ABSTRACT

The Indus Water Treaty, a historic agreement signed in 1960 between India and Pakistan, has long been a cornerstone of trans boundary water management. However, in the contemporary context characterized by rapid technological progress and the unpredictable impacts of climate variability, the treaty faces unprecedented challenges. This research delves into the intricate interplay between technology and climate change in reshaping the Indus Waters Treaty. The study examines the evolving dynamics of water resource management within the Indus River Basin, where advancements in technology have led to innovative monitoring systems, data analytics, and remote sensing tools. These technological interventions offer the potential to enhance the treaty's implementation and efficiency while addressing critical issues such as water scarcity, equitable distribution, and environmental sustainability. Climate variability poses a formidable threat to the delicate balance maintained by the treaty. Increasingly erratic weather patterns, glacial melt, and altered precipitation regimes necessitate adaptive strategies to safeguard the interests of both nations. This research explores how the treaty can adapt to the changing climatic conditions, incorporating resilience and flexibility into its framework. Through a multidisciplinary analysis, this study underscores the imperative for India and Pakistan to collaboratively embrace technology and adapt the Indus Waters Treaty to ensure the equitable and sustainable utilization of this vital water resource. The findings shed light on potential pathways for modernizing the treaty, fostering regional cooperation, and mitigating the challenges posed by technological progress and climate variability. Ultimately, this research aims to contribute to the broader

Aadil Ahmad Shairgojri and Subramanian

discourse on trans boundary water governance in an era of rapid change and uncertainty (Thatte, C. D. 2018).

Keywords: Indus Waters Treaty, Technological Progress, Climate Variability, Remote Sensing, Trans boundary Water Governance.

INTRODUCTION

The Indus Water Treaty, signed in 1960, stands as a testament to international diplomacy's capacity to resolve complex issues. It delineated the allocation of water from the Indus River system between India and Pakistan, two nations sharing this vital resource. However, as we stand on the precipice of the third decade of the 21st century, the treaty faces challenges that were unforeseeable at its inception. Technological progress and the specter of climate change have reshaped the landscape of water resource management, necessitating a reassessment of the treaty's relevance and adaptability (Zawahri, N., & Michel, D. 2018). Technological advancements in the fields of hydrology, remote sensing, and data analytics have revolutionized water resource management. The Indus River Basin has not remained untouched by these innovations. Sophisticated monitoring systems, satellite imagery, and hydrological models have provided new tools for understanding the basin's hydrological dynamics. These technological interventions have the potential to enhance the treaty's implementation (Sharma, D. K. 2023). Real-time data sharing and analysis can facilitate better water resource management, enabling more equitable distribution and timely response to crises. Moreover, these tools can aid in resolving disputes and building trust between the signatory nations. One notable example is the use of remote sensing to monitor glacial melt in the Himalayas. As climate change accelerates glacial retreat, this technology can provide crucial data for adjusting water flow predictions, enabling proactive planning to mitigate downstream risks (Aijaz, A., et.al 2017).

Climate change, with its unpredictable consequences, poses a grave challenge to the Indus Waters Treaty. Increasingly erratic weather patterns, altered precipitation regimes, and shifting glacier dynamics threaten the delicate balance maintained by the treaty. The treaty did not anticipate the extent of climate change's impact on the basin. Changes in the timing and volume of water flows could disrupt established patterns of water allocation, leading to disputes and potentially exacerbating tensions between India and Pakistan (Alam, U. Z. 1998). One of the most pressing concerns is the potential for increased flooding and droughts. Climate models predict more extreme weather events, and the treaty's mechanisms for managing these events may prove inadequate in the face of such unpredictability. In this era of technological progress and climate uncertainty, adaptation is imperative. The Indus Waters Treaty must evolve to remain effective. It requires modernization to incorporate the benefits of technological advancements, improving data sharing and dispute resolution mechanisms. The treaty should incorporate climate resilience into its framework. This may involve a reevaluation of water allocation quotas (Qureshi, W. A. 2016) considering the long-term impacts of climate change on water availability. Flexibility and cooperation will be key to managing these challenges successfully. The Indus Waters Treaty is at a crossroads. Technological progress offers the potential for more efficient management and dispute resolution, while climate change threatens to disrupt established systems. To navigate these challenges successfully, India and Pakistan must come together to adapt and modernize the treaty. By doing so, they can ensure the equitable and sustainable utilization of the Indus River system for generations to come, demonstrating that even in the face of unprecedented challenges, diplomacy and cooperation remain potent tools for resolving complex issues.

OBJECTIVES OF THE STUDY

The main objectives of the study are multifaceted. Firstly, we aim to analyze the impact of advancements in hydroelectric technology since the 1960 signing of the treaty on dam construction and water management in the Indus River basin. Concurrently, we seek to explore how climate change has influenced water resources in the Indus basin and evaluate the treaty's ability to adapt to these shifting climatic conditions. Furthermore, we intend to investigate the economic losses and environmental costs incurred by India and other stakeholders due to the treaty's

Aadil Ahmad Shairgojri and Subramanian

constraints on dam construction and operation. In addition, we will assess the political and diplomatic implications of potential revisions to the Indus Water Treaty, particularly regarding the incorporation of modern engineering practices and considerations related to climate change. As part of our study, we will propose recommendations aimed at modifying the treaty to align it with contemporary technological advancements, climate change realities, and the equitable distribution of water resources. Finally, we will emphasize the broader implications of adapting the Indus Waters Treaty for the management of trans boundary water resources in other regions that encounter similar challenges, there by contributing valuable insights to the field of international water resource management.

METHODOLOGY

The study adopts a descriptive and analytical qualitative research approach, primarily employing thematic analysis to identify trends and patterns. It heavily relies on secondary sources, including academic books, scholarly articles, and government of India reports, World Bank reports, and online website publications. These sources are meticulously examined to extract valuable insights into the subject matter, emphasizing the historical context, technological advancements, climate change impacts, economic and environmental costs, and political implications associated with the Indus Water Treaty. The thematic analysis framework helps in synthesizing and interpreting the information gleaned from these diverse sources, ultimately contributing to a comprehensive understanding of the treaty's past, present, and potential future adaptations within the broader context of transboundary water resource management.

Area of study
The study investigates the transformation of the Indus Water Treaty in response to technological advancements and changing climatic conditions, with a specific focus on its potential reshaping to address contemporary challenges in water resource management.

RESULT AND DISCUSSION

Revisiting the Indus Waters Treaty: Adapting to Modern Realities
The Indus Water Treaty, inked in Karachi on September 19, 1960, by then-Indian Prime Minister Jawaharlal Nehru and then-Pakistani President Ayub Khan, is a water allocation agreement facilitated and mediated by the World Bank. Its purpose is to allocate the available water resources of the Indus River and its tributaries between the two countries. This historic treaty resolved a longstanding water dispute between India and Pakistan when it was signed. However, as time has passed, it has become evident that advancements in technology have surpassed the original intentions and principles of the treaty. This underscores the urgency for both India and Pakistan to consider renegotiating the treaty, as permitted under Article XII (3). It is widely acknowledged that the technical expertise specified in the treaty has become outdated, and it is equally crucial to reevaluate the agreement in light of the impacts of climate change.

Water Dispute Background: The Involvement of the World Bank
Before India gained independence, water-related disputes were already present between the regions of Punjab and Sindh within unified India. After India and Pakistan became independent nations in 1947, this water dispute escalated into an international conflict. The issue of water allocation was officially raised with the governments of both India and Pakistan in 1948. Over the next four years, representatives from both countries engaged in discussions, yet they continued to hold steadfast to their respective positions (Qureshi, W. A. 2017). In May 1952, the World Bank, which had significant institutional and financial interests in both India and Pakistan, stepped in. The then-President of the World Bank, Eugene Black, offered the Bank's assistance in mediating the conflict. After extensive deliberations, the offer to mediate by the World Bank was accepted by both nations. Subsequently, negotiations continued, culminating in the signing of the Treaty on September 19, 1960. This Treaty was a unique

and groundbreaking agreement at that time, as it provided a peaceful framework for managing a precious natural resource for both emerging economies. According to the Treaty, the waters of the Eastern Rivers were made available for unrestricted use by India, while Pakistan was obligated to prevent any interference with the waters of the River Sutlej Main and the River Ravi Main in the reaches where these rivers flow within Pakistan but have not yet crossed into the country. In return, Pakistan was entitled to receive the waters of the Western rivers. India was granted limited use of the Indus, the Jhelum, and the Chenab Rivers for purposes such as domestic consumption, non-consumptive use, and agricultural needs as specified in Annex C of the Treaty, and hydroelectric power generation as outlined in Annexure D of the Treaty. Additionally, the Treaty addressed the engineering and legal complexities of the dispute through its eight annexure.

The Indus River Basin

The Indus River can be broadly divided into two primary tributaries: the river Kabul on the right bank and the river Panjnad (Panchnad) on the left bank. The river Panjnad is formed by the convergence of the river Jhelum and the River Chenab collectively referred to as the Western rivers in the Indus system. The River Panjnad (Baudouin, et.al 2020) eventually flows into the Arabian Sea south of Karachi. The Ravi, the Beas, and the Sutlej rivers are categorized as the Eastern Rivers. In India, significant tributaries of the Indus include the Jhelum, the Sutlej, the Chenab, the Ravi, the Beas, and the Ghaggar rivers. The Indus and Sutlej rivers originate in Tibet, while the others originate within India. Apart from these tributaries, the Kabul River, originating in Afghanistan, joins the River Indus in Pakistan. The outlets of the sub-basins are at Nimoo for the River Indus and Akhnoor for the River Chenab (Bolch, T. 2019).

Water Distribution Disparities

As per the Treaty's provisions, India was granted exclusive access to the waters of the Eastern rivers, estimated at 40.7 BCM (billion cubic meters) or 33 MAF (million acre-feet), while Pakistan was given full utilization rights over the Western rivers, estimated at 166.5 BCM or 135 MAF. Strikingly, India's allocation represents only approximately 19.6% of the total water share of the Indus river system through the Eastern Rivers, despite having almost double the catchment area in relation to this percentage. In contrast, Pakistan receives approximately 81% of the water share of the Indus system, with about half of its catchment area falling within Pakistan's boundaries. Recent assessments of water flow in the Indus basin among the riparian nations may differ from the values established in the 1960s. In the Indus River system, India contributes 50.86 BCM of water through the River Indus and the River Satluj, while Pakistan is allocated 186.48 BCM through the Western rivers (Sahni, H. K. 2006). According to Pakistani officials in 2019, they received 168.6 BCM in the Western rivers and an additional 6.04 BCM in the Eastern Rivers.

 Additionally, Pakistan also receives 33 BCM of water from Afghanistan. Consequently, Pakistan's total water allocation amounts to 207.2 BCM, out of which roughly 46.9 BCM is lost to the Arabian Sea due to inefficiencies within its water management system. This unequal distribution has led to Pakistan receiving an excessive share of water, despite its smaller catchment area. Conversely, on India's side, the states of Punjab, Haryana, and Rajasthan face acute water shortages. In the Indian state of Punjab, the net dynamic groundwater resources are 21.44 MCM (million cubic meters), while groundwater pumping reaches 31.16 MCM, resulting in an annual groundwater deficit of 9.72 MCM. The state is categorized as "over-exploited." Groundwater levels in most parts of Punjab have receded to more than 200 meters below the surface (Abas, N. et.al 2019). Out of Punjab's total land area of 5.03 million hectares, 4.32 million hectares are afflicted by a severe decline in groundwater levels. Similarly, the Indian state of Haryana, which was carved out of Punjab after the Treaty's signing, is also grappling with severe water stress. Rajasthan, where the Thar Desert is situated, receives only 83 mm of annual rainfall in the Jaisalmer district. Extensive areas in Rajasthan are covered by sand dunes, and numerous communities endure extreme temperatures exceeding 50 degrees Celsius. The availability of water for the growing population in the state is under severe strain (Akhtar, D. S. 2010).

Water Crisis in Indian States

Inefficiencies in agriculture, a deteriorating canal system, surface and groundwater pollution, soil contamination, and interstate disputes among Indian states continue to afflict the Indus Basin. Furthermore, the region faces the challenges of a rising population and declining per capita water availability (Begum, T. 2011). Punjab and Haryana, which account for approximately 4% of India's population, contribute 25% of the nation's total wheat production. Ensuring the water needs of these states is imperative not only for their economic and human development but also for guaranteeing food security for India's 1.4 billion people.

Technological Advancements in Hydroelectric Projects: Spillway Locations

The production of hydroelectric power from Western rivers in India remains a contentious issue within the context of the Treaty. Part 3, Annexure D of the Treaty permits India to establish new run-of-the-river hydroelectric plants. It specifies that if gated spillways are deemed necessary for such plants, the position of these gates in the "normally closed position" should be determined based on a balance between (Raza, K., & Adnan, M. 2023) sound and economical design and satisfactory construction and operation of works." However, it's crucial to acknowledge that the technology for constructing dams for hydroelectric projects has evolved significantly since 1960. In 1960, the concept of low-level sluice spillways in dams to facilitate the passage of entire flood discharges and the removal of sediments was non-existent due to limitations in hydraulic hoisting equipment for sluice gate operation. The Chenab and Indus rivers transport substantial sediment loads annually (Hafeez, S., et.al 2022). A reasonable interpretation of the Treaty implies that its stipulation for "sound and economical design and satisfactory construction and operation of works" should allow India to utilize contemporary and advanced technologies rather than obligating the construction of dams with "overflow spillways" at the top of the dam. The placement of these spillways plays a critical role in the reservoirs' long-term viability (Mustafa, D. 2010). Spillways positioned at the dam's uppermost section accelerate sedimentation, resulting in dam blockage within a few years of project commissioning. This leads to reduced peaking storage capacity and significant wear and tear of power-generating units, accompanied by operational and maintenance challenges. For instance, the dam of the Salal Hydroelectric Project on the Chenab River is already almost completely filled with sediment. Similarly, the dam of the Baglihar Hydroelectric Project on the Chenab River has faced a similar fate, with the reservoir almost filled to its upper limit. According to a study conducted by an International Consulting Company, (AC, M. S. 2005). Jammu and Kashmir has been deprived of approximately US $0.8 billion annually or INR 6,000 crores per year over the past five decades due to the restrictive clauses in the Treaty.

Pakistan's Dual Standards

Pakistan is currently constructing numerous major hydroelectric projects, such as Daimer Basha, Dasu, Mahl, Patrind, and Gulpur, on the River Indus and its tributaries, including areas in Pakistan-occupied Jammu & Kashmir. The Karot Hydroelectric Project became operational in 2022. These projects are designed to facilitate the passage of design floods and sediments through low-level sluice spillways, indicating that none of these projects rely on the technological expertise of the 1960s (Grumbine, R. et.al 2011). Consequently, it is unjustifiable for India to be confined by the technological standards of that era, as stipulated by the Treaty. The critical question that the World Bank must address is whether it will approve funding for a project anywhere in the world that utilizes technology involving overflow spillways on sediment-laden sluices dating back to the 1960s, as India is compelled to do. The Treaty fails to consider the consequences of rapid climate change on the environment. The governance framework of the Treaty lacks provisions for resilience against these risks. Given the urgent need to address climate change's likely impact on the Indus water basin, a modification of the Treaty is warranted (Sridharan, E. 2005).

Hydroelectric Advancements' Impact on Indus River Basin

Advancements in hydroelectric technology since the signing of the Indus Waters Treaty in 1960 have had a significant impact on dam construction and water management in the Indus River basin. One of the most notable advancements in hydroelectric technology has been in the efficiency of power generation. Modern turbines and generators are more efficient at converting water flow into electricity. As a result, new hydroelectric projects in the Indus basin can generate more electricity from the same amount of water, which is crucial for meeting growing

energy demands in the region (Ilyas, A., et.al 2022). The treaty originally favored the use of overflow spillways at the top of dams. However, advancements in dam engineering now allow for the construction of low-level sluice spillways. These spillways are more effective at managing floodwaters and sedimentation, as they can release water and sediments at lower levels, reducing the risk of sediment accumulation and damage to the dam's infrastructure. This innovation can extend the lifespan of dams and improve their overall effectiveness in water management (Azmat, M. 2015). Modern hydroelectric projects are equipped with advanced monitoring and control systems. These systems allow for real-time data collection and analysis, enabling dam operators to make more informed decisions about water release, reservoir levels, and power generation. This level of automation and control enhances water management efficiency and reduces the risk of operational errors. Advancements in hydroelectric technology have also led to a greater focus on environmental considerations. New dam designs often include fish-friendly features such as fish ladders or bypass channels to facilitate fish migration (Duncan, J., et.al 2012). Improved sediment management techniques help mitigates the ecological impact of sediment buildup in reservoirs. Climate change has brought about changes in precipitation patterns and water availability in the Indus basin. Advanced hydroelectric technology allows for more flexible and adaptive water management strategies. For instance, modern dam designs may include the ability to adjust water releases to respond to changing climate conditions, helping to ensure a more reliable water supply (Dinar, S., et.al 2015). The advancements in hydroelectric technology have transformed dam construction and water management in the Indus River basin. These advancements have improved the efficiency, safety, and environmental sustainability of hydroelectric projects. Embracing these innovations can help the region better cope with the challenges posed by increasing water demands, sedimentation, and the uncertainties associated with climate change. Revisiting the treaty to incorporate these technological advancements may be essential to ensuring equitable and sustainable water resource management in the Indus basin (Sharma, A. K., & Thakur, N. S. 2017).

Climate Change Impacts in the Indus Basin and Treaty Adaptability

The burgeoning impact of climate change on water resources in the Indus basin underscores the pressing need to evaluate the treaty's adaptability to these evolving climatic conditions. Notably, climate change has instigated discernible shifts in precipitation patterns across the Indus basin, manifesting as altered monsoon seasons, temporal and intensity variations in rainfall, and heightened precipitation variability. These transformations have direct repercussions on the accessibility and equitable distribution of water resources within the region. The Himalayan glaciers stand as pivotal contributors to the Indus River system's water supply. Escalating temperatures have expedited the process of glacial melting, (Michel, D. 2018) resulting in an initial surge in water flow. Paradoxically, this surge is projected to reverse as glacier volumes continue to dwindle, potentially culminating in diminished water availability over the long-term. This phenomenon constitutes a formidable challenge to the treaty's existing water allocation framework. The nexus between climate change and elevated temperatures has precipitated augmented water demands in sectors encompassing agriculture, industry, and domestic consumption.

This amplified demand exerts added stress on an already constrained water resource pool within the basin, accentuating existing challenges. Climate change's association with more frequent and severe extreme weather events, including floods and droughts, imparts further complexity to the landscape. Such climatic perturbations can disrupt the region's water management and infrastructure, thereby impacting the capacity to execute water control and allocation in accordance with the treaty's stipulations. The escalating sea levels introduce an additional dimension of concern. They have the potential to instigate saltwater intrusion into the coastal regions of the Indus delta, resulting in the salinization of freshwater sources. This further diminishes the already scarce pool of usable water resources within the basin, compounding the multifaceted challenges posed by climate change. In light of these intricate and interrelated climate-induced transformations in the Indus basin, a comprehensive evaluation of the treaty's adaptability to the evolving climatic milieu is not only prudent but imperative (Wolf, A. T. 2012). Effectively addressing the ramifications of climate change on water resources is essential to ensure the continued relevance and efficacy of the Indus Waters Treaty, facilitating equitable water allocation and sustainable management practices between India and Pakistan amidst a dynamically changing environmental backdrop.

Aadil Ahmad Shairgojri and Subramanian

Assess the treaty's adaptability to these changing climatic conditions

The Indus Waters Treaty's fixed water allocation provisions may necessitate a reevaluation to introduce more flexibility and adaptability in response to the changing dynamics of water availability driven by climate change (Ringler, C. et.al 2014). One potential enhancement could involve incorporating mechanisms for periodic reassessment of water-sharing agreements, which would be guided by updated hydrological data, thereby bolstering the treaty's resilience in the face of shifting climate patterns. Furthermore, acknowledging the ecological consequences of climate change, the treaty could be amended to include provisions geared toward safeguarding ecosystems impacted by fluctuating water flows (De Stefano, et.al 2012). These provisions might encompass the establishment of environmental flow requirements aimed at preserving the overall health of the rivers within the basin. In light of the heightened risk of extreme weather events associated with climate change, the treaty could also encompass provisions for coordinated disaster preparedness and response between India and Pakistan. Such provisions would aim to mitigate the devastating effects of floods and droughts, fostering cooperation in managing climate-induced emergencies. Moreover, recognizing the influence of glacial melt water on heightened sediment transport in rivers, the treaty could explore the implications for hydropower generation and sediment management in dams (Dinar, S., et.al 2015). To ensure the treaty remains adaptive to changing conditions, its governance mechanisms may require regular reviews and updates informed by the latest climate data and scientific assessments. Climate change presents significant challenges to the water resources of the Indus basin. To uphold the treaty's enduring relevance and effectiveness, adapting its provisions to address climate change impacts, (Yaqoob, A. S. M. A. 2015) promote sustainable water management, and ensure equitable water allocation between India and Pakistan amidst evolving climatic conditions may be of paramount importance.

Economic and Environmental Costs of Treaty-Imposed Dam Constraints

Investigating the potential economic losses and environmental costs incurred by India and other stakeholders due to the treaty's constraints on dam construction and operation reveals several key considerations. The treaty imposes restrictions on India's ability to fully utilize the Western rivers for hydroelectric power generation, potentially resulting in economic losses related to unrealized electricity production. The extent of these losses depends on the number and capacity of affected hydroelectric projects. India's substantial energy needs may lead to increased reliance on fossil fuels like coal and natural gas to meet electricity demand, resulting in economic and environmental costs associated with higher greenhouse gas emissions. The treaty's allocation of water resources can exacerbate water scarcity in states such as Punjab, Haryana, and Rajasthan, impacting agricultural productivity and food security, thereby incurring economic losses in the agriculture sector. The constraints on dam construction and operation, including the use of overflow spillways, can contribute to environmental degradation (Lutz, A. F et.al 2016) through sedimentation, affecting reservoir storage capacity and requiring costly dredging operations. Alterations in river flows can also impact aquatic ecosystems and biodiversity, incurring environmental costs.

Fifthly, ongoing maintenance costs for infrastructure affected by sedimentation and wear and tear due to overflow spillways can result in economic expenditures. The treaty's constraints may intensify water stress in certain regions, leading to economic losses stemming from conflicts over water allocation and the need for water management measures (Zawahri, N., & Michel, D. 2018). The stakeholders may need to invest in environmental compensation measures, such as habitat restoration or water quality improvement projects, to mitigate the environmental impacts of dams and reservoirs, incurring associated economic costs. Legal disputes between India and Pakistan regarding treaty compliance and water sharing can lead to economic losses due to legal fees and diplomatic efforts to resolve disputes. Quantifying the precise economic losses and environmental costs necessitates a comprehensive assessment considering factors like the number and size of impacted dams, sedimentation levels (Nax, N. A. 2016) agricultural consequences, and environmental impacts. Such assessments typically involve interdisciplinary research and collaboration among experts in economics, environmental science, and engineering.

Aadil Ahmad Shairgojri and Subramanian

Political and Diplomatic Implications of Modernizing the Indus Waters Treaty

Assessing the political and diplomatic implications of revising the Indus Waters Treaty to incorporate modern engineering practices and accommodate climate change considerations involves a multifaceted analysis. The Indus Waters Treaty has served as a cornerstone of India-Pakistan relations for decades, and any proposed revisions to the treaty would necessitate delicate negotiations and diplomatic efforts. The political climate and the willingness of both countries to engage in such negotiations will be of paramount importance. The process could potentially strain diplomatic relations if not managed with utmost care (Qureshi, W. A. 2021). Revising the treaty demands a high level of mutual trust between India and Pakistan. Both parties must have confidence that the proposed changes will be mutually beneficial, and that each side will faithfully adhere to the revised terms. Establishing trust-building measures will be essential to create an environment conducive to successful negotiations. Given the historical role of the World Bank in mediating the original treaty, there may be an opportunity for international mediation to facilitate discussions on revisions. However, this could introduce additional complexities, as the interests and influence of international actors must be considered. The Indus River basin holds critical importance for regional stability. Any disruptions or disputes that may arise from treaty negotiations could have broader implications for the stability of neighboring countries in the region. It may be necessary to consult with regional stakeholders to mitigate such risks. Water is a fundamental security issue, and any alterations to the treaty could be perceived as a threat to national water security by either India or Pakistan (Ali, S. S., et.al 2021) Striking a balance between the legitimate water needs of both countries while effectively addressing modern challenges such as climate change presents a nuanced and politically sensitive challenge. In both India and Pakistan, domestic political considerations can exert influence on decisions related to the treaty. Political leaders may encounter pressure from domestic constituencies, especially those in water-scarce regions, who may harbor concerns regarding treaty revisions affecting water availability.

Incorporating climate change considerations into the treaty may entail adjustments in water allocation that could potentially impact downstream regions and ecosystems (Magsig, B. O. 2017) Effectively addressing these environmental concerns while preserving political goodwill presents a formidable diplomatic challenge. The revision process would necessitate a profound understanding of the legal, technical, and engineering aspects associated with water management. Access to experts and the ability to navigate intricate technical discussions would prove indispensable for the success of negotiations. Any revisions introduced to the treaty should be grounded in a long-term commitment to cooperation (Rao, S. 2017). Climate change impacts and technological advancements will persistently evolve, and the treaty should demonstrate adaptability to changing conditions over time. Revising the Indus Waters Treaty to encompass modern engineering practices and climate change considerations constitutes a complex undertaking rife with significant political and diplomatic implications. It would demand a delicate balancing act, encompassing trust-building initiatives, regional stability considerations (Adeel, Z., et.al 2016) and the acknowledgment of each country's water security concerns. Engaging in such a process would necessitate a high level of political determination and diplomatic finesse to ensure a mutually beneficial outcome.

Trans boundary Water Management Lessons from Indus Treaty

The process of adapting the Indus Waters Treaty to address contemporary challenges carries profound implications for the management of trans boundary water resources in regions confronting analogous issues. Its successful adaptation can serve as an instructive model for other regions grappling with trans boundary water disputes. It exemplifies that, (Qaddumi, H. 2008) even in politically sensitive contexts, countries can prevent conflicts over shared water resources through diplomacy, cooperation, and forward-thinking agreements. Climate change, a global challenge affecting water availability and quality in numerous regions, underscores the treaty's relevance. Its adaptation to climate change realities sets an influential precedent for trans boundary water agreements worldwide. By incorporating climate resilience measures, it demonstrates how countries can adapt to changing hydrological conditions while maintaining cooperation (Susskind, L. 2018). The treaty's emphasis on environmental conservation and ecosystem protection establishes a noteworthy precedent, recognizing the ecological significance of shared river systems. Other regions can draw from these provisions to develop their own agreements, striking a balance between water use and environmental sustainability. The integration of modern engineering practices in dam construction and operation, a core aspect of the treaty's adaptation, has the potential to inspire innovation in similar contexts.

68484

Aadil Ahmad Shairgojri and Subramanian

Sharing knowledge about improved water management technologies can greatly benefit countries confronting analogous challenges in optimizing their water resources. Robust mechanisms for data sharing and transparency foster trust among riparian states. Such trust-building measures can be leveraged in other regions to encourage cooperation and information exchange, ultimately enhancing water management practices. The treaty's dispute resolution mechanisms offer valuable lessons in peaceful conflict resolution concerning trans boundary water disputes (Kamran, et.al, 2017). These experiences can be applied in other regions to develop effective mechanisms for addressing disagreements over shared water resources. The involvement of local communities and stakeholders in decision-making processes highlights the importance of considering the interests and concerns of those directly impacted by water management decisions. Similar participatory approaches can be embraced in other regions to ensure comprehensive and inclusive decision-making. Investment in capacity building and knowledge-sharing initiatives, a notable feature of the treaty's adaptation, can be replicated elsewhere to ensure that countries possess the technical expertise required for effective shared water resource management. Exploring the utilization of international organizations or third-party mediators as facilitators in treaty negotiations can be considered in other regions as a means of resolving disputes and (Choudhury, E. 2017) promoting cooperation. Promoting public awareness and education about responsible water management can foster a culture of water conservation and cooperation in regions grappling with analogous challenges. The adaptation of the Indus Waters Treaty offers a wealth of insights and best practices for the global management of trans boundary water resources. It underscores the potential for diplomacy and collaborative agreements to address complex water-related challenges and promote sustainable, equitable, and peaceful water management in regions characterized by shared river systems.

Looking Forward: Reconsidering the Treaty

As we cast our gaze into the future, it becomes evident that the circumstances that surrounded the Treaty's ratification 63 years ago are no longer relevant. The Treaty must now acknowledge the new realities faced by India, an emerging economy with the world's largest population, heavily reliant on monsoons and agriculture, and facing substantial climate change-related risks and sedimentation challenges. India's ability to effectively address climate change is not only crucial for its vast population but also for the well-being of humanity as a whole (Bhatnagar, M. 2008). These factors must be taken into serious consideration if the Treaty is to remain relevant, sustainable, and equitable for the people of the Indian subcontinent. In accordance with contemporary engineering standards, India should have the flexibility to construct hydroelectric projects that incorporate low-level sluice spillways. This necessitates the establishment of a new framework. Such a revision is essential not only to address the annual losses incurred by India due to dam damage but also to ensure the survival of the Treaty by adapting to the evolving parameters and advancements in technological expertise, thus promoting both fairness and sustainability (Saad, M., et.al 2018).

Major Findings

1. The study reveals that advancements in hydroelectric technology since the treaty's signing in 1960 have significantly impacted dam construction practices in the Indus River basin.
2. Climate change has emerged as a major driver of change in the Indus basin, leading to shifting precipitation patterns, glacial melting, and increased water demand due to higher temperatures.
3. The treaty's allocation of water resources, although equitable in its time, has led to a situation where Pakistan receives a disproportionate share of water compared to India, which has led to water scarcity issues in certain Indian states.
4. The study highlights significant economic losses incurred by India and other stakeholders due to the treaty's constraints on dam construction and operation, including unrealized hydroelectric power generation, increased reliance on fossil fuels, and agricultural productivity impacts.
5. The treaty's provisions, such as overflow spillways, have led to environmental degradation, including sedimentation in reservoirs, alterations in river flows, and aquatic ecosystem impacts, resulting in additional environmental costs.

Aadil Ahmad Shairgojri and Subramanian

6. The study emphasizes the need for the treaty to adapt to climate change realities, such as glacial meltwater contributions and increased frequency of extreme weather events.
7. Successfully revising the treaty requires trust-building measures between India and Pakistan, considering the historically sensitive nature of water disputes in the region.
8. The World Bank's involvement in mediating the original treaty suggests the potential for international mediation to facilitate discussions on revisions. However, this introduces additional complexities.
9. Any disruptions or disputes arising from treaty negotiations could have broader implications for regional stability, potentially affecting neighboring countries and stakeholders.
10. Water is viewed as a fundamental security issue, and changes to the treaty could be perceived as a threat to national water security by either India or Pakistan.
11. The study underscores the importance of deep technical expertise in water management and the need for access to experts in dam construction and operation.
12. Any revisions made to the treaty should be based on a long-term commitment to cooperation, ensuring that the treaty remains adaptable to evolving climate conditions and technological advancements.

Recommendations for Modernizing Indus Waters Treaty
Proposing recommendations for modifying the Indus Waters Treaty to align with contemporary technological advancements, climate change realities, and equitable water distribution involves a comprehensive approach that addresses the challenges and opportunities presented by the evolving context. Here are some key recommendations:

1. Establish a mechanism for periodic reviews of the treaty, considering the latest hydrological data and climate change projections. This will ensure that the treaty remains adaptable to changing conditions over time.
2. Integrate climate change considerations into the treaty, recognizing the impact of changing precipitation patterns, glacial melt, and extreme weather events on water resources. Develop provisions that allow for adaptive water management strategies in response to climate variability.
3. Update the treaty to allow for the use of modern dam construction and operation practices, including low-level sluice spillways, which are more effective in managing sedimentation and floodwaters. This can extend the lifespan of dams and improve their overall efficiency.
4. Include provisions for the protection and restoration of ecosystems affected by dam construction and operation. Establish environmental flow requirements to maintain the health of river systems and aquatic habitats.
5. Enhance data-sharing mechanisms between India and Pakistan, promoting transparency in water-related information. Develop a joint platform for real-time data exchange to facilitate better water management decisions.
6. Promote cooperative water management practices that prioritize equitable water distribution and minimize disputes. Encourage joint initiatives for water conservation, efficient irrigation practices, and sustainable agriculture.
7. Strengthen the dispute resolution mechanisms within the treaty to expedite the resolution of water-related conflicts through diplomatic means. Consider involving impartial third-party mediators when necessary.
8. Mandate comprehensive environmental impact assessments for all new dam projects, considering their potential ecological consequences and long-term sustainability.
9. Address the impact of sedimentation on hydropower generation and incorporate solutions to manage sediments effectively. Explore opportunities for joint hydropower projects that benefit both countries.
10. Involve local communities and stakeholders in decision-making processes related to water management and dam construction. Recognize their rights and concerns in the treaty provisions.
11. Develop strategies for effective drought and flood management, considering the increasing frequency of extreme weather events associated with climate change.
12. Invest in capacity building and knowledge-sharing initiatives to ensure that both India and Pakistan have the technical expertise to implement the treaty's provisions effectively.
13. Consider the role of international organizations or third-party mediators in facilitating discussions and resolving disputes when bilateral negotiations reach an impasse

14. Promote public awareness and education campaigns to inform the citizens of both countries about the importance of water conservation, equitable water sharing, and the benefits of a revised treaty
15. Ensure that any modifications to the treaty reflect a long-term commitment to cooperation and equitable water distribution, taking into account the interests and needs of both India and Pakistan.

CONCLUSION

The Indus Water Treaty, while a landmark agreement in water sharing between India and Pakistan, is facing unprecedented challenges in the modern era characterized by rapid technological progress and increasing climate variability. The evolution of these two critical factors necessitates a thoughtful and proactive approach to reshape the treaty to ensure its continued effectiveness in managing the shared Indus River basin. Technological progress has significantly altered the way water resources are managed and monitored. Remote sensing, data analytics, and Geographic Information Systems (GIS) have revolutionized our ability to track water flow, precipitation patterns, and glacial melt in near-real-time. Incorporating these technologies into the treaty framework can provide both India and Pakistan with more accurate and timely data to inform their water management decisions. By creating a joint technical committee responsible for integrating these tools, the treaty can adapt to the 21st-century realities and enhance transparency and trust between the parties. Climate variability poses a substantial threat to the sustainability of the Indus River basin. The region is experiencing shifting weather patterns, erratic monsoons, and the accelerating retreat of glaciers in the Himalayas.

These changes have the potential to disrupt the delicate water balance established by the treaty. To address this, the treaty should include provisions for adaptive management, allowing the parties to respond flexibly to changing climate conditions. Furthermore, it may be necessary to establish a mechanism for sharing the burden of climate adaptation measures and infrastructure investments to mitigate the impact of climate change on water resources. Moreover, fostering greater cooperation and people-to-people exchanges between India and Pakistan can contribute to mutual trust and understanding. Water diplomacy should extend beyond the government level to include civil society, academia, and non-governmental organizations, fostering a broader sense of ownership and shared responsibility for the sustainable management of the Indus River. The Indus Waters Treaty is at a critical juncture, where the convergence of technological progress and climate variability demands a recalibration of its mechanisms. While the core principles of the treaty remain sound, its operational aspects require modernization to meet contemporary challenges. Through the integration of advanced technology, adaptive management strategies, and enhanced cooperation, India and Pakistan can ensure the equitable and sustainable utilization of the Indus River's waters, safeguarding the livelihoods and well-being of millions of people dependent on this vital resource. The urgency of reshaping the treaty cannot be overstated, as it holds the key to regional stability, environmental sustainability, and the prosperity of the Indus River basin for generations to come.

ABSTRACT

The Co_3O_4 core, SiO_2 shell, and over coated GO sheet are the topics of this work. These core shells' biosynthetic methods, opto-structural characteristics, and super capacitor function have been described. The qualities both with and without coating were thoroughly examined. The absorbance and transmittance have also been described by the optical characterization methodologies for GO based Co_3O_4 core and SiO_2 coated shell nano particles. By using XRD and FTIR, their physical characteristics have been designed. Cyclic voltammetry was used to examine the capacitance behavior of Co_3O_4 core and SiO_2 coated shell nano particles based on GO. With an emphasis on their applications, the potential of such GO-based Co_3O_4 core and SiO_2 coated shell nano particles is highlighted.

Keywords: GO sheet, core shell, Biosynthesis, physical characterization and impedance.

INTRODUCTION

Recently, a number of physical and chemically based methods have been used to produce the diverse Co_3O_4 nanostructures and improve their theoretical specific potential and electrochemical capacity. Due to its low potential or energy density and poor cycling stability, research on novel cobalt oxide composite materials for super capacitors has been thoroughly analyzed [1]. Precipitation, sol-gel combustion, thermal decomposition, chemical vapor deposition, wet polymerization, laser ablation, solvo thermal procedures, micro-emulsion, and hydrothermal techniques are some examples of these. In addition to these conventional synthesis procedures, green synthesis techniques provide a number of advantages, including cost effectiveness, a lack of need for extra chemicals, and environmentally friendly practices with little waste production [2]. These Co_3O_4 nano particles are employed in human immunization adjuvants, magnetic resonance contrast agents, medication delivery systems, and as adjuvants. The synthesis of core/shell structured materials provides the supporting behavior between the core and shell materials. The primary benefits of nanostructure materials increased by a SiO_2 core shell are superior environmental stability and material compatibility [3]. Because silica materials offer excellent physical, chemical, mechanical, and optical properties, they are frequently used in high-tech applications. The peculiar optical properties of SiO_2 nanoparticles revealed at the nano scale have been determined to be caused by surface flaws.

Silica nano particles have undergone substantial investigation to determine the size-dependent physicochemical features and specific optical characteristics at lower sizes. Due to the increase in optical fluorescence intensity for stilbene 420 in mesoporous silica nanoparticles, these nano materials would be more advantageous for the usage of nano sensors and nanolasers [4]. Graphene, a notably one atom-thick carbon substance, is a current favorite for developing functional modified materials. Graphene is regarded as a possible candidate for a wide range of applications in many technological disciplines, including nano electronics, composites, energy storage devices, effective lasers, photo detectors, and biological applications, because of its exceptional physical and chemical properties [5]. Metal salt, a reducing agent, and a stabilizing agent are three crucial requirements for the metallic nanoparticles that are biosynthesized using plant extract in order to regulate the size of the particles and prevent their aggregation. Bioreduction, synthesis, and stability of metal nano particles may involve bio molecules such proteins and enzymes, amino acids, carbohydrates, alkaloids, terpenoids, tannins, saponins, phenolic compounds, reducing sugar, and vitamins. The amount of nanoparticle synthesis is significantly impacted by the ion reduction potential and the capacity of plants to reduce when poly phenols, enzymes, and other chelating agents are present [6]. In this study, the Co_3O_4/SiO_2 core shell was made using an environmentally benign synthesis method and a natural extract of Aristolochia indica. Analysis was done on the physical, optical characterization, and capacitance behavior of Co_3O_4 core and SiO_2 coated shell GO based nano particles.

PREPARATION OF $Co_3O_4/SiO_2/GO$ CORE SHELL

The Aristolochia Indica plant's dried stem weighed 20 g. Then, 100 ml of distilled water was added, and it was heated at 55 °C for 10 minutes. The solution turned from translucent to a light yellowish color. The resulting extract was filtered using What man No. 1 filter paper, and the filtrate was then collected in a 250 ml Erlenmeyer flask. The 0.5M cobalt carbonate solution was incorporated with 20 ml of dried Aristolochia Indica stem extract, and the combination was constantly stirred at 60 °C for 15 minutes. The mixture was continually swirled for 90 minutes. The outcome was a precipitate with a light purple color that was washed five times in distilled water and ethanol. The precipitate was also dried for 11 hours at 100 °C. At 360 °C, the resulting Co_3O_4 nano powder was calcined. Eventually, black Co_3O_4 nano powder was obtained and used for further investigation. Aristolochia Indica dried stem extract (20 ml) and a 0.5 M cobalt carbonate solution were combined, and the mixture was constantly stirred at 60 °C for 15 minutes. The mixture was vigorously stirred for the full 90 minutes. A light purple precipitate was the end product, and it was washed five times in distilled water and ethanol. Additionally, the precipitate was dried for 11 hours at 100 °C. A 360 °C calcination process was used to produce Co_3O_4 nano powder. The black Co_3O_4 nano powder was eventually collected and used for further investigation. For the $Co_3O_4/SiO_2/GO$ nano composite, 20 mL of a GO aqueous suspension (1.0 mg/mL) was mixed with 0.6 mg of Co_3O_4/SiO_2, and the resultant solution was aged for 30 min. Once more, add 10 mL of Aristolochia Indica extract drop wise to the prepared solution and stir

continuously for 90 minutes at room temperature. After that, the resulting solution was decanted, and an oven was used to dry the $Co_3O_4/SiO_2/GO$ core-shell at 100 °C for 24 hours. Finally, a black $Co_3O_4/SiO_2/GO$ core shell was gathered and employed for additional research.

RESULT AND DISCUSSION

X-ray Diffracto gram Analysis
The crystalline and phase structures of the eco-friendly Co_3O_4 core and SiO_2-coated shell nanoparticles were investigated using XRD analysis (Figure 1). In the diffraction of the core Co_3O_4, peaks at 2θ = 31.4°, 36.98°, 44.9°, 55.8°, 59.4°, and 65.4° were observed. These peaks matched the planes of the PCPDF No. 653103 at (220), (311), (400), (422), (511) and (440). An intense peak at 2θ for the core-shell $Co3O4/SiO_2$ corresponds to the (111), (220), (311), (400), (003), (022), (511) and (440) planes matched with JCPDS No:421467, and is 19.2°, 31.6°, 37.2°, 45°, 50.7°, 55.6°, 59.8°, and 65.6°, respectively [7-9]. Peaks at 2θ were seen when GO was introduced to the Co_3O_4/SiO_2 core shell. These peaks correspond to the (111), (002), (011), (003), and (022) designs of the GO-based cobalt core encased in silicon. They were 18.5°, 26.2°, 26.6°, 29.1°, 33.8°, 35.7°, 45.9°, and 54.8°. [10]. The Debye-Scherrer formula was used to determine the average particle size in the peak locations.

$$D = 0.9\lambda / \beta\cos\theta \tag{1}$$

Where β is full width at half maximum (FWHM), θ is the diffraction angle, and λ = 1.5418 (X-Ray wavelength). Table 1 shows the typical size of the core and core-shell. Inner atomic gap refers to the separation between the parallel atomic planes. The high-intensity diffraction angle (θ) is used to Calculate it. The length of dislocation lines per unit surface area, often known as the dislocation density, is calculated by

$$\delta = \frac{1}{D^2} \tag{2}$$

Where D is the particle size in nm and δ is the dislocation density. It can be seen in figure 2. Table 1 contains a summary of these values. The following relation was used to determine the microstrain of the GO-based Co_3O_4 core covered with SiO_2:

$$\varepsilon_{micro} = \beta\cos\theta / 4 \tag{3}$$

Where β indicates for full width at half maximum (FWHM), micro strain stands for ε_{micro}, and θ is the diffraction angle. The following equation was used to determine the stacking defect of the Co_3O_4 core made of GO and covered in a SiO_2 shell

$$SF = \frac{2\pi^2}{45\sqrt{3}\tan\theta} \tag{4}$$

Where the stacking fault is SF. The following formula was used to compute the X-ray density:

$$\rho_x = \frac{ZM}{N_a a^3} \tag{5}$$

Where a is the volume, NA is Avogadro's number, M is the molecular mass, and ρx is the X-ray density. These values were displayed in table 1. Figure 2 illustrate the dislocation densities of the prepared core Co_3O_4, core shell SiO_2 and $Co_3O_4/SiO_2/GO$. From the figure 2, the dislocation density increased with decreasing the crystalline size. The developments of dislocations were obstructed by additional dislocations present in the prepared GO based Co_3O_4 core coated with SiO_2 shell. A more dislocation density implicit a more rigidity of the core shells [11].

Functional Group Analysis
The FT-IR spectra of a GO-based Co_3O_4 core coated with shell SiO_2 nano particles in the range of 4000 to 400 cm⁻¹ are shown in the peaks of Figure 3. The broad band at 3422 cm⁻¹ and 3417 cm⁻¹, the absorption at 2922 cm⁻¹ to 2853 cm⁻¹

due to the stretching vibration of C-H alkanes, and the peak at 1620 cm^{-1}, 1638 cm^{-1}, and 1617 cm^{-1} are all attributed to the O-H stretching and bending modes of water in the peak of CO_3O_4. The stretching vibration of the C=O bond causes the weak absorption peaks at 1121 cm^{-1}, 1126 cm^{-1}, 1115 cm^{-1}, 1021 cm^{-1}, and 1020 cm^{-1}, whereas the high absorption peaks at 618 cm^{-1}, 662 cm^{-1}, and 623 cm^{-1} are caused by the stretching vibration of the metallic oxygen bond in the Co-O band. Co^{2+}, Co^{3+}, and O^{3-} is given accept for this band. The stretching and bending vibrations of the silicon-oxygen bond are related to the prominent bands at 466 cm^{-1}, 416 cm^{-1}, 467 cm^{-1}, 565 cm^{-1}, and 540 cm^{-1}. Force constant had a linear impact on the bond length between metal and oxygen ions and the change in absorption band frequency that was related to the A sited and B sites [12]. Furthermore, Tetrahedral Co_3O_4, Co_3O_4/SiO_2, and $Co_3O_4/SiO_2/GO$ core shells have force constants of 1.72×10^{-2} Nm^{-1}, 2.9×10^{-2} Nm^{-1}, and 3×10^{-2} Nm^{-1}, respectively. The force constants for Co_3O_4, Co_3O_4/SiO_2, and $Co_3O_4/SiO_2/GO$ core shells, are 1.272×10^{-2} Nm^{-1}, 1.872×10^{-2} Nm^{-1}, and 272×10^{-2} Nm^{-1} respectively. As the amount of SiO_2 and GO in the coating grows, so does the material's force constant. The findings revealed that the coating materials SiO_2 and GO had an impact on force constant increases [12].

Impedance spectroscopy analysis

The most crucial method for examining the electrical response and material transport characteristics is impedance spectroscopy. In general, it is possible to assess the contribution of the nano particle's grain, grain boundary, and electrode effect over a wide range of frequencies at room temperature. Typically, the complex dielectric constant ($\mathcal{E}^*$) complex impedance (Z^*), electric modulus (M^*), and loss tangent (tan) are used to describe a material's electrical properties. It is possible to compute and relate these variables to one another. It is possible to write the computation that determines the complex impedance (Z^*) as [14].

$$Z^* = Z' + jZ'' \tag{6}$$

SiO_2 and GO coatings increase the internal resistance of core shell Co_3O_4/SiO_2 and core shell $Co_3O_4/SiO_2/GO$ in comparison to core Co_3O_4. The charge controlled zone is represented by a single semicircle in the high frequency band of each curve, giving the impression that they are all similar. However, despite the curves appearing to be identical in terms of their forms, they actually differ considerably in terms of size [15]. This indicates that while each sample's effective area will vary, the same fundamental processes must be at work on all of these coatings (Figure 4). The semicircle typically reflects the grain boundary contribution at intermediate frequencies and the electrode impact at higher and lower frequencies, respectively. When SiO_2 and GO are added to the Co_3O_4 core, the values of Z' at low frequencies fall, mimicking the behavior of semiconductors [13]. The complex impedance spectrum of core Co_3O_4, core shell Co_3O_4/SiO_2, and core $Co_3O_4/SiO_2/GO$ at room temperature is depicted in Figure 4 over a broad frequency range. The semicircle typically reflects the grain boundary contribution at intermediate frequencies and the electrode impact at higher and lower frequencies, respectively.

CONCLUSIONS

Co_3O_4 core, Co_3O_4/SiO_2, and $Co_3O_4/SiO_2/GO$ nano powders were successfully synthesized employing aqueous extracts from *Aristolochia indica* as an efficient biosynthesis agent. The creation of pure, crystalline Co_3O_4 core and Co_3O_4/SiO_2 and $Co_3O_4/SiO_2/GO$ core shell nano powders with average particle sizes of 16 nm, 21 nm, and 31 nm, respectively, is confirmed by structural and optical analysis of these powders using methods like XRD. All of the prepared core and core shell samples reported at room temperature exhibit a single semicircle arc in impedance spectroscopy, which denotes the presence of a semiconducting property in the material. These findings show that the Co_3O_4/SiO_2, $Co_3O_4/SiO_2/GO$, and bio-synthesized Co_3O_4 core shell could be useful in a number of applications, including energy storage in pseudo capacitors.

ABSTRACT

Gujarat has 1,600 km of long coastline and is well known for its marine macro algal abundance and diversity. Marine algae also known as seaweed are primitive non-flowering photosynthetic macro phytes occurring in tidal regions of seas and oceans and they are natural renewable resources. The main aim of present study is to anti-oxidant and anti-bacterial properties. The seaweed species were collected from Gopnath, Gulf of Cambay, Gujarat. Based on the results obtained from study it can be proved that the Chlorophyta species of seaweed shows more efficiency for used as antioxidant compared to Rhodophyta species. A seaweed species *Ulva lactuca* demonstrated the highest zone of inhibition in terms of antibacterial and antifungal activity when compared to other seaweed species.

Keywords: Seaweed, Antioxidant, Antibacterial, Anti-fungal, Antimicrobial

INTRODUCTION

The coastal habitat has been referred to as the "Natural Medicine Chest of the New Millennium," and its popularity is rapidly increasing worldwide. Seaweeds are referred as marine macro algae, are a type of heterogeneous plant that thrive in marine or brackish water habitats and grow prolifically on rocky substrates. They are recognized as one of the earliest producers of entire aquatic biomass [1]. According to Ferrara et al. (2020), the classification of algae is primarily based on their pigments, and they are categorized into three main taxonomic groups, namely Phaeophyta, Rhodophyta, and Chlorophyta [2]. The reported number of seaweed species exceeds 10,000, out of which a mere 145 species are utilized for human consumption due to their desirable taste, consistency, or culinary versatility [3]. Additionally, they are known to contain a diverse range of bioactive molecules, including but not limited to protein, amino acids, polyunsaturated fatty acids, vitamins, minerals, dietary fibers, and pigments [4]. The investigation of secondary metabolites, such as alkaloids, phenols, flavonoids, saponins, steroids, tannins, triterpenoids,

68497

Nirali Goswami *et al.,*

anthraquinones, glycosides, and other active metabolites, has been extensive in the search for therapeutic drugs [5].According to Elsie (2010), the antibacterial properties of phytochemicals make them effective in treating various microbial diseases [6]. Additionally, they function as agents for reducing lipid and glucose levels in the blood, lowering blood pressure, and regulating cholesterol levels. In addition, it has been reported that the aforementioned seaweeds exhibit a significant abundance of essential nutrients such as vitamins A, Bl, B12, C, D, and E, alongside riboflavin, niacin, pantothenic acid, folic acid, and amino acids, as stated by Manam [5]. The increasing popularity of seaweed nutraceutical supplements and functional foods can be attributed to their manifold health benefits. According to a recent study, nations where individuals frequently consume seaweeds had lower rates of obesity and diet-related diseases [7]. The advantageous characteristics of macroscopic algae have long been associated with human and animal existence, and have been utilized as a means of sustenance, animal fodder, soil enricher, and medication. The current investigation focused on the examination and analysis of anti-bacterial and anti-oxidant activities of seaweeds.

MATERIALS AND METHODOLOGY
Study area
The study location chosen is the Gopnath coast, which is approximately 75 kilometers away from Bhavnagar. Geographically, it may be found at coordinates 21.20° N and 72.10° E in the Gulf of Khambhat (Fig. 1). The terrain near the shoreline is marked by a significant abundance of rocky formations. The abundance and variety of seaweeds at Gopnath can be attributed to the favourable substrate conditions.

Seaweed collection and powder preparation
Different seaweed species were collected from the Gopnath region during low tide conditions and promptly transported to the laboratory.

Powder preparation
The preparation of the seaweed powder involved a two-step process of sun drying in which collected seaweeds were allowed to dried for 5-6 days followed by oven drying. Then the dried material was crushed using grinder and stored for future analysis.

Antioxidant assay
For the assessment of antioxidant properties, a methanol solution was used to extract a total of nine species of seaweed. The antioxidant capacity of seaweeds was assessed by quantifying their ability to scavenge free radicals using 2,2-diphenyl-1-picrylhydrazyl (DPPH). The reaction mixture contains 2.5 mL of DPPH solution   and a 0.1 to 0.3 mL of plant extract and then the total volume was made   up to 3mL using methanol. The OD was taken at 0 min and after 30 min   at 517 nm. The standard [8] used for experiment was butylated hydroxytoluene (BHT). The extract's ability to scavenge hydrogen peroxide and its reducing power were assessed using the methodology outlined by Sobuj et al. [9].

Antimicrobial activity
Antibacterial study
The seaweed samples for antibacterial study were prepared in six different solvents (Hexane, Methanol, Chloroform, Dichloromethane, Ethanol and Acetone). The N-agar plates were prepared and two bacterial cultures(*B. subtilis* and *E. coli*) were poured on n-agar plate. Then a well of 6mm size were aseptically punched using a sterile cork borer after that the 100 µl methanolic extracts of seaweed were transferred into separate wells. These plates were incubated at 37°C for 24-48 hours. After that the zone of inhibition of each extract was measured.

Antifungal assay
Antifungal activities of the different crude seaweed extracts were performed using the agar well-diffusion assay. Two fungal Inoculum of (*Aspergillus niger* and *Mucor mucedo*) was prepared by growing the fungal culture in the Potato dextrose agar medium and then the test compound was suspended in tween 80 solution. The fungal suspensions were uniformly spread over Potato Dextrose Agar plate using sterile cotton swab followed

by punching of 6 mm wells using cork borer. The wells were filled with seaweed extract of three species. Fluconazole and methanol were used as a standard and control respectively [10].

RESULTS AND DISCUSSION

Seaweed diversity
During the study period, seaweeds constituted species enlisted as per the classes. A total of nine seaweed species were identified during study period (Fig 3).

Antioxidant Assay
Seaweeds are a valuable source of natural antioxidant chemicals, expanding the range of natural antioxidants beyond terrestrial sources. The identification of phyto constituents, including phenols, flavonoids, and tannins, in seaweed reveals that its extract may possess antioxidant properties. This activity was thought to aid in the prevention of several diseases by scavenging free radicals.[11].

DPPH Assay
The assay is based on the ability of antioxidants to neutralize the stable free radical DPPH (2,2-diphenyl-1-picrylhydrazyl).. Methanol extracts of seaweeds significantly reduced DPPH radicals in dose-dependent manners. The DPPH scavenging activity was found maximum in Chlorophytaspecies i.e., *Ulva lactuca* (65%) species followed by *Enteromorpha compressa* (41%) and *Ulva conglobata* (38%) (Fig 4). *Ulva lactuca* shown significant potential for DPPH radical scavenging activity, comparable to that of commercial Antioxidants (BHT-67%). Similar result was also reported by Sanger et al (2021)[12]. Minimum activity was found in Rhodophyta species that is *Ahnfeltiaplicata*(11%).

H_2O_2 Scavenging assay
The ability of seaweeds extracts to scavenge H_2O_2 increased with elevated concentrations. Though H_2O_2 exhibits minimal reactivity on its own, but it produces highly reactive species, such as OH •, by its interaction with metals (Fe^{2+} or Cu^{2+}) and superoxide anions in the Haber-Weiss reaction. Hence, the reduction of H_2O_2 is crucial for cellular functioning and could be a desirable characteristic of these seaweed species. The highest H_2O_2 scavenging activity was recorded in *Ulva lactuca* (52.6%) followed by *Enteromorpha compress* (35.8%) and *Ulva conglobata* (34.2%) (Fig 5). During the experiment it wasobserved that Chlorophyta members have highest scavenging activity followed by Rhodophyta members.

Reducing Power
The presence of reductones in seaweeds is responsible for their ability to reduce capacity and their involvement in preventing chain initiation, binding metal ions, decomposing peroxides, and scavenging radicals. The methanolic extract of seaweeds exhibited a higher reducing capacity than the well-known antioxidantascorbic acid (ASA). Chlorophyta species *Ulva lactuca*, *Enteromorpha compressa* and Rhodophyta species *Catenellaimpudica* shows the highest concentration that is 3.73, 3.44 and 2.4 µg/mL respectively. Similar results were also obtained by [13]**.**

Antimicrobial Assay
Antibacterial activity
Optimization of solvent for Extraction
The antibacterial effect of seaweed extracts was investigated using various solvents, such as acetone, chloroform, methanol, ethanol, hexane, and DCM, through the agar well diffusion test method against two bacterial species. Table 1 highlight the antibacterial efficacy of various seaweed extracts. Out of the six solvents that were examined, the Acetone extract showed the highest level of inhibition on the growth of the bacterial species that were tested. The acetone extract exhibited the most potent inhibitory action against the selected bacterial strains,

surpassing the inhibitory activity of other solvent extracts. The acetone extract exhibited the highest level of activity against *B. subtilis* (9 mm) and *E. coli* (6 mm) (Fig 6).

Antimicrobial activity of Acetone extract

The microbiological organisms Escherichia coli and Bacillus subtilis exhibited different levels of antibacterial activity when exposed to three different seaweed extracts. Different species of seaweed were collected and analysed for their antibacterial activity. Chlorophyta species of seaweeds was most effective among studied species for their antibacterial activity. The methanol extract of *Ulva lactuca* shown highest activity against *E. coli* (8 mm) followed by *B.subtilis* (7 mm) similarly *C. impudica* shows the highest activity against *E.coli* followed by *B.subtilis* whereas the seaweed species Enteromorpha compress a shows highest *B. subtilis* (5.25mm) followed by *E.coli* (4.5mm). The *U. lactuca* was most active against all tested pathogens. The extracts of almost all studied species shown activity against B. subtilis *E. coli* which is relatively very close to the standard antibiotic Vancomycin and ampicillin 10mcg (Table 2 and Fig 7).

Antifungal activity
Optimization of Concentration for Antifungal activity

The antifungal activity of seaweed extracts was studied by using different concentration viz., 20 ppm, 40 ppm, 60 ppm, 80 ppm and 100 ppm by agar well diffusion test technique against three different fungal species. Table 3 shows the antifungal activity of different concentration of seaweed. Among the five-concentration tested, extract having 100 ppm concentration exhibited maximum inhibition on the growth of the tested fungal species (Fig 7).

Antifungal activity of optimized dose (100ppm)

The methanolic extracts of seaweed species were evaluated for their antifungal activity against two pathogenic fungi, *Aspergillus niger* and *Mucor mucedo.* The results demonstrated the significant antifungal activity of the seaweed extract. The Chlorophyta species *Ulva lactuca* showed maximum antifungal activity against both tested pathogenic organisms *A. niger* (10.25 mm) and *M. mucedo* (8 mm) whereas minimum inhibition was recorded in *Enteromorpha compress* that is 3.5mm and 4.25 mm for *A. niger* and *M. mucedo* respectively (Table 4 and Fig 8). Phenolic compounds are very potent to show the antifungal activity against such pathogens [14]. The antifungal effects of extracts were comparable with the standard antifungal agent, fluconazole as standard antifungal agent and were establish to be active against both the fungal strain tested and showed similar zone of inhibition with seaweed extract. In the present experiment, the Chlorophyta species showed the strongest activities against the test bacteria and fungi, similar result was obtained by Padmakumar and Ayyakkannu[15][16].

CONCLUSION

The Gopnath coast offers a diverse array of seaweed species, which can be attributed to the availability of suitable substratum that provides an appropriate habitat for most algal species. Based on the results obtained from DPPH Assay, reducing power, H_2O_2 scavenging assay it can be proved that the Chlorophyta species of seaweed shows more efficiency for used as antioxidant compared to Rhodophyta species. A seaweed species *Ulva lactuca* demonstrated the highest zone of inhibition in terms of antibacterial and antifungal activity when compared to other seaweed species. So, from this study it can be concluded that the Chlorophyta species specially *Ulva lactuca* has the potential to use as antioxidant agent, it can be also used as natural antifungal and antibacterial agent.

ABSTRACT

This study investigates the role of Inverse Reinforcement Learning (IRL) in fortifying cyber security within smart cities, recognizing the escalating integration of advanced technologies in urban landscapes. Addressing cyber security challenges, including IoT vulnerabilities and privacy concerns, the paper explores IRL's potential in analyzing user behaviors and system interactions to detect cyber threats. It discusses the development of adaptive cyber security systems driven by IRL, emphasizing real-time threat mitigation. Ethical considerations and future prospects, envisioning AI-driven threat analysis and secure-by-design strategies, are also examined. The paper aims to contribute insights into leveraging IRL for safeguarding smart city infrastructures, fostering resilient urban environments.

Keywords: Inverse Reinforcement Learning (IRL), Smart city cyber security, Urban infrastructure security, Internet of Things (IoT) security, Anomaly detection, Behavioral modeling, AI-driven threat analysis, Secure-by-design approaches, Ethical considerations, Privacy-preserving techniques, Human-centric cyber security, Adaptive cyber security strategies, Future trends in IRL, Threat prediction in smart cities, Context-aware cyber security.

INTRODUCTION

In recent years, the rapid evolution of technology has catalyzed the transformation of conventional urban spaces into interconnected smart cities, fostering efficiency, connectivity, and innovation. However, this integration of technology into urban infrastructure has concurrently amplified vulnerabilities, posing significant cyber security challenges. Ensuring the resilience of smart city systems against cyber threats and attacks has become a critical concern. In response to these challenges, this paper investigates the application of Inverse Reinforcement Learning (IRL) as a strategic framework for enhancing cyber security measures within the context of smart cities. With the burgeoning complexity and interconnectivity of urban infrastructures, the study aims to explore how IRL can decipher and predict cyber threats, detect anomalies, and ultimately contribute to the development of adaptive cyber security systems tailored to the dynamic nature of smart city environments. Through an ethical lens and forward-looking perspective, this research endeavors to offer insights into leveraging IRL as a potential solution for fortifying the digital resilience of smart urban landscapes.

Prior Research Insights: IRL Applications in Smart City Cyber security

Research within the domain of Inverse Reinforcement Learning (IRL) has increasingly recognized its potential applications in addressing cyber security challenges specific to smart cities. Existing studies offer insights into the utilization of IRL techniques for enhancing the security posture of urban environments. For instance, Maxim Kalinin et al., 2021 [1] conducted a comprehensive analysis on Cyber security Risk Assessment in Smart City Infrastructures which presented a novel approach to cyber security risk management in smart cities using object typing, data mining, and quantitative risk assessment, employing artificial neural networks for automated and accurate risk evaluation across diverse object types within the dynamic digital infrastructure. Similarly, H. Habibzadeh et al., 2019[2]in their paper outlined the dual facets of challenges and opportunities in deploying Cyber Physical Systems (CPSs) within smart cities, encompassing technical, policy, and governance considerations crucial for implementation success. These studies collectively underscore the feasibility and efficacy of IRL in deciphering nuanced cyber threats prevalent in the complex ecosystems of smart cities. Moreover, the review article of I.V.D. Srihith et al [3] explores the multifaceted role of AI, machine learning, and advanced technologies like Deep Reinforcement Learning (DRL) and Machine Learning (ML) in addressing diverse aspects of smart cities while outlining research challenges and future directions for smart city advancement.

In addition to threat detection, IRL has been investigated for its potential in inferring user behaviors and decision-making, contributing to proactive security measures. The published paper of David Massimo [4] introduced the application of Recommender Systems in Internet of Things (IoT) contexts, outlining a novel learning approach for generating explainable human behavior models and recommendations in sensor-enabled environments, along with techniques for simulating user behavior and analyzing collective dynamics. These findings underscore the significance of leveraging IRL to analyze and predict human behaviors in enhancing preemptive cyber security strategies tailored for urban settings. In recent times, the integration of the Internet of Things (IoT) into smart cities has significantly enhanced operational efficiency and the quality of life. However, this proliferation of IoT devices has concurrently escalated cyber security risks, exposing vulnerabilities to malicious attacks. To combat these threats, various studies [5, 6, 7, 8] have delved into employing machine learning (ML) techniques for attack and anomaly detection within IoT networks of smart cities. These investigations explore diverse ML algorithms, including LR, SVM, DT, RF, ANN, KNN, ensembles (bagging, boosting, stacking), and cross-validation to bolster cyber security defenses. Emphasizing the significance of ML in cyber threat identification, these studies highlight its potential in addressing numerous security challenges such as intrusion detection, malware identification, and anomaly detection in IoT devices. Furthermore, they underscore the evolving nature of IoT security threats and the pivotal role of ML in countering these challenges, affirming ML as a promising technology for enhancing IoT security measures. The acquisition of human travel behavior data at various granularity levels is vital for urban planning and transportation management. However, conventional travel surveys often lack frequency and fail to adapt to evolving transportation

Bhargav Goradiya *et al.,*

dynamics. Addressing this challenge, [9, 10] propose innovative approaches using Inverse Reinforcement Learning (IRL) and synthetic data generation techniques. In [9], an IRL-based framework is introduced to model individual decision-making in urban settings, utilizing real-time GPS data to replicate human travel behavior patterns. The results showcase the model's capability to simulate individual travel plans and estimate city-wide travel demand, offering insights into hourly population distribution without compromising individual privacy. Complementing this, [10] highlights the significance of synthetic data in preserving sensitive information while resembling original datasets. This systematic review assesses diverse synthetic data models for urban mobility, emphasizing their practical applicability and potential for safeguarding privacy in mobility datasets. Exploring the realm of smart city applications involving Unmanned Aerial Vehicles (UAVs), this research project [11] focuses on area scanning using advanced UAVs with enhanced sensory capabilities. The evolution of these devices, marked by increased range and capacity, has facilitated automation, minimizing the reliance on human resources. Applications encompass traffic and pollution monitoring, land surveying, civil security control, and natural disaster monitoring.

To optimize UAV operations, the study examines the potential integration of Monte-Carlo Tree Search (MCTS) and Reinforcement Learning (RL), established methods in control tasks, aiming to develop efficient algorithms suited for diverse UAV applications within smart cities. Addressing the escalating issue of traffic congestion in urban areas, multiple research studies [12, 13, 14, 15, 16, 17] propose innovative strategies employing Reinforcement Learning (RL) and Vehicular Ad-hoc Networks (VANETs) to optimize traffic flow and alleviate congestion. These studies explore diverse approaches, including multi-agent RL frameworks, Q-learning, Markov Decision Processes (MDPs), and predictive road traffic management systems. Source [12] introduces a futuristic concept allowing structural modifications to the urban layout for enhanced traffic management, achieving a notable 31.5% reduction in total travel time (TTT). Meanwhile, [13], [14], [15] delve into RL-based approaches, considering path selections, speed regulation, and congestion avoidance through diverse algorithms and reward functions, demonstrating promising performance in congestion reduction and traffic optimization.

Additionally, [16] proposes a predictive traffic management system leveraging VANET architecture, showcasing significant enhancements in total journey time and vehicle waiting time. Furthermore, [17] explores group-based routing methods considering vehicles' similarities in urban transportation environments, aiming to enhance urban development and optimize traffic distribution. These studies collectively underscore the potential of RL-driven solutions and VANETs in devising effective strategies to mitigate traffic congestion and improve urban traffic management. Collectively, these studies offer valuable insights into the multifaceted applications of IRL within the realm of smart city cyber security, showcasing its potential in anomaly detection, adaptive security, and understanding user behaviors to bolster the resilience of urban infrastructures against cyber threats. These insights underscore the versatility of IRL, positioning it as a strategic tool to fortify the digital defenses of complex urban environments. In the context of prior research insights on IRL applications within smart city cyber security, Table I outlines ongoing research directions specifically tailored for the advancement of Inverse Reinforcement Learning (IRL) in urban environments. This table highlights crucial areas of exploration in IRL, emphasizing the need for continued research and ethical considerations in fortifying cyber security measures.

Challenges in Smart City Cyber security
As smart cities continue to evolve with technological integration, they encounter a spectrum of cyber security challenges unique to their complex and interconnected infrastructures.

Vulnerabilities in IoT Devices and Infrastructures
The proliferation of Internet of Things (IoT) devices within smart cities introduces vulnerabilities that pose significant security risks. These devices, often interconnected and resource-constrained, become potential entry points for cyber-attacks. Vulnerabilities include insufficient security protocols, lack of firmware updates, and susceptibility to exploitation, thereby compromising the integrity of critical systems such as traffic management, public services, and energy distribution.

Bhargav Goradiya *et al.,*

Complexity of Interconnected Systems

Smart cities consist of diverse systems and networks interconnected to enable efficient functioning. However, this intricate web of interconnected systems amplifies the attack surface, rendering it susceptible to sophisticated cyber threats. The complexity arises from the integration of multiple components, each with its own security protocols and compatibility requirements, thereby heightening the challenge of maintaining comprehensive cybersecurity measures across the entire ecosystem.

Data Privacy Concerns

The collection and utilization of vast amounts of data within smart cities for improving services and decision-making processes raise profound privacy concerns. The seamless integration of data from various sources, including IoT sensors, surveillance systems, and citizen interactions, necessitates stringent measures to safeguard personal information. Ensuring data privacy while harnessing the benefits of data-driven innovations remains a critical challenge.

Evolving Cyber Threat Landscape

The dynamic nature of cyber threats poses an ongoing challenge for smart city cyber security. Attack methodologies continually evolve, encompassing a wide array of threats, including malware, ransom ware, phishing attacks, and zero-day vulnerabilities. The rapid evolution of attack techniques necessitates proactive measures to anticipate and mitigate emerging threats promptly.

Human Factor and Awareness

Human error and lack of cyber security awareness among smart city inhabitants and stakeholders contribute significantly to cyber security vulnerabilities. Inadequate cyber security education and training, coupled with complacency, increase the susceptibility to social engineering attacks, compromising the overall security posture of smart city systems.

Fundamentals of Inverse Reinforcement Learning

Inverse Reinforcement Learning (IRL) serves as a fundamental framework that enables machines to infer human-like behaviors and decision-making processes by observing and learning from expert demonstrations. This section aims to elucidate the foundational principles and key components of IRL in the context of cybersecurity within smart cities:

Understanding the Concept of IRL

At its core, Inverse Reinforcement Learning involves inferring an underlying reward or objective function from observed behaviors rather than directly learning a policy. Unlike traditional Reinforcement Learning (RL), where the agent learns from reward signals, IRL focuses on deducing the hidden rewards guiding expert behavior.

Key Components of IRL

1. **Reward Inference:** IRL operates under the assumption that observed expert behaviors are optimal concerning an unknown reward function or objective. Instead of directly learning a policy as in RL, IRL aims to reverse-engineer this reward function. It endeavors to uncover the latent reward signals that likely drive the observed behaviors, allowing machines to discern the implicit decision-making criteria.
2. **Modeling Behavioral Preferences:** The core challenge in IRL involves interpreting observed trajectories or sequences of actions taken by experts. By analyzing these behavioral demonstrations, IRL seeks to discern patterns and preferences inherent in the expert's actions. This modeling process involves understanding how the observed behaviors align with the inferred reward function, enabling the learning agent to generalize and make decisions in line with the expert's behavior.
3. Optimization for Reward Inference: IRL encompasses a spectrum of optimization methods employed to infer the most probable reward function governing expert behavior. Techniques include maximum likelihood estimation and various IRL algorithms, each aimed at reducing the latent rewards that best explain the observed actions. These algorithms iteratively refine the inferred reward function to align more closely with observed behaviors.

Suitability of IRL in Cyber security for Smart Cities

IRL's ability to model complex decision-making processes and infer underlying objectives aligns with the dynamic and intricate nature of cyber security within smart cities. By analyzing behavioral patterns and inferring rewards, IRL presents a promising avenue for understanding and predicting cyber threats, detecting anomalies, and formulating adaptive security strategies tailored to urban environments.

Applications of IRL in Smart City Cyber security

The utilization of Inverse Reinforcement Learning (IRL) techniques within the cyber security landscape of smart cities presents a transformative approach to address cyber threats. IRL methods exhibit promising applications in various domains, facilitating the analysis of user behaviors, network traffic, and system interactions to detect anomalies and preempt potential cyber threats. This section delineates the specific applications of IRL techniques and their role in fortifying adaptive cyber security strategies within urban environments:

Analyzing User Behaviors

IRL enables the modeling and analysis of user behaviors across diverse smart city applications and services. By observing interactions between users and urban systems, IRL discerns behavioral patterns and deviations, aiding in the identification of anomalies that may signify potential cyber threats. Understanding user behaviors assists in formulating adaptive security measures tailored to mitigate emerging risks.

Network Traffic Analysis

The intricately interconnected network infrastructure within smart cities necessitates vigilant monitoring of network traffic. IRL techniques excel in analyzing network data, identifying abnormal traffic patterns, and detecting potential cyber intrusions or attacks. Leveraging IRL for network traffic analysis empowers security systems to adapt dynamically, responding promptly to emerging threats and vulnerabilities.

System Interactions and Anomaly Detection

By observing system interactions and operational data, IRL facilitates the detection of anomalies indicative of cyber security breaches or irregular system behavior. Through trajectory analysis and reward inference, IRL identifies deviations from expected system behaviors, enhancing the capability to preemptively detect and mitigate potential cyber threats within smart city infrastructures.

Empowering Adaptive Cyber security Strategies

IRL's capacity to learn from observed behaviors and adapt in real-time plays a pivotal role in empowering adaptive cyber security strategies within smart cities. The ability to infer underlying reward structures and model optimal decision-making aids in crafting agile and responsive security measures capable of dynamically adapting to evolving cyber threats, ensuring the resilience of urban systems.

Ethical Implications and Privacy Concerns

The deployment of Inverse Reinforcement Learning (IRL) techniques in cyber security within smart cities presents ethical considerations and privacy concerns that warrant careful deliberation. As IRL-driven security systems collect, analyze, and act upon data from urban environments, ethical considerations arise, primarily focusing on privacy preservation and broader ethical implications. One of the paramount ethical concerns revolves around the preservation of individual privacy amidst the utilization of IRL for cyber security purposes. The pervasive data collection required for behavioral analysis and anomaly detection within smart city environments raises concerns about potential intrusions into citizens' privacy. Striking a delicate balance between enhancing cyber security measures and safeguarding individual privacy rights necessitates stringent data anonymization, encryption, and robust privacy-preserving mechanisms. The opacity surrounding the operation of IRL algorithms and their decision-making processes accentuates the ethical imperative for transparency and accountability.

As IRL systems learn from observed behaviors to predict cyber threats, ensuring transparency in algorithmic decision-making becomes crucial. Establishing mechanisms for explaining IRL-derived decisions and fostering algorithmic accountability frameworks becomes imperative to engender trust and comprehension among stakeholders. The potential for biases inherent in IRL algorithms poses ethical challenges, particularly concerning fairness and impartiality. Biases embedded in training data or algorithmic models might perpetuate disparities or discrimination, impacting decision outcomes. Therefore, rectifying biases and ensuring fairness in IRL-based cyber security systems demands rigorous bias mitigation strategies, ethical algorithm design, and continuous evaluation to prevent discriminatory outcomes. Respecting individuals' rights to informed consent and fostering citizen awareness regarding the use of IRL-based cyber security measures in smart cities becomes pivotal. Providing clear and comprehensive information about data collection practices, behavioral analysis, and the purpose of cyber security initiatives enables citizens to make informed decisions about their participation and encourages active engagement in enhancing cyber security while safeguarding privacy.

Future Perspectives

The future landscape of Inverse Reinforcement Learning (IRL) applications within smart city cyber security holds promising prospects, poised to witness remarkable advancements and innovative trajectories. This Fig. 1, illustrates anticipated advancements in Inverse Reinforcement Learning (IRL) applications within the realm of cyber security for smart cities. It visually showcases several key trends

AI-Driven Threat Analysis

Anticipated advancements in IRL envision the integration of advanced artificial intelligence techniques to drive more sophisticated threat analysis and prediction models within smart cities. These AI-powered systems would harness IRL's capacity to discern behavioral patterns, enabling the proactive identification and prediction of cyber threats. For instance, future IRL-based systems might utilize deep learning architectures to detect subtle anomalies in user behaviors or network traffic, forecasting potential threats before they manifest.

Contextual Adaptability and Dynamic Response

Future IRL applications in smart city cyber security are poised to emphasize contextual adaptability and real-time response capabilities. These systems would exhibit heightened adaptability to dynamic urban environments by continuously learning from evolving cyber threats and adjusting security measures accordingly. For instance, IRL-based cyber security systems might dynamically reconfigure network defenses or access control protocols in response to detected anomalies, ensuring rapid and contextually relevant countermeasures.

Secure-by-Design Approaches and Ethical AI Integration

The future direction of IRL applications emphasizes the integration of secure-by-design principles into cyber security frameworks within smart cities. Future IRL systems will prioritize ethical considerations and privacy preservation from their inception, embedding ethical AI guidelines into algorithmic development. For instance, the design of IRL algorithms might integrate privacy-preserving techniques such as federated learning or differential privacy to ensure robust security measures without compromising individual privacy rights.

