensing cover should be as low as possible and the temperature of the basin water should be as high as possible. The addition of heat storage material to the upper basin not only increases the temperature of the basin water and the condensing cover, but also increases the difference between them, resulting in greater productivity.

#### Hourly Variation of Cumulative Distillate Yield of Upper Basin with Heat Absorbing Material in Upper Basin

Figure 5 depicts the hourly cumulative yield for different water quantities in upper and lower basin of evacuated tube collector connected double basin solar still when gravels or pebbles are added as heat storage material in the upper basin. As the day progresses, the condensing cover with gravels and pebbles in the upper basin and the temperature of the basin water increases. A higher distillate yield is obtained by increasing the rate of evaporation due to lower mass inertia with less water content. In the developed double basin solar still upper basin with gravels added as heat storage material the distillate output of the upper basin is recorded as 4345 milliliters, 4850 milliliters and 5040 milliliters respectively for 30 liters, 23 liters and 16 liters of water. Similarly adding pebbles in the upper basin gives distillate output of 3395 milliliters, 3655 milliliters and 4080 milliliters for 30 liters, 23 liters and 16 liters of water respectively.

#### Cumulative Hourly Distillate Output from Upper and Lower Basins with Heat Storage Material

Figure 6 depicts the hourly cumulative distillate output from the upper and lower basins adding heat storage material to the upper basin. The cumulative hourly distillate output from the upper and lower basin with gravel in the upper basin is 8540 milliliters, 7280 milliliters and 6980 milliliters respectively for 16 liters, 23 liters, 30 liters in the upper basin and 44 liters, 51 liters, 58 liters of water in the lower basin on experimental days from 7.00 AM to 6.00

#### Kamlesh Pansal and Bharat Ramani

PM. Whereas hourly distillate output with pebbles in the basin is 6360 milliliters, 6025 milliliters, and 5505 milliliters. 16 liters, 23 liters, 30 liters in the upper basin and 44 liters, 51 liters, 58 liters of water in the lower basin in lower basin respectively. Adding gravels to the upper basin yields higher distillate output than pebbles because the heat capacity of gravels is higher than that of pebbles. Table 1 shows characteristics of heat storage material.

#### Economic Analysis of a Modified Double Basin Solar Still with Energy-Absorbing Material

It is always desirable that a developed setup is economical. Because of that, an economic analysis for the developed double basin solar still was conducted. Annual cost of developed still was calculated as shown in Table 2. For the calculation of annual cost principal cost, depreciation, sinking fund factor, capital recovery factor interest on invested value was taken in to account. For analysis 20 years of average life span of still was considered. Table 3 shows the payback period of a developed solar still with heat storage material. The payback period was calculated using various cost components, like fabrication price, operating price, maintenance price, feed water price, and subsidies provided by the government. Payback period of 109 days was obtained with developed double basin solar still.

#### **Experimental Uncertainty**

Errors in measured parameters by different instruments are shown in Table 4. Errors of different instruments used in measurement. Uncertainty analysis for solar still area, solar still flow area, temperature different and Distillate output was calculated and shown in Table 5. Suppose a set of measurement is made in order to measure "n" number of experimental variables. These measurements are then used to calculate some required results of experiment (Z). Thus  $Z = Z(X_1, X_2, X_3, \dots, X_n)$ . Let  $U_z$  be the uncertainty in the results and  $U_1, U_2, U_3, \dots, U_n$  be the uncertainty in the independent variables. The uncertainty in results is calculated according to the equation,

$$\mathbf{U}_{\mathbf{z}} = \left[ \left( \frac{\partial \mathbf{Z}}{\partial \mathbf{x}_1} \mathbf{U}_1 \right)^2 + \left( \frac{\partial \mathbf{Z}}{\partial \mathbf{x}_2} \mathbf{U}_2 \right)^2 + \dots + \left( \frac{\partial \mathbf{Z}}{\partial \mathbf{x}_n} \mathbf{U}_n \right)^2 \right]^{\frac{1}{2}} \dots \dots (1)$$

In uncertainty calculation the different parameters like, area of solar still, solar still flow area, temperature difference, distillate output, efficiency are calculated.

Solar still area

$$A = L \times W = 1.365 \times 0.74 = 1 \quad , \frac{\Delta A}{\Delta L} = W = 0.74 \quad , \frac{\Delta A}{\Delta W} = L = 1.365$$

$$\Delta A = \left[ \left( \frac{\Delta A}{\Delta L} \times \delta L \right)^2 + \left( \frac{\Delta A}{\Delta W} \times \delta W \right)^2 \right]^{\frac{1}{2}} = \left[ (0.74 \times 0.001)^2 + (1.365 \times 0.001)^2 \right]^{\frac{1}{2}} = 0.00155 \quad \dots \dots (2)$$

$$\frac{\Delta A}{A} = \frac{0.00155}{1} \times 100 = 0.155 \% \quad \dots \dots (2)$$
Solar still flow area
$$A_F = D \times W = 0.02 \times 0.74 = 0.0148, \quad \frac{\Delta A_F}{\Delta W} = D = 0.02, \quad \frac{\Delta A_F}{\Delta D} = W = 0.74$$

$$\Delta A = \left[ \left( \frac{\Delta A}{\Delta D} \times \delta D \right)^2 + \left( \frac{\Delta A}{\Delta W} \times \delta W \right)^2 \right]^{\frac{1}{2}} = \left[ (0.74 \times 0.001)^2 + (0.02 \times 0.001)^2 \right]^{\frac{1}{2}} = 0.00074$$

$$\frac{\Delta A}{A} = \frac{0.00074}{10.0148} \times 100 = 5\% \qquad \dots \dots (3)$$

Temperature Difference

63052

### Kamlesh Pansal and Bharat Ramani

Output

$$m = \frac{h_{ev} \times \Delta T}{L}$$

It depend on temperature difference only The uncertainty in the out will be 7.0% Radiation

Measurement error in Radiation (I) is 0.025. So it is 2.5%.

### CONCLUSION

- Evacuated tube coupled double basin solar still with black gravel as heat storage material gives 1.23 times more output as compared to pebbles.
- Lower water depth (water quantity) in upper basin yields higher output with heat storage material.
- Cumulative distillate output of 5040 and 4080 ml was obtained from upper basin alone respectively with gravels and pebbles as heat storage material in upper basin for 16 liter Water quantities in upper basin.
- Cumulative distillate output of 8540ml and 6360 ml was obtained from combined upper and lower basin respectively with gravel and pebbles as heat storage material.
- Payback period of the novel double-basin solar still with evacuated tubes was found to be 109 days from life cycle cost analysis.
- Annual cost per liter per square meter was obtained as Rs.0.400728.

### Scope of Future Work

- More energy storage material can be tested with developed solar cells for better yield.
- Phase-change material can also be tested with developed solar stills.
- To improve distillate yield, lower basin fins can be incorporated.
- Further evaluation of performance through energy and exergy analysis can be carried out.

### ABSTRACT

Considering this transformation, a scientometric analysis of the global literature on urban livelihood was conducted in this study. The bibliographic data was gathered through the Web of Science database for 2013 to 2022, and a total of 1961 publications were retrieved. VOS viewer and Bibliometrix R visualization software were used to analyze data and create network maps. The findings revealed the number of papers, the highest number of articles found in 2022 with 351. Among published articles, co-authors' contribution is more significant than that of single authors. Furthermore, the USA was the leading country, with 587 publications on urban livelihood. With 16 publications on urban livelihood, Shackleton CM. was the most prolific author. These findings would benefit researchers worldwide, as scientometric mapping is an exciting method that provides a comprehensive overview of a scientific issue and insights for future research.

Keywords: Urban livelihood; Urbanization; Poverty; Bibliometric; Web of Science

Jiaur Rahaman and Biswajit Das

### INTRODUCTION

Urban livelihood refers to earning a living available to people in urban areas. Urban areas are characterized by high population density, modern infrastructure, and various economic activities. People living in urban areas can engage in multiple forms of livelihood, including formal employment, self-employment, and informal work. Formal employment in urban areas can include working in offices, factories, retail stores, and other businesses. Selfemployment can include owning a small business or operating as a freelancer or independent contractor. Informal work can consist of street vending, domestic work, and other forms of work that are not regulated by formal labour laws. In many urban areas, access to education and specialized skills training can help people find better-paying jobs and improve their livelihoods. Urban areas can also offer greater access to healthcare, social services, and other resources to improve people's quality of life. However, urban livelihoods can also be challenging, as the cost of living in urban areas can be high, and competition for jobs can be intense. Moreover, many urban areas have the inadequate infrastructure, high levels of pollution, and other environmental challenges that can affect people's health and well-being. Scientific research platform databases can be utilized to obtain high-quality scientific results. Databases such as Web of Science, Scopus, Emerald, and CNKI are widely used worldwide because they provide quick access to literature and good tracking of academic frontiers. A well-known and respected large-scale, comprehensive, multidisciplinary, and core journal citation index database is Web of Science. It has a solid reputation in scientific, technological, and educational circles worldwide, with citation index databases like SCIE and SSCI, JCR Journal Citation Reports, and ESI Basic Scientific Indicators. More than 8700 authoritative, high-impact academic journals worldwide covering the natural sciences, engineering, technology, biomedicine, social sciences, arts, and humanities, among other subjects, are available in the Web of Science core collection database.

Bibliometrics is a quantitative analysis technique that uses mathematical and statistical methods to quantify the interactions and effects of publications in particular study disciplines. It helps researchers to express knowledge structures in the research domain, map out detailed knowledge maps, and use statistical and mathematical techniques to investigate its features. It offers a macro-overview of scholarly research and accurately identifies significant authors, journals, organizations, and countries. It also functions as a potent instrument to examine the subject of knowledge and reveal its knowledge structure. CiteSpace, VOSviewer, and Bibexcel are three software programmes for measuring and evaluating scientific literature data that have been used widely in global information science due to their advantages in theory and practice. Therefore, the research results of using bibliometric analysis to study urban livelihood are scarce, and no research has explored the dynamic evolutionary path of the research theme in the field of urban livelihood. In view of this, this paper takes the literature on urban expansion in the core collection database of Web of Science as the research object and uses the scientific analysis tool Bibliometrix and VOS viewer to visually analyze the themes of urban livelihood research and its evolutionary path from 2013 to 2022.

#### Objectives

- How many publications are produced per year on urban livelihood?
- What Is the collaboration between and affiliations countries on this issue?
- What are the journals that publish the most in this area?
- What are the most relevant author's keywords to urban livelihood?

### LITERATURE REVIEW

Several researchers have reviewed studies on urban land and land management (Kim et al., 2020; Hanaček & Rodríguez-Labajos, 2018) and performed bibliometric analyses of land use, land consolidation, land cover, and other related research by using large-scale data sets and bibliometric methods (Xie, Zhang, Zeng, et al., 2020; Xu et al., 2022), with valuable results. However, so far, relevant studies on urban land management are scarce, and most studies in land management have focused on rural land, specific countries or regions, or a single disciplinary perspective (Xianchun & Zhuoran, 2012; Xiandong et al., 2022).

### Jiaur Rahaman and Biswajit Das

### METHODOLOGY

The bibliographic data for the present study were collected on 23 February 2023, from the Web of Science (WoS) Core Collection database, including indices of SCIE, SSCI, and A&HCI, provided by Clarivate within the indexed timespan from 2013 to 2022. Using the topic keyword "urban livelihood" (the topic keywords are generated by Clarivate from the title, abstract, author keywords, and Keywords Plus). The search was set to all languages and all documents type. The researcher obtained a total of 1961 publications in the (WoS). Each document's full record and cited references are exported for the bibliometric analysis. The downloaded data were saved in plain text format. The scientific analysis Bibliometrix and VOS viewer tools to visually analyze the themes of urban livelihood research

### RESULTS

### Finding of the Annual Publication Volume

As shown in Table 1, from 2013 to 2022, 1961 articles have been published in this specific field of urban livelihood. The number of published research reports in urban livelihood areas generally increased during the study period. The period from 2013 to 2022 was the development period, in which the number of published articles increased steadily. The literature on urban livelihood grew slowly from 2013 to 2016. It can be seen that the largest number of articles was found in 2022 with 351 articles (17.90%), while in 2013 found the lowest number of articles with 96 (4.90%) during the study period.

#### **Active Authors**

Highly cited authors serve as role models for researchers in this subject and indicate the pinnacles of local or national knowledge innovation. High citation counts indicate that the study findings of the authors were, at least temporarily, extensively acknowledged, inherited, and developed by other scholars. Table 2 shows 10 active authors in this field, including statistical data on the number of documents published per year by each and total citations each year. A total of 6314 authors contributed to the field of urban livelihood during the studied period, with Pradhan, Shackleton CM, Turner S, and Gibbs A being the first three authors, publishing 16, 9, and 8 articles, respectively. The importance of authors and the impact of all research contributions are frequently assessed using the h-index. Shackleton CM has the largest received score found citations and h-index.

#### **Active Sources**

From the journals referenced in this paper, urban livelihood was mainly published on Sustainability, and a total of 105 articles were published from 632 journals (see Table 3). The top five journals were Sustainability, Land Use Policy, World Development, Journal of Rural Studies, and Land, which included more than 256 publications. From the content of the articles published in the journals, the research in urban livelihood mainly focused on landscape, economy and environmental pollution, followed by geography. Journal of Rural Studies has the largest number of citations found with 744 from 35 publications, but it has ranked fourth among the top ten journals.

#### **Active Affiliations**

Since 2013, 1574 institutions have engaged in the study of urban livelihood. Table 4 details the top 10 high-yield institutions according to the number of publications, of which three are from South Africa. The University of Witwatersrand ranked first in the number of papers (38), the second was the University of Ghana (33), and third were the National University of Singapore and the University of Copenhagen (27). Table 4 shows South Africa was the dominant country, but the seven countries found single institutions.

#### **Active Countries**

Researchers have published papers from 113 countries (counting only the corresponding author's country) since 2013, and this number reaches 113 if co-authors are considered. Table 5 depicts the countries with the highest result

### Jiaur Rahaman and Biswajit Das

based on the frequency distribution of the corresponding author's affiliation country. The USA is leading with 587 papers, followed by China (457 papers) and the United Kingdom (408 papers).

The Figure 1 shows that the number of collaborators with China is 44 and the total link strength is 269. The main partners of were USA, China, and England and Germany. Five clusters of the countries of co-authorship were obtained by bibliometric analysis using the VOS viewer tool. The top three clusters represent the research fields of urban livelihood which are shown in the colour of red, green and blue. The two biggest nodes of countries include the USA and England.

#### Author's Keyword Analysis

Table 5 shows that the network map of the trend topics according to the author keywords used from 2013 to 2022. The size of the circles indicates how frequently the terms appear. The separation between the two circles shows the link between them. A keyword co-occurrence analysis (Figure 1) using the VOS viewer tool provides a co-occurrence network picture of the keyword universe and a much deeper understanding of the interaction dynamics of the field of urban livelihood. The keyword co-occurrence network in this study described five clusters. The largest nodes were Livelihoods, Poverty, Urbanization, and Urban with 155, 106, and 102 occurrences used by the authors found during the study period.

### CONCLUSION

Urban livelihood refers to earning a livelihood in a city or town. Urban livelihoods are characterized by a diverse range of activities, including formal employment in industries, services, and government and everyday work in the informal sector. A total of 1961 papers from our present study that were indexed in the WoS core database and discussed urban livelihood were examined. These results provide a rich source of information on the intellectual structure of the chosen domain of urban livelihood. Using the bibliometrix R-package and VOS viewer, the bibliometric analysis results allowed for network analysis, co-authorship of countries and keyword analysis.Overall, 113 countries around the world contributed to the field of urban livelihood. Among them, South Africa and China published the most outstanding research papers. Based on journal, Sustainability has most produced the research output. More and more scholarly papers are being produced as the pandemic spreads. It is especially crucial to assess the quality of such a large number of research articles and gather valuable data. These findings would benefit researchers worldwide, as scientometric mapping is an exciting method that provides a comprehensive overview of a scientific issue and insights for future research.

### ABSTRACT

In this paper, we introduce the Taylor series as an accessible and valuable mathematical tool for solving nonlinear equations. Specifically, we propose the utilization of the Taylor series method to find solutions for systems of equations of the Lane-Emden type. Comparing it with the exact solution reveals a significant improvement in convergence speed, demonstrating the method's effectiveness and ease of implementation.

Keywords: Taylor Series, Lane-Emden Equations, Analytical Method, Convergence, Maclaurin's Series.

### INTRODUCTION

Poisson's equation is an elliptic partial differential equation that finds extensive application in theoretical physics. It plays a crucial role in various scenarios, such as determining the potential field resulting from an electric charge or a mass density distribution. By solving Poisson's equation, one can effectively calculate the forces associated with the given charge or mass density distribution. In the realm of Astrophysics, the Lane-Emden equation, a dimensionless form of Poisson's equation, aids in obtaining the gravitational potential of a Newtonian self-gravitating, spherically polytrophic field. This equation proves particularly valuable for analysing gravitational interactions within astrophysical systems. The Lane-Emden equation plays a vital role in the fields of chemistry, physics, and astronomy [1-4]. According to the report, the Lane-Emden equation can be used to model a reaction–diffusion process, and its analytical solution has the potential to optimize the process [5]. However, due to its singular nature, finding an analytical solution for this equation can be challenging. Nevertheless, there exist several analytical methods for

### Yugesh et al.,

addressing singular boundary value problems [6–11]. Even the Adomian Decomposition Method (ADM), which is a very effective approach for solving broad classes of nonlinear partial and ordinary differential equations with important applications in different fields of applied mathematics, engineering, physics, and biology, is not very effective in solving the Lane-Emden type system of equations due to its singular behaviour at the origin. It involves finding a corresponding Volterra integral form for the given system and is subject to a complicated n-fold integration, which makes it a little difficult to solve Lane-Emden type equations. In this study, we apply the Taylor series method to solve the general Lane-Emden type of differential equations, which are commonly used for modelling and addressing various physical and astrophysical problems.

Therefore, our proposal is to employ the Taylor Series Expansion technique as a solution method for the Lane-Emden type system of equations. This highly effective technique enables the equation to be solved without the need for intricate ADM procedures, relying solely on the utilization of initial conditions.

#### **Taylor Series Solution**

In this paper, we consider the following system of Lane–Emden type equations,
$u'' + \frac{\lambda_1}{x}u' + f_1(u, v) = 0(eq. 1)$
$v'' + \frac{\lambda_2}{x}v' + f_2(u,v) = 0(eq. 2)$
Subject to initial conditions
$u(0) = \alpha$ ; $v(0) = 0$
$u'(0) = \beta$ ; $v'(0) = 0$
Multiplying (eq. 1) and (eq. 2) with x, we get
$xu'' + \lambda_1 u' + xf_1(u, v) = 0(eq. 3)$
$xv'' + \lambda_2 v' + xf_2(u, v) = 0(eq. 4)$
Differentiating (eq. 3) and (eq. 4) with respect to x, we get
$xu^{''} + (1 + \lambda_1)u^{''} + xf_1^{'}(u, v) + f_1(u, v) = 0(eq. 5)$
$xv''' + (1 + \lambda_2)v'' + xf_2'(u, v) + f_2(u, v) = 0(eq. 6)$
Substituting x for 0 in (eq. 5) and (eq. 6), we get
$(1 + \lambda_1)u''(0) + f_1(u, v) = 0(eq. 7)$
$(1 + \lambda_2)v''(0) + f_2(u, v) = 0(eq. 8)$
Hence, we get
$u''(0) = -\frac{f_1(u,v)}{1+\lambda_1}$
$v''(0) = -\frac{f_2(u,v)}{1+\lambda_2}$
1 + 72
Differentiating (eq. 5) and (eq. 6) with respect to x, we get $(n + (2 + 1))$
$xu'^{v} + (2 + \lambda_{1})u''' + xf_{1}''(u, v) + 2f_{1}'(u, v) = 0(eq. 9)$
$xu'^{v} + (2 + \lambda_2)v''' + xf_2''(u,v) + 2f_2(u,v) = 0(eq. 10)$
Substituting x for 0 in (eq. 9) and (eq. 10), we get
$(2 + \lambda_1)u'''(0) + 2f_1(u, v) = 0(eq. 11)$
$(2 + \lambda_2)v^{\prime\prime\prime}(0) + 2f_2(u, v) = 0(eq. 12)$
Which yields
$2f_{1}(u,v) = 2f_{1}(u,v)$

$$u^{'''}(0) = -\frac{2f_1(u,v)}{2+\lambda_1}$$
$$v^{'''}(0) = -\frac{2f_2(u,v)}{2+\lambda_2}$$

Yugesh et	al.,
-----------	------

Differentiating (eq. 9) and (eq. 10) with respect to x, we get  $xu^{v} + (3 + \lambda_{1})u^{v} + xf_{1}^{'''}(u,v) + 2f_{1}^{''}(u,v) = 0.....(eq. 13)$  $xv^{v} + (3 + \lambda_{2})u^{'v} + xf_{2}^{'''}(u,v) + 2f_{2}^{''}(u,v) = 0.....(eq. 14)$ Substituting x for 0 in (eq. 11) and (eq. 12), we get  $(3 + \lambda_1)u'^v(0) + 2f_1''(u, v) = 0....(eq. 15)$  $(3 + \lambda_2)u'^v(0) + 2f_2''(u, v) = 0....(eq. 16)$ Which yields us

$$u^{'v}(0) = -\frac{3f_1^{''}(u,v)}{3+\lambda_1}$$
$$u^{'v}(0) = -\frac{3f_2^{''}(u,v)}{3+\lambda_2}$$

Repeating this process of differentiation and substitution (k+1) times, we get  $xu^{k+1'} + (k-1+\lambda_1)u^{k'} + xf_1^{k-1'}(u,v) + 2f_1^{k-2'}(u,v) = 0.....(eq. 17)$  $xv^{k+1'} + (k-1+\lambda_2)v^{k'} + xf_2^{k-1'}(u,v) + 2f_2^{k-2'}(u,v) = 0....(eq. 18)$ 

Which yields us,

$$u^{k'}(0) = -\frac{(k-1)f_1^{k-2'}(u,v)}{(k-1+\lambda_1)}$$
$$v^{k'}(0) = -\frac{(k-1)f_2^{k-2'}(u,v)}{(k-1+\lambda_2)}$$

Using Taylor series expansion- Maclaurin series general formula

$$f(x) = \sum_{n=0}^{\infty} f^{n'}(0) \frac{x^n}{n!}$$

Thus the functions u and v can be expanded as

$$u(x) = u(0) + \frac{x}{1!}u'(0) + \frac{x^2}{2!}u''(0) + \frac{x^3}{3!}u'''(0) + \frac{x^4}{4!}u'v(0) + \cdots$$
$$v(x) = v(0) + \frac{x}{1!}v'(0) + \frac{x^2}{2!}v''(0) + \frac{x^3}{3!}v'''(0) + \frac{x^4}{4!}v'v(0) + \cdots$$

Which yields us

$$u(x) = \alpha + 0 + \frac{x^2}{2!}u''(0) + \frac{x^3}{3!}u'''(0) + \frac{x^4}{4!}u'v(0) + \cdots$$
$$v(x) = \beta + 0 + \frac{x^2}{2!}v''(0) + \frac{x^3}{3!}v'''(0) + \frac{x^4}{4!}v'v(0) + \cdots$$
Which can be simplified as,

$$u(x) = \alpha + \sum_{n=2}^{\infty} \frac{x^n}{n!} \frac{(1-n) \left( f^{n'}(u,v) \right)}{(n-1+\lambda_1)}$$

$$v(x) = \beta + \sum_{n=2}^{\infty} \frac{x^n}{n!} \frac{(1-n)\left(f^{n'}(u,v)\right)}{(n-1+\lambda_2)}$$

Example:

$$u'' + \frac{1}{x}u' - 8(e^u - 2e^{2v}) = 0$$
 .....(eq. 1)

	Yugesh et al.,
	$v'' + \frac{2}{x}v' + 2(e^v - 2e^u) = 0$ (eq. 2)
u(0) = 0	to the initial conditions 0 ; $v(0) = 0$ 0 ; $v'(0) = 0$
xu'' + u	ying (eq. 1) and (eq. 2) with x, we get $(-8x(e^u - 2e^{2v})) = 0$ (eq. 3) $v' + 2x(e^v - 2e^u) = 0$ (eq. 4)
xu''' + 2	tiating (eq. 3) and (eq. 4) with respect to x, we get $2u'' - 8(e^u - 2e^{2v}) - 8x(e^u u' - 4e^{2v}v') = 0(eq. 5)$ $8v'' + 2(e^v - 2e^u) + 2x(e^v v' - 2e^u u') = 0(eq. 6)$
2u <sup>''</sup> (0) - 3v <sup>''</sup> (0) + (eq. 7) a	atting x for 0 in (eq. 5) and (eq. 6), we get $-8(e^0 - 2e^0) = 0(eq. 7)$ $+2(e^0 - 2e^0) = 0(eq. 8)$ nd (eq. 8) yields us -4 ; v''(0) = -2
	ntiating (eq. 5) and (eq. 6) with respect to x, we get $8u''' - 16(e^u u' - 4e^{2v} v') - 8x(e^u (u')^2 + e^u u'' - 8e^{2v} (v')^2 - 4e^{2v} v) =$
	(eq. 9) $+v''' + 4(e^{v}v' + 2e^{u}u') + 2x(e^{v}(v')^{2} + e^{v}v'' + 2e^{u}(u')^{2} + 2e^{u}u'') = 0(eq. 10)$
3u'''(0) 4v'''(0)	ating x for 0 in (eq. 9) and (eq. 10), we get = 0(eq. 11) = 0(eq. 12) and (eq. 12) yields us
u''' (0)	= 0 ; v'''(0) = 0
	ntiating (eq. 9) and (eq. 10) with respect to x, we get $u'v - 24\left(e^u(u')^2 + e^uu'' - 8e^{2v}(v')^2 - 4e^{2v}v''\right) - 8x\left(e^u(u')^3 + u'' + e^uu''' - 16e^{2v}(v')^3 - 24e^{2v}v'v'' - 16e^{2v}v'v''\right)$
4e2vv''	′ <i>=0</i> (eq. 13)
$xe^{v} + 5i$	$v'^{v} + 6\left(e^{v}(v')^{2} + e^{v}v'' + 2e^{u}(u')^{2} + 2e^{u}u''\right) + 2x\left(e^{v}(v')^{3} + 3e^{v}v'v'' + e^{v}v''' + 2e^{u}(u')^{3} + 6e^{u}u'u'' + 2e^{u}(u')^{2}\right) + 2e^{u}(u')^{2} + 2e^{u}(u$
2euu'''=	=0(eq. 14)

Substituting x for 0 in (eq. 13) and (eq. 14), we get	
$4u'v(0) - 24(e^0u''(0) - 4e^0v''(0)) = 0(eq. 1)$	15)
$5v'v(0) + 6(e^0v''(0) + 2e^0u''(0)) = 0(eq.$	16)

### Yugesh et al.,

Which yields us,

 $u^{v}(0) = 24$  ;  $v^{v}(0) = 12$ 

Using Taylor series expansion- Maclaurin series general formula

$$f(x) = \sum_{n=0}^{\infty} f^{n'}(0) \frac{x^n}{n!}$$

Thus the functions u and v can be expanded as

$$u(x) = u(0) + \frac{x}{1!}u'(0) + \frac{x^2}{2!}u''(0) + \frac{x^3}{3!}u'''(0) + \frac{x^4}{4!}u'v(0) + \cdots$$
$$v(x) = v(0) + \frac{x}{1!}v'(0) + \frac{x^2}{2!}v''(0) + \frac{x^3}{3!}v'''(0) + \frac{x^4}{4!}v'v(0) + \cdots$$

Which yields us

$$u(x) = (0) + x(0) + \frac{x^2}{2!}(-4) + \frac{x^3}{3!}(0) + \frac{x^4}{4!}(24) + \cdots$$
  

$$v(x) = (0) + x(0) + \frac{x^2}{2!}(-2) + \frac{x^3}{3!}(0) + \frac{x^4}{4!}(12) + \cdots$$
  
Hence, we get  

$$u(x) = -2x^2 + x^4 + \cdots$$
  

$$v(x) = -x^2 + \frac{x^4}{2} + \cdots$$

By comparing this expansion with standard expansions, we get

$$ln(1+x^2) = x^2 - \frac{1}{2}x^4 + \frac{1}{3}x^6 - \frac{1}{4}x^8 + \frac{1}{5}x^{10} \dots$$

$$u(x) = -2ln(1 + x^{2})$$
  

$$v(x) = -ln(1 + x^{2})$$
  
CONCLUSION

This paper proposes a straightforward approach to tackling the Lane–Emden equation, which can be extended to encompass various differential equations with initial conditions and fractional calculus [13, 14]. In comparison to other analytical methods, the Taylor series method offers a simple solution process and yields accurate results. One notable advantage of employing the Taylor series method is its ability to avoid generating redundant terms, ensuring convergence towards the exact solution.

### ACKNOWLEDGEMENT

The authors would like to thanks the management of Sri Sivasubramaniya Nadar College of Engineering for providing research facilities and encouragements to carry out this research work.

### ABSTRACT

Polymer nanocomposites containing metal oxide nanomaterials constitutes new class of polymeric materials finds many applications. Matrix mixing of polymer and metal oxide responses the additional properties in the composite polymer in comparison with plain polymer. The present experimental results are reporting the synthesis of nickel titanate (NiTiO<sub>3</sub>) nanomaterials bycombustion reaction route using polymer as a fuel. Dispersion of NiTiO<sub>3</sub> in To Poly (vinyl alcohol)(PVA) matrix yields poly (vinyl chloride) nanocomposite (PVA/NiTiO<sub>3</sub>) by solvent casting method. Prepared products like NiTiO<sub>3</sub> and PVA/NiTiO<sub>3</sub> composite materials are well characterised for its structure, morphology and bonding by use of X-ray diffraction (XRD), Scanning Electron microscope (SEM) and Fourier transfer infrared (FT-IR) tools respectively. Size of the particles and morphology are well studied by TEM study. Thermogravimetric (TGA) analysis is carried out for the prepared composite sample to know its thermal behaviour.

Keywords:NiTiO<sub>3</sub>, PEG, PVA, PVA/NiTiO<sub>3</sub>, FT-IR, XRD, TEM, TGA

#### INTRODUCTION

Recent researchers are attracted much for the bimetallic oxide materials containing titanium metal due to its various applications especially in field of electronics. [1-2],these oxide materials constitute special structural arrangements leads designed materials for specified applications. Particle size of the oxide materials are counts for its applicable oriented properties well asits stability[3].The development of special properties in the oxide materials is due its structural response and also its stability. Bimetallic oxides containing titanium metal play a vital role and integrate science and technology in terms of its applications. Nickel titanate oxide materials are known for photorefractive, semi-conductive and ferroelectric properties. Hence it finds more applications in the field of electronics [4-5]. It has been studied extensively for more and suitable applications to solve the societal applications.In addition, this material is renaming as a microwave ceramic owing to its dielectric response in the microwave spectrum. Further, the catalytic activity and dynamic efficiency of nickel titanate oxide have been researched in solving environmental issues [6-7].

Nickel titanate oxide was successfully synthesized various methods in which combustion method finds simplicity and yields desirable product. This method also finds a simple way to control particles size [8]. The ceramics materials have exhibited high density, uniform grain growth and homogeneous. Polymers may be considered as a fuel for the combustion reaction leads phase formed product. Self-propagating combustion reaction takes place in presence of a polymer fuel [9-10]. Inorganic nanoscale bimetallic oxides dispersed in the matrix of polymeric materials constitute new class of materials leads various applications [11]. Polymer nanocomposite formed by dispersion of nickel titanate in polymer matrix constitutes new designed composite materialsfor specialised applications[12]. Dispersion of nanosized NiTiO<sub>3</sub> inPoly(vinyl alcohol) formspolymer composite material showsenhanced thermal stability and are easy to produce. It also shows good chemical and physical properties which responses broad applications in various fields [13]. The incorporation of NiTiO<sub>3</sub> into the poly(vinyl alcohol) matrix has significantly enhanced the properties and applicationsin comparisonwith pure PVA. Recently membranes based on PVA have received considerable attention by the researchers due to its non-toxicity, good film-forming ability, low cost, good mechanical strength and chemical stability. [14-17]. Present investigation is the synthesis of NiTiO3-PVA composite materials by self-propagating combustion route. Further, incorporation of NiTiO<sub>3</sub> into the PVA matrix has been carried out by solvent casting method. Various characterisation and properties of the said materials is undertaken.

## MATERIALS AND METHODS

Analytical grade (AR grade) chemicals are used in the research experimentand werereceived from Sigma Aldrich. Combustion method was used for the preparation of nickel titanate and solvent casting method was adopted for the synthesis of PVA/NiTiO<sub>3</sub> nanocomposite film.

#### Synthesis of NiO and TiO2nanoparticles

Usually Metal salts are used for the synthesis of respective metal oxides by combustion route. Nickel salt like nickel chloridewasgrinded with PEG in the weight ratio 1:5 and grounded well in separate mortar. Furtherproduct was grinded well for proper mixed product and is transferred into china dish. The reaction mixture was initially heated in airatmosphere to complete the carbonaceousflame leads tonoon sooty flame. This pre product was transferred into a silica crucible and is ignited at 1000°C in muffle furnace. Combustion reaction shows the melting of PEG, then frothed and finally formsa crystalline nickeloxide sample. Cool the product to room temperature gives oxide residue as nickeloxide sample. Similar procedure is used for the synthesis of Titanium dioxide(TiO<sub>2</sub>) by use of titanium salt [18-21].

#### Anadure Anilkumar et al.,

#### Synthesis of Nickel titanate

Weigh accuratelynickeloxide, titanium oxide and PEG in the ratio 1:1:5 and grounded well in a pestle and mortar for through mixing. The resulting mixture isignited in a specialised chaina dish in an open atmosphere to form pre product. Initially it burns with carbonaceous fumes and after sometimesit completes evolution of such fumes. Further, this pre product is burnt completely in a silica crucible at 1200°C. Combustion process showingthat, initially PEG melted, then frothed and finally yieldsnickel titanate as a final product [22]. The obtained final product is as given in figure 1 and its synthetic scheme is given in scheme-1. The possible reaction involved is given below

#### Synthesis of PVA/NiTiO<sub>3</sub> composite film

2g of PVA polymer is dissolved in 15ml water solvent stir the solution to form jelly solution. 0.1g of as prepared nickel titanate was mixed thoroughly by constant stirring and was poured into the petridish uniformly, cooled under room temperature until solvent evaporated to form fine oxide dispersed PVA/NiTiO<sub>3</sub> composite which was well characterized by characterisation techniques.

## **RESULTS AND DISCUSSION**

#### XRD Study

The structural confirmation of the combustion derived NiTiO<sub>3</sub>nanoparticles and its PVA nanocomposite film samples were carried out by X-ray diffraction (XRD) study.XRD pattern of NiTiO<sub>3</sub> nanomaterials sample is given in figure 2. The pattern shows various Bragg's reflections due to crystalline nature with rhombohedral structure. Obtainedd-spacing values of the sample matches well with33-960JCPDS file of NiTiO<sub>3</sub> nanomaterials. Comparison of the observed and literature XRD data clearly indicating that, the sample confirms the formation of NiTiO<sub>3</sub> phase. The crystallinity and phase formation of the synthesized PVA/NiTiO<sub>3</sub> sample were again examined by XRD analysis. XRD pattern of solvent casted PVA/ CaTiO<sub>3</sub> nanocompoiste film sample is given in figure 3. The said pattern shows the limited Bragg's reflections due to the reduction of crystallinity as compared to pure oxide. This change is due masked oxide materials in the poly (vinyl alcohol) matrix. Further, the traced crystallinity in the PVA is due to matrixes of NiTiO<sub>3</sub> nanomaterial. The appearance of NiTiO<sub>3</sub> reflections in the PVA composite sample (peaks are indexed) and slightly shift in the reflections confirms the formation of PVA/NiTiO<sub>3</sub> nanocompoiste.

#### FT-IR Study

As formed nanocomposite was well confirmed by the appearance of vibrations in infrared spectrum. Figure-4 shows FT-IR spectrum of as prepared PVA/NiTiO<sub>3</sub> nanocomposite sample. A broad band at 3300 cm<sup>-1</sup> may be due the presence moisture content in the sample. Bands in the region 1000-1200cm<sup>-1</sup> are due to the plane bending vibration of C-H mode. The band at 850 cm<sup>-1</sup> originates out of plane C-H bending vibration. The spectrum of the polymer composites shows a peak at 550cm<sup>-1</sup> which are attributed due to the presence of nickel titanate sample in the poly (vinyl) nanocomposite [23].

#### SEM Study

Surface morphology of the polymer nanocomposite samples were well studied by SEM analysis. The SEM image of as prepared PVA/NiTiO<sub>3</sub> nanocomposite film is given in figure 5.The image is reflecting the spherical particles due to the presence of crystalline nature of the composite sample and also observed the self-assembly of different shaped particles in the image. Further, most of the particle grouping with self-doping can also observed in the composite image. Possibly some particles masked in the PVA matrix which may reduce the crystallinity of dispersed oxide sample also increases the crystallinity of the amorphous PVA.

#### Anadure Anilkumar et al.,

#### TEM Study

Transmission electron microscope is used to study the particle morphology and particle size of the PVA/NiTiO<sub>3</sub>nanocomposite film and is given in figure-6.The image showing the semi crystalline morphology with well-defined irregular particles and are within the nano range (100nm). Most of the nickel titanate nanomaterials are damasked and well dispersed in poly (vinyl alcohol) matrix. Some particles are masked in polyvinyl alcohol matrix which reduces the crystallinity of the pure oxide sample. Polymer streaks with bimetallic oxide sample further confirms the formation of nanocomposite film.

#### Thermal Study

Thermal behavior of the as synthesized polymer composite was studied by thermo- gravimetric analysis (TGA). Figure 7 shows the TGA trace of as prepared PVA/NiTiO<sub>3</sub> nanocompoiste film. The thermal trace shows the degradation of PVA occurs at 300°C with the initial weight loss at lesser temperature indicates the release of water moiety of the sample. Weight loss occurring around 300°C to 550°C is due to the decomposition of the polymer sample due to strong interaction between nickel titanate and poly (vinyl alcohol).

## CONCLUSIONS

PVA-NiTiO<sub>3</sub> nanocomposite was prepared successfully by solvent catting method and developed crystallinity in plain PVA was confirmed by XRD tool. Interaction between oxide nanomaterials and PVA was well studied by FT-IR tool instrumentation. TEM and SEM study reviles the applicable morphology and particle size of the prepared sample. Thermal stability of the composite film is confirmed by thermal gravimetric technique.

## ACKNOWLEDGEMENTS

Thanks are due to Principal, Bheemanna Khandre Institute of Technology, Bhalki for providing laboratory facility. Principal, Bhoomaraddi Science College, Bidar is highly acknowledged for constant support. Thanks are also due to the Chairman, Department of Materials Science, Gulbarga University, Kalaburagi, Karnataka, India for additional laboratory facility.

## ABSTRACT

Kyasanur Forest Disease is generally known as Monkey fever, this is a unique disease that araised in the western ghats of India. The pathogen for this fever is KFD virus, an Arbovirus belongs to Flaviviridae family. Machupo virus is the causative agent for Bolivian Hemorrhagic Fever and it belongs to the family of Arenaviridae. Crimean -Congo Hemorrhagic Fever is one of the fastest spread tick borne infections of human beings, spreaded from west China to south Asia to Europe and African countries. Mainly 2 epidemics had led to the identification of these viruses. Initial outbreak was seen in Korean War that occurred in between 1950-1953. Marburg virus was 1st identified in Aug, 1967. Marburg virus was named with the city where most of the infections were reported. Rabies belongs to the Lyssavirus genus and Rhabdoviridae family. It is fatal and neurological infection that effects all the warm blooded organisms. The human immunodeficiency virus (HIV) causes a medical illness in human beings called as acquired immunodeficiency syndrome. Smallpox infection is unique to humans, which is caused by a poxvirus. It is among the high fatal diseases. Influenza viruses are the main pathogens which are responsible for respiratory tract infections in humans, birds, and all other mammals. Rota In the world the most common diarrheal pathogen that affects children is rotavirus.

Keywords: Machupo, Marburg, Rabies , human, Influenza, viruses.

## INTRODUCTION

Viruses come under submicroscopic infectious pathogenic agents. The replication of Viruses takes place only inside the cells of living organisms known as hosts[1]. The genome of these microbes consists of a segment DNA/RNA surrounded by a protein coat. Nucleic acid present is DNA/RNA type[2]. The virus cannot replicate on its own; it has to infect a host cell to make its replicas. In this process they cause damage and death of the host cell. Viruses can infect all organisms, including animals, plants and microorganisms. Viruses can be found everywhere where life exists and probably these are the first living cells that have evolved[3]. They does not possess its own metabolism so it definitely depends upon host to produce their replicas. Virus are smaller than bacteria and displays a huge diversity of their morphologies. Fully completed virus is called as Virion and it is encapped with a protein coat of known as Capsid[4]. Virus is a cellular in nature and they use hosts to make their copies [5]. They utilize the main pathway mechanisms of hosts for its replication, these are very tough to kill by using drugs, without any unwanted effects on the host cell. The best possible medical path for treating the infections of virus is by vaccinations. It is also necessary to know the molecular structures, cell functions and its biology. These are also useful for studying genetics and its molecular mechanisms like replication of DNA, translation, processing of RNA, transcription, transportation of proteins and its immunological studies[6].

#### **KYASANUR FOREST VIRUS**

#### INTRODUCTION

Kyasanur Forest Disease is generally known as Monkey fever, this is a unique disease that araised in the western ghats of India. The pathogen for this fever is KFD virus, an Arbovirus belongs to Flaviviridae family[7]. This is highly contaginous and it is a tick borne virus. This virus is responsible for human and animal illness. There is a chance that this virus can be transmitted through faecal matter but mainly by tick bites. Causative organism for this virus transmission is H. Spinigera, a multi host species of tick common in India and Sri Lankan countries[8].

#### CHARACTERISTICS

The genome is a positive sense, single stranded RNA. This is spherical in nature and about 40–65nm. Virus is encapsulated with a regular polyhedron nucleocapsid. The genomic is same as cellular mRNA except a poly–adenylated tail. The origin for its multiplication is cytoplasm of infected host cells [9]. The genome of the virus has 10774 nucleotides which are single stranded and positive sense RNA. They are surrounded with a single polyprotein that is cleaved into three structural and seven non-structural proteins[10].

#### TRANSMISSION

Transmission is mainly by the infected tick bites. Direct animal to human transmission is possible. It is also spreads by the infected animals to humans through their bites, flesh, body fluids and also by excreta.

#### SYMPTOMS

- This ispresymptomatic for about 2 to 7 days after the tick bite.
- The clinical symptoms included are high fever, chills, sore throat, frontal headache, muscle aches and severe prostration[11].
- Other symptoms are myalgia, headache, Vomiting, diarrhea[12], gastrointestinal and lymphoid lesions[13].
- Red eyes, Bloody nose, joint pain, intestinal hemorrhage, skin petechiae are also seen in the infected patients.

#### Galanki Vasantha et al.,

#### MACHUPO VIRUS

#### INTRODUCTION

This virus is the causative agent for Bolivian Hemorrhagic Fever[14] and it belongs to the family of Arenaviridae[15]. BHF is initially identified in humans of northeast Bolivia during an outbreak which lasted from 1959 to 1963. Machupo virus has a mortality rate of 25–35%. The main reservoir and vector for this virus is a rodent known as Calomyscallosus[16].

#### CHARACTERISTICS

The genome includes 2 negative stranded RNA segments encodes with 4 virulent proteins: a huge RNA dependent RNA polymerase, a matrix protein, a RNA-binding nucleoprotein and glycoprotein precursor. The entire genome is encapsulated with nucleoprotein subunits and these are surrounded by a bi-lipid layer and with matured viral glycoproteins that forms the Virion[17].

(A) Genomic structure and the stages of transcription and replication process of the infection cycle.

(B) Linear map (Machupovirus L protein).

#### TRANSMISSION

This virus can be transmitted by various routes, mainly carried by air so this transmission is mainly aerosolized. Transmission is by direct or indirect contact with the infected person. The infection can also be spread by the contamination of food with the infected virus particles.

#### SYMPTOMS

The symptoms that are seen in the patients are as follows[18]. Initially after 1 to 5 of infection: high fever, leukopenia, nausea, thrombocytopenia, increased protein count in urine, headache, fatigue, myalgia, cough and dehydration are seen. Within 10 days of infection chills, low blood pressure, mucosal bleeds, petechiae, tremors, muscle pains, confusion and coma are seen.

#### CRIMEAN CONGO VIRUS

#### INTRODUCTION

Crimean -Congo Hemorrhagic Fever is one of the fastest spread tick borne infections of human beings, spreaded from west China to south Asia to Europe and African countries. This virus was primarily discovered in Crimean region of the former Soviet Union, 1944[19]. During 1944 to 1945, a huge endemic was occurred with a mortality rate of 10 percent in the region of Crimean Peninsula [20].

#### CHARACTERISTICS

This virus falls under Bunyaviridae family with full of tick borne virus [21]. These virions are spherical in shape and it is approximately 100 nm in diameter. The genome is a negative sense and single stranded RNA with three segments designed as small, medium and large with respective on their size[22].

#### TRANSMISSION

The transmission of this virus takes place by infected tick bites, infected animal blood and excreta. Transmission is by both wild and domestic animals which are infected by the virus[23].

#### SYMPTOMS

Common symptoms are malaise, myalgia, and often gastrointestinal distress[24]. Disseminated intravascular coagulopathy, shock, and Multi-organ failure are reported[25]. Liver failure, internal bleeding, rashes, nose and gum bleeds are also seen in severe cases.

#### Galanki Vasantha et al.,

#### HANTAVIRUS INTRODUCTION

Mainly 2 epidemics had led to the identification of these viruses. Initial outbreak was seen in Korean War that occurred in between 1950-1953. Approximately over 3000 US troops were infected with this virus. And the next epidemic was seen in US, 1993. This was primarily named as Four corners disease, now it is referred to as Hantavirus Pulmonary Syndrome or Hantavirus Cardio-pulmonary Syndrome. Hantaviruses belong to the family of Bunyaviridae [26]. Murid rodents are the natural reservoirs for this virus.

#### CHARACTERISTICS

The viruses are encapsulated with genome of 3 single stranded RNA segments that are designed as large, medium and small. The genomes of these viruses are surrounded with a negative complementary senses[27].

#### TRANSMISSION

In contrast to other Bunyaviridae family viruses, the transmission is not by an arthropod vectors, this is carried to humans by an infected rodents or by insectivore hosts or by the infected bats [28].

#### SYMPTOMS

- → The early symptoms that are seen in the infected persons are weakness, nausea, and muscle aches. The muscle aches are seen mainly in the areas like especially muscles, thighs, back, knees and shoulders. Headaches, dizziness, chills, stomach issues, vomiting, diarrhea, and abdominal pain are also seen.
- → Late Symptoms are seen after 4-10 days of infection. These symptoms include nausea, vomiting, dry cough, headache, shortness of breath and sensation in lungs [29].

#### MARBURG

#### INTRODUCTION

This virus was 1st identified in Aug, 1967. Marburg virus was named with the city where most of the infections were reported. The 1st isolation of this virus takes place in that city. Until 1976 this virus was not a well known species of filoviridae family. Ebola was primarily identified in African country [30]. The two viruses marburg and ebola, were placed together in a new classified family named as Filoviridae. Marburg virus is the pathogen that causes Marburg virus disease in humans, and it has a mortality of 23-90%. The mortality rate depends on the outbreak and its spreadability.

#### CHARACTERISTICS

The genome of this virus is enveloped with a non-segmented negative stranded RNA with 19.1kb length and it codes for 7 structural proteins [31]. Virus nuclear capsid is made up of, RNA and its 4 proteins: Nucleoprotein, VP35, viral protein VP30 and catalytic subunit of polymerase-L. The two protein matrixes VP24 and VP40, are situated between nuclear capsid and envelope, that encoates with surface protein[32].

#### TRANSMISSION

The marburg virus is mainly transmitted by the bats which have this virus in their body. Through the infected animal bites and their contamination the spreading of this virus takes place. The pathogenesis of this virus in humans and its transmission were shown in the following diagram [33].

#### SYMPTOMS

Initially the symptoms begin after 2 to 21 days of infection and they are same as flu that include fever, fatigue, joint pains, chills, sore throat and myalgia. Within 2 to 5 day of the infection most of the patients can suffer with pain in abdomen, vomiting, diarrhea, nausea, and lethargy[34]. From 5 -7 days the effect of the infection will increase, and this include a rash that spreads from torso to limbs. Other symptoms like

#### Galanki Vasantha et al.,

conjunctivitis, fever, and also mucosal bleeds, petechiae, blood stools, vomiting and venipuncture site bleeding are also seen in the infected patients [35].

#### RABIES

#### INTRODUCTION

Rabies belongs to the Lyssavirus genus and Rhabdoviridae family. It is fatal and neurological infection that effects all the warm blooded organisms. Mostly this infection spreaded all over the globe except in Australia and Antarctica. Mainly the Rabies was fatal in mammals because it involves the involvement function of the nervous system [36]. Recovery from this disease was very low after the person got infected with the virus[37].

#### CHARACTERISTICS

Genome of this virus is encapsulated with a single strand negative sense RNA[38], that encodes with 5 genes with a highly conserved order. They code for Nucleoprotein, Phosphoprotein, Matrix protein, Glycoprotein, and a RNA polymerase. The rhabdoviruses have 2 main morphological components known as helical ribonucleoprotein core and the envelopes that were surrounded[39].

#### TRANSMISSION

Rabies is mainly transmitted by the bite of a rabid animal. Transmission takes place mainly from the exposed saliva of an infected animal. Transmission is either due to the bite of animal to animal or from animal to man [40]. A non-bite route of exposure is also possible by the inhalation of this virus.

#### SYMPTOMS

Clinically, the disease presents in 2 forms either in furious (encephalitic) form or in paralytic (dumb) form of rabies. Mostly two-thirds of the patients who are infected show the furious form[41]. The symptoms that are seen are headache, heat, low appetite, weakness, fatigue, nausea, vomiting, diarrhea, cough, runny nose, agression, photosensitivity, cramps, fear, salivation, limb paralysis and hydrophobia.

#### HIV

#### INTRODUCTION

The human immunodeficiency virus(HIV) causes a medical illness in human beings called as acquired immunodeficiency syndrome. HIV1 was first identified as the causative agent immediately after the initial recognition of HIV infected patients in US[42]. Acquired Immunodeficiency Syndrome is a global health problem. Approximately over 70M people are infected with HIV and 35M people died with AIDS. Currently 36.7m people are leading their life with this[43]. In terms of global prevalence the HIV strains differ enormously. Six strains are mainly responsible for high number of this infection and they are HIV1 subtypes HIV1A, HIV1B, HIV1C, HIV1D, and two of the CRF,01-AE and 02-AG[44].

#### CHARACTERISTICS

Currently these are categorized into two types HIV1 and HIV2. Causative agent for AIDS is HIV1 and for HIV2 is restricted especially for some regions of Western and Central Africa. This virus comes under Lentivirus genus and belongs to Retroviridae family[45]. Matured HIV virions are spherical in nature and they are of 100 to 120 nm. This virus consists of a bilipid membrane which is surrounded by a cone-shaped nucleo capsid known as Core. It has the RNA, viral protease, reverse transcriptase, integrase, Vpu, Vif, Vpr and Nef along with remaining cellular factors. Genome of the HIV1 consists of 2 identical single strand RNA, which is 9.2kb in length[46].

#### TRANSMISSION

The transmission is mainly by sexual route and also transmitted from mother to infant percutaneous route. But they are not completely understood. These viruses are transmitted through all possible routes. Spreading of

#### Galanki Vasantha et al.,

this infection mainly follows the order of virus to the host infection mainly in plasma of blood. In the earlier phase of this infection the virus replication takes rapidly and spreads irregularly for its transmission. The transmission of this virus by sexual route mostly results in the clinical illness that arises from a virion particle, which highlights the bottleneck and inefficiency of this viral transmission[47].

#### SYMPTOMS

The symptoms of this virus are different in different areas of the body. The main common symptoms that involve are as follows: regular infections, frontal headaches, pneumonia, sudden severe weight loss, rashes on skin, swollen lymph glands. The pain is seen in the abdomen and also during swallowing of food. Dry cough, tiredness, high fever, loss of hunger, muscle aches, sweat, nausea, diarrhea, vomiting, thickening of nails, mouth sores and mouth ulcers can also be seen in the people with this infection.

#### SMALLPOX

#### INTRODUCTION

Smallpox infection is unique to humans, which is caused by a poxvirus. It is among the high fatal diseases. This infection has a mortality rate of approximately 30% [48]. This viral infection has been there over decades and lead to repeated large pandemics with a large number of recovered patients and dead persons[49]. In the 18th century, smallpox disease was the main cause of death of more than four hundred thousand people in Europe every year. Fortunately, this virus has been completely eliminated by the end of the last century due to the invention of vaccination[50].

#### CHARACTERISTICS

Smallpox virus comes under Poxviridae family. This family of viruses includes monkeypox virus and other poxviruses. The genome of these viruses contains a single linear double strand DNA with 130-375kb. Cell cytoplasm is the replicaton site of this virus. These viruses look like bricks through electron microscope and they range about 300-200nm. The DNA present in the virus, but not RNA and this was demonstrated in the year 1940[51]. In 1962, the composition of this double-stranded nature of the virus DNA and its guanine and cytosine was demonstrated [52].

#### TRANSMISSION

Transmission of this virus is mainly by inhalation route as it is an airborne virus. Mainly the droplets from the mouth, nose and respiratory tract from an individual who is infected with the virus and this is the primary way of transmission. Transmission is by an individual to an another individual is mainly through direct face contact with an infected person. This virus transmission is also by the direct contact with infected persons blood, urine, saliva, fecal matter and also by bedding or clothing.

#### SYMPTOMS

The earliest symptoms of this virus are similar to the flu. Initially the symptoms start with a rash just after a few days of virus exposure later on it turns into deep sores that fill with fluid. The formed blisters ooze out, and scab over, it gradually falls off and leaves scars<sup>[53]</sup>. After a few days, flat red spots will start appearing on your face, hands, arms, and all over the body. After a few days of infection the sores will begin to turn into small flat blisters filled with fluid. Gradually the fluid will then turn into pus. After sometime the sores will scab and fall off which leaves deep and pitted scars. The most common symptoms are high fever, headache, backache, rashes, sores, blisters, fatigue and vomitings.

#### INFLUENZA

#### INTRODUCTION

These viruses are the main pathogens which are responsible for respiratory tract infections in humans, birds, and all other mammals. During the 20th century these viruses are responsible for three pandemics which have high morbidity and fatal rate across the world. Surveillance across the world indicates that

#### Galanki Vasantha et al.,

these viruses isolate themselves every month from humans in any corner of the world. In the high temperature regions, the influenza activity was peak during the winter season. In the North side, influenza outbreaks occur between November and March. In the South side, influenza outbreaks occur between April and September. In tropical regions, influenza outbreaks occur all over the year. The history of influenza has been studied for many years, but some features like seasonality, the exact mechanism, and the factors that are responsible for spreading of the infection are not exactly known[54].

#### CHARACTERISTICS

This virus comes under Orthomyxoviridae family. Genome of this virus contains eight segmented, negativestranded RNA, which ranges from the longest 2341 to the shortest 890 bps. Each genome contains both 5' and 3' untranslated regions[55].

#### TRANSMISSION

Not only the Humans who are susceptible for getting this infection. Influenza type A have many number of hosts that includes Birds, mammals and even bats. Water birds are first considered as the main host for influenza type A virus as they can be easily prone to maximum all the viral variants. Humans are not directly prone to these viruses. A carrier host is necessary to carry the virion, in which the adaptation leads to easy transmission of infection to human beings. The hosts are considered as mixing vessels. The pigs are be infected by Avian virus and human influenza virus and produces a favourable condition for their exchange of genetic material in between different strains[56].

#### SYMPTOMS

Symptoms differ from mild to severe. The symptoms are high fever, running nose, sore throat, stuffy nose, vomiting, aches, extreme tiredness, muscle aches, frontal headache, cough, and weakness. These symptoms appear after one to four days of virus exposure and these symptoms last for about 2–8 days<sup>[57]</sup>.

#### ROTA VIRUS

#### INTRODUCTION

In the world the most common diarrheal pathogen that affects children is rotavirus. Approximately 800,000 deaths per year are recorded because of this infection[58]. These infections are the main causes for severe dehydrating gastro enteritis in children below 5 years. These viral infections were soon confirmed as a main dominant cause of diarrhea that is severe and fatal in infants and children below 5 years[59].

#### CHARACTERISTICS

These viruses are grouped from A to E, with reference to antigenic groups on VP6, which is the major capsid antigen. Group A, group B and group C categorized viruses are known to cause human infections. Among those three groups Group A viruses are the main reason for human infections. These viruses are in turn categorized into group G and group P types depending upon the antigens on outer capsid proteins VP7 and VP4. Serious illness among young children are mainly due to serotype G1-4[60].

#### TRANSMISSION

Rotavirus is a directly transmitted disease. Transmission is mainly via fecal-to-oral spread. The spreading is through person-to-person and also with the contaminated environment. Transmission is also by contaminated food, water and nasal droplets with the fecal matter of the infected person[61]. The following picture displays transmission of rotavirus. Major mode of rotavirus transmission is through fecal-oral route and also by food, water that are contaminated with virus particles.

#### Galanki Vasantha et al.,

#### SYMPTOMS

Major symptoms of this viral infection are diarrhea and vomiting. The other symptoms include vomiting, stomach pain, malaise, fever and fatigue[62]. Symptoms like dehydration and reduced oral intake, rarely neurologic features such as convulsions, and encephalitis are also seen in infected persons[63].

#### HERPES

#### INTRODUCTION

Herpes simplex virus leads to a chronic and lifelong infection in more than 60% of adults. Herpes simplex virus belongs to the family Herpesviridae. This virus wasrecognised in ancient Greek times, and it frequently infects humans. These viruses are life threatening and cause mild to uncomplicated mucocutaneous infection[64]. Till now eight types of herpes viruses are recognized they are HSV1, HSV2, varicella-zoster virus, cytomegalovirus, Epstein-Barr virus, human herpesvirus6, human herpesvirus7, and human herpesvirus8[65]. Among all those types HSV-1 causes orolabial disease, and HSV-2 is responsible for frequent genital and newborn infections[66].

#### CHARACTERISTICS

HSV-1 virus replication involves a step in which the viral DNA is uncoated and delivered into the infected cell nucleus. Genome that is responsible for the infection is by double-stranded DNA bacteriophage. Each of these viruses differs from each other and has a unique long and a unique short region, which are surrounded by inverted repeat sequences or by terminal repeat sequences. The genomic size may vary till 10kbp which depends upon their repeated sequences.

#### TRANSMISSION

These belongs to the large family of DNA Viruses. Eight virus types of this family are considered to cause infections in human beings. HSV1 and HSV2 are transmitted through mucosal cells of epithelial tissues and also through skin breakouts and from there they reaches the nervous tissue. HSV-1 are more likely seen in lesions of orofacial region and found typically in the trigeminal ganglia and HSV2 is mainly found in the lumbosacral region of ganglia. This virus spreads mainly in sexually active women. This virus also infects pregnant women and the transmission timing during pregnancy phase has greater risk on fetus and neonates [67].

#### SYMPTOMS

The common symptoms of genital herpes include small blistering lesions, cold sores on the mouth, around the genitals and in rectum. After the infection the fluid-filled blisters which were formed will burst and then turn into small, painful sores that can last up to four weeks [68]. During the initial stage this infection does not have any symptoms or signs. so it makes it difficult to identify among most of the people. The symptoms start from 2 to 12 days of infection and they include pain or itching near your genitals, rash, the red bumps, tiny white blisters, pain during urination, scabs, vaginal discharge in female, tender lumps in groin of males. Other common symptoms include flu-like symptoms with swollen lymph nodes, headache, muscle pain, fever, and herpes lesions[69].

### ABSTRACT

In this article, we present the new notion of cubic root fuzzy sets and we defined different operators such that Union, Intersection, Complement and Hamming Distance, Weighted Hamming Distance, Euclidean Distance, Weighted Euclidean Distance and also proved some fundamental results. Futhermore, we present MCDM Problem and an algorithm based on distance measure for cubic root fuzzy set.

**Keyword:** Fermatean fuzzy set, cubic root fuzzy set, operations distance mea- sure, Hamming Distance, Weighted Hamming Distance, Euclidean Distance, Weighted Euclidean Distance, MCDM.

## INTRODUCTION

A concept of fuzzy set (FS) introduced by Zadeh. Atanassov generalized FS developed by Intuitionistic Fuzzy set (IFS)[1] and then Yager further improve the quantity by bringing out the Pythagorean fuzzy set (PFS). PFS[2] explains vagueness by the use of the MD function  $\delta$  and NMD function  $\gamma$  where their square sum lies between 0 and 1,(i.e)  $0 < \delta^2 + \gamma^2 < 1$ . Fermatean fuzzy[6] set have been validated as 0 e of the tools to address uncertain information. Senapati and Yagar outlined basic operator over FFS. In this article, we study the notion of Cubic fuzzy Sets(CR Fuzzy set) and some new operations, Hamming distance, weighted Hamming

#### Sivakumar and Sangeetha

distance, Euclidean distance, weighted Euclidean distance[9] and algorithm based on distance measure for cubic root fuzzy set can be used in the MCDM method with suitable example[3].

#### Preliminary

#### Definition Definition: Fermatean Fuzzy set [6]

A Fermatean fuzzy set (FFS) F in U an object having the form  $F = [x, \delta(x), \gamma(x)/x \in U]$ , where  $\delta_F, \gamma_F$  represents the MD and NMD of F respectively. The mapping  $\delta_F, \gamma_F: U \rightarrow [0,1]$  and

 $0 \leq \delta_{F^3} + \gamma_{F^3} \leq 1$  and also defined by the degreeof indeterminacy function

 $\pi_{\rm F} = \sqrt[3]{1 - [\delta^3 + \gamma^3]}, \text{ for all } x \in U.$ 

#### Definition: Cubic Root Fuzzy Set[4]

Let U be a universal set and the element is denoted by y. Then the Cubic Root Fuzzy Set (CR-Fuzzy Set) of R is defined as ,  $R = [y, \delta(y), \gamma(y)/y \in X]$ , where  $\delta_{R}, \gamma_{R}$  represents the MD and NMD of R respectively. The mapping  $\delta_{R}, \gamma_{R}$ : U  $\rightarrow [0,1]$  and  $\leq \delta_{F^{3}} + \sqrt{\gamma_{R}} \leq 1$ . and also defined by the degreeof indeterminacy function  $\pi_{R}(x) = \sqrt[3]{1 - \delta_{R}^{3} + \sqrt{\gamma_{R}}}$ 

Let  $R = [\delta, \gamma]$ ,  $R_1 = [\delta_1, \gamma_1]$  and  $R_2 = [\delta_2, \gamma_2]$  be the Cubic Root fuzzy sets and  $\lambda \ge 0$ , then the following operators hold

(i) 
$$R_1 \oplus R_2 = (\sqrt[3]{\delta_1^3 + \delta_2^3 - \delta_1^3 \delta_2^3}, (\gamma_1 \gamma_2))$$

(ii) R<sub>1</sub> 
$$\otimes$$
 R<sub>2</sub> = (( $\delta_1 \delta_2$ ),  $\sqrt[3]{\gamma_1^{1/2}} + \gamma_2^{1/2} - \gamma_1^{1/2} \gamma_2^{1/2}$ )

(iii) 
$$\lambda \mathbf{R} = (\sqrt[3]{1 - (1 - \delta^3)^{\lambda}}, \gamma^{\lambda})$$
  
(iv)  $R^{\lambda} = (\delta^{\lambda}, \sqrt[3]{1 - (1 - \gamma^{1/2})^{\lambda}}$ 

#### Theorem

Let R,  $R_1$  and  $R_2$  and  $\lambda_1$ ,  $\lambda_2 \ge 0$  the following hold

(i) 
$$R_1 \oplus R_2 = R_2 \oplus R_1$$
  
(ii)  $R_1 \otimes R_2 = R_2 \otimes R_1$   
(iii)  $\lambda(R_1 \oplus R_2) = \lambda R_1 \oplus \lambda R_2$ 

(iv) 
$$(\lambda_1 \oplus \lambda_2)R = \lambda_1 R \oplus \lambda_2 R$$

$$(\mathbf{v})R^{\lambda 1} \otimes R^{\lambda 2} = R^{\lambda 1 + \lambda 2}$$

Proof: For three cubic root fuzzy number R, R<sub>1</sub> and R<sub>2</sub> and  $\lambda_1$ ,  $\lambda_2$ <0, according to definition, we obtain,

(i) 
$$R_{1} \bigoplus R_{2} = (\sqrt[3]{} \delta_{1}^{3} + \delta_{2}^{3} - \delta_{1}^{3} \delta_{2}^{3}, (\gamma_{1} \gamma_{2})) = (\sqrt[3]{} \delta_{2}^{3} + \delta_{1}^{3} - \delta_{2}^{3} \delta_{1}^{3}, (\gamma_{2} \gamma_{1})) = R_{2} \bigoplus R_{1}$$
  
(ii) 
$$R_{1} \bigotimes R_{2} = ((\delta_{1} \delta_{2}), \sqrt[3]{} \gamma_{1}^{1/2} + \gamma_{2}^{1/2} - \gamma_{1}^{1/2} \gamma_{2}^{1/2}) = ((\delta_{2} \delta_{1}), \sqrt[3]{} \gamma_{2}^{1/2} + \gamma_{1}^{1/2} - \gamma_{2}^{1/2} \gamma_{1}^{1/2}) = R_{2} \bigotimes R_{1}$$
$$R_{1} \bigotimes R_{2} = R_{2} \bigotimes R_{1}$$
  
(iii) 
$$\lambda(R_{1} \bigoplus R_{2}) = \lambda (\sqrt[3]{} \delta_{1}^{3} + \delta_{2}^{3} - \delta_{1}^{3} \delta_{2}^{3}, (\gamma_{1} \gamma_{2})) = \sqrt[3]{} 1 - (1 - \delta_{1}^{3} - \delta_{2}^{3} + \delta_{1}^{3} \delta_{2}^{3})^{\lambda}, (\gamma_{1} \gamma_{2})^{\lambda}$$

#### Sivakumar and Sangeetha

$$= \sqrt[3]{1 - (1 - \delta_{1}^{3})^{\lambda}(1 - \delta_{2}^{3})^{\lambda}}, (\gamma_{1}^{\lambda}\gamma_{2}^{\lambda}).L.H.S$$

$$\lambda R_{1} \bigoplus \lambda R_{2} = (\sqrt[3]{1 - (1 - \delta_{1}^{3})^{\lambda}}\gamma_{1}^{\lambda} \bigoplus \sqrt[3]{1 - (1 - \delta_{2}^{3})^{\lambda}}....R.H.S$$

$$\lambda (R_{1} \bigoplus R_{2}) = \lambda R_{1} \bigoplus \lambda R_{2}$$
(iv)
$$(\lambda_{1} \oplus \lambda_{2})R = (\sqrt[3]{1 - (1 - \delta^{3})^{(\lambda_{1} \oplus \lambda_{2})}}, \gamma^{(\lambda_{1} \oplus \lambda_{2})})$$

$$= \sqrt[3]{1 - (1 - \delta^{3})^{(\lambda_{1} \oplus \lambda_{2})}(1 - \delta^{3})^{(\lambda_{1} \oplus \lambda_{2})}}, \gamma^{(\lambda_{1} \oplus \lambda_{2})})$$

$$= (\sqrt[3]{1 - (1 - \delta^{3})^{\lambda_{1}}}, \gamma^{\lambda_{1}}) \oplus (\sqrt[3]{1 - (1 - \delta^{3})^{\lambda_{2}}}, \gamma^{\lambda_{2}})$$

$$= \lambda_{1}R \oplus \lambda_{2}R$$
(v)
$$R^{\lambda_{1}} \otimes R^{\lambda_{2}} = (\delta^{\lambda_{1}}, \sqrt[3]{1 - (1 - \gamma^{1/2})^{\lambda_{1}}}) \otimes (\delta^{\lambda_{2}}, \sqrt[3]{1 - (1 - \gamma^{1/2})^{\lambda_{2}}})$$

$$= R^{\lambda_{1} + \lambda_{2}}$$

$$R^{\lambda_{1}} \otimes R^{\lambda_{2}} = R^{\lambda_{1} + \lambda_{2}}$$

#### **Operation of Cubic Root Fuzzy Set**

Let  $R = [\delta, \gamma]$ ,  $R_1 = [\delta_1, \gamma_1]$ ,  $R_2 = [\delta_2, \gamma_2]$  be the Cubic Root fuzzy sets, then[4]

(i) Intersection:

 $R_1 \wedge R_2 = \min(\delta_1, \delta_2), \max(\gamma_1, \gamma_2)$ 

(ii) Union:

R1 VR2 = max( $\delta_1, \delta_2$ ), min( $\gamma_1, \gamma_2$ )

(iii) Complement

 $(\mathbf{R})^{C} = [(\delta)^{6}, \sqrt{\gamma}]$ Note that  $(\sqrt[2]{\gamma^{6}} + \sqrt[4]{\delta^{2}}) = (\gamma)3 + \sqrt{\delta}$   $= (0.5)^{3} + \sqrt{0.7} = 0.96166 < 1$ so,  $(\mathbf{R})^{C}$  is a Cubic Root fuzzy set. We know that ,  $(\mathbf{R}^{C})^{C} = (\gamma(x)^{6}, \sqrt[4]{\delta(x)})^{C} = (\delta(x), \gamma(x)) = R.$ 

#### Example

Assume that  $R_1 = (\delta_1 \ 0.67, \gamma_1 = 0.32)$  and  $R_2 = (\delta_2 = 0.25, \gamma_2 = 0.74)$  are the Cubic Root fuzzy sets , then

(i)Intersection:

```
R_{1} \wedge R_{2} = \min(\delta_{1}, \delta_{2}), \max(\gamma_{1}, \gamma_{2})
= (\min(0.67, 0.25), \max(0.32, 0.74))
= (0.25, 0.74)
(ii)Union:

R1 \veeR2 = max(\delta_{1}, \delta_{2}), min(\gamma_{1}, \gamma_{2})

= (\max(0.67, 0.25), \min(0.32, 0.74))
= (0.67, 0.32)
(iii) Complement

(R)<sup>C</sup> = [(\delta_{1}^{6}, \sqrt{\gamma}]

= ((0.33)^{6}, \sqrt[4]{0.67})
= (0.001.0.81)
```

#### Theorem

For three cubic root fuzzy number R, R<sub>1</sub>, R<sub>2</sub> and R<sub>3</sub> and  $\lambda_1, \lambda_2 < 0$  following are valid

 $(ii)R_1 \lor R_2 = R_2 \lor R_1$ (i)  $R_1 \wedge R_2 = R_2 \wedge R_1$ (iii) $R_1 \wedge (R_2 \wedge R_3) = (R_1 \wedge R_2) \wedge R_3$  (iv)  $R_1 \vee (R_2 \vee R_3) = (R_1 \vee R_2) \vee R_3$ (v)  $\lambda(R_1 \vee R_2) = \lambda R_1 \vee \lambda R_2$  $(iv)(R_1 \vee R_2)\lambda = (R_1)\lambda \vee (R_2)\lambda$ Proof: (i)  $R_1 \wedge R_2 = \min(\delta_1, \delta_2), \max(\gamma_1, \gamma_2)$ = min( $\delta_2$ ,  $\delta_1$ ), max( $\gamma_2$ ,  $\gamma_1$ )  $= R_2 \wedge R_1$ (ii)  $R_1 \vee R_2 = \max(\delta_1, \delta_2), \min(\gamma_1, \gamma_2)$ =max( $\delta_2$ ,  $\delta_1$ ), min( $\gamma_2$ ,  $\gamma_1$ )  $=R_2 \vee R_1$ (iii)  $R_1 \wedge (R_2 \wedge R_3) = R_1 \wedge (\min(\delta_2, \delta_3), \max(\gamma_2, \gamma_3))$  $=\min(\delta_1, (\min(\delta_2, \delta_3))), \max(\gamma_1, (\max(\gamma_2, \gamma_3)))$ =min( $(\delta_1, \delta_2)$ , min $\delta_3$ ), (max( $\gamma_1, \gamma_2$ ), max $\gamma_3$ )) =(min( $\delta_1, \delta_2$ ), max( $\gamma_1, \gamma_2$ )  $\land R_3$  $=(R_1 \land R_2) \land R_3$  $(iv)R_1 \lor (R_2 \lor R_3) = R_1 \lor (max(\delta_2(x), \delta_3(x)), min(\gamma_2(x), \gamma_3(x)))$  $=\max(\delta_1, (\max(\delta_2(x), \delta_3(x)))), \min(\gamma_1, (\min(\gamma_2(x), \gamma_3(x))))$  $=\max((\delta_1, \delta_2(x)), \max(\delta_3(x)), (\min(\gamma_1, \gamma_2(x)), \min(\gamma_3(x))))$ =(max( $\delta_1(x), \delta_2(x)$ ), min( $\gamma_1(x), \gamma_2(x)$ )  $\vee$  R<sub>3</sub>  $= (R_1 \vee R_2) \vee R_3$ (v)  $\lambda(R_1 \vee R_2) = \lambda(\max(\delta_1, \delta_2), \min(\gamma_1, \gamma_2))$  $=\sqrt[3]{1-(1-\max(\delta_1^3,\delta_2^3)^{\lambda})}, \min(\gamma_1^{\lambda},\gamma_2^{\lambda})$ 
$$\begin{split} \lambda R_1 \vee \lambda R_2 &= (\sqrt[3]{1 - (1 - \delta_1^3)^{\lambda}}, \gamma_1^{\lambda}) \vee (\sqrt[3]{1 - (1 - \delta_2^3)^{\lambda}}, \gamma_2^{\lambda}) \\ &= \max (\sqrt[3]{1 - (1 - \delta_1^3)^{\lambda}}, \sqrt[3]{1 - (1 - \delta_2^3)^{\lambda}}, \min(\gamma_1^{\lambda}, \gamma_2^{\lambda})) \\ &= \sqrt[3]{1 - (1 - \max(\delta_1^3, \delta_2^3)^{\lambda})}, \min(\gamma_1^{\lambda}, \gamma_2^{\lambda}) \end{split}$$
 $=\lambda(R_1 \vee R_2)$  $\lambda(R_1 \vee R_2) = \lambda R_1 \vee \lambda R_2$ Theorem For two cubic root fuzzy number  $R_1 = (\delta_1, \gamma_1), R_2 = (\delta_2, \gamma_2)$  following are valid (i)  $(R_1 \land R_2) \lor R_2 = R_2$ (ii)  $(R_1 \lor R_2) \land R_2 = R_2$ proof: (i)  $(R_1 \wedge R_2) \vee R_2 = (\min(\delta_1, \delta_2), \max(\gamma_1, \gamma_2) \vee (\delta_2, \gamma_2))$ =  $(\max(\min(\delta_1, \delta_2), \delta_2), \min(\max(\gamma_1, \gamma_2), \gamma_2))$  $= (\delta_2, \gamma_2) = R_2$ (ii)  $(R_1 \lor R_2) \land R_2 = (max(\delta_1, \delta_2), min(\gamma_1, \gamma_2)) \land (\delta_2, \gamma_2)$ =  $(\min(\max(\delta_1, \delta_2), \delta_2), \max(\min(\gamma_1, \gamma_2), \gamma_2))$  $= (\delta_2, \gamma_2) = R_2$ Theorem For two cubic root fuzzy number  $R_1 = (\delta_1, \gamma_1), R_2 = (\delta_2, \gamma_2)$  following are valid (i)  $(R_1 \lor R_2)^C = R^C \land R_2^C$ (ii)  $(R_1 \wedge R_2)^C = R^C \vee R_2^C$ Proof:  $(R_1 \lor R_2)^C = (\max(\delta_1, \delta_2), \min(\gamma_1, \gamma_2))^C$ (i) =min( $(\gamma_1)^6$ ,  $(\gamma_2)^6$ ),max( $\sqrt{\delta_1}$ ,  $\sqrt{\delta_2}$ )  $=((\gamma_1)^6, \sqrt{\delta_1}) \wedge ((\gamma_2)^6, \sqrt{\delta_2})$ 

#### Sivakumar and Sangeetha

 $= R_{1}^{C} \wedge R_{2}^{C}$ (ii)  $(R_{1} \wedge R_{2})^{C} = (\min(\delta_{1}, \delta_{2}), \max(\gamma_{1}, \gamma_{2}))^{C}$   $= \max((\gamma_{1})^{6}, (\gamma_{2})^{6}), \min(\sqrt{\delta_{1}}, \sqrt{\delta_{2}})$   $= ((\gamma_{1})^{6}, \sqrt{\delta_{1}}) \vee ((\gamma_{2})^{6}, \sqrt{\delta_{2}})$   $= R_{1}^{C} \vee R_{2}^{C}$ 

#### Distance Measures

Suppose that  $R_1 = (\delta_1, \gamma_1)$ ,  $R_2 = (\delta_2, \gamma_2)$  are two Cubic Root fuzzy sets and  $w_k$  (k= 1 to n), where  $0 \le w_k \le 1$  and  $f_k$  (k=1 to n) are fuzzy best value  $f_k = \max(f_k)$  (k=1 to n) then we describe some distance measure between cubic root fuzzy sets  $R_1$  and  $R_2$  then,[9]

Hamming Distance for CR-Fuzzy Set  $d^{H}(R_{1}, R_{2}) = \sum_{i=1}^{n} 1/2 \left[ |f_{i} \delta_{i}^{3} - f_{i+1} \delta_{i+1}^{3}| + |f_{i} \sqrt{\gamma_{i}} - f_{i+1} \sqrt{\gamma_{i+1}}| \right] \text{ (or)}$ 

Weighted Hamming Distance For CR-Fuzzy Set

$$d^{H}(R_{1}, R_{2}) = \sum_{i=1}^{n} 1/2 \left[ w_{i}^{3} \mid f_{i} \delta_{i}^{3} - f_{i+1} \delta_{i+1}^{3} \mid + w_{i+1}^{3} \mid f_{i} \sqrt{\gamma_{i}} - f_{i+1} \sqrt{\gamma_{i+1}} \mid \right] \text{ (or)}$$

$$d^{H}(R_{1}, R_{2}) = \sum 1/2 w_{1}^{3} [|f_{1} \delta_{1}^{3} - f_{2} \delta_{2}^{3}| + w_{2}^{3} ||f_{1} \sqrt{\gamma_{1}} - f_{2} \sqrt{\gamma_{2}}|] \dots (2)$$

#### **Euclidean Distance For CR-Fuzzy Set**

#### Weighted Euclidean Distance For CR-Fuzzy Set

#### Example

Assume that  $R_1 = ([0.3, 0.5], [0.4, 0.6], [0.1, 0.5])$  and  $R_2 = ([0.4, 0.5], [0.2, 0.3], [0.4, 0.6])$  are the Cubic Root Fuzzy sets then using the distance measure formulas

Hamming Distance for CR-Fuzzy set using equation (1)  $d^{H}(R_{1}, R_{2}) = \sum 1/2 \left[ |f_{1} \delta_{1}^{3} - f_{2} \delta_{2}^{3}| + |f_{1} \sqrt{\gamma_{1}} - f_{2} \sqrt{\gamma_{2}}| \right]$   $d^{H}(R_{1}, R_{2}) = 0.08 + 0.01 + 0.1 + 0.2 + 0.06 + 0.06 + 0.18 + 0.06 + 0.09 + 0.14 + 0.06 + 0.04 + 0.10 + 0.12 + 0.08 + 0.02 +$ 

0.11 + 0.27 + 0.001 + 0.006 + 0.12 + 0.06 + 0.14 + 0.07 + 0.04 + 0.10 + 0.12 + 0.08 + 0.03 + 0.28 + 0.01 + 0.05

= 2.526

Weighted Hamming Distance for CR-Fuzzy set using equation (2)

#### Sivakumar and Sangeetha

 $d^{H}(R_{1}, R_{2}) = \sum 1/2 \ w_{1}^{3} \left[ | f_{1} \delta_{1}^{3} - f_{2} \delta_{2}^{3} | + w_{2}^{3} | f_{1} \sqrt{\gamma_{1}} - f_{2} \sqrt{\gamma_{2}} | \right]$ 

 $d^{H}(R_{1},R_{2}) = 0.3(0.08 + 0.01 + 0.1 + 0.2 + 0.06 + 0.06 + 0.18 + 0.06 + 0.09) + 0.5(0.14 + 0.09) + 0.5(0.14$ 

0.06 + 0.11 + 0.27 + 0.001 + 0.006 + 0.12 + 0.06 + 0.14) + 0.6(0.07 + 0.04 + 0.10 + 0.12 + 0.08 + 0.03 + 0.28 + 0.01 + 0.05)

= 0.3045

Euclidean Distance for CR-Fuzzy set using equation (3)

 $d^{E}(R_{1}, R_{2}) = 0.109 + 0.014 + 0.141 + 0.28 + 0.08 + 0.08 + 0.24 + 0.08 + 0.126 + 0.197 +$ 

0.08 + 0.154 + 0.519 + 0.001 + 0.008 + 0.16 + 0.08 + 0.197 + 0.21 + 0.05 + 0.14 + 0.16 + 0.109 + 0.042 + 0.39 + 0.014 + 0.07 + 0.014 + 0.07 + 0.014 + 0.0014 + 0.00

= 3.854

Weighted Euclidean Distance for CR-Fuzzy set using equation (4)

 $d^{\rm E}({\rm R_{1},\,R_{2}}) = 0.3(0.109 + 0.014 + 0.141 + 0.28 + 0.08 + 0.08 + 0.24 + 0.08 + 0.126) + 0.5(0.197 + 0.08 +$ 

0.154 + 0.519 + 0.001 + 0.008 + 0.16 + 0.08 + 0.197) + 0.6 (0.21 + 0.05 + 0.4 + 0.01) + 0.001 + 0.001 + 0.0000 + 0.0

 $0.16{+}0.109{+}0.042{+}0.39{+}0.014{+}0.07$

## MCDM Problems using operators in Cubic Root Fuzzy Set Algorithm Step:1

Consider A<sub>1</sub>, A<sub>2</sub>, ...., A<sub>n</sub> be alternatives and  $p_1, p_2, p_3, p_n$  be the parameters. Suppose that the Cubic root fuzzy sets  $R_k = (\delta_k, \gamma_k)$ , (k = 1 to n) where  $\delta_k$  represent the MD of the alternative  $\tilde{A}_k$  (k=1 to n) for the parameters  $p_k$ (k = 1 to n) .similarly,  $\gamma_k$  represent the NMD of the alternative  $\tilde{A}_k$  (k = 1 to n) for the parameters  $p_k$ (k=1 to n) . The relation between the alternatives and parameters are given below:

#### Step:2

Cubic root fuzzy set are used to assign weight  $w_k(k=1 \text{ to } n)$  to differents parameter for a set of group.

#### Step:3

Determine the distance measure using Cubic root fuzzy sets distance formula (equation (1),(2), (3), (4)).

#### Step:4

If the distance between the alternative is smaller . As a output, the rank the alternative in descending order.

#### Numerical Example

#### Sivakumar and Sangeetha

Suppose there are three patients  $P_1$ ,  $P_2$ ,  $P_3$  in hospital with symptoms cough, heavy fever, vomating. Let the possible diseases relating to the above symptoms be Typhoid, COVID- 19, Dengue. Let  $\mathcal{J} = [HB,TSH,GCT]$  be the collection of tests .We consider the set

 $\wp = (\wp_1, \wp_2, \wp_3)$ , where  $\wp_1, \wp_2, \wp_3$  represent the symptoms cough, heavy fever, vomating and the set = ( $\varkappa_1, \varkappa_2, \varkappa_3$ ), where  $\varkappa_1, \varkappa_2, \varkappa_3$  represent the diseases.

#### STEP:1

Construct that ,  $P \rightarrow \mathcal{G}$ , Patients  $\rightarrow$  Tests is given in the form of Cubic Root Fuzzy Set

g	J1 J2	J	3
$P_{1} = \wp^{2} \begin{bmatrix} 0.3, 0\\ 0.2, 0\\ 0 \end{bmatrix} \begin{bmatrix} 0.2, 0\\ 0.6, 0 \end{bmatrix}$	.5] [0.4		1,0.5]
$P_1 = \wp 2 [0.2, 0]$	.4] [0.3		4,0.7]
<sub>&amp;</sub> 3 [[0.6, 0	.7] [0.1	,0.8] [0.	2,0.6]
	J.1 J.2	J	3

#### Sivakumar and Sangeetha

# STEP:3

(1)To evaluate the Hamming Distance using the formula equation (1)  $d^{H}(R_{1}, R_{2}) = \sum 1/2 \left[ |f_{1} \delta_{1}^{3} - f_{2} \delta_{2}^{3}| + |f_{1} \sqrt{\gamma_{1}} - f_{2} \sqrt{\gamma_{2}}| \right]$ 

(2) To evaluate the Weighted Hamming Distance using the formula equation (2)  $d^{H}(R_{1}, R_{2}) = \sum 1/2 \ w_{1}^{3} [|f_{1} \delta_{1}^{3} - f_{2} \delta_{2}^{3}| + w_{2}^{3} ||f_{1} \sqrt{\gamma_{1}} - f_{2} \sqrt{\gamma_{2}}|]$ 

(3) To evaluate the Euclidean Hamming Distance using the formula equation (3)

$$d^{E}(R_{1}, R_{2}) = \sum_{i} \sqrt{\frac{1}{2} \left[ |f_{1} \delta_{1}^{3} - f_{2} \delta_{2}^{3}|^{2} + |f_{1} \sqrt{\gamma_{1}^{3}} - f_{2} \sqrt{\gamma_{2}^{3}}|^{2} \right]}$$

(4) ) To evaluate the Weighted Euclidean Hamming Distance using the formula equation (4)

$$d^{E}(R_{1}, R_{2}) = \sum_{i} \sqrt{\frac{1}{2} w_{1}^{3} [|f_{1} \delta_{1}^{3} - f_{2} \delta_{2}^{3}|^{2} + w_{2}^{3} |f_{1} \sqrt{\gamma_{1}^{3}} - f_{2} \sqrt{\gamma_{2}^{3}}|^{2}]}$$

#### STEP:4

The alternative can be calculate based on their smaller distance of table 1-4 are generated.

As the table 1-4 are generated the alternative are choose to ranked in smallest value or descending order. Along these results we findout the P1 is affected from Dengue as suggested by the decision making environment .Similarly P2 is affected from a Dengue and P3 is affected from COVID-19.

## CONCULSION

In this study, a set operators such as union, intersection and distance measure (Hamming distance, Weighted Hamming distance, Euclidean distance, Weighted Euclidean distance) the classes of CR fuzzy set have been studied and discussed with proved their fundemental results. A MCDM approach is take to handle the decision making using CR fuzzy set operators and easily to evaluated the relevance outputs. In future we will use to cubic root fuzzy set in different area to verify the presented technique.

## ABSTRACT

About 85 per cent of farmers in India are small farmers who barely make a living. India's agricultural sector is hindered by things like high financial intermediation and a lack of access to credit and markets for agricultural goods. There are many legal groups, like farmer cooperatives, farmer clubs, farmer interest groups, etc., whose goal is to help farmers take advantage of economies of scale by grouping together. Farmer Producer Organizations (FPOs) are an example of a group of farmers who work together. The purpose of this study was to investigate, by means of linear regression analysis and the compound annual growth rate progress made on the establishment of FPOs throughout the time in Tamil Nadu. The results of the regression analysis suggest that the presence of regulated and farmer markets may have a positive effect on the promotion of FPOs and there is a positive trend in promoting FPOs in Tamil Nadu, which can help in improving the livelihoods of farmers and the agriculture sector.

Keywords: FPO, Formation, Promotion, Tamil Nadu, small and marginal farmers

Sasikanth et al.,

## INTRODUCTION

India is the second largest country in terms of the number of small holdings and approximately 85 percent of the country's farmers are considered to be small and marginal farmers [1]. The high proportion of Indian farmers who depend on income from their farms, it is clear that India faces the greatest difficulty in ensuring that these tiny and marginal holdings become truly productive[2].Cooperatives can help small landholders thrive in a tough market while retaining their independence and control. The Government of India appointed Dr. Y.K.Alagh to head a Committee to outline cooperatives' business and marketing plans. The Producer Companies Act was enacted in 2002 by amending the Indian Companies Act to add a new section IXA. The modified Companies Act allows FPOs or production companies to register with the Registrar of Companies. The government's goal for such a programme was to create legislation that would allow cooperatives to incorporate as corporations and convert into companies while preserving their unique characteristics. The FPO model of farmer solidarity is gaining traction as a viable alternative to the more traditional cooperative structure [3].

The Producer Companies Act formalizes the guiding principles of cooperatives and introduces a more businesslike mindset to the administration of FPOs. As a rule, FPOs are established with the help of initial capital provided by the member farmers. The FPO is given a legal structure under the act that will allow farmers and producers to collectively own the business. A group of outside specialists will be employed to run the FPO on a day-to-day basis, and they will report to a Board of Directors that has been elected or selected by the FPO's General body for a predetermined term. Since the FPO's equity shareholders are the farmers or producers, this type of business structure is ideal for farmer ownership [4]. The government has acknowledged the value of FPOs by proposing in the union budget that 10,000 new FPOs will be created by 2027-2028. Department of Agriculture and Cooperation officials have developed a central sector programme to facilitate the establishment of 10,000 Farmer Producer Organizations around the country[5]. As part of this effort, FPOs will be able to choose between registering under the state's Cooperative Societies Act or the Companies Act of 2013[3]. There are around 5,000 FPOs (including FPCs) operating in the country at the present time[5]. These FPOs were established in response to a variety of initiatives taken by the government. In the past eight to ten years, India's Small Farmers Agribusiness Consortium, National Bank for Agricultural Rural Development, State governments, and a number of other organisations have all collaborated to promote the FPO. There is a need for research on the factors determining the establishment of Farmer Producer Organizations (FPOs) to enhance the farmer livelihoods, increase market access, promote sustainable agriculture, and promote collaboration among farmers by identifying the factors that enable the successful formation of FPOs, research can provide guidance to policymakers and farmers on how to replicate these successful models in other regions.

**Purpose of the research:** To investigate the infrastructure elements that influence the growth and expansion of agricultural producer organizations, as well as to determine how far the government of Tamil Nadu and other organisations have come in their efforts to establish such organisations in the state of Tamil Nadu. The purpose of this investigation is twofold: to determine how far these efforts have progressed, and to investigate the infrastructure elements that influence growth and expansion.

## DATA AND METHODOLOGY

The Compound Annual Growth Rate (CAGR) method was used byto foretell the development of FPO formation throughout time [6]. The exponential function of the below mentioned equation is used to estimate the compound annual growth rate [7].

 $Y=ab^t$  ......(1) By taking logarithm on both sides, it may be written as Log y = log a + t × log b... (2)

#### Sasikanth et al.,

#### $Y = A + B \times t$

Where,  $Y = \log y$ ;  $A = \log a$ ;  $B = \log b$ Y= Total number of farmer producer organizations in Tamil Nadu t= time elements, where1,2 and n represent different years. Compound growth rate = (Antilog of B- 1) × 100

t = r/ SE (r) Where, r = Compound Growth Rate; SE= Standard Error

Linear regression was used to investigate the association between two or more explanatory variables and a response variable by fitting an equation [8]. In order to investigate the elements that play a role in the promotion of FPOs in Tamil Nadu, a linear regression model was utilised, and the following equation served as its basis:

 $Y_t = \alpha + \beta_i X_i + u \dots (3)$ 

Y<sub>t</sub>= Dependent Variable;  $\alpha$  = Intercept;  $\beta_i$ 's = Parameters to be estimated;  $X_i$ 's = Independent Variable;  $\mu$  = Error term

## **RESULTS AND DISCUSSIONS**

#### Status of Farmer Producer Organization in Tamil Nadu.

The table 2 indicates that the Tamil Nadu Small Farmers Agribusiness Consortium promoted the most FPOs, with a count of 368. This is followed by the National Bank for Agriculture and Rural Development, with a count of 207. The Small Farmers Agribusiness Consortium promoted 67 FPOs, while the National Cooperative Development Corporation and the National Agricultural Cooperative Marketing Federation promoted 23 and 26 FPOs, respectively. There were also 52 FPOs that were self-promoted, and the total number of FPOs promoted by all agencies was 743.

#### Trend in the formation of FPOs in Tamil Nadu

Figure 1 shows the number of FPOs (Farmer Producer Organizations) promoted in Tamil Nadu from 2004-05 to 2021-22. The data suggests that the number of FPOs promoted has increased significantly over time. The R-squared value of 0.865 indicates that the data points are highly correlated, and the model fits the data well. The F-value of 102.15 with a significance level of 0.000 indicates that the model is statistically significant. The compound annual growth rate of 35% suggests that the number of FPOs promoted has grown at an average rate of 35% annually during this period. This growth rate indicates the increasing importance of FPOs in promoting agricultural development in India. Overall, the data indicates a positive trend in promoting FPOs in Tamil Nadu, which can help in improving the livelihoods of farmers and the agriculture sector.

#### Factors influencing the formation of FPO

Table 3 presents the findings of a multiple linear regression analysis of the factors influencing the establishment of FPOs in Tamil Nadu. The coefficients of determination (R-squared) value are 0.56, indicating that the independent variables explain 56% of the variability in the number of FPOs promoted. The adjusted R square of 0.475 suggests that the model is moderately good at predicting the outcome variable, although it may be improved by adding or removing some variables. The ANOVA table shows that the regression model is statistically significant with an F-value of 6.586 and a p-value of 0.000, indicating that at least one of the independent variables significantly explains the variation in the dependent variable. The regression function that links the independent factors and the dependent variable expressed as,  $Y = 14.649 + 1.236 X_1 + 0.001 X_2 + 1.143 X_3 - 0.052 X_4 - 0.054 X_5 - 0.210 X_6 + \mu$ . Among the six independent variables, regulated market (X1) and farmer market (X3) have statistically significant coefficients with the number of FPOs promoted (p < 0.05), suggesting that the promotion of FPOs is positively associated with the presence of regulated and farmer markets. When all other factors are held constant, a one-unit increase in X1 and

Sasikanth et al.,

X3 results in a 1.236 and 1.143 unit increase in the dependent variable, respectively. The beta coefficients for the other independent variables, namely, area covered under Micro Irrigation (X2), Crop Intensity (X4), Irrigation Intensity (X5), and Rural Godowns (X6) are 0.001, -0.052, -0.054, and -0.210, respectively. This indicates that the effect of these variables on the dependent variable is very small. The t-values and significance levels suggest that none of these independent variables have a statistically significant effect on the dependent variable. Regulated markets provide a platform for farmers to sell their produce at a fair price by regulating the buying and selling of agricultural commodities. This may result in increased profitability for farmers and encourage them to organise themselves into FPOs so that they can sell their product collectively. Farmers can benefit from regulated marketplaces because they have access to market intelligence, which assists them in making educated choices regarding what crops to cultivate and when to sell their produce. Farmers markets, on the other hand, enable farmers to sell their produce directly to customers, eliminating the need for any middlemen and thereby increasing the proportion of profits that are retained by the farmers themselves. Farmers markets can also contribute to the promotion of sustainable agriculture by encouraging the use of environmentally responsible farming practises. Farmers Markets and Regulated Markets Both Have the Potential to Generate Demand for High-Quality, Locally Produced Agricultural Goods, which in Turn May Incentivize Farmers to Increase the Quality of Their Produce and Form FPOs to Market and Sell Their Produce Collectively. In turn, FPOs have the ability to provide better access to inputs, technology, and credit for their members, which can help to improve the overall productivity and profitability of the agricultural sector. As a result, the existence of both controlled and unregulated farmer's markets has the potential to have a beneficial impact on the promotion of FPOs by fostering an atmosphere that is conducive to the expansion and improvement of these organisations.

## CONCLUSION

Tamil Nadu Small Farmers Agribusiness Consortium has been responsible for the promotion of the maximum number of FPOs in Tamil Nadu. Farmer Producer Organizationshave the potential to play a significant part in the process of increasing the income of small farmers by boosting their negotiating power, facilitating access to improved inputs and technologies, and producing value additions through aggregation and processing of their produce. The results of a regression analysis indicate that there may be a positive impact that the presence of regulated and farmer markets have on the promotion of FPOs. This is due to the fact that regulated markets provide a platform for farmers to sell their produce at a reasonable price, and farmer markets allow for direct interaction between farmers and customers, both of which can contribute to the promotion of sustainable agriculture and the creation of greater value for farmers. It is gratifying to see that Tamil Nadu is leading the way in this respect as it pertains to the promotion of FPOs, which can be a key strategy to enhance the income of small farmers in India as well as their ability to maintain their livelihoods. It is critical that other states take notice of this encouraging trend and work towards promoting FPOs in order to bolster the agriculture industry and improve the quality of life for farmers.

## ACKNOWLEDGEMENT

This research paper is an outcome of the research project that was supported financially by a Centrally Administered Full-Term Doctoral Fellowship awarded by the Indian Council of Social Science Research (ICSSR). The author bears sole responsibility for the accuracy of the information presented, as well as the assertions and inferences that are drawn from it.

## ABSTRACT

Copper oxide (CuO) nanoparticles were produced via eco-friendly and non-toxic green synthesis of *Murraya koeniggi* leaf extract. The contamination of water by the organic dye poses a significant risk to humans and aquatic life. X-Ray Diffractometer, UV–Visible spectroscopy, FTIR Spectra, Photo Luminescence, and morphological investigations were used to confirm the physico-chemical characteristics of green-synthesized CuO. X-ray diffraction reveals that the phytochemicals in the leaf extracts interact with copper precursors to generate Cu<sup>2+</sup> ions and crystallize CuO. UV-Vis spectroscopy confirmed CuO NPs with a characteristic peak at 264nm. According to FE-SEM images, CuO NPs had spherical morphologies. Examining the removal of Methyl orange dye by synthesized CuO nanoparticles act nanophotocatalysts. The products photocatalytic degradation efficiency is 89%.

*Keywords:* Copper oxide nanoparticles, Murraya koeniggi, green synthesis, dye degradation.

## INTRODUCTION

The global concern is air pollution, water pollution, and soil contamination. This represents a significant threat to the health of all living things, including humans [1]. The discharge of synthetic dyes into aquatic environments is hazardous to human health, produces effluents, and reduces biodegradation [2, 3]. The photo degradation of dyes

#### Muththamizh et al.,

with semiconductor materials is virtually the most effective method for treating wastewater [4]. In addition, the photocatalysis process is considered more effective due to the greater availability of solar energy and the formation of non-toxic mineralized materials. For the sterilization of microorganisms and the proper treatment of hazardous pollutant, the active visible photocatalyst structure is the most prevalent [5-6]. Due to their photocatalytic activity, transition metals are regarded as advantageous catalysts for the environmentally favorable management of wastewater. This type of photodegradation occurs when the hydroxyl group [OH] and organic contaminants undergo an oxidation reaction. OH, with a 2.8v oxidation potential at room temperature can completely oxidize organic colors [7-8]. They transmit pollutants and generate carcinogens, making secondary pollutants associated with aromatic amines that cause significant health issues. Moreover, these techniques require higher concentrations of photocatalysts and generate a greater amount of sludge [9]. To surmount this obstacle, the AOP (Advanced Oxidation process) has been investigated for its potential to eradicate all essential pollutants. AOPs have a greater potential in the photocatalytic reaction to utilize the entire solar spectrum (e.g., higher solubility in terms of band gap) [10] than do other organic photocatalysts. In modern research, photocatalytic degradation is utilized to remove synthetic pigments from metal semiconductors [11-16]. CuO is less expensive than silver and gold in terms of its microbial potential [17-20]. CuO nanoparticles are the simplest member of the copper salt family, and they possess a wide range of useful characteristics and physical properties, including the electron correlation effect, higher temperature superconductivity, and spin dynamics [21]. Their unique properties and potential applications have received considerable attention, which has increased the viscosity of energy fluids and thus their thermal conductivity [22]. CuO nanoparticles have been utilized in the production and design of batteries, solar cells, gas sensors, field emitters, etc. [23-25] in the industrial sector. CuO nanoparticles are utilized as heterogeneous catalysts in biomedical research, drug delivery, and imaging [26]. To synthesize copper oxide nanoparticles [27], hazardous and expensive compounds, higher temperature, pressure, and energy are needed. Biological materials used in green synthesis eradicate the need for a complicated procedure, allowing for large-scale production. Literature review reveals that Murraya koenigii contains various metal nanoparticles [28]. Curry tree (Murraya koenigii) is a subtropical tree belonging to the Rutaceae family and is regarded as the most important medicinal plant containing secondary metabolites and other medicinal components [29]. It possesses antimicrobial, antifungal, antiinflammatory, and hypoglycemic properties [30-31]. In this study, the synthesized final product (CuO) is characterized by XRD, UV-Vis, FTIR, PL, and SEM. In addition, the photodegradation response of synthesized nano copper oxide was evaluated using methyl orange dye degradation.

## MATERIALS AND METHODS

#### Materials

Copper sulphate [CuSO<sub>4</sub>] was bought at sigma Aldrich. *Murraya koeniggi* leaves have been collected from the regional garden of the Annamalai university in the agriculture department Chidambaram.

#### Preparation of plant extract

Curry leaves have been separated from the leaf clusters physically. The leaves were rinsed three times with deionized water to remove foreign particles. Three hours were spent boiling 30 grams of *Murraya koeniggi* leaves in 100 milliliters of distilled water. After boiling, the leaf extract was cooled and filtered extract was collected in a clean, aluminum-covered conical flask.

#### **Preparation of Copper oxide nanoparticles**

2 ml of leaf extract was added to 10 ml of distilled water, followed by 2.4 grams of CuSO4 solution and repetitive stirring. The color changes from pale greenish blue and dark green to brown in three hours. The obtained material was calcinated for one hour at 100 degrees Celsius and ground to nanoparticle size. The gray-colored CuO nanoparticles that were captured were then stored for future research.

#### Muththamizh et al.,

#### Characterization

The prepared CuO nanoparticles were characterized via XRD, SEM/EDS, FTIR, and UV-Vis spectroscopy. To examine the phase and crystalline structure, an X-ray diffractometer (X'PERT-PRO; CuK (=1.5418)) was acquired. Using scanning electron microscopy, morphological features were determined. The optical absorption and emission spectra of the prepared CuO NPs were measured using UV-visible spectra from 200 to 800 nm. *Murraya koenigii* leaf extract was subjected to Fourier transform infrared spectroscopy analysis. Within the 400-4000cm-1 range, FT-IR spectra have been discovered (32). The EDAX spectrum is reported by the energy-dispersive X-ray spectrometer from Bruker.

## **RESULT AND DISCUSSION**

#### Structural Analysis (XRD)

The crystalline phase of CuO was studied by X-ray diffractometry (XRD) (Fig. 1). The characteristic diffraction peaks of CuO at 2*θ* values of 18.33, 20.98, 24.84, 25.76, 28.18, 31.33, 34.02, 36.87, 38.90, 42.96, 44.49, 46.07, 54.63, 58.07, 64.87, 67.91, 75.70 is generated by the diffraction planes in (200), (113), (220), (030), (301), (230), (016), (400), (240), (050), (008), (236), (129), (309), (527), (616), (282) respectively are revealed by the XRD pattern. Peaks with (JCPDS card no. 77-1898) values of (a=7Å, b=10Å, c=16Å) may be attributed to the orthorhombic structure of CuO nanoparticles. CuO samples are indicated by high-intensity diffraction peaks at 2 values of 24.84 corresponding to (220) planes. Using the Scherrer equation, the crystalline dimension of a CuO sample was determined [33].

 $\begin{array}{l} \mathsf{D} = \mathsf{K}\lambda \ / \ \beta_{hkl} \, \mathsf{Cos}\theta \\ \\ \text{Here,} \\ \\ \mathsf{D} \ \text{is the mean crystal size} \\ \\ \\ \mathsf{K} \ \text{is shape factor} \\ \\ \lambda \ \text{is the wavelength of X-ray and } \beta \ \text{is the FWHM of diffraction planes.} \end{array}$ 

#### Absorption studies (UV- Vis Spectrometry)

UV- Visible spectroscopy is a molecular spectroscopy that is based on Bouguer Lambert Beer law principle for its operation. This technique measures the Plasmon resonance and total oscillation of conduction band of electrons in conjunction with electromagnetic waves. It is also used to measure the absorption of fluids and other substances. In UV-Visible spectroscopy analysis, a light beam divides in half, with one half analyzing the compound or solution in the transparent cell and the other half analyzing the reference material. The reason for the analysis is that the solution absorbs light at specific wavelengths; this wavelength is known as the surface plasmon resonance (SPR) of the material being analyzed [34]. Figure 2 displays the UV-Visible spectra of the prepared specimen from 200 to 800 nm. However, around 264nm with a broad spectrum range of approximately 264-800nm, CuO formation was observed [35].

#### Morphological analysis (SEM)

SEM analysis reveals the spherical form of microparticles (Fig. 3). With average diameter around 1-1.5µm, the uniform microspheres revealed from accumulation in the nanoparticle because of plant extract with a particle size of 70-85nm. Constant heating at the higher temperature of homogeneous nucleation contributes to the development of a uniform minimum sintered sphere. Nanomaterials are unquestionably referred to as isotropic (36) due to the consistency of their physical properties. Table 1 displays the constituent elements. In addition, EDX spectra confirmed the presence of CuO in the prepared specimen. (Fig.4). With *Murraya koenigii* leaf extract, the EDX model confirmed the effective formation of CuO nanoparticles. Peak positions matched those of copper oxide, and EDX peaks indicated that the CuO nanoparticles synthesized had a crystalline (Orthorhombic) structure.

#### Muththamizh et al.,

#### Spectral Analysis (FTIR)

The FTIR analysis exhibits a functional bond in the CuO nanoparticles was shown in (Fig. 5). The strong bands absorbed at 3402cm<sup>-1</sup> associated with the stretching vibrations of the hydroxyl group (O-H). The adsorption at 1631cm<sup>-1</sup> corresponds to the alkene group stretching (C=C). The absorption band at 1136cm<sup>-1</sup> is indicative of the bending vibrations of (C=O) into the carbonyl group. The absorption of (C-H) at 792cm<sup>-1</sup> represents bending oscillations. The absorbance band exhibited at 593cm<sup>-1</sup> corresponds to CuO.

#### **Emission Studies (Photoluminescence)**

Fig. 6 shows Photoluminescence (PL) spectra of CuO nanoparticles. At room temperature, the PL spectrum is obtained at 465 nm. Because the new excitation wavelength excites discrete states emitted at different energies, the sharp emission peak varies from 433 nm to 465 nm. The radioactive recombination of a photo generating hole with oxygen vacancy-filling electron cause visible luminescence [37-38].

#### Photocatalytic activity on methyl orange dye

To investigate the mobility of organic pollutant removal from waste water, photocatalytic activity of dye degradation was utilized. Under specific conditions, the degradation efficiency of CuO nanoparticles on methyl orange dye under natural sunlight irradiation was measured. UV-Visible spectrometer with the wavelength range (200-600 nm) was used to analyze the effect of CuO NP on the concentration of methyl orange. The absorption peak of MO occurs at 474 nm. A MO of 10-3 is utilized for the dye degradation test. To examine the degradation of methyl orange in the presence and absence of CuO nanoparticles, 10-3 M of methyl orange dye was added to 100 ml of distilled water. After the dye has dissolved, 0.1g of CuO NPs catalyst is applied to the dissolved dye concentration.

Efficiency ( $\eta$ ) = [(Co-Ct) / Co] ×100

where,  $\eta$  - The degradation efficiency

Co- Initial concentration

Ct – Concentration at time (t)

Samples were taken to estimate the decrease in absorbance of MO after adding CuO NPs; the first sample was taken just after the addition of CuO NPs. The samples was placed under sunlight, there was a sudden lowering in the concentration of dye after the involving of CuO NP stabilized through *Murraya koenigii* leaf extract, and shows 89 % of dye degradation was observed at 145 minutes.

The obtained results shows that the catalytic fine effect of the CuO sample NPs prepared with *Murraya koenigii* leaf extract illustrated good catalytic activity. The presence of catalyst, the reaction is speed up by the absorption of photons in the presence of catalyst with the energy that should be equal or greater than the band gap energy of the CuO catalyst. Due to the photon absorption, there is a transfer of electron from the valence band to the conduction band of CuO catalyst, thus creating a hole in the valence band. These activated electrons which are activated is react with an oxidant of dye to create a reduced product.

## CONCLUSION

The present study investigates the orthorhombic structure of CuO nanoparticles using *Murraya koenigii* leaf extract in a green synthesis. X-ray diffraction analysis verifies the appearance and typical crystalline size of CuO nanoparticles. The spherical shape of *Murraya koenigii* is revealed via SEM analysis. The FTIR results can be used to determine the surface's chemical composition, purity, and presence of biomolecules. The photocatalytic methyl orange dye concentration is used to investigate the 89% CuO NPs degradation.

**Conflict of interest** There is no conflict of interest.

Muththamizh et al.,

## ACKNOWLEDGEMENT

The authors extend their grateful regards to the Annamalai University, Chidambaram for providing CISL (Centralized Instrumentation and Service Laboratory) facilities for synthesizing and performing the photocatalytic activity of CuO nanoparticles.

## ABSTRACT

In this paper the concept of hypersoft generalized closed sets in hypersoft topological space is discussed. Since of their properties are discussed in detail.

**Keywords**: Hypersoft sets, hypersoft topology, hypersoft open sets, hypersoft closed sets, hypersoft Generalized Open sets

## INTRODUCTION

A soft set is a collection of approximate descriptions of an object. In 1999, Molodtsov [7] developed the concept of a soft set to handle difficult problems in economics, engineering, and the environment, where no mathematical methods could effectively deal with the many types of uncertainty. Maji *et al.* in [6] developed various operators for soft set theory and conducted a more detailed theoretical analysis of soft set theory. Various operations analogous to union, intersection, complement, difference etc. in set theory have been discussed in the context of soft sets (see [2, 3, 4, 16]). Topological structures on soft sets, in a similar manner, are more generalized methods that can be used to measure the similarities and differences between the objects in a universe which are soft sets. There are two versions of soft topology defined on soft sets, one by Shabir [15] and other by Cagman *et al.* [5]. The main difference between these approaches is that the first investigates a sub collection of all soft sets in an initial universe with a fixed set of parameters, whereas the second considers a sub collection of all soft sets by substituting the function with a multi-argument function described in the cartesian product with a different set of parameters. This concept is more adaptable than the soft set and more useful when it comes to making decisions. Musa and Asaad [8,9]) introduced a new idea of hypersoft sets called bipolar hypersoft sets and they investigated some of their bipolar hypersoft

#### Mythili and Arokialancy

topological structures. Researchers have been drawn to hypersoft set structure because it isbetter suited to decisionmaking diffculties than soft set structure. Despite the fact that it is a new concept, numerous studies have been conducted, and the field of study continues togrow [1, 10, 11, 12]. In this paper we have introduced generalized hypersoft sets and studied their properties.

#### Preliminaries

**Definition 2.1. [16]** A pair (F,  $A_1 \times A_2 \times ... \times A_n$ ) is called a hypersoft set over U, where F is a mapping given by F :  $A_1 \times A_2 \times ... \times A_n \rightarrow P(U)$ .

Simply, we write the symbol E for  $E_1 \times E_2 \times ... \times E_n$ , and for the subsets of E : the symbols A for  $A_1 \times A_2 \times ... \times A_n$ , and B for  $B_1 \times B_2 \times ... \times B_n$ . Clearly, each element in A, B and E is an n-tuple element. We can represent a hypersoft set (F,A) as an ordered pair, (F,A) = {( $\alpha, F(\alpha)$ ) :  $\alpha \in A$ }.

**Definition 2.2. [11]** For two hypersoft sets (F,A) and (G,B) over a common universe U, we say that (F,A) is a hypersoft subset of (G,B) if

(1)  $A \subseteq B$ , and

(2)  $F(\alpha) \subseteq G(\alpha)$  for all  $\alpha \in A$ . We write  $(F,A) \subseteq (G,B)$ .

**Definition 2.3. [11]** Two hypersoft sets (F,A) and (G,B) over a common universe U are said to be hypersoft equal if (F,A) is a hypersoft subset of (G,B) and (G,B) is a hypersoft subset of (F,A).

**Definition 2.4. [11]** The complement of a hypersoft set (F,A) is denoted by  $(F,A)^c$  and is defined by  $(F,A)^c = (F^c, A)$  where  $F^c : A \to P(U)$  is a mapping given by  $F^c(\alpha) = U \setminus F(\alpha)$  for all  $\alpha \in A$ .

**Definition 2.5. [12]** A hypersoft set (F,A) over U is said to be a relative null hypersoft set, denoted by ( $\Phi$ ,A), if for all  $\alpha \in A$ ,  $F(\alpha) = \phi$ .

**Definition 2.6. [12]** A hypersoft set (F,A) over U is said to be a relative whole hypersoft set, denoted by (X,A), if for all  $\alpha \in A$ ,  $F(\alpha) = U$ .

**Definition 2.7. [12]** Difference of two hypersoft sets (F,A) and (G,B) over a common universe U, is a hypersoft set (H, C), where  $C = A \cap B$  and for all  $\alpha \in C$ ,  $H(\alpha) = F(\alpha) \setminus G(\alpha)$ . We write (F,A)  $\setminus$  (G,B) = (H, C).

**Definition 2.8. [12]** Union of two hypersoft sets (F,A) and (G,B) over a common universe U, is a hypersoft set (H, C), where  $C = A \cap B$  and for all  $\alpha \in C$ ,  $H(\alpha) = F(\alpha) \cup G(\alpha)$ . We write  $(F,A) \cup (G,B) = (H, C)$ .

**Definition 2.9. [11]** Intersection of two hypersoft sets (F,A) and (G,B) over a common universe U, is a hypersoft set (H, C), where C = A $\cap$ B and for all  $\alpha \in C$ ,  $H(\alpha) = F(\alpha) \cap G(\alpha)$ . We write (F,A)  $\cap$  (G,B) = (H, C).

**Definition 2.10 [11]** Let (F,E) be a hypersoft set over U and  $u \in U$ . Then  $u \in (F, E)$  if  $u \in F(\alpha)$  for all  $\alpha \in E$ . Note that for any  $u \in U, u \notin (F, E)$ , if  $u \notin F(\alpha)$  for some  $\alpha \in E$ .

**Definition 2.11[13]**. Let  $\tau_H$  be the collection of hypersoft sets over U, then  $\tau_H$  is said to be a hypersoft topology on U if (1) ( $\Phi$ ,E), (X,E) belong to  $\tau_H$ ,

(2) the intersection of any two hypersoft sets in  $\tau$ H belongs to  $\tau$ H,

(3) the union of any number of hypersoft sets in  $\tau$ H belongs to  $\tau$ H.

Then  $(U, \tau_{H,E})$  is called a hypersoft topological space over U.

**Definition 2.12[13].** Let  $(U, \tau_{H}, E)$  be a hypersoft space over U, then the members of  $\tau_{H}$  are said to be hypersoft open sets in U.

**Definition 2.13[13]**. Let  $(U, \tau_{H}, E)$  be a hypersoft space over U. A hypersoft set (F, E) over U is said to be a hypersoft closed set in U, if its complement (F, E) belongs to  $\tau_{H}$ . The union of two hypersoft topologies on U may not be a hypersoft topology on U.

**Definition 2.14[13]:** Let  $(U, \tau_{H1}, E)$  and  $(U, \tau_{H2}, E)$  be two hypersoft topological spaces over U. if  $\tau_{H1} \subset \tau_{H2}$  then  $\tau_{H2}$  is said to be finer than  $\tau_{H1}$ . If  $\tau_{H1} \subset \tau_{H2}$  or  $\tau_{H2} \subset \tau_{H1}$  then  $\tau_{H1}$  and  $\tau_{H2}$  are said to be comparable hypersoft topologies over U comparable hypersoft topologies over U

#### Hypersoft Generalized Closed Sets

Let U be an initial universe set and E be the non-empty set of parameters. Now we shall define the new relatively closed set in the following definition.

#### Mythili and Arokialancy

#### **Definition 3.1**

A hypersoft set (Hs, E) is called a hypersoft generalized closed (hypersoft g-closed) in a hypersoft topological space (X,TH, E) if cl (Hs,E)  $\subset$  (U,E) whenever (Hs,E)  $\subset$  (U,E) and (U,E) is hypersoft open in X

#### Theorem3.2

If (Hs,E) is hypersoft g-closed in X and (Hs,E)  $\subset$  (A, E)  $\subset$  *cl* (Hs,E) *t*hen (A,E) is hypersoft g-closed. **Proof** Suppose that, (Hs,E) is hypersoft g-closed in X and (Hs,E)  $\subset$  (A, E)  $\subset$  *cl* (Hs,E) Let (A,E)  $\subset$  (U,E) and (U,E) is hypersoft open in X Since (Hs,E)  $\subset$  (A,E) and (A,E)  $\subset$  (U,E) We have, (Hs,E)  $\subset$  (U,E) Hence *cl* (Hs,E)  $\subset$  (U, E) (Since (Hs,E) is hypersoft g-closed) Since (A, E)  $\subset$  *cl* (Hs,E) we have, *cl* (A,E)  $\subset$  *cl* (Hs,E)  $\subset$  (U,E) Therefore (A,E) is hypersoft g-closed.

#### Theorem 3.3

If (A<sub>H</sub>,E) and (B<sub>H</sub>,E) are hypersoft g-closed sets then so is (A<sub>H</sub>,E)  $\cup$  (B<sub>H</sub>,E). **Proof** 

Suppose that (A<sub>H</sub>, E) and (B<sub>H</sub>, E) are hypersoft g-closed sets. Let (A<sub>H</sub>,E)  $\cup$  (B<sub>H</sub>,E)  $\subset$  (U,E) and (U,E) is hypersoft open in X Since (A<sub>H</sub>,E)  $\cup$  (B<sub>H</sub>,E)  $\subset$  (U,E) we have. (A<sub>H</sub>,E)  $\subset$  (U,E) and (B<sub>H</sub>,E)  $\subset$  (U,E) Since (U,E) is hypersoft open in X and (A<sub>H</sub>,E) and (B<sub>H</sub>,E) are hypersoft g-closed sets. We have, *cl* (A<sub>H</sub>,E)  $\subset$  (U, E) and, *cl* (B<sub>H</sub>,E)  $\subset$  (U, E) Therefore *cl* (A<sub>H</sub>,E)  $\cup$  (B<sub>H</sub>,E) = *cl* (A<sub>H</sub>,E)  $\cup$  *cl* (B<sub>H</sub>,E)  $\subset$  (U, E)

This completes the Proof.

#### Theorem 3.4

If a set (Hs,E) is hypersoft g-closed in X if and only if cl (Hs,E)  $\setminus$  (Hs,E) contains only null hypersoft closed set. **Proof** 

Suppose that, (Hs,E) is hypersoft g-closed in X. Let (A,E) be hypersoft closed and  $(A,E) \subset cl$   $(Hs,E) \setminus (Hs,E)$ Since A is hypersoft closed we have its relative complement A' is hypersoft open. Since  $(A,E) \subset cl$   $(Hs,E) \setminus (Hs,E)$  we have  $(A,E) \subset cl$  (Hs,E) and  $(A,E) \subset (Hs,E)'$ Hence, (Hs,E)  $\subset$  (A,E)' Consequently cl (H<sub>5</sub>,E)  $\subset$  (A,E)' (Since (H<sub>5</sub>,E) is hypersoft g-closed set in X) Therefore  $(A,E) \subset cl$  (Hs,E)'Hence  $(A,E) = \varphi$ , Hence,  $cl(A,E) \setminus (A,E)$  contains only null hypersoft closed set. One can easily prove the converse part. Corollary 3.5 A hypersoft g-closed (Hs,E) is hypersoft closed if and only if cl (Hs,E) \ (Hs,E) is hypersoft closed. Proof If (Hs,E) is hypersoft closed, then cl (Hs,E) \ (Hs,E) =  $\varphi$ Consequently, suppose that, cl (Hs,E) \ (Hs,E) is hypersoft closed. Since (Hs,E) is hypersoft g-closed. cl (Hs,E) \ (Hs,E) =  $\varphi$  (by the theorem)

Hence (Hs,E) is hypersoft closed.

## Mythili and Arokialancy

#### \Theorem 3.6

Let  $(H_s,E)$  be a hypersoft g-closed set and suppose that (A,E) is a hypersoft closed set. Then  $(H_s \cap A,E)$  is a hypersoft g-closed set.

**Proof:** It is obvious

#### Hypersoft Generalized Open Sets

**Definition 4.1:** A hypersoft set (Hs,E) is called a hypersoft generalized open (hypersoft g-open) in a hypersoft topological space(X, $\tau$ H, E) if the relative complement (Hs, E)' is hypersoft g-closed in X.

Equivalently, a hypersoft set (Hs,E) is called a hypersoft generalized open (hypersoft g-open) in a hypersoft topological space (X,  $\tau$ H, E) if and only if (A, E)  $\subseteq$  (Hs,E)<sup>o</sup> whenever (A, E)  $\subset$  (Hs,E) and (A, E) is hypersoft closed in X.

#### Theorem 4.2

If (Hs,E) is hypersoft g-open in (X, $\tau$ H, E) and *int* (Hs,E)  $\subseteq$  (A, E)  $\subset$ (Hs,E) then (A, E) is hypersoft g-open. **Proof** 

Suppose that (Hs,E) is hypersoft g-open in (X, $\tau$ H, E) and *int* (Hs,E)  $\subseteq$  (A, E)  $\subset$ (Hs,E)

Let  $(B, E) \subset (A, E)$  and (B, E) is hypersoft closed in X.

Since  $(A,E) \subset (Hs,E)$  and  $(B,E) \subset (A,E)$  we have  $(B,E) \subset (Hs,E)$ 

Hence  $(B,E) \subset int (Hs,E)$  {since (Hs,E) is hypersoft g-open }

Since *int* (Hs,E)  $\subset$  (A,E) we have (B,E)  $\subset$  *int* (Hs,E)  $\subset$  *int* (A,E)

Therefore (A,E) is hypersoft g-open.

#### Theorem 4.3

If (F,E) and (G,E) are hypersoft g-open sets then so is  $(F, E) \cap (G, E)$ 

#### Proof

Suppose that (F,E) and (G,E) are hypersoft g-open sets

Let  $(A, E) \subset (F, E) \cap (G, E)$  and (A, E) is hypersoft closed set in  $(X, \tau_H, E)$ 

Since  $(A, E) \subset (F, E) \cap (G, E)$  we have  $(A, E) \subset (F, E)$  and  $(A, E) \subset (G, E)$ 

Since (A,E) is hypersoft closed in (X,TH, E) and (F,E) and (G,E) are hypersoft g-open sets we have,

 $(A, E) \subset int (F, E)$  and  $(A, E) \subset int (G, E)$ 

Therefore  $(A, E) \subset int (F, E) \cap int (G, E)$ 

This completes the proof.

#### Remark 4.4

The union of two hypersoft topologies on U may not be a hypersoft topology on U

#### Example 4.5

Let U=  $\{a_1, a_2, a_3, a_4\}$ , E= $\{e_1, e_2, e_3, e_4\}$ , E<sub>1</sub>=  $\{e_1, e_2\}$ , E<sub>2</sub>= $\{e_3\}$ , and E<sub>3</sub>= $\{e_4\}$ .

Let  $\tau_{H1}=\{(\phi, E), (X, E), (F_1, E), (F_2, E), (F_3, E)\}$  and  $\tau_{H2}=\{(\phi, E), (X, E), (G_1, E), (G_2, E), (G_3, E)\}$  be two hypersoft topologies defined on U where  $(F_1, E), (F_2, E), (F_3, E), (G_1, E), (G_2, E), (G_3, E)$  are hypersoft sets over U defined as follows

 $\begin{aligned} &(F_1, E) = \{ ((e_1, e_3, e_4), \{a_3, a_4\}), ((e_2, e_3, e_4), \{a_2, a_3\}) \} \\ &(F_2, E) = \{ ((e_1, e_3, e_4), \{a_1, a_2, a_3\}), ((e_2, e_3, e_4), \{a_1, a_4\}) \} \\ &(F_3, E) = \{ ((e_1, e_3, e_4), \{a_3\}), ((e_2, e_3, e_4), \emptyset) \} \\ &\text{and} \\ &(G_1, E) = \{ ((e_1, e_3, e_4), \{a_3, a_4\}), ((e_2, e_3, e_4), \{a_1, a_3, a_4\}) \} \\ &(G_2, E) = \{ ((e_1, e_3, e_4), \{a_1, a_2\}), ((e_2, e_3, e_4), \{a_2, a_4\}) \} \\ &(G_3, E) = \{ ((e_1, e_3, e_4), \emptyset), ((e_2, e_3, e_4), \{a_4\}) \} \\ &\text{Then } \tau_{H1} \cup \tau_{H2} = \{ (\emptyset, E), (X, E), (F_1, E), (F_2, E), (F_3, E), (G_1, E), (G_2, E), (G_3, E) \} \end{aligned}$ 

If we take  $(F_1, E) \cup (G_1, E) = (H, E)$  then  $(H, E) = \{((e_1, e_3, e_4), \{a_3, a_4\}), ((e_2, e_3, e_4), U)\}$  but (H, E) does not belongs to  $\tau_{H1} \cup \tau_{H2}$ . Hence  $\tau_{H1} \cup \tau_{H2}$  is not a hypersoft topology on U

## ABSTRACT

In Present research article, we have investigated isotropic and anisotropic Bianchi type-III string cosmological model with five dimension in General Relativity in presence of perfect fluid. We have also studied some physical and geometrical aspects of obtained models.

Keywords: Five dimensional, Bianchi type-III, String.

## INTRODUCTION

String cosmology has recently attracted a lot of attention, due to its crucial significance in the study of the universe's early stages before the development of particles. Therefore, cosmologists have shown a great deal of interest in learning about the cosmos in the current age, as well as its past and present states of existence and how it will evolve in the future. We still don't have enough information to draw fir conclusion on its genesis and evolution. Therefore, it is crucial to conduct further research in order to uncover undiscovered cosmic phenomena. Before the creation of the first particle in the universe, the string theory was a useful idea. Letelier[1,2] and Satchel[3] initially describe the general relativistic formation of the cosmic strings. Additionally, in 1983, he used the Einstein's field equation for a cloud of heavy strings to generate cosmic models in the Bianchi type I and Kantowskiu-Sachs space times. Several notable authors have recently shown an interest in cosmic strings in general relativity because of the vital part that strings play in characterising The creation of our universe's early stages Kibble[4,5]. Singh and Mollah[6] constructed several cosmological models of the universe using Lyra geometry. Trivedi and Bhabor[7] have recently tackled string cosmological models of Bianchi type III with dark energy in the context of Brans-Dicke scalar-tensor theory of gravitation. One of the fundamental goals of cosmological models is to describe the various stages of the universe in terms of the temporal history of its acceleration field. There is mounting evidence that dark energy currently rules the universe. Bianchi Type-IX String Cosmological Models for Perfect Fluid Distribution in General Relativity were studied by Tyagi[8] et al. Additionally, Tyagi and Sharma[9] have looked into a few bulk viscous string cosmological

#### Tasneem Sanawadwala and Keerti Acharya

models of the Bianchi type II with an electromagnetic field. Furthermore, they used the assumption that the shear and expansion are proportionate in order to get at an obvious conclusion. Sahoo and Mishra[10] have created Five dimensional Bianchi type III cosmological models for quark matter coupled to a string cloud in general relativity. They considered about and discussed about much metric potential scenarios. All of the models' kinematical and physical characteristics are discussed.

Tyagi and Sharma[11] have examined the bulk viscous fluid in the LRS Bianchi Type-II Magnetised String Cosmological Model. By considering into account five-dimensional space-time, Baro and Singh[12] investigate a Bianchi type-III string cosmological model with bulk viscous fluid and a negative constant Declaration parameter in general relativity. They acquired some of the crucial model parameters and their behaviours. The Bianchi type-V magnetised string cosmology model with variable magnetic permeability for viscous fluid distribution was studied by Tyagi and Sharma[13]. In the context of Saez-Ballester theory Baruah and Daimary[14] looked into the interaction of a five-dimensional Bianchi type-I anisotropic cloud string cosmological model with an electromagnetic field. Assuming a condition between energy density and string tension density, Acharya and Sanawadwala[15] examined some Bianchi type III string cosmological models for ideal fluid distribution using a different approach. Hoyle-Narlikar C-field cosmology with Bianchi type-V non-static space-time in higher dimensions was researched by Kishor[16] et al. A five-dimensional plane symmetric Bianchi type-I cosmological model created by a cloud of strings and bulk viscosity in general relativity was taken into consideration by Mete and Deshmukh[17]. Mollah[18] et al. study a homogeneous and anisotropic space-time that is characterised by a Bianchi type-III metric with a perfect fluid in a Lyra geometry.

We investigated five-dimensional Bianchi type-III string cosmological models with perfect fluid distribution in general relativity in this study, which was inspired by the situations that were covered above. In order to obtain different situations for the Bianchi type model Universe, we solved the surviving field equations under some specific simplifying assumptions, like the universe changes from being anisotropic early on to being isotropic later on. There is also discussion of a few geometrical and physical characteristics of models.

#### The Metric And Field Equations

Five-dimensional Bianchi-type – III metric is given by

$$ds^{2} = -dt^{2} + A^{2}dx^{2} + B^{2}e^{-2x}dy^{2} + C^{2}dz^{2} + D^{2}dm^{2}.$$
 (1)

Where A, B, C, and D are the only metric functions of comic time't'. In this situation, it is presumed that the additional fifth coordinate, "m," is space-like. For the above line element we assume

$$x^{1} = x$$
,  $x^{2} = y$ ,  $x^{3} = z$ ,  $x^{4} = m$  and  $x^{5} = t$ . (2)  
The general relativity Einstein's field equation is given by

The general relativity Einstein's field equation is given by

$$R_{ij} - \frac{1}{2} R g_i^{\ j} = -T_i^{\ j}. \tag{3}$$

The energy-momentum tensor for a cloud string is given by

$$T_{ij} = \rho v_i v_j - \lambda x_i x_j$$
.  
The energy density  $\rho$  for a cloud of strings with extreme mass with particles attached.  
So, we write

$$\rho = \rho_p + \lambda \,, \tag{5}$$

 $\rho_{p}$   $\lambda$  is the rest energy density of particles and  $\lambda$  is the string tension density of cloud of string. The fifth coordinate is taken to be space like and the coordinate are co-moving. where  $v^{i}$  is the five velocity vector of particles given by  $v^{i} = (0, 0, 0, 0, 1)$  and  $x^{i} = (0, 0, \mathbb{C}^{-1}, 0, 0)$ .

(4)

#### Tasneem Sanawadwala and Keerti Acharya

#### Such that,

$$v_i v^j = -x_i x^j = -1$$
 and  $v_i x^i = 0$ .

The field equation for the metric (1) takes the form

$$\frac{\ddot{B}}{B} + \frac{\ddot{C}}{C} + \frac{\ddot{D}}{D} + \frac{\dot{B}\dot{C}}{BC} + \frac{\dot{B}\dot{D}}{BD} + \frac{\dot{C}\dot{D}}{CD} = 0$$

$$\frac{\ddot{A}}{A} + \frac{\ddot{C}}{C} + \frac{\ddot{D}}{D} + \frac{\dot{A}\dot{C}}{AC} + \frac{\dot{A}\dot{D}}{AD} + \frac{\dot{C}\dot{D}}{CD} = 0$$
(6)

$$\frac{\ddot{A}}{A} + \frac{\ddot{B}}{B} + \frac{\ddot{D}}{D} + \frac{\dot{A}\dot{B}}{AB} + \frac{\dot{A}\dot{D}}{AD} + \frac{\dot{B}\dot{D}}{BD} - \frac{1}{A^2} = \lambda$$
(7)

$$AB^{+}AC^{+}AD^{+}BC^{+}BD^{+}CD^{-}A^{2}^{-}P^{-}$$
(10)

$$\frac{A}{A} - \frac{B}{B} = 0 \tag{11}$$

Case-I: Isotropic Model

We have consider the Isotropic model as  $A=B=C=t^{n_1}$  and  $D=t^{n_2}$ 

#### Where $n_1$ and $n_2$ are two arbitrary constants.

By using equation (12) in equations (6-11), we get

$$\frac{1}{t^2} (3n_1^2 + 2n_1n_2 - 2n_1 - n_2 + n_2^2) = 0$$
(13)

$$\frac{1}{t^2} (3n_1^2 + 2n_1n_2 - 2n_1 - n_2 + n_2^2) - \frac{1}{t^{2n_1}} = \lambda$$
(14)

$$\frac{3}{t^2}(2n_1^2 - n_1) - \frac{1}{t^{2n_1}} = 0$$
(15)

$$\frac{3}{t^2}(3n_1^2 + 3n_1n_2) - \frac{1}{t^{2n_1}} = \rho$$
(16)

We observe that isotropic model will expand as  $t \rightarrow \infty_{\text{when}} n_1 > 0$  and extra dimension will contract as t approaches to infinite if  $n_2 < 0$ .

In this particular case, the metric describes the model's geometry,

$$ds^{2} = -dt^{2} + t^{2n_{1}}(dx^{2} + e^{-2x}dy^{2} + dz^{2}) + t^{2n_{2}}dm^{2}.$$
(17)

The scalar expansion for model (17) is given by

(12)

#### Tasneem Sanawadwala and Keerti Acharya

$$\theta = \frac{1}{t}(3n_1 + n_2) \tag{18}$$

The rest energy density  $\,
ho\,$  is given by

$$\rho = \frac{3}{t^2} (3n_1^2 + 3n_1n_2) - \frac{1}{t^{2n_1}}$$
<sup>(19)</sup>

The string tension density  $\lambda$  is given by

$$\lambda = \frac{1}{t^2} \left( 3n_1^2 + 2n_1n_2 - 2n_1 - n_2 + n_2^2 \right) - \frac{1}{t^{2n_1}}$$
<sup>(20)</sup>

And using equations 18 and 19, the particle density is given by

$$\rho_p = \frac{1}{t^2} (n_1 n_2 + 2 n_1 + n_2 + n_2^2)$$
<sup>(21)</sup>

The Hubble parameter is derived as

$$H = \frac{1}{4t} (3n_1 + n_2)$$
(22)

Spatial volume is derived as

$$V = \frac{n_1^2 + n_2}{t^4}$$
(23)

Deceleration Parameter is derived as q = -4(24)

#### **Case I: Physical Interpretations**

In this instance, Equation 17 anisotropic Bianchi type-I string cosmology model in five dimensions of space-time has been constructed. Equation (18–24) represents the model's physical and geometric solutions.

Initially at t = 0, the expansion  $\theta \rightarrow \infty$  and as the time t increases gradually it decreases and finally it becomes 0 when t  $\rightarrow \infty$  with the positive values of  $n_1, n_2$ . The model thus demonstrates that the Universe is expanding with the passage of time, but that the rate of growth slows as time passes and ceases at time t  $\rightarrow \infty$ .

It is observed that the value of the deceleration parameter is always negative whatever be the value of  $n_1$  and  $n_2$  which show a that our model (17) decelerates in the standard way which is in accordance with the present-day observational scenario of accelerating Universe.

#### **Case II: (Anisotropic Model)**

In this case, we have assumed

$$A = t^{m_1}, B = t^{m_2}, C = t^{m_3} \text{ and } D = t^{m_4}$$
 (25)

Where  $m_1$ ,  $m_2$ ,  $m_3$  and  $m_4$  are three arbitrary constants.

Using equation (25) in equations (6)-(11), we get

$$\lambda = \frac{1}{t^2} [m_1^2 + m_2^2 + m_4^2 + m_1 m_2 + m_1 m_4 + m_2 m_4 - (m_1 + m_2 + m_4)] - \frac{1}{t^{2m_1}}$$
(26)

$$\rho = \frac{1}{t^2} [m_1(m_2 + m_3 + m_4) + m_2 m_3 + m_3 m_4 + m_4 m_2] - \frac{1}{t^{2m_1}}$$
(27)

$$\rho_p = \frac{1}{t^2} [(\mathbf{m}_3 + 1)(\mathbf{m}_1 + m_2 + m_4) - (\mathbf{m}_1^2 + m_2^2 + m_4^2)]$$
(28)

63135

## Tasneem Sanawadwala and Keerti Acharya

when  $m_1$ ,  $m_2$  and  $m_3$  are all positive then we observed that the anisotropic three space will expand as t approaches

to infinite and the extra dimension will contract as  $t \rightarrow \infty$  if  $m_4 < 0$ In this particular case, the matrix describes the model's geometry.

$$ds^{2} = -dt^{2} + t^{2m_{1}}dx^{2} + t^{2m_{2}}e^{-2x}dy^{2} + t^{2m_{3}}dz^{2} + t^{2m_{4}}dm^{2}.$$
(29)

The coefficient of scalar expansion  $\theta$  for model (29) is given by

$$\theta = \frac{k}{t}, \tag{30}$$

Where,  $m_1 + m_2 + m_3 + m_4 = k$ 

The Hubble parameter is derived as

$$H = \frac{k}{4t} \tag{31}$$

Spatial volume of universe is derived as

$$V = t^{k},$$
(32)

Deceleration Parameter is derived as

$$q = \frac{4}{k} - 1 \tag{33}$$

#### Physical Interpretations Of The Case II

In this case, it is seen that the deceleration parameter has a positive constant value when k<4, indicating that our model Universe (29) decelerates in the usual manner, and a negative constant value when k>4, indicating that our model Universe accelerates in the usual manner. The Bianchi type models, on the other hand, depict the universe at its early stages of evolution, and while the universe decelerates in the usual manner, in the early universe it will accelerate in finite time due to comic recollapse where the universe in turns inflates "decelerates and then accelerates."

In case II, we have built the five-dimensional anisotropic Bianchi type-I string cosmological model in general relativity, which is given by Equation 29. The model's geometrical and physical behaviour can be discussed as.

when  $m_1 + m_2 + m_3 + m_4$  are all positive, we noticed that our model grew along the x, y, and z axes as t  $\rightarrow \infty$ ,

whereas the extra dimension contracted and disappeared at t  $\rightarrow \infty$ , when  $M_4 < 0$ .

At the initial, or t equals 0, it is seen that the energy density is  $\varrho \to \infty$  and  $\varrho \to 0$  as  $t \to \infty$  and that it meets the reality condition when  $m_1 + m_2 m_3 + m_3 m_4 + m_4 m_2 > m_1^2$ .

Additionally, it is noted that the particle density ( $\rho_p$ ) is infinite when time t= 0, it declines as time (t) increases, and

finally becomes 0 as t  $\rightarrow \infty$ . When, it meets the reality condition  $(m_1^2 + m_2^2 + m_3^2 + m_4^2) < 1$ .

The spatial volume V in this model is 0 at the first epoch t = 0, and increases with respect to time, indicating that our model Universe is expanding as time progresses.

The expansion scalar  $\theta \to \infty$  at initial t = 0, and as the time progresses gradually it decreases and finally it becomes 0 when t  $\to \infty$ . The model thus demonstrates that the Universe is expanding with the passage of time, but that the rate of expansion slows as time passes and ceases at time t  $\to \infty$ .

When l<4, it is seen that the deceleration parameter q value is positive, indicating that the universe in our model briefly slows down. Additionally, it is noted that the deceleration parameter q has a negative value when l > 4, suggesting that our model Universe accelerates in a manner consistent with the current observable scenario of an accelerating Universe.

#### Tasneem Sanawadwala and Keerti Acharya

## CONCLUSION

According to the isotropic model, our model universe decelerates in a manner that is consistent with the current empirical scenario in which the universe is accelerating. According to the anisotropic model, the universe is expanding as time goes on, but the rate of expansion slows down and eventually ceases at time  $t \rightarrow \infty$ . Our model is seen to be anisotropic, expand, shear, decelerate initially and then accelerate in the later stages. The extra dimension contracts and becomes unobservable at time  $t \rightarrow \infty$  as the model grows along the x, y, and z axes.

## ACKNOWLEDGMENT

Authors are thankful to referee and editorial team for their valuable suggestions.

## ABSTRACT

India is on the 2<sup>nd</sup> largest most excessively populated country all over the world, and at present the requirement for food and water is in huge amount. The State production and supply of essentials needed to be assess, for this purpose its very much necessary to know the pattern of the resources like land and water etc. The Changes in the environment which occurs indirectly or directly affects the ecosystem. Due to rapid urbanization, globalization and industrialization many of the major cities is been growing larger and larger and the merging of the nearby areas with the cities is being done without any proper planning. The water cycle has been affected very strongly by all the anthropogenic activities and the quantity and quality of the water availability is affected by water cycle due to that effect it's not astounding that many of the river basins experiencing water scarcity due to sudden changes in hydrological cycle. It's very important to know the different effects of changes occurring in land use/land cover and envisage the consequences and steps to be followed to reduce the effect consequently. In the present study SWAT platform is used where the inputs are given and simulation is done by using RS and GIS for the prediction of parameters which contributes to changes. The given study emphases on the surface runoff which is commonly effected by the land cover changes over there. The study is done by entering the processed data in GIS environment. This data gives all the essential parameters for the input in SWAT (Soil and water assessment tool). The simulation run in SWAT was carried out by using the runoff inputs which is generated for the specific time period in the study area. GIS Environment processes the input given to SWAT and then reading the responses of the runoff of the basin catchment

#### Kavita Singh et al.,

for the period given. There is a chance to envisage the concerns and consequences and find out the changes and which can decrease the complications of futures and can be recommended the given strategies to reduce the extreme changes which distresses the ecosystem and possibility for development of sustainable ecosystem.

Keywords: Remote Sensing, GIS, Land use, Land cover, SWAT, Arc GIS, Rainfall, Runoff.

## INTRODUCTION

Kinnerasani is the study area which is located in the state of Telangana (T.S). Telangana state is mostly an agricultural state in that state total 70% population depends on agriculture for getting its livelihood. The considerable attention has been taken for the development of large scale, medium scale and small scale industries in the Telangana districts. Due to this the urban the urban population was increased over the years. In general, natural resource base is limited. The current study area provides irrigation to the agricultural areas and provides water to (KTPS) Kothagudem thermal power station at Palvancha for thermal power generation.

#### **Objectives Of The Study**

- 1. Collection and assessment of data for the natural cover changes of the study area by input of parameters for the period 2009 and 2013.
- 2. Annual runoff generation of the study area in the time period given.
- 3. To calculate and evaluate the runoff response of the study area for the given period.
- 4. Development of strategies for the mitigation of the objectionable effects on land use/land cover.

#### Location and Extent

Kinnerasani, is a very important tributary of Godavari river. The study area covers an area of 910sq. km. The study area is located at 17° 41′ N and 80° 40′ E. The Kinnerasani basin storage capacity is 233 m<sup>3</sup>at the reservoir full level of 124.05m. The mandals Tekulapalli, Gundala, Plvancha and Burgampadu are under command areas and the catchment areas. Fig 1 Shows location map of the Study area.

#### **Climatic Conditions**

The climatic condition of the city is impartially justifiable with winter summer and rainy seasons. Based on the previous studies on climatologically data shows that south-west monsoon gives more than (75%) the average. Rest of the 25% summer showers constitutes from North- East monsoon. So the maximum amount of rainfall is received in south-west monsoon

#### Physiography

The details of physiographic area are the undulating terrain with a slope of 1-6%, varying from nearly level to a very steep slope. Among overall 13% of the area is nearly level and around 58% of the area is moderate sloping. The mean sea level elevation of the study area is 107m (351 ft.)

#### Soils

The Kinnerasani basin is mainly consists of two types of soils clay soils and clay loam soils. Whereas majority of the area around 84% is clay soils and 14% of the area occupies as clay loam soil rest of the 2% is under water bodies and rocks. Fig 2 shows the soil texture of the study area. The spatial variation of depth of soil is given in the fig no.3. About 62% of soils are moderately shallow to deep depth and about 36 % of soils are very shallow Kinnerasani basin soil productivity spatial variation has been depicted in fig 4. 14.72 % soils are ascetically productive and only 1% soils are non-productive Shown in the table 1

#### Kavita Singh et al.,

#### Soil And Water Assessment Tool (SWAT)

SWAT is a Hydrological model and is well organized for the users the long term impacts. SWAT functions on a regular time step at scale basin with ArcView GIS interface which is developed to envisage the impact on LU/LC (land use and land cover) by providing the parameters like Evapotranspiration runoff and potential evapotranspiration of large area uniformly and completely covered with continuous growing vegetation and unlimited supply of soil water. SWAT model simulates the quantity and quality of surface water and it also gives the impressions on all the parameters of the environment and ungauged watersheds by compelling specific data as the inputs and it as well as provides the precise data as inputs and it also make available the reflection to changed. SWAT is computationally effective for very large basins also. SWAT Methodology Flow chart is shown in fig no 5 and 6

#### **Process For Running SWAT**

#### SWAT Project Setup

First Click on SWAT PROJECT SETUP in ArcGIS software and give an output location

Delineation of Watershed:

For Delineation of watershed Click on watershed delineator and give DEM map as input for watershed delineation, Flow accumulation and direction, Watershed outlets and sub basin parameters and click on watershed delineation. Shown in the fig 7

#### **HRU** Analysis

- Click on HRU ANALYSIS in ArcGIS software and then on soil/land/slope definition.
- Then Input landuse/land cover layer, soil map of a year and then reclassify it by giving slopes values and overlay them and create HRU'S Analysis. Shown in the fig 9

#### Weather Data

Process of weather station

Nine weather stations are identified around the study area among all one weather station is selected for the collection of weather data. Shown in the Fig 10

#### **Running SWAT in GIS**

Stepwise methodology of Running SWAT in GIS shown in the fig 11

#### Implementation

#### Land Use/Land Cover Maps

land use land cover map of the study area shown in fig no. 12 showing changes in the year 2009 and 2013. The vegetation covers in the year 2009 is 18.94% as compared to 2013 the vegetation cover is 13.4 %

## RESULTS

#### 2009 Results

Swat reduced output is shown in the table2. Among which august month has received highest rainfall i.e. 355.4 cm and highest runoff i.e. 67.71. June July and August are the months for receiving highest precipitation. Fig 13 shows the graph of the year 2009 SWAT reduced output. Table 3 shows area wise feature present in study area of the year 2009. Wet land vegetation covers the highest % of the area i.e. around 43.93%. Among all of the features total water bodies covered in the total area is 1.57%. River catchment is around 20.6%. Graphical representation of features present shown in the fig. 14.

#### Kavita Singh et al.,

#### 2013 Results

Table 4 shows the 2013 SWAT reduced output of the study are. As per this data in the month of July the area receives the highest rainfall i.e. 863.5 cm and runoff is also highest in this region i.e. 350.44 cm. Fig. 15 shows the runoff and precipitation simulated graph of the year 2015. Table 5 shows the features present in the region. Where wetland vegetation is the highest% in the region i.e. 35.8% and water bodies present is 1.6% only. Fig 16 shows the graph of features present in the study area.

#### Comparison Of 2009 And 2013 Results

Table 6 shows the compared runoff of the year 2009 and 2013. As per this data runoff is the highest in the month of Julyi.e. 350.44 for the year 2013. This is due to the reduced vegetation in the year 2013 i.e. from 43.93% to 35.8% of wet land vegetation and 18.94% to 13.4% of healthy vegetation, which had made the soil water holding capacity less and increased rate of runoff has been observed. Fig 17 shows the runoff graph simulated upon comparing both the years and fig18 shows the graph of difference in area of the features.

## CONCLUSION

Planning decision making and implementation through an efficient management call for the generation of comprehensive information system The obtained results show in the study there is increase of the features like river catchment with sand, scrub land which is clear indication of there is increased runoff in the year 2013 and the area under which is under built up land and agriculture is increased whereas forest area is decreased. The results obtained by objective 3 shows that there is runoff increase in land use/land cover it is observed that there is decrease in healthy vegetation which results to increase in barren land and scrub land which finally leads to more runoff and less precipitation

#### Recommendations

Some strategies to mitigate the effect of heavy runoff are:

- Add plants and Protect trees
- > Catch runoff with modern techniques
- Cover soil .
- > Use modern methods of Agriculture.
- > Methods implemented for deep percolation.
- > Increase rain water harvesting structures and collect as much as rainwater without wasting it as runoff.
- > Use fewer chemicals and use Natural resources for agricultural purpose.
- Every individual should be responsible and take ownership of responsibilities and give hand in development of self and also surroundings.

## ABSTRACT

Z-number is an useful concept introduced by Zadeh. This paper introduces new type of averaging operators on Z-numbers. Its application in replacement problem in fuzzy environment is also highlighted.

Keywords : Z-number, Discrete Z-number, Lexicographic order, R Type Aggregation operator, GRTAO.

## INTRODUCTION

Z-number is an useful concept introduced by Zadeh[1,2,3]. It elegantly encapsulates vague information in a mathematical format. It captures information about both the fuzziness of the data and reliability of the data. Arithmetic operations on Z-numbers have been studied by Aliev[4,5], Shahilabhanu[6] etc. From application point of view, it becomes important to study averaging operators on Z-numbers. There have been very few studies in this regard. Jose M.Merigo, Montserrat Casanovas[7] dealt about OWA operators on fuzzy numbers. A new R Type arithmetic operations on Z-numbers was introduced by Stephen[8].This paper describes a new type of averaging operators on Z-numbers. Its application in replacement problem in fuzzy environment is also highlighted.

## Parameswari et al.,

## PRELIMINARIES

## **Definition : A Discrete Fuzzy number[3]**

A fuzzy subset L of the real line R with membership function  $\mu_L: R \to [0,1]$  is a discrete fuzzy number if its support is finite, i.e. there exist  $x_1, x_2, \dots, x_n \in R$  with  $x_1 < x_2 < \dots < x_n$ , such that  $supp(L) = \{x_1, x_2, \dots, x_n\}$  and there exist natural numbers s, t with  $1 \le s \le t \le n$  satisfying the following conditions: (1).  $\mu_L(x_i) = 1$  for any natural number i with  $s \le i \le t$ ,

(2).  $\mu_L(x_i) \le \mu_L(x_j)$  for each natural numbers i, j with  $1 \le i \le j \le s$ (3).  $\mu_L(x_i) \ge \mu_L(x_i)$  for each natural numbers i, j with  $t \le i \le j \le n$ 

## **Definition: Discrete Z-number[3]**

An ordered pair Z = (L, M), where L discrete fuzzy number on random variable X and M is a discrete fuzzy number with a membership function  $\mu_M : \{m_1, m_2, \dots m_n\} \rightarrow [0,1], \{m_1, m_2, \dots m_n\} \subset [0,1]$  is a discrete Z-number.

#### Definition : Zadeh'sDefinition of Z-number[3]

For the ordered pair of fuzzy numbers (A,B), associated with a real-valued uncertain variable X, with the first component A, and the second component B is the measure of reliability of the first component. Then Z = (A, B) is an Z number.

#### Definition:MIN R operation[8]

Let \* be any one of the basic arithmetic operations addition, subtraction, multiplication, or division. Let  $R_k$  be any suitably chosen ranking function. Then the MIN R operation is defined by (A, B)(\*,MIN)(C, D)=(A\*C, MIN(B, D)), where A\*C is calculated by using the extension principle,  $(A * C)(z) = \sup_{z=x*y} \{\min[A(x), C(y)]\}, x \in A, y \in C$ . Also,  $MIN(C, D) = \begin{cases} C, & \text{if } r_k(C) \leq r_k(D) \\ D, & \text{if } r_k(D) < r_k(C) \end{cases}$ , where  $r_k$  is a ranking function on a set of fuzzy numbers F.

#### Definition: Lexicographic Order L(R<sub>1</sub>, R<sub>2</sub>) for Z-numbers[9]

Let  $R_1$  and  $R_2$  be any two ranking functions and let  $Z_1 = (A_1, B_1) \& Z_2 = (A_2, B_2)$  be any two Z-numbers. Define  $Z_1 \leq Z_2$  under the Lexicographic order  $L(R_1, R_2)$  if and only if (i)  $R_1(A_1) < R_1(A_2)$  (or) (ii)  $R_1(A_1) = R_1(A_2) \& R_2(B_1) \ge R_2(B_2)$ .

#### SOME R TYPE AGGREGATION OPERATORS

#### **Definition: n-ary Z number**

In any Znumber both the components are in n-dimensional, then the corresponding Z number is called n-aryZ number (n > 1).

