ABSTRACT

The Union Territory of Jammu and Kashmir conspicuously emerges as the most underdeveloped region within the Indian union with regards to the pivotal facet of industrialisation. Unfortunately, it has proven to be unsuccessful in establishing a presence within the industrial landscape of our nation. Despite the numerous challenges faced in the progression of the Micro, Small, and Medium Enterprises (MSME) sector, there has been a significant upswing observed in this domain within the union territory. Consequently, this development has fostered promising opportunities for lucrative employment within the region. In light of the prevailing unemployment scenario, the objective of this study is to meticulously examine the growth and effectiveness of employment generation facilitated by Micro, Small, and Medium Enterprises (MSMEs) within the region of Jammu and Kashmir. The study utilised the linear regression paradigm to evaluate the impact of micro, small, and medium enterprises (MSMEs) on employment, while considering the incorporation of secondary data sources. The investigation additionally utilised the Shapiro-Wilk test as a means to evaluate the normality of the data. The study's findings indicate that the expansion of the Micro, Small, and Medium Enterprises (MSME) sector has a positive impact on the creation of job opportunities in the Union Territory of Jammu and Kashmir**.**

Keywords: MSMEs, Jammu and Kashmir, Employment, Shapiro-wilk, Growth

INTRODUCTION

The incontrovertible establishment of a correlation between a nation's economic expansion and its level of industrialisation has been duly noted (Dar & Bhat 2013).In the context of highly developed industrialised nations like Japan, Germany, the United Kingdom, and the United States, there exists a widespread recognition of the significant contribution made by micro, small, and medium-sized enterprises (MSMEs) to the broader economic fabric. The

67194

Shubarat Shameem and Rajeswari

micro, small, and medium enterprises (MSMEs) are commonly acknowledged as the catalysts driving economic growth in numerous developing nations, with India being no exception. Poverty and unemployment emerge as systemic quandaries in developing nations like India, thereby demanding the augmentation of industrial sectors to provide lucrative employment prospects for the most socioeconomically marginalised segments of society. This would provide them with an opportunity to liberate themselves from the intergenerational cycle of poverty to which they were born. Small and medium-sized enterprises (SMEs) assume a pivotal position within the economy due to their inherent capacity to expeditiously and economically engender significant employment prospects. Micro, Small, and Medium Enterprises (MSMEs) not only serve as a means to address regional disparities and foster a more equitable distribution of national income and resources, but they also play a crucial role in creating substantial employment prospects with a considerably lower investment requirement in comparison to larger corporations. The empirical data indicates that micro, small, and medium-sized enterprises (SMBs) have a significant impact on achieving a range of societal and economic goals. These include the creation of more job opportunities, increased export activities, and the promotion of entrepreneurial initiatives. The veracity of this phenomenon remains consistent across both developed and developing economies, as evidenced by the empirical investigation carried out by Shelly et al. in the year 2020. In the Indian context, it is imperative to acknowledge that enterprises are classified as micro-enterprises when the capital investment in plant and machinery does not surpass the threshold of one crore, and their annual turnover does not exceed the sum of five crores.

Micro-enterprises are defined as enterprises whose investment in plant and machinery does not exceed the threshold of ten crores, and their turnover does not surpass fifty crores. Conversely, it is worth noting that medium-sized enterprises are delineated as entities whose capital expenditure on physical infrastructure and equipment does not surpass the threshold of fifty crores, while their overall revenue does not exceed the limit of two hundred and fifty crores, as per the classification provided by MSME in the year 2020. The sector encompassing micro, small, and medium-sized enterprises (MSMEs) assumes a pivotal role as an indispensable support system for the Indian economy. According to the report on Micro, Small, and Medium Enterprises (MSMEs) published by the Working Group for the 12th Five Year Plan (2012-2017), it is worth mentioning that this specific sector holds considerable significance in the realm of manufacturing production, accounting for a substantial 45% share. Additionally, it plays a pivotal role in the overall exports, contributing a noteworthy 40%. The present count of gainfully employed individuals in the industrial sector stands at around 80 million, encompassing a notable sum of approximately 36 million commercial enterprises, as reported in the comprehensive Working Group Report spanning the years 2012 to 2017. As per the comprehensive findings outlined in the Working Group Report spanning the years 2012 to 2017, it is imperative to acknowledge the remarkable degree of productivity demonstrated by the micro, small, and medium enterprises (MSMEs) operating within the confines of our national boundaries. The small-scale sector plays a crucial role in creating productive job possibilities for millions of people in developing countries like India, which are marked by a surplus of labour but a shortage of capital. It is remarkable that the Indian government has properly incorporated the small and medium business sector into its all-encompassing five-year plans, given the crucial role that SMEs play in the country's economy.

The government places a high priority on the growth of the SME sector, which includes micro, small, and medium-sized businesses. The government's top priority is helping micro, small, and medium-sized businesses (MSMEs) like those involved in the coir and khadi industries and the village industries prosper, as stated in the Ministry of Micro, Small, and Medium-Sized Enterprises' Results-Framework Document (2012-2013). The goal of this effort is to help already existing businesses and encourage the creation of brand new ones by working with the appropriate Ministries/Departments, State Governments, and other stakeholders. Micro, Small, and Medium-Sized Enterprises (MSMEs) in India have been contributing more and more to the country's GDP, as seen by their annual report for the fiscal year 2020-2021. The percentage of GDP contributed by micro, small, and medium-sized enterprises (MSMEs) has been on the rise, from 29.14% in fiscal year 2014-2015 to 30.27% in fiscal year 2018-2019. Micro, small, and medium-sized enterprises (MSMEs) account for 49% of total exports. However, the respected government of India has developed a plan to increase that number to a remarkable 75% (Pwc 2020a, 2020b).Therefore; it can be argued that MSMEs significantly contribute to the nation's social and economic development by acting as supplemental

Shubarat Shameem and Rajeswari

entities to bigger firms and performing the roles of auxiliary units. The Union Territory (UT) of Jammu and Kashmir is strategically located in the northernmost part of the Indian union. The geographical area in question proudly showcases a plethora of bountiful natural resources, including but not limited to Gypsum, limestone, coal, lignite, and quartzite. These valuable assets play a substantial role in fostering and enhancing its overall economic well-being. Moreover, in addition to its copious agricultural and horticultural bounties, the locality also showcases extensive tracts of sylvan landscapes. The favourable climatic conditions of the state lend themselves remarkably well to the cultivation of silkworms, an indispensable element in the manufacturing of exquisite silk fabric. The state's extraordinary natural beauty, globally acclaimed havens for rejuvenation, deep-rooted legacy of skilled craftsmanship, and captivating geographical characteristics have conferred upon it a unique and indispensable standing in the domains of tourism and artisanal industries.

It is noteworthy that the state is presently in its nascent phases of industrial advancement and conspicuously trails behind the remainder of the nation in terms of progress in industrialisation, to such an extent that it has been omitted from the comprehensive national industrial map. The unfavourable industrial milieu can be ascribed to a multitude of consequential factors, encompassing an unappealing socio-cultural fabric, insufficient infrastructure and transportation amenities, restricted capital accessibility, a dearth of capital expertise, and political upheaval and unrest prevailing within the jurisdiction. As Butt (2005) posits, the present state of affairs is characterised by a dearth of expansive industrial enterprises. Nevertheless, throughout the preceding two decades, there has been a notable surge in the inception of Micro, Small, and Medium Enterprises (MSMEs). As per the conclusive data of the fiscal year 2020-21, it has come to light that the state has borne witness to the establishment of a substantial number of 709,000 micro, small, and medium enterprises (as reported in the MSMEs Annual Report 2020-21b).The prevailing industrial topography of Jammu and Kashmir (J&K) is predominantly distinguished by the existence of Micro, Small, and Medium Enterprises (MSMEs), which assume a momentous role in propelling industrial and holistic economic advancement within the Union Territory (UT). The Micro, Small, and Medium Enterprises (MSMEs) make a notable contribution of approximately 8% to the overall Gross State Domestic Product (GSDP). These enterprises play a significant role in generating employment opportunities, encompassing both the manufacturing and services sectors, as elucidated in the Industrial Policy of 2021.The state possesses the inherent capacity to furnish propitious circumstances for micro, small, and medium enterprises (MSMEs), contingent upon the allocation of adequate focus and resources towards the advancement of these entrepreneurial ventures.

LITERATURE REVIEW

The exponential growth of small and medium-sized enterprises (SMEs) gives rise to a corresponding augmentation in job prospects, thereby making a valuable contribution towards the alleviation of poverty rates. The scholarly enquiry conducted by Herman (2012) has revealed that small and medium-sized enterprises (SMEs) in Romania demonstrate a greater inclination towards labour absorption when compared to their larger counterparts. The scholarly enquiry undertaken by Kowo, Adenuga, and Sabitu (2019) has revealed a noteworthy association between micro, small, and medium enterprises (MSMEs) and the mitigation of poverty in Nigeria. The correlation at hand can be primarily ascribed to the generation of novel employment opportunities facilitated by these enterprises. The research undertaken by Rotar, Pami, and Bojnec (2019) provides additional insight into the positive correlation that exists between Micro, Small, and Medium Enterprises (MSMEs) and their capacity to assimilate labour. The academic endeavours undertaken by Gebremariam and Gebremedhin in the year 2004, Hamdar, Najjar, and Karameh in 2017, and Manzoor et al. in 2019 have made substantial contributions to the respective field of enquiry.As per the scholarly findings of Ntea et al. (2014), it is an incontrovertible verity that micro, small, and medium enterprises (MSMEs) have consistently played a pivotal role as the bedrock for fostering economic progress and advancement, not solely limited to emerging nations but also encompassing sophisticated economies. Based on the scholarly work of Dey (2014), one can deduce that micro, small, and medium enterprises (MSMEs) exert a nuanced impact on diverse facets of the economy. These enterprises not only make a positive contribution to the Gross Domestic Product (GDP), production output, and employment opportunities, but they also play a vital role in guaranteeing the affordability and accessibility of goods and services within the economy.

Furthermore, it is widely acknowledged that Micro, Small, and Medium Enterprises (MSMEs) possess a propensity for providing ingenious and resourceful resolutions to tackle burgeoning obstacles and cater to the ever-changing demands of the marketplace. In a scholarly enquiry conducted by S. Gade (2018), a comprehensive analysis was undertaken to evaluate the implications of India's micro, small, and medium-sized enterprise (MSME) sector on the nation's holistic development and advancement. Moreover, the aforementioned study has furnished perceptive recommendations with the explicit objective of fortifying the micro, small, and medium enterprises (MSMEs) domain, thereby guaranteeing its enduring contribution to the advancement and progress of the nation. The undeniable significance of small and medium-sized enterprises (SMEs) in augmenting the economic milieu cannot be contested. These enterprises have demonstrated noteworthy progress in the realm of job creation, facilitating the advancement of rural industrialisation, nurturing the entrepreneurial mindset, and alleviating regional imbalances (Bhuyan, 2016). In their scholarly endeavour, Bhat and Yatoo (2019) embarked upon a meticulous analysis of the myriad factors that facilitate or impede the assimilation of cloud computing within the realm of small and medium-sized enterprises (SMEs) situated in the northern region of Jammu and Kashmir, India. The erudite scholars expound upon the notion that micro, small, and medium-sized enterprises (MSMEs) can reap substantial benefits from the integration of cloud computing into their operations. This innovative approach empowers them to effectively harness technological resources, thereby potentially enhancing their prospects for expansion and development. According to the scholarly research conducted by Amir, S. and Iqbal, J. (2019), it is crucial to recognise that the importance of an investment holds no weight unless it undergoes a meticulous and all-encompassing assessment procedure. The erudite scholars undertook an enquiry into the consequences of varied capital budgeting choices on the effectiveness of small and medium-sized enterprises in the region of Jammu and Kashmir.

Bhat and Soni (2015) cogently emphasised the crucial significance attributed to SIDCO in alleviating the state's predicament of unemployment by fostering the establishment of sustainable employment opportunities. These organisations are serving as intermediaries, facilitating communication and coordination between various levels of governance and proprietors operating within the industrial sector. It is imperative to refrain from underestimating the intrinsic worth that industry promotional organisations, such as SIDCO, possess in their capacity to foster and facilitate the expansion of economies. The scholarly research conducted by Arvind Kumar Singh and his colleagues in 2014 delved into the crucial role that entrepreneurs play in promoting the growth and development of micro, small, and medium enterprises (MSMEs). This study shed light on the significant challenges faced by the MSME sector and highlighted the importance of entrepreneurial efforts in overcoming these obstacles. Furthermore, the scholars delved into the noteworthy promotional initiatives undertaken by the Government of India in order to revitalise this particular industry. The scholarly publications authored by Kumar & Kumar (2018) and Rathore and Mathura (2019) provide valuable insights into the intricate and multifaceted complexities encountered by micro, small, and medium enterprises (MSMEs), encompassing a comprehensive range of external and internal dimensions. The foremost challenges faced by micro, small, and medium enterprises (MSMEs) revolve around the domains of finance, production, safety, inadequate working capital, restricted availability of testing infrastructure, scarcity of raw materials, and fierce competition, among various other factors. In light of the aforementioned context, the primary aim of this study is to evaluate the progression and effectiveness of micro, small, and medium enterprises (MSMEs) in terms of their impact on the generation of employment opportunities within the Union Territory of Jammu and Kashmir. The investigation shall encompass a temporal span commencing in 1999 and concluding in 2021. The prevailing body of research pertaining to the expansion and efficacy of Micro, Small, and Medium Enterprises (MSMEs) within the geographical confines of Jammu and Kashmir has predominantly adopted a limited temporal scope. Henceforth, the evaluation of the influence exerted by MSMEs on employment yields an inconclusive outcome owing to the restricted temporal scope of the analysis. Furthermore, barring a select cohort of esteemed scholars, the prevailing body of research predominantly directs its attention towards the evaluation of the formidable obstacles encountered by the Micro, Small, and Medium Enterprises (MSME) sector within the geographical confines of the Jammu and Kashmir region.

OBJECTIVE

The objective of this study is to assess the growth and performance of Micro, Small, and Medium Enterprises (MSMEs) in the union territory of Jammu and Kashmir.

MATERIAL AND METHODS

This study utilises secondary data obtained from a wide range of published and unpublished sources, encompassing the Government of India, the Government of Jammu and Kashmir, and various scholarly articles, among other references. The principal data sources employed in this study encompass the annual reports of the Ministry of Micro, Small, and Medium Enterprises (MSME), the annual reports of the Directorate of Economics and Statistics in Jammu and Kashmir, the Digest of Statistics in Jammu and Kashmir, and the Economic Survey of Jammu and Kashmir. The aforementioned sources offer invaluable time series data, serving as the bedrock of our analysis. Descriptive statistical measures, such as the growth rate, have been utilised to evaluate the progression of micro, small, and medium-sized enterprises (MSMEs) and the subsequent generation of employment over different time periods. The application of the basic regression model has been utilised to evaluate the impact of micro, small, and medium enterprises (MSMEs) on employment, wherein MSMEs are considered as the independent variable and employment as the dependent variable. The utilisation of the Shapiro-Wilk test has been employed as a means to evaluate the conformity of the data to a Gaussian distribution. The investigation into the concept of normality and, in a broader sense, the evaluation of assumptions regarding the distribution, has been a substantial area of continuous statistical enquiry (Shapiro & M.B., 1965).Through the utilisation of the Shapiro-Wilk test, an individual shall be able to discern an outcome comprising a statistical measure and a probability value. If the p-value surpasses the conventional threshold of 0.05, one can deduce that the data aligns with the principle of normality, as hypothesised by Shapiro and M.B in 1965[b]

RESULTS AND DISCUSSION

Growth rate
Table 1 illustrates the growth rate of Micro, Small, and Medium Enterprises (MSMEs) and the corresponding employment generation in the state of Jammu and Kashmir (J&K).The growth rate has been determined using the following formula

G =b2-b1/b1

Where G =Growth rate
b2= Current years MSMEs or employment, b1= previous year MSMEs or employment
The table 1 depicts the phenomenon of employment generation within the Micro, Small, and Medium Enterprises (MSMEs) sector in the esteemed union territory of Jammu and Kashmir. Upon careful examination of the information depicted in table1, a discernible pattern emerges, revealing that the temporal interval spanning from 2003 to 2004 showcases a noteworthy surge in the production of job opportunities facilitated by Micro, Small, and Medium Enterprises (MSMEs). The employment generation by Micro, Small, and Medium Enterprises (MSMEs) in the region of Jammu and Kashmir experienced a noticeable decrease during the timeframe of 2018-19. This decline can be primarily attributed to the existing state of political instability within the region. The fiscal period of 2020-21 has witnessed a noticeable decrease in the ability of Micro, Small, and Medium Enterprises (MSMEs) to create job prospects, a phenomenon primarily ascribed to the unparalleled global health crisis referred to as the Covid-19 pandemic. In the aforementioned temporal epoch, it is of considerable import to acknowledge the conspicuous escalation in the unemployment rate of the nation, predominantly ascribed to the rigors prophylactic and curbing measures instituted by the Indian government in response to the epidemic (Shameem, S., & Rajeswari, M., 2022)

Shubarat Shameem and Rajeswari

Regression Model

A linear regression model has been utilised to examine the impact of Micro, Small, and Medium Enterprises (MSMEs) on employment. In this analysis, employment is considered the dependent variable, while MSMEs are treated as the independent variable. Nevertheless, it is worth noting that the Shipro-Wilk test has been utilised as a means of evaluating the suitability of the linear regression model for the provided dataset. From the table 2, it becomes evident that the calculated p-values surpass the critical threshold of 0.05 for both instances being analysed. Henceforth, it is justifiable to posit that the dispersion of the dates conforms to a normal distribution. Therefore, the application of the linear regression model becomes viable. The formulation of the linear regression model is undertaken with the purpose of elucidating the fluctuation of the dependent variable, which pertains to employment, in relation to its covariance with the independent variable, specifically Micro, Small, and Medium Enterprises (MSMEs).

$$Y_i = \beta_0 + \beta_1 X_i + \acute{\epsilon}$$

Y_i =Dependent variable (Employment), X_i=Independent variable (MSMEs) .$\acute{\epsilon}$= Random error term
β_0 =Model parameter (intercept), β_1= Model parameter (coefficient)

Upon careful examination of the data presented in table 3, one can discern that the R-square value manifests itself at an impressive magnitude of 0.829. This observation indicates that the independent variable, specifically MSMEs (Micro, Small, and Medium Enterprises), exhibits a remarkable 82.9% influence on the dependent variable, which relates to the aspect of employment. Moreover, after conducting a meticulous analysis, it becomes evident that the computed p-value is recorded as 0.003, a significantly smaller value compared to the customary threshold of 0.05(Table3). As a result, we can assert with confidence that a significant and meaningful correlation can be established between the dependent variable, which is Employment, and the independent variable, referred to as MSMEs. The results provided in table 4, one can discern that the model's coefficient value manifests itself as 4.007. This suggests that a marginal increase in the independent variable, specifically MSMEs, will result in a proportional change of 4.007 units in the dependent variable, namely Employment. Furthermore, it is imperative to acknowledge that the coefficient magnitude demonstrates a favourable inclination, thus indicating a direct association between Micro, Small, and Medium Enterprises (MSMEs) and the phenomenon of employment.

CONCLUSION

The Indian economy has experienced a discernible surge in the importance ascribed to micro, small, and medium-sized enterprises (MSMEs) as a catalyst for both innovation and the creation of novel employment prospects. It functions as the quintessential tool for enhancing economic expansion and fortifying manufacturing efficiency. This study effectively elucidates the significant and positive impact of the proliferation of micro, small, and medium enterprises (MSMEs) on the mitigation of the unemployment rate within the Jammu & Kashmir Union Territory (UT). It is worth noting that despite the UT's primary representation of India's small-scale industrial activity geographically, the findings highlight the favourable outcomes resulting from the growth of MSMEs in addressing unemployment challenges. Despite facing various obstacles, the micro, small, and medium enterprises (MSME) sector in the state is displaying a praiseworthy trajectory of expansion, consequently exerting a positive impact on both the state's unemployed population and the overall economy. It is of utmost importance for the Jammu and Kashmir Directorate of Industries and Commerce, SIDCO SICOOP, and JKEDI to adopt a proactive approach in actively involving the younger demographic of the region. It is of utmost importance that both the state and federal government partake in a synergistic endeavour to propel the state's burgeoning industrial sector towards a more sophisticated and prosperous state. The prompt and efficient advancement of infrastructure development in the region is of utmost importance, as significant investments in micro, small, and medium-sized enterprises (MSMEs) represent a viable avenue for nurturing the expansion and progress of the state's industrial sector. The efficacious execution of policies and initiatives intended to cultivate the expansion of Micro, Small, and Medium Enterprises

Shubarat Shameem and Rajeswari

(MSMEs) within a jurisdiction mandates a synergistic endeavour from the federal and regional authorities. The provision of collective assistance is of utmost importance in order to effectively facilitate the growth and progression of these enterprises, thereby making a significant contribution to the overall economic advancement of the region. The progression of micro, small, and medium-sized enterprises (MSMEs) within the state calls for a synergistic intervention from both the federal and state authorities. If duly nurtured, the micro, small and medium-sized enterprise (MSME) sector within the state harbours the potential to engender gainful employment prospects for a significant segment of the jobless populace within the region. As the rapid growth of this specific industry unfolds, it is expected that a corresponding decrease in the unemployment rate will occur, thereby mitigating the primary cause of apprehension within the Jammu and Kashmir administrative region.

ABSTRACT

The present study was made to the effect of different concentrations of sodium chloride (NaCl) with the application of vermincompost on germination and biochemical constituents of *Arachis hypogaea* L. The germination study were conducted with various concentrations of NaCl (mM) with vermincompost (%) (0, 10, 25, 50, 10mM+5%, 25mM+10%, 50mM+25% and 100%Vermi compost) and the data were assessed 25th day after germination. The accumulation of proline and glycine betaine content increased at extreme level of 50mM NaCl+ 25%VC. In 100% vermin compost all parameters increased moderately as compare to control. The enzyme activities like catalase, peroxidase and ascorbate peroxidase drastically decreased upto 50mM NaCl and gradually increased in addition with vermicompost. The maximum enzyme activities shown at 50mM NaCl+ 25 % Vermicompost.

Keywords: *Arachis hypogaea* L., Salinity, vermicompost, asmolytes., enzyme activities.

INTRODUCTION

One of the biotic stressors which adversely affects plant growth and development in their natural habitats is soil salinity. The excretion of salt can occur as a result of natural or manmade processes that lead to the irrigation of soil water, which in turn results in an accumulation of salt and disturbs its general growth and development. The total area in the world is 397 million hectares, which includes 19.5% of irrigation lands with salinity and 2.0% of dry areas are exposed to salinity [1]. The Vermicompost is the organic fertilizer made from earthworm droppings that have

67203

been crushed. They say the plants are very good at absorbing nutrients. In addition, vermicompost has been shown to reduce adverse effects of salt stress on different crops in a number of studies [2].Vermicomposting, which is used for the biotransformation of different waste streams that serve as pollution storage facilities, is an emerging eco-friendly technology. Nitrogen rich organic compost that can improve plant health and fertility is produced from solid soil waste of certain earthworms eg, *Eisenia foetida* sp. Thus, problems such as safe disposal of organic waste, increasing crop production and maintaining food security can be solved by green vermicomposting technology. This has resulted in the development and use of organic products, such as organic fertilisers, green manure mixtures, combinations of fertilizers used for crop rotation, vegetable residues, straw or animal waste with more complex forms like biodegradants, vermicompost, earthworm humus. The use of which has increased, as it contributes to the creation and development of sustainable agriculture [3]; [4]; [5]. One of the key environmental challenges for agricultural production across the world is salinity. In plants, salt stress is characterized by two primary types of physiological stress. In particular, NaCl increases can lead to reduction in the availability of groundwater for plant irrigation due to an increase in internal osmolotic potential according to [6]. Second, due to increased uptake of toxic ions such as Na^+ and reduced uptake of essential elements such as K^+ [7] and P [6], increased NaCl may cause ionic stress. The necessity of maintaining water conditions with osmotic adaptation, allowing maintenance of the turgor while maintaining K^+ Na^+ and stoichiometric selectivity is therefore directly responsible for plant tolerance to salt stress [8].

One of the important cultivation practices is to use soil conditioners with organic fertilizer properties in order to mitigate the adverse effects of salinity on plant growth. By increasing the concentration of micronutrients [9]; [10] and soil macronutrients and improving their structure, organic matter contributes to soil fertility and quality, according to [2]. Proline, which can be found mostly on higher plants, is the most basic of all osmolytes. It is an amino acid and normally rigid, so it has a crucial role to play in response to different algal stresses by means of adaptation, signals and recovery mechanisms. Proline accumulation has been shown to enhance stress tolerance in plants, which may be increased by proline accumulation at chloroplast and cytoplasm level as well as when plant is subjected to strain [11]. In the study of tolerance to plant stress, proline accumulation is a major indicator. Plants accumulation of proline with NaCl salinity has also been observed in several other plants, and proline accumulation may also contribute to non-enzymatic detoxification of free radicals [12].Concentrations of glycine betaine significantly increased under salt stress in mung bean cultivars [13]. A derivative of methyl glycine, the quaternary ammonium compound GB N,N,N, trimethylglycine is also called parent betaine. The most widely grown in GBs is betaine, which has been produced by desiccation as a result of different biological stress factors including drought, salinity and temperature extremes [14]. Glycine betaine, a major complementary compound which is in Poaceae and Chenopodiaceae species under different salinity levels has been shown to participate in multiple defense mechanisms against stress related plant diseases [15]; [16]. GB is an amphoteric metabolite that is highly soluble in water and is electrically neutral in a wide pH range [17]. By controlling ion channels, enhancing plasma membrane H^+-ATPase enzyme activity, improving phosphate absorption, and regulating phosphate homeostasis, GB can decrease salt-induced potassium influx[18]; [19]. When GB and proline are present in high concentrations, plants are protected from oxidative stress so well that antioxidant metabolites and enzymes are not as important in salinity-related ROS defense [20]; [21]; [22].

Through a wide range of mechanisms and functions, plant antioxidants contribute significantly to the development of plants. Plants have a number of antioxidant enzymes that are associated with ROS scavenging, and exposure to oxidative stress is known to increase the synthesis of these enzymes. The ROS are made up of free radicals including superoxide radicals (O_2), hydroxyl radicals (OH), perhydroxyl radicals (HO_2), and alkoxy radicals as well as non-radical forms like hydrogen peroxide (H_2O_2) and singlet oxygen ($^1O_2$) that are found both within and outside of the plant's cells. A single electron transfer from dioxygen (O_2) to superoxide radicals (O_2) can produce superoxide radicals [23]. Mainly, these plant enzymes are superoxide dismutase (SOD), catalase (CAT), peroxidase (POX), glutathione peroxidase (GPX), glutathione reductase (GR), glutathione S-transferases (GST), ascorbate peroxidase (APX), monodehydroascorbate reductase (MDHAR), and dehydroascorbate reductase (DHAR), which work as part of the antioxidant defence system. The plant has antioxidant defence systems consisting of enzymatic and not enzymatic components that hold the ROS balance in a cell under stress. For example, they activate superoxide

dismutase (SOD) and catalase (CAT) enzymes for sweeping different types of ROS. However, depending on the duration and severity of the salt stress, the effect of salt stress on plants varies, according to [24]. The potential of vermicompost fertilisers for improving soil physical and chemical conditions as well as its role in mitigating the damage caused by salt stress to plant growth. In salt stress, the use of vermicompost increases the activity of the antioxidant enzymes in the plant [25]; [26]. Therefore, using vermicompost may be an effective method to mitigate the adverse effects resulting from excessive Na^+ and Cl^- levels on soils in order to enhance their antioxidants and chlorophyll content.

MATERIALS AND METHODS

Experimental Studies
Arachis hypogaea L. seeds were collected from Seed Research Institute, Aduthurai and this seeds were surface sterilized with 1% sodium hypochloride for five minutes. Then washed with tap water thrice used as a germination studies. The seeds were germinated with various concentration of NaCl (0,10,25 and 50mM) and also application of vermicompost (10mM+5%, 25mM+10%, 50mM+25% and only 100% vermicompost). The seeds could not survive above 50mM NaCl. Five seedlings of each replicate was selected for recorded morphological parameter on 25th day after sowing. The fresh weight of the seedlings were separated and weighed electronic balance. The separated plants organs were kept in hot air oven at 80^0 C for 24 hours and then weighed in electronic balance. The leaf area was calculated by measuring the length, width and number of leaves and multiplied by correlation factor (0.66) and derived from the method of Yoshida et al., 1972.

Osmolytes
Based on the method of [27], proline has been obtained and estimated. According to the methodology of [28], these samples have been collected and estimated. Statistically, the method of a Complete Randomised Block Design with ANOVA one way method was used to analyse this data.

Enzyme Activity
The protocol outlined by [29] was followed in order to estimate the catalase activity. The [30] protocol was followed when performing the peroxidase activity. The method outlined by [31], was followed in order to estimate the ascorbate peroxidase activity. Complete randomised block design was used to statistically analyse the data (ANOVA one-way method).

RESULTS AND CONCLUSION

Germination percentage, Length of seedlings, fresh weight and dry weight
The highest germination percentage was observed in control plant (95%) and in salinity treatment the maximum germination was observed in the optimum level of 50mM NaCl and combined with application of vermicompost 50mM NaCl + 25% VC was higher when compared to control. The highest values was recorded in 50mM NaCl (60%) and 50mM NaCl + 25% VC (90%) when compared to control (Table 1). In the course of drought, salt and heat stress conditions, Vermicompost preparation increased seed germination in both seed sets [32]. The data on the effect of salinity and application with vermicompost on the seedling shoot length and root length (14.9 g plant^{-1}; 12.4 g plant^{-1}) on 50mM+25% VC when compared to control. The similar trend was observed in fresh weight and dry weight also and their was observed in (11.4 g plant^{-1}; 10.38 g plant^{-1}) and (10.5 g plant^{-1}; 9.5 g plant^{-1}) when compared to control (Table 2). A study has shown that the use of VL improved root development, total leaf area, leaf count and stem thickness when exposed to NaCl induced salt stress by increasing tomato seed growth. In this respect, it has been reported that the application of leaves to pomegranate seed, when treated with NaCl, has reduced the Na content and also reduced the degradation of chlorophyll and oxidative stress, suggesting that it has an effect on reducing salt stress, VL [33].

Debasish Dikshit and Venkatesan

Proline

The results on the accumulatioin of proline content increased with increasing concentrations up to 50mM NaCl and 50mM NaCl + 25% vermicompost and this was recorded in leaf, stem and root (9.541, 7.102 and 4.4 mg g^{-1} fr. wt.) and (13.104,10.891 and 7.159 mg g^{-1} fr. wt.) .when compared to control (Fig. 1). In saline environments, plants produce more proline [34], yet using more vermicompost makes it harder for plants to cope with NaCl stress [35] .

Glycinebetaine

When compared to control on the 25th day after treatment, the accumulation of glycinebetaine content increased with extreme levels of 50mM NaCl salinity and 50mM NaCl + 25% vermicompost (4.207, 3.104, and 2.33 mg g-1 fr. wt. and 5.3991, 4.856, and 3.889 mg g-1 fr. wt., respectively) (Fig. 2). Glycine betaine is widely involved in increasing plant resistance under various environmental stresses, including salinity and drought [36]. In addition with vermicompost also increase in the glycine betaine content [37].

Enzyme Activities

Catalase

The result on the catalase activity decreased in increasing salinity up to 50mM NaCl level and gradually increase with increasing in addition of vermicompost. Maximum increase in catalase activity was recorded in 50mM NaCl + 25% vermicompost (3.94 unit min^{-1} mg protein) when compared to control. It was also recorded that in 100% vermicompost catalase activity was moderately higher than control (3.23 unit min^{-1} mg protein) (Fig. 3). In a study, SOD and CAT activities significantly increased in tandem with the rise in salt levels, enabling the plant to withstand salt stress. When compared to control plants (non-VC), the VC treated plants were observed to have considerable SOD and CAT activities that actively participate in the sweep of ROS [24]; [25].

Peroxidase

The results on the peroxidise activity decreased with increasing concentrations up to 50mM NaCl and gradually increased in addition with vermicompost. Maximum increase in the peroxidase activity was recored in 50mM NaCl+25% vermicompost (5.391 unit min^{-1} mg protein) when compared to control on 25th day after treatment. The extreme level of 100% vermicompost peroxidae activity was moderately higher than control (5.211 unit min^{-1} mg protein) (Fig.4). According to the results of an analysis of variance, the simple effects of salinity and vermicompost stress on the activity of antioxidant enzymes were significant; additionally, the interaction effects of treatments on catalase, superoxide dismutase, ascorbate peroxidase, and glutathione peroxidase were significant, but the interaction of these two factors with malondialdehyde was not significant [26].

Ascorbate Peroxidase

The data on the ascorbate peroxidase activity of various concentration of salinity with combined vermicompost are given in fig.5. The result on ascorbate peroxidase decreased in increasing salinity up to 50mM NaCl level and gradually increase with increasing in addition of vermicompost. Maximum increase in as corbate peroxidase activity was recorded in 50mM NaCl + 25% vermicompost (43.568 unit min^{-1} mg protein) when compared to control. At extreme level of 100% vermicompost ascorbate peroxidase activity was moderately higher than control (39.11 unit min^{-1} mg^{-1} protein). [38] Assessed the impact of salinity and vermicompost supplementation on levels of antioxidant enzymes activity in photosynthetic pigments. The findings of an analysis of variance show that salt stress and vermicompost significantly altered the amounts of ascorbate peroxidase, catalase, Glutathione peroxidase, Superoxide, dismutases or total chlorophyll enzymatic reactions.

ABSTRACT

To Evaluate and Compare the shear bond strength of Orthodontic Metal brackets bonded with color-changing adhesive with a conventional light-cure adhesive. In this investigation, 150 permanent premolar teeth that had been extracted intact were employed. Before bonding, fluoride varnish was administered to every tooth sample, and bracket bonding was completed 21 days later. Five categories of adhesives were separated. Group A- 3M Trans bond XT (control group), Group B- 3M Trans bond Plus, Group C- Brace Paste (AMERICAN ORTHODONTICS), Group D- Gren Gloo (ORMCO), and Group E- Blue Gloo (ORMCO), along with Clear fill SE primer (Kuraray Noritake Dental Inc, Japan) Universal Etchant, were used to adhere the metal brackets. The brackets were cured with a 3MTM Elipar deep cure-S light-curing device. All samples will be kept in artificial saliva and examined three times using the INSTRON universal testing system to ascertain the SBS: - One week, one day, and one. Descriptive statistics comparing the SBS interval to 24 hours and one week, with a mean and standard deviation that ranges from 6.34 to 9.45 Mpa. The substantial variation in shear bond strength between all of the groups is revealed by one-way ANOVA test groups and within groups. The shear bond strength was highest in Group D, Gren Gloo (ORMCO), and lowest in Group A, 3MTM Trans bond TM XT (control group). Comparing various groups at three distinct time points revealed the confidence interval, which indicated that statistically there was no difference. Among the Five Color changing adhesives, Gren gloo demonstrated average shear bond strength that was significantly higher than other adhesives Blugloo, Trans bond Plus, Brace Paste, and Trans bond XT (Control group) at 24 hrs and one month.

Keywords: Shear bond strength, orthodontic brackets, color-changing adhesive, ARI index.

INTRODUCTION

The adhesion between the orthodontic metal brackets and the enamel surface must be preserved for a fixed orthodontic treatment to succeed. Although bonding failure framesets may not be satisfactory to them, they still greatly increase therapy efficacy and positively impact clinical practice. Often, the wire needs to be cut to make things right, and therapy is much overdue. The use of various adhesives with varying bond strengths and the kinds of orthodontic brackets to which the glue melted can be the subject of this study. Buono core, in 1955 introduced the produced etching technique, where phosphoric acid preparation was used to achieve micro porosities[1]. Newman 1965 introduced the novel concept of bonding orthodontic attachments to tooth surfaces utilizing epoxy adhesive [2]. An experimental study by Zachrison described that a cautiously achieved bonding technique might be on anterior teeth, premolars, and mandibular second molars, while the evidence. At the same time, and would suggest that the first molars be banded[3].To manufacture micro porous surfaces, Buonocore first devised the produced etchings in 1955. The innovative idea of using epoxy adhesive to connect orthodontic attachments to tooth surfaces was first proposed by Newman in 1965. A cautiously executed bonding approach may be used on anterior teeth, premolars, and mandibular second molars, according to an experimental investigation by Zachrison. Additionally, and would recommend that the first molars be banded[4]. Color-changing adhesives are popular and widely used among orthodontists because of the positive traits mentioned. Currently, work is being done to incorporate specific chromatic agents into composite resin glue so that they change color as they cure. They have the advantage of flash removal, which reduces plaque and decalcification buildup and helps patients maintain better dental hygiene. The shear bond strength of composite resin adhesive and either glass ionomer cement or resin-modified hybrid in vitro study has been compared in a study[5]. However, compared to other bonding agents, the benefits of a color-changing adhesive and perception of shear bond strength. The primary finding of the current study is Color color-changing adhesives have strong bond strengths under diverse situations, suggesting that they can be effectively used in orthodontic practice.

MATERIALS AND METHODS

In the current in-vitro study, 150 maxillary first premolars that had recently undergone extraction for orthodontic treatment were gathered, carefully cleaned, and kept at room temperature for two weeks in 0.1 percent (wt/vol) thymol. Premolars were chosen based on the presence of broken teeth, attrited teeth, carious teeth, hypo plastic teeth, cracks on the enamel surface, and gross abnormalities of enamel on the facial and occlusal surfaces,

METHODOLOGY

Extracted maxillary up to the CEJ, which separates the crown surface and is exposed for bonding orthodontic brackets, the first premolar teeth were set with acrylic resin. Before bonding, each tooth was cleaned and polished using a pumice water paste and a rubber cup bur on a slow-speed contra-angle hand piece. The teeth were then rinsed with some water and allowed to air dry.

Brackets
The study used an orthodontic metal upper premolar bracket system with a 0.022 x 0.028 slot (Gemini series, 3M Unitek). The bracket base surface area was found to be 9.61 mm2 as per data provided by the manufacturer (Fig 1)

Light-cure bonding adhesives
The light-cure bonding adhesive used to bond the brackets for the study is as follows (Fig 2):
1. 3M™ Trans bond™ XT (control group)
2. 3M™ Trans bond™ Plus
3. Brace Paste(AMERICAN ORTHODONTICS)

4. Gren Gloo(ORMCO)
5. Blu Gloo(ORMCO)

With long-term marginal sealing, the Clear fill SE primer from Kuraray Noritake Dental Inc. in Japan has stronger and excellent bond strength (Fig 3 a). It has low method sensitivity and, in effect, no post-operative sensitivity. There is no need for a separate acid etching, and the moisture content of the tooth surface requires less monitoring. A 37 percent phosphoric etchant liquid gel known as 3M ESPE Scotch bond Etchant is used to etch enamel and dentin. It has outstanding marginal integrity and high bond strength for highly attractive quality (Fig 3 b).Protective fluoride varnish (Fluor Protector S Ivoclar Vivadent) offers improved defense against teeth erosion and cavities. This cutting-edge varnish technology consistently dissolves fluoride and guarantees immediate fluoride availability. Fluor Protector S provides a compact form of the whole fluoride dose. The varnish's ideal flow and wetting capabilities are caused by its low viscosity(Fig 3 c).

Light cure unit, Stereomicroscope (SEM), and Aluminum-mounting jig
a. 3M ESPE Elipar ™ Deep cure with the intensity of 1,200 mW/cm2.
b. Scanning Electron Microscope (Magnus, Olympus, Japan).
c. Aluminum mounting jig with an Acrylic resin-filled tooth embedded in it. and bond strength test with the In strong machine showing where the de bonding force was applied With two exposures lasting 10 seconds each, 3M ESPE Elipar TM Deep cure with wavelength 430-480 nm and light intensity 1,470 mW/cm2 (-10% /+20%) was used to start the polymerization process (curing time)(Fig 4 a). After the base of the bracket's surface area was de bonded, the properties of the teeth's surfaces were examined using a scanning electron microscope. The base of the bracket slot surface was scanned using a (Magnus, Olympus, Japan) microscope at a magnification of 40, and then progressively examined in detail at a magnification of 100 to find any surface roughness(Fig 4 b).An aluminum-mounting 150mm x 150mm was selected and the tooth was embedded in the jig**.** Mounting a bracket made of aluminum that has the following measurements: A bespoke square block of aluminum measuring 50 mm in length and 30 mm in width was chosen, and a tooth made of acrylic resin fill was inserted into it(Fig c).

Bonding Procedure
Thirty tooth samples of all the Groups were first polished with a super-fine polishing paste (Clean Joy, VOCO), then etched for 30 seconds with 37 percent phosphoric acid, rinsed, and air-dried. At the same time, Clear fill SE Primer

Figure 5 Thirty teeth samples of all the Groups (Group-A 3M Trans Bond-XT, Group – B   3M™ Trans bond™ Plus, Group – C Brace Paste (AMERICAN ORTHODONTICS) Group – D Gren Gloo (ORMCO) and Group – E   Blu Gloo (ORMCO) with color coding stickers on the samples (KurarayNoritake Dental Inc., Japan) was applied in a thin layer to the enamel surface, and then an orthodontic bracket was bonded with Group-A 3M Trans Bond-XT, Group – B 3M™ Trans bond™ Plus, Group–C Brace Paste (AMERICAN ORTHODONTICS)Group – D GrenGloo (ORMCO)and Group – E Blu Gloo (ORMCO)(Fig 5). The surplus flush was eliminated The study used an orthodontic metal upper premolar bracket system with a 0.022 x 0.028 slot (Gemini series, 3M Unitek)., the extra flush adhesive material was removed with a probe before curing, taking care not to compromise the position of the bracket. The adhesive was light-cured for a total of 10 seconds with the Elipar deep cure-S light-curing equipment.

Bond Strength Testing
Following the completion of the bonding operations, the samples were subjected to a shear bond strength test utilizing a universal testing machine (Fig 6). The device consists of two jigs. The stirring component of the machine's cross-load component was where the upper jig was fastened. The stationary component was fastened to the lower jig. The plotter and monitor were connected to the crosshead components. To maintain distance and equal alignment of the labial surface of the tooth and the shear die, the teeth were modified into the jig. A shear knife-edge blade with the same dimension as the bracket imparted the shear force to it at a crosshead speed of the bond strengths were computed in mega pascals, and the shear bond force required to shear the bracket and cause bonding failure was documented in Newtons (MPa). All of the samples underwent the same testing procedure, and the results were

documented. The software Origin 7.1 was used to store the data on a PC (Origin Lab, California, USA). The calculated values were confirmed. In each group of three samples, one sample was chosen whose surface had been treated with 37 percent phosphoric acid. All of the samples were subjected to the test again, and the results were noted and saved. The results attained were noted. The samples were put through a universal testing machine's shear bond strength test at a crosshead speed of 0.5 millimeters per minute. The results were recorded in Newton and converted into the following equation.

Shear bond strength in Mega pascals = De bonding force in Newton's
                                                    Bracket base area (12:6mm2

Adhesive Remnant Index (ARI)
All specimens were inspected after de bonding using a stereomicroscope (Magnum, Olympus, Japan) at 10x magnification to measure the amount of adhesive still present on the tooth surfaces

 The ARI scale has a range of 5 to 1
5 = No composite left over on the enamel surface
 4 = Less than 10% of composite left over the tooth surface
 3 = More than 10% but less than 90% of the composite left over the tooth surface
 2 = More than 90% of the composite left over on the tooth surface
 1 = The entire composite, with an impression of the bracket base left on the tooth surface

STATISTICAL ANALYSIS
The shear bond strength of the five groups is potted as mean and standard deviation. Descriptive statistics, including the mean, standard deviation, and minimum and maximum values, were calculated for each of the tested groups. test for analysis of variance The statistically significant variations in mean Shear bond strength across the five groups were determined using a one-way analysis of variance (ANOVA). Shear bond strength at various intervals between the five groups was examined, and a one-way Friedman test was used to define in which group the statistically significant difference between inter- group multiple comparisons belonged.

STATISTICAL SOFTWARE
Statistical software, Statistical Package for Social Science (SPSS) Version 26.0, was used to analyze the data. Graphs and tables were created using Microsoft Word 2016 and Excel 2016. If a p0.05 percent level of significance and p0.01 was highly significant at a 1 percent level of efficacy, the statistical difference was deemed to be significant.
Graph 1 Comparison of Shear Bond Strength between Different groups at 3 different intervals

RESULTS

Shear Bond Strength
Compared to SBS 24 hours and SBS 1 month, the interval between SBS 1 Week had the greatest P-value in the normality test (Kolmogorov-Smirnova and Shapiro-Wilk): 0.008 (Table 1). When comparing the three intervals of the descriptive statistics of the five groups, Group D GrenGloo (ORMCO) had the greatest descriptive values: the one-month SBS interval had the highest Mean = 7.8940, Standard deviation = 1.06435, a minimum of 6.34 Mpa and a maximum of 9.45 Mpa (Table.2). Shear bond strength comparison between 5 groups at various intervals (Friedman Test) *significance >0.05. At various intervals across the five groups, groups B, D, and E exhibit substantial efficacy of 0.054, 0.006, and 0.008, respectively, which is related to a significant difference in shear bond strength (Table 3). Group D had a significant difference of 0.041, 0.041, and 0.005 between 24 hours and 1 week and 1 week and 1 month, according to an intergroup comparison. Similar to group E, there is a significant difference of 0.001, 0.006, 0.001, and 0.006 for 1 month, 24 hours, and 1 month, 1 week (Table.4). One-way ANOVA was used to compare

groups and within-group differences. The difference between the means of Group D and Group E is statistically significant, as evidenced by the confidence interval for the difference being between 92.221 and 70.203. The differences do not appear to be statistically significant, according to the confidence intervals for the remaining mean groups (Table 5). The confidence range for the ANOVA test comparison between various groups at three separate time points indicated that there was no statistically significant difference (Table 6)(Graph 1).

Adhesive Remnant Index

The ARI scale ranges between 0 and 3, indicating the ARI Score of Group 4 GrenGloo (ORMCO) had less than Twenty five percent ARI of the score of 0 only at 24 h on the tooth than the bracket mesh (Table 7). Because the bond breakdown primarily occurred at the bracket-adhesive interface, the mesh like pattern is visible in the two bracket bases. However, due to the leftover bonding substance, not well defined. There was a noticeable difference between the two groups, showing air bubbles in the residual adhesive on the bracket bases that were bonded and a well-defined resin penetration into the sections of the base bracket in the more substantial occurrence (Figures 7a and 7b).

DISCUSSION

The clinical practice of orthodontics has changed and advanced due to the bonding of braces. To maintain the bond strength, it is necessary to develop the bonding process while reducing time and lowering exposure to volume. They further assert that Grengloo's chemical affinity for metal brackets ensures constant binding strength. Damon 2 brackets (ORMCO) were adhered to using Blugloo and Trans bond XT, two conventional adhesives, to compare their shear bond strengths. They discovered that the bond strengths were far more than those needed to withstand masticatory and orthodontic stresses, and there was no discernible change in the shear bond strength. The findings suggested that employing Blugloo adhesive, which has advantageous color-changing qualities and facilitates adhesive release during bonding [6] did not decrease bond strength. The mean shear bond strength of four adhesives was measured between 16.0 and 22.2 MPa. According to the current investigation, Greengloo has the highest shear bond strength among color-changing adhesives while Trans bond XT has the lowest (control). The Shear bond strength variation between color-changing adhesives was not statistically significant in the present study, however. In the current testing, however, Greengloo's shear bond strength was noticeably higher than any other adhesives'.

According to Bayani et al., the examined groups' shear bond strengths ranged from 14.05 to 31.25 MPa. When light-cured for the 20s, Greengloo adhesive demonstrated the greatest Shear bond strength values, whereas Trans bond Plus adhesive demonstrated the lowest values Trans bond Plus adhesive's ARI scores were much higher than those of the competing glue, and the differences in ARI values were not statistically significant [7]. Shamnur et al. assessed and compared the bond failure rate, bonding time, and time required for the adhesives to change the color of two color-changing bracket bonding adhesives Trans bond Plus. There was no indication that either is clinically effective or efficient. Clinically speaking, the benefit of color-changing bracket bonding adhesives is that they reduce chair side time due to their ability to change colors, which makes it easier to remove flash when bonding brackets [8]. The shear bond strength of a color-changing adhesive and a traditional light-cure glue were contrasted at various de bonding times by Yousse finia et al. Trans bond Plus had the highest mean SBS at 15MPa after one week. In terms of the shear bond at various periods and ARI [9]. Trans bond nd XT tested for one week had the lowest mean SBS of 13.8 MPa, but their graphs and tables were created. According to Scribante et al., in vivo, clinical research should be carried out to confirm the in vitro results. In vitro, bonding studies represent one of the initial stages of materials testing. Studies on color-changing adhesives in vivo are lacking. The study is the first to evaluate the therapeutic efficacy of an experimental resin to a standard one *in vivo* [10]. When Maurya et al. compared the shear bond strengths of glass ionomer (Fuji Ortho), conventional composite resin 3M Trans bond XT, color-changing composite resin 3M Trans bond Plus, and conventional, etch, and 3M Trans bond Plus Self Etch Primer, they discovered that the glass ionomer resin adhesive had the lowest shear bond strength and the light-cure conventional composite resin had the highest. The bonding of Grngloo and Blgloo was equivalent when the shear bond strength of color-changing adhesives was compared to that of the traditional light cure glue [11].

However, Trans bond Plus' bond strength was considerably lower than Light Bond's. The sealant Ortho Solo (ORMCO), which is utilized in Grngloo and Blgloo, may be the reason for their relatively higher bond strengths. Ortho Solo is a universal sealant and bond enhancer that releases fluoride. Ortho Solo, according to its creators, has a bond-enhancing feature that enhances adherence to the tooth at the adhesive interface and lowers bond failure rates. In Ortho Solo, the glass filler serves as a stress and shock absorber, reducing cracks that could cause bond failure [12]. Manufacturers claim that a proprietary chemical used in Grngloo's design boosts traumatic impact resistance by 118%. It is thought that a minimum bond strength of 6 to 8 MPa is needed to support regular orthodontic treatment (Reynolds, 1975) [13]. In our research, the shear bond strength varied significantly. The highest shear bond strength was found in Grengloo, which ranged from 6.34 MPa to 9.45 MPa during 1 month and 24 hours. Bond failure in Grngloo was relatively low compared to other adhesives. Contrary to a related study by Duers et al., 3m Trans boand XT had the highest bond failure rate. For Trans bond PLUS, Blugloo, and Trans bond XT, the average shear bond strength is much greater at 24 hours than at 15 minutes. At 15 minutes compared to 24 hours, Gréngloo's average shear bond strength was more significant. Gréngloo had the highest average shear bond strength after 15 minutes of testing.

At 24 hours, Gréngloo had the weakest average shear bond strength [14]. For usage in clinical orthodontic treatment, the Trans bond Plus, Brace paste, Blugloo, and Gréngloo all showed sufficient shear bond strength. The circumstances in which color changes take place are the main distinctions between the five different adhesives. After exposure to light for the light cure, Trans bond Plus turns translucent from its pink hue. Similar to how Brace paste transforms from a purple color to transparent with exposure to light for light curing, Grengloo and Blugloo transition from green tint and blue tint, respectively, to translucent after an increase in temperature, and their respective color tint returns with a temperature. Bond strengths depend on the technique used, and under different experimental circumstances, the same orthodontic bonding materials can provide varied outcomes .Although clinical research on patients may be of interest to this study, laboratory data cannot be drawn from clinical settings, hence clinical investigations must be conducted to yield meaningful results. Future research should replicate the current study over longer periods and assess the shear bond strength and ARI index 24 hours later. This research was conducted in a lab setting that altered intraoral circumstances. Results in clinical settings may be impacted by elements such as enamel composition, saliva contamination, and differences in assessments between intraoral forces and universal testing machine forces. The dearth of information points to the need for additional clinical investigations on the shear bond strength, the potential for enamel damage, and strategies to reduce the dangers associated with color-changing orthodontic adhesives.

CONCLUSION

Compared to the other adhesives Blugloo, Trans bond Plus, Brace Paste, and Trans bond XT (Control group), Grengloo of the Five Color Changing Adhesives showed an Average Shear Bond Strength that was Significantly Higher. The ARI scores for Greengloo were significantly higher than those for the other adhesives, but they were not significantly different for Blugloo, Base Paste, or Trans bond Plus. The mean Shear bond strength of all the groups remained beyond the safety limit. At three further time intervals of 24 hours, one week, and one month, all the adhesives revealed increased Shear bond strength in comparison to previous orthodontic adhesives.

LIMITATIONS

In comparison to in vivo research, the limitations of this in vitro study's consideration of elements influencing the shear bond strength of the adhesives included saliva, blood, intraoral temperature, occlusal stresses, and others. Therefore, it is advised that research be done to evaluate the shear bond strength of orthodontic bonding adhesives in vivo with all oral variables.

ABSTRACT

Emotional labour the word sinc e 1983 generally encompass, work that goes unpaid and unrecognized. After entering into the world of "employees   emotion" the word emotional labour adding more meaning to the customer facing employees emotion. Even the limited research in this emotional labour field, it is very new to Indian context so The present study aims to examines how some characteristics and some strategies like employee attitude towards Store, job benefits, organization a support, store image, emotional intelligence, personal values and gender effects in a employees emotional labour Management. In addition, the study investigates the role of above mentioned strategies act as a predictors of employees emotional labour Management. To find out the structured data, self-designed questions were coined, especially for customer facing employees in apparel stores which are in chennai. Totally 213 valid responses were obtained to predict the Employees Emotional Labour. Managing emotions is not a easy task. Employees need to get trained to express their expected emotion, so the study also examined how the employee genuinely cared for their organisation by the help of emotional labour. This study results offered crucial theoretical and managerial implications which serves as a value addition to the prevailing Emotional Labour research.

Keywords: Emotional labour, job benefits, organisational support, store image, emotional intelligence, personal values.

Frank Sunil Justus and Subha

INTRODUCTION

Directing our Emotion is an art. People are managing their emotions by practicing mindfulness, yoga, meditation etc. Numerous people of the total population living in this world will be as workers. It is more important to pay attention to our emotions where we are as a worker than it is to look at our emotions as an individual. Hoch child(1983 the managed Heart,) explained that regulating and directing the emotional Appearance of the Emotions with the persons who are facing for to meet the organizational expectations in their professional work role. In many places the phrase "our service with a smile". 'Is this possible in the sense of "labor" emanating from the human brain, which is a pile of different emotions?' The question naturally arises for all of us. It is imperative to express the same feelings to all the clients they meet while being a worker. For that, companies also need to balance the mindset of workers. Various external factors and self-factors of the worker affect all workers to express the same feelings especially positive emotions to fulfill the purpose of the company. In this research article we will look at the various hitherto undefined factors involved in managing Emotional Labor Management in that category. As like words of Arlie Russell Hoch child this paper is going to explore the new dimensions of managed hearts. Service industry accounts for above 60% of global GDP and the economy (the sector fact book, 2017), growing research has targeted on frontline service personnel' behaviors, attitudes, and emotions (grandey,2008;mayer et al., 2009; dong et al., 2015). All through carrier delivery, but, employees ought to agree to organizational expectancies and dreams to suppress negative feelings and Display good feelings, which is characterized as emotional exertions (ash forth and humphrey,1993; brother ridge and grandey,2002).Emotions exertions contains different displaying guidelines: Surface acting and deep Acting. Surface acting emphasizes converting outward emotional show as opposed to altering the internal genuine emotions (Abraham, 1998; grandey, 2000),while deep acting highlights regulating the internal emotions to satisfy necessities of the paintings grandey, 2000;hülsheger and schewe,2011)

Objective of the Study
This Exploration aims to identify the various predictors and their effect on emotional labour management among apparel store employees in Chennai.

REVIEW OF LITERATURE

The increase in Service providing enterprise the importance of personnel' emotional exertions has triggered, and it has acquired accelerated interest from various fields which includes organizational conduct and organizational psychology (Grandey and Gabriel,2015). Grandey (2000) stated that emotional labor can negatively affect employees' task pleasure, and the task satisfaction has robust implications for attendance, turnover, sabotage, job overall performance, and the mental and bodily health of personnel (Miao et al., 2017).A variety of research have found that emotional Labour work required by using organizational norms can negatively have an effect on character well-being (Hülsheger and Schewe,2011).The end result of another study affords the assist for moderating effect of emotional intelligence on how employees' Deep Acting and Surface Acting apprehend clients' reactions that might have an effect on employees' Emotional Exhaustion and Job Satisfaction, and consequently, Turnover Intention (Young Hee Lee1, Suk Hyung Bryan Lee and Jong Yong Chung 2019).Since 1980s, the presence and manifestation of emotions in work life and the role of emotions in corporate success has been discussed increasingly (Secer,2005). The concept of emotional labor, which arose accordingly, was mentioned for the first time in 1983 inside 'The Managed Hearth' of Hoch child and was defined as the management of emotions that are expressed through face or body in return for a p rice, for anybody to be able to observe (Wharton, 2009).

Thereby, making sure that a certain emotional signal would be delivered to the other party through manners during the work was now considered to be among the necessities of many jobs, as a feature of the job role that is undertaken (Secer,2005). Especially in the service sector, or in health and education professions which necessitate human relations, as emotional capabilities gained importance (Savas,2012;Kaya & Tekin,2013), the concept of emotional

labor was defined to be a second duty that should be exercised along with basic tasks (Ozkan,2013), or the nameless duty that the workers should be performing while doing their work.

Emotional Labour Management

To Analyses the Dependent variable (ELM) this study refers to the degree of ease with which an employee manages emotional labour at workplace. In the Questionnaire scale 4 items adopted from Adelman (1995). Focal factor whether or no longer or now not emotional Labour work is a possibility of job stress evolved a measure of emotional labour work in a sample of employees employed in an career requiring a immoderate degree of emotional labor and explored how the kind of and amount of emotional labor are associated with employee reactions in their job. so this study adopted following aspects to measure ELM. First predominant influencing value is "Induce feelings" . It will produce an emotional state in employee; that leads to make the customers to feel the importance of the product in their life. And to make the customer to like and trust the brand. Because trust is playing a important role in buying. Then they'll unfold the word quickly to friends, thru social media, and on overview sites (Jenn Goddu 2021). This will actually fits in the view of employee also. The term "expressive behavior" refers to ease elements of conduct which seem motivational states. "expressive behavior" is used proper right here to cover emotional attitudes and moods, cognitive attitudes (interest, attention), activation states (arousal, fatigue), and extra-or-much less eternal attitudes which can be character attributes.(Bain 1859; Lipps 1905; Scheler 1913). In the way the term "worker expressive behavior" is refers to smile and behave in a friendly manner towards the customer. Customers have sure expectancies that ought to be met while buying a product. Expectancies are private visions of the outcome of an experience and can be positive or terrible. Those expectancies are based on a purchaser's perceptions. It is critical for agencies to comprehend that customers have different degrees of expectations. There are two simple degrees: number one expectancies, which might be a client's maximum simple requirements for an interplay, and secondary expectancies, which might be based totally on previous studies that function improvements to number one expectancies (Helen Jeske; Edith Chimusoro ;Anis Mahomed Karodia 2015). Based on this mentioned study "to conceal any negative feelings about the customer" is a vital task in emotional management. Precise customer service looks as if common experience for all employees.The average of these 4 item ratings is taken and The average values above or equal 2.5 is considered as ease in management of emotional labour and coded as '1'.The average values below 2.5 is considered as difficulty in management of emotional labour and coded as '0'. This study aims to check the factors which affect the employees' management of emotional labour.

Employee Attitude towards the Store

To Identify the emotional Labour of people working in mall, Employee attitude plays a vital role. Consistent with the perceived nature of the employment Relationship, Employee- organisation relationship (EOR) idea demonstrates that the connection among the agency and personnel involves a chain of perceived interactions that generate duties to reciprocate (Cropanzano and Mitchell, 2005).Some researches presents proof of the connection among perceived store image and selection making, even though the varieties of choice range significantly (fair cloth, et al., 2001; jin & kim,2003; osman,1993;ward,bitner & barnes,1992). Robust guide was discovered for the connection between shop image belief and both patronage preference (amirani & gates,1993;paulins & geistfeld,2003;thang & tan, 2003) and approach/avoidance behaviour. However, research indicated that in a few instances the relationship between keep picture perception and technique/avoidance behaviour became mediated by way of emotional Labour (Donovan &rossiter,1982; moye&giddings,2002; ward et al., 1992). Hence Hypothesis is framed as Follows

Employee Attitude towards the Store Positively Influence Emotional Labour Management

Employee Attitude towards the Store is refers to the set of emotions, beliefs, and behaviors that an employee has believes toward the store. To analyze Employee Attitude towards the Store scale adopted from Cook and Wall (1980).

Frank Sunil Justus and Subha

Job Benefits
In today's hiring field, Employees expect bundle of benefits. And also it is important for attracting and preserving top talent. Employment self assurance survey was conducted in Reviewing Platform called glassdoor (2015), about 60% of Employees report that remuneration and perks are a prime thing in thinking about whether to just accept a task offer. The survey additionally determined that 80% of personnel could pick extra Benifit over a pay increase. Google is famous for its over-the-top perks, which consist of lunches made by using a professional chef, biweekly chair massages, yoga training, and haircuts. (Kerry Jones , 2017)Without tremendous skills, no business method will be victorious. Without dedicated talent, no enterprise strategy will closing. Long past are the times even as a immense salary and more than one weeks of paid time without work were sufficient to draw and keep skills. Rising from the pandemic, personnel need more meaningful and greater holistic benefits (Rachel Ranosa 2021) Worker benefits are rewards that the organisation gives to personnel best for the truth that they are its employees. Normally, they may be not tied to employee overall performance. Sometimes but, they depend on repute of worker inside the organization, his merits and the time he has labored in the corporation. Worker blessings may be segmented into 3 simple groups (strenitzerová,2015.) advantages of a social nature (corporate pensions, existence insurance, enterprise loans and guarantees for loans, child care employees (nurseries and kindergartens), and many others..), blessings of work nature (meals, discount for company products to personnel, language tutor ,and many others..)They refer to the employees' perception of the monetary as well as non-monetary remuneration, gains and rewards they receive in their job. Hence Hypothesis is framed as Follows

Job Benefits has a significant positive role in Emotional Labour Management
Organizational Support
Perceived organizational support is a belief of an employee that the organisation values their contributions and cares about their well-being (eisenberger et al., 1986).After eisenbergeretal. Proposed the idea of perceived organizational support, after that scholars mainly focused on the development of size scale, the factors affecting perceived organizational aid, and the fine impact of perceived organizational aid on employees and corporations via empirical studies. The antecedent variables that affect perceived organizational guide can be summarized as three classes, such as organizational elements, person elements, courting among organisation or organizational dealers and personnel. Among them, the organizational factors encompass organizational fairness, working situations, organizational political behavior, organizational size, organizational cultures. Individual factors consist of values, nice or bad emotions, pre-hiring experience, paintings reputation and other variables." dating between employer or organizational marketers and employees include mental settlement, worker-company healthy, chief-member trade, control communication, leadership style and other variables. (Hochwarter,2003;Eisenberge & Stingl hamber,2016),It refers to an employee's perception that the organization values his or her work contributions and cares about the employee's well-being. Hence Hypothesis is framed as Follows

Organizational Support has a significant positive effect on Emotional Labour Management
Store Image
In summary, behavioral definition of shop loyalty is an inclination of clients to buy repetitively in a time frame and it can be operationally described and measured as purchase ratio as repetitive buy behavior (raj 1982), purchase frequency. By the usage of these definitions, it can be objectively measured and has a bonus of distinguishing shop loyalty for numerous shops. But it has limitations that researchers can effortlessly use subjective decisions and that it's miles tough to explain how the shop loyalty is formed and why it modifications. Store Image is Defined as, The concept of store image become used by means of Martineau (1958) for the primary time. He defined it as "a store described in customers' thoughts partially primarily based on practical attributes and partially based totally on mental attributes." he claimed that keep image consists of its characteristic attributes and it makes customers sense the store extraordinary from others. Useful attributes are assortment of commodities, layout, region, price value relation, and provider that purchasers can objectively examine with different shops. Mental attributes are elegance and luxuriousness that constitute special attributes of that keep It is the sum of impressions of the store in the minds of customers. Hence Hypothesis is Framed as Follows

Frank Sunil Justus and Subha

Store Image has a significant positive role on Emotional Labour Management
Emotional Intelligence
There are elements that resonate with management style, overall performance and behaviour, namely emotional intelligence (EI) or emotional quotient (EQ). The term emotional intelligence (EI) changed into first coined by means of mayer and salovey (1990) wherein they advised that ei changed into a intellectual technique in which formerly independent variables such as questioning and feeling paintings in partnership. George (2000) asserts that EI is the diploma wherein emotions are cognitively managed. Stein (2009) on the other hand defines EI because the ability to "tune in to the sector, study conditions and to connect to others while taking fee of your very own existence". Salovey and mayer (1990) at first defined emotional intelligence as social intelligence. This resonates with the capacity to analyse the emotions and feelings of one's self and of others and to utilise the knowledge to form individual's thinking and movements consequently. Income managers will often recruit income people structured upon a mess of different standards together with individual, personality, skills and intelligence (IQ). Those elements are frequently considered to be key characteristics in terms of supporting the recruitment choice of a sales character. According to cherniss (2000) IQ alone isn't always a superb predictor of job performance and this statement was in addition reinforced via hunter and hunter (1984) who contend that iq will handiest account for twenty-five percent of the variance in terms of a person's performance. It refers to the ability of an individual to perceive, control, and evaluate emotions. Consistent with cherniss (2000) the pace of change maintains to increase through the world of paintings wherein there are more expectations and needs positioned upon someone's cognitive, emotional resources and therefore those set of equipment turns into extra pertinent in these days dynamic operating surroundings. The Scale of Wong and Law's (2002) EI scale – specifically Self-emotion appraisal (SEA) and Others' emotion appraisal (OEA) items were adopted. Hence Hypothesis is framed as Follows

Emotional Intelligence Support is completely produce favour effect on Emotional Labour Management
Personal Values
A noted study by morgeson and Humphrey (2006), autonomy has a significant place in motivational work tactics. Further to being the most broadly studied activity characteristic, it's also the maximum influential (humphrey and morgeson,2008). Moreover, activity autonomy is the activity characteristic associated with innovative behavior ((Liu Et Al 2011 De Spiegelaere Et Al., 2014; Orth And Volmer, 2017), and it also appears to be related to Personal values. Thus, we concentrate on process autonomy in our take a look at.

We anticipate that an person can attempt to have extra independence at their job whilst it is congruent together with his/her Personal values. As Personal values have been verified to develop in the early levels of lifestyles after which be highly strong across time (vecchione et al.,2015, 2016;cieciuch et al., 2016), and as job autonomy is more likely to exchange in terms of the organizational context, the job itself, and the connection among the supervisor and the subordinate (hackman and oldham,1976, 1980), we deal with values as predictors of process Individually. Primarily based on schwartz's (1992) principle, we assume that employees may be extra or much less disposed toward seeking Individuality of their job based on the fundamental personal values they decide on. Someone can be tremendously inspired to have an opportunity to make choices and experience independent at work because it's miles of critical importance to him/her, at the same time as some other character may awareness on different attributes of the task and no longer strive for Individual due to the fact does not don't forget it to be vital for job. As referred to by means of sagiv and roccas (2017) The idea of basic Personal Values proposed by way of Schwartz,(1992) is presently considered to be the most complete and empirically grounded technique to human values (sagiv et al., 2011a; cieciuch,2013). Schwartz argued that values are "suited trans situational dreams, various in importance, that function guiding ideas within the existence of someone or different social entity" (schwartz,1994, p. 21). Values have motivational power by presenting route and emotional depth to movement and by using being received thru socialization, in the context of dominant organization values, as well as thru character studying (schwartz, 1994). The central assumption of the theory is that primary values shape a popular, round continuum and are organized in accordance with the inducement that they explicit. Relationships among motivations can be like minded, conflictual or inappropriate to one another (schwartz,1992). Due to its structure, the price continuum can be partitioned in

67227

distinctive manners (sagiv and roccas,2017). They refer to broad desirable goals that motivate people's actions and serve as guiding principles in their lives. So indigenously self created scaled used to prove the following hypotheses**.**

Personal Values influence in a positive way on Emotional Labour Management

RESEARCH METHODOLOGY

The Dependent Variable of the study is Emotional Labour Management (Binary variable). The study aimed to prove the relationship between Emotional Labour Management and Employee attitude towards store, Job Benefits, Organizational Support, Store Image, Emotional Intelligence, Personal Values, and Gender. In the survey Independent Variables and All metric variables measured on a 5-point Likert scale except gender. This study aimed to look out apparel stores in Chennai, one of the top metropolitan cities in India. The sample consisted of personnel operating in 3 retail formats. That means Small-scale apparel stores, electronics and domestic home equipment stores and cell phone shops. A total of 24 retail shops were selected based totally on their proprietor/supervisor's consent and criterion that the store assistants/employees at once interacted with clients to promote their merchandise. The sample comprised fifty seven percentage male and forty three percentage female employees between 24 to fifty eight years of age and their month-to-month earnings starting from rs. 4,000 to rs. 20,000. The self-document questionnaire changed into administered to all the front-line employees inside the decided on shops. Typical, 238 valid responses had been received which have been used for similarly analysis. The conceptual framework encapsulating the predictors of emotional labour management of consumer-facing employees is presented in Figure 1.

Analysis and Interpretation
Stage 1: Exploratory Factor Analysis
Objective - To test the grouping of the items into seven constructs hypothesized in the conceptual framework

Stage 2: Logistic Regression
Objective – To identify the significant predictors and its impact on emotional labour management of apparel store employees. In other words, logistic regression was performed to ascertain the effects of hypothesized variables on the likelihood that the employees find it easy to manage emotional labour.

The logistic regression results are presented below:
Estimation terminated at iteration number 6 because parameter estimates changed by less than .001.
The explained variation in the dependent variable i.e. emotional labour management is indicated by Cox & Snell R Square and Nagel kerke R Square values which are also referred as pseudo R^2 values. Note that these values can be interpreted in the same manner as R^2 values in multiple regressions, but with more caution. As presented in Table 3, we can conclude that 42.2 to 56.5 percent of variation in the dependent variable is explained by the predictor variables in the model. Table 4 presents the Hosmer and Leme show Test which is used to evaluate the model goodness-of-fit. The output returns a chi-square value and p-value where a significant p-value indicates poor model fit. Here, the p-value is 0.057 which is insignificant (>0.05) implying that the logistic model is a fairly good fit for the data. Logistic regression estimates the probability of an event occurring which in this case is the ease in managing emotional labour by the employees. The classification table above presents the classification accuracy of the model which is found to be 79.2 percent. In other words, the model is able to predict 79.2 percent of the cases correctly which is a fairly acceptable predictive power for a logistic model. The logistic regression output in Table 6 shows that six out of seven input variables emerged as significant predictors of emotional labour management of the employees since their p-values (Sig.) were below 0.05. Except personal values variable, the other measurement variables in the model i.e. employee attitude towards store, job benefits, organizational support, store image and emotional intelligence had a positive impact on emotional labour management, since the adjusted odds ratio i.e. Exp(B) for all variables were above 1.0. Hence, their confidence intervals are entirely above 1.0 which implies that an increase in these predictor variables increases the odds of the outcome i.e. improves the employees' ease of emotional labour

management at their job. Job benefits perceived by the employee was found to be most important predictor with the highest adjusted odds ratio of 6.734. This signifies that for every unit increase in perceived job benefits of the employees, there is 6.734 times higher odds of them able to easily manage emotional labour at their job. Employees' attitude towards the store was found to be the second impactful predictor with an odds ratio of 2.773 which denotes that for every unit increase in employees' attitude towards the store, there is 2.773 times more likelihood of them managing emotional labour with ease. Emotional intelligence of the employees was identified as the third significant predictor of emotional labour management with an odds ratio of 2.733. This implies that every unit increase in emotional intelligence of the employees translates to 2.733 times higher odds of them experiencing ease in managing emotional labour at their job. Gender was found to be the next important predictor of emotional labour management with an odds ratio of 2.543. This indicates that compared to male employees, female employees were 2.543 times more likely to easily managing emotional labour at their workplace. Organizational support and store image were the other variables with comparatively lower predictive effect indicated by odds ratio of 2.197 and 1.739 respectively. Thus, employees who have better organizational support and perceive superior store image are more likely to easily managing emotional labour at their job.

CONCLUSION AND RESEARCH IMPLICATIONS

This study explored the emotional labour management among customer-facing employees working in small retail stores in Chennai. While past research has primarily analysed emotional labour (EL) in terms of the degree of emotional work experienced and type of strategy used (surface acting and deep acting), this study is a one-of-its-kind to evaluate EL in terms of ease of its management. The study proposed and validated a new conceptual framework incorporating the various determinants of employees' ease of emotional labour management. The logistic regression analysis revealed that employees' perception of their job benefits, their positive attitude towards the store and emotional intelligence are the most important factors determining the ease of emotional labour management. Gender also played a significant role where female employees found it easier to manage emotional labour. Besides, organizational support and store image were also significant predictors of ELM. The study findings offer crucial research and managerial implications for various stakeholders such as academicians, retailers and human resource managers.

From the research/academic perspective, the study findings offer numerous theoretical implications. Job benefits was found to be the most significant predictor suggesting that monetary and non-monetary benefits perceived by employees not just affects their job satisfaction (validating Equity theory), but also improves their psychological motivation to manage emotional labour effectively. Employees' positive attitude towards the store found to be the second most significant predictor of emotional labour management validates the Herzberg's Two-Factor theory of Motivation. The validation of emotional intelligence–emotional labour management relationship corroborated Grandey's (2000) emotional regulation model and Job Demand-Resources theory. The finding that female employees in customer-facing roles more effectively manage emotional labour corroborate the theory that women excel at handling interpersonal aspects of emotional labour since they possess better empathetic accuracy than men (Vial & Cow gill, 2022). Organizational support emerging as a significant predictor of emotional labour management substantiated the Grandy's model and reciprocity principle based on Social Exchange theory. Thus, this study was able to validate some of existing theories and relationships in organizational behaviour as well as offer some new findings and insights as a value addition to the existing EL literature. In small-scale retailers, the employees who directly interact with customers to make sales have an emotionally laborious job which plays a crucial role in retailer's success. These employees directly responsible for sales require higher ELM (Justus & Ramesh,2009). Since employees' perception of job benefits, attitude towards store, organizational support and store image are the important predictors, the store officials must care for and invest appropriately in their human assets by providing training, incentives, encouragement and recognition for their hard work. Its only when the employees feel that they are genuinely cared for by their organization, they are emotionally involved and can effectively handle an emotionally laborious job. A worker has an obligation to express positive feelings towards the employer during the

work period. It is very important to make employees to understand the need to manage their emotions. The findings reiterate the importance of training effective emotion al labour management to employees. It is essential to recruit the right people for this job who are emotionally intelligent with good emotion regulation and social networking skills. The retail managers can employ EI tests during recruitment of new employees and training of existing employees to improve their EI. In addition, the employees should be offered optimal job benefits based on their role and performance since they have a huge impact on their emotional labour management and turnover intentions. In addition, the supervisor/owner should support their employees by providing necessary resources, help, motivation and recognition besides showing care and concern for their well-being. Employees function on the principle of reciprocity insinuating that only a healthy two-way employee-employer relationship with mutual understanding and benefits can thrive and sustain. The key to retailer success is to employ emotionally intelligent frontline employees and provide the right mix of resources, job benefits and supervisor support to help them manage EL effectively which in turn will improve their performance and longevity in the organization.

Limitations and Future Research Directions

This study performed the use of a small sample of employees operating in 24 small-scale retail shops in Chennai and the retailers were selected using convenient sampling technique. Hence, essential warning needs to be taken earlier than generalizing the results.   Only few variables were considered to prove the relationship between Emotional Labour Management .In fact, there can be numerous other factors influencing the ELM which can be used in other type of retail store employees. Future studies can focus on validating the conceptual framework using a bigger, numerous pattern. Researchers can also examine the emotional labour management of personnel running in other type of retail formats and inspect the differences. In addition, extra constructs inclusive of customer orientation, coping skills, coaching , mentoring, and Employee welfare can be integrated within the conceptual framework and examined. The employees' control of emotional labour can be verified with supervisor comments and sales facts from outlets.

ABSTRACT

The multiple deferred state sampling MDS (0,2) plan generation and selection using the zero-inflated Poisson model is presented as a new method in this research. Models are created at the risk of both the producer and the consumer for a predetermined acceptable and limited quality level. This provides a mechanism for choosing the ZIP multiple deferred state sampling MDS (0,2) based on various entry parameter combinations. Tables for figuring out the corresponding AQL and AOQL are also provided.

Keywords: Average Outgoing Quality Level (AOQL), Acceptable Quality Level (AQL). Zero-inflated Poisson distribution with Multiple Deferred State Sampling MDS (0,2) Plan.

INTRODUCTION

An essential tool for statistical quality control is acceptance sampling. Through inspection from the raw stage to the final stage, this tool is utilized to improve the product's quality. If the product is not properly inspected or tested, it could harm the brand's reputation on the international market. The demand for quality items will rise, which will also raise the company's profits when they are released onto the market following examination. As a result, industrial engineers are paying attention to sampling plans. The main goal of sampling inspection is to lower inspection costs while ensuring that the customer will be satisfied with a sufficient degree of quality on the products being inspected. Quality assurance includes the inspection of raw materials, semi-finished goods, and finished

67234

goods. Acceptance sampling is the common name for the process used when inspection is done with the intention of accepting or rejecting a product and is based on adherence to a standard. Sampling is frequently used in both government and business to regulate the quality of the transportation of raw materials, supplies, and finished goods. Worth am and Baker established the idea of the Multiple Dependent (or delayed) State (MDS) sampling plan (1976). The MDS sampling plan is a member of the class of conditional sampling techniques. In these producers, a lot's acceptance or rejection is based not only on the sample from that lot but also on the sample results from prior lots or from future lots, as well as the sample from that lot (in the case of deferred state sampling). The operational technique and characteristics of the attributes MDS sampling plan may be found in Worth am and Baker (1976) and this plan was researched further by Vaerst (1982).Tables for the selection of the multiple deferred state MDS-1 sampling plan using the Poisson distribution have been provided by Subramani and Govindaraju in 1990 for the stated acceptable and limiting quality levels. Suresh (1993) suggested methods for choosing a Multiple Deferred State Sampling plan of type MDS and MDS- 1 index while taking filter and incentive effects into account.

When dealing with data made up of numerous over-dispersed zeros, the Zero-Inflated Poisson (ZIP) distribution is the best choice. Several academic fields, including agriculture, epidemiology, econometrics, public health, process control, medicine, and manufacturing, have employed ZIP distribution. Bohning et al. (1999), Lambert (1992), and Yang et al. are a few publications that use ZIP distribution (2011). Sim and Lim discuss the creation of control charts using the ZIP distribution (2008). In McLachlan and Peel, several theoretical elements of ZIP distributions are discussed (2000). Latha and Palanisamy (2018) have detailed the procedure and table for design and selection of chain sampling Plan with Zero - Inflated Poisson Distribution. Loganathan and Shalini (2013) developed single sampling plans by characteristics under the condition of ZIP distribution. Method and tables for building and choosing a Modified Chain Sampling Plan with Zero-Inflated Poisson Distribution have been discussed by Latha and Palanisamy in 2019.

The Multiple Deferred State Sampling Plan (0,2)

The Multiple Deferred State Sampling Plan (0,2) is a statistical quality control method used in manufacturing and production processes to determine whether a batch of products meets certain quality standards. In this plan, the batch is divided into multiple subgroups or lots, and each subgroup is inspected using a sampling procedure. The (0,2) notation indicates that no defects are allowed in the first sample of each subgroup, and if one or more defects are found in the first sample, a second sample is taken. If two or more defects are found in the combined samples, the entire subgroup is rejected. This plan is called "deferred state" because the decision to accept or reject the subgroup is not made until the second sample is taken, if necessary. This allows for a more accurate assessment of the quality of the batch and reduces the likelihood of rejecting a subgroup that may meet the required standards.

Operating Procedure for MDS (0, 2) Plan

The MDS (C_1, C_2) stands for the Multiple Deferred State Sampling Plan with two sampling stages, where C_1 and C_2 are the acceptance numbers for the first and second sampling stages, respectively. Here is the operating procedure for this plan:

1. Divide the batch into subgroups or lots, and randomly select a sample from each subgroup for inspection. The sample size for both stages is fixed in advance.
2. In the first sampling stage, inspect the sample for any defects or non-conformities. If no defects are found, the subgroup is accepted. If one or more defects are found, proceed to the second stage.
3. In the second sampling stage, take a second sample of the same size as the first sample from the subgroup. Inspect this second sample for any defects or non-conformities.
4. If the combined number of defects found in the first and second samples is less than or equal to C_1, the subgroup is accepted. If the combined number of defects is greater than C_1 but less than or equal to C_2, the decision is deferred, and a third sample is taken.
5. In the third sampling stage, take a third sample of the same size as the first two samples from the subgroup. Inspect this third sample for any defects or non-conformities.

6. If the combined number of defects found in the first, second, and third samples is less than or equal to C_2, the subgroup is accepted. If the combined number of defects is greater than C_2, the subgroup is rejected.
7. Repeat this process for each subgroup or lot in the batch.

The MDS (C_1, C_2) plan provides a balance between the cost of inspecting many samples and the risk of accepting a batch with poor quality. By allowing for multiple sampling stages, this plan provides a more accurate assessment of the quality of the batch and reduces the likelihood of rejecting a subgroup that may meet the required standards.

Operating Procedure for MDS (0, 2) Plan
A multiple deferred state sampling plan of Worth am and Baker (1979) with $C_1 = 0$ and $C_2 = 2$ is operated as follows:
 ➢ From each lot, take a random sample of n units and observe the nonconforming units, d.
 ➢ If d = 0, accept the lot; if d > 1, reject the lot.
 ➢ If d = 1, accept the lot, provided the forthcoming m lots in succession are all accepted (previous m lots in case of multiple dependent state sampling).
 ➢ The OC function of the MDS (0.1) plan is given by the equation

Pa (p) = P_{C1} + [P_{C2}- P_{C1}] [P_{C1}]^m

where

P_{C1} = $\varphi + (1-\varphi)\,e^{-np}$,

P_{C2}= $\varphi + (1-\varphi)\,e^{-np}$) + $(1-\varphi)\,e^{-np}\, np$

Operating Characteristic function for Multiple Deferred Sampling MDS (0,2) Plan with ZIP Model
The OC function is defined as
$$P_a(p) = P[X \leq c]$$
Where "p" is the probability of fraction defective.

The numbers of defects are zero for many samples there may consider Zero – inflated Poisson probability distribution. The probability mass function of the ZIP (φ, λ) distribution is given by Lambert (1992) and McLachlam and peel (2000)
$$P\big(X = x\,\big|\varphi, \lambda\,\big) = f(x)\ + (1 - \varphi)\, P(X = x|\lambda)$$
where

$$f(x) = \begin{cases} 1, & if\ x = 0 \\ 0, & if\ x \neq 0 \end{cases}$$

and

$$P(X = x\,/\,np) = \frac{e^{-np}\ (np)^x}{x!}, \qquad \text{when x =0, 1, 2, …}$$

The probability mass function can also be expressed as

$$P(X = x\,|\varphi, np\,) = \begin{cases} \varphi + (1-\varphi)\,e^{-np} & when\quad x = 0 \\[2mm] (1-\varphi)\dfrac{e^{-np}\,(np)^x}{x!}, & when\quad x = 1,2,…,0 < \varphi < 1,\ \lambda > 0 \end{cases}$$

In this distribution, φ may be called as the mixing proportion. φ and $(n\,p)$ are the parameters of the ZIP distribution. According to McLachlan and Peel (2000), a Zip distribution is a special kind of mixture distribution.