Human-Centric Cyber security and Behavioral Modeling

As IRL advances, future applications in smart city cyber security will increasingly focus on human-centric approaches by delving deeper into behavioral modeling and understanding. These systems will employ more nuanced and granular behavioral analysis to predict and thwart cyber threats. For example, future IRL models might incorporate cognitive psychology principles to model human decision-making, enhancing the accuracy of anomaly detection based on human behavior analysis.

CONCLUSION

In closing, the exploration of Inverse Reinforcement Learning (IRL) within the context of smart city cyber security illuminates its profound potential. From the extensive literature review and discussions, it becomes evident that IRL holds the key to transformative advancements in fortifying urban infrastructures against evolving cyber threats. Its ability to decipher behavioral patterns, predict anomalies, and enable adaptive security strategies underscores its significance in enhancing cyber security measures tailored for smart cities. However, as we navigate this promising trajectory, ongoing research remains imperative. Continuous innovation and exploration into IRL methodologies are crucial to harness its full potential. Moreover, ethical considerations stand as paramount pillars in implementing IRL-based solutions, demanding vigilance in safeguarding individual privacy rights, ensuring transparency, and mitigating biases. Embracing these dual imperatives—ongoing research and ethical adherence—will pave the way for the responsible and effective deployment of IRL, fostering resilient and secure smart city ecosystems for the benefit of society.

ABSTRACT

The primary objective of this study is to evaluate and contrast the efficacy of Muscle Energy Technique and McKenzie exercise, when employed in conjunction with Janda's approach, for the management of Upper Crossed Syndrome in lactating women. A comparative study was conducted at the Faculty of Physiotherapy, Dr. MGR Educational and Research Institute. Thirty lactating women diagnosed with UCS, aged 25-40 years, were recruited. They were randomly allocated to either Group A (MET with Janda's approach) or Group B (McKenzie exercise with Janda's approach). The interventions were carried out for five weeks. Outcome measures included the Cranio vertebral angle (CVA) as an indicator of posture and the Neck Disability Index (NDI) to assess functional impairment. Statistical analysis was performed using appropriate tests. After the intervention period of 5 weeks, a significant improvement in the Cranio vertebral angle was observed for both the Muscle Energy Technique and McKenzie exercise interventions. However, Group B (McKenzie exercise) exhibited a higher mean Cranio vertebral angle of 46.13, indicating greater effectiveness compared to Group A (Muscle Energy Technique) with a mean angle of 44.32. This difference was statistically significant at $P \leq 0.001$. n terms of the Neck Disability Index, both groups demonstrated a noteworthy reduction in post-test mean values following the

intervention. Group B (McKenzie exercise) displayed a lower mean value of 12.12, reflecting more effective outcomes in comparison to Group A (Muscle Energy Technique) with a mean value of 15.31. This difference was also statistically significant at P ≤ 0.001.

Keywords: Muscle energy technique, McKenzie exercises, Janda's approach, Upper Crossed Syndrome, Lactating women

INTRODUCTION

Upper Crossed Syndrome (UCS) develops when the muscles in the neck, shoulders, and chest become imbalanced, typically due to poor posture. This results in tightness of muscles like the levator scapulae, upper trapezius, and pectoralis minor, along with occasional tightness of the pectoralis major, coupled with weakness in deep neck flexors, lower trapezius, and rhomboids[1,2]. This pattern creates an X-shaped muscle imbalance[3]. This muscular imbalance leads to joint dysfunction, particularly affecting joints such as the atlanto-occipital joint, C4-C5 segment, cervicothoracic joint, glenohumeral joint, and T4-T5 segment[4,5]. The postural changes associated with UCS encompass forward head posture, increased cervical lordosis, thoracic kyphosis, elevated and protracted shoulders, and rotation or abduction with winging of the scapulae[5]. These changes compromise glenohumeral stability, as the glenoid fossa becomes more upright due to the weakening of the serratus anterior, resulting in shoulder abduction, rotation, and winging[6]. This weakened state necessitates increased activation of the levator scapulae and upper trapezius muscles to maintain proper glenohumeral alignment. Such a situation ultimately leads to side effects like pain and inflammation in the affected muscles[7]. Cervical pain is a commonly encountered musculoskeletal issue, which if untreated, can lead to severe complications[8]. Its occurrence is influenced by various factors, including musculoskeletal structure, age-related body changes, cultural practices, motor performance, and occupation.

This condition tends to be more prevalent among women, in higher-income countries compared to lower- and middle-income countries, and in urban areas[9]. Breastfeeding offers numerous physical and mental health benefits for both mothers and infants. The posture adopted during breastfeeding, intended to facilitate comfortable latching and milk flow, can sometimes contribute to issues like mechanical neck pain, brachial plexus discomfort, carpal tunnel syndrome, and various spinal deviations[10]. Upper Crossed Syndrome can also arise due to poor positioning of infants during breastfeeding, along with the adaptive postures mothers adopt while nursing[11]. These musculoskeletal problems associated with posture are influenced by different breastfeeding positions, which can either exacerbate or alleviate them. The resulting pain can manifest anywhere in the body and may occur during or after breastfeeding[12]. Physiotherapy interventions involve specialized exercises aimed at elongating muscles, enhancing strength and stability, and providing pain relief, particularly in the cervical spine. Manual techniques like Mobilization and Manipulation are employed to restore normal joint range of motion, addressing joint hypokinesia.

Muscle Energy Technique (MET), Active Isolate Stretching (AIS), and Strain Counter Strain are soft tissue methods used to treat neck pain and enhance range of motion. This study aims to compare the efficacy of muscle energy technique and McKenzie exercise, combined with Janda's approach. Muscle Energy Technique is an advanced stretching method rooted in Autogenic Inhibition and Reciprocal Inhibition concepts[13]. It aids in strengthening weak muscles by utilizing the length-tension relationship of contracted, spastic, or shortened muscles, ultimately restoring normal joint range of motion[14]. The technique can be executed through post-isometric relaxation and post-facilitation stretch approaches, targeting muscle imbalances and shortened muscles, respectively. MET has also been associated with pain relief[15]. The McKenzie exercise involves repetitive self-therapeutic exercises focused on extension[16]. This strategy encompasses mobilization, manipulation, self-therapeutic exercises, and patient education. It aims to alleviate musculoskeletal issues by improving posture and function, reducing pain recurrence, and alleviating associated stress[17-19].Janda's approach is a traditional technique involving targeted stretching for tight muscles and strengthening exercises for weak muscles. The objective is to enhance posture, diminish pain, and

Veena Kirthika *et al.,*

reduce inflammation[20]. This study is the pioneering endeavour to assess the effectiveness of muscle energy technique versus McKenzie exercise in lactating women diagnosed with upper crossed syndrome.

MATERIALS AND METHODS

This study employs an experimental design, specifically utilizing the Comparative Pre and Post-test approach. The research was conducted over a span of 5 weeks at the Faculty of Physiotherapy, Dr. M.G.R Educational and Research Institute. The participants included a cohort of a hundred lactating women, all aged around 25 years. The selection criteria were centered on identifying individuals displaying symptoms of upper crossed syndrome. From this initial pool, 30 lactating women who exhibited specific symptoms such as musculoskeletal discomfort in the neck and shoulders, cervicogenic headaches, and forward head posture, were chosen to participate in the study. Exclusion criteria were applied, excluding individuals with a history of cervical spine trauma, instability, other arthritic conditions, or spinal deformities. The chosen 30 subjects were then randomly divided into two groups: Group A and Group B, with each group comprising 15 participants. Clear explanations regarding the study's objectives and the prescribed exercise protocols were provided to all participants. Additionally, each participant completed an informed consent form before any study-related procedures were initiated. Ethical approval for the study was obtained from the University Research and Ethics committee, and the study was meticulously conducted in accordance with the guidelines set forth in the Helsinki Declaration of 2013, as endorsed by the World Medical Association [21]. Baseline measurements, termed pre-test measures, were taken at the outset of the study. These measurements encompassed the assessment of the Neck Disability Index and the cranio vertebral angle. These initial measurements served as a foundation against which subsequent changes were evaluated throughout the study.

Participants allocated to Group A underwent a therapeutic regimen involving Muscle Energy Technique (MET) targeting the upper trapezius, levator scapulae, and pectoralis muscles. The application of MET comprised both post isometric relaxation (PIR) and Post Facilitation Stretch (PFS) techniques. Each session consisted of a single set encompassing 5 repetitions, with a frequency of 3 sessions per week on alternate days. This intervention was carried out in conjunction with Janda's approach and spanned a period of 5 weeks. During the MET stretching exercises, the duration of the stretches was maintained at 8-10 seconds for PIR and 15 seconds for PFS. The participants were positioned in both supine lying and sitting postures during the MET sessions [22]. During the post isometric relaxation (PIR) technique, participants were guided to engage their agonist muscles by exerting approximately 10-20% of their available force, sustaining the contraction for a duration of 5 to 10 seconds. To ensure balanced opposing forces, resistance was applied by the therapist to counter the individual's exertion. Following this contraction phase, participants were directed to achieve complete relaxation.

Subsequently, the therapist would proceed to address the next barrier, eliminating any initial slack in the muscles. This sequential process was repeated for the new barrier, completing a total of 3 to 5 repetitions during each session. The PIR technique was administered thrice weekly as part of the intervention protocol [23]. In the context of post facilitation stretch, the muscles that had become shortened were positioned at a midpoint between their fully stretched and fully relaxed states. During this phase, participants engaged in an isometric contraction of the muscles, exerting a maximum level of effort for a duration of 5-10 seconds. The therapist provided complete resistance against this effort. Upon releasing the contraction, an immediate controlled stretch was applied to reach a new point of resistance. This stretch was executed without any sudden jerking or bouncing motions and was sustained for a minimum of 10 seconds. Following this, participants relaxed for approximately 20 seconds [24]. This sequence of actions was then repeated for the same muscle group, and the entire process was carried out for a total of 3 to 5 repetitions within each session. The post facilitation stretch technique was incorporated into the intervention protocol, with sessions scheduled three times a week.

Trapezius Stretching

During this stretching exercise, the subject assumed a seated position. They were instructed to flex their neck and then rotate it towards the same side as the flexed neck. The head was maintained in a neutral position while the individual lifted the shoulder on the same side as the rotation. To create resistance, a counterforce was gently applied for a duration of 10 seconds, holding the position. Subsequently, the contraction was released, and the muscle was stretched gradually until a new point of resistance was encountered. This entire procedure, involving contraction and subsequent stretch, was repeated for a total of 3 to 5 iterations [25].

Levator scapulae Stretching

The participant, situated in a seated position, is directed to flex their neck and subsequently rotate it towards the opposite side. While maintaining a neutral head position, the individual is then prompted to elevate the shoulder on the same side as the initial neck rotation. To impart resistance, a counter force is gently applied, and this resistance is sustained for a duration of 10 seconds while holding the designated posture. Following the contraction phase, the resistance is released, and a controlled stretch is administered to the muscle until a novel point of resistance is met. This is done for a total of 3 to 5 repetitions during each session [26].

Pectoralis muscle (Clavicular division) Stretching

The participant assumes a supine position, and their arm is extended and abducted until a sensation of tightness is experienced. The extended arm is then maintained in this position and supported by the therapist's leg. The participant is instructed to lift the extended arm, while the therapist simultaneously applies resistance. This resistance is maintained for a duration of 10 seconds. Following the contraction phase, the participant is prompted to release the effort, and the arm is gently slid along its path. This series of actions, encompassing contraction, resistance, and subsequent movement, is repeated for a total of 3 to 5 cycles during each session [27].

Pectoralis muscle (Sternal division) Stretching

The participant lies in a supine position, and their arm is extended and abducted to approximately 45 degrees until they feel a sense of tightness. The extended arm is then upheld in this position, with the therapist's leg providing support. The participant is then directed to lift the arm while the therapist applies resistance. This resistance is sustained for a duration of 10 seconds. After the contraction phase, the participant is instructed to release the exertion, and the arm is gently moved along its trajectory. This sequence of actions, encompassing contraction, resistance, and subsequent movement, is reiterated for a total of 3 to 5 cycles during each session [28].

Mckenzie Exercises

Participants allocated to Group B received treatment involving McKenzie's exercise regimen, performed for 20 minutes per day, three times a week over the course of five weeks. This exercise program was administered in conjunction with Janda's approach [29].

Chin Tucks

The participant is instructed to maintain an upright seated posture and gently lower the chin without tilting the head. This position should be held for a duration of 10 seconds before being released.

NeckRetraction and Extension

The participant is directed to sit in an upright posture and gently retract the neck by pulling it backward. This position should be held for 1-2 seconds before returning to the retracted position. Subsequently, the neck is gradually brought back to the neutral position.

Side Bending Exercise

While maintaining a straight gaze, the participant tilts their head sideways until the ear touches the shoulder. This position should be held for a few seconds before repeating the same movement on the opposite side.

Neck Rotation

Turn the head to the right while keeping the gaze fixed, holding the position for a few seconds. Repeat the same movement on the left side.

Neck Flexion

The participant is guided to lower their head towards the chest. Next, they are to lift their hand and interlock their fingers at the back of the head, using this grip to gently push the head further towards the chin.

Shoulder Shrugs

The participant is instructed to inhale slowly while simultaneously lifting their shoulders towards the ears. The breath is held in this elevated position for a duration of 10 seconds. Subsequently, they are to exhale slowly and gradually return to the initial starting position.

Janda's approach

Janda's approach follows a traditional methodology that involves providing stretches to tight muscles and exercises to strengthen weakened muscles. The primary aim of this approach is to enhance posture, alleviate pain, and reduce inflammation. Additionally, a hydro-collator pack will be applied to the region experiencing cervical pain prior to commencing the treatment [30].

Stretching exercises

Stretching exercises are prescribed for the levator scapulae, upper trapezius, and pectoralis muscles, with each stretch held for a duration of 20 seconds. This sequence is repeated five times per day.

Strengthening exercises

Strengthening exercises are recommended for the middle and lower trapezius, serratus anterior, infraspinatus, and deep neck flexors. Each exercise consists of 2 sets, with 10 repetitions per set, to be performed daily.

RESULTS

The gathered data were organized and examined through a combination of descriptive and inferential statistical methods. The statistical package for social science (SPSS) version 24 was employed to analyze all the parameters. For within-group comparisons, the paired t-test was utilized to ascertain any statistical distinctions. To determine the statistical differences between the groups, the independent t-test (also known as the Student t-Test) was employed.

The provided table displays the Mean, Standard Deviation (S.D), t-test results, degree of freedom (df), and p-values for the comparison of pre-test and post-test week data between Group A and Group B. The data in the table indicates that there is no notable difference in pre-test values between Group A and Group B (*P > 0.05), suggesting a lack of statistical significance. However, the table also highlights a significant statistical difference in post-test values between Group A and Group B (***- P ≤ 0.001), indicating that there are meaningful distinctions between the two groups in terms of their post-test outcomes. The table provided presents the Mean, Standard Deviation (S.D), t-test results, degree of freedom (df), and p-values for the comparison of pre-test and post-test week data between Group A and Group B.The data from the table indicates that there isn't a significant distinction in pre-test values between Group A and Group B (*P > 0.05), implying a lack of statistically noteworthy variation. However, the table also indicates a statistically significant distinction in post-test values between Group A and Group B (***- P ≤ 0.001), suggesting that meaningful differences exist between the two groups regarding their post-test outcomes.

The Mean, Standard Deviation (S.D), t-value, and p-value between pre-test and post-test within Group A and Group B are presented in the provided table. A remarkably significant statistical difference is evident between the pre-test and post-test values within both Group A and Group B (***- P ≤ 0.001). The Mean, Standard Deviation (S.D), t-value,

and p-value between pre-test and post-test within Group A and Group B are displayed in the table above. Significantly high statistical differences exist between the pretest and posttest values within both Group A and Group B (***- P ≤ 0.001). When comparing the mean values of Cranio vertebral angle between Group A and Group B, there is a noteworthy increase in post-test mean values for both groups. Particularly, Group B (McKenzie exercise) demonstrates a higher mean value of 46.13, signifying its effectiveness compared to Group A (Muscle Energy Technique) with a mean value of 44.32, at a statistically significant level of P ≤ 0.001. As a result, the null hypothesis is rejected. Similarly, in the context of Neck Disability Index score, a substantial reduction in post-test mean values is observed for both Group A and Group B. Notably, Group B (McKenzie exercise) exhibits a lower mean value of 12.12, indicating its higher effectiveness in comparison to Group A (Muscle Energy Technique) with a mean value of 15.31, at a significance level of P ≤ 0.001. Consequently, the null hypothesis is rejected. Furthermore, upon examining the Pre-test and Post-test differences within Group A and Group B for both Cranio vertebral angle and Neck Disability Index Score, a highly significant disparity in mean values is evident at P ≤ 0.001.

DISCUSSION

Upper crossed syndrome is a prevalent postural abnormality seen in both the youthful and older generations. It mainly stems from extended periods of inadequate posture, resulting in rounded shoulders, a forward head stance, and a visible arch in the upper back and neck region [31]. This issue is also widespread among mothers who adapt their positions while nursing their infants. Utilizing a blend of stretching routines, targeted exercises, and deliberate postural corrections can serve as a proactive measure against the onset of upper crossed syndrome. This study represents the inaugural attempt to investigate the comparative efficacy of Muscle Energy Technique in contrast to McKenzie's exercises within the lactating female demographic. Muscle Energy Technique stands as an advanced stretching methodology that aids in the rehabilitation of debilitated muscles, concurrently offering pain mitigation. On the other hand, McKenzie's exercise regimen is a self-directed therapeutic approach, characterized by repetitive extensions. Its primary objective revolves around ameliorating musculoskeletal concerns, enhancing both posture and functionality, and curbing the reoccurrence of pain along with its attendant stress.

 The evaluation of forward head posture involved the measurement of the cranio vertebral angle, accomplished through the utilization of the ON Protractor app. Additionally, the degree of neck disability was gauged employing the Neck Disability Index, a scale comprised of ten sections where each item is assigned a score ranging from 0 to 5. The cumulative score obtained from this assessment can be doubled to yield a percentage score. The cranio vertebral angle and the score from the Neck Disability Index were both measured prior to and following the intervention, encompassing pre-test and post-test evaluations. A cohort of 30 participants was divided into two groups: Group A (consisting of n=15) and Group B (also consisting of n=15). In Group A, the intervention involved Muscle Energy Technique sessions conducted over a span of 5 weeks. These sessions encompassed a single set of 5 repetitions, scheduled for 3 sessions per week on alternate days. Meanwhile, Group B underwent McKenzie's exercises for a duration of 20 minutes daily, 3 times a week, over a period of 5 weeks. Notably, both groups were exposed to Janda's approach, encompassing a combination of strengthening and stretching exercises. As reported by Sajjad Ali et al. in 2017, their study concluded that Muscle Energy Technique (MET) has demonstrated considerable effectiveness, particularly when employing Post-Isometric Relaxation (PIR) and Proprioceptive Facilitation Stretching (PFS) techniques. These techniques were found to be beneficial in addressing issues such as hypertonicity, dysfunctional joint mechanics, and the subsequent heightened activity of mechanoreceptors associated with these conditions [32].

As indicated by Kostopolos et al. in 2008, their study yielded the conclusion that passive stretching exhibited a lesser degree of effectiveness in comparison to Muscle Energy Technique (MET). The research favored the utilization of MET in cases of mechanical neck pain. The study further demonstrated that MET led to a significant reduction in neck pain and notable enhancements in neck function [33]. Nevertheless, it's important to note that not all literature supports the assertion that Muscle Energy Technique (MET) is superior to conventional stretching methods. A study by Shenouda et al. in 2012 directly compared MET with stretching and arrived at a different conclusion. Their

research indicated that neither approach exhibited clear superiority over the other, implying that both strategies were comparable in terms of effectiveness [34]. As per the findings of Seyoon Kim et al. in 2019, their investigation into the impact of McKenzie exercises on forward head posture led to several conclusions. They reported that implementing McKenzie exercises over a span of 4 weeks led to notable enhancements in the Cranio vertebral angle. Specifically, the angle improved from 46.00° before commencing the exercises to 51.14° following the exercise regimen. The study also indicated that McKenzie exercises had the capacity to rectify abnormal posture and potentially accelerate the timeline towards achieving postural improvement [35]. The study conducted by Aguilar-Ferrándiz et al. in 2019, aimed to assess the immediate impacts of a single session of McKenzie exercises on individuals afflicted with upper crossed syndrome. The outcomes of the study demonstrated that participants who engaged in the McKenzie exercises exhibited positive changes in their posture and experienced a decrease in pain levels, in contrast to a control group [36]. Following a duration of 5 weeks of intervention, the present study's conclusion was derived through rigorous data analysis. The statistical analysis revealed significant effects in Group B, where McKenzie's exercise was employed, with a significance level of $P \leq 0.001$. As a result, the null hypothesis was rejected based on these findings. Muscle Energy Technique (MET) functions by enhancing the function of the musculoskeletal system through joint mobilization and the stretching of tense muscles and fascia. This approach aims to alleviate pain, facilitate improved circulation, and enhance the flow of lymphatic fluid. MET achieves these effects by inducing relaxation in specific muscles or muscle groups. This relaxation addresses heightened muscle tension, which is often associated with pain and restricted mobility in certain areas or joints. This process involves two fundamental mechanisms namely Post-Isometric Relaxation which involves reducing tension in an agonist muscle following isometric contraction. This relaxation helps alleviate pain and stiffness associated with the muscle. In Reciprocal Inhibition, the tone of an antagonist muscle decreases after the isometric contraction of its corresponding agonist muscle. This contributes to improved muscle tension, leading to pain relief and increased range of motion. The McKenzie exercise regimen employs techniques that apply controlled loading to address the adaptive muscle shortening in the neck area, which can lead to uncomfortable restrictions in movement and diminished spinal mobility. This therapeutic approach proves particularly effective as it leverages the patient's own force in a direction that alleviates chronic neck pain symptoms. Serving as an active therapeutic method, it encompasses an educational element and involves repeated movements or sustained positions.

These actions collectively work to reduce pain and disability while enhancing spinal mobility, all while minimizing movement constraints attributed to kinesiophobia. Additionally, the McKenzie exercise methodology is tailored to tackle musculoskeletal issues through the enhancement of posture and functionality. Its overarching objective is to mitigate pain recurrence and the associated stress, thereby offering a comprehensive approach to addressing these concerns [37]. Both the Muscle Energy Technique and a combination of McKenzie Exercise and Janda's Approach show potential in managing Upper Crossed Syndrome among lactating women. MET offers precise muscle targeting and immediate effects, but may demand more therapist involvement. On the other hand, the combination of McKenzie Exercise and Janda's Approach provides a more accessible, patient-centered approach that can be easily integrated into daily routines. However, further research is needed to establish the superiority of one approach over the other in this specific population. A personalized approach considering the patient's preferences, therapist expertise, and available resources will likely yield the best outcomes.

MET targets specific muscles through resisted contractions, providing direct neuromuscular input to restore balance. It requires skilled therapists to accurately apply the technique based on each individual's needs. MET involves active participation of the patient in muscle contractions against resistance. Research supporting the effectiveness of MET for UCS management is limited but promising. McKenzie and Janda's approach target overall muscle imbalances, addressing both weakened and tight muscles through exercises and stretches. It offers a more generalized set of exercises, making it easier for patients to perform them independently. McKenzie and Janda's approach rely on the patient's active participation in performing exercises and stretches. Studies on McKenzie exercises and Janda's Approach show positive results in improving posture and reducing pain, especially when combined. They may have an advantage in promoting self-management and long-term adherence due to the ease of performing exercises without specialized assistance. Nonetheless, the study's outcome indicated that the

effectiveness of McKenzie exercises surpassed that of Muscle Energy Technique in managing Upper Crossed syndrome within lactating women. The present study concluded that both the Muscle Energy Technique and McKenzie exercise demonstrate a significant increase in the Cranio vertebral angle, as well as a reduction in mechanical pain and neck disability in individuals with Upper Crossed Syndrome, specifically among lactating women. However, notable improvements are observed in GROUP B, which undergoes McKenzie exercises. The findings of this comparative study suggest that McKenzie exercises are more effective than the Muscle Energy Technique in addressing Upper Crossed Syndrome among lactating women.

ABSTRACT

An expanding topic of research in the fields of computational and theoretical chemistry is the structural characterization of molecular compounds. Such assessment of the molecular structure and fundamental connectivity results in molecular descriptors, also known as topological indices, which are intended to forecast chemical characteristics and bioactivities. The topological indices also have a significant impact on the research exploring quantitative structure-activity relationships (QSAR) and quantitative structure-property relationships (QSPR), which correlate a chemical structure to its properties. Irregularity indices have the potential to quantitatively characterize the topological properties of non-regular graphs. In recent decades, 2-D covalent organic frameworks (COFs) are getting prominence due to their predictable topologies and organized nanopores. In this study, we computed certain degree-based irregularity measures of thiophene-based covalent triazine framework (TBCTF). We also compared our results graphically.

Keywords: Covalent organic framework, irregularity indices, topological index, molecular graph.

INTRODUCTION

By employing graphs, we can analyze molecular structures. As a subfield of mathematics, chemical graph theory focuses on the analysis of chemical graphs. A specific category of chemical graphs known as molecular graphs describes the topology of molecules [1,2]. Let $\Theta = \left(\Upsilon(\Theta), \; \dagger(\Theta) \right)$ denotes a molecular graph with order η (number of nodes) and size τ (number of links). The notation $\hbar \xi$ is adapted for the link joining the nodes $\hbar$ and ξ. The

symbol $\lambda_\hbar$ denotes the degree of $\hbar$ (*ie.*, $\hbar \in \Upsilon(\Theta)$), which is the number of nodes that are neighbor to $\hbar$ [3,4]. This article considers molecular graphs that are connected, loopless, finite, undirected and without multiple links. The topological indices often referred to as structural descriptors that have the ability to predict the physicochemical properties, are one of the most important aspects of QSAR/QSPR modeling [5-7]. The topological indices have started to emerge as essential descriptors in the field of molecular chemistry and chemical graph theory due to their simplicity in usage compared to the use of numerically intense quantum chemical computations. The activity of molecular compounds heavily relies on their structures and the relationship of molecular structure dependency can be quantitatively symbolized by P = g (M), where P denotes the specific property and M represents the molecular structure [8]. The wiener index was the first structural descriptor used in biology and chemistry in 1947, when chemist Wiener [9] established it for investigating boiling points of alkanes. The degree-based topological indices employed in mathematical chemistry are defined on the basis of the degree of the node of a graph. The first genuine degree-based structural descriptor is Randić index (branching index) which was introduced by Milan Randić in 1975 [10]. Due to the extensive use of the Randić index, the generalised Randić index was developed Bollobas and Erdos [11].

Randić index $R = \displaystyle\sum_{\hbar\xi \in \dagger(\Theta)} \frac{1}{\sqrt{\lambda_\hbar \, \lambda_\xi}}$

Amic *et al.*[12] have defined an important molecular descriptor known as reciprocal Randic index, which is given by

$$RR = \sum_{\hbar\xi \in \dagger(\Theta)} \sqrt{\lambda_\hbar \, \lambda_\xi}$$

After that, a pair of degree-based Zagreb indices were introduced by Gutman *et al.* [13], which are defined below,

$$M_1 = \sum_{\hbar\xi \in \dagger(\Theta)} \left(\lambda_\hbar + \lambda_\xi\right) = \sum_{\hbar \in \Upsilon(\Theta)} \lambda_\hbar^2$$

$$M_2 = \sum_{\hbar\xi \in \dagger(\Theta)} \left(\lambda_\hbar \, \lambda_\xi\right)$$

Then, Furtula *et al.*[14] investigated the Forgotten index for certain chemical networks.

$$F = \sum_{\hbar\xi \in \dagger(\Theta)} \left(\lambda_\hbar^2 + \lambda_\xi^2\right) = \sum_{\hbar \in \Upsilon(\Theta)} \lambda_\hbar^3$$

Cote et al. [15] proposed the COFs as a novel class of organic porous crystalline polymers with nature. Long-range ordered crystalline frameworks can be formed thanks to the COFs' capacity for thermodynamically controlled covalent bonding and self-heating. Superior chemical stability in organic solvents is a crucial characteristic of COFs. Owing to their metal-free architectures and pure covalent bonding, COFs have a high degree of stability. Large pores distinguish COFs from other porous silicas and inorganic zoelites. This characteristic of COFs can be useful in catalysis, where large pores accelerate reactant diffusion and product desorption, improving selectivity and yield [16]. Numerous frameworks such as hexagonal, chain silicate, honeycomb, silicate and oxide networks are similar to the systems of chemical/atomic structure. Such networks have certain distinctive properties that are quite significant. Their applications are greatly influenced by their structural characteristics. Characterization of the various properties of these frameworks is urgently required to address the growing demands of the materials for future nanotechnology. In this article, we exclusively focus on the computation of irregularity indices of TBCTF network.

Srinivasan and Helen

Preliminaries

A numerical quantity related with a graph that reflects the irregularity of the graph is called an irregularity index. An irregularity index is a more concise approach to represent the irregularity. Moreover, the development of irregular indices relies on the transformation of a molecular graph into a total number that captures the irregularity of the molecular arrangement on the map [21].

The topological index
$$\mathrm{TI}(\Theta) = \begin{cases} \text{non-negative,} & \Theta \text{ is irregular} \\ 0, & \Theta \text{ is regular} \end{cases}.$$

Albertson [18] coined the phrase "irregularity of a graph Θ " in 1997. This variant is represented by $A(\Theta)$. Another name for this invariant is the third Zagreb index. He demonstrated that "the irregularity of any graph is an even number". Additionally, he investigated upper bounds for bipartite graphs, triangle-free graphs and the irregularity of trees. In [22], it was investigated how irregularity of unicyclic graphs and matching number and trees relate to one another. Hansen et al. [23] defined the graphs with the highest degree of irregularity. The irregularity of graph operations was calculated by Abdo and Dimitrov [24]. Abdo et al. [25] described the total irregularity measure of a graph Θ in 2014. The irregularity measures of several chemical structures were studied in [26–29]. The degree-based irregularity indices that will be needed to calculate our main results are displayed in Table 1. We apply graph-theoretical tools, link partition techniques, analytical methods, degree counting methods and combinatorial computation techniques for obtaining our primary findings. GNU-OCTAVE v.5.2.0 software is employed for 3-D surface mapping.

RESULTS AND DISCUSSIONS

In this section, we discuss about the topological aspects of TBCTF network and also compute the irregularity indices for each network.

Topological characteristics of TBCTF

A family of organic polymers with well defined structure and persistent porosity is known as COFs. The feature that COFs are synthetically modifiable, geometrically pre designable and functionally accessible is a crucial characteristic. COFs typically contain lightweight components including C, N, B, O, H and Si, which contributes to their low mass density [30]. In order to facilitate the selective oxidation of alcohols into the appropriate ketones and aldehydes under the influence of visible light, Huang et al. [31] proposed TBCTF as illustrated in Fig. 2. Thiophene and triazine are the two building blocks that make up the unit cell of TBCTF. The purpose of band gap engineering is to utilize constitutional isomers of TBCTF. We reserve the symbol $\Theta_1(\varsigma, \alpha)$ for the molecular graph of TBCTF, where ς represents the number of fundamental units in every row and α indicates the number of fundamental units in every column. A basic computation reveals that $\Theta_1(\varsigma, \alpha)$ contains $33\varsigma\alpha$ nodes and $39\varsigma\alpha - \varsigma - \alpha$ links.

Theorem 3.1 If the molecular graph $\Theta_1(\varsigma, \alpha)$ symbolizes the TBCTF, then

(1) $\mathrm{B}(\Theta_1(\varsigma, \alpha)) = \frac{648\varsigma^2\alpha^2 - 18(\varsigma^2\alpha + \varsigma\alpha^2) - 4(\varsigma^2 + \alpha^2) - 8\varsigma\alpha}{1089\varsigma^2\alpha^2}.$

(2) $\mathrm{A}(\Theta_1(\varsigma, \alpha)) = 30\varsigma\alpha - 2(\varsigma + \alpha).$

(3) $\mathrm{IR1}(\Theta_1(\varsigma, \alpha)) = \frac{2700\varsigma^2\alpha^2 - 66(\varsigma^2\alpha + \varsigma\alpha^2) - 40\varsigma\alpha - 20(\varsigma^2 + \alpha^2)}{33\varsigma\alpha}.$

(4) $\mathrm{IR2}(\Theta_1(\varsigma, \alpha)) = \sqrt{\frac{261\varsigma\alpha - 18(\varsigma + \alpha)}{39\varsigma\alpha - (\varsigma + \alpha)}} - \left(\frac{78\varsigma\alpha - 2(\varsigma + \alpha)}{33\varsigma\alpha}\right).$

$$= \left[6ln\left(\frac{2}{\sqrt{3}}\right)+18ln\left(\frac{5}{2\sqrt{6}}\right)\right]\varsigma\alpha-2ln\left(\frac{5}{2\sqrt{6}}\right)(\varsigma+\alpha).$$

Figure 2 and Figure 3 show the 3-D surface plots of various irregularity indices. It is worth mentioning that, the IR1(Θ_1) index exhibits the highest response in relation to the structural complexity of TBCTF network. Whereas, the B(Θ_1), IR2(Θ_1), and IRFW(Θ_1) indices would be less responsive to the lattice irregularity.

CONCLUSION

In this research, we computed accurate expressions for some irregularity indices of TBCTF network. We also present a comparative analysis of such indices using graph structures. When compared to other indices, the IR1 index has relatively high prediction capability for determining the structural irregularity of those networks. These insights have been advantageous and helpful in comprehending the difficult irregular nature of such lattices and could possibly be applied to other scientific fields. By this study, researchers may gain a better understanding of how these frameworks might evolve with different irregular aspects.

ABSTRACT

Kalanchoepinnata leaf extract was used in the Co-Precipetation method to synthesize zirconium dioxide nano particles. The prepared nano particle have been characterized by powder X-ray diffraction, Fourier transform infrared spectroscopy, ultraviolet spectra, also evaluated for their antibacterial efficiency against bacterial strains. The prepared ZrO_2 nano particles monoclinic structure, with an average crystalline size of about 20 nm, was shown by the XRD pattern. The growth of gramme positive Staphylococcus aureus and gramme negative E. coli bacteria was significantly inhibited by nano crystalline zirconium dioxide, as per the results of the antibacterial efficiency.

Keywords: *Kalanchoe pinnata*, Nano particles, Antimicrobial activity, Fourier transform infrared spectroscopy, X-ray Diffraction.

INTRODUCTION

Because of its great inflexibility and resistance to fracture, zirconium oxide (ZrO_2) is widely utilized in the fight against bacterial plaque. To solve this problem, ZrO_2 nano particles, a reliable antibacterial agent that can inhibit a variety of microbes, can be employed. The use of zirconia ceramics as implant biomaterials is growing in popularity [1]. Zirconia has been used in structural properties [2, 3], dental crowns [4,5], femoral heads for total hip replacement [6, 7], electrolyte for solid oxide fuel cells [8, 9], and catalytic applications [10, 11] due to its extraordinary mechanical, optical, electrical conductivity, and thermal properties. Materials with nanostructures showed diversephysio-chemical characteristics that are ignored in bulk materials. Compared to regular ZrO_2, nanosized ZrO2 has far superior chemical and physical properties. In terms of stability and safety, inorganic antimicrobial compounds have a substantial advantage over organic antimicrobial agents. The usefulness of nano particles in biological applications including nanomedicineis becoming more widely acknowledged [7]. The medical field benefits greatly from the use of nano particles in cancer therapy, drug delivery, and cell imaging. Although zirconia nano particles have potential medicinal uses, few research have looked at their involvement in dental imaging and bone tissue. This is an amazing example of nano science in medicine. This material is also useful in anti-infection applications. A major concern for public health is the on going rise in micro organisms resistance to antibiotics. Thus, the current investigation has attempted to highlight the antibacterialZrO_2 nano particle characteristics were ascertained by use of the agar diffusion method. Numerous synthesis approaches, such as co-precipitation [8], solid state reaction [9], hydrothermal method [10], sol-gel [11], and microwave aided solution method [12], have been used to produce nanosized zirconium dioxide particles. The microwave assisted solution technique for nano materials has gained popularity in recent years due to its several uses, including uniform heating, quick processing times, low power requirements, and unique synthetic properties [13]. This paper investigates the antibacterial activity, FTIR, UV, and XRD of prepared ZrO_2 nano particles.

EXPERIMENTAL

Preparation of Plant Extract

I bought fresh Kalanchoepinnata leaves from a nearby vendor. In a 500 ml beaker filled with 450 ml of double-distilled water, about 50g of leaves were boiled for 30 minutes. What mann No. 1 filter paper was then used to filter the extract. The filtrate was stored for the entire night at 4°C in a refrigerator.

Green Synthesis of Zirconia Nanoparticles

The process of green synthesis was used to preparation of zirconia nanoparticles. A 500 ml beaker containing 450 ml of plant extract. 50 ml of a 0.02M aqueous solution of zirconyl chloride octahydrate were added dropwise, agitated, and left at 80°C for two hours without any disturbances. A few days ago, the particles were formed. The resultant solution was allowed to evaporate for four hours at 150°C in a vacuum air oven. To convert hydroxide into ZrO_2, the materials were heated in a muffle furnace for three hours at 500°C.

Detection method

Using an X-ray diffracto meter (X-PERT PRO PANlytical, Netherlands), the XRD patterns of the materials were examined in order to determine their crystalline nature. As a diffraction source, CuKα radiation with a wavelength of λ = 1.5406 Å and a step size of 0.050 was employed, covering the diffraction range of 10-80º. A Shimadzu 8400S FTIR spectrometer was used to record the FTIR spectra, which were obtained in the 4000-400 cm-1 range. Using an agate mortar, the materials are finely divided in KBr before being compressed at 250 MPa into a circular disc with a diameter of 10 mm and a thickness of 0.5 mm. An infrared light source is used to dry these pellets. The produced nanoparticles' optical characteristics were noted using a JASCO UV visible spectrometer. ZrO_2 nano particles were assessed using the well-disc-diffusion method, which was applied tovalidate the antibacterial efficaciousness. The test organisms employed were clinical isolates viz., E. Coli, and Staphylococcus aureus which were procured from

Department of Microbiology, Coimbatore medical college and hospital (CMHC), Coimbatore. Nutrient agar medium was used to maintain the bacterial cultures. Finally, various zirconium oxide nanoparticle concentrations were added to each disk. For twenty-four hours, the antibacterial assay plates were incubated at 37°C. The sizes of the inhibitory zones were measured in mm.

RESULT AND DISCUSSION

UV-Visible Analysis

The UV-VIS absorption spectra of synthesized Zirconia nano particles dissolved in ethanol at room temperature is shows in the figure 1. A sharp peak observed at about 224 nm could be attributed to the band gap energy of This peak showed a small blue shift compared to the bulk. In the semiconductor nano particles, it is usually observed that band gap energy is increased (blue shift) with decreasing particle size .Apart from the strong absorption peak, a weak peak centered at 283 nm was observed. Which was followed by a peak at 403 nm with a shoulder of about 411 nm. In general, the emissions that appear at short wavelength can be ascribed to the excitation from the near band-edge transitions. The broad band and the substantial red shift of the band maximum, as compared to the band gap of the bulk material. The estimated optical band gap of the sample is lower than those of bulk zirconia.

FT-IR Spectrum

The FT-IR spectrum of the zirconia nano particle samples in the range 400–4000 cm−1 was observed in below figure in order to ascertain its molecular nature. The FT-IR spectrum of the ZrO2 nano particles in Figure shows a strong absorption with a maximum peak at 587 cm−1 , due to the Zr–O vibration, which confirms the formation of the ZrO_2 structure . The absorption peak in the region of 1388 cm−1 corresponds with O–H bonding, while a peak in the region of 1553 cm−1 may be due to the adsorbed moisture. A peak in the region of 3564 cm−1 is attributed to the stretching of O–H groups, characteristic of a highly hydrated compound. This highly hydrated compound enhances water uptake within the modified membranes with zirconia, which gives potential applications in fuel cells. The peak observed at 2300 cm−1 and 2322cm−1 corresponds with the structural O–H stretching of the nano materials. The peak observed in the region of 1550 cm−1 is due to the adsorbed moisture. Symmetric frequencies of Zr–OH were observed at 1080 cm−1.

XRD analysis

The product's cube phase was revealed by the XRD pattern. The expanding XRD peak revealed that the crystallite size of ZrO_2 was fine. The Scherrer formula was used to calculate the ZrO_2 sample's average crystalline size, which came out to be roughly 20 nm. Furthermore, a modest shift to higher or smaller d-values was seen in comparison to the reference pattern. which are properties of zirconium in a tetragonal phase and can be indexed to the standard pattern of the tetragonal phase of ZrO_2, which is in good agreement with reported data (JCPDS No.81-1544) (Chuah et al., 2001).. The peaks and bumps in these XRD patterns indicate that these materials are amorphous. These findings suggest that the samples' gradual aging favored thetetragonal structure growth, the monoclinic peaks completely disappeared.

Biological Activity

Test microorganisms

The test organisms used were clinical isolates *viz.,* ., *E. Coli*, and Staphy lococcus aureus which were obtained from Department of Microbiology, Coimbatore medical college and hospital (CMHC), Coimbatore. The bacterial cultures were maintained on nutrient agar medium.

Growth and Maintenance of Test Microorganism for Antimicrobial Studies

The bacterial cultures was maintained on nutrient broth (NB) at37°C.

Preparation of Inoculums

The gram positive bacteria, Staphylococcus aureus, and gram negative bacteriaE.Coliwere pre-cultured in nutrient broth overnight in a rotary shaker at 37°C, centrifuged at 10,000 rpm for 5 min, pellet was suspended in double distilled water and the cell density was standardized spectro photo metrically (A_{610} nm). The samples were tested by the well diffusion method. Different concentration of the extracts (100 μg/ml) was prepared by reconstituting with methanol. The test microorganisms were seeded into respective medium by spread plate method 10 μl(10 cells/ml) with the 24h cultures of bacteria growth in nutrient broth. After solidification the filter paper wells (5 mm in diameter) impregnated with the extracts were placed on test organism-seeded plates. Amoxicillin (10 μg) used as standard for antibacterial test. The antibacterial assay plates were incubated at 37°C for 24hrs. The diameters of the inhibition zones were measured

in mm.

CONCLUSION

The present study the eco-friendly and convenient greener route synthesis of ZrO_2 nano particles using *Kalanchoe pinnata* leave sextract. FTIR and XRD pattern of the samples proved the formation of ZrO_2 nano particles and their crystalline structure. Synthesized ZrO_2 nano particles exhibited significant bacterial activity against Escherichia coli, Streptococcus aureus.

ABSTRACT

Justici agendarussa Burm.F. was a herbal plant that contains chemical compounds such as alkaloids, saponins, flavonoids, polyphenols, essential oils, tannins and steroids. The plant extraction has been carried out by these following three chemical compounds such as Chloroform, Distilled Water, Methanol and Acetone. *Justici agendarussa Burm.F.* has long been used as an anti-inflammatory and pharmacologically,this plant has been reported that have antibacterial, analgesic, anthelmintic, anti-cancer, anti-inflammatory, antioxidant, anti-HIV, toxicity, sedative hypnotic and male contraception drugs. Phytochemical analysis of the leaf extract of *Justici agendarussa* on four different solvents shows that Alkaloids are present in all solvents except chloroform. Carbohydrates are present in Acetone and Distilled water but absent in methanol and chloroform solvents. Flavonoids are present in all solvents except in chloroform. Glycosides and Saponoins are present in all solvents. Tannins absent in all solvents except acetone. Protein are present in Acetone and Distilled water but absent in methanol and chloroform solvents. Antibacterial activity reported against pathogens such as *Escherichia coli, Stretomyces aureus. Pseudomonas* showed that the plant extract can be used to treat diseases caused by these bacteria. Antioxidant activity was determined at ambient temperature by means of a 2,2 - diphenyl-1-1-picrylhydryzyl (DDPH) colorimeter.

Keywords: *Justici agendarussa*, Antioxidant, Antibacterial, Phyto chemical, Medicinal plant.

INTRODUCTION

Herbal medicines derived from plant extracts are being increasingly utilized to treat a variety of clinical diseases, though relatively little knowledge about their mode of action is available. *Justici agendarussa* belongs to family Acanthaceae is commonly known as Nili-Nirgundi. The plant is up to one meter height and found in tropical and subtropical parts of Asia and in India at seashore area like Valsad, Surat and Hills likePavagarh. J. gendarussa herb is cultivated in Indian gardens for its attractive foliage and flowers. The herb is cultivated in Indian gardens for its attractive foliage and flowers (Abeloff,2008;Altschuler*et al*,2007; Birks *et al*,2007).To explore the possibility of using the traditional medicine with proper chemical and pharmacological profiles, there has been a large volume of work aimed at scientific validation of efficacy of herbal drugs used in the traditional medicine(Fabricant *et al*,2001).*Justicia* belongs to the family Acanthaceae, which are scattered in Asia, such as China, Philippines, India, Indonesia, Malaysia, Sri Lanka, Pakistan, Thailand and the Andaman Islands. *J.gendarussa* grew wild in the forest and can also be planted as a medicinal plant or hedge plant (Sinansari*et al*,2018). Traditionally the plant has vigorous therapeutic application and is used in the treatment of human immunodeficiency viruses (HIV), inflammation, bronchitis, vaginal discharges, eye diseases, dyspepsia and male contraception with constituents like alkaloids, flavonoids, terpenoids, carotenoids, phenolic compounds, sugar, starch etc.(Mangai,2018).

In Malaysia, the leaves are applied for politicking to treat head ace and pains, as a lotion to treat swelling and rheumatisum and in bath after confinement, the roots treat for thrush and cough (Wahi*et al*, 1974).The sequential screening for phytochemicals of *j.gendarussa* leaves are rich in alkaloids, flavanoids, saponin, carbohydrates, steroids, triterpenoids, carotenoids, aminoacids, tannins, phenolics, coumarines and Anthraquinones. Major active components of their species are the flavonoids vitexin, apigenin and also sitosterols, alkaloids and reducing sugars(Woodham and Peters,1998).Leaves contain a bitter alkaloid (justiciine) and they are rich in potassium salts. Root is bitter in taste considered anodyne, antiperiodic, antiplasmodic, carminative, diaphoretic, diuretic, emetic, febrifuge and laxative (Marathakam*et al*,2012).*J.gendarussa*has pharmacological effects such as fever, cough, jaundice, mouth sores, arthritis, cephalgia, hyplegia, facial paralysis, bronchitis, chronic rheumatism, liver disorders, respiratory disorders, indigestion, anti-inflammatory, and anti-cancer(Altschuler*et al, 2017*). The phyto chemical analysis of the plants is very important commercially and has great interest in pharmaceutical companies for the production of the new drugs for curing of various diseases. The phyto chemical research approach is considered effective in discovering bioactive profile of plants of therapeutic importance(Ojinnaka*et al*,1984).

MATERIALS AND METHODS

Collection and drying of plant materials
Justici agendarussa Burm was collected from Annamalai nagar, Department of Botany, Annamalai University, Chidambaram. Plants were appropriately rinsed with distilled water to purge dust, dirt and other possible parasites and then were shade dried at 25-30ºC. The dried parts root, stem, and leaves were pulverized incoherently and then stored in clean, dried plastic bags for extraction.

Extraction of plant materials
For the preliminary phyto chemical analysis, extract was prepared by weighing 50 gm of the dried powdered stem, leaf and root was subjected to hot successive continuous extraction with 250 ml n-distilled water, chloroform, acetone and ethanol solvents. The extraction process was carried out for 72 hrs and then the extract was collected. It was evaporated in a hot plate and residue was collected, kept in desiccators. All the extracts obtained by successive extraction method are subjected to qualitative phytochemical analysis.

Preliminary Phytochemical Analysis(Subramanian*et al*,2012)
A systematic and complete study of crude drugs should include a complete investigation of both primary and secondary metabolites derived from plant metabolism. The different qualitative chemical tests are to be performed establishing profiles of the given extracts for their nature of chemical composition. Following chemical tests were carried out for different extracts of *Justiciagentrarussa*to
identify the presence of various phyto chemical constituents.

Test for Carbohydrates(Kokate *et al*,2001)
To 2ml of plant extract, 1ml of Molisch's reagent was added. Presence of purple (or) reddish colour indicates presence of Carbohydrates.

Test for Tannins
To 1ml of plant extract, 2ml of 5% ferric chloride was added. Formation of dark blue or greenish black colour indicates the presence of tannins.

Test for Saponins
To 2ml of filtrate, 2ml of Distilled water was added and shaken in a graduated cylinder for 15mins lengthwise 1cm, layer of form foam indicates the presence of Sapon in.

Test for Flavanoids(Mills et al,2000)
To 2ml of filtrate, 1ml of 2N NaOH was added presence of yellow colour indicates the presence of flavonoids.

Test for Alkaloids(Cromwell,1955)
Dragendorff's Test (Potassium Bismuth Iodide): The acid layer was treated with few drops of Dragendorff's reagent Formation of reddish brown precipitate indicates the presence of alkaloids.

Hager's Test
The acid layer was treated with few drops of Hager's reagent. Formation of yellow precipitate indicates the presence of alkaloids.

Test for glycosides(Subramanian*et al*,2012)
Borntragers Test
2ml of chloroform solutions of the extracts of Justiciagentrarussa. were treated with 1ml of dilute (10%) ammonia and shaken. Pink-red color in the ammoniacal (lower) layer indicates the presence of anthracene derivatives.

Cardiac Glycosides
2ml of chloroform solutions of the extracts of *Justiciagentrarussa.* were treated with conc.H_2SO_4. Appearance of ring at the inter phase indicates the presence of deoxysugars in cardenolides.

Test for Protein
To 2ml of filtrate, 1ml of 0.2% Ninhydrin reagent was added and heated blue colour reveals the presence of proteins.

Antibacterial activity
Different zone of inhibitions were shown by extracts and fractions of leaves of *Justici agendaruss a* with different concentrations. The extracts / fractions obtained from our selected plants were screened against different bacterial strains. Peptone was taken as control for antibacterial activity. Bacterial culture was inoculated in the test tubes. To check the turbidity the following microorganisms were treated with the extract *Staphylococcus aureus, Klebsiella pneumonia, Pseudomonas aeruginosa.* The extracts of Sample shown no effects against the tested bacteria and there was no Zone formation in any of the extracts. Graph represents the zone of formation (mm) of Sample (Fig2) for all the tested organisms and shows maximum activity against bacilli for the acetone and ethyl acetate extracts.

68545

Antioxidant/free radical scavenging activity

The extract was filtered and dried. The extract was dissolved in methanol with a final concentration of 1mg/ml. The free radical scavenging activity of the extract was analyzed by the DPPH. The extracts were dissolved in 1ml of methanol and mixed with 1ml of DPPH solution. The mix was vortex and in cubated for 30mins. The O.D of the solution was then measured at 518nm in UV spectrometer.

$$\text{Radical scavenging activity} = \frac{\text{Absorbance of Control} - \text{Absorbance of Sample}}{\text{Absorbance of control}} \times 100$$

RESULT AND DICUSSION

Phytochemical analysis of the leaf extract of *Justici agendarussa* on four different solvents shows that Alkaloids are present in all solvents except chloroform. Carbohydrates are present in Acetone and Distilled water but absent in methanol and chloroform solvents. Flavonoids are present in all solvents except in chloroform. Glycosides and Saponoin are present in all solvents. Tannins absent in all solvents except acetone. Protein are present in Acetone and Distilled water but absent in methanol and chloroform solvents. The results of phytochemical analysis of *Justici agendarussa* leaves extracts from different solvents were tabulated (Table1). The acetone extract of crude sample showed 62.5% inhibition of DPPH radicals and chloroform extract showed 45.5% inhibition of DPPH radicals. The acetone extract of leaf shows increase percentage of free radical scavenging activity. On comparing antioxidant activity (Table 2) of the three different samples of *Justici agendarussa* the Acetone extract showed the maximum percentage inhibition of DPPH radicals among the other different solvents. Phytochemicals in plant material have raised interest among scientists, food manufacturing and pharmaceutical industry, as well as consumers for their roles in the maintenance of human health. Phytochemicals are the bioactive, non-nutrient, and naturally occurring plant compounds found in fruits, vegetables, and whole grains. They can be categorized into various groups, i.e., polyphenols, organosulfur compounds, carotenoids, alkaloids, and nitrogen-containing compounds.

Many phyto chemicals are potent effectors of biologic processes and have the capacity to influence disease risk via several complementary and overlapping mechanisms. In recent times there has been considerable significance in the use of plant material as an unconventional method to control pathogenic microorganism(Pushparani*et al*,2017) and many components of plants products have been shown to be particularly targeted against resistant pathogenic bacteria (Aqil*et al*,2005). The appearance of multidrug resistant strain of many pathogens is a severe threat and makes chemotherapy more difficult. Furthermore, the current price of most of the chemotherapeutic agents is intolerable to the public particularly in developing countries like India (Nostro*et al*,2006). Therefore attempts must be directed towards the development of effective natural, non-toxic drug for treatment (Gopalkrishnan Sarala*et al* ,2010). Therefore the present work was carried out to explore the antimicrobial property of *Justici agendarussa.* The plant based products have been effectively proven for their utilization as source for antimicrobial compounds. AC – Acetone; MTH-Methanol; CHF- Chloroform; AQ-Aqueous.'+' indicates the presence of the particular phytochemical, '–' indicates the absence of the particular phytochemical

CONCLUSION

The present study demonstrates the phyto chemical assessment of *Justici agendarussa.* These phyto chemicals seems to be responsible for diverse biological assays of the plant extracts. The current study report antimicrobial activities of *J. gendarussa* for the first time. Our results showed that both the plant species shows good potential against the tested antimicrobial essays. Based on our results it is recommended that the crude extracts and different solvent soluble fractions of our selected plants can be used for therapeutic purposes and also would escort to synthesize safe herbal drugs with least side effects.

ABSTRACT

Worldwide, an increase in the prevalence of fungal infections, particularly dermatophytosis, has been noted. The members of the research community to look for alternative natural substances such as essential oils have been spurred by the resistance of some species of fungi to antifungal medicines, expensive treatment costs, and toxic effects of present drugs. In the current investigation, the antifungal activity of clove oil was assessed in vitro using the agar disc diffusion method at various dilutions (0, 10, 20, 50, and 100%) on the isolated fungus (*Trichophyton sp, Microsporum sp. Epidermophyton sp*). The combination effect of antifungal ointment and essential oil with natural products from plants is a prospective strategy to produce a new potent antifungal agent. As a result, this research demonstrated that antifungal ointment mixed with essential oil shows a synergistic effect. GC-MS was used to identify phytochemicals and bioactive substances in combination of clove oil and antifungal ointment (Luliconazole). The bioactive components available in mixture were compared to recognized substances in the National Institute of Standards and Technology's database library (U.S.). Agar well diffusion was used to test the antifungal efficacy and synergistic effects of AFOs with clove oil.

Keerti Singh *et al.,*

GC-MS *divulged* one hundred sixty-one (161) bioactive compounds in Clove oil and AFOs, respectively. Minimum Inhibitory Concentration (MIC) by Clove oil AFOs ranged from 1.25 to 10.0 mg/ml. Combinatory effects of AFOs with Clove oil revealed synergistic properties. A promising alternative therapy to treat dermatological infections without side effects is the development of innovative products employing bioactive compounds from plants and commercially available AFCs.

Keywords: AFOs, Dermatophytes, AFCs, MIC, GCMS.

INTRODUCTION

Mycotic illnesses are increasingly considered a substantial public health problem because they cause high morbidity (1,2). By overusing broad-spectrum antibiotics, which reduce the number of non-pathogenic bacteria that inhibit the growth of fungus through competition, the spread of fungal illnesses is growing(3). Antifungal medications are effective in treating some fungal infections, but their abuse always makes the problem worse. Superficial and subcutaneous fungal infections can be highly hazardous if not treated quickly, effectively, and with the necessary medications. Over the years, resistance has been encountered frequently due to the improper use of antifungal medications(4,5).Deep and superficial fungal infections are both treated with anti-fungal chemotherapy. The ideal way to combat the main skin dermatophytes may be by topical application of anti-fungal medications, which guarantees direct access and a better retention rate at the target. Topical administration also helps to prevent pre-systemic metabolism and lessen systemic toxicity. Different medications, such as clotrimazole, itraconazole, and ketoconazole, are applied topically to the skin by rubbing or spreading(6). The topical administration of anti-fungal medications, however, has been linked to undesirable skin responses, including allergic rashes and itching. Additionally, standard formulations require frequent administration at high doses, which increases the risk of both local and systemic toxicity(7).Aside from various adverse effects caused by commercially available antifungal medications, worldwide drug resistance to numerous treatments is rapidly increasing, and the effectiveness of a single antibiotic against resistant microbes is declining. Pathogenic dermatophytic multi-drug resistance is forcing ongoing therapeutic failure, which urgently calls for an innovative complementary strategy to the development of new, effective antimicrobial medicines. A blueprint for the development of efficient antifungal drugs or creams from natural herbs is now a point of consensus among researchers, medical professionals, and pharmaceutical companies(8).

This will help overcome the limitations of conventional therapy and produce antifungal agents with dose efficiency. Combining the effects of commercial antifungal medications with natural items will show great effectiveness in treating fungal infections while improving the efficacies of antibiotics (creams, ointments or pills) and reducing their adverse effects. It will be a complementary and alternative strategy to fight recurrence occurrences of fungal infection to combine and synergistically affect commercial antifungal medications with natural bioactive substances from plants(5). Medicinal plants are loudly sources of treasurable secondary metabolites and thus, subsidize to accessibility of natural drugs in globally(5). One of the most significant plants in conventional medicine, clove (*Syzygium aromaticum*) is a member of the Myrtaceae family(9). Clove essential oil is used in aromatherapy and in dentistry emergencies to relieve toothaches. The chemical groups and classes that make up clove oil include monoterpenes, sesquiterpenes, and phenolic hydrocarbons(10).Eugenol, a volatile phenylpropanoid that is widely employed in the pharmaceutical business, is the principal component of flower bud essential oil and is considered to be its primary chemotype.

Additionally, it includes humulene, -caryophyllene, and eugenol acetate. *S. aromaticum* has shown antiviral activity against viruses that are spread by food, antibacterial activity, with low quantities being able to stop bacterial development, and efficacy in the treatment of bacterial illnesses(11,12).Their compounds have biological advantages such as antioxidant, insecticidal, antifungicidal, anticarcinogenic, antibacterial and anesthetic properties.

68551

Additionally, due to its abundance in several phytochemicals such sesquiterpenes, monoterpenes, hydrocarbons, and phenolic compounds, it has antiprotozoal properties(13,14,15). Clove oil has a variety of uses in the pharmaceutical and cosmetic industries, as evidenced by its therapeutic potential in phytomedicine. Therefore, biologically active compounds in medicinal plants can be exploited and incorporated in AFCs, which will be a newsworthy option towards new prototype antifungal agents. Natural products in plants act as reservoirs of novel bioactive compounds and as excellent source of drug discovery with diverse biopharmaceutical applications(16,5). This study therefore, revealed synergistic antifungal potential of over-the-counter AFOs with Clove oil against clinically important Dermatophytes.

MATERIALS AND METHODS

Collection and identification of plant materials
In this study plant oils (Clove oil, Eucalyptus oil and Ginger oil) were procured from local ayurvedic medical shop of Dehradun, Uttarakhand, India.

Source of antifungal ointments (AFOs)
The commercially available AFOs namely; Clotrimazole (1%), Miconazole Nitrate (2%), Ketoconazole (2%), Fusidic Acid (0.2%), Clobetasol (0.05%), Luliconazole (1%) and Terbinafine Hydrochloride (1%) were used. These AFCs were certified by National Agency for Food and Drug Administration and Control (NAFDAC), a federal agency under the Federal Ministry of Health.

Collection of Dermatophytes
The tested dermatophyte isolates viz: *Trichophyton sp.*, *Microsporum sp.* and *Epidermophyton sp.* were isolated from mild and chronic dermatophytosis cases from OPDs of different clinics of Dehradun District. MTCC strains viz., *Trichophyton rubrum* (MTCC 296), *Microsporum gypseum* (MTCC 2819), and *Epidermophyton flaccosum* (MTCC 7880) were also procured from IMTECH, Chandigarh, India as a control agent.

Determination of Phytochemicals and Bioactive Compounds in Clove Oil and AFOs
The bioactive compounds in the Clove oil and AFOs were identified with the aid of gas chromatography– mass spectrometry (QP2010 plus Shimadzu, Japan), Column, GC, SH-I-5Ii MS Capillary, 30m x 0.25mm x 0.25um, injection mode: Split less. The operating conditions of the GC-MS set for the analysis were as follow: oven temperature 45°C for 2 min then 140°C at 5°C/ min and finally increased to 280°C ad held isothermally for 10 min. The sample injection was 2μL and the carrier gas was helium at 1mL/min. The ionization of the sample components was carried out 70Ev. NIST14.L library (2020) was then searched to compare the structures of the compounds with that of the NIST database. Compounds were then identified based on the retention times and mass spectra with already known compounds in the NIST library (C:\Database\NIST14.L).

Antifungal activities of Clove oil and AFOs
The antifungal assay was carried out using the agar well diffusion method described by CLSI[7]. A suspension of dermatophytic strain (1.0 × 105 sfu/ml) was adjusted with the aid of spectrophotometer (UNICO S-1100 RS) to 0.5 McFarland standard. Dimethyl sulfoxide (DMSO 2% v/v) was used to reconstitute since most of AFOs and plant extracts (Clove oil) were not soluble in sterile distilled water. The concentration of AFOs, and Clove oil were reconstituted to 10.0 mg/ml. Plant extract was sterilized using a Millipore membrane filter (0.22 μm). The sterility of AFOs and Clove oil were confirmed after Millipore filtration, by introducing 0.1 ml of supposed sterile extract into sterilized Sabouraud's dextrose agar. Each labelled plate was seeded with tested dermatophyte by means of sterile swab stick rolled on Sabouraud's dextrose agar and Nutrient agar media. Sterile cork borer was used to make well (6 mm) in the Petri dishes. Aliquots of Clove oil (1000 μl) and AFOs (10 mg) were dropped in each well. The plates were incubated at 26 °C for 48 h. The zones of inhibition around well were measured in millimetres (mm). For synergism activity, concentration of each AFOs and Clove oil was adjusted to 3.0 mg/ml.

Keerti Singh *et al.,*

Determination of Minimum Inhibitory and Fractional Inhibitory Concentration Index (FICi)

The minimum inhibitory concentration was determined by using method described by CLSI[7]. The varying concentrations of 1.25, 2.5, 5.0, and 10.0 mg/ml for AFOs and Clove oil were prepared and incorporated into a set of sterile tubes. Each test tube was inoculated with 0.1 ml of standardized fungal inoculum and incubated at 26 °C for 48 h. The MIC were recorded as the lowest concentration to prevent growth of macroscopically visible colonies on plates, while there was visible growth on plates without AFOs and Clove oil. To determine MIC of combined AFO with Clove oil, varying concentrations of 1.0–3.0 mg/ml was used. The synergism, indifference, and antagonism of combined AFO with Clove oil were screened on the studied dermatophytes.

RESULTS

Inhibitory Potentials and Synergistic Antifungal Efficacy of AFOs With Clove Oil Against Pathogenic Fungi-

The antifungal activity of the antifungal ointments and essential oils against dermatophytes (*Trichophyton sp.*, *Epidermophytone sp.*, *Microsporium sp.*) was measured in this study. AFOs specifically- Clotrimazole, Fusidic acid, Luliconazole, Ketoconazole, Clobestol, Terbinafine and Miconazole, and Essential oils specifically- Clove oil, Eucalyptus oil and Garlic oil against tested dermatophytes. Clove oil exhibited more prominent inhibitory effects than AFOs. Clotrimazole, Fusidic acid, Ketoconazole, Clobestol, Terbinafine and Miconazole were devoid of inhibitory effect against the dermatophytes as compared to Luliconazole. Luliconazole displayed zones of inhibition against tested dermatophytes with values ranged from 8 mm to 26 mm, Clove oil have inhibitory zones of 10 mm to 39 mm and mixture of Luliconazole & Clove oil have inhibitory zones of 11 mm to 40 mm respectively.

Evaluation of Antifungal Activity of the Antifungal Ointments, Essential Oils and Antifungal Drugs Against Dermatophytes

The data presented in table 1 showed- the maximum antifungal susceptibility observed by Ketoconazole ointment (61%), clove oil (83%), Eucalyptus oil (83%) and Ketoconazole drug (78%) against *Trichophyton sp.* The highest antifungal susceptibility observed by Luliconazole ointment (100%), Terbinafine ointment (100%), Ketoconazole ointment (60%), Clotrimazole ointment (60%), Miconazole ointment (60%), Clove oil (100%), Eucalyptus oil (60%) and Terbinafine drug (100%), Ketoconazole drug (80%) against *Epidermophytone sp.* The highest antifungal susceptibility observed by Luliconazole ointment (100%), Terbinafine ointment (100%), Ketoconazole ointment (60%), Clotrimazole ointment (60%), Miconazole ointment (60%), Clove oil (100%), Eucalyptus oil (100%) and Fluconazole drug (100%), Ketoconazole drug (100%), Itraconazole drug (100%) against *Microsporium sp.*

Combinatory Synergistic Effect of AFOs And Clove Oil Against Dermatophytes

All the dermatophytes isolated from skin were susceptible to one or more antifungal ointments, antifungal drugs and essential oil. In this study synergistic antifungal activity was evaluated for the remaining five combinations. A synergistic effect was observed because the inhibitory activity of the mixture was more than those of the individual. Combination of Antifungal ointments and Clove oil against *Trichophyton sp.*: When these two were mixed the growth inhibitory activity were: Luliconazole + Clove oil (95.12%), Ketoconazole + Clove oil (85.36%), Clotrimazole + Clove oil (60.97%), Miconazole + Clove oil (48.78%), Terbinafine + Clove oil (31.70%). Combination of Antifungal ointments and Clove oil against *Microsporium sp.*:When these two were mixed the growth inhibitory activity were: Luliconazole + Clove oil (100%), Ketoconazole + Clove oil (50%), Clotrimazole + Clove oil (0%), Terbinafine + Clove oil (50%), Miconazole + Clove oil (25%). Combination of Antifungal ointments and Clove oil against *Epidermophytone sp.*:When these two were mixed the growth inhibitory activity were: Luliconazole + Clove oil (100%), Terbinafine + Clove oil (60%), Miconazole + Clove oil (60%), Clotrimazole + Clove oil (40%), Ketoconazole + Clove oil (0%) (Table-2). Luliconazole + Clove oil displayed the highest (p < 0.05) zones of inhibition of 50 mm, 45 mm and 40 mm against Epidermophytone (MTCC-7880), microsporium sp. (MTCC-2819) Trichophyton sp. (MTCC-296). Luliconazole (AFO) + Clove oil against Trichophyton sp., Luliconazole (AFO) + Clove oil against Microsporium sp., Luliconazole (AFO) + Clove oil against Epidermophytone and Luliconazole (AFO) + Clove oil against (MTCC) displayed

synergistic properties. Other combinatory effects of Antifungal ointments with Clove oil, Anti-fungal drugs with Clove oil and Clove oil with Eucalyptus oil were showed antagonistic effect.

Phytochemical and Bioactive Compounds in AFOs (Luliconazole) and Clove Oil as revealed by GC-MS

The results of the preliminary screening shown in figure -1 clearly indicate that Chromatogram of Luliconazole and Clove oil with peaks for various bioactive constituents. The peaks were shown 162 bioactive compounds in AFOs and Clove oil, respectively. Table- 3, show the presence of bioactive compounds in Luliconazole and Clove oil, respectively identified with GC MS. Eugenol (59.69%) was the major compound and other bioactive compounds such as Zingiberene, Acetyleugenol, Spathulenol, Arachidonic acid, Anisylacetate, Phthalic acid, Acepromazine, Widdrol, Chamigrene, Benzoic acid, Propeoic acid, Caryophlene acid, Farnesol, Humulene epoxide I, Pogostole, Propanone, Ether, Ascabiol, Bisomel etc found in the Luliconazole and Clove oil (Table- 3)

DISCUSSION

Fungal skin infections are one of the most widely distributed types of cutaneous and mucocutaneous infections, which represent a serious public health issue(17). The ongoing development of various antibiotic resistance by pathogenic fungal strains has prompted research across the board, which has indicated the urgent need to investigate fresh possible strategies to advance antifungal therapeutics(18,5). In this study, the combinatory potential of AFOs with Essential oils was assessed. Luliconazole was efficient AFO against dermatophytes in vitro. The azole drug luliconazole has potent anti-fungicidal properties against Trichophyton species, much as terbinafine.

A combination of luliconazole's powerful in vitro antifungal activity and its advantageous pharmacokinetics in the skin may be the cause of its potent antifungal action(19). In this investigation, the in vitro antifungal efficacy of over-the-counter AFOs (Luliconazole) and their synergistic interactions with Essential oil (clove oil) against dermatophytes from clinical sources were attributed to phytochemicals as well as bioactive components in essential oils. Natural chemical substances found in plants called phytochemicals are biologically active and can fight against illnesses (5).These biologically active phytochemicals, which include phenol, flavonoids, saponins, alkaloids, steroids, terpenoids, cardiac glycosides, anthraquinones, and tannins, are present in the investigated extracts, making them beneficial for a variety of medical applications, including antimicrobial against pathogenic microorganisms. The one hundred sixty-two chemical elements were qualitatively found in the combination of luliconazole and clove oil: eugenol and caryophyllene are as major components. These components have antibacterial, anti- fungal, anti-inflammatory, insecticidal, and anti-oxidant potential, making them potentially useful for the preparation of both herbal and modern medicines(20). They are also traditionally used as a flavoring agent and antimicrobial material in the food industry. Additionally, it has medicinal uses in traditional medicine such as antiphlogistic, anti-vomiting, analgesic, anti-carcinogenic, antispasmodic, anti-carminative, renal support, antiseptic, diuretic, odontalgic, stomachic, tonicardic, and antispasmodic(17). Along with its carminative and simulative properties, it is renowned for its fragrant condiment value. Potential synergistic interactions between two or more AFOs and essential oils can reduce the occurrence of resistance mutants, increase their potency against pathogens, and operate as an efficient alternative to conventional medicine for the treatment of many fungal infections(5).

ABSTRACT

We study an X1.5 class solar flare observed from an active region NOAA 13006 on May 10, 2022. This flare was accompanied by other energetic activities such as the propagation of an Extreme Ultraviolet (EUV) wave, coronal loop oscillations, Coronal Mass Ejections (CMEs), etc. We analyze this event using high spatial and temporal resolution observations from the Atmospheric Imaging Assembly (AIA) on board the Solar Dynamics Observatory (SDO), Extreme-Ultraviolet Imager (EUVI) of the Solar Terrestrial Relations Observatory-Ahead (STEREO-A), and the Large Angle and Spectrometric Coronograph (LASCO) within the Solar and Heliospheric Observatory (SOHO) satellites. We found that the EUV waves are initiated at the start of the flare, i.e., they are driven by the solar flares. It consisted of both fast and slow wave components. These shock wave fronts create oscillations in the bundle of coronal loops. One of the loops studied further to estimate the oscillation parameters. This loop oscillated with a period of 5.3 minutes with a damping time of 14±1 minutes. After that, we evaluated the oscillated coronal loop length by combining observations from AIA/SDO and EUVI/STEREO-A. Then, we estimated the magnetic field strength as 68 G with the help of coronal seismology.

INTRODUCTION

Coronal loops are considered as closed magnetic flux tubes rooted in the photosphere. They can be an effective medium for waves and oscillatory activities [3]. These waves and oscillations can be triggered in various ways, such as by energetic events (e.g., solar flares, CMEs), the eruption of a flux tube, or the ejection of a plasmoid [39], flare-induced shocks [25,19], and reconnection due to nearby loop interactions [31]The EUV waves are referred to by

Safna Banu K and Ram Ajor Maurya

different names such as Extreme-ultraviolet Imaging Telescope (EIT) waves, since they are clearly observable in EUV wavelengths. They manifest as coronal propagating fronts, shock waves, or coronal waves [14]. The EUV waves are known as fast-mode magnetoacoustic waves [12,18], They are also treated as pseudo-waves [12]. These waves create successive bright and density enhancements while propagating through the solar disk at a typical speed of 100 km/s to thousands of km/s. They can generate Moreton waves and fast-mode MHD shocks. EUV waves are mainly associated with filament eruptions and CMEs rather than solar flares [37,32]. During the observation and analysis of EUV waves, one can observe propagating stationary wave fronts [14], non-wave components such as filament or coronal loop oscillations [10]. These waves reflect when reaching coronal holes or active regions [37,17] and are also refracted into varying density plasma [20]. The oscillatory patterns observed in the coronal loops, filaments, or prominences created by flare-driven shocks or EUV waves are studied by many researchers such as [25,4,33].

They confirmed that these waves and oscillations are either high amplitude rapidly decaying or low amplitude decayless oscillations [2,27]. Among these, Transverse Loop Oscillations (TLO) in the fundamental mode are mostly observed [4,26]. However, harmonics can also be seen [36,15]. The first analysis of TLOs with the observations from the Atmospheric Imaging Assembly (AIA)on board the Solar Dynamics Observatory (SDO) was performed by[7]. The oscillatory parameters (period, damping time, phase, etc.) and the theoretical model of the coronal loop oscillations help us to deduce the physical parameters such as magnetic field strength, density, etc., of the coronal plasma [30,24]. However, the density and the magnetic field value continuously vary along coronal loops. Thus, the parameters estimated with this tool might differ from the actual values [7]. [1] mentioned that the stratification of these parameters has to be included for reliable values. Still, it is difficult to evaluate the density contrast directly[5]. The density values can be measured using the Differential Emission Measure (DEM) method. The DEM is also used to evaluate the temperature of coronal plasma [38]. By applying this method to the AIA passband, [3] estimated the magnetic field seismologically. In this paper, we observe and analyze EUV wave properties, solar flares, associated CME, and coronal loop oscillation induced by the shocks from the flare site on May 10, 2022, seen in the active region NOAA 13006. The rest of the paper is arranged as follows. Section 2 discusses the observational data used. Section 3 deals with analysis and results. Finally, section 4 provides a summary and conclusions.

OBSERVATIONAL DATA
We use observations from AIA/SDO, EUVI/STEREO-A/B, and SOHO/LASCO for the analysis. The AIA has seven extreme ultraviolet (EUV) band passes. One of them is 304Å, whose emission is from He II at a temperature of T=0.05MK. The other six EUV wavelengths have iron emission bands: 171Å from Fe IX at T=0.63MK, 131Å from Fe VIII at T=0.37MK, Fe XX at T=9.1MK and Fe XXIII, 94Å from Fe XVIII at T=6 (6.3)MK, 193Å from Fe XII at T=1.4MK and Fe XXIV at T=19MK, 211Å from Fe XIV at T=2 (1.9)MK, 335Å from Fe XVI at T=2.5 (2.7) MK [28,22]. It provides continuous full-disk images of the Sun with a temporal cadence of 12 second, pixel resolution of $0''.6$, and a spatial resolution of $1''.5$. We used the Geosynchronous Operational Environmental Satellites (GOES) observations in the 0.5–4.0Å and 1.0–8.0Å wavelength bands to understand the energetics of flaring events in X-rays. One can check the association of CMEs with the selected flaring events by combining observations from the SOHO/LASCO [9] CME Catalog[16] and Computer-Aided CME Tracking (CACTus - a software package) CME list [29]

ANALYSIS AND RESULTS
EVENT DETAILS
The active region (AR) NOAA 13006 is observed at 31° south and 9°west of the solar disk on May 10, 2022, as shown in Figure 1(a). The GOES X-class flare flux profile in Figure 2 shows that the X1.5 flare started at 13:50UT, peaked at 13:55UT, and ended at 13:59UT. This flare was associated with a propagating EUV wave and a CME, as shown in Figure 3. The EUV wave started at 13:21UT and ended at 14:59UT. Similarly, from the SOHO/LASCO CME catalog, the flare and EUV wave-associated CME started at 14:36UT with a position angle of 124 °and a velocity of 414.7km/s, then accelerated to -3.98m/s². Therefore, the data duration is taken as May 10, 2022, 13:15 to May 10, 2022, 15:00 in the SDO/AIA 171Å intensity images.

Safna Banu K and Ram Ajor Maurya

PROPAGATION OF THE EUV WAVES

We observed a propagating shock wave in all directions across the solar disk from the flare site, as marked with red cross in Figure 1(a). Primarily, it propagated towards the south part of the solar disk. To study the kinematics and their role in the initiation of loop oscillations, we considered 20 slits starting from the flare site and extending towards the direction of propagation (Figure 1(a)). Subsequently, we created time-space intensity maps of the wave propagation along these 20 slits. The primary shock wave fronts are observed in slits 1-4, 9-10, 12, and 18-19. However, more wave fronts are clearly visible in slits 5-8, 11, and 13-17 (for an example, see Figure 1(b) and (c)). Thus, from the computed time-space map of the propagating shock wave front along slits 14 and 16, as shown in Figure 1(b) and (c), the white dotted lines numbered from 1 to 5 represent the positions of the fast and slow wave fronts, and the crossed oscillatory patterns depict the coronal loops further used for the oscillation studies. For the calculation of the wave front speed, we visually inspected the edges of the wave front and manually marked the wave front position, as seen by the white dotted lines. Subsequently, we performed a quadratic fit to the wave front positions, as shown in Figure 1(d). This allowed us to obtain the speed of both the fast and slow components of the shock wave (see Table 1). The velocity range for the fast wave component is 1000km/s, while the slow wave has a velocity range of 100 – 350km/s. Both the fast and slow components can be observed in Figure 1(b) and (c). Notably, the maximum velocity of the fast wave front is along the slit 14 direction. Thus, we confirmed, following [11], that the primary wave front is the fast component of the shock wave, observed in all 20 slit directions, while the remaining wave fronts are the slow components, only observed in slits 5-8, 11, and 13-17. From the time-space intensity map in Figure 1 along slits 14 and 16, and the bottom panel of Figure 2, we observe that this shock wave initiated simultaneously with the solar flare, reached the coronal loops, and triggered oscillations in the bundle of loops.