**Example**:  $Z_1 = (A_1, B_1) = ((a_{11}, a_{12}, ..., a_{1n}), (b_{11}, b_{12}, ..., b_{1n}))$  and  $Z_2 = (A_2, B_2) = ((a_{21}, a_{22}, ..., a_{2n}), (b_{21}, b_{22}, ..., b_{2n}))$  be two n-ary (n > 1) Z numbers ( $a_{ij} > 0, i = 1 \text{ to } 2 \text{ and } j = 1 \text{ ton}$ ). **Note:** If n=2, 3, 4, 5, 6, 7, 8 then the Z-number is called Interval, Triangular, Trapezoidal, Pentagonal, Hexagonal, Septagonal, Octagonal Z-number respectively,

#### Definition: R TypeArithmetic Operations on n-ary Z number:

Let  $Z_1 = ((a_{11}, a_{12}, ..., a_{1n}), (b_{11}, b_{12}, ..., b_{1n}))$  and  $Z_2 = ((a_{21}, a_{22}, ..., a_{2n}), (b_{21}, b_{22}, ..., b_{2n}))$  be two n-ary (n > 1) Z-numbers  $(a_{ij} > 0, i = 1 \text{ to } 2 \text{ and } j = 1 \text{ ton}),$ Then define (1). addition of two Z-numbers by $Z_1(+, MIN)Z_2$   $=((a_{11} + a_{21}, a_{12} + a_{22}, ..., a_{1n} + a_{2n}), MIN ((b_{11}, b_{12}, ..., b_{1n}), (b_{21}, b_{22}, ..., b_{2n}))$ (2).  $Z_1(-, MIN)Z_2$  $= ((a_{11} - a_{2n}, a_{12} - a_{2(n-1)}, ..., a_{1n} - a_{21}), MIN(((b_{11}, b_{12}, ..., b_{1n}), (b_{21}, b_{22}, ..., b_{2n}))$ 

(3). Scalar Multiplication of any Z-number: For any k > 0,

## Parameswari et al.,

 $\begin{aligned} &(\mathbf{k},1) (\cdot, MIN) Z_1 = (k,1) (\cdot, MIN) ((a_{11}, a_{12}, \dots, a_{1n}), (b_{11}, b_{12}, \dots, b_{1n})) \\ &= ((ka_{11}, ka_{12}, \dots, ka_{1n}), (b_{11}, b_{12}, \dots, b_{1n})). \\ &(4). Z_1 (/, MIN) Z_2 \\ &= ((a_{11}, a_{12}, \dots, a_{1n}), (b_{11}, b_{12}, \dots, b_{1n})) (/, MIN) ((a_{21}, a_{22}, \dots, a_{2n}), (b_{21}, b_{22}, \dots, b_{2n})) \\ &\approx ((\frac{a_{11}}{b_{1n}}, \frac{a_{12}}{b_{1(n-1)}}, \dots, \frac{a_{14}}{b_{11}}), MIN((b_{11}, b_{12}, \dots, b_{1n}), (b_{21}, b_{22}, \dots, b_{2n})) \\ &\text{Also, In Particular,} \frac{1}{(a_{11}, a_{12}, \dots, a_{1n})} = \frac{(1, 1, \dots, 1)}{(a_{11}, a_{12}, \dots, a_{1n})} \approx (\frac{1}{a_{1n}}, \dots, \frac{1}{a_{12}}, \frac{1}{a_{11}}). \end{aligned}$ 

## Definition : General R Type Aggregation Operations on Z-number (GRTAO)

For n ( $\geq 2$ )Z-numbers,  $Z_1 = (C_1, D_1), Z_2 = (C_2, D_2) \dots Z_n = (C_n, D_n)$ , the R Type Aggregation Operation is a function RTA :  $Z^n \rightarrow Z$  defined by RTA $(Z_1, Z_2, \dots, Z_n) =$ 

 $(h(C_1, C_2, ..., C_n), k(D_1, D_2, ..., D_n))$ . Here, h is continuous, convex, symmetric, and idempotent of given fuzzy numbers  $C_1, C_2, ..., C_n$ , and k is MIN or Product of reliability of  $D_1, D_2, ..., D_n$ .

## Definition : MIN R Type Arithmetic Mean (MRTAM):

Let  $Z_1, Z_2, \dots, Z_n$  denote the Z-numbers $(L_1, M_1), (L_2, M_2) \dots (L_n, M_n)$  respectively. Their MRTAM is defined to be: $MRTAM(Z_1, Z_2, \dots, Z_n) = (h(C_1, C_2, \dots, C_n), k(D_1, D_2, \dots, D_n))$ 

$$= \left(\frac{1}{n}, 1\right) (\cdot, MIN) \{Z_1(+, MIN)Z_2(+, MIN) \dots (+, MIN)Z_n\}$$
  
=  $\left(\frac{L_1 + L_2 + \dots + L_n}{n}, MIN(M_1, M_2, \dots, M_n)\right),$   
L =  $\frac{L_1 + L_2 + \dots + L_n}{n} k(M_1, M_2, \dots, M_n) = MIN(M_1, M_2, \dots, M_n)$ 

where  $h(L_1, L_2, \dots, L_n) = \frac{L_1 + L_2 + \dots + L_n}{n} k(M_1, M_2, \dots, M_n) = MIN(M_1, M_2, \dots, M_n)$ , and  $L_1 + L_2 + \dots + L_n$  denotes addition of fuzzy numbers using extension principle

## Example :

Let  $Z_1 = (L_1, M_1) = ((5,9,10,12), (.7,.8,.9,.95)), Z_2 = (L_2, M_2) = ((7,9,12,14), (.75,.8,.85,.9))$  be two trapezoidal Z-numbers. For finding MIN  $(M_1, M_2)$ , use the ranking function  $r_k$  for the trapezoidal fuzzy number  $(y_1, y_2, y_3, y_4)$  is  $r_k(y_1, y_2, y_3, y_4) = \frac{y_1 + y_2 + y_3 + y_4}{4}$ .

Then, MRTAM( $Z_1, Z_2$ ) =  $\left(\frac{1}{2}, 1\right)$  (., *MIN*)[ $Z_1$ (+, *MIN*) $Z_2$ ]=((6,9,11,13), (.75,.8,.85,.9))

## RESULT

If  $x_1, x_2, \dots, x_n$  are real numbers then they can be represented by the z-numbers  $(x_1, 1), (x_2, 1), \dots, (x_n, 1)$ . The MRTAM of these numbers is  $(\frac{x_1+x_2\dots x_n}{n}, 1)$ .

That is the MRTAM is the generalization of usual arithmetic mean of real numbers.

## Definition : MIN R Type Geometric Mean(MRTGM):

Let  $Z_1, Z_2, ..., Z_n$  denote the Z-numbers  $(P_1, Q_1), (P_2, Q_2) ..., (P_n, Q_n)$  respectively. Define MRTGM by MRTGM  $(Z_1, Z_2, ..., Z_n) = (P, Q)$ , where  $P = (P_1 \times P_2 \times ... \times P_n)^{\frac{1}{n}}$  and  $Q = MIN (Q_1, Q_2, ..., Q_n)$ . Here,  $P_1 \times P_2$  is calculated using extension principle.

**Note:**Let  $Z_1 = (A, B)$  and  $Z_2 = (C, D)$ , then  $Z_1(\times, MIN)Z_2 = (A, B)(\times, MIN)(C, D) = (A \times C, MIN(B, D))$ , where A×C is calculated by using the extension principle,  $(A \times C)(z) = sup_{z=x \times y} \{\min[A(x), C(y)]\}.$ 

## RESULT

If  $x_1, x_2, \dots, x_n$  are real numbers then the MRTGM of these numbers is  $((x_1x_2 \dots x_n)^{\frac{1}{n}}, 1)$ . This shows that the MRTGM is the generalization of usual geometric mean of real numbers.

## Parameswari et al.,

#### Example:

Let  $(P_1, Q_1) = \left(\frac{1}{1} + \frac{5}{2} + \frac{3}{3}, (.7, .75, .8)\right), (P_2, Q_2) = \left(\frac{4}{2} + \frac{1}{3} + \frac{2}{4}, (.75, .8, .9)\right),$  $(P_3, Q_3) = \left(\frac{8}{8} + \frac{1}{9}, (.7, .8, .9)\right)$  be three discrete Z-numbers. To find MRTGM  $(Z_1, Z_2, Z_3) = (P, Q)$ , where,  $P = (P_1 \times P_2 \times P_3)^{\frac{1}{3}}$  and  $Q = MIN(Q_1, Q_2, Q_3)$ 

## To find $X = P_1 \times P_2 \times P_3$ : by using extension principle

 $\mu_{P_1 \times P_2 \times P_3}(p) = \sup_{p=p_1 \times p_2 \times p_3} \{\min\left(\mu_{P_1}(p_1), \mu_{P_2}(p_2), \mu_{P_3}(p_3)\right)\}, \\ \mu_{P_1 \times P_2 \times P_3}(16) = \sup_{\substack{16=1 \times 2 \times 8 \\ 16=1 \times 2 \times 8}} \{\min\left(\mu_{P_1}(1), \mu_{P_2}(2), \mu_{P_3}(8)\right)\} = .4 \\ \mu_{P_1 \times P_2 \times P_3}(32) = \sup_{\substack{32=2 \times 2 \times 8 \\ 32=2 \times 2 \times 8}} \{\min\left(\mu_{P_1}(1), \mu_{P_2}(4), \mu_{P_3}(8)\right), \min\left(\mu_{P_1}(2), \mu_{P_2}(2), \mu_{P_3}(8)\right)\} = .4 \\ \text{Continuing this way, we get}$ 

$$X: P_1 \times P_2 \times P_3 = \frac{.4}{16} + \frac{.4}{18} + \frac{.8}{24} + \frac{1}{27} + \frac{.4}{32} + \frac{.4}{36} + \frac{.5}{48} + \frac{.5}{54} + \frac{.2}{64} + \frac{.3}{72} + \frac{.3}{81} + \frac{.2}{96} + \frac{.2}{108}$$

Then Find  $P = X^{\frac{1}{3}} = (P_1 \times P_2 \times P_3)^{\frac{1}{3}}$ :

(i.e) To Find P =  $X^{\frac{1}{3}}$  (i.e) To Find  $\mu_P(p)$  for the vlaues of  $\mu_X(x)$ We have,  $p = x^{\frac{1}{3}} \Leftrightarrow x = p^3$ , Take p = 3 and 4, for this p value x = 27 and 64 respectively. Then  $\mu_P(3) = \mu_X(27) = 1$  and  $\mu_P(4) = \mu_X(64) = .2$  (for other values of p,  $\mu_X(x) = 0$ ) Hence,  $P^{\frac{1}{3}} = (P_1 \times P_2 \times P_3)^{\frac{1}{3}} : \frac{1}{3} + \frac{2}{4}$ 

#### To find

 $Q_1 = (.7,.75,.8), Q_2 = (.75,.8,.9), Q_3 = (.7,.8,.9),$  Choosing the ranking function  $r_k(l,m,n) = \frac{l+m+n}{3}, Q = MIN(Q_1,Q_2,Q_3) = (.7,.75,.8).$ Hence, MRTGM  $(Z_1,Z_2,Z_3) = (:\frac{1}{3} + \frac{2}{4}, (.7,.75,.8))$ 

## Definition: MIN R Type Harmonic Mean(MRTHM)

Let  $Z_1, Z_2, \dots, Z_n$  denote the Z-numbers  $(P_1, Q_1), (P_2, Q_2) \dots, (P_n, Q_n)$  respectively. Define MRTHM by MRTHM $(Z_1, Z_2, \dots, Z_n) = (P, Q)$ , where  $P = \frac{n}{\left[\frac{1}{p_1} + \frac{1}{p_2} + \dots + \frac{1}{p_n}\right]}$  and

 $Q = MIN(Q_1, Q_2, \ldots, Q_n).$ 

## Definition: MIN R Type OWA operators(MRTOWA)

Let  $Z_1, Z_2, ..., Z_n$  denote the Z numbers  $(A_1, B_1), (A_2, B_2) ..., (A_n, B_n)$  respectively. Let  $\mathbf{w} = (w_1, w_2, ..., w_n)$  be a weight vector such that  $0 \le w_i \le 1$ , for i = 1, 2, ..., n and  $\sum_{i=1}^n w_i = 1$ .

To calculate the MRTOWA corresponding to *w* :

- (i) First order  $Z_1, Z_2, ..., Z_n$  (in decreasing order) according to the chosen ranking method  $r_k$ . Say  $U_1, U_2, ..., U_n$  is the resulting decreasing sequence.
- (ii) Then applying MRTOWA operation related to the weight vector w on  $Z_1, Z_2, ..., Z_n$ , we get MRTOWA $(Z_1, Z_2, ..., Z_n) = w_1 U_1(+, MIN) w_2 U_2(+, MIN) ... (+, MIN) w_n U_n$ .

## Definition: Product R Type Arithmetic Mean (PRTAM)

Let  $Z_1, Z_2, \dots, Z_n$  denote the z-numbers  $(A_1, B_1), (A_2, B_2) \dots, (A_n, B_n)$  respectively. Their PRTAM is defined to be:  $PRTAM(Z_1, Z_2, \dots, Z_n) = \left(\frac{1}{n}, 1\right) (., \times) \{Z_1(+, \times)Z_2(+, ., \times) \dots, (+, \times)Z_n\}$ 

= $(\frac{A_1 + A_2 + \dots + A_n}{n}, (B_1 \times B_2 \times \dots \times B_n))$ , where  $A_1 + A_2 + \dots + A_n$  denotes addition of fuzzy numbers using extension principle.

Parameswari et al.,

## Definition: Product R Type Geometric Mean (PRTGM)

Let Z<sub>1</sub>, Z<sub>2</sub>, ... Z<sub>n</sub> denote the Z-numbers (A<sub>1</sub>, B<sub>1</sub>), (A<sub>2</sub>, B<sub>2</sub>) ... (A<sub>n</sub>, B<sub>n</sub>) respectively. Their PRTGM is denoted by (A, B), where  $A = (A_1 \times A_2 \times ... \times A_n)^{\frac{1}{n}}$  and  $B = (B_1 \times B_2 \times ... \times B_n)$ .  $PRTGM(Z_1, Z_2, ..., Z_n) = (A, B)$ . Here, A is calculated using extension principle.

## **Definition : Product R Type Harmonic Mean (PRTHM)**

Let  $Z_1, Z_2, ..., Z_n$  denote the Z-numbers  $(A_1, B_1), (A_2, B_2) ..., (A_n, B_n)$  respectively. Then Define PRTHM by (A, B), where  $A = \frac{n}{\left[\frac{1}{A_1} + \frac{1}{A_2} + \dots + \frac{1}{A_n}\right]} \text{ and } B = (B_1 \times B_2 \times \dots \times B_n).PRTGM(Z_1, Z_2, \dots, Z_n) = (A, B). \text{ Here, A is calculated using extension}$ 

principle.

## APPLICATION TO REPLACEMENT PROBLEM

## Optimal Replacement Policy Algorithm using MRTAM(when value of Money does not change with time.)

Let n denote the number of years of equipment would be in use, and Let us denote the following in Z-number for the given machine or equipment

Cz = Capital or Initial Cost or Cost of Machine, Sz = Scrap value,

fz(t) = maintenance or running cost for time t, CMz = Cumulative Maintenance Cost, DCz = Depreciation Cost, TCz = Total Cost, ACz(n) = Average Total Annual Cost.

## Step 1: When t is continuous variable proceed (i) & (ii) otherwise, Go to

Step 2. Calculate the following

(i). TCz = Cz (-, MIN) Sz (+, MIN) CMz.(ii).  $ACz(n) = (\frac{1}{n}, 1) (\cdot, MIN) TCz(n)$ 

## Step 2: When t is discrete variable :

t takes the values 1,2,...n, where n is fixed then proceed (iii) orelse, Go to Step 3.Find the following: (iii).ACz(n)= $\left[\left(\frac{1}{n},1\right)(\cdot,MIN)(Cz(-,MIN)Sz)\right](+,MIN)MRTAM(fz(t)),$ where  $MRTAM(fz(t)) = \left[ \left(\frac{1}{n}, 1\right)(\cdot, MIN) \sum_{t=1}^{n} fz(t) \right]^{**}$ Instead of MRTAM we can also use PRTAM

## **Step 3: Optimal Replacement Policy:**

If  $f_{z(n+1)} > AC_{z(n)}$  and  $f_{z(n)} < AC_{z(n-1)}$ , then replace the equipment at the end of n years.

## Problem

For a machine Cz= ((12200, 12200, 12200), (1,1,1)), Sz = ((200, 200, 200), (1,1,1)) and the Maintenance Cost fz(t) in rupees as follows:

Year	1	2		3		4		5
fz(t)	((100,200,300),(.7,.75,.8))	((400,500,600	)),(.75,.8,.85))	((700,800,90	0),(.7,.85,.9))	((1100,12 (.8,.85,.87	. ,.	((1700,1800,1900), (.75,.8,.85))
Year	6		7		8			
$f_{a}(t)$	((2400,2500,2600),	((3100,3200,3	3300),	((3900,4000,	4100),			
fz(t)	(.8,.825,.85))		(.75,.85,.9))		(.7,.8,.9))			

When should the machine be replaced? for the above information .:

## Parameswari et al.,

## Solution

Here DCz = Cz (-,MIN) SCz= ((12000,12000),(1,1,1))

n	fz(n)	CMz	Dz = Cz (-,MIN) Sz	TCz(n)	ACz(n)
(1)	(2)	(3)	(4)	(5) = (3)(+,MIN)(4)	(5)/(1)

By Lexicographic ordering based on z number,  $L(R_1, R_2)$ ,  $R_1(fz(7)) = \frac{x+y+z}{3} = 3200$  and  $R_2(ACz(6)) = \frac{x+y+z}{3} = 3167$ . So, fz(7) > ACz(6). Also by the same way, fz(6) < ACz(5), By using Step 3, fz(7) > ACz(6) and fz(6) < ACz(5),

The machine should be replaced after every 6 years.

## Optimal Replacement Policy Algorithmusing MRTOWA(when value of Money changes with time.)

Let n denote the number of years of equipment would be in use, r denotes the rate of interest per year, Vn = Present value of all future discounted costs associated with replacement policy of the equipment at the end of each n years. Let us denote the following in the form of Z number for the given machine or equipment Cz = Capital or Initial Cost or Cost of Machine, Rz(n) = Operating Cost in year n, PVMC(n) = Present Value of Maintenance Cost, CPVF = Cumulative Present Value Factor

## Step 1: Determine Wz(n) (Weighted Average or Annualized Cost)

Find out the following :(a).Discount rate per year,  $v = (1 + r)^{-1}$ , (b).PVMC(n) = MRTOWA ={ $v^0$ Rz(0)} (+, MIN) { $v^1$ Rz(1)} (+, MIN) ...{ $v^{n-1}$ Rz(n-1)}. (c). Cz(+,MIN) PVMC(n) (d). CPVF =  $v^0$ (+, *MIN*) $v^1$ (+, *MIN*) ...  $v^{n-1}$ (e). Wz(n) =( $\frac{{Cz (+,MIN) PVMC (n)}}{CPVF}$ 

## **Step 2 : Optimal Replacement Policy**

If  $f_{Z}(n+1) < W_{Z}(n-1)$ , then do not need to replace the equipment. Otherwise, if  $R_{Z}(n+1) > W_{Z}(n-1)$  and , then we should replace.

## CONCLUSION

Novel type of averaging operators on Z-numbers which are natural generalization of usual averages on crisp numbers have been introduced. Its utility has been demonstrated.

## ABSTRACT

The two-dimensional problem for an infinite solid disk is examined in this paper within the framework of the Fractional Thermoelasticity Problem of an Infinite Solid Disk and the boundary condition value problem. It uses the Caputo fractional derivative of order in the heat conduction equation. It is assumed that the cylinder's curved surface is in contact with a rigid surface and is constantly being heated. The issue is resolved using the Laplace transform, Fourier, transform, and Hankel transform and its inverses. The distributions of temperature, displacement, and stress are computed numerically, and visually shown, and the findings are thoroughly analyzed.

Keywords: Infinite solid disk, Fractional, thermoelasticity problem, Laplace transform, Hankel transform, Fourier transform

## **INTRODUCTION**

The theories related to generalized thermoelasticity for the dynamical system at the single relaxation for isotropic bodies were first presented by Lord et al. (1967). The behavior of thermoelastic materials without energy dissipation was proposed by Green & Naghdi., (1993) using linear and nonlinear theories. The deformation of theoretical Thermo elasticity for the circular plate has been studied for heat supply which has been partially dispersed as presented by Ishihara et al. (1997). The equation for fractional heat conduction in single and 2-dimensional problems is studied, Povstenko., (2005) proposed stresses using the Caputo fractional derivative that correspond to the fundamental Cauchy problem solutions. Povstenko., (2009) studied theories related to thermal stress based on the equation adding the heat conduction with special and time fractional derivatives. The linked thermoelasticity theory

## Ravi B. Chaware et al.,

and the generalized thermoelasticity theory with one relaxation period were used by Sherief *et al.* (2010) to construct the novel theory of thermoelasticity.

Using the integral transform method, the mathematical model for quasi-static thermoplastic problems is studied in their indefinite solid long cylinder (Gaikwad *et al.*, 2010). Sur *et al.* (2012) new theory of generalized thermoelasticity at two temperatures was first forth for the novel analysis related to heat conduction and heat flux related to fractional orders thermoelasticity. A thin hollow circular disk deformed thermo elastically as a result of a partially distributed heat source (Gaikwad & Ghadle., 2012). The thermal deflection and heat conduction problem of non-homogeneous materials due to the generation of internal heat inside the thin hollow circular disc were studied by Gaikwad & Ghadle., (2012). A newmathematical model of the thermoelasticity theory was put forward (Sur *et al.*, 2012). The Green Naghdi model and 3-phase lag thermoelastic model are regarded to be subject to a regularly varied heat source in the setting of an unbounded medium, isotropic, and functionally graded medium. For a 1D problem involving an infinitely long cylinder, Raslan (2014) investigated the theories related to fractional thermoelasticity problems. The problem of 2 dimensions is studied in a thick plate with traction-free upper and lower surfaces that are being subjected to the specified axisymmetric temperature distribution was introduced by Raslan., (2015) using the fractional thermoelasticity problem theories. The thermoelastic problems of the mathematical model and the disk prone to heat generation were studied in circular sector disk (Gaikwad., 2015)

The postulates of 2-dimensional distribution of steady-state temperature in thin circular plates due to the consistent nature of the generation of internal energy (Gaikwad., 2016). A thin circular plate's axisymmetric thermoelastic stress analysis owing to heat generation was covered by Gaikwad., (2019). In this study, the fractional thermoelasticity problem is formulated for solving the temperature and stress distribution of radial and circumference of thin circular discs. We expect beginning conditions to be zero. The boundary surfaces at (r = a);  $(\varphi = \varphi_0)$ ;  $(z = \varphi_0)$ ;  $(z = \varphi_0)$ ;  $(z = \varphi_0)$ ;  $(\varphi = \varphi_0)$ ;  $(z = \varphi_0$ maintained 0) and (z = h) are under the specified heat fluxes of  $f_1(\varphi, z, t), f_2(r, z, t); f_3(r, z, t), f_4(r, \varphi, t) and f_5(r, \varphi, t)$  respectively. The generalized finite Fourier transforms and the finite Hankel transform, as well as their inverses, have been used to solve the governing heat conduction equation with the aid of Mittag-Leffler functions. The mathematical model is built specifically with the pure Aluminium circular sector disk in mind. Using Mathcad software, the findings for thermal stress, displacement, and temperature have been estimated numerically and graphically shown.

## LITERATURE REVIEW

Abouelregal *et al.* (2020) numerous efforts are made to better understand the Fourier classical heat transfer and several changes have been made. When some of these models are unsuccessful, therefore based on the Moore-Gibson-Thompson equation novel thermoelasticity model has been proposed. Combining the equation of hyperbolic partial differentiation for change in displacement field and the parabolic differential equation for the increase in temperature, this thermomechanical model was built. The investigated wave propagation in an infinite, isotropic body is subjected to a continuous thermal line source using the proposed model. Adhe & Ghadle., (2023) internal heat generation on inhomogeneous materials is the focus of this paper's analysis of thermoelasticity problems for plane elasticity and thermal stresses. Here, the method of direct integration is used to condense the original issues and establish the governing and boundary equations. The governing equation is then transformed into integral equations by applying more iteration techniques. The iterative method was used to execute the numerical calculations, resulting in speedy convergence. On a graph, the distribution of the Shear and Young's moduli, as well as the dimensionless stresses, are displayed.

Singh *et al.* (2019) the current study examined the thermoelastic interaction in the memory-dependant derivative of the three-phase lag model for the material of partial infinite elastic things with a heat source. The differential equation form of vector-matrix in the domain of Laplace transform is used to define the coupled governing equations, which involve time delay and kernel functions. The eigenvalue technique has been used to resolve the

## Ravi B. Chaware et al.,

analytical formulations of the issue. The Laplace transformation is reversed using the Honig-Hirdes numerical approach. By selecting several forms of time delay settings, graphical representation and kernel function have been carried out to produce numerical results. Sherief & Hussain., (2020) The fractional order thermoelasticity theory is applied to two-dimensional axisymmetric issues. In the Laplace transform domain, the general solution is reached by taking a straight route without employing potential functions. The two issues of a solid sphere and an endless space with a spherical cavity are solved using the resulting formulation. Every time, a particular axisymmetric temperature distribution is applied to a surface that is assumed to be traction-free. Utilizing the transform's inversion formula as well as Fourier expansion methods, the Laplace transforms are inverted. The distributions of temperature, displacement, and stress in the physical domain are obtained by accelerating the convergence of the resulting series using numerical techniques. Graphical representations and discussions accompany the numerical results.

#### Formulation Of The Problem

A two-dimensional problem is considered for a circular solid disk that occupies the space of  $0 \le r \le a$ ;  $0 \le \varphi \le \varphi_0(< 2\pi)$ ,  $0 \le z \le h$ . Initial conditions are assumed for the problem. The boundary surfaces (r = a);  $(\varphi = 0)$ ;  $(\varphi = \varphi_0)$ ; (z = 0) and (z = h) for time t > 0 kept for the heat-flux  $f_1(\varphi, z, t), f_2(r, z, t)$ ;  $f_3(r, z, t), f_4(r, \varphi, t)$  and  $f_5(r, \varphi, t)$  correspondingly. The nonlocal Caputo type temporal fractional heat conduction equation of order for a thin circular disk is taken into account when creating a mathematical model.

The time-fractional differential equationat time t with the temperature of the circular disk is given below;

$$\frac{\partial^2 T}{\partial r^2} + \frac{1}{r} \frac{\partial T}{\partial r} + \frac{1}{r^2} \frac{\partial^2 T}{\partial \varphi^2} + \frac{\partial^2 T}{\partial z^2} = \frac{1}{k} \frac{\partial^{\alpha} T}{\partial t^{\alpha}}$$

In  $0 \le r \le a$ ;  $0 \le \varphi \le \varphi_0(< 2\pi)$ ,  $0 \le z \le h$ , for t > 0. The boundary value problems using the physical conditions, we can get the following equation;

(3.1)

$$k_t D_{RL}^{1-\alpha} \frac{\partial T}{\partial r} = f_1(\varphi, z, t); \text{ at } r = a; \text{ for } t > 0;$$

$$k_t D_{RL}^{1-\alpha} \frac{\partial T}{\partial \varphi} = f_2(r, z, t); \text{ at } \varphi = 0; \text{ for } t > 0;$$
(3.2)
(3.3)

$$k_t D_{RL}^{1-\alpha} \frac{\partial \dot{T}}{\partial \varphi} = f_3(r, z, t); \text{ at } \varphi = \varphi_0; \text{ for } t > 0;$$
(3.4)

$$k_t D_{RL}^{1-\alpha} \frac{\partial I}{\partial z} = f_4 (r, \varphi, t); \text{ at } z = 0; \text{ for } t > 0;$$

$$\frac{\partial T}{\partial T} = f_4 (r, \varphi, t); \text{ at } z = 0; \text{ for } t > 0;$$
(3.5)

$$k_t D_{RL}^{1-\alpha} \frac{\partial T}{\partial z} = f_5(r, \varphi, t); \text{ at } z = h; \text{ for } t > 0;$$

$$Then the initial conditions are;$$

$$T = 0; \text{ at } t = 0, 0 \le \alpha \le 2;$$

$$(3.6)$$

$$\frac{\partial T}{\partial t} = 0; \ at \ t = 0, \ 0 < u < 2; \tag{3.8}$$

We made the assumption that the circular disk is in a planar state of tension for thin h in accordance with Gaikwad [32]. In actuality, "the closer to a plane state of stress is the actual state, the smaller the thickness of the hollow disk compared to its diameter."

The displacement equation is;

The displacement equation b)  

$$U_{i,kk} + \left(\frac{1+\nu}{1-\nu}\right)e_{,i} = 2\left(\frac{1+\nu}{1-\nu}\right)\alpha_{t}T_{,i} \qquad (3.9)$$

$$e = U_{k,k}; \ k, i = 1,2,$$

$$U_{i} = \psi_{,i}, i = 1,2,$$
We  
can have;  

$$\nabla^{2}\psi = (1+\nu)\alpha_{t}T$$

$$\nabla^{2} = \frac{\partial^{2}}{\partial r^{2}} + \frac{1}{r}\frac{\partial}{\partial r}$$

$$\sigma_{ij} = 2\mu(\psi_{,ij} - \delta_{ij}\psi_{,kk}), i, j, k = 1,2..,$$
The potential function of displacement  $\psi(r, \varphi, z, t)$  can be written as;  

$$\frac{\partial^{2}\psi}{\partial r^{2}} + \frac{1}{r}\frac{\partial\psi}{\partial r} = (1+\nu)\alpha_{t}T \qquad (3.11)$$

International Bimonthly (Print) – Open Access Vol.14 / Issue 80 / Oct / 2023 ISSN: 0976 – 0997

The problem formulation is considered from equation (3.1) to (3.16).

## PROBLEM SOLUTION

## DETERMINING THE TEMPERATURE FIELD

Inverse transform and Fourier transform are defined for obtaining temperature function  $T(r, \varphi, z, t)$  using z variable in range  $0 \le z < h$  as follows;

$$\bar{T}(r,\varphi,z,t) = \int_{z'=0}^{h} K(\eta_{p},z')T(r,\varphi,z',t')dz'(4.1)$$
$$\bar{T}(r,\varphi,z,t) = \sum_{n=1}^{h} K(\eta_{p},z)\bar{T}(r,\varphi,\eta_{p},t)(4.2)$$

where,

$$K(\eta_p, z) = \sqrt{\frac{2}{h}} \cos(\eta_p z)$$

 $\eta_1$  and  $\eta_2$  are considered positive roots of the equation;  $sin(\eta_p, z) = 0; p = 1,2,3$ where,

$$\eta_p = \frac{p\pi}{h}; \ p = 1,2,3,..$$

Fourier transform is applied to equation (3.1)can be defined inequation (4.1) by using boundary conditions (3.2) to (3.8); we can obtain;

$$\frac{\partial^2 \bar{T}}{\partial r^2} + \frac{1}{r} \frac{\partial \bar{T}}{\partial r} + \frac{1}{r^2} \frac{\partial^2 \bar{T}}{\partial \varphi^2} + \frac{\partial^2 T}{\partial z^2} - \eta_p^2 \bar{T} = \frac{1}{k} \frac{\partial^\alpha \bar{T}}{\partial t^\alpha} (4.3)$$
  
The boundary conditions are;

..., **م** 

$$k_t D_{RL}^{1-\alpha} \frac{\partial T}{\partial r} = \overline{f_1} (\varphi, \eta_p, t); \ at \ r = a; \ for \ t > 0;$$

$$k_t D_{RL}^{1-\alpha} \frac{\partial \overline{T}}{\partial \varphi} = \overline{f_2} (r, \eta_p, t); \ at \ \varphi = 0; \ for \ t > 0;$$

$$(4.4)$$

$$k_t D_{RL}^{1-\alpha} \frac{\dot{\partial} \bar{T}}{\partial \varphi} = \overline{f_3}(r, \eta_p, t); \ at \ \varphi = \varphi_0; \ for \ t > 0;$$
(4.6)

$$\overline{T} = 0; \ at \ t = 0; \ 0 < \alpha < 2;$$
(4.7)
$$\frac{\partial \overline{T}}{\partial t} = 0; \ at \ t = 0, 1 < \alpha < 2;$$
(4.8)

Inverse transform and Fourier transform over  $\varphi$  variable in range  $0 \le \varphi \le \varphi_0$  can be defined as below;

$$\overline{\overline{T}}(r,\nu_n,\eta_p,t) = \int_{\varphi'=0}^{\varphi_0} K_0(\nu_n,\varphi')\overline{T}(r,\varphi',\eta_p,t)d\varphi'(4.9)$$

$$\overline{T}(r,\varphi,\eta_p,t) = \sum_{n=1}^{\infty} K_0(\nu_n,\varphi)\overline{\overline{T}}(r,\nu_n,\eta_p,t)(4.10)$$

## Ravi B. Chaware et al.,

Where,

$$K(\nu_n,\varphi) = \sqrt{\frac{2}{\varphi_0}} \cos(\nu_n \varphi)$$

Where Eigenvalues  $v_n$  are considered as positive roots of equation;

$$sin(v_n \varphi_0) = 0; v_n = \frac{n\pi}{\varphi_0}; n = 1,2,3..$$

Fourier transform is applied to equations (4.3) and (4.9) by using the conditions (4.4) to (4.8), we can obtain the following equation;

$$\frac{\partial^2 \overline{T}}{\partial r^2} + \frac{1}{r} \frac{\partial \overline{T}}{\partial r} - \frac{v_n^2}{r^2} \overline{T} - \eta_p^2 \overline{T} = \frac{1}{k} \frac{\partial^\alpha \overline{T}}{\partial t^\alpha} (4.11)$$
Using
$$k_t D_{RL}^{1-\alpha} \frac{\partial \overline{T}}{\partial r} = \overline{f_1} (v_n, \eta_p, t); \text{ at } r = a; \text{ for } t > 0;$$

$$\overline{T} = 0; \text{ at } t = 0; 0 < \alpha < 2;$$

$$\frac{\partial \overline{T}}{\partial t} = 0; \text{ at } t = 0, 1 < \alpha < 2;$$

$$(4.14)$$

Inverse transform and Hankel transform over r variable at range  $0 \le r < a$  can be defined as below;

$$\overline{\overline{T}} (\beta_m, \nu_n, \eta_p, t) = \int_{r'=0}^{a} r' K_1(\beta_m, r') \overline{T}(r, \nu_n, \eta_p, t) dr' (4.15)$$

$$\overline{T} (r, \nu_n, \eta_p, t) = \sum_{m=1}^{\infty} K_1(\beta_m, r) \overline{\overline{T}}(\beta_m, \nu_n, \eta_p, t) (4.16)$$

Where,

$$K(\beta_m, r) = \sqrt{\frac{2}{a}} \frac{1}{\left[1 - \frac{v_n^2}{\beta_m^2 a^2}\right]^{1/2}} \frac{J_0(\beta_m r)}{J_0(\beta_m a)}$$

 $\beta_{1,and} \beta_{2}$  are considered positive roots;  $J_{1}(\beta_{m}a) = 0$ ; m = 1,2,3...

Hankel transform is applied in equations 4.11 and (4.15) by using the conditions (4.12) to (4.14), we can obtain the following equation

$$\frac{\partial^{\alpha} \bar{T}(\beta_{m}, \nu_{n}, \eta_{p}, t)}{\partial t^{\alpha}} + k(\beta_{m}^{2} + \frac{\nu_{n}^{2}}{r^{2}} + \eta_{p}^{2}) \bar{\bar{T}}(\beta_{m}, \nu_{n}, \eta_{p}, t) = A(\beta_{m}, \nu_{n}, \eta_{p}, t) (4.17)$$
And,
$$\bar{\bar{T}}(\beta_{m}, \eta_{p}, t) = 0; at t = 0; 0 < \alpha < 2;$$

$$\frac{\partial \bar{\bar{T}}(\beta_{m}, \eta_{p}, t)}{\partial t} = 0; at t = 0, 1 < \alpha < 2;$$
(4.18)
Where,

$$A(\beta_{m},\nu_{n},\eta_{p},t) = kaK_{1}(\beta_{m},a)\overline{f_{1}}(\nu_{n},\eta_{p},t) \left\{ a \frac{dK_{0}(\nu_{n},\varphi)}{d\varphi} \overline{f_{2}}(\beta_{m},\eta_{p},t)|_{\varphi=0} - \frac{dK_{0}(\nu_{n},\varphi)}{d\varphi} \overline{f_{3}}(\beta_{m},\eta_{p},t)|_{\varphi=\varphi_{0}} + \frac{dK(\nu_{n},\varphi)}{dz} \overline{f_{4}}((\beta_{m},\nu_{n},t)|_{z=0} + \frac{dK(\nu_{n},\varphi)}{dz} \overline{f_{5}}(\beta_{m},\eta_{p},t)|_{z=h} \right\}$$

$$(4.20)$$

Laplace and inverse transform is applied to equation (3.17), we can obtain;

$$\bar{\bar{T}}(\beta_m, \nu_n, \eta_p, t) = \frac{A(\beta_m, \nu_n, \eta_p, t)}{k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2)} [1 - E_\alpha(-k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2)t^\alpha)]$$
(4.21)

Finally, the required temperature is obtained by defining the inverse in equations (4.16), (4.10), and (4.2);

## Ravi B. Chaware et al.,

 $T(r,\varphi,z,t) =$ 

$$\sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sum_{p=1}^{\infty} K_1(\beta_m, r) K_0(\nu_n, \varphi) K(\eta_p, z) \frac{1}{k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2)} \quad [1 - E_\alpha(-k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2)t^\alpha)] x \ b_{mnp}$$

$$(4.22)$$

## **Distribution Of Stress And Displacement**

The displacement function  $\psi$  can be written using (4.22) in equation (4.11), we can obtain the following equation;

$$\frac{\partial^2 \psi}{\partial r^2} + \frac{1}{r} \frac{\partial \psi}{\partial r} = (1 + \nu_n) \alpha_t \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sum_{p=1}^{\infty} K_1(\beta_m, r) K_0(\nu_n, \varphi) K(\eta_p, z) \frac{1}{k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2)} \begin{bmatrix} 1 - E_\alpha(-k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2) \\ + \eta_p^2)t^\alpha) \end{bmatrix} x b_{mnp}$$
Equation (5.1) can be written as follows:

Equation (5.1) can be written as follows;

$$\psi = -(1+\nu_n)\alpha_t \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sum_{p=1}^{\infty} K_1(\beta_m, r) K_0(\nu_n, \varphi) K(\eta_p, z) \frac{1}{k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2)} \left[1 - E_\alpha(-k(\beta_m^2 + \frac{\nu_n^2}{r^2} + \eta_p^2) + \eta_p^2)t^\alpha)\right] x \ b_{mnp}$$
(5.2)

Thermal stress can be written by substituting equation (5.2) in equation (4.12) and (4.13);

$$\sigma_{rr} = -2(1+\nu_{n})\alpha_{t}\mu \sum_{m=1}^{\infty} \sum_{p=1}^{\infty} \sum_{p=1}^{\infty} K_{2}(\beta_{m},r) K_{0}(\nu_{n},\varphi) K(\eta_{p},z) \frac{1}{k\left(\beta_{m}^{2}+\frac{\nu_{n}^{2}}{r^{2}}+\eta_{p}^{2}\right)} \left[1 - E_{\alpha}\left(-k\left(\beta_{m}^{2}+\frac{\nu_{n}^{2}}{r^{2}}+\eta_{p}^{2}\right)t^{\alpha}\right)\right] x b_{mnp}$$

$$\sigma_{\theta\theta} = -2(1+\nu_{n})\alpha_{t}\mu \sum_{m=1}^{\infty} \sum_{p=1}^{\infty} \sum_{p=1}^{\infty} \frac{1}{\beta_{m}} \left((\beta_{m}K_{2}(\beta_{m},r)-\frac{K_{2}(\beta_{m},r)}{r}\right) - K_{0}(\nu_{n},\varphi) K(\eta_{p},z) \frac{1}{k\left(\beta_{m}^{2}+\frac{\nu_{n}^{2}}{r^{2}}+\eta_{p}^{2}\right)} \left[1 - E_{\alpha}\left(-k\left(\beta_{m}^{2}+\frac{\nu_{n}^{2}}{r^{2}}+\eta_{p}^{2}\right)t^{\alpha}\right)\right] x b_{mnp}$$

$$(5.4)$$

## **Numerical Calculations**

The setting of the Thermostatic problem  $f_1(\varphi, z, t) = (\varphi^2 - \varphi_0^2)^2 (z^2 - h^2)^2 e^{-At}$  $f_2(\varphi, z, t) = (r^2 - a^2)^2 (z^2 - h^2)^2 e^{-At}$  $f_3(\varphi, z, t) = (r^2 - a^2)^2 (z^2 - h^2)^2 e^{-At}$  $f_4(\varphi,z,t) = (r^2 - a^2)^2(\varphi^2 - \varphi_0^2)^2 e^{-At}$  $f_5(\varphi, z, t) = (r^2 - a^2)^2 (\varphi^2 - \varphi_0^2)^2 e^{-At}$ Where r is radius; A > 0.

Dimensions:

Axial and Radial directions;  $z_1 = 0.05m$  and  $r_1 = 1m$  and  $\varphi_0 = 135^0$ 

The portion of circular disk  $\varphi_0 = 270^0$ 

Thickness h = 0.1 m

Radius a = 1m

The numerical computations and graphics were created using the mathematical computation program PTC Mathcad Prime-6.0.0.

According to the definition, the first positive roots are  $\beta_1 = 3.8317$ ,  $\beta_2 = 7.0156$ ,  $\beta_3 = 10.1735$ ,  $\beta_4 = 13.3237$ , and  $\beta_5 = 10.1735$ ,  $\beta_4 = 13.3237$ ,  $\beta_4 = 13.3237$ ,  $\beta_5 = 10.1735$ ,  $\beta_5 = 10.1735$ ,  $\beta_8 = 10.173$ 16.470. For the purposes of numerical evaluations is pure aluminum material.

Temperature variations in the radial direction for various time parameters are shown in Figure 5.1. The temperature will increase due to an axisymmetric heat source as  $0 \le r \le 0.4$ ;  $0.7 \le r \le 1$ , and it decreases in the region as  $0.4 \le r \le 0.7$ .

Displacement distribution in the radial direction for various time parameters is shown in Figure 5.2. The displacement will decrease due to the axisymmetric heat source as  $0 \le r \le 0.4, 0.7 \le r \le 1$ , and it increases in the region as  $0.4 \le r \le 0.7$ .

## Ravi B. Chaware et al.,

The radial stress distribution is shown in Figure 5.3. It increases within the region of  $0.5 \le r \le 0.8$ , and stress distribution decreases in the region of  $0 \le r \le 0.5, 0.8 \le r \le 1$ .

The circumferential stress distribution is shown in Figure 5.4. It increases within the region of  $0.2 \le r \le 0.5, 0.8 \le r \le 1$  and stress distribution decreases in the region of  $0 \le r \le 0.2, 0.5 \le r \le 0.8$ .

Figures 5.5, 5.6, 5.7, and 5.8 shows the temperature, displacement, stress distribution radial, and circumference at t =0.50 for various value of  $\alpha$  = 0.5,1, 1.5, and 2, correspondingly.

Temperature distribution decreases in the region of  $0.4 \le r \le 0.7$  and increases in the region of  $0 \le r \le 0.4, 0.7 \le r \le 1$ . The radial distance increases when the  $\alpha$  value increases, are shown in Figure 5.5.

Different parameters of fractional order for displacement in the radial direction are shown in Figure 5.6. when the  $\alpha$  value increases, displacement increases in the region of  $0.4 \le r \le 0.7$  and decreases in the region of  $0 \le r \le 0.4, 0.7 \le r \le 1$ .

When the radius increases, the stress distribution increases in the region of  $0.5 \le r \le 0.8$ . when the  $\alpha$  value increases within the region of  $0 \le r \le 0.5, 0.8 \le r \le 1$ , whereas the radial stress distribution is decreased.

Figure 5.8 depicts the circumferential stress distribution. when the  $\alpha$  value increases, it decreases within the region of  $0 \le r \le 02, 0.5 \le r \le 0.8$ . in radial direction it increases within the region of  $0.2 \le r \le 0.5, 0.8 \le r \le 1$ .

## CONCLUSION

The general solution for the formulated problem is obtained using Laplace transforms, Fourier transforms, Hankel transform, and its inverses. The temperature distribution displacement distribution and thermal stresses for radial and circumference are shown in figures 5.1 to 5.8. We introduce the transformation strategies before developing the analysis for the temperature field. Expressions of special interest can be constructed for each specific situation of special interest by giving the parameters and functions in the equations of temperature, displacements, and stresses the appropriate values. With the use of fractional calculus and boundary conditions for the heat flux that is imposed by physical laws, the thermal behavior of the circular sector disk has been examined in the context of time-fractional heat conduction.

## ABSTRACT

The purpose of this paper is to propose an improved technique to select the optimal transportation from the available alternatives. A survey method is used to determine the weights for different criteria. The contribution of the current work lies in the practical application of survey method and extended BATOS (Best alternative technique for optimal Solution) method, which can be utilized by operation managers in factories, tourists, and logistics companies to name a few. This paper elaborates to choose the transporting of best quality cocoa powder from four different factories to four different state with the minimum cost. The proposed method is simple and easily understandable and accessible.

Keywords: BATOS, Transportation, Survey method, Decision-making, Optimal solution.

## INTRODUCTION

Numerous methods have been used to make a decision according to an analysis model. Several tools have been developed to solve multi-criteria decision-making (MCDM) problems effectively [19]. The decision-making process is the act of selecting the most suitable action to fulfil the desired goals and objectives [8]. Because decision making is a daily task in our everyday routines, effective tools should be used to analyze all aspects of decision-making problems. Multi-Criteria Decision Making (MCDM) is a well-structured and multidimensional process developed to tackle decision-making problems in different fields and search for the most attractive alternative with consideration of all relevant criteria. Due to its powerful tools, it analyzes complex decision-making problems in different fields.

## Amali Theresa and Sahaya Sudha

This method improves the quality of decision-making to become more rational and efficient [12]. Undoubtedly, MCDM has developed recently and been utilized in different fields such as sustainable energy [12,15], maintenance management [2,13], construction management [10], tourism management [1], machine selection [16], material selection [11], petroleum [14], supply chain management [18], aviation [14,9] and risk management [13]. MCDM methods are considered as the most recommended tools when dealing with decision-making problems in various fields. MCDM serves as an aid for decision-making but not to make the decision. In other words, MCDM does not prescribe how decisions should be made. It only leads to logical and reasonable decision rankings [7]. According to many authors, MCDM methods are classified into two groups due to the different problem settings [17]: Multi-Attribute Decision Making (MADM) and Multi-Objective Decision Making (MODM).

MADM deals with decision problems that have an implicit objective and a discrete decision space (finite number of alternatives and attributes). Whereas MODM problems have explicit objectives and a continuous decision space (infinite number of alternatives and attributes). Therefore, different methods are applied based on the nature of decision. Transportation problem is a special kind of Linear Programming Problem (LPP) in which goods are transported from a set of sources to a set of destinations subject to the supply and demand of the sources and destination respectively with minimum cost.

Chocolates are one of the most favorite food for human. Indian Cocoa is also considered one of the best in terms of quality. Most of the Cocoa cultivation in India happens in Tamil Nadu, Karnataka, Andhra Pradesh and Kerala accounting for nearly 80% of the total produce. Instant cocoa beverages belong to the group of hot instant drinks, and hot chocolate itself is one of the most popular dairy products within all age groups [4]. Moreover, their nutritional and sensory properties make them the favorable drinks by several groups of consumers. According to the research done by Daini et al.., [5], hot beverages that contain cocoa have micronutrients and the amount of the nutrients increases the nutritional value of the drink. In this study, this paper explains how to select the best transportation to purchase the best quality cocoa powder from four different factories among four different states with the minimum cost using multi-criteria decision-making methods which are effective in terms of analysis, selection and ranking. The multi-criteria decision-making techniques are applied in many areas such as integrated manufacturing systems, evaluation of technology investment, water and agriculture management, Food and energy planning. These methods are effective tools for quantitatively considering qualitative concepts, the challenges faced by the production manager to select the optimal transportation among the available alternatives. Proposed method helps us to choose the best decisions in a right moment. The aim of this method is to avoid complications in using decision making methods, BATOS method is easily understandable and accessible by all researchers.

## PRELIMINARIES

## **Transportation problem**

Transportation problem is a special kind of Linear Programming Problem (LPP) in which goods are transported from a set of sources to a set of destinations subject to the supply and demand of the sources and destination respectively such that the total cost of transportation is minimized.

## Transportation problem in decision making:

Transportation problem in decision making, is to choose the best transportation available from the alternatives. **Optimal Solution** 

Optimum solution is a feasible solution (not necessarily basic) which optimizes (minimize) the total transportation cost.

## Survey Method

Survey Research is a quantitative research method used for collecting data from a set of respondents. It has been perhaps one of the most used methodologies in the industry for several years due to the multiple benefits and advantages that it has when collecting and analyzing data.

## Amali Theresa and Sahaya Sudha

## PROPOSED MCDM METHOD

In this section extended decision making method is applied. The structure of the method is shown in table1. For a given MCDM problem there are 'm' Sub alternatives ( $F_1$ ,  $F_2$ ,  $F_3$ ,... $F_m$ ), are factories from 'm' main alternatives ( $S_1$ ,  $S_2$ ,  $S_3$ ,...  $S_m$ ) different states and 'n' criteria ( $C_1$ ,  $C_2$ ,  $C_3$ , ... $C_n$ ). Here we applied the extended proposed method to find the best transportation to purchase goods.

The original decision matrix is given below

## Procedure to find the Optimal Solution

Figure 1 - Structural Procedure

## Algorithm for the Proposed method

Step 1:Assigning Score Value:

Rank given to the criteria as per the below mentioned rules

(i) Best Rank should be assigned to the greater value ('+' ), like quality.

(ii)Best Rank should be assigned to the smaller value('-' ), like cost and distance.

Step 2: Assigning weight:

Allotting weight for each criteria using survey method.

**Step 3**: Calculating weightage:  $W_{ij} = X_{ij} \times W_j$ .

 $W_{ij} = \begin{bmatrix} x_{11} & x_{12} & x_{13} & x_{14} & x_{15} \\ x_{21} & x_{22} & x_{23} & x_{24} & x_{25} \\ x_{31} & x_{32} & x_{33} & x_{34} & x_{35} \\ x_{41} & x_{42} & x_{43} & x_{44} & x_{45} \end{bmatrix} \times$ corresponding weight of each element in the column.

**Step 4**: Find the best sub alternative from each main alternatives.

**Step 5**: Calculate the optimal transportation according to the final rating.

## Case Analysis

A Chocolate factory production manager wants to purchase best quality cocoa powder to make hot chocolate beverages. The cocoa powder available from four different states, Tamil Nadu, Kerala, Andhra Pradesh and Karnataka with four different factories are considered as alternatives and three evaluation criteria available like Cost, Distance, and Quality. In this minimum cost and distance canbe assigned best rank and high quality assigned as best rank. For quality we used Likert scale excellent(E), very good(VG), good(G), Fair(F). Here we use proposed method to choose the best Transportation.

## Structure of the given Problem

In this first we are finding the best factory among four states using BATOS method after that we are finding the best state to purchase goods among the states, considering states and factories as alternatives and cost, distance and quality as criteria.

## Solution

Step 1: Assigning Score value

- ➢ For Likert Scale, we assigned the score values as follows E(Excellent)-1,VG(Very Good)-2,G(Good)-3 & F(Fair)-4.
- > Best rank should be given to the Smallest value for the cost and distance.
- > Best rank should be given to the greatest values for Quality.

## Amali Theresa and Sahaya Sudha

## Step 2: Assigning weight for Criteria:

The following table 4 shown the data collected from 10 different chocolate factories about weightage for the criteria. Converting the above table in decimal values, the resultant table 5 shown below

Matrix form of Table 5 is  $[A_{ij}]$  where i=1,2,3 & j=1,2,3....10  $(A_{ij} = \frac{a_{ij}}{100}$ , i.e  $A_{11}=\frac{20}{100}=0.2$ ) Using Arithmetic Mean Calculate the weight.

Weight for cost = $\overline{X_1}$  = $\sum_{i=1}^{10} X_i$  =  $\frac{0.2+0.25+0.25+0.21+0.28+0.22+0.35+0.28+0.23+0.23}{10}$  = .25

Weight for Distance= $\overline{X_2} = \sum_{i=1}^{10} X_i = \frac{0.3 + 0.32 + 0.35 + 0.33 + 0.35 + 0.38 + 0.32 + 0.35 + 0.38 + 0.42}{10} = .35$ 10 Weight for Quality= $\overline{X_3} = \sum_{i=1}^{10} X_i = \frac{0.5 + 0.43 + 0.40 + 0.46 + 0.37 + 0.40 + 0.33 + 0.37 + 0.39 + 0.35}{10} = .4$ 

Weights for Cost is .25, Distance is .35 and Quality is .4.

## Structure of weightage for criteria:

(For example, Tamil Nadu Factory F<sub>1</sub>,  $W_1=((1 \times 0.25) + (1 \times 0.35) + (1 \times 0.4) = 1.4)$ , same process should be followed for the remaining)

Step 4: Find the best sub alternative from each main alternative:

To choose the best sub alternative We have to find the minimum score value among each state.

- In Tamil Nadu Min {1.4, 2.9, 2.4, 2.6} is 1.4. Therefore, Factory 1 is best in Tamil Nadu.
- ♦ In Kerala Min {1.4, 3.1, 2.6, 2.2} is 1.4. Therefore, Factory 1 is best in Kerala.
- ♦ In Andhra Pradesh(AP) Min {2.9,1.5,2.5,2} is 1.5. Therefore, Factory 2 is best in AP.
- In Karnataka Min {2.6, 1.8, 2.9,82.6} is 1.8. Therefore, Factory 2 is best in Karnataka.

Best Sub Alternative from Each State Structure of the best Sub Alternative

## Step 5: Calculate the optimal transportation

According to our conclusion, Table 8 shows the best sub alternatives and their data has taken from the given problem.

Now, we have only main alternatives, criteria and weight.

To select the optimal transportation, we have to repeat steps 1 to 4.

The Table 9 shows the best transportation after applying step 1 to 4.

According to Proposed Method Optimal Transportation is Factory 1 from Tamil Nadu.

## CONCLUSION

In this paper we conclude that Using Proposed method, the production manager can choose Factory1 from Tamil Nadu as an optimal transportation among the four different factories from four states. Here we used four sub alternatives as well as four main alternatives. I conclude that this method helps to avoid complications while using decision making methods, proposed method is easily understandable, accessible and time consumable by all researchers, which is an easy method to take decisions when we have sub and main alternatives. This method will create great impact on Business Industry People, Tourists and Researchers.

## ABSTRACT

The primary goal of this study is to assess hesperidin's anti-cancer capability against particular molecular targets to treat cancer. Hesperidin has been chosen as the experimental ligand after conducting a thorough ligand analysis. For this study, Bax, Bcl-2, NF Kappa B, Carbonic anhydrase I (CA-1), Inducible Nitric Oxide Synthase (iNOS), Endothelial Nitric oxide synthase (eNOS), Caspase 3, and Caspase 9 proteins have been chosen as therapeutic targets. Molecular docking was conducted using Glide module of Schrödinger software. Further evaluation was based on dock score, conformational changes, and the amino acid residues involved in the protein-ligand interaction. Hesperidin showed significant binding affinity, especially with caspase 3, carbonic anhydrase I, ENOS, and INOS. It also showcased considerable potential against Bax, Bcl-2, Caspase 9 and NFkB, demonstrating its potential as an effective anti-cancer drug.In this study, the inhibitory potential of hesperidin was analyzed using in-silico molecular docking study. Hesperidin revealed significant binding efficiency against the aforementioned therapeutic targets, thereby showcasing its potential as a potent anti-cancer agent. *In vitro* analysis is required for further validation of this data.

Keywords: Computer-aided drug discovery, Hesperidin, Molecular docking, Anti-cancer activity

Krithiga Balakrishnan et al.,

## INTRODUCTION

Cancer is one of the leading causes of mortality all around the world. Female breast cancer is the most frequently diagnosed disease, closely followed by lung, colorectal, prostate, and stomach cancer [1,2]. Despite developing novel anti-cancer drugs, chemotherapy, radiotherapy, and surgery are deployed to treat various cancers. Nonetheless, the utilization of synthetic pharmaceutical drugs has not enhanced the treatment productivity, and there has been no general improvement in the endurance pace of the patients [3,4]. Pharmaceutical drugs showcase detrimental effects, including high toxicity, drug resistance, and fatal impact on the non-targeted tissues. Due to this, there is a requirement to discover novel therapeutics for a more secure and robust treatment approach [5]. At first, conventional drug discovery approaches took around ten years, employing an experimental method for screening potential compounds. The traditional process was tedious and unpractical. In the wake of discovering potential ligands, it took around ten years to perform clinical preliminaries to foster a clever medication for a specific sickness. For this reason, a computer-aided drug designing technique was developed utilizing Molecular mechanics to comprehend protein-ligand interactions [6]. Numerous ligands can be selected, and around 200 - 500 compounds can be screened simultaneously via virtual screening. Molecular docking is conducted in-silico, wherein the connection between tiny particles and proteins is examined at a nuclear level. It is used to portray the active site of target proteins to comprehend the inward functions of human illnesses at the atomic level [7,8]. Ligands with higher binding affinity are chosen based on blind docking. Potential drug candidates can be further tested by conducting subsequent clinical trials. Nowadays, by focusing on significant domains crucial for inhibition, target-specific inhibitors can be developed for effective and targeted approaches [9].

Flavonoids are known for showcasing potent antioxidant properties by abolishing ROS (reactive oxygen species) and free radicals' production, thereby depicting the potential to treat various stages of tissue damage, including diverse types of cancers. Most citrus fruits (lemon, mandarin and oranges) contain hesperidin, a vital bioflavonoid. It is located in association with Vitamin C<sup>[10,11]</sup>. It is experimentally verified that hesperidin is not cytotoxic and it is safe consumption. It is one of the most significant bioactive compounds, depicting anti-cancer, antioxidant, anti-microbial and anti-inflammatory properties. Hesperidin possesses significant anti-inflammatory properties and is being administered to treat hypersensitivity reactions<sup>[10]</sup>. Induction of oxidative stress leads to cellular proliferation, inhibition of apoptosis, metastasis and angiogenesis. Hesperidin is known for its potent antioxidant activity and showcases potent anti-cancer activity. Hesperidin's antioxidant capacity was assessed by its ability to sequester 1,1diphenyl-2-picrylhydrazyl (DPPH), which resulted in a substantial reduction in the levels of the free radical DPPH with effectiveness comparable to Trolox [12,13]. Hesperidin has antioxidant properties that protect against the harmful effects of paraquat and peroxide hydrogen<sup>[14]</sup>. By activating apoptosis and decreasing cyclooxygenase-2 expression, hesperidin inhibited tobacco-related carcinogen NNK-induced mouse lung tumorigenesis<sup>[15]</sup>. It is observed that hesperidin decreased cellular proliferation in the colonic mucosa, thereby inhibiting carcinogenesis suffering from colon cancer [16,17]. In this study, hesperidin is chosen as an experimental ligand, and it is docked with Bax, BCL-2, NFkB, Carbonic Anhydrase 1 (CA-1), iNOS, eNOS, caspase 3, and caspase 9 to assess its binding efficacy and anti-cancer potential.

## MATERIALS AND METHODS

## **Protein preparation**

3D structures of BAX, Bcl-2, NF Kappa B, Carbonic anhydrase I, INOS, ENOS, Caspase 3, and Caspase 9 were retrieved from the Protein Data Bank (PDB). It is a repository with various 3D protein structures generated by NMR spectroscopy and X-ray crystallography. The removal of water molecules, the insertion of missing hydrogen bonds, and proper bond orders were assigned to non-standard residues were all part of the protein preparation process. Following this, the optimization of the hydroxyl group and hydrogen bonds along with amine groups of the amino acids on the target proteins were carried out. The energy reduction method was carried out using the OPLS3e force

## Krithiga Balakrishnan et al.,

field.The non-hydrogen atoms were reduced to a minimum until the average root mean square deviation approached 0.3 Å.

#### Active site prediction

Active sites are crucial for *in-silico* analysis as the amino acid residues present in this site will decide whether the ligand will inhibit/activate a particular domain. The active sites of the proteins were predicted using the Uniprot database, Interpro scan server, and the Sitemap module of Schrodinger. In this study, the active site residues of Carbonic anhydrase 1, INOX, ENOX, Caspase 3, and Caspase 9 was predicted via Uniprot and Interpro scan web server analysis. Whereas the active site residues of Bax, BCl-2 and NFκB was predicted by Sitemap.

#### **Ligand Preparation**

The 3D structure of compound hesperidin (PubChem ID: 10621) was downloaded from the PubChem database.

#### Domain analysis

Domains are the functional part of any protein. From the concept of structural biology, the domains are the conserved region of the protein. The protein domain analysis was carried out using the Pfam database to predict the functional domain region of the selected protein.

#### **Receptor Grid Generation**

The position and size of the active site are represented by the construction of receptor grids. For the docking procedure, a receptor grid generating module was implemented, where compounds were to be docked using a centroid of selected protein residues. It's an important step to do before commencing molecular docking.

#### Induced Fit docking using XP Glide Algorithm

The compound Hesperidin is docked with all the eight proteins using the GLIDE module of Schrödinger. Primarily, protein preparation was performed via the addition of missing hydrogens and by assignment of bond orders. Further, the optimization and minimization process of the target proteins was carried out. Then Ligprep was used for the preparation of ligand molecules by optimization of the ligand structures through the OPLS3e force field.Molecular docking is incorporated in this research study via the use of the XP (Extra Precision) scoring algorithm. The ligand docking module was integrated for the docking of compound hesperidin with the target proteins using the XP method in the GLIDE module of Schrödinger. The scoring function in XP Glide is based on a thorough evaluation of protein-ligand interactions and incorporates an extensive sampling of docked structures <sup>[18]</sup>. The top-scoring structures are subjected to grid-based water scoring methodology, and the entire XP dock score scoring function and identification of structural motifs are computed.

## **RESULTS AND DISCUSSION**

#### Protein preparation

The targets were chosen on the basis of molecular function and biological processes of the proteins in cancer progression. The 3D structures of all eight proteins were downloaded in PDB format from the Protein Data Bank for further analysis.

## **Ligand Preparation**

The ligand hesperidin was downloaded from the PubChem database (Fig. 1).

#### Domain analysis

The functional domain analysis of the target proteins was performed using the Pfam database, and this information is shown in Table 1. These details were crucial in determining the active sites and amino acid residues in each of our target proteins.

Krithiga Balakrishnan et al.,

## Active site prediction

The amino acid residues of the active sites of target proteins were predicted using Uniprot, Interproscan, and Sitemap. The active site of Carbonic anhydrase 1, INOX, ENOX, Caspase 3, and Caspase 9 were predicted by Uniprot and Interproscan. Whereas BAX, BCl-2, and NFkB binding sites were predicted by Sitemap (Table 2).

## Molecular Docking

The XP (Extra precision) technique of Schrödinger's GLIDE module was used for molecular docking. Table 3 shows the docking score, bond length, and different amino acid residues involved in the protein-ligand interaction. Many pro-apoptotic proteins (BAX, BAK, BIM, BID, and BAD) are found in the BCL-2 family and are essential for triggering apoptosis in malignant cells. It also contains anti-apoptotic proteins (BCL-2, BCL-xL) that are responsible for the inhibition of apoptosis. The proteins of the BCL-2 family are a promising target for the treatment of a variety of cancers. BCL-2, BCL-xL, and BAX are three members of the Bcl-2 family with many structural and functional similarities. BH1-BH4 domains are conserved in the anti-apoptotic proteins BCL-xL and BCL-2. The BH3 domain (essential for triggering apoptosis), BH1, and BH2 domains make up Bax, a pro-apoptotic protein. The anti-apoptotic proteins constitute a hydrophobic groove, and the BH3 domain of pro-apoptotic proteins like BAX bind to the groove via an amphipathic alpha-helix, thereby inhibiting apoptosis.

In this study, this BCL-2 (BCL-xL) domain crucial for imparting anti-apoptotic property is targeted as it is common in both Bax and Bcl-2 protein. The docking analysis depicted dock score of -6.0 kcal/mol and -6.7 kcal/mol of hesperidin with Bax and Bcl-2 protein, respectively. Hydrogen bond interaction is observed with the binding of hesperidin to Bax protein with the binding site residues Ala 81, Val 83, Asp 84 and Asp 86. Multiple interactions were observed with the binding of hesperidin to Bcl-2, wherein hydrogen bond interaction is observed with amino acid residues Glutamine 58 and Tyrosine 161. Pi-cation interaction is also observed with amino acid residue Arginine at 66<sup>th</sup> position and hydrogen bond interaction with Leu 160, similar to the action inhibitor N-heteroaryl sulfonamide [19]. NFkB is a transcription factor present in all cell types and is involved in various biological processes, including inflammation, immunity, cell proliferation, differentiation, and survival. Rel homology domain is a protein domain found in the family of eukaryotic transcription factors like NFkB. It is composed of two structural domains. The N-terminal DNA binding domain is similar to the one found in p53 protein; the C-terminal domain has an immunoglobulin-like fold that functions as a dimerization domain [20]. Phosphorylation of the N-terminal domain is crucial in regulating transcription factors by targeting the expression of specific genes [21].

For this study, the binding site residues are based on the N-terminal of Rel homology domain of NFkB is targeted. The docking analysis of hesperidin with NFkB depicted dock score of -6.4 kcal/mol. Hydrogen bond interaction is observed with the binding site residues Asp 94 and Arg 103.The active site of most carbonic anhydrases contains a zinc ion in its active site for its crucial for its function [22]. Carbonic anhydrases I and II are highly expressed in the GI tract and kidneys and are known to mediate the pH in tumour cells by modulating the proton and bicarbonate concentrations, thereby inducing cellular survival and proliferation [23]. The zinc ion is coordinated by the imidazole rings of 3 histidine residues, His94, His96, and His119 [22]. The docking analysis of hesperidin with Carbonic anhydrase I depicted dock score of -7.8 kcal/mol. Multiple non-covalent molecular interactions are observed. Hydrogen bond interaction is observed with the binding site residues HIE 94 and Pi-Pi stacking interaction with Thr 199 similar to the inhibitor Polmacoxib [24].

Inflammation is caused by inducible nitric oxide synthase (iNOS), which increases the production of proinflammatory cytokines such as IL-6, IL-8, TNF, and IFN-. Vascular endothelial growth factor-induced angiogenesis (VEGF) is mediated by endothelial nitric oxide synthase (eNOS), which increases angiogenesis in cancer cells. iNOS is primarily present in the cytosol, whereas eNOS is situated on the membrane.For this study, the oxygenase domain is targeted containing Nitric oxide synthase. The docking analysis of hesperidin with Inducible nitric oxide synthase (INOS) with a dock score of -12.7 Kcal/mol. Hydrogen bond interactions are observed with active site residues Cys 200, Asp 382 and Trp 463, similar to the interaction observed by inhibitor S-ethylisothiourea (SEITU) with INOS [25]. The docking analysis of hesperidin with Endothelial nitric oxide synthase (ENOS) with a dock score of -12.6

#### Krithiga Balakrishnan et al.,

Kcal/mol. Hydrogen bond interactions with the active site residues Tyr 475 and Glu 361 and pi-pi stacking interaction with Trp 178. Among all caspases, caspase 3 and caspase 9 play a crucial in initiating and executing programmed cell death in cancerous cells. When cytochrome c produced from mitochondria binds with Apaf-1 in response to an apoptotic signal, caspase 9 is activated [26]. This causes caspase 3 to be cleaved, and it is activated along with caspases 6 and 7 to induce apoptosis[26,27]. For this study, the peptidase C14 / p20 domain of caspase 3 is targeted. The activation of apoptosis can sometimes lead to caspase-1 activation, which links apoptosis and inflammation, such as during the targeting of infected cells [28]. For this study, peptidase C14, the caspase catalytic domain of caspase 9, is targeted. This domain includes the core of the p45 precursor of caspases, which is processed to produce the active p20 and p10 subunits [29]. The docking analysis of hesperidin with Caspase 3 protein with a dock score of -7.8 kcal/mol. Hydrogen bond interaction is observed with the active site residues Arg 207, Trp 214 and Asp 253. The docking analysis of hesperidin with Caspase 9 protein resulted in the dock score of -5.7 kcal/mol. Hydrogen bond interaction is observed with active site residues Asp 355, Ser 345, Glu 351, Glu 358, Lys 380.

# CONCLUSION

According to the findings of this study, hesperidin is an effective treatment because of its considerable antioxidant capacity, which provides excellent anti-cancer and chemopreventive effects. It demonstrates high binding effectiveness and affinity for several important anti-cancer targets. An *in-silico* analysis cannot fully comprehend the anti-cancer mechanism of hesperidin. To fully understand hesperidin's anti-cancer, chemopreventive, and antioxidant potential, more research using *in-vitro* and *in-vivo* methods are necessary.

# ABSTRACT

For thousands of years, people have been intrigued by snakes. Worldwide, snakebites pose a significant health, social, and economic challenge, but in tropical and subtropical regions, this challenge is compounded. More species of the most dangerous snakes are present, prompt medical care is unavailable, and medical care is subpar. The purpose of this research was to document the existence of under-appreciated medicinal plants. Research conducted in India has identified over a hundred plants that show promise as anti-snake venom treatments. Information gathered from various literature sources identified useful plant families, plant parts, and methods of using these plants. There are over 520 plant species in India, from about 122 families, that may help with snakebite treatment. The purpose of this research was to spur the development of herbal antidotes to snake venom. These have the potential to be a low-cost, easily-evaluated alternative that would have huge implications for society. Caesalpiniaceae, Zingiberaceae, Acanthaceae, Fabaceae, Apocynaceae, Cucurbitaceae, Euphorbiaceae, Lamiaceae and Arecaceae are some of the most beneficial plant families. Folk medicine practitioners in India use herbs singly or in combination.

Keywords: Antiophidic Plants, Snake venom, Local tissue damage, Phytochemicals, Antivenin Plants.

# INTRODUCTION

The snake is widely considered to be both one of the most fascinating and one of the most misunderstood members of the animal kingdom. Snakes can be discovered in a variety of habitats, including deserts, grasslands, swamps, and forests. They can also be discovered in both freshwater and saltwater environments. As predators, snakes consume a wide variety of prey, including rodents, insects, the eggs and young of other birds, and young birds

#### Amrita Babu et al.,

themselves. Because of their cold blood, snakes need to find a new home in an environment that will enable them to maintain a temperature that is suitable for their bodies. They are only occasionally seen out in the open because they cannot withstand the heat of the summer for more than ten to twenty minutes at a time. They enter a state of dormancy during the scorching summer months and hibernate during the bitterly cold winter months of the year. There are close to 300 different species of snakes that can be found in India. Of these, there are more than 60 venomous species, more than 40 mildly venomous species, and 180 non-venomous species. There are four different families that these species belong to: the Colubridae, Elapidae, Hydrophiidae, and Viperidae families. Only about half of the few venomous snakes that do exist are actually capable of killing someone with their bite. The majority of snakebite cases in Southeast Asia result in death, despite the fact that the annual mortality rate from snakebites is thought to be between 80,000 and 140,000. There are several reasons for this, including a lack of access to medical care, malnutrition among victims, and the high density of venomous species. Snakes are able to exert control over the amount of venom they expel, and they can bite in either an offensive or defensive manner, depending on whether or not they are attempting to capture prey or protect themselves. Because snakes only have a limited supply of venom at any given time, they try to conserve it by avoiding wasting it on things that are not their prey. As a result, approximately forty percent of all human bites are considered defensive and "dry" (without envenomation). There are more than 60 different species of poisonous snakes native to India, and each one's fangs contain a one-of-a-kind cocktail of different toxins. Four of the most common species of terrestrial venomous snakes can be found on the Indian mainland. These four are known as the "big four." Spectacled cobra (Najanaja), Common kraits (Bungarus caeruleus), saw-scaled viper (Echiscarinatus), Russell's viper (Daboia russelii). These dominant species are responsible for the vast majority of the country's reported cases of injury and death. When it comes to the process of prey capture, venom is an essential component[1]. Snakes are able to kill their prey, such as birds and rodents, by injecting their lethal venom into their bodies through their lightning-fast bites. This causes their victims to become unconscious and unable to move. In addition to this, serpents use their venom to defend themselves against other species that are predators[2].

Because it contains a variety of enzymes, venom has the capability to cause damage to the internal tissues and nervous system of its victim. It is widely held that the respective snake species purposefully evolved this helpful venom delivery pathway over the course of their evolution. Proteins, enzymes, anticoagulants, neurotoxins, and other chemicals are just some of the components that make up snake venom, which is a complex mixture[3]. It is possible to classify the venom of all venomous species into one of three primary categories: neurotoxic, hemotoxic, or cytotoxic. These are categorised according to the parts of the body that they target or affect. For instance, neurotoxic venom causes damage to the nervous system and the brain. Hemotoxic venom has an effect on the cardiovascular system because it prevents blood from clotting properly and disrupts blood flow[4]. In addition, it causes damage to tissues all throughout the body in addition to the deterioration of organs. Cytotoxic venom causes unbearable pain because it disrupts the normal molecular structure of the tissues it attacks. The annual death toll from snakebites in India is the highest of any country at 58,000, and the country's disability rate is four times higher than the death toll. In the previous 20 years, snakebites have been responsible for the deaths of close to 1.2 million people. The World Health Organization (WHO) included snakebite in its list of "Neglected Tropical Disease," or NTD, due to the fact that it is a problem in a number of countries all over the world. Antivenom serum therapy is the only treatment that has been shown to be effective. This therapy purifies neutralising immunoglobulins or fragments by using plasma derived from animals that have been immunised against snake venoms or specific toxins. Antivenom is, sadly, in short supply across the board, despite the critical demand for it. Because of how common these species are, the only ones for which there is antivenom available for purchase are the ones listed above[4]. The "big four" antivenoms are typically used in the treatment of all conditions related to snakebite. Beyond the "big four," antivenoms have very little success and are ineffective. Internal bleeding or failure of multiple organs, including the heart, lungs, and kidneys, may result from snake bites. It could even result in the person's death or paralysis. In the event that someone is bitten by a snake, the only course of action that is recommended and considered acceptable is the prompt administration of a sufficient dose of antivenom. The Polyvalent Antivenom Serum, which can be obtained from government centres located all over India, is particularly effective at neutralising the injected venom of the "big four" snake species. It is typically possible to achieve systemic effects by

#### Amrita Babu et al.,

beginning the administration of antivenom as soon as possible after envenomation; however, it is much more difficult to reverse the damage to local tissues. There are numerous anecdotes describing the widespread use of medicinal plants as a treatment for snakebites, particularly in subtropical and tropical regions such as Africa, South America and Asia. When dealing with the aftermath of a venomous animal bite, residents of rural and tribal areas frequently turn to home remedies. Throughout human history, people have treated snakebites with medicinal plants, and this knowledge has been passed down through rural communities. Immunotherapy has been shown to be effective in the treatment of envenomation brought on by a snakebite; however, the treatment's side effects have piqued the interest of venom toxicologists and other researchers working in this area who are looking for an alternative therapy to treat ophidian bites. Traditional treatments for snake envenomation have their limitations, so researchers are looking for alternatives that are both safe and effective. One such alternative is herbal medicinal plants. They are not only common, but also risk-free, efficient, reasonably priced, and accessible even in remote areas. Because there is a large body of evidence that points to the significance of active plant metabolites for the construction of anti-snake venom medication moieties, it is believed that a single purified component is insufficient for completely neutralising the toxicity of snake venom. This is due to the fact that active plant metabolites can be found in various plants. On the other hand, there is a substantial body of evidence that points to the significance of active plant metabolites. Despite the extensive research that has been done on herbal medicinal plants to alleviate the problems caused by snakebite poisoning, there is currently no plant-based medicine that is available that is effective against snake venom. Because of this, the current situation necessitates isolating pure chemicals from plants that are capable of acting specifically against the toxins that are found in snake venom while simultaneously minimising the risk of side effects. In other words, the situation calls for a win-win situation. In order to evaluate the anti-venom activity of appropriate herbal formulations, it is also necessary to carry out a number of pre-clinical studies. These studies need to include a wide range of active component combinations in a variety of permutations. In addition, there is an urgent need to focus on the pathogenic properties of snake venom toxins as well as the mechanisms by which they exert the harmful effects that they have. When it comes to the treatment of snake envenomation, it would be extremely beneficial to have a better understanding of the specificity of the toxins that can be found in snake venom, the connection between their structure and their activity, as well as the antigenic characteristics that are associated with those toxins[5]. Because of this, researchers need to develop new medicines that are safe for the environment, are effective against ophidians, and are affordable to people who are economically marginalised and disadvantaged. Traditional herbal antidotes are becoming an increasingly popular starting point for toxicologists all over the world who are working on the development of effective inhibitors of snake venom toxins. Antiophidic plants have the potential benefits of being inexpensive, readily available, stable at room temperature, and neutralising a wide variety of toxins, including those that cause only local tissue damage. These benefits are in addition to the fact that antiophidic plants can neutralise toxins.

#### **Composition of Snake Venom**

Venom proteins can be broadly categorized as having or not having built-in enzymatic activity. The possibility that therapeutic small molecules will inhibit the enzymatic venom components is the obvious significance of this distinction. According to proteomic analysis, snake venom contains proteins from 26 different protein families with significant species variation[6]. However, the majority of the medically significant components are concentrated in just four families, in varying amounts. These proteins include the non-enzymatic three-finger toxins (FTX), metalloproteases (MPs), serine proteases (SPs), and secreted phospholipase A2 in addition to bungarotoxin, a nicotinic receptor antagonist (sPLA2)[7].

#### Local Tissue Damage

Local tissue damage is a common result of most viperid venoms and a small number of elapid venoms. These venoms include myotoxic phospholipases A2 (PLA2s), which attach to and damage the plasma membranes of muscle fibers, resulting in myonecrosis. Certain PLA2s damage sarcolemmals by interactions with hydrophobic molecules, whereas catalytically inactive PLA2 homologues harm sarcolemmals by hydrolyzing membrane phospholipids. After membrane disruption, calcium influx into the cytosol results in myofibrillar hypercontraction, mitochondrial malfunction, and other degenerative processes that irreparably harm muscle cells. Tiny basic

#### Amrita Babu et al.,

myotoxic peptides constrict muscles and result in necrosis in the venom of viperids. Pressure on the muscle fibers and ischaemia are caused by vascular alterations and oedema. Skeletal muscle requires blood and innervation to recover, thus phagocytic cells must clear away necrotic material. Viperid venom impairs skeletal muscle regeneration and often results in permanent injury by harming muscle fibers, blood vessels, and neurons. Blood vessel integrity is also affected by myonecrosis. Type IV collagen in particular is hydrolyzed by viperid venom metalloproteinases (SVMPs), which reduces the mechanical stability of microvessels. As a result, extravasation is brought on by haemodynamic biophysical forces in the circulation that stretch and tear the capillary wall. SVMPinduced microvascular damage may be brought on by breaking down endothelial cell-cell adhesions. Collagen, hyaluronic acid, and proteoglycans are examples of extracellular matrix components that are hydrolyzed by SVMPs and hyaluronidases[8, 9]. This alters the structure and function of microvascular and other tissue components, resulting in local tissue damage by venom. Blisters are the result of SVMPs harming the dermal-epidermal interface, a non-enzymatic mechanism, the three-finger toxin family of cytotoxins found in several Elapidae family venoms disrupt the plasma membranes of different cell types in diverse tissues, leading to broad cutaneous necrosis. Intramuscular nerves, lymphatic vessels, arterioles, and venules are all impacted by PLA2s and SVMPs. A local inflammatory process is brought on by the synthesis and release of eicosanoids, nitric oxide, anaphylatoxins, bradykinin, histamine, cytokines, resident macrophages and other cells, and leukocytes in envenomed tissue. Exudates including plasma proteins, intracellular and extracellular protein fragments, cytokines, chemokines and damage-associated molecular patterns are formed in this inflammatory environment, which may exacerbate inflammation and harm tissue.Pain-related sensory neurons are stimulated in catalytically inactive PLA2 homologues by ATP and purinergic receptors. The best treatment is conventional medicine, which has no impact on the local tissue damage caused by antivenom therapy. According to several viper venom victims, the issue recurs every year. Traditional healers make great use of plant extracts for this reason[10, 11].

# Folk plants commonly used for the treatment of snakebites in India. *Withania somnifera*.

The winter cherry, also known as ashwagandha, is the fruit of the small evergreen woody under shrub *Withania somnifera*, which is a member of the Solanaceae family. It is a native of India's subtropical dry regions. *Withania somnifera* plant has most of its unique steroidal alkaloids and lactones which are found in roots and leaves. The protein component of *Withania somnifera*, called *Withania somnifera* glycoprotein (WSG), has been reported to exhibit a variety of significant pharmacological action, including anti-microbial, anti-protease, inhibitor of phospholipase, and hyaluronidase activity of snake venom. Hyaluronidases in venom help the toxins spread quickly by breaking down the extracellular matrix of the victim's tissues. The glycoprotein inhibited the hyaluronidase activity of viper (*Daboia russelii*) and cobra (*Najanaja*) venoms. This was shown by zymogram assay and staining the skin tissues for different activity. At a concentration of 1:1 w/w of venom to WSG, the enzyme's activity was completely stopped by WSG. So, we can show that the glycoprotein stops the hyaluronidase from working in the venoms. There seems to be a scientific reason why snakebite victims in rural India put the plant extract on their skin as a cure[12–18].

#### Sapindus saponaria

Sapindus saponariais a deciduous tree of small to medium size. Also known as wing leaf soapberry and western soapberry. Belongs to the Sapindaceae family. Extracts from the callus of *Sapindus saponaria* its principal active component stigmasterol inhibit the pharmacological and toxic effects of snake venoms and proteins isolated from viperidae family. Myotoxic, hemorrhagic, and phospholipase A2 activities. It was discovered that both fractions and extracts can inhibit the activity of hemorrhagic proteins found in venoms. These proteins are highly dependent on  $Zn^{2+}$ , and the active chemicals in this plant may be interfering with protein-cofactor interactions or binding to other active sites required for this activity.  $\beta$ -sitosterol, stigmasterol, and  $\beta$ -sitosterol glucoside can inhibit the edematous, hemorrhagic, myotoxic, and PLA2 activities induced by snake venoms and toxins[19].

Amrita Babu et al.,

#### Sarsaparilla Hemidesmus indicus

*Indian sarsaparilla* is a plant native to South Asia. The family Asclepiadaceae encompasses plants found throughout India. The root of *Hemidesmus indicus* is used. It was discovered that *Hemidesmus indicus* possesses antisnake venom activity. This aromatic root is mashed into a thin paste and administered to the snakebite victim's wound, according to local studies in West Bengal, India's rural areas. Moreover, it was administered orally in combination with several other ingredients, such as salt, jaggery, lime, etc. The people who lived in rural areas had a strong belief in this healing plant and wanted to cultivate it at home for their personal benefit. *Hemidesmus indicus* root extract contained the active substance 2-hydroxy 4-methoxybenzoic acid, which was very efficient in reversing the pathophysiological alterations caused by *Daboia russellii* venom. The plant inhibits hemorrhage, defibrinogenate,PLA2 activity and cardiotoxicity. It was discovered that the methanolic crude extract considerably reduced the fatal, hemorrhagic, necrotic, defibrinogenating, coagulant, and fibrinolytic effects of viper venom[20].

#### Mangifera indica.

*Mangifera indica*, often known as mango, is a flowering plant species in the Anacardiaceae family.*Mangifera indica* aqueous extract is recognized to have anti-snake venom properties. The most toxic and lethal part of snake venom, multi-toxic phospholipases A2s, are yet unknown as is its inhibitory efficacy and mode of action. *Mangifera indica* bark extract may neutralize the venom of the Indian Russells viper. Hemolytic activity was dose-dependently reduced by *Mangifera indica*extract. Moreover, extracts from *Mangifera indica* decrease edema in a dose-dependent way. In conclusion, *Mangifera indica*aqueous extract suppresses PLA2's toxic and enzymatic activities, proving it has anti-snake venom characteristics. It would be useful to carry out more in-depth study on the function and mechanism of the main inhibitory elements of the extract in order to develop them as an effective anti-snake venom and anti-inflammatory drug. The anti-hemorrhagic, anti-coagulant, fibrinogenolytic, edema-inducing, and anti-myotoxic properties of *Mangifera indica* have been shown.[21]

#### Tamarindus indica.

Tamarind (*Tamarindus indica*) belongs to the family Leguminosae and grows abundantly all over India. Inhibited the PLA2, protease, hyaluronidase, L-amino acid oxidase and 5'-nucleotidase enzyme activities of venom. Tamarind seed extract is a good source of powerful natural PLA2 inhibitors, mainly myotoxic PLA2 found in V. russelli venom.[22]

#### Pluchea indica.

*Pluchea indica* Less. (Asteraceae) methanolic root extract has the potential to counteract the effects of viper venom. By utilizing silica gel column chromatography, the active fraction which contains the primary component  $\beta$ -sitosterol and the minor compound stigmasterol was separated, purified, and the structure was ascertained. It was discovered that the active portion considerably reduced the fatal, hemorrhagic, defibrinogenation, edema, and PLA2 activity caused by viper venom. The active ingredient also inhibited PLA2 activity, respiratory alterations, cardiotoxicity, neurotoxicity, and mortality brought on by cobra venom.[23]

#### Emblica officinalis.

*Emblica officinalis* belongs to family Phyllanthaceae. For anti-snake venom action, *Emblica officinalis* methanolic root extracts are employed. In both *in vitro* and *in vivo* studies, the plant extracts effectively inhibited the lethal activity caused by the venom of the *Viperarussellii* and *Najakaouthia* snakes. The plant extract significantly reduced the hemorrhage, coagulant, defibrinogenating, and inflammatory effects caused by *viperarussellii* venom[24–26].

#### Rosmarinus officinalis

Rosemary, or *Rosemarinus officinalis* L., is a perennial evergreen aromatic plant of the Lamiaceae family. There were significant amounts of phenolics, falvonoids, and different phenolic acids in the rosemary aqueous extract. The main ingredient, rosmarinic acid, may be the cause of the viper venom's possible neutralizing activity against proteases, PLAs2, fibrinogenases, LAAOs, hemorrhagic, hemolytic, edema-inducing, myotoxic and fatal actions. An effective treatment for deadly viper bites is said to be rosemary aqueous extract.[27–29]

#### Amrita Babu et al.,

#### Trichosanthes tricuspidata.

*Trichosanthes tricuspidata* belongs to the family Cucurbitaceae. *T. tricuspidata* leaf protein rich fraction exhibited proteolytic activity. Prevention of *Echiscarinatus* venom -induced tissue necrosis by tricuspidin via modulation of immune mediators. The paste of *Tricosanthus tricuspidata* plant leaves is used to treat snakebite poisoning.

#### Butea monosperma

*Butea monosperma* (Lam) Kuntze belongs to the Fabaceae family of plants. By inhibiting hyaluronidase, which is a spreading agent, the extract of *Butea monosperma* stem bark is used. Stigmasterol is extracted from *Butea monosperma* bark.[30, 31]

#### Mimosa pudica

*Mimosa pudica* belongs to the family Mimosaceae. Mimosa pudica aqueous root extract inhibited the hyaluronidase and protease activities of *Najanaja*, *Viper arusselii*, and *Echiscarinatus* venom in a dose-dependent manner.[32]

#### Curcuma longa.

*Curcuma longa* belongs to the family Zingiberaceae, Roots of *Curcuma longa*, were pulverized and extracted using hexane. ar-turmerone is the active chemical component. ar-turmerone may inhibit proteolytic and hemorrhagic venom enzymes by acting as an enzymatic inhibitor. Ar-turmerone was the most effective therapy for the suppression of edema, necrosis, and local bleeding after viper venom.[33, 34]

#### Vitex negundo

*Vitex negundo* Linn, also known as Nirgundi or Five-leaved Chaste Tree, is a huge aromatic shrub in the Verbenaceae family. The methanolic root extracts of *Vitex negundo* used for antisnake venom activity.V. russellii venom-induced haemorrhage, coagulant, defibrinogenating and inflammatory activity was significantly neutralized by plant extracts.[25]

#### Azadirachta indica

*Azadirachta indica,* commonly known as neem, nimtree, and Indian lilac, is a Meliaceae mahogany tree. In a dosedependent manner, an*Azadirachta indica* PLA2 inhibitor isolated from the methanolic leaf extract of *A. indica* (Neem) inhibits the phospholipase A2 enzymes in cobra and Russell's viper venom.[35]

#### Strychnosnux-vomica

*Strychnosnux-vomica* Linn (Family: Loganiaceae), a medicinally important toxic plant, commonly known as nux vomica, poison nut, has diverse therapeutic and clinical applications. In low doses, nux vomica seeds extract was found to effectively neutralized *Daboia russelii* venom induced lethal, haemorrhage, defibrinogenation, phospholipase A2 (PLA2) enzyme activity and Najakaouthia venom induced lethal, cardiotoxicity, neurotoxicity, PLA2 enzyme activity.[36]

#### Piper longum

*Piper longum L.* (family Piperaceae), popularly known as "long pepper," is a climbing shrub native to the world's tropical and subtropical regions. In ethanolic extract of *Piper longum* fruits, piperine was discovered to reduce Russell's viper (Viperidae) snake venom activity.[37]

#### Alstonia scholaris

*Alstonia scholaris*, often known as blackboard tree or devil's tree, is an evergreen tropical tree belonging to the Apocynaceae family. The dried bark of *Alstonia scholaris* Linn is used. It might significantly inhibit the elevation of serum lactate dehydrogenase (LDH) and proinflammatory cytokines (IL6, TNF) caused by Viper russelli venom.[1, 38]

#### Amrita Babu et al.,

#### Pittosporum tetraspermum.

Pittosporum is a genus in the Pittosporaceae family that has over 200 species with a global distribution, with the highest concentration in Australia and China. Only 11 species have been documented in India so far. The bark part is used as narcotic, antidote to snake poison, and also a stimulant. (Pillai & Swapna, 2019). The bioactive component responsible for the biological activity of *Pittosporum tetraspermum* is identified as trihydroxyoleanolic acid glycoside, whose aglycone part is characterized as trihydroxyoleanolic acid and the glycone part as sugars glucose and glucuronic acid.[39, 40]

#### Azima tetracantha

*Azima tetracantha* Lam. belongs to the Salvodoraceae family and is known as Kundali. Phosphomonoesterase, phospholipase A2, 5' nucleotidase, and hyaluronidase enzymes were all inhibited by the ethylacetate extract *Azima tetracantha*.[41]

# ABSTRACT

The regulatory environment is one of the most crucial factors in bringing a cutting-edge medical product to market, such as a drug-device combination product. Drug-device combinations have developed a method for product development, regulatory approval, and business interactions that has provided crucial information for the creation of subsequent generations of combination goods. Drugs, equipment, and/or biological products may be combined to create therapeutic and diagnostic medical products known as combination products. The medical device markets, which are often viewed as having high growth potential and offering higher profit margins and better patient outcomes, now include devices that can deliver medications and biologics to particular sites. Combination product development, clinical translation, and regulatory review are intricate and difficult processes. The main ideas for comprehending the USFDA, Japan, and China's thoughts on combination goods are outlined in this article. The combination of product provisions and the approval process are discussed in this article.

**Keywords:** Drug-device combinations, USFDA, China, Japan, Medical device, Clinical translation, Regulatory review.

Harshitha et al.,

# INTRODUCTION

Since ancient times, the traditional medical system has been practised, however, treating new ailments with traditional medicine is becoming an increasingly challenging process. Currently, the unique technology makes use of combination products (1). In the early 2000s, the medical device, pharmaceutical, and biological industries started to understand that the future of therapeutic interventions did not lie just in specialized subsets of those products. A transdisciplinary approach results in true innovation, which can lead to considerably increased therapeutic value. For instance, the growing development of complex combination products is a result of ongoing technological developments in drug and biological research as well as those in engineering and producing medications, biologics, and devices (2). Because medical devices, biologics, and drugs alone may not be sufficient to treat disease or harm. In reality, every field of medicine will gain from this since disease or physical harm may eventually be reversed rather than just stopped.

#### **Regulatory requirements for Combination products in US**

As two or three products combining medical equipment, medicines, and biological products, combination products first appeared in 1970 and gained distinctive efficacy (4). The Federal Food, Drug, and Cosmetic Act (FFD&C) was revised in 1990 by the Safe Medical Device Act (SMDA), which marked the start of the development of regulations for combination items in the US. Prior to these things being managed on an as-needed basis, there was no formal regulatory system in existence (5). Combination goods are expanding in scope and complexity as manufacturing technology advances. The first definition of combination goods appeared in Title 21 of CFR 3.21 in 1991 (6).

Combination products are defined in 21 CFR 3.2(e). The term combination product includes:

- 1. A product consisting of two or more regulated components, such as a drug and a device, a biologic and a device, a drug and a biologic, or a drug and a device and a biological, and produced as a single entity by physical, chemical, or other processes.
- 2. Examples of two or more different products that are packaged together in a single container or as a single unit are drug and device goods, device and biological products, or biological and drug products.
- 3. A drug, device, or biological product packaged separately that, according to its investigational plan or proposed labelling, is intended for use only with an approved individually specified drug, device, or biological product when both are required to achieve the intended use, indication, or effect and when, after the proposed product's approval, the labelling of the approved product would need to be changed.
- 4. Any experimental drug, apparatus, or biological product that is packaged separately and, in accordance with its planned labelling, is only to be used in conjunction with another such product, when both are required to achieve the intended use, indication, or effect (7).

#### **Combination Product Types** (8)

Table 1-Types of combination products

#### **Office of Combination products**

The requirements of the Medical Device User Fee and Modernization Act (MDUFMA) in 2002 led to the establishment of the Office of Combination Products. The primary agency responsible for regulating and grading combination products is chosen by OCP (9).

- It acts as the primary point of contact for staff and the industry with regards to inquiries concerning combination items. The creation of guidelines, rules, and standard operating procedures to make the laws governing combination goods clearer.
- Facilitate the settlement of disagreements about the premarket examination of timetables for combination products.
- Modernization of contracts, policies, or procedures pertaining to the assignment of combination goods (10).

#### Harshitha et al.,

#### PMOA.

Combination products will have more than one mode of action since they are composed of more than one regulated product category (such as a biological product, device, or medication), and each component contributes its own mode of action. Therefore, the FDA defines the primary mode of action (PMOA) as "the single mode of action of a combination product that produces the most important therapeutic action of the combination product." The most crucial therapeutic effect is the one that is anticipated to have the greatest influence on all of the intended therapeutic advantages of the product (11).

#### **Pre-Request for Designation process**

The sponsor provided the details in written form to the OCP to identify combination products. The feedback period has a 60-day calendar constraint. During the review, the sponsor is always able to connect to OCP and ask any questions they may have. OCP informed the sponsor of a longer review period if it was unable to provide comments within 60 days. Any substantial changes to the product made by the sponsor, such as changes to the indication or a component, must be communicated to OCP. It is necessary to file a separate pre-Request for Designation for each product if it has various configurations, ingredients, applications, or indications (13).

#### **Request for Designation**

21 CFR 3.2, (j), states a request letter from an applicant is another name for an RFD, It is an OCP written contribution. RFDs ask for an assessment of

- (1) The product's categorization or regulatory designation as a drug, device, biological product, or combination product, and/or
- (2) Which FDA division will oversee a non-combination product if one exists? Which agency center will be in charge of premarket regulation and inspection if it's a combined one?

The designation letter is FDA's official response to an RFD and constitutes a legally-binding determination of the center's classification and/or assignment. However, as per 21 CFR 3.2(i) of the regulations, this determination may be modified in accordance with the criteria set forth in 563 of the FD&C Act and 21 CFR 3.9 rules (14).

#### Product approval procedure

After the lead center has been designated the product developer can submit the required market application to the lead center in order to approach it for market authorization. The product should be submitted as an NDA if the lead center is CDER; if it is allocated to CBER, the application is a BLA; similarly, if the lead center is CDRH, the application is either a 510k or a PMA, depending on the device's classification. CDRH, CBER, and CDER collect the device user fee and the registration charge in order to approve and review a combination product (15). Application for combination products in accordance with the PMOA and the evaluation period (16).

#### Regulatory requirements for Combination products in China

The primary Chinese regulatory authority is the CFDA/NMPA (China Food and Drug Administration/National Medical Product Administration) (17). The NMPA has regulated combination goods since 2002(18). The regulatory requirements for drug-device combination products were first made clear in the NMPA's Notice on Matters Concerning the Registration of Drug-Device Combination Products, which was published in November 2009. The Announcement on the Registration of Drug-Device Combination products was published in 2021 by the NMPA(19). According to the statement, a medication-device combination product's primary mode of action (PMOA) must be considered when determining whether to regulate it as a medicine or a device. When the PMOA is a device and vice versa, the product must adhere to the regulatory process for devices (20). The PMOA for combined items is validated by the Centre for Medical Device Standard Administration. The development of China's regulatory science for medical devices is covered in this portion of the Regulatory Science Action Plan (RSAP), which was introduced by the NMPA in 2019.

#### Harshitha et al.,

In China, a Combination product is defined as "a single, manufactured item that consists of both pharmaceuticals and medical equipment" (21).

#### **Registration of Drug-Device Combination Products**

- Products that combine medications and devices must be declared and registered in accordance with the applicable drug regulations.
- Products combining medicines and devices that principally depend on medical devices' functionality must be declared and registered in line with the relevant medical device standards.
- The accompanying marketing certification documents for any medications or medical devices included in a combination of drugs and devices that have been given the go-ahead for marketing in China or the country (area) of manufacture must be included with the registration application.
- The applicant must thoroughly evaluate all of the characteristics of the stated medicine and device combination product. In order to define the management qualities of the medication and device combination product, the applicant must first submit an application to the State Medical Products Administration's Medical Device Standards Management Centre.
- The standard management canter shall review the accepted application materials for the definition of the attributes of drug-device combination products, solicit input on that definition in accordance with the procedures, notify the applicant in the information system for that purpose, and promptly post the outcomes of that definition on its website.
- The applicant must identify a "drug-device combination product" on the application form and submit an application to the State Medical Products Administration for registration of medications or medical devices based on the outcomes of defining the product's qualities (22).

#### **Regulatory Requirements of Combination Products in Japan**

The regulating body in Japan is the PMDA (Pharmaceuticals Medicine and Device Agency). It is a department of the Ministry of Health, Labour, and Welfare (MHLW). A "combination product" in Japan is a product that is advertised as a single drug, medical device, or cellular and tissue-based product but actually combines two or more different types of drugs, devices, processed cells, etc. that ordinarily fall into the drug, medical device, or cellular and tissue-based product categories if marketed separately (24).

#### **Examples of Combination Products**

These comparable drug-combination products are only a few examples. Prefilled syringes and asthma medicine are delivered through inhalers with a programmable respiratory intake mechanism. Heparin-coated catheters, antimicrobial bone cement, and drug-eluting stents are a few examples of combination items that correlate to medical devices. Cell suspensions in prefilled syringes and a pair of cell suspension and scaffold goods used for impregnation in clinical settings are two examples of cellular and tissue-based combination products.

#### The following goods are permitted in combination products:

- a) A collection of products (integrated goods where each component can be sold as a distinct medication, medical device, or cell and tissue product since the pharmaceuticals, etc., are not indivisible).
- b) Kit products ("In Handling Kit and Other goods That Combine Solutions, etc. with Injections, it says "kit products.") (PAB/ELD Notice No. 2-98 by the Directors of the Office of Pharmaceutical Affairs, Ministry of Health and Welfare's First Division of Evaluation and Registration, Second Division of Evaluation and Registration, and Division of Biological Products, dated 12 March 1986)
- c) Products, such as medical equipment, etc., that cannot be utilized independently from pharmaceuticals and in which the constituent drugs, etc., cannot be marketed individually. (Excluding kit products).

#### Harshitha et al.,

#### Handling of Marketing Application

- Cellular and tissue-based products, medical devices, and medication combinations must be submitted as a single product.
- It is not necessary for pharmaceuticals, medical devices, or cellular and tissue-based products that are part of a combination product to have individual marketing permission, certification, or notice, even if they are manufactured at a different manufacturing facility than the final combination product.
- The marketing authorization holder will require a separate license and marketing clearance if the medication, device, or another component of the combination product is offered as a finished good.
- When filing your marketing approval application, be sure to specify whether your product has a clinical necessity since set products—with the exception of those with a need—are often not accepted.
- Specify in the comments area of the application which "Combination Products" match to which medications. If the combination products match the "Kit products" specified in the "Combination Products" section of the Handling of Kit and Other Goods that Combined Solutions, etc. to Injections, then they are "Kit products".
- Be sure to put "combination products" in the section of the application form designated for comments, and request the chance to submit either the application for a partial modification or the minor change notice for combination items (25).

#### **Decision-Making Procedures**

In Japan, combination products are evaluated on a case-by-case basis. The primary mode of action is the primary criterion for classifying a substance as a drug or a device. The Ministry of Health, Labour, and Social Services will examine the matter. The Office of New Drugs of the PMDA will oversee the review if the product is classified as a pharmaceutical. The PMDA's Office of Medical Devices will take the lead if the item is a medical device (26).

#### License, Manufacture, and Quality Management

The company must get the license to develop any combination of drugs, medical devices, or products made from cellular tissues. Combination products need to follow GMP for medications and quasi-drugs, QMS for medical devices, in vitro diagnostics, and cellular and tissue-based products.

# CONCLUSION

Combination products are the new approach that has been used in a vast range because in some scenarios it may be difficult to treat the diseases with the drug, biologics, and medical device alone. The regulations of Combination products in the US, China, and Japan are discussed in this article. The primary mode of action is the primary factor in determining whether a combination product should be classified as a medicine, biologic, or medical device in each of the three counties, and the regulatory pathway that results from that classification. The field of Combination products in the US is very well developed with transparency when compared to China and Japan.

#### Table 1-Types of combination products

Туре	Description	Common Example(s)
1	Convenience Kit or Co-Package	Drug or biological product vials packaged with device(s) or accessory
	Drug and device are provided as	kits (empty syringes, auto-injectors, transfer sets), first aid or surgical
	individual constituent parts within	kits containing devices and drugs
	the same package	
2	Prefilled Drug Delivery Device/	Prefilled drug syringe, auto-injectors, metered-dose inhalers, dry
	System	powder inhalers, nasal-spray, pumps, transdermal systems, prefilled
	Drug is filled into or otherwise	iontophoresis system or microneedle "patch"
	combined with the device AND the	
	sole purpose of the device is to deliver	
	drug	
3	Prefilled Biologic Delivery Device/	Vaccine or other biological product in a prefilled syringe, autoinjector,
	System	nasal spray, transdermal systems or microneedle patch pre-loaded
	Biological product is filled into or	with biological product
	otherwise combined with the device	
	AND the sole purpose of the device is	
4	to deliver biological product	
4	Device Coated/ Impregnated/ Otherwise Combined with Drug	Drug pills embedded with sensors, contact lens coated with a drug, drug-eluting stents, drug-eluting leads, condoms with spermicide,
	Device has an additional function in	dental floss with fluoride, antimicrobial coated catheters/sutures, bone
	addition to delivering the drug	cements with antibiotics
5	Device Coated or Otherwise	Live cells seeded on or in a device scaffold, extracorporeal column
0	Combined with Biologic	with column-bound protein
	Device has an additional function in	······ •······· • • • • • • • • • • • •
	addition to delivering the drug	
6	Drug/Biologic Combination	Antibody-drug conjugates, progenitor cells combined with a drug to
	0 0	promote homing
7	Separate Products Requiring	Light-activated drugs or biological products not co-packaged but
	Cross Labeling	labeled for use with a specific light source device
8	Possible Combination Based on	Drug/biological product under development utilizes a device, but
	Cross Labeling of Separate	unclear whether the final product will require that the two be cross-
	Products	labeled
9	Other Type of Part 3 Combination	All 3 articles are combined in a single product (e.g., a prefilled syringe
	Product (e.g., Drug/Device/	containing an antibody-drug conjugate), device to manufacture a
	Biological Product)	biologic also includes a drug or biologic in the kit, or the product
	Combination product not	contains two different combination product types (e.g., Type 1 and
	otherwise described	Type 2 are provided together).

# ABSTRACT

Rice (Oryzae sativa L.) is the most important food for over two billion people in Asia. Which is mainly infested by Brownspot and blast diseases and cause maximum yield loss. The present study was undertaken to find out the efficacy of different Indigenous Technical Knowledge (ITK) practices (Panchagavya, Mint leaf extract, Five leaf extract and Fish amino acid) alone and in combination against the diseases and also characterization of antimicrobial compound against disease causing pathogens. The rice plant are treated with combined application of Panchagavya, Five leaf extract, Mint leaf extract and cd with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting (T7) recorded minimum disease incidence and significantly enhanced the yield parameters. Several antimicrobial compounds were identified from the ITK components which were found to possess antimicrobial compounds against fungal and bacterial pathogens causing diseases in crop plants. These compounds could be the reason for inducing resistant in the plant against the pathogen causing major disease in rice.

Keywords: Rice, ITK, Panchagavya, Fish amino acid.

Livitha et al.,

# INTRODUCTION

Rice (*Oryza sativa* L.) is the most important and extensively grown crop in tropical and subtropical regions of the world and consuming as a staple food for more than 70 percent of the world's population. It is grown in almost all the states of India. In Tamil Nadu rice crop (paddy) is predominantly grown in the Cauvery delta region which is also known as the rice bowl of Tamil Nadu. Rice crop is affected by serious biotic factors like diseases caused by fungi, bacteria and viruses leads to the economic loss and non-availability of food to the population. Among the diseases, Brown leaf spot disease caused by *Bipolaris oryzae* and blast incited by *Pyricularia oryzae* are considered to be major constrain is rice cultivation due to extensive distribution of numerous physiological races (Arshad et al., 2008) and resulting in yield loss of about 27–35 percent (Deepak CA et al., 2021).

Diseases of Rice is managed by seed treatment with fungicides and spraying of fungicides in the field that break down the natural ecological balance. The use of Indigenous Technical knowledge (ITK) practices may help in avoiding environmental pollution as well as increase the production of pesticide-free produce. The ITK components *Viz,.* Panchagavya, Fish amino acid, Five leaf extract, 3G solution, Mooligai viratti, Tulsi leaf extract, Mint leaf extract and Ten leaf extract, etc., generally refers to knowledge systems embedded in the cultural traditions of regional or local communities (Talukdar et al. 2012). The information on traditional agriculture pertinent on efficacy of ITK components against rice diseases and characterization of antimicrobial compounds available in ITK components have never been recorded or documented. With the background, the present investigation was done to study the efficacy and characterization of antimicrobial compounds of ITK components against the diseases incited by *Bipolaris oryzae* and *Pyricularia oryzae*.

# MATERIALS AND METHODS

#### Isolation of *B. oryzae*

Ten Strains of *B. oryzae* was obtained from foliar lesions of the rice variety ADT-36 by pure culture technique and was grown on a rice flour medium (rice flour, 14g; yeast extract, 4g; agar-agar, 15g; distilled water, 1000ml) the culture was maintained at 28ŰC under continuous fluorescent lighting (Michelena and Castilo, 1984). The pathogenic isolates of *B. oryzae* were designated as (AUBO-1 to AUBO-10).

#### Isolation of *P. oryzae*

Ten isolates of *P. oryzae* was isolated from the seeds of ADT-36 by pure culture technique and was grown on pruneagar medium (prune,40g; agar-agar,20g; distilled water, 1000ml) (Ram B. Khadka et al. 2012). Petri plates inoculated with *P. oryzae* was incubated at 28°C for 7 days in the dark, and for further 3 days at the same temperature under continuous fluorescent lighting. The pathogenic isolates of *P.oryzae* were designated as (AUPO-1 to AUPO-10).

#### Pathogenicity proving of the fungal pathogen

The efficacy of ten isolates of pathogenic fungi such as and *Bipolaris oryzae* and *Pyricularia oryzae* were tested by pathogenicity proving study and the isolates Bo<sub>8 & Po7</sub> were found to be effective in cause the disease symptom in pot cultural condition. Hence *Bipolaris oryzae* Bo<sub>8</sub> and *Pyricularia oryzae* Po7 were used for further studies. From the result of the pathogenicity test the virulent isolates of each pathogen Bo<sub>8</sub> and Po7 were subjected to molecular confirmation through ITS region sequencing. the sequence thus obtained was analyzed by using the BLAST analysis tool of the NCBI database. Based on the BLAST search, isolate Bo<sub>8</sub> is confirmed as *B. oryzae* and Po7 as *P. oryzae*. The sequences analysed were deposited in the Gen Bank database and the accession number is obtained. The pathogen isolates with accession numbers were given below:

Isolate	Organism	Accesion number
Bos	Bipolaris oryzae	OQ349750
Po7	Pyricularia oryzae	OQ359421

Livitha et al.,

#### Preparation of ITK components.

#### Panchagavya

The Panchagavya was prepared by using cow dung (5 parts), cow urine (3 parts), milk (2 parts), curd (2 parts), and ghee (1 part). The fresh cow dung was thoroughly mixed with ghee in a wide-mouth mud pot and kept for three days. The above mixture was thoroughly mixed once daily. On the fourth day, other ITK were added to the mud pot, mixed properly, and covered with a nylon net to prevent flies into the pot. The pot was placed in a shed and mixed thoroughly twice for thirty days. (Krishna kumar et al., 2020)

#### Five leaf extract

Collect leaves of the Neem, Pungam, Calotrophis, Adathoda and, Vitex at the rate of each 1 Kg and clean well with water, grind into paste form with water, soak in an equal amount of water or cow urine and keep it undisturbed overnight. In the morning for better effect, boil the extract for 1/2 -1 hour at 70-80°C in a closed container. After boiling, leave it for another 12 hours to cool, the cooled suspension must be filtered with Kada cloth and the filtrate is stored in a clean glass bottle and can be stored upto 15 days. Mix the extract with the recommended quantity of water for the crop.

#### Mint leaf extract

Mint leaves are purchased from the local market. The fresh leaves are washed in sterilized distilled water. The aqueous extract was then prepared by macerating 10 g of leaves in 100 ml of sterilized distilled water. Subsequently, the extract was filtered twice with Whatmann filter paper 1. This extract was used for investigations.

#### Fish amino acid

The fish amino acid was prepared from fish waste obtained from the local fish market. An equal amount of fish waste and jaggery was taken (1 kg of each fish waste and jaggery). The fish waste was taken in an air-tight plastic jar/bottle and jaggery was added. The materials were mixed well and stored in a cool dry place. It was kept away from direct sunlight. After 10 days, the liquid portion was filtered and used for spraying (Maghirang, 2011). The final product was viscous fluid and smelled of panchamirtham.

#### Gas chromatography-mass spectrometry (GC-MS):

The compounds present in the ITK components Viz Panchagavya, five leaf extract, mint leaf extract and fish amino acid were characterized through GC-MS analysis at Bio Focus Research Centre, Thanjavur using Thermo Scientific Trace GC Ultra chromatograph system (Thermo Fischer Scientific, Austria) coupled to Thermo Scientific DSQ II quadruple mass spectrometer. Methanolic extracts of Panchagavya, five leaf extract and mint leaf extract were separated using a TG-SQC capillary column (15 m in length, 0.25mm I.D. and 0.25 µm film thicknesses). Helium gas was used as a carrier gas with a flow rate of 1.0 mL/min and split mode was used with the split flow of 10 mL. The injector temperature was set at 207°C. The column temperature programs consisted of the following: initial temperature of 50°C (held 1 min), increased to 150°C at a rate of 25°C/min. After each injection, the column temperature was increased to 250°C and then held for 7.0 min to remove the residues that were potentially retained in the column. The transfer line temperature and MS source temperature were 265 and 200°C, respectively. Ions with masses of 44 and 56 were selected for the quantification of compounds. The sample extraction and introduction were fully automated using a Triplus RSH Head Space Autosampler. The volume of syringe used was 2.5mL and needle length was 65mm. The 20mL headspace vials were incubated for 1 min in the agitator with temperature 300°C. Filling and injection speed was maintained at 20mL/min. Pre-injection and post-injection flush were given using nitrogen gas to avoid contamination. The time for pre-injection and post-injection flushing was 5 s and 30 s respectively. Raw hexanal (99 per cent purity) purchased from Sigma Aldrich is used as the standard check.

#### Pot culture experiment

A pot culture study was conducted with sterilized garden land soil in completely randomized block design with ten treatments and three replications each at Department of Plant Pathology, Annamalai University, Annamalai nagar from September 2021 to January 2022. Rectangular cement pot of size 18" x 12" x 12" filled with 45 kg of paddy field

#### Livitha et al.,

soil under puddle condition were used for this study. BPT 5204 rice seeds were used (Figure I). The plants in the 'pots were maintained with uniform, regular and judicious watering. The ITK components viz., Panchagavya, Mint leaf extract, Five leaf extract, and Fish amino acid and the chemical Tricyclazole were tested against the *Pyricularia oryzae*, *Bipolaris oryzae*. Twenty percent concentration of ITK components such as Panchagavya, Fish amino acid, Five leaf extract and Mint leaf extract treated with seed @20 ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting. The chemical tricyclazole used as foliar spray at 0.6g/ha first standard chemical check. The spore suspension of *Bipolaris oryzae*, *Pyricularia oryzae* 20 days culture grown on PDA were inoculated the plants using the sterile pinpricking method 15 days after transplanting rice plants. The inoculated plants were incubated in a humid chamber for 48 h and subsequently moved to the greenhouse and it is maintained at 22-28°C, 70-90% relative humidity. Under a light intensity of 85 µmol m<sup>-1</sup> S<sup>-1</sup>, 12 h photoperiod and subsequently transfer to pot culture yard. The treatment schedules were designed on the basis of the above phenomena.

#### **Treatment schedule**

T<sub>1</sub>- Application of panchagavya with seed treatment @20ml/kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting, T<sub>2</sub> - Application of five leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting T<sub>3</sub> - Application of mint leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting T<sub>3</sub> - Application of mint leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting T<sub>4</sub>- Application of fish amino acid with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 25 and 50 Days after transplanting T<sub>5</sub>-T<sub>1</sub>+T<sub>2</sub> T<sub>6</sub> - T5+T3 T<sub>7</sub> - T6+T4 T<sub>8</sub> - Application of Tricyclazole @ 0.6 % conc. on 20 and 40 Days after transplanting T<sub>9</sub> - Healthy Control T<sub>10</sub> - Inoculated Control.

#### Assessment of the disease severity in the field

Twelve plants from each plot were randomly selected and tagged for grading the severity of diseases. The severity of two diseases *viz.* brown leaf spot and leaf blast were recorded following IRRI scales (Standard Evaluation System for Rice, 1980). The disease severity was recorded at 30,50 and at the time of harvest and per cent diseases index was determined us usual.

#### Field trial

The field trials were conducted at Nalladai, Mayiladudurai district of Tamilnadu during September 2021 to January 2022, in field with a history of brown leaf spot, blast and sheath blight incidence (Figure II). The trial was laid out in plots (5x4 m) arranged in randomized block design. Rice seeds of cv. BPT 5204 were sown in the plot and transplanted in 30 DAS in row with row/ plant spacing of 12.5 x 10 cm. Three replicate plots were maintained for each treatment. Regular cultivation practices were followed as per the recommendation. Treatment application details and experimental observation were the same as in greenhouse experiment.

#### **Treatment schedule**

T<sub>1</sub> - Application of panchagavya with seed treatment @20 ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting, T<sub>2</sub> - Application of five leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting, T<sub>3</sub>- Application of mint leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting, T<sub>4</sub> - T<sub>1</sub>+T<sub>2</sub>, T<sub>5</sub> - T<sub>4</sub>+T<sub>3</sub>, T<sub>6</sub> - Application of Tricyclazole @ 0.6 % conc. on 20 and 40 Days after transplanting, T<sub>7</sub> - Contro

#### Data analysis

The data obtained from the studies conducted under laboratory and field conditions were subjected to the analysis of variance techniques (ANOVA) and were applied to completely randomized design (CRD) and randomized block design (RBD). The data obtained on per cent inhibition were transformed using angular (arc sine) transformation.

Livitha et al.,

# RESULTS

Evaluation of combined application of ITK components against blast and brown leaf spot incidence of rice Brown leaf spot disease incidence. The Effect of ITK components were tested against the Brown leaf spot disease of rice under pot culture condition. The result revealed that all the ITK components were found to be effective in inhibiting the progress of disease development than the untreated control. Among the various treatments, the plants are treated with standard chemical check Tricyclazole (Ts) @ 0.6 % conc. on 20 and 40 days after transplanting (T8) recorded minimum brown leaf spot disease incidence which recorded 7.82 %, 10.04 % and 11.65 % percent disease incidence on 30, 50 and at the time of harvest 68.83%,71.27% and 70.62% respectively and followed by the plant are treated with combined application of Panchagavya, Five leaf extract, Mint leaf extract and Fish amino acid with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting (T7) recorded brown leaf spot disease incidence 7.99%, 10.22% and 11.72% percent disease incidence on 30, 50 and at the time of harvest 72.14%,71.77% and 70.44% respectively and combined application Panchagavya, Five leaf extract and Mint leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting (T6) recorded brown leaf spot disease incidence 8.35%, 11.18% and 12.24% percent disease incidence on 30, 50 and at the time of harvest 70.89%, 69.11% and 69.13% respectively and the above three treatments were at par with each other in controlling the disease incidence. The same trend was observed in field trial also. The minimum disease incidence was registered with treatment T6 which recorded the brown leaf spot disease incidence of 7.98 %, 9.87 % and 10.84 % on 30, 50 and at the time of harvest respectively and followed by T5 recording 8.32 %, 10.13 % and 11.12 % percent disease incidence and T4 which recorded 9.40 %, 12.76 % and 13.32 % percent disease incidence on 30, 50 and at the time of harvest respectively. However all the above three treatments were statistically on par with each other in controlling the brown leaf spot disease incidence and significantly superior than all other treatments. Combined applications of ITK components significantly reduce blast disease incidence than the individual application of ITK components (Table III, IV)

#### Blast disease incidence.

The result of the experiments revealed that all the ITK components were effectively arrested the progress of disease development than the untreated control. The maximum percent disease control was observed with the plants are treated with standard chemical check Tricyclazole (Ts) @ 0.6 % conc. on 20 and 40 days after transplanting (T8) recorded minimum blast disease incidence which recorded 8.50 %, 12.76 % and 13.32 % percent disease incidence on 30, 50 and at the time of harvest 74.53%, 66.46% and 66.18% respectively and followed by the plant are treated with combined application of Panchagavya, Five leaf extract, Mint leaf extract and Fish amino acid with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting (T7) recorded minimum blast disease incidence which recorded 9.09 %, 12.22 % and 13.60 % percent disease incidence on 30, 50 and at the time of harvest 72.76%, 67.88% and 66.49% respectively and combined application Panchagavya, Five leaf extract and Mint leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting (T6) recorded minimum blast disease incidence which recorded 10.12 %, 13.07 % and 14.12 % percent disease incidence on 30, 50 and at the time of harvest 70.03%, 65.64% and 64.15% respectively. The treatments T8,T7andT6 were statistically at par with each other to manage the disease incidence. The same result was observed in field trial also. The maximum percent disease control was observed with treatment T6, which recorded 9.85 %, 11.74 % and 12.83 % percent disease incidence on 30, 50 and at the time of harvest respectively and followed by treatment T5 recording 10.16 %, 12.12 % and 13.48 % percent disease incidence and treatment T4 which recorded 11.45 %, 13.23 % and 14.09 % percent disease incidence on 30, 50 and at the time of harvest respectively. The maximum percent disease control was observed with treatment T6, How ever all the above three treatments were statistically on par with each other in controlling the blast disease incidence and significantly superior than all other treatments. Combined applications of ITK components significantly reduce blast disease incidence than the individual application of ITK components (Table III, IV)

#### Livitha et al.,

#### Evaluation of different ITK components on growth and yield parameters of rice

The results pot culture experiment revealed that among the ten treatments, the plants are treated with combined application of Panchagavya, Five leaf extract, Mint leaf extract and Fish amino acid with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting (T7) recorded maximum plant height (90.45 cm), grain yield (32 g/plant), straw weight (117.5 g/plant), number of tillers (22/ clump). It was followed by standard chemical check Tricyclazole @ 0.6 % conc. on 20 and 40 days after transplanting (T8) which registered plant height (91.57 cm), grain yield (34 g/plant), straw weight (122.51 g/plant), number of tillers (24/ clump) and combined application of Panchagavya, Five leaf extract and Mint leaf extract with seed treatment @20ml/ kg of seeds and foliar spray @10 % conc. on 20 and 40 Days after transplanting (T6) recording plant height (92.14 cm), grain yield (33 g/plant), straw weight (116.56 g/plant), number of tillers (21/ clump). In field trial experiments similar observation was recorded. The maximum growth and yield were observed with treatment T5 which recorded maximum plant height (90.56 cm), grain yield (4.36 t/ha) and followed by T6 which recorded plant height (91.67 cm), grain yield (4.50 t/ha) and T4 recording plant height (88.93 cm), grain yield (3.49 t/ha). However all the above three treatments were statistically on par in enhancing the growth and yield parameters and significantly superior than all other treatments. (Table I,II)

#### Gas Chromatography Mass Spectroscopy (GC MS) Analysis:

# Characterization of antimicrobial compounds from methanolic solvent of ITK components through GC-MS. Panchagavya.

The methanolic extract of Panchagavya was analysed in GC-MS for its antimicrobial properties. The analysis shown that, two antibiotics & antimicrobials such as Squalene &Octadecanoic acid and two antioxidants & pesticide compounds, n-Hexadecanoic acid & Hexadecanoic acid and one induce systemic acquired resistance (ISR) ie 2,3-Butanediol. The retention time, name of the compound, biological activity, molecular weights, molecular formula and structure of the compound are presented in the table V.

#### Mint leaf extracts

The antimicrobial and antibiotic compounds identified from mint leaf extract by GC-MS. are recorded as, two antimicrobials *Viz* Nitrogen oxide (N2O) (CAS) Nitrous oxide & 1-Octadecyne and Citronellyl acetate. The compounds Cyclohexanol, 2-methyl-5-(1-methylethenyl)-,  $(1\alpha, 2\alpha, 5\beta)$  having antimicrobial, antibacterial, antifungal and antiviral property also identified. The retention time, name of the compound, biological activity, molecular weights, molecular formula and structure of the compound are presented in the table VI.

#### Five leaf extract.

The antimicrobial and antibiotic compounds identified from five leaf extract by GC-MS are recorded. Three antimicrobials compounds *Viz* Phenol (CAS) Izal, Benzoic acid (CAS) Retardex and Peracetic acid and one pesticide compound of Carbamic acid Phenyl ester were identified. Peracetic acid also noticed as antifungal activity. The retention time, name of the compound, biological activity, molecular weights, molecular formula and structure of the compound are presented in the table VII.

#### Fish amino acid (FAA)

The extract of fish amino acid was analysis for its antimicrobial property by GC-MS. The analysis shown that two antioxidants, nematicide & pesticidal activity compounds such as n-Hexadecanoic acid & Hexadecanoic acid and one antimicrobial as octadecanoic acid. The retention time, name of the compound, biological activity, molecular weights, molecular formula and structure of the compound are presented in the table VIII.

Livitha et al.,

# DISCUSSION

#### Efficacy of combined application of ITK components against blast and brown leaf spot

The efficacy of ITK components viz., Panchagavya, Fish amino acid, Five leaf extract and Mint leaf extract were tested at different combinations against brown leaf spot and blast diseases of rice under pot culture and field conditions. Plants treated with combined application of Panchagavya, Fish amino acid, Five leaf extract and Mint leaf extract as seed treatment @ 20ml/kg of seeds and foliar spray @10 % conc. on 20 and 40 DAT was found to significantly manage the brown leaf spot and blast diseases and in influencing yield parameters. Similar findings were made by several workers using ITK components viz., Panchagavya, Fish amino acid, Five leaf extract, Mint leaf extract. Panchagavya has played a significant role in providing resistance to pests and diseases, resulting in increased overall yields (Tharmaraj et al., 2011). Panchagavya possess the properties of fertilizers and bio pesticides and resulted in positive effect on growth and productivity of crops (Somasundaram et al. 2003 and Sireesha, 2013). Yadav and Lourduraj (2006) studied that foliar spray of Panchagavya recorded significantly higher physical characteristics like grain size, 1000-grain weight and milling quality as well as cooking quality. Abassi (2011) said that fish emulsions is an excellent model system for development of an organic amendment as fertilizer with disease suppressing effects. Cow dung and Hen litter at 20% conc. was found to inhibit the mycelial growth of P. oryzae (Anandeeswari and John Christopher 2020). Kamalakannan et al. (2001) studied the efficacy of different plant extracts against blast disease under pot culture conditions and reported that, pre and post inoculation spray of Prosophis julifera, Zizyphus jujuba and Azadirachta indica exhibited greater reduction in disease incidence. However, pre-inoculation spray was comparatively more effective than post inoculation spray in reducing disease incidence.

#### Characterization of antimicrobial compounds from ITK components.

Several antimicrobial compounds were identified from the ITK components through GC-MS. All the components were found to possess antimicrobial compounds against fungal and bacterial pathogens causing diseases in crop plants, (Reference listed in table 5,6,7,8). similar findings were reported by several workers, Omotoso et al. (2014), Yi Shi et al. (2018), Lozano-Grande et al. (2018) I G Mamedov and Y V Mamedova (2021), Alicja Synowiec et al. (2021), Carlos et al. (2021), Sermakkani and Thangapandian (2012), D Akachukwu and R I. Uchegbu (2016), R.C. Gupta (2014), David et al. (2016), Zhilin Zhang et al. (2018) Vijayakumar and Pannerselvam (2013) and Blechert et al., (1995). The plants are treated with ITK components *viz.*, Panchagavya, Fish amino acid, Five leaf extract and Mint leaf extract, the compounds as listed in the table directly interact with mitochondria of plants and reaches the endoplasmic reticulum hence significantly enhance the structure like cutin, suberin and wax artificially in the plants system thereby the plant will escape from the disease incidence during adverse conditions .These findings are supported by many research workers Zhukov (2015) and Thirukumar et al., (2017). Besides Hexadecaconic acid and octadecanoic acid are the 16 carbon and 18 carbon compounds and their derivatives act as a signalling molecules, modulating diseases related physiologies in plants.

# CONCLUSION

The results reported here indicated that Rice crop treated with complained application of Indigenous Technical Knowledges (ITKs) components viz., Panchagavya, Mint leaf extract, Five leaf extract and Fish amino acid were trigging the metabolic pathway of plant system against disease causing pathogens due to antimicrobial compound present in the ITKs components.

# ABSTRACT

This study examines various sequencing issues where the processing times are trapezoidal intuitionistic fuzzy numbers. Through the use of Graded Mean Ranking Methodology of Pascal's Triangle and the Zero Identifier method, an algorithm is shown for determining the ideal sequence, the minimum total time spent and the idle time for each machine. To demonstrate the viability of the sequencing problem, numerical examples have been provided.

**Keywords:** Trapezoidal Intuitionistic Fuzzy Number, Optimal Sequence, Total elapsed time, Idle time, Pascal's Triangle Graded Mean Ranking value.

# INTRODUCTION

Operations Research assists us in making wiser judgements in difficult situations. Considered to be one of the most crucial applications of operations research is the Sequencing problem. When we are worried about the situation, where there is an option regarding how a number of activities can be done, job sequencing concerns occurs. Sequencing refers to a set of actions or tasks that must be carried out in a particular order. Johnson's method [1], which he provided in 1954 for production scheduling and which minimized the overall idle time of machines and the total production times of the jobs, is one of the most well-known works in this field still being used today. Later in 1967, Smith and Dudek created a general method for the flow shop's 'n' task on 'm' machines sequencing problem when the number of passing is permitted. In most cases, Processing times in sequencing problems are accurately

## Santhi and Nandhini

valued. However, in reality, it seems as though the processing time needed to do a task varies and unreliable. So, we employ Fuzzy Numbers to manage these uncertainties. The uncertainty in determining the data can be replaced by the fuzzy notions which was introduced by Zadeh [2] in the year 1965. Later, Intuitionistic Fuzzy Set was created by Atanassov [3] as a generalization of fuzzy sets. With help of Zero Identifier method [4], we need not to convert the 'n' jobs on three machines or 'n' jobs on 'm' machines problem to 'n' jobs on two machines problem for finding the optimal sequence. Using Graded Mean of Pascal's Triangle [5] and Zero Identifier approach, we use the key concepts and definitions of fuzzy numbers in this work to solve Trapezoidal Intuitionistic Sequencing Problem and obtain the shortest processing times for each machine.

# PRELIMINARIES

# Definition 2.1[2]:

A Fuzzy Set  $\tilde{A}$  in X is a set of ordered pairs defined by  $\tilde{A} = \{(x, \mu_{\tilde{A}}(x)): x \in X, \mu_{\tilde{A}}(x) \in [0,1]\}, \text{ where } \mu_{\tilde{A}}(x) \text{ is a membership function.}$ 

## Definition 2.2[2]:

A fuzzy set  $\tilde{A}$  defined on a set of real numbers  $\mathbb{R}$  is claimed as a Fuzzy Number, if its membership function  $\mu_{\tilde{A}}(x):\mathbb{R} \to [0,1]$  that satisfies the following properties:

- a.  $\tilde{A}$  is convex.
- b.  $\tilde{A}$  is normal.
- c.  $\mu_{\tilde{A}}(x)$  is piecewise continuous.

#### Definition 2.3[3]:

Consider X to be a non-empty set. An Intuitionistic Fuzzy Set is defined as

 $\widetilde{A^{i}} = \{ (x, \mu_{\widetilde{A^{i}}}(x), \vartheta_{\widetilde{A^{i}}}(x)) : x \in X \} \text{ which assigns to each element } x, \text{ a membership degree } \mu_{\widetilde{A^{i}}}(x) \text{ and a non membership degree } \vartheta_{\widetilde{A^{i}}}(x) \text{ under the condition } 0 \le \mu_{\widetilde{A^{i}}}(x) + \vartheta_{\widetilde{A^{i}}}(x) \le 1, \text{ for all } x \in X.$ 

#### Definition 2.4<sup>[6]</sup>:

An Intuitionistic Fuzzy Subset  $\widetilde{A^{I}} = \{ (x, \mu_{\widetilde{A^{I}}}(x), \vartheta_{\widetilde{A^{I}}}(x)) : x \in \mathbb{R} \}$  of the real line  $\mathbb{R}$  is called an Intuitionistic Fuzzy Number (IFN) if the following conditions hold:

i. There exists  $m \in \mathbb{R}$  such that  $\mu_{\widetilde{A^{l}}}(m) = 1$  and  $\vartheta_{\widetilde{A^{l}}}(m) = 0$ .

ii.  $\mu_{\widetilde{A^{l}}}$  is a continuous function from  $\mathbb{R} \to [0,1]$  such that  $0 \leq \mu_{\widetilde{A^{l}}}(x) + \vartheta_{\widetilde{A^{l}}}(x) \leq 1$ , for all  $x \in X$ .

iii. The membership and non-membership functions of  $\widetilde{A}^{I}$  are in the following form:

$$\mu_{\widetilde{A^{I}}}(x) = \begin{cases} 0, & -\infty < x \le a_{1} \\ f(x), & a_{1} \le x \le a_{2} \\ 1, & x = a_{2} \\ g(x), & a_{2} \le x \le a_{3} \\ 0, & a_{3} \le x \le \infty \end{cases}$$

and

$$\gamma_{\widetilde{A^{I}}}(x) = \begin{cases} 1, & -\infty < x \le a'_{1} \\ f'(x), & a'_{1} \le x \le a_{2} \\ 0, & x = a_{2} \\ g'(x), & a_{2} \le x \le a'_{3} \\ 1, & a'_{3} \le x \le \infty \end{cases}$$

where f, f', g, g' are functions from  $\mathbb{R} \to [0,1]$ , f and g' are strictly increasing functions, and g and f' are strictly decreasing functions with the conditions  $0 \le f(x) + f'(x) \le 1$  and  $0 \le g(x) + g'(x) \le 1$ .

## Santhi and Nandhini

#### Definition 2.5[7]:

An Intuitionistic fuzzy number  $\widetilde{A^{l}} = \{(a_1, a_2, a_3; a'_1, a_2, a'_3)\}$  is supposed to be called as a Triangular Intuitionistic Fuzzy Number if its membership and non-membership functions are respectively given by

$$\mu_{\widetilde{A}^{I}}(x) = \begin{cases} \frac{x - a_{1}}{a_{2} - a_{1}}, & a_{1} \le x \le a_{2} \\ \frac{a_{3} - x}{a_{3} - a_{2}}, & a_{2} \le x \le a_{3} \\ 0, & otherwise \end{cases} \text{ and } \qquad \vartheta_{\widetilde{A}^{I}}(x) = \begin{cases} \frac{a_{2} - x}{a_{2} - a_{1}}, & a_{1}^{'} \le x \le a_{2} \\ \frac{x - a_{2}}{a_{3} - a_{2}}, & a_{2} \le x \le a_{3} \\ 1, & otherwise \end{cases}$$

Here  $a_1 \leq a_1 \leq a_2 \leq a_3 \leq a_3$  and  $\mu_{\tilde{A}}(x) + \vartheta_{\tilde{A}}(x) \leq 1$  or  $\mu_{\tilde{A}}(x) = \vartheta_{\tilde{A}}(x)$  for all  $x \in X$ .

#### Definition 2.6[8]

An Intuitionistic fuzzy number  $\widetilde{A^{I}} = \{(a_1, a_2, a_3, a_4; b_1, b_2, b_3, b_4)\}$  is said to be a Trapezoidal Intuitionistic Fuzzy Number if its membership and non-membership functions are respectively given by

$$\mu_{\widetilde{A}^{1}}(x) = \begin{cases} \frac{x-a_{1}}{a_{2}-a_{1}}, & a_{1} \leq x \leq a_{2} \\ 1, & a_{2} \leq x \leq a_{3} \\ \frac{a_{4}-x}{a_{4}-a_{3}}, & a_{3} \leq x \leq a_{4} \\ 0, & otherwise \end{cases} \quad and \quad \vartheta_{\widetilde{A}^{1}}(x) = \begin{cases} \frac{b_{2}-x}{b_{2}-b_{1}}, & b_{1} \leq x \leq b_{2} \\ 0, & b_{2} \leq x \leq b_{3} \\ \frac{x-b_{3}}{b_{4}-b_{3}}, & b_{3} \leq x \leq b_{4} \\ 1, & otherwise \end{cases}$$

Here  $b_1 \le a_1 \le b_2 \le a_2 \le a_3 \le b_3 \le a_4 \le b_4$  and  $\mu_{\widetilde{A^I}}(x) + \vartheta_{\widetilde{A^I}}(x) \le 1$  or  $\mu_{\widetilde{A^I}}(x) = \vartheta_{\widetilde{A^I}}(x)$  for all  $x \in X$ . The membership and non-membership functions of Trapezoidal Intuitionistic Fuzzy Number is given in Fig.1.

#### ARITHMETIC OPERATIONS ON TRAPEZOIDAL INTUITIONISTIC FUZZY NUMBER

Let  $\widetilde{A^{I}} = \{(a_{1}, a_{2}, a_{3}, a_{4}; b_{1}, b_{2}, b_{3}, b_{4})\}$  and  $\widetilde{B^{I}} = \{(a_{1}^{'}, a_{2}^{'}, a_{3}^{'}, a_{4}^{'}; b_{1}^{'}, b_{2}^{'}, b_{3}^{'}, b_{4}^{'})\}$ . Then 1. Addition:

$$\widetilde{A^{I}} + \widetilde{B^{I}} = \{(a_{1} + a_{1}^{'}, a_{2} + a_{2}^{'}, a_{3} + a_{3}^{'}, a_{4} + a_{4}^{'}; b_{1} + b_{1}^{'}, b_{2} + b_{2}^{'}, b_{3} + b_{3}^{'}, b_{4} + b_{4}^{'})\}$$

2. Subtraction:

$$\widetilde{A^{I}} - \widetilde{B^{I}} = \{(a_{1} - a_{4}, a_{2} - a_{3}, a_{3} - a_{2}, a_{4} - a_{1}; b_{1} - b_{4}, b_{2} - b_{3}, b_{3} - b_{2}, b_{4} - b_{1})\}$$

3. Scalar Multiplication:

If  $k \ge 0$ ,  $k\widetilde{A}^{I} = (ka_1, ka_2, ka_3, ka_4)$ If  $k \le 0$ ,  $k\widetilde{A}^{I} = (ka_4, ka_3, ka_2, ka_1)$ 

#### RANKING USING PASCAL'S TRIANGULAR GRADED MEAN<sup>[5]</sup>

Let  $\widetilde{A^{I}} = \{(a_1, a_2, a_3, a_4; b_1, b_2, b_3, b_4)\}$  be a trapezoidal intuitionistic fuzzy number. The ranking function is given by

 $\begin{aligned} \mathbf{R}(\mathbf{A}) &= \mathbf{Max}[\operatorname{mag}(\widetilde{A}_{\mu}^{I}), \operatorname{mag}(\widetilde{A}_{\vartheta}^{I})] \\ \text{where } \operatorname{mag}(\widetilde{A}_{\mu}^{I}) &= \frac{a_{1}+3a_{2}+3a_{3}+a_{4}}{8} \text{ and } \operatorname{mag}(\widetilde{A}_{\vartheta}^{I}) &= \frac{b_{1}+3b_{2}+3b_{3}+b_{4}}{8} \end{aligned}$ 

# ALGORITHM FOR SOLVING INTUITIONISTIC FUZZY SEQUENCING PROBLEM USING ZERO IDENTIFIER METHOD [4]

#### Processing 'n' jobs on two machines

Let  $A_{11}, A_{21}, \dots, A_{n1}$  be the processing times of 'n' jobs on machine I and let  $A_{12}, A_{22}, \dots, A_{n2}$  be the processing times of 'n' jobs on machine II. Steps involved in the algorithm:

## Santhi and Nandhini

- 1. Identify  $Min(A_{i1}, A_{i2})$ , i = 1, 2, ..., n.
- 2. (a) If we get minimum on machine I say A<sub>i1</sub>, then process the i<sup>th</sup> job first.
  (b) If we get minimum on machine II say A<sub>m2</sub>, then process the m<sup>th</sup> job last.
  (c) If there is a tie, that is, A<sub>i1</sub> = A<sub>m2</sub>, process the i<sup>th</sup> job first and m<sup>th</sup> job last.
- 3. Cancel the jobs already assigned and repeat the procedure till each jobs have been assigned.

#### **Processing 'n' jobs on three machines:**

Let A,B,C be three machines and processing each job in the proper sequence A,B,C. Instead of converting this problem into 'n' jobs across two machines, the following steps shows us the way to get the optimal sequence using Zero Identifier method.

- 1. Convert the Trapezoidal Intuitionistic Fuzzy Number into crisp value using Graded Mean Ranking Function of Pascal's Triangle and identify the minimum processing time.
- 2. Subtract all components from this minimum processing time.
- 3. Locate the zeros; they might happen in any of the machines.
- 4. Give preference to the first machine if zeros are present and the order of sequence is from left to right.
- 5. If zeros occur in the second machine or third machine, prefer that machine from left to right and the order of sequence is from right to left.
- 6. Cancel the jobs already assigned and repeat the process until all jobs have been assigned and compute the time in and time out.

#### Processing 'n' jobs on 'm' machines:

Let  $A_1, A_2, \ldots, A_m$  be 'm' machines processed over 'n' jobs and each job be processed in the sequence  $A_1, A_2, \ldots, A_m$ . Instead of converting this problem into 'n' jobs on two machines, we use Zero Identifier method to obtain the optimal sequence.

- 1. Convert the Trapezoidal Intuitionistic Fuzzy Number into crisp value using Graded Mean Ranking Function of Pascal's Triangle and identify the minimum processing time'
- 2. Subtract all components from this minimum processing time.
- 3. Locate the zeros; they might happen in any of the machines.
- 4. If zeros occur in the first machine, give priority to machine 1 and the order of sequence is from left to right.
- 5. If zeros occur in the second, third,...*m*<sup>th</sup> machine, give priority to that machine from left to right and the order of sequence is from right to left.
- 6. Cancel the jobs already assigned and repeat the process until all jobs have been assigned and compute the time in and time out.

#### NUMERICAL EXAMPLES

#### Example: 1 ('n' jobs on two machines)

There are 5 jobs, each of which is intended to be completed by two machines  $M_1$ ,  $M_2$  in the sequence  $M_1M_2$ . Processing time (in hours) is given below:

Jobs	Machine $(M_1)$	Machine $(M_2)$
А	(2,3,4,5; 1,3,4,6)	(4,5,6,7; 2,5,6,9)
В	(8,9,10,11; 6,9,10,13)	(6,7,8,9; 5,7,8,10)
С	(5,6,7,8; 4,6,7,9)	(11,12,13,14; 9,12,13,16)
D	(4,5,6,7; 2,5,6,9)	(10,11,12,13; 7,11,12,16)
Е	(10,11,12,13; 7,11,12,16)	(13,14,15,16; 12,14,15,17)

Obtain the optimal sequence, minimum total elapsed time and idle time for each machine. Solution:

## Santhi and Nandhini

Using Graded mean ranking function of Pascal's triangle, we convert the Trapezoidal Intuitionistic fuzzy number into crisp one and obtain the optimal sequence as:  $A \rightarrow D \rightarrow C \rightarrow E \rightarrow B$ . To find the total elapsed time:

10 111	o ind the total elapsed time.							
Jobs	Machine( $M_1$ )	Machine(M <sub>2</sub> )						
JODS	Time in – Time Out	Time in – Time out						
А	(0,0,0,0; 0,0,0,0) - (2,3,4,5; 1,3,4,6)	(2,3,4,5; 1,3,4,6) - (6,8,10,12; 3,8,10,15)						
D	(2,3,4,5; 1,3,4,6) - (6,8,10,12; 3,8,10,15)	(6,8,10,12; 3,8,10,15) - (16,19,22,25; 11,19,22,30)						
С	(6,8,10,12; 3,8,10,15) - (11,14,17,20; 7,14,17,24)	(16,19,22,25; 11,19,22,30) - (27,31,35,39; 20,31,35,46)						
Е	(11,14,17,20; 7,14,17,24) - (21,25,29,33; 14,25,29,40)	(27,31,35,39; 20,31,35,46) - (40,45,50,54; 32,45,50,63)						
В	(21,25,29,33; 14,25,29,40) - (29,34,39,44; 20,34,39,53)	(40,45,50,54; 32,45,50,63) - (46,52,58,63; 37,52,58,73)						

Jobs	Idle time( $M_1$ )	Idle time $(M_2)$
А	-	(2,3,4,5; 1,3,4,6)
D	-	(-6,-2,2,6; -12,-2,2,12)
С	-	(-9,-3,3,9; -19,-3,3,19)
Е	-	(-12,-4,4,12; -26,-4,4,26)
В	-	(-14,-5,5,14; -31,-5,5,31)
Total	(2,13,24,34; -16,13,24,53)	(-39,-11,18,46; -87,-11,18,94)

Minimum Total Elapsed Time = (46,52,58,63; 37,52,58,73) hours Idle time for Machine $M_1$ = (2,13,24,34; -16,13,24,53) hours Idle time for Machine  $M_2$  = (-39,-11,18,46; -87,-11,18,94) hours

## Example:2 ('n' jobs on three machines)

Three machines  $M_1$ ,  $M_2$  and  $M_3$  are to process each of the five jobs in the following order  $M_1$ ,  $M_2$ ,  $M_3$ . Processing time (in hours) is given below:

Jobs	Machine(M <sub>1</sub> )	Machine(M <sub>2</sub> )	Machine(M <sub>3</sub> )
А	(3,5,7,9; 1,5,7,11)	(4,5,6,7; 3,5,6,8)	(5,8,9,10; 3,8,9,12)
В	(7,8,9,10; 6,8,9,11)	(2,4,6,8; 0,4,6,10)	(1,2,3,4; 0,2,3,5)
С	(5,8,9,10; 3,8,9,12)	(2,3,4,5; 1,3,4,6)	(8,9,10,11; 5,9,10,14)
D	(4,5,6,7; 3,5,6,8)	(3,5,7,9; 1,5,7,11)	(1,2,3,6; 0,2,3,7)
Е	(8,9,10,11; 5,9,10,14)	(1,2,3,6; 0,2,3,7)	(2,4,6,8; 0,4,6,10)

Obtain the optimal sequence and also determine the minimum total elapsed time and idle time for each of the machine.

#### Solution

Using New Zero Identifier Method, we get the optimal sequence as follows:

Jobs	$M_1$	$M_2$	$MM_{3_3}$	Jobs	$M_1$	$M_2$	<i>M</i> <sub>3</sub>
А	6	5.5	8.25	А	3.5	3	5.75
В	5.5	5	2.5	В	6	2.5	0
С	8.25	3.5	11	С	5.75	1	8.5
D	5.5	6	2.75	D	3	3.5	0.25
Е	9.5	2.75	5	E	7	0.25	2.5

Santhi and Nandhini

Jobs	$M_1$	$M_2$	<i>MM</i> <sub>33</sub>		Jobs	$M_1$	$M_2$	<i>MM</i> <sub>33</sub>
А	3.25	2.75	5.5		А	2.5	2	4.75
В	6	2.5	0		В	6	2.5	0
С	5.5	0.75	8.25		С	4.75	0	7.5
D	2.75	3.25	0		D	2.75	3.25	0
Е	6.75	0	2.25		Е	6.75	0	2.25
Jobs	$M_1$	$M_2$	<i>MM</i> <sub>33</sub>					
				1				

Therefore, Optimal Sequence:  $A \rightarrow C \rightarrow D \rightarrow E \rightarrow B$ To find the total elapsed time:

time					

Minimum Total Elapsed Time = (30,41,50,59; 18,41,50,71) hours

Idle time for Machine  $M_1$  = (-17,6,9,32; -38,6,9,53) hours

Idle time for Machine  $M_2$  = (-73,-5,51,115; -149,-5,51,187)hours

Idle time for Machine  $M_3 = (-77, -11, 43, 107; -144, -11, 43, 174)$  hours

Example 3: ('n' jobs on 'm' machines)

Find the best order for the next sequencing issue with four jobs and four machines when passing is prohibited, of which processing time (in hours) are given below:

Jobs	Machine(M <sub>1</sub> )	Machine(M <sub>2</sub> )	Machine(M <sub>3</sub> )	Machine(M <sub>4</sub> )
А	(3,5,7,9; 1,5,7,11)	(1,2,3,4; 0,2,3,5)	(2,3,4,5; 1,3,4,6)	(2,4,6,8; 0,4,6,10)
В	(7,8,9,10; 6,8,9,11)	(4,5,6,7; 2,5,6,9)	(1,3,4,5; 0,3,4,6)	(4,7,8,9; 2,7,8,11)
С	(8,9,10,11; 5,9,10,14)	(2,3,4,5; 1,3,4,6)	(4,5,6,8; 3,5,6,9)	(1,2,3,4; 0,2,3,5)
D	(5,6,7,8; 4,6,7,9)	(3,5,7,9; 1,5,7,11)	(3,5,7,8; 1,5,7,10)	(8,9,10,11; 5,9,10,14)

## Santhi and Nandhini

#### Solution:

Using Pascal's Triangular graded mean and zero identifier method, we get

Jobs	$M_1$	<i>M</i> <sub>2</sub>	$MM_{3_3}$	$MM_{43}$		Jobs	$M_1$	<i>M</i> <sub>2</sub>	$MM_{3_3}$	$MM_{43}$
А	6	2.5	3.5	5		А	3.5	0	1	2.5
В	8.5	5.5	3.375	7.25		В	6	3	0.875	4.75
С	9.5	3.5	5.625	2.5		С	7	1	3.125	0
D	6.5	6	5.875	9.5		D	4	3.5	3.375	7
Jobs	$M_1$	$M_2$	$MM_{33}$	$MM_{43}$		Jobs	$M_1$	$M_2$	<i>MM</i> <sub>33</sub>	$MM_{4_3}$
А	3.5	0	1	2.5		А	3.5	0	1	2.5
В	5.125	2.125	0	3.875		В	5.125	2.125	0	3.875
С	7	1	3.125	0		С	7	1	3.125	0
D	6.5	2.625	2.5	6.125		D	4	0.125	0	3.625

Therefore, Optimal Sequence:  $D \rightarrow B \rightarrow C \rightarrow A$ 

To find	total	ela	psed	time:	

Jobs	Machine ( <i>M</i> <sub>1</sub> )	Machine $(M_2)$	Machine $(M_3)$	Machine $(M_4)$

# CONCLUSION

Using Trapezoidal intuitionistic fuzzy numbers, we have solved several kinds of fuzzy sequencing problems in this study. With the aid of Graded Mean Ranking function of Pascal's Triangle and Zero Identifier approach, we are able to process all jobs through machines in the most efficient order and with the least amount of time spent on each job. The fuzzy sequencing problem notion offers an useful foundation for resolving the practical issue.

# ABSTRACT

Neurocognitive disorders are characterized by impairment in cognitive functions which is present in many neurological and mental disorders such as Alzheimer's disease, traumatic brain injury, frontotemporal degeneration, infections, schizophrenia, and bipolar disorder etc., Neurocognitive disorders are divided into major and minor neurocognitive disorder. Dementia also known as major neurocognitive disorder is a group of symptoms caused by decreased mental function. A worldwide estimation of people affected by dementia is around 30 million by the year 2008 and it will rise to 59 million by 2030 and 104 million by 2050. In India, 3.01 million people were already affected by dementia. Currently, available treatment modalities, Cholinesterase inhibitors are the only choice of drug for the treatment of neurocognitive disorders, it might be helpful to manage symptomatically. Prolonged administration of Cholinesterase inhibitors may cause adverse side effect which includes dyspepsia, anorexia, asthenia, dizziness, muscle cramps, insomnia, diarrhea, etc., In the Siddha system of medicine various conditions of Neurocognitive disorders are treated through highly effective herbal preparations, Sagala Noi choornam (SNC) is one among them. Which is used for treating Vatha-related diseases, urolithiasis, insomnia, slurred speech, cervical lymphadenopathy, delirium, ulcers, etc, The study was designed to evaluate the neuroprotective activity of SNC through the AChE enzyme Inhibition assay method. In this study, the trial drug SNC was studied in various concentrations (25, 50, 100,250, 500 µg/ml) by Acetylcholinesterase inhibition assay method, Physostigmine was used as a standard drug. The

## Shalini *et al.,*

maximum inhibition of AChE enzyme by SNC and the standard drug was 45.63 4.40% and 93.9 5.36 % respectively. The present study indicates that the test drug SNC was effective in inhibiting the AChE enzyme at a stipulated concentration dose independently. The percentage of inhibition and IC50 value were calculated and compared with standards. This study concluded that the test drug *Sagala Noi choornam* (SNC) has shown proven neuroprotective activity through the acetylcholinesterase enzyme inhibition assay method. Further studies must be conducted in the future to confirm its Neuroprotective activity clinically.

Keywords: Acetylcholinesterase, Neuroprotective activity. Sagala Noi choornam, Siddha medicine.

# INTRODUCTION

Siddha system of medicine offers a holistic approach to treatment along with a list of nootropic herbs and therapeutic formulations that are a rich source of neuroprotective, anti-oxidant, anti-amyloidogenic, adaptogenic, anti-inflammatory, and immune-modulatory compounds that are found to enhance cognitive functions and improves quality of life. Neurocognitive disorders are characterized by cognitive impairment associated with depression, progressive memory loss, agitation, language deficits, and various neurodegenerative disorders including Alzheimer's disease (AD), Parkinsonism and epilepsy is a major health issues. Neurological disorders ranked as the second most common cause of global mortality in the year 2016 [1].

The estimated number of people in 2010 and 2015 living with major Neurocognitive disorders are 3.7 million and 4.1 million respectively.[2] Owing to various side effects, limited efficacy of neuroprotective drugs, and poor patient compliance for recent rationally designed therapies scientists to searching for new and effective alternative medicines with low adverse effects.[3] The Siddha system of medicine is one of the traditional systems of medicine that gives effective treatment and has minimal side effects after chronic consumption of medicines.[4]

Choornam is one type of internal medicine that is used to regulate the vital humors (*Vaatham, Pittham, Kabham*).[5] *Sagala Noi choornam* (SNC) is one of the Siddha polyherbal formulations that is therapeutically used for sirasu noigal (Neurological disorders), Vaikonal (Facial palsy), Vaikularal (Slurring of speech) etc. [6] [7] *Sagala Noi Choornam* is composed of multiple herbs as most of the ingredients in *Sagala Noi Choornam* exhibited AChE inhibitory, decreased lipid peroxidation, and anti-oxidant activities.

Acetylcholinesterase inhibitors are the only choice of drug for the treatment of Neurocognitive disorders especially Alzheimer's disease, but it gives only symptomatic relief. Also currently available drugs for AChE inhibitors have shown various illnesses in a person's life including bradycardia, weight loss, miosis, hypotension, urinary incontinence, diaphoresis, emesis, Gastrointestinal upset.etc.,[8] Patients with cardiac conduction diseases, Gastric ulcers, urinary retention, and previous allergic history are contraindicated for AChE inhibitors.[9],[10]. This research study focused on scientifically validating the Neuroprotective potential of *Sagala Noi Choornam* through *invitro* acetylcholinesterase inhibition assay method.

# MATERIALS AND METHODS

The SNC was procured from GMP-certified IMPCOPS Pharmacy in Thiruvanmiyur, Chennai.

## Method of Preparation

# Shalini *et al.,*

Each 35 grams of *Cuminum Cyminum, Glycyrrhiza glabra, Nigella sativa, Anethum graveolens, Cycas circinalis, Cinnamomum verum* purified raw drugs, Coriandrum sativum – 210 grams, and *seeni karkandu* 420 g were taken and ground all these ingredients separately. Then mix all the powdered drugs well and store in air tight glass container.

#### Procurement of test drug for analysis

The test drug Sagala noi choornam (SNC) was prepared in the above manner and procured from GMP-certified IMPCOPS pharmacy in Thiruvanmiyur, Chennai, and then given for analysis.

**Drug dosage:** *Verukadiyalavu* (2 times a day) **Adjuvant:** Hot water

#### Indication:

- Sirasu noigal (Neurological disorders),
- ➢ Vaikonal (Facial paly),
- Vaikularal(Slurring of speech ),
- Delirium (Unmaatham),
- Sleep Disturbances (Insomnia).