The probability of acceptance for Multiple Deferred State Sampling MDS (0,1) Plan based on Zero-inflated Poisson distribution. $P_a(p) = (\varphi + (1-\varphi)\,e^{-np}\ ) + (1-\varphi)\,e^{-np}\, np)\ (\varphi + (1-\varphi)\,e^{-np}\ )^m$

Average Outgoing Quality (AOQ) for Multiple Deferred State Sampling MDS (0,1) Plan with ZIP Model

For the Multiple Deferred State Sampling Plan with Zero- inflated Poisson distribution. Average Outgoing Quality (AOQ) is approximately obtained by.

$$\text{AOQ} = p\, P_a\,(p)$$

Which implies

$$n\text{AOQ}= np\,(\varphi +(1-\varphi)\,e^{-np}\,)+(np)^2\,e^{-np}\,(1-\varphi)\,(\varphi +(1-\varphi)\,e^{-np}\,)^m$$

Differentiating AOQ with respect to *np* and equating to *0*, the value of Average Outgoing Quantity Limit (AOQL) can be obtained by solving the equation.

$$(\varphi +(1-\varphi)\,e^{-np}\,)\,(1-np)-m\,(np)^2\,(1-\varphi)^2\,e^{-2np}\,)\,(\varphi +(1-\varphi)\,e^{-np}\,)^{m-1}$$
$$+\,(np)\,e^{-np}\,(1-\varphi)\,(\varphi +(1-\varphi)\,e^{-np}\,)^m\,(2-np)\qquad =0$$

From Equation (5) the values of *n p (=n p$_m$)* can be calculated for different values of φ and *i*. Substituting *n p$_m$* in equation (4) n AOQL values are obtained.

OC curves for n = 800, m = 1,2,3 and φ = 0.0001 and constructed and given in Figure 1.

Figure 2: gives AOQ curves for MDS (0,1) with ZIP n = 800, m = 1,2,3 and φ = 0.0001.

Selection Procedure of Multiple Deferred State Sampling MDS (0,2) Plan with Zip Model

This section presents procedures and tables for the construction of Multiple Deferred State Sampling MDS (0,2) Plan with Zip Model and for selection of plans by specified properties. This section provides a method for the selection of Multiple Deferred State Sampling MDS (0,2) Plan with Zip Model based on different combinations of entry parameter, Tables for determining the associated AQL and AOQL are also given. Table 5.2.1 is constructed for the selection of Multiple Deferred State Sampling MDS (0,2) plan with ZIP given φ, the parameter of Zero inflated Poisson distribution and for the required AOQL. Such table can be extended for any value of φ and AOQL. For example when AOQL of 2.5 percentage $\varphi = 0.09$ the following (n, φ, m) are obtained as(18,1),(17,2),(16,3),(18,4), (18,5), (18,6), (18,7), (18,8) or (18,9) one of which may be chosen according to the requirement of inspection.

Selection Procedure Based on Multiple Deferred State Sampling MDS (0, 2)
Plan with ZIP Model Based On AOQL and AQL

Table 5.2.2 is constructed for the selection of ZIP Multiple Deferred State sampling MDS (0,2) plan for the given value of AOQL and AQL. For given values AQL and AOQL the ratio AOQL/AQL are obtained. The sample size n is obtained and hence a combination (φ,n, m) for given AOQL and AQL for the ZIP multiple deferred state sampling MDS (0,2) plan is obtained. For example, when AOQL =0.1 and AQL=0.05, the table values closer to the ratio AOQL/AQL=2 is obtained as 2.05076for which (φ .m) =(0.05,2) and 2.32171,for which (φ .m) = (0.09,2).Similarly more combination of (φ,m) can be formed as per the inspection.

Construction of AQL / AOQL Table

In Table 5.1.3, values of *np$_1$* have been calculated for p$_1$ defined as AQL such that P$_a$(p) = 0.95. The n AOQL values and the ratio AOQL/AQL are given. For example, given that AQL=0.15 percent and AOQL is 0.25 percent, then (AOQL/AQL) = 1.666. From table 5.1.3, the values closer to this is 1.66375 which corresponding to a value of φ = 0.05 with m = 1, np$_1$ = 0.1714. Hence np$_1$ / p$_1$ = 0.1714/ 0.0015 = 114.26, i.e., about 114. Thus, the Multiple Deferred State Sampling MDS (0,1) plan. Given AQL=0.05 percent and AOQL = 0.1 percent is given by n = 271, φ = 0.05 and m = 2.

In similar manner, Multiple Deferred State sampling MDS (0,2) plan can be constructed for a wide range of AQL and AOQL values as in the given table.

67237

CONCLUSION

The selection of the MDS (0,2) plan with ZIP for quality level is the major focus of our work in this article. Average Outgoing Quality Level (AOQL) mathematical modeling is completely derived and examined. It has been demonstrated that the ZIP distribution is beneficial for predicting the results of manufacturing processes that result in many defect-free goods. The multivariate ZIP model can be helpful to detect specific process equipment issues and to simultaneously minimize various sorts of defects when there are multiple types of faults. A ZIP distribution is the ideal probability distribution for the number of defects per unit in a well-monitored production process where non-defects are more common. These strategies give customers reassurance about the quality of the lot following the inspection or the quality of the incoming goods. So, one may suggest this kind of sample designs for improved quality control procedures. The quality control professionals will find this approach more helpful in meeting customer demands.

ABSTRACT

Sleep plays a vital role in maintaining psychological well-being in individuals. The objective of the study is to explore the impact of anxiety related to the COVID-19 pandemic on the quality of sleep. In this cross-sectional research, various standardized measures were implemented to evaluate COVID-19 anxiety and sleep quality among a sample of eighty-five young adults. Statistical analysis involved the use of t-tests and correlation techniques. The research employed a snowball sampling approach. The study aimed to uncover the association between COVID-19 anxiety and sleep quality. The findings indicate that COVID-19 anxiety has had an adverse effect on sleep quality, especially among women as compared to men. In addition, the research emphasizes mitigating various interventions such as mindfulness and adhering to daily routines as potential strategies to enhance sleep quality and alleviate COVID-19 anxiety.

Keywords: Sleep, Stress, health, sleep disorders, mental health

INTRODUCTION

COVID-19 (Corona virus disease)is an illness of the lungs that emerged in an outbreak in December 2019 and progressed to pose a global pandemic. Nowadays and worldwide, the focus has shifted to COVID-19and its consequences on mental health. Recognizing the anxiety level among adults and its effects on sleep quality is essential. World Health Organization (WHO), on January 30th, 2020, declared this disease a public health emergency and later declared it a pandemic. Sleep plays an integral role in health. Getting quality sleep is as essential as food and water. Sleep affects almost every body system, such as our mood, immune system, brain, heart, lungs, and ability to function efficiently. This investigation carries a positive outlook while studying variables like COVID-19 anxiety and sleep quality. Various types of stressors create problems in our day-to-day life. Daily problems or hassles

67245

Tisha Bhatia and Vineeth Kumar

are those things that make us irritated, dissatisfied, and distressed, which can cause mental strain and disrupt sleep. Some ways it can impact people's lives are feelings of isolation, nightmares, change in appetite, energy, fear, worry, sadness, more screen time, and worsening of psychological conditions. Mornin et al. (2020) state that ample sleep is necessary to maintain good physical health and proper immune system functioning. Sleep is a fundamental physiological and behavioral state characterized by unconsciousness, minimal physical activity, and reduced responsiveness to external stimuli. The state is connected to circadian rhythms and intricate internal processes. In humans, the hypothalamus contains the SCN (suprachiasmatic Nucleus)often referred to as the "biological clock". Which regulates the release of melatonin and plays a role in facilitating sleep. Changes in daily activity, jet lag, and sometimes sleep disorders can disrupt circadian rhythms (Blask, 2009; Matts and Sehgal,2016). However,COVID-19 anxiety is also one of the main reasons for disrupting the circadian rhythm. In addition, various physiological changes occur while we are asleep. A) Cardiovascular: Rapid changes occur in blood pressure and heart rate while we are asleep. These are determined by autonomic nervous system activity. For example, little blood pressure and heart rate increase as large body movements. B) Respiratory: While sleeping, the respiratory flow becomes faster and more erratic, especially in REM sleep. Hypoventilation leads to deficient ventilation, which causes a reduction in oxygen and an increase in carbon dioxide in NREM sleep. Not eating proper food and lack of physical exercise causes obesity problems, eventually leading to bigger problems like increased cholesterol, high blood pressure, and digestive problems. In addition, waking up late caused them to have low motivation for their work and feel lethargic the whole day. Furthermore, engagement in activities which is tiring makes their mood irritating. It can cause sleep problems. Dwelling negative thoughts can make them feel gloomy, hampering their sleep. Furthermore, it eventually disturbs their routine. Thus, this study focuses on problems, challenges, and how to cope and have a positive outlook in difficult times.

LITERATURE REVIEW

According to Carskadon and Dement (2011), "sleep is a reversible behavioral state of perceptual disengagement from, and unresponsiveness to, the environment." Sleep is considered essential for the proper functioning of the brain and body. For example, a night of proper sleep can help in reasoning. It is also said that sufficient sleep is required for appropriate psychological well-being and the working of cognitive processes. However ,the COVID-19outbreak has worsened sleep quality among adults. After the covid-19, it has been noticed that the sleeping hours were less than 8 hours among individuals. Sleep generally aids in regulating typical and steady physiological functions such as brain maturation, memory retention, and acquiring knowledge(Abel et al.,2013). Persistent disruption in circadian rhythm can lead to a higher risk of developing diseases such as cancer, diabetes, cardiovascular diseases, and viral infections. (Almeida and Maleheiro,2016; Kecklund And Axelsson,2016). The pressure to perform well in exams among students was straining for them, which caused academic stress among them since everything got shut down. Schools and colleges everything got shifted to online mode. Furthermore, some students' parents with poor economic conditions must suffer more since they cannot get their children electronic devices so that they can attend their classes online, which causes financial and mental stress among them. It can cause various sleep disturbances among adults and can cause poor sleep quality, leading to difficulty falling asleep, waking up frequently, waking up too early, and Un-refresh sleep. The most common disorder or dysfunction is insomnia, which can cause irritability, fatigue, difficulty tolerating stress, and mood disturbances.

Monroe and Simon(1991) reported that the diathesis-stress model could describe the effect of insomnia on depression and anxiety. Those individuals developed certain diseases, for example, anxiety or depression. In this case, the stress created by insomnia might provoke anxiety and depression. Following puberty, hormonal changes could also be one of the reasons that can cause sleep disturbances, which means excessive daytime sleepiness. It had been seen typically between fifteen to twenty-five years old. Then, they abruptly enter into REM sleep. Nightmares and night terrors are the other most common dysfunction that has mostly been reported. It may require treatment if it causes lots of problems getting enough sleep. The National Sleep Foundation (2009) defined that insufficient sleep duration among adolescents is less than eight hours per day. A progressive decline in sleep quality has been observed in

many adolescents worldwide. The reason for the sleep delay is the nighttime activities that keep them awake. With new technologies, caffeine intake leads to poor quality sleep among individuals. While sleeping, dreams play a significant role. People tend to have nightmares or night terrors when anxious or stressed. Dreams are story-like sequences. It can be organized, chaotic, vivid, or bizarre. Individuals tend to remember their dreams, while some do not the following day. Also, according to the study, it has been noticed that more individual often wakes up from REM sleep. Therefore, they are more likely to remember the dream. There are various ways to measure sleep, such as EEG and an electroencephalogram, which helps to measure the electrical activity in the brain. Muscle activity is measured by electromyography (EMG).Eye movements during sleep by electro-oculo graphy(EOG),Low motivation to do work, daytime sleepiness, and getting angry about petty things can seriously affect the usual living style of an individual. For this, coping strategies have been there in which the focus should be decreasing stress and overcoming the challenges affecting everyday life.(Proud foot et al. 2004) studied randomized control therapy on demographic variables and technology-based cognitive-behavioral therapy targets anxiety and depression within primary care settings. There are different ways to cope with stress and anxiety, which affects the quality of sleep, for instance taking pauses from consuming news content whether it's through watching, reading, or engaging with stories on social media. It can upset your mood and fill your mind with negative thoughts .Improving sleep hygiene means improving sleep habits, Escaping avoidance and accepting reality**,** establishing daily routines**,** taking care of your body by eating healthy food, doing a physical workout**,** self-control, controlling yourself from the habits that can cause problems**,** an dregulating your behaviors. Thus, the present investigation examined how COVID-19 anxiety and sleep quality are interrelated among young adults in India. Furthermore, it aimed to analyze potential variations in COVID-19 anxiety and sleep quality based on the gender of the youth in India.

METHODOLOGY

In this cross-sectional study, snowball sampling has been used. A total of 85 Indian adults comprising 32 males and 50 females, formed the sample. Some responses were eliminated because they were incomplete. The age range of the participants was 17- 29 years. Socio demographic information regarding age, gender, and occupational status was collected from the participants. The study employed the COVID-19 Pandemic Anxiety Scale (COVID-19PAS; Kumar et al., 2020) and Pittsburgh Sleep Quality Index (PSQI) to evaluate COVID-19 anxiety and sleep quality. Data collection was conducted through Google Forms. The PSQI, a self-assessment tool, that gauges subjective sleep quality has self-rated inquiries divided into seven categories: sleep latency, sleep disturbance, habitual sleep efficiency, sleep duration, use of sleep medication, and daytime dysfunction. The gathered data underwent analysis using SPSS 21. Descriptive, bi variate correlation and Independent sample t-tests were computed on the collected data. To assess the magnitude of correlations, Cohen's criteria(1988) were utilized, where a score of 0.50 indicates the large effect size, 0.30 denotes the moderate effect size, and 0.10 signifies the small effect size. Cronbach's alpha was computed to evaluate the reliability of scales.

RESULTS AND DISCUSSION

The primary aim of this study was to investigate the link between COVID-19 anxiety and the sleep quality of young adults in India. Additionally, we sought to assess gender-based variations in COVID-19 anxiety and sleep quality between males and females. Our analysis revealed a significant correlation between sleep quality and COVID-19 anxiety among young adults, as shown in Table 2. This correlation table underscores a noteworthy association between these variables (Cohen, 1988). Notably, higher sleep quality scores were indicative of poorer sleep quality. Fear demonstrated a moderate correlation with somatic concerns, implying that heightened fear is linked to increased anxiety about falling ill, which can disrupt daily functioning. Fear also displayed a strong association with pandemic-related anxiety, specifically COVID-19 anxiety, highlighting how fear has contributed significantly to anxiety surrounding the pandemic. However, fear exhibited only a low correlation with subjective sleep quality, sleep latency, habitual sleep efficiency, sleep disturbance, daytime dysfunction, and the overall Pittsburgh sleep quality index (PSQI). Fear did not substantially impact these components but did contribute to some sleep-related

issues. Fear exhibited a negative correlation with sleep medication and sleep duration. As fear levels rose, medication use decreased, and sleep duration shortened. Comparatively, somatic concerns showed a highly significant association with COVID-19 anxiety and sleep quality. This suggests that the fear of contracting a potential illness and constant worry about falling sick significantly increased COVID-19 anxiety and severely affected the sleep quality of young adults. On the other hand, somatic concerns moderately influenced subjective sleep quality, sleep latency, habitual sleep efficiency, sleep disturbance, and daytime dysfunction. Concerns related to falling ill affected various aspects of sleep but did not to an extent that severely impeded daily functioning. Somatic concerns had no impact on sleep medication or sleep duration.COVID-19 anxiety moderately correlated with subjective sleep quality, habitual sleep efficiency, sleep latency, sleep disturbance, daytime dysfunction, and the Pittsburgh Sleep Quality Index (PSQI). This indicates that COVID-19 anxiety affected various facets of sleep and overall sleep quality, resulting in poorer sleep among individuals and impacting their overall well-being and daytime productivity.COVID-19 anxiety was also negatively associated with sleep duration and medication intake. As anxiety levels increased, sleep duration decreased, and reliance on sleep medication decreased. A low correlation was observed between daytime dysfunction and habitual sleep efficiency, suggesting that COVID-19 anxiety influenced these aspects but did not lead to significantly longer nighttime wakefulness while in bed.

Table 3 presented gender differences between males and females regarding anxiety and pandemic-related sleep quality. The results revealed significant disparities in fear, somatic concerns, the COVID-19 Anxiety Scale, subjective sleep quality, sleep duration, sleep disturbance, and daytime dysfunction. However, no substantial distinctions were observed between men and women in terms of sleep latency, habitual sleep efficiency, sleep medication, and sleep quality index. The findings also indicated that females exhibited higher levels of COVID-19 anxiety and poorer sleep quality compared to males. Several factors could contribute to this observation, including the fact that females typically spend more time at home, potentially leading to anxiety about the future. This research offers beneficial insights and approaches into the COVID-19 pandemic-related anxiety among young adults to address them effectively, This research raises awareness about holistic health, encompassing physical, psychological, and emotional well-being. It also serves as a guide for promoting a positive mindset, encouraging individuals to approach life challenges with optimism even during difficult times. It facilitates individuals to make productive use of their time by engaging in meaningful activities and maximizing their potential.

CONCLUSION

Based on the examination of the study of COVID-19 anxiety and sleep quality, we can deduce that a considerable association exists between COVID-19 anxiety and an individual's sleep quality. COVID-19 anxiety has profound effects on sleep quality among individuals, which has disrupted the sleep cycle and inculcated bad habits among individuals. The pandemic gave rise to stress, uncertainties, and worries about the future, which perniciously affected the quality of sleep among individuals. It has been observed that females experience higher levels of COVID-19 anxiety than males, resulting in significant disturbances in females. This research provides proper insights into the difficulties individuals face and recommends coping strategies. It accentuates the importance of health and being physically, psychologically, and emotionally fit. The findings encourage individuals to maintain a positive outlook, even in tough times, emphasizing mental and emotional strength, Moreover, it enables mental health professionals to develop strategies for addressing stress and anxiety during crises like pandemics.

ABSTRACT

Herbal remedies are an essential component of many primary healthcare systems across the globe. However, as these remedies become more prevalent, negative side effects and interactions with other drugs become more common, leading to increased regulatory measures. The specific laws governing the production and distribution of herbal products vary between countries, with different classifications such as functional foods, dietary supplements, and traditional medicines. Each country has its own unique set of regulations for traditional and herbal remedies. Establishing a standardized The European pharma sector, medical professionals, and patients all benefit from a robust herbal medicine market. To coordinate the manufacture and distribution of traditional herbal remedies in the European market, The Committee for Herbal Medicinal Products(HMPC) was formed. Directive 2004/24/EC, issued by the European Parliament and the Council of Europe in the year 2004, serves as the future legal basis for the therapeutic application of medicinal plants in Europe. By this Directive, all herbal medicines that are made commercially accessible must be recognized by the national regulatory agencies of every European nation and adhere to a set of accepted safety and efficacy standards.

Keywords: Herbal, Medicinal products, Traditional Medicine, European Union

INTRODUCTION

Herbal remedies have an extended history and have been utilized for decades throughout Europe. The desire to capitalize on the knowledge of traditional treatment systems has reawakened interest in herbal medicines, notably in Europe, wherein herbal products have been included in so-called "alternative," "complementary," or "integrative" medical practices. Despite several advances in technology in the manufacture of synthetic pharmaceuticals, interest in natural remedies is on the rise in Europe right now. According to statistics from the WHO, 80% of the population prefers herbal medications to treat their medical issues.(1)"Plant-derived goods or substances having medicinal properties or additional benefits for human health" are considered herbal remedies, which contain either raw material or processed ingredients from one or more plants". During a particular point, people have utilized plants to cure and safeguard themselves against different ailments. However, with the advancement of science, the utilization of Herbal Medicines (HMs) has become more widespread. (2) The considerable experience of both practitioners and patients throughout time (entire historical timeline) may be used to explain why herbal treatments have become so popular. Additionally, these medicines are generally considered to be safe for use. Each country has its regulations and laws regarding traditional and herbal medicines. Practitioners of traditional medicine around the world widely use herbal medicines due to their established efficacy. Herbal products are the most widely used kind of traditional medicine in Western Europe, according to the WHO.(3)The European Medicines Agency's Committee for Herbal Medicinal Products (HMPC) sets criteria for quality, non-clinical inquiries, clinical effectiveness, and safety. The European Union recently established legislation designating plant-based goods as medications, and other member states now accept those that meet quality standards and have been recognized by a particular member state.(4)The use of natural medicinal products has been crucial in meeting the basic healthcare needs of populations. Herbal medicines have been authorized in Europe under one of the two directives, "well-established use," or "traditional herbal medicinal products," both of which have stringent quality- and safety-related standards.(5)The well-established usage method is a streamlined registering process for herbal medical products that have been continuously in use for at least ten years, with at least five of those years spent in the EU.(6)"Traditional herbal medicinal products," enacted in 2004, enable a corporation to prove that the medicinal product has been in use for a minimum of 30 years inside the EU, or 15 years between the EU and 30 years across the EU.(7)

Herbal Medicine
Herbal medicine, also known as herbalism or phytotherapy, is a traditional medicinal practice that involves using plants and products produced by plants to mitigate various health conditions and promote overall well-being. Humans have relied on herbs for healing purposes for thousands of years, dating back to ancient civilizations. The use of different parts of plants such as leaves, flowers, stems, roots, and seeds is common in herbal medicine, as they contain various chemical compounds with potential therapeutic effects, including alkaloids, flavonoids, essential oils, tannins, and other bioactive substances. The combination of these compounds can have a synergistic effect and contribute to the plant's medicinal properties. (8,9)

History of Herbals in Europe:
Herbalism has a lengthy history in Europe, with the first mention of it happening in the first century BC in Western Europe. Bay leaf and rosemary were included in a list of savory and sacred plants used in cooking and on special occasions by the Greeks and Romans, who built on the Egyptians' usage of herbs. (10).

To heal the sick, monks in European monasteries throughout the Dark Ages copied herbal writings, maintained herb gardens, and employed herbal treatments. Because the primary purpose of the plant was as a remedy, knowledge of medieval botany was intimately tied to medical knowledge. Herbals were organized according to the names of the plants, distinguishing characteristics, medicinal plant sections, therapeutic powers, and in some cases, preparation and instruction for use. Dioscorides, a Greek physician and pharmacologist who flourished between 40 and 90 A.D., generated the first study of herbal medicine that was accepted as a medical norm in the European tradition. European herbals saw innovation and diversification during the Modern Age and Renaissance, moving away from

Gunaseelan *et al.,*

being merely conventional model adaptations and towards relying more on direct observation. The advent of recent advances in the field of chemistry the study of toxicology and pharmacology reduced the medicinal efficacy of classical herbals in the latter part of the seventeenth century, and Florasystematic accounts of the plants found growing in a particular areareplaced herbs with accurate botanical terms, classifications, and representations. The EU has created rules for herbal medical goods to ensure their security and efficacy even though they have remained a significant component of healthcare in Europe.(12,13)

Challenges in Ensuring Consistency and Safety of Herbal-Based Medicines:
An additional concern that remains uncertain is the limited understanding of the composition of herbal-based medicines. Herbs are natural products, and as such, their chemical composition can differ based on several variables, including the botanical species, the portion of the plant utilized (such as a seed, flower, root, or leaf), storage conditions, exposure to sunlight and humidity, type of soil, harvesting season, and geographic location. Despite being standardized for high pharmaceutical quality, commercial goods that contain herbs might fluctuate from batch to batch in their composition and quantities of chemical ingredients.(14) Even the same manufacturer may make products over time that contain various substances. Due to this heterogeneity, there may be considerable variations in pharmacological efficacy, including problems with pharmacodynamic and pharmacokinetic drug metabolism. Therefore, it is important to ensure that there is reliable and consistent information on the composition of herbal-based treatments to avoid potential health risks.(15)

Effectiveness and Safety of a Traditional Herbal Remedy
To assess traditional herbal treatments' Quality, Effectiveness, and Safety, it is important to answer several basic questions.
1.   Is it necessary to determine which specific treatment should be studied?
2.   It must be determined whether the treatment can be studied using modern scientific protocols.
3.   Is it important to consider whether it is scientifically appropriate to directly export herbal medicine from one country to a different country?

Many aspects can impact the result of treatment(traditional),both in the laboratory and the clinic. These include the knowledge, skills, and beliefs of the sponsors, as well as the patient's attitudes towards the treatment .Cultural variations in the acceptance of the treatment and its compliance, as well as the patient-physician relationship and access to the other therapy, are also important considerations. In the era of globalization, assessing the transferability of herbal medicine treatment is not the primary objective of clinical research. Instead, effectiveness and safety should be assessed by accepted clinical medical practices.(16)

Establishment of Regulatory Standards for Herbal Medicines
The declaration of Alma-Ata was the earliest recognition of herbal remedy's importance and use in basic healthcare on a worldwide scale. It states, "Primary medical treatment relies on medical professionals, including nurses, doctors, midwives and other assistants, and community service providers as appropriate, as well as conventional healers as needed".(17)Lack of strong regulations for safety evaluation, effectiveness, monitoring the quality, and understanding of traditional medicine/complementary and alternative medicine (TM/CAM) and ineffective quality control are major issues found in various regulatory systems. Plant-based products may be categorized differently under different regulatory systems, including food, functional food, supplements, or herbal remedies. Herbal medications consist of active ingredients derived from plant parts, other materials of plants, or their mixtures, while the European Medicines Agency (EMEA) defines herbal medicines as unprocessed plants,plant parts, fungi, lichen, algae, and exudates.(18) European Directive 2004/24/EC (Major legislation or Guidance documents)-The EU's legal framework for the marketing and sale of traditional herbal medicinal products is set down in European Directive 2004/24/EC, also referred to as the Traditional Herbal Medicinal Products Directive. The regulation strives to guarantee the effectiveness, security, and purity of such items while permitting their ongoing use based on historical usage.(19) The term *"herbal drug preparations"* refers to herbal medications that have undergone the extraction process, the process of distillation fractionation, cleansing, concentration, or fermentation, products, like retrieved juice, tinctures, essential oils, expressed juice, or processing exudates, can be produced or processed traditional

medications. The unregulated and growing market for herbal medicinal products is leading to safety issues due to these inconsistencies in regulation and quality control.(20)

Formation/Creating EU Committee for Herbal Medicines
The HMPC was created in Europe for the European Medicines Agency in September 2004 in London. This Committee was established to harmonize the manufacture & trade of the traditional herbal remedy in the European market. The HMPC committed to issue or publish the monographs and guidelines related to" remedies derived from herbs and plants for medicinal purposes.".(21) The HMPC comprises 33 members out of which 28 members represent the EU and one each from Norway & Iceland (EEA-EFTA states). The remaining five members of HMPC represent different domains of science. The Herbal Medicinal Product(HMP) functions in collaboration with "The European Directorate for the Quality of Medicines & HealthCare." (EDQM)and various scientific authorities in Europe and around the world. The scientific experts of the European Commission, EU candidates such as Montenegro, Serbia, Albania, Bosnia, FYROM, Herzegovina, Kosovo Turkey, and EDQM take part in different meetings of HMPs as official observers. On 26 April 2007, the French regulation (Ordinance no. 2007613) implemented the Directive 2004/24 which demonstrated that the HMPC was mainly responsible for the evaluation, registration & authorization for the herbal products. The French Directive 2004/24 further amended the law in Directive 2001/83/EC, which allows the marketing of various therapeutic products only after regulatory parameters concerned with quality, safety, and efficacy.(22)

European Regulations and Guidelines
By European Directive 2001/83/EC, the effectiveness, quality, and safety results of certain assessments, and experimental findings are taken into account when issuing marketing authorization for herbal medical products. The Directive 2001/83/EC specifies standards for conventional herbal medicine, a list of commonly used herbal ingredients, herbal product monographs, and requirements for a streamlined registration procedure.(23)The HMPC, a branch of EMA, was created concerning EU Regulation No 726/2004 and European Directive 2004/24/EC (2004, Sep). The majority of herbal product manufacturers experienced multiple obstacles while attempting to comply with European Directive 2004/24/EC's simplification of the registration process while also meeting the standards of Directive 2001/83/EC for efficacy in specific. (24)

To overcome such difficulties
The "Traditional Herbal Medicinal Products Directive" (THMPD); 2004/24/EC) is Traditional Herbal Medicinal Products Directive is an important component of the law governing produced products made from herbs, was established by the EU in 2004. A preliminary transition phase existed, and it concluded across the EU in 2014. The THMPD imposed strict rules on the importation and sale of commercially manufactured herbal medicine products and enforced the registration of all such items in one of the three categories. They can first be registered with a Product Licence by following the same legal processes as medicines. (25)This demands pharmacokinetic data from research studies that indicate effectiveness, which is practically impossible for herbal medicines that frequently comprise a lot of components. Second, when there have been at least ten years of established use in the EU with recognized efficacy and a tolerated safety profile, the Well Established Use regulation may be used. A different method for registering items is the Traditional Use Registration (TUR) process. The prerequisites for a TUR include verification of:

- Conventional use for a minimum of three decades, of which 15 years must be spent in the EU, for the indicated indications(23)
- The ingredients' quality satisfies European requirements
- An assessment of the product's safety conducted by a registered medical professional, chemist, "scientifically qualified" expert (such as a toxicologist), or herbalist who belongs to a professional organization.
- TUR materials must be marked or labeled with the phrases "A traditional herbal medicinal product" and "based on traditional use only" from beginning to end. A thorough Health Information Leaflet must be provided.

A herbalist has been permitted by UK law to meet with specific patients, make diagnoses, and produce herbal remedies on their premises, provided that they do not contain any forbidden or restricted components. It falls under

the "herbalist exemption" of The Human Medicine Regulations 2012, Regulation 3. This remains the same regardless of training or prior work experience, and the THMPD. (26)

Quality, Safety, Effectiveness, and Post-Sale Monitoring For Herbal Products in the EU
Quality Requirements
Unlike conventional medicines, which are usually single biological or chemical entities, herbal drugs consist of blended composites containing multiple ingredients. These constituents are often poorly understood, and standardization can be difficult due to the unknown active principles responsible for the medicinal effects. Additionally, the variability of plant constituents can be influenced by environmental conditions and agricultural practices. As a result, quality requirements for herbal medicines can be more challenging to establish and maintain compared to conventional medicines.(27)

Herbal Medicinal Products(HMP)
Herbal products should meet the same pharmaceutical quality requirements as other therapeutic products, adhering to rules for excellent industrial practices, appropriate farming and collecting practices, etc. To confirm safety, quality, and efficacy the initial application for an HMP should include The above-mentioned requirements are necessary to maintain the quality and safety of HMPs throughout their manufacturing process. Moreover, the application for the finished herbal medicinal product should also include a description of the components used to produce the therapeutic product, controls for the finished product's uniformity and the accuracy of the methods of analysis used to assess the product's quality, and stability controls to ensure the product's shelf life. To obtain a comprehensive list of requirements for producing herbal medicinal products, it is essential to refer to the Directive 2003/63/EC Directive and additional guidelines issued by the EMA. These guidelines provide detailed information on the production, quality, and herbal medicinal products safety and are essential for confirming that these products meet the necessary standards for human use.(28)

Safety and Efficacy
There is often a range of evidence available for herbal medicines/products, which may be limited. Furthermore, information about these products is typically assessed from varying perspectives and filtered through differing opinions based on experimental or conventional practice with different types of general medicines in different countries. Conventional toxicological and pharmacological studies or clinical trial findings are not necessarily necessary for the traditional utilization of natural medicinal products due to their extensive history of usage, except for genotoxicity. Although some herbal medicines can undergo rigorous clinical trials, the current regulatory framework does not incentivize manufacturers to do so. As a result, there is an inadequate of reliable information about the health risks of many herbal medications, proposing problems regarding assessment of their effectiveness based on evidence-based medicine criteria.(29) Even though many individuals believe that medicines made from herbs are safe because of their origins in nature and long heritage of usage, well-controlled clinical studies and reports of cases have demonstrated that they can have undesirable side effects. Herbal medicines should be used with caution in certain patient populations, such as those with HIV-AIDS, pregnant or breastfeeding women, children, and the elderly, as well as when used in combination with conventional medicines. Careful consideration is necessary in these situations. The EU herbal monographs offer all the necessary details for using medications that contain herbal ingredients or mixtures. This information is based on nonclinical and scientific information, historic use, and experience both inside the EU and, if accessible, elsewhere within it. The two sections of the monographs are well-established usage and conventional use. The monograph is employed to develop the necessary details about the product, such as the packaging leaflets and the summary of product features.(30) The applications for established herbal remedies must follow standard clinical conditions requiring a medical assessment by 2004/24/EC(Directive). In other words, herbal medicinal products can only indicate light signs that are consistent with their conventional usage. Therefore, indications for THMPs are restricted to self-medication and do not require medical intervention. Any labeling, leaflet, and Advertisements for these goods have to include a specific statement: THMP), absolutely based on a long-standing usage, for use in the indicated application". Only Over-the-counter (OTC)usage is permitted for THMPs. Advertisement regarding medical products is prohibited from stating their effectiveness or

safety is primarily attributable to the fact that they are natural substances under Article 90(h) of Directive 2001/83/EC.(31)

Post-market Surveillance
As many herbal products lack complete testing for their effects and risks, pharmacovigilance is crucial for identifying any adverse reactions. HMP must follow EU regulations for continuous monitoring and pharmacovigilance to ensure safety concerns are identified and addressed. However, monitoring the safety of HMPs presents challenges due to their unique characteristics and regulation compared to conventional medicines, requiring adaptation of existing post-market monitoring methods. The primary technique to determine safety signals in connection with herbal medications is spontaneous reporting. Adverse drug reaction reports are collected and analyzed using statistical methods to identify disproportionate reporting rates. The most extensive collection of ADR reports exists at the WHO's Collaborating Centre for Monitor Drug Safety, and EudraVigilance is the technology that is employed in the EU to manage safety information. The data gathered is published in the EU databases of assumed adverse drug response reports. An accepted technique for assessing safety is prescription event monitoring, but it has limited use for herbal medicines due to their infrequent prescription. Case-control and cohort investigations are a few examples of pharmaco epidemiological techniques that are used to evaluate the hypothesis that is being formed after identifying safety signals, although these techniques are not utilized for herbal medications. Lack of Standardization: Herbal medicines are derived from natural sources, and their chemical composition can vary significantly due to factors such as plant species, growing conditions, and preparation methods. This lack of standardization makes it challenging to conduct consistent and reliable pharmacy oepidemiological studies on herbal products.(32) Manufacturers are obligated to submit Periodic Safety Update Reports(PSUR)to appropriate agencies for each authorized medicine as part of their drug surveillance duties. These reports include an assessment of the benefit-risk balance and an update on the product's global safety experience. However, PSURs aren't often required for low-risk or outdated medications, such as THMPs and medications with an extended duration of usage. Rather, PSURs are limited to providing upon request or when the marketing authorization contains a condition.(33)

Introducing Natural/Herbal Medications to the European Market
Organizations must comply with national procedures that are observed by National Competent Agencies to launch herbal/traditional medicinal goods to the EU Member States' market. Three primary regulatory channels may be utilized to sell herbal health goods in EU member countries(21)

Application Requirements
The application for traditional medicine includes:
a. Name and permanent address of the producer(manufacturer).
b. Name of the drug.
c. Information on all of the pharmaceutical product's components, especially qualitatively and quantitatively.
d. Assessment of the possible environmental hazards associated with the medicinal product.
e. Explanation of the production process.
f. Intended therapeutic uses, situations where usage is not recommended, and side effects.
g. Dosage instructions, form of medication, how it's administered, and the estimated lifespan.
h. Justification regarding any necessary safety precautions or storage conditions to storethe product.
i. Explanation of the quality control techniques utilized by the manufacturer.
j. A brief overview of the product's characteristics.
k. Documentation demonstrating that the manufacturer has the authorization to make pharmaceuticals in the country where they operate.(34,35)

Registration Requirements of Herbals in Europe
The EMA includes the HMPC, which provides authoritative assessments based on herbs and remedies, accompanied by instructions on their suggested applications and secure use requirements. This provides a clear reference point for

Gunaseelan *et al.,*

enterprises and national competent authorities when drafting an authorization to market or registration proposal for herbal medicines in the EU's member countries being evaluated. The main functions of HMPC include

- The HMPC is responsible for developing EU monographs that outline the acknowledged therapeutic benefits and acceptable dosage levels for natural medicines and preparations of herbal medicine.
- The Herbal Medicines and Healthcare Product Regulatory Administration of the European Union created the Traditional Herbal Medicines Registration Scheme (THMRS), which lists plant-based ingredients, mixtures, and formulations that can be added to traditional herbal medications. To make the process for registering traditional herbal medical items simpler,2001/83/EC amended Directive 2004/24/EC to implement these rules. The primary aim of these guidelines is to safeguard the general population's health while advancing the sale of herbal medications. The active ingredients, herbal substances, herbal preparations, or a mixture of both might be found in traditional herbal medicines. (19)

Simplified Registration Procedure
Directive 2004/24/EC (the Herbal Directive) developed a streamlined registration process in 2004 for traditional herbal medicines that have a long history of medical use (at least 30 years, including 15 in the EU) but do not meet the criteria for "well-established use" required for marketing permission. The streamlined procedure for registration seeks to safeguard the free circulation of herbal medicines across the EU and promote health for everyone.(36,37)

Safety and Quality Standards
Traditional herbal remedies must adhere to the safety and quality criteria as fully licensed pharmaceuticals to get Traditional Herbal Registration (THR).(38)

Scientific Evidence
The EU wants comprehensive scientific evidence to assure the safety and efficacy of all pharmaceuticals, including herbal therapies. There should be documented scientific research on the acknowledged safety and effectiveness of traditional herbal medicines.(36)

Traditional Medicinal Use: For natural medical goods to be registered, proof of at least 15 years of traditional medicines use in the member states of the EU and that all have developed pharmacovigilance programs is required.

Manufacturing and Quality: Requests for conventional herbal medicines must meet the same criteria as those for marketing authorizations. The availability of contemporary science-based public summaries in the European Pharmacopoeia and their counterparts generated by the pharmaceutical sector will influence the efficacy of herbal ingredients as well as medicinal products.(39)

Pharmacovigilance Requirements
Adverse Event Reporting
Marketing Authorization Holders (MAHs) of herbal drugs are obligated to set up procedures for gathering and evaluating data on adverse events (unwanted effects) associated with the drugs they sell. These adverse occurrences might include both known and undiscovered adverse reactions, as well as any additional information linked to safety.

Timely Reporting
Adverse incidents must be informed to the proper organizations within certain timeframes. The intensity of the occurrence determines the timeliness of reporting. Serious adverse reactions, particularly those that result in mortality or a life-threatening scenario, must be reported as soon as possible.(40)

Risk Management Plans (RMPs)
An RMP may be necessary in some circumstances for herbal medications. A Risk Management Plan (RMP) includes methods for determining, characterizing, and managing known and prospective hazards connected with herbal medicine. It contains strategies to reduce those dangers.(41)

Marketing Authorization

The herbal products must have marketing authorization approval before being introduced into the market. Based on the application there are 4 pathways for applying a marketing authorization within the EU described in Figure: 2

Centralised Procedure

For herbal medical goods that are designed to be sold and promoted throughout all EU member states as well as in Iceland, Liechtenstein, and Norway, the Centralized Procedure in theEU is a legal means to receive marketing approval. The European Medicines Agency (EMA) is in charge of coordinating the Centralized Procedure. The applicant makes a single submission to the EMA for herbal products seeking clearance via the Centralized Procedure. The application is assessed by the EMA together with data regarding the effectiveness, security, and purity of the herbal product. The EMA issues a centralized marketing authorization that is valid in all of the nations that participate if the herbal product complies with the essential requirements. (44)

Decentralized Procedure

The Decentralized Procedure for herbal remedies is comparable to that for traditional pharmaceuticals. When a candidate wishes to concurrently sell a herbal remedy in many EU member states, it is employed. The application is evaluated first by the "Reference Member State" (RMS), which is one member state. The other "Concerned Member States" (CMS) receive a draft assessment report that was prepared by the RMS. The CMSs are given the chance to voice any concerns or complaints. The RMS gives a joint marketing authorization, allowing the herbal product to be advertised in all of the contributing member states, if there are no complaints or if any objections are overruled.(45)

Mutual Recognition Procedure

Acquiring marketing permission for herbal goods within the EU can also be done through the Mutual Recognition Procedure (MRP). The MRP enables an applicant to request recognition of that authorization in other member states (the "Concerned Member States" or CMS) if a herbal remedy has already received permission in one EU member state (the "Reference Member State" or RMS).The RMS conducts an initial evaluation after receiving the application from the applicant. After receiving permission from the RMS, the applicant may utilize the MRP to ask the CMSs to recognize the RMS's judgment. If the CMSs concur with the RMS's judgment, they issue the herbal product their national marketing authorizations, allowing it to be promoted in their respective nations.(46)

National Procedure

The simplest method for gaining marketing authorization in each EU member state is the National Procedure for herbal goods. To commercialize their herbal product, the applicant applies directly to the national competent authorities of that nation. The national authority assesses the request by its specific rules and specifications before approving or rejecting marketing licenses for just that particular nation. Herbal goods designed for marketing only inside one EU member state are subject to the National Procedure. It's vital to remember that due to differing international laws and standards, the particular processes and specifications for herbal product certification might change in different nations and areas outside the EU. To guarantee that their products fulfill consumer quality, efficacy, and safety criteria, producers and sponsors of herbal remedies must adhere to every regulation and law that applies.(43,47,48)

Challenges

The Difficulties with Herbal Medicines

One of the main difficulties is to impartially evaluate contradictory information from toxicology, epidemiology, and other sources, as well as ensuring the authenticity of the botanical substances employed.

The following primary concerns still need to be addressed:

- Communicating uncertainties.
- Providing comprehensive documentation of pharmacology, toxicity, and clinical aspects.
- Maintaining pharmacovigilance.
- Investigating the mechanisms behind the efficacy of harmful additives.

- Assessing potential drug interactions.
- Addressing limitations related to available participants and clinical trial constraints.
- Implementing standardization measures.
- Conducting thorough safety and efficacy evaluations. (49)

Issues with the Regulatory Status of Herbal Medicines

A regulatory structure for historic herbal medical goods in the EU was intended by the THMPD, which went into force in 2004. The cumbersome and expensive nature of its execution, however, has drawn criticism from small producers of conventional herbal treatments.(50) Complexity of Registration Procedure: Registering herbal medications may be a lengthy and costly procedure. For traditional herbal treatments that have an extensive record of safe usage but lack comprehensive clinical trial evidence, meeting the demands for safety and effectiveness data might be difficult. Lack of Standardization: Because medicinal products are derived from natural sources, their chemical structure might vary according to factors such as plant species, growth circumstances, and preparation techniques. Because of this lack of uniformity, it is difficult to apply similar regulatory standards across various items. Mutual Recognition Procedure (MRP): The MRP permits herbal medical products authorized in one EU member country to be accepted and acknowledged in other EU member countries. Variations in the interpretation of regulations by various member states, on the other hand, might cause delays and discrepancies in the authorization process.(51)

Challenges in Evaluation of the Safety and Efficacy

It is undoubtedly that the standards, research procedures, benchmarks, and strategies required to assess the safety as well as herbal medications' effectiveness are considerably greater than what is needed for conventional or standard drugs. There may be several hundred natural components in a solo herbal remedy, and there might be much more in a combination of herbal remedies. Herbs can interact with one another in ways that either strengthen or weaken the therapeutic benefits they have on the body. Combining specific herbs might occasionally have undesirable side effects or lessen the efficiency of the treatment. Analyzing a single essential element in these kinds of situations may be problematic, particularly if the herbal product is a blend of two or more plants.(52)

CONCLUSION

Herbal products play a significant role in human life which are derived from natural sources. The legal framework and utilization of herbal drug products differ greatly from country to country, resulting in challenges for their unrestricted distribution. However, Rules and regulations applicable to medications made from herbs in Europe are among the most thorough and comprehensive worldwide. There are currently five primary regulatory pathways available for manufacturers to market herbal medications or herbal medicinal productsin Europe. To ensure their quality, safety, and effectiveness, herbal healthcare products are subject to regulations within the European Union's rules and regulations for pharmaceuticals. Due to the distinctive characteristics of these products, a simplified procedure has been developed to ensure pharmaceutical quality while still meeting the effectiveness and safety standards needed for marketing support. TheHMPC was created to comply with Directive (EC) No 726/2004 and2004/24/EC. This committee is in charge of the streamlined registration process used by European Union member states for traditional herbal medicine items. Overall, the regulations governing herbal goods in Europe act as an example for other domains, showing how a unified regulatory structure may strike a compromise between protecting the public's health and maintaining cultural assets. These rules will keep evolving as knowledge develops and new research is published, ensuring that herbal remedies continue to be a crucial and secure component of healthcare in the EU.

Abbreviations

ADR- Adverse Drug Reaction
CAM- Complementary and Alternative Medicine

CMS- Concerned Member States
EDQM- European Directorate for the Quality of Medicines & HealthCare
EMEA/EMA- European Medicines Agency
EU- European Union
HM- Herbal Medicine
HMPC- Committee for Herbal Medicinal Product
MHA- Marketing Authorization Holder
MRP- Mutual Recognition Procedure
OTC- Over The Counter
PSUR- Periodic Safety Update Reports
RMP- Risk Management Plan
RMS- Reference Member State
THMPD- Traditional Herbal Medicinal Products Directive
THMRS- Traditional Herbal Medicines Registration Scheme
TM- Traditional Medicine
TUR- Traditional Use Registration
WHO- World Health Organization

ABSTRACT

Positive psychologists substantiate that cultivating the pro-social behavior of school students is a major weapon to develop a sustainable society. As pro-social behavior, gratitude, and forgiveness are most comprehensive components to be lived a meaningful life. Although, it can happen only if school environment provides an opportunity to students to perceive school well-being. Research revealed that gratitude, forgiveness, and school well-being are the major components that help to develop school students holistically. So, the present study is aimed to study the moderational analysis of gratitude, forgiveness, and school well-being of secondary school students. Descriptive correlational method was used in the present study and data were collected from 988 school students (class ix & x) of 50 secondary schools by administrating Gratitude questionnaire, forgiveness inventory, and school well-being scale. The present study revealed significant (0.01) correlation between gratitude and school well-being, and forgiveness and school well-being. However, the correlation between forgiveness and gratitude is found not significant. The study also revealed no moderation effect of the interaction of forgiveness and school well-being on gratitude, the interaction of gratitude and school well-being on forgiveness, and the interaction of gratitude and forgiveness on school well-being.

Keywords: Gratitude, Forgiveness, School well-being.

INTRODUCTION

Gratitude is the appreciation experienced by persons when someone does something kindness or helpful for them [1]. The term gratitude is derived from the Latin word 'Gratia' which entails some alternative of grace, gratefulness

67265

Anil Chandra Mili and Pranjal Buragohain

and graciousness [2]. It is a meaningful and valuable appreciation to someone or a group for their invaluable support and helps [3]. Pruyser mentioned gratitude as "kindness, generousness, gift, the beauty of giving and receiving" [4]. Robert Emmons, a leading positive psychologist defined the gratitude very comprehensively as "a sense of thankfulness and joy in response to receiving a gift, whether the gift be a tangible benefit from a specific other or a moment of peaceful bliss evoked by natural beauty" [5]. He further conceptualized the gratitude as an emotion, a virtue, a motive, a skill and an attitude, a moral sentiment, and a coping response [6]. McCullough and colleagues defined the gratitude in the sense of moral barometer, moral reinforcer, and moral motives.[2] As a moral barometer, gratitude serves for beneficiaries by signaling the value of relationship with supporter for the gift offered upon them; as a moral reinforcer gratitude increase individual's positive hope and expectation about their future; and as a moral motive gratitude increase the offering pro-social behavior towards other people. So, they believed that grateful people always accept everything as a gift and applied this positive viewpoint in a relational context. Hussong and colleagues also defined gratitude as a "cognitively-mediated, socio-emotional process that results in a sense of appreciation, happiness or joy due to the appraisal of having received something, which is not due to personal effort but to a benefactor's free and unrestricted intentions to give" [7].

It has been seen much argued regarding the meaning of forgiveness [8]. Although, majority of existing literature regarded as human strength [9], as interpersonal process [10], as self focus process [11], as forgiveness of self, others, and situation [9]. To define the forgiveness, Hargrave and Sells focused on 'dyadic forgiveness' and conceptualized the forgiveness an overt expression and careful reconciliation [12]. McCullough and colleagues asserted forgiveness in the sense of reflects increase in pro-social motivation towards another such as- the less desire to avoid the transgressing person and to harm or seek revenge toward that individual and increase desire to act positively toward the transgressing person [13]. Enright and colleagues defined forgiveness as "a willingness to abandon one's right to resentment, negative judgment, and indifferent behavior toward one who unjustly hurt us, while fostering the undeserved qualities of compassion, generosity, and even love toward him or her" [10]. The positive psychologists defined forgiveness as freeing from a negative attachment to the source that has transgressed against a person [9], in the sense of reflects increase in pro-social motivation towards another such as- the less desire to avoid the transgressing person and to harm or seek revenge toward that individual and increase desire to act positively toward the transgressing person [13], and as "a willingness to abandon one's right to resentment, negative judgment, and indifferent behavior toward one who unjustly hurt us, while fostering the undeserved qualities of compassion, generosity and even love toward him or her" [10]. Baumeister and colleagues mentioned two dimension of forgiveness in their forgiveness model viz. intra-psychic and interpersonal [14]. The intra-psychic forgiveness refers to whether an individual has forgiven whereas the interpersonal forgiveness describes whether an individual has communicated forgiveness to their transgressor. Hillman hypothesized the components of Brecker's tripartite framework of human attitude with two dimensional model of forgiveness and identified three types of forgiveness viz. behavioral (external) forgiveness, affective (internal) forgiveness and cognitive (internal) forgiveness [15].

School well-being is the positive experiences of a student perceived in a school environment. Tian and colleagues stated school well-being as a student's school satisfaction and positive effect on school. According to them, school satisfaction refers to a global cognitive evaluation of school life that emerge from day to day school experience of students and positive affect in school refers to the frequency of positive emotions experienced especially during school such as feelings relax, pleasant, hope, safe or more importantly happiness and satisfaction of the students [16]. It is a concern with positive effect, persistence, strength, dedication, and concentration of school activities and is strongly correlated to the feeling of self-efficiency and students' motivation towards positive hopes and feelings. School well-being can be perceived through the achievement of meaningful goals, relationships, personal growth and development, health, safety, and satisfaction. Konu and Rimpela mentioned that school well-being is more important to develop positive emotions like hope, resiliency, joy, optimism, and health of students to improve their well-being [17]. Seligman, the conceptual founder of positive psychology also argued the importance of school well-being and mentioned its reasons such as (i) the current flood of depression (ii) the nominal increase in happiness over the last two generations (iii) well-being enhances learning and holistic thinking (iv) an antidote to the runway incidence of depressions (v) a way to increase life satisfaction and (vi) an aid to better learning and more creative

thinking [18]. Regarding the above-mentioned core reasons, researchers and psychologists in the field of positive psychology started to argue for the framework of schools for the well-being of students [19, 20, 18]. And these ideas are the resource to develop a new area of positive psychology named 'school well-being. Health Education Partnership Limited, Norwich suggested three basic areas of school well-being such as- emotional well-being, psychological well-being, and social well-being school students [21].

The related literatures showed that most of the studies in gratitude had been conducted on adults. Despite of it only inconceivable studies have been conducted on child/adolescents. So, majority of research tools and techniques constructed of gratitude are focused on only adults. Froh and colleagues mentioned that the gap of the study on gratitude between adults and child/adolescents is the question of understanding and developmental implications of gratitude and most of the researchers are regarded it as inevitable points [22]. But some study revealed that gratitude emerges from earliest stages of infancy [23], between 7-10 ages [24], between 6-10 ages [25], and fully matured at age10 [26]. So, emerging studies of gratitude on children and adolescents are extended and designed for measuring both emerging gratitude and mature forms of trait gratitude [1]. Many psychologists argued that the study of gratitude of adolescent is more important for several reasons. First, it associated with positive emotional functioning [1] and linked positive affect [27, 22]. As a positive emotion gratitude proceeds toward better life outcomes [28], healthier life and more resilient, optimism and well-being [29], broaden the analytical strategies [30], and more importantly gratitude reduce the negative emotions [31]. Second, gratitude is associated to a wide range of pro-social social outcomes viz. compassion, healthy relationships, generosity and empathy [2], and develop the optimism and positive affect among middle school students [22]. Third, gratitude increase social functioning of adolescents that indentified as a major component of pro-social behavior [27]. Researchers found several studies conducted to measure the relation of gratitude with others variables. The studies revealed that the gratitude among early adolescents is negatively associated with physical symptoms whereas it is positively associated with school satisfaction, positive effect, social support, optimism, and emotional support [22], among late adolescents gratitude is positively associated to academic achievement, social integration and negatively associated with envy and materialism [1], gratitude enrich more positive emotions of school children [25], and gratitude has positive relationship between optimism, and well-being in adolescent [29].

As similar to the gratitude, review of related literatures revealed that most of the study in forgiveness had been conducted on adult. Leever mentioned two reasons for the gap of the study on forgiveness between adults and adolescents. First is the question of understanding and developmental implications of forgiveness and second is whether adolescents exhibit similar forgiveness trends as adults. Although, understanding of the concept of forgiveness of children and adolescents under different conditions has been previously studied and it revealed that the development of the concept of forgiveness is normally occurring at a young age [32]. Darby and Schlenker conducted a study to evaluate the children's understanding of forgiveness and adult in social judgments (i.e. intentions, apologies, and motives) and revealed similar result with adults [33]. Park and Enright also conducted a study to measure the developmental progression of the understanding of forgiveness of adolescents in Korea and revealed that external as well as internal forgiveness exists among adolescents [34]. Thompson and Snyder also revealed that motivation for forgiveness of child and adults is occur in the same manner and it is linked to psychological health and well-being [35] while un-forgiveness is correlated with higher psychopathology [36, 37]. Furthermore, the different abnormality of individual related pathologies depends on the amount or type of forgiveness [38]. Personality factors have been found to highly correlate with dispositional forgiveness of both self and others [39]. Failure to forgive self has been connected to more intra-punitive pathologies such as- anxiety and depression, while failure to forgive others has been associated with extra-punitive pathologies, such as- social alienation, social introversion, depression, and psychoticism [40]. Mauger and his colleages also found deficits in forgiveness of self related to higher amounts of overt psychopathologies e.g. schizophrenia [41].

The study of the school well-being is relatively new concept of positive psychology. Konu and Rimpela is the pioneer of the study of school well-being [17]. They developed the 'school well-being model' based on the sociological perspective of the 'well-being model' [42]. After development of the school well-being model, researchers of positive

67267

psychology started to study on school well-being of school students especially in Finland. The basic idea of the school well-being model is to assess well-being as an entity in a school setting. In present decade, the term school well-being is popularly used as an explicit educational aim [43]. Many developed countries have been preparing their school as a responsible institution to contribute to well-being of students, society, usually in the form of well educated and healthy workforce. Finland, New Zealand, Australia, England, United State of America and more recently China, Indonesia and Japan in Asia are some countries which explicitly stated the well-being of the students in the national curriculum. The Ministry of Education of New Zealand stated 'school well-being is vision for young students who will seize the opportunities offered by new knowledge and technologies to secure a sustainable social, cultural, economic and environmental future for country. Many researchers have conducted study on well-being and academic perspective of students and revealed that emotional well-being is a most powerful indicator of academic achievement and success of students and subsequently it improves the quality of later life (youngminds.org. uk). Gutman and Vorhaus found that students with higher level school well-being perceived higher levels of academic achievement and interestingly they are more engaged in school activities.[44] Duckworth and Seligman studied well-being and intelligent as a determinant of student's academic achievement. They found that emotional and social well-being of students is more significant determinant of academic achievement than Intelligent Quaint [45]. An international study of OECD also revealed a positive correlation between social and emotional well-being of school students. According to Durlak and colleagues, the ability of the emotional management of students can support their learning, commitment, academic engagement, and ultimate school success [46]. The study of Buecker and his colleagues revealed that subjective well-being of students is the powerful approach to solve the disciplinary problems of school students, to improve school satisfaction, enhance academic achievement and flourishing of students, communities as well as nations [47]. The positives emotions of the students which assembled by school well-being enlarges cognitive perspective, level of creativity, productivity and leads the gratitude, hope and emotional regulation of students and offering a happy life [48]. Literatures revealed that school well-being is more important in developing student's competency, resilience, and health in order to improve their well-being [49, 50, 51]. World Health Organization (WHO) mentioned that the national growth and development is highly dependent on health status, quality of the students and well established school environment [52]. Mental and emotional well-being of students improves their performance and broadens the intellectual, physical and social resources of a nation [18]. Students with better emotional and mental health are easier to relate with work, better decision makers, are more creative and better in problem solving, innovation, persistence and productivity [53, 18].

After precisely reviewed the related literatures of gratitude, forgiveness, and school well-being of secondary school students, researchers did not able to find literatures that conducted to study on the relationship between the variables under study. Therefore, this study is an effort to minimize the literatures gap.

Research Objectives
1. To analysis the descriptive statistics of gratitude, forgiveness, and school well-being.
2. To establish the bivariate correlation between gratitude, forgiveness, and school well-being.
3. To perform the moderation analysis of gratitude, forgiveness, and school well-being.

METHODOLOGY AND MATERIALS

Descriptive survey method was used in the present study. The sample students were selected by applying a stratified random sampling technique. Accordingly, 988 school students (ix & x) of Tinsukia district, Assam were selected as a sample and collected the required data. The sample students are comprised of different examination boards i.e. Board of Secondary Education, Assam (SEBA), Central Board of Secondary Education (CBSE), and Indian Certificate of Secondary Education (ICSE). Three measuring scale were used in the present study. Brief descriptions of the scales are given below.

- **Gratitude Questionnaire-6 (GQ-6)** GQ-6 is consists of six items usually used to measure the gratitude of adults only but revalidated it by factor analysis to measure the gratitude of adolescents.[1] The revalidated version is

consisted of five items and it is used in the present study. The item 6 of the original GQ-6 was eliminated for its high difficulty index for adolescents. GQ-6 is a 7 point Likert type scale, so scoring procedure of favorable and unfavorable statements suggested by Likert is applied. Higher scores in the scale indicate higher level of gratitude and lower scores in the scale indicate lower level of gratitude.

- **Child/Adolescent Dispositional Forgiveness Inventory (CADFI)** The Child/Adolescent Dispositional Forgiveness Inventory [34] is modified version of Heartland Forgiveness Scale.[9] It was modified to measure the forgiveness of children and adolescents. The scale is comprised of 3 subscales viz. Forgiveness of Self (5 items), Forgiveness of Others (3 items) and Forgiveness of Situation (6 items). The scale is a 7-points scale ranging from 1 (almost always false of me) to 7 (almost always true of me). Higher scores in the CADFI indicate higher level of forgiveness and lower scores indicate lower level of forgiveness.
- **School Well-Being Scale** The school well-being scale constructed and standardized by Mili & Buraguhain [54] is used in the present study. It is a 60-item scale constructed and standardized to measure the level of school well-being of secondary school students. The school well-being scale is a five-point Likert-type scale. The scoring procedure suggested by Likert for favorable and unfavorable items was followed. The total of all the responses score constituted the total school well-being score of the students. A higher student's score on the scale referred to higher school well-being and a lower student's score on the scale referred to lower school well-being of the students.
- **Statistical Analysis** Statistical analyses were conducted with the Statistical Package for the Social Sciences (SPSS) version 26. The statistical techniques i.e. Mean, Standard deviation, bivariate correlation analyses, and moderation analysis were applied and interpreted.

RESULTS AND DISCUSSION

The researchers decided to analysis and interpret the obtain data as per as the sequence of the objectives and the findings of the present study are presented below with the help of appropriate tables and models along with their interpretation accordingly.

Objective-1: To analysis the descriptive statistics of gratitude, forgiveness, and school well-being of secondary school students. In this regards, descriptive statistics were calculated and which shown in **table- 1.**

Table 1 presents the descriptive statistics. The mean and standard deviation of school well-being, forgiveness, and gratitude were found 232.15, 28968; 60.38, 7.852; and 26.42, 5.151 respectively. The researchers further attempted know the descriptive levels of variables under study in category wise viz. male, female, rural, and urban. Details were given in table 1.

Objective- 2: To establish the bivariate correlation between gratitude, forgiveness, and school well-being.

Table 2 shows the Pearson's coefficient of correlation of gratitude, forgiveness, school well-being of secondary school students. The correlation between gratitude and school well-being, and forgiveness and school well-being were found significant at 0.01. However, the correlation between forgiveness and gratitude is found not significant. Further, the researchers attempted to know the correlations of gratitude, forgiveness, and school well-being in category wise viz. male, female, rural, and urban. Correlations were found significant at 0.01 level of significance. Details are given in the **table 3.**

Objective- 3: To perform the moderation analysis of the variables under study. So, researchers tried to investigate the moderation effect of each other of the variables. In this regard, researchers carried the moderation process by a conceptual model given below (conceptual model 1).

Statistical model 1 presents the process of moderation analysis. Before test the moderation effect of school well-being and forgiveness as an independent variable, researcher checked whether there were significant correlation between gratitude with school well-being and as well as forgiveness. The result showed a significant correlation (p < 0.05) between gratitude and both the independent variables (school well-being & forgiveness). Then, researchers proceeded to test the moderation effect. So, researchers created a new moderating variable (interaction) run the statistical model. The result showed a no significant moderation effect on gratitude of secondary school students, because the p value is found greater than the 0.05.

Again, **statistical model 2** presents the process of moderation analysis. Before test the moderation effect of school well-being and gratitude as an independent variable, researchers checked whether there were significant correlation between forgiveness with school well-being and gratitude. It was found a significant correlation ($p < 0.05$) between forgiveness and both the independent variables (school well-being & gratitude). Then, researchers created a new moderating variable (interaction) and tested its effect on forgiveness. However, the result showed a no significant moderation effect ($p > 0.05$) on forgiveness of secondary school students.

Statistical model 3 presents the moderation analysis. To carry out the moderation analysis, researcher checked whether there were significant correlation between school well-being with forgiveness and gratitude. And, the result showed a significant correlation ($p < 0.05$) between school well-being with both the independent variables (forgiveness & gratitude). Then, researcher proceeded to test the moderation effect. So, researchers created a new moderating variable (interaction) and tested its effect on school well-being. However, it was found a no significant moderation effect ($p > 0.05$) on school well-being of secondary school students.

CONCLUSION

In the present study, researchers attempted to study the co-relationship between gratitude, forgiveness, and school well-being of secondary school students. In this regards, researchers found significant (0.01) correlation between gratitude and school well-being, and forgiveness and school well-being. However, the correlation between forgiveness and gratitude is found not significant. Further, the researchers estimated the correlations of gratitude, forgiveness, and school well-being in category wise viz. male, female, rural, and urban. And, correlations were found significant at 0.01 level of significance. In the moderation analysis, researchers found that interaction of forgiveness and school well-being has no moderation effect on the relationship between school well-being and gratitude. Similarly, it was found no moderation effect of the interaction of gratitude and school well-being on the relationship between school well-being and forgiveness. Again, no moderation effect of the interaction of gratitude and forgiveness was found on the relationship between gratitude and school well-being.

ABSTRACT

Despite the fact that society has become tolerant and inclusive, people with dwarfism still experience discrimination in every aspect of life. This is because the society had perceived them as a mere difference of having shorter body size than being disabled. Such perceptions eventually kept them out of the societal purview. Hence this study is intended to uncover their distinct challenges which extend from personal to public spaces. For this the researcher employed purposive sampling technique to collect data from 12 participants using semi structured interview guide. The inclusion criterion is that the participants must be a member in Tamil Nadu Dwarfism Welfare Association, with the notion of providing rich and in-depth information on the research objectives. Thematic analysis was done to analyse and interpret the data. The findings had three broad themes such as challenges at personal spaces, challenges at public spaces and psycho-social challenges explained under nine different sub themes. The results are interpreted using socio ecological model with the individual at the centre, surrounded by family, welfare organization and policy making bodies at different levels. The challenges encountered by people with dwarfism can be eliminated by the combined efforts of the individual, family, welfare organization and policy making bodies to attain a living with utmost wellness.

Keywords: People with dwarfism, Disability, Day-to-day challenges, Qualitative, Thematic analysis.

INTRODUCTION

Dwarfism is a medical or genetic condition that results in short stature, characterized by an adult height of about 147 centimetres or less, of both proportionate and disproportionate body sizes (Little People of America, 2020). In India, the Rights of Persons with Disabilities Act (RPwD) of 2016 had increased the types of disabilities from 7 to 21, of which the category of dwarfism is included as one form of physical disability (Narayan et.al., 2017). However, dwarfism is socially perceived as a mere difference of having shorter body size and hence fail to consider them as disabled (Shakespeare et.al., 2010). It is observed that the body size of people with dwarfism, is incapacitating in a built environment created for an average sized person, but that a body size that differs greatly from the average is not accepted as disability in society (Pritchard, 2021). Additionally, their medical conditions are not apparent always and the general insight that most people with dwarfism do not have severe physical restrictions on their activities had also amplified the negligent attitude of the society (Thompson et.al, 2008). Within the context of disability discourse, dwarfism borders on dual concepts of stigma and identity. People with dwarfism are affixed with an in-born ascribed stigma, through which they are branded as different and consequently devalued that seldom transpose (Olaniyan 2019). In terms of identity, they are regarded as "discursive identity" and are centered around the butt of humour and curiosity (Kruse 2003).Having said that, like any other forms of physical disabilities; People with dwarfism also experience difficulties on a daily basis owing to their body size and inability to fit into the socially constructed norm. The phase of literature review disclosed that most of the studies concerning people with dwarfism focused only on the issues of stereotyping, their cultural representation and media portrayal. It is acknowledged that the society's ignorance towards their disproportionate body sizes is the reason for the concealment on the difficulties they experience. Therefore, the study is intended to comprehend the distinct challenges faced by people with dwarfism on everyday basis. In the present study, the intricacy encompassing disability issues informed the use of Bronfenbrenner Socio ecological model (1976) as the theoretical framework. According to him, people are trapped in a nested system in which many components have a substantial impact on how they grow, and such developments are primarily affected by the interactions between people and their environment (Akotoet.al, 2022). As this study demands to understand the challenges of people with dwarfism, they are placed at the center, surrounded by the family support at the level of micro system, and the role of welfare organization at the level of meso system and the policy making bodies at the level of macro system. (See Fig. 1)

MATERIALS AND METHODS

Participants
Purposive sampling technique was used to select 12 individuals with dwarfism, between the age group of 20-40 years of which 6 are male and 6 are female. The inclusion criterion is that the participants must be a member in Tamil Nadu Dwarfism Welfare Association with the notion of providing rich and in-depth information on the research questions. As the study involved people of marginalized section, pseudonyms were used instead of the names of the participants. Table 1 illustrates the demographics of the participants.

Data collection
Face to face interviews were carried out for about 45-60 mins to gather information on the research objectives through semi-structured interview guide. In the interview, the participants were encouraged to share their experience about challenges related to daily life. For instance, what are the difficulties you encounter when you're at home? In what ways the infrastructure in public places hinder your social participation? etc., was followed by probing questions. The participants were aware of the aims and method of the study and written informed consent forms were obtained from all participants. They were given the freedom to leave the study at any time and had their data confidentiality guaranteed.

Data Analysis

All the audio taped interviews were transcribed verbatim and further translated into English without altering the meaning of the conversation. The transcribed data was analyzed manually using thematic analysis (Braun et.al, 2006), where the researcher read the transcripts multiple times to familiarize with the data and started generating initial codes. The codebook had labels or tags assigned to the segments of the data that captured meaningful concepts or ideas. After the completion of initial coding, an overarching category was derived by clubbing similar meaningful codes, followed by systematically grouping the categories to form themes.

Ethical considerations

Bharathiar University Human Ethics Committee approved this study (BUHEC/067/2023). Permission was received from the research supervisor and doctoral committee members of the researcher.

RESULTS

Day-to-day challenges

Participants involved in the in-depth interview spoke about different forms of challenges encountered on daily basis and the emergent themes are as follows: (See Table 2)

Theme I- Underpinning challenges at private life

By virtue of being short, people with dwarfism struggle to execute their daily activities at their private spaces. The implementation of such challenges involves accessing the switch boards, door handles, clothesline, dish washing sink, etc., making it tedious to complete their basic household tasks. In general, the houses of people with dwarfism are not designed to their heights and they seek the instrumental support like scales, sticks, chairs, ladder and tables to access the household equipment's."… I can't get onto the cot without assistance, so beneath my cot there exist a permanent stool for me to climb onto it. Similarly, there will be a long stick against the wall, with which I will on the electric switches..." (P5: 38-year-old employed man)However, the nuclear family composed of both the partners being short statured, design their house in accordance to their height and convenience making life comparatively easier at home."…Since both of us are short, we always had to depend on our family members for the smallest of things. Hence, we restructured our house to our comfort like lowering the kitchen countertops and clothesline to our feasibility…" (P6: 39-year-old married man)

Cooking nonetheless remains an unavoidable challenge in the everyday life of persons with dwarfism. They experience inconvenience while cooking, as the kitchen utensils are considered to be bigger in size and does not suffice the size of their fists. The usage of smaller utensils alone will not be adequate rather certain modifications like lowering the countertops, constructing stable platforms and creating adjustable pull-out shelves in the kitchen must be made in order to accommodate them."... Since the palm of my hands are too small as a child, I have trouble in holding big vessels for the purpose of cooking and to wash dishes. And also, I refrain from hosting visitors for lunch/dinner because I am unable to prepare for large group of people…" (P9: 34-year-old women)To wear clothes of one's own choice and likeness is a form self-expression, unfortunately people with dwarfism are unable to wear clothes of their adoration rather wear those unwilling clothes only for the mere fact of fitting their body size. As a result, people with dwarfism are obliged to use only custom-made dresses to fit their height and size, and this issue of clothing might look very insignificant to average sized people but the real agony is felt when such desires remain unfulfilled."...I wish to wear saree (traditional Indian dress) but I can't as it is very lengthy. Whenever I see women wearing a saree, I feel so jealous of them and eventually will end up thinking as to why God created me this way..." (P10: 26-year-old women)

Theme II- Challenges at public spaces

The infrastructural challenges at public places are immeasurable to a person with short stature. Participants asserted that even to walk on a road without the assistance of a fellow being is arduous, since the operator of huge vehicles at times fail to notice a person of short height and may strike them. Additionally, the placement of service counters, ATMs and restrooms are at an elevation that is beyond their height and combination of all such undisclosed difficulties minimize their involvement in activities outside home."…. I can never use the public toilets as they are built for an average sized man and most of the times, I avoid visiting malls often and I wonder why people are ignorant of our infrastructural needs…." (P1: 32-year-old man)Places of entertainments such as shopping malls, theatres, parks, beaches, hotels etc. are built with facilities that are unapproachable to people with dwarfism. It is because the structural amenities in the entertainment places are established in a manner that are inaccessible to them. With relation to places of worship, on routine days the struggle is minimal when compared to those of a festive season. The temple becomes so crowded that even after trying hard, people with dwarfism can never reach out to the idol statue as they get caught in the crowd. The fear of experiencing breathing difficulties after being entrapped in the crowd serve as a barrier to visit religious places often."…. The seats in the cinema theatres are unfavorable to me and when I sit down to watch a movie, I can only view the head of the person in front of me. I will always feel that some effective modifications must be made to accommodate myself into the theatres …." (P3: 29-year-old-man)

Commutation nevertheless remains a challenge, as the public vehicles are designed without taking their travel needs into consideration. The public transport systems such as trains, buses and auto rickshaws often lack proper accessibility features with high step heights, inaccessible handrails and grab bars, and cramped seating arrangements. Getting onto a public transport vehicle, to accomplish their tasks on an everyday basis is undeniably a strenuous job for them. Apart from this, they will have to strive really hard to get a driving license, therefore the chances of owning and driving a private vehicle of their own is also limited."…. I work for an MNC, and getting to the office every day is not at all a simple chore for me. I'll have to wait for a less crowded compartment for hours in the station because if I get into one, the knees of my fellow passengers would be level with my nose, making breathing difficult. ….." (P7: 27-year-old women)To seek a job is extremely challenging for a person with dwarfism, and if employed; the trouble multiplies due to the inaccessibility of amenities at workplace. It is designed in an unfavorable manner, such that buttons in the elevators, the seating arrangements like chairs and tables and the documents placed, are all at an unreachable height. This is because the workplace is usually constructed for an average sized man and undermined the idea of encompassing people of all sizes comfortably."… At first, when I approached a grocery store for a job, they rejected me for my height and looks. That is when I decided to seek a job where my height and identity will remain invisible to public domain, and eventually ended up in a Business Process Outsourcing company. I experienced difficulty even there as the table and chair were not of my height and will always need a colleague's assistance to get onto it…."(P12: 34-year-old unmarried women)

Theme III- Psycho-social challenges

Constant gazing at individuals with dwarfism, is invasive and offensive which reinforces the idea that they are abnormal and different from others. Such repeated act of gazing manifests that general public is curious to know more about them especially their age and marital status. Respondents stated that when people around stare, it magnifies their fear of being negatively evaluated. This eventually hinders their effective involvement and participation in social situations."………Once my aesthetic average sized girlfriend and I walked on road and I challenged her that people's attention will be on me than the beautiful you. To her surprise people crossing us gazed at me, just because I'm a dwarf and they were curious to know about me, especially my age. This act of staring at me happens very often that makes me feel so uncomfortable…" (P6: 39-year-old man)Respondents asserted that they frequently come across unsolicited comments, mostly derogatory statements about their height, size and other physical features on a daily basis. To call upon them, people often use humiliating names especially those phrases from visual media. They are treated as objects of fun and trolled for not fitting into the socially imposed beauty standards. The intensity of shaming hikes when others in the society gossip about their marital and sexual life in a

Zuvairiya Nassar and Sampath Kumar

mysterious way. They endure one or more of the aforementioned forms of teasing that consequently lowers their self-esteem and confidence."….. Whenever I join my friends; to play street cricket, they never allow me to take batsman or bowler role, instead my peer mates make fun that I fit only to field along with the small children on the streets. When they treat me as a child, I get hurt…" (26-year-old man)People with dwarfism are always viewed through the stereotypical lens and labels such as clown, joker, entertainer are often used on them. The societal prejudices on the other hand, considers them as 'being pity, childlike, innocent and quick tempered'; eventually ends up in limiting their opportunities. In addition, the preconceived notion that people with dwarfism are incapable to complete a task also exist predominantly. Such unauthentic notions have an adverse effect in their daily lives, especially on their mental health."… I gave a marriage proposal to an average-heighted, longtime friend of mine. Though he liked me, he was not ready to marry me as he presumed that I'm incapable of having sex and to bear a child…" (P10: 26-year-old women)

DISCUSSION

By using the socio-ecological model, the findings of this study were deduced. The role of family support at the level of micro system, role of welfare organization at meso system, and the policy making bodies at macro system are necessary to understand the strategies involved in eliminating the daily obstacles faced by people with dwarfism. Family is an intrinsic social institution with the capacity to influence the behavior of an individual (Aldersy2012). Thus, it is important to comprehend the everyday challenges of people with dwarfism in the context of their family ties and human relationships (Pfeifer et.al, 2021). This study revealed that persons with dwarfism, possessing a supportive family are able to overcome their day-to-day obstacles brought on by both material and intangible factors at a slightly manageable and faster pace when compared to its counterpart. Family members aid in assisting their disabled inmates by modifying the home's infrastructure in proportion to their height, like lowering the switch boards, providing accessible door handles, availability of smaller staircases, customizing the chairs and tables to their height, lowering the kitchen tabletops, availability of smaller vessels, lowering the clothesline etc. It is evident that people with dwarfism experience very minimal struggles in the areas attainable through family support such as housing pattern and infrastructural facilities at home (Baidi et.al, 2018). Another strenuous task for a person with dwarfism is to mobilize from one place to another using a vehicle (Urenev et.al, 2023). This issue can be addressed by the family members, either by arranging a vehicle comfortable for them to get onto or otherwise they can accompany them during travel. Family members must inseminate the sense of assurance by staying attentive to their emotional needs and empathizing them in every possible way, especially at the time of despair. Further dissecting the micro system, i.e., support from parents, siblings, spouse and children are all inevitable to combat the daily challenges in a constructive manner.

At the level of meso system, the welfare organization for the people with dwarfism plays an indispensable role as it aids in determining their needs, expressing their views and stand points on priorities, assessing services and public awareness (Khasnabis 2010). The results conveyed that by associating oneself with the dwarfism organization, a resource to accumulate their human capital certainly amplifies the quotient of social relationships (Machalek et.al, 2015). Moreover, studies reported that many little people had discouraging experiences of insulting and bullying for their physical appearance (Kruse 2002), which eventually made them anxious to appear in public places and that confined them to stay indoors. The welfare organization for people with dwarfism aids in eliminating the fear of being negatively evaluated and build in confidence and self-esteem. Along with the enhancement of personality, informational support with regards to education, mate selection and employment is provided (Thompson et.al, 2008). The welfare organization functions in a constructive way, as it instills the sense of assurance and hope for every member and stands by them, especially at the time of hardship. The purpose of such welfare organization is not merely for the development of a sense of communion but also alleviates the problems of physical inconvenience, by associating with people of similar issues (Weinberg, 1968).

At the macro system, efforts from policy makers to build a disability free environment and implications on strict anti-discrimination laws will certainly improve the conditions of people with dwarfism. The infrastructural barriers can be resolved by the adoption of Universal design, an approach with the principle of providing access for all types of disabled people as opposed to the current disability design imbibing only wheelchair users and visually impaired (Pritchard 2016). Universal design is based on the postulate that there exists only one population, comprising individuals with diverse attributes and therefore accommodates people with different body shapes and sizes (Iwarsson et.al, 2003). Additionally, they are discriminated by the educational institutions wherein they are denied to opt desired courses (courses like medicine, catering, disciplines that use laboratory like microbiology, chemistry, etc. - dismissed). Similar structural discrimination is evident in the employment sector where they are denied of skill-based work rather expected to do the conventional job as comedians in movies, as jokers in circus or to attract the crowd by issuing pamphlets (Pritchard et.al 2020). Such issues can be resolved by the enactment of anti-discriminatory laws in the field of education, employment, housing and in public areas. In short, the issues of people with dwarfism are often caused by societal barriers of prejudice and inaccessibility of their environments, and not by the inherent physical differences or medical issues (Hill, 1986).

CONCLUSION

Through the lens of people with dwarfism, amidst confined functional mobility, this paper revealed the limited opportunities available for accessing the amenities at public places and personal space. The societal perception, that people with dwarfism are incapable of performing certain functions and the act of treating them different from others are the predominant cause for their psycho social challenges. In a nutshell, to resolve the challenges encountered by them and to attain a living with utmost wellness, the combined efforts of the individual, family, organization and policy making bodies is essential.

LIMITATIONS

The researcher faced quite a few rejections from people with dwarfism as they were anxious and apprehensive to take part in the in-depth interview. In addition, the presence of family members and peers were unavoidable at the time of interview.

ABSTRACT

A graph G with vertex set annotated for the distinct vertices, f : V(G) → {1,2,3…|V| } is used to label the vertices of a graph with vertex set V in such a way that the labels given to any two adjacent vertices x and y are relatively prime, (i.e) gcd {f(x), f(y)} = 1 then it is referred to have a prime labeling. In this paper, we present results concerning prime labeling of corona product of graphs. Star Graph and Cycle graph are taken into consideration. Also, the efficiency of the labeling technique is analyzed with the example.

Keywords: Labeling, Prime Labeling, Corona Product of Graphs.

INTRODUCTION

In this paper, the finite simple undirected graph was taken into consideration. A set of vertices V(G), a set E(G) and its incidence relation make up the graph G. We refer the following book [1] for the terms used in graph theory. The term labeling was first introduced by Rosa[5] and presented several graph labeling methods. Later, Roger Entringer introduced prime labeling. [7] Tout *et.al* considered some classes of graph and identified the graphs which admits prime labeling. We have citied the survey of graph labeling by Gallian J.A[3]. In 1970, [2] Frucht and Harary introduced the corona product of graphs. They defined a new and simple operation of two graphs so that the resultant graph is isomorphic with the product of two graphs. [4] Meena.S and Naveen. J,found Corona Product of wheel Graphs with path and star graph, crown graph with path and star graph and they applied the prime labeling. [6] Thamothara Pandian *et.al*, also generated prime graphs using corona product of cycles and wheels with complete Graphs. In this paper, we proved that the graph obtained by attaching the copy of star graph $K_{1,n}$ to each vertex of cycle graph C_3 and C_4 so that the resultant is prime graph.

67284

Preliminaries

The basic notions, concepts and definitions are reviewed in the session.

Definition: 2.1

For a Graph G = (V, E) assigning of labels to the vertices or the edges of a graph is known as labeling. Labels are often represented by integers.

Definition: 2.2

For a graph G = (V, E) with p vertices, if the mapping f : V(G) → {1,2,3…| V| = p }are used to label the vertices of a graph with vertex set V in such a way that the labels given to distinct vertices x and y are relatively prime, (i.e) gcd {f(x), f(y)} = 1 then it is referred to have a prime labeling.

Definition: 2.3

The graph G ∘ H that results from taking one copy of G and | V(G) | copies of H and attaching the i-th vertex of G to every vertex in the i-th copy of H is known as the corona product of two graphs G and H.

Definition: 2.4

A Star graph $K_{1,n}$ is a tree with n leaves and 1 internal node. Instead, for a n - vertex graph n-1 vertices have degree 1 and one vertex has degree n - 1, making a star graph a unique class of graph.

Definition: 2.5

A graph made up of a single cycle or specifically a collection of vertices linked together in a closed chain is referred to as a cycle graph C_n

Prime Labeling Of Corona Product of Cycle and Star Graph

Theorem: 3.1

The graph $C_3 \circ K_{1,n}$ admits prime labeling if n ≥ 2.

Proof:

We consider the cycle graph of order 3 and star graph of order n + 1.

Let { v_1, v_2, v_3 } be the vertices of the cycle graph.

V (C_3) = { v_i : 1 ≤ i ≤ 3 }

Star graph vertices are represented by

$V (K_{1,n})$ = { u_i , u_i^j : 1 ≤ j ≤ n , 1 ≤ i ≤ n}

Here, { u_i } be the internal node of the star graph.

According to the corona graph specification, each vertex of $V (C_3)$ is adjacent to every vertex of a copy of $V (K_{1,n})$

As a result, the cycle and path graph's corona product yields a total number of vertices is

$V (C_3 \circ K_{1,n})$ = { v_i : 1 ≤ i ≤ 3 } ∪ { u_i : 1 ≤ i ≤ n } ∪ { u_i^j : 1 ≤ j ≤ n , 1 ≤ i ≤ n}

Therefore, the graph $C_3 \circ K_{1,n}$ has 3n + 6 vertices.

Define a labeling f : v → { 1, 2, 3, …., 3n + 6} as follows.

For 1 ≤ i ≤ n

f(v_i) = 2i - 1, f (u_i) = 2i + 5,

f(u_i^1) = 4i – 2, f (u_i^2) = 4i,

f(u_i^3) = i + 12, f (u_i^{4+j}) = i + 3j + 12

The adjacent vertices can be demonstrated as relatively prime and the numbers are labeled alternatively.

gcd (f (v_i) , f(u_i)) = gcd (2i – 1, 2i+5) = 1

since both are odd consecutive integers.

gcd (f (v_i) , f(u_i^1)) = gcd (2i – 1, 4i - 2) = 1

gcd (f (v_i) , f(u_i^2)) = gcd (2i – 1, 4i) = 1

gcd (f (v_i) , f(u_i^3)) = gcd (2i – 1, i +12) = 1

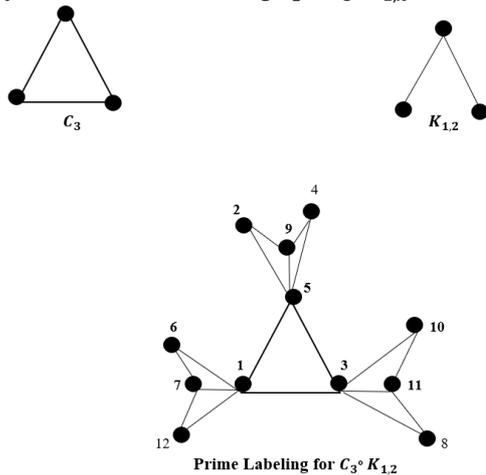
gcd (f (v_i) , f(u_i^{3+j})) = gcd (2i – 1, i+3j+12) = 1

since the two numbers are consecutive integers, the gcd of these two numbers is 1.