EUV WAVES AND CME RELATION

The SOHO/LASCO observations (see top panels of Figure 3) indicate that this event is associated with a partial halo CME which starts at 14:36UT in the C2 field-of-view (FOV) with a position angle of 124° and an angular width of 159°. In Figure 3, the top panel represents the SDO/AIA and SOHO/LASCO/C2 observations before the CME started, where we can observe the EUV wave front on the solar disk at 14:03UT (left-top panel) and the peak of the CME at 16:24UT (top right-bottom panel). The bottom panel shows the propagation of the CME along with the solar height, where crosses represent the height with time, and the solid curve gives the fitted values. Figure 2 provides a relation between the flare, shock wave, and CME initiation. This illustrates that shocks initiated along with the flare, and the CME started after the end phase of the flare. It is certain that the shocks are initiated along with the flare. However, we are not certain whether the solar flare or the coronal wave/shocks triggered the CME. Thus, it seems that the flare causes the initiation of the CME and its propagation.

SHOCK WAVE INDUCED CORONAL LOOP OSCILLATIONS

In order to analyze the shock wave (fast component)-induced coronal loop oscillations, distinct loops are identified from a bundle of oscillating coronal loops in the time-space map in the AIA 171Å intensity (see Figure 1(a) and (b)). We then select one oscillating loop L_2 with a sufficient number of oscillation cycles and distinguishable ability from nearby loops. To study the oscillation properties of L_2, we choose 10 slits perpendicular to the plane of oscillation, as shown in the top-left panel of Figure 4. Subsequently, time-space maps along these 10 slits are determined by joining intensity values along each slit as a function of time. The top-right panel of Figure 4 displays the time-space intensity maps along slits 4, 5, and 6, where crosses represent the mean position of the loop. The shock fronts propagating across the loop oscillation are clearly observed. Confirming that the wave amplitude decreases as it propagates, we identify a decaying oscillation along slits 4, 5, and 6, chosen for showing more than three clear cycles of oscillation patterns. Subsequently, we create the time series of loop oscillation along these slits by taking intensity as a function of time from the time-space map. To calculate the oscillated coronal loop length, we employ two methods. First, we manually inspect the loop location in the AIA 171Å intensity imagery and confirm these positions by tracking the loop's intensity in the time-space map. This process is repeated ten times to obtain more accurate loop positions. Mean and standard deviation values are taken as the loop position and error in the calculation, respectively (for

Safna Banu K and Ram Ajor Maurya

references, see papers [8,21]). The mean values, represented by crosses in the top-left panel of Figure 4, are used to determine the foot points of the loop, visible just before the oscillation starts. The loop length is then evaluated according to [6], considering the loop position and the location of its foot points. The projected coronal loop length is estimated as L_2 = 305 ±3 Mm. Secondly, we compare EUVI/STEREO and AIA/SDO observations, including both STEREO A and B [21],[36]. Using stereoscopy, we observe the oscillated coronal loop from two different viewpoints and construct a three-dimensional view of the loop. This method provides a more accurate loop length compared to a projected image value with errors. The stereoscopically deduced value of the coronal loop is L = 302.1Mm. Following this, the estimated mean positions of the coronal loops with time (see the top-right panel of Figure 4) are used to evaluate the oscillation parameters. In the bottom panel of Figure 4, a linear trend is subtracted from the time series of the loop, and the resulting time series is fitted with an exponential damping cosine function of the form as shown below(see solid curves in bottom (b) panel of Figure 4),

$$(t) = A_0 \cos\left(\frac{2\pi(t-t_0)}{P} + \phi\right) \exp\left(-\frac{t-t_0}{\tau}\right) + A_1 + A_2(t - t_0)\,(1)$$

where A_0, P, ϕ, τ, and t_0 represent the amplitude, period, phase, damping time, and reference time of oscillation, respectively. Additionally, A_1 and A_2 are linear constants related to the amplitude. The fitting was performed using MPFITFUN in the Interactive Data Language (IDL) with the Levenberg–Marquardt least-squares minimization method[23]. However, this method did not fit well with the mean position of the loops. Consequently, we determined the Fourier power spectra (FPS) of the time series (see panel (c) of the bottom of Figure 4) to obtain a more accurate period of the oscillation. We computed the FPS for the remaining slits. The oscillation parameters derived from the mentioned methods are tabulated in Table 2. From Table 2, the L_2 loop oscillates with an amplitude of ≈ 26±6 Mm, a period of 5.3 minutes, and a damping time of 14±1 minutes. The errors in the measurements may primarily be due to the error in the estimated loop position. The single peak in the FPS indicates that L_2 is in the fundamental mode of oscillation. To confirm this, we analyzed the cross spectra and the phase spectra with the time series along different slits, as mentioned in [8]. We concluded that L_2 oscillates in the fundamental mode, as there is no significant phase difference for the slit positions of the coronal loop. Furthermore, one can estimate the kink speed C_K, Alfven speed V_{A0}, and the magnetic field strength B by using the stereoscopically deduced loop length and the period of oscillation. For a fundamental mode, the loop length L and period P of oscillation can be related to the phase speed v_{ph} of the wave as [30,25]

$$v_{ph} = \frac{2L}{P}\,(2)$$

Then, the magnetic field strength inside of a coronal loop can be estimated (for more details refer the paper [8])[30,25],

$$B = V_{A0}\sqrt{\mu_0\mu_c m_p n_e}\,(3)$$

where V_{A0} is the Alfven speed, μ_C=1.27 is the mean molecular weight in the corona, and m_P is the proton mass. The electron density n_e in the coronal plasma can be taken as $(7-10)\times10^9 cm^{-3}$[34]. Thus, the estimated coronal parameters are listed in Table 3. However, the density and magnetic field values vary along a loop. Therefore, coronal seismology provides an average value of the magnetic field inside an oscillating coronal loop [7]. One can evaluate the temperature distribution of the loops and density contrast by using the differential emission measure (DEM) method and more accurate magnetic field values with nonlinear force-free field (NLFFF) extrapolation methods

SUMMARY AND CONCLUSIONS

The EUV wave nature and its induction of transverse coronal loop oscillation are analyzed using observations from SDO/AIA 171Å intensity images, SOHO/LASCO/C2 field of view, and STEREO-A/EUVI 195Å images on May 10, 2022, in the AR NOAA 13006. From the shock wave analysis, it is evident that there is a fast mode and a slow mode component for the shock wave front or EUV waves [13]. The speed of the fast component is in the range of 1000 km/s, while that of the slow mode ranges from 100 to 350 km/s. The speed of the slow component depends on the nearby magnetic field configuration. Typically, EUV waves originate from solar flares, filament eruptions, or CMEs.

Safna Banu K and Ram Ajor Maurya

In this case, the shocks emerge at the onset or the start of the flare, indicating a flare-driven shock wave propagation, with the CME starting after the end phase of the flare. As the fast component of the shock wave propagates in all directions, especially towards the south part of the solar disk, it can cause oscillations in the bundle of coronal loops. Therefore, we analyzed the oscillation properties and plasma parameters of the shock wave-induced coronal loops. We found that the loop oscillated with an average period of 5.3 minutes, an amplitude of $\approx 26\pm6$ Mm, and a damping time of 14 ± 1 minutes. Fourier power spectra and phase analysis confirmed that the loop is in the fundamental mode of oscillation, with different parts of the loop oscillating in phase. The projected coronal loop length was estimated as 305 ± 3 Mm using a method discussed by [6]. The stereoscopically measured loop length is $L=302.1\pm0.1$ Mm. The errors in the measurements may be due to the loop position and other factors. Subsequently, the magnetic field in the coronal loop is deduced from the values of the period of oscillation and the more accurate loop length, obtaining a field value of ≈ 68 G.

ABSTRACT

In this paper, the concept of difference arithmetic geometric mean index of a graph G denoted by DAGM (G) is introduced and the difference arithmetic geometric mean index DAGM(G) of few families of graphs is computed. Further, we establish correlation and regression of physico-chemical properties of isomers of octane using difference arithmetic geometric index are investigated.
Subject Calssification : 05C07, 05C09, 05C90

Keywords: Molecular graph, isomers of octane, correlation, Difference arithmetic geometric index of graphs

INTRODUCTION

Graph theory is one of the branches of Mathematics having most magnificent development in recent years. It is the study of relationship between vertices and edges. It provides a helpful tool for quantifying and simplifying the many moving parts of dynamic systems. Studying graphs through a framework provides answers to many arrangements, networking, optimization, matching and operational problems. Graphs can be used to model many types of relations and processes in physical, biological, social and information systems, and it has a wide range of useful applications.

Revathy

Preliminaries

Some known definitions and results related to difference arithmetic geometric mean index ofgraphs for ready reference to go through the work presented in this paper are discussed in this section.

Def 2.1 Let G = (V, E) be a graph with vertex sets V(G) and edge sets E(G). The geometric – arithmetic mean index is defined as $GA(G) = \sum_{uv \in E(G)} \frac{2\sqrt{d_u d_v}}{d_u + d_v}$ where d_u and d_v are the degrees of end-vertices of an edge uv

Def 2.2 Let G = (V,E) be a graph with vertex sets V(G) and edge sets E(G). The arithmetic geometric mean index is defined as $AG(G) = \sum_{uv \in E(G)} \frac{d_u + d_v}{2\sqrt{d_u d_v}}$ where d_u and d_v are the degrees of end-vertices of an edge uv

Def 2.3 Let G = (V,E) be a graph with vertex sets V(G) and edge sets E(G). The harmonic index of a graph is defined as $H(G) = \sum_{uv \in E(G)} \frac{2}{d_u + d_v}$ where d_u is the degree of vertices.

Def 2.4 The general Randic index of a graph was proposed by Bollobas and Erdos and is defined as
$$R_\propto (G) = \sum_{uv \in E(G)} (d_u d_v)^\propto$$

Def 2.5 Let G = (V,E) be a graph with vertex sets V(G) and edge sets E(G). The sum connectivity index of a graph is defined as $\chi(G) = \sum_{uv \in E(G)} \frac{1}{\sqrt{d_u + d_v}}$

Difference Arithmetic Geometric Mean Index

Motivated by the definition of arithmetic geometric index, **Difference arithmetic geometric mean index (DAGM(G))** of a simple graph G is defined. Also, Difference arithmetic geometric mean index of the standard graphs are found.

Definition3.1 Difference arithmetic geometric mean index of graph G, denoted by DAGM (G) is defined as
$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$ for all u, v belongs to V(G)

Remark

It is known that, for all the same data Arithmetic Mean = Geometric Mean.
For any k – regular graph G, $d_u = k$, for all u, v belongs to V(G). In this case,
clearly DAGM (G) = 0.
From this remark, it follows that the DAGM(K_n) = 0

Theorem 3.2: For the complete bipartite graph$K_{m,n}$, the DAGM index is
$DAGM (K_{m,n}) = \frac{mn(m+n)}{2} - (mn)^{\frac{3}{2}}$

Proof Let V $(K_{m,n}) = V_1 \cup V_2$ where V_1 and $V_2$are the partitions of V such that every vertex u belongs to $V_1$is adjacent to every vertex v belongs to V_2. Note that d(u) = n, d(v) = n. Also, $|E (K_{m,n})| = mn$
$$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$$
$DAGM (K_{m,n}) = \frac{mn(m+n)}{2} - (mn)^{\frac{3}{2}}$

Corollary For the star graph K $_{1, n-1}$,the DGAM index is $\frac{n(n+1)}{2} - (n-1)^{\frac{3}{2}}$

It follows from the above theorem by replacing m by 1, n by n-1

Theorem 3.3 For the cycle graph C_n, n ≥ 3, the DGAM index is zero.

Proof Since C_n is a regular graph of order2, For any k – regular graph G, $d_u = k$, for all u, v belongs to V(G). Obviously DAGM (G) = 0.
$$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$$
$DAGM(Cn) = 0$

Theorem 3.4 For the path graph P_n , n≥3, the DAGM index is $3 - 2\sqrt{2}$
Proof Let V(P_n) = {$v_1, v_2, \dots v_n$} , |E (P_n) | $= n - 1$
Note that d(u_1) = d(u_n) = 1 and d(u_i) = 2 for $2 \le i \le n - 1$

68569

$$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$$

DAGM (P_n) = $3 - 2\sqrt{2}$

Theorem 3.5 For the wheel graph, W_n, $(K_1 + C_n)$, $n \geq 4$, the DAGM index is equal to

$$\frac{(n-1)(n+2)}{2} - \sqrt{3}\,(n-1)^{\frac{3}{2}}$$

Proof Let $V(W_n) = \{v_1, v_2 \dots v_n\}$ and $E(P_n) = \{e_1, e_2 \dots e_{2n-2}\}$

By the edge partition of W_n on the basis of the degrees of the vertices of each edge, there are two types of edges and the number of edges is $n-1$ in each type.

$$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$$
$$= (n-1)\left(\frac{3+3}{2} - \sqrt{9}\right) + (n-1)\left(\frac{3+n-1}{2} - \sqrt{3(n-1)}\right)$$
$$= \frac{(n-1)(n+2)}{2} - \sqrt{3}\,(n-1)^{\frac{3}{2}}$$

Theorem 3.6 For the friendship graph F_n, for an integer $n \geq 2$, the DGAM index is

2n (n + 1) - $4n\sqrt{n}$

Proof Let $V(F_n) = \{v_1, v_2 \dots v_{2n+1}\}$ with v_1 as the centre vertex.

$E(F_n) = \{v_1 v_i / 2 \leq i \leq 2n+1\} \cup \{v_{2i} v_{2i+1} / 1 \leq i \leq n\}$

By using the edge partition of F_n, on the basis of the degrees of the vertices of each edge, there are two types of edges namely n and 2n

$$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$$

$DAGM(F_n) = $ 2n (n + 1) - $4n\sqrt{n}$

Theorem3.7 For the double star graph $S_{m,n}$ for an integer m, n ≥ 3, the DGAM index is DGAM

$$S_{m,n} = \frac{p^2 + q^2 + p + q - 2}{2} - \sqrt{p}(p-1) - \sqrt{q}(q-1) - \sqrt{pq}$$

Proof Let $V(K_{1,n,n}) = \{u\} \cup \{v_1, v_2, \dots, v_n\} \cup \{w_1, w_2, \dots, w_n\}$. By using the edge partition of $S_{m,n}$ on the basis of the degrees of the vertices of each edge, there are three types of edges,

$d(u_0) = p$, $d(u_1) = 1$, number of edges = $p - 1$, $d(v_0) = q$, $d(v_1) = 1$, number of edges = $q - 1$

$d(v_0) = P$, $d(v_0) = q$; number of edges = 1

$$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$$

$$DAGM(S_{m,n}) = (p-1)\left(\frac{p+1}{2} - \sqrt{p}\right) + (q-1)\left(\frac{q+1}{2} - \sqrt{q}\right) + \left(\frac{p+q}{2} - \sqrt{pq}\right)$$

Therefore, $DAGM(S_{m,n}) = \frac{p^2 + q^2 + p + q - 2}{2} - \sqrt{p}(p-1) - \sqrt{q}(q-1) - \sqrt{pq}$

Applications of the DGAM index of a graph in chemistry

Different organic molecules of organic compounds have different properties based upon their structure such as the Cycloalkanes. Cycloalkanes are the class of hydrocarbons having a ring-like structure. This ring is formed due to their saturated nature, and they have three compounds of alkane present in the structure which helps them in forming a ring. They have the general formula C_nH_{2n}, where n is said to be the number of carbon atoms present in the organic compound.

Revathy

DAGM index of Octane isomers

In this section, the DAGM index of various octane isomers are calculated. It is compared with the existing boiling point, entropy, density of various octane isomers. The topological indices for 3 – Methyl heptane and 4 – Methyl heptane are same.

DAGM index of cycloalkanes.

A cycloalkane has n carbon atoms and 2n-2 hydrogen atoms is denoted by C_n^{2n-2}. The molecular graphs of them are obtained by attaching 2n – 2 pendant vertices corresponding to hydrogen atoms to vertices of a cycle corresponding to carbon atoms

Theorem 5.1 For $n \geq 3$, the DAGM index is equal to DAGM $(C_n^{2n-2}) = n + 9 - 6\sqrt{3}$

Proof The cycloalkane molecular graph C_n^{2n-2} has $3n – 2$ vertices including two vertices (namely C_1 and C_2) of degree three, $n – 2$ vertices C_3, C_4,……….C_n of degree 4 and correspond to the carbon atoms of cycloalkenes and the remaining $2n – 2$ vertices (namely H's) are end vertices and they correspond to hydrogen atoms of cycloalkenes. Thus, on the basis of degrees of the vertices, we divide the edge set into partitions.

$E_1 = \{uv \in E(C_n^{2n-2}) / d(u) = d(v) = 4\}$, $E_2 = \{uv \in E(C_n^{2n-2}) / d(u) = d(v) = 3\}$

$E_3 = \{uv \in E(C_n^{2n-2}) / d(u) = 3; d(v) = 4\}$, $E_4 = \{uv \in E(C_n^{2n-2}) / d(u)=1;\ d(v) = 3\}$

$E_5 = \{uv \in E(C_n^{2n-2}) / d(u) = 1; d(v) = 4\}$

There are 5 types of edges where $|E_1| = n – 3$, $|E_2| = 1$, $|E_3| = 2$, $|E_4| = 2$, $|E_5| = 2n – 4$

$$DAGM(G) = \frac{d_u + d_v}{2} - \sqrt{d_u d_v}$$

$$DAGM(C_n^{2n-2}) = n + 9 - 6\sqrt{3}$$

CONCLUSION

In this paper, the concepts of difference arithmetic geometric means index of some standard graphs are computed. Also, difference arithmetic geometric means index of a graph in chemistry is discussed.

ABSTRACT

Urban development and smart urban communities embody two ideal models of development that emerged in the previous century in response to cities' aspirations to be more responsive to the needs of their inhabitants, create conditions that promote a high quality of life, and foster sustainability in an increasingly globalized world. The recognition that excessive resource consumption brings humanity closer to a future where essential goods may become scarce for large segments of the population, coupled with significant technological advancements in resource conservation, urban monitoring, and informed decision-making, has brought these two disciplines closer than ever before, despite their distinct developmental paths thus far. Numerous initiatives aimed at building smart cities seek to harness information and communication technologies (ICTs) to enhance the effectiveness, efficiency, transparency, and accountability of communications and transactions between the government and citizens. Given the pivotal role of ICTs in the planning of smart cities, a considerable amount of city investment is dedicated to the development of new technologies. Consequently, smart cities create and

68573

manage various innovative services that facilitate the dissemination of information pertaining to all aspects of citizens' lives through web-based and interactive applications. Smart cities possess several essential attributes: a smart economy, smart people, smart governance, smart mobility, smart environment, and smart living.

Keywords: Sustainable Smart Cities, Urban Development, Internet of Things (IoT), Big Data.

INTRODUCTION

Today, a wide array of sensors is being implemented worldwide to measure various variables both inside and outside of human-built homes. These sensors, coupled with actuators, are capable of performing complex tasks and are compatible with different platforms and contexts. The concept of smart cities has evolved to prioritize sustainability, citizen well-being, and economic development. The rapid urbanization and unplanned expansion of cities bring significant changes to economies at different levels—city, country, or region. Consider the consumption of water, fuel, and electricity, which leads to high levels of pollution, negatively impacting the lives of citizens, climate, and the environment. Cities have transformed into smart entities with the integration of various sensors, intelligent devices, energy meters, outlets, and appliances. This integration allows for unique and intelligent control over devices within homes. This paradigm shift brings sustainability and substantial savings, whether in terms of money or resources. While the ideal scenario envisions a web-based platform for processing information related to a single house in a fully-fledged smart city, achieving this nationwide is still a distant reality. To facilitate seamless operation, there is a need for standardized protocols across devices from different manufacturers. Such protocols would simplify device operation and reduce the need for advanced coding and time management skills.

Innovative concepts aid in identifying domain-specific technologies, protocols, and privacy data for IoT environments with specific purposes. Our research model addresses various issues related to smart home devices, including location determination and the provision of services. This ensures satisfactory performance in terms of time duration and power usage. Methods like buffering, caching, and event-triggered messaging facilitate the smooth operation of smart homes. The idea of connecting smart homes to the internet presents flexible solutions for managing power and converting energy forms. Our application can be extended to perform tasks such as energy management, exploring power-efficient rules for smart cities by connecting physical devices. In recent years, the Indian government has pledged to develop smart cities, and our goal is to provide a smart framework that enables not only the development but also the thriving of these smart cities. Information, derived from various sensors and analyzed by sophisticated analytical engines like PIG-based Bigdata applications, is the power that drives these cities. The upcoming era of smart cities relies on intelligent sensing power achieved through IoT frameworks, allowing communication not just between people but also with their homes and devices.

Different institutions are joining the discussion, educating state management and learning centers about the impact on the future economy, people's welfare, and service quality. State officials are exploring effective information and communication technology resources, uncovering opportunities for citizens to follow a progressive path. Transforming cities with sophisticated technology integrated into smart cities requires documenting policies, actions, projects, and programs into various modules. However, implementing this idea is challenging due to a lack of mature provisions and a focus on methods rather than groundwork and deployment. Smart cities, coined as such, should be transparent, easy to understand, responsive, and capable of coping with current and future technologies. Stakeholders in these cities must understand the environment, its manageability, adaptability, and flexibility to handle complex tasks. Effective management of such complex cities requires leadership and the ability to perform when necessary. Our research aims to test the practical implementation of a smart district and demonstrate how complementary elements can work together to create a simulation model for actual city development. We also aim to shed light on uncharacterized modules of smart cities, stakeholders' roles and responsibilities, unknown features,

and the deployment process. The idea of smart cities has captivated the Indian public and stakeholders in recent years. It represents a city that utilizes the latest information and communication technology for its development. Stakeholders' investments in smart cities often involve deploying networks within the city, allowing for more efficient management and comprehensive reporting of control systems through Big data analysis. Real-time and accurate reports generated from this Big data framework enhance the decision-making process. However, it is essential for the public to understand that participation in smart cities is not mandatory and there is more to it than meets the eye.

LITERATURE REVIEW

Imagine returning home in the evening and your house springs to life, all thanks to the advancements in sensor technology. Smart homes, also known as automated homes, intelligent buildings, integrated home systems, or domestics, are the result of recent design developments. In cryptography, both symmetric and asymmetric key encoding are used. Symmetric key encoding requires the same key for encryption and decryption, while asymmetric key encoding uses a pair of keys, a public key, and a private key, for encryption and decryption. The objective of cryptography is to ensure secure transmission of messages from the source to the destination without interception. By networking individual system modules, preset scenes can be executed to make your everyday life safe and comfortable. Imagine arriving at your house, and the garage door opens, the driveway is well lit, blinds are raised, and the alarm system is deactivated. When you leave your house, this technology ensures that your lights are switched off, blinds are lowered, lobbies are at rest, heating is turned down, and the alarm system is activated with a simple touch of a button. The door communication station at the entrance is robust, weather-resistant, and features solid metal buttons and illuminated glass nameplates. It is highly secure against tampering and can only be dismantled using a special tool. Depending on the system configuration, when the bell button is pressed in the dark, exterior lighting is automatically switched on to welcome visitors.

Optimum communication and safety are always guaranteed. The hidden camera captures sharp images, and the digital signal processor ensures excellent speech quality. The high-quality TFT color monitor inside the house displays the transmitted image, which can be shifted or zoomed in on via the onscreen display with touch functionality. The proposed system does not require a dedicated server PC and offers a novel communication protocol to monitor and control the home environment beyond basic switching functionality. With integrated full duplex operation and a digital signal processor, the system enables error-free and synchronous speech, telephone calls, and automatic calibration to ambient conditions. Active suppression of street noise optimizes comprehensibility. The indoor station has audio and video functions, and its touch screen and large push button guarantee simple and convenient adjustment and operation. Individual messages can be recorded and saved with the voice memo function, and when a message is left, an LED on the keypad flashes to indicate its presence.

When the doorbell is pressed, the camera image is automatically stored with the date and time, allowing you to determine who was at the door while you were away. The menu can be accessed by touching the info button, and stored messages are displayed chronologically. You can select or retrieve picture messages using the arrow keys. IoT technology welcomes you into the house by raising the internal blinds and switching on ceiling lights. Various scenes can be programmed using a central controller. With a presence detector, you can control room lighting, saving energy by only switching on lights when someone is present. LED pilot lights illuminate the stairs, ensuring safety even when the ceiling lights are off. The room controller sets the right mood, whether for a game of chess or a cozy evening by the fire, with just a click of a button. LED outlets help navigate through dark rooms without the need to switch on the lights. The kitchen diner, as the focal point of the house, is ideally suited for the IoT home controller. Its user-friendly touch screen allows for management of functions throughout the house.

Enabling IoT and Big data

Controlling and visualizing the central functions of your house is effortless with individually installed control panels in each room. Additionally, the intelligent facility pilot software allows control via any PC, thanks to its bundle of Windows application standard interfaces. This multi-room control enables you to listen to news in the kitchen, rock music in the bathroom, and a radio play in the children's bedroom. Smart metering is a crucial aspect of intelligent and efficient energy management. With the facility pilot, it is logical to continuously record, display, and evaluate consumption values for electricity, water, and thermal energy. This feature provides an overview of your house's security status, indicating whether any doors or windows have been opened. Network cameras are visualized, allowing you to monitor activities inside and around your house.As primary energy costs rise, sophisticated heating control systems become more important. The facility pilot simplifies this task by allowing you to adjust the thermal settings in each room based on demand and occupancy. The visualization screen displays set points and actual temperatures in all rooms, providing easy control and influence. Blinds, shutters, and curtains also contribute to heat protection by shielding against solar radiation in summer and reducing heat transmission in winter. Automatic time and weather-dependent control are highly recommended.

Lighting control through the facility pilot offers increased convenience and energy savings. In addition to switching and dimming lights from one location, the software enables the creation of individual scenarios by combining multiple light fittings and blinds in a specific area. A roof-mounted combo sensor provides weather data, which is connected to the weather statin through the facility pilot. The facility pilot can even display internet content using its browser function when connected to a network with internet access via its LAN interface. Whether simple browsing or complete remote interrogation of your building functions, the facility pilot offers a wide range of capabilities. An energy-saving automatic switch ensures that lights are turned on when someone is present. To enhance the landscape, treated water will be filtered by grass, allowing its reuse throughout the city. Nutrient uptake from the grass will contribute to the beauty of the landscape. Special trees, such as date palms, will be planted in the smart city, serving both aesthetic and functional purposes. For example, date palms need to be pollinated in the spring, and the dates can be harvested in August. Other trees like avocado, papaya, pomegranates, mulberry, and fig trees will benefit from the shade provided by the palm trees. Irrigation and treatment systems will be installed using pipes across the city, utilizing treated sewage for watering these plants.

Smart City Energy Management

The smart grid revolutionizes the way electricity and information are exchanged between utilities and customers. It is an evolving network of communications, controls, computers, automation, and innovative technologies working together to enhance the efficiency, reliability, security, and sustainability of the grid. With the integration of newer technologies like wind and solar energy production and plug-in electric vehicle charging, this smart grid replaces aging infrastructure and enables utilities to effectively communicate with consumers to manage their electricity needs.The smart home plays a crucial role in this system, allowing consumers to actively manage their electricity usage. Through smart meters, which measure a home's electricity consumption more frequently, utilities can provide customers with accurate information to effectively manage their electricity bills. Inside the smart home, a home area network (HAN) connects smart appliances, thermostats, and other electric devices to an energy management system. Smart appliances and devices can adjust their operation schedule to reduce electricity demand on the grid during critical times, leading to lower energy bills for consumers. These devices can be controlled and scheduled remotely over the web or through other interfaces like a TV.

Analyzing different scenarios helps evaluate the impact of uncertainties related to renewable energy sources on the optimal planning solution. While renewable resources like wind and solar power are sustainable and growing sources of electricity, their variable nature adds complexity to grid operations. The smart grid provides the necessary data and automation to efficiently integrate solar panels and wind farms into the grid, optimizing their energy production and utilization. To meet the constantly changing energy demands, utilities must manage power plant operations based on the required power at different times of the day. The cost of delivering power varies depending on the time of day it is consumed. Peak demand times, when electricity usage is high, require additional and often

Lakshmi Devi *et al.,*

less efficient power plants to be activated, resulting in higher delivery costs. By actively moderating electricity usage, especially during peak demand times, utilities can reduce operating costs. Through the smart grid, utilities can incentivize consumers to shift their electricity usage away from peak hours, leading to a more evenly distributed electricity production throughout the day.

Deployment of grids in smart cities

India is poised to enter a new era of growth and technological advancement, but the increasing energy demand poses a significant challenge. It is projected that India's energy demand will triple in the next decade, requiring efficient and sustainable solutions. Smart grids offer a way to meet this growing demand for electricity while enhancing the efficiency of power transmission and distribution networks. The Ministry of Power, Government of India, has assigned smart grid pilot projects to state-owned distribution utilities. The New Energy Technology Development Organization (NEDO), an agency of the Government of Japan, has offered to fund the Smart Grid project in India through a Japanese government grant. NEDO has partnered with a consortium led by Fuji Electric Japan to implement this project, leveraging the strong cross-cultural and business relationship between India and Japan. Fuji Electric is at the forefront of developing new energy technologies in India. Smart grids leverage digital technology to create greener and more efficient energy transmission and distribution systems. Fuji Electric Japan and Fuji Electric India are working together to implement the smart grid project in an Indian state.

 Consistent and reliable power quality is crucial for business success. India faces frequent power fluctuations and inconsistent supply, hindering the productivity of businesses. Machines equipped with sensitive electronic components suffer damage and malfunctions due to voltage fluctuations. Stable power supply would extend the lifespan of machines, eliminating the need for large servos and constant voltage transformers. Furthermore, a continuous and reliable electricity supply would reduce transmission and distribution losses, which currently stand at a high 30% in the country. Strengthening the electrical network and improving resource management are essential to address these issues. Smart grid technology can seamlessly integrate into the existing electrical grid infrastructure. Any faults or issues along the power transmission line would be instantly reported to the grid, allowing for prompt repairs. With a smart grid, the power supplied to consumers would have uniform quality, without voltage fluctuations. Additionally, as energy consumption predominantly occurs in cities, which are hubs of economic activity, implementing smart grid solutions in urban areas would be particularly impactful.

Transcending the Era of Smart Homes

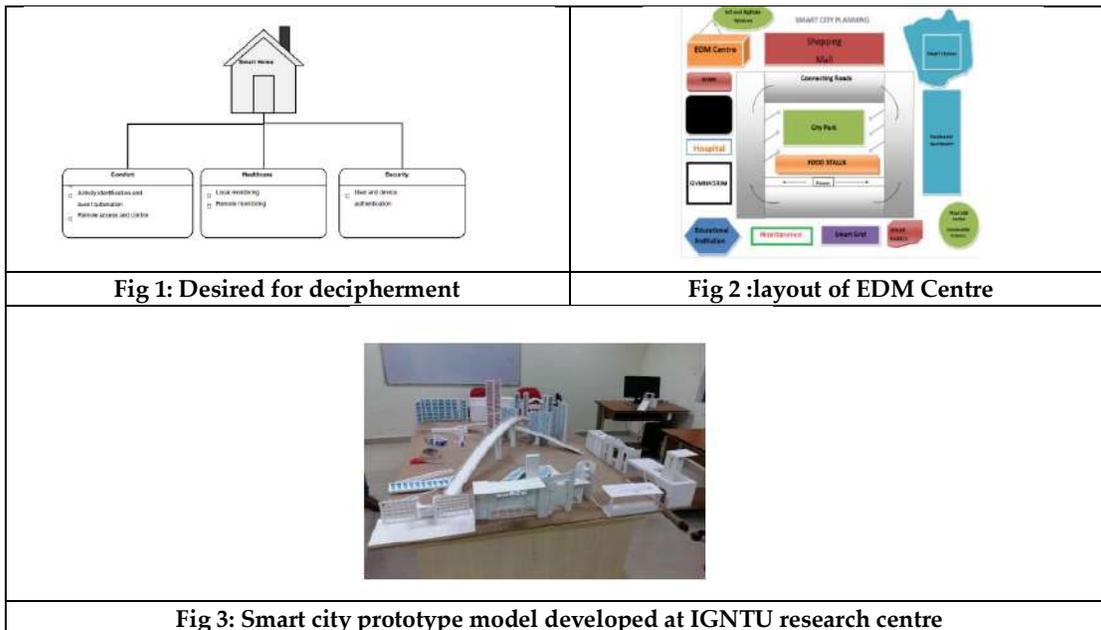
The future of urban transportation is being reshaped by advancements in technology, including autonomous cars, buses, and on-demand shuttles. These connected vehicles hold the potential to solve major transportation challenges in urban areas. The Smart City challenge in India encourages midsized cities to apply for resources and leverage technology to address transportation issues. The winning city will have the opportunity to implement bold, data-driven ideas that make transportation safer, easier, and more reliable.The convergence of technology and transportation offers tremendous opportunities for communities, but local decision-makers need to envision how these tools can enhance mobility, reduce climate change impacts, improve livability, and enhance safety. The Smart City challenge aims to stimulate conversations and encourage innovative solutions across India. Technologies that help prevent collisions are being developed and can be applied to urban environments where pedestrians, cyclists, and vulnerable road users coexist. By collecting data on near-collisions and analyzing patterns, infrastructure planners can make informed decisions to reduce future accidents.

Cities serve as living laboratories for testing new capabilities to solve problems. However, cities often lack sufficient resources to implement large-scale initiatives. International companies work with cities on pilot projects, including in Indian states. While there is global interest in future smart city solutions, implementation depends on funding and finding the right business models. For instance, upgrading street lamps to energy-efficient LEDs presents an opportunity to add additional sensors that can detect human presence or monitor traffic flow. However, determining who pays for these upgrades and defining sustainable business models remain challenges. The connectivity of everything is a fundamental aspect of smart cities. However, network infrastructure ownership and provision

68577

become public policy issues. Cities need to establish decision-making offices and address spectrum challenges. Municipalities that lead in these areas can become exporters of solutions. Connectivity is crucial for running a city efficiently, and when everything is connected, bandwidth demand increases significantly. Ensuring open and accessible urban data for all stakeholders is a complex problem that requires coordination. As cities undergo modernization, it is essential to prioritize connectivity in infrastructure, such as lamp-posts and streetlights. Access to data and connectivity should be universal, enabling effective use of urban data to drive informed decision-making.

RESULTS AND DISCUSSION

The aim is to establish a theory that latest advancements like IoT, Cloud and Big data can be used as a bedrock for sustainable smart cities in India. In this chapter we would like to demonstrate the use of IoT, Cloud and Bigdata using a prototype model for future smart cities in India. For the said purpose we have divided our research work into three phases among which we will discuss Phase-I and Phase-II in this chapter and Phase-III in the Results chapter . Figure 1 above illustrates several crucial aspects of the infrastructure that will be incorporated into future smart cities in India, as envisioned through our research. The following are explanations for the buildings included in the layout: EDM Centre: EDM, or Electronic Data Management Centre, serves as a centralized hub for data acquisition from various sources across the city. This facility plays a vital role in a smart city scenario. With the presence of IoT-based sensors throughout the city, there is a significant influx of sensory data related to monitoring, retail market transactions, banking, and network transactions, among others. The primary purpose of the EDM Centre is to properly store, filter, and analyze this vast amount of data. Staff members at this centre are responsible for maintaining city records, issuing certificates, and providing services to stakeholders. Essentially, the EDM Centre functions not only as a municipal corporation hub but also as a mega data centre equipped with advanced equipment and sophisticated software for analysis and reporting. The idea is to utilize Big Data technology in this centre, ensuring its integration with the IoT network spread across the city. Establishing an EDM Centre is essential in a smart city to ensure efficient data management, as a lack of streamlined data management systems could lead to chaos in such an advanced urban environment. Connecting the EDM Centre with the city's infrastructure enables continuous monitoring and contributes to the overall sustainability of the smart city vision.


CONCLUSION

Our goal is to establish sustainable smart cities in India by leveraging technologies like IoT, Big Data, and Cloud computing. We recognize that data is a crucial resource for achieving sustainability and propelling us into the future. Cities worldwide are progressively integrating technology into every aspect of their operations, including public transportation, IT connectivity, water and power supply, sanitation, solid waste management, urban mobility, governance, and citizen participation. This integration utilizes various cutting-edge technologies, from Big Data to the Internet of Things. By the year 2050, it is estimated that 70% of the global population will be residing in cities, occupying less than 2% of the Earth's surface. This rapid urbanization presents numerous challenges, including pollution, infrastructure, accessibility, traffic congestion, mobility, safety, and public health, to name a few. The development and integration of innovative technologies such as the Internet of Things and Artificial Intelligence offer multifaceted solutions, which are known as smart cities today. Smart cities are highly interconnected urban areas equipped with advanced technologies to enhance the lives of their residents. In India, there are still neighbourhoods struggling with limited access to electricity. In a smart city, sensors would be deployed to analyze electricity usage across various sectors, allowing for optimized energy distribution throughout the power grid. This would result in fewer power outages and a more balanced energy distribution system.

ABSTRACT

The development of a series of new Schiff base metal complexes of Cobalt(II), Manganese(II), Nickel(II), Copper(II), and Zinc(II) with a tridentate (three donor atoms) Schiff base was the outcome of the interaction between propionic acid hydrazide and Dehydroacetic acid analogue. The synthesized ligand and metal complexes were characterized by mass spectrometry, ^{1}H and ^{13}C NMR, IR (infrared) spectroscopy and elemental analysis. According to the IR spectrum data, during formation of complex coordinate bond between enolic O and azomethine N atoms with metal ions and the ligand behaves as a tridentate ligand with ONO donor atoms. The evolution of metal ligand bonding in a 1:1 stoichiometric ratio is shown by the complexes' mass spectra (M:L). All synthesized complexes were examined for their ability to combat with both gram-positive and gram-negative bacteria using *Gentamycin* as a reference drug. The ligand and metal complexes also screened for their DNA-Photocleavage activity using gel electrophoresis method. In contrast to ligands, metal complexes have been found to reflect higher activity and future improvements to ligand structure may result in more potent antibacterial and anti cancer medications.

Keywords: DHA (Dehydro acetic acid analogue), Tridentate Schiff base, Antibacterial properties, Spectroscopy.

INTRODUCTION

A significant function in medicinal chemistry is played by Schiff's base and their metal complexes. The Schiff's bases are a new family of crucial chemicals for medicine and pharmacology [1-6] that include double bonds between carbon and nitrogen. Schiff's bases are well known for being that are anti-fungal[7], anti-bacterial[8-11], anti-tuberculosis[12], anti-anthelmintic[13], andanti-tumor[14-15] DNA binding[16] and cleaving agents[17-19] due to the chelating activity of the azomethine nitrogen atom. Schiff's bases were widely used in analytical chemistry for the catalyst in various organic reactions like polymerization and hydrogenation as well as the identification of harmful metals in low concentrations [20] in the purification of the untreated wastewater from industries [21]. Many heterocyclic derivatives with powerful anti-fungal and anti-microbial [22-23] capabilities have been created using dehydroacetic acid, a flexible starting material. Numerous DHA-based Schiff bases and their metal complexes with various metal ions have already been created and tested for anti-fungal, in vitro antibacterial and DNA photo cleavage activities [24-25] because of the promising anti-microbial and chelating capabilities of DHA.

In addition to this, DNA is the principal site of action for the majority of anticancer medicines, according to cell biology studies. The DNA of cancer cells can interact with tiny molecules to stop cell division, which may result in cancer cells dying [26]. In recent years, the relationship between metal ions and DNA has become more significant in a desire to look for new and potentially effective non-radioactive chemotherapeutic treatments [27] Numerous Schiff's bases were discovered to have anticancer qualities. Design and manufacture of such metal complexes that can precisely bond with tumor cell DNA molecules are essential because they can reflect important host structure information and potentially function as anti-tumor drugs in the future. For these goals, the field of transition-metal complexes has been thoroughly investigated. The way and molecule-DNA binding affinity of such complexes determines how effective they are, though, in the host cell. . In the current study, we report the synthesis of a novel hydrazone Schiff base via a condensation reaction of propanoic acid hydrazide with dehydroacetic acid analouge and further report the preparation of its complexes with first transition metal ions. The ligand and all of the metal complexes were studied using a variety of analytical methods, including ^{1}H, ^{13}C NMR, IR, mass spectrometry, and elemental analysis conductance. For DNA photo cleavage study, Schiff's and its metal complexes were finally screened.

MATERIALS AND METHODS

Merck's DHA was acquired and used without additional purification. All additional chemicals including solvents was of LR grade and were used exactly as they were provided. In this study, double distilled water was used. Using a Bruker 500 MHz instrument, the ^{1}H and ^{13}C NMR of the ligand and complexes were recorded, respectively. IR spectra were obtained using the KBr pellet method on a Simadzu IR Affinity in the 4,000–400cm-1 range. The Agilent (ALR-QC-LCMS) Mass Spectrometer was used to collect mass spectra.

EXPERIMENTAL SECTION
Synthesis of Dehydroacetic acid analogue
1. Add4-hydroxy-6-methyl-2-pyrone(1.26g,.99mmol),propionyl chloride(.960ml,11.0mmol),NEt$_3$(1.68ml,11.9mmol),DMAP(13mg,.10mmol)and toluene(50ml)to a100ml round bottom flask equipped with a reflux condenser.
2. Stir the mixture under Argon.
3. Heat the mixture to reflux for 72 hrs.
4. Concentrate the mixture by flash chromatography (4:1 hexanes/EtOAcOH with 1% AcOH) to obtain the product.

Characterization of analouge

^{1}HNMR (DMSO-d_6, 500 MHz) (ppm): 2.38(S,3H,CH3) ;4.66(S,1H,Ring proton);2.75(m,2H,CH2);1.31(t,3H,CH3); 6.13(S,1H,OH) The appearance of extra CH_2 at 2.75 (m,2H,CH2) confirms formation of analogue.

Synthesis of Ligand

In accordance with the steps outlined below, the ligand was created by reacting Acetic hydrazide (0.01 mol) with DHA analogue (0.01 mol). propionic hydrazide (0.01 mol) was dissolved in 25 ml of aqueous ethanolic solution while being constantly stirred, and 25 ml of a warm ethanolic mixture containing (0.01 mol) DHA was then added After being refluxed for an hour in the water bath, the reaction mixture was then allowed to cool at room temperature. The end result underwent filtering, two washes with 70% aqueous ethanolic solution, and four hours of drying in a hot air oven at 65 °C. The resulting solid has no colour.

SYNTHESIS OF METAL COMPLEXES
GENERAL PROCEDURE

By combining a 25 ml methanolic solution of the ligand (PL^1) with a 10 mL methanolic solution of the corresponding metal salt, several metal compounds were created. The pH of the resulting reaction mixture was adjusted to eight with the addition of a 10% methanolic KOH solution. The solution was then allowed to cool at Room Temperature after four hours of refluxing. The complexes were filtered, washed with excess ethanol to remove unneeded metal salts, then dried for six hours at 70°C in a hot air oven, and the compounds were found to be non-hygroscopic at room temperature.

RESULT AND DISCUSSION

Chemistry

DHA and its derivatives have a significant amount of chemical and physical relevance, according to the conducted research in literature. The chemistry and biology of DHA and its derivatives were thoroughly investigated by R.P. Saini and Sushil Kumar from our research lab. As a result of their groundbreaking research, it is anticipated that metal complexes of the Dehydroacetic Acid Analogue may have increased biological activity. We started our research from the synthesis of a chemical analogue of DHA namely (4-hydroxy-6-methyl-2-pyrone) reported in literature. It involves treatment of DHA with propionyl chloride in presence of Triethyl amine and toluene as solvent along with DMAP as catalyst. Mixture was stirred under Argon atmosphere for an hour than resultant was

Vivek Sharma *et al.,*

transferred to round bottom flask and refluxed for 72 hrs. The product obtained was concentrated by using flash chromatography and desired compound was obtained. The spectroscopic techniques like mass, ^{1}H NMR and ^{13}C NMR were used to identify the structure of synthesized analogue. The strong peak at 4.66 ppm is caused by the ring proton; the multiplet at 2.75 ppm is caused by 2H of CH_2 . The appearance of extra CH_2 at 2.75 ppm CH_2 confirms formation of analogue. The singlet at 2.38 ppm is caused by CH3 attached to the ring and the triplet at 1.31 ppm is caused by CH_3 next to CH_2 and the singlet at 6.13 ppm in enolic OH. The method used to produce the ligand from the analogue of DHA involved dissolving propionic hydrazide (0.01 mol) in an aqueous ethanolic solution while stirring continuously, then adding heated ethanolic mixture containing the analogue of DHA (0.01 mol). The reaction mixture was allowed to cool at room temperature and cleaned with ethanolic solution after being refluxed for an hour in the water bath., The resulting solid has no colour and was characterized by its ^{1}H NMR,^{13}C NMR and Mass spectroscopy. The ^{1}H NMR spectrum of the ligand showed a intense peak of 3 methyl protons of DHA molecule as a singlet at delta value 1.807. The 3 methyl protons of (CH_2-CH_3) observed as an adjacent multiplet at 0.772 delta value. The singlet at 8.20 ppm is due to 1 H of -CHO while the singlet at 6.141ppm due to ring proton. The CONH proton resonated at 7.241 and the enolic proton of the DHA ring observed as a singlet at 10.67ppm.

Appearance of peak at 7.241ppm confirms formation of ligand. Similarly, **^{13}C NMR** (DMSO-d$_6$, 500 MHz) showed that the disappearance of carbonyl carbon of DHA analogue from 220 and appearance of an additional peak due to carbon of (-C=N) at 155.11 further confirms the synthesis of ligand. The 23.33 ppm due to CH_3 of DHA .The mass spectral analysis of the above compound showed M+1 peak at mass spectra peak at 252.12. The Ligand was dissolved in methanol and then a methanolic solution of metal acetate was added to this methanolic solution. The resultant reaction mixture was refluxed at 70 degrees Celsius for 3 to 4 hours. The resulting reaction mixture's pH was brought down to eight. The solid separated during the refluxing time, and the bulk was then allowed to cool at room temperature. Filtering and refrigerated methanol were used to wash the solid. The resulting solid underwent further recrystallization in ethanol before being baked at 70°C. The complete physical and chemical analysis of the above synthesized compounds was performed and was characterized by ^{1}H NMR, ^{13}C NMR, Mass and IR spectroscopy. In all complexes, values of NMR come approximately same and were in accordance with expected values. A triplet due to 3H of methyl proton of N=C-CH2-***CH3*** observed at delta 0.77 , multiplet due to 2 protons of -*N=C*-CH_2Observed at delta 1.52,singlet of methyl 3H attached with aromatic ring C6H5-CH3 observed at delta 1.86, singlet due to 3 protons attached with carbonyl group COCH3 observed at delta1.89,sharp singlet due to ring proton observed at delta 6.16,singelet due to one proton of CONH observed at delta 8.14,and triplet due to 3H of O=C-CH2-***CH3*** observed at 1.35 and multiplet due to -*N=C*-CH_2 observed at 1.53ppm.

Similarly, mass spectra of complex [($C_{10}H_{12}N_2O_6$)Mn] FL^1(Mn) gives peak at *337.02,*[($C_{10}H_{12}N_2O_6$)Zn] FL^1(Zn) give peak at *346,*[($C_{10}H_{12}N_2O_6$)Ni] FL^1(Ni) give peak at *340.02,*[($C_{10}H_{12}N_2O_6$)Cu] FL^1(Cu)give peak at 345.01,[($C_{10}H_{12}N_2O_6$)Co] FL^1(Co)give peak at 342.0 all values were found to be in accordance with expected values. In addition to this, the IR spectrum of the ligand illustrates the following characteristic bands at 3000–3500, 1653, 1683 and 1151cm^{-1}. These Bands may be assigned to t$_{OH}$ (intra-molecular hydrogen bonding), t$_{C=O}$(carbonyl group), t$_{C=N}$(azomethine) and t$_{C-O}$(enolic) stretching modes, respectively. In the spectra of metal complexes the absence of a weak broad band in the range 3,300–3,500cm^{-1}suggests the deprotonation of enolic –OH and subsequent coordination with the metal ion through the oxygen atom of the enolic group. It can further be supported by increase in frequency of enolic C–O stretch by some extent which is different in different complexes. In the IR spectra of metal complexes, the t$_{C=N}$ shifted to lower frequency as compared to free ligand which indicates the involvement of nitrogen atom of azomethine group in coordination with the metal ion. It may be due to the donation of lone pair of electrons of nitrogen atom of azomethine to the empty *d* orbitals, of metal ions. Furthermore, IR spectra of metal complexes show characteristic non-ligand bands in 570–650and440–501cm^{-1}regionwhich can be assigned to t$_{M-O}$ and t$_{M-N}$ vibrations, respectively.

Vivek Sharma *et al.,*

BIOLOGICAL ACTIVITY
Antibacterial activity

All synthesized complexes were examined for their ability to combat with both gram-positive and gram-negative bacteria using agar well diffusion method and findings thus obtained were compared with ***Gentamycin*** as a reference drug. The results were reported in the form of diameter of zone of inhibition at minimum inhibitory concentrations of 5mg/ml. As per the results obtained, it is clearly observed that all the metal complexes especially nicle complex showed good antibacterial activity against all the bacterial stains employed.

DNA Photo cleavage Activity

The gel electrophoresis method used to check the DNA photo cleavage activity of the synthesized ligand and metal complexes. Super coiled plasmid DNA used to complete the study. At the end of the study, it was observed that upon UV irradiation, ligand showed much less impact on the conversion of open circular DNA to the relaxed DNA when compared to its metal complexes. All the metal complexes showed excellent DNA photo cleavage activity than ligand itself. The results of study showed in Figure 2.

CONCLUSION

The synthesized ligand and its metal complexes showed good antibacterial as well as DNA photo cleavage activity. Some modifications in the structure of ligand may possess enhanced biological activity as conducted in this study. Even after the use of a huge amount of antibiotic drugs, Bacteria are becoming mutant day by day, so, there is a need of developing more potent antibacterial drugs in future to overcome this problem.

ABSTRACT

Mono Ammonium Glycyrrhizinate was used in the treatment of Rheumatoid Arthritis. The goal of the current investigation was to determine whether liquor rice root extract of Mono Ammonium Glycyrrhizinate has any potential to treat rheumatoid arthritis and to investigate its likely mode of action. Complete In order to evaluate the Rheumatoid Arthritis activity of liquor rice root extract fractions at 50 mg/kg and 100 mg/kg oral doses for 28 days, female *Albino wistar* rats were administered Freund's adjuvant, which induces arthritis. The analysis included measurements of the ankle joints' radiographic and histological composition, paw volume, body weight, arthritic score, hematological and biochemical markers, and so forth. By using the Sandwich ELISA Method, pro-inflammatory cytokine arrays (IL-6, IL-1,) were calculated. Significant (p 0.05) reduction of arthritic score, paw volume, and thickness with liquor rice root extract. Reduction in body weight and changes to hemological markers have been stopped by liquor rice root extract. Significant architectural alterations were found in the joints of treated rats after radiographic and histological analysis. In the current study, higher levels of (IL-6, IL-1) were found in the CFA-control group, which was a substantial increase compared to levels in the rats in the normal group. Comparing the rats treated with MAG at 50 and 100 mg/kg to the animals in the CAF-Control group, a Significant reduction in (IL-6, IL-1) levels was seen.

According to the available information, Mono Ammonium Glycyrrhizinate's protective effects against CFA-induced arthritis may have resulted from its improved haematological profile, antioxidant properties, and anti-inflammatory properties.

Keywords: Anti-inflammatory activity, mono Ammonium Glycyrrhizinate, Rheumatoid Arthritis, Complete Freund's adjuvant, Arthritis in Female *Albino wistar* Rats

INTRODUCTION

Rheumatoid arthritis (RA) is an auto-immune disease that is complex, multi factorial, and systemic in nature. It primarily affects the small joints in the hand and feet in the body [1]. It develops in a symmetrical manner and causes pain, stiffness, and impaired function. However, the pathogenesis of RA is the accumulation of microbial products in synovial tissue, as well as persistent infection of the articular surface of the joint, which triggers an immune response and changes the integrity of the joint components. In RA [2], the immune system responds to auto-refractory B-lymphocytes and produces rheumatoid factors (RF) auto-antibodies, as well as anti-cyclic Citrullinated Peptide (CP) antibodies. However, there are two sides to the immune response. Chronic inflammation plays an important role in the progression of disease and contributes to the development of age related diseases, including RA [3]. Liquorice is an herbaceous perennial plant that is native to southern Europe and Asia. It is related to beam and peas [4]. It grows to 1 meter high and has pinnate leaves that are 7-15 cm in length and 9-7 cm in length. The flowers are 0.8-12 cm in length, purple or pale whitish-blue in colour, and produced in loose inflorescences [5]. It is mainly found wild in the southern part of Europe and part of Asia. Today, it is cultivated in many parts of the world [6]. Liquorice can be used as a flavoring for tobacco, confectionery, beverages, jams and marmalades [7]. It is also used to treat many ailments and diseases. It is also known as an antiviral for slowing down the progression of HIV infection [8].

MATERIALS AND METHODS

Plant Material
Powdered roots of Mono Ammonium Glycyrrhizinate (Mesh size 250) supplied by Pharmaceutical Shop Jadavi Lallubhahi & Co. In Hyderabad, India [9]

Preparation of Plant Extract
The roots of liquor rice are weighed up to 40-50% and soaked with water. The roots are then macerated for 24 hours for softening. This softens the roots, making it easier to extract later. After the roots are macerated, the extract should be filtered and the resulting extract should be stored securely

Experimental Animals
In this study, adult female wistar rats weighing 200-210g were used. Animals were obtained from Mahaveer Enterprises in Hyderabad. Laboratory conditions were as follows: (1) 12:12 L/dark; (2) 23±10C; (3) Standard animal diet; (4) Ad libitum water; (5) CPCSEA approval of our collage for conducting animal experiments (Registration No: 516 / 01/ A/CPCSEA).

Experimental Design
Rats were acclimated for two weeks before the experiment. After acclimatization, rats were kept fasting for 18 hours before the experiment. Now, we have randomly split the rats into 4 groups of 6 animals.
Group I rats (normal control)
Group II rats (Disease control)
Group III rats (low dose test compound)
Group IV rats (high dose test compound)

Dose selection

The acute oral toxicity studies were performed in accordance with the OECD426 Guidelines. The studies were performed on female *albino wistar* rats weighing 25-35g. The study was divided into 4 groups of 6 rats each. The rats were fasted overnight. They were kept hydrated and fed libitum. The selected functional foods were orally administered at a dose of 2000 mg/kg body weight.

Evaluation of Rheumatoid Arthritis

Determination of Paw Volume

The Paw volume was measured with the help of a plethysis mograph. The results were recorded at 0th Day, 7th Day, 14th Day, 21st Day and 28th Day. Measurement of Adjuvant Arthritis The severity of Adjuvant arthritis was measured by measuring the hind paw volume. The increase of paw edema is calculated using the following formula [10].

$$\%\text{increase in paw Edema} = T_0\_T_t/T_0 \times 100$$

Where T_0 = Mean Paw Thickness at 0 and T_t = Mean Paw Thigh Thickness at a specific time. Results were statistically compared to CFA-Control.

Determination of Arthritic Score

The rats were evaluated for arthritis symptoms every three days from day 1 to 28 post-CFA using a scoring system designed to assess the severity of the condition. A 5-point scale was used to determine the severity of the erythroidism and the loci of the swelling, as well as the duration of the symptoms.

0 = no swelling or focal redness;

1= Finger joints with mild swelling;

2= Ankle or wrist joints with mild swelling.

3= Full-body inflammation;

4= Deformation or Alkalosis.

After treatment, the animals were dosed with anesthetics (inhalation of diethyl ether) and blood was drawn from Retro orbital sinus using EDTA-containing capillary tube for hematological and serum biochemical parameters (EDTA-free). Blood was left at room temperature for 30 minutes and then centrifuged for 10 minutes at 10:00 rpm. The biochemical parameters were as follows:

Determination of Hematological Parameters

On Day 28, following CFA-administration, blood samples were collected from all groups via cardiac puncture under mild general anesthesia with diethyl ether, and stored in appropriate blood collection tubes. [11] The hematological parameters (red blood cells, hemoglobin content, white blood cells, platelets) were assessed immediately after the blood sample collection with the help of biochemical auto analyzers.

X-Radiology Assessment

On the day 28 post CFA- injection, Radiographs were taken with X-Ray apparatus (PHILIPS Diagnose X-Ray, Amsterdam, and Netherlands). The focal film distance was 60cm at 55kVp and according to the extent of osteoporosis, joints spaces, soft tissue inflammation, sub chondral erosion, and joint ankylosis on a scale of 0-4 as described by vijaya Lakshmi etal. [12]The highest possible score is 20 per paw. X-Ray images were analyzed and separated by two certified radiologists who were blinded to the treatment groups.

Estimation of IL-6 by Sandwich ELSA Method

Materials to be provided by the End –User

To make a phosphate-based salt solution, add 8.0g of NaCl, 1.4g of Na_2HCO_4, 1.2g of HCl, 0.4g of KCL, and add 1L of deionized salt to 1L of water. The pH should be 7.4 and the filtration should be 0.2μm. You can also use a wash buffer, like Cat. Number 421601, or a PBS + 0.05% tween -20 solution. If you're looking for a stop solution, you can use Cat. Number 43001 or an acid solution like $2H_2SO_4$. Finally, you can use a plate sealer like Cat. Number 423601.

ELISA PROCEDURE
Day-1

For each well,add 100μL of dilute capture antibody solution, seal the well plate, and incubate for 24 hours at 20C to 80C.

Day-2

1. Wash Plate 4 Times*, block the plate by adding 200μL 1X Assay Diluent A to each well, seal plate and incubate at room temperature for1hour with shaking on a plate shaker. All the subsequent incubation with shaking should be 3.7 performed similarly.
2. Wash plate 4 times*, add μL diluted standards and samples to the appropriate wells.
3. Seal the plate and incubate at room temperature for 2 hours with shaking.
4. Wash plate 4 times*, add 100μL diluted detected antibody solution to each well, seal the plate and incubate at room temperature for 1hour with shaking.
5. Wash the plate 4 times*, add 100μL diluted Avidin-HRP solution to each well, seal the plate and incubate at room temperature for 30 minutes with shaking.
6. Wash plate 5 times*, soaking for 30 seconds to 1 minute per wash. Add 100μL of freshly mixed TMB substrate solution to each well and incubate in the dark for 15 minutes.[13]
7. Add 100μL of stop solution to each well. Read absorbance value at 450nm and 570nm within 15 minutes. [15]The absorbance at 570nm can be subtracted from the absorbance at 570nm can be subtracted from the absorbance at 450nm. Wash step is crucial to assay precision. Wash the plate with at least 300μL of wash buffer per well and bolt any residual buffer by firmly tapping the plate upside down or clean absorbent paper.

Estimation of IL-1βby Sandwich ELSA Method
Materials to be provided by the End –User& reagent preparation

Materials and reagent preparation of IL-1β are same as IL-6.

ELISA PROCEDURE
Day-1

Add 100μLdiluted capture antibody solution to each well, seal the plate and incubate overnight between 2^0C and 8^0C.

Day-2

1. Wash Plate 4 Times*, block the plate by adding 200 μL 1X Assay Diluent A to each well, seal plate and incubate at room temperature for1hour with shaking on a plate shaker. All the subsequent incubation with shaking should performed similarly.
2. Wash 4 times with wash buffer
3. Add 50 μL/well of assay buffer D to wells that contain either standard dilutions or samples.
4. Add 50 μL well of standard dilutions or samples to the appropriate wells.
5. Seal the plate and incubated at the room temperature for 2 hours with shaking.
6. Wash plate 4 times/ add100μL diluted detection antibody solution each well, seal the plate and incubate at the room temperature for 1 hour with shaking.[15]
7. Wash the plate 4 times add100μL diluted Avidin –HRP solution to each well, seal the plate and incubate at room temperature for 30 minutes with shaking.
8. Wash plate 5 times soaking for 30 seconds to 1 minute per wash. Add100μL of substrate solution to each well and incubate in dark for 20 minutes.
9. Add 100μL stop solution to each well. Read absorbance at 450nm and 570nm within 15 minutes. The absorbance at 570nm can be subtracted from the absorbance at 450nm.[16]

Plate washing: wash step is crucial to assay precision. Wash plate with at least 300μL of wash buffer and blot any residual buffer by firmly taping the plate upside down on clean absorbent paper.

Statistical Analysis

Following one-way ANOVA analysis, Dunnett's multiple comparison test is used to compare the results, which are presented as mean Standard deviation.

RESULTS

Safety Evaluation of Mono Ammonium Glycyrrhiziate (MAG)

During treatment, *Albino wistar* Rats' physiological function was compared to that of the healthy control group, which remained unaltered. Specifically, throughout the course of the study, there were no glaring abnormalities, toxic reactions, or deaths that occurred up to 28 days. The *albino wistar* rats in the treatment group do not gain or lose weight when compared to the control group, indicating the safety of the treatment.

Effect of MAG on CFA-Induced Arthritis in Paw Oedema

The paw swelling of the CFA Group Significantly Increased When Compared With the Control Group and Gradually Increased After the Model Manipulation, Indicates that the CFA Model Was Established Successfully. When compared to the CFA control group, the treated rats' paw swelling volume was significantly less after the administration of MAG (50 and 100mg/kg). The results below clearly demonstrate that the MAG has reduced RA paw swelling.

Estimation of Biological Parameters

All values were MEAN±SEM, n=6, ***$P<0.001$, **$P<0.04$, *$P<0.05$, and ns$P<0.05$.utilizing a one-way ANOVA-Dunnett's multiple comparison test and ###$p0.001$ when disease control was compared to the Control Group. DISCUSSION

Rheumatoid arthritis (RA) is an abnormal autoimmune disease that damages the structure of the joints and causes deformity. Recently, CFA has gained popularity as a method for evaluating the effectiveness of herbal arthritis treatments. Liquorice root extract significantly (P 0.05) decreased paw volume, thickness, and arthritic score. Liquorice root extract has stopped changes in haematological parameters and weight loss. Significant architectural changes in the joints of treated rats were discovered through radiographic and histological analysis. When compared to levels in the rats in the normal group, the CFA-control group in the current study demonstrated elevated levels of (IL-6, IL-1), which was a significant increase. Significant reductions in (IL-6) and (IL-1) levels were seen in rats given MAG at 50 and 100 mg/kg

CONCLUSION

MAG shown to decrease the paw volume and increase the spontaneous activity in CFA induced RA in female wistar albino rats. The blood parameters like RBC, Haemoglobin counts were increased and decreased WBC by MAG at 100mg/kg has more potent activity while compared with 50mg/kg of MAG in CFA induced RA in female wistar albino rats. MAG at 50and 100mg/kg showed a significant reduction of IL-6, IL-1β levels in CFA induced arthritic in rats.(paw and sciatic nerve). Histopathological examination of paw revealed that the MAG treated rats showed significant regeneration of damaged paw of CFA induced arthritis in rats. The mono ammonium glycyrrhizinate showed protective activity in CFA induced arthritis might be due to their enhanced haematological profile, antioxidant and anti-inflammatory activity.

ABSTRACT

Thyroid is an important endocrine gland located anterior to the Trachea. Hypothyroidism is 10 times
greater in women than man especially elder women. Hypothroidism causes sexual dysfunction, hyper
prolactenemia and depression in women. The adult onset of overt hypothyroidism significantly shows
neuropsychiatric symptoms affecting mood and cognition. It causes slowing of thought process and
speech, decreases attention, concentration, memory, perception and psychomotor function. Mood swings
and emotional disturbances are commonly found in hypothyroid patients. Weight gain and goiter
provokes discomfort and cosmetic concerns in women. Fatigue which is associated with quality of life is
more prevalent in hypothyroid patients. Exploring quality of life in chronic disease conditions especially
the diseases affecting physical and mental abilities is important. To estimate the quality of life [QOL] in
Kuraiveethananoi [Hypothyroidism] patients with add on siddha management attending Ayothidoss
Pandithar Hospital, NIS through Short Form Health Survey-36[SF36]. 50 Kuraiveethananoi
[Hypothyroidism] patients were included in this study based on inclusion and exclusion criteria. This
study was conducted at Ayothidoss Pandithar Hospital, National Institute of Siddha. Data related to
quality of life in Kuraiveethananoi [Hypothyroidism] patients were collected using Short Form Health
Survey -36 [SF-36]. The mean scorings of SF – 36questionnaire in 8 domains include general health-62.30,

physical function-72.40, physical limitations-66.10, emotional limitations-69.29, vitality-61.42, emotional well -being-65.04, social activities-68.30 and body pain-66.50. The mean scores of all the 8 domains were above 60. It is concluded that the quality of life of Kuraiveethananoi [Hypothyroidism] patients was good after taking siddha medications along with allopathy medications.

Keywords: Quality of life, Hypothyroidism, Kuraiveethananoi, Siddha Management

INTRODUCTION

Siddha is an ancient system of medicine flourished well among the Dravidians peninsular of south India[1]. The basic concepts of Siddha system include Aimpootham, Mukkuttram 96 thathuvam etc. In Siddha system of medicine Hypothyroidism is called as Kuraiveethananoi. The prevalence of Hypothyroidism is about 1% to 2% worldwide. Subclinical hypothyroidism accounts for about 8% in women and 3% in male stating that its prevalence is more common among women worldwide [2]. The prevalence in India is reported as 3.5% to 4.2%. The subclinical hypothyroidism reported in India is 8.02%-19.3% [3]. Hypothyroidism is common in women and older people. It affects 3 to5% of the adult population [4]. A study showed that quality of hypothyroid patients is impaired compared with controls of similar age and gender [5].A study in Amsterdam showed hypothyroid patients have lowered cognitive function, mental health and vitality compared to Dutch reference group [6]. Mood and emotional disturbances also significantly affect the HRQL in Hypothyroid patients. Goiter causes discomfort and cosmetic concern, fatigue and anxiety also impair the quality of life in Hypothyroid patients. So there is a need for the alternative medicines to improve the quality of life in Hypothyroid patients. Apart from the medicines, siddha system of medicine have therapies such as Yoga and Pranayama to improve the mental health and social behaviour. Assessing the quality of life of Kuraiveethananoi [Hypothyroid] patients become a foremost thing as it is a chronic disease. So the study was conducted to assess whether the quality of life Kuraiveethananoi [Hypothyroidism] patients is improved while taking siddha treatment along with allopathy medications. SF-36 was the scale employed in this study to assess the quality of life in Hypothyroid patients [7].

METHODS

It was a hospital based cross sectional study conducted in hypothyroid patients taking Siddha medications in Out Patient Department[OPD] of Ayothidoss Pandithar Hospital, National Institute of Siddha. This study was carried out after getting approval from ethics committee- NIS/IEC/2021/MP -1 [Institutional ethics committee] and also registered in CTRI-CTRI/2022/02/040071 [Clinical Trial Registry of India]. The study period was 6 months with the sample size of 50 patients. The sampling method used was purposive sampling. This study was conducted from February 2022 to April 2022. All the patients included in this study falls within the age group of18-50 years. Known case of Hyperthyroidism and CA thyroid patients were excluded from the study. Informed consent was obtained from before enrolment. The patients were given medicines for 3 months and the results were observed.

Short form [SF-36]
The health status of the pateints were assessed using Short Form -36 questionnaire. This includes questions under 8 different domain, namely General health, physical functioning, physical role limitations, emotional role limitations, Energy, social function and body pain. Each domain score were coded and summed to 0 [worst health status] to100 [best health status].

Data collection
All the participants are given a brief description about the study. Data collected regarding the Age, sex, social status, Demographic details, duration of the illness, treatments history, personal habits, symptoms etc**.,** and completed the SF-36 questionnaires during their visit to the OPD of Ayothidoss Pandithar Hospital.

Data Analysis

All the data collected were managed using an Excel sheet. Descriptive data were reported as a Mean and Standard deviation.

DISCUSSION

Hypothyroidism is one of the common diseases affecting the HRQL of the productive age groups and elderly people. Hypothyroidism is a chronic condition which has greater impact on all metabolic functions and growth. In this study 42% of participants belong to the age group of 40-50 year and 65% to the age groups of 31-40 years old. 92% were female patients and 8% of male patients. 90% of the participants were from urban area and 10 % of participants from the rural area. 68% belong to lower socio- economic status and 57% were unemployed. All the pateints completed the Siddha treatment for 3 months. Song et al. had stated that hypothyroid or subclinical hypothyroid patients had reduced sleeping duration, longer latency and decreased satisfaction with their sleep. In the present study 86% had regular and good sleep [8]. 72% had family history of hypothyroidism. This shows that the person with family history of hypothyroidism can be screened. Hypothyroidism causes heavy bleeding, oligomenorrhea, amenorrhoea and irregular menstrual cycle [9]. In this study 77% of the women in the reproductive age groups have regular menstrual cycle. In this study 2% cases had history of Goiter, 12% were infertile, 32% were obese and 6% had peripheral neuropathy. An Indian study reported that 33% of the overt and 11% of the subclinical hypothyroidism patients were obese [10]. Among 50 patients, 5[10%] cases had hypertension, 1[2%] cases had coronary artery disease, 2[4%] cases had bronchial asthma, 11[22%] cases had Diabetes mellitus, 1[2%] cases had psychiatric disease and 1[2%] had dyslipidemia. Pateints with TSH greater than 10uIU/ml indicates possibility of increased risk for cardiovascular disease proposed by American Academy of Clinical Endocrinology [11].

Previous study states that poor HRQL is due to fatigue [12]. In this study 68% had no complaints of fatigue after taking siddha medications. Depression also had impact in quality of life in hypothyroid patients. In this study 50% had complaints of depression. Elderly with subclinical hypothyroidism showed highest risk for depression [13]. Even with the use of levothyroxine, there is no significant improvement in depression in subclinical hypothyroid patients.[14] SF -36 questionnaire used in this study is a general health survey questionnaire to measure the quality of life with 8 domains. The mean scorings of SF – 36 questionnaire includes general health-62.30, physical function-72.40, physical limitations-66.10, emotional limitations-69.29, vitality-61.42, emotional well- being-65.04, social activities-68.30 and body pain-66.50. Sivaprasad et al. conducted a study in Indian population. The mean scores of each domain in SF-36 scale was 57.3 in general health domain, 51.9 in physical function domain, 65.2 in physical limitations domain, 77 in emotional limitations domain, 60.4 in vitality domain, 63.2 in emotional well- being domain,76.6 in social activities domain and 60 in body pain domain. By comparing the data of the above mentioned study with the present study, improvement noted in the physical function, General health, body pain and social function domains after taking siddha medications. Siva prasad et al, stated that the quality of life of hypothyroid patients were impaired even after the adequate replacements by comparing with the general population. It also states that there is worse health status negatively associated with the TSH levels in blood.[12]Limitations of the study is that this study was conducted only in 50 patients. Further, this study needs to be conducted in larger sample size.

CONCLUSION

As all of the mean scoring of SF-36 was observed as >50, which indicates that the quality of life is good after taking Siddha medications along with Allopathy medicines. Hypothyroidism affects the quality of life significantly. Depression, impaired memory and muscle weakness were the symptoms persistent even after treatment. Goiter and obesity provokes cosmetic concern. These factors negatively influence the quality of life. Hence along with medications, consistent yoga therapy may help to improve the mental well-being of the patients. Healthy diet may also support to improve the health status of the hypothyroid patients.

ABSTRACT

Generative Adversarial Networks (GANs) are a type of deep learning model that has received significant attention recently for their ability to generate realistic synthetic data. GANs consist of two neural networks, a generator, and a discriminator, that are trained in an adversarial setting to produce high-quality samples. The generator network generates fake samples, while the discriminator network tries to distinguish between the fake and real samples. Through iterative training, the generator learns to produce increasingly realistic samples that can fool the discriminator. This article discusses the different techniques that can be used to improve the performance of the GAN. Furthermore, this article examines some of the challenges and limitations of GANs, such as mode collapse and instability. It proposes future research directions, such as improving the quality and diversity of the generated samples and developing more interpretable and explainable models.

INTRODUCTION

Deep learning has witnessed remarkable progress in recent years, enabling machines to learn and extract meaningful representations from vast amounts of data. One exciting area of research within deep learning is Generative Adversarial Networks (GANs), a framework proposed by Good fellow et al. in 2014 [1]. GANs have revolutionized the field of generative modeling, providing a novel approach to learning and generating data that faithfully captures the underlying distribution of real-world examples.

Agnes Lydia *et al.,*

The fundamental concept behind GANs lies in the interplay between two neural networks: the *generator* and the *discriminator*. The generator network synthesizes new samples from random noise to deceive the discriminator into classifying them as real. Simultaneously, the discriminator network learns to differentiate between real and generated samples, striving to identify the true data distribution correctly. This adversarial process gradually improves the generator's ability to create increasingly realistic samples while the discriminator becomes more efficient in distinguishing real from fake. GANs have gained immense popularity in recent years due to their impressive capabilities in generating visually compelling images, synthesizing realistic videos, translating images across domains, and even generating text and speech. Moreover, GANs have found applications in data augmentation, anomaly detection, style transfer, and many other areas [2]. However, the training of GANs remains a challenging task, often plagued by issues such as mode collapse, instability, and hyper parameter sensitivity. This research paper aims to comprehensively review GANs, covering their fundamental principles, training challenges, and architectural variations. It discusses the diverse applications of GANs across multiple domains, highlighting their impact on Computer vision, Natural Language Processing, and Healthcare. This article also delves into recent advancements in GAN research, including techniques to address training instabilities, evaluate GAN performance, and incorporate additional information into the generative process. This review aims to provide researchers and practitioners with a comprehensive understanding of GANs, their underlying principles, and their vast potential for future advancements. By exploring the advancements and applications of GANs, this article aims to inspire further research and foster the development of innovative solutions that harness the power of generative modeling for real-world challenges.

BACKGROUND
Generative Adversarial Networks
The GAN framework consists of two main components: a generator network and a discriminator network. The generator aims to create synthetic samples that resemble real data, while the discriminator's role is to distinguish between real and fake samples. The two networks are trained in an adversarial manner, competing against each other to improve their respective performances as in Fig .1 [3]. The different stages explaining the working of a GAN is as follows

Initialization
The generator and discriminator networks are initialized with random weights. The generator takes a random noise vector (latent space) as input and produces a synthetic sample, while the discriminator takes a sample (real or fake) and outputs a probability score.

Training Process
1. **Real Sample Discrimination** In the first step, a batch of real samples from the training dataset is fed to the discriminator. The discriminator computes the probabilities for each sample being real and updates its weights to improve its ability to distinguish real samples [4].
2. **Synthetic Sample Discrimination** The generator network generates a batch of synthetic samples by taking random noise as input. These synthetic samples, along with some real samples, are fed to the discriminator. The discriminator updates its weights to improve its ability to differentiate between real and fake samples [4].
3. **Generator Improvement** The generator network is trained to fool the discriminator. It takes random noise as input and aims to generate synthetic samples that the discriminator incorrectly classifies as real. The generator's weights are updated based on the discriminator's feedback to improve its ability to generate realistic samples.
4. **Adversarial Training** The generator and discriminator continue to improve their performances through adversarial training iteratively. Steps 1-3 are repeated for multiple iterations, allowing both networks to learn and improve over time.

CHALLENGES IN TRAINING GANS

Training Generative Adversarial Networks (GANs) can be challenging due to several reasons:

Convergence

The training process continues until a convergence point is reached, where the generator produces synthetic samples that are highly realistic, and the discriminator is unable to distinguish between real and fake samples effectively.

Mode collapse

This occurs when the generator learns to produce a limited number of samples, which are repeated frequently instead of generating diverse and varied samples [5]. This can occur when the discriminator is too powerful and the generator cannot learn from the feedback it receives.

Instability

GANs are notoriously difficult to train, as the optimization problem is non-convex and can result in unstable behavior [6]. This can lead to oscillations in the loss function, and the generator and discriminator may become stuck in a suboptimal equilibrium.

Training time

Training GANs can be computationally expensive and time-consuming, especially when dealing with large datasets or complex models.

Over fitting

Like any deep learning model, GANs can over fit the training data, resulting in poor generalization performance.

Hyper parameter tuning

GANs have several hyper parameters that must be carefully tuned to perform well [7]. These hyper parameters include the learning rate, batch size, number of training iterations, and the architecture of the generator and discriminator networks.