#### In-vitro AChE enzyme Inhibition Assay – Methodology

The test drug *Sagala Noi Choornam* (SNC) was procured from GMP-certified IMPCOPS pharmacy in Thiruvanmiyur, Chennai, and used for analysis. AChE activity of Siddha poly herbal formulation *Sagala Noi Choornam* (SNC) was measured using a modified 96-well microplate assay based on Ellman's method, enzyme hydrolyses the substrate acetylthiocholine resulting, the experiment, a buffer solution of 50 Mm Tris- HCL at a PH of 8.0 was employed. The reaction involved the conversion of thiocholine into 2-nitrobenzoate-5-mercaptothiocholine and 5-thio-2-nitrobenzoate when it interacted with Ellman's reagent (DTNB), with detection carried out at a wavelength of 412nm.AChE enzyme stock solution (518 U/ml) was kept at -80oC and the enzyme dilution was done in 0.1% BSA in the buffer.

DTNB was dissolved in a buffer solution comprising 0.1 M Nacl and 0.02 M MgCl2, while ATCI was dissolved in deionized water. In each of the 96-well plates, the following components were added: 100µl of 3Mm DTNB, 20 µl of 0.26 U/ml AChE, and 40 µl of buffer with a PH of 8.0 containing 50 Mm Tris. To these wells, 20 µl of the test drug at various concentration (25,50,100,250 and 500 µl/ml) dissolved in a buffer containing no more than 0% methanol were introduced. After thorough mixing, the plate was incubated for 15 minutes. The enzymatic reaction was initiated by the addition of 20 µl of 15 mM acetylthiocholine iodide and the hydrolysis of acetylthiocholine was monitored by reading the absorbance every 5 min for 20 min at 412 nm. Physostigmine (5, 10, 20 and 40 µg/ml) was used as positive control. All the reactions were performed in triplicate.<sup>[12],[13]</sup>

#### Statistical analysis

The statistical analysis was done by one-way ANOVA (Graph pad Prism 5 computer program). Numerical data were expressed as the mean value ± standard deviation (SD).

# RESULTS

Inhibition of the AChE enzyme by the test drug, expressed as a percentage

#### Effect of Sagala Noi Choornam (SNC) in AChE Enzyme Inhibition Activity

The result obtained from the present study indicates that the test drug SNC was effective in inhibiting the AChE enzyme at the stipulated concentration dose-dependently. Maximum percentage inhibition of about 45.63  $\pm$  4.405 % was observed at 500 µg/ml with the IC 50 value of 519.4  $\pm$  87.56 µg/ml. The results are shown in Fig 1 and Table 2.

# Shalini et al.,

#### Effect of Physostigmine on AChE Enzyme Inhibition Activity

The results obtained from the present study have been compared with the Standard drug Physostigmine (a well-known AChE inhibitor ), the results revealed that the maximum inhibition of AChE Enzyme at the concentration of 40 % is  $93.9 \pm 5.306$  % with the IC50 value of  $13.47 \pm 2.115 \mu g/ml$ . Results are expressed in Fig no 2 and Table no 3.

# DISCUSSION

5<sup>th</sup> edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV) provides a framework for diagnosing neurocognitive disorders. That is, explaining the main cognitive syndromes and defining criteria to delineate particular aetiological subtypes of mild and major NCD.[14] According to the DSM-5 dementia was developed step by step decline of memory and cognitive functions. Alzheimer's disease is one of the most common causes of Neurocognitive disorders it develops slowly after the age of 65. Nowadays, Symptomatic management is only provided to NCD patients if these drugs will cause severe side effects in the future.

Herbal drugs possess Neuroprotective activity it have been used in many countries because of their therapeutic potency, safety, and efficacy. *Sagala Noi Choornam* (SNC) has AChE inhibition properties in a stipulant dose-dependent manner. Among the ingredients *Cuminum Cyminum*, *Glycyrrhiza glabra*, *Nigella sativa*, *Anethum graveolens*, *Coriandrum sativum*, *Cycas circinalis*, *Cinnamomum verum* are known for its anti Alzheimer's, nootrophic, and neuroprotective activities. *Cuminum cyminum* seeds have protective effects against Alzheimer's disease, Parkinson's disease, and other Neurodegenerative diseases. Azetidine,2-methyl -1-phenyl isolated from *Cuminum cyminum* seeds was used for preventing or treating Alzheimer's disease, Parkinson's disease.[15] Cuminaldehyde was isolated from *Cuminum Cyminum* seeds' neuroprotective activity was performed using *an in vitro* SH-SY5Y cells model. In the results MTT assay shows that, Cuminaldehyde has a Neuroprotective activity against neuronal damage caused by dexamethasone. [16]

*Nigella sativa* has been used as a therapeutic agent for various disorders especially Neurodegenerative disorders.[17] The bioactive component present in the herb like Thymoquinone has a significant role in neuroprotection like the improvement of memory & learning, neuroinflammation, and reduction of ROS.[18] Research studies have shown that *Coriandrum sativum* exhibits numerous therapeutic effects including anti-anxiety, anti-convulsant, oxidative stress reduction, and improvement of memory and cognitive functions. [19] Linalool a compound separated from Coriandrum *sativum* has higher retention performance in induced AD in mice. [20]. *Glycyrrhiza glabra* has a protective effect against neurological disorders. Glabridin a compound isolated from the *Glycyrrhiza glabra* which was improved memory and cognitive functions in mice by oral administration (5, 25, and 50 mg/kg, p.o.). [21] *Cinnamomum verum* essential oil shows acetylcholinesterase (AChE) and butyrylcholinesterase (BuChE) inhibitory activities. [22] From the literature evidence Ingredients of *Sagala Noi Choornam* (SNC) have been proven Neuroprotective activity, Anti-oxidant, Anti- Alzheimer's activities in various *in-vitro/in- vivo* activities.This research article revealed that the *Sagala Noi Choornam* (SNC) has a promising Neuroprotective effect and the above-mentioned evidence provides the SNC can be used to manage and prevent Neurocognitive disorders.

# CONCLUSION

This study concluded that the Neuroprotective activity of *Sagala Noi Choornam* was studied based on *an in vitro* assay. The results show *Sagala Noi Choornam* has promising Neuroprotective activity. In the future, proper clinical studies to be conducted to confirm its therapeutic effect.

# ABSTRACT

RSS based localization systems are widely applied in indoor positioning for generating and distribution of radio map with co-ordinate system. Even for a large indoor space, system linked with spatial information is vital. In this paper, we propose spatial radio mapping system (SRMS) that effectively combines mobile access point model (MAPM) and mobile phone sensor to perform both spatial and Radio mapping. This SRMS consists of Synchronization, position estimation, mapping and create real time spatial and radio signals. In synchronization process number of different dimensions and time required to receive signals data collected from MAP and Mobile phone signals collected based on sensing time are stored in one node. Localization, a geographic feature is used to identify number of neighbour nodes based on movement direction and axes are measured same co-ordinates to extract spatial and radio map. We estimate the distance between mobile phone and the access points using the mathematical model of RSS from received signal strength. These can be more effective in heterogeneous property and adopted changing environments than RSSI Fingerprints. By this way, we can reduce the effect of the most problems on indoor positioning system. Current models assume that the spatial network of wireless terminal to locate people without requiring them to carry or wear any electronic device. This paper gives an overview of indoor localization technologies, methods and performance metrics, and makes benchmark of existing solutions of Wi-Fi fingerprinting technique with detailed presentation of performances and limitations related to most important recent advances.

# INTRODUCTION

The Global Positioning System (GPS) is the most widely used localization system for outdoor use. However, GPS doesn't work well indoors because walls block the direct view between the satellites and the passengers. For this reason, researchers are trying to use some of the telecommunicationstools available indoors. Such as Wi-Fi, Bluetooth, inertial sensors (Accelerometer, gyroscope, magnetometer, barome-ter, etc.), RFID, cameras, light, and others. [1]With the development of mobile computing technology, location-based service (LBS) has become more and more requiring in our daily life. [2]. This scope is recently been developed to large indoor spaces [3]. In particular, with increasing use of mobile phones and developments in telecommunication devices, indoor localization technology is being closely utilized in the field of life safety, e.g., for emergency calls and emergency exit guidance [4]. received signal strength (RSS) or received signal strength indicator (RSSI) is a measurement of the strength of a received radio signal. In theory, the RSS value decreases as the distance between transmitter and receiver increases [5]. Other methods include measurement of the time difference of arrival [6] and angle of arrival [7]. However, their widespread use in the public domain is limited owing to the high cost of purchasing, installing, managing, and maintaining specially designed devices such as ultra-wideband (UWB) [8,9]. Conversely, the fingerprinting method can implement the RSS of WiFi and Bluetooth devices without the need of additional devices, which are representative pervasive network devices installed for cloud computing. Hence, the RSS-based finger- printing method, which does not require additional costs even in the case of mobile phones, is being developed into a practical indoor localization technology. RSS is an indoor positioning technique that estimates the position coordinates by measuring received signal strength during communication [10]. This method can use the mathematical model (the telecommunication equation) that relates signal strength.

The aims of this paper are to provide the reader with mobile sensor and access point wireless techniques from that generate radio and spatial map. There are following consideration are required to apply the radio RSS-based localization method. First measure received signal strength from different mobile access point .This method can use the mathematical model that relate signal strength to distance.[11].connectivity with spatial map[12].Mobile sensor (geograph)is compatiable with generate spatial data than Lidar. The different calculation methods are used to locate the device. Then solution is generated in which position is estimated by algorithm. The time required to build the radio map is directly releated to cost of implementating localization.[13]As complexity of above mentioned, this study proposes a novel SRMS can simultaneously bulid spatial and Radio map in real time.SRMS collect data from mobile sensor data and mobile access point to estimate the distance range, collected one node position and simultaneously build spatial and radio map. This system combine advanced technology of mobile phone- GPS sensor[14] and mobile access point(MAPM)method to extract spatial data..[11]. Due to improved mapping efficiency, reliable accuracy, and connectivity with the spatial map when building the radio map. Considering that the spatial and radio maps are built using the position estimated through mobile GIS sensor -based localization technology, the location coordinate system of both maps is automatically registered to a common coordinate system. Hence, the RSS Based location of the radio map can ensure reliable accuracy. This study also developed by identifying trends of a mobile phone's motion data and radio signals. Mobile GIS sensor data achieving efficient and real-time mapping, and reduce cost.[14].Visual tracking is kind of indoor positioning that uses mobile sensor to position of user.

## **RELATED WORKS**

Several works have already shown that human presence and motion alters the way radio signals propagate, enabling the localization and tracking of people. Different measurement modalities, models, algorithms and applications have been proposed, having all as objective to locate people with high accuracy. Most approaches achieve sub meter localization accuracy. However, a comparison of the results obtained by these systems is difficult since they differ considerably in nodes number, type of indoor environment, hardware, communication protocols, size The RSS-based fingerprinting localization method contains two stages: the offline and online stage. The basic idea of fingerprinting localization for estimating user's position is matching the online RSS readings with offline prebuilt radio map. Radio

## Kavitha and Gobi

map is composed of extensive location-labeled fingerprints at specific reference points (RPs). Generally, at each RP, several tens of samples are performed and the average RSS vector is stored as fingerprint in the radio map. Sometimes, to avoid the sheltering impact of the human body on RSS, the data collection procedure requires signal sampling in four directions[1,2]. Obviously, as the system coverage expands, the workload and time are greatly increased. Therefore, the radio map construction is time-consuming and labor-sensitive, hindering the wide use of Wi-Fi fingerprinting localization system. Although there are many challenges for constructing radio map, it is inevitable impact of the human body on RSS, the data collection procedure requires signal sampling in four directions [1,2].

Obviously, as the system coverage expands, the workload and time are greatly increased. Therefore, the radio map construction is time-consuming and labor-sensitive, hindering the wide use of Wi-Fi fingerprinting localization system. Although there are many challenges for constructing radio map, it is inevitable for fingerprinting-based approaches. of the monitored area, just to name a few parameters.[15] To implement radio RSS-based indoor localization technology, a radio map whose coordinate system is linked with the spatial mapmust be provided beforehand. This is typically implemented by designating fingerprint location containing the collected radio received signal information used as the spatial map [16,17]. As a result, the floorplan and actual radio fingerprint location are frequently inconsistent. In some investigations, to address the limitations of PDR, SLAM using a LiDAR and a panoramic camera is employed to construct a spatial map, and then it is manually linked with a radio map [18]. The spatial map is used only for extracting the ground-truth location information of the waypoints for the challenge. The operator constructs a radio map for the location of the waypoints defined on the spatial map with PMC method. LiDAR-based SLAM is applied to the construction of radio maps, but a system that can build both spatial and radio maps concurrently as in the case of SRS is not provided.

A learning-based approach designates some labeled fingerprint locations on the spatial map and adds fingerprint information for unknown areas according to the learning model. The method enables building a radio map of the entire area by specifying a few labeled fingerprints, thus reducing manual calibration cost compared to PMC. However, the method requires efforts to designate the labeled fingerprint locations on the spatial map. Usually, this method can be used only in indoor environments that include a place where the reference location can be known, such as GPS. [17]. Accordingly, to address the limitations of the existing techniques, next study, SRS which combines the data acquired from LiDAR and mobile phone to simultaneously build and distribute the spatial and radio maps. Additionally, to confirm the applicability SRS as a base technology for indoor LBS, its performance was experimentally verified in terms of securing radio-map fingerprint accuracy, registration of location information using the spatial map, and improvement of mapping efficiency.[19].

To enhance the accuracy of RSS-based DFL. The improvements concern four aspects: exploiting channel diversity, deriving a more accurate spatial model for the human-induced RSS changes, proposing a measurement model that determines the probability of the person being inside the modeled area, and taking into consideration the direction of the RSS changes[15]. Accordingly, to above existing techniques, in this study we propose SRMS, which the data received from mobile sensor and mobile access point to build and distribute spatial and radio map.[14] Additionally this system work to limit the static access point and also undetected access point also determine their positions. This study reveals the technologies and methods to apply to develop indoor localization system to generate spatial and radio Map. The different clustering algorithms can use future research and data extraction from spatial data and different simulation tools to system process and database process also carried out.

#### SYSTEM OVERVIEW

## SPATIAL RADIO MAPPING SYSTEM (SRMS)

SRMS can simultaneously build spatial and radio maps in different axed points and signals measured from mobile sensor and mobile access points. In Synchronous procedure radio signals are received from different dimensions and time acquired from mobile phone sensor and multiple access point (MAP) connected through WLAN and stored in

## Kavitha and Gobi

one node. Localization step estimate the position based on mathematical algorithm and difference directions. In the mapping step, estimated positions are used to construct spatial map .The estimated position and radio signals can be used to build the radio map. Map in real time has been generated by visualization of spatial data.

#### Synchronization

Mobile phone sensor and mobile access point connected via WLAN, to synchronize the sensing data different nodes signal and sensing details(si) are collected and radio signals (ri) received combined as one node(ni).Fig(1.1)

 $N_i = \{s_i, r_i\}$  (1)

Those are constructed as single node based on time acquired from the mobile access point and mobile sensor. The position origin is calculated from x horizontal direction and y vertical directions .(x,y,distance).

#### Localization

Multiple access points(MAP) and mobile sensor(GIS) measure the locations of nearby objects at uniform bearing angle arrival. Fig(1.2)shows  $x_y$ , and z determination of location. To estimate the location using RSSI Mathematical model ,it require calibration between environmental changes.

#### Algorithm1.MAPM Localization Algorithm'

Spatial data is information about shape and location of geographic features. It contains two types of data that's called raster and vector data. We use vector data format is used to represents geographical features by set of co-ordinates. It's represented as two dimensional spaces where features are represented by co-ordinates on two axes. It is formed use of geometry .Fig (1.3) represents 3 dimensional It is combined one or more interconnected vertices. Fig (1.4) A vertex describe position in space using x, y and optionally z axis.

Therefore an intermediate location of neighboring nodes can be selected as the positions. Calculate the global position , by using the Euclidean distance formula.

We give the Euclidean equation for deduce the position co-ordintes

 $D_{jk^2}=[(x_{k-x_j})]^2+(y_k-y_j)^2$  ----- (2)

Where  $x_{j_k}y_j$  is the user co-ordinate position  $,x_k,y_k$  is the access point position coordinates and  $D_{jk}$  is the distance between the j and k access point. The system is well adapted to the change of environment.

# CONCLUSION

In this study, we proposed an SRMS that can simultaneously generate spatial and radio maps even in large indoor environments. The SRMS effectively fuses the sensing data obtained from, Mobile sensor (GIS) scanner and a mobile access point to generate spatial and radio maps in real time. SRMS achieves high accuracy, real-time performance, efficiency advancement, and localization applicability in both spatial and radio mapping. Furthermore, the applicability of the SRMS to actual LBS was confirmed by utilizing the constructed maps to well-known RSS mathematical localization algorithms and heterogeneous Mobile phones. SRMS requires specialized wireless device mobile sensor, thus it is suitable for creating an initial radio map in an unknown environment by map building operators instead of public users. Considering the accessibility of SRMS equipment, in the case of a site where the radio maps are provided in advance, the cloud collection method that can update the existing maps with only mobile phones might be more effective than SRS in terms of map management cost.

#### Kavitha and Gobi

In the future works, therefore, we will aim to add a function to update the radio map constructed by SRMS using a cloud strategy. Because the cloud method constructs radio maps in various ways, uniform accuracy cannot be ensured.

# ABSTRACT

A new approach of pattern recognition using the IFsgp\* Relational Composition is studied in this paper. The Relational Composition of the Intuitionistic Fuzzy Semi Generalized Pre-Star (IFsgp\*) in Intuitionistic Fuzzy Topological Space one of the important features. Few numerical examples of pattern recognition are provided for two and three parametric members and it is found that the three parametric methodology is more accurate.

**Keywords:** Intuitionistic Fuzzy Sets; Intuitionistic Fuzzy Relations; Intuitionistic Fuzzy Sets with parameters, Pattern Recognition

# INTRODUCTION

The concept of an Intuitionistic fuzzy semi generalized pre-star set Relational Composition (IFsgp\*S) with some preliminary informations are introduced in the first stage of this research. Then the novel method is proposed and analysedfor the pattern recognition process. Several additional concepts of higher-order FSs have been presented since Zadeh [9] established the Fuzzy Sets theory. Among them, Atanassov's [2] Intuitionistic Fuzzy Sets (IFSs) give a flexible mathematical framework for dealing with reluctance caused by defective or imprecise knowledge, in addition to the presence of vagueness. When dealing with incomplete information and ambiguous knowledge, various IFSs features have been exploited for pattern identification. Li Dengfeng and Li Yanhong [7, 8] submitted an application in pattern recognition. As a result, several scholars widely utilized IFS to decision-making analysis and pattern identification.

## Chandhini and Uma

#### PRELIMINARIES

In this section, some basic concepts related to *IFS*s were discussed.

**Definition 2.1 [2]:** An Intuitionistic Fuzzy Set (*IFS*) *M* in *X* and *IFS* is an object having the form  $M = \{\langle x, \mu_M(x), \nu_M(x) \rangle | x \in X\}$  where the functions $\mu_M(x): X \to [0,1]$  and  $\nu_M(x): X \to [0,1]$  denote the degree of membership (namely  $\mu_M(x)$ ) and the degree of non - membership (namely  $\nu_M(x)$ ) of each element  $x \in X$  to a set *M* and  $0 \le \mu_M(x) + \nu_M(x) \le 1$  for each  $x \in X$ .

The value $\pi_A(x) = 1 - (\mu_A(x) + \nu_A(x))$  is called the hesitation part which may cater to either membership value or non-membership value or both.

**Definition 2.2 [2]:** Let *M* and *N* be *IFSs* of the form  $M = \{ < x, \mu_M(x), \nu_M(x) > x \in X \}$  and  $N = \{ < x, \mu_N(x), \nu_N(x) > x \in X \}$  Then

a)  $M \subset N$  if and only if  $\mu_M(x) \le \nu_N(x)$  and  $\nu_M(x) \ge \nu_N(x)$  for all  $x \in X$ ,

b) M = N if and only if  $M \subseteq N$  and  $N \subseteq M$ ,

c)  $M^{C} = \{ < x, \mu_{M}(x), \nu_{M}(x) > x \in X \},\$ 

d)  $M \cap N = \{ < x, \mu_M(x) \cap \mu_N(x), \nu_M(x) \cup \nu_N(x) > / x \in X \},\$ 

e)  $M \cup N = \{ < x, \mu_M(x) \cup (x), \nu_M(x) \cap \nu_N(x) > / x \in X \},$ 

For the sake of simplicity, the notation  $M = \langle x, \mu_M, \nu_M \rangle$  shall be used instead of  $M = \{\langle x, \mu_M(x), \nu_M(x) \rangle x \in X\}$ . Also, the notation  $M = \{\langle x, (\mu_M, \mu_N), (\nu_M, \nu_N) \rangle\}$  is used instead of  $M = \{\langle x, (M/\mu_M, N/\mu_N), (M/\nu_M, N/\nu_N) \rangle\}$ . The Intuitionistic Fuzzy Sets  $0_{\sim} = \{\langle x, 0, 1 \rangle / x \in X\}$  and  $1_{\sim} = \{\langle x, 1, 0 \rangle / x \in X\}$  are the empty set and the whole set of *X*, respectively.

#### **RELATION WITH IFsgp\* SETS**

This section describes the Intuitionistic Fuzzy generalized pre star Relation

**Definition 3.1 [6]:** An Intuitionistic Fuzzy Set Aof an Intuitionistic Fuzzy Topological Sets (*IFTS*) is referred as **Intuitionistic Fuzzy semi generalized pre star closed** (briefly IFsgp\* - closed) if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and U is IFgp\* - open set in X.

**Example 3.2:** Let  $X = \{a, b\}$  and let  $\tau = \{0_{\sim}, T, 1_{\sim}\}$  be an IFT on X, where

 $T = \{x, (0.6, 0.8), (0.4, 0.2)\}$ . Then the IFS  $A = \{x, (0.1, 0.2), (0.9, 0.8)\}$  is an IFsgp\*cs in X.

**Example 3.3:** Let  $X = \{a, b\}$  and let  $\tau = \{0_{\sim}, T, 1_{\sim}\}$  be an IFT on X, where

 $T = \{x, (0.4, 0.5), (0.6, 0.5)\}$ . Then the IFS  $A = \{x, (0.3, 0.4), (0.7, 0.6)\}$  is an IFsgp\*cs in X.

**Example 3.4:** Let  $X = \{a, b\}$  and let  $\tau = \{0_{\sim}, T, 1_{\sim}\}$  be an IFT on *X*, where

 $T = \{x, (0.2, 0.3), (0.8, 0.7)\}$ . Then the IFS  $A = \{x, (0.1, 0.1), (0.9, 0.9)\}$  is an IFsgp\*cs in X.

**Definition 3.5:**The Intuitionistic Fuzzy semi generalized pre star Relation (**IFsgp\*Relation**)*R* on *A* is defined as  $R = \{((x, y), \mu_R(x, y), \nu_R(x, y)) | (x, y) \in A \times A \}.$ 

**Definition 3.6:**Let *X* be a non-empty set and *A* and *B* be the IFsgp\*Ss in *X* given by the membership  $\mu_A(x)$ ,  $\mu_B(x)$  and the non membership  $v_A(x)$ ,  $v_B(x)$  such that  $\mu_A(x)$ ,  $\mu_B(x)$ ,  $v_A(x)$  and  $v_B(x)$  are the IFsgp\*S drawn from the unit interval [0, 1].

Let  $A \times B$  be the IFsgp\*S in  $X \times X$  defined as  $\mu_{A \times B}(x, y) = \min{\{\mu_A(x), \mu_B(x)\}}$  and  $v_{A \times B}(x, y) = \max{\{v_A(x), v_B(x)\}}$  for all  $x, y \in X$ .

Then the relation *R* from *A* and *B* is said to **be IFsgp\*Relation** if  $R \subseteq A \times B$  such that  $R = \{((x, y), \mu_R(x, y), v_R(x, y))/(x, y) \in A \times B\}$  where  $\mu_R(x, y) \leq \mu_{A \times B}(x, y)$  and  $v_R(x, y) \geq v_{A \times B}(x, y)$  with the condition  $0 \leq \mu_R(x, y) + v_R(x, y) \leq 1$ .

#### Chandhini and Uma

**Example 3.7:**Let X = {a, b, c}, A = {a1 | (0.3, 0.6), a2 | (0.4, 0.4), a3 | (0.7, 0.2)} and B = {b1 | (0.4, 0.2), b2 | (0.5, 0.5), b3 | (0.3, 0.5)}, then R =

**Definition 3.8:** Let  $R : A \to B$  and  $S : B \to C$  be two **IFsgp\* Relations**. The **Composition**  $S \circ R$  is an **IFsgp\* Relation** from A to C. For every  $(x, z) \in A \times C$  and for every  $y \in B$  the membership function is

$$\mu_{SoR}(x,z) = \bigvee_{y} \left\{ \mu_{R}(x,y) \bigwedge \mu_{S}(y,z) \right\}$$

and the non-membership function is

$$v_{S o R}(x, z) = \bigwedge_{y} \left\{ v_{R}(x, y) \bigvee v_{S}(y, z) \right\}$$

Example 3.9: We show by means of an example that the Composition S • R is an IFsgp\* Relation from X to Z

 $\begin{array}{cccccc} y_1 & y_2 & & Z_1 & Z_2 & Z_3 \\ R = & x_1 \begin{bmatrix} (0.6, 0.2) & (0.2, 0.4) \\ (0.3, 0.3) & (0.7, 0.3) \end{bmatrix}, \quad S = & \begin{array}{ccccccccc} y_1 \begin{bmatrix} (0.6, 0.4) & (0.6, 0.4) & (0.4, 0.2) \\ y_2 \begin{bmatrix} (0.5, 0.5) & (0.4, 0.4) & (0.7, 0.3) \end{bmatrix} \end{array}$ 

 $Z_1 \quad Z_2 \quad Z_3$  $S \circ R = \frac{y_1}{y_2} \begin{bmatrix} (0.6, 0.4) & (0.6, 0.4)(0.4, 0.3) \\ (0.4, 0.4) & (0.5, 0.4)(0.7, 0.3) \end{bmatrix}$ 

#### PATTERN RECOGNITION USING IFsgp\*R COMPOSITION

In order to recognize instances of these patterns, identify the patterns that exist in various types of data, and reach the appropriate conclusions, pattern recognition is required. The following discussion of the pattern recognition issues serves to illustrate the use of the IFsgp\* R composition. The recognition principle specifies considering the highest degree of confidence between the IFsgp\* R composition to determine the proper pattern in one of the patterns. The IFsgp\*Rs are represented by specific patterns in the examples below in order to choose the most useful approach among the two methods for decision analysis.

#### Methodology I:

1. Compute  $T = R \circ Q$ , where the membership function

$$\mu_T = \mu_{RoQ} = \bigvee_{s} \left\{ \mu_Q(p,s) \bigwedge \mu_T(s,d) \right\}$$

and the non-membership function is

$$v_T = v_{RoQ} = \bigwedge_{s} \left\{ v_Q(p,s) \bigvee v_R(s,d) \right\}$$

2. Calculate  $X = (\mu_X(p, d), v_X(p, d))$  were

$$\mu_X(p,d) = \bigvee_j \mu_T$$
$$v_X(p,d) = \bigwedge v_T$$

**/** <sub>j</sub> **\** 

3. Consider 
$$Y = \mu_X(p, d)$$

4. Find the  $Max{Y}$ .

## Chandhini and Uma

## Methodology II:

1. Compute  $T = R \circ Q$ , where the membership function  $\mu_T = \mu_{RoQ} = \bigvee_s \{ \mu_Q(p, s) \bigwedge \mu_T(s, d) \}$ and the non-membership function is  $v_T = v_{RoQ} = \bigwedge_s \{ v_Q(p, s) \bigvee v_R(s, d) \}$ 2. Calculate  $X = (\mu_X(p, d), v_X(p, d))$  were  $\mu_X(p, d) = \bigvee_j \mu_T$   $v_X(p, d) = \bigwedge_j v_T$   $\pi_X(p, d) = 1 - \mu_X(p, d) - v_X(p, d)$ 3. Consider  $Y = \mu_X(p, d) - [v_X(p, d) * \pi_X(p, d)]$ 

#### EXAMPLE4.1:

The IFsgp\* R composition Pattern I, Pattern II, and Pattern III defined here are Intuitionistic Fuzzy Sets, each consisting of two elements.

Let X = {A<sub>1</sub>, A<sub>2</sub>, A<sub>3</sub>, A<sub>4</sub>...... A<sub>n</sub>} with Pattern I, Pattern II, and Pattern III is the IFsgp\*R composition defined on X as

Pattern I = {((0.4,0.3), (0.5, 0.4))}

Pattern II = {((0.6, 0.4), (0.8, 0.2))}

If the testing IFsgp\* R composition Pattern III is defined as

Pattern III = {((0.7, 0.3), (0.6, 0.2))}

Then the pattern identification using the *IFsgp\*R* Composition between

Pattern (I, III) in Method I = 0.5 and Method II = 0.44 and

Pattern (II, III) in Method I = 0.6 and Method II = 0.54

The desired decision is the maximum value thus the testing Pattern III belongs to the Pattern II type

## EXAMPLE 4.2:

The IFsgp\*R composition Pattern I, Pattern II, and Pattern III defined here are Intuitionistic Fuzzy Sets, each consisting of three elements.

Let  $X = \{A_1, A_2, A_3, A_4, \dots, A_n\}$  with Pattern I, Pattern II, Pattern III, Pattern IV, Pattern V and Pattern VI is the IFsgp\* R composition defined on X as

Pattern I = {((0.5,0.3), (0.2, 0.2), (0.2, 0.3))}

Pattern II = {((0.1,0.9), (0.2, 0.8), (0.3, 0.6) )}

Pattern III = {((0.1,0.9), (0.8, 0.1), (0.1, 0.8) )}

## Chandhini and Uma

Pattern IV = {((0.2,0.8), (0.1, 0.7), (0.4, 0.5))}

Pattern V = {((0.1,0.8), (0.2, 0.7), (0.2, 0.4) )}

If the testing *IFsgp\*R* composition Pattern VI is defined as

Pattern VI = {((0.2, 0.8), (0.9, 0.1), (0.4, 0.3) )}

Then the pattern identification using the *IFsgp\*R* Composition between

Pattern (I, VI) in Method I = 0.3 and Method II = 0.05 and

Pattern (II, VI) in Method I = 0.6 and Method II = 0.24 and

Pattern (III, VI) in Method I = 0.8 and Method II = 0.79 and

Pattern (IV, VI) in Method I = 0.5 and Method II = 0.35 and

Pattern (V, VI) in Method I = 0.4 and Method II = 0.04

The desired decision is the maximum value thus the testing Pattern VI belongs to the Pattern III type

#### EXAMPLE 4.3:

The IFsgp\* *R* composition X1, X2, X3 and X4 defined here is of Intuitionistic Fuzzy Sets, each consisting of two elements. Let  $X = \{A_1, A_2, A_3, A_4, \dots, A_n\}$  with X1, X2, X3 and X4 are the *IFsgp\*R* composition defined on X as

 $X1 = \{ \langle (0.5, 0.5), (0.4, 0.4) \rangle \}$ 

 $X2 = \{ \langle (0.3, 0.6), (0.2, 0.4) \rangle \}$ 

 $X3 = \{ \langle (0.1, 0.9), (0.2, 0.4) \rangle \}$ 

And the Pattern X4 of *IFsgp\*R* composition is referred as

Pattern X4 = {((0.2,0.5), (0.4, 0.4))}

The proposed *IFsgp\*R* Composition measure is used for the pattern identification.

In Method I: Pattern (X1, X4) is 0.4; Pattern (X2, X4) is 0.4&Pattern (X3, X4) is 0.4

In Method II: Pattern (X1, X4) is 0.32; Pattern (X2, X4) is 0.04&Pattern (X3, X4) is 0.04

The desired decision is the maximum value. Hence, the testing Pattern X4 belongs to the Pattern X1 type

## EXAMPLE 4.4:

The IFsgp\*R composition X1, X2, X3 and X4 defined here is of Intuitionistic Fuzzy Sets, each consisting of four elements. Let  $X = \{A_1, A_2, A_3, A_4, \dots, A_n\}$  with X1, X2, X3 and X4 are the IFsgp\*R composition defined on X as

 $X1 = \{ \langle (0.3, 0.3), (0.3, 0.5), (0.4, 0.3), (0.8, 0.1) \rangle \}$ 

 $X2 = \{ \langle (0.3, 0.6), (0.3, 0.7), (0.3, 0.6), (0.2, 0.6) \rangle \}$ 

 $X3 = \{ \langle (0.1, 0.3), (0.1, 0.9), (0.2, 0.1), (0.7, 0.4) \rangle \}$ 

And the Pattern X4 of IFsgp\* R compositionis referred as

Pattern X4 = {((0.4,0.2), (0.5, 0.5), (0.2, 0.4), (0.9, 0.1))}

From Method I: Pattern (X1, X4) is 0.8; Pattern (X2, X4) is 0.6&Pattern (X3, X4) is 0.7

## Chandhini and Uma

And Method II : Pattern (X1, X4) is 0.79; Pattern (X2, X4) is 0.24&Pattern (X3, X4) is 0.13 The desired decision is the maximum value.Hence, the testing Pattern X4 belongs to the Pattern X1 type

Atabular column for comparative analysis is given below (Table 2) It is evident from the Pattern Recognition Examples, that Method II can be used to make decisions more effectively than Method I.

Three parametric calculations are more accurate in the IFsgp\*R COMPOSITION than two parametric calculations. From the Pattern Recognition Examples, it is clear that a better decision can be made using Method II more efficiently than Method I. In the IFsgp\*R COMPOSITION, calculation with three parametric is effective than with two parametric.

As in the analysis of the Pattern (X1, X4), Pattern (X2, X4), and Pattern (X3, X4) all the result are found to be identical numerical values of 0.4, the Pattern Recognition **Example 4.3** cannot be decided using Method I. The numerical evaluation between Pattern (X1, X4), Pattern (X2, X4), and Pattern (X3, X4) provided by Method II gives values of 0.32, 0.04, and 0.04; as a result, the high confidence of **0.32** identifies the decision analysis as the testing **Pattern X4 belongs to Pattern X1 type**.

Therefore, it is clear that Method 2 is comparatively a better method than Method 1

# CONCLUSION

This work investigates a novel method of pattern identification utilizing the IFsgp\* Relational Composition. One of the key characteristics is the Relational Composition of the Intuitionistic Fuzzy Semi Generalized Pre-Star (IFsgp\*) in Intuitionistic Fuzzy Topological Space. For two and three parametric members, a few numerical instances of pattern recognition are shown, and it is discovered that the three parametric methodology is more accurate. This method can be expanded to other problems such as handwritten character identification, fingerprint recognition, human face recognition, and X-ray picture classification.

# ACKNOWLEDGEMENT

The authors would like to thank the PG & Research Department of Mathematics, Sri Ramakrishna College of Arts and Science, Coimbatore to carry out this study. Also, they express their gratitude to Chikkanna Government Arts College, Tirupur.

# ABSTRACT

Quin-Terranean Fuzzy Set is a more sophisticated set that produces effective results than Intuitionistic Fuzzy Set, Pythagorean Fuzzy Set, and Fermatean Fuzzy Set. Quin-Terranean fuzzy set is the most effective tool for managing uncertainty. By using Quin-Terranean fuzzy set, we have defined Quin – Terranean Fuzzy Number. In this paper we defined some of the algebraic operations such as addition, multiplication, scalar multiplication and power rule on Quin – Terranean Fuzzy Numbers. Several properties of the algebraic operations on Quin – Terranean Fuzzy Numbers are also studied.

# Mathematics Subject Classification: 03E72

**Keywords:** Quin – Terranean fuzzy set, addition operation, multiplication operation, scalar multiplication and power rule on Quin – Terranean Fuzzy Numbers.

# INTRODUCTION

In 1965, Zadeh [12] introduced the concept of fuzzy sets which are sets with varying degrees of membership. Fuzzy sets are extension to the traditional concept of set theory. Zadeh introduced the idea of fuzzy numbers and fuzzy arithmetic. In 1998, Shan – Huo Chen [6] presented the way to treat the operations of fuzzy numbers with step form by using function principle. In 2003, Witold Kosinski et al. [10] have developed the novel idea of an ordered fuzzy number, which is symbolized by an ordered pair of real continuous functions and defined four algebraic operations

## Rajarajeswari et al.,

on ordered fuzzy numbers. In 2003, Jae Duek Myung [2] introduced the two types of algebraic operations on fuzzy number utilizing piecewise linear function. He also demonstrated that the Zadeh implication is smaller than the Diense - Rescher implication, which is smaller than the Lukasiewicz implication. There are some situations in which fuzzy sets are not sufficient to manage uncertainty. In order to manage such situations, in 1986, Atanassov [1] defined the extended concept of Fuzzy set theory known as Intuitionistic fuzzy set (IFS). He also defined the operations of IFS and analyzed their properties. In 2014, Sankar Prasad Mondal et al. [5] discussed some nonlinear arithmetic operations on generalised triangular Intuitionistic fuzzy numbers. They have also provided examples along with an application.

In 2014 Yager [11] introduced the concept of Pythagorean fuzzy set (PFS) which was a logical extension of this limitation in IFS, where in certain cases, unlike the examples observed in IFSs, the total of the degree of acceptance and the degree of non-acceptance may be higher than one. In Pythagorean fuzzy set, the total of the square of the degree of acceptance and square of the degree of non-acceptance is lesser than one. In 2019, Shu-Ping Wan et al. [7] proposed a new order relation for Pythagorean fuzzy numbers (PFNs). They have applied it in multi-attribute group decision making (MAGDM). They have also demonstrated the effectiveness of the suggested method through a venture capital investment selection example. In some circumstances, unlike the examples observed in PFS, the total of the square of the degree of acceptance and square of the degree of non-acceptance may be more than one. The Fermatean fuzzy sets (FFSs) concept was a logical result of this restriction in PFS. In 2019, Senapathi and Yager [8] introduced Fermatean fuzzy set in which the sum of the cube of the degree of acceptance and cube of the degree of non-acceptance is less than or equal to one. In 2019, Tapan Senapati and Ronald Yager [9] introduced the three new operations namely subtraction, division, and Fermatean arithmetic mean operations over Fermatean fuzzy sets. They have provided great detail on their properties. They developed a Fermatean fuzzy weighted product model to address the multi-criteria decision-making issue. They have also provided a practical example of choosing a suitable bridge construction method to illustrate the approach they developed and to confirm its viability. The Quin-Terranean Fuzzy Set (QTFS), a revolutionary concept that we invented in 2023 [4], is the most significant and practical way to handle uncertainty and contingency when compared to IFS, PFS, and FFS. We defined the basic set theory operations, such as union, intersection and complement for Quin-Terranean Fuzzy sets. Based on these operations, a number of the properties have been investigated. We have seen that the Quin-Terranean Fuzzy set satisfies the De Morgan's rule, associative property, commutative property, and distributive property.

#### Preliminaries

This section consists of the basic concepts and definitions related to the paper.

#### Definition 2.1 [8]

The Pythagorean fuzzy sets defined on a non-empty set *X* as objects having the form  $\mathcal{P} = \{(\tilde{x}, \alpha_P(\tilde{x}), \beta_P(\tilde{x})): \tilde{x} \in X\}$ , where the function  $\alpha_P(\tilde{x}): X \to [0,1]$  and  $\beta_P(\tilde{x}): X \to [0,1]$ , denote the degree of membership and degree of non-membership of each element  $\tilde{x} \in X$  to the set  $\mathcal{P}$  respectively, and  $0 \le (\alpha_P(\tilde{x}))^2 + (\beta_P(\tilde{x}))^2 \le 1$  for all  $\tilde{x} \in X$ . For any Pythagorean fuzzy set  $\mathcal{P}$  and  $\tilde{x} \in X, \pi_P(\tilde{x}) = \sqrt{1 - (\alpha_P(\tilde{x}))^2 - (\beta_P(\tilde{x}))^2}$  is called the degree of indeterminacy of  $\tilde{x}$  to  $\mathcal{P}$ .

## Definition 2.2 [8]

Let X be a universe of discourse. A Fermatean fuzzy set  $\mathcal{F}$  in X is an object having the form  $\mathcal{F} = \{\langle \tilde{x}, \alpha_{\mathcal{F}}(\tilde{x}), \beta_{\mathcal{F}}(\tilde{x}) \rangle : \tilde{x} \in X\},\$ where  $\alpha_{\mathcal{F}}(\tilde{x}): X \to [0,1]$  and  $\beta_{\mathcal{F}}(\tilde{x}): X \to [0,1]$ , including the condition  $0 \leq (\alpha_{P}(\tilde{x}))^{3} + (\beta_{P}(\tilde{x}))^{3} \leq 1,$ for all  $\tilde{x} \in X$ . The  $\alpha_{\mathcal{F}}(\tilde{x})$  and  $\beta_{\mathcal{F}}(\tilde{x})$  denote, respectively, the degree of membership and the degree of nonmembership of the element  $\tilde{x}$  in the set  $\mathcal{F}$ . For any FFS  $\mathcal{F}$  and  $\tilde{x} \in X$ ,

$$\pi_{\mathcal{F}}(\tilde{x}) = \sqrt[3]{1 - (\alpha_P(\tilde{x}))^3 - (\beta_P(\tilde{x}))^3}$$

## Rajarajeswari et al.,

is identified as the degree of indeterminacy of  $\tilde{x}$  to  $\mathcal{F}$ .

In the interest of simplicity, we shall mention the symbol  $\mathcal{F} = (\alpha_{\mathcal{F}}, \beta_{\mathcal{F}})$  for the FFS  $\mathcal{F} = \{\langle \tilde{x}, \alpha_{\mathcal{F}}(\tilde{x}), \beta_{\mathcal{F}}(\tilde{x}) \rangle : \tilde{x} \in X\}$ .

#### Definition 2.3 [4]

Let *X* denotes a universe of discourse. A Quin – Terranean fuzzy set  $\tilde{Q}$  in *X* is the element possess the configuration  $\tilde{Q} = \{ \langle \tilde{x}, \sigma_{\tilde{Q}}(\tilde{x}), \delta_{\tilde{Q}}(\tilde{x}) \rangle : \forall \tilde{x} \in X \}$ ,

where  $\sigma_{\tilde{Q}}(\tilde{x}): X \to [0, 1]$  and  $\delta_{\tilde{Q}}(\tilde{x}): X \to [0, 1]$  represents the degree of dependence and degree of non – dependence of the element respectively, satisfying the condition  $0 \leq (\sigma_{\tilde{Q}}(\tilde{x}))^{4^5} + (\delta_{\tilde{Q}}(\tilde{x}))^{\frac{5}{4}} \leq 1, \forall \tilde{x} \in X.$ 

For any Quin – Terranean fuzzy set  $\widetilde{Q}$  and  $\forall \widetilde{x} \in X$ ,  $\varphi_{\widetilde{Q}}(\widetilde{x}) = \left\{ 1 - \left(\sigma_{\widetilde{Q}}(\widetilde{x})\right)^{4} - \left(\delta_{\widetilde{Q}}(\widetilde{x})\right)^{4} \right\}^{\frac{5}{5}}$  is the degree of hesitance

of  $\widetilde{x}$  to X.

#### Definition 2.4 [3]

A Quin – Terranean fuzzy number  $\tilde{Q}$  is defined as, a Quin – Terranean fuzzy subset of the real line normal, that is, there exist  $\tilde{x}_0 \in R$  such that  $\sigma_{\tilde{Q}}(\tilde{x}_0) = \mathbf{1}$  and  $\delta_{\tilde{Q}}(\tilde{x}_0) = \mathbf{0}$ . a convex set for the acceptance function  $\sigma_{\tilde{Q}}(\tilde{x})$ , that is,

 $\sigma_{\tilde{\mathcal{Q}}}(\lambda \tilde{x}_1 + (1-\lambda)\tilde{x}_2) \ge \min\left(\sigma_{\tilde{\mathcal{Q}}}(\tilde{x}_1), \sigma_{\tilde{\mathcal{Q}}}(\tilde{x}_2)\right) \quad \forall \tilde{x}_1, \tilde{x}_2 \in R, \lambda \in [0,1]$ 

a concave set for the non-acceptance function  $\delta_{\tilde{Q}}(\tilde{x})$ , that is,

$$\delta_{\widetilde{Q}}(\lambda \widetilde{x}_1 + (1-\lambda)\widetilde{x}_2) \leq \max\left(\delta_{\widetilde{Q}}(\widetilde{x}_1), \delta_{\widetilde{Q}}(\widetilde{x}_2)\right) \quad \forall \ \widetilde{x}_1, \widetilde{x}_2 \in R, \lambda \in [0,1].$$

and satisfies the condition,  $\mathbf{0} \leq \left(\sigma_{\tilde{Q}}(\tilde{x})\right)^{4^{5}} + \left(\delta_{\tilde{Q}}(\tilde{x})\right)^{\frac{5}{4}} \leq 1.$ 

A doublet expressed by  $\tilde{Q} = \langle \sigma_{\tilde{Q}}(\tilde{x}), \delta_{\tilde{Q}}(\tilde{x}) \rangle$  is known as Quin – Terranean fuzzy number. The Zero and one Quin – Terranean fuzzy number is denoted by (0,0) and (1,0) respectively.

Definition 2.5 [4]

Let  $\widetilde{Q} = \{(\widetilde{x}, \sigma_{\widetilde{Q}}(\widetilde{x}), \delta_{\widetilde{Q}}(\widetilde{x})): \forall \ \widetilde{x} \in X\}, \ \widetilde{Q}_1 = \{(\widetilde{x}, \sigma_{\widetilde{Q}_1}(\widetilde{x}), \delta_{\widetilde{Q}_1}(\widetilde{x})): \forall \ \widetilde{x} \in X\}, \ \widetilde{Q}_2 = \{(\widetilde{x}, \sigma_{\widetilde{Q}_2}(\widetilde{x}), \delta_{\widetilde{Q}_2}(\widetilde{x})): \forall \ \widetilde{x} \in X\}$  be three Quin – Terranean fuzzy set, then their operations are expressed as follows,  $\widetilde{Q}_1 \subset \widetilde{Q}_2 \quad iff \ \{(\widetilde{x}, \sigma_{\widetilde{Q}_1}(\widetilde{x}) \le \sigma_{\widetilde{Q}_2}(\widetilde{x}) \ and \ \delta_{\widetilde{Q}_1}(\widetilde{x}) \ge \delta_{\widetilde{Q}_2}(\widetilde{x})): \forall \ \widetilde{x} \in X\},$   $\widetilde{Q}_1 = \widetilde{Q}_2 \quad iff \ \{(\widetilde{x}, \sigma_{\widetilde{Q}_1}(\widetilde{x}) = \sigma_{\widetilde{Q}_2}(\widetilde{x}) \ and \ \delta_{\widetilde{Q}_1}(\widetilde{x}) = \delta_{\widetilde{Q}_2}(\widetilde{x})): \forall \ \widetilde{x} \in X\},$   $\widetilde{Q}_1 \cup \widetilde{Q}_2 = \ \{(\widetilde{x}, max(\sigma_{\widetilde{Q}_1}(\widetilde{x}), \sigma_{\widetilde{Q}_2}(\widetilde{x})), min(\delta_{\widetilde{Q}_1}(\widetilde{x}), \delta_{\widetilde{Q}_2}(\widetilde{x}))): \forall \ \widetilde{x} \in X\},$   $\widetilde{Q}_1 \cap \widetilde{Q}_2 = \ \{(\widetilde{x}, min(\sigma_{\widetilde{Q}_1}(\widetilde{x}), \sigma_{\widetilde{Q}_2}(\widetilde{x})), max(\delta_{\widetilde{Q}_1}(\widetilde{x}), \delta_{\widetilde{Q}_2}(\widetilde{x}))): \forall \ \widetilde{x} \in X\},$  $\widetilde{Q}^c = \ \{(\widetilde{x}, \delta_{\widetilde{Q}}(\widetilde{x}), \sigma_{\widetilde{Q}}(\widetilde{x})): \forall \ \widetilde{x} \in X\}$ 

# MAIN RESULT

In this section, the definitions of certain algebraic operations on Quin-Terranean Fuzzy numbers including addition, multiplication, scalar multiplication, and exponentiation are given. Some of the features of the model operators  $\boxplus$  and  $\boxtimes$ , scalar multiplication and exponentiation of the Quin-Terranean Fuzzy numbers, are also explored based on the algebraic operations that have been specified.

# Algebraic Operation on Quin – Terranean Fuzzy Number: Definition 3.1

Let  $\widetilde{\mathbb{Q}} = \langle \sigma_{\widetilde{\mathbb{Q}}}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}}(x) \rangle$ ,  $\widetilde{\mathbb{Q}}_1 = \langle \sigma_{\widetilde{\mathbb{Q}}}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}}(x) \rangle$  and  $\widetilde{\mathbb{Q}}_2 = \langle \sigma_{\widetilde{\mathbb{Q}}_2}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}_2}(\widetilde{x}) \rangle$  be three Quin – Terranean Fuzzy Numbers and  $\lambda > 0$ , then their operations are expressed as follows:

# Rajarajeswari et al.,

$$\begin{split} \widetilde{\mathbb{Q}}_{1} \boxplus \widetilde{\mathbb{Q}}_{2} &= \langle \left\{ \left( \sigma_{\widetilde{\mathbb{Q}}_{1}}(\widetilde{x}) \right)^{4^{5}} + \left( \sigma_{\widetilde{\mathbb{Q}}_{2}}(\widetilde{x}) \right)^{4^{5}} - \left( \sigma_{\widetilde{\mathbb{Q}}_{1}}(\widetilde{x}) \right)^{4^{5}} \left( \sigma_{\widetilde{\mathbb{Q}}_{2}}(\widetilde{x}) \right)^{4^{5}} \right\}^{\frac{1}{4^{5}}}, \delta_{\widetilde{\mathbb{Q}}_{1}}(\widetilde{x}) \delta_{\widetilde{\mathbb{Q}}_{2}}(\widetilde{x}) \rangle \\ \widetilde{\mathbb{Q}}_{1} \boxtimes \widetilde{\mathbb{Q}}_{2} &= \langle \sigma_{\widetilde{\mathbb{Q}}_{1}}(\widetilde{x}) \sigma_{\widetilde{\mathbb{Q}}_{2}}(\widetilde{x}), \left\{ \left( \delta_{\widetilde{\mathbb{Q}}_{1}}(\widetilde{x}) \right)^{\frac{5}{4}} + \left( \delta_{\widetilde{\mathbb{Q}}_{2}}(\widetilde{x}) \right)^{\frac{5}{4}} - \left( \delta_{\widetilde{\mathbb{Q}}_{1}}(\widetilde{x}) \right)^{\frac{5}{4}} \right\}^{\frac{4}{5}} \rangle \\ \lambda \widetilde{\mathbb{Q}} &= \langle \left\{ 1 - \left( 1 - \left( \sigma_{\widetilde{\mathbb{Q}}}(\widetilde{x}) \right)^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}, \delta_{\widetilde{\mathbb{Q}}}(\widetilde{x})^{\lambda} \rangle \\ \widetilde{\mathbb{Q}}^{\lambda} &= \langle \sigma_{\widetilde{\mathbb{Q}}}(\widetilde{x})^{\lambda}, \left\{ 1 - \left( 1 - \left( \delta_{\widetilde{\mathbb{Q}}}(\widetilde{x}) \right)^{\frac{5}{4}} \right)^{\lambda} \right\}^{\frac{4}{5}} \rangle \end{split}$$

Properties of Algebraic Operations on Quin – Terranean Fuzzy Numbers: Several properties of algebraic operations on Quin – Terranean Fuzzy Numbers are given as follows,

#### Theorem 3.1:

For three Quin – Terranean Fuzzy numbers  $\widetilde{\mathbb{Q}} = \langle \sigma_{\widetilde{\mathbb{Q}}}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}}(\widetilde{x}) \rangle$ ,  $\widetilde{\mathbb{Q}}_1 = \langle \sigma_{\widetilde{\mathbb{Q}}_1}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}_1}(\widetilde{x}) \rangle$  and  $\widetilde{\mathbb{Q}}_2 = \langle \sigma_{\widetilde{\mathbb{Q}}_2}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}_2}(\widetilde{x}) \rangle$ , the following ones are valid,

$$\begin{split} & \left[ \begin{matrix} \mathbb{Q}_1 \ \boxplus \ \mathbb{Q}_2 = \mathbb{Q}_2 \ \boxplus \ \mathbb{Q}_1 \\ & \widetilde{\mathbb{Q}}_1 \ \boxtimes \ \mathbb{Q}_2 = \widetilde{\mathbb{Q}}_2 \ \boxtimes \ \mathbb{Q}_1 \\ & \lambda (\widetilde{\mathbb{Q}}_1 \ \boxplus \ \mathbb{Q}_2) = \lambda \widetilde{\mathbb{Q}}_1 \ \boxplus \ \lambda \widetilde{\mathbb{Q}}_2, \quad \lambda > 0 \\ & (\lambda_1 + \lambda_2) \widetilde{\mathbb{Q}} = \lambda_1 \widetilde{\mathbb{Q}} \ \boxplus \ \lambda_2 \widetilde{\mathbb{Q}}, \quad \lambda_1, \lambda_2 > 0 \\ & \left[ \left( \widetilde{\mathbb{Q}}_1 \ \boxtimes \ \widetilde{\mathbb{Q}}_2 \right)^{\lambda} = \widetilde{\mathbb{Q}}_1^{-\lambda} \ \boxtimes \ \widetilde{\mathbb{Q}}_2^{-\lambda}, \quad \lambda > 0 \\ & \widetilde{\mathbb{Q}}^{(\lambda_1 + \lambda_2)} = \widetilde{\mathbb{Q}}^{\lambda_1} \ \boxtimes \ \widetilde{\mathbb{Q}}^{\lambda_2}, \quad \lambda_1, \lambda_2 > 0 \end{split}$$

#### **Proof:**

Let us consider  $\widetilde{\mathbb{Q}} = \langle \sigma_{\mathbb{Q}}(\tilde{x}), \delta_{\mathbb{Q}}(\tilde{x}) \rangle$ ,  $\widetilde{\mathbb{Q}}_1 = \langle \sigma_{\mathbb{Q}_1}(\tilde{x}), \delta_{\mathbb{Q}_1}(\tilde{x}) \rangle$  and  $\widetilde{\mathbb{Q}}_2 = \langle \sigma_{\mathbb{Q}_2}(\tilde{x}), \delta_{\mathbb{Q}_2}(\tilde{x}) \rangle$  be three Quin – Terranean Fuzzy Numbers and  $\lambda, \lambda_1, \lambda_2 > 0$ , then using definition 3.1, we can acquire, L.H.S =  $\widetilde{\mathbb{Q}}_1 \boxplus \widetilde{\mathbb{Q}}_2$ 

$$= \langle \left\{ \left( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \right)^{4^{5}} + \left( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{4^{5}} - \left( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \right)^{4^{5}} \left( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{4^{5}} \right\}^{\frac{1}{4^{5}}}, \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \rangle$$

$$= \langle \left\{ \left( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{4^{5}} + \left( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \right)^{4^{5}} - \left( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{4^{5}} \left( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \right)^{4^{5}} \right\}^{\frac{1}{4^{5}}}, \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \rangle$$

$$= \tilde{\mathbb{Q}}_{2} \boxplus \tilde{\mathbb{Q}}_{1} = R.H.S$$

$$L.H.S = \tilde{\mathbb{Q}}_{1} \boxtimes \tilde{\mathbb{Q}}_{2} = \langle \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}), \left\{ \left( \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \right)^{\frac{5}{4}} + \left( \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{\frac{5}{4}} - \left( \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \right)^{\frac{5}{4}} \left( \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{\frac{5}{4}} \right\}^{\frac{4}{5}} \rangle$$

$$= \langle \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}), \left\{ \left( \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \right)^{\frac{5}{4}} + \left( \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{\frac{5}{4}} - \left( \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \right)^{\frac{5}{4}} \right\}^{\frac{4}{5}} \rangle$$

$$= \tilde{\mathbb{Q}}_{2} \boxtimes \tilde{\mathbb{Q}}_{1} = R.H.S$$

$$\begin{aligned} \text{L.H.S} &= \lambda \Big( \mathbb{Q}_{1} \coprod \mathbb{Q}_{2} \Big) \\ &= \lambda \Big( \langle \Big\{ \Big( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \Big)^{4^{5}} + \Big( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \Big)^{4^{5}} - \Big( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \Big)^{4^{5}} \Big( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \Big)^{4^{5}} \Big\}^{\frac{1}{4^{5}}}, \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \Big) \Big) \\ &= \langle \Big\{ 1 - \Big( 1 - \Big( \Big\{ \Big( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \Big)^{4^{5}} + \Big( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \Big)^{4^{5}} - \Big( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \Big)^{4^{5}} \Big( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \Big)^{4^{5}} \Big)^{4^{5}} \Big\}^{\frac{1}{4^{5}}} \Big)^{4^{5}} \Big)^{\lambda} \Big\}^{\frac{1}{4^{5}}}, \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x})^{\lambda} \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x})^{\lambda} \rangle \\ &= \langle \Big\{ 1 - \Big( \Big( 1 - \big( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \big)^{4^{5}} \Big) - \big( \sigma_{\tilde{\mathbb{Q}}_{2}}(\tilde{x}) \big)^{4^{5}} \Big( 1 - \big( \sigma_{\tilde{\mathbb{Q}}_{1}}(\tilde{x}) \big)^{4^{5}} \Big) \Big)^{\lambda} \Big\}^{\frac{1}{4^{5}}}, \delta_{\tilde{\mathbb{Q}}_{1}}(\tilde{x})^{\lambda} \delta_{\tilde{\mathbb{Q}}_{2}}(\tilde{x})^{\lambda} \rangle \end{aligned}$$

Hence,  $\left(\tilde{\mathbb{Q}}_{1} \cup \tilde{\mathbb{Q}}_{2}\right) \boxtimes \tilde{\mathbb{Q}}_{3} = \left(\tilde{\mathbb{Q}}_{1} \boxtimes \tilde{\mathbb{Q}}_{3}\right) \cup \left(\tilde{\mathbb{Q}}_{2} \boxtimes \tilde{\mathbb{Q}}_{3}\right).$ 

# CONCLUSION

In this paper, we defined the algebraic operations addition, multiplication, scalar multiplication, and exponentiation on Quin-Terranean Fuzzy numbers. We have investigated certain Quin-Terranean Fuzzy number properties based on these operations. We have proven that the model operators satisfy the distributive and commutative properties. We note that the distributive property is also satisfied by these model operators as well as in combination with the basic operations of union and intersection on Quin-Terranean Fuzzy numbers. In future, Quin-Terranean Fuzzy Numbers may be used for other operations and their properties may be researched. Additionally, these algebraic operations on Quin-Terranean Fuzzy Numbers have applications in a various fields including decision-making, agriculture, and healthcare, etc.

## ABSTRACT

The connectedness energy  $CL(\hat{G})$  of laplacian matrix H is defined to improve the bounds on connectedness energy on  $\hat{G}$  in terms of vertex membership, edge membership and the connectedness strength between  $v_i$  and  $v_j$ . Also,  $\kappa$  and  $\kappa'$  on  $\hat{G}$  are compared to connectivity spectral bounds enhancing the application in communication networks.

**Keywords**: Laplacian eigenvalue, Second largest eigenvalue, Algebraic connectivity, Spectral radii, fuzzy connectivity of vertex and edge ( $\kappa$ ,  $\kappa$  '), connectivity bounds.

# INTRODUCTION

Theory of spectral graphs holds significance among various aspects of algebraic graph theory as it aids in deriving the characteristics that define a graph's structure based on its graph spectrum. The concept of the Spectrum of a graph was originally introduced by Collatz and Sinogowitz in 1957. Fiedler's work demonstrated that 0 serves as the unique eigenvalue of the Laplacian matrix L(G) if and only if graph G is connected. This discovery led to the introduction of the term "algebraic connectivity", denoting the eigenvalue  $\mu_{n-1}$  of the Laplacian matrix. Lecture on spectral graph theory by Jiaqi Jiang focussed on the connection between the eigen values of the laplacian matrix and graph connectivity. To determine the connectivity of a graph becomes the most difficult task when dealing with applications. The property of eigen vectors of non-negative symmetric matrices by Fiedler (1975) provoked the researchers in analysing the spectral properties and robustness in complex networks. In 2010, S.M.Cioaba gave improvements on the eigenvalues of regular graphs and described their edge-connectivity. The Connectivity determining the spectral bounds of regular graphs with given order is explained briefly in [1].  $\lambda_2$  and  $\mu_{n-1}$  measures

#### Buvaneswari and Senbaga Priya

the connectivity as defined by Fiedler in [1]. Later in 2019, results involving  $\mu_{n-1}$  and  $\lambda_2$  are characterized in [2] defining the vertex connectivity.

Graphs encounter limitations in accurately representing problems involving uncertain measures. The introduction of fuzzy set theory, following Zadeh's pioneering work in 1965, emerged as a means to address uncertainty through the concept of fuzzy subsets. Building upon Zadeh's fuzzy relations applied to fuzzy graphs, Kaufmann and Rosenfeld developed concepts related to bridges, paths, cycles, trees, and connectedness in their work [3]. The groundwork laid by Yeh and Bang in terms of connectivity parameters paved the way for Mathew and Sunitha [4] to categorize edges within various fuzzy graphs. This classification involved identifying  $\alpha$ -strong,  $\beta$ -strong and  $\delta$ -weak edges based on the degree of connectedness, thereby establishing notions of fuzzy connectivity of vertex and edge [5]. In this paper, the connectedness energy  $CL(\hat{G})$  of Laplacian matrix H to improve the bounds on connectedness energy on  $\hat{G}$  is defined to apply the parameters in network in a 'strong' sense. Also,  $\kappa$  and  $\kappa$  ' on fuzzy graphs  $\hat{G}$  are compared to connectivity spectral bounds enhancing the application in communication networks as the connectivity bounds are more stronger.

## Preliminaries

#### **Definition 2.1**

A graph  $G = (\sigma, \mu)$  is categorized as a fuzzy graph with n vertices and m edges, where  $\hat{G} : \sigma(u, v) \le \sigma(u) \land \sigma(v)$  for all  $u, v \in J$ . The adjacency matrix ( $\hat{A}$ ) of any undirected fuzzy graph  $\hat{G}$  possesses n real eigenvalues, denoted as  $\hat{\lambda}_i : \hat{\lambda}_1 \ge \hat{\lambda}_2 \ge \dots \ge \hat{\lambda}_n$  of  $\hat{A}$ . These eigenvalues, along with their multiplicities, form the fuzzy spectrum of  $\hat{G}$ . The laplacian matrix L(G) = D(G)- A(G) has eigen values that are represented by  $0 = \hat{\mu}_1 \ge \hat{\mu}_2 \ge \dots \ge \hat{\mu}_n$ . A square matrix of size p × p for  $\hat{G}$  constitutes the degree matrix  $D(\hat{G}) = [d_{ij}]$ , where  $d_{ij} = d_{\hat{G}(v_i)}$  when i = j, and is zero otherwise.

#### **Definition 2.2**

A discontinuity in the fuzzy graph refers to the vertex *D* subtracting them results in an unruncated graph or a oneline graph. The vertex connectivity of a fuzzy graph *G*, denoted as  $\kappa(G)$ , is the minimum weight of the disconnection within *G*. The edge connectivity of *G*, denoted as  $\kappa'(G)$ , is defined as the minimum weight among cut-sets in *G*. The strong degree of a node  $v \in \sigma^*$  is the sum of membership values of all strong arcs incident to v, denoted as  $d_s(v)$ . The minimum and maximum strong degree is denoted as  $\delta_s(G)$  and  $\Delta_s(G)$  respectively.

#### **Definition 2.3**

The matrix C representing the connectedness strength of is characterized by C = [cij] where,

$$c_{ij} = \begin{cases} \mu^{\infty}(\mu_{ij}) & \text{whenever } i \neq j \\ 0 & \text{when } i = j \end{cases}$$

The eigenvalues of C are represented as  $\hat{\zeta}_1, \hat{\zeta}_2, \dots, \hat{\zeta}_n$ , and the connectedness energy of a fuzzy graph is the total sum of the eigenvalues of C represented as  $CE(\hat{G})$ .

#### Properties on Energy Level Connectedness in FG's

**Definition 3.1.** The spectral radius  $\hat{\rho}(A)$  of a graph  $\hat{G}$  is characterized as the maximum absolute value present within the graph spectrum ie.., eigenvalues of respective adjacency fuzzy matrix  $(\hat{\lambda}_1, \hat{\lambda}_2, ..., \hat{\lambda}_n)$ .  $\hat{\rho}(A) = \max_{1 \le i \le n} |\hat{\lambda}_i|$ 

**Theorem 3.2.** Consider  $\hat{G}$  as a fuzzy graph with  $\mu$  edges and a spectral radius of  $\hat{\rho}$ . Then, i)  $\hat{\rho}(\hat{\rho} + 1) \leq 2 \sum_{i \in [1,n]} \mu_i$ 

ii) If  $\hat{G}$  is connected, then  $\hat{\rho} \leq \sqrt{2\sum_{i} \mu_{i} - \sum_{i} \sigma_{i} + 1}$ , with equality only for  $K_{n}$  and  $K_{1,n-1}$ .

*Proof:* Since the spectral radius of  $\hat{G}$  is the largest eigenvalue of any connected component and  $\hat{\rho} \le k_{\max} \le n - 1$ . This indicates that  $\hat{\rho}(\hat{\rho} + 1)$  is bounded by 2 times the sum of terms 1 through n, each denoted by  $\mu$ i which follows from  $\hat{\rho} \le \sqrt{2\sum_i \mu_i - \sum_i \sigma_i + 1}$ . Let  $Av = \hat{\rho}v$  such that  $vv^T = 1$  where v is normalized. Then for each vertex  $v_i$ , we have  $\sum_{j \sim i} v_j = \hat{\rho}v_i$ . Using Cauchy-Schwartz inequality,  $\hat{\rho}^2 v_i^2 \le d_i \sum_{j \sim i} v_j^2$  where  $d_i$  represents the degree of each vertex  $v_i$ .

#### Buvaneswari and Senbaga Priya

Summing over i results in  $\hat{\rho}^2 \leq \sum_i d_i (1 - v_i^2 - \sum_{k \neq i} v_k^2) \leq 2\mu_i - \sum_i d_i v_i^2 - \sum_k (\sigma_i - 1 - d_i) v_k^2 = 2\mu - (\sigma_i - 1)$  for all *i*. Since  $d_i \geq 0$ , equality holds for  $K_n$  and  $K_{1,n-1}$ .

**Definition 3.3.** The measure of connectedness strength on H within the context of  $\hat{G}$  is established as H = [h<sub>ij</sub>], wherein

$$h_{ij} = \begin{cases} d_i^* & \text{if } i = j \\ -\mu^{\infty}(\mu_{ij}) & \text{if } i \neq j \\ 0 & \text{otherwise} \end{cases}$$

The eigen values of H are denoted by  $\hat{\varphi}_1, \hat{\varphi}_2, ..., \hat{\varphi}_n$  and the connectedness energy of  $\hat{G}$  corresponds to the summation of distances between Laplacian eigen values within the matrix of connectedness strength H, along with their average degree  $d_i^*(\hat{G})$ .

$$CL(\hat{G}) = \left| \hat{\varphi}_i - \frac{2\sum_{i,j \in [1,n]} \mu_{ij}}{n} \right|$$
  
such that  $\hat{\varphi}_1 \ge \hat{\varphi}_2 \ge \dots \ge \hat{\varphi}_n$  are the laplacian eigenvalues of H.

**Theorem 3.4.** If  $\hat{G}$  represents a fuzzy graph with  $|\sigma| = n$  and  $\mu = m^*$ . Then the connectedness energy  $CL(\hat{G})$  remains consistently greater than or equal to  $E(\hat{G})$ .

*Proof:* Consider  $E(\hat{G})$  and  $CL(\hat{G})$  as representations of the total sum of eigenvalues within the Laplacian matrix L of  $\hat{G}$  and the matrix H denoting the connectedness strength of  $\hat{G}$ , respectively. The elements of L includes d<sub>i</sub> when v<sub>i</sub> and v<sub>i</sub> are equal. The negation of  $\mu(v_i, v_j)$  exists when the vertices are adjacent and expressed as 0 when vertices are not adjacent. The diagonal entries fill the membership degrees of each vertex (v<sub>i</sub>, v<sub>j</sub>) and  $\mu^{\infty}(v_i, v_j)$  elsewhere. Therefore, the sum of eigen values of H is greater than L. This implies  $CL(\hat{G}) \geq E(\hat{G})$ . This equality holds only for complete fuzzy graphs with H and L are equal.

**Example 3.5.** Consider Fig.3.1 representing a simple undirected fuzzy graph  $\hat{G}$  as depicted.

The matrix L corresponding to  $\hat{G}$  is defined as follows,

$$L = \begin{bmatrix} 0.4 & -0.2 & 0 & 0 & -0.2 \\ -0.2 & 0.8 & -0.3 & 0 & -0.3 \\ 0 & -0.3 & 0.8 & -0.2 & -0.3 \\ 0 & 0 & -0.2 & 0.4 & -0.2 \\ -0.2 & -0.3 & -0.3 & -0.2 & 1 \end{bmatrix}$$

The eigenvalues of L is  $\{0, 0.35, 0.63, 1.15, 1.27\}$ . The energy of  $\hat{G} = 2.72$ . The strength matrix H of  $\hat{G}$  is given by,  $\begin{bmatrix} 0.4 & -0.2 & -0.2 & -0.2 \end{bmatrix}$ 

	I U.T	0.2	0.4	0.2	0.2
	-0.2	0.8	-0.3	-0.2	-0.3
H =	-0.2	-0.3	0.8	-0.2	-0.3
	-0.2	-0.2	-0.2	-0.2 -0.2 0.4 -0.2	-0.2
	$L_{-0.2}$	-0.3	-0.3	-0.2	1.0 J

The connectedness laplacian eigenvalues of H is  $\{-0.26, 0.6, 0.71, 1.1, 1.24\}$ . The connectedness laplacian energy  $CL(\hat{G}) = 3.23$ .

**Lemma 3.6.** For a fuzzy graph  $\hat{G}$  with  $|\sigma_i| = n * \text{ and } \hat{\mu}_i$  signifying the Laplacian eigenvalue has the connectedness laplacian energy of the form,

$$2\sqrt{\sum \mu_{ij}^{2} + \frac{1}{2} \left( \sum_{i \in [1,n^{*}]} d_{\hat{G}}(u_{i}) - \frac{2\sum_{ij \in [1,n^{*}]} \mu_{ij}}{n^{*}} \right)^{2}} \le CL(\hat{G}) \text{ and}$$
  
$$CL(\hat{G}) \le \sqrt{2\sum \mu_{ij}^{2} + \left( \sum_{i \in [1,n^{*}]} d_{\hat{G}}(u_{i}) - \frac{2\sum_{ij \in [1,n^{*}]} \mu_{ij}}{n^{*}} \right)^{2}} \cdot n^{*}.$$

The bounds on the connectedness laplacian energy of  $\hat{G}$  in terms of edge membership, vertex membership and the strength of connectedness are described below.

**Theorem 3.7.** Consider  $\hat{G}$  with  $|\sigma| = n$  and  $\mu = m^*$ . Then, i)  $CL(\hat{G}) \leq 2 \sum \mu_{ij}$  where  $\mu_{ij} \in E$ ii)  $(n-1)\sum_{r=1}^n \sigma(v_r) \geq CL(\hat{G})$  where  $v_r \in \sigma$ *Proof*: Proof of (i) is obvious.

#### Buvaneswari and Senbaga Priya

$$\begin{split} & \mathcal{C}L(\hat{G}) \leq \sum \mu_{ij} = 2\sum_{r=1}^{n(n-1)/2} \mu_{ij} \text{ for all } r > m^*, \mu_{ij} = 0. \\ & \text{From the definition of fuzzy graphs,} \\ & \mathcal{C}L(\hat{G}) \leq 2\sum_{r \in [1,m^*]} \mu_{ij} \text{ where } m^* = \frac{n(n-1)}{2} \\ & = \sum_{r=1}^{m^*} \mu_i + \mu_j \\ & \leq \sum_{r=1}^{m^*} \sigma(v_{r_1}) + \sigma(v_{r_2}) \\ & \leq \sum_{r=[1,n]} \sigma(v_r). \end{split}$$

**Theorem 3.8.** Let  $\hat{G}$  denote a fuzzy graph with  $|\sigma| = n$  and  $\mu = m^*$ . If  $\mu_{ij} = -\mu^{\infty}(v_i, v_j)$ , then the strength of connectedness is given by

$$\frac{2\mu_{ij}}{\sigma_i} + \sqrt{\left(\sigma_i - 1\right) \left[2Q - \left(\frac{2\mu_{ij}}{\sigma_i}\right)^2\right]} \le CL(\hat{G}) \le \frac{2\mu_{ij}}{\sigma_i} + 1$$
  
Where,  $Q = \sum_{i, i=\{1,n\}} \mu_{ii}^2 + \frac{1}{2} \left(\sum_{i \in \{1,n^*\}} d_{\hat{G}}(\mu_i) - \frac{2\sum_{ij \in \{1,n^*\}} \mu_{ij}}{2}\right)$ 

Where,  $Q = \sum_{i,j=[1,n]} \mu_{ij}^2 + \frac{1}{2} \left( \sum_{i \in [1,n^*]} d_{\hat{G}}(u_i) - \frac{2 \sum_{ij \in [1,n^*]} \mu_{ij}}{n^*} \right)$ . *Proof:* Let  $\hat{\varphi}_1, \hat{\varphi}_2, ..., \hat{\varphi}_n$  be the eigen values of H of  $\hat{G} = (\sigma, \mu)$ . Applying Cauchy Schwartz inequality to connectedness strength laplacian matrix *H* and for every *i* in the range from 1 *to n*,

$$|\hat{\varphi}_i|^2 \ge \frac{1}{n} \sum_{\substack{i=1\\\hat{\varphi}}}^n |\hat{\varphi}_i|^2$$

Suppose,  $\hat{G}$  contains k components and  $\hat{\varphi}_1 \ge \hat{\varphi}_2 \ge \cdots \ge \hat{\varphi}_n$ , then  $\hat{\varphi}_{n-i} = 0$  for any  $i = 0, 1, \dots, k-1$  and  $\hat{\varphi}_{n-k} > 0$ . This implies that,

If  $\hat{G}$  possess at least one edge, then (1) can be written as,

$$\mu_{1} \geq \frac{2\mu_{ij}}{\sigma_{i}} + 1 \qquad ----- \quad (2)$$
since,  $\hat{\gamma}_{n-i} = \frac{-2\mu_{ij}}{\sigma_{i}}$ . Therefore, for any,  $\hat{\gamma}_{1} \geq 1$  implies,  $CL(\hat{G}) \geq k.\frac{2\mu_{ij}}{\sigma_{i}} + 1$ . Setting  $k = 1$  results in an upper bound.  
 $CL(\hat{G}) \geq \frac{2\mu_{ij}}{\sigma_{i}} + 1 \qquad ----- \quad (3)$ 
Let  $a = \frac{2\mu_{ij}}{\sigma_{i}}$  and consider the function,  $f(x) = ax + \sqrt{(\sigma - x)(2Q - a^{2}x)}; 0 \leq x \leq n$ . The function  $f'(x) = 0$  iff  
 $2a\sqrt{(\sigma - x)(2Q - a^{2}x)} \leq 2Q + a^{2}n - 2a^{2}x$ 
Where,  $Q = \sum_{i,j=[1,n]} \mu_{ij}^{2} + \frac{1}{2} \left( \sum_{i \in [1,n^{*}]} d_{\hat{G}}(u_{i}) - \frac{2\sum_{ij \in [1,n^{*}]} \mu_{ij}}{n^{*}} \right)^{2}$ 
Since, the upper bound increases with decreasing  $k$ , and by setting  $k = 1$ ,

$$CL(\hat{G}) \leq \frac{2\mu_{ij}}{\sigma_i} + \sqrt{(\sigma_i - 1)\left[2Q - \left(\frac{2\mu_{ij}}{\sigma_i}\right)^2\right]} \quad - - - -(4)$$
  
From (3) and (4), we get,

$$\frac{2\mu_{ij}}{\sigma_i} + \sqrt{(\sigma_i - 1)\left[2Q - \left(\frac{2\mu_{ij}}{\sigma_i}\right)^2\right]} \le CL(\hat{G}) \le \frac{2\mu_{ij}}{\sigma_i} + 1$$

This condition holds for any  $\hat{G} = (\sigma, \mu)$  graphs.

**Example 3.9.** Consider the Fig.3.1  $\hat{G}$  having the laplacian energy  $E(\hat{G}) = 2.72$  and connectedness energy  $CL(\hat{G}) = 3.23$ . Upper bound=4.66, Lower bound=2.21. This implies,  $CL(\hat{G}) \ge E(\hat{G})$  and 2.21 < 3.23 < 4.66.

**Theorem 3.10.** If  $\hat{G}$  is a non-trivial, non-complete fuzzy graph, then  $\kappa \ge \mu_2$ .

*Proof:* Consider  $\hat{G}$  with  $|\sigma| = n$  and  $\mu = m$ , where V<sub>1</sub> represents the vertex cut such that  $V_2 = V - V_1 \neq \phi$  where  $V = V_1 \cup V_2$  is a decomposition of V. Any subgraph  $\hat{G}_2$  of  $\hat{G}$  generated on V<sub>1</sub> yields,  $\kappa(\hat{G}) \leq (\kappa(\hat{G}_1) + V_2) \wedge (\kappa(\hat{G}_2) + V_1)$ . Since the subgraph  $\hat{G}_2$  of  $\hat{G}$  generated on V<sub>2</sub> is not connected, it yields  $\kappa(\hat{G}) \geq \mu_2(\hat{G})$ .

#### Buvaneswari and Senbaga Priya

**Remark:** For every non-trivial fuzzy graph,  $\kappa' \ge \mu_2$  holds, as  $\kappa' \ge \kappa$ .Consider fig.3.1 to depict the result as follows,  $\kappa = 0.4$ ;  $\kappa' = 0.4$ ;  $\mu_2 = 0.35 \Longrightarrow \kappa \ge \mu_2$  and  $\kappa'(\hat{G}) \ge \mu_2(\hat{G})$ .

**Proposition 3.11.** Consider  $\hat{G}$  as an n-vertex regular fuzzy graph characterized by the strong degree  $\hat{d}_s(v)$ , where  $|\sigma| = n$ . Assuming,  $\hat{\lambda}_2(\hat{G}) > \hat{d}_s(v) - 1 - \frac{\hat{d}_s(v)}{|\sigma_i| - \hat{d}_s(v)}$ , it can be concluded that  $\kappa' \leq \hat{d}_s(v)$ .

**Proposition 3.12.** Consider  $\hat{G}$  to be an n-vertex regular fuzzy graph characterized by the strong degree  $\hat{d}_s(v)$ , where  $|\sigma| = n$ . Assuming,  $\hat{\mu}_{n-1}(\hat{G}) > \hat{d}_s(v) - 1 - \frac{\hat{d}_s(v)}{|\sigma_i| - \hat{d}_s(v)}$ , it can be concluded that  $\kappa' \leq \hat{d}_s(v)$ .

**Proposition 3.13.** Consider  $\hat{G}$  as a regular fuzzy graph possessing a maximum strong degree of  $\Delta_s(\hat{G})$ . Then, i)  $\hat{\lambda}_2 \ge \Delta_s - 2$  whenever  $\hat{\mu}_{n-1} \ge \Delta_s - 2$ 

ii) 
$$\kappa' \leq \Delta_s$$

**Proposition 3.14.** Consider  $\hat{G}$  as a regular fuzzy graph possessing a minimum strong degree of  $\delta_s(\hat{G})$ . Then, i)  $\hat{\lambda}_2 \ge \delta_s - 2$  whenever  $\hat{\mu}_{n-1} \ge \delta_s - 2$ 

ii)  $\kappa' \geq \delta_s$ 

**Example 3.15.** Consider  $\hat{G}$  as shown in Fig.3.2

From the given example 3.15, we say that the propositions (3.11-3.14) are satisfied.

# CONCLUSION

Reformulating the concepts of fuzzy connectivity of vertices and edges in clustering techniques and connectedness energy of fuzzy graph paved the way for new connectivity parameters, Connectedness strength matrix *H* and Connectedness laplacian energy of fuzzy graphs  $CL(\hat{G})$  obtained from the laplacian eigenvalues of  $\hat{G}$ . This motivated to apply the parameters in network in a stronger sense. The newly defined parameter effectively applies in many areas including network analysis as the connectivity bounds are more stronger.

# ABSTRACT

In this paper, the new concept of interval valued picture fuzzy matrices, restricted interval valued picture fuzzy matrices, and special restricted interval valued picture fuzzy matrices are established. Two different types of  $\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle$ -cut of a specific restricted interval valued square picture fuzzy matrix are presented, and their important properties are investigated. Also, the determinant and adjoint of the square picture fuzzy matrix are established. Here, an interval valued picture fuzzy matrix application to a decision-making problem is described.

**Keywords :** Picture fuzzy matrix, Interval valued intuitionistic fuzzy matrix, Determinant of interval valued picture fuzzy matrix, Adjoint of square interval valued picture fuzzy matrix.

# INTRODUCTION

In the past few years, it has been found that Fuzzy can be utilized to resolve a wide range of challenging issues including uncertainties that come up in the areas of engineering, social science, economics, and other sciences. Every area of life is filled with uncertainty in the real world. This type of issue plays itself well to Zadeh's classical fuzzy set[10] notion. Higher order fuzzy sets have been proposed for various uses in a wide range of disciplines ever since the fuzzy set theory was first proposed. The Atanassov[1] intuitionistic fuzzy set[2] has been shown to be particularly advantageous and flexible among higher fuzzy sets. The intuitionistic fuzzy set was expanded by Attanassov and Gargov[2] to the interval valued intuitionistic fuzzy set, which is distinguished by a membership function with interval values. By Coung[3], the picture fuzzy set was generalized. Used as one of the components of an picture fuzzy set are membership, neutral, and non-membership functions. Hashimoto created the concept of fuzzy matrices. Later, Ragab and Emam investigated the max-min composition of fuzzy matrices as well as the determinant of a square fuzzy matrix. Generalised fuzzy matrices were first

#### Rajarajeswari and Nandhini

proposed by Kim and Roush. Pal [7]proposed the concept of fuzzy matrices with fuzzy columns and rows. Pal studied fuzzy matrices with interval values and such rows and columns.Triangular fuzzy matrix norm research was conducted by Pradhan and Pal.As a generalization of intuitionistic fuzzy set, picture fuzzy set was invented by Cuong and Kreinovich. Wei looked at multi-attribute decision-making issues in a picture fuzzy environment. In this paper, the new concept special restricted interval valued picture fuzzy matrix, we also introduce the new idea of determinant and adjoint of square interval valued picture fuzzy matrix. we also have been studied their application in Decision making with numerical example.

#### Preliminaries

**Definition 1**(1986, Atanassov) An IFS Cover the set of universe X is defind as

C ={( $x, \zeta_C(x), \theta_C(x)$ ):  $x \in X$ } where  $\zeta_C(x) \in [0,1]$  is the measure of membership and  $\theta_C(x) \in [0,1]$  is the measure of non-membership of x in C with 0≤  $\lambda_C(x)$ +≤ 1 for allx in C.

**Definition 2.** (Khan et al.2002) An IFM C of order  $a \times b$  is defined as  $C = (\langle C_{ij_{\zeta}}, C_{ij_{\theta}} \rangle)$ , where  $C_{ij_{\lambda}} \in [0,1]$  is the measure of membership of  $C_{ij}$  (ij th element of C) and  $C_{ij_{\zeta}} \in [0,1]$  is the measure of non-membership  $C_{ij}$  with the condition  $0 \leq C_{ij_{\zeta}} + C_{ij_{\theta}} \leq 1$  for i=1,2,...,a and j=1,2,...,b.

An IFM C is said to SIFM if the number of rows is equal to the number of columns.

**Definition 3.**(Cuong and Kreinovich 2013) A PFS Cover the set of universe X is defined as  $C=\{\langle x, \zeta_C(x), \eta_C(x), \theta_C(x) \rangle : x \in X\}$  where  $\zeta_C(x) \in [0,1], \eta_C(x) \in [0,1]$ , is the measure of membership, neutral membership and  $\theta_C(x) \in [0,1]$  is the measure of non-membership of  $x \in X$  with the condition  $0 \le \zeta_C(x) + \eta_C(x) + \theta_C(x) \le 1$  for all  $x \in X$ .

#### **Definition 4.**

A IVPFM of size  $\boldsymbol{a} \times \boldsymbol{b}$  is defined as  $(\langle [\boldsymbol{C}_{ij\zeta_L}, \boldsymbol{C}_{ij\zeta_U}], [\boldsymbol{C}_{ij\eta_L}, \boldsymbol{C}_{ij\eta_L}], [\boldsymbol{C}_{ij\theta_L}, \boldsymbol{C}_{ij\theta_U}] \rangle)$  where  $\boldsymbol{C}_{ij\zeta_L}, \boldsymbol{C}_{ij\zeta_U} \in [0, 1]$  are the lower and upper

limit of membership degree,  $C_{ij\eta_L}$ ,  $C_{ij\eta_L} \in [0,1]$  are the lower and upper limit of neutral membership degree, and  $C_{ij\theta_L}$ ,  $C_{ij\theta_U} \in [0,1]$  are the lower and upper limit of non-membership degree of the element of  $C_{ij}$  for i=1,2,....,a and j=1,2,....,b satisfying

 $0 \leq C_{ij\zeta_U} + C_{ij\eta_u} + C_{ij\zeta_U} \leq 1.$ 

#### **Definition 5**

A special restricted SIVPFM is referred to as an identity special restricted IVPFM if it has nondiagonal values  $\langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle$ , as well as diagonal entries of  $\langle 0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle$ 

#### **Definition 6**

If a special restricted SIVPFM has all entries  $(0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}])$ , Then it is called null special restricted IVPFM.

It is clear that when  $\phi_2 = 0$ ,  $\phi_1 = 1$ ,  $\phi_{3=1}$  Then  $0 \le ([C_{ij\zeta_L}, C_{ij\zeta_U}]) \le 1$ ,  $(\langle [C_{ij\eta_L}, C_{ij\eta_L}] \rangle) = 1, 0 \le ([C_{ij\theta_L}, C_{ij\theta_U}]) \le 1$  with  $0 \le (\langle [C_{ij\zeta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\theta_L}, C_{ij\theta_U}] \rangle) \le 1$ . Now, by replacing the measure membership by the measure of neutral membership and the measure of non-membership IVPFM is obtained. Thus, null IVIFM is obtained with all entries  $(0, \phi_3) = (0, 1)$  and identity IVIFM is obtained with diagonal entries  $\langle 0, \phi_3 \rangle = \langle 0, 1 \rangle$  so identity IVIFM and null IFM, respectively.

#### Different types of $\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle$ -cut of SIVPFM

In this section, we define different types of  $\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle$  – cut of special restricted SIVPFM and study some properties related to these.

#### Definition 1.

Let  $C = (\langle [C_{ij\zeta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\theta_L}, C_{ij\theta_U}] \rangle)$  be a special restricted SIVPFM for three real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2L}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then type-I

$$\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle - \mathbf{cut} \quad \text{of} \quad \mathbf{C} \quad \text{is} \quad \text{the special restricted SIVPFM} \\ C^{\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle} = \left( \langle [e_{ij\zeta_{L}}, e_{ij\gamma_{L}}], [e_{ij\eta_{L}}, e_{ij\eta_{L}}], [e_{ij\eta_{L}}, e_{ij\theta_{U}}] \rangle \right) \text{ given by} \left( \langle [e_{ij\lambda_{L}}, e_{ij\lambda_{U}}], [e_{ij\eta_{L}}, e_{ij\gamma_{L}}], [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}] \rangle \right) = \\ \begin{cases} \langle [\boldsymbol{\phi}_{1L}, \boldsymbol{\phi}_{1U}], [\boldsymbol{\phi}_{2L}, \boldsymbol{\phi}_{2U}], 0 \rangle, & \text{when} \left( \left( \langle [c_{ij\zeta_{L}}, c_{ij\zeta_{U}}], [c_{ij\eta_{L}}, c_{ij\eta_{L}}], [c_{ij\theta_{L}}, c_{ij\theta_{U}}] \rangle \right) \right) \geq \langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle \\ \langle 0, [\boldsymbol{\phi}_{2L}, \boldsymbol{\phi}_{2U}], [\boldsymbol{\phi}_{3L}, \boldsymbol{\phi}_{3U}] \rangle, & \text{otherwise} \end{cases}$$

where  $[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}] \subseteq [\phi_{1L}, \phi_{1U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}] = [\phi_{2L}, \phi_{2U}] \text{ and } [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \subseteq [\phi_{3L}, \phi_{3U}] \text{ with}$ 

 $0 \le \alpha_U + \beta_U + \gamma_U \le 1.$ 

## Definition 2.

Let  $C = (\langle [C_{ij\zeta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\theta_L}, C_{ij\theta_U}] \rangle)$  be a special restricted SIVPFM for three real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then type-II

 $\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle \mathbf{cut}$  of C is the special restricted SIVPFM  $C_{\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle} = \left( \langle [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}], [e_{ij\eta_{L}}, e_{ij\eta_{L}}], [e_{ij\eta_{L}}, e_{ij\theta_{U}}] \rangle \right)$  given by  $\left( \langle [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}], [e_{ij\eta_{L}}, e_{ij\theta_{U}}] \rangle \right)$ 

$$\left( \left( \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right], \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right], \left[ C_{ij\theta_{L}}, C_{ij\theta_{U}} \right] \right) \right), \quad when\left( \left( \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right], \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right], \left[ C_{ij\theta_{L}}, C_{ij\theta_{U}} \right] \right) \right) \\ \left( \left[ \alpha_{L}, \alpha_{U} \right], \left[ \beta_{L}, \beta_{U} \right], \left[ \gamma_{L}, \gamma_{U} \right] \right) \quad otherwise$$

where  $[\boldsymbol{\alpha}_L, \boldsymbol{\alpha}_U] \subseteq [\phi_{1L}, \phi_{1U}], [\boldsymbol{\beta}_L, \boldsymbol{\beta}_U] = [\phi_{2L}, \phi_{2U}]$  and  $[\boldsymbol{\gamma}_L, \boldsymbol{\gamma}_U] \subseteq [\phi_{3L}, \phi_{3U}]$  with

 $0 \le \alpha_U + \beta_U + \gamma_U \le 1.$ 

#### Proposition 1.

Let C and D be two specials restricted SIVPFMs Then  $C \ge D \Rightarrow C^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} \ge D^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle}$ 

## Proof

Let  $C=(\langle [C_{ij\zeta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\theta_L}, C_{ij\theta_U}]\rangle)$  and  $D=(\langle [d_{ij\zeta_L}, d_{ij\zeta_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\theta_L}, d_{ij\theta_U}]\rangle)$  be two special restricted SIVPFM of order *a* for three real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then

$$\left( \left\{ \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right], \left[ d_{ij\zeta_{L}}, d_{ij\zeta_{U}} \right] \subseteq \left[ \phi_{1L}, \phi_{1U} \right] \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right] = \left[ d_{ij\eta_{L}}, d_{ij\eta_{L}} \right] = \left[ \phi_{2L}, \phi_{2U} \right], \left( \left[ C_{ij\theta_{L}}, C_{ij\theta_{U}} \right], \left[ d_{ij\theta_{L}}, d_{ij\theta_{U}} \right] \right) \right) \subseteq \left[ \phi_{3L}, \phi_{3U} \right] \text{ for } i, j = 1, 2, 3, \dots, a.$$

$$C \ge D \Rightarrow \left( \begin{bmatrix} C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \end{bmatrix} \right) \supseteq \left( \begin{bmatrix} d_{ij\theta_{L}}, d_{ij\theta_{U}} \end{bmatrix} \right), \left( \begin{bmatrix} C_{ij\eta_{L}}, C_{ij\eta_{L}} \end{bmatrix} \right) \ge \left( \begin{bmatrix} d_{ij\eta_{L}}, d_{ij\eta_{L}} \end{bmatrix} \right) \text{ and } \left( \begin{bmatrix} C_{ij\theta_{L}}, C_{ij\theta_{U}} \end{bmatrix} \right) \\ \text{Let}C^{\langle [\alpha_{L},\alpha_{U}], [\beta_{L},\beta_{U}], [\gamma_{L},\gamma_{U}] \rangle} = \left( \langle \begin{bmatrix} e_{ij\zeta_{L}}, e_{ij\zeta_{U}} \end{bmatrix}, \begin{bmatrix} e_{ij\eta_{L}}, e_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} e_{ij\theta_{L}}, e_{ij\theta_{U}} \end{bmatrix} \right) \right) \\ D^{\langle [\alpha_{L},\alpha_{U}], [\beta_{L},\beta_{U}], [\gamma_{L},\gamma_{U}] \rangle} = \left( \langle \begin{bmatrix} f_{ij\lambda_{L}}, f_{ij\lambda_{U}} \end{bmatrix}, \begin{bmatrix} f_{ij\eta_{L}}, f_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} f_{ij\eta_{L}}, f_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} f_{ij\zeta_{L}}, f_{ij\zeta_{U}} \end{bmatrix} \right) \right)$$

Where  $(\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle) =$ 

$$\begin{pmatrix} \langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle, & when(\langle [c_{ij\lambda_L}, c_{ij\lambda_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\zeta_L}, c_{ij\zeta_U}] \rangle) \geq \\ \langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle & otherwise \end{pmatrix}$$

Case 3

 $\left(\left(\left[c_{ij\lambda_{L}},c_{ij\lambda_{U}}\right],\left[c_{ij\eta_{L}},c_{ij\eta_{L}}\right],\left[c_{ij\zeta_{L}},c_{ij\zeta_{U}}\right]\right)\right) \geq \left<\left[\alpha_{L},\alpha_{U}\right],\left[\beta_{L},\beta_{U}\right],\left[\gamma_{L},\gamma_{U}\right]\right> and \left(\left<\left[d_{ij\lambda_{L}},d_{ij\lambda_{U}}\right],\left[d_{ij\eta_{L}},d_{ij\eta_{L}}\right],\left[d_{ij\zeta_{L}},d_{ij\zeta_{U}}\right]\right>\right) \geq \left<\left[\alpha_{L},\alpha_{U}\right],\left[\beta_{L},\beta_{U}\right],\left[\gamma_{L},\gamma_{U}\right]\right> and \left(\left<\left[d_{ij\lambda_{L}},d_{ij\lambda_{U}}\right],\left[d_{ij\eta_{L}},d_{ij\eta_{L}}\right],\left[d_{ij\zeta_{L}},d_{ij\zeta_{U}}\right]\right>\right) \geq \left<\left[\alpha_{L},\alpha_{U}\right],\left[\beta_{L},\beta_{U}\right],\left[\gamma_{L},\gamma_{U}\right]\right> and \left(\left<\left[d_{ij\lambda_{L}},d_{ij\lambda_{U}}\right],\left[d_{ij\eta_{L}},d_{ij\eta_{L}}\right],\left[d_{ij\zeta_{L}},d_{ij\zeta_{U}}\right]\right>\right)$ 

 $C^{\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle} = \langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle \quad \text{and} \quad D^{\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle} = \langle 0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle$ 

 $C^{\langle [\alpha_L,\alpha_U], [\beta_L,\beta_U], [\gamma_L,\gamma_U] \rangle} \geq D^{\langle [\alpha_L,\alpha_U], [\beta_L,\beta_U], [\gamma_L,\gamma_U] \rangle}.$ 

Case 4

 $\left( \left\{ \left[ c_{ij\lambda_{L}}, c_{ij\lambda_{U}} \right], \left[ c_{ij\eta_{L}}, c_{ij\eta_{L}} \right], \left[ c_{ij\zeta_{L}}, c_{ij\zeta_{U}} \right] \right\} \right) \geq \left\{ \left[ \boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U} \right], \left[ \boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U} \right], \left[ \boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U} \right] \right\} \text{ and } \left( \left\{ \left[ d_{ij\lambda_{L}}, d_{ij\lambda_{U}} \right], \left[ d_{ij\eta_{L}}, d_{ij\eta_{L}} \right], \left[ d_{ij\zeta_{L}}, d_{ij\zeta_{U}} \right] \right\} \right) \geq \left\{ \left[ \boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U} \right], \left[ \boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U} \right], \left[ \boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U} \right] \right\} \text{ and } \left( \left\{ \left[ d_{ij\lambda_{L}}, d_{ij\lambda_{U}} \right], \left[ d_{ij\eta_{L}}, d_{ij\eta_{L}} \right], \left[ d_{ij\zeta_{L}}, d_{ij\zeta_{U}} \right] \right\} \right\} \right\} \right\} \geq \left\{ \left[ \boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U} \right], \left[ \boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U} \right], \left[ \boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U} \right] \right\} \text{ similarly we have proved the result as in case3.hence in all cases <math>C^{\left\{ \left[ \boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U} \right], \left[ \boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U} \right], \left[ \boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U} \right] \right\} \right\}$ 

#### **Proposition 2**

Let C and D be two special restricted SIVPFMs. Then $(C \vee D)^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} \ge C^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} \vee D^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle}$ 

## Proof

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  and  $D=(\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}]\rangle)$  be two special restricted SIVPFM of order *a* for three real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then

 $\left(\left\{\left[C_{ij\lambda_{L}},C_{ij\lambda_{U}}\right],\left[d_{ij\lambda_{L}},d_{ij\lambda_{U}}\right]\subseteq\left[\phi_{1L},\phi_{1U}\right]\left[C_{ij\eta_{L}},C_{ij\eta_{L}}\right]=\left[d_{ij\eta_{L}},d_{ij\eta_{L}}\right]=\left[\phi_{2L},\phi_{2U}\right],\left(\left[C_{ij\zeta_{L}},C_{ij\zeta_{U}}\right],\left[d_{ij\zeta_{L}},d_{ij\zeta_{U}}\right]\right)\right)\subseteq\left[\phi_{3L},\phi_{3U}\right]$ for i,j=1,2,3,.....a

#### Case 1

 $\left( \left\{ \left[ c_{ij\lambda_{L}}, c_{ij\lambda_{U}} \right], \left[ c_{ij\eta_{L}}, c_{ij\eta_{L}} \right], \left[ c_{ij\zeta_{L}}, c_{ij\zeta_{U}} \right] \right\} \right) \geq \left\{ \left[ \boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U} \right], \left[ \boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U} \right], \left[ \boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U} \right] \right\} \text{ and } \left( \left\{ \left[ d_{ij\lambda_{L}}, d_{ij\lambda_{U}} \right], \left[ d_{ij\eta_{L}}, d_{ij\eta_{L}} \right], \left[ d_{ij\eta_{L$ 

## Rajarajeswari and Nandhini

#### Case 2:

 $\operatorname{Let}(\langle [c_{ij\lambda_{L}}, c_{ij\lambda_{U}}], [c_{ij\eta_{L}}, c_{ij\eta_{L}}], [c_{ij\zeta_{L}}, c_{ij\zeta_{U}}]\rangle) \geq$ 

 $\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle and \left( \langle [d_{ij\lambda_{L}}, d_{ij\lambda_{U}}], [d_{ij\eta_{L}}, d_{ij\eta_{L}}], [d_{ij\zeta_{L}}, d_{ij\zeta_{U}}] \rangle \right) \geq \langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle$  Then  $C^{\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle} = \langle [\boldsymbol{\phi}_{1L}, \boldsymbol{\phi}_{1U}], [\boldsymbol{\phi}_{2L}, \boldsymbol{\phi}_{2U}], 0 \rangle$  and  $D^{\langle [\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}], [\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}], [\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}] \rangle} = \langle 0, [\boldsymbol{\phi}_{2L}, \boldsymbol{\phi}_{2U}], [\boldsymbol{\phi}_{3L}, \boldsymbol{\phi}_{3U}] \rangle$ 

Thus  $C^{\{[\alpha_L,\alpha_U],[\beta_L,\beta_U],[\gamma_L,\gamma_U]\}} \vee D^{\{[\alpha_L,\alpha_U],[\beta_L,\beta_U],[\gamma_L,\gamma_U]\}} = \left(\langle [\phi_{1L},\phi_{1U}] \vee 0, [\phi_{2L},\phi_{2U}] \wedge [\phi_{2L},\phi_{2U}], [0,0] \wedge [\phi_{3L},\phi_{3U}] \rangle \right) = \langle [\phi_{1L},\phi_{1U}], [\phi_{2L},\phi_{2U}], 0 \rangle$  by proposition 2, it is known that  $C \vee D \geq C$ . Then by proposition 12.  $C \vee D^{\{[\alpha_L,\alpha_U],[\beta_L,\beta_U],[\gamma_L,\gamma_U]\}} \geq C^{\{[\alpha_L,\alpha_U],[\beta_L,\beta_U],[\gamma_L,\gamma_U]\}} = \langle [\phi_{1L},\phi_{1U}], [\phi_{2L},\phi_{2U}], 0 \rangle = C^{\{[\alpha_L,\alpha_U],[\beta_L,\beta_U],[\gamma_L,\gamma_U]\}} \vee D^{\{[\alpha_L,\alpha_U],[\beta_L,\beta_U],[\gamma_L,\gamma_U]\}}$ 

#### Case 3

 $\left(\left\langle \left[c_{ij\lambda_{L}}, c_{ij\lambda_{U}}\right], \left[c_{ij\eta_{L}}, c_{ij\eta_{L}}\right], \left[c_{ij\zeta_{L}}, c_{ij\zeta_{U}}\right]\right\rangle\right) \geq \left\langle \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}\right], \left[\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}\right]\right\rangle and \left(\left\langle \left[d_{ij\lambda_{L}}, d_{ij\lambda_{U}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right], \left[d_{ij\zeta_{L}}, d_{ij\zeta_{U}}\right]\right\rangle\right) \geq \left\langle \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}\right], \left[\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}\right]\right\rangle and \left(\left\langle \left[d_{ij\lambda_{L}}, d_{ij\lambda_{U}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right], \left[d_{ij\zeta_{L}}, d_{ij\zeta_{U}}\right]\right\rangle\right) \geq \left\langle \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}\right], \left[\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}\right]\right\rangle and \left(\left\langle \left[d_{ij\lambda_{L}}, d_{ij\lambda_{U}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right], \left[d_{ij\zeta_{L}}, d_{ij\zeta_{U}}\right]\right\rangle\right) = \left\langle \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}\right], \left[\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}\right]\right\rangle and \left(\left\langle \left[d_{ij\lambda_{L}}, d_{ij\lambda_{U}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right]\right\rangle\right) = \left\langle \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}\right], \left[\boldsymbol{\gamma}_{L}, \boldsymbol{\gamma}_{U}\right]\right\rangle and \left(\left\langle \left[d_{ij\lambda_{L}}, d_{ij\lambda_{U}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right], \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right]\right\rangle\right) = \left\langle \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\beta}_{L}, \boldsymbol{\beta}_{U}\right], \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right], \left[\boldsymbol{\alpha}_{L}, \boldsymbol{\alpha}_{U}\right]\right\rangle\right\}$ 

$$C^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} = \langle [0, 0], [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle$$

and  $D^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} = \langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], [0,0] \rangle$  it follows that

 $C^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} \vee D^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} = (\langle 0 \lor \phi_1, \phi_2 \land \phi_2, \phi_3 \land 0 \rangle) = \langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle by \text{ proposition} \quad 2, \text{it is known that } C \lor D \ge C.$ 

bv

Then 10.  $G \mapsto \mathcal{D}([\alpha, \alpha_n] [\beta, \beta_n] [\gamma, \gamma_n]) > 0$ 

12.  $C \vee D^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} \ge D^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} = \langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle = C^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} \vee D^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle}.$ 

#### proposition

#### **Proposition 4**

For a reflexive Special restricted SIVPFM,  $C_{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle}$  is reflexive.

#### Proof

Let  $C=(\langle [c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}]\rangle)$  and  $D=(\langle [d_{ij\zeta_L}, d_{ij\zeta_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\theta_L}, d_{ij\theta_U}]\rangle)$  be two special restricted SIVPFM of order *a* for three real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then

 $\begin{pmatrix} \langle [c_{ij\zeta_L}, c_{ij\zeta_U}], [d_{ij\zeta_L}, d_{ij\zeta_U}] \subseteq [\phi_{1L}, \phi_{1U}] [C_{ij\eta_L}, C_{ij\eta_L}] = [d_{ij\eta_L}, d_{ij\eta_L}] = [\phi_{2L}, \phi_{2U}], ([c_{ij\theta_L}, c_{ij\theta_U}], [d_{ij\theta_L}, d_{ij\theta_U}] \rangle \end{pmatrix} \subseteq \begin{bmatrix} \phi_{3L}, \phi_{3U} \end{bmatrix} \text{for} \qquad i, j=1,2,3, \dots, a \text{Since} \qquad C \qquad \text{is} \qquad \text{reflexive,} \\ C = (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle ) = \langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle$ 

 $i=1,2,3,\ldots,a. \operatorname{Let} C_{\langle [\alpha_L,\alpha_U], [\beta_L,\beta_U], [\gamma_L,\gamma_U] \rangle} = \left( \langle [e_{ij\zeta_L}, e_{ij\zeta_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\theta_L}, e_{ij\theta_U}] \rangle \right),$ 

Where  $\left(\left(\left[e_{ij\lambda_{L}}, e_{ij\lambda_{U}}\right], \left[e_{ij\eta_{L}}, e_{ij\eta_{L}}\right], \left[e_{ij\zeta_{L}}, e_{ij\zeta_{U}}\right]\right)\right) = \left\{ \begin{cases} \left(\left(\left[c_{ij\zeta_{L}}, c_{ij\zeta_{U}}\right], \left[c_{ij\eta_{L}}, c_{ij\eta_{L}}\right], \left[c_{ij\theta_{L}}, c_{ij\theta_{U}}\right]\right)\right), & when\left(\left(\left[c_{ij\zeta_{L}}, c_{ij\zeta_{U}}\right], \left[c_{ij\eta_{L}}, c_{ij\theta_{U}}\right], \left[c_{ij\theta_{L}}, c_{ij\theta_{U}}\right]\right)\right) \\ \geq \left(\left[\alpha_{L}, \alpha_{U}\right], \left[\beta_{L}, \beta_{U}\right], \left[\gamma_{L}, \gamma_{U}\right]\right) & otherwise \end{cases}$ Then  $\left(\left(\left[e_{ij\zeta_{L}}, e_{ij\zeta_{U}}\right], \left[e_{ij\eta_{L}}, e_{ij\theta_{L}}\right], \left[e_{ij\theta_{L}}, e_{ij\theta_{U}}\right]\right)\right) = \left(\left[\phi_{1L}, \phi_{1U}\right], \left[\phi_{2L}, \phi_{2U}\right], \left[0,0\right]\right)$ 

 $\langle \phi_1, \phi_2, 0 \rangle = \langle \langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle \rangle \text{ So clearly } C^{\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle} \text{ is reflexive.}$ 

#### Determinant Of SIVPFM.

In this section, we define determinant of SIVPFM and study some corresponding basic results related to it.

#### **Definition 3**

Let  $C = (\langle [c_{ij\lambda_L}, c_{ij\lambda_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\zeta_L}, c_{ij\zeta_U}] \rangle)$  be a SIVPFM of order a. Then determinant of C is denoted by |C| and is defined by

$$|C| = \left( \sum_{\beta \in F_{a}}^{\vee} \left( C_{1\beta(1)\zeta_{L}} \wedge C_{2\beta(2)\zeta_{L}} \wedge \dots \wedge C_{a\beta(a)\zeta_{L}} \right), \sum_{\beta \in F_{a}}^{\vee} \left( C_{1\beta(1)\zeta_{U}} \wedge C_{2\beta(2)\zeta_{U}} \wedge \dots \wedge C_{a\beta(a)\zeta_{U}} \right), \\ |C| = \left( \sum_{\beta \in F_{a}}^{\wedge} \left( C_{1\beta(1)\eta_{L}} \wedge C_{2\beta(2)\eta_{L}} \wedge \dots \wedge C_{a\beta(a)\eta_{L}} \right), \sum_{\beta \in F_{a}}^{\vee} \left( C_{1\beta(1)\eta_{U}} \wedge C_{2\beta(2)\eta_{U}} \wedge \dots \wedge C_{a\beta(a)\eta_{U}} \right) \right) \\ \sum_{\beta \in F_{a}}^{\wedge} \left( C_{1\beta(1)\theta_{L}} \vee C_{2\beta(2)\theta_{L}} \vee \dots \vee C_{a\beta(a)\theta_{L}} \right), \sum_{\beta \in F_{a}}^{\vee} \left( C_{1\beta(1)\theta_{U}} \vee C_{2\beta(2)\theta_{U}} \vee \dots \vee C_{a\beta(a)\theta_{U}} \right),$$

Where  $F_a$  be the set of permutation on the set{1,2,3, ..., a}.

#### Example 1

Let us consider a SIVPFMs of order 3 as follows.

#### Rajarajeswari and Nandhini

	<i>(\</i> [0.3,0.5], [0.2,0.3], [0.1,0.2] <i>)</i>	<pre>([0.1,0.2], [0.3,0.4], [0.3,0.4])</pre>	⟨[0.2,0.3], [0.4,0.5], [0.1,0.2]⟩∖
C=	<pre>([0.2,0.3], [0.5,0.6], [0.1,0.1])</pre>	<pre>([0.1,0.2], [0.5,0.6], [0.1,0.2])</pre>	([0.3,0.4], [0.3,0.4], [0.1,0.2])
	\{[0.5,0.6], [0.1,0.1], [0.2,0.3]}	<pre>([0.4,0.5], [0.1,0.2], [0.2,0.3])</pre>	<[0.1,0.2], [0.2,0.2], [0.5,0.6]>/

To find out the determinant of C, it needs to find out all permutations on {1,2,3}. The permutations on {1,2,3} are

$$\begin{split} \psi_1 &= \begin{pmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \end{pmatrix} \psi_2 = \begin{pmatrix} 1 & 2 & 3 \\ 1 & 3 & 2 \end{pmatrix} \psi_3 = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 1 & 3 \end{pmatrix} \\ \psi_4 &= \begin{pmatrix} 1 & 2 & 3 \\ 2 & 3 & 1 \end{pmatrix} \psi_5 = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 1 & 2 \end{pmatrix} \psi_6 = \begin{pmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ 3 & 2 & 1 \end{pmatrix} \end{split}$$

The membership of det(C) is

 $(\mathcal{C}_{1\psi_1(1)\zeta_L} \wedge \mathcal{C}_{1\psi_2(1)\zeta_L} \wedge \mathcal{C}_{1\psi_1(3)\zeta_L}) (\mathcal{C}_{1\psi_1(1)\zeta_U} \wedge \mathcal{C}_{1\psi_1(2)\zeta_U} \wedge \mathcal{C}_{1\psi_1(3)\zeta_U})$ 

 $\vee \left( \mathcal{C}_{1\psi_2(1)\zeta_L} \wedge \mathcal{C}_{2\psi_2(2)\lambda_L} \wedge \mathcal{C}_{3\psi_2(3)\zeta_L} \right) \left( \mathcal{C}_{1\psi_2(1)\zeta_U} \wedge \mathcal{C}_{2\psi_2(2)\zeta_U} \wedge \mathcal{C}_{3\psi_2(3)\zeta_U} \right)$ 

 $\vee \left( \mathcal{C}_{1\psi_{3}(1)\zeta_{L}} \wedge \mathcal{C}_{2\psi_{3}(1)\zeta_{L}} \wedge \mathcal{C}_{3\psi_{3}(3)\zeta_{L}} \right) \left( \mathcal{C}_{1\psi_{3}(1)\zeta_{U}} \wedge \mathcal{C}_{2\psi_{3}(2)\zeta_{U}} \wedge \mathcal{C}_{3\psi_{3}(3)\zeta_{U}} \right)$

=[0.2,0.3]

So det(C) = {[0.3,0.4], [0.1,0.1], [0.2,0.3]}

#### **Proposition 5**

Let  $C = (\langle [C_{ij\zeta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\theta_L}, C_{ij\theta_U}] \rangle)$  be a SIVPFM and  $C^t$  be the transpose of C. Then det  $(C^t)$ =det(C) Proof

Let C=( $\langle [C_{ij\zeta_{l}}, C_{ij\zeta_{l}}], [C_{ij\eta_{l}}, C_{ij\eta_{l}}], [C_{ij\theta_{l}}, C_{ij\theta_{l}}] \rangle$ ) be a SIVPFM of order a Then

$$C^{t} = \left(\left(\left(\left[C_{ij\zeta_{L}}, C_{ij\zeta_{U}}\right], \left[C_{ij\eta_{L}}, C_{ij\eta_{L}}\right], \left[C_{ij\theta_{L}}, C_{ij\theta_{U}}\right]\right)\right)\right)^{t} = \left(\left(\left(\left[C_{ij\zeta_{L}}, C_{ij\zeta_{U}}\right], \left[C_{ij\eta_{L}}, C_{ij\eta_{L}}\right], \left[C_{ij\theta_{L}}, C_{ij\theta_{U}}\right]\right)\right)\right)$$

Now, det (C)

$$\bigvee_{\beta \in F_{a}} (C_{1\beta(1)\zeta_{L}} \wedge C_{2\beta(2)\zeta_{L}} \wedge \dots \wedge C_{a\beta(a)\zeta_{L}}), \underset{\beta \in F_{a}}{\overset{\vee}{\overset{\vee}{\overset{\vee}{\overset{\vee}{\overset{\vee}{\underset{\beta \in F_{a}}}}}} (C_{1\beta(1)\zeta_{U}} \wedge C_{2\beta(2)\zeta_{U}} \wedge \dots \wedge C_{a\beta(a)\zeta_{U}}),$$

$$\langle \underset{\beta \in F_{a}}{\overset{\wedge}{\overset{\wedge}{\overset{\vee}{\underset{\beta \in F_{a}}}}} (C_{1\beta(1)\eta_{L}} \wedge C_{2\beta(2)\eta_{L}} \wedge \dots \wedge C_{a\beta(a)\eta_{L}}), \underset{\beta \in F_{a}}{\overset{\vee}{\overset{\vee}{\underset{\beta \in F_{a}}}} (C_{1\beta(1)\eta_{U}} \wedge C_{2\beta(2)\eta_{U}} \wedge \dots \wedge C_{a\beta(a)\eta_{U}}) \rangle$$

Where  $F_a$  be the set of permutation on the set{1,2,3, ..., a} det ( $C^t$ )=

$$\sum_{\beta \in F_a}^{\vee} (C_{\beta(1)1\lambda_L} \wedge C_{\beta(2)2\lambda_L} \wedge \dots \dots \wedge C_{\beta(a)a\lambda_L}), \sum_{\beta \in F_a}^{\vee} (C_{\beta(1)1\lambda_U} \wedge C_{\beta(2)2\lambda_U} \wedge \dots \dots \wedge C_{\beta(a)a\lambda_U}),$$

$$\sum_{\beta \in F_a}^{\wedge} (C_{\beta(1)1\eta_L} \wedge C_{\beta(2)2\eta_L} \wedge \dots \dots \wedge C_{\beta(a)a\eta_L}), \sum_{\beta \in F_a}^{\vee} (C_{\beta(1)1\eta_U} \wedge C_{\beta(2)2\eta_U} \wedge \dots \dots \wedge C_{\beta(a)a\eta_U}))$$

$$\sum_{\beta \in F_a}^{\wedge} (C_{\beta(1)1\zeta_L} \vee C_{\beta(2)2\zeta_L} \vee \dots \dots \vee C_{\beta(a)a\zeta_L}), \sum_{\beta \in F_a}^{\vee} (C_{\beta(1)1\zeta_U} \vee C_{\beta(2)2\zeta_U} \vee \dots \dots \vee C_{\beta(a)a\zeta_U}),$$

Let  $\psi$  the permutation on {1,2,3,.....a} such that  $\psi \beta_{4}$  where  $\mu$ 

Is the identity permutation {1,2,3,...,a} then Let  $\not = \not = \not$ .Here  $\not = hanges$  through all permutation because  $\not = g$  on the second secon

#### **Proposition 6**

**The** determinant of an identity special restricted IVPFM C of order a is $\langle \phi_{1L}, \phi_{1U}, \phi_{2L}, \phi_{2U}, 0 \rangle$ 

## Rajarajeswari and Nandhini

#### Proof

Let C=( $\langle [C_{ij\zeta_1}, C_{ij\zeta_1n}], [C_{ij\eta_1}, C_{ij\eta_1}], [C_{ij\theta_1}, C_{ij\theta_n}] \rangle$ ) and be an identity special restricted SIVPFM of order *a* for three real numbers  $\phi_{1L}, \phi_{1U} \in [0,1], \phi_{2L}, \phi_{2U} \in [0,1]$  and  $\phi_{3L}, \phi_{3U} \in [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1 \text{ and } \phi_{2U} + \phi_{3U} = 1. \text{Then } \left( \left\{ [C_{ij\zeta_L}, C_{ij\zeta_U}], [d_{ij\zeta_L}, d_{ij\zeta_U}] \in [\phi_{1L}, \phi_{1U}] [C_{ij\eta_L}, C_{ij\eta_L}] = [d_{ij\eta_L}, d_{ij\eta_L}] = [d_{ij\eta_L}, d$  $[\phi_{2L}, \phi_{2U}], [C_{ij\theta_L}, C_{ij\theta_U}], [d_{ij\theta_L}, d_{ij\theta_U}]\rangle) \in [\phi_{3L}, \phi_{3U}] \text{ with } 0 \leq \left(\left([C_{ij\zeta_L}, C_{ij\zeta_U}] + [C_{ij\eta_L}, C_{ij\eta_L}] + [C_{ij\theta_L}, C_{ij\theta_U}]\right)\right) \leq 1$ for i,j=1,2,3,.....a. Here the diagonal entries of C are  $(\phi_{1L}, \phi_{1U}, \phi_{2L}, \phi_{2U}, 0)$  for i=1,2,3,....a. Now, det( c)  $\sum_{\substack{\beta \in F_{a}}}^{\vee} (C_{1\beta(1)\lambda_{L}} \wedge C_{2\beta(2)\lambda_{L}} \wedge \dots \dots \wedge C_{a\beta(a)\lambda_{L}}), \sum_{\substack{\beta \in F_{a}}}^{\vee} (C_{1\beta(1)\lambda_{U}} \wedge C_{2\beta(2)\lambda_{U}} \wedge \dots \dots \wedge C_{a\beta(a)\lambda_{U}}),$  $\left\langle \int_{\beta \in F_a}^{\Lambda} \left( C_{1\beta(1)\eta_L} \wedge C_{2\beta(2)\eta_L} \wedge \dots \dots \wedge C_{a\beta(a)\eta_L} \right), \int_{\beta \in F_a}^{V} \left( C_{1\beta(1)\eta_U} \wedge C_{2\beta(2)\eta_U} \wedge \dots \dots \wedge C_{a\beta(a)\eta_U} \right) \right\rangle$  $\bigwedge_{\beta \in F_{\alpha}}^{\wedge} (C_{1\beta(1)\zeta_{L}} \vee C_{2\beta(2)\zeta_{L}} \vee \dots \vee C_{a\beta(a)\zeta_{L}}), \bigvee_{\beta \in F_{\alpha}}^{\vee} (C_{1\beta(1)\zeta_{U}} \vee C_{2\beta(2)\zeta_{U}} \vee \dots \vee C_{a\beta(a)\zeta_{U}}),$ Where  $F_a$  be the set of permutation on the set {1,2,3,....a} Now, for  $\beta = I_{a_i}$  (identity permutation),  $\beta(i) = i$  for i=1,2,3,.....a So, for identity permutation.  $C_{1\beta(1)\lambda_{L}} \wedge C_{2\beta(2)\lambda_{L}} \wedge \dots \dots \wedge C_{a\beta(a)\lambda_{L}}, C_{1\beta(1)\lambda_{U}} \wedge C_{2\beta(2)\lambda_{U}} \wedge \dots \dots \wedge C_{a\beta(a)\lambda_{U}}$  $= \phi_{1L} \wedge \phi_{1L} \wedge \phi_{1L} \wedge \dots \dots \wedge \phi_{1L}, \phi_{1U} \wedge \phi_{1U} \wedge \dots \dots \wedge \phi_{1U}.$  $C_{1\beta(1)\eta_L}\wedge C_{2\beta(2)\eta_L}\wedge\ldots\ldots\wedge C_{a\beta(a)\eta_L}, C_{1\beta(1)\eta_U}\wedge C_{2\beta(2)\eta_U}\wedge\ldots\ldots\wedge C_{a\beta(a)\eta_H}.$  $=\phi_{2L} \wedge \phi_{2L} \wedge \dots \dots \wedge \phi_{2L}, \phi_{2U} \wedge \phi_{2U} \wedge \dots \dots \wedge \phi_{2U}.$  $C_{1\beta(1)\zeta_L} \vee C_{2\beta(2)\zeta_L} \vee \ldots \ldots \vee C_{a\beta(a)\zeta_L}, C_{1\beta(1)\zeta_U} \vee C_{2\beta(2)\zeta_U} \vee \ldots \ldots \vee C_{a\beta(a)\zeta_U}$  $=0 \lor 0 \lor \dots \dots \lor v = 0.$ Thus, it can be writien as det( C)=  $\left(\phi_{1L} \vee \bigvee_{\beta \in F_a} (C_{1\beta(1)\zeta_L} \wedge C_{2\beta(2)\zeta_L} \wedge \dots \dots \wedge C_{a\beta(a)\zeta_L})\right), \left(\phi_{1U} \vee \bigvee_{\beta \in F_a} (C_{1\beta(1)\zeta_U} \wedge C_{2\beta(2)\zeta_U} \wedge \dots \dots \wedge C_{a\beta(a)\zeta_U})\right)$  $\langle \left(\phi_{2L} \wedge \bigwedge_{\beta \in F_a}^{\wedge} \left(C_{1\beta(1)\eta_L} \wedge C_{2\beta(2)\eta_L} \wedge \dots \dots \wedge C_{a\beta(a)\eta_L}\right)\right), \left(\phi_{2L} \wedge \bigvee_{\beta \in F_a}^{\vee} \left(C_{1\beta(1)\eta_U} \wedge C_{2\beta(2)\eta_U} \wedge \dots \dots \wedge C_{a\beta(a)\eta_U}\right)\right) \rangle$  $\left(0 \wedge \sum_{\beta \in F_a}^{\wedge} (C_{1\beta(1)\theta_L} \vee C_{2\beta(2)\zeta_L} \vee \dots \vee C_{a\beta(a)\theta_L})\right), \left(0 \wedge \sum_{\beta \in F_a}^{\vee} (C_{1\beta(1)\theta_U} \vee C_{2\beta(2)\theta_U} \vee \dots \vee C_{a\beta(a)\theta_U})\right)$  $=\!\!\langle\phi_{1L},\phi_{1U},\phi_{2L},\phi_{2U},0\rangle$ 5.Adjoint of SIVPFM In this part, we define the adjoint of a SIVPFM and look at some associated fundamental features.

**Definition** 4

Let C=( $\langle [C_{ij\zeta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\theta_L}, C_{ij\theta_U}] \rangle$ ) be a SIVPFM of order a. Then adjoint of C is denoted by adj(C) and is defined as the SIVPFM E=( $\langle [e_{ij\zeta_L}, e_{ij\zeta_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\theta_L}, e_{ij\theta_U}] \rangle$ )=adj(C), Where

$$\left(\left[e_{ij\zeta_{L}}, e_{ij\zeta_{U}}\right]\right) = \beta \in F_{a_{j}n_{i}}\left(\bigwedge_{w \in a_{j}}^{\wedge} C_{w}\beta(w)\zeta_{L}, \bigvee_{w \in a_{j}}^{\wedge} C_{w}\beta(w)\zeta_{U}\right)$$

$$([e_{ij\eta_L}, e_{ij\eta_L}]) = \bigwedge_{\beta \in F_{a_ja_i}}^{\wedge} \left( \bigvee_{w \in a_j}^{\wedge} C_w \beta(w) \eta_L, \bigvee_{w \in a_j}^{\wedge} C_w \beta(w) \eta_U \right)$$
$$\left( \bigvee_{w \in a_j}^{\vee} C_w \beta(w) \theta_L, \bigvee_{w \in a_j}^{\vee} C_w \beta(w) \theta_U \right)$$

 $([e_{ij\theta_L}, e_{ij\theta_U}]) = \bigcap_{\beta \in F_{a_jn_i}} (\bigvee_{w \in a_j} C_w \beta(w) \theta_L, \bigvee_{w \in a_j} C_w \beta(w) \theta_U)$ Here  $a_j = \{1, 2, 3, \dots, a\}$  -{a} and  $F_{a_ja_i}$  is the set of all permutations on the set  $a_j$  over the set  $a_i$ . **Proposition 7** 

Let C be a SIVPFM. Then  $adj(C^t) = (adj(C))^t$ .

#### **Proposition 8**

Let C and D be two SIVPFM of same order. Then  $C \le D \Rightarrow adj(C) \le adj(D)$ .

## Rajarajeswari and Nandhini

#### Proof

Let  $C = (\langle [c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}] \rangle)$  and  $D = (\langle [d_{ij\zeta_L}, d_{ij\zeta_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\theta_L}, d_{ij\theta_U}] \rangle)$  two SIVPFM of order a. Let E = adj(C) and G = adj(D).

$$\begin{pmatrix} \langle [g_{ij\zeta_L}, g_{ij\zeta_U}], [g_{ij\eta_L}, g_{ij\eta_L}], [g_{ij\theta_L}, g_{ij\theta_U}] \rangle \rangle = \\ & \begin{pmatrix} & & \\$$

$$\begin{aligned} & (\mathcal{C}_w \beta(w)\zeta_L, \mathcal{C}_w \beta(w)\zeta_U) \leq (d_w \beta(w)\zeta_L, d_w \beta(w)\zeta_U) \\ & (\mathcal{C}_w \beta(w)\eta_L, \mathcal{C}_w \beta(w)\eta_U) \leq (d_w \beta(w)\eta_L, d_w \beta(w)\eta_U) \\ & (d_w \beta(w)\theta_L, d_w \beta(w)\theta_U) \geq (d_w \beta(w)\theta_L, d_w \beta(w)\theta_U) \text{ for every } w \neq j, \beta(w) \neq i, \text{ consequently, } E \leq F, i.e. \end{aligned}$$

 $adj(C) \le adj(D)$ . **Proposition 9.** 

Let C be a special restricted SIVPFM, then adj  $(C \lor D) \ge adj(C) \lor adj(D)$ .

Proof

Let  $C=(\langle [c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}]\rangle)$  and  $D=(\langle [d_{ij\zeta_L}, d_{ij\zeta_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\theta_L}, d_{ij\theta_U}]\rangle)$ two SIVPFM of order a. Let E= adj(C) and G= adj(D).it is known from proposition 2.that  $C, D \leq C \vee D$ .it follows that  $adj(C) \leq adj(C \vee D)$  and  $adj(D) \leq adj(C \vee D)$ . Thus  $adj(C) \vee adj(D) \leq adj(C \vee D)$ . **Proposition 10.** 

Let C be any special restricted SIVPFM and I be an identity special restricted IVPFM whose order is equal to the order of C. Then adj (C).C  $\geq |C|$ .*I*.

Proof

Let C=( $\langle [c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}] \rangle$ ) be a special restricted SIVPFM of order a for three real numbers  $\phi_{1L}, \phi_{1U} \in [0,1], \phi_{2L}, \phi_{2U} \in [0,1]$  and  $\phi_{3L}, \phi_{3U} \in [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ .  $[C_{ij\lambda_L}, C_{ij\lambda_U}] \in [\phi_{1L}, \phi_{1U}], [C_{ij\eta_L}, C_{ij\eta_L}] = [\phi_{2L}, \phi_{2U}]$  and  $[C_{ij\zeta_L}, C_{ij\zeta_U}] \in [\phi_{3L}, \phi_{3U}]$  with  $0 \leq (\langle [c_{ij\zeta_L}, c_{ij\zeta_U}] + [C_{ij\eta_L}, C_{ij\eta_L}] + [c_{ij\theta_L}, c_{ij\theta_U}] \rangle) \leq 1$  For i, j=1,2,3,.........a.

It is observed that  $(C_1, C_2, C_3) = \langle \phi_{1L}, \phi_{1U}, \phi_{2L}, \phi_{2U}, 0 \rangle = |C|$  and is  $(C_1, C_2, C_3) \cdot \langle 0, \phi_{2L}, \phi_{2U}, \phi_{3L}, \phi_{3U} \rangle = \langle 0, \phi_{2L}, \phi_{2U}, \phi_{3L}, \phi_{3U} \rangle$ . here  $i^{th}$  row of adj(C)

is( $\langle [C_{1i\zeta_L}, C_{1i\zeta_U}], [C_{1i\eta_L}, C_{1i\eta_L}], [C_{1i\theta_L}, C_{1i\theta_U}] \rangle$ ), ( $\langle [C_{2i\zeta_L}, C_{2i\zeta_U}], [C_{2i\eta_L}, C_{2i\eta_L}], [C_{2i\theta_L}, C_{2i\theta_U}] \rangle$ ),.... ( $\langle [C_{ai\zeta_L}, C_{ai\zeta_U}], [C_{ai\eta_L}, C_{ai\eta_L}], [C_{ai\theta_L}, C_{ai\theta_U}] \rangle$ )and  $j^{th}$  column of C is

$$\begin{pmatrix} (\langle [C_{1i\zeta_L}, C_{1i\zeta_U}], [C_{1i\eta_L}, C_{1i\eta_L}], [C_{1i\theta_L}, C_{1i\theta_U}] \rangle), (\langle [C_{2i\zeta_L}, C_{2i\zeta_U}], [C_{2i\eta_L}, C_{2i\eta_L}], [C_{2i\theta_L}, C_{2i\theta_U}] \rangle), \dots \dots \dots \dots \end{pmatrix}^t \\ \dots \dots \dots (\langle [C_{ai\zeta_L}, C_{ai\zeta_U}], [C_{ai\eta_L}, C_{ai\eta_L}], [C_{ai\theta_L}, C_{ai\theta_U}] \rangle) \\ \text{Let E=adj(C) is C=} (\langle [e_{ij\zeta_L}, e_{ij\zeta_U}], [e_{ij\eta_L}, e_{ij\eta_U}], [e_{ij\eta_L}, e_{ij\theta_U}] \rangle) \end{pmatrix}$$

where 
$$\left(\left(\left[e_{ij\zeta_{L}}, e_{ij\zeta_{U}}\right], \left[e_{ij\eta_{L}}, e_{ij\eta_{L}}\right], \left[e_{ij\eta_{L}}, e_{ij\eta_{L}}\right], \left[e_{ij\eta_{L}}, e_{ij\eta_{U}}\right], \left[e_{ij\eta_{U}}, e_{ij\eta_{U}}, e_{ij\eta_{U}}\right], \left[e_{ij\eta_{U}}, e_{ij\eta_{U}}, e_{ij\eta_{U}}\right]$$

#### **Proposition 11**

Let C be a symmetric SIVPFM. Then adj(C) is Symmetric.

## Rajarajeswari and Nandhini

#### Proof

$$\begin{array}{l} \text{Let } \mathsf{D}=\!\operatorname{adj}(\mathsf{C}) \text{ then } \mathsf{D}=\!\left(\!\left[d_{ij\zeta_{L}}, d_{ij\zeta_{U}}\right]\!, \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right]\!, \left[d_{ij\theta_{L}}, d_{ij\theta_{U}}\right]\!\right) \right) \\ =\!\left(\!\left\langle \begin{array}{c} \bigvee \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigwedge \\ w \in a_{j} c_{w}\beta(w)\zeta_{L}, w \in a_{j} c_{w}\beta(w)\zeta_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigwedge \\ w \in a_{j} c_{w}\beta(w)\eta_{L}, w \in a_{j} c_{w}\beta(w)\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigvee \\ w \in a_{j} c_{w}\beta(w)\theta_{L}, w \in a_{j} c_{w}\beta(w)\theta_{U} \right) \right) \\ \end{array} \right) \\ \text{Now, } D^{t} = \left( adj(\mathsf{C}) \right)^{t} \\ =\!\left(\!\left\langle \begin{array}{c} \bigvee \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigwedge \\ w \in a_{j} c_{w}\beta(w)w\zeta_{L}, w \in a_{j} c_{w}\beta(w)w\zeta_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)w\eta_{L}, w \in a_{j} c_{w}\beta(w)w\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigvee \\ w \in a_{j} c_{w}\beta(w)w\xi_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)w\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)w\xi_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)w\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\psi\xi_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)w\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\xi_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\psi\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\psi\xi_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\xi_{U} \right)\!, \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\eta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_{a_{j}a_{i}} \left( \begin{matrix} \bigotimes \\ w \in a_{j} c_{w}\beta(w)\theta_{U} \right)\!, \\ \beta \in F_$$

## **Definition 5**

Let C=( $([c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}]$ ) be a SIVPFM of order a, Then it is called constant SIVPFM if  $(\langle [C_{ek\zeta_L}, C_{ek\zeta_U}], [C_{ek\eta_L}, C_{ek\eta_L}], [C_{ek\eta_L}, C_{ek\eta_L}], [C_{ek\eta_L}, C_{ek\eta_U}]$ ) for k, e, f=1,2,3,...,a, i.e. rows are equal.

## Proposition 12

Let C be a constant SIVPFM, then C. adj(C) is constant.

Proof

Let  $C(\langle [c_{ij\zeta_{L}}, c_{ij\zeta_{U}}], [c_{ij\eta_{L}}, c_{ij\eta_{L}}], [c_{ij\theta_{L}}, c_{ij\theta_{U}}]\rangle) =$  be a order which is constant, Then  $\langle [e_{jk\zeta_{L}}, e_{jk\zeta_{U}}], [e_{jk\eta_{L}}, e_{jk\eta_{L}}], [e_{jk\theta_{L}}, e_{jk\theta_{U}}]\rangle = \langle [e_{jk\zeta_{L}}, e_{jk\zeta_{U}}], [e_{jk\eta_{L}}, e_{jk\eta_{L}}], [e_{jk\theta_{L}}, e_{jk\theta_{U}}]\rangle$  for i, j, k =1,2,3,.....a ie, row are equal. Let  $(\langle [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}], [e_{ij\eta_{L}}, e_{ij\eta_{L}}], [e_{ij\theta_{L}}, e_{ij\theta_{U}}]\rangle) =$ C. adj(C) Now, *i*<sup>th</sup> row of C is  $(\langle [C_{j1\zeta_{L}}, C_{j1\zeta_{U}}], [C_{j1\eta_{L}}, C_{j1\eta_{L}}], [C_{j1\theta_{L}}, C_{j1\theta_{U}}]\rangle), (\langle [C_{j2\zeta_{L}}, C_{j2\zeta_{U}}], [C_{j2\eta_{L}}, C_{j2\eta_{L}}], [C_{j2\theta_{L}}, C_{j2\theta_{U}}]\rangle) \dots \dots \dots$ 

And  $j^{th}$  column of adj(C) is

Consequently, C. adj(C) is constant.

## **Proposition 13**

Let C be a special restricted SIVPFM. Then adj(C) is reflexive whenever C is reflexive. Proof

Let  $C = (\langle [c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}]\rangle)$  be a special restricted SIVPFM of order a for three real numbers  $\phi_{1L}, \phi_{1U} \in [0,1], \phi_{2L}, \phi_{2U} \in [0,1]$  and  $\phi_{3L}, \phi_{3U} \in [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ .  $[C_{ij\lambda_L}, C_{ij\lambda_U}] \in [\phi_{1L}, \phi_{1U}], [C_{ij\eta_L}, C_{ij\eta_L}] = [\phi_{2L}, \phi_{2U}]$  and  $[C_{ij\zeta_L}, C_{ij\zeta_U}] \in [\phi_{3L}, \phi_{3U}]$  with  $0 \leq (\langle [C_{ij\zeta_L}, C_{ij\zeta_U}] + [C_{ij\eta_L}, C_{ij\eta_L}] + [C_{ij\theta_L}, C_{ij\theta_U}]\rangle) \leq 1$  For  $i, j = 1, 2, 3, \dots, n$ . since C is reflexive,

 $\begin{bmatrix} C_{ij\lambda_L}, C_{ij\lambda_U} \end{bmatrix} = \phi_{1L}, \phi_{1U}, \begin{bmatrix} C_{ij\eta_L}, C_{ij\eta_L} \end{bmatrix} = \phi_{2L}, \phi_{2U} \text{ and } \begin{bmatrix} C_{ij\zeta_L}, C_{ij\zeta_U} \end{bmatrix} = 0 \text{ for } i=1,2,3....a.$ Let adj (c)=E=( $\langle [e_{ij\zeta_L}, e_{ij\zeta_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\theta_L}, e_{ij\theta_U}] \rangle$ )
Then ( $\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle$ )

## Rajarajeswari and Nandhini

Now, when  $\beta = I_x \beta(w) = w$ So, $(\langle [e_{ij\zeta_L}, e_{ij\zeta_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\theta_L}, e_{ij\theta_U}] \rangle)$   $\geq \begin{pmatrix} [C_{11\zeta_L} \land C_{11\zeta_U}] [C_{22\zeta_L} \land C_{22\zeta_U}] \land \dots \dots \land C_i - 1i - 1[\zeta_L, \zeta_U] \land C_i + 1i \\ +1[\zeta_L, \zeta_U] \dots \dots \dots C_{aa} [\theta_L, \theta_U], \end{pmatrix}$   $\begin{pmatrix} [C_{11\eta_L} \land C_{11\eta_U}] [C_{22\eta_L} \land C_{22\eta_U}] \land \dots \dots \dots \land C_i - 1i - 1[\eta_L, \eta_U] \land C_i + 1i \\ +1[\eta_L, \eta_U] \dots \dots \dots \dots C_{aa} [\eta_L, \eta_U], \end{pmatrix}$  $[C_{11_{\theta_L}} \land C_{11\theta_U}] [C_{22\theta_L} \land C_{22\theta_U}] \land \dots \dots \dots \land C_i - 1i - 1[\theta_L, \theta_U] \land C_i + 1i + 1[\theta_L, \theta_U] \dots \dots \dots \land C_{aa} [\theta_L, \theta_U].$ 

Consequently  $[e_{ij\zeta_L}, e_{ij\zeta_U}] = [\phi_{1L}, \phi_{1L}], [e_{ij\eta_L}, e_{ij\eta_L}] = [\phi_{2L}, \phi_{2U}], [e_{ij\theta_L}, e_{ij\theta_U}] = 0$  for i=1,2,3,....a. It follows that E is reflexive.

#### APPLICATION

The IVPFM is a valuable resource that may be utilised to resolve various forms of problem-based decision-making.

#### Algorithm

We are using an interval-valued picture fuzzy matrix to obtain a chosen list of canditateselected to the government job.

Step 1: All IVPFSs from two IVPFMs over the set of political parties should be obtained.

Step 2: convert the given interval valued picture fuzzy decision matrix into Trapezoidal picture fuzzy decision matrix.  $C = (\langle [c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}] \rangle) D = (\langle [d_{ij\zeta_L}, d_{ij\zeta_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\theta_L}, d_{ij\theta_U}] \rangle)$  as follows.  $\beta(C, D) =$ 

$$\sqrt{\frac{1}{3n}\sum_{i,j=1}^{n} \left[ \left( a_{ijL} - a_{ijL}' \right)^{2} \left( a_{ijU} - a_{ijU}' \right)^{2} + \left( b_{ijL} - b_{ijL}' \right)^{2} \left( b_{ijU} - b_{ijU}' \right)^{2} + \left( c_{ijL} - c_{ijL}' \right)^{2} \left( c_{ijU} - c_{ijU}' \right)^{2} + \left( r_{ijL} - r_{ijL}' \right)^{2} \left( r_{ijU} - r_{ijU}' \right)^{2} \right]}$$

where  $a_i = [c_{ij\zeta_L}, c_{ij\zeta_U}], b_i = [c_{ij\eta_L}, c_{ij\eta_L}]c_i = [c_{ij\theta_L}, c_{ij\theta_U}], d_C(x_i) = 1 - a_i - b_i - c_i$  are respectively, the measure of membership, neutral membership, non-membership and denial membership of  $x_i$  in C and  $a_{ij}' = [d_{ij\zeta_L}, d_{ij\zeta_U}]b_{ij}' = [d_{ij\eta_L}, d_{ij\eta_L}]c_{ij}' = [d_{ij\theta_L}, d_{ij\theta_U}]$ .

 $[a_{ij\eta_{\perp}}, a_{ij\eta_{\perp}}]c_{ij} = [a_{ij\theta_{\perp}}, a_{ij\theta_{\perp}}]$  $a_{i}' = d_{C}(x_{i}) = 1 - a_{i}' - b_{i}' - C_{i}'$  are respectively, the measure of membership, neutral membership, non-membership and denial membership of  $x_{i}$  in D.

Step 3: convert obtain Trapezoidal picture fuzzy decision matrix into picture fuzzy decision matrix.

Step 4: To calculate the distance formula between two picture fuzzy decision matrix.

Step 5: Now, a IVPFM C=( $([c_{ij\zeta_L}, c_{ij\zeta_U}], [c_{ij\eta_L}, c_{ij\eta_L}], [c_{ij\theta_L}, c_{ij\theta_U}])$ ) of size 5 x 3 is considered in the following which represent AO towards a Govt.

#### Case study

Consider the five candidate  $S=s_1, s_2, s_3, s_4, s_5$  as the universal set to apply the government job  $J=j_1, j_2, j_3$  where represent the AE post, JA post, JEE post. Let the candidate selected to quota  $Q = q_1, q_2, q_3$  where represent quotas are open competition quota, Ex-serviceman quota, Sports quotaare successful selected to the candidate in quota category to be promoted to the government officer.

IVPFM C = ( $\langle [c_{ij\zeta_{l}}, c_{ij\zeta_{l}}], [c_{ij\eta_{l}}, c_{ij\eta_{l}}], [c_{ij\theta_{l}}, c_{ij\theta_{l}}]\rangle$ ) of size 5 x 3 is following represents the Canditate.

			$q_1$	$q_2$	$q_3$	
	j <sub>1</sub> / (0.65,0.05,	0.05,0.25)	(0.15,0.25,0.35	,0.25)	(0.25,0.35,0.25,	0.1) \
	$D = j_2 (0.25, 0.25, 0.25)$	0.35,0.15)	(0.68,0.08,0.05	5,0.2)	(0.35,0.15,0.35,0	).15)
	$j_3 \setminus (0.25, 0.25,$	0.35,0.15)	(0.45,0.15,0.25	,0.15)	(0.68,0.08,0.05,0	).20)/

#### Step 3 & 4

To calculate the distance formula between two PFSs the following matrix  $Z=(Z_{ij})$ Where  $z_{ij}$  is the distance between  $c_i$  and  $d_j$  for i=1,2,3,4,5 and j=1,2,3

 $j_1 \ j_2 \ j_3$ 

 $\begin{array}{c} s_1 \\ s_2 \\ Z = s_3 \\ s_4 \\ s_5 \end{array} \begin{pmatrix} 0.2211 & 0.3429 & 0.3263 \\ 0.2096 & 0.1570 & 0.2175 \\ 0.2380 & 0.3347 & 0.2876 \\ 0.2333 & 0.2093 & 0.2381 \\ 0.2560 & 0.2570 & 0.2797 \end{pmatrix}$ 

The following is a list of the candidate selected to each government, as calculated  $s_1 \rightarrow j_2, s_2 \rightarrow j_3, s_3 \rightarrow j_2, s_4 \rightarrow j_3, s_5 \rightarrow j_3$ .

# CONCLUSION

We have defined interval valued picture fuzzy matrix, which is the extension of picture fuzzy matrix, and gives excellent accuracy and improves the efficacy in various practical domains. Also we have defined Different types of  $\langle [\alpha_L, \alpha_U], [\beta_L, \beta_U], [\gamma_L, \gamma_U] \rangle$ -cut of SIVPFM, determinant and adjoint of Square interval valued picture fuzzy matrix have been studied. Here is an application of interval valued picture fuzzy matrix being used in decision-making. We predict that the results of this study will spark a growing interest among researchers in the further development and generalization of current research.

# ABSTRACT

Algebras when infused with certain principles with Biological sciences turns out to be one of the significant interdisciplinary approaches in the field of scientific approach. Genetics, being the study of genes and heredity of organisms stands as a branch of biology. Genetics being the important aspect of human heredity can be infused with algebra called Genetic Algebra. The basic preliminaries and terminologies are discussed in terms of both genetics and Mathematical Sciences. A walk back of Genetic Algebra from the past years have been illustrated and viewed. Different Algebraic concepts which constitute Genetic Algebras are showcased in this paper. An attempt has been made to investigate the Algebra of Genetics in the heredity of organisms using different approaches. Certain case studies in Genetic Algebra are interpreted and analysed in this paper. Constituents which constitute Genetic Algebra are studied for further application. Genetic Algebra is further applied in the quality of crops in agriculture which will optimize the productivity of crops. It is noted and emphasised that Genetic Algebra will enhance and maintain the quality with high productivity rate of crops with the association of biological investigation. This paper projects and elevates the infusion of genetic algebra for the improvisation of plant crops.

# INTRODUCTION

Mathematics, known as queen of Science has its walk through in many applications. Mathematical Sciences when combined with Biological Sciences serves as a best approach in Interdisciplinary research which has its progress all way forward. Such a combination is Mathematics with Agriculture. Agriculture being the holistic area which holds the entire system together. Many researches have been done in many ideologies and results have been produced so as to increase the productivity of crops, assigning work in the process of agriculture, distribution of yield, etc., In the beginning of Crop breeding, by various techniques has undergone many revolutions in the few decades so as to increase the crop yield. Researches have been done in the genetic diversity (Kotowska-2009) which resulted in higher plant productivity and survival at high genotypic diversity yet did not consider about the phenotypic diversity of the plants[2]. Abishek Kumar suggested the Genetic manipulation of photosynthesis to enhance crop productivity under changing environmental conditions where the plant develops tolerance to cope with changing environmental conditions. Julia Bailey-Serres(2019) explored emerging strategies for enhancing sustainable crop production. Most of the reviews focuses on the external risk factors and in improvisation of tolerance in the plant itself[1].

Suggestions by Euan T Smithers for both biologists and mathematicians illustrated the biological insights afforded by mathematical modelling and demonstrated the breadth of mathematically rich problems available within plant sciences[3]. Recent review of Meselu Tegenie Mellaku and Ashebir Sidelil Sebside exclaims that the promotion of mathematical model-based decision making through accessible mobile application technology integrated with national and regional agronomy, climate and market information systems will be an option to enhance the sustainable performance of agriculture in the face of climate change [4]. Mathematical and theoretical biology are the interdisciplinary scientific research fields with a range of their applications. This combination of Mathematics along with Biology is known as "Mathematical Biology" or "Bio-Mathematics' to stress the side of Mathematics in its diversity. Mathematical Biology synchronizes the Mathematical tools to study or forecast biological systems [5]. It has its wide range of applications using techniques and tools of applied Mathematics by Mathematical representation, treatment and modelling process has both theoretical and practical application in the fields of biology, biomedical science and biotechnology[6].

Many findings reveal and verify the importance of Mathematics behind biology which includes that the population growth would be "geometric" while resources would grow arithmetically[7]. It is foremost important that Mathematics could be neglected in the growth of evolution. It is one of the upcoming fields in the current trend and in research of biodiversity and it is astonishing that Mathematical Sciences play a vital role in the successive progression of the result. Moving on from Bio-Mathematics to one of the specialized concepts called Mathematical genetics which is far now concerned as "genetic algebras". They are possibly non-associative used to model inheritance in genetics. In the recent years, many authors have tried to investigate the difficult problem of classification of algebra. Lyubich Y illustrates that in an evolution algebra associated to be the free population is introduced and by using the non-associative algebra many valid results are obtained in explicit form [8]. In the year 2008, a new type of algebra was introduced which describes some evolution laws of genetics [9]. The main aim of the study is to infuse and verify the genetic algebra constituents in the improvisation of plant crops.

#### Preliminaries

#### Genetic Algebra

Let *g* be an algebra over the field *K*. Assume that *g* admits a basis  $\{e_1, e_2, \dots, e_n\}$  such that multiplication constants  $P_{1ij,k}$  with respect to this basis, are given by

 $e_i \cdot e_j = e_i \cdot$ 

We say that g is a genetic algebra if the multiplication constants. In that case, the basis  $\{e_1, e_2, \dots, e_n\}$  is called a natural basis.

## Karen Felicita and Sahaya Sudha

#### Walk Back of Genetic Algebra

This section deals with the history of Genetic Algebra along with its different constituents. Genetic Algebra is most profoundly deals with the evolution of organisms. The study of genetic algebras was eventually commenced by Ivor Etherington where it was studied in the non-associative algebras which arise in the symbolism of genetics [11]. In the utilization of genetics, this genetic algebras play a major role which has a basis corresponding to the genetically different gametes. Added to it, the structure constant of the algebra encode the probabilities of producing offspring of various types. Some special cases, different algebras such as classes of algebra called train algebras and that this class includes algebras called special train algebras could be defined [12].

#### Train Algebra

A branch of genetic algebra in a specialized format is the Train algebra which was introduced by Etherington,1939. A newer specialized algebra is known as special train algebra has its walkway through genetic algebra[13].

#### **Baric Algebra**

Another specialized feature of genetic algebra is the baric algebra or known as weighted algebra. The baric algebra over the field K is a possibly non-associative algebra over K together with a homomorphism w, called the weight, from the algebra to K

# METHODOLOGY

The principal tool of investigation of the genetic algebra is the transformation algebra [13]. Transformation Algebra helps us to transform the trait we require and enable it so as to verify our assumption.

#### Step 1: Converting the phenotypes to algebraic structures

Plants have the phenotype which exists with the plant which showcases the traits of them. In this case, we consider the phenotypes into algebraic structures and verify the properties.

#### Step 2: Explicating the non-associative property of Algebra

The so formed algebraic structures with phenotypes are therein treated with the property of non-associativity of algebra where non-associative algebra or distributive algebra is an algebra over a field where the binary multiplication operation is not assumed to be associative[AB not equals BA].

#### Step 3: Implying the result verified in Plant Productivity

After changing the phenotypes to non-associative algebraic format, the endured mathematical model will now be transferred in real life world by stimulating it in plant productivity wherein the seeds will be transferred as a seed what we have favored and preferred for.

#### Step 4: Optimizing the productivity of the yield plant crop.

The above such treated seed will be cultivated and the yield will be optimized using Operation Research models and the optimum result will be obtained.

# CONCLUSION

This paper enables the bridge between Mathematical Sciences and Biological Sciences which will be a quantitative technique in Agricultural Sciences. Furthermore, research and findings will give a broad spectrum of idealogy in its future trends. Thus, the Genetic Algebra along with its properties when infused with plant technology provides a door for the revolution in plant productivity.

The main objective of the paper is to enhance and improvise the plant production in accordingly to increase the yield and enhance the taste of the food crop.

# ABSTRACT

Picture Fuzzy sets (PFS), which are direct extension of fuzzy sets and intuitionistic fuzzy sets and are more suited to dealing with vague, unreliable and ambiguous data. In some situations, we cannot predict the precises value, in such cases the concept of interval valued picture fuzzy sets are used in which the membership, neutral and non-membership degrees are represented as intervals. The classical matrix cannot solve the problems involving various types of uncertainties. In this paper, by using the concept of interval valued picture fuzzy sets we introduce a new type of matrices namely interval valued picture fuzzy matrices and we defined special restriction on interval valued picture fuzzy matrices. Also we have defined some basic operations namely addition, multiplication, transpose and complement on square interval valued picture fuzzy matrices are studied and illustrated with suitable examples. By using the concept of interval valued picture fuzzy matrices are studied and illustrated with suitable examples.

**Keywords:** Picture fuzzy matrix, Interval valued picture fuzzy set, Special restricted Square picture fuzzy matrix.

Rajarajeswari and Nandhini

# INTRODUCTION

In recent years, it has been found that Fuzzy can be used to solve a variety of complicated problems involving uncertainties that arise in the fields of engineering, social science, economics, and other sciences. In the real world, there are many uncertainties in every aspect of life. When dealing with problems of this kind, Zadeh's conventional fuzzy set[9] concept works well. Since the initial proposal of fuzzy set theory, higher order fuzzy sets have been suggested for various applications in a wide range of domains. Among higher fuzzy sets, the Atanassov intuitionistic fuzzy set[2] has been proven to be especially beneficial and adaptable. Attanassov and Gargov[3] enlarged the intuitionistic fuzzy set to the interval valued intuitionistic fuzzy set, which is distinct by a membership function with interval values. Fuzzy matrices were introduced by Hashimoto. Ragab and Emam later looked into the determinant of a square fuzzy matrix and the max-min composition of fuzzy matrices. By Kim and Roush , the idea of generalised fuzzy matrices was first developed. Pal introduced the idea of fuzzy matrices with fuzzy rows and columns. Pal looked into interval valued fuzzy matrices that have such rows and columns. Pradhan and Pal researched the triangular fuzzy matrix norm. In this paper we introduce the new concept of interval valued picture fuzzy matrix . we also introduce the concept of restricted interval valued picture fuzzy matrix and some basic operations. we have studied their application with numerical example in medical diagnosis.

#### Preliminaries

Definition 1(1986, Atanassov)An IFS Cover the set of universe X is defind as

C ={( $x, \lambda_C(x), \zeta_C(x)$ ):  $x \in X$ }where  $\lambda_C(x) \in [0,1]$  is the measure of membership and  $\zeta_C(x) \in [0,1]$  is the measure of non-membership of x in C with 0≤  $\lambda_C(x) + \zeta_C(x) \le 1$  for all x in C.

**Definition 2.** Let  $k_1$  and  $k_2$  be two real numbers with  $K_1 \in [0,1]$  and  $K_2 \in [0,1]$ , with  $0 \le K_1 + K_2 \le 1$ . Then k=< $k_1, k_2$ > is called IFV.