Thus, f is prime labeling.

Hence $C_3 \circ K_{1,n}$ is a prime graph.

Analytical Evaluation of the graph $C_3 \circ K_{1,n}$

Prime Labeling for $C_3 \circ K_{1,2}$


Theorem: 3.2

The graph $C_4 \circ K_{1,n}$ admits prime labeling if n ≥ 2.

Proof:

We consider the cycle graph of order 4 and star graph of order n + 1.

Let { v_1, v_2, v_3, v_4 } be the vertices of the cycle graph.

$V(C_4) = \{ v_i : 1 \le i \le 4 \}$

Star graph's vertices are represented by

$V(K_{1,n}) = \{ u_i, u_i^j : 1 \le j \le n, 1 \le i \le n\}$

Here, { u_i } be the internal node of the star graph.

According to the corona graph specification, each vertex of $V(C_4)$ is adjacent to every vertex of a copy of $V(K_{1,n})$

As a result, the cycle and path graph's corona product yields a total number of vertices is

$V(C_4 \circ K_{1,n}) = \{ v_i : 1 \le i \le 4 \} \cup \{ u_i : 1 \le i \le n \} \cup \{ u_i^j : 1 \le j \le n, 1 \le i \le n\}$

Therefore, the graph $C_4 \circ K_{1,n}$ has 4n + 8 vertices.

Define a labeling f : v → { 1, 2, 3, …., 4n + 8} as follows.

For 1 ≤ i ≤ n

$f(v_i) = 2i - 1$, $f(u_i) = 2i + 7$,

$f(u_i^1) = 2i$, $f(u_i^2) = 2i + 8$,

$f(u_i^3) = i + 16$, $f(u_i^{3+j}) = i + 4j + 16$

The adjacent vertices can be demonstrated as relatively prime and numbers are labeled alternatively.

gcd (f (v_i), f(u_i)) = gcd (2i − 1, 2i+7) = 1

since both are consecutive odd integers.

gcd (f (v_i), f(u_i^1))   = gcd (2i − 1, 2i) = 1

gcd (f (v_i), f(u_i^2))   = gcd (2i − 1, 2i + 8) = 1

gcd (f (v_i), f(u_i^3))   = gcd (2i − 1, i +16) = 1

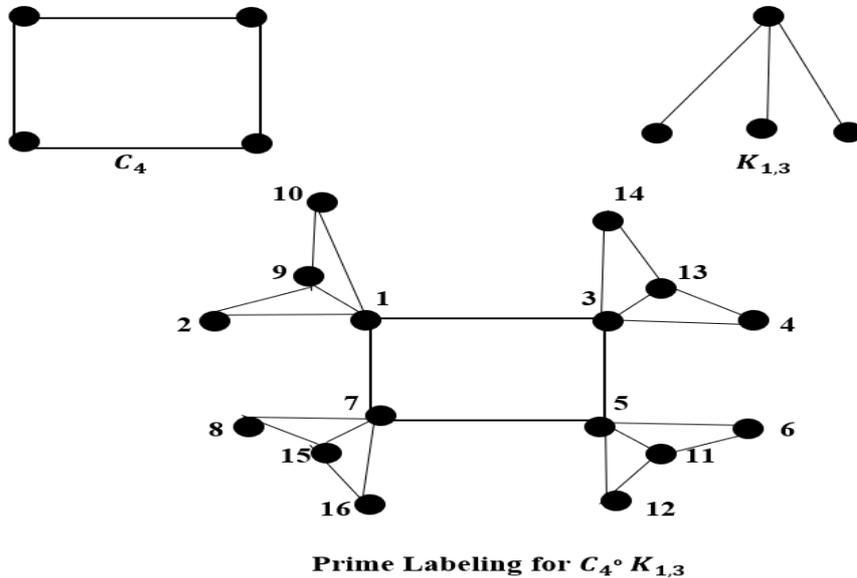
gcd (f (v_i), f(u_i^{3+j})) = gcd (2i − 1, i+4j+16) = 1

since the two numbers are consecutive integers, the gcd of these two numbers is 1.

Thus, f is prime labeling.

Hence $C_4 \circ K_{1,n}$ is a prime graph.

Analytical Evaluation of the graph$C_4 \circ K_{1,n}$

Prime Labeling for $C_4 \circ K_{1,3}$


CONCLUSION

The most advantageous field of graph labeling with several applications is prime labeling. We have shown that the newly built corona product of graphs derived from cycle of order 3 and star graph of order n admits prime labeling. Moreover, we have also acquired the corona product of cycle of order 4 and star graph of order n which acknowledges prime labeling. Analysis of the labeling technique is also examined. We would also look into additional structures with prime labeling in more detail.

ABSTRACT

Higher education institutions must focus on employee aptitude in a competitive, globalized world to ensure proper performance and delivery. In this cutthroat environment, the correct aptitude can spur progress and possibly guarantee holistic development. The teaching community has a significant role in determining the fate of both a nation and a race in addition to being viewed as a factor of production. The focus should be placed on identifying and developing the best policies and procedures to nurture, develop, and evaluate the right aptitude among employees and teachers because the right aptitude is the source of competitive advantage for the organization and higher educational institutions. The effectiveness of the instructor is also influenced by the organization's coordinated use of structure, strategy, and policy, as well as the physical and psychological environment, motivational techniques, etc. This article's goal is to compare the teaching abilities of educators working in publicly funded and independently funded institutions, as well as to emphasize the differences in teaching abilities between male and female educators. For this reason, male and female teachers in government-aided and independently funded university-affiliated colleges in Chennai, India, were surveyed using the Teaching Aptitude Test. The results of the investigation revealed that male instructors had a mean aptitude rating that was greater than that of female teachers. Additionally, male professors in government-aided colleges are more qualified than those in independently funded colleges, and vice versa for female teachers.

67288

Antony Lawrence and Jeyanthi

Additionally, it was discovered that male and female teachers receive different results on each of the distinct aptitude components.

INTRODUCTION

According to Dave N. and Raval D. (2015), "teaching aptitude" is a state of being or a group of traits that a person possesses and that are indicative of their capacity to comprehend not only the subject matter but also the purposes and procedures of education. It indicates a person's propensity for making complex ideas clear and illuminating ambiguities. The focus should be placed on identifying and developing the best policies and strategies to nurture, develop, and evaluate the right aptitude among employees and teachers because it is the source of competitive advantage for the organization and higher educational institutions (Jan F. et al., 2015). Teachers are the foundation of education, and student's performance is heavily reliant on their ability and attitude (Lal R. and Shergil S. S., 2012). Nobody can properly fill his shoes or have the same kind of impact on kids as he can when working alone. The teachers are the center of attention, play a crucial part in the educational system, and serve as a connecting link between a country's educational system and its students. The effectiveness and productivity of the instructor, both of which are influenced by the teacher's appropriate aptitude, determine the impact of any timetable or program related to education. Teachers should be aware of their significance in the educational system, possess a proper and balanced attitude toward their work, and act as change agents. Assembling a learning society and preparing future educators to be lifelong learners are the responsibilities of teacher educators (Khan M.S. et al., 2014). However, teacher educators can only perform their duties well if their education is better and is delivered correctly.

In both government-aided and independently funded institutions, teachers should be able to work with the proper aptitude and attitude thanks to government infrastructure, policies, and plans (Jose M.M., 2008). The effectiveness of a teacher may be influenced by the organization's coordinated use of structure, strategy, and policy, as well as the physical and psychological environment, motivating techniques, and other factors (Ramon, 2017). The focus should be placed on identifying and developing the best policies and strategies to nurture, develop, and evaluate the right aptitude among employees and teachers because the right aptitude is the source of competitive advantage for the organization and higher educational institutions (John J. S., 2016). Employee performance could be viewed as a dependent variable surrounding the organization's structure, strategy, and policies, as well as the physical and psychological environment, motivating techniques, etc. Teachers should have a positive outlook on their line of work despite an uneven support structure. The active participation of instructors and faculty in higher education institutions demonstrates their interest in both teaching and learning. A teacher's positive attitude will provide the classroom a boost, ignite fresh energy, and further transform learning into an engaging and enjoyable activity.Every person has a unique point of view and ability for teaching and learning, which influences the teacher's task-related action orientation and behavior. Particularly in the national capital region of Delhi, the working environment, policies, and real working situation of government-aided and self-financed colleges differ, and this is frequently complemented by the exceptional aptitude of male and female teachers.

Objectives of the Study
The following list includes the study's key goals.
1. To assess the teaching abilities of male professors employed in government-funded and privately funded colleges in Chennai.
2. To assess the teaching abilities of female professors employed in government-funded and privately funded colleges in Chennai.

Hypotheses

H$_{01}$- In Chennai, there is no appreciable difference between male professors who work in government-aided and independently funded colleges in terms of their ability for teaching.

H$_{A1}$- In Chennai, there is a considerable disparity between the teaching abilities of male professors working in government-aided and privately funded institutions.

H$_{02}$- InChennai, there is no appreciable difference between the teaching abilities of female professors working at government-aided and privately funded institutions.

H$_{A2}$- In Chennai, there are notable differences between female professors who work in government-aided and independently funded colleges in terms of their ability to teach.

METHODOLOGY

Sampling Details

Sample Size - There were 180 respondents in the overall sample size taken into account, which was divided as follows:

Data Collection Sources

To gather data, both primary and secondary sources were utilized. With the use of research papers, journals, websites, and other pertinent published sources, secondary data was gathered.

Tool for Primary Data Collection
Brief description of TAT developed by Jai Prakash and R.P. Srivastava

Jai Prakash and R. P. Srivastava created the Teaching Aptitude Test (TAT) scale to assess teachers' aptitude, which aids in determining their suitability for the profession. To collect and analyze data, this standard scale uses the Otis and Smith approach (Kant, R., 2012). There are 15 subcategories (sub-tests) under each of the scale's 10 items. The answer was recorded using a Likert scale. The Guttman and Spearman-Brown Prophecy formulas were used to calculate the reliability of the data using the split-half approach, which produced correlation coefficients of 0.891 and 0.91, respectively. The scale has the following sub-areas as subtest

1. Cooperative Attitude,
2. Kindliness,
3. Patience,
4. Wide interest,
5. Fairness,
6. Moral Character,
7. Discipline
8. Optimism,
9. Scholarly Taste,
10. Enthusiasm.

Variables Considered

1. **Dependent Variable** - In a scientific experiment, the variable under test and being measured is known as the dependent variable. The dependent variable in the study is teaching aptitude.
2. **Independent Variables** –To compare a feature to another variable, it draws attention to or makes references to those that the researcher or investigator is either controlling or observing. Gender is one of the independent factors in the study.

Antony Lawrence and Jeyanthi

Data Analysis
Male Teachers
In accordance with the above table.
1.   A government-aided college's male professors' median score was found to be 192.47.
2.   Male instructors at self-financed colleges had a mean value of 184.31.
3.   A government-aided college's male teachers' S.D. value was discovered to be 49.6.
4.   It was discovered that the S.D. value for male professors at government-aided colleges was 27.2.
5.   The degree of freedom was 48.

The null hypothesis is rejected and the alternate hypothesis, which states that there is a significant difference in the teaching aptitude of male teachers in government-aided and self-finance colleges, is accepted. The calculated values of t are compared to the values that are tabulated values of t and it is found that at 0.01 level of significance, the values are significant. After data analysis, it was discovered that there is a substantial difference in mean and standard deviation, indicating that male teachers' aptitude for teaching is stronger in a self-financed institution than in a government-aided college.

Chart Showing Component Wise Teaching Aptitude of Male Teachers
After examining the aforementioned table, it was discovered that men who teach in self-financed colleges are more intensive in terms of fairness, a cooperative attitude, discipline, and optimism than men who teach in government-aided universities, as evidenced by the higher mean scores that were obtained in the aforementioned circumstances. However, because their mean scores are comparably higher in the corresponding components, the male teaching staff at government-aided colleges are intense in terms of patience and extensive interest in their subject matter.
According to the previous table

1.   It was shown that female lecturers at government-aided colleges had a mean value of 175.27.
2.   It was shown that female lecturers at self-financed colleges had a mean value of 180.17.
3.   Female professors at government-aided colleges were found to have an S.D. Value of 55.26.
4.   Female teachers at Government-aided Colleges were found to have an S.D. value of 36.33.
5.   It had 128 degrees of freedom.

The null hypothesis is rejected and the alternate hypothesis, which states that there is a significant difference in the teaching abilities of female teachers in government-aided and self-finance colleges, is more likely to be accepted. The calculated values of t are compared to the values that are tabulated values of t, and it was found that at the 0.01 level of significance, the values are significant. The examination of the data revealed that there is a substantial difference in the means and standard deviations, which suggests that female professors' teaching abilities are more intensive in self-financing colleges than in government-aided colleges.

Chart Showing Component wise teaching Aptitude of Female Teachers
After data analysis, it was discovered that female teachers in self-financed colleges are more intense in terms of Moral Character, Scholarly Taste, Fairness, Enthusiasm, and Wide Interest because their recorded mean scores are higher than those of female teachers in government-aided colleges, whereas female teachers in government colleges are more intense in terms of Kindness, Patience, and discipline. After all, their recorded mean scores are higher.

FINDINGS

According to the study, it was discovered that male professors in government-financed universities have much higher teaching aptitude than their counterparts who work in a self-financed system. In the case of female teachers, the reverse was discovered. Moral character, discipline, optimism, cooperation, and fairness were attitude traits that male teachers in government-aided colleges scored higher on than those in self-financed colleges. They performed

worse than self-financed colleges in terms of friendliness, intellectual qualities, and enthusiasm, nevertheless. There isn't much of a difference in terms of wild interest. When compared to female teachers at government-funded institutions, self-financed college teachers had much higher moral character, academic taste, excitement, fairness, and crazy interest. However, compared to their counterparts at independently funded colleges, the abilities of female professors in government-aided colleges are more significant in terms of qualities like Kindness, Cooperation, and Discipline.

The study's findings could lead to the following inferences:
1. Male professors in Chennai who work in government-aided and independently funded colleges have quite different teaching styles.
2. The teaching abilities of female professors employed at government-supported and privately funded colleges in Chennai vary significantly.
3. Due to awareness, flare, and competition to survive, male professors' teaching abilities are more intense at self-financed colleges than in government-aided colleges.
4. In self-financed colleges compared to government-aided colleges, female professors' teaching aptitude is more intense, mostly because of their enhanced scholastic interests, capacity for learning, and lucidity.

Limitations of the Research
1. Only Chennai was taken into consideration, hence the outcomes and conclusions may differ in other areas.
2. Teachers' teaching aptitude was the only element taken into account for the current study, while actively taking into account additional factors could enhance the results.
3. No other higher education institutions, such as universities or independent institutions, were used to choose the sample of teachers; only degree-granting institutions linked with universities were considered.
4. The sample size had a considerable bias in favor of female teachers.

CONCLUSIONS

Teaching is a way to achieve perfection rather than just a way to make a living. A nation's and society's future is primarily dependent on education, and teachers must play a vital role in ensuring that it is both sustainable and successful. An updated and rigorous aptitude is required along with all other essential elements like knowledge, intelligence, and communication to increase the quality of instructors. Teaching is a dynamic process that needs to be developed in accordance with the changing needs and demands of society and pupils. With positive aptitude, teachers can turn a process of learning into sustainable learning, strengthening the social fabric in the process. Although there are many aspects that determine teaching ability, values, beliefs, and attitudes shape it. Both male and female teaching staff must possess the necessary teaching aptitude because a teacher with the appropriate aptitude can adopt the proper methodology and can influence the destiny of the country. Additionally, male teachers who work in self-financed colleges are more intense in terms of the components of fairness, cooperation, discipline, and optimism, whereas male teachers who work in government-aided colleges are more intense in terms of patience and broad interest. In terms of moral character, scholarly taste, fairness, enthusiasm, and wide interest, female teaching staff members working in self-financed colleges are more intense (as their horizon for learning, enthusiasm towards teaching and learning, scholarly taste, and cooperative attitude are intense), whereas female teaching staff members working in government-aided colleges are more intense in terms of kindness, patience, and discipline.

ABSTRACT

In today's society, wireless communication technologies are crucial for applications in entertainment, commerce, health, and security. With each iteration, these systems have improved, and currently fifth generation (5G) wireless networks are being introduced globally. Due to its usage of higher frequency bands on the wireless airwaves than 5G, 6G is anticipated to theoretically offer maximum speeds up to 100 times faster than those of 5G. The application of artificial intelligence (AI) to such wireless networks is one of the essential elements of 6G technologies. This paper shares the knowledge about new scenarios of 6G beyond 2030, Architecture of 6G and future research directions in 6G. Finally, discussed ongoing 6G Projects.
Keywords: 5G, 6G, Artificial Intelligence.

INTRODUCTION

Sixth Generation (6G) is a new wireless technology that has attracted many scholars and researchers. A major promise of 6G is to extend the benefits of AI and ML to wireless networks and users. 6G will also use AI and ML techniques to deliver advances in technological metrics such as higher throughput, support for new high-demand applications, and enhanced use of radio frequency bands [W. Saad F. Tariq, 2020] · M Z. Chowdhury] One of the most important AI technologies envisioned as a key technology for 6G will be DL as it has powerful applications to achieve learning from more human-like scenarios. However, this article provides an overview of broad categories of AI techniques, including DL, and their potential role in future he 6G communication systems. The current growth in data size and usage has prompted many researchers to focus more on meeting latency and energy targets by improving existing wireless systems in various aspects. [W. Saad et al., 2020].

New Scenarios of 6G Beyond 2030
By 2030, new application scenarios will proliferate. Scenarios fall into three categories: Intelligent Production, Intelligent Life, and Intelligent Society. Typical use cases beyond 2030 (Sodhro et al., 2020; Khan et al., 2020).

Intelligent production
The digital economy has the potential to expand through the application of developed technologies in agriculture and industry. 6G will enable intelligent manufacturing through computerization. For example, drones are used in agriculture. Robotics and virtual reality improve production efficiency. With modern technologies such as the digital twin, 6G will enable smart manufacturing more importantly.

Smart Life
Twin Body Area Network with the internet and intelligent interactions could change our lives in 2030 such as smart home, smart bank etc.

Smart Society
Ubiquitous coverage networks in 2030 will greatly expand public service coverage and bridge the digital divide between sectors. Overall, 6G networks will enhance social governance and provide a solid foundation for a better society. Figure 1 shows a new scenario occurring in 6G networks. Table 1 demonstrate the 6G advantages compare to 4G and 5G.

Architecture of 6G
The ecosystem is expected to create new demands for both KPIs and KVIs to support a variety of new use cases while 6G architecture best supports existing use cases. To meet these needs, 6G architectures are expected to evolve in six key areas (Figure 2) [G. Kunzmann et al., 2022].

Flexibility
6G architecture should be more flexible in various dimensions. The 6G architecture must work in both large wide area network deployments and very local on-premises and personal area networks. Second, in terms of feature placement, 6G architectures are expected to meet various latency targets and meet other requirements dynamically. For example, supporting XR services requires ultra-low latency for specific users in limited regions and timeframes. For example, the ability to scale dynamically is essential to accommodate changing network loads.

Specialization
Given the variety of use cases and deployments, the 6G architecture should be able to offer customized functionality. For example, a particular 6G subnet, a lightweight sensor network, or some extreme network use case may require a particular set of features, but leave out other features that are not required for that type of network.

Robustness and Security
Users in vertical industries expect network services to be delivered in a robust, resilient and truly ubiquitous manner that allows for multi-connectivity as needed. Also short-range terahertz cellules network architecture and non manner terrestrial network architecture (NTN). Another major security goal is meeting high expectations in terms of trust and data protection.

Cloud platform
The ongoing shift to hosting network functions on cloud platforms will continue and grow. Deployments are moving significantly from specialized telecom cloud platforms to general-purpose public, private, or hybrid clouds on-premises, at the (far) edge, or in central locations. 6G will provide a unified orchestration interface for distributed

cloud service management, complemented by segment-specific abstractions. B. For 6G RAN. This enables special features in cloud nodes, such as: B. Hardware Acceleration.

Programmability

Implementations should also reach new levels of programmability, like hardware-agnostic programming languages like P4, and run on any cloud platform. Serverless services and multi-vendor capabilities are easier to integrate with open, service-based interfaces and a more modular system design. This allows you to provision networks or instantiate network slices with exactly the features and services you need.

Simplicity and sustainability

At the same time, we expect more from our network, so we must also consider ways to simplify our architecture. The complexity and number of functions within the system have increased in past generations. While stronger zero-touch automation capabilities provide the means to address system complexity, the advent of 6G will force us to rethink architectures, removing, redesigning, or consolidating functionality in favor of service-based applications. It also provides opportunities. It also acts as a control plane between the radio access network (RAN) and the core network, simplifying signaling procedures along with distributed non-access stratum (NAS) interfaces. Another example is creating a tailor protocol stack to enable efficient integration of his customer-specific 6G subnets. Simplifying the placement of functions and providing more flexibility and dynamism also helps achieve sustainability goals by reducing signal volume and power consumption. A clear commitment to "designing for sustainability" will be important in 6G. Artificial intelligence and machine learning techniques are expected to be an integral part of the 6G architecture. This is the technology needed to realize the vision of a truly cognitive network that adapts to different scenarios and deployments. AI/ML is expected to play a key role in automating and optimizing networks and improving system security. For widespread use of AI/ML, the architecture includes functions and interfaces for large-scale data acquisition, processing and distribution, training to improve models, and updating inference models within functions is needed. [G. Kunzmann et al., 2022].

End-to-end 6G architecture view

Figure 2 shows the planned end-to-end (E2E) 6G architecture. The infrastructure resource layer provides physical resources for hosting network functions and services. This layer includes all switches, routers, transport links, data centers, cloud infrastructure, radios, and non-virtualized radio functions such as Radio Units (RUs), Distribution Units (DUs), Base Stations, etc. is also included. The Network Services Layer is expected to be fully cloud-based and is grouped into Far Edge, Edge, Core/Central, and Public/Private Clouds to cover a wide variety of clouds that can be deployed by multiple stakeholders. doing. The far edge is characterized by the heterogeneity of devices with different software and hardware technologies, such as personal devices and IoT devices. It provides a public framework that establishes control channels across multiple clouds and enables seamless collaboration and networking. By implementing all network functions, operations and applications as services, the 6G architecture will be software-based, intelligent and efficient. Applications running on 6G systems require communication and computing services with specific QoS and QoE requirements that can be provided by dedicated network slices. There is a gradual move toward increasing levels of automation and using fully automated closed-loop control. This is supported by the parallel adoption of advances in AI/ML technology. Overview of 6G Architectural Innovations This section discusses some of the architectural innovations that should be considered to achieve his 6G design goals mentioned above.

These innovations span all layers of the 6G system and include 6G hardware platforms, common cellular network functions, specializations for specific use cases and requirements, and orchestration layer components, as shown in Figure 3. It consists of functions. After briefly discussing the architectural innovations, we will introduce some of them in more detail. From a platform perspective, we envision a heterogeneous distributed cloud environment. H. 6G networks can span multiple clouds in different locations and involve multiple stakeholders. Cloud capabilities such as hardware acceleration will become essential components for integration. B. To support cloud-native

Hepziba Gnanamalar and Sheeba

implementation of deep learning processing and lower-layer RAN functions.At the functional level, new functional partitions within the RAN can be designed between the RAN and core network functions, with the aim of enabling optimized UE RAN core architecture design. This simplifies the steps involved and consolidates similar functionality. Possible solutions range from simply extending existing interfaces to breaking domain isolation entirely, or anything in between. Dynamic and adaptive feature placement can best address the trade-offs between network performance, complexity, power consumption, and most importantly service and consumer requirements. At the same level, we also expect changes to the vast amount of data and information that will be collected, stored, and made available, including AI/ML-powered analytics at all levels of mobile networks.

Data is created and collected in multiple areas and layers of the network and can be delivered wherever it is needed. Thus, a common framework for disclosure, registration, detection, and delivery of different types of data, such as real-time streaming data, status data from various registrars' services, and data accumulated for training ML models. I believe it is necessary. The convergence of networks and computers is also being considered. In this context, it is important to ensure privacy and provide reliable solutions [Gilberto Berardinelli, 2021].

Impact of 6G
6G technology, which is still in the early stages of research and development, is expected to bring about significant advancements in wireless communication beyond 5G. When combined with artificial intelligence (AI), 6G has the potential to have a profound impact on various aspects of society and technology. Here are some potential impacts of 6G through AI

Ultra-Fast Data Transfer
6G is expected to provide ultra-high data transfer speeds, potentially reaching terabits per second. When combined with AI,this could enable real-time processing of massive datasets, benefiting applications in healthcare, autonomous vehicles, and scientific research.

Low Latency
6G aims to reduce latency to a minimum, making real-time communication nearly instantaneous. AI-powered applications, such as remote surgery or autonomous drones, could operate with minimal delay, enhancing their capabilities.

AI-Enhanced Network Management
AI algorithms can optimize 6G networks for efficient resource allocation, network slicing, and self-healing in the case of network failures. This could lead to more reliable and resilient communication networks.

AI-Driven IoT
6G is expected to support a massive number of IoT devices. AI can be used to manage and analyze the data generated by these devices, making them more intelligent and responsive to user needs.

Enhanced AR and VR
6G's high-speed, low-latency connectivity combined with AI can enhance augmented reality (AR) and virtual reality (VR) experiences. This could revolutionize gaming, education, training, and teleconferencing.

AI-Powered Smart Cities
6G can enable the development of smart cities with interconnected infrastructure. AI can optimize traffic management, energy consumption, and public services, leading to more sustainable and efficient urban living.

AI-Driven Health care
Telemedicine and remote healthcare services could benefit from 6G's capabilities, with AI enabling remote diagnostics, patient monitoring, and personalized treatment recommendations.

AI for Disaster Management
AI can analyze data from various sensors and sources in real-time to improve disaster prediction, response, and recovery efforts, leveraging 6G's connectivity.

AI in Education
With 6G's high-speed internet, AI-powered personalized education platforms can become more accessible, offering immersive and interactive learning experiences.

AI-Enhanced Security
6G networks will need robust security measures. AI can assist in threat detection and prevention, ensuring the integrity and confidentiality of data transmitted over 6G networks.

Environmental Monitoring
6G combined with AI can be used for advanced environmental monitoring, aiding in climate research and conservation efforts

AI-Driven Robotics
High-speed, low-latency 6G networks can enable remote control and coordination of AI-driven robots in various fields, including manufacturing, agriculture, and healthcare. It's important to note that the full realization of these impacts will depend on the successful development and deployment of 6G technology, as well as the integration of AI into various applications. Additionally, ethical and privacy considerations will be crucial when implementing AI in conjunction with 6G to ensure responsible and secure use of these technologies.

Challenges of 6g Through Artificial Intelligence
The integration of 6G technology and artificial intelligence (AI) presents several challenges that need to be addressed for the successful deployment and utilization of these technologies. Here are some of the primary challenges

Technical Complexity and Innovation
Developing and implementing 6G networks with AI capabilities is a highly complex task. These networks will require entirely new infrastructure, including advanced hardware, software, and communication protocols. Continuous innovation is needed to make these technologies practical and efficient.

Network Reliability
Ensuring the reliability and availability of 6G networks is crucial. AI applications heavily rely on real-time data and low latency, making network downtime or disruptions unacceptable, particularly in critical applications like healthcare and autonomous vehicles.

Data Privacy and Security
With the proliferation of AI-driven devices and applications in 6G networks, there will be an increased volume of sensitive data in circulation. Protecting this data from cyber attacks, data breaches, and unauthorized access is a significant challenge that requires robust security measures and encryption.

Ethical Considerations

The use of AI in 6G networks raises ethical concerns, such as algorithmic bias, transparency, and accountability. Ensuring that AI is used responsibly and ethically in applications like autonomous systems and decision-making processes is essential.

Regulatory Frameworks

Policymakers and regulatory bodies will need to adapt and develop new regulations to address the unique challenges posed by 6G and AI. Balancing innovation with the protection of individual rights and societal interests is a complex task.

Spectrum Allocation

6G technology will require access to new frequency bands, and spectrum allocation must be coordinated globally. Ensuring fair allocation while avoiding interference with other services and technologies is a significant challenge.

Energy Efficiency

The development and operation of 6G networks with AI can be energy-intensive. Ensuring energy efficiency and sustainability will be crucial to minimize the environmental impact of these technologies.

Digital Inclusion

Bridging the digital divide and ensuring that the benefits of 6G and AI are accessible to all, regardless of location or socioeconomic status, is a challenge. Expanding network coverage and affordability will be essential.

Interoperability

Ensuring that different components and devices in the 6G ecosystem can work seamlessly together is a technical challenge. Developing common standards and protocols for interoperability is critical.

Human-AI Collaboration

Determining the appropriate roles and responsibilities of humans and AI systems in various applications, such as healthcare, education, and transportation, will be a challenge. Striking the right balance to optimize collaboration is crucial.

Workforce Skills

As AI becomes more integrated into various industries through 6G, there will be a need for a workforce with new skills and capabilities. Preparing the workforce for this transition is essential.

Environmental Impact

The development and deployment of 6G and AI technologies may have environmental impacts, such as increased energy consumption and e-waste. Mitigating these impacts and pursuing sustainable practices is important. Addressing these challenges will require a collaborative effort among governments, industry stakeholders, researchers, and organizations. It will also require ongoing research, innovation, and a commitment to responsible and ethical use of 6G and AI technologies.

FUTURE RESEARCH DIRECTIONS IN 6G

In this section, future research scopes of 6G are discussed.

Machine learning applications

Algorithms Machine learning is an important area for 6G, so different machine learning algorithms should be studied to study their impact on different performance factors for 6G. Generalizing the machine learning process

does not yield satisfactory results for data that is frequently added to applications. Prioritized federated learning should be kept on the list of top priorities for machine learning applications, but it also suffers from fairness issues [L. Loven et al., 2019], [F. Tariq et al., 2019] . Transfer learning can be an efficient approach to adapt 6G systems to the wireless environment [B. Li et al., 2019].

Scalable and Reliable Blockchain-Enabled 6G

We typically use block chain in 6G for secure storage in various smart services such as immutable ledgers and distributed transactions [H.-N. Dai et al., 2019]. Block chain is also used in various smart services such as healthcare, smart supply chain management, etc. 6G technology enables ultra-low latency and low power consumption while maintaining security perspective. We also want to improve the scalability and reliability of the 6G system. Block chain can be an efficient tool to address all the above features while addressing privacy concerns [L. Loven et al., 2019].

Meta-learning-enabled 6G

I would like to experiment with a specific machine learning technique or algorithm for 6G applications. In this case, meta-learning provides a machine learning model that learns metadata for machine learning-based experiments. We aim to fuse general machine learning and meta-learning. This may lead to smarter technologies for his future 6G applications and wireless cellular technology development [L. Loven et al., 2019].

Cloud-based architecture and technology

Fundamentally, 6G is an edge-centric, data flow-based technology. The chain of network functions and services is dynamically determined based on the optimal balance of consumed and available resources in the cloud network. The system should be based on a combination of various machine learning approaches in a cloud environment. It also focuses on the privacy and security of datasets used in technology [L. Loven et al., 2019].

Terahertz frequencies to boost data rates

To improve the data rate for 6G applications and high data rate is one of the most important requirements for his 6G. To do this, we use the frequency band above 52.6 GHz at ultrafast rates of 100 Gbps and above [M. Shafi et al., 2017]. Use the THz band to improve spectral efficiency and mitigate free-space losses, molecular absorption, etc. [M. Shafi et al., 2017], [H. Wang et al., 2014]. Also, integrating a large number of antennas can improve the signal-to-noise ratio (SNR), so the range of power efficiency needs to be better controlled. By applying multiple-input multiple-output (MIMO) configuration, cost-effective high data rate deployment can be achieved in a wide range of 6G networks [40]. We should also be concerned with electromagnetic fields and bio-aware jet flow fields [H. Wang et al., 2014].

AI-based Edge Computing

Mobile computing, which is also used in 5G, cannot keep up with the increased data processing. Therefore, mobile edge computing is gaining tremendous momentum because it can partition the network into cloud computing architectures. There is a need to reduce latency in 6G networks with easy access to cellular networks [F. Tang et al., 2020]. To use more AI throughout the end device or 6G technology process. Also noteworthy are the offline computing capabilities using machine learning techniques [F. Tang et al, 2020] that enable intelligent allocation and offloading of resources in the cloud and at the edge. The application/dataset into mini-batches and use a central controller that helps map across multiple processing devices [F. Tang et al, 2020] at the edge or in the cloud. In real-time communication, clouding (or edge clouding) is expected as a technical goal for 6G connectivity. The use of AI and the impact of reusable data can reach new promising economic scales and many other new areas. Learning-based online connections between the various components of the 6G framework should be built. In agriculture and industry, 6G intelligently handles production generation and enhances secure and very fast connections between different modules. 4.7. Use of Location Based Intelligent Systems (LIS). LIS-based mmWave systems can be used as locations for 6G designs. Now we want to find the best place where we can race reflections and meta surfaces. This

task is very difficult and an inverse channel modeling problem. On the other hand, efficient use of materials in LIS needs to be studied [M. Piran et al., 2019].

6G PROJECT
This section selects major 6G projects that have recently been launched and describes the goals, objectives, and achievements of each project.

Hexa X Project
One of the major 6G projects to start in 2021 is Hexa-X. Nokia launches Hexa-X with Ericsson (Ericson et al., 2021). In this project, various research institutes and universities collaborate to put the latest technology into practical use. These include Dresden, Pisa, Aalto, Turin, Ol, Chalmers, Madrid and Kaiserslautern. Other commercial partners include Qacom, Networks, wings ICT Solutions, bcom, Atos, Intel and Siemens, with TIM, Orange and Telefonica believed to be running the project. The Hexa-X project aims to lay the foundation for 6G networks by 2030 and advance global research and innovation (R&I) into the next generation. The Hexa-X project aims to develop the tools necessary to bring the next generation of wireless communications to Europe and beyond. The project seeks to introduce new 6G technologies and strategies to address six main challenges. We present the most important 6G challenges.

Here is the Hexa-X project:

- Connect Intelligence: Human-to-device communications must leverage new technologies such as artificial intelligence (AI) and machine learning (ML) to improve the quality and efficiency of communications.
- Network of networks: The digital ecosystem requires the establishment of an integrated network of networks. Ideally, this network should be versatile, intelligent, and scalable.
- Sustainability: A sustainable network requires efficient use of resources. • Global service coverage: Global and extensive coverage of 6G networks requires the development of cost-effective and practical approaches.
- Best experience: New network services require high data rates, low latency, massive capacity, and precise location technology.
- Reliability: Next-generation systems must provide data protection, communication integrity, confidentiality, and resilience for advanced security.

Network design, artificial intelligence-driven air interfaces, THz radio access, and network virtualization are being developed to address these issues. This project will focus on connecting the physical, digital, and human worlds using these state-of-the-art communication methods. Hexa-X plans to develop precise location, survey and resource management methods.

DEDICAT6 project
The 6G project "Dynamic Coverage Extension and Distributed Intelligence for Human Centric Applications with 6G with Guaranteed Security, Privacy and Trust" (DEDICAT6) will start in 2021. The project involved several countries such as Greece, Finland, France, Spain, Great Britain and Germany. DEDICAT6's main goal is to transform 5G into a smart platform like 6G. The vision of this intelligent platform is to improve resource utilization, reduce latency, reduce energy consumption, minimize capital and operating expenses (CAPEX/OPEX), and improve security, trust, and privacy. problem should be strengthened. The project addresses four cases including smart highways, smart warehouses, public safety, and enhanced experiences (Srinati et al., 2021). The DEDICAT6 project uses block chain and AI technology to build an intelligent connected platform. The platform allows you to combine your current infrastructure with non-traditional infrastructure. New infrastructure must be intelligent, flexible, support real-time, and energy efficient. This project introduces new techniques using predictive caching and intelligent compute placement for intelligent dynamic resource connection distribution. DEDICAT6 also attempts to develop and design dynamic range extension mechanisms that take advantage of connected devices.

vehicles, drones, robots, etc. These devices cover areas that cannot be quickly accessed in the event of additional temporary capacity for infrastructure, emergencies, or special events. Additionally, many factors need to be considered, such as: B. Device locations and charging station locations for optimal placement and distribution of devices. It also covers mobile service security, reliability assurance, data protection, and the interface between digital ecosystems and human interaction. The project aims to significantly improve resource management, connectivity scaling, security, intelligent network load balancing, and human-machine interaction. A project platform defines several solutions for achieving project goals.

RISE 6G Project

In January 2021, Reconfigurable, Intelligent and Sustainable Environment for 6G Wireless Networks was launched as one of the leading technologies (RISE 6G). Seven countries and 13 partners will adopt RISE-6G. We are proud to have CEA-Leti as one of his strategic partners. This project will continue for the next three years (Di Renzo et al., 2019). The RIS (Reconfigurable Intelligent Surfaces) technology used in RISE-6G is one of the most promising future technologies. The dynamic and targeted control of radio wave propagation enables the perception of the wireless environment as a service. RIS technology creates an intelligent, sustainable and adaptive wireless environment. A total of four challenges are the focus of the project (Liaskos et al., 2018). First, real signal propagation is simulated. It is then integrated into RIS's various new network architectures. Third, numerous use cases have been developed to enable QoS in dynamic wireless programmable environments such as: B. Precise localization, green communication, power consumption, and huge capacity. Fourth, we need to ensure specific rules for airwaves and data security. Devices connected to high-capacity areas are dynamically managed with RIS-enabled settings to minimize power consumption and avoid interference. This project contributes to standardization and brings its technical perspective to the implementation of the project in the industrial field. As a result, Europe maintains technical leadership in his B5G/6G race globally, enabling the development of new European-designed services and economic opportunities.

Meta Project

Meta Wireless is another EU-funded project. This project paves the way for the next generation of his 6G and beyond wireless networks. Most wireless network systems typically assume that the propagation radio channel characteristics are static in nature. Subsequent generations of wireless networks regard the channel as an uncontrollable element (Chirivella-Perez et al., 2021). Meta Wireless treats the environment as a quantity to improve and optimize network performance. RIS has been deployed to operate wireless environments (Hussein et al., 2019). RIS is a planar structure of meta materials and is electromagnetically discontinuous. They do not contain the traditional laws of diffraction and reflection. However, it can be controlled to adjust the phase and wave front of the radio wave. When used to coat objects, walls, or building facades, it allows real-time tuning of the electromagnetic response of the environment. The integration of RIS and wireless networks saves more energy, improves network security, and increases system design freedom. Meta Wireless develops algorithms, theoretical frameworks, optimization protocols, and key foundations for RIS applied to network architectures. Additionally, an open access simulator is designed for network optimization. The simulator analyzes ray tracing modules, creates RIS environments, and tests large-scale RIS environments (Ali et al., 2021).

6G Brains Project

Today's large-scale industrial tasks, services, facilities, and devices of the future require innovative wireless connectivity systems. These intelligent wireless connectivity systems need to be unlocked by new spectrum resources and AI systems to fully manage network resources. The project "Bringing Reinforcement Learning Into Radio Light Network for Massive Connections (6G BRAINS)" (Shi et al., 2021) aims to develop AI at multiple decision-making levels for future industrial applications of large scale and varying requirements. Develop a driven self-learning platform. , such as large-scale connectivity via device-to-device (D2D) (Hady et al., 2020). This AI system is designed to dynamically allocate resources to new frequency links such as THz and optical wireless communications (OWC). The system also aims to increase network reliability and capacity, improve location accuracy and reduce end-to-end delay. The project is said to be the first to propose a new deep reinforcement learning (DRL)-based cross-layer

solution to support 6G requirements. This project aims to set a basic standard for B5G and 6G AI technology. This project aims to create a solid foundation and global standardization of his B5G and 6G technology in areas related to industrial environments. Project solutions aim to transform traditional systems into smart and intelligent systems such as smart factories and smart transportation systems.

These systems have less static intelligent elements. For example, buildings are considered fixed elements, but they are intelligent and flexible. In these new environments, any device can be wireless and routed using 3D SLAM mechanisms. 6G BRAINS Multi access Edge Computing (MEC) develops predictive mechanisms that are updated as in the case of maintenance of old machines. In addition, modeling of his D2D cluster using AI system is developed to improve resource sharing in his OWC band and 200 GHz and 300 GHz bands of 6G BRAINS. This modeling is important to enable the use of THz and OWC in his 6G in industrial environments. The 6G BRAINS solution (Nayak and Patgiri, 2021) also aims to reduce latency, increase availability of high-capacity communication services, extend coverage areas for indoor, outdoor, and indoor/outdoor environments, and concurrent non-real-time transmission. Real-time streaming of data and critically important data. Finally, this project studies device mobility. It seeks to extend the coverage of all connected devices in different scenarios in every location, such as factories and factories.

CONCLUSION

5G technology is not enough to meet the growing communication needs. To satisfy the communication technology needs of this new era, it is therefore vital to plan for the implementation of 6G networks. The development of communication networks from 1G to 5G, research activities on 6G mobile networks, enabling technologies for 6G networks, and the current state-of-the-art are all covered in this paper's thorough overview of the 6G wireless generation networks. The paper shown the architecture and end to end 6G architecture view of the upcoming 6G technology. 6G current projects are discussed and future research ideas are tinted for the researchers.

ABSTRACT

In recent years, the e-commerce market has experienced remarkable expansion, with the security of personal and financial information being a key factor in its popularity. Ensuring the safety of customer data is essential to maintain trust in online transactions. This paper highlights the importance of securing data and building customer trust, particularly when transferring money through online transactions. One technology that has emerged in recent years is facial recognition, which uses digital images to automatically identify a person's information. Facial recognition technology, commonly employed in security systems and airports, is designed to match facial images from various perspectives in order to identify individuals and deter fraudulent activities. This cutting-edge tool plays a crucial role in preventing fraud and enhancing crime control. By capturing and storing facial images, it enables future identification and investigation. Operating on the basis of distinct facial characteristics like cheek curves, eyes, nostrils, and other unique features, this technology remains effective even in environments with limited lighting conditions, effectively combating identity theft.

Keywords: Security, Face recognition, Mobile Banking, Online Transaction, Authentication.

INTRODUCTION

Security is a critical factor in the digital age, especially when it comes to online transactions. One way to enhance security is through the use of OTP (One-Time Password) verification or facial recognition. OTP verification is a process where a unique password is generated for each transaction, which is sent to the user's registered mobile number or email. The user then enters this OTP to complete the transaction, ensuring that only the authorized user can carry out the transaction. This method provides an extra layer of security as even if someone has access to the

67310

Mohd Salman and Rahul Kumar Mishra

user's login credentials, they won't be able to complete the transaction without the OTP. Facial recognition, on the other hand, involves using the user's face as a means of verification. The facial features of the individual are captured. and compared to pre-registered image, and the transaction is approved only if there is a match. This method is secure and convenient as it eliminates the need for the user to remember passwords or enter OTPs. It sounds like the system you are proposing is using facial recognition as a form of biometric authentication to verify the identity of the user during transactions. This is one way to enhance security and reduce the risk of fraudulent transactions. However, it's worth noting that facial recognition technology is not foolproof and can sometimes fail to match a user's face, especially in certain lighting conditions or if the user has changed their appearance. In such cases, sending an OTP (one-time password) can provide an additional layer of security.

The use of biometric authentication, specifically face recognition, in the case of account takeover is a promising solution to reduce fraud. Through the process of capturing and validating a real-time image of the cardholder during a transaction, the system can ensure that the person using the account is the authorized user. Face recognition stands out among various biometric data authentication methods, including fingerprint, hand geometry, iris, and palm. It offers exceptional usability and enjoys widespread acceptance. Additionally, it can be implemented with existing hardware such as smart phones or cameras, making it a practical solution for many businesses and consumers. However, it's important to note that biometric authentication should not replace other security measures such as PINs, but rather be used in conjunction with them for added security. Also, it's important to ensure that the biometric data is stored securely and is not vulnerable to hacking or theft. To enhance security further, facial recognition technology can be used to verify the identity of the user. This technology uses biometric data to confirm the identity of the user, such as facial features, which are unique to each person. By using facial recognition technology, authorized users can easily and securely access their accounts without the need for a password.

Overall, it is important to use a combination of strong passwords and advanced security technologies, such as facial recognition, to prevent unauthorized access and protect sensitive information.

What is Face recognition

Facial recognition technology is becoming increasingly common in many different industries, including law enforcement, security, retail, and social media. The technology uses algorithms to analyze and By examining various facial attributes, including the interocular distance, nasal shape, and facial contours, a distinctive "facial signature" can be established for every person. This process involves comparing these features to differentiate individuals from one another. The application of facial recognition extends to a broad range of uses, encompassing not only security measures but also various other purposes and surveillance, access control, and identity verification. For example, some airports and border control checkpoints Utilize facial recognition technology for identity verification of travelers, while some retail stores use the technology to identify and track customers for marketing purposes. However, facial recognition technology is also controversial, as it raises concerns about privacy, accuracy, and bias. Some experts have raised concerns about the potential for facial recognition systems to be used for mass surveillance or to discriminate against certain groups of people. Additionally, Instances have occurred where technology has generated inaccurate outcomes, resulting in incorrect identifications and unjustifiable arrests.

REVIEW OF LITERATURE

Biometric face recognition filters with the option to be easily canceled

Biometric authentication systems Utilize distinct physical or behavioral attributes to authenticate the identities of individuals. Biometric templates are the digital representations of these characteristics and are stored in a database for future comparisons. However, one challenge with biometric templates is their revocability. In case of a security breach, it may be necessary to revoke a template to prevent further unauthorized access. Therefore, it is crucial to design biometric authentication systems that can produce revocable templates. In this article, we propose a new scheme for producing revocable biometric templates. We use minimum mean correlation energy (MMCE) filters,

67311

which are widely used in biometric authentication systems. MMCE filters are designed based on training images that are specific to an individual's biometric characteristics. However, using the original training images to construct the filter creates a problem of revocability since the images cannot be changed once they are stored in the database. Overall, our proposed scheme provides a solution for producing revocable biometric templates without compromising authentication performance. The incorporation of this enhancement has the potential to enhance the security of biometric authentication systems significantly, consequently fostering their wider acceptance and utilization across various applications.

Develop a predictive model for facial recognition

The "Associate-Predict" (AP) model you described is a promising approach to managing variations between parties in facial recognition. By using a complementary common identity dataset with multiple images for each identity, the model can account for intra specific variability in facial features, such as changes in pose, lighting, and expression. The AP model works by first identifying facial features and encoding them into a compact representation. Then, it uses a predictive association model to match faces based on their encoded features, rather than relying solely on visual appearance. This approach allows the model to more accurately measure the similarity between faces, even when they are in significantly different settings. Overall, the AP model is a novel solution to a challenging problem in facial recognition. It has the potential to improve the accuracy and reliability of facial recognition technology, while also addressing concerns around privacy and bias. However, further research and development are needed to fully evaluate its effectiveness and ensure that it is being used in an ethical and responsible manner.

Facial feature detection for facial authentication

The mentioned research introduces an algorithm that focuses on detecting facial features and automating the extraction of features for face authentication. The approach employed in the research combines multiple techniques for both region detection and feature extraction from facial images. By leveraging these methods, the algorithm aims to enhance the accuracy and efficiency of facial authentication processes. The paper also mentions the use of a feature vector dimensionality reduction method. This approach offers the potential to decrease the dimensionality of the extracted feature vectors, which can help reduce computational complexity and improve the efficiency of the face authentication system. Overall, the approach described in the paper provides a comprehensive framework for facial feature detection and authentication. By combining various techniques for region detection and feature extraction, the proposed approach can effectively identify and authenticate individuals based on their facial features.

Partial Face Recognition

The method being discussed is commonly known as an "alignment-free" approach, indicating that it doesn't depend on accurately aligning facial features like eyes, nose, and mouth for face recognition. Rather, the technique outlined in the research paper utilizes a descriptor of variable size to represent each face, essentially capturing a collection of key point descriptors. This approach aims to capture the distinctive and discriminative features of a face by automatically detecting a set of key points. By employing this technique, the algorithm seeks to extract relevant facial information that can contribute to accurate and reliable face recognition. Various methods, including the Scale-Invariant Feature Transform (SIFT), Speeded up Robust Features (SURF), and Oriented FAST and Rotated BRIEF (ORB), can be utilized to identify these crucial points. Once detected, each key point is associated with a descriptor, which is computed based on the surrounding image details. These descriptors are subsequently combined to create a comprehensive representation of the entire face. The size of the descriptor can vary, depending on the number of key points detected and their distribution across the face. To recognize a partial face, the same process is applied to the image patch containing the partial face, and the resulting descriptor is compared to the descriptors of the known faces in a database using a similarity measure such as Euclidean distance or cosine similarity. The advantage of this approach is that it can handle partial faces captured under different conditions and orientations without the need for precise alignment. However, it may not be as accurate as alignment-based methods for recognizing full faces, especially under challenging conditions such as low resolution or occlusion.

Mohd Salman and Rahul Kumar Mishra

Improving User Authentication for Online Credit Card Payments
This article presents a novel process that introduces face match verification to enhance the security of online payment systems. The proposed method aims to strengthen the authentication process by incorporating facial recognition technology. By utilizing face match verification, the system enhances the overall security and reduces the risk of fraudulent transactions in online payment systems. The proposed process involves the use of facial recognition technology to verify the identity of the user making the transaction. This technology compares the user's face with a stored reference image to determine whether they are the legitimate owner of the account. The simulation provides valuable insights and data that contribute to the overall assessment of the system's effectiveness. The simulation involves a series of test scenarios to assess the accuracy and efficiency of the face match verification process. The results of the simulation demonstrate that the proposed process can effectively improve the security of online payment systems. Overall, the article highlights the importance of implementing advanced security measures to safeguard user information during online transactions. The proposed process with face match verification is a promising solution that can help to prevent unauthorized access and fraudulent activity in online payment systems.

A Face Recognition System in Real-Time Utilizing the Enhanced Local Binary Patterns Histogram Algorithm
The Local Binary Patterns Histogram algorithm is a widely used method for face recognition. It works by extracting local features from an image, encoding those using binary patterns, and then using a histogram to represent the distribution of these patterns. However, the LBPH algorithm suffers from decreased recognition rates when faced with variations in lighting, expression, and pose. To address these issues, a modified version of the LBPH algorithm called Median-based LBPH (MLBPH) has been proposed. In this method, instead of using the gray value of a pixel directly, the gray value is replaced by the median value of its surrounding pixels. This helps to reduce the effects of noise and other variations in the image. After the pixel values have been replaced by their median values, the image is divided into sub-blocks, and a statistical histogram is created for each block. These histograms are then combined to form a dictionary of MLBPH objects. When faced with a test image, the MLBPH algorithm extracts features from the image in the same way, and then compares the resulting feature vector to the MLBPH dictionary to find the closest match. Overall, the MLBPH algorithm is an improvement over the original LBPH algorithm, as It exhibits greater resilience towards changes in lighting conditions, facial expressions, and body positions. However, like any face recognition algorithm, it is not perfect and may still face challenges when dealing with highly variable images.

Exploring Deep Learning for Face Recognition Research
Deep learning models have consistently demonstrated exceptional performance in the field of face recognition, setting new benchmarks in accuracy and efficiency. The deep neural networks used in face recognition can learn hierarchical representations of facial features, which can be used to identify and verify individuals with high accuracy. There are various techniques and methods used in deep learning for face recognition, This line mentions three types of neural networks: convolutional neural networks (CNNs), recurrent neural networks (RNNs), and deep belief networks (DBNs). These models are trained on large datasets of labeled facial images and can learn to recognize and distinguish between different individuals. The applications of deep learning in face recognition are vast, ranging from security and surveillance to user authentication in mobile devices and social media platforms. The technology is also being used in healthcare for medical imaging analysis and in the entertainment industry for facial recognition-based special effects.

Review of Face Recognition Techniques
Research in the field of face recognition has been conducted from different perspectives, such as computer vision, machine learning, and pattern recognition. The development of face recognition technology has gone through several stages, including face detection, face alignment, feature extraction, and matching. Each of these stages involves different techniques and algorithms, and the development of these techniques has led to the improvement of face recognition accuracy. The evaluation of face recognition systems involves various criteria, such as accuracy, speed, and robustness. To evaluate the performance of face recognition algorithms, researchers use different face recognition databases, such as LFW, CFP, and IJB-A. The development of face recognition technology has led to significant progress in the field of biometrics. The technology has become an essential tool in various fields, and

ongoing research is focused on improving its accuracy, speed, and reliability. The use of general evaluation criteria and databases has allowed researchers to compare and evaluate different face recognition systems and techniques.

GPU-accelerated LBPH Algorithm for Frontal and Side Profile Face Recognition

LBPH algorithm is a popular method for facial recognition and can be implemented on different hardware platforms. The use of GPU for LBPH algorithm can significantly improve the performance of the system. In this paper, the LBPH algorithm is implemented on GPU for front and side face recognition. In this paper, the performance of the LBPH algorithm on CPU and GPU is compared. The experimental results show that the GPU implementation of the LBPH algorithm is significantly faster than the CPU implementation. The use of GPU reduces the execution time of the algorithm, making it suitable for real-time applications.

Digital Image Processing for Face Detection and Recognition System

Facial recognition systems have become an important technology in many industries, including security, law enforcement, and social media. As you mentioned, there are two main techniques used in facial recognition: Eigen face and Fisher face. The Eigen face method involves using principal component analysis to reduce the dimensionality of facial images, representing them as a linear combination of eigen faces, which are essentially statistical representations of the variations in a set of training images. The Fisher face method, on the other hand, uses Fisher's linear discriminant analysis to find a linear combination of facial features that best discriminates between different classes of faces. Digital image processing plays a critical role in developing facial recognition systems, as it involves preprocessing and enhancing images to improve the accuracy and robustness of the recognition algorithms. Techniques such as image normalization, filtering, and segmentation are commonly used in facial recognition systems to improve the quality of facial images and reduce the impact of variations in lighting, pose, and facial expression. However, facial recognition technology also raises concerns about privacy and ethical issues, particularly in the context of surveillance and law enforcement. As such, it is important to consider these issues and implement appropriate safeguards and regulations to ensure that facial recognition technology is used ethically and responsibly.

Study on Face Recognition Techniques

In the past few years, the popularity of facial recognition systems has soared due to their ability to provide a convenient and secure means of identifying individuals across various settings. These systems use biometric data, such as facial features, to identify individuals and grant access to certain areas or services. In order to develop a precise and efficient facial recognition system, it is crucial to utilize a variety of techniques and technologies. Facial recognition begins with the initial stage of face detection, which entails locating and identifying faces within an image or video. This process usually involves a combination of skin probabilistic image search and skin segmentation techniques. Skin probabilistic image search focuses on identifying areas in the image with skin-like tones, while skin segmentation employs algorithms to separate the skin regions from the non-skin regions. Once a face is detected, additional steps are taken to extract distinctive features for recognition. This typically involves morphometric operations to capture the facial boundary regions, allowing for analysis and identification of unique attributes such as the positioning of the eyes, nose, and mouth. Haar like feature detection can also be utilized to identify specific facial features like the eyes and mouth. Lastly, the detected face is subjected to face recognition technology to improve the accuracy of individual identification. This is accomplished by employing a combination of classifiers, such as neural networks, support vector machines, and decision trees. These classifiers assess the extracted facial features and compare them to a database of known faces, enabling the determination of the individual's identity.

Implementing a Face Recognition System in Real-Time

It is true that facial recognition technology has become increasingly important in a wide range of applications, including security, law enforcement, and user verification. Your proposed algorithm could potentially improve the efficiency and accuracy of facial recognition systems. PCA and LDA are two commonly used techniques in facial recognition. PCA reduces the dimensionality of the face image data by transforming the original images into a set of

Mohd Salman and Rahul Kumar Mishra

eigen faces. LDA, on the other hand, finds a linear combination of the original features that maximizes the class separation between different individuals. By combining the strengths of these two techniques, your algorithm may be able to achieve better recognition rates than either technique alone. Additionally, implementing the facial recognition system on an embedded system like Raspberry Pi 3 can make it more accessible and easier to deploy in real-world applications. However, it is important to note that facial recognition technology has also been subject to criticism and controversy, particularly in terms of privacy and potential biases in the data used to train the algorithms. It is important to carefully consider and address these concerns when developing and implementing facial recognition systems.

Rapid and Optimal Execution of Convolutional Neural Networks

The authors of the paper identified a key challenge faced by deep neural networks for image recognition tasks - the trade-off between depth and width. While increasing the depth of a network can lead to better accuracy, it also increases the number of parameters and computational complexity, making it more difficult to train and slower to evaluate. On the other hand, increasing the width of a network can improve accuracy but also increases the memory requirements and computational cost. In addition, the authors introduced other techniques to reduce the computational cost of the network, such as using 1x1 convolutions for dimensionality reduction and introducing auxiliary classifiers to encourage the network to learn more discriminative features. Overall, the Inception architecture proposed in this paper achieved state-of-the-art performance on the ILSVRC14 dataset while being more computationally efficient than previous approaches.

Detection of Credit Card Fraud Using Transaction Behavior

According to the paper, multiple classifiers were assessed in the process of model creation. The results indicate that the Random Tree and J48 classifiers achieved the most accurate outcomes, with accuracy values of 94.32% and 93.50% respectively. The accuracy of a detection model holds significance as it directly influences the model's ability to identify irregular transactions effectively. Upon further examination, it was observed that J48 exhibited a superior comprehension of transaction log data. This discovery emphasizes the significance of comprehending the data under analysis while constructing a detection model. Overall,the paper's recommendation to have a detection model in place as a fallback in case of EMV chip card technology failure is a wise one. It is important to have measures in place to detect anomalous transactions, as they can be indicative of fraudulent activity. The use of classifiers such as Random Tree and J48 can aid in the detection of anomalous transactions, with J48 being a better choice for understanding processing log data.

METHODOLOGY

Module 1: Dataset Creator

In this module, our objective is to create a comprehensive dataset that incorporates the user's photos along with the corresponding data they have provided. In order to achieve this, we will make use of different libraries. These include cv2, which is utilized for computer vision tasks, numpy for efficient handling of image arrays, and sqlite3 for creating the database dataset. The user's photographs will be stored in an array format to maintain the arrangement of pixels within a structured array. Furthermore, the relevant information, such as the user's ID and name, will be incorporated into the name of the stored image, thereby establishing a connection between the user and the system during the initial usage. The module utilizes the cascade classifier function from the cv2 library to store the user's photos using the Haar cascade algorithm. This module captures images using a camera as input and saves them in a grayscale format compatible with LBPH. The algorithm performs the necessary operations. Upon activation of the module, users will be prompted to input their name and ID number. The module incorporates the cv2 function to capture camera input and generate a block that utilizes the Harr Cascade Algorithm to identify facial features. A block is triggered whenever a face is detected, and a grayscale border is subsequently applied to the face, which is then saved in the database. At present, the code within this module determines the number of photos to be stored, with the current setting being 51.

Mohd Salman and Rahul Kumar Mishra

Module 2: Trainer

During this lesson, we will undergo training on the dataset created in the preceding module and export the resulting trained data as a.yml file. This particular module relies on several libraries, namely cv2 for image processing, os for accessing file paths, and numpy for image pixel manipulation and classification in array form. Another library utilized in this module is the Python Imaging Library. To facilitate image recognition, the module implements a local binary pattern histogram. This module utilizes the LBPH algorithm to train the images in the dataset by comparing their light and dark contrast. The primary objective is to establish boundaries for each object present in the image, achieved by initially assigning labels to distinct sets of pixels.

Module 3: Detector

The module serves as the primary component through which the client can obtain desired output. To harness real-time functionality within this module, the cv2 library is utilized. Additionally, the numpy library is employed to manipulate both the pixel array of the image and the camera's input stream, specifically in the context of regional binary operations. Moreover, the module incorporates the utilization of pattern histograms to facilitate the matching process of faces within the input image. The basic idea behind LBP is to describe the local structure of an image by comparing each pixel to its neighboring pixels. Specifically, LBP calculates a binary code for each pixel in an image based on the relative values of its neighboring pixels. This binary code is then used as a feature descriptor to represent the texture of the image. The LBP operator works by comparing the gray level intensity of each pixel with its surrounding neighbors. For each pixel, a binary pattern is generated based on the comparisons of the intensity value of the central pixel to its neighbors. The pattern is then converted to decimal form to produce the LBP value for that pixel. The LBP values for all the pixels in an image are then concatenated to form a feature vector. LBP has been used in a wide range of applications, such as face recognition, texture classification, object detection, and even medical imaging. It is a computationally efficient feature descriptor and is robust to illumination changes and noise. However, it may not be as effective in representing more complex textures or patterns. In the first module yields two outputs: the customer id, which the customer inputted in previous, and a confidence value. The confidence value is determined by comparing the real-time input image of the person to the machine's trained image, indicating the accuracy of the machine's prediction. To ensure secure and reliable payment processing, the One-Time Password (OTP) is delivered to the email address provided during registration of the recognized individual. The transaction can only be successfully completed after entering the OTP, which is verified using a PIN, adding an extra layer of security.

Architecture of face recognition system

Many techniques are used in face recognition some are given blow:

LAPH Algorithm

The LBPH approach involves dividing the visual frame into a grid-like arrangement, with each pixel representing a grid cell. In order to capture the image's contrast, the algorithm examines the pixel and its surrounding pixels, forming virtual lines. A circular boundary is placed around the central pixel, and eight neighboring pixels are chosen. If the central pixel's value exceeds that of its neighbors, it is assigned a '0'; otherwise, a '1' is assigned. This procedure generates virtual lines across the image, effectively capturing the fluctuations in light and dark contrasts.

Neural Network

A neural network can be described as a network or circuit composed of biological neurons in the field of biology. In modern times, the term "neural network" can also encompass an artificial neural network comprising artificial neurons or nodes. Therefore, a neural network can encompass both a biological neural network composed of biological neurons and an artificial neural network utilized for addressing artificial intelligence (AI) challenges.

Cascade Algorithm

Instead of relying on virtual lines, the Cascade Algorithm employs wavelets to process images. Prior to applying this technique to a photograph, the image must be converted to grayscale. By sampling light and dark hues from various

67316

Mohd Salman and Rahul Kumar Mishra

images and blending them, a wave pattern is generated. This Haar wavelet pattern is then employed to analyze facial structure and aid in recognition.

Existing System
A typical multi-factor authentication system typically starts by asking the user to enter their login details, including their username and password. Afterward, an extra verification step is added, such as receiving an SMS message on the user's registered phone, which serves as something they possess. By incorporating photo recognition into the authentication process, an additional layer of security can be introduced without excessively burdening authorized users during the login process. Many banks utilize photo recognition as part of their multi-factor authentication system, allowing customers to securely access their accounts and authorize financial transactions. Moreover, photo recognition authentication proves to be an effective safeguard against phishing attempts, where deceptive websites attempt to replicate the appearance of genuine banking platforms.

Data Flow Diagram
A data flow diagram (DFD) is a visual depiction illustrating the movement of data within an information system. It presents a broad perspective of the system's data flow while avoiding excessive intricacies. With a DFD, one can easily visualize the movement of data between different processes within the system. This enables stakeholders to gain a better understanding of the system's information flow and identify any areas that may require improvement or optimization.

The system's flow follows these steps:
1. The user enters the preferred payment amount and verifies it.
2. The system conducts facial authentication by comparing the provided image with pre-existing datasets.
3. Upon successful facial verification, the payment is successfully executed.
4. In the event of facial verification failure, the system prompts the user to input a PIN code.
5. If the PIN code is verified, the payment is processed successfully.
   If the PIN code verification fails, the payment is declined. This process ensures the security and authorization of payments by employing facial recognition as the primary method and a secondary verification approach to mitigate the possibility of unauthorized transactions.

RESULT

Learning Rate (0.0001)
In the graph mentioned, the x-axis represents the images, which could refer to different samples or instances in a dataset. The y-axis represents the IOU (Intersection over Union), which is a metric commonly used to evaluate the accuracy of object detection or segmentation algorithms. The IOU measures the overlap between the predicted and ground truth regions, providing a measure of how well the algorithm performs in capturing the objects of interest. The graph is likely used to visualize the relationship between the images and their corresponding IOU values, which can help analyze the performance of a model or algorithm in terms of object detection or segmentation accuracy. In the blow graph y-axis stand for recall and x-axis stand for image. Based on the conducted experiments, it was found that a learning rate of 0.0001 resulted in the detection of objects. However, it is noted that this learning rate led to lower accuracy in terms of classification. A lower learning rate like 0.0001 generally means smaller weight and bias adjustments during the training process. While this may allow the model to detect objects, it could lead to slower convergence and potentially lower classification accuracy.

Iterations: 800000
In the blow graph y-axis stand for recall and x-axis stand for image. In the blow graph y-axis stand for recall and x-axis stand for image. Based on the conducted experiments, it was found that the optimal value for the training parameter "Iterations" was 800,000. When training the network for fewer iterations, fewer bounding boxes were

Mohd Salman and Rahul Kumar Mishra

predicted, and the accuracy was lower. Training iterations refer to the number of times the model goes through the training data during the training process. It allows the model to update its weights and biases, gradually improving its performance. In this case, training the network for 800,000 iterations led to improved performance in terms of both the number of predicted bounding boxes and their accuracy. However, it's important to note that the optimal number of iterations may vary depending on the specific dataset, model architecture, and problem being addressed.

CONCLUSION

The objective of the research is to improve the ease of payment by leveraging the OpenCV module in the Python programming language. It involves creating a database of user face images, along with their account details and registered phone number. The system employs the LBPH algorithm and Haar cascade classifier for training purposes within the project. Once the user's face is recognized by the machine, a unique OTP (One-Time Password) is generated and sent to the registered email address during the payment process. To provide additional security, the OTP is further reinforced with pin verification. This combination of facial recognition, OTP, and pin verification ensures a robust and secure payment experience.

ABSTRACT

Biodegradable packaging materials have gained significant attention in recent years due to the growing concerns about plastic pollution and environmental sustainability. This review article explores the potential of cellulose-based bio films as a sustainable alternative for packaging in the pharmaceutical and food industries. Cellulose, a renewable and biodegradable polymer, offers several advantages such as biocompatibility, mechanical strength, and barrier properties. This review evaluates the current state of cellulose-based bio films in packaging applications and discusses their potential benefits and challenges.

Keywords: Biodegradable, biocompatibility, cellulose

INTRODUCTION

Plastic packaging has been widely used in the pharmaceutical and food industries due to its convenience and durability. However, the environmental consequences of plastic waste have raised concerns, prompting the exploration of alternative packaging materials. Biodegradable cellulose-based biofilms have emerged as a promising option due to their renewable nature, biocompatibility, and potential to reduce the environmental impact of packaging. The use of plastic for packaging has grown extensively in recent years. Inert and non-biodegradable plastic materials represent ~30% of municipal solid waste. In this context, biodegradable films can be a source of saving of energy and an important issue for environmental protection [1]. Biodegradable polymers into three groups of (a) blends of synthetic polymers (i.e., polyethylene) with natural polymers, (b) bacterial polyesters

67321

(polyhydroxyalkanoates), and (c) natural polymers more or less modified (polysaccharides or proteins) [2]. Considering the low cost of raw material and the beneficial impact on the environment, the natural polymers became the subject of intensive studies for the development of biodegradable films [3].

Introduction to Cellulose Biofilms
Cellulose biofilms represent a promising class of biodegradable materials with diverse applications, ranging from packaging to biomedical devices. These biofilms are primarily composed of cellulose, a linear polysaccharide consisting of repeating glucose units linked together by β-1,4 glycosidic bonds. Cellulose is the most abundant biopolymer on Earth and is mainly found in plant cell walls, making it a renewable and sustainable resource [4].

Cellulose as a Renewable Polymer
One of the key advantages of cellulose-based bio films is the renewability of the raw material. Cellulose can be sourced from various plant-based feed stocks such as wood pulp, cotton, hemp, and agricultural residues [5]. This abundance and renewability make cellulose a viable alternative to petroleum-based plastics, addressing concerns related to resource depletion and environmental sustainability.

Biocompatibility and Safety
Cellulose is inherently biocompatible and safe for contact with biological systems, including human tissues [6]. This property is of particular importance when considering applications in the pharmaceutical and biomedical fields, where direct contact with the human body or sensitive drug compounds is common. Cellulose-based bio films have been extensively studied for wound dressings, tissue engineering scaffolds, and drug delivery systems [7].

Mechanical Strength and Barrier Properties
Cellulose bio films possess remarkable mechanical strength, which can be further enhanced through processing and modification techniques [8]. These bio films also exhibit excellent barrier properties against oxygen, moisture, and UV radiation, making them suitable for various packaging applications [9]. In the food industry, cellulose-based bio films can extend the shelf life of products by acting as an effective barrier against external factors that contribute to spoilage and degradation.

Environmental Benefits
Perhaps the most compelling feature of cellulose bio films is their biodegradability [10]. Unlike conventional plastics that persist in the environment for centuries, cellulose-based materials can be broken down by microorganisms into harmless compounds, reducing long-term ecological impact and mitigating plastic pollution issues.

Versatility in Processing and Functionalization
Cellulose bio films are highly versatile materials that can be processed into various forms, including films, coatings, and composites [11]. Additionally, cellulose's surface can be modified to introduce specific functionalities, such as antimicrobial properties or controlled drug release, expanding its range of applications in both the pharmaceutical and food industries [12].

Biomasses that can be used for Cellulose Extraction
Cellulose, a natural polymer composed of glucose units, is a key component of plant cell walls. It can be extracted from a wide range of biomasses, making it a versatile and sustainable raw material for various applications. Here, we'll discuss some of the biomasses commonly used for cellulose extraction, along with relevant references in Vancouver formatting

Wood Biomass
Wood is one of the most abundant and widely used sources of cellulose. Both hardwoods (e.g., oak, birch) and softwoods (e.g., pine, spruce) contain significant amounts of cellulose [13].

Cotton Linters
Cotton linters are short cellulose fibers obtained from the cotton plant after ginning. They are primarily composed of cellulose and are used for various industrial applications, including papermaking [14].

Agricultural Residues
Various agricultural residues, such as rice straw, wheat straw, and sugarcane bag gasse, are rich sources of cellulose. These residues are often left unused and can be valorized through cellulose extraction [15].

Algae
Certain types of algae, such as green algae and brown algae, contain cellulose in their cell walls. Algae-derived cellulose has gained attention for its potential in sustainable bio products [16].

Bacterial Cellulose
Bacterial cellulose is produced by various bacterial strains, such as Aceto bacter and Komagataei bacter. It is a unique source of high-purity cellulose with applications in biotechnology [17].

Municipal Solid Waste (MSW)
Cellulose can also be extracted from paper and cardboard components of municipal solid waste. Recycling cellulose from MSW contributes to waste reduction [18]

Applications of Cellulose Biofilms in Pharmaceutical and Food Industry
Applications of Cellulose Bio films in Pharmaceutical Industry
Cellulose-based biofilms have gained significant attention in the pharmaceutical industry due to their biocompatibility, biodegradability, and potential for controlled drug delivery. These versatile materials find application in various aspects of pharmaceutical packaging and drug delivery systems.

Drug Delivery Systems
Cellulose-based bio films have been explored as promising materials for drug delivery systems. They can be tailored to control the release of pharmaceutical compounds, ensuring the sustained and controlled delivery of drugs to patients. By adjusting the composition and structure of cellulose bio films, researchers can achieve specific drug release profiles, making them suitable for a wide range of therapeutic applications [19].

Blister Packaging
In the pharmaceutical industry, blister packaging is commonly used to protect individual doses of medication. Cellulose-based blister packs have emerged as an eco-friendly alternative to traditional plastic blister packaging. These bio films provide a protective barrier for pharmaceutical products while being biodegradable and compostable, addressing sustainability concerns [20].

Edible Films for Oral Drug Administration
Cellulose-based bio films have also been investigated for their potential use in edible films for oral drug administration. These films can encapsulate pharmaceutical compounds, making them easier to administer, especially for pediatric and geriatric populations. They dissolve in the oral cavity, releasing the drug and eliminating the need for traditional tablets or capsules [21].

Wound Dressings
Cellulose bio films have been employed in the development of wound dressings for pharmaceutical applications. These bio films possess moisture-absorbing properties and can be designed to release pharmaceutical agents, promoting wound healing and reducing the risk of infection [22].

Sadique Hussain Tapadar and Durga Prasad Kemisetti

Vaccine Stabilization

The stability of vaccines is crucial for their efficacy. Cellulose-based bio films have been explored as stabilizing agents for vaccine formulations. They can help protect the vaccine from degradation due to temperature fluctuations and moisture exposure, making them valuable in the storage and transportation of vaccines [23].

Drug-Coated Implants

Cellulose bio films can be coated with pharmaceutical compounds to create drug-coated implants. These implants provide controlled drug release over an extended period, making them suitable for localized drug delivery applications, such as implantable contraceptive devices and orthopedic implants [24].

Buccal Drug Delivery

In buccal drug delivery, cellulose-based bio films have been used to create mucoadhesive drug delivery systems. These systems adhere to the mucous membranes of the oral cavity, allowing for the controlled release of pharmaceutical compounds, providing an alternative to traditional oral delivery methods [25].

Taste-Masking in Pediatric Medications

Cellulose bio films can be employed to mask the taste of pharmaceutical formulations, particularly important for pediatric medications. By encapsulating the drug in a taste-masked cellulose-based bio film, it becomes more palatable and easier to administer to children [26].

Applications of Cellulose Bio films in Food Industry

The pharmaceutical industry has been actively exploring cellulose-based biofilms as a sustainable and versatile alternative for various packaging and drug delivery applications. The following sections discuss the key applications of cellulose bio films in pharmaceuticals.

Food Wraps

Cellulose-based bio films are increasingly being used as an eco-friendly alternative to conventional plastic wraps. These bio films are particularly advantageous for wrapping fruits, vegetables, cheeses, and baked goods. They provide excellent moisture resistance, maintaining the freshness of the food products, and helping to extend their shelf life. Cellulose food wraps are also compostable, reducing waste and environmental pollution [27].

Edible Packaging

Edible packaging represents an innovative application of cellulose bio films in the food industry. These bio films can be used to create edible coatings or casings for various food items, such as sausages, candies, and even beverages. They offer a unique combination of biodegradability and consumer convenience. Edible packaging reduces the need for additional packaging materials and enhances the overall eating experience [28].

Barrier Films

Cellulose-based bio films can be engineered to function as effective barrier materials, providing protection against moisture, oxygen, and other contaminants. In food packaging, these barrier films are crucial for preserving the quality and safety of perishable products. They are commonly used for packaging snacks, cereals, and dehydrated foods. The biocompatibility of cellulose bio films ensures that they do not compromise the sensory properties or safety of the enclosed food items [29].

Fresh Produce Packaging

Cellulose-based bio films are employed in the packaging of fresh produce, such as salads, herbs, and berries. Their moisture-resistant properties help maintain the appropriate humidity levels within the packaging, reducing wilting and extending the shelf life of the produce. These bio films are especially useful for organic and natural food products, where sustainable packaging is a significant selling point [30].

Dessert and Pastry Packaging
In the dessert and pastry industry, cellulose bio films are used for packaging delicate and perishable items like cakes, pastries, and chocolates. They provide an excellent moisture barrier, preventing the items from becoming soggy or losing their crispness. Additionally, cellulose bio films can be printed with food-safe ink for branding and product information [31].

Dairy Product Packaging
Cellulose bio films are used for packaging dairy products such as yogurt and cheese. They help maintain the freshness and flavor of these products while offering a sustainable alternative to traditional plastic containers. The biodegradable nature of cellulose bio films aligns with the environmentally conscious preferences of many consumers [32].

FUTURE PROSPECTS AND CHALLENGES
Future Prospects and Challenges: the future prospects of Cellulose Bio films in Pharmaceutical and Food Industry are discussed elaborately below

Sustainability and Environmental Benefits
Biodegradable cellulose-based bio films offer pharmaceutical companies an eco-friendly alternative to traditional packaging materials. As global sustainability concerns grow, the pharmaceutical industry is likely to increasingly adopt cellulose-based bio films to reduce its environmental footprint.

Extended Shelf-Life
Cellulose-based bio films can be engineered to provide excellent barrier properties against moisture, oxygen, and UV radiation. This can extend the shelf-life of pharmaceutical products, ensuring their efficacy over a longer period, which is a significant advantage in the industry [33].

Customizability and Functionalization
Researchers are exploring methods to customize cellulose-based bio films to meet specific pharmaceutical packaging needs. Functionalization with antimicrobial agents, desiccants, or indicators for temperature and humidity can enhance product stability and safety [34].

Drug Delivery Integration
Cellulose-based bio films can be designed not only as packaging but also as drug delivery carriers. This integrated approach may lead to innovative drug delivery systems, simplifying dosing regimens and improving patient compliance.

Printable Electronics and Smart Packaging
Incorporating printable electronics into cellulose-based bio films can enable smart packaging solutions. These can provide real-time information on product status, authenticity, and usage, enhancing pharmaceutical safety and traceability [35]
.
Challenges of Biodegradable Cellulose-Based Bio films in Pharmaceutical Packaging
Regulatory Compliance
Meeting stringent pharmaceutical regulations and quality standards is a significant challenge. Pharmaceutical packaging materials must adhere to strict guidelines for safety, stability, and compatibility with drugs. Manufacturers will need to navigate regulatory hurdles to gain widespread acceptance.

Sadique Hussain Tapadar and Durga Prasad Kemisetti

Scalability
While research shows promise, scaling up the production of cellulose-based bio films to meet the demands of the pharmaceutical industry remains a challenge. Large-scale production methods that maintain quality and consistency are needed [36].

Cost Considerations
At present, cellulose-based bio films may be more expensive to produce compared to conventional plastics. Pharmaceutical companies must weigh the environmental benefits against the potentially higher production costs.

Durability and Handling
 Ensuring that cellulose-based bio films can withstand the rigors of pharmaceutical handling and distribution, including resistance to tearing and puncturing, is vital.

Biodegradability in Controlled Environments
While biodegradability is an advantage, pharmaceutical products should ideally remain stable during their intended shelf-life. Balancing biodegradability with the need for long-term product integrity can be complex.

Consumer Acceptance
Pharmaceutical packaging materials must instill confidence in consumers regarding product safety and integrity. Ensuring that consumers understand the benefits of cellulose-based bio films is essential for their successful adoption [37].

CONCLUSIONS

In conclusion, biodegradable cellulose-based bio films hold great promise as sustainable and effective packaging materials in the pharmaceutical industry. However, addressing challenges related to regulatory compliance, scalability, cost-effectiveness, durability, and consumer acceptance will be critical for their widespread adoption. Continued research and innovation in this area are necessary to fully realize the potential of cellulose-based bio films in pharmaceutical packaging. Cellulose-based bio films hold significant promise as a sustainable packaging material in the pharmaceutical and food industries. Their renewable nature, biocompatibility, and strong barrier properties make them a viable alternative to traditional plastics. With ongoing research and innovation, cellulose-based bio films are poised to play a crucial role in reducing the environmental impact of packaging while ensuring product safety and quality.

ABSTRACT

Work life balance is satisfaction of one mind and someone current state of achieving their goal. It is depend on many factors such as living standard, needs, family situation, marital status etc. Work life balance of women working ladies is never stable as they have come across to different phases of life. Work life balance before and after marriage will be different. There are many factors which are affecting work life balance of working women. This paper is based on working women in education sector of Bangalore city. Now a days women and men are equal. Their wants, passion, mission, career is same. Women also have same importance of career what men are having. Both are earning equal amount of money to run families. There are several factors affecting work life balance of women working in education sectors specially in colleges, universities, and schools. All the factors are properly analysed in this paper. Work life balance is fluctuating with passage of time and age. During the starting years of career, there are more expectation and one person is not satisfied with working environment and salary. With passage of time, expectations of teachers will shift to job security, family preference with less salary.

Keywords: Career, Education, Expectations, Goal, Marital, Needs.

INTRODUCTION

Work-life balance for women working in the education sector can be both rewarding and challenging. Educators play a crucial role in shaping the future of society, but their dedication to their profession can sometimes lead to an imbalance between work and personal life. Prioritizing self-care and well-being are essential for women in the

67329

education sector. Engaging in activities that reduce stress and promote mental and physical health can help maintain a healthy balance. Educational institutions and policymakers can contribute to improving the work-life balance of women in the education sector by implementing policies that support flexible work arrangements, offering adequate leave policies, providing access to professional development opportunities, and creating a supportive and inclusive work environment. Ultimately, achieving a successful work-life balance requires a combination of individual efforts, organizational support, and societal recognition of the valuable contributions made by women educators. Teachers often invest significant emotional energy in their work, as they must support and empathize with students facing various challenges. Managing this emotional labour can be emotionally draining and impact their personal lives. Engaging with parents through parent-teacher conferences, school events, and extracurricular activities can take up valuable personal time. Staying updated with new teaching methods and participating in professional development activities is essential for educators. However, attending workshops and training sessions can further impact their work-life balance.

Objective of Study
- To know various factors affecting work life balance of women teachers
- To study whether nature of occupation affecting work life balance

RESEARCH METHODOLOGY

This paper is based on primary and secondary data. Secondary data is collected from various journal, articles, book. There was thorough study done from various published articles. Primary data is also collected by interacting with some women working in colleges and schools in Bangalore.

LITERATURE REVIEW

Work-life balance has emerged as a critical aspect of the well-being and job satisfaction of women teachers worldwide. In Bangalore city, a thriving educational hub in India, women teachers face unique challenges in managing their professional responsibilities while maintaining a fulfilling personal life. This literature review aims to study the factors that impact the work-life balance of women educators in Bangalore city, drawing insights from existing research and studies.

Workload and Time Demands
Numerous studies highlight the heavy workload and time constraints faced by women teachers in Bangalore. Balancing lesson planning, grading, administrative tasks, and classroom teaching often leads to extended work hours and reduced personal time (Poonam & Yadav, 2020; Roy & Joshi, 2019).

Emotional Labor and Burnout
The emotional labour involved in teaching can take a toll on women teachers' well-being. Studies reveal that women teacher in Bangalore experience higher emotional exhaustion and burnout due to their responsibilities in supporting students' emotional needs and maintaining a positive classroom environment (Chandrasekharan & Majeed, 2018; Natarajan & Jayashree, 2021).

Family and Caregiving Roles
Women teachers in Bangalore often face the challenge of balancing their professional roles with family and caregiving responsibilities. Research indicates that societal expectations and gender norms place additional pressure on women teachers to fulfill domestic duties, leading to a potential work-life conflict (Devaraj & Udupa, 2018; Janaki & Srinivasan, 2019).

Ramandeep Kaur

Workplace Policies and Flexibility
The availability of flexible work arrangements and family-friendly policies significantly influences work-life balance. Studies suggest that a lack of flexible working hours and limited access to maternity leave and childcare facilities contribute to work-life imbalance among women teachers in Bangalore (Kumari & Chaudhary, 2018; Verma & Srivastava, 2020).

Organizational Support and Work Culture
The supportiveness of the organizational culture and leadership plays a crucial role in women teachers' work-life balance. Research indicates that a positive work culture that values work-life integration and offers support for personal commitments can positively impact women teachers' job satisfaction and well-being (Shetty & Rao, 2022; Thomas & Rao, 2019).

Factors Affecting Work Life Balance of Women Teachers
The work-life balance of women teachers can be influenced by various factors, which can vary depending on individual circumstances, workplace environment, and societal norms.

Workload and Time Demands
The workload of teachers can be extensive, involving lesson planning, grading, preparing materials, and interacting with students and parents. The time demands of teaching can make it challenging for women to balance their professional responsibilities with personal commitments.

Emotional Labor
Teaching often involves emotional labor, as educators invest time and energy in understanding and supporting their students' needs. Managing this emotional labor can be emotionally draining and impact personal well-being.

Work Hours and Scheduling
Traditional school schedules may require teachers to work long hours during the day, leaving less time for personal activities and family obligations.

Administrative Responsibilities
In addition to teaching, women teachers may have administrative duties, such as attending meetings, participating in committees, or overseeing extracurricular activities, which can further extend their work hours.

Parental Expectations
Women teachers who are also mothers may face added pressure to balance their roles as educators and caregivers, leading to increased responsibilities in both areas.

Lack of Work-Life Integration
The demands of teaching can make it challenging for women to integrate their personal and professional lives seamlessly, leading to conflicts between work and family commitments.