Evaluation

It can be difficult to evaluate the performance of a GAN objectively, as there is no clear metric to measure the quality of the generated samples [8]. Some common evaluation methods include visual inspection, computing the *Frechet Inception Distance* (FID), or using human evaluators. In summary, training GANs can be challenging due to non-convex optimization problems, instability, training time, over fitting, mode collapse, hyper parameter tuning, and evaluation difficulties. However, with careful design and training, GANs can generate realistic and diverse samples that match the characteristics of a given dataset.

METHODOLOGY

There are several ways to improve the performance of Generative Adversarial Networks (GANs):

Adjust the architecture:

The architecture of the generator and discriminator can be modified to improve the performance of the GAN, like,

- Adding more layers to the generator can help it generate more complex samples.
- Adding more layers to the discriminator can help distinguish between real and fake samples better.

Increase the training time:

GANs require a lot of training time to achieve good performance.

- Increasing the number of epochs
- Increasing the amount of data used to train the GAN can improve its performance.

Use better optimization algorithms:

Using optimization algorithms like Adam, which can adapt the learning rate based on the gradients, can improve the convergence rate and stability of the GAN. Some of the alternate optimizers are

- Adagrad
- Adadelta
- RMSprop

Agnes Lydia *et al.,*

Use regularization techniques:
Regularization techniques like *weight decay*, *dropout*, and *batch normalization* can help prevent over-fitting and improve the generalization of the GAN [9].

Use alternative loss functions:
Alternative loss functions like *Wasserstein loss* or *hinge loss* can help improve the training stability of the GAN [10].

Use pre-training:
Pre-training the generator or discriminator on a related task can help initialize the network weights and improve the performance of the GAN.

Use data augmentation:
 Data augmentation techniques like *rotation*, *scaling*, and *flipping* can increase the diversity of the training data and improve the performance of the GAN.

Use conditional GANs:
Conditional GANs, where the generator and discriminator are conditioned on additional information like *class labels*, can generate more realistic samples and improve the performance of the GAN in certain applications [11].

Conditional Generative Adversarial Networks (cGANs)
Conditional Generative Adversarial Networks (cGANs) are an extension of the original GAN architecture that allow the generator and discriminator to be conditioned on additional information, such as class labels, attributes, or other features. This allows the GAN to generate samples that are not only realistic but also match a specific class or attribute. The main idea behind cGANs is to introduce a new input to both the generator and discriminator networks, which represents the additional information [12]. For example, in a dataset of handwritten digits, this input could be the class label of the digit (i.e., the number it represents). The generator takes as input both the noise vector z and the additional information y, and produces a fake sample x. The discriminator takes as input both the real or fake sample x and the additional information y, and produces a binary output indicating whether the sample is real or fake.

$$J(D) = -\frac{1}{2}E_{x \sim p_{data}} \log D(x) - \frac{1}{2}E_z \log(1 - D(G(y))) \tag{1}$$

$$J(G) = -\frac{1}{2}E_y \log(D(G(y))) \tag{2}$$

where, J(D) indicates the Loss function of the Discriminator network, J(G) indicates the Loss function of the Generator network, D(x) indicates the probability of 'x' to be real, G(y) indicates accuracy of the samples generated, Z indicates random noise induced while training. During training, the objective of the discriminator is to correctly classify real and fake samples, while also correctly classifying the additional information y. The objective of the generator is to produce samples that are not only realistic but also match the additional information y. The loss function for the generator in a cGAN is typically a combination of the binary cross-entropy loss and the additional information loss [13]. The binary cross-entropy loss measures how well the discriminator can distinguish between real and fake samples. In contrast, the additional information loss measures how well the generator can match the additional information y. The steps involved in training a cGAN are as follows:

for number of training iterations **do**
 for k steps **do**
  - Sample mini batch of m noise samples $\{z^1,…,z^m\}$ from noise prior $p_g(z)$.
  - Sample mini batch of m examples from data generating distribution $p_{data(x)}$
  - Update the discriminator by reducing its stochastic gradient as

$$\nabla_{\theta_d} \frac{1}{m} \sum_{i=1}^{m} [\log D(x^i) + \log(1 - D(G(y^i)))]$$

Agnes Lydia *et al.,*

end for

- Sample minibatch of m noise samples $\{z^1,\ldots,z^m\}$ from noise prior $p_g(z)$.
- Update the generator by descending its stochastic gradient as:

$$\nabla\theta_g \frac{1}{m}\sum_{i=1}^{m} \log(1 - D\left(G(z^i)\right))$$

end for

cGANs have been used in a variety of applications, such as image synthesis, image-to-image translation, text-to-image synthesis, and speech synthesis [14]. They have been shown to produce high-quality samples that match the specified class or attribute, and are often used in situations where it is important to control the output of the GAN.

RESULTS AND ANALYSIS

With the knowledge gained from the extensive analysis made on the existing works, a comparison has been made to exhibit the difference in performance between an Unconditional GAN and Conditional GAN(Fig 2). For experimentation purpose the dataset that has been implemented is Fashion MNIST dataset. This dataset comprises of 60,000 small grayscale images of the size 28x28 pixels. It is a collection of clothing images that belongs to 10 different classes, namely, t-shirts, shoes, dresses, etc. This experiment consists of two phases. In the first phase, the Fashion MNIST dataset is fit into a regular Unconditional GAN model and in the second phase the same dataset is fit into a modified Conditional GAN model. The following parameters are set while training the model:

1. Activation Function: LeakyReLu
2. Stride: 2 x 2
3. Optimizer: Adam
4. Learning Rate: 0.0002
5. Momentum: 0.5

These parameters are chosen based on the experiments conducted in another research relevant to this work [15][16]. The structure of the Generator network and Discriminator network of the regular GAN built and trained in this experiment is given in Table 1 and Table 2. The structure of the Generator network and Discriminator network of the regular cGAN built and trained in this experiment is given in Table 3 and Table 4. The Loss values obtained while training the Discriminator network over Real Image samples from the dataset fed on GAN vs. Conditional GAN are plotted as shown in Fig 3. The objective is to reduce the loss value while maintaining the accuracy of regenerating the image samples flawlessly. It is observed that Conditional GAN has reduced outliers while trained over the same number of iterations as the Unconditional GAN. A similar pattern of reducing outliers is observed in the Loss values obtained while training the Discriminator network of GAN vs.cGAN over a set of Fake images (Fig.4). Fig. 5 shows the Loss values obtained while generating new image samples using the Generator Network of GAN vs Conditional GAN. The outliers are removed and the values are better distributed showing an improvement in the performance of cGAN in comparison to a GAN. Fig.6 and Fig.7 show the difference in performance between an Unconditional GAN and a Conditional GAN. The objective is to generate image samples that are similar to the input images. The reduction of fluctuations in the loss values of the Generator network in the Conditional GAN (Fig.7) indicates that the network has developed the ability to generate better samples. The Samples generated by Unconditional GAN and Conditional GAN is given in Fig.8 and Fig.9. It is observed from the images generated by an Unconditional GAN that some of the images are not complete and makes it difficult to identify the category of the image sample it intends to generate. Such a sample is highlighted in Fig.8. This discrepancy has been eliminated while generating images using a Conditional GAN neural network, as in Fig.9.

SCOPE FOR FUTURE RESEARCH

Conditional Generative Adversarial Networks (cGANs) have shown tremendous potential in various applications where the generation of specific outputs based on given conditions is required. However, there are several future challenges that researchers and practitioners need to address to improve further and effectively utilize cGANs. Some of these challenges include

Data scarcity and imbalance

Conditional GANs typically require paired data, where both the input condition and the corresponding output are available. However, acquiring paired data can be challenging and time-consuming, especially in domains where the data is scarce or imbalanced. Developing effective techniques for training cGANs with limited or unpaired data is a significant challenge.

Mode collapse in conditional generation

Mode collapse, where the generator produces a limited variety of outputs, can also occur in conditional generation tasks. This can result in the generator generating similar outputs for different input conditions, reducing the diversity and quality of the generated samples. Developing methods to mitigate mode collapse in cGANs is crucial to ensure that the generator can capture the full range of possible outputs for different input conditions.

Interpretability and controllability

Understanding and controlling the output of a cGAN is another challenge. As the generator learns the mapping from input conditions to outputs, it becomes essential to provide interpretable and controllable ways to manipulate the conditions and guide the generation process. Techniques for disentangling factors of variations and ensuring controllability in cGANs need further exploration.

Scalability to high-dimensional and complex conditions

Many real-world applications involve high-dimensional and complex input conditions, such as images or videos with multiple attributes or complex textual descriptions. Designing cGAN architectures and training strategies that can effectively handle such high-dimensional and complex conditions is a challenge that needs to be addressed.

Evaluation metrics for conditional generation

Assessing the quality and performance of cGANs in conditional generation tasks is a non-trivial task. Developing appropriate evaluation metrics that can capture the fidelity, diversity, and controllability of the generated outputs for different input conditions is crucial to objectively measure the effectiveness of cGAN models.

Robustness to noisy and incomplete conditions

Real-world conditions can be noisy or incomplete, introducing uncertainty and challenges in conditional generation tasks. Ensuring the robustness of cGANs to handle noisy or incomplete input conditions is an important challenge that requires designing models capable of handling such variations and providing reliable outputs. Addressing these challenges will contribute to advancing the field of conditional generative modeling and enable the effective use of cGANs in various applications, including image synthesis, style transfer, data augmentation, and many others. Overcoming these challenges will ultimately lead to more reliable and versatile cGAN models that can generate high-quality outputs based on specific conditions.

CONCLUSION

In conclusion, Generative Adversarial Networks (GANs) stand as a remarkable innovation in the realm of deep learning, captivating attention for their prowess in creating lifelike synthetic data. The interplay between the generator and discriminator networks, engaged in an adversarial dance, fuels the evolution of GANs to generate increasingly convincing samples. This article has delved into the arsenal of techniques available to enhance GAN

performance while shedding light on the challenges, including the notorious mode collapse and instability. As we navigate the frontier of GAN research, the call for improving sample quality and diversity echoes loudly, alongside the pursuit of models that are not just powerful but also interpretable and explainable. The journey of GANs is far from over; it's an evolving narrative with promises and challenges that continue to shape the landscape of artificial intelligence.

ABSTRACT

The recent rise of drug-resistant bacteria has created serious problems in the field of medicine, which necessitates research into efficient antibacterial medicines. Green techniques provide a lot of advantages over traditional physical and chemical ones and have several benefits, including being low-cost, energy-efficient, safe, and rapid and also provide tiny, biocompatible nanostructures with potential medical applications that include antibacterial and anticancer activities. The experimental study is to evaluate the efficacy of loquat leaf extract Silver nano particles for antibacterial and anticancer activity. The green synthesized silver nano particle was characterized using UV-vis Spectroscopy, X-Ray Diffraction, Fourier Transform Infrared Spectroscopy, and Scanning Electron Microscopy(SEM). The UV-Vis absorption spectrum was obtained for the silver nano particles of loquat leaf extract at 434nm due to the Surface Plasmon Resonance vibration confirmed the synthesis of silver nano particles. The structural peaks in the XRD pattern showed the average crystalline size around 16.5nm and FT-IR spectrophotometer peaks observed indicates the presence of O-H stretching group-alcohol, O-H Stretching carboxylic group, O=C=O,C=C alkene, N-O Stretching Nitro compounds OH bending phenols. The spherical shape has been found with the high resolution Scanning Electron Microscopy(SEM).The potential antibacterial action of AgNPs was determined by measuring the inhibition zone,(Micrococcus luteus-2mm, Vibrio Cholerae-2mm,Salmonella typhi-2mm,Shigella flexneri-3mm, Pseudomonas flurscens-1mm, and

68614

Kasthuri Santira Kumari and Iruthaya Kalai Selvam

Escherichia coli-4mm).The use of AgNPs in biomedical applications as it depends on their safety, the in vitro cyto toxicity of the biosynthesized AgNPs on Vero cell line and MCF-7human breast cancer cell line using MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazoliumbromide] assay was done. The result of in vitro analysis showed that the AgNPs demonstrated dose-dependent cyto toxicity against the Vero Cell line and MCF-7 breast cancer cells but higher against the latter MCF-7 than the former Vero Cell line.

Keywords: Green synthesis, silver nano particles, loquat leaf, *Eriobotrya japonica,* Antibacterial activity, anti-cancer activity.

INTRODUCTION

The Metallic nano particles have been used extensively in biotechnology and in the biomedical area in recent years[1].It has been established that silver nano particles (Ag NPs) are a novel engineering tool with exceptional distinctive properties and morphologies. Due to the extremely high surface area to volume ratio of silver nano particles, especially those in 1-100 nm size range, its manufacture, application both are competent areas of scientific study. Diverse AgNP size ranges and shapes are required for diverse interactions with bacteria and viruses[2].Ag NPs have gained attention in recent years for their bactericidal and inhibitory activities against a variety of diseases[3].Tetracycline and streptomycin, two common medicine used as conventional antibiotics, have long been used to prevent bacterial infections. As the resistant power is developed in multi drug-resistant bacterial strains they are not inhibited by these antibacterial drugs. Therefore, it is deemed vital to create biomaterials that target microorganisms with bacterial antibiotic resistance. Comparatively, to traditional silver micro particles, AgNPs with large surface areas can offer a better interface for bacterial interaction. In the United States, nano silver has been utilized as a biocidal agent for more than a century in colloidal form of silver and silver nitrate[4].In contrast to other metal nano particles, silver-based nano products exhibit unique physical, chemical, and biological characteristics. It has a wide range of uses in the food industry, medicine, biomedical imaging, cosmetics, polymers and also as fungicidal and bactericidal agents[5].Plant-mediated nano particle synthesis is superior to microbial methods due to the availability, simplicity, and lack of cost[6].Loquat belongs to the family Rosaceae, species *Eriobotrya japonica,* genus *Eriobotrya,* order Rosales and they are grown for its fruit. Loquat is seen to bea shrub or a small tree. The tree grows up to 5-10metres tall and the leaves are dark green, tough and it's about 10-25cm long with a fuzzy texture. This study was designed with the loquat leaf extract silver nano particles that are eco-friendly, simple, and advantageous.

MATERIALS AND METHODS

Collection and Synthesis of Silver Nano particles using Loquat Leaf
Fresh loquat leaves were collected from the nearby place of Bodi, Tamil Nadu, India and washed repeatedly and dried. About 10gm of cleanly washed, dried, fine-cut leaves were boiled with 200ml of distilled water for 5 minutes till the color change from watery to light yellow color. The extract was allowed to be cooled at room temperature, then filtered with No1 what man filter paper and stored at the room temperature for further findings. Loquat leaf silver nano particles were synthesized by adding 5ml of loquat leaf extract with 100ml of 1×10^{-3} m aqueous $AgNo_3$ solution and heated at 80 0 c for 2 minutes till the change of color to brown.

Characterization Of Silver Nano particles
Uv-Vis Spectroscopy
UV-vis spectroscopy is most reliable technique for the primary characterization of synthesized nano particles which also helps to monitor the synthesis and stability of AgNPs[7].Synthesis of silver nano particles were confirmed by UV-Vis spectrophotometer at the wavelength of 250-600 nm (CHEMILINE CL – 1320 Spectrophotometer). Nano

particles are the very tiny materials having size ranges from 1 to 100 nm[8].Well-documented observations of this peak, which is attributed to a surface plasmon resonance, have been made for different kinds of metal nano particles with diameters ranging from 2 to100 nm.[9], [10].The UV-vis spectrum of synthesized AgNPs showed an intense absorbance peak at420nm due to the excitation of longitudinal plasmon vibrations in AgNPs solution[11].According to several findings, the surface plasmon resonance of AgNPs between 410nm and450 nm may correlate to spherical nano particles.([12],[13].A characteristic peak with strong absorption in the visible region forms for the metallic nano particle synthesized from a particular salt [14].The stability of silver nano particles produced through biological methods was examined for nearly 12 months and using UV-Vis spectro photometry a surface plasmon resonance peak at the same wave length was found.[15]

XRD
XRD is a common analytical technique for observing the crystalline structure of metallic nano particles by penetration of X-rays deeply into the material ([16], [17].The (XRD) data for the study were obtained using (RIGAKU – MINLFEEX – 600).The diffraction pattern obtained confirms the formation of nano particles with crystalline structure [18]. The particle size is calculated from the XRD data, using the Debye–Scherrer equation by determining the width of the Bragg reflection law according to the equation $D= K\lambda/\beta \cos\theta$, where D is the particle size(nm), K is the Scherrer constant, λ is the wavelength of X-ray, β is the (FWHM) full-width half maximum and θ(half of Bragg angle) is the diffraction angle that corresponds to the lattice plane [19]. XRD is a potent method for the study of nano materials [20].

FTIR
Fourier transforms infrared (FTIR) spectrophotometer (Model (Shimadzu, India) was used to characterize the functional Group and composition of AgNP at a range of 4,000 cm-1 to 400 cm -1.FTIR is a molecular vibration spectroscopy showing different chemical functional groups in different chemical classes[21].FTIR is a simple, appropriate technique that is an important cost-effective, non-invasive technique that determines the function of biological molecules in the reduction of silver nitrateto silver[15].FTIR can be utilized to explore the surface chemistry of synthesized metal nano particles and to observe the bio molecule and its involvement in nano particle synthesis and can be used in finding and analyzing different capping agents[16].In FTIR, the sample is subjected to infrared radiation, some of which are absorbed by the sample and some are not. The spectra got indicate the absorption and transmission that are characteristic of the sample material[22]

SEM
Scanning Electron Microscopy (SEM) analysis was carried out using a JEOL JSM- 6390 model at 20 kV. A thin carbon-coated film of the sample was formed as a small amount of the sample is placed on the copper grid. The extra moisture was removed using blotting paper and under a mercury lamp, the sample film placed on the SEM grid was dried for 5minutes before analysis[23].

Antibacterial activity of synthesized silver nano particles (Disc Diffusion Method, Heatly, 1944)[24]
About 0.3ml of green synthesized silver nano particles were applied to a 4mm sterile disc. Likewise, 4mm sterile discs were soaked in 0.3ml of amikacin for control. All the discs were allowed to dry at room temperature. Pathogenic bacterial strains were inoculated in sterile broth and incubated at 37°C for 24 hrs. Pathogens were swabbed and placed on the surface of 20ml of solidified nutrient agar in the sterile Petri dishes. The control and the experimental discs were placed in the sterile solidified nutrient agar petri plates to assess the effect of the silver nano particles on pathogens. These agar plates were incubated for 24 hours at 37°C and the antibacterial activity was measured based on the inhibition zone which were formed around the discs.

Cytotoxicity and Anticancer Activity[25]
Vero cell line and MCF-7 Cell lines were obtained from National Centre for Cell Sciences, Pune (NCCS). The cells were maintained in DMEM supplemented with 10% FBS, penicillin (100 U/ml), and streptomycin (100 µg/ml) in a humidified atmosphere of 50µg/mlCo 2 at 37°C.Cytotoxicity Analysis was done using the Vero cell line and the

Kasthuri Santira Kumari and Iruthaya Kalai Selvam

MCF-7 Cell line was used for the Anticancer Activity of the green synthesized silver nano particles using loquat leaf extract. Using 24-well plates the Cells (1×10^5/well) were plated and incubated at 37°Cwith5% CO_2 condition. When the cell reaches the confluence, the samples of various concentrations were added and incubated for 24hrs. After incubation, the sample was removed from the well and washed with phosphate-buffered saline (pH 7.4) or DMEM without serum.100μl/well (5mg/ml) of 0.5% 3- (4,5-dimethyl-2-thiazolyl)-2,5-diphenyl—tetrazoliumbromide (MTT) was added and incubated for 4 hours. After incubation, about 1ml of DMSO was added to all the wells. UV-Spectrophotometer was used to measure the absorbance at570nmwith DMSO as the blank. Measurements were performed and the concentration required fora 50% inhibition (IC50) was determined graphically. The % cell viability was calculated using the following formula:

% Cell viability = A570 of treated cells / A570 of control cells × 100
(A570 is Absorbance at 570nm).Graphs are plotted using the % of Cell Viability at the Y-axis and the concentration of the sample in X- axis. Cell control and sample control were included in each assay to compare the full cell viability assessments

RESULTS AND DISCUSSION

UV-Vis spectroscopy
The synthesized silver nano particles were confirmed by the change of color as shown in Fig1 and also by analyzing the excitation of surface plasmon resonance (SPR) using Shimadzu UV-vis spectrophotometer at 434 nm is shown in Fig 2

XRD
The particles crystalline nature was confirmed through analysis using X-ray diffraction, and the XRD pattern displayed several Bragg reflections. The XRD pattern obtained is shown in Fig 3.The XRD spectrum is well-matched to the standard JCPDS values and confirmed that the silver particles formed were in the form of nano crystals, as evidenced by the peaks at 2θ values of 38.2, 44.1, 64.1, and 77.6 θ, corresponding to (111), (200), (220) and (311), respectively Bragg reflections of silver, The X-ray diffraction results clearly show that crystalline silver nano particles were formed by the reduction ofAg+ ions by the loquat leaves extract. The Debye–Scherrer equation was used to determine the average crystallite diameter from half width of diffraction peaks and it clearly illustrates that AgNPs were nano crystalline. The average particle size and the fine structure of synthesized silver nano particles were identified using the Debye-Scherrer formula, $D=K\lambda/\beta\cos\theta$ Where D is said to be the mean crystallite size of AgNPs particles, λ is the wavelength of the x-ray source (0.1541 nm) used in XRD, β is the full width at half maximum of the diffraction peak, K is said to be the Scherrer constant with value from 0.9 to1, and θ is the Bragg diffraction angle. From the Debye–Scherrer equation, the average crystallite size of AgNPs synthesized is 16.5 nm.

FT-IR
Shimadzu FT-IR spectrophotometer peaks observed indicate the presence of various functional groups. The FT-IR spectra peaks are shown in Fig 4.The peak at 3855cm $^{-1}$ results due to the stretching of O-H stretching group-alcohol, The peak at 3724 cm $^{-1}$ and 3635 cm $^{-1}$indicates the O-H stretching, The peak at 2922cm $^{-1}$shows O-H stretching Carboxylic group, The shoulder peak shows 0=C=O group at 2341cm $^{-1}$,The peak at 1662cm $^{-1}$ is assigned for C=C stretching alkene, The peak at 1517cm $^{-1}$indicates the N-O stretching nitro group, The peak at 1392cm $^{-1}$ shows the O-H bending phenol, Thus the peak or prominent bands observed at 3855cm $^{-1}$, 2922cm $^{-1}$,2341cm $^{-1}$,1662cm $^{-1}$,1517cm $^{-1}$,1392cm $^{-1}$, 1068cm $^{-1}$, indicates the presence of O-H stretching group-alcohol, O-H Stretching carboxylic group, O=C=O,C=C alkene, N-O Stretching Nitro compounds, OH bending phenols and the shown functional groups mainly acts as a reducing agent and capping agent.

SEM
Fig 5. shows the SEM images of the green synthesized silver nano particles (AgNPs).The images of SEM clearly show that the AgNPs were spherical nano particles with an average diameter value of 16.5 nm

Kasthuri Santira Kumari and Iruthaya Kalai Selvam

Anti-bacterial effect

The potential antibacterial action of Ag NPs was confirmed by the measurement of the inhibition zone Micrococcus luteus-2mm, Vibrio Cholerae-2mm,Salmonella typhi-2mm,Shigella flexneri-3mm, Pseudomonas fluorescens-1 mm. This is shown in Table 1 and fig 6 and fig 7.AgNPs were regarded as a superior antibacterial agent. Because of its non-toxic effect on human cells and the weaker capacity of bacteria to develop resistance to silverions([26]–[28].The current investigation was carried out to investigate the growth-inhibitory effects of biosynthesized AgNPs against human pathogens, It was discovered that all human infections are effectively inhibited by biosynthesized AgNPs. Ag NPs enhanced antibacterial action is a result of their unique surface properties[29].According to several studies, silver nano particles may adhere to the cell membrane& surface, impairing the cells permeability and respiration processes. Smaller Ag NPs would have a greater bactericidal impact than larger Ag NPs due to their vast surface area accessible for interaction[30].It is also feasible that Ag NPs not only interact with the surface of the membrane but they also penetrate and interact with the interior of bacteria[31].The inhibitory mechanism of silver ions is unclear but still partially known. For Ag NPs and the bactericidal effect against bacteria, three potential pathways have been postulated. First, it is thought that Ag+ interferes with bacterial cell membranes through the process of plasmolysis, which inhibits the synthesis of cell membranes[31] Second, Ag NPs disrupt the thiol group of the bacterial cell, impairing cell division and ultimately causing death[32].Finally, Ag NP releases silver ions which would enter the cell wall and damage DNA by condensing and disrupting the protein synthesis[33] Consequently, the involvement of three potential processes may be responsible for Ag NPs and the bactericidal activity in this experiment. Ag NPs and the antimicrobial effect is influenced by the characteristics of different bacterial species.

The peptidogly can layer thickness , which is exclusively found in pathogenic bacteria, is the primary distinction between gram-positive and gram-negative bacteria. About membrane structure, it has sugar and amino acid polymer that forms the cell wall, or exterior of the plasma membrane, and it gives the structure strength to combat the cytoplasm osmotic pressure. Gram-positive bacteria have a 50% thickness and Gram-negative bacteria have an 8%thickness. As a result, Gram-positive bacteria have many peptidoglycan layers, no outer membrane, and lipo-polysaccharide, but they also have a lengthy chain of teichoic acids. Gram-negative bacteria, on the other hand, have a thin, single layer of peptidoglycan that is devoid of teichoic acid. According to reports, gram-positive and gram-negative bacteria strains are killed effectively by AgNPs[34].Gram-negative bacteria are more susceptible to destruction by AgNPs than gram-positive bacteria. As gram-negative bacteria have an outer layer of lipo polysaccharide (LPS), a thin layer of peptidoglycan, and an innermost plasma membrane only they are more susceptible to destruction, and Gram-positive bacteria have one cyto plasmic membrane and a cell wall that is relatively thick and made up of several peptidoglycan layers (20-80 nm)([35]–[37].

Cancer Activity

The green synthesized silver nano particles using the loquat leaf extract showed less cytotoxicity in the Vero cell line and showed higher cyto toxicity in the MCF-7 Cell line which helps us to find that there is more anticancer activity. This is shown in Table 2 and Table 3.Fig 8 and Fig 9 show the cyto toxicity of the Vero cell line and anti-cancer activity inthe MCF-7 cell line. One of the rapidly evolving and promising methods for combating cancer with metallic nano particles is Nano medicine. Due to unanticipated drug-related adverse effects, lack of specificity of low drug concentrations at the tumor target site, and the development of chemoresistance, current cancer treatments like chemotherapy and radiation therapy have limitations[38], [39].The greatest, most suitable, and also with alternative therapeutic approach for treating cancer is nanoparticle-mediated treatment. When therapeutic medicines are encapsulated in nanoparticles (NPs), they can target specific sick cells or tumor tissues either passively oractively. This property has led to their application as drug delivery systems[40].As there is less cytotoxicity in normal cells and higher cyto toxicity in cancer cells these green synthesized silver nano particles can be further used for application as a drug by conducting experiments in the future.

Kasthuri Santira Kumari and Iruthaya Kalai Selvam

CONCLUSION

The green synthesized silver nano particle using loquat leaf is a potential source for anti-bacterial activity as the zone of inhibition which clearly shows their effectiveness against the bacteria and as for as the Anti-cancer activity is concerned the silver nano particles are very effective in destroying those cells than the normal cell. This study further recommends for medical analysis in future research work.

ABSTRACT

Tumours are a prevalent and consequential clinical phenomenon in modern civilization, presenting in various anatomical sites inside the human body. Brain tumours are the most prevalent of the numerous forms of tumours. The prompt detection of tumours through the utilization of magnetic resonance imaging (MRI) scans is of paramount significance in minimizing the probable mortality rate among patients. Deep Learning is a multidisciplinary domain including a diverse range of methodologies utilized to develop models capable of efficiently processing and analyzing visual data. This study employs many algorithms to develop a brain tumour detection model, aiming to provide doctors with accurate and efficient assistance in their decision-making processes. The model utilized in this work was subjected to training using a dataset of around 2870 photographs. The training procedure encompassed the application of deep learning and machine learning methods that are based on neural networks. The employed methodologies include Logistic Regression, Support Vector Machines (SVM), ResNet50, and Convolutional Neural Networks (CNN) with three, four, and five layers. The aim of this study is to establish a systematic and reliable method for detecting brain tumours using MRI scans, thereby assisting healthcare professionals in making informed clinical decisions.

Keywords: Brain Tumour, Convolutional Neural Networks, Logistic Regression, Support Vector Machine.

Abishanko Mondal and Annwesha Banerjee Majumder

INTRODUCTION

The human brain serves as a crucial organ that plays a pivotal role in governing the central nervous system and overseeing the many physiological activities of the human body. Brain tumours are neo plastic formations characterized by the aberrant proliferation of brain tissue, resulting in the formation of cellular masses. Brain tumours can be categorized into two main types: primary tumours, which start within the brain itself, and secondary tumours, also known as metastatic tumours, which develop in other parts of the body and subsequently spread to the brain. Tumours can be classified into two categories: benign or malignant. Malignant tumours are characterized by their cancerous nature and necessitate prolonged treatment such as radiotherapy or chemotherapy. The occurrence of headache is frequently observed as a prevalent manifestation of brain tumours, often accompanied by additional symptoms such as vomiting, auditory impairments, unilateral bodily weakness, gait instability, and alterations in cognitive function and behavioural patterns. This study employed a range of machine learning models and deep neural networks to assess their respective performance to detect brain tumours. The initial phase encompassed the utilization of Logistic Regression and Support Vector Machine models.

Logistic regression is a straightforward and comprehensible model that is well-suited for small datasets. It offers the ability to estimate probabilities and do feature selection. Support Vector Machines (SVMs) provide exceptional performance in high-dimensional environments, effectively mitigate the issue of over fitting, and provide a wide range of applications through the use of kernel functions.ResNet50 and Convolutional Neural Networks (CNNs) were utilized for more intricate jobs. Convolutional neural networks (CNNs) are widely recognized for their proficiency in extracting local information, acquiring hierarchical representations, and demonstrating translation invariance. The organization demonstrates exceptional proficiency in the field of image analysis and has successfully attained cutting-edge performance in several computer vision tasks. The ResNet50 architecture, which is a deep neural network using skip connections, effectively mitigates the issue of vanishing gradients and attains notable accuracy while maintaining a reasonable amount of parameters. Section 2 of this study examines a limited number of existing scholarly works in order to get insight into the underlying operational principles. part 3 provides a comprehensive overview of the methods employed, while part 4 presents the experimental data. Finally, section 5 concludes the study.

LITERATURE SURVEY

The research work by P. Kumar, B. Vijay Kumar focused about the detection of brain tumour to reduce the death rate. They conducted the research work in 4 stages. In the first stages, pre-processing is done by filtering algorithm, secondly the segmentation is done by using clustering algorithm, third feature extraction by Gray-Level Co-occurrence Matrix(GLCM). [1]. In Ref [2] the dataset has been examined by G. Cinarer, B.G. Emirogluby using machine learning techniques including Linear Discriminant Analysis (LDA), Support Vector Machines (SVM), Random Forest (RF), and KNN in the literature. In the experiment conducted by M. Sajjad, S. Khan, K. Muhammad, Deep learning models have, however, taken on a significant role in machine learning in recent years due to their ability to analyse complicated relationships in an efficient manner. In adifferent research, the classification of brain tumour classes (I, II, III, and IV) using the VGG-19 architecture yielded 0.90 accuracy and 0.96 average precision [3].A deep CNN-based method for automated brain tumour diagnosis and grading was proposed by Seetha, J., and S. S. Raja. Fuzzy C-Means (FCM) is the system's foundation for segmenting the brain, and from these segmented areas, texture and form characteristics were collected, which were then fed into SVM and DNN classifiers. The outcomes revealed that the method achieved 97.5% accuracy rate [4].M.Sasikala and N. Kumaravel suggested a genetic algorithm feature selection for wavelet feature set feature dimension reduction. The technique is centred on choosing the best possible features vector to feed into the chosen classifier, such as an artificial neural network (ANN) [5].Convolutional neural networks (CNN) and Grey Level Co-occurrence Matrix (GLCM) based features were used to create the brain tumour classification system reported by Widhiarso, Wijang, Yohannes Yohannes, and CendyPrakarsah. Energy, Correlation, Contrast, and Homogenity these four features were extracted from four angles

(0°, 45°, 90°, and 135°) for every image to feed them into CNN model. [6].For the categorization of brain tumours, Ozyurt, Fatih, et al. integrated CNN with neutrosophic set- expert maximum fuzzy (NS-CNN) sure entropy. For brain tumour segmentation, they employed the neutrosophic set-expert maximum fuzzy-sure entropy approach. These pictures were then given to CNN to extract features, and fed to SVM classifiers to be categorised as benign or malignant. 95.62% of their attempts were successful on average [7].Using a modified version of AlexNet CNN, Khawaldeh, Saed, et al. suggested a technique for non-invasively grading glioma brain tumours.

Whole-brain MRI scans were used for the classification procedure, and the labels applied to the pictures were applied at the image level rather than the pixel level. [8].Javaria Amin et al., utilized multiple machine learning and deep learning approaches. They used a transfer learning ResNet-50 model with average global pooling to deal with the gradiant vanishing and over fitting issues. [9].For the aim of detecting brain tumours from MRI images, the authors employed the DNN, KNN(for k=1 and k=3), LDA, and SMO algorithms. By using the DNN technique, they were capable to reach 0.97 as recall value, 0.97 as precision, 0.97 as f-measure, and 0.984 as AUC. By employing the KNN technique with k=1, they achieved a recall value of 0.955, a precision of 0.956, an f-measure of 0.955, and an AUC of 0.967. By using the KNN method with k=3, they obtained 0.864 as recall value, 0.892 as precision, 0.866 as f-measure, and 0.954 as AUC. By using the LDA method, they were able to attain 0.955 as recall value, 0.957 as accuracy, 0.955 as f-measure, and 0.983 as AUC. By using the SMO algorithm, they were able to get 0.939 for recall, 0.941 for accuracy, 0.963 for f-measure, and 0.939 for AUC [10].A hierarchical deep learning-based brain tumour classifier using CNN was developed by the authors for the current work.

Glioma, meningioma, pituitary, and no-tumor were the four classes into which the model separated the input. With a miss rate of 7.87%, the suggested model achieved an accuracy of 92.13%. For predicting glioma, meningioma, no-tumour, and pituitary, respectively, the accuracy is 92%, 92%, 90%, and 96%, and the miss rate is 8%, 8%, 10%, and 4% [11].A model for early brain tumour detection was developed by K. Salçin. Images from magnetic resonance imaging (MRI) have been examined to identify the tumor-bearing areas and categorise these areas according to the type of tumour they are. [12]. Using MRI images, a model to determine the kind of brain tumour was put out by S. Sarkar, et al. In order to classify the data, a 2D Convolutional Neural Network (CNN) was trained, and it effectively detected meningiomas, gliomas, and pituitary tumours with an overall accuracy of 91.3%. [13].A dataset of 10,000 images were used in the study by authors Hamza Rafiq Almadhoun and Samy S. Abu Naser. For the purpose of evaluating their models, they employed their model as well as Inception V3, VGG16, MobileNet, and ResNet models. [14].A model to identify brain tumours using MRI images was developed by the authors B. Kokila, M. S. Devadharshini, A. Anitha, and S. A. Sankar. The multitask classification using Convolutional Neural Networks (CNN) is ready to categorize and identify tumours. Using this CNN-based model, which achieved a 92% accuracy rate [15].Rashid made a research on clear view of the target area i.e the location occupied by tumor. He has introduced methods like Anisotropic filtering for noise removal, Support Vector Machine for segmentation and morphological operations to separate the injured area from the normal one. [16].

PROPOSED METHODOLIGY
Through this proposed model brain tumour at an early stage by applying best model out of four different machine learning and deep learning models. The block diagram of the proposed model has been shown in the figure1.

DATASET COLLECTION & DESCRIPTION
The image dataset is collected from Kaggle. It contains almost a total 2870 number of image files. The image files are from 4 different classes, those are , PITUITARY TUMOR, GLIOMA TUMOR , MENINGIOMA TUMOR ,NO TUMOR

Methods used for Brain Tumour Detection
By using this combination of machine learning and deep learning algorithms, along with appropriate data preprocessing techniques, the Brain Tumor Detection model aims to achieve accurate and reliable classification of brain tumor images, contributing to improved medical diagnostics and patient care. The mentioned algorithms used

for model training are Logistic Regression, Support Vector Machine (SVM), Convolutional Neural Network (CNN), and ResNet50.

Logistic Regression

The logistic regression, a general statistical model was actually developed by **Joseph Berkson**, in 1944[8] . In this proposed model Logistic Regression has been applied and its performances have been observed in details. The mathematical function used to represent Logistic Regression is the sigmoid \. The sigmoid function takes any real-valued number and maps it to the range (0, 1). It is commonly used in logistic regression to convert the output of a linear function into a probability value between 0 and 1. The sigmoid function is defined as follows in equation no 1:$\sigma(z) = 1 / (1 + e^{-z})$ (1)

where: $\sigma(z)$ represents the output probability (the predicted probability of belonging to the positive class).

z is the linear combination of the input features and their corresponding weights. It is given by: $z = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + ... + \beta_r x_r$

Support Vector Machine

In this phase Support Vector machine has applied and performance has been analyzed. The SVM algorithm was discovered by **Vladimir N.Vapnik and Alexey Ya.Chervonenkis**[9]. SVM can be used for Regression and Classification problem also. Here the problem is also a classification problems, so SVM can be used. The mathematical representation of Support Vector Machine (SVM) for binary classification can be described as follows: Given a training dataset with input features x_i (where i = 1, 2, ..., n) and corresponding binary class labels y_i (where y_i is either +1 or -1), the goal of SVM is to find the optimal hyper plane that best separates the two classes in the feature space. The hyper plane can be represented as equation no 2 $w \cdot x + b = 0$ (2)

w is the weight vector perpendicular to the hyper plane.

x is the input feature vector.

b is the bias term (intercept).

The decision rule for classifying a new data point x_i is based on the sign of the function $w \cdot x_i + b$:

If $w \cdot x_i + b > 0$, then the data point belongs to the positive class. If $w \cdot x_i + b < 0$, then the data point belongs to the negative class.

Convolution Neural Network

Yann LeCun came with the invention of Convolutional Neural Networks (ConvNets) in 1980[10]. Convolution Neural Network is normally used to classify image data. Here the dataset is an image dataset , so CNN is used to classify the image dataset.

1CNN with 3 Layers

This model contains 3 convolution layers, there is one max-pooling layer and one drop-out layer for each convolution layer. After that the images get flattened , those are sent to the dense layer. The model summary is given below

2 CNN with 4 Layers

This model contains 4 convolution layers, there is one max-pooling layer and one drop-out layer for each convolution layer. After that the images get flattened , those are sent to the dense layer. The model summary is given below :

3 CNN with 5 Layers

This model contains 5 convolution layers, there is one max-pooling layer and one drop-out layer for each convolution layer. After that the images get flattened , those are sent to my dense layer. The model summary is :

Abishanko Mondal and Annwesha Banerjee Majumder

ResNet50

ResNet50 is a specific variant of the Convolutional Neural Network (CNN) architecture known as Residual Network (ResNet). It was introduced by Microsoft Research in 2015 and won the Image Net Large Scale Visual Recognition Challenge (ILSVRC) that year. ResNet50 is one of the ResNet models, and the "50" in its name indicates that it has 50 layers.

RESULT ANALYSIS

In this phase all four models- Logistic Regression, Support Vector Machine, Convolutional Neural Network and ResNet50 have been built and trained on the brain tumour dataset. The outcomes and observations of the experiments have been represented in below section. The level of accuracy attained by each model in this investigation is presented as follows: The logistic regression model achieved an accuracy rate of 80%, while the support vector machine (SVM) model achieved an accuracy rate of 83%. The Convolutional Neural Network (CNN) model, consisting of three layers, achieved an accuracy rate of 88%. The CNN model, consisting of four layers, achieved an accuracy rate of 91%. The Convolutional Neural Network (CNN) model, consisting of five layers, achieved an accuracy rate of 88%. The ResNet50 model achieved an accuracy rate of 92%.

LOGISTIC REGRESSION

Here Logistic Regression is used to develop a model for brain tumorim age classification in   the following different 4 categories. The classification report of this model has shown in figure 3.

SUPPORT VECTOR MACHINE (SVM)

SVM is used here to develop the model for classifying the images in the following 4 classes : 1.'No Tumor', 2. 'Pituitary Tumor' 3. 'Glioma Tumor'4. 'Meningioma Tumor'. The classification report of this model has shown in the figure 4 below.

CONVOLUTIONAL NEURAL NETWORK (CNN)

CNN is one of the most efficient and accurate algorithm for dealing with image classification problem.

3-LAYERS CNN

Here , from the total images of the dataset 70% of images are used for training & 30% of images are used for testing. The variation of Loss and accuracy with the number of epochs are shown in the following figure 5 and 6. The classification report of this model has shown in the figure 7 below.

4-LAYERS CNN

Here , from the total images of the dataset 70% of images are used for training & 30% of images are used for testing. From a total of 2870 files 2009 files are used for training & 861 files are used for validation. The number of epochs in this model is 20. The testing score of the model is 0.9059233665466309 .The variation of Loss and accuracy with the number of epochs has shown in the figure 8 and 9 below. The classification report of this model has shown in the figure 10 below.

5-LAYERS CNN

Here , from the total images of the dataset 70% of images are used for training & 30% of images are used for testing. From a total of 2870 files 2009 files are used for training & 861 files are used for validation. The number of epochs in this model is 20. The testing score of the model is 0.888501763343811 . The variation of Loss with the number of epochs has shown in the figure 11 and 12 below. The classification report of this model has shown in the figure 13 below.

RESNET 50

In this phase from the total images of the dataset 80% of images are used for training and 20% of images are used for testing. From a total of 2870 files 2296 files are used for training and 574 files are used for validation. The number of epochs in this model is 10. The testing score of the model is 0.9216 . The variation of Loss with the number of epochs has shown in the figure 14 and 15 below.

CONCLUSION

In this work comprehensive approach for brain tumour detection from MRI scan images, employing a range of Deep Learning and Machine Learning algorithms has been presented. The models implemented, applying Logistic Regression, SVM, CNN with 4 layers, and ResNet50, have demonstrated promising results in accurately classifying brain tumour images. The achieved test accuracies showcase the effectiveness of the models, with CNN and ResNet50 achieving the highest accuracy rates of 91% and 92%, respectively. The classification report, along with the confusion matrix, provides detailed insights into the models' performance, offering precision, recall, F1-score, and support for each class. Additionally, visualizations of loss vs. epochs and accuracy vs. epochs highlight the successful training process of the models. These remarkable findings suggest that the developed models can be utilized with confidence to determine the presence of brain tumours in MRI scans, paving the way for improved medical diagnostics and patient care in the field of neuroimaging.

ABSTRACT

Cholelithiasis is a typical digestive condition. Bile that has been kept in the gallbladder solidifies into a substance like stone to create gallstones. An excessive amount of bile salts, bilirubin (a bile pigment), or cholesterol can all lead to gallstones. According to age, sex, and regional distribution, cholelithiasis prevalence varies. According to modern research, surgery is the primary method of therapy for this illness. A 29-year-old female patient came to Siddha Hospital with compliments of sudden onset of pain in the right upper quadrant of the abdomen. Along with this pain, moderate back pain, nausea, and vomiting present, bloating stomach, feeling of fullness, and inability to eat fatty food for3 months. Initially she consulted an allopathy hospital and after she had taken a USG abdomen. She had 5-7 stones with the size of 4 – 6mm, She refused surgery and was treated with Siddha medicine for 25days.This case report revealed that the Siddha formulation had a therapeutic effect in the therapy of Cholelithiasis since an Ultra sonogram performed following the Siddha treatment indicated that "No calculus were seen in the gallbladder." The patient's health state significantly improved .

Keywords: Siddha medicine, Pithapaikal , Gall bladder stone

INTRODUCTION

Several bile duct and gallbladder problems are included under gallbladder illnesses. Gallstone production is referred to as cholelithiasis, which may or may not have overt symptoms. Right upper quadrant pain that waxes and wanes, then ceases within a few hours until the next episode, is known as biliary colic and is due to a temporary obstruction of the common bile duct. Cholecystitis is an inflammation of the gallbladder caused by a gallstone obstructing the cystic duct. Once a gallstone reaches the common bile duct, the condition is referred to as choledo cholithiasis. Cholangitis, an inflammation of the bile duct, may arise from this. Gallstone pancreatitis is an inflammation of the pancreas brought on by a gallstone blocking the pancreatic duct. Complicated gallbladder disease refers to acute cholecystitis, choledocholithiasis, cholangitis, and/or gallstone pancreatitis [1]. The causes of gallbladder disease are multi factorial Gallstone development could be influenced by elements that impact hepatic synthesis of cholesterol, gallbladder function (stasis or inflammation), bile acid generation, or intestine absorption of cholesterol and bile acids. Risk factors include both modifiable and non modifiable variables[2].

Cholelithiasis affects 10 to 20% of the global population and has been estimated to affect 2 to 29% of Indians. It is seven times more prevalent in North India. The ratio is 4:1, with women being more impacted than males. Gallstones are reportedly more frequent among forty-year-old, obese, reproductive females. Only surgery, namely gall bladder removal (cholecystectomy), is used to treat cholelithiasis, which impairs protein and fat digestion[3]. The classical texts of Siddha do not specifically mention the illness cholelithiasis. In Siddha, the term "Kaladaippu" refers to a stone that is only spoken in relation to Urinary calculi[4]. Gall bladder stores Pitham, hencethe organ gall bladder is considered as Pittha organ in Siddha , and the stone formed in it can be considered as Pithakaba disease. Siddha medicine has a lot of literature evidence on the medicine for this condition rather than clinical studies. This case study analyzes the treatment of gallstone under Siddha treatment by scientifically [5]. As a result, this case report was taken into consideration in order to describe the potentiality of Siddha medication in the management of cholelithiasis.

Risk factor

Nutritional factors that may increase risk of gallstones include constipation; eating fewer meals per day; low intake of the nutrients folate, magnesium, calcium and vitamin [6] and at least for men, a high intake of carbohydrate, a high glycemic load and high glycemic index diet.[7] Wine and whole-grained bread may decrease the risk of gallstones[8].

Case presentation

A 29 Years old female patient reported to Kongan Siddha clinic , Tanjavore with compliments of pain in right upper quadrant of the abdomen to pain radiating to right sub scapular are since 3 months , feeling of fullness, inability to eat fatty , are associate complients . she consult an Multispecialty Hospital, 4-day history of progressively increasing abdominal pain in the right upper quadrant, associated with vomiting , On Physical examination reveals severe pain at right upper quadrant. Patient was advised to take USG Abdomen, she has 5-7 stones with the size of 4 – 6mm ,They advised for surgery. she refused surgery and came to our clinic and she was treated with Siddha medicine for 25days .

General examination

The general condition of the patient was stable. She had no other associated systemic illnesses. Weight: 56kg; height: 160 cm; body build: normal. Vitals were within the normal limit**.** BP: -110/70 mm Hg**; HR: 85**/min; PR: 83/min; **RR: 20**/min**.**

Physical examination

Per abdomen: Tender, particularly in the upper right quadrant with a positive Murphy's sign.

Diet and lifestyle advice

Gallstone production is influenced by dietary components as well as lifestyle choices. Hence, healthy and regular food was advised which can be digested easily. A low-fat diet was advised to the patient. The patient was advised to eat citrus- flavoured items (such as oranges and lemons).Warm water was also advised for consume.

Follow-up and outcomes

The patient was followed up for 1 month. All symptoms were subsided within 10 days. After 25 days of Siddha treatment, she was advised to go for ultra-sonography, which were compared with that of previous scan reports. In USG scan, no GB stone was identified, and the patient had no symptoms.

DISCUSSION

Gallstones, also known as cholelithiasis, are calcified collections of digestive fluid that can develop in the gallbladder. The gallbladder, a tiny organ, is located directly below the liver, A digestive liquid stored in the gallbladder, flows into the small intestine. Usually, bile contains enough chemicals to break down the cholesterol the liver excretes. However, if the liver excretes more cholesterol than the bile can break down, the extra cholesterol may crystallize and finally solidify into stones.[12] Gallstones are asymptomatic in the majority of cases and affect 6% of men and 9% of women . 1% to 2% of people with asymptomatic gallstones that were unintentionally identified will experience symptoms or consequences each year. In a healthy gallbladder and biliary tree, asymptomatic gallbladder stones do not require treatment unless they cause symptoms.[13][14][15] According to Siddha, Vaatham, Pitham and Kapamall three dhosamplaysa role for the formation of gallstone, excessive increase of Pitham due to spicy food ,alcohol etc. to creates the basic stone formation. An exceptionally sticky combination results when Pittham and Kapham, both aggravated by fatty, heavy diets. This concoction is dried by Vatham, which then shapes it into the form of a stone. Giving Raja peathiennai on empty stomach will balance Thiridhosam and remove the excessive fat in our body.

The Navauppumazhugu and Neermullikasayam are indicated for breaking stone in Siddha classic litraturies. Further, Neermullikasayam is considered as one of the best anti-oxidants, Hypolipidemic activity, Diuretic activity, hepato-protective, and poses anti-inflammatory properties.[16] Karisaalaikarpam has anti-oxidants and hepato protective activity[17] Kadalnooraiparpam(Scraping) will reduce the concentration of bile by reducing mucous hyper secretion and hyper-lipidemia. Motility of the gallbladder is improved due to the Vaatham(Directing Vata in right direction) property. Nvauppumezhugu by its Prabavam, thus dissolves the stone and corrects the metabolic causes and prevent the further formation of Pithapaikal (Cholelithiasis). It significantly decreases TC, TG, and LDL levels while raising HDL levels, facilitating in the dissolution of gall stones caused by cholesterol. Liquefied bile will be filtered and expelled through the urine as a result of the diuretic (lithotriptic) action. Even the patient's overall health and symptoms is gradually becoming better.

CONCLUSION

In this case report, the patient's Cholelithiasis (Pithpaikal) treatment has yielded good outcomes. According to the USG-abdomen, the patient eliminated 4-6mm and 5-7 of gallstones in 25 days by taking Siddha treatment. Furthermore, the patient's general health has significantly improved. There fore, Siddha medicine has the potential to treat cholelithiasis effectively, according to the findings of this case study As a result, those who are affected by the condition should be encouraged to benefit from Siddha medicine and actively contribute to the nation's prosperity by residing enthusiastic lives.

ABSTRACT

Heavy metals are the anxiety of the present days. Among the heavy metals, Chromium (VI) is regarded as a highly toxic heavy metal released largely from textiles, tanneries, electroplating and metallurgical industries. To remove such high concentrations of Chromium (VI), an advanced method is essential. Thus, biosorption using plant derived biosorbent, which is an organic material produced from various sources such as *Prosopis juliflora* dried leaf powder, can be applied successfully for Chromium(VI) reduction. The major objectives of this study was the remediation of the Chromium(VI) heavy metal using *Prosopis juliflora* dried leaf powder and determine the effect of initial metal ion concentration, pH, temperature and biomass loading on the percentage removal of Chromium. The optimum initial metal ion concentration, pH, temperature and biomass loading was found to be 50mg/l, 2.0, 30°C and 4g respectively. Remediation of Chromium(VI) using *Prosopis juliflora* dried leaf powder proved to be effective and removed the maximum concentration of Chromium(VI). Hence, the use of plant derived dried *Prosopis juliflora* leaf powder as biosorbent was highly effective as a sorbent, which could effectively be applied to small as well as large-scale levels.

Keywords: Plant derived biosorbent, Chromium, sorption experiments and *Prosopis juliflora*

Vaideeshwaran *et al.,*

INTRODUCTION

Chromium(Cr) is widely used in many chemical and manufacturing industries, leather, electroplating, tanning, medicine and pigment production (Singh *et al.,* 2021). Usually, more than 2.5–3.0 times the amount of Chromium waste is discharged during the generation of Chromium. For historic purposes, Chromium waste has been simply were piled up; therefore, the release of dissolved Chromium causes significant pollution problems for the soil, surface water and groundwater environment. In polluted soils, Chromium exists predominantly in two states: trivalent Chromium(III) and hexavalent chromium Chromium(VI). Chromium(III) has low toxicity, weak mobility, and low bioavailability and is readily sequestered by natural clays or precipitation as $Cr(OH)_3$ (Yang *et al.,* 2021). In contrast, Chromium(VI) exists mainly as $HCrO_4$ and CrO_4 2- oxyanions, which exhibit strong mobility and high bioavailability (Song and Ma, 2017).The toxicity of Chromium(VI) is roughtly 100 times higher than that of Chromium(III) (Choppala *et al.,* 2015). Therefore, Chromium(VI) compounds have been listed as priority pollutants by the Environmental Protection Agency (EPA) due to their mutagenicity, carcinogenicity and teratogenicity to humans (IARC, 2010). The Chromium(VI) content in contaminated soil is generally more than 1000 mg/kg (Wang *et al.,* 2020), approximately 175 – 1000 times higher than the risk screening value (≤5.7 mg/kg) for the soil contamination of land for development land in soil environmental quality standards in China (GB 36600–2018). Therefore, examining suitable alternate economical approaches for the remediation of Chromium(VI)-polluted soil is an urgent task. The main treatment methods for Chromium(VI) polluted soil remediation include chemical reduction (Jiang *et al.,* 2019), chemical washing (Gautam *et al.,* 2020), electro kinetic remediation (Zhou *et al.,* 2018) and Phytoremediation methods (Muthusaravanan *et al.,* 2018).

Chemical reduction primarily converts highly toxic Chromium(VI) into low toxic and it is difficult to migrate Chromium(III) precipitation through chemical reduction reaction, which can effectively decrease the migration ability and bioavailability of Chromium(VI) (Karimi-Maleh *et al.,* 2021). Chemical washing is more suitable for Chromium(VI) polluted soil with large particle size and high coefficient of permeability, such as sandy soil (Wang *et al.,* 2021). For clay soil, the ability of washing agent in soil is restricted, and the maintaining and adsorption capacity of clay for Chromium(VI) is strong, so its elution efficiency is low. Electro kinetic remediation can remove heavy metal rapidly and efficiently in top soil through electro migration and electro osmotic advection controlled by a direct-current electric field (Kirkelund *et al.,* 2019). The disadvantage of electro kinetic remediation is elevated power consumption and high cost. Phytore mediation is another method, in which plants, due to their intrinsic nature, can remove metals from soil and aquatic environment, but this also suffers from adverse effect such as deposition of heavy metals in their tissue as well as their slow rate of growth which limits their uses for the mentioned purposes on large scale. Adsorption has been used as the best methodology since it is inexpensive, eco-sustainable, and has a high rate of elimination. Various number of mineral and organic low-cost adsorbents were reported in literature for the removal of pollutants such as raw and modified clays, tea wastes, coal fish, saw dust, activated carbon, hazel nut shell and olive tree pruning. The adsorption capabilities of the biomass-based adsorbents can more effectively be utilized if the phytore mediation capability of a given plant is evaluated prior to its conversion into a biosorbent.

MATERIALS AND METHODS

Plant derived bio sorbent
The Prosop is juliflora leafs was collected from around Chidambaram Town of Cuddalore District in Tamil Nadu. Leafs were washed, dried and crushed in primary crusher, air dried in sun for several days until its weight remains constant. After drying, it is crushed in roll crusher and hammer mills. The material obtained through crushing and grinding is screened through BSS mesh with a pore size of 75µm. Finally the product obtained is stored in glass bottles for further use.

Vaideeshwaran *et al.,*

Preparation of stock chromium solution
1000 mg/l of stock chromium solution was prepared by dissolving 2.83 g of Potassium dichromate in 1 litre of double distilled water.

Batch biosorption studies
Batch experiments were carried out in Erlenmeyer flasks by adding known amount of *Prosopis juliflora* dried leaf powder in 100 ml aqueous Potassium dichromate solution. The flasks were agitated on a shaker with a constant shaking rate at 150 rpm for 135 min until equilibrium was attained. Samples were taken from the solution at regular time intervals for testing the residual metal ion concentration in the solution. The residual concentration of chromium ions in the solutions was determined spectrophotometrically at 540 nm using Diphenylcarbazide as the colour complexing agent. The effect of initial Chromium ion concentration on percentage removal of Chromium was analyzed by conducting experiments with different initial Chromium ion concentrations namely 50 mg/l, 100 mg/l, 150 mg/l, 200 mg/l and 250 mg/l under identical conditions of temperature (30°C), pH-2 and biomass loading (4g). The effect of initial pH on percentage removal of chromium was studied by conducting experiments at different initial pH namely 2,3,4,5 and 6 under identical conditions of initial Chromium(VI) ion concentration, temperature and biomass loading. The effect of temperature on percentage removal of chromium was studied by conducting experiments at different temperature namely 25°C, 30°C, 35°C and 40°C under identical conditions of initial Chromium(VI) ion concentration, initial pH and biomass loading. The effect of biomass loading on percentage removal of chromium was analyzed by conducting experiments with different biomass load namely 1g/l, 2g/l, 3g/l, 4g/l and 5g/l under identical conditions of initial Chromium(VI) ion concentration, initial pH and temperature.

Percentage removal of chromium

The percentage removal of chromium was calculated by Percentage removal of chromium $= \dfrac{Co - Ct}{Co}$

$$\frac{\text{Initial concentration} - \text{Final concentration}}{\text{initial concentration}} \times 100$$

Where,
C_O = Initial concentration
C_t = Final concentration
Specific uptake of chromium
The specific uptake of chromium was calculated by

Specific uptake $= \dfrac{Co - Ct}{M} \times v$

Where,
C_O = Initial concentration
C_t = Final concentration
M = Mass of bio sorbent
V = Volume of metal solution

RESULT AND DISCUSSION

The biosorption capacity (quantity of biosorbed metal ions per unit weight of the biosorbent) of the biosorbent increases initially with the increase in metal ion concentration and then attains a saturation value. However, the bio sorption efficiency of the bio sorbent reduced with increase in metal ion concentration. The higher bio sorption efficiency at low metal concentration is due to the complete interaction of ions with the available binding which sites results in higher rates of efficiency. At higher concentrations, the number of metal ions remaining unbound in the solution is high due to the saturation of available binding sites (*Naiya et al.*, 2009). In the present study, *Prosopis juliflora* plant leafs was collected from around Chidambaram Town in Cuddalore District of Tamil Nadu. The effect

of initial metal ion concentration on percentage removal of   chromium by *Prosopis juliflora* dried leaf powder was studied and the results were presented in Fig-1. As initial metal ion concentration of chromium increases from 50(mg/l), 100(mg/l), 150(mg/l), 200(mg/l) and 250(mg/l).The percentage removal of chromium reduced with increasing initial metal ion concentration. The highest chromium removal efficiency 93.5% was observed at 50(mg/l), for higher concentrations considerable reductions were found in chromium removal efficiency. The percentage removal of chromium reduced from 93.5 to 87.5%. The effect of initial metal ion concentration on specific uptake of chromium by *Prosopis juliflora* dried leaf powder was examined and the results were presented in Fig-2. As initial metal ion concentration of chromium increases form 50(mg/l), 100(mg/l), 150(mg/l), 200(mg/l) and 250(mg/l) the specific uptake of chromium increases with increasing initial metal ion concentration from 10.5mg/g to 52.5mg/g, suggesting the competing effects between the metal ions for the binding sites in biomass is very strong at the lower concentration 50(mg/l), it is found to be less. At lower concentrations, all metal ions present in the solution would interact with the binding sites and thus allowed 100% adsorption. At higher concentrations, more Cr ions are left unabsorbed in solution due to the saturation of binding sites. This indicates to be due to the increase in the number of ions competing for the available binding sites in the biomass (Puranik and Paknikar, 1999).

pH is an important parameter for adsorption of metal ions from aqueous solution because it affects the solubility of the metal ions, concentration of the counter ions on the functional groups of the adsorbent and the degree of ionization of the adsorbate during reaction. Biomass has active sites capable of binding metal ions. Thus it is regarded as a complex ion exchanger similar to a manufacturing resin. Such bond formation could be followed by displacement of protons and is dependent in part on the extent of protonation which is determined by the pH (Volesky and Holan, 1995). The effect of pH on percentage removal for the sorption of chromium by *Prosopis juliflora* dried leaf powder was examined and the results are given in the Fig-3. The percentage removal of chromium reduced with pH increases from 2.0 to 6.0. The highest percentage removal of chromium was obtained at pH 2.0 as 90.5%. The pH of the medium affects both the solubility of metal ions and ionization of the functional groups which are acidic and carry negative charges rendering cell walls to be potent scavenger of cations (*Prasad et al.,* 2003). At very low pH, the functional groups remain in in protonated form and create less conductive binding charges condition for the bio sorption due to the reduction in negatively charged surface. However, with the increase in pH, the negative charge density on the cell surface increases due to deprotonation of the metal-bindings sites, thus increasing the attraction of metallic ions with positive charge thus accepting the bio sorption on the cell surface (Abdi, 2015). The effect of temperature on percentage removal for the sorption of chromium by *Prosopis juliflora* dried leaf powder was investigated and the results were summarized in Fig-4. It is evident that the percentage removal of chromium increased with increasing the temperature 25ºC to 30ºC.

The highest percentage removal of chromium was recorded at 25ºC as 86.5% further increasing the temperature up to 40ºC, the percentage removal of Chromium decreased. Similarly the results strongly support the view expressed by (*Ahalya et al.,* 2003). (*Goyal et al.,* 2003) reported that the biosorption efficiency remains unaffected within the range 20-35 ºC, although high temperatures, such as 50 ºC, may increase biosorption in some cases, but these high temperatures may cause permanent damage to microbial living cells and then reduce metal uptake. Adsorption reactions are primarily exothermic and the extent of adsorption increases with decreasing temperature. At high temperature, the density of the boundary layer decreased, due to increased tendency of the metal ion to separated from the *Colocasia esculenta* biomass surface to the solution phase, which resulted in a reduce in the adsorption as temperature was increased (Horsfall and Spiff, 2004). The effect of biomass loading on percentage removal for the sorption of Chromium by *Prosopis juliflora* dried leaf powder was examined and the results were presented in Fig-5. The percentage removal of chromium increases from 76.5 to 89.5%. At 4g of *Prosopis juliflora* dried leaf powder biomass loading was obtained the highest percentage removal of chromium 89.5%. There is no significance difference in removal efficiency for increase of 5g of biomass. This increase in sorption efficiency with increase in biomass concentration is indicative of the higher number of binding sites at increased biomass concentration. The lower increment in percentage removal of chromium observed above biomass of Citrus reticulate waste concentration of 1.0 g/L may be attributed to the strong limitations of chromium ions mobility in the bio sorption medium (*Zubair et al.,* 2008).

CONCLUSION

In the present work, *Prosopis juliflora* biomass showed the high removal effiiency of Chromium(VI) at 50(mg/l) initial concetration of chromium, optimum pH-2, temperature 30°C and biomass loading 4g/l were resulted respectively. It can be concluded that *Prosopis juliflora* biomass is promising biosorbent for removal of heavy metals for polluted sites.

ABSTRACT

Phyllanthus reticulatus Poir. is well known for its significance in traditional medicine all over the world. It has a variety of traditional uses and is used for treating diabetes, bleeding gums, and digestive disorders. Additionally, it is applied topically as a poultice for skin ulcers, sores, and swellings. Present study provides an overview of the phytochemistry and cytotoxicity of *Phyllanthus reticulatus.* Preliminary analysis with methanol, chloroform and petroleum ether extracts showed the presence of terpenoids, flavonoids, steroids, coumarins, phenols, flavonoids, and alkaloids. GC-MS analysis of methanol extract showed the presence of an array of 22 biologically active components with a wide range of therapeutic properties. The MTT assay was used to examine the cytotoxic effects of *Phyllanthus reticulates* on colon cancer cell line HT-29. It showed an IC_{50} value of 69.65 µg/ml which measures the acute toxicity of plant extract for colon cancer cells. This may be due to the presence of anticancer components in *Phyllanthus reticulatus..* Present study thus shows that *Phyllanthus reticulates* can unquestionably be a promising candidate in the search for plants that have anticancer properties. However, more studies are necessary to understand its mode of action and its effect on different tissue sites.

Keywords: *Phyllanthus reticulatus,*Preliminary phytochemical analysis, GC-MS analysis, Cytotoxicity, HT-29 cell line

INTRODUCTION

Plants are a vital source of food, fibre, medicine, and other essentials. Traditional plant based medicine is the primary source of healthcare for more than 80% of the world's population. Due to their potential for use in both science and medicine, herbal remedies are gaining popularity. Herbal treatments are often made up of mixtures of various plant parts, which might improve their medicinal effects. Herbal formulations effectiveness is based on the presence of phytochemical components [1]. A therapeutic plant's medical effectiveness depends on its phytoconstituents, which can work singly or in combination. Alkaloids, flavonoids, phenolics, tannins, saponins, steroids, glycosides, terpenes, and other important phytochemicals all have unique functional qualities [2]. Phytochemicals have multiple functions in plants, such as disease defence, flavour, colour, and aroma enhancement, as well as protection against pathogens, pollutants, stress, drought, and UV rays. Based on their protective role as well as their physical and chemical properties, more than 4,000 phytochemicals have been identified and categorised [3]. Studies have demonstrated the therapeutic benefits of these phytochemicals for a wide range of illnesses, from critical problems like cancer to common coldand emphasises the preventative effects of phytochemicals against chronic diseases [4]. GC coupled to MS is a highly effective technique and a preferred method for analysing small and volatile molecules. It is extremely useful for determining unidentified chemicals and evaluating multi-component systems [5].

By analysing the spectra and comparing them to reference spectra, GC can identify new chemical compounds in complicated combinations [6]. While GC can distinguish between volatile and semi-volatile substances with great resolution, it cannot identify them. However, MS can provide thorough structural details, enabling accurate identification and quantification of the majority of substances [7]. Cancer is a leading cause of death globally, resulting in nearly 10 million deaths annually. Despite efforts to combat the disease, it remains a significant problem, necessitating the development of effective treatments. While innovative synthetic chemotherapeutic drugs have been created, their high cost and limited success in recent years have generated a demand for potent new anticancer medications. Natural products derived from plants have emerged as promising agents for cancer prevention and treatment, as they have demonstrated potential for inhibiting carcinogenesis and related inflammatory processes. The plant kingdom has been a valuable source of cancer drugs, including Podophyllumlignans, Camptotheca alkaloids, Taxusditerpenes, and Vinca alkaloids [8]. Cytotoxicity studies are essential for evaluating the safety of drugs and other substances that come into contact with human cells, which makes them important in drug development and toxicity evaluation. Various methods, such as cell viability assays, flow cytometry, and microscopy, are used to perform cytotoxicity assays. Cell lines derived from single cells are widely used in cancer research and drug development due to their uniform gene responses.

Cancer cell lines serve as valuable in vitro model systems and represent a rich and consistent source of biological material for experimental purposes [9]. *Phyllanthus*, a genus in the Phyllanthaceae family, includes shrubs and trees with an array of applications in pharmacognosy, medicinal chemistry, and economic botany. The genus has garnered significant attention for its anti-HIV, anticancer, and anti-HBV properties, leading to in depth research on its pharmacology and chemistry. In India, fifteen species of *Phyllanthus* are commonly used in traditional medicine. They are also known for their bitter and astringent taste and various medicinal benefits [10]. *Phyllanthus reticulates* Poir.in particular, serves multiple purposes, ranging from food to medicine [11]. Different parts of this plant have traditionally been used to treat a variety of health conditions, including urinary infections, bleeding gums, malaria, and digestive disorders. The *Phyllanthus reticulates* leaves and roots are used to cure fractures, diabetes, and have diuretic and antibacterial effects [12]. Notably, P. *reticulatus* extract has demonstrated anti-proliferative, apoptotic, and anti-migratory actions; these effects are essentially explained by the extract's capacity to cause apoptosis in cancer cells [13]. Taking all these aspects into consideration preliminary phytochemical analysis using different extracts of *Phyllanthus reticulates* was conducted followed by the GC-MS analysis for identifying volatile phytochemical constituents of the methanol extract of the plant. Screening of the cytotoxic activity of extract of

Sajitha Menon and Sreethu

Phylanthus reticulates against colon cancer HT-29 cell line was also performed to elucidate its anti-proliferative property.

MATERIALS AND METHODS

In the present study, phytochemical profiling was carried out by qualitative and GC-MS techniques whereas bioactivity screening mainly emphasized on cytotoxic studies with HT - 29 cell line. *Phyllanthus reticulatus* Poir. was collected at flowering and fruiting stage from Kanjirapuzha region of Palakkad District, Kerala. The aerial parts of healthy plants were collected and brought to the laboratory for subsequent processing. Leaves and stem were separated and shade dried at room temperature for 2-3 weeks. The dried material was made into fine powder and stored in air tight containers. Dried powder (50 g) was extracted with three different solvents - methanol, chloroform and petroleum ether in a soxhlet device for 6–8 hours. The resulting extracts were then filtered, cooled, and concentrated to remove solvent in a rotary evaporator and were kept at 4 °C in amber-coloured glass vials for further studies.

Preliminary Phytochemical Analysis

Methanol, chloroform and petroleum ether extracts of *Phyllanthus reticulatus* were subjected to different chemical tests for the detection of different phytoconstituents using standard procedures [14, 15].

1. Dragendroff's test for alkaloids: Combining 1 ml of sample solution with Dragendroff reagent (potassium bismuth iodide) in a test tube forms an orange-red precipitate if alkaloids are present.
2. Test for phenols: Treating 1 ml of the extract with 5% ferric chloride results in a dark green/brown precipitate, indicating the presence of phenols.
3. Steroid and terpenoid test: Mixing 1 ml of the sample solution with chloroform, followed by a few drops of concentrated sulphuric acid, leads to a reddish-brown color at the interphase if steroids and terpenoids are present.
4. Flavonoid test: NaOH test: Adding 3 ml of diluted NaOH to 1 ml of the sample solution produces a yellow precipitate, disappearing upon addition of diluted HCl, confirming the presence of flavonoids. Lead acetate test: Combining 1 ml of lead acetate solution with the sample solution results in a white turbid precipitate, indicating the presence of flavonoids.
5. Coumarin test: Adding 1 ml of sample to 1 ml of $FeCl_3$ in a test tube reveals a dark green tint, changing to yellow upon addition of five drops of concentrated HNO_3, indicating the presence of coumarins.
6. Cardiac glycoside test (Keller-Killani test): Mixing 2 ml of acetic acid, 1 ml of concentrated H_2SO_4, 1 drop of $FeCl_3$ solution, and 5 ml of extract in a test tube forms a brown ring if cardiac glycosides are present.
7. Tannin test: Lead acetate test: Adding a few drops of 10% lead acetate to 2 ml of the sample results in the formation of a white precipitate, indicating the presence of tannins.Potassium dichromate test: Adding a few drops of the sample to a strong solution of potassium dichromate produces yellow precipitates, confirming the presence of tannins.
8. Saponin test (froth test): Mixing 2 ml of distilled water with 1 ml of the sample solution in a test tube and shaking the mixture creates froth if saponins are present.
9. Quinone test: Treating a small amount of the extract with strong HCl leads to the formation of a yellow colour precipitate, indicating the presence of quinones.

Gas Chromatography-Mass Spectrometry (GC-MS) analysis

The volatile compounds in *Phyllanthus reticulates* methanol extract were identified and measured using GC-MS. The GC-MS analysis was performed using a Shimadzu QP-2010 Plus with a Thermal Desorption System TD 20. It has a 60 m x 0.25 mm x 0.25 m diethylene glycol-coated WCOT column (AB-Innowax 7031428, Japan). Helium served as the carrier gas, flowing at a rate of 1.21 ml/min and with a 77.6 kPa column pressure. Temperatures of 260°C were chosen for the injector and detector. Sample (8 μl) was injected into the column at a split ratio of 10:0. Component separation was achieved using a linear temperature programme that ran from 70°C to 260°C for a total of 65.32 minutes. At a voltage of 70 eV for electron ionisation (EI), the mass range was 40-700 m/z, the detection voltage was

68647

1.5 V, and the peak width was 2s. The constituents were identified by comparing the linear retention indices, MS fragmentation patterns, and mass spectra libraries from the National Institute of Standards and Technology (NIST) and Wiley to those of other compounds with known compositions. They were then quantified using their GC peak regions, and the result was expressed as a percentage.

Cytotoxic evaluation using MTT assay on HT- 29 cell line

HT-29 (Human colon cancer) cell line procured from National Centre for Cell Science (NCCS), Pune, India and maintained in Dulbecco's modified Eagle's medium, DMEM (Sigma Aldrich, USA) was cultured in 25 cm^2 tissue culture flask with DMEM supplemented with 10% FBS, L-glutamine, sodium bicarbonate (Merck, Germany) and antibiotic solution containing: Penicillin (100μg/ml), Streptomycin (100μg/ml), and Amphotericin B (2.5μg/ml). It was kept at 37ºC in a humidified 5% CO_2 incubator (NBS Eppendorf, Germany). The viability of cells were evaluated by direct observation of cells by Inverted phase contrast microscope followed by MTT assay method.

Cells seeding in 96 well plate

Two days old confluent monolayer of cells were trypsinized and then the cells were suspended in 10% growth medium. Cell suspension (100μl, 5x103 cells/well) was seeded in 96 well tissue culture plate. It was incubated at 37ºC in a humidified 5% CO_2 incubator. Compound stock was prepared with 1mg of sample, weighed and dissolved in 1ml 0.1% DMSO using a cyclomixer. The sample solution was filtered with 0.22 μm Millipore syringe filter to ensure sterility.

Anticancer Evaluation

The growth medium was removed after 24 hrs., freshly prepared each compounds in 5% DMEM were serially diluted five times by two fold dilution (100μg, 50μg, 25μg, 12.5μg, 6.25μg in 500μl of 5% DMEM) and each concentration of 100μl were added in triplicates to the respective wells and incubated at 37ºC in a humidified 5% CO_2 incubator. Non treated cells were also maintained as control.

Anticancer Assay by Direct Microscopic observation

Entire plate was observed after 24 hours of treatment in an inverted phase contrast tissue culture microscope (Olympus CKX41 with Optika Pro5 CCD camera)**.**Detectable changes in themorphology of the cells indicating cytotoxicity were noted.

Anticancer Assay by MTT Assay

Fifteen mg of MTT (Sigma, M-5655) was reconstituted in 3 ml PBS until completely dissolved and sterilized by filter sterilization. After incubation period (24 hours), the sample content in wells were removed and 30μl of reconstituted MTT solution was added to all test and control wells, the plate was gently shaken and incubated at 37ºC in a humidified 5% CO_2 incubator for 4 hours. After the incubation period, the supernatant was removed and 100μl of MTT solubilisation solution (DMSO, Sigma Aldrich, USA) was added and the wells were mixed by pipetting up and down in order to solubilize the formazan crystals. The absorbance values were measured by using a microplate reader at the wavelength of 540 nm [16]. The percentage of growth inhibition was calculated using the formula:

% of viability $= \frac{\text{Mean OD Samples}}{\text{Mean OD of control group}} \times 100$

Statistical analysis

Experimental results are expressed as Mean ± SEM. All experiments were replicated three times. The IC_{50} values were calculated from linear regression analysis.

RESULT AND DISCUSSION

The major objective of the present study was to identify the phytochemicals present in the extract through preliminary phytochemical screening as well as to identify volatile components by GC-MS followed by evaluation of cytotoxic potential of *Phyllanthus reticulates* Poir. The initial phytochemical screening was conducted with methanol, chloroform and petroleum ether extracts. The results obtained are summarised under the following subtitles.

Preliminary phytochemical analysis
Medicinal properties of plants may be attributed to the phytochemical compounds in them with properties such as antioxidant activity, antimicrobial effect, anti-cancer properties, etc. In this study, qualitative phytochemical analysis was conducted with methanol, chloroform and petroleum ether extracts of *Phyllanthus reticulatus.*. The observations are summarized in Table 1. The methanol extract of the plant showed the presence of alkaloids, phenol, steroid, terpenoid, coumarins and quinones. Also, the results were positive for flavonoids and tannins in the lead acetate test. The chloroform extract gave results for alkaloids, phenol, steroids, terpenoid and flavonoids. The petroleum ether extract showed the presence of alkaloids, phenol, steroids, terpenoids, coumarins and quinones whereas, tannins gave positive results in the lead acetate test only. Functional bioactive substances of plant origin have been a valuable source for numerous therapeutic medications for humans and have been crucial in the management of numerous diseases all over the world. These substances have a huge variety of chemical and structural properties contributing to their bioactive potential[17]. Presence of a variety of phytocomponents in preliminary analysis is an indication of the therapeutic potential of plant under study. Since methanol extract of *Phyllanthus reticulatus* showed more class of compounds in preliminary screening, this extract alone was considered for further studies.