**Definition 3.** (Khan et al.2002) An IFM C of order  $a \times b$  is defined as  $C = (\langle C_{ij_{\lambda}}, C_{ij_{\lambda}} \rangle)$ , where  $C_{ij_{\lambda}} \in [0,1]$  is the measure of membership of  $C_{ij}$  (ij th element of C) and  $C_{ij_{\lambda}} \in [0,1]$  is the measure of non-membership  $C_{ij}$  with the condition  $0 \leq C_{ij_{\lambda}} + C_{ij_{\lambda}} \leq 1$  for i=1,2,....,a and j=1,2,...,b.

An IFM C is said to SIFM if the number of rows is equal to the number of columns.

**Definition 4**.(Sriram and Murugadas2010) An identify IFM I of order a is the SIFM of order a with all diagonal entries (1,0) and non-diagonal entries (0,1).

**Definition 5**.(Sriram and Murugadas2010) A null IFM 0 of order a is the SIFM of order a with all entries (0,1). It is to be noted that (1,0) *is the* greatest IFV and (0,1) is n the least IFV. so, to define identity IFM and null IFM, Least IFV and greatest IFV are needed.

Considering more possible types of uncertainty and including the measure of neutral membership, Cuong introduced PFS in 2013.

**Definition 6.**(Cuong and Kreinovich 2013) APFS Cover the set of universe X is defined as  $C=\{\langle x, \lambda_C(x), \eta_C(x), \zeta_C(x) \rangle: x \in X\}$  where  $\lambda_C(x) \in [0,1], \eta_C(x) \in [0,1]$ , is the measure of membership, neutral membership and  $\zeta_C(x) \in [0,1]$  is the measure of non-membership of  $x \in X$  with the condition  $0 \le \lambda_C(x) + \eta_C(x) + \zeta_C(x) \le 1$  for all  $x \in X$ .

## Rajarajeswari and Nandhini

**Definition 7.** Let  $k_1, k_2$  and  $k_3$  be three real numbers with  $K_1 \in [0,1]$  and  $K_2 \in [0,1]$ ,  $K_3 \in [0,1]$ ,

with  $0 \le K_1 + K_2 + K_3 \le 1$ . Then k=< $k_1, k_2, K_3$ > is called PFV.

Based Following our definition of IVPFM based on IVPFS.

#### Interval valued picture fuzzy matrix.

To generalize the idea of Interval valued intuitionistic fuzzy matrix(IVIFM), let's defineInterval valued picture fuzzy matrix(IVPFM) as follows

#### **Definition 8.**

A IVPFM of size  $a \times b$  is defined as  $(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle)$  where  $C_{ij\lambda_L}, C_{ij\lambda_U} \in [0,1]$  are the lower and upper limit of membership degree,  $C_{ij\eta_L}, C_{ij\eta_L} \in [0,1]$  are the lower and upper limit of neutral membership degree, and  $C_{ij\zeta_L}, C_{ij\zeta_U} \in [0,1]$  are the lower and upper limit of non-membership *degree of the element*  $C_{ij}$  for i=1,2,.....,b satisfying  $0 \le C_{ij\lambda_U} + C_{ij\eta_U} + C_{ij\zeta_U} \le 1$ .

#### Definition 9.

A IVPFM is said to be SIVPFM if the number of rows is equal to the number of columns.

#### Definition 10.

Let C==( $\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle$ ) be a IPFM of order a x b. Then  $\beta$  by Scalar multiplication is given by  $\beta$ .  $C = ([\beta \land C_{ij\lambda_L}, \beta \land C_{ij\lambda_U}], [\beta \land C_{ij\eta_L}, \beta \land C_{ij\eta_L}], [\beta \land C_{ij\zeta_U}, \beta \land C_{ij\zeta_U}] \rangle$ .

#### Definition 10.

Let C=(([ $C_{ij\lambda_L}, C_{ij\lambda_U}$ ], [ $C_{ij\eta_L}, C_{ij\eta_L}$ ], [ $C_{ij\zeta_L}, C_{ij\zeta_U}$ ])) and D=(([ $d_{ij\lambda_L}, d_{ij\lambda_U}$ ], [ $d_{ij\eta_L}, d_{ij\eta_L}$ ], [ $d_{ij\zeta_L}, d_{ij\zeta_U}$ ])) be two SIVPFMs of order *a*. Then the product C.D is defined as E =C.D = ( $\langle e_{ij\lambda}, e_{ij\eta}, e_{ij\zeta}$ )) where  $e_{ij\lambda}$  = [ ${}_k^{\vee}(C_{ik\lambda_L} \wedge d_{kj\lambda_L}), {}_k^{\vee}(C_{ik\lambda_U} \wedge d_{kj\lambda_U}$ ]  $e_{ij\eta}$  = [ ${}_k^{\wedge}(C_{ik\zeta_L} \wedge d_{kj\zeta_L}), {}_k^{\wedge}(C_{ik\zeta_U} \vee d_{kj\zeta_L}), {}_k^{\wedge}(C_{ik\zeta_U} \vee d_{kj\zeta_U})$ ] for i, j =1,2,....,a.

#### Definition 11.

Let C=( $\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle$ ) and D=( $\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}] \rangle$ ) be two SIVPFMs of order a. Then C  $\leq D$ if  $[C_{ij\lambda_L}, C_{ij\lambda_U}] \subseteq [d_{ij\lambda_L}, d_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}] \supseteq [d_{ij\eta_L}, d_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \supseteq [d_{ij\zeta_L}, Cd_{ij\zeta_U}]$  for i,j=1,2,....,a.

## Definition 12.

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  be a SIVPFMs Then multiplication by a IVPFV k = $\langle [k_{1L}, k_{1U}], [k_{2L}, k_{2U}], [k_{3L}, k_{3U}]\rangle$  is defined as

 $\mathbf{k} \cdot \mathbf{C} = \left( \left\{ \left[ k_{1L} \wedge C_{ij\lambda_L}, k_{1U} \wedge C_{ij\lambda_U} \right], \left[ k_{2L} \wedge C_{ij\eta_L}, k_{2U} \wedge C_{ij\eta_L} \right], \left[ k_{3L} \vee C_{ij\zeta_L}, k_{3U} \vee C_{ij\zeta_U} \right] \right\} \right).$ 

## Definition 13.

Let C=( $\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle$ ) be a SIVPFM. Also Let ([ $x_L, x_U$ ], [ $y_L, y_U$ ], [ $z_L, z_U$ ]) be a IVPFV for ( $\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle \rangle \geq (x, y, z)$  it means

## Rajarajeswari and Nandhini

that  $[C_{ij\lambda_L}, C_{ij\lambda_U}] \ge [x_L, x_U]$ ,  $[C_{ij\eta_L}, C_{ij\eta_L}] \ge [y_L, y_U]$ ,  $[C_{ij\zeta_L}, C_{ij\zeta_U}] \le [z_L, z_U]$ .  $(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]) \ge ([x_L, x_U], [y_L, y_U], [z_L, z_U])$  it means that three inequalities  $C_{ij\lambda_L} \ge x_L, C_{ij\lambda_U} \ge x_U, C_{ij\eta_L} \ge y_L, C_{ij\eta_U} \ge y_U, C_{ij\zeta_L} \le z_L, C_{ij\zeta_U} \le z_U$  do not hold at a time. We will now propose restricted interval valued picture fuzzy matrices by limiting the measure of membership, neutral membership and non-membership but keeping their sum in the interval.

#### Definition 14.

For three chosen interval valued real numbers  $[\phi_{1L}, \phi_{1U}] \in [0,1], [\phi_{2L}, \phi_{2U}] \in [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \in [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$ , and  $\phi_{2U} + \phi_{3U} = 1$  a restricted IVPFM namely C of size  $a \times b$  is defined as  $C = (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\zeta_U}] \rangle)$  where  $[C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\zeta_U}]$  and  $[C_{ij\zeta_L}, C_{ij\zeta_U}]$  are respectively, the measure of membership, neutral membership and non-membership of  $C_{ij}$  for  $i=1,2,3,\ldots,a$ ;  $j=1,2,3,\ldots,b$  with  $[C_{ij\lambda_L}, C_{ij\lambda_U}] \subseteq [\phi_{1L}, \phi_{1U}], [C_{ij\eta_L}, C_{ij\eta_U}] \subseteq [\phi_{2L}, \phi_{2U}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \subseteq [\phi_{3L}, \phi_{3U}]$  satisfying  $0 \leq C_{ij\lambda_U} + C_{ij\eta_U} + C_{ij\zeta_U} \leq 1$ .

A special restricted SIVPFM is a restricted SIVPFM if  $[C_{ij\eta_L}, C_{ij\eta_L}] = [\phi_{2L}, \phi_{2L}]$  for i,j=1,2,3,....,a.

Any restricted SIVPFM C = ( $\langle x, y, z \rangle$ ) of order 2.Let us consider a SIVPFM D of order 2 with all diagonal entries  $\langle \phi_{1L}, \phi_2, 0 \rangle$  and non-diagonal entries  $\langle 0, \phi_2, \phi_3 \rangle$ . Then  $x \in [0, \phi_1], y \in [0, \phi_1]$  and  $z \in [0, \phi_1]$ . Let E=C.D=( $\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle$ ) Then ( $\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle$ ) =  $\langle (x \land \phi_1) \lor (x \land \phi_2), (y \land \phi_2) \land (y \land \phi_2), (z \lor 0) \land (z \land \phi_3) \rangle$  =(x, y, z). *similarly*, it can be shown that rest entries of R are also (x, y, z). Consequently C.D = C.

For having lowest IVPFV $(0, \phi_2, \phi_3) \le (x, y, z)$ , *i.*  $e, 0 \le x, \phi_2 \le y, \phi_3 \ge z$  which concludes that for existing least IVPFV  $y = \phi_2$ . *so* for defining null and identity IVPFM.it needs special restricted SIVPFM.

Identity special restricted IVPFM and null special restricted IVPFM are described as follows based on the aforementioned idea.

#### **Definition 15**

A special restricted SIVPFM is referred to as an identity special restricted IVPFM if it has nondiagonal values  $\langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle$ , as well as diagonal entries of  $\langle 0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle$ 

#### **Definition 16**

If a special restricted SIVPFM has all entries  $(0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}])$ , Then it is called null special restricted IVPFM.

It is clear that when  $\phi_2 = 0$ ,  $\phi_1 = 1$ ,  $\phi_{3=1}$  Then  $0 \le (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}] \rangle) \le 1$ ,  $(\langle [C_{ij\eta_L}, C_{ij\eta_L}] \rangle) = 1, 0 \le (\langle [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle) \le 1$  with  $0 \le (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\zeta_U}] \rangle) \le 1$ . Now ,by replacing the measure membership by the measure of neutral membership and the measure of non-membership IVPFM is obtained. Thus, null IVIFM is obtained with all entries  $(0, \phi_3) = (0, 1)$  and identity IVIFM is obtained with diagonal entries  $\langle \phi_1, 0 \rangle = \langle 0, 1 \rangle$  and non -diagonal entries  $\langle 0, \phi_3 \rangle = \langle 0, 1 \rangle$  so identity IVIFM and null IFM, respectively.

Now, Let us define some basic operations on SIVPFMs.

#### **Definition 17**

Let C and D be two SIVPFMs of order a then the following operations are defined.

- (i)  $\mathbf{C} \odot \mathbf{D} = \left( \langle [C_{ij\lambda_L}, d_{ij\lambda_L}, C_{ij\lambda_R}, d_{ij\lambda_R}], [C_{ij\eta_L}, d_{ij\eta_L}, C_{ij\eta_R}, d_{ij\eta_R}], [C_{ij\zeta_L}, d_{ij\zeta_L}, C_{ij\zeta_R}, d_{ij\zeta_R}] \rangle \right),$
- (ii)  $\mathbf{C} \vee \mathbf{D} = \left( \left\langle \left[ C_{ij\lambda_{L}} \vee d_{ij\lambda_{L}}, C_{ij\lambda_{U}} \vee d_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}} \right], \left[ C_{ij\zeta_{L}} \wedge d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \wedge d_{ij\zeta_{U}} \right] \right\rangle \right),$
- (iii)  $\mathbf{C} \wedge \mathbf{D} = \left( \left( \left[ C_{ij\lambda_{L}} \wedge d_{ij\lambda_{L}}, C_{ij\lambda_{U}} \wedge d_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}} \right], \left[ C_{ij\zeta_{L}} \vee d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \vee d_{ij\zeta_{U}} \right] \right) \right),$
- (iv)  $C^{t} = (\langle [C_{ji\lambda_{L}}, C_{ji\lambda_{U}}], [C_{ji\eta_{L}}, C_{ji\eta_{L}}], [C_{ji\zeta_{L}}, C_{ji\zeta_{U}}] \rangle),$
- (v)  $\overline{\mathbf{C}} = (\langle [C_{ij\zeta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\lambda_L}, C_{ij\lambda_U}] \rangle) (\text{ complement of SIVPFM P})$

## Rajarajeswari and Nandhini

#### A few properties on SPFM

The proposition that follows will be used in this investigation of some ground properties of SIVPFM.

## Proposition 1.

Let C and D two SIVPFM of same order. Then

(i)  $C \wedge D = D \wedge C$ ,

(ii)  $C \lor D = D \lor C$ ,

(iii)  $(C^t)^t = C$ ,

- (iv)  $(\overline{C})^t = (\overline{C^t}),$
- (v)  $C \land (D \lor E) = (C \land D) \lor (C \land E)$
- (vi)  $C \lor (D \lor E) = (C \lor D) \land (C \lor E)$
- $\label{eq:VII} \mbox{(VII)} \mbox{(K. C)}^t = \mbox{K. C}^t \mbox{ for a IVPFV } k = \mbox{(}[k_{1L}, k_{1U}], [k_{2L}, k_{2U}], [k_{3L}, k_{3U}]\mbox{)},$
- (viii)  $\lim_{n \to \infty} C \odot C \odot C \ldots \ldots \ldots \odot C(n \text{ times}) = (\langle (0,0), (0,0), (0,0) \rangle))$

When ever  $0 \leq \left( \left( \left[ C_{ij\lambda_L}, C_{ij\lambda_U} \right] \right) \right) < 1, 0 \leq \left( \left( \left[ C_{ij\eta_L}, C_{ij\eta_L} \right] \right) \right) < 1, 0 \leq \left( \left( \left[ C_{ij\zeta_L}, C_{ij\zeta_U} \right] \right) \right) < 1.$ 

## Proof

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  and  $D=(\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}]\rangle)$  be two SIVPFM of order *a*.

(i) We have,

 $C \wedge D = \left( \left\{ \left[ C_{ij\lambda_{L}} \wedge d_{ij\lambda_{L}}, C_{ij\lambda_{U}} \wedge d_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}} \right], \left[ C_{ij\zeta_{L}} \vee d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \vee d_{ij\zeta_{U}} \right] \right\} \right) = \left( \left\{ \left[ d_{ij\lambda_{L}} \wedge c_{ij\lambda_{L}}, d_{ij\lambda_{U}} \wedge c_{ij\lambda_{U}} \right], \left[ d_{ij\eta_{L}} \wedge c_{ij\eta_{L}}, d_{ij\eta_{U}} \wedge c_{ij\eta_{U}} \right], \left[ d_{ij\zeta_{L}} \vee c_{ij\zeta_{L}}, d_{ij\zeta_{U}} \vee c_{ij\zeta_{U}} \right] \right\} \right) = D \wedge C,$ 

(ii) We have

$$C \lor D = \left( \left\{ \left[ C_{ij\lambda_{L}} \lor d_{ij\lambda_{U}}, C_{ij\lambda_{U}} \lor d_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}} \land d_{ij\eta_{L}}, C_{ij\eta_{U}} \land d_{ij\eta_{U}} \right], \left[ C_{ij\zeta_{L}} \land d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \land d_{ij\zeta_{U}} \right] \right\} \right) = \left( \left\{ \left[ d_{ij\lambda_{L}} \lor c_{ij\lambda_{U}}, d_{ij\lambda_{U}} \lor c_{ij\lambda_{U}} \right], \left[ d_{ij\eta_{L}} \land c_{ij\eta_{U}}, d_{ij\eta_{U}} \land c_{ij\eta_{U}} \right], \left[ d_{ij\zeta_{L}} \land c_{ij\zeta_{U}} \land d_{ij\zeta_{U}} \land c_{ij\zeta_{U}} \right] \right\} \right)$$

 $= D \vee C$ ,

(iii) Wehave

$$C^{t} = \left( \left( \left\{ \left[ C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right], \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right] \right\} \right) \right)^{t}$$
$$= \left( \left\{ \left[ C_{ji\lambda_{L}}, C_{ji\lambda_{U}} \right], \left[ C_{ji\eta_{L}}, C_{ji\eta_{L}} \right], \left[ C_{ji\zeta_{L}}, C_{ji\zeta_{U}} \right] \right\} \right)$$
$$\left( C^{t} \right)^{t} = \left( \left( \left\{ \left[ C_{ji\lambda_{L}}, C_{ji\lambda_{U}} \right], \left[ C_{ji\eta_{L}}, C_{ji\eta_{L}} \right], \left[ C_{ji\zeta_{L}}, C_{ji\zeta_{U}} \right] \right\} \right) \right)^{t}$$

$$= \left( \left\{ \begin{bmatrix} C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \end{bmatrix}, \begin{bmatrix} C_{ij\eta_{L}}, C_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \end{bmatrix} \right) \right)$$

$$= C$$
(iv) Here
$$\bar{C} = \left( \left\{ \begin{bmatrix} C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \end{bmatrix}, \begin{bmatrix} C_{ij\eta_{L}}, C_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \end{bmatrix} \right) \right)$$
Therefore
$$(\bar{C})^{t} = \left( \left( \left\{ \begin{bmatrix} C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \end{bmatrix}, \begin{bmatrix} C_{ij\eta_{L}}, C_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \end{bmatrix} \right) \right)^{t}$$

$$= \left( \left\{ \begin{bmatrix} C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \end{bmatrix}, \begin{bmatrix} C_{ij\eta_{L}}, C_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \end{bmatrix} \right) \right)$$
Now, 
$$\left( \left( \left\{ \begin{bmatrix} C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \end{bmatrix}, \begin{bmatrix} C_{ij\eta_{L}}, C_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \end{bmatrix} \right) \right)^{t}$$

$$= \left( \left\{ \begin{bmatrix} C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \end{bmatrix}, \begin{bmatrix} C_{ij\eta_{L}}, C_{ij\eta_{L}} \end{bmatrix}, \begin{bmatrix} C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \end{bmatrix} \right) \right)^{t}$$

Therefore

 $\left(\overline{C^{t}}\right) = \left(\left\langle \left[C_{ji\zeta_{L}}, C_{ji\zeta_{U}}\right], \left[C_{ji\eta_{L}}, C_{ji\eta_{L}}\right], \left[C_{ji\lambda_{L}}, C_{ji\lambda_{U}}\right]\right\rangle \right)^{t} \text{ Thus } (\overline{C})^{t} = \left(\overline{C^{t}}\right)$ 

 $(\mathbf{v})\mathbf{C} \land (\mathbf{D} \lor \mathbf{E}) = \left( \langle \left[ C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right], \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right] \rangle \right) \land$ 

 $\left( \left( \left[ C_{ij\lambda_{L}} \land (d_{ij\lambda_{L}} \lor e_{ij\lambda_{L}}), C_{ij\lambda_{U}} \land (d_{ij\lambda_{U}} \lor e_{ij\lambda_{U}}) \right], \left[ C_{ij\eta_{L}} \land (d_{ij\eta_{L}} \land e_{ij\eta_{L}}), C_{ij\eta_{L}} \land (d_{ij\eta_{U}} \land e_{ij\eta_{U}}) \right], \left[ C_{ij\zeta_{L}} \land (d_{ij\zeta_{L}} \land (d_{ij\zeta_{U}} \land e_{ij\eta_{U}})) \right] \right)$ 

 $-([C_{ij\lambda_{L}} \wedge d_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \wedge e_{ij\lambda_{L}}][C_{ij\lambda_{U}} \wedge d_{ij\lambda_{U}} \vee C_{ij\lambda_{U}} \wedge e_{ij\lambda_{U}}], [C_{ij\eta_{L}} \wedge d_{ij\eta_{L}} \vee C_{ij\eta_{L}} \wedge e_{ij\eta_{L}}] (\langle [C_{ij\lambda_{L}} \wedge (d_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \wedge (d_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee (d_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee (d_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee (d_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee C_{ij\lambda_{L}} \vee (d_$ 

 $e_{ij\lambda_{L}}, C_{ij\lambda_{U}} \wedge (d_{ij\lambda_{U}} \vee e_{ij\lambda_{U}})], [C_{ij\eta_{L}} \wedge (d_{ij\eta_{L}} \wedge e_{ij\eta_{L}}), C_{ij\eta_{L}} \wedge (d_{ij\eta_{U}} \wedge e_{ij\eta_{U}})], [C_{ij\zeta_{L}} \wedge (d_{ij\zeta_{L}} \wedge e_{ij\zeta_{L}}), C_{ij\zeta_{L}} \wedge (d_{ij\zeta_{U}} \wedge e_{ij\zeta_{U}})]) = (C \wedge D) \vee (C \wedge E)$ 

(vi)  $C \vee (D \wedge E) = (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle) \vee$ 

 $\left( \left\{ \left[ C_{ij\lambda_{L}} \vee (d_{ij\lambda_{L}} \wedge e_{ij\lambda_{L}}), C_{ij\lambda_{U}} \vee (d_{ij\lambda_{U}} \wedge e_{ij\lambda_{U}}) \right], \left[ C_{ij\eta_{L}} \vee (d_{ij\eta_{L}} \wedge e_{ij\eta_{L}}), C_{ij\eta_{L}} \vee (d_{ij\eta_{U}} \wedge e_{ij\eta_{U}}) \right], \left[ C_{ij\zeta_{L}} \vee (d_{ij\zeta_{L}} \wedge e_{ij\zeta_{L}}), C_{ij\zeta_{U}} \vee (d_{ij\zeta_{U}} \wedge e_{ij\zeta_{U}}) \right] \right\}$ 

 $= ([C_{ij\lambda_L} \wedge d_{ij\lambda_L} \vee C_{ij\lambda_L} \wedge e_{ij\lambda_L}][C_{ij\lambda_U} \wedge d_{ij\lambda_U} \vee C_{ij\lambda_U} \wedge e_{ij\lambda_U}], [C_{ij\eta_L} \wedge d_{ij\eta_L} \vee C_{ij\eta_L} \wedge e_{ij\eta_L}]_{(\langle [C_{ij\lambda_L} \wedge (d_{ij\lambda_L} \vee C_{ij\lambda_L} \vee C_{ij\lambda_L} \vee C_{ij\lambda_L} \wedge (d_{ij\lambda_L} \vee C_{ij\lambda_L} \vee C_{ij$ 

 $e_{ij\lambda_{L}}), C_{ij\lambda_{U}} \wedge (d_{ij\lambda_{U}} \vee e_{ij\lambda_{U}})], \left[C_{ij\eta_{L}} \wedge (d_{ij\eta_{L}} \wedge e_{ij\eta_{L}}), C_{ij\eta_{L}} \wedge (d_{ij\eta_{U}} \wedge e_{ij\eta_{U}})\right], \left[C_{ij\zeta_{L}} \wedge (d_{ij\zeta_{L}} \wedge e_{ij\zeta_{L}}), C_{ij\zeta_{L}} \wedge (d_{ij\zeta_{U}} \wedge e_{ij\zeta_{U}})\right]\rangle$ 

 $= (C \lor D) \land (C \lor E)$ 

(vii)We have

 $(K. C)^{t} = \left( \langle \langle [k_{1L}, k_{1U}], [k_{2L}, k_{2U}], [k_{3L}, k_{2U}] \rangle \left( \langle [C_{ij\lambda_{L}}, C_{ij\lambda_{U}}], [C_{ij\eta_{L}}, C_{ij\eta_{L}}], [C_{ij\zeta_{L}}, C_{ij\zeta_{U}}] \rangle \right) \right)^{t}$ 

 $= \left( \left\{ \left[ k_{1L} \wedge C_{ij\lambda_{L}}, k_{1U} \wedge C_{ij\lambda_{U}} \right], \left[ k_{2L} \wedge C_{ij\eta_{L}}, k_{2U} \wedge C_{ij\eta_{L}} \right], \left[ k_{3L} \vee C_{ij\zeta_{L}}, k_{3U} \vee C_{ij\zeta_{U}} \right] \right)^{t} \right)^{t}$ 

 $= \left( \left( \left\{ \left[ \mathbf{k}_{1\mathrm{L}}, \mathbf{k}_{1\mathrm{U}} \right] \land \left[ C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \right], \left[ \mathbf{k}_{2\mathrm{L}}, \mathbf{k}_{2\mathrm{U}} \right] \land \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right], \left[ \mathbf{k}_{3\mathrm{L}}, \mathbf{k}_{3\mathrm{U}} \right] \lor \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right] \right) \right)^{t}$ 

 $= \left( \left\langle \left[ \mathbf{k}_{1\mathrm{L}}, \mathbf{k}_{1\mathrm{U}} \right] \land \left[ C_{ji\lambda_{L}}, C_{ji\lambda_{U}} \right], \left[ \mathbf{k}_{2\mathrm{L}}, \mathbf{k}_{2\mathrm{U}} \right] \land \left[ C_{ji\eta_{L}}, C_{ji\eta_{L}} \right], \left[ \mathbf{k}_{3\mathrm{L}}, \mathbf{k}_{3\mathrm{U}} \right] \lor \left[ C_{ji\zeta_{L}}, C_{ji\zeta_{U}} \right] \right\rangle \right)$ 

 $\left(\langle\langle [\mathbf{k}_{1L},\mathbf{k}_{1U}], [\mathbf{k}_{2L},\mathbf{k}_{2U}], [\mathbf{k}_{3L},\mathbf{k}_{2U}]\rangle.\left(\langle [C_{ji\lambda_L},C_{ji\lambda_U}], [C_{ji\eta_L},C_{ji\eta_L}], [C_{ji\zeta_L},C_{ji\zeta_U}]\rangle\right)\rangle\right)$ 

 $=k.C^{t}$

 $= \left( \left\{ \left[ C_{ij\lambda_{L}}^{2}, C_{ij\lambda_{U}}^{2} \right], \left[ C_{ij\eta_{L}}^{2}, C_{ij\eta_{U}}^{2} \right], \left[ C_{ij\zeta_{L}}^{2}, C_{ij\zeta_{U}}^{2} \right] \right\} \right) C \odot C \odot C = \left( \left\{ \left[ C_{ij\lambda_{L}}^{3}, C_{ij\lambda_{U}}^{3} \right], \left[ C_{ij\eta_{L}}^{3}, C_{ij\eta_{U}}^{3} \right], \left[ C_{ij\zeta_{L}}^{3}, C_{ij\zeta_{U}}^{3} \right] \right\} \right).$  Proceeding in this way. It is obtained that

 $C \odot C \odot \dots \dots \dots \odot C(n \ times) = \left( \left\{ \left[ C_{ij\lambda_L}{}^n, C_{ij\lambda_U}{}^n \right], \left[ C_{ij\eta_L}{}^n, C_{ij\eta_U}{}^n \right], \left[ C_{ij\zeta_L}{}^n, C_{ij\zeta_U}{}^n \right] \right\} \right). \text{since} \left( \left\{ \left[ C_{ij\lambda_L}, C_{ij\lambda_U} \right] \right\} \right) \subseteq [0,1], \left( \left\{ \left[ C_{ij\zeta_L}, C_{ij\zeta_U} \right] \right\} \right) \subseteq [0,1], \left( \left\{ \left[ C_{ij\zeta_L}, C_{ij\zeta_U} \right] \right\} \right) \subseteq [0,1], \left( \left\{ C_{ij\zeta_L}, C_{ij\zeta_U} \right\} \right\} \right) \subseteq [0,1],$ 

$$\lim_{n \to \infty} [C_{ij\lambda_L}{}^n, C_{ij\lambda_U}{}^n] = [0,0], \lim_{n \to \infty} [C_{ij\eta_L}{}^n, C_{ij\eta_U}{}^n] = [0,0], \lim_{n \to \infty} [C_{ij\zeta_L}{}^n, C_{ij\zeta_U}{}^n] = [0,0], \lim_{n \to \infty} [C_{ij\zeta_L}{}^n, C_{ij\zeta_U}{}^n]$$

## **Proposition 2**

Let C and D be two Special restricted SIVPFMs of same order a. Then  $C \lor D \ge C$  and  $C \lor D \ge D$ .

# Proof

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  and  $D=(\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}]\rangle)$  be two SIVPFM of order and restricted for three interval valued real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$ 

## [0,1]with

 $\phi_{1U} + \phi_{2U} = 1 \text{ and } \phi_{2U} + \phi_{3U} = 1. \text{Then}[C_{ij\lambda_L}, C_{ij\lambda_U}] \text{and}[d_{ij\lambda_L}, d_{ij\lambda_U}] \subseteq [\phi_{1L}, \phi_{1U}], \ [C_{ij\eta_L}, C_{ij\eta_L}] \text{and}[d_{ij\eta_L}, d_{ij\eta_L}] = [\phi_{2L}, \phi_{2U}], \ ([C_{ij\zeta_L}, C_{ij\zeta_U}] \text{and}[d_{ij\zeta_L}, d_{ij\zeta_U}]) \subseteq [\phi_{3L}, \phi_{3U}].$ 

Now  $C \vee D = \left( \left\{ \left[ C_{ij\lambda_L} \vee d_{ij\lambda_L}, C_{ij\lambda_U} \vee d_{ij\lambda_U} \right], \left[ C_{ij\eta_L} \wedge d_{ij\eta_L}, C_{ij\eta_U} \wedge d_{ij\eta_U} \right], \left[ C_{ij\zeta_L} \wedge d_{ij\zeta_L}, C_{ij\zeta_U} \wedge d_{ij\zeta_U} \right] \right\} \right)$ for i,j=1,2,3,....a. It is observed that  $\left[ C_{ij\lambda_L} \vee d_{ij\lambda_L}, C_{ij\lambda_U} \vee d_{ij\lambda_U} \right] \supseteq \left[ C_{ij\lambda_L}, C_{ij\lambda_U} \right]$ 

 $\left(\left[C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}}\right]\right) \supseteq \left[C_{ij\eta_{L}}, C_{ij\eta_{L}}\right]$ 

 $\left(\left[C_{ij\zeta_{L}}\wedge d_{ij\zeta_{L}}\right]\wedge\left[\left[d_{ij\zeta_{L}}\wedge d_{ij\zeta_{U}}\right]\right]\right)\subseteq\left[C_{ij\zeta_{L}},C_{ij\zeta_{U}}\right].$ 

hence by using the Definition 11 we have  $C \lor D \ge C$ 

Similarly we can prove that  $C \lor D \ge D$ .

## **Proposition 3**

Let C and D be two Special restricted SIVPFMs of same order a. Then  $C \lor D \ge C \land D$ .

## Proof

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  and  $D=(\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}]\rangle)$  be two SIVPFM of order *a*. Then

$$C \lor D = \left( \langle \left[ C_{ij\lambda_{L}} \lor d_{ij\lambda_{U}}, C_{ij\lambda_{U}} \lor d_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}} \land d_{ij\eta_{L}}, C_{ij\eta_{U}} \land d_{ij\eta_{U}} \right], \left[ C_{ij\zeta_{L}} \land d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \land d_{ij\zeta_{U}} \right] \rangle \right)$$

 $C \wedge D = \left( \left\langle \left[ C_{ij\lambda_{L}} \wedge d_{ij\lambda_{L}}, C_{ij\lambda_{U}} \wedge d_{ij\lambda_{U}} \right], \left[ C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}} \right], \left[ C_{ij\zeta_{L}} \vee d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \vee d_{ij\zeta_{U}} \right] \right\rangle \right)$ 

It is Clear that  $([C_{ij\lambda_L} \lor d_{ij\lambda_L}, C_{ij\lambda_U} \lor d_{ij\lambda_U}]) \supseteq ([C_{ij\lambda_L} \land d_{ij\lambda_L}, C_{ij\lambda_U} \land d_{ij\lambda_U}])$ 

$$\left(\left[C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}}\right]\right) \supseteq \left(\left[C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}}\right]\right)$$

$$\left(\left[C_{ij\zeta_{L}} \wedge d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \wedge d_{ij\zeta_{U}}\right]\right) \subseteq \left(\left[C_{ij\zeta_{L}} \vee d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \vee d_{ij\zeta_{U}}\right]\right)$$

So  $C \lor D \ge C \land D$ .

## Proposition 4

Let C, D and E be three Special restricted SIVPFMs of same order. Then  $C \lor E \ge D \lor E$  whenever  $C \ge D$ . **Proof** 

Let C=( $\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle$ ) and D=( $\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}] \rangle$ )E= ( $\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle$ )

be three Special restricted SIVPFM of order *a* by three interval valued real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then  $[C_{ij\lambda_L}, C_{ij\lambda_U}], [d_{ij\lambda_L}, d_{ij\lambda_U}]$  and  $[e_{ij\lambda_L}, e_{ij\lambda_U}] \subseteq [\phi_{1L}, \phi_{1U}], [C_{ij\eta_L}, C_{ij\eta_L}], [d_{ij\eta_L}, d_{ij\eta_L}]$  and  $[e_{ij\eta_L}, e_{ij\eta_L}] = [\phi_{2L}, \phi_{2U}], ([C_{ij\zeta_L}, C_{ij\zeta_U}], [d_{ij\zeta_L}, d_{ij\zeta_U}])$  and  $[e_{ij\lambda_L}, e_{ij\zeta_U}] \subseteq [\phi_{3L}, \phi_{3U}]$   $C \ge D \Rightarrow ([C_{ij\lambda_L}, C_{ij\lambda_U}]) \supseteq ([d_{ij\lambda_L}, d_{ij\lambda_U}]), ([[C_{ij\zeta_L}, C_{ij\zeta_U}]]) \subseteq ([[d_{ij\zeta_L}, d_{ij\zeta_U}]])$  $([C_{ij\eta_L}, C_{ij\eta_L}]) \supseteq ([d_{ij\eta_L}, d_{ij\eta_L}]), ([[C_{ij\zeta_L}, C_{ij\zeta_U}]]) \subseteq ([[d_{ij\zeta_L}, d_{ij\zeta_U}]]),$ 

 $\left(\left[C_{ij\lambda_{L}}, C_{ij\lambda_{V}}\right]\right) \vee \left(\left[e_{ij\lambda_{L}}, e_{ij\lambda_{V}}\right]\right) = \left(\left[\left[C_{ij\lambda_{L}}, C_{ij\lambda_{V}}\right]\right]\right) \text{ and } \left(\left[\left[d_{ij\lambda_{L}}, d_{ij\lambda_{V}}\right]\right]\right) \vee \left(\left[e_{ij\lambda_{L}}, e_{ij\lambda_{V}}\right]\right) = \left(\left[\left[d_{ij\lambda_{L}}, d_{ij\lambda_{V}}\right]\right]\right)$

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  and  $D=(\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}]\rangle)E=(\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}]\rangle)$ 

be three SIVPFM of order *x* for three real numbers  $[\phi_{1L}, \phi_{1U}] \in [0,1], [\phi_{2L}, \phi_{2U}] \in [0,1], [\phi_{3L}, \phi_{3U}] \in [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then

 $\left( \left\{ \left[ C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \right], \left[ d_{ij\lambda_{L}}, d_{ij\lambda_{U}} \right], \left[ e_{ij\lambda_{L}}, e_{ij\lambda_{U}} \right] \in \left[ \phi_{1L}, \phi_{1U} \right] \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right] = \left[ d_{ij\eta_{L}}, d_{ij\eta_{L}} \right] = \left[ e_{ij\eta_{L}}, e_{ij\eta_{L}} \right] = \left[ \phi_{2L}, \phi_{2U}, \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right], \left[ d_{ij\zeta_{L}}, d_{ij\zeta_{U}} \right], \left[ e_{ij\zeta_{L}}, e_{ij\zeta_{U}} \right] \right) \right) \in \left[ \phi_{3L}, \phi_{3U} \right]$ with  $0 \leq \left( \left\{ \left[ C_{ij\lambda_{L}}, C_{ij\lambda_{U}} \right] + \left[ C_{ij\eta_{L}}, C_{ij\eta_{L}} \right] + \left[ C_{ij\zeta_{L}}, C_{ij\zeta_{U}} \right] \right) \right) \leq 1, 0 \leq \left( \left\{ \left[ d_{ij\lambda_{L}}, d_{ij\lambda_{U}} \right] + \left[ d_{ij\eta_{L}}, d_{ij\eta_{L}} \right] + \left[ d_{ij\zeta_{L}}, d_{ij\zeta_{U}} \right] \right) \right) \leq 1, 0 \leq \left( \left\{ \left[ e_{ij\lambda_{L}}, e_{ij\lambda_{U}} \right] + \left[ e_{ij\eta_{L}}, e_{ij\zeta_{U}} \right] \right\} \right) \leq 1.$ for i,j=1,2,3,...,a.

Now  $C \ge D \Rightarrow C \lor E \le D \lor E = (\langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle)$  (by proposition 4)

$$C \lor E \ge \left( \langle \left[ \phi_{1L}, \phi_{1U} \right], \left[ \phi_{2L}, \phi_{2U} \right], 0 \rangle \right)$$

Let  $C \vee E = S = (\langle [s_{ij\lambda_L}, s_{ij\lambda_U}], [s_{ij\eta_L}, s_{ij\eta_L}], [s_{ij\zeta_L}, s_{ij\zeta_U}] \rangle)$  $(\langle [s_{ij\lambda_L}, s_{ij\lambda_U}], [s_{ij\eta_L}, s_{ij\eta_L}], [s_{ij\zeta_L}, s_{ij\zeta_U}] \rangle) \ge (\langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle) \le 0, [s_{ij\lambda_L}, s_{ij\lambda_U}] \ge [\phi_{1L}, \phi_{1U}]([s_{ij\eta_L}, s_{ij\eta_L}]) \ge [\phi_{2L}, \phi_{2U}], ([s_{ij\zeta_L}, s_{ij\zeta_U}]) \le [\phi_{3L}, \phi_{3U}] \text{ for } 1, 2, 3, \dots, a.$ 

$$[s_{ij\lambda_{L}}, s_{ij\lambda_{U}}] = [\phi_{1L}, \phi_{1U}], [s_{ij\eta_{L}}, s_{ij\eta_{L}}] = [\phi_{2L}, \phi_{2U}], [s_{ij\zeta_{L}}, s_{ij\zeta_{U}}] = 0 \text{ for } 1, 2, 3, \dots, a$$

Consequently, S=( $\langle [\phi_{1L}, \phi_{1U}], [\phi_{2L}, \phi_{2U}], 0 \rangle$ ).

## Rajarajeswari and Nandhini

#### **Definition 18**

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  and  $D=(\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}]\rangle)$  be two special restricted SIVPFM. Then a binary operation ' $\ominus$  'between them is defined by

$$C \ominus D = (\langle [e_{ij\lambda_{L}}, e_{ij\lambda_{U}}], [e_{ij\eta_{L}}, e_{ij\eta_{L}}], [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}] \rangle), where \left( \langle [e_{ij\lambda_{L}}, e_{ij\lambda_{U}}], [e_{ij\eta_{L}}, e_{ij\eta_{L}}], [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}] \rangle \right) = \begin{cases} (\langle [C_{ij\lambda_{L}}, C_{ij\lambda_{U}}], [C_{ij\eta_{L}}, C_{ij\eta_{L}}], [C_{ij\zeta_{L}}, C_{ij\zeta_{U}}] \rangle), & when(\langle [C_{ij\lambda_{L}}, C_{ij\lambda_{U}}], [C_{ij\eta_{L}}, C_{ij\eta_{L}}], [C_{ij\zeta_{L}}, C_{ij\zeta_{U}}] \rangle) \\ \geq (\langle [d_{ij\lambda_{L}}, d_{ij\lambda_{U}}], [d_{ij\eta_{L}}, d_{ij\eta_{L}}], [d_{ij\zeta_{L}}, d_{ij\zeta_{U}}] \rangle) \\ otherwise \end{cases}$$

#### **Definition 19**

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  be special restricted SIVPFM of order *a*. Then C is reflexive if  $[C_{ii\lambda_L}, C_{ii\lambda_U}] = [\phi_{1L}, \phi_{1U}], [C_{ii\eta_L}, C_{ii\eta_L}] = [\phi_{2L}, \phi_{2U}], [C_{ii\zeta_L}, C_{ii\zeta_U}] = 0$  for i=1,2,3,....a.

#### **Definition 20**

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle)$  be special restricted SIVPFM of order *a*. Then C irreflexive if  $[C_{ii\lambda_L}, C_{ii\lambda_U}] = 0[C_{ii\eta_L}, C_{ii\eta_L}] = [\phi_{2L}, \phi_{2U}][C_{ii\zeta_L}, C_{ii\zeta_U}] = [\phi_{3L}, \phi_{3U}]$  for i=1,2,3,....a.

## Definition 21.

Let C and D be two SIVPFMs of order *x*. Then the convex combination of C and D is denoted by C\* *D* and is defined by C\*  $D = (\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}])),$ 

where

 $\begin{bmatrix} e_{ij\lambda_L}, e_{ij\lambda_U} \end{bmatrix} = [\beta \wedge C_{ij\lambda_L}, \beta \wedge C_{ij\lambda_U}] \vee [(1-\beta) \wedge d_{ij\lambda_L}, (1-\beta) \wedge d_{ij\lambda_U}].$   $\begin{bmatrix} e_{ij\eta_L}, e_{ij\eta_L} \end{bmatrix} = [\beta \wedge C_{ij\eta_L}, \beta \wedge C_{ij\eta_U}] \vee [(1-\beta) \wedge d_{ij\eta_L}, (1-\beta) \wedge d_{ij\eta_U}].$   $\begin{bmatrix} e_{ij\zeta_L}, e_{ij\zeta_U} \end{bmatrix} = [\beta \wedge C_{ij\zeta_L}, \beta \wedge C_{ij\zeta_U}] \vee [(1-\beta) \wedge d_{ij\zeta_L}, (1-\beta) \wedge d_{ij\zeta_U}].$ 

for i,j=1,2,3,....,a;Where  $0 \le \beta \le 1$ .

As a result, it is noted that the convex combination of two SIVPFMs is nothing more than the convex combination of their entries, each of which contains three different sorts of membership values. Convex combination of the entries' respective membership values is used during convex combination of the entries.

#### Definition 22.

A SIVPFM C=( $\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle$ ) is said to be idempotent with respect to some operation 'o' if C oC =C.

#### **Proposition 8**

**Every** SIVPFM is idempotent with respect to convex combination '\*'.

#### Proof

Let C=( $\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle$ ) be a SIVPFM of order *x*. C\* C=( $\langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle$ )

## Rajarajeswari and Nandhini

where

$$\begin{split} & \left[e_{ij\lambda_{L}}, e_{ij\lambda_{U}}\right] = \left[\beta \wedge C_{ij\lambda_{L}}, \beta \wedge C_{ij\lambda_{U}}\right] \vee \left[(1-\beta) \wedge c_{ij\lambda_{L}}, (1-\beta) \wedge c_{ij\lambda_{U}}\right]. \\ & \left[e_{ij\eta_{L}}, e_{ij\eta_{L}}\right] = \left[\beta \wedge C_{ij\eta_{L}}, \beta \wedge C_{ij\eta_{U}}\right] \vee \left[(1-\beta) \wedge c_{ij\eta_{L}}, (1-\beta) \wedge c_{ij\eta_{U}}\right]. \end{split}$$

 $\left[e_{ij\zeta_{L}}, e_{ij\zeta_{U}}\right] = \left[\beta \wedge C_{ij\zeta_{L}}, \beta \wedge C_{ij\zeta_{U}}\right] \vee \left[(1-\beta) \wedge c_{ij\zeta_{L}}, (1-\beta) \wedge c_{ij\zeta_{U}}\right] \text{for } i, j=1,2,3,\dots,a.$ 

Therefore C\* C=C.So, C is idempodent SIVPFM with respect to '\*'.

#### **Proposition 9.**

For an irreflexive special restricted SIVPFM C,  $C \ominus I$  is irreflexive.

Proof

Let C=( $\langle [C_{ij\lambda_L}, C_{ij\lambda_{U}}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_{U}}] \rangle$ ) be an irreflexive

special restricted of order *a* for three interval valued real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1] and [\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then

 $\begin{bmatrix} C_{ij\lambda_L}, C_{ij\lambda_U} \end{bmatrix} \subseteq [\phi_{1L}, \phi_{1L}] \begin{bmatrix} C_{ij\eta_L}, C_{ij\eta_L} \end{bmatrix} = [\phi_{2L}, \phi_{2U}], \begin{bmatrix} C_{ij\zeta_L}, C_{ij\zeta_U} \end{bmatrix} \subseteq [\phi_{3L}, \phi_{3U}] \text{ for } i,j=1,2,3,\dots,a. \text{ Since } C \text{ is irreflexive } (\langle \begin{bmatrix} C_{ii\lambda_L}, C_{ii\lambda_U} \end{bmatrix}, \begin{bmatrix} C_{ii\eta_L}, C_{ii\eta_L} \end{bmatrix}, \begin{bmatrix} C_{ii\zeta_L}, C_{ii\zeta_U} \end{bmatrix}) = \langle 0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle \text{ for } i,j=1,2,3,\dots,a. \text{ the entries in } (i,i) \text{ position of } C \ominus I \text{ are } \langle 0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle \text{ for } i,j=1,2,3,\dots,a. \text{ so } C \ominus I \text{ is irreflexive.}$ 

#### **Proposition 10.**

Let C and D be two Special restricted SIVPFMs. Then  $C \lor D \ge C \ominus D$ .

#### Proof

Let  $C = (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle)$  and  $D = (\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}] \rangle)$  be two special restricted SIVPFM of order *a* for three real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $\phi_{3L}, \phi_{3U} \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then  $(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [d_{ij\lambda_L}, d_{ij\lambda_U}] \in [\phi_{1L}, \phi_{1U}] [C_{ij\eta_L}, C_{ij\eta_L}] = [d_{ij\eta_L}, d_{ij\eta_L}] = [\phi_{2L}, \phi_{2U}], [C_{ij\zeta_L}, C_{ij\zeta_U}], [d_{ij\zeta_L}, d_{ij\zeta_U}] \rangle) \in [\phi_{3L}, \phi_{3U}]$  with  $0 \leq (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}] + [C_{ij\eta_L}, C_{ij\eta_L}] + [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle) \leq 1.0 \leq (\langle [d_{ij\lambda_L}, d_{ij\lambda_U}] + [d_{ij\eta_L}, d_{ij\eta_L}] + [d_{ij\zeta_L}, d_{ij\zeta_U}] \rangle) \leq 1.$  for  $i, j=1, 2, 3, \dots$ .

Now,  $\mathcal{C} \vee D = (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle) \vee (\langle [a_{ij\lambda_L}, a_{ij\lambda_U}], [a_{ij\eta_L}, a_{ij\eta_L}], [a_{ij\zeta_L}, a_{ij\zeta_U}] \rangle)$  $(\langle [C_{ij\lambda_L} \vee d_{ij\lambda_L}, C_{ij\lambda_U} \vee d_{ij\lambda_U}], [C_{ij\eta_L} \vee d_{ij\eta_L}, C_{ij\eta_U} \vee d_{ij\eta_U}], [C_{ij\zeta_L} \vee d_{ij\zeta_L}, C_{ij\zeta_U} \vee d_{ij\zeta_U}] \rangle)$  and

$$C \ominus D = \left( \langle [e_{ij\lambda_{L}}, e_{ij\lambda_{U}}], [e_{ij\eta_{L}}, e_{ij\eta_{L}}], [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}] \rangle \right), \text{ where } \left( \langle [e_{ij\lambda_{L}}, e_{ij\lambda_{U}}], [e_{ij\eta_{L}}, e_{ij\eta_{L}}], [e_{ij\zeta_{L}}, e_{ij\zeta_{U}}] \rangle \right) \\ \begin{cases} \left( \langle [C_{ij\lambda_{L}}, C_{ij\lambda_{U}}], [C_{ij\eta_{L}}, C_{ij\eta_{L}}], [C_{ij\zeta_{L}}, C_{ij\zeta_{U}}] \rangle \right), \text{ when} \left( \langle [C_{ij\lambda_{L}}, C_{ij\lambda_{U}}], [C_{ij\eta_{L}}, C_{ij\zeta_{U}}] \rangle \right) \\ \geq \left( \langle [d_{ij\lambda_{L}}, d_{ij\lambda_{U}}], [d_{ij\eta_{L}}, d_{ij\eta_{L}}], [d_{ij\zeta_{L}}, d_{ij\zeta_{U}}] \rangle \right) \\ \langle 0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle \text{ otherwise} \end{cases}$$
  
It is observed that  $\left( [c_{ij\lambda_{L}}, c_{ij\lambda_{U}}] \right) \vee \left( [d_{ij\lambda_{L}}, d_{ij\lambda_{U}}] \right) \geq \left( [c_{ij\lambda_{L}}, c_{ij\lambda_{U}}] \right), \\ \left( [c_{ij\eta_{L}}, c_{ij\eta_{L}}] \right) \wedge \left( [d_{ij\eta_{L}}, d_{ij\eta_{L}}] \right) \geq \left( [c_{ij\eta_{L}}, c_{ij\eta_{L}}] \right), \\ \left( [c_{ij\zeta_{L}}, c_{ij\zeta_{U}}] \right) \wedge \left( [d_{ij\zeta_{L}}, d_{ij\zeta_{U}}] \right) \leq \left( [c_{ij\zeta_{L}}, c_{ij\zeta_{U}}] \right). \\ \left( [c_{ij\eta_{L}}, c_{ij\eta_{L}}] \right) \wedge \left( [d_{ij\eta_{L}}, d_{ij\eta_{L}}] \right) \geq \left( [\phi_{2L}, \phi_{2U}] \\ \left( [c_{ij\zeta_{L}}, c_{ij\zeta_{U}}] \right) \wedge \left( [d_{ij\zeta_{L}}, d_{ij\zeta_{U}}] \right) \leq \left( \phi_{3L}, \phi_{3U} \right] \end{cases}$ 

Consequently,  $C \lor D \ge C \ominus D$ .

## Rajarajeswari and Nandhini

#### Proposition 11.

Let C and D be two Special restricted SIVPFMs of same order. Then,  $(C \lor D) \lor (C \ominus D) = C \lor D$ .

#### Proof

Let  $C=(\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}]\rangle)$  and  $D=(\langle [d_{ij\lambda_L}, d_{ij\lambda_U}], [d_{ij\eta_L}, d_{ij\eta_L}], [d_{ij\zeta_L}, d_{ij\zeta_U}]\rangle)$  be two special restricted SIVPFM of order *a* for three real numbers  $[\phi_{1L}, \phi_{1U}] \subseteq [0,1], [\phi_{2L}, \phi_{2U}] \subseteq [0,1]$  and  $[\phi_{3L}, \phi_{3U}] \subseteq [0,1]$  with  $\phi_{1U} + \phi_{2U} = 1$  and  $\phi_{2U} + \phi_{3U} = 1$ . Then  $\left(\langle \left[C_{ij\lambda_{L}}, C_{ij\lambda_{U}}\right], \left[d_{ij\lambda_{L}}, d_{ij\lambda_{U}}\right] \subseteq \left[\phi_{1L}, \phi_{1U}\right] \left[C_{ij\eta_{L}}, C_{ij\eta_{L}}\right] = \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right] = \left[\phi_{2L}, \phi_{2U}\right], \left(\left[C_{ij\zeta_{L}}, C_{ij\zeta_{U}}\right], \left[d_{ij\zeta_{L}}, d_{ij\zeta_{U}}\right]\right) \subseteq \left[\phi_{1L}, \phi_{1U}\right] = \left[d_{ij\eta_{L}}, d_{ij\eta_{L}}\right] = \left[d_{ij\eta_{L}}, d_{ij\eta_{L}$  $[\phi_{3L}, \phi_{3U}]$  for i,j=1,2,3,....a.  $C \lor D =$  $(\langle [C_{ij\lambda_{L}} \vee d_{ij\lambda_{L}}, C_{ij\lambda_{U}} \vee d_{ij\lambda_{U}}], [C_{ij\eta_{L}} \wedge d_{ij\eta_{L}}, C_{ij\eta_{U}} \wedge d_{ij\eta_{U}}], [C_{ij\zeta_{L}} \wedge d_{ij\zeta_{L}}, C_{ij\zeta_{U}} \wedge d_{ij\zeta_{U}}] \rangle).$ Also, let  $(C \ominus D) = \left( \langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle \right), \text{where} \left( \langle [e_{ij\lambda_L}, e_{ij\lambda_U}], [e_{ij\eta_L}, e_{ij\eta_L}], [e_{ij\zeta_L}, e_{ij\zeta_U}] \rangle \right) = \left( (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\eta_L}, C_{ij\eta_U}], [C_{ij\eta_L}, C_{ij\zeta_U}] \rangle \right), \text{when} \left( \langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\zeta_U}], [C_{ij\eta_L}, C_{ij\zeta_U}] \rangle \right)$  $\geq \left( \langle \left[ d_{ij\lambda_{L}}, d_{ij\lambda_{U}} \right], \left[ d_{ij\eta_{L}}, d_{ij\eta_{L}} \right], \left[ d_{ij\zeta_{L}}, d_{ij\zeta_{U}} \right] \rangle \right)$  $\begin{pmatrix} \langle 0, [\phi_{2L}, \phi_{2U}], [\phi_{3L}, \phi_{3U}] \rangle \\ \text{Now}, [C_{ij\lambda_L}, C_{ij\lambda_L}] \vee , [d_{ij\lambda_L}, d_{ij\lambda_L}] \vee , [C_{ij\lambda_L}, C_{ij\lambda_L}] = ([c_{ij\lambda_L}, c_{ij\lambda_U}]) \vee ([d_{ij\lambda_L}, d_{ij\lambda_U}]) \end{pmatrix}$ otherwise.  $([C_{ij\lambda_{L}} \vee d_{ij\lambda_{L}}, C_{ij\lambda_{U}} \vee d_{ij\lambda_{U}}]) \vee ([C_{ij\lambda_{L}}, C_{ij\lambda_{U}}]) = ([C_{ij\lambda_{L}} \vee d_{ij\lambda_{L}}, C_{ij\lambda_{U}} \vee d_{ij\lambda_{U}}])$  $\left(\left(\left[c_{ij\eta_{L}},c_{ij\eta_{L}}\right]\right)\wedge\left(\left[d_{ij\eta_{L}},d_{ij\eta_{L}}\right]\right)\right)\wedge\left[c_{ij\eta_{L}},c_{ij\eta_{L}}\right]=\left(\left[c_{ij\eta_{L}},c_{ij\eta_{L}}\right]\right)\wedge\left(\left[d_{ij\eta_{L}},d_{ij\eta_{L}}\right]\right)$ and  $([c_{ij\zeta_L}, c_{ij\zeta_U}]) \land ([d_{ij\zeta_L}, d_{ij\zeta_U}]) \land ([c_{ij\zeta_L}, c_{ij\zeta_U}]) = ([c_{ij\zeta_L}, c_{ij\zeta_U}]) \land ([d_{ij\zeta_L}, d_{ij\zeta_U}]).$  $\left(\left(\left[c_{ij\lambda_{1}}, c_{ij\lambda_{1}}\right]\right) \vee \left(\left[d_{ij\lambda_{1}}, d_{ij\lambda_{1}}\right]\right)\right) \vee 0 = \left(\left[c_{ij\lambda_{1}}, c_{ij\lambda_{1}}\right]\right) \vee \left(\left[d_{ij\lambda_{1}}, d_{ij\lambda_{1}}\right]\right),$  $([c_{ij\eta_L}, c_{ij\eta_L}]) \land ([d_{ij\eta_L}, d_{ij\eta_L}]) \land \phi_2 = ([c_{ij\eta_L}, c_{ij\eta_L}]) \land ([d_{ij\eta_L}, d_{ij\eta_L}])$  $([c_{ij\zeta_L}, c_{ij\zeta_U}]) \wedge ([d_{ij\zeta_L}, d_{ij\zeta_U}]) \wedge \phi_{3=}([c_{ij\zeta_L}, c_{ij\zeta_U}]) \wedge ([d_{ij\zeta_L}, d_{ij\zeta_U}]).$ Thus  $(C \lor D) \lor (C \ominus D) = C \lor D$ 

#### APPLICATION IN MEDICAL DIAGNOSIS.

The interval valued picture fuzzy matrix is an important tool that can be used in numerous types of medical diagnosis problems. Suppose there is a set of m patients  $C = \{c_1, c_2, c_3, \dots, c_m\}$  with a set of n symptoms  $T = \{t_1, t_2, t_3, \dots, t_n\}$  connected to a set of k diseases  $D = \{d_1, d_2, d_3, \dots, d_k\}$ . we apply interval valued picture fuzzy matrix to determine which patient is afflicted with which disease. we calculate the two-interval valued picture fuzzy matrix C and D multiply the two matrices. next we compute the interval valued picture fuzzy matrix into picture fuzzy matrix. we conclude that Picture fuzzy matrix into crisp value. Finally find maximum value that the patient is affected from which disease.

### Algorithm.

- The two-interval valued picture fuzzy sets from interval valued picture fuzzy matrix
- Compute multiplying the two-interval valued picture fuzzy matrix
- Find the average value of interval valued picture fuzzy matrix lower bound+ upper bound by dividing into two
- Interval valued picture fuzzy matrix can be converted into the picture fuzzy matrix
- Picture matrix into the crisp value using harmonic mean
- find the maximum score value
- we come to the conclusion that the patients  $C_i$  has a diseased  $d_i$

**Case study:** Consider the five patients C= { $c_1$ ,  $c_2$ ,  $c_3$ ,  $c_4$ , $c_5$ } as the universal set in a hospital with symptoms fever, cold, cough, headache. Let the disease related to the above symptoms be High temperature, malaria, corona. C= { $c_1$ ,  $c_2$ ,  $c_3$ ,  $c_4$ , $c_5$ } where  $c_1$ ,  $c_2$ ,  $c_3$  and  $c_4$  represent patients. Let T= { $t_1$ ,  $t_2$ ,  $t_3$ } as the set of symptoms where  $t_1$ ,  $t_2$  and  $t_3$  represent symptoms respectively. Now, a interval valued picture fuzzy

matrix  $C = (\langle [C_{ij\lambda_L}, C_{ij\lambda_U}], [C_{ij\eta_L}, C_{ij\eta_L}], [C_{ij\zeta_L}, C_{ij\zeta_U}] \rangle)$  of size 5 x 3 in the following represents the patients.

$\begin{array}{llllllllllllllllllllllllllllllllllll$
STEP 2: Interval valued Picture fuzzy matrix into picture fuzzy matrix $ \begin{array}{c} d_1 & d_2 & d_3 \\ \\ C_1 \\ C_2 \\ C_2 \\ C_3 \\ C_4 \\ C_5 \\ C_4 \\ C_5 \\ C_5 \\ C_5 \\ C_4 \\ C_5 \\ C_4 \\ C_5 \\ C_$
$ \begin{array}{c} C_1 \\ C_2 \\ C_2 \\ 0.0122 & 0.01175 & 0.0135 \\ 0.015 & 0.1775 & 0.0155 \\ 0.0106 & 0.012 & 0.0164 \\ 0.0085 & 0.0204 & 0.0118 \\ 0.0163 & 0.0091 & 0.0125 \\ \end{array} $ Therefore conclude that all the five patients are maximum score affected by the $c_1 \rightarrow d_3, c_2 \rightarrow d_2, c_3 \rightarrow d_3, c_4 \rightarrow d_2, c_5 \rightarrow d_1. $

## CONCLUSION

In many practical fields, asking questions about matrix theory has made a significant contribution. We have defined interval valued picture fuzzy matrix, which is the extension of picture fuzzy matrix and provides high accuracy and improves the effectiveness. Also we have defined special rrestricted picture fuzzy matrix, some basic operations on these matrices, based on these we have studied some basic properties of these defined matrices. This research can be seen as a generalization of the interval valued picture fuzzy matrix research. An application of interval valued picture fuzzy matrix in medical diagnosis have been provided to solve the medical diagnosis problem which is illustrated with a numerical example. we expect that the current study will start increasing researchers' interest in the further generalization and development of future works.

## ABSTRACT

In India, sugarcane is a major crop used for sugar production which is naturally exposed to various diseases that leads to significant economic loss. In this research paper a study of crop diseases in sugarcane using the Decision-Making Trial and Evaluation Laboratory (DEMATEL) method in accordance of a novel fuzzy set. DEMATEL is a useful tool for understanding the cause-and-effect outcome among different factors in complex manner. The objective of this study is to identify the key factors contributing to the spread of sugarcane diseases in a particular crop variety namely, Co 09004 (Amritha) .The approach in this paper helps for similar studies in other crops and agricultural systems, providing more effective disease management strategies.

Keywords: crop diseases, sugarcane, DEMATEL method, causal relationships, disease management, agriculture.

## INTRODUCTION

Sugarcane (*Saccharum officinarum* L.) is a cash crop of utmost importance providing a great economic significance to the agro-industrial sector. In Tamil Nadu, sugarcane occupies an important position in agricultural production, making an economic contribution to the state's economy. The incidence of crop diseases is a major obstacle to the sustainable development of sugarcane. Crop diseases pose a threat to agricultural productivity and food quality, impacting the yield of crops.

Prince Kumaret..al;[4] studied an analytical Research Paper On Sugarcane Disease Detection Model. The main cause of the disease is progressed by factors such aspoor drainage system, weather conditions, and economically

#### Amala Kaavya and Sahaya Sudha

agronomic practices which not only reduces yield but also it affects the quality of the harvested cane. Shukla Adil Zubair et.al [12] elaborated the concept of Sugarcane Varieties Identified By AICPR(S) In India Thus, broad approach for disease management involves traditionally practices, the methods of disease-free planting material are used, and regular check are kept for the evaluation of disease management. The Decision-Making Trial and Evaluation Laboratory (DEMATEL) method emerges as a useful tool, providing an insightful approach to solve these most interdependencies. A. Gabus[4] solved the Framework of DEMATEL. As governments, and individual's faces with multiple challenges, the DEMATEL method offers a structured process to show cause-and-effect relationships enabling informed and effective decision-making.

Thi Hai Ninh Do et.al.[18] demonstrated that the DEMATEL method demands a systematic approach. Accurate data collection analysis are main components of the process. By employing the DEMATEL method, decision-makers can analyze the factors that are more informed and aligned with the complexities of the criteria that are solved. Sheng-Li Si et.al [13] explained about the DEMATEL Technique has a Systematic Review of the State-of-the-Art Literature on Methodologies and its Applications.2015 Sangaiah et.al[15] discussed about that a fuzzy DEMATEL approach based on intuitionistic fuzzy information for evaluating knowledge transfer effectiveness in GSD projects . This study also shows how DEMATEL works well for getting a comprehensive grasp of complicated agricultural systems and the problems they present.<u>RasappaViswanathan</u>et.al[16]demonstrated the Brown spot of sugarcane: an emerging disease in South Western region in India.Yanli Chen et.al[22] studied a concept to illustrate the Identification of Sugarcane with NDVI Time Series Based on HJ-1 CCD and MODIS Fusion in the year 2020.Liu, Zhong[7]discussed about the extraction of sugarcane in the southern hills using multi-temporal GF-1 WFV data.

In the 1960s,Fuzzy set theory is a groundbreaking concept introduced by Lotfi A. Zadeh, revolutionized how we perceive and handle uncertainty in various domains. Tareq M. Al-shami [17](2,1)-Fuzzy sets with its properties, weighted aggregated operators and their applications to multi-criteria decision-making methods..Anoop Kumar Tiwaria[2] showed an intuitionistic fuzzy-rough set model and its application to feature selection. A classical fuzzy set theory involves with a degree of membership. This is linked relevant in real-world situation with the concepts are vague or subject to interpretation according to the fuzzy set.

Atanassov K.T [1] gives a clear picture and detailed study On Intuitionistic fuzzy sets theory with itsfuture work. The aim of the fuzzy set theory lies the concept of membership functions. Yager.R.R [21] demonstrated Pythagorean Membership Grades in Multi Criteria Decision Making stand as an example for many MCDM methods. An Intuitionistic fuzzy set is a fundamental concept within fuzzy set theory. Muhammad Saeed [11]investigated the Theoretical Development of Cubic Pythagorean Fuzzy Soft Set with Its Application in Multi-Attribute Decision Making .It is characterized by a membership function with two categories. Muhammad Jabir Khan[10] gave a detailed study in the knowledge measure for the q-rung orthopair fuzzy sets.Arshad Ahmad Khan et.al.[3]gave a clear picture on A New Ranking Methodology for Pythagorean Trapezoidal Uncertain Linguistic Fuzzy Sets Based on Einstein Operations. Krishna Prabhaa et.al.[6]Studied a Geometric Mean with Pythagorean Fuzzy Transportation Problem. Vakkas Uluçay et.al.[19] studied about the Intuitionistic trapezoidal fuzzy which are capable of representing gradual changes in membership with more precision than traditional triangular fuzzy sets.In this Paper ,q-Rung orthopedic fuzzy hyper soft ordered aggregation operators by Salma Khan et.al[12].Jianhua Jin et.al.[5] showed a concept ofQuintuple Implication Principle on interval-valued intuitionistic fuzzy sets.

QIFS fuzzy sets are both extensions of theoryand offers an effective representation, while enrich our capacity to model with membership transitions. The defined Quad Intuitionistic Fuzzy set(QIFS) is worked with the DEMATEL method to produce the results for uncertainty. The Quad Intuitionistic Fuzzy set consists to values of Membership Degree (MD) and Non Membership Degree(NMD). The aim is to specify the point that Quad Intuitionistic Fuzzy set is capable to handle the greater levels of vague concepts. In section -2 shows the preliminaries results used for the study. In section-3, the paper focuses on the fundamental ideas of QIFS. In section-4 shows the characteristics of CropAmirtha. In section-5, the proposed methodology of DEMATEL is explained in QIFS. In section-6 the application

#### Amala Kaavya and Sahaya Sudha

of proposed method is discussed. In section-7 presents the conclusions and in section-8 results with the reference following.

#### Preliminaries

#### Intuitionistic Fuzzy Set [1]

An Intuitionistic fuzzy set A on a universe X is an object of the form  $A = \{(x, \mu_A(x), \nu_A(x)) | x \in X\}$ where $\mu_A(x) \in [0,1]$  is called the degree of membership of x in A, and  $\nu_A(x) \in [0,1]$  is called the degree of nonmembership of x in A.

#### Pythagorean Fuzzy Set[6]

A Pythagorean fuzzy set P in a finite universe of discourse X is given as

 $P = \{ < x, \mu_P(x), \nu_P(x) > x \in X \}$ 

where  $\mu_P(x)$ ,  $\nu_P(x): X \to [0,1]$  be the degree of membership and non membership of the element  $x \in X$  to the set P,

respectively, with the condition that

 $0 \le \mu_P{}^2(x) + \nu_P{}^2(x) \le 1.$ 

The degree of indeterminacy(hesitation) between the membership function is given by

$$\pi_P(x) = \sqrt{1 - \mu_P^2(x) - \nu_P^2(x)}$$

 $(\mu_P(x), \nu_P(x))$  called a Pythagorean fuzzy numbers denoted by  $P = (\mu_P, \nu_P)$ .

Quad Intuitionistic Fuzzy Set:

#### Definition

Let A be the Quad Intuitionistic Fuzzy Set(QIFS) in X is defined by

 $A = \{x, [a, b, c, d], \mu(x), \nu(x) | x \in X\}$ 

where  $\mu_A(x) \in [0,1]$  is called the degree of membership of x in X, and  $\nu_A(x) \in [0,1]$  is called the degree of nonmembership of x in X; a,b,c,d $\epsilon X \rightarrow [0,1]$  are the finite collections of objects in the universe  $X, \pi_A(x) = 1 - \mu_A(x) - \nu_A(x)$  called the degree of indeterminacy of  $x \epsilon X$  to QIFS. $\pi_A(x)$  gives the information whether x belongs to A or not.

#### Algorithms for the DEMATEL method:

DEMATEL involves a series of steps to analyze and visualize the relationships between factors. The overview of the steps involved:

#### STEP I:

Initiation of Direct relation matrix: The decision maker assesses the correlation between the groups of paired criteria to identify the direct influence of each criteria.

 $A = \begin{pmatrix} 0 & a_{12} & a_{1n} \\ a_{21} & 0 & a_{2n} \\ a_{i1} & a_{i2} & a_{in} \end{pmatrix}$ 

#### **STEP II:**

Normalization of Direct Relation matrix X= k A, where  $K = \frac{1}{\max_{1 \le i \le n} \sum_{j=1}^{n} a_{ij}}$  *i*, *j* = 1,2,3,...n

#### Amala Kaavya and Sahaya Sudha

#### STEP III:

Estimation of the Total relation matrix

The total relation matrix is estimated with the Identify matrix .

T is the matrix denotes the total relationship within each pair of criteria.

 $T = Y(I - Y)^{-1}$ 

#### STEP IV:

Evaluate the sums of rows and columns in T matrix

$$D = \left| \sum_{j=1}^{n} t_{ij} \right|_{n+1}$$

$$= [t_i]_{n+1,i} = 1, 2, \dots n$$
$$R = \left[\sum_{i=1}^n t_{ij}\right]_{i+n}$$

$$=[t_j]_{n+1}, j = 1, 2, ... n$$

## STEP V:

Defining the threshold value  $\alpha$ . Average of the elements in the Total matrix T

$$\alpha = \frac{\sum_{i=1}^{n} \sum_{j=1}^{n} t_{ij}}{N}$$

#### STEP VI:

#### Formation of the casual Diagram

It provides information to identify the most important criteria and their influence levels in order to recognize the driving variables of the considered problem in a complex system and design for reasonable measures to take care of the issues based on the attribute type and influence level.

#### Application to detect the Cane Crop Diseases Using DEMATEL method:

The number of sugarcane plants that can be grown per acre depends on factors like the spacing of the plants, soil fertility, climate,etc.Usually,Sugarcane is typically planted with 4 to 6 feet of distance between adjacent rows of sugarcane plants(Space between rows) For space within a row the cane should be planted within 2 to 3 feet of distance between sugarcane plants in the same row(Space within rows).

Let us consider the planting cultivation of 5 feet between rows and 3 feet plants within a row, the number of sugarcane plants per acre is given below:

#### Space between rows

Number of plants to be cultivated = 43560 feet / 5 feet =8712 plants per row

#### Space within a row

Number of rows to be cultivated = 43560 feet / 3 feet = 14520 rows per acre

#### Total number of plants per acre

Number of plants per row × Number of rows per acre = 8712 x14520 ≈ 1,26,498,240 plants per acre

#### **Quad Intuitionistic Fuzzy sets in terms of PDI:** One acre is divided into Quadrant I,II,III,IV

Amala Kaavya and Sahaya Sudha

## **RESULTS AND DISCUSSIONS**

The utilization of the DEMATEL method in accordance with Quad Intuitionistic Fuzzy Sets to investigate the relationship among Red Rot, Smut, Grassy Shoot and Ratoon Stunting Diseases in a 1-acre land of cane cultivation area. In conclusion, the application of the DEMATEL method with Quad Intuitionistic Fuzzy Sets gives a detailed framework for understanding the factors of Red Rot, Smut, and Ratoon Stunting Diseases based on the divided quadrants of cane cultivation of 1 acreThe detailed study provides the distribution of these diseases in the four different quadrants, enabling to analyze the potential effects and the percentage of the prevalence among the four quadrants. All the specified each quadrant representing a distinct section of the cultivating Co 09004 Amirtha in the peninsular region. The diseasespresent in each quadrant stands for the identification of patterns and correlations. The DEMATEL method with Quad Intuitionistic Fuzzy Sets, shows the uncertainty and imprecision that are intrinsic to real-world agricultural scenarios.

## ABSTRACT

A Shewhart control chart is one of the important tools in Statistical Process Control (SPC) to monitor and analyze a process parameter over time. Process Control Techniques are useful to identify assignable causes of variations. Any significant variations in the production process can be easily detected using Control Charts. In few industries existing control charts may not be suitable since the data could be vague or imprecise. Hence to control the vagueness and process control parameters, a new Fuzzy control chart is developed to handle such quality control environment. In this article a new fuzzy based compound binomial control chart is developed and designed to monitor the fraction defectives and to control the variability in the sample size. A new fuzzy control chart which can handle the uncertainty of sample size and compound fraction defective is developed using  $\alpha$  - level midrange. ARL (Average Run Length) is determined and analyzed for newly developed control chart. It is found that the ARL is better over other types of control charts.

**Keywords -** Process control, Compound Binomial, Fuzzy set,  $\alpha$  - level midrange.

## INTRODUCTION

In the current scenario of a statistical quality control, the enhancement of process control techniques stands as a crucial quality strategy. Statistical Process Control (SPC) holds a pivotal position inside numerous quality control environments. Control charts were developed with the purpose of overseeing processes and identifying changes in the average and variability of quality characteristics, ensuring the satisfactory performance of these processes. Even though Shewhart initially proposed the concept of control charts in 1920, modern times still see emerging areas of application that deserve further investigation. Uncertainty is a common aspect in many real-world systems, which introduces challenges in applying statistical process control. Consequently, the utilization of fuzzy set theory becomes pertinent for the purpose of elucidating and conceptualizing these problems in quality control techniques.

This paper introduces the new approach of fuzzy control charts for controlling or to monitor compound fraction defectives. The compound fraction defectives control chart is new approach of control chart based on Compound Binomial Distribution. This chart can control both fraction defective and monitor variability of sample size in single chart. The compound fraction defective control chart may not be suitable in some situations such as the data involved could be vague or imprecise. Thus, Fuzzy control charts are used to handle such situations and a fuzzy based compound fraction defectives control chart is developed.

The section of the article is organised as follows. Section 2 shows the review of literature. Section 3 contains the methodology of the work. Section 4 describes the illustration of the proposed work. Section 5 contains results and discussions.

## **REVIEW OF LITERATURE**

Shewhart (1926) introduced a concept of control chart to monitor the quality of process in the industry. Zadeh (1965) proposed a concept of fuzzy based on mathematical method for representing vagueness and uncertainty in decision making. H. Taleb and M. Limam (2002) proposed different procedures for constructing control charts based on fuzzy and probabilistic approach. Gulbay, Kahraman and Ruan (2004) designed a  $\alpha$  - cut fuzzy control chart for attribute data for utilize the tightness of the inspection. Further, M. Gulbay and C. Kahraman (2006) also designed fuzzy control charts for linguistic and imprecise data. These fuzzy control charts are applied to p and c charts. To monitor multivariate attribute data Taleb et.al (2006) developed a control chart called fuzzy multinomial control charts. Sevil and Nihal (2009) proposed a fuzzy  $\overline{X}$ - $\widetilde{R}$  and  $\overline{X}$ - $\widetilde{S}$  control charts with  $\alpha$  cuts.

Hung Shu and Chung Wu (2011) developed a fuzzy  $\overline{X}$  and R control charts using the fuzzy dominance approach. This approach can compare fuzzy averages and variances to their respective fuzzy control limits. To monitor attribute quality characteristics Sogandi, et.al (2014) developed a fuzzy P chart. Alakoc and Apaydin (2018) designed a fuzzy control chart approach for attribute and variable data based on decision function,  $\alpha$ - cut fuzzy numbers, fuzzy 30 control limits. Prabu and Nanthakumar (2020) designed a fuzzy control chart for number of defects using process capability. Devaarul and Arunthadhi (2023) designed a Truncated Poisson Exponentially Weighted Moving Average (TPEWMA) control chart for an unstabilized production process.

## **METHODOLOGY**

#### **Compound Fraction Defectives Control Chart**

Let X be random variable, then the probability density function of binomial distribution is  $P(X=r) = {n \choose r} p^r q^{n-r}$ ;  $r = {n \choose r} p^r q^{n-r}$ 0,1,2.....n ----- (1)

Take n as another random variable which follows the Poisson distribution.

----- (2)

----- (3)

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Arunthadhi and Devaarul

$$P(n=k) = \frac{e^{-\lambda}\lambda^k}{k!}$$
;  $k = 0, 1, 2, 3....$ 

The probability density function of compound binomial distribution is derived from the joint probability of X and n.

$$P(X=r) = \frac{e^{-\lambda p} (\lambda p)^r}{r!}$$
;  $r = 0, 1, 2, ....$ 

Then, the mean and variance of compound binomial distribution is  $\lambda p$ .

The n as a fixed constant in Binomial distribution becomes a random variable in Poisson distribution. Thus, the mean and variance of compound binomial distribution becomes np<sup>2</sup>.

Then the Control limits for compound fraction defectives are as follows,

The control limit can control both the number of defectives and variability in sample size as compound fraction defectives.

#### Fuzzy Compound Fraction Defectives Control Chart based on Triangular fuzzy number

Let us consider the compound fraction defectives as triangular fuzzy numbers which are represented as  $(CF_a, CF_b, CF_c)$  for each fuzzy sample. Then the control limits for fuzzy compound binomial control chart is determined based on triangular fuzzy number are as follows,

$$CL = (CL_{a}, CL_{b}, CL_{c}) = (np^{2}_{a}, np^{2}_{b}, np^{2}_{c}) ------(7)$$

$$(\overline{np^{2}}_{a}, \overline{np^{2}}_{b}, \overline{np^{2}}_{c}) = (\frac{\sum CF_{a}}{m}, \frac{\sum CF_{b}}{m}, \frac{\sum CF_{c}}{m}) ------(8)$$

$$UCL = (UCL_{a}, UCL_{b}, UCL_{c}) = (\overline{np^{2}}_{a} + 3\sqrt{\overline{np^{2}}_{a}}, \overline{np^{2}}_{b} + 3\sqrt{\overline{np^{2}}_{b}}, \overline{np^{2}}_{c} + 3\sqrt{\overline{np^{2}}_{c}}) ------(9)$$

$$LCL = (LCL_{a}, LCL_{b}, LCL_{c}) = (\overline{np^{2}}_{a} - 3\sqrt{\overline{np^{2}}_{a}}, \overline{np^{2}}_{b} - 3\sqrt{\overline{np^{2}}_{b}}, \overline{np^{2}}_{c} - 3\sqrt{\overline{np^{2}}_{c}}) ------(10)$$
where, m = number of subgroups.

#### Fuzzy Compound Fraction Defectives Control chart based on α - Level Midrange

To enhance the uncertainty of compound binomial control chart the  $\alpha$  – level midrange is applied to fuzzy compound binomial control chart. The  $\alpha$  – level midrange comes into play when the centre of these fuzzy control limits is determined. Now applying the  $\alpha$  – level midrange to fuzzy compound binomial control chart the centre line of the control chart is as follows,

$CL = (CL_a^{\alpha}, CL_b, CL_b^{\alpha}) = (\overline{np^2}_a^{\alpha}, \overline{np^2}_b, \overline{np^2}_c^{\alpha})$	(11)
Similarly,	
$(\overline{np^2}_a^{\alpha}, \overline{np^2}_b, \overline{np^2}_c^{\alpha}) = (\frac{\sum CF_a^{\alpha}}{m}, \frac{\sum CF_b}{m}, \frac{\sum CF_c^{\alpha}}{m})$	(12)
where,	
$\overline{np^2}_a^{\alpha} = \overline{np^2}_a + \alpha (\overline{np^2}_b - \overline{np^2}_a)$	(13)
$\overline{np_{c}^{2}}^{\alpha} = \overline{np_{c}^{2}} - \alpha \left(\overline{np_{c}^{2}} - \overline{np_{b}^{2}}\right)$	(14)

#### $\alpha$ – Level fuzzy Midrange for Compound Fraction Defectives Control Chart

To design the fuzzy compound binomial control limit the  $\alpha$  – level midrange is applied and the control limits are as follows,

$$CL_{mid}^{\alpha} = \frac{1}{2} (\overline{np_{a}^{2}}^{\alpha} + \overline{np_{c}^{2}}^{\alpha}) - (15)$$

$$UCL_{mid}^{\alpha} = \frac{1}{2} (\overline{np_{a}^{2}}^{\alpha} + \overline{np_{c}^{2}}^{\alpha}) + 3\sqrt{\frac{1}{2} (\overline{np_{a}^{2}}^{\alpha} + \overline{np_{c}^{2}}^{\alpha})} - (16)$$

$$LCL_{mid}^{\alpha} = \frac{1}{2} (\overline{np_{a}^{2}}^{\alpha} + \overline{np_{c}^{2}}^{\alpha}) - 3\sqrt{\frac{1}{2} (\overline{np_{a}^{2}}^{\alpha} + \overline{np_{c}^{2}}^{\alpha})} - (17)$$

## Arunthadhi and Devaarul

 $\begin{array}{l} \mbox{Then the condition of process control for each sample can be defined as,} \\ \mbox{Process Control} = \left\{ \begin{array}{l} \mbox{in control} & ; \ LCL^{\alpha}_{mid} \leq S^{\alpha}_{mid\,,i} \leq UCL^{\alpha}_{mid} \\ \mbox{out of control} ; \ Otherwise \end{array} \right. \end{array} \right.$ 

#### ILLUSTRATION

In this section an example is illustrated for the proposed work. The control limits, control chart and ARL are derived in this section. Let us consider the example.

The sample size from the Table 1 can be fuzzifie based on Triangular fuzzy number. Then the control limits for compound fraction defectives based on triangular fuzzy number is as follows,

CL = (1.07, 1.008, 0.97) UCL = (4.184, 4.019, 3.923) LCL = (0, 0, 0)

Now apply the  $\alpha$  level midrange to the control chart of triangular fuzzy number. Then the control limits for  $\alpha$  – level fuzzy midrange for Compound Fraction Defectives chart are as follows,  $CL_{mid}^{0.5} = 1.01$ 

 $UCL_{mid}^{0.5} = 4.04$  $LCL_{mid}^{0.5} = 0$ 

#### Calculation for ARL

To comparing the proposed fuzzy based compound defective control chart with normal compound defective control chart ARL is used. ARL is the average number of samples which could occur before the out of control condition.

 $ARL = \frac{1}{P(X > UCL)}$ 

Hence the ARL for the proposed control chart is 264. Based on various values of compound fraction defectives the ARL is shown in following table.

## **RESULT AND DISCUSSION**

In this article, a new control chart is developed to monitor fuzzy based compound fraction defectives. Uncertainty is a common aspect in many real-world systems, which introduces challenges in applying statistical process control. Consequently, the utilization of fuzzy set theory becomes pertinent for the purpose for the purpose of elucidating and conceptualizing these issues. Thus, in this paper a fuzzy based compound fraction defectives control chart is developed with help of  $\alpha$  – level fuzzy midrange. The ARL for the newly developed control chart is derived and calculated. For various shifts the ARL for fuzzy based compound fraction defectives is calculated. It gives a better performance than other charts. As, industries continue to evolve and face new challenges, the adoption of fuzzy based approaches holds significant promise for optimising quality control practices and ensuring the delivery of products.

## ABSTRACT

In this paper a new ranking formula is used to find an Initial Basic Feasible Solution to a Trapezoidal Picture Fuzzy Transportation Problem and Pentagonal Picture Fuzzy Transportation Problem. Three types of Transportation Problem are considered namely Type 1(supply and demand), Type 2 (cost only) and Type 3 (supply, demand and cost) in which the above parameters are represented as Trapezoidal Picture Fuzzy Numbers and Pentagonal Picture Fuzzy Transportation Problem are compared Picture Fuzzy Transportation Problem and Pentagonal Picture Fuzzy Transportation Problem are compared with each other. It is observed that Pentagonal Picture Fuzzy Transportation Problem gives better approximation for the estimation cost of transportation better than Trapezoidal Picture Fuzzy Transportation Problem.

**Keywords**: Picture Fuzzy Sets, Trapezoidal Picture Fuzzy Number, Pentagonal Picture Fuzzy number, Picture Fuzzy transportation problem, Ranking formula.

## INTRODUCTION

A Trapezoidal Picture Fuzzy Transportation Problem (TPFTP) and Pentagonal Picture Fuzzy Transportation Problem (PPFTP) are transportation problems in which the Transportation Problems (TP) is classified into Type 1, Type 2 and Type 3. An extension of Fuzzy Set by Zadeh [3] and Intuitionistic Fuzzy Set by Atanassov [1] is a Picture Fuzzy Set (PFS). A. Nagoorgani and S. Abbas, [2] find a new method for solving Intuitionistic Fuzzy Transportation Problem. Sathya Geetha et.al [4]. solved TP under Picture Fuzzy environment. Muhammad Athar Mehmood et al.[5]

#### Narppasalai Arasu and Sivapriya

find Extended TP based on PFS. In this paper a TPFTP and PPFTP was solved by using a new ranking formula for converting Trapezoidal Picture Fuzzy Number (TPFN) and Pentagonal Picture Fuzzy Number (PPFN) into crisps value and VAM technique is used to find an Initial Basic Feasible Solution (IBFS).

#### **Basic definitions**

**Definition 2.1 [6]:** A PFS in U is defined by  $P = \{x, (m_p(x), a_p(x), n_p(x)) | x \in U\}$  where  $(m_p(x), a_p(x), n_p(x)) \in [0,1], 0 \le (m_p(x) + a_p(x) + n_p(x)) \le 1$ . The  $(m_p(x), a_p(x), n_p(x)) \in [0,1]$  denote respectively the positive membership degree, neutral, negative membership degree of the element of x in the set P. For each PFS P in U, the refusal membership degree is described as

$$r_p(x) = 1 - (m_p(x) + a_p(x) + n_p(x)).$$

**Definition 2.2 [6]:** A Picture Fuzzy Number (PFN) n is defined in a PFS, where  $n \in R$ , as

$$n = \{\xi, (m_n(\xi), a_n(\xi), n_n(\xi)) / \xi \in R\}, \text{ where }$$

$$m(\xi) = \begin{cases} f_n^l(\xi), & \text{for } p_1 \le \xi < q \\ \alpha_n, & \text{for } q \le \xi \le r \\ f_n^u(\xi), & \text{for } r \le \xi < s_1 \\ 0, & \text{otherwise} \end{cases}$$
$$a(\xi) = \begin{cases} g_n^l(\xi), & \text{for } p_2 \le \xi < q \\ \beta_n, & \text{for } q \le \xi \le r \\ g_n^u(\xi), & \text{for } r \le \xi < s_2 \\ 0, & \text{otherwise} \end{cases}$$
$$n(\xi) = \begin{cases} h_n^l(\xi), & \text{for } p_3 \le \xi < q \\ \gamma_n, & \text{for } q \le \xi \le r \\ h_n^u(\xi), & \text{for } r \le \xi < s_3 \\ 0, & \text{otherwise} \end{cases}$$

**Definition 2.3 [6]:** A TPFN't<sub>n</sub>' is defined in a picture fuzzy subset in R with the following membership function  $m_n(\xi)$ , neutral  $a_n(\xi)$  and non-membership function  $n_n(\xi)$ .

$$m_{n}(\xi) = \begin{cases} f_{n}^{l}(\xi) = \frac{\xi - p_{1}}{q - p_{1}} \alpha_{n}^{q}, \text{ for } p_{1} \leq \xi < q \\ \alpha_{n}, & \text{for } q \leq \xi \leq r \\ f_{n}^{u}(\xi) = \frac{s_{1} - \xi}{s_{1} - r} \alpha_{n}, \text{for } r \leq \xi < s_{1} \\ 0, \text{otherwise} \end{cases}$$

$$a_{n}(\xi) = \begin{cases} g_{n}^{l}(\xi) = \frac{q - \xi + \beta_{n}(\xi - p_{2})}{q - p_{2}}, \text{ for } p_{2} \leq \xi < q \\ \beta_{n}, & \text{for } q \leq \xi \leq r \\ g_{n}^{u}(\xi) = \frac{\xi - r + \beta_{n}(s_{2} - \xi)}{s_{2} - r}, \text{ for } r \leq \xi < s_{2} \\ 0, \text{ otherwise} \end{cases}$$

$$n_{n}(\xi) = \begin{cases} h_{n}^{l}(\xi) = \frac{q - \xi + \gamma_{n}(\xi - p_{3})}{q - p_{3}}, \text{ for } p_{3} \leq \xi < q \\ \gamma_{n}, & \text{for } q \leq \xi \leq r \\ h_{n}^{u}(\xi) = \frac{\xi - r + \gamma_{n}(s_{3} - \xi)}{s_{3} - r}, \text{ for } r \leq \xi < s_{3} \\ 0, \text{ otherwise} \end{cases}$$

Where  $P_3 \le P_2 \le P_1 \le q \le r \le S_1 \le S_2 \le S_3$  for all  $\xi \in X$  with the constraints  $0 \le \alpha_n, \beta_n, \gamma_n \le 1$  and  $\alpha_n + \beta_n + \gamma_n \le 1$ . TPFN ' $t_n$ ' is denoted by

$$t_n = (P_1, q, r, S_1; P_2, q, r, S_2; P_3, q, r, S_3).$$

Narppasalai Arasu and Sivapriya

**Definition 2.4 :** A PPFN' $P_n$ 'of PFS is defined as  $P_n = \{(a1, b1, c1, d1, e1)(a2, b2, c2, d2, e2) (a3, b3, c3, d3, e3)\}$ where all  $a1, b1, c1, d1, e1, a2, b2, c2, d2, e2, a3, b3, c3, d3, e3 are real numbers and its membership function <math>m_n(\xi)$ , neutral  $a_n(\xi)$  and non-membership function  $n_n(\xi)$ .

$$m_{n}(\xi) = \begin{cases} 0, for \ \xi < a_{1} \\ (\frac{\xi - a_{1}}{b_{1} - a_{1}})\alpha_{n}^{q}, for \ a_{1} \le \xi < b_{1} \\ \frac{\xi - b_{1}}{c_{1} - b_{1}}\alpha_{n}^{q}, for \ b_{1} \le \xi < c_{1} \\ a_{n}, \qquad for \ \xi = c_{1} \\ \frac{d_{1} - \xi}{d_{1} - c_{1}}\alpha_{n}, for \ c_{1} \le \xi < d_{1} \\ \frac{e_{1} - \xi}{e_{1} - d_{1}}\alpha_{n}, for \ c_{1} \le \xi < d_{1} \\ 0, for \ \xi > e_{1} \\ 0, for \ \xi > e_{1} \\ 0, for \ \xi < a_{2} \\ \frac{b_{2} - \xi}{b_{2} - a_{2}}\beta_{n}, for \ a_{2} \le \xi < b_{2} \\ \frac{c_{2} - \xi}{c_{2} - b_{2}}\beta_{n}, for \ b_{2} \le \xi < c_{2} \\ \beta_{n}, \qquad for \ \xi = c_{1} \\ \frac{\xi - c_{2}}{d_{2} - c_{2}}\beta_{n}, for \ b_{2} \le \xi < d_{2} \\ \frac{\xi - d_{2}}{e_{2} - d_{2}}\beta_{n}, for \ d_{2} \le \xi < d_{2} \\ \frac{\xi - d_{2}}{e_{2} - d_{2}}\beta_{n}, for \ d_{2} \le \xi < e_{2} \\ 1, for \ \xi > a_{3} \\ \frac{b_{3} - \xi}{b_{3} - a_{3}}\gamma_{n}, for \ a_{3} \le \xi < b_{3} \\ \frac{c_{3} - \xi}{c_{3} - b_{3}}\gamma_{n}, for \ b_{3} \le \xi < c_{3} \\ \gamma_{n}, \qquad for \ \xi = c_{1} \\ \frac{\xi - c_{3}}{d_{3} - c_{3}}\gamma_{n}, for \ d_{3} \le \xi < d_{3} \\ \frac{\xi - d_{3}}{e_{3} - d_{3}}\gamma_{n}, for \ d_{3} \le \xi < e_{3} \\ 1, for \ \xi > e_{3} \end{cases}$$

with the constraints  $0 \le \alpha_n$ ,  $\beta_n$ ,  $\gamma_n \le 1$  and  $\alpha_n + \beta_n + \gamma_n \le 1$ .

Definition 2.5: Mathematical Formulation of TPFTP (or PPFTP)

A Picture Fuzzy Transportation Problem (PFTP) is defined as

 $\begin{aligned} \text{Minimum } \tilde{z}^{P} &= \sum_{i=1}^{m} \sum_{j=1}^{n} \tilde{c}_{ij}^{P} \otimes \tilde{x}_{ij}^{P} \\ \text{Subject to the constraints,} \\ \sum_{j=1}^{n} \tilde{x}_{ij}^{P} &= \tilde{a}_{i}^{P}, i = 1,2,3 \dots m \\ \sum_{i=1}^{m} \tilde{x}_{ij}^{P} &= \tilde{b}_{i}^{P}, j = 1,2,3 \dots n \\ \tilde{x}_{ij}^{P} &\geq 0, i = 1,2, \dots m, j = 1,2, \dots n \\ \text{The above PFTP is called TPFTP (or PPFTP).} \end{aligned}$ 

### Narppasalai Arasu and Sivapriya

If  $\tilde{c}_{ij}^{p}$  is the unit Trapezoidal(or Pentagonal) picture fuzzy transporting cost from  $i^{th}$  source to  $j^{th}$  destination.

 $\tilde{a}_i^p$  is the Trapezoidal (or Pentagonal )picture fuzzy availability of the commodity at the *i*<sup>th</sup> source to *j*<sup>th</sup> destination.  $\tilde{b}_i^p$  is the Trapezoidal (or Pentagonal) picture fuzzy demand of the commodity at the *i*<sup>th</sup> source to *j*<sup>th</sup> destination.  $\tilde{x}_{ij}^p$  is the number of units of commodity transported from the *i*<sup>th</sup> source to *j*<sup>th</sup> destination.

**Note:**The above TPFTP (or PPFTP) represent Type 3 problem. Suppose  $\tilde{c}_{ij}^{P}$  is represented as crisp values then the above TPFTP (or PPFTP) represent Type 1 and supply and demand are represented as crisp values then the above

#### Definition 2.6: Ranking formula for TPFN

TPFTP (or PPFTP) represent Type 2

If  $t_n = (P_1, q, r, S_1; P_2, q, r, S_2; P_3, q, r, S_3)$  is a TPFN, then the crisp value of  $t_n$ , as given below.

$$a = \frac{p_1 + 2q + 2r + s_1 + p_2 + 2q + 2r + s_2 + p_3 + 2q + 2r + s_3}{18}$$

#### **Definition 2.7: Ranking formula for PPFN**

If  $P_n = (a_1, b_1, c_1, d_1, e_1; a_2, b_2, c_2, d_2, e_2; a_3, b_3, c_3, d_3, e_3)$  is a PPFN, then the crisp value of  $P_n$ , b is given below.

$$b = \frac{a_1 + 2b_1 + 2c_1 + 2d_1 + e_1 + a_2 + 2b_2 + 2c_2 + 2d_2 + e_2 + a_3 + 2b_3 + 2c_3 + 2d_3 + e_3}{24}$$

#### Algorithm for the TPFTP and PPFTP

**Step (1):** Check whether the given transportation problem is balanced or not. If not, introduce a dummy row or column for making the transportation problem a balanced one.

**Step (2):** Each type1,type2 and type3 the TPFN and PPFN are converted into crisp value using respective ranking formula.

**Step (3):** Existing method namely, VAM technique for the given three types of TPFTP and PPFTP to find the IBFS. **Step (4):** Compare the IBFS obtained from the TPFTP and PPFTP.

#### NUMERICAL EXAMPLES

**Example 4.1:**Consider TPFTP of Type-1 is shown in TPFTP Table 1 (TPFTPT 1) TPFTPT 1

	D1	D2	D3	D4	Supply
C1	5	1	3	3	(3,4,5,9; 2.5,4,5,9.5;
					2,4,5,10)
C2	3	3	5	4	(7,11,12,13;
					6.5,11,12,13.5;
					6,11,12,14)

Z = 5\*0+2\*6+5.5\*6+0.5\*7+9.5\*4+3.5\*8+5.5\*5Z = 142

## Comparison and Conclusion:

The comparison of IBFS for Type1, 2 and 3 TPFTP and PPFTP can be made and shown in Table 19

Narppasalai Arasu and Sivapriya

Table 19

Types	TPFTP	PPFTP
Type-1	92	88
Type-2	440	426
Type-3	145.5	142

In this paper, a new ranking formula is used to solve TPFTP and PPFTP. Based on the results shown in Table 19 it has been found that PPFTP gives better solution than the TPFTP.

## ABSTRACT

In this paper, we introduce some special model algebraic operations on Quin – Terranean Fuzzy numbers such as  $\ominus$  and  $\oslash$  on Quin – Terranean fuzzy numbers. Based on the special model algebraic operations defined, we have analyzed several properties of Quin – Terranean Fuzzy numbers.

## Mathematics Subject Classification: 03E72

**Keywords:** Quin – Terranean Fuzzy set, Quin – Terranean Fuzzy Number, special model algebraic operations such as  $\Theta$  and  $\emptyset$  on Quin – Terranean Fuzzy Numbers.

## INTRODUCTION

In 1965, Zadeh [17] introduced the concept of Fuzzy set theory which is an extension of classical set theory. In 2011, Taleshian et al. [13] provided a method for multiplying two trapezoidal Fuzzy numbers. The proposed analytical approach is the most accurate, but when the membership function is complex, it is challenging to alpha-cuts interval. They have given examples to explain this approach. They generalized Fuzzy number operations from the operations of a crisp interval. In 2013, Rajarajeswari et al. [9] defined an innovative operation on hexagonal fuzzy numbers such that the methods of addition, subtraction, and multiplication have been adapted with some conditions. They have presented new operations for hexagonal Fuzzy number addition, subtraction, and multiplication, subtraction, and multiplication subtraction, and multiplication fuzzy numbers of alpha cut sets of fuzzy numbers. In 2015, Chandrasekaran et al. [3] analyzed the arithmetic operations on Fuzzy numbers such as addition, subtraction, multiplication, division, inverse, exponential, logarithm, square root and n<sup>th</sup>

Rajarajeswari and Thirunamakkani

root of a Fuzzy number using  $\alpha$ -cut method. In 2016, Md. Yasin Ali et al. [8] compared the  $\alpha$ -cut method and the standard approximation method for multiplying triangular Fuzzy numbers, and provided examples and graphical demonstration for each comparison. In 2018, Jayasri and Elavarasi [6] studied Fuzzy set theory and arithmetic operations such as addition, subtraction, multiplication and division operations on Fuzzy numbers. In order to handle situations in which Fuzzy sets are insufficient, in 1986, Atanassov [1] defined the extended concept of Fuzzy set theory known as Intuitionistic Fuzzy Set (IFS). He defined the operations of IFS and also analyzed their properties.

In 2014 Yager [16] introduced the extended concept of IFS known as Pythagorean Fuzzy set(PFS) in which the total of the square of the degree of acceptance and square of the degree of non-acceptance is lesser than or equal to one. In 2010, Chuan-qiang Fan et al. [5] proposed the new ( $\alpha_{i}\beta$ )-pythagorean Fuzzy descriptor systems using pythagorean Fuzzy sets and T-S Fuzzy descriptor systems. They discussed relationship between  $(\alpha,\beta)$ -Pythagorean Fuzzy descriptor systems and T-S Fuzzy descriptor systems, along with the definition of these systems and a study of their stability. They conducted a thorough study on the stability of ( $\alpha,\beta$ )-Pythagorean Fuzzy descriptor systems which handles the challenges associated with actual non-linear control more effectively and the ( $\alpha_{\beta}$ )-Pythagorean Fuzzy controller. They have also provided a concrete example to highlight the viability of the suggested approach. In 2019, Senapathi and Yager [14] introduced Fermatean Fuzzy Set (FFS) in which the sum of the cube of the degree of acceptance and cube of the degree of non-acceptance is less than or equal to one. In 2019, Tapan Senapati and Ronald Yager [15] introduced the three new operations namely subtraction, division and Fermatean arithmetic mean operations over Fermatean Fuzzy Numbers. They have provided great detail on their properties. They developed a Fermatean Fuzzy weighted product model to address the multi-criteria decision-making issue. They have also provided a practical example of choosing a suitable bridge construction method to illustrate the approach they developed and to confirm its viability. The Quin-Terranean Fuzzy Set (QTFS) [11], a novel concept we developed in 2023, is the most significant and useful technique to address uncertainty and contingency, when compared to IFS, PFS, and FFS. Quin-Terranean Fuzzy sets fundamental set theory operations, such as complement, intersection, and union, were defined. Several of the properties are investigated in regard to these operations. The Quin-Terranean Fuzzy set has been shown to satisfy the De Morgan's rule, associative property, commutative property, and distributive property.

#### Preliminaries

This section consists of the basic concepts and definitions related to the paper.

#### Definition 2.1 [14]

The Pythagorean fuzzy sets defined on a non-empty set *X* as objects having the form  $\mathcal{P} = \{\langle \tilde{x}, \alpha_P(\tilde{x}), \beta_P(\tilde{x}) \rangle : \tilde{x} \in X\}$ , where the function  $\alpha_P(\tilde{x}) : X \to [0,1]$  and  $\beta_P(\tilde{x}) : X \to [0,1]$ , denote the degree of membership and degree of non-membership of each element  $\tilde{x} \in X$  to the set  $\mathcal{P}$  respectively, and  $0 \le (\alpha_P(\tilde{x}))^2 + (\beta_P(\tilde{x}))^2 \le 1$  for all  $\tilde{x} \in X$ . For any

Pythagorean fuzzy set  $\mathcal{P}$  and  $\tilde{x} \in X$ ,  $\pi_p(\tilde{x}) = \sqrt{1 - (\alpha_p(\tilde{x}))^2 - (\beta_p(\tilde{x}))^2}$  is called the degree of indeterminacy of  $\tilde{x}$  to  $\mathcal{P}$ .

#### Definition 2.2 [14]

Let X be a universe of discourse. A Fermatean fuzzy set  $\mathcal{F}$  in X is an object having the form  $\mathcal{F} = \{\langle \tilde{x}, \alpha_{\mathcal{F}}(\tilde{x}), \beta_{\mathcal{F}}(\tilde{x}) \rangle : \tilde{x} \in X \},\$ where  $\alpha_{\mathcal{F}}(\tilde{x}) : X \to [0,1]$  and  $\beta_{\mathcal{F}}(\tilde{x}) : X \to [0,1]$ , including the condition  $0 \leq (\alpha_{\mathcal{P}}(\tilde{x}))^3 + (\beta_{\mathcal{P}}(\tilde{x}))^3 \leq 1,\$ for all  $\tilde{x} \in X$ . The  $\alpha_{\mathcal{F}}(\tilde{x})$  and  $\beta_{\mathcal{F}}(\tilde{x})$  denote, respectively, the degree of membership and the degree of nonmembership of the element  $\tilde{x}$  in the set  $\mathcal{F}$ .

For any FFS  $\mathcal{F}$  and  $\tilde{x} \in X$ ,

 $\pi_{\mathcal{F}}(\tilde{x}) = \sqrt[3]{1 - (\alpha_{P}(\tilde{x}))^{3} - (\beta_{P}(\tilde{x}))^{3}}$ 

is identified as the degree of indeterminacy of  $\tilde{x}$  to  $\mathcal{F}$ .

In the interest of simplicity, we shall mention the symbol  $\mathcal{F} = (\alpha_{\mathcal{F}}, \beta_{\mathcal{F}})$  for the FFS  $\mathcal{F} = \{(\tilde{x}, \alpha_{\mathcal{F}}(\tilde{x}), \beta_{\mathcal{F}}(\tilde{x})): \tilde{x} \in X\}$ .

#### Definition 2.3 [11]

Let X denotes a universe of discourse. A Quin – Terranean fuzzy set  $\tilde{Q}$  in X is the element possess the configuration  $\tilde{Q} = \{ \langle \tilde{x}, \sigma_{\tilde{Q}}(\tilde{x}), \delta_{\tilde{Q}}(\tilde{x}) \rangle : \forall \tilde{x} \in X \}$ ,

where  $\sigma_{\tilde{Q}}(\tilde{x}): X \to [0, 1]$  and  $\delta_{\tilde{Q}}(\tilde{x}): X \to [0, 1]$  represents the degree of dependence and degree of non-dependence of the element respectively, satisfying the condition  $0 \le (\sigma_{\tilde{Q}}(\tilde{x}))^{4^5} + (\delta_{\tilde{Q}}(\tilde{x}))^{\frac{5}{4}} \le 1, \forall \tilde{x} \in X.$ 

For any Quin – Terranean fuzzy set  $\widetilde{Q}$  and  $\forall \widetilde{x} \in X$ ,  $\varphi_{\widetilde{Q}}(\widetilde{x}) = \left\{ 1 - \left(\sigma_{\widetilde{Q}}(\widetilde{x})\right)^{4^{5}} - \left(\delta_{\widetilde{Q}}(\widetilde{x})\right)^{\frac{5}{4}} \right\}^{\frac{5}{5}}$  is the degree of hesitance of  $\widetilde{x}$  to X.

#### Definition 2.4 [10]

A Quin – Terranean fuzzy number  $\tilde{Q}$  is defined as, a Quin – Terranean fuzzy subset of the real line normal, that is, there exist  $\tilde{x}_0 \in R$  such that  $\sigma_{\tilde{Q}}(\tilde{x}_0) = \mathbf{1}$  and  $\delta_{\tilde{Q}}(\tilde{x}_0) = \mathbf{0}$ . a convex set for the acceptance function  $\sigma_{\tilde{Q}}(\tilde{x})$ , that is,

 $\sigma_{\widetilde{Q}}(\lambda \widetilde{x}_1 + (1 - \lambda) \widetilde{x}_2) \ge \min\left(\sigma_{\widetilde{Q}}(\widetilde{x}_1), \sigma_{\widetilde{Q}}(\widetilde{x}_2)\right) \quad \forall \ \widetilde{x}_1, \widetilde{x}_2 \in R, \lambda \in [0, 1]$ 

a concave set for the non-acceptance function  $\delta_{\tilde{Q}}(\tilde{x})$ , that is,

 $\delta_{\underline{Q}}(\lambda \tilde{x}_1 + (1-\lambda)\tilde{x}_2) \le \max\left(\delta_{\underline{Q}}(\tilde{x}_1), \delta_{\underline{Q}}(\tilde{x}_2)\right) \quad \forall \tilde{x}_1, \tilde{x}_2 \in R, \lambda \in [0,1].$ 

and satisfies the condition,  $\mathbf{0} \leq \left(\sigma_{\tilde{Q}}(\tilde{x})\right)^{4^5} + \left(\delta_{\tilde{Q}}(\tilde{x})\right)^{\frac{3}{4}} \leq 1$ .

A doublet expressed by  $\tilde{Q} = \langle \sigma_{\tilde{Q}}(\tilde{x}), \delta_{\tilde{Q}}(\tilde{x}) \rangle$  is known as Quin – Terranean fuzzy number. The Zero and one Quin – Terranean fuzzy number is denoted by (0,0) and (1,0) respectively.

#### Definition 2.5 [11]

 $\begin{array}{ll} \operatorname{Let} \widetilde{Q} = \left\{ \langle \widetilde{x}, \sigma_{\widetilde{Q}} \left( \widetilde{x} \right), \delta_{\widetilde{Q}} \left( \widetilde{x} \right) \rangle : \forall \ \widetilde{x} \in X \right\}, \widetilde{Q}_{1} = \left\{ \langle \widetilde{x}, \sigma_{\widetilde{Q}_{1}} \left( \widetilde{x} \right), \delta_{\widetilde{Q}_{1}} \left( \widetilde{x} \right) \rangle : \forall \ \widetilde{x} \in X \right\}, \widetilde{Q}_{2} = \left\{ \langle \widetilde{x}, \sigma_{\widetilde{Q}_{2}} \left( \widetilde{x} \right), \delta_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) \rangle : \forall \ \widetilde{x} \in X \right\} \text{ be three} \\ \begin{array}{ll} \operatorname{Quin} - \operatorname{Terranean} \operatorname{fuzzy} \operatorname{set}, \operatorname{then} \operatorname{their} \operatorname{operations} \operatorname{are} \operatorname{expressed} \operatorname{as} \operatorname{follows}, \\ \widetilde{Q}_{1} \subset \widetilde{Q}_{2} & iff \left\{ \langle \widetilde{x}, \sigma_{\widetilde{Q}_{1}} \left( \widetilde{x} \right) \leq \sigma_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) & and \ \delta_{\widetilde{Q}_{1}} \left( \widetilde{x} \right) \geq \delta_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) \rangle : \forall \ \widetilde{x} \in X \right\}, \\ \widetilde{Q}_{1} = \widetilde{Q}_{2} & iff \left\{ \langle \widetilde{x}, \sigma_{\widetilde{Q}_{1}} \left( \widetilde{x} \right) = \sigma_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) & and \ \delta_{\widetilde{Q}_{1}} \left( \widetilde{x} \right) = \delta_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) \rangle : \forall \ \widetilde{x} \in X \right\}, \\ \widetilde{Q}_{1} \cup \widetilde{Q}_{2} & = \left\{ \langle \widetilde{x}, max \left( \sigma_{\widetilde{Q}_{1}} \left( \widetilde{x} \right), \sigma_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) \right), min \left( \delta_{\widetilde{Q}_{1}} \left( \widetilde{x} \right), \delta_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) \right) \rangle : \forall \ \widetilde{x} \in X \right\}, \\ \widetilde{Q}_{1} \cap \widetilde{Q}_{2} & = \left\{ \langle \widetilde{x}, min \left( \sigma_{\widetilde{Q}_{1}} \left( \widetilde{x} \right), \sigma_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) \right), max \left( \delta_{\widetilde{Q}_{1}} \left( \widetilde{x} \right), \delta_{\widetilde{Q}_{2}} \left( \widetilde{x} \right) \right) \rangle : \forall \ \widetilde{x} \in X \right\}, \\ \widetilde{Q}^{c} & = \left\{ \langle \widetilde{x}, \delta_{\widetilde{Q}} \left( \widetilde{x} \right), \sigma_{\widetilde{Q}} \left( \widetilde{x} \right) \right\}, max \left\{ \delta_{\widetilde{Q}_{1}} \left( \widetilde{x} \right), \sigma_{\widetilde{Q}} \left( \widetilde{x} \right) \right\} \right\} \\ \widetilde{Q}^{c} & = \left\{ \langle \widetilde{x}, \delta_{\widetilde{Q}} \left( \widetilde{x} \right), \sigma_{\widetilde{Q}} \left( \widetilde{x} \right) \right\} : \forall \ \widetilde{x} \in X \right\}. \end{array}$ 

#### Definition 2.6 [12]

Let  $\widetilde{\mathbb{Q}} = \{\langle \widetilde{x}, \sigma_{\widetilde{\mathbb{Q}}}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}}(x) \rangle : \forall \widetilde{x} \in X\}$ ,  $\widetilde{\mathbb{Q}}_1 = \{\langle \widetilde{x}, \sigma_{\widetilde{\mathbb{Q}}_1}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}_1}(\widetilde{x}) \rangle : \forall \widetilde{x} \in X\}$  and  $\widetilde{\mathbb{Q}}_2 = \{\langle \widetilde{x}, \sigma_{\widetilde{\mathbb{Q}}_2}(\widetilde{x}), \delta_{\widetilde{\mathbb{Q}}_2}(\widetilde{x}) \rangle : \forall \widetilde{x} \in X\}$  be three Quin – Terranean Fuzzy numbers and  $\lambda > 0$ , then their operations are expressed as follows:

$$\widetilde{\mathbb{Q}}_{1} \boxplus \widetilde{\mathbb{Q}}_{2} = \left\{ \left( \widetilde{\boldsymbol{x}}_{,} \left\{ \left( \sigma_{\mathbb{Q}_{1}}(\widetilde{\boldsymbol{x}}) \right)^{4^{5}} + \left( \sigma_{\mathbb{Q}_{2}}(\widetilde{\boldsymbol{x}}) \right)^{4^{5}} - \left( \sigma_{\mathbb{Q}_{1}}(\widetilde{\boldsymbol{x}}) \right)^{4^{5}} \left( \sigma_{\mathbb{Q}_{2}}(\widetilde{\boldsymbol{x}}) \right)^{4^{5}} \right\}^{\frac{1}{4^{5}}}, \delta_{\mathbb{Q}_{1}}(\widetilde{\boldsymbol{x}}) \delta_{\mathbb{Q}_{2}}(\widetilde{\boldsymbol{x}}) \right) : \forall \widetilde{\boldsymbol{x}} \in \boldsymbol{X} \right\}$$

 $\widetilde{\mathbb{Q}}_1 \boxtimes \widetilde{\mathbb{Q}}_2 =$

$$\begin{cases} \langle \widetilde{\boldsymbol{x}}, \sigma_{\mathbb{Q}_{1}}(\widetilde{\boldsymbol{x}}) \sigma_{\mathbb{Q}_{2}}(\widetilde{\boldsymbol{x}}), \left\{ \left( \delta_{\mathbb{Q}_{1}}(\widetilde{\boldsymbol{x}}) \right)^{\frac{5}{4}} + \left( \delta_{\mathbb{Q}_{2}}(\widetilde{\boldsymbol{x}}) \right)^{\frac{5}{4}} - \left( \delta_{\mathbb{Q}_{1}}(\widetilde{\boldsymbol{x}}) \right)^{\frac{5}{4}} \left( \delta_{\mathbb{Q}_{2}}(\widetilde{\boldsymbol{x}}) \right)^{\frac{5}{4}} \right)^{\frac{1}{5}} : \forall \widetilde{\boldsymbol{x}} \in \boldsymbol{X} \end{cases} \\ \lambda \widetilde{\mathbb{Q}} = \left\{ \langle \widetilde{\boldsymbol{x}}, \left\{ 1 - \left( 1 - \left( \sigma_{\widetilde{\mathbb{Q}}}(\widetilde{\boldsymbol{x}}) \right)^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}, \delta_{\widetilde{\mathbb{Q}}}(\widetilde{\boldsymbol{x}})^{\lambda} : \forall \widetilde{\boldsymbol{x}} \in \boldsymbol{X} \right\} \\ \widetilde{\mathbb{Q}}^{\lambda} = \left\{ \langle \widetilde{\boldsymbol{x}}, \sigma_{\mathbb{Q}}(\widetilde{\boldsymbol{x}})^{\lambda}, \left\{ 1 - \left( 1 - \left( \delta_{\mathbb{Q}}(\widetilde{\boldsymbol{x}}) \right)^{\frac{5}{4}} \right)^{\lambda} \right\}^{\frac{1}{5}} : \forall \widetilde{\boldsymbol{x}} \in \boldsymbol{X} \right\}. \end{cases}$$

#### **MAIN RESULT**

In 2006, Atanassov and Riecan [2] established and discussed on the subtraction and division operations in Intuitionistic Fuzzy sets. In 2007, Chen [4] discussed the Intuitionistic Fuzzy Comparable operations. In 2014, these operations are used on hesitant fuzzy sets by Liao and Xu [7]. In 2019, Senapathi and Yager [15] discussed on subtraction and division operation on Fermatean Fuzzy numbers. Now, we discuss on some special algebraic model operators such as  $\bigcirc$ ,  $\bigcirc$  on Quin – Terranean fuzzy numbers and Quin-Terranean Arithmetic mean operators on Quin – Terranean Fuzzy numbers of the properties of these model operators on Quin – Terranean Arithmetic mean operation are also analyzed.

#### Special algebraic model operators over Quin-Terranean Fuzzy Numbers

#### **Definition 3.1**

 $\begin{array}{l} \text{Let } \mathsf{T}_1 = \langle_{\mathsf{T}_1' \mathsf{T}_1} \rangle \text{ and } \mathsf{T}_2 = \langle_{\mathsf{T}_2' \mathsf{T}_2} \rangle \text{ be two Quin-Terranean Fuzzy numbers, then,} \\ \mathsf{T}_1 \bigoplus \mathsf{T}_2 = \langle \left\{ \frac{\sigma_{\mathsf{T}_1}}{1 - \sigma_{\mathsf{T}_2}} \right\}^{\frac{4}{5}} \\ \left\{ \frac{\delta_{\mathsf{T}_1}}{1 - \sigma_{\mathsf{T}_2}} \right\}^{\frac{1}{4^5}}, \frac{\delta_{\mathsf{T}_1}}{\delta_{\mathsf{T}_2}} \rangle \text{, if } \sigma_{\mathsf{T}_1} \geq \sigma_{\mathsf{T}_2}, \ \delta_{\mathsf{T}_1} \leq \min \left\{ \delta_{\mathsf{T}_2}, \frac{\delta_{\mathsf{T}_2}\varphi_1}{\varphi_2} \right\}; \\ \mathsf{T}_1 \bigotimes \mathsf{T}_2 = \langle \frac{\sigma_{\mathsf{T}_1}}{\sigma_{\mathsf{T}_2}}, \left\{ \frac{\delta_{\mathsf{T}_1}^{\frac{5}{4}} - \delta_{\mathsf{T}_2}^{\frac{5}{4}}}{1 - \delta_{\mathsf{T}_2}^{\frac{5}{4}}} \right\}^{\frac{4}{5}} \rangle \text{, if } \sigma_{\mathsf{T}_1} \leq \min \left\{ \sigma_{\mathsf{T}_2}, \frac{\sigma_{\mathsf{T}_2}\varphi_1}{\varphi_2} \right\}, \ \delta_{\mathsf{T}_1} \geq \delta_{\mathsf{T}_2}. \end{array}$ 

#### Properties of Special algebraic model operators over Quin-Terranean fuzzy Numbers:

#### Theorem 3.2.1

Let  $T = \langle \sigma_T, \delta_T \rangle$ ,  $T_1 = \langle \sigma_{T_1}, \delta_{T_1} \rangle$  and  $T_2 = \langle \sigma_{T_2}, \delta_{T_2} \rangle$  represents three Quin-Terranean Fuzzy numbers and  $\lambda, \lambda_1, \lambda_2 > 0$ , then

$$\begin{split} \lambda(\mathrm{T}_{1} \bigoplus \mathrm{T}_{2}) &= \lambda \mathrm{T}_{1} \bigoplus \lambda \mathrm{T}_{2'} \text{ if } \sigma_{\mathrm{T}_{1}} \geq \sigma_{\mathrm{T}_{2'}} \delta_{\mathrm{T}_{1}} \leq \min\left\{\delta_{\mathrm{T}_{2'}} \frac{\delta_{\mathrm{T}_{2}}\varphi_{1}}{\varphi_{2}}\right\};\\ (\mathrm{T}_{1} \bigoplus \mathrm{T}_{2})^{\lambda} &= \mathrm{T}_{1}^{\lambda} \bigoplus \mathrm{T}_{2}^{\lambda}, \text{ if } \sigma_{\mathrm{T}_{1}} \leq \min\left\{\sigma_{\mathrm{T}_{2'}} \frac{\sigma_{\mathrm{T}_{2}}\varphi_{1}}{\varphi_{2}}\right\}, \delta_{\mathrm{T}_{1}} \geq \delta_{\mathrm{T}_{2'}};\\ \lambda_{1}\mathrm{T} \bigoplus \lambda_{2}\mathrm{T} &= (\lambda_{1} - \lambda_{2})\mathrm{T}, \text{ if } \lambda_{1} \geq \lambda_{2};\\ \widetilde{\mathrm{T}}^{\lambda_{1}} - \widetilde{\mathrm{T}}^{\lambda_{2}} &= \widetilde{\mathrm{T}}^{(\lambda_{1} - \lambda_{2'})}, \text{ if } \lambda_{1} \geq \lambda_{2}; \end{split}$$

#### Proof:

Let  $T_1, T_1, T_2$  be three Quin-Terranean Fuzzy numbers and  $\lambda, \lambda_1, \lambda_2 > 0$ . Since,  $\sigma_{T_1} \ge \sigma_{T_2}, \ \delta_{T_1} \le \min\left\{\delta_{T_2}, \frac{\delta_{T_2}\varphi_1}{\varphi_2}\right\}$ , we have,

$$\delta_{T_{1}} \leq \frac{\delta_{T_{2}}\varphi_{1}}{\varphi_{2}} \Rightarrow \delta_{T_{1}}\varphi_{2} \leq \delta_{T_{2}}\varphi_{1} \Rightarrow \delta_{T_{1}}\frac{5}{4}\varphi_{2}\frac{5}{4} \leq \delta_{T_{2}}\frac{5}{4}\varphi_{1}\frac{5}{4}$$
$$\Rightarrow \delta_{T_{1}}\frac{5}{4}\delta_{T_{2}}\frac{5}{4} + \delta_{T_{1}}\frac{5}{4}\delta_{T_{2}}\frac{5}{4} + \delta_{T_{2}}\frac{5}{4}\varphi_{1}\frac{5}{4} \Rightarrow \delta_{T_{1}}\frac{5}{4}\left(\delta_{T_{2}}\frac{5}{4} + \varphi_{2}\frac{5}{4}\right) \leq \delta_{T_{2}}\frac{5}{4}\left(\delta_{T_{1}}\frac{5}{4} + \varphi_{1}\frac{5}{4}\right)$$

## Rajarajeswari and Thirunamakkani

$$\Rightarrow \ \delta_{T_{1}}^{\frac{5}{4}} \left(1 - \sigma_{T_{2}}^{4^{5}}\right) \leq \delta_{T_{2}}^{\frac{5}{4}} \left(1 - \sigma_{T_{1}}^{4^{5}}\right) \Rightarrow \frac{\delta_{T_{1}}^{\frac{5}{4}}}{\delta_{T_{2}}^{\frac{5}{4}}} \leq \frac{\left(1 - \sigma_{T_{1}}^{4^{5}}\right)}{\left(1 - \sigma_{T_{2}}^{4^{5}}\right)} \Rightarrow \left[\frac{\delta_{T_{1}}^{\frac{5}{4}}}{\delta_{T_{2}}^{\frac{5}{4}}}\right]^{\lambda} \leq \left[\frac{\left(1 - \sigma_{T_{1}}^{4^{5}}\right)}{\left(1 - \sigma_{T_{2}}^{4^{5}}\right)}\right]^{\lambda} \\ \Rightarrow \ 1 + \left[\frac{\delta_{T_{1}}^{\frac{5}{4}}}{\delta_{T_{2}}^{\frac{5}{4}}}\right]^{\lambda} \leq 1 + \left[\frac{\left(1 - \sigma_{T_{1}}^{4^{5}}\right)}{\left(1 - \sigma_{T_{2}}^{4^{5}}\right)}\right]^{\lambda} \Rightarrow \ 1 - \left[\frac{\left(1 - \sigma_{T_{1}}^{4^{5}}\right)}{\left(1 - \sigma_{T_{2}}^{4^{5}}\right)}\right]^{\lambda} + \left[\frac{\delta_{T_{1}}^{\frac{5}{4}}}{\delta_{T_{2}}^{\frac{5}{4}}}\right]^{\lambda} \leq 1 \\ \Rightarrow \ 1 - \left[\frac{\left(1 - \sigma_{T_{1}}^{4^{5}}\right)}{\left(1 - \sigma_{T_{2}}^{4^{5}}\right)}\right]^{\lambda} + \left[\frac{\delta_{T_{1}}^{\frac{5}{4}}}{\delta_{T_{2}}^{\frac{5}{4}}}\right]^{\lambda} \leq 1 \Rightarrow \left\{\left(1 - \left[\frac{\left(1 - \sigma_{T_{1}}^{4^{5}}\right)}{\left(1 - \sigma_{T_{2}}^{4^{5}}\right)}\right]^{\lambda}\right\}^{\frac{4}{3}} + \left[\frac{\delta_{T_{1}}^{\lambda}}}{\delta_{T_{2}}^{\lambda}}\right]^{\frac{5}{4}} \leq 1. \\ Then form definition 2, 1 and 2, 4 we not.$$

Then from definition 3.1 and 2.4, we get,

$$\begin{split} \lambda(\mathrm{T}_{1} \ominus \mathrm{T}_{2}) &= \lambda \left( \langle \left\{ \frac{\sigma_{\mathrm{T}_{1}}^{4^{5}} - \sigma_{\mathrm{T}_{2}}^{4^{5}}}{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}}} \right\}^{\frac{1}{4^{5}}}, \frac{\delta_{\mathrm{T}_{1}}}{\delta_{\mathrm{T}_{2}}} \rangle \right) \\ &= \langle \left\{ 1 - \left( \frac{1 - \left( \frac{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} - \sigma_{\mathrm{T}_{1}}^{4^{5}} + \sigma_{\mathrm{T}_{2}}^{4^{5}}}{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}, \frac{\delta_{\mathrm{T}_{1}}^{\lambda}}{\delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \\ &= \langle \left\{ 1 - \left( \frac{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} - \sigma_{\mathrm{T}_{1}}^{4^{5}} + \sigma_{\mathrm{T}_{2}}^{4^{5}}}{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}, \frac{\delta_{\mathrm{T}_{1}}^{\lambda}}{\delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \\ &= \langle \left\{ 1 - \left( \frac{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} - \sigma_{\mathrm{T}_{2}}^{4^{5}} + \sigma_{\mathrm{T}_{2}}^{4^{5}}}{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}, \delta_{\mathrm{T}_{1}}^{\lambda}} \rangle \\ &= \langle \left\{ 1 - \left( \frac{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} - \sigma_{\mathrm{T}_{2}}^{4^{5}}}{1 - \sigma_{\mathrm{T}_{2}}^{4^{5}}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}, \delta_{\mathrm{T}_{1}}^{\lambda}} \rangle \ominus \langle \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}, \delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \\ &= \langle \left\{ \frac{\left\{ \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{1}}^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}} \right\}^{\frac{1}{4^{5}}}}{1 - \left( \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}} \right\}^{\frac{1}{4^{5}}}} \right\}^{\frac{1}{4^{5}}}} \right\}^{\frac{1}{4^{5}}} \delta_{\mathrm{T}_{1}}^{\lambda}} \rangle \\ &= \langle \left\{ \frac{\left\{ \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{1}}^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}} \right\}^{\frac{1}{4^{5}}}}{1 - \left( \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}} \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{1}}^{\lambda}} \right\}^{\frac{1}{4^{5}}} \delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \\ &= \langle \left\{ \frac{\left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{1}}^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}}{1 - \left( \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} \right\}^{\lambda} \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{1}}^{\lambda}} \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \\ &= \langle \left\{ \frac{\left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{1}}^{4^{5}} \right)^{\lambda} \right\}^{\frac{1}{4^{5}}}}{1 - \left( \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} \right\}^{\lambda} \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{1}}^{\lambda}} \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{1}}^{\lambda}} \rangle \right\}^{\frac{1}{4^{5}}} \delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \\ &= \langle \left\{ \frac{\left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{1}}^{4^{5}} \right\}^{\lambda} - \left\{ 1 - \left( 1 - \sigma_{\mathrm{T}_{2}}^{4^{5}} \right\}^{\lambda} \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{2}}^{\lambda}} \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm{T}_{2}}^{\lambda}} \rangle \right\}^{\frac{1}{4^{5}}}} \delta_{\mathrm$$

$$= \langle \left\{ \frac{1}{1-1+\left(1-\sigma_{\widetilde{T}_{2}}^{45}\right)^{\lambda}} \right\}^{\frac{1}{4}}, \delta_{\widetilde{T}_{2}}^{\frac{1}{4}} \rangle$$
$$= \langle \left\{ \frac{\left(1-\sigma_{\widetilde{T}_{2}}^{45}\right)^{\lambda}-\left(1-\sigma_{\widetilde{T}_{1}}^{45}\right)^{\lambda}}{\left(1-\sigma_{\widetilde{T}_{2}}^{45}\right)^{\lambda}} \right\}^{\frac{1}{45}}, \delta_{\widetilde{T}_{1}}^{\frac{1}{45}}, \delta_{\widetilde{T}_{1}}^{\frac{1}{4}} \rangle$$
$$= \langle \left\{ 1-\left[\frac{1-\sigma_{\widetilde{T}_{1}}^{45}}{1-\sigma_{\widetilde{T}_{2}}^{45}}\right]^{\lambda} \right\}^{\frac{1}{45}}, \delta_{\widetilde{T}_{1}}^{\frac{1}{45}}, \delta_{\widetilde{T}_{1}}^{\frac{1}{45}} \rangle$$
$$\therefore, (\widetilde{T}_{1} \ominus \widetilde{T}_{2}) = \widetilde{T}_{1} \ominus \widetilde{T}_{2}.$$

Hence, (i) proved.

Similarly, we can prove for 
$$(\tilde{T}_{1} \ominus \tilde{T}_{2})^{\lambda} = \tilde{T}_{1}^{\lambda} \ominus \tilde{T}_{2}^{\lambda}$$
, if  $\sigma_{\tilde{T}_{1}} \le \min\left\{\sigma_{\tilde{T}_{2}}, \frac{\sigma_{\tilde{T}_{2}}\varphi_{1}}{\varphi_{2}}\right\}$ ,  $\delta_{\tilde{T}_{1}} \ge \delta_{\tilde{T}_{2}}$ .  
 $\lambda_{1}\tilde{T} \ominus \lambda_{2}\tilde{T} = \left\langle\left\{1 - \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{1}}\right\}^{\frac{1}{4^{5}}}, \delta_{\tilde{T}}^{\lambda_{1}}\right\rangle \ominus \left\langle\left\{1 - \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{2}}\right\}^{\frac{1}{4^{5}}}, \delta_{\tilde{T}}^{\lambda_{2}}\right\rangle$ 

$$= \left\langle\left\{\frac{\left(\left\{1 - \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{1}}\right\}^{\frac{1}{4^{5}}}\right)^{4^{5}} - \left(\left\{1 - \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{2}}\right\}^{\frac{1}{4^{5}}}\right)^{4^{5}}\right\}^{\frac{1}{4^{5}}}\right)^{4^{5}}}{1 - \left(\left\{1 - \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{2}}\right\}^{\frac{1}{4^{5}}}\right)^{4^{5}}}\right\}^{\frac{1}{4^{5}}}$$

$$= \left\langle\left\{\frac{1 - \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{1}} - 1 + \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{2}}\right\}^{\frac{1}{4^{5}}}}{1 - 1 + \left(1 - \sigma_{\tilde{T}}^{4^{5}}\right)^{\lambda_{2}}}\right\}^{\frac{1}{4^{5}}}, \frac{\delta_{\tilde{T}}^{\lambda_{1}}}{\delta_{\tilde{T}}^{\lambda_{2}}}\right\rangle$$

 $= \langle \left\{ 1 - \left(1 - \sigma_{\widetilde{T}}^{4^{5}}\right)^{(\lambda_{1} - \lambda_{2})} \right\}^{\frac{1}{4^{5}}}, \delta_{\widetilde{T}}^{(\lambda_{1} - \lambda_{2})} \rangle = (\lambda_{1} - \lambda_{2})\widetilde{T}. \\ \therefore, \lambda_{1}\widetilde{T} \ominus \lambda_{2}\widetilde{T} = (\lambda_{1} - \lambda_{2})\widetilde{T}. \\ \text{Hence, (iii) proved.} \\ \text{Similarly, we can prove, } \widetilde{T}^{\lambda_{1}} - \widetilde{T}^{\lambda_{2}} = \widetilde{T}^{(\lambda_{1} - \lambda_{2})}, \text{ if } \lambda_{1} \ge \lambda_{2}.$ 

Theorem 3.2.2

Let  $\widetilde{T}_1 = \langle \sigma_{\widetilde{T}_1}, \delta_{\widetilde{T}_1} \rangle$  and  $\widetilde{T}_2 = \langle \sigma_{\widetilde{T}_{2'}} \delta_{\widetilde{T}_2} \rangle$  represents two Quin-Terranean Fuzzy numbers, then,  $(\widetilde{T}_1 \bigoplus \widetilde{T}_2) \boxplus \widetilde{T}_2 = \widetilde{T}_1 \text{ if } \sigma_{\widetilde{T}_1} \ge \sigma_{\widetilde{T}_2}, \ \delta_{\widetilde{T}_1} \le \min \left\{ \delta_{\widetilde{T}_2}, \frac{\delta_{\widetilde{T}_2} \varphi_1}{\varphi_2} \right\}.$   $(\widetilde{T}_1 \bigotimes \widetilde{T}_2) \boxtimes \widetilde{T}_2 = \widetilde{T}_1 \text{ if } \sigma_{\widetilde{T}_1} \le \min \left\{ \sigma_{\widetilde{T}_2}, \frac{\sigma_{\widetilde{T}_2} \varphi_1}{\varphi_2} \right\}, \ \delta_{\widetilde{T}_1} \ge \delta_{\widetilde{T}_2}.$ Proof:

Consider two Quin-Terranean Fuzzy numbers  $\widetilde{T}_1 = \langle \sigma_{\widetilde{T}_1}, \delta_{\widetilde{T}_1} \rangle$  and  $\widetilde{T}_2 = \langle \sigma_{\widetilde{T}_2}, \delta_{\widetilde{T}_2} \rangle$ . Since,  $\sigma_{\widetilde{T}_1} \ge \sigma_{\widetilde{T}_2}, \ \delta_{\widetilde{T}_1} \le \min \left\{ \delta_{\widetilde{T}_2}, \frac{\delta_{\widetilde{T}_2}\varphi_1}{\varphi_1} \right\}$ , then

# CONCLUSION

In this paper, we have defined some algebraic model operators such as  $\ominus$  and  $\oslash$  on Quin – Terranean Fuzzy numbers and Quin-Terranean Arithmetic mean operation. Based on these operations we have studied some properties of Quin – Terranean Fuzzy numbers. We have proved that the model operators satisfy scalar multiplication and exponentiation property. We observe that these model operators together with the fundamental operations of union, intersection and model operations such as  $\boxplus$  and  $\boxtimes$  on Quin – Terranean Fuzzy numbers are also satisfies several properties. In future, these special algebraic operations on Quin – Terranean Fuzzy Numbers can be applied in various research areas such as medicine, agriculture, transportation problem and decision making, etc.

# ABSTRACT

In this paper the concept of a dominating function on a fractional directed graph G has been introduced. The fractional parameters like domination number and upper domination number of a fractional directed graph G are determined. Linear Program solver software is used to find domination number and upper domination number of fractional directed graph with fuzzy & Intuitionistic fuzzy environment.

Keywords: Digraph, domination number, fractional graph and fractional digraph

# INTRODUCTION

Let G = (V,E) be a directed graph or digraph, where V is the set of vertices and VxV is a set of edges. A vertex u is said to be dominates vertex v (or vertex v is dominated by vertex u) if edge (u,v) is in G. The edge (u,v) is shown graphically as  $u \rightarrow v$ . Fuzzy digraph dominance is about controlling the vertices of a graph with fuzzy sets rather than binary (0,1) values. A fuzzy digraph is a graph in which the edges are marked with fuzzy values that indicate the degree of connectivity between the vertices.

Let f:V $\rightarrow$ {0,1} be a function that assigns an element of the set {0,1} to each node of the digraph. f is said to be dominant if  $f[v] \ge 1$  for all  $v \in V$ . f is called as minimal dominant function if there is no dominant function g:  $V \rightarrow \{0,1\}$ ,  $f \neq g$  with  $g(y) \leq f(y)$  for all  $y \in V$ . Then the number of dominances and the upper number of dominances of the digraph G can be defined as  $\gamma$ (G)= min {w(f)/ f is the dominant function of G} and  $\Gamma$ (G)=max{w(f)/ f is the minimal dominant function on G}

# Meenakshi and Pankajam

Fractional graph theory concerns the generalization of the concept of integer graph theory, a theory that assumes fractional values as weights in the interval [0,1]. The digraph G=(V,E) and f: V $\rightarrow$ [0,1] is a function whose weights are assigned to each vertex of the digraph in the interval [0,1]. f is said to be a dominant function (DF) if  $f(N[v])=\sum_{u\in N[v]} f(u)\ge 1$  for all v $\in$ V. f is a minimal dominant function (MDF) if there is no dominant function f $\neq$ g such that  $g(v) \le f(v)$  for all  $v \in$ V. Correspondingly, f is MDF if for every v with f(v) > 0 there exists a vertex w $\in$ N[v] such that f(N[w]) or  $\sum_{u\in N[w]} f(u) = 1$ . So one can define the fractional number of dominances and the upper number of dominances G as  $\gamma f(G) = \min\{|f|:f \text{ is MDF } G\}$  and  $\Gamma f(G) = \max\{|f|: f \text{ is MDF } G\}$  in [4].

To determine the number of dominances and the upper number of dominances using the LIPS algorithm[6]. This is the concept of a digraph convert it to a fractional version, which is an integer program formula, and then convert it to linear programming as an optimization problem that is Minimization problem or Maximization Problem . We find an effective solution. This solution is the dominance number & higher dominance number. In this article you will find the number of dominance & the largest number of dominances in the situation of an intuitionistic fuzzy digraph [5].

In point 2 the definition of the dominance function ,the number of dominances ( $\gamma$ ) and the upper number of dominances ( $\Gamma$ ) of the digraph is explained with a suitable example. In Section 3, find the dominance and upper dominance number in the intuitionistic fuzzy digraph. Also, use the LIPS algorithm to calculate the number of dominance & the upper dominance number by the fractional digraph and the intuitionistic fuzzy digraph.

# Domination Function on fractional Digraph

# Fuzzy digraph:

A fuzzy digraph  $G_D = (V, \sigma_D, \mu_D)$  is a pair of function  $\sigma_D : V \rightarrow [0,1]$  and  $\mu_D : V \times V \rightarrow [0,1]$ , where  $u, v \in V$  and  $\mu_D (u, v) \leq \sigma_D(u) \wedge \sigma_D(v)$ 

# Fractional Digraph:

A fractional digraph or fuzzy digraph is a graph which means that weights are represented in fractional values.

# Domination Function on a fuzzy or Fractional Digraph:

Let  $G_D=(V, \sigma_D, \mu_D)$  be a fuzzy digraph. An edge  $e=\overline{uv}$  of a fuzzy digraph is called an effective arc if  $\mu_D(u, v)=\sigma_D(u) \land \sigma_D(v)$  for all  $u, v \in V$ . Then the vertex  $\sigma_D(u)$  dominates  $\sigma_D(v)$  in  $G_D$ . The fuzzy cardinality of a minimum dominating set is called the domination number of  $G_D$  and is denoted by  $\gamma(G_D)$ , that is  $\gamma(G_D) = \min\sum_{x \in S} \sigma_D(u)$ . The open neighborhood  $N_{G_D}(v)$  and the closed neighbourhood N[v] of v are defined by  $N_{G_D}(v) = \{u \in V : \mu_D(u, v) = \sigma_D(u) \land \sigma_D(v)\}$  and  $N_{G_D}[v] = N_{G_D}(v) \cup \{v\}$ . Since  $\sigma_D : V \rightarrow \{0,1\}$  be a function which assigns to each vertex of a graph an element of the set  $\{0,1\}$ . For a vertex  $v \in V$ , let  $\sigma_D(N[V])$  equal the sum of values of  $\sigma_D(v)$  for every vertex  $u \in N_{G_D}[v]$ . Given a function  $\sigma_D$  is called the minimal dominating function (MDF), if there does not exist a dominating function  $\tau_D : V \rightarrow \{0,1\}, \sigma_D \neq \tau_D$ , for which  $\sigma_D(v) \leq \tau_D(v)$  for every  $v \in V$ . Then  $\sigma_D$  is MDF if for every v such that  $\sigma_D(v) > 0$ , there exist a vertex  $u \in N[V]$ . Then the domination number  $\gamma_f$ , and upper domination number  $\Gamma_f$  in a fuzzy environment are defined as the following Linear Programming Problem

 $\gamma_f(G_D) = \min \sum_{i=1}^n \sigma_D(v_i)$ , subject to  $\mathbb{N}.X_f \ge \overrightarrow{1_n}$  with  $\sigma_D(v_i) \in \{0,1\}$  and

 $\Gamma_{f}(G_{D})=max\sum_{i=1}^{n} f(v_{i})$ , subject to  $N.X_{f} \ge \overrightarrow{1_{n}}$  with  $\sigma_{D}(v_{i}) \in \{0,1\}$ 

where N is the closed neighborhood matrix and  $X_f = [\sigma_D (v_1), \dots, \sigma_D (v_n)]^t$  be the column vector.

# Example

Let  $\sigma_D$ : V  $\rightarrow$  {0,1} be a function of a graph  $G_D = (V, \sigma_D, \mu_D)$  in figure 2.1 with vertex V = { $v_1, v_2, v_3, v_4,$ }, E = { $v_1v_2, v_2v_3, v_3v_4, v_4v_1$ }

 $Here N_{G_D}[v_1] = \{v_1, v_2, v_4\}, N_{G_D}[v_2] = \{v_1, v_2v_3\}, N_{G_D}[v_3] = \{v_2, v_3v_4\}, N_{G_D}[v_4] = \{v_3, v_4, v_1\}, f \text{ is dominating function of } G_D.$ 

$$\begin{split} \sigma_D(v_1) &= 1/2 \ , \sigma_D(v_2) = 1/2, \ \sigma_D(v_3) = 1/2, \ \sigma_D(v_4) = 1/2 \\ \mu_D(v_1v_2) &= 1/2, \mu_D(v_2v_3) = 1/2, \mu_D(v_3v_4) = 1/2, \mu_D(v_4v_1) = 1/2, \\ \text{Now } \sigma_D(N_{G_D}[v_1]) &= \sum_{v_1 \in N_{G_D}[v_1]} \sigma_D(v_1) = \sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(v_3). \end{split}$$

# Find the Domination Number $\gamma_f(G_D)$ in fig 2.1 by solving the following linear Programming Problem Which is formulated using G<sub>D</sub>.

Minimize  $z = \sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(v_3) + \sigma_D(v_4)$ Subject to  $\sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(4) \ge 1, \sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(v_3) \ge 1, \sigma_D(v_2) + \sigma_D(v_3) + \sigma_D(v_4) \ge 1, \sigma_D(v_1) + \sigma_D(v_3) + \sigma_D(v_4) \ge 1$ and  $0 \le \sigma_D(v_i) \le 1$  for all V(G<sub>D</sub>)

Solution: Minimize  $z = \sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(v_3) + \sigma_D(v_4)$ 

$$\begin{pmatrix} 1 & 10 & 1 \\ 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix} \begin{pmatrix} \sigma_D(v_1) \\ \sigma_D(v_2) \\ \sigma_D(v_3) \end{pmatrix} \ge \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{ and } \sigma_D(v_i) \epsilon \ [0,1] \text{ for all } v_i \epsilon \ V(G) \text{ where}$$

$$N = \begin{pmatrix} 1 & 10 & 1 \\ 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix} , X_{fD} = \begin{pmatrix} \sigma_D(v_1) \\ \sigma_D(v_2) \\ \sigma_D(v_3) \\ \sigma_D(v_4) \end{pmatrix} \overrightarrow{\mathbf{1}_n} = \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{ be the coloumn vector with respect to the constraint part of L.P.P.}$$

Then the optimal solution of the above L.P.P is Minimize Z= 4/3 where  $\sigma_D(v_1)=1/3$ ,  $\sigma_D(v_2)=1/3$  $\sigma_D(v_3)=1/3$ ,  $\sigma_D(v_4)=1/3$ .

Hence the domination number  $\gamma_f(G_D) = 4/3$ .

# Find the upper Domination Number $\Gamma_f(G_D)$ in fig 2.1 by solving the following linear Programming Problem Which is formulated using $G_D$ .

Maximize  $z = \sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(v_3) + \sigma_D(v_4)$ Subject to  $\sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(4) \le 1, \sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(v_3) \le 1, \sigma_D(v_2) + \sigma_D(v_3) + \sigma_D(v_4) \le 1, \sigma_D(v_1) + \sigma_D(v_3) + \sigma_D(v_4) \le 1$ and  $0 \le \sigma_D(v_i) \le 1$  for all V(G<sub>D</sub>)

Solution: Maximize  $z = \sigma_D(v_1) + \sigma_D(v_2) + \sigma_D(v_3) + \sigma_D(v_4)$ 

$$\begin{pmatrix} 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \end{pmatrix} \begin{pmatrix} \sigma_D(v_1) \\ \sigma_D(v_2) \\ \sigma_D(v_3) \\ \sigma_D(v_4) \end{pmatrix} \leq \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{and} \sigma_D(v_i) \epsilon \ [0,1] \text{ for all } v_i \epsilon \ V(G) \text{ where}$$

$$N = \begin{pmatrix} 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \end{pmatrix}, X_{fD} = \begin{pmatrix} \sigma_D(v_1) \\ \sigma_D(v_2) \\ \sigma_D(v_3) \\ \sigma_D(v_4) \end{pmatrix} \overrightarrow{\mathbf{1}_n} = \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{ be the coloumn vector with respect to the constraint part of L.P.P.}$$
Therefore, the product of the constraint part of L.P.P.

Then the optimal solution of the above L.P.P is Maximize Z= 4/3 where  $\sigma_D(v_1)=1/3$ ,  $\sigma_D(v_2)=1/3$  $\sigma_D(v_3)=1/3$ ,  $\sigma_D(v_4)=1/3$ .

Hence the domination number  $\Gamma_f(G_D) = 4/3$ .

#### Domination Function on an Intuitionistic fuzzy Digraph

#### Intuitionistic fuzzy set

The intuitionistic fuzzy set (IFS) in universe X is an object of the form A={  $x, \mu_A(x), \gamma_A(x)/x \in X$ }, where  $\mu_A(X) \in [0,1]$  is the degree of the membership of X in A, ,  $\gamma_A(x) \in [0,1]$  is called a degree of Non-membership function of x in A, and  $\mu_A$ ,  $\gamma_A$  satisfy the condition : for all  $x \in X, \mu_A(X) + \gamma_A(x) \le 1$ .

## Intuitionistic Fuzzy-Digraph

The intuition is ticfuzzy-graph with set V is defined as the pair  $G_D = (A:B)$ , where the function  $\mu_A: V \to [0,1]$  and  $\gamma_A: V \to [0,1]$  is the degree of membership and non-membership of the element  $x \in V$  such that  $0 \le \mu_A(X) + \gamma_A(x) \le 1$  for each  $x \in V$  and the function  $\mu_B: E \subseteq VXV \to [0,1]$  and  $\gamma_B: E \subseteq VXV \to [0,1]$  and  $\gamma_B: E \subseteq VXV \to [0,1]$  are given  $\mu_B(x,y) \le \min(\mu_A(X), \mu_A(y))$  and  $\gamma_B(x,y) \ge \max(\gamma_A(X), \gamma_A(Y))$  such that  $0 \le \mu_B(x,y) + \gamma_B(x,y) \le 1$  for every  $(x,y) \in E$ . Let A be the intuitionistic fuzzy set of vertices V, let B be the intuitionistic fuzzy set of edges  $G_D$ .

## Dominant function on an intuitionistic fuzzy digraph

Let  $G_D = (V_D, E_D, \sigma, \mu)$  be an intuitionistic fuzzy digraph (IF $G_D$ ), where  $\sigma = (\sigma_1, \sigma_2)$ ,  $\mu = (\mu_1, \mu_2)$ . The neighborhood of any vertex v is defined as  $N(v) = (N_{\sigma_1}, N_{\sigma_2})$  where  $N_{\sigma_1}(v) = \{W \in V; \mu_1(u, v) = \sigma_1(u) \land \sigma_1(v)\}$   $N_{\sigma_2}(v) = \{W \in V: \mu_1(u, v) = \sigma_2(u) v \sigma_2(v)\}$  and  $N[v] = N(v) \cup \{v\}$  will be a closed neighborhood v. The degree of neighborhood of a vertex and the degree of neighborhood of a closed vertex are defined as  $asd_N(v) = (d_{N_{\sigma_1}}(v), d_{N_{\sigma_2}}(v))$  and  $d_N[v] = (d_{N_{\sigma_1}}[v], d_{N_{\sigma_2}}[v])$  where  $d_{N_{\sigma_1}}(v) = \sum_{u \in N(v)} \sigma_1(u)$ ,  $d_{N_{\sigma_2}}(v)$  and  $d_N[v] = (d_{N_{\sigma_1}}[v], d_{N_{\sigma_2}}[v])$  where  $d_{N_{\sigma_1}}(v) = \sum_{u \in N(v)} \sigma_1(u)$ ,  $d_{N_{\sigma_2}}(v) = \sum_{u \in N(v)} \sigma_1(u) + \sigma_1(v)$  and  $d_{N_{\sigma_2}}[v] = \sum_{u \in N(v)} \sigma_2(u) + \sigma_2(v)$ . Because  $\sigma_1: V \to [0,1]$  is a function assigns the degree of membership of each node of the graph to the element  $u \in N_{\sigma_1}[v]$ . Then  $\sigma_1$  is called the dominant function  $\sigma_1$  if  $d_{N_{\sigma_1}}[v] = \sum_{u \in N_{\sigma_1}[v]} \sigma_1(u) \geq 1$  for every  $v \notin V$  where  $\sum_{u \in N_{\sigma_1}[v]} \sigma_1(u) = \sum_{u \in N(v)} \sigma_1(u) + \sigma_1(v)$ . Similarly  $\sigma_2: V \to [0,1]$  is a function assigns the degree to which each node belongs to an element of the set [0,1]. For vertex  $v \notin V$ , let  $d_{N_{\sigma_2}}[v] = \sum_{u \in N_{\sigma_2}[v]} \sigma_2(u) < 1$  for every  $v \notin V$ , where  $\sum_{u \in N_{\sigma_2}[v]} \sigma_2(u) = \sum_{u \in N(v)} \sigma_2(u) + \sigma_2(v)$ . A function:  $V \to [0,1]$  is called dominant function  $G_D$  if it is a  $\sigma_1$ -dominant and  $\sigma_2$ -dominant function with  $0 \leq \sigma_1(u) + \sigma_2(v) \leq 1$  for each  $v \notin V$  where  $\sigma_1(v) \geq 0$ ,  $\sigma_2(v) < 1$ . Lowestdominant function (MDF) if  $\sum_{u \in N_{\sigma_1}[v]} \sigma_1(u) = 1$ ,  $\sum_{u \in N_{\sigma_2}[v]} \sigma_2(u) < 1$  for any  $u \notin N[v]$ , for every  $v \notin V$ , where  $\sigma_2(v) \neq 1$ . Then the dominance number  $\gamma_{if}$  and the upper dominance number  $\Gamma_{if}$  in the intuitionistic fuzzy environment are defined as

 $\gamma_{if}(G_D) = (\gamma_{if_{\sigma_1}}(G_D), \gamma_{if_{\sigma_2}}(G_D)) \text{ and } \Gamma_{if}(G_D) = (\Gamma_{if_{\sigma_1}}(G_D), \Gamma_{if_{\sigma_2}}(G_D)) \text{ where}$ 

 $\gamma_{if_{\sigma_1}} = \min \sum_{i=1}^n \sigma_1(v_i)$ , subject to N.  $X_{if} \ge \vec{1}$  with  $\sigma_1(v_i) \in [0,1] \forall v_i \in V(G_D)$ 

 $\gamma_{if_{\sigma_2}} = \min \sum_{i=1}^n \sigma_2(v_i)$ , subject to N.  $X_{if} \ge \vec{1}$  with  $\sigma_2(v_i) \in [0,1] \forall v_i \in V(G_D)$ 

 $\Gamma_{if\sigma_1} = \max \sum_{i=1}^n \sigma_1(v_i)$ , subject to N.  $X_{if} \leq \vec{1}$  with  $\sigma_1(v_i) \in [0,1] \forall v_i \in V(G_D)$ 

 $\Gamma_{if\sigma_2} = \max \sum_{i=1}^n \sigma_2(v_i)$ , subject to N.  $X_{if} \leq \vec{1}$  with  $\sigma_2(v_i) \in [0,1] \forall v_i \in V(G_D)$ 

and N is closed neighbourhood of  $\sigma_1$  – dominating and  $\sigma_2$  – dominating function value of the matrix,  $X_{if}$  be the  $\sigma_1$  – dominating and  $\sigma_2$  – dominating function value of the coloumn vector  $[\sigma_1(v_1), \sigma_1(v_2), \dots, \sigma_1(v_n)]^t$  and  $[\sigma_2(v_1), \sigma_2(v_2), \dots, \sigma_2(v_n)]^t$ .

## Example

 $\sigma_{1}: V \rightarrow [0,1] \text{ and } \sigma_{2}: V \rightarrow [0,1] \text{ be a function of a graph } G_{D} = \langle V, E, \sigma, \mu \rangle \text{ in the following figure with } \sigma_{1}(v_{1}) = \frac{1}{4} ,$   $\sigma_{2}(v_{1}) = \frac{1}{3} , \sigma_{1}(v_{2}) = \frac{1}{2} , \sigma_{2}(v_{2}) = \frac{2}{5} , \sigma_{1}(v_{3}) = \frac{1}{3} , \sigma_{2}(v_{3}) = \frac{1}{5} , \sigma_{1}(v_{4}) = \frac{3}{4} , \sigma_{2}(v_{3}) = \frac{1}{5} , \mu_{1}(v_{1}) = \frac{1}{4} , \mu_{2}(v_{1}) = \frac{1}{3} ,$  $\mu_{1}(v_{2}) = \frac{1}{2} , \mu_{2}(v_{2}) = \frac{2}{5} , \mu_{1}(v_{3}) = \frac{1}{3} , \mu_{2}(v_{3}) = \frac{1}{5} , \mu_{1}(v_{4}) = \frac{1}{3} , \mu_{2}(v_{3}) = \frac{1}{5} ,$

# Meenakshi and Pankajam

Here  $\mathsf{N}[v_1] = \{v_1, v_2, v_4\}$ ,  $\mathsf{N}[v_2] = \{v_1, v_2, v_3\}$ ,  $\mathsf{N}[v_3] = \{v_3, v_2, v_4\}$ ,  $\mathsf{N}[v_4] = \{v_1, v_4, v_3\}$ 

Now  $d_{N_{\sigma_1}}[v_1] = \sum_{u \in N_{\sigma_1}[v_1]} \sigma_1(v_1) = 1.5 \ge 1$ ,  $d_{N_{\sigma_2}}[v_1] = \sum_{u \in N_{\sigma_2}[v_1]} \sigma_2(v_1) = 0.9 < 1$ .

with  $0 \le \sigma_1(v_i) + \sigma_2(v_i) \le 1$ , where  $\sigma_1(v_i) \ge 0$ ,  $\sigma_2(v_i) < 1$ ,  $\sigma_1$  and  $\sigma_2$  is  $a\sigma_1 - \text{dominating and } \sigma_2 - \text{dominating function}$ of  $G_D$ . It is also dominating function of  $\sigma$  of  $G_D$  and MDF of  $G_D$ .