Limited Professional Growth Opportunities
In some cases, limited opportunities for career advancement or professional growth may impact the motivation and work-life balance of women teachers.

Supportive Work Environment
The work-life balance of women teachers can be influenced by the support they receive from school administrators, colleagues, and the overall work culture. A supportive work environment can reduce stress and improve work-life integration.

Flexibility in Work Arrangements
part-time positions, job-sharing, or telecommuting options, can empower women teachers to manage their time effectively.

Ramandeep Kaur

Gender Stereotypes and Expectations
Societal expectations and gender stereotypes can influence the roles and responsibilities assigned to women teachers, affecting their work-life balance.

Personal Support System
The presence of a supportive partner, family, or social network can play a crucial role in helping women teachers manage their personal and professional commitments. Addressing these factors requires a multi-faceted approach involving supportive workplace policies, cultural changes, and societal attitudes towards women's roles in the education sector. By creating a more inclusive and flexible environment, women teachers can be & Regenerate equipped.

Government and Non-Government Women Teachers
Government Women Teachers
Employment
Government women teachers work in educational institutions that are funded and managed by the government. These institutions include public schools, colleges, universities, and government-run educational programs.
Job Security
Government teachers generally enjoy a higher level of job security due to their positions being governed by government regulations and policies. They often have permanent or long-term contracts and are protected from arbitrary dismissals.
Salary and Benefits
Government women teachers often receive standardized pay scales and benefits, which may include pension plans, health insurance, paid leave, and other social security benefits. Their salaries are typically determined based on government guidelines.
Working Conditions
Government schools and institutions usually follow fixed working hours and academic calendars. Teachers may have regular vacations and holidays according to the academic schedule.
Professional Development
Government teachers may have access to various professional development opportunities provided or sponsored by the government, which can enhance their skills and career growth.
Union Representation
Government teachers often have the option to join teachers' unions or associations that advocate for their rights, negotiate for better working conditions, and address their concerns collectively.

Non-Government Women Teachers:
Employment
Non-government women teachers work in private educational institutions or non-profit organizations. These institutions include private schools, colleges, universities, tutoring centres, and education-related NGOs.
Job Security
Non-government teachers may have a comparatively lower level of job security compared to government teachers. Their employment may be based on contractual agreements or contingent on the institution's financial stability.
Salary and Benefits
Salaries and benefits for non-government teachers can vary widely depending on the financial health and policies of the specific institution they work for. Some private institutions may offer competitive salaries, while others may struggle to provide adequate compensation.
Working Conditions
Non-government women teachers may experience more varied working conditions, ranging from flexible working hours in tutoring centres to fixed schedules in private schools or universities.

Strategies for Improving Women Work Life Balance

Improving work-life balance is important for enhancing overall well-being, reducing stress, and increasing productivity. Here are some effective strategies that can help individuals achieve a better work-life balance:

Set Priorities

Identify your most important personal and professional goals and prioritize them. Focus on activities and tasks that align with your values and contribute significantly to your well-being and success.

Learn to Say No

Avoid over committing yourself by learning to say no to additional work or social obligations when your schedule is already full. Prioritize your existing commitments before taking on new ones.

Time Management

Utilize effective time management techniques to make the most of your work hours. Plan your day, create to-do lists, and use tools such as calendars or productivity apps to stay organized.

Delegate Tasks

If possible, delegate tasks at work and at home to lighten your load.Delegating responsibilities can help you focus on essential tasks and reduce feelings of overwhelm.

Flexibility and Remote Work

If your job allows, explore opportunities for flexible working hours or remote work arrangements. Flexibility can give you more control over your schedule and improve work-life integration.

Take Breaks

Incorporate short breaks during work hours to rest and recharge. Stepping away from your desk and taking short walks can enhance productivity and reduce stress

CONCLUSION

In conclusion, work-life balance is a crucial aspect of the well-being and job satisfaction of women teachers in Bangalore city. Our research has identified several factors that significantly influence their work-life balance. Firstly, demanding workload and time constraints faced by women teachers contribute to work-life imbalance. Juggling teaching responsibilities, administrative duties, and personal commitments can lead to increased stress and burnout. Secondly, the emotional labour involved in teaching and the pressure to meet parental expectations can further impact work-life balance. Women teachers often invest significant emotional energy in understanding and supporting their students, which can be emotionally 5 Regenerate draining. Thirdly, the lack of flexible work arrangements and access to family-friendly policies in some educational institutions can hinder women teachers' ability to balance their professional and personal lives effectively. Moreover, gender stereotypes and societal expectations play a role in shaping women teachers' roles and responsibilities, often leading to additional caregiving duties at home.

ABSTRACT

Data mining has evolved into an important and active area of research because of theoretical challenges and practical applications associated with the problem of discovering interesting and previously unknown knowledge from very large real-world databases. In this paper, generation of association rules for dry beans dataset is considered. Apriori algorithm is used for the generation of association rules. Generated association rules are analyzed to determine the significant attributes which are helpful to identify the variety of dry beans.

Keywords: Data Mining, Association Rules, Frequent Item sets, Apriori.

INTRODUCTION

Data mining, which is also referred to as Knowledge Discovery in Databases (KDD), means a process of nontrivial extraction of implicit, previously unknown and potentially useful information (such as knowledge rules, regularities) from data in databases. Discovering knowledge from data should therefore be seen as a process containing steps such as understanding the domain, preparing the data set, discovering patterns (data mining), post processing of discovered patterns and putting the results to use. Association rule mining is one of the most important and well researched techniques of data mining. It aims to extract interesting correlations, frequent patterns, associations or casual structures among sets of items in the transaction databases or other data repositories [7]. Given a collection of items and a set of records, each of which contain some number of items from the given collection, an association discovery function is an operation against this set of records which return affinities that exist among the collection of

items. These affinities can be expressed by rules such as "72% of the records that contain items A, B and C also contain items D and E". The specific percentage of occurrences (in the case 72) is called the confidence factor of the association. Also, in the association, A, B and C are said to be on an opposite side of the association to D and E. Association Discovery can involve any number of items on either side of the association. A typical application that can be built using association discovery is supermarket problem. The problem is to analyze customers' buying habits by finding associations between the different items that customers place in their shopping baskets. The discovery of such association rules can help the retailer to develop marketing strategies, by gaining insight into matters like "which items are most frequently purchased by customers". It also helps in inventory management, sale promotion strategies, etc. Clustering is the identification of classes (clusters) for a set of unclassified objects based on their attributes. The objects are so clustered that the intraclass similarities are maximized and the interclass similarities are minimized based on some criteria. Once the clusters are decided, the objects are labeled with their corresponding clusters, and common features of the objects in a cluster are summarized to form the class description [4]. For example, a set of new diseases can be grouped into several categories based on the similarities in their symptoms, and the common symptoms of the diseases in a category can be used to describe that group of diseases.

Statement of the Problem

Data set dry bean is taken from the UCI machine learning repository. It includes values of sixteen features used to classify dry beans into 7 classes (Seker, Barbunya, Bombay, Cali, Horoz, Sira, Dermason). The dataset contains 13611 samples out of which 2027 samples are of Seker, 1322 samples of Barbunya, 522 samples of Bombay, 1630 samples of Cali, 1928 samples of Horoz, 2636 samples of Sira and 3546 Dermason samples. The dry bean dataset consists of 17 fields and 13611 records. The attributes along with their minimum and maximum values are presented in Table 1 and Figure 1. Table 2 shows the attribute Area and its range of values. Table 3 shows the attribute class and its range of values. Data discretization refers to a method of converting a huge number of data values into smaller ones so that the evaluation and management of data become easy. After applying data discretization technique, numeric attribute values are converted into a finite set of intervals.

METHODOLOGY

Discovery of interesting association relationships among huge amounts of data will help in marketing, decision making, fraud detection and business management. Therefore, mining association rules from large datasets has been a focused topic in recent research into knowledge discovery in databases [1,2,3].

The following is the standard definition of association rules:

Let I = {$i_1, i_2, \ldots i_m$} be a set of attribute values, called items. Let D be a set of database transactions where each transaction T is a set of items such that $T \subseteq I$. An association rule is an implication of the form $A \Longrightarrow B$, where $A \subseteq I$, $B \subseteq I$, and $A \cap B = \phi$. A is called the antecedent of the rule, and B is the consequent of the rule. The rule $A \Longrightarrow B$ holds in the transaction set D with support sup and confidence conf, where sup($A \Longrightarrow B$)=P($A \cup B$), conf($A \Longrightarrow B$)=P(B/A)=sup($A \Longrightarrow B$)/sup(A). Sup(A) is the percentage of transactions in D that contain A. Rules that satisfy both a minimum support threshold (min_sup) and a minimum confidence threshold (min_conf) are called strong ones.

In this paper, Apriori algorithm is used for generation of association rules. Apriori is an algorithm for extracting association rules from data. It contains the search space for rules by discovering frequent itemsets and only examining rules that are made up of frequent itemsets. Apriori deals with items and itemsets that make up transactions. Items are flag-type conditions that indicate the presence or absence of a particular thing in a specific transaction. An itemset is a group of items which may or may not tend to co-occur within transactions. Apriori proceeds in two stages. Firstly, it identifies frequent itemsets in the data, and then it generates rules from the table of frequent itemsets.

The first step in Apriori is to identify frequent itemsets. A frequent itemset is defined as an itemset with support greater than or equal to the user-specified minimum support threshold s_{min}. The support of an itemset is the number of records in which the itemset is found divided by the total number of records.

Sobha Rani and Siva Ram Prasad

The algorithm begins by scanning the data and identifying the single-item itemsets (i.e., individual items, or itemsets of length 1 that satisfy this criterion. Any single item that does not satisfy the criterion is not to be considered further, because adding an infrequent item to an itemset will always result in an infrequent itemset.

Apriori then generates itemsets recursively using the following steps:

- Generates a candidate set of itemsets of length k (containing k items) by combining existing itemsets of length (k-1). For every possible pair of frequent itemsets p and q with length (k-1), it compares the first (k-2) items (in lexicographic order); if they are the same, and the last item in q is (lexicographically) greater than the last item in p, it adds the last item in q to the end of p to create a new candidate itemset with length k.
- Prunes the candidate set by checking every (k-1) length subset of each candidate itemset; all subsets must be frequent itemsets, or the candidate itemset is infrequent and is removed from further consideration.
- Calculates the support of each itemset in the candidate set, as support = N_i/N where N_i is the number of records that match the itemset and N is the number of records in the training data.
- Itemsets with support $\geq s_{min}$ are added to the list of frequent itemsets.
- If any frequent itemset of length k is found, and k is less than the user-specified maximum rule size k_{max}, it repeats the process to find frequent itemsets of length (k+1).

When all frequent itemsets have been identified, the algorithm extracts rules from the frequent itemsets. For each frequent itemset L with length k > 1, Apriori generates rules using the following steps:

- Calculates all subsets A of length (k-1) of the itemset such that all the fields in A are input fields and all the other fields in the itemset (those that are not in A) are output fields. Call the latter subset A^I. (In the first iteration this is just one field, but in later iterations it can be multiple fields).
- For each subset A, it calculates the evaluation measure (rule confidence by default) for the rule $A \Longrightarrow A^I$.
- If the evaluation measure is greater than user-specified threshold, it adds the rule to the rule table, and, iflength k of A is greater than 1, it tests all possible subsets of A with length (k-1).

RESULTS AND DISCUSSION

Apriori algorithm first identifies the frequent itemsets (with the given minimum support at 10%) for dry beans dataset. When all frequent itemsets have been identified, the algorithm extracts rules (with the given minimum confidence at 50%) from the generated frequent itemsets for the dry bean dataset. Some of the generated association rules by Apriori algorithm are as follows:

Rules for Dermason:

Rule 1 for Dermason (1374, 99%)
        If Equiv Diameter is in (-∞,202.056824]
        and Roundness is in (0.890472,0.940579]
        then Dermason

Rule 2 for Dermason (1373, 99%)
        If Equiv Diameter is in (-∞,202.056824]
        and Roundness is in (0.890472,0.940579]
        and Perimeter is in (-∞,670.7994]
        then Dermason

Rule 3 for Dermason (1241, 98%)
        If Roundness is in (0.890472,0.940579]
        And Shape Factor1 is in (0.007382,0.008149]
        then Dermason

Rule 4 for Dermason (1492, 98%)
        If Perimeter is in (-∞,670.7994]
        and Roundness is in (0.890472,0.940579]
        then Dermason

Rule 5 for Dermason (1243, 86%)

67337

Sobha Rani and Siva Ram Prasad

If Solidity is in (0.987134, ∞)
and Shape Factor1 is in (0.007382,0.008149]
then Dermason
Rule 6 for Dermason (1265, 58%)
If Solidity is in (0.987134, ∞)
and Perimeter is in (670.7994,816.8628]
and Minor Axis Length is in (156.281238, 190.049822]
then Dermason

Rule 1 specifies that if Equiv Diameter is in (-∞,202.056824] and Roundness is in (0.890472,0.940579], then there is 99% chance that dry bean is of type Dermason and 1374 instances support this rule. Rule 2 specifies that if Equiv Diameter is in (-∞, 202.056824] and Roundness is in (0.890472,0.940579] and Perimeter is in (-∞, 670.7994], then there is 99% chance that dry bean is of type Dermason and 1373 instances support this rule. Rule 3 specifies that if Roundness is in (0.890472, 0.940579] and Shape Factor1 is in (0.007382,0.008149], then there is 98% chance that dry bean is of type Dermason and 1241 instances support this rule. Rule 4 specifies that if Perimeter is in (-∞,670.7994] and Roundness is in (0.890472,0.940579] then there is 98% chance that dry bean is of type Dermason and 1492 instances support this rule. Rule 5 specifies that if Solidity is in (0.987134, ∞) and Shape Factor1 is in (0.007382, 0.008149] then there is 86% chance that dry bean is of type Dermason and 1243 instances support this rule. Rule 6 specifies that if Solidity is in (0.987134, ∞) and Perimeter is in (670.7994,816.8628] and Minor Axis Length is in (156.281238, 190.049822] then there is 58% chance that dry bean is of type Dermason and 1265 instances support this rule.

From above association rules 1, 2, 3, 4 are important. So,

1. Equiv Diameter is in (-∞,202.056824] and Roundness is in (0.890472, 0.940579]
2. Equiv Diameter is in (-∞,202.056824] and Roundness is in (0.890472, 0.940579] and Perimeter is in (-∞,670.7994]
3. Roundness is in (0.890472, 0.940579] And Shape Factor1 is in (0.007382, 0.008149]
4. Perimeter is in (-∞, 670.7994] and Roundness is in (0.890472, 0.940579] are the combination of important attributes which indicates that the dry bean is of type Dermason.

Rules for Horoz
Rule 1 for Horoz (1335, 99%)
If Eccentricity is in (0.842176, +∞)
and Equiv Diameter is in (242.869883,283.682942]
then Horoz
Rule 2 for Horoz (1335, 99%)
If Area is in (43839.6,67259.2]
and Eccentricity is in (0.842176, +∞)
and Equiv Diameter is in (242.869883,283.682942]
then Horoz
Rule 3 for Horoz (1335, 99%)
If Eccentricity is in (0.842176, +∞)
and Convex Area is in (44941.7,69199.4]
and Equiv Diameter is in (242.869883,283.682942]
then Horoz
Rule 4 for Horoz (1234, 99%)
If Eccentricity is in (0.842176, +∞)
and Equiv Diameter is in (242.869883,283.682942]
and Shape Factor2 is in (0.000874,0.001184]
then Horoz
Rule 1 specifies that if Eccentricity is in (0.842176, +∞) and Equiv Diameter is in (242.869883, 283.682942] then there is 99% chance that dry bean is of type Horoz and 1335 instances support this rule. Rule 2 specifies that if Area is in

www.tnsroindia.org.in ©IJONS

(43839.6, 67259.2] and Eccentricity is in (0.842176, +∞) and Equiv Diameter is in (242.869883, 283.682942] then there is 99% chance that dry bean is of type Horoz and 1335 instances support this rule. Rule 3 specifies that if Eccentricity is in (0.842176, +∞) and Convex Area is in (44941.7,69199.4] and Equiv Diameter is in (242.869883, 283.682942] then there is 99% chance that dry bean is of type Horoz and 1335 instances support this rule. Rule 4 specifies that if Eccentricity is in (0.842176, +∞) and Equiv Diameter is in (242.869883, 283.682942] and Shape Factor2 is in (0.000874, 0.001184] then there is 99% chance that dry bean is of type Horoz and 1234 instances support this rule.

From above association rules 1, 2, 3, 4 are important. So,

1.Eccentricity is in (0.842176, +∞) and Equiv Diameter is in (242.869883, 283.682942]

2.Area is in (43839.6,67259.2] and Eccentricity is in (0.842176, +∞) and Equiv Diameter is in (242.869883, 283.682942]

3.Eccentricity is in (0.842176, +∞) and Convex Area is in (44941.7,69199.4] and Equiv Diameter is in (242.869883,283.682942]

4.Eccentricity is in (0.842176, +∞) and Equiv Diameter is in (242.869883,283.682942] and Shape Factor2 is in (0.000874,0.001184] are the combination of important attributes which indicates that the dry bean is of type Horoz.

Rules for Seker

Rule 1 for Seker (1248, 98%)

If Aspect Ratio is in (1.165411,1.3050955]

and Equiv Diameter is in (202.056824,242.869883]

and Shape Factor4 is in (0.994528, ∞)

then Seker

Rule 2 for Seker (1269, 95%)

If Aspect Ratio is in (1.165411,1.3050955]

and Solidity is in (0.987134, ∞) and Shape Factor4 is in (0.994528, ∞)

Rule 1 specifies that if Area is in (67259.2,90678.8] then there is 60% chance that dry bean is of type Cali and 1246 instances support this rule. Rule 2 specifies that if Shape Factor1 is in (0.00508,0.005847] then there is 57% chance that dry bean is of type Cali and 1242 instances support this rule. Rule 3 specifies that if Shape Factor2 is in (0.000874, 0.001184] then there is 39% chance that dry bean is of type Cali and 1239 instances support this rule. Rule 4 specifies that if Eccentricity is in (0.772929, 0.842176] then there is 34% chance that dry bean is of type Cali and 1433 instances support this rule.

Rules for Barbunya
No rules were generated for the class Barbunya**.** So, there are no significant attributes which are helpful to identify Barbunya dry bean.

Rules for Bombay
No rules were generated for the class Bombay. So, there are no significant attributes which are helpful to identify Bombay dry beans. The number of strong rules generated by Apriori algorithm for different minimum confidences (with 10% minimum support) is presented in Table 4 and Figure 2.

CONCLUSION

Association rules for dry bean dataset are generated using algorithm Apriori. The rules are analyzed and some of the graphs are generated. Using generated rules, the combinations of significant attributes which are helpful to identify the variety of dry beans are identified.

ABSTRACT

Hypothyroidism concerns a significant proportion of women in India, which may culminate in an array of ailments like depression, abnormal heart rate, hypertension, excess weight, and elevated cholesterol. Hypothyroidism is on the rise in India, with a prevalence of 11%, which is significantly higher than the rates of 2.6% in the UK and 4.6% in the USA. The effectiveness of Yoga and Ayurvedic Diet has been demonstrated in addressing various health issues such as weight reduction, dyslipidaemia (specifically LDL cholesterol), depression, cardiovascular and respiratory problems. Additionally, these integrated approaches have shown promise in restoring the autonomic nervous system, offering valuable benefits in the management of issues associated with hypothyroidism. The study aimed to investigate if there were notable differences in specific physical variables, such as Waist Circumference (WC), and biochemical variables, like Low Density-Lipoprotein (LDL), in middle-aged women diagnosed with Hypothyroidism as a result of engaging in Yoga and following an Ayurvedic Diet. A randomized experimental study was carried out to assess the effectiveness of Yoga and an Ayurvedic Diet on Waist Circumference (WC) and Low Density-Lipoprotein (LDL) levels in middle-aged women aged between 35 and 60, who had been diagnosed with Hypothyroidism. Thirty middle-aged women were randomly divided into groups: 15 in both the Yoga and Ayurvedic Diet group, and the remaining 15 in the control group. Over eight weeks, the Experimental Group I (Yoga and Ayurvedic Diet) and Control Group II underwent pre-test and post-

Pallavi Latari Helwade *et al.,*

test evaluations having assessments centred on Waist Circumference (WC) and Low Density-Lipoprotein (LDL) ANCOVA (Analysis of Covariance) was employed to determine significant differences among the groups. The test of significance was set at a confidence level of 0.05. The study concluded that, as an integrated approach of, both Yoga and an Ayurvedic Diet, showed significant efficacy in lowering the Waist Circumference (WC) and the Low Density-Lipoprotein (LDL) among middle-aged women diagnosed with Hypothyroidism.

Keywords: Yoga & Ayurvedic Diet, Hypothyroidism, Waist Circumference (WC), Low Density-Lipoprotein (LDL), Middle-aged women.

INTRODUCTION

Hypothyroidism, where the thyroid gland is less active, causes a shortage of thyroid hormones, affecting crucial bodily functions like metabolism. If not addressed, it can lead to several health problems, including higher cholesterol levels that increase the risk of heart disease. Slower metabolism often results in weight gain. Furthermore, hypothyroidism can lower heart rate and raise blood pressure, possibly causing heart issues. It also influences fertility, mental health, and immunity, making individuals more prone to infections. The complex control of thyroid hormones is managed by the hypothalamic-pituitary-thyroid axis, a component of the neuroendocrine system tasked with preserving hormone equilibrium. Stress has the potential to impact this axis, altering processes such as metabolism, protein synthesis, and growth, which encompasses bone and neural development. Additionally, stress can influence the responsiveness to catecholamine hormones like adrenaline. In middle age, women often face increased stress levels, impacting their overall health, which is crucial for shaping later years' quality of life. As akey contributor to family and community health, it's pivotal to address their physical, psychological, social, and spiritual well-being. Proper evaluation and management of conditions like hypothyroidism are essential for their holistic health. Taking a proactive stance, women in this age group should seek medical attention for potential health issues and adopt a healthy lifestyle to fulfil their crucial roles. Prioritizing health during this stage positively influences well-being in later years, ensuring a fulfilling life.

Hypothyroidism exhibits varying prevalence worldwide, with India reporting 11%, in contrast to 2% in the UK and 4.6% in the USA(Bagcchi S., 2014).The highest rates are observed in individuals aged 36-50 (13.1%), while those aged 18-35 show lower prevalence (7.5%)(Unnikrishnan A et.al, 2011). Among individuals with diabetes, hypothyroidism rates range from 4.8% to 31.4%. Moreover, 9.5% of South Indians display elevated thyroid-peroxidase antibodies in the general population(Nair A *et.al,* 2018). Recognizing these global disparities and potential associations with diabetes is essential for effective management and promoting awareness of how the condition affects diverse populations. This study delves into the impact of Yoga & Ayurvedic Diet, an ancient Indian mind-body technique, on middle-aged women diagnosed with Hypothyroidism. The approach aims to stabilize and recondition the psycho-physiological makeup, influencing natural endocrinal homeostasis. Previous research has suggested positive effects of Yoga & Ayurvedic Diet on parameters such as waist circumference, body mass index (BMI), heart rate, and total cholesterol. This current study specifically focuses on investigating the influence of Yoga & Ayurvedic Diet on waist circumference and Low-Density Lipoprotein in middle-aged women with Hypothyroidism. Understanding the potential benefits of these practices in managing waist circumference and related health factors could contribute to enhanced well-being for this specific population.

Yoga is a holistic practice that encompasses both breath control (pranayama) and physical postures (asanas). It is a rich and ancient tradition with a profound presence in the world. Yoga, as an ancient Indian mind-body technique, is designed to bring stability and recondition the psycho-physiological makeup of individuals, which in turn can influence the body's natural endocrine balance. One notable effect of yoga is its association with increased levels of gamma-aminobutyric acid (GABA) in the brain. GABA is an inhibitory neurotransmitter that plays a role in reducing

Pallavi Latari Helwade *et al.,*

stress and promoting relaxation(Streeter CC et.al, 2007).Meditation, a key component of yoga, exerts its effects through various physiological pathways, primarily involving the endocrine system. This includes the regulation of the hypothalamic-pituitary-adrenal (HPA) axis, the hypothalamic-pituitary-thyroid (HPT) axis, and the renin-angiotensin-aldosterone system, as well as energy homeostasis. Research in the field of yoga has yielded several significant findings. These include a reduction in anxiety levels, an increase in galvanic skin response (GSR) indicating enhanced relaxation, an increase in alpha brainwave activity associated with a calm mental state, a decrease in blood pressure, improvements in the body's response to tilt and cold pressor challenges, a decrease in catecholamines (stress hormones), and a decrease in plasma renin activity. These changes are indicative of a reduction in sympathoadrenal activity and renin-angiotensin system activity, as well as an improvement in baroreceptor sensitivity(Selvamurthy W *et.al*) Yoga and Ayurvedic diet recommendations are recommended for women who have been diagnosed with Hypothyroidism to assist in reducing their body mass indexand addressing weight concerns in the waist circumference and hip areas. Numerous studies have already demonstrated that the combination of yoga and ayurveda dietary adjustments yields positive outcomes in terms of weight circumference and low-density lipoprotein (LDL) reduction. The inclusion of astringent, pungent, and bitter food items, as outlined, is instrumental in rebalancing the Kapha, Pitta, and Vata doshas. These food choices, when coupled with yoga, are also instrumental in lowering hyperlipidemia by regulating blood glucose levels in the body.

As a result of yogic practices and dietary modifications, the body experiences a reduction in ama (toxic waste), which leads to a significant improvement in iron absorption within the bloodstream. This boost in mineral levels facilitates effective communication among the body's trillions of cells and enhances processes such as the conversion of T4 to T3 within the blood and cell membranes. The combination of Ayurvedic dietary choices and yogic practices also aids in the decalcification and soothing of the hypothalamus and pituitary gland. Consequently, this positive influence on the Hypothalamic-Pituitary-Thyroid (HPT) axis results in a decrease in Thyroid Stimulating Hormone (TSH) levels, ultimately alleviating the symptoms of hypothyroidism in women.

Contributing Factors to Hypothyroidism
Hashimoto's disease, Thyroiditis (inflammation of the thyroid), Congenital hypothyroidism (present at birth), Surgical removal of part or all of the thyroid, Thyroid radiation treatment, Certain medications, Iodine deficiency.

Indications
Fatigue, weight gain, sensitivity to cold, joint and muscle pain, dry skin or thinning hair, irregular menstrual periods or fertility issues, reduced heart rate, and feelings of depression.

Potential Complications
Goiter, Heart Problems, Myxedema, Infertility, Birth Defects, Mental Health Challenges.

Diagnostic Procedure
Evaluation through blood samples, assessing levels of TSH, T3, and T4 hormones.

Treatment Approaches
Thyroid Replacement therapy using medications like Levothyroxine, accompanied by lifestyle modifications, including exercise and adherence to a Yoga & Ayurvedic Diet.

Study Goals
Investigate if there is a significant difference in selected physical variable Waist Circumference (WC) and biochemical variable Low-Density Lipoprotein (LDL) among middle-aged women diagnosed with Hypothyroidism as a result of practicing Yoga & Ayurvedic Diet.

Pallavi Latari Helwade *et al.,*

Problem Statement
The study aimed to determine the efficacy of Yoga & Ayurvedic Diet on specific physical variables, including Waist Circumference (WC), and biochemical variables such as Low-Density Lipoprotein (LDL), among middle-aged women diagnosed with Hypothyroidism.

Hypothesis
The study postulated that there would be noteworthy differences in Waist Circumference and Low-Density Lipoprotein (LDL) levels between the Yoga & Ayurvedic Diet group and the control group among middle-aged women diagnosed with Hypothyroidism.

Inclusion Criteria
- Women diagnosed with Hypothyroidism (aged 35-60 years)
- T3 levels within the normal range (2.0-4.0 pg/ml); T4 levels within the normal range (0.8-1.8 ng/dl)
- TSH levels between 4.2 mIU/l and 10 mIU/l, within the normal range (0.5-4.20 mIU/l)
- Willing and capable of independently attending the intervention/control sessions
- Capable of providing written informed consent.

Exclusion Criteria
- Individuals who have undergone any form of thyroid surgery
- Individuals diagnosed with cardiac disorders, morbid obesity at stage III, uncontrolled diabetes, pulmonary dysfunction, and carcinomas
- Individuals suffering from congenital or secondary hypothyroidism
- Women who are pregnant, lactating, or planning pregnancy in the near future
- Those dependent on drugs and alcohol
- Individuals unwilling to participate in the study

METHODOLOGY

This study is ethically approved by Institutional Human Ethics Committee with having reference number, MMCH & RI IEC/PhD/30/JUNE/22. In a randomized experimental study, 30 middle-aged women with Hypothyroidism were randomly selected using a random sampling group design from Chennai, aged 35 to 60 years. They were divided into two groups, Group I and Group II, each consisting of 15 subjects. The hypothesis posited that significant differences would emerge due to the implementation of Yoga & Ayurvedic Diet on Waist Circumference and Low-density lipoprotein among middle-aged women diagnosed with Hypothyroidism compared to the control group. Prior to the training program, a pre-test was conducted for both Group I and Group II on the selected dependent variables. Group I underwent Yoga & Ayurvedic Diet treatment, while Group II (Control Group) did not receive any specific treatment but engaged in active rest. Following an experimental period of eight weeks, both groups were retested on the same selected dependent variables. Analysis of covariance (ANCOVA) was employed to determine significant differences between the experimental group and the control group.

RESULTS AND DISCUSSION

The data related to the variable collected from both groups before and after the training period underwent statistical analysis through Analysis of Covariance (ANCOVA) to ascertain significant differences. The hypothesis was tested at a confidence level of 0.05, and the results are presented in Table I and Table II. In Table I, the obtained F value for pretest scores in both the experimental and control groups was 0.07, which was lower than the required F value of 4.2 for significance at the 0.05 level. This indicates that there was no significant difference between the groups at the pretest, and the randomization at the pretest was equal. However, the analysis of posttest scores showed a significant difference between the groups, with an obtained F value of 18.15 exceeding the required F value of 4.2. This suggests

that the differences between the posttest means of the subjects were significant. Considering both pretest and posttest scores among the groups, adjusted mean scores were calculated and subjected to statistical treatment. The obtained F value of 84.18 surpassed the required F value of 4.21. This indicates a significant difference among the means due to eight weeks of Yoga & Ayurvedic Diet on waist circumference in centimeters, in line with a study conducted by Geetha B. Shetty *et.al.,* (2020). The ordered adjusted mean on waist circumference in centimeters was visually presented through a bar diagram for a better understanding of the study results, as shown in Figure-1.

The study results revealed that Group I exhibited significant differences in Waist Circumference due to the implementation of Yoga & Ayurvedic Diet. Consequently, the hypothesis was accepted at a confidence level of 0.05. These findings align with observations made by experts, including Geetha B. Shetty *et.al.,* (2020). In Table II, the obtained F value for pretest scores, 0.03, was lower than the required F value of 4.2 for significance at the 0.05 level. This indicates no significant difference between the groups at the pretest, affirming equal randomization. However, posttest score analysis revealed a significant difference between the groups, with an obtained F value of 18.23 exceeding the required F value of 4.2. This suggests significant differences between the posttest means of the subjects. Considering both pretest and posttest scores among the groups, adjusted mean scores were calculated and subjected to statistical treatment. The obtained F value of 194.60 surpassed the required F value of 4.21, indicating a significant difference among the means due to eight weeks of Yoga & Ayurvedic Diet on Low-Density Lipoprotein in mg/dl, consistent with a study by Rukamani Nair *et.al.,* (2021). The ordered adjusted mean on Low-Density Lipoprotein in mg/dl was presented through a bar diagram for a clearer understanding of the study results, as shown in Figure - 2. The study results demonstrated that Group I exhibited significant differences in Low-Density Lipoprotein levels due to the implementation of Yoga & Ayurvedic Diet. Consequently, the hypothesis was accepted at a confidence level of 0.05. These findings align with observations made by experts, including Rukamani Nair *et.al.,* (2021).

CONCLUSION

In summary, the study found significant reductions in both Waist Circumference (WC) in centimetres and Low-Density Lipoprotein (LDL) in mg/dl due to the implementation of Yoga & Ayurvedic Diet in Group I compared to the Control Group among middle-aged women diagnosed with Hypothyroidism. This leads to the conclusion that Yoga & Ayurvedic Diet is beneficial for middle-aged women with Hypothyroidism.

ABSTRACT

Bio-Fuels have emerged as a promising solution to the global energy and environmental challenges of the 21st century. Bio-Fuels are renewable energy sources derived from biological materials such as plants, algae, and waste organic matter. They offer an environmentally friendly alternative to conventional fossil fuels, as they have the potential to significantly reduce carbon dioxide emissions when integrated into the energy mix. Bio-Fuels come in various forms, with the two most prevalent types being bio-ethanol and biodiesel. Bio-ethanol is primarily produced from crops like corn and sugarcane, while biodiesel is typically derived from vegetable oils and animal fats. This article gives a comprehensive review on the research and evolution of Bio-Fuels and the important findings in this area of study. This work also makes an efforts to address the current challenges in production and availability of Bio_ Future needs.

Keywords: Bio-Fuels, Emissions, Sustainable energy, Renewable Energy

INTRODUCTION

Bio-Fuels offer a sustainable and renewable energy solution that can significantly reduce greenhouse gas emissions, enhance energy security, and promote sustainable agriculture practices. Their development and utilization will play

a crucial role in transitioning towards a greener and more sustainable energy future. They can be produced domestically, reducing the need for energy imports and enhancing national energy self-sufficiency. The production of biofuels also aligns with sustainable agriculture practices. Many biofuel feedstocks can be grown on marginal lands, reducing competition with food crops and mitigating land-use conflicts. The following are some of the important contribution in the area of Bio-fuels research. Alternate fuels for combustion ignition (CI) and spark ignition (SI) motors have become amazingly basic on account of the expanded worries on climate security, the need to diminish overdependence on oil and various other financial viewpoints [1]. Because of the expanding attention to the exhaustion of petroleum derivative assets and natural issues, biodiesel turned out to be an ever-increasing number of alluring in the new years. Biodiesel creation is a promising and significant field of examination because of the importance it gains from the rising petrol cost and its natural benefits. The utilization of biodiesel in the auto industry, the difficulties of biodiesel industry advancement, and the biodiesel strategy are talked about too [2]. As one of the significant makers and customers of sugars and the second crowded country, India gives a high need to food creation. Notwithstanding, the Indian creation of bio-ethanol can be visualized effectively and primer examinations show a promising road. In the long haul, lignocellulose-to- ethanol is the most reasonable pathway according to a natural perspective. Be that as it may, its creation cost should be diminished for allowing this interaction to drive forward the methodology of biomass-to- ethanol around the world [3]. Practically all the current fuel ethanol is created from palatable sources (sugars and starch), lignocelluloses biomass (LCB) has attracted a lot of consideration on ongoing occasions. Nonetheless, the transformation effectiveness just as ethanol yield of the biomass varies enormously regarding the source and nature of LCB, fundamentally because of the variety in lignocelluloses content. As endeavors to abuse LCBs into business ethanol creation, late examination endeavors have been dedicated to the techno-monetary upgrades of the general change measure. A variety of biomass, innovative methodologies, and microbial commitment to the change of LCB into ethanol are being done [4]. The new advances in the pretreatment of lignocelluloses biomass, with a consideration on the use of green solvents, including ionic liquids and significant eutectic solvents, followed by enzymatic saccharification using assistant proteins for the gainful saccharification of pretreated biomass is being completed. The joining of different advances is suggested and inspected for successful biomass utilization and improved ethanol yields and benefit [5].

The full environmentally friendly power creation of the Brazilian sugarcane industry includes, other than ethanol creation, the utilization of biogases and straw. The biogases is scorched in factories for cogeneration and any overflow bioelectricity is offered to the matrix. While 40% of the straw should be left for soil security, 60% could be utilized for cogeneration. This examination assessed the energy reconciliation of original (1G) and second- age (2G) ethanol tasks and the subsequent overflow energy. The work utilized trial and distributed information of higher calorific estimations of these buildups too of lignin, a strong interaction stream [6]. Nigella Sativa is such a plant- animal category native to Middle-east, Eastern Europe, and the Asian Subcontinent. Dark cumin seeds got from N. Sativa are one of the recognized biomasses to create biodiesels for the utilization in an unmodified CI motor. The burning attributes of the NSME20 mix additionally shown comparable examples like diesel fuel with a slight decrease in chamber pressing factor and warmth discharge rate. At long last, it has been reasoned that the recently evolved Nigella sativa methyl ester can be utilized as economical biofuel for different energy applications in the current situation[7].Microalgae have as of late pulled in impressive interest around the world, because of their broad application potential in environmentally friendly power, biopharmaceutical, and nutraceutical ventures. Microalgae are inexhaustible, supportable, and conservative wellsprings of biofuels, bioactive therapeutic items, and food fixings. As biofuels, they are an ideal substitute to fluid petroleum products regarding cost, inexhaustibility, and ecological concerns. Microalgae have a critical capacity to change environmental CO_2 over helpful items like starches, lipids, and other bioactive metabolites [8].

Microalgae are autotroph organic entities that use light energy to incorporate different high- esteem bioactive mixtures like polysaccharides, proteins, and lipids. Because of its quick development rate and capacity to get by in a brutal climate, microalgae these days are applied in different mordern regions. The way toward acquiring microalgae- based biomolecules begins with the determination of appropriate microalgae strain, development, trailed by

downstream handling of the biomass (i.e., pre-treatment, reaping, extraction, and cleansing). The final results of the cycles are biofuels and other significant bioproducts [9].

Algae are progressively arising as quite possibly the most encouraging feasible and long haul wellsprings of biomass and oils for fuel, feed food, and other co-items. The primary centre was in the development and utilization of microalgae on biofuel recuperation. Essentially every one of these advantages comes from the way that these plants have advanced more than billions of years to create and store energy like oil, and they do this more proficiently than some other known regular or designed cycle [10].

ADVANCEMENTS

Different methodologies like the fitting of hydrolytic chemicals to build the particular action of specific enzymatic response and commitments by conspicuous researchers for compelling use of celluloses and hemicelluloses for bioethanol creation have been examined. We have additionally featured the correlation on the usage of basic sugars (hexoses and pentoses) by microscopic organisms and growths and depicted the new progressed methods used for the creation of ethanol [11].

Imidazolium-based ionic fluids have been pulled into huge consideration in making biofuels from biomass. Because of the great thickness, the natural dissolvable overall is applied to improve the properties of the ionic fluids. The kinematic consistency is estimated by a Ubbelohde narrow viscometer at air pressure (0.0967 MPa) from 303.15 K to 353.15 K. The Vogel-Fulcher- Tammann condition is acquainted with connecting the thickness [12]. A nonlinear ideal H- boundlessness control approach is used for bioreactors focusing on improved biofuels creation. The powerful model of the bioprocess occurring in the bioreactor goes through surmised linearization around impermanent equilibria which are recomputed at every cycle of the control strategy. For the around linearized model of the bioprocess, an H-endlessness input regulator is planned. Under moderate conditions, it is demonstrated that the control circle is all around the world asymptotically steady. The proposed control strategy settles at long last the nonlinear ideal control issue for bioreactors in a computational effective and of demonstrated union way [13].

The physiological properties, including biochemical arrangement and cell divider thickness, of microalgal species, remarkably affect the pretreatment of biomass and its further transformation to biofuels. Different biofuels (bioethanol, higher alcohols (C3-C5), and biodiesel) were delivered utilizing energy-effective microwave pretreatment, progressive sugar/protein maturation, and lipid transesterification from three microalgal strains. This proposes that the utilization of a fitting pretreatment strategy for microalgal strains having diverse physiological properties is fundamental for improving the extraction productivity and change of biomass to biofuels with less waste creation [14].

Because of the modern turn of events and improved expectations for everyday comforts, utilization of raw petroleum expanded to another stature, and because of which our air got dirtied to a degree of implosion. Substitute energizes like biodiesel, biogas, packed flammable gas (CNG), hydrogen and melted oil gas (LPG) could be viewed as an option in contrast to traditional raw petroleum. Execution and emanation of inner burning motors utilizing substitute energize assume a significant part in its turn of events. This effect on different working boundaries and conditions for inward ignition motor running on various substitute energizes. The ash particles affect the climate [15]. Bio-oil and bio-crude are the fluid biofuels acquired from lignocellulosic biomass through pyrolysis and liquefaction, individually. Bio-oil is viewed as sub-par fuel for a regular diesel motor, and redesigning is required. The physical-compound properties of bio-oil can be improved fundamentally by presenting the emulsion innovation of blending bio-oil with diesel, biodiesel, and mixed bio-oil with methanol, ethanol, and fish oil. The essential burning examinations including vanishing can be separated into three gatherings, for example, flawless bio-oil, emulsion, and mixed bio-oil. The use of splash, ignition and outflow attributes in the use of bio-oils for warmth and force age is likewise. The physicochemical properties, principal ignition studies, and burning and outflow attributes of pyrolytic oil are presented [16].

Nithish Reddy and Siva Reddy

A huge issue of biofuels is their low oxidative solidness, which could be improved by the expansion of manufactured cell reinforcements. Hence, the checking of cell reinforcement content assumes a significant part in utilizing biofuels. The new strategy for volumetric assurance of manufactured cancer prevention agent propyl gallate (propyl 3,4,5-trihydroxybenzoate) in biofuels utilizing direct scope voltammetry with a gold circle terminal as the working cathode was created. The proposed technique can be utilized to control the nature of biofuels [17]. Lignocellulosic biorefinery offers affordable and manageable creation of energized and synthetic compounds. In any case, the consecutive and moderate change of xylose into target items stays one of the primary difficulties for acknowledging proficient mechanical lignocellulosic biorefinery. An incredible blended sugar is made for the co-maturing strain of *S.cerevisiae*, XUSEA, with improved xylose transformation limit during synchronous glucose/xylose co-ageing. The exhibition of the recently designed strain with improved xylose catabolism was also supported by hoisting maturation temperature and, consequently, essentially diminished the co-ageing time [18].

To help the lignocellulosic biomass-based bio-economy, much thought is needed to advance xylose- utilizing adequacy, utilizing rehashing cell regulatory associations, to achieve incredible co- development of xylose and other cellulosic carbon sources under present-day conditions, and to mishandle the ideal characteristics of yeast xylose processing for conveying various fills and artificial materials [19]. The creation of biofuels from lignocellulosic biomass stays a perplexing test in modern biotechnology. Endeavors to utilize yeast for transformation face the topic of which have an organic entity to utilize, counterbalancing the simplicity of hereditary control with the guarantee of strong mechanical aggregates. Various designing systems for extending substrate goes and differentiating results of *S. cerevisiae* have been created. Different yeasts, by and large, do not have these instruments, yet harbor predominant aggregates that could be abused in the brutal cycles needed for lignocellulosic biofuel creation. Conversely, oleaginous yeasts, for example, Yarrow IA lipolytic fit for delivering high titers of lipids are quickly progressing as far as the instruments accessible for their metabolic control [20]. Self- fueled biosensor, as another detecting stage, uses biofuel cells as a simultaneous force source and biosensor framework, with the benefits of no outer force source, basic instrumentation and simple scaling down. Then, persuaded by biomimetics for the epitome of fragile tissue inside cautious exterior in nature, the embodiment of normal macromolecules by metal regular designs (MOFs) have been winded up being a convincing system for improving the biocatalytic activity in keeping up natural limits [21]. Biofuel cells utilize compound responses and organic impetuses to deliver electrical energy, giving perfect and sustainable power. Enzymatic biofuel cells (EBFCs) have promising attributes and likely applications as an elective fuel hotspot for low-power electronic gadgets. It likewise depicts how scientific methods can be utilized to follow the intermediates between the compounds inside the enzymatic course. We expect to show how a superior self-controlled sensor configuration dependent on EBFCs produced for ethanol recognition can be adjusted and carried out in power gadgets for biosensing applications [22].

Quite possibly the most referred to meanings of cosmology is "an express and formal determination of a conceptualization". Through conceptualization, pertinent ideas are recognized to unequivocally portray a wonder in a conventional machine-intelligible language. There are numerous utilizations of metaphysics designing, like structure semantic web frameworks, working with information the board, supporting the coordinated appraisal of rural frameworks, organizing information for supportability science and building up an undertaking focused portable help route framework [23]. Conceptual Nano and fine particles have caused genuine medical conditions. Notwithstanding the constant decrease of their fixations, the excess sums are as yet thought to be an issue in pressure start motors. A TD 313 Fiat diesel rig (a 4-stroke, 4-chamber, water-cooled and direct infusion motor) is used. The centralizations of all PM sizes were diminished when the motor was running at medium speed and burden. On the other hand, fixations expanded when the motor was running at low and high loads and velocities. Results exhibited that biokerosene is better compared to biodiesel–diesel mixes in decreasing PM emanations [24].

Options of non-renewable energy source assets as inexhaustible biodiesel fuel and alcohols addresses the most recent innovation to be created related to the declining of petroleum derivative assets alongside higher raw petroleum cost. In this investigation, four-stroke, single chamber, and direct infusion diesel motor execution and emanations are

assessed. The test results show expanding in brake explicit fuel utilization with the expanding of higher mass parts of liquor mixes, which is credited to diminishing the lower warming worth (LHV) of the mixes.

Higher brake warm effectiveness contrasted with diesel fuel was delivered. An expressive decrease in carbon monoxide (CO) of (16.1% - 46.6% vol.) with complete unburned hydrocarbons (UHC) diminishing of (7.4% - 25.3% ppm), and nitric oxides (NOx) of (8.5% - 23.5% ppm). Biodiesel and alcoholic mixes are reasonable to be utilized as options in contrast to diesel without the requirement for any adjustments in customary diesel motors [25]. The toxins come about because of Kerosene burning in the stonemasonry stoves, which emanates variable kinds of toxins to the air and items. Biofuels delivered from palatable food squanders have been added to lamp oil at various rates to diminish harmfulness levels, most eminently the lead partition in lamp oil. The aftereffects of the investigation show that the kerosene biofuel mixes are spotless and liberated from lead and sulfur compounds, notwithstanding the accessibility of creative potential [26]. The issues of expanding the proficiency and improving the natural nvitingness of warmth motors are pressing issues of humankind. The article manages the utilization of biofuel as fuel for responding to inner burning motors. A short outline of flow research on this point is introduced in the article. In light of the aftereffects of mathematical recreation, another plan of the spout atomizer is proposed, the ideal fuel infusion advance point and the fuel supply law for the fundamental methods of diesel motor activity are chosen. The proposed measures have prompted an expansion in the successful catalyst (to 5%), a decline in explicit fuel utilization (up to 6%) and an improvement in natural invitingness [27]. The common dissolvability of two fills should be improved by adding co-solvents. In this way, three butanol isomers were chosen to contemplate the solubilization capacity and fuel properties improvement in the mixes of low- carbon liquor and rapeseed oil. Results show the situation of the stage limit increments because of low-carbon liquor broke up into rapeseed oil with the continuous expansion of co- dissolvable until the presence of one-stage fluid in both full scale and miniature perceptions. The appropriate elective fuel framework can be set up as per the fuel prerequisites of various motors [28]. Theoretical The immediate utilization of corn oil as bio-fuel in motors is promising, however, the Transesterification for plant oil burns through enormous energy. The transcriptome examination of corn seed, unsaturated fat desaturase 2 (FAD2), stearoyl-ACP desaturase (SAD) and phospholipid: diacylglycerol acyltransferase (PDAT) were the vital catalysts in the blend of unsaturated fats. In this way, corn oil can be utilized straightforwardly by mixing with low- carbon alcohols and co-solvents, in the interim the transcriptome investigation of the unsaturated fat biosynthesis gives a novel plan for the use of corn oil in motors[29].

Transesterification of a grain of corn oil tests in KOH reactant and supercritical methanol were concentrated without utilizing any impetus. Biodiesel, an option biodegradable diesel fuel, is gotten from fatty oils by Transesterification with methanol and ethanol. In Transesterification, free unsaturated fats and water consistently produce adverse consequences, since the presence of free unsaturated fats and water causes cleanser development, devours impetuses, and diminishes impetus viability, all of which bring about a low transformation[30]. There are numerous significant reactant factors like impetus type and piece, support type and pretreatment conditions (for example calcination temperature and time) which are used to accomplish significant returns for the transesterification response. Moreover, operational conditions like response temperature, liquor type, liquor to oil molar proportion and blending speed have likewise very high importance [31]. The rising worldwide interest for practical energy assets is bringing about a sped up expansion in biodiesel utilization. To lessen energy utilization and the measure of wastewater created, just as to stay away from the creation of wasteful finished results, classes of compounds, particularly lipases, are as a rule effectively investigated as substitutes to synthetic impetuses. This article features a few parts of lipase-catalyzed biodiesel creation. As per the writing, elective arrangements incorporate the utilization of ease, whimsical crude materials, new backings, the explanation of systems of lipase immobilization, and ideal plans and operational settings for bioreactors [32].

The expanded worldwide interest in biofuels has provoked the quest for options in contrast to palatable oils for biodiesel creation. Given the bounty and cost, squander and nonedible oils have been researched as possible feedstocks. To grow the practicality of enzymatic biodiesel creation, extensive exertion has been coordinated toward measure advancement regarding biodiesel efficiency, application to wide scopes of the substance of water and

unsaturated fats, increasing the value of glycerol results, and bioreactor plan. Nonetheless, it can likewise be anticipated that further interaction advancement will prompt a decreased expense in chemical arrangement just as in downstream cycles[33]. Unique Biodiesel, a sustainable fuel, has extraordinary potential in satisfying a consistently expanding transport fuel interest. Lipases are reasonable to creating a cleaner and greener biodiesel under milder conditions since it produces fewer squanders than the regular synthetic interaction. Obstructions related to the mechanical achievability of the enzymatic framework are principally a direct result of high impetus creation and sterilization costs, the reasonably more sluggish reaction rate, and lipases inactivation achieved by methanol and glycerol, which may be overpowered by sub-nuclear headways[34].

Difficulties related to worldwide asset exhaustion, anthropogenic ozone-depleting substance age and an unnatural weather change, because of broad non-renewable energy source use have catalyzed the investigation of pathways for elective biofuel creation to decrease undesirable natural results. Critically notwithstanding, existing biofuel creation measures have been portrayed by negative natural results to a great extent because of optional poisonousness impacts emerging from the utilization of mineral acids (or mineral soluble bases) to catalyze biofuel creation measures. To hence improve the ecological exhibitions of biofuel creation measures, a few analysts have researched the plausibility of upgraded and maintainable naturally kindhearted lipase-catalyzed biofuel creation measures [35]. Biodiesel is one of the significant biofuels and a spotless fuel source as an option to petroleum-based diesel fills. Biodiesel enjoys a few benefits and weaknesses. Transportability, high burning effectiveness, low sulfur and sweet-smelling content, high cetane number and biodegradability are benefits of biodiesel. Burdens of biodiesel are high consistency, lower energy content, high cloud and pour point, high nitrogen oxide discharge, lower motor speed and force, injector cooking, excessive cost and motor disintegration [36].

The investigation of CPO fluid waste-based biodiesel creation innovation has been directed. The points of this investigation were to get biodiesel from Industrial fluid misuse of CPO preparing and to distinguish the sort of methyl-ester compound of the biodiesel. The creation of biodiesel was applied in two stages of responses; esterification response utilizing H_2SO_4 and transesterification utilizing CaO impetus at 60 °C for 2 h. GC-MS examination result showed that methyl ester from fluid misuse of CPO contains methyl hexadecanoic 12.87%, methyl 9- octadecanoic 19.98%, methyl 8ctadecenoate 5.71%, and methyl 8,11-octadecadienoate 10.22% [37]. Utilized browning oil contains synthetic segments both from warming and singed food content. The work behind this is to comprehend the interaction of degumming in searing oil that is earthy coloured to dark after compound corrosive refining with Phosphoric corrosive (H_3PO_4). The scientific technique utilized was GC-MS, upheld by thermogravimetry and FTIR Analysis.

Six (6) tops with m/z 88 as ethyl ester part markers and supposedly there are two pinnacles of ethyl linoleate and ethyl oleate as unsaturated fats in Gas Chromatography-Mass Spectrometry[38]. Developing concern for energy assets and the climate has expanded interest in the investigation of elective wellsprings of energy. To meet expanding energy necessities, there has been developing interest in elective fills like biodiesel to give an appropriate diesel oil substitute for inner burning motors. Biodiesels offer a promising option in contrast to diesel oil since they are inexhaustible and have comparative properties. It is a promising substitute as an elective fuel and has acquired huge consideration because of the anticipated brevity of customary energizes and natural concern. The usage of fluid fills, for example, biodiesel created from squandering cooking oil by transesterification measure addresses quite possibly the most encouraging alternatives for the utilization of customary petroleum products [39].WTO (squander transformer oil) has been considered as a trade for diesel as drawing from the wellspring of energy from byproducts would help lessen the fuel cost. In that capacity, WTO was exposed to fuel refinement measure by trans-esterifying it in two phases utilizing corrosive and salt impetuses [40].

Plenty of examinations were directed on IDI motor with different biodiesels. Audit of the consequences of these undertakings with different added substances and mixes with or without supercharging of the motor are introduced in this section. Motor chamber vibrations (reflect ignition excitation) as FFT and time waves were recorded at spiral focuses and vertical on the chamber body to survey the burning affinity in all instances of studies. The outcomes

Nithish Reddy and Siva Reddy

with relative advantages are counted [41]. Contrail cirrus represents a significant portion of aeronautics environment sway. Here it present extraordinary perceptions from two DLR-NASA aero plane crusades that deliberate exhaust and contrail attributes of an Airbus A320 consuming either standard stream powers or low sweet-smelling economical aeronautics fuel mixes. The outcomes show that ash particles can direct the quantity of contrail cirrus ice precious stones for current emanation levels. Decreased contrail ice numbers cause less energy statement in the climate and less warming [42].

In the last quarter of 2018, low enhanced uranium dioxide fuel with zirconium composite cladding was utilized effectively to change over the centre of NIRR-1 from HEU to LEU fuel and the eliminated centre got back to the nation of beginning. The target of this review was to examine the chance of powering a similar framework with substitute The PC programming chose for these examinations were the SCALE code framework and the VENTURE PC. While the SCALE code framework was utilized to produce an appropriately found middle value of multigroup cross- segment library for the examined LEU centre models for the NIRR-1 framework, the VENTURE PC was used to give criticality data, not many gathering motions and force thickness circulations inside the centre of the demonstrated framework[43]. Globalization, industrialization and urbanization have prompted the worldwide energy emergency. There is an extraordinary interest in non-environmentally friendly power sources to meet the energy needs. This thusly has prompted the fatigue of petroleum derivatives. This has prompted the advancement of the age of biofuels. The current review plans to give an outline of the advancement of the various ages of biofuels for practical improvement in the coming future for worldwide development. It gives a plan to investigate cutting edge biofuels to meet our energy needs. Even though biofuel is certainly not an 'Environmentally friendly power energy", it very well may be utilized as a substitute energy source. Great energy approaches ought to likewise be declared by the states to execute productively and viably [44].Energy interest on the planet is these days becoming farther of cutoff points of installable age limit. Thusly, future energy requests ought to be met and improved proficiently and safely. Energy arrangements ought to be upheld by using sustainable power sources. Cost, a portion of the overall industry and strategy are the principal hindrances for the advancement of an environmentally friendly power. In the procedure plans of numerous nations, the reasonable advancement according to the boundaries. New empowering innovations identified with sustainable power sources will likewise assist with diminishing ecological expenses, and subsequently, the energy frameworks will be worked both safely and financially without natural issues [45].

Energy is the driver in the financial advancement of any country. Normally, non-industrial nations like India will represent a 25% climb in overall energy interest by 2040 because of the expansion in the per capita pay and quick industrialization. Among the conceivable fluid fills, methanol is exceptionally encouraging. Methanol is a solitary carbon particle compound and can be created from a wide assortment of sources like gaseous petrol, coal, and biomass. The properties of methanol are favourable for use in fuel motors since it has a supercharged number and fire speed. Other potential employment of methanol is: as a cooking fuel in rustic regions, and as a fuel for running the energy components. The current review surveys the constraints in the hydrogen economy and why moving towards a methanol economy is more helpful [46]. Proton trade film power devices have been as of late created at an expanding pace as perfect energy change gadgets for fixed and transport area applications. High platinum cathode loadings contribute fundamentally to costs. This is the reason further developed impetus and backing materials just as impetus layer configuration is fundamentally required. Late advances in nanotechnologies and material sciences have prompted the disclosures of a few profoundly encouraging groups of materials. These incorporate platinum-based compounds with shape-chose nanostructures, platinum-bunch without metal impetuses, for example, metal-nitrogen-doped carbon materials and alteration of the carbon backing to control surface properties and ionomer/impetus cooperations. This audit centres around this load of late turns of events and it closes with a conversation of future examination bearings in the field [47].

Strong oxide power modules (SOFCs) are power-producing gadgets with high efficiencies and are considered promising choices to alleviate energy and natural issues related to petroleum derivative advances. Nanoengineering of cathodes used for SOFCs has arisen as a flexible apparatus for fundamentally improving the electrochemical

exhibition however needs to beat issues for incorporation into useful cells appropriate for far and wide application. The combination of the nanoengineered cathode layers into customary anode-upheld cells empowered the accomplishment of high current densities at 0.7 V coming to ~2.2 and ~4.7 A/cm2 at 650 °C and 700 °C, separately. This outcome exhibits that tuning material properties through a compelling nanoengineering approach could altogether support the electrochemical presentation of cathodes for the advancement of cutting edge SOFCs with high force yield [48]. The current work is a work to deliver fluid fuel oil from plastic-based clinical squanders through warm breaking measures under oxidizing conditions. The blended plastics from clinical squanders were considered as a feedstock, destroyed into little pieces and warmed at 773 ± 10 K for 40 min with a warming pace of 20 K/min in a cluster reactor for warm breaking measure. The properties of fluid items were likewise inspected and contrasted with the business fuel oil. The normal yield of caramel and tacky fluid fuel was gotten to be 52 wt% and the gross calorific worth of the fluid was found 41.32 MJ/kg which is equivalent to that of business diesel. This investigation reasons that the fluid oil got from the warm breaking of blended plastics involved a composite combination of natural parts. A lot of non-corrupted constituents like plasticizers, forerunners, and so forth stayed in the item having some financial qualities with human wellbeing and ecological effects during consuming have been tended to in the recent concern [49].

The dried and pummeled clinical strong waste was pyrolyzed at 500 °C, and the parts and attributes were examined after the strong, fluid and gas items were gathered separately. The carbon content of strong items after sanitization was up to 63.13%, and the hotness esteem was 5454.54 kcal/kg. Moreover, to benefit as much as possible from the pyrolysis oil, the fluid item was isolated and purged by fragmentary buildup under the state of decompression. The impact of cycle boundaries, for example, vacuum degree and gathering temperature were underlined, and the ideal innovative condition was acquired as follows: vacuum degree 0.04 MPa, warming temperature 140 °C and the main stage consolidating temperature was 70 °C. The consistency estimation of the leftover high-thickness parts was expected to give information backing to the arrangement of tar connecting gear and channeling issues functional applications [50].

By vacuum pyrolysis, the elastic part of utilized tires is changed into oil and gas and the carbon dark filler is recuperated as pyrolytic carbon dark (CBP). In this way, CBP can supplant business carbon dark grades in specific elastic applications. CBP was effectively tried as a filler in the street asphalt. The complete pyrolytic oil can be utilized as a fluid fuel. The oil can likewise be refined into various portions: a light, a centre distillate and a substantial division. The light division was decidedly tried as a fuel added substance. Moreover, this portion contains significant synthetics, for example, d,l-limonene. The centre part was effectively tried as a plasticizer in rubbers. The pyrolytic gas can be utilized as a make-up heat hotspot for the pyrolysis cycle [51].

To enhance the fluid result of pyrolysis from as much as 500 g of polypropylene (PP) plastic waste, utilizing a proper bed type reactor in a vacuum condition (−3 mm H2O), to limit the oxygen entering the reactor. The fume moves through the 4-plate refining bubble cap plate segment for fractionation by using heat from the reactor. Interaction conditions at 500–650 °C and of 580 °C ideal fluid oil yield is 88 wt.%, including lamp fuel in the plate I with a volume of 350 ml, gas in plate II and III with a volume of 228 ml, and plate IV had no condensate. Gas yield is 5 wt.% and the rest is roast. The attributes of fuel got from plastic-like thickness, consistency, octane–cetane number, debris content and calorific worth have comparative properties with those of non-renewable energy sources [52]. The expendable needle is one of the significant things in clinical waste. Polypropylene (PP) is the primary constituent of a few needles, yet the majority of them have the body from PP and the cylinder from high thickness polyethene. These plastics have a high potential as hydrocarbons hotspots for the substance industry. In this review, Pyrolysis of waste needles was acted in a semi-cluster reactor comprised of hardened steel at a temperature scope of 400–550 °C and a warming pace of 20 °C min−1. The greatest (83 wt%) fluid yield was acquired at temperature 450 °C. FT-IR investigation of the pyrolysis oil showed the presence of alkanes, alkenes and aromatics rings. From GC–MS investigation, it was tracked down that the pyrolysis oil contains around 25 kinds of mixtures having carbon chain length in the scope of C10–C20. The actual properties of the pyrolysis oil were near a combination of diesel and petroleum [53].

CONCLUSIONS

Bio-Fuels represent a multifaceted solution to address some of the pressing challenges associated with traditional fossil fuels. They offer promise in terms of reducing greenhouse gas emissions, enhancing energy security, and promoting economic development. However, several critical factors must be considered to maximize their benefits while minimizing potential drawbacks Bio- Fuels offer a promising pathway to reduce carbon emissions and enhance energy security but require careful consideration of environmental, economic, and technological factors. Continued research, innovation, and sustainable practices are essential to realize the full potential of Bio-fuels as a viable and environmentally friendly alternative to fossil fuels. In summary, Bio-fuels hold promise as a transitional energy source that can contribute to reducing carbon emissions and enhancing energy security. However, their successful integration into our energy landscape requires a holistic approach, addressing environmental, technological, and policy challenges. With continued research, innovation, and responsible practices, Bio-fuels can play a significant role in the global effort to combat climate change and secure a sustainable energy future.

ABSTRACT

The exploration of novel chemical compounds plays a pivotal role in the advancement of various scientific fields. In this context, the prepared and thorough investigations of Azomethine derivatives hold significance. The current study reports the synthesis of Schiff base ligand, N'-(2-hydroxy-3-methoxybenzylidene) benzo hydrazide (HL) by reversible condensation reaction of primary amine and carbonyl compound. Further, Schiff base ligand was utilized to prepare the Mo+6and VO+4 metal complexes M1L and M2L, respectively. A recent study focused on the synthesis of a Schiff base prepared from 4-Methylbenzoylhydrazine and 2-Hydroxy-m-anisaldehyde using a modified Sandmeyer's method. Notably, this synthetic approach resulted in the formation of distinctive color complexes, namely Mo+6 and VO+4 complexes with HL. The structural characterization of the synthesized Azomethine was meticulously carried out using a range of analytical techniques. UV-Vis spectrometry, Infrared spectroscopy, Elemental analysis, nuclear magnetic resonance, electron spin resonance, thermo gravimetric analysis, conduct ometric measurements, and vibrational spin magnetometry were employed

Nageshwara Reddy Gosu et al.,

to elucidate the molecular structures of these compounds comprehensively. Furthermore, the compounds were subjected to biological screening to assess their potential activity against various microorganisms. The study revealed noteworthy inhibitory effects of the synthesized compounds against bacterial strains like *Salmonella typhi*, *Enterococcus faecalis*, and *Escherichia coli*. This antimicrobial activity underscores the potential applications of these compounds in the field of medicine and pharmaceuticals.

Keywords: Synthesis, Characterization, Schiff base, Biological activity.

INTRODUCTION

Azomethine compound, also known as a Schiff bases, represent a versatile class of organic compound with a wide range of applications in various scientific and industrial fields. The compounds you are referring to are called imines. Imines are organic compounds characterized by the presence of a carbon-nitrogen double bond (C=N) within their structure. They are formed through a condensation reaction between a primary amine (RNH_2) and either an aldehyde (RCHO) or a ketone (RCOR'). This reaction is known as imine formation or imine synthesis. The general chemical reaction for imine formation can be represented as,

RCHO or RCOR' + RNH_2 → R_2C=NR' + H_2O

Metal complexes of Schiff bases have undergone thorough investigation in recent years   [1-2]. Their utility spans various crucial sectors, from their deployment as pesticides [3] to their roles as catalysts [6-8], antibacterial agents and antiviral [4,5]. Notably, the thermal behavior of transition metal complexes of Schiff bases has been a subject of extensive exploration [9-11]. In the current study, the author presents an innovative series of metal complexes featuring Mo^{+6} and VO^{+4}, coordinated with a Azomethine ligand derived from 4-Methylbenzoylhydrazine and 2-Hydroxy-m-anisaldehyde (HL). Rigorous characterization encompassing vibrational spin magnetometry, TGA-DTA, FT-IR, elemental analysis, ^{1}HNMR, UV-Visble Spectrometry, VSM, Conduct ometric measurements and ESR was performed to unravel bonding modes, geometries, and properties of these complexes. Additionally, a thorough assessment of the biological studies of both the ligand (HL) and their respective Mo^{+6}, VO^{+4} metal complexes (M_1Land M_2L) was undertaken.

MATERIALS AND METHODS

In the present study, analytical grades compounds were used. The utilized organic substances are methanol (AR-Loba, 99.8%), rectified spirit (Loba, 98%), Tri ethyl amine (F Iwasaki, I Tanaka), 4-Methylbenzoylhydrazine (Aldrich, 99%), and 2-Hydroxy-m-anisaldehyde (Aldrich, 99%). The inorganic substances are sodium acetate trihydrate (AR-Merck, 99.5%), Ammonium molydedate (AR-Merck, 99%), hydrochloric acid (AR-Fisher, 37%), Sodium Acetate (Anala R), Ammonium Meta vanadate (AR-Finar, 98%) and triple distilled water.

Preparation of Schiff base ligand (HL) and its metal complexes (M_1L and M_2L)
The suggested schematic representation of the HL, M_1L, and M_2L complexes were provided in Scheme 1, which were synthesized using a standard procedure as reported earlier [3,21].

Preparation of Schiff base ligand (HL)
4-Methylbenzoylhydrazine (3.00g) and 2-Hydroxy-m-anisaldehyde (3.04g) dissolved in 25ml methanol, refluxed with 1ml triethylamine for 3 hours. After cooling, pale yellow needle crystals formed, washed with methanol, dried, yielding pure product for analysis (Table 1).

Nageshwara Reddy Gosu et al.,

Preparation of compound M_1L and compound M_2L

In synthesizing Mo^{+6} and VO^{+4} metal complexes represented M_1L and M_2L, metal chloride salts of these metals were utilized. Dissolving 2.85g HL in methanol, adding 6.17g and 0.59g metal chlorides in CH_3COONa solution, refluxing for 6 hours, and isolating vibrant orange and pale green crystals. Purification, recrystallization, and vacuum drying yielded promising metal complexes. Analytical data in Table 1 offers systematic insights into properties.

RESULTS AND DISCUSSION

Characterization of FT- IR spectra

Comparative analysis of the IR spectra involved examining the HL ligand spectrum alongside those of the Mo^{+6} and VO^{+4} complexes. The relevant data were meticulously compiled in a Table 2, accompanied by corresponding assignments, while visual representation was achieved through Figures 1, 2 and 3. The initial FT-IR spectra of the HL ligand displayed a prominent broad peak at 1643 cm^{-1} [14], attributed to the -C=N stretching of the Schiff base group. In the context of the complexes, this band exhibited a downward shift to 1622 cm^{-1} and 1637 cm^{-1} [15] for the Mo^{+6} and VO^{+4} complexes. This shift indicated the participation of the Schiff base ligand (>C=N) in the complexation process, driven by a reduction in electron density on the Nitrogen atom. This alteration pointed to metal coordination through to the N atom. Transitioning to the FT-IR spectrum of this metals chelates, a conspicuous absence of stretching -OH bond was observed at 3558 cm^{-1} [16]. This absence signified proton displacement through the phenolic hydroxyl group upon complexations, underlining covalent bond between metal ions and oxygen from the phenolic group. Further analysis of the FT-IR spectrum of the Mo^{+6} and VO^{+4} complexes revealed the broad peak band [17] encompassing approximately 3348 cm^{-1} and 3418 cm^{-1}. This band was attributed to the stretching frequency -OH vibrations of H_2O molecules linked with in the complexes formation. Additionally, weak peak bands appear at 802.22 cm^{-1} and 816.48 cm^{-1} corresponded to the -OH wagging and rocking vibrations of coordinated H_2O molecule. Notably, a distinct sharp peak band emerged within the 938-952 cm^{-1} region, reflecting the presence of the stretching frequency (V=O) mode. Within the complexes, novel bands emerged that were absent in the ligands spectrum. Specifically, bands appear at 456 cm^{-1} and 448 cm^{-1} was recognized as stretching frequencies' of M-O, whereas bands at 822cm^{-1} and 752 cm^{-1} [18] was associated with the stretching frequencies of M-N [19-21].

Characterization of H^1 NMR spectra

H^1 Nuclear Magnetic Resonance spectrum of the HL and Mo^{+6} and VO^{+4} complexes were presented in Figure 4, 5, and 6, using DMSO-D6 as the solvent. Corresponding chemical shifts value were consolidated in Table 3. The HL exhibited a singlet peak appear at 2.38 ppm [21], attributed to proton bond to the Schiff base. Upon complexation, singlet experienced a downfield shift to 2.36 ppm and 2.34 ppm for the Mo^{+6} and VO^{+4} complexes, respectively. The shift indicated a shielding effect on the Schiff base group. This Proton associated with this aromatic ring formed a multiplet peak appear at 7.25 ppm, while the $–OCH_3$ group of protons displayed a singlet at 1.19 ppm. Notably, the proton of the phenolic group [22] displayed a singlet appear at 11.50 ppm in ligand spectrum, a signal that disappear in complexes. In H^1 NMR spectra of this Mo^{+6} and VO^{+4} complexes, the peak appear signal corresponding to the Schiff base proton experienced a shift from 2.38 ppm to 2.36ppm, 2.34 ppm. The shift signified the shielding effect on the Schiff abse group. These protons of the aromatic ring within the 7.25 - 7.28 ppm range [22] exhibited broad peak and less intensity signals in the complexes compared to the Azomethine. Within the complex, protons of the aromatic ring at 7.25 - 7.28 ppm displayed broader and less intensity signals, further were corroborating this phenomenon. Moreover, the appearance of a peak at 2.79 ppm in Mo^{+6} and VO^{+4} complexes indicated the coordination of H_2O molecules through interaction with in the metal ions.

Conductivity measurements

The molar conductance of complexes in approximately 10^{-3} M concentration of DMF was measured at a temperature of 27 ± 20°C using the Systronic 303 direct reading conductivity bridge. A predetermined quantity of solid complexes was transferred into a 25 ml standard flask and dissolved in dimethylformamide. The solution was then diluted with

DMF to reach the flask's specified volume. Pour the solution of the complex into a 100 ml beaker that has been cleaned and dried. The molar conductance measurements of the complexes turned out to be below 20 Ohm^{-1} cm^2 mol^{-1}, which indicates their non-electrolytic characteristics. These recorded values strongly imply that the current set of complexes is indeed non-electrolytic in nature. You can find the molar conductance values of these metal complexes listed in Table 4.

UV-VIS. Analysis

A comparison of the electronic spectra of HL and M$_1$L, M$_2$L compounds in aqueous solutions has been documented in recent studies. The electronic spectrum of both the HL and its M$_1$L, M$_2$L metal complexes was made evident, and the associated transition was meticulously cataloged in Table 5. Specifically, the ligand electronic spectrum featured a distinct signal band peak appear at 278 nm, a manifestation of the π-π* transitions. Additionally, in the higher concentration spectrum of the complexation, the transitions of d-d surfaced within the visible region. In essence, this analysis of electronic spectra offers profound insights into the electronic energy landscapes of the ligand and its metal complexes. The observed shifts, the appearance of new bands, and the manifestation of d-d transitions collectively contribute to a comprehensive understanding of how complexation impacts electronic behaviors, thus enriching our comprehension of these compounds' responses to UV-Visible radiation.

ESR spectral studies

The Electronic spin resonances spectrum of the complexes in its polycrystalline state exhibited a singular broad peak signal, attribute to dipolar broaded and the enhancement of spin lattice relaxations. Anisotropic spectrum were obtain for this complex in dimethylformamide at Low Nitrogen Temperature, and represented Electronic spin resonances spectrum of M$_2$L complex was presenting in Figure 7. Within this low temperature spectra, three peak of minor intensities has been discerned, they are believed to emanate formed the $g^{\parallel}$ components. Spin hamiltonian, along with bonding parameters and orbital's reduction of the M$_2$L complexes, has been exhaustively present in the Table 6. The calculation of $g^{\parallel}$ and $g^{\perp}$ values utilized the free radical of DPPH a g marker. A seminal observation by Kvelson & Neiman [23] suggests that a given value below 2.3 indicates covalent character, while a value exceeding 2.3000 signifies ionic charactered in M-L bonds within complex. By applied these criterion, it can be inferred that covalent bonding characterizes the metal-ligand interactions in these complex [24]. Observed trend of $g^{\parallel} > g^{ave} > g^{\perp} > 2.0023$ for the complexes strongly suggests that the unpair electrons was localized in the dx^2-dy^2 and dz^2 orbitals of the VO^{+4} ion within the complexes. Additionally, the G value for these complexes exceeding four implies the absence of interaction between M-M center in a dimethylformamide media. Furthermore, Electronic spin resonances parameter, including $g\parallel$, $g^{\perp}$, $A^{\parallel*}$, and $A^{\perp*}$, as well as the energy of d-d transition, were employed to evaluated bonding parameter (α^2), orbital's reduction parameter ($K^{\parallel}$, $K^{\perp}$), and dipolar interactions (P) [25]. Remarkably, the observation of $K^{\parallel} < K^{\perp}$ implies the presences of out of plane π-bonding. Notably, the α^2 value for the presented chelate fall within the ranges of 0.420-0.482, providing strong supported for the covalence nature of this complex. Building upon Bereman's and Giordano insights, the identificated of bonding group from dipolar term P value was proposed. The reduction parameter of P value from the ion values (0.0360 cm^{-1}) is indicative of robust covalence bond. The P value obtained for the present complex, ranging from 0.0290 to 0.0360 cm^{-1}, consistently align with in the bonded of metal ion to O and N donor atoms. The collective analysis of Electronic spin resonances line shapes, Electronic spin resonances data, and electronic spectral data converges to suggest a square planar for M$_2$L complex [26].

Magnetic moment measurements

Table 7 displays the magnetic value for the complexes. Remarkably, these values reflect substantial contributions from orbital effects and magnetic susceptibility, particularly for the octahedral structure complex at RT. In the case of the M$_1$L complexes, the magnetic moment measures 5.12 B.M. Notably, this values is lower the spin only values, indicative of paramagnetism reduced. This observation strongly implies the formed of a low spin complexes characterized by an octahedral geometry. Equally significant, the M$_2$L complex exhibits a magnetic moment of 5.27 B.M. Once again, these value falls below the spin only values, underscoring paramagnetism reduced. In this instance,

the diminished magnetic moment provides compelling evidence for the formed of a low spin complex with a square planar geometry.

Thermal Studies

The thermo analytical data for the metal complexes has been comprehensively detailed in Table 8, while the corresponding thermo grams are visually represented in Figures 8 and 9. Notably, the M_1L complexes exhibit impressive thermal stability, remaining intact up to 815°C. The initial decomposition stage is characterized by the endothermic dehydrated of the metal complex, accompanied by the loss of two H_2O molecules within range of the temperature of 82-212°C. This process leads to the formed of anhydrous complexes [28]. The 2nd decomposition stage, featuring 2 endothermic processes, occurs around 480°C, forming a stable intermediate [29-30]. An exothermic decomposition step follows, resulting in the generation of the respective metal oxide as the decomposition final product at temperatures exceeding 595°C. It is important to note that these decomposition behaviors were observed under a nitrogen atmosphere. The experimental mass loss data corresponding to each stage are meticulously documented in Table 8. Similarly, the complexes display considerable thermal stability, maintaining their structural integrity up to 840°C. The initial decomposition stage involves the dehydrate exothermic of these metal complexes, leading to the loss of two H_2O molecule within range of the temperature 82-324°C, ultimately yield complex. The subsequent second decomposition stage, characterized by two exothermic processes, occurs around 450°C, result in the formed of a stabled intermediate phase. The ultimate exothermic decomposition process produces the respective M-O as the decomposition of the final product at temperatures surpassing 695°C. As with the Mo complexes, these thermal behaviors were observed under a nitrogen atmosphere, and the associated mass loss data for each stage can be found in the Table 8. Notably, at elevated temperatureded, the corresponded M-O are forming as stable end product. The experiment percentages mass losses were further comparing against calculated weights. The analysis of thermal data reveals a stability order among the complexes, with M_1L complexes exhibiting greater stability than M_2L complexes.

Biological Activity

In this present research, the primary objective of the author was to investigate the potential antibacterial studies of both the HL and M_1L, M_2L corresponding complexes. The selected bacterial strains for this investigation were *S. typhi, E. faecalis,* and *E. coli.* The method used is paper disc, as outlined in Table 9, was employed to assess the biological activity of these compounds. The outcomes of the biological testing of the metal complexes revealed several important insights. A comparative analysis between the free HL and M_1L, M_2L respective metal chelates clearly demonstrated that the metal chelates exhibit notably more antibacterial studies in comparison to the uncomplexed ligand. This electron delocalization led to an increase in the lipophilicity of the complexes, as cited in reference [31]. This heightened lipophilicity, in turn, facilitated the penetrated of the complex into lipid membranes, ultimately obstructing the metal chelate sites on the enzymes within the microorganisms. The assessment of antibacterial studies were quantified by measured the size of the zone of inhibition in millimeters. Upon comparing these results, it was evident that the Mo^{+6} and VO^{+4} Complexes of Schiff exhibited more substantial antibacterial activity when compared to the corresponding ligand. This finding suggests that these metal complexes possess potential as antibacterial agents, demonstrating their effectiveness against the selected bacterial strains.

CONCLUSIONS

The study synthesized Mo^{+6} and VO^{+4} complexes of N'-(2-hydroxy-3-methoxybenzylidene) benzohydrazide (HL). Spectroscopic analyses described the ligand HL and its complexes M_1L and M_2L. IR spectra indicated ligand (C=N) stretching shifting from 1643 cm^{-1} to 1622 cm^{-1} and 1637 cm^{-1} for Mo and VO complexes. ^1H NMR shifts were observed at 2.38 ppm for HL, 2.36ppm for M_1L, and 2.34 ppm for M_2L. Ligand transitions at 268 nm and 278 nm shifted to 382 nm for M_1L complexes, and 408 nm for M_2L complexes. Complexes thermal stability was assessed at 293-1173 K, with water molecules dehydrating and forming anhydrous substances that degraded into metal oxides.

Molar conductance measurements in DMF confirmed non-electrolytic nature. ESR spectra of VO^{+4} complex pointed to an octahedral geometry, with axial symmetry $g\parallel > g\perp > 2.0023$. Antibacterial testing on three bacterial strains revealed ligand HL best against E. coli, complex M_1L best against *E. faecalis*, and complex M_2L most effective against *E. coli*.

ABSTRACT

Let $G(V,E)$ be a graph. A $S \subseteq V$ is called a dominating set of G if every vertex in $V-S$ is adjacent to atleast one vertex in S. The domination number $\gamma(G)$ is the minimum cardinality taken over all such dominating sets in G. A $S \subseteq V$ is a dominating set and the induced subgraph $\langle S \rangle$ is triple connected, then a subset of a nontrivial graph G is said to be a triple connected dominating set. The minimum cardinality taken over all three connected dominating sets is called the triple connected dominating number and is denoted by $\gamma_{tc}(G)$. Similarly the minimum cardinality taken over all strongly triple connected dominating sets is called strong triply connected dominating number and is denoted by $\gamma_{stc}(G)$. A strong triple connected dominator color of a graph G is a perfect triple color in which every vertex dominates every vertex of at least one color class. The minimum number of colors required for a strong triple connected dominator coloring of G is called the strong triple connected dominator chromatic number of G and is denoted by $\chi_{stc}(G)$. In this paper, we obtain bounds for general graphs and characterize the corresponding extremal graphs.

Keywords: Domination number, triple connected graph, strong triple connected domination number, strong triple connected dominator chromatic number (stc).

INTRODUCTION

Let $G(V, E)$ be a graph, where V and E the vertex and edge set of G. Denote $V = p$ and $E = q$, refer to [1] and [2]. The topic of the coloring and dominating set can be referred to [3,4]. The concept of dominator coloring was studied in [5]. In the modern world today, the concepts of three connected graphs with real-life applications have been introduced in [6]. A strong domination number $\gamma_{st}(G)$ is defined as the minimum cardinality of a strong domination set. In [7] one can find a comprehensive survey of the results of different types of dominating number of a graph.

Theorem 1.1 [5] Let G be a connected graph of order p. Then $\chi_d(G) = p$ iff G is the complete graph K_p.

Theorem 1.2 [6] A connected graph G is not triple connected iff there exists a $H -$ cut with $\omega(G - H) \geq 3$ such that $|V(H) \cap N(C_i)| = 1$ for at least three components C_1, C_2 and C_3 of $G - H$.

Theorem 1.3 [8] For any graph G, $\gamma_{nc}(G) \leq \left\lceil \dfrac{p}{2} \right\rceil$.

Theorem 1.4 [8] Let G be a graph with $\Delta < p - 1$. Then $\gamma_{nc}(G) \leq p - \Delta$.

Strong Triple Connected Dominator Chromatic Number
Definition 2.1
A strongly triple connected dominator coloring of a graph G is a perfect triple coloring of G in which every vertex dominates every vertex of atleast one color class. The minimum number of colors required for a strong triple connected dominator chromatic of G is called the strong triple connected dominator chromatic number of G and is denoted by $\chi_{stc}(G)$.

Example 2.2 For the graph in Figure 1.1, the strong triple connected dominator chromatic number of $\chi_{stc}(G) = 3$ and $S = \{v_1, v_2, v_3\}$ forms a $\gamma_{stc}(G)$ - sets. Hence $\gamma_{stc}(G) = 3$.

Observation 2.3 Strong triple connected dominator chromatic number does not exists for all graphs and if exists, then $\chi_{stc}(G) \geq 3$ and also the strong triple connected domination number of $\gamma_{stc}(G) \geq 3$.

Proposition 1 For any connected graph G, $\gamma(G) \leq \chi(G) \leq \chi_d(G) \leq \chi_{stc}(G) \leq \gamma_{tc}(G)$.

Theorem 2.1. If G is a strong triple connected graph with $\delta(G) = 3$ and k support vertices and support $\chi_{stc}(G) \geq k + 1$, and $\chi_{stc}(G) = k + 1$ iff the set of vertices without support is an independent dominating set of G.

Proof. Let S denote a set of supported vertices of G. Let $v \in S$. Then in any $\chi_{stc}(G) -$ the color v of the leaf v or close to it appears $\chi_{stc}(G) \geq k + 1$, so now $V - S$, if we form an independent dominant set G, $\{\{v\} : v \in S\} \cup \{V - S\}$ its dominant color is $\chi_{stc}(G) = k + 1$.

Conversely, suppose that $\chi_{stc}(G) = k + 1$. Let C be a $\chi_{stc}(G) -$ coloring of G, such that $\{v\}$ is a coloring class for every $v \in S$. So $V - S$ is a color class. In C and hence $V - S$ is an independent dominating set G.

Theorem 2.2 Let G be a strong triple connected complete graph with $\delta(G) = 3$. Then $\chi_{stc}(G) > \gamma_{stc}(G)$.

Proof. Let $\{v_1, v_2, \ldots, v_k\}$ is a $\chi_{stc}(G) -$ coloring of G, where every supported vertex is a triple coloring class and the set of all leaves of G is in a triple coloring class, say v_3. $S = \{v_1, v_2, \ldots, v_k\}$ where $v_i \in V_i$, $3 \le i \le k$. Clearly S contains all support vertices. We now say that S is a dominating set of G. Let $v \in V - S$ and V dominate the color class. If $i > 3, v_i$ is dominant. If $i = 3$, then v is a support vertex or leaf and is therefore dominated by S. Thus $\gamma_{stc}(G) \le |S| = \chi_{stc}(G) - 1$.