GC-MS analysis
Gas chromatography-mass spectrometry (GC-MS), is a hybrid analytical technique that combines the separation powers of GC with the detection features of MS. While a sample's volatile components can be separated by GC, MS help to fragment the components and identify them based on their mass. With the improved sample identification and better sensitivity, GC-MS is applicable in a variety of different contexts. The extract in methanol was chosen as a solvent for GC-MS analysis since early phytochemical testing indicated that it contained a higher amount of phytochemicals. Because of its polarity, methanol is a perfect solvent. It can draw molecules from plant components, both hydrophilic and lipophilic. As methanol is quite volatile, we can distil the solvent after extraction at a low temperature to eliminate it. In the present study of GC-MS analysis with methanol extract of *Phyllanthus reticulatus,*the results revealed the presence of 22 different phytoconstituents with various retention times (Table 2). Phytol was the main component followed by Dehydrovomifoliol. Octacosanol, γ-sitosterol, Phytyl palmitate and Henicosanol were found as the remaining major components in *Phyllanthus reticulatus.*.

Phytol and its derivatives have shown a variety of properties including cytotoxic, anti-inflammatory, anti-diabetic, anti-hyperalgesic, antimicrobial, anti-tumour, antifungal and antispasmodic activity [18].The primary monoterpenoids discovered using GC-MS analysis were dehydrovomifoliol. In general, monoterpenoids have a distinctive taste and odour, and they have been utilised as food additives, insecticides, insect repellents, and has immense therapeutic potential[19]. Fatty acid and fatty alcohols were the predominant class of compounds identified followed by terpenoids, steroids and alkane. Palmitic acid , Linoleic acid methyl ester, Oleic acid methyl ester, Methyl stearate, Behenic acid methyl ester, and Methyl lignocerate were the predominant fatty acid compounds and 1-Heneicosanol, 1-Heptacosanol, Henicosanal,Octacosanol,1-Triacontanol derivative were the respective fatty alcohols identified. Neophytadiene, palmitic acid, linoleic acid, oleic acid, phytol, methyl stearate, 1-hepatacosanol, docosanoic acid, squalene, vitamin E, henicosanol, octacosanol, gamma sitosterol and phytyl palmitate identified have displayed sufficient level of anticancer activity in many studies. These phytochemicals often act via regulating molecular pathways which are implicated in growth and progression of cancer. The underlying processes include boosting antioxidant status, neutralising carcinogens, reducing proliferation, inducing cell cycle arrest and apoptosis,

68649

and immune system control[20]. Figure 1 summarizes the peak of volatile compounds identified in the methanol extract of *Phyllanthus reticulatus*. Safer medications for cancer could be developed using bioactive plant compounds and formulations. Even though, numerous plants and phytochemicals have been explored for this purpose, only a few of them have made it to the point of clinical trial. Therefore, the efficiency and toxicological evidence of the *Phyllanthus reticulatus* anticancer phytochemicals necessitate further clinical research. They must be produced in forms with sufficient bioactivity and bioavailability. Since GC-MS analysis identified numerous possible anticancer phytocomponents in *Phyllanthus reticulatus*, methanol extract of the plant was subjected to cytotoxicity studies with HT-29 human colon cancer cell line.

Cytotoxicity studies using MTT assay on HT- 29 cell line

Cytotoxicity activity of *Phyllanthus reticulatus* extract was tested against HT -29 human colon cancer cell line at different concentrations to determine the IC_{50} by MTT assay. Results of different concentrations of *Phyllanthus reticulaues* extract (6.25, 12.5,25,50,100 μg/ml) are graphically represented in Figure 2. The MTT assay of *Phyllanthus reticulatus* showed significant effect on Colon HT-29 cells (Fig. 3). The percentage of cell viability decreases with increasing concentration of test compounds and IC_{50} value was found to be 69.65 μg/ml. The study thus confirmed that *Phyllanthus reticulatus* has potential anticancer activity in terms of cytotoxicity towards colorectal cell line.Many species of Phyllanthus are known to have anticancer properties. *Phyllanthus amarus* is reported to have immunomodulatory and anticancer efficacy [21]. *Phyllanthus emblica* is also known topossess anticancer and cancer-preventive qualities. The anticancer action of *Phyllanthusemblica* has been attributed to its antioxidant function, but undoubtedly other pathways play an equally significant role [22, 23]. Compounds derived from *Phyllanthus niruri* have demonstrated significant cytotoxicity, anticancer and chemomodulatory effects [24]. *Phyllanthus reticulates* is also reported to have a wide range of pharmacological properties, including anticancer properties [25, 26].These properties elucidated by different species of Phyllanthus can be attributed to the diverse combinations of phytochemicals in them. However, only further screening and research alone can reveal the components responsible for the cytotoxicity and the mechanism behind the activity. Present study evidently shows that *Phyllanthus reticulatus* can be a prospective candidate in the screening of anticancer compounds. However in-depth studies are required to identify the active components responsible for the activity and their mechanism of action should be thoroughly explored. Large clinical trials are recommended to unveil the potential of *Phyllanthus reticulatus* and its constituent's enormous ability for treating and preventing various ailments including cancer.

ABSTRACT

Air compressors are critical components in various industrial applications, and their reliable operation is vital for maintaining productivity and preventing costly downtime. Timely detection of compressor failures can significantly reduce maintenance costs and prevent potential hazards. In this study, we propose a novel approach for air compressor failure detection using time series data and Convolutional Neural Networks (CNNs) in deep learning. We collected time series data from multiple sensors installed on an air compressor system, including pressure, temperature, and vibration readings. The dataset was carefully labeled with normal operation periods and various failure scenarios, encompassing different types of mechanical and operational faults. To facilitate the CNN's processing capabilities, we converted the time series data into grayscale images using the Gramian Angular Field (GAF) transformation. For the CNN model design, we employed a customized architecture, leveraging convolution layers, pooling layers, and fully connected layers. Hyperparameters, such as the number of filters, kernel size, and learning rate, were fine-tuned through validation to optimize the model's performance. Data augmentation techniques were utilized to enhance the generalization capability of the model and mitigate over fitting. The proposed CNN-based approach achieved promising results in detecting air compressor failures. Our model exhibited high accuracy in distinguishing normal operation from various failure patterns. Furthermore, the model demonstrated robustness when exposed to unseen test data, indicating its potential for real-world deployment. This research contributes to the field of predictive maintenance for industrial systems by presenting a data-driven approach to air compressor failure

detection. The application of CNNs to process time series data as images proved to be an effective way to capture the underlying patterns associated with impending failures. This study's findings pave the way for developing intelligent condition monitoring systems that can preemptively identify air compressor faults, leading to improved maintenance strategies and reduced operational disruptions.

Keywords: CNN, Air compressor, GAF

INTRODUCTION

Air compressors are widely used in various industrial processes to generate compressed air, serving critical functions such as power tools operation, pneumatic machinery, and HVAC systems. These mechanical devices play a pivotal role in maintaining productivity and efficiency across a spectrum of industries. However, their complex nature and continuous operation make them susceptible to various failures, which can lead to significant economic losses, production downtime, and safety hazards. Traditional methods for monitoring air compressors often rely on rule-based systems and statistical analyses of sensor readings. While these approaches have been effective to some extent, they often lack the ability to capture intricate patterns and subtle anomalies in time series data. Moreover, they struggle to generalize well across diverse failure scenarios, hindering their capability to detect previously unseen faults. With the rapid advancements in deep learning techniques, Convolutional Neural Networks (CNNs) have emerged as powerful tools for pattern recognition tasks, particularly in the realm of computer vision. However, their application to time series data is relatively less explored, presenting a unique opportunity to harness the potential of CNNs for air compressor failure detection.

In this research, we propose a novel approach that leverages the capabilities of CNNs in deep learning to detect air compressor failures using time series data. By converting time series sensor readings into grayscale images through the Gramian Angular Field (GAF) transformation, we enable CNNs to process the data as images. This conversion facilitates the utilization of CNNs' hierarchical feature extraction and pattern recognition abilities, allowing them to discern intricate temporal patterns associated with various failure modes. The objectives of this study are twofold: Firstly, to explore the viability of using CNNs for air compressor failure detection, and secondly, to demonstrate the effectiveness of time series data representation as images through the GAF transformation. By achieving these goals, we aim to contribute to the growing body of research in predictive maintenance for industrial systems.

The remainder of this paper is organized as follows: Section 2 provides a detailed information about Anomaly Approach for Detecting Failures. Section 3 explains failure detection methods using time series data. Section 4 presents the methodology, detailing the dataset, preprocessing steps, CNN architecture, and training procedures. Finally, Section 5 concludes the research paper. In conclusion, this research aims to establish a novel and data-driven approach for air compressor failure detection by combining time series data with CNNs in deep learning. The potential implications of our work include improved maintenance strategies, enhanced safety measures, and increased operational efficiency across industries that rely on air compressor systems.

Anomaly Approach for Detecting Failures

Everything on earth is a signal source. Humans have continuously measured and collected naturally occurring signals such as temperature, wind speed, precipitation, and sunspot intensity to adapt to their environment. Furthermore, in most industries, such as economics (such as sales and market trends), finance (such as stock prices), biomedical (such as heart and brain activity), and manufacturing (such as yield), a large number of different industrial activities have taken place over decades. data has been generated). Across industries, data owners actively collect and use data to improve products, processes, services. Especially with the advent of Industry 4.0, industries have started to intensively use large numbers of sensors to monitor assets and systems simultaneously, leading to increased efficiency and safety [Assendorp J.P *et al*, 2017]. Among various types of data, time-series data has long

been studied in academic fields such as medicine, meteorology, and economics, and is now an essential subject of analysis in most practices. Time series analysis refers to a series of tasks aimed at extracting meaningful information from time series data. The knowledge gained can be used not only to diagnose past behavior, but also to predict the future. Well-known examples of time series analysis include classification, clustering, forecasting, and anomaly detection.

Anomaly detection, the process of identifying unexpected elements or events in data, has become an area of interest for many researchers and professionals, and is now one of the major tasks in data mining and quality assurance. [Blázquez-García A *et al*, 2020]. It has been researched and made great progress in various application fields. Classical methods such as linear model-based methods [Shyu M.L *et al*, 2003], distance-based methods [Angiulli F, 2002], density-based methods [Breunig M.M, 2002], and support vector machines [Scholkopf B, 2001] are still viable choices for algorithms. However, as target systems grow larger and more complex, these methods encounter limitations. This means the inability to work with multidimensional data or deal with the lack of labeled anomalies. In particular, detecting anomalies in time-series data is a challenge because it requires considering together the order and causality between observations along the time axis. Recently, many approaches have been developed to address these challenges. For example, Hu *et al*. [Hu M, 2019] proposed a new computational method using the regression plot (RP), which is a square matrix consisting of time repeating states of a dynamic system. They measure the local recurrence rate (LREC) by scanning the RP using a sliding window and detect abnormalities by comparing the similarity between the LREC curve statistics.

Deep learning, a sub-field of machine learning algorithms inspired by the structure and function of the brain, has gained a lot of attention in recent years. Deep His learning method learns about the complex dynamics of data without assuming the underlying patterns of the data. This property makes it the most attractive choice for time series analysis today. For example, Yang *et al*. [Yan K, 2019] proposed combining an ensemble long short-term memory (LSTM) neural network that stores long-term patterns in time series with the stationary wavelet transform (SWT) to predict energy expenditure. Their experimental results showed that the proposed deep learning method outperforms classical computational methods.   The purpose of this study is to validate state-of-the-art deep learning-based anomaly detection methods for time series data. To our knowledge, previous reviews on this topic [Assendorp J.P *et al*, 2017], [Blazquez-García A, 2020] are limited to a mere classification of models based on descriptions of mechanisms and their properties. In this article, anomalies are discussed and the air compressor time series datasets are the input for the proposed autoencoder approach. The result of the auto encoder approach were processed in to the unsupervised learning to get the better result to predict the Air Compressor information. Hawkins [Hawkins D.M, 1980] described outliers as observations suspected to be generated by different mechanisms because they differ significantly from other observations. In this context, anomalies in time series data can be described as data points within time steps that appear unexpectedly. Significantly different behavior from previous timesteps. Table 1, demonstrates the different forms of anomaly patterns. Following previous studies in the literature, we classify the types of anomalies associated with time series data as follows:

 Abnormal points - A point anomaly is a data point or sequence that suddenly deviates from the norm. Such anomalies appear as transient noise and are often caused by sensor errors or abnormal system behavior. For detection, operators conventionally set upper and lower control limits, commonly referred to as UCL and LCL, respectively, based on previous data. Values outside these limits are considered point anomalies.
Abnormal context Similar to point anomalies, contextual anomalies represent data points or series of data observed over a short period of time, but do not deviate from the normal range in the same way as predefined anomalies bounded by UCL and LCL. is not. However, given the context, the data points are out of range. Expected pattern or shape. Because of this, it can be difficult to detect these anomalies.
Collective anomalies This type of anomaly refers to a set of data points that are considered anomalous because they exhibit changes over time. Individual values within this type of anomaly may seem harmless, but the whole is suspicious. Long-term context is especially important to recognize because they are not immediately recognizable.
Other types of anomalies An anomaly is anything outside of normal, so what is abnormal depends on what you

Sheeba and Hepziba Gnanamalar

define as normal. In general, anomalies can be categorized into one of the three types above, but there are other aspects that can categorize anomalies into more specific categories. In Table 1, Classification and examples of anomalous patterns described in [Bao Y *et al* , 2019].

In summary, an anomaly is a data point that was either very rare or logically impossible to occur in the past. However, multivariate time series data may not classify anomalies as in the previous example. Multivariate time series data require additional considerations and relationships between variables along the time axis. As the number of variables increases, more diverse patterns emerge. In that case, the anomaly pattern may be irregular and the difference between normal and abnormal conditions may not be clear. In that case, the anomaly pattern may be irregular and the difference between normal and abnormal conditions may not be clear. Scanning and aggregating individual univariate time series data to identify anomalies does not guarantee the accuracy of the detection results. This is because only a few anomalous points are masked by other healthy variables and can have a significant impact on the entire target system. The problems can be by extracting unique variables or features to reduce dimensionality, or by using models complex enough to recognize different patterns. Following section is demonstrates how anomaly detection could be done by the CNN approach and the KDCCA.

Failure Detection Methods Using Time Series
A comprehensive review of related literature on failure detection methods using time series data reveals a diverse array of approaches and techniques employed across various industries. Here, the paperpresent a condensed overview of some prominent methodologies, highlighting their strengths and limitations:

Statistical Methods
Statistical methods have been extensively used for failure detection in time series data. Techniques such as mean, median, standard deviation, and trend analysis have proven useful in identifying abnormal patterns and deviations from the expected behavior. While simple and interpretable, statistical methods may struggle to capture complex and subtle anomalies, limiting their effectiveness in handling highly dynamic systems.

Time Series Decomposition
Time series decomposition techniques, like Seasonal and Trend decomposition using LOESS (STL), decompose time series data into its underlying components: trend, seasonal, and remainder. By focusing on the remainder component, anomalies can be detected. While useful for detecting repetitive failures, they may not perform well for detecting sudden or abrupt changes.

Autoregressive Integrated Moving Average (ARIMA)
ARIMA models are widely used for time series forecasting but can also be employed for anomaly detection. These models consider the time dependencies and seasonality in the data. However, they may struggle with capturing non-linear patterns and may require fine-tuning of hyperparameters for optimal performance.

Support Vector Machines (SVM)
SVM has been applied to time series data by converting time series into feature vectors through techniques like Dynamic Time Warping (DTW). SVM can be effective when the data has clear boundaries between normal and abnormal behavior. However, SVM's performance may degrade when dealing with high-dimensional time series data.

One-Class Support Vector Machines (OCSVM)
 OCSVM is a variant of SVM used for unsupervised anomaly detection. It is trained on only normal instances and identifies anomalies as data points lying outside the learned boundaries. OCSVM is useful when labeled failure data is scarce, but it may struggle with complex and multi-modal anomalies.

Neural Networks

Recurrent Neural Networks (RNNs) and Long Short-Term Memory (LSTM) networks have been successfully applied to time series data for anomaly detection. RNNs and LSTMs can capture long-term dependencies, making them suitable for sequential data. However, training deep neural networks may require large amounts of labeled data and can be computationally expensive.

Hybrid Approaches

Several studies combine multiple methods to improve failure detection accuracy. For example, combining statistical methods with machine learning techniques or using ensemble approaches can lead to more robust results.

Deep Learning and CNNs

CNNs, primarily designed for image recognition, have been adapted for time series data using image-like representations, like Gramian Angular Field (GAF) or Markov Transition Field (MTF). These approaches capture complex temporal patterns, making them effective for failure detection. However, CNNs may require larger datasets and longer training times.

Transfer Learning

Transfer learning has gained attention for failure detection in time series data. Pretrained models on similar domains or related tasks can be fine-tuned on specific failure detection datasets, reducing the need for extensive data collection and training. In conclusion, failure detection using time series data involves a broad range of techniques, each with its strengths and limitations. The choice of method depends on the specific characteristics of the data, the nature of the failures to be detected, the availability of labeled data, and the computational resources at hand. As the field of data-driven predictive maintenance continues to evolve, the combination of traditional statistical methods, machine learning algorithms, and deep learning techniques is likely to yield more accurate and efficient failure detection solutions.

Proposed Methodology of CNN

Figure 1 explain the steps for the proposed methods and Figure 2 shows the proposed encoder/decoder network architecture for Top-K DCCA (Divisive Correlation Clustering Algorithm). The encoder consists of three convolutional layers and the decoder consists of three unfolding layers. There is also a clustering module for encoder bottleneck indication. An autoencoder applies a stack of one-dimensional convolutional layers to both the encoder and decoder non convolutional layers. Encoder transforms multivariate

Transform time-series datasets into latent representations and extract relevant characteristics of datasets. The decoder then reconstructs the original dataset from the generic low-dimensional latent representation. Since the decoder reads the input based on the encoded representation of the bottleneck layer, i.e. for H. Conv 3 layers, the activation map from the Conv 3 layer can be viewed as the encoded representation of their stack input record. Therefore, it is clear that the coded representation has a testable relationship with the input features, as the decoder recreates the input features from the activation map of the coded representation. The input size for each level follows the naming convention (stack, number of sizes, number of levels, inputs, order of channels, length). Figure 2. Proposed architecture of a clustering-enhanced deep autoencoder for anomaly detection. In addition to the latent representation, we use a clustering engine to make the latent representation more nuanced so that we can better understand the difference between normal and abnormal behavior. As indicated, we use clustering only on a subset of latent representations selected based on various criteria described below.

The rationale behind this architectural choice is to find a middle ground between consistent latent representations to achieve good reconstruction accuracy while still allowing a subset of latent representations to be subjected to more sophisticated, downstream processing. to make it suitable. The architecture modules are detailed below. Combining autoencoder structures with CNNs is a standard approach for unsupervised deep learning in various image and video processing tasks [Ribeiro M, 2018]. Here, the encoder and decoder use convolutional and deconvolutional

Sheeba and Hepziba Gnanamalar

layers to extract important information in the latent representation. The similar approach for time series analysis as proposed in [Chadha G.S *et al,* 2021]. In this approach, sensor channels and the time dimension form the inputs to the network. As noted in the study, applying standard two-dimensional kernels is not suitable due to the lack of meaningful relationships between sensor channels, resulting in poor performance. A 1D convolution operation is performed on a portion of the total input space called the received field. Given each variable, we denote a receptive field of size nr m to step over the input T m sequence. The pth convolution 1D kernel of the first layer can be represented by the 2D tensor K(p) = [k(p) i,j] 2 Rnrm . Indices i, j specify dimensions along the time or variable axis. The extracted output or feature map from the convolution operation with the convolution kernel is a one-dimensional tensor H=[hi].

Typically, multiple convolution kernels are used in each convolution layer, resulting in multiple feature maps, which are then built into a 2D tensor H = [hi,p]. Each convolution kernel is responsible for extracting different features from the input data. Formally, the convolutional 1D operation can be summarized as follows:
(Batch - Size x Number of Input Channels x Sequence - Length)
In addition to the latent representation, can use a clustering engine to make the latent representation more nuanced so that to better understand the difference between normal and abnormal behavior. As indicated, can use clustering only on a subset of latent representations selected based on various criteria described below. The rationale behind this architectural choice is to find a middle ground between consistent latent representations to achieve good reconstruction accuracy while still allowing a subset of latent representations to be subjected to more sophisticated, downstream processing. to make it suitable.

Let's take a closer look at the architecture module. Combining autoencoder structures with CNNs is a standard approach for unsupervised deep learning in various image and video processing tasks [Ribeiro M, 2018]. Here, the encoder and decoder use convolutional and deconvolutional layers to extract important information in the latent representation. We use a similar approach for time series analysis as proposed in [Chadha G.S *et al*, 2021]. In this approach, sensor channels and the time dimension form the inputs to the network. As noted in the study, applying standard two-dimensional kernels is not suitable due to the lack of meaningful relationships between sensor channels, resulting in poor performance. A 1D convolution operation is performed on a portion of the total input space called the received field. Given each variable, we denote a receptive field of size nr m to step over the input T m sequence. The pth convolution 1D kernel of the first layer can be represented by the 2D tensor K(p) = [k(p)i,j] 2 Rnrm . Indices i, j specify dimensions along the time or variable axis. The extracted output or feature map from the convolution operation with the convolution kernel is a one-dimensional tensor H=[hi]. Typically, multiple convolution kernels are used in each convolution layer, resulting in multiple feature maps, which are then built into a 2D tensor H = [hi,p].Each convolution kernel is responsible for extracting different features from the input data. Formally, the convolutional 1D operation can be summarized as follows

$$h_{i,p} = (x * k)_i = \sum_{g=1}^{n_r} \sum_{f=1}^{m} x_{i+g-1,f} \cdot k_{g,f}^p$$

$$\forall i \in \{1, \ldots, T - n_r + 1\}$$

$$\forall p \in \{1, \ldots, d_{q+1}\},$$

→ Equation 1

In equation 1, where hi,p denotes the output of the (i)th received field and the pth convolution kernel, xi+gπ1, f are the elements of the received field of the input variable kg, f is the convolution kernel, dq+ 1 is , indicates the number of convolution kernels in the given shift. Convolution, also known as transposed convolution, performs the inverse operation of convolution such that each feature map is up sampled to the original input. The weights of the convolution and deconvolution filters can be bound, but are left unbound in this work.

Since the approach dealing with variable-length time series where the time dimension is important, can use a sliding window approach for the time dimension. So can define a window of size mw n with T >> mw > m and analyzed within his one processing step of the deep autoencoder. The time series of the time dimension is then extended by the SW step to define a new window to be processed in the next step. This approach has several advantages over processing the entire input sequence directly. In particular, a single data point fxig is processed multiple times with different settings, which increases the robustness of the resulting convolution kernel. This result was achieved by applying the proposed Top-K DCCA approach to a pure unsupervised learning environment. This means that error information labels were not used to train the model. The results achieved with the proposed approach are compared with the basic architecture and the standard DCCA approach, referred to below as the vanilla architecture

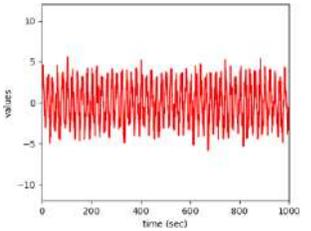
The standard architecture is a 3-layer convolutional architecture, but the top-K DCCA models have been tested on 2- and 3-layer convolutional layer architectures. The architectural description of the Top-K DCCA architecture is as follows[Maas, A.L, 2013]:

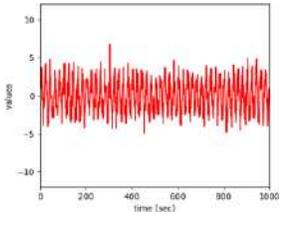
- Three convolutional layers with activation function LeakyReLU.
- All convolutional layers have a kernel size of 3
- The number of convolutional channels starts at 64 channels and doubles for each layer.
- The number of clustering channels is fixed at 128 at the bottleneck layer.
- A lot size of 20, a = 0.6, b = 0.001 is used.
- All models are trained for 100 epochs using an SGD (Stochastic Gradient Descent) optimizer with an L2 penalty of 0.02.

Figure 3, shows about the over all steps to be followed for the failure detection.

CONCLUSION

In conclusion, this study presents a novel and effective approach for air compressor failure detection using time series data and Convolutional Neural Networks (CNNs) in deep learning. By converting the time series data into grayscale images through the Gramian Angular Field (GAF) transformation, we harnessed the power of CNNs' image processing capabilities to capture intricate temporal patterns associated with different failure scenarios. The results demonstrate the viability and potential of CNNs for accurate and reliable air compressor failure detection. The customized CNN architecture, coupled with data augmentation techniques, achieved high accuracy in distinguishing between normal operating conditions and various failure modes. The model's robustness was validated through rigorous testing on an unseen dataset, indicating its ability to generalize well to real-world scenarios. The implications of this research are significant for industries relying on air compressor systems. The CNN-based failure detection system offers a proactive approach to predictive maintenance, enabling early detection of potential faults and preventing costly downtime and potential safety hazards. The utilization of time series data as images for CNN processing represents a novel and effective means to capture temporal dependencies, surpassing the limitations of traditional statistical methods in handling complex and dynamic failure patterns. Nevertheless, there are areas for future exploration and improvement. Fine-tuning the CNN architecture and hyperparameters may lead to even higher detection accuracy and efficiency. Additionally, investigating the incorporation of transfer learning techniques, where CNN models pretrained on related domains can be adapted, could mitigate the need for extensive data collection in specific scenarios.

As the field of deep learning and predictive maintenance continues to evolve, further research and development in this domain will enhance the capabilities of air compressor failure detection systems. It is essential to remain vigilant in monitoring the model's performance in real-world applications and to continuously update the model with new




Sheeba and Hepziba Gnanamalar

data to adapt to changing operating conditions and potential novel failure scenarios. In conclusion, the integration of time series data with CNNs in deep learning has demonstrated significant potential for advancing failure detection methods in air compressor systems, ultimately contributing to improved operational efficiency, reduced maintenance costs, and enhanced safety across various industries

ABSTRACT

Diabetes is one of the hazardous diseases in present era. Diabetic retinopathy is an eye disease which is caused due to diabetes. This condition affects the retina (blood vessels at the back of the eye), resulting in blindness. Diabetic retinopathy can occur in numerous ways, from no symptoms to minor vision impairments. In order to check whether a person got affected or not, the patient should visit a hospital, for the reports and should wait for long time. With the development of Machine learning techniques, there is an ability to look into the problem as well as rapid result. The aim of the examination is to develop a system which might classify the Microaneurysms (early diabetic retinopathy disease) of a patient with a better accuracy. This will remove the noise from fundus images uploaded by user by using hessian based morphological filtering techniques and machine learning classifiers to give accurate result. The performance evaluation of the developed system was tested by comparing with the ground truth of the publically available dataset IDRID.

Keywords: Diabetic Retinopathy (DR), Microaneurysms (MA) Fundus Images, Morphology, Machine learning, Accuracy

Indiradevi Gedela , and Madhavi

INTRODUCTION

Medical imaging has a wide range of applications, including early detection of illnesses and treatment process monitoring [1]. The major goals of medical imaging enhancement are to reduce noise, improve contrast, and assist professionals in making an accurate diagnosis of disorders. Diabetes affects the retina of the eye which causes diabetic retinopathy disease. The retina, which is light-sensitive lining behind the eye, will be damaged. Diabetic Retinopathy mostly affects both the eyes. If the disease is not treated in the early stage, damaged blood vessels can cause vision loss. The DR disease is categorized as Proliferative and Non-Proliferative [2]. One of the first signs of DR that an ophthalmologist seesis MA, which is mostly caused by blood vessel leaks on the surface of the retina. The MAs resemble tiny circular spots on the retinal surface and have a round shape and a red tint. Hemorrhages develop on the retinal surface when the walls of MAs are breached. Exudates are created when blood that leaks from retinal blood vessels contains proteins and lipids. If these exudates build up close to the macula, they can cause complete blindness. The human eye's internal anatomy is made up of several different components, including the iris, macula, vessels, vitreous, optic disc, optic cup, cornea, pupil, etc. The veins in the eye are among the different eye elements that are crucial for analyzing and grading disorders like DR. Additionally existing techniques for diagnosing are remark- ably inefficient in light of the fact that it requires extremely enormous investment, because of which the treatment might lead to incorrect way.

 The fundus cameras are typically used to take images of the eye's interior architecture (retina). When Digital retinography is a popular noninvasive technique for screening and tracking the diseases of eye. Digital images from medical retinal scanning are frequently used in medical diagnosis to find the diseases of eye. Damage to capillaries in the eye is a complication of diabetic retinal diseases include diabetic retinopathy, diabetic macular edoema, glaucoma, and cataracts are shown in figure-1. determining the cause of various eye illnesses, the fundus images are crucial. A telescopic picture of the retinal structure is provided by the intricate optical system of fundus camera's, which is made up of several lenses [3]. The period of this infection has no indications of DR, so it transforms into a genuine challenge to identify it in the beginning stage. Based on the unparalleled breakthrough in Artificial Intelligence (AI) and supervised as well as unsupervised Machine Learning (ML), the accuracy of automated systems for segmenting reti- nal vessels is significantly increased. For the quick detection of eye illnesses, the large-scale implementation of an automated system based on machine learning is extremely important Numerous unsupervised experiments have been suggested to improve retinal images for vascular segmentation. To segment vessel formation, a variety of methods are used, including the morphological top-hat operator and derivatives of Gaus- sian [4], multi-scale morphology and seed point tracking [5], artificial bee colony optimization and fuzzy c-means [6], parallel pipeline median filtering [7] and Hybrid Fusion Method Combining Spatial Image Filtering [8]. The subject of retinal vascular segmentation is addressed in the literature using a variety of U-Net-based models, such as patch-based multi-scale dilated convolution [9], dual encoder scheme [10], second-order attention mechanism based on patche [8], [11], location attention module [12], a technique for cascading residual channel attention [13], and a back-propagation neural network model employed in [14].

This paper focuses mainly on the detection and categoriza- tion of DR based on the identification of MA in the fundoscopy images. The proposed algorithm minimizes problems such as over-fitting and under-fitting. The associated work in the field of clinical research as well as AI shows that, experts have proposed and implemented different AI systems, yet the general survey among these significant learning procedures is still missing at this point in light of everything. Prior investigations on DR disclosure used SVM and other AI estimations to orchestrate, and they are divided into several classes [15].

- **Image Pre-processing** In this phase the fundus image dataset shown in figure-2. The library is critical for image processing because it has a wealth of built-in functions for quick processing [15]. Noisy data is removed from the training images to improve their quality. All of the images have been resized to 128x128.
- **Image Augmentation** Sklearn(Scikit learn) is a library of Python for machine learning that is a simple and

efficient tool for predictive data analysis. It has multiple inbuilt functionalities that can perform certain tasks like image classification, regression, dimensionality reduction, model selection and preprocessing etc.

- **Image Classification phase** The dataset is divided into a training dataset and a testing dataset using the train- test-split function.
- **Machine learning models** LR, DT, SVM, RF, and KNN are used to determine whether an individual is affected by the DR disease or not, due to microaneurysms. Several functions are used to train the model to get good accuracy.
- **Testing** The model is tested using sample testing images to check model performance and obtain better results and accuracy.

These are all the phases involved in developing the model to predict the disease. Flow chart of the process is showed in figure-**3**.

METHODOLOGY

This segment involves the portrayal of the methodology used. The phases engaged in developing this methodology are as follows

Data Acquisition

Any sort of issue can be tackled using AI only when collection of data is provided for training and testing process. The DR dataset which is used is taken from IDRID comprising of high-resolution retina images. Subsequent to gathering the information from IDRID, the dataset is given to the pre-processing phase

PROPOSED WORK

As stated, the number of experts available is very small as compared to the number of diseased population. Thus the al- gorithms developed with the help of computers gives a reliable way to reduce the workload of experts. Microaneurysms (MA) is the key mark and the earliest occurring changes in the retina of a DR affected person. They are small, dark red, circular dots resulting due to swellings in retinal capillaries. The diameter of a Microaneurysms may range from 10 to 125 microns. Since MA are first occurring lesions for DR, their detection can help in early DR detection. The paper describes a simple method for MA detection using morphological techniques. Retinal MAs are focal dilatations of retinal capillaries. They are discrete, localized saccular distensions of the weakened capillary walls and appear as small round dark red dots on the retinal surface. According to the medical definition of MA [2], [16], it is a reddish, circular pattern with a diameter $\lambda < 125 \ \mu m$. We aim to find an MA by its diameter and isolated connected red pixels with a const ant intensity value, and whose external boundary pixels all have a higher value; in the green plane of a RGB image. A preprocessed retinal image is used as preliminary image for MA detection. Sensitivity, specificity, precision and accuracy are chosen as measurement of the accuracy of the algorithm s. All measures can be calculated based on four values, namely the true positive (TP) rate, the false positive (FP) rate, th e false negative (FN) rate, an d the true negative (TN) rate. These values are defined in Table-I . Sensitivity is the percentage of the actual MA pixels that are detected, and specificity is the percentage of non-MA pixels that are correctly classified as non-MA pixels. Precision is the percentage of detected pixels that are actually MAs. Accuracy is the overall per-pixel success rate o f the classifier. The sensitivity, sensitivity, precision and accuracy are computed using equation 1-4, respectively.

Indiradevi Gedela , and Madhavi

$$Sensitivity = \frac{TP}{TP + FN} \qquad (1)$$

$$Specificity = \frac{TN}{TN + FN} \qquad (2)$$

$$Precision = \frac{TP}{TP + FP} \qquad (3)$$

$$Precision = \frac{TP + TN}{TP + TN + FP + FN} \qquad (4)$$

The numbers of MAs are also counted for automated grading of the severity of the DR. Example resulting images of MA detection are shown in Figure-4(a) to 4(h) The method presents the microaneurysms detection from color fundus images of the retina. The method is very simple which makes use of mathematical morphology functions for detection of microaneurysms. Pre-processing of Input Fundus Image Input image is the fundus image of the retina. Let it be denoted by I. Input image is an 8 bit RGB image. The process begins with the extraction. The next step is to remove the noise from the image. The MAs appear as small dark dots In the image. The smallest MA looks similar to a pepper noise. Hence the image is morphological filtered with the kernel size of 5 5 to remove the pepper noise from image. In the proo_sed method, first creates a kernel, which is a structuring element of size (5,5) and shape of an ellipse function. Then it applies two morphological filters, an opening and a closing filter, to the image function. Opening is the process of eroding the image followed by dilation, which is useful in removing noise. Closing is the reverse, dilation followed by erosion, which is useful in closing small holes or dark regions in the image. The kernel is used as the structuring element for both these operations. After that, it applies Sobel operator to find the derivative of the image in the x and y direction. Sobel operator uses a kernel to convolve the image and calculate the gradient of the image intensity. The dx variable stores the derivative of the image in the x direction and dy variable stores the derivative of the image in the y direction. For calculation of the Hessian matrix, which is the sum of the squares of dx and dy, by squaring dx and dy and adding them. In order to calculate the Hessian matrix, which is the sum of the squares of the partial derivatives of an image in the x and y direction, using the following steps:

1. Calculate the partial derivatives of the image in the x and y direction using the Sobel operator or any other derivative operator.
2. Square the values of the partial derivatives in the x and y direction.
3. Add the squared partial derivatives in the x and y direc- tion to get the Hessian matrix.
4. The partial derivatives of the image in the x and y direc- tion are stored in the dx and dy variables, respectively. These values are then squared using the ** operator and added together to calculate the Hessian matrix, which is stored in the hessian variable.
5. The hessian variable will hold the result.

It's worth noting that the Hessian matrix is a 2x2 matrix that contains the second order partial derivatives of the image intensity function. The matrix is used to detect interest points in an image, which can be used for feature detection and matching in computer vision tasks such as object recognition and image registration. The Hessian matrix is a 2x2 matrix that contains the second-order partial derivatives of the image intensity function. This can be done using the Sobel operator or any other derivative operator. The Sobel operator uses a kernel to convolve the image and calculate the gradient of the image intensity. It is used to detect interest points in an image, which can be used for feature detection and matching in computer vision tasks such as object recognition and image registration.

RESULTS AND DISCUSSION

The algorithm is tested on Indian Diabetic Retinopathy Im- age Dataset (IDRID). It is one of the first database representa- tive of an Indian population [17], consists of both normal, and DR images. This section explains the experimental findings for the suggested method. IDRID datasets were used for the tests in order to assess the effectiveness of the proposed DR system. 35,126 fundus photos taken by fundus cameras under various environmental circumstances are included in IDRID datasets. The five fundus image types used in the standard IDRID dataset are non-DR, mild severe, moderate severe, severe, and PDR with varying percentages, as indicated in Table. First, fundus images were scaled down to 224×224 pixels in order to achieve efficient computational results. The pre-processing operation was next carried out for better outcomes, then microaneurysm segmentation. To obtain a flexible implemen- tation of the logistic regression, SVM, and KNN were used to obtain the significant results. Sensitivity, specificity, precision and accuracy in this experiment are 81.61%, 99.99%, 63.76% and 99.98%, respectively. The accuracy curves of proposed method with different classifiers are shown the figure-5.

CONCLUSION

The number of diabetic patients has risen during the past several years. As a result, diabetic retinopathy (DR) is now a significant problem. Deep neural networks have been utilised to tackle this issue by playing a crucial part in identifying the symptoms in the very early stages of DR. The feature extraction of retinal fundus pictures for the proposed DR classification system was done using the logistic regression, Random forest, Decision Tree, SVM, and KNN methods. Sen-sitivity, specificity, precision and accuracy in this experiment are 81.61%, 99.99%, 63.76% and 99.98%, respectively.

ABSTRACT

In this paper we introduced the basic concept of k - Hermitian Matrix, some Properties of Hermitian Matrix given. Our Intention is to define $k-$ Perhermitian and $k-$ SkewPerhermitian as a Generalized of $k-$ Perhermitian extend many of the basic concept and theorems on $k-$ Perhermitian Matrix. Also we discussed $k-$ SkewPerhermitian basic concept, therorems and example are given.

Keywords: *Hermitian , $k-$ Hermitian, $k-$ Perhermitian, $k-$ Skew Perhemitian..*

INTRODUCTION

Centrosymmetry corresponds to symmetry about the centre of the Matrix Persymmetry is symmetry across the secondary main diagonal. Ann Lec [1] has discussed secondary symmetric and skew symmetric secondary orthogonal matrices Cantoni and Butler[2] have studied Eigenvalue and Eigenvactors of symmetric centrosymmetric matrices, James and Weaver][3] have characterize centrosymmetric(cross symmetrices) their basic properties, Eigenvalue and Eigenvectors, Hazewinkel and Michiel[4] have studied symmetric matrices, Hill Bules and Waters[5] have focused on Perhermitian , Haze winkel and Michiel [6] have studied Hermitian matrix, Hill and Wters have studied On k– Real and k– Hermitian matrices. Here Skew Perhemitian is equal to S Perhemitian.

Definition 1

Punithavalli and Vijayalakshmi

A square matrix P be complex number of order n × n is said to be hermitian if $P = P^H$

(ie) $p_{ij} = \overline{p_{ij}} \, \forall \overline{i, j}$.

Definition 2

A square matrix P be complex number of order n × n is said to be Perhermitian if   the elements of P satisfy the relation $p_{ij} = \overline{p_{n+1-j,n+1-i}}$ (ie) $P = P^H$

Preliminaries and Notations

Let P is Perhermitian , P^H is conjugate transpose of P . Let K be a fixed product of disjoint transposition in S_n and a Perhermitian K associated with KI , K satisfies the properties $K^2 = I$, $K^T = K$

Theorem 1

Let P be complex number of order n × n is k−Perhermitian then $P = KP^H K$

Proof.

$$KP^H K = KPK \text{ where } P^H = P$$

$$= PKK \text{ where } PK = P^H K$$

$$= PK^2 = P.$$

Theorem 2

Let P be complex number of order n × n is k−Perhermitian then $P^H = KPK$

Proof.

$$KPK = KP^H K \text{ where } P = P^H$$

$$= P^H KK \text{ where } KP^H = P^H K$$

$$= P^H K^2 = P^H.$$

Example

Let $P = \begin{pmatrix} 9 & 2+3i & 10 \\ 2-3i & 7 & 2-3i \\ 10 & 2+3i & 9 \end{pmatrix}$, $P^H = \begin{pmatrix} 9 & 2+3i & 10 \\ 2-3i & 7 & 2-3i \\ 10 & 2+3i & 9 \end{pmatrix}$

(i) $KP^H K = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} 9 & 2+3i & 10 \\ 2-3i & 7 & 2-3i \\ 10 & 2+3i & 9 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$

$= \begin{pmatrix} 10 & 2+3i & 9 \\ 2-3i & 7 & 2-3i \\ 9 & 2+3i & 10 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$

$$= \begin{pmatrix} 9 & 2+3i & 10 \\ 2-3i & 7 & 2-3i \\ 10 & 2+3i & 9 \end{pmatrix}$$

$$= P$$

(i) $KPK = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} 9 & 2+3i & 10 \\ 2-3i & 7 & 2-3i \\ 10 & 2+3i & 9 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$

$$= \begin{pmatrix} 10 & 2+3i & 9 \\ 2-3i & 7 & 2-3i \\ 9 & 2+3i & 10 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 9 & 2+3i & 10 \\ 2-3i & 7 & 2-3i \\ 10 & 2+3i & 9 \end{pmatrix}$$

$$= P^H$$

Theorem 3

If P be complex number of order $n \times n$ is $k-$Perhermitian then $P + P^H$ is also $k-$Perhermitian

Proof.

A Matrix P be complex number of order $n \times n$ is $k-$Perhermitian then $P = KP^H K$ .Since P^H is also $k-$ Perhermitian then $P^H = KPK$

To prove $P + P^H$ is also $k-$ Perhermitian

show that $P + P^H = K(P + P^H)K$

Now $K(P + P^H)K$ $\quad = K(P + P^H)^H K$

$= K(P^H + (P^H)^H)K$

$= K(P^H + P)K$

$= KP^H K + KPK$

$= P + P^H.$

Example

Let $P = \begin{pmatrix} 4 & 2+5i & 5 \\ 2-5i & 6 & 2-5i \\ 5 & 2+5i & 4 \end{pmatrix}, \qquad P^H = \begin{pmatrix} 4 & 2+5i & 5 \\ 2-5i & 6 & 2-5i \\ 5 & 2+5i & 4 \end{pmatrix}$

$P + P^H = \begin{pmatrix} 8 & 4+10i & 10 \\ 4-10i & 12 & 4-10i \\ 10 & 4+10i & 8 \end{pmatrix}, \quad (P + P^H)^H = \begin{pmatrix} 8 & 4+10i & 10 \\ 4-10i & 12 & 4-10i \\ 10 & 4+10i & 8 \end{pmatrix}$

$$K(P + P^H)^H = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} 4 & 2+5i & 5 \\ 2-5i & 6 & 2-5i \\ 5 & 2+5i & 4 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 8 & 4+10i & 10 \\ 4-10i & 12 & 4-10i \\ 10 & 4+10i & 8 \end{pmatrix}$$

$$= P + P^H.$$

Theorem 4

If P be complex number of order n×n is k−Perhermitian PP^H and P^HP is also k−Perhermitian .

Proof.

A Matrix P be complex number of order n×n is k−Perhermitian then P = KP^HK .since P^H is also k−Perhermitian then $P^H = KPK$.

show that

$$K(PP^H)^HK = K((P^H)^HP^H)K$$

$$= K(PP^H)K$$

$$= (PP^H)^H$$

$$= (P^H)^HP^H$$

$$= PP^H.$$

Similarly $K(P^HP)^HK = P^HP$

Example

$$\text{Let } P = \begin{pmatrix} 8 & 4+2i & 10 \\ 4-2i & 6 & 4-2i \\ 10 & 4+2i & 8 \end{pmatrix}, \qquad P^H = \begin{pmatrix} 8 & 4+2i & 10 \\ 4-2i & 6 & 4-2i \\ 10 & 4+2i & 8 \end{pmatrix}$$

$$PP^H = \begin{pmatrix} 184 & 96+48i & 180 \\ 96-48i & 76 & 96-48i \\ 180 & 96+48i & 184 \end{pmatrix}, \quad (PP^H)^H = \begin{pmatrix} 184 & 96+48i & 180 \\ 96-48i & 76 & 96-48i \\ 180 & 96+48i & 184 \end{pmatrix}$$

$$K(P + P^H)^H = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} 184 & 96+48i & 180 \\ 96-48i & 76 & 96-48i \\ 180 & 96+48i & 184 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 184 & 96+48i & 180 \\ 96-48i & 76 & 96-48i \\ 180 & 96+48i & 184 \end{pmatrix}$$

$$=PP^H.$$

Theorem 5

If P and Q are k−Perhermitian then PQ is also k−Perhermitian .

Proof.

Let P and Q are k− Perhermitian then P = KP^{H}K , Q = KQ^{H}K . Since P^H and Q^H are also k−Perhermitian , then P^H = KPK, Q^H = KQKTo prove PQ is k− Perhermitian
show that PQ = K(PQ)^{H}K

Now

$$\begin{aligned} K(PQ)^H K &= K(Q^H P^H)K \\ &= K(KQK)(KPK)K \\ &= K^2 Q K^2 P \\ &= QP = PQ. \end{aligned}$$

Example

Let $P = \begin{pmatrix} 6 & 2i \\ -2i & 6 \end{pmatrix}, Q = \begin{pmatrix} 7 & 3i \\ -3i & 7 \end{pmatrix}$

$PQ = \begin{pmatrix} 48 & 32i \\ -32i & 48 \end{pmatrix}, \quad (PQ)^H = \begin{pmatrix} 48 & 32i \\ -32i & 48 \end{pmatrix}$

$$\begin{aligned} K(PQ)^H &= \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 48 & 32i \\ -32i & 48 \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \\ &= \begin{pmatrix} 48 & 32i \\ -32i & 48 \end{pmatrix} \\ &= PQ. \end{aligned}$$

Theorem 6

If P and Q are k− Perhermitian of same order then $\lambda_1 P + \lambda_2 Q$ is also k−Perhermitian .Where λ_1 and λ_2 are scalar.

Proof.

Punithavalli and Vijayalakshmi

Let P and Q are k−Perhermitian then $P = KP^HK$ and $Q = KQ^HK$.

Since P^H and Q^H are also k− Perhermitian, then $P^H = KPK$, $Q^H = KQK$. Now let us show that, $\lambda_1 P + \lambda_2 Q$ is k−Perhermitian.

For

$$\text{consider} \quad K(\lambda_1 P + \lambda_2 Q)^H K \quad = \quad K(\lambda_1 P^H + \lambda_2 Q^H)K$$

$$= \quad \lambda_1 K P^H K + \lambda_2 K Q^H K$$

$$= \quad \lambda_1 P + \lambda_2 Q$$

Theorem 7

If P and Q are k−Perhermitian of same order then PQ + QP is also k−Perhermitian.

Proof.

Let P and Q are k−Perhermitian then $P = KP^HK$ and $Q = KQ^HK$. Since P^H and Q^H are also k−Perhermitian, then $P^H = KPK$, $Q^H = KQ$

To Prove PQ + QP is k−Perhermitian, show that

$$K(PQ + QP)^H K = K((PQ)^H + (QP)^H)K$$

$$= \quad K(PQ)^H K + K(QP)^H K$$

$$= \quad KPQK + KQPK$$

$$= \quad PQ + QP.$$

Example

$$\text{Let } P = \begin{pmatrix} 6 & 2i \\ -2i & 6 \end{pmatrix}, Q = \begin{pmatrix} 7 & 3i \\ -3i & 7 \end{pmatrix}, \quad PQ = \begin{pmatrix} 48 & 32i \\ -32i & 48 \end{pmatrix}$$

$$QP = \begin{pmatrix} 48 & 32i \\ -32i & 48 \end{pmatrix}, \quad PQ + QP = \begin{pmatrix} 48 & 32i \\ -32i & 48 \end{pmatrix}, \quad (PQ + QP)^H = \begin{pmatrix} 96 & 64i \\ -64i & 96 \end{pmatrix}$$

$$K(PQ + QP)^H = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} 96 & 64i \\ -64i & 96 \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 96 & 64i \\ -64i & 96 \end{pmatrix}$$

$$= PQ + QP.$$

Punithavalli and Vijayalakshmi

Theorem 8

Let P be complex number of order $n \times n$ is k– Perhermitian then KP is also k–Perhermitian .

Proof.

A matrix P be complex number of order $n \times n$ is k– Perhermitian then $KP^HK = P$ .Since P^H is also is k– Perhermitian then $KPK = P^H$

We will show that,

$$\text{Now } K(KP)^HK = K(K^HP^HK)$$
$$= KP^H(KK^H)$$
$$= K(P)$$
$$= K$$

Definition 3

A square matrix P be complex number of order $n \times n$ is said to be Skew hermitian if

$-P = P^H$

(ie) $p_{ij} = -p_{ij}$ $\forall \overline{i, j}$.

Definition 4

A square matrix P be complex number of order $n \times n$ is said to be S Perhermitian if   the elements of P satisfy the relation $p_{ij} = \overline{-p_{n+1-j, n+1-i}}$ (ie) $-P = P^H$

Theorem 9

Let P be complex number of order $n \times n$ is k– S Perhermitian then $-P = KP^HK$

Proof.

$KP^HK = K(-P)K$ where $P^H = -P$

$= -PK = -P$.

Theorem 10

Let P be complex number of order $n \times n$ is k– S Perhermitian then $-P^H = KPK$

Proof.

$$KPK = K(-P^H)K$$
$$= -P^HK^2 = -P^H$$

Example

$$\text{Let } P = \begin{pmatrix} 7i & 4-6i & 0 \\ -4-6i & 0 & -4-6i \\ 0 & 4-6i & 7i \end{pmatrix}, \quad P^H = \begin{pmatrix} -7i & -4+6i & 0 \\ 4+6i & 0 & 4+6i \\ 0 & -4+6i & -7i \end{pmatrix}$$

$$KPK = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} 7i & 4-6i & 0 \\ -4-6i & 0 & -4-6i \\ 0 & 4-6i & 7i \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 0 & 4-6i & 7i \\ -4-6i & 0 & -4-6i \\ 7i & 4-6i & 0 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 7i & 4-6i & 0 \\ -4-6i & 0 & -4-6i \\ 0 & 4-6i & 7i \end{pmatrix}$$

$$= -P^H.$$

Theorem 11

Let P be complex number of order n × n is k−S Perhermitian then KP is also k−SPerhermitian .

Proof.

A matrix P be complex number of order n × n is k−S Perhermitian then $KP^HK = -P$.

Since P^H is also is k− S Perhermitian then $KPK = -P^H$

We will show that, $KP = -K(KP)^HK$

$$\text{Now } K(KP)^HK = -K(P^HK^HK)$$
$$= -K(P^H(KK^H))$$
$$= -K(P^HI)$$
$$= -K(-P) = KP.$$

Example

$$\text{Let } P = \begin{pmatrix} 4i & 8+2i & 0 \\ -8+2i & 0 & -8+2i \\ 0 & 8+2i & 4i \end{pmatrix}, \quad P^H = \begin{pmatrix} -4i & -8-2i & 0 \\ 8-2i & 0 & 8-2i \\ 0 & -8-2i & -4i \end{pmatrix}$$

$$KP = \begin{pmatrix} 0 & 8+2i & 4i \\ -8+2i & 0 & -8+2i \\ 4i & 8+2i & 0 \end{pmatrix}, (KP)^H = \begin{pmatrix} 0 & -8-2i & -4i \\ 8-2i & 0 & 8-2i \\ -4i & -8-2i & 0 \end{pmatrix}$$

$$KP = -K(KP)^HK$$

Punithavalli and Vijayalakshmi

$$= \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} \mathbf{0} & -\mathbf{8}-\mathbf{2i} & -\mathbf{4i} \\ \mathbf{8}-\mathbf{2i} & \mathbf{0} & \mathbf{8}-\mathbf{2i} \\ -\mathbf{4i} & -\mathbf{8}-\mathbf{2i} & \mathbf{0} \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

$$= -\begin{pmatrix} \mathbf{0} & -\mathbf{8}-\mathbf{2i} & -\mathbf{4i} \\ \mathbf{8}-\mathbf{2i} & \mathbf{0} & \mathbf{8}-\mathbf{2i} \\ -\mathbf{4i} & -\mathbf{8}-\mathbf{2i} & \mathbf{0} \end{pmatrix}$$

$$= \begin{pmatrix} \mathbf{0} & \mathbf{8}+\mathbf{2i} & \mathbf{4i} \\ -\mathbf{8}+\mathbf{2i} & \mathbf{0} & -\mathbf{8}+\mathbf{2i} \\ \mathbf{4i} & \mathbf{8}+\mathbf{2i} & \mathbf{0} \end{pmatrix}$$

$= KP.$

Theorem 12

If P and Q are $k-$ S Perhermitian matrix then PQ is also $k-$ S Perhermitian matrix.

Proof.

Let P and Q are $k-$ S Perhermitian matrix then $-P = KP^HK$, $-Q = KQ^HK$. Since P^H and Q^H are also $k-$ S Perhermitian , then $-P^H = KPK$, $-Q^H = KQK$. Toprove PQ is $k-$ S Perhermitian we will show that $PQ = K(PQ)^HK$ Now

$$\begin{aligned} K(PQ)^HK &= K(Q^HP^H)K \\ &= K(-KQK)(-KPK)K \\ &= K^2QK^2PK^2 \\ &= QP = PQ. \end{aligned}$$

Theorem 13

If P and Q are $k-$ S Perhermitian of same order then $PQ - QP$ is also $k-$ SPerhermitian.

Proof.

Let P and Q are $k-$ S Perhermitian then $-P = KP^HK$ and $-Q = KQ^HK$. Since P^H and Q^H are also $k-$ S Perhermitian, then $-P^H = KPK$, $-Q^H = KQK$ .To Prove $PQ - QP$ is $k-$ S Perhermitian ,

We will show that $PQ - QP = K(PQ - QP)^HK$

$$\begin{aligned} K(PQ - QP)^HK &= K((PQ)^H - (QP)^H)K \\ &= K(PQ)^HK - K(QP)^HK \\ &= K(Q^HP^H)K - K(P^HQ^H)K \\ &= K[(-KQK)(-KPK)]K - K[(-KPK)(-KQK)]K \\ &= K^2PK^2QK^2 - K^2QK^2PK^2 \\ &= PQ - QP. \end{aligned}$$

Theorem 14

If P be complex number of order $n \times n$ is k– S Perhermitian then $P - P^H$ is also k–S Perhermitian

Proof.

A Matrix P be complex number of order $n \times n$ is k– S Perhermitian then $-P = KP^H K$. Since P^H is also k– S Perhermitian then $-P^H = KPK$

The prove $P - P^H$ is also k– S Perhermitian show that $P - P^H = K(P - P^H)K$ Now $K(P - P^H$

$)^H K$

$$= -[K(P - P^H)^H]K$$

$$= -[K(P^H - (P^H)^H)]K$$

$$= -[K(P^H - P)K]$$

$$= -[KP^H K - KPK]$$

$$= -[-P - (-P^H)]$$

$$= P - P^H.$$

Example

Let $P = \begin{pmatrix} 8i & 12+7i & 0 \\ -12+7i & 0 & -12+7i \\ 0 & 12+7i & 8i \end{pmatrix}$, $P^H = \begin{pmatrix} -8i & -12-7i & 0 \\ 12-7i & 0 & 12-7i \\ 0 & -12-7i & -8i \end{pmatrix}$

$P - P^H = \begin{pmatrix} 16i & 24+14i & 0 \\ -24+14i & 0 & -24+14i \\ 0 & 24+14i & 16i \end{pmatrix}$, $(P - P^H)^H = \begin{pmatrix} -16i & -24-14i & 0 \\ 24-14i & 0 & 24-14i \\ 0 & -24-14i & -16i \end{pmatrix}$

-     $-K(P - P^H)^H K = -\begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} -16i & -24-14i & 0 \\ 24-14i & 0 & 24-14i \\ 0 & -24-14i & -16i \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$

$= -\begin{pmatrix} -16i & -24-14i & 0 \\ 24-14i & 0 & 24-14i \\ 0 & -24-14i & -16i \end{pmatrix}$

$= \begin{pmatrix} 16i & 24+14i & 0 \\ -24+14i & 0 & -24+14i \\ 0 & 24+14i & 16i \end{pmatrix}$

$= P - P^H.$

CONCLUSION

We introduceed the concept of k -Perhermitian and k - S Perhermitian , We also described a method for finding the basic concept and theorems on k -Perhermitian andk - S Perhermitian example are given

ABSTRACT

India is known as the "Diabetes Capital of the World," indicating that it has the world's biggest number of diabetes cases. Diabetes is a common illness in India as well as the rest of the world. On the other hand, an increase in blood sugar levels can cause severe complications such as Diabetic Retinopathy and Diabetic Neuropathy. We will be dealing with Diabetic Retinopathy, often known as Diabetic Eye Disease, in this project. As previously stated, it is caused by excessive increase in blood sugar levels due to diabetes. Diabetic Retinopathy is a disorder that disturbs the fundus in the eye and can have serious concerns if left untreated. If not treated early on, it might result in permanent blindness. This permanent loss of vision , however, can be avoided if detected early. Hence, we are proposing method that can help us in detection of Diabetic Retinopathy in advance and take preventive measures against it.

Keywords: Diabetic retinopathy, convolutional neural networks, retina, blood sugar

INTRODUCTION

The healthcare industry is one of India's greatest industries, and it has grown more effective when ailments are diagnosed and treated early on. Diabetes is a disease in which blood sugar levels rise as a result of a lack of insulin in the body. According to the studies it is known that diabetes affects around 425 million adults across the world[2]. It not only increases blood sugar levels but also affects other parts of body like the nerves, heart,retina, and kidneys [1][2]. In this project we are dealing with Diabetic Retinopathy(DR), an eye disease. Diabetic Retinopathy is a diabetic disorder that causes the retina's blood vessels to deepen and results in outflow fluids and blood. If DR progresses to an advanced extent, it might result in vision damage. DR is responsible for 2.6 percent of all blindness worldwide.

Patients with diabetes who have been unwell for a long period are more prone to develop DR. Regular retina screening is necessary for diabetic individuals to identify and treat diabetic retinopathy (DR) at its early stage in order to avert blindness. The presence of various sorts of lesions on a retina picture is used to detect DR[3].

Diabetic Retinopathy is a type of disease that can be caused to any person who is suffering from diabetes. It can be detected by the appearance of microaneurysms (MA), hemorrhages (HM), hard and soft exudates (EX). In general, there are four stages of Diabetic Retinopathy. Below is a list of them.

1. Microaneurysms only present in mild non-proliferative DR.
2. Moderate non-proliferative DR: Microaneurysms and other vascular abnormalities (example: hard exudates, cotton wool spots dot and blot haemorrhages).
3. Severe non-proliferative DR: It also includes intraretinal haemorrhages (20 per quadrant), obvious venous pelleting in two quadrants, or microvascular anomalies in one quadrant.
4. Proliferative DR:Severe nonproliferative DR with at least one neovascularization/vitreous/pre-retinal haemorrhage.

The goal of this research is to classify an eye image (either right or left) into one of the following classes of eyesight: 0 indicates no DR, 1 shows mild DR, 2 shows moderate DR, 3 indicates severe DR, and 4 shows Proliferative DR. As a result, our mission is to develop an sovereign analytic system capable of recognising and naming illness types.The following figures[1.1,1.2,1.3,1.4 and 1.5] shows the various stages of DR.

LITERATURE SURVEY

Carrera suggested an unique technique to detect Diabetic Retinopathy from input retinal images using Digital Image Processing in 2016 [9]. It was put to the test on 400 retinal pictures from a database. Rao devised a hybrid technique in 2016 that combined morphological processing and fuzzy C-means clustering with SVM classifier to detect exudates and microaneurysms (lesions) in raw retinal images. In 2016, Yadav published a study that looked at various fundus/retinal image enhancing techniques that can be used to detect Diabetic Retinopathy [5]. In 2016, Gupta presented a method for detecting blood vessels in the eye[6]. It was accomplished using Gaussian filtering and the Morphological Administrator. Seoud introduced a method for automatically detecting and validating haemorrhages and micro aneurysms using a given colour fundus image in 2016[7]. Karami presented a dictionary learning (DL)-based technique in 2017. It was created utilising the K-SVD technique to construct the best atomic representation of fundus images based on pre-learned dictionaries.

The Proposed System's Architecture

In this project, we have rendezvous a user interface using HTML and CSS, using which the user can embed/upload an input image. After uploading the image, the image is then sent the trained model for classification, in this phase it undergoes several steps. In first step, the input image undergoes pre-processing in order to filter the noise if any present in that image. After that pre-processed image will be used for selecting the features. The features will be selected and the model gets trained that helps to predict whether the input image has Diabetic Retinopathy or not. After that outcomes reinstate back to the User interface and are displayed in a new web page.

Implementation

The project involved in the development of the mode (using CNN) that helps in detecting whether a person is affected by the disease or not. In order to perform the image pre-processing we have used python tools namely pillow for image transformations.

Convolutional Neural Networks, also known as Shift Invariant or Space Invariant Artificial Neural Networks, are a type of Deep Neural Network used in Deep Learning (SIANN). Between the input layer and the output layer, there are multiple hidden layers. Shared weight architecture is used for calculation of weights at each nodes in the network. It is fully connected and was inspired by biological process in human brain. Fig .4 depicts the steps involved in CNN.

Venkat Narayana Rao *et al.,*

Algorithm CNN

Step 1:Convolution Operation – the image becomes abstracted to a feature map ReLU layer - A Rectified Linear Unit layer, produces a linear functionalit

Step 2: Pooling - Convolutional networks can be neighborhood or worldwide pooling layers to speed up the concealed calculation. Pooling layers lessen the dimensionality of data by linking the outputs of dendrite clusters at one layer into a single dendrite at the subsequent layer.

Step 3: Flattening – moves from pooled to flattened layers

Step 4: Full connection – In completely associated layers, every dendrite in one layer is associated with each and every dendrite in the following layer.The inputs are always taken in tensor format in CNN, where it contains input image height, weight and number of channels.

Convolution layers are a series of resemblant point maps generated by sliding multiple kernels (feature detectors) across an input and projecting element wise dot(or pixel) as feature maps, assuming the input of the convolution Neural network has the dimension H,W,C (stacked together). still, k2, C confines, If each kernel in the set k1, k2, C dimensions, then K_d := size of the set determines how many output layers the convolution layer will have. Assume there's a stride Zs that represents the sliding element of the point chart, as well as a zero-padding parameter Z_P that regulates the size of the point charts and kernels. The resultant dimension of such a convolution layer will then be H1 x W1 x D1

(H1, W1, D1) = ((H + 2Zp − k1)/ Zs + 1 , (W + 2Zp − k2)/ Zs + 1 , K_d)

Activation functions define a neuron's output based on a collection of inputs. For non-linear transformation the proportion of direct net input value is processed via an activation function. An example of typical activation. The capability is founded on restrictive likelihood. and it returns one or zero as a result.

ReLU : f(x) = { 0 for x< 0, x for x >= 0}

f '(x)= { 0 for x < 0 , 1 for x >= 0 }

Pooling layers is the process of downsampling a layer's total output to a single dendrite. If we indicate k as the size of the kernel (currently accepted as square)), D_n as the number of windows in the kernel., and Z_s as the pace to construct pooling layers, then the pooling layer's output dimension will be (assuming H1,W1,D1 input):

H2 × W2 × D2, where (H2, W2, D2) = ((H1 − k)/Z_s + 1, (W1 − k)/Z_s + 1, D_n)

RESULTS AND DISCUSSION

The accuracy of the model is around 88% and is able to predict the 4 types of Diabetic Retinopathy along with No DR. Fig 5.1 and 5.2 provide the details of the testing and training for the given model.

CONCLUSION

This paper aims to assist the user in detecting diabetic retinopathy easily and the trained model has shown an accuracy of 88%. Considering this model might improve the accuracy, with large volume of images. This application can also be used by ophthalmologists in diagnosing the disease. The classification of the input image is carried out in accordance with the presence of microaneurysms, both hard and soft exudates, small dots, leaky blood vessels in the retinal image. The application was tested with various input images, and the images are classified into one of the 5 stages hence showcased the best results as depicted in section 5.

ABSTRACT

Based on certain well-known graphs, we look into some current trends on the line graph, along with some relevant line graph properties and traits. We started our work by discussing general terms about the line graphs of a few well-known graphs, such as the complete, bipartite, and regular graphs. Based on the fundamental ideas, we develop formulae for the degree, vertices and edges of the iterative line graph of these graphs. The demonstrated iterative formulas for the degree, vertices and edges of complete, bipartite, and regular graph's are important for building chains of related graph's line graphs. With the aid of some indicated findings and a list of iterative results, our work is justified. The iterative equations obtained will be useful for the algorithm on line graphs, in the context of graph practical and theoretical issues based on coloring and partitioning of a graph.

Keywords: phrases Complete, Bipartite, Regular, Iterative Line Graph, Line Graph

INTRODUCTION

The first mathematician to introduce graph theory was Euler [7], who did it in 1736. The study of graphical structure is known as graph theory in mathematics, and it is used to represent pair-wise interactions between objects. Mathematically graph $G = (V, E)$ is a collection of sets of points V known as vertices and a set of line E, joining points of V, known as edges. Order and graph size are determined by the number of vertices and edges, respectively. Graph $G's$ line graph $L(G)$ is a graph with its vertices as points, which are mapped by the edges of G. If two edges of G have a common vertex, then the two vertices of $L(G)$ that are mapped to those two edges of G are connected. Line graph has a rich history as of graph itself, come to a paper by Harary and Norman [6]. A

68688

book on graph theory by Harary [5] describes many results for line graphs. Though it was already used by Whitney [10], where he studied edges isomorphism, and by Krausz [11], who gives the first Characterization based on edge. Beineke theorem [3] for a simple graph to be a line graph is given by L.W. Beineke. Hassler Whitney[10] proved that a line graph is helpful to recover the structure of a graph G that is connected with one exceptional case. J. Bagga [2] studied the new and old generalizations of line graphs, which involve the concept of a super line graph. Till now, the various concepts of line graphs have been studied and there is a long list to specify its characteristics [5]. A book on line graphs and line diagraphs is available written by Beineke and J. Bagga [4] providing various information regarding line graphs and iterated line diagraphs and generalizations. A Singless Laplacian matrix of some special line graph is obtained by us to find the spectrum of them [12]. To utilize line graphs up to the required iterations we are presenting the main properties of line graphs and finding out some iterated formulae for our future prospects so that we can use them directly in algorithms. With a focus on complete, complete bipartite, and regular graph's line graph, the paper is organized into different sections; Section 2 provides the basics of line graphs of a few well-known graphs. We also derive and demonstrate the theorems related to the derivation of formulae for the edges and vertices of line graphs in this part. Section 3 of this article provides an introduction to iterative line graphs and derives iterative formulae for complete, complete bipartite, and regular graph's line graphs. With a justification of regularity, Section 4 implements our findings over well-known results.

2. 1ˢᵗ Iterative Line Graphs of Some Elementary Graph
We are providing here the elementary concepts of the line graph of some well-known graphs with some modification and implementation of previously proven results**.** Some important properties and theorems which are required to justify our work are described in this section.

2.1. Null Graph's 1ˢᵗ Iterative Line Graph
A graph type known as a null graph has zero degrees at each vertex. Since there are no edges in the null network, when we make a line graph of it, it is an empty graph on zero nodes.

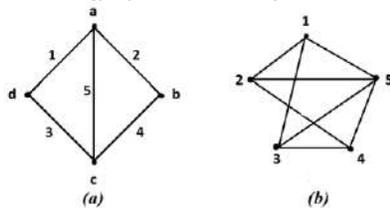
2.2.Simple Graph's 1ˢᵗ Iterative Line Graph
The line graph that corresponds to a simple graph is also a simple graph.


Figure 2.1 Simple Graph G and its L(G)

2.3.Complete Graph's Iˢᵗ Iterative Line Graph
A simple graph in which all of the vertices are connected to one another constitutes what is known as a complete graph, such a graph with n vertices is denoted by K_n. A Complete graph's line graph will be a regular graph as explained with the help of the following theorem.

Theorem 2.3.1 K_n's line graph will be $(2n-4)$ regular with $\dfrac{n*(n-1)}{2}$ vertices.

Proof- Consider a complete graph K_n, in this graph, the degree of each vertex will be $n-1$ and the edges associated with this vertex are connected to $n-2$ other edges from one end and $n-2$ other edges from the other end, which means in the line graph the vertex formed by these edges will connect to $(2n-4)$ vertices.

Also, we know that the size of K_n is $\dfrac{n*(n-1)}{2}$, that will be the order of K_n's line graph.

Kajal Mittal and Pranjali Kekre

Thus the K_n's line graph will be $(2n-4)$ regular with $\dfrac{n*(n-1)}{2}$ vertices.

Lemma 2.3.1 *The $\dfrac{n(n-1)(n-2)}{2}$ is size of K_n's line graph, where n is the order of K_n.*

Proof- If G is any graph of size $'e'$ and order $'n'$, then by handshaking Theorem [9] we have

$$\sum_{i=1}^{n} \deg(v_i) = 2e.$$

$$(2.1)$$

Also since K_n's the line graph is $(2n-4)$ regular with $\dfrac{n*(n-1)}{2}$ vertices (as mentioned in theorem 2.3.1).

So here using Equation (2.1), we get

$$2(n-2)*\frac{n*(n-1)}{2} = 2e.$$

$$(2.2)$$

Thus,

$$e = \frac{n(n-1)(n-2)}{2}.$$

$$(2.3)$$

Hence the size of K_n's line graph is $\dfrac{n(n-1)(n-2)}{2}$.

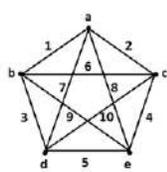
As per the observation of Theorem 2.3.1 and Lemma 2.3.1, the K_5's line graph will be a 6-regular graph of order 10 and size 30 as shown in Figure 2.2. Similarly, K_4's line graph will be a 4-regular graph of order 6 and size 12 as shown in Figure 2.3.


Figure 2.2 K_5 Graph and its $L(K_5)$ *Figure 2.3 K_4 Graph and its $L(K_4)$*
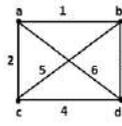
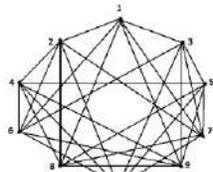
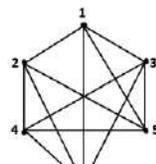






2.4. Complete Bipartite Graph's Iˢᵗ Iterative Line Graph

A complete bipartite graph $K_{m,n}$, is a simple graph such that the vertices set V can be partitioned like $V = A \cup B : A \cap B = \phi$, where A and B have m and n vertices respectively and all of the vertices in the set B are adjacent to all of the vertices of a set A. With the limitations that no two neighboring vertices are from the same set.

Theorem 2.4.1 *The complete bipartite graph's line graph $L(K_{m,n})$ is $m+n-2$ regular with order mn.*

Proof- As per the definition of a complete bipartite graph $K_{m,n}$ every n vertex of the first set is connected to every m vertex of the second set, so the edge joining a vertex of one set to another set is associated with $m-1$ edges from one end and $n-1$ edges from other ends, so in a line graph, the vertex corresponding to the edge is connected to $m+n-2$ other vertices so $L(K_{m,n})$ is $m+n-2$ regular.

Also, as the size of $K_{m,n}$ is mn the order of $L(K_{m,n})$ will be mn.

Lemma 2.4.1 *The counting of edges in $L(K_{m,n})$ is $\dfrac{m^2 n + mn^2 - 2mn}{2}$.*

Proof- The result is followed by the famous handshaking theorem.

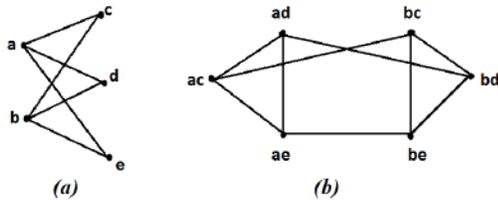
As an example, a complete bipartite graph $K_{2,3}$ and its line graph as shown in Figure 2.4(a) and 2.4(b) respectively.


Figure 2.4 $K_{2,3}$ Graph and its $L(K_{2,3})$

As per our observation of Theorem 2.4.1 and Lemma 2.4.1, the $K_{2,3}$'s line graph 3-regular with 6 vertices and 9 edges as $m = 2$ and $n = 3$.

2.5. k – Regular Graph's Iˢᵗ iterative Line Graph

A k – regular graph is a simple graph having the degree of each vertex equal to k.

Theorem 2.5.1 *The order n and k – regular graph's line graph is a $2k - 2$ regular graph with $\dfrac{nk}{2}$ vertices and $\dfrac{nk(k-1)}{2}$ edges.*

Proof- As the size of order n and k – regular will be $\dfrac{nk}{2}$, thus the graph's line graph will have $\dfrac{nk}{2}$ vertices. As the network is of a regular graph, an edge linked to two neighboring vertices connects to $k - 1$ other edges from one end and $k - 1$ edges from the opposite end. Thus the line graph's vertex formed by this edge will connect to other $2k - 2$ vertices in the line graph, so the k – regular graph's line graph is $2k - 2$ regular.

And now by using the handshaking theorem, we can say the cardinality of the edge set in the line graph will be $\dfrac{nk(k-1)}{2}$.

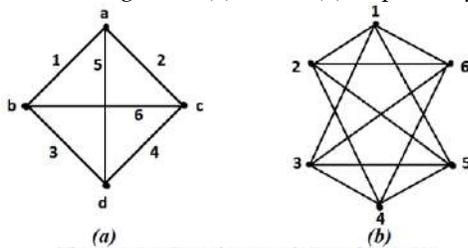
By observation of Theorem 2.5.1, the 3-regular graph $G's$ line graph is 4-regular with 6 vertices and 12 edges as shown in Figure 2.5(a) and 2.5(b) respectively.


Figure 2.5 3-Regular Graph G and its L(G)

2.6. Complement Graph's Line Graph

In a complement graph H of G two vertices are connected if and only if they are not connected in G. In a complement, nodes are the same as G and the edges set consists of all the edges that are not in G. Here we show that the complement of some line graph. A complement of the line graph may be disconnected.

Figure 2.6 (a) shows; graph G its line graph 2.6(b) and the complement of line graph 2.6(c).

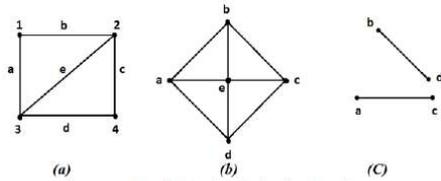
Kajal Mittal and Pranjali Kekre


Figure 2.6 Graph G and L(G) then its Complement

The $K_5's$ line graph complement is a Petersen graph; with 10 vertices and 15 edges.

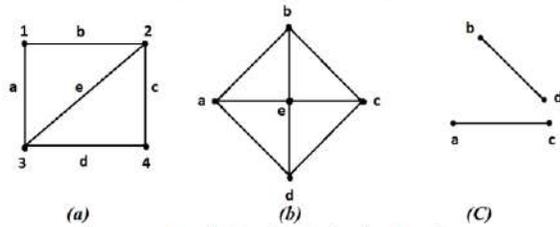
2.7 Graphs Complement's Line Graph


Figure 2.6 Graph G and L(G) then its Complement

Figure 2.7 (a) shows the graph G, 2.7(b) its complement G^c and 2.7(c) is G^c's line graph $L(G^c)$. In some graphs, the complement of a graph is disconnected then the line graph of this type of graph is disconnected. Since the complement of a full graph is a null graph, the line graph of a complement of a complete graph will also be a null graph.

3. Iterative Line Graphs

The graph $G's$ iterative line graph $L^i(G)$ defined as

$$L^i(G) = \begin{cases} G & : i = 0 \\ L\left(L^{i-1}(G)\right) & : i > 0 \end{cases}$$

Van Rooij and Wilf [8] considered the iterative sequence of a graph.

3.1 Iterative Formula for Complete Graph's Line Graph K_n

Using Theorem 2.3.1 and Lemma 2.3.1, we can say $L(K_n)$ will be $(2n-4)$ regular with $\dfrac{n(n-1)}{2}$ vertices and

$\dfrac{n(n-1)(n-2)}{2}$ edges, also using Theorem 2.5.1 line graph of a k – regular graph with n vertices will be $2k-2$

regular with $\dfrac{nk}{2}$ vertices and $\dfrac{nk(k-1)}{2}$ edges.