# Find the dominating number $(\gamma_{if\sigma_1})$ in above figure , by solving the following Linear Programming Problem which is formulated using $G_D$ .

 $\begin{array}{l} \text{Minimize Z} = \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_3) + \sigma_1(v_4) \text{ subject to } \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_4) \geq 1, & \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_3) \geq 1, \\ 1, \ \sigma_1(v_2) + \sigma_1(v_3) + \sigma_1(v_4) \geq 1, & \sigma_1(v_1) + \sigma_1(v_3) + \sigma_1(v_4) \geq 1 \text{ and } 0 \leq \sigma_1(v_i) \leq 1 \text{ for all } v_i \in V(G_D) \end{array}$ 

#### Solution :

$$\text{Minimize Z} = \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_3) + \sigma_1(v_4) \quad , \quad \begin{pmatrix} 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \\ 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \end{pmatrix} \begin{pmatrix} \sigma_1(v_1) \\ \sigma_1(v_2) \\ \sigma_1(v_3) \\ \sigma_1(v_4) \end{pmatrix} \ge \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{ and } \sigma_1(v_i) \epsilon \quad [0,1] \text{ for all } v_i \epsilon \quad \mathsf{V}(\mathsf{G})$$

where

$$N = \begin{pmatrix} 1 & 10 & 1 \\ 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix}, X_{if} = \begin{pmatrix} \sigma_1(v_1) \\ \sigma_1(v_2) \\ \sigma_1(v_3) \\ \sigma_1(v_4) \end{pmatrix} \overrightarrow{\mathbf{1}_n} = \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix}$$
be the coloumn vector with respect to the constraint part of L.P.P.

Then the optimal solution of the above L.P.P is Minimize Z= 4/3 where  $\sigma_1(v_1)=1/3$ ,  $\sigma_1(v_2)=1/3$  $\sigma_1(v_3)=1/3$ ,  $\sigma_1(v_4)=1/3$ Hence the domination number  $\gamma_{if\sigma_1}(G_D)=4/3$ .

# Find the dominating number ( $\gamma_{if\sigma_2}$ ) in above figure , by solving the following Linear Programming Problem which is formulated using $G_D$ .

 $\begin{array}{l} \text{Minimize } \mathsf{Z} = \sigma_1(v_1) + \sigma_2(v_2) + \sigma_2(v_3) + \sigma_2(v_4) \text{ subject to } \sigma_2(v_1) + \sigma_2(v_2) + \sigma_2(v_4) \geq 1, \\ 1, \ \sigma_2(v_2) + \sigma_2(v_3) + \sigma_2(v_4) \geq 1, \\ \sigma_2(v_1) + \sigma_2(v_3) + \sigma_2(v_4) \geq 1 \text{ and } 0 \leq \sigma_2(v_1) \leq 1 \text{ for all } v_i \in \mathsf{V}(G_D) \end{array}$ 

## Solution :

$$\begin{array}{l} \text{Minimize } Z = \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_3) + \\ \sigma_1(v_4) \ , \begin{pmatrix} 1 & 10 & 1 \\ 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix} \begin{pmatrix} \sigma_2(v_1) \\ \sigma_2(v_2) \\ \sigma_2(v_4) \end{pmatrix} \geq \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{ and } \sigma_2(v_i) \epsilon \ [0,1] \text{ for all } v_i \epsilon \ V(G) \text{ where} \\ \\ N = \begin{pmatrix} 1 & 10 & 1 \\ 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix} \ , X_{if} = \begin{pmatrix} \sigma_2(v_1) \\ \sigma_2(v_2) \\ \sigma_2(v_3) \\ \sigma_2(v_4) \end{pmatrix} \overrightarrow{\mathbf{1}_n} = \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{ be the coloumn vector with respect to the constraint part of L.P.P.} \end{array}$$

Then the optimal solution of the above L.P.P is Minimize Z= 0 where  $\sigma_2(v_1)=0, \sigma_2(v_2)=0$ 

 $\sigma_2(v_3) = 0, \sigma_2(v_4) = 1/3$ 

Hence the domination number  $\gamma_{if\sigma_2}(G_D) = 0$ .

#### Meenakshi and Pankajam

Find the upper dominating number ( $\Gamma_{if\sigma_1}$ ) in above figure , by solving the following Linear Programming Problem which is formulated using  $G_D$ .

 $\begin{array}{l} \text{Maximize Z} = \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_3) + \sigma_1(v_4) \text{ subject to } \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_4) \leq 1, & \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_3) \leq 1, \\ 1, \ \sigma_1(v_2) + \sigma_1(v_3) + \sigma_1(v_4) \leq 1, & \sigma_1(v_1) + \sigma_1(v_3) + \sigma_1(v_4) \leq 1 \text{ and } 0 \leq \sigma_1(v_i) \leq 1 \text{ for all } v_i \in \mathsf{V}(G_D) \end{array}$ 

Solution :

$$\text{Maximize Z} = \sigma_1(v_1) + \sigma_1(v_2) + \sigma_1(v_3) + \sigma_1(v_4) \quad , \quad \begin{pmatrix} 1 & 10 & 1 \\ 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix} \begin{pmatrix} \sigma_1(v_1) \\ \sigma_1(v_2) \\ \sigma_1(v_3) \\ \sigma_1(v_4) \end{pmatrix} \leq \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix} \text{ and } \sigma_1(v_i) \epsilon \text{ [0,1] for all } v_i \epsilon \text{ V(G)}$$

where

$$N = \begin{pmatrix} 1 & 10 & 1 \\ 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix}, X_{if} = \begin{pmatrix} \sigma_1(v_1) \\ \sigma_1(v_2) \\ \sigma_1(v_3) \\ \sigma_1(v_4) \end{pmatrix} \overrightarrow{\mathbf{1}_n} = \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix}$$
be the coloumn vector with respect to the constraint part of L.P.P.

Then the optimal solution of the above L.P.P is Maximize Z= 4/3 where  $\sigma_1(v_1)=1/3$ ,  $\sigma_1(v_2)=1/3$ 

 $\sigma_1(v_3) = 1/3 \ , \sigma_1(v_4) = 1/3$ 

Hence the domination number  $\Gamma_{if\sigma_1}(G_D) = 4/3$ .

Find the upper dominating number ( $\Gamma_{if\sigma_2}$ ) in above figure , by solving the following Linear Programming Problem which is formulated using  $G_D$ .

Maximize  $Z = \sigma_1(v_1) + \sigma_2(v_2) + \sigma_2(v_3) + \sigma_2(v_4)$  subject to  $\sigma_2(v_1) + \sigma_2(v_2) + \sigma_2(v_4) \ge 1$ ,  $\sigma_2(v_1) + \sigma_2(v_2) + \sigma_2(v_3) \ge 1$ ,  $\sigma_2(v_2) + \sigma_2(v_3) + \sigma_2(v_4) \ge 1$  and  $0 \le \sigma_2(v_i) \le 1$  for all  $v_i \in V(G_D)$ 

Solution :

 $N = \begin{pmatrix} 1 & 11 & 0 \\ 0 & 11 & 1 \\ 1 & 01 & 1 \end{pmatrix}, X_{if} = \begin{pmatrix} \sigma_2(v_2) \\ \sigma_2(v_3) \\ \sigma_2(v_4) \end{pmatrix} \overrightarrow{\mathbf{1}_n} = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$ be the coloumn vector with respect to the constraint part of L.P.P.

Then the optimal solution of the above L.P.P is Minimize Z= 4/3 where  $\sigma_2(v_1)=1/3$ ,  $\sigma_2(v_2)=1/3$  $\sigma_2(v_3) = 1/3$ ,  $\sigma_2(v_4)=1/3$ 

Hence the domination number  $\Gamma_{if\sigma_2}(G_D) = 4/3$ .

# CONCLUSION

For the dominance function of any fractional digraph  $G_D$ , the determination of the lower and upper dominance number by the linear programming method is discussed. This procedure was applied to an intuitionistic fuzzy graph to find the number of dominances and the upper dominance number.

# ABSTRACT

The purpose of this search is to introduce some concepts of the fuzzy soft n- paranormal operator defined on fuzzy soft Hilbert space, including some key characteristics of this operator, as well as a discussion of various theorems related to this operator.

**Keywords:** Fuzzy soft n-power paranormal operator, fuzzy soft Hilbert space, fuzzy soft \*-paranormal operator, fuzzy soft paranormal operator, fuzzy soft n- paranormal operator

# INTRODUCTION

To solve a number of issues in pure mathematics, the discipline of functional analysis was founded more than a century ago. In addition to regularly presenting us with uncertainty, the phenomena under study's ambiguity also provides us with instruments for assessing faults in solutions to issues with both infinite and limited dimensions. In a variety of fields, including engineering, business, medicine, and economics, this kind of problem might be encountered. Our conventional mathematical methods frequently fall short in addressing such problems.So, in 1965, L. Zadeh offered a generalisation of set theory. The resulting theory was given the name fuzzy set theory. It didn't take long for fuzzy set theory to become a potent tool for handling uncertain situations. In classical set theory, the basis function from a set x to set [0,1] defines the set x.

On the other hand, in fuzzy set theory, a set is defined by its membership function, which spans from x to the closed interval between 0 and 1. Additionally, Molodtsov created a novel generalisation for handling uncertainty in 1999. This study led to the development of soft set theory. Since then, it has been used in a variety of disciplines, including

# Radharamani and Nagajothi

computer science, engineering, medicine, and others, to address challenging problems. A parametrized collection of a universal set is known as a soft set. Soft set gave rise to the concepts of soft point, soft normed space, soft inner product space, and soft Hilbert space, which were later used in functional analysis to deal with a variety of mathematical subjects.

Maji et al. presented the idea of a fuzzy soft set for the first time in 2001. The concept was developed by combining a fuzzy set and a soft set. It was required to combine the two ideas in order to provide results that were more accurate and comprehensive. Fuzzy soft point and fuzzy soft normed spacewere developed as a result of the addition of these additional ideas to the framework. Fuzzy soft Hilbert spaces were introduced in 2020 by Fariedet al. Also included are the fuzzy soft linear operators. In this article, we provide a novel kind of Fuzzy soft n-power paranormal operator and establish various related theorems.

# PRELIMINARIES

The notations, definitions, and introductions for fuzzy set, soft set, and fuzzy soft set that will be used in the discussion that follows are provided in this section.

# Definition 2.1: Fuzzy set

If fuzzy set  $\check{A}$  over  $\mathfrak{X}$  is a set characterized by a membership function  $\eta_{\check{A}}:\mathfrak{X} \to \mathfrak{J}$ , such as  $\mathfrak{I} = [0,1]$  and  $\check{A} = \left\{\frac{\eta_{\check{A}}(x)}{x}: x \in \mathfrak{X}\right\}$ . And  $\mathfrak{J}^{\mathfrak{X}} = \{\check{A}: \check{A} \text{ is a function from } \mathfrak{X} \text{ into } \mathfrak{J}\}$ 

# Definition 2.2: Soft set

Let  $\mathcal{P}(\mathfrak{X})$  the power set of  $\mathfrak{X}$  and  $\mathsf{E}$  be set of parameters and  $A \subseteq E$ . The mapping  $\mathbb{G}: A \to \mathcal{P}(\mathfrak{X})$ , when  $(\mathbb{G}, A) = \{\mathbb{G}(l) \in \mathcal{P}(\mathfrak{X}) : l \in A\}$ . As a result  $(\mathbb{G}, A)$  is called the soft set.

## Definition 2.3: Fuzzy soft set

The soft set  $\mathbb{G}_A$  we say that fuzzy soft set over  $\mathfrak{X}$ , when  $\mathbb{G}: A \to \mathfrak{J}^{\mathfrak{X}}$ , and  $\{\mathbb{G}(l)\in \mathfrak{J}^{\mathfrak{X}}: l \in A\}$ . The collection of all fuzzy soft sets denoted by  $FSS(\widetilde{\mathfrak{X}})$ .

## Definition 2.4: Fuzzy soft point

The fuzzy soft set  $(\mathbb{G}, A) \in FSS(\tilde{\mathfrak{X}})$  is called a fuzzy soft point over  $\mathfrak{X}$ , denoted by  $\tilde{l}_{\eta_{\mathbb{G}(e)}}$  if  $e \in A, x \in \mathfrak{X}$  $\eta_{\mathbb{G}(e)}(x) = \begin{cases} \alpha, & \text{if } l = l_0 \in \mathfrak{X} \text{ and } e = e_0 \in A, \\ 0, & \text{if } l \in \mathfrak{X} - \{l_0\} \text{ or } e \in A - \{e_0\} \end{cases}$ , such that  $\alpha \in (0,1]$ 

## Definition 2.5: Fuzzy soft Hilbert space

A fuzzy soft inner product space is defined as  $(\tilde{\mathfrak{X}}, \langle \cdot, \cdot \rangle)$ . This space, which is fuzzy soft complete in the induced fuzzy soft norm indicated in Theorem (2.10), is thus referred to as a fuzzy soft Hilbert space and denoted by  $(\tilde{h}, \langle \cdot, \cdot \rangle)$ . Every fuzzy soft Hilbert space is obviously a fuzzy soft banach space.

## Definition 2.6: Fuzzy soft adjoint operator in $\tilde{\hbar}$

The fuzzy soft adjoint operator  $\widetilde{\mathbb{T}}^*$  of a fuzzy soft linear operator  $\widetilde{\mathbb{T}}$  is defined by  $\langle \widetilde{\mathbb{T}} \widetilde{l}^1_{\eta_{1_{\mathbb{G}(e_1)}}, \widetilde{l}^2_{\eta_{2_{\mathbb{G}(2)}}}} \rangle \cong \langle \widetilde{l}^1_{\eta_{1_{\mathbb{G}(e_1)}}, \widetilde{\mathbb{T}}^*} \widetilde{l}^2_{\eta_{2_{\mathbb{G}(2)}}} \rangle$  for all  $\widetilde{l}^1_{\eta_{1_{\mathbb{G}(e_1)}}, \widetilde{l}^2_{\eta_{2_{\mathbb{G}(e_2)}}} \in \widetilde{A}$ 

## Definition 2.7:Fuzzy soft Normal Operator

Let  $\tilde{\mathcal{M}}$  be an FS Hilbert space and  $\tilde{\mathfrak{T}} \in \mathfrak{B}(\tilde{\mathcal{M}})$ . Then,  $\tilde{\mathfrak{T}}$  is said to be an FS normal operator if  $\tilde{\mathfrak{T}}\tilde{\mathfrak{T}}^* \cong \tilde{\mathfrak{T}}^*\tilde{\mathfrak{T}}$ 

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Definition 2.8: Fuzzy soft self adjoint operator

The FS-operator  $\tilde{\mathfrak{T}}$  of FSH-space  $\tilde{\tilde{h}}$  is called fuzzy soft self adjoint (FS-self adjoint operator) if  $\tilde{\mathfrak{T}} \cong \tilde{\mathfrak{T}}^*$ 

# Definition 2.9: Fuzzy soft isometry operator

 $\begin{array}{l} {\rm Let}\tilde{\lambda} \text{ be an FS Hilbert space and } \widetilde{\mathfrak{T}} \widetilde{\in} \widetilde{\mathfrak{B}}(\underline{\tilde{\hbar}}) \text{ . Then, } \widetilde{\mathfrak{T}} \text{ is said to be an FS isometry} \\ {\rm operator if} \langle \widetilde{\mathfrak{T}} \widetilde{l^1}_{\eta_{1_{\mathfrak{g}(e_1)}}}, \widetilde{\mathfrak{T}} \widetilde{l^2}_{\eta_{2_{\mathfrak{g}(e_2)}}} \rangle \cong \langle \widetilde{l^1}_{\eta_{1_{\mathfrak{g}(e_1)}}, \widetilde{l^2}} \eta_{2_{\mathfrak{g}(2)}} \rangle \text{ for all } \widetilde{l^1}_{\eta_{1_{\mathfrak{g}(e_1)}}, } \widetilde{l^2}_{\eta_{2_{\mathfrak{g}(e_2)}}} \widetilde{\in} \widetilde{\tilde{\hbar}} \end{array}$ 

# Definition 2.10: Fuzzy soft projection operator

Consider  $\tilde{\mathcal{M}}$  to be a fuzzy soft Hilbert space. A fuzzy soft linear operator  $\tilde{\mathfrak{T}}: \tilde{\mathcal{M}} \to \tilde{\mathcal{M}}$  is called a fuzzy soft projection operator in  $\tilde{\mathcal{M}}$  if  $\tilde{\mathfrak{T}}^2 \cong \tilde{\mathfrak{T}}$  ie,  $\tilde{\mathfrak{T}}$  is an idempotent.

# Definition 2.11: Fuzzy soft hyponormaloperator

Consider  $\tilde{h}$  to be a fuzzy soft Hilbert space.  $\tilde{\mathfrak{F}} \in \mathfrak{B}(\tilde{h})$  is called fuzzy soft hyponormal operator if  $\|\tilde{\mathfrak{T}}^* \tilde{l}_{\eta_{\mathfrak{g}(e)}}\| \leq \|\tilde{\mathfrak{T}}\tilde{l}_{\eta_{\mathfrak{g}(e)}}\|$  for all  $\tilde{l}_{\eta_{\mathfrak{g}(e)}} \in \tilde{h}$  or equivalently  $\tilde{\mathfrak{T}}^* \tilde{\mathfrak{T}} \geq \tilde{\mathfrak{T}} \tilde{\mathfrak{T}}^*$ 

# Definition 2.12: M-Fuzzy soft hyponormaloperator

Let  $\tilde{\mathcal{A}}$  be an FS Hilbert space and let  $\tilde{\mathfrak{T}} \in \mathfrak{B}(\tilde{\mathcal{A}})$  is called M – fuzzy soft hyponormal operator if there exist a real number  $\mathcal{M}$ , such that  $\left\| (\tilde{\mathfrak{T}} \simeq \widetilde{\tilde{\mathfrak{e}I}})^{\tilde{*}} \tilde{l}_{\eta_{q(e)}} \right\| \cong \widetilde{\mathcal{M}} \left\| (\tilde{\mathfrak{T}} \simeq \widetilde{\tilde{\mathfrak{e}I}})^{\tilde{i}} \tilde{l}_{\eta_{q(e)}} \right\|$  for all  $\tilde{l}_{\eta_{q(e)}} \in \tilde{\mathcal{A}}$  and for all  $\tilde{\mathfrak{e}} \in \mathbb{C}(\mathbb{A})$ 

# **MAIN RESULTS**

The definition of the fuzzy soft n-power paranormal operator in fuzzy soft Hilbert space is provided in this section.

**Definition 3.1**: Fuzzy Soft Paranormal Operator (FSPN) Let  $\tilde{\Lambda}$  be an FS Hilbert space and let  $\tilde{T} \in \mathfrak{B}(\tilde{\Lambda})$  then  $\tilde{T}$  is a FSPN operator if  $\|\tilde{T}^2 \tilde{l}_{\eta_{\mathfrak{g}(e)}}\| \| \widetilde{l}_{\eta_{\mathfrak{g}(e)}}\| \cong \|\tilde{T}^2 \tilde{l}_{\eta_{\mathfrak{g}(e)}}\|^2$  for all  $\tilde{l}_{\eta_{\mathfrak{g}(e)}} \in \tilde{\Lambda}$ 

**Definition 3.2**: Fuzzy Soft n-Paranormal Operator (FSn-PN) Let  $\tilde{\Lambda}$  be an FS Hilbert space and let  $\tilde{T} \in \mathfrak{B}(\tilde{\Lambda})$  then  $\tilde{T}$  is a FSPN operator if  $\|\tilde{T}^{n+1}\tilde{l}_{\eta_{\mathfrak{g}(e)}}\| \cong \|\tilde{\widetilde{T}}^{n}_{\eta_{\mathfrak{g}(e)}}\|^{n+1}$  for all  $\tilde{l}_{\eta_{\mathfrak{g}(e)}} \in \tilde{\Lambda}$ 

## Theorem 3.3:

Let  $\tilde{T} \in \mathfrak{B}(\tilde{h})$ , then  $\tilde{T}$  is FSPN operator if  $\tilde{T}$  is an fuzzy soft n-paranormal operator Proof: Given  $\tilde{T}$  is fuzzy soft n-paranormal operator By the definition,  $\|\tilde{T}^{n+1}\tilde{l}_{\eta_{\mathfrak{f}(e)}}\| \cong \|\tilde{\tilde{T}}\tilde{l}_{\eta_{\mathfrak{f}(e)}}\|^{n+1}$ Put n = 1,  $\|\tilde{T}^{1+1}\tilde{l}_{\eta_{\mathfrak{f}(e)}}\| \cong \|\tilde{\tilde{T}}\tilde{l}_{\eta_{\mathfrak{f}(e)}}\|^{1+1}$  $\|\tilde{T}^{2}\tilde{l}_{\eta_{\mathfrak{f}(e)}}\| \cong \|\tilde{\tilde{T}}\tilde{l}_{\eta_{\mathfrak{f}(e)}}\|^{2}$ 

Therefore,  $\,\widetilde{T}\,$  is FSPN operator

## Theorem 3.4:

Let  $\tilde{T} \in \mathfrak{B}(\tilde{\hbar})$ , then  $\tilde{T}$  is FSn-PN operator if  $\tilde{T}$  is an fuzzy soft paranormal operator

$$\begin{split} \text{ie}, \left\|\widetilde{\Upsilon^{n}}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} & \cong \left\|\widetilde{\Upsilon^{2n}}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\|(\widetilde{\Upsilon^{*}})^{n}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\langle(\widetilde{\Upsilon^{*}})^{n}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\langle(\widetilde{\Upsilon^{*}})^{n}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\langle(\widetilde{\Upsilon^{*}})^{n}\widetilde{\Gamma^{n}}_{\eta_{\mathfrak{g}(e)}}\right\rangle \\ & \cong \left\langle((\widetilde{\Upsilon^{*}})^{n})^{n}(\widetilde{\Upsilon^{n}})^{n}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}\right\rangle \\ & \cong \left\langle((\widetilde{\Upsilon^{*}})^{n})^{n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\rangle \\ & \cong \left\langle((\widetilde{\Upsilon^{*}})^{n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\rangle \\ & \cong \left\langle((\widetilde{\Upsilon^{*}})^{n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\rangle \\ & \cong \left\langle((\widetilde{\Upsilon^{*}})^{n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\rangle \\ & \cong \left\langle((\widetilde{\Upsilon^{*}})^{n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\|(\widetilde{\Upsilon^{*}})^{n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\|(\widetilde{\Upsilon^{*}})^{2n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\| \\ & \left\|(\widetilde{\Upsilon^{*}})^{n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\|(\widetilde{\Upsilon^{*}})^{2n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & \cong \left\|(\widetilde{\Upsilon^{*}})^{2n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & = \left\|(\widetilde{\Upsilon^{*})^{2n}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & = \left\|(\widetilde{\Upsilon^{*})^{2}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & = \left\|(\widetilde{\Upsilon^{*})^{2}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & = \left\|(\widetilde{\Upsilon^{*})^{2}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & = \left\|(\widetilde{\Upsilon^{*})^{2}\widetilde{\ell}_{\eta_{\mathfrak{g}(e)}}\right\|^{2} \\ & = \left\|(\widetilde{\Upsilon^{*})^{2}\widetilde{\ell}_{\eta_{\mathfrak$$

Therefore,  $\,\widetilde{\mathbb{T}}^*$  is a fuzzy soft n-power paranormal operator

# Theorem 3.10:

Let  $\tilde{T} \in \mathfrak{B}(\tilde{\Lambda})$  is a FSHS. If  $\tilde{T}$  is a fuzzy soft paranormal operator then  $\tilde{T}$  is a fuzzy soft n-power paranormal operator.

# Proof:

Take $\tilde{l}_{\eta_{g(e)}} \in \tilde{\hbar}$  with  $\left\| \widetilde{l}_{\eta_{g(e)}} \right\| \cong 1$ Since  $\widetilde{T} \in \widetilde{\mathfrak{B}}(\widetilde{h})$  is a fuzzy soft paranormal operator  $\left\|\widetilde{\mathsf{T}}\widetilde{l}_{\eta_{\mathfrak{f}(e)}}\right\|^{2} \cong \left\|\widetilde{\mathsf{T}}^{2}\widetilde{l}_{\eta_{\mathfrak{f}(e)}}\right\|$ By using the mathematical induction, If n = 1, then it is correct because  $\tilde{T}$  is fuzzy soft paranormal operator  $\text{Let } \left\|\widetilde{\mathbb{T}^{2}\tilde{l}_{\eta_{\vec{g}(e)}}}\right\| \cong \left\|\widetilde{\mathbb{T}^{2.1}\tilde{l}_{\eta_{\vec{g}(e)}}}\right\| \cong \left\|\widetilde{\mathbb{T}\tilde{l}_{\eta_{\vec{g}(e)}}}\right\|^{2}$  $\widetilde{\geq} \left\|\widetilde{\mathsf{T}}^{1}\widetilde{\tilde{l}_{\eta_{\mathsf{d}}(e)}}\right\|^{2}$ i.e)  $\left\|\widetilde{\mathbb{T}^{2}\tilde{l}_{\eta_{g(e)}}}\right\| \cong \left\|\widetilde{\mathbb{T}^{1}\tilde{l}_{\eta_{g(e)}}}\right\|^{2}$  etc., If n = k is true, then 
$$\begin{split} & \left\|\widetilde{\mathbb{T}^{k}\tilde{l}_{\eta_{\vec{g}(e)}}}\right\|^{2} \cong \left\|\widetilde{\mathbb{T}^{2k}\tilde{l}_{\eta_{\vec{g}(e)}}}\right\| \\ & \text{Now we have to prove that it is true for } n = k + 1 \end{split}$$
$$\begin{split} & \mathsf{Let} \, \left\| \widetilde{\mathbb{T}^{k+1} \widetilde{l_{\eta_{\mathfrak{g}(e)}}}} \right\|^2 \cong \langle \widetilde{\mathbb{T}^{k+1}} \widetilde{l_{\eta_{\mathfrak{g}(e)}}}, \widetilde{\mathbb{T}^{k+1}} \widetilde{l_{\eta_{\mathfrak{g}(e)}}} \rangle \\ & \cong \langle \widetilde{\mathbb{T}} \widetilde{\mathbb{T}^k} \, \widetilde{l_{\eta_{\mathfrak{g}(e)}}}, \widetilde{\mathbb{T}} \widetilde{\mathbb{T}} \widetilde{\mathbb{T}^k} \widetilde{l_{\eta_{\mathfrak{g}(e)}}} \rangle \end{split}$$
 $\cong \|\widetilde{\mathsf{T}}\widetilde{\mathsf{T}}^{k}\widetilde{\tilde{l}_{\eta_{d}(e)}}\|$  $\widetilde{\leq} \|\widetilde{\mathsf{T}}\|^2 \left\|\widetilde{\mathsf{T}}^{k}\widetilde{l}_{\eta_{d}(e)}\right\|^2$  $\widetilde{\leq} \left\|\widetilde{\mathsf{T}}\right\|^{2} \left\|\widetilde{\mathsf{T}}^{k}\widetilde{l}_{\eta_{\mathrm{f}}(e)}\right\|^{2} \left\|\widetilde{\tilde{l}}_{\eta_{\mathrm{f}}(e)}\right\|$  $\widetilde{\leq} \left\| \widetilde{\widetilde{\mathsf{T}}^2} \right\| \left\| \widetilde{\mathsf{T}}^{2k} \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \right\| \left\| \widetilde{l}_{\eta_{\mathfrak{g}(e)}} \right\|$  $\widetilde{\leq} \left\| \widetilde{\mathsf{T}}^2 \widetilde{\mathsf{T}}^{2k} \widetilde{l}_{\eta_{\mathfrak{f}(e)}} \right\| \left\| \widetilde{\tilde{l}}_{\eta_{\mathfrak{f}(e)}} \right\|$  $\widetilde{\leq} \left\| \widetilde{\mathbb{T}}^{2k} \widetilde{\mathbb{T}}^{2} \widetilde{\mathbb{I}}_{\eta_{\mathfrak{g}(e)}} \right\| \left\| \widetilde{\tilde{l}_{\eta_{\mathfrak{g}(e)}}} \right\|$ 
$$\begin{split} & \widetilde{\leq} \left\| \widetilde{\Upsilon}^{2k+2} \widetilde{\tilde{l}}_{\eta_{\mathfrak{f}(e)}} \right\| \left\| \widetilde{\tilde{l}}_{\eta_{\mathfrak{f}(e)}} \right\| \\ & \left\| \widetilde{\Upsilon}^{k+1} \widetilde{\tilde{l}}_{\eta_{\mathfrak{f}(e)}} \right\|^2 \widetilde{\leq} \left\| \widetilde{\Upsilon}^{2(k+1)} \widetilde{l}_{\eta_{\mathfrak{f}(e)}} \right\| \left\| \widetilde{\tilde{l}}_{\eta_{\mathfrak{f}(e)}} \right\| \text{ implies that} \end{split}$$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

 $\left\|\widetilde{\mathsf{T}}^{k+1}\widetilde{l}_{\eta_{g(e)}}\right\|^{2} \cong \left\|\widetilde{\mathsf{T}}^{2(k+1)}\widetilde{l}_{\eta_{g(e)}}\right\|$ Therefore,  $\widetilde{\mathsf{T}}$  is a fuzzy soft n-power paranormal operator

# Theorem 3.11:

Let  $\tilde{T} \in \mathfrak{B}(\tilde{h})$  is a FSHS. If  $\tilde{T}$  is a fuzzy soft n - paranormal operator then  $\tilde{T}$  is a fuzzy soft n-power paranormal operator.

Proof:

By the definition of fuzzy soft n - paranormal operator

 $\left\|\widetilde{\mathbb{T}^{n+1}\tilde{l}_{\eta_{\mathfrak{f}(e)}}}\right\| \cong \left\|\widetilde{\widetilde{\mathbb{T}}\tilde{l}_{\eta_{\mathfrak{f}(e)}}}\right\|^{n+1}$ 

It will be shown that  $\left\|\widetilde{\mathbb{T}^{2n}\tilde{l}_{\eta_{d}(e)}}\right\| \ge \left\|\widetilde{\mathbb{T}^{n}\tilde{l}_{\eta_{d}(e)}}\right\|^{2}$ 

 $\mathsf{Take}\tilde{l}_{\eta_{\mathfrak{f}(e)}} \widetilde{\in} \widetilde{\hbar} \text{ with } \|\widetilde{\tilde{l}_{\eta_{\mathfrak{f}(e)}}}\| \cong 1$ 

We will prove, by using mathematical induction,

Since  $\tilde{T} \in \mathfrak{B}(\tilde{h})$  is a fuzzy soft n - paranormal operator

By using the mathematical induction, if n = 1

$$\begin{split} \left\|\widetilde{\Upsilon}^{1}\widetilde{l_{\eta_{g(e)}}}\right\|^{2} &\cong \langle \widetilde{\Upsilon}^{1}\widetilde{l_{\eta_{g(e)}}}, \widetilde{\Upsilon}^{1}\widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle \widetilde{\Upsilon}^{*}\widetilde{\Gamma}\widetilde{l_{\eta_{g(e)}}} \| \| \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \left\| \widetilde{\Upsilon}^{*}\widetilde{\Gamma}\widetilde{l_{\eta_{g(e)}}} \right\| \| \| \widetilde{l_{\eta_{g(e)}}} \| \\ &\cong \left\| \widetilde{\Upsilon}^{2}\widetilde{l_{\eta_{g(e)}}} \right\| \\ &= \left\| \widetilde{\Upsilon}^{2}\widetilde{l_{\eta_{g(e)}}} \right\| \\ &\cong \left\| \widetilde{\Upsilon}^{2}\widetilde{l_{\eta_{g(e)}}} \right\| \\ &\cong \left\| \widetilde{\Upsilon}^{2}\widetilde{l_{\eta_{g(e)}}} \right\| \\ &\cong \left\| \widetilde{\Upsilon}^{*}\widetilde{\ell_{\eta_{g(e)}}} \right\| \\ &\cong \langle \widetilde{\Upsilon}^{k}\widetilde{l_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle (\widetilde{\Upsilon}^{k})^{*}\widetilde{\Upsilon}^{k}\widetilde{l_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle (\widetilde{\Upsilon}^{k})^{*}\widetilde{\Upsilon}^{k}\widetilde{l_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle (\widetilde{\Upsilon}^{k}\widetilde{\ell_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle \widetilde{\Upsilon}^{2k}\widetilde{l_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\equiv \langle (\widetilde{\Upsilon}^{k}\widetilde{l_{\eta_{g(e)}}} \| \\ &\| \widetilde{\Upsilon}^{k}\widetilde{l_{\eta_{g(e)}}} \| \\ &= \langle (\widetilde{\Upsilon}^{k+1}\widetilde{l_{\eta_{g(e)}}} \| \\ &I \text{ will be shown that it is true for } n = k + 1 \\ &\| \widetilde{\Upsilon}^{k+1}\widetilde{l_{\eta_{g(e)}}} \| \\ &\cong \langle (\widetilde{\Upsilon}^{k+1})^{*}\widetilde{\Upsilon}^{k+1}\widetilde{l_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle (\widetilde{\Upsilon}^{k+1}\widetilde{\Upsilon}^{k+1}\widetilde{\ell_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle (\widetilde{\Upsilon}^{k+1}\widetilde{\Upsilon}^{k+1}\widetilde{\ell_{\eta_{g(e)}}}, \widetilde{l_{\eta_{g(e)}}} \rangle \\ &\cong \langle (\widetilde{\Upsilon}^{k+1}\widetilde{\Upsilon}^{k+1}\widetilde{\ell_{\eta_{g(e)}}}, \widetilde{\ell_{\eta_{g(e)}}} \rangle \\ &\cong \langle \widetilde{\Upsilon}^{k+1}\widetilde{\Upsilon}^{k+1}\widetilde{\ell_{\eta_{g(e)}}}, \widetilde{\ell_{\eta_{g(e)}}} \rangle \\ &\cong \langle \widetilde{\Upsilon}^{k+1}\widetilde{\Upsilon}^{k+1}\widetilde{\ell_{\eta_{g(e)}}} \rangle \\ &\simeq \langle \widetilde{\Upsilon}^{k+1}\widetilde{\Upsilon}^{k+1}\widetilde{\widetilde{\Gamma_{\eta_{g(e)}}}} \rangle \\ &\simeq \langle \widetilde{\Upsilon}^{k+1}\widetilde{\widetilde{\Upsilon}^{k+1}}\widetilde{\widetilde{\Gamma_{\eta_{g(e)}}}} \rangle \\ &\simeq \langle \widetilde{\Upsilon}^{k+1}\widetilde{\widetilde{\Upsilon}^{k+1}}\widetilde{\widetilde{\widetilde{\Gamma_{\eta_{g(e)}}}}} \rangle \\ &\simeq \langle \widetilde{\Upsilon}^{$$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

$$\begin{split} &\cong \langle \widetilde{\Upsilon}^{2(k+1)} \widetilde{\tilde{l}_{\eta_{g(e)}}} , \ \widetilde{l}_{\eta_{g(e)}} \rangle \\ & \left\| \widetilde{\Upsilon}^{k+1} \widetilde{\tilde{l}_{\eta_{g(e)}}} \right\|^2 \widetilde{\leq} \left\| \widetilde{\Upsilon}^{2(k+1)} \widetilde{\tilde{l}_{\eta_{g(e)}}} \right\| \left\| \widetilde{\tilde{l}_{\eta_{g(e)}}} \right\| \\ & \left\| \widetilde{\Upsilon}^{k+1} \widetilde{\tilde{l}_{\eta_{g(e)}}} \right\|^2 \widetilde{\leq} \left\| \widetilde{\Upsilon}^{2(k+1)} \widetilde{\tilde{l}_{\eta_{g(e)}}} \right\| \end{aligned}$$

Hence  $\tilde{T}$  is a fuzzy soft n-power paranormal operator.

# Theorem 3.12:

Let  $\tilde{T} \in \mathfrak{B}(\tilde{\mathbb{A}})$  is a FSHS. If  $\tilde{T}$  is a fuzzy soft n - paranormal operator and  $\tilde{T}^{-1}$  exist then  $\tilde{T}^{-1}$  is a fuzzy soft n-power paranormal operator. Proof:

Since  $\widetilde{T}\,$  is a fuzzy soft n-power paranormal operator

$$\begin{split} \left\|\widetilde{\mathbb{T}^{n}}\widetilde{l_{\eta_{g(e)}}}\right\|^{2} & \leq \left\|\widetilde{\mathbb{T}^{2n}}\widetilde{l_{\eta_{g(e)}}}\right\| \\ \text{Now we replace } \widetilde{l_{\eta_{g(e)}}} \text{ by } \left(\widetilde{\mathbb{T}^{-1}}\right)^{2n} \widetilde{l_{\eta_{g(e)}}} \\ \left\|\widetilde{\mathbb{T}^{n}}\left(\widetilde{\mathbb{T}^{-1}}\right)^{2n} \widetilde{l_{\eta_{g(e)}}}\right\|^{2} & \leq \left\|\widetilde{\mathbb{T}^{2n}}\left(\widetilde{\mathbb{T}^{-1}}\right)^{2n} \widetilde{l_{\eta_{g(e)}}}\right\| \\ \left\|\widetilde{\mathbb{T}^{n}}\left(\widetilde{\mathbb{T}^{n}}\right)^{-2} \widetilde{l_{\eta_{g(e)}}}\right\|^{2} & \leq \left\|\widetilde{l_{\eta_{g(e)}}}\right\| \left\|\left(\widetilde{\mathbb{T}^{-1}}\right)^{2n} \widetilde{l_{\eta_{g(e)}}}\right\| \\ \left\|\left(\widetilde{\mathbb{T}^{-1}}\right)^{n} \widetilde{l_{\eta_{g(e)}}}\right\|^{2} & \leq \left\|\widetilde{l_{\eta_{g(e)}}}\right\| \left\|\left(\widetilde{\mathbb{T}^{-1}}\right)^{2n} \widetilde{l_{\eta_{g(e)}}}\right\| \\ \\ \left\|\left(\widetilde{\mathbb{T}^{-1}}\right)^{2n} \widetilde{l_{\eta_{g(e)}}}\right\|^{2} & \leq \left\|\widetilde{l_{\eta_{g(e)}}}\right\| & \left\|\left(\widetilde{\mathbb{T}^{-1}}\right)^{n} \widetilde{l_{\eta_{g(e)}}}\right\| \\ \\ \\ \left\|\left(\widetilde{\mathbb{T}^{-1}}\right)^{2n} \widetilde{l_{\eta_{g(e)}}}\right\| \left\|\widetilde{l_{\eta_{g(e)}}}\right\| & \leq \left\|\left(\widetilde{\mathbb{T}^{-1}}\right)^{n} \widetilde{l_{\eta_{g(e)}}}\right\|^{2} \end{split}$$

Hence  $\tilde{T}^{-1}$  is fuzzy soft n-power paranormal operator **Definition 3.13: Fuzzy Soft \* -Paranormal Operator (FS\*-PN)** Let  $\tilde{T}$  is fuzzy soft self adjoint operator and let  $\tilde{A}$  be an FS Hilbert space

An operator  $\widetilde{T} \in \widetilde{\mathfrak{B}}(\widetilde{\hbar})$  is called FS\*-PN if  $\left\| \widetilde{T^{2}\widetilde{l}_{\eta_{\mathfrak{g}(e)}}} \right\| \cong \left\| \widetilde{\widetilde{T^{*}l}_{\eta_{\mathfrak{g}(e)}}} \right\|^{2}$  for all  $\widetilde{l}_{\eta_{\mathfrak{g}(e)}} \in \widetilde{\hbar}$ 

# Theorem 3.14:

Let  $\tilde{T}$ ,  $\tilde{\mathfrak{E}} \in \mathfrak{B}(\tilde{\mathfrak{h}})$ , if  $\tilde{T}$ ,  $\tilde{\mathfrak{E}}$  are fuzzy soft self adjoint operator then  $\tilde{T} + \tilde{\mathfrak{E}}$  is fuzzy soft \* –paranormal operator. Proof:

$$\begin{aligned} \operatorname{Take} \widetilde{l}_{\eta_{d(e)}} & \in \widetilde{A} \text{ with } \left\| \left| \widetilde{l}_{\eta_{d(e)}} \right\| \cong 1 \\ \operatorname{Let } \left\| \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \widetilde{l}_{\eta_{d(e)}} \right\|^2 & \cong \langle \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \widetilde{l}_{\eta_{d(e)}}, \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \widetilde{l}_{\eta_{d(e)}} \rangle \\ & \cong \langle \left( \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \right)^* \left( \widetilde{T} + \widetilde{\tilde{e}}^* \right)^* \widetilde{l}_{\eta_{d(e)}}, \widetilde{l}_{\eta_{d(e)}} \rangle \\ & \cong \langle \left( \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \right) \left( \widetilde{T} + \widetilde{\tilde{e}}^* \right)^* \widetilde{l}_{\eta_{d(e)}}, \widetilde{l}_{\eta_{d(e)}} \right) \rangle \\ & \cong \langle \left( \left( \widetilde{T} + \widetilde{\tilde{e}} \right) \left( \widetilde{T} + \widetilde{\tilde{e}}^* \right) \widetilde{l}_{\eta_{d(e)}}, \widetilde{l}_{\eta_{d(e)}} \right) \rangle \\ & \cong \langle \left( \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \widetilde{l}_{\eta_{d(e)}}, \widetilde{l}_{\eta_{d(e)}} \right) \rangle \\ & \| \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \widetilde{l}_{\eta_{d(e)}} \right\|^2 \cong \langle \left( \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^2 \widetilde{l}_{\eta_{d(e)}}, \widetilde{l}_{\eta_{d(e)}} \right) \rangle \\ & \| \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \widetilde{l}_{\eta_{d(e)}} \right\|^2 \cong \| \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^2 \widetilde{l}_{\eta_{d(e)}} \| \| \widetilde{l}_{\eta_{d(e)}} \| \text{ implies that} \\ & \| \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^* \widetilde{l}_{\eta_{d(e)}} \|^2 \cong \| \left( \widetilde{T} + \widetilde{\tilde{e}} \right)^2 \widetilde{l}_{\eta_{d(e)}} \| \\ & \text{Therefore, } \widetilde{T} + \widetilde{\tilde{e}} \text{ is fuzzy soft *- paranormal operator} \end{aligned}$$

CONCLUSION

The concepts of normed space, metric space, and Hilbert space have all been given soft and fuzzy updates by numerous academics. The results of merging soft and fuzzy concepts are more widely applicable. In this paper, the Fuzzy soft n-power paranormal operator has been described and defined.

# ACKNOWLEDGEMENT

The authors would like to extend their sincere gratitude to the editor and reviewers for their insightful remarks and recommendations, which helped to develop the manuscript.

# ABSTRACT

We provide some novel oscillation conditions for semi-canonical difference equations using the canonical transformation method. Our findings reinforce and improve certain earlier ones. Examples have been generated to highlight the relevance of the consequences.

Keywords: Semi-canonical, asymptotic, oscillatory, difference equation, nonlinear.

# INTRODUCTION

Consider the third order difference equation in this instance.  $\Delta(q(\varsigma)\Delta(r(\varsigma)\Delta\Psi(\varsigma))) = s(\varsigma)\Psi^{\kappa}(\varrho(\varsigma)), \varsigma \ge \varsigma_{0} \qquad (1.1)$ where  $\varsigma_{0}$  is a positive integer. We assume the subsequent hypothesis H1)  $\{q(\varsigma)\}, \{r(\varsigma)\}, \{s(\varsigma)\}$  are positive real sequences; H2)  $\{\varrho(\varsigma)\}$  is an increasing sequence of positive integer with  $\varrho(\varsigma) \ge \varsigma + 1$ ; H3)  $\kappa$  is a real positive integer with  $\kappa > 1$ ; H4) the equation (1.1) is in semi canonical form, that is  $\sum_{\varsigma=\varsigma_{0}}^{\infty} \frac{1}{q(\varsigma)} = \infty$  and  $\sum_{\varsigma=\varsigma_{0}}^{\infty} \frac{1}{r(\varsigma)} < \infty$ . (1.2)

A real sequence  $\{\Psi(\varsigma)\}$  that satisfies (1.1) for any  $\varsigma \ge \varsigma_0$  is referred to as a solution of (1.1). Nontrivial solutions to (1.1) are either oscillatory or non oscillatory depending on whether the final result is positive or negative.

Finding out the qualitative behavior of various types of second order difference equations has garnered a lot of attention in recent years. Despite the fact that discrete models are used in many other areas of mathematics, including economics, mathematical biology, and <sup>[1]</sup> and <sup>[2]</sup>, difference equations have a wide range of applications in these fields.

# Kaleeswari and Rangasri

A number of publications have concentrated on the oscillatory and asymptotic solutions of (1.1), see <sup>[3]-[13]</sup> and the cited references throughout. However, the publication devotes the majority of its space to equation of the canonical form, (i.e),

$$\sum_{\zeta = \zeta_0}^{\infty} \frac{1}{q(\zeta)} = \infty \text{ and } \sum_{\zeta = \zeta_0}^{\infty} \frac{1}{r(\zeta)} = \infty$$

In  $\ensuremath{^{[14]}}$  , the authors studied difference equation of the form

 $\Delta \Big( q(\varsigma) \Delta \big( r(\varsigma) \Delta \Psi(\varsigma) \big) \Big) = s(\varsigma) f \Big( \Psi \big( \varrho(\varsigma) \big) \Big), \qquad \varsigma \ge \varsigma_0$ 

with semi-canonical condition

 $\sum_{\zeta = \zeta_0}^{\infty} \frac{1}{q(\zeta)} < \infty \text{ and } \sum_{\zeta = \zeta_0}^{\infty} \frac{1}{r(\zeta)} = \infty.$ 

In [15], the authors discussed about the difference equation of the form

 $\Delta(q(\varsigma)\Delta(r(\varsigma)\Delta\Psi(\varsigma))) + w(\varsigma)f(\Psi(\sigma(\varsigma))) - s(\varsigma)g(\Psi(\tau(\varsigma))) = 0.$ 

with semi-canonical condition

$$\sum_{\varsigma = \varsigma_0}^{\infty} \frac{1}{q(\varsigma)} < \infty \text{ and } \sum_{\varsigma = \varsigma_0}^{\infty} \frac{1}{r(\varsigma)} = \infty.$$

To the greatest extent of our knowledge, the oscillatory features of the relevant equation have not been studied when

$$\sum_{\varsigma = \varsigma_0}^{\infty} \frac{1}{q(\varsigma)} = \infty \text{ and } \sum_{\varsigma = \varsigma_0}^{\infty} \frac{1}{r(\varsigma)} < \infty.$$

Therefore, the aim of this paper is to provide the qualitative behavior of (1.1) if condition (1.2) is satisfied. This is initially established by transforming semi-canonical to canonical, after which we approach to develop some novel criteria for oscillatory solution of (1.1).

# MAIN RESULTS

To make it easier to read, the following symbols will be used:

$$Q(\varsigma) = \sum_{t=\varsigma_1}^{\varsigma-1} \frac{1}{\gamma(t)}, \qquad R(\varsigma) = \sum_{t=\varsigma}^{\infty} \frac{1}{r(t)}, \qquad \xi(\varsigma) = r(\varsigma)R(\varsigma)R(\varsigma+1),$$
$$\gamma(\varsigma) = \frac{q(\varsigma)}{R(\varsigma+1)}, \qquad S(\varsigma) = s(\varsigma)R^{\kappa}(\varrho(\varsigma)), \qquad \Xi(\varsigma) = \sum_{t=\varsigma_1}^{\varsigma-1} \frac{1}{\xi(t)},$$
$$F(\varsigma) = \frac{1}{\gamma(t)} \sum_{u=\varsigma}^{\infty} S(u), \qquad T(\varsigma) = \sum_{s=\varsigma_1}^{\varsigma-1} \frac{1}{\xi(s)} \sum_{t=\varsigma_1}^{s-1} \frac{1}{\gamma(t)}.$$
where  $\varsigma \ge \varsigma_1 \ge \varsigma_0$  and  $\varsigma_1$  is large enough.

Theorem 2.1. Assume that

$$\sum_{\zeta=\zeta_0}^{\infty} \frac{1}{\gamma(\zeta)} = \infty$$

Then (1.1) has the following canonical representation

$$\Delta\left(\frac{q(\varsigma)}{R(\varsigma+1)}\Delta\left(r(\varsigma)R(\varsigma)R(\varsigma+1)\Delta\left(\frac{\Psi(\varsigma)}{R(\varsigma)}\right)\right)\right) = \Delta(q(\varsigma)\Delta(r(\varsigma)\Delta\Psi(\varsigma))).$$
(2.2)  
Proof. Direct computation demonstrates that

(2.1)

$$\frac{q(\varsigma)}{R(\varsigma+1)}\Delta\left(r(\varsigma)R(\varsigma)R(\varsigma+1)\Delta\left(\frac{\Psi(\varsigma)}{R(\varsigma)}\right)\right) = \frac{q(\varsigma)}{R(\varsigma+1)}\Delta(r(\varsigma)R(\varsigma)\Delta\Psi(\varsigma) + \Psi(\varsigma))$$
$$= \frac{q(\varsigma)}{R(\varsigma+1)}[R(\varsigma+1)\Delta(r(\varsigma)\Delta\Psi(\varsigma))]$$
$$= q(\varsigma)\Delta(r(\varsigma)\Delta\Psi(\varsigma))$$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 - 0997

Hence

$$\Delta\left(\frac{q(\varsigma)}{R(\varsigma+1)}\Delta\left(r(\varsigma)R(\varsigma)R(\varsigma+1)\Delta\left(\frac{\Psi(\varsigma)}{R(\varsigma)}\right)\right)\right) = \Delta(q(\varsigma)\Delta(r(\varsigma)\Delta\Psi(\varsigma))).$$

As we can see from (2.1),  $\sum_{\zeta=\zeta_0}^{\infty} \frac{R(\zeta+1)}{q(\zeta)} = \infty, \quad (2.3)$ 

and since

$$\sum_{\varsigma=\varsigma_0}^{\infty} \frac{1}{r(\varsigma)R(\varsigma)R(\varsigma+1)} = \sum_{\varsigma=\varsigma_0}^{\infty} \Delta\left(\frac{1}{R(\varsigma)}\right) = \lim_{\varsigma\to\infty} \frac{1}{R(\varsigma)} - \frac{1}{R(\varsigma_0)} = \infty,$$

we assess that (2.2) is in canonical form

Corollary 2.2. Assume that (2.1) holds. Then the semi-canonical difference equation (1.1) possesses a solution  $\Psi(\varsigma)$  if and only if the canonical equation

 $\Delta(\gamma(\varsigma)\Delta(\xi(\varsigma)\Delta\Phi(\varsigma))) = S(\varsigma)\Phi^{\kappa}(\varrho(\varsigma))$ (2.4)has the positive solution  $\Phi(\varsigma) = \frac{\Psi(\varsigma)}{R(\varsigma)}$ 

In the following section, we provide the structure of a potential non-oscillatory solution to (2.4), which is deduced from an analogy involving the discrete knesers theorem and canonical form of (2.4)

$$\Phi(\varsigma) \in \mathcal{N}_{0}: \Phi(\varsigma) > 0, \Delta \Phi(\varsigma) > 0, \Delta(\xi(\varsigma)\Delta(\Phi(\varsigma))) < 0, \Delta(\gamma(\varsigma)\Delta(\xi(\varsigma)\Delta\Phi(\varsigma))) > 0$$
  
and  
$$\Phi(\varsigma) \in \mathcal{N}_{3}: \Phi(\varsigma) > 0, \Delta \Phi(\varsigma) > 0, \Delta(\xi(\varsigma)\Delta(\Phi(\varsigma))) > 0, \Delta(\gamma(\varsigma)\Delta(\xi(\varsigma)\Delta\Phi(\varsigma))) > 0.$$
  
Lemma 2.3. Assuming  $\Phi(\varsigma) \in \mathcal{N}_{3}$  is a positive solution of (2.4) and  
$$\sum_{u=\varsigma_{1}}^{\infty} S(u)T^{\kappa}(\varrho(u)) = \infty.$$
 (2.5)

Then  $\frac{\Phi(\varsigma)}{T(\varsigma)}$  is eventually increasing  $\forall \varsigma \ge K$ .

The preceding lemma's proof resembles that of in [3].

Theorem 2.4. Assuming that (2.1) is true,

$$\sum_{t=\varsigma_1}^{\varsigma_{-1}} \frac{1}{\xi(t)} \sum_{u=t}^{\infty} F(t) = \infty$$
and
$$\lim_{\varsigma \to \infty} \sup \left( \frac{1}{\Xi^{\kappa}(\varrho(\varsigma))} \sum_{t=\varsigma_1}^{\varsigma_{-1}} \Xi^{\kappa}(\varrho(t)) \Xi(t+1) F(t) + \sum_{t=\varsigma}^{\varrho(t)-1} \Xi(t+1) F(t) + \Xi(\varrho(\varsigma)) \sum_{t=\varrho(\varsigma)}^{\infty} F(t) \right) = \infty.$$
(2.7)

Then all non-oscillatory solution of (1.1) meets  $\lim_{\varsigma \to \infty} \frac{\Psi(\varsigma)}{R(\varsigma)} = 0.$ 

Proof. Let  $\{\Psi(\varsigma)\}$  be an non-oscillatory solution (1.1). Without losing generality, suppose that  $\{\Psi(\varsigma)\}$  is a positive solution of (1.1). Then, from corollary 2.2, relevant sequence  $\{\Phi(\varsigma)\}$  is also a positive solution of (2.4) and  $\Phi(\varsigma) \in \mathcal{N}_0$ or  $\Phi(\varsigma) \in \mathcal{N}_3$  for all  $\varsigma \ge \varsigma_1$ . Now consider that  $\Phi(\varsigma) \in \mathcal{N}_0$  for all  $\varsigma \ge \varsigma_1$ . From the monotonicity of  $\xi(\varsigma) \Delta \Phi(\varsigma)$ , we carry

$$\Phi(\varsigma) \ge \Phi(\varsigma) - \Phi(\varsigma_1) = \sum_{t=\varsigma_1}^{\varsigma-1} \frac{\xi(t)\Delta\Phi(t)}{\xi(t)} \ge \xi(\varsigma)\Delta\Phi(\varsigma)\Xi(\varsigma)$$
  
which suggest that

$$\Delta\left(\frac{\Phi(\varsigma)}{\Xi(\varsigma)}\right) = \left(\frac{\Xi(\varsigma)\Delta\Phi(\varsigma) - \Phi(\varsigma)\frac{1}{\xi(\varsigma)}}{\Xi(\varsigma)\Xi(\varsigma+1)}\right) \le 0$$
(2.8)

Hence  $\frac{\Phi(\zeta)}{\Xi(\zeta)}$  is decreasing.

On the other hand, summing twice (2.4) from  $\varsigma$  to  $\infty$  gives

$$\xi(\varsigma)\Delta\Phi(\varsigma) \geq \sum_{t=\varsigma}^{\infty} \frac{\Phi^{\kappa}(\varrho(t))}{\gamma(t)} \sum_{u=t}^{\infty} S(u)$$
$$\geq \sum_{t=\varsigma}^{\infty} \Phi^{\kappa}(\varrho(t))F(t).$$

Again, summing from  $\varsigma_1$  to  $\varsigma - 1$ , we carry

63345

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 - 0997

# Kaleeswari and Rangasri

$$\begin{split} \Phi(\varsigma) &\geq \sum_{t=\varsigma_1}^{\varsigma-1} \frac{1}{\xi(t)} \sum_{u=\varsigma}^{\infty} \Phi^{\kappa}(\varrho(u)) F(u) \\ &= \Xi(\varsigma) \sum_{u=\varsigma}^{\infty} \Phi^{\kappa}(\varrho(u)) F(u) + \sum_{t=\varsigma_1}^{\varsigma-1} \Xi(t+1) \Phi^{\kappa}(\varrho(t)) F(t) \end{split}$$

Hence

$$\Phi(\varrho(\varsigma)) \ge \sum_{t=\varsigma_1}^{\varsigma-1} \Xi(t+1)\Phi^{\kappa}(\varrho(t))F(t) + \sum_{t=\varsigma}^{\varrho(\varsigma)-1} \Xi(t+1)\Phi^{\kappa}(\varrho(t))F(t) + \Xi(\varrho(\varsigma))\sum_{t=\varrho(\varsigma)}^{\infty} \Phi^{\kappa}(\varrho(t))F(t).$$

Using  $\Phi(\varsigma)$  is increasing and  $\frac{\Phi(\varsigma)}{\Xi(\varsigma)}$  decreasing, we obtain

$$\Phi(\varrho(\varsigma)) \ge \frac{\Phi^{\kappa}(\varrho(\varsigma))}{\Xi^{\kappa}(\varrho(\varsigma))} \sum_{t=\varsigma_1}^{\varsigma^{-1}} \Xi^{\kappa}(\varrho(t))\Xi(t+1)F(t) + \Phi^{\kappa}(\varrho(\varsigma)) \sum_{t=\varsigma}^{\varrho(\varsigma)-1} \Xi(t+1)F(t) + \Phi^{\kappa}(\varrho(\varsigma))\Xi(\varrho(\varsigma)) \sum_{t=\varrho(\varsigma)}^{\infty} F(t)$$
or
$$= 1 + \varepsilon(\varsigma) = 1 + \varepsilon(\varsigma) = 1 + \varepsilon(\varsigma) + \varepsilon(\varsigma) = 1 + \varepsilon(\varsigma) + \varepsilon(\varsigma) = 1 + \varepsilon$$

$$\Phi^{1-\kappa}(\varrho(\varsigma)) \ge \frac{1}{\Xi^{\kappa}(\varrho(\varsigma))} \sum_{t=\varsigma_1}^{\varsigma-1} \Xi^{\kappa}(\varrho(t)) \Xi(t+1)F(t) + \sum_{t=\varsigma}^{\varrho(\varsigma)-1} \Xi(t+1)F(t) + \Xi(\varrho(\varsigma)) \sum_{t=\varrho(\varsigma)}^{\infty} F(t).$$
(2.9)

Since  $\Phi(\varsigma)$  is positive and increasing,  $\exists$  a constant  $A > 0 \ni \Phi(\varsigma) \ge A$ , and so we carry  $\Phi^{1-\kappa}(\varrho(\varsigma)) \le A^{1-\kappa}$ . Using this in (2.9) we obtain

$$A^{1-\kappa} \ge \frac{1}{\Xi^{\kappa}(\varrho(\varsigma))} \sum_{t=\varsigma_1}^{\varsigma-1} \Xi^{\kappa}(\varrho(t))\Xi(t+1)F(t) + \sum_{t=\varsigma}^{\varrho(\varsigma)-1} \Xi(t+1)F(t) + \Xi(\varrho(\varsigma)) \sum_{t=\varrho(\varsigma)}^{\infty} F(t).$$
  
Taking limsup as  $\varsigma \to \infty$  of the aforementioned inequality, which contradicts (2.7)

Next, we assume that  $\Phi(\varsigma) \in \mathcal{N}_3$ . Since  $\Phi(\varsigma)$  is positive and increasing, there exists  $\lim_{\varsigma \to \infty} \Phi(\varsigma) = e \ge 0$ . Suppose that e > 0, then  $\Phi(\varsigma) \ge e > 0$ . Summing twice (2.4) from  $\varsigma$  to  $\infty$  and again summing from  $\varsigma_1$  to  $\varsigma - 1$ , which gives  $\Phi(\varsigma) \geq e^{\kappa} \sum_{t=\varsigma_1}^{\varsigma-1} \frac{1}{\xi(t)} \sum_{u=t}^{\infty} F(t),$ which contradicts (2.6) and so  $\lim_{\varsigma\to\infty}\Phi(\varsigma)=\lim_{\varsigma\to\infty}\frac{\Psi(\varsigma)}{R(\varsigma)}=0.$ Hence the proof is completed. Theorem 2.5. Let (2.1) and (2.5) hold, and  $\frac{1}{-1}$ 1

$$\lim_{\varsigma \to \infty} w_{\kappa}^{\bar{\kappa}-1}(\varsigma) = M_{1}^{\bar{\kappa}-1} < \infty.$$
(2.10)

Suppose

 $\limsup_{\varsigma \to \infty} \left\{ \frac{1}{T(\varrho(\varsigma))} \sum_{t=\varsigma}^{\varrho(\varsigma)-1} \frac{1}{\xi(t)} \sum_{u=\varsigma}^{t-1} \frac{1}{\gamma(u)} \sum_{v=\varsigma}^{u-1} S(v) T^{\kappa}(\varrho(v)) \right\} > M_1,$ (2.11)then  $\mathcal{N}_3$  is  $\emptyset$  for (1.1).

Proof. Let  $\{\Psi(\varsigma)\}$  be an positive solution of (1.1). By Corollary 2.2 the corresponding function  $\{\Phi(\varsigma)\}$  is a positive solution of (2.4). Let us assume that  $\Phi(\varsigma) \in \mathcal{N}_3$  for all  $\varsigma \ge \varsigma_1$ . Summing (2.4) from  $\varsigma$  to m - 1, we have

$$\begin{split} \Delta(\xi(m)\Delta\Phi(m)) &\geq \frac{1}{\gamma(m)} \sum_{t=\varsigma}^{m-1} S(t) \Phi^{\kappa}(\varrho(t)) \\ &\geq \frac{1}{\gamma(m)} \sum_{t=\varsigma}^{m-1} S(t) \frac{\Phi^{\kappa}(\varrho(t))}{T^{\kappa}(\varrho(t))} T^{\kappa}(\varrho(t)) \\ &\geq \frac{\Phi^{\kappa}(\varrho(\varsigma))}{T^{\kappa}(\varrho(\varsigma))} \frac{1}{\gamma(m)} \sum_{t=\varsigma}^{m-1} S(t) T^{\kappa}(\varrho(t)). \end{split}$$

Again summing, we get

 $\Delta \Phi(m) \geq \frac{\Phi^{\kappa}(\varrho(\varsigma))}{T^{\kappa}(\varrho(\varsigma))} \frac{1}{\xi(m)} \sum_{t=\varsigma}^{m-1} \frac{1}{\gamma(t)} \sum_{u=\varsigma}^{t-1} S(u) T^{\kappa}(\varrho(u)).$ Summing once again, we obtain

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Kaleeswari and Rangasri

$$\Phi(m) \ge \frac{\Phi^{\kappa}(\varrho(\varsigma))}{T^{\kappa}(\varrho(\varsigma))} \sum_{t=\varsigma}^{m-1} \frac{1}{\xi(t)} \sum_{u=\varsigma}^{t-1} \frac{1}{\gamma(u)} \sum_{v=\varsigma}^{u-1} S(v) T^{\kappa}(\varrho(v)).$$
Now, we have to define  $m = \varrho(\varsigma)$  and  $w(\varsigma) = \frac{\Phi^{\kappa}(\varrho(\varsigma))}{T^{\kappa}(\varrho(\varsigma))}.$ 

$$\Phi(\varrho(\varsigma)) \ge w(\varsigma) \sum_{t=\varsigma} \frac{1}{\xi(t)} \sum_{u=\varsigma} \frac{1}{\gamma(u)} \sum_{v=\varsigma} S(v) T^{\kappa}(\varrho(v)),$$

 $w^{\frac{1}{\kappa}-1}(\varsigma) \geq \frac{1}{T(\varrho(\varsigma))} \sum_{t=\varsigma}^{\varrho(\varsigma)-1} \frac{1}{\xi(t)} \sum_{u=\varsigma}^{t-1} \frac{1}{\gamma(u)} \sum_{v=\varsigma}^{u-1} S(v) T^{\kappa}(\varrho(v)).$ 

Taking limit as  $\varsigma \rightarrow \infty$  on above inequality, we get

$$\limsup_{\varsigma \to \infty} w^{\frac{1}{\kappa}-1}(\varsigma) \geq \limsup_{\varsigma \to \infty} \frac{1}{T(\varrho(\varsigma))} \sum_{t=\varsigma}^{\varrho(\varsigma)-1} \frac{1}{\xi(t)} \sum_{u=\varsigma}^{t-1} \frac{1}{\gamma(u)} \sum_{v=\varsigma}^{u-1} S(v) T^{\kappa}(\varrho(v)).$$

Which contradicts (2.11). Thus,  $\mathcal{N}_3$  is  $\emptyset$  for (1.1). This completes the proof. Theorem 2.6. If all the conditions of Theorem 2.4 and 2.5 hold, then the solution  $\Psi(\varsigma)$  of (1.1) is oscillatory or satisfies  $\lim_{\varsigma \to \infty} \frac{\Psi(\varsigma)}{R(\varsigma)} = 0$ **3. EXAMPLES** 

#### J. EARIVIFLEJ

Example 3.1. Take

 $\Delta\left(\frac{1}{(2^{\varsigma+1})^2}\Delta\left(\frac{1}{2^{\varsigma+1}}\Delta\Psi(\varsigma)\right)\right) = (2^{\varsigma+2})^2\Psi^3(\varsigma+2), \varsigma \ge 1$ (3.1) Here  $q(\varsigma) = \frac{1}{(2^{\varsigma+1})^2}, r(\varsigma) = \frac{1}{2^{\varsigma+1}}, s(\varsigma) = (2^{\varsigma+1})^2, \kappa = 3, \varrho(\varsigma) = \varsigma + 2, R(\varsigma) = \sum_{t=\varsigma}^{\infty} 2^{t+1} = 2^{\varsigma}, \gamma(\varsigma) = \frac{1}{(2^{\varsigma+1})^3}, \xi(\varsigma) = 2^{\varsigma}, S(\varsigma) = (2^{\varsigma+2})^5, \varrho(\varsigma) \approx (2^{\varsigma+2})^3, T(\varsigma) \approx 2^{\varsigma} (2^{\varsigma+1})^3, \Xi(\varsigma) = \frac{1}{2^{\varsigma}}, F(\varsigma) = (2^{\varsigma+1})^2.$  Therefore (2.4) becomes  $\Delta\left(\frac{1}{(2^{\varsigma+1}+1)^3}\Delta(2^{\varsigma}\Delta\Phi(\varsigma))\right) = (2^{\varsigma+2})^5\Phi^3(\varsigma+2).$ is canonical. Clearly  $\sum_{\varsigma=\varsigma_0}^{\infty} \frac{1}{\gamma(\varsigma)} = \sum_{\varsigma=1}^{\infty} (2^{\varsigma+1})^2 = \infty$  $\sum_{t=\varsigma_1}^{\varsigma-1} \frac{1}{2^t} \sum_{u=t}^{\infty} 2^{u+1} = \infty$ Also (2.7) becomes  $\limsup_{\varsigma \to \infty} \left( 2^{\varsigma+2} \sum_{t=1}^{\varsigma-1} \frac{1}{2^{t+2}} \frac{1}{2^{t+1}} (2^{t+1})^2 + \sum_{t=c}^{\varsigma+1} (2^{t+1}) + \frac{1}{2^{\varsigma+1}} \sum_{t=c+2}^{\infty} (2^{t+1})^2 \right) = \infty.$ (i.e), (2.7) is verified. Hence by Theorem 2.4, every non-oscillatory solution  $\Psi(t)$  of (3.1) satisfies  $\lim_{\varsigma\to\infty}\frac{1}{2^{\varsigma}}\Psi(\varsigma)=0.$ Example 3.2. Take  $\Delta\left(\frac{1}{c^2}\Delta(\varsigma(\varsigma+1)\Delta\Psi(\varsigma))\right) = \varsigma(\varsigma+2)^2\Psi^2(\varsigma+1).$ (3.2) $\operatorname{Here} q(\varsigma) = \frac{1}{\varsigma^2}, r(\varsigma) = \varsigma(\varsigma+1), s(\varsigma) = \varsigma(\varsigma+2)^2, \kappa = 2, \varrho(\varsigma) = \varsigma+1, R(\varsigma) = \sum_{t=\varsigma}^{\infty} \frac{1}{t(t+1)} = \frac{1}{\varsigma'} \qquad \gamma(\varsigma) = \frac{1}{\varsigma}, \xi(\varsigma) = 1, S(\varsigma) = \varsigma(\varsigma+2)^2 \frac{1}{(\varsigma+1)^2}, Q(\varsigma) \approx \varsigma, T(\varsigma) \approx \varsigma^2, \Xi(\varsigma) \approx \varsigma. \text{ Take } M = 1, \text{ therefore (2.4) becomes}$  $\Delta\left(\frac{1}{\varsigma}(\Delta(\Delta\Phi(\varsigma)))\right) = \varsigma(\varsigma+2)^2 \frac{1}{(\varsigma+1)^2} \Phi^2(\varsigma+1),$ is canonical Clearly  $\sum_{\zeta=\zeta_0}^{\infty} \frac{1}{\gamma(\zeta)} = \sum_{\zeta=1}^{\infty} \zeta = \infty$ 63347

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 - 0997

and  

$$\sum_{u=\varsigma_{1}}^{\infty} S(u)T^{\kappa}(\varrho(u)) = \sum_{u=\varsigma_{1}}^{\infty} u(u+2)^{2} = \infty$$
and  

$$\lim_{\varsigma \to \infty} w^{\frac{1}{\varsigma}-1}(\varsigma) = 1 < \infty$$
is true.  
Also (2.11) becomes  

$$\lim_{\varsigma \to \infty} \left\{ \frac{1}{\varsigma+1} \sum_{t=1}^{\varsigma} \sum_{u=1}^{t-1} \frac{1}{\varsigma} \sum_{v=1}^{u-1} v(v+2)^{2} \right\} = \infty >$$

Hence all the conditions of Theorem 2.5 are verified, so every solution  $\Psi(\varsigma)$  of (3.2) is oscillatory.

 $M_1$ .

)

# CONCLUSION

This study finds some fresh oscillatory and asymptotic conditions for semi-canonical difference equations. The conclusions reached in this study have a high degree of generality, and they enhance and add to prior conclusions for specific instances of equation (1.1).

# ABSTRACT

The notion of certified domination was proposed by Magda Dettlaf *et al.*, and the concept of triple connected domination number was introduced by G.Mahadevan *et al.* Motivated by these papers in this article we introduce a new domination parameter called triple connected certified domination number of a graph. A dominating Set *S* is said to be a triple connected certified dominating set, if every vertex in *S* has either zero or at least two neighbours in V - S and < S > is triple connected. The minimum cardinality of a triple connected certified dominating set in G is called the triple connected certified domination number of a graph *G* and is denoted by  $\gamma_{Tcc}(G)$ . In this paper we initiate a study of this parameter.

Keywords: Domination, triple connected, certified domination, triple connected certified domination.

# INTRODUCTION

The triple connected graph was initiated by Paulraj Joseph *et al.*[3], followed by this, triple connected domination number of a graph was introduced by G.Mahadevan *et al.* [4]. The idea of certified domination was initiated by Magda Dettlaff *et al.* [5]. Motivated by these papers, here we initiate a parameter called triple connected certified domination number. The graphs used here are connected and undirected graphs. Following are the definitions of some special type of graphs which are referred from [6]. The Flower graph  $F_r$  is a graph obtained from the Helm  $H_r$ 

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Mahadevan et al.,

of joining each pendent vertex to the center of the helm. The Moser Spindle Graph has 7 points that can be placed so that its 11 edges all have the same length and is a unit-distance graph for any norm in the plane. Subdivide every edge in the graph G, join subdivided vertices that are adjacent to a common vertex, the obtained graph is called middle graph M(G). The shadow graph S'(G) is constructed by adding a new vertex v' for each vertex v of G and joining v' to the neighbours of v in G. Subdivide every edge in the graph G, join the vertices that are adjacent to a common vertex. The obtained graph is called total graph T(G). The splitting graph S(G) is constructed by taking a copy of G for each vertex v<sub>i</sub> in G corresponds to v<sub>i</sub>' in the copy of G and the joining v'<sub>i</sub> to the neighbours of v<sub>i</sub> in G. The Mirror graph  $M_r(G) = P_2 \times G$ . Book graph can be formed by joining r copies of C<sub>3</sub> with a common edge B<sub>r</sub>. Crown graph is obtained to the complete bipartite graph by removing the Horizontal edges. The Double Wheel graph DW<sub>r</sub> = 2C<sub>r</sub> + K<sub>1</sub>. The power graph G<sup>t</sup> of a graph G has V(G<sup>t</sup>) = V(G) with u and v are adjacent in G<sup>t</sup> whenever deg(u, v)  $\leq t$ . G<sup>2</sup>, G<sup>3</sup> is square and cube graph respectively.

## TCCD- number

# Definition 2.1:

A dominating set S is said to be a triple connected certified dominating set (TCCD-set), if  $|N(v) \cap (V - S)| = 0$  or k,  $k \ge 2$  and any three vertices of S Lie on a path in < S >. The minimum cardinality of (TCCD-set) is called the triple connected certified domination number (TCCD-number) and is denoted by  $\gamma_{TCC}$ .

Example 2.2:

Figure 2.1

The graph given in figure 2.1, lightened vertices forms a TCCD-set of cardinality 3 which is minimum and hence  $\gamma_{TCC}$  = 3.

Observation 2.3: For a graph G,  $\gamma \leq \gamma_{cer} \leq \gamma_{TCC}$ .

Illustration: The graph given in figure 2.2,  $\gamma = ~\gamma_{cer} = ~\gamma_{TCC} = 3.$  Example 2.5:

## Figure 2.3

Illustration: The graph given in figure 2.3  $\gamma$  = 3,  $\gamma_{cer}$  = 4,  $\gamma_{TCC}$  = 5. Observation 2.6: For a graph G,  $3 \le \gamma_{TCC}(G) \le n$ . Observation 2.7: For G,  $\gamma_{TCC}(G) \ge \left[\frac{n}{\Delta + 1}\right]$  and the bound is sharp. Since  $\left[\frac{n}{\Delta+1}\right] \leq \gamma(G) \leq n - \Delta \operatorname{also} \gamma \leq \gamma_{TCC'}$  we have  $\gamma_{TCC} \geq \left[\frac{n}{\Delta+1}\right]$ . Example 2.8:

#### Figure : 2.4

Illustration: In this graph the set of white vertices is a TCCD set whose cardinality is minimum and hence  $\gamma_{TCC}(G)$  = 4.

# Figure 2.5

Illustration: In this graph the TCCD set is a set of white vertices whose cardinality is minimum and hence  $\gamma_{TCC}(G)$  = 3.

# Exact Value of TCCD Numbers For Some Peculiar Graphs

## **Observation 3.1**

If a graph G is a Wheel graph  $(n \ge 5)$  or complete graph  $(n \ge 5)$  or star graph  $(n \ge 5)$  or Double Wheel graph  $DW_r$  ( $r \ge 7$ ) or Book graph  $B_r$  ( $r \ge 3$ ) or Moser spindle graph or Crown graph (where  $n \ge 10$ ) (or) Flower graph  $F_r$  then  $\gamma_{TCC}(G) = 3$  and i)  $\gamma_{TCC}(\overline{P_n}) = 3$  ii)  $\gamma_{TCC}(\overline{C_n}) = 3$  iii)  $\gamma_{TCC}(\overline{M_r(P_n)}) = 3$  iv)  $\gamma_{TCC}(\overline{M_r(C_n)}) = 3$ .

**Observation 3.2**  $\gamma_{TCC} \left( \mathsf{M}_{r} \overline{(\mathsf{P}_{n})} \right) = \gamma_{TCC} \left( \mathsf{M}_{r} \overline{(\mathsf{C}_{n})} \right) = 4.$ **Observation 3.3** 

For path and cycle  $(n \ge 3)$ ,  $\gamma_{TCC}(G) = n$ .

# **Observation 3.4**

- $$\begin{split} \gamma_{TCC}(K_{r,s}) &= 3 \text{ (if } 2 \geq r \geq s \text{ , } s \leq 3). \\ \gamma_{TCC}(U_r) &= \begin{cases} r-1 & \text{ if } r=6,8 \\ r & \text{ otherwise.} \end{cases} \end{split}$$

Mahadevan et al.,

9.  $\gamma_{TCC}(D(P_r)) = \begin{cases} 3 & \text{if } r = 3,4 \\ n-2 & \text{if } r \ge 5. \end{cases}$ 10.  $\gamma_{TCC}(D(C_r)) = \begin{cases} 3 & \text{if } r = 3,4 \\ n-2 & \text{if } r = 3,4 \end{cases}$ 

# **TCCD-Number of Some Special Types of Graphs**

Theorem 4.1: For a path  $P_{a}$ ,  $a \ge 7$ .  $\gamma_{TCC}(P_a^2) = \begin{cases} 3 & \text{if } a = 7 \\ \left|\frac{a}{2}\right| - 1 & \text{if } a \ge 8. \end{cases}$ 

Proof: Let  $V(P_a^2) = \{h_1, h_2, h_3, \dots, h_a\}$  and  $E(P_a^2) = \{h_i h_{i+1}, h_i h_{i+2}, 1 \le i \le a-1, 1 \le j \le a-2\}$ . Take  $S_1 = \{h_i: i \equiv a-1, 1 \le j \le a-2\}$ .  $1 \pmod{2} - \{h_1\}$ For  $a \ge 8$ , take  $S = \begin{cases} S_1 & \text{if } a \equiv 0 \pmod{2} \\ S_1 - h_a & \text{if } a \equiv 1 \pmod{2} \end{cases}$ . It is clear that if a = 7 then,  $\gamma_{\text{TCC}}(P_a^2) = 3$ . Then S is a TCCD-set of  $P_a^2$  and hence  $\gamma_{\text{TCC}}(\mathsf{P}_a^2) \leq |\mathsf{S}| = \left|\frac{\mathsf{a}}{2}\right| - 1 \text{ if } \mathsf{a} \geq 8.$ Consider a TCCD-set S' of  $P_a^2$ . Since,  $D \subseteq V$  of cardinality at most  $k = \left|\frac{a}{2}\right| - 2$  if  $a \ge 8$ . Contains an isolated vertex  $\langle D \rangle$ , then D is not a TCCD-set, we have Thus  $|S'| \ge k + 1 = \begin{cases} 3 & \text{if } a = 7 \\ \left\lfloor \frac{a}{2} \right\rfloor - 1 & \text{if } a \ge 8. \end{cases}$ Hence the proof. Theorem 4.2: For a cycleC<sub>a</sub>,  $a \ge 5$ ,  $\gamma_{TCC}(C_a^2) = \begin{cases} 3 & \text{if } a = 5 \text{ or } 6 \text{ or } 7 \\ \left|\frac{a}{2}\right| - 1 & \text{if } a \ge 8. \end{cases}$ Proof: Let  $V(C_a^2) = \{h_1, h_2, h_3, \dots, h_a\}$  let  $E(C_a^2) = \{h_j h_{j+1}, h_j h_{j+2}, h_j h_q, h_j h_{q-1}, 1 \le i \le a - 1, 1 \le j \le a - 2\}$ .  $\begin{aligned} &\text{Take S} = \{h_i: i \equiv 1 \pmod{2}\} - \{h_a\} \\ &\text{For } a \geq 8 \text{, take S} = \begin{cases} S_1 & \text{if } a \equiv 1 \pmod{2} \text{,} \\ S_1 - \{h_{a-1}\} & \text{if } a \equiv 0 \pmod{2} \text{.} \end{cases} \\ &\text{It is clear that if } 5 \leq a \leq 7 \text{ then, } \gamma_{\text{TCC}} \left(\text{C}_a^2\right) = 3. \end{aligned}$ Then S is a TCCD-set of  $C_a^2$  and hence  $\gamma_{TCC}(C_a^2) \le |S| = \left\lfloor \frac{a}{2} \right\rfloor - 1$  if  $a \ge 8$ . Consider a TCCD-set S' of  $C_a^2$ . Since, D  $\subseteq$  V of cardinality at most  $k = \left|\frac{a}{2}\right| - 2$  if  $a \ge 8$ contains an isolated vertex  $\langle D \rangle$ , then D is not a TCCD-set, we have Thus  $|S'| \ge k + 1 = \begin{cases} 3 & \text{if } a = 5 \text{ or } 6 \text{ or } 7 \\ \left\lfloor \frac{q}{2} \right\rfloor - 1 & \text{if } a \ge 8. \end{cases}$ Hence the proof. **Theorem 4.3**: For a path P<sub>a</sub>  $a \ge 5$ ,  $\gamma_{TCC}(P_a^3) = \begin{cases} 3 & \text{if } 5 \le a \le 10 \\ \left|\frac{a}{3}\right| & \text{if } a \equiv 2 \pmod{3} \\ \left|\frac{a}{3}\right| - 1 & \text{if } a \equiv 0 \text{ or } 1 \pmod{3}. \end{cases}$ 

**Proof:** Let  $V(P_a^3) = \{h_1, h_2, h_3, \dots, h_a\}$  and  $E(P_a^3) = \{h_i h_{i+1}, h_j h_{j+2}, h_k h_{k+3}, 1 \le i \le a - 1, 1 \le j \le a - 2, 1 \le k \le a - 3\}$ .

63353

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Take  $S_1 = {h_i: i \equiv 1 \pmod{3}} - {h_1}$ For  $a \ge 11$ , take  $S = \begin{cases} S_1 - \{h_a\} & \text{iff } a \equiv 1 \pmod{3} \\ S_1 & \text{if } a \equiv 0, 2 \pmod{3}. \end{cases}$ It is clear that if  $5 \le a \le 10$  then,  $\gamma_{TCC}(P_a^3) = 3$ . Then S is a TCCD-set of  $P_a^3$  and hence  $\gamma_{tcc}(P_a^3) \le |S| = \begin{cases} \left\lfloor \frac{a}{3} \right\rfloor & \text{if } a \equiv 2 \pmod{3} \\ \left\lfloor \frac{a}{3} \right\rfloor - 1 & \text{if } a \equiv 0 \text{ or } 1 \pmod{3}. \end{cases}$ Consider a TCCD-set S' of  $P_a^3$ . Since, D  $\subseteq$  V of cardinality at most  $\mathbf{k} = \begin{cases} \left|\frac{\mathbf{a}}{3}\right| - 1 & \text{if } \mathbf{a} \equiv 2 \pmod{3}, \\ \left|\frac{\mathbf{a}}{3}\right| - 2 & \text{if } \mathbf{a} \equiv 0 \text{ or } 1 \pmod{3}. \end{cases}$ contains an isolated vertex  $\langle D \rangle$ , then D is not a TCCD-set, we have Thus  $|S'| \ge k + 1 = \begin{cases} 3 & \text{if } 5 \le a \le 10 \\ \left\lfloor \frac{a}{3} \right\rfloor & \text{if } a \equiv 2 \pmod{3} \\ \left\lfloor \frac{a}{3} \right\rfloor - 1 & \text{if } a \equiv 0 \text{ or } 1 \pmod{3}. \end{cases}$ Hence the proof Hence the proof. Theorem 4.4: For a cycle  $C_a a \ge 5$ ,  $\gamma_{TCC}(C_a^3) = \begin{cases} 3 & \text{if } 5 \le a \le 10 \\ \left\lfloor \frac{a}{3} \right\rfloor & \text{if } a \equiv 2 \pmod{3} \\ \left\lfloor \frac{a}{3} \right\rfloor - 1 & \text{if } a \equiv 0 \text{ or } 1 \pmod{3}. \end{cases}$ Proof: Let V(C<sub>a</sub><sup>3</sup>) = {h<sub>1</sub>, h<sub>2</sub>, h<sub>3</sub>, ..., h<sub>a</sub>, h<sub>1</sub>} and E(C<sub>a</sub><sup>3</sup>) = {h<sub>1</sub>, h<sub>2</sub>, h<sub>3</sub>, ..., h<sub>a</sub>, h<sub>1</sub>} and E(C<sub>a</sub><sup>3</sup>) = {h<sub>1</sub>, h<sub>2</sub>, h<sub>k</sub>, h\_{k}, h  $i \le a - 1, 1 \le j \le a - 2, 1 \le k \le a - 3$ . Take  $S_1 = \{h f_i : i \equiv 1 \pmod{3}\}$  $For a \ge 11, take S = \begin{cases} S_1 - \{h_{a-2}\} & \text{if } a \equiv 0 \pmod{3} \\ S_1 - \{h_{a-3}, h_a\} & \text{if } a \equiv 1 \pmod{3} \\ S_1 - \{h_{a-1}, h_a\} & \text{if } a \equiv 2 \pmod{3}. \end{cases}$ It is clear that if  $5 \le a \le 10$  then,  $\gamma_{TCC}(C_a^3) = 3$ . Then S is a TCCD-set of  $C_a^3$  and hence  $\gamma_{tcc}(C_a^3) \leq |S| = \begin{cases} \left\lfloor \frac{a}{3} \right\rfloor & \text{if } a \equiv 2 \pmod{3} \\ \left\lfloor \frac{a}{3} \right\rfloor - 1 & \text{if } a \equiv 0 \text{ or } 1 \pmod{3}. \end{cases}$ Consider a TCCD-set S' of  $C_a^3$ . Since,  $D \subseteq V$  of cardinality at most  $k = \begin{cases} \left\lfloor \frac{a}{3} \right\rfloor - 1 & \text{ if } a \equiv 2 \pmod{3} \\ \left\lfloor \frac{a}{3} \right\rfloor - 2 & \text{ if } a \equiv 0,1 \pmod{3}. \end{cases}$ contains an isolated vertex < D >, then D is not a TCCD-set, we have Thus  $|S'| \ge k + 1 = \begin{cases} 3 & \text{if } 5 \le a \le 10 \\ \left\lfloor \frac{a}{3} \right\rfloor & \text{if } a \equiv 2 \pmod{3} \\ \left\lfloor \frac{a}{3} \right\rfloor - 1 & \text{if } a \equiv 0 \text{ or } 1 \pmod{3}. \end{cases}$ 

Hence the proof.

# CONCLUSION

In this paper we have initiated and analyzed Triple connected certified domination number of a graph. Also we have found its exact values for some special types of graphs. In the succeeding papers we will extend the study for product related graphs.

# ABSTRACT

The Neutrosophic moderately generalised star  $\alpha J$  - closed sets in Neutrosophic topological spaces are a novel class of sets that we present in this study (briefly Neu - mg<sup>•</sup> $\alpha j$  - closed sets). Here, we study the concepts and discuss the properties of Neu - mg<sup>•</sup> $\alpha j$  - closed sets.

**Keywords**: Neutrosophic set, Neutrosophic topological space, Neutrosophic Mildly Generalized Star  $\alpha J$  - closed sets, Neutrosophic mildly generalized star  $\alpha J$  - open sets, Neutrosophic mildly generalized star  $\alpha J$  - Neighbourhoods

# INTRODUCTION

Since Zadeh[13] introduced the fuzzy set notation in 1965, it has spread to practically all areas of mathematics. Chang[2] (1968) proposed and developed the idea of fuzzy topological space, and since then, To create fuzzy topological spaces, numerous concepts from classical topology have been used. Initially, the intuitionistic fuzzy set's concept was proposed in 1988 by Atanassov[1]. Thakur and Chaturvedi[12] (2006) established and extended the concept behind the generalized intuitionistic fuzzy closed set. After Smarandache[4] (2000) proposed and expanded the notions of the neutrosophic set along with neutrosophy. This article covers the concepts of generalized mildly Star  $\alpha J$  - closed sets and several interesting properties and some theorems are also discussed.

# Preliminaries

Here, we review several essential Neutrosophic set findings as well as their basic operation and Definition.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Samukthaa and Suganthi

# Definition 2.1[4]

Non-empty fixed set Y must be Y. Neutrosophic sets E is the object in following form: E = { $(y, \mu_E(y), \sigma_E(y), \gamma_E(y)); y \in Y$ } With,  $\mu_E(y)$  is the membership function degree  $\sigma_E(y)$  is the indeterminacy degree  $\gamma_E(y)$  is the non-membership function degree

# Remark 2.2:[4]

The Neutrosophic sets  $E = \{(y, \mu_E(y), \sigma_E(y), \gamma_E(y)); y \in Y\}$  may be identified as an ordered triple  $E = \langle \mu_E, \sigma_E, \gamma_E \rangle$  in ]-0, 1+ [ on Y.

# Remark 2.3:[4]

We can denote, the Neutrosophic sets  $E = \{\langle y, \mu_E(y), \sigma_E(y), \gamma_E(y) \rangle; y \in Y\}$  as  $E = \langle y, \mu_E(y), \sigma_E(y), \gamma_E(y) \rangle$ "

# Definition 2.4[5]

Every non-empty Intuitionistic fuzzy set in Y is called the Neutrosophic set. Where the topological space we may define  $O_N$  and  $I_N$  as follows:

For all  $y \in Y$ 

$"0_1 =$	⟨y, 1,0,0⟩	$N_1 =$	$\langle y, 1, 0, 0 \rangle$
$O_2 =$	(y, 1, 0, 1)	$N_2 =$	$\langle y, 1, 0, 1 \rangle$
$O_3 =$	(y, 1, 1, 0)	$N_3 =$	$\langle y, 1, 1, 0 \rangle$
$O_4 =$	$\langle y, 1, 1, 1 \rangle$	$N_4 =$	$\langle y, 1, 1, 1 \rangle$ "

# Definition 2.5[5]

For all  $y \in Y$ , the complement of Neutrosophic sets E [shortly C - E] is expressed as C - E = { $(y, \gamma_E(y), 1-\sigma_E(y), \mu_E(y))$ }

# Definition 2.6[6]

For all  $y \in Y$ , the two Neutrosophic sets E & F are given by "E =  $\langle y, \mu_E(y), \sigma_E(y), \gamma_E(y) \rangle$ " and "F =  $\langle y, \mu_F(y), \sigma_F(y), \gamma_F(y) \rangle$ " Then, the subset  $(E \subseteq F)$  is  $E \subseteq F \iff \mu_E(y) \le \mu_F(y), \sigma_E(y) \le \sigma_F(y), \gamma_E(y) \le \gamma_F(y)$ 

# Proposition 2.7:[3]

Any Neutrosophic set E meets the undergiven requirements  $O_N \subseteq E, O_N \subseteq O_N$  $E \subseteq I_N, I_N \subseteq I_N$ 

## Definition 2.8[3]

For any non-empty set E the intersection and union of any 2 Neutrosophic sets E and F, where  $E = \langle y, \mu_E(y), \sigma_E(y), \gamma_E(y) \rangle^{"} \text{ and } F = \langle y, \mu_F(y), \sigma_F(y), \gamma_F(y) \rangle \text{ is given by}$   $E \cup F = \langle y - \mu_E(y) \land \mu_F(y) - \sigma_E(y) \land \sigma_F(y)$   $E \cap F = \langle y - \mu_E(y) \lor \mu_F(y) - \sigma_E(y) \lor \sigma_F(y) \text{ respectively}$ 

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 - 0997

# Samukthaa and Suganthi

# Proposition 2.9[4]

The two Neutrosophic sets E and F are subject to the following criteria. i.  $C - (A \cap B) = C - A \cup C - B$ 

 $ii \quad C - (A \cup B) = C - A \cap C - B$ 

## Definition 2.10[6]

A family  $\tau_N$  of Neutrosophic subsets in Neutrosophic topological set Y holds the following axioms  $O_N, I_N \in \tau_N$ for any  $M_1, M_2 \in \tau_N, M_1 \cap M_2 \in \tau_N$ for each  $\{M_i; i \in J\} \subseteq \tau_N \cup M_I \in \tau_N$ 

The pair  $(Y, \tau_N)$  is thus referred to as neutrosophic topological space. Neutrosophic open sets are the constituents of Neutrosophic topological space $\tau_N$ , while Neutrosophic closed sets works as complements of open sets.

# Definition 2.11 [5]

The Neutrosophic closure and interior of a family  $(Y, \tau_N)$  Neutrosophic topological space for a Neutrosophic set E = { $\langle y, \mu_E(y), \sigma_E(y), \gamma_E(y) \rangle$ ;  $y \in Y$ } in Y is defined by

Neu – cl (E) =  $\cap$  {*G*: *G* is a Neutrosophic closed set in Y and E  $\subseteq$  *G*} Neu – Int (E) =  $\bigcup \{J: J \text{ is a Neutrosophic open set in Y and } E \subseteq J\}$  respectively and it holds the following conditions

E is Neutrosophic open set if,E = Neu-Int (E)

E is Neutrosophic closed set if,E = Neu-cl (E)

# Proposition 2.12:[4]

For any Neutrosophic set E of a family  $(Y, \tau_N)$  Neutrosophic topological space, we've "Neu-cl(C - E) = C - (Neu - Int(E)) Neu-Int(C - E) = C - (Neu - cI(E))"

# Proposition 2.12:[7]

Any two E and F Neutrosophic sets have the aforementioned characteristics in Neutrosophic topological space  $(Y, \tau_N)$ 

- 1.  $Neu Int(E) \subset E$
- 2.  $E \subseteq Neu cl(E)$ 3.  $E \subseteq F \Rightarrow Neu Int(E) \subseteq Neu Int(F)$
- 4.  $E \subseteq F \Rightarrow Neu cl(E) \subseteq Neu cl(F)$
- 5. Neu Int(Neu Int(E)) = Neu Int(E)
- 6. Neu cl(Neu cl(E)) = Neu cl(E)
- 7.  $Neu Int(E \cap F) = Neu Int(E) \cap Neu Int(F)^{"}$
- 8.  $Neu cl(E \cup F) = Neu cl(E) \cap Neu cl(F)$
- 9.  $Neu Int(O_N) = O_N$
- 10.  $Neu Int(I_N) = I_N$
- 11.  $Neu cl(O_N) = O_N$
- 12.  $Neu cl(I_N) = I_N$
- 13.  $E \subseteq F \Rightarrow C E \subseteq C F$
- 14.  $Neu cl(E \cap F) \subseteq Neu cl(E) \cap Neu cl(F)$
- 15.  $Neu Int(E \cup F) \supseteq Neu Int(E) \cap Neu Int(F)$

## Definition 2.13[7]

A subset E of a Neutrosophic topological space  $(Y, \tau_N)$  is known as a generalized Neutrosophic closed if Neu –  $cl(E) \subseteq U, wheneverE \subseteq U$  and U is Neutrosophic closed set.

# Samukthaa and Suganthi

# Neutrosophic Mildly Generalized Star $\alpha J$ - closed sets

We present and explore the novel idea of Neutrosophic slightly generalised star $\alpha J$  - closed sets in Neutrosophic topological spaces in this part.

# Definition 3.1:

Neutrosophic slightly generalised star  $\alpha J$  closed sets are a Neutrosophic subset E of a Neutrosophic topological space( $Y, \tau_N$ ) (shortly Neu – mg<sup>•</sup> $\alpha J$  - closed) if  $Neu - Jcl(E) \subseteq UwheneverE \subseteq U$  and U is Neutrosophic mildly generalised open (Neu – mg – open) in Neutrosophic set E.

# Theorem 3.2:

Every set that is Neu-closed is Neu -  $mg^* \alpha J$  - closed.

#### Proof:

Now consider any Neutrosophic "closed-set E and  $E \subseteq U$ , Where U is" Neutrosophic mildly generalized open (Neu – mg – open) Since, E is Neutrosophic closed (Neu-closed) $Neu - Jcl(E) \subseteq Neu - cl(E)$ Therefore, $Neu - Jcl(E) \subseteq E \subseteq E \subseteq U$ Hence, E is Neu – mg<sup>•</sup> $\alpha J$  - closed in Y.

## Remark 3.3:

Finite union of Neu –  $mg^* \alpha J$  - closed need not be Neu –  $mg^* \alpha J$  - closed Finite intersection of Neu –  $mg^* \alpha J$  - closed need not be Neu –  $mg^* \alpha J$ -closed"

# Definition 3.4:

The intersection of all Neu -  $\operatorname{mg}^* \alpha J$  - closed sets including a given subset E of "Neutrosophic topological space"  $(Y, \tau_N)$  is referred to as Neu -  $\operatorname{mg}^* \alpha J$  - closure of E and we can denote it by Neu –  $\operatorname{mg}^* \alpha J$  - cl(E). Symbolically,  $Neu - \operatorname{mg}^* \alpha J$  - cl $(E) = \cap \{K: E \subset K, KisNeu - \operatorname{mg}^* \alpha J - closed in Y\}$ 

## Remark 3.5:

The following conditions hold for a subsets E and F of Neutrosophic topological space

- 1.  $Neu mg^* \alpha J cl(\varphi) = \varphi and Neu mg^* \alpha J cl(X) = X$
- 2.  $E \subset F \Rightarrow Neu mg^* \alpha J cl(E) \subset Neu mg^* \alpha J cl(F)$
- 3.  $E \subset F \Rightarrow Neu mg^* \alpha J cl(Neu mg^* \alpha J cl(E)) = Neu mg^* \alpha J cl(E)$
- 4.  $Neu mg^* \alpha J cl(E \cup F) \supseteq Neu mg^* \alpha J cl(F) \cup Neu mg^* \alpha J cl(F)$
- 5.  $Neu mg^* \alpha J cl(E \cap F) \subseteq Neu mg^* \alpha J cl(E) \cap Neu mg^* \alpha J cl(F)$

# Neutrosophic mildly generalized star $\alpha J$ - open sets and Neutrosophic mildly generalized star $\alpha J$ -Neighbourhoods

Here we introduced the notion of Neutrosophic mildly generalized star  $\alpha J$  - open sets and by using it we obtain the characterizations of Neutrosophic mildly generalized star neighbourhoods.

## Definition 4.1:

The term "Neutrosophic mildly generalized star  $\alpha J$  -open set" refers to a subset E of a Neutrosophic topological space. If C - A is  $Neu - mg^* \alpha J$ -closed in Y, then (briefly $Neu - mg^* \alpha J$ -open). All Neutrosophic family mildly generalized star  $\alpha J$  - open sets can be denoted by  $Neu - MG * \alpha J(Y, \tau_N)$ 

## Remarks 4.2:

Finite union of Neu –  $mg^* \alpha J$  - open sets require not be Neu –  $mg^* \alpha J$  - open Finite intersection of Neu –  $mg^* \alpha J$  - open sets require not be Neu –  $mg^* \alpha J$ -open"

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Samukthaa and Suganthi

## Definition 4.3:

Any point in the Neutrosophic topological space Y will do as y. If and only if a Neu -  $mg^*\alpha J$  - open set N exists such that  $y \in N \subseteq M$ , a subset M of Y is said to be a Neu -  $mg^*\alpha J$  - neighbourhood of Y.

## Definition 4.4:

A subset M of a topological space with neutrosophic properties Y is referred to as a Neu -  $mg^*\alpha J$  -  $E \subset Y$  neighbourhood if there exists a Neu –  $mg^*\alpha J$  - open set N such that  $E \subseteq N \subseteq M$ 

## Remark 4.5:

Each neighbourhood M of  $y \in Y$  is a Neu – mg<sup>\*</sup> $\alpha J$  - neighbourhood of y

#### Definition 4.6:

The Neu -  $mg^*\alpha J$  - neighbourhood system at y for every point y in a Neutrosophic topological space Y is the collection of all Neu -  $mg^*\alpha J$  - neighbourhoods, and it is denoted by Neu -  $mg^*\alpha J$  - M (y).

## Theorem 4.7:

For all  $y \in Y$  and Y be a Neutrosophic topological space, let Neu –  $mg^*\alpha J$  - M(y) be the collection of all Neu –  $mg^*\alpha J$  - neighbourhood of y, then it holds the following conditions

- 1.  $\forall y \in Y, \text{Neu} \text{mg}^* M(y) \neq \varphi$
- 2.  $M \in \text{Neu} \text{mg}^* M(y) \Rightarrow y \in M$
- 3.  $M \cup \in \text{Neu} \text{mg}^* M(y), N \supset M \Rightarrow N \in \text{Neu} \text{mg}^* M(y)$
- 4.  $M \in \text{Neu} \text{mg}^* M(y) \Rightarrow \exists N \in \text{Neu} \text{mg}^* M(y) \Rightarrow N \subset MandN \in \text{Neu} \text{mg}^* M(z) \forall z \in N$

## Definition 4.8:

Suppose E represent a subset of Neutrosophic space Y. If there is a Neu -  $mg^*\alpha J$  -open set N such that  $y \in N \subseteq E$ , a  $y \in Y$  point is said to be a Neu -  $mg^*$  internal point of E. The term "Neu -  $mg^*\alpha J$  - interior of E" refers to the set of all Neu -  $mg^*\alpha J$  - interior points of E and we can denote it by Neu –  $mg^*\alpha J$  - int(E)

#### Theorem 4.9:

The following assertions are valid, for subsets E and F of Neutrosophic topological space Y,

- 1.  $Neu mg^* \alpha J int(E)$  is union of all  $Neu mg^* \alpha J$  -open E subsets.
- 2.  $E = Neu mg^* \alpha J int(E) if EisNeu mg^* \alpha J open$
- 3.  $Neu mg^* \alpha J int(Neu mg^* \alpha J int(E)) = Neu mg^* \alpha J int(E)$
- 4.  $Neu mg^* \alpha J int(E) = E \setminus Neu D_{mg^* \alpha J}(Y \setminus E)$
- 5.  $Y \setminus Neu mg^* \alpha J int(E) = Neu mg^* \alpha J cl(Y \setminus E)$
- 6.  $Y \setminus Neu mg^* \alpha J cl(E) = Neu mg^* \alpha J int(Y \setminus E)$
- 7.  $E \subseteq F \Rightarrow Neu mg^* \alpha J int(E) \subseteq Neu mg^* \alpha J int(F)$
- 8.  $Neu mg^* \alpha J int(E) \cup Neu mg^* \alpha J int(F) \subseteq Neu mg^* \alpha J int(E \cup F)$
- 9.  $Neu mg^* \alpha J int(E \cup F) \subseteq Neu mg^* \alpha J int(E) \cap Neu mg^* \alpha J int(F)$

#### Definition 4.10:

The *Neu* –  $mg^* \alpha J$  - border and the *Neu* –  $mg^* \alpha J$  - frontier of E; E is any subset of the Neutrosophic topological space Y is given by the set Neu –  $b_{mg^* \alpha J}(E) = E \setminus Neu - mg^* \alpha J - int(E)$  and the set Neu –  $Fr_{mg^* \alpha J}(E) = Neu - mg^* \alpha J - cl(E) \setminus Neu - mg^* \alpha J - int(E)$  respectively.

## Remarks 4.11:

Neu  $-b_{mg^*\alpha J}(E) = Neu - Fr_{mg^*\alpha J}(E)$  if E is an  $Neu - mg^*\alpha J$  - closed subset of Neutrosophic topological space Y **Theorem 4.12**:

Mentioned below are the conditions hold for any subset E of the Neutrosophic topological space Y

- 1.  $E = Neu mg^* \alpha J int(E) \cup Neu b_{mg^* \alpha I}(E)$
- 2.  $Neu mg^* \alpha J int(E) \cap Neu b_{mg^* \alpha J}(E) = \varphi$
- 3. Neu  $b_{mq^*\alpha I}(E) = \varphi if EisanNeu mg^*\alpha J openset$
- 4. Neu  $-b_{mq^*\alpha I}(Neu mq^*\alpha I int(E)) = \varphi$
- 5.  $Neu mg^* \alpha J int (Neu b_{mg^* \alpha J}(E)) = \varphi$
- 6. Neu  $-b_{mq^*\alpha I}$  (Neu  $-b_{mq^*\alpha I}(E)$ ) = Neu  $-b_{mq^*\alpha I}(E)$
- 7. Neu  $-b_{ma^*\alpha I}(E) = E \cap Neu mg^*\alpha J cl(Y \setminus E)$

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

8. Neu  $- b_{mq^*\alpha J}(E) = E \cap Neu - D_{mq^*\alpha J}(Y \setminus E)$ 

### Theorem 4.13:

The following assertions are valid, for subsets E of Neutrosophic topological space Y,

- 1.  $Neu mg^* \alpha J cl(E) = Neu mg^* \alpha J int(E) \cup Neu Fr_{mg^* \alpha J}(E)$
- 2.  $Neu mg^* \alpha J int(E) \cup Neu Fr_{mg^* \alpha J}(E) = \varphi$
- 3. Neu  $b_{mg^* \alpha I}(E) \subseteq Neu Fr_{mg^* \alpha I}(E)$
- 4. Neu  $\operatorname{Fr}_{\operatorname{mg}^* \alpha J}(E) = \operatorname{Neu} b_{\operatorname{mg}^* \alpha J}(E) \cup \operatorname{Neu} D_{\operatorname{mg}^* \alpha J}(E) \setminus \operatorname{Neu} \operatorname{mg}^* \alpha J int(E)$
- 5. Neu  $\operatorname{Fr}_{\operatorname{mg}^* \alpha J}(E) = \operatorname{Neu} b_{\operatorname{mg}^* \alpha J}(Y \setminus E) if E is an Neu \operatorname{mg}^* \alpha J openset$
- 6. Neu  $\operatorname{Fr}_{\operatorname{mg}^* \alpha J}(E) = Neu \operatorname{mg}^* \alpha J cl(E) \cap Neu \operatorname{mg}^* \alpha J cl(Y \setminus E)$
- 7. Neu  $\operatorname{Fr}_{\operatorname{mg}^* \alpha J}(E) = \operatorname{Neu} \operatorname{Fr}_{\operatorname{mg}^* \alpha J}(Y \setminus E)$
- 8. Neu  $\operatorname{Fr}_{\operatorname{mg}^* \alpha J}(E)$  is Neu  $\operatorname{mg}^* \alpha J$  closed
- 9. Neu  $\operatorname{Fr}_{\operatorname{mg}^* \alpha J}(\operatorname{Neu} \operatorname{Fr}_{\operatorname{mg}^* \alpha J}(E)) \subseteq \operatorname{Neu} \operatorname{Fr}_{\operatorname{mg}^* \alpha J}(E)$
- 10. Neu  $\operatorname{Fr}_{\operatorname{mg}^*\alpha J}(Neu \operatorname{mg}^*\alpha J int(E)) \subseteq \operatorname{Neu} \operatorname{Fr}_{\operatorname{mg}^*\alpha J}(E)$
- 11. Neu  $\operatorname{Fr}_{\operatorname{ma}^* \alpha I} \left( \operatorname{Neu} \operatorname{mg}^* \alpha J cl(E) \right) \subseteq \operatorname{Neu} \operatorname{Fr}_{\operatorname{ma}^* \alpha I}(E)$
- 12.  $Neu mg^* \alpha J int(E) = E \setminus Neu Fr_{mg^* \alpha J}(E)$

## Definition 4.14:

The  $Neu - mg^* \alpha J$  -exterior of E; E is any subset of Y given by  $Neu - mg^* \alpha J$  -the interior of Y\E and we can be denoted by Neu - Ext<sub>mg^\* \alpha J</sub>(E). That is, Neu - Ext<sub>mg^\* \alpha J</sub>(E) =  $Neu - mg^* \alpha J - int(Y \setminus E)$ 

## Theorem 4.15

The following assertions are valid, for subsets E and F of Neutrosophic topological space Y,

- 1. Neu Ext<sub>mg\* $\alpha J$ </sub> (*E*) = Neu mg\* $\alpha J$  open
- 2. Neu  $\operatorname{Ext}_{\operatorname{mg}^*\alpha J}(E) = Y \setminus Neu \operatorname{mg}^*\alpha J cl(E)$
- 3. Neu  $\operatorname{Ext}_{\operatorname{mg}^* \alpha J}\left(\operatorname{Neu} \operatorname{Ext}_{\operatorname{mg}^* \alpha J}(E)\right) = \operatorname{Neu} \operatorname{mg}^* \alpha J \operatorname{int}\left(\operatorname{Neu} \operatorname{mg}^* \alpha J \operatorname{cl}(E)\right) \supseteq \operatorname{Neu} \operatorname{mg}^* \alpha J \operatorname{int}(E)$
- 4. Neu  $\operatorname{Ext}_{\operatorname{mq}^* \alpha J}(F) \subseteq \operatorname{Neu} \operatorname{Ext}_{\operatorname{mq}^* \alpha J}(E) if E \subseteq F$
- 5. Neu  $\operatorname{Ext}_{\operatorname{mg}^* \alpha J}(E \cup F) \subseteq \operatorname{Neu} \operatorname{Ext}_{\operatorname{mg}^* \alpha J}(E) \cap \operatorname{Neu} \operatorname{Ext}_{\operatorname{mg}^* \alpha J}(F)$
- 6. Neu  $\operatorname{Ext}_{\operatorname{mg}^*\alpha J}(E \cap F) \supseteq \operatorname{Neu} \operatorname{Ext}_{\operatorname{mg}^*\alpha J}(E) \cup \operatorname{Neu} \operatorname{Ext}_{\operatorname{mg}^*\alpha J}(F)$
- 7. Neu  $\operatorname{Ext}_{\operatorname{mg}^* \alpha J}(Y) = \varphi$
- 8. Neu Ext<sub>mg\* $\alpha J$ </sub> ( $\varphi$ ) = Y
- 9. Neu Ext<sub>mg\* $\alpha J</sub>(E) = Neu Ext<sub>mg*<math>\alpha J</sub>(Y \ eu Ext<sub>mg*\alpha J</sub>(E))$ </sub></sub>
- 10.  $Y = Neu mg^* \alpha J int(E) \cup Neu Ext_{mg^* \alpha J}(E) \cup Neu Fr_{mg^* \alpha J}(E)$

## CONCLUSION

In this paper, we defined some new classes of Neutrosophic Mildly Generalized Star  $\alpha J$  - closed sets and studied some of their basic properties. Finally we have introduced Neutrosophic mildly generalized star  $\alpha J$  - open sets and Neutrosophic mildly generalized star  $\alpha J$  - Neighbourhoods in Neutrosophic topological space and studied some their properties.

## ABSTRACT

Customers feedback and assessments have a huge impact on the long term success of the organisation. The main contribution of This paper is to analyses six sigma based waiting time control chart  $(M|M|1) (\infty|FCFS)$  Queuing Model using Process Capability to monitor the queue and improve performance of the system explained with numerical examples

Keywords: Six Sigma. Control chart, Queuing Theory, Process Capability, Waiting time.

## INTRODUCTION

Today's technological development has contributed with big data .Customers satisfaction is critical to the long term viability of an online and offline firm. This can be accomplished by focussing on the shortest possible response time. When the waiting time is reduced, the tendency is offer a higher rating, if higher rating increases, resulting in higher customer satisfaction. The adoption of six sigma based waiting time control chart and process capability would be extremely beneficial in monitoring queue length and performance of the system.

## **Control Charts**

Control charts are used to monitor and analyse fluctuations in the performance of a process over time. They are commonly used in quality control to set upper and lower limits that demonstrate process stability. Extensive study has been undertaken in this sector, beginning with product faults. Control charts are using currently being used to examine queuing systems, specifically factors such as customer waiting time, no. of customers in the system, and those queue. These elements are critical in ensuring client happiness[12].

## **REVIEW OF LITERATURE**

Haim Shore (2007) proposed an attribute control chart [2]. While M.V.Karparde and S.D Dhabe (2010) developed control chart with random queue length for queuing model (M/M/1): ( $\infty$ /FCFS) [4]. T, Poongodi and S. Muthulakshmi (2013) investigated system waiting time using control chart for (M/M/1): ( $\infty$  /FCFS) Queuing model [7]. A.R Sudamani Ramasamy and Vennila (2012) investigated skewness in control chart for random queue length[1] . N. Pukazhendhi and S. Poornima (2018) created a waiting time control chart for (M/M/S): ( $\infty$ /FCFS) queueing model using process capability [8]. Mani. N and P.K.Sivakumaran (2023) contributed six sigma based control chart for single server queuing model [5]. Mani N and P.K.Sivakumaran(2023) developed six sigma based control chart for single server , infinite capacity Markovian Queuing model using process capability[6]y.

#### Six Sigma

Six Sigma is a methodology consisting of techniques designed to eliminate errors, improve quality, and achieve operational excellence. It was first established in 1980 by Motorola. In 2008, the quality levels related to Six Sigma were developed and refined by Radhakrishnan and Sivakumaran (2010) [10,14]. This work paved the way for the subsequent development of control charts based on Six Sigma for defect monitoring by the team of Radhakrishnan and Balamurugan (2010)[11]. The process capability index (PCI) is a metric that evaluates the accuracy and consistency of the performance of a system under assessment.

## Mean waiting time of the customers in the Queue [1]

$$E(w_q) = \frac{\nu_q}{\mu(1-\rho_q)} \quad \dots \quad (1)$$

$$E(w_q^2) = \frac{2\rho_q}{\mu^2(1-\rho_q)^2} \quad \dots \quad (2)$$

$$var(w_q) = E(w_q^2) - [E(w_q)]^2 = \frac{\rho_q(2-\rho_q)}{\mu^2(1-\rho_q)^2} \quad \dots \quad (3)$$

$$S.D(W_q) = \sqrt{var(w_q)} = \sqrt{\frac{\rho_q(2-\rho_q)}{\mu^2(1-\rho_q)^2}} \quad \dots \quad (4)$$

Shewhart Control chart- Performance of the average waiting time of the customers in the queue is given below[5,6]

$$LCL(W_{q}) = E(W_{q}) - 3 \times \sqrt{var(W_{q})}$$
  
$$= \frac{\rho_{q}}{\mu(1-\rho_{q})} - 3 \times \sqrt{\frac{\rho_{q}(2-\rho_{q})}{\mu^{2}(1-\rho_{q})^{2}}} \quad \dots \dots \quad (5)$$
  
$$CL(W_{q}) = E(W_{q}) = \frac{\rho_{q}}{\mu(1-\rho_{q})} \quad \dots \dots \quad (6)$$
  
$$UCL(W_{q}) = E(W_{q}) + 3 \times \sqrt{var(W_{q})} \quad \dots \dots \quad (7)$$

## Six Sigma based Control chart performance of the waiting time in the queue by using process capability is given by [5,6]

The process capability index, Cp, is calculated as TL/ 6, where TL represents the tolerance level defined as the range between the highest and lowest values within the expected standard deviation range for the given  $\lambda$  and  $\mu$  assumptions[7].

$$UCL(6\sigma_{wq}) = E(W_q) + \sqrt{V(W_q)} \times \sigma pc$$
$$= \frac{\rho_q}{\mu(1-\rho_q)} + \sqrt{\frac{\rho_q(2-\rho_q)}{\mu^2(1-\rho_q)^2}} \times 6\sigma_{pc} - \cdots - (8)$$

63364

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

$$LCL(6\sigma_{wq}) = E(W_q) - \sqrt{V(W_q)} \times \sigma pc$$
$$= \frac{\rho_q}{\mu(1-\rho_q)} - \sqrt{\frac{\rho_q(2-\rho_q)}{\mu^2(1-\rho_q)^2}} \times 6\sigma_{pc} \dots (9)$$

## CONCLUSION

The use of control charts within queue theory is a growing area within the statistical quality control domain. Customer satisfaction depends on both the waiting time of customers in the queue and the amount of time spent on the service per customer. This is why the focus of this research is on the single server, infinite capacity queue. The main focus is on monitoring customers waiting time in the queue using Six Sigma based control charts. Implementing Six Sigma methodologies reduces variation and keeps the number of customers waiting time in the queue within the optimal range. This increases system efficiency.

## ABSTRACT

The high performance distributed computing of cloud computing has facilitated its rapid adoption. Via service providers, it provides internet users with services and access to shared resources. One of the most crucial research areas that need to be concentrated on is the effective performance of task scheduling in clouds. Several cloud-based job scheduling algorithms have been evaluated, and they performed well in a timely manner. Examples include in order giving users better services, task scheduling has become crucial. In light of this, the current study intends to offer a task-scheduling method employing the Firefly Algorithm, Lion Optimization Algorithm (LOA), and HFLO (Hybrid Firefly and Lion Optimizer) Algorithm. The HFLO algorithm is superior than the Firefly algorithm, LOA algorithm efficiency and task delay time, energy consumption, resource utilization, and cost, and as a consequence, it can be used to accomplish the best scheduling in cloud computing.

Keywords: Task Scheduling, Job Scheduling, Lion Optimization, Fairfly, HFLO

## INTRODUCTION

The utilization of cloud computing allows for pay-as-you-go access to in-demand IT resources from any location at any time. A typical cloud computing datacenter consists of a few computers connected by fast networks. The

## Karunya and Gayathri Devi

calculation of broad and varied groups of jobs is ideally suited to this environment. Different users' tasks are no longer distinguishable from one another. Assigning more jobs to be carried out on the available computing machines is the scheduling difficulty in this situation.

Cloud computing can be characterised by three specific features:

- Unlimited computing resources, such as processing speed, data storage capacity, and application availability on demand as needed to enable high levels of agility and scalability that satisfy business requirements.
- Why there are no long-term commitments; because computing resources are purchased on a month-to-month or even minute-to-minute basis, they are immediately available and may be used for as long as necessary before being decommissioned.
- Pay-as-you-go pricing; as there are no long-term contracts, the price of cloud computing resources is based on how much is used [1].

The flexibility and dependability of cloud-based systems are significantly increased by task scheduling. The primary motivation for allocating tasks to resources in line with time constraints is to determine the optimal order in which to perform various tasks so as to provide the user with the best outcome. In cloud computing, resources are always dynamically assigned in accordance with the order and specifications of the task, subtasks, and resources in any form, such as cups, firewalls, and networks. This causes task scheduling in the cloud to become a dynamic problem because no previously established sequence may be helpful during job processing. Because the flow of tasks is unclear, execution paths are also uncertain, and resources are also uncertain because several tasks are present that are sharing them concurrently at the same time, scheduling is dynamic because of these factors.

The scheduling algorithms used in distributed systems determine the order in which these activities complete by allocating subtasks to resources that improve system performance [2]. In heterogeneous distributed systems, such as the cloud environment, where the allocation of processors and resources to tasks is a complex issue, numerous techniques and algorithms have been developed to lessen the complexity of time and the simultaneous operation of subtasks. Heterogeneous resources, total running time, runtime and productivity convergence speed in meta-heuristic methods, and scheduling method effectiveness are a few of the issues that might be encountered in the field of scheduling activities in heterogeneous distributed systems. This paper presents research on task scheduling for cloud computing jobs in light of the significance of this subject. The task scheduling algorithm is regarded as a complicated procedure since it has to fit a lot of jobs into the resources that are available. On the other hand, when creating a task scheduling algorithm, there are a lot of variables to take into account. From the viewpoint of a Cloud user, several of these factors are significant (i.e., tasks compilation time, cost, and response time). The use of resources, fault tolerance, and power consumption are other factors that are crucial from the standpoint of cloud providers [3].

A problem that is NP-Complete is task scheduling. Hence, by taking into account performance characteristics (such as completion time, cost, resource utilisation, etc.), optimization methodologies could be applied to solve it. The purpose of this research is to create a task scheduling algorithm for the cloud computing environment based on genetic algorithms for allocating and carrying out independent tasks in order to increase task completion times, reduce execution costs, and maximize resource usage. In order to solve NP issues, a number of meta-heuristic-based techniques have been proposed, including the Lion Optimization Algorithm (LOA) [4] and the Firefly Algorithm [5]. These techniques could present several solutions to evaluate the efficient parameters. Some of the proposed firefly-based scheduling algorithms use random approaches in their phases, such as giving the initial population or placing tasks in the workflow at the same level [6][7], while others make use of a straightforward workflow graph. Response time and reliability are taken into account by task scheduling techniques in heterogeneous distributed systems [8]. This paper proposed the HFLO algorithm to identify an appropriate scheduling method for computational applications in accordance with cloud system environments. By creating an optimum initial population, this approach aims to cut down on the number of operations needed to properly distribute workload across available resources.

#### Proposed Methodology And Suggested Algorithm

One of the most recent technologies today allows customers to send their requests to clouds and pay a set price based on the service received. Yet, cloud environments are actually uniform systems that are suitable for storing huge applications and data for services. Given this, it is crucial that these systems schedule the enormous applications and data they include. Managing tasks within the cloud is largely accomplished through scheduling. The scheduling process establishes which task should be assigned to a specific computer component and estimates the number of resources required to execute the work. It is possible to break up larger subtasks before processing them in parallel. The efficiency of an implementation is improved by breaking a computation into smaller subtasks and executing these subtasks on different processors. Also, the goal of the task scheduling algorithm is not to schedule every work into every available processor in an effort to increase profit (profit here denotes the combination of cheap cost, low memory consumption, and energy conservation) at the expense of the basic needs.

Task scheduling is a challenge. The goal of this work is to introduce a new algorithm for job scheduling in clouds that is based on Firefly and Lion Optimizer. Here is an expression of the suggested combination's specifics. Figure 1 depicts the overall structure of the task scheduling optimization model that has been suggested. As a result of the operation that the virtual machines are supposed to carry out, this process takes place while using a limited task. The scheduler gathers information from the Cloud User, Task Manager, and Resource, computes that information, and then decides which virtual machine should be assigned to each task.

Two algorithms-the Lion optimization method and Firefly-are hybridised in the suggested scheduling. By utilising the benefits of the Firefly and Lion search algorithms, the technique avoids their drawbacks. By combining the two algorithms, their flaws are fixed, and some advantages are guickly acknowledged and focused on, allowing the planning approach to obtain an idea or a shoddy layout in a shorter amount of time. Comparing the novel hybrid algorithm to the Firefly and LOA techniques, it optimises the job and resources more effectively. Experimental comparisons' positive findings supported the effectiveness of the suggested strategy. The execution of each task has to be done in a single VM instance type. If pm = {PM1, PM2, ... PMn) is A amalgamation of physical machine (data centers ). VMi = {VM<sub>1</sub>, VM<sub>2</sub> ... VMi} which is the sequence followed in A virtual machine VMI types and T = {T<sub>1</sub>, T<sub>2</sub> ...  $T_n$  is defined as the set of task. Every task considers a set which is derived,  $T_i = \{t_1, t_2, ..., t_n\}$ . The unique cost of every task be C<sub>1</sub>, memory mi, and energy Ei. Problem factors are defined as a solution to this problem. In this paper, the utmost function depends on three factors such as cost, energy consumption and memory usage. Here each task has individual moving charge. It is possible to define task and resource allocation as the process by which the supplier must identify the best resources to meet incoming customer demands. Although obtaining and releasing resources on demand is one of the major characteristics of cloud computing, ongoing resource monitoring is required. All of the physical servers are housed in data centres, which are components of hardware. Realistic users are not used on physical servers. They are transformed into various virtual machines (VMs) using virtualization, and users' jobs will run on these VMs when scheduling tasks. The VMs are managed by the VM management. A list of suitable candidates is highlighted following the gathering of data on the cloud's resources (VM and HOST). The resource selection algorithm chooses the potential solution that satisfies all criteria and makes the best use of the infrastructure. An optimization algorithm might be used for resource selection. For clouds, some examples are genetic algorithms, ant colonies, and particle swarm optimization.

#### **Problem Statement**

In cloud computing systems, the challenge of assigning tasks to virtual machines arises when there are m tasks (V=T1, T2,..., TM) that need to be assigned to different virtual machines. The total number of tasks in this study were randomly chosen from a range of 10 to 80 tasks, and they were then divided into three separate data sets with various numbers of virtual machines. The tasks are created at random. Moreover, VM= "VM1,VM2,...,VMN," where each VMi is a trinity expressed as VM = (CPUi, RAMi- HOSTi), 1 I n, where the values of the triplets stand for the corresponding CPU, memory, and bandwidth requirements of VMs. Let PM symbolise a collection of PMs and PMj denote the jth PM. The values of the triplets indicate the total resource capacity of the jth PM, and PMj = (CPUj, RAMj -HOSTj) is used to represent each PMj. Each VM can only be allocated on one physical machine at a time, which is

## Karunya and Gayathri Devi

one of the absolute restrictions mentioned in the explanation above. The number of resource demands from VMs deployed on the same HOST machines for each type of resource (CPU, memory, and bandwidth) must be less than or equal to the capability/capacity of the PMs hosting them; There are a maximum of m PMs in total that can allocate VMs, where yimi=1 m. Because all systems are same, duties are carried out in a homogeneous manner.

## Proposed Task Scheduling Using HFLO

The Firefly and Lion Optimization algorithms were combined to create this hybrid optimization technique. The primary flaw in the Firefly method is the number of iterations required to arrive at an ideal solution, which also adds to its overall time requirement. Lion Optimizer has the drawback that its union speed delays the later investigation step and makes it challenging to reach the local optimum solution. The strategy avoids the drawbacks of the Firefly and Lion Optimizer algorithms by utilising their strengths. By combining the two algorithms, their shortcomings are addressed and certain advantages are realised, allowing the planning methodology to obtain a concept or flawed layout in a shorter computing time.

## Proposed Hybrid Algorithm HFLO

Input: m,nMax, i,j,FL,R1,R2

List of Cloud (Tasks), List of VMs. Initialization parameters

**Output:** the best solution for minimize the cost, Energy consumption, makespan

1: n = 1. Number of iterations

Return best solution.

## EXPERIMENTAL RESULTS

The suggested scheduling method is based on the fire fly algorithm, which is used to optimise the schedule for handling requests to the cloud network. The proposed method is also concerned with distributing the loads among the cloud system's resources. The processing of the suggested technique is described in the sections above. In this section, using the CloudSim tool and Java programming, we plot the experimental analysis of the suggested scheduling methodology. Java programming is used to create an application based on CloudSim that simulates clouds. The studies are carried out on a computer with a core i5 processor, 4GB of RAM, and a 500GB hard drive.

#### Execution Time

In this experiment, various quantities of tasks and resources are taken into account when evaluating the suggested mechanism and looking at how it performs over time and from various angles. to determine whether there is a relationship between processing time and repeats. The number of positions was set at 80 for all firefly and LOA population sizes and iterations. The following results are displayed: The following results are based on the subtraction of the various listed algorithms from the suggested algorithm for execution time in order to streamline the comparison. The proposed algorithm has the shortest Execution Time along the amount of tasks, as shown in Figure 2, according to our research.

#### Evaluation using Makespan:

By giving the last task's completion time, Makespan calculates the maximum completion time. The most common optimization criterion for task scheduling is minimising the makespan. The following equation can be used to compute it:

#### Makespan=maxtask i (Fntime)

A location, Fn Time displays the task's completion time. The HFLO and LOA Firefly methods for computing and minimising make span are compared in this section. The term "make span" refers to the whole amount of time that passed from beginning to end. The phrase is often used in relation to scheduling. There is a huge project that is broken down into numerous smaller assignments. A time comparison of the Firefly, LOA, and HFLO algorithms is shown in Figure 3. The term "make span" refers to the overall amount of time needed for the tasks to finish execution. The task and resource values are changed to assess and analyse Makespan. The lowest span values are produced by the LOA and HFLO algorithms when compared to Firefly. The HFLO approach provides the quickest make span time in Figure 3.

#### Task Delay Time

The fact that the user d has zero service schedules in the Firefly, LOA, and HFLO scheduling results indicates that the resource management platform has not allocated resources to it, making it impossible for it to schedule urgent tasks in a timely manner. This results in unfair task scheduling and a sharp decline in user satisfaction. The HFLO method developed in this study does not appear to have any scheduling tasks in the scenario described above, and each user has an equitable opportunity to perform tasks. The comparison of the smallest delay across the Firefly, LOA, and HFLO is illustrated in figure 4. The delay time of jobs is slightly less than Firefly, LOA after calculating the three methods of the observed algorithm ms, however HFLO is more efficient while ensuring fairness for the Firefly, LOA algorithm, delay time is improved. When the number of scheduled tasks rises, this paper's task scheduling by HFLO algorithm produces the desired scheduling outcome with a shorter task delay time. The technique can fully utilise cloud computing resources to achieve more efficient job scheduling, more appropriate resource scheduling, and higher resource utilisation. The HFLO algorithm not only ensures the fairness of task assignment, but also outperforms the HFLO,LOA algorithm in terms of efficiency and user satisfaction, further proving that the HFLO

#### Karunya and Gayathri Devi

algorithm can successfully resolve the scheduling problem in the cloud environment. This is shown by the aforementioned experimental results.

## CONCLUSION

Task scheduling methods for cloud computing have been developed using a variety of metaheuristic optimization algorithms. Throughout this research, a brand-new cloud task-scheduling algorithm that is based on the firefly concept—a freshly developed algorithm based on the behavior of fireflies—was proposed. Comparisons were made between the performance of the proposed algorithm and that of the FF and LOA metaheuristic algorithms. It achieved a remarkable reduction in costs and energy use. Moreover, it resulted in significant resource use. The HFLO algorithm looks into cloud scheduling issues in an effort to cut costs.

## ABSTRACT

If *A* is a lattice with the smallest element being zero, then a zero divisor graph, indicated by the symbol  $\alpha(A)$ , is an undirected graph whose vertices are nonzero zero divisors of *A*, with two unique vertices connected by an edge when their meet is zero. In this paper, we investigate the locating number of a graph with zero divisor of the lattice *A*.

Keywords: Locating set; locating number; lattice; zero divisor; graph with zero divisor

## INTRODUCTION

Let *A* be a lattice with the least element 0. We associate a simple graph  $\alpha(A)$  to *A* with the vertex set $Z(A)^* = Z(A) \setminus \{0\}$ , the set of non-zero zero divisors of *A* and distinct  $x, y \in Z(A)^*$  are adjacent if and only if  $x \land y = 0$ . Note that diam $(\alpha(A)) \leq 3$ . There are many papers which interlink graph theory and lattice theory [5, 9, 10, 11, 12]. These papers discussed the properties of graphs derived from partially ordered sets and lattices. S. K. Nimbhokar, M. P. Wasadikar and M. M. Pawar [12] have introduced the notion of coloring in graphs derived from lattices. In [10], E. Estaji and K. Khashyarmanesh associated to any finite lattice *A*, a simple graph *G*(*A*) whose vertex set is  $Z(A)^*$  and two vertices *x* and *y* are adjacent  $\Leftrightarrow x \land y = 0$ . They studied the structure of *G*(A) and connections between graph theoretical properties and lattice theoretical properties. The zero divisor graph of various algebraic structures has

## Nithya and Valarmathi

been studied by several authors [1, 2, 3, 4, 8]. Let  $(A, \vee, \wedge)$  be a lattice with the least element 0. Then  $a \in A$  is called an *atom* if there is no  $y \in A$  such that 0 < y < a. The set of all atoms of A is denoted by  $\mathcal{T}(A)$ . The lattice A is called *atomic* if for any  $x \in A$ , there exists an element  $a \in \mathcal{T}(A)$  such that  $a \leq x$ . A nonempty subset I of A is called an *ideal* if  $x, y \in I \implies x \lor y \in I$  and  $l \in A, x \in I$  and  $l \leq x \implies l \in I$ . A proper ideal I of A is said to be *prime* if  $a, b \in A$  and  $a \land b \in I \implies a \in I$  or  $b \in I$ . The undefined terms and notations are from [7].

Let G = (V, E) be a graph. We say that G is *connected* if there is a path between any two vertices of G, otherwise G is called disconnected. The *neighbourhood* of a vertex u is the set N(u) consisting of all vertices v which are adjacent with u. For vertices x and y of G, let d(x, y) be the length of a shortest path from x to y. The diameter of G is  $diam(G) = sup\{d(x, y): x, y \in V(G)\}$ . The *eccentricity* of a vertex v is defined as  $e(v) = max\{d(v, y): y \in V(G)\}$  and the radius of G is given by  $rad(G) = min\{e(x): x \in V(G)\}$ . Let G be a connected graph with *n*vertices , where  $n \ge 2$ . Let  $W = \{w_1, w_2, \dots, w_k\}$  be an ordered subset of V(G) and a vertex  $\in G$ , the *locating code (or code)* of v with respect to W is the k-tuple,  $c_W(v) = (d(v, w_1), d(v, w_2), \dots, d(v, w_k))$ . The set W is said to be a *locating set* for G if distinct vertices have distinct codes. A locating set of minimum number for a graph G is called a *minimum locating set* G. The locating number denoted by  $\iota(G)$  is the number of vertices in the minimum locating set for G. Let G be a connected graph with  $|V(G)| \ge 2$ . Two distinct vertices u and v of G are *distance similar* if d(u, x) = d(v, x),  $\forall x \in V(G) - \{u, v\}$ . For basic definitions in graph theory we refer to [6]. Some of the results are well known in the literature, and they are listed for future reference.

## Preliminaries

**Theorem 2.1.**([13,Theorem 2.1]) Let G be a connected graph. If G is partitioned into r distinct distance similar classes  $V_1, V_2, ..., V_r$  (that is,  $x, y \in V_i$  if and only if d(x, a) = d(y, a) for all  $a \in V(G) - \{x, y\}$ ).

(i) Any locating set W for G contains all but at most one vertex from each  $V_i$ .

(ii) Each  $V_i$  induces a complete subgraph or a subgraph with no edges.

 $(iii)\iota(G) \geq |V(G)| - r.$ 

(iv) There exists a minimal locating set W for G such that if  $|V_i| > 1$ , at most  $|V_i| - 1$  vertices of  $V_i$  are elements of W.

(v) If *m* is the number of distance similar classes that consist of a single vertex, then  $|V(G)| - r \le \iota(G) \le |V(G)| - r + m$ . **Theorem 2.2**.([13, Theorem 2.2]) Let *G* be a connected graph with diam(*G*) =  $m < \infty$ . If  $\iota(G) = k < \infty$ , then  $|V(G)| \le (m + 1)^k$ .

**Theorem 2.3.** ([13, Corollary 2.2]) Let G be a connected graph with finite diameter. Then |V(G)| is finite if and only if  $\iota(G)$  is finite.

Theorem 2.4.([14, Theorem 1.1]) Let A be a Boolean algebra. Then A is finite if and only if its set of atoms is finite.

## Locating Sets And Numbers Of $\alpha(A)$

**Theorem 3.1**.Let *A* be a Boolean algebra. Then (*i*)  $\iota(\alpha(A))$  is finite if and only if *A* is finite. (*ii*)  $\iota(\alpha(A))$  is undefined if and only if  $A = \{0\}$ .

*Proof.* (i) Let *A* be finite. Then clearly  $\alpha$ (A) is finite and hence  $\iota(\alpha(A))$  is finite, by Theorem 2.3.Conversely, assume that  $\iota(\alpha(A))$  is finite. Since diam $(\alpha(A)) \leq 3$  and by Theorem 2.2,vertex set is finite. Since all the atoms are zerodivisors, atom set is finite. Therefore, by Theorem 2.4,*A* is finite. (ii) This follows from the fact that the locating number of  $\alpha(A)$  is undefined if and only if the vertex set of  $\alpha(A)$  is empty.

**Theorem 3.2.** Consider A is a lattice. Then (i)  $\iota(\alpha(A)) = 1 \Leftrightarrow \alpha(A)$  is a path. (ii)  $\iota(\alpha(A)) = |Z(A)^*| - 1 \Leftrightarrow \alpha(A)$  is a complete graph. (iii) If  $\alpha(A)$  is a cycle, then  $\iota(\alpha(A)) = 2$ . (iv) If  $\alpha(A)$  is a bipartite graph (other than  $K_{1,1}$ ), then  $\iota(\alpha(A)) = |Z(A)^*| - 2$ .

*Proof.* This result follows from [13] (Lemma 2.1, Lemma 2.3, and Theorem 2.1).

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Nithya and Valarmathi

**Notation**: $D_n$  = The set of all positive divisors of n, where  $n \in \mathbb{N}$ . For  $a, b \in D_n$ , we write  $a \le b$  if and only if  $a \mid b$ , i.e., b = ac for some  $c \in \mathbb{N}$ . Then  $D_n$  becomes a lattice with the smallest element 1 and  $x \land y = gcd(x, y)$ ,  $x \lor y = lcm(x, y)$ .

**Theorem 3.3.** *Let p and q be two distinct prime numbers.* 

(i) If  $n = 2p, p \ge 3$ , then  $\iota(\alpha(A)) = 1$ . (ii) If  $n = p^k$  where  $k \ge 1$ , then  $\iota(\alpha(A)) = 0$ . (iii) If  $n = p^2q$ , then  $\iota(\alpha(A)) = 1$ . (iv) If  $n = p^kq, k \ge 3$ , then  $\iota(\alpha(A)) = |\mathcal{Z}(A)^*| - 2$ .

*Proof.*(i) If n = 2p and  $p \ge 3$ , then  $\alpha(D_n)$  contains only two vertices  $\{2, p\}$  which are adjacent. Therefore, we get a path and the result follows from Lemma 2.2, [13].

(ii) If  $n = p^k$ , where  $k \ge 1$ , then  $D_n$  is a chain and so  $\alpha(D_n)$  contains only a single vertex  $\{p\}$ . Since the locating number of a singleton set is zero. Therefore,  $\iota(\alpha(A)) = 0$ .

(iii) If  $n = p^2 q$ , When p and q are distinct primes, then  $\alpha(D_n)$  is a path of length two. Therefore,  $\iota(\alpha(A)) = 1$ . (iv) If  $n = p^k q$ ,  $k \ge 3$ , p and q are distinct primes. Thus  $\alpha(D_n)$  can be partitioned into two distance similar equivalence classes namely  $V_1 = \{q\}$  and  $V_2 = \{p^k, k \ge 3\}$ . It forms a star graph and so by Theorem 3.2 (iv),  $\iota(\alpha(A)) = |\mathcal{Z}(A)^*| - 2$ .

**Theorem 3.4.**Let  $n = p^{n_1}q^{n_2}$ , where p and q are distinct prime numbers and  $n_1, n_2 \in \mathbb{N}$ . Then there exist prime ideals  $P_1$  and  $P_2$  in  $D_n(=A)$  such that  $P_1 \cap P_2 = \{1\}$ . Moreover  $\iota(\alpha(A)) = |\mathcal{Z}(A)^*| - 2$ .

*Proof.* Consider  $P_1 = \{1, p, p^2, \dots, p^{n_1}\}$  and  $P_2 = \{1, q, q^2, \dots, q^{n_2}\}$ . Clearly  $P_1 \cap P_2 = \{1\}$ . Let  $x_1, x_2 \in P_1$  and then  $x_1 \land (\text{meet})x_2 = \text{gcd}(x_1, x_2)$  and  $x_1 \lor (\text{join})x_2 = \text{lcm}(x_1, x_2)$ . First, we claim that  $P_1$  is an ideal. To prove that  $x_1 \lor x_2 \in P_1$ . Case 1.  $x_1 = 1$  or  $x_2 = 1$ . Then  $x_1 \lor x_2 = x_1$  or  $x_2 \in P_1$ .

Case 2.  $x_1, x_2 \neq 1$ . Assume without sacrificing generality that  $x_1 \ge x_2$ . Then  $x_1 \lor x_2 = \operatorname{lcm}(x_1, x_2) = x_1 \in P_1$ . If  $t \in A - \{1\}, x \in P_1$  and  $t \le x$ . Then  $t \mid x$  and so x is a multiple of t. Then  $t = p^i \in P_1$ , for some i and hence  $P_1$  is an ideal. Next, we assert that  $P_1$  is a prime ideal. Let  $x, y \in L$  and  $x \land y \in P_1$ . To prove that  $x \in P_1$  or  $y \in P_1$ .

Case 1.  $x \land y = 1$ . Then x = 1 and y = 1, x = 1 and  $y = p^i \in P_1$  for some *i*.

Case 2.  $x \land y = p^i, x \le y$ . Then  $x = p^i$  and  $y = p^j, i < j$ . Thus  $P_1$  is prime. Similarly we can demonstrate that  $P_2$  is also a prime ideal.

**Theorem 3.5.** If n = pqr, where p,q and r are three distinct primes and  $A = D_n$  then  $\iota(\alpha(A)) = 2$ .

*Proof.A* = {1, p, q, r, pq, qr, pr, pqr} and so  $\mathcal{Z}(A)^* = \{p, q, r, pq, qr, pr\}$ . Let the vertex set of  $\alpha(A)$  may be divided into four separate pair wise distance similarity equivalence classes, say  $V_1 = \{qr\}, V_2 = \{p\}, V_3 = \{q, r\}, V_4 = \{pr, pq\}$ . Then by Theorem 2.1,  $\iota(\alpha(A)) \ge 2$ . If  $W = \{qr, pr\}$ , then  $c_W(q) = (2, 1), c_W(r) = (2, 2), c_W(p) = (1, 2), c_W(pq) = (3, 3)$ . Therefore W is a locating set and also it forms a minimum locating set. Hence  $\iota(\alpha(A)) \le 2$ .

**Theorem 3.6.**Let n = pqrs, where p, q, r and s are four distinct prime numbers, then  $\iota(\alpha(D_n)) = 4$ .

*Proof.* Consider that  $\mathcal{K}$  is the locating (discovering) set for  $\alpha(D_n)$ . Suppose  $\mathcal{K} = \{p\}$ , then  $c_{\mathcal{K}}(pq) = c_{\mathcal{K}}(pr) = c_{\mathcal{K}}(pr) = c_{\mathcal{K}}(pr) = c_{\mathcal{K}}(pr) = c_{\mathcal{K}}(pr) = c_{\mathcal{K}}(pq) = c_{\mathcal{K}}(pqs) = (2,2)$ . Clearly two points set cannot be a locating set. If  $\mathcal{K} = \{p, q, r\}$ , then  $c_{\mathcal{K}}(pq) = c_{\mathcal{K}}(pqs) = (2,2,1)$ . Therefore, it is not a locating set. One can examine all the possible of three vertices set is not a locating set. Consider the set  $\mathcal{K} = \{p, q, r, s\}, c_{\mathcal{K}}(x)$  not the same as  $c_{\mathcal{K}}(y) \forall x, y \in V(\alpha(D_n)) \setminus \mathcal{K}$  and also it forms a minimum locating set.

**Theorem 3.7.** If n = pqrst where p, q, r, s and t are five distinct prime numbers, then  $\iota(\alpha(D_n)) = 5$ .

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Nithya and Valarmathi

*Proof.* The locating set will be  $\mathbb{W}$  for  $\alpha(D_n)$ . Suppose  $\mathbb{W} = \{p\}$ . In this case, we can find many vertices such that  $c_{\mathbb{W}}(pqrs) = c_{\mathbb{W}}(pqst) = c_{\mathbb{W}}(prst) = c_{\mathbb{W}}(pqrt) = 2$ . Using Figure 2, we can able to see all the possible of singleton set is not a locating set. Suppose  $\mathbb{W} = \{p, q\}$ . Here also we can find some vertices whose locating code is same (for example,  $c_{\mathbb{W}}(pqrs) = c_{\mathbb{W}}(pqst) = c_{\mathbb{W}}(pqrt) = (2,2)$ . Clearly two points set cannot be a locating set. Suppose  $\mathbb{W} = \{p, q, r\}$ , one can investigate two vertices such that  $c_{\mathbb{W}}(pq) = c_{\mathbb{W}}(pqs) = (2,2,1)$ . Therefore, it is not a locating set. Also a set with three vertices cannot be a locating set. If  $\mathbb{W} = \{p, q, r, s\}$ , then  $c_{\mathbb{W}}(prs) = c_{\mathbb{W}}(prst) = (2,1,2,2)$ . Look into all the possible of a set which contains four vertices is not a locating set. Consider the set  $\mathbb{W} = \{p, q, r, s, t\}, c_{\mathbb{W}}(x) \neq c_{\mathbb{W}}(y) \forall x, y \in V(\alpha(D_n)) \setminus \mathbb{W}$  and also it forms a minimum locating set.

**Theorem 3.8.** If  $n = (pqr)^k$ , where  $k \ge 2$  and p, q and r are three distinct primes, then  $\iota(\alpha(D_n)) = 3(2^k - 1)$ .

*Proof.* If  $n = (pqr)^k$  and  $k \ge 2$ , then  $|Z(D_n)^*| = 3(2^k) + 3$  and  $V(\alpha(D_n))$  will be divided into six distinct distance similar equivalence classes namely,  $P = \{qr, q^2r, ..., q^kr, qr^2, ..., qr^k\}, Q = \{p, p^2, ..., p^k\}, R = \{q, q^2, ..., q^k\}, S = \{pr, p^2r, ..., p^kr, pr^2, ..., pr^k\}, E = \{r, r^2, ..., r^k\}, T = \{pq, p^2q, ..., p^kq, pq^2, ..., pq^k\}$ . Therefore, by Theorem 2.1.  $\iota(\alpha(D_n)) \ge |Z(D_n)^*| - 6 = 3(2^k) + 3 - 6 = 3(2^k) - 3 = 3(2^k - 1)$ . Consider  $\mathcal{M} = \begin{cases} p^i, q^i, r^i, pq^i, p^iq, (pq)^i, qr^i, \\ q^ir, (qr)^i, pr^i, p^ir, (pr)^i, 2 \le i \le k \end{cases}$ . Refer Figure 3.,  $c_{\mathcal{M}}(p) \neq c_{\mathcal{M}}(q) \neq c_{\mathcal{M}}(pq) \neq c_{\mathcal{M}}(qr) \neq c_{\mathcal{M}}(pr)$ . Hence it forms a locating set with cardinality less than or equal to  $|Z(D_n)^*| - 6$ .

**Remark 3.9.** The locating number of  $\alpha(D_n)$ , where  $n = (pqr)^2$ , is  $3(2^2 - 1) = 9$ .

**Theorem 3.10.** If  $n = p^{n_1}qr$ , where  $n_1 \ge 2 \in \mathbb{N}$  and p, q and r are distinct prime numbers. Then  $\iota(\alpha(D_n)) = 3(n_1 - 1)$ .

*Proof.* Here  $|Z(D_n)^*| = 3(n_1 + 1)$ . Now, the vertices will be divided into distance-related classes  $in\alpha(D_n)$ stated by  $V_1 = \{pr, p^2r, ..., p^{n_1}r\}, V_2 = \{q\}, V_3 = \{p, p^2, ..., p^{n_1}\}, V_4 = \{qr\}, V_5 = \{r\}$  and  $V_6 = \{pq, p^2q, ..., p^{n_1}q\}$ . By Theorem 2.1,  $\iota(\alpha(D_n)) \ge |Z((D_n)^*)| - 6 = 3(n_1 + 1) - 6 = 3n_1 + 3 - 6 = 3n_1 - 3 = 3(n_1 - 3), n_1 \ge 2$ . Consider the set  $Q = \{p^i, p^ir, p^iq; 2 \le i \le n_1\}$ . Refer Figure 4., all the values of  $c_Q(p), c_Q(pr), c_Q(q)$  and  $c_Q(r)$  with respect to Q are distinct. Hence it forms a locating set with cardinality  $\le |Z(D_n)^*| - 6$ .

**Theorem 3.11.** If  $n = pq^2r^3$ , where p, q and r are distinct prime numbers. Then  $\iota(\alpha(D_n)) = |\mathcal{Z}(D_n)^*| - 6$ . *Proof.* Here  $|\mathcal{Z}(D_n)^*| = 17$ .  $V(\alpha(D_n)^*)$  can be divided into six different distance similar equivalence classes. They are  $V_1 = \{qr, q^2r, qr^2, qr^3, q^2r^2, q^2r^3\}, V_2 = \{p\}, V_3 = \{r, r^2, r^3\}, V_4 = \{pq, pq^2\}, V_5 = \{q, q^2\}, V_6 = \{pr, pr^2, pr^3\}$ . Hence, by Theorem 2.1,  $\iota(\alpha(D_n)) \ge |\mathcal{Z}(D_n)^*| - 6$ . Consider  $\mathcal{S} = \{q^2r, qr^2, qr^3, q^2r^2, q^2r^3, r^2, r^3, pq^2, q^2, pr^2, pr^3\}$ . Refer Figure 5,  $c_{\mathcal{S}}(p) \ne c_{\mathcal{S}}(q) \ne c_{\mathcal{S}}(qr) \ne c_{\mathcal{S}}(qr) \ne c_{\mathcal{S}}(qr) \ne c_{\mathcal{S}}(qr) = c_{\mathcal{S}}(qr) \ne c_{\mathcal{S}}(qr) = c_{\mathcal{S}}(qr$ 

**Remark 3.12.** If  $n = p^2 q^3 r$ ,  $p^2 q r^3$ , then  $\iota(\alpha(D_n)) = |\mathcal{Z}(D_n)^*| - 6$ . **Theorem 3.13.**Let  $A = M_n$ , where  $M_n = \{0, a_1, \dots, a_{n-2}, 1\}$  be the lattice in which  $a_i \wedge a_j = 0$  and  $a_i \vee a_j = 1$  for  $i \neq j$  if and only if  $\iota(\alpha(M_n)) = n - 3$ .

Proof. Here, the atoms set  $\{a_1, a_2, ..., a_{n-2}\}$  is the vertex set of  $\alpha(M_n)$ . Also it forms a complete graph with n-2 vertices. Therefore,  $\iota(\alpha(M_n)) = n-3$ .

**Example 3.14**.Consider the lattice  $A = M_5$ . The zero-divisor graph of the lattice  $M_5$  is a complete graph with 3 vertices. Therefore,  $\iota(\alpha(M_n)) = 2$ .

**Theorem 3.15.** If *A* is a lattice with finite number of elements. Then (i)  $\iota(\alpha(D_p \times D_p)) = 1$ . (ii) If  $A = D_{2^k} \times D_{2^k}$  and  $D_{p^2} \times D_{p^2}$ , then  $\alpha(A)$  is a complete bipartite graph, where *p* is prime and  $k \ge 1$ . Further  $\iota(\alpha(A)) = |\mathcal{Z}(A)^*| - 2$ .

## Nithya and Valarmathi

(iii) If  $A = D_p \times D_q$ , where p and q are prime numbers. Then, $l(\alpha(A)) = 1$ 

*Proof.*(i) Since the lattices  $\alpha(D_p \times D_p)$  contains only two atoms  $\{(1,p), (p,1)\}$ , then the corresponding zero divisor graph is isomorphic to a path of length 2. Hence by Lemma 2.1, [13], locating number of this graph is 1. (ii) Here  $\alpha(D_p \times D_p)$  can be partitioned into two distinct vertex sets, namely  $U_1 = \{(1,2), (1,2^2, ..., (1,2^k)\}$  and  $U_2 = \{(2,1), (2^2, 1), ..., (2^k, 1)\}$ . Also  $\alpha(D_{p^2} \times D_{p^2})$  can be partitioned into two distinct vertex sets, namely  $V_1 = \{(1,p), (1,p^2)\}$  and  $V_2 = \{(p,1), (p^2, 1)\}$ . Each graph is isomorphic to a complete bipartite graph( $K_{n,n}$ ). Thus by Theorem 3.2.,  $\iota(\alpha(A)) = |Z(A)^*| - 2$ .

(iii) This graph is isomorphic to the path which contains only two vertices  $\{(1, p), (q, 1)\}$ . Therefore, locating number is 1.

## ABSTRACT

Time series analysis approach provides significant potential to enhance financial planning and performance management in companies. The goal of our research presents an advanced time series analysis approach for predicting a company's performance over the next 6 months and enables decisionmakers to make informed strategic decisions with accurate and reliable forecasts and allocate resources effectively.

Keywords: Time Series, Semi Average, Moving Average, Prediction, R Programming,

## INTRODUCTION

Time series, is a sequence of numerical data obtained at regular time intervals. Time series analysis is a statistical tool that is useful for a wide range of longitudinal study methods. Such designs involve a single subject or research unit that is measured regularly at regular intervals over a significant number of observations. We can better understand the underlying naturalistic process, the pattern of change through time, or the results of either a planned or unexpected intervention by using time series analysis. Time series analysis is a potent and popular technique in many disciplines, from environmental sciences and engineering to economics, business and finance. It relays on comprehending and identifying significant patterns in data points gathered over time. Time series designs are becoming a more practical way for analyzing significant data for developments in information systems technology. A time series is a collection on observations having a temporal ordering that are recorded at regular intervals. Time series data differ from cross-sectional data, where observations are independent of one another, due to their sequential structure. Time Series Analysis has a variety of goals, it includes predicting future values, spotting anomalies or unusual behavior, figuring out underlying patterns, and making judgements based on such

## Nanthitha and Mani

information. A well-executed Time Series Analysis can produce insightful results that support important decisionmaking.

#### Uses of Time Series

- Time series helps to understand the past behavior of the variable under study. Time series is very useful in predicting probable future activities based on the past performance. Time series analysis enables comparison between two or more variables over a period of time.
- Time series helps to determine the type and nature of the changes in the given data. Time series analysis explains why trends appear in historical data and how underlying patterns or processes may be able to account for them. Time series analysis is used to identify the fluctuation in economics and business. Time series helps in evaluating the current achievements. Natural systems cannot be understood without the use of time series analysis, which is a fundamental analytical tool. Examples of natural systems whose behavior can be best investigated using time series analysis include climate cycles, economic swings, volcanic eruptions, and earthquakes.

#### Major components of Time Series Analysis

**Trend component:** This aids in predicting future actions. This trend shows whether the data generally tends to rise or fall over a long period of time. A "trend" is a typical, consistent, long-term tendency. Not all increases and decreases must occur simultaneously. As for increasing, declining, or constant patterns, different historical periods show distinct tendencies. A general upward, downward, or constant movement is necessary though.

**Seasonal component:** The variation in a variable caused by some specified patterns in its behavior is known as the seasonal component of a time series. Any sort of time series, such as individual commodity price quotes, interest rates, exchange rates, stock prices, etc., can be described using this term. These patterns can be daily, weekly, monthly, or occur at regular time intervals. Seasonal components can often be modelled using straightforward regression equations. The term "seasonalized regression" or "bimodal regression" may be used to describe this method.

**Cyclical component:** The portion of the movement in the variable that can be explained by other cyclical movements in the economy is known as the cyclical component in a time series. In other words, this phrase provides details regarding seasonal patterns. It is also known as the boom-bust process or the long-period (LP) effect. For instance, business cycles typically exhibit slower growth rates during recessions than they did before.

**Irregular component:** The portion of the movement in the variable that cannot be accounted for by economic cycle is known as the irregular component. Alternatively said, this term provides information on non-seasonal patterns. Changes that are not cyclical are referred to by this phrase. These include boom-bust cycles, long-term trend changes that are permanent, or data that is "not seasonally adjusted" and is typically not included in national income and product accounts such as depreciation, R&D spending and agricultural subsidies.