Theorem 2.3 Let T be a tree of strong triple connected order p. If T contains a $\gamma_{stc}(G)$ -set S such that $V - S$ is independent, then $\chi_{stc}(G) = \gamma_{stc}(G) + 1$.

Proof. From Theorem1.2 $\chi_{stc}(G) = \gamma_{stc}(G) + 1$. Let $S = \{v_1, v_2, \ldots, v_k\}$ as a $\gamma_{stc}(G)$-set in T such that $V - S$ is independent. Then $C = \{\{v_i\} : 1 \le i \le k\} \cup \{\{V - S\}\}$ is a $\chi_{stc}(G) -$ coloring of T, so $\chi_{stc}(G) = \gamma_{stc}(G) + 1$.

RESULT

For any graph G, $\gamma(G) \le \chi(G) \le \chi_d(G) \le \chi_{stc}(G) \le \gamma_{tc}(G)$.

Theorem 2.4 Let G be a strong triple connected graph G, $\chi_{stc}(G) + \gamma_{stc}(G) \le p + 1$ and the equality C_5 or K_p iff G is isomorphic, if $p \ge 4$ where $Y \subseteq E(G)$, $|Y| = p - 2$ and the edge-induced sub graph $\langle Y \rangle$ is a star.

Proof: If $\Delta < p - 1$; Then $\gamma_{stc}(G) \le p - \Delta$ and $\chi_{stc}(G) + \gamma_{stc}(G) \le p + 1$. Hence, $\chi_{stc}(G) + \gamma_{stc}(G) \le p + 1$, if $\Delta = p - 1$, then $\Delta = p - 2$; The inequality is obvious. If $\gamma_{stc}(G) = 3$; Then G is neither an odd cycle nor a complete graph. Therefore, $\chi_{stc}(G) + \gamma_{stc}(G) \le 2 + \Delta \le 2 + p - 1$. Now, suppose G is a graph with $\chi_{stc}(G) + \gamma_{stc}(G) = p + 1$.

Case (i): $\Delta = p - 1$

Then $\gamma_{stc}(G) \le 3$: if $\gamma_{stc}(G) = 2$; Then $\chi_{stc}(G) = p$ and hence G is isomorphic to K_p: Assume $\gamma_{stc}(G) = 3$: From Theorem 1.2 G has a vertex v with $\deg v = n - 1$ and v is a cut vertex of G: Since , $\chi_{stc}(G) = p - 1$; $G - v$ is G_1 and G_2 with two components $G_1 = K_1$ and $\langle V(G_2) \cup \{v\} \rangle = K_{p-1}$: Hence $G = K_p - Y$ where $Y \subseteq |E(G)|. |Y = p - 2|$ and the edge induced subgraph is a star.

Case (ii): $\Delta < p - 1$

Then $\gamma_{stc}(G) \le p - \Delta$. .But $\chi_{stc}(G) + \gamma_{stc}(G) = p + 1$; It follows that $\chi_{stc}(G) \ge \Delta + 2$ and hence, $\chi_{stc}(G) \ge \Delta + 1$: Hence G is an odd cycle and $\gamma_{stc}(G) \le p - \Delta = p - 2$: Hence $G = C_5$: The converse is obvious.

Theorem 2.5 For any connected graph G with $p > 3$, we have $3 \le \chi_{stc}(G), \gamma_{stc}(G) \le p - 1$ and the bounds are sharp.

Proof: The lower bound follows from Definition 2.1 and the upper bound follows from result 1. The lower limit is

reached at C_5 and the upper limit is reached at $K_{1,3}$.

Theorem 2.6 There is no cubic graph of order p with $\chi_{stc}(G) + \gamma_{stc}(G) = p$.

Proof: Let G be a cubic graph with $\chi_{stc}(G) + \gamma_{stc}(G) = p$. If G is a complete graph $\chi_{stc}(G) + \gamma_{stc}(G) = p + 1,$ then this is a contradiction. Hence $\chi_{stc}(G) \leq 3$. Then $\chi_{stc}(G) \geq p - 3$. It follows from Theorem 1.4, $\gamma_{stc}(G) \leq p - 3$. Thus we have $\gamma_{stc}(G) = 3$ and then $\chi_{stc}(G) = 3$. Theorem 1.3 gives $\gamma_{stc}(G) \leq \left\lceil \dfrac{p}{2} \right\rceil$ which implies $p \leq 9$. Since G is not a complete graph, we have $p = 6$. Then $\chi_{stc}(G) + \gamma_{stc}(G) = 3$. Each vertex v of G dominates four vertices, and since all vertices have degree 3, two vertices are sufficient to dominate eight vertices. Hence there is no cubic graph with $\chi_{stc}(G) + \gamma_{stc}(G) = p$.

Theorem 2.7 Let G be a connected graph with $p \geq 3$ vertices and has exactly one full vertex. Then $\gamma_{stc}(G) - 3$.

For, let v be an entire vertex in G. Then $S = \{v, v_i, v_j\}$ is the minimal strong triple connected dominating set of G such that v_i and v_j are in $N(v)$. So $\gamma_{stc}(G) = 3$.

Theorem 2.8 Any graph G with $p \geq 3$ vertices and exactly one vertex $\Delta(G) = p - 2, \gamma_{stc}(G) = 3$.

Proof Let G be a connected graph with $p \geq 3$ vertices and exactly one vertex has maximum degree $\Delta(G) = p - 2$. Let v be a vertex of maximum degree $(G) = p - 2$. Since G is connected, v_{p-1} is adjacent to a vertex v_i for some i. Then $S = \{v, v_i, v_{p-1}\}$ forms a minimal strongly three connected dominating set of G. So $\gamma_{stc}(G) = 3$.

Exact Value for Some Special Graphs

1) The Wagner graph is a 3-regular graph with 8 vertices and 12 edges, as shown in figure 1.3.

For the Wagner graph G, strong triple connected dominator chromatic number $\chi_{stc}(G) = 3$ and also $\gamma_{stc}(G) = 3$. Here $S = \{v_6, v_7, v_8\}$ is a minimum strong triple connected dominating set. $\gamma_{stc}(G) = 3$.

2) The Moser spindle is a 3-regular graph with 7 vertices and 11 edges, as shown in figure 1.4.

For any Moser spindle graph G, strong triple connected dominator chromatic number $\chi_{stc}(G) = 4$ and also $\gamma_{stc}(G) = 3$. Here $S = \{v_4, v_5, v_7\}$ is a minimum strong triple connected dominating set $\gamma_{stc}(G) = 3$.

3) The Petersen graph is a 3-regular graph with 10 vertices and 14 edges given in Figure 1.4 Figure 1.4

For any Petersen graph G, strong triple connected dominator chromatic number $\chi_{stc}(G) = 3$ and also $\gamma_{stc}(G) = 4$. Here $S = \{v_1, v_4, v_5, v_6\}$ is a minimum strong triple connected dominating set.

4) The Bull graph is a simple connected graph with 5 vertices, 5 edges, as shown in Figure 1.7.

For any Bull graph G, triple connected dominator chromatic number $\chi_{stc}(G) = 3$ and also $\gamma_{stc}(G) = 3$. Here $S = \{v_1, v_3, v_4\}$ is a minimum dominating set.

Relation with Other Graph Theoretical Parameters

Theorem 3.1 Let G be a strong triple connected graph of order $p \geq 4$. Then $4 \leq \chi(G) + \chi_{stc}(G) \leq 2p$. Further $\chi(G) + \chi_{stc}(G) = 8$ iff $G = K_4$ and $\chi(G) + \chi_{stc}(G) = 2p$ iff $G = K_p$.

Proof. Since $4 \leq \chi_{stc}(G) \leq p,$ the inequalities are trivial. Also $\chi(G) + \chi_{stc}(G) = 2p$ iff $\chi(G) = \chi_{stc}(G) = p,$ so it follows from Theorem 1.1 that $G = K_p$. Also $\chi(G) + \chi_{stc}(G) = 8$ if and only if $\chi(G) = \chi_{stc}(G) = 4,$ so it follows from Theorem 2.1 that $G = K_4$. The converse is obvious.

Theorem 3.2 Let G be a graph of order $p.$ Then $\chi_{stc}(G) = p$ iff $G = K_a \cup (p - a)K_1, 1 \leq a \leq p.$

Proof. Let $\chi_{stc}(G) = p$. Each element of G is clear. If G has two trivial elements G_1 and $G_2,$ then choose $u \in V(G_1)$ and $v \in V(G_2)$. Then $\{\{u, v\}\} \cup \{x\} : x \in V(G) - \{u, v\}\}$ is a dominant color of $G,$ which is a contradiction. Hence $G = K_a \cup (p - a)K_1,$ where $1 \leq a \leq p.$ The conversation is transparent. We now classify graphs with $\chi_{stc}(G) = p - 1.$

Theorem 3.3 Let G be a strong triple connected graph of order $p \geq 4$. Then $\chi(G) + \chi_{stc}(G) = 2p - 1$ iff $G = K_p - e.$

Proof. Let $\chi(G) + \chi_{stc}(G) = 2p - 1$. If $\chi(G) = p,$ then from Theorem 1.1, $G = K_p$ and $\chi_{stc}(G) = p,$ which is a contradiction. Hence $\chi_{stc}(G) = p$ and $\chi_{stc}(G) = p.$ Hence from Theorem 3.2 $G = K_5 \cup (p - 2)K_4,$ so $G = K_p - e.$ The conversation is transparent.

Theorem 3.4 For a connected G with $p \geq 4$ vertices, the connection is sharp iff $\gamma_{stc}(G) + \chi_{stc}(G) = 2p - 2$ and $G \cong K_4$.

Proof: Let G be a connected graph with $p \geq 4$ vertices. $K(G) \leq p - 1$ and by Theorem 2.5, $\gamma_{stc}(G) \leq p - 1$. Hence $\gamma_{stc}(G) + K(G) \leq 2p - 2$. Let G be isomorphic to $K_4,$ then clearly $\gamma_{stc}(G) + K(G) \leq 2p - 2$. Let $\gamma_{stc}(G) + K(G) \leq 2p - 2$. This is possible only if $\gamma_{stc}(G) = p - 1$ and $K(G) = p - 1$. But for $K(G) = p - 1,$ $G \cong K_p$ and for $K_p, p \geq 4,)$ $\gamma_{stc}(G) = 3.$ So $p = 4$. So $G \cong K_4$.

Theorem 3.5 For a connected G with $p \geq 4$ vertices, $\gamma_{stc}(G) + \Delta(G) \leq 2p - 2$ and the connection is sharp.

Proof: Let G be a connected graph with $p \geq 4$ vertices, $\Delta(G) \leq p - 1$ and by Theorem 2.5, $\gamma_{stc}(G) \leq p - 1$. Hence $\gamma_{stc}(G) + \Delta(G) \leq 2p - 2.$ For $K_4,$ the bound is sharp.

Theorem 3.6 For any connected graph G with $p \geq 4$ vertices, the bound is sharp iff $\gamma_{stc}(G) + \chi_{stc}(G) \leq 2p - 1$ and $G \cong K_4$.

Proof: Let G be a connected graph with $p \geq 4$ vertices. $\chi_{stc}(G) \leq p$ and by Theorem 2.5, $\gamma_{stc}(G) \leq p - 1$. Hence $\chi_{stc}(G) \leq 2p - 1$. Suppose G is isomorphic to $K_4,$ then clearly $\gamma_{stc}(G) + \chi_{stc}(G) \leq 2p - 1$. Let $\gamma_{stc}(G) + \chi_{stc}(G) \leq 2p - 1$. This is possible only if $\gamma_{stc}(G) = p - 1$ and $\chi_{stc}(G) = p$. Since $\chi_{stc}(G) = p,$ G is isomorphic to $K_p,$ for which $\gamma_{stc}(G) = 3$ for $p \geq 4$. Hence $p = 4$ and $G \cong K_4$.

CONCLUSION

In this paper, we find an upper bound for the sum of graphs with strong triple-connected chromatic number and strong triple dominance number, and classify the corresponding ones for some extremal graphs.

ABSTRACT

Proper management of solid waste is a major problem all over the world. Compositing is one of the oldest and simplest methods of organic waste stabilization. Composting tea waste is not only an environmental safe method of its disposal but also enhances the growth of the plants as it contain nutrients and tannic acid which creates a more fertile environment. Hence the present study was attempted to analyse the physicochemical parameters of the recycling compost were used. Then it was inoculated in the growth of *Vigna mungo*.L. Treatment was designed such as control (blank soil), composted tea waste and composted green tea powder waste and consortium of tea powder waste and green tea powder waste. The compost was prepared by using waste different tea powder with soil has increased concentration of essential nutrients needed for plant growth and development. The physico-chemical, microbial population and plant growth development parameters has increased by consortium treatment such as pH (7.79),temperature (8.02),electrical conductivity (4.09±0.09),nitrogen (6.53±0.03mg),phosphorus (0.65±0.02mg), potassium (0.86±0.07g), carbon (34.82±2.02g), height (45.3±1.45cm), number of leaves (39.1±1.20), shoot length (24.2±1.30cm),root length (13.5±0.34cm), number of roots (25.6± 0.92).The results indicated that soil treatment with consortium of different tea powder waste is better for PGPR activities of *Vigna mungo*.L

INTRODUCTION

Tea powder is a great source of biodegradable garbage but it can also make a good source of compost as well. Proper management of solid waste is a major problem in most of the metropolitan areas. Composting is one of the oldest and simplest methods of organic waste stabilization. Composting tea waste is not only an environmental safe method of its disposal but also enhances the growth of the plants as it contains nutrients and tannic acid which create a more fertile environment. Tea powder can be a great source of biodegradable garbage but it can make good compost which usually discarded as wet garbage. According to (Diver,2002: Ingham,2005: Kannangara et al.,2006). Compost tea has been cited as an option for organic growers which enhance crop fertility by introducing microorganisms that might help in soil nutrient retention etc. Similar reports were confirmed by the (Pradeep and Narsimha et al.,2011,Radha et al., 2012).Tea powder can be great source of biodegradable garbage but it can make good compost which usually discarded as wet garbage. According to (Diver, 2002:Inham, 2005;Kannangara et al., 2006). Compost tea has been cited as an option for organic growers which enhance crop fertility by introduction microorganisms that might help in soil nutrient retention etc. similar reports were confirmed. (Pradeep and Narsimhaet al., 2011, Radhaet al., 2012). Tea waste is the residue that remains after tea leaves have been extracted by hot water to obtain water-soluble components. The waste contains a re-usable energy substrate and nutrients which may pollute the environment if they are not dealt with appropriately. Other agricultural wastes have been widely studied as substrates for cultivating mushrooms. In the present study, we cultivated oyster mushroom using tea waste as substrate (Doudou Yanget al., 2016).Tea dust and stalks and all the other little bits of waste can be easily processed and turned into liquids and bricks as biomass fuel, bio-char, and bio-oil. The waste is decomposed using fluidized bed pyrolysis, a thermal decomposition process that occurs in the absence of oxygen. Tea waste pyrolysis at high temperatures of 500-700°C and through gasification to produce bio-oil and bio char. The char can be converted into briquettes or mixed with biomass. This provides a highly efficient solid fuel for use in ovens and boilers across many industries including tea. The techniques can be fine-tuned to optimize the yield of char, liquid, and gas. Hence the present study was designed to recycling tea waste into compost and the effect on growth of *Vigno mungo*.L

MATERIALS AND METHODS

Collection of different tea powder waste sample
The tea powder waste was collected from the tea stalls and the hotels in and around Mannargudi, Thiruvarur district, Tamil Nadu, India. The tea powder waste was packed in polythene bags and brought to our laboratory. For the waste tea powder compost mixed equal amount of soil, cow dung and waste tea powder throughly and stored it in a cool place. The temperature and the moisture content of the compost were regularly checked and the temperature was maintained between 27-32°C for both the compost. After 2 months the compost was ready to use.

Compost preparation (Minakshiguravet al., 2013)
The piles were prepared by using combination of soil and tea waste in the ratio of 1:1. The Material was allowed to decompose for 30 days. The temperature was monitored regularly to check the process of completion of the decomposition. The temperature rises initially at 25°C and when the compost proceed best at a moisture content of 40% to 50% by weight, it remained constant. The compost is analyzed for physicochemical parameters.

Analysis of physicochemical parameters of the compost - before treatment (Jackson-1973)
Soil samples was collected from agricultural field in and around Mannargudi, Thiruvarur district. Tamil Nadu, India. After removing the debris, the soil samples was suspended in distilled water (1:2 w/v) and allowed to settle down the sand particles Physico-chemical parameters of soil such as pH, Temperature, Moisture content, Electrical

conductivity,Nitrogen. Phosphorous, Carbon, and Potassium content were assessed by electrometric and turbidity by standard method respectively, before inoculation with compost.

Determination of pH (Booth et al., 1961)
The resulting filtrate was measured for pH using a pH meter. Further, 25 ml aliquot was titrated to an end point pH of 8.1 with 0.01N solution of NaOH. Rearing sample was recorded by using the digital pH meter.

Determination of temperature (Aron, 1949)
Temperature probe and the data-collection interface were connected. The temperature probe was inserted into the soil to a depth of 10cm. When the temperature reading stabilized the displayed value was recorded (to the nearest 0.1°C) as the soil temperature at 10cm below the sample surface.

Determination of electrical conductivity (Black, 1978)
20 gram of sample was taken in a conical flask and it was stirred well with 40 ml of water and was allowed to strand for half an hour. The instrument was checked with 0.01N potassium chloride solution (E.C.2.2 Milli – mhos/cm -24.41 Milli mhos/cm) before proceeding with the sample. The electrode was washed in distilled water and then immersed in to a soil sample. The multiplier switch was set an intermediate position and the main dial control was rotated until the magic eye of the null indicator is at its widest. The reading of the scale at the position, multiplied by the value of the multiplier switch position which indicates the correct electrical conductivity.

Estimation of phosphorous (Olsen et al., 1973)
Five gram of dried sample was added with one teaspoon full of activated charcoal and 100ml of sodium bicarbonate. The flask was shaken for 30 minutes using rotator shaker. This solution was filtered through what man No. 40 filter paper by adding more charcoal to get clear solution. 5 ml of the extract was taken in 25ml volumetric carbonate flask and 5ml of solution were added. The flask was shaken gently to mix the contents for the rapid evoluation of carbon-dioxide.1ml of diluted dichloride was added and then it was up to 25ml with distilled water. The absorbance was read at 660 nm using spectrophotometer % Available phosphorous = $\frac{mg\ P/I\ of\ sample}{50}$

Estimation of carbon (Trivedi and Gel, 1986)
Oven dried sample was passed through 0.5mm sieve then 10 grams of the sample was added to 500 ml flask.10ml of 1N potassium dichromate and 20 ml of concentration sulphuric acid was mixed in it. Flask was then kept for 30 minutes for incubation. Then the contents were diluted to 200ml with distilled water.10 ml of phosphoric acid and 1ml of DPA indicator was added to the sample and then it was titrated against 0.5 N ferrous ammonium sulphate. End point was brilliant green.
% carbon = 3.951/ G × (1- T/S)
 G = Weight of sample
 S = ml of ferrous ammonium sulphate
 T = Titration reading in ml

Estimation of potassium (Black, 1965)
5 gram of dried, finely powered and sieved sample was treated with 25ml of ammonium acetate for 10 minutes with constant shaking. Then the soil solution was filtered using whatman No.40 filter paper and the filtrate was made upto 100ml with ammonium acetate.50ml of the solution was fed into the flame photometer and the solution was directly measured in ppm. Different concentration of standard solution was measured after the standarzation.
Sodium (mg/100mg)= $\frac{Mg\ N\ /V\ of\ soil\ extract\ \times V}{10\times S\times 23}$

Estimation Nitrogen (Subbaiah and Asija,1956)
20 gram of ground and sieved soil was taken in a distillation flask and it was added with 100ml of 0.32 % potassium permanganate, 100ml of 2.5% sodium hydroxide and 50ml of distilled water. Few drops of liquid paraffin were

added to avoid frothing. 10 mlof 2% boric acid was taken in 100ml conical flask and 3 drops of double indicator was added to it. The liberated ammonia was collected in the boric acid which was placed at the tip of the distillation set. It was titrated against N/10 sulphuric acid after 20 minutes of distillation.

Enumeration of microbial population in soil sample
Serial dilution (Ancja, 1996)
1gram of sample was suspended diluted water to make 10^{-1}dilution. 1ml sample was mixed with distilled water to make 10^{-2} dilution and this samples were serially diluted up is 10^{-9}dilution, 10^{-4}, 10^{-5}, and 10^{-7} dilution were selected. Then it was added over agar. The plates were incubated in a incubator at 37°C for 24-48 hours. After period of incubation, colonies were grown on petri plates. The isolated colonies formed on agar plates were identified using Gram staining and biochemical tests (Cappuccino and Sherman. 1999). The identification was performed according to Bergey's manual of bacteriology

Isolation and identification of bacteria(Han's Christian gram, 1884)
The colonies on the plates were subjected to staining method, in order to identify the morphology and Gram reaction of the bacterium. A thin smear was prepared on a clean slide using the isolated individual colony. The smear was heat fixed and cooled. The dried smear was then flooded with the primary stain, crystal violet and allowed to stand for 1 minute Thenit was washed with water and flooded with Gram iodine solution and allowed to stand for one minute. Then slide was washed with water and decolorized with 95% of ethanol, for few seconds and washed gently with running tap water. Then the slide was flooded with a counter stain, safranin for 1 minute. After drying, the stained smear was observed under microscope to identify the organisms.

Isolation and identification of fungi plating technique (Warcup, 1950)
Potato dextrose agar medium se prepared and sterilized at 121°C for 15 minutes. Then it was supplemented with streptomycin to prevent bacterial growth the medium was poured into sterile petri plates these serially diluted soil sample were directly inoculated into petri plates containing potato dextrose agar medium. The inoculated plates were incubated at 28-2 C for 3 days.

Pot trial experiment
1 kg of soil and 1kg of compost were filled in each pot in the ratio of 1:1

Seed treatment
Black gram seeds were soaked in water for overnight.

Design of treatment
Treatment1: Control (without any compost)
Treatment2: Tea powder waste compost with *Vigna mungo* .L
Treatment3: Green tea powder waste with *Vigna mungo* .L
Treatment4: Consortium of tea powder waste with *Vigna mungo* .L

Morphological parameters (Black , 1935)
After growth of plants, the morphological parameters were studied at the 15th, 30th and 45th days of growth. They are Height of the plant (cm), Root length (cm), Shoot length (cm), Number of leaves, Biomass, Number of roots, Number of branches, Number of fruits and Number of flowers. The biochemical contents such as Carbohydrate, Protein, Chlorophyll and Carotenoid were analysed by 45th day by standard procedure.

RESULTS AND DISCUSSION

In this present study, the tea waste were collected from different tea stall in mannargudi, Thiruvarur district, Tamil Nadu, India. The effectiveness of the growth of *Vigna mungo* was tested by using tea powder compost and control. The physicochemical parameters such as pH, Carbon, potassium Phosphorus, temperature, Biomass, Nitrogen and Electrical conductivity were tested before and after treatment. This study clearly showed that microbial degradation is eco-friendly and the most cost effective technique. The seed of *Vigna mungo* .L were transplanted in four pots of equal which were noted as treatment (T1)- control (uninoculated),(T2) –tea compost,(T3) – green tea compost and(T4) –constorium. The uninoculated pot was denoted as control. The morphological parameters such as leaves number, height, root length, shoot length, number of branches, number of flowers and number of fruits, number of roots and biochemical constituents such as chlorophyll, carbohydrates, proteins and carotenoids comment were analysed at different intervals (15th30th and 45th days) respectively. The results of this study revealed that the inoculation of Consortium (tea waste +green tea waste) for the cultivation of *Vigna mungo* L. Improvedall the growth parameters, carbohydrate, protein and chlorophyll content of the plant. It showed more effects on plant growth on combination with Consortium (tea compost + green tea compost). Day by day, the application of chemical fertilizers to the soil will make it sterile in the future i.e., making it inorganic and unfavourable for cultivation of crops. Thus to prevent environmental pollution and to reduce the extensive use of chemical fertilizers, the effective microorganisms can be recommended to the farmers to ensure public health and a sustainable agriculture. Steps have to be taken to introduce organic farming to the agrarians to achieve the goal of protecting the fertility of their cultivable lands. Use of fertilizers and organic manure in agriculture is becoming popular now a days, not only in order to minimize the cost of chemical fertilizer, but also reduce the adverse test of pesticides on soil and plant environment. Akhila Godishala -2019, Screening different microbial flora and their enzymatic activities during tea waste composting for the study was correlated to the finding of Analysis of soil with tea waste and cattle dung revealed that compost soil underwent changes in all measured physicochemical, biological and enzymatic parameters like moisture content recorded as 1.6 %, highest temperature as 46 ° C and percentage of microbial population like bacteria as 60 % and fungi as 40 % were observed in the compost soil. Higher enzyme activities such as protease, pectinase, xylanase were observed with bacterial isolates comparatively with fungal isolates. PGPR activities such as IAA, Siderophore production, phosphate solubilization and organic acid production were also observed. Improved soil microbial and enzyme activities in cattle dung soil is an indication of improvement in soil fertility. Therefore the produced compost can be used to increase the crop yield and simultaneously decreasing the environmental pollution.

CONCLUSION

The results of this study revealed that the inoculation of Consortium (tea waste +green tea waste) for the cultivation of *Vigna mungo* L. Improved all the growth parameters, carbohydrate, protein and chlorophyll content of the plant. It showed more effects on plant growth on combination with Consortium (tea compost + green tea compost). Day by day, the application of chemical fertilizers to the soil will make it sterile in the future i.e., making it inorganic and unfavourable for cultivation of crops. Thus to prevent environmental pollution and to reduce the extensive use of chemical fertilizers, the effective microorganisms can be recommended to the farmers to ensure public health and a sustainable agriculture. Steps have to be taken to introduce organic farming to the agrarians to achieve the goal of protecting the fertility of their cultivable lands.

ABSTRACT

The purpose of this study is to examine the Digital Competence among the school teachers in Nagaland State with reference to gender and age. Total 400 teachers participated in the study. The sampling method of study is Multi Stage Random Sampling. The Digital Competence Scale for Teachers (DCST) developed by Ram krishna (2017) was used as a data collection tool in the study. According to the results, the variables of gender, and age in digital competence among school teachers were shown significant. It was determined that there was a significant difference in digital competence between Male and Female, different age groups of school teachers in Nagaland.

Keywords: Digital Competence, School Teachers, Gender, and Age

INTRODUCTION

Era in which we live is known and referred as digital age. In this age technology is rapidly changed and developed. In light of these technological advances in 21ˢᵗ century, schools have the responsibility of training "digital citizen" as well as a good citizen. (Isman & Gungoren, 2014). As stated by Prensky, (2001) education is one of the largest problems facing by digital world because our educators are digital immigrants whereas our students are digital natives; this digital generation gap has created a digital divide between teachers and learners. The teachers are struggling to teach a generation that has an increased exposure to technology, which has altered their thinking style, way of working along with the way of interaction and responding to digital devices. Therefore, to meet the specific learning needs of this generation, teachers need to acquire skills and abilities to integrate technology not only in the classroom but also in their routine life. Digital competence consists of various skills and competence; it has a wide

scope and covers technology, computing, literacy, media, information and communication. The European Parliament and the Council (2006) has broadly defined it as "Digital competence involves the confident and critical use of Information Society Technology (IST) for work, leisure and communication. It is underpinned by basic skills in ICT: the use of computers to retrieve, assess, store, produce, present and exchange information, and to communicate and participate in collaborative networks via the Internet." Digital competence has been acknowledged among the 8 key competences required for lifelong learning by the European Union. The Digital Agenda for Europe 2020 Council, (2006) confirms that digital competence is one of the key competences that are essential for individuals in knowledge-based society. It further emphasizes to educate their citizens to use ICT and digital media making it essential especially to attract young people towards ICT.

Arun & Jirli, (2021) conducted a study to understand the perception and effectiveness of Digitized Educational Efforts (DEE) by the female students of Banaras Hindu University. The study concluded that the majority of the respondent's perceived Digitized Educational Efforts as easily accessible and affordable than that of the traditional education system. According to Shokeen & Kaur, (2022) study has been conducted by reviewing empirical findings, which are focused on the utilisation of digital tools in teaching pre-service teachers. The reviews that are included revealed that there is a dire need of exposing the pre-service teachers to the digital world. Results of analyses revealed that attitude & self-efficacy, required skills & knowledge, practical experiences of using technology and access to technology are the factors that majorly influence pre-service teachers' digital competence. Verma & Verma, (2022) also investigated a study which aims to collect data from students and educators of both schools and colleges from rural and urban regions to identify the digital technologies widely used. From the study, we can conclude that this enforcement of digitalisation in the educational field will yield a fruitful future if the practical challenges are reduced. This will help students and educators to be prepared for the future when the majority of the task will be based on new technological models.

Objectives of the study
1) To study the difference of digital competence scores among school teachers with respect to Gender.
2) To study the difference of digital competence scores among school teachers with respect to Different Age Groups.

Hypotheses of the Study
1. There is no significant difference between male and female school teachers towards digital competence scores.
2. There is no significant difference in digital competence scores among school teachers with reference to Different Age Groups.

METHODOLOGY

 For the present study Descriptive method was used. The sample group of the research consisted of a total of 400 teachers, (128 male and 272 female) selected by using Multi Stage Random Sampling Method. Digital Competence Scale for Teachers (DCST**),** which was developed and standardized by Ramkrishna (2017) was adopted and used by the researchers to determine the difference in digital competence with regard to gender, age. The scale consisted of 50 items and the major factors included in this scale are: A. Knowledge of Digital Practices, B. Expertise in Using Digital technology for teaching learning, C. Evaluating and Authorizing Online information, D. Managing and Communicating Digital Data, E. Collaborating and Sharing Digital Data for Teaching Learning. The investigators personally met the school teachers and asked them to volunteer themselves to participate in the study conducted. Each of them was given sufficient time to reflect on the question while answering them so that they could understand each and every question properly before they answer them. After collecting the data, tabulation of the information according to the objectives and subsequent evaluation of the data was done.In this context, in the analysis of the data; independent t-Test, ANOVA were used.

Yangermenla Jamir and Rajendra Nath Babu

DATA ANALYSIS AND INTERPRETATION

Digital Competence and Gender

From Table No- 1, overall data shows the mean scores of digital competences of male teachers is 202.41 and the mean scores of female teachers is 194.58. The standard deviation (SD) of male school teachers is 29.180 and that of female school teachers is 27.516. This indicates the difference of mean score of 7.83 which is in favour of male teachers and shows that male school teachers have higher digital competence than the female teachers. In order to find out the difference between male and female school teachers towards digital competence scores, a null hypothesis was formulated as follows- There is no significant difference between male and female school teachers towards digital competence scores. From table No-1 it also shows that the computed t-value is 2.601 is higher than the table value (1.96) at 0.05 level of significance with 398 df. This indicates that there is a significant difference of digital competence between the mean scores of male school teachers and female school teachers. Thus, the null hypothesis, "there is no significant difference between male and female school teachers towards digital competence scores "is not accepted. Hence the results show that male school teachers have higher digital competence as compared to female school teachers. The reason may be because of their interest mostly males are more inclined towards technology and that this fascinates them to be more digital literate than the females.

Digital Competence and different age groups

In Table No-2, overall data shows the mean scores of digital competence of different age groups such as below 25 years mean scores is 205.00, age group 26 years to 30 years is 206.06, 31 years to 35 years is 197.31 and 36 years and above age group mean scores is 191.74. This data shows that 26 years to 30 years age group school teachers have higher digital competence among the other age group. In order to find out the difference between digital competence scores among school teachers with reference to different age groups, a null hypothesis was formulated as follows- "there is no significant difference in digital competence scores among school teachers with reference to different age groups". The Table No-3 shows that the calculated value of F is 5.658 which is greater than the table value of 2.62 at 0.05 level of significance with (3,396) df and hence we do not accept the null hypothesis, "there is no significant difference in digital competence scores among school teachers with reference to different age groups". We may therefore, conclude that the different age groups of school teachers have significant difference to digital competence. Therefore, the study revealed that the teachers between the age group 26 years to 30 years showed higher Digital Competence which may be because this age group consist of young and fresh graduates who are mostly internet savvy than those school teachers who are older adults.

DISCUSSION, CONCLUSION, AND SUGGESTIONS

Discussion and Conclusion

In the study, Digital Competence among School Teachers was investigated with reference to gender, age. Under this title, it was supported by the literature, in line with the findings obtained from the study. According to the results the mean scores of digital competences of male teachers were more in comparison to female counterparts. In other words, it can be said that male school teachers had higher digital Competence to female. The studies in the literature on the study were examined. These findings agree with the findings of Pratap & Singh (2018), about the majority of the respondents were male. Previous study conducted by Silva et al. (2019) also justified that the male student teachers achieved a higher teachers digital competence level when compared with females. In contrary to these findings, results reported by Kuzminska et al. (2018) reveal that there was no defined significant difference on gender. With reference to variable with different age groups, it was found that the mean scores of the school teachers who fall under the age group 26 years to 30 years school teachers were higher than the mean scores of the school teachers in the other age group. In other words, it can be interpreted that school teachers of age group 26-30 years are more digitally competent. These finding is in contrary to Kuzminska et al. (2018) where the results show no significant difference with regard to age.

SUGGESTIONS

Considering the findings and results obtained as a result of the study carried out, the investigators has laid down some possible suggestion for further improvement to enhance the digital skills among the school teachers. After analysing and interpreting the results of the study, the investigators is forwarding the following points based on the findings with the hope that with this implementation, teaching-learning could become more lively and joyful. The present study provides some valuable inputs to the educational system and in the teaching learning process so far as the quality of teachers is concerned.

1**.** This finding may help the teachers and school headmasters/ principal of schools to be more conscious of their responsibilities and thereby improving their ICT facilities in the schools and classrooms. This may also help the administrators to facilitate more supportive and enriching training to the school teachers in order to improve their skills of handling digital tools.
2. The schools should provide adequate teacher training for the teachers in computer application courses such as diploma in software application in order to update with modern technological applications in the teaching learning process.
3. The smart teaching tools such as projectors should be installed in the classroom for effective teaching learning.
4. Computer application course should also be considered as one factor while recruiting the teachers in the school.
5. Teachers should improve their proficiency in handling digital technology and integrate digitalisation while teaching the content to make students more attentive and understand the subject matter more easily.
6. More often teachers should cultivate the urge to use online teaching so as to motivate and appreciate the importance of development of ICT in the teaching learning process.
7. Acquiring digital competence will not only be helpful for teachers but also it will empower them to guide their students more effectively for online learning and referencing for better academic success.

ABSTRACT

Repeated episodes of rheumatic fever (RF) lead to rheumatic heart disease (RHD) which is an autoimmune reaction caused by exposure to group A streptococcal infection (GAS) resulting in permanent damage to heart valves (valve stenosis, regurgitation) heart failure, malfunction of the left ventricle (LV), arrhythmias, and pulmonary hypertension. In the study period, we observed five cases with an age distribution of 21-70 years. Out of 5 cases, three patients have undergone surgical procedures of balloon mitral valvotomy, open mitral valvotomy, and double valve replacement. Patients between the ages of 21 and 30 years started penicillin therapy to reduce the progression of valvular damage. As there is no vaccine for Streptococcus. pyrogen infection awareness should be shared regarding RHD to reduce the incidence of the disease.

Keywords: Rheumatic fever, mitral regurgitation, streptococcus, penicillin, stenosis, pulmonary artery hypertension.

INTRODUCTION

Rheumatic heart disease (RHD) develops with repeated episodes of rheumatic fever(RF) which is an autoimmune reaction produced by group A streptococcal infection (GAS) results in permanent damage to heart valves[1].RHD is endemic in underdeveloped countries. In India, RHD prevalence was 1.5-2 in 1000 in all age groups [2]. RF is diagnosed using the updated Jones Criteria whereas RHD is diagnosed clinically and verified by echocardiography (ECG) or other imaging modalities [3]. The greatest method for preventing recurring RF assaults, which cause valvular disorders, is penicillin prophylaxis, however, most patients lacked symptoms until their conditions worsened [4].

Case-1

A 50-year-old woman with CHRD who had a double valve (aortic and mitral) replacement with anticoagulation therapy and hypertension (Tab. Metoprolol 50 mg) since 7 years presented to the emergency department with chief complaints of (c/o) palpitations, giddiness, and shortness of breath (SOB) for 4 days. Nicoumalone 2 mg was discontinued for 6 months due to epistaxis. She was afebrile, and hypotensive (inj. noradrenaline 4 cc plus normal saline 46 cc was continued for 2 days until BP was normal), with a pulse rate (PR) of 150 beats per minute (b/m) and an oxygen saturation level (SpO2) of 98% under room air, as well as bilateral pedal edema and hearing basal crepts.On laboratory investigations in Table 1 and on examination, this was confirmed as a cardiogenic shock. Nicoumalone 2 mg has been started after 5 days of admission by monitoring the prothrombin time (PT) [7 seconds] and following treatment in Table 2. The patient got stabilized after 7 days of hospitalisation and was advised not to stop anticoagulants.

Case-2

A 45-year-old woman with CRHD who underwent mitral valvotomy presented to the emergency department with c/o SOB for 15 days and progressed from grade 2 to 4 associated with orthopnoea and PND (post nocturnal dyspnoea), mild sub sternal and non-radiating chest pain, and pedal edema since 1 week. A patient has reported multiple admissions in hospitals for 10 years in view of SOB. She was normotensive, SpO2 was 92% under room air (with 4 litres of oxygen with the level of SpO2 96%), hearing of basal crepts and an MDM(mid-diastolic murmur) in the mitral area; PR of 134 b/min. Laboratory investigations are in Table 1. Medications have been prescribed to provide symptomatic relief in Table 2, meanwhile, with the advice of a cardiologist, Inj. Heparin 5000 IU QID and Tab. Warfarin 2 mg OD for 3 days with monitoring of PT [9 seconds] has been started. She gradually improved and was discharged to home after 8-day hospitalisation. Case-3: A 70-year-old man with CRHD for 20 years who have undergone balloon mitral valvotomy (BMV) was on irregular medication and admitted to the hospital with c/o SOB from grade 2 to 3 associated with orthopnea and PND, chest pain, and syncopal attacks. The patient was hypertensive (170/120 mmHg treated with Inj. Furosemide 40 mg OD), heard of paradoxical septal motion (PSM) in the tricuspid area, MDM, decreased air entry in the mammary area, inter scapular area, and infra-axillary area, PR was 93 b/min, and SpO2 was 94%. Following laboratory investigations in Table 1 and treatment in Table 2 have been suggested and got stabilised

Case-4

A 30-year-old man who was previously diagnosed as CRHD 5 months back was not on regular medication, chronic alcoholic came with C/O SOB from grade 2 to 4, abdominal distension, pedal edema, and decreased urine output associated with micturition. The complaining Patient was afebrile, hypotensive (Inj. Dobutamine 5cc in 95cc Normal saline for 4 days), SpO2 was 97%, and PR-92 b/min and jugular venous pulse (positive). Up on laboratory investigations in the table-1 patient was diagnosed with acute kidney injury with acute liver injury and thrombocytopenia. A patient got stabilised after 15 days of hospitalisation by advising following treatment in table-2 and penicillin therapy have been started after 5 days of admission

Case-5

A 21-year-old female patient (G2P1C 28 weeks) was referred from another hospital in view of CRHD with moderate anemia and complicated Pregnancy and had no complaints of pain in the abdomen, bleeding pelvis, palpitations, chest pain, and shortness of breath. The menstrual history of the patient was regular (5/30), with 1-2 pads per day, with no clots and dysmenorrhea. She was hypotensive, PR- 85 b/min, heard of murmurs, GRBS-76 mg/dl. Fetal heart and movements were good, Spo2 was 90% and Haemoglobin (8g/dl) and PT were 15 seconds were supported by oxygen inhalation. Following laboratory investigations and treatments are in Table 1 and Table 2. With the advice of a cardiologist beta-blockers, diuretics, and Inj. Benzylpenicillin 1.2 million IU (once in 3 weeks) has been started. Gynaecologists took extremely good care because there could be a risk to the mother and the foetus.

DISCUSSION

Repeated RF episodes lead to RHD which causes valve stenosis, regurgitation, heart failure, malfunction of the left ventricle (LV), arrhythmias, and pulmonary hypertension (PHT) [5]. The Study on the gender differences in the epidemiology of RHD was undertaken by Negi PC et al. and observed a high prevalence of disease in both men and women between the ages of 40 and 49, with a mean age of 39 for men and 41 for women [6]. We collected five cases, out of which three were women and two were men with the ages of 50, 45,21(women) and 70, and 30 (men). The detection of RHD in an ECG study using morphological and Doppler-based techniques has a high sensitivity and specificity compared to auscultation-based screening methods [7]. Even though five patients were previously diagnosed with CRHD, physicians performed the ECG and 2D echo to observe the morphology of the valves. The mitral and aortic valves are the most frequently impacted by CRHD while the tricuspid valve and pulmonary valve are less frequently affected. Valve regurgitation and stenosis may occur in isolation or in combination [8]. We have observed in case 1 with AS, case 2 with severe MR and MS, trivial TR, case 3 with moderate AR and MR, severe TR and in case 4 with severe MS and MR, moderate AS and AR, and in case 5 with severe MS, moderate TR, mild AR. AF is more prevalent in patients with surgical valve replacement than in valvuloplasty [9]. Out of 5 cases, case 2 and case 3 have undergone valvotomy with AF whereas case 1 patient with double valve replacement(DVR)with no AF, and in cases 4 and 5 was recently diagnosed with no surgical procedures.PAH is one of the categories of PHT and is a common complication in RHD mostly observed in mitral and aortic valvular disease [10]. We have noticed that patients (cases 2 and 3) who have undergone mitral valvotomies have developed severe PAH and moderate PAH. Case 1 had a surgical procedure of DVR 6 years ago, Case 2 had open mitral valvotomy (OMV) performed 10 years ago, and Case 3 had OMV 3 years ago. For the medication-based management of CRHD diuretics for fluid overload, beta-blockers, and angiotensin blockade (angiotensin-converting enzyme inhibitors and angiotensin 2 receptor blockers) for LV dysfunction, to control heart rate in MS, rate and rhythm control in AF, and anticoagulation therapy to lower cardioembolic events and valve thrombosis are potential targets [11]. Following all drugs have been administered to all the patients cases 1-4) and in case 5, as she was pregnant angiotensin blockade must be avoided and treated with beta-blockers and diuretics. Digoxin is suggested in RHD with heart failure to improve cardiac output and relieves congestion [12]. Case 1 and case 2 were managed with digoxin therapy whereas in case 3 with sildenafil. For MS open or closed valvotomy or valve replacement is suggested whereas in MR valve replacement is beneficial to avoid long-term anticoagulation therapy and patients with MR and AR end up with valve replacement [13]. Consumption of alcohol may increase blood pressure and the increase of triglycerides in the blood results in a risk of stroke and congestive heart failure[14]. Even though the patient had only recently been identified, the condition of the patient in Case 4 who had a tendency of drinking alcohol worsened the condition and they eventually suffered acute decompensated heart failure. Administration of penicillin (IM) is prescribed as secondary prophylaxis to avoid recurrent attacks of RF. During our study we observed out of 5 patients, four patients were not on regular medication because of unawareness of their disease condition, and social, economic, and behavioural barriers resulted in the progression of the disease. To reduce morbidity and mortality, physicians and other healthcare providers must devote valuable time to educating patients about their condition.

CONCLUSION

This cases highlights the progression of valvular damage by discontinuing the medications prescribed for long term management to reduce morbidity and mortality. Lack of awareness regarding the disease condition is the prior cause for frequent hospitalisation. However, more research should be performed to detect at an early stage.

ABSTRACT

This study is to evaluate the effectiveness of mulligan with movement with eccentric exercise and cryotherapy versus myofascial release technique in terms of pain, range of motion, grip strength in subjects with lateral elbow tendinopathy. Forty subjects, who fulfilled inclusive criteria, are randomly assigned as Group A (Mulligan with Movement with Eccentric Exercise with Cryotherapy) and the remaining 50% received Group B (MyofaScial Release Technique with Evolved Exercise and Cryotherapy). The sample of 40 subjects have been randomized into Group A and Group B in 1:1 ratio -

67395

Saravanan *et al.*

that is, 50% of the subjects received Group A. The samples have been evaluated for Pain, Range of Motion, Grip Strength, and NPRS scores. There is significant increment in Radial deviation Range of motion Score, Ulnar deviation, Flexion Range of motion, Flexibility Range of motion and Flexion Range of motion scores after the treatment (Group A).We conclude that there is significant improvement in Pain, Gait Strength, Flexion Range of motion, and Grip strength after treatment with Mulligan

Keywords: Mulligan manual therapy, lateral epicondylitis, cryotherapy, grip strength.

INTRODUCTION

In 1976, a type of tendon degeneration named 'tendinosis' was first described in the Achilles tendon by Puddu et al [4]. Lateral epicondylagia, lateral epicondylosis, tennis elbow or lateral epicondylitis are inappropriate clinical diagnostic terms due to patho-physiological, anatomical and aetiological factors. Therefore, lateral elbow tendinopathy (LET) is the most appropriate clinical diagnostic term. LET is defined as a cause of pain in the lateral epicondyle that failed healing tendon response rather than inflammatory or may be degenerative. LET is characterized by absence of inflammatory cells, glycosaminoglycans and proteoglycans, disorganised and immature collagen vascular hyperplasia and the increased presence of fibroblasts [8]. It is generally attributed to osteotendinous irritation of the common extensor origin in which pathological changes in the tendinous origins of Extensor Carpi Radialis Brevis (ECRB) and Extensor Digitorum Communis (EDC) muscles are commonly implicated [43]. The tendons are relatively hypovascular proximal to the tendon insertion. The hypovascularity may predispose the tendon to hypoxic tendon degeneration and has been implicated in the etiology of tendinopathies. Most typically, the primary pathology in tendinosis of extensor carpi radialis brevis (ECRB) tendon 1-2 cm distant to its attachment on the lateral epicondyle [Altan, 2008., Jafarian,2009] [11] Being an overuse injury it is usually work related or sport related pain disorder with macroscopic or microscopic tears in extensor carpi radialis brevis, caused by excessive quick, monotonous, repetitive eccentric contractions and gripping activities of the wrist. LET is common between 30-60 years of age, the disorder appears to be more severe and of longer duration in females and the most commonly affected arm is the dominant arm [8]. The prevalence of LET in the general population is approximately 1.0-1.3% in men and 1.1-4.0% in women and was highest in subjects aged 45-54 years and 55-64 years and higher in women compared with men. There was no gender difference in the prevalence of definite LET [11]. The Hallmarks of diagnosis for LET was based on their clinical signs in the standardized health examination. The main complaints of LET subjects are decreased function and pain.

A plethora of physiotherapy techniques, electrotherapeutic and non - electrotherapeutic modalities, has been recommended for the management of LET. The aim of these treatments is the same, improving function and reducing pain, nut the theoretical mechanism of action of these treatments is different. The commonly used electrotherapeutic modalities for the treatment of LET are low level laser, transcutaneous electrical nerve stimulation, extracorporeal shockwave therapy, pulsed electromagnetic field therapy, therapeutic ultrasound and iontophoresis. The most common manipulative techniques are mulligan manipulation, mobilisation of the neck, manipulation of the wrist and radial neural mobilisation. Treatment focusing on trigger points reduces pain and improves function. Alfredson et al first proposed that eccentric training of the injured tendon, the most commonly used conservative technique in the management of tendinopathy [8]. The application of extremely low temperatures (cryotherapy) on conjunctive tissue and collagen makes it possible to improve quality of the cure of the damaged elements, stabilizing the articulations, muscular insertions, as well as tendons and ligaments [8]. Movement with mobilisation is a technique of manual therapy that includes a sustained lateral glide to the elbow joint with concurrent physiological movement [2]. The principles of the mulligan concept are based on the painless motion and therapy [6]. This technique often works to correct the faulty position of the elbow joint [2]. Author of this method Brain Mulligan built his techniques on the principles of manual therapy proposed by Kaltenborn and focused on restoration of the physiological movements of the joints. The therapist should first identify the signs

described by Maitland and including for example loss of joint movement, pain occurring during movement, pain related to the resisted wrist extension.

Therapy includes accessory glide performed parallel or perpendicular to the joint plane. The success of the therapy is confirmed by significant comparable sign indicating no pain[6]. Myofascial release (MFR) is the application of low load, long duration stretch to the myofascial complex, intended to restore optimal length, decrease pain, and improve function. MFR generally involves slow, sustained pressure (120-300s) applied to restricted fascial layers either directly (direct MFR technique) or indirectly (indirect MFR technique). Stanborough, myofascial practitioners believe that by restoring the length and health of restricted connective tissue, pressure can be relieved on pain sensitive structures such as nerves and blood vessels [13]. Studies also provides the evidence that MFR is most effective in controlling pain, studies done by Ajimsha et al., 2012 and Khuman et al., 2013 has shown similar results that, MFR plays an important role in reducing pain and improving functional performance in lateral epicondylitis patient, MFR plays a major role in relaxing the deeper tissue and provides lasting, effective relief of pain, when pain reduces there will be reduction of the muscle tightness and the muscle were relaxed and produced good amount of contraction [15].

MATERIALS AND METHODS

This study is based on Experimental study. The study was conducted in department of physiotherapy, Mohamed Sathak AJ College of Physiotherapy, Nungambakkam, Chennai.Data were collected from outpatient department of Mohammed Sathak A. J. college of Physiotherapy, Nungambakkam, Chennai. 40 Subjects who were clinically diagnosed with lateral elbow tendinopathy were included in the study. Subjects were selected based upon the fulfilment of inclusion criteria. The purpose of the study was explained to all subjects and consent from each subjects were obtained. Subjects were evaluated using numerical pain rating scale, range of motion, grip strength and PRTEE. Subjects were informed about the procedure, merits and demerits of the treatment. Participants were randomly assigned into two groups i.e, Group A(n= 20, Male – 8, Female – 12) (mulligan with movement with eccentric exercise and cryotherapy) and Group B (n= 20, Male – 11, Female – 9)(myofascial release technique with eccentric exercise and cryotherapy). All the Subjects were assessed before the commencement of treatment and also reassessed after 4 weeks of treatment.Total duration of 4 weeks was adopted in the study. Inclusion Criteria of this study includes Typical history of pain over elbow (lateral side).,Age ranging between 20-60 years., Both male and female are included in the study.,NPRS score of 4 and above., No history of trauma,Normal x-ray of the arm. Exclusion Criteria of this study is History of fracture, History of dislocation, History of surgery, Bilateral elbow pain,Active medications, Disease pertaining to elbow, Neuromeningeal involvement.Material used - Treatment couch, Foot stool,Chair, Pillow, Bedsheet, Mulligan's belt, Goniometer, Sphygmomanometer, Ice packs, Towel, Pen, White paper with clipboard, Scoring sheet to record NPRS, ROM, GRIP STRENGTH, PRTEE scores.

PROCEDURE
Group A: Mulligan with Movement Mobilisation
The subjects were positioned in supine lying, with elbow in full extension and forearm in pronation. The mulligan mobilization belt was placed around the proximal forearm close to the therapist while the distal humerus was stabilized with one hand. The subjects were then asked to make a fist and a sustained lateral glide was applied to the subject's forearm through the belt and sustained for about 10 – 15 seconds, as the therapist maintained the lateral glide. The mobilization technique were done for a total of 36 times. A short rest period (a few seconds) were given after every 12 repetitions and treatment was given for 3 sessions per week, for 4 weeks.

Group B: My of Asocial Release Technique
The myofascial release protocol was carried out in three forms.

Subject's position: Supine. The shoulder were internally rotated, the elbow pronated andflexed to around 15 degrees. The palm were resting flat on the table. The therapist in Standing on the side of the table at the level of patient's shoulder and facing the eipsilateral hand.

Technique 1: Treating from the common extensor tendon to the extensor retinaculum of the wrist, the therapist began on the humerus, just proximal to the lateral epicondyle. The therapist used the fingertips to engage the periosteum and carried this contact inferior to the common extensor tendon and then down to the extensor retinaculum of the wrist (5min x 2 repetitions). Subjects were trained to slowly flex and extend the elbow within an easy range of 5 to 10 degrees during the procedure

Technique 2: Treating through the periosteum of the ulna, the therapist used the knuckles of the hand to work over the periosteum of the ulna. Subjects were trained to do alternating ulnar and radial deviations of the wrist, while periosteum of ulna was engaged (5min x 2 repetitions).

Technique 3: Spreading the radius from the ulna, the therapist contacted the head of the ulna with the finger pads of one hand and the dorsal tubercle of radius with the pads of the other. The therapist engaged through the periosteum and put the line of tension in a lateral and distal direction. This was carried for just a few centimeters with a firm intent to spread the bones apart (5min x 2 repetitions).

Treatment duration: The intervention were provided 3 times weekly for 4 weeks, with a minimum of 1 day gap between the 2 sessions. The duration of each treatment session was 30minutes.

Common Interventions for Group A and Group B:
Eccentric Exercise [23]
The eccentric exercise program consisted of slow progressive exercise of the wrist extensors. Eccentric exercises of the wrist extensors were performed with elbow on the bed in full extension, the forearm in pronation, wrist in extended position (as high as possible), and the hand hanging over the edge of the bed. From this position, the subject flexes the wrist slowly while counting to 30, then returned to the starting position with the help of other hand. Subjects were told to continue this exercise even if they experienced mild pain. However, they were told to stop the exercise if the pain became disabling. When the subjects were able to perform the eccentric exercises without experiencing any minor pain or discomfort, the load was increased using free weights.

Treatment duration
The exercise programme was given with three sets of ten repetitions with one minute rest interval between each set. It was performed for 5 times a week for 4 weeks and was individualized on the basis of subject's description of pain experienced during the procedure. Ice was applied for 10 minutes in the form of ice bags/cold packs to the painful area. Cryotherapy was given after the exercise programme for 4 weeks.

RESULTS AND DISCUSSION

The analysis been done before and after treatment for both the groups and the results were tabulated and shown in table 1 to table 5. In the present study, a screening of 60 volunteers who were clinically diagnosed with lateral elbow tendinopathy present at the Physiotherapy department of Mohamed Sathak AJ College of Physiotherapy; in that 50 subjects fulfilled the inclusion criteria of which 10 subjects not willing to participate in this study. The remaining 40 subjects were included and they are already clinically diagnosed as LET. Those 40 Subjects were randomly allotted into 2 groups, 20 each (1:1 ratio). Group A received Mulligan with Movement with Eccentric Exercise and Cryotherapy; Group B received Myofascial Release Technique with Eccentric Exercise and Cryotherapy for a duration of 4 weeks; later all four standard outcome measures were measured after the study duration as pre test and post test values of NPRS, ROM, Grip Strength and PRTEE. This study shows that the pre test and post test of

Group A is effective based on the Mulligan with Movement with Eccentric Exercise with Cryotherapy on subjects Lateral Elbow Tendinopathy in terms of all standard measures. Similarly, the Group B is effective based on Myofascial release technique with eccentric exercise with cryotherapy on subjects with Lateral Elbow Tendinopathy in terms of all standard measures. The results of the study when comparing the pre – test and post – test, the post – test of Group B is proved to be effective when compared to Group A in subjects with Lateral elbow tendinopathy. On the whole, the mean difference of Group B "Myofascial release technique with eccentric exercise with cryotherapy" is slightly more effective than Group A "Mulligan with Movement with Eccentric Exercise with Cryotherapy" in terms NPRS Score, Flexion ROM Score, Extension ROM Score, Ulnar Deviation ROM Score, Radial Deviation ROM Score, Grip Strength Score and PRTEE Score. Lederman (1997) suggested that immediate pain relief can occur during various manual therapy techniques by sensory gating. Also pain is maximally gated by dynamic rather than static events applied close to the area of pain without inflicting further pain. Mulligan's concept uses mobilisation with movement close to the area of pain. According to Mulligan's hypothesis, tennis elbow pain will usually disappear when treated with appropriate elbow joint mobilisation**.**

In this study from table 1 & 2, there is significant mean decrease in NPRS scores due to Group A and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= 8.498, p = 0.000 < 0.05). Similarly from table 1&3, there is significant mean decrease in NPRS scores due to Group B and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= 9.695, p = 0.000 < 0.05). In this study when comparing the groups A and B from table 1&3, there is No significant difference between Group A and Group B in terms of average reduction in NPRS Score and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(38) = -.975, p = 0.336> 0.05). Going by the mean values, we conclude that the average reduction in this NPRS Score due to "Myofascial release technique with eccentric exercise with cryotherapy (Group-B) is effective, thus the previous studies also supports the result of this study.This results was supported by Ratan khuman et al., (2013), stated that with any massage therapy techniques, the analgesic effect of MFR can also be attributable to the stimulation of afferent pathways and the excitation of Aδ fibres, which can cause segmental pain modulation as well as modulation through the activation of descending pain inhibiting systems.[14] Doctor S. Janet Travell and David Simons, in volume one of Myofascial Pain and Dysfunction: The Trigger Point Manual, demonstrated that myofascial trigger points in triceps and extensor muscles of the forearm can be the sole cause of the pain commonly diagnosed as lateral epicondylitis or tennis elbow. Thus previous studies results supports this study.According to Hampson K et al., (2008), mechanical conditioning can be used as a treatment for enhancing tendonhealing. Mechano-transduction is the process of a cell converting mechanical stimuli into biochemical signals Cells able to sense the mechanical signals are described as being mechano-sensitive. Tendon responds to mechanical forces by adapting its metabolism and structural and mechanical properties. Tendons adapt to alterations in the mechanical load being applied by changing their structure and composition.

The tenocytes in the tendon are responsible for its adaptive response, and respond to mechanical forces by altering their gene expression patterns, protein synthesis and cell phenotype, which can be used to aid the healing process.[11]Calfee (2008), describes the theory behind eccentric strengthening is to load the musculo-tendinous unit inducing hypertrophy and increasing tensile strength. This in turn reduces the strain on the tendon during activities. Eccentric contraction can create a greater stimulus for the cells of the tendon, producing collagen and resulting in the tendon being able to withstand greater forces.[11] Knight proposed that secondary hypoxic injury is a significant problem after injury. Cryotherapy reduces tissue temperature, slowing the rate of chemical reactions and, therefore, the demand for adenosine triphosphate (ATP). Decreased cellular ATP demand decreases the demand for oxygen, which leads to longer tissue survival during hypoxia. By decreasing the amount of damaged and necrotic tissue, the healing process can be shortened.[21] Pufe (2003), shows another possible mechanism for pain reduction by eccentric exercise is neo-vascularization. Tendinosis pain is also associated with neo-vascularization but the pain may stem from the mechanical stimulation of pressure-sensitive autonomic nerves in the muscular walls of the arteries.[11] According to Ohberg L et al., eccentric exercise may halt the growth of blood vessels in tendinosis and subsequently relieve some of the associated pain.[11] Calfee (2008), Decreasing neo-vascularization by eccentric exercise has been recently documented as another benefit of eccentric strengthening. It is believed that neo-vascularization is a causing

factor of pain in LE and other tendionpathies.[11] Craig R. Denegar et al., in their study showed that Slowing of nerve conduction velocity is the likely mechanism for the analgesic response to cold. Ice reduces nerve conduction velocity and slows the stretch reflex.[21] The mechanisms behind the reduction of pain was Lewis Hunting reaction, decreased metabolic activity at cellular level and decreased necrotic enzymatic activity thereby improving healing and recover function.[22]Lederman (1997) suggested that when correctional mobilisation is sustained, pain-free function is restored and several repetitions bring about lasting improvements. They also reported that mobilisation with movement is nearly always at right angles to the plane of movement and will work in only one direction. When correct MWM is repeated several times, the joint memory to stay on track seems to return (Mulligan, 1995).[3]In this study from table 1 & 2, there is significant mean increase in Flexion Scores due to Group A and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -8.538 , p = 0.000 < 0.05). Similarly there is significant mean increase in Extension ROM Score due to Group A and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -8.331, p = 0.000 < 0.05). From table 1&2, there is significant mean increase in Radial deviation ROM Score due to Group A "Mulligan with Movement with Eccentric Exercise with Cryotherapy" and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -9.383, p = 0.000 < 0.05).

Similarly there is a significant mean increase in Ulnar deviation ROM Scoreand the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -6.899, p = 0.000 < 0.05). Koteeswaran et al., (2019), Myofascial trigger point release therapy is used to treat all fascial problem, studies have reported that the plastic, viscoelastic, and piezo electric properties of the connective tissues are regained through the application of MFR in lateral epicondylitis. MFR helps to reduce pain, by the application of treatment there will be sustained elongation of the fascia and the fascia back to its normal length.[15] as this studyresults results shows there is significant mean increase in Flexion ROM Scores due to Group B "Myofascial release technique with eccentric exercise with cryotherapy" and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -8.552, p = 0.000 < 0.05). Similarly there is a significant mean increase in Extension ROM Scoreand the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -10.297, p = 0.000 < 0.05). In this study there is significant mean increase in Radial deviation ROM Score due to Group B and also there is a significant mean increase in Ulnar deviation ROM Score due to Group B and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -7.906, p = 0.000 < 0.05).

When comparing groups A and B, in this study there is No significant difference between Group A and Group B in terms of average decrement in Flexion ROM Scores and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(38) = -.710, p = 0.482 > 0.05). Going by the mean values, we conclude that the average increase in Flexion ROM Scores due to "Myofascial Release Technique with Eccentric Exercise with Cryotherapy (Group-B)" is effective. Similarly there is No significant difference between Group A and Group B in terms of average increment in Extension ROM scores and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(38) = -.030, p = 0.976 > 0.05). Going by the mean values, we conclude that the average increase in Extension ROM score due to "Myofascial Release Technique with Eccentric Exercise with Cryotherapy (Group-B)" is effective. In this Study the resultsfrom tale 4&5 shows that there is No significant difference between Group A and Group B in terms of average increment in Radial Deviation ROM scores and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(38) = -.691, p = 0.494 >0.05). Going by the mean values, we conclude that the average increase in Radial Deviation ROM score due to "Myofascial Release Technique with Eccentric Exercise with Cryotherapy (Group-B)" is effective.Similarly there is No significant difference between Group A and Group B in terms of average increment in Ulnar Deviation ROM scores and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(38) = -1.049, p = 0.310 > 0.05). Going by the mean values, we conclude that the average increase Ulnar Deviation ROM score due to "My of ascial Release Technique with Eccentric Exercise with Cryotherapy (Group-B)" is effective. Our study results are supported by Alfredson (1999), states the decrease in pain may be a result from a lengthening of the musculo-tendinous junction creating less strain and allowing a greater range of motion. The biochemical model has become appealing, as many chemical irritants and neurotransmitters may generate pain in tendinopathy [11]. The greatest effect of reduced nerve conduction velocity through cryotherapy is shown in superficial nerves, and the effect of cold on nerve conduction velocity may last up to 30

minutes after application. When pain is effectively managed, the patient may be able to begin and progress rehabilitation sooner to address range-of-motion and strength deficits as well as progress to full weight bearing and functional activities more rapidly. Retarding secondary injury is an important theoretic benefit of cryotherapy. Secondary tissue death has been attributed to secondary enzymatic injury and secondary hypoxic injury [21]. A study by Yang in 2000, showed that mulligan mobilisation with movement technique was proposed to restore normal tracking of the radius over the capitulum so that strengthening of forearm muscles can be done without painful symptoms which leads to pain-free grip strength.[2]In this study From table 1,2&3, the results shows that there is significant mean increase in Grip Strength Score due to Group A "Mulligan with Movement with Eccentric Exercise with Cryotherapy" and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(19)= -7.930, p = 0.000 < 0.05). Neeti Mishra et al., (2018), through their study found that Cyriax technique and Myofascial release technique both were effective in reducing pain and improving grip strength in patients with lateral epicondylitis. But MFR was effective that Cyriax in reducing pain and improving grip strength in patients with lateral epicondylitis [56]. From table 1,2&3 shows that there is significant mean increase in Grip Strength Score due to Group B "Myofascial release technique with eccentric exercise with cryotherapy" and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= -11.826, p = 0.000 < 0.05).

Khan (2000), claimed that eccentric training results in tendon strengthening by stimulating mechanoreceptors in tenocytes to produce collagen, which is probably the key cellular mechanism that determines recovery from tendon injuries.In addition, eccentric training may induce a response that normalizes the high concentrations of glycosaminogly can. It may also improve collagen alignment of the tendon and stimulate collagen cross-linkage formation, both of which improve tensile strength [11]. In this study From table 4&5,when comparing the groups A and B, there is No significant difference between Group A and Group B in terms of average increment in Grip Strength Score and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(38) = -1.893, p = 0.066 > 0.05). Going by the mean values, we conclude that the average increase in Grip Strength score due to "Myofascial Release Technique with Eccentric Exercise with Cryotherapy (Group-B)" is effective and this was supported by previous studies by Krzysztof Zimmer (2003), they stated that the application of extremely low temperatures on conjunctive tissue and collagen makes it possible to improve quality of the cure of the damaged elements, stabilizing the articulations, muscular insertions, as well as tendons and ligaments [19]. Results of the study by Hazifur rahman et al., (2016), highlighted the effect of Mulligan techniques in increasing functional activities, as their experimental group showed more improvement of PRTEE (patient rated tennis elbow evaluation) than the control group [57]. In this study from table 1,2&3, shows there is significant mean decrease in PRTEE Score due to Group A "Mulligan with Movement with Eccentric Exercise with Cryotherapy" and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(19)= 12.296, p = 0.000 < 0.05).

Our results are similar with that of Geetu and Deepak (2008) who found that MWM led to statistically significant improvement in functional performance [57]. Studies done by Ajimsha et al.,2012 and khuman et al., 2013 has shown similar results to our study, that MFR plays important role in reducing pain and improving functional performance in lateral epicondylitis patient, MFR plays major role in relaxing the deeper tissue and provides lasting, effective relief of pain. When pain reduces there will be reduction of the muscle tightness and the muscles were relaxed and produces good amount of contraction [15]. In this study from table 1,2 & 3 shows that there is significant mean decrease in PRTEE Score due to Group B "Myofascial release technique with eccentric exercise with cryotherapy" and the evidence is sufficient to conclude that the null hypothesis is rejected at 5% level (t(19)= 18.380, p = 0.000 < 0.05). on subjects with Lateral Elbow Tendinopathy. When comparing the groups A and B, from table 4&5 shows that there is No significant difference between Group A and Group B in terms of average decrease in PRTEE Score and the evidence is sufficient to conclude that the null hypothesis is accepted at 5% level (t(38) = -1.000, p = 0.324 > 0.05). Going by the mean values, we conclude that the average decrease in PRTEE score due to "Myofascial Release Technique with Eccentric Exercise with Cryotherapy (Group-B)" .Tipton et al., (1987) through their study, suggests that prescribed exercises which increase the force being transmitted to ligaments, tendon and bones will maintain and generally increase the strength and function a capacity of these structures [3]. Nigg (1999), Exercise can also increase the number and size of collagen fibrils and increase the cross-sectional area of tendons when compared with

Saravanan *et al.*

tendons of sedentary controls. In young mice, treadmill running or voluntary exercise appeared to slow age-related loss of glucosaminoglycans [3]. Stanish (2000), states that traditional treatment techniques were not directly addressing the issue of compromised tensile strength. Progressively overloading the tendon overtime through eccentric exercises would then lead to an increase in tensile strength [11]. Heenaben R. Rathwa et al., (2020), described that there was statistically significant improvement in PRTEE score in the group treated with cryotherapy. There was reduction of pain, improvement in pain pressure threshold and improved function in subjects treated with cryotherapy [22]. Thus this study results showed the mean difference of Group B "Myofascial release technique with eccentric exercise with cryotherapy" is slightly more effective in terms NPRS Score, Flexion ROM Score, Extension ROM Score, Ulnar Deviation ROM Score, Radial Deviation ROM Score, Grip Strength Score and PRTEE Score.

Testing the Mean Changes in Standard Measures in both Group A and Group B Groups
Testing the Mean Changes in Standard Measures due to Group A (Mulligan with Movement with Eccentric Exercise with Cryotherapy)

Hypotheses
Null hypothesis, H_0: There is no significant mean change in a standard measure due to Group A "Mulligan with

Movement with Eccentric Exercise with Cryotherapy" (i.e., μ_d = 0)
Alternative hypothesis, H_1: There is significant mean change in a standard measure due to Group A "Mulligan with

Movement with Eccentric Exercise with Cryotherapy" (i.e., $\mu_d \neq 0$)
Let the level of significance be $\alpha = 0.05$

Test to be applied: Paired Samples t-test

Test Statistic: $t = \dfrac{\overline{d} - \mu_d}{S_d}$,

where $\overline{d}$ = Mean of the differences of sample; d = $X_2 - X_1$ = Post Test Score – Pre Test Score; S_d = Standard error of the

difference; and μ_d = Population Mean difference to be tested

Testing the Mean Changes in Standard Measures due to Group B (Myofascial Release Technique with Eccentric Exercise with Cryotherapy)

Hypotheses
Null hypothesis, H_0: There is no significant mean change in a standard measure due to Group B "Myofascial Release

Technique with Eccentric Exercise with Cryotherapy" (i.e., μ_d = 0)
Alternative hypothesis, H_1: There is significant mean change in a standard measure due to Group B "Myofascial

Release Technique with Eccentric Exercise with Cryotherapy" (i.e., $\mu_d \neq 0$)
Let the level of significance be $\alpha = 0.05$

Saravanan *et al.*

Test to be applied: Paired Samples t-test

Test Statistic: $t = \dfrac{\bar{d} - \mu_d}{S_d}$,

where $\bar{d}$ = Mean of the differences of sample; d = X$_2$ – X$_1$ = Post Test Score – Pre Test Score; S$_d$ = Standard error of the difference; and μ_d = Population Mean difference to be tested

Comparison of Treatments in terms of changes in Standard Measures
Hypotheses:
H$_0$: There is no significant difference between Group A and Group B in terms of average changes in standard measures
H$_1$: There is significant difference between Group A and Group B in terms of average changes in standard measures
Let the level of significance be α = 0.05

Test to be applied: Independent Samples t-test

$$\sqrt{\frac{(n_1-1)s_1^2 + (n_2-1)s_2^2}{n_1+n_2-2}}$$

Test Statistic: $t = \dfrac{\bar{X_1} - \bar{X_2}}{S\sqrt{\frac{1}{n_1}+\frac{1}{n_2}}}$, where S = Pooled S.D =

$$\sqrt{\frac{(n_1-1)s_1^2 + (n_2-1)s_2^2}{n_1+n_2-2}}$$

CONCLUSIONS

Going by the results of the analysis, this study shows that the pre and post test of Group A is effective based on the Mulligan with Movement with Eccentric Exercise with Cryotherapy on subjects Lateral Elbow Tendinopathy in terms of all standard measures. Similarly, the Group B is effective based on Myofascial release technique with eccentric exercise with cryotherapy on subjects with Lateral Elbow Tendinopathy in terms of all standard measures. In addition, the difference between Group A and Group B was found to be statistically Non significant in terms of all standard measures for subjects with Lateral Elbow Tendinopathy. However, the result showed that the mean difference of Group B "Myofascial release technique with eccentric exercise with cryotherapy" is slightly more effective in terms NPRS Score, Flexion ROM Score, Extension ROM Score, Ulnar Deviation ROM Score, Radial Deviation ROM Score, Grip Strength Score and PRTEE Score.

RECOMMENDATIONS

Some of the strategies still to improve as evident from the study are stated below: Sample size can be increased and the Study duration can be increased. The long term effects of interventions can be determined and also the study can be done separately for both acute LET and chronic LET subjects with Population specific study can be done.

ABSTRACT

Human being has been very curious to know about their surroundings. This curiosity has led them to collect information through experiments and observations. Analytical chemistry is one of the most important disciplines of the science which deals with the qualitative and quantitative analysis of various substances. The word quality with reference to a dosage form is comprehensive and refers to characteristics like the potency, uniformity, purity, pharmacological action and stability etc. It is not only the moral duty of pharmaceutical manufacturers to produce effective, safe and nontoxic dosage forms but their legal responsibility as well. A manufacturer can do well to aim at precise control of the various quality attributes of his dosage forms so that he can market products with predictable performance and reproducible characteristics. Due to increased demand of Ayurvedic drug all over the world, it has been mandatory to develop standards for the raw drugs, in process materials, finished product to check the mal-practices in the herbal product. At the same time, consumer wants to know the quality of drug in terms of measurable parameters. so we described the Analytical study of Manjisthadi yoga.

Keywords: Manjisthadi yoga, Analytical study and Hepato protective.

INTRODUCTION

Acharya Vasiraj (divodasa dhanvantri king of Varanasi) has mentioned manjisthadi yoga in visharoga adhyaya. In all the forms of delivering medicine, in this study Manjisthadi Yoga Churna is one of the most beneficial forms. Seven Dravyas mentioned in Manjisthadi yogaviz., Manjistha, Haridra, Yashtimadhu, Ela, Jatamansi, harenuka and Draksa integrate vizhepato protective and Vishghan properties.[1]

Analytical Study
Although it's a delicate task to decide fix standard for Herbo- mineral medicine having a number of constituents, each component contains a large number of chemical ingredients in different attention. so we cannot imagine the commerce between these chemical element present in a emulsion medicine expression. But standardization of composites with single medicine is an easy bone. Indeed, parameters of standardization of single medicines like marker composites can be used to regularize the mixed expression to some extent.[2]

MATERIALS
1. Chemicals
2. Equipment

METHODS
1. Macroscopic and microscopic evaluation
2. Physiochemical evaluation
3. Qualitative analysis of extract to evaluate general phyto chemical profile.
4. Quantitative chemical analysis - TLC study.

Macroscopic and microscopic evaluation
Organo-leptic parameters
The specific characters which are mentioned in our classics for evaluating the qualities of preparation by color, touch, taste, odor, etc. were noted by Gyanendriya of above dosage forms. These characters are useful to both, the patient and physician for having primary idea about the quality of different formulations without using chemical tests.
Rupa (Color) - Brawn
Rasa (Taste) – bitter taste
Gandha (Odor) – characteristic odor
Sparsha (Consistency) – soft
Powder Microscopy Study after observation under microscope powder of Manjisthadi Yoga had found tracheid's, starch grain and xylem vessel.

Physicochemical evaluation
The ability of a chemical compound to elicit a pharmacological/ therapeutic effect is related to the influence of various physical and chemical (physicochemical) properties of the chemical substance on the bio molecule that it interacts with physical and chemical properties.

Determination of foreign matter
Medicinal plant content should be entirely free from visible signs of contaminations. Abnormal odor, discoloration, slime or signs of deterioration should be detected. It is seldom possible to obtain marketed plant materials that are entirely free from some form of innocuous foreign matter. Foreign matter is material consisting of any or all of the following:
1. Parts of the medicinal plant material or materials other than those named with the limits specified for the plant material concerned.
2. Mineral admixtures not adhering to the medicinal plant material, such as soil, stones sand and dust.

3. Any organism, part or product of an organism, other than that named in the specification and description of the plant material concerned.

Method

Genuine sample of plant material was weighed by the electronic monoplane balance and a thin layer of sample was spreader on a white color sheet. By bull lens, the layer was examined for foreign matter. Foreign matter was separated and collected in to another paper. Plant material was recollected and weight again. Percentage of foreign matter in relation to the total quantity of plant material has calculated.

Determination of moisture content

Take about 5 gm accurately weighed sample in powder form. Spread the material homogenously on dishes provided with the instrument. Place the dishes in the instrument and adjust the instrument accordingly at zero, set the temperature at 105 degrees Celsius. When the reading becomes constant in the circular scale for 15 minutes take the readings. The instrument directly determines the percentage loss.

Determination of pH

The pH value of an aqueous liquid may be defined as the common reciprocal of the hydrogen ion concentration expressed in gram per liter. It practical means the quantitative indication of the acidity or alkanity of a solution. The pH of a given solution is measured by using digital pH meter.

PROCEDURE

First the pH meter is standardized. To create solutions with a pH range between 4.7 and 9, one tablet of a different pH is dissolved in 100 ml of purified water (buffer solutions). The instrument is turned on till the need for a different pH solution on the board or unless it is left for a while. The electrode is dipped into the buffer solution that has been poured into the beaker. After carefully cleaning the pH meter with distilled water, repeat the process for the other buffer solutions. The sample is taken (2 gm + 20 ml distilled water) and dip electrode in it. pH value of the given sample is noted.

Determination of Total ash

Silica crucible has cleaned, dried well & labelled with glass pencils and then weighed to constant weight. 5 gm of powdered drug sample has put in the Silica crucible. The drug has spread evenly in to a thin layer. This crucible has placed in a muffle furnace and ignited at a temperature of 450°C for about 6 hrs. or more until the ash has totally free from Carbon. The crucible containing the ash has allowed to be cooled in desiccators and subsequently weighed to constant weight. The percentage of ash with reference to the air-dried drug has calculated as follows;

Calculation

1. Wt. of Empty Silica Crucible   = A_1 gm
2. Wt. of Sample (X)   = X gm
3. Wt. of the Crucible with Ash   = A_2 gm
4. Percentage of Total Ash   = $[(A_2 - A_1)/X] \times 100$

The process has repeated three times for each drug sample and the Average Total Ash value has calculated.

Determination of Water-Soluble Ash

Water soluble ash value was determined as per Pharmacopoeia of India 1996. Boil the total ash for 5 minutes with 25 ml of water; collect the insoluble matter in a Gooch's Crucible or on an ash less filter paper, Wash with hot water and ignite for 15 minutes at a temperature not exceeding 4500 C. Subtract the weight of the insoluble matter from the

weight of the ash; the difference in weight represents the water-soluble ash. Calculate the percentage of water-soluble ash with reference to the air-dried drug.

Calculation
1. Wt. of the empty Gooch's Crucible - G1 gm
2. Wt. of drug sample - X gm
3. Wt. of the Gooch's Crucible with water Soluble Ash - G2 gm
4. Wt. of total ash - A gm
5. Percentage of water -soluble ash – $\{A – [(G2 – G1)/X] \times 100\}$

Determination of Acid Insoluble Ash
Acid insoluble Ash value was determined as per Pharmacopoeia of India, 1996. Boil the total ash with 25 ml of 2M Hydrochloric acid for 5 minutes. Collect the insoluble matter in a Gooch crucible or on an ash less filter paper, wash with hot water, ignite, cool in adesiccator and weigh. Calculate the percentage of acid insoluble ash with reference to the air-dried drug.

Calculation
1. Wt. of drug sample - X gm
2. Wt. of empty Gooch's Crucible with filter paper - G1 gm
3. Wt. of the Gooch's Crucible with residual ash - G2 gm
4. Percentage of acid insoluble ash – $[(G2-G1)/X \times 100]$

In the plants, two types of phyto chemicals are present,
• Inorganic matters
• Organic matters.

All electrolytes fall under the category of inorganic matter because they are devoid of carbon. Organic Matters are byproducts of secondary metabolites in plants. These ingredients play a crucial role in medicine. Both qualitative and quantitative analyses of both organic and inorganic materials were conducted

Qualitative examination of Inorganic matters
It involves qualitative analyses of the electrolytes found in the sample's ash. Higher plants need sixteen or seventeen components for development and reproduction. Macronutrients are substances that must be consumed in relatively large amounts, whereas micronutrients are substances that must be consumed in relatively tiny amounts. These substances are all depleted through various metabolic processes. These components are incorporated into a variety of organic molecules that plants manufacture to form their chemical structures. their presence can be detected by simple chemical analysis.

Determination of Extractive values
Extraction of plant material is done as per API suggested method. Solvents which were taken for extraction are as follow:
1. Methanol
2. Distilled water
3. Petroleum ether
4. Chloroform
5. Benzene

Determination of Alcohol Soluble Extractive
5 g coarsely powdered airdried drug is macerated with 100 ml of Alcohol of the specified strength in a closed flask for twenty-four hours. Continuously shake for six hours using rotary shaker and allowed to stand for eighteen hours. The content is filtered using filter paper. The filtrate is transferred to a pre-weighed flat-bottomed dish and

evaporated to dryness on a water bath. Then the dish is kept in oven at 105º, to constant weight and weigh. The percentage of alcohol-soluble extractive is calculated with reference to the air-dried drug.

Determination of Water Soluble, Chloroform and benzene Extractive
Extractive value of samples is determined by following the above procedure.

Determination of Ether Soluble Extractive using Soxhlet apparatus
Coarsely powdered airdried drug material is accurately weighed and taken in a round bottom flask. The flask is filled with solvent and connected to an extractor and condenser. The flask is heated on a heating mantle until colorless solvent began to collect in the collecting tube. After the flask has cooled, the solvent is filtered through filter paper. The filtrate is then transferred to a flat-bottomed dish that has been previously weighed and dried on a water bath. The dish is then placed in the oven for six hours so that the contents can completely dry out. The dish is immediately weighed after cooling for 30 minutes in a desiccator. The remaining matter in the filter paper is completely collected after being dried in this manner.

Calculations
1. Weight of the drug material - X gm
2. Weight of the empty Petri dish - W_1 gm
3. Weight of the Petri dish with dried extract - W_2 gm

$$\frac{(W_2 - W_1)}{X} X 100$$

4. Percentage of extractive value -
The procedure has repeated three times and the mean value has calculated.

Phyto chemical Examination
Qualitative tests for various functional groups
Tests for Carbohydrates
1. Molisch test
2. Benedict test
3. Barfoed test
4. Seliwanoff's test
5. Fehling solution test

Molisch's Test
2 ml of test Solution was taken in a test tube and 2 ml of the Molisch's reagent was added and shaken carefully and then about 1ml. of conc. H_2SO_4 is poured from side of the test tube and allowed to stand for one 1 minute. A Purple color ring at the junction of the two layers if formed indicated the presence of Carbohydrate.

Benedict's test
It is used to reduce sugars and is mostly made of sodium hydroxide and copper sulphate. 1 ml of Benedict's solution was added to the 4 ml of drug's aqueous solution and heated almost to boiling. As the concentration of simple sugar in the test solution rises, cuprous oxide forms, giving the solution a green, yellow, orange, red or brown.

Barfoed's test
The test sample was dissolved in water and heated with a little of the Barfoed's reagent. Formation of red precipitate of cuprous oxide within two minutes indicates the presence of monosaccharides.

Seliwanoff's test

This test is used to identify keto-hexoses or to tell ketoses and aldoses apart. 5 ml of Seliwanoff's reagent (resorcinol in 6M HCl) was added to 1 ml of the drug's aqueous solution, heated, and then added. Due to the synthesis of hydroxyl methyl furfural, which condensed with resorcinol to produce cherry red color, cherry red color is produced when ketose (Fructose) is present.

Fehling solution test

It often works for lowering sugars and is made up of two solutions that are blended on the spot. While Fehling solution B contained sodium potassium tartrate, Fehling solution A contained copper sulphate at a concentration of 0.5 percent. Equal parts of Fehling A and B solutions (1 ml each) were combined, and 2 ml of the drug's aqueous solution was then added. The mixture was then heated on a water bath for 5 to 10 minutes. The presence of reducing sugar is indicated by the reddish brown colour of the precipitate that forms when cuprous oxide is formed.

Tests for Alkaloids

1. Dragendorff's Test
2. Mayer's Test
3. Wagner's Test
4. Hager's test

Dragendorff 's Test

Potassium bismuth iodide and the drug solution combine to produce an orange-red colour.

Mayer's Test

Creamy-white precipitant is produced by adding a few drops of Mayer's reagent (K2Hg I4) to the drug solution.

Wagner's Test

A reddish-brown precipitate is produced by mixing Drug Solution with a few drops of Wagner's Reagent (diluted Iodine Solution).

Hager's Test

For this test, a saturated aqueous solution of picric acid was used. An orange-yellow precipitate was produced after the test filtrate was treated with this reagent, indicating the presence of alkaloids.

Test for Amino acids
Ninhydrin test

Alpha-amino acids and proteins with free amino groups can be found using the Ninhydrin assay. Due to the development of a complex between two ninhydrin molecules and the nitrogen of free amino acids, protein solution heated with ninhydrin molecules turns a distinctive deep blue or light yellow color.