Combining the above two statements, we get

$L^2(K_n) = L(L(K_n)) = L(G),$ Where G is $2n-4$ regular with $\dfrac{n(n-1)}{2}$ vertices and $\dfrac{n(n-1)(n-2)}{2}$ edges. Using

Theorem 2.5.1 $L^2(K_n)$ will be $2(2n-4)-2 = 4n-10$ regular with $\dfrac{n(n-1)(n-2)}{2}$ vertices and

$\dfrac{n(n-1)(n-2)(2n-5)}{2}$ edges. Similarly, $L^3(K_n)$ will be $8n-22$ regular with $\dfrac{n(n-1)(n-2)(2n-5)}{2}$ vertices and

$\dfrac{n(n-1)(n-2)(2n-5)(4n-11)}{2}$ edges. Iteratively following this, we get a formula for $i > 3$, $L^i(K_n) = G$, where G

Kajal Mittal and Pranjali Kekre

will be $k^{(i)} = \left(2^i n - 2^{i+1} - \sum_{r=1}^{i-1} 2^{i-r} \right)$ regular graph having vertices $n^{(i)}$ given by Equation (3.1) and edges

$e^{(i)} = \dfrac{n^{(i)} k^{(i)}}{2}$ given by simplified equation (3.2) for direct use:

$$n^{(i)} = \frac{n(n-1)(n-2) \prod_{j=i}^{3} \left(2^{j-2} n - 2^{j-1} - \sum_{r=1}^{j-2} 2^{j-2-r} \right)}{2},$$

$$\text{(3.1)}$$

$$e^{(i)} = n(n-1)(n-2) \left(2^{i-2} n - 2^{i-1} - \sum_{r=1}^{i-1} 2^{i-2-r} \right) \prod_{j=i}^{3} \left(2^{j-2} n - 2^{j-1} - \sum_{r=1}^{j-2} 2^{j-2-r} \right)$$

$$\text{(3.2)}$$

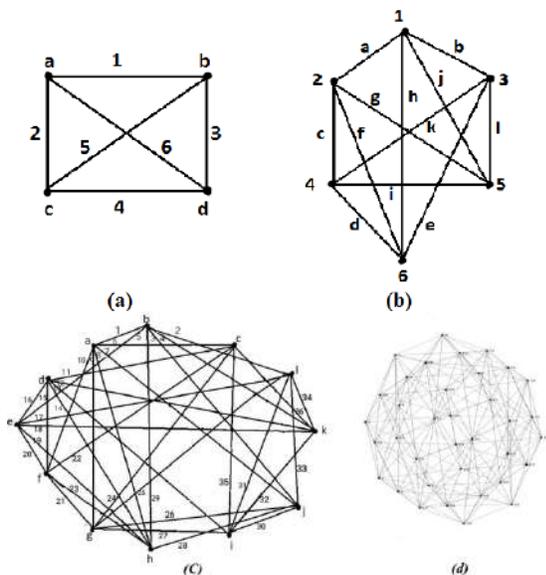
The complete graph K_4 is having 4 vertices and 6 edges, then by the property 2.3 1ˢᵗ line graph of K_4 will be 4-regular with 6 vertices and 12 edges as shown in figure 3.1(b), and the 2ⁿᵈ iterative line graph of K_4 will be 6-regular with 12 vertices and 36 edges as shown in figure 3.1(c), 3ʳᵈ iterative line graph of K_4 will be 10- regular with 36 vertices and 180 edges as shown in figure 3.1(d), all these results are obtained by using equation (3.1) and equation (3.2).


Figure 3.1 Graph K_4 and its $L(K_4)$, $L^2(K_4)$, $L^3(K_4)$

3.2 Iterative Formula for Complete Bipartite Graph's Line Graph $K_{m,n}$

By Theorem 2.4.1 and Lemma 2.4.1 we have, the complete bipartite graph's line graph $L(K_{m,n})$ will be $m+n-2$

regular of order mn and size $\dfrac{m^2 n + mn^2 - 2mn}{2}$. also using Theorem 2.5.1 we have, the order n, $k-$regular

graph's line graph will be $2k-2$ regular with $\dfrac{nk}{2}$ vertices and $\dfrac{nk(k-1)}{2}$ edges.

Combining these two statements, $L^2(K_{m,n}) = L(L(K_{m,n})) = L(G)$ where G is $m+n-2$ regular with mn vertices

and $\dfrac{mn(m+n-2)}{2}$ edges.

Kajal Mittal and Pranjali Kekre

Using Theorem 2.5.1 $L^2(K_{m,n})$ will be $2(m+n-2)-2=2m+2n-6$ regular with $\dfrac{mn(m+n-2)}{2}$ vertices and

$\dfrac{mn(m+n-2)(m+n-3)}{2}$ edges. Similarly, $L^3(K_{m,n})$ will be $4m+4n-14$ regular with $\dfrac{mn(m+n-2)(m+n-3)}{2}$

vertices and $\dfrac{mn(m+n-2)(m+n-3)(2m+2n-7)}{2}$ edges. Iteratively following this we get a formula for $i>3$,

$L^i(K_{m,n})=G,$ where G will be $k^{(i)}=\left(2^{i-1}m+2^{i-1}n-2^i-\displaystyle\sum_{r=1}^{i-1}2^{i-r}\right)$ regular graph having vertices $n^{(i)}$ given by

equation (3.3) and edges $e^{(i)}=\dfrac{n^{(i)}k^{(i)}}{2}$ given by simplified equation (3.4) for direct use:

$$n^{(i)}=\dfrac{mn(m+n-2)\displaystyle\prod_{j=i}^{3}\left(2^{j-3}m+2^{j-3}n-2^{j-2}-\displaystyle\sum_{r=1}^{j-2}2^{j-2-r}\right)}{2}.$$

(3.3)

$$e^{(i)}=mn(m+n-2)\left(2^{i-3}m+2^{i-3}n-2^{i-2}-\displaystyle\sum_{r=1}^{i-1}2^{i-2-r}\right)\displaystyle\prod_{j=i}^{3}\left(2^{j-3}m+2^{j-3}n-2^{j-2}-\displaystyle\sum_{r=1}^{j-2}2^{j-2-r}\right).$$

(3.4)

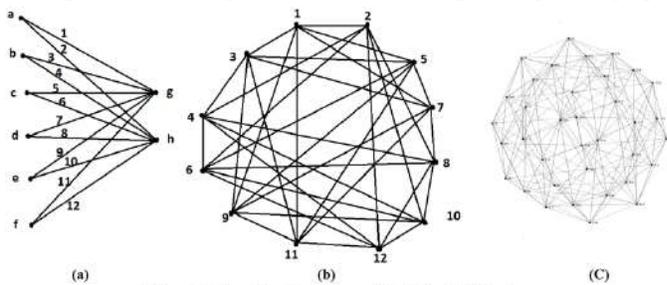
The given graph G is a complete bipartite graph $K_{6,2}$, with 8 vertices and 12 edges then by the property 2.4, its 1st line graph will be 6-regular with 12 vertices and 36 edges as shown in figure 9(b) and the 2nd iterative line graph will be 10-regular with 36 vertices and 180 edges shown in figure 9(c), these results are obtained by using equation (3.3) and equation (3.4). Figure 3.2 shows, a complete bipartite graph $K_{6,2}$ and the iterative sequence of the line graph.


Figure 3.2 Complete Graph $K_{6,2}$ and its $L(K_{6,2})$, $L^2(K_{6,2})$

3.3 Iterative Formula for k -Regular Graph's Line Graph

By Theorem 2.5.1 we have, the order n, $k-$regular graph's line graph will be a $2k-2$ regular graph of order $\dfrac{nk}{2}$

and size $\dfrac{nk(k-1)}{2}$. Also, we know that the regular graph's line graph is again a regular graph and

$L^2(G)=L(L(G))=L(G')$ where G' is $2k-2$ regular graph with $\dfrac{nk}{2}$ vertices and $\dfrac{nk(k-1)}{2}$ edges then $L^2(G)$

will be $2(2k-2)-2=4k-6$ regular with $\dfrac{nk(k-1)}{2}$ vertices and $\dfrac{nk(k-1)(2k-3)}{2}$ edges. Similarly, $L^3(G)$ will

be $8k-14$ regular with $\dfrac{nk(k-1)(2k-3)}{2}$ vertices and $\dfrac{nk(k-1)(2k-3)(4k-7)}{2}$ edges. Iteratively following this

Kajal Mittal and Pranjali Kekre

we get a formula for $i > 3$, $L^i(G) = G'$, where G' will be a $k^{(i)} = \left(2^i k - 2^i - \sum_{r=1}^{i-1} 2^{i-r} \right)$ regular graph having vertices

$n^{(i)}$ given by Equation (3.5) and edges $e^{(i)} = \dfrac{n^{(i)}k^{(i)}}{2}$ given by simplified equation (3.6) for direct use:

$$n^{(i)} = \frac{nk(k-1)\prod_{j=i}^{3}\left(2^{j-2}k - 2^{j-2} - \sum_{r=1}^{j-2} 2^{j-2-r} \right)}{2},$$ (3.5)

$$e^{(i)} = nk(k-1)\left(2^{i-2}k - 2^{i-2} - \sum_{r=1}^{i-1} 2^{i-2-r} \right)\prod_{j=i}^{3}\left(2^{j-2}k - 2^{j-2} - \sum_{r=1}^{j-2} 2^{j-2-r} \right).$$ (3.6)

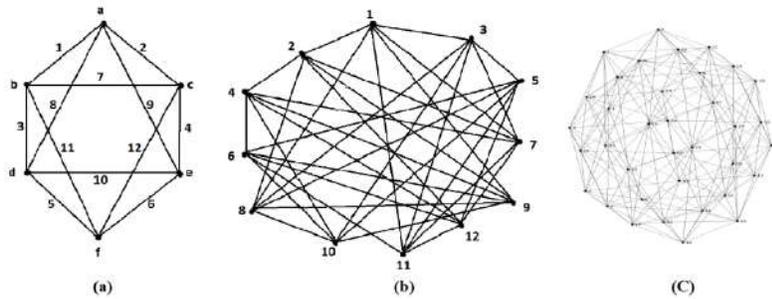
Consider a graph G that is 4-regular, with 6 vertices and 12 edges then by the property 2.5, its 1st line graph will be 6-regular with 12 vertices and 36 edges as shown in Figure 3.3(b), 2nd iterative line graph will be 10-regular with 36 edges and 180 edges as shown in Figure 3.3(c), all these results obtained by using Equation (3.5) and Equation (3.6). Figure 3.3 shows, a 4-regular graph and the iterative sequence of the line graph.


Figure 3.3 4-Regular Graph G and its L(G), L²(G)

4. Justification of Our Iterative Formulae Using the Implementation of Famous Results

Some essential properties of line graphs are as follows:

4.1. If G is a (p,q) graph whose degree sequence is $d_1, d_2, d_3,\ldots\ldots d_p$ and $L(G)$ is a (p',q') graph, then $p' = q$ and

$q' = \sum_{i=1}^{p} \binom{d_i}{2}$ first discovered by Whitney [10].

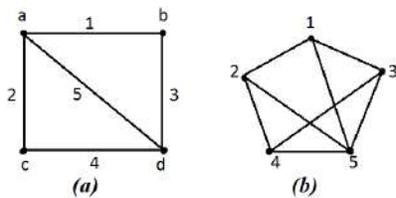
Example 4.1.


Figure 4.1 Graph G and its L(G)

As shown in Figure 4.1, a graph G is (4, 5) with degree sequence 3, 2, 2, 3 and $L(G)$ is (5,8) graph as $p' = 5$ and

$$q' = \sum_{i=1}^{p} \binom{d_i}{2} = \sum_{i=1}^{4} \binom{d_i}{2} = \binom{3}{2}+\binom{2}{2}+\binom{2}{2}+\binom{3}{2} = 3+1+1+3 = 8.$$

We can justify our Theorem 2.3.1 of a complete graph by Whitney's result,

Kajal Mittal and Pranjali Kekre

K_n is a graph $\left(n, \dfrac{n(n-1)}{2}\right)$ with a degree for each vertex $n-1$. According to Whitney's formula $L(K_n)$ is a graph

with order $\dfrac{n(n-1)}{2}$ and $\displaystyle\sum_{i=1}^{n}\binom{n-1}{2} = \dfrac{n(n-1)(n-2)}{2}$ edges, the same as we have proved in Lemma 2.3.1. Our result

gives a justification for regularity in addition to it.

Also if we consider a $k-$regular graph $\left(n, \dfrac{nk}{2}\right)$ i.e. a graph with n vertices having degree k. According to

Whitney's formula line graph of the $k-$regular graph will be a graph with $\dfrac{nk}{2}$ vertices and $\displaystyle\sum_{i=1}^{n}\binom{k}{2} = \dfrac{nk(k-1)}{2}$

edges, including the fact $2k-2$ regular, proved by Theorem 2.5.1.

Following the concept of regularity and using Whitney's result, we claim the justification of our iterative formulae.

4.2. As per Skiena if G is a graph of n nodes, e edges then a line graph of degrees d_i contains $n'=e$ nodes and

$e' = \dfrac{1}{2}\displaystyle\sum_{i=1}^{n}d_i^2 - e$ edges [9].

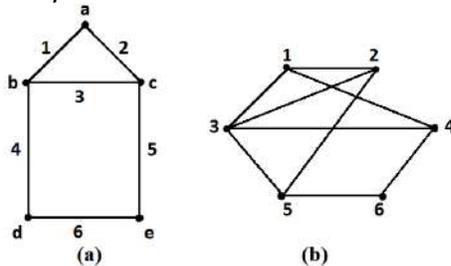
Example 4.2.


Figure 4.2 Graph G and its L(G)

As shown in Figure 4.2, a graph G with 5 nodes and 6 edges, then the line graph of degree of vertex 2, 3, 3, 2, 2

contain $n'=6$ nodes and $e' = \dfrac{1}{2}\displaystyle\sum_{i=1}^{5}d_i^2 - e = \dfrac{1}{2}(2^2 + 3^2 + 3^2 + 2^2 + 2^2) - 6 = 9$ edges.

Now by Theorem 2.3.1, a complete graph, K_n is $\left(n, \dfrac{n(n-1)}{2}\right)$ graph, then the line graph is a graph having a degree

of each vertex $n-1$ containing $n' = \dfrac{n(n-1)}{2}$ nodes and $e' = \dfrac{1}{2}\displaystyle\sum_{i=1}^{n}(n-1)^2 - \dfrac{n(n-1)}{2}$ edges.

Also, we have a $k-$regular graph $\left(n, \dfrac{nk}{2}\right)$, then the line graph is a graph having a degree of each vertex k

containing $n' = \dfrac{nk}{2}$ nodes and $e' = \dfrac{1}{2}\displaystyle\sum_{i=1}^{n}k^2 - \dfrac{nk}{2}$ edges. Thus this point 4.2 also justifies our results.

Our obtained iterative formulae of section 3, also satisfied the result provided by Whitney [10] and Skiena [9]. The

following Table 1 shows the vertices, edges, and regularity of the iterative sequence of line graph $L^i(G)$ of G for

the ith iteration, using our obtained iterative formulae as per the G, where G is as specified. From the above table,

we can justify our formulae as   is 3-regular and its 1st line graph is 4-regular with 6 vertices the result obtained for

its 2nd iteration is the same as the 1st iterative line graph of a 4-regular graph with 6 vertices and so on for successive

iteration. The same justification can be observed for a complete bipartite graph for the specified example in which the

considered complete bipartite graph's first line graph is 6 regular with 12 vertices as of 1st iteration of the considered regular graph and so the next obtained iterative results are the same.

CONCLUSION

In this paper, we have provided some deduction on a known line graph with iterative formulae of vertices, edges, and regularity of iterative sequence of complete, complete bipartite, and regular graph's line graph, starting with the basic concept of a line graph and covering several significant aspects. We also discuss how our formulae have been utilized in comparison to previously established outcomes, which supported our conclusion. We can now determine the line graph and corresponding Signless Laplacian matrix for any iteration using the formulae we obtained, allowing us to use them to practically construct specified coloring techniques.

ABSTRACT

A compartmental mathematical model describes the dynamics of the spread of Type-2 diabetes.The dynamical growth of the type 2 diabetes is depicted in a diagram as in Figure 1. Its investigation has been analyzed by using the observed equations from this diagram. Also a theoretical investigation of drug non-adherence is carried out hence forth.The stability analysis is used to examine a classification of the observed differential equations; under the provided criteria, the non-trivial significant point obtained is locally asymptotically compact. The MATLAB least-squares curve fitting technique, which is considered the mathematical model for the glucose tolerance test (GTT), is used to set the actual glucose data values. These approaches are used to compute the stable state distributions of diabetic subpopulations quantitatively. The findings indicate that, given a stringent diet and medication regimen, more than half of clinical diagnosis efforts are required to have a diagnosed population in addition to the undiagnosed.

Keywords: Diabetes, Plasma glucose, Plasma insulin, and interstitial insulin, non-adherence, and GTT model.

Swaminathan *et al.,*

INTRODUCTION

Diabetes is a disease characterized by the body's failure to produce insulin, which regulates blood sugar levels [1]. The study of diabetes can be considered at cell level. The glucose-insulin mathematical model gives a clear understanding of what take place in the blood stream glucose levels. Beta cells are the pancreas manufacture insulin in the blood stream. When beta cells die, the amount of insulin produced is reduced.Lack of physical activity and obesity are frequently responsible for this. Diabetes is also a habit; it develops in genetically susceptible persons and has become an epidemic [3]. Failure to control blood sugar levels causes extra problems. The exact cause of diabetes is unknown [4]. Alternative therapies can then be evaluated by comparing their respective performance measures, and the therapy with the maximal (or minimal) value of this criterion can thus be recommended [19].The body is approximated compartmentally. Then, the peripheral interactions out of the glucose dynamics,insulin dynamics and glucagon dynamics are described [12]. We chose the Sorensen model [30] as the base model and then estimated theSorensen model parameters using available clinical data obtained from type 2 diabetic subjects[21].

Mathematical Formulation
Compartmental Model
Comprehensive models present effective resources for comprehending, forecasting, and regulating various processes. The management of diabetic patients through adaptive model-based control includes the step-by-step fitting of a dynamic model to patient data. This process utilizes the "refined" model to calculate prospective insulin dosage regimens [12]. The insulin concentration in the interstitial fluid (ISF) of insulin-sensitive tissues plays a crucial role in stimulating glucose utilization [7]. Researchers have measured the concentration of interstitial insulin in human subcutaneous adipose tissue and skeletal muscle.

Diabetes has been depicted using a compartmental representation, wherein a human being's blood components consist of three elements [8]: Interstitial insulin action, plasma glucose, and plasma insulin [9]. These components are illustrated below in the diagram.
The differential equations relating the dynamics of Figure 1 are specified by

$$\overset{*}{G} = -X(t) - P_1 \tag{1}$$

$$\overset{*}{I}(t) = P_3 \tag{2}$$

$$\overset{*}{X}(t) = P_3 - P_2 \tag{3}$$

Substituting (3) in (1), we get

$$\overset{*}{G}(t) = P_2 - P_3 - P_1 \tag{4}$$

with the initial condition that $G(t_0) = G_0$, $X(t_0) = X_0$, $I(t_0) = I_0$ and $t \succ 0$

The total population is calculated as follows:
$$N = G + I + X$$

From the above figure 1, I is the plasma insulin level and I_b marks its basal stage; G is the plasma glucose level and represents its basal stage G_b. The combined differential equations for the glucose minimum model [11] are written as

$$\frac{dG}{dt} = -[X + p_1]G + p_1 G_b \tag{5}$$

Swaminathan *et al.,*

$$G_0 = G_b + \frac{D}{V}$$

$$\frac{dX}{dt} = -p_2 X + p_3 [I - I_b]; \qquad (6)$$

Comparing equation (4) and (5), we get

$$p_2 - p_3 - p_1 = -[X + p_1]G + p_1 G_b$$

$$[X + p_1]G = p_3 - p_2 + p_1[1 + G_b]$$

$$G = \frac{p_3 - p_2 + p_1(1 + G_b)}{(X + p_1)} \qquad (7)$$

Comparing equation (3) and (6), we get

$$p_3 - p_2 = -p_2 X(t) + p_3 I(t) - p_3 I_b$$

$$p_3 I(t) = p_3 - p_2 + p_2 X(t) + p_3 I_b$$

$$I = \frac{(1 + I_b)p_3 + (X - 1)p_2}{p_3} \qquad (8)$$

In these equations, $G(t_0) = G_0$ as well as $X = 0$. X, is the interstitial insulin at time t[30]. This model has four unknown parameters X, p_1, p_2 and p_3 all of which are defined with units and have brief descriptions below

Equations (7) and (8), with parameters p_1, p_2, p_3, $X(t)$, I_b and G_b generate illustrated equations and parameters for the nominal glucose metabolism model[20]. At the top are differential equations for glucose dynamics $G(t)$ in a mono-compartmental [13] "glucose space" and insulin dynamics in a "remote" compartment $X(t)$.Glucose vegetation grows at a rate proportional to the difference between plasma glucose $G(t)$ and the basal fasting glucose [6]level G_b.

In this model, t is the time; $G(t)$ is the plasma glucose concentration[32] at time t; G_b is the plasma insulin concentration at time t; $X(t)$ is the insulin concentration in the "remote" compartment at time t; G_b is the basal plasma glucose level; I_b is the basal plasma insulin level $G(0) = G_0$; p_1, p_1, p_3 and G_0 are unknown factors in the model that are uniquely identifiable from frequently sampled intravenous glucose tolerance tests; glucose effectiveness is p_1; and insulin sensitivity[14]is p_3.

Glucose Tolerance Test Model
The differential equation classification governing the GTT model can be expressed as follows:

$$\frac{dg}{dt} = -p_1 \cdot g - p_2 \cdot i + J \qquad (9)$$

$$\frac{di}{dt} = p_3 \cdot g - p_4 \cdot i \qquad (10)$$

Positive constants p_i $(i = 1,2,3,4)$; $g(t)$ is the difference between blood glucose absorption and $G(t)$ its baseline value G_0; J is the rate of glucose combination from the guts. As demonstrated in the following equations, $i(t)$ is the difference between plasma insulin absorption and $i(t)$ its baseline value I_0.

$$g = G - G_0 \quad\quad (11)$$

$$i = I - I_0 \quad\quad (12)$$

Where G and I are the parameters for blood glucose absorption, plasma insulin and p, a_1, a_2, a_3, a_4 are parameters. Using equations (11) and (12) in equations (9) and (10), we get

$$\frac{d(G - G_0)}{dt} = -p_1(G - G_0) - p_2(I - I_0) + J \quad\quad (13)$$

$$\frac{d(I - I_0)}{dt} = p_3(G - G_0) - p_4(I - I_0) \qu\quad (14)$$

Using Picard's Method of Iteration [25] for the above equations (11) and (12), we get

$$dG(t) - dG(t_0) = [-p_1(G - G_0) - p_2(I - I_0) + J]dt \qu\quad (15)$$

$$dI(t) - dI_0(t) = [p_3(G - G_0) - p_4(I - I_0)]dt \qu\quad (16)$$

Integrating on both sides, we get

$$G(t) = G_0 - \int_{t_0}^{t_1} [p_1(G - G_0) + p_2(I - I_0) - J]dt \qu\quad (17)$$

Similarly, we get

$$I(t) = I_0 - \int_{t_0}^{t} [p_3(G - G_0) + p_4(I - I_0)]dt \qu\quad (18)$$

From equations (11) and (12), we create a perturbation variable [27],

$g = G_0 - G_0$ and $i = I - I_0$

Where G_0 and I_0 are the symmetry values for blood glucose and insulin absorption[18], respectively.

Consequently,

$$f_1(G_0, I_0) = 0 , f_2(G_0, I_0) = 0 \qu\quad (19)$$

We develop the general model for linear expressions with these definitions and represent the linearized perturbation model [28] given by:

$$\frac{dg}{dt} = \frac{\partial f_1(G_0, I_0)}{dg} g + \frac{\partial f_2(G_0, I_0)}{di} i \qu\quad (20)$$

$$\frac{di}{dt} = \frac{\partial f_2(G_0, I_0)}{dg} g + \frac{\partial f_2(G_0, I_0)}{di} i \qu\quad (21)$$

Where g and i are represent the linearized perturbed variables.

Here f_1 and f_2 are the partial derivative functions. Where these functions are implicit is in the composition of glucose and insulin. As blood glucose levels rise, tissue glycogen uptake and storage in the liver are stimulated. Increases in insulin also enhance glucose uptake in tissues and the liver. As a result, it is apparent that

$$m_1 = -\frac{\partial f_1(G_0, I_0)_1}{dg}_1 < 0 \text{ and } m_2 = -\frac{\partial f_1(G_0, I_0)_1}{di} < 0 \qu\quad (22)$$

Increases in blood glucose cause the production of insulin, but increases in insulin just cause the metabolism of surplus insulin to increase [16, 22]. This data implies that

$$m_4 = \frac{\partial f_2(G_0, I_0)}{dg} > 0 \quad \text{and } m_3 = -\frac{\partial f_2(G_0, I_0)}{di} < 0 \qu\quad (23)$$

Stability Analysis

From the above results, we can write the linearized system [10] as follows:

$$\begin{pmatrix} \dot{g} \\ \dot{i} \end{pmatrix} = \begin{pmatrix} -m_1 & -m_2 \\ m_4 & -m_3 \end{pmatrix} \begin{pmatrix} g \\ i \end{pmatrix}$$

Where $\dot{g} = \dfrac{dg}{dt}$ and $\dot{i} = \dfrac{di}{dt}$

The linear system for these characteristic equations is given by:

$$\det \begin{vmatrix} -m_1 - \lambda & -m_2 \\ m_4 & -m_3 - \lambda \end{vmatrix} = 0 \qquad (23)$$

$$\lambda^2 + (m_1 + m_2)\lambda + m_1 m_3 + m_2 m_4 = 0$$

Here's $p(\lambda) = \lambda^2 + d_1\lambda + d_2$ where $d_1 = m_1 + m_2, d_2 = m_1 m_3 + m_2 m_4$ It's worth noting that the d_i's are all positive.

$$\lambda_1 = \frac{-(m_1 + m_2) + \sqrt{(m_1 + m_2)^2 - 4(m_1 m_3 + m_2 m_4)}}{2}$$

$$\lambda_2 = \frac{-(m_1 + m_2) - \sqrt{(m_1 + m_2)^2 - 4(m_1 m_3 + m_2 m_4)}}{2}$$

If $(m_1 + m_2)^2 > 4(m_1 m_3 + m_2 m_4)$, then $\sqrt{(m_1 + m_2)^2 - 4(m_1 m_3 + m_2 m_4)} < (m_1 + m_2)$. So that λ_1 and λ_2 are both negative.

If $(m_1 + m_2)^2 < 4(m_1 m_3 + m_2 m_4)$, then the equation $\sqrt{(m_1 + m_2)^2 - 4(m_1 m_3 + m_2 m_4)}$ must be is a complex quantity. Hence both λ_1 and λ_2 are both complex and negative real parts. Hence the model is stable around (0, 0).Hence the characteristic equation has positive coefficients by definition. The solutions to basic differential equations are either complex with a negative real portion or have both Eigen values that are negative real [21, 26]. As a result of this self-regulatory system, we attain a stable equilibrium in these situations.

Because of the GTT, we used to determine blood glucose levels, the complex Eigen values are the only linearized solution. The physiological response to a "sugar high" is what we think of (maximum of blood glucose), this is followed by a "sugar low" (a minimum of blood glucose below equilibrium) [24] that urges more eating after an hour or two. So here's the general solution:

$$g(t) = e^{-\alpha t}(c_1 \cos(\omega t) + c_2 \sin(\omega t)) \qquad (24)$$

Where $\alpha = \dfrac{m_1 + m_3}{2}$ and $\omega = \dfrac{1}{2}\sqrt{4(m_1 m_3 + m_2 m_4) - (m_1 + m_3)^2}$

If we take $c_1 = A\cos(\omega\delta)$ into account and $c_2 = A\sin(\omega\delta)$. Hence the blood glucose level of the above compartment is approximately as below:

$$G(t) = G_0 + Ae^{-\alpha t}\cos(\omega(t - \delta)) \qquad (25)$$

Here there are five parameters to be calculated from the above equation (which can be reduced to four by requiring that $g(0) = 0$.) The values of these parameters are calculated by the nonlinear least-square method [29]. If

Swaminathan *et al.,*

$G_1, G_2, G_3, \ldots\ldots, G_n$ are the patient's blood glucose concentration was measured at different times $t_1, t_2, t_3, \ldots, t_{n'}$ then we immediately find that the values $G_0, A, \alpha, c_1, c_2, \omega, \delta$ are to minimize the mean square error function:

$$E = \sum_{k=1}^{n} G_k - G_0 - Ae^{-\alpha t} \cos(\omega(t - \delta)) \quad (26)$$

It is worth noting that the requirement $c_1, c_2, c > 0$ implies that condition (24) is met.

Figure 1 depicts a three-dimensional phase portrait with a variety of initial conditions. We can see from the charts that all of the trajectories converge to the point (0, 0, 0). As a result, (0, 0, 0) represents a stable equilibrium point, and the model is globally stable .

Modeling with experimental data

The blood glucose level that our model predicts is fitted with a data set in this part, and key model parameters are computed. The data-set shows glucose Vs. time data for two individuals: Subject A, who is healthy and Subject B, who has diabetes. A data set from "Modeling Diabetes" was used by Joseph M.Mahaffy [21]

Figure 2 displays the confidence interval and best fit curve.Confidence intervals are statistical intervals created from a set of observable data [17]. The interval suggests that it may contain the parameter's actual value."

$G(t) \pm \sigma/\sqrt{N} \rightarrow$ Confidence interval" and "$\sigma \rightarrow$ standard deviation of data" are used synonymously in this context. The confidence interval narrows while confidence remains unchanged as N increases. The obtained parameters' values are G_b -the blood sugar level after a fast. ω -Angle of the frequency of the damped oscillator. Table 2 demonstrates that diabetics have lower values for both than do healthy people.

τ - The total amount of time required to lower blood glucose levels to their lowest feasible level is known as the digestive system's time constant for blood glucose reduction. According to Table 2, this parameter's value is essentially the same in diabetics and healthy people.

ω_0 -The natural angular frequency of the damped oscillator.

T_0 -The natural time period of the damped oscillator.

Here, the data set is shown, and Image 6 fits a function with confidence intervals. Subject A is normal, whereas subject B has mild diabetes, as shown by their respective values in Table 3 (2.3418% and 4.0569%). In light of this, it is evident that a person's score T_0 for determines whether or not they are pre-diabetic (for which $T_0 \approx 4.0 hours$) or not.

We determine the duration.The crucial interval $T_0 = 2\pi/\omega_c$ where $\omega_c^2 = \omega^2 + \alpha^2$ .According to Ackerman et al. [1] if $T_c < 4$ the person is normal, and if $T_c > 4$, then the person has diabetes. Now, two fictitious situations are considered: one compares a healthy individual to a Type-2 diabetic, and the other does the same for Type-1 diabetics. In terms of predicting the presence of pre-diabetes, this result is more reliable than the earlier model result. We also determined the value of an important parameter that was omitted from the earlier models. This measurement reveals how soon glucose reaches the bloodstream after leaving the digestive system [23]. Diabetes and blood sugar levels should never have an impact on this variable. As seen in Table 2, the value of is nearly the same for both healthy and diabetic persons, thus τ is therefore independent of diabetes and not dependent on blood glucose levels.

A simulated surface plot in three dimensions how T_0 varies with the range of α and ω is shown in Figure 3. Additionally, we observe that at a point, both falls α and ω increases significantly. High T_0 blood glucose levels that persist for an extended period of time are an indication of pre-diabetes.A three-dimensional simulated scatter plot is shown in Figure 4.Here, blue dots denote normal patients (for the indicated $T_0 < 4.0$ hours) and red dots denote pre-diabetic cases (for the indicated $T_0 \geq 4.0$ hours). This diagram demonstrates the existence of two entirely

distinct zones for healthy and diabetic individuals.It also demonstrates the wide variety of α and ω that might differ from person to person.

RESULTS AND DISCUSSIONS

The critical point is stable according to the stability analysis done in this study.This indicates that even when the system is disturbed or unsettled, it tends to this state.The two techniques for solving a linear system of equations were alternately utilized to calculate the steady state. The compartmental and GTT approaches are these techniques. The comparisons demonstrate that the Compartmental technique outperforms the GTT method in terms of accuracy. Compartmental technique's answer is more accurate than GTT method. Simulations are run to determine the impact of changing a few parameters on the variable, and the results are displayed as the aforementioned figures.

CONCLUSION

Consideration is given to the research of diabetes control brought on by drug use noncompliance. The stability study demonstrates that states are found using differential equation systems.The findings demonstrate the asymptotically stability of the equilibrium point.By taking the stability point into account, the outcome is stable. The compartmental model and the perturbation model were employed, and they were contrasted. According to the clinical diagnosis, managing diabetes is more than 90% effective. The clinical effort necessary to achieve the objective must be significantly increased when compared to the non-adherence method.The GTT model analysis effectively controls low-GI foods and medications, which is beneficial for diabetics. The results of the glucose tolerance test reveal whether the patient has diabetes or not.It is possible to effectively control blood sugar levels by using this way of computing the compartmental model by considering data collected over a long period of time.

ABSTRACT

An ulcer is erosion in the lining of the stomach or duodenum. It is caused by disruption of the gastric mucosal defense and repair systems. Peptic ulcer is a widespread health disorder today. Plant-derived compounds have been used as drugs, either in their original or semi-synthetic form. Recent studies shows that there has been much interest in natural approaches towards medication derived from traditional knowledge of the pharmacological properties of plants and attempts have been made to know about the effects of poly herbal formulation in the treatment or prevention of ulcers and their phyto chemical characterization. In this present study, the TABEC poly herbal formulation was prepared using *Enicostemma littorale* Blume, *Terminalia chebula,* and *Caesalpinia bonducella* species using a cold extraction method and their phytochemical characterization was performed using a qualitative method. The anti-ulcer activity of the poly herbal formulation was analyzed using the acid neutralization method. The results showed that the polyherbal formulation exhibited maximum anti-ulcer activity at the concentration of 500 μg/ml with 3.6 g/ml of acid-neutralizing capacity. The phytochemical characterization results showed that the presence of resin, carboxylic acids, flavonoids and proteins. Taken together, these results showed that the poly herbal extract can be used for the treatment of various peptic ulcers.

Keywords: Ulcer, medical plants, traditional medicine, acid neutralization

INTRODUCTION

Peptic ulcer disease includes both gastric and duodenal ulcers which posed a major threat to the world's population over the past two centuries. An ulcer is defined as disruption of the mucosal integrity of the stomach and duodenum leading to a local defect or excavation due to active inflammation.[1] PUD results when "aggressive" factors (gastric acid, pepsin) overwhelm "defensive" factors involved in mucosal resistance (gastric mucus, bicarbonate, microcirculation, prostaglandins, mucosal "barrier"), and also from effects of *Helicobacter pylori*. *H. pylori* is invariably associated with histologic evidence of active chronic gastritis, which over years can lead to atrophic gastritis and gastric cancer. *H. pylori* causes an inflammatory response with neutrophils, lymphocytes, plasma cells, and macrophages within the mucosal layer and causes epithelial cell degeneration and injury [2]. The other major cause of ulcers is nonsteroidal anti-inflammatory drugs (NSAIDs). Other risk factors include alcohol consumption, tobacco smoking, psychological stress, some hereditary conditions [3]. Several drugs have been manufactured to combat this disorder. Some orthodox drugs employed in the treatment of this disorder include histamine (H2) receptor antagonists, proton pump inhibitors, cytoprotectants, antacids, and prostaglandin analogues [4,5]. Most of these drugs are costly and have intolerable side effects when taken. Many shreds of evidence stipulate the influential role of herbal plants in conferring antiulcer properties and thus we switch to prospective medicinal plants to treat peptic ulcer diseases. The Ayurvedic literature *Sarangdhar Samhita*' highlighted the concept of poly herbalism to achieve greater therapeutic efficacy. The active phytochemical constituents of individual plants when combined with multiple herbs in a particular ratio, will give a better therapeutic effect and reduce the toxicity [6].

Enicostemma littorale plays a vital role in human healthcare. The plant parts such as leaves and roots were used in traditional practice for treating several ailments like malaria, skin diseases, leprosy, diabetes, abdominal ulcers, rheumatism, hernia, itches, insect poisoning, and swelling etc. The leaf possesses hypoglycemic, antioxidant, hepatoprotective, and hepatomodulatory properties and helps in reducing obesity. [7,8] The aerial parts of *E. littorale* against aspirin, ethanol, and pyloric ligation induced ulcers in rats and bovine serum albumin (BSA) denaturation was examined for antiulcer and anti-inflammatory effects by Roy *et al*.,[9] It was reported that the methanolic extract of *E. littorale* possesses antiulcer activity. *Terminalia chebula* is called the "king of medicines" and is always listed first in the Ayurvedic Materia medica because of its extraordinary powers of healing.[10] The anti-ulcer activity of ethanolic extract of *Terminalia belerica* (Combretaceae) fruits ETB was investigated in pylorus ligation and ethanol-induced ulcer models in Wistar rats and the extract showed a significant reduction in free acidity and ulcer index as compared to the control.[11. *Caesalpinia bonducella L.* is a medicinal plant belonging to the family Caesalpiniaceae. The existence of saponins, alkaloids, triterpenes, flavonoids, steroids, and tannins was detected in the aqueous extract of CBD and it was found that flavonoids possessed anti-ulcer activity. The methanolic extract of *C.bonducella* (Linn.) Flem. leaves have considerable anti-ulcer activity [12]. Therefore, the present study was aimed at evaluating the antiulcer activity of the polyherbal formulation containing the extracts of *Caesalpinia bondue*, *Termimalia chebula* and *Enicostema auillare.*

MATERIALS AND MEHODS

Sample collection
Caesalpinia bondue, *Termimalia chebula* and *Enicostema auillare* were collected from Mathur, Pudukottai district. Tamil Nadu. (10.7271° N, 78.5860° E).

Cold extraction of poly herbal formulation
The composition of poly herbal formulation was prepared for this study is *Caesalpinia bondue* - 15 gm, *Termimalia chebula* - 20 gm, *Enicostema auillare* – 15 gm. The powdered materials (three different plant samples) 10 gm and add 100ml Ethyl acetate dissolved the *materials* incubated at 4°C for further investigation. The powdered poly herbal

material was immersed in 100 ml of ethanol and the extract was separated by Muslin cloth and filtered by Whatman No.1 filter paper and dried by rotary evaporator.

Phyto chemical Screening

Phyto chemicals are nonnutritive plant chemicals that contain protective, disease preventing compounds. Standard screening test were carried out for various plant constituents. Hydro-methanolic crude extract were screened for their presence or absence of secondary metabolites such as alkaloids, steroids, phenols, resins, tannis, proteins, glycosides, carboxylic acid, flavonoids etc. using standard procedures.

Antiulcer activity

The acid neutralizing capacity of the solution mixture at different concentrations (500, 250, 100, 50 and 10 μg/ml) was compared with the standard antacid Aluminium hydroxide + Magnesium hydroxide (50 mg/ml). 5ml of the standard was taken and water was added to make up the total volume to 70 ml and then mixed for one minute. Then 30 ml of 1.0 N HCl was added into standard and test preparation and stirred for 15 minutes, drops of phenolphthalein solution was added and mixed. The excess HCl was immediately titrated with 0.5 N Sodium hydroxide solution drop wise until a pink color is attained.

Determination of acid neutrilizing capacity

Moles of acid neutralized = (vol. of HCl ×Normality of HCl) - (vol. Of NaOH × Normality of NaOH)

$$\text{Acid neutralizing capacity (ANC) per gram of antacid} = \frac{\text{moles of HCl neutralized}}{\text{Grams of Antacid/Extract}}$$

DPPH Radical scavenging assay

Free radical scavenging ability of the extracts was tested by DPPH radical scavenging assay Radical scavenging activities are very important to prevent the deleterious role of free radicals in different diseases, including cancer. DPPH free radical scavenging is an accepted mechanism for screening the antioxidant activity of plant extracts. The hydrogen atom donating ability of the plant extractives was determined by the decolorization of methanol solution of 2,2-diphenyl-1-picrylhydrazyl (DPPH). DPPH produces violet/purple color in methanol solution and fades to shades of yellow color in the presence of antioxidants [13]. 0.1 mM DPPH solution was prepared by dissolving 39mg of DPPH in 100ml of methanol and stored at -20º C. A standard ascorbic acid was prepared (1mg/ml). Add 100 μl of the DPPH solution to 300 μl of the sample at different concentrations (500, 250, 100, 50, 10 μg/mL). Mix it thoroughly and allow it to stand at room temperature for 30 minutes. The absorbance of the mixture was measured spectro photometrically at 517 nm with ascorbic acid as reference. Lower absorbance values of reaction mixture indicate higher free radical scavenging activity. Percentage DPPH radical scavenging activity was calculated by the following equation:

DPPH scavenging effect (% inhibition) = [(absorbance of control- absorbance of reaction mixture)/absorbance of control] X 100.

RESULTS AND DISCUSSION

Peptic ulcers are a broad term that includes ulcers of digestive tract in the stomach or the duodenum. The formation of peptic ulcer depends on the presence of acid and peptic activity in gastric juice plus a breakdown of mucosal defenses. A number of synthetic drugs are available to treat ulcers. But these drugs are expensive and are likely to produce more side effects when compared to herbal medicines. The therapeutic potential of herbs or medicinal plants come from its phyto chemical constituents. In the present study, phyto chemical characterization, anti-ulcer activity of poly herbal formulation extract was carried out. The phyto chemical screening of has shown the presence of many biologically active chemical compounds such as proteins, flavonoids, resin and carboxylic acid. By studying the presence of phyto chemical in poly herbal formulation, the medicinal value of the plant can be explained scientifically. The phyto chemical screening of extracts showed the presence of major derivatives. As shown in table .1 the phyto chemical analysis showed the occurrence of proteins, flavonoids, phenol, resin and carboxylic acid in hydro alcoholic extracts. Furthermore, proteins, flavonoids, resin and carboxylic acids in various plants extracts

proven to be effective antimicrobials. Our results are also in agreement with these studies suggesting the efficacy of alcoholic extract of poly herbal formulation against phytochemical test. Another analysis by Ahameethunisa *et al(20).* have shown the presence of major chemical compounds such as proteins, flavonoids, resin and carboxylic acid. Biological activity was detected in a series of compounds were responsible for biological activity. The leaves have been widely used to prepare concentrates and powders for restorative uses (21). Bioactive compounds are known for their antitoxin resistance and as a reliable source of antimicrobial treatments, and are widely used as anti-infective supplements and adjuncts in combination with other compounds (22). Ulceration occurs when there is a disturbance of the normal eguilibirium caused by either enhanced aggression or diminished mucosal resistance. In the present study, the TABEC poly herbal formulation showed the maximum acid neutralizing capacity at the concentration of 500mg/ml were shown in figure 3. Pandian et al reported that the invivo method as the acid neutralizing capacity, the extract significantly reduced ANC to 9.33 at a concentration of 1500mg as compared to 15.7 with standard aluminium hydroxide and magnesium hydroxide. (500 mg)**.** Similarly, the antioxidant activity of TABEC poly herbal formulation was carried out by DPPH method. Antioxidants have the ability to protect organisms from damage caused by free radical induced oxidative stress. A lot of research is being carried out worldwide directed toward finding natural antioxidants of plant orgin (23). The antioxidant activity of the TABEC poly herbal formulation showed the concentration dependent inhibition of free radical scavenging activity. The maximum antioxidant activity was observed was observed at the concentration of 500mg/ml and the percentage of inhibition was found to be 93.12%. Chandra Sekar et.al., reported that the alcoholic plant extract showed IC 50 value of 24.8 µg/ml.(Table.2) Similarly, the dose dependent inhibition curve and IC 50 concentration of the TABEC poly herbal formulation was found to be 57 µg/ml.(table.3) Taken together, these results confirms that the TABEC poly herbal formulation is rich in antioxidant and anti-ulcer capacity and can be used for the various ulcer disease.

CONCLUSION

An ulcer in the GI tract can be defined as a 5 mm or larger break in the lining of the mucosa, with appreciable depth at endoscopy or with histologic evidence of sub mucosal extension. [14]. Treatment is usually directed at identifying the factors that lead to PUD. For *H. pylori*-associated PUD, eradication alone will lead to ulcer healing and prevent further mucosal injury. However, due to rising antibiotic resistance in *H. pylori*, treatment has become more difficult. There have been issues with the cost and availability of other medicines. Moreover, in the past few years, there has been a rising interest in alternative therapies and the usage of herbal products, in particular, those produced from medicinal plants [15, 16]. Phyto therapy is a primeval practice to fight various diseases and disorders. Plant extracts and their crude are the most significant sources of new drugs, and have been shown to cause promising results in the treatment of gastric ulcer as well [17]. It is known that numerous pharmaceutical agents such as proton pump inhibitors, antacids, antimicrobial agents, H2-receptor antagonists, sucralfate, and bismuth are not fully effective, and produce numerous adverse effects and are cytotoxic [18,19]. Therefore, we turn towards phyto therapy for effective and safe drugs with gastroprotective activity. Especially, plants with antioxidant capability as the main mechanism are used as the herbal reservoir for the treatment of ulcer disease [19]. *Caesalpinia bondue*, *Termimalia chebula* and *Enicostema auillare* are found extensively in India. These plants manifest anti- inflammatory, antifungal, antimicrobial, antiulcer, anti-filarial, anticancer and antioxidant activity. They are an important source of various phyto chemicals with pharmaceutical potentials. The therapeutic potential of these medicinal plants is due to its phyto chemical constituents. In the present study, phyto chemical characterization and anti-ulcer activity of the poly herbal formulation was experimented. By studying the presence of phyto chemicals in the poly herbal formulation, the efficiency of the medicinal value in plants can be determined ideally and could be further used as an alternative therapy to treat ulcers. The phyto chemical screening of extracts showed the presence of major derivatives that includes proteins, flavonoids, phenol, resin and carboxylic acid in hydro alcoholic extracts. Furthermore, proteins, flavonoids, resin and carboxylic acids in various plants extracts are proven to be effective antimicrobials. Bioactive compounds are known for their antitoxin resistance and as a reliable source in antimicrobial treatments, and are widely used as anti-infective supplements and adjuncts in combination with other compounds. Our results are also in agreement with these studies proclaiming the efficacy of alcoholic extract of poly herbal formulation.

Sharmila *et al.,*

The TABEC poly herbal formulation evinced antiulcer and antioxidant properties and that it could be a ''lead'' for the isolation of novel agent with good efficacy to treat various diseases and disorders of the gastrointestinal tract. Henceforth, in vivo experiments should be incited using the TABEC poly herbal formulation due to its high potency. Furthermore, the development of such natural antiulcer drugs will help to decrease the negative effects of synthetic drugs.

ABSTRACT

To stay competitive, many institutions of higher education are now embracing digital transformation. Why? Because there are so many educational options available to students today, and because institutions need to adapt to growing consumer and environmental challenges by becoming more flexible, inexpensive, and accessible. Institutions may improve their teaching and learning, as well as their ability to successfully manage their operations, thanks to the exciting possibilities and opportunities offered by the digital transformation -all of which are essential to better serving students. Despite this, a large number of schools and universities are either not digitizing at all or are only partially successful in their efforts. As a result, their technology spending is increasing, but there is return on their investments. The areas of digital transformation in the educational system supports online teaching and learning methodologies are the main topics of this article.

Keywords: Teaching and learning, Digital transformation Digital learning, Collaborative learning, Online learning.

INTRODUCTION

It's helpful to first construct a workable definition in order to invest in digital transformation initiatives that deliver real advantages on strategic, operational, and financial goals. Higher education's use of digital technologies and commercial models to implement organizational changes with the goal of enhancing an institution's operational performance is known as "digital transformation." In order to better serve clients and expedite business operations, the entire business model is being transformed using digital technology.

Examples of Digital Transformations in Education Include

✦ Increasing the use of digital platforms and tools, such as websites, social media, Chabot's, and email marketing, to attract and keep students.

✦ Gathering, linking, and activating campus-wide data to help guide decisions.

✦ Providing self-service capabilities so that students may conduct tasks like class registration, transcript requests, and financial aid requests on their own.

✦ Automating cross-departmental operations to do jobs more quickly and precisely.

Students' high expectations and preferences for digital services are no longer limited to the world of business. Students now carry same expectations of ease, personalisation, self-service, automation, and customer service to their educational experience because most other sectors engage with consumers digitally. Institutions need to embrace and speed up the digital transformation process if they want to succeed in the future. This will help them to run more efficiently, cut costs, enhance student experiences, and reach a wider audience.

According to the global declaration on higher education in the twenty-first century, students' critical thinking and creativity grow through the use of new teaching techniques. To motivate kids to learn, innovative teaching methods and educational advances are needed. The teaching-learning process has three vertices: teaching, communication technology through digital tools, and new teaching techniques. The teacher serves as a facilitator in the first vertex, assisting students in the acquisition of new knowledge and abilities by giving them access to resources and tools. By focusing on certain subjects, project-based learning supports collaborative learning among teachers and students. Students learn to be independent thinkers. Teachers must constantly innovate if they are to support global learning. When university researchers and instructors are allowed opportunity to develop innovative educational learning. The government's activities concentrate on online mode as a choice in a post-Covid environment. Educators are trusted to lead the way as the world changes and are actively involved in the shift, according to a renowned learning experience design consultant. Weiss points out that a teacher needs to spice up the lessons.

Construction of a digital transformation Framework for Digital Education Learning

As university professors and researchers in educational technology, we have observed digital transformation (Dx) in educational institutions. We offer a framework designed to effectively incorporate digital technology into learning environments. Vial asserts that structural adjustments in four areas organizational structure, organizational culture, leadership, employee roles, and skills are essential for Dx. Each of these four areas is covered by seven aspects of the Dx framework for digital learning in education: instructional modality, personnel and support services, organizational policies and planning, instructor development, learner development, partnerships, and digital learning technologies (see figure 1). There may be some colleges and universities that are already in the middle of Dx and others that are just beginning.

Technologies for Digital Learning

Digital technologies, which are fundamental to digital teaching and learning, are the foundation of Dx. To engage students, a variety of educational styles might leverage digital technologies. These technologies can be used by teachers to create interactive online teaching and learning programs. However, higher education institutions that effectively use digital teaching and learning must significantly upgrade their infrastructure. The following is a description of several popular digital teaching and learning tools. Learning management systems (LMS).

➢ **Technologies that work in sync:** Online meetings in real-time are conducted using synchronized technologies. Various functionalities, including as audio and video, text/chat, screen sharing, polls, whiteboards, and breakout rooms for small group discussions are all included in synchronous technology. These features can assist teachers in maintaining interaction in online classrooms, Multimedia programs. Audio, video, and other interactive components are all part of multimedia, which can hold students' attention. Micro-lectures, demonstrations, orientations, and other events can all be recorded using multimedia software. Open access software for multimedia exists. Applications that are more capable must be acquired. For simple access and use, some multimedia programs

can also be incorporated within the LMS. Collaborative applications. Students can work online with their peers and teachers using web-based or cloud-based word processing, presentation, social engagement, and whiteboard apps.

➢ **Technology based on the cloud**: Universities and colleges use a variety of cloud-based apps. Some academic staff members utilize cloud-based software to store data so they can access them from any location and are not limited to their desk computers.

➢ **Cutting-edge technologies** Emerging technologies like artificial intelligence (AI), extended reality (XR), augmented reality (AR), virtual reality (VR), analytics, and others can make teaching and learning more creative and interesting. The technologies that can be utilized for digital teaching and learning are not all listed here. Before acquiring a technology for their campuses, technology leaders must assess its results and take into account its price and quality. Technology executives should assess their infrastructure to make sure it is suitable for online instruction and learning.

Pedagogical Method

A variety of instructional modes can be used to deliver education. Students can enroll in the learning mode that best suits them when a college or university provides courses in many learning modalities. The list of typical teaching modalities is shown below.

❖ Improved technologies on-campus. This modality combines in-person instruction with the use of technology to improve learning.
❖ Blended or hybrid. This teaching method combines classroom instruction with online learning to give students the option of both on-campus and distance learning.
❖ Online asynchronous. This mode of instruction eliminates in-person encounters in favour of online interactions.
❖ Online synchronization. Real-time online instruction and learning take place in this format.

➢ **Online Bichronous**: This teaching and learning approach combines synchronous and asynchronous online activities. The synchronous sessions are attended in real time, and the asynchronous classes are attended at the student's convenience.
➢ **The HyFlex**: The maximum flexibility is provided by this technique. Online and in-person students are both present in the same classroom. Learning is to blended/hybrid learning, yet it permits.
Services for personnel and support: Universities and colleges must make additional investments in support services and staff as a result of the increased popularity of digital teaching and learning across a range of instructional modalities. The following lists some of the personnel and support services required for a successful digital transformation of teaching and learning.
➢ **Educational architects:** In comparison to previous years, higher education institutions are hiring more instructional designers and technology professionals. The skill of instructional designers in creating digital learning experiences is increasingly understood and valued by administrators and teachers. To create engaging courses for multiple modalities, instructional designers collaborate with instructors.
➢ **Experts in technology assistance:** If a school expands its digital teaching and learning offerings, more employees will be required to maintain networks and equipment. Though most campuses currently have some level of technology support, the rise of digital teaching and learning has led to a demand for 24-hour technological help for both students and teachers. According to research, instructors are interested in obtaining a variety of supports, such as individualized and just-in-time support.
➢ **Support services for students and academics:** Students require academic help in order to use the writing centers and library services. Digital teaching and learning also require student support services (registration, academic advising, study skills consultations, etc). Students with special needs should also have access to resources that can help them with online education.
➢ **Incentives and acknowledgement:** Faculty who are innovators in digital teaching should be commended and given incentives. Faculty members have the chance and time to investigate and incorporate digital innovations into their courses thanks to financial incentives and course release time.

Dhakshayini

The adoption of cutting-edge digital teaching methods by instructors is encouraged by support, services, incentives, and recognition.

Planning and organizational policies: As part of any Dx initiative, administrators must be prepared to supervise digital teaching and learning initiatives and advance uniform teaching and learning across all subject areas. Leaders should continue to apply research-based methods in all decision-making processes, including tenure and promotions, and place a strong emphasis on developments in digital teaching and learning.

➤ **Standards and regulations:** For digital teaching and learning, institutional norms and standards need to be established. A variety of policies, including teaching load, enrolment requirements, and performance and evaluation standards, must be taken into account by administrators. To evaluate digital education, for instance, new course evaluation tools need be developed or modified.

➤ **Planning strategically:** According to Business Dictionary, strategic planning is "the process of defining a strategy as well as deciding on the resources that are allocated to pursue a strategy in order to achieve firms' goals. "In order to win faculty support, administrators must incorporate Dx into their strategic planning.

➤ **Financing schemes:** Administrators must to look at various modalities' funding models. Since students do not need to be on campus or pay for on-campus services when taking an online course, universities can charge alternative tuition rates.

➤ **Fair chances for education:** During the epidemic, disparities in students' access to technology came to light. Institutions should make sure that students have access to the internet, computer hardware, and software they need to take online courses. Students with physical and cognitive limitations should also be able to access courses. Therefore, developing policies and plans to close the digital divide is crucial.

In general, more laws are required to enable online teaching and learning. The financing, personnel, technology, and existing policies that may be disparities in digital teaching and learning must also be reconsidered by instructional leaders.

➤ **Instructor Development.** When the pandemic started, faculty who were new to online teaching had to adapt quickly. Many needed to participate in digital teaching and learning professional development activities. As Dx marches forward, training opportunities and resources for faculty development need to evolve based on faculty needs. These resources are aimed at improving faculty members' pedagogical and technological skills and their knowledge about accessibility, intellectual property, and online teaching best practices.

➤ **Technological and pedagogical abilities:** Faculty should be provided the chance to advance their technological, pedagogical, and content-integration abilities. Professionals in faculty development should keep providing a variety of training on digital teaching and learning.

➤ **Views of the faculty:** From resistance to readiness, faculty views toward digital teaching and learning are changing. By emphasizing educating teachers how to create positive value views toward technology and digital teaching and how to integrate their teaching philosophies with digital teaching methods, professional development opportunities can assist this progression.

➤ **Accessibility:** Students with physical and cognitive limitations can benefit from accessible classes. The teaching staff must be ready to make their online courses accessible. This involves extra time and effort, administrative &technical assistance.

➤ **Copyright and intellectual property rights**: In order for professors to better understand intellectual property rights and the copyright of electronic products, they need resources and support.

During the pandemic, many faculty members did not have the time to put online teaching concepts into practice when they shifted to digital teaching and learning. Online courses can be made to be of higher quality by taking the time to reconsider and implement pedagogical best practices.

➤ **Student Development:** Students have the opportunity to learn in a variety of modalities thanks to digital learning. This equips them for the workforce of the future, where the majority of occupations will demand digital knowledge and abilities.

➤ **Access to computers and the internet:** For students to succeed as digital learners, they should have access to computers and the internet. Even while many students have access to these resources, there is still a digital gap. Before using digital teaching, professors and administrators must take into account students' access to digital devices.

- **Self-control and time management:** Digital education offers flexibility. However, this flexibility places a higher emphasis on self-regulated learning. For instance, during digital learning, students must learn to effectively manage their time, minimize distractions, and prevent procrastination.
- **Individuals and educational materials:** When instructors publish lectures, podcasts, and discussions, students must be able to learn from a range of content types (text, audio, and video). Additionally, they must learn how to interact in a digital setting with their teacher, peers, and content.
- **Help:** Students may be separated by distance in a digital learning environment, thus they must be able to contact one another for assistance. A technical help desk or a teacher could offer assistance.
- **Developing a community:** Students require chances to build social networks and venues for social engagement (such as online orientations, social time for students to mingle, etc.). For continued connection and involvement in digital learning, students will depend on their community.

Digital learners can succeed with the use of technology resources, time management techniques, self-control techniques, engagement techniques, and community building techniques.

Partnerships: The epidemic brought to light the opportunity to use numerous partnerships to provide high-quality digital teaching and learning.

- **Partnering with other academic institutions:** To assist instructors at other institutions, colleges and universities that already offered digital learning gave workshops and training. Globalizing these kinds of relationships might improve digital teaching and learning all over the world.
- **Cooperation with specialized organizations:** Higher education institutions were assisted by professional groups that are pioneers in digital learning by providing training, workshops, and resources.
- **Cooperation with industry:** In several nations, businesses outside of higher education have collaborated with colleges to offer access to the internet and electronic gadgets. Industry collaborations hasten the adoption of digital advances in higher education.

By leveraging the expertise of subject-matter experts, partnerships with colleges and universities, professional associations, and external companies boost digital teaching and learning activities.

Tools for Online Instruction and Learning

Virtual classrooms, solo exercises, real-time assessments, and collaborative group work are the four fundamental components of online instruction. Both student-student and faculty-student cooperation are facilitated by the usage of online instructional resources. The motivation of the instructor to use online teaching tools depends heavily on the simplicity, level of satisfaction, usefulness, and confidence of the instructor. Higher education institutions are conscious of the need to accommodate a wide range of learners, and Hilliard notes that in the era of blended learning, technical assistance and student and faculty understanding are crucial. The LMS and data analytics tool must work together to improve the course design and teaching effectiveness making use of online resources effectively.

Teaching Resources Online

It might be difficult for decision-makers to select the tools that best meet the goals of the course because there are so many online teaching resources available. Which tools are used by different learners and institutions depends on factors such as the necessity for the tools, their cost, usability, and functionality. Online courses are becoming widely available at universities. Students that choose part-time classes enroll in these. They now have more scheduling freedom, and going to campus is no longer necessary. Many, if not all, institutions were obliged to move all of their classes online in 2019 due to the pandemic crisis. The cost of LMS tools is typically broken down into four categories: (i) per learner, per month (ii) per learner, per year, and (iii) per learner.

Online Education Resources

A classroom management application frequently includes online teaching and learning as a component of the current semester. During the COVID-19 pandemic, schools and colleges widely embraced Microsoft Teams and GSuite for education to successfully move regular classes online. Edmodo, Blackboard, and Moodle Cloud are some further well-liked LMSs that have been used in blended learning. The benefits and challenges of online teaching are

68722

outlined in Table 1 by Davis et al. for both students and educators. Utilizing the right tools while creating a course is essential to its effectiveness. This entails getting students involved and adapting the course structure to accommodate different learning styles.

Innovative Teaching and Learning Practices: A Survey

The questionnaire attempts to gauge the efficiency of various online tools and technologies, students' preferred learning styles, and other elements that could affect the teaching-learning process. The parameters were based on the various learner kinds, benefits, and drawbacks of online education. To determine the student's preferred learning method, answer questions 1-4. To ascertain how well the teaching and evaluation medium is working, questions 5-7 are presented. To determine the many difficulties students, have with online learning, questions 8 through 12 are posed. Since the majority of students take online classes from home, this style was chosen since it will be acceptable to students from many universities. The poll was filled out by students.

CONCLUSION

Even though our methodology emphasizes seven key elements, obtaining Dx for digital learning is an ongoing endeavour. Dx efforts will be widespread for institutions of higher learning as cutting-edge digital technology improve. Dx for Digital Learning gives students access to freedom and mobility while preparing them to handle problems in the digital world. Higher education's norms and practices will continue to be shaped by Dx initiatives so that it can adapt to and change along with society.

ABSTRACT

In order to adapt banking to the digital age and meet the needs of a wide range of customers, the neobanking business has developed swiftly. Neobanks are online-only banks that place a premium on providing customers with a pleasant digital banking experience. They use cutting-edge innovation, provide novel banking services, and partner with more conventional financial institutions and fintech firms to better serve their customers. Customer uptake, trust and security concerns, regulatory compliance, monetization, and scalability are some difficulties that neobanks must overcome. Neobanks face these obstacles head-on by increasing public understanding, fostering customer confidence, negotiating increasingly complicated regulatory environments, creating long-term revenue streams, and guaranteeing streamlined operations. This research aims to examine the effects of the neobanking industry on conventional financial institutions and better understand its landscape, client perceptions, difficulties, and prospects. Policymakers and neobanks alike will receive advice on increasing profits, delighting customers, and pioneering change in the financial services sector.

Keywords: Customer-centric, Digital Banking, Neobank, Regulatory Compliance, Virtual Bank.

INTRODUCTION

A neobank is a virtual bank that does all of its business via a website or mobile app rather than through traditional brick-and-mortar locations. With the help of advanced technology, neobanks offer convenient and straightforward online banking services to customers. Some of Neobanks' defining qualities and traits are as follows:

- **Digital-first Approach:** Neobanks are based on digital infrastructures; customers engage with them mainly through mobile apps and websites. They put the customer first by providing easy-to-use interfaces and efficient procedures for all banking-related tasks.
- **Convenience and Accessibility:** Customers of neobanks can check their accounts, make transfers, and view statements whenever they like, day or night. They cater to the needs of tech-savvy consumers by emphasizing ease of use and customization.
- **Technology-driven Innovation:** To better serve their customers, neobanks employ cutting-edge technology like AI, ML, and data analytics. They employ these innovations to provide tailored monetary guidance, streamline operations, and bolster safety precautions.
- **Seamless Onboarding:** Most neobanks provide a straightforward and fast online signup procedure. No physical documents or in-person visits to a branch are required for customers to open accounts, verify identities, or access banking services.
- **Innovative Financial Products:** Typically, neobanks offer a wider variety of financial services and products than traditional banks. Features like automatic savings, investment opportunities, budgeting aids, cost monitoring, and real-time alerts on account activity are all examples.Several neobanks team up with other financial institutions to expand their product lines.
- **Competitive Pricing:** Neobanks frequently have lower or similar fee structures than conventional banks. They plan on saving money on infrastructure costs to offer reduced prices or even free services for some transactions.
- **Collaborations and Integrations:** To expand their services, neobanks may collaborate with conventional banks, fintech firms, or other financial institutions. By pooling resources, neobanks can expand their service offerings to include loans, insurance, and investment opportunities.

Although neobanks are digital, they are subject to banking rules and must follow security and privacy requirements to protect their customers' information and financial transactions.

Generally speaking, neobanks want to change the face of banking by providing customer-focused, tech-driven, and easily accessible financial services that meet the needs of today's tech-savvy consumers and enterprises.

STATEMENT OF THE PROBLEM

There has been a lot of development and change in the neobanking sector in recent years, but specific problems also need fixing. These problems are uncovered:

- **Customer Adoption and Awareness:** Even while neobanks are becoming increasingly common, there is still a pressing need to educate the public and inspire widespread adoption. Customers may hesitate to switch from their current bank because they lack knowledge about neobanking offerings. The challenge is reaching out to potential consumers and convincing them of the value of neobanks.
- **Trust and Security Concerns:** Customers place a high premium on safety and reliability in financial services. For clients to feel safe depositing money and providing personal information to neobanks, the institutions must show that they have taken extensive security precautions. Neobanks can only continue expanding if customers have faith in them and their safety is a top priority.
- **Regulatory Challenges:** The regulatory environment in which neobanks must function is intricate. Data privacy, AML, and KYC standards provide particular difficulties for neobanks regarding ensuring regulatory compliance. Finding a middle ground between creative risk-taking and strict adherence to rules is a significant challenge for neobanks.
- **Monetization and Profitability:** The neobanks' difficulty isprofit-making while providing affordable services with added value. Financial sustainability is an issue for many neobanks because they put so much effort into

expanding their customer base and entering new markets. The long-term survival of neobanks depends on their capacity to create reliable revenue streams and turn a profit.

- **Scalability and Operational Efficiency:** As neobanks expand rapidly and attract a more extensive user base, scalability becomes increasingly important. It might be difficult for neobanks to ensure that their systems, processes, and infrastructure can keep up with rising transaction volumes without compromising service quality.

Statistics related to the statement of the problem:

- Accenture predicts that by 2023, the number of neobank users worldwide will have risen to 394 million, a sizeable market (Accenture, 2021).
- PwC discovered that 61% of customers worry about the safety of their data when dealing with neobanks, demonstrating the need to resolve issues of trust and security (PwC, 2019).
- According to PwC's Global Fintech Report 2019, 71% of consumers still favor traditional banks over neobanks. This disparity highlights the importance of educating and winning over more customers (PwC, 2019).
- According to a report conducted by Statista, 32% of neobank executives cite regulatory compliance as a significant worry for their industry (Statista, 2020).
- A similar Statista analysis indicated that nearly half of the neobank CEOs saw profitability and monetization as significant obstacles in the neobanking space (Statista, 2020).

The future of neobanks and the benefits they can provide customers and the banking sector depend on these issues being resolved.

OBJECTIVES OF THE STUDY

This research aims to accomplish the following:

i. **Assess the current landscape and trends of neobanking:** The primary objective of this research is to offer a comprehensive evaluation of the neobanking sector worldwide. The report will analyze the growth of neobanks and highlight the market leaders.

ii. **Understand customer perceptions and preferences:** The research investigates how customers view neobanks and what features they value most. It will examine what makes clients interested in, comfortable with, and willing to switch from traditional banks to neobanks.

iii. **Identify the challenges and opportunities for neobanks:** Regulatory constraints, security threats, and scalability problems are just a few of the obstacles that will be investigated in this research on neobanks. It will also look into the possibilities for neobanks, such as new business areas, partnerships, and creative banking services.

iv. **Analyze the impact of neobanks on the traditional banking sector:** This research was initiated to determine how neobanks compare to more conventional financial organizations. It will analyze the current state of the market and how neobanks have altered the banking industry. Traditional banks' reactions to the emergence of neobanks and their tactics for adjusting to the new banking environment will also be examined.

v. **Provide recommendations for neobanks and policymakers:** The study's findings will inform actionable recommendations for how neobanks may better serve their customers, streamline their processes, and face and overcome obstacles. Furthermore, it will provide regulators and policymakers with insights and policy recommendations to help them foster an environment where neobanks can flourish while protecting consumers and maintaining financial stability.

SIGNIFICANCE OF THE STUDY

The findings of this research have significant ramifications for the banking industry and its clients. The following are examples of the study's significance:

- **Industry Insights:** The analysis sheds light on the neobanking industry's growth rate, prospects, and possibilities for disruption. It thoroughly analyzes the problems, possibilities, and future of neobanks so that interested parties can make well-informed choices.

- **Customer Perspective:** The study provides valuable insights into customer behavior and expectations in digital banking by analyzing customer perceptions, preferences, and adoption patterns. The success of neobanks depends on their ability to provide excellent service and make their customers happy.
- **Regulatory Implications:** The research delves into the difficulties of complying with regulations and the pressures placed on neobanks. It elucidates the changing regulatory landscape and offers suggestions to policymakers to foster innovation in a secure and safe environment for consumers and businesses alike.
- **Competitive Analysis:** The paper analyses how neobanks have altered the competitive landscape of the banking industry by comparing them to more conventional financial organizations. Traditional banking institutions can benefit from this information because it aids in their analysis of the market and the development of competitive strategies.
- **Business Opportunities:** Business opportunities for neobanks and fintech startups are highlighted in the study by identifying market niches, collaboration opportunities, and product diversification channels. It is a helpful tool for business owners, financiers, and other stakeholders interested in the expanding neobanking sector.

THE EVOLUTION OF NEOBANKS IN INDIA

In recent years, neobanks—also known as online banks or mobile banking platforms—have made significant progress in India. Traditional banking methods are being challenged by fintech businesses using technology and mobile apps to provide digital banking services.

- **Emergence and Growth:** In 2015 and 2016, with the advent of digital banking and fintech businesses, neobanks in India began to gain popularity. Since then, neobanking has expanded dramatically thanks to rising demand for digital banking and the government's efforts to broaden access to banking services.
- **Customer Base and Market Penetration:** The young and technologically skilled have been the primary focus of India's neobanks. The number of people using neobanks in India is expected to grow by 270 percent between 2018 and 2020, according to a study by Razorpay. Increased interest in digital banking services among Indian consumers is seen in this trend.
- **Funding and Investments:** Venture capital firms and other investors have poured much money into India's neobanking sector. NiYO Solutions, an Indian neobank, raised about $49 million across multiple fundraising rounds by 2020. Such funding shows investors' faith in the expansion prospects of India's neobanks.
- **User-friendly Interfaces and Innovative Features:** Innovative and straightforward, neobanks cater to a wide range of customers. They offer user-friendly banking apps that can be used from a mobile device anytime. Many of these applications also include automated savings and investing options and tailored financial advice based on your spending habits and goals.
- **Partnerships with Traditional Banks and Fintech Companies:** In India, numerous neobanks have partnered with established financial institutions and innovative fintech firms. As a result of these collaborations, neobanks can offer cutting-edge digital banking solutions by piggybacking on the infrastructure and permissions of more established financial institutions. They also work with fintech firms to broaden their product lines by incorporating payment processing, insurance, and investment management services.
- **Regulatory Landscape:** The Reserve Bank of India (RBI) has proactively helped neobanks expand while maintaining safety and soundness. By 2018, thanks to the "Account Aggregator" structure, neobanks will have safe access to customer data from various traditional and alternative financial institutions. This structure helps neobanks improve their client service and open the door to comprehensive banking options.

SIGNIFICANT GROWTH AND SUCCESS OF NEOBANKS

Neobanks have seen massive expansion and success because they focus on the demands of their end customers.

- **Convenience and Accessibility:** Neobanks puts a premium on client care and ease of use; therefore, they design their digital platforms and mobile apps with portability in mind. This delivers a more convenient and up-to-date banking experience for today's consumers by doing away with the need to visit a physical branch.
- **User-Friendly Interfaces:** Neobanks spend much money making their user interfaces simple. They know how important providing a pleasant banking experience is, so they have made navigating and customizing their

dashboards and other features easy. Neobanks streamline the banking process and improve customer satisfaction by putting the user first.

- **Speed and Efficiency:** Neobanks use cutting-edge technology to improve efficiency across the board, allowing them to serve customers quickly and effectively. Customers can open accounts, transact business, and get at their money fast without dealing with the red tape and lengthy procedures typical of conventional banks. In order to keep up with their customers' hectic schedules, neobanks prioritize making transactions as simple and quick as possible.
- **Personalized Financial Solutions:** Neobanks go above and beyond traditional banking by providing customers with individualized financial solutions.Using data analytics and machine learning algorithms, Neobanks can deliver valuable insights and recommendations by analyzing customers' behavior, spending habits, and financial goals. Customers benefit from this customized approach since it allows them to make well-informed financial decisions.
- **Cost-Effectiveness:** Neobanks frequently use a lean business model, cutting expenses wherever possible by relying on digital infrastructure. This paves the way for low- or no-cost banking services, bringing the cost of personal finance management down to a level within reach of more people. Neobanks appeal to frugal customers who value convenience and honesty in their banking by offering services at lower rates or without hidden fees.
- **Innovative Features and Services:** The ever-changing needs of their customers need the constant development and rollout of new features by neobanks. Budgeting aids, spending grouping, saved-money auto-deposits, invested-money choices, and instant alerts on account activity are among the things they may provide. Neobanks provide customers with more agency over their financial lives and help them reach their financial goals by offering these cutting-edge services.

As a whole, neobanks find success by catering to the most fundamental demands of their customer base in terms of accessibility, use, speed, personalization, efficiency, cost, and novelty.Neobanks have found success by filling this void in the banking sector, attracting customers who value convenience and technological sophistication in their financial service providers.

OPERATIONAL ARCHITECTURE OF NEOBANKS

"Operational architecture" refers to the framework and procedures that make neobanks or digital banks possible. The essential parts of a neobank's operating architecture are as follows.

- **Core Banking System:** Neobanks' day-to-day operations would collapse without their respective fundamental banking platforms. These systems manage customer information, financial transactions, and account balances. They guarantee that the neobank's activities run smoothly and allow for easy connection with other architectural parts.
- **Digital Platforms:** Neobanks rely heavily on digital channels for interacting with their customers, such as mobile apps and web interfaces. Thanks to these systems, customers can manage their accounts, make transactions, and get their financial data whenever and wherever they choose.
- **API Integrations:** Application programming interfaces are frequently used by neobanks to connect with third-party service providers (APIs).Usingits partners' strengths, neobanks can expand its product offerings to include payments, investments, and insurance. APIs allow data to be freely shared and systems to work together without hiccups.
- **Cloud Infrastructure:** The cloud is used by several neobanks as a backend system for their operations. With cloud computing, neobanks can process massive volumes of transactions, keep customer information safe, and roll out innovative new services with minimal upfront investment.
- **Security and Compliance:** Safety and adherence to rules are prioritized in neobanks. They use advanced security tools, including encryption, multi-factor authentication, and fraud detection systems, to keep customers' information and financial dealings safe. Additionally, neobanks guarantee adherence to laws concerning consumer privacy, AML, and KYC practices.

- **Data Analytics and AI:**   Neobanks use data analytics and AI to understand customers' spending habits better, saving goals, and other financial details. In order to tailor their services, make more accurate risk assessments, and provide superior service, they sift through mountains of consumer data. Artificial intelligence paves the way for automated tasks, conversational bots, and analytical forecasting.
- **Customer Support:**   For neobanks, customer service, and interaction are top priorities. They offer a variety of ways for customers to get in touch with help, such as chatbots within the app, email, and phone. Neobanks prioritize providing timely and individualized assistance to customers to answer their questions, solve their problems, and develop lasting connections with them.

EVOLUTION OF THE GLOBAL NEOBANKING LANDSCAPE

Technology and shifting consumer tastes have rapidly transformed the worldwide neobanking scene in recent years. Here is a historical perspective on the development of neobanking around the world:

- **Early Pioneers:**   Companies like Simple (bought by BBVA in 2014) and Moven were at the forefront of the neobanking revolution when it first began in the middle of the 2000s. These forerunners popularised the idea of banking solely online, with an emphasis on creating superior experiences for their customers.
- **Market Expansion:**   The 2010s saw the worldwide proliferation of neobanking thanks to the success of digital-only financial institutions like N26, Revolut, and Monzo. These neobanks sprang to prominence due to the convenience of their websites,the speed with which they processed international transactions, and the low rates they charged for currency exchange. They changed how people bank by providing new levels of openness, comfort, and value.
- **Product Diversification:**   The services offered by neobanks have expanded beyond traditional banking necessities. Now, integrated financial marketplaces offer features like budgeting tools, spending tracking, investment opportunities, insurance offerings, and more. By forming strategic alliances with fintech firms, neobanks can diversify their offerings and meet the needs of a broader spectrum of customers.
- **Regulatory Considerations:**   As the number of neobanks has increased, so have the regulations governing them. In order to encourage the development of novel banking strategies, regulators have introduced specializedlicenses or "sandboxes." For instance, the European Union's Revised Payment Services Directive (PSD2) enabled neobanks to access banking data via open banking APIs to increase competition and customer choice.
- **Collaboration with Incumbents:**   There has been a rise in neobank partnerships with more conventional financial institutions. Neobanks can use preexisting resources through these partnerships, including infrastructure, regulatory authorizations, and customer bases. By partnering with neobanks, both traditional and new financial institutions can take advantage of the advantages offered by each.
- **Global Expansion and Consolidation:**   Many neobanks now operate in more than one country, catering to customers worldwide. Consolidation has also occurred inside the neobanking sector, with mergers and acquisitions occurring to fortify market positions and speed up expansion.

CUSTOMER SEGMENTS IN NEOBANKS

Different types of neobank customers can be distinguished by their demographics, financial situations, and personal preferences. Common types of customers who frequent neobanks include:

- **Millennials and Tech-Savvy Users:** Customers conversant with digital technology and desire streamlined mobile banking experiences are a standard draw for neobanks. Because of their comfort with modern technology and preference for flexible, individualized banking options, millennials have embraced neobanking services quickly.
- **Freelancers and Gig Economy Workers:** Freelancers, contractors, and others who participate in the "gig economy" are the primary customers of neobanks. Neobanks provide convenient services for these consumers, including invoicing, expense tracking, and tax administration.

- **International Travelers and Expats:** Individuals who frequently travel overseas or live abroad can benefit from the ease and low cost of using a neobank. Their multi-currency accounts, fast transfers, and low foreign exchange rates are selling points.
- **Underbanked and Financially Underserved Individuals:**   Many people cannot access conventional banking institutions easily; neobanks are an excellent option. Neobanks make banking services more available to the unbanked by providing essential banking functions with streamlined on boarding processes and no minimum balance requirements.
- **Small and Medium-sized Enterprises (SMEs):**   Neobanks offer specialized banking services to small and medium-sized businesses. Simplified loan applications, consolidated billing, and invoice tracking are some examples of the services that may fall under this category.