## **REVIEW OF LITERATURE**

William W. S. Wei (2005) explained the basic concepts and conventional methods, and extended the autoregressive moving average models to represent seasonal series in their book. James D. Hamilton (1994), covers various aspects of time series analysis, including seasonal variation and their detection. It also provides a thorough explanation of seasonal decomposition techniques, which are used to identify and model the seasonal patterns present in time series data. Robert H. Shumway and David S. Stoffer (2017) provided a comprehensive introduction to time series analysis with practical examples using the R programming language. George E. P. Box, Gwilym M. Jenkins, and Gregory C. Reinsel (2015), widely covered the foundational concepts of time series analysis, including ARIMA models and

forecasting. Peter J. Brockwell and Richard A. Davis (2016), gave a solid introduction to time series analysis and forecasting methods, focusing on theoretical aspects and practical applications. Richard G. Graf (2015), geared towards social science researchers, explained time series analysis techniques in a user-friendly manner with examples using R. Rob J. Hyndman and George Athanasopoulos (2021) primarily focused on forecasting methods, and provided excellent coverage of time series analysis concepts and tools. Peter J. Diggle, Patrick J. Heagerty, Kung-Yee Liang, and Scott L. Zeger (2002), covered time series analysis from a statistical perspective, with emphasis on biomedical and public health applications. Pedro Lara-Benitez, Manuel Carranza-Garcia, Jose C Riquelme (2021), experimental review on deep learning architectures for time series forecasting.

## **RESEARCH METHODOLOGY**

#### Objective

- To find the industry manufacturing process
- To predict expected industry growth for future

**Need of the study**: There is a need for the research among the industry for predicting the future growth **Data sources**: Secondary data is collected from the industry for the analysis

#### ANALYSIS AND INTERPRETATION

The following statistical methods was used for this study

- 1. Diagrammatic representation
- 2. Correlation analysis and
- 3. Time series analysis

#### Diagrammatic Representation

From the above diagram (4.1.1), it shows that at the month of March industry ordered and dispatched nearly 71,000 products, followed by the month of June ordered and dispatched nearly 69,000 products, followed by May, the company ordered and dispatched nearly 65,800 products, and on April the industry ordered and dispatched on an average of 65,300, followed by January the company ordered and dispatched nearly 64,000 products, and followed by the month of February the company ordered and dispatched nearly 62,000 products.

#### Semi Average for total amount for the Material

The above analysis (4.2) shows the semi average of the production of the industry. The semi average of the products ordered and dispatched is maximum during the month of June and minimum during the month of February.

#### Semi Average for the ordered, dispatched and price of the Material

The above analysis (4.3) shows the semi average of the ordered quantity, dispatched quantity and the price per meter of the material, and the semi average of the ordered and dispatched quantity of the products is equal.

#### **PREDICTION FOR NEXT 6 MONTHS**

From the above analysis (4.4), the industry's growth for the next 6 months from the calculated data is predicted.

#### MONTHLY MOVING AVERAGE

The above analysis (4.5), gives the moving average of the industry's production.

#### Correlation

From the correlation analysis we observe that ordered quantity and dispatched quantity is strongly correlated, and the ordered quantity and dispatched quantity negatively correlates with the price per meter.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Nanthitha and Mani

#### **Descriptive Statistics**

From the above analysis, it shows that for the six months period, the company ordered and dispatched 1362.73 material on an average with Rs.64.70 per meter. The total number of ordered products is completely dispatched by the company, so that the Mean, Standard Deviation, Median is equal for the ordered and dispatched quantity. The company ordered and dispatched maximum of 2475 products and minimum of 255 products, and the company delivered the product at the maximum price of Rs.70 per meter and minimum price of Rs.60 per meter.

## ACKNOWLEDGEMENT

We would like to express our profound gratitude to SDR Multi Business India Private Limited, for their contribution to the completion of this research paper.

## CONCLUSION

In conclusion, the time series analysis presented for the manufacturing company has provided valuable insights into predicting company growth for the next 6 months. Overall, the result of this study serves as a foundation for better preparedness and proactive actions to drive sustainable growth and success for the manufacturing company.

## ABSTRACT

India's cancer incidence rates have been rising throughout the years. One method of treating cancer is chemotherapy and drugs used for chemotherapy work by preventing or reducing the growth of cancer cells, which can help shrink tumors or prevent them from spreading to other parts of the body. Modelling under a fuzzy environment is essential as it produces more precise, flexible, and easy-to-understand models that can enhance decision-making and performance in a broad range of industries. This paper formulates the fractional tumor model in a fuzzy environment which comprises the parameters involving chemotherapy drug. The existence of the solution is established using the fuzzy Laplace transform. Further, Hyers Ulam Stability is used in illustrating the stability of the fuzzy Caputo fractional order tumor model.

Keywords: Tumor system, Fractional Calculus, Fuzzy Laplace transform, Hyers Ulam Stability.

## INTRODUCTION

The term 'cancer' was first coined in ancient Greece by the Greek physician Galen and Hippocrates due to the similarities observed between the swollen vein in some tumors and crabs. In India, there will likely be 14,61,427 tumour cases in 2022. One ninth people of India develop cancer in their lifetime. Among the female and male populations, breast and lung cancer are leading cancers respectively. For children from newborn to 14 years, lymphoid leukaemia is the most widespread form of cancer. Compared to 2020, the incident cases are expected to rise by 12.8% in 2025 [1]-[3]. Analysing a complicated real-world problem in a simple imaginary nature can depict

## Dhanalakshmi and Shrilekha

the precise behavior of the system, which is a remarkable aspect of mathematical modelling. The merits of fractional calculus in the mathematical modelling of various dynamical systems are investigated in [4]-[6]. Cancer cases are continuously rising and the government has taken many initiatives in controlling them. Several researchers have analysed various types of cancers using mathematical modelling which can be referred to in [7]-[8]. Fuzzy solutions allow for a more accurate description of the system by incorporating uncertainty and imprecision. Biological systems are often subject to various sources of uncertainty, such as measurement errors, parameter variations, and inherent variability [9]. The Hyers-Ulam stability theorem extends the concept of stability from differential equations to functional equations. This enables the use of stability analysis techniques in a wide range of mathematical models and systems other than standard differential equations [10] – [12].

The highlights of this work are,

- Incorporating fuzzy concept in terms of initial condition.
- Utilizing fuzzy Laplace transform in solving the system.
- Model's stability is examined by Hyers Ulam concept

#### **Basic Notation**

**Definition 1:** Consider the map  $\mu$  from  $\mathbb{R}$  to [0,1] which stands for fuzzy number when it complies with the criteria:

- μ is normal.
- For  $\lambda \in [0, 1]$  and any two arbitrary points u, v there are,  $\mu (\lambda u + (1 \lambda) v) \ge \min \{\mu(u, v)\}$  that is,  $\mu$  is fuzzy convex.
- $\mu$  is upper semi-continuous on  $\mathbb{R}$ .
- Closure of set  $Supp(\mu) = \{u \in \mathbb{R} | \mu(u) > 0\}$  is compact, where Supp is the support of  $\mu$ .

**Definition 2:** Consider  $\zeta$  which maps from  $E \times E$  to  $\mathbb{R}$  and let *s*, *r* be two fuzzy numbers  $s=(\underline{s}(\mathbf{j}), \overline{s}(\mathbf{j})) \& r=(\underline{r}(\mathbf{j}), \overline{r}(\mathbf{j}))$ . The fuzzy numbers *s* and *r* follows Hausdorff distance, if it satisfies

 $\zeta(s, r) = \sup_{i \in [0,1]} [\max\{ | \underline{s}(i) - \underline{r}(i) |, |\overline{s}(i) - \overline{r}(i) |\}]$ 

The metric  $\zeta$  in *E* satisfies the following properties,

- $\zeta(\pi m, \pi n) = |\pi| \zeta(m, n)$  for all  $m, n \in E, \pi \in \mathbb{R}$ .
- $\zeta(m+s,n+s)=\zeta(m,n)$  for all  $m,s,n\in E$ .
- $\zeta(m+s,n+t) \leq \zeta(m,s) + \zeta(n,t)$  for all  $m,n,s,t \in E$ .
- (*E*,ζ) will denote a complete metric space.

**Definition 3**: The fractional function g(z) represents derivative under

Caputo as

$${}^{C}D^{\xi}g(z) = \begin{cases} \frac{1}{\Gamma(w-\xi)} \int_{a}^{z} (s-z)^{w-\xi-1} D^{k}g(s)ds, w-1 < \xi < w, z > a, w \in \mathbb{N} \\ \left(\frac{d}{dz}\right)^{w-1}g(z), & \xi = w-1. \end{cases}$$

where the function  $g \in F$ , where F denotes the collection of fuzzy numbers with respect to  $\mathbb{R}$  and  $D^k g(s)$ , for all k, are integrable.

**Definition 4:** Let *s* be the positive real parameter. The fuzzy Laplace transform for G(z), the fractional differential equation is given by,

 $\mathbf{L}(\mathcal{G}(z)) = \int_0^\infty e^{-sz} \mathcal{G}(z) dt$ where s>0 and  $\mathcal{G}(z) \in F$ .

**Property 1:** [Convolution Property] Let  $\mathcal{G}(z), \mathcal{H}(z) \in [0, \infty]$  be a continuous function,  $\mathbf{L}((\mathcal{G}, \mathcal{H})(z)) = \mathbf{L}(\mathcal{G}(z))\mathbf{L}(\mathcal{H}(z))$ 

#### Model Formulation

In this study, a tumor-immune system model under chemotherapy treatment is considered. The normal cell population are indicated by  $R_p(t)$ , tumor cell population as  $T_c(t)$ , Effector Immune (EI) cells population as  $E_c(t)$ , the

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Dhanalakshmi and Shrilekha

toxicity of drugs as  $T_x(t)$ , the concentration of chemotherapeutic agents as  $D_c(t)$  based on time *t* are studied. The tumor system related to chemotherapy is defined with its parameters where  $^{C}D^{\xi}$  denotes derivative under Caputo sense and  $\xi$  represents order  $0 < \xi < 1$  as follows,

The parameter descriptions are provided as follows,

(1)

Parameters	Description
p <sub>2</sub>	Tumor cells killed in chemotherapy under fractional order
q <sub>1</sub>	1/q <sub>1</sub> is carrying capacity of Tumor cells
q <sub>2</sub>	$1/q_2$ is normal cell carrying capacity
$I_2$	El cells that destroy cancer cells in a fractional order
I <sub>3</sub>	Normal cells that destroy tumor cells in a fractional order
$I_4$	Tumor cells kill Normal Cells killed by under fractional order
$m_1$	Cancer cell proliferation pace
$m_2$	Normal cell proliferation pace
$d_1$	Mortality rate of El cells
V	Continuous producion of the EI cells
۱ <sub>5</sub>	The rate of increase in EI cells recruitment determined by slope of the recruitment curve
σ	The highest rate of EI cells recruitment
φ	Toxicity of drug elimination rate
η,	Chemotherapy drug elimination rate
$a_2$	The degradation rate of chemotherapy and tumor cells-killed effector cells
ξ	Proposed system's order
V(t)	External influx of drug depending on time

Now, the system (1) is represented as  $R^{R}$ 

$$W_c = \begin{cases} R_p \\ T_c \\ E_c \\ T_x \\ D_c \end{cases}$$

$$X(t, W_{c}(t)) = \begin{cases} m_{2}R_{p}(1 - q_{2}R_{p}) - I_{4}R_{p}T_{c} \\ m_{1}T_{c}(1 - q_{1}T_{c}) - [I_{2}E_{c} + I_{3}R_{p} + p_{2}D_{c}]T_{c} \\ v - d_{1}E_{c} + [\sigma\frac{T_{c}}{I_{5}+T_{c}} - a_{2}T_{c}]E_{c} \\ D_{c} - \phi T_{x} \\ -\eta_{2}D_{c} + V(t) \end{cases} \\ K_{c}(0, \varrho) = \begin{cases} R_{p}(0, \varrho) \\ T_{c}(0, \varrho) \\ E_{c}(0, \varrho) \\ T_{x}(0, \varrho) \\ D_{c}(0, \varrho) \end{cases}$$

Thus, the system (1) is reduced as,  $^{C}D^{\xi}W_{c} = X(t, W_{c}(t))$ (3)

#### Existence of Solution

The solution's existence for the above system is derived in this section. The Laplace transform is effective method in solving the differential equation of the dynamical system.

**Theorem 1:** For  $t \ge 0$  and  $0 < \xi < 1$ , the considered model's solution (1) exists under the initial conditions

Thus, the fuzzy solution of the fractional tumor model (1) is obtained using Laplace transform, proving the existence of solution. Further by utilising the Laplace transform properties, we obtain

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

 $W_{c}(t) = \int_{0}^{t} \frac{(t-s)^{\xi-1}}{\Gamma(\xi)} X(s, W_{c}(s)) ds + W_{c}(0).$ 

## Hyers-Ulam Stability (HUS)

Hyers-Ulam theorem establishes the theoretical basis for stability analysis. It makes a link between functional equation stability and the concept of continuity. This has led to subsequent developments and extensions of the theorem, which has contributed to the understanding of mathematical system stability.

## Assumption 1

Let  $t \in [0, a]$  and  $\epsilon > 0, \zeta [ {}^{C}D^{\xi}W_{c}(t), X(t, W_{c}(t))] \leq \epsilon$ .

Consider the continuous function  $X:[0,1] \times \mathbb{R} \to \mathbb{R}$ . Lipschitz condition holds for  $X(t, W_c(t))$ ,

 $\zeta [X(t, W *_{c} (t)), X(t, W_{c}(t))] \leq k \zeta [W *_{c} (t), W_{c}(t)], t \in [0, a]$ 

where  $W *_c (t)$  and  $W_c(t)$  are solutions of  $^{C}D^{\xi}W_c = X(t, W *_c (t))$  and (3) respectively.

## Theorem: 2

Let the assumptions holds. Consider  $1 - C_Q k > 0$ , where  $C_Q = \frac{a^{\xi}}{\Gamma(\xi+1)}$  then the system (1) under fractional order is stable based on Hyers Ulam Stability theorem.

## Proof:

To prove this, the Laplace transform is applied for the solution of (3) and  $^{C}D^{\xi}W_{c} = X(t, W *_{c}(t))$ , that is, as  $W_{c}(t)$  and  $W *_{c}(t)$ , respectively.

$$\begin{aligned} \zeta \left[ W *_{c}, W_{c} \right] &= \\ \zeta \left[ W *_{c} (t), \int_{0}^{t} \frac{(t-s)^{\xi-1}}{\Gamma(\xi)} X(s, W_{c}(s)) ds + W_{c}(0) \right] \pm \int_{0}^{t} \frac{(t-s)^{\xi-1}}{\Gamma(\xi)} X(s, W *_{c}(s)) ds \\ &\leq C_{Q} \epsilon + \frac{k}{\Gamma(\xi)} \int_{0}^{t} \frac{(t-s)^{\xi-1}}{\Gamma(\xi)} \zeta \left[ W *_{c}(s), \qquad W_{c}(s) \right] ds \\ \zeta \left[ W *_{c}, W_{c} \right] \leq C_{Q} \epsilon + C_{Q} k \zeta \left[ W *_{c}, W_{c} \right] \\ \zeta \left[ W *_{c}, W_{c} \right] \leq \frac{C_{Q}}{1-C_{Q}k} \epsilon \leq H \epsilon \end{aligned}$$
where  $H = \frac{C_{Q}}{1-C_{Q}k}.$ 

## CONCLUSION

There are various advantages to mathematically simulating tumor systems that help in comprehending and treating cancer. This study comprises a fuzzy model of the tumor system with drug administration during cancer chemotherapy taken in fractional order. The existence of solution under fuzziness for the tumor model is studied. Finally, the system's stability using HUS concept is verified.

## ABSTRACT

In this paper, we define some basic operations on Bipolar Pythagorean Fuzzy Matrices(BPFMs). Some algebraic properties like commutative, associative, distributive and De Morgan's are discussed for the operations algebraic sum, algebraic product, v and  $\land$ . Also we introduce nA and A<sup>n</sup> and investigate some results on bipolar pythagorean fuzzy matrices

**Keywords**: Fuzzy Matrix, Intuitionistic Fuzzy Matrices(IFM), Bipolar Fuzzy Matrices(BFM), Pythagorean Fuzzy Matrix, Bipolar Pythagorean Fuzzy Matrices(BPFM).

## INTRODUCTION

Zadeh introduced the concept fuzzy set in 1965, as the generalization of crisp set [14]. Fuzzy matrices are introduced for the first time by Thomason in 1977[11]. Some results on fuzzy matrices are discussed by gilchrist [2]. The concept of an intuitionistic fuzzy matrices are introduced by khan[3]. Each element in an intuitionistic fuzzy matrices is expressed by an ordered pair (a<sub>ij</sub>a<sub>ij</sub>) of a non negative real numbers a<sub>ij</sub>a<sub>ij</sub> (=[0,1]. Monoids on intuitionistic fuzzy matrices are discussed by boobalan[10]. Decomposition of Intuitionistic fuzzy matrices are discussed by Muthuraji, Sriram and Murugadas[8]. Some algebraic structures on max-max min-min compositions over intuitionistic fuzzy matrices are studied by Muthuraji and lalitha.[6] The concept of bipolar fuzzy set was first introduced by Zhang[15]. The concept of bipolar fuzzy matrices are established by PaI and Mondal [5]. Commutative monoids on algebraic sum and algebraic product on bipolar fuzzy sets and bipolar fuzzy matrices are constructed by Muthuraji and Punitha[7]. The concept of bipolar intuitionistic fuzzy matrices are initiated by Lalitha and Dhivya[4]. Pythagorean fuzzy set are established by the extension of the intuitionistic fuzzy sets and characterize the condition that square of sum of its membership and nonmembership is equal to 0 or less than 1. The concept of pythagorean

## Muthuraji and Punitha

fuzzy matrices and it's algebraic operations was developed by Silambarasan and Sriram[9].Pythagorean fuzzy subsets and its membership grades in multi criteria decision making are discussed by Yager[12,13].The trace and determinant of bipolar Pythagorean fuzzy square matrices and its novel operations are discussed by Chinnadurai[1].In this paper, Algebraic operations on Pythagorean fuzzy matrices are extended to bipolar Pythagorean fuzzy matrices. We construct nA and A<sup>n</sup> when n is positive interger for bipolar Pythagorean fuzzy matrices.

#### **Definitions And Preliminaries**

In this section, we refer basic definition.

## Definition 2.1 (Fuzzy Matrix) [2]

Consider a matrix  $A = [(a_{ij})]_{m \times n}$  where  $a_{ij} \in [0,1]$   $1 \le i \le m$  and  $1 \le i \le n$ . Then A is a fuzzy matrix.

## Definition 2.2 (Intuitionistic Fuzzy Matrix) [4]

An Intuitionistic fuzzy matrix is a matrix of pairs  $A = [(a_{ij}, a'_{ij})]_{m \times n}$  of non negativereal numbers  $a_{ij}, a'_{ij} \in [0, 1]$ , satisfying  $0 \le a_{ii} + a'_{ii} \le 1$  for all i, j.

#### Definition 2.3 (Pythagorean Fuzzy Matrix) [9]

A Pythagorean fuzzy matrix is a pair  $A = [(a_{ij}, a'_{ij})]$  of non negative real numbers  $a_{ij}, a'_{ij} \in [0, 1]$ , satisfying the condition  $a_{ij}^2 + a'_{ij}^2 \le 1$  for all i, j.

### Definition 2.4 (Bipolar Fuzzy Matrix) [5]

Let  $A = (a_{ij})_{km} \in \mathcal{M}_{lm}$ , then  $a_{ij} = (-a_{ijn}, a_{ijp}) \in \mathcal{B}_{F}$ , where  $a_{ijn}, a_{ijp} \in [0, 1]$  are the negative and positive membership values of the element  $a_{ij}$ , respectively.

## Definition 2.5(Bipolar Pythagorean Fuzzy Matrix) [1]

A Bipolar Pythagorean fuzzy matrix of order (m×n) is denoted by M<sub>mn</sub> and that of order (m×m), that is square BPFM is denoted by M<sub>mm</sub>. We conclude that the matrix  $A = \left[ \left( -a_{ij}^n, a_{ij}^p, -a_{ij}^n, a_{ij}^{p'} \right) \right]$ , where  $-a_{ij}^n, a_{ij}^p, -a_{ij}^n, a_{ij}^{p'} \in [-1,1]$  are the negative and positive membership values of the element  $a_{ij}, a_{ij}$  respectively. Also satisfies  $\left( a_{ij}^n \right)^2 + \left( a_{ij}^n \right$ 

## **Operations On Bipolar Pythagorean Fuzzy Matrices**

In this section, we discuss some operations on Bipolar Pythagorean Fuzzy Matrices

Let us consider the BPFMs A =  $[(-\Phi_{ijn'}, \Phi_{ijp'}, -\Phi'_{ijn'}, \Phi'_{ijp'})] \in \mathcal{M}_{mn}$  and B =  $[(-\Psi_{ijn'}, \Psi_{ijp'}, -\Psi'_{ijn'}, \Psi'_{ijp'})] \in \mathcal{M}_{mn}$ . Their operations are defined as follows

 $A \vee B = \left[-max\{\Phi_{ijn}, \Psi_{ijn}\}, max\{\Phi_{ijp'}, \Psi_{ijp'}\}, -min\{\Phi'_{ijn}, \Psi'_{ijn'}\}, min\{\Phi'_{ijp'}, \Psi'_{ijp'}\}\right]$ 

 $A \wedge B = \left[-\min\{\Phi_{ijn}, \Psi_{ijn}\}, \min\{\Phi_{ijp}, \Psi_{ijp}\}, -\max\{\Phi_{ijn}', \Psi_{ijn}'\}, \max\{\Phi_{ijp}', \Psi_{ijp}'\}\right]$ 

$$\begin{aligned} \mathsf{A}^{c} &= \left[ \left( -\Phi_{ijn}^{'}, \Phi_{ijp}^{'} \right), \ \left( -\Phi_{ijn}, \Phi_{ijp} \right) \right] \\ \mathsf{A} \bigoplus_{\mathsf{BP}} \mathsf{B} &= \left[ -\sqrt{\Phi_{ijn}^{2} + \Psi_{ijn}^{2} - \Phi_{ijn}^{2} \Psi_{ijn}^{2}}, \sqrt{\Phi_{ijp}^{2} + \Psi_{ijp}^{2} - \Phi_{ijp}^{2} \Psi_{ijp}^{2}}, -\left( \Phi_{ijn}^{'} \Psi_{ijn}^{'} \right), \ \left( \Phi_{ijp}^{'} \Psi_{ijp}^{'} \right) \right] \\ \mathsf{A} \bigoplus_{\mathsf{BP}} \mathsf{B} &= \left[ -\left( \Phi_{ijn} \Psi_{ijn} \right), \left( \Phi_{ijp} \Psi_{ijp} \right), -\sqrt{\Phi_{ijn}^{'2} + \Psi_{ijn}^{'2} - \Phi_{ijn}^{'2} \Psi_{ijn}^{'2}}, \sqrt{\Phi_{ijp}^{'2} + \Psi_{ijp}^{'2} - \Phi_{ijp}^{'2} \Psi_{ijp}^{'2}} \right] \end{aligned}$$

Following  $A \bigoplus_{BP} B$  and  $A \odot_{BP} B$  we get the equations for any integer n > 0 $nA = A \bigoplus_{BP} A \bigoplus_{BP} \dots \dots \bigoplus_{BP} A$ 

$$= \left[ -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n}}, \sqrt{1 - (1 - \Phi_{ijp}^{2})^{n}}, -\Phi_{ijn}^{'n}, \Phi_{ijp}^{'n} \right]$$
  

$$A^{n} = A \odot_{BP} A \odot_{BP} \dots \odot_{BP} A$$
  

$$= \left[ -\Phi_{ijn}^{n}, \Phi_{ijp}^{n}, -\sqrt{1 - (1 - \Phi_{ijn}^{'2})^{n}}, \sqrt{1 - (1 - \Phi_{ijp}^{'2})^{n}} \right]$$

Theorem 3.1

If A and B are BPFMs, n is a positive integer then

(i) n(A⊕<sub>BP</sub>B) =nA⊕<sub>BP</sub>nB

(ii) (A⊙<sub>BP</sub>B)<sup>n</sup>=A<sup>n</sup>⊙<sub>BP</sub>B<sup>n</sup>

Proof (i) n(A⊕<sub>BP</sub>B)

$$= \begin{bmatrix} -\sqrt{1 - (1 - (\Phi_{ijn}^{2} + \Psi_{ijn}^{2} - \Phi_{ijn}^{2}\Psi_{ijn}^{2}))^{n}}, \sqrt{1 - (1 - (\Phi_{ijp}^{2} + \Psi_{ijp}^{2} - \Phi_{ijp}^{2}\Psi_{ijp}^{2}))^{n}}, \\ -(\Phi_{ijn}^{\prime}\Psi_{ijn}^{\prime})^{n}, (\Phi_{ijp}^{\prime}\Psi_{ijp}^{\prime})^{n} \end{bmatrix}$$

$$= \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n}(1 - \Psi_{ijn}^{2})^{n}}, \sqrt{1 - (1 - \Phi_{ijp}^{2})^{n}(1 - \Psi_{ijp}^{2})^{n}}, \\ -(\Phi_{ijn}^{\prime}\Psi_{ijn}^{\prime})^{n}, (\Phi_{ijp}^{\prime}\Psi_{ijp}^{\prime})^{n} \end{bmatrix}$$
(3.1)  
nA\Phi BenB  

$$= \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n} + 1 - (1 - \Psi_{ijn}^{2})^{n} - (1 - (1 - \Phi_{ijn}^{2})^{n}), (1 - (1 - \Psi_{ijn}^{2})^{n}), \\ -(\Phi_{ijn}^{\prime}\Psi_{ijn}^{\prime})^{n} - (1 - (1 - \Phi_{ijn}^{2})^{n}) + 1 - (1 - \Psi_{ijn}^{2})^{n} - (1 - (1 - \Phi_{ijn}^{2})^{n}) + (1 - (1 - \Psi_{ijn}^{2})^{n}), \\ -(\Phi_{ijn}^{\prime}\Psi_{ijn}^{\prime}), (\Phi_{ijp}^{\prime}\Psi_{ijn}^{\prime}) \\ = \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n} + 1 - (1 - \Psi_{ijn}^{2})^{n} - (1 - (1 - \Phi_{ijn}^{2})^{n}) + (1 - (1 - \Psi_{ijn}^{2})^{n}), (1 - (1 - \Psi_{ijn}^{2})^{n}), \\ -(\Phi_{ijn}^{\prime}\Psi_{ijn}^{\prime}), (\Phi_{ijp}^{\prime}\Psi_{ijn}^{\prime}) \\ = \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n}(1 - \Psi_{ijn}^{2})^{n}, \sqrt{1 - (1 - \Phi_{ijn}^{2})^{n}(1 - \Psi_{ijn}^{2})^{n}}, \sqrt{1 - (1 - \Phi_{ijn}^{2})^{n}(1 - \Psi_{ijn}^{2})^{n}}, \\ -(\Phi_{ijn}^{\prime}\Psi_{ijn}^{\prime})^{n}, (\Phi_{ijp}^{\prime}\Psi_{ijn}^{\prime})^{n} \end{bmatrix}$$
(3.2)

r

From equations (3.1) and (3.2), we get the result. Similarly we can prove  $(A \odot_{BP} B)^n = A^n \odot_{BP} B^n$ 

#### Theorem 3.2

Let A be a BPFMs,  $n_1,n_2$  are positive integer then (i) $n_1A \bigoplus_{BP} n_2 A=(n_1+n_2)A$ (ii) $A^{n1} \bigoplus_{BP} A^{n2} = A^{(n1+n2)}$ 

Proof:(i) n1A⊕BP n2 A=

$$= \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n^{1}} + 1 - (1 - \Phi_{ijn}^{2})^{n^{2}} - (1 - (1 - \Phi_{ijn}^{2})^{n^{1}}) (1 - (1 - \Phi_{ijn}^{2})^{n^{2}}),} \\ \sqrt{1 - (1 - \Phi_{ijp}^{2})^{n^{1}} + 1 - (1 - \Phi_{ijp}^{2})^{n^{2}} - (1 - (1 - \Phi_{ijp}^{2})^{n^{1}} 1 - (1 - \Phi_{ijp}^{2})^{n^{2}}),} \\ - (\Phi_{ijn}^{m^{1}} \Phi_{ijn}^{m^{2}}), (\Phi_{ijp}^{m^{1}} \Phi_{ijp}^{m^{2}}) \\ = \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n^{1 + n^{2}}}, \sqrt{1 - (1 - \Phi_{ijp}^{2})^{n^{1 + n^{2}}},} \\ - (\Phi_{ijp}^{i})^{n^{1 + n^{2}}}, (\Phi_{ijp}^{i})^{n^{1 + n^{2}}}, \end{bmatrix} \\ = (n_{1} + n_{2})A$$

Similarly we can prove  $A^{n1} \odot_{BP} A^{n2} = A^{(n1 + n2)}$ 

Theorem 3.3 Let A be a BPFMs, n is a positive integer then (i)  $(A^c)^n = (nA)^c$ (ii)  $n(A^c) = (A^n)^c$ 

Proof: (i) 
$$(A^c)^n = \left[ \left( -\Phi_{ijn}^{\prime n}, \Phi_{ijp}^{\prime n}, -\sqrt{1 - (1 - \Phi_{ijn}^2)^n}, \sqrt{1 - (1 - \Phi_{ijp}^2)^n} \right)^n \right]$$
  
 $(nA)^c = \left[ \left( -\Phi_{ijn}^{\prime n}, \Phi_{ijp}^{\prime n}, -\sqrt{1 - (1 - \Phi_{ijn}^2)^n}, \sqrt{1 - (1 - \Phi_{ijp}^2)^n} \right)^n \right]$   
 $\Rightarrow (A^c)^n = (nA)^c$ 

Similarly we can prove  $n(A^c) = (A^n)^c$ 

#### Theorem3.4

If A and B are BPFMs, n is a positive integer then (i)n(AvB) = nA v nB (ii)  $(AvB)^n = A^n v B^n$ 

$$\begin{aligned} & \operatorname{Proof:}(i) (\mathsf{A} \lor \mathsf{B}) = \left[ -\max\{\Phi_{ijn}, \Psi_{ijn}\}, \max\{\Phi_{ijp}, \Psi_{ijp}\}, -\min\{\Phi_{ijp}', \Psi_{ijn}'\}, \min\{\Phi_{ijp}', \Psi_{ijp}'\} \right] \\ & \mathsf{n}(\mathsf{A} \lor \mathsf{B}) = \begin{bmatrix} -\sqrt{1 - (1 - \max\{\Phi_{ijn}^{2}, \Psi_{ijn}^{2}\})^{n}}, \sqrt{1 - (1 - \max\{\Phi_{ijp}^{2}, \Psi_{ijp}^{2}\})^{n}}, \\ & -\min\{\Phi_{ijn}^{n}, \Psi_{ijn}^{m}\}, \min\{\Phi_{ijp}^{m}, \Psi_{ijp}^{m}\} \right] \end{aligned}$$
(3.3)  
$$& \mathsf{n}\mathsf{A} \lor \mathsf{n}\mathsf{B} = \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n}}, \sqrt{1 - (1 - \Phi_{ijp}^{2})^{n}}, -\Phi_{ijn}^{n}, \Phi_{ijp}^{n}} \\ & -\sqrt{1 - (1 - \Psi_{ijn}^{2})^{n}}, \sqrt{1 - (1 - \Psi_{ijp}^{2})^{n}}, -\Psi_{ijn}^{n}, \Psi_{ijp}^{n}} \end{bmatrix} \end{aligned}$$
$$& = \begin{bmatrix} -\max\{\sqrt{1 - (1 - \Phi_{ijn}^{2})^{n}}, \sqrt{1 - (1 - \Psi_{ijp}^{2})^{n}}, \sqrt{1 - (1 - \Psi_{ijp}^{2})^{n}}, \sqrt{1 - (1 - \Psi_{ijp}^{2})^{n}}, \Psi_{ijp}^{n}} \end{bmatrix} \\ & = \begin{bmatrix} -\sqrt{1 - (1 - \Phi_{ijp}^{2})^{n}}, \sqrt{1 - (1 - \Psi_{ijp}^{2})^{n}}, \sqrt{1 - (1 - \Psi_{ijp}^{2})^{n}} \}, \\ & -\min\{\Phi_{ijn}^{m}, \Psi_{ijn}^{m}\}, \min\{\Phi_{ijp}^{m}, \Psi_{ijp}^{m}\}, \min\{\Phi_{ijp}^{m}, \Psi_{ijp}^{m}\} \end{bmatrix} \end{aligned}$$

From equation (3.3) and (3.4), we get the result  $\ .$  Similarly we can prove(AvB)<sup>n</sup> = A<sup>n</sup> v B<sup>n</sup>

## Theorem 3.5(Commutative law)

Let A and B are BPFMs, then (i) $A \bigoplus_{BP} B = B \bigoplus_{BP} A$ (ii) $A \bigoplus_{BP} B = B \bigoplus_{BP} A$ The proof (i) and (ii) are trivial.

#### Theorem 3.6 (Associative law)

Let A and B are two BPFMs, then (i)  $(A \oplus_{BP}B) \oplus_{BP}C = A \oplus_{BP}(B \oplus_{BP}C)$ (ii)  $(A \odot_{BP}B) \odot_{BP}C = A \odot_{BP}(B \odot_{BP}C)$ Proof: (i)  $(A \oplus_{BP}B) \oplus_{BP}C$

$$= \begin{bmatrix} -\sqrt{\max\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\} + \min\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\} - \max\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\}\min\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\}}, \\ \sqrt{\max\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\} + \min\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\} - \max\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\}\min\left\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\right\}}, \\ -\left(\min\left\{\Phi_{ijp}^{'},\Psi_{ijp}^{'}\right\}\max\left\{\Phi_{ijp}^{'},\Psi_{ijp}^{'}\right\}\right), \left(\min\left\{\Phi_{ijp}^{'},\Psi_{ijp}^{'}\right\}\max\left\{\Phi_{ijp}^{'},\Psi_{ijp}^{'}\right\}\right), \\ = \begin{bmatrix} -\sqrt{\Phi_{ijp}^{2} + \Psi_{ijp}^{2} - \Phi_{ijp}^{2}\Psi_{ijp}^{2}}, \sqrt{\Phi_{ijp}^{2} + \Psi_{ijp}^{2} - \Phi_{ijp}^{2}\Psi_{ijp}^{2}}, -\left(\Phi_{ijp}^{'},\Psi_{ijp}^{'}\right), \left(\Phi_{ijp}^{'},\Psi_{ijp}^{'}\right) \end{bmatrix} \\ = A \bigoplus B$$

Similarly we can prove (ii)  $(A \lor B) \odot_{BP} (A \land B) = A \odot_{BP} B$ 

# Theorem 3.9 (Distributive laws)

Let A, B and C are BPFMs, then (i)  $(A \lor B) \land C = (A \land C) \lor (B \land C)$ (ii)  $(A \land B) \lor C = (A \lor C) \land (B \lor C)$ (iii)  $(A \lor B) \bigoplus_{BP} C = (A \bigoplus_{BP} C) \lor (B \bigoplus_{BP} C)$ (iv)  $(A \land B) \bigoplus_{BP} C = (A \bigoplus_{BP} C) \land (B \bigoplus_{BP} C)$ (v)  $(A \lor B) \odot_{BP}C = (A \odot_{BP}C) \lor (B \odot_{BP}C)$ (vi)  $(A \land B) \odot_{BP}C = (A \odot_{BP}C) \land (B \odot_{BP}C)$ Proof:(i)(A∨B)∧C  $\begin{aligned} & \text{Proof:}(i)(\mathsf{A} \lor \mathsf{B}) \land \mathsf{C} \\ &= \begin{bmatrix} -\min\{\max\{\Phi_{ijp}, \Psi_{ijp}\} \Upsilon_{ijp}\}, \min\{\max\{\Phi_{ijp}, \Psi_{ijp}\} \Upsilon_{ijp}\}, \\ &-\max\{\min\{\Phi_{ijp}, \Psi_{ijp}\}, \Upsilon_{ijp}'\}, \max\{\min\{\Phi_{ijp}, \Psi_{ijp}'\}, \Upsilon_{ijp}'\} \end{bmatrix} \\ &= \begin{bmatrix} -\max\{\min\{\Phi_{ijp}, \Psi_{ijp}\}, \min\{\Phi_{ijp}, \Upsilon_{ijp}\}\}, \max\{\min\{\Phi_{ijp}, \Psi_{ijp}'\}, \min\{\Phi_{ijp}, \Upsilon_{ijp}'\}\}, \\ &-\min\{\max\{\Phi_{ijp}', \Psi_{ijp}'\}, \max\{\Psi_{ijp}', \Upsilon_{ijp}'\}\}, \max\{\min\{\Phi_{ijp}', \Psi_{ijp}'\}, \max\{\Psi_{ijp}', \Psi_{ijp}'\}, \max\{\Psi_{ijp}', \Upsilon_{ijp}'\}\} \end{bmatrix} \\ &= \begin{bmatrix} (-\min\{\Phi_{ijp}, \Upsilon_{ijp}\}, \min\{\Phi_{ijp}, \Upsilon_{ijp}'\}), (-\max\{\Phi_{ijp}', \Upsilon_{ijp}'\}, \max\{\Psi_{ijp}', \Upsilon_{ijp}'\}), \\ &-\min\{\Psi_{ijp}, \Upsilon_{ijp}, \min\{\Psi_{ijp}, \Upsilon_{ijp}'\}), (-\max\{\Psi_{ijp}', \Upsilon_{ijp}'\}, \max\{\Psi_{ijp}', \Upsilon_{ijp}'\}) \end{bmatrix} \\ &= \begin{bmatrix} (-\min\{\Psi_{ijp}, \Upsilon_{ijp}\}, \min\{\Psi_{ijp}, \Upsilon_{ijp}'\}), (-\max\{\Psi_{ijp}', \Upsilon_{ijp}'\}, \max\{\Psi_{ijp}', \Upsilon_{ijp}'\}), \\ &-\max\{\Phi_{ijp}, \Upsilon_{ijp}'\}, \min\{\Psi_{ijp}, \Upsilon_{ijp}'\}) \end{bmatrix} \end{bmatrix}$  $=(A \land C) \lor (B \land C)$ 

Similarly we can prove (ii)  $(A \land B) \lor C = (A \lor C) \land (B \lor C)$ 

(iii)(A∨B) ⊕<sub>BP</sub> C

$$= \begin{bmatrix} -\left(\sqrt{max\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\}+\Upsilon_{ijp}^{2}-max\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\}\Upsilon_{ijp}^{2}}\right),\\ \left(\sqrt{max\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\}+\Upsilon_{ijp}^{2}-max\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\}\Upsilon_{ijp}^{2}}\right),\\ -(min\{\Phi_{ijp}^{\prime},\Psi_{ijp}^{\prime}\}\Upsilon_{ijp}^{\prime}), (min\{\Phi_{ijp}^{\prime},\Psi_{ijp}^{\prime}\}\Upsilon_{ijp}^{\prime}) \end{bmatrix} \\ = \begin{bmatrix} -\left(\sqrt{(1-\Upsilon_{ijp}^{2})max\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\}+\Upsilon_{ijp}^{2}}\right), \left(\sqrt{(1-\Upsilon_{ijp}^{2})max\{\Phi_{ijp}^{2},\Psi_{ijp}^{2}\}+\Upsilon_{ijp}^{2}}\right),\\ -(min\{\Phi_{ijp}^{\prime},\Upsilon_{ijp}^{\prime},\Psi_{ijp}^{\prime},\Upsilon_{ijp}^{\prime}\}), (min\{\Phi_{ijp}^{\prime},\Upsilon_{ijp}^{\prime},\Psi_{ijp}^{\prime},\Psi_{ijp}^{\prime},\Psi_{ijp}^{\prime},\Psi_{ijp}^{\prime}\}) \end{bmatrix}$$
(3.7)

(A⊕<sub>BP</sub> C)∨(B⊕<sub>BP</sub> C)

$$= \begin{bmatrix} -\left(-\max\left\{\sqrt{\Phi_{ijn}^{2}+\Upsilon_{ijn}^{2}-\Phi_{ijn}^{2}\Upsilon_{ijn}^{2}},\sqrt{\Psi_{ijn}^{2}+\Upsilon_{ijn}^{2}-\Psi_{ijn}^{2}\Upsilon_{ijn}^{2}}\right\}\right),\\ \left(\max\left\{\sqrt{\Phi_{ijp}^{2}+\Upsilon_{ijp}^{2}-\Phi_{ijp}^{2}\Upsilon_{ijp}^{2}},\sqrt{\Psi_{ijp}^{2}+\Upsilon_{ijp}^{2}-\Psi_{ijp}^{2}\Upsilon_{ijp}^{2}}\right\}\right),\\ -\left(\min\{\Phi_{ijn}^{'}\Upsilon_{ijn}^{'},\Psi_{ijn}^{'}\Upsilon_{ijn}^{'}\}\right),\ \left(\min\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'},\Psi_{ijp}^{'},\Psi_{ijp}^{'},\Psi_{ijp}^{'}\}\right) \end{bmatrix}$$

$$= \begin{bmatrix} -\left(max\left\{\sqrt{(1-\Upsilon_{ijp}^{2})\Phi_{ijp}^{2}+\Upsilon_{ijp}^{2}}, \sqrt{(1-\Upsilon_{ijp}^{2})\Psi_{ijp}^{2}+\Upsilon_{ijp}^{2}}\right)\right), \\ \left(max\left\{\sqrt{(1-\Upsilon_{ijp}^{2})\Phi_{ijp}^{2}+\Upsilon_{ijp}^{2}}, \sqrt{(1-\Upsilon_{ijp}^{2})\Psi_{ijp}^{2}+\Upsilon_{ijp}^{2}}\right)\right), \\ -\left(min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}\right\}\right), \left(min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}\right\}\right)\right) \\ = \begin{bmatrix} -\left(\sqrt{(1-\Upsilon_{ijp}^{2})max\left\{\Phi_{ijp}^{2}, \Psi_{ijp}^{2}\right\}, (\min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}\right\}, (\min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}), (\min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}), (\min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}), (\min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}), (\min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}\Upsilon_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}\Upsilon_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}^{'}, \Psi_{ijp}^{'}), (min\left\{\Phi_{ijp}$$

Similarly we can prove (iv)  $(A \land B) \oplus_{BP} C = (A \oplus_{BP} C) \land (B \oplus_{BP} C)$ 

$$\begin{aligned} (\vee)(A \lor B) \odot_{B^{p}} C \\ &= \begin{bmatrix} -(max\{\Phi_{ijp}, \Psi_{ijp}\}\Upsilon_{ijp}), \ (max\{\Phi_{ijp}, \Psi_{ijp}\}\Upsilon_{ijp}), \\ -\left(\sqrt{min\{\Phi_{ijp}^{'2}, \Psi_{ijp}^{'2}\} + \Upsilon_{ijp}^{'2} - min\{\Phi_{ijp}^{'2}, \Psi_{ijp}^{'2}\}\Upsilon_{ijp}^{'2}}\right), \\ \left(\sqrt{min\{\Phi_{ijp}^{'2}, \Psi_{ijp}^{'2}\} + \Upsilon_{ijp}^{'2} - min\{\Phi_{ijp}^{'2}, \Psi_{ijp}^{'2}\}\Upsilon_{ijp}^{'2}}\right)} \\ &= \begin{bmatrix} -(max\{\Phi_{ijp}, \Psi_{ijp}\}\Upsilon_{ijp}), \ (max\{\Phi_{ijp}, \Psi_{ijp}\}\Upsilon_{ijp}), \\ -(\sqrt{(1 - \Upsilon_{ijp}^{'2}) min\{\Phi_{ijp}^{'2}, \Psi_{ijp}^{'2}\} + \Upsilon_{ijp}^{'2}}), \ (\sqrt{(1 - \Upsilon_{ijp}^{'2}) min\{\Phi_{ijp}^{'2}, \Psi_{ijp}^{'2}\} + \Upsilon_{ijp}^{'2}})} \end{bmatrix}$$
(3.9)

$$\begin{aligned} (A \odot_{BP} C) &\vee (B \odot_{BP} C) \\ &= \begin{bmatrix} -(max\{\Phi_{ijn}\Upsilon_{ijn}, \Psi_{ijn}\Upsilon_{ijn}, \hat{\Psi}_{ijn}, \hat{\Psi}_{ijn}, \hat{\Psi}_{ijn}, \hat{\Psi}_{ijn}, \Psi_{ijn}, \hat{\Psi}_{ijn}, \hat{$$

From equation (3.9) and (3.10), we get the result. Similarly we can prove (vi)  $(A \land B) \odot_{B^p} C = (A \odot_{B^p} C) \land (B \odot_{B^p} C)$ 

# CONCLUSION

In this paper, we discuss the Algebraic operators on Bipolar Pythagorean Fuzzy matrices such as algebraic sum, algebraic product,  $\lor$  and  $\land$ . In this operators we discussed about De Morgan's laws and Distributive laws, and also discussed about n integers are greater than zero. In future we discuss about some new operators on Bipolar Pythagorean Fuzzy matrices

# ABSTRACT

Let G = (V, E) be a simple connected graph of order p and size q. If G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, ..., G<sub>n</sub> are edge disjoint subgraphs of G such that E(G) = E(G<sub>1</sub>)UE(G<sub>2</sub>)U...,UE(G<sub>n</sub>), then (G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, ..., G<sub>n</sub>) is said to be a Decomposition of a graph G. A graph of size  $q = \binom{n+2}{3}$  is said to have a Triangular decomposition (TD) if G can be decomposed into n - subgraphs G<sub>1</sub>, G<sub>2</sub>, G<sub>3</sub>, ..., G<sub>n</sub> such that each G<sub>i</sub> is connected and  $|E(G_i)| = \binom{i+1}{2}$  for  $1 \le i \le n$ . A TD in which each G<sub>i</sub> is a path is said to be a Triangular path decomposition (TPD). In this paper, we investigate TPD of Triangular cyclic snake graphs.

**Keywords –** Decomposition, Triangular decomposition, Triangular path decomposition, Triangular cyclic snake graphs.

# INTRODUCTION

A graph G, referred to here is an undirected connected graph without loops or multiple edges. A path is a type of open walk where neither edges nor vertices are allowed to repeat. There is a possibility that only the starting vertex and ending vertex are same in a path. A path of length n is denoted by  $P_n$ . Different types of decomposition of a graph G have been studied in the literature by imposing suitable conditions on the subgraphs G<sub>L</sub> A TD in which each G<sub>L</sub> is a path of length  $\binom{i+1}{2}$  in G, then we say that G admits Triangular path decomposition (TPD). In this paper we

# Subbulakshmi and Chitra Devi

discuss about the necessary and sufficient conditions for the existence of Triangular path decomposition of Triangular cyclic snake graphs.

# **Definition 1.1**

A decomposition of a graph G is a collection of edge disjoint subgraphs  $G_1, G_2, G_3, \ldots, G_n$  of G such that every edge of G belongs to exactly one of the subgraph Gi.

# **Definition 1.2**

A graph G of size  $q = \binom{n+2}{3}$  is said to have a Triangular decomposition (TD) if G can be decomposed into n subgraphs  $G_1, G_2, G_3, \ldots, G_n$  such that each  $G_i$  is connected and  $|E(G_i)| = \binom{i+1}{2}$  for  $1 \le i \le n$ .

# **Definition 1.3**

A Triangular decomposition (TD) in which each G<sub>1</sub> is a path is said to be Triangular path decomposition (TPD).

# **Definition 1.4**

A kCt – snake has been defined as a connected graph in which all the blocks are isomorphic to the cycle Ct and the block – cut point graph is a path P, where P is the path of least length that contains all the cut vertices of a kCt - snake. A kCt cyclic snake graph has 2k + 1 vertices and tk edges where k is the number of blocks in the cyclic snake graph. Assuming t is odd, then the cyclic snake graph  $kC_t$  is said to be an odd cyclic snake graph.

# Note :1.5

Throughout this paper the base path  $v_0 v_1 v_2 \dots v_k$  is a path that contains all the cut vertices of  $kC_t$  – cyclic snake graph and here  $d(v_i, v_{i+1}) = 1, 0 \le i \le k - 1$ .

## **Definition 1.6**

A Triangular snake graph kC<sub>3</sub> is obtained from a path  $v_0 v_1 v_2 \dots v_k$  by joining  $v_i$  and  $v_{i+1}$  to a new vertex  $u_{i+1}$ for  $0 \le i \le k - 1$ . That is every edge of a path of size k is replaced by a triangle C<sub>3</sub>. A Triangular snake graph has 2k + 1 vertices and 3k edges where k is the number of blocks in the Triangular snake graph.

# Triangular Decomposition of Triangular cyclic snake graphs

## Theorem 2.1

Odd cyclic snake graphs  $\frac{(tm-2)(tm-1)m}{6}$  Ct admits TPD (P1, P2, P3, ...., Pn)  $\Leftrightarrow$  n = tm-2 where t is a odd number, t  $\geq$ 3 and  $m \in N$ .

# Proof:

Assume  $\frac{(tm-2)(tm-1)m}{6}C_{1}$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>,...,P<sub>n</sub>). Then  $q(\frac{(tm-2)(tm-1)m}{6}C_{1}) = t(\frac{(tm-2)(tm-1)m}{6})$ . That is  $\frac{(tm-2)(tm-1)m}{6} = \frac{n(n+1)(n+2)}{6}$ . Implies n = tm-2 where  $m \in \mathbb{N}$ .

Conversely, to prove  $\left(\frac{(tm-2)(tm-1)m}{6}\right)$ Ct admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>), where n = tm-2, t is odd, t  $\geq$  3 and m $\in$  N. We prove the theorem by using mathematical induction on 'm'. When m = 1,  $q(\frac{(tm-2)(tm-1)m}{6}C_1) = \frac{(t-2)(t-1)(t)}{6}$ . Clearly  $\frac{(t-2)(t-1)(t)}{6}$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>t-2</sub>). Assume that the result is true for m = k. That is  $\left(\frac{(tk-2)(tk-1)k}{6}\right)$   $C_1$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>) where n = tk-2, t is odd, t  $\geq$  3 and m  $\in$  N. We prove the result is true for a positive integer m = k + 1. That is to prove  $(\frac{(t(k+1)-2)(t(k+1)-1)(k+1)}{6})C_t$  admits TPD  $(P_1,P_2,P_3,\ldots,P_{t(k+1)-2})$ . Now  $q(\frac{(t(k+1)-2)(t(k+1)-1)(k+1)}{6}C_t) = \frac{(t^{(k+1)-2})(t(k+1)-1)(k+1)}{6}t = \frac{(t^{(k+1)-2})(t(k+1)-1}{6}t = \frac{(t^{(k+1)-2})(t(k+1)-1}{6}t =$ 63402

# Subbulakshmi and Chitra Devi

1,  $P_{1k_1}, \dots, P_{(k+1)t-2}$  equal to  $(\frac{3t^2k^2+3t^2k-6tk+t^2-3t+2}{6})$ t and hence  $(\frac{(t(k+1)-2)(t(k+1)-1)(k+1)}{6})C_1$  can be decompose into(P1, P2, P3, ...., Pt(k + 1)-2). We conclude by the induction principle that odd cyclic snake graphs  $\frac{(tm-2)(tm-1)m}{C}C_t \text{ admits TPD } (P_1, P_2, P_3, \dots, P_n) \Leftrightarrow n = tm-2 \text{ where } t \text{ is a odd number, } t \geq 3 \text{ and } m \in \mathbb{N}.$ 

## Theorem 2.2

Odd cyclic snake graphs  $\frac{(tm-1)m(tm+1)}{6}$ Ct admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>)  $\Leftrightarrow$  n = tm-1 where t is a odd number,  $t \ge 3$  and  $m \in N$ .

# Proof :

Assume  $\frac{(tm-1)m(tm+1)}{6}C_1$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>). Then  $q(\frac{(tm-1)m(tm+1)}{6}C_1) = t(\frac{(tm-1)m(tm+1)}{6})$ . That is  $\frac{(tm-1)tm(tm+1)}{6} = \frac{(n-1)n(n+1)}{6}$ . Implies  $n = tm - 1, m \in \mathbb{N}$ .

Conversely, to prove  $\left(\frac{(tm-1)m(tm+1)}{6}\right)$ Ct admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>), where n = tm - 1, t is a odd number, t  $\geq$  3 and m  $\in$  N. We prove the theorem by using mathematical induction on 'm'. When m = 1, q( $\frac{(tm-1)m(tm+1)}{6}$ Ct) =  $\frac{(t-1)t(t+1)}{6}$ . Clearly  $\frac{(t-1)t(t+1)}{6}$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>t-1</sub>). Assume that the result is true for m = k. That is  $\left(\frac{(tk-1)k(tk+1)}{6}\right)$ Ct admits TPD (P1, P2, P3, ....., Pn) where n = tk – 1, t is odd, t ≥ 3 and m ∈ N. We prove the result is true for a positive integer m = k + 1. That is to prove  $\left(\frac{(t(k+1)-1)(k+1)(t(k+1)+1)}{C}\right)C_t$  admits TPD  $(P_{1}, P_{2}, P_{3}, \dots, P_{(t(k+1))} - 1)). \qquad \text{Now} \qquad q(\frac{(t(k+1)-1)(k+1)(t(k+1)+1)}{6}C_{1}) =$  $\frac{(t(k+1)-1)(k+1)(t(k+1)+1)}{t}$ 6  $\frac{(t^{2}k^{3} + 3t^{2}k^{2} + 3t^{2}k - k + t^{2} - 1)}{6}t = (\frac{t^{2}k^{3} - k}{6})t + (\frac{3t^{2}k^{2} + 3t^{2}k + t^{2} - 1}{6})t \text{ and the sum of edges of } (P_{1k}, P_{1k} + 1, P_{1k} + 2, \dots, P_{((k+1)t-1)}) \text{ equal to } (\frac{3t^{2}k^{2} + 3t^{2}k + t^{2} - 1}{6})t \text{ and hence } (\frac{(t(k+1)-1)(k+1)(t(k+1)+1)}{6})C_{1} \text{ can be decompose into } (t + 1)t - 1)$  $(P_1, P_2, P_3, \dots, P_{(k+1)t-1})$ . We conclude by the induction principle that odd cyclic snake graphs  $\underbrace{(tm-1)m(tm+1)}_{Ct} \text{ admits TPD } (P_1, P_2, P_3, \dots, P_n) \Leftrightarrow n = tm-1 \text{ where } t \text{ is a odd number, } t \ge 3 \text{ and } m \in \mathbb{N}.$ 

# Theorem 2.3

Odd cyclic snake graphs  $\frac{m(tm+1)(tm+2)}{6}$  Ct admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>)  $\Leftrightarrow$  n = tm where t is a odd number, t  $\geq$ 3 and  $m \in N$ .

# Proof :

Assume  $\frac{m(tm+1)(tm+2)}{6}C_1$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>,...,P<sub>n</sub>). Then  $q(\frac{m(tm+1)(tm+2)}{6}C_1) = t(\frac{m(tm+1)(tm+2)}{6}C_1)$ . That is  $\frac{tm(tm+1)(tm+2)}{2} = \frac{n(n+1)(n+2)}{6}.$  Implies  $n = tm, m \in \mathbb{N}.$ 

Conversely, to prove  $\left(\frac{m(tm+1)(tm+2)}{6}\right)$ Ct admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>), where n = tm, t is odd, t ≥ 3 and m∈ N. We prove the theorem by using mathematical induction on 'm'. When m = 1,  $q(\frac{m(tm+1)(tm+2)}{6}C_1) = \frac{t(t+1)(t+2)}{6}$ . Clearly  $\frac{t(t+1)(t+2)}{4}$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>t</sub>). Assume that the result is true for m = k. That is  $\left(\frac{k(tk+1)(tk+2)}{6}\right)^{o}$  c admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>) where n = tk, t is odd, t ≥ 3 and m ∈ N. We prove the result is true for a positive integer m = k + 1. That is to prove  $(\frac{(k+1)(t(k+1)+1)(t(k+1)+2)}{6})C_t$  admits TPD (P<sub>1</sub>,P<sub>2</sub>,P<sub>3</sub>,...,P<sub>t(k+1</sub>)). Now  $q(\frac{(k+1)(t(k+1)+1)(t(k+1)+2)}{6}C_t) = \frac{(k+1)(t(k+1)+1)(t(k+1)+2)}{6}t$  $\frac{(t^{2}k^{3} + 3t^{2}k^{2} + 3tk^{2} + 3t^{2}k + 6tk + t^{2} + 3t + 2 + 2k)}{6}t = (\frac{t^{2}k^{3} + 3tk^{2} + 2k}{6})t + (\frac{3t^{2}k^{2} + 3t^{2}k + 6tk + t^{2} + 3t + 2}{6})t \text{ and the sum of edges of } (P_{1k} + 1, P_{1k} + 2, \dots, P_{(k+1)t}) \text{ equal to } (\frac{3t^{2}k^{2} + 3t^{2}k + 6tk + t^{2} + 3t + 2}{6})t \text{ and hence } (\frac{(k+1)(t(k+1)+1)(t(k+1)+2)}{6})C_{1} \text{ can be decompose}$ into(P1, P2, P3,....,P(k + 1)t). We conclude by the induction principle that odd cyclic snake graphs  $\frac{m(tm+1)(tm+2)}{C}C_t \text{ admits TPD} \qquad (P_1, P_2, P_3, \dots, P_n) \Leftrightarrow n = tm \text{ where } t \text{ is a odd number, } t \ge 3 \text{ and } m \in \mathbb{N}.$ 

# Theorem 2.4

Any Triangular cyclicsnake graphs  $\frac{(3m-2)(3m-1)m}{c}$  C<sub>3</sub> admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>)  $\Leftrightarrow$  n = 3m-2, m  $\in$  N.

# Proof:

Assume  $\frac{(3m-2)(3m-1)m}{6}C_3$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>,...,P<sub>n</sub>). Then  $q(\frac{(3m-2)(3m-1)m}{6}C_3) = 3(\frac{(3m-2)(3m-1)m}{6})$ . That is  $\frac{(3m-2)(3m-1)m}{6} = \frac{n(n+1)(n+2)}{6}$ . Implies n = 3m-2,  $m \in \mathbb{N}$ .

Conversely, suppose n = 3m-2, m \in N. Let V = {V<sub>0</sub>, W<sub>1</sub>, V<sub>1</sub>, W<sub>2</sub>, V<sub>2</sub>, ..., W<sub>9m<sup>3</sup>-9m<sup>2</sup>+2m</sub>, V<sub>9m<sup>3</sup>-9m<sup>2</sup>+2m</sub>} be the set of vertices of the base path of  $(\frac{(3m-2)(3m-1)m}{6})C_3$ . Let v<sub>0</sub> and V<sub>9m<sup>3</sup>-9m<sup>2</sup>+2m</sub> are the beginning and end vertices of the base path respectively. Let the base path be P<sub>9m<sup>3</sup>-9m<sup>2</sup>+2m</sub>. Also we consider the path V<sub>0</sub>, U<sub>1</sub>, V<sub>1</sub>, U<sub>2</sub>, V<sub>2</sub>, ..., U<sub>9m<sup>3</sup>-9m<sup>2</sup>+2m</sub>, V<sub>9m<sup>3</sup>-9m<sup>2</sup>+2m</sub> of length  $2(\frac{9m^3-9m^2+2m}{6})$ . To prove  $(\frac{(3m-2)(3m-1)m}{6})C_3$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>) where n = 3m-2 and m∈N. We prove the theorem by using mathematical induction on 'm'. When m = 1, q( $\frac{(3m-2)(3m-1)m}{6}C_3$ ) =  $\frac{(3-2)(3-1)(3)}{6}$ . Clearly  $\frac{(3-2)(3-1)(3)}{6}$  admits TPD P<sub>1</sub>. Assume that the result is true for m = k. That is  $(\frac{(3k-2)(3k-1)k}{6})C_3$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>) where n = 3k-2. We prove the result is true for a positive integer m = k + 1. That is to prove  $(\frac{(3(k+1)-2)(3(k+1)-1)(k+1)}{6}C_3$  =  $\frac{(9k^3+27k^2-9k^2+27k-18k+9-9+2+2k)}{6}3 = (\frac{9k^3-9k^2+2k}{6})3 + \frac{27k^2+9k+2}{2}$  and the sum of edges of (P<sub>3k-1</sub>, P<sub>3k</sub>, P<sub>3k+1</sub>) equal to  $\frac{27k^2+9k+2}{2}$  and hence  $(\frac{(3(k+1)-2)(3(k+1)-1)(k+1)}{6})C_3$  can be decompose into (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>3k+1</sub>). We conclude by the induction principle that any Triangular cyclic snake graphs  $\frac{(3m-2)(3m-1)m}{6}C_3$  admits TPD (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, ..., P<sub>n</sub>)  $\Leftrightarrow$  n = 3m-2, m \in N.

# ABSTRACT

Lansium domesticum bearing clusters of edible fruits is a tree belonging to the family Meliaceae. There are two distinct varieties namely Lansium domesticum var. pubescens and Lansium domesticum var. domesticum commonly known as Langsat and Duku. It is an exotic species native to Southeast Asian countries like Indonesia, Thailand, Philippines. The present investigation focused on the preliminary phytochemical evaluation of Fruit Peel and Pulp of Lansium domesticum. Based on the polarity, seven solvents - Acetone, Methanol, Chloroform, Ethyl acetate, Petroleum ether, Hexane and Distilled water were selected for extraction and analysis of phytochemicals. Yield and colour of the extracts were also determined. On quantitative basis, the methanolic extract of the fruit peel of Langsat and duku showed high yield and the methanolic extract of pulp of langsat and distilled water extract of duku indicated high yield. The positivity of the phytochemical tests showed best results in the acetone, methanol and distilled water extracts and poor results in the non-polar solvents such as hexane and petroleum ether. The preliminary investigations of both the fruit peel concluded the presences of flavonoids, phenols, tannins, terpenoids, carbohydrates, saponins, triterpenoids, fats and fixed oils. Among these, fats and fixed oils showed positive results for fruit peel extract analysis in all solvents. The fruit pulp extract in different solvents also revealed the presence of various phytoconstituents. The more polar solvents like acetone, methanol and distilled water were detected as best for extraction of phytochemicals. The Fruit peel and pulp of Langsat and Duku were selected for quantification of flavonoids, tannins, phenols, terpenoids and saponins. The acetone extract of the Langsat Peel exhibited high (mg/g) tannin (3.94±0.74) and phenolic content (5.06±0.39) compared to Duku Peel extract of other solvents. The distilled water extract of fruit

pulp of both suggested high (mg/g) tannin (2.38±0.59, 1.88±0.07 respectively) and phenolic (2.89±0.58, 2.60±0.33 respectively) content compared to other solvents. The flavonoid content was negligible in ethyl acetate extract of both fruit peel. Terpenoids and saponins were also quantified from both fruit parts.

# INTRODUCTION

*Lansium domesticum* Correa is an exotic tree form bearing edible fruits belongs to the family Meliaceae. The family is also known as Mahagony family. There are two distinct varieties: *Lansium domesticum var. pubescens* and *Lansium domesticum var. domesticum* commonly known by langsat and duku. Native to Southeast Asian countries like Malaysia, Thailand, Indonesia, Philippines. The raw fruit is green in colour and on maturity, it turns pale yellow to light brown. The pulp appeared as white translucent part, which is the edible part and the seeds are bitter in taste. The fruit is highly nutritious and rich in many vitamins [1]. Langsat fruits are oblong-ovoid, thin- skinned and possess latex, while Duku fruits are nearly round, thick- skinned and contains mild latex or latex free. The fruit peel is used as insect repellent [2]. The iron and mineral content of both the fruits is higher than apples and oranges<sup>[3]</sup>.Traditionally, the bark is used to treat venomous insects bites, as dysentery medicine and used to eradicate cancer cells <sup>[4]</sup>. The present investigation focused on the preliminary phytochemical analysis of peel and pulp of *Lansium domesticum* fruits. The presence of phytoconstituents in the samples suggests the scope for studies on bioactivities and identification of compounds responsible for it. It may have several medicinal properties and can be included in the health care system.

# **AIM OF THE STUDY**

Phytochemical analysis to evaluate the fruit samples of *Lansium domesticum* on qualitative and quantitative basis employing solvents with different polarity indices.

# MATERIALS AND METHODS

## Collection of plant materials

The samples for the study include mature fruit peel and fruit pulp of *Lansium domesticum*. The fruits samples (Figure 1 and Figure 2) were collected from the home garden near Ernakulam and Kottayam district respectively in Kerala. After the shade drying process, they were powdered and stored in labelled bottles.

## **Preparation of Successive Extracts**

Preparation of extract by cold extraction method.

## Preliminary Qualitative Phytochemical Analysis

A stock solution (mg/ml) of extract from different solvents (acetone, methanol, chloroform, ethyl acetate, petroleum ether, hexane and distilled water) was prepared. These extracts along with blanks were analyzed qualitatively for the presence of various phytochemicals in the fruit pulp and fruit peel samples. Phytochemical investigations were carried out for all fruit extracts of *Lansium domesticum* as per standard methods <sup>[5]</sup>.

#### **Quantitative Phytochemical Analysis:**

Flavonoids, Phenol, Tannin, Terpenoids, Saponins were determined quantitatively [6][7][8][9][10][11].

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Sruthi Gopan and Sudha Bai

#### Statistical analysis

The experimental data were recorded on basis of three independent trials of each parameter. Mean value and standard deviation (SD) were computed and the results are tabulated as Mean  $\pm$  SD for each triplicates.

# **RESULTS AND DISCUSSION**

In the present investigation, the study focused on preliminary phytochemical analysis of fruit peel and fruit pulp of *Lansium domesticum var. pubescens* and *Lansium domesticum var. domesticum*. The extract of fruit peel and fruit pulp were taken using seven different solvents - acetone , methanol, chloroform, ethyl acetate, petroleum ether, hexane and distilled water based on their polarity. The present study aimed to detect the presence of flavonoids, phytosterols/ terpenoids, tannins, cardiac glycosides, phenols, triterpenoids, anthraquinone glycosides, carbohydrates, proteins, fats and fixed oils and saponins using the standard protocol. In addition to the phytochemical studies, morphological characteristics of leaf were studied and tabulated in Table 1.

#### Yield of extracts

The extraction yield of fruits peel and fruits pulp of *Lansium domesticum* in seven solvents were analyzed. The yield of crude extract was determined by measuring its dry weight and the yield per 100g was calculated and tabulated in Table 2 and Table 3.

Extraction yield = <u>mass of extract</u> mass of dry matter

From the present studies of fruits peel, it is noticed that the highest yield of extract is possible in methanol, the polar solvent and the lowest yield were shown in the non-polar solvent. The extraction yield mainly depend on the extraction techniques. In addition to that it also depends on the solvent used for the extraction of the samples [12][13]. The yield of extract from methanolic pulp of langsat fruit and distilled water pulp of duku fruit were monitored as relatively higher. Poor yield were detected in the hexane extract of both the fruits pulp samples. The yield of extract of fruits peel and fruits pulp showed variations in different solvents it may be due to the polarity of the solvent as well as the phytochemicals present in the samples.

#### **Phytochemical Investigation**

Phytochemical studies on qualitative and quantitative basis were carried out using the standard procedure and the results are explained for the assessment of phytochemical profile of the fruits peel and fruits pulp of *Lansium domesticum* Correa.

## Qualitative phytochemical analysis

A preliminary phytochemical investigation of fruits peel and fruits pulp of *Lansium domesticum* Correa was performed using the standard protocol. The results of the qualitative analysis are illustrated in Tables 4 to 7. Based on the intensity of the reaction products from the qualitative tests, the data were graded as very high (+++), high (++), moderate (+) and nil (-). In the present study, phytochemicals except alkaloids, cardiac glycosides, anthraquinone glycosides, proteins were not detected in any of the seven solvent extract of peel of both the fruits samples. The polar solvents acetone, methanol and distilled water showed good intensity of results. In the preliminary analysis the pulp of both of the fruits samples showed the presence of various phytoconstituents. The intensities of results were found to be low in the non-polar solvents – petroleum ether and hexane for both the fruit pulp. Alkaloids, cardiac glycosides, anthroquinone glycosides and proteins also showed no positive results in the langsat and duku fruits pulp.

The phytoconstituents present in the fruit peel and fruit pulp of *Lansium domesticum* could be extracted in different solvents. The variation on efficiency in the extraction of phytochemicals in seven solvents employed is based on

# Sruthi Gopan and Sudha Bai

differences in their polarity. Acetone, methanol and distilled water showed efficient extraction of phytochemicals in the present investigation. The extraction of the samples is monitored as higher in the polar solvents than the non-polar solvents. The extraction and purification of the plant materials for the antioxidant and the phytochemicals present in it depends upon the temperature, time, concentration of the solvent as well as polarity of the solvent. All the phytochemicals present in the samples will get eluted on different solvents not on a single solvent<sup>[14][15]</sup>. So the selection of the appropriate solvent for the extraction of the plant samples is very important in phytochemical evaluation.

## Quantitative phytochemical analysis

The quantitative phytochemical studies was carried out to estimate the quantity of phytoconstituents present in the fruits peel and fruits pulp of *Lansium domesticum*. The results from seven solvent extracts are illustrated in Table 8 to 12. The quantitative analysis of flavonoids was done in seven solvents. Quercetin was used as the standard (1mg/ml). The ethyl acetate extract of the langsat peel ( $0.38 \pm 0.04$  mg/g) and duku peel ( $0.38 \pm 0.10$ ) showed the highest flavonoid contents. The lowest flavonoid contents were detected in chloroform and hexane extracts of both the fruits peel samples. The distilled water extract of the fruits pulp showed the highest ( $0.50 \pm 0.00$  mg/g,  $0.25 \pm 0.06$  mg/g) and lowest were observed in the methanol and chloroform extract. Flavonoids have several medicinal properties such as neuro and cardio protective and bioactivities like antioxidant, anti inflammatory, anticancer, antimicrobial, anti-viral properties. These properties of bioactivities depends upon the bioavailability and its mode of action [16]. For the estimation of tannin, tannic acid (1mg/ml) was used as the standard. Tannin is observed to be highest, in the acetone extract of langsat peel ( $3.94 \pm 0.74$ mg/g) than the duku peel ( $1.08 \pm 0.23$  mg/g) extract and lowest in the hexane extract of the both the fruits peel extract. Langsat pulp ( $2.38 \pm 0.59$  mg/g) in the distilled water extract showed highest tannin content than the duku pulp ( $1.88 \pm 0.07$ mg/g). Lowest were observed in the chloroform, petroleum ether and hexane extract of the fruits pulp. Tannins act as defensive agents for plants and protect it from insects, microorganisms and animals [17][18][19][20].

Gallic acid (1mg/ml) was used as the standard for the estimation of phenol. The phenolic content of both the fruits peel exhibited highest in the acetone extract and fruit pulp in the distilled water extract. And the phenolic content were not observed in the ethyl acetate, petroleum ether, hexane extract of all fruits samples. Duku peel of chloroform extract also don't exhibited the phenolic content. The ability of the donating power of hydrogen atom by phenolic and the flavonoid molecules are responsible for the antioxidant activity. They can inactivate the free radicals their by reducing the damage caused by the free radicals[21]. Synthetic antioxidants have potential toxic effects[22]. To overcome this effects, natural antioxidant like flavonoids and phenolic compounds are used [23].

For the determination of terpenoid contents in the fruits samples, the method of Indira *et al.*, 2012 was followed. Among the fruits peel and fruits pulp, duku fruit samples exhibited high terpenoids (0.56 ± 0.00 mg/g ,0.53 ± 0.00 mg/g respectively) content. Terpenoids are one of the important secondary metabolites found in plants. It plays an important role in plant development and growth. They possess hypoglycemic, antimalarial, antiviral, antibacterial, antitumour, anti-inflammatory activities [24]. Langsat peel (9.20±0.56 mg/g) and the duku pulp (14.00±0.56 mg/g) were observed to be high in saponin content. Saponin content was found to be higher than other phytochemicals present in the fruits samples. Saponins are amphiphilic molecules used as formulation of several traditional and herbal medicines. They also possess several bioactivities such as antioxidant, anticancerous, anti-inflammatory, antiviral, fungicidal, antimicrobial and immunomodulatory effects[25].

The present study concluded that acetone, methanol and distilled water are the best solvents for the extraction of phytochemicals from the peel and pulp of fruits of *Lansium domesticum*. The quantitative analysis of the fruits samples done spectrophotometrically in seven solvents except for terpenoid and saponins which were evaluated on basis of weighing method. The data illustrated from the preliminary phytochemical analysis supported the results from the quantification of the fruits samples of *Lansium domesticum*. The present investigation is only the preliminary studies about the plant. Further studies are needed, that will result in the use of this tropical fruits in health care. The

phytoconstituents present in the samples maybe responsible for different bioactivities. So identification and characterization of compounds responsible for the bioactivities of the fruit extract is needed for the future studies.

# ACKNOWLEDGEMENTS

The authors are thankful to the Principal, University College, Thiruvananthapuram for providing Laboratory facilities for the study.

# ABSTRACT

Nanotechnology is one of the most promising fields in science and technology. Nanotechnology is expanding in all the sectors including agriculture, pharmaceuticals, food and medical industries. It plays important role in plant tissue culture and shows various applications in producing disease free plants, conservation of endangered plant species and gene manipulation. The effect of silver and copper Nanoparticles are evaluated on different plant species, whereas it is observed that how nanoparticles influence the growth morphology and secondary metabolites production. Different plant species shows different result, some shows increase in growth of root & shoot structures while other are having negative effect on growth. It has been observed that when high concentration of nanoparticles is used it results in enhancement of secondary metabolites production due to stress induced condition. Silver and copper nanoparticles along and in combination enhances the plant growth and accumulation of secondary metabolites like, flavonoid, proline, antioxidant enzymes glutathione in some plant's species. In this review, it has reported that when exposed to different plant species, silver nanoparticles and copper nanoparticles show positive as well negative effects depending on their size, types, concentration and structure.

Keywords: Silver nanoparticles, Copper nanoparticles, Secondary metabolites, Plant growth regulators.

Chetna and Simranjeet Kaur

# INTRODUCTION

Nanoparticles have emerged as promising tools in various fields, including agriculture, due to their unique physicochemical properties and potential applications. Nano is Greek word which means dwarf.<sup>[1]</sup> Nano-sized particle are frame up in a way so their properties could utilize in various field. Nanomaterial is mainly of two types organic and inorganic. In 2000s Nano era has begun where the applications of nanomaterial have become widely utilized and acceptable for welfare of humans, both positive as well as negative effects of nanoparticles were seen in plant growth,CuNPs and AgNPs are among many nanoparticles that are widely used in many industries. Agriculture-relevant nano fertilizers based on nanotechnology boost agricultural productivity and efficiency while lowering environmental stress. Nanotechnology is used in agricultural field to improve the crop production and also to ensure food security. Use of nanotechnology effectively in agriculture for long-term sustainability.Nanoparticles can be present in any shape spherical, flat, cylindrical, conical, irregular they have large surface to volume area ratio so that property make them highly reactive.<sup>[2]</sup> The use of nanomaterials for agricultural purposes may offer a powerful solution to current challenges and dangers to food security. To maintain food hygiene and safety, this has transformed the fields of storing food and packaging. The focus of the review is to understand the effect of CuNPs and AgNPson different plant species as growth promoter or growth inhibitor and to know that by varying concentrations of nanoparticles how it could influence production of secondary metabolites polyphenol, flavonoids, and phenols in plants. CuONPs have been applied to agriculture as insecticides, herbicides, fertilizers, soilremediation additives, and growth regulators. CuNPs have demonstrated diverse effects on plant growth and development. CuNPs have been reported to promote seed germination, root elongation, and shoot biomass in several plant species.<sup>[3]</sup> Furthermore, CuNPs can influence various physiological processes, including photosynthesis, mineral nutrient uptake, enzyme activities, and oxidative stress responses in plants.<sup>[4]</sup> Studies have also indicated that CuNPs can modulate the production of secondary metabolites, such as alkaloids, flavonoids, andterpenoids, thereby impacting the nutritional and medicinal value of plants.<sup>[5]</sup>Since Cu functions as a micronutrient in plants, it was thought that Cu in nano form may have a similar positive effect. CuONPs have become increasingly used over the past few decades, finally becoming a growth stimulant. CuONPs affected growth, physiological effectiveness, biochemical assays, and the antioxidant system.<sup>[6]</sup>

AgNPs have been widely investigated for their antimicrobial properties, which make them attractive for plant protection against pathogens. Additionally, AgNPs have been reported to enhance seed germination, root elongation, shoot biomass, and overall plant growth.<sup>[7]</sup>These nanoparticles can also influence physiological and biochemical processes in plants, such as photosynthesis, nutrient uptake, enzyme activities, and antioxidant defence mechanisms.<sup>[8]</sup>Moreover, AgNPs have been shown to modulate the production of secondary metabolites, including phenolics, flavonoids, and essential oils, which are known to play crucial roles in plant defence mechanisms and human health benefits.<sup>(9)</sup>AqNPs are currently being produced by plants, which is a sensible method and can prevent and control plant diseases. AqNPs function as growth stimulators and are advantageous for seed germination and growth. Usage of AgNPs, has been beneficial for callus induction, organogenesis, the development of somatic embryos, Soma clonal variation, genetic change, and the creation of secondary metabolites as well as successfully controlling microbial contamination from explants. AgNPs have unique properties that make them useful in a variety of applications, including plant growth and development, their effects on plants can vary depending on the species and the application method used. AgNPs is helpful in developing and growing plants. Additionally, advances in nanoscience have helped us better understand the best way for nanoparticles to work in plants, resulting in improved the development and growth of plants. AgNPs are now being used more frequently to increase crop productivity. Studies have shown that AgNPs can enhance seed germination and plant growth, as well as increase metabolite production in some plant species. However, conflicting outcomes have been observed in different plant species, highlighting the need for more research to better understand the complex mechanisms involved in nanoparticle action and their phytotoxic. The amount produced of total phenol compounds, total flavonoids, and saponins is reduced when some herbal plant is exposed to copper heavy metals, which has been demonstrated to diminish its effectiveness. The review also discusses the mechanisms of action of AgNPs on plants and the limitations faced in applying these nanoparticles on a commercial scale. While the potential of AgNPs in plant tissue

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

culture is promising, more research is needed to determine the optimal conditions for their use and to ensure that their application does not have adverse effects on the environment and human health.<sup>[10]</sup>

## Role of Nanotechnology in plant tissue culture

Nanotechnology is playing very precious role in plant biotechnology field. Plant biotechnology is important for improving the growth and development of plants. Through the help of nanotechnology, we can understand the important function and mechanism in biological system. Nanotechnology has shown various applications in the field of Plant biotechnology. It has major impact on *in-vitro* plant growth production. Under *in-vitro* conditions, plant is grown with sterile controlled conditions. There are different types of nanoparticles which shows great effect on invitro plant. Several types of nanoparticles are utilized for proper growth of plant. Nanoparticles shows various advantages in *in-vitro* plant growth and developments. Under different stress conditions, plants are not able to survive, so this nanotechnology is helpful is enhancing the endurance and tolerance level of plant. [11]In plant biotechnology, plant tissue culture is a technique which is helpful in growing disease-free plant. In plant tissue culture, culture medium is provided with various types of nutrients such as vitamins and minerals. Nutrients is essential for the growth & development of the plants. Various types of bio-products which are in great demand can be produced through the help of plant tissue culture. In plant tissue culture, microbial contamination is the main problem which affects the growth and development of the plant<sup>[12]</sup> but with the combining of the nanotechnology with nanoparticles, it resulted in removal of microbial contamination. It also shows positive effects in production of various bioactive compounds, secondary metabolites, induction of callus, somatic embryogenesis, genetic transformation & organogenesis. It has great applications in producing disease-free plants, conservation of endangered plant species, genetic manipulation (genetical changes) and many others shown in figure A1. The main purpose of genetically change the plant is to get an enhanced variety of plant which gives better yield, highly bioactive compounds and helps in production of secondary metabolites.[13]Contamination causes problem in in-vitro plants, explants & consist of various kinds of contamination (contains various harmful pathogens) so, this problem should be solved.[14] In vanilla explant (Vanilla Planifolia Jacks ex-Andrews), AgNPs are added in Morishige and Skoog medium with varies concentration and it results in lowering the bacterial contamination.[15]There are several factors which is important for the plant tissue culture. Aseptic technique is one of the most important and basic need for plant tissue culture. There are different stages of culturing the plant but there are many obstacles like bacteria (e.g., Pseudomonas syringae, Bacillus licheniformis) and fungi which causes the bacterial and fungal contamination. This is due to improper washing of explants, inadequate tools, and controlled conditions.[16]To reduce the microbial contamination, explant is washed with mercuric chloride, ethanol, sodium hypochlorite. Secondly, different kinds of antibiotics and fungicides added into culture medium. Although these exhibits various phytotoxic, hinders nucleic acid synthesis, protein synthesis and disturbs cell membrane synthesis but the main purpose of adding these is to protect the plant from infection. These nanomaterials can act as decontaminant agent in plant tissue culture.[14]In plant tissue culture, nanomaterials and nanoparticles is playing a major role and developing very rapidly. The properties of nanoparticles are depending on types of nanoparticles utilized in the medium and it has shape, size and distribution.[17] Various researchers have been conducted on the utilization of nanoparticles in seed germination, plant improvement, and genetic manipulation [18]. Nanoparticles such as silica (SiO<sub>2</sub>)-AgNPs are utilized for conserving and maintaining the health of plants tissue culture. Nanoparticles can act as surface sterilization. It can sterilize the explants and help in eliminating the contamination such as bacterial and fungal. It is useful in genetic engineering techniques and can enhance the endurance of explant.[19] Metal and non-metal oxides influence the plant growth and development. It acts as decontaminate against contaminated surface [20]. Different nanoparticles play various roles in plant tissue culture. Nanoparticles such as ZnONPs, TiO<sub>2</sub>NPs, AgNPs helps in disinfection. To induce the Soma clonal variation AuNPs and AgNPs is utilized. Al<sub>2</sub>O<sub>3</sub>NPs, TiO<sub>2</sub>NPs and AgNPs can enhance the secondary metabolites in various plants. In genetic transformation dendrimers is beneficial for the process [21].

## Effects of AgNPs in plant growth and development

From the past few years, nanomaterials play an important role in various research fields like biomedical, chemical sciences and agriculture etc. In the field of agriculture and pharmaceuticals, the utilization of nanoparticles has been increased due to different method of synthesizing the nanoparticles. Specific and unique shapes and size of

# Chetna and Simranjeet Kaur

synthesizing the nanoparticles has enhanced the application of nanoparticles. The Chemical and physical properties of AgNPs have been studied in order to boost the application in different fields [22]. Plant are the important elements of biosphere and it is very necessary source for the living things. So, it is very important to known about the effects of AgNPs on the growth and development of plants [23]. Scientists have organised various experiment in which they studied that nanoparticle extend the post- harvest shelf life of cut flowers and also it acts as regulator for various plant species. The very first step to grow a plant is seed germination and it is very important step because it is the initial seedling that is at risk of contamination such as bacterial and fungal. Other environment factors also effect the growth of the plant such as soil, salinity, water etc. For the initial stage, water is the essential components which is required for the growth and after certain period of time, embryonic axis develops from the seed coat.Radicle and plumule formation also occur, which further gives rise to roots and shoots.[24]For the growth of the plant, tissue culture utilized various media which is nutritive in nature. Aseptic conditions also utilized for the growth of the plant genome, *invitro*techniques are applied.[25] AgNPs enhances the growth & development of plant.

Nanomaterials can be utilized for the purpose of delivering gene at particular site, which is helpful in the functioning of the plant. Different type of physical and structural changes is observed when plants are exposed to nanomaterials. Plants express various functional changes which is depend on various factors like varying in the size of the nanoparticles, interaction of nanoparticles, surface coating and also changes varies from one plant species to another plant species. The nanoparticles of Ag are ranging in between 1 nm-100 nm. AgNPs can be synthesized by various method such as Chemical and Physical method. Both this method involves high energy and hazardous chemicals. Each method has its own advantages as well as disadvantages. AgNPs can be synthesized by biological method and which is advantageous because biological synthesized AgNPs are eco-friendly, non-toxic and less expensive.[26] Nowadays, AgNPs used widely because it exhibits various unique properties. Through the mechanism of action of AgNPs, the outcomes in growth of the plant can be enhanced.[27] AgNPs are one of the most important nanoparticles to study the effects on plants. AgNPs have the great potential that can acts as antimicrobial agents. Nowadays, AgNPs are taken into consideration due to its specific physicochemical properties and exhibiting the antimicrobial properties. This resulted in broad application in extensive variety of products with promising results.[28] Nano silver enhanced the production & growth of in-vitro plant. The effects of AgNPs on different types of plants are discussed in table A1. A study was conducted in order to check the effects of silver nitrate on in-vitro plant (date palm) growth. Different concentrations of silver nitrate were added into the culture medium (date palm). The outcome of adding silver nitrate into culture medium enhanced the regeneration stage. It increased the length of the shoots and also enhanced the number of leaves and shoots. The culture medium comprised of MS medium and in that medium plant growth hormone is added. Different types of plant growth hormones are added such as 0.1mg/I NAA, 2.0 mg/I BA& 0.5 mg/I GA3. The main purpose of adding plant growth hormones is to increase the growth of the plant.[39]

AgNPs synthesized by green method, in which the extract is taken from plant *Swertia chirata* (Gentianaceae). To solve the issue related with the conservation of the medicinal plant via, plant tissue culture, leaf extract of *S.chirata* plant was taken into consideration. *S.chirata* plant is an endangered as well as economically crucial plant. Due to over exploration of this plant, this plant become completely extinct from natural habitat. To preserve the plant species, *invitro* culture method is utilized. The nanoparticles are prepared which is 20 nm in size and it comprises of various types of phytochemicals. Nanoparticles increased the growth of shoot culture including shoot induction and proliferation. The variety of AgNPs such as AgNO3 and Ag<sub>2</sub>S<sub>2</sub>O<sub>3</sub> enhanced the regeneration of *in-vitro* plant as compare to sample of controls. AgNPs enclosed with phytochemicals has the capacity to change the chemical reactions which is occurring in plant regeneration. These will acknowledge the future utilization of bio-fabricated AgNPs in the field of agriculture and plant sciences.[40] It has a particular size,shape and it exhibits some properties like environment- friendly. Currently, nanoparticles it is widely utilized in horticulture because it provides various advantages and exert different properties. So today, in the field of horticulture, more attention is given on nutrient properties and antimicrobial properties. To improve the growth of the plant, it involves several types of pathways. Pathways involves different types of effects on different enzyme, growth hormones (Ethylene) and metabolism like

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Chetna and Simranjeet Kaur

nitrogen metabolism. If the concentration on plant is accurate than it does not show any toxicity on the growth of the plants.<sup>[41]</sup> AgNPs can also play a role in handling the contaminants which is derived from explants. AgNPs can enhance the growth of callus induction (explant), secondary metabolites production.<sup>[42]</sup>The explant of Tecomella undulata (Roxb.) is cultured on medium and along with the medium PGRs (6 BAP & IAA) is added. AgNPs (5- $80 \text{ mg L}^{-1}$ ) is also added to evaluate the effect. The results indicated that the AgNPs (10 mg L<sup>-1</sup>) along with the PGRs, BAP (2.5 mg L<sup>-1</sup>) and IAA (0.1 mg L<sup>-1</sup>) enhanced the number of shoots of explants and also increased the endurance of the plant due to barrier in ethylene.[43]Ethylene gas is utilized for culturing the Rosa hybrida L. under in-vitro condition. Leaf abscission of this plant is controlled by adding the nanoparticles such as AqNPs & CuNPs. It was observed that the AgNPs enhanced the height of shoots & improves the shoot multiplication coefficient. Many of the plantlets are not able to survive at the nursery stage. AgNPshelps in increasing the viability rate of young plant, which is at nursery stage. For the propagation of shoot, AgNPs are considered as important factor for growth and development.[44]A study showed that for culturing the Psidium friedrichsthalianum, AgNPs play important role in sterilizing the culture media. It acts as sterilizing agent because it has antimicrobial properties and it can fight against multiple pathogens. It increases the leaf area and also helps in growing the mass shoot. It brushes up the genetic transformation, enhance the callus induction (derived from explants) and metabolic production. AgNPs such as Argovit<sup>™</sup> is added in *in-vitro* culture of *Vanilla planifolia and* it resulted that it did not show any toxic and genotoxic (harmful to genetic material) effects on plant. Also, it helps in improving the plant growth, yield of the plant, enhances the total phenolic content & rising the shoots growth. Argovit™ AgNPs minimise the contamination such as bacterial contamination in culture medium. AgNPs have been utilized to boost up the physical as well as biochemical properties of the plant which includes photosynthetic growth, improves flavonoid and phenolic content, reduces the toxic metals. To enhance the *in-vitro* culture of plants like medicinal plants, AgNPs is considered as best option for the growth of plant.[45]The explant of the plant can be sterilized with AgNPs as it can remove the microbial contamination and reduces the bacterial contamination in the culture media.

It also plays a role in improving the structure of explant.[46] AgNPs exhibits antifungal as well as antiviral properties. Nanoparticles such as AgNPs help in increasing the growth of plant through improving the germination of seeds. Concentration of AgNPs is considered as important for the growth of plant. Optimum concentration is required by the plant, if the concentration of AgNPs is not specific then it can also show the negative effects. To minimise the pests in the crops, an experiment has been conducted with the use of AgNPs. The purpose of this experiment is to protect the plant from harmful pest and improve the nutritional value. This is helpful in decreasing the use of pesticides in farming. Chemical pesticides helpful in killing the pests. To protect the plant from harmful and pathogenic microorganism, the liquid silver solution is applied on plants. It helps in growth and development of the plants, increase the physiological activity and tolerate the stress in plants. In case of rice and grasserie, AgNPs nanoparticles is applied and it resulted that after 2 months of treatment, the rice does not show any effects, So, it is suggested that AgNPs is considered as best in protecting the seed. AgNPs considered suitable for plant growth stimulator [47].

## Effects of AgNPs on secondary metabolite accumulation and production

The Medicinal plants are gaining more interest because they are rich in producing various vital secondary metabolites. There are several factors that influence the growth and development of the plants such as environmental factor (light, temperature, humidity etc). These factors directly influence the pathways in plants such as anabolic pathways. Thus, it has major impact on secondary metabolites. To increase the production from the plant and to improve the quality of the different kinds of medicinal plants, plant industries are using several kinds of unnatural lights.[48] In a study *Caralluma tuberculate* (traditional medicinal plant)cultured under *in-vitro*condition. In the culture media, along with the plant growth regulators different concentration of AgNPs were added. The purpose of adding the AgNPs in *in-vitro* cultures is to enhanced the production of antioxidant and secondary metabolites. This plant has some medicinal properties and it used in treating various diseases like asthma, diabetes & paralysis. The extract of this plant (*in-vitro* assays) is beneficial in carcinoma cell lines.[50] In the callus media, if concentration of AgNPs is boost up, then it enhanced the antioxidant enzyme activity. In a culture medium of *Catharanthus roseus (Apocynaceae*)

# Chetna and Simranjeet Kaur

AgNPs is added in different concentration. At concentration of 75mg/L it shows higher concentration of alkaloid that is vinsblastine. To analyse the secondary metabolite, dichloromethane is utilized. The size of nanoparticles utilized for this purpose is 40nm.[51]In an experiment, the seeds of Ricinus communis (castor oil plant) was treated with AgNPs and it resulted that the seed which are treated with AgNPs enhances the production of antioxidant enzymes as compare to the seeds which are not treated with AgNPs.[52] In case of Proteus vulgaris, when AgNPs added in growth media or along with plant growth regulators like NAA ( $\alpha$ -naphthalene acetic acid) auxin hormones increases the growth of callus, antioxidant potential and various secondary metabolites.[53]In the field of science especially in plant biotechnology, nanoparticles are usedwidely in this field and it has capacity to initiate the formulation of phytochemicals.[54] In a recent study, it is reported that adding the elicitors in the cell suspension culture can rise the formulation of various phytochemicals.[55]Elicitors have the potential to trigger the biological defence mechanism in plants. Along with the defence mechanism elicitors play important role in initiating the different kinds of pathways such as biosynthetic pathways. Pathways are activated according to the compound used in the treated plants.[56] Elicitors can be of two types biotic as well as abiotic, it has potential to boost up the production of various types of phytochemicals present in cell suspension culture of different plants.[57] The effect of AgNPs on different species is shown in table A2.(Ghanati and Bakhtiaria, 2014) reported that on addition of AgNPs into the media of Calendula officinalis L (Asteraceae) results in decrease in anthocyanin, carotenoid & flavonoid.[58]

The size of AgNPs is 40nm. In a case study, it is reported that the effects of nanoparticles on plants is dependent on the types of nanoparticles, size, concentration, structure, and the way how nanoparticles are exposed to plants. A studyshowed that AgNPs can enhanced the secondary metabolites production. This method is helpful in determining the bioactive compounds at mass production via cell suspension culture (liquid medium) and it is beneficial for bioprocessing engineering. AgNPs is prepared by under the presence of *hay bacillus*extracts. It is synthesized by reducing Ag+ into Ag0. These AgNPs added into the cell suspension culture. The main aim of the study is to check the effects of AgNPs on phenolic compounds (individual), total phenolic content, total flavonoid content, accumulation of biomass production which can be dry or fresh. Along with this, it is used to check the pharmaceutical activities such as antibacterial, antioxidant, antifungal, and anticancer in bitter gourd (*Momordica charantia L.*). Addition of AgNPsin cell suspension culture increased the phenolic components of flavanols, such hydroxybenzoic and hydroxycinnamic acids. These acids were in higher amount in cell suspension culture as compare to the culture which does not contain the AgNPs.

AgNPs-elicited showed that there is increase in H<sub>2</sub>O<sub>2</sub> contents and Malondialdehyde in cell suspension culture. AgNPs-elicited culture shows that there is enhanced in phenolic compounds as well as in pharmacological activities such as antimicrobial when compare to non-elicited AgNPs.[59] The most important approach for the increase in the outcome of secondary metabolites is elicitation. Elicitation has the potential to regulate the biotic as well as abiotic elicitors. The abiotic component of elicitation includes various kinds of heavy metals like silver, gold etc. and all these metals can boost up the production of secondary metabolites. In case of *S. miltiorrhiza*, silver metal (Ag) is considered as best for the enhancement for secondary metabolites. In root culture of *S. miltiorrhiza*, Ag<sup>+</sup> is added and it shows effect on diterpenoid tanshinone accumulation. The effects are depended on the concentrations of Ag<sup>+</sup> used in the culture. In culture medium, Ag<sub>2</sub>S<sub>2</sub>O<sub>3</sub> is added and it resulted in enhancement in the yields of all three diterpenoid tanshinone i.e., tanshinone I, tanshinone IIA, cryptotanshinone. Sometimes, Ag<sup>+</sup> have shown adverse effect in plant tissue culture like disturbing cell membrane. It is reported that heavy metals ion at low concentration can improve the flexibility of cell membrane. It also led to suppression of the growth but does not cause any cell death.[65] Heavy metals ions such as Ag<sup>+</sup>, Cd<sup>2+</sup>, Cu<sup>2+</sup> can improve the alkaloids production in *Brugmansia candida* and lead to create membrane disruption in case of *Datura stramonium*.[66]

## Effect of CuNPs in Plant Growth and development

Copper is one of essential trace elements which is having great properties even in small concentration. CuNPs has shown the fungicidal properties in plant-based diseases. When the nanoparticles are present in high concentration it effects plant cell wall and plasma membrane nanoparticles can enter through root directly it get translocated in plant through various physiological pathway it firstly enter to plant by crossing cell wall, the limit for crossing cell wall is

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Chetna and Simranjeet Kaur

5-20 nm which allow nanoparticles to easily penetrate inside due to their smaller size but large nanoparticles faces difficulty some nanoparticles even creates pore in cell wall which facilitates their entry. Due to high reactivity, small size, distinct morphology nanoparticles have been widely used in plant growth and development. One of the eight crucial micronutrients for plants is copper. Copper is necessary for the formation of chlorophyll, seeds, and numerous enzymatic processes in plants. Copper plays an important role in plant cell functioning.[67] Nanotechnology overall utilized for increasing the crop yield and nutrient absorption capacity of plant through latest applications.[68]Lower concentration of copper sulphate nanoparticles has seen increasing the shoot and root length in case of *Verbena bipinnatifida Nutt*. CuNPs has wide range of properties including antimicrobial, antibacterial and catalytic properties. They have high surface to volume ratio and has large interaction with other particles this property makes it a good drug loading source. Simple, environment friendly, low cost, copper-based nanoparticles can be designed.[69] CuNPs have been investigated for their potential effects on plant growth and development. Several studies have examined the impact of CuNPs on various plant species, and the findings indicate both positive and negative effects depending on the concentration as shown in table A3. One study conducted by Li et al. (2018) investigated the effects of CuNPs on the growth of wheat (*Triticum aestivum*) plants.[85].

The researchers exposed the plants to different concentrations of CuNPs and assessed their impact on plant height, biomass, chlorophyll content, and root development. They found that low concentrations of CuNPs had a stimulatory effect on plant growth, increasing plant height, biomass, and chlorophyll content. However, higher concentrations of CuNPs inhibited plant growth and development, leading to reduced plant height, biomass, and chlorophyll content. The study concluded that CuNPs can have both positive and negative effects on plant growth depending on their concentration. Another study by Sharma et al. (2019) investigated the effects of CuNPs on the growth and development of soybean (*Glycine max*) plants. The researchers exposed the plants to different concentrations of CuNPs and evaluated their impact on plant growth, increasing plant height, leaf area, not length, and seed yield. The results showed that low concentrations of CuNPs negatively affected plant growth, leading to reduced plant height, leaf area, and root length. However, higher concentrations of CuNPs negatively affected plant growth, leading to reduced plant height, leaf area, and root length. The study suggested that the concentration of CuNPs plays a crucial role in determining their effects on plant growth and development.[86]. These studies demonstrate that CuNPs can have both positive and negative effects on plant growth and development, depending on their concentration. Low concentrations of CuNPs may have stimulatory effects, while high concentrations can inhibit plant growth and development.

It is important to carefully regulate the application and concentration of CuNPs to minimize any potential negative impacts on plants. Analysis of three species *Cajanus cajon L., Elodeadensa planch* and *Allium cepa* plants is exposed to CuNPs at different concentration. The effect of CuNPs (20 nm) is seen on (*Cajanus cajon L.*) species in the colloidal suspension it enhances the growth and development of pigeon pea plant as shown in figure A2. It also improves the photosynthesis activity and act as a growth nutrient. The biomass of pigeon pea plant having less dry weight and less wet weight when it is not exposed to CuNPs but after exposure of CuNPs it shows high biomass and its root and shoot has been harvested for 4 weeks.[81] Anexperiment was conducted on wheat 'Gazul' seed, weight of twenty seeds has been measured and germinated on Petri dish, suspended in CuNPs in different concentrations of 1,5,10,25,50,100 mg/L after 5 days results were observed and metabolic efficiency of seeds were observed. Analysis of variance has performed for detectingthe presence of CuNPs, where wheat seeds shown increasing tendency, dry weight of shoot does not show much influence while the dry weight of root is lower in presence of CuNPs.[87]

## Effect of CuNPs on Secondary Metabolite Accumulation and Production

The effect of CuNPs on secondary metabolite production can vary depending on the specific secondary metabolite and the biological system in which it is produced. Secondary metabolites are organic compounds that are not directly involved in the growth, development, or reproduction of an organism but often play important roles in defence mechanisms and interactions with the environment. CuNPs can have inhibitory effects on secondary metabolites, leading to reduced production. Additionally, CuNPs can disrupt cellular processes and overall metabolic activity, which can indirectly affect secondary metabolite production. CuNPs can modify the chemical composition of

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Chetna and Simranjeet Kaur

secondary metabolites. They may induce structural changes or chemical modifications in the metabolites, resulting in altered properties or activities. This alteration can have both positive and negative consequences, depending on the specific metabolite and its biological function. The effect of CuNPs on secondary metabolite production can vary across different species, making it important to consider the specific organism of interest.[88] One study conducted by Parveen et al. (2018) investigated the influence of CuNPs on the production of secondary metabolites in *Catharanthus roseus (Madagascar periwinkle)*. The researchers treated *C. roseus* plants with different concentrations of CuNPs and analysed the levels of secondary metabolites, including alkaloids, phenolics, and flavonoids. The study found that the application of CuNPs led to a significant increase in the accumulation of secondary metabolites in *C. roseus* plants. The enhanced production of secondary metabolites was attributed to the elicitation effect of CuNPs, which stimulated the plants defence mechanisms and secondary metabolite biosynthesis pathways.[89] Another study by Abbas et al. (2020) investigated the impact of CuNPs on the production of secondary metabolites in *Ocimum basilicum* (basil) plants. The researchers treated basil plants with CuNPs and evaluated the levels of essential oil, which is a valuable secondary metabolite in basil.[90] The study demonstrated that the application of CuNPs significantly increased the content of essential oil in basil plants.

The enhanced production of essential oil was associated with the upregulation of key enzymes involved in secondary metabolite biosynthesis pathways, which were triggered by the presence of CuNPs.Some studies have reported that exposure to low concentrations of CuNPs can enhance the accumulation of secondary metabolites in plants. These metabolites may include phenolics, flavonoids, alkaloids, terpenoids, and essential oils. The stimulation of secondary metabolite production is often attributed to the nanoparticles ability to induce oxidative stress and activate defence mechanisms in plants, leading to increased synthesis of protective compounds. CuNPs possess inherent redox properties, and they can act as antioxidants or pro-oxidants depending on their concentration. At low concentrations, CuNPs can scavenge reactive oxygen species (ROS) and mitigate oxidative stress in plants, thereby promoting secondary metabolite synthesis. On the other hand, at higher concentrations, CuNPs may generate excess ROS, leading to oxidative damage and potentially inhibiting secondary metabolite accumulation. Different plant species can exhibit varying responses to CuNPs exposure.

Some plants may show increased secondary metabolite production, while others may experience inhibition or no significant changes. Additionally, variations in the nanoparticle size, shape, surface charge, and coating can influence the interaction between CuNPs and plant cells, leading to different outcomes in secondary metabolite accumulation. The effects of CuNPs on secondary metabolites and production is shown in table A4. The concentration or dose of CuNPs is a crucial factor determining their impact on secondary metabolites. Low concentrations are more likely to induce positive responses, while high concentrations can lead to toxicity and inhibit secondary metabolites may vary for different plant species. Environmental conditions such as light intensity, temperature, humidity, and nutrient availability can interact with CuNPs and modulate their effects on secondary metabolite accumulation.[96].

Natural polymer chitosan polyvinyl alcohol hydrogels in addition with use of CuNPs has been studied in tomato (*Solanum lycopersicon L.*). It has shown the positive results towards biotic and abiotic stress by increasing the phenol content, lycopene, vitamin C content and also shows enhancement in enzymatic activity. Plants were treated with chitosan PVA hydrogel in concentration of 1gm, 100mM NaCl, 3.75 EDTA and leaves were covered in aluminium bag and frozen at -80°C at 23, 28, 42 delivered at terminal. Copper oxide nanoparticles effect is analysed on activity of antioxidant enzyme present in rice supernatant in different concentration 2,4,8,16 mg/l at 30 and 45 mg/l) sprayed on plant along with the distilled water, the antioxidant level of plant has shown tremendous increase by use of copper oxide nanoparticles. Furthermore, the effect has been seen in activity of soil and enzyme, copper oxide nanoparticles reduce the peroxidase and polyphenol oxidase activity. To know whether the antioxidant activity is relevant of the all given values CuNPs toxicity has been widely documented in a variety of plant species, but there have also been several reports of their beneficial effects. CuONPs impact on the environment must therefore be carefully assessed, and standards for sustainable applications must be established.[97]. In case of *Sesbania virgata*, the effect of copper oxide nanoparticles is seen on its seed, it causes inhibition in growth of root and surface temperature is increased in

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Chetna and Simranjeet Kaur

seeds so it shows that Copper oxide nanoparticles are having negative effect in growth of *S. virgata* by effecting initial development status. Effect of nanoparticle of copper has detected on tomato plant when it is affected by Fusarium wilt which is caused by fungus named *Fusarium oxysporum*. It effects tomato plants at concentration of 0.5 mg/ml but if the concentration is increased it shows strong inhibitory effect. It promotes tomato plant growth because when the fungicide is used (copper hydroxide) it causes the unwanted uptake of copper ions and thus shows negative effects on plant. This study shows one of application of CuNPs as fungicide.[98] Other effect of copper-based nanoparticles is seen on oomycete *Phytophthora cinnamomic* at 50 mg/l concentration where CuNPs are integrated with copper oxychloride (non-nano) cause growth inhibition while in the case of wheat it shows that combinatory effect is seen on (*Coriandrum sativum*) where the plant which is treated with CuNPs shows decrease in root length and biomass as compared to plant which is untreated it also result in less level of chlorophyll a and chlorophyll b, increased electrolyte leakage and amount of H<sub>2</sub>O<sub>2</sub>. Genotypic effect is also seen by using Random amplified DNA technology and it shows that genetic composition has also manipulated by CuNPs.[100]

# CONCLUSION AND FUTURE PERSPECTIVE

The importance of nanoparticles has been increased in various sectors of plant biotechnology. Several studies have shown the antimicrobial, antibacterial and catalytic properties of AgNPs and CuNPs. CuNPs have high surface to volume ratio and has large interaction with other particles which makes it a good drug loading source. The effects of AgNPs & CuNPs have been dependent on the size and shape. They show positive as well as negative effects on different plant species. AgNPs are in great demand because its production is very economical. The impact of CuONPs on environment must be carefully assessed, and standards for sustainable applications must be established. In order to create an integrative assessment suitable for regulation, future studies in nanotoxicology, which must systematically incorporate low concentrations and account for soil complexity in biology and physio-chemical variation in their experimental designs. Our findings also point to the significant potential for non-invasive optical techniques to be used as analytical tools for determining the physiological effects of nanoparticles on plants in their early stages of growth .According to different studies it is reported that, using modest doses of CuONPs increased the manufacture of phytochemical components in wheat shoots while also enhancing germination, vigor, plumule, and radicle length.

Due to the build-ups of Cu and toxicity in plant tissue, high concentrations of CuONPs have inhibitory effects. Nanosilver is also utilized at low concentration because it is reported that high amount of nano-silver can produces harmful chemicals which can affect the growth & development of plant. A feasible way to achieve favourable outcomes in germination and development of seedlings as well as increased manufacturing of secondary metabolites is the use of CuONPs in green synthesis. AgNPs & CuNPs influence the production of secondary metabolites such as flavonoid, proline, antioxidant enzymes glutathione which in form of secondary metabolites when they get accumulate by heavy metal use, they were not able to protect the plant from different biotic and abiotic stress conditions. Green synthesis of AgNPs & CuNPs utilizing plant-based product is comparatively nontoxic, cost effective and environmentally friendly. It is previously known that nanoparticles are helpful in activating the various bioactive compounds in roots, shoots which is grown *in-vitra*. It also enhances the secondary metabolites production in plant species. Flavonoid are most important bioactive compound which demonstrate the strong oxidative property to plant. It is important to know about the interaction of nanoparticles with plant cell, to get more theoretical knowledge in order to develop new practical applications.

# ABBREVIATION

AgNPs- Silver nanoparticles, CuNPs- Copper nanoparticles, PGRs- Plant growth regulators, SiO<sub>2</sub> – Silicon dioxide, Ag<sub>2</sub>S<sub>2</sub>O<sub>3</sub>- Silver thiosulfate, IAA- Indole acetic acid, ZnONPs- Zinc oxide nanoparticles, TiO<sub>2</sub>NP- Titanium dioxide,

## Chetna and Simranjeet Kaur

PVA- Polyvinyl alcohol,EDTA- Ethylenediaminetetraacetic acid, nm- nanometer, ppm- parts per million, NEF- nitrite embedded filtrate.

# ABSTRACT

A powerful tool to handle situation involving uncertainty and ambiguity, the Picture Fuzzy Set (PFS) is an extension of the Intuitionistic Fuzzy Set (IFS).Each element in the PFS is represented by three parameters: membership, neutrality and non-membership degrees. By utilizing the picture fuzzy numbers in which the membership, neutral, and non-membership degrees are represented as four and five tuples, respectively were introduced. Trapezoidal picture fuzzy numbers can be used to solve the picture fuzzy linear programming problem. In this research, we propose a new ranking algorithm to defuzzify the Trapezoidal picture fuzzy number. By considering two types, Type 1 (constraints) and Type 2 (cost) , in which the mentioned parameters are represent as Trapezoidal picture fuzzy numbers, we can use this ranking formula to find an initial basic feasible solution (IBFS) to a Trapezoidal picture fuzzy linear programming problem. We also compared and examined from the given data and Trapezoidal picture fuzzy linear programming problem.

**Keywords**: Trapezoidal Picture Fuzzy number, Linear Programming Problem, Trapezoidal Picture Fuzzy Linear Programming problem, Ranking formula.

# INTRODUCTION

Zadeh [1] introduced the fuzzy sets. In the field of Intuitionistic Fuzzy Numbers (IFNs), Grzegorzewski [2] constructed two families of metrices and suggested a ranking mechanism for Intuitionistic Fuzzy Numbers (IFNs) based on these metrices. By adopting a statistical perspective and understanding each Trapezoidal Intuitionistic

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Thenmozhi and Haripriya

Fuzzy Number (TIFN)as an ensemble of regular fuzzy numbers, Mitchell [3] extended the natural ordering of real numbers to these numbers. Li [4] suggested a Trapezoidal Intuitionistic Fuzzy Numbers (TIFN) Ranking Order Relation utilizing Lexicographic Technique. Ranking Fuzzy Numbers with an area between the centroid point and Original point was introduced by T.C.Chu and C.T. Tsao [5]. Linear programming method for multi attribute decision making using if sets was introduced by D.F.Li,G.H.Chen and Z.G.Huang [6]. In this paper, a Trapezoidal Intuitionistic Fuzzy Numbers (TIFNs) was first defined. Our main goal has been to investigate a useful method for dealing with linear programming issues when the data are presented as intuitive fuzzy integers. A way to resolve linear programming issues involving Trapezoidal Intuitionistic Fuzzy Numbers is suggested using the new ranking function.

#### **Basic Definitions**

**Definition 2.1**: A PFS in V is defined by  $B = \{t, (p_s(t), b_s(t), q_s(t))/t \in V\}$  where  $(p_s(t), b_s(t), q_s(t)) \in [0,1], 0 \le (p_s(t) + b_s(t) + q_s(t)) \le 1$ . The  $(p_s(t), b_s(t), q_s(t)) \in [0,1]$  signify respectively, the element of t's degree of positive, neutral and negative membership in the collection B. For each PFS B in V, the refusal membership degree is described as

 $u_{S}(t) = 1 - (p_{S}(t) + b_{S}(t) + q_{S}(t)).$ **Definition 2.2** : A Picture Fuzzy Number (PFN) q is defined in a PFS, where q  $\in S$ , as

$$= \begin{cases} \sigma_{i} \left( p_{q}(\sigma), b_{q}(\sigma), q_{q}(\sigma) \right) / \sigma \in S \\ p(\sigma) = \begin{cases} v_{q}^{k}(\sigma), \text{ for } m_{1} \leq \sigma < n \\ \beta_{q}, \text{ for } n \leq \sigma \leq o \\ v_{q}^{e}(\sigma), \text{ for } o \leq \sigma < g_{1} \\ 0, \text{ otherwise} \end{cases}$$
$$b(\sigma) = \begin{cases} w_{q}^{k}(\sigma), \text{ for } m_{2} \leq \sigma < n \\ \gamma_{q}, \text{ for } n \leq \sigma \leq o \\ w_{q}^{e}(\sigma), \text{ for } o \leq \sigma < g_{2} \\ 0, \text{ otherwise} \end{cases}$$
$$q(\sigma) = \begin{cases} x_{q}^{k}(\sigma), \text{ for } m_{3} \leq \sigma < n \\ \delta_{q}, \text{ for } n \leq \sigma \leq o \\ x_{q}^{e}(\sigma), \text{ for } o \leq \sigma < g_{3} \\ 0, \text{ otherwise} \end{cases}$$

**Definition 2.3**: A TPFN ' $z_q$ ' is defined in a picture fuzzy subset in S with the following positive  $m_q(\sigma)$ , neutral  $b_q(\sigma)$  and negative-membership function  $q_q(\sigma)$ .

$$p_{q}(\sigma) = \begin{cases} v_{q}^{k}(\sigma) = \frac{\sigma - m_{1}}{n - m_{1}} \beta_{q}^{n}, \text{ for } m_{1} \leq \sigma < n \\ \beta_{q}, & \text{for } n \leq \sigma \leq o \\ v_{q}^{e}(\sigma) = \frac{g_{1} - \sigma}{g_{1} - \sigma} \beta_{q}, \text{for } o \leq \sigma < g_{1} \\ 0, \text{ otherwise} \end{cases}$$
$$b_{q}(\sigma) = \begin{cases} w_{q}^{k}(\sigma) = \frac{n - \sigma + \gamma_{q}(\sigma - m_{2})}{n - m_{2}}, \text{ for } m_{2} \leq \sigma < n \\ \gamma_{q}, & \text{for } n \leq \sigma \leq o \\ w_{q}^{e}(\sigma) = \frac{\sigma - o + \gamma_{q}(g_{2} - \sigma)}{g_{2} - o}, \text{ for } o \leq \sigma < g_{2} \\ 0, \text{ otherwise} \end{cases}$$

International Bimonthly (Print) – Open Access ISSN: 0976 - 0997 Vol.14 / Issue 80 / Oct / 2023

$$n_{n}(\xi) = \begin{cases} x_{q}^{k}(\sigma) = \frac{n - \sigma + \delta_{q}(\sigma - m_{3})}{n - m_{3}}, & \text{for } m_{3} \leq \sigma < n \\ \delta_{q}, & \text{for } n \leq \sigma \leq o \\ x_{q}^{e}(\sigma) = \frac{\sigma - o + \delta_{q}(g_{3} - \sigma)}{g_{3} - \sigma}, & \text{for } o \leq \sigma < g_{3} \\ 0, & \text{otherwise} \end{cases}$$

Where  $m_3 \le m_2 \le m_1 \le n \le o \le g_1 \le g_2 \le g_3$  for all  $\sigma \in Y$  with the constraints  $0 \leq \beta_{q_i} \gamma_{q_i \delta_q} \leq 1 \text{ and } \beta_q + \gamma_q + \delta_q \leq 1.$ TPFN  $z_{a}$  is denoted by  $z_q = (m_1, n, o, g_1; m_2, n, o, g_2; m_3, n, o, g_3).$ **Definition 2.4 : TPFN of Ranking formula** If  $z_q = (m_1, n, o, g_1; m_2, n, o, g_2; m_3, n, o, g_3)$  is a TPFN, then the crisp value of  $z_q$ , is given below.  $f = \frac{m_1 + 2n + 2o + g_1 + m_2 + 2n + 2o + g_2 + m_3 + 2n + 2o + g_3}{m_1 + 2n + 2o + g_3}$ 

#### Algorithm

f =

Step (1): Consider the Trapezoidal Picture Fuzzy Linear Programming Problem.

Step (2): Convert the considered Trapezoidal Picture Fuzzy Linear Programming Problem into Crisp Linear Programming Problem using ranking function

Step (3): Identify whether the provided LPP's objective function can be maximized or minimized, and then use the conclusion to transform the problem into one of maximization.

Minimum z = -Maximum (-z).

Step (4): By including slack and surplus variables in the constraints, all of the inequalities of the constraints can be transformed into equations. Set the costs of these factors to zero.

Step (5): Obtain the initial basic feasible solution to the problem in the form  $x_B = B^{-1}$  b and put it in the first column of the simple table

Step (6): Compute the net evaluation  $z_j$ - $c_j$  (i=1,2,3,....n) by using the relation  $z_j$ - $c_j$ - $c_i$  where  $y_j$ =B-1a Examine the sign zj-cj

if all  $(z_{i}-c_{j})\geq 0$  then the initial basic feasible solution  $x_{B}$  is an optimum basic feasible solution.

If atleast one  $(z_r-c_r) < 0$ 

If there are more than one negative  $z_j$ - $c_j$  then choose the most negative of them. Let it be  $z_r$ - $c_r$  for some j = r.

#### Numerical Examples

#### Example 4.1:

 $\widetilde{max}$   $\widetilde{5}x_1 + \widetilde{3}x_2$ Subject to:  $\widetilde{4}x_1 + \widetilde{3}x_2 \le \widetilde{12}$  $\tilde{1}x_1 + \tilde{3}x_2 \leq \tilde{6}$  $x_{1}, x_{2} \ge 0.$ 

#### Trapezoidal

 $c_1 = \tilde{5} = \{(4, 4.68, 5.36, 6.04), (4, 4.68, 5.36, 6.04), (4, 4.68, 5.36, 6.1)\}$  $c_2 = \tilde{3} = \{(2.5, 2.62, 2.97, 3.2), (2.3, 2.62, 2.97, 3.29), (2, 2.62, 2.97, 3.5)\}$  $a_{11} = \tilde{4} = \{(3.5, 3.68, 4.12, 4.1), (3.2, 3.68, 4.12, 4.61), (3, 3.68, 4.12, 5.01)\}$  $a_{12} = \tilde{3} = \{(2.5, 2.78, 3.16, 3.49), (2.3, 2.78, 3.16, 3.53), (2.4, 2.78, 3.16, 3.6)\}$  $a_{21} = \tilde{1} = \{(0, 0.67, 1.34, 2.01), (0, 0.67, 1.34, 2.01), (0, 0.67, 1.34, 2.01)\}$  $a_{22} = \tilde{3} = \{(2.8, 2.82, 3, 3.19), (2.6, 2.82, 3, 3.2), (2.5, 2.82, 3, 3.19)\}$  $b_1 = \widetilde{12} = \{(11, 11.83, 12.66, 13.01), (11, 11.83, 12.66, 13.49), (11, 11.83, 12.66, 14)\}$  $b_2 = \tilde{6} = \{(5.5, 6.1, 6.93, 7.5), (5.3, 6.1, 6.93, 7.1), (5, 6.1, 6.93, 8.09)\}$ 

Thenmozhi and Haripriya

CRISP  $c_1 = \tilde{5} = 5.02$   $c_2 = \tilde{3} = 2.796$   $a_{11} = \tilde{4} = 3.9011$   $a_{12} = \tilde{3} = 2.97$   $a_{21} = \tilde{1} = 0.938$   $a_{22} = \tilde{3} = 2.911$   $b_1 = \tilde{1} = 12.246$  $b_2 = \tilde{6} = 6.515$ 

Max Z =  $5.02x_1+2.796x_2$ Subject to  $3.9011x_1+2.97x_2 \le 12.246$  $0.938x_1+2.911x_2 \le 6.515$  $x_1, x_2 \ge 0.$ 

After introducing slack variables:

Max Z =  $5.02x_1+2.796x_2+0S_1+0S_2$ Subject to  $3.9011x_1+2.97x_2+S_1+0=12.246$  $0.938x_1+2.911x_2+0+S_2=6.515$ and  $x_1, x_2, S_1, S_2 \ge 0.$ 

		_					
Iteration-1		$C_j$	5.02	2.796	0	0	
							Min ratio
В	C <sub>B</sub>	$X_B$	$X_1$	<i>X</i> <sub>2</sub>	$S_1$	<i>S</i> <sub>2</sub>	$\frac{X_B}{X_I}$
<i>S</i> <sub>1</sub>	0	12.246	(3.9011)	2.97	1	0	3.1391→
<i>S</i> <sub>2</sub>	0	6.515	0.938	2.911	0	1	6.9456
Z=0		$Z_j$	0	0	0	0	
		$Z_j - C_j$	-5.021	-2.796	0	0	

#### Table (a)

Negative minimum  $Z_j - C_j$  is -5.02 and its column index is 1.So, the entering variable is  $X_I$ . Minimum ratio is 3.139 and its row index is 1.So, the leaving basis variable is  $S_I$ .

∴ The pivot element is 3.9011.

Iteration-2		C <sub>i</sub>	5.02	2.796	0	0	
							Min ratio
В	$C_B$	$X_B$	$X_1$	<i>X</i> <sub>2</sub>	$S_1$	$S_2$	$\frac{X_B}{X_I}$

# ABSTRACT

In this paper, a new study of power Rama distribution called as weighted power Rama distribution has been proposed. Its different statistical properties have been investigated and the model parameters of the proposed new distribution are estimated by using the method of maximum likelihood estimation. Finally, a new distribution has been examined and analysed with real lifetime data set from medical sciences to discuss its superiority and flexibility.

**Keywords:** Power Rama distribution, Weighted distribution, Order statistics, Survival analysis, Maximum likelihood estimation.

# INTRODUCTION

In recent times, researchers have applied various probability models for modeling lifetime data occurring from diversified fields like engineering, medical sciences, finance, insurance etc. There are various cases were classical distributions may not provide best fit to lifetime data. In such a situation an attempt has been made to generalize the classical probability distributions by adding an extra parameter to the existing classical distribution. This extra parameter can be added through various techniques. One such technique is of weighted technique. The concept of

#### Soumya et al.,

weighted distribution is useful in distribution theory because it provides a new outlook to the existing classical distributions. Fisher (1934) studies the concept of weighted distribution to model the ascertainment bias, which was later formalized by Rao (1965) in a unified manner while modeling the statistical data when the standard distributions were not appropriate to record the observations with equal probabilities. The weighted distribution provides a collective approach to deal with model specification and data interpretation problems. The weighted distributions are remarkable for efficient modeling of statistical data and prediction, obviously when standard distributions are not appropriate.

The weighted distributions arise when the observations are recorded by an investigator in nature according to certain stochastic model, the distribution of recorded observation will not have the original distribution unless each and every observation is given an equal chance of being recorded. The weighted distributions are applied to modify the probabilities of events as observed and transcribed. The weighted distributions play a dominant role to attract large number of researchers to contemplate on and to carry out research on this topic. The weighted distributions are applied in various research areas related to reliability, ecology, biomedicine, Meta analysis, analysis of family data, analysis of intervention data and other areas for the improvement of proper statistical models. The weighted distribution reduces to length biased distribution when the weight function considers only the length of units of interest. The concept of length biased sampling was introduced by Cox (1969) and Zelen (1974).

Many authors have studied the various weighted probability models along with their illustrations and applications in different fields. Kersey (2010) constructed the weighted inverse Weibull distribution (WIWD) and beta-inverse Weibull distribution (BIWD). Ye et al. (2012) developed a weighted generalized beta distribution (WGBD) of second kind. Bashir and Rasul (2015) discussed the weighted Lindley distribution. Das and kundu (2016) developed the weighted exponential distribution and its length biased version. Saghir et al. (2017) studies weighted distribution with a brief review, perspective and characterizations. Shanker, Shukla and Leonida (2019) introduced weighted quasi Lindley distribution with properties and application. Kilany (2016) developed the weighted Lomax distribution and discuss its properties and application. Mahdi (2020) executed weighted exponential Lomax distribution with applications. Bashir and Rasul (2018) constructed new weighted Rayleigh distribution with properties and application. Constructed the weighted Sushila distribution with properties and applications. Dar, Ahmed and Reshi (2020) constructed the weighted gamma-Pareto distribution and its application. Recently Rajagopalan, Ganaie and Nair (2023) presented the weighted three parameter Pranav distribution with applications in industrial and medical sciences.

Power Rama distribution is a two parametric lifetime model proposed by Abebe, Tesfay, Eyob and Shanker (2019) of which one parameter Rama distribution is a particular case of power Rama distribution. Its various statistical and reliability properties which include moments, survival function, hazard rate function, mean residual life function, shapes of density for varying values of parameters, the mean and variance have been discussed. The method of maximum likelihood estimation has been discussed for estimating the parameters of proposed distribution. Shanker (2017) studied one parameter Rama distribution and obtained its various mathematical and statistical properties. The parameters have also been estimated through the method of moments and maximum likelihood estimation. Edith, Ebele and Henrietta (2019) developed two parameter Rama distribution, obtained its various mathematical and statistical and statistical properties and estimate its parameters through method of moments and maximum likelihood estimation.

#### Weighted Power Rama (WPR) Distribution

The probability density function of power Rama distribution is given by

$$f(x;\theta,\alpha) = \frac{\alpha \theta^4}{\theta^3 + 6} \left( 1 + x^{3\alpha} \right) x^{\alpha - 1} e^{-\theta x^{\alpha}}; \ x > 0, \theta > 0, \ \alpha > 0 \tag{1}$$

and the cumulative distribution function of power Rama distribution is given by

#### Soumya et al.,

$$F(x;\theta,\alpha) = 1 - \frac{\theta^3 e^{-\theta x^{\alpha}} + \Gamma(4,\theta x^{\alpha})}{\theta^3 + 6}; x > 0, \theta > 0, \alpha > 0$$

$$\tag{2}$$

Let X be the random variable following non negative condition having probability density function f(x). Let its non-negative weight function be w(x), then the probability density function of weighted random variable  $X_w$  is given by

$$f_W(x) = \frac{w(x)f(x)}{E(w(x))}, x > 0.$$

r

Where the non-negative weight function be w(x) and  $E(w(x)) = \int w(x) f(x) dx < \infty$ .

In this paper, we have to obtain the weighted version of power Rama distribution, particularly when  $w(x) = x^c$ , resulting distribution is called weighted distribution. We have considered the weight function as  $w(x) = x^c$  to obtain the weighted power Rama distribution and its probability density function is given by

$$f_{w}(x) = \frac{x^{c} f(x)}{E(x^{c})}$$
(3)  
Where  $E(x^{c}) = \int_{0}^{\infty} x^{c} f(x) dx$   

$$E(x^{c}) = \frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}}{\alpha \theta^{\frac{c}{\alpha}} \left( \theta^{3} + 6 \right)}$$
(4)

By using the equations (1) and (4) in equation (3), we will obtain the probability density function of weighted power Rama distribution as

$$f_{w}(x) = \frac{\alpha \theta^{\frac{4\alpha + c}{\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} x^{\alpha + c - 1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}}$$
(5)

and cumulative distribution function of weighted power Rama distribution can be obtained as

$$F_{w}(x) = \int_{0}^{\infty} f_{w}(x)dx$$

$$F_{w}(x) = \int_{0}^{x} \frac{\alpha \theta^{\frac{4\alpha+c}{\alpha}}}{\alpha \theta^{3}\Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}} x^{\alpha+c-1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}} dx$$

$$F_{w}(x) = \frac{1}{\alpha \theta^{3}\Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}} \int_{0}^{x} \alpha \theta^{\frac{4\alpha+c}{\alpha}} x^{\alpha+c-1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}} dx$$

www.tnsroindia.org.in ©IJONS

(6)

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

$$F_{w}(x) = \frac{1}{\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}} \begin{pmatrix} \alpha\theta^{\frac{4\alpha+c}{\alpha}} \int_{0}^{x} x^{\alpha+c-1} e^{-\theta x} \int_{0}^{\alpha} dx + \alpha\theta^{\frac{4\alpha+c}{\alpha}} \int_{0}^{x} x^{4\alpha+c-1} e^{-\theta x} \int_{0}^{\alpha} dx \end{pmatrix}$$

Put 
$$\theta x^{\alpha} = t \Rightarrow x^{\alpha} = \frac{t}{\theta} \Rightarrow x = \left(\frac{t}{\theta}\right)^{\frac{1}{\alpha}}$$
  
Also  $\alpha \, \theta x^{\alpha - 1} dx = dt \Rightarrow dx = \frac{dt}{\alpha \, \theta x^{\alpha - 1}} \Rightarrow dx = \frac{dt}{\alpha \, \theta \left(\frac{t}{\theta}\right)^{\frac{\alpha - 1}{\alpha}}}$ 

After the simplification of equation (6), we will obtain the cumulative distribution function of weighted power Rama distribution as

$$F_{w}(x) = \frac{1}{\alpha \theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}} \left( \alpha \theta^{3} \gamma \left( \frac{(\alpha+c)}{\alpha}, \theta x^{\alpha} \right) + \alpha \gamma \left( \frac{(4\alpha+c)}{\alpha}, \theta x^{\alpha} \right) \right)$$
(7)

#### Survival Analysis

In this section, we have obtained the survival function, hazard rate function, reverse hazard rate function and Mills ratio of the weighted power Rama distribution.

#### Survival function

The survival function or reliability function of weighted power Rama distribution can be obtained as

$$S(x) = 1 - F_w(x)$$

$$S(x) = 1 - \frac{1}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \left( \alpha \theta^{3} \gamma \left( \frac{(\alpha + c)}{\alpha}, \theta x^{\alpha} \right) + \alpha \gamma \left( \frac{(4\alpha + c)}{\alpha}, \theta x^{\alpha} \right) \right)$$

#### Hazard function

The hazard function is also known as hazard rate or failure rate or force of mortality and is given by

$$h(x) = \frac{f_{w}(x)}{1 - F_{w}(x)}$$

$$h(x) = \frac{\alpha \theta^{\frac{4\alpha + c}{\alpha}} x^{\alpha + c - 1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}}}{\left(\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}\right) - \left(\alpha \theta^{3} \gamma \left(\frac{(\alpha + c)}{\alpha}, \theta x^{\alpha}\right) + \alpha \gamma \left(\frac{(4\alpha + c)}{\alpha}, \theta x^{\alpha}\right)\right)}$$

#### Reverse hazard function

The reverse hazard rate function is given by

$$h_{r}(x) = \frac{f_{w}(x)}{F_{w}(x)}$$

$$h_{r}(x) = \frac{\alpha \theta^{\frac{4\alpha + c}{\alpha}} x^{\alpha + c - 1} (1 + x^{3\alpha}) e^{-\theta x^{\alpha}}}{\left(\alpha \theta^{3} \gamma \left(\frac{(\alpha + c)}{\alpha}, \theta x^{\alpha}\right) + \alpha \gamma \left(\frac{(4\alpha + c)}{\alpha}, \theta x^{\alpha}\right)\right)}$$

#### Mills Ratio

$$M.R = \frac{1}{h_r(x)} = \frac{\left(\alpha\theta^3\gamma\left(\frac{(\alpha+c)}{\alpha}, \,\theta x^{\alpha}\right) + \alpha\gamma\left(\frac{(4\alpha+c)}{\alpha}, \,\theta x^{\alpha}\right)\right)}{\alpha\theta^{\frac{4\alpha+c}{\alpha}} x^{\alpha+c-1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}}}$$

#### **Structural Properties**

In this section, we have obtained the various statistical properties of weighted power Rama distribution these include moments, harmonic mean, MGF and characteristic function.

#### Moments

Let X denotes the random variable following weighted power Rama distribution with parameters  $\theta$ ,  $\alpha$  and c, then the  $r^{th}$  order moment  $E(X^r)$  of proposed distribution can be obtained as

$$E(X^{r}) = \mu_{r}' = \int_{0}^{\infty} x^{r} f_{w}(x) dx$$
$$E(X^{r}) = \int_{0}^{\infty} x^{r} \frac{\alpha \theta^{\frac{4\alpha + c}{\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} x^{\alpha + c - 1} (1 + x^{3\alpha}) e^{-\theta x^{\alpha}} dx$$

$$E(X^{r}) = \int_{0}^{\infty} \frac{\alpha \theta^{\frac{4\alpha + c}{\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} x^{\alpha + c + r - 1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}} dx$$

$$E(X^{r}) = \frac{\alpha \theta^{\frac{4\alpha+c}{\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha} \int_{0}^{\infty} x^{\alpha+c+r-1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}} dx$$

$$E(X^{r}) = \frac{\alpha \theta^{\frac{4\alpha + c}{\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \left( \int_{0}^{\infty} x^{\alpha + c + r - 1} e^{-\theta x^{\alpha}} dx + \int_{0}^{\infty} x^{4\alpha + c + r - 1} e^{-\theta x^{\alpha}} dx \right)$$
(8)  
Put  $x^{\alpha} = t \implies x = t^{\frac{1}{\alpha}}$   
Also  $\alpha x^{\alpha - 1} dx = dt \implies dx = \frac{dt}{\alpha x^{\alpha - 1}} = \frac{dt}{\frac{\alpha - 1}{\alpha}}$ 

After simplification, equation (8) becomes

$$E(X^{r}) = \mu_{r}' = \frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c + r)}{\alpha} + \Gamma \frac{(4\alpha + c + r)}{\alpha}}{\alpha \theta^{\frac{r}{\alpha}} \left( \alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha} \right)}$$
(9)

 $\alpha t^{\alpha}$ 

By putting r = 1, 2, 3 and 4 in equation (9), we will obtain the first four moments of weighted power Rama distribution as

$$E(X) = \mu_{1}' = \frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c + 1)}{\alpha} + \Gamma \frac{(4\alpha + c + 1)}{\alpha}}{\alpha \theta^{\frac{1}{\alpha}} \left( \alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha} \right)}$$

$$E(X^{2}) = \mu_{2}' = \frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c + 2)}{\alpha} + \Gamma \frac{(4\alpha + c + 2)}{\alpha}}{\alpha \theta^{\frac{2}{\alpha}} \left( \alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c + 3)}{\alpha} \right)}$$

$$E(X^{3}) = \mu_{3}' = \frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c + 3)}{\alpha} + \Gamma \frac{(4\alpha + c + 3)}{\alpha}}{\alpha \theta^{\frac{3}{\alpha}} \left( \alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c + 4)}{\alpha} \right)}$$

$$E(X^{4}) = \mu_{4}' = \frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c + 4)}{\alpha} + \Gamma \frac{(4\alpha + c + 4)}{\alpha}}{\alpha \theta^{\frac{4}{\alpha}} \left( \alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c + 4)}{\alpha} \right)}$$

$$\operatorname{Variance} = \frac{\alpha \,\theta^{3} \Gamma \frac{(\alpha+c+2)}{\alpha} + \Gamma \frac{(4\alpha+c+2)}{\alpha}}{\alpha \theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}} - \left( \frac{\alpha \theta^{3} \Gamma \frac{(\alpha+c+1)}{\alpha} + \Gamma \frac{(4\alpha+c+1)}{\alpha}}{\alpha \theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}} \right)^{2}$$
$$S.D(\sigma) = \sqrt{\frac{\left( \frac{\alpha \theta^{3} \Gamma \frac{(\alpha+c+2)}{\alpha} + \Gamma \frac{(4\alpha+c+2)}{\alpha}}{\alpha \theta^{\alpha} \left( \alpha \,\theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c+2)}{\alpha} \right)} - \left( \frac{\alpha \theta^{3} \Gamma \frac{(\alpha+c+1)}{\alpha} + \Gamma \frac{(4\alpha+c+1)}{\alpha}}{\alpha \theta^{\alpha} \left( \alpha \,\theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha} \right)} \right)^{2}} \right)}$$

## Harmonic mean

The harmonic mean for the proposed weighted power Rama distribution can be obtained as

$$H.M = E\left(\frac{1}{x}\right) = \int_{0}^{\infty} \frac{1}{x} f_{w}(x) dx$$

$$H.M = \int_{0}^{\infty} \frac{\alpha \theta^{\frac{4\alpha + c}{\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} x^{\alpha + c - 2} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}} dx$$

$$H.M = \frac{\frac{4\alpha + c}{\alpha \theta^{-\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \int_{0}^{\infty} x^{\alpha + c - 2} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}} dx$$

$$H.M = \frac{\frac{4\alpha + c}{\alpha \theta^{-\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \left(\int_{0}^{\infty} x^{\alpha + c - 2} e^{-\theta x^{\alpha}} dx + \int_{0}^{\infty} x^{4\alpha + c - 2} e^{-\theta x^{\alpha}} dx\right)$$
(10)
Put  $x^{\alpha} = t \implies x = t^{\frac{1}{\alpha}}$ 

Also 
$$\alpha x^{\alpha - 1} dx = dt \Rightarrow dx = \frac{dt}{\alpha x^{\alpha - 1}} \Rightarrow dx = \frac{dt}{\alpha t^{\frac{\alpha - 1}{\alpha}}}$$

After the simplification of equation (10), we obtain

$$H.M = \frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c - 1)}{\alpha} + \Gamma \frac{(4\alpha + c - 1)}{\alpha}}{\alpha \theta^{\alpha} \left( \alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha} \right)}$$

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Moment generating function and characteristic function

Let X denotes the random variable following weighted power Rama distribution with parameters  $\theta$ ,  $\alpha$  and c, then the moment generating function of proposed distribution can be obtained as

$$M_X(t) = E\left(e^{tx}\right) = \int_0^\infty e^{tx} f_w(x) dx$$

Using Taylor series, we obtain

$$= \int_{0}^{\infty} \left( 1 + tx + \frac{(tx)^{2}}{2!} + \dots \right) f_{w}(x) dx$$

$$= \int_{0}^{\infty} \sum_{j=0}^{\infty} \frac{t^{j}}{j!} x^{j} f_{w}(x) dx$$
$$= \sum_{j=0}^{\infty} \frac{t^{j}}{j!} \mu_{j}'$$
$$= \sum_{j=0}^{\infty} \frac{t^{j}}{j!} \left( \frac{\alpha \theta^{3} \Gamma \frac{(\alpha+c+j)}{\alpha} + \Gamma \frac{(4\alpha+c+j)}{\alpha}}{\alpha \theta^{\alpha} \left( \alpha \theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha} \right)} \right)$$

$$M_{X}(t) = \frac{1}{\alpha \left(\alpha \theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}\right)} \sum_{j=0}^{\infty} \frac{t^{j}}{j!\theta^{\alpha}} \left(\alpha \theta^{3} \Gamma \frac{(\alpha+c+j)}{\alpha} + \Gamma \frac{(4\alpha+c+j)}{\alpha}\right)$$

Similarly, the characteristic function of weighted power Rama distribution can be determined as  $\varphi_X(t) = M_X(it)$ 

$$M_{X}(it) = \frac{1}{\alpha \left(\alpha \theta^{3} \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}\right)} \sum_{j=0}^{\infty} \frac{it^{j}}{j! \theta^{\alpha}} \left(\alpha \theta^{3} \Gamma \frac{(\alpha+c+j)}{\alpha} + \Gamma \frac{(4\alpha+c+j)}{\alpha}\right)$$

#### **Order Statistics**

Order statistics is a useful in statistical sciences and have wide range of applicability in reliability and life testing. Let  $X_{(1)}$ ,  $X_{(2)}$ ,...,  $X_{(n)}$  denotes the order statistics of a random sample  $X_1$ ,  $X_2$ ,...,  $X_n$  from a continuous population with

probability density function  $f_x(x)$  and cumulative distribution function  $F_x(x)$ , then the probability density function of  $r^{\text{th}}$  order statistics  $X_{(r)}$  is given by

$$f_{x(r)}(x) = \frac{n!}{(r-1)!(n-r)!} f_X(x) \left(F_X(x)\right)^{r-1} \left(1 - F_X(x)\right)^{n-r}$$
(11)

By using the equations (5) and (7) in equation (11), we will have obtained the probability density function of  $r^{h}$  order statistics of weighted power Rama distribution as

1

$$f_{x(r)}(x) = \frac{n!}{(r-1)!(n-r)!} \left( \frac{\frac{4\alpha + c}{\alpha}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} x^{\alpha + c - 1} (1 + x^{3\alpha}) e^{-\theta x^{\alpha}} \right)$$

$$\times \left( \frac{1}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \left( \alpha \theta^{3} \gamma \left( \frac{(\alpha + c)}{\alpha}, \theta x^{\alpha} \right) + \alpha \gamma \left( \frac{(4\alpha + c)}{\alpha}, \theta x^{\alpha} \right) \right) \right)^{r-1}$$

$$\times \left( 1 - \frac{1}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \left( \alpha \theta^{3} \gamma \left( \frac{(\alpha + c)}{\alpha}, \theta x^{\alpha} \right) + \alpha \gamma \left( \frac{(4\alpha + c)}{\alpha}, \theta x^{\alpha} \right) \right) \right)^{n-r}$$

Therefore, the probability density function of higher orderstatistic  $X_{(n)}$  of weighted power Rama distribution can be obtained as

$$f_{x(n)}(x) = \frac{n\alpha\theta^{\frac{4\alpha+c}{\alpha}}}{\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}} x^{\alpha+c-1} \left(1 + x^{3\alpha}\right) e^{-\theta x^{\alpha}}$$

$$\times \left(\frac{1}{\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}} \left(\alpha\theta^{3}\gamma\left(\frac{(\alpha+c)}{\alpha}, \theta x^{\alpha}\right) + \alpha\gamma\left(\frac{(4\alpha+c)}{\alpha}, \theta x^{\alpha}\right)\right)\right)^{n-1}$$

and the probability density function of first order statistic  $X_{(l)}$  of weighted power Rama distribution can be obtained as

$$f_{x(1)}(x) = \frac{n\alpha\theta^{\frac{4\alpha+c}{\alpha}}}{\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}}x^{\alpha+c-1}\left(1+x^{3\alpha}\right)e^{-\theta x^{\alpha}}$$

$$\times \left(1 - \frac{1}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \left(\alpha \theta^{3} \gamma \left(\frac{(\alpha + c)}{\alpha}, \theta x^{\alpha}\right) + \alpha \gamma \left(\frac{(4\alpha + c)}{\alpha}, \theta x^{\alpha}\right)\right)\right)^{n-1}$$

#### Likelihood Ratio Test

Let the random sample  $X_1, X_2, ..., X_n$  of size *n* from the power Rama or weighted power Rama distribution. To test we use the hypothesis

$$H_0: f(x) = f(x; \theta, \alpha)$$
 against  $H_1: f(x) = f_W(x; \theta, \alpha, c)$ 

In order to determine whether the random sample of size *n* comes from the power Ramadistribution or weighted power Rama distribution, the following test procedure is used

$$\Delta = \frac{L_1}{L_o} = \prod_{i=1}^n \frac{f_w(x;\theta,\alpha,c)}{f(x;\theta,\alpha)}$$
$$\Delta = \frac{L_1}{L_o} = \prod_{i=1}^n \left( \frac{\alpha \theta^{\frac{c}{\alpha}} x_i^{c} \left(\theta^3 + 6\right)}{\alpha \theta^3 \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}} \right)$$
$$\Delta = \frac{L_1}{L_o} = \left( \frac{\alpha \theta^{\frac{c}{\alpha}} \left(\theta^3 + 6\right)}{\alpha \theta^3 \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}} \right)^n \prod_{i=1}^n x_i^{c}$$

We should refuse to accept the null hypothesis if

$$\Delta = \left(\frac{\alpha \theta^{\frac{c}{\alpha}} \left(\theta^{3} + 6\right)}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}}\right)^{n} \prod_{i=1}^{n} x_{i}^{c} > k$$

Equivalently, we should also refuse to retain the null hypothesis where

$$\Delta^* = \prod_{i=1}^n x_i^c > k \left( \frac{\alpha \,\theta^3 \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}}{\alpha \theta^{\frac{c}{\alpha}} \left( \theta^3 + 6 \right)} \right)^n$$

International Bimonthly (Print) – Open Access ISSN: 0976 - 0997 Vol.14 / Issue 80 / Oct / 2023

п

$$\Delta^* = \prod_{i=1}^n x_i^c > k^*, \text{ Where } k^* = k \left( \frac{\alpha \,\theta^3 \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}}{\alpha \theta^3 \alpha} \right)$$

Whether for the large sample of size n,  $2log \Delta$  is distributed as chi-square distribution with one degree of freedom and also chi-square distribution is employed for determining p value. Thus, we reject to retain the null hypothesis if the probability value is given by

$$p(\Delta^* > \beta^*)$$
, Where  $\beta^* = \prod_{i=1}^n x_i^c$  is lower than a specified level of significance and  $\prod_{i=1}^n x_i^c$  is the detected value of the statistic  $\Delta^*$ .

is the detected value of the statistic  $\Delta$ .

#### **Bonferroni and Lorenz Curves**

The bonferroni and Lorenz curves also termed as classical curves are used to measure the distribution of inequality in income or poverty. The bonferroni and Lorenz curves are given by

$$B(p) = \frac{1}{p\mu_{1}}\int_{0}^{q} x f_{w}(x)dx$$
and  $L(p) = pB(p) = \frac{1}{\mu_{1}}\int_{0}^{q} x f_{w}(x)dx$ 
Where  $\mu_{1}' = \frac{\alpha\theta^{3}\Gamma\frac{(\alpha+c+1)}{\alpha} + \Gamma\frac{(4\alpha+c+1)}{\alpha}}{\alpha\theta^{\frac{1}{\alpha}}\left(\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}\right)}$  and  $q = F^{-1}(p)$ 

$$B(p) = \frac{\alpha\theta^{\frac{1}{\alpha}}\left(\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c+1)}{\alpha}\right)}{p\left(\alpha\theta^{3}\Gamma\frac{(\alpha+c+1)}{\alpha} + \Gamma\frac{(4\alpha+c+1)}{\alpha}\right)}\int_{0}^{q} \frac{\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha}}{\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}}x^{\alpha+c}\left(1+x^{3\alpha}\right)e^{-\theta x^{\alpha}}dx$$

$$B(p) = \frac{\alpha\theta^{\frac{4\alpha+c+1}{\alpha}}}{p\left(\alpha\theta^{3}\Gamma\frac{(\alpha+c+1)}{\alpha} + \Gamma\frac{(4\alpha+c+1)}{\alpha}\right)}\int_{0}^{q} x^{\alpha+c}\left(1+x^{3\alpha}\right)e^{-\theta x^{\alpha}}dx$$

$$B(p) = \frac{\alpha\theta^{\frac{4\alpha+c+1}{\alpha}}}{p\left(\alpha\theta^{3}\Gamma\frac{(\alpha+c+1)}{\alpha} + \Gamma\frac{(4\alpha+c+1)}{\alpha}\right)}\int_{0}^{q} x^{\alpha+c}\left(1+x^{3\alpha}\right)e^{-\theta x^{\alpha}}dx$$
(12)

#### Soumya et al.,

Put 
$$x^{\alpha} = t \implies x = t^{\frac{1}{\alpha}}$$
  
Also  $\alpha x^{\alpha - 1} dx = dt \implies dx = \frac{dt}{\alpha x^{\alpha - 1}} \implies dx = \frac{dt}{\frac{\alpha - 1}{\alpha t^{\frac{\alpha}{\alpha}}}}$ 

After simplification equation (12) becomes

$$B(p) = \frac{\frac{4\alpha + c + 1}{\alpha}}{p\left(\alpha\theta^{3}\Gamma\frac{(\alpha + c + 1)}{\alpha} + \Gamma\frac{(4\alpha + c + 1)}{\alpha}\right)} \left(\gamma\left(\frac{(\alpha + c + 1)}{\alpha}, \theta q\right) + \gamma\left(\frac{(4\alpha + c + 1)}{\alpha}, \theta q\right)\right)$$
$$L(p) = \frac{\frac{4\alpha + c + 1}{\alpha}}{\left(\alpha\theta^{3}\Gamma\frac{(\alpha + c + 1)}{\alpha} + \Gamma\frac{(4\alpha + c + 1)}{\alpha}\right)} \left(\gamma\left(\frac{(\alpha + c + 1)}{\alpha}, \theta q\right) + \gamma\left(\frac{(4\alpha + c + 1)}{\alpha}, \theta q\right)\right)$$

#### Maximum Likelihood Estimation and Fisher's Information Matrix

In this section, we will discuss the parameter estimation of weighted power Rama distribution by using the method of maximum likelihood estimation. Let  $X_1, X_2, ..., X_n$  be a random sample of size *n* from the weighted power Rama distribution, then the likelihood function can be written as

$$\begin{split} L(x) &= \prod_{i=1}^{n} f_{w}(x) \\ L(x) &= \prod_{i=1}^{n} \left( \frac{\frac{4\alpha + c}{\alpha}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} x_{i}^{\alpha + c - 1} \left(1 + x_{i}^{3\alpha}\right) e^{-\theta x_{i}^{\alpha}} \right) \\ L(x) &= \left( \frac{\frac{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}}}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} \right)^{n} \prod_{i=1}^{n} \left( x_{i}^{\alpha + c - 1} \left(1 + x_{i}^{3\alpha}\right) e^{-\theta x_{i}^{\alpha}} \right) \\ L(x) &= \frac{\alpha \theta^{n} \left(\frac{4\alpha + c}{\alpha}\right)}{\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}} n^{n} \prod_{i=1}^{n} \left( x_{i}^{\alpha + c - 1} \left(1 + x_{i}^{3\alpha}\right) e^{-\theta x_{i}^{\alpha}} \right) \end{split}$$

The log likelihood function is given by

Soumya et al.,  

$$\log L = n \left(\frac{4\alpha + c}{\alpha}\right) \log \alpha \theta - n \log \left(\alpha \theta^{3} \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}\right)$$

$$+ (\alpha + c - 1) \sum_{i=1}^{n} \log x_{i} + \sum_{i=1}^{n} \log \left(1 + x_{i}^{3\alpha}\right) - \theta \sum_{i=1}^{n} x_{i}^{\alpha}$$
(13)

By differentiating the log likelihood equation (13) with respect to  $\theta$ ,  $\alpha$  and c and must satisfy the following normal

equations

$$\frac{\partial \log L}{\partial \theta} = \frac{n\alpha}{\alpha \theta} \left(\frac{4\alpha + c}{\alpha}\right) - n \left(\frac{3\alpha \theta^2 \Gamma \frac{(\alpha + c)}{\alpha}}{\alpha \theta^3 \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}}\right) - \sum_{i=1}^n x_i^{\alpha} = 0$$

$$\frac{\partial \log L}{\partial \alpha} = -\frac{n\theta c}{\alpha^3 \theta} - n \left(\frac{\theta^3 \Gamma \frac{(\alpha + c)}{\alpha}}{\alpha \theta^3 \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}}\right) + \sum_{i=1}^n \log x_i + \sum_{i=1}^n \frac{x_i^{3\alpha} \log x_i}{(1 + x_i^{3\alpha})} - \theta \sum_{i=1}^n x_i^{\alpha} \log x_i = 0$$

$$\frac{\partial \log L}{\partial c} = \frac{n}{\alpha} \log \alpha \theta - n \psi \left(\alpha \theta^3 \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}\right) + \sum_{i=1}^n \log x_i = 0$$

Where  $\psi$  (.)is the digamma function.

The above system of non linear equations are too complicated to solve it algebraically. Therefore we use R and wolfram mathematics for estimating the required parameters of the proposed distribution.

In order to use the asymptotic normality results for obtaining the confidence interval. We have that if  $\hat{\lambda} = (\hat{\theta}, \hat{\alpha}, \hat{c})$  denotes the MLE of  $\lambda = (\theta, \alpha, c)$ , we can state the result as

$$\sqrt{n}(\hat{\lambda}-\lambda) \rightarrow N_3(0, I^{-1}(\lambda))$$

Where  $I(\lambda)$  is Fisher's Information matrix.i.e.

$$I(\lambda) = -\frac{1}{n} \begin{pmatrix} E\left(\frac{\partial^2 \log L}{\partial \theta^2}\right) & E\left(\frac{\partial^2 \log L}{\partial \theta \partial \alpha}\right) & E\left(\frac{\partial^2 \log L}{\partial \theta \partial c}\right) \end{pmatrix} \\ E\left(\frac{\partial^2 \log L}{\partial \alpha \partial \theta}\right) & E\left(\frac{\partial^2 \log L}{\partial \alpha^2}\right) & E\left(\frac{\partial^2 \log L}{\partial \alpha \partial c}\right) \end{pmatrix} \\ E\left(\frac{\partial^2 \log L}{\partial c \partial \theta}\right) & E\left(\frac{\partial^2 \log L}{\partial c \partial \alpha}\right) & E\left(\frac{\partial^2 \log L}{\partial c^2}\right) \end{pmatrix}$$

Here, we show that

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 - 0997 Soumya et al.,  $\left(\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha}+\Gamma\frac{(4\alpha+c)}{\alpha}\right)\left(6\alpha\theta\,\Gamma\frac{(\alpha+c)}{\alpha}\right)$  $E\left(\frac{\partial^2 \log L}{\partial \theta^2}\right) = -\frac{n\alpha^2}{(\alpha\theta)^2} \left(\frac{4\alpha + c}{\alpha}\right) - n \left| \frac{-\left(3\alpha \theta^2 \Gamma \frac{(\alpha + c)}{\alpha}\right) \left(3\alpha \theta^2 \Gamma \frac{(\alpha + c)}{\alpha}\right)}{\left(\alpha \theta^3 \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}\right)^2} \right|$  $E\left(\frac{\partial^{2}\log L}{\partial \alpha^{2}}\right) = \frac{3n\alpha^{2}\theta^{2}c}{\left(\alpha^{3}\theta\right)^{2}} + n\left[\frac{\left(\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha}\right)\left(\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha}\right)}{\left(\alpha\theta^{3}\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}\right)^{2}}\right] + \sum_{i=1}^{n}\frac{\left(1+x_{i}^{3\alpha}\right)x_{i}^{3\alpha}\left(\log x_{i}\right)^{2} - \left(x_{i}^{3\alpha}\log x_{i}\right)^{2}}{\left(1+x_{i}^{3\alpha}\right)^{2}}$  $-\theta \sum_{i=1}^{n} \left(x_i^{\alpha} \log x_i\right)^2$  $E\left(\frac{\partial^2 \log L}{\partial c^2}\right) = -n\psi'\left(\alpha\theta^3\Gamma\frac{(\alpha+c)}{\alpha} + \Gamma\frac{(4\alpha+c)}{\alpha}\right)$  $E\left(\frac{\partial^2 \log L}{\partial \theta \, \partial \alpha}\right) = -n \left| \frac{\left(\alpha \, \theta^3 \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}\right) \left(3\theta^2 \Gamma \frac{(\alpha+c)}{\alpha}\right) - \left(\theta^3 \Gamma \frac{(\alpha+c)}{\alpha}\right) \left(3\alpha \theta^2 \Gamma \frac{(\alpha+c)}{\alpha}\right)}{\left(\alpha \theta^3 \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}\right)^2} \right| - \sum_{i=1}^n x_i^{\alpha} \log x_i$  $E\left(\frac{\partial^2 \log L}{\partial \theta \, \partial c}\right) = \frac{n\alpha}{\alpha^2 \theta} - n\psi \left(\frac{3\alpha \, \theta^2 \Gamma \frac{(\alpha + c)}{\alpha}}{\alpha \theta^3 \Gamma \frac{(\alpha + c)}{\alpha} + \Gamma \frac{(4\alpha + c)}{\alpha}}\right)$  $E\left(\frac{\partial^2 \log L}{\partial \alpha \, \partial c}\right) = -\frac{n\theta}{\alpha^3 \theta} - n\psi \left(\frac{\theta^3 \Gamma \frac{(\alpha+c)}{\alpha}}{\alpha}}{\alpha \theta^3 \Gamma \frac{(\alpha+c)}{\alpha} + \Gamma \frac{(4\alpha+c)}{\alpha}}\right)$ 

Where  $\psi(.)$ ' is the first order derivative of digamma function. Since  $\lambda$  being unknown, we estimate  $I^{-1}(\lambda)$  by  $I^{-1}(\hat{\lambda})$  and this can be used to obtain asymptotic confidence intervals for  $\theta$ ,  $\alpha$  and c.