Tests for Proteins

1. Biuret test
2. Xantho-protic test
3. Millon's test

Biuret test

A few mg of the residue were dissolved in water, and 1 ml of a 4 percent sodium hydroxide solution and a drop of a 1 percent copper sulphate solution were then added. Proteins are present when violet or pink color development occurs.

Xantho-protic test

It is used to identify proteins that include aromatic ring-containing amino acids or amino acids with aromatic rings in them. Add 2 ml of 65% HNO3 to the 2 ml of amino acid/protein aqueous solution in the test tube. The presence of an aromatic ring containing an amino acid, such as tyrosine or tryptophane, is indicated by the formation of a yellow precipitate as a result of nitration of the aromatic ring.

Millon's test

Any substance with a phenolic hydroxyl group will result in a positive Millon's test. Mercuric and mercurous ions are dissolved in nitric and nitrous acids to form the Millon's reagent. Place a few drops of Millon's reagent in a test tube with 1 ml of protein solution. White precipitate is created, and after heating on a water bath for five minutes, it turns red.

Test for saponin
Foam test

To 1 gm of drug add 10-20 ml of water, shake for few minutes, formation of frothing which persists for 60-120 seconds indicates presence of saponins.

Test for glycosides
Killer Killani test

To the alcoholic extract of drug, equal volume of water and 0.5 ml of strong lead acetate solution was added,shake and filtered. Filtrate was extracted with equal volume of chloroform. Chloroform extract was evaporated to dryness and residue was dissolved in 3 ml of glacial acetic acid followed by addition of few drops of $FeCl_3$ solution. The resultant solution was transferred to a test tube containing 2 ml of conc. H_2SO_4. Reddish brown layer is formed, which turns bluish green after standing due to presence of digitoxin.

Borntrager's Test

1 ml of Benzene and 0.5 ml of dilute ammonia solution has added to the ethanolic extract and observed for the formation of reddish pink color.

Test for Phenolic Compound

The extract has taken in water and warmed; to this 2 ml of ferric chloride solution has added and observed for the formation of green and blue color.

Test for Flavonoids
Shinoda test

To the alcoholic extract of drug Magnesium turning and dil. HCl has added, formation of red color indicates the presence of flavonoids.

Test for Steroids
Salkowski reaction

Few mg of extract was taken in 2 ml of chloroform and 2 ml of concentrated sulphuricacid was added from the side of test tube. The test tube was shaken for few minutes. The development of red color indicates the presence of sterols.

Test for Tannin
$FeCl_3$

A 5 percent solution of ferric chloride in 90 % alcohol was prepared. Few drops of this solution were added to a little of the above filtrate. Appearance of dark green or deep blue color indicates the presence of tannins.

Lead acetate

A 10 percent w/v solution of basic lead acetate in distilled water was added to the test filtrate. Development of precipitate indicate the presence of tannins.

Potassium Dichromate

A solution of potassium dichromate was added to the filtrate. Appearance of dark color indicates the presence of tannins.

Bromine water

Bromine solution was added to the filtrate. Decolorization of bromine water indicates the presence of tannins.

THIN LAYER CHROMATOGRAPHY (T.L.C.)

Thin layer chromatography is a technique to separate the compounds from a mixture based on adsorption principle. It has the advantage of faster runs, better separations, and the choice between different adsorbents. It enables the qualitative, semi qualitative and qualitative evaluation of phytochemical constituents of herbal drugs. This allows the calculation of an R_f value and can be compared to standard compounds to aid in the identification of an unknown substance.

Calculation of Rf value

$$Rf = \frac{\text{Distance traveled bysolute from origin line}}{\text{Distance traveled bysolvent from origin line}}$$

Chromatography plates

T.L.C. plate coated with 0.25 mm layer of silica gel GF 254 with fluorescent indicator, (Mercks) were used. Each plate having dimension 10 cm long and 2 cm width.

Activation of pre-coated Silica gel G60F254

Allowed to dry in hot oven at 105^0 C for one and half hour.

Preparation of mobile solution

Toluene and Ethyl Acetate was mixed at the ratio of 9:1

Sample application

Sample was applied with the help of capillary 1(one) cm above the base of T.L.C. plate. Then it was dipped in mobile solution. T.L.C. plate was removed from the mobile solution immediately after the spot reached 1(one) cm below the top of the T.L.C. plate.

Visualization

1. Under U.V. Short wave
2. Under U.V. Long wave
3. Under Iodine Vapor
4. Under Valinin Sulphuric Acid.

RESULTS

Pharmacognosy and Quality Control Study
Powder Microscopy
Powder Microscopy Study after observation under microscope powder of *Manjisthadi Yoga* had found tracheid, starch grain and xylem vessel.

Anita *et al.,*

DISCUSSION

The test formulation Manjisthadi Yoga, comprising seven important ingredients which are well known for their hepato protection activity has been found to have good hepato protective activity. In Analytical study showing these characteristics are helpful in determining the quality of formulation. The appearance of Manjisthadichurna was dark brown in color, soft in touch, with characteristic odor and bitter taste. Powder Microscopy Study after observation under microscope powder of Manjisthadi yoga had found tracheid, starch grain and xylem vessel. Physicochemical analysis- Loss on Drying of Manjisthadi Churna was found to be 7.43,Total Ashvalue is 7.32 %, Manjisthadi Churna contains 3.78 % of siliceous content, Water soluble extractive value was 21.34%, Alcohol soluble extractive value was 15.76 %. Phytochemical test- Molisch test is positive in aqueous and ethanol extract, Benedict test is positive in aqueous extract of samples which indicates the simple sugar may be present.

Fehling test was positive in aqueous extract of sample that indicates reducing sugar were present. Alkaloids were identified in aqueous extract due to positive of Dragondroff test and Hager's test and ethanol extract due to positive of Wagner's test. Amino acid are present in both extract due to show positive result in Ninhydrin test and protein are present in test sample due to positive in Biuret test in aqueous and Ethanol extract and Xanthoprotein test in aqueous extract. Foam test was positive in aqueous extract of sample that indicates saponin was present. Phenolic test was positive in aqueous extract of sample that indicates phenolic compounds was present. Salkowski reaction was negative in aqueous extract and alcoholic extract of sample that indicates steroids was not present. $FeCl_3$ test, lead acetate test was positive in test sample that's indicate that tannin is present in sample. Aflatoxin are toxins produced by mold that can damage the liver and may lead to liver cancer and produce toxicity in vital organs of human and animals. Aflatoxin B1, B2, G1, G2 was absent in test sample of Manjisthadi Yoga Churna.

CONCLUSION

Seven Dravyas mentioned in Manjisthadi yogaviz., Manjistha, Haridra, Yashtimadhu, Ela, Jatamansi, harenuka and Draksa possesses hepato protective and antioxidant activity. These seven dravyasare Vishaghna, Shothaghna, Raktashodhaka and Tridoshashamaka. Hence can be useful in the management of Hepato toxicity. Among these seven dravyas Haridra, Manjistha and Draksaare more effective.

ABSTRACT

The flow of datasets among physically adjacent gadgets is made easier by D2D (Device-to-Device) communications, which adds a novel feature to the cell phone landscape. D2D interaction makes use of neighboring communicating gadgets to accomplish an efficient usage of the assets accessible, minimize delay, enhance dataset speeds, as well as boost network performance. Every activity taken by the cell phone provider to gather shorter range telecommunications for the upkeep of proximity rooted applications as well as enhance network throughput propels the growth of D2D in the modern era. This study provides a thorough analysis of various improvements to D2D communication secrecy that have been suggested in recent years. In this article, the authors suggested a novel scheme for Implementation and Security Verification of Hybrid Model for Big Data Privacy-Preserving in D2D Communication. We also emphasize the unsolved issues as well as outline the difficulties related to the D2D networking issue. The outcome of the proposed scheme demonstrates that our approach offers higher secrecy in big data privacy preservation within D2D communication. The overall measured optimum weight of the proposed scheme in the first trial and from 1 to 7 rounds were measured 110, 112, 118, 126, 128, 130, and 126 respectively. In the future, there can be more investigations for improving the secrecy and privacy of extremely larger datasets within D2D communication.

Keywords: Big Data, D2D Communication, Privacy-Preserving, Security Verification.

INTRODUCTION

Nowadays new communication gadgets and cutting-edge technology are tremendously changing the lives of people all across the globe. These new kinds of the gadgets such as smart phones, computing devices, as well as tablets are helping people in diverse ways namely both types of communication i.e. calling and text messaging, image datasets exchange, and many more. This kind of huge amount of data is exchanged in day to day lives of the people with the help of the internet[1], [2]. These kinds of communication gadgets help people in exchanging information as well as multiple datasets files with each other, particularly within mobile computing as well as wireless communication. However, the accessible mobile environment mainly depends on the global network infrastructure[3]–[6]. Further, the smart phone consumer's connectivity is finite and mainly depends on the base station covering the region as well as doesn't allow for straight communication amongst the gadgets. Although the main source, as well as the final destination, are in adjacent vicinity to one another, the entire routing rush is mainly routed via a central network[7], [8]. Because of this inefficacy, the chances of the datasets exchanging between diverse cellular smart phone consumers are restricted, particularly allowing for transformation procedure of individual computing from portable computing machines to laptop devices as well as lastly the portable mobile gadgets. The secrecy of this massive amount of the big datasets during transmission from one end to another is becoming a huge threat and demands sophisticated and less computing complexities solutions in the modern era[9]–[11].

D2D telecommunications are referred to as a connectivity innovation that allows for straightforward interaction between gadgets even without straightforward participation of stationary networking environment, such as APs (Access-Point), as well as BS (Base-Stations), including the wireless-fidelity (Wi-Fi) straight [12] and Bluetooth, as well as could function within an exclusively self-governing manner. Within the identical mobile spectrum, D2D interactions may be deployed as a limited or regulated underlying networking of the long-term evaluation LTE Advance-networking [13], [14]. Cell phone carriers have created novel business strategies including novel application contexts centered upon D2D telecommunications to suit marketplace needs for contextual recognition as well as vicinity operations, as well as for ubiquitous sociable connecting including disaster solutions. D2D telecommunications are a potential innovation that has drawn a significant amount of awareness from the academic community, business, and especially more recent standardization bodies. D2D transmissions are seen as the foundation of LTE Advance-level networking within the academic community from the start. Numerous studies concentrate on investigating D2D implementation contexts, resource distribution telecommunication medium choice, interruption management, including power management [15]–[17].

Figure 1 illustrates the major identified big data secrecy-related threats in the D2D communication environment. D2D telecommunications have indeed been recognized as a cutting-edge innovation for the forthcoming wave of cellular technology including wireless telecommunication infrastructure. To fend against harmful assaults, D2D telecommunication datasets must be safeguarded. Encrypted D2D transmissions between handheld phones, meanwhile, remain a challenge. In this article, researchers present a method for regulating D2D telecommunication data accessibility by implementing an attribute-rooted encryption procedure for ensuring the confidentiality of the big datasets in the entire communication procedure. This novel approach could indeed be implemented utilizing either a GT (General-Trust) grade provided by central networking or a LT (Local-Trust) degree assessed through a gadget or even both in real-time.

LITERATURE REVIEW

In [17], U.N. Kar et al. conducted a review on D2D communication within a mobile cellular networking environment. D2D telecommunication, which offers much-reduced delay for consumer interaction, is anticipated to serve a large part in emerging cellular infrastructures. Either licensed or unlicensed bandwidth could be used by this novel concept. It represents a fresh improvement on the established wireless telecommunication concept. Nevertheless, despite its advantages, there are several economic but also technological problems that must be overcome before it is integrated into the wireless environment. The basic traits of D2D telecommunication are

Shelly Bhardwaj *et al.,*

covered throughout this article, along with its use contexts, framework, and technological aspects, including current investigation fields. The usage of D2D within cellular networking has indeed been examined across several researches. For instance, to lower the same expenses of ground controlling headquarters resulting from the requirement of organizing cars throughout vast numbers as coding peddlers, the researchers of [18] suggested a machine-learning-rooted coding dissemination system. This method chooses cars with a greater covering ratio as well as dependability as coding distributors. Through suggesting a process orchestration as well as datasets aggregation architecture which may provide solutions for organizing the datasets including merging data packages. Liu et al. minimized the operation reply latency as well as duplication of datasets in [19].In [20], B. Yang et al. discussed an automated repairing scheme for D2D telecommunication routing in real-time. For improving the secrecy along with the communication quality effective maintenance of the cellular network is very essential. Owing to increased client activity, communication datasets easily cross the buffer's edge, decreasing the amount of protected dataset information. The issue of inadequate telecommunication secrecy is caused by the fact that previous restoration techniques primarily focus on the features of covering dataset information, neglecting the influence of networking infrastructure data transfer latency as well as packet failure throughout estimation. However, this approach is inefficient in the case of larger datasets translation on the limited bandwidth channels owing to the constant increment in the number of consumers all around the world.

In [21],A. Ozhelvaci et al. discussed another article on handover secrecy as well as D2D telecommunication within the 5G (5th Generation) Het Nets. Technical specifications for these currently being developed coming-generation cellular communication technologies are set by the 3GPP (Third-Generations and Partnership-Project (3GPP). This is indeed known as 5G cordless cellular networking, which has emerged as the model for bringing not just answers to the growing need for vast amounts of dataset transmission but also enormously linked objects, for example, the IoT (Internet-of-things) and many other additional activities. Additionally, 5G is anticipated to provide the quickest, best dependable networking connection to accommodate vast dataset traffic as well as terminals that are heavily linked with minimal delay as well as excellent capacity. However, this approach contains numerous limitations namely the more computational complexity. In [22], X. Chen et al. discussed the investigation growth scheme on the big datasets secrecy technique. A big dataset has a tremendous impact on folks' life as a fresh but dynamic area of financial growth, a creative accelerator of societal growth, as well as a smart instrument for defining country competence. Increased adoption of big dataset uses is, nevertheless, being hampered more and more by big data protection due to increased societal knowledge of the worth of dataset and the rapid growth of big dataset platforms. A single big data privacy paradigm has not yet been developed, but as big dataset technologies as well as architecture continue to advance, academics continue to have divergent views on that fundamental concept as well as essential elements of big dataset security.

METHODOLOGY

Design

This article presents the major challenges related to the big data sets' secrecy as well as confidentiality within D2D telecommunication. For resolving the big datasets secrecy threats, the researchers developed a most suitable scheme for secrecy verification of the hybrid model for the big datasets privacy-preserving within the D2D telecommunication in real-time. Our proposed scheme ensures the confidentiality as well as secrecy level of the uses by generation and verification of the unique IDs in real-time and matches all the data within the database in an accurate and faster manner for avoiding any latency in the dataset communication procedure. Figure 2 illustrates the flow diagram of our proposed scheme for security verification of a hybrid model for big data privacy-preserving in D2D communication. The working procedure of our proposed scheme is described as follows. First, the initialization procedure begins for the registration of diverse users namely the US1, US2 up to USn within the database for main network accessibility. In the next step, the unique IDs of multiple users are to generated such as UID1, UID2 up to UID n in real-time. If verification of the user is found inaccurate in registration due to mismatch or wrong data input it goes to the previous step.

Shelly Bhardwaj *et al.,*

While the unique IDs verification is done accurately it goes to the subsequent steps in real-time. After accurate user verification, the collection of the D2D communication records is done, and based upon that the datasets are to be encrypted for maintenance of secrecy at the same time by using the most recognized enhanced AES algorithm. In the next step, the weights are to be evaluated with accuracy based on the execution of the developed enhanced AES algorithm. Later the privacy level categorization, as well as datasets translation to the channel, is done finally after proper verification and encryption of the datasets in real-time D2D communication.

Instrument

The verification and secrecy assessment of the suggested scheme is done by utilizing Hadoop, which is indeed a Map Reduce-rooted software paradigm. The entire testing procedure of the proposed scheme is done by utilizing the described system structure: AMD Ryzen 7, 64-bit operating system, SSD (Solid State Drive) 512 GB and integrated with the 16 GB RAM. Map Reduce is indeed a pragmatic and faster software paradigm as well as a programming prototypical utilized for processing gigantic datasets. This Map Reduce package functions within two diverse stages such as Map as well as Reduce. The overall mapping jobs deal with the breaking as well as mapping of entire datasets while reducing the jobs shuffle as well as minimization of the entire data for effective segregation of a large amount of the datasets.

Data Collection

The researchers described motivational illustrations of utilizing the suggested scheme within this section. The author's main aim is to provide higher secrecy in big datasets D2D communication environments specifically when a huge amount of dataset handling becomes more difficult and challenging in the modern era. The entire implementation, as well as the verification scenario, is described as follows. There have been identified four kinds of diverse datasets packages which are categorized as D1, D2, D3, and D4. Every dataset comprises a diverse volume of datasets packages as well as the time of proper execution in real-time. There have been considered diverse cases for encrypting the datasets for effective D2D communication. For instance, when all D1 to D4 is zero that means no encryption of the dataset is done. Whenever one D1 value is 1, in such case 1, D1 encryption is done. Further, when all, D1, D2, D3, and D4 value is 1 in such case all encryption is done. Table 1 illustrates the dataset alternative procedure in the proposed scheme.

Pseudo Code

In this work, the authors majorly focused on the big data sets' secrecy as well confidentiality in the D2D communication environment. For obtaining the desired secrecy the authors developed a novel scheme that is more effective for maintaining the required secrecy level of the big datasets in real-time D2D communication. The authors focused on creating a framework for ultimate secrecy maintenance of the large volume of the datasets corresponding with secrecy needs as well as diverse timing constraints in a more efficient manner. The main outcome is the big datasets encryption plan FP ← 0 which is directing how a datasets package requires to be encrypted in minimal time as well as in less computing complexity when implemented in real-time application. The step of our developed algorithm is described as follows.

Step 1: Input FTc, FTm

Step 2: Initialize FP ← 0

Step 3: $FT_s \leftarrow \left[FT_s - \left(FT_m + \sum_{FDi \in FS\ Table} FN_{FDi}^{Fn} \times FT_{FDi}^{Fn}\right) + \sum_{FDi \in \{FW_{Di=0}\}} FN_{FDi}^{Fn} \times FT_{FDi}^{Fn}\right]$

Step 4: while FS table not vacant do

Step 5: Obtain FD_i having top primacy via FS Table

Step 6: for $\forall FD_i$, i=0 to FN_{Di} do

Step 7: if $FT_s > FT_{FDi}^{Fe} - FT_{FDi}^{Fn}$, then

Step 8: Addition of 1, FDi to FP

67424

Shelly Bhardwaj *et al.,*

Step 9: $FT_s \leftarrow FT_s - \left(FT_{FDi}^{Fe} - FT_{FDi}^{Fn}\right)$

Step 10: else

Step 11:Break

Step 12: end if

Step 13:end for

Step 14: end while

Step 15: Outcome FP

RESULTS AND DISCUSSION

The confidentiality, as well as desired secrecy of the big datasets handling, is becoming a massive threat, especially in the D2D communication environment. In recent years, diverse investigators developed multiple approaches for protecting the datasets in D2D communication against numerous kinds of assaults over the channels. However, these kinds of existing approaches have multifarious drawbacks in the modern D2D communication infrastructure and require more novel approaches for protecting the data sets more efficiently. For resolving these major threats in the real world the authors investigated and developed a novel scheme for implementation and security verification of a hybrid model for big data privacy-preserving in D2Dcommunication. The authors described the overall experiment evaluations within this section. The researchers initially established the trial setup rooted in the lab settings effectively. Initially, the authors modeled the simulation environment for performing the simulation procedure, and based upon that entire performance evaluation has been done with greater accuracy as well as precision for avoiding the chances of any errors. In this work, enhanced AES algorithms have been utilized for the big datasets D2D communication. Furthermore, the required cloud environment has indeed been created within the laboratory for handling and utilization of the multiple huge volume datasets in numerous trails in real-time for secrecy verification of big data in a D2D environment.

Additionally, researchers assessed the effectiveness of their proposed approach from diverse two viewpoints, including the degree of privacy preservation as well as computational effectiveness. Our trial conditions, which included several setups for achieving the anticipated assessment objectives, were in keeping with those diverse two elements. Through setting up varying numbers of datasets packets as well as the datasets encryption processing duration for every packet, researchers were able to simulate various kinds of workloads levels for the datasets transfer. Researchers rated several datasets packets with various security weights to assess the overall capacity to safeguard information. Additionally, to evaluate the effectiveness of optimum remedy takeovers, researchers employed an enhanced AES technique to get the outcomes of the optimum solutions. The overall trial setup information is described as follows.

Trial 1: The authors assessed the datasets packets volume from 1 to 7 initially. The time of encryption was considered among 4 to 10 units. Furthermore, the secrecy weighted amount for every dataset packet was considered from 1 to 7 initially.

Trial 2: The authors assessed the datasets packets volume from 1 to 8 initially. The time of encryption was considered among 3 to 15 units. Furthermore, the secrecy weighted amount for every dataset packet was considered from 1 to 8 initially.

Trial 3: The authors assessed the datasets packets volume from 1 to 9 initially. The time of encryption was considered among 2 to 20 units. Furthermore, the secrecy weighted amount for every dataset packet was considered from 1 to 9 initially.

Shelly Bhardwaj *et al.,*

Trial 4: The authors assessed the datasets packets volume from 1 to 10 initially. The time of encryption was considered among 1 to 30 units. Furthermore, the secrecy weighted amount for every dataset packet was considered from 1 to10 initially.

Figure 3 illustrates the overall measured optimum privacy weight of the proposed scheme for data secrecy in D2D communication in seven rounds in the first trial. The overall measured optimum weight of the proposed scheme in the first trial and from 1 to 7 rounds was measured 110, 112, 118, 126, 128, 130, and 126 respectively. While in the case of S. O. Ogundoyin[23] scheme the measured weights were 100, 90, 85, 80, 75, 70, and 60, respectively. The measured outcome demonstrates that our scheme offers optimum and improved parametric values in comparison to the previous scheme.

Figure 4 illustrates the overall measured optimum privacy weight of the proposed scheme for data secrecy in D2D communication in seven rounds in the second trial. The overall measured optimum weight of the proposed scheme in the second trial and from 1 to 8 rounds was measured 114, 117, 120, 128, 134, 136, 138, and 145 respectively. While in the case of S. O. Ogundoyin[23] scheme the measured weights were 95, 89, 80, 78, 73, 65, 60, and 57, respectively. The measured results show that, when compared to the prior method, ours provides optimal and enhanced parametric values.

Figure 5 illustrates the overall measured optimum privacy weight of the proposed scheme for data secrecy in D2D communication in seven rounds in the third trial. The overall measured optimum weight of the proposed scheme in the third trial and from 1 to 9 rounds was measured 113, 118, 124, 129, 135, 138, 140, 142, and 145 respectively. While in the case of S. O. Ogundoyin [23] scheme the measured weights were 94, 89, 84, 79, 74, 69, 64, 59, and 54 respectively. The observed finding reveals that, in contrast to the prior scheme, our strategy gives optimal as well as enhanced parametric values.

Figure 6 illustrates the overall measured optimum privacy weight of the proposed scheme for data secrecy in D2D communication in seven rounds in the fourth trial. The overall measured optimum weight of the proposed scheme in the fourth trial and from 1 to 10 rounds was measured 115, 119, 127, 136, 143, 146, 148, 149, 150, and 152, respectively. While in case of S. O. Ogundoyi[23] scheme the measured weights were 92, 88, 84, 80, 76, 72, 68, 64, 60, and 56, respectively. These same assessed results indicated that, in contrast to the prior methodology, our approach delivers optimal but also more enhanced parametric values.

CONCLUSION

Nowadays optimal datasets secrecy has become one of the major threats in modern D2D telecommunication infrastructure because of huge traffic over the finite bandwidth channels. Due to the huge amount of datasets translation into day-to-day lives, the possibility of information leakage is increasing and demanding more attention towards novel approaches and pragmatic solutions. In this article, the authors developed a new scheme for implementation and security verification of a hybrid model for big data privacy-preserving in the D2D communication environment. In this work, the authors utilized the most recognized enhanced AES algorithm for the dataset's encryption in real-time. The overall measured optimum weight of the proposed scheme in the second trial and from 1 to 8 rounds was measured 114, 117, 120, 128, 134, 136, 138, and 145 respectively. The findings of the proposed schemes are enhanced and demonstrate that this is a well-suited scheme in the modern D2D communication scenario for maintaining the secrecy as well as privacy of the large datasets in a more effective manner and offers very minimal computing complexity. In recent years, several authors have worked in this area for improving the secrecy and privacy of big data translation in the D2D communication environment. However, due to extremely large datasets translation over finite bandwidth channels, there are diverse secrecy issues in modern communication infra structure, therefore there is a huge scope and need for future research in this arena.

ABSTRACT

Postpartum depression (PPD) is one of the most common maternal morbidities after delivery adversely affecting the well-being of mothers and their new-borns.PPD symptoms results in negative association between mother-baby bonding, severely affects infant cognitive development, language, behaviors, sleep quality, physical-mental health of both mother and children. In extreme cases, maternal suicide and infanticide thought might frequently occur in depressed mothers. PPD is a frequently overlooked health issue requiring timely and early-stage treatment to prevent serious complications. In recent years, Machine Learning (ML) models are increasingly used in healthcare particularly in psychiatry prediction to improve patient health status. ML models are specifically applied to support medical personnel in the prediction of PPD for pregnant mothers using electronic health data (EHD) to improve management of the condition. It is well-known for its ability to analyze vast quantities of data and estimate PPD probability which help the physicians in decision-making and early diagnosis of disorder. This this paper presents a detailed review of various ML frameworks developed to predict PPD and categorize PPD disorder from EHD data. First, different PPD disorder recognition models designed by many researchers based on ML algorithms are studied in brief. Then, a comparative study is conducted to understand the drawbacks of those algorithms and suggest a new solution to classify the PPD disorder accurately at its earlier phase to reduce the morality rate and improve the health status of mother and children.

Keywords: Postpartum depression, Electronic Health Data, Electronic Health Data, Machine Learning, Psychiatry Prediction

INTRODUCTION

Pregnancy and childbirth are significant life events for women. These transitory life events have very great impact onmother's physical and mental health, this condition is termed as Postpartum Depression (PPD) [1]. PPD is a serious public health problem that accounts for more than 24% of all postpartum fatalities, making it the most prevalent reason for mother perinatal mortality. PPD not only adversely affects the physical and mental health of mothers, it is detrimental to the growth and development of infants [2]. PPD symptoms have also been linked to poor mother-baby bonding, newborn physical and cognitive development, language development, infant behaviors, and sleep quality [3]. Childbirth significantly exposes women to many mental diseases, with PPD being the leading cause of postpartum haemorrhage in the body [4]. Clinical symptoms of PPD such as difficulty falling or staying asleep, prolonged sleeping, fluctuations in mood, loss of appetite, dread of hurting someone, severe worry about the baby, sadness or excessive crying, feelings of guilt and hopelessness, difficulty concentrating and recollecting, absence of desire in interests and daily activities, suicidal thoughts, and persistent thoughts of suicide are some of the notable actions of the delivered mother [5]. The earlier prevention of PPD will reduce the morality rate and enhances the physical-mental health of the mother and the well-being of the infants

It is well-accepted that intervention by either pharmacological treatment or psychological counseling might reduce the risk of perinatal depression and may improve the outcomes of both mother and child, however the safety of exposure to antidepressant medications during pregnancy and breastfeeding is still a challenging part [6-7]. Although the risk factors of PPD are well-known, there are no quantitative risk assessment tools to support the screening and clinical management of women during perinatal period. Electronic health records (EHR) from primary care services provide rich representation of the patient's medical condition, including diagnoses, drug prescriptions, procedures and lab tests. This information along with the patient's socio-demographic background are a useful source of information for estimating risk and predicting disease [8-9]. The physiological questionnaire Edinburgh Postnatal Depression Scale (EPDS) is frequently used by psychiatrist or doctors to diagnose PPD [10]. The EPDS data were collected from delivered mothers for one week, the score was evaluated by medical experts, and participants with PDD symptoms were identified. As a part of multistage progress follow-up was carried out by collecting the Patient Health Questionnaire-9 (PHQ-9), Postpartum Depression Screening Scale (PDSS) questionnaires for the above-predicted participants until six weeks [11]. The EPDS screening focuses on postpartum mood disorder and ignores anxiety, irritability and other symptoms that have been found to be common among women, especially during reproductive-related times [12]. However, demographic statistics or social support information are not taken into account in EPDS evaluation. This may lead to concerns that EPDS may not detect a wide range of pre- and postpartum symptoms and illnesses. Additionally, the EPDS has a lower positive predictive value in normal populations compared to validation study populations.

In recent time, Machine Learning (ML) plays an important role to predict PPD at its earlier stage. ML models are hypothesized with efficient data interpretation, précised decision making, provides accurate psychiatry care, focusing on the progression of PPD over time and effectively distinguishing different PPD stages [13]. ML algorithms include Support Vector Machines (SVMs), Genetic Algorithm (GA), K-Nearest Neighbour (KNN) Random Forest (RF), Navies Bayes (NB) Artificial Neural Networks (ANNs), Decision Tree (DT), Bayesian Networks (BNs) and so on. These algorithms aim to identify the data correlations from the complex patterns, benefits to provide automated tasks for developing new hypothesis [14]. Furthermore, ML models are effective at categorizing the large EHR data with less computational problems, reducing long procedure times, numerous measurement values, complicated analyses, personalised evaluations, operator subjectivity, and broad observation ranges. It also successfully used in psychiatry to predict major depressive disorder persistence, chronicity, severity, and treatment response [15].

The aim of this study is to provide a complete survey of various ML models and their applications in recognizing the PPD for enhancing the early prediction rate and reduces the morality rate. Also, a comparative study is presented to address the advantages and disadvantages of those models to suggest future scope. The rest of the sections are

prepared as follows: Section II discusses various models designed to detect and classify the PPD using EHR data. Section III provides the comparative analysis of those models. Section IV summarizes the entire study and suggests the upcoming scope.

Survey on Post Partum Depression Prediction Using Machine Learning Model

Jiménez-Serrano *et al*. [16] developed a mobile health application to predict PPD based on ML model. Initially, mobile health app was developed for android platforms using model's best performance for mothers and clinicians monitoring their patients' tests. The models were trained using ML techniques with an internal evaluation using a hold-out strategy predict postpartum depression (PPD) during the first week after childbirth with a reasonable accuracy. Fatima *et al*. [17] constructed a ML model for PPD prediction from social media text. Initially, the linguistic features were extracted using linguistic inquiry word count (LIWC) from the social media. Then, two layers were constructed to distinguish PPD from non-PPD depressive posts. In the first layer, general and depressive discussion were categorized. In the second layer, PPD and non-PPD depressive posts were segregated. Finally, the SVM and LR method effectively predict depressive content (PPD + non-PPD) and bifurcate PPD and non-PPD content using the same feature set which provides robust PPD prediction capabilities.

Betts *et al*. [18] presented a prediction model to identify women at risk of postpartum psychiatric admission. The dataset was collected, pre-processed and normalized. The pre-processed were given as input to the various ML models ton predict the hospital admission following the delivery in which the primary diagnosis was recorded as apsychotic depressive disorder. The LR and elastic net model to identify mothers at risk of postpartum psychiatric admission for early treatment task. Shin *et al*. [19] developed a predictive model for PPD depression using ML model. A retrospective cohort study using data from the pregnancy risk assessment monitoring system. The imbalance between the two groups were evaluated by a balanced resampling using both random down-sampling and the synthetic minority over-sampling technique. The ML was utilized RF, stochastic gradient boosting, SVM, NB, kNN, LR were employed to identify the postpartum depression. Zhang *et al*. [20] constructed a ML model for PPD prediction based on a cohort study. The EPDS was used to collect the data based on their psychological score. Then, the random forest-based filter feature selection (FFS-RF) were employed to select the features within a certain bound value range potential predictors and incorporated into the final prediction model. Finally, the SVM and RF was adopted for the PPD prediction.

Hochman *et al*. [21] developed a ML model for PPD prediction. In this method, gradient-boosted DT algorithm was applied to EHR data to obtain the clinical features. The features were incorporated into the ML model for automatic and risk analysis for early PPD prediction tasks. Andersson *et al*. [22] developed a predicting woman with depressive symptoms postpartum with ML using clinical, demographic and psychometric data from postpartum questionnaires. The collected dataset waspre-processed and normalized using KNN model. Then the obtained data was given as input to the ML model to predict the depressive postpartum depression. Amit *et al*. [23] suggested a PPD risk detection model using ML model. This model allowed for early alert of PPD and analyzes the risk prior to pregnancy. It analyzes the subjective and accuracy of the screening tasks which enables timely interventions and consequently applied to improved health status of the mother and child health. The evaluation of timely interventions helps the early alert status of PPD and prevents the risk prior to pregnancy.

Zhang *et al*. [24] utilized a ML model for predicting the risk of PPD among pregnant women. In this method, the EHR data was collected, pre-processed and normalized. The structured query and natural language processing (NLP) was employed to select the minimal list of features from the datasets. Finally, different ML model like RF, DT, LR, XGboostand multilayer perceptron (MLP) were adopted to detect collective patterns across features that maximally discriminate outcome classes for PPD detection. Raisa *et al*. [25] constructed a ML approach for early detection of PPD in bangladesh. The survey on various socio-demographic questions and EPDS data was collected, pre-processed and augmented using synthetic minority oversampling approach (SMOTE). The SMOTE provides synthetic members based on the euclidean distances between data points in feature space. Finally, SVM, RF, LR and XGBoost were employed for the for PPD detection.

Wakefield and Frasch [26] created an ML model based on antepartum EHR data for patients who needed PPD therapy Four ML models were generated and optimized using the distributed RF model. Model 1 adopted itself with publicly available socio demographic variables. Model 2 includes mother mental health data prior to pregnancy. Model 3 used recursive feature removal to develop a compact and cost-effective model. Model 4 titrated the input data further to eliminate pre-pregnancy mental health factors for PPD detection.

Gopalakrishnan *et al*. [27] constructed a ML model for the prediction of PPD. Initially, the data was collected and then it was divided into EPDS and Background Information (BI) of pregnancy women. The RF model was employed to select the relevant features. The selected features were fed into lasso regression model to predict the risk factors and forecast the prevalence of PPD symptoms. Prabhashwareem *et al*. [28] developed a ML model for predicting mothers with PPD. The collected data consists of mother's family, social background, and other data-related status which was pre-processed and normalized using Min-Max normalization. The obtained data was fed into Feed-Forward Neural Network (FFANN), Adaptive Neuro-Fuzzy Inference System with Genetic Algorithm (ANFIS - GA), RF and SVM for the prediction of PPD risk levels. Rousseau *et al*. [29] suggested a ML model to identify the pregnant women's risk for persistent post-traumatic stress following childbirth (PTS-FC). From the collected data, women's profiles were categorized into Stable-High-PTS-FC and Stable-Low-PTS-FC using the latent class evaluation. Then, the DT was employed to identify women at risk for Stable-High PTS-FC for early prediction.

Huang *et al*. [30] developed a prenatal depression and assessing model bias using ML model. The EHR data was collected from large urban city hospital. The collected data was pre-processed and normalized using min-max normalization. Then, Shapley Additive Explanations (SHAP) was employed to interpret the data. Moreover, the disparate impact (DI) and equal opportunity difference (EOD) was employed to assess the model bias. The interpreted data would be fed into elastic net to classify and predict different stages of PPD. Wakefield and Frasch [31] presented a method for detecting PPD using EHR data. In this method, four ML models were created and optimized using distributed RF and the logistic regression (LR) model. The model 1 relied only on easily accessible socio-demographic data. Model 2 includes mother mental health data prior to pregnancy. Model 3 used recursive feature removal to create a compact model. Model 4 calibrated the input data further in order to simplify pre-pregnancy mental health factors. Finally, the LR model was employed the identical input data as Model 3 for the final prediction of PPD. Liu *et al*. [32] presented an optimization ML model for PPD risk assessment and preventive intervention strategy. In this method, the EHR data of parturients that underwent a cesarean delivery was collected and pre-processed. The SHAP was employed for the data interpretation. The propensity score matching (PSM) was developed to compare the incidence of PPD between training and testing groups for differentiating PPD with high or low risk symptoms. Finally, the obtained features were given as input to the XG Boost which provides early intervention for the high-risk groups for the effective PPD prediction.

Compartive Analysis
In this part, a comparative study is presented according to the benefits and drawbacks of PPD prediction models by utilizing different ML methods whichare briefly studied in above section and the comparison is provided in below table 1. From the above table, the article [16-32] is studied and it is concluded that the article [27] yields better detection result for PPD detection and classification derived from the EHR data using various ML model. In the article [27],the data collection and statistical analysis for examining the link between risk factors and PPD symptoms were analyzed through for the early prediction task. Demographic information, EPDS, PDSS, and PHQ-9 screening tests were used to identify PPD risk variables in a distributed survey. Screenings were conducted one week to six weeks after delivery. During the initial phase, questionnaire scores were calculated to identify emerging cases of depression. If an EPDS result was affirmative, a woman's PHQ-9 and PDSS questionnaires were assessed in the second stage to reduce misdiagnosis. Then, collected data was pre-processed and the features were selected using the RF model. The collected data was fed into multiple ML models and lasso regression models, yielding high accuracy results for PPD detection and classification enabling early prediction.

CONCLUSION

PPD is a severe health concern which significantly impacts maternal and neonatal health. The development of an automated predictive model for early diagnosis of PPD is crucial to manage the morality rate. ML models are effective in identifying at-risk patients postpartum using HER datawith low complexity challenges. In this paper, a comprehensive review on different ML methods for detecting the PPD using EHR data according to their strengths, weaknesses and prediction efficiencies are provided. The discussed challenges and performances are key access for the researchers to develop fully functional models that could help in improving in PPD prediction and diagnosis and provides ultimately personalized treatments for new mothers and their infants. So, Future work focuses on developing advanced computation models for fast mobile applications to provide real-time point-of-care diagnosis and clinical decision support systems for the consistent health status monitoring of PPD patients.

Table. 1 Comparison of different ML associated PPD models

Ref no	Technique	Advantages	Disadvantages	Performance Evaluation
[16]	ML model	Rapid interpretation Culturally Sensitive and cost-effective	It provides lower result on larger dataset	Accuracy = 0.79; Sensitivity = 0.53; Specificity = 0.83; AUC = 0.66
[17]	LIWC, SVM, LR	It works well on larger data and provides consistent result throughout the prediction experiment	Easy prone to noise and vulnerability factors which enhances the classification error	Accuracy for depressive content identification = 91.7%; Accuracy for PPD content Prediction = 86.9%
[18]	LR, Elastic net model	Less computational cost and time	It takes long time to train the model	AUC- Receiver Operating Curve (ROC) =
[19]	RF, stochastic gradient boosting, SVM, NB, kNN, LR	Lower computational complexity and generalizability error	The data interpretation was difficult and lower convergence rate	Accuracy = 0.650; Precision = 0.649; Sensitivity = 0.650; F1-Score = 0.651 AUC = 0.864
[20]	FFS-RF, SVM	Lower classification error and better data interpretation	Lower efficiency as it was trained with smaller data size	Sensitivity = 0.69; AUC = 0.78
[21]	Gradient-boosted DT	It efficiently works on large sample size	Lower generalizability and scalability	AUROC = 0.712; Sensitivity = 0.69; Specificity = 0.91
[22]	ML model	High Generalizability and easy interpretability	This method results in high uncertainty issues	Accuracy = 73%; Sensitivity = 72%; Specificity = 75%; AUC = 81%
[23]	ML model	Better convergence rate and quantitative risk estimation	High misclassification error and easy prone to noisy data	AUC = 0.844; Sensitivity= 0.76; Specificity = 0.80.
[24]	NLP, RF, DT, LR, MLP, XG-Boost	Timely prevention, lower negative outcomes computational burden	High loss of information and lack of comprehensive screening of data	AUC = 0.912; Sensitivity = 0.80; Specificity = 0.79
[25]	SMOTE, SVM, RF, LR and XGBoost	High scalability on larger dataset and lower computational cost	Inappropriate biasselectionand trained with limited data samples .	Accuracy = 85%; Sensitivity = 84.4%; Precision = 85.2%; F1-Score = 84.4% AUC = 92.4%;
[26]	Distributed RF	Efficient convergence rate and scalability	Unbalanced sample distribution in the dataset may affect the performance rate	AUC = 0.91; Sensitivity = 0.68
[27]	RF, Lasso regression	Reduces the overfitting issues and less time	High class disparity makes it difficult to train the model	AUC = 78; Accuracy = 71%;

Suganthi and Geetha

		complexity		Sensitivity = 56%; Specificity = 86%;
[28]	FFANN, ANFIS – GA, RF and SVM	High appropriate and timely response with stable performances	Insufficient data samples lead to degrade the performance.	Accuracy = 95%; Testing error rate = 0.0600; Sensitivity = 94%
[29]	Decision tree, latent class evaluation	This model reduces the bias selection and uncertainty issues	Increase in the data, increases the complexities	Accuracy = 80.6%
[30]	SHAP, DI, EOD, Elastic-Net	Effective removes the model's bias and robust to noisy data	Failed to extract the optimal features subset to enhance the accuracy and reduce misclassified instances	ROCAUC = 0.75; Sensitivity = 80%;
[31]	Distributed RF and LR	Lower complexity and robust to uncertainty issues	The model's performance was notably lower due to its training on a limited dataset.	AUC = 0.93; Sensitivity = 0.71
[32]	XGBoost	Better execution time and convergence rate	It takes long time to train the model	AUROC = 0.789; PPD risk probability = 21.5%

ABSTRACT

This review document provides a brief overview of the performance analysis on different control techniques when applied to the brushless DC motor (BLDCM). These types of motors are non-linear in nature, therefore conventional controllers (PI, PID) do not achieve the desired steady-state performance. To achieve the control objective, intelligent controllers are presented with such a scheme according to various other control techniques such as (PI, PID, Fuzzy, ANN, Hybrid Adaptive Fuzzy, Neural-Fuzzy, Hybrid Neuro-Fuzzy, diffuse scrolling mode, MRAC, FPIDSMC and FSMC) were investigated by several researcher .These techniques differ in several ways, such as control architecture, controller adjustment method, dynamic and steady-state performance. The document presents a comparative review of the performance analysis of conventional and intelligent control techniques.

Keywords: BLDC motor, PI,PID, Fuzzy, ANN, Hybrid Adaptive Fuzzy, Neural-Fuzzy, Hybrid Neuro-Fuzzy, sliding mode fuzzy, MRAC, FPIDSMC and FSMC.

INTRODUCTION

A permanent magnet (PM) synchronous motor with trapezoidal induced voltage waveform is called a BLDC motor. A BLDC motor is activated electronically rather than mechanically based on feedback on the rotor position. The rotor

of the BLDC motor contains permanent magnets and the stator has a winding. Rotor position detected by sensors positioned internally or externally. The BLDC motor is the most popular for various industrial applications (90% closed loop control with PI, PID thanks to the intrinsic advantage of simple structure and robust operation), robotics, avionics thanks to its high torque speed characteristics, less noise and less maintenance [1] Feedback is based on the sensor or not on the sensor. position sensors as feedback with this the parameter changes are temperature, pressure with the system with parameter changes are affected [2]. So the sensorless rotor position detection system [3] has received more and more attention. The sensorless method mainly includes the post EMF method, the Flux Linkage based method. But this controller is not suitable for the BLDC motor due to the non-linear behavior of the variations of the system parameters in different load conditions of the BLDC motor, the researcher proposed different techniques (hybrid, intelligent and robust controllers). The compensated system designed using the non-iterative controller design approach provides the desired specifications with greater precision for the different BLDC drive systems. The transient response of the compensated system is better than that obtained using the conventional design approach [4]. Fuzzy Sliding Mode Control with PID Compensator [5] introduced for BLDCM, this method features a robust control system with the Fuzzy Sliding Mode Controller and an additional compensator. FPIDSMC and FSMC controllers can provide robustness to external uncertainties and disturbances, FPIDSMC offers better performance than FSMC compared to the external load torque, vibrations are avoided and the system response is improved. Complete analysis of the fuzzy logic controller for PMBDCMD presented for a fast dynamic response such as speed and torque in a short time in case of sudden changes or load disturbances [6].

The adaptive diffuse control method is used with sliding mode control algorithms. AFSMC performance is generating free phenomena and system stability will be improved compared to conventional sliding mode control to reduce the vibration of the nearby sliding surface [7]. The Intelligent Brain Emotional Learning Based Controller (BELBIC) is adapted for BLDCM. BELBIC's high level of precise self-learning offers fast and fast responses at transient speeds in a wide range of speeds from 20 to 300 rpm. Good monitoring has excellent control performance, good robustness and adaptability [8]. In [9] A comparison between DC motor position control by a PIDSMC fractional diffuse surface and a PIDSMC diffuse surface clearly shows that FPIDSMC offers better performance than PIDSMC compared to the external load torque. It is a robust controller and vibrations against external load torque are avoided. In [10] a fractional order derivative and a proportional controller (FOPD) is proposed for typical second order plants. The closed circuit system can achieve favorable dynamic performance and robustness compared to other techniques. A PI Fuzzy Gain Scheduling (FGSPIC) controller is proposed for BLDCM, three separate PI controllers for different low, medium and high speed sampling time intervals. , robust in a variable sampling situation (different loading conditions) [11]. A comparative study between PI, fuzzy and hybrid PI-Fuzzy controller (the hybrid controller has integrated both the diffuse controller and the PI controller) for speed control of the brushless DC motor (BLDC) ", a diffuse controller offers a better response starting speed while PI The controller has a good compliance with respect to the variation of the load torque, but the hybrid controller has the advantage of integrating the superiority of these two controllers to improve the performance of the control. The PI has a good load torque but a slow tuning response Shorter settling time The hybrid driver has integrated both the fuzzy driver and the PI driver During a high-speed error, the hybrid driver has improved the dynamic performance of the BLDC Motor [12] A speed controller intelligent for brushless DC motor with this PID method and PID controller of Fuse to control the BLDCM speed proposed FPID controller performs better than the conventional PID controller, when the engine undergoes sudden changes at ever higher speeds. The speed of the motor that must be kept constant during a sudden load varies with the fuzzy PID controller, but with the PID controller adjustment it is the problem that FPIDC can overcome [13].

In [14] the design of a BLDCM speed control using the PIC16F877A microcontroller. variation under load. By varying the PWM signal from the microcontroller to the motor controller, it is possible to control the motor speed and also the performance analysis of a BLDCM drive speed with PI and a diffuse-based controller. The dynamic behavior of the fuzzy logic controller provides a much better dynamic response and is robust. The fuzzy logic controller offers a better response than the PI controller. A cascade SMCNRPID controller for BLDCMD is proposed for better performance than the conventional PID controller. It reveals excellent performance in the treatment of overdrive,

under drive and settling times, SMCNRPID reduces vibrations when the system is moved on a sliding surface [15]. A cascaded SMCNRPID controller shows a faster and vibration-free response to pitch disturbances, has more robust features than the conventional PID controller [16]. For BLDCM (BLDC motor) a robust diffuse neural control is proposed. the control signal includes diffuse neural control, supervised control and error states. The regulation laws for network parameters are from Lyapunov's theorem for network convergence and stability. The proposed controller was run on a TMS320F2812 DSP. It is feasible and effective even under variable load conditions [17]. In [18] a fuzzy estimator is proposed for driving the PMBLDC motor without reverse speed sensor. In this method the conventional sensorless method and the fuzzy estimate of electromagnetic fields are compared. The algorithm proposed using the fuzzy EMF estimator obtains robust control for the change of an external condition and continuously estimates the rotor speed in transient and steady state conditions. The proposed sensorless drive method without additional circuit has superior performance compared to conventional sensorless methods.

In [19] direct torque control based on the Fuzzy Logic Controller has been demonstrated. DTC has some advantages such as a simple and easy to implement algorithm, a faster torque response, a reduced torque fluctuation and a lower sensitivity to parameter changes, which is why the system has used DTC methods to eliminate the exceeding responses of speed and torque. PI controller compared to Fuzzy Logic controller. The effectiveness of the FLC controller is greater than other controllers. PI controller replaced by FLC. Using Fuzzy Logic Control, the starting current was reduced due to the reliability of the FLC controller. The effectiveness of the FLC controller was verified by simulation. In [20] Modeling and control of BLDC three-phase motors by means of PID with genetic algorithm for BLDCM. In this paper, conventionally tuned PID controllers and genetic algorithm are proposed as a global optimizer for finding optimized PID gains for BLDC motor position control. A comparative analysis with GA and ZIEGLER NICHOLS METHOD (ZNM). Controller performance with GA optimized gains are much more efficient than the ZN method in terms of rise time, settling time, overshoot and set point detection. But ZNM provides the initial values of the PID gains for GA optimization. [21] Modeling and simulation of BLDC motors in the MATLAB GUI presented for various types of BLDC motors that minimize torque ripple. Performance evaluation leads to very useful modeling to study the drive system before starting the design of the dedicated controller, taking into account the relevant dynamic motor parameters. [22] The BLDC motor drive system with sensorless control that uses the Adaptive Neuro Fuzzy Inference (ANFIS) system algorithm for BLDCM, the algorithm consists of the Least Squared method in its forward path while its feedback path uses the posterior propagation method. The modeled BLDC drive system was subjected to the NeuroFuzzy adaptive inference system (ANFIS) for sensorless estimation in closed loop operation. This document examines the sensorless control of the BLDC motor. ANFIS is a very powerful approach to building a complex and nonlinear relationship between a set of inputs and outputs. In [23] A DTC technique for BLDCM with non-sinusoidal rear EMF presented for high torque response and minimization of torque ripple to drive BLDCM.

A slide observer design was proposed to estimate the trapezoidal EMF of a BLDC motor. It is robust due to the uncertainties of the parameters, it can be used to estimate the subsequent EMF and generate the torque. It is used to estimate the non-sinusoidal posterior EMF waveform in a BLDCM using only stator current measurements. A modified version of the non-dominated genetic classification algorithm (NSGA-II) is used as an effective optimization tool to adjust the speed controller PID controller parameters and the selection of four slider observer gains. The relationship between the PID controller and sliding mode is also satisfied with NSGA-II. The effectiveness of the proposed system was validated by the simulation results. In [24] The design of the Fuzzy PID controller for brushless DC motor has proposed lower, higher and constant speeds even when the load varies. a comparative study of the integral integral proportional controller (PID) and the integral integral proportional Fuzzy controller of the three-phase BLDC motor. The widespread PID controller has better control performance than the conventional PID controller when sudden load disturbance occurs. Conventional PID controller difficult to adjust parameters. Because Fuzzy tuning has the ability to satisfy control characteristics and is easy to calculate. The improved Fuzzy PID controller has superior PID control over the conventional.

In [25] Conventional and fuzzy PID controller with field programmable matrix (FPGA) proposed for BLDCM speed control. It was simulated and synthesized using the Xilinx Foundation package and implemented in the Xilinx XC3S400 FPGA. The dynamic response of the system using the proposed controller is better than a conventional controller. The proposed method provides several BLDCM speed commands with correct speed regulation. In [26], hybrid fuzzy control solutions for BLDC units with variable moment of inertia offer four Takagi-Sugeno hybrid fuzzy controllers consisting of two Neuro-diffuse PI hybrid controllers and two adaptive fuzzy sliding controllers. two hybrid PI-NFCs based on an online adaptation of a PI-FC and two ASMFCs based on online adaptation of the switching gain. First, the VMI is characteristic for many servo applications, it may be necessary to use controllers adapted to the operating point. Second, fuzzy control can offer advantageous nonlinear control solutions compared to other BLDCM control solutions. These control techniques and design methods expand the industrial application areas of BLDCM drives and are also implemented for other control applications. The control structures have robustness, system stability and offer constant performance in the presence of model uncertainties. In [27] a comparison of the performance of the PMBLDCM drive with the speed controller PI and FLC is proposed. FLC offers good results in terms of torque ripples and current control limits for windings. Low starting current is achieved if FLC is used, leading to a low cost reversing switch. the starting torque is reduced compared to the use of the PI controller, but does not cause starting problems. It can be easily applied to industrial applications where reliable and inexpensive operation of the BLOC motor drive is required. In [28], the conventional Slip Mode Observer (CSMO) and Enhanced Slip Mode Observer (ISMO) are proposed for BLDCM. The improved scroll mode observer eliminates the problem of unwanted vibrations in the conventional scroll mode observer. ISMO stability was verified by Lyapunov's stability analysis. The use of the sigmoid function in Sliding Mode Observer (SMO) allows to estimate the position of the rotor with high precision and to obtain a faster response. Enhanced Slider Mode Observer (ISMO) has good convergence and solid observer performance. In [29], the sensorless control of BLDC motors uses the closed circuit PWM controller.

An FPGA-based implementation of the BLDC FSTP unit that uses PWM control and real-time experiment. Hardware implementation is performed using the SPARTAN-3 processor. The VHDL (Very High Speed Description Language) program is developed in XILINX to generate the PWM pulses controlled to control the system. In [30] a sliding mode control algorithm (SMCA) is proposed for controlling the speed and current of a BLDC motor. The exponential approach of the flow law was used to design the flow laws for the mathematical model of the BLDC engine developed. An SMCA compared to an integral proportional controller (PIC). The scroll mode control offers much better performance in terms of steady state error, faster settling time, excessive speed response and elimination of the best noise rejection capabilities. but there is the Chattering effect. In [31] Reduction of torque ripple and increase of the torque capacity proposed for the BLDC motor. To increase the torque, the BLDC 9-phase motor model was studied and its efficiency and ripple reduction were tested by simulation. The comparison between the three-phase, 5-phase and 7-phase and 9-phase BLDCM models discussed and the effect of the increase in the number of phases shows that the starting torque of the motor will increase and the efficiency of the motor will also increase slightly. the torque ripple will decrease.

In [32] A Neuro-Fuzzy Hybrid (N.F.) - P.I. Proposed controller powered to control the speed of BLDC motors. A solid S.S.E.E. (removal of steady state errors) to enrich the entire control process. The hybrid system, P.I. N.F.C. is the main loop of the controller while the integral S.S.E.E. The controller reimburses steady state errors. In this he proposed the BLDC unit's capabilities for fast tracking, small steady-state errors and high stability despite all the load and parameter changes compared to other conventional controllers. In [33] Model of adaptive reference controller (MRAC) that uses an artificial neural network controller (ANN) proposed for brushless DC motors (BLDC). The MRAC-based model is capable of monitoring speed and reducing the effect of parameter changes under different conditions. BLDCM suitable for applications such as robotics and position detection. The MRAC-based model is able to monitor the speed and effect of parameter changes compared to the performance of the traditional PID controller. The proposed RNA-based control scheme is robust, efficient and easy to implement.

Venu and Tara Kalyani

In [34] the anti-roll PI controller and the fuzzy controller proposed for BLDC motor speed control. The comparison with the PI controller. Conventional PI controllers are slower than popular, anti-winding controllers. From the simulation results, it is clear that for the load variation, the PI windproof controller gave a better response than the conventional PI and the widespread controller. Therefore, the anti-roll PI controller proves more suitable to drive the BLDC motor during load variation. In [35], fuzzy tuning in PID sliding mode is proposed for the BLDCM drive system. The PIDSMFC-based BLDC motor drive system tracks the error and causes the actual speed to follow the reference speed when the system is subject to a gradual change in the reference speed, sudden load disturbance and parameter changes. The comparison between BLDC motor speed control from PIDSMFC and SMFC, that PIDSMFC offers better performance than SMFC compared to external load disturbances, so the controller is a robust controller, vibrations are avoided and the system response against load from external impact.

In [36] Fractional Order PI Controller (FOPI) proposed for BLDC Motor Drive. It is done with the Oustaloup filter. The desired response obtained by adjusting in 1 / S ^ . The FOPI controller tested on the BLDC motor for various operating modes and performance compared to the conventional PI controller. The performance of the FOPI controller is quite good with constant speed and constant torque mode compared to the conventional PI controller. In [37] The fractional order fuzzy logic controller (FOFLC) proposed for the BLDC motor. Controller performance tested under different operating conditions and sudden load disturbance. The performance of the FOFLC controller compared to the FOPI controller and the conventional PI controller. Torque, speed response are faster and smoother than the FOPI and PI controllers in terms of rise time, maximum exceedance and stabilization time. In [38] a sliding mode controller (FOSMC) was proposed to improve the dynamic performance of a BLDC motor.

The FOSMC has a robustness against external load disturbances, so the controller is a robust controller, without vibrations in case of sudden load variations. In various operating modes constant torque mode, constant speed mode such as engine in running conditions, generation and reverse condition. In all these operating modes, the dynamic response of the BLDC motor observes dynamic parameters of rise time, peak overflow and BLDCM settling time. The engine is quite good with FOSMC compared to the PI controller. The performance of the BLDC motor with the FOSMC methodology provides a smooth and faster torque speed response than the normal PI controller. In [39] Fractional order based super torque algorithm (FOSTA) proposed for controlling the BLDC motor under various operating conditions. Simulations are performed in various operating modes and controller performance is tested on the BLDC dynamic motor model using matlab-simulink. FOSTA performances are compared with the normal PI controller. FOSTA has a good dynamic response compared to the PI controller.

BLDC Motor Mathematical Modelling
State space representation of BLDC motor is represented[40]

$\dot{X}=AX+BX$ (1)

$X=[I_d I_q \ \omega \ \theta]^T$

$\frac{dI_a}{dt}=\frac{V_d}{L}-\frac{I_d}{\tau}+\omega I_q$ (2)

$\frac{dI_q}{dt}=\frac{V_q}{L}-\frac{I_q}{\tau}-\omega I_d-\frac{K_e}{L}\omega$ (3)

$\frac{d\omega}{dt}=\frac{PK_e}{J}I_q-\frac{f}{J}\omega-\frac{P}{J}T_L$ (4)

$\frac{d\theta}{dt}=\omega$

The output   equation is given by

Y=CX, Y=[I_d I_q]^T   (5)

$C=\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{bmatrix}$

V_d, V_q,I_d,I_q are voltages and currents on a (*d*,*q*) frame,

T_L=Load torque, ω- electrical angular velocity,

K_e=factor torque, *L*-inductance, *R*-resistance,

τ = Electric time constant.

$\underline{v}=[\mathbf{R}]\underline{i}+[L]\frac{di}{dt}+\underline{e}$ (6)

Where R is the stator resistance per phase

$$R = \begin{bmatrix} R & 0 & 0 \\ 0 & R & 0 \\ 0 & 0 & R \end{bmatrix}$$

L is the matrix of inductance interims of self and mutual inductance, L_s, M

$$L = \begin{bmatrix} L_s & -M & -M \\ -M & L_s & -M \\ -M & 0 & L_s \end{bmatrix}$$

$\underline{e} = [e_a\, e_b\, e_c]^T$ is the vector of the trapezoidal back EMF

$$\frac{d}{dt}\begin{bmatrix} I_a \\ I_b \\ I_c \end{bmatrix} = \begin{bmatrix} \frac{1}{L_T} & 0 & 0 \\ 0 & \frac{1}{L_T} & 0 \\ 0 & 0 & \frac{1}{L_T} \end{bmatrix}\begin{bmatrix} V_{an} \\ V_{bn} \\ V_{cn} \end{bmatrix} - \begin{bmatrix} R & 0 & 0 \\ 0 & R & 0 \\ 0 & 0 & R \end{bmatrix}\begin{bmatrix} I_a \\ I_b \\ I_c \end{bmatrix} - \begin{bmatrix} e_{an} \\ e_{bn} \\ e_{cn} \end{bmatrix} \qquad (7)$$

$L_T = L_{s+}M$

The equation of motion is

$$J\frac{d\omega_r}{dt} = T_{em} - T_L - f\omega_r \qquad (8)$$

$$T_{em} = \frac{1}{\omega_r}(e_{an}i_a + e_{bn}i_{b} + e_{cn}i_c), \qquad (9)$$

ω_r-mechanical speed [rad/s], T_l– load torque [N m] , J - motor shaft and load inertias [kg m^2]
F –frictional damping coefficient [N m s/rad m],
T_{em} - electromagnetic torque [N].

CONCLUSION

The Performance review of different control strategies for BLDC Motor are conventional controllers(PIC,PIDC), intelligent controllers are (FLC, ANN, FLCANN, HybridFuzzy, NF, VHDL, FPGA, NSGA-II, ZNM, BELBIC) and robust controllers are sliding mode controller as(PIDSMC,FPIDSMC,SMFLC,SMO,ISMO,CSMO) and finally Fractional order controllers are (FOPI, FOFLC, FOSMC, FOSTA) based control scheme is presented in this paper. During the study it was observed that, although fractional order controller displayed improvement in dynamic performance of BLDC motor operating parameters but still it could not establish its superiority indisputably in terms of steady state performance of the system. Various different control scheme were also combined with FOPI controller, FOFL Controller, FOSM Controller and FOSTA to further improve upon its limitation.

ABSTRACT

The Siddha system is an ancient traditional system practiced in southern parts of India. The patient reports at the National Institute of Siddha (NIS) have increased every day. Among them many are surgical cases, reporting NIS for treatment without surgery. The aim of this study is to document the surgical cases reporting towards the Siddha system of medicine at NIS OPD. It is an effort to prove the quality of healthcare in Siddha in such unmanageable cases of the Modern medicine system without surgery. A Hospital-based Cross-sectional observational study was conducted in the year 2018 for three months i.e. June to August on surgical cases reporting at NIS OPD. A total of 200 patients (100 New

Keerthika *et al.,*

surgical cases and 100 Old surgical cases) were selected through the Judgmental sampling method. The patients of new and old surgical cases were assessed individually well-designed questionnaire. It was approved with the NIS/IEC/2018/22, 07-05-2018, and analyzed using STATA. By analyzing the studySinus and Fistula, Intervertebral disc diseases, Anorectal diseases, and Female Genital tract diseases were the highly reported surgical cases in NIS. Most of the surgical cases didn't opt for Surgery due to recurrence (31%), fear (29%), and hih cost (25%) for treatment. So, prefer the Siddha management without surgical correction. And this study proves 57% of cases were satisfactory with Siddha treatment and 28% of cases were improved after Siddha treatment. The para-surgical procedures such as Karanool, Bone setting, leech therapy, and chemical cauterization were done for those surgical cases in NIS. Surgical cases approaching Siddha medicine give much scope to develop it as a holistic treatment.

Keywords: Surgical cases; Siddha treatment;Para surgical procedures

INTRODUCTION

Siddha system is an ancient traditional system practiced in southern parts of India. Various internal and external medicines mentioned in literature considered as the treasury of Siddha system. In the Siddha system, the treatment has been classified into three groups, such as Vinnavar Maruthuvam, Maanidar Maruthuvam, Asura Maruthuvam. The first two groups refer the method of treatment with oral medications. In the Vinnavar Maruthuvam, medicines like parpam, chenduram, guru, kuligai prepared from mercury, sulphur and pashanams are used. In the Maanidar Maruthuvam, medicines prepared from herbs chunam, ranam, kudineer, vadagam are used. The third groupAsura Maruthuvam refers to method of surgery. They employed the surgical method in various morbid conditions of human body, which could not be cured with oral medications and non-invasive procedures. In Siddha system of medicine, Surgical method (Asura Maruthuvam) it has three divisions: Aruvai, Agni, Karam.

ARUVAI- Diseases treated with surgical instrument
AGNI- Diseases treated with heat application.
KARAM- Diseases treated with chemical cauterization.

Aruvaiis divided into 13 types. It includes Leech application (Attai vidal), Surgical treatment(Aruvai), Incision(Kiral), Bloodletting (Kurthi vangal), Probe application(Salagai vidal), Medicated wick/plug (Varthi), Blowing(Uthal), Enema / Clyster(Piccu), Suction(Urinjal), Bone setting(Kombu kattal), Murical(Therapeutic fracture), Massage(Thokkanam), Banding(kattu). Agni is divided into 5 types. It includes Cauterization (Suttigai), Steam bath (Vedhu), Fomentation (Ottradam), Medicated Pouch (Pottanam), and Fumigation(Pugai). Karam is divided into 7 types. It includes Chemical cauterization (Karam), Mediated Lint (Silai), Ointment(Kalimbu), Medicated powder(Podi), Poultice(Kali), Cream (Pasai).[1]. Most of the above methods are followed in the National Institute of Siddha for various ailments. Ano rectal diseases, bone and ligament injury, disorders of intervertebral discs, and varicose veins are the most reported cases in Aruvai Maruthuvam opd of NIS. The parasurgical procedures such as Karanool, Bone setting, leech therapy, chemical cauterization, and thermal cauterization were performed in those surgical cases in NIS. Siddha system plays a major preventive, curative and promotive role in community health. Most of the conditions which are not treated by other systems of medicine without surgery are managed by internal and external medicines of Siddha or via Para surgical procedures of Siddha system. Considering the increased reporting of surgical cases at NIS for treatment without surgery, a cross sectional study was conducted to explore the quality of healthcare in Siddha in such unmanageable cases of Modern medicine system without surgery and to document the patients reporting in NIS for various surgical conditions. Also to explore the various treatment modalities employed in Siddha System for surgical cases at NIS. Patient satisfaction

Survey about the cases treated in NIS for various surgical conditions were also documented. Surgical cases approaching Siddha medicine give much scope to develop it as a holistic treatment.

MATERIALS AND METHODS

Study design
This Hospital based Cross-sectional study was carried out in the National institute of Siddha, Chennai which is an apex institute for Siddha medicine. The period of study from June to August 2018. Surgery referred cases were selected through the Judgmental sampling method.

Ethical considerations
Before the commencement of the trial, the study protocol was submitted to the institutional ethical committee (IEC number; NIS/IEC/2018/22 Dated: 07-05-2018) of NIS, Chennai and approved. The trial was registered prospectively by the Clinical Trial Registry under clinical trial registration number- CTRI/2018/06/014513. All the participants were explained about the study and provided verbal and written informed consent forms, after getting their signed written informed consent they were enrolled in the study.

Sample size
The patients of New surgical cases and Old surgical cases of the age group between 12 to 65 were assessed individually through well designed questionnaire. 100 New cases and 100 Old cases were selected during their visit to hospital.

Methods of data collection
A total of 200 patients were collected using well designed questionnaire. The patients visiting NIS OPD for various surgical cases were interviewed using a well structural questionnaire. The author conducted the study under the supervision of Head of Department and Faculties of Sirappu Marthuvam in a separate enclosure to ensure the privacy of patients. New cases were selected on the first day of visit to the hospital after consulting respective doctors. They were enquired about their ailment, reason for choosing Siddha, and the management advised by other systems like Allopathy and the type of management advised in National Institute of Siddha. Old cases were selected during their treatment period in siddha. They were enquired about their ailment, the management advised by other system like Allopathy and the type of management they underwent in National Institute of Siddha. Also the prognosis of their ailment after treatment in NIS were analyzed.

STATISTICAL ANALYSIS

All collected data were entered in MS Access software using a pre-designed form for data entry and STATA software was used to perform statistical analysis. Basic descriptive statistics include frequency distributions and tabulations were performed. Statistics were explained through descriptive and cross tabulation.

RESULTS

The results were studied and tabulated under the following heading
1. Source of information about Siddha
2. Source of information about Ayothidass Pandithar Hospital(APH) of National Institute of Siddha(NIS)
3. Age distribution
4. Sex distribution
5. Economic status

Keerthika *et al.,*

6. Profile of surgical cases reporting NIS OPD
7. Reason for choosing Siddha for surgical cases
8. Cases having recurrence after surgery in Modern Medicine and came for Siddha treatment in NIS
9. Surgical cases reported for Post-surgical management
10. Reason of visit to NIS in new cases
11. Referred surgical cases by NIS
12. Opinion of new cases after first consultation in NIS
13. Mode of treatment in NIS
14. Surgical cases and their Para surgical procedures
15. Prognosis
16. Patient satisfactory survey

Observation

The source of information about siddha for patients visiting APH of NIS were referred by patient treated in NIS (54%) shows the acceptance and satisfaction of patients treated by Siddha Medicine in NIS

Observation

The source of information for patients about NIS were referred by patient treated in NIS (63%) shows the health care service in NIS by Siddha Treatment

Observation

The maximum number of Surgical caseswere in the age group between 40-50 years (29%) and 50-60 years (23%)

Observation

Majority of surgical cases reported were males 59%**.**

Observation

The majority of surgical cases were from Middle class (62.5%) and lower class(31%).

Observation

Sinus and Fistula, Intervertebral disc diseases, Anorectal diseases, Female Genital tract diseases were the highly reported surgical cases in NIS.

Observation

Most of the surgical cases didn't opt for Surgery due to fear of recurrance(31%) and due to fear for surgery(29%) for treatment. So prefer the siddha management without surgical correction.

Observation

Anorectal diseases(26%), Sinus and Fistula(20%) were the mostly reported cases after recurrence in Surgery.

Observation

 Cancer and Anorectal cases were the majority of reported surgical cases for post-surgical management and prevention from recurrence of disease.

Observation

67% of the surgical cases were reported to NIS OPD for treatment without Surgery.

Observation

86% of the surgical cases were opt Siddha for further treatment

Observation

52% of the surgical cases were treated with both internal and external therapies. 31% of the cases were treated with Para surgical procedures along with medications

Observation

Surgical cases who had treatment more than 3 months were analyzed and it shows, in 97% of cases symptoms were reduced and in 93% of cases had no recurrence.

Observation

57% of the surgical cases were satisfactory with Siddha treatment and 28% improved after Siddha treatment.

Keerthika *et al.,*

DISCUSSION

Surgical procedures have opted for diseases that are not treated with internal medicines alone. Extensive references are seen in ancient Tamil literature with regard to the various methods of treatment with surgical measures. The texts of Siddhars like therar, Agathiyar, Nagamuni explains various surgical procedures. There are 26 types of surgical instruments (Satharavuthangal) mentioned in the text Agathiyar Nayana vidhi. Many surgical methods illustrated in the above literature are not practical in use nowadays. Since few of surgical procedures are used extensively in treating diseases. So this study aimed to document those surgical procedures in various disease conditions. Surgical cases like Anorectal diseases, Varicosities, Ulcers, Sinus and Fistula, Skin and subcutaneous diseases, intervertebral diseases, fractures and ligament injuries, Carcinoma and Neck swelling, Female genital tract diseases, Abdominal cases, Hernia and Renal diseases were the most reported cases in NIS OPD. The mode of treatment in Siddha for such cases were internal medicines, external medicines, and Para surgical procedures. Since Surgery is an expensive procedure with complications and recurrence, many Surgeries referred cases were reported to Siddha for their further management. The recurrence of anorectal cases and frequency of anal fistula is a common surgical case reported at Aruvai Maruthuvam OPD of NIS. The recurrence rate might have been found to be low when patients have taken Siddha medications after surgery. Para surgical procedures such as Leech therapy, Bone setting, Karanool, and Karam (chemical cauterization) are carried out in OPD of the National Institute of Siddha. And this study proves 57% of cases were satisfactory with Siddha treatment and 28% of cases were improved after Siddha treatment.

CONCLUSION

This hospital-based cross-sectional study proves that many surgical cases benefited from Siddha treatment at the National Institute of Siddha. Patients with complaints of Fistula in ano, fracture and ligament injury, and varicosities are the most referred cases those reported in Aruvai Maruthuvam OPD. Parasurgical procedures such as Karanool, Bone setting, leech therapy, and chemical cauterization was done in those surgical cases in NIS. Surgical cases approaching Siddha medicine give much scope to develop it as a holistic treatment.

ABSTRACT

This paper aims to explore the gender role portrayals in the novel "Gender Queer: A Memoir" by Maia Kobabe. The novel is a graphic memoir that delves into the author's personal journey of self-discovery and exploration of gender identity. Through a close analysis of the characters and their interactions, this paper will examine how gender roles are depicted and challenged in the narrative. The paper will begin by providing a brief overview of the novel and its significance in the context of LGBTQ+ literature. It will then delve into the various characters and their representations of gender roles. The protagonist, Maia, will be the primary focus, as their experiences and struggles with gender identity form the core of the narrative. Furthermore, the paper will explore the secondary characters and their impact on the portrayal of gender roles. This includes Maia's family, friends, and romantic partners, all of whom play a role in shaping their understanding of gender. The paper will examine how these characters either reinforce or challenge societal expectations of gender. The paper will also examine the visual elements of the graphic memoir. The illustrations and visual storytelling techniques employed by Kobabe will be analyzed to understand how they contribute to the portrayal of gender roles.

Keywords: Gender identity, Gender roles, Gender stereotypes, LGBTQ+ literature, Coming-of-age

INTRODUCTION

The introduction of the essay could provide a brief overview of the novel "Gender Queer: A Memoir" and its significance in the context of exploring gender role portrayals. It might touch on the importance of literature in shaping perceptions of gender and identity, and introduce the purpose of the essay, which is to analyze and discuss the portrayal of gender roles in the novel "Gender Queer: A Memoir" The importance of exploring gender role portrayals in the novel "Gender Queer: A Memoir" lies in its potential to foster understanding and dialogue about diverse gender experiences. This analysis can contribute to broader discussions on challenging societal norms, promoting inclusivity, and enhancing empathy towards individuals who navigate complex gender identities. The cultural, social, and historical context surrounding the novel "Gender Queer: A Memoir" is crucial to understanding its portrayal of gender roles. Published on 28 May 2019, during a period of increasing awareness and discussions around gender diversity, the book engages with shifting societal attitudes towards non-binary and transgender identities. Additionally, examining the broader socio-cultural climate during the time of the novel's creation can shed light on how the author's personal experiences and perspectives intersect with larger conversations about gender norms and expectations.

Aims
The aims of this exploration are

1. To dissect the gender role portrayals in "Gender Queer: A Memoir"
2. To analyze how the novel challenges or reinforces conventional notions of gender. By delving into the characters, narratives, and themes
3. This study seeks to reveal the author's intentions, the impact of their choices, and the potential implications for readers' understanding of gender roles and identities.
4. Ultimately, the goal is to contribute to a nuanced dialogue surrounding gender diversity and representation in literature.

OBJECTIVES
The objectives of this exploration include

1. **Character Analysis :** To analyze the development of characters in "Gender Queer: A Memoir" and examine how their gender roles and identities are portrayed throughout the narrative.

2. **Theme Examination :** To identify and discuss recurring themes related to gender roles, expectations, and challenges that emerge in the novel.

3. **Author's Intent :** To interpret the author's intentions behind their portrayal of gender roles and investigate how they contribute to the overarching message of the novel.

4. **Impact on Readers :** To explore how the novel's portrayal of gender roles might influence readers' perspectives on gender diversity, identity, and societal norms.

5. **Critical Analysis :** To critically assess whether the novel challenges or reinforces prevailing notions of gender, considering both the author's intentions and potential reader interpretations.

6. **Contribution to Discourse :** To contribute to ongoing conversations about gender representation in literature and provide insights into the evolving understanding of gender roles in contemporary society.

METHODOLOGY

The study will employ a qualitative analysis approach, this exploration involves a comprehensive reading, interpreting and exhaustive analysis of primary source "Gender Queer: A Memoir" through qualitative research methods. The study navigates through assessment of psychological, gender, ethical and social issues. The existing

critical material, discourse analysis. Aims identify and examine instances where gender roles and stereotypes are presented, challenged, or subverted.

Areas of exploration
Chapter 1
Identification of traditional gender roles and stereotypes presented in the novel.
"Gender Queer: A Memoir" is an autobiographical graphic novel by Maia Kobabe, which explores their experiences with gender and sexuality. In the book, traditional gender roles and stereotypes are challenged and deconstructed in various ways:

Binary Gender Norms
Maia questions the traditional binary understanding of gender as male and female, highlighting the limitations and constraints it imposes on individuals who don't fit neatly into these categories. The novel challenges binary gender norms by chronicling the author's personal journey of self-discovery and their experiences navigating a non-binary identity. It delves into the complexities of gender and relationships, shedding light on the fluidity and diversity of gender expressions and orientations. The book serves as a powerful narrative that challenges traditional binary gender norms and invites readers to reconsider their understanding of gender.

Gendered Clothing
The author discusses the topic of gendered clothing and its significance in their personal journey. Throughout the novel, Maia explores their discomfort with traditional gendered clothing expectations and the challenges they face in finding clothing that aligns with their gender identity, which is non-binary. This exploration highlights how society's rigid gender norms and clothing expectations can be limiting and restrictive for individuals who don't fit within the binary. Maia's experiences with clothing serve as a central theme in the book, illustrating the ways in which clothing can be a powerful tool for self-expression and identity exploration. It also underscores the importance of breaking free from societal expectations and embracing one's true self, even when it comes to something as seemingly simple as clothing choices. The novel provides valuable insights into the complexities of gender and clothing and how these aspects are intertwined in the author's journey of self-discovery.

Sexual Orientation Stereotypes
Maia's experiences as asexual and questioning of societal expectations are a central theme. Maia Kobabe, who identifies as a non-binary and asexual person. The novel is a coming-of-age story that explores themes of gender identity and sexuality. In the book, Maia challenges many stereotypes and misconceptions related to sexual orientation and gender. They share personal experiences and feelings about their own journey, shedding light on the complexities of human identity beyond traditional stereotypes. The book aims to break down these stereotypes and promote a more inclusive understanding of sexual orientation and gender diversity.

Body Image and Expectations
Maia's journey as a non-binary person involves navigating their own feelings and societal pressures regarding their physical appearance. They candidly explore their experiences with body dysphoria, the discomfort or distress related to the incongruence between one's gender identity and physical body. Throughout the novel, Maia shares personal stories and illustrations that highlight the struggles and complexities of coming to terms with their own body image. They challenge traditional norms and expectations surrounding physical appearance and emphasize the importance of self-acceptance and self-love. In doing so, the book contributes to the ongoing conversation about body image, encouraging readers to reconsider and question societal ideals and standards, particularly as they relate to gender identity and expression. It promotes a more inclusive and empathetic understanding of diverse body types and appearances.

Pavansagar Doustan

Gendered Language and Pronoun

Maia Kobabe, the author explores the use of gendered language and pronouns in a deeply personal way. Maia, who identifies as non-binary and asexual, reflects on their own experiences with pronouns and how language can impact one's sense of self and identity. Throughout the book, Maia discusses their preference for gender-neutral pronouns such as "they/them" and their encounters with others who may not understand or respect their chosen pronouns. This exploration sheds light on the challenges and misunderstandings that non-binary individuals often face in a world where gendered language is the norm. The novel serves as a valuable resource for readers to understand the significance of using correct pronouns and inclusive language when interacting with people of diverse gender identities. It encourages empathy and respect for individuals who, like Maia, navigate a world that often imposes rigid gender expectations and language constructs.

Family and Social Pressure

Maia Kobabe, the author candidly discusses the impact of family and social pressures on their journey of self-discovery and understanding of their gender identity and sexuality. Maia shares their experiences of coming out to their family and the mixed reactions they received. The novel portrays the challenges Maia faced in reconciling their own identity with the expectations and norms imposed by their family and society. It highlights the tension between the desire for acceptance and the need to be true to oneself. Throughout the book, Maia's narrative sheds light on the broader societal pressures and stereotypes related to gender and sexuality, showing how these can affect an individual's self-esteem and mental well-being. Ultimately, "Gender Queer: A Memoir" provides readers with a deeply personal and relatable perspective on the complexities of family and social dynamics when it comes to accepting and understanding gender and sexual diversity. It emphasizes the importance of empathy, communication, and support in navigating these challenges.

Sex Education and Stereotype

The author explores themes related to sex education and stereotypes. Maia's journey as a non-binary and asexual individual involves navigating their own understanding of sexuality and relationships in a society where conventional norms and stereotypes often prevail. The book touches on Maia's experiences with sex education and the lack of representation and information about non-binary identities and asexuality. Maia challenges stereotypes surrounding asexuality and portrays their own experiences in a way that educates readers about this often misunderstood sexual orientation. By sharing their personal experiences and feelings, Maia aims to break down stereotypes and misconceptions related to both non-binary identities and asexuality. The book encourages readers to question traditional views on sexuality and relationships, promoting a more inclusive and informed understanding of diverse sexual orientations and gender identities.

CONCLUSION

The novel "Gender Queer: A Memoir" by Maia Kobabe serves as a powerful exploration of gender role portrayals that challenges and subverts traditional norms. Through the author's personal perspective on gender identity and expression, the book offers readers a unique glimpse into the world of non-binary and genderqueer experiences, ultimately contributing to broader discussions on gender diversity and inclusivity. Kobabe's fluid and non-binary identity, rejection of gender stereotypes, and open discussions on sexuality and relationships challenge societal expectations surrounding gender roles. The memoir also delves into the complexities of family and societal acceptance, shedding light on the hurdles faced by individuals whose gender identities do not conform to traditional norms. "Gender Queer: A Memoir" encourages self-exploration, empathy, and understanding, making it a valuable resource for readers, educators, and advocates interested in promoting a more inclusive and tolerant society. Through its candid and relatable storytelling, this book normalizes conversations about gender diversity and advocates for a world where all gender identities are accepted and celebrated. n essence, the novel serves as both a personal narrative and a platform for broader social change, challenging the status quo and inspiring discussions

that contribute to a more inclusive and empathetic world. Maia Kobabe's memoir exemplifies the power of literature in fostering understanding and acceptance of diverse gender experiences.

ABSTRACT

In management, economics, operation research, and many other industrial applications, a linear programming model is crucial. In situations where the data is uncertain and not hundred percent reliable, it is good to use linear programming modelled with Z-number parameters (ZLPM). We show how to convert Z-linear programming problem to a fuzzy linear programming problem with a certain reliability. Then the FLP problem can be tackled by using suitable existing methods. This approach ensures that the information regarding reliability is not lost.

Keywords: Fuzzy sets, Z-number, Ranking function, Triangular Z-number, Fuzzy linear Programming problem, Z-linear programming problem.

INTRODUCTION

Many application problems, modelled as mathematical programming problems may be formulated with uncertainty. Tanaka *et al*. [1]originally put out the idea of fuzzy mathematical programming at the general level within the context of Bellman and Zadeh's fuzzy decision [2]. Zimmermann [3] put forward the first fuzzy linear programming (FLP) concept. Afterward, many authors considered various types of FLP problems and proposed several approaches for solving them[4-6]. A novel method for resolving FLP problems based on Z-number was presented by T.Allahviranloo.et.al [7].Kumar *et al*. [8] proposed a new method to find the fuzzy optimal solution of fully fuzzy linear programming problems. Ganesan and Veeramani [9] introduced a new approach for solving a kind of linear programming involving symmetry trapezoidal fuzzy numbers without converting them to crisp linear programming problems. A note on FLP problems utilizing L-R fuzzy numbers was published by Nagoor Gani *et al* in [10]. Recently,

Poornima Devi and Velammal

Zadeh introduced the notation of Z-numbers in 2011. The idea of a Z-number has to do with the dependability of information. In this paper, we converted the ZLP problem into an FLP problem, and the FLP problem has already existing methods and the proposed method utilizes R-type operations introduced by Stephen [11].

Preliminaries

Definition: Fuzzy set

A fuzzy set in X is defined as a set of ordered pairs A=$\{(x, \mu_A(x)) | x \in X\}$, where $\mu_A(x)$ is referred to as the membership function for the fuzzy set. If X is a group of objects represented by the generic symbol X, then X is the definition of a fuzzy set A in X. Each element of X is assigned a membership value between 0 and 1 using the membership function.

Definition: Triangular fuzzy number

A fuzzy number $\tilde{A}$= (a,b, c) is defined as a triangular fuzzy number only if the membership function of this is represented as:

$$\mu_{\tilde{A}}(x) = \begin{cases} \frac{x-a}{b-a} & a \leq x \leq b \\ \frac{c-x}{c-b} & b \leq x \leq c \\ 0 & c \leq x \leq d \end{cases}$$

Definition: Ranking function

Let F(R) be a set of fuzzy numbers that is defined as a set of real numbers. Function $\Re: F(R) \to R$, is a ranking function that maps every fuzzy number into the real line.

Definition: Zadeh's definition of z-number

AZ-number is an ordered pair of fuzzy numbers Z=(A,B), associated with the uncertain real-valued variable X, with the first component A, a restriction on the possible values for X, as well as the second component B, a measure of the first component's reliability.

Definition: Triangular Z-number

In the Z-number Z= (A, B), if both components A and B are triangular fuzzy numbers, then the corresponding Z-number is called a Triangular Z-number.