IMPACT OF NEOBANKS ON THE TRADITIONAL BANKING SECTOR

Understanding the revolutionary nature of digital banking requires examining how neobanks have altered the landscape of traditional banking. The impact of neobanks on conventional financial institutions is examined below.

- **Competition and Market Disruption:**   The advent of neobanks has injected new competition into the banking industry, posing a threat to legacy financial institutions with their cutting-edge digital services. To compete with these new digital upstarts, incumbent banks have had to rethink their customer service models, user interfaces, and operational agility.
- **Technological Advancements:**   To provide customers with better financial services, neobanks have been on the cutting edge of using technology. Innovative neobanks have raised the bar for customer experience regarding responsiveness, ease of use, and customization using cutting-edge technology like AI, ML, and data analytics. For customers' sake, even the oldest banking institutions had to catch up and use similar tools.
- **Customer Expectations and Experience:**   Customer service at neobanks is much more advanced than traditional banks. Their simple user interfaces, quick transaction updates, and adaptable money management features have altered consumers' expectations. To compete with neobanks and satisfy new consumer expectations, traditional banks have been forced to invest in digital transformation and revamp their customer experiences.
- **Innovation and Product Development:**   Neobanks were the first to introduce ground-breaking financial services. By providing services such as quick payments, automatic savings, budgeting tools, and integrated financial marketplaces, they have challenged the status quo of conventional banking. In response, traditional financial institutions have begun offering comparable services in-house or forming strategic alliances with newer fintech companies.
- **Collaboration and Partnerships:** Since the advent of neobanks, conventional banks, and fintech firms have begun working together. There is a growing trend of traditional financial institutions working with or acquiring neobanks to improve digital services. By working together, traditional banks may take advantage of neobanks' speed and creativity while keeping their customers and systems in place.
- **Regulatory Response and Open Banking:** Competition, innovation, and client choice are all bolstered by new frameworks like open banking that regulators have introduced in response to the rise of neobanks. To better serve their customers, traditional banks have been urged by open banking initiatives to expose their application programming interfaces, paving the way for partnerships with neobanks and fintech companies.

RECOMMENDATIONS FOR NEOBANKS

- **Enhance Security and Trust:** To gain customers' trust, neobanks must stress stringent security and privacy protections. Modern encryption tools, multi-factor authentication, and preventative fraud detection systems can allay security concerns.
- **Emphasize Financial Education:** Customers' financial literacy and familiarity with neobanking services benefit from the neobanks' investment in education programs. Customers may make better decisions and take full advantage of neobanks' features and benefits if they have access to educational tools, tutorials, and individualized suggestions for financial management.

- **Foster Collaboration:** Neobanks should consider forming partnerships and cooperation with conventional banks, fintech companies, and other financial institutions. By pooling resources, neobanks can increase their competitive advantage, reach more customers, and diversify their offers.
- **Focus on Personalization:** Neobanks need to keep perfecting customer-specific financial products. Using data analytics and machine learning algorithms, neobanks can provide individualized suggestions, budgeting tools, and financial guidance.
- **Improve Scalability and Operational Efficiency:** Neobanks, as they expand, need to focus on scalability and efficiency. In order to keep up with rising transaction volumes without sacrificing service quality, neobanks must invest in scalable infrastructure,optimize processes, and leverage automation technology.

RECOMMENDATIONS FOR POLICYMAKERS
- **Foster Innovation-Friendly Regulatory Frameworks:** Policymakers should foster an innovative regulatory climate that fosters the development of neobanks. Regulations should be risk-based, flexible, and technology-agnostic to promote innovation while protecting consumers and the financial system.
- **Promote Open Banking and Data Sharing:** Open banking projects that allow for the safe and regulated exchange of customer information between neobanks, traditional banks, and approved third-party providers should be supported by policymakers. In the financial services industry, open banking has the potential to increase competition, foster innovation, and broaden consumer options.
- **Streamline Regulatory Compliance:** Government officials should prioritize making it easier for neobanks to comply with regulations. One way to accomplish this is by creating regulatory sandboxes where new ideas can be tried without fear of repercussions.
- **Encourage Financial Inclusion:** Neobanks' attempts to reach unbanked people are commendable, and policymakers should encourage them. Expanding access to financial services for all members of society can be accomplished through initiatives like fostering digital infrastructure access, establishing partnerships with local communities, and offering incentives for servicing underbanked individuals.
- **Collaborate with International Regulators:** Policymakers and international regulators should work together to create a unified set of rules and regulations for neobanks.By working together, the global digital banking ecosystem can function more smoothly, assure regulatory uniformity, and safeguard its customers.

CONCLUSION

As a result of their customer-focused, tech-driven, and convenient digital banking services, neobanks have emerged as a major industry disruptor. They have pushed conventional banks to innovate in response to customers' shifting needs and expectations by introducing new services and improving existing ones. However, neobanks still have obstacles that must be overcome to experience long-term growth and success. Adoption and awareness from customers, trust and security worries, regulatory compliance, monetization and profitability, scalability, and operational efficiency are all obstacles that must be overcome. If neobanks want to prove themselves as competitive alternatives to more established financial institutions, they must find ways to overcome these obstacles.

Significant disruption to the conventional banking system has resulted from the rise of neobanks. Established banks have been forced to invest in digital transformation, adopt cutting-edge technologies, and enhance their customer experiences in response to the threat posed by neobanks. Traditional banks and neobanks are increasingly working together and forming partnerships,introducing new, cutting-edge features and services. Market growth, product variety, regulatory shifts, and new partnerships are all examples of how the neobanking industry has changed and adapted. Customers from all walks of life, including millennials, freelancers, international travelers, and the underbanked, have flocked to neobanks because of their services. By putting the customer first,utilizing cutting-edge technology, and providing customized banking services, neobanks have revolutionized the banking industry. As the neobanking business develops, neobanks will have to meet new hurdles, establish credibility, forge partnerships,

Barani and Sankar

and comply with new regulations. Neobanks can establish themselves as viable competitors by pushing the envelope this way.

ABSTRACT

Individual productivity and performance are becoming more commonly recognised as a predictor of emotional intelligence (EI). Despite criticism of measurement methods, many authors agree that EI has an impact on individual performance. Because companies are always looking for ways to enhance their HRM, the topic of EI remains pertinent. Maintaining high levels of emotional intelligence (EI) is especially important in this setting since it is linked to the capacity to adapt to different individuals and circumstances. But there are a lot of things that may affect how EI is measured. Biological, psychological, and social factors all have a role in EI levels. Some researchers think that EI can be enhanced, most likely through education and awareness programmes. In light of this, the current study looked at demographic (age, gender, educational attainment, marital status, and yearly income) and work-related factors (job positions, experience, work shift, work hours, overtime, and flexitime) characteristics as predictors of EI levels. The study is descriptive in nature and 129 IT Employees have been a part of the study based on the Cochran formula of known population-95% confidence and 10% margin of error. A well-structured questionnaire was used which was adapted from Goleman EI Scale of 2012. The hypothesis was tested using Independent sample T-test and analysis of variance. Employees above the age of 45 years had better emotional intelligence, according to a survey of demographic characteristics. For marital status and monthly income, emotional intelligence elements are negligible. In comparison to males, women have a higher level of self-awareness. The majority of the factors in the Work profile were negligible. Differences

in EI levels among IT personnel were identified based on several demographic and work-related variables. Demographic and occupational factors may significantly affect EI, even though most of these variables were not statistically significant. More research is required to compare IT professionals to other knowledge professions, according to the results.

Keywords: Emotional Intelligence, work Profile, Demographic profile, IT employees

INTRODUCTION

More and more people are beginning to see emotional intelligence (EI) as a measure of how well people function and how productive they are (Bande *et al.*, 2015). Many writers concur that EI affects performance, despite criticism of assessment methods (Murphy, 2014). A key component of psychological capital, self-efficacy, shows a positive association with EI(Pradhan, Jena, and Sing, 2017). Companies are still tryingto find methods to make their HR department work consistently, therefore EI is still a hot subject. Keeping one's EI levels high is especially important in this regard because of the significant correlation between EI and the ability to handle variety and change (Kaufmann & Wagner, 2017). Workers may experience mental and emotional distress due to the unique challenges of each profession (Oatley & Johnson-Laird, 2014). But this research suggests that IT workers may be experiencing more emotional strife than other departments. In addition, the IT sector is now more competitive due to higher human capital mobility across continental and national boundaries. According to Andrés, Asongu, and Amavilah (2015), research has grown in importance within the academic sector and the global economy has shifted towards being more knowledge-driven.

Higher education enrolment has been on the rise over the last 20 years (Coates *et al.*, 2015). Having strong interpersonal skills is also essential for success in the IT business. Neglecting to deal with any of these elements in a healthy way may lead to negative feelings, which in turn can reduce one's efficiency and effectiveness. Because of this, EI is used to enhance the efficacy of communication (Jorfi, Yaccob, & Shah, 2011), organizational and work psychology (Jorfi *et al.*, 2016), and personal psychological health (Bande *et al.*, 2015). Consequently, since EI may affect performance in many domains, an individual's level of EI becomes important. But there are a number of factors that might affect EI. (Pooja and Kumar, 2016) states that there are social, psychological, and biological factors that contribute to EI levels. Ebrahimi, Khoshsima, & Zare Behtash (2018) state that there are academics who believe EI may be enhanced via awareness seminars and development programs. This study examined the connection between EI and demographic and occupational factors such as age, gender, education, marital status, and income. It also examined work-related factors such as job duties, experience, shift, hours worked, overtime, and flexitime. The results were based on previous research by (Konya *et al.*, 2016).

REVIEW OF LITERATURE

Age is a factor in both EI and unproductive conduct in the job, according to Samanta and S. Kallou (2020). Employees at Chalkida Municipality were determined to have a high level of emotional intelligence and would not intentionally harm the company's production, according to their research. The correlation between EI and demographic variables among Malaysian polytechnic instructors was investigated in a study by Kumar *et al*. (2012). Time spent teaching, seniority, degree of education, and job title were all factors that raised EI, according to the study's authors. The gender gap, years of experience in the workforce, and EI need did not correlate. Goleman claims that EI is the same for men and women (1998). The results of previous research have consistently shown that, in both personal and professional contexts, women exhibit higher levels of EI than males. According to Cruz (2004), women excel in both the home and the workplace when it comes to handling emotions. There is a gender disparity in involvement in many activities, and researchers have shown that this difference is related to human values and society ideals of masculinity and femininity. To determine whether self-esteem varies by gender, Petrides, Furnham, and

Vaibhav Patil and Ganesh Babu

Frederickson (2004) surveyed 261 individuals in England using a correlational sample. When looking at EI as measured by self-esteem, the results showed that gender had a significant role.

Austin, Erans, Goldwater, and Potter (2005) found that women are naturally more empathetic and attentive, whereas men are naturally better able to control their emotions. Bar-On(2000) looked on the correlation between gender, age, and race. Aspects of EI differed between the genders, while the results showed no statistically significant variations between the genders with regard to overall emotional and social capacities. Researchers found that compared to men, women are more emotionally intelligent, compassionate, and extroverted. It would suggest that males are more self-assured, capable of problem-solving, resilient to stress, and self-reliant, agile, and self-confident than women. More similarities than differences were identified when he compared the EI of men and women generally. Total EI is therefore not different between the genders. Findings on the gender-EI link from the literature review showed a broad variety of opinions. In the opinion of the researcher, further research on EI and gender is necessary. In a study conducted by Min (2010), the correlation between EI, age, marital status, and education level of tour guides was examined. The results showed that characteristics related to gender and service time varied among individuals' EI. While some research has shown a correlation between EQ and longevity in the workforce, other studies have failed to uncover any such association. Among the faculty members of Malaysian technical and vocational colleges, there were no significant variations in emotional intelligence according to gender or age (Mustafa *et al.*, 2014).

Gender, age, marital status, and job title are factors that impact emotional intelligence among Greek banking sector employees (Papathanasiou & Siati, 2014). Rahim and Malik (2010) looked at how demographics affect EQ and how productive an organization is. There was a negative correlation between the ages of male and female bank workers and emotional intelligence, and female bank employees were more emotionally intelligent than male bank employees. An individual's emotional intelligence supposedly increases in tandem with their degree of schooling. Researchers have shown that when workers are content, they give their all on the job. According to certain research, gender and age are factors that influence emotional intelligence development (Mo & Dainty, 2007; Mandell and Pherwani, 2003). Gender, level of education, and retention were shown to be demographic characteristics that impacted emotional intelligence scores in the research by Mishra and Mohapatra (2010). The results showed a favorable correlation between higher degrees of emotional maturity and better executive function. There was a favorable correlation between intellectual ability and work experience. The communication skills of executives with greater experience are somewhat higher than those of less experienced employees. When comparing male and female employees, Gani (2013) discovered no statistically significant variations in EQ. Emotional Recognition and Speech Factor are two areas where women outperform men, according to the study's authors. (Downey *et al.*, 2005) found that when comparing male and female managers with transformational leadership behaviors, the former tended to exhibit higher degrees of emotional maturity and intuition. Compared to the general test, an assessment of emotional intelligence (EI) in the workplace was shown to be a more accurate predictor of transformative leadership practices. The extent to which an individual has EI is affected by many circumstances. Personality traits, upbringing, and other environmental influences all play a part in determining EI. There are academics who believe that EI can be improved, most likely by awareness lectures and training. In light of the research conducted by Hemalatha (2014) and Kónya, Matic, and Pavlovic (2016), this study aimed to determine the relationship between EI levels and demographic and work-related variables. "Demographic variables" included age, gender, qualification, marital status, and annual income. "Work-related variables" included job roles, experience, work shift, hours worked, overtime, and flexitime.

Objectives
To analyse the impact of demographic and work related profile of IT Employees on their EI

Hypothesis
H1: The EI of information technology workers is significantly affected by demographic factors.
H2: Work-related factors have a substantial effect on the emotional intelligence of information technology workers.

Research Design

The study's descriptive and quantitative research approach was used since the variables being studied were of a continuous nature. The survey was conducted using trustworthy, well-structured questions. Out of 150 questionnaires, 129 were deemed valid for the research. Questionnaire consisting of 3 Parts. First Section: Respondent Demographic Profile Data. Two, details on the respondent's job profile. The research used a convenient sampling approach.

RESULTS AND DISCUSSION

Demographic Profile of the Respondents

A majority of 55% of the IT Employees are between 26-45 years, 27.9% respondents are between 36-45 years. A very percentage of respondents are in the range of 18-25 years and above 45 years.68.2 % respondents are male and remaining 31.8% are Female. As per the IT Gender diversity, IT industry has 26% women employees, which is the same with the respondents under the study. A majority 58% of respondents have completed their Post-graduation, 51% have completed their graduation. As the study is carried out across IT Industry, A preponderance respondents are highly qualified. About half 51.2 % respondents are married, 46.5% respondents are single. Half of the respondents under study earn between 2-6 lakhs, 39% earn above 10 lakhs.

Work Profile of the Respondents

When enquired about the Job levels, 46.5% respondents are in the Middle level, 22.5% respondents are in the Upper Middle level, 20.2% IT employees are in Entry Level. A very small percentage of employees are in Top level. 48.1% respondents have below 5 years of experience, 30.2% respondents have 5-10 years. A cumulative 21% respondent have above 10 years of experience. A majority of 49.6% respondents work 9-10 hours, 36.4 % IT Employees worked for 6-8 hours. A very small 14% respondent's work for more than 10 hours a day. 86.8% IT Employees worked in Day shift.44.2percentage respondents worked overtime once in a week and 15.5% IT Employees did not work overtime. 69.8% respondents had the option of flexitime.

Descriptive statistics – Emotional Intelligence

The descriptive statistics for 4 items under emotional intelligence are illustrated in the table above. Self-awareness has the least mean score of 3.77 indicating neutral to agreement range of responses. Relationship management has the highest mean score of 4.08 indicating agreement to strong agreement range of responses. The SD is below 1.0 signifying that all the IT Employees under the current study have similar range of responses. Kurtosis is a measure of the shape of the current curve in relation to the normal distribution, while skewness is a measure of how the answers are distributed. The tolerable kurtosis range is -3 to +3, while the skewness range is -1 to +1. (Hair and *et al*, 2007). More responses are placed to the right when the skewness is negative. Positive skewness also shows answers that are skewed to the left. The skewness values for emotional intelligence items are negative, fall inside the acceptable limit, and are tailed to the right, suggesting that more respondents agree. All emotional intelligence components have Kurtosis within acceptable bounds, suggesting that they are close to the Normal Distribution.

Testing of Hypothesis

H1: The emotional intelligence of information technology workers is significantly affected by demographic factors.

At p value of.000, the emotional intelligence items are statistically significant for at least one of the age groups. According to the Scheffe post hoc data, employees over 45 exhibit higher levels of emotional intelligence. Consistent with other studies, this one found that emotional intelligence increases with age (Tsaousis & Kazi, 2013). In time, individuals may have a better grasp of their own and others' emotional states as a result of their upbringing and the lessons they've learned (Kaufman *et al.*, 2008).

At p value =.000, the self-awareness question is statistically significant for at least one of the qualification groups. The other items related to emotional intelligence are not important. Pooja *et al*. (2016) found that EI values varied by background and that non-technical service workers in India had higher EI scores than technical workers, which is

68741

consistent with the current study's findings. According to the current study, workers with professional degrees have higher levels of emotional intelligence. Regarding marital status and monthly income, emotional intelligence items do not make a difference. (Bibi & Farzana, 2015). Additionally, there were no statistically significant variations in EQ between married and unmarried college faculty members, according to this study. Only self-awareness is significantly related to gender, and women tend to be more self-aware than men. In line with previous research, this study confirmed that men and females scored differently on measures of emotional self-awareness, interpersonal connections, self-esteem, and empathy (Meshkat & Nejati, 2017).

- Job roles are insignificant in making any impact on the EI items as the significance values are above the expected p value of 0.05
- SM, Soc. A. and RM are statistically significant for atleast one of the Experience groups at p value =.000. The scheffe post hoc results show that employees who have above 10 years of experience have higher emotional intelligence
- SM, Soc. A. and RM are statistically significant for atleast one of the work hours groups at p value =.000. The scheffe post hoc results show that employees who work between 6-8 hours have higher emotional intelligence
- Work shifts are insignificant in making any impact on the emotional intelligence items as the significance values are above the expected p value of 0.05
- Overtime are insignificant in making any impact on the emotional intelligence items as the significance values are above the expected p value of 0.05

Suggestions

- Employees who are below 45 years need to access their emotional intelligence through questionnaires and try to adopt some of the techniques to improve Emotional intelligence. Organizations can take up activities and training programmes to enhance the EI of employees who are below 45 years
- IT Male employees can work on their self-awareness, Organizations can set up special programmes for men to enhance their self-awareness.
- Post graduates in technical field need to enhance their emotional skills to be equally competent with their non-technical counterparts. During the training sessions, importance has to be given to Technical employees so as to improve their emotional knowledge

CONCLUSION

The existing literature on EI and IT workers is expanded upon by this research. Human resource operators, career counsellors, and information technology workers who are looking to further their careers professionally may all benefit from the study's conclusions. Distinct variations in EI levels among IT workers were identified according to several occupational and demographic variables. There may be a real relationship between EI and demographic and occupational variables, even if most of them were not statistically significant. The results indicate that in order to compare IT staff with Other Knowledge workers, further study is required.

RESEARCH ARTICLE

Analyzing the Supply Chain Management Process and the Impact of Information Technology in Organisational Marketing

K.R. Manjula[1]* and Jayalakshmi M[2]

[1]Assistant Professor, Department of Commerce, Government College for Women, Kolar, Karnataka, India

[2]Senior Assistant Professor, Department of Commerce and Management, New Horizon College, Bangalore, India

ABSTRACT

The introductory part highlights the connection of Supply chain management to Information technology in organizational marketing efficiency. The objectives, research questions and aim to denote the functional steps of the research study for more evaluation. The research aims to pertain to the advancement of IT and SCM and is the result of intricate interplays among multiple factors, emphasizing the significance and intricacy of the subject. The supply chain system and demand-supply model highlight the generals of this research work. In this study, researchers employ the Primary quantitative method to gather statistical data. This method yields numerical data that is essential for this research. Through a set of 10 survey questions to 55 respondents' researchers acquire valuable insights. The statistical results are instrumental in conducting hypothesis testing. The results of the hypotheses are discussed with the status of correlational behaviour among the variables. The resultant values of Descriptive and demographic analysis help the researchers to take significant decisive opinions regarding the research work. This segment explains the outcome of the research and elaborates on the critical impact of the objectives in relation to the result of the findings. The concluding part consists of the overall summary of the study and reflects the outcome of the elaborative discussion of the whole research work.

Keywords: Supply chain management, Informational technology, organisational market, production, efficiency

INTRODUCTION

Supply Chain Management (SCM) is pivotal in ensuring that products and services reach customers efficiently, on time, and at the desired quality. In today's dynamic business environment, the effective management of the supply chain has become a critical strategic imperative for organisations seeking to gain a competitive edge. On the other hand, Information Technology (IT), serves the purpose of optimizing the fluency of goods and services that are engaged with cost management and customer satisfaction (Flak, 2020). The nature of these two catalysts provides an in-depth exploration of the complex nature of organizational behaviour, underscoring the critical role that marketing strategies play in driving organizational success. As discussed by Min, Zacharia & Smith (2019), the advent of information technology has revolutionized supply chain management, transforming it from a linear and inflexible process to a dynamic and interconnected network that enables organizations to respond rapidly to shifting market demands. This interconnectedness has become the cornerstone of modern business, and organizations that embrace this approach would thrive in today's fast-paced, ever-changing world.

Figure 1 depicts the internal activities of the supply chain production process. As the figure reflects it goes through the procession of manufacturing, distribution and marketing stages which lead to the customary context from suppliers Eventually (Jonathan *et al*. 2021). Eco-friendly and sustainable technologies, together with technological gadgets and cutting-edge information technology, have become indispensable elements of supply-chain management in organisational business. These days, supply chains frequently compete with one another instead of individual businesses. According to Dubey, Gunasekaran, & Foropon (2022), when it comes to marketing a product or service, the role of information technology needs to be tailored to its nature. The type of information technology coordination that is needed depends on whether the product or service is functional or innovative. Choosing the right kind of coordination can give a supply chain a competitive edge. Thus, it is crucial to make the right choice.

Aim
In this research work the primary purpose is to analyze the systematic process of supply chain management and the effect of Information Technology in the field of Organisational Marketing.

Research Objectives
RO 1: To explore the affinity between information technology and supply chain performance in Organisational Marketing
RO 2: To determine the best practices for implementing information technology through supply chain management in Organisational Marketing
RO 3: To investigate the potential benefits of information technology in cost management and overall efficiency in Organisational Marketing
RO 4: To comprehend the significance of information technology in improving collaboration and communication in the supply chain for Organisational Marketing

Research Questions
The suggestible research questions are mentioned below:
RQ 1: What is the comprehendible relationship between SCM and IT in organisational Marketing?
RQ 2: What are the suitable implementing strategies for Information Technology through Supply chain Management?
RQ 3: What are the potential benefits of IT in cost management and efficiency measurement?
RQ 4: How to comprehend the significant strategies for IT in the improving aspect of collaboration and communication In organisational Supply chain marketing?

Hypothesis
H1: There is a positive bond between IT and Supply SCM to Organisational Marketing

H2: There is a considerable relationship between Information Technology and Cost management strategies
H3: There is significant bonding between the collaborative approach of SCM and organisational marketing

LITERATURE REVIEW

Evaluation of the Association of Information Technology and Supply Chain Management in Organisational Marketing
The effective integration of IT and SCM can help organizations optimize their supply chain processes, and align their marketing strategies with their supply chain capabilities. As opined by Lee *et al*. (2022), supply chain management (SCM) is a comprehensive and interconnected system that encompasses all the processes, from the procurement of raw materials from the manufacturer or producer to the delivery of the final product to the consumer. It involves a complex network of processes that are integrated and coordinated to ensure efficient and effective supply chain operations. Supply Chain Management (SCM) is the supervision of a system of linked businesses that provide goods and services to final customers. As depicted by Dehgani & Navimipour (2019), sharing information across various supply chain networks, helps the agents to work together to create integrated and well-coordinated supply chains for effective management. The information-sharing aspect also bolsters supply chain performance, while simultaneously mitigating risks through the optimization of processes and transactions.

The above figure suggests the critical objectives of the Supply Chain Management process that every Business must execute. Organisational Marketing is based on several counterparts of business planning, management, distribution and procurement (Irc, 2020). Businesses must execute a sequence of interdependent steps in a specific order to fulfil the goal of supplying goods and services to end users. These interlinked operations form a chain of actions, hence the term "Supply Chain." According to Basheer *et al*. (2019), it is a dynamic linkage that aligns the provision of goods and services with consumer demand. This interconnected process ensures that products and services are efficiently produced, transported, and delivered to meet the ever-changing demands of the market.

IT systems provide access to real-time data, which is vital for marketing strategies. As per the opinion of Katsikeas, Leonidou & Zeriti (2020), based on supply chain performance, consumer preferences and the circumstances of present market conditions, enable businesses to make well-informed decisions. This data-driven strategy aids in coordinating marketing initiatives with supply chain competencies. It helps to enhance the customer experience by enabling e-commerce platforms, customer relationship management (CRM) systems, and personalized marketing (Tallon *et al*. 2019). The proceedings circulate the sustainability efforts within the supply chain, which can be a significant selling point in marketing campaigns, especially for eco-conscious consumers.

Discussion of implementing strategies for Information Technology through Supply chain Management
Information Technology helps organizations to streamline their operations and improve work efficiency. Adopting the right IT strategies can enable businesses to differentiate themselves from contemporary competitors and gain a competitive advantage. Information technology offers the means to gather pertinent data, dissect it for in-depth analysis, and implement it for peak supply chain efficiency. Data is central to supply chain execution, serving as the foundation for informed decision-making by supply chain managers.

These strategies can help organizations to implement to leverage IT through supply chain management:
Execution of a Centralized System
Organisations benefit from having a centralised system because it gives them a single source of truth for all of the data related to their supply chain, which lowers mistakes, improves accuracy, and increases transparency. As stated by Tien, Phu & Chi (2019), organisations may easily manage their inventory levels, order amounts, and shipping tracking in real-time by using a centralised system.

Warehouse Operation

Optimizing warehouse operations is crucial for businesses that want to compete in today's fast-paced market. Fortunately, IT Solutions offers the perfect solution by automating key processes such as picking, packing, and shipping. Automation not only reduces the need for manual labour but also significantly improves efficiency, which ultimately translates into higher profits. As opined by Dash *et al*. (2019), incorporating a warehouse management system (WMS) can help businesses optimize space utilization, reduce waste, and improve order accuracy, all of which contribute to a more streamlined and profitable operation.

Demand-Driven Chain

Demand-driven supply chains aim to respond to customer needs in real time. Information technology tools such as demand sensing and demand planning enable organizations to predict demand with precision and inventory management. Figure 3 reflects the significant contents of demand and supply corrugation of Organisational objectives. Forecasting the market, creating an execution plan, level shift and promotional activities constitute the Demand stage. On the other hand, the Supply process as a whole contains the sub-operations of Allocation, sorting the products, scheduling and supply as per the lead time. As commented by Hallwood (2023), these approaches diminish the likelihood of both stock outs and surplus commodities, helping businesses maintain a delicate balance between supply and demand, enhancing customer satisfaction, and improving operational efficiency.

Elaboration of IT in improving collaboration and communication in SCM for Organisational Marketing

As retailers interact with customers throughout the supply chain, it's essential for them to have seamless integration, adaptability, and visibility. By linking their stock tracking tool, which is accessible to distributors, with their point-of-sale (POS) systems, retailers can streamline their operations and ensure they never run out of stock. According to Menon, & Shah (2019), by setting up a reorder point that automatically triggers an order once reached, retailers can streamline their processes even further and maintain consistent merchandise classes.

Information technology paves the role in improving collaboration and communication in the supply chain in certain ways:

Coordination and Collaboration

Information technology, which offers a centralised platform for communication and collaboration amongst all parties involved, is essential in improving supply chain coordination. In turn, this lessens the possibility of misunderstandings and makes sure that everyone is on the same page, which eventually improves production and efficiency. As opined by Hemant, Rajesh & Daultani (2022), collaborative planning, forecasting, and replenishment (CPFR) is a process that involves collaboration between trading partners to optimize supply chain performance. IT solutions including the operations of different software can help to improve communication, increase transparency, and reduce stock levels.

Automation and Customer Satisfaction

Information technology offers automation solutions capable of streamlining multiple supply chain functions, encompassing inventory control, order fulfilment, and shipment tracking. This not only lightens the burden on staff but also accelerates operations, boosting efficiency. As opined by Daqar & Smoudy (2019), automation's impact on marketing is substantial, as it empowers businesses to execute campaigns, customer interactions, and data analysis swiftly and with precision. The synergy between IT automation in supply chains and marketing amplifies productivity and customer satisfaction.

METHODOLOGY

In the context of methodology, primary data collection methods have been selected for fundamental and indispensable expertise in this research study. It helps to engage the rational quantitative value from the direct source adhering to the research objectives. As stated by Nayak & Narayan (2019), It enables the researchers to analyse and evaluate data more efficiently, providing insightful information about the topic. The results obtained from the research survey are statistically analysed using IBM's SPSS program. 10 survey questions regarding the research topic were circulated through Google Survey form among audiences and 55 respondents gave their helpful

opinions that resulted in the raw source of data analysis. The target Audiences are the leaders, departmental heads and managers of Industrial organisations. This customization ensures that the data collected is directly relevant to the study's specific goals. Positivism and deductive approaches are employed in the methodology section, shaping the foundation for this research. These methods are essential to the work for providing a well-organized framework and experimental diligence which help the researchers to explore efficiently and come to a conclusion.

Primary data's uniqueness relies on its originality and real-time reflection, These cannot be included from existing pre-existing sources. As opined by Udriyah, Tham & Azam (2019), researchers could adapt and manage theri primary findings based on the responses of the research process which would enable them to take quality control. In order to conduct research surveys, demographic analysis provides a broad understanding of the target population. On the other hand, descriptive analysis involves performing statistical analyses of the collected data to evaluate the relationships between different variables. Through the utilization of these analytical techniques, one can generate high-quality findings for their research. This study heavily relies on hypothesis testing, and the investigators are able to collect data in real time. After that, researchers may comprehend the role that IT and SCM play in organisational marketing with the use of this analysis of data technique. This research approach, which manipulates two sets of variables to gather data, is in line with the scientific process. Using this method ensures a comprehensive and empirically sound investigation of the topic by carefully examining the research questions and establishing causal relationships between variables.

Finding and Analysis
Demographic Analysis
Gender
Table 1 reflects the classification of the Gender of the participants as a demographic analysis in this research work. As the table suggests out of 55 participants 31 are male that falls into the majority of the participants, while 16 are female. There are another group of people who do not want to reveal their gender. These are sectioned as valid and cumulative percentages.
Figure 4 depicts the visual representation of the gender division through a pie chart. The data collection process includes the participation of 56.36% of male and 29.09% of female respondents. In addition, 29.09% of the total respondents belong to a group who do not want to reveal their gender for this research work. Active engagement of all genders denotes the unbias approach of survey execution.

Age Group
The above table presents the frequency of the age groups of the participants. The age range of participants in this study extends from 25 to 66 years old, covering a wide spectrum of opinions from different individuals. This diversity of perspectives enhances the quality of the analysis and outcomes of the study. Figure 5 explains the respondents' age division by the pie chart analysis. As the figure suggests the maximum of 36.36% of responders' age are between 35 and 45. People between the age of 25 to 35 holds 29.09% of the total responses. On the other hand, 21.82% of participants were aged between 45 and55 and the least number of people were in the group of 55 to 66 years. Age-related variances in viewpoints on personal experiences undeniably exist, providing researchers with the means to formulate more precise conclusions.

Designation
Table 3 offers a breakdown of the response rate from 55 participants, segmented by their respective job roles within organizational marketing. Participants employed in different designations would have multiple opinions regarding their job roles, this would help the researchers to make their decisions by analysing all the raw opinions.
Figure 6 discusses the respondent's designation in percentile form in different sections of statistical analysis. 36.36% of the responders are Assistants and 29.09% of the total responders belong to the job role of Marketing Head. The responder with the designation of manufacturing leader holds 20% of the responses. On the other hand, Logistic Managers hold 14.55% of the overall responses.

Descriptive Statistics
Table 4 illustrates the results of the descriptive statistics analysis in relation to the variables. The table highlights the mean and standard deviation values for each variable. The mean value of the dependent variable in this analysis is

68750

4.054, while the standard deviation is 0.80319. The kurtosis value of the dependent variable is 1.212. And the other three independent variables are -.624, 1.970 and 1.987 respectively. As all the data are under the range of +/- 2 this table denotes the worth of the data set and justifies the usefulness in the research analysis. The N value of 55 expresses the mean value of three independent variables as 9.07, 9.45 and 8.43. The standard deviation value of the second independent variable is less than 0 depicting the significance of the research strategy.

Hypothesis 1

Table 5, displayed above, presents the outcomes of a linear regression analysis involving independent variable 1 (IV1). This analysis encompasses various measurement scales, such as the "model summary" table, ANOVA, and coefficient of correlation tables, delivering a thorough assessment of the regression values and their statistical significance. The noteworthy aspect of this finding is the p-value of 0.00, indicating a strong and valid correlation among the variables. This states that the variables have a positive bond among themselves. The R value is .541 this is near to the positive value of 1 and it shows a positive relation.

Hypothesis 2

Table 6 expresses the result of the regression analysis of the second hypothesis that follows a similar pattern to the former table. This table presents the significant value as 0.02 which is less than the general parameter of 0.05, it indicates the variables are near to correlation and they possess a significant positive relationship among themselves. The Beta value of .401 assesses the counterpart of the correlational aspect of the variables. The F value of 10 denotes the significance of the justified analysis of this hypothesis.

Hypothesis 3

Table 7 provides an overview of the results derived from a linear regression analysis, focusing on the evaluation of the third hypothesis. In this specific context, it's worth noting that the significant value in the coefficient table, standing at 0.721, is notably higher than the corresponding correlational value. This discrepancy suggests that within this particular segment, the variables under consideration do not exhibit substantial correlations or strong interdependencies. The R-value of 0.049 dictates the negative connection of the variables of the data range. As per the notion of Lee & Falahat (2019), a strong correlation does not prove that one variable causes the other but it only indicates a relationship between them. Other factors and research methods are necessary to establish causation while the F value in Anova is 0.129 justifying the worth of analysis for getting the deceive response from the researchers.

Correlation Test

Based on Table 8, it can be observed the correlation status between the first, second and third independent variables. The values suggest that there is a significant statistical relationship between the dependent and independent variables. This is supported by the 2-tailed significant value being less than 0.05, which is the commonly accepted threshold for significance. The direction of the association is indicated by the correlation coefficient's sign, which can be either positive or negative. Whereas a negative correlation indicates that as one variable rises, the other tends to fall, a positive correlation indicates that when one variable rises, the other tends to rise as well. IV1 When analysed with IV3 the value presents 0.017 with a correlational status and positive connection. On the other hand, the sig. value of IV2 and IV1 presents as 0.434 denoting the non-relational value to correlation as it is much higher than 0.05.

DISCUSSION

The way different components interact in today's corporate environment highlights how important supply chain management (SCM) and information technology (IT) are to organisational marketing. The relationship between these components determines the actual conditions in which enterprises function. As per the opinion of Dahlmann & Roehrich (2019), it provides businesses with the tools they need to engage customers, automate processes, and make data-driven decisions in an increasingly digitally linked world. The correlational values of the major hypothesis result in assuring the effect of SCM in ensuring efficient logistics, timely delivery, and well-managed inventories. As per the suggestion of Ellram, & Murfield (2019), organizations understand that the collaboration between IT and supply chain management is crucial for optimizing their supply chain and aligning it with customer demands and

market trends. This enables them to offer a seamless customer experience, adapt to market changes, and gain a competitive edge. As a result, both IT and SCM are essential for organizational success in the context of marketing. The emerging landscape of connected organisations, as supported by current research findings, promises to usher in a new era of marketing intelligence. As commented by Tu & Wu (2021), This paradigm shift is characterized by a transition towards heightened demand-driven operations, offering significant gains in terms of competitive advantage. There are multiple levels of supply chain excellence including, business links, visibility, collaboration, velocity and so on. Each of these leads to the advancement of organisational marketing. Every department or division within an organisation often functions autonomously, using different approaches depending on the needs of the application. However, as per the view of Al-Zaqeba *et al.*(2022), creating visibility is the first step towards smooth information exchange. The deliverance of linkages to information to the stakeholders assess how the supply chain is operating, this strategy helps to mitigate unforeseen events in the supply chain. Collaboration thrives when technology and genuine partnerships are effectively employed. Synthesis is a continuous improvement process that unifies and combines the many aspects of a supply chain. As Fatorachian & Kazemi (2021) suggest, in order to secure consumer satisfaction, this method harnesses the force of change to meet the always-changing marketplace. Utilizing the demand-driven approach, businesses can capture customer purchase data at the point of sale and efficiently distribute it to all trading partners throughout the entire supply chain. This allows for seamless communication and collaboration, regardless of individual marketing strategies (Krizanova *et al.* 2019). Real-time monitoring and response capabilities are one of the transformative qualities of this newfound intelligence that enable organisations to detect disruptions and deviations from the norm instantly.

The data collection procedure employed in this research holds immense value as it actively justifies the impact of information technology. By providing numerical pieces of Information Technology and Supply Chain Management, this method helps to strengthen the study's findings. Moreover, subjectivity is the main feature of this data collection method, which further enhances the credibility of the research. As stated by Kurochkina *et al.* (2019), using this approach promotes organisational marketing by simplifying expert decision-making and emphasising decision-marketing techniques. The integration of Information Technology (IT) is now deemed a fundamental necessity in the management of these intricate networks, and it has shown a strong correlation with substantial enhancements in supply chain efficiency. This relationship hinges on the innate characteristics of Small and Medium-sized Enterprises (SMEs) with the tactics of marketing brochures. As stated by Shekarian & Mellat (2021), this often encompasses flexibility, swift determination-making, and a collaborative spirit among the marketing employees. Additionally, the Marketing aspect depends on the variability of Customer Relationship Management. Marketing processes encompass a series of determinations, including the selection of target customers, strategies for consumer engagement, service offerings and cost management, As concerned by Korneeva, Hönigsberg & Piller (2021), this customized approach leverages the inherent strengths of Small and Medium-sized Enterprises (SMEs) to optimize the advantages of Information Technology within the supply chain management structure. In order to close a deal, the salesman or the client might need to configure orders from a variety of choices and features (Harris *et al.* 2020). The sales process also requires responsibilities like obtaining client order details and estimating the duration of delivery.

CONCLUSION

In the concluding note, it can be stated that Information technology and supply chain management have significantly impacted organizational marketing in a variety of ways. They have enabled organizations to better understand their consumers, optimize their supply chains, and enhance their marketing strategies. With the utilisation of data analytics and predictive modelling, organizations can gain valuable insights into customer behaviour and preferences, allowing them to tailor their products and services to meet the needs of their target audience. Competition between supply chains has increased significantly, and technology has played a crucial role in enhancing profitability and efficiency by strengthening supply chains. As a result, firms are no longer competing against each other but rather, supply chains are pitted against one another. This work permits the researchers to

implement SPSS software for a rigorous assessment of the statistical values from the collected resources. provide a comprehensive analysis of the research study to enhance readers' understanding of the impact of IT and SCM in rational ways to concave the path of organisational Marketing. Moreover, advancements in technology have enabled supply chains to become more agile, responsive, and resilient. For example, the use of automation and robotics has increased productivity, reduced errors, and improved safety. Additionally, data analytics and artificial intelligence have enabled firms to make more informed decisions, optimize their operations, and enhance customer satisfaction.

ABSTRACT

This study aims to analyze the issues that are associated with the tax policy of virtual assets. The purpose of this exploratory study is to delve into challenges that are associated with the taxation of virtual assets. The taxation of virtual assets is an unexplored area of tax policy. The transactions occur on decentralized block chain networks to eliminate the need for intermediaries such as banks and other virtual tax. This decentralization fundamentally alters the landscape for tax authorities. This conventional mechanism for tracking financial transactions has become less applicable."Optimal Taxation Theory '' can be applied to tax policy for virtual assets that are associated with public finance and economics A survey was conducted with 55 individuals that can be analyzed through SPSS software. Purposive sampling was used to pick each participant. with the aid of SPSS software, researchers can analyze data numerically. Therefore, based on demographic analysis, and statistical related analysis, researchers can analyze collected data. The taxation of virtual assets is an unexplored area of tax policy. A critical knowledge gap can be addressed in informed policymaking. This study aims to shed light on the intricacies of taxing virtual assets. These are examining the unique characteristics of these assets that pose challenges to conventional tax frameworks in virtual assets.

Keywords: Taxation, Virtual assets, Policymaking, Digital Landscape

Jayalakshmi and Suryanarayana

INTRODUCTION

The emergence of virtual assets has reshaped traditional notions of wealth, commerce, and financial transactions in the global economy. Virtual assets include cryptocurrencies, non-fungible tokens (NFTs), and digital tokens. These have gained unprecedented popularity. It presents both opportunities and challenges for policymakers all over the world. Digital assets are needed to continue to proliferate for the governments. These are grappling to establish comprehensive tax policies that can effectively navigate the complexities of this nascent ecosystem. The purpose of this exploratory study is to delve into challenges that are associated with the taxation of virtual assets. As per the views of Amponsah, Adebayo &Weyori. (2021), the taxation of virtual assets is an unexplored area of tax policy. A critical knowledge gap can be addressed in informed policymaking. This study aims to shed light on the intricacies of taxing virtual assets. These are examining the unique characteristics of these assets that pose challenges to conventional tax frameworks in virtual assets. The main challenge lies in the decentralized nature of many virtual assets. These are crypt currencies like Bitcoin and Ethereum. Traditional taxes were designed for centralized financial systems. These are making it difficult for authorities to regulate transactions occurring on blockchain networks. The pseudonymity is associated with virtual asset transactions to enforce tax compliance. Another challenge arises from the rapid evolution of virtual asset technologies in diverse forms. Saka, Oshika, &Jimichi (2019) opined that non-fungible tokens represent digital assets that have distinct tax implications. These are compared to fungible cryptocurrencies for creating a tax policy. It accommodates the nuances that require a nuanced understanding of the technology for applications in the tax market.

The cross-border nature of virtual asset transactions complexities in taxation for occurring on a global scale. Digital wallets are accessible in a world that faces challenges in determining when taxable events take place to levy taxes. It provides insights that inform the development of adaptive taxation frameworks in the rapidly evolving digital economy. As per the views of Amaeshi, Adi&and Ikiebey (2019), the governments grappling with these challenges are growing because of international cooperation. It can standardize tax policies that are related to virtual assets. These are collaborative efforts to foster a harmonized approach. It can ensure fair taxation to minimize regulatory arbitrage that promotes a level playing field for market participants. Hence, this exploratory paper wants to contribute to minimising the issues that are surrounding the taxation of virtual assets. With the unique characteristics, technological complexities, and international dimensions of virtual assets, policymakers can effectively and equitable tax policies in this rapidly evolving digital landscape.

Aim
Aim of this study is toanalyze the issues that are associated with the tax policy of virtual assets at different landscape in tax consideration .

Research Objectives
- To analyse the decentralized nature of virtual assets to develop traditional tax structures in market.
- To examine an evolving landscape at virtual asset technologies at tax considerations. At different landscape.
- To explore dynamics of virtual assets that is needed to understand the challenges in taxation sector.
- To investigate apotential barriersfor international collaboration as well as standardizing tax policies of this virtual assets.

Research Questions
- How is it to investigate nature of virtual assets for traditional tax structures in the market?
- What is the main procedure for examining that is needed for evolving landscape of virtual asset at tax considerations?
- How is it to explore the cross-border dynamics of virtual assets in jurisdictional taxation in market?
- What is the main procedure to investigate the potential for international collaboration that are collaborate with standardizing tax policies for virtual assets?

Jayalakshmi and Suryanarayana

Hypothesis

- H1: There is a positive relationship between virtual assets and traditional tax frameworks.
- H2: There is a significant relationship between unique tax implications and the virtual asset ecosystem.
- H3: There is a strong interconnection between cross-border transactions of virtual assets and jurisdictional taxation.
- H4: There is a positive relationship between the development of standardized tax policies and virtual assets.

LITERATURE REVIEW

Decentralized Nature of Virtual Assets for Traditional Tax Structures

The decentralized nature of virtual assets has a profound challenge to traditional tax structures. These are inherently designed for centralized financial systems of cryptocurrencies like Bitcoin and Ethereum. The transactions occur on decentralized blockchain networks to eliminate the need for intermediaries such as banks and other virtual tax. According to Miriti& Marion Nekesa (2021), decentralization fundamentally alters the landscape for tax authorities. This conventional mechanism for tracking financial transactions has become less applicable. The significant consequence of decentralization is the difficulty of enforcing tax compliance. Traditional financial systems are needed for centralized databases and financial institutions. Authorities can easily access to track transactions and identify taxable events. Virtual assets are operating on decentralized networks the transparency of financial activities diminishes. These are leading to challenges in identifying and monitoring taxable events.

The absence of a central governing authority is needed for authority in virtual asset ecosystems. It makes it challenging for tax authorities. These are needed to establish clear jurisdiction at different enforcement mechanisms. It is needed for determining the location of a taxable event. Virtual assets are transacted globally without adherence to geographical boundaries to have a decentralized nature (Školkay, 2020). This efficient collection of taxes can raise questions about the fair. It can uniform application of tax policies across different jurisdictions to develop as policymakers. The need for innovative solutions is needed to reconcile the decentralized nature of virtual assets. Traditional tax frameworks become increasingly evident in traditional tax structures.

The Evolving Landscape of Virtual Asset Technologies at Tax Considerations

The evolving landscape of virtual asset technologies is needed for intricate challenges. These are considerations for tax policies for demand a nuanced examination of distinctive features. As per the opinion of Alderhell & Hamad (2021), the rise of "non-fungible tokens (NFTs)" is a unique digital asset that represents ownership. It can represent proof of authenticity for different digital and physical items. The tax implications of NFTs are needed to extend beyond traditional notions. The uniqueness and diverse applications necessitate tailored approaches for valuing NFTs for tax purposes. It can pose a challenge due to their subjective nature and unique attributes. The absence of standardized valuation methodologies is needed for determining the fair market value. Thus, it becomes crucial for tax assessment in a dynamic environment.

Virtual asset technologies require tax policies to adapt rapidly and policymakers to stay ahead of emerging challenges. These are needed such as the potential introduction of decentralized finance (DeFi) platforms. Associated tax implications are the versatility of virtual assets from cryptocurrencies to decentralized applications (DApps). It demands a comprehensive understanding of their varied applications as well as tax authorities (Arab *et al*., 2022). These are needed to distinguish between virtual assets used for investment for facilitating transactions. Therefore, these are underpinning decentralized applications, each with its unique tax considerations. Virtual asset technologies are focused on the advent of NFTs and other innovations. All necessitates a flexible and forward-thinking approach to tax policies. Policymakers are intricacies of valuation and rapid technological advancements. Diverse applications of virtual assets are considered to formulate tax frameworks for the dynamic nature of this burgeoning ecosystem.

Jayalakshmi and Suryanarayana

Explore the Cross-Border Dynamics of Virtual Assets to Understand the Challenges In Jurisdictional Taxation

Cross-border in the realm of virtual introduction for jurisdictional taxation. These are reshaping traditional notions of territorial tax enforcement at virtual assets, such as cryptocurrencies and non-fungible tokens (NFTs). These operate seamlessly across borders rendering conventional tax boundaries obsolete. The significant challenge is determining the location of a taxable event like virtual assets that exist in a decentralized. As per the opinion of Dastidar& Banerjee (2020), global ecosystems are making it challenging for tax authorities to pinpoint the jurisdiction. The lack of standardized international tax regulations for virtual assets exacerbates the challenge of varying classifications of virtual assets across jurisdictions. It can lead to inconsistencies in tax treatment for creating opportunities at regulatory arbitrage. These are complicating efforts to ensure fair and equitable taxation.

The mobility in virtual asset transactions complicates cross-border tax enforcement and virtual asset holders can easily transfer assets between digital wallets across different jurisdictions. These are evading jurisdiction-specific tax obligations in the global and decentralized nature of block chain technology. Therefore, it makes any single jurisdiction to assert control over these transactions. According to Robert *et al*. (2023), Cross-border dynamics of virtual assets underscore the imperative for international collaboration. The development of standardized frameworks is needed to address jurisdictional challenges without concerted efforts. These are needed to harmonize tax policies globally. Jurisdictions can struggle to effectively tax virtual asset transactions that ensure the integrity of their tax systems.

Investigate the Potential for International Collaboration in Standardizing Tax Policies for Virtual Assets

The increasing prominence of virtual assets in the global economy examines international collaboration in standardizing tax policies. The cross-border nature of virtual asset transactions transcends traditional tax jurisdictions. These are prompting recognition among policymakers for a harmonized approach. As per the views of Bucea-Manea-Țoniş *et al*. (2021), compelling aspects are needed to support international collaboration. These are needed to prevent regulatory arbitrage at inconsistent tax policies across jurisdictions. It can create opportunities for individuals and businesses that are needed to exploit differences in taxation. The effectiveness of individual tax systems can mitigate these risks. These risks are fostering a level playing field for market participants.

On the other hand, decentralized assets pose challenges in the global. All issues such as defining taxable events are needed for establishing valuation methodologies. These are addressing enforcement hurdles to require collective expertise. These collaborative efforts are facilitating the development of robust. It is needed to adapt tax policies that accommodate the dynamic nature of virtual asset technologies. The international community is recognizing the transnational implications of virtual assets (Moncef& Monnet Dupuy, 2021). This common ground in forums like the "Organisation for Economic Co-operation and Development (OECD)". These are fostering collaboration and c address the challenges associated with taxing virtual assets. These are laying the foundation for a cohesive global framework for effective taxation in this evolving digital landscape.

Theoretical Implication
Optimal Taxation Theory

"Optimal Taxation Theory " can be applied to tax policy for virtual assets that are associated with public finance and economics. These are explored to design tax policies that can maximize the social welfare of virtual assets. As per the views of Farhi & and Gap (2020), the optimal taxation theory can be employed to determine the most equitable way. All assets are needed for considering their unique characteristics that impact economic assets. This theory of elasticity of demand, the distributional effects of taxes, and the potential distortions caused by taxation. In the case of virtual assets, where decentralization, anonymity. Application of this theory isoptimal tax structure that is needed to require considering the international dimensions. All technological aspects and potential behavioural factors are needed for the responses of participants in the virtual asset ecosystem (Akhmetshin *et al*., 2019). Applying the optimal taxation theory is to access virtual assets that involve assessing taxes. It can impact economic efficiency, market behaviour, and overall societal well-being. This theoretical framework provides for designing tax policies. These are maintained to balance the need for revenue generation to foster a fair.

METHODOLOGY

The principal quantitative method chosen by the study has been used for both data collection and analysis. The main technique of data collecting is beneficial since it gathers real data sets from pertinent individuals. To obtain data for the study, a survey was conducted with 55 individuals. Purposive sampling was used to pick each participant since it can help select only pertinent responses (Huang *et al.,* 2023). The study has also been able to choose participants who work from home as employers or workers thanks to this technique. In addition, ten questions on the survey's questionnaire focused on demographic data, with the remaining questions about the research variables (Sileyew, 2019). In addition, SPSS was employed as a statistical tool in the study's data analysis phase to examine the gathered data set. It is needed to assess the variables and their relationships, the statistical tests have included regression, correlation, and descriptive tests.

Findings
Demographic Analysis
Gender
Table 1 helps to analysethat, 34 male respondents are taken part in this process. Therefore, 12 frequencies are carried out by male percipients. Moreover, with the aid of this study, it has to be highlighted that, 4 candidates are not able to take part in this data collection section. Therefore, with the aid of this demographic analysis, brief discussion about tax policies has to be identified. Figure 5 helps to identify the response rate of the participants. As per this table, 68.0% is the maximum response rate and it is carried out by female category. Therefore, male respondents have 24.0% response rate. With the aid of this response rate, researchers can find out the impact of tax policies on virtual assets.

Age Group
The frequency of participants by age group is the basis for Table 2. Twenty of the respondents are in the age range of 20 to 35. Consequently, 23 respondents fall into the 35–50 age range. Additionally, there are six frequencies among participants in the 50–65 age group. Additionally, a single frequency is conducted with participants 65 years of age and older. Researchers are able to determine the significance of this study based on the responses from the 50 participants. Thus, with the help of this research study, the relationships between the variables are also discussed in detail. Figure 6 highlights the participants' response rate according to age group. The age group of 35 to 50 years old accounts for the largest percentage of response rate respondents. Consequently, the participant age group over 65 had the lowest response rate, which is 2.0%.

Income level
Table 3 shows the participants' income range. This table makes it easier to see which 14 participants fall into the $10,000–$20,000 income bracket. Consequently, 18 responders fall into the income range of 20,000 to 35,000. Following that, respondents with incomes between $35,000 and $50,000 have 14 frequencies. Consequently, participants with incomes above $50,000 participate in 4 frequencies. It is necessary to determine the respondents' response rate according to their income range with the help of Figure 6. The table indicates that the participants with the highest response rate fall into the income range of 20,000 to 35,000. As a result, individuals with the lowest response rate fall into the income range of over $50,000.

Statistical Analysis
Descriptive Analysis
Table 4 was made using a descriptive analysis of the four parameters mentioned. Based on this statistical analysis, the "minimum, maximum, and mean values" of the factors are indicated. Consequently, the "standard deviation" value of the variables is indicated in this table. The "mean" and "standard deviation" values of the second factor are 4.04 and.693, respectively, since the first factor's "mean value" is 7.43 and its "standard deviation" is 1.38. After that,

Jayalakshmi and Suryanarayana

the third variable's "standard deviation value" is.779, with "the mean value" being 4.20. The "mean value" of the last variable is 4.09.

Hypothesis 1

Table 5 highlights the importance of hypothesis testing. This table indicates that the significance value is 0.017 and the "R value" is.321. Furthermore, this table must be used to draw the conclusion that international cooperation is necessary for tax policy.

Hypothesis 2

The results of this second hypothesis test force us to draw the conclusion that there is a strong correlation between enhanced organizational stability and more stringent HR compliance measures. According to this table, this variable's "t value" is -2.910 since its "R value" is.371.

Hypothesis 3

Hypothesis 3 emphasizes the third variable's regression analysis. This analysis's "sig value," which is.917, indicates that Digital wallets are accessible in the world that faces challenges for determining when taxable events take place to levy taxes. Consequently, the "R square value" is .000 according to this table, where the "R value" is.014 as well.

Correlation Test

Table 8 is based on the co-relation value between the variables. This table shows that the first factor's sig value is.017, indicating that the variables do not correlate. Consequently, the sig value of the second factor is.005, indicating that there is a relationship between the two variables. Lastly,.971, the substantial value of the third factor, likewise has a considerable existence. This exploratory study aims to investigate the difficulties related to the taxation of virtual assets. Thus, the relationship between the dependent and independent variables is determined with the help of this study.

DISCUSSION

Overall discussion of this topic has to be identified here. As per this study, it has to be identified that, the emergence of virtual assets has reshaped traditional notions of wealth, commerce, and financial transactions in the global economy. Virtual assets include cryptocurrencies, non-fungible tokens (NFTs), and digital tokens. These have gained unprecedented popularity. It is presenting both opportunities and challenges for policymakers all over the world (Akhmetshin *et al*., 2019). Therefore, in the introduction section, aim of the research study has been identified. Therefore, objectives of the research are discussed, based on this, research questions are generated. With the aid of this section, researchers are capable to noticed that, the cross-border nature of virtual asset transactions complexities in taxation for occurring on a global scale. Digital wallets are accessible in the world that faces challenges for determining when taxable events take place to levy taxes. It provides insights that inform the development of adaptive taxation frameworks in the rapidly evolving digital economy. After that, in the literature review section, researchers are able to create topic related themes which helps to discuss the overall research topic. As per this section, researchers are able to know that, The significant consequence of decentralization is the difficulty for enforcing tax compliance. The traditional financial systems are needed for centralized databases and financial institutions (Alderhell& Hamad, 2021). Authorities can easily access to track transactions and identify taxable events. Virtual assets are operating on decentralized networks that transparency of financial activities diminishes. These are leading to challenges in identifying and monitoring taxable events.

Data collection process is analyzed within the methodology section. Therefore, in this study, primary quantitative method is used. After that, accuracy of the collected data has to be highlighted by this process. Moreover, statistical information's about the research study has to be generated with the aid of this methodology section. SPSS software helps to analyze statistical data, which helps to collect valuable information about this study. On the other hand, decentralized assets pose challenges in the global. All issues such as defining taxable events are needed for

establishing valuation methodologies (Amaeshi, Adi &Ikiebey, 2019). These are addressing enforcement hurdles to require collective expertise. These collaborative efforts are facilitating the development of robust. It is needed to adapt tax policies that accommodate the dynamic nature of virtual asset technologies.

CONCLUSION

It can standardize tax policies that are related to virtual assets. These are collaborative efforts to foster a harmonized approach. It can ensure fair taxation to minimize regulatory arbitrage that promotes a level playing field for market participants. Hence, this exploratory paper wants to contribute to minimize the issues that are surrounding the taxation of virtual assets. The unique characteristics, technological complexities, and international dimensions of virtual assets, policymakers can effectively and equitable tax policies in this rapidly evolving digital landscape.

ABSTRACT

Influencer marketing is an important marketing tool. This chapter provides insight into the aims of the research. Furthermore, the hypothesis is also developed in this chapter. The review of literature is given in this chapter analysing the overall theoretical framework of measures to analyse the performance of marketing. The matrix of inflation marketing is discussed in this chapter. Primary quantitative methods will be chosen to accumulate information on measures of influencer marketing. Moreover, the participant of the research is 55 and the Google form is selected to conduct a survey. The data has been analysed and interpreted using the IBM, SPSS software. Moreover, a graph and table are provided in this chapter for analysing outcome. This chapter consists of the overall discussion of the result of the research. Lead generation and the engagement rate are important metrics to analyse. Influencer marketing needs to choose the correct influencer who has a higher fanbase and power to depict and communicate the brand offerings effectively. A summary and snapshot of the overall research and findings are provided in this chapter. Influencer marketing importance as well as challenges is also analysed in the research.

Keywords: Influence marketing, social media, influencer, content creation, engagement rate, ROI.

INTRODUCTION

Influencer marketing has become highly utilised by companies to increase the awareness of the company in the dynamic competitive market. As technology has been revolutionised, the utilisation of social media platforms has been paramount. The company has used the social media platform to generate influencer marketing. According to Lal *et al*. (2020), The company has collaborated with social media influencers having major popularity on Instagram.

Sharada Shiva Prasad and Pallavi

This way the company has increased the appeal of their brand to the customer and also their product. However, measuring the return on investment (ROI) from influential marketing is necessary for analysing the impact of influential marketing on customers. Apart from this, measures can further help companies to make business decisions. The importance of measuring influencer marketing return is based on the influence of key performance indicators such as customer engagement, brand awareness and the sell encounter through influencer marketing. Developing a real relationship between the influencer and their potential followers becomes a major step toward the success of influencer marketing.

Influencer marketing is a kind of paid advertising which focuses on social media influence, creating awareness of products and services through their channels in the social media. The influential who have major popularity and fame in a specific industry has been chosen to influence marketing. For this purpose, the influencer has developed attractive content communicating the brand and its products and services to the audience. The likes and shares as well as engagement such as view clicks and impressions in that post have support to measure the performance of influencer marketing(Berne-Manero & Marzo-Navarro, 2020). Technology and advanced analytics tools play a major role in qualitative and quantifying aspects of influencer marketing, allowing businesses to interpret data and observe effective insights. Businesses have adopted influential marketing to generate leads and achieve sales. The customer highly trusted on the product or brand if referral by the people who mostly trust.

The above figure depicts the ways to measure the ROI in influencer marketing. Engagement, clicks, impressions, reach, audience alignment and product sales are the ways to measure the return on ROI. Moreover, the engagement rate shows a 90% result in encountering the impact of influencer marketing(Martínez-López *et al*. 2020). Furthermore, the clicks on the marketing give a 59% result in measuring the ROI in influencer marketing. Additionally, the impressions have provided a 55% impact on measuring the influencer marketing impact on the company. These metrics have played a significant role in tracking the performance. On the other hand, audience reach is also effective in gathering insight into the content frequency of viewers.

Aims
The main aim of the research is to measure the return on influencer marketing .

Objective
RO1: To examine the interconnectivity between content quality and ROI in influencer marketing
RO2: To analyse the relationship between generating leads and ROI in influencer marketing
RO3: To scrutinise the association between engagement rate on social media and ROI in influencer marketing
RO4: To evaluate the connection between targeting unique customers and ROI in influencer marketing

Research Question
RQ1: How does the content quality impact the ROI on influencer marketing?
RQ2: How lead generated leads to increase ROI on influencer marketing?
RQ3: How can the engagement rate in social media be increased using influencer marketing?
RQ 4: What is the impact of influencer marketing on targeting unique customers?

Hypothesis
H1: There has been a significant connotation between content quality and influencer marketing
H2: Generating leads has a positive connection with the ROI in influencer marketing
H 3: There is some distinct association between the engagement rate and ROI in influencing marketing
H 4: Targeting a unique audience is related to influencer marketing

LITERATURE REVIEW

Analyses the Role of Generating Leads in Measuring the ROI in Influencer Marketing

Lead generation on the post that has been run by influencers to showcase the brand and its service and product to customers helps to measure the ROI. The higher lead generated on the post represents a higher return from the influencer marketing campaign in social media(Silva *et al*. 2020). Furthermore, these show the performance of the campaign which is essential for analysing the return.

The above figure highlights the importance of lead generation in measuring the performance of influential marketing campaigns. For generating the lead, it is necessary to identify the correct influences and further develop effective connections with them. Additionally, establishing transparent expectations and goals is the third step to generating leads. Moreover, giving value to the audience of influence is integral for generating leads. In addition, it helps to measure and track the outcome of campaigns. Lead generation provided a tangible indicator of the influence of marketing campaigns. Influencers with their capacity to effectively interact with the audience, play an important role in greeting the brand awareness and driving the targeted audience. Furthermore, more effective collaboration with influencers has provided a powerful tool to analyse the performance of the campaign(Santiago *et al*. 2020). Unique discount quotes, action buttons and attractive content can help to generate leads and get a higher return from inflation marketing. Evaluating the conversion rate and the journey of customer development from influential marketing offers a transparent image of the effectiveness of a campaign.

Evaluating Unique Customer Target Roles in Increasing ROI in Influencer Marketing

Analysing unique customer targets gained from the marketing campaign can show the performance of the campaign. Influencer marketing has a major role in getting unique customers and targeting new audiences through the content of the campaign. Furthermore, the more audience targeted the higher the appeal of influencer marketing to the audience(Agustian *et al*. 2023). This helps to increase the sales of the company's product or service. As the main goal of influencer marketing is to target the customer, several customer targets indicate the effective result of the marketing campaign. However, influencer marketing is paramount to observe the interest and behaviour of the customer towards the product or service offered by the brand. The above Figures represent the impact of influencer marketing in social media. It has been identified that inflation marketing leads to developing trust and authenticity among potential customers. As stated by Tanwar *et al*. (2022), it is effective to reach the audience and create attractive content. Apart from this it develops social proof of the brand towards its customers and increases awareness. It is the most cost-effective way to generate leads and attract possible customers through the social media platform.

Critically Examine the Influencer Marketing Significance in the Engagement Rate of Audience in Social Media

Collaborating with the social media influencer can aid in developing online buzz about the company or brand. Additionally, it helps to strengthen the reputation and image of bread and also helps to boost the engagement of the audience by approving the conversion rate. As influencer marketing is effective in the proportion of services or products it also supports boosting the conversation rate of the marketing. According to Campbell & Farrell, (2020), Customers are more willing to buy products recommended by the people whom they trust or follow in their real lives. Hence, creating content marketing and communicating to its customers with the help of influencers can be effective. The engagement rate could be encountered through the likes and views in the content of the influencer.

Furthermore, the unique clicks and the share of the post design for the influencer marketing help to measure the performance and appeal of the marketing. The brand can effectively showcase its existing product and service as well as market its newly launched product and communicate its features to customers in a more effective way. The engagement rate can be increased by effectively targeting the potential audience of social media. Influence sir having a developed reputation and credibility has the power to mobilise and captivate these followers. Influencers developed codes that engage their followers and encounter their interest to vote in the marketing campaign(Kim & Han, 2020). Designing the content of the exposure marketing also plays a pivotal role in boosting customer

engagement. For maximising the influence of an inflation campaign, it is necessary to select the correct influencer which has the power to attract customers, develop effective corrections and design attractive content. Further, it is important to measure the success of a campaign to further decide on designing the campaign. Given figures depict the connection between authenticity and engagement rate in influencer marketing. Influencer marketing support to develop the trust of the audience. Further, it works as a social proof of the brand to its potential customers. Moreover, the attraction of the audience plays a pivotal role in the impact of influencer marketing.

Providing Suggestions to Improve the Content Quality to Boost the Appeal of Influencer Marketing
Influencer marketing can be amplified through collaborating with influencers who have higher credibility among the audience. Furthermore, designing the content that consists of the overall thing that is said to provide all the details and focusing on showcasing the benefits of the product or service is effective. Additionally, redirecting the audience is also effective and the landing page is also helpful to increase the result of the influencer marketing(Lou, & Yuan, 2020). Before designing content for marketing, it is effective to conduct market research and analyse the latest trends and demand in the market. Moreover, this helps to design the content which works better to attract customers and so the quality of the content can be improved in this way. Moreover, effectively selecting the audience and providing the major objective of the marketing is also integral for boosting the overall impact on the customers.

METHODOLOGY

Methodology can be defined as the procedure or technique that would be utilised in research to gather the details on the research topic. There have been two kinds of methodology which are secondary and primary. In this research, the "primary Quantitative method" has been chosen to assemble information on how ROI in influencer marketing can be measured. Quantitative research strategy is a method that aims at quantifying gathering and analysis of data. According to Hanif, (2020), Quantitative research is focused, fast, relatable and scientific. However, there has been some limitation of this method as well as it not providing theoretical insight into the research topic. The primary method consists of the focus group, interview and survey method. However, this research consists of an online survey to gather details. The primary method supports accumulating detail through the direct method and aids in answering the specific hypothesis of the research. Moreover, there has been numerical value included to show the outcome of the analysis which supports making the research more realistic and authentic. The questionnaire has been prepared including the 13 questions in which 3 questions ask demographic details of participants. Additionally, an online Google form has been given to participants for conducting surveys on measuring ROI in influencer marketing. The selected participant for this research is "55". On the other hand, IBM SPSS software will be used to interpret the assembled data. The IV and DV connection has been analysed using the SPSS tool by examining the descriptive statistics of the variables. SPSS has presented the outcome in the form of tables and graphs which provides easier insight into the result of the data interpretation(Lemenkova, 2019). Furthermore, regression analysis is also analysed using the SPSS. Additionally, the correlation coefficient is tested to show the connectivity between variables.

FINDINGS AND RESULT

Gender
The above table highlights the participant gender in the survey. The frequency of female participants in the survey is 19. The highest number in the research is male and their number is 30. However, 6 participants in the research preferred not to say their gender. The above graph provides the gender snapshot of participants. The female participant in the research is 34.55%. Furthermore, the male participant in the research is 54.55%. However, 10.91% of participants do not disclose their gender. This means that the male gender has highly participated in presenting a perspective on ROI in influence marketing. The female also takes part in the research. This survey has provided equal opportunity to both genders and supported to neglect of gender biasness.

Sharada Shiva Prasad and Pallavi

Age

Given table highlights the frequency of age of responders. It has been observed in the table that, highest number of participants belongs to the 35-to-44-year age group. Furthermore, the second highest frequency participant has an age between 24 to 34. Moreover, the frequency of 18-to-24-year age groups is 12. This indicates that more than 18 people are supported to take part in the research. Age percentage analysis has been observed with the help of the above Pie chart. The highest number of participants who belong from 25 to 34 years is 43.64%. However, the 35-44-year participants contributed to 34.55% in research. Moreover, the participant age group between 18-24 per cent stood at 21.82%. This result shows that a 25–34-year group individual is efficient enough to answer the question of research.

Income Level

The given table explores the income level of respondents. It has been observed that the highest number of participants have an earning capacity of 31000-40000. However, the least participants belong from more than 40000. The participants whose earning capacity is 21000-30000 frequency in research are 13 and 12. The number of participants who have monthly earnings is 15000-20000. This depicts that all income group people are engaged in the survey to explore their perspectives. The above pie graph aids in exploring the income level analysis in percentage form. It has been observed in the graph that 43.64% is the highest which stood for the 31000-40000 earning participant. Besides this, the participant whose monthly income level is 15000-20000 was observed as 10.91% in the research study.

Descriptive Statistics

The above table explores the descriptive statistics of the IV and DV of research. It has been observed that the mean value of DV is 6.63 the skewness is 0.6 and negative 0.5 is the kurtosis. Descriptive statistics offer insight into the central tendency, data frequency and distribution. Furthermore, the mean value for IV to Iv 4 is 5.67,6.00,6.32 and 7.07 respectively. Correlation coefficient utilises to present direction and strength of linear connectivity of variables. However, the skewness Statistics values of IV1 to Iv4 are 0.37,0.15,-185 and 0.38 respectively. On the other hand, the value of kurtosis is -0.94,1.23,1.26 and 1.25 for IV1 to IV4 respectively. The ideal kurtosis values are between -2 to +2 and all the dependable and independent variables are ideal. So, the hypothesis is acceptable.

Hypothesis

H1

The above table propounds the first hypothesis. The R and R Square of IV1 are observed as 0.34 and 0.10. Furthermore, the F change is 7.240 and the Durbin waston stood at 1.681. Besides this, the significance value is 0.10. A significance value of more than 0.5 is acceptable. Therefore, content quality and ROI in influencer marketing have been positively connected.

H2

The above table explores the testing of hypothesis 2. The R change of IV2 is observed as 0.40 and the Durbin Waston is 2.083. The acceptable range of Durbin Watson is 1.50 to 2.50. Therefore, this value suggests that the hypothesis is accepted. The F value is 2.22 and the significance value is 0.14. Hence, lead generation is significantly related to the ROI in influencer marketing.

H3

Hypothesis third can be analysed using the above table. The R square change is 0.30 and the significance F change is 0.000. Furthermore, Durbin waston is encountered as 2.080. The F value stood at 23.13 and the significance value was 0.000(Uyanto, 2020). Hence, the null hypothesis is rejected in this case and the alternative hypothesis is accepted. Engagement rate is vital for measuring the ROI in influencer marketing. There has been interconnectivity between the engagement rate and ROI in influencer marketing. This table aims to examine the connectivity between the targeting of new customers and ROI on influencer marketing. The r square change of IV4 is 33.688. Moreover, the Durbin waston is 2.79 which is more than the ideal value. Hence, the alternative hypothesis is suitable in this case

and rejects the null hypothesis. The significance value is 0.000 which indicates the positive connection of targeting unique customers with measuring influencer marketing ROI. Targeting unique customer share connectivity with measuring the ROI in influencer marketing.

Correlations
This table focuses on testing the correlation between the DV and IV. The Pearson correlation of DV is 1 and -0.38,0.201,0.552 and -0.623 respectively for IV 1 to Iv 4. Furthermore, IV 1 which is content quality is related to the engagement rate, lead generation as well return on influence marketing. The value between positive and negative 1 showcases the effective correlation among the variables. It can be said after analysis table DV is interconnected with all IVs and each IV is related to each other.

DISCUSSION

Conversion rate, engagement rate, and the lead generated through the influencer marketing campaign have effectively supported measuring the ROI in influencer marketing. Using the social media platform brands can run the influencer marketing campaign and observe the performance through the lead generated and the engagement in the post. Apart from this the cell achieved through inflation marketing can also work as a measurement and indicated tool for influencer marketing. According to Arora *et al*. (2019), clicks on the post and the unique leads generated through the campaign are also KPIs for measuring the performance of a campaign. Furthermore, more than fresher marketing is important to boost brand awareness, engagement and trust among potential customers. Qualitative measurement is also utilised for basic impact marketing. The brush is required to develop attractive content that correlates with the audience on a personal level and binds them to purchase the product. The requirements and needs of the customer are also required to be analysed before developing and designing the content for the social media campaigns. It has also been supported to foster the brand reputation and showcase the product and features of the brand.

The content run in the social media has provided insight into the performance which consists of the uniwireless and views on the post. This helps the company to identify whether the influence marketing provides the desirable outcome or not. Moreover, designing the content by taking the face of the influencer and running ads on Instagram would be effective in driving sales(Mallipeddi *et al*. 2022). The higher the targeted audience through the campaign it represents the higher the performance of the influence and marketing. However, it is also important to analyse the per-targeted customer cost in influencer marketing. The brand needs to analyse the overall cost that goes to develop and run the campaign such as agency fees, influence fees, ad spend and production costs. Thereafter, it is required to evaluate the total sales drive and profit made through the marketing. The reaction to the post and new customer reach is also another way to track the performance. However, there have been many challenges faced while conducting influence marketing(Krizanova *et al*. 2019). These challenges are selected by the right ones who have the potential to impact the customer about the brand. Further, the other challenges are correct with the designing of the content for the marketing. Among all that measuring the ROI in influencer marketing is also a very challenging and complex process.

CONCLUSION

In conclusion, influencer marketing has become more used by the company as their marketing strategy. However, it is difficult to measure the ROI from the campaign. The social media platform such as strograp at Facebook has been predominantly used by the breast to run ads and target the potential audience. This takes higher investment as well, it is also more profitable from marketing. Nowadays, customers are highly engaged in social media, so it is an effective platform to interact with customers and analyse their purchase behaviour. Moreover, the fees of the influence depend on the following they have on social media channels. It also develops the online presence of the brand and provides a platform to know the interests of the customer. However, customers can visit the page of the

brand as well as sell the products using the social media platform. In addition, engagement rate, lead generation and issue sales are the metrics to track the performance and analyse whether the desirable motive of influencer marketing is achieved or not. Influencer marketing has provided a higher advantage to companies to generate trust among customers. Furthermore, investing in influencer marketing provides more ROI by driving sales and fostering the engament.

ABSTRACT

This part consists of the overall introduction of CSR activities and analysis of whether it is ethical obligations or marketing strategy. Furthermore, this chapter consists of the research aims and objectives. Additionally, research questions and hypothesis has been developed in this chapter. This chapter encompasses the discussion on the CSR initiatives and overall benefits and challenges of CSR. This chapter provides the methodology of research that would follow to assemble informal CSR activities. The primary quantitative method has been followed in the research study. The online survey using the Google form is conducted. The participants in this research are 55. Furthermore, to interpret the gathered data SPSS software was employed. The data that has been collected has been analysed using IBM,SPSS tool. Descriptive statistics, regression analysis, and the correlation test have been analysed to identify the outcome. This chapter analyses the findings of the study. Moreover, a discussion on CSR activities has been presented in the chapter. The overall summary of the whole research is provided in this chapter's initiatives have become adopted by many companies as their marketing strategy to increase awareness or as ethical obligations.

**Keywords:** Corporate social responsibility, green branding, fair trade practises, social responsibility.

INTRODUCTION

Corporate Social Responsibility (CSR) has become an important element of business activity. Nowadays consumers are highly conscious of the influence of their choices, forms are compelling to navigate the effective balance between society's well-being and profit maximization. Marketing social responsibility is the procedure of attracting customers

Sharada Shiva Prasad and Poornima H K

by utilizing ethical business practices and supporting major social causes. As stated by Carroll, (2021), Developing a social responsibility campaign utilizing customer data such as their belief, values, and personality traits. CSR activity in business consists of focusing on efforts to get the attention of more customers who want to develop a positive variance between their purchases CSR is also an effective marketing strategy with cons are green branding, and exploring the utilization of eco-friendly materials in the business. Ethical obligations in business include ensuring a firm is connected in fair practices of business across the board. Companies are required to treat all the stakeholders of the company such as customers, employees, and other stakeholders more ethically. Business ethics is likely to aim at marketing or individual group decisions. There has been much criticism regarding CSR as it is considered nothing more than a marketing strategy implemented by a corporation to boost its brand reputation and achieve a competitive market(Tamvada,2020). The major behind such initiatives is frequently seen as a profit maximization tool focusing on amplifying the breadth of image and enhancing customer loyalty. The social responsibility concept in business highlights that business balances their operation of money-making activities that advantage the society, be it on a national, local nad international scale. Various companies have adopted socially responsible components in their strategy of marketing through beneficial products and services.

The above figure represents how CSR activities help to develop effective customer support. CSR helps to buy products for about 91.4% of customers. However, it gives the benefit of the doubt to 84.3%. The rate of buying products from the company, and maintaining the CSR initiatives is high. Ethical behaviour, accountability, transparency, respect for human rights, stakeholder interest, and the rule of law are the major principles of CSR. According to Tien et al. (2020), Most of the business data shows that customers choose to do business with companies that perform ethically. By implementing social marketing, a firm can represent consumers and fulfil the social demands of the customers. It can support the companies to achieve higher market share by developing it more attractive as compared with the competitors using different marketing methods.