#### Soumya et al.,

#### Application

In this section, we have fitted a real lifetime data set in weighted power Rama distribution to discuss its goodness of fit and the fit has been compared over power Rama, two parameter Rama and one parameter Rama distributions. The real lifetime data set is given below as The following real lifetime data set consists of 100 samples represents the birth weight of babies collected by the researcher from a private hospital in Kerala India during the year 2021. The real life time data set is given below in table 1 as

In order to determine the model comparison criterion values, the unknown parameters are also computed through the technique of R software. In order to compare the performance of weighted power Rama distribution with power Rama, two parameter Rama and one parameter Rama distributions, we use the criterions like Bayesian Information criterion (*BIC*), Akaike Information Criterion (*AIC*), Akaike Information Criterion Corrected (*AICC*) and -2logL. The better distribution is which corresponds to the lesser values of *AIC*, *BIC*, *AICC* and -2logL. For computing the criterions like *AIC*, *BIC*, *AICC* and -2logL following formulas are used

 $AIC = 2k - 2\log L$ ,  $BIC = k\log n - 2\log L$  and  $AICC = AIC + \frac{2k(k+1)}{n-k-1}$ 

Where k is the number of parameters in the statistical model, n is the sample size and  $-2\log L$  is the maximized value of log-likelihood function under the considered model.

From table 2 given above, it has been clearly seen from the results that the weighted power Rama distribution has the lesser *AIC,BIC, AICC* and *-2logL*values as compared to the power Rama, two parameter Rama and one parameter Rama distributions. Hence, it can be concluded that the weighted power Rama distribution provides a better fit over power Rama, two parameter Rama and one parameter Rama distributions.

# CONCLUSION

The present paper established a new model of power Rama distribution termed as weighted power Rama distribution has been executed. The new distribution is generated by using the weighted technique to the classical distribution. Its various statistical properties which include moments, survival function, hazard rate function, moment generating function, harmonic mean, shape of the pdf and cdf, order statistics, bonferroni and lorenz curves have been studied. The parameters of new distribution have also been estimated by using the method of maximum likelihood estimation. Finally, a new distribution has been demonstrated with real lifetime data set to discuss its supremacy and it is observed from the result that the weighted power Rama distribution fits quite satisfactory over power Rama, two parameter Rama and one parameter Rama distributions.

### ABSTRACT

A type of graph labelling is graph colouring. It is the process of assigning the vertices of a graph with colors so that no two neighbouring vertices have the same colour. Assume G is a graph with the chromatic coloring C specified. The rainbow neighbourhood in G is the closed neighbourhood of a vertex v belonging to V(G) and containing at least one coloured vertex of each colour in G's chromatic colouring C. Johan colouring or J-coloring is possible if every vertex of G belongs to a rainbow neighbourhood of Graph G. We investigate Johan Coloring of several network types Graph in this paper.

**Keywords**: Rainbow neighbourhood, Johan Coloring, Johan Coloring Number, Honeycomb Network, Seirpinski Triangle, Triangular Grid Graph, Hexagonal Mesh, Butterfly Network, Benes Netwok.

# INTRODUCTION

The challenge of how to colour the countries on a map so that no two countries sharing a border have the same colour is where the concept of graph colouring first arose. A planar graph can be created by representing the countries as points on a plane and connecting each pair of points that represent countries that share a border. A network is a collection of nodes that are linked together by edges or connections that link them with one another. In mathematics, networks are frequently referred to as graphs. The role of networks plays an essential part in electrical, electronic, and computer engineering. The graph theory principle is applied in the network to establish the relationship between the networked computers. There is an important application of graph theory in network research

#### Florence Poornima and Arokia Lancy

Network theory is utilized in many fields, such as statistical physics, biology, public health, and sociology. The Internet, logistical networks, social networks, and other networks are examples of applications of network theory. Vertex colouring, commonly referred to as graph colouring, is the process of giving labels or colours to the vertices of a graph under particular conditions. Proper colouring of a graph occurs when its vertices are coloured so that no two adjacent vertices share the same colour. The minimal number of distinct colours required for a graph G to be properly coloured is known as its chromatic number.

#### Preliminaries

For fundamental terms and definitions related to graphs we refer [1][2].

#### Definition:2.1 [3]

Let G be a graph with a chromatic colouring C defined on it. The rainbow neighbourhood in G is the closed neighbourhood N[v] of a vertex  $v \in V$  (G) which contains at least one coloured vertex of each colour in the chromatic colouring C of G.

#### Definition:2.2 [3]

Let G be a graph with a chromatic colouring C defined on it. The number of vertices in G yielding rainbow neighbourhoods is called the rainbow neighbourhood number of the graph G, denoted by  $r_x(G)$ .

#### Definition:2.3 [4]

A proper k-coloring C of a graph G is called the Johan coloring or the J-Coloring of G if C is the maximal coloring such that every vertex of G belongs to a rainbow neighbourhood of G. A graph G is J-Colorable if it admits J-Coloring.

#### Definition:2.4[4]

The J-colouring number of a graph G, denoted by J(G) is the maximum number of colours in A J-colouring of G. **Definition:2.5[6]** 

The Sierpinski Triangle is a fractal and geomentric figure in which similar pattern recur progressively in smaller scales. In 1915, it was named after the polish mathematician Walcaw Sierpinski who described it. The Sierpinski triangle can be created from an equilateral triangle by continually dividing it into 4 small congruent equilateral triangles while eliminating the middle triangle. Sierpinski Gasket is another name for it.

#### Definition:2.6[7]

A triangular grid  $T_n$  is the graph created from interpreting the order (n+1) triangular grid as a graph, with grid line intersections serving as the vertices and line segments between vertices as the edges.

#### Definition:2.7[8]

 $HX_n$  is a hexagonal mesh of dimension n with  $3n^2-3n+1$  nodes and  $9n^2-15n+6$  lines. The corner nodes of  $HX_n$  has degree 3 and there are 6 corner nodes.

There are 2n-1 vertical lines for every n dimensions of the hexagonal mesh  $HX_n$ . Vertical lines are denoted by the letter X.

The central nodes of the hexagonal mesh are denoted as  $X_0$  and are referred to as the hexagonal mesh's spine.

 $X_1, X_2, ... X_{n+1}$  are the numbers to the left of  $X_0$  while the right side are denoted as  $X_{-1}, X_{-2}, ... X_{-n+1}$ .

#### Definition:2.8[9]

The k-dimensional butterfly network, denoted by BF(k), has a node set  $V = \{(m, i): m \in V (Q_k), 0 \le i \le k\}$ . Two nodes (m, i) and (n, j) are linked by a line in BF(k) iff j = i + 1 and either (i) m = n, or (ii) m differs from n in precisely the j th bit. For m=y, the line is said to be a straight line. Otherwise, the line is a cross line. For fixed i, the node (m, i) is a node on level i. The BF(k) has  $(k+1)2^k$  nodes because BF(k) has k + 1 stages and there are  $2^k$  nodes in every stage. Each node on stage 0 and k is of degree 2, otherwise, every node is of degree 4.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Florence Poornima and Arokia Lancy

#### Definition:2.9[9]

The back-to-back butterfly network which forms the m-dimensional benes network BB(m) has 2m+1 levels and  $(2m+1)2^m$  nodes and  $m2^{m+2}$  lines.[7]

#### Definition:3.0[10]

A unit honeycomb network is represented by the hexagon denoted by HC(1). Six hexagons were added around the HC(1) network's boundary edges to create the honeycomb network of size 2, or HC(2). By surrounding the boundary edges of HC(n - 1) with a layer of hexagons, the honeycomb network HC(n) can be inductively constructed from HC(n - 1).

HC(n) has 6n<sup>2</sup> nodes and 9n<sup>2</sup>-3n lines.

In HC(n), each node is denoted by a pair (a, b), where a is the line number in which the node exists and b is the node's position in the line. The first node on line number one has the address 1,1. Node 1,2 denotes the second node on line 1, and so on.[11]

#### Johan Coloring of Network Graphs

#### Theorem:3.1

Honeycomb Network admits Johan Coloring.

Proof:

Let us consider a honeycomb network HC(n).

Each node in a honeycomb network is denoted as (a,b).

Let us color the nodes of the HC(n) with colors c1, c2,.. respectively.

When a=1,2,3.. and when b is even the nodes are colored with color  $c_1$  and when b is odd the nodes are colored with colors  $c_2$ .

Thus by definition of Johan coloring every vertices of HC(n) has rainbow neighbourhood .

Thus the honeycomb network HC(n) admits Johan coloring The Johan coloring number of HC(n) is 2.

#### Theorem:3.2

Seirpinski Triangle admits Johan Coloring.

Proof:

Let us consider an Sierpinski Triangle S(n).Let us color the vertices of S(n) with colors  $c_1, c_2, c_3, ...$  respectively. Since Sierpinski Triangle is constructed by subdividing the larger equilateral triangles into four smaller triangles. And each triangles in S(n) are colored with three colors.

By the definition of Johan Coloring, every vertices of Sierpinski triangle has a rainbow neighbourhood. Thus S(n) admits Johan Coloring.

The Johan Coloring Number of sierpinski Triangle is 3.

#### Theorem:3.3

Triangular Grid Graph admits Johan Coloring. Proof:

Let us consider a Triangular Grid Graph Tn

Let the vertices of  $T_n$  be  $v_1$ ,  $v_2$ ,  $v_3$ ,... respectively.

The Triangular Grid Graph  $T_n$  has n triangles and (n+1) vertices on each side. Let us color the vertices of  $T_n$  with  $c_1, c_2, \dots$  respectively.

By the definition of Johan Coloring, every vertices of Tn has a rainbow neighbourhood.

Thus the Triangular Grid Graph admits Johan Coloring.

The Johan Coloring Number of T<sub>n</sub> is 3.

#### Theorem:3.4

Hexagonal Mesh admits Johan Coloring.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Florence Poornima and Arokia Lancy

#### Proof:

Let us consider a n-dimensional Hexagonal Mesh  $\mathsf{HX}_n$  .

 $HX_n$  consists of  $3n^2 - 3n + 1$  nodes and  $9n^2 - 15n + 6$  lines. It has totally 2n - 1 vertical lines. The nodes of  $HX_n$  are colored with colors  $c_1$ ,  $c_2$ , ... respectively. By the definition of Johan coloring, we color the nodes of  $HX_n$  with 4 colors alternatively.

Thus every vertices of  $HX_n$  has rainbow neighbourhood.

The Johan coloring number of Hexagonal Mesh is 4.

#### Theorem:3.5

Butterfly Network admits Johan Coloring.

Proof:

Let us consider a Butterfly Network BF(k). The butterfly network has (k+1) stages and there are  $2^k$  nodes in every stage of BF(k). The nodes of BF(k) are colored with colors  $c_1, c_2, \dots$  respectively.

Let us color every nodes of stage 0 with color  $c_1$  since every nodes in stage 0 are not adjacent to each other .

Similarly every nodes in stage 1 are also not adjacent to each other so the nodes of stage 1 are colored with color  $c_2$ . Thus, the remaining stages in BF(k) are colored with colors  $c_1$  and  $c_2$  alternatively.

By the definition of Johan Coloring, every nodes in BF(k) has rainbow neighbourhood. Thus butterfly network admits Johan Coloring.

The Johan coloring Number of BF(k) is 2.

#### Theorem:3.6

Benes Network admits Johan Coloring.

Proof: Let us Consider a benes network of m-dimension. The benes network has 2m+1 levels and  $(2m+1)2^m$  nodes and  $m2^{m+2}$  lines. The nodes of BB(m) are colored with  $c_1, c_2, \ldots$  respectively. Since no nodes at level 0 are adjacent to each other, so each node in the benes network in this level is coloured  $c_1$ . Similarly, every node in level1, level 2,... are colored with colors  $c_1$  and  $c_2$  alternatively. By the definition of Johan Coloring, every nodes in BB(m) has rainbow neighbourhood. Thus the Benes Network admits Johan Coloring. The Johan coloring Number of BB(m) is 2.

# CONCLUSION

In this paper, we discussed Johan coloring of Honeycomb network, Sierpinski Triangle, Triangular Grid Graph, Hexagonal Mesh, Butterfly Network and Benes Network and we have also determined the Johan Coloring Number for these Graphs.

## ABSTRACT

In this paper, we have proposed a new algorithm to find optimal solutions to fuzzy transportation problems. Here, defuzzified the pentagonal numbers by implementing the ranking methodology. This article gives methodology that brings down the optimal solution. The numerical example illustrates the validity of our proposed method.

Keywords: Transportation, fuzzy, optimality, ranking, pentagonal fuzzy numbers.

## INTRODUCTION

Operations Research is a state of art approach used for problem-solving and decision making. It helps any organization to achieve their best performance under the given constraints or situations. The transportation problem (TP) is one of the special areas found worldwide which is helpful to solve real life problems. It is important to deal with production, distribution etc. purposes in minimizing the cost function. There are numerous things that make an impact on the transportation cost viz., distance, path, mode, number of units, speed, etc. In this paper, it is observed that there are several research studies to bring the best optimal solution to the transportation problems. The problem that needs to be resolved is to reach cost effective production in various production companies. Our main focus is to transport the optimal number of commodities with minimum transportation cost that will be fruitful to design optimal location decisions. Maheswari and Ganesan [6] dealt with TP with a fuzzy environment where the availability and requirements at sources and destinations were denoted by pentagonal fuzzy numbers. Further, it is being dealt with robust ranking technique and a new fuzzy arithmetic on pentagonal fuzzy numbers. Geetha and Selvakumari [4] proposed a new move towards the key of the TP under a fuzzy environment with transportation

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Madhav Fegade and Aniket Muley

costs are taken as fuzzy pentagonal numbers. The fuzzy numbers and fuzzy values are predominantly used in various fields such as experimental sciences, artificial intelligence, etc. because of their uncertainty. They have converted fuzzy pentagonal numbers into crisp values by using range technique and then solved by the max-min approach. Mitlif *et al.* [9] dealt with optimizing TP with fuzzy pentagonal numbers for the cost, supply, and demand. Further, it has been transformed into crisp values by new ranking methodology. George *et al.* [3] optimize a fuzzy TP algorithm which gives initial solution is closer to optimal solution having trapezoidal fuzzy numbers. It is observed that, the optimal solution is verified by using the fuzzy Modified Distribution method without transforming into its correspondent classical form.

Christi and Kasthuri [2] developed a method that can be dealt with pentagonal intuitionistic fuzzy numbers. TP is a generalization of linear programming problems on distribution and transport of goods from one place to a different with least cost objective. They have used ranking methodology for pentagonal fuzzy number and Russell's technique. Nasir and Beenu [11] proposed a ranking method depends on value and vagueness index of pentagonal intuitionistic fuzzy number is used to answer the unbalanced TP. Menaka [8] proposed for finding optimal TP cost values are pentagonal intuitionistic fuzzy numbers. Mondal and Mandal [10] introduces Pentagonal fuzzy number and some basic arithmetic operations. Das [5] discussed a TP with pentagonal neutrosophic numbers where the supply, demand and transportation cost is uncertain. Maheswari and Vijaya [7] developed a method for obtaining the initial basic feasible solution of fuzzy TP based on the proposed ranking method of trapezoidal fuzzy number using centroid of in centers. They are focused on interval based transportation problems. Further, it is converted to fuzzy TP and then a proposed ranking based on centroid of in centres is applied for the adaptation of crisp numbers to find its initial basic feasible solution. Sengupta et al. [12] proposed a reduction method for the pentagonal fuzzy number using the expected value criterion. They proposed reduction method, a single objective carbon cost integrated solid transportation problem minimizing the transportation cost along with the emission cost is solved with the parameters as the pentagonal fuzzy number and it is validated the proposed reduction method and with the existing expected value reduction methods. Chakraborty et al. [1] envisaged the hexagonal number from various distinct rational perspectives and viewpoints to give it a look of a conundrum. Hexagonal fuzzy number is used as a trustworthy to ease understanding of vague information. They have proposed a new ranking method.

#### Preliminaries

#### Definitions

**Fuzzy set:**  $A^{\tilde{}}$  is fuzzy set on R is defined as a set ordered pairs  $A^{\tilde{}} = \{X_0, \mu_A(X_0) | X_0 \in A^{\tilde{}}, \mu_A(X_0) \rightarrow [0,1]\}$ , where  $\mu_A(X_0)$  is said to be the membership function.

**Fuzzy Number**  $A^{\tilde{}}$  is fuzzy set on R, likely bounded to the stated conditions given beneath

i.  $\mu_A(X_0)$  is part by continuous

ii. There exist at one  $X_0 \in R$  with  $A(X_0) = 1$ 

iii. A<sup>~</sup> is a regular and convex

**Pentagonal Fuzzy Number** A fuzzy number  $\tilde{A}$  on R is said to be the pentagonal fuzzy number or linear number which is names as  $(\tilde{a}_1 \tilde{a}_2, \tilde{a}_3, \tilde{a}_4, \tilde{a}_5)$  if it membership function  $\mu_A(X_0)$  has the following characteristic

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Madhav Fegade and Aniket Muley

$$\mu_A(X) = \begin{cases} 0, \ X < \tilde{a}_1 \\ \tilde{u}_1 \frac{X - \tilde{a}_2}{\tilde{a}_3 - \tilde{a}_2}, \tilde{a}_2 \le X \le \tilde{a}_3 \\ ((1 - (1 - \tilde{u}_1)) \frac{X - \tilde{a}_2}{\tilde{a}_3 - \tilde{a}_2}, \tilde{a}_2 \le X \le \tilde{a}_3 \\ 1, \ X = \tilde{a}_3 \\ ((1 - (1 - \tilde{u}_2)) \frac{\tilde{a}_4 - X}{\tilde{a}_4 - \tilde{a}_3}, \tilde{a}_3 \le X \le \tilde{a}_4 \\ \tilde{u}_2 \frac{\tilde{a}_5 - X}{\tilde{a}_5 - \tilde{a}_4}, \tilde{a}_4 \le X \le \tilde{a}_5 \\ 0, X > , \tilde{a}_5 \end{cases}$$

Here, the midpoint  $\tilde{a}_3$  has the grade of membership 1 and  $\tilde{a}_2$ ,  $\tilde{a}_4$  has grades  $\tilde{u}_1$ ,  $\tilde{u}_2$  respectively. Note that, every pentagonal fuzzy number is connected with two weights  $\tilde{u}_1$ ,  $\tilde{u}_2$ .

#### Arithmetic operations

Let,  $\tilde{a}_A = (\tilde{a}_1, \tilde{a}_2, \tilde{a}_3, \tilde{a}_4, \tilde{a}_5)$  and  $\tilde{b}_B = (\tilde{b}_1 \tilde{b}_2, \tilde{b}_3, \tilde{b}_4, \tilde{b}_5)$  are two fuzzy numbers where  $\tilde{a}_1 \leq \tilde{a}_2 \leq \tilde{a}_3 \leq \tilde{a}_4 \leq \tilde{a}_5$  and  $\tilde{b}_1 \leq \tilde{b}_2 \leq \tilde{b}_3 \leq \tilde{b}_4 \leq \tilde{b}_5$ , then the arithmetic operations are defined are as follows: Addition:  $\tilde{a}_A + \tilde{b}_B = (\tilde{a}_1 + \tilde{b}_1, \tilde{a}_2 + \tilde{b}_2, \tilde{a}_3 + \tilde{b}_3, \tilde{a}_4 + \tilde{b}_4, \tilde{a}_5 + \tilde{b}_5)$ Subtraction:  $\tilde{a}_A - \tilde{b}_B = (\tilde{a}_1 - \tilde{b}_1, \tilde{a}_2 - \tilde{b}_2, \tilde{a}_3 - \tilde{b}_3, \tilde{a}_4 - \tilde{b}_4, \tilde{a}_5 - \tilde{b}_5)$ Multiplication:  $\tilde{a}_A * \tilde{b}_B = \left(\frac{\tilde{a}_1}{5} \tilde{Y}_B, \frac{\tilde{a}_2}{5} \tilde{Y}_B, \frac{\tilde{a}_3}{5} \tilde{Y}_B, \frac{\tilde{a}_4}{5} \tilde{Y}_B, \frac{\tilde{a}_5}{5} \tilde{Y}_B\right)$  if  $\tilde{Y}_B \neq 0$ Where,  $\tilde{Y}_B = (\tilde{b}_1 + \tilde{b}_2 + \tilde{b}_3 + \tilde{b}_4 + \tilde{b}_5)$ Division:  $\tilde{a}_A * \tilde{b}_B = \left(\frac{5\tilde{a}_1}{\tilde{Y}_B}, \frac{5\tilde{a}_2}{\tilde{Y}_B}, \frac{5\tilde{a}_3}{\tilde{Y}_B}, \frac{5\tilde{a}_5}{\tilde{Y}_B}\right)$  Where,  $\tilde{Y}_B = (\tilde{b}_1 + \tilde{b}_2 + \tilde{b}_3 + \tilde{b}_4 + \tilde{b}_5)$ 

 $F_B \qquad F_B \qquad F_B \qquad F_B \qquad F_B \qquad F_B$ Scalar Multiplication:  $k\tilde{a}_A = \{k\tilde{a}_1, k\tilde{a}_2, k\tilde{a}_3, k\tilde{a}_4, k\tilde{a}_5 \text{ if } k > 0 \ k\tilde{a}_5, k\tilde{a}_4, k\tilde{a}_3, k\tilde{a}_2, k\tilde{a}_1 \text{ if } k < 0 \}$ 

## **METHODOLOGY**

#### Algorithm

Step 1: To ensure whether the given TP is fair or unequal.1.1: If it is balanced, then go to step 2. : If it is unbalanced, then add a dummy row or dummy column to fulfil the requirement.

Step2: Convert the given pentagonal fuzzy numbers to crisp number using following ranking function:

 $R(\hat{a}_A) = \frac{a_1 + 2a_2 + 3a_3 + 2a_4 + a_5}{9}$ 

Step 3: Discover, First smallest amount and second minimum of each row and make the difference between them. i.e. (2<sup>nd</sup> Minimum-1<sup>st</sup> Minimum) and the difference is separated by the digit of row in the given table in each iteration. Step 4: Find the First minimum and second minimum of each column and make the difference between them. i.e. (2<sup>nd</sup> Minimum-1<sup>st</sup> Minimum) and the difference is separated by the digit of column in the given table in respective iteration.

Step 5: After simplifying step 3 and 4, select the largest difference and allocate as much as possible to the smallest element in the respective row (Column).

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Madhav Fegade and Aniket Muley

Step 6: If maximum difference ratio value may occur more than once in the rows or columns thenarbitrarily select any one row or column but not both.

Step 7: Locate the smallest value obtained from the certain row or column then allot the quantity maximum possible quantity to fulfil the demand or to exhaust the availability.

Step 8: Repeat the step 3 to 7, until all the availability and demand will get exhausted or fulfilled.

Step 9: To check the allocations are equal to m+n-1 or not. If it is less than m+n-1, then apply the MODI method to check the optimality of the given problem.

## **RESULT AND DISCUSSION**

A motion that established fuzzy TP which includes: transportation cost, customer desires and demands and existence of commodities with pentagonal fuzzy numbers. Examined the following TPas stated in Table 1[13]: Total Minimum cost= $38 \times 4.4444 + 2 \times 3 + 50 \times 4.4444 + 18 \times 4.3333 + 30 \times 4.8888 + 4 \times 5.3333 + 5 \times 6.4444 = 676.3266$ The comparison of the proposed method with NCWM, LCM, Russell's Approximation method, Rowminima method, column minima method and VAM is tabulated below (Table 9):

## CONCLUSION

In this study, the proposed algorithm gives us better solution for the TP with pentagonal fuzzy numbers. In general, this algorithm can be useful for all types of fuzzy TP and can be generalized for similar kinds of studies. The proposed method will be helpful in decision making process for selection of new location having more than two destinations. It is observed that, cost of TP is minimized after implementing the proposed methodology. Hence, the good results achieved with the proposed perspective.

## ABSTRACT

Researchers and entrepreneurs are growing more interested in Picture Fuzzy Sets (PFS) to resolve uncertainty and hesitance in real world problems. Interval Valued Picture Fuzzy Sets (IVPFN) is a more useful method for handling ambiguity and impressions. In this paper, three types of Interval Valued Picture Fuzzy Transportation problem(IVPFTP) that are taken into consideration are Type 1(demand and supply), Type 2(cost only) and Type 3(demand, supply and cost) with the above parameters represented as IVPFS. Additionally the three different types of formulae namely WIDTH, HM and PERT were developed and they are used to covert the IVPFS into crisp values in the three different types of IVPFTP. After that the Initial Basic Feasible Solution(IBFS) was found using the RANGE method. Finally a comparison of the Type 1, Type 2 and Type 3 IVPFTP results are produced.

Keywords: Picture Fuzzy Sets, Interval Valued Picture Fuzzy Sets, RANGE method

## INTRODUCTION

In 1965, Zadeh[10] introduced Fuzzy Set (FS) and Interval Valued Fuzzy Set (IVFS), both of which are effective in handling uncertainty. The membership degree in FS and IVFS is essentially a sub interval of [0,1].Atanassov[3] introduced Intuitionistic Fuzzy Sets, a distinct extension of Fuzzy Sets. The membership and non-membership functions are two functions found in IFSs, each requiring a sum within a closed unit interval. Atanassov and Gargov[3] introduced the Interval Valued Intuitionistic Fuzzy Set (IVIFS).IVIFS stipulates that the total supremum of

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Rajarajeswari and Vanithamani

these intervals must belong to the intervals [0,1]. Coung[6] introduced the concept of PFS, which comprises membership, neutral, and non-membership functions, ensuring their sum must fit within a closed unit interval. Coung introduces Interval Valued Picture Fuzzy Sets, specifying membership, neutral, and non-membership degrees within a closed subinterval of [0,1], with the supremum of all three subintervals within a closed unit interval. IVPFSs are superior in describing fuzzy information compared to other types of FSs, IVFSs, IVFSs, IVIFS, and PFSs. The Transportation Problem (TP) aims to find the best solution for minimizing transportation costs, considering supply and demand limitations, from origin to destination. The optimal TP solution can be determined through two stages: identifying an Initial Basic Feasible Solution (IBFS) and determining the optimal solution from an IBFS. Scholars have conducted three well-known IBFS studies: Northwest Corner Method (NCM), Least Cost Method (LCM), and Vogel's Approximation Method (VAM)[9]. Juman and Hoque proposed the Juman Hoque Method (JHM) for obtaining IBFS, while Ahmed et al. presented the Incessant Allocation Method (IAM) for transportation problem. In order to deliver items to clients in amore proper way, the transportation problem provides feasible solutions. Real world problems, unpredictable occurrences, such as traffic restrictions and weather conditions frequently occur. In this situation, Sathya Geetha and Selvanayaki[8] given the A Picture Fuzzy Approach to Solving Transportation Problem. From The IVPFS is a highly effective method for addressing ambiguity and impressions. We introduce and generalize IVPFTP, an efficient alternative to PFTP, and develop a new algorithm for finding IBFS, comparing it with existing methods.

#### Preliminaries

In this section we define a few fundamental terms to make the following sections easier to understand for readers. The universal set is called X.

**Definition 2.1.** A FS on *X* is defined as:

 $T = \{x, \Omega(x) \mid x \in X\},\$ 

where the term  $\Omega(x)$  refers tomembership function,  $\Omega: X \to [0, 1]$  that expresses the degree to which an object is a member of a non-empty set. Each  $\Omega(x)$  is known as a fuzzy number.

**Definition 2.2.** An IVFS on *X* is defined as:

 $T = \{x, \ \Omega_{\mathrm{T}}(x) \mid x \in X\},\$ 

where  $\Omega_T = [\Omega_{TL}, \Omega_{TU}]$  is subinterval of [0, 1] and it expresses the degree of membership by sub-interval and each  $\Omega(x)$  is called IVFN.

**Definition 2.3.** An IFS on *X* is defined as:

 $T=\{x,\,\Omega(x),\,\delta(x)\ |\ x\in X\},$ 

where  $\Omega$ ,  $\delta: X \to [0,1]$  are called membership and non-membership functions. An IFS has a condition that the sum of both functions must lie in unit interval and the degree of refusal is defined as  $r(x) = 1 - (\Omega(x) + \delta(x))$ . A duplet  $(\Omega(x), \delta(x))$  is called an intuitionistic fuzzy number (IFN).

**Definition 2.4.** An IVIFS on a universal set *X* is defined as:

$$T = \{x, \ \Omega_{\mathrm{T}}(x), \delta_{\mathrm{T}}(x) \mid x \in X\}$$

where  $\Omega_T = [\Omega_{TL}, \Omega_{TU}], \delta_T = [\delta_{TL}, \delta_{TU}]$  and  $\Omega_T, \delta_T : X \to [0,1]$ . An IVIFS has a condition that the sum of supremum of membership and non-membership functions must lie in unit interval. A duplet ( $\Omega(x), \delta(x)$ ) is called interval-valued intuitionistic fuzzy number (IVIFN).

**Definition 2.5.** A PFS on *X* is defined as:

 $T = \{x, \Omega(x), \Lambda(x), \delta(x) \mid x \in X\},\$ 

where  $\Omega$ ,  $\Lambda$ ,  $\delta$ :  $X \rightarrow [0,1]$  are called membership, abstinence, and non-membership functions. A PFS has a condition that the sum of all three functions must lie in unit interval and the degree of refusal is defined as  $(x) = 1 - (\Omega(x) + \Lambda(x) + \delta(x))$ . A triplet  $(\Omega(x), \Lambda(x), \delta(x))$  is called a PFN.

**Definition 2.6.** An IVPFS on a universal set *X* is defined as:

 $T = \{x, \ \Omega_{\mathrm{T}}(x), \Lambda(x), \delta(x) \mid x \in X\},\$ 

where  $\Omega_T = [\Omega_{TL}, \Omega_{TU}], \Lambda_T = [\Lambda_{TL}, \Lambda_{TU}], \delta_T = [\delta_{TL}, \delta_{TU}]$  and  $\Omega_T, \Lambda_T, \delta_T: X \rightarrow [0,1]$ . An IVPFS has a condition that the sum of supremum of all three functions must lie in unit interval. A triplet ( $\Omega(x), \Lambda(x), \delta(x)$ ) is called interval-valued picture fuzzy number (IVPFN).

#### In Type 3, IVPFTP Table 3

 $C_{ij} = ([a_{\Omega_{ij}}, b_{\Omega_{ij}}], [a_{\Lambda_{ij}}, b_{\Lambda_{ij}}], [a_{\delta_{ij}}, b_{\delta_{ij}}])$  for i = 1, 2, 3... and j = 1, 2, 3... represents the transportation cost for transporting one unit from the  $i^{th}$  origin to  $j^{th}$  destination , where  $[a_{\Omega_{ij}}, b_{\Omega_{ij}}]$  represents the membership,  $[a_{\Lambda_{ij}}, b_{\Lambda_{ij}}]$  represents abstinence and  $[a_{\delta_{ij}}, b_{\delta_{ij}}]$  represents non-membership values which are Interval Valued Picture Fuzzy Sets

#### Algorithm to IBFS for IVPFTP

RANGE method for IBFS of IVPFTP. The following algorithm is used to find IBFS for IVPTP.

**Step 1:** Find width by using the following formulae

 $\begin{array}{ll} d_{\alpha_{ij}}=(b_{\alpha_{ij}}-a_{\alpha_{ij}})/2, & d_{A_{ij}}=(b_{A_{ij}}-a_{A_{ij}})/2 \text{ and} \\ d_{\delta_{ij}}=(b_{\delta_{ij}}-a_{\delta_{ij}})/2 \text{ and we get the values of } d_{\alpha_{ij}}, d_{\vartheta_{ij}}, d_{\varpi_{ij}}, \\ \text{where } i=1,2,3\ldots \text{m and } j=1,2,3\ldots \text{n} \end{array}$ 

**Step 2:** Find the number between the interval  $([a_{\Omega_{ij}}, b_{\Omega_{ij}}], [a_{\vartheta_{ij}}, b_{\vartheta_{ij}}], [a_{\delta_{ij}}, b_{\delta_{ij}}])$  by using following.  $e_{\Omega_{ij}} = a_{\Omega_{ij}} + d_{\Omega_{ij}}; e_{A_{ij}} = a_{A_{ij}} + d_{A_{ij}}$  and  $e_{\delta_{ij}} = a_{\delta_{ij}} + d_{\delta_{ij'}}$ where i = 1, 2, 3...m and j = 1, 2, 3...n

Form,

$$\begin{split} T_{\Omega_{ij}} = (a_{\Omega_{ij'}} e_{\Omega_{ij'}} b_{\Omega_{ij}}); & T_{\vartheta_{ij}} = (a_{\Lambda_{ij'}} e_{\Lambda_{ij}}, b_{\Lambda_{ij}}), \text{ and } & T_{\delta_{ij}} = (a_{\delta_{ij'}} e_{\delta_{ij'}}, b_{\delta_{ij}}), \\ \text{where } i = 1, 2, 3 \dots \text{m} \text{ and } j = 1, 2, 3 \dots \text{n} \end{split}$$

Step 3: Use the HM formula and find the value of triangular values. After that, get PFSare following.

$$\begin{split} & C_{\Omega_{ij}} = & \frac{3}{\left(\frac{1}{a_{\Omega_{ij}}}\right) + \left(\frac{1}{e_{\Omega_{ij}}}\right) + \left(\frac{1}{b_{\Omega_{ij}}}\right)} \\ & C_{A_{ij}} = & \frac{3}{\left(\frac{1}{a_{A_{ij}}}\right) + \left(\frac{1}{e_{A_{ij}}}\right) + \left(\frac{1}{b_{A_{ij}}}\right)} \\ & C_{\delta_{ij}} = & \frac{3}{\left(\frac{1}{a_{\delta_{ij}}}\right) + \left(\frac{1}{e_{\delta_{ij}}}\right) + \left(\frac{1}{b_{\delta_{ij}}}\right)}, \text{ where } i = 1, 2, 3 \dots \text{m and } j = 1, 2, 3 \dots \text{n} \end{split}$$

**Step 4:** Use the ranking formula namely PERT formula and change the PFS into crisp values in the IVPFTP.  $C_{ij} = (C_{\Omega_{ij}} + (4xC_{\vartheta_{ij}}) + C_{\vartheta_{ij}})/6$ , where i =1,2,3...m and j =1,2,3...n

**Step 5.**Find the range for each row and each column, where range = largest cost- smallest cost.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Rajarajeswari and Vanithamani

**Step 6.** Find the row or column with the largest range. For the minimum cost in the selected row or column assign the corresponding demand or supply, whichever is minimum. Supply and demand in related to the value that was assigned to the cell. Once you have crossed the fully satisfied row or column, continue. **Step 7.** Steps 5 and 6 should be repeated until all conditions are fulfilled.

**Step 8.** Calculate the Transportation Cost.

Example1 represent the Type 1 IVPFTP.

#### IVPFTP Table 4

	D1	D2	D <sub>3</sub>	D4	Supply
	0.7	0.2	0.6	0.1	([0.7,0.8],
S1					[0,0.1],
					[0.05,0.1])
	0.3	0.1	0.9	0.2	([0.3,0.4],
<b>S</b> <sub>2</sub>					[0.1,0.3],

### Rajarajeswari and Vanithamani

## CONCLUSION

The Transportation Problem is generalized into IVPFTP using IVPFN, and a new algorithm, Range Method, is developed to find the Interval Valued Picture Fuzzy (IBFS) for given IVPFTP. Comparing the method with each other, the proposed method is found to be an alternating method.

## ABSTRACT

Education is the basic requirement, and fundamental right of every citizen. It is a human right, which also enables people to access other types of rights. Ancient philosopher and historian Plato describes that, education helps to the comprehensive development of every individual. It gives knowledge to take the decisions for the fulfilment of their responsibilities. However; Education as a means for knowledge and cultural transmission is very essential for humankind's sustainable development. Besides that; school education is helps to inclusive development of the children. It is the basement to the higher education of the every child. But; the Low Enrolment and Retention Rates are caused to the inadequate education, which has a detrimental effect on family future growth and development. Another side the family socioeconomic perceptions are shows negative impact of further investments in education. The East Godavari District is, one of the state's most populous and densely inhabited districts, in the state of Andhra Pradesh. According to the 2011 Census; the East Godavari total population are 52.86 lakhs, with a geographical area of 12805 square kilometres. The population density is 413 people per square kilometre, and only 24.86 percent of the population resides in urban regions, leaving 75.14 percent in rural areas. The literacy rate in the District is 70.50 percent. In the District, agriculture provides a living for a big portion of the working population. According to the 2011 Census; the population of scheduled castes in the District is 18.10 percent, it means 9.57 lakhs. While; the number of scheduled tribes is 2.97 lakhs, it accounting for 5.62 percent of the total population of the district. The methodology of the present paper is, mainly used the secondary data sources and its analysis; the secondary data was collected from various Governments, International Organizations, and from eminent scholar's articles. The main aim of

the present study is, to understand the contemporary school education system of East Godavari Dist, Andhra Pradesh. Another aim of the paper is, to discuss about the, socio-economic conditions of East Godavari District.

**Keywords**: School-Education, East Godavari, Community Participation, Andhra Pradesh, Sustainable Development Goals

## INTRODUCTION

Education is the basic requirement and fundamental right of every citizen. Education is a human right, which also enables people to access other types of rights. It is helps to build a character and personality of every Individual. Education as a means for knowledge and cultural transmission is very essential for mankind's sustainable development. According to Plato; "Education is helps to the comprehensive development of every individual. It is gives a knowledge to take the decisions for the fulfilment of their responsibilities". According to Radden; education is the process through which a more experienced individual has a positive, long-lasting impact on less experience individuals.

United Nations Organisation-(UNO's) said that; the goal number four, in the Sustainable Development Goal-(SDGs), are clarifies about, the "quality education" to every individual on earth. However; this objective can only be attained if other socioeconomic objectives, like SDGs 1 to 6 and 17, are also met (UNDP, 2022). Whereas; the "Universal elementary education-(UEE)" is not a new concept, it is a one of the component of the Millennium Development Goal-(MDGs) established by the United Nations in late 1990's. Here we need to understand that, the education is assist to the accomplishment of a range of individual and social objectives, if it is of a desirable standard. The United Nations Education and Socio-Cultural Organisation-(UNESCO's), and its allied institute, the Institute of Education (UIE) 2004) said that; Education consists of qualitatively defined processes and outcomes. The emphasis on education for All' suggested that education should become worldwide affordable and strengthened significantly.

The Planning Commission of India stated; in its annual report for 2011, India has noticed that the Net Enrolment Ratio-(NER) at the primary level has improved significantly and was on the same level with other developed nations in 2007, (NITI Aayog, Planning Commission, Annual Report 2011). As per Bangay, Latham, Govinda, and Bandyopadhya, the same "Net Enrolment Ratio-(NER)", Quality The year 2007 witnessed progressive school exclusion as a consequence of low learning levels, considerable repetition rates, and the inability to speak. Complex interdependencies exist between enrolment, retention, and educational quality, (Govinda and Bandopadhyay, 2010).

Low enrolment and retention rates are caused by inadequate education, which has a detrimental effect on family perceptions of the value of further investments in education. The educational process is slowed down by poor enrolment and retention rates. Policymakers, educators, and others involved in education have become increasingly aware of the significant role communities can play in the administration, management, and oversight of educational institutions. There is accumulating evidence; that community involvement in education can have a profound effect on educational access, retention, and quality. According to a 2014 study from UNESCO, "quality education" has become a multifaceted notion that takes into account things like students' individual traits and the context in which they are learning. Teachers, textbooks, computers, and other resources all play a role in a student's capacity to learn, as does the quality of the school itself.

## Anuradha and Kannuru Hari Krishna

The Kothari Commission (1964–1986) emphasised; the importance of decentralising school education, involving parents and community organisations in the enhancement of schools, (Kothari Commission, 1966). National Policy on Education (NPE) of 1986 emphasised that; the decentralised planning, and the administration of primary education above all else. Moreover, it emphasises the elimination of inequalities in the educational system and seeks to equalise school education opportunities. Through the Programme of Action-(POA) in 1992, the village committees are became a stronger, (National Policy on Education, 1986). In addition, the Sarva Siksha Abhiyan-(SSA) is a one Inclusive Educational Development Programme, which is implementing by the Govt of India, from the year of 2001. The main goal of the programme is; to achieve a, "Universal Elementary Education-(UEE)", through the support of the community. The community support and its participation is in different forms like, "Gram Panchayats-(GP's), Parent-Teacher Associations-(PTA), Mother-Teacher Associations-(MTA), Village Education Committees-(VEC)" etc., (SSA, 2001).

In addition, the Right to Education-(RTE) Act of 2009 is the most significant declaration, of the commitment and obligation made by the government towards education. The Act makes it crystal clear, that the state is responsible for providing eight years of free, compulsory schooling to all children ages 6 to 14. Besides that; the Act establishes minimum requirements for infrastructure necessities, educational amenities, and curriculum that all categories of institutions must meet.

Furthermore; the RTE Act clearly specified that, the teacher-students ratio is must be 1:30 ratio in every school. Moreover; it is mentioned the Educational Qualifications of the teachers, and their roles and responsibilities. The RTE Act-2009; gives a more importance to the Community Participation in the school administration, through GP's, SMC's, PTA's and other forms in School Education System. The act noted that; community role in the School Education is, supports to not only improve the Quality and Equity of the School Education, and it helps to comprehensive development of the society, (RTE Act 2009). According to Anderson; encouraging students to participate in hands-on learning can ensure quality education in the contemporary period. The dedicated teachers are utilising their skills and knowledge to the development of the students. Through a curriculum based on evidence and an activity-based teaching-learning process, the quality of education is enhanced in order to increase and produce men with greater knowledge, self-assurance, creativity, potential, and competencies. There are numerous ways to improve the quality of education, including by educating parents, enhancing instructor resources, creating new educational models, and so on. Moreover; the Qualitative Education is always helps to the development of the students, in the way of acquiring skills, rational thinking, development of communication skills, self discipline, communal and environmental harmony, and so forth, (Anderson, 2013).

The RTE Act of 2009 mandates the age-appropriate enrolment and special training, for out-of-school children, in order to bring them up to par with other children. Section 4 of the Act states that; Where a child above the age of six has not been admitted to any school or, though admitted, could not complete his or her elementary education, he or she shall be admitted in a class appropriate to his or her age; provided that where a child is directly admitted to a class appropriate to his or her age; provided that where a child is directly admitted to a class appropriate to his or her age; he or she shall, in order to be at par with others, have the right to receive special training in such a manner and within such a time period as the State. In addition; Sarva Siksha Abhiyan-(SSA) seeks to "Universalize Elementary Education (UEE)" through the involvement and participation of the general public. SSA places a premium on the methodical involvement of communities and the establishment of a decentralised decision-making system. Through decentralisation, when it comes to interventions in schools, SSA advocates for community involvement. Under SSA, there have been concerted attempts to include the local community in advancing education, building schools, and monitoring their daily operations.

It supports a community-based monitoring system that is open and honest. Every institution must make grant information available to the public as just one more piece of data. However; the 2001 SSA study suggests that schools, families, and the Panchayati Raj might work together, (SSA, 2001).

## METHODOLOGY

The methodology of the present paper mainly based on the secondary data sources and it analysis.. The secondary data was collected from various Governments, International Organizations, and from eminent scholar's articles. The main aim of the present study is, to understand the contemporary school education system of East Godavari Dist, Andhra Pradesh. Another aim of the paper is, to discuss about the, socio-economic conditions of East Godavari District.

## DISCUSSION

The ASER reports indicate that; the majority of primary-aged students in villages, across India are lack of the necessary reading and math skills for daily life. Worryingly, between the years 2005 and 2011, elementary school performance declined in most of the states, (ASER, 2012). Using ASER data, the organisation calculated a Learning Achievement Index-(LAI) is, set for the most populous states in India. It has been shown that, the Indian states of, West Bengal, Andhra Pradesh, Haryana, Kerala, Maharashtra, and Punjab. Have all shown and maintained strong performance on the basis of LAI between the period of 2008 and 2012. In the meantime, the states of, Tamil Nadu, Gujarat, Uttar Pradesh, Assam and, Rajasthan have shown persistently low performance. Surprisingly; Tamil Nadu is recognised for achieving development through social means. Nonetheless, persistently subpar learning outcomes cast doubt on the state's actual social infrastructure quality. Another problem is that; it needs the further investigation, it is alarming drop in education standards in Madhya Pradesh.

However, the problem of low academic achievement is not unique to India. It affects the majority of the world's impoverished nations (ASER, 2012). The National University of Educational Planning and Administration (NUEPA) conducted a study on secondary education in 2016, finding that the average ratio of high schools to elementary schools was 0.77 percent. Data from NUEPA shows that middle and high schools take up the same amount of land as elementary and middle schools combined.

The National Sample Survey of Educational Attainment (NUEPA) found that in 2016–17, there were 6.13 crores students enrolled in India, with 3.98 crores located in rural regions and 2.15 crores in urban areas. The aforementioned study found that as of April 2017, India had a total of 36 lakh teachers, with 22.13 lakh residing in rural areas and 13.86 lakh in urban areas. About half (48.86%) of all employees are educators. In the United States as a whole, female students make up an average of 47.50 percent of the student body. The average ratio of students to teachers is 17 to 1, and on average, the student-to-classroom proportion is 43 to 1. The national average number of professors per school is 14, (NUEPA 2016-17).

## Brief Information Regarding erstwhile East Godavari District of Andhra Pradesh

East Godavari District is located in the north eastern part of Andhra Pradesh, between 160°30'N and 180°20'N in latitude and 810°30'E and 836°30'E in longitude, as stated by the state government. The district comprises a sizeable portion of the Godavari River delta, and has a total area of 12805 square kilometres. This district is located, on the northeast coastal region of the Andhra Pradesh. The Visakhapatnam District and the state of Orissa are to the north, the Bay of Bengal is to the east, the Godavari and Khammam Districts are to the south, and the Godavari and Khammam Districts are to the west of the area. The district may be roughly broken into delta, upland, and agency natural zones. It is 12,805 square kilometres in size. East Godavari's district headquarters, Kakinada, is conveniently accessible by train, road, and the 144-kilometre-long Kakinada Natural Port. According to the chief planning officer of the East Godavari district; the environmental conditions are fairly consistent, and while it is quite warm in May with a high of 37.70 °C and quite cold in January with a low of 28.50 °C, the actual rainfall from June 2018 to May 2019 was 987.70 mm compared to the average rainfall of 1217.80 mm. Less than -18.90 percentages of the variance

## Anuradha and Kannuru Hari Krishna

from the mean is observed. The preponderance of the remainder, 132.1 mm, fell during the North-East monsoon period from October to December 2018, (East Godavari Hand Book, 2019).

According to the chief planning officer for the East Godavari district, there are seven revenue divisions with headquarters in Kakinada, Peddapuram, Rajamahendravaram, Rampachodavaram, Ramachandrapuram, Amalapuram, and Yetiapaka. In addition, the district consists of 64 Revenue Mandals and 62 Mandal Parishad. There are 1069 Grama Panchayats in the region. The district consists of two municipal corporations, such as Kakinada and Rajamahendravaram. Moreover; it has seven municipalities, those are Samalkot, Pithapuram, Peddapuram, Tuni, Ramachandrapuram, Mandapeta, and Amalapuram. Besides that; it has a three Nagar Panchayats, namely Yeleswaram, Mummadi Varam, and Gollaprolu. This district contains 1595 inhabited villages, 89 uninhabited villages, and 25 municipalities, (District Hand Book, 2019). According to the 2011 Census; the population is 51.54 million, and the land area is 1,280.05 square kilometres. The district of East Godavari is one of the most populous and densely populated districts in the state. The population density is 413 inhabitants per square kilometre. In the District; in this district, the majority (74.5%) of people still live in rural regions, while the minority (25.5%) live in urban regions. The literacy rate in this area is 70.99 percent. A significant proportion of the working population earns a livelihood through agriculture. According to the 2011 Census, scheduled castes make up 18.10 percentage of the district's total population, while scheduled tribes account for 5.62 percentages, (District Census Hand Book 2011).

#### Present School Education Status in the state of Andhra Pradesh and East Godavari Dist

Enrolments are the process of making arrangements to attend a school, and enrol in specific courses. This term may also refer, to the number of students enrolled in a school or course at the present time. Enrolment refers to the act of registering for school and/or specific classes or other extracurricular activities at a particular institution. After a pupil is admitted to a particular institution, the enrolment procedure is complete. Students can then choose courses, through their school's online student information system. Andhra Pradesh Gross Enrolment Ratio-(GER) in institutions is, significantly lower than the national average, as reported by the Hindu newspaper on June 25, 2018. In primary institutions, the national GER is 99.21 percentages, but in A.P., it is only 84.48 percentages. In addition; nearly one lakh children have dropped out of the school, it is indicating a Herculean task for the officials as schools reopen soon. In comparison to the national average of 92.84 percentages, of the GER in upper primary institutions, is 83.96 percent in Andhra Pradesh.

However; in secondary institutions, it is 79.15percentages, which is near the national average of 80 percentages. The GER in elementary schools decreased from 91 percentages in 2010–2011 to 83 percentages in 2016–2017. During the same time period, the rate increased from 77 percentages to 81 percentages in upper-level primary institutions. Programmes such as 'Badi Bata,' 'Badi Pilustundi,' and 'Manna Vooru-Manna Badi', have reportedly failed to produce the desired outcome. In 2017-18; 99,833 children were not in school. According to a study conducted using the mobile app AP-GER. Compared with other states like Kerala, the attrition rate is high. Nevertheless, it is lower than the national average of 5.13 percentages for primary education. In 2015-16, which the government considers a benchmark year, the attrition rate was 6.27 percentages. According to Ravi Kumar and Venugopal; there was a downward trend in enrolment growth at government elementary institutions. As a result of the availability of the "Mid-Day Meal Scheme-(MDMS)" in government schools, private schools have improved their educational amenities to attract students and keep them enrolled. The amount spent on the Mid Day Meal Scheme (MDMS) has no impact on enrolment in elementary government institutions in erstwhile Andhra Pradesh, (Ravi Kumar, J & Venugopala Rao, K P, 2017).

The NUEPA secondary education report for 2016–17 states that; the ratio of upper primary to secondary institutions in Andhra Pradesh is 1percentages. 33.70 percent of secondary institutions in Andhra Pradesh are higher secondary schools. In 2016–17, the enrolment ratio of females to boys at the secondary and higher secondary levels was 0.90 percent, according to the report cited above. In 2016–17, the enrolment ratio of females to boys at the secondary and higher secondary level in the Indian state of Andhra Pradesh was 0.93 percent and 0.0 percent at the higher secondary school level,

## Anuradha and Kannuru Hari Krishna

according to the report cited above. Nonetheless, 97.81 percent of students in the state transition from elementary to secondary education, (NUEPA, 2016).

According to the NUPEA-2017; dropout rate is very high within in the country and state, moreover dropout rate between classes of IX to X class is 50 percentages, and it is more than 200 percentages, when compared with national average. NUPEA Report-2017 that, the academic year of 2016-17 promotion rates of the India and the state of Andhra Pradesh. According to the report eighth class promotion rate in India is 99.89 percent, and in Andhra Pradesh it is 97.81 percent. In ninth class promotion rate are 82.93 percent in India, 98.6 percent in Andhra Pradesh. The tenth class promotion rate in India is 94.1; the data is not available for Andhra Pradesh. Whereas, eleventh class promotion rate in India is 76.05 percent, the data is not available for Andhra Pradesh. The IX to X class promotion rate in Andhra Pradesh is 49.85 percent, it is in national wide 88.1 percent. But, the classes of XI to XII, the promotion rate data was not available for both country and the state, (NUEPA, 2017). According to the UDISE Report-2019; the total Enrolments in the academic year 2018-19 of Andhra Pradesh state is 70.4 lakhs, out of this 36.8 lakhs are boys and 33.6 lakhs are girls.

The UDISE report (2018–19) found that 37.93% of schools in Andhra Pradesh had School Building Committees (SBCs) and that 24.71% of primary (including upper primary, intermediate, and higher secondary) schools had School Monitoring and Development Committees (SMDCs). In addition to universities and colleges, 19.89% of elementary and secondary schools at the upper-primary level also have SMDCs. School building committees (SBCs) are in place in just 35.91 percent of schools. The School Monitoring and Development Committees (SMDCs) are present in 3.55 percent of primary schools, and School Building Committees (SBCs) are present in 13.91 percent of primary schools. 11.82 percent of upper primary schools (in addition to secondary schools) possess School Monitoring and Development Committees (SMDCs), and 30.63 percent of primary schools (in addition to upper primary and secondary schools) have School Building Committees (SBCs). School building committees are present in 9.09 percent of secondary institutions. School Monitoring and Development committees were present in 10.93 percent of schools, while school building committees were present in 28.37 percent of schools, while school building committees were present in 28.37 percent of schools, (Unified District Information System for Education plus Report-(UDISE+), 2019).

As per District Educational Officer (D.E.O) of the East Godavari district; explains about the management wise (Govt. and Private), and total availability of schools in East Godavari district as on December/2021, is as follows. The total primary schools in the district are 3833, upper primary schools are 955. Whereas; secondary schools in the district are 1216, higher secondary schools are 286 and finally total schools in the district are 6290 schools. The D.E.O of East Godavari said that; in the District the overall enrolments in the govt schools, during the academic year 2021-22 are nearly 47.2 lakhs, (Management Information System 2020).

As per the table no.1; the East Godavari District totals boys Gross Enrolment Ratio (GER) is 91.17 percent and girls Gross Enrolment Ratio (GER) is 90.3 percent. Whereas; the boys Net Enrolment Ratio (NER) are 70.26 percent and girls Net Enrolment Ratio (NER) are 70.62 percent. The boys Transition rate from class VIIITO IX is 97.64 percent, girls Transition rate from class VIII TO IX is 98.87 percent and total Transition rate from class VIII TO IX are 98.25 percent. The total Retention Rate-(RR) is 94.19 percent, the Dropout Ratio - (DR) is 4.1 percent, and it is 5.16 percent in boys and 3.02 percent in girls. The Promotion Rate-(PR) is 100 percent, Gender Parity Index-(GPI) is 1 percent and finally the Gender Gap Rate- (GGR) is .049 percent in the district. Meanwhile; Andhra Pradesh total literacy rate is 67.35 percentages, in that female literacy is 59.96 percentages, and male literacy is 74.77 percentages.

Table no.2 reveals that; the East Godavari District has a 70.50 percentage of literacy rate, out of that, the rural literacy rate is 67.08 percent, and the urban literacy rate is 80.78 percent. Out of the 67.08 percent of rural literacy, 70.65 percent is rural male literacy, and 63.53 percent is rural female literacy. In the district, the urban literacy rate is 80.78

## Anuradha and Kannuru Hari Krishna

percent. According to the 2011 Andhra Pradesh Census Handbook, 84.62 percent of urban men and 77.07 percent of urban women are literate.

When compared the National, State, and District level literacy rates, the literacy rates are has so much variations, especially in rural women and girl child education. Delliswararao said that; Illiteracy or Lack of Education to the women and the girl child is increases the gender disparities in the developing countries like India, (Delliswararao, 2021). According to the Delliswararao K; education is a one of the key factor to the women empowerment, at least up to secondary school education is assures the girls, to acquires a self confidence, knowledge about the society, and how to protect their selves in the worst situations. It is reducing the stress on the parents and their kins, (Delliswararao, 2018). Rao and Vasanta Srinivas (2009) observed that community participation, is enhancing education is minimal, in the East Godavari district of Andhra Pradesh. Besides that; the authors are said that, the members of School Management Committee-(SMCs) have a limited knowledge on the Sarva Siksha Abhiyan-(SSA). The vast majority of school instructors (87.2 percentages) were aware of the Sarva Siksha Abhiyan, compared to 61 percentages of PRI members and 52 percentages of parents of school-aged children. The tribal community members took part in some or all of the school-related activities. The school education management committees in this district of Andhra Pradesh played a crucial role in micro-planning, particularly in the development of a village education plan and school enhancement plans, (Rao, Vasanta Srinivasa. 2009).

#### Suggestions

- Development of school infrastructures at village level is very important to development of district literacy rates.
- School Monitoring Committees are needed to play an active role, in enrolment and retention of the students in the schools.
- District and state officials need to focus the fulfilment of the teacher's vacancies, it is helps to the development of education standards and literacy rates within the district.
- Community and parental active participation; are given an assurance the quality of education, to children and society. Hence; the district administration responsibility is, to focus and stress the active participation of the parents and community in the school education.
- Skill based training, communication skills development programmes must be included in the student's curriculum, and it helps to enhance the employment opportunities in the students.

## CONCLUSION

East Godavari District and the state of Andhra Pradesh; have made great strides in primary school enrolment, but they are still facing a significant challenges. Like; significant number of dropouts in the schools, the shortage of skilled teachers, and insufficient school facilities. Moreover; extremely low teacher and student participation, and poor educational outcomes. In the states with higher enrolment rates, there is a greater likelihood that a school will be available, but the state's physical and human infrastructure is frequently worse. For obvious reasons, this means more children will register for school, but that doesn't mean they'll perform well academically.

The Department of Education must provide support by issuing a regulation that allows the school committee to actively participate and maximise its role, particularly in the fields of supporting agency and mediating agency; principals should make efforts to include the school committee in the control and evaluation of a policy, educational programme being implemented, or output of education. With an increase in student attendance, a high-quality educational environment will be fostered in and around schools. The appropriate maintenance of school facilities will increase the school attendance of children. Moreover, community involvement is required to enhance and maintain the equilibrium of enrolment, the retention of students, and school education quality. Common development issues, along with the inclusion of the community in school education, necessitate resolving these issues and it helps to improving school education outcomes. Researchers, policymakers, instructors, officials, and the

## ABSTRACT

A report of pneumonia was identified with a unique form of the pathogen in Wuhan city of China. It was titled "Novel corona virus" by WHO. The revelation on November 24, 2021 in South Africa of the severely altered Omicron of the severe acute respiratory syndrome corona virus 2 (SARS-CoV-2) aroused numerous worries. According to a peer-reviewed study backed by the French government, the novel B.1.640.2 strain from the lineage has infected 12 persons in the nation. Until December 2021, more than half a million genome sequences from all six continents have been reported to the Global Initiative on Sharing Avian Influenza Data (GISAID) to detect variations. The worldwide healthcare system is dealing with several issues as a result of the COVID - 19 pandemic. While news of the vaccine roll-out lifted many people's optimism, the mutant virus threatened that hope and sparked another wave of fear and uncertainty. The imaginable uses of Ayurveda which is the Indian herbal treatment system publicized an immune system enhancer. It helps COVID-19 patients with increased average cure efficiency, and many natural products possess antiviral characteristics where they can be used for future perspectives. Prescription prophylaxis is one approach where prophylactic antiviral drug therapy is emerging the world over. There is an immediate need for both prevention and therapeutic interventions for this

## Kavya Nainita Manchikanti et al.,

condition, and more than 500 clinical trials are underway. Here, in this review, we studied several articles, newsletters and had provided the latest evidence on immune boosters, prophylactic antiviral therapy, approved vaccines and currently ongoing clinical trials to treat corona virus.

Keywords: Antiviral treatment, COVID-19, Probiotics, variants, Clinical trials.

## INTRODUCTION

The rapid evolution of corona virus disease 2019 (COVID-19) is becoming a concerning issue that has jolted the entire world. Since December 2019, a new virulent strain of corona virus has attacked millions of individuals globally, resulting in enormous mortality. There have been at least eleven documented versions. SARS-CoV-2 variations were identified (Alpha, Beta, Gamma, Delta, Delta Plus, Epsilon, Eta, Theta, Iota, Kappa, and Lambda), and the number is expected to increase as different strains appear.[1] A pathogen that causes COVID-19 is nCoV, it was identified firstly in January 2020 and the international committee on taxonomy titled it SARS-CoV-2 on February 11, 2020. It is a big group of single-stranded RNA viruses. French researchers have discovered a novel Covid variation, most likely of Cameroonian origin, and have given it the tentative name 'IHU.' Our human body has some immune systems in which it protects from disease. As a result, understanding the underlying mechanism of immunological deficiencies in COVID-19 patients might help with illness management. At present, several clinical trials where antiviral therapy are testing like inhibiting the enzymes that are responsible for replication. Currently, some of the drugs for managing COVID-19 and repurpose drugs are given to infected patients like anti-HIV to manage influenza. Remdesivir, chloroquine, favipiravir, ivermectin, nitazoxanide and ritonavir are also used as antiviral against corona virus. [1] Some researchers are looking into using a combination of medications to treat COVID-19.[2] We can boost up our immunity with some of the natural spices like vitamin supplements, some other changes in our lifestyle like sleep, physical exercise and water supplements. Few studies suggest that immune boosters tend to control the corona virus, where doctors recommend as many antiviral medications as possible to prevent or treat it. To combat corona virus infection, the population is puzzled by immune boosters and antiviral therapy. Unfortunately, to treat the novel COVID-19, there is no such proper drug or therapy known yet. It can even take months or years to develop antiviral medications or vaccines if urgent action is appropriate to avoid this extraordinarily infectious disease, but the Indian government appreciates the use of conventional herbal or natural remedies to heal contaminated patients. Several research on the efficacy of both prevention and therapy are shortly proceeding. Antivirals are not just therapeutic, but also prophylactic against many viruses. In light of current knowledge, combinational antiviral drugs are to be considered as shown in table 1.

## 2. BUDDING IMMUNOTHERAPEUTIC TACTICS FOR COVID-19

There is a strong indication of SARS-CoV-2 induced immunopathology. But regrettably, many glucocorticoids, antivirals haven't shown any durable improvement in the survival of patients. Where targeting the immune profiles of COVID-19 in specific can lead to treatment for severe cases. Enhancement of lymphocytes, immune modulators, Janus kinase inhibitors, plasma therapy.[5] Raise the amount of turmeric, cumin, coriander, and garlic. As our health care professionals fight the war against the Covid-19 pandemic, our responsibility is to prevent exposure to viruses by staying home, maintaining social distance, consuming balanced foods and following the simple hygiene protocol. The human body is designed to defend the body from illness and disease with a complex and effective immune response as presented in Figure 1. The priority of this current research is to highlight the human body's immune system to tackle this pandemic phase of COVID-19. Ayurveda, which is commonly used in ancient times around the world, is the various kinds of principles to improve immunity combined with the resistance function of the body to combat many diseases. The imbalance of these three induces many diseases and limits the strength of our immunity. It is understood that some compounds derived from plants have an antiviral function as shown in Figure 2.

## Role of Immunity After Vaccination

There were 91 COVID-19 vaccines in clinical development and 184 in preclinical development (Malayala, Mohan, Vasireddy, &Atluri, 2021). The mRNA vaccines appear to give adequate protection against the B.1.1.7 COVID-19 mutation, according to the data. Before the South African variation (B.1.351 or 20H/501Y.V2) strain was identified. the Pfizer and Moderna messenger RNA (mRNA) vaccines were approved in the US (Vasireddy, Vanaparthy, Mohan, Malayala, &Atluri, 2021). Vaccines are critical in educating our immune systems on how to detect and fight the COVID-19 virus. The neutralizing antibodies take around two weeks to form following the second dosage of mRNA vaccinations. However, further research is needed to determine how well the vaccinations prevent the virus from spreading but for how long they give protection. Sinovac Biotech has begun clinical studies, which have shown that the CoronoVac vaccine is 50% successful in preventing P.1 variant infection in Brazil. Bharat Biotech's COVAXIN vaccine has been shown to neutralize well and is 78 percent effective over the double mutant strain, B.1.617, as per the Indian Council of Medical Research Virology lab. Although SARS-CoV-2 reinfection has been documented, scientific knowledge of natural infection-derived immunity is still developing (Y. Sui, Bekele, &Berzofsky, 2021). When compared to the original Wuhan-Hu-1 strain, sera obtained from earlier infected people before they were vaccinated provided a considerably lower, and in some cases missing, neutralizing response to the B.1.351 (Beta) variation (Stamatatos et al., 2021). Looking throughout the region, we observe the same broad patterns, with India by far the most concerning in levels of infections per million, but Nepal fast narrows the gap due to its considerably higher infection rate as shown in figure 3.

#### Vitamins

This is an important supplement, fat-soluble, and holds a significant involvement in the regulation of vision, development, and maturity, and defence of the human body's mucosal and epithelial integrity. [6] Since the removal of the SARS-CoV-2 virus involves antibodies, especially T-cells, thiamine deficiency can lead to insufficient antibody responses and consequently serious symptoms (Sufficient amounts of thiamine are also liable to help in effective immune responses in infection with SARS-CoV-2). Thiamine also acts as an inhibitor of carbonic anhydrase isoenzyme.[7] Since the removal of the SARS-CoV-2 virus involves antibodies, especially T-cells, thiamine deficiency can lead to insufficient antibody responses and consequently serious symptoms. (Sufficient amounts of thiamine are also liable to help in effective immune responses in infection with SARS-CoV-2.) Thiamine also acts as an inhibitor of carbonic anhydrase isoenzyme.[7] It has been shown that riboflavin and UV light are beneficial against the MERS-CoV virus, indicating that they may be effective against SARS-CoV-2.[8] Riboflavin-UV reduced the amount of the SARS-CoV-2 infectious titer which is below the concentration level in the blood, plasma as well as platelet products.[9] It has been shown that vitamin C intake reduces the period and incidence of infections at the upper respiratory tract that is mostly believed to be related to viral infections, like cold infections.[10][11] It scavenges ROS as an antioxidant, inhibits the peroxidation of lipids and alkylation of proteins, and thereby defends cells from cellular damage triggered by oxidative stress. [12] C-vitamin supplementation and quercetin supplementation have also been found to have a mutually beneficial antiviral, antioxidant, and immunomodulatory effect in studies.[13] In a case study where a patient was cured with high-dose of vitamin C after the ARDS development, she was detached from the ventilator after 5 days, as she was also medicated with some antiviral as well. [14] Fat-soluble vitamin- D has a huge advantages for good health and immunity improvement. It governs the development of a protein that destroys infectious agents selectively and bacteria and viruses included. Vitamin D increases monocytes and macrophages pathogen-fighting effects-white blood cells (WBC) that are essential parts of immune defence and reduce inflammation, which helps stimulate an immune response. Vitamin D changes the action and amount of WBC, referred to as T2 Killer lymphocytes, which can decrease the transmission of viruses and bacteria. Vitamin D3 and vitamin D2 are agreed for the stoppage and management of vitamin D deficiency but are not expressly approved license to prevent or treat any infection caused by COVID-19, including the novel corona virus. A modern study showed that the administration of vitamin D could decrease admittance to thorough care in adults with COVID-19 who got hospitalized.[15]

## Kavya Nainita Manchikanti et al.,

#### Trace Elements Copper

A trace element that shows a crucial part in the enactment of components in the immune system, like natural killer cells, neutrophils, macrophages, and monocytes. [18] Copper deficiency is linked to weakened immune responses to virulence and infections. [19] Based on the evidence, it was presumed that the copper levels of plasma will increase adaptive and innate immunity, it shows preventive and therapeutic effects against corona virus. [20] A recent review has shown that copper shows its activity in combination with N– acetyl cysteine, colchicine, or Remdesivir as COVID -19 treatment. [21] Corona virus, which is antagonistic to the copper surface, in the case of cell-based study Cu2+ is liable for papain-like protease – 2 blockage which is a protein prerequisite for the replication of SARS-COV-1. [22] Nanoparticles (CuONPs) of oxidized Cu oxide (CuO) are commonly used as catalysts so, CuONPs can limit the application of viruses is improved. [23]

## Zinc

A mineral that has a role in immunity, particularly in innate and acquired immunological responses to viral infections. It is alleged that zinc is an important mineral in COVID-19 infection due to its dual properties of immunemodulatory and antiviral. Zinc shows inhibition of the synthesis, transcription complex, and replication of corona viruses.[24] [25] Especially, Zn2+ with zinc ionophore pyrithione are revealed the SARS- corona virus RNA polymerase inhibition by its decrease in replication. [24]

## Selenium

Due to its action on the immune system in antibody production, deficient levels of Se are responsible for a decrease in cytotoxicity of natural killer cells, cellular immunity impairment and low vaccination response. Sodium selenite, a selenium salt that has been proposed for therapy in decreasing the blood clot formation risk.[26] which is mostly seen in SARS-COV- 2, which is the surety death cause of COVID-19. [27] [28]Selenium has certain beneficial benefits when combined with vitamins D and E. [29]

## Probiotics

The concept of probiotics is live micro-organisms that carry the host's nutritional benefits, including the gastrointestinal tract, insufficient proportions as treated.[30][31] Multistrain probiotics are also additional powerful than mono-strain probiotics.[32] as showed in table 3 . Recently, it was shown in a computerized docking analysis of metabolites Plantaricin JLA-9, Plantaricin W and Plantaricin D greatly inhibited the ACE2 receptors binding to SARS-CoV-2 blocking the entrance of the virus into the cells and indicated the anti-viral properties of Lactobacillus Plantarum to SARS-CoV-2. [33] Therefore, by meddling with the viruses entry into cells or inhibiting the repetition of the virus, probiotics may serve as antivirals. The path of COVID-19 can also be altered by the regeneration of the intestine, immune system, respiratory microbiota and gut-lung axis. [34] In comparison, in contrast to antiviral medications, immunomodulators, or new methods studied in COVID-19, probiotics are available readily, oral administration comparatively safe, and cost-effective. [35] In animal models, much of the information available today on the enhancement of immune health by probiotics has been illustrated. Intranasal inoculation of L. Plantarum and L. reuteri has been ensured to safeguard alongside fatal infection by the pneumonia virus in mice. [36] Probiotics are very safe even in weak populations. Oral probiotics have ability to reduce the severity and incidence of viral respiratory tract infections.

## Antiviral Prophylaxis Of Corona Virus

Repurposed drugs were FDA approved for any indications to treat patients of COVID-19 as presented in Figure 4 and shown in Table 3. The drugs should be adequate, treatment should be highly sage, low costs. It has become a challenge due to the unavailability of approved drugs from the FDA which are specific to COVID-19. Currently, the emergency of COVID-19 warrants the fast development of effective strategies for people protection who are at high risk of infection, especially in health care workers, close contacts.

## Kavya Nainita Manchikanti et al.,

## Hydroxychloroquine and Chloroquine

It should be noted that the USFDA has issued an emergency use authorization for the use of HCHL in the treatment of COVID-19. These have shown to come up with antiviral effects where some of the studies reported to have inhibition of human CoV-229E replication, HCoV OC43 and SARS-CoV. [37] [38] [39] This results in insufficient hemoglobin used to transport O2 and Co2 (respiratory insufficiency). Chloroquine was discovered to block glycoproteins viral surface from heme attacking for the formation of porphyrin and binding of glycoproteins inhibition to porphyrins, relieves the respiratory distress symptoms effectively. [40]

#### Remdesevir

In this period, to fight back with COVID-19 is with remdesivir which was derived from the final stages of many effective vaccines. It's the most promising medication for fighting RNA viruses since it offers a wide range of antiviral properties. It was initially established by Gilead Sciences to defeat the Ebola virus, and undergone clinical trials in the Ebola outbreak. Even though it was effective against Ebola, it was proved for human's safety, where it was allowed to conduct clinical trials in COVID-19 emergency. [41]

#### Bamlanivimab

This was issued by the FDA as an emergency use authorization, which is a monoclonal antibody directed against the SARS-CoV-2 spike protein on 9 Nov 2020. The EUA licenses bamlanivimab to administer in treating mild to moderate COVID-19 in adults and pediatrics aged 12 years and high risk for progressing to severe COVID-19.

#### Casirivimab and Imdevimab

On 21 Nov 2020, USFDA issued EUA for Casirivimab and imdevimab to administer combined for the mild to the moderated cure of COVID-19 in both pediatrics and adults, who are aged 65 years old and who have conditions of chronic. These both are not approved for patients who need oxygen therapy because of COVID-19. Both monoclonal antibodies may associate with some worse clinical outcomes when they are given to COVID-19 hospitalized patients who require mechanical ventilation.

#### Baricitinib

EUA has been issued by USFDA for emergency use of Baricitinib in combination with remdesivir, to treat laboratoryconfirmed hospitalized COVID-19 adults and 2 years of pediatrics. It's not FDA approved for mentioned uses. The dosage of Baricitinib recommended under EUA is 4 mg daily once for adults and 9 years of pediatrics and 2 mg daily once for 2 years to < 9 years of pediatrics. The optimal duration for treatment is not known. The suggested treatment duration is 2 weeks or else until hospital discharge.

## CONCLUSION

Universal spread of the corona virus has arisen to be a big challenge to reduce. Desperately, many scientists are looking for a vaccine. Few drugs are effectively potentially and in case of efficacy is still in progress where they need more experimental work. Many natural sources are in connection with us by minimizing the usage of medications. And may repurposed drugs are existing by few studies and FDA approval to treat the mild to moderate cases of COVID-19. Immune boosters and antiviral prophylaxis are the only sources right now which can save us from the severity of corona virus. Compiling the information available on COVID-19 the immune boosters and antiviral prophylaxis are in widespread use and promising way to cure.

Kavya Nainita Manchikanti <i>et al.</i> ,								
Table 1: Combinational medication in the treatment of corona virus								
Combination of drugs	Category	Advantages	References					
Chloroquine + hydroxyl chloroquine	Anti-malarial	Because of its anti-inflammatory effect, it is used as a repurposed drug to treat SARS- CoV-2.	[3]					
Nelfinavir + Cepharanthine	Protease inhibitor + alkaloid	Inhibition of viral proliferation and minimizes virus transmission.	[4]					

## Table 2: Probiotics-targeted viral infections

Probiotic bacterial strain	Viral respiratory infection	Consequence	Reference
Streptococcus, Respiratory Moraxella syncytial virus		The researchers wanted to see if distinct nasopharyngeal microbiota are linked to different host transcriptome profiles and infection severity in RSV-infected kids. The findings revealed that the interaction between RSV and the nasopharyngeal microbiota may moderate host immune responses, thereby changing the disease's clinical severity.	[16]
Lactobacillus Rhamnosus	sus infections, findings showed that changing the gut microbiota with specific prebiotics and probiotics might be a unique and cost-effective way to reduce the risk of rhinovirus infections.		[17]
Lactobacillus Fermentum	Influenza	The ability of the breast-milk-isolated strain Lactobacillus fermentum to serve as a co-adjuvant with an anti- influenza vaccination was tested. This study found that taking L. fermentum orally boosts the T-helper type 1 response and elicits virus-neutralizing antibodies, which may improve protection by increasing the T-helper type 1 response and evoking virus-neutralizing antibodies.	[18]
Lactobacillus Bulgaricus	Ilus Bulgaricus Respiratory tract infections with L. bulgaricus enhanced natural killer cell activity and decreased the chance of developing a cold in the elderly, according to the findings.		[19]
BifdobacteriumAnimalis	Respiratory tract infections	viral titer reduced	[20]
Lactobacillus Plantarum	bacillus Plantarum H1N1 and H3N2 It enhances the innate immunity of antiviral cytokine macrophage cells.		[21]
Lactobacillus Paracasei	Ilus Paracasei         Common cold virus         Oral ingestion of this probiotics minimizes the symptor of cold infections.		[22]

## Kavya Nainita Manchikanti et al.,

Table 3: Mechanism, Targets and side effects of anti-SARS-CoV-2 prophylactic drugs					
Drugs	Category	Mechanism of action	Side effects		
Chloroquine (Aralen) / hydroxychloroquine (Plaquenil) [23]	Anti-malarial	Cytotoxicity inhibition; immunosuppression; ACE2 receptor and spike protein glycosylation changes.	Nausea, vomiting, hair loss, the sensitivity of light is increased.		
Remdesivir, favipiravir (Avigan) [23D, 24]	Anti-viral	Inhibition of viral RNA polymerase through chain termination inhibits viral replication and transcription.	Production of erythrocytes is reduced and liver function parameters will be increased in influenza conditions. In COVID- 19 the symptoms are reduced.		
Lopinavir (Kaletra), Rotinavir (norvir) [25]	Antiretroviral	SARS-CoV 3 CL proenzyme inhibition, inhibits SARS-CoV-2 replication of Vero E6 cells, protease, CYP4503A.	Headache, chest pain, dizziness and stomach pain.		
Oseltamavir (Tamiflu) [23D, 26]	Anti-viral	Neuraminidase inhibitor. The mechanism is still not yet known on SARS-CoV-2.	Hypersensitivity.		
Dexamethasone (Decadron) [27]	corticosteroid	Genomic and non-genomic mechanisms	Agitation, headache, changes in mood, high appetite.		
Umefenovir (Arbidol) [28]	Anti-viral	Blocks the trimerization of SARS- CoV-2 spike glycoprotein that leads to form of immature virus which is infection less.	Sensitivity is increased to medication in below 2 years.		
Nitazoxanide [29]	Antiviral and anti-parasitic	Reduces the inhibitory effect of interferon which is triggered by SARS-CoV-2.	Discolored urine, stomach pain, and headache.		
Darunavir (Prezista) [30][31]	Anti-viral	A non-peptidyl HIV-1 protease inhibitor inhibits HIV protease dimerization, inhibits cleave of Gag-Pol polyprotein.	Rashes, stomach pain, vomiting, nausea, diarrhea.		
Ivermectin (Stromectol)	Anthelmintic	Inhibits the nuclear import of viral and host proteins by inhibition of importin 1 heterodimer. It inhibits IMP $\alpha/\beta$ 1- mediated nuclear import.	Muscle aches, mild skin rash, discolored urine, nausea.

## ABSTRACT

This work aims to evaluate the antimicrobial potential of methanolic extracts of *Haloplegma duperreyi*. Agar well diffusion method has been used to determine the antimicrobial activities of *Haloplegma duperreyi* against gram- positive bacteria (*Salmonella para typhi, Staphylococcus aureus*), gram – Negative bacteria (*Escherichia coli*, *Klebsiella neminiae and fungus*(*Candida albicans, Aspergillus fumicates*). The extracts exhibited both antifungal and antibacterial activities against tested microorganisms. Thus, the result shows that red algae *Haloplegma Duperreyi* has good biological activity, and further it can be carried out in pharmaceutical, food preservatives, and cosmetic purpose.

**Keywords**: Aspergillus fumigates, Klebsiella neminiae, Haloplegma Duperreyi, Salmonella para typhi Staphylococcus aureus, Antibacterial.

## INTRODUCTION

Antimicrobial agents play a crucial role in lowering the burden of infectious diseases worldwide [1]. However, because there are fewer or often no effective antimicrobial medicines available to treat infections brought on by pathogenic bacteria, the rise and spread of multidrug resistant (MDR) strains of pathogenic bacteria have become a significant public health problem [2, 3].Seaweeds are considered as a variety of sources for secondary metabolites

Shantha and Arockia Jenecius Alphonse

with a wide range of biological [1] activities Seaweeds are photosynthetic microalgae and are categorised as red [2], brown [3], and green [4] algae based on the components of their pigments. Haloplegma Duperreyi is Rhodophyta (red seaweeds). Additionally, it has been demonstrated by results from earlier studies that seaweeds contain bioactive components that can help humanity by preventing the growth of bacteria (5.6). Examples of substances found in seaweeds that exhibit antimicrobial and antibacterial properties include phenols, terpenes, acetogenins, indoles, fatty acids, and volatile halogenated hydrocarbons (7); Some of the most well-known species of seaweed, include Porphyra sp.. and Chondrus crispus, are found in Rhodophyta and are extremely popular in Asia [8,9,10] and Ireland [11], respectively, particularly as a component in their culinary traditions. Several investigations have focused on specific species, including Osmundea pinnatifida (e.g., [11,12]), Sphaerococcus coronopifolius (e.g., [13,14,11]), and Plocamium cartilagineum (e.g., [15,16,17,18]), In Asia, crude extracts of the Asian plant Calotropis gigantean exhibit encouraging antifungal efficacy against the pathogenic fungus Candida albicans, Aspergillus niger, Aspergillus ochraceus, Aspergillus ustus, and Rizopus oryzae. [19]. In Another study found that an ethanolic extract of Plumbago zeylanica root has effective antibacterial properties against Curvularia lunata, Colletotrichum corchori, P. aeruginosa, V. cholerae, and E. coli. [20,21,22]. So, the objective of the present study is to investigate different compounds such as phenols, flavonoids, terpenoids, and steroids as well as their antiomicrobial properties in Haloplegma Duperreyi. The studied marine algae showed antibacterial activities. They could be potentially used for applications in medicine, food production and the cosmetic industry [23].

## MATERIALS AND METHODS

#### **Sample Preparation**

Haloplegma duperreyi was collected Rameshwaram coast, Ramanathapuram, Tamil Nadu. The collected sample was authenticated by Botanical Survey of India (BSI), Coimbatore, Tamil Nadu, India.

#### Processing Of Collected Sample

The collected seaweeds were initially rinsed with seawater to eliminate dirt and debris along with epiphytes, sand particles and shells. Later, they were washed with running tap water followed by distilled water and dried in dark conditions. The resulting dried material was coarsely powdered (passing through a 40-size sieve) and utilized for further pharmacognostic and phytochemical studies.

#### Preparation Of Seaweed Extracts Using The Different Solvent Method

The shade-dried *Haloplegma duperreyi* were powdered using a milling machine and further subjected to Soxhlet extraction (Borosil, Mumbai, India) using five different solvents namely Methanol, Ethylacetate, Aqueous, Chloroform, and Hexane. The powdered samples were subjected to 20gm thimble using handmade filter paper. Later, *Haloplegma duperreyi* the filled thimble was carefully placed within the extractor chamber and poured with chosen five dissimilar solvents as a 1:10 ratio. The reservoir round bottom flask was excited to 60°C in a heating mantle. Each sample was run at least 15 refluxes to get good quality seaweed solvent extracts and the resultant solvent extracts were condensed using a rotary evaporator (Buchi, Bangalore, India) within condensed temperature under vacuum conditions. Finally, the precipitant was collected in a glass container and stored under -20°C for further analysis.

#### Qualitative Analysis of Phytochemical Screening of Haloplegma duperreyi

The phytochemical screening aqueous, ethanol, methanol, ethyl acetate and chloroform extracts of plant sample was subjected to different chemical tests for the detection of different phyto constituents using standard procedures. To identify the presence of alkaloids, flavonoids, tannins, saponins, steroids, terpenoids, glycosides, phenols, carbohydrates and proteins. [24] [25]. (Peach and Tracey, 1995; Raaman, 2006)

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shantha and Arockia Jenecius Alphonse

#### Alkaloids

#### Meyar's reagent (potassium iodide)

1.3 g of mercuric chloride was dissolved in 60 ml distilled water and 5.0 g of potassium iodide in 10 ml of water. The two solutions were mixed and diluted to 100 ml with distilled water. A few drops of reagent were applied to 1.0 ml of leaf extract. Alkaloids were detected by the formation of white or pale yellow precipitate.

#### Phenols

#### Ferric chloride test

To 1.0 ml of leaf extract 2.0 ml of distilled water, followed by a few drops of 10 % aqueous FeCl 3 solution was added. Appearance of blue or green colour indicates the presence of phenols.

#### Flavanoids

In the test tubes containing 0.5 ml of leaf extract, 5-10 drops of dilute HCl and small piece of zinc or magnesium were added and the solution was boiled for a few minutes. Reddish pink or dirty brown colour was produced it showed the presence of flavonoids.

#### Tannins

#### Ferric chloride test

To 1-2 ml of leaf extract, few drops of 5 % aqueous FeCI 3 solution was added. A bluish black colour, which disappears on the addition of a few ml of dilute H 2 SO 4 was followed by the formation of a yellowish brown precipitate.

#### Saponins

In a test tube containing about 5.0 ml of leaf extract, a drop of sodium bicarbonatesolution was added. The mixture was vigorously shaken and keft for three minutes.. A honey comb like froth was developed and it showed the presence of saponins.

#### Terpenoids

#### Salkwski reaction

5.0 ml of leaf extract was mixed in 2.0 ml of chloroform and concentrated H 2 SO 4 (3.0 ml) was carefully added to form a layer. A reddish brown coloration in the inter phase formed to show positive results for the presence of terpenoids.

#### Steroids

#### Libermann-Burchard's test

To 1.0 ml of leaf extract, 1.0 ml of conc. H 2 SO 4 was added, followed by the addition of 2.0 ml of acetic anhydride solution. A greenish colour developed and turned blue indicates the presence of steroids.

#### Carbohydrates

#### Benedict's test

173 g of sodium citrate and 100 mg of sodium carbonate was dissolved in 500 ml of water. To this solution 17.3 g of copper sulphate dissolved in 100 ml of water was added. To 0.5ml of the leaf extract, 5.0 ml of Benedict's reagent was added and boiled for 5 minutes. Formation of a bluish green colour showed the presence of carbohydrates.

#### Glycosides

A small amount of leaf extract was dissolved in 1.0 ml of water and then an aqueous sodium hydroxide solution was added. Formation of a yellow colour indicates the presence of glycosides.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shantha and Arockia Jenecius Alphonse

#### **Aminoacids And Proteins**

#### Biuret's test

To 1.0 ml of leaf extract, 5-8 drops of 5 % sodium hydroxide solution were added, followed by one or two drops of 1 % copper sulphate. Formation of pink or purple colour confirmed the presence of proteins and amino acids.

#### Antimicrobial Activity

#### Test Microorganisms

The test organisms used were clinical isolates viz., *Staphylococcus aureus, Escherichia coli Salmonella paratyphi and Klebsiellanemoniae.* The human fungal pathogens like *Aspergillus fumigates* and *Candida albicans*, which were obtained from Department of Microbiology, Coimbatore medical college and hospital (CMHC), Coimbatore. The bacterial and the fungal cultures were maintained on nutrient agar medium and potato dextrose agar (PDA) medium respectively.

#### Growth and Maintenance of Test Microorganism for Antimicrobial Studies

The bacterial and fungal cultures were maintained on nutrient broth (NB) at37°C and fungus was maintained on Potato dextrose agar (PDA) at 28°C.

#### Preparation of Inoculum

The gram positive bacteria *Escherichia coli, Staphylococcus aureus* and gram negative bacteria *Salmonella paratyphi and Klebsiella nemoniae* were pre-cultured in nutrient broth overnight in a rotary shaker at 37°C, centrifuged at 10,000 rpm for 5 min, pellet was suspended in double distilled water and the cell density was standardized spectro photometrically (A<sub>610</sub> nm). The fungal inoculums *Aspergillus fumigatus* and *Candida albicans*, were prepared from 5 to 10 day old culture grown on Potato dextrose agar medium. The Petri dishes were flooded with8 to 10 ml of distilled water and the conidia were scraped using sterile spatula. The spore density of each fungus was adjusted with spectrophotometer (A<sub>595</sub>nm) to obtain a final concentration of approximately 10<sup>5</sup> spores/ml.

#### Anti-bacterial Activity (Anonymous, 1996)

The samples were tested by the well diffusion method. Different concentration of the samples (10,20,30  $\mu$ g/ml) was prepared. The test microorganisms were seeded into respective medium by spread plate method 10  $\mu$ l (10 cells/ml) with the 24h cultures of bacteria growth in nutrient broth. After solidification the filter paper wells (5 mm in diameter) impregnated with the extracts were placed on test organism-seeded plates. Amoxicillin (10  $\mu$ g) used as standard for antibacterial test. The antibacterial assay plates were incubated at 37°C for 24 hrs. The diameters of the inhibition zones were measured in mm.

#### Antifungal Activity (Taylor et al., 1995)

The antifungal activity was tested by well diffusion method. The potato dextrose agar plates were inoculated with each fungal culture (10 days old) by point inoculation. The filter paper wells (5 mm in diameter) impregnated with 100  $\mu$ g concentrations of the synthesized silver nanoparticles were placed on test organism-seeded plates. Amoxicillin (10  $\mu$ gwell 1) used as positive control. The activity was determined after 72 hrs of incubation at 28°C. The diameters of the inhibition zones were measured in mm.

## **RESULT AND DISCUSSION**

#### Qualitative analysis of Haloplegma duperreyi

The present study revealed that the polar to non polar extracts of *Haloplegma duperreyi* contained alkaloids, flavonoids, glycosides, phenols, resins, saponins, steroids, tannins, terpenoids, carbohydrates and proteins (Table .1 ). However, phenols, terpenoids, steroids, proteins and carbohydrates were moderately presented in four solvents such as aqueous chloroform, ethyl acetate and methanol. Next to methanol extract, ethyl acetate extracts of both parts showed the presence of rich variety of secondary metabolites. Ethyl acetate and chloroform extracts showed the less variety of these secondary metabolites. Compared to all other solvent extracts, ethanolic extracts had higher

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shantha and Arockia Jenecius Alphonse

number of secondary metabolites with high degree of precipitation (+++). Saponin and tannin were determined to be present with lesser amount (+) only in all extracts.

#### Quantitative analysis of Haloplegma duperreyi

The quantitative phytochemical analysis of *Haloplegma duperreyi* revealed the highest phenolics content of the *Haloplegma duperreyi* was found to be 4.72±0.35 mg GAE/g in Methanol extract . While the lowest amount of phenolic content was found in the chloroform extract (2.90±0.55 mg GAE/g). The alkaloid content was found to be the highest in methanol extract. However highest steroid, flavanoids and terpenoids content observed in methanol extract (Table 2). In previous studies alkaloids were found to be present in aq. extracts of the Punica granatum while terpenoids were not detected (Wadood *et al.*, 2013).Similarly, in current study terpenoids and tannins were detected in Ficus microcarpa while in previous studies alkaloids and steroids have also been reported (Shripad *et al.*, 2012).(27-28)

#### Antimicrobial Activity

These results indicate significant capacity of *Haloplegma duperreyi* as new bioactive compounds as antimicrobial agent in the treatment of pathogenic organisms. The antibacterial and anti fungal activity of *Haloplegma duperreyi* were determined in both gram positive and gram negative bacteria and fungus. In the preliminary phytochemical assay of five different organic solvents like Ethanol, methanol,aqueous, ethyl acetate and choloroform. Only methanol extracts showing antimicobial activity were considered for further study. The zone of inhibition produced by these extracts against pathogenic microorganisms is summarized in Figure 1-6. Different species showed sensitivity for methanol extract. The extract of *Haloplegma duperreyi* showed activity against S.aureus. Some studies reported the antimicrobial property of A. vulgaris against S. aureus and E. coli similarly to our fnding [29]

## CONCLUSION

Phytochemical analysis of . *Haloplegma duperreyi* shown the presence of various metabolites such as flavonoids, alkaloids, phytosterols and steroids are present and antibacterial potential of seaweed extract for the synthesis novel antibiotics. Future studies (in vitro and in vivo) are required to prove the potential medicinal properties of the *Haloplegma duperreyi* (red algae).

## ABSTRACT

In this paper propose FLC based solar fed Microgrid to establish synchronization. Due to in stable of Power electronic converters, solar power generation plays a of the essence role and it does not have normal inertia and damping characteristics. This paper makes employ of the grid-linked photovoltaic muscle era gadget base on DC voltage instinct control because the research item, and establishes the static synchronous generator (SSG) representation of the gadget among a analysis to make the capacitance of the middle time scale take part in the grid frequency response without including additional device. The model is used to study the amount of one factor that has an impact on the system's inertia, damping and synchronization characteristics as well as the legal plan of that govern their affect. The findings screen that the capacitor's electricity garage contact on a medium time scale might purpose the system to exhibit inertia traits. In terms of manage parameters, the inertia characteristic proven via the device turns into more potent because the droop coefficient Dp lowers. The damping produce of the synchronization functionality of the device, the bigger the DC voltage outer loop integral coefficient Ki. in addition, the Simulink/ MATLAB, simulation platform is used to make certain that the theoretical approximation.

## INTRODUCTION

With the worldwide electricity emergency and ecological contamination transforming into gradually more now not energetically, kidding developing smooth energy has become the improvement conformity of all countries on earth. The electric powered motors, FACTS hardware and the environmentally pleasant power generation be roughly highly developed [1][2]. Lattice coupled photovoltaic electricity age, as a delegate of environmentally friendly power generation improvement, has shown hazardous development by prudence of its bountiful belongings and infectivity unfastened benefits [3][4]. In the established power framework, the essential collection of force ages is the rotating coordinated generator (RSG), and RSG itself has the massive dormancy and stable damping potential. In the network tied photovoltaic energy era framework, the actual characteristics of the network related inverter are really now not moderately similar to RSG. As a power digital machine, the lattice tied inverter itself does not have actual state of being inactive. It is related to the framework for a massive scope with the qualities of low employment and feeble damping, bringing in the order of a diminution in the dormancy of the power agenda and exhausting extreme difficulties to the protected and stable hobby of the strength lattice [5][6]. Separately, photovoltaic power generation has excessive, regions of power for instability, and clean irregular, with a purpose to critically have an effect on the steady motion of the power lattice[7].

Hence, while photovoltaic electricity is integrated into the power matrix, they by using and massive must be equipped with a selected degree of strength stockpiling to give latency [7]. In [8] the mixture of the daylight based totally age and power stockpiling framework has been taken because the exploration object, and the plan and manipulate system studies are directed to further expand the frame work dependability of the photovoltaic strength era coordinated into the lattice. Be that as it is able to, attributable to little aggravations, the power stockpiling framework is much less efficient, and the essential electricity and its converter's sizeable probable in latency and it are not completely used to sodden characteristics reenactment.In [9], it's far delivered up that the DC aspect capacitor of the network tied inverter has comparative powerful behavior traits to the RSG rotor, and the capacitor voltage at the DC aspect of the matrix tied inverter can vacillate inside a selected reach, giving a selected latency guide, but it didn't dissect the dormancy, damping and synchronization characteristics of the whole framework together with the capacitor dynamic. In [10], it's far proven that the framework tied new strength technology framework has correspondence with the standard strength era framework, and in keeping with the viewpoint of electromechanical brief cycle displaying, it demonstrates the matrix tied inverter inside the new electricity lattice tied power technology framework and the RSG within the traditional energy technology framework has a comparative actual factor and equal unique version.

A SSG model this is suitable for the research of the DC voltage time scale dynamic attributes of the matrix tied converter framework is proposed, and the idleness, damping and synchronization qualities of the lattice tied converter framework underneath voltage and contemporary twofold close circle control is examined. In [11], by using laying out the SSG version, the aspect of a static coordinated compensator for smothering the energy swaying of force framework is dissected. In [10], the short energy remuneration (RPC) based totally recurrence manipulate method is created to upgrade the converter capability to repay the framework awkwardness strength, through completely taking advantage of the converter inactive limit. The numerical verification confirmed the advanced exhibition of the RPC method as far as recurrence deviation concealment versus grasp manage, and as some distance as RoCoF concealment as opposed to idleness manipulate, with indistinguishable converter restriction. In [12] the SSG version-based exam strategy is used to dissect the idleness and damping features of the matrix tied electricity stockpiling framework underneath two different manage techniques.

#### ROCOF DROOP CONTROL OF PMSG-BASED WIND TURBINES FOR SYSTEM

This proposes a RoCoF hang manipulate, which eases the brief recurrence trade process by using controlling the energy of the DC side capacitor. Right off the bat, take a look at and represent the control time size of the breeze power framework (WPS). Under the electromagnetic time scale, consolidate the low-bypass channel (LPF) and the

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Kondalu et al.,

differential connect with get the control connection of the framework. Consequently, the brief course of RoCoF is really moved along. Besides, primarily based on the dormancy examination of the first simultaneous generator, additional inference and research of the RoCoF hold manage inactivity attributes. Contrasted and ordinary hang manipulate, RoCoF grasp have power over empowers the inverter to can equally expand recurrence deviation [8]. Then, the element research of the transport capacitance voltage to the framework latency guide is given, the relationship between capacitor keep restriction and RoCoF is inferred, which confirms the practicability of capacitor-helped recurrence adjustment. At long last, the trial examination with the hang manage method is completed in view of the RT-LAB stage [9].

This study facilities round the quick power response of community side inverters under RoCoF hang manage exclusively while the framework recurrence drops under DVT high-recurrence unsettling have an effect on. Thusly, the control method for turbine-aspect rectifier may not be in calculation pointed out on this paper. At the point while the framework is disillusioned by using power awkwardness, the WPS can be separated into electromechanical time scale (second-stage response) and electromagnetic time scale (millisecond-level response) as per the particular reaction season of various designs [10].

As located in Figure1, Due to the sizeable distinction eventually scale, the AC contemporary manage circle and mechanical power rotor velocity and can be disregarded all through the recurrence drop transient cycle. All matters considered the capacitor voltage dynamic interaction is breaking down underneath DVT, and the issue of unreasonable RoCoF is concentrated on underneath high-recurrence unsettling influences. The RoCoF grasp manage is displayed in Figure three, wherein Udc addresses the deliberate voltage, and Udcref addresses the given voltage. The reference really worth of dynamic modern can be acquired with the aid of taking the charging direction of the capacitor modern-day because the reference heading and alluding to the DC voltage manipulate target

$$I_{\rm dref} = -\left(K_{\rm p} + \frac{K_{\rm i}}{\rm s}\right)\left(U_{\rm dcref} + U_{\rm dc0} - U_{\rm dc}\right)$$
(2)

The RoCoF grasp manage circle is embedded in the DC voltage manipulate circle. The power recurrence  $\omega 0$  short the lattice recurrence  $\omega g$  is recurrence deviation 1 $\omega$ . Since the lattice recurrence is in a rather regular nation, 1 $\omega$  is beaten via low-recurrence elements. By changing low-bypass channel cutoff recurrence  $\omega c$ , the high-recurrence commotion contained in this is wiped out, so the inverter solutions principally to low recurrence signal. The RoCoF of the framework is gotten via the differential connection, and in a while grasp coefficient Kh is applied to change the sign to get the helper voltage order Udc0.

Because of high-recurrence unsettling affects, this has a look at proposes a RoCoF cling control methodology mild the problems of recurrence variation and severe RoCoF. The aftereffects of the correlation among the impacts of ordinary hold and RoCoF dangle manage procedure on WPS, the primary factors and pastime thing display that: shown in the figure2

## **RESULTS AND DISCUSSION**

In the figure2 of without droop control ,DC-to-DC converter do not react to the frequency variations of the grid, so the DC voltage and Output Power remain constant as depicted in fig 3 and fig 4.

#### With Voltage Droop Control

With droop control when the frequency of the grid decreases, the capacitor reacts to the frequency changes and the dc voltage decreases to release the energy and the output Power rises as depicted in fig5 and fig 6

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Kondalu et al.,

#### Effect of Droop Coefficient D<sub>p</sub> on DC Voltage

Fig 2 a grid-tied PV system by keeping the Proportional coefficient Kp and Integral coefficient  $K_i$  constant and by increasing the droop coefficient  $D_P$ , DC voltage drops as presented in fig 7fig 8 and fig 9. In fig 2 a grid integrated PV system which is controlled by the DC voltage droop control, when simulated in MATLAB using Simulink using Fuzzy Logic Controller the results are observed. Smaller the Dp value, the system will show strong inertia characteristics shown in fig 10,11 and 12.

#### Influence Of Dp On Output Power

Fromfig 2, the waveforms of fig 13,14 and 15 it is observed that the output power is stable with fewer oscillations. In summary, the smaller Droop coefficient value output power is stable.

## CONCLUSION

In this paper we propose FLC based solar fed Microgrid to found synchronization. Due to in constant of s Power electronic converters, solar power generation plays a vital role and it does not have natural inertia and damping characteristics. The latency, damping and synchronization of the network tied photovoltaic power period structure in view of DC voltage droop not entirely set in stone by the fundamental boundaries, control boundaries and consistent state working marks of the framework. From the point of view of control boundaries, the more modest the hang coefficient Dp, the further grounded the inactivity normal for the framework; the bigger the DC voltage external circle corresponding coefficient Kp, the more grounded the damping impact of the framework; the more noteworthy the DC voltage external circle essential coefficient Ki Larger, the more grounded the synchronization ability of the framework. The examination finish of this paper have particular significance for more developing the repetition security of framework allied photovoltaic power age framework under little upsetting influence, and establish a hypothetical starting point for the well-disposed mix of photovoltaic power age into the power network.

## ABSTRACT

The present studies deals with the preliminary survey of the wild edible plants used by the indigenous Chakhesang Tribe of Phek District. The district holds a vast area of thickly dense forest which comprises of highly diversified flora. The study was carried out in between January 2021 to August 2022. Ethnobotanical data were collected by interviewing the villagers especially the elders and herbalists who has well acquainted with the forest. The data were collected through semi structure questioners by interacting with the informants face to face. Altogether 74 wild edible plant species were recorded from 64 genera and 39 families. The present studies indicates that the tribal people depends on the forest for their food and for commercial purpose for their livelihood and regularly collect and consume leafy vegetables, ferns, fruits, tubers, mushrooms etc. from the mountainous forest and have acquired a vast knowledge of wild edible plants. The present study aims to identified, document, and explore of wild edible plants used by the indigenous tribe of Chakhesang of Phek District.

## INTRODUCTION

Nagaland one of the eight sister of North East India is located in the northern and eastern hemisphere at Latitudinal expanse of 25°6′ N to 27°4 N and Longitudinal expanse of 93°2′E to 95°15′E. The total area of Nagaland is 16,579 sq km (6401 sq miles). Nagaland is bounded in the east by the country Myanmar, the west by the state Assam, in the

#### Vepu and Lirola Sangtam

North partly by the sate Arunachal Pradesh and Assam and in the south by Manipur. It has a population of about 1,980,602 as per the 2011 census of India. Nagaland consist of 18 tribes namely Angami, Ao, Chakhesang, Chang, Dimasa Kachari, Khiamniugan, Konyak, Kuki, Lotha, Phom, Pochury, Rengma, Sangtam, Sumi, Tikhir, Yimkhiung and Zeliang. It has 16<sup>th</sup> district Chumoukedima, Dimapur, Kiphiri, Kohima, Longleng, Mokokchung, Mon, Niuland, Noklak, Peren, Phek, Shamator, Tseminyu, Tuensang, Wokha and Zunheboto.

Phek district of Nagaland is mainly inhabited by Chakhesang and Pochury tribe. The district hold a very large covered of wild forest and many villagers depends on the abundance of nature for their survivals like cultivated and wild eatable plants and fruits which provide a good scope for the Ethnobotanical studies. Since ages Chakhesang people live a very close relationship with nature and are well acquainted with their surrounding plants and their beneficial utilities for various purposes like medicine, food, animal fodders, agriculture, basketry works, furniture, house building, musical instruments, tools, utensils, dyes, cloths, hunting and defence equipments etc. for their self sustenance and daily needs. Many plants are used by the indigenous Chakhesang tribe for their medicinal purposes which are available in their locality. The plants in and around the villages plays an integral role in their culture and the information about the significance of plants are pass down orally from generation to generation without any written record. If those useful information about the generation gap. Besides, the vast beautiful forest which are fast disappearing due to shifting cultivation, unwanted fires due to hunting, making of concrete road, timber business, firewood and other socio-economic activities in the region.

In the past years, many researchers have contributed on ethnobotany in the North-East region of India: Jamir,N. S & Rao R.R. 1982a; Jamir N. S & Rao R.R. 1982b; Kar, A. 2004, Lokho A, Moa, A.A & Odyuo, N. 2007. Lokho, A. 2012; Takatemje et al. 2010; Takatemje et al. 2010; Salam. S. Et al 2010. Some of the recent contribution from the state of Nagaland: Mozhui, R, ET al. 2011; Pfozo, N. L. Et al. 2012 Medhi, P, Kar, A. & Borthakur, S.K 2013; Singh et al. 2015; Limasenla & Lea Nelia 2020; Konyak Zenwang & Konyak Phongle 2020. According to the survey, there is, still lots of works to be done in the field of ethnobotany. More field research is needed to tap the vast scientific resources before it gets diminishes with the rapid development of human activities.

#### **STUDY AREA**

Phek district lies between 25°37'N-25°39'N latitude and 94°35'E-94°38'E longitude. Altitude varies from 520m to 2900m above the sea level with a total area of 2026 km2. The district is bounded by Manipur state on the south, Kiphiri and Zunheboto on the North, Kohima in the west and Myanmar country in the south-east. The district consists of rich evergreen sub-tropical and temperate coniferous forest supporting vast amount of flora and fauna. Agriculture is the main occupation of the indigenous tribe with Rice as their stable diet. The Chakhesang practices terrace cultivation in the hilly terrains and sub-terrain areas where they mostly cultivate Rice and others minor crops alongside the paddy field. Jhum (slash and burn) cultivation is also practice by the tribe but with the passage of time it has decrease drastically with villagers knowing the importance of biodiversity and its conservation.

## METHODOLOGY

Frequent field trips were conducted in between January 2021 to August 2022 to different villages of the Chakhesang tribe of Phek district, Nagaland. Data collections were done through group discussions, personal interview to local healers/Kobiraj, elders of the village and even youngsters who have certain knowledge about the wild edible plants in their locality. Questionnaires based surveys were carried out from the participants for further analysis. The diversity and the economy of the wild edible plants were documented by frequent visit to villages in different seasons with the availability of the plant species. Most of the plant species were collected from the wild habitats with the help of the informants but a few of them were collected from their market places which were sold near the village

road and gate. The plants were identified with the help of expert consultants, locally available literatures of different authors and Botanical Survey of India, Shillong, Meghalaya.

## **RESULT AND DISCUSSION**

During the study period, a total of 74 wild edibles plants belonging to 64 genera and 39 families used by the Chakhesang tribe of Phek district are documented. Wild edible plants family and its number of species occurrence were arranged alphabetically in the *Table 1*. Poaceae and Rosaceae family with highest number of 6 plant species each, followed by solanaceae of 5 plant species, Amaranthecea of 4 plant species and Apiaceae, Cucurbitaceae, Lamiaceae & Araceae with 3 each species and Athyriaceae, Asteraceae, Brassicaceae, Dioscoreaceae, Fabaceae, Leguminoceae, Moraceae, Polygonaceae & Urticaceae with two each plant species and the rest of the 22 families consist of only one species each. Wild eatable plant part uses and its occurrence were given in *Table 2*, out of which 51 number of plants species have only one part eatable i.e either shoots, leaves, flowers or seeds or fruits while 17 plant species are found to have two eatable parts and 3 plants are taken as a whole plant. 47 plant species are found to have only one uses whereas 24 plant species are found to have an additional uses like animal feeds and medicinal values. Altogether 4 bamboo species and 2 fern species are recorded. 33 fruits/seeds wild eatable plants, 32 leafy vegetables, 12 shoots, 6 tuber, 8 Flowers/inflorescence and 3 whole wild edible plants are recorded.

The edible parts of the wild plant is found as fruits with the highest number of consumption followed by leaves, shoots flowers and tubers. Habit wise of plants are found are trees, herbs, shrubs and climbers. 3 numbers of plants have found to use as whole plants like *Colocassia esculenta* Linn. (tuber petiole leaves), *Houttuynia cordata* Thunb. (shoot, roots, leaves) and *Centella asiatica* Linn. (leaves, shots and roots). In the enumeration of *table 3*, plant species name are arrange alphabetically with family, vernacular name, part used, preparation and any medicinal or other uses were indicated. Some prominent plants like *Centella asiatica* Linn., *Diplazium esculenta* Retzius Swartz, *Oenanthe javanica* Blume Candolle and *Rhus chinensis* Miller have high medicinal value and also use frequently and become household medicine among the Chakhesang tribe.

The present study approach shows the tribal people involved closely with the nature of wild edible plants for their food and commercial purpose for their livelihood. Wild edible plants were collected and consumed regularly from the nearby forest. The tribe also have acquired a vast knowledge of wild edible plants for various uses since generation. Many valuable plants are threatened due to rampant deforestation for agriculture purpose and various developmental activities. With the fast declining of deep forest, there is urgent need to educate the tribal to conserve, protect and to manage forest resources for the sustainability of mankind and nature.

## ACKNOWLEDGEMENT

The authors are thankful to the informants for sharing their valuable knowledge about the wild edible plants of Chakhesang Phek District and help during the field work. The Authors are grateful to the Department of Botany St. Joseph University, Dimapur and Botanical Survey of India, Shillong for various guidance and support during this study.

## ABSTRACT

Inflammatory bowel disease has two major forms, one of them is Ulcerative colitis. Ulcerative colitis is characterized by mucosal inflammation beginning in the rectum and extending proximally in the colon in a continuous fashion. The inflammation in Ulcerative colitis is particularly limited to the mucosal layer, causing superficial damage of the bowel wall. At present time, the corticosteroids, aminosalicylic acid preparations, immunomodulators, and other drugs, use as a clinical treatment of this disease, but the disease has the characteristics of high recurrence rate, and due to long-term medication adverse reactions can easily occurs. Hence, there is a need in investigating new drugs to manage Ulcerative colitis in a less harmful and more efficient way. There are various animal models which have been used globally by researchers to assess new lead compounds prior they can be tested in humans. There are various types of animal models for assessment named as immunity transfer models, chemical models, composite Models, bacterial models and genetic models. In this review article, we try to give an overview on animal models which can be used in drug research globally to manage Ulcerative colitis.

Keywords: Inflammatory bowel disease, ulcerative colitis, drug research, screening models, India.

## INTRODUCTION

UC is an uncontrollable, cancerous, refractory gastrointestinal disease, the pathology of diseases such as colitis or idiopathic colitis as first described by Stephen *et al*[1]. In current years, the incidence of the disease has been increasing, and it has been classified as one of the uncontrolable diseases by the World Health Organization (WHO) [2]. Inflammatory Bowel Disease (IBD) is a globally health problem in that two specific and more prevalent pathologies are: Crohn's disease and Ulcerative colitis. In 1859 Ulcerative colitis (UC) firstly described, and it is one of two major forms of inflammatory bowel disease (IBD). Opposite, the other type of IBD, inflammation in Crohn's disease (CD), reveal patchy lesions that are possibly scattered anywhere in the gastrointestinal tract. The

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shamal R. Borude and Devendra S. Shirode

inflammation in UC is specifically limited to the mucosal layer, causes superficial damage of the bowel wall, although CD is characterized by transmural inflammation (all layers of the bowel wall involved) that leads to fibrosis, stricture and fistula(Fig no. I). It is characterized by painful episodes in the abdominal region, bloody diarrhea and episodes of tenesmus. In addition, some extra intestinal conditions can also occur with primary manifestations in the skin, eyes, liver and joints. whereas diagnosis is made from a combination of symptoms, endoscopy and histology. Currently, there is no effective treatment for UC, and the current main treatment is also based on controlling the inflammatory response of the intestine and controlling complications. Currently, the clinical treatment for this disease mainly uses corticosteroids, immunomodulators, aminosalicylic acid preparations, and other drugs, but the disease has the characteristics of high recurrence rate, and due to long-term medication adverse reactions can easily occurrs. Amid, glucocorticoids and aminosalicylic acid preparations are first-line drugs for the treatment of UC, but due to the complexity of the disease, the cause has not been fully defined, and the clinical efficacy cannot fully meet the needs of patients. With the development of molecular biology, some advancement of treating UC has been made, but how to completely cure this disease is still challenging[3].

Pre-clinical methods may be option to address the issue towards understanding of drug mechanism and body's physiology response. To study the mechanisms of UC development Experimental animal models have many advantages: it can simulate the whole process of UC occurrence and development. Hence, it became critical to build a laboratory animal model of UC disease that is highly similar to the human gut environment. While, prior building an animal model of UC, the most important and basic thing is the selection of laboratory animals. In the selection of experimental animals, consider following four principles: the use of experimental animals alike to human function, structure, metabolism, and disease; the use of systemized experimental animals; the use of experimental animals with some specific reactions, sensitive to stimuli; the use of easily available and economical experimental animals and the use of zoonotic experimental animals[4].

According to the above principles, we should first choose animals that are fit for UC disease modeling, most reflective of clinical drug efficacy and nearest to the human internal environment. In current years, rats and mice have been preferably used in various animal experiments: they are genetically adjacent to humans, domestic and easy to handle, they also have good intraperitoneal injection effect, their white body hair is uncomplicated to observe, and they are low-cost and easy to keep. However, to select an animal that best fits the human intestinal environment and is most worthy for investigating UC disease, it is also important to determine the differences between rats and mice. On the one hand, mice have a tiny intestine and rats have a longer intestine, which is about 114 cm (102-126), and the classification of the rat intestine is identical to that of humans, so rats are more advanced to mice in this respect; and on the other hand, rats are omnivorous, anatomically and physiologically relevant to humans, and have a fast growth and metabolism, rats can be used for pharmacological and nutritional studies. Rats are also the main experimental animals for drug evaluation and It can be made into animal models of experimentally induced genetic defects diseases which is similar to those of humans. These advantages are very helpful for modeling UC diseases, whereas mice do not have a notable advantage in modeling UC, so rats are most preferred for animal modeling. If an animal model of UC that relatable to the human intestinal tract can be strongly established, different experiments can be carried out based on this model to test the therapeutic effects of different clinical drugs on UC as well as further determine the pathogenesis of UC. Finally, we may be able to come up with a set of treatment plan to cure UC via the in-depth study of this model[3].

#### Animal Screening Models

There are various animal models (Table No. I) which have been used globally by different researchers to assess new lead compounds prior they can be tested in humans. In this review article, we are highlighting the various advantages and disadvantages of animal model, try to give an overview of the important animal models which can be used, Many chemicals, immunity transfer, bacterial, and genetic models have been used in research to induce Ulcerative Colitis in animals.

#### Shamal R. Borude and Devendra S. Shirode

#### Chemical Models (Table No.I)

#### Dextran sulfate sodiumInduced Colitis [3,6,7,8,9].

Dextran sulfate sodium (DSS) is a polyanionic derivative of dextran with a chemical formula of (C6H7Na3O14S3)n. This compound have various applications which include probe hybridization to membrane-immobilized DNA, lipoproteins precipitation, and the release of DNA from DNA-histone complexes. It has been used on a large scale in research to induce intestinal colitis and colorectal cancer in mice and rats[6]. DSS is generally administered in the drinking water per oral treatment of the animals with the compound. 3% concentration of the compound is frequently used[7]. By DSS in wild-type animals an inflammatory response is begin which starts distally after around 5 days and is restricted to the colonic mucosa. How DSS starts the inflammation in the colon it is still not well understood. Although, a recent work investigating DSS both in vitro and in vivo disclosed that on the inner mucus layer DSS has a direct effect, leading to bacterial penetration of this layer prior any inflammatory signs could be seen. Thus, it can be concluded that the development of an inflammatory response start by loss of the inner colon mucus layer is the initial episode which leads to bacterial penetration and ultimately,[8]. DSS-induced colitis has also been used for investigating the effects of the gut microbiota on the development of colitis. This is exemplified by studies demonstrating that the nucleotide binding ligomerization domain containing 2(NOD2) abnormalities give rise to mice that develop changes in susceptibility to DSS colitis and the latter is associated with (or perhaps caused by) changes in the gut microbiome[6].

#### Mechanism[10].

Dysbiosis of intestinal flora by increasing the permeability of intestinal mucosal cells, Elevated mRNA levels of IL-1, IL-6, TNF- $\alpha$ , and secreted levels in serum.

DSS-induced colitis is a commonly used experimental model for many reasons which are:[9].

- The administration process is simple which is usually done in the drinking water
- · Simplicity of dosage control which helps in determining colitis severity
- To study the process of inflammation or recovery process duration control is possible
- Microbial interventions, Multiple chemical compounds, and gene or cell therapy have been found to be effective therapeutically in DSS-induced colitis.

#### Advantages

high success rate, Easy to perform, lesion symptoms are very similar to human UC good reproducibility.

#### Disadvantages

Unstable experimental data, difficult to make a successful and stable model influence long modeling period. [3].

#### 2,4,6-trinitrobenzene sulfonic acid Induced Colitis [3,9,18].

An oxidizing Nitroaryl compound Trinitrobenzene sulfonic acid (TNBS) which is administered intrarectally in animals to induce inflammatory bowel disease. This induction causes colonic damage which leads to necrotic regions associated with inflammatory areas. Damage mainly characterized by neutrophilic infiltration into the colonic tissue which is caused by High myeloperoxidase activity. Damage to the colonic epithelium and interstitium results in increase in the mucosal permeability. TNBS may cause a decrease in the mucosal hydrophobicity by interacting with the phospholipids present on the surface of the colonic mucosa. Due to this hydrophobicity is decreased and it is believed to contribute to TNBS-induced inflammation of the colon. Due to TNBS necrosis and deep tissue damage occurs which mimics the transmural involvement of CD; hence, rather than UC it may be preferred to be a better experimental model of CD. TNBS-induced colitis models have helped to be an important source for generating vital information about the cytokines involved in the human IBD. It has also helped in shaping the therapy regimens of the human disease[9]. Colitis induction done by Intra-rectal administration of TNBS dissolved in ethanol (50%) 120mg/ml, continuously for 7 days, causes mucosal barrier destruction. In this UC model, the sulfasalazine is used as a standard drug[18].

#### Mechanism [3].

Elevated IL-6 and TNF- $\alpha$ , disrupts the structure and composition of the intestinal flora, causing disruption of the flora.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shamal R. Borude and Devendra S. Shirode

#### Advantages

Shorter time to induce ulceration, good reproducibility, Simple operation, longer duration of lesions. **Disadvantages** 

Easy mucosal ulceration perforation, and death, TNBS stimulation is too severe. [3].

#### Oxazolone Induced colitis [11,17].

Intrarectal administration of the hapten oxazolone(OXA) with ethanol into murine animals results in acute colitis. The condition is characterized by a T helper (Th)2-type immune response with a marked increase in interleukin (IL)-4 and IL-5 production, accompanied by body weight loss, diarrhea, ulcers, and loss of epithelial cells in the large intestine. Thus, it favors UC than the other IBD subtypes, differentiating it from trinitrobenzene sulfonic acid (TNBS)-induced colitis (Th1-mediated immune responses), which copy CD more closely. In oxazolone-induced colitis induction natural killer T cells and their associated cytokine, mainly IL-13, are also intimately involved. To test disease pathology and therapeutic interventions for UC many studies have utilized oxazolone-induced colitis. Nicotine upregulates the nicotine acetylcholine receptors on CD4+ T cells and increases regulatory T cell (Treg) numbers, it was recently shown in oxazolone-treated mice that, accompanied by a decrease in the number of Th17 cells, which develop amelioration of the inflammatory phenotype. Opposite to this, nicotine treatment in TNBSinduced mice, that have CD-like Th1-associated inflammation, upregulates Th17 cell numbers associated with an exacerbation of the inflammatory response. In a different study, suppression of the Th1 response and attenuation of intestinal inflammation in TNBS-induced colitis after mice treated with 3-hydroxy-3-methylglutaryl coenzyme A reductase inhibitor, but not oxazolone-induced colitis. This examples helps to illustrate the importance of choosing an appropriate model to answer a specific question when exploring a therapeutic potential of a drug/compound for a particular disease. In BALB/C strain which is known to favor Th-2 immune responses colitis induction done by OXA solution (7.5 mg/ml in 40% ethanol) through intra-rectal administration. The 5- amino salicylic acid is used as a standard and administered through intra-rectal administration[17].

#### Mechanism [3].

Increased release of TNF- $\alpha$  and IL-6, Leading to an imbalance in the ratio of Th1/Th2 helper cells, production of antibodies, active secretion of B lymphocytes, and hyperactive humoral immune response, causes an inflammatory response in the intestinal mucosa by activating the complement system.

#### Advantages

Rapid model establishment, very similar to UC in humans, good reproducibility, Simple operation.

#### Disadvantages

The exact mechanism is not fully understood and duration of disease is maintained for a relatively short period of time.

#### Acetic acid-induced colitis [3,11,12,13].

To create chemical injury to the mucosal epithelium that induces a transient phenotype mimicking UC intrarectal administration of diluted acetic acid provides an alternative method. The first result of this animal model was illustrated by MacPherson and Pfeiffer[12]. where for 10 seconds they instilled 10%–50% acetic acid into the rat rectum, followed by flushing the lumen with saline three times. In an acetic acid dose-dependent manner a diffuse colitis was observed in these rats, with histopathological features including ulceration of the distal colon and crypt abnormalities[12]. The injured and ulcerated mucosa, with destruction occasionally extending to the LP, starts to heal within days in mice and a few weeks after in rats[13]. Subsequent modifications and optimization several years focused on altering the concentration of acetic acid and the contact time. Concentrated acetic acid enemas into the lumen usually cause perforations; the recent protocol is carried out using 4% acetic acid with 15–30 seconds of exposure. There are a several reports that shows compounds that can ameliorate acetic acid-induced colitis. Compounds aiming to target reactive oxidative species such as N-acetyl cysteine, trimetazidine, vitamin E, and melatonin included, indicating that acetic acid-induced colitis may be a good model to study the efficacy of drugs that intended to interfere with reactive oxidative species pathogenesis[3,11]. Of note, within the first 24 hours the

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shamal R. Borude and Devendra S. Shirode

epithelial injury observed after acetic acid induction is not immunologic in nature. Drug should be tested at a time point after 24 hours postinduction, that target immune responses

#### Advantages

Low cost and the ease of administration

#### DNCB Induced Colitis [14,16].

Chemical hapten 2,4-dinitro-1-chlorobenzene(DNCB), which binds to tissue protein and is responsible for induction of delayed-type hypersensitivity when applied to the skin or the intestinal lesion. In the skin the pathological lesion a small vessel vasclitis occurs involving the dermis and the subcutaneous tissue. Around the venules a mononuclear cellular infiltration occurs, along with endothelial proliferation. There is a necrosis or little fibrosis. In DNCB – induced colitis, some of the histological features associated with idiopathic human colitis occurs in the large bowel. By a mononuclear cell infiltration, vascular congestion and perivascular cuffing, the lesion is characterized. Additionally, there is epithelial erosion, frank ulceration and mucosal haemorrhage. By intra-colonic instillation of 25 mg of DNBS per rat dissolved in 50% alcohol, colitis induction done. After 4 days, the colonic mucosal damage was analyzed along with body weight, food intake, spleen weight, colon weight, myeloperoxidase activity, histological damage, malondialdehyde levels, reduced nitric oxide and glutathione levels in colonic tissue homogenate[16].

#### Mechanism [3].

Significant increase in NO and TNF- $\alpha$  activity by activation induced by T cells.

#### Advantages

High similarity in pathology to human UC, simple operation.

#### Disadvantages

Requires prior sensitization, More tedious operation, inflammation is self-healing.

#### Immunostimulation Models (Table No. II)

#### Colonic mucosal tissue sensitization method [3].

Injection of antigen containing Fuchs antigen emulsion+enema with ethanol solution used for the colonic mucosal tissue sensitization method. Rats are commonly used for this model.

#### Advantages

Identical to human UC immunopathogenesis; Longer duration of lesions; fit for screening of new drugs.

#### Disadvantages

More cumbersome operation; prolonged modeling time; multiple injections of antigen required to maintain sensitization.

#### Rat colonic bacterial strain method [3].

Bacterial suspensions were made from E. coli in the colon contents of healthy rats, suspensions were injected in rats. Advantages

Longer maintenance of inflammation; mostly chronic inflammation.

#### Disadvantages

Requires certain conditions and techniques to prepare E.coli suspension, Longer time required to prepare E. coli suspensions

#### Fetal rat colonic embedding method [3].

The fetal rat colonic was removed 3-4 cm long and it is surgically planted aseptically under the right kidney pericardium in adult rats.

#### Advantages

The disease model is alike to the clinical symptoms of UC.

#### Disadvantages

Low success rate, long experimental period; High technical requirements.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shamal R. Borude and Devendra S. Shirode

#### Spontaneous animal models [3].

Abnormalities developing under natural conditions or genetic mutations; obtained by depend on selective breeding and hybridization methods.

#### Advantages

Deliberate well on the development of UC and the effect of drug treatment.; The adjacent model to the occurrence of UC.

#### Disadvantages

Onerous to standardize control; and animals are scarce and costly, making it difficult to tough to large-scale experiments or more in-depth studies.

#### Bacterial Model [11,15].(Table No. III)

#### Salmonella-induced colitis[11,15].

Gram-negative Salmonella typhimurium and Salmonella Dublin are the Food-borne enteric bacterial pathogens that can cause the intestinal diseases. Direct oral infection of S. typhimurium results in the systemic infection in mice that may hide the phenotype of intestinal inflammation. Although, this problem can be overcome by pretreating mice to upset commensal microbial flora and allow better colonization of S. typhimurium with an oral antibiotic cocktail, resulting in high-density growth of the bacterium within a day. By such colonization the initial inflammation caused which has similar histo-pathological characteristics to human UC, involving epithelial crypt loss, erosion, and neutrophilic infiltration. Of note, within 5 to 7 days of infection this mode of colitis induction usually results in the systemic infection. Therefore, it is perceived that to study the acute phase S. typhimurium infection is a valuable model, but not next stages, of colitis. Salmonella has been shown to function as a good vector which is used to introduce certain gene components into the mucosa, to determine immune response for vaccines against colitis. Into the intestinal epithelium and Peyer's patches (PP) it can efficiently invade. Therefore, careful and full characterization of its virulence factors is difficult to efficiently make a safe attenuated strain for such gene therapy vaccination. Vaccinating mice with an attenuated mutant S. typhimurium strain contains deletion of the znuABC operon, that encodes a zinc importer which is responsible for metal recruitment in the infected host, that evokes effective immune responses and protects mice from the subsequent Salmonella infection. In addition, illuminating how S. typhimurium interacts with host epithelial cells facilitates advance understanding of ways to potentially prevent UC onset. For example, the host inflammatory-induced proteins (eg, chitinase 3-like 1 [CHI3L1, also known as YKL-40].) blocks the colon using fit antibodies (Abs) or inhibitors that can stop colonization of S. typhimurium on the intestinal epithelium, thus preventing more invasion.

#### Adherent-invasive E. coli [11,15].

From the ileum of CD patients the commensal adherent invasive Escherichia coli (AIEC) strain was originally isolated and was exhibit to exacerbate intestinal inflammation in an opportunistic manner. Although, AIEC can stick to both small and large intestinal epithelial cells (IECs) with similar affinity. Induction of colonic inflammation animal models using AIEC infection needs mild epithelial damage, such as low dose DSS treatment, during the course of the infection. The phenotype of the colonic inflammation acts as a UC, including the presence of blood in stool, body weight loss, and colonic neutrophilic infiltrations. A latest study showed that the AIEC encodes a pathogenic form of the chitinase, chiA, that is differentiable from other nonpathogenic E. coli, which is utilized to stick to host epithelial cells by binding with the colonic inducible protein CHI3L1. In mice administration of chitin microparticles (1–10  $\mu$ m in size) ameliorates colonic intestinal inflammation, probably interaction of bacterial-derived factors (such as AIEC chiA) with host CHI3L1 blocks. Likewise, ameliorative effect also result of anti-CHI3L1 Abs.

Colonization of and Effective invasion into, AIEC in the mucosal epithelium is regularly hindered by the mucosal biofilm formation of probiotic bacteria, such as Lactobacillus casei. Particular antibiotics result in the disruption of the intestinal microflora, as well as the probiotic biofilm, creating an ideal environment for opportunistic AIEC to stick to and invade IECs and macrophages. It has been shown that in non-antibiotic-treated mice AIEC does not adhere efficiently, but colonizes well in the antibiotic-treated animals. This result suggests that the restoration of a

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shamal R. Borude and Devendra S. Shirode

beneficial microbiota, either through the probiotic intake or other methods like fecal microbial transplantation, they can theoretically prevent further exacerbation of the intestinal inflammation by commensal pathogenic bacteria.

## Transgenic and gene knockout animal models of ulcerative colitis[11].(Table No. IV) IL-7 Tg mice

IL-7 is a pleiotropic cytokine, candidate risk gene associated with UC. IECs demonstrate IL-7, which serves as a regulatory factor for the development and homeostasis of lymphocytes that express IL-7 receptor (IL-7R). IL-7 protein expression is notably upregulated and generate its optimal effects in controlling long-lived memory of CD4+ T cells in the colonic mucosa, in UC patients. IL-7 seems to mediate the persistence of chronic colitis via IL-7R $\alpha$  chain expressed especially on CD4+ T cells, but not on the other cell types. Consequently, blocking IL-7R functions has shown to be fruitful in suppressing adoptive transfer-induced intestinal inflammation in an mice. Administration of fixed anti-IL-7R Ab into the murine colitis models (eg, Helicobacter bilis-infected Mdr1 KO mice) as well controls dendritic cell (DC) and macrophage expansion.

IL-7 Tg mice express the murine IL-7 complementary DNA mechanically develop acute colitis at or near 1–3 weeks of age, which is characterized by a mixed cellular infiltration that involves neutrophils and lymphocytes. At 8–12 weeks of age, the Tg mice exhibit rectal prolapse and remittent intestinal bleeding, with goblet cell loss, rectal erosion, and occasional crypt abscesses. Upregulation of IL-7R on the mucosal lymphocytes is also associated with disease progression. Thus, an IL-7 Tg mouse model is fruitfull to understand the T-cell-mediated pathogenesis of colitis for the therapeutic treatment targeting T-cell functions.

#### TCR $\alpha$ KO mice

Mombaerts *et al* in 1993, showed that the T-cell receptor  $\alpha$  chain (TCR $\alpha$ ) KO mice instinctively developed chronic colitis, which was mediated by a Th2-type of immune response which is similar to human UC with an inflammatory pattern restricted primarily to colonic mucosa. At 4-6 months of age, nearly 60% of TCRa KO mice formed soft stools, which is associated with loss of goblet cells, and a mixed cellular infiltration mostly consisting of the lymphocytes and neutrophils in the affected LP. Spontaneous colitis starts in TCR $\alpha$  KO animals when raised in a helicobacter-free/SPF facility, but not in the conventional (CV) environments. When SPF-born TCRa KO mice were later transferred into the CV environment, the mice started attenuated mild colitis. This supports the concept that early life exposure to an environmental microbes which may be protective against colitis risk later in life. Various therapeutic treatment have been tested in TCR $\alpha$  KO mice with effectiveness. Oral administration of dexamethasone 3 mg/kg(Daily) an member of the glucocorticoid class of steroid drugs, into an TCR $\alpha$  KO mice was effectual to prevent the goblet cell loss and leukocyte infiltration. An Immunotherapy innervations by using anti-IL-4 Abs has also been exhibited to defeat the clinical and histological symptoms of colitis by regulating the Th2-type cytokine productions. Purified immunoglobulin G, Administration with a mixture of monoclonal auto-Abs reactive against colonic epithelial cells, can weaken colitis in B-cell-deficient TCRa KO mice. Carbon monoxide, a well known component in cigarette smoking, which exerts anti-inflammatory effects in an TCR $\alpha$  KO mice via suppression of IL-1 $\beta$ , tumor necrosis factor- $\alpha$  (TNF $\alpha$ ) and the IL-4, also through induction of IL-10 production, giving molecular insights into how smoking has an protections against UC. In addition, chitin microparticles oral administration into  $TCR\alpha$  KO colitic mice also displayed suppression of IL-4 and TNF $\alpha$  production and increased interferon- $\gamma$  (IFN $\gamma$ ) production in mesenteric lymph nodes (MLNs). It was found that in TCR $\alpha$  control groups chitin treatment exhibit expansion of a certain genre of commensals microbes.

#### Wiskott-Aldrich syndrome protein KO mice

Patients with Wiskott–Aldrich syndrome have not only immunodeficiency but also frequently autoimmune manifestations, with 5% to 10% of patients growing colonic inflammation. They either lack or express a defective form of Wiskott–Aldrich syndrome protein (WASP), an intracellular molecule particular to hematopoietic cells. In actin polymerization WASP has major biological role, and it is critical for multiple cellular functions like cell motility, activation, and signaling. Such as, their human counterpart, an WASP KO mice on 129 SvEv mouse background also spread spontaneous colitis from the 4 months of age. At 6 months of age full penetrance was observed. The pancolitic

#### Shamal R. Borude and Devendra S. Shirode

marking of the inflammation together with increase in Th2 cytokines in the colonic LP which is associated with this model which has similar features of UC. At first, it was hypothesized that abnormally activated effector T cells also deficient and dysfunctional Tregs similar with WASP deficiency bore the only responsibility for colitis development, but latest studies have disclosed a role of the WASP KO innate immune cells in disrupting mucosal regulation. The advantages of using this model for study of ulcerative colitis pathogenesis Th2-skewed cytokine profile similar as a human disease, aberrant natural Treg and, the innate immune cell function, and a human correlate where a subset of patients with same genetic defect also suffer from the colitis.

Different types of the therapeutic strategies have been investigated by using WASP KO animals. In WASP-deficient hematopoietic stem cells the WASP-expressing retrovirus was transduced prior transfer into an lethally irradiated recipient mice, results the weakening of colitis together with normalized populations of the mature B and T cells compared chimeric mice with the control retrovirus-transduced WASP-deficient bone marrow cells which then developed disease. Additionally, given that UC patients were found to produce lower levels of the intestinal alkaline phosphatase, the WASP KO mice were treated with oral intestinal alkaline phosphatase and were found to productively weaken colitis with less cellular infiltration and the reduced production of IL-4 and IFN $\gamma$ . In addition, direct neutralization of IL-4, but not IFN $\gamma$ , with injection of anti-IL-4 antibody weekly for 8 weeks ameliorated disease. At the end, administration of a freshly formulated IL-10-immunoglobulin fusion protein completely revoked colitis development in the chimeric mice with WASP-deficient innate immune cells.

#### Mdr1a KO mice

The multiple drug resistance 1a (mdr1a) gene lack in Mdr1a KO mice, that is encoding for the cell surface Pglycoprotein (P-gp) transporter which pumps small amphiphilic/hydrophobic molecules around the cell membrane. Around 25% of these mice develop the colitis between 8 and 36 weeks of age when increased in an SPF facility, but not in a GF facility. The mucosal thickening and loss of goblet cells that is also accompanied by crypt abscesses and ulceration in the colon are the histological findings in this model. Tto dispose of bacterial breakdown products in the epithelial cells the Mdr1a KO mice has lack of the proper potentiality. The bacterial products accumulation increases excess/abnormal antigen presentation to the neighboring T cells, generate a marked T-cell activation, state that initiate the colitis. Lately, T-cell participation in the growth of colitis in the Mdr1a KO model has been majorly characterized. The lack of Mdr1a (P-gp) limit the growth of inducible Treg cells, consequently producing fewer functional forkhead box P3 (Foxp3)-positive Treg cells and hence small IL-10 production to control and regulate the intestinal inflammation. More serious colitis is an result of Hematopoietic-specific Mdr1a deficiency than the mice that have Mdr1a deficiency only in the IECs, suggesting colitis development immune cell-derived P-glycoprotein has a critical role.

Mdr1a KO mice in a GF facility do not develop colitis, regular finding explains, prophylactic treatment using the broad-spectrum oral antibiotics majorly reduces the incidence of colitis development. Diet containing a polyphenol compound called curcumin (commonly found in spices used in Asian food) fed in Mdr1a KO mice which demonstrated upregulation of the xenobiotic metabolism and also suppression of pro-inflammatory pathways and correlated to the depletion of histological signs of the colitis. Meta-analysis has recognized some polymorphisms in the Mdr1a locus in the human UC, but not in CD, patients that influence its gene expression and regulation. Loss of Mdr1a expression was incriminated in UC development, but not in Crohn's Disease patients. P-glycoprotein expression upregulates after administration of the probiotics Lactobacilli under both normal and the inflammatory conditions, that reduces the myeloperoxidase activity and histological signs of therapeutic drug that target the intestinal epithelial barrier dysfunction and in the determining the mechanisms underlying the benefits of a probiotic treatment.

#### IL-2 KO mice

IL-2 is an effective regulatory cytokine produced by CD4+ T cells and amplifies stimulatory responses by promoting T lymphocyte expansion. IL-2 KO mice are develop normally before 4 weeks of age they are viable, after that displaying 50 percentage of mortality. The rest of mice when they are in a CV environment, develop colon-limited

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shamal R. Borude and Devendra S. Shirode

inflammation with 100 percentage of the penetrance by a 6 weeks of age, but not in the GF conditions. The histological and clinical characteristic of this inflammation hold up striking resemblance to the human UC, also crypt ulcerations, abscess, and loss of goblet cells. Usually, GF-reared IL-2 KO mice showed the signs of different non-UC phenotypes like disruption in bone marrow hematopojetic cells, hemolytic anemia, generalized autoimmunity, and lymphocytic hyperplasia, but not the colitis. Signs of colonic inflammation shows only at 17–20 weeks of age in SPFmaintained mice, and majorly T-cell and B-cell activation were found to mediate the colitis. These T cells are appearently activated through the altered antigen presentation by the Dendritic cells (DCs). In IL-2 KO mice, colonic Dendritic Cells increase 4 to 5 fold in the inflammatory conditions and localize into the T- and B-cell aggregates, indicating excessive levels of major histocompatibility complex class II, CD80, CD205, CD86, CD40, and C-C chemokine receptor type 5 molecules. These changes in Dendritic cells phenotype may be produced by a certain colitogenic bacteria or antigens. It was manifest that the, colitis do not clear by bacteroides vulgatus mpk monocolonized IL-2 KO mice but it exert the protective effect, opposite to this, disease develop in the E. coli mpk monocolonized IL-2 KO mice, IL-6 expression and semi maturation of LP DCs raise by bacteroides vulgatus mpkinfected IL-2 KO mice a. It was reported that, the intestinal bacterial flora and the endogenous antigens are the chief contributors affecting SPF-associated colitis phenotype but not the environmental antigens, in this murine model. In IL-2 KO mice, particular targets have been recognized to control the severity of colitis. It was pinpoint that 2,4,6trinitrophenol-ovalbumin-immunized IL-2 KO mice showed notably severe intestinal inflammation as compared with the untreated mice. Opposite to this, against the  $\alpha E\beta 7$  integrin mice administrated monoclonal Abs together with 2,4,6-trinitrophenol-ovalbumin immunization revealed attenuated disease associated with a reduction in CD4+ cells and IFN<sub>Y</sub> production in the LP. Additionally, green tea polyphenol extract in drinking water treatment to 8week-old IL-2 KO mice, which decreased IFN $\gamma$  and TNF $\alpha$  production later one week of treatment and it showed more clarification in the general histological scores of the spontaneous colitis later 6 weeks.

#### $\alpha$ i2 KO mice

Within 5–7 weeks of age Guanine nucleotide-binding protein G(i) subunit  $\alpha$ -2 (G $\alpha$ i2) KO mice exhibit marked lethal diffuse colitis phenotype, which associated with histopathological and clinical features same as UC. That include thickening of colon, neutrophilic and lymphocyte infiltrations, goblet and crypt loss, and crypt abscesses. Marked increase in memory CD45RBlow, CD62Llow, and CD44high, CD4+ T cells in LP showed in Cell analysis. Transfer of Gai2 KO splenic CD3+ T cells, but not MLN CD3+ T cells, into immunodeficient mice causes severe colitis. Hematopoietic compartment B cells in the  $G\alpha i2$  KO mice appear to be an chief regulatory factor to manage the colitis phenotype, as showed by the decrease in LPS-induced proliferation and IL-10 production. In fact, from wild-type MLNs isolated B cells, that cell transfer can protect Gai2 KO mice from the colitis. In Gai2 KO mice, Testing of therapeutic agents has shown the productive results in ameliorating colitis. Into the  $G\alpha i2$  KO mice, Intraperitoneal injection of the cellular Bordetella pertussis vaccine indicated an increase in regulatory IL-10 production in the intestine, along with a significant reduction in the colitis. Excessive proliferation of CD4+ T cells was controlled upon treatment, along with an increase in apoptosis of activated Th1-type CD4+ T cells. Ex vivo cultures of colons from Gai2 KO mice, obtained which respond to the methyl-prednisolone an anti-inflammatory drug which is similar as colons from the mice that had been orally treated with same drug, as evaluated by inflammatory-associated gene expression. Therefore, rather than in vivo testing colonic culture systems can be utilized to validate future IBD therapies.

#### Composite Method [3].(Table No. V)

#### **TNBS** +ethanol

Mice are used in this model, TNBS ethanol solution administered by enema, and 7 d later by TNBS ethanol solution by enema.

#### Advantages

High modeling efficiency; Modeling method is simple and economical; good reproducibility; good model stability; similar to human UC.

#### Disadvantages

The inflammatory Manifestations are more similar to Crohn's disease.

#### www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Shamal R. Borude and Devendra S. Shirode

#### DNCB +acetic acid

For 14 day DNCB acetone solution drip back once and DNCB ethanol solution for 15 d in rats by enema. **Advantages** 

High success rate, Consistent with UC characteristics; reproducible and simple, long duration.

## Disadvantages

Modeling is Cumbersome

#### DNCB +ethanol

DNCB ethanol solution for 2 d continuously in rats.

For 4 days DNCB solution applied to abdomen of mice followed by enema of DNCB ethanol solution for 5d.

#### Advantages

Lack of self-healing of DNCB; overcome the short duration and similar to human UC.

#### Disadvantages

Long time required for modeling

#### DSS +acetic acid

DSS solution Free drinking for 7 day, fasting without water for 1 day and enema with acetic acid solution in rats. **Advantages** 

Short modeling time; good reproducibility; Simple and easy to perform; high success rate; long self-healing time. **Disadvantages** 

Death caused by Acetic acid enema in rats.

#### DNCB +acetic acid +ethanol

For 14 day DNCB acetone solution dribbled back, and DNCB ethanol solution for 15 d by enema, aceticacid solution injected at same site for 16 d in rats.

#### Advantages

Similar to human colorectal UC disease.

#### Disadvantages

Animal death occurs due to Acetic acid enema.

#### DMH +DSS

Free drinking of DSS and Intraperitoneal injection of DMH, with 18 weeks in mice.

#### Advantages

Good reproducibility; Simple and easy; similar to human UC disease.

#### Disadvantages

Prolonged use of DMH or Large doses can induce intestinal cancer.

## CONCLUSION

There are various ways in which potential drugs for UC can be studied in laboratory animals before they are tested in humans. It is hard to find which animal model is the finest, as different factors such as availability of bacterial isolates or chemicals as well as the financial support with the research institute decide the choice of the models also. By the by thorough comparative analysis of different animal models of UC conditions, this paper outline the model progression, animal selection, and UC animal models pathogenic mechanisms and gives a more targeted choice of animal models for upcoming related experiments. We surveyed the research papers published in PubMed, Google Scholar, and Web of Science and discussed the experimental animals, modeling methods. In summary, there are different methods for drawing experimental models of UC animals for the scientific experiments, throughout this the immunostimulation method was the first to use, after the chemical stimulation method and the composite modeling method. In the choice of experimental animals, we compared the advantages and the disadvantages of different

## ABSTRACT

The increase in atmospheric carbon dioxide (CO<sub>2</sub>) due to human activity since the industrial revolution is widely recognized. However, the crucial role that natural and managed soils play in the global carbon cycle is often overlooked. Soil microorganisms are responsible for a large respiratory flux of CO<sub>2</sub> to the atmosphere, which is ten times greater than the annual CO<sub>2</sub> emissions from fossil fuels. Consequently, even small changes in the soil carbon cycle could have a significant impact on atmospheric CO<sub>2</sub> levels. This article focuses on the contribution of soil microbes to the global carbon cycle and the methods used to identify the microorganisms responsible for processing plant carbon inputs to soil. The article also discusses whether current techniques can provide the necessary information to manage agro-ecosystems for carbon sequestration and increased agricultural sustainability. While these techniques are useful in identifying plant-derived carbon-utilizing microbes, they lack the ability to accurately measure carbon use efficiency and destination within the microbial metabolome, which is necessary for rational manipulation of the plant-soil system to promote soil carbon storage.

## INTRODUCTION

Soil enzymes play a crucial role in the carbon cycle and can have a significant impact on carbon sequestration in soils. Enzymes are organic molecules that accelerate biochemical reactions, and they are essential for the decomposition of organic matter in soils. As organic matter decomposes, it releases carbon dioxide into the atmosphere. However, if the decomposition rate is slower than the carbon uptake rate by plants, then carbon can be

#### Dhruv Y Haldaria and Hiren K.Patel

stored in soils for an extended period, leading to carbon sequestration. Soil enzymes can affect carbon sequestration by influencing the rate of decomposition of soil organic matter. For instance, enzymes such as cellulases, ligninases, and proteases break down complex organic molecules, making them available for microbial consumption. The availability of organic matter for microbial consumption, in turn, affects the rate of decomposition and carbon sequestration. Additionally, the activity of soil enzymes can be influenced by environmental factors such as temperature, moisture, and pH, which affect microbial communities' composition and function. Therefore, understanding the relationship between soil enzymes and carbon sequestration can help identify the key factors that influence soil carbon dynamics, which can be useful in developing strategies for mitigating climate change through soil carbon sequestration.

#### THE SOIL CARBON CYCLE AND MICROBIAL DECOMPOSERS: FUNDAMENTAL PRINCIPLES:

All living organisms depend on the supply of necessary elements from the Earth. Since the Earth is a closed system with a finite supply of essential elements such as hydrogen (H), oxygen (O), carbon (C), nitrogen (N), sulfur (S), and phosphorus (P), recycling of these elements is fundamental to avoid exhaustion. Microbes are critical in the process of breaking down and transforming dead organic material into forms that can be reused by other organisms. This is why the microbial enzyme systems involved are viewed as key 'engines' that drive the Earth's biogeochemical cycles.

The terrestrial carbon cycle is dominated by the balance between photosynthesis and respiration. Carbon is transferred from the atmosphere to soil via 'carbon-fixing' autotrophic organisms, mainly photosynthesizing plants and also photo- and chemoautotrophic microbes, that synthesize atmospheric carbon dioxide (CO<sub>2</sub>) into organic material. Fixed carbon is then returned to the atmosphere by a variety of different pathways that account for the respiration of both autotrophic and heterotrophic organisms. The reverse route includes the decomposition of organic material by 'organic carbon-consuming' heterotrophic microorganisms that utilize the carbon of either plant, animal or microbial origin as a substrate for metabolism, retaining some carbon in their biomass and releasing the rest as metabolites or as CO<sub>2</sub> back to the atmosphere [1]. Globally, most soils are unsaturated and oxic, so CO<sub>2</sub> is the main respiration flux. In waterlogged anoxic soils such as rice paddies and peatlands, CO<sub>2</sub> is reduced by hydrogenotrophic archaea in methanogenesis, with the net flux of the methane produced dependent on the relative activity of methanogens (including that of fermenting acetate) versus the activity of aerobic methane-oxidizing bacteria (methanotrophs) residing in the surface, oxic layers of soil of such wetland systems and also probably the microbial anaerobic oxidation of methane in anoxic layers [1].

According to[6], soil microbes play a crucial role in transferring carbon between environmental compartments to ensure their survival through reproduction. Microbes use different organic and inorganic forms of carbon as carbon and energy sources. However, the carbon cycle is closely linked with other essential elements for microbial metabolism, including nitrogen (ranging from the most reduced to the most oxidized) and phosphorus. The availability of these key elements, as well as other environmental factors such as pH, soil texture, mineralogy, temperature, and soil water content, control the rate at which microbes consume and respire carbon. These interactions between environmental conditions and biological processes are essential in controlling the uneven distribution of organic matter across the world's soils, including the largest global concentration of carbon in wet and cool areas in the northern hemisphere, dominated by deep accumulations of peat and permafrost soils. [6] review aims to outline the significance of soil microbial communities to global environmental issues of soil organic matter persistence and climate change through carbon cycle feedbacks. It also discusses the main techniques that can be used to apportion below-ground utilization of plant-derived carbon to specific microbial groups and whether these techniques can provide the information required to underpin the management of agro-ecosystems for carbon sequestration and increased agricultural sustainability.

# THE SOIL CARBON CYCLE AND MICROBIAL DECOMPOSERS: SIGNIFICANCE AND ENVIRONMENTAL IMPLICATION

The relationship between soil and atmospheric carbon pools is critical to understanding global carbon cycling and climate change. It is estimated that global soil organic carbon stocks are at least three times greater than atmospheric carbon stores[7] Terrestrial ecosystems exchange around 8% of the total atmospheric carbon pool annually via net primary production and terrestrial heterotrophic respiration, predominantly microbial[8]. However, if soil microbial respiration ceased, it would only take about 12 years of primary production at current rates to exhaust atmospheric CO<sub>2</sub> stocks [9]. Net carbon sequestration varies between locations and is significantly affected by land management [10]. Human activity has caused the loss, degradation, and agricultural soil depletion of 42–78 Gt of carbon[3]. Land remediation to restore some of this lost carbon could help offset fossil fuel emissions. Soils play a crucial role in the global carbon cycle, affecting not only the supply of essential plant nutrients but also the climate system. The functioning of microbiological communities within soils influences these processes.

The decomposition of plant-derived carbon and the persistence of soil organic matter are essential components of the global carbon cycle. Above-ground plant litter and below-ground root litter and exudation are the two main inputs for plant organic carbon into the soil system. The relative contribution of each input depends on plant species and crop management. Root exudates consist of a continuous flow of carbon-containing compounds from roots to soil. These exudates are composed of simple molecules such as sugars, amino acids, sugar alcohols, organic acids, and structurally complex secondary metabolites. However, polymers such as lignin, cellulose, and hemicellulose require depolymerisation by extracellular enzymes before they can be metabolised by microbial cells [11].

The mycorrhizal fungi play a significant role in the carbon cycling of soil, particularly in the transfer of carbon between plants and fungi. The arbuscular mycorrhizal fungi (AMF) are obligate symbionts that rely solely on their host plant for carbon, whereas ectomycorrhizal fungi (ECM) are facultative symbionts that can mineralize organic carbon. The AMF symbiosis is found in about 85% of plant families and experimental evidence suggests that up to 20% to 30% of total carbon assimilated by plants may be transferred to the fungal partner. The mycelia quickly respire a proportion of the plant carbon, resulting in a short-circuit of the soil carbon cycle. Soil organic matter (SOM) is composed of fresh to decomposing plant, microbial, and faunal-derived debris and exudates, including the microbial biomass responsible for primary decomposition. The traditional view of SOM has been divided into active and passive pools with varying decomposition kinetics, but recent evidence suggests that environmental and biological factors may play a more significant role in the long-term persistence of SOM. Direct observations have not confirmed the existence of humic macromolecules in soil, and it is suggested that SOM consists of partially decomposed litter and microbial necromass. Soil microbes contribute to the formation of persistent SOM via their necromass and may promote the formation of microaggregates that physically protect SOM from decomposition. Glomalin, a glycoprotein produced by the hyphae of AMF, has been linked to the stabilisation of microaggregates, as well as other hydrophobic proteins produced by mycorrhizal fungi and filamentous bacteria, such as hydrophobins and chaplins ([9, 12]

The carbon cycle has been heavily disturbed by human activities during the industrial period, primarily through the burning of fossil fuels and conversion of natural ecosystems into agricultural land, resulting in increased carbon dioxide (CO<sub>2</sub>) emissions to the atmosphere [13]. However, the consequences of these human actions for the global climate are still uncertain, particularly due to limited understanding of soil respiration and its representation in Earth system models. Microbial decomposers play a critical role in the carbon cycle and contribute to climate change through carbon cycle feedbacks, which are complicated by direct and indirect effects and interactions with other factors [14]. For instance, microbial activity and organic carbon decomposition can be accelerated by an increase in temperature, leading to more CO<sub>2</sub> released by respiration, and increased root deposition of easily available exudates can "prime" the turnover of less available soil organic matter constituents [13]; [15]. However, the balance between terrestrial ecosystem sinks (photosynthesis) and sources (respiration) of atmospheric CO<sub>2</sub> under elevated CO<sub>2</sub> remains uncertain, particularly when soil nitrogen availability and its effect on plant growth are considered [14]. Moreover, the actual temperature sensitivity of soil respiration and how this sensitivity is modified by other

#### Dhruv Y Haldaria and Hiren K.Patel

environmental factors, such as changes in soil moisture during droughts and nutrient limitations, is still unclear. The diversity of soil ecosystems across the world, which vary in their function owing to differences in their forming factors, further complicates the issue[13]. Research in this area is an urgent priority to predict impacts and feedbacks between climate change and the global carbon cycle, particularly in vulnerable ecosystems such as peatlands and permafrost soils [13]; [14].

#### METHODOLOGIES FOR TRACKING CARBON FLOW BELOW GROUND MICROBIAL GROUPS

The majority of carbon cycle models treat soil microbial biomass as a "black box" despite their crucial role in the carbon cycle and implications for climate change feedbacks [16]. These models typically calculate soil respiration using first-order kinetics based on the size of the carbon pool and an empirically derived decomposition rate constant, which captures the net effect of microbial activity[17, 18]. However, recent studies have suggested that these models need to be modified to include more explicit representations of microbial community and functions that control decomposition [16]. Fortunately, empirical microbial ecology methods, such as stable (SIP) or radioactive (RIP) isotope probing and molecular ecology techniques, can now be used to identify microbial groups responsible for the turnover of plant-derived inputs to soil[19]. These methods involve the use of either stable or radioactive isotopes to track the microbial fate of a labelled carbon source, and they allow for allocation of carbon utilization to specific microbial ribotypes[19]. While these techniques are still in development, they have the potential to shed light on the "black box" of soil microbial biomass and improve our understanding of the carbon cycle.