Definition: MIN R Type operation

Let $* \epsilon \{+, -, \times, /\}$, the MIN R operation on the set of all continuous Z-number is defined to be
(A, B)($*$, min)(C, D)= (A$*$C, min (B, D)), where the extension principle is used to calculate A$*$C and min (B, D) = B if $R_k(B) < R_k(D)$ and D if $R_k(D) < R_k(B)$

Definition: Sum of two Triangular Z-numbers by MIN R

Let Z_1= (A_1, B_1) & Z_2= (A_2, B_2) be any two Triangular Z-numbers, then $Z_1(+, min)Z_2 = (A_1, B_1)(+, min)(A_2, B_2) = (A_1 + A_2, min(B_1, B_2))$

Definition: Product R Type operation

Let $* \epsilon \{+, -, \times, /\}$, the Product R operation on the set of all continuous Z-number is defined to be
(A, B)($*, \cdot$)(C, D)= (A$*$C, B $\cdot$ D), where A$*$C and B $\cdot$ D are calculated using extension principle

Definition: Sum of two Triangular Z-numbers by Product R

Let Z_1= (A_1, B_1) & Z_2= (A_2, B_2) be any two Triangular Z-numbers, then $Z_1(+, \cdot)Z_2 = (A_1, B_1)(+, \cdot)(A_2, B_2) = (A_1 + A_2, B_1 \cdot B_2)$

Converting ZLPP to FUZZY LPP

The ZLPP is mathematically formulated as mentioned below:

Max $\sum_{j=1}^{n} c_j x_j$

Subject to

$$\sum_{j=1}^{n} a_{ij} x_j \leq b_i \quad \forall\, i = 1,2,3, \ldots, m$$

$x_j \geq 0 \ \forall\, j = 1,2,3, \ldots, n$

where $c_j = (c_{j1}, c_{j2})$, $a_{ij} = (a_{ij1}, a_{ij2})$ and $b_i = (b_{i1}, b_{i2})$ are all Z-numbers.

In this section, novel approach to solving the Z-linear programming problem is suggested.

Let us discuss two distinct cases related to the Z-linear programming problem

Case (i):

Here the summation is interpreted as a (+, min) operation.

Consider the ZLPP

Max $\left[(c_1, c_1') x_1 (+, \min)(c_2, c_2') x_2 (+, \min) \ldots (+, \min)(c_n, c_n') x_n \right]$

Subject to

$(a_{11}, a_{11}') x_1 (+, \min)(a_{12}, a_{12}') x_2 (+, \min) \ldots (+, \min)(a_{1n}, a_{1n}') x_n \leq (b_1, b_1')$

$(a_{21}, a_{21}') x_1 (+, \min)(a_{22}, a_{22}') x_2 (+, \min) \ldots (+, \min)(a_{2n}, a_{2n}') x_n \leq (b_2, b_2')$

$(a_{31}, a_{31}') x_1 (+, \min)(a_{32}, a_{32}') x_2 (+, \min) \ldots (+, \min)(a_{3n}, a_{3n}') x_n \leq (b_3, b_3')$

$$\vdots \cdots \vdots$$

$(a_{m1}, a_{m1}') x_1 (+, \min)(a_{m2}, a_{m2}') x_2 (+, \min) \ldots (+, \min)(a_{mn}, a_{mn}') x_n \leq (b_m, b_m')$

$$x_1, x_2, x_3, \ldots, x_n \geq 0$$

The above ZLPP is converted into the following FLPP

Max $[c_1 x_1 + c_2 x_2 + c_3 x_3 + \cdots + c_n x_n]$

Subject to

$a_{11} x_1 + a_{12} x_2 + a_{13} x_3 + \cdots + a_{1n} x_n \leq b_1$

$a_{21} x_1 + a_{22} x_2 + a_{23} x_3 + \cdots + a_{2n} x_n \leq b_2$

$a_{31} x_1 + a_{32} x_2 + a_{33} x_3 + \cdots + a_{3n} x_n \leq b_3$

$\vdots\vdots\vdots\vdots\vdots$

$a_{m1} x_1 + a_{m2} x_2 + a_{m3} x_3 + \cdots + a_{mn} x_n \leq b_m$

$x_1, x_2, x_3, \ldots, x_n \geq 0$

The reliability of this system is

Min $(c_1', c_2', \ldots, c_n', a_{11}', a_{12}', \ldots, a_{n1}', a_{21}', a_{22}', \ldots, a_{2n}', \ldots, a_{m1}', a_{m2}', \ldots, a_{mn}', b_1', b_2', \ldots, b_m')$

Solving the FLPP:

Consider the case where $c_1, c_2, \ldots, c_n,\ a_{11}, a_{12}, \ldots, a_{n1},\ a_{21}, a_{22}, \ldots, a_{2n},\ \ldots, a_{m1}, a_{m2}, \ldots, a_{mn},\ b_1, b_2, \ldots, b_m$ are all triangular fuzzy numbers.

Suppose $c_j = (c_{j1}, c_{j2}, c_{j3})$, $a_{ij} = (a_{ij1}, a_{ij2}, a_{ij3})$ and $b_i = (b_{i1}, b_{i2}, b_{i3})$

Then the FLPP can be converted to LPP by the method suggested by Klir and Yuan[12]

Choose a suitable ranking function R. Let $C_j = R(c_j)$. Then the objective function is converted to $C_1 x_1 + C_2 x_2 + \cdots + C_n x_n$

$a_{111} x_1 + a_{121} x_2 + \cdots + a_{1n1} x_n \leq b_{11}$

$a_{112} x_1 + a_{122} x_2 + \cdots + a_{1n2} x_n \leq b_{12}$

$a_{113} x_1 + a_{123} x_2 + \cdots + a_{1n3} x_n \leq b_{13}$

$a_{211} x_1 + a_{221} x_2 + \cdots + a_{2n1} x_n \leq b_{21}$

$a_{212} x_1 + a_{222} x_2 + \cdots + a_{2n2} x_n \leq b_{22}$

$a_{213} x_1 + a_{223} x_2 + \cdots + a_{2n3} x_n \leq b_{23}$

$\vdots \cdots \vdots$

$a_{m11} x_1 + a_{m21} x_n + \cdots + a_{mn1} x_n \leq b_{m1}$

$a_{m12} x_1 + a_{m22} x_n + \cdots + a_{mn2} x_n \leq b_{m2}$

$a_{m13} x_1 + a_{m23} x_n + \cdots + a_{mn3} x_n \leq b_{m3}$

and $x_1, x_2, x_3, \ldots, x_n \geq 0$

Poornima Devi and Velammal

Example 1:

Consider the ZLPP

Max $(c_1, c_1')x_1(+,\min)(c_2, c_2')x_2(+,\min)(c_3, c_3')x_3$

Subject to constraints

$(a_{11}, a_{11}')x_1(+,\min)(a_{12}, a_{12}')x_2(+,\min)(a_{13}, a_{13}')x_3 \le (b_1, b_1')$

$(a_{21}, a_{21}')x_1(+,\min)(a_{22}, a_{22}')x_2(+,\min)(a_{23}, a_{23}')x_3 \le (b_2, b_2')$

$x_j \ge 0$

Where the c_j, a_{ij} and b_i are given in the following table

c_1	c_2	c_3
(around 14, very sure)	(around 13, sure)	(around 16, almost sure)

a_{ij}			b_i
a_{i1}	a_{i2}	a_{i3}	
(approximately 12, very sure)	(approximately 13, sure)	(approximately 12, sure)	(approximately 500, sure)
(approximately 14, sure)	(0,1)	(approximately 13, very sure)	(approximately 470, sure)

The linguistic terms can be converted to fuzzy terms in the following table:

c_1	c_2	c_3
((12,14,16), (.85,.9,.95))	((11,13,15),(.75,.8,.85))	((15,16,17),(.65,.7,.75))

a_{ij}			b_i
a_{i1}	a_{i2}	a_{i3}	
((10,12,14), (.85,.9,.95))	((11,13,15), (.75,.8,.85))	((10,12,14), (.75,.8,.85))	((480,490,500), (.75,.8,.85))
((12,14,16), (.75,.8,.85))	((0,0,0),(1,1,1))	((11,13,15), (.85,.9,.95))	((460,470,480), (.75,.8,.85))

Solution

First, we convert the given ZLPP into FLPP

Max $(12,14,16)x_1 + (11,13,15) x_2 + (15,16,17) x_3$

Subject to constraints

$(10,12,14) x_1 + (11,13,15) x_2 + (10,12,14) x_3 \le (480,490,500)$

$(12,14,16) x_1 + (11,13,15) x_3 \le (460,470,480)$

$x_1, x_2, x_3 \ge 0$

The reliability of this FLPP system isMin (very sure, sure, completely sure, almost sure)

= Min ((.85,.9,.95),(.75,.8,.85),(1,1,1),(.65,.7,.75))

=(.65, .7, .75) = almost sure

We can rewrite it as the following LPP using the method of Klir and Yuan[12]

Max $14x_1+13x_2+16x_3$

Subject to constraints

$10x_1+11x_2+10x_3 \le 480$

$12x_1 + 13x_2 + 12x_3 \le 490$

$14x_1+15x_2+14x_3 \le 500$

$12x_1+11x_3 \le 460$

$14x_1 + 13x_3 \le 470$

Poornima Devi and Velammal

$16x_1+15x_3 \leq 480$

$x_1, x_2, x_3 \geq 0$

The initial simplex table is represented as

c_B	Basis	c_j x_B	14 x_1	13 x_2	16 x_3	0 s_1	0 s_2	0 s_3	0 s_4	0 s_5	0 s_6
0	s_1	480	10	11	10	1	0	0	0	0	0
0	s_2	490	12	13	12	0	1	0	0	0	0
0	s_3	500	14	15	14	0	0	1	0	0	0
0	s_4	460	12	0	11	0	0	0	1	0	0
0	s_5	470	14	0	13	0	0	0	0	1	0
0	s_6	480	16	0	15	0	0	0	0	0	1

The solution to the above simplex method is given by

c_B	Basis	c_j x_B	14 x_1	13 x_2	16 x_3	0 s_1	0 s_2	0 s_3	0 s_4	0 s_5	0 s_6
0	s_1	$\frac{1828}{15}$	$\frac{4}{225}$	0	0	1	0	$\frac{-11}{15}$	0	0	$\frac{4}{225}$
0	s_2	$\frac{914}{15}$	$\frac{2}{225}$	0	0	0	1	$\frac{-13}{15}$	0	0	$\frac{2}{225}$
13	x_2	$\frac{52}{15}$	$\frac{-14}{225}$	1	0	0	0	$\frac{1}{15}$	1	0	$\frac{-14}{225}$
0	s_4	108	$\frac{4}{15}$	0	0	0	0	0	1	0	$\frac{-11}{15}$
0	s_5	54	$\frac{2}{15}$	0	0	0	0	0	0	1	$\frac{-13}{15}$
16	x_3	32	$\frac{16}{15}$	0	1	0	0	0	0	0	$\frac{1}{15}$
	z_j	$\frac{8356}{15}$	$\frac{3658}{15}$	13	16	0	0	$\frac{13}{15}$	0	0	$\frac{58}{225}$
	$z_j - c_j$	$\frac{508}{225}$	0	0	0	0	$\frac{13}{15}$	0	0	$\frac{58}{225}$

As all$z_j - c_j \geq 0$,the current basic feasible solution is optimal and the solution for the LPP is as follows:

$x_1 = 0$,$x_2 = \frac{52}{15}$, $x_3 = 32$and Max$\frac{8356}{15}$

The solution for the FLPP is $x_1 = 0$,$x_2 = \frac{52}{15}$, $x_3 = 32$and

Max $(12,14,16)0+ (11,13,15)\frac{52}{15}$ +(15,16,17) 32

$= (0,0,0) + \left(\frac{572}{15}, \frac{676}{15}, 52\right) + (480, 512,544)$

$= \left(\frac{7772}{15}, \frac{8356}{15}, 596\right)$

The solution to the ZLPP is $x_1 = 0$, $x_2 = \frac{52}{15}$, $x_3 = 32$and Max$=\left(\left(\frac{7772}{15}, \frac{8356}{15}, 596\right), (.65,.7,.75)\right)$

Case (ii):

Here the summation is interpreted as a $(+,\cdot)$ operation.

Consider the ZLPP

Max $\left[(c_1, c_1')x_1(+,\cdot)(c_2, c_2')x_2(+,\cdot) \ldots (+,\cdot)(c_n, c_n')x_n\right]$

Subject to

$(a_{11}, a_{11}')x_1(+,\cdot)(a_{12}, a_{12}')x_2(+,\cdot) \ldots (+,\cdot)(a_{1n}, a_{1n}')x_n \leq (b_1, b_1')$

67464

$(a_{21}, a_{21}')x_1(+,\cdot)(a_{22}, a_{22}')x_2(+,\cdot) \dots (+,\cdot)(a_{2n}, a_{2n}')x_n \le (b_2, b_2')$

$(a_{31}, a_{31}')x_1(+,\cdot)(a_{32}, a_{32}')x_2(+,\cdot) \dots (+,\cdot)(a_{3n}, a_{3n}')x_n \le (b_3, b_3')$

$\vdots \vdots \dots \vdots \vdots$

$(a_{m1}, a_{m1}')x_1(+,\cdot)(a_{m2}, a_{m2}')x_2(+,\cdot) \dots (+,\cdot)(a_{mn}, a_{mn}')x_n \le (b_m, b_m')$

$x_1, x_2, x_3, \dots, x_n \ge 0$

The above ZLPP is converted into the following FLPP

Max $[c_1x_1 + c_2x_2 + c_3x_3 + \dots + c_nx_n]$

Subject to

$a_{11}x_1 + a_{12}x_2 + a_{13}x_3 + \dots + a_{1n}x_n \le b_1$

$a_{21}x_1 + a_{22}x_2 + a_{23}x_3 + \dots + a_{2n}x_n \le b_2$

$a_{31}x_1 + a_{32}x_2 + a_{33}x_3 + \dots + a_{3n}x_n \le b_3$

$\vdots\vdots\vdots\vdots\vdots$

$a_{m1}x_1 + a_{m2}x_2 + a_{m3}x_3 + \dots + a_{mn}x_n \le b_m$

$x_1, x_2, x_3, \dots, x_n \ge 0$

The reliability of this system is

Product $(c_1', c_2', \dots, c_n', a_{11}', a_{12}', \dots, a_{n1}', a_{21}', a_{22}', \dots, a_{2n}', \dots, a_{m1}', a_{m2}', \dots, a_{mn}', b_1', b_2', \dots, b_m')$

Solving the FLPP

Consider the case where $c_{11}, c_{21}, \dots, c_{n1}$, $a_{11}, a_{12}, \dots, a_{n1}$, $a_{21}, a_{22}, \dots, a_{2n}$, $\dots, a_{m1}, a_{m2}, \dots, a_{mn}$, $b_{11}, b_{21}, \dots, b_{m1}$ are all triangular fuzzy numbers.

Suppose $c_j = (c_{j1}, c_{j2}, c_{j3})$, $a_{ij} = (a_{ij1}, a_{ij2}, a_{ij3})$ and $b_i = (b_{i1}, b_{i2}, b_{i3})$

Choose a suitable ranking function R. Let C_j=R (c_j). Then the objective function is converted to $C_1x_1 + C_2x_2 + \dots + C_nx_n$

Then the FLPP can be converted to LPP by the method suggested by Klir and Yuan[12]

$a_{111}x_1 + a_{121}x_2 + \dots + a_{1n1}x_n \le b_{11}$

$a_{112}x_1 + a_{122}x_2 + \dots + a_{1n2}x_n \le b_{12}$

$a_{113}x_1 + a_{123}x_2 + \dots + a_{1n3}x_n \le b_{13}$

$a_{211}x_1 + a_{221}x_2 + \dots + a_{2n1}x_n \le b_{21}$

$a_{212}x_1 + a_{222}x_2 + \dots + a_{2n2}x_n \le b_{22}$

$a_{213}x_1 + a_{223}x_2 + \dots + a_{2n3}x_n \le b_{23}$

$\vdots \vdots \dots \vdots \vdots$

$a_{m11}x_1 + a_{m21}x_n + \dots + a_{mn1} \le b_{m1}$

$a_{m12}x_1 + a_{m22}x_n + \dots + a_{mn2} \le b_{m2}$

$a_{m13}x_1 + a_{m23}x_n + \dots + a_{mn3} \le b_{m3}$

$x_1, x_2, x_3, \dots, x_n \ge 0$

Example 2

Consider the ZLPP

Max $(c_1, c_1')x_1(+,\cdot)(c_2, c_2')x_2$

Sub to constraints

$(a_{11}, a_{11}')x_1(+,\cdot)(a_{12}, a_{12}')x_2 \le (b_1, b_1')$

$(a_{21}, a_{21}')x_1(+,\cdot)(a_{22}, a_{22}')x_2 \le (b_2, b_2')$

$x_j \ge 0$

c_1	c_2
(around 6 , very sure)	(around 8, completely sure)

Where the c_j, a_{ij} and b_i are given in the following table

a_{ij}		b_i
a_{i1}	a_{i2}	
(approximately 30, very sure)	(approximately 20, completely sure)	(approximately 300, sure)
(approximately 5, completely sure)	(approximately 10, sure)	(approximately 110, very sure)

Poornima Devi and Velammal

The linguistic terms can be converted to fuzzy terms in the following table:

c_1	c_2
((5,6,7), (.85,.9,.95))	((7,8,9), (1,1,1))

a_{ij}		b_i
a_{i1}	a_{i2}	
((28,30,32), (.85,.9,.95))	((18,20,22), (1,1,1))	((280,300,320) (.75,.8,.85))
((4,5,6), (1,1,1))	((8,10,12), (.75,.8,.85))	((90,110,130), (.85,.9,.95))

Solution

First we convert the given ZLPP into FLPP

Max $(5,6,7)x_1 + (7,8,9)x_2$

Subject to constraints

$(28,30,32) x_1 + (18,20,22) x_2 \leq (280,300,320)$

$(4,5,6) x_1 + (8,10,12) x_2 \leq (90,110,130)$

$x_1, x_2 \geq 0$

The reliability of this FLPP system is =product (very sure, completely sure, sure)

$=(.85,.9,.95) \cdot (1,1,1) \cdot (.75,.8,.85)$

$= (0.6375, 0.72, 0.8075)$

We can rewrite it as the following LPP using the method of Klir and Yuan[12]

Max $6x_1 + 8x_2$

Subject to constraints

$28x_1 + 18x_2 \leq 280$
$30x_1 + 20x_2 \leq 300$
$32x_1 + 22x_2 \leq 320$
$4x_1 + 8x_2 \leq 90$
$5x_1 + 10x_2 \leq 110$
$6x_1 + 12x_2 \leq 130$
$x_1, x_2 \geq 0$

The initial simplex table is represented by

c_B	Basis	c_B x_B	6 x_1	8 x_2	0 s_1	0 s_2	0 s_3	0 s_4	0 s_5	0 s_6
0	s_1	280	28	18	1	0	0	0	0	0
0	s_2	300	30	20	0	1	0	0	0	0
0	s_3	320	32	22	0	0	1	0	0	0
0	s_4	90	4	8	0	0	0	1	0	0
0	s_5	110	5	10	0	0	0	0	1	0
0	s_6	130	6	12	0	0	0	0	0	1

The solution to the above simplex method is given by

c_B	Basis	c_B x_B	6 x_1	8 x_2	0 s_1	0 s_2	0 s_3	0 s_4	0 s_5	0 s_6
0	s_1	$\dfrac{700}{63}$	0	0	1	0	$-\dfrac{19}{21}$	0	0	$\dfrac{20}{126}$
0	s_2	$\dfrac{350}{63}$	0	0	0	1	$-\dfrac{20}{21}$	0	0	$\dfrac{10}{126}$
6	x_1	$\dfrac{245}{63}$	1	0	0	0	$\dfrac{1}{21}$	0	0	$-\dfrac{11}{126}$

67466

0	s_4	$\frac{10}{3}$	0	0	0	0	0	0	1	$-\frac{2}{3}$
0	s_5	$\frac{5}{3}$	0	0	0	0	0	0	1	$-\frac{5}{6}$
8	x_2	$\frac{80}{9}$	0	1	0	0	$-\frac{1}{42}$	0	0	$\frac{8}{63}$
	z_j	$\frac{850}{9}$	6	8	0	0	$\frac{2}{21}$	0	0	$\frac{31}{63}$
		$z_j - c_j$	0	0	0	0	$\frac{2}{21}$	0	0	$\frac{31}{63}$

As all $z_j - c_j \geq 0$, the current basic feasible solution is optimal and the solution for the LPP is as follows:$x_1 = \frac{245}{63}$, $x_2 = \frac{80}{9}$ and Max = $\frac{850}{9}$

The solution for the FLPP is $x_1 = \frac{245}{63}$, $x_2 = \frac{80}{9}$ and

Max $(5,6,7)\frac{245}{63} + (7,8,9)\frac{80}{9} = \left(\frac{175}{9}, \frac{210}{9}, \frac{245}{9}\right) + \left(\frac{560}{9}, \frac{640}{9}, 80\right)$

$$= \left(\frac{735}{9}, \frac{850}{9}, \frac{965}{9}\right)$$

The solution to the ZLPP is $x_1 = \frac{245}{63}$, $x_2 = \frac{80}{9}$ and Max = $\left(\left(\frac{735}{9}, \frac{850}{9}, \frac{965}{9}\right), (0.6375, 0.72, 0.8075)\right)$

CONCLUSION

An innovative approach to solving ZLPP has been provided in this paper. Here we have demonstrated the approach using numerical examples.

ABSTRACT

The study of texts, images, and films that create and reflect human interactions with the natural environment and with nonhuman species is an integral part of the Environmental humanities s. It is usually told as a development from an original focus on mostly British and American literatures of the last two hundred years to a much broader comparatist spectrum of literatures and periods. The convergence of colonial oppression and environmental degradation, the unequal distribution of resources and risks, and the continuing conditions of social justice are highlighted. Thus ecocriticism exemplifies the diffusion of comparatist assumptions and perspectives into other fields of literary study, as comparative and seeks to connect environmentally oriented research across a variety of disciplines in the humanities and social sciences. In order to do so, this research paper addresses environmental views which have been lacking from disciplines such as history, literature and philosophy.

Keywords: Environmental degradation, social justice, environmental humanities, comparative assumtions

INTRODUCTION

Nature nurtures human life in its own way. It's not opaque, it's dynamic, it's capricious, and it's arbitrary. It is intended to strengthen humanity all over the world. It'll cover the whole planet and form a functional ecosystem. It provides for the maintenance of individual species in harmony. The most remarkable thing is that plants and microbes allow oxygen and water to live. A feeling of wonder and worry is always born out of love and fascination with nature. The rapid growth of interdisciplinary discussions has been fueled by the writings of humanized writers on environment issues. Many stories and tales created discourses on the charismatic earth and its sacredness while

67468

science finds it as an ecological function of the ecosystem. Many stories and legends have been written about a charismatic planet with its sacredness, while scientists think it is an essential function of the ecosystem. In their practices of producing meaning, the environment and humanities are always looking for reform. The first environmental thinker and literary artist, Henry David Thoreau, lived deliberately in the woods, and his experiments at the edge of the pond were partly economic. Thoreau is not opposed to labor; rather, he believes that people sacrifice the vital elements of their lives like self actualization, communities, places and posterity in a bid to sell themselves as labourers. He encouraged people to drive life into a corner and find in it deep meaning, spiritual fulfilment, aesthetic pleasure, ecological literacy and community vitality. His two-year experiment at the pond's edge was an effort to document different ways to understand and value living a simple life to nature. Thus, many writers have interlinked nature and have always permeated literature emphasising nature in their writing. By writing about them and teaching them to keep them in print, ecologists have already been actively engaged in the recovery and promotion of neglected works.

Over a decade the New York Times declared the "Greening of the Humanities" (DeLoughary), a remarkable shift that highlights the role of literature in mediating environmental knowledge and in articulating a poetics of place in the alienating wake of globalization. This change has renewed the humanities and provided a methodology to consider an environment's complex history in order to think about new directions for our ecologies. Despite the digitization, an approach inspired by theory and practice is needed in order to cope with environmental chaos. The demand for solutions to the global ecological crisis thus has a new kind of thinking and a new community, which is creating academic knowledge as an environmental solution. Amongst many new genres in the digital world, environmental humanities restarted its way back and grow along with the development of literature, philosophy, history, geography, gender studies and anthropology from 1970s. This Research Paper takes a look at how the environment humanities and their conceptualization of nature have begun to be incorporated into literature stories

Emergence of Environmental Humanities

The environmental humanities have been around for over a century. During the 1970s and 1980s, it developed in the field of the humanities as a result of the development of literature, philosophy, history, geography, gender studies and anthropology. In late 1990s, it was originally known as "ecological humanities" (Nye and Robert 3). It had been adopted in the field of postcolonial or feminist studies by Australian researchers.

Serpil Oppermann and Serenella Iovina in his introduction to " The Environmental Humanities and the Challenges of the Anthropocene"   remarks " The environmental humanities contextualizes and complements environmental science and policy with a focus on narrative, critical thinking, history, cultural analysis, aesthetics and ethics(1). Different perceptions exist, however, as to whether or not the humanities were given enough space at universities from 1960 onwards in a field that has already been established by an interterdisciplinary approach. " The roots of the environmental humanities traced back to some of the earliest cosmological narratives, stories and symbols among the world's oldest cultures" (5ed by Joni Adams Humanities for the environment). After many shortfalls in environmental crisis, especially in the case of climate change, many environmental activists and scientists begin to think more deeply about questions of " culture, language and narrative" (Heise 294). Environmental humanities is a term first suggested in Australia in 2011 by historian Libby Robin, ethnographer and literary critic Deborah Bird Rose and ecofeminist Val Plumwood, who formed a group to study the "ecological humanities"(Nye et al.). Thus the environmental humanities has become a global intellectual movement that reconciles the relationship between scientific disciplines and the humanities, which are essential to understand and resolve dilemmas that have been created by industrial society.

What is Environmental Humanities?

Despite the advent of digitalisation, ecological chaos needs to be dealt with in a holistic manner based on theory and practice. Although the digital world is home to a great many new genres, environmental humanities have come much earlier than that. In the 1970s and '80s, it was fueled by developments in literature, philosophy, history, geography, gender studies and anthropology. But, in the latter part of the twentieth century, Postcolonial and

Feminist studies had an influence on this field. They argued first of all that humans standing outside nature and controlling it are based upon a concept of the natural world, which they perceive as passive and feminine. The environmental humanities have become a global intellectual movement that examines the relationship between scientific and technical disciplines and the humanities, which are essential to understand and resolve dilemmas that have been created by industrial society.   However, a number of areas that contributed to the environmental humanities, in particular literature, cultural geography, anthropology, and history, had begun to bridge the gap between them and science half a century ago.

REVIEW OF LITERATURE

It has been over a decade since the New York Times declared the " Greening of the Humanities" (qutd in DeLoughrey and Handley 9), a remarkable shift that highlights the role of literature in mediating environmental knowledge and in articulating a poetics of place in the alienating wake of globalization. It has revitalised the humanities, providing a method of thinking about environmental history in terms of its complexity and imagining new directions for our ecological future. In the last decades, Genealogies in disciplines like anthropology, geography, literature, history, philosophy, and science and technology studies have contributed to developing discourses on ecofeminism, public ecology, and environment justice. On the whole, historians are better equipped to understand such global interconnections then scholars of literature. However, Jamaica Kincaid , Antiguan American novelist, essayist, gardener, and gardening writer, expressed her disappointment and amusement at the homogenisation of the natural world in the eighteenth century in her *My Garden Book* as follows: These countries in Europe shared the same botany, more or less, but each place called the same thing by a different name: and these people who make up Europe were (are) so contentious anyway, they would not have agreed to one system for all the plants they had in common, but these new plants from far away, like the people far away, had no history, no names, and so they could be given names (qutd in DeLoughrey and Handley 11).

Whereas, the British historian, Richard Grove points out as "green imperialism"(11 DeLoughrey and Handley), that is a process that foregrounds the etymological definition of diaspora as the spreading of seeds, and destabilizes our association of flora and fauna with a natural landscape. Vandana Shiva, an Indian environmental activist is linking the current practice of patenting life forms and indigenous knowledge to a binomial taxonomy for all global flora and fauna. This ecocritical turn in literary studies has produced an innovative body of scholarship, including an international conference association and multiple journals, scholars have lamented that the dominant discourse of the field continues to be marked by an Anglo - American and a national framework rather than engaging broader contexts. Actually, according to Rob Nixon's comments on the New York Times article celebrating this year's inauguration, all of the two dozen or so green authors cited are American.

Transdisciplinary projects in the Environmental Humanities have involved storytelling, semi -structured interviews and visual ethnography to develop usable models for directing energy development, agricultural practices, land use, and water management. The subfields in the Environmental Humanities are eco criticism, environmental philosophy and history, critical animal studies, queer ecologies, eco feminism, environmental sociology, political ecology, eco materialism and post humanism. Creative cooperation among humanities and sciences could therefore be encouraged by the pragmatic approach of the environmental humanities. New ways of thinking and new communities that produce environmental solutions as a form of academic knowledge are therefore needed in the context of the global environmental crisis. In that context, an issue of this research paper focuses on the development of ecological humanities in literature narrative and how they are recasting themselves into historical works. Paradoxically, as American ecocriticism expands and gains increasing relevance in the context, its major narrative threads are producing and nationalist genealogy origin. The fact that the ecological approach to literature is not restricted by geographical borders, language and nationality makes such a general lack of interaction with postcolonial methodologies and contexts peculiar. To foreground the literature's engagement the and the environment have been shaped by the history of empire. This ecocritical turn in literary studies has produced an

innovative body of scholarship, including an international conference association and multiple journals, scholars have lamented that the dominant discourse of the field continues to be marked by an Anglo - American and a national framework rather than engaging broader contexts. Actually, Rob Nixon makes it clear in his response to this glowing New York Times article that all the two dozen or so green authors mentioned are Americans.

Conceptualizing Nature

There's a great deal of literature that could be discussed, as human relations with the forest are an important part of much precolonial Indian thinking. Nature writing has been an integral theme in nineteenth and twentieth century literature, dating back to Upanishad times. E.M. Forster's *A Passage to India*, Rudyard Kipling's imprerialist adventure tales, travel narratives such as Colonel Burton's *Tigers of the Raj* or the man -eating tiger adventures of passionate jungle lover Jim Corbett. These writers from the West disagreed with a certain aspect of UK's assault on forests. In the post colonial era, nature writing in the South Asian Diaspora, of Indian nature writing writers like Rabindaranath Tagore, A.K.Ramanujan and Meena Alexander have synthesized Indian nature philosophy in the contexts of other continents. classics like Rabindranath Tagore's poetry, and R.K.Narayan's fiction have been a major influence on nature writing in the twentieth century. South Asian nature writing that describe the effects of British colonialism on India's forest communities: nature themes originating in paradigms of Independence for instance, the Chipko movement and the dichotomies of nature thought between Gandhi and Nehru: and contemporary literature that examines indigenous tribal, peasant and women's and men's issues in relation to their forest home.

In fact, the recent rich body of socially engaged poetics historically ties environmental degradation and structural discrimination to Indian cultural presenxuity in a postcolonial context, which is why an understanding of the socioecological outcomes of colonial policies and actions are essential for India. One legacy of European colonisation, which has not diminished with the postcolonial context, is that of environmental racism as VandanaShiva, Gail Omvedt, Ramachandra Guha, Madhav Gadgil, Mahaswetha Devi, Nina Sibal have all recently demonstrated. Along the list, one prominent writer from south India, Tamil Nadu is Kavery Nambisan, She takes all possible efforts to break the existing dogma of tribal women's image in pre- independence time. Similarly many literary works are informative by holding the historical events, tribal thoughts, customs, fashion, food practices, dedication towards their profession, mutual treatment of people, behavioural differences of mankind, bond with animals and nature, sociological and economical indifferences attempt to understand the perspectives of peculiar thinkers who clearly give a huge characterization of the mankind and its region. In order to make her characters and story more intense and effective, Nambisan is incorporating the place's pride, history and culture. To illustrate the changes in people's minds as time went on, she brought back traditional values and their existing attachment to it. Especially the novel, *The Scent of Pepper*, deals with the Kodava Clan, its customs for over hundred years. This notable work remains to be diplomatic in exposing the Kodava, their bond with nature and people's life in the pre-independent period. She discusses about the eternal beauty of Coorg, refreshing coffee vegetation, recovering pepper, the evergreen surface of the places and well cultured and nature bound kodava, yerava and kongetira clans. Her description of nature will make the readers feel like they're living among characters. It is easy for readers to get into the inner life, emotions, and thoughts of nature. It's always good to take a look at the web of connections, ideas and discussions that Environmental Humanities have in their respective fields.

CONCLUSION

Thus, environmental humanities cannot be a solitary practice; it can be widely collaborated across discipline, period and specialization as its lifeblood. This is why the environmental humanities therefore welcome new talent, but they do not control access to their experience or the community. In this context the humanities can be of greatest use in assisting scholars to draw up a list of myriad tales which have been forgotten by writers' voices. So the humanities can dig deeply into lost histories and find patterns for a future that is once again possible.

ABSTRACT

Transportation problems are one of the improvised versions of linear programming. Least-Cost Method, which is used to calculate the transportation cost. This method is very useful for decision-makers. The objective of the article is to introduce MATLAB code for fuzzy transportation problems using the least-cost method to solve the fuzzy data and make the process easier. Because of insufficient or missing information, the available supply and anticipated demand are frequently fuzzy in real-world circumstances. This article proposes a MATLAB code for the least-cost fuzzy transportation problem.

Keywords: Fuzzy Transportation problem (FTP),Triangular Fuzzy Number, MAT LAB, Fuzzification, Defuzzification.

INTRODUCTION

The Transportation problem involves finding the minimum- cost plan for distributing stocks of goods or inventories from multiple origins to multiple destinations that demand the goods. The transportation model can be used to determine how to allocate the inventories available from the prismatic manufactories to the storages that stock or demand those goods, in such a way that total shipping cost is minimized. Generally, analysis of the problem will produce a shipping plan that pertains to a certain period of time (day, week), although once the plan is established, it'll generally not change unless one or further of the parameters of the problem (stock, demand, unit shipping cost)

67473

Rajkumar *et al.,*

changes. In the area of Linear Programming Problem (LPP), modeling of Transportation Problem (TP) is essential in cracking most real life problems as far optimization is concerned. MATLAB is used for treating programming of LPP, a condition applied to as M- File that can influence from codes. The Paper discusses to study TP that would calculate the use of MATLAB codes using a fine modeling. The model develops the transportation result for the North West Corner Rule, Least Cost system, Vogel's Approximation methodology, and MODI methodology for the TP. It's clear that a lot of work has been involved in by numerous experimenters in interrogate about of applicable result styles to similar problem. Likewise, logical approach and MATLAB rendering are the styles used by utmost experimenters in the operation of these effective proposed ways. In this paper, an original MATLAB coding was written that would support in the calculation of similar problems with easiness especially when the problem at LPP and TP. For each model, we use a combination of logical methodology and MATLAB encrypting to study the easiest way that would be effective while find the result of different problems. MATLAB is the important computational tool in operation exploration. The MATLAB coding methodology is better than logical methodology for cracking TP. This methodology gives us reasonable result in Transportation problem.

MATERIALS AND METHODS

Least-Cost or Matrix Minima
Track: 1
Define the needed cost in the cost matrix of the transportation table. Let M_{ij} be a cost matrix. Allocation will be $x_{ij} = \min(a_i, b_j)$ in the cell (i, j).

Track: 2
If $p_{ij} = a_i$, cross off the ith row of the transportation table and reduction b_j by a_i. Then go to track 3.
If $p_{ij} = b_j$, cross off the jth column of the transportation table and reduction a_i by b_j. Then go to track 3.
If $p_{ij} = a_i = b_j$, cross off either the ith row or jth column but not one and the other.

Track: 3
Replication track 1 and 2 for the operating reduced transportation table until all the margin necessities are satisfied. Whenever the minimal cost isn't unique make an arbitrary choice among the minima.

Algorithm for Proposed Method
The proposed method's algorithm solves the fuzzy transportation problem by using MATLAB.
Step: 1 Define the variables of the Triangular membership function.
Step: 2 Defuzzification of the value by using the method centroid or bisector
Step: 3 Next, assign the values in the array as a matrix.
Step: 4 Apply the matrix value in the LCM Transportation Problem Code
Step: 5 Execute the code to get a better optimal solution.
Similarly, we can write about the trapezoidal membership function.

Fuzzification
Fuzzification is the process of making a crisp quantity fuzzy.

Defuzzification
The method of defuzzification involves taking a single number from the output of the combined fuzzy set. It is used to convert the findings of fuzzy inference into a clear output. In other words, a decision-making algorithm that chooses the optimal crisp value based on a fuzzy set achieves defuzzification. 'centroid', 'bisector', 'mom', 'lom', 'som'.

NUMERICAL EXAMPLE

Predefined variables in the program, using 3 × 4 matrix variables.

CONCLUSION

This paper proposes a MATLAB code to solve matrix minima in a fuzzy environment. This method gives relatable cost from solving fuzzy transportation problem using defuzzification tool, simply known as converting fuzzy value into crisp value. From the numerical example, we get two types of data entry in the program: one is already written in the programme itself, and the other is that after running the program, we input the data to get the output. Here we use a (3, 4) and (4, 4) matrix of variables. In future we built more programs for different dimension of matrix. From this paper, we conclude that matrix minima, or fuzzy LCM, is optimum.

ABSTRACT

Nanosized biomaterials stand out in the material sciences as a result of their likely applications and benefits over different synthetic and actual methodologies. Metallic nanoparticles (metal or metal oxide nanoparticles) have accomplished wonderful prevalence because of their intriguing natural, physical, chemical, attractive, and optical properties. The natural strategy is liked as it gives a green, upfront, effortless, ecofriendly, quick, and savvy course for the green blend of nanoparticles. Plants have complex phytochemical constituents like sugars, amino acids, phenolics, flavonoids, terpenoids, and proteins, which can act as decreasing and balancing specialists. In the current work, we detailed a blend of nickel oxide nanoparticles utilizing a natural product plant extract of *Bauhinia variegata* by ethanolic extraction. The nanostructures of the examples were portrayed utilizing UV-Visible spectroscopy, Fourier transform infrared red spectroscopy (FT-IR), X-ray diffraction (XRD) and Scanning electron microscopy (SEM). The spherical nature and size of nickel oxide nanoparticles were found at 151 nm to 217 nm.

Keywords: Nanotechnology, Nickel oxide, *Bauhinia Variegata,* FTIR, XRD, SEM

INTRODUCTION

Nanoparticles (NPs) are typically spherical particles with dimensions between 1-100 nanometers [1]. In order to gain access to new classes of functional materials with unheard-of features and uses, researchers have extensively studied nanostructured materials [2]. Conductive paints [3] , rechargeable batteries [4], chemical catalysts [5], optoelectronics [6], magnetic recording medium [7], ferrofluids [8], contrast-enhanced magnetic resonance imaging [9–11] and other applications all make use of magnetic nanoparticles. Improved biological therapy, wastewater treatment, and environmental remediation all greatly benefit from nanotechnology. Due to their chemical, physical, electrical,

catalytic, and optical properties, nanoparticles can act as a possible catalyst in the oxidation process to purify industrial sewage water [12–13]. Due to their applicability in a variety of fields, bimetallic nanoparticles have recently attracted a lot of attention. Their value stems from unique characteristics that set them apart from monometallic nanoparticles. It has been previously reported [14-15] that the synthesis of Cu-Ni alloy nanoparticles in a 1:1 ratio was achieved utilizing the micro emulsion technique, sodium dodecyl sulfate and oleic acid. One of the transition metals, nickel, exhibits magnetic properties as a bulk substance in addition to having a number of other intriguing characteristics and uses, including catalysis and the storage of hydrogen. The literature contains techniques for creating nickel nanoparticles, including electrochemical reduction [16], chemical reduction [17] and sol-gel [18]. Nickel nanocrystals, which are magnetic transition metal nanoparticles, are challenging to make because they are easily oxidized. Several techniques were used in organic media to produce pure nickel nanocrystals in order to prevent the production of oxide or hydroxide. Nickel oxalate has been thermally decomposed at 450 °C to produce nickel oxide nanoparticles. Thermal decomposition is a novel way to generate stable, mono dispersed materials among the several techniques discovered for the manufacture of nickel and nickel oxide nanoparticles [19], and it is a rapidly growing field of study. It is quicker, cleaner, and more cost-effective than the traditional process. To expand the application areas and meet the demands of basic research, the thermal reduction technique should be improved in order to produce nickel nanoparticles with adjustable size and form. A drunkard concentrate of *B. variegata* stem bark has shown critical hepatoprotective activity against liver harm brought about via carbon tetrachloride [20]. With the improvement of nanotechnology, nanoparticles (NPs) have been broadly utilized in industry, farming, medication, and day-to-day existence. Carbon nanotubes, polymeric nanoparticles, metallic nanoparticles, microbially combined nanoparticles, liposomes, and attractive nanoparticles are among the most studied nanostructures for biomedical applications in disease treatment and analysis. Amalgam NPs, for example, were effectively created for malignant growth theranostics [21].

The aim of this study, green synthesis of Nickel oxide nanoparticles from *Bauhinia varigetae* plant fruit extract. At first, was to investigate effect of several experimental parameters on the size of nickel oxide particles and determination of best experimental conditions for synthesis of Nickel oxide (NiONPs) nanoparticles in aqueous media. Therefore, a statistical experiment design procedure was used to investigate effects of four parameters on the size of formed particles including concentration of metal ion solution, plant extract concentration, pH and temperature of the reaction. Synthesized nickel oxide nanoparticles characterized by UV-Visible spectroscopy, Fourier transform infrared spectroscopy, X-ray diffraction and Scanning electron microscopy.

MATERIALS AND METHODS

Collection of *Bauhinia variegata* Plant Material
The *Bauhinia variegata* fruit samples were taken at the Pudukkottai, Tamil Nadu, India, campus of the J.J. College of Arts and Science, were properly cleaned with double distilled water after being washed numerous times with tap water to get rid of unwanted material. To remove moisture content, the cleaned *Bauhinia variegata* fruit were completely dried at room temperature in the open air under shade for 15 days. An electrical grinding device was used to crush the dried fruit of the *Bauhinia variegata* plant fruit and create a fine powder.

Chemicals and Reagents
The chemicals and reagents, which included Ethanol (C_2H_5OH), Nickel Chloride ($NiCl_2$), Sodium Hydroxide (NaOH), Hydrochloric Acid (HCl), and double distilled water (DDW) were bought from Sigma Aldrich, Pvt Ltd and utilized without further purification. The chemicals employed in this study were all of the analytical variety.

Preparation of Extract for Phytochemical Screening

The *Bauhinia variegata* fruit that had been harvested was washed twice: once with tap water to get rid of the dust, and once with distilled water. In a 250-ml beaker, 10 g of leaves were combined with 100 ml of sterile, decanted water. The mixture was then heated for 5 minutes and allowed to cool to room temperature (30°C). The cooked mixture was then processed through Whatman filter paper No.1 after being coarsely ground in a kitchen grinder. The filtrate was used to form nanoparticles of nickel oxide.

Synthesis of Nanoparticles
Preparation of Plant Extract (Reducing Agent)

*Extracts were prepared by taking 20 gm of *Bauhinia varigata* fruits, washing them thoroughly with double-distilled water, and cutting them into fine pieces. Then, the pieces are boiled in 100 ml of double-distilled water for 20 minutes at 60 °C in a glass beaker. After boiling, the extract was filtered using Whatman No. 1.

Preparation of Metal Solution (Precursors)

Precursors for Nickel nanoparticles ($NiCl_2$) were purchased from Sigma Aldrich, Pvt Ltd, and prepared freshly. The precursor for preparing nickel nanoparticles was 5mM of nickel chloride using double-distilled water.

Synthesis of Nickel Oxide Nanoparticles

To produce nickel oxide nanoparticles, a precise mixture of 10 ml of extract and 90 ml of nickel chloride solution at a concentration of 5mM was used (1: 10). The transition from green to dark brown was a sign that nickel oxide nanoparticles (NiONPs) was being synthesized. The purified NiONPs was washed with sterile distilled water at 10,000 rpm for 20 minutes in a cooling centrifuge. The pellet was gathered and put away for examination.

Characterization of the Synthesized Nickel Oxide Nanoparticles
UV-Visible Spectroscopy

Ultraviolet-visible spectroscopy (UV-Vis) submits to absorption spectroscopy in the UV-visible spectral area. The nickel nanoparticles were characterized in a Perkin Elmer Lambda 35 UV-vis spectrophotometer. Because the scanning range for the samples is 200–1100 nm, the double-distilled water is used as a blank reference.

Fourier transfer infrared spectroscopy (FTIR)

The nanoparticles were characterized using a Perkin Elmer Spectrum Two Infra-Red Spectrophotometer. Two milligrams of the sample were mixed with 100 mg of potassium bromide (KBr). Once compressed to prepare a salt disc roughly 3 mm in diameter, the discs were at once kept in the sample holder. The FTIR spectra were recorded in the absorption range between 4000 - 400 cm^1.

X-ray Difraction Analysis (XRD)

The particle size and nature of the nickel nanoparticles were determined by using the XRD. This was done using the Shimadzu XRD–6000/6100 model with 30 kV and 30 mA with Cuk radians at a 2 angle. X-ray powder diffraction is a fast analytical technique. This is chiefly used for phase identification of a crystalline material and can supply information on unit cell dimensions. The analyzed material is thinly ground, and the normal bulk composition is established. The particle or grain size of the nickel nanoparticles was determined using Debye Sherrer's equation.

$$D = 0.94 / B \cos\theta$$

Scanning Electron Microscope Analysis (SEM)

The SEM is a kind of electron microscope (Carl Zeiss EVO 18) that images a sample by scanning it with an elevated energy beam of electrons in a raster scan model. This film of the sample was prepared on a carbon-coated nickel grid by just dropping a very small amount of the sample on the grid. The extra solution was removed with a blotting paper, and then the films on the SEM grid were permitted to dry by putting them below a mercury lamp for 5 minutes.

RESULT AND DISCUSSION

Phytochemical Screening

Preliminary phytochemical screening of the *Bauhinia variegata* fruit extracts was tested for alkaloids, flavonoids, saponins, terpenoid tannins, carbohydrates, and steroids. The choice of these extracts was based on their highest potency against antimicrobial activity. The results are indicated as (Positive) for the presence and (Negative) for the absence of phytochemicals.

Effect of Various Parameters on formation of NiONPs

The form and size of the nickel nanoparticles are influenced by a number of characteristics that might change during the formation of nickel oxide nanoparticles. Hence, a factorial design of trials using the "one factor at a time" strategy has been used to determine the ideal circumstances. The investigative elements in this case were altered one at a time, while the remaining components remained the same [22]. Temperature (26℃, 40℃, 50℃, 60℃, and 70℃), salt concentration (1mM, 2mM, 3mM, 4mM, and 5mM) [23]. pH (pH5, pH6, pH7, pH8, and pH9) [24] and plant extract (1:10, 2:10, 3:10, 4:10, and 5:10) were evaluated [25] as the best conditions to maintain minimum polydispersity in nickel oxide nanoparticles.

Characterization Study of Nickel Oxide Nanoparticles
UV-Visible Spectroscopy

The characteristic's most extreme frequency was resolved utilizing a bright noticeable (UV-visible) spectrophotometer at a large number of frequencies from 200–1100 nm. The UV-visible spectra of nickel oxide nanoparticles were recorded on a Perkin Elmer Lambda 35 reflectance spectrometer at room temperature [26]. UV-visible investigation of *Bauhinia variegata* extricate shows two characteristic ingestion groups at 218 nm and 257 nm; in any case, after being dealt with metal arrangement with *Bauhinia variegata* separates, the retention groups were found to move to 206nm and 214nm because of surface plasmon, which means the formation of nickel oxide nanoparticles (NiONPs). It likewise implies that the organic product separate goes about as a diminishing specialist and may cause the decrease of the nickel.

Fourier- Transform Infrared Spectroscopy (FTIR)

The FTIR study revealed the interaction sites of extract molecules with nickel metal ion to form NiONPs. The FTIR spectra of *Bauhinia variegata* powder and synthesized NiONPs showed several peaks in the spectral range of 4000-400cm^{-1}shown in figure 3a and 3b, indicating the presence of the Phyto molecules from the extract on the surface of NiONPs, which confirms the stabilizing role played by the Phyto molecules in the synthesis of NiONPs. The strong broad peak at 3409 cm^{-1} was attributed to (O–H) alcohol present at the surface of NiONPs, medium peaks at 2922 cm^{-1}, 2853 cm^{-1}, were due to alkane C-H stretching of the alkane group. The strong band around 1266 cm^{-1} was assigned to the bridged form of any aromatic amine group (C-N), The strong peak at 1115cm^{-1} due to C-O stretching of aliphatic group, the strong peak at 1064cm^{-1} due to C-O stretching of primary alcohol, the strong peak appeared at 875cm^{-1} due to C-H stretching of 1,3 disubstituted [27].

XRD analysis of Nickel Oxide Nanoparticles

The crystallographic structure of NiONPs was revealed by X-ray diffraction (XRD) analysis. An XRD pattern was recorded by Tescan Oxford diffractometer with an operation voltage of 45 kV at 30 mA using Equation (1).

D=kλ/βcosθ   **—— (1)**

Where D=the crystsllite size of NiONPs, λ=the frequency of x-beam source (1.54059 nm) utilized in XRD, β=the full width at half limit of the diffraction top/, K=the scherrer's steady with esteem from 0.9 to 1, θ= the Bragg point. The crystalline nature of NiONPs was revealed by X-ray diffraction analysis. The diffraction peaks with 2θ degrees at 23.97, 35.53, 50.92, and 67.12 corresponded to the (300), (311), (211), and (112), Bragg's reflections of the simple cubic (SC) crystalline structure of Nickel oxide, respectively. XRD analysis result shows average nano-size range about 27nm using Scherrer's equation.

Sivakumar

Scanning Electron Microscope analysis of Nickel oxide nanoparticles

The morphology of NiONPs was presented by SEM analysis. The NiONPs were homogenized by an agate mortar. The surface morphology of cobalt oxide NPs was investigated by SEM, and the response is shown in Fig. 5. It is obvious from the SEM image that the particles were spherical in shape and agglomerated with an average size of 181 nm. Agglomerations in the particles depend upon the nature of the extract and the compounds present in the extract.

CONCLUSION

The Nickel oxide nanoparticles were successfully synthesized by using novel *Bauhinia variega*te plant fruit provides cost effective, easy and proficient way for synthesis of NiONPs. The functional group present in the fruit extract was confirmed by FTIR analysis. These functional groups were mainly responsible for the reduction of nickel metal ions into NiONPs. The synthesized nickel oxide nanoparticles were analyzed using UV-spectrophotometer, FITR, XRD and SEM

ABSTRACT

Hamstrings are the group of muscles present in the posterior compartment of the thigh. It is found that this muscle has tendency to get tight in people undergoing prolonged sitting such as college students. It is evident that reduced flexibility of hamstring can be the source of low back as well as neck and shoulder pain. Also, tight hamstrings can alter the posture and increases the risk of injury. The study focuses on comparing the effectiveness of sub occipital muscle inhibition technique versus doming of diaphragm on hamstring flexibility in computer workers. A total number of 120 individuals were selected for the study. Participants with Pop lite al angle (PA) <125 degrees or forward flexion distance > 5cm were included. They were divided into two groups of 60 each. Group A was given SMI technique for 4 minutes and Group B was given DD approach for 5 minutes. Pre- and Post- Hamstring flexibility was assessed by using Active Knee Extension (AKE) test (right and left), Straight leg raise (SLR) test (right and left) and Modified sit and reach test (MSRT). Kolmoorov -Smirnov test was used to check the normality of the data. Wilcox on Signed Rank test was used for within group comparison for AKE and paired-t test was used for SLR a nd MSRT in Group A. For Group B, Wilcox on Signed Rank test was used for outcomes AKE and SLR and paired t-test was used for MSRT. Mann-Whitney U test was used for between group comparisons of mean difference between pre- and post- data in both the groups.

67490

Keshvi Shah *et al.,*

In within group comparison, p- value of Group A and Group B is (<0.001) for AKE (right and left), SLR (right and left) and MSRT. While in between group comparison, p- value is (>0.05) for AKE and SLR but for MSRT, p-value is (<0.001). This study concludes that SMI technique as well as DD approach is found to improve hamstring flexibility, but SMI technique was found superior to DD approach for targeting posterior chain flexibility.

Keywords: Hamstring flexibility, DD approach, SMI, AKE, MSRT.

INTRODUCTION

Body of the human is an astounding machine. It is designed for long-term mobility as well as an incredible ability for compensating and adaptation. The fascial, or connective tissue matrix, is a key component of compensation. Fascia is an ongoing matrix of connective tissue linking numerous body's organs together.[1] Muscles inside the human body are broken down into three categories: skeletal, smooth, and cardiac. Histologically, skeletal as well as cardiac muscles are known as striated muscles, because muscle fibers seem striated underneath light microscopy. In general, there are two types of muscle fibers: type I and type II, often known as slow-twitch and fast twitch fibers, respectively.[2]Hamstrings consists more type II fibers than quadriceps or adductor magnus, according to Garrett et al. published well acknowledged examination of cadaver specimens (1984), who hypothesized this muscle composition may be a factor in the hamstrings' high susceptibility to strain injuries. It is assumed that fibers type II are highly vulnerable to strain injury since they are recognized to be more susceptible to break down following lengthening contractions. [3]Complex of hamstring musculature is situated in fascial region of rear thigh, consisting biceps femoris over the outer side and semi membranosus and semi tendinosus over inner side. These muscles are distinctively noticeable as they are two joint muscles, crossing both the femoroace tabular and tibiofemoral joints. The hamstrings have a crucial function in the gait cycle during activities like running and walking as they operate as the knee flexors and hip extensors. Hamstrings restricts knee extension just prior but also throughout initial contact ,offering dynamical support to antero - posterior translatory movement of tibia in reference to the femur in conjunction with the anterior cruciate ligament's static support (ACL).[4]Flexibility refers to capacity of a muscle to elongate, permitting number of joints to traverse through ROM. It is described as the ability to move one or more joints comfortably and without experiencing any pain. In order to minimize or prevent injury, flexibility enables the tissue to respond to tension more quickly, disperse force impaction, and enhance movement's effectiveness and efficacy.[5] One of the muscles that are most frequently tight is the hamstring. The hamstring muscle is the one that suffers the most damage in the human body, crossing multiple joints along with considerable functional excursion and numerous muscle fiber type II. [5] This gives rise to postural variations at pelvic region giving rise to posterior tilting and flat back posture. [6] A higher amount of stress on the spinal soft tissues is found due to the reduced lumbar curvature which is result of reduced pelvis mobility caused by hamstring muscle shortening. As a result, it has been demonstrated that inadequate hamstring flexibility alters typical biomechanical patterns, impacting balance, functionality, and athletic performance. It also reduces mobility, results in postural deviations, discomfort, and raises the risk of injury. [7]Several studies have linked a shortening of the hamstrings to an increased risk of hamstring strain. Reduced hamstring extensibility can also cause low back pain because the shortened hamstrings will pull the pelvis into posterior direction, resulting in the compensations of the spine. [8]Current Indian information technology (IT) and IT-enabled sectors already employ over 2 million people, and this figure is rising daily. Many musculoskeletal conditions and discomforts, together referred to as work-related musculoskeletal illnesses, have sedentary labour as their primary contributing factor (WRMSD).

Sedentism is a significant risk factor for several manageable illnesses that impairs quality of life. Muscle stiffness, reduced joint range of motion, and diminished flexibility are all side effects of a sedentary lifestyle that may interfere with daily activities. A person who spends their entire day sitting down, like students or desk-job workers, experiences accommodative substitutes which may shorten their hip muscles. Long periods of sitting cause the

pelvis to tilt, that leads to shortening of hamstring.[9]There are numerous techniques which are being used for enhancing muscle elasticity. Although stretching has long been utilized to promote extensibility, analysis found no evidence that it can be used as a stand-alone approach for preventing hamstring injuries.[6] Soft tissue mobilization, my of as cial release techniques, muscle energy technique, as well as other new interventions for enhancing flexibility are being researched for immediate impacts on hamstring flexibility. Interestingly, a prior study found that greater hamstring muscle tension and shortening can induce neck and shoulder pain. This happens because the cervical spine's soft tissue binds the dura and sub occipital muscular fascia, and the my of as cial chain's "superficial back line" unites neck to lower body. So, if sub occipital muscles' tone is diminished (passively, through a fascial therapy, or through active motions), it is likely that hamstring muscles' tone will also get reduced and the extent of hip flexion or knee extension would increase10]A recent study found that an intervention targeting the sub occipital muscles improved hamstring flexibility.[11] A manual technique called the sub occipital muscular inhibition (SMI) approach aims to ease up the tight sub occipital muscles by reducing my of as cial constriction in the area.[12]Since the sub occipital muscles include a high concentration of neuromuscular bundles, relaxing the muscle fascia promotes greater stretching and lowers knee flexor tone. It is true because a single neural pathway via the dura mater binds hamstrings along with sub occipital muscles. This was dubbed as "superficial back line" by Myers. [13]Other researchers looked at hamstring elasticity while taking into account postural muscle constraints, including the diaphragm. The diaphragm is such muscle with a trefoil-shaped tendon at its middle that blends seamlessly through the fibrous pericardium. Lumbar vertebral bodies, arcuate ligaments, costal margins, and xiphoid process constitute where the diaphragm originates from.[7]The diaphragm doming (DD) method is utilized to improve the diaphragm's function and restore its normal movement. The body acts as a dynamic system not as a discrete part whilst implementing kinetic chain techniques, which are focused on movement patterns. A diaphragm technique can influence remote structures like the hamstring muscles since there is a biomechanical connection seen between diaphragm and other structures.[7] Given the diaphragm's intricate structure and essential part in the postural chain's biomechanics, our hypothesis is that a technique for normalizing the diaphragm could have an effect on the posterior muscle chain. There is dearth of evidences for the effectiveness of both the techniques. So, this study was carried out to compare both techniques and determine whether one is superior to the other, which could be an alternative option. The goal of the current study was to evaluate the efficacy of the Sub occipital Muscle Inhibition Technique versus Doming of Diaphragm Approach for increasing hamstring flexibility in computer professionals.

MATERIAL AND METHODOLOGY

Design

This was a randomized clinical trial (pre and post intervention). Based on a previous study done by Érika Quintana Aparicio et al[12] , the size of the effect (5.03˚) and the SD (9.58) for the Straight Leg Raise (SLR) test of left side, for an α value of .05 and a statistical power of 0.84, revealed that the size of each group should be 57 subjects. The study confirmed to the guidelines of the Instututional Ethics Committee for Human Research – Sainath Hospital, Ahmedabad (IECHR-SAINATH HOSPITAL/AHMC/47). All subjects signed an informed consent form before their inclusion.

Subjects

The study included 120 participants (92 males) with a mean age of 42.51 ± 5.21 years. The subjects were from ABB INDIA LIMITED (68 subjects randomized between both groups) and REMARK ADVERTISEMENTS (52 subjects randomized between both groups).Inclusion criteria[8,14] were as follows: (1)Participants who gave informed consent; (2) Age group between 35-55 years; (3) Gender: both male and female; (4) Computer workers with work experience of at least 7 consecutive years, with extended sitting for a minimum of 5 hours/day; (5) Participants having hamstring tightness with PA<125 degrees or forward flexion distance test of more than 5 cm. Subjects with following criteria were excluded from the study [5,6,14] : (1) History of neck trauma; (2) Previous history of fracture or trauma or fracture of lower limb; (3) History of herniated disc or lumbar protrusion; (4) History of acute neck and

back pain; (5) History of pain, paresthesia in lower limb; (6) History of muscle tendon lesions of hamstring muscles (tendonitis, elongations, muscle tears) atleast one month before study; (7) Subjects using medication that could affect the measurement (e.g.: muscle relaxants); (8) Pregnant lady; (9) Received any manual therapy within the previous month.

Evaluations

Hamstring flexibility was assessed pre- and post- intervention using following three outcome measures. *ACTIVE KNEE EXTENSION TEST:*[11]Active knee extension was measured with gonio meter while the subject was in supine lying with hip stabilized at 90 degrees flexion. The gonio meter was placed in such a way that non movable arm was aligned along the femoral shaft pointing greater trochanter and the movable arm along tibial shaft pointing the lateral malleolus with lateral knee joint-line as a fulcrum. The participants were asked to extend the testing knee actively as much as possible. Then the knee flexion angle (popliteal angle) was measured using goniometer. Three readings were taken for active knee extension of which average was calculated. Bilateral measurements were taken. The test and retest measurement reliability coefficients for right and left extremities is .99. The hamstring is considered tight if the angle is less than 125 degrees. *STRAIGHT LEG RAISE TEST:*[15]Another frequently used test to check hamstring flexibility is the SLR test. In this test, the subject lies in supine position and the fibular malleolus, was marked with a marker. Goniometer's axis was aligned with the projection of the greater trochanter of the femur. Goniometer's stationary arm was kept parallel to the table. Knee and ankle were always extended. Holding the talus and not rotating the hip, the subject's lower limb was gradually raised until he/she complains of stiffness or soreness in the thigh region, bents his/her knee, or begins to swing the pelvis in retroversion. The movable arm of the goniometer was then pointed in line with the fibular malleolus, and the degree of straight leg elevation was recorded. Bilateral assessment was done. The hamstring is considered tight if this angle is less than 80 degrees. It has high interobserver reliability (0.94-0.96).made box with a measure tape (inch tape) affixed to the top was used to administer the test (Figure 1). The box had a 33 centimeter height. *MODIFIED SIT AND REACH TEST:*[16,17]A specifically made box with a measure tape (inch tape) affixed to the top was used to administer the test (Figure 1). The box had a 33 centimeter height.

Stage 1

The MSRT was calculated by measuring the finger-to-box distance in accordance with the methods outlined by Hoeger et al, compensating for the proportional disparities between arm and leg lengths. The subject was positioned on the floor with their feet flat against the box and their head, back, and hips against the wall (90 degrees at the hip joint). Only scapular abduction was permitted in this position, which also required the subject to place hands over hands and extend their arms outward until they were level with the measurement scale. When the feet were resting against the box, the finger-to-box distance (FTB) was calculated as the distance between the fingertips and that location (point 15 of the scale).

STAGE 2:

Sit and reach score (SRT score) is measured following the measurement of FTB distance. For this, the subject was positioned on the floor with their feet flat against the box and their legs fully extended, shoulder width apart. The participant placed one hand on top of the other with their knees completely extended. They steadily reached forward as far as they could without jerking, sliding their hands across the ruler's top, and kept that posture for at least two seconds. The final location of the fingertips on or toward the ruler was recorded as the SRT score in centimeters. Then after, MSRT score was calculated using the following equation: MSRT score = finger-to-box distance (cm) + (SRT score – 15 cm).The test was performed twice, and the average retained.

INTERVENTIONS

Group A (Sub occipital Muscle Inhibition Technique) (Figure 2)

The SMI technique was employed as a treatment and was carried out according to the literature.

Keshvi Shah *et al.,*

The participants were positioned in a supine position. The therapist was seated at the head end of the patient with both palms under the participant's heads, touching the evaluator's index, middle and ring fingertips with MCP joints in 90 degrees of flexion between the second cervical vertebra's spinous process and the occipital condyles. Following that, painless and steady pressure was applied upward and towards the therapist for 4 minutes, or until relaxation of tissue of sub occipital region was attained. The subjects were requested to keep their eyes close during the procedure to avoid movements of the eye that can alter the tone of the sub occipital muscles [4,15].

Group B (Doming of Diaphragm approach) (Figure 3)
The diaphragm doming is a technique for relaxing the diaphragm's resting condition and improving its contraction and relaxation functions. Its purpose is to improve the expiration phase by increasing the pressure gradient between the thorax and the abdomen. The subject was in supine lying position. The therapist was facing the subject and wrapped her hands around the subject's thoracic cage, slipping her fingers beneath the costal edges. After that, the thorax was carefully rotated to the left and right to see which orientation provides the most mobility and ease of motion. The thorax is eased in the direction of more free rotation. The hands were utilized to support and follow the tissues as a gentle release throughout this position, which was held for 5 minutes [14].

STATISTICAL ANALYSIS

The collected data were analyzed using SPSS version 26.0. Kolmogorov-Smirnov test was used to check the normality of the data. For Group A, Wilcoxon Signed Ranks test was used for within group comparison of AKE. For SLR and MSRT, paired t-test was used for within group comparison. For Group B, Wilcoxon Signed Ranks test was used for AKE and SLR. For MSRT, paired t-test was used for within group comparisons. Mann-Whitney U test was used for between group comparisons of difference of pre- and post- means.

RESULTS

The total sample included 120 subjects, of which 60 were assigned to Group A, whereas other 60 were included in Group B. The age of the individuals ranged between 35 and 55 years, with a mean of 41.88 ± 4.77 in Group A and 43.15 ± 5.66. The sample comprised total of 92 men and 28 women. Table 1 shows the characteristics and comparisons of the 2 study groups at the beginning of the study (pre-intervention between-group analysis— baseline). (Graph 1 and 2)Table 2 shows within group comparisons in Group A and Group B for pre- and post- data of AKE (right and left), SLR (right and left) and MSRT. Results suggests statistically significant (p-value <0.001) improvement in hamstring flexibility in both the groups. (Graph 3)Table 3 shows between group comparisons of difference of means of pre- and post- values of AKE (right and left), SLR (right and left) and MSRT in both the groups by using Mann Whitney U test. Results shows statistically insignificant (p-value > 0.05) difference between both groups for outcomes AKE (right and left) and SLR (right and left), but statistically significant (p-value <0.001) difference between groups for MSRT. So, significantly greater improvement was observed in Group A for MSRT than in Group B. These statistics shows that both techniques are equally effective in improving hamstring flexibility, but SMI technique is more effective for targeting posterior chain flexibility.

DISCUSSION

Current study compared the effects of the Sub occipital Muscle Inhibition Technique and the Doming of Diaphragm Approach on computer workers' hamstring flexibility. This study entailed 120 individuals (60 in each group). Participants were randomly allocated into two separate groups, Group A comprised of 15 women and 45 men and Group B comprised of 13 women and 47 men. Both groups' age ranges from 35 to 55. Mean Age, Height and Weight in Group A is 41.88, 165.45 and 68.72 respectively and that in Group B is 43.15, 167.82 and 70.55 respectively. Group

A received Sub occipital muscle inhibition technique and Group B received Doming of Diaphragm approach. The Sub occipital Muscle Inhibition technique was administered for 4 minutes to the subjects in Group A. Applying the AKE test, SLR test, and MSRT, hamstring flexibility was analyzed pre- and post - intervention. According to the result, there is significant difference of -12.55 for AKE (R), -13.25 for AKE (L), -17.16 for SLR (R), -17.65 for SLR (L) and -4.55 for MSRT. Data therefore shows that the hamstring flexibility has been significantly increased by the sub occipital muscle inhibition technique .Localized stretching procedures to improve hamstring length may exacerbate the regional inflammatory reaction, increases muscle spasm, and cause increased guarding in individuals suffering from acute lower back pain. Pollard and Ward's study's recommended cervical spine approach may prevent pressuring or stressing vulnerable structures while enhancing hip flexion range of motion and hamstring elasticity. Their studies find out the remoteness of the site of treatment to the region of effect but there was lack of explanation for this effect. [18]The study of Neha Gupta et al[19], concluded that that neck flexors' my of as cial release approach is beneficial for increasing hamstring flexibility and provided justification for the SMI technique. Thus, results of this study correspond with other published studies on this matter highlighting the efficacy of SMI technique for enhancing hamstring extensibility. By using the SMI technique, hamstring flexibility was improved due to the fact that sub occipital muscles gets relaxed which in turn leads to the relaxation of the superficial backline. With "onion peel effect", the goal of SMI is to provide soft traction to feel the tension in the soft tissues and break down the muscle barrier by repeatedly straining and relaxing it. For fascia to relax effectively, proper pressure and soft extension should be applied on the area where fascia limitation is felt.

In the human body, the sub-occipital muscles comprises the maximum muscle spindles and are the proprioceptor monitors that play a vital role in governing head posture. It is interesting to note that, Pontell et al. reported that the sub-occipital muscles are associated to the cervical dura mater by a myodural bridge linkage. Based on this result, it is also plausible that the myodural bridge's diminished tension post the SMI technique may ease dural enfolding, subsequently lessening the initiation of the nociceptive pain mechanisms [5,6,] Hence, results reflects that by direct relaxation of the posterior neck region by utilizing the SMI technique is primarily responsible for increased stretching and a decrease in the tone of the myodural bridge and hamstring muscles. Subjects in Group B received 5 minutes of Doming of Diaphragm approach. According to the result, there is significant difference of -12.01 for AKE (R), -11.73 for AKE (L), -18.53 for SLR (R), -18.55 for SLR (L) and -3.08 for MSRT. So, this demonstrates that the DD approach has resulted in a noticeable positive impact on hamstring flexibility. Hamstrings mainly intervene in posture and mobility in the sagittal plane, either by limiting trunk flexion or, in case of dysfunction, exaggerating or maintaining excessive backward movement. Breathing is one of the finest methods for correcting pelvic tilt. From a conceptual standpoint, applying Diaphragm Doming would prompt engagement of core stabilizing muscles and restoration of abnormal motor control techniques used by people with tight hamstrings, thus increasing hamstring extensibility. Debora Fortes Marizeiro et al in his study concluded that sedentary women benefitted from diaphragmatic myofascial release therapy in terms of improved chest wall mobility, posterior chain muscle flexibility, and some lumbar spine motions [20].

Another study of Francisco J. Gonzalez-Alvarez et al has proven that diaphragmatic stretching substantially enhanced cervical extension, right and left cervical flexion, flexibility of the posterior chain, and ribcage excursion at the xiphoid level in healthy individuals.[21]. Findings of this study are thus congruent with those that other writers have previously documented. Given that muscles function synergistically together in a chain, it is likely that the doming of the diaphragm method can promote hamstring flexibility. This is because contractions of muscular chains can alter the ROM in different remote structures or muscles. It has been hypothesized that when a muscle shortens, both nearby and distant muscles compensate. The biomechanical association between the diaphragm and other tissues offers base to the idea that diaphragm doming can affect other remote structures. According to a current theory in the medical literature, the body will try to make up for inadequate core stability by increasing the tightness of the hamstrings. "Kuszewski et al" claim that the contrary might also be present. In his research, he hypothesized and defended that improved performance of core stability would result in increased flexibility of the hamstring musculature [22]. Thus, diaphragm being the roof of the core, doming of diaphragm can have effect on hamstring muscles' elasticity.Thus, results of current trial showed that, there is no significant statistical difference between two

groups for outcomes AKE and SLR, but for MSRT, p-value <0.05, thus by looking at mean differences of pre-post data, we can say that SMI technique was found superior to the DD approach for improving hamstring flexibility. By this, we can say that, with SMI technique, whole of the superficial back-line, covering that of the cervical, thoracic, lumbar, as well as lower extremities gets relaxed as a result, it showed greater improvement in MSRT, as the test procedure involves thoraco-lumbar as well as lumbo-pelvic motion.Thus, this study proves that SMI technique as well as DD approach is found to improve hamstring flexibility, but SMI technique was found superior to DD approach for targeting posterior chain flexibility.

CONCLUSION

This study concludes that significantly greater improvement was observed in Group A that received sub occipital muscle inhibition technique for MSRT than in Group B that received Doming of diaphragm approach. Both methods were found to be equally effective for AKE and SLR test. As a result, both methods are successful for increasing hamstring flexibility, however for targeting posterior chain flexibility, the sub occipital muscle inhibition technique was found to be superior to the doming of diaphragm.

CLINICAL IMPLICATION
According to literatures, diminished hamstring flexibility could be the source of low back pain (LBP). Interestingly, a hamstring muscle tension and shortening can induce neck and shoulder pain. Along with this, fascial restrictions could also lead to reduced range of motion across the joint. Also, reduced hamstring flexibility can alter the posture and increases the risk for injury. Nowadays, fascia release therapy is widely used approach to increase the muscle flexibility. Therefore, clinicians should take into consideration about the SMI technique for targeting postural chain flexibility as well as DD approach for improving my kinetic chain functions.

LIMITATIONS
1. Long term follow-up was not taken.
2. Control group was not taken.
3. Subjects were taken from only two companies.

FURTHER RECOMMENDATIONS
1. Study can be carried out in different population.
2. Long lasting effect can be checked.
3. More subjects can be taken for the study.
4. Different interventions can be compared.

ABSTRACT

Fear of fall (FOF) is a serious problem since it impairs physical function and increases the prospect of falls among older people. There were a few interventions that have been demonstrated to reduce fear of falling, with multi factorial approaches. However, older persons may not always be able to use or prefer multi factorial programs. Hence, this study is intended to analyze the fear of fall, by providing simple exercises, among elderly population. To analyze the efficacy of simple exercises on fear of fall, among elderly population. The subjects who satisfied the inclusion criteria and those who willing to participate were recruited for the study an informed consent was obtained from all the participants. 36 samples were collected. The demographic data were obtained and the FES (Fall Efficacy Scale) was explained clearly, then the individual scoring was done and documented. Subjects who scored≥ 20 on FES were selected and simple exercises were given. This exercise session was given for 2weeks, (3 days/week). After 2 weeks exercises session, Patients were reassessed and scored with FES, the results were noted and statistically analysed. Paired t-test was done to analyse the difference between pre-test FES and post-test FES. There was a significant difference between pre-test FES and post-test FES, among elderly population by the supervised simple exercises. Thus, the study concluded that, the supervised simple exercises along with motivation had influence and showed a significant reduction in FOF, among elderly population.

Keywords: Aged, Exercise, Fear of falling, Physical fitness

INTRODUCTION

Older people frequently have fall anxiety and experience fear of falling (FOF), which has major physical and psychological impacts.[1]Fall-related consequences can be severe enough leading to long-term impairment and a significant decline in their quality of life.[2]Fear of fall can lead to limitations on or avoidance of everyday tasks, loss

of independence, a decline in social interaction, depression which may lead to deterioration in quality of life. [3] Among older persons, a higher prevalence of comorbidities, a lack of physical exercise, poor performance in everyday activities, and mobility restrictions have all been identified as predictors of fear of falling [3] . Fear of falling issue has been a big concern for older adults, their families, and healthcare professionals as well, given that it can increase the need for medical services. The clinical, psychological, social, and epidemiological ramifications of the fear of falling should be given special consideration since they have a significant impact on the older adult's health, wellbeing, and quality of life (QoL). [4] Even though fear of fall is a psychological state which indirectly leads to physical weakness and reduced mobility, one of the most effective methods for reducing the fear of fall among older people has been demonstrated to be exercise. [5]Exercise has been shown to be a successful method for reducing elderly people's fear of falling and actual falls. [6] Engaging in physical activity as a fall prevention technique lowers participant's fear of falling following the intervention. The combined effects of supervised simple exercises were found to reduce Fear of Fall and improve balance, reduce their risk of falling, increase their independence, and thereby promote their community participation. [6] In our study we therefore tried to incorporate a set of simple exercises under supervision for the individuals with the fear of fall. It is advised to start physical activity programmes for the elderly in a secure setting will build up sufficient self-confidence level to reduce fear of fall significantly. The primary purpose of this study was to evaluate the effects of simple exercise intervention on fear of fall among elderly population also to identify the perceived self-confidence following exercises which might improve physical health and reduce fear of fall.

MATERIALS AND METHODS

An interventional study was conducted in Physiotherapy out-patient department for the period of 3 months. Sample size was calculated using G-power software, and the total sample size estimated was 36. The Older adults those who can walk independently without using any assistive device in the age group of (aged ≥ 60 to 95 years), and those who score ≥ 20 on Fall Efficacy Scale- International Questionnaire were included in this study. And those with a history of visual and auditory impairments, dizziness, vestibular, neurological, orthopaedic, cardio-respiratory, psychological, uncontrollable systemic disease, severe musculoskeletal conditions requiring active management and the subjects receiving palliative care were excluded from this study. The Institutional Ethics Committee at Sri Rama chandra Institute of Higher Education and Research granted its approval on this study (CSP/23/FEB/122/107). The study was conducted among patients who attended Physiotherapy Outpatient Department at Sri Rama chandra Hospital. The subjects who satisfied the inclusion criteria and those were willing to participate were recruited for the study an informed consent was obtained from all the participants. 36 samples were collected. The demographic data were obtained by the therapist and the fall efficacy scale- international questionnaire was explained clearly, then the individual scoring was done and documented before the exercises. Subjects who scored≥ 20 on Fall Efficacy Scale-International Questionnaire were considered for the study and the following exercises were given. This exercise session was given for 2weeks, (3 days/week).

Figure 1. Seated Alternate Weight Shifts
Patients is asked to sit on a chair, slowly lean the body to the right, while keeping both the feet in contact with the floor, Repeat in other direction (10 repetitions each)

Figure 2. Seated Calf Raise
Patient is asked to sit on the chair, slowly raise both the heels off from the ground, while keeping all the toes in contact with the floor. (10 repetitions each)

Figure 3.Seated Toe Raise
Patient is asked to sit on the chair, slowly raise all the toes from the ground, while keeping the heels in contact with the floor (10 repetitions)

Figure 4. Seated Knee Flexion and Extension
Patient is asked to sit on the chair, slowly lift the right knee and bend down, repeat in other side (10 repetitions)

Figure 5. Heel Raise with Support
 Patient is asked to stand upright with knees straight, slowly raise both heels until weight is on balls of the feet, while holding on to the back of a straight chair. (10 repetitions)After 2 weeks exercises session, Patients were reassessed and scored with fall efficacy scale –international questionnaire, the results were noted and statistically analysed.

RESULTS

The collected data were analyzed using SPSS statistics software 23.0 version Normality test was analyzed using Shapiro-wilk test . For analysing Pretest FES and Post-test FES, paired t-test was used.

Table-1. Demographic data

Table-2. Statistically significant difference showed on post-test fes on mean and standard deviation.

Table-3. The above results shows that there was a statistically significant difference between pre and post-test fes, among elderly population. (p value <.001)

DISCUSSION

The present study investigated the efficacy of simple exercises on fear of fall, among elderly population. Although, this study is robust in supporting that physical exercise itself is an effective strategy to reduce fear of fall. Another factor associated with fear of falling was age. We found that senior adults (70 years or older) were more fearful of falling than younger older adults (60-69 years). Previous study done by Vitorino L et al, showed that the factors associated with fear of falling were, poor health and age, especially for those above 70 year. [5] All the exercises were done under supervision for 2 weeks (3 days/week) in order to build their self-confidence and avoid flaws during exercises. The idea of supervised exercises is to improve confidence level along with the mobility and strength of the lower limbs. There were also some evidences which is in line with our study by Saija Karin anta et al., who says that the effect of exercise interventions on fear of falling showed moderate level of reduction in fear of fall. [7] In this study, we found that there is a significant reduction on fear of fall, among elderly population. Even though exercises programs mainly aimed at improving physical fitness this has found to influence the self-confidence of the elderly who participated in the exercises sessions which had increased the motivation and reduced the fear of fall. Previous study done by Christain Erik et al., showed evidence that older adults with more engagement in physical activity had reduced fear of falling. [8] Our study found out that effect of exercise interventions had reduced fear of falling among elderly population even though the reduction was not very significant among very older individuals due to age related complications, this study has proved that a proper intervention along with motivation and supervision would create a change and reduce the fear and improve the mobility.

LIMITATIONS
Psychological component was not assessed.

CONCLUSION

Thus, the study concluded that, the supervised simple exercises had influence and showed a significant reduction in

fear of fall, among elder population. Hence, this supervised simple exercises can be recommended clinically for the elderly population, and easier to perform which can also improve their level of confidence in a considerable way.

ABSTRACT

Machine Intelligence is a mapping of human intelligence into artificial intelligence by which decisions may be performed by machines even better than human beings in complex situations. In the present scenario, the use of Machine Intelligence in educational sectors is a very demanding research area through which many problems related to student performance may be solved by extracting useful information from the fast-growing educational data. These studies can decrease the failure rate by providing well-timed counseling and advice to needy students and also may be pretty useful to fill the vacant seats by predicting good-performing students or providing suitable marks in the circumstances of pandemics. In the educational field, machine intelligence is implemented by applying various machine learning models to the students' data. In the present paper, the application of various state-of-the-art machine learning models such as Decision Tree, Naïve Bayes, k-Nearest Neighbor, Support Vector Machine, and Random Forest has been implemented in context to the educational data, and by applying these predictive models, it may be concluded that all the models used in the present study were capable to predict students' academic performance with more than 83% accuracy and Naïve Bayes has achieved highest accuracy of 89.61%.

Keywords: Machine Learning Models, Predictive Modeling, Educational Data Mining, Students' Academic Performance, Prediction.

INTRODUCTION

Education is the strongest weapon that has the ability to change society by impacting the growth of the nation and subsequently the growth of the whole world. So the main duties of every educational organization should be to provide quality education to every student and to identify weak learners at an early stage so that they can be counseled by their teachers or administration timely. Due to digitization and online practices in the education sector, the vast amount of educational data is available in electronic form but timely extraction of valuable information from this data is a very challenging task. In today's scenario, a very popular field named Machine intelligence is used to make important decisions by extracting useful information from a large amount of data with the help of machine learning models such as Decision Tree, Naive Bayes, Bayesian Network (Bayes Net), k-Nearest Neighbors (k-NN), Support Vector Machine (SVM), Artificial Neural Network (ANN), etc. Machine learning models are mathematical structures that are trained by training datasets and then are used to identify the required information. When machine learning models are applied to educational data, students' academic performance may be predicted so that the failure rate can be decreased by providing timely feedback and support to poor performers. With the help of machine intelligence, students' academic performance such as their grades or marks could be predicted on the basis of different attributes like their background, past academic performance, etc. So the implementation of machine learning models on educational data would be very beneficial to students as well as educators, as students may get their feedback from time to time to improve their shortcomings and educators could reduce the failure rate of students. The main goal of this paper is to develop a methodology to identify good and poor performers and to accomplish this purpose; the following steps have been performed

1. Apply five different classification techniques viz. Decision tree, Random Forest, Naïve Bayes, k-NN, and SVM on the Students' dataset and analyze the performance of all the five machine learning techniques in predicting students' performance at the time of starting the course.
2. Compare all five classification techniques on the basis of three performance metrics namely "accuracy", "recall" and "precision".

Although in the past, most of the authors predicted the performance of students during the course; the novelty of this paper is that the prediction task was performed at the time of starting the course. Thus, weak learners could be identified at an early stage and could be counseled by their teachers as soon as possible. The organization of this paper is as follows. In section 2, a brief survey of machine learning models used in educational data has been presented. The methodology to apply machine learning models to educational data is given in section 3. In section 4, experimental results that compare different machine learning strategies on educational datasets in terms of classification accuracy, precision, and recall are elaborated. Finally, the conclusion and future works are mentioned in section 5.