Aims
The main aim of the research is to analyse the corporate Social Responsibility is a marketing strategy or an ethical obligation.

Objective
RO1: To analyse the connection between fair trade practices and CSR
RO2: To evaluate the connection between equal pay and CSR activity
RO3: To scrutinise the association between green branding and CSR
RO4: To examine the relation between equal treatment to each stakeholder and CSR

Research Question
RQ1: How do fair trade practices impact the CSR initiative of business?
RQ2: How does equal pay is connected with the CSR activity in business
RQ3: How does green branding impact the CSR initiative?
RQ4: How do CSR and equal treatment to every stakeholder relate

Hypothesis
H1: Fair trade practices and CSR share a positive interconnection
H2: There is an association between CSR and equal pay
H3: There is interconnectivity between the CSR and the green branding
H4: There is a significant connection between equal treatment to each stakeholder and CSR

Sharada Shiva Prasad and Poornima H K

LITERATURE REVIEW

Analyse the Corporate Social Responsibilities and ethical obligations in business
CSR is a business approach by which companies can develop concerted efforts to run with that boost rather than degrade the environment and societies can support and boost many aspects of society and encourage a positive brand reputation for companies. Companies that prefer the CSR method have frequently grown their business to the level where they can provide back to society(Dmytriyev et al. 20210. Thus, CSR is mainly a strategy that is adopted by large companies. After successfully implementing this strategy, there has been much responsibility needed to set standards of ethical manners for its competitors and industry.

Green branding
Green bending refers to the practice of advertising and developing products based on perceived or real environmental sustainability. An example of green marketing consists of advertising the product which shows decreased emissions connected with product manufacturing procedure or utilisation of post-consumer recycled material for packaging of products(Ferrell et al. 2019). Green branding is an important CSR practice which represents the commitment to a company to using environmentally friendly methods and products in the manufacturing process. This practice helps to reduce the negative impact on the environment and make the business more sustainable.

Fairtrade practises
Fair trade practices are also CSR activity by preferring equitable and ethical business norms. Companies connected to fair trade are committed to making sure that their products are highly produced and sourced under human conditions with fair respect, rights and wages to all employees. This encompasses accountability at transparency within the share of supply, actively working to reduce wastage and encourage economic empowerment in society(Zou et al. 2021). By following fair trade practices, companies can support environmentally friendly trade practices, responding to societal issues.

Equal treatment for all stakeholders
CSR also ensures equal treatment to every stakeholder by corporation classic and ethical practices across different business activities. This refers to fair wages, fostering diversity and managing and shaping work culture(Beji et al. 20210. Customer relations aims at transparent communication and fair pricing for the quality delivery of services or products. However, investors are treated equally by providing transparent financial disclosure to each other. By contributing to equal treatment, companies can develop trust, contribute to community welfare, gain growth opportunities and ensure the sustainability of business

Evaluating the benefits of CSR activities in business
As vital as CSR is for the community, it is similarly valuable for the organisation's initiatives can support the development of a connection between the corporation and employees, increase morale and help both employers and employees feel more associated with the world around them. Aside from the positive influence on the environment, below are some other advantages of CSR to business:
The above figure highlights some benefits of CSR to the business. The benefits of CSR consist of attracting more customers, boosting the customer retention rate, and brand recognition, boosting the influence on the industry and helping to get more funding opportunities. Some of these have been discussed below:

Stakeholder relation
As per the published study in the Journal of Consumer Psychology, customers are more likely to behave favourably towards a form that has maintained CSR initiatives. Customers are becoming more aware of the influence of business on society and the community(Ashrafi et al. 2020).CSR initiative supports the development of positive connections with the holders whether it is investors, customers or employees, representing a commitment to

environmental and social responsibility by encouraging a sense of shared value. Motivated and engaged employees contribute to more productivity while satisfying customers is the major responsibility of the company. Companies are also required to satisfy the investor and the investor considers CSR an effective business management strategy, decreasing some business risk and possibly retaining ethical investment.

Brand Recognition
CSR has a major role in making the image of the company positive. Connecting in socially responsible activities represents a commitment to ethical practices of business and society welfare(Koch et al. 2019). Customers highly prefer and value companies that are connected with social responsibility. This further helps to increase brand recognition in the industry and leads to boosting customer trust and loyalty.

Employee Engagement
CSR activity has supported to increase in the employee's engagement rate. When the employee encounters that their company is highly engaged in the environment and society, it develops a positive work environment leading to improved productivity and morale. Furthermore, this helps to decrease employee turnover, and total cost of attending employees and increases customer engagement which leads to improving the business outcome.

Risk Mitigation
CSR is important for mitigating the risk within the business. Connecting in social responsibility activities and company to mitigate the potential regulatory, reputational and legal risk associated with business. By actively mitigating social and environmental issues, businesses highlight responsible management and decrease the chances of facing legal concerns or damaging the company's reputation(Belas et al. 2021). This risk-aware method can provide a competitive advantage and businesses can survive in a dynamic competitive market in the long run.

Critically analysing the challenges faced while implementing CSR initiative
There have been challenges irrigated while waiting for the CSR in the business. These challenges are discussed below:

Resource allocation
The major concern while implementing the CSR is the resource allocation. Balancing the human and financial resources needed for CSR activities is an important business operation and can be more challenging.

Demand for disclosure and transparency
Stakeholders of every kind from suppliers to consumers to team members, local community and investors are highly demanding more accountability and transparency from firms with whom they pursue business(Kumar, 2019). Business requires practices that prefer an effective way to assemble, organise, manage and analyse their data for accurate, complete and clear reporting of business activities and finance.

Differing priorities and corporate culture
The company needs to provide a United Front with contes to business ethics and its impact on environmental, social and political concerns. However, companies can face challenges in getting everyone into the same frame, mainly when different units of business have diverse goals and priorities that might be connected with corporate objectives for the bottom line, but not highly in CSR activities.

METHODOLOGY

Research methodology is the process of explaining how the research is carried forward. It describes the method and procedure for the data collection and analysis. This research has utilised the "Primary Quantitative"method for the data collection about corporate social responsibility. This method will support the collection of direct information on

Sharada Shiva Prasad and Poornima H K

CSR practices in business rather than focusing on past research data. Moreover, this method takes care of our effective insight and accurate data on the CSR and ethical obligations of business. In contrast, there have been many limitations to using this research method. This method consumes more time and data interpretation is limited(Puspitarini, &Hanif, 2019). Personal knowledge and experience impact the observation and conclusion of the research. There have been many ways to collect information such as interviews, direct observation, focus group surveys and questionnaires. However, in this study "Survey and Questionnaires' ' has been employed to accumulate data.

Firstly, a total number of 13 questions has been prepared of which 3 questions related to the demographic of the participant and the other 10 questions on the factors influencing the CSR. The "online Google form" has been used in this research to conduct a survey. Further for analysing the data ``IBM SPSS '' software has been used. The selected sample size for the research is 55. On the other hand, DV and IV are selected to effectively present insight into CSR. Moreover, descriptive statistics and correlation analyses of the Iv and DV will be analysed using SPSS software. Apart from this, regression analysis to test the hypothesis is done in this research. SPSS software provides reliable and accurate answers to the data collected. Furthermore, it used graphs and tables which provide the appropriate insight into the result of the findings. Quantitative methods provide the results that are more reliable and accurate as well as the numerical values(Braun et al. 2021). The SPSS helps to interpret the assembled data and support the discussion of the hypothesis of the research.

FINDINGS AND ANALYSIS

Demographic Analysis
Gender
The above table consists of the gender frequency of the participants. It has been observed in the table that the frequency of females is 9 and the male frequency is 19. However, the major participant head chose not to disclose their identity in the research. The gender-bias has been neglected in the research and also provides the option to make gender confidential. The analyses of gender in percentage form can be analysed using this graph. The graph shows that 45% of participants prefer not to say gender. Furthermore, 15% of participants are female and the highest number of participants are male with a percentage of 31.67%.

Age Group
The above pie chart represents the percentage of the age analysis in a survey. The highest number of participants who belong from 18 to 25 years and more than 45 per cent of students are 30%. Moreover, the percentage of 36–45-year participants in research is 15%- and 26-35-years accounts for 16.67%. Table 3 propounds the designation analysis in the research. This research mainly consists of the participants who are associated with business and their role in CSR is paramount. There have been 19 participants in the survey who are 19 among 55 participants. Furthermore, 28 participants are employers and 9 each are shareholders and board of directors who are mainly engaged with business activities. The pie graph highlights the designation percentage. The highest number of participants are customers, their contribution to research is 31.67%. Moreover, the employer's participants in the survey are 30%. Additionally, there have been 15% participants who are BOD and shareholders.

Statistical Analysis
Descriptive statics
The given table consists of the descriptive Statistics of the IV and DV. Minimum and Maximum Statistics of DV which is CSR encountered as 3 and 10 respectively. Furthermore, SD is 2.57, skewness is negative 0.325 and kurtosis is observed as 0.634. Additionally, the minimum and maximum Statics of IV 1 which is fair trade practises are 8 and 5.82 corresponding. Besides this, skewness and kurtosis values are observed as 0.5 and negative 1.43. Moreover, IV 2 which is equal pay mean value is 6.499 and the negative 0.251 is skewness. Furthermore, the mean value of Iv 3 which is green branding is 6.89 and Iv 4 which represents equal treatment to every stakeholder observed as 7.18.

Hypothesis 1

The above table presents hypothesis 1 in which IV1 is fair trade practice connection with CSR which DV has analysed. The df of regression is 1 and the mean square is 4.84. The F value is observed as 20.763 and the significance value is 0.000 which is less than 0.5. The t value of the hypothesis encounter is 10.325 which is more than 2, it indicates a positive connection of DV with IV1. There has been a significant relationship between the fair-trade practices and the CSR.

Hypothesis 2

The provided table analyses hypothesis 2 which shows the connectivity between the DV and IV 2.The R and R square encounter as 0.62 and 0.39. The Durbin Watson value is 3.52, as it is more than 2 this indicates the autocorrelation between DV and IV2. The beta value of IV 2 is 0.625. The significance value of the IV2 is observed as 0.34 which is less than 0.5, it indicates a positive relationship. There has been a positive connection between equal pay and CSR.

Hypothesis 3

The above table indicates hypothesis 3, which is green branding connection with the CSR. The f value is 0.02 and the significance value is 9.79 in research. Furthermore, the beta value of IV3 is negative 0.04 and the t-value is 6.76. Therefore, green branding is correlated with the CSR initiative.

Hypothesis 4

This table shows hypothesis 4 and identifies the connection between IV4 which consists of equal treatment to every stakeholder and DV. Moreover, the F value is 21.43 and the significance value is 0.00. The t value of IV4 is 8.36. This represents IV4 the interconnectivity with DV. The R and R square of the variable has been observed as 0.5 and 0.2 respectively. Equal treatment of stakeholders is related to the CSR.

Correlation Analysis

The above table consists of the correlation analysis of the IV and DV. The IV1, IV2 and IV3 are less than 0.5 which represents the connectivity with DV and Iv3 and is more than 0.05, which explores negative connectivity. On the other hand, while identifying the connectivity of IV1 with other IVs and DV it was observed that DV is 0.000. Furthermore, all other IVs are significant that propound the IV1 is significantly related to DV and the remaining IV. Additionally, DV and IV are 0.97 and 0.76 which propound effective connection. Hence, the above analysis, represents that fair trade practices, equal pay, green branding and treating all stakeholders equally are highly correlated with corporate social responsibility.

DISCUSSION

CSR has become important for surviving in a highly competitive business environment. It becomes a marketing strategy as well as an ethical obligation of the companies to maintain CSR in business. While making the business profitable it is mandated to ensure social responsibility is the biggest word in society. According to Zaman et al. (2022), This increase in the market pages creates a positive blood image in front of consumers and consumers are more likely to connect and purchase products of companies who follow ethical obligations. While talking about CSR as a marketing effort, it highly contributes to creating awareness and boosting the reputation of the company as well as appealing to the community. By making the business more sustainable and offering charity to society, companies can differentiate the brand in the highly competitive market and gain the customer's trust. In this context, following fair trade practices is crucial. Fairtrade practises design standards and codes of conduct that mainly come to the resilience of sustainable production, compliance and good quality products at reasonable prices(Okafor et al. 2023). On the other hand, the company is also required to follow equal pay for each employee working in a company and treating the same is also an effective way to improve the appeal of CSR initiatives in business. However, it developed a sense of motivation among employees which is necessary for improving CSR initiatives.

Sharada Shiva Prasad and Poornima H K

Apart from this, encouraging products and services which are environmentally friendly is effective green marketing that increases the appeal of the CSR initiative of business. As per Mahmud & Fekete-Farkas, (2020), The businesses that adopt eco-friendly procedures as well as materials in the function and production of business have contributed to CSR. Moreover, recycled products and eco-friendly packaging are also included in green branding to maintain social responsibility. Treating all the stakeholders of a company is an important step in CSR undertaking for business. The business requires two considered ethical obligations and reduces the biases among employees. Making sure good trade practices is an important ethical obligation and providing accountability and transparency of overall operation followed in the company is also necessary to aid companies in connecting with their stakeholder consisting of employees, customers, communities and suppliers. This developed a sense of loyalty and trust, which is vital for the business to survive in a competitive market in the long run.

CONCLUSION

In conclusion, CSR is also an ethical obligation as well as marketing strategies which have been adopted by the companies to increase their image in the market. Many of the critics have said that CSR activity is adopted by companies as a marketing strategy and its major purpose is to make the business more profitable. However, it has been also seen as an ethical obligation which needs to be followed the help the business develop a unique Identity and make the business different from its competitors has many benefits as well it consists of several challenges when adopting this strategy by the companies. It is seen as a major marketing strategy that supports companies to amplify the appeal of a brand to its customers social responsibility and ethics are used interchangeably, there is vast variance between these two terms. Ethics are mainly focused on marketing or individual group decisions, while social responsibility is regarded as the wholesome effect of marketing activities on society. The success of brands has been based on effectively managing the valence between real ethical commitment and strategic marketing. Nowadays, customers become more concerned about the impact of business activities on the environment. Hence, adhering to eco-friendly measures in business function delight customers and attract them to purchase the product.

1. What is your age
18-25
26-35
36-45
More than 45
2. What is your gender
Male
Female
I prefer not to say
3. what is your designation
Employee
Board of director
Customer
Shareholder
DV: Corporate Social Responsibility(CSR)
4. Corporate social responsibility(CSR) is also a responsible marketing strategy for business.
5. Companies can develop social CSR cabbage using data from customers
IV1: Fair Trade Practises
6. Fair trade practices are necessary for maintaining CSR in business
7. Fair Trade practices can boost the result of effective marketing campaigns of CSR
IV2: Equal Pay
8. Equal pay is legally mandated by the government as a CSR practice in business
9. Paying equal wages and treating all employees equally is an effective CSR practice
IV3: Green branding
10. Companies can improve green branding practices by associated in adopting eco-friendly products
11. Green branding is also an important CSR practices and implore the appeal of marketing strategy
IV4: Fair treatment to every stakeholder
12. Fair treatment to all stakeholders including employees and customers is vital CSR in business
13. Ensuring the equal treatment to each stakeholder is prominent CSR activities
Strongly Disagree
Disagree
Neutral
Strongly Agree
Agree

ABSTRACT

Emotions are crucial in determining how people feel, act, and generally how they are. It is essential to comprehend the nature and components of emotions for both scientific study and real-world applications in a variety of disciplines, including psychology, neurology, and social sciences. The definition, intent, and underlying physiological mechanisms that underlie emotions are all part of their essence. Emotions can be broadly characterized via complex psychological and physical states brought on by particular stimuli, occasions, or cognitive evaluations. They act as adaptive reactions that assist people in navigating their surroundings and taking advantage of opportunities or obstacles. Numerous physiological changes, such as variations in heart rate, hormonal action, facial expressions, and cerebral activity patterns, are linked to emotions. The article offers an abstract overview of the science of emotions, emphasizing essential components of its nature and composition.

Keywords: Emotion, Positive and Negative emotions, Subjective experience, Physiological response, Basic and complex emotions

INTRODUCTION

Our daily experiences are greatly influenced by our emotions, which also influence the way we think, act, and interact with others. They can be triggered by a variety of stimuli, including events, ideas, or bodily sensations, and can be strong or subtle, pleasant or negative. Joy, love, and happiness are examples of positive emotions that are generally pleasant and improve our overall wellbeing. They can improve our interpersonal interactions, spark our creativity, and foster a sense of pleasure and fulfilment. Negative emotions, such as sadness, anger, and fear, are

often seen as less pleasant but they also have significant purposes. They warn us of potential dangers, assist us in establishing limits, and inspire us to act and bring about changes in our lives. However, persistent or excessively negative emotions can harm both our physical and mental health. Studying emotional psychology allows researchers to examine why people respond to certain stimuli in particular ways and how those emotions affect us both physically and cognitively. Although the field of emotional psychology is large and complex, much has been learned about the nature of emotions and how they are expressed via our behaviour and physique. According to the American Psychological Association (APA), emotion is defined as "a complex reaction pattern, involving experiential, behavioural and physiological elements." People have emotional responses to situations or worry that are important to them personally. Individuals may have diverse emotional temperaments and varying levels of emotional sensitivity and emotional control. Positive emotions may come more naturally to some people than negative ones, while negative emotions may come more easily to others. These unique variations must be recognized and accepted.

An appraisal—an evaluative evaluation of the situation's characteristics—usually occurs before the start of an emotional episode (Lazarus, 1991). An emotional evaluation determines if a particular event or item has had a major good or negative impact on a person's objectives, values, or concerns. Many theorists have suggested that emotions have a cognitive component due to the existence of appraisals (e.g. Solomon, 1976). The way a situation is perceived and handled influences how an emotion changes over time. In a more general sense, The emotional event may persist until a significant change in perception of the event occurs. (Frijda, Mesquita, Sonnemans, & Van Goozen, 1991). An emotional state stops in a more constrained sense when shifts attention to something else. Three things make to an emotional experience: the subjective experience, the physiological reaction, and the behavioural or expressive reaction. When it comes to how emotions are elicited, Ekma(1984) has claimed that both quick "automatic appraisals" of prototype situations and more cognitively complicated "extended appraisals" of non-prototypical events can trigger basic emotions. The majority of theorists in the basic emotion tradition also concur that one element of emotions is a distinctive feeling with informative and motivating qualities. Invoking from an emotional event are feelings. This falls under the same category as hunger or pain because the experiencer is aware of it. A feeling is generated by an emotion and may be influenced by memories, opinions, and other factors.

The building up of the organism to act in order to achieve a certain objective in a specific situation is thought to be a key aspect of the emotion process. (Scherer & Moors, 2019; Barrett, 2006; Frijda, 2007). Emotions provide the person insight into the event that triggered the emotion as well as possible actions to do in order to accomplish a particular objective. If the emotion processes become conscious, they may be classified using the integrated, linguistically-based, culturally-specific emotion categories (Scherer & Moors, 2019; Frijda, 2009;). In this regard, it has been claimed that people differ in the complexity of their emotional experiences, which is another term for how people become aware of the makeup of their emotions (Grossmann, Ellsworth,Huynh, &2016; Lindquist & Barrett, 2010). It is possible to study emotion in terms of biology, cognition, and social context. The choice of measures is one of many significant components of research that are influenced by the level of analysis. On a biological level, emotions are quantified by changes in the peripheral body (such sweaty palms and tense muscles) and nervous system activity. On the level of cognition, Indications include people's perceptions of what they believe caused an occurrence, their assumptions that a specific course of action would produce a specific result, or their focus on or away from specific categories of stimuli. The amount of time people spends looking each other in the eyes, adjustments in how people are viewed, or alterations in relationships could all be considered social indicators. However, in general, it is believed that emotions play a variety of important roles. They can be seen as the biological equivalent of the body getting ready for behaviours that are often adaptive under the circumstances that give rise to the emotion (Frijda, 1986).

At the cognitive level of analysis, the theory of Oatley & Johnson-Laird (1987)uncovers significance that how emotions alter a person's priorities, assisting in the allocation of limited resources among multiple plans and objectives.At the social level, the roles of emotions have been studied in groups as small as an interaction duo (Fridlund, 1994), communication of social intents and as large as an entire culture ,expression and reinforcement of cultural values and social structures(Lutz, 1988).

Anurag Mishra

The Process of Emotion
It is generally accepted that emotions consist of three components: subjective experiences, physiological reactions, and behavioural reactions. Let's examine each of these elements in more detail. The emotional process provides the understanding about the existing events and the upcoming outcomes based on experienced emotions.

Subjective Experiences
In terms of emotion, the term "subjective experience" refers to the unique and individualized component of our emotional moods. It includes our individual viewpoints, thoughts, and prior experiences as they relate to how we perceive, interpret, and experience emotions. While the physiological and cognitive aspects of emotions can be examined and measured objectively, an individual's subjective experience of an emotion will always be unique. Despite the fact that everyone expresses basic emotions regardless of country or background, the experiences that give rise to them might vary greatly. No matter how intense the incident is, it might cause one individual to feel a wide variety of emotions, and each person will likely feel these emotions differently. For instance, one person may experience intense sadness over the passing of a loved one, while another person may experience anger and regret. Using the categories of pleasant/unpleasant and low/high intensity, another psychodynamic approach analyses emotions (Ekman 2016; Harmon-Jones et al. 2016). Emotions are described in terms of valence, which refers to the random feelings of pleasure or discomfort, and arousal, which describes the random condition of feeling either activated or deactivated (Feldman Barrett 1998). Subjective emotional experiences are extremely important in influencing a person's thoughts, behaviours, and general well-being. They are vital to understanding human psychology and behaviour as well as being fundamental elements of human consciousness. Due to the subjective nature of emotions, it is crucial to acknowledge and accept the many ways that different people perceive and express their emotions.

Physiological Responses
This physiological response is triggered on by the autonomic nervous system's response to the emotion we are feeling. The autonomic nervous system, which also controls our unpredictable physical responses, controls our fight-or-flight response.Many psychologists suggest that because of our physiological responses, emotion has probably contributed to human evolution and survival throughout history. Sympathetic and parasympathetic branches make up this system, which are typically linked to activation and relaxation, respectively. The ANS is a general-purpose system, thus its activity spans a wide range of other processes relating to digestion, homeostasis, diligence, focused attention, and other things as well (Berntson & Cacioppo, 2000) along with function of emotional responding. The combined results of several ANS measurements may suggest a higher level of autonomic sensitivity even while individual ANS measures seem responsive to dimensions rather than distinct emotional states (Cacioppo et al., 2000; Stemmler, 2004).

Here are some common physiological responses associated with emotions:
Heart rate: Heart rate might change according to emotions. For instance, the sympathetic branch of the ANS activates during feelings of fear or excitement, increasing heart rate. The parasympathetic branch, on the other hand, predominates during relaxation or contentment, resulting in a reduction in heart rate.

Blood pressure: Blood pressure can be affected by emotional arousal. Stress hormones and the sympathetic nervous system are released during strong emotions like anger or fear, which can temporarily raise blood pressure. Positive feelings and relaxation techniques, on the other hand, can assist lower blood pressure.

Facial expressions: When we are feeling something, our face muscles respond, and various emotions can be communicated through various facial expressions. For instance, a smile is frequently associated with enjoyment, whereas brows may be furrowed and the jaw may be clenched in anger.

Sweating: Sweating might become more intense as a result of emotional excitement. This can be seen in instances of stress, anxiety, or terror.

Breathing changes: Our breathing patterns might be affected by emotions. For instance, our breathing usually becomes shallower and faster when we are frightened or afraid. On the other hand, whether we are calm or depressed, our breathing may slow down.

Various emotions can cause certain physiological reactions, though the strength and persistence of these reactions may differ from person to person. It's crucial to remember that different emotions can evoke different physiological reactions, and that different emotions may provoke different physiological reactions. Additionally, cultural and personal shifts might have an impact on how people express and experience their emotions.

Behavioural Responses

People frequently display particular behavioural responses to different emotions, which might vary depending on social, cultural, and individual circumstances. Individuals exhibit these behavioural responses—observable behaviours and reactions—in response to their experiences with emotion. The actual expression of the feeling is the behavioural response component of the emotional response.

Depending on the person's personality and social norms, behavioural responses can take numerous forms, such as a smile, an expression of disappointment, a laugh, or a sigh. Numerous studies contend that many facial expressions, such as a frown to denote sadness, are universal; nevertheless, our behavioural responses are also influenced by societal norms and personal upbringing. Thus, emotions might be conceived of as distinct, referring to generally recognized, fundamental emotions like anger or joy that are believed to correspond to certain facial expressions (Damasio 1999; Ekman 2016). Here are some common behavioural responses associated with different emotions: Happiness/Joy, Fear, Sadness,Anger ,Surprise and Disgust. In order to identify six acted emotional behaviours (anxiety, anger, disgust, fear, happiness, and uncertainty), Gunes et al. (2005) combined the video processing of facial expression with nine upper body gestures.

It's essential to keep in mind that behavioural reactions to emotions are frequently complex and influenced by a variety of variables. Individuals may also develop the ability to control their behaviour in response to social expectations and norms. Determining emotional intelligence and establishing healthier interpersonal interactions require an understanding of the link between emotions and conduct.

Basic and Complex Emotions

In the next context, the study has explained about the basic and complex emotions. Every individual has various kinds of emotional states of mind. The body generates the emotions which can be segregated in to two parts basic emotions and complex emotions. Basic emotions are easily recognized by their facial expressions and frequently happen unconsciously. Charles Darwin was the first to propose the notion that feelings manifested in the face are universal. His theory of evolution was built around the idea that emotions and the ways in which they are expressed are both biological and evolutionary. That facial (and other) expressions are widely viewed as central to the notion of basic emotions is not an accident.According to Fridlund et al. (1987), the most distinguishing characteristic of a basic emotion is the facialexpression. Tomkins recognized nine primary emotions (which he referred to as "affect programs"): interest, enjoyment, surprise, fear, anger, distress, shame, contempt, and disgust. These, he insisted, are what the human motivating system is driven by. (Tomkins, 1962).

(Ekman, 1992) an emotional psychologist, established six basic emotions that could be read from facial expressions. They included joy, sorrow, fear, anger, surprise, and disgust. In 1999, he added exhilaration, disgust, contempt, shame, pride, satisfaction, and humour to the list.The most important of them all was a unique, universally expressed, and widely recognized facial expression. Ekman also suggested some other crucial characteristics that all (or at least, most) basic emotions reportedly possess.

The following criteria were used to derive them:
Basic emotions must originate from human instinct;When presented with the same situation, everybody can display the same basic feelings; People share the same fundamental feelings under the same language, and they must all

Anurag Mishra

express these basic emotions in the same manner. The idea that human emotions are universal to all races and civilizations served as the foundation for Ekman's basic emotion model. Although fundamental emotions can be interpreted differently depending on cultural background, basic emotions can also be combined to create complex or compound emotions.

Eight fundamental emotions were categorized into pairs of opposites by psychologist Robert Plutchik in the 1980s, including joy and sadness, anger and fear, trust and disgust, and surprise and anticipation. He has generated wheel model also known as the componential model, according to their respective intensities, the stronger emotions are located in the centre of the wheel model, while the weaker emotions are located at either end.The study of sentiment frequently makes use of these discrete emotions, which can be broadly divided into three categories of polarity (positive, negative, and neutral).

Complex emotions like grief, jealousy, or regret may not have as evident and have diverse outward manifestations**.** The definition of a complex emotion is "any emotion that is an aggregation of two or more others." The APA gives the illustration of how hate is a combination of fear, rage, and contempt. On the other hand, fundamental emotions are pure and innate. Love, shame, jealousy, gratitude, prideand concern are only a few examples of additional complex emotions. At least two separate emotions, either sequentially or simultaneously, are included in emotional complexity. A rapid transition in two or more emotional states, such as the sudden appearance of one emotion followed by another emotion, is known as a sequential or continuous state. According to certain studies (Ben-Ze'ev and Revhon, 2004; Berrios, 2019), emotional complexity is determined by an individual's level of emotional awareness. Indicators of emotional complexity, according to some researchers, include mixed feelings (Trudel-Fitzgerald et al., 2017). Studies on shame, guilt, andhumiliation have revealed that these feelings may serve to inspire behaviour that complies with ethical standards and atones for wrongdoings in the past. Shame is typically thought to centre on one's own self-worth or on being exposed to criticism from others; Contrarily, it is typically observed that guilt tends to concentrate more on specific wrongdoings and is caused more by an individual's private conscience than by exposure to the public. Humiliation and shame are related in that both are associated with public exposure, but they can be distinguished from one another in a number of ways. For example, unlike shame, humiliation is not something that one experiences in private. (Tangney & Fischer, 1995).The social functions of **envy and jealousy** might also be taken into consideration. The uncomfortable or unpleasant feeling toward a person who possesses what one himself desires but lacks is referred to as "envy". It frequently combines hatred and inferiority. When a person thinks their relationship with another person is at risk because of a rival who might replace them, they experience the emotion of jealousy.Like envy, jealousy can take many different forms, but they can all be understood as driving forces to preserve and strengthen the relationship under threat or, if that is impossible, to come to terms with its end. (Salovey ,1991).

In the experiment, Scherer (1998) demonstrates how some situations might result in multiple emotions occurring at once. Both the terms "complex emotions" and "blends of emotions" are used to describe these feelings. Some of the ways they can manifest themselves include a rapid sequence of different emotions, an overlap of emotions, a covering of one emotion by another, the repression of one emotion, or the exaggeration of one emotion. Desires can cause some complex emotions. A human is compelled by want to recreate an earlier scenario that satisfied a need and, as a result, increased their level of pleasure. The need that will be satisfied, the object of the desire, and the internal feeling make up the desire. Emotional, cognitive, and behavioural components of internalized experiences are present to fulfil the desire.(Burgstaller et al,2007) the perceived position that the individual is in and the predicted likelihood that a need or desire will be met both have an impact on how intense the complex feeling will be. The intensity of the complex emotion might also vary depending on whether the scenario that causes it was started by the person experiencing it or by another person.

CONCLUSION

Anurag Mishra

The definition of emotions is continually being developed. Scholars continue to have a variety of views on what emotions are, and preexisting beliefs are frequently challenged. Even so, there is a reliable base of knowledge to take into account when researching the topic. We can all express and control our emotions in different ways. How we experience and communicate our emotions can be influenced by cultures, societal norms, and our own experience. While some people might be more reticent or struggle to recognize and express their emotions, others may be more outgoing. Emotions are, in the end, an essential part of the human experience. They add variety and complexity to our lives even though they can be complicated and occasionally difficult. Gaining more self-awareness, resilience, and fulfilment can be attained by learning to manage and harness the power of emotions. Effectively understanding and controlling emotions is a crucial ability that can support personal development, wholesome relationships, and general wellbeing. People can better recognize, comprehend, and control their emotions with the use of strategies like mindfulness, emotional intelligence, and therapy. Psychological tests, neuroimaging methodologies, and measurements of the psychophysiology of the brain have all been used in research on the science of emotions. These studies have uncovered the crucial brain networks and areas involved in the neurological mechanisms underlying emotional processing. Additionally, improvements in computational modelling have shed light on the dynamic interactions between many emotional components, revealing the complexity of emotions. The science of emotions has important ramifications in a variety of fields. It provides understanding into emotional diseases, techniques for regulating emotions, and therapeutic approaches in psychology and mental health. It contributes to social science research on interpersonal interactions, social bonding, and empathy. It aids in the separation of the complex relationships between emotion, perceptions, focus, and memory in cognitive neuroscience. In summary, the study of emotions offers a multifaceted framework for comprehending the origins and elements of human emotions. Researchers and practitioners obtain a greater understanding of the underlying mechanisms, functions, and impacts of emotions through the integration of data from psychology, neurology, and related domains, which leads to a more thorough understanding of human behaviour and wellbeing.

ABSTRACT

The essential point of this survey is to investigate the noteworthiness and pertinence of passionate insights in directing and upgrading one`s conduct and execution both inside and in a proficient setting. A speedy survey of the writing is conducted to decide the relative noteworthiness of passionate insights strategies to gage enthusiastic insights and the associations between enthusiastic insights and personal execution group viability administration and showcasing that most successfully coordinate one`s movement towards individual and authoritative growth. All the criteria are found to have a great relationship with passionate insights which may be a key perspective in dissecting changing and coordinating conduct towards individual and authoritative progress. Measuring passionate insights is challenging since it is hazy in case it comes from a person`s nature or by means of procured information and experience. Future investigate ought to concentrate on constructing superior observational models that take into consideration all the vital characteristics that enthusiastic insights has in arrange to have an in-depth information of its viewpoint indeed in spite of the fact that there are numerous conceptual and a modest bunch observational confirmation accessible to best back passionate insights.

Keywords: Group victory, passionate insights(Emotional Intelligence) and relationship marketing, job Fulfillment.

INTRODUCTION

Feeling could be a complicated psycho physiological encounter of a person`s mental state and his association with inner or biochemical and outside or natural powers. Feeling in individuals is fundamentally characterised by "physiological excitement expressive practices and cognizant encounter." Feeling may be connected to a assortment of distinctive variables such as a person`s identity temperament personality etc. The space of cognitive capacity known as enthusiastic insights (EI) incorporates identity characteristics and social capacities that bolster interpersonal conduct. A common definition of insights is the capacity to lock in goal-oriented versatile conduct and passionate insights. The approaches or actions, or even the succession of activities, that an employee must engage in to accomplish goals related to his employment are referred to as that employee's performance. It may also be used as a tool to determine whether or not a certain employee is meeting the goals set forth by his or her superiors and used as a way to review and assess performance. The achievements can be assessed based on effectiveness, quality, meeting deadlines, etc. (Kahtani, 2013 as a source) In most depictions, emotions take the form of enhanced decision-making abilities. The ability to recognise and distinguish one's own emotions from those of people around oneself is central to the concept of passionate insights, which can help one overcome obstacles in daily life and find solutions to problems. An individual's ability to exert leadership and achieve success within an organisation are both impacted by his level of enthusiastic insight, according to mental writing analyzers. When a person has high EI, they are better able to help the group reach its goals in a timely manner. Passionate insights, according to Ajay Goyal (2007), are an intangible quality that improves the gap between an individual's performance and his success in a team setting. In the past, associations would gauge an employee's memory and problem-solving skills, and then link those aptitudes to how well they ran errands. This method was called cognitive insights. Both Gardner and Sternberg fought tooth and nail to get conceptual frameworks put in place to make sense of findings. They laid the groundwork for the creation of the innovative and crucial marvels of passionate intelligence with their theories of interpersonal and intrapersonal insights. Meanwhile, in 1990, Salovey and Mayer successfully used logical tools to analyse and operationalize the most promising idea of eager insights (EI). A mechanism that coordinates the thinking and feeling brain forms is what Salovey and Mayer say creates passionate discoveries. Part one of this theory concerns the extent to which people can learn to regulate their emotions, and part two concerns the extent to which emotions can be managed rationally. It has the ability to understand and manage emotional responses (Mayer & Salovey 2000). He posits that joyful shrewdness imparts four crucial abilities:

1.   Detecting and perceiving feelings;
2.   Utilizing feelings to empower thought;
3.   Enthusiastic proficiency;
4.   Passionate administration.

Positive relationships exist between EI and commitment to one's work , work fulfilment completion of errands and commitment to authoritative adequacy. Palmer et al. (2002) found that people with enthusiastic competence tend to specific a tall level of fulfilment with their lives. Arrangements will without a doubt be affected in support of an association by those who can control and coordinate their feelings scholarly people.

Instead of evaluating an employee's performance based on his prior accomplishments rather than his ability to overcome future challenges, EI is now used as a valid metric to identify the top performers inside the organisation who have higher execution standards than their colleagues. Emotional intelligence tests are able to detect and record not only one's own but also other people's emotions (Goleman 1998; Mayer and Salovey 1997).It speeds up gather execution participation and cooperation. Star company execution and officials positioned EI over other qualities counting sorting out arranging and monetary and advertise investigate (trade wire 2004). Gabriele (2013) found the connect between the four enthusiastic competences and looked into how they associated to perspectives related to work-related wellbeing. The four passionate competency factors were built into a show called the Authoritative Passionate Insights Survey (ORG-EIQ) which was utilized to perform this consider on 1506 representatives from 20 diverse associations. Exploratory calculate examination (EFA) and corroborative calculate investigation (CFA) are utilized to dissect the EI structure that the association has proposed. The same strategy is utilized to explore angles

related to wellbeing as well as life adjust and temperament. The connect between the two factors is decided by relationship coefficients. Whereas the fit of the show is tried utilizing fit records the auxiliary show is examined utilizing auxiliary condition displaying (SEM). The legitimacy of amassed EI at the hierarchical level is examined utilizing the intraclass relationship coefficient (ICC). Analysing the varieties in EI among the diverse associations taken into thought utilizing ANOVA is one strategy. The four enthusiastic aptitudes were appeared to be successively related by ORG-EIQ and to have merged legitimacy with the hypothetical ideas.

The most successful and efficient performance in the organisation, according to many experts, is a leader with excellent emotional intelligence. Stronger emotional intelligence was linked by Schutte and his team to happier moods and higher self-esteem. Emotionally intelligent persons tend to have a negative link with job stress, according to Petrides and Furnham's (2006) findings that this trait is gender specific. Cary Cherniss inspected a number of vital issues that help directors' senior specialists and bosses in understanding the esteem that EI ought to have in an association. Agreeing to his case investigation people with high EI essentially outflanked their peers in a assortment of areas counting the US Discuss Drive Counselling firms' refreshments the retail division and fabricating stores which is able without a doubt be invaluable and bolster the success of the association. Enthusiastic Remainder Stock (EQI) a degree of EI that can be moved forward through preparing and learning recognises competent representatives within the association and is presently broadly utilized by numerous associations to assess an candidate. Traditional Intelligence Quotient (IQ) is a measure of workers' proficiency in the company, but it is not particularly useful for determining the efficiency of individual tasks and remains relatively constant over time. Passionate insights (EI) may help promote social states of mind and ethical behaviour, according to Goleman and Emmerling (2003), who studied the connection between EI and corporate morals.

According to Bar-on (1997), emotional intelligence is also known as emotional competence since it includes elements related to motivation, affective dispositions, and personal, emotional, and social skills. EI is seen as a crucial enhancer for the successful promotion of organisational growth by Aahkanasy and Daus (2005). The relationship between enthusiastic insights and applications in healthcare organisation was assist inspected by first year recruit and Rubino (2002) in their think about on the subject. The five centre ranges of enthusiastic insights are self-mindfulness, social mindfulness, self-direction, social abilities, and self-inspiration. These where investigated based on earlier inquire about on the positive relationship between social and enthusiastic insights over errand execution. The elements that make up EI are what give it its beauty. It examines an employee's interpersonal and intrapersonal abilities as well as his capacity to deal with stress from both his personal life and his profession. Self-awareness is under the intrapersonal skill category, social awareness falls under interpersonal skill, while self-inspiration and self-control deal with managing stress and dealing with one's own feelings about one's profession. Not as it were can a manager's abilities help in successful administration, but too his or her passionate insights features a noteworthy affect on the project's result (Morris and Feldman, 1996; Goleman, 2001; Bass, 2002). Fulmer and Barry (2004) described how emotional intelligence, in conjunction with cognitive abilities, influences the extent to which a negotiator gathers information and uses that information to draw conclusions. Decisions, situations, and answers based on both situational elements and face-to-face contacts can be better handled and managed in this way. Moon points out that EQ and cultural intelligence are strongly related concepts (CQ). Although emotional intelligence (EQ) and cognitive intelligence (CQ) are distinct, there is a correlation between some EQ traits and CQ variables. Emotionally intelligent people, according to Wong and Law (2002), are better at managing their own emotions, reading and responding to the emotions of others, and enhancing their own and others' performance at work.

Despite the fact that managers and employees are participating in several EI programmes to enhance their job happiness and performance, there is still a lack of scientific support supporting the positive effects of emotional intelligence on the workplace. The issue that emotional intelligence researchers encounter is its unreliability. Davis et al. (1998) said in their study's conclusion that "as currently posited, nothing survives of EQ that is distinctive and psychometrically sound. So, while objective EQ measures have poor reliability, questionnaire assessments are too closely tied to recognised personality traits. Emotional intelligence, however, continues to be a productive performer

in the workplace, looking at individuals from a new angle, evaluating, motivating, modifying, and directing their actions and behaviour in a way that supports organisational performance.

Methods of Emotional Intelligence Assessment

Emotional intelligence tests abound, but scientific evidence supports the validity of just a handful. Emotional intelligence tests typically involve administering a questionnaire or setting up an interview. But, differences between subgroups and the method of administration (paper, electronic, or postal) should be considered to guarantee validity. The approach's flaw is the rising cost of administration and development. Common methods for gauging emotional intelligence include ability-based exams and comprehensive integrative examinations. Commonly used measures of emotional intelligence include the Mayer-Salovey-Caruso-Emotional Intelligence (MSCEI) test, which measures the following four concepts: perceiving emotions through pictures and faces, understanding emotions through mixes and changes, fostering thoughts through facilitations and sensations, and managing emotions through feelings administration and relationships. The methodology for this test was the multi-factor Enthusiastic insights scale (MEIS). Passionate insights (EI) are evaluated on the 141-item MSCEI exam with two scores: 15 required scores and 3 optional scores. Under key MSCEIT, one learns to manage their emotions, whereas under experiential MSCEIT, one encounters feelings and uses them to promote cognition.

A crossover demonstration that assesses propensity based on four concepts—self-mindfulness, social mindfulness, self-administration, and social abilities—the 117-question Hay-group Passionate Competency Inventory (ECI) was created by Daniel Goleman and Richard Boyatzis. It generates a 20-page report that is more difficult to analyse and understand than the MSCEIT exam. A 133-item assessment of employees' interpersonal, intrapersonal, adaptability, stress management, and general mood abilities, the Emotional Quotient Inventory (EQI) was developed by Reuven Bar-On (Bar On, 2004). A 133-item assessment of employees' interpersonal, intrapersonal, adaptability, stress management, and general mood abilities, the Emotional Quotient Inventory (EQI) was developed by Reuven Bar-On (Bar On, 2004). Cognitive behavioural restricting technology is utilised in coaching to monitor improvements and changes in behaviour. Passionate self-mindfulness, passionate expression, passionate thinking, passionate self-administration, passionate administration of others, and passionate self-control are the seven dimensions that this technology uses to measure behavioural changes and improvements.

Individual Success and Emotional Intelligence

The connection between deeply felt insights and individuals' psychological health was discovered by Carmeli (2009). In order to carry out this think, a sample of randomly selected respondents from various associations is contacted through study that is executed at different periods. A central bunch is formed with a limited number of responders to advance the instrument. The creators set out to create something using emotional intelligence as the independent variable and psychological health as the dependent one. While this study does not account for cultural differences, it does find a favourable correlation between emotional intelligence and psychological well-being, which significantly influenced the latter. Timothy (2006) sought to identify the factors influencing the emergence of problems in highly regulated organisations by gauging the emotional intelligence of those involved. Observation is the key to measuring stakeholders' emotional intelligence in different industries. Stakeholders have different levels of influence and authority when it comes to managing problems and resolving labour disputes depending on the various industries in which they operate. Those involved would handle the situation far more effectively if they have a high level of emotional intelligence (EI).

There is an obvious inverse relationship between Emotional Intelligence and societal success. Nikolaou investigated the relationship between Emotional Intelligence (EI), biographical traits, occupational stress, and organisational commitment (2002). It also stresses the ways in which certain aspects of the workplace influence EI levels. One hundred twelve mental health professionals, the vast majority of whom are married women with bachelor's degrees, with an average age of 36.14 years and a standard deviation of 7.76, were recruited for this study. They were asked to rate on a 5-point scale, with a '5' representing strongly representative and a '1' not representing, in order to test different aspects of emotional intelligence and the use of emotional intelligence on problem solving. They were given

91 self-report questionnaires based on Mayer's theoretical model. An improved version of the Occupational Stress Indicator (OSI), the ASSET model can quantify stress in the workplace since it can identify both the sources and the consequences of stress. A two-point scale measuring the organization's commitment to the employee (COE) and the employee's commitment to the organisation (EOC) forms the basis of the overall Job Stress Index (CEO). The study's variables are all correlated using the Pearson correlation coefficient. To find out how different types of labour affect EI and occupational stress, we use analysis of variance. To find out how effective EI and organisational commitment are as predictors of occupational stress, hierarchical regression analysis is used. While there was no significant difference in total EI score or occupational stress across the sexes, professionals with higher EI scores tended to be more committed to their organisations and experience less stress on the job. Attempting to ascertain whether there are any discernible variations in the unproductive conduct exhibited by people with diverse emotional intelligence patterns, Satish P. (2005) focused on persons from China. The 116 participants in this study filled out a questionnaire that included numerous negative behaviours ranked on a 5-point Likert scale. Statistical methods such as t-tests and the alpha coefficient are used to evaluate its validity. Recent research has shown that emotional intelligence plays a role in the development of counterproductive habits.

However, people with different patterns of emotional intelligence do not differ significantly in their generally unproductive behaviours. Using the school board adequacy show, which is the best indicator of school board authority, Margaret M. Hopkins (2007) examined the relationship between enthusiastic insights and board administration tools through a survey that aims to distinguish the event and impact of enthusiastic insights competencies in authority and decision-making forms. Board administration spaces, as identified by Boyatzis et al. (2002) and Smoley (1999) as having 18 enthusiastic insights competencies based on the Enthusiastic Competency Inventory (ECI), are showcased here. The six basic categories of spaces are as follows: decision-making, gathering, forcing specialists, community connection, working to progress within the school board, and vital activity. There were six domains where six of the eighteen competences were determined to be common. This study highlights the significance of regularly giving board members with training to improve their emotional intelligence competency. This will help them make better judgments and develop their leadership abilities.

There was a considerable disparity between the sexes on the emotional intelligence exam. Women had much greater emotional intelligence compared to men with college degrees. Training and development programmes can refer to Elizabeth's (2002) empirical study of emotional intelligence's function in MBA performance evaluations. The 295 students that take the Emotional Quotient (EQ) test represent a wide range of ethnicities and functional areas of study, and their average age is 23.5. In addition to collecting information about students' demographics, we evaluate their academic performance based on their high school rating and Cumulative Grade Point Average (CGPA). To find out if there is a correlation between EI and a person's major, ANOVA is utilised. To investigate whether there is a correlation between EI and membership in various subgroups, a T-test is employed. Using CGPA and the five components as dependent variables in regression analysis, we can find out the relationship between EI and performance. Effective empirical assessment is made possible by condensing the scale through factor analysis.

The surveys are designed to assess validity and reliability, and to uncover their underlying reason, exploratory-factor analysis is employed. In order to carry out Confirmatory Factor Analysis, Structure Equation Modelling is employed. There were five factors taken into account, which is comparable to Goleman's dimensions. To evaluate the reliability of the model, the coefficient alpha is computed for every component.

(2019) Dr. Sapna and Bhagyshree M. Bhoir undertook a study to determine Employee Performance in Manufacturing Organizations and Emotional Intelligence are Related. Workers and employers in the manufacturing industry in Mumbai and Navi Mumbai make up the study's sample. One hundred manufacturing facility employees participated in a pilot study. Findings indicate a favourable relationship between emotional intelligence and job performance, with higher correlation values being associated with better results. Factors connected to an employee's emotional intelligence have a direct impact on their job performance, according to the cited research.

Team Efficiency and Emotional Intelligence

In 2011, Umar Ghuman developed a group emotional intelligence model. A comprehensive literature review informs an examination of two primary theories that provide the most compelling explanations for group emotional intelligence. A questionnaire has been generated and is sent to the respondents. All of the comments and suggestions are used to build a model. Its validity is confirmed by using statistical approaches. In an attempt to rectify previous manipulation flaws, they included homogeneity into the model. Building an error-free model with multiple components. Interpersonal and emotional intelligence are a part of it, and they can be utilised to connect organisational effectiveness with job performance. Having high levels of emotional intelligence both within and between teams is a part of this.

Programs for training and development are believed to be pioneers in enhancing the abilities, motivation, and skills of subordinates, which in turn improves the group's chances of success. The specialist, obligation, and justify components of these programmes should be crystal obvious. The CEO is able to sustain the group dynamics that motivate his employees to achieve the organization's goals. A manager's enthusiasm, in addition to their driving skills, is a major factor in the success or failure of a project (Morris and Feldman, 1996; Goleman,1998,2001; Bass,2002). Consistent with their personality traits, supervisors typically create a work atmosphere, as stated by Dickson et al (2001). It follows that directors who are masters of self-control can, without a doubt, motivate their teams to incredible heights. A critical understanding of the processes underlying these norms is significantly associated with team efficiency, social captiveness, and their production; Druskat and Wolff (1999, 2001) established behavioural benchmarks called enthusiastic competent bunch standards (ECGN) to demonstrate enthusiastic insights at the bunch level. The ability model of emotional intelligence (EI) and its relationship to teamwork behaviour was attempted to be investigated by Nicholas (2009). This study's sample consisted of 68 MBA students hailing from a variety of cultural backgrounds. Their average age was 30.7 and their standard deviation was 6.1. The class was randomly assigned to one of thirteen groups and given ninety-eight days to come up with a plan for a management intervention modification that would boost the organization's efficiency. Each participant took the consensus-scoring MSCEIT test of emotional intelligence before being assigned to a group to start the experiment. Respondents score their own agreement or disagreement on a 7-point Likert scale, where 1 indicates "strongly disagree" and 7 indicates "strongly agree." Eby and Dobbin's three-item subscale measure is used for the collective assessment. Each team member is asked to rate his teammate every 98 days using a 7-point Likert scale and a specially-made questionnaire that takes the team's performance into account. As a measure of the subject's cognitive ability, the participant's Grade Point Average (GPA) acts as the study's control variable. Combining the total EI and the collectivist measure, we employ regression analysis to investigate the interplay of all the factors, so avoiding multi-collinearity issues. The association between EI score and collectivism measure is identified using confirmatory factor analysis and bi-variate correlation on CPA data. Although it may not be immediately apparent, emotional intelligence did show a positive correlation with team performance. It is discovered that EI shows a clear and direct difference in the processes of transition and intermediate teams.

An important factor in improving the team's performance in the company is how subordinates perceive the leadership and intelligence of their boss. Subordinates should prioritise increasing their effectiveness and efficiency rather than getting distracted by unimportant tasks. Which, in the long run, boosts consumer happiness and loyalty while improving the company's image. This efficient measure can only be implemented when the manager-subordinate relationship is strong. While getting to know your coworkers is easy, getting to know your boss will require more effort and time. When it comes to implementing this vital practise inside his team, a manager with high emotional intelligence will do a better job than one without (Peter J. Jordan, 2010). If all goes according to plan, the business will see higher employee satisfaction and retention rates as a result of less employee turnover.

Leadership and Emotional Intelligence

An effective chief executive officer (CEO) knows the hierarchical objective, plans it out, puts it into action, and builds an activity plan that is effectively communicated to everyone in his team. Directors who are genuinely clever have a better chance of successfully managing their projects and employees. Emotional intelligence (EI) of the chief

executive officer (CEO), board of director effectiveness, and decision-making process were all linked in a study by Mohammed Ali (2012). For this study, Fern Hill and Industrial Alliance Companies administered a questionnaire to 180 Tunisian CEOs (ranging in age from 25 to 58) to assess their emotional intelligence and psychological make-up (EI). Hill and the Industrial Alliance Companies to learn more about EI and what characteristics make them tick. Leverage ratios and company size are examples of control variables. From these considerations, three empirical models are derived: To identify the subjective elements that impact a board's decision-making function, one must first BSIZE. One way to measure the size of a board is by looking at its membership. 2.BIND looks at how emotional elements relate to board independence, where board independence is defined as the percentage of independent directors relative to the total number of board members. 3. DUAL, to find out how the CEO's emotions relate to his or her dualities. Here, emotional elements such as EI and emotional bias are considered. For the third model, we use logistic binary regression to test its parameters, while for the previous two, we use linear regression to evaluate them. There is a negative correlation between the CEO's dualism and emotional intelligence and the BOD's efficiency. Boyatzis (1982) investigated the relationship between a person's emotional intelligence and their performance on two levels of stress tests: the dependent and independent levels. Workers high in emotional intelligence were also highly productive, according to the study. Emotional intelligence and its relationship to supervisory leadership performance was something that Robert Kerr attempted to investigate. To measure emotional intelligence, researchers use the Mayer Salovey Caruso Emotional Intelligence Test (MSCEIT). To analyse the results, they administer attitude surveys, which consist of nine questions. The subordinates rate each question on a 10-point Likert scale, where 1 represents strongly disagreeing and 9 represents strongly agreeing. The sample for this study consists of 1258 employees and 38 supervisors from the same organisation. The average age of the employees is 39, and the standard deviation is 0.05. Pilot tests are carried out to ensure that surveys are valid and reliable. Factor analysis is employed to ascertain the fundamental reasons behind the questionnaires developed for the purpose of assessing their reliability and validity. Factor analysis can be performed on strongly correlated data sets, according to the Kaiser-Meyer-Olkin metric. Finding the cronbach's alpha demonstrates that the surveys are consistently grouped. A Pearson correlation coefficient was used to determine the relationship between EI and how subordinates rated their supervisor's leadership abilities. They did demonstrate a positive correlation, but not to the degree expected; this shows that although EI is a major factor in predicting leadership abilities, there are many other factors that influence subordinates' perceptions of leadership's efficacy. When considering managerial EI scores during the recruiting, training, and development processes, this beneficial correlation has shown to be illuminating.

Group adequacy, enthusiastic connection to subordinates, and group effectiveness are fostered when leaders with tall passionate insights are able to effectively communicate the organization's vision and objectives to its team members. Pioneer trade enrollment and passionate insights are constructively channelled because the former entails adapting to varied social movements and introducing feelings (Liden et al.,1993). Their subordinates are motivated by their passionate connection with their supervisor, as this is viewed as an essential quality in a group leader: the ability to listen to and meet the demands of subordinates (Rahim et al, 2002). Sincere and astute managers can demand more from their employees without significantly impacting their job satisfaction or the pleasant work environment. By bringing their subordinates' interfaces in line with the association's, they can prevent project delays and quality mishaps (Barbuto and Burbach, 2006). Lopes et al. (2003) found that managers with high EI had better control over push and the kinds of problems that seemed to trigger whittling down. They can also uphold high-quality relationships.

According to Jordan et al. (2002), emotionally intelligent employees handle situations at work where one feels most threatened by their job security. The relationship between supervisors' emotional intelligence and their transformative leadership was investigated by Panagiotis (2009) when managers were selected from diverse departments and levels. To assess their perceptions of their subordinates' leadership and emotional intelligence, respectively, they were administered Multifactor leadership questionnaires and 7-point Likert scale emotional intelligence indices. Factor analysis was performed to enhance the reliability of the collected data. A favourable correlation between emotional intelligence and transformational leadership was found in the study.

A study was carried out by Fatehi (2018) in Jordanian banks to determine the impact of emotional intelligence on leadership styles, degrees of emotional intelligence, and common leadership philosophies. The study's author developed a questionnaire to gauge emotional intelligence and various leadership styles (self-awareness, self-management, social awareness, and relationship management). The study used a number of statistical methods to test its assumptions and answer its questions. Among the many important findings from the study is that social awareness is the EQ component most strongly associated with leadership style. Nawal Lazraq (2020) conducted a case study on the camp's public administration and economic sector in an effort to determine how EQ affects leadership effectiveness. To do this, they examined how each of the five EQ dimensions affected performance (internal intelligence, social intelligence, adaptability, stress management, and general mood). This objective was met by employing the descriptive analytical method. For the emotional intelligence variable, we used the Bar-On and Parker (2000) model, and for the leadership behaviour variable, we used the Thomas W. Kent (2001) model. We used multiple regression and linear correlation tests to statistically investigate the association after we had the right data. There is a strong relationship between emotional intelligence and effective leadership in both the private and public sectors, the study found. Executives need a solid grounding in emotional intelligence to build and sustain their companies' success. If they want to be successful, executives need to work on their technical and motional competencies. Given this context, a 2022 study by Larras and Kirche investigated the interplay between leadership and emotional intelligence, as well as their effects on the efficiency of the HENKEL foundation in Algeria. To do this, they used a qualitative approach based on document analysis, first-hand observation, and interviews with executives. Results analysis revealed that the HENKEL Foundation's overall performance is influenced positively by the connection between emotional intelligence and leadership.

Marketing Efficiency and Emotional Intelligence

By utilising various domains of Goleman's modified model, Gladson (2009) sought to quantitatively and qualitatively analyse the impact of emotional intelligence on the success of marketing. For the purpose of this research, 108 companies out of 365 that are listed on the Nigerian stock exchange were chosen. For the 20 EQ tests, one person in charge of HR is selected as an informant, and for the 15 MARKETING-RELATED surveys, another person in charge of the marketing division is recruited. All 108 of these illustrious organisations have their headquarters in Lagos. Instruments used in this study include the Kotler and the Likert scales. On a scale from 1 (strongly disagree) to 5 (strongly agree), the former measures emotional intelligence, while the latter evaluates the efficacy of a marketing campaign. Each of the four areas of emotional intelligence has its own Cronbach alpha coefficient, which is used to evaluate the reliability of the measurements. Means with a respectable standard deviation could be retrieved. The marketing effectiveness can be measured using a preliminary exploratory factor model and confirmatory factor analysis. Principal component analysis is employed to understand the relationship between emotional intelligence and the efficacy of marketing campaigns. Multiple regressions were run to examine the results that indicated a positive correlation between the two variables.

The viewpoints of both the buyer and the vendor are taken into account in relationship marketing. Suppliers and consumers are said to work together in harmony when there is mutual trust between the two parties (Johnston, 2004). What consumers consider as enhancing their confidence in suppliers are direct communication, preparation, and a robust responsiveness from suppliers (Carr and Pearson, 1999). Researchers Troy Hefferman and colleagues looked at the correlation between managers' trust and EI levels and their financial success in 2005. For this study, 129 branch managers and 92 relationship managers from an Australian global bank took an online MSCEIT exam. Only relationship managers between the ages of 25 and 66 were asked to fill out the survey, which included questions about how trust is built. During their biannual management performance review, the organisation compiles data on managers' performance and ranks them from 1 to 5. To do a confirmatory factor analysis, structural equation modelling is employed. Despite the importance of complete trust, a considerable positive correlation was discovered between managers' financial performance and overall EI. The bank's bottom line improves as the relationship manager's EI rises. The connection between buyer and seller, which involves the exchange of value between multiple individuals, can be better understood when relationship marketing factors such as empathy, leadership, and collaboration are considered and linked. Emotional intelligence can be a powerful tool for buyers to improve their

connections with suppliers. Lillian Schumacher lays forth the fundamental steps that explain how a buyer's EI and relationship effectiveness are revealed (2009). Here, emotional intelligence serves as the independent variable, while relationship performance serves as the dependent variable. One hundred and ten suppliers and thirty-four purchasers from US-based businesses utilise the two tools. One way to gauge a buyer's emotional intelligence is with the ECI-U version, which is based on the SAQ (Self-Assessment Questionnaire) and the EAQ (External Assessment Questionnaire). Another way is with the PAQ, which is distinct from the PSAQ (Performance Self-Assessment Questionnaire) and the External Performance. There are a total of twenty questions on the PAQ, and each one uses a five-point Likert scale. There is a factor analysis of the buyer's relationship performance and emotional intelligence. There was a greater and more positive correlation between EI and relationship performance when suppliers evaluated customers' relationships rather than the buyers themselves. From the supplier's point of view, this increases the buyer's social awareness, self-management skills, and capacity to keep in touch with suppliers. This goes to show how crucial EI is for facilitating mutual understanding and productive strategic partnerships between suppliers and buyers.

CONCLUSION

The ability to monitor and understand one's own and other people's emotional states is known as emotional intelligence. The ability to handle conflicts well is directly related to one's productivity and efficiency on the job, making emotional intelligence testing essential. necessary. People that are emotionally intelligent are better able to manage their projects and their subordinates. The success or failure of a project is heavily dependent on the manager's emotional intelligence in addition to their leadership abilities. They are able to get exceptional work out of their team members without negatively impacting their job satisfaction, work performance, or the quality of the work environment. Emotional intelligence is still seen as a valued asset by organisations that value their employees, even though there is a lack of actual research to back its reliability. distinctive perspective that undeniably enhances organisational efficacy.

ABSTRACT

Social media has become an integral part of people's lives, and their social presence is highly emphasized and invested in. YouTube, which is a social media platform, allows individuals from any location worldwide to upload videos that can be viewed globally. YouTube is currently the largest video content provider globally. The objective of the current study is to identify and analyze emotions and sentiments expressed in response to Tulu YouTube videos. Tulu is a Dravidian language primarily spoken in the Dakshina Kannada and Udupi districts of Karnataka, as well as some parts of the Kasargod district of Kerala, by approximately 1.8 million people. This language primarily utilizes the Kannada script in its current usage. The study identified various video genres and analyzed over 10,000 responses. A gold standard data set was created and labeled to detect emotions and sentiments as 'positive, negative, and neutral.' Traditional learning algorithms were utilized to analyze this data set, and empirical analysis was conducted. To overcome data imbalance, a data augmentation technique was employed.

Keywords: comments, emotions and sentiment analysis, Tulu language, YouTube videos · Data set · Data augmentation · Ensemble

Durairaj Thenmozhi *et al.,*

INTRODUCTION

YouTube is a social media platform that enables users to share videos with viewers worldwide. It also captures users' opinions on the videos, which can be categorized as neutral, favourable, or critical. Currently, YouTube is considered the second most visited website, followed by Google. (Marcoux, 2021) (Gandini, 2018) In this research, we have annotated Youtube comments in the Tulu language, written in both English and Kannada, as a response to the various genres of Tulu videos. Tulu is a native language largely spoken in the Dakshina Kannada district of Karnataka state as well as in the northern part of the Kasargod District of Kerala by around 1.8 million people and 5 million worldwide (Kannadaguli). The other languages spoken in Dakshina Kannada include Beary, Konkani, Malayalam and Kannada. Tulu, considered as one of the five major Dravidian languages is also one of the most highly developed languages of the Dravidian family; the other four being Tamil, Kannada, Telugu and Malayalam (Shetty, 2010) . Currently, the Kannada script (Kannada lipi), is used to write Tulu and other under-resourced languages like Konkani, Coorgi and Sankethi. This study aims to understand how sentiments are expressed in a code-mixed context where multiple languages at the sentence, word and sub-word level are used by analysing the comments that are communicated in response to Tulu YouTube videos (Chakravarthi, 2019).

Research Gaps

Tulu has a lot in common with the Kannada language and some similarities with Tamil and Malayalam. There is not much research work carried out on this language as compared to other south Indian languages like Tamil, Telugu, Malayalam or Kannada. Similarly, sentiment analysis (SA) of content in other languages is available. However, there are not many studies of SA of content in Tulu or other low-resource languages (Hegde, 2022) . Hence, our study aims to contribute to the existing corpus of sentiment analysis of YouTube comments, in Tulu, to understand user opinion.

Our contributions in this research include:
1. Creating a data set that can be accessed by users of YouTube for opinions, reviews
and general understanding of products, places, businesses and entertainment.
2. Analysing the impact of data augmentation.
3. Analysing the impact of ensemble models on performance.

Related Work

The main goal of our research study is to create a data set that identifies the emotions of the users as a response to Tulu YouTube videos and detect sentiments using various baseline models. Of the few research studies that have been undertaken in the Tulu language, most of them deal with the linguistic and phonological aspects of the language (P.J., 2010). Some deal with automatic speech recognition for the Tulu language (G, 2022) and character recognition of the Tulu script (Bhat, 2021) . Social media, while being easily accessible to all simultaneously protects user identity. Users can express their ideas and opinions and give feedback without any fear or restrictions. Several studies have used YouTube comments for text-based emotion recognition (Hassan, 2016) . Similarly, there have been studies on hate and offensive speech detection in other low-resource languages like Afaan Oromoo language (Kanessa, 2021) . There are several research articles that deal with sentiment analysis of Twitter data (Gloor, 2011) , (Agarwal, 2011), social networks (Liu, 2016) , news (Balahur, 2013) , Facebook feeds (Ortigosa, 2014) and social media (Yue, 2019) .

METHODOLOGY

Sentiment analysis, which is increasingly becoming important in business and society, is the computational study of people's opinions, sentiments, emotions, and attitudes offering insights for opinion analysis and social media analysis (Liu B. , 2010) . Analysing sentiments which involves using facial expressions, voice, gestures, posture etc., is comparatively easier than trying to extract them using only comments and that too without the user context.

68817

Although sentiments can be assessed using emoticons as well, for this study, we used only those comments in Tulu written in either Kannada or English or code-mixed texts using both.

Data Set Creation
To construct a dataset, we watched Tulu Youtube videos based on genres like stand-up comedies, food channels, vlogs, cooking shows, comedies, short plays, movie reviews, etc. The general objective was to make this dataset accessible for various applications that may be used as a buyer guide, knowledge creation about a particular place or a restaurant, business strategy for user opinion about a particular product etc., in short, building a data corpus.

Data Collection
The YouTube Data API is used to extract data from YouTube comments, and authentication is required to access its features. An OAuth client ID is obtained for this purpose. The API is then passed links to various YouTube videos, and the comments were extracted from them.

Data Extraction
Using the YouTube Data API, the video ID, title, and comments are obtained for each video. For every comment, the video ID and comment text are extracted and saved into a CSV file.

Data Pre-Processing and Exporting
Once the CSV file was obtained, the comment text is pre-processed to eliminate any non-ASCII characters, emoticons, English words, junk characters, and Tulu alphabets, thereby obtaining raw English text. The collected text's sample is presented in Table 1

Data Annotation
After collecting the data, we annotated the data based on the comment. This task is done manually, where every comment is read, the mood is analysed, and accordingly annotated. We did not look into the grammaticality of the language as user comments are usually in code-mixed languages and mostly with emoticons. We only analysed those comments in Tulu that are written using the Kannada and English scripts. The comment was labelled as "Positive" if there were words of appreciation/regard, "Negative" if there were words which were hateful and "Neutral" if the comments had neither positive or negative words and emotions. Comments like "ಪೊರ್ಲಾತುಂಡು", "Mast porl aatund ,keep rocking jai tulu naad", "ಜೋಕ್ಲ್ ಅತಿಜಂದ್ ಕೇನುನಕ್ಲೆಗ್ ಎರ್ ಯೆಡ್ಡೆ ಬಾಯಿಂಗ್ ಬಿಗ ಪಡಿಯಾರ್ ಕುಶಿ ಆಂಡ್ ಯ್‌ಂಕ್ " (It's beautiful,It's very beautiful, keep rocking victorious Tulu naad, you shut the mouths of people asking you as to why you have not had a child yet) were considered positive. Phrases like "imber teachera marre....Eer comedy malpunen thoothina jokulu manipande kulluva claasd ??!!!...Akullala techer n comedy malpayera??...Enk ave doubt....", "ಎಂಥ ಕರ್ಮದ ಕಾಮಿಡಿ ಮಾರೆ" (What kind of a teacher is this? The children who watch these videos in which teachers are heckled, will they behave themselves in their classes? I wonder if they too will poke fun at their teachers?, What nonsense comedy is this?) were labelled as negative. Comments like "Er yet like korre pandala yankleg onje sari like korre aapini" (how many ever times you request for a 'like', we can 'like' it only once) are considered neutral.

Corpus Analysis
Initially 7,385 comments were annotated, out of which 1,700 tweets remained after pre-processing the comments. The complete statistics of the corpus is tabulated in Table 2 The distribution of labels based on the three class in the data set is represented as Table 3. As shown in the table, the data set is unbalanced with 126 instances of "Negative" class, 906 instances of "Neutral" class and 667 instances of "Positive" class.

Durairaj Thenmozhi *et al.,*

Baseline models

The dataset contains three columns, namely ID, comment text, and class label that describes the sentiment associated with the text. Traditional models were trained on this dataset, with further pre-processing of the comments, feature extraction, and classification using the baseline models.

Data pre-processing

Fields that are not required for computation like the ID field was dropped. The comment text data was further processed to convert to lowercase, emoticons, punctuations, links and non-ASCII text were removed. Using NLTK package, stop words have been removed. The instances were tokenized and lemmatized using the Word NetLemmatizer from NLTK stem.

Feature extraction

Extraction of features from the comments was performed using three vectorizers namely - Term Frequency-Inverse Document Frequency (TF-IDF), CountVectorizer and FastText.

- TF-IDF: It is a statistic that calculates a score by measuring the importance of a word in a document, which depends on the length of the document and the generality of the word.
- Count Vectorizer: It is a feature extraction method that is used to vectorize a text into a matrix or vector of frequencies. These frequency count represent the frequency of occurrence of a word in the text.
- Fast text: It is a free, open-source library that is used to classify text and learn word representations from the text.

Classifiers

Seven classifiers such as Decision Tree, Ada Boost Classifier, K-Nearest Neighbour, Multi-layer Perceptron, Logistic Regression, Random Forest and Support Vector Machine of the library Scikit-learn (Pedregosa, 2011) were used as the baseline classification models.

- Decision Tree (DT): The decision tree classifier builds a classification model by the construction of a decision tree. The classification involves the prediction of target values that are obtained from the decision rules formed using the features. The maximum depth of the decision tree is specified to avoid overfitting of the model. In our case , it was set to five.
- Ada Boost Classifier (ABC): AdaBoost classifier is an ensemble method that combines various weak classifiers to obtain a more accurate and strong classifier model. It is an iterative process where, at every successive iteration more importance is given to the misclassified instances by adjusting their corresponding weights. In our study, 100 estimator models with t0 random state were used as hyperparameters of the model.
- K-Nearest Neighbour (KNN): The KNN classifier is an iterative method that classifies data points based on a similarity metric. In our implementation, this similarity metric was Euclidean distance and the number of neighbours were set to three.
- Multi-layer Perceptron (MLP): The MLP classifier model consists of layers of neurons that form a neural network. This network is trained with the data and the predicted results are back propagated for error. In our implementation, the MLP model consists of layers of 100 neurons each, trained at a learning rate of 0.001 with the activation function as relu over 200 iterations.The random state was set as zero as to have same train and test data sets across different executions.
- Logistic Regression (LR): The LR model predicts the class or target label based on the calculation of probability of occurrence of an event. The target variable is modelled using a logistic function which returns the probability of the label. During implementation the random state parameter was set to zero as to have same train and test set across different executions.
- Random Forest (RF): Random Forest is a method that performs an ensemble of different decision trees that are trained on subsets of data samples drawn from the original dataset with replacement. The RF classifier was implemented with a maximum depth of the tree as two and 100 number of estimators.

- Support Vector Machine (SVM): The SVM classifier is a method used to classify data by finding a separator which is described by a hyper-plane separating the data points in the space. To enable this, data is mapped from lower dimensions to higher dimensions. The model was trained with a linear kernel (L-SVM) function of degree three, 0.025 regularization parameter. The regularization parameter is inversely proportional to the strength of regularization.

IMPLEMENTATION AND RESULTS

The feature extraction was performed using the approaches defined in subsection 3.4.2, classified using classifiers described in subsection 3.4.3 and evaluated using stratified k-fold sampling of Scikit-learn (Pedregosa, 2011) . During the validation of the model, data was split into five folds and the average weighted-average F1-Scores are tabulated in Table 4. From Table 4 , it is clear that the model with Logistic Regression classifier applied on the features extracted using TF-IDF performs well with an F1-score of 0.6768. From Table 4, the best performing models are ABC, LR and MLP. An ensemble classifier model of these models as baseline models together resulted in an F1-score of 0.7271 for TF-IDF feature extraction.

With Data Augmentation
The comments data is populated with more "Negative" and "Positive" instances to obtain a balanced dataset for a better performance. SMOTE (Synthetic Minority Oversampling Technique) was applied after the vectorization of text to balance the data. In this approach, the features are extracted (P.J., 2010) using features defined in section 3.4.2, augmented as explained in section 4.1 and classified using the baseline models defined in section 3.4. The performance in terms of F1-scores have been tabulated in Table 5. From Table 5, it is evident that applying SMOTE has improved the performance for most instances. Further, Logistic Regression with TF-IDF performs well with an F1-score of 0.7049. From Table 5, it is clear that the model with Logistic Regression classifier applied on the features extracted using TF-IDF method performs well with an F1-score of 0.7152. From Table 5, the best performing models are ABC, LR and MLP. An ensemble classifier model of these models as baseline models together resulted in an F1-score of 0.7404 for TF-IDF feature extraction. The best performing model in each case has been obtained by ensembling the best performing baseline models. In addition to ensembling, the measure/significance of improvement in performance after applying data augmentation was measured by using the Benefit Cost Ratio (BCR) of the F1-score values, which is calculated by dividing the proposed total benefit cost by the proposed total cost. If the BCR is greater than 1, then the proposed cost is said to be significant.

$$BCR\ metric_{(f1)} = \frac{F1\ score\ of\ proposed\ model\ (with\ data\ augmentation)}{F1\ score\ of\ model\ without\ data\ augmentation}$$

The BCR values calculated using the above equation is plotted in Figure 2. The Y-axis represents the BCR scores and the X-axis represents the different baseline models applied on the data. The data points show the distribution of BCR scores of each baseline model. It is evident that the improvement in performance of the baseline models with augmentation is significant since all the BCR values are greater than 1.

From Table 5, it is clear that the model with Logistic Regression classifier applied on the features extracted using TF-IDF method performs well with an F1-score of 0.7152. From Table 5, the best performing models are ABC, LR and MLP. An ensemble classifier model of these models as baseline models together resulted in an F1-score of 0.7404 for TF-IDF feature extraction. The best performing model in each case has been obtained by ensembling the best performing baseline models. In addition to ensembling, the measure/significance of improvement in performance after applying data augmentation was measured by using the Benefit Cost Ratio (BCR) of the F1-score values, which is calculated by dividing the proposed total benefit cost by the proposed total cost. If the BCR is greater than 1, then the proposed cost is said to be significant.

Durairaj Thenmozhi *et al.,*

$$BCR \text{ metric } _{(f1)} = \frac{F1 \text{ score of proposed model (with data augmentation)}}{F1 \text{ score of model without data augmentation}}$$

The BCR values calculated using the above equation is plotted in Figure 2. The Y-axis represents the BCR scores and the X-axis represents the different baseline models applied on the data. The data points show the distribution of BCR scores of each baseline model. It is evident that the improvement in performance of the baseline models with augmentation is significant since all the BCR values are greater than 1.

Chi-Square test is a statistical test is used to understand the difference between the observed results and the expected results. The formula for chi-square is as given below where O_k is the observed value and E_k is the expected value. Chi Squared test was performed on the F1-score and accuracy of the different baseline models, compared to the best performing ensemble model as shown in Table 8 and Table 9 respectively.

F1-Score TF-IDF   Bigram

$$\tilde{\chi}^2 = \sum \frac{(O_k - E_k)^2}{E_k}$$

Error Analysis

Error Analysis provides a better understanding of the performance of the model by analysing the errors made during classification by the system. The error rates where calculated using the confusion matrix and are as shown in the Table 10.

For instance, the comment *"Heroine edde ijjiyal Arjunanne"* translated in English as *"Heroine is not good, Arjunanne"* is evidently a negative comment and is correctly classified as negative by the model. Such instances of evidently negative or positive comments are correctly classified. It is however observed that text involving multiple emotions are not classified correctly, for instance *"Orudakulu gattadakulen kevala malper but e movie nu 100 days housefull show ethundu yankluna chikkamaglur dha koppa du"* is translated as *"although the city people look down on the people of the village, we the poeple of Koppa in Chikkamaglur will make sure that this movie has a houseful theatrical run of 100 days"* Here the first half of the comment reveals a different emotion from the second half. It has been observed that the model cannot differentiate between the various nuances of the language and therefore cannot identify the correctness of the labels. Similarly, the interpretation of rhetorical questions or suggestions also differs from one person to another and with respect to the context. The comment "*Brustaachara NAASAMULPULE*" which translates as *"eradicate corruption"* which in the context of the video is a request or a suggestion to put an end to this social evil cannot always be concluded as a neutral comment.

Scope for Future Work

This work can be further extended by analysing performance for deep learning models, use larger or more complex datasets or to explore other methods of data augmentation to further improve the performance.

CONCLUSIONS

Sentiment Analysis of Youtube comments by a user helps understand user opinion, emotions and sentiments. Social Media is a significant part of our lives through which people voice their opinions, views, thoughts and concerns on a public forum. Thus, we propose a data set that helps analyse user sentiments and emotions and also perform an empirical analysis on the same. An empirical analysis of baseline Machine learning Models like DT (Decision Tree), ABC (AdaBoost Classifier), KNN (K-Nearest Neighbours), MLP (Multi-Layer Perceptron), LR (Logistic Regression), RF (Random Forest) and SVC (Support Vector Classifier) was done for the evaluation of the data set. Among these, the model with Logistic Regression classifier applied on the features extracted using TF-IDF method performs well with an F1-score of 0.6768. It was observed that the ensemble model of ABC, LR and MLP baseline models has the best F1 Score of 0.7271, Data augmentation significantly improves the performance of all the baseline models with Logistic Regression classifier performing better than the other baseline models.

Data set Availability

The data used can be accessed through the given public Github repository. https://github.com/shreya1110-dev/Tulu Sentiment Data .