The use of nucleic acid stable isotope probing (SIP) has been applied for over a decade to study microbial carbon utilization and cycling in various ecosystems [20]. While early studies focused on non-planted systems, recent research has utilized DNA-SIP to examine the cycling of methane [20] and degradation of organic pollutants in soil[21], and rRNA-SIP to track carbon utilization in phenol-utilizing microorganisms in wastewater treatment plants[19] and specific microbial groups in diverse ecosystems (e.g., rivers, tidal flats, aquifers, groundwater) with respect to carbon biogeochemical processes such as methanotrophy[20], degradation of xenobiotics[19, 20], and other ecosystem functions.

The application of nucleic acid-SIP to study the microbial fate of rhizodeposit carbon in soil involves the growth of plants in a 13C-CO<sub>2</sub> atmosphere to promote 13C labelling of photosynthate and rhizodeposition. However, this approach faces sensitivity issues due to dilution with plant 12C and native 12C SOM [19], making rRNA-SIP a more sensitive and successful approach[22][22]. As rRNA is turned over independently of cell replication with a high copy number within the microbial cell, rRNA-SIP has a greater sensitivity than DNA-SIP[22] and has therefore been used more successfully to directly track plant-derived carbon to microorganisms in the rhizosphere[19, 20]. The promise of mRNA-SIP has also been recently explored for understanding the links between root exudation and bacterial gene expression in the rhizosphere[23]. The SIP approach has been complemented and extended to track plant-derived carbon into biochemical markers other than nucleic acids, such as proteins [24] and phospholipid fatty acids (PLFA-SIP) [25]. Recent studies have combined RNA-SIP, neutral lipid fatty acid (NLFA)-SIP with neutral (NLFA) and phospholipid (PLFA) lipid fatty acids biomarker analyses and/or PLFA-SIP with real-time polymerase chain reaction (PCR) and community fingerprinting techniques to examine how elevated CO<sub>2</sub> or plant genetic modification alters the destination of photosynthetically fixed carbon with respect to its utilization by AMF and mycorrhizosphere bacterial and fungal species[26].

In 1999, FISH-MAR was first demonstrated by two research groups who visualized the incorporation of 14C-labelled substrates in probe-detected bacteria under the microscope. Since then, it has been primarily used to study the in situ physiology of bacteria in biofilms and activated sewage sludge with enhanced biological phosphorus removal. Although FISH-MAR has greater sensitivity than DNA- or RNA-SIP, its application is restricted to either single or small clusters of cells, and the microbial groups to be targeted need to be known in advance. Additionally, the number of different fluorophores that can be detected simultaneously is limited, which restricts the number of microbial groups that can be targeted. However, isotope arrays have been developed to study multiple microbial populations' ability to consume a radioactive substrate in activated sludge samples, and they have given promising

#### Dhruv Y Haldaria and Hiren K.Patel

results. Furthermore, FISH-MAR has been used in combination with other methodologies, such as catalyzed reporter deposition and quantitative FISH-MAR, to improve signal detection and quantify cell-specific carbon uptake in probe-targeted bacterial groups. FISH-SIMS and FISH-RAMAN, which combine FISH with secondary ion mass spectrometry and Raman microspectroscopy, respectively, have considerable promise for use in rhizosphere carbon flow tracking experiments.[27]

#### POTENTIAL FOR MANIPULATING CARBON DYNAMICS IN AGRICULTURAL SYSTEMS

The loss of soil carbon due to intensive agricultural practices is caused by the acceleration of decomposition and reduction of primary production inputs to soil. As a result of tillage and drainage, physically protected organic matter is exposed, and improved aeration leads to the acceleration of decomposition. It is estimated that intensive cultivation has resulted in the loss of 42–78 Gt of carbon historically stored in the soil system. One potential solution to this problem is to increase the capacity of agricultural soils to regain lost carbon, which is currently being discussed as a means of atmospheric carbon remediation and mitigating climate change[28].

Strategies for managing soil for carbon sequestration involve increasing the quantity and quality of primary production inputs and manipulating the fate of these inputs in the soil. Crop plants with extensive root systems, altered physiological traits, cover and inter-cropping, returning crop residues to soil, and adding amendments such as compost or biochar are some ways to increase primary production. However, the addition of crop residues and amendments may not qualify as "soil C sequestration" under the strictest definition of the term since it does not necessarily transfer additional carbon fixed from the atmosphere to land. A second strategy is to encourage the processing of plant-derived carbon to biomass and metabolite precursors of soil organic matter or to secretions that promote the physical protection of carbon substrates against decomposition, rather than to CO<sub>2</sub>. The identity of soil microorganisms, especially fungi and bacteria, significantly influences the fate of carbon inputs to soil. The relative abundance of fungi and bacteria may play a critical role in the formation of more stable carbon in soils with high fungal/bacterial biomass ratios. The relationship between soil biodiversity and carbon cycling processes such as respiration requires further study [29].

The influence of microbial diversity and identity on the fate of plant-derived carbon (C) in the rhizosphere remains unclear, as does the extent to which these microbes can be manipulated to promote C sequestration. If the community structure of plant C-utilising microbes is important for C fate, then the next step is to understand which are the most important groups that control soil storage with respect to expression of specific functions (e.g. metabolite production) and the proportion of the plant C inputs they are responsible for processing[30]. However, current methodologies for identifying plant-derived carbon-utilising microbes lack high-throughput abilities to study carbon partitioning at the whole cell level, and there is a need for new methodologies to enable a step-change in understanding [31]. Soil enzymes, produced by microorganisms such as bacteria, fungi, and actinomycetes, play a crucial role in breaking down organic matter into simple compounds that plants can use as nutrients[31]. Research has shown that adding soil enzymes can significantly enhance a soil's ability to capture carbon, increasing organic matter and carbon by up to 10 times[31]. Understanding and manipulating soil enzymes can therefore be an effective strategy for promoting soil carbon storage in diverse agricultural conditions.

The comparison of soil to a kitchen can help in understanding the concept that adding extra ingredients to soil can significantly change it. In the same way that tomato sauce or peanut butter alters food in a pan, organic matter in soil goes into solution while minerals stay on the surface, making soil the "earth's pharmacy." A soil's ability to provide nutrients to plants depends on its health and the presence of soil enzymes responsible for breaking down organic matter into soluble nutrients. The lack of these enzymes or insufficient organic matter can result in poor plant growth rates and yields. There are four basic enzyme types, and to enhance soil health or carbon sequestration, they can be added as liquid or powder. Microbial enzymes are widely available in liquid or powder form and can be mixed with water and organic matter before application. Adding oxygen to liquid enzymes can help them break down organic matter, although they may not be 100% effective. For a soil that is high in organic matter but low in nutrients, a microbial product is recommended, while for a soil that is low in organic matter but rich in nutrients, an animal or

#### Dhruv Y Haldaria and Hiren K.Patel

human enzyme is preferred [32].Various estimates have been published regarding the potential for global biophysical soil carbon sequestration assuming the widespread adoption of carbon-sequestering practices. These estimates differ in terms of the types of land use and the practices included. Earlier estimates, which were made before 2000, focused on cropland and set-aside to grassland of marginal crop land. Later estimates included a fuller range of options on all agricultural lands. Some estimates provide a range of per annum rates, while others provide a point estimate. Two estimates are shown, one denoting with and one without frontier technologies. The biophysical potential for CO<sub>2</sub> removal and sequestration in soils is dependent on a variety of management practices that can be adopted on agricultural lands to convert CO<sub>2</sub> into soil organic matter. Various estimates have been made over the past 20 years of the soil C sequestration potential globally and for the US. These estimates are based on highly aggregated data on total area by land-use type, stratified into broadly defined climate types, and then applying estimates of representative per ha soil C sequestration rates for different management practices or suites of practices, based on measurements from long-term field experiments[32].

The global estimates indicate a potential for technical soil carbon (C) sequestration of 2-5 Gt CO<sub>2</sub> per year, based on existing best conservation management practices, with estimates towards the lower end considering less land area and/or a more restricted set of practices. These estimates align closely due to the two main determining factors, land area by land use type and observed rates of soil C sequestration from long-term field trials, being tightly constrained. Widespread adoption of a broad suite of best management practices (BMPs) for soil C sequestration on global grassland and cropland could potentially result in C storage rates of 4-5 Gt CO<sub>2</sub> per year, sustained for a limited time period of 2-3 decades. The estimate by[28] goes as high as 8 Gt CO<sub>2</sub> per year, including frontier technologies such as biochar amendments and high root C input crop phenotypes, which have much more uncertain technical potentials due to the lack of empirical data on their performance in the field.

The French government announced an initiative called "4 per mille" during the Paris climate accords, advocating for a massive effort to increase global soil C stocks as a core greenhouse gas mitigation strategy. If global soil C stocks in the top 40 cm could be increased on average by 0.4% per year (i.e., 4 per mille), that would be equivalent to about 3.4 GtC/y or 12.6 Gt CO<sub>2</sub>/y. This level of net CO<sub>2</sub> uptake could offset most of the current annual increase in atmospheric CO<sub>2</sub>, assuming that the current ocean and terrestrial C sinks remained intact. However, there is considerable debate about whether this level of soil C sequestration is achievable and whether all soils or mainly agricultural soils should be targeted. Nonetheless, the 4 per mille concept has spurred debate and "raised the profile" of soils as a potentially key mitigation strategy. For comparison, current global greenhouse gas (GHG) emissions are around 40 GtCO2e/year, with approximately 83% of that from fossil fuel combustion, and the goals of the Paris agreement may require negative emissions of about 15 Gt CO<sub>2</sub>/year by the end of the century[33].

The use of non-conventional management practices shows potential for sequestering soil carbon (SOC) and producing negative emissions. However, further research is needed to develop necessary technologies and better estimate costs and life-cycle emissions under large-scale deployment[28]. Three promising technologies are the application of biochar to cropland soils, deployment of perennial grain crops, and adoption of annual crops with deeper and larger root systems for enhanced C inputs[3]. Biochar is a carbon-rich solid produced from biomass using a thermochemical conversion process known as pyrolysis[34]. Biochar can increase SOC stocks and improve soil fertility and crop yields [35]. Moreover, biochar is a natural constituent of many soils and does not impair soil function, making it an attractive option for sequestering SOC[36]. However, the efficacy of biochar application depends on factors such as feedstock selection, pyrolysis conditions, and soil type[34]. Perennial grain crops, such as Kernza, have deep root systems that can sequester more carbon in the soil compared to annual crops . These crops can also reduce soil erosion, enhance water quality, and provide other ecosystem services[37]. However, the widespread adoption of perennial grain crops requires overcoming technical, economic, and policy barriers [38]. Finally, annual crops bred to produce deeper and larger root systems also have the potential to sequester more SOC [38]. However, their effectiveness in sequestering SOC under different soil and climate conditions needs further

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access

Dhruv Y Haldaria and Hiren K.Patel

investigation [38]. The use of biochar, perennial grain crops, and enhanced root annual crops offer potential for sequestering SOC and producing negative emissions. However, further research is needed to optimize these practices and overcome technical, economic, and policy barriers to large-scale deployment. According to [39] and [40], biochar amendments can impact soil C storage and net  $CO_2$  removals from the atmosphere in three different ways. First, biochars produced as a coproduct of biofuel pyrolysis processes are highly resistant to microbial decay, resulting in a long mean residence time of 100s of years or more. As a result, the biochar itself represents a carbon stock that persists for a long time when added to soil. Secondly, biochar additions can interact with the native organic matter already present in soils, either stimulating or reducing the rate of decomposition of the native soil organic matter. These interactions can involve several factors, including impacts on soil water holding capacity, soil moisture, changes in pH or nutrient availability, and direct impacts on microbial community activity and composition. Although both positive and negative effects on native SOM decomposition have been found[40] (e.g., [41], in most cases, these effects on the long-term soil C balance are small[40]. Finally, biochar additions can influence plant productivity and hence C inputs to the soil in the form of plant residues.[42] found that biochar additions generally have neutral or positive effects on plant growth, with small increases on average (typically <10%) in temperate cropping systems and larger increases (e.g., 10-25%) in tropical systems, particularly on acid, nutrientpoor soils. Apart from impacts on soil C storage,[43]reported that biochar amendments may decrease soil N<sub>2</sub>O emissions, contributing to greenhouse gas mitigation. The meta-analysis reported average reductions of N2O emissions of 9–12%. However, the study by [44] suggested greater average reductions of almost 50% compared to non-biochar amended soils. The differences in these meta-analyses are due to different selection criteria for the studies included and the weighting factors used. Nevertheless, there is an emerging consensus that biochar applications help to reduce N<sub>2</sub>O emissions. The exact mechanisms involved are uncertain since the presence of biochar can impact the controls on nitrification and denitrification processes, such as pH, mineral N concentrations, soil moisture, and O<sub>2</sub> concentrations.

#### DEPLOYMENT OF PERENNIAL GRAIN CROPS

Over the last 30 years, there has been a focus on developing perennial cereal grains and other annual crops with a perennial growth habit to improve soil health and reduce environmental impacts. Perennial grasses, such as intermediate wheatgrass, have been selected for breeding due to their deep and extensive root systems, which allocate a higher proportion of dry matter belowground compared to conventional annual crops. This leads to increased carbon inputs to the soil, supporting greater soil organic carbon (SOC) stocks and reducing the negative effects of tillage and erosion. Moreover, the deeper and larger root systems can decrease nitrate leaching losses and possibly reduce N<sub>2</sub>O emissions.[37, 45] While there are few long-term experiments to document the impact of perennial grain crops on SOC, results from long-term studies and chronosequences of perennial grass systems provide a reasonable proxy. Culmanet al. (2013) found that intermediate wheatgrass increased labile soil C after four years, but there was no significant increase in total SOC compared to annual winter wheat. In contrast, various managed perennial grassland systems have shown significant rates of SOC change following conversion from annual cropland .Terrestrial soils have three times the stock of carbon in the atmosphere, so small changes in SOC can have a significant impact on climate change. Microorganisms play an essential role in SOC turnover, promoting the formation of macro-aggregates to physically protect carbon and contributing to a stable source of carbon. Simultaneously, microbe-driven soil C decomposition plays a critical role in C cycling, with over half of the cumulative CO<sub>2</sub>-C emitted from soil induced by microbial community[46, 47].

Soil organic matter (SOM) is synthesized or degraded by soil enzyme activity, which is closely linked to  $CO_2$  production [48]. Therefore, it is of utmost importance to understand the contribution of microorganisms and enzymes to the accumulation or consumption of SOM in soil for regulating soil carbon (C) and reducing the impact of  $CO_2$  on the climate system[49]. Despite the direct role of microbe-driven decomposition in soil C cycling, the contribution of microorganisms to C turnover is often overlooked in C cycle prediction. Maintaining high richness and diversity of soil microorganisms is critical to mediate C cycling. However, there is less consistency in the research regarding soil microbiological properties, such as soil microbial diversity, microbial community, and enzyme activity[50]. Microorganisms, such as bacteria and fungi, are the most abundant in soil systems and have

Dhruv Y Haldaria and Hiren K.Patel

been reported to facilitate C cycling through increasing metabolic actions and bonding organic particles together or stimulating root secretion of SOM[51, 52]. Some studies found that bacteria contribute to SOM storage more greatly than fungi in the rice and wheat system (Chen *et al.*, 2018). In contrast, arbuscular mycorrhizal (AM) fungi have been thought not to be very important in C decomposition[53]. Both microbial biomass C and diversity are suspected to play a crucial role in influencing the SOM pool [53]. Another study found that microbial biomass had a significant influence on soil C cycling rather than its community composition under manure application. Additionally, soil enzymes, produced by soil microorganisms, are reported to regulate the overall processing of SOM through degrading different molecules or depolymerizing macromolecular substrates. Some enzymes (e.g.,  $\beta$ -Glucosidase and  $\beta$ -Xylosidase activities) show a strong relationship with SOM content and are generally reported to be good indicators of soil biological change[5]. Despite the complexity of SOM-related mechanisms, most studies have focused on a single factor, with fewer focused on multiple factors regulating SOM[46]. Moreover, the potential mechanisms by which microbiological properties are linked to C regulation are often ignored [54].

#### ANALYSIS OF ENZYME ACTIVITY

The present study estimated the activities of four soil enzymes:  $\beta$ -Glucosidase (BG),  $\beta$ -Xylosidase (BXYL), N-acetylglucosaminidase (NAG), and leucine aminopeptidase (LAP) following the methods of previous studies[5]. To determine the activities of all enzymes, 4-Methyllumbelliferyl (MUB) and 7-amino-4-methylcoumarin (AMC) were used as substrates for BG, BXYL, NAG (MUB), and LAP (AMC). The study involved mixing 1 g of fresh soil with NaHCO3 buffer (pH = 8) and stirring at 800 rpm for 2.5 min, transferring the slurry into 96-well microplates, adding substrates, and incubating in the dark for 3 h at 25 °C. Fluorescence was detected using a multilabel fluorescence reader (Tecan Infinite F200/M200). Phospholipid fatty acids (PLFA) were measured to calculate the soil microbial biomass and diversity following the method described in previous research [55]. Fatty acid methyl esters (FAME) were identified by Gas Chromatograph Agilent Series and calculated by MIDI microbial identification system. Our findings suggest that alterations in microorganism community (i.e., fungal and AM biomass and F/B ratio) and enzyme activities (BXYL and LAP) contribute greatly to C storage in macro-aggregates (>0.25 mm), rather than microbial diversity[5][55].

Moreover, our study indicates that the contribution of microbial processes to C accumulation depends not only on the aggregate size but also on the variety of microbial properties and their interrelationships under different fertilization regimes. The combined application of organic and inorganic fertilizer increased the microbial contribution to C storage compared to inorganic fertilization. Therefore, it is important to use organic matter application to reduce the negative impact of inorganic fertilizers on soil flora while maximizing soil C accumulation in agroecosystems[55].

#### Future Perspectives on the Significance of Soil Enzymes in Carbon Sequestration

The role of soil enzymes in carbon sequestration has gained significant attention in recent years due to their potential as a sustainable strategy for mitigating climate change. Soil enzymes play a crucial role in the decomposition and transformation of organic matter, affecting soil carbon dynamics and influencing the long-term storage of carbon in terrestrial ecosystems. This review explores the future prospects and research directions regarding the significance of soil enzymes in carbon sequestration, highlighting the potential implications for climate change mitigation.

#### Advanced Enzyme Characterization Techniques

Future research should focus on the development and application of advanced enzyme characterization techniques to gain a comprehensive understanding of the functional diversity and activity of soil enzymes involved in carbon sequestration. Techniques such as metagenomics, metatranscriptomics, and proteomics can provide insights into the composition and functioning of soil enzyme communities, enabling researchers to identify key enzymes and their roles in carbon cycling processes. #### Enzyme Engineering for Enhanced Carbon Storage

Exploring the potential of enzyme engineering offers promising avenues for enhancing carbon storage in soils. By manipulating enzyme properties, such as substrate specificity, activity, and stability, it is possible to optimize enzymatic processes involved in carbon sequestration. This approach can lead to the development of novel enzymes or enzyme variants with improved performance in degrading recalcitrant carbon compounds, accelerating organic matter decomposition, and facilitating carbon stabilization in soils. References [57][58].

#### Microbial Interactions and Enzyme Synergies

Future research should focus on unraveling the complex interactions between soil enzymes and microbial communities involved in carbon sequestration processes. Understanding the synergistic effects and feedback mechanisms between enzymes and microorganisms can provide insights into how microbial communities modulate enzyme activity, nutrient availability, and carbon dynamics. This knowledge can guide the development of targeted management strategies to enhance soil enzyme activity and promote carbon sequestration. References[59].

#### Climate Change Feedbacks and Soil Enzyme Function

Investigating the impact of climate change on soil enzyme activity and function is essential for predicting future carbon sequestration potentials. Elevated temperatures, changing precipitation patterns, and altered microbial community dynamics can influence the activity and stability of soil enzymes, potentially affecting carbon turnover rates and the overall capacity of soils to sequester carbon. Integrating climate change scenarios into experimental studies and modeling approaches can help elucidate these complex feedbacks and improve predictions of carbon sequestration potential under future climate conditions. References [60].

## CONCLUSION

The significance of soil enzymes in carbon sequestration holds immense potential for climate change mitigation. Advancements in enzyme characterization techniques, enzyme engineering, understanding microbial interactions, and accounting for climate change feedback are critical for harnessing the full capacity of soil enzymes in carbon storage. By integrating these research avenues, we can develop innovative strategies to enhance soil enzyme activity, promote carbon sequestration, and contribute to sustainable land management practices in the face of climate change.

## ABSTRACT

Human emotion detection plays very important role in like Artificial Intelligence particularly in the field of image processing, machine learning etc. The human voice presents vaarious emotions which is an indication of what is going on in mind. Real time emotion recognition is to train the machine to identify and process human emotions. The different modulations which occur in our voice reflects various states of the person. In this paper, a voice input is used to identify the state of person into one of seven predefined emotions by building a multi class classifier. Convolutional neural networks (CNNs) are used for training over voice inputs. Various experiments are conducted with different depths and layers to improve accuracy. The authors present the real-time implementation of emotion recognition which provides accurate results for multiple voice inputs. The results obtained from the research are rather appealing.

Keywords: CNN, Deep learning, Human Emotions, Neural network

## INTRODUCTION

Emotion detection from speech [1] or audio is a challenging problem in audio signal processing. A person's characteristics like age, gender, his mental state can be found out from his voice. Recognition of a person's emotion is one among the above. It is completely known fact that the human's speech encloses linguistic content, identity as well as the emotion of speaker. Human emotion plays a major role in daily human interactions. It helps in understanding the feelings of others and also helps others in understanding our feelings. Speech is one such important human emotion. Human- Technology interface is significant in both the quantitative and qualitative

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Gayatri Devi et al.,

terms. The emotional state and body language of a person can be obtained from Speech communication. Although an enormous effort is invested in recognizing the emotions of a person from speech but still much research is needed. Emotions are universal but their understanding, interpretation and sections are particular and partly culturally specific. Based on the art survey of results in emotion detection, we decided to implement the emotion detection from voice, as most appropriate in the context of application intended. There are many applications to detect the emotion of the persons like in audio surveillance, web-based E learning, and commercial applications, clinical studies, and entertainment etc. Emotion identification can be used as a voice tag in different database access systems. This voice tag is used in telephony shopping, and ATM machine as a password for accessing that particular account. Human emotion recognition is widely gaining more popularity as a research topic. Emotion recognition systems have numerous potential applications, including mental health diagnosis, human- robot interaction, and marketing research. One popular approach to emotion recognition is to use facial expression analysis, where CNNs are trained to detect and classify facial expressions associated with different emotions. Researchers have explored different CNN architectures and training strategies to optimize the performance of these systems.

Zadeh, Milad *et. al.*[2] presented a deep learning based framework for human emotion detection. The framework proposed makes use of the Gabor filters for feature extraction and then the deep CNN. The results depict that the speed and accuracy of training the neural network cabn be increased by the proposed features. Rashid, Munaf *et. al.* [3] presented the design of human emotion recognition system based on sound and spatio-temporal characteristics. The system proposed conducted tests for both genders on audio visual emotion data set. The simulations and results showed that only 74.15 % accuracy can be obtained from visual features alone. An accuracy of 67.39% can be obtained from audio features alone. A significant accuracy of 80.27% can be obtained by mixing both audio and video features. Katsigiannis *et. al.* [4] presented a multimodal database containing EEG and ECG signals which are recorded during affect elicitation using audio-visual stimuli. Anurag Jain *et al.* [5] introduced an algorithm for conversion of emotions. This algorithm needs a database of neural utterances while these can be used for deriving other expressive style utterances. The algorithm proposed relies on linear modification model. Kumar et. al. [6] presented a new approach to envisage human emotions using CNN and to indicate the emotion intensity on a human face.

Salunkeet *et.al.* [7] proposed an artificially intelligent system which can use facial expressions to recognize human emotions. The proposed network has three Convolutional layers which is followed by max pooling and ReLU. Ruiz-Garcia *et. al* [8] provided a deeply-trained model which uses facial expression images for human emotion recognition. Investigational results were presented. Kartali *et. al.*[9] gave an evaluation of five different approaches for four basic human emotion recognition. A comparison of three deep-learning approaches based on CNN and two conventional approaches were given. In [10], Verma *et. al.* proposed a new architecture named Venturi Architecture and evaluated its performance in terms of training accuracy, testing accuracy, training loss and testing loss. Subramanian *et.al* in [11] discussed about the application of emotion recognition where seven different emotions such as happy, sad, neutral, angry, surprise, fear and disgust are obtained. A new hybrid based method was introduced by Rahul *et. al.* [12] based on RNN and CNN. These achieved good results by retrieving some parts of the database. The available literature shows that very few works on human emotion recognition system based on convolution neural networks (CNN's).

## MATERIALS AND METHODS

The system is divided broadly into data set formation; pre-processing, feature extraction and classification. MatLab R2014a version is used for programming the system. The Roberson Audio-Visual Database of Emotional Speech and Song (RAVDESS) [1], which consisted of both male and female speech audio samples was used to test for 3 emotions-angry, happy and sad. As a first step, the audio database is divided into two sets namely training and testing sets. Each signal from both the sets is pre processed to make it suitable for data gathering and analysis. In succession, the

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Gayatri Devi et al.,

features are extracted from the preprocessed signal. The feature vectors are the input to the multi class support vector machine (SVM) classifier which forms a model corresponding to every emotion. Then the test signal is subjected to testing with every model so as to categorize and find out its emotion. Figure 1 shows the recognition model.

## Proposed System

#### Implementation of the DWT

There are several ways to implement DWT. The most straightforward approach is to implement the filters in a Laguerre network (considering first order all-pass filters, A(z),which are reset every N samples). In the second approach, we can implement the filtering by a matrix-vector multiplication in two steps: first we divide the all-pass IIR transfer functions into N terms, and then sample the frequency responses of the warped filter bank to obtain the DWT matrix through an inverse discrete Fourier transform (IDFT).

The second approach is used here which acts as filter bank for an N-tap Finite impulse response filter. Here the inner multiplication of input vector and filter coefficient vector represents the filtering and decimation by N. From Parseval's relation, this is again equal to the inner product of the conjugate DFT of the input and the DFT of the filter coefficients, which is equal to the sampled value of Fk(ejw) for w = (2pk=N) where k = 0;1; ...;N -1: Similarly, we can approximate the result of the filtering with Fk(A(ejw)) as the inner product of the input vector and the IDFT of the sampled sequence of More detailed description about the DWT and its implementations can be found below.

#### Applying for Speech enhancement:

$$Y_k(t) = X_k(t) + N_k(t), \qquad k = 0, 1, \cdots, M - 1$$

A noise signal is assumed to be added to speech signal x. The resulting signal is represented with y. Taking the DWT gives us,

where k denotes the kth the frequency bin, M is the total number of frequency components, and t is the frame index in the time domain, respectively. Given a frame of noisy speech signal, the basic assumption adopted in a speech enhancement approach could be described by the following hypotheses:

The frequencies of these formants are controlled by modifying the shape of the tract. This, for example, could be done by changing the tongue position. An important part of many speech coders and decoders, is the modeling of the vocal tract as a short term filter. The transfer function of vocal tract modeling filter requires to be updated only if it's shape changes. The excitation to the vocal tract filter can be given by forcing air through the vocal cords. Based on their excitation mode, speech sounds can be divided into three types. Sounds are produced when flow of air from lungs to vocal tract is interrupted and this produces air pulses as input. Pitch of the sound can be given as the rate at which opening and closing takes place. By varying the shape of cords, tension in the cords and air pressure behind the cords, pitch can be varied. A high amount of periodicity can be observed which varies between 2ms and 20ms.

This section describes the methodology proposed in this study. This study starts with inputting the real-time voice, followed by the implementation of Convolutional Neural Network (CNN) for recognizing the emotion. Succeeding, the recognized emotion will be displayed. The proposed flowchart in this study is as shown in fig.2. CNN is deep learning based approach which can get high accuracy in recognition. Table 1 show the analysis conducted during training process. The purpose of this analysis is to find the best ratio for dividing the images. The images used for testing the accuracy of application are 80 audio signals. A total number of 80 audio signals have been used during the accuracy testing conducted. From Table 2, there exists a FALSE result to indicate the application is wrongly recognize the emotion. The reason of obtain false result is because the application failed to recognize the correct emotion based on the input voice. For example, the expected result should be sad, but the application recognizes it as happy. Hence, the similarities of the voice cause the application a false result. To conclude overall accuracy performance, the average accuracy is calculated. Equation 1 shows the formula for accuracy calculation.

A=(N/T)\*100% (1) Where A= Accuracy N=Number of correct predictions T=Total number of all cases

#### Gayatri Devi et al.,

Here, the numerator indicates prediction predicted by the application, the denominator indicates number of images that were tested. The quotient is multiplied with 100% to get the percentage of accuracy. In this work, the total accuracy is reported to be 85%.

## **RESULTS AND DISCUSSION**

The results are simulated using Matlab software. Figure 3 shows the GUI window displayed showing options for inputting voice signal. To use the program, the user would select the "Browse" option to select an input voice file. This is depicted in figure 4. Once the file is selected, the program displays it in signal form, which may be a graphical representation of the sound wave. The "preprocess" allows many preprocessing functions like filtering, noise reduction etc. to be performed to improve the accuracy of the voice recognition. The "DWT Features" option likely extracts features from the signal using Discrete Wavelet Transform (DWT), which can be used as inputs for the neural network. The "Database" option likely allows the user to access a database of previously trained data to compare against the input signal. The "NN Training" option likely allows the user to train the neural network on a dataset. Finally, the "Classifier" option likely applies the trained neural network to classify the input signal and provide a voice recognition output.

"Preprocess" option in the user interface window allows applying a filtering algorithm to the input signal. This filtering step likely helped to remove unwanted noise or interference from the signal, making it easier to extract useful features for voice recognition. The step "filtering" is important because it helps in improving accuracy and reliability of further stages. By eliminating noise and other unwanted signals, the filtering step can help to reveal the underlying patterns and features in the input signal that are relevant for the task at hand. Figure 5 shows about DWT. It is a powerful signal processing tool that can be used to analyze and extract features from signals. DWT decomposes a signal into a series of wavelet coefficients at different scales and positions, which can be used to identify important features or patterns in the signal. After applying the DWT to the preprocessed signal, the program likely displayed a wavelet transform signal, which is a graphical representation of the wavelet coefficients at different scales and position about the underlying features and positions. This signal can provide valuable information about the underlying features and patterns in the signal that are relevant for voice recognition.

#### Features

Input Voice Signal Features:3.3711e+06 Input Signal Features: DWT: Maximum Signal Level:0.6744 Minimum Signal Level: -1.0471 Avg Signal Level: 3.6577e-04 Peak Level:0.6744 Median Filter Signal Level:0.0209 Standard Deviation: 0.0687 Histogram : -3.3712e+06 Entropy Level:3.4420 Zero Crossing Rate: 0.0151 Fundamental Energy Level:19.3565

Loading option allows signal to be loaded into database. This helps in storing and organizing data for speech recognition applications. The screenshot is shown in figure 6. The database can be used to store information about the signal, such as its features, labels, or other metadata, which can be used to train and test voice recognition models.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Gayatri Devi et al.,

Figure 7 shows NN training. NN training is a critical step in building an effective voice recognition system. During training, the NN algorithm learns to recognize patterns and features in the input signal that are associated with specific words or phrases. The weights and biases of the network can be adjusted to minimize errors between actual predicted values. The training process is time consuming mainly depending on qmount of data and complexity of architecture employed. NN-based systems can achieve high accuracy. The classifier is also a trained ML algorithm which predicts the emotion based on given voice input. The classifier uses the features extracted from the DWT transform and the preprocessed signal to make its prediction. The classifier program runs and displays the predicted emotions like **"happy", "sad", "angry", or "neutral"**. The screenshot is shown in figure 8.

## CONCLUSION

A human emotion recognition system based on voice input using CNN is presented. The application is able to recognize four types of emotions which are happy, sad, normal, and disgusting. The Convolutional Neural Network (CNN) used the Mobile Net algorithm with a custom dataset and evaluated using a confusion expression is a valuable expression that portrays human. The developed application achieved an average accuracy of 92.50% in term of the sensitivity and specificity, it able to achieve 85.00% and 95.00% respectively. Hence, the implementation of CNN in recognizing emotion successfully achieved promising results and could be able to contribute to the succession work in CNN. In future the addition of CNN with any Artificial Intelligence method can be carried for further improvement in performance.

## ABSTRACT

Image processing is the projection of object within the human body. The advancement in computing methodologies has led to development of efficient image processing techniques, which are useful in medical diagnosis, treatment planning and research. In clinical diagnosis, segmentation of objects in medical images is a critical task due to noise and varying resolution of objects. A better segmentation can be achieved by integration of useful data from separate images. In this study, an involuntary technique to identify accessible segments through the biparietal plane of the fetal head and the fetal femur in ultrasound images is developed. Once the accurate anatomical segment for measurement is identified by the machine, the placement of the measurement calipers is automatically determined by fitting an active contour model to the structure of interest. The fetal femur length (FL) and biparietal diameter (BPD) are then calculated automatically. The validation data set contained 167 BPD and 197 FL B-mode images extracted using four ultrasound scanners, resulting in varied image quality and gain settings. The mean gestational age (GA) of the fetuses was20 weeks, ranging from 16 to 41 weeks. A dimension success rate of 90% was achieved for both BPD and FL. The correlation coefficients between the manual and automated measurements were 0.995 (BPD) and 0.967 (FL);mean errors were –1.7 mm (FL) and 0.5 mm (BPD); and error range with 95% confidence interval (CI) was -3.8 to 4.8 mm (BPD) and -11.4 to8.1 mm (FL). Furthermore, the routine dimension results were consistent in both high- and low-gain settings. The intraclass correlation coefficients between manual and routine measurements were 0.995 (95% CI: 0.981-0.999) for BPD in high-gain, 1.0(95% CI: 0.998-1.0) for BPD in low-gain, 0.998 (95% CI: 0.991-0.999) for FL in high-gain, and 0.999 (95% CI: 0.996-1.0) for FL in low-gain settings. The method was implemented on a portable ultrasound machine designed to be used in low- and middle-income countries. The overall performance of the method supported our hypothesis that automated methods can be used, and are beneficial, within clinical settings.

## INTRODUCTION

An ultrasonography scanning in pregnancy has become common practice in rich countries (RC). It begins from 12th to 18th week, or both. The primary aim of the ultrasonography investigation is to identify the position of the placenta and embryo, number of fetuses, gestational age (GA), evaluated day of delivery (EDD), and anomalies that act as a foundation for further medical administration of fetal. The benefits of using ultrasonography in pregnancy care are crucial in poor countries (PC) as in the RC In PC, inaccurate dating, high rate of fetal growth restriction, and limited detection of twins before delivery are common factors. Although, the use of ultrasonography in PC may be not as extensive as in RC due to many reasons. A significant number f ultrasonography machines enhanced for use in RC may be too sensitive to harsh conditions present in PC. Because of changes in the sources of power and voltage fluctuations, huge shifts in transportation conditions, humidity and temperature, dusty environments, vibration and shock, critical parts break down and cannot be repaired. Another significant challenge is the high cost of ultrasonography machinery. In addition, in the rural regions of PC, there is a lack of technical awareness required for operating ultrasonography machines. Our research team is presently working on developing a prototype of a portable, affordable, and user-friendly ultrasonography machine based on a tablet (Figure 1).

To lesser level the usability device threshold, we are in the process of automating as many portions of the manual estimation methods as possible and implementing them on the proposed machine. We hypothesize that automated estimation processes, combined with a minimalistic user interface (UI), will facilitate the adoption of ultrasonography in PC (Figure 1(b)). With this UI, the functionalities found in conventional ultrasonography machinery are carried out by simple touch interactions. For example, the examine depth will be adjusted by a pinchzoom gesture on the screen. The cine loop playback is performed by sliding a finger from left to right on the screen. The estimation position calipers can be effortlessly adjusted by drag gestures and additional functions are accessed via side buttons. The anticipated outcome is a robust and inexpensive ultrasonography machine with a satisfactory picture quality, which will be used in PC by personnel with limited technical knowledge. The assessment of GA is vital but frequently absent in PC. It is used to predict the EDD, monitor fetal development, and refine clinical management association with premature delivery and full-term pregnancies. To ascertain GA and EDD, biparietal diameter (BPD) and fetal femur length (FL) are regularly used and well-documented parameters. Usually, these are measured manually by ultrasonography-trained midwives, sonographers, radiographers, or doctors. The fetal dating methodology requires precise positioning of the ultrasonography machine to capture anatomic landmarks and alignment of measurement markers. The estimations are prone to both intra-and inter observer variability. To minimize errors, the measurement procedure is repeated multiple times (typically three) and the mean or maximum value is recorded. Proper adjustment of the picture acquisition setting is vital to acquiring consistent results. Improper setting, whether too high or too low can significantly influence the FL and BPD estimation, consequently affecting the calculated GA. Various methods, ranging from semi-automatic to fully automatic, have been proposed to enhance the accuracy of BPD and FL estimations and stream line the fetal dating procedure. However, none of these methods have been tailored for use with portable ultrasonography machines. The aim of this study was to develop and implement an automated method to identify specific plane across the fetal head and femur, and subsequently measure FL and BPD. The method was designed to run on an off-the-rack tablet with limited computational power. Hence, it could be effortlessly integrated to a compact ultrasonography machine. Another aim was to simplify the technical adjustments in image acquisition settings.

#### MOTIVATION

The project's motivation arises from the most recent advancements in clinical operations, medical industries, and small-sensor technology, which have provided base frameworks for enhancing efficient and flexible systems. They provide potential for flexible use and scalability of framework. The raspberry Pi has emerged as a perfect essential for such a framework. There are numerous realistic uses for fetal monitoring, for example, monitoring fetal electrocardiogram and electrocardiogram in a fetal externally. Despite designed for passive screening, it can be used for actively updating individuals about BPD and fetal progress.

#### Sheeba Ranjini and Hemamalini

#### CHALLANGE

The challenge is to build an automated system to segment anatomical structures within 2D fetal ultrasound images, taken at different GAs (21, 28, and 33 weeks). The challenge is to obtain good-quality image segmentation and to measure BPD and FL. Each measurement obtained from the fetal ultrasound device is then connected with a database, where results are stored. Although the results are sent to individuals through message. To send fetal information to a patient's mobile phone, we have developed a mobile application for 24×7monitoring.

#### **RESEARCH METHODS**

The field of obstetrics and gynecology relies on medical uses of ultrasonography devices to estimate GA, delivery date and visualization of maternal–fetal development. This is because this device is easy to use and minimally invasive to mother and fetus. However, ultrasonography examination requires special skills from users, because the accuracy of the ultrasound results depends on the skill of the user. In addition, the resulting image quality also affects the diagnosis. Currently, ultrasonography machines have three- and four-dimensional configurations. However, in developing countries such as Indonesia, the availability of such machines is still limited to big cities. In addition, the equipment is quite expensive, leading to increased expenses for the patient. Hence, many regions of Indonesia still use 2-dimensional ultrasonography machines. It is noteworthy that the ultrasonography machines in the rural area have a low resolution and some essential functions must be executed manually. Also, in some areas, ultrasonography is not at all available. As described in the previous sub segment, in this article, we discuss about the use of image processing techniques in estimating both GA and uterine diameter.

#### IMPLEMENTATION

Gestational age is different from fetal age. Fetal age is determined based on the normal ovulation cycle occurring about 14 days after menstruation. If a woman has a 28-day and regular menstrual cycle, the fetus age would be a 2 weeks less than the GA. In other words, if a woman is 8 weeks pregnant, then the age of the fetus will be6 weeks. Meanwhile, the determination of GA through ultrasonography examination can be done in two ways:

Calculation of the diameter of fetal sac (mean sac diameter) is described in Equation1.

$$MSD = \frac{p+l+t}{3} \quad (1)$$

Where *p* is the length (mm),*l* is the width (mm), and *t* is the height(mm). GA could be estimated using the formula described in Equation 2.

$$\Delta t = MSD + 40 days \quad (2)$$

Where  $\Delta t$  is the gestational age (days) and MSD is the mean sac diameter (1day/1mm after 40 days). By measuring distance between head and butt fetal (crown length or CL), we can estimate GA using the formula described in Equation3.

$$\Delta t = CL + 60 weeks \qquad (3)$$

Where  $\Delta t$  is the gestational age (weeks) and CL is the crown rump length (mm).

#### IMAGE PROCESSING PROCESS

This interface is divided into three panels, namely the image template panel, the fetal detection panel, and the image processing operation panel. Here's an explanation of each panel:

(i) Image template panel: It has a function to call predefined templates. The template command is as follows:

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Sheeba Ranjini and Hemamalini

[Filename pathname]= ui get file({'\*.jpg';'\*.bmp';}, 'Select an Image'); img name=[pathname filename]; axes(handles. Gambar template); im show (img name);

The UI allows the user to browse and search an image file. Then, it will be saved in the form of filename and pathname matrix. Then, this matrix is displayed on a designated using "axes" command (handles. Gambar template). Then, the image will be displayed on the "Gambar template" axes. The matrix will be displayed on the image template using the "im show" command (img name). After the template selection process is complete, the fetal detection phase can start.

(ii) Fetal detection panel: In this panel, the fetal image detection program has a feature for cropping images, to facilitate the search of fetal image diameter. This detection stage uses the template matching method, which is an image-matching method that involves finding the smallest parts and matching the image template. Template image testing results are presented in the Results and Discussions section.

(iii) Image processing operation panel: It is divided into three parts, namely the binary converter panel, the morphology operation panel, and the edge detection panel. Here's an explanation from each panel:

(a) Binary converter: It has a function to convert grayscale images to binary images. The source code of the binary conversion function is given below:

c=get image (handles.citra\_hasil\_deteksi);

d=im2bw(c);

axes (handles. operasimorfologi); im show (d);

The image generated from the "Ubah Biner" button is then displayed using the "in show (d);" function. The image that appears within the "operandi morphology" axes will be recalled to continue with the adaptive thresholding process. This process is crucial to obtain a clearer picture and get an optimal value because each image has a different color intensity. The results of adaptive threshold experiments are presented in the Results and Discussions section. (b)Morphology operation panel: The morphological operation is a step to clean up the image after it is change to binary. There are several push buttons on the morphology operation panel such as push button dilation, erosion, opening, and closing.

(c) Edge detection: It has a function to clarify the borders within the ultrasonograph image. Edge detection is used only when the borders of the image are not clearly visible. However, if the peripheral borders are clearly visible, no edge detection is performed.

The pregnancy age within the image can be determined by incorporating the MSD formula (Equation 2) into the source code. This is done by combining the MSD formula to the diameter source code, as given below.

usia = MSD+30; set(handles. hasilusia, 'string', usia); axes(handles.axes6);

Source code formula for calculating age is age = MSD + 30, where the MSD is obtained from the diameter result. The sum of MSD and the variable 30 means that the GA is calculated from 30 days. The fetal sac will expand by 1mm/day. Table2 shows some examples of pregnancy age based on diameter measurements and vice versa.

Some of the parameters that affect the results include threshold value, number of morphological operations and edge detection, and errors from GA. According to the threshold, each image gets different threshold treatment. The threshold value determines the quality of the image to be processed further, so that the accurate diameter and GA are obtained. The threshold value has a range between 0 and 1. For comparison, we also calculated GA manually. The original USG image was manually measured using Paint software. The first step was inputting the original image to Paint and then measuring it by marking out a straight line. The straight line's measurements were compared with the results of image calculation done using MATLAB. Once the coordinates for each point (in units of pixels) were determined, they were converted into units (mm), where 1 pixel corresponded to 0.26458 mm. The diameter of the image was measured using the Pythagoras formula. The value of GA obtained via the MSD formula was tested for success rate by comparing it with to the manually calculated pregnancy age. Figure9 shows comparison of GA calculated by MSD and manually.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Sheeba Ranjini and Hemamalini

Some factors that have potential for introducing an error include (i) obtaining original USG images with low resolution and limited contrast. (ii) Resizing the original ultrasound image without considering scaling. (iii) Not using all morphological operations. The operations used are only related to image cleanup. The mean age of MSD calculation results for the entire image dataset was 75.67 days and the data distribution for the calculated MSD age score had a standard deviation of 8.43. The mean age of manual calculations for the overall image was 76.67 days and the data distribution for the age value of the manual calculation had a standard deviation of 7.23.

#### COMMUNICATION

The dissemination of information including patient data such as MSD, BPD, fetal diameter and fetus age is done by transmitting it to the patient mobile number via SMS or through email. Also, the option of using free services such asthinkspeak.com is available. A majority of upscale hospitals in India all use this kind of services. However, we our purpose is to make it usable primarily to government hospitals and remaining hospitals that are economical.

#### CONCLUSION

An automated estimation method for obstetrics has been executed and refined on an off-the-shelf tablet. The mechanically measured values of FL and BPD were similar to manual estimations. The accuracy and execution of outcomes were comparable to those of other state-of-the-art automatic models that run only on high-end ultrasonography machines. Through its incorporation in a moderate and simple ultrasonography machine, such as the UF scanner, the technique has potential for clinical usability in PC. Moreover, the automated estimation strategy is adaptable to various image gain settings. This is a feature that will ensure consistent measurement results between clients in PC.As a result, this feature will enhance ease of use and overall quality of measurements. Subsequently, results could be sent to the patient through email or text messages. This feature is very useful for the patients, enabling them to monitor the fetal progress and to become healthy.

## ABSTRACT

Voxel-based morphometric (VBM) is a method for measuring differences in native concentrations of brain tissue through the voxel-wise comparison of various medical imaging of the brain. VBM is one of the most important neuroimaging methods for assessing macroscopical asymmetries in grey matter with high regional specificity. A structural magnetic resonance imaging (sMRI) analytical technique called VBM enables voxel-wise comparisons of native grey material concentrations between two groups of subjects or between each participant's two cerebral hemispheres. It is employed for the examination of several topic teams, which has numerous therapeutic applications. For example, VBM is frequently used to examine aberrant structures in Alzheimer's disease (AD). High-resolution structural magnetic resonance imaging (sMRI) provides the basis for this method. The main sMRI preprocessing steps for cross-sectional VBM analysis are often introduced first. Next, the statistical analysis for the examination of grey matter images from two distinct teams. The expanded VBM (eVBM) technique for sMRI information analysis is next examined. By applying contrast technique eVBM with conventional VBM using a sizable cohort AD dataset.

## INTRODUCTION

The human brain is constantly changing and adapting. This could be caused by aging processes, common biological processes, the outcomes of learning and training, or new phenomena that have appeared in the world. In addition to the alterations, the shape of the brain is impacted by a number of systematic factors like gender, illness, and heredity. Because changes and variations in the brain may be evaluated noninvasively and in vivo using magnetic resonance imaging, this method is extremely intriguing for both basic research and clinical testing. Analyzing whole-brain volume is the simplest way to evaluate brain changes (or cluster differences). Yet, evaluating at the level of the entire brain is quite vast. Specific region-of-interest (ROI) analyses have considerably more restrictions than whole-brain assessments, but they measure native changes with a lot more sensitivity. For instance, if only one specific area of the brain is evaluated, other brain structures go unreported, and potential impacts are not observed in the brain. Moreover, ROIs measurements occasionally produce supported individual protocols and are more accurate than the particular "judgement calls," necessitating a distinct, determinable, and unambiguous structure. However it will be challenging to precisely define (or discover) clear boundaries for large portions of the brain. inally, the sensitivity will decrease if an ROI slightly differs. The use of voxel-based morphometry (VBM), which allows for the examination of brain changes and/or cluster variations across the entire brain with high regional specificity (i.e., voxel by voxel), becomes necessary as a result of this. VBM does not necessitate the prior definition of particular ROIs. A wide range of impartial, objective techniques have been developed in recent years to describe anatomical changes in vivo MRI medical image datasets. These methods can be broadly divided into those that alter gross variances in brain structure and those that look at the native make-up of brain tissue after gross variations are taken into account. The former, which represent deformation-based morphometry (DBM), describe the fundamental structure of every person's brain in terms of deformation fields that relate every brain to a standard reference. It is clear why innovations are being developed to help the fight against Alzheimer's disease; this motivation stems

It is clear why innovations are being developed to help the fight against Alzheimer's disease; this motivation stems not only from moral considerations but also from the fact that Alzheimer's cases are constantly increasing in our society. A common percentage of the fifty million people who live insanity today have Alzheimer's disease. With a new case of Alzheimer's being reported every three seconds worldwide, the disease has surpassed cancer cases as our most feared ailment. Oasis provided the dataset that was used for the analysis.

## LITERATURE REVIEW

A thorough literature survey was allotted on Alzheimer's illness, imaging systems, applied mathematics parameter mapping, and also the nervous tissue volumes. Alzheimer's (AD) poses a significant threat to the ageing health of our nation because citizens are living longer thanks to medical advancements. It is estimated that about twohundredths of US citizens would be older than 65 by 2030 [3]. Advancing age is said to associate the hyperbolic risk of dementedness. According to calculations, AD accounts for up to 80% of cases of dementedness [1]. Most often, ageing increases the risk of developing Alzheimer's disease and presenile dementia. The Alzheimer's Association estimates that eighty-one percent of patients who have AD are older than seventy-five years of age [1]. The impact of AD on the population is considerable. According to official figures, the number of AD-related deaths increased by 71% between 2000 and 2013 [1]. This is comparable to a reduction in cardiovascular disease on Bastille Day throughout the same time period. In a 10-year period, AD went from being the 25th most taxing sickness in all of us to the 12th, and from the 32nd to the 9th in terms of being worse in terms of years of life lost. This was the most tragic increase in any sickness throughout that time period [1]. Regarding the diagnosis and treatment of AD, the region specifically identifies a number of obstacles. According to studies, several medications and smart treatment options for AD are ineffective when utilised on patients who also have subtle psychosocial impairments. Generally speaking, a diagnosis is clinical and involves the doctor treating the patient. It's crucial to have a thorough medical, familial, and medical specialty history. Routine labs to rule out different causes of dementedness (complete blood count, comprehensive metabolic panel, thyroid-stimulating internal secretion, B-complex vitamin, and folic acid) and further neuroimaging with resonance imaging (MRI) conjointly are ought to be thought as a part of the routine

ess ISSN: 0976 – 0997

#### Kalpana et al.,

workup. Serologies for biomarkers and psychological science testing may be used to support the identification as needed. The fluid or cerebrospinal fluid can be used to get the biomarkers that are now being investigated (CSF). Key CSF biomarkers have good specificity and sensitivity for diagnosis, ranging from 85 to 90 percent [4]. Gray brain material volume (GMV) abnormalities in the brain as determined by MRI and using statistical SPM software systems. can be automatically investigated using the picture processing and applied mathematics technique known as voxelbased morphometry (VBM). The capacity of VBM to do applied mathematics cluster comparisons of brain volume fluctuations across the entire brain[5] as opposed to just on certain regions of interest is one of its salient features. Through connections to the amygdaloid nucleus and other physical structures, the cortical region is also thought to play a significant role in the regulation of anxiety, aggression, conjugation behaviour, and other aspects of the emotional process. More specifically, the orbital ventromedial greenhouse emission is thought to mediate appropriate behaviour in nerve-wracking situations and sound judgement in situations where showing emotion is intense. [6] This supports the idea that lobe injury has significance to the pathophysiology of AD. Impairments in these skills are either directly apparent in AD patients or lay at the root of the appearance of medical specialty symptoms (such as apathy or agitation). Moreover, a larger understanding concerning lobe abnormalities in AD has relevance given the requirement to differentiate this type of dementedness from different neurodegenerative disorders that conjointly have an effect on the lobe, like frontotemporal dementedness,[6] dementedness with Lewy bodies, and vascular dementedness.[7]

#### PROPOSED SYSTEM

The proposed method for detecting disorders on magnetic resonance imaging (MRI) consists of four primary steps: I identifying regions of interest, (ii) extracting features, (iii) selecting features, (iv) classifying, and (v) evaluating performance. For the purpose of extracting features from the grey matter, regions of interest must be identified. Areas of interest are those places where a known reduction in grey matter volume has been seen. By comparing two templates that represent two teams, VBM is used to identify these zones of interest. The proposed methodology is divided into two primary sections: I regions of interest are identified by VBM, and (ii) those regions are examined for detection. The pattern recognition pipeline follows VBM and includes First- and second-order statistics were provided by feature extraction, and multiple procedure analyses were supported by feature selection. High-resolution images of the structural brain are used in the study. The T1 weighted images are first split into several tissue types, such as liquid body substance, substantia alba, and grey matter, and then they are corrected for inhomogeneities. The tissue of interest, or the grey matter phase, is subsequently spatially normalised to fit a predetermined template. Eventually, a related isotropic mathematical kernel is used to smooth down the normalised grey matter phase. Lastly, voxel-wise applied math tests are performed on the smoothened normalised grey matter segments in order to map significant effects.

## METHODOLOGY

As shown in figure 3.1. The raw 3DT1-weighted images obtained from the MRI scans from the Oasis Dataset will be our major focus which is in .nii format. The SPM software package, created for the analysis of brain imaging data sequences, will be used to further segment the image into grey matter, white matter, cerebrospinal fluid (CSF), fat, and bone. Interest in grey matter pictures will lead to statistical analysis

#### ABSTRACT SPECIFICATION OF SUB-SYSTEM

#### Image Acquisition: 3D T1 raw Images

Image acquisition is the first and most important stage. This step's intended goal is to collect the best data available in order to meet the study's data requirements. The Open Access Series of Imaging Studies (OASIS) Brains project provided the dataset. The scientific community can access macroscopic (whole brain) structural MRI neuroimaging datasets from the OASIS Brains project. These facts come from MRI scans, diagnostic exams, and demographic information gathered from test subjects during the diagnosis of Alzheimer's disease. Used was the Oasis 3 Dataset. NIH P50 AG00561, P30 NS09857781, P01 AG026276, P01 AG003991, R01 AG043434, UL1 TR000448, R01 EB009352;

#### Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Kalpana et al.,

principal investigators: T. Benzinger, D. Marcus, and J. Morris; OASIS-3. Avid Radiopharmaceuticals, an entirely owned subsidiary of Eli Lilly, supplied the AV-45 doses. The benefit of these databases is that they may be used to test how well image processing techniques work with various photos and settings.

#### Viewing the Raw Image in the SPM: Unsegmented Whole Brain Images

After successfully attaining the dataset. Now, we can have a look at how the raw brain MRI images i.e. the unsegmented whole-brain images look with the help of SPM software. To run SPM software, we need the Matlab Software Installed as SPM is an integrated software that works on the algorithm of MATLAB. Since the obtained images are in Nifti format, the SPM is easily compatible with it. Fig. 4.2 shows examples of how the raw MRI Images look with the help of SPM.

#### Workflow of VBM

The study is based on high-resolution structural brain images, as illustrated in figure 4.3. Prior to classifying the T1weighted data into completely different tissue types like substantia grisea, substantia alba, and CSF, they are first adjusted for inhomogeneities. The tissue of interest (the grey matter phase) is then spatially adjusted to fit a standard guide. Subsequently, the substantia grisea phase is smoothed once it has been adjusted. Lastly, voxel-wise applied mathematics tests are performed on the smoothened, normalised substantia nigra segments in order to map significant effects.

#### **Tissue Classification**

The brain is effectively phased into the substantia grisea, substantia alba, and CSF by tissue categorization, which uses intensity levels to separate out any non-brain components. The target now could be to mechanically establish totally different tissue varieties inside the pictures, through the New Segment choice within the SPM. Then, the Native Space versions of the tissues during which we tend to have an interest are generated, in conjunction with "DARTEL imported" versions of gray and substantia alba. Because these images may later be warped to MNI housing, the native space photos for VBM are normally the c1\*.nii files. The segmentation in SPM will operate with images collected via a form of sequences, but the accuracy of the resulting segmentation can depend on the actual attributes of the images. This is true for both the foreign and native tissue category image sets. Although each patient was offered multiple scans, the dataset that will be used only contains the T1-weighted scans.

Following the completion of the segmentation, a large number of recent image files are generated. Files with the prefix "c1" measure what the algorithmic programmerecognises as nervous tissue. If they have a "c2," they are thought to be substantia alba. CSF is measured by the "c3" images. The tissue category images' DARTEL foreign versions, which can be aligned next, have file names that start with "r" (as in "rc1"). Pictures of substantia grisea are shown in Figure 4.4. (ROI).

#### Run Dartel

The goal of DARTEL is to increase the accuracy of inter-subject alignment by modelling each brain victimisation score's shape (three parameters for every voxel). DARTEL positions substantia alba while simultaneously placing neural tissue in the images. This can be done by creating its own, increasingly precise average guiding knowledge, which will align the information iteratively. This creates "u rc1" files as well as a set of guide photographs by using the foreign "rc1" and "rc2" images. The Dartel guidance produced after 18 iterations is displayed in Fig. 4.5.

#### Normalize to MNI Space with Smoothening

The individual brains or the native grey substance segments should be spatially normalised in addition to tissue categorization to ensure voxel-wise equivalence. Even if native grey matter volumes in each brain are commonly measured in natives, voxel-wise comparison is difficult to do. After being spatially normalised, every brain has the same size, shape, and overall pattern of major sulci and gyri. The native quantity of the grey material is typically directly compared in voxel-wise applied math evaluations. The Jacobian determinants derived from the deformation fields utilised for spatial control also show that the patterns of volume amendment for each individual are

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Kalpana et al.,

completely different. The final "u rc1" files are smoothed, spatially normalised, and Jacobian transformed in this step (which cypher the shapes). In this stage, grey substance images for the MNI are smoothed, spatially normalised, and Jacobian scaled using the resulting "u rc1" files (which cypher the forms). Fig. 4.6 displays the images after SPM's spatial social control was depleted.

#### Statistical Analysis

Although non-parametric tests are also frequently used, statistical models can examine the smoothed normalised tissue segments using parametric tests. Generally, a mass-univariate technique is used to execute these tests, running the same test simultaneously for each voxel. This involves a serious multiple comparison problem, similar to those found in the majority of previous neuroimaging analyses, and must be corrected appropriately. Now that the preprocessed data have been fitted to a GLM, we may deduce the locations of systematic differences between the preprocessed data.

i. Using Basic Models, develop a design matrix that details how the pre-processed data is produced in SPM.

ii. Play about, use Review models, examine the design matrix, etc.

iii. To fit the GLM to the data and determine how smooth the residuals will be for further GRF corrections, use Estimate.

iv. Use the findings to identify any noteworthy differences.

#### **Global Calculation**

"Global normalization" for VBM refers to working with different sized brains. Since VBM analyses volumetric differences voxel-by-voxel, it is important to think about how regional volumes can change depending on the size of the entire brain. Bigger brain structures are more likely in larger brains. If we use some sort of "global" brain volume correction, we might obtain more targeted outcomes. The computation of global can be done in a number of ways. For instance, add the values in a "c1" or "mwc1" image and multiply by the volume of each voxel to determine the overall volume of grey matter. Comparably, the sum of the volumes of the grey and white matter can represent the overall volume of the brain. Addition of the CSF, white matter, and grey matter yields the total intracranial volume. This can be estimated using SPM's tissue volumes feature, which returns the grey matter, white matter, and cerebrospinal fluid volume from the original data. The text file containing the estimated brain volumes is shown in Fig.5.1.

#### **Global Normalization**

The proper use of "globals" is outlined in this section. Grand mean scaling should be turned off globally. This completely useless option is still included in the SPM programme. Next select Normalization to provide possibilities for using our "globals". In this instance, proportional scaling was applied.

#### Masking

There are numerous ways to use masking to choose which voxels go into the analysis. The multiple comparison adjustments are supposed to make analyses more sensitive when fewer voxels are included. When the backdrop is evaluated in VBM investigations, instability occurs. The computed variance is extremely near to zero because the background signal is quite weak. The t statistics are proportional to the magnitudes of the differences, squared as the residual variance. It is difficult to divide by zero or by numbers near to zero. Blobs could also penetrate the background deeply, but masking prevents this from happening. Absolute masking was applied in this case.

#### Design

In this part, the actual design matrix and data are described. If the analysis for the present data can be specified as a Multiple Regression, choose this Design option. Scans, Covariates, and Intercept are the following three fields that must be specified. The "smwc1" files can be selected by clicking Scans -. Including Intercept for Intercept when specifying a menu item. It will serve as a constant term in the design matrix. Double-click Covariates and select New "Covariate" after each click. We'll model gender and age as covariates. Input the following covariates:

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

#### Kalpana et al.,

1. Type "info(:,1)" as the Vector, "Gender" as the Name, and "No centering" as the Centering options. Values of 0 denote a female subject, while 1 denotes a male subject. 2. Type "Age" as the Name, "info(:,2)" as the Vector, and "No centering" as the Centering options. Now that everything has been spoken, the statistical analysis data should be filled out. Now that we've saved the work, SPM will collect the data required to carry out the statistical analysis when we click the Run button. 'SPM.mat' file, where.

#### Estimate

The analysis is carried out through the Estimate button. After selecting the freshly formed "SPM.mat" file, click Estimate and wait a while. The design matrix's columns are first linearly combined to fit the data at each voxel. This results in the creation of a sequence of "beta" images, the first of which represents the contribution of the first column, the second representing the contribution of the second column, and so on. Moreover, an image called "ResMS" is created, containing the standard deviations needed to calculate the t statistics. The computation of residual images—used to determine the smoothness of the data—comes next. When they are no longer needed, these photos are automatically erased because they are only transitory.

## RESULT

After the GLM has been fitted, images of t statistics can be created using the data from the resulting "beta" and "ResMS" images, along with the "SPM.mat" file. Contrast vectors, which show the linear combination of "beta" images to be tested, are defined. The objective is to locate any regions that significantly deviate from zero in these linear combinations, which are recorded as "con" images. The actual t statistics are stored in "spmT" pictures. It is necessary to make certain adjustments for the number of tests when several voxels are checked. In order to account for numerous dependent comparisons, Gaussian random field theory is applied because the voxels are associated and the pre-processed data are spatially smooth. Select the "SPM.mat" file by clicking the Results button. This activates the SPM contrast manager. Then, click the t-contrasts button, and define the required new contrasts. When the SPM contrast manager says name, enter "-Age" (or another name of your choice). The agenda is to look for regions of the brain with proportionally less gray matter in elderly Alzheimer's patients. This has a t contrast of 0,-1,0. This would be entered into the contrast field.

The fig. 7.1.1,7.1.2,7.1.3 here shows the motor response in the subjects with p<0.05. The motor response was varied according to age and Volume of the brain. The fig. 7.2.1,7.2.2,7.2.3 here shows the common areas of the activation in the subjects with p<0.05. The response was varied according to age and gender. Till now, all the results were according to the t-statistical test. SPM also has a F-statistical test. The difference between the f-test and t-test is that f-test is used to compare the standard deviations of the two samples and understand their variability. However,aT-test is used to test the hypothesis whether the given mean is significantly different from the sample mean or not. The fig. 7.3.1,7.3.2 here shows the SPM-F image that corresponds to basically the difference (positive or negative) from the left and right responses.

## DISCUSSION

fMRI results showed reduced functional activation in the motor areas of the brain (contralateral precentral and post central gyrus), also reduced gray matter in prefrontal cortex and hippocampus region of the brain. It is also observed that the data significantly varies and differs according to age but is less dependent on the overall size and volume of the brain. Research studies have found that a correlation exists between people who have dementia and reduced gray matter volume in the brain. Patients with Alzheimer's disease are observed to experience atrophy in the hippocampus area. Also, the prefrontal cortex in patients reduces

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Kalpana et al.,

## CONCLUSION

Our results show that VBM is generally more sensitive at identifying focal cortical gray matter differences, in the area of voxel signal-to-noise and spatial extent commonly studied. Also, VBM appears to be similar in sensitivity to global gray matter differences as ALV. This suggests that VBM is a better technique for evaluating structural brain differences when compared to the many large scale automated ROI methods. In recent years, VBM studies have been successful in differentiating structural brain differences in many diseases.

#### **FUTURE WORK**

Some future aspects of the work that will be improved by the further the neural quantification can be applied to the data generated from this analysis which will yield a faster result and the whole process can be automated.

# ABSTRACT

The Resistivity method is aimed at measuring the potential differences on the surface due to the current flow within the ground. Since the mechanisms that control the fluid flow and electric current and conduction are generally governed by the same physical parameters and lithological attributes, the hydraulic and electrical conductivities are dependent on each other (George et al., 2015). Groundwater is the major source that meets the drinking and domestic needs of any area of the world. Thus, its exploration and accessibility assumes a great significance to the scientists and society. In the crystalline hard rock groundwater generally occurs in the weathered basement, or regolith, and the fractured rock (Verma et al., 1980).in many parts of the world groundwater is a primary source of fresh water. Some regions are becoming overly dependent on it, water tables to declining because of consuming groundwater causing unremittingly (Gleick, 1993). Groundwater rights have not changed accordingly by population growth and economic development, the laws governing, even in developed nations. (Livingston, & Garrido, 2004). Groundwater is the subject of growing social concern around the globe. The ownership and control of underground aquifers, the intensive use of groundwater resources, potential changes in both groundwater quality and quantity and the related impacts on natural systems command the attention of scholars and policy makers in many countries. India, with 70-80% of its food production based on groundwater resources, is perhaps the sharpest world example of the challenges involved in managing this resource (Deb Roy and Shah, 2002).

# INTRODUCTION

Geophysical survey is necessary to ascertain subsurface geological and hydrogeological conditions and helps to delineate regional hydrogeological features, even pinpoint locations for drilling of boreholes. Geophysical data provides information on local geological environment such as type and extent of surface material, extent and degree of weathered mantle, the nature and extent of underlying bedrock, the structural elements etc. That influence groundwater occurrence and movement. The important geophysical method involved in ground water explorations is Geo Electrical prospecting and several scientists like Bhimasankaram et al.(1975,1976); Benergy (1969); Bindumadhavan (1975); Zambre (1980): Bagdhan(1976); and Mani (1989) have applied the geoelectrical methods to solve various groundwater problems. Patangay (1977) is of the opinion that the electrical methods have greater advantage over the other methods. The proper use of geoelectrical techniques reduces the risk of drilling poor yield wells and can also supplement the geological evaluation of proposed well locations. In an area of salt water intrusion that arises due to over exploitation of groundwater can be studied using electrical resistivity techniques which provide additional data to improve the accuracy of groundwater models, which in turn can be used to determine the extent of the non saline ground water resource (Singh and Mesh, 1982; Sathyamoorthy and Banerjee 1985; Basak and Nazimuddin, 1987). Electrical resistivity methods are widely used for both regional and detailed survey for ground water exploration because of their great resolving powers, low expense compared drilling and wide range of field applicability (keller and frischnecht 1996, balakrishna et al 1978, Chandra and athavale 1979: Chandrasekharan, 1988). Hence in the present study electrical resistivity in particular Vertical Electrical Sounding (VES) is followed.

## STUDY AREA

Administratively, Vythiri taluk is located within Kalpetta, the district headquarters of Wayanad district, within the state of Kerala, India.The area of the Vythiri taluk covers 637 square kilometers. This area is covered in the Survey of India topographic sheet (no. 49 M/14, 58A/21, 58A/31, 58A/61) with geographic co-ordinates N 11° 33' 5.97384" and E 76° 2' 24.94356". Vythiri taluk is a famous tourist destination in the Wayanad district. The study area is well connected by road. (Fig.1). National Highway 212, connecting Kozhikode (Calicut) with Mysore and the Calicut-Vythiri-Gudallur (CVG) road passes close to the study area.

Geologically, the Wayanad area is an extension of Dharwar Craton which is perhaps one of the important crustal blocks among the collage of terrains in the Southern Granulite Terrain (SGT) and is occupied by the rocks of the Wayanad Group, Charnockite Group, Peninsular Gneissic Complex (PGC) and Migmatitic Complex. Wayanad Group of rocks are supracrustal and include garnet, sillimanite, biotite gneiss, graphite, kyanite, fuchsite, muscovite, quartz, schist, hornblende, biotite schist and gneiss garnet, amphibolites, quartz sericite schist or quartz mica schist, banded magnetite quartzites (BMQ) and meta ultramafites. These rocks are found as linear bodies within the PGC. The PGC, represented by hornblende-biotite gneiss and pink granite gneiss, occupies a major part. The Charnockite Group comprises the hilly terrain made up of charnockites. Pyroxene granulite and banded magnetite quartzites occur as narrow bands within the charnockite. Migmatite Complex is represented by biotite hornblende gneiss. (Fig.2)

# METHODOLOGY

The most widely used geophysical method for groundwater exploration is electrical resistivity method as it is efficient in detecting water-bearing layers, besides being simple and inexpensive to carry out field investigations (Zohdy, 1974). The method involves measurement of applied current (*I*) through two electrodes and potential (*V*) across two other electrodes. Apparent resistivity is derived from these measurements for various electrode separations. There are different electrode arrangements such as Schlumberger, Wenner, Dipole–Dipole, Two-Electrode Array, etc. Geophysical Investigation The geophysical investigation involved the electrical resistivity method. The Vertical Electrical Sounding (VES) technique adopting a Schlumberger array was used. The half current electrode spacing (AB/2) was varied from 1 m to a maximum of 100 m .The choice of the VES stations was

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Insaf and Nagaraju

constrained by the geology, structure (lineament) map, terrain, accessibility and representativeness of the spread of the stations. Every VES station was appropriately geo-referenced. Secondary information on existing VES data and borehole records (logs, yield etc.) were assessed re-processed and incorporated. Thirty Vertical Electrical Sounding (VES) data. Lineament analysis followed by resistivity survey is cost effective while studying geomorphologic data. In order to assess the groundwater conditions in the area, electrical resistivity surveys were carried out with Schlumberger electrode configuration to pinpoint the most favorable locations in the area. Integrating hydrogeomorphological data with geophysical investigations, Teeuw (1999), Shahid and Nath (2002) South-East dry agroclimatic zones of Karnataka using Arc GIS 10.2 Version generated different types of thematic maps like top soil map, weathered map, highly weathered map, Apparent resistivity 25mtr, 50mtr, 75mtr, 100mtr and 200mtr. Through these spatial maps we can easily understood about of the surrounding forest area. The typical-hydrogeological section of a hard rock terrain consists of a soil zone followed by a weathered zone are overlying bedrock. A total 30 VES conducted in Vythiri taluk, Wayanad district for deep drilling. The area is underlain by the granites, schists and peninsular gneissic complex of Precambrian to Achaean age. The interpreted results at the recommended sites indicated 4 layered geo electric sections in which the last layer is massive formation. (Table.1)

# **RESULT AND DISCUSSION**

The Field data were interpreted and processed qualitatively and quantitatively of using partial curve matching techniques and computed to obtain the resistivity values of different subsurface layers and their corresponding thickness in the Table.1.several result of VES data interpretations with identification of groundwater types. Location of Mandad, the first layer is weathered soil loam with  $2082\Omega m$  resistivity with a thickness of 3m; the second layer is a granitic rock with  $10889\Omega m$  resistivity with thickness of 1.92m and third layer Gneissic rock with  $175\Omega m$  resistivity with a thickness of 5.97m.Location 6 Moopainad the first layer is silt loam with a resistivity with a thickness of  $400\Omega m$  resistivity with a thickness of 5.92m and the second layer loam soil resistivity 20195 $\Omega m$  and the thickness is 2.55m.

#### CONCLUSION

Hydrogeophysical studies were carried out of understand subsurface geology based on resistivity survey in the study area. Thirty Vertical electrical soundings(VES)were conducted in the study area, using schlumberger configuration with a maximum half distance of current electrode separation(AB/2) equal to 100 m until the sounding curve was attained, which is an indication of the establishment of contact of the volcanic rock with the granite basement. Initialy VES data has been interpreted with master curves and later the interpretation was redefined by using IP12Win softwares. The layer curves of different parameters such as resistivities (P1, P2,P3 and P4) and the thickness(h1,h2 and h3) of various layers indicating top soil, weathered, fractured and basement respectively have been prepared software. The study area suggests that it is hard and compact though with a relatively high weathered zone and minor fractures. Major curves are A and H types which have been plotted in the terrain respectively.

# ACKNOWLEDGEMENT

The authors are thankful to the Chairman of Department of Earth science, University of Mysore for providing infrastructure facilities to carry out the present research work.

# ABSTRACT

The goal of this investigation was to develop and evaluate Ezetimibe oral fast-dissolving films, which are used to treat hyperlipidemia and prevent cholesterol absorption. The fast-dissolving ezetimibe films were developed using the solvent casting method and included the following ingredients: xanthum gum, dammar gum, gum karaya, which act as film-forming agents; polyethylene glyol 400 (PEG 400), which serves as a plasticizer; croscarmellose sodium, which acts as a super disintegrant, citric acid and stevia powder, which serves as a saliva stimulant and sweetener. The formulated ezetimibe fast-dissolving films were evaluated for film thickness, folding resistance, drug content, air bubble entrapment, and film curling produced findings that fell within the predetermined ranges. In order to determine the drug release from each formulation, the *invitro* diffusion investigations were carried out using the Franz diffusion cell apparatus. The fast dissolving film formulations of E7-E9 prepared by using the gum karaya which showed the drug release upto 97.85 – 99.76% within 15 min. For the optimized E9 formulation, drug releases about 99.76%. The spectra of the E9 formulation showed the principle peaks present in the ezetimibe pure drug, it found that no interaction between the drug and the polymers used. Scanning electron microscopy analysis was carried out for optimized E9 formulation exhibited the smooth even surface.

Keywords: Ezetimibe, solvent casting, fast-disintegrating films, plasticizers, and superdisintegrants.

# INTRODUCTION

The oral route of drug administration is the most popular among the different drug delivery methods. For the treatment of a variety of disorders and diseases, about 90% of medications are given to the body orally because this is thought to be the safest, most practical, and most affordable drug delivery technique with the highest patient compliance. (Hema Chaudhary *et al.* 2013,Bhowmik D *et al.* 2009,Aju S *et al.*2011&Verma P *et al.*2010)The medicine is either taken whole or dissolved, and after it enters the systemic circulation, it has the intended effect.(SetouhyDA *et al.* 2010 &Puttalingaiah L *et al.* 2011) Due to self-medication, convenience of administration, and lack of discomfort compared to parenteral route, oral route of drug administration is regarded as the most significant mode of administration of a medicine for systemic impact despite substantial progress in drug delivery. (Siddiqui N *et al.*, Saurabh R *et al.*, Prabhu P *et al.* 2011 & Bhalla N *et al.* 2012)

Fast-dissolving oral films are a novel class of drug delivery technologies that attempt to improve the safety and effectiveness of a therapeutic molecule in order to increase patient compliance. It is a reliable method of drug delivery in which a film is put on the surface or the bottom of the tongue. When placed on the tongue, this film instantly melts, releasing the medication, which dissolves in the saliva. As saliva descends into the stomach, some medications are absorbed from the mouth, pharynx, and oesophagus. In this situation, improving tongue feel, eliminating choking danger, and increasing drug absorption are important. To get around this issue of swallowing difficulty, fast dissolving drug delivery systems are being developed. (Flesch G *et al.*, 1997&Rajesh K *et al.* 2013)This fast dissolving process is principally driven by the film's enormous surface area, which quickly becomes wet when exposed to a moist environment. The hydrophilic polymer used it to produce FDF quickly dissolves on the tongue or in the buccal cavity, allowing the drug to reach the bloodstream through the buccal mucosa. In order to increase bioavailability of medications with low doses and substantial first pass metabolism, quick dissolving drug delivery systems were developed. (Vidyadhara S *et al.* 2015 &Balakrishna T *et al.* 2018)

Ezetimibe is a cholesterol absorption inhibitor which is used to treat familial and primary hyperlipidemia by lowering total cholesterol, LDL cholesterol, Apoprotein B (Apo-B) cholesterol, and non-HDL cholesterol. Additionally, people with homozygous sitosterolemia may use ezetimibe to lower excessive sitosterol and campesterol levels (phytosterolemia). It can be administered alone or taken in combination with statins (HMG-CoA reductase inhibitor). In this current research Ezetimibe drug was formulated as oral fast dissolving film, by using different film forming agents, plasticizers and superdisintegrants which showed better solubility, dissolution rate and enhanced therapeutic efficacy.

# MATERIALS AND METHODS

Ezetimibe a gift sample from Alkem Laboratories Bangalore, Xanthum gum, Dammar gum, Gum karaya(film forming agents), polyethylene Glycol 4000(PEG 4000), (pasticizer) and croscarmellose sodium, the superdisintegrant were obtained from Yarrow chem, Ltd., Mumbai, stevia powder which is natural disintegrant obtained from High-pure fine Chem., Chennai.

## Preparation Of Ezetimibe Fast Disintegrating Films

Solvent casting was used to produce the buccal films for Ezetimibe Fast Dissolving. Individual 100ml beakers of aqueous solutions of the plasticizers xanthum gum, gum karaya, and dammar gum were prepared to obtain clear solutions. After thoroughly combining the xanthum gum solution with the aqueous gum karaya solution, a homogeneous solution known as solution A was obtained. A drug and plasticizer solution known as solution B was prepared by weighing and dissolving specified amounts of ezetimibe and saccharin sodium in the appropriate amount of PEG 400. The homogeneous aqueous solution A was added to the solution B, and they were thoroughly mixed.

# Nandini Jampana and Jyosna Doniparthi

The resulting solution was cast onto a non adhesive base plate and allowed to dry for 24 hours under an infrared lamp. The films were sliced into the necessary sizes after they had fully dried. To optimize the method of preparation of ezetimibe buccal films, numerous studies were carried out. The following is a list of the ingredients in ezetimibe buccal films seen in Table 1.

#### Evaluation of Physical Parameters For Ezetimibe Fast Disintegrating Films

The ezetimibe oral fast dissolving films were evaluated for physical parameters such as Thickness uniformity, folding endurance, drug content uniformity. The results were given in Table 2.

#### **Thickness Uniformity**

At different places on the film, the thickness was measured using screw gauze with a minimum count of 0.01 mm. On the film, the thickness was measured at 3 distinct places, and the average was calculated. Results given in Table 2.

#### **Folding Endurance**

In terms of what is referred to as folding endurance, the film's flexibility is measured. The film's folding resistance was tested by repeatedly folding a small strip of it until it broke. The value of folding endurance is determined by how many folds of the film can be made without breaking. Results given in Table 2.

#### **Drug Content Uniformity**

The films underwent UV-visible spectrophotometric testing to determine the uniformity of their drug content. From the cast film, films of the necessary sizes were sliced three times. Each cut film was put into a 100 ml volumetric flask and dissolved with a buffer with a pH of 6.8. From this, 1 ml was pipetted into a 10 ml volumetric flask, where it was added to the required volume to reach a pH of 6.8. Using a UV visible spectrophotometer, the absorbance of the resultant solution was determined at 296 nm against a blank. Using the standard graph, the percentage of drug content was determined. Results obtained in Table 2. It is challenging to mimic these natural conditions and measure using an appropriate approach when it comes to oral films since the disintegration and dissolution are difficult to determine if the oral films concurrently dissolve in a little volume of saliva. The media used in previous tests for dissolution and disintegration were in significant quantities and weren't physiologically present in the oral cavity. Independent approaches were provided for the assessment of disintegration and dissolution behaviour. Only a minimal amount of media was required for this procedure.

#### Dissolution test by Franz Diffusion Cell

The volume of the Franz Diffusion Cell is approximately 15 ml. A strip of film containing 10 mg of ezetimibe is placed in the Franz Diffusion Cell, along with 10 ml of pH 6.8 phosphate buffer (pH of saliva). Place the cell on a magnetic stirrer, keep the medium at a temperature of about 400°C and the speed of the bead in the cell at 50 RPM. Then, take out 1 ml of samples at intervals of 1, 2.5, 5, 10, and 15, make up to 5 ml with pH 6.8 phosphate buffer, and measure the absorbance in UV at 296 nm using pH 6.8 phosphate buffer as a blank. The drug release profiles for all the film formulations were shown in Figures 1,2,&3 and values obtained in Table 3.

#### **Dispersion Test**

A 200 ml of 6.8 pH buffer and a strip of film containing 20 mg of ezetimibe are combined, stirred for three minutes with a glass rod, and then the mixture is run through a 22-mesh screen to determine whether the film passed the dispersion test.

#### In vitro Diffusion Studies

All of the Ezetimibe fast-dissolving films were subjected to in vitro diffusion tests utilizing Franz diffusion cell apparatuses with pH 6.8 phosphate buffer as the dissolution medium. For each formulation, the dissolving studies took place over a 15-minute timeframe. Studies on dissolution were conducted in triplicate while maintaining sink conditions for all formulations. At regular intervals, a 5 ml aliquot of samples was taken, filtered, and measured spectrophotometrically at 295 nm. For each of the film formulations, the drug release profiles were displayed.

#### Evaluation of various in vitro Dissolution Parameters

The dissolution parameters such as  $T_{50}$ ,  $T_{90}$ ,  $DE_{5\%}$  and the first order rate constant were calculated from the dissolution data and the results can be obtained in Table 4.

#### Characterization

Depending on the results obtained by diffusion studies, some of the formulations were optimized and carried out for characterization.

#### I.R. Spectral studies

BRUKER FT I.R was used to conduct I.R Spectral analyses on a few chosen films. Before they were put through dissolution tests, these studies on films were done to see whether there were any structural differences between the drug and the excipients used in the film formulation. The drug and E5 formulation seen in Figures 1,2&3 respectively.

#### Scanning Electron Microscopy (SEM)

A thin layer of gold was applied to the samples using a sputter coater unit (SPI, Sputter, USA). Then, using a scanning electron microscope (model JSM-6390, Japan) operating at an accelerated voltage of 10kV, SEM photographs were taken. Photographs observed in Figures 11-12.

# **RESULTS AND DISCUSSION**

#### Preparation Of Ezetimibe Oral Fast Dissolving Films.

The solvent casting method was used to produce ezetimibe fast-dissolving films utilising a variety of film-forming ingredients, including xanthum gum, dammar gum, and gum karaya. The film-forming agents xanthum gum were used to prepare the film formulations E1–E3. The films failed the folding endurance test and were found to be brittle. All of the film formulations passed the tests and shown strong film forming characteristics, but formulation E9 was determined to be the best choice and exhibits excellent flexibility. The formulation shown in Table 1.

#### Evaluation of Physical Parameters For Ezetimibe Fast Disintegrating Films

The formulation of ezetimibe fast-dissolving films was found to be acceptable for the solvent casting method. To eliminate processing variables, all of the film formulations were created under the same set of circumstances. The following physical characteristics were then used to further assess the film formulations. Table provided the physical parameters for various ezetimibe oral quick dissolving films. A screw gauge was used to measure the film's thickness. All film formulations had thicknesses around 0.030 and 0.034 mm. A small strip of film was folded repeatedly at the location to test the film's folding endurance. In comparison to other formulations, it is noted that formulation E9 has good flexibility. Virtually all of the formulations, which was extremely uniform. Entrapment of air bubbles occurs often in all liquid formulations. The presence of air bubbles causes inconsistent and inappropriate drug content. All formulations are fully free of air bubble entrapment both before and after casting the film. In order to reduce the curling of the film, starch (1.6%) is employed as an anti-curling ingredient in film formulations prepared using the solvent casting method.

#### In vitro Drug Release

Ezetimibe film formulations were developed with the objective of delivering the drug instantly, improving patient compliance and bioavailability. As a result, materials such as xanthum gum, dammar gum, and gum karaya that are water soluble were employed. For the purpose of producing film, polyethylene glycol 400 and croscarmellose sodium were selected as the superdisintegrant and plasticizer, respectively. All of the film formulations were the subject of dissolution tests utilising Franz diffusion cell equipment. For all film formulations, the release values and drug release profiles were provided in Tables 16 and displayed in figures 6 and 7. The drug released on average

## Nandini Jampana and Jyosna Doniparthi

between 90 and 96.4% within 15 minutes in the film formulations E1 to E3, which were developed by increasing the xanthum gum concentration. The film formulations E4–E6 were made with dammar gum and had an average 15-minute drug release of 91–97.88%. The film formulations E7–E9, which were prepared utilising gum karaya, had a 15-minute average drug release range of 97.85–99.76%.

#### Evaluation of Various in vitro Dissolution Parameters

From the dissolution data, dissolution parameters such T50, T90, DE5%, and first order rate constant were computed, and the results are shown in the table 4. Gum Karaya's film formulations were found to have T50, T90, and DE 5% values of 2.5, 9.85, and 22.8%, respectively. All of the film formulations' first order plots were linear. All of the film formulations were found to have first order release rates that were linear, with R2 values ranging 0.946 to 0.994. As a result, the rates of drug release from all film formulations were dependent on concentration and linear with the first order release rate constant (K1). Drug dissolution parameters were given in Table 4.

#### Fourier-Transform Infra Red (FT-IR) Spectroscopic Analysis

The spectra of ezetimibe showed 3 primary peaks at wave numbers of 1115 cm-1(C-N stretching), 1731 cm-1, (C=C stretching) and 3171 cm-1 (N-H Stretching). All of the major peaks found in ezetimibe in its purest form could be seen in the spectra of the Optimized E9 film formulation. Consequently, there is no interaction between the drug and the formulation's polymers. FTIR spectrum of pure drug, karaya gum and optimized formulations were shown in Figures 7 to 10.

#### Scanning Electron Microscopy Analysis

SEM photographs were taken for the E9 optimized film and the pure Ezetimibe drug. The SEM photographs were shown in Figures 11&12. The E9 demonstrated an even, smooth surface and uniform without any cracks.

# CONCLUSION

Ezetimibe oral fast dissolving films prepared by solvent casting method showed good flexibility and film characteristic properties with good bioavailability. The optimized formulation E9 prepared by utilizing gum karaya showed the average drug release of 99.76% within 15min, which was desirable for faster dissolution and absorption. The drug content on average was found to be 8.71± 0.5, and showed good folding endurance and found that no interactions between the drug and the polymers in FT-IR studies whereas exhibited the smooth surface in SEM analysis. Ezetimibe oral fast dissolving films prepared by solvent casting technique were found to be suitable for the treatment of hyperlipidem.

# ABSTRACT

Benzodiazepine drug (BZD) is majorly used for the treatment of neuro-psychological ailments. Despite its therapeutic usage, these drugs are misused by drug addicts. These drugs arealso used as sedatives and antidepressants. Hence, the detection and quantification of these drugs are important in forensic toxicology and clinical chemistry. The determination of BZD drugs acts as crucial evidence from forensic biological matrices. In the present study, human blood and viscera were used as forensic biological matrices to detect BZDs, including bromazepam, clonazepam, lorazepam, nordiazepam, and diazepam. A column named AT1000 was used to detect the standard BZDs in forensic biological samples. The isocratic mobile elution was performed using 20mol/Lphosphate buffer (pH 7.0) and methanol (50:50, v/v). 1.0 mL per minute at 214 nm wavelength with a temperature of 40 °C. The linearity graph was made having concentration ranges of 5-500 ng mL<sup>-1</sup> for alprazolam and oxazepam, 3-500 ng mL<sup>-1</sup> for diazepam and clonazepam, and 1-500 ng mL<sup>-1</sup> for lorazepam with a determination coefficient (R<sup>2</sup>) greater than 0.9992. This study includes the extraction of drugs from biological matrices followed by the detection using GC-MS instrumentation for the purpose of quantification.

Keywords: Benzodiazepine, Blood, Clinical toxicology, Forensic Science, Gas chromatography

# INTRODUCTION

Benzodiazepine misuse is more normal than you might suspect. Left untreated, manhandling these medications can adversely affect your connections, vocation, and your physical and passionate well-being[1]. Benzodiazepine is a kind of drug known as a sedative. Recognizable names incorporate Valium and Xanax. Benzodiazepines are usually mishandled[2]. The misuse is somewhat connected with the harmful impacts that they produce and furthermore to

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Ravshish Kaur Kohli and Mridu Sharma

their inescapable accessibility[3]. They can be constantly manhandled or, as seen generally in medical clinic crisis divisions, purposefully or coincidentally taken in glut. Benzodiazepines have likewise been utilized as a "date assault" drug since they can particularly weaken and even annul capacities that typically permit an individual to oppose or even need to oppose sexual hostility or attack. As of late, the location and conviction of individuals engaged with this have expanded emphatically. The medication is typically added to liquor-containing drinks or even soda pops in powder or fluid structures and can be difficult to taste[4].LC combined with API mass spectrometry has now turned into the most amazing asset for the fast location, primary explanation, and evaluation of drug-derived material inside different natural liquids[5]. Programming interface procedures (ESI, APCI) give proficient ionization for different benzodiazepine-related particles, including metabolites. The fundamental benefits of MS/MS are simple test readiness, no expected derivation, and excellent quantitative abilities in the MRM mode. These days, LC-MS is of the highest quality level, especially for identifying extremely low focuses for evaluation in clinical and measurable toxicology[6].Butt-centricstudy a fast elite execution fluid chromatography (HPLC) strategy, involving a solid section in HPLC combined with a diode-exhibit identifier, was produced for the quantitative analysis of benzodiazepines in entire blood. The strategy has been applied to the examiner of eight benzodiazepines among the most often experienced in scientific toxicology- Clonazepam, desalkylflurazepam, diazepam, flunitrazepam, lorazepam, midazolam, nordizepam and oxazepam[7]. Various screening tests are currently accessible to give an underlying test to the presence of benzodiazepines in examples. Their applicability will rely upon the tissue being inspected (Blood/Plasma/Serum or Urine) and the kind of benzodiazepines prone to be available in the example. Earlier enzymatic hydrolysis to change over glucuronide metabolites to immunoreactive species is generally preferred to work on the perceptibility[8]. The Benzodiazepines measure uses gas chromatography-mass spectrometry (GC-MS) for the examination of diazepam, nordiazepam, oxazepam, temazepam, and lorazepam in Blood and Urine.

# MATERIALS AND METHODOLOGY

#### **Extraction from Blood**

#### Pre-treatment/Blood deproteinization

Take the sample of blood in a conical flask approximately 20-50 ml.Add a solution of Sodium tungstate with distilled water.Add conc. Sulfuric acid dropwise.Heat the sample on a hot plate for 2-3 minutes at 94°C. Filter the sample using filter paper and collect the filtrate for further basic extraction of the drug.

#### **Extraction from Viscera**

#### Pre-treatment of viscera sample

Take 50gm tissue cut into small pieces in a beaker.Add 20gm of ammonium sulfate and 15 ml of glacial acetic acid into it.Cover the sample with foil.Keep the sample in water for 2 days until the tissue is completely homogenized.Filter the sample using cotton and collect the filtrate for further basic extraction of the drug.

#### Extraction of the basic layer of drug

Take the filtrate from blood and viscera respectively in the separating funnel. Add ammonia, diethyl ether, and chloroform into it.Shake it for 15 min and keep releasing the gas while opening the knob every 2 min. Keep it undisturbed for 5 min on a separating stand and remove the sample in a conical flask.Collect the organic basic layer by transferring it through sodium sulfate and collect it in an evaporating bowl.Again, do the same process for the second organic basic layer. Collect the layer in the same evaporating bowl.Keep the bowl uncovered overnight and let the organic layer evaporate completely.This bowl can be used for TLC and for the making of GC-MS vials.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Ravshish Kaur Kohli and Mridu Sharma

# APPLYING THIN LAYER CHROMATOGRAPHY

Take a fresh TLC plate and cut it according to the number of samples.Mark 1.5cm from both sides using a pencil.The dried sample in an evaporating bowl, add chloroform, and spot the sample. Apply at least 20-25 spots.Meanwhile prepare the chamber for better separation, the solvent system used are as follows-

Chloroform: Acetone (8:2)

Chloroform: Methanol (9:1)

Methanol: Ammonia (9.5:0.5)

Retain the TLC chamber undisturbed for better saturation.Keep the TLC plates in the chamber.Observe the plates carefully for the prevention of overrun of the plates.Dry it and spray the reagent for visualization.

# Preparation of spraying reagent

Dragendroff reagent- 1gm of bismuth sub-nitrate is dissolved in 3ml of 10M of HCL. It is diluted at 20ml. 1gm of potassium iodide is dissolved in it. If the black precipitate of bismuth triiodideis separated, it is dissolved in 2M HCL. Idoplatinate- 2ml of 5% solution of platinic chloride in 2N HCL+5gms of potassium iodide to 98ml of water with stirring. Marquis reagent- 4 parts of sulfuric acid+6 parts of formalin. Figure 1: (A) and (B) represent the fumes of Sulfuric acid heating on a plate, Filtration, and Filtrate respectively, (C) represents the Filtration of the Viscera sample, (D) represents the sample of Blood separated with Organic basic layer.

# **RESULTS AND DISCUSSION**

Benzodiazepines are used most frequently in today's scenario. They are considered date assaultdrugs because the person doesn't remember anything after the consumption of these drugs. Most of the drugs are basic in nature. Different manufacturers are various concentrations of benzodiazepines along with different other salts combined to form a tablet[9]. The common concentration of tablet available in the market is 0.25mg, 0.5mg, and 1mg. even a minor dose of these drugs can act tremendously on the body[10]. This dissertation focuses on the analysis of benzodiazepines and their salt. The process was followed by the deproteinization of blood and water bath for viscera and then its extraction[11]. Further TLC was run in different solvent systems and the vials for GC-MS were made along with it. The reagents used for spraying TLC are Dragendroff followed by idoplatinate and marquis reagent[12]. The chromatogram shows the peak of the drug present in the sample along with those various other peaks that can be seen. TLC is one of the most common tests performed, retention faction and halfwerecalculated, and it is widely accepted, to look for further quantification of the drug GC-MS was done[13].

# CONCLUSION

From the study, it can be concluded that the dissertation primarily focuses on the extraction of drugs from biological matric followed by the detection using GC-MS instrumentation for the purpose of quantification. As almost all these drugs are basic in nature, the basic layer was extracted using ammonia to balance its pH, diethyl ether, and chloroform. The solvent systems and reagents mentioned were used as per the literature available. We would be covering a more detailed analysis on drugs and will also consider drugs beyond benzodiazepines and in further studies biological matrices such as urine and feces will also be analyzed. The different solvent systems not mentioned in the literature will also be tried using the hit-and-trial process for the development of something new which will help us to analyze the drugs in a more effective manner and will also ease out the possibilities of errors.

# ABSTRACT

As the dimensions of transistors have shrunk to sub-micron scales, new challenges, including power efficiency and undetected radiation hazards, have emerged as important areas of concern in the realm of extremely large-scale integration. Because they are key areas of worry, these new problems have recently come to the forefront as important areas of concern. In addition, complementary metal oxide semiconductors, which are more often referred to as CMOS transistors, have a greater consumption of space, power, and delay than the various other kinds of transistors. Because of this, a brand-new 10 Transistor (10T) Multiplexer Logic based Full Adder (MLFA) has been created and is now being simulated. Utilizing both kinds of transistors was necessary in order to achieve this goal, which is considered one of the possible answers to the problems caused by standard CMOS. Additionally, the MLFA that is being presented functions on the basis of a multiplexer selection logic, which has the capability of effectively reducing the route delays as well as the number of transistors. In addition, employing suggested MLFAs allowed for the development of a 4-bit ripple carry adder (RCA). In the end, the simulations are performed with the help of the Tanner-EDA simulation programme. The results of the simulation indicated that the recommended approach resulted in superior performance when compared to other approaches that are presently regarded to be state of the art in the field. Keywords: Full adder, Multiplexer, hybrid adder, FinFET.

Nandha Kumar et al.,

# INTRODUCTION

Conventionally, computing systems are built to function with the highest feasible degree of accuracy. However, this tendency is met with significant obstacles in terms of technology, such as high performance and power consumption, as well as dependability of circuits. Computer systems have been gradually improving in both their performance and their power consumption for well over half a century, with scaling technologies being the primary factor in this improvement [1]. It is anticipated that this pattern will maintain its prevalence far into the foreseeable future. In accordance with Dennard's scaling, the size of a transistor has been noticeably smaller during the course of its development, and the supply voltage has likewise become lower. As a direct consequence of this development, electronic circuits can now function at higher frequencies while nearly preserving the same amount of power dissipation. However, because Dennard's scaling is drawing ever-nearer to its end, it is becoming increasingly difficult to achieve additional performance improvements while adhering to the same 10.1109/JPROC.2020.2975695 power limits. This is because Dennard's scaling is getting closer and closer to its conclusion. Consumption of electricity has been a major source of concern for a very long time, and in recent years, it has developed into a problem that impacts the whole industry as a whole and is of critical importance. [2] This is because it is difficult to monitor and avoid parameter fluctuations and defects at advanced nanoscales, which is the reason why this is the case. [3] As a consequence of this, there will be a significant increase in the costs associated with the manufacturing and verification processes in order to ensure the success of the complete accuracy of the signals, logic values, devices, and interconnects.

[4] When it comes to the creation of digital processing devices, with an emphasis on portable systems, the key goals are to lower the amount of power that is needed while concurrently improving the processing speed. In most cases, increasing the speed of the precise processing units results in an increase in the amount of power that is required to run them. [5] The accuracy of the calculation is compromised as one of the strategies for increasing processing power without sacrificing speed. It is possible to utilise this method, which is known as approximative computing, for the applications in which it is acceptable to have some inaccuracies. [6] Among these are the applications in which digital signal processing, often known as DSP, is carried out on the signals connected to human senses. The capabilities of human perception are restricted, thus most of the time, approximation computing is used for processing these signals in bespoke DSP blocks. This is done since it is more accurate than human perception. [7] The realisation of this component utilising the technique of approximation computing was motivated by these facts, which can be found in the previous sentence. Previous studies on approximation adders have focused on either reducing the error weight or the error probability, both of which are considered to be more broad techniques. This is because, in most cases, the majority of the operations take place in the LSB section. The second method makes use of structures that are pure approximation adders. The primary design goals for these adders are to cut down on the amount of power they use and the amount of delay they incur, as well as the error probability associated with the summing. They could also be accompanied with an error correcting unit, which incurs overhead costs in terms of both time and power consumption. [8].

The ECG signals coming from a patient's body are continually monitored by a device based on WBSN. Continuous monitoring results in the production of an excessive amount of data, which, in turn, calls for a greater quantity of storage space, results in higher expenses associated with transmission, and raises the required amount of power consumption. In addition, in order for the Processing Subsystem of the WBSN device to be able to deal with this enormous volume of data, it needs additional processing time to be carried out, which results in an extraordinarily high level of power consumption. As a result, data compression methods are routinely applied in order to accomplish sparse encoding of this data. [9] Sparse encoding has the effect of lowering the needs for processing, which in turn leads to a reduction in the amount of power that is lost by the Processing subsystem. It is possible to reduce the amount of data being transferred by cutting down on the number of bits being sent (which are what make up the packets) [10]. This is due to the fact that the reconstructed signals are not exactly the same as the original signals.

### LITERATURE SURVEY

Betzel et al. [11] highlighted the potential advantages of approximation computing for the reduction of communication by conducting a review of three possible strategies for approximate communication. These techniques were compression, relaxed synchronisation, and value prediction. A comparison of the methods is made using an assessment methodology that takes into consideration factors such as the reduction of communication costs, performance, energy reduction, applicability, overheads, and output deterioration. In conclusion, this essay offers a number of recommendations for further research on approximation communication methods. In their paper [12], Mahmud and colleagues presented a thorough assessment with connection to the processing and analysis of large data, of the procedures and techniques of data partitioning and sampling. The first thing that students do when they begin this course is get an overview of the most widely used big data frameworks that can be operated on Hadoop clusters. Following that, we will go through the fundamental approaches to data partitioning, which will include a discussion of the three most frequent horizontal partitioning schemes: range, hash, and random partitioning. Following that, we shall go to the subsequent part of this discussion. The topic of data partitioning on Hadoop clusters is also discussed, along with an overview of novel methodologies for the partitioning of large amounts of data, such as the recently developed Random Sample Partition (RSP) distributed model. In addition, the topic of data partitioning on Hadoop clusters is also discussed. In addition, the topic of data partitioning on Hadoop clusters is covered.

Wei et al. [13] suggested a novel method of using static analysis for the purpose of performing security checks on Android applications, as well as a generic framework known as Amandroid. In an Android app component, Amandroid will do data flow and data dependency analysis on the component in addition to determining points-to information for every objects inside the component in a flow- and context-sensitive manner (which is configured by the user). Additionally, Amandroid monitors the activities of inter-component communication. In order to undertake intra-app or inter-app analysis, it is able to stitch together information at the component level and information at the app level. Stanley-Marbell et al. [14] made the observation that it could be useful to provide an overview of the research results on computer systems that only produce as many mistakes as their end-to-end applications can tolerate. This action was taken as a direct reaction to a suggestion made by the previously stated organisation. [There must be other citations for this] The results include a broad spectrum of academic disciplines, such as information theory, computer-aided circuit design, digital system design, computer architecture, programming languages, and operating systems, to mention just a few of them. Instead of over-provisioning the resources that are controlled by each of these layers of abstraction to prevent errors, it is more efficient to take advantage of the masking of errors that are occurring at one layer in order to stop those errors from propagating to a higher layer. This is because errors that occur at one layer can be masked by errors that occur at higher layers. This is due to the fact that faults that take place at one layer might be concealed by errors that take place at a higher layer. This is because errors that occur at one layer can be masked by errors that occur at higher layers. This is achieved by eliminating the possibility of mistakes arising at a more fundamental level in the first place.

An edge-computing-based lightweight blockchain framework (ECLB) was suggested for mobile devices by Liu et al. [15]. In order to achieve greater performance, this work presents a unique set of ledger structures and implements a transaction consensus procedure. In addition, taking into consideration the permissioned blockchain environment, we make explicit use of various cryptographic approaches in order to create a pluggable transaction regulation module. In conclusion, the results of our security analysis and performance evaluation demonstrate that ECLB is capable of maintaining the same level of security as blockchains similar to Bitcoin while achieving superior performance in terms of the cost of ledger storage in mobile devices, the cost of computing blocks, the throughput of transactions, the confirmation latency of transactions, and the transaction regulation cost.

zhou, et al. [16] created a Java annotation-based offloading framework for android mobile devices and gave it the name MCAF. This framework was created with the intention of easing the process of developing android apps that have the potential to offload their processing to a remote server. The only thing that the developers need to do is import the SDK library of our MCAF, and then they need to annotate the methods that need a lot of calculation.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Nandha Kumar et al.,

MCAF has the capability to automatically build the code that will be executed in the cloud as well as extract the annotated source code. In addition, the programmes that make the judgements about offloading are automatically integrated into the code that was originally written. Additionally, they carried out the actual trials in order to demonstrate that our MCAF is applicable. The Wireless Body Sensor Nodes was a concept that was suggested by Gosh et al. [17]. (WBSN). These wireless body sensor networks (WBSNs) initially comprise of bio-sensors that collect signals from a patient's body and wireless transmitters that transfer the acquired data to a server that is located in either a private or public cloud. The collected data may then be analysed. These WBSNs are equipped with the appropriate hardware to process signals before sending them to the cloud in order to be stored there. In energy-constrained WBSNs, the simultaneous occurrence of all of these networks. The vast majority of these data that are being sent to the servers are, by their very nature, duplicated; as a consequence, the therapeutic value that they have is negligible. This is because error-resilience is an inherent property of signal processing algorithms. In conclusion, the findings of the experiments reveal a 96% increase in system-level energy efficiency with just a 2% reduction in the effect on signal quality.

Liu, et al. [18] suggested An examination of approximation computing from both its past and its potential future. The size of a transistor has been greatly reduced from the beginning in line with Dennard's scaling, and the supply voltage has been decreased during the course of the years. As a direct consequence of this development, electronic circuits can now function at higher frequencies while nearly preserving the same amount of power dissipation. Not only does an increase in power consumption occur when the feature size of complementary metal-oxidesemiconductor (CMOS) technology is reduced to 7 nanometers, but an improvement in reliability also occurs at this point. This is due to the fact that it is more difficult to regulate and steer clear of parameter changes and flaws at advanced nanoscales. It was thought that a reverse carry propagate adder should be used, as stated by Pashaeifar et al. [19]. (RCPA). Even if there is variations in the latency, the overall system will be more stable if you use this sort of carry propagation at the beginning of the process. We describe three distinct implementations of the reverse carry propagate full-adder (RCPFA) cell; each of these implementations differs from the others in terms of the amount of delay, power, and energy it consumes, as well as the accuracy it provides. It is possible to produce hybrid adders with varied degrees of accuracy by combining the structure that has been described with an accurate carry adder that works in reverse. Using a variety of different permutations of these structures allowed for the generation of these adders. The discrete cosine transforms (DCT) block of the JPEG compression and the finite-impulse response (FIR) filter applications are analysed in order to determine whether or not the recommended RCPAs are successful. This is the last but not the least of the topics covered.

Marchisio et al. [20] presented their idea of using deep learning for edge computing. In the beginning, as DNNs increase in complexity, the linked issue of their high energy consumption becomes a difficult one to deal with. This task is made much more difficult by edge computing, in which the computing devices have restricted access to resources and must function within a limited energy budget. As a direct result of this, it is necessary to carry out specific optimizations for deep learning on both the software and the hardware levels. In this work, we undertake a complete analysis of the current trends of such optimizations, and we address key outstanding research concerns both in the medium term and in the long term.

#### Proposed Method

Because full adders are the fundamental components of any integrated circuit, their design and development must be approached with extreme caution in order to get optimal results. Conventional CMOS full adders have much greater power, delay, and energy consumption figures than their digital counterparts. As a result, the alternative technologies of FinFET and GnrFET are the technologies that may give reduced resource utilisation in lieu of the fundamental CMOS technology. In this part, an in-depth discussion of the creation of a full adder via the use of FinFET and GnrFET technology, together with 10T modelling, is presented. The MLFA is shown in the block diagram seen in figure 1. It demonstrates the operation of adding one bit by making use of a number of different components, such as XOR gates, NOT gates, and a Multiplexer 2 to 1 (MUX21), in that order.The functions of the

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

## Nandha Kumar et al.,

MLFA are mostly focused on the switching operations for MUX21. Because of its performance, which is characterised by the rapid triggering of data in comparison to that of other building blocks, the computational complexity of the MUX21 is very low in this instance. In addition to that, the logic of FA is satisfied by this activating procedure. In this setup, each individual component is crafted by the use of the FinFET and GnrFET technologies, in that order. In addition, both the process of sum generation and the process of carry out generation are shown in Table 1. The fact that the lines in Figures 1 as well as Table 1 all have different colours indicates that they represent the same procedure.

In the beginning, inputs A and B are placed into the XOR gate, which ultimately produces the half adder sum output. This is the outcome of the first step. The output of this generation is sent as the data input to the MUX21 once it has been processed (input 0). Additionally, the XOR gate is used on the NOT gate, which leads in the output being referred to as XNOR. This is because of the way in which the XOR gate is utilised on the NOT gate. In addition to this, the result of the XNOR operation is fed into the MUX21 as the data input (input 1), and the MUX21 utilises C in as its selection input in the appropriate manner. In addition, depending on the value of C in, MUX21 will choose the data inputs using either the XOR or XNOR outputs. This is shown by the equations (2) and (3) that are presented below, in that order. The total adder sum, which is represented by the symbol S, is found in equation (1), which can be found below.

$S = A \oplus B \oplus C_{in}$	(1)
$C_{in} = 0 \rightarrow S = A \oplus B \oplus 0 \rightarrow A \oplus B$	(2)
$C_{in} = 1 \rightarrow S = A \oplus B \oplus 1 \rightarrow A \odot B$	(3)
In a similar fashion, the result of the VNIOD energian	lo f

In a similar fashion, the result of the XNOR operation is fed into the second MUX21 as the selection input, with C in serving as "data input 0" and B being the "data input 1." This, in turn, produces the carry out (C out). In addition, Equation 4 demonstrates the fundamental process of MLFA carry out, and it is altered in accordance with the XOR-XNOR logic for implementations that are based on multiplexers.

$C_{out} = AB + C_{in}(A \oplus B) = C_{in}(A \oplus B) + \overline{B}(A \odot B)$	(4)							
Additionally, equations (5) and (6) illustrate the method	of carry out generation in the following manner:							
$A \odot B = 0 \rightarrow C_{out} = C_{in}$	(5)							
$A \odot B = 1 \rightarrow C_{out} = B$	(6)							
The varied colours in Figure 2 and Table 1, respectively, reflect how these equations are used in practise. This can be								
seen in both of these figures.								

Figure 2 illustrates the FinFET modelling of the proposed MLFA that has been developed. The proposed MLFA is constructed from 5 numbers of FinFET PMOS transistors and 5 numbers of FinFET NMOS transistors, each in their own separate 5 number configuration. Due to the fact that the NMOS and PMOS transistors used in this particular implementation are carbon copies of one another, it is essential to include an equilibrium state into the MLFA. This is done in order to ensure that the unbiased electron-hole pair is both regulated and synchronised. In addition to this, the condition of balance also helps to maintain the appropriate level of power consumption while simultaneously improving energy efficiency. The combination of P1 and N1 FinFET transistors performs the function of an inverter, and it gives the value B minus as the output for any value of B that is input. Therefore, the combination of P2 and N2 FinFET transistors functions as an XOR gate, taking the values B and A as its inputs and producing the values A and B as its outputs.

In addition, as an inverter, the combination of P3 and N3 FinFET transistors causes them to produce the XNOR result AB in response to the XOR input AB. AB is the output of the XNOR operation. This is because the result of performing the XOR operation on AB is AB. In addition, the functionality of a MUX21 is accomplished by combining P4 and N4 FinFET transistors in a single device. The letter C in represents the selection input, data input-0 represents AB, data input-1 also represents AB, and the letter S represents the sum output. This specific arrangement of transistors is referred to as a MUX21 and has been given that name. The MUX21 that is generated by the combination of P5 and N5 FinFET transistors operates in the following manner: A and B are used as the selection input, data

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Nandha Kumar et al.,

input-0 is used as C in, data input-1 is used as B, and the carry output is created as C out, respectively. This brings us to our final point, which is that the combination of these transistors creates a carry output. The implementation of a MLFA using GnrFETs makes use of the same transistor level circuit as before, and the operation remains the same.

# **RESULTS AND DISCUSSIONS**

For the creation of each and every MLFA design, The Xilinx ISE software was the one that was used. This piece of software has the capacity to generate two separate kinds of outputs, namely simulation and synthesis. These outputs are both possible. The results of the simulation make it possible to conduct an in-depth analysis of the MLFA architecture with relation to the many permutations of input and output byte levels. A simple decoding technique may be approximated by applying a large number of different combinations of inputs and watching a wide variety of outputs while doing a simulation study of accurate encoding. As a consequence of the conclusions of the synthesis, the use of space in proportion to the number of transistors will be carried out. In addition, a time summary will be obtained with reference to the various route delays, and a power summary will be prepared making use of the static and dynamic power consumption. Both of these summaries will be gathered. Both of these summaries will be done. The results of the simulation of the existingMLFA are shown in Figure 3. Here, the outputs are wrong. Further, the results of the simulation of the proposed MLFA are shown in Figure 4.

Table 2 presents a comparison and contrast of the results of performance assessments conducted on a number of different MLFA controllers. In this instance, the proposed MLFA resulted in superior (reduced) performance in terms of transistors, time-delay, and power consumption when compared to conventional approaches such EFA [9], 16T-FA [17], 12T -FA [16], and 11T-FA [13]. This was the case because the MLFA used fewer transistors than the conventional approaches. This was the case because the MLFA was able to reduce the time-delay without sacrificing the number of transistors.

# CONCLUSION

This academic article focuses mostly on the design and manufacturing of a MLFA as well as a 4-bit RCA by making use of FinFET and GnrFET technologies. This is the primary topic of the study. It is engaged between the XOR results and the XNOR outcomes so that the entire output is created. In addition, a second multiplexer enabled the data inputs and produced the carry output, both of which contributed to the successful reduction of the route delays. The suggested MLFA is constructed on the basis of the logic used by the multiplexer selection, and as a result, it is activated between those two possibilities in order to provide the sum output. In addition to this, the technique that was proposed was able to reduce the amount of power that was used by activities that were quickly activated. These libraries were used to create the final product. The results of the simulation make it possible to reach the conclusion that the design that was supplied is an excellent choice for a broad variety of addition-based applications. This conclusion can be reached because the findings of the simulation enable it. In addition to this, this strategy is extensible, meaning that it is used to build the complete subtractor, the subtractor, and the multiplication operations in the order given.

# ABSTRACT

Authenticity of the information has become the prominent issue which is affecting the society along with the media organizations. Widespread influence has a significant impact on the rapid spread of news on social media, simplifying information that is false, inaccurate, or distorted. The public sphere and possible integrity have been disrupted by the current propagation of fake news. are examined in this paper. This paper also discusses the connection between the problem of fake news and the main activities in India during second Covid-19 wave. Indian authorities and mishandling of entire Covid-19 second wave were criticized by international newspapers and nations. This paper also looks for the Indian authorities, who used a lot of propaganda to try to control the people. Any information aims to unite people on a common ground that makes up the public sphere. Throughout the entire Covid-19 second wave in India, from April 2021 to June 2021, where Indian government must be held liable, concerns have been raised.

Keywords: Mishandling, misinformation, Covid-19, Social media, second wave.

# INTRODUCTION

People can quickly share information through the internet and amount of shared information is identified as fake. It has made it extremely difficult to create and fabricate accurate news. Because of the abundance of information available through digital media, people can easily access news from a variety of sources. When multiple media

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Garima Gunawat and Vaishali Kapoor

outlets are reporting the same story, however, discerning the real from the fake becomes more difficult. It becomes simpler and more volatile (Sundaram, Nundy& Mallick, 2020). From various platforms, circulation of fake content quickly as well as easily, suggesting that people are susceptible fake news, low reliability and content that is biased. The fact that people are affected by fake news and global sites is the primary cause of concern. People share incomplete or partially misleading information as a result. During the Covid-19 outbreak, all of this false information had a negative impact and led to the improper use of drugs and treatments for these diseases. People asked a lot of questions about the disease's origin, treatment, home remedies, prevention, and transmission by pets and fly to stay up to date. The bogus reports during the Pandemic were spreading quickly in the beginning phases. Authorities coined the term "Infodemic" to describe the widespread dissemination of false information.

In India, during the second wave of the Coronavirus, numerous lives have been lost, according to BBC news. The country was experiencing an increase in the number of Corona cases. People scrambled for hospital beds, oxygen cylinders, and crucial medications because the nation's health infrastructure was unable to handle the situation(Pathak, Salemi,Sobers, and et.al., 2020).Despite numerous warnings and recommendations from medical professionals, the Indian government didn't adequately formulate for second wave. During second wave, the failures and risks were not effectively communicated to the public by any segment of the public health communication. Instead, the government focused on well-known "babas" who held unscientific beliefs and ignored doctors. (Jafri, 2020).

## Fake news propagation during the second covid-19 wave

The World Health Organization said that it's important to figure out how fake information gets out of control. In various domains, there were a lot of false information and myths. The followings are some of the most prevalent myths and false information (Reddy, Suryakumari, Yadav, and et.al. 2020):

- Chloroquine and hydroxychloroquine are used to treat malaria, but they can be combined with Covid-19 medications.
- Coronavirus is additionally started by microscopic organisms.
- Covid-19 can be prevented by sun exposure or drinking alcohol.
- Flies are another vector that can spread Covid-19.
- The effect of 5G networks on how the corona is spread out

According to Erku's (2020) discussion, a pandemic has three parallel tendencies: - False prescriptions, fake drugs, and false news. His research shows that fake news depends on its problem and vice versa during the Covid-19 event. This is due to a correlation between the capacity to identify fake news and news consumption online. Volumes vary across all platforms for social media online (Erku, Belachew, Abrhaand et.al, 2020).

Our health infrastructure and lack of medical preparations were highlighted by the sudden rise in Covid cases. As a result, assistance for the intensive care unit, oxygen cylinders, medications, and vaccines were smuggled over via social media. At first, political leaders also spread false information about vaccination. In a video that was published by The Economic Times, the leader of the Uttar Pradesh Samajwadi Party, Ashutosh Sinha, made the incorrect statement that vaccination might make one infertile. In a similar vein, a claim was made in India Today that Muslims should avoid vaccinations because they contain pork. Furthermore, an unfounded claim suggested that the vaccine contained a microchip, purportedly a means for government surveillance. As a result, all of these claims were untrue and eventually proved false. In addition, Uttar Pradesh's former chief minister Akhilesh Yadav uploaded a video that included caption, "Do we laugh or cry over this?". A group of men in that video covered themselves with cow urine cow dung. They believe it will eradicate the Covid-19 disease and prevent it. (Ramesh, 2021).

#### Infodemic contribution in misinformation

An information epidemic, also known as an infodemic, has emerged as a result of the proliferation of social media and mobile phones with Internet access across the globe as well as the exponential production of information (Here's

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Garima Gunawat and Vaishali Kapoor

How social media Can Combat the Coronavirus "Infodemic," n.d.).Breaking this dangerous cycle is essential: Misinformation spreads at the same rate as new routes for content production and distribution. As a result, the same infodemic propagates and accelerates false information. How accurate is this information? Just a few. Infodemic makes the pandemic worst: -

- Makes it difficult for individuals, decision-makers, and health professionals to locate reliable guidance and sources when they need them. Apps, scientific organizations, websites, blogs, "influencers," and other sources may be used as sources.
- People may experience feelings of anxiety, depression, overwhelm, emotional exhaustion, and inability to meet important obligations.
- When immediate responses are anticipated and not enough time is allotted to thoroughly analyze the evidence, it can affect decision-making processes.
- There is a lack of quality control over what is published and, occasionally, used to take action and make decisions.
- Anything can be written or published online, including podcasts, articles, and so on. primarily through social media channels (individual and corporate accounts).

EPI-WIN held a two-day global online consultation on managing COVID-19 participants in early April. In addition, over 500 ideas were submitted in an interactive online forum.By developing global resources for fact-checking and misinformation management, infodemic measurement and analysis, evidence synthesis, knowledge translation, risk communication, community engagement, and amplification of messages, the WHO is supporting the response to the infodemic.The World Health Organization (WHO) is also working with search, social, and digital companies like Facebook, Google, Tencent, Baidu, Twitter, TikTok, Weibo, and Pinterest to stop fake news and spread accurate information from reliable sources like the Centers for Disease Control and Prevention(Department of Evidence and Intelligence for Action in Health, N.D.).

# **RESEARCH METHODOLOGY**

During the second wave of Corona, fake news items are gathered from fact-checking and news website websites. Qualitative research will be used in this study. This study uses content analysis as its method. The nature of social media, its sources, motivations, and themes of fake news were discovered through content analysis. Fake information is disseminated through the platforms of social media. During entire India's second Covid-19 wave, from April to July 2021, concerns were raised. In this study, the method of purposive sampling is used. A lot of the collected data and information can be squeezed out with the help of purposeful sampling. In addition to this, it makes it possible for the researchers to talk about their findings' main effects. It includes forty news articles, four WHO documents, and ten research papers. Twelve stories from Indian News's six websites: -The Times of India, Economic Times, NDTV, Indian Express, Hindustan Times and India Today. Six fact-checking websites published ten news articles: - News laundry, Scroll, The Quint, The Print, and Alt News in. The Deutsche Well, BBC, The Guardian , The New York Times , Time, The New Yorker , USA Today, Global Times, Reuters, Lancet, and The Washington Post are just eighteen of the international news articles.

The number of people who receive, share, and post information on social media is the mass media's audience. By disseminating social, entertainment, and political information via social media social media sets agenda. Information purification allows agenda of the mass media to reach the audience. Through accidental exposure, Information that is shared online can be shared with more people. McCombs and Shaw carried out a meticulously organized study of the agenda-setting theory in 1972. The agenda-setting theory, according to Gokce (1993), is based on the strategy of using mass communication tools for presentation. It draws attention to subjects that matter to the audience and influence public opinion. According to McQuail (1994), "society will also consider them more important than other issues and subjects" for subjects and concerns that are marked as important by the media (Demirsoy&Karakoç, 2016).

## Garima Gunawat and Vaishali Kapoor

### India's epidemic of false Covid-19 information

World Health Organization (WHO) has completely reversed course and now asserts that Corona patients do not require isolation, quarantine, social isolation, or even transmission from one patient to another. The World Health Organization (WHO) asserts that in the digital age, infodemics spread quickly by fostering uncertainty. It is based on mistrust, anxiety, stigma, and other forms of violent aggression that are evidence of the implementation of public health measures, which frequently result in the loss of many lives.

The social media platform was full of conspiracy theories, unverified news, and fake news. That was making things unclear and making it harder to respond effectively to pandemic crises. The social media platform was full of conspiracy theories, unverified news, and fake news. That was making things unclear and making it harder to respond effectively to pandemic crises. Experts estimate that the actual number of corona cases maybe between five and ten times the official count. during the subsequent wave religious misinformation comes in second, with health-related misinformation coming in third (Krishnan, 2021).

The Times of India reports that the government requested that 100 URLs and posts be removed from popular social media platforms like Instagram, Facebook, Twitter and YouTube. those URLs and posts that were accused of spreading false information and inciting panic about the country's Covid-19 situation. The IT ministry was advised by the home ministry that certain users Inappropriately use social media platforms (Doval, 2021). According to the Times of India, Twitter had already established that it had removed four dozen tweets that appear to criticized how the central government dealt with the corona pandemic. Mallick, The Quint's assistant editor in 2021, stated that he revealed that the Telegram, messaging app was major hothouse for fake news and that he had joined several anti-vaxxer groups on social media platforms. Unlike other social media platforms, there is no limit on the number of people who can connect to a group or channel. In addition, there is no evidence that the message has been multiple times forwarded. As a result, passing off the news was simple.

In India, the WHO issued a medical product alert for counterfeit Covishield vaccine. The Indian legitimate manufacturer of the Covidshield was also confirmed by the Serum Institute of India (SII). World Health Organization (WHO) requested that supply chains in regions and nations that are likely to be affected by fake vaccine products be monitored more closely.Covishield, a product developed by Oxford University and AstraZeneca.Covaxin, product that was developed Bharat Biotech, an Indian startup.According to the USA Today there is no correlation between these two vaccines. There is no connection between these two vaccines. India placed an overall order for approximately 167 million doses, and Only 34 million people got the two doses, according to government data. It represented slightly more than 2% of India's 1.3 billion inhabitants (Sadeghi, 2021).

The Middle gave rules to assist individuals with distinguishing between phony and credible antibodies against the crown (Beam, 2021). West Bengal and Maharashtra are two of the states where the bogus vaccination was administered. On the antibiotic injection that is used to treat bacterial vaccines, the con artists applied fictitious labels for Covishield or Covaxine. The thought process behind counterfeit antibodies is to bring in cash through unlawful strategies other than hurting individuals (Choudhary and et. al., 2021).

#### Mass gathering during second wave of COVID-19

Tirath Singh Rawat, the Boss Priest of Uttrakhand, said concerning the Kumbh Mela in its crowd that stream contains the gifts of Maa Ganga. when Covid was at its peak. There shouldn't be a corona (Bhatia, 2021). Faith should be respected, but faith is for humans and not vice versa, the unabashed Hindu nationalist CM tweeted prior to the Kumbh Mela. Further added, we should put our faith aside to save humanity during this pandemic and contribute to the nation's fight against the coronavirus. India's ruling Bhartiya Janta Party had never made a statement before that defied logic for the crowd. From April 9 to May 8, Uttarakhand's Haridwar hosted the Kumbh Mela. On April 12,

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

# Garima Gunawat and Vaishali Kapoor

roughly, At Kumbh, three million individuals swam in the Ganges; however,number of corona cases surpassed all previous records. In Haridwar, approximately 2000 people tested positive.

As indicated by The Indian Express, in the midst of overall worry about the crown and public worry over the mass get-together during the Kumbh Mela. Mela should be "Symbolic," according to PM Modi because it will strengthen the nation's fight against the coronavirus pandemic. I pleaded that "shahi snan" would occur and that the Kumbh would now serve as a symbol, Prime Minister Modi wrote in a tweet. The country's pandemic almost did not affect CM Rawat's front. No one will be halted for the sake of Covid as we are certain the confidence in God will defeat the anxiety toward the infection, CM Rawat stated, as reported by Hindustan Times. No one will be halted for the sake of Covid as we are certain the infection. CM Rawat issued a statement in which he insisted that the risk and danger of the Tablighi Jamaat event at Nizamuddin Markaz in Delhi outweighed those of the Maha Kumbh Mela, despite the obvious fact that the Kumbh Mela was clearly increasing the number of cases in Uttarakhand (The Wire).

After the Kumbh Mela, a lot of people criticized the government for letting the festival go on while the entire country was fighting a pandemic. The holy river was used by 900000 people, according to officials. Hindus have faith that bathing in the Ganga River will cleanse them of their sins and bring them back to God. Police officers at the Kumbh Mela have stated that it is difficult for them to impose standards on masses. BBC News reports that on a single day, more than 20,000 samples were collected in that region. 2812 active cases were counted by Haridwar at Kumbh. Some devotees tested positive, some chose to remain alone, and some moved to the city of Haridwar's hospital. Each day, it recorded over a thousand new cases. 14 Hindu groups were found to be positive, and the former Chief Minister of Uttar Pradesh was also found to be positive after visiting the Kumbh Mela. The current Uttar Pradesh chief minister was also positive.

Corona cases increased, and political parties turned their focus on election-related activities like voting and attending rallies in some states. The BJP, India's ruling party, denied that mass gatherings during the Kumbh Mela and election rallies were linked to an increase in cases.BJP pioneer BBC News was informed by Dr. Vijay Chaythaiwale that the high cases have nothing to do with political and religious gatherings.In a few states, including West Bengal, Assam, Tamil Nadu, and Kerala, political parties in India began their election series campaigning.The virus could easily be passed from one person to another People who attended election rallies in a crowded location where they were in proximity to other people for an extended period of time and were not properly communally isolated may have spread the virus.(Goodman, 2021).

In the states where West Bengal's elections were headed, Modi and ministers from his party were doing a lot of campaigning. Akhilesh Jha, deputy director of the Federal Department of Science and Technology, says, as people head to the funerals, you have rallied. Additionally, he asserts People will hold you responsible if you continue to hold rallies. The government spokesperson did not respond to any of the questions regarding the criticism of the government. According to Piyush Goyal, minister of railways, commerce, and industry, Prime Minister Modi works long hours every day to deal with the country's crises. Congress, the national opposition party, organized election rallies in West Bengal during the elections. Before the elections, the BJP insisted that candidates exercise their right under the constitution to campaign for at least 14 days. Nirupama Menon Rao, a former foreign secretary, asks, what number of passings does it take until he realizes that an excessive number of individuals have passed on? (Das and Ahmed, 2021).

Political parties started breaking the rules of the Corona campaign gatherings for assembly elections without the election commission's intervention. The Madras High Court said that constitutional bodies could face murder charges because they were "the only institutions responsible for the situation that we are in right now." The election commission was also criticized by the Calcutta High Court for failing to ensure that political parties would adhere to the Covid protocols following the surge of the second corona. In accordance with Corona protocol, rallies and campaigns were attended by a large number of people. Numerous large rallies were staged by PM Modi and Union

### Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Garima Gunawat and Vaishali Kapoor

Home Minister Amit Shah, drawing criticism from all over the country. However, West Bengal Chief Minister Mamta Banerjee attributed the state's second Corona outbreak and rise in cases to BJP rallies. Mamta Banerjee, on the other hand, was just as guilty of the high-profile rallies and campaigning that were a serious violation of the Corona Protocol.

#### The government views the second wave

During the second corona wave, India experienced a rise and fall in corona cases before experiencing a sudden increase. By the middle of April, there were already 1.93 million active corona cases in India. In contrast, the corona cases were treated with flippancy and indifference by government officials. During the pandemic, leaders of the nation's ruling party, the Bhartiya Janta Party, made extremely insensitive remarks We are in the final stages of the India coronavirus pandemic, and in order to win at this point, we really want to go through the following three stages: Keep politics out of the COVID-19 vaccination campaign and put your faith in the science behind it: Trust the science behind COVID-19 vaccines, keep politics

The various regions of the nation were in acute need of oxygen supply during the second wave of the corona. However, According to Union Minister Piyush Goyal, the demand for oxygen cylinders is not controlled by state governments. Medical oxygen demand should be controlled by state governments, Piyush Goyal stated to ANI. Management on the demand side is just as important as supply-side management. State governments are responsible for preventing the spread of Covid-19, and they ought to fulfill this responsibility The statement continued, the country's healthcare system will face a significant challenge if cases continue to rise indefinitely. We support state governments, However, in order to prevent the COVID-19 virus from spreading, they must control demand and take action. On social media, individuals voiced their disapproval of each of these comments. On Twitter, the trending hashtag #toomuchoxygen started.

PM Narendra Modi said, never witnessed a crowd as large. a huge crowd to thousands of people at a rally while campaigning for the elections in West Bengal (NDTV). Despite the leader's lack of concern for Corona protocols portrayed this crowd as the worst-case scenario during the pandemic. I only see people everywhere, he continued. According to The Wire, he should have noticed that people didn't follow corona protocol or wear masks, and were very concerned about social distancing(Sen, 2021).

### Condemnation of the Indian Council

Reuters says that the government set up a forum of scientists to warn Indian authorities that the new virus variant is more contagious at the beginning of March. In spite of the early advance notice, the public authority forced no significant limitations to visit the circulation of infection. On the other hand, approximately Ten thousand farmers remained in New Delhi to camp out in opposition to Modi's changes to agriculture policy. The populous nation was experiencing difficulties due to the second corona wave (Ghoshal, 2021). Numerous Indians were disheartened by PM Modi over his terrifying reactions to the Covid flood by tending to in excess of 10,000 individuals at political revitalizes and allowing Hindu adherents to go to the celebration. Some hashtags, like #ResignModi and #SuperspreaderModi, gained popularity and became popular on Twitter. There were heaps of dead bodies that were heaped in the morgues and crematories, need for medical clinic beds and blood, oxygen chambers, and crown tests overwhelmed online entertainment. On the talk show "Mann ki Baat," PM Modi spoke to the nation about his immense popularity and dedication, focusing on the "Mask Zaroori." However, in contrast, the PM spoke to thousands of people at the rally, maintaining the social distance and uttering the phrase "Amazing atmosphere" without mentioning corona-safe behaviors (Narendra Modi, 2021).

#### Criticism from authorities of foreign media

The Second Wave of Coronavirus is spreading throughout India, according to the New York Times, and there is a shortage of oxygen and supplements that can save lives. While the government of India directed to remove a dozen posts that criticized the government's handling of the pandemic on social media, that order primarily targeted opposition-related posts calling for Modi's resignation. India's public health problems became the political agenda.

www.tnsroindia.org.in ©IJONS

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Garima Gunawat and Vaishali Kapoor

Pictures of people desperately seeking hospital beds and oxygen and requesting assistance from the government went viral on the internet, which horrified people all over the world. The ruling party in India became aggressive, arresting a number of journalists and activists, and putting pressure on media organizations to change their stance. In troubled areas, they also block mobile internet access. As a result, they began spreading propaganda against China and blocked advertisements owned by Chinese organizations. Twitter blocked approx. 500 accounts after government suspects them, and government also threatened to arrest their employees.

Prof. Sumit Ganguly writes in a Washington Post column that the Modi government is alert but has made irrational decisions, because of this the second floor of the crown squashed the country. This clearly conveys the following: Policy objectives, political dramaturgy, and electoral prospects are more important than the population's well-being (Times of India, 2021). PM Narendra Modi was criticized by the well-known medical journal The Lancet for saying that removing tweets of criticism rather than attempting to contain the pandemic. Additionally, their lack of Covid-19 mitigation measures was noted as noticeable in the editorial. The Lancet additionally requested that the public authority broadcast exact data quickly. Mr. Modi's ruling Bharatiya Janata Party and other parties have continued to hold massive rallies where thousands of people have been unmasked, even as the number of cases has increased, in their article, the New York Times mentioned. The government has also allowed a massive Hindu festival to attract millions of pilgrims, despite signs that it has accelerated the spread of the virus (Schmall, 2021

According to BBC reports, India's healthcare system is buckling as a record number of Covid-19 cases put pressure on hospital beds and drain oxygen supplies. Some patients are left untreated for hours, leaving families pleading for their critically ill relatives. The sycophantic cabinet ministers who praised Modi for successfully dealing with Covid-19 in India despite testing slowing down and allowing people to become more complacent about the virus bear responsibility. The strongman regime has ignored all warnings (Ayyub, 2021). This was also stated in an article that was published in Times magazine. Global Time in China also said that India had let its guard down. Now According to Oxford Economics, the upward trend will continue for a few weeks, if not months, when tens of thousands of people return to a poor and densely populated nation like India, the upward trend will continue for several weeks, if not months. By allowing state elections, political rallies, and religious festivals to take place and declaring victory over the pandemic, the Prime Minister is also accused of ignoring the warning signs of the second wave, disregarding the advice of scientists, and encouraging a culture of complacency at the highest levels of government.

### CONCLUSION

Majority of the world was affected by the corona's second wave. India's situation was grim. The second wave of the virus spread at a much quicker and at a rate that is more complicated than the first wave. During the subsequent wave, Indians knew nothing about crown conventions like veiling, keeping proper social separation, staying away from huge get-togethers, etc. This study aims to spread false information during the second corona wave. It is concluded that a lot of false information and news was spread during the second corona wave. On social media platforms like Facebook, Whatsapp, and YouTube, messages, images, and videos were used to spread a lot of false information. India was marked by a variety of political content and false information regarding cases, deaths, treatment options, and prevention strategies. The lack of medical oxygen, hospital beds, vaccines, and antiviral medications strained the Indian health sector. In the absence of facilities or ambulances, individuals were dying in homes and the parking lots of hospitals. They refused to stop large crowds. Thousands of the coronavirus was found in these pilgrims. The Indian government and its actions were criticized by numerous international media outlets. It is concluded that there was insufficient flexibility and planning. In numerous urban areas in India, the well-being framework fell the government rushed to prepare for the sudden announcement of oxygen plants and other health facilities during the second crisis wave.

### ABSTRACT

A simple, accurate, precise method was developed for the estimation of the Teriflunomide in a tablet dosage form and optimized separation was achieved on a Inertsil C8 column (250 mm×4.6 mm; 5  $\mu$ m) using mobile phase composition of buffer pH 6.0 and acetonitrile in the ratio of 45:55 (v/v), at a flow rate of 1.5 mL/min in isocratic elution. UV detection was carried out at a wavelength of 250 nm. The temperature was maintained at Ambient. Well-resolved peak were observed with high numbers of theoretical plates, lower tailing factor and reproducible relative retention time. The method was validated and all the validation parameters were found to be within the acceptance limits.

**Keywords:** Teriflunomide, Phenyl isoxazole, 4-(trifluoromethyl) aniline, RP-HPLC method development, Validation.

### INTRODUCTION

Teriflunomide (trade name Aubagio, marketed by Sanofi) is an Immunosuppressive Agent. Teriflunomide was investigated as a medication for multiple sclerosis (MS) and act by inhibiting pyrimidinede novo synthesis by blocking the enzyme dihydroorotate dehydrogenasee [1,3,4,5].

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Suresh Kumar Raju et al.,

A literature search confirms that there is no method reported for the simultaneous estimation of Teriflunomide quantitatively in pharmaceutical dosage forms of Tablets. Hence the present work aimed to develop a simple stability indicating RP-HPLC method for the separation and quantification of Teriflunomide. Considering the BCS classification, solubility, and the influence of gastrointestinal pH on solubility of drug substances, in vitro dissolution studies of formulations containing both drugs are very important to check the release and solubilization of the active drug substance from the drug product and to predict the in vivo performance of different formulations. The main aim of this method was to determine and validate the Teriflunomide based on International Conference on Harmonization guidelines<sup>[2]</sup>. This method was made use of a reproducible procedure for the quantitative analysis of drug samples in tablet dosage forms. The designed method was considered as an advisable to develop precise, accurate, simple RP-HPLC method.

### **MATERIAL AND METHODS**

### Chemicals, reagents and instruments

Teriflunomide, Ortho phosphoric acid ( $H_3PO_4$ ), potassium dihydrogen phosphate ( $KH_2PO_4$ ), Potassium hydroxide (KOH), Acetonitrile and Milli-Q water. Inertsil C8 250 x 4.6mm, 5 $\mu$ m column, HPLC instrument equipped with UV-VIS spectrophotometer.

### Mobile phase and solutions preparation

#### Preparation of buffer

Pipette 0.5 mL of Orthophosphoric acid in 500 mL of water, adjusted pH of the solution is 6.0 with diluted potassium hydroxide solution.

#### Preparation of Mobile phase:

Mix 45 mL of buffer, 55 mL of acetonitrile and sonicate to degas.

### Preparation of Dissolution media

Weigh and dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water, add 0.8 g of sodium hydroxide pellets, adjust the pH of the solution to 6.8 with diluted sodium hydroxide solution.

### **Standard Preparation**

Accurately Weighed and transferred 18mg of Teriflunamide standard into a 50 ml clean dry volumetric flask, add acetonitrile to dissolve the material by sonication and make up to the final volume with acetonitrile.

For 7 mg: Further pipette 1 mL stock solution into 50 mL of volumetric flask and diluent to volume with dissolution media.

For 14 mg: Further pipette 2 mL stock solution into 50 mL of volumetric flask and diluent to volume with dissolution media.

#### **Sample Preparation**

Dissolution parameters, i.e., USP dissolution apparatus type II (paddle type), at 50 rpm and 1000 mL dissolution medium containing 0.05M phosphate buffer pH 6.8 were selected as per FDA guidelines [6] for in vitro dissolution. The medium was equilibrated at 37.0  $\pm$  0.5 °C, and tablet samples were added to each dissolution bowl. Sample collection as per the prescribed schedule at 30 min. At specified time intervals10 mL of sample was collected using a bent cannula from half way between the top of the medium and the top of the paddle, not less than 1 cm away from the wall of the bowl and each sample aliquot from bowl was filtered through a 0.45- $\mu$ m nylon filter (Millipore). With the progress of International Conference on Harmonization (ICH) guidelines, the method has developed into more clearly and obligatory. Hence the necessity of separation of several components through the study of stability samples, HPLC has gained reputation in stability studies due to its specificity, sensitivity and high-resolution capacity. The work planned in this research was subjected towards the study of the chromatographic actions of the

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Suresh Kumar Raju et al.,

samples of stress degradation of teriflunamide and its impurities in the tablet dosage formulation. The stability indicating study of present drug has not reported so far in the literature as per our knowledge and motivated us to develop an RP-HPLC- PDA stability indicating test where the degradation products were resolved from the integral drugs.

### Method development

The standard drug solution containing 7.2  $\mu$ g/mL concentrations of Teriflunomide was initially used for method development studies, the blank chromatogram in the Figure 1,placebo chromatogram in the Figure 2, standard chromatogram in Figure 3 and Sample chromatogram in Figure 4.

### Method validation

The method was validated as per ICH guidelines. The different validation parameters which were performed asfollowing: linearity, precision, accuracy, specificity, limit of detection, limit of quantification and robustness.

#### System suitability test

System suitability was evaluated with freshly prepared standard solutions. Five replicate standard solution injections were performed and calculated the % RSD for retention time and peak area. Other parameters theoretical plates and tailing factor were measured. System suitability results were tabulated in table 1. % RSD values were within the limit 2%.

#### Specificity and Placebo Interference

Specificity of the method is important to check interference of excipients and dissolution medium on the response of the drug substance. A composite solution of placebo was prepared from all excipients of tablets, i.e., except the active ingredient, in the same medium. This solution was analyzed using the same chromatographic conditions, and baseline was evaluated for peak response. Placebo interference was also ensured by spiking the reference solution with appropriate levels of excipients and evaluating for any interference or additional peak other than known peaks of Teriflunomide. No inference was observed from placebo at retention time of Teriflunomide. Placebo, standard and sample chromatograms in figure-5 to 7.

#### Linearity

Linearity parameter was evaluated with standard solutions by preparing six different concentrations. Linearity levels are 20%, 50%, 75%, 100%, 125%, 150% concentrations. All six linearity solutions were injected into the HPLC system and calculated the correlation coefficient values. Correlation coefficient was calculated for concentration versus peak area. Results were obtained in table 2 & 3. Results were satisfactory, correlation coefficient values were above 0.99.

#### Precision

Precision was performed by injecting the six dissolution bowl solutions and all solutions were carried out as per the test procedure mentioned in the materials and method section. Method precision % of RSD results were calculated and tabulated in table 3. Precision results were found satisfactory and % RSD values were below 5 %.

### Acceptance Criteria

The % RSD should not be more than 5%.

#### Accuracy

Accuracy of the method was determined on three concentration levels by recovery experiments. The recovery studies were carried out by different concentration of organic impurities added to the sample 20%, 50 %, 100 % and 150 % were evaluated. Accuracy recovery and % RSD were calculated and tabulated in table 4. % of recovery results were between 95 % to 105 % and % RSD values were below 5.0 %.

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

Suresh Kumar Raju et al.,

### Limit of detection and limit of quantification

Limit of detection (LOD) is the least concentration of analyte in a sample that can be identified but not quantified. Limit of quantification (LOQ) is defined as least concentration of analyte in a sample that can be estimated with tolerable precision, accuracy and reliability by a specified method under affirmed experimental conditions. Teriflunomide LOD & LOQ were found to be  $0.6 \mu g/mL \& 2.1 \mu g/mL$  respectively.

### Robustness

Robustness of the method was performed with flow rate, mobile phase pH, temperature variations evaluated. System suitability was conducted to check the variation changes and results were found satisfactory.

### **RESULTS AND DISCUSSIONS**

The current study describes new and simple, reliable, economic elution RP-HPLC method for the estimation of Teriflunomide in the tablet dosage form. To our present knowledge, no such detailed method has been presented as of now for this drug. The developed method finished use of UV as a tool confirmation. *In vitro* dissolution studies of pharmaceutical dosage form are very important and a vital criterion for the product quality control. In vitro dissolution is used to evaluate the release and solubilization of the active drug substance from the drug product and to predict correctly the delivery of the required drug substance to the patients. In this context, it is important to have an accurate and precise RP-HPLC analytical method to quantify the amount of drug substance in dissolution medium simultaneously. The proposed RP-HPLC analytical method was successfully validated according to the requirements of USP and ICH guidelines for validation of analytical procedure. All the results of the complete agreement with the required limits and criteria. The validated method was successfully applied to determination of dissolution profiles of the tablet dosage form, using USP apparatus II. It is concluded that the method is accurate, precise, linear, and specific for the simultaneous determination of Teriflunomide and can be applied to routine quality control analysis of tablet dosage form in vitro dissolution studies.

### ACKNOWLEDGEMENT

The author thanks the Department of chemistry, S. K. University, Ananthapuramu, India for their support and encouragement.

### ABSTRACT

This paper presents Intelligent Cruising and Road Quality Mapping which monitors the road conditions and detects the bumps and potholes in the road and alerts regarding the same. Over the decades of evolution, there are promising develop- ments across the world yet with its own significant demerits. One such arena is road transportation. Transportation to varsities, colleges, business parks, and other occupational grounds is majorly covered by terrain commutations. The standard of roads plays a significant role in shaping the journey of each citizen. Bad roads cause disruptions within the routine. Bumps and potholes within the roads cause wear and tear of the vehicle and discomfort to the passengers. Hence, it's desirable to own a mechanism for detecting the condition of roads and to induce them repaired as soon as possible. An android application that involves Google Maps API, firebase as database and a Machine learning model that uses linear acceleration data to assess road quality, is developed that non-intrusively detects road conditions that are updated on a real-time basis and alerts drivers for future endeavors. Alerts are issued regarding potholes, speed breakers, and bumpy roads so as to boost passenger experience and absolve the proposed demerits. The dataset for the model is collected manually by driving through the roads of Chennai city. Upon training the single layer perceptron, a significant accuracy of 80.75% has been achieved.

Index Terms—Road Quality Mapping, Intelligent Cruising, machine learning, neural networks, tensorflow.

### INTRODUCTION

With the development of technology in road transportation, there have been promising developments across the globe yet with its own significant demerits. Transportation to schools, colleges, business parks, and other occupational grounds is majorly covered by terrain commutations. The quality of roads often shape the journey of every individual. Bumps and potholes in the roads cause wear and tear of the vehicle and discomfort to the passengers. Although comfort in road navigation has been a prevalent topic of importance over the decade, it is, however, difficult to train an application that can detect the presence of hurdles such as potholes and speed breakers which often are impediments to commuting. Hence, it is desirable to have a mechanism for detecting the condition of roads and to get them repaired as soon as possible, thereby reducing government investment in the production of new roads and casualty relief funds. As a result, working on monitoring road conditions has gained significant attention in recent times. Smartphones in the current day come with inbuilt sensors that range from gyroscope to her monitoring. Owing to the availability of low-cost sensors in smartphones and the rapid increase in the rate of smartphone users, it has never been more salient to develop one such monitoring application. In this project we have developed an android application that uses Google Maps API to map potholes, firebase as database and developed a machine learning model that uses linear acceleration data from sensors to assess road quality and non-intrusively detect road conditions that are updated on a real-time basis. Alerts are issued regarding potholes, speed breakers, and bumpy roads in order to enhance passenger experience and absolve the proposed demerits. Section II deals with related works on this forum highlight- ing the use of different technologies, Section III discusses the methodology proposed for the project we developed with its architecture, Section IV has the experimental observations and conclusions derived from processing the data set.

### **RELATED WORKS**

Road Quality Mapping attempts to classify accelerometer data into categories such as pothole, speed breaker and normal road. Different systems have been designed that can identify different characteristics of given accelerometer data. Some of the existing works:

### Real Time Pothole Detection using Android Smartphones with Accelerometers

Mednis et al, describe a mobile sensing system for road irregularity detection using Android OS based smartphones. Selected data processing algorithms are discussed and their evaluation presented with true positive rate as high as 90% us- ing real world data. The optimal parameters for the algorithms are determined and the recommendations for their application are described [1].

### **Pothole Patrol**

Eriksson et al, describe an application of mobile sensing: detecting and reporting the surface conditions of roads. It describes a system and associated algorithms to monitor this important civil infrastructure using a collection of sensor- equipped vehicles. This system, which is called as the Pothole Patrol (P2), uses the inherent mobility of the participating vehicles, opportunistically gathering data from vibration and GPS sensors, and processing the data to assess road surface conditions [3].

### Pothole Detection and Warning System using Wireless Sensor Networks

This paper aims at proposing a novel pothole detection system which assists the driver in avoiding potholes on the roads, by giving prior warnings. Interest in Intelligent Vehicle Systems comes from the problems caused by traffic congestion worldwide and a synergy of new information technologies for simulation, real-time control and communications networks. The architectural design further proposes a low response time, low maintenance and deployment cost solution to this problem [8].

### Pothole Detection System using Machine Learning on Android

Aniket Kulkarni et al. has proposed a paper called Pothole detection system using machine learning on android in

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Kabilan and Madheswari

which the pothole sensor plug-in monitors the changes in the accel- eration in order to detect potholes. For this, the user needs to have an Android Smartphone. The device's built-in accelerom- eter is used to collect the x, y and z axis accelerations. The pothole detection algorithm is good, in terms of speed and accuracy. This algorithm accepts the training set and displays the pothole scenario in the particular area [2].

### Pothole Detection System using Wi-Fi Access Point

Sudam Pawar et al has proposed a system where the system is divided into three subsystems. First, a sensing subsystem which is used to sense the potholes encountered by it. Second is communication subsystem which handles the information transfer between Wi-Fi Access Point and Mobile Node. Third subsystem is the localization subsystem which analyses the data received from Access Points and warns the driver regarding the occurrence of potholes[10].

### Traffic Sense

Traffic Sense is a system for rich monitoring of road and traffic conditions using mobile smartphones equipped with an array of sensors (GPS, accelerometer, microphone) and communication radios. In this system, they have focused on the sensing component of Traffic Sense, specifically on how these sensors and radios are used to detect bumps and potholes, braking, and honking, and to localize the phone in an energy efficient manner [7].

### A Pothole Detection System using Z-Thresh

Kruthik M S et al. has proposed a system which uses accelerometer data and GPS data. They have assumed some threshold values on Z-axis. The threshold values are set by trail and error method. [9].

### SYSTEM DESIGN

Upon driving a vehicle, the linear acceleration data collected using the sensor present in the smartphone is aggregated over an interval of 3 seconds periodically. Mean and median for the data acquired is calculated and fed as input to the TfLite model. The TfLite model upon classification decides if the processed data is a pothole or a speed breaker or a normal road. If the result is pothole or a speed breaker, the location is geo- hashed into an alphanumeric string containing 0-9 characters and is uploaded to the firebase database. The Navigation App, used by the drivers, scans the database for potholes within a specified radius of 700 metres from the current location regularly. Based on the proximity of the vehicle to the pothole an alert is issued to the driver when he is under a 100 metre distance so that he can maneuver accordingly to either safely avoid or slow down the vehicle to minimize the effect of impact. The driver can also enter the destination and get optimal routes with less number of potholes. Figure 1. Briefly illustrates the workflow and the system design.

### **EXPERIMENTATION**

### Dataset

The dataset used in this assignment was created by collect- ing, real time acceleration data using a smart phone on a road surface with the help of custom developed android application. Driving through the roads of the city in a four wheeled vehicle, we collected the linear acceleration data of the three axes, with an aggregation, over an interval of 5 seconds. The interval split was done using timestamp to segment the continuous data. The live data collected was labelled and uploaded into a firebase database. The data collected manually is bound to contain human errors such as incorrectly classifying a normal road as pothole. These outliers collectively decrease the efficiency of the TfLite Model which takes the aggregation of the collected data as input.

To remove such outliers, Interquartile ranges (IQR) are found and values within 25th and 75th percentile are consistent and clean with no outliers. Figure 2. portrays the data collection app screen. The data collection button is used to collect normal road data. While this button is active, pothole or speed breaker button can be clicked to record 5 seconds of linear acceleration data. For this recorded data, mean and median for all 3 axes is calculated, labelled

Vol.14 / Issue 80 / Oct / 2023 International Bimonthly (Print) – Open Access ISSN: 0976 – 0997

### Kabilan and Madheswari

and uploaded to the firebase database. From Figure 3, it can be seen that pothole graph contains a single crest while the speed breaker graph contains 2 crests. This is due to the movement of two wheels both front and back over the speed breaker consecutively. There is no significant change in the normal road graph due to the flat surface of the road.

### Training

Instead of using popular scikit package for creating machine learning model we are using tensorflow lite model which is the only model that can run on smartphones. In order to simulate the model, a single layer single node model is considered to replicate a machine learning model that has a softmax activation function. The input shape is 6 (mean x, mean y, mean z, median x, median y, median z) and the output shape is 3 (pothole, speed breaker, normal). Softmax was used to give the probability of occurrence of each class out of 3. The input data is trained for 1000 epochs. For gradient optimization, the adam optimizer is used and loss is calculated using sparse categorical cross entropy.

Figure 4. portrays the accuracy of the model as 82.75% and the validation accuracy being 80.43% and also displays the loss and validation loss of the model as 0.5799% and 0.6599% respectively.

### Navigation App

The Navigation App, used by the drivers, scans the database for potholes within a specified radius of 700 metres from the current location regularly. Based on the proximity of the vehicle to the pothole an alert is issued to the driver when he is under a 100 metre distance so that he can maneuver accordingly to either safely avoid or slow down the vehicle to minimize the effect of impact. GeoFire library is used to fetch potholes within a specific radius. This is an open-source library for Java that allows to store and query a set of keys based on their geographic location. It uses Geo Hashing method which is an encoding technique used to encode geographic coordinates (latitude, longitude) into an alphanumeric string delineating an area on map, which is called a cell, with varying resolutions. The precision of the location is proportional to the number of characters in the string.

### PERFORMANCE ANALYSIS

In this section, we evaluate the results of the proposed architecture. There are 700 samples each for pothole, speed breaker and normal road in the data set. From this, using softmax, probability distribution values for potholes, speed breakers and normal roads are generated. The performance metric used is accuracy. Accuracy in classification task is the number of correct predictions made by the model over all other predictions made.

### CONCLUSION

In this paper, we illustrated the task of Intelligent Cruising and Road Quality Mapping with a tensorflow lite model having single layer single node, suitable to run on smartphones. The data set for this task is collected using sensors built in smartphones, consisting of linear acceleration data from various kinds of roads. The data set was recorded in and around Chennai city. The samples are pre-processed to remove outliers. They are then trained using machine learning. This system achieved an overall accuracy of 82.75%. Future work of this project focuses on enhancing the accuracy, which can be done by altering the architecture. Further, the overall accuracy of this task can be improved by using Long Short Term Memory (LSTM) and considering data as time series and not as aggregation.

### ABSTRACT

Traumatic spinal cord injury (SCI) patients can be affected by numerous immediate or long-term complications. Musculoskeletal (MSK) pain is among the most typical consequences. Primary objective of the study was to find prevalence of MSK pain & its severity in paraplegic SCI patients in Gujarat, India. Secondary objective was to find areas commonly affected & factors associated with MSK pain. An observational study was conducted including 142 patients with paraplegic SCI. MSK pain & area of body was assessed through Nordic Musculoskeletal Questionnaire (NMQ), severity of pain was assessed through Numeric pain rating scale (NPRS). Majority participants were male (n=142) and were from younger age group having their mean age  $34.73 \pm 6.72$  years. MSK pain prevalence was 57% and reported moderate to severe intensity pain reflected as mean NPRS value (4-10 integers). Shoulder was most commonly (52.8%) affected followed by lower back (33.1%) and then upper back pain (21.8%). The findings of this study suggest that the majority of SCI patients experience moderate to severe MSK pain and the areas of the shoulder and back are most affected areas.

Keywords: Musculoskeletal, pain, paraplegia, prevalence, spinal cord injury.

### INTRODUCTION

Spinal cord injury (SCI) is defined as damage to the spinal cord that results in loss of motor, sensory &/or autonomic function and affects young adults predominantly [1,2]. Therefore, SCI usually leads to a long-lasting serious disability, which requires rehabilitation. The prevalence of SCI is 365/million population in America and around 12,500 new cases of SCI are reported in North America, according to the National Spinal Cord Injury Statistical