Related work

Machine intelligence has been implemented in educational areas for extracting useful information from educational datasets and to make the right decisions timely when dealing with educational problems. There are various supervised machine learning techniques such as classification (Decision Tree, Naïve Bayes, Bayes Net, SVM, ANN, Random Forest, etc.) and regression; and unsupervised machine learning techniques such as clustering (k-mean, DBSCAN, etc.) and association rule mining (Apriori Algortihm), which may be applied on educational data. Acharaya and Sinha (2014) applied classification algorithms namely Decision Tree, SVM, ANN, and Bayes Net on students' datasets to forecast the students' academic performance at an early stage. In their study, they identified that Decision Tree and SVM outperformed all the other classifiers [1]. Another research conducted by Tripti et al. (2014) implemented two classification techniques namely Random Tree and J48 on the academic data of MCA students' and observed Random Tree to be outperformed in comparison to J48 [2]. Further, Binh and Duy (2017) pointed out that due to the diverse personalities various students have different manners of learning and that impact the outcome of students' results. On the basis of the manner of learning, they predicted students' academic performance by

implementing ANN algorithm for the prediction [3]. Ha et al. (2020) used PART, OneR, Random Tree, Random Forest, J48, Naive Bayes, SVM, and MLP to predict the final marks of students by using the background and academic data as attributes and concluded that Naïve Bayes and MLP outperformed other algorithms with prediction accuracy of 86.19% [4]. Atlam et al. (2022) applied Logistic Regression, Random Forest, AdaBoost, Extreme Gradient Boosting, Support Vector Machine, and Decision Tree to analyze the impact of COVID-19 on the psychological health of students [5]. Pande (2023) predicted the performance of students with the help of various machine learning models, including k-NN, SVM, and Logistic Regression. They found that the SVM classifier with a linear kernel achieved the highest accuracy of 84.37% [6]. Ensemble classifiers are also very popular in the educational sector for the prediction of students' academic performance. These classifiers are made up of many single classifiers for increasing the accuracy of the prediction task [7]. There are various examples of ensemble classifiers such as Random Forest, Voting Classifier, Adaptive Boosting, Gradient Boosting Machine, Stacking Classifier, Extreme Gradient Boosting, etc. Pandey and Taruna (2014) compared four different types of ensemble techniques namely Bagging, Boosting, Random Forest, and Adaboost for predicting the student's academic performance, and found that Random Forest was the best ensemble classifier [8]. The same team consisting of Pandey and Taruna (2016) has implemented an ensemble model by integrating three different classifiers viz., Decision tree, Aggregating One-Dependence Estimators, and k-NN and applied this ensemble classifier to engineering students' data for forecasting their future performance. In their research, they found that the proposed model outperformed other models [9]. Ashraf et al. (2018) performed an investigation to predict student performance by using a pedagogical dataset and applied an ensemble classifier namely Stacking C to that dataset.

In their research, they achieved 95.65% accuracy with Stacking C and concluded that data balancing procedures namely under sampling (spread sub-sampling) and oversampling (SMOTE) increased accuracy to 95.96 % and 96.11% respectively [10]. Kumari et al. (2018) have applied three ensemble techniques viz. Voting, Bagging, and Boosting, through which they achieved the best result in comparison to single classifiers and also proved the reliability of the proposed model [11]. Injadat et al. (2020) have used an ensemble learner from a combination of six potential machine learning algorithms for predicting students' academic performance [12]. Asselman et al. (2021) have implemented several integrated classifiers for improving the forecasting rate and concluded that XGBoost has the maximum efficiency to identify low performers [13]. Yagci (2022) evaluated SVM, Random Forest, Naïve Bayes, k-NN, and Logistic Regression for forecasting the end-year marks when applied to a dataset of 1854 students with academic attributes. They concluded Random Forest gave the highest prediction accuracy of 74.6% [14]. Goundar et al. (2022) implemented several classification algorithms to construct a prediction model that determines the academic performance of students. They found that Random Forest performed better than other algorithms [15]. The regression technique is a numeric value prediction data mining technique used to find out the relationship between dependent variables and one or more independent variables, as well as to determine how such a relationship can be used to predict students' academic achievements. Husain et al. (2021) performed regression analysis of student academic performance using deep learning [16]. Unsupervised machine learning techniques such as clustering and association rule mining are other popular methods in the educational sector. Clustering is used to identify groups of students who have similarities in learning Govindasamy and Velmurugan (2018) conducted research in which they compared four different types of clustering namely k-Medoids, k-Means, Fuzzy C-Means, and Expectation Maximization for evaluating students' academic performance. They observed that Fuzzy C-Means and Expectation Maximization performed better than the other two [17]. Goh et al. (2020) implemented k-means clustering with a deterministic model to analyze the student's academic performance [18]. Association rule mining is a machine learning technique used to find out rules that will predict the occurrence of an item based on the occurrences of other items. Hussain et al. (2018) implemented Apriori algorithm to find the association rule mining among all the students' attributes and displayed the important rules [19].

From past studies, it may be concluded that different types of supervised and unsupervised machine learning models are very beneficial in educational sectors for predicting the academic outcome of students so that poor performers may get timely support from their administration or faculties and good performers may get placed in any reputed organization or may help to low performers also. It may also be observed from the past literature, that a

particular machine learning algorithm is not suitable for all the datasets. The accuracy of any machine learning model depends on the features of the students' dataset. Past studies have focused on identifying the student's academic performance by using different categories of features that were related to students' background, past academic performance, social, psychological, and behavioral characteristics. So, before applying any machine learning model, the identification of necessary features is a very important step for predicting students' future outcomes efficiently.

METHODOLOGY

In this section, we discuss how any machine learning model could be implemented on any educational data for estimating good and poor performers. To perform any machine learning task easily and efficiently, firstly data is pre-processed so that all the noise, duplicity, and unrelated features may be removed. After pre-processing, data is ready for application in any machine learning model. The schematic of the methodology is given in Fig. 1.

Dataset Selection
There are two types of data i.e. primary or secondary. Primary data is newly created and secondary data is already available. Primary data can be collected through questionnaires, interviews, observation, schedules, etc. The questionnaire is the most popular method for collecting primary data. So, in this study, data is collected from students of different branches of Bipin Tripathi Kumaon Institute of Technology, Dwarahat (Almora), India through the questionnaire that was filled out by participants through online mode. The dataset which is a type of primary data, consisting of 383 records containing background, academic, psychological, and social features were used to predict students' academic outcome and to find out the best machine-learning strategy. All the attributes in a dataset are categorical. The basic attributes of the investigated educational datasets are given in Table 1. From the above table, it is shown that there are different categories of students' features in which the target variable is 'first-semester grade' having two different values 'A' and 'B'. The student having Grade A denotes 'good performer' and the student having Grade B denotes 'poor performer'. The goal of the present study is to identify good performers and poor performers with the help of machine learning models by which machine intelligence denotes a significant role in the educational sector.

Data pre-processing
In this step, feature selection, balancing the dataset, handling missing values, and data transformation may be performed according to the characteristics of a dataset. By feature selection techniques, only relevant and influential features are selected automatically or manually. Further, there are various machine learning techniques that do not support missing values, so the handling of missing values is also important. Moreover, if a dataset has a high difference between positive classes and negative classes, then an imbalanced dataset has to be converted into a balanced dataset by the various types of re-sampling techniques such as oversampling, undersampling, and hybrid sampling. Furthermore, data transformation is also very necessary for converting data into a format that is suitable for machine-learning models by various types of encoding schemes. In the present work, the examined dataset was balanced, low dimensional, and did not contain any missing values. So, only data transformation was required to preprocess the data that was done with the help of Label Encoder of sklearn. preprocessing module of Python programming language.

Apply machine learning model
In the present work, five different machine learning models were created viz. Decision Tree [20], Naïve Bayes [21], k-NN, SVM [22], and Random Forest model [23] were applied to the examined "labeled" dataset of students and their results were compared. For the model validation, the hold-out method was used in which 80% of the dataset was reserved for the training purpose and 20% of the dataset was reserved for the testing purpose. In the dataset, the total number of records is 383, among them, 306 records were used for training and 77 records were used for testing. In the testing dataset, 43 records were for class 'A', and 34 records were for class 'B'. For the equal class distribution

in the training set as in the original dataset, stratified sampling was used. All the passing parameters for the machine learning techniques were set with the help of the Grid Search CV algorithm, so that better results may be achieved.

Result evaluation and comparison

The performance of any machine learning model could be evaluated and compared in terms of precision, recall, accuracy, f1-score, etc. are computed with the help of a popular tool called "confusion matrix" [24]. In our study, binary classification is done as our aim to find out low-performing students so a 2 x 2 confusion matrix is used that consists of four different values viz. True Positive, False Positive, False Negative, and True Negative. From the confusion matrix, a performance metric "classification accuracy" of the model can be calculated. Because of the fact that only accuracy is not sufficient to conclude whether a classifier significantly predicts low performers and good performers, other performance metrics "recall" and "precision" for low performers and good performers were also calculated for each classifier.

RESULTS

In the present study, to find out students' academic performance five supervised machine learning models viz. Decision Tree, Naïve Bayes, k-NN, SVM, and Random Forest were implemented on the students' dataset. The implementation was done by using Python's open-source machine learning library 'sklearn'.

Machine learning strategies

In this paper, all of the five machine learning models and their passing parameters that were set by Grid Search CV are listed in Table 2.

Decision Tree

In this work, CART (Classification & Regression Tree) was implemented that uses "Gini" as attribute selection criteria by restricting the tree's height up to 3. When Decision Tree was applied to the students' dataset, 83.11% accuracy was achieved with the following confusion matrix: From Table 3, it is shown that Decision Tree truly identifies 39 good performers out of actual 43 good performers, and 25 low- performers out of actual 34 low performers, this means that recall values for Class A and Class B are 91% and 74% respectively. Further, Decision Tree predicts 48 students as good performers, but among them, only 39 students are truly identified, so precision for class A is 81%, similarly precision for class B is 86%.

Naive Bayes

After implementing Gaussian Naive Bayes on the dataset, the results are presented in Table 4. Table 4 presents that Naive Bayes classifier correctly classifies about 89.61%. Further, recall for identifying good performers and low performers are 91% and 88.23% respectively. Moreover, precision for good performers and low performers are also 91% and 88% respectively. All three metrics viz. accuracy, precision, and recall for Naïve Bayes are better than the Decision tree.

k-Nearest Neighbors (k-NN)

In the present work, the value of k was set to 19. The result of k-NN is given in Table 5. From the confusion matrix, it was found that k-NN has achieved 84.42% accuracy. Table 5 represents k-NN identifies good performers efficiently as its recall for class A is 95% but recall is low (71%) for class B i.e. it could not identify low performers efficiently. Further, Precision for good performers and low performers are 80% and 92% respectively. In comparison to others, k-NN has the highest precision for class B.

Support Vector Machine (SVM)

When SVM with "rbf" kernel was implemented on the data set then 85.71% accuracy was achieved. The result of this algorithm is given in Table 6. From Table 6, it is concluded that SVM can truly identify 39 good performers out of 43

and can also identify 27 low-performers out of 34. So, the recall for class A and class B are 91% and 79% respectively. Moreover, precisions for Class A and Class B are 85% and 87% respectively.

Random Forest
After implementing Random Forest with 7 estimators on the students' dataset, 85.71% accuracy was achieved which is the same as SVM and its confusion matrix is also the same as Table 6 of SVM.

Comparison of different machine learning strategies
In this section, the comparison of all five machine learning models is described. The comparison of different classifiers in terms of their accuracy, precision, and recall for class A and class B are described in Table 7. From Table 7, it is observed Naïve Bayes has the highest classification accuracy, highest precision for class A, and highest recall for class B. Recall for class A and precision for class B are also high. So, it is concluded that the overall performance of Naïve Bayes is higher than other models. For better understanding, a graphical representation of the above results is shown in Fig. 2, Fig. 3, and Fig. 4. Fig. 2 represents the comparison of different classifiers in terms of accuracy, Fig. 3 represents precision and recall for class A of different classifiers, and Fig. 4 represents precision and recall for class B of different classifiers. From Fig. 2, it is concluded that accuracy is highest for Naive Bayes. Hence, Naïve Bayes outperformed other classifiers. All the machine learning algorithms have accuracies greater than 80%, it is concluded that all the machine learning algorithms are able to predict students' academic performance at an early stage. Further, Fig. 3 and Fig. 4 represent the comparison among different machine learning models in terms of precision and recall for identifying good performers and low performers respectively. From both figures, it is concluded that Naïve Bayes has achieved high precision and high recall for both classes in comparison to any other classifiers. Overall, in the present study, it is concluded that Naive Bayes achieved the highest accuracy with high precision and high recall values for class A and Class B both.

CONCLUSION AND FUTURE WORK

The present work focuses on the application of machine intelligence in the educational sector. The success of any educational organization depends upon the success of its students so the primary goal of the present study is the identification of weak students at an early so that they could get timely support from their teachers. To achieve this goal, five different supervised machine learning techniques viz. Decision Tree, k-NN, SVM, Random Forest, and Naïve Bayes were applied to the students' dataset for classifying students as low-performers or good-performers. It was observed that all five algorithms can predict student performance at an early stage with more than 80% accuracy. After that, the performance of all the classification techniques is evaluated and compared. From this study, it was concluded that Naïve Bayes achieved maximum accuracy (89.61%) and also achieved the highest recall (88.23%) for predicting poor performers. The present study implies that machine-learning models are helpful in the academic field. With the help of these models, decision-makers can make a plan for the institution's strategy and policy effectively [25] as well as allocate limited resources efficiently [26]. Besides this, managers could predict academic failure and could act accordingly such as taking extra classes, providing training for improvement in study skills, etc. [27]. Moreover, machine learning models could be used to identify good performers who increase the reputation of any organization. Such students could help low-performing peers in their studies. This study has some limitations. One of them is the size of the dataset was limited to only 383 students of only one institute hence it is sample-biased, the results are valid for this sample only, this limitation may be resolved by increasing the size of the dataset and including data of more institutes of different region. Another limitation of this study is related to the education field. In this paper, only engineering students are considered but this study could be implemented for other educational fields like art, science, and management too. An additional limitation of this study is related to feature selection. In this work, all the input features were selected. So in the future, these limitations may be resolved by using feature-selection techniques so that better prediction accuracy can be achieved. Further, any other types of machine learning strategies like clustering or any other ensemble machine learning may be used for improving the results.

ABSTRACT

Asthma is one of the most common chronic conditions among children, impacting an estimated 7.5% of children and adolescents under 18 years of age worldwide. Conventional treatments often involve the use of bronchodilators and corticosteroids, which may provide temporary relief but fail to address the underlying causes. This case presentation explores the successful treatment of a pediatric patient with asthma using individualized homoeopathy. 7years old girl came with complaints of recurrent symptoms of breathlessness, coughing and wheezing. She is currently using short acting bronchodilators since last 10 days. After careful case taking considering her physical and mental symptoms and repertorisation, Bryonia alba 30 was prescribed. Her initial Asthma control Questionnaire (ACQ) score was 28. On subsequent follow ups Using the Asthma Control Questionnaire (ACQ) as an outcome measure, the case tracked symptomatic improvement and no bronchodilator usage over time. The case study indicates the potential effectiveness of homoeopathic medicine as a complementary approach in pediatric asthma management, warranting further investigation in controlled clinical studies.

Keywords: Pediatric Asthma; Individualized Homoeopathy; Bronchodilators; Asthma Control Questionnaire.

INTRODUCTION

Asthma is one of the most common chronic conditions among children, impacting an estimated 7.5% of children and adolescents under 18 years of age worldwide [1]. These patients frequently experience recurrent episodes of wheezing, coughing, shortness of breath, and chest tightness, which can lead to substantial impairments in their quality of life [2]. The standard care of pediatric asthma primarily involves the use of bronchodilators and corticosteroids [3]. However, these medications can pose potential side effects and may not fully control the symptoms or progression of the disease [4]. Consequently, many parents and caregivers are seeking alternative or complementary treatments, such as homoeopathy[5]. Homoeopathy, is system of medicine developed in the late 18th century, based on the principle of "like cures like" [6].Individualized homoeopathic treatment, a unique approach within homoeopathy, involves individualized remedies to each patient based on their specific symptoms and overall health status [7].

MATERIAL AND METHODS

In this case study, a patient of pediatric age group from Sainath Hospital OPD of Ahmedabad Homoeopathic Medical College, Parul University, Gujarat is presented which shows how the chronic respiratory ailments were managed with Homoeopathic medicines. Homoeopathic Case taking and Record-keeping format is followed. Asthma control Questionnaire (ACQ) Scoreis used to assess the effectiveness and outcome of treatment. It is simple questionnaire to measure the adequacy of asthma control and change in asthma control which occurs either spontaneously or as a result of treatment. ACQ was developed and validated by Prof. Elizabeth F. Juniper, MCSP, MSc. (8)Initial score was 28; the score was taken on every subsequent follow-up to assess the outcome of the treatment. (Table 1)

Case Report
Case Study
A7years old girl came with her parents at Sainath Hospital OPD of Ahmedabad Homoeopathic Medical College, Parul University, with chief complaint of recurrent episodes of coughing, wheezing, and shortness of breath since the age of 4. The symptoms were particularly exacerbated during seasonal changes, during damp weather and exposure to dust and strong smell. The episodes were accompanied by chest tightness and frequent nocturnal awakening due to breathing difficulties. Child's parents reported various incidences of hospitalizations for asthma exacerbations in the past 2 years. At the time of consultation, she was on inhalation of quick acting bronchodilators2 to 3 times a day for the past 4 months, but with temporary relief only. Frequency of these inhalations had increased in the last 2 weeks. Parents sought an alternative treatment approach due to concerns about the long-term use of bronchodilators and the desire for a more holistic and individualized approach.

Medical History
The patient had a history of recurrent attacks of coughing, wheezing and breathlessness, while consulted with a physician Bronchial Asthma was diagnosed 3 years ago. Medical history and follow-up revealed that the patient was treated with Modern medicines, but there was no relief in symptoms. Her mother had Bronchial asthma during childhood. Patient was fair complexioned and lean and thin. She had light colored hairs which seems dry and rough. She is little bit ill tempered, very stubborn and shouts and cries loudly if refused some demand. Parents reported that they are vegetarian and her appetite is good. She likes sweets very much, and drinks lots of water daily and perspires profusely, especially on head, face, and neck. Parents said that she is highly active and extrovert. She always wants to play and likes to have someone with her all the time. Her concentration is poor and she is not much interested in studies. Depending on the constitution, modalities, and pathological symptoms and on the knowledge of Homoeopathic Materia Medica, *Bryonia alba* was prescribed in 30CH potency, in a single dose with *Placebo* in 40

Siddharth Saurabh and Ketan Shah

size globules every 2 hourly for 3 days (Table 1 & 2; Fig. 1). Parents were advised to continue bronchodilator inhalation if condition demands.

Selection of Remedy

The case was repertorised using Synergy Homoeopathic Software with reliable repertory[9], to find the similar group of remedies, after analysis and evaluation of symptoms. Following symptoms were taken for the repertorisation to get group of remedies which are very similar to the patient's overall constitution.

Obstinate	*Difficult concentration*
Fear of being alone	*Playful*
Desire sweets	*Desire for company*
Profuse perspiration	*Anger in children*
Thirst for large quantities of water	*Contradiction-intolerant*

Repertorisation gives the result as shown in Figure 1. Following remedies were compared with the help of Homoeopathic Materia Medica for final selection of the remedy-

- *Lycopodium cla.*
- *Bryonia alb.*
- *Phosphorus*
- *Conium mac.*
- *Aconite nap.*
- *Hepar sulph.*

Bryonia was selected with the following considerations and symptom similarity on consulting Homoeopathic Materia Medica-

- Bryonia patients are irritable, ill-tempered which brings on complaints.[10,11]
- Ill effects of anger, fright. [12]
- Cough at night, must sit up [10]
- Thirst for large quantity of water
- Bryonia works nicely for difficult respiration, breathing quick, difficult, and anxious [13]
- Ailments from sudden change in weather, draft of air [10,11]

DISCUSSION

Bronchial Asthma is one of the most common chronic conditions among children, impacting an estimated 7.5% of children and adolescents under 18 years of age worldwide. The present study was primarily aimed to investigate the effectiveness of the individualized homoeopathic medicine in the management of cases of pediatric asthma. The selection of the remedy, Bryonia, was based on a thorough evaluation of the patient's symptoms, temperament, and overall health and backed by Repertorisation and Materia medica both. The treatment appeared to reduce the severity and frequency of asthma attacks, improve lung function, and reduce dependence on bronchodilators in this child, as evident from Asthma Control Questionnaire. Homoeopathy aims to stimulate the body's self-healing mechanisms by matching the patient's symptoms to a carefully chosen remedy. It offers a holistic approach to asthma management, addressing the underlying causes rather than suppressing symptoms.

CONCLUSION

The case study suggests that homoeopathy can be considered as an effective method for the treatment of pediatric asthma. It can be adopted as an alternative approach that could improve patient outcomes and reduce dependency on conventional medicines, i.e.; bronchodilators. A larger number of cases and controlled clinical trials can be carried out to further confirm the results.

ACKNOWLEDGEMENTS

Declaration of Patient Consent
The author certify that he had obtained all appropriate consent from the patient and along with her parents for investigation reports and other clinical information to be reported in the journal.

ABSTRACT

Most widely using Denoising methods will include filters, but it will not remove the noise completely whereas Wavelet transforms will remove noise in a better way. In this paper, various noises are introduced in the sample images and it was removed using filters or wavelet transformations. Some of the filters used in this paper are im filter, f special, speckle, Gaussian, salt & pepper, median, wiener, motion blurred filter etc. Some of the wavelet transforms used are DWT, DTCWT, Haar & TWT etc. while Denoising using filters, elapsed time was calculated and for wavelet transforms MSE & PSNR values are calculated and compared.

Keywords: DWT, DTCWT, TWT, Haar

INTRODUCTION

A nice picture conveys exactly the words that you think & feel. But if the picture contains noise, then it won't give you satisfaction. For CT images, it should be clear. So that physician can diagnose the disease accurately & noise removal plays an important role. In this paper, various denoising methods like applying filters and wavelets are applied over the image and then MSE & PSNR values are calculated. We can achieve better generalization over different noise levels for denoising approaches[1]. Some of the commonly introduced noises are Gaussian noise model, White noise, Brownian noise, Impulse noise, Salt and Pepper noise, Shot noise, Periodic noise, Speckle noise, Photon noise or Poisson noise, Structured noise, Gamma noise, Rayleigh noise etc. The process of removal of noises is called as Denoising.

Subhashini

DENOISING USING FILTERS

An image is introduced with noise and then it is passed under several noise removal filters, name of the filters with its elapsed time are given in table 1. When we take an MRI image, Poisson-Gaussian noise is mostly produced. Sometimes while taking images of moving objects, it will make the light into beautiful streaks of colour in motion blurred image. While doing some of the jobs like echo cancellation, signal restoration, wiener filter plays a major role. It will reduce the output signal and averaged squared distance signals by calculating the coefficients of wiener filter. While doing noise removal, preservation of edges are done by median filter. It is one of the important noise removal filtering technique from images and signals.

CALCULATING MSE & PSNR VALUES

Noise removal will be better if it is done through wavelets instead of filters. So wavelet transformation was used for noise removal like discrete wavelet transformation and dual tree complex wavelet transformation are also used. It is far better than regular usage of filters.

DWT & TWT

Discrete wavelet Transformation and Toggle Wavelet Transformation are used for noise removal. Both the method uses wavelet transforms with more co efficient which is able to find location and number of times information. So it is efficient one. For DWT, the samples are discretely sampled and it will more efficient then Fourier transformation. Different types of noises are introduced for different images and values are calculated and tabulated in table 4. Usually there are different noises and they will be removed or reduced without compromising the information captured from the observed scene by using bilateral filtering[2] is one of the most popular denoising approaches[3].

HAAR & TWT

We can select any arbitrary term for the processing tasks like image denoising using Probability Distribution Equation (PDE) & combinations of many PDEs[5]. Usually edge detection methods which use wavelet threshold denoising techniques are commonly used to save more edge information from loss to enhance the quality of the denoised image[6]. The deep wavelet multi scale autonomous unmanned analysis based medical image denoising in real time and information hiding model are producing far better results[7]. Wavelet-based global–local filtering networks include a base image plus three-directional detail images by applying discrete wavelet transform in a noisy image and Aim of inverse discrete wavelet transform is to build high-quality images with all processed components[8].

CONCLUSION

Image Denoising plays a crucial role in medical imaging. Initially filters are used for Denoising. Their experimental results were discussed. Then Denoising were done with the help of wavelet transformations, in this paper discrete wavelet transformation (DWT), dual tree complex wavelet transformation (DTCWT) and Toggle wavelet transformation were applied in noisy image and their results were discussed in terms of PSNR (peak-signal-to- noise-ratio) & MSE (Mean Squared Error) values. From above results, it is clearly proved that wavelet transformations are best in image Denoising.

ABSTRACT

Endophytes are an imperative component of plant micro-ecosystems, residing beneath the healthy epidermal tissues without causing probable diseases and a good source for agriculture applications and pharmaceuticals. The aim of this study was to investigate isolated fungal diversity and their evaluation for Plant Growth Promoting Activities (PGPA).Eight different terrestrial plant systems were selected on the basis of their higher medicinal value in daily life needs. Stem bark was used as an explant and a total of 13 fungal isolates were obtained. All the fungal strains were identified on the basis of their growth morphology and their microscopic view. Three different classes were represented by 13 isolates, out of which 10 come under Eurotiomycetes, one in Incertaesedis, and 2 in Sordariomycetes, respectively. Test organisms (Salmonella typhimurium, Pseudomonas aeroginosa) were used to check the antimicrobial activity of isolates. All the fungal isolates were screened for their PGP activities by performing different assays such as Phosphate solubilizing assay, Indole-3-acetic acid test, amylase activity, Cellulose degrading activity, Hydrogen cyanide production activity, and Ammonia production activity respectively. Most of the isolates were good candidate for plant growth promotion, but few of them have very significant ability.

67525

Diwakar Aggarwal *et al.,*

As per gill us niger and As per gill us sp. Has shown good activity in almost all plant growth promoting tests (*In vitro*). In the future, these isolates might be used for plant growth promoting (PGP) purposes in field condition.

Keywords: Endophytes,terrestrial plant, PGPA, *In vitro* tests.

INTRODUCTION

The wide range of Indian ecosystems has a great diversity of medicinal plants, approximately 8000 species out of 17000 species of higher plants, have similar properties as conventional pharmaceutical drugs and they are considered medicinal and used in the synthesis of different drugs [1]. Nowadays, the use of medicinal plants is widely spread throughout the world because it is considered a common cheaper herbal drug substitute and has less side effects. These are utilized for a large number of years to flavour and preserve food products. Several plants also show antimicrobial activity on the basis of their chemical compositionand also well known to harbor number of endo symbitiotic fungi that might be associated with the production of pharmaceutical products. They produce number of bioactive compounds utilized throughout the globe for different purposes. The temperate region and tropical rainforest have a great biological diversity of endophytic fungi, where approximately 300,000 host plant species are naturally distributed [2].So, it is important to explore more endophytic myco flora in the most familiar medicinal plants which were easily available in surrounding area. Endophytes are meiosporic and mitosporic organisms, which are widely existinside the healthy tissues (root, stem, leaf, fruit and seed etc.) of living plants via quiescent infections, until the end of its entire life and also utilized by plant as an indirect defense against herbivores by secreting bioactive secondary metabolites. These organisms are good source of antibiotics belong to the phylum Ascomycota, showsa symbiotic relationship with host plant, inhabit the internal tissues of plants underneath the epidermal cells layer [3]. It provides several benefits to the plant which can include essential nutrient uptake and protection from insects that are feeding on them and birds or mammals. The relationship between endophytic fungus and their host plant species is still limited because this interaction is not completely understood.

The endophytic fungus has ability to produce wide variety of new bioactive secondary metabolites that are used for making various natural products by industries. The existence of this symbiotic organisms in host plant plays a significant role in their metabolic system that influences the growth and development of the plant. So, the host plants make long term co-evolution with pathogen as a resistance mechanism and produce various secondary metabolites [3].Endophytes are omnipresent and isolated almost from all groups of plant species ranging from sea grasses to large trees in ecosystem. In earlier studies, several endophytic strains have been identified from many host plants, including cereal crops, cereal grains, fruits, vegetables and also from other tree species. These are also a good source of bioactive products which helps in the improvement the nutritional value of host plant and enhance the resistance toward pest, disease and physical stress [4, 5] and these compounds (alkaloids, flavinoids, terpenoids, steroids, phenols, phenolic acids, tannins and peptides) can be used in food, agricultural and pharmaceutical industries which act as an enzyme and shows antimicrobial and anti-malarial activities [6]. An important example of such usage of these secondary metabolites is Taxol which is an anticancer agent produced by endophytic fungi (Taxomycesandrenae) of Hypomycetes class [6]. Plant tissues gets inhabited by PGPE (plant growth promoting endophytes), show close linkage inside plant tissues and facilitates enzyme activities and nutrients exchange [7, 8]. Endophytes possess dynamic potential to activate insoluble phosphate and also supply proper nitrogen content to their host plant [9, 10]. Previous studies improved our knowledge regarding the association of endophytic fungi with their host plant and also described the effects of various waves of biotic and abiotic stresses on endosymbiotic plants [11, 12, 13, 14]. However, these are also beneficial to the host plantin terms of higher PGR hormones production which might be showed their antagonistic behavior against pest and pathogens [15, 16]. These endophytes secreted phytohormones (gibberellic acid and IAA) or plant growth regulating compounds which lead to enhance the quality, production rate, influence development of plants and might be growth of different host plants in a stressful environment [17, 18, 19]. No more studies have been found yet related to PGP mechanisms of endophytic fungi

67526

Diwakar Aggarwal *et al.,*

leading to enhancement of plant growth. Endophytic isolates of *Oryza sativa* and Limoniumsinense showed adaptable plant growth-promoting activities including phosphate solubilization, nitrogen-fixation and IAA synthesis [20, 21].

In this work, we have taken some familiar medicinal plants for the isolation of endophytic fungi because they have more importance in the medical and Agriculture (such as, Eucalyptus globulus, *Mangifera indica*, *Acacia nilotica*, *Terminalia arjuna*, *Sesbania grandiflora*, *Psidium guajava*, *Syzygium cumini* and *Calotropis procera*), so we tried to identify some endo symbiotic fungi which directly and indirectly play a key role in the plant growth and development. Several different fungal strains were isolated using stem portion as an explant from these herbal plants. However, with the help of these isolates, we were able to check their Plant growth-promoting activity using different compositions of media. As per the PGP activities results, we can assume that these isolated organisms might be responsible for influencing the growth and other fitness parameters of plants.

MATERIALS AND METHODS

Plant material collection and sterilization
The plant materials were collected from fully matured medicinal plants of the surrounding area of Mullana and Jagadhari (Haryana) in between the month January and February of 2018. The fresh, healthy ordisease-free stem part were collected from *Eucalyptus globulus, Mangifera indica, Acacia nilotica, Terminalia arjuna, Sesbania grandiflora, Psidium guajava, Syzygium cumini* and *Calotropis procera*, excised carefully with sterile scalpel and kept inside the sterile poly bags and brought to the laboratory for storage at 4°C.

Isolation of Endophytic fungi
An altered method was used for the isolation of endophytes from plant explants already reported by Arnold et al. [22].All stem explants were cut into small pieces (0.5-1.0 cm) and washed thoroughly before processing under the running tap water. Surface sterilization of explants were done by soaking the material in 70% ethanol for 1 minute, followed by 2 minutes (0.1%) mercuric chloride ($HgCl_2$) treatment and rinsed with double distilled autoclaved water for 4-5 times to remove the remnants of sterilizing agents. After air drying, the explants and inner tissues were kept in petri-dishes having aqueous agar (1.5%) supplemented with (3mg/100ml) streptomycin antibiotic and incubated at 25-28°C to initiate the mycelia growth. Mycological medium (i.e., PDA) was used to culture grown mycelium, supplemented with concentrations of Streptomycin as mentioned previously and plates were incubated properly at 28 ± 2°C to complete their growth cycle. Morphological colonies of each fungal culture described the purity and transfer the final culture to slant tubes of PDA. To examine the contaminated endophytic fungi, as a control, non-disinfected section of surface-sterilized explants was also placed over the same agar medium concentration (1.5%).

Identification of Endophytic Fungi
Macroscopic study
Morphological identification of all isolated fungal culture was done by culturing each culture on PDA medium plates (without streptomycin) for seven days, continuously observe the growth appearance on both sides of culture plates (top and bottom) on the basis of the standard taxonomic key, we were able to identify each culture, according to their color, diameter of fungal colony, texture, morphology and dimensions of conidia and hyphae [23, 24].

Microscopic study
By using tease mount method, microscopic slides of each isolated fungal culture were prepared using Lacto phenol cotton blue reagent for tentative recognition and observed each slide under Electron microscope (Compound microscope) through 40×100 magnifying lenses [25]. According to the characteristics of culture, formation of mycelium and spores helps us to identify all the unknown isolated endophytic fungi.

Diwakar Aggarwal *et al.,*

Colonization frequency

To calculate the Colonization frequency percentage of each isolated fungal culture, following formula described below [26].

$$\text{CF (\%)} = \frac{\text{No. of segments colonized by isolated fungi}}{\text{Total no. of segments examined}} \times 100$$

Plant Growth Promoting Activities (PGPA)

Phosphate solubilizing assay

To check the phosphate solubilizing capacity, each isolated fungal culture inoculated on the Pikovskyas agar medium plates separately and incubated at 25-28°C for 48-72 hours[27].

Indole-3-acetic acid (IAA) synthesis test

Fungal cultures were dipped into LB broth conical flasks supplemented with tryptophan, incubated at 25°C in BOD shaker for 48 hours. After incubation, using Whatman No.1 filter paper, filter the grown culture and centrifuge the filtrate. Add 1-2 ml of Salkowski's reagent in the supernatant of fungal culture, kept in dark at room temperature for 30 minutes [28].

Antimicrobial activity

To check the antimicrobial activity of each fungal isolate, test organisms (*Salmonella typhimurium, Pseudomonas aeroginosa*) were taken from the MTCC (Microbial Type Culture Collection) Chandigarh (India),streaked around the fungal culture discs in PDA plates and incubated at 25°C for 24-48 hours [29].

Amylase activity

Fungal culture were cut into small discs with the help of sterilized cork borer and placed over the GYEPA medium plates (Glucose- 0.5g, Yeast extract- 0.05g, peptone- 0.25g, agar- 8g, and pH-6) supplemented with 1% soluble starch and incubate at 25-28°C for 5 days. After incubation, cultured plates were flooded with 1% iodine and 2% potassium iodide [30].

Cellulose degrading activity

Equal sized fungal cultures were placed over the Carboxyl methyl cellulose (CMC) agar plates (1% CMC, 1M NaCl, 1.5% agar and 0.01% congo red) and analysed qualitatively using agar diffusion method. After the incubation of 72-96 hours at 30°C, plates were flooded with congo red solution destained using 1M NaCl for 15 minutes, however the formation of clear zone around isolates indicate the cellulose activity [31].

Hydrogen cyanide (HCN) production activity (Cyanogenesis)

Fungal culture discs were kept over the Nutrient agar medium plates, covered with lid having picric acid solution dipped What man filter paper inside and incubated at 25-28°C for 7 days in an inverted manner [32].

Ammonia production activity

Peptone medium (Broth) were inoculated with different fungal culture discs separately, and incubated at 27°C for 48-72 hours. After incubation, 0.5ml of Nessler's reagent was added individually over the fungal growth in each conical flask [33].

RESULTS AND DISCUSSION

As reported earlier, most of the isolated endophytic fungal strains have been described on the basis of their morphological characters (peridium and ascospore morphology, gleba, odour and colour) observed in microscopic

Diwakar Aggarwal *et al.,*

view [34] however, at species level, it seems to be very difficult to identify them because of small set of homoplasy and morphological features [34]. Now a day, researchers progressively worked on the extraction of endophytic fungi from different medically important plants to check their activity against malignant tumor cells. To check the cytotoxicity, a total of 172 endophytic fungal strains were isolated from 3 medicinal plants and after tested their fermentation broths they showed cytotoxicity of 50% growth inhibition [35]. To evaluate the various bioactivities, crude extract of 51 isolated endophytic fungal strains were used which were isolated from Garcinia plant and their results showed cytotoxic activity against KB, NCIH187 cell and Vero respectively [36]. Several noteworthy fungal isolates were obtained from endophytic fungi that synthesize bioactive compounds that fulfill the needs of pharmaceutical industries and agriculture and these compounds can also be used as lead molecule for the development of novel drug [2]. Endophytic fungi commonly found from different medicinal plants, may produce bioactive compounds for pathogenic inhibition. In present study, total 13 endophytic fungal strains were isolated(1 from Eucalyptus globules, 4 from *Mangifera indica*, 2 from *Acacia nilotica*, 1 from *Terminalia arjuna*, 1 from *Sesbania grandiflora*, 1 from *Psidium guajava*, 1 from *Synzium cumini* and 2 from *Calotropins procera*)using selective media from 8 medicinal plants those were used to very useful in daily life. In India, all these medicinal plants are very much familiar and has been used for years. However, this analysis is the first report from familiar medicinal plants that describes how the endo symbiotic fungal strains involved in Plant Growth Promoting Activities. Total of thirteen endophytic fungi was reported from eight medicinal plants of medicinal value. According to the standard protocol of Aggarwal and Hasija (1980) and Barnett and Hunter (1998), all the isolated fungal strains were identified and characterized on the basis of their micros copical and cultural properties [24, 37].Out of 13 dissimilar strains, 10 strains belong to Eurotiomycetes class, 2belong to Sordariomycetes class and 1 was belong to Incertaesedis, as depicted in Table 1.All the strains were morphologically dissimilar and each culture was encoded by a different unique code to maintain properly in the laboratory. Isolated *Aspergillus* strains showed CF ranging from 1.22 % to 5.34%, *Penicillium* species strain showed 4.76%- 8.33% CF, *Chaetomium* species showed 12.69% CF and one *Ascomycete Incertaesedis* sp. strain showed 9.52% of (CF) colonization frequency.

Screening of endophytic fungi for Plant Growth Promoting Activities (PGPA)

Isolated endophytic fungal cultures were screened to determine the various plant growth promoting activities (Phosphate solubilizing activity, IAA synthesis test, Amylase production activity, Cellulolytic activity, HCN production activity, Ammonia production activity) and antimicrobial activity against *Salmonella typhimurium, Pseudomonas aeroginosa* test organisms. The solubilizing activity of each fungal isolate were measured on the basis of colony diameter and halo zone. SK4 (*Aspergillus niger*) and SK8 (*Penicillium* sp.) culture formed clear halozones on the medium plates which revealed that they can solubilize tri- calcium phosphate which indicate the formation of potential organic acids leads to promoting plant growth traits[38, 39, 40]. IAA synthesis rate of all the isolated organisms were described on the basis of change in colour of LB culture to pink colour, compare the control one (without fungal culture)after treated with Salkowski's reagent. Out of thirteen isolates, three (*Aspergillus terreus, Penicillium* sp. and *Chaetomium* sp.) produced higher concentration of IAA which was most relatable to the previous studies of induction IAA from *Pseudomonas aeruginosa* organism from *Liliumlanci folium*[41, 42]. *Salmonella typhimurium, Pseudomonas aeruginosa* test organisms were used to check the antimicrobial activity using disc diffusion method but none of the isolated fungal strains exhibit any activity, only mutualistic growth observed over the plates. Isolate SK4 (*Aspergillus niger*), SK8 (*Penicillium* sp.) and SK10 (*Aspergillus flavus*) were found to be higher amylase producer with maximum amylase activity and other isolates showed low amylase activity.

Qualitative analysis of Cellulolytic activity revealed the presence of maximum zone of inhibition around the fungal colony of *Chaetomium* sps. (5-6mm) shows its potential producer character of cellulase enzyme and is observed to be prominent in degrading cellulose content. Similar results were reported in previous study of isolated *Penicillium* sp. from Tumakuru medicinal plant [43].Three fungal cultures SK4 (*Aspergillus niger*), SK11 (*Ascomycete Incertaesedis* sp.) and SK14 (A) (*Aspergillus* sp.) produced higher concentration of (HCN) hydrogen cyanide. Similarly in previous study *Pseudomonas fluorescens* isolate from Fababean used as a plant growth promoter and also defence against the plant pathogens [44].Ten cultures exhibited the ammonia production activity, indicated by the change in color from brown to yellow broth media by addition of Nessler's reagent [33], presented in Table 3.In this work, most of the

isolates showed plant growth promoting activity (PGPA) but *Chaetomium* sp. was observed to be most active fungal stain as compared to others. Isolates were assessed for plant growth promoting activity (PGPA) through In dole Acetic activity, Phosphate solubilization, ammonia production, Hydrogen cyanide (HCN) production and anti-pathogenic activities. Similarly in earlier studies, isolated fungal strains from different plants were proved for their crucial function for improvement in plant growth [45, 38]. They also evaluate for their cellulolytic activity and amylase production potential. Most of the isolates were good candidate for plant growth promotion, but few of them have very significant ability. *Aspergillus niger* and *Aspergillus* sp. Has shown good activity in almost all plant growth promoting tests (In vitro). In future, these isolates might be used for plant growth promoting (PGP) purposes in field condition.

ABSTRACT

the impairments leads to loss of functional abilities and mobility. Mothers care-giving for a child with functional limitations and long-term dependence influences mothers' QoL in terms of physical and emotional functioning. This increases the workload of day- to- day life activities of mother lead to deterioration of health and quality of life. Active participation of mothers in handling the children with cerebral palsy has a great effect on rehabilitation of children. To find out the impact of levels of disability in cerebral palsy children over physical health of mothers. It is an observational study with 45 mothers and cerebral palsy children were included in the study. Children with spastic cerebral palsy; from 4-6 years of age; Both genders and mothers who are primary care givers of cerebral palsy children. Children with cerebral palsy were assessed for their different levels of disability by using Gross motor function classification of system (GMFCS). Similarly, Mothers of cerebral palsy children were checked for the presence of physical health problems in taking care of their children. Physical health problems of mothers handling various levels of disability cerebral palsy children were analyzed using the percentage. Mother's handling cerebral palsy children, more commonly suffered with back pain, shoulder pain and knee pain especially those who handle level III, IV, V disability children. Awareness and early identification of these physical health problems and their management may improve quality of life of mothers and also will help in better handling of their children.

Keywords: Levels of disability in cerebral palsy children, physical health problems, quality of life of mothers.

INTRODUCTION

Cerebral palsy occurs due to damage of the developing brain during pregnancy, birth or shortly after birth which results in physical disability. Cerebral palsy is one of the most common physical disabilities in children with a prevalence of 2 per 1000 live births. Cerebral palsy is creating a wide range of impairments in children [2,3], including abnormal muscle tone, decreased motor control, muscle weakness, balance deficits [4]. scoliosis, hip dislocation and contractures of soft tissues[5]. In addition, these impairments can influence a wide range of functional abilities such activities of daily living (dressing and toileting) and mobility (transfers and ambulation) depending on the severity of the condition. As children in cerebral palsy age, they are at risk for health complications and loss of ambulation and functional mobility skills [6]. Cerebral palsy children have reduced range of motion at various joints of their bodies and this is because of the muscle stiffness. Also, cerebral palsy children have limitations in play due to some restrictions in movement, sensory processing, cognitive abilities and their environment and social interactions. Spastic cerebral palsy may result in increased muscle tone, stiffness and involuntary movements. Spasticity may cause shortening and rigidity of muscles, which can worsen if not treated. Cerebral palsy children may undergo frequent injuries and trauma. Especially with increased scores in GMFCS levels. Care-giving is a natural role of mothers, however, providing care for a child with functional limitations and long-term dependence is entirely different and influences mother's QoL in terms of physical and emotional functioning [7]. Mothers of children with Cerebral palsy have significant roles in the management and the treatment of Cerebral palsy. Care giving includes various activities such as lifting, heavy lifting and turning providing assistance for ADL-using toileting, dressing, transfers etc. Manual handling can put physical strain on mothers and be a contributing factor to a higher pain severity [8,9]. The caregivers' physical demands gradually increase over time as the child grow. Consequently, musculoskeletal system problems become prevalent and challenging health matters among the caregivers of a child with Cerebral Palsy. These may impact upon both the physical and mental health of the caregivers especially mothers. Changes in healthcare systems and societal attitudes have resulted in almost all children remaining at home in the care of their families. Poor caregiver health has negative implications of child, family and community, resulting in decreased production of work and that increases the healthcare costs of the caregiver [10]. The main challenges for parents is in managing chronic health problems of the disabled child and the requirements of everyday living. Although increasing attention has been given to the quality of life of children with cerebral palsy, much less attention has been given to the health and quality of life of parents of children with cerebral palsy. Mothers who is taking care of a cerebral palsy children, may suffer with lots of physical health problems specially like neck pain, shoulder pain, back pain & fatigue [11]. This increase in workload of day- to- day life activities of mother lead to deterioration of health and quality of life. Active participation of mothers in their therapy for physical health problems has a great effect on rehabilitation of children. If they fail, the children may suffer. Health professionals working in the area of childhood disability must be aware of the relatively poorer quality of life of primary caregivers. More attention is to be given to their needs. Especially in chronic disorders patient's parents are exposed to cumulative trauma, because of their children's transfers, bathroom activities, school activities etc [12]. These activities include prolonged static postures such as slouched sitting and forward bending as well as repetitive tasks like pulling, lifting and carrying. Poor posture and faulty body mechanics used during home and work activities contribute substantially to Low Back Pain (LBP).[13] And also, low back pain is influenced by the interaction of physical, mental and social factors. There is a need for specific aim to improve the well-being of caregivers of children of cerebral palsy.

These have been related to the higher demand of care that their child's disability requires of them. All of these initiatives indicate an important role for the study and promotion of the health of care givers of children with chronic conditions involving health or development and to improve quality of life of mothers who are the primary caregivers.

AIM OF THE STUDY

To find out the impact of levels of disability in cerebral palsy children over physical health of mothers.

METHODOLOGY

Site of the study: Vidya Sudha, Sri Ramachandra Learning Centre for Children with Special needs.
Study Design: Observational study
Sampling method: Convenient Sampling
Sample size: 45

Inclusion Criteria: Children with spastic cerebral palsy; from 4-6 years of age; Both genders Mothers who were primary care givers of cerebral palsy children.

Exclusion Criteria: Mothers of cerebral palsy children who were unwilling to participate.

PROCEDURE FOR DATA COLLECTION

This study has been approved by the Ethics committee for students projects with reference no: CSP/23/APR/127/359.The Children's and mothers who met the inclusion criteria were included in the study. Informed consent was obtained from mothers of cerebral palsy children. Children with cerebral palsy were assessed for their different levels of disability by using Gross motor function classification of system (GMFCS).   Similarly, Mothers of cerebral palsy children were checked for the presence of physical health problems like neck pain, shoulder pain, back pain, knee pain, hip pain, ankle pain & fatigue.

RESULTS AND DISCUSSION

Physical health problems of mothers handling various levels of disability cerebral palsy children were analyzed using the percentage. When analyzing physical health problems in mothers handling in level-I disability cerebral palsy children, it was found that only one mother was under this category and she was found to be suffering from back pain and hip pain. In this study five children had level II disability, their mothers suffered from physical health problems in the order of shoulder pain, back pain, upper limb pain, neck pain, knee, ankle and fatigue respectively. Mothers had more number of physical health problems like more back pain, upper limb pain, neck pain and fatigue. Nobody had hip pain, ankle pain and knee pain. Children dependency is more on their mothers and that results in more physical problems. In children with level-IV disability needs help for sitting, walks with assistance, but cannot turn or balance or uneven surfaces, self-mobility can be only with a powered wheelchair. So, mothers had to lift and assist the child for their transfers, due to this mother suffers with physical health problems particularly back pain, neck pain, shoulder pain, upper limb pain, knee pain. Children need in level-V needs assistance for sitting and walking need help from mothers, mobility with a powered wheelchair. Mothers had more physical health problems with back pain, shoulder pain, fatigue, knee pain, hip pain with no ankle pain. As child completely depends on mother for their daily living activities, physical health problem was more severe. In comparing all the levels of disability using gross motor functional classification system mothers with level III, IV and V children had more number of physical health problems like shoulder pain, neck pain, back pain, knee pain and fatigue comparing with the other pains. Because, these children were confined mostly to the wheelchairs, also gaining weight due to lack of movements and needed increased the dependence of mother. This resulted in more number of physical health problem in mothers.

Kavitha and Rajarajeswari

Additionally in our study, we have found that mothers also complained of heel pain, numbness of foot, calf muscle catch, numbness of hand, abdominal sprain, giddiness, elbow pain, restlessness and breathing difficultly. As the functional levels of children with cerebral palsy get worse upper limb pain, shoulder pain, neck pain, knee pain and fatigue increased and negatively influenced the quality of life of mothers. When the level of functional dependence increases in cerebral palsy children, there was an extensive physical health burden on mothers who were handling them. These physical health problems increased during lifting, carrying, transfer activities in particular. Similarly, Leaning forward, rotation, lifting, pushing and pulling movements by mothers during care of their disabled children and their activities of bathing, clothing, carrying and feeding their children created an increasing stress on musculoskeletal systems of mothers [14]. Physical activities along with the overweight and low level of education were contributors to suffering from chronic pains among the mothers of cerebral palsy-children [15]. In addition, children with moderate-to-severe motor disabilities have lack of ability to walk independently and transfer of children becomes difficult as the child's age and body mass index increases [16]. As a result, we can say that mothers with children in cerebral palsy were more affected in terms of musculoskeletal pains and quality of life [17]. So, it is important in teaching and training the mothers who are handling cerebral palsy children with number of simple and home exercises like isometric neck exercise, stretches for back muscles, upper extremities, quadriceps muscle and calf muscles, hot packs and cold packs for pain, massage, relaxation techniques, yoga. Such simple exercises may help the mothers to prevent from early physical health problems and musculoskeletal pain. It is said to be cost effective. Also mothers handling children with disabilities need more awareness and motivation to engage them to do exercise [18]. In order to achieve a better quality of life and reduce the physical health burdens, it is important for mothers take regular medications and psychological counseling can also be a added on benefit in handling the disabled child.

CONCLUSION

Mother's handling cerebral palsy children, more commonly suffered with back pain, shoulder pain and knee pain comparing, especially those who handle level III, IV, V disability children. Awareness and early identification of these physical health problems and their management may improve quality of life of mothers and also will help in better handling of their children.

ABSTRACT

India is fortunate to have a diverse range of water bodies that support a substantial human population as well as wildlife, but they are constantly threatened by uncontrolled expansion of anthropogenic activities. Due to inadequate management of these water bodies, both the quality and quantity of their water have declined, and many of them have vanished. Industrialization, domestication, agricultural practices, urbanization, and other anthropogenic activities which are growing along with the population are to blame for the destruction of these water bodies. The most prevalent waterborne infections in India include typhoid, diarrhea, cholera, jaundice, dysentery, amoebiasis, dengue fever, and malaria. Each year, these water-borne illnesses kill thousands of people in India. Despite the fact that the government has built, enlarged, and modernized wastewater treatment facilities throughout the years, water pollution has remained a severe problem due to a lack of resources, public education and awareness. The Indian government has implemented multiple steps to minimize water pollution, and these efforts are being monitored but the problem is like as the same.

Keywords: Water bodies, pollution, Wastewater treatment, Government policies, Awareness drives.

INTRODUCTION

Water, soil, fire, sky, and air are essential to the survival of all living things. One of the "basic components" that we require to survive is water (Singh 2008)[1]. Rivers, lakes, glaciers, rainfall, groundwater, and other water supplies are essential in many economic sectors, including agriculture, forestry, industrial activity, hydropower generation,

Namrata Jadaun   and Sonali Pandey

fisheries, animal rearing, and other creative endeavors (Tyagi et al., 2013) [2]. Freshwater makes up around 2.7 percent of all water on the planet, with 75.2 percent frozen in the polar regions and the remaining 22.6 percent available as groundwater. Freshwater may be found in rivers, lakes, and ponds, as well as in the temperature, humidity, soil boundaries, and vegetation. India possesses only 4% of the world's freshwater, although having about 18% of the world's population. The National Remote Sensing Center (NRSC) reported 6,35,661 water bodies in India(Standing committee on water resources, 2015-16)[3]. The Tata Institute of Social Sciences (TISS) claims that most large cities lack adequate water supplies. On the basis of origin Indian river drainage system is classified in to Peninsular Rivers and the Himalayan Rivers (Balasubramanian, 2007)[4]. Himalayan rivers are perennial and Peninsular rivers are seasonal.

Major cities in India are located along riverbanks .According to a report issued by the United Nations on March 22, 2010, World Water Day, 80% of urban garbage in the nation ends up in rivers, and the issue is getting worse because of unchecked urban development and lax government oversight (Garg, 2012)[5]. In India, over 2.6 billion people, or 40% of the world's population, lack access to basic sanitation, and more than a billion continue to consume tainted water (Pandey, 2006)[6]. More than 2.2 million people are estimated to pass away each year due to diseases brought on by tainted drinking water and inadequate sanitation (Bhat, 2014)[7]. The most prevalent waterborne infections in India include typhoid, diarrhea, cholera, jaundice, dysentery, amoebiasis, dengue fever, and malaria. According to research presented to the Lok Sabha on the instances and fatalities brought on by water-borne illnesses in India, between 2013 and 2017, the nation recorded 69.14 million cases of four water-borne illnesses. Other deadly diseases included viral hepatitis (2143), typhoid (2061), and cholera, which claimed 20 lives. Diarrhea claimed 6514 lives overall (Kumar and Tortajada, 2020)[8]. Many indicators, including dissolved oxygen (DO), biochemical oxygen demand (BOD), coliform organisms, pH, and others, can be used to detect and quantify water contamination in natural water bodies. Water quality standards state that BOD and DO levels in drinking water should be less than 2 mg/L and6 mg/L.

Importance of traditional water bodies in India

Inspite of drinking and bathing these water bodies are primarily accountable for a significant portion of India's GDP and jobs coming from tourism and seafood farming. Fish production increased significantly from 0.2 million tons in 1950–1951 to about 5.1 million tons in 2010–2011.Waterbody banks are crucial locations for animal reproduction and provide migrating birds with a habitat. In certain regions, endangered and threatened animal species can be found (Sahu, 2011)[9]. Boating, hunting, fishing, trapping, bird watching and many more outdoor activities available in these wetlands. Additionally, it has been noted that just taking pictures of wetland-dependent species draws around 50 million visitors annually who spend about $10 billion (Watershed management division 2015)[10]Excellent tourist attractions include the river system, waterfalls, scenic lakes, and springs. Tourism helps to promote the preservation of these natural resources (Sharma and Sharma, 2017)[11]

Sources of pollution in water bodies of India

Water is easily contaminated since it is the most ubiquitous solvent on the earth, capable of dissolving more compounds than any other liquid. Natural and artificial sources of pollution are both possible. Volcanic activity, forest fires, seepage from rocks into the water are some examples of natural sources of pollution. Many anthropogenic or artificial sources come from home and industrial garbage they may be direct and indirect sources of pollution. The effluent outfalls of factories, refineries, and other businesses, which release fluids of varying qualities into water bodies, are direct sources of water contamination. Indirect sources of water contamination include pollutants that enter the water supply through soil/groundwater systems and the environment through precipitation. In soils and groundwater exist residues from human agricultural activities like fertilizers, pesticides and improperly disposed of industrial waste (CPCB,2016)[12].

Namrata Jadaun   and Sonali Pandev

Industrialization

Petroleum hydrocarbons, chlorinated hydrocarbons, different acids, alkalis, heavy metals, dyes, detergents, and other dangerous compounds are only a few of the pollutants found in industrial wastes, all of which drastically affect the pH of water. These substances are harmful to living things found in water bodies and can kill them (Kumar, 1996)[13]. In comparison to other industries, distilleries, the textile and paper industries have a greater impact on water bodies. Previously used as sources of drinking water, Hyderabad's Osmansager and Himayatsagar lakes are now filled with poisonous effluents produced by nearby factories (Ramachandraiahet al., 2004)[14].

Urbanization

Urbanization has been highlighted as one of the most significant factors contributing to the extinction and destruction of these water systems. India, like other developing nations, has been going through this shift from old rural economies to modern industrial economies, which is measured by urbanization (Datta, 2006)[15]. According to an examination of census data from 2011, urbanization has grown by 31.8% in India over the past ten years, which is a significant role in the deterioration and extinction of water bodies (Kang, 2013)[16].

Agricultural Practices

Eutrophication of water bodies is caused by farming activities, such as the use of nitrogen and phosphorus fertilizers and their run-off (Sugam et al.,2018)[17]. Lonar Lake, located in Maharashtra's Buldhana district and dubbed the world's third-largest natural saltwater lake, is suffering from cultural eutrophication as a result of toxic chemicals such as inorganic fertilizers, pesticides, and insecticides accumulating along with the runoff of the river (Yannawar, 2013)[18].

Domestication

Untreated sewage discharge is India's biggest source of water pollution. Sewage was listed as a highly polluting source by the Indian Planning Commission in its Tenth Plan Document, accounting for almost 80% of all water contamination (Malik and Biswas, 2013)[19]. The highest concentration of perflu or ooctanoic acid (PFOA), which was discovered in untreated sewage samples, was found to be 3.1 ng L^{-1}, according to a survey the Ganges River dolphin was estimated to have 27.9 $ng^{g-1}ww$ of perfluoro octane sulfonic acid (PFOS) in it (Yeung et al., 2009)[20].

Pollution due to Religious and social values of water bodies in India

Unburned corpses are dumped into the river after being incinerated on the riverbanks. Because of the Hindu belief that cremation of the deceased allows them to reach salvation, this problem is specific to Varanasi. Because of this, the river receives about 15,000 tonnes of ash each month. The large people populations that the mass bathing activities bring to the river's edge have a significant negative impact on both the ecosystem of the river and the health of those who participate owing to the exposure to a variety of health issues (Sridhar et al., 2015[21]; Verma et al.,2022[22]).

Degradation of quantity and quality of the water bodies in India

Any direct or indirect alteration of the physical, thermal, chemical, biological, or radioactive properties of any components of the environment by, discharge, emission, or deposit of wastes in such a manner as to adversely affect public health, animals, birds, ecosystems, aquatic life and plants. Due to the concurrent rise of human activity along rivers, water sources have become more and more hazardously polluted in recent decades (Alam et al., 2009)[23]. As a result of human activities like farming, mining, industries, or urban development, a lot of heavy metals are produced and discharged into the aquatic environment. They are subsequently deposited in sediments, where the food chain biomagnifies them (Yi et al., 2011)[24]. Many of the factories that line the river's bank discharge untreated wastewater into it. The deteriorating condition is explained by the fact that the once-seasonal river transporting freshwater has changed into a perennial river carrying large amounts of sewage and effluents (Kang and Seth, 2012)[25]. According to a report, pesticides (DDT and HCH) were discovered in considerable concentrations in freshwater systems, bottled drinking mineral water samples, and some rural regions in Delhi, Bhopal, and other

Namrata Jadaun   and Sonali Pandey

towns (Agrawal et al., 2010)[26]. Although heavy metals are still prevalent in the aquatic environment, several preventative measures are being employed to reduce the flow of heavy metals into the water system (Dural and Bickici 2010 [27]; Khound and Bhattacharyya 2017[28]).Water quality monitoring data shows that the water quality is low at several monitoring points along Indian rivers. There is also a lot of anecdotal evidence of high levels of pollution in Indian rivers, especially in the more developed states and near big cities. India generates 29 billion liters of wastewater every day but only collects and treats 6 billion liters of water. Although 1,20,000 tons of municipal solid waste are produced every day, only 70% of it is collected and only 5% is treated (Sengupta,2007)[29]. Approximately 2,277 lakh people reside in the 498 Class I cities in India. They generate about 35,558 MLD of wastewater, of which about 11553 MLD, or roughly 32%, gets processed (CPCB 2009-10)[32]. In 410 towns in India's Class II cities, there are around 300 lakh residents. Only 234 MLD (or 8.6%) of the 2696 MLD of wastewater they produce is treated (CPCB 2009-10)[30]. Although treatment capacity only increased from 2,758 MLD to 23,277 MLD, sewage generation surged from 7,067 MLD in 1978–1979 to 62,000 MLD in 2014–15. (CPCB, 2021)[31]. Sewage generation from urban centers is expected to be 72,368 MLD, and there are 1,631 STPs (including proposed STPs) with a total capacity of 36,668 MLD encompassing 35 States/UTs in India. Considering such a gap of untreated sewage, the remaining amount is sewage. 75% of India's surface water bodies have been contaminated by the discharge of untreated wastewater (CPHEEO, 2012)[32].

Status of water bodies pollution in India

Ganga River

Thousands of fishes and other aquatic life forms have died as a result of the increased amount of excess water pollution in the Ganga River. Kanpur's 19 sewers discharge untreated sewage into the Ganges right away. Wastewater from tanneries is the main cause of Ganga River contamination in Kanpur. The recent statewide lockdown in India from March 25 to April 14, 2020, because of COVID-19, has resulted in an improvement in the clarity of the Ganga River's water quality. Due to the lockdown, where people have stayed at home and businesses have closed, it was found that the dissolved oxygen level rose by 25–30% while the biochemical o oxygen demand level fell by 35–40%(Singhetal.,2020)[33]. Uttar Pradesh generated great amount of waste water through a very high number of industry discharge in compare to other cities while Jharkhand have no industries along the river sides so no waste water generation in ganga river.

Yamuna river

According to data, the Yamuna River has become one of the most polluted rivers in India and the globe. The Yamuna River is the largest tributary of the Ganga. It originates near Bandar Punch in Mussourie, Uttarakhand, from the Yamunotri glacier. Delhi's entire household and industrial rubbish output contributes the most to Yamuna River pollution, followed by Agra and Mathura. The river water is in the CPCB category E. Sharma et al., 2020 study the Yamuna River's water contamination using physicochemical parameters. The fact that total coliform, temperature, and hardness are all increasing is alarming (Sharma et al., 2020)[34]. The Yamuna has been reduced to a little stream that discharges sewage, dirt, and other contaminants as well as industrial effluents, to minimize pollution levels, quick dramatic action is required (Mishra, 2010)[35]. It is not advised to drink the river water because the heavy metal pollution index (which ranges from 98.2 to 555.1) classified almost 85% of it as highly dangerous (Asim and Rao, 2021)[36]. The contamination of the Yamuna River in Dehradun has been blamed on tourism, bad sewage systems, and a lack of waste water management services.

Kasardi River It was discovered that the majority of these harmful heavy metal concentrations were substantially higher than the maximum allowable limits in the study of the Kasardi River, which gets a heavy discharge of waste effluent from the near by Taloja industrial zone of Mumbai (Lokhande et al, 2011)[37].

Gomti River

The Gomti River is a holy river that flows from Gomat Taal near Madho Tanda in Pilbhit, India. An investigation revealed that the Gomti River's water was highly contaminated with organic waste. In several of the areas, the Dissolved Oxygen (DO) level was nil. The average minimum DO value recorded was 0.95 mg/l. The river water is

perilous for any home use, including bathing, as it exceeded the CPCB's authorized standard of Biochemical Oxygen Demand (3.35-18.93 mg/l) (Singh et al., 2005)[38]. According to an analysis of river's water quality with several physicochemical parameters, the water was unfit for human consumption, and that some sites had extremely high heavy metal limits (Singh et al.,2016)[39].

Mahanadi River system is the largest in the state of Odisha. The water in the basin's downstream regions has been contaminated by sewage deposited from Cuttack and Sambalpur, making it unfit for potable and agriculture. Sulphate concentrations (as high as 360.50 mg/l) were found to be far beyond the acceptable limit for domestic use (Sundaray et al., 2009)[40].

Cauvery River is one of the most important rivers in Karnataka and Tamil Nadu. It originates in Talakaveri, Kodagu, Western Ghat, Karnataka and flows into the Bay of Bengal. Vijayalaksmi et al. (2013)[41] assessed the water quality of the Cauvery River and reviewed the findings using physicochemical parameters and microbiological populations, and determined that the levels of the parameters were greater than the standard value. All human activities, such as sewage, industrial waste, and agricultural runoff, release various chemicals into the Cauvery River, polluting the river.

Damodar River also known as sorrow of Bangal originated from Chota Nagpur Plateau. Banerjee and Ghosh (2012)[42] assessed the water quality of the river, the samples were collected from seven different locations and tested for parameters such as pH, EC, TDS, DO, BOD, Pb, Fe, SO_4 2-, and so on. They determined that greater heavy metal concentrations and BOD levels indicated a significant organic load.

River Hindon offers a considerable quantity of water to the densely populated and mostly rural population of western Uttar Pradesh. Water pollution indicated that Hindon's water quality was relatively bad in terms of its suitability for residential use, with criteria several times higher than the CPCB permissible limit. (Suthar et al.,2010)[43].

River Kolong's water quality index (WQI) score of 122.47 during the monsoon season indicates extremely low, unsatisfactory water quality. In one of their assessments, the CPCB identified the Kolong River as one of the most contaminated rivers in India. (Bora and Goswami, 2017)[44].

Indus, Beas, and Sutlej Rivers
Multivariate statistical methods were used to examine data on the heavy-metal condition of the Indus, Beas, and Sutlej Rivers, as well as the Harike Wetland, from 2013 to 2017. The Sutlej River and the Harike Wetland were found to be severely polluted with heavy metals because of the population's rapid increase and quick industrialization (Kumar et al.,2018)[45].Sutlej River is Punjab's longest river. The city's untreated sewage and industrial wastes are dumped into the river. The WQI performed at numerous river places demonstrates that the water quality is unfit for human consumption (Sharma et al., 2018)[46].

Hooghly River Khumanet al. (2019) investigated the distribution of pesticide persistent organic pollutants in the Hooghly River. They documented widespread use of organo chlorine pesticides (OCPs) such as Endosulfan, DDT and HCH (Khumanet al., 2019)[47].

Ramganga River
Ramganga flows from the Dudhatoli hills in Uttarakhand's Chamoli district. Physicochemical measures were used to analyses the water quality of the Ramganga River. The findings of the entire examination revealed that the Ramganga River's water quality was fairly poor. They discovered that the BOD, COD, and phosphorus levels were over the WHO and BIS allowed limits (Gupta et al.,2016)[48].

Namrata Jadaun   and Sonali Pandey

Dravyavati river, which serves as the primary drainage channel of Jaipur, Rajasthan, has increased by 75% in sewage and sludge content, with heavy metals (Fe, Mn, and Zn) levels above WHO standards (Rajput et al., 2017)[49].

Lake Ukkadam Sediments in Coimbatore were found to have concentrations of Hg and Cu of 5.08 mg/kg dry weight and 203.32 mg/kg dry weight, respectively (Shivalingamet al., 2021)[50].

Nainital Lake
Heavy metal concentrations in Nainital Lake are rising as a result of increased human activity and modern agricultural methods. Because the lake is the community's sole source of drinking water, heavy metals have the greatest potential to harm aquatic life by entering the food chain. (Malik and Biswas, 2013)[51].

Chilika Lake's sediments are rich in heavy metals (Pb, Ni, Cr, Cu, and Co), with a high concentration of lead (Pb) indicating a potential biological concern (Barik et al.,2018)[52].
In **Mansagar Lake**, Jaipur, COD climbed to 500 mg/l during the rainy season due to an increase in metal content, when it was only 200 mg/l before the wet season. Peak summer and late winter seasons have been found to have higher levels of pollutants (Sing and Jain, 2021)[53].

Acts, Policies and Awareness drives for the rehabilitation of water bodies in India by the Government
In many areas of India, large stretches of rivers lack the flows necessary to support marine ecology, cultural requirements, and aesthetics and are badly polluted by untreated industrial effluents and urban garbage. India had to take various measures to preserve water bodies due to the country's increasing water shortage, declining water quality, and poor management (Kumar and Bharat, 2014)[54]. The Government of India is running several programs to preserve natural water bodies. According to the Rural Development Ministry, the Mahatma Gandhi National Rural Employment Guarantee Scheme (MGNREGS), the government's most well-known rural employment guarantee program, is being reoriented toward water conservation to boost water storage and agricultural activities in India (Hindustan Times, Jul 02, 2019)[55].To revive and restore fading water bodies that have significantly reduced irrigation capacity, the Government of India initiated the Repair, Renovation, and Restoration (RRR) of Water Bodie's scheme. After a successful pilot run, a full-scale version of the plan was implemented during the XI Plan. Due to the benefits associated with its implementation, the system was also implemented in the XII Plan. The National Wetland Conservation Programme (NWCP) was established by the Ministry of Environment, Forestry and Climate Change (MoEF and CC) in 1987 to conserve the country's identified wetlands, preventing their destruction, and ensuring their wise use for the benefit of local communities and the preservation of biodiversity as a whole. Under the National Lake Management Plan, the MoEF and CC are also supporting the States in their efforts to conserve and restore contaminated and damaged lakes in urban and semi-urban areas of the world (NLCP). In situ lake cleaning procedures including de-weeding, de-silting, bio-remediation, artificial wetland approach, etc. are included in the NLCP. These actions include the prevention of pollution from point sources by intercepting, redirecting, and treating the pollution load entering the lake.

The Ministry of Telangana began a program called "Mission Kakatiya" in 2014-15 to repair 46,531 water bodies. In June 2015, The Atal Mission for Rejuvenation and Urban Transformation (AMRUT)[56] was established to provide urban services such as sewerage/septage, water supply, irrigation, green space and parks, urban transportation, and water body rejuvenation, specifically for drinking water supply and groundwater recharge. India has been an active member of the United Nations and is dedicated to the UN's 2015 Sustainable Development Goals (SDGs). Under SDGs 6 and 11, India aspires to improve its water bodies, and water quality, and deliver a holistic sustainable solution (Bais et al., 2020)[57]. SDG6 ensures that by 2030, everyone has access to safe and clean drinking water, improves water quality by lowering emissions, eliminating dumping, limiting the release of hazardous chemicals and products, and considerably expanding global recycling and safe reuse. Among these programs is the National Rural Drinking Water Program (NRDWP), the Accelerated Urban Water Supply Program (AUWSP), Namame-Gange (National Mission for Clean Ganga), and the National Water Policy. The National Mission for Clean Ganga (NMCG) would have completed 22 projects and approved 17 new ones by 2020, totaling Rs. 557.83 crores in the

fields of Sewerage Infrastructure, Ghats and Crematoria, Afforestation, Pollution Abatement, Biodiversity, and others (MJS, 2020)[58].

The Water (Prevention and Control of Pollution) Act of 1974
The Central and State Pollution Control Boards (the CPCB and SPCBs) were established by the Water (Prevention and Control of Pollution) Act to oversee, offer guidelines and standards, and carry out rules relating to the treatment and disposal of sewage and trade effluents.

The 2012 National Water Policy
Water allocation (drinking, irrigation, hydropower, navigation, commercial, and other uses), conservation, and conjunctive use are all prioritized in the NWP. It focuses on water conservation, recycling, and reuse, as well as water demand management, sectoral water use quality, sanitation, water supply and increasing water availability.

The Environmental (Protection) Act 1986
The Central Government was given the authority to establish guiding principles to reduce environmental pollution under this Act. The environmental regulations set criteria for the quality of surface water for a variety of uses (irrigation, domestic, industrial, recreational, etc.).

National Water Quality Monitoring Programme (NWMP)
As part of the National Water Quality Monitoring Program, the CPCB tracks 2021 locations on Rivers, 608locations on Lakes/ Ponds/ Tanks, 63 locations on Creeks/Seawater/marine water, 65locations on Canals, 60 locations on Drains, 56 locations on Sewage Treatment Plants, 5locations on Water Treatment Plants (Raw Water), and 1233 on wells. Under NWMP 36Real-Time Water Quality Monitoring Stations were installed in River Ganga (CPCB19-20)[59].

National Plan for Conservation of Aquatic Eco-systems (NPCA)
Scheme backed by the government is implemented in February 2013 under the Ministry of Environment, Forest and Climate Change for the conservation of wetlands and lakes, lakefront development and beautification in urban lakes.

Ganga Action Plan I(GAPI)
The World Bank Board of Directors approved the Second National Ganga River Basin Project (Ganga–II) for US$ 400 million on June 25, 2020. (Rs. 3023.10 crores).On July 7, 2020, the World Bank and India's Department of Economic Affairs signed aloan agreement(MJS, 2020)[58].

The Namami Gange program was launched in 2014 by the government of India to clean the Ganga River and a budget of Rs20,000 crore was allocated for 2015-2020. There are 8 Common Effluent Treatment Plants (CETPs) and 105 Sewage Treatment Plants (STPs) located on the banks of the river Ganga.

The Yamuna Action Plan (YAP Phase-I) was initiated in 1993 by the Government of India with the assistance of the Government of Japan, to improve river water quality to the required bathing standard. This plan was implemented under the name Yamuna action plan II (YAP Phase-II) from 2000 to 2002. In 2017, the 'Maily Se Nirmal Yamuna' Revitalization Plan 2017 Phase-I was implemented, with the Finance Ministry allocating roughly Rs 344 crores for the construction of STPs in the Najafgarh Drain (PIB report, 2017)[60].

Atal Mission for Rejuvenation and Urban Transformation (AMRUT) Ministry of Housing and Urban Affairs, Government of India started in 2015, The Mission will focus on water supply, Sewerage and sep tage management, non-motorized urban transport, storm water drainage tore duce flooding and increase green space/parks.

Namrata Jadaun   and Sonali Pandey

National River Conservation Plan (NRCP) was launched in 1995, The GAP Phase II program was linked with the National River Conservation Plan (NRCP) in 1996, integrating all river-cleaning initiatives across the country under the NRCP's umbrella scheme. Presently NRCP covered polluted stretches of 33 rivers. The projects "Assessment of the ecological status of select 6 Indian rivers (namely Mahanadi, Cauvery, Godavari, Periyar, Narmada, and Barak River)" and "A project to enhance and restore the river Rani Chu in Zone-I, Gangtok, Sikkim" have been approved for a total of Rs.95.36 crore under the NRCP by the wildlife institute of India (WII), Dehradun (MJS,2020)[58]. According to STANDING COMMITTEE ON WATER RESOURCES (2015-16), the Jalmanthan and 'India Water Week awareness program has been organized by the Ministry of Water Resources, River Development and Ganga Rejuvenation to spread awareness for the protection and maintenance of water bodies.

The National Water Quality Sub Mission (NWQSM) was initiated by the Indian government to improve the quality of drinking water in areas where people are forced to drink polluted water. The Indian government initiated Swajal, a community-led drinking water initiative, in March 2018 (Ahmed and Araral,2019)[61]. To encourage all stakeholders to construct Rain Water Harvesting Structures (RWHS) that are suitable for climatic conditions the National Water Mission launched the "Catch the Rain" campaign with the tagline "Catch the Rain - when it falls, where it falls" (MJS, 2020)[58]. On November 14, 2019, the National Water Mission launched the "SahiFasal" campaign to encourage farmers in water-stressed areas to grow crops that are not water-intensive but use water efficiently (MJS,2020)[58].The state government of Rajasthan launched the campaign 'Jal Chetna' in 2006 through public participation, focusing primarily on de-silting and sediment excavation to improve the reservoir's potential for water retention by which Budha Lake in Ajmer benefitted (Sharma et al.,2009)[62]. The Government of Rajasthan initiated the Mukhyamantri Jal swavlamban Abhiyan ('water self-reliance mission') in 2016 in 295 Blocks across 33 districts to establish a water-sustainable Rajasthan.

CONCLUSION

According to the study, the bulk of India's water sources are highly contaminated and provide a threat to human health. To address the complicated water scenario that exists today, which is characterized by scarcity and the depletion of this renewable but limited resource, India's water legislation continues to be inconsistent, contradictory, and ineffectual. The amount of sewage predicted to be generated is 72,368 MLD, but only 20,235 MLD of the available capacity has been used, leaving 52,133 MLD of untreated sewage. Realizing sewage as a resource will enable less raw water to be used, which will help preserve natural water supplies. Non-potable uses for treated sewage include irrigation, horticulture, toilet flushing, firefighting, non-contact impoundments, washing of floors, roads, trains, and buses, and industrial utilities. The use of bio-fertilizers rather than chemical fertilizers should be encouraged. Domestic and industrial wastewater should be adequately managed in wastewater treatment facilities before being released into natural aquatic habitats. The best preventative measures involve managing farm run-off and avoiding the dumping of home and industrial effluents. Despite environmental policy legislation and constitutional provisions for environmental protection, our country faces a severe problem with industrial waste disposal, which pollutes natural resources at all hours of the day and night. It is important to strictly enforce the laws governing water treatment. No solid garbage should ever be dumped into waterways. Depending on the quantity, concentration, toxicity, and presence of non-biodegradable organics in the effluents, industries may employ one or more of the following processes for the treatment of industrial wastewater: volume reduction, strength reduction, neutralization, equalization, and proportion; removal of suspended solids, colloidal solids, inorganic dissolved solids, and organic dissolved solids. So, rather than treating with expensive treatment systems, it is necessary to strengthen the capacity of water pollution treatment and raise public awareness of the need to improve water quality and prevent water pollution. The river sites should be cleaned using bioremediation and phytore mediation technologies.

ABSTRACT

One of the plant growth regulators, gibberellic acid (GA₃), helps plants tolerate salt efficiently and minimizes the effects of salt stress. The current study aimed to determine the effect of GA₃ on seed germination and physiological parameters of four seeds: *Majidea zangueberica* Kirk ex oliv., *Phyllanthus emblica* L., *Tectona grandis* L. f. and *Tabebuia aurea* (Silva Manso) Benth. & Hook. f. ex S. Moore, under different salt concentrations. The experiment was conducted using a factorial design with a completely randomized block design and three replicates. Two levels of salinity (50 mM and 100 mM NaCl) and two hormone conditions (GA₃ at 150 ppm versus without GA₃) were the experimental conditions. When the salt level was 50mM NaCl, priming the seeds of these tree species with 150 ppm of GA₃ significantly increased the germination percentage, decreased mean germination time, increased shoot and root length and raised the total weight of the seeds ($P<0.05$).

Keywords: Salt priming, tolerance, Germination percentage, Gibberellic acid, Shoot and root length.

INTRODUCTION

Salinity, induced by a higher concentration of salt in the soil, significantly affects a substantial portion of plants. This issue is particularly pronounced in regions with hot and dry conditions, and it stands as one of the most serious obstacles impeding crop germination and productivity [1;2]. The adverse effects of elevated soil salinity levels, resulting from a combination of high osmotic potential and unique ion toxicity, greatly impact both the quality and quantity of plant production. These effects lead to the suppression of seed germination, seedling growth, and developmental phases [3;4]. Notably, the germination percentage, shoot and root length, as well as the fresh weight of the shoot and root, all exhibit abnormalities attributed to the higher salt concentration. Plants encounter two fundamental challenges in saline environments. First, the soil contains a significant amount of salt, which diminishes the osmotic potential of the soil solution, thereby reducing water absorption by plants and inducing a water deficit. Furthermore, the increased absorption of Na^+ and Cl^- ions results in plant deficit. Furthermore, the increased absorption of Na^+ and Cl^- ions results in plant toxicity, preventing the essential uptake of vital nutrients [5;6]. Plant growth regulators, such as GA_3, are highly effective in stimulating and optimizing germination, plant development, and photosynthetic activity. This is attributed to their ability to trigger numerous physiological responses in plants [7]. In saline conditions, patterns of growth reduction can emerge. However, these patterns can be mitigated by the progressive efficacy of exogenous GA_3 application, which influences various morphological, physiological, and biochemical activities in plants. The utilization of GA_3 is particularly helpful in reducing saline stress, with its effectiveness being more pronounced in salt-resistant cultivars [8]. Gibberellic acid contributes to the alleviation of the deleterious effects of salinity to a certain extent by enhancing vigor, antioxidative enzyme activity, and the accumulation of osmolytes. Furthermore, GA_3 treatment facilitates the production of hydrolytic enzymes, which are essential for breaking down endospermic starch as seeds initiate growth during germination [9; 10] Hence, the objective of the present study is to comprehend the germination activity and seedling growth achieved through priming with GA_3 in seeds of *Majidea zangueberica* Kirk ex oliv., *Phyllanthus emblica* L., *Tectona grandis* L.f. and *Tabebuia aurea* (Silva Manso) Benth. & Hook. f. ex S. Moore. Additionally, the seeds were subjected to NaCl treatment to assess their tolerance capacity during both germination and the early seedling growth phases.

MATERIALS AND METHODS

Seed collection

Mature seeds of *Majidea zangueberica* Kirk ex oliv. (Sapindaceae), *Phyllanthus emblica* L. (Phyllanthaceae), *Tectona grandis* L.f. (Lamiaceae) and *Tabebuia aurea* (Silva Manso) Benth. & Hook. f. ex S. Moore (Bignoniaceae) were collected between September and December 2020 from the Western Ghats, Sadivayal area in the Coimbatore district (11.0168° N, 76.9558° E). The collection site experiences an average annual temperature of 26°C, varying from 32°C in September to 19°C in December. Several hundred seeds were gathered from 10 randomly selected trees within a 20-km radius by gently shaking the mature trees. Subsequently, the seeds were transported to the laboratory on the same day. Upon arrival, they were visually examined and any damaged or unhealthy seeds, as well as debris, were meticulously removed. The seed surface underwent sterilization using a 5% sodium hypochlorite solution for a duration of 10 minutes, followed by thorough rinsing with sterile distilled water for 4 to 5 cycles. Afterward, the seeds were air-dried on a bench for a day before being stored in airtight glass bottles under room temperature and humidity conditions, remaining preserved until their utilization in the experiment.

Hormonal priming

The seeds were subjected to priming by immersing them in a 150 ppm GA_3 solution for a duration of 12 hours at 27°C, all conducted in complete darkness. This was achieved by enveloping the Petri dishes with two layers of aluminium foil paper to ensure an absence of light. After the priming process, the seeds were taken out and cleansed under running tap water, followed by three rinses using sterile distilled water. The cleansed seeds were then gently dried by being placed between filter papers. Upon completion of the drying step, the seeds were positioned within

Petri dishes containing moist no.1 What man filter paper. These Petri dishes were maintained under room conditions at a temperature of 27°C. As for the control group, the seeds (which were not subjected to priming) were soaked in water for a span of 12 hours, subsequently dried once again, and then arranged in Petri dishes with moist No.1 What man filter paper, all under the same room conditions at 27°C. A fully randomized factorial experiment was conducted, encompassing three replicates of 25 seeds each for both the control, salt treated and primed with salt treated groups(seed with 50mM Nacl and seed with 100mM Nacl). These groups were subjected to equal volumes of NaCl solutions at two distinct concentrations: 50mM and 100 mM..Various physiological parameters, including seed germination percentage and mean germination time, were determined using the following formulas. The lengths of both shoot and root of all seedlings were gauged utilizing a transparent ruler. Additionally, the fresh weights of the seedlings were measured using a weighing balance. For further analysis, the seedlings were subjected to drying at 70°C for a duration of 12 hours, after which their dry weights were recorded [11;12].

Measurements of germination efficiency
Total germination (TG) was measured every day and terminated at day 14 after sowing (Kandil et al. 2012). It was computed as:

TG% $=\frac{n}{N}$ ×100, Where n is the total germinated seeds, and N is the total seeds sown.

Mean germination time (MGT) was calculated according to[13]

MGT$=\frac{\sum(n \times d)}{N}$

where n = number of seeds germinated on each day,
      d = number of days from the beginning of the test, and
      N = total number of seeds germinated at the termination of the experiment

The Vigour index (VI) was measured using the formula of [14]
 VI= TG% × Seedling Length (cm)/100

Statistical analysis
All experiments were carried out in triplicates and results are expressed as mean ± SE (n=3). To analyse the differences among mean values of different treatments one-way analysis of variance (ANOVA) was conducted. The data were analyzed using SPSS (2.0) software.

RESULTS

Seeds of *Majidea zangueberica* Kirk ex oliv., *Phyllanthus emblica* L., *Tectona grandis* L.f. and *Tabebuia aurea* (Silva Manso) Benth. & Hook. f. ex S. Moore. were sown and irrigated with different concentrations of saline solutions, and the outcomes of the study were collected by determining various germination and seedling growth parameters.

Germination Percentage and Mean Germination Time of the four Seeds
The analysis of variance revealed significant effects of both salinity and priming with GA₃ on the germination percentage and mean germination time of *Majidea zangueberica, Phyllanthus emblica, Tectona grandis* and *Tabebuia aurea* (P <0.05) (Table 1). Among these species, at the salinity level of 50 mM NaCl, the germination percentage was highest in Samanea saman, followed by *Phyllanthus emblica* (33.00± 0.58), *Tectona grandis* (30.00 ± 0.58), *Majidea zangueberica* (23.33 ± 0.88) where as the *Tabebuia aurea* exhibited the lowest percentage (22.33 ± 0.88). Notably, germination was significantly more successful up to the 50mM NaCl salinity level in the primed seeds compared to the 100 mM NaCl level. When seeds with the treatment of NaCl level without GA₃ showed germination percentage were less when compared with primed group. Seed germination is pivotal and critical phase within the plant life cycle, significantly influencing plant establishment and overall productivity. This process can be impeded by various abiotic stresses, with salt stress posing distinct challenges. Recent research corroborates earlier findings [15] suggesting that plants employ the accumulation of specific inorganic ions or organic compounds to regulate osmotic potential. This serves as a strategy to counteract the initial impediments posed by salinity, aiding in the maintenance of appropriate ion concentrations in the soil solution. Consequently, this adaptive mechanism helps safeguard

against compromised water uptake by the roots, thus enabling efficient seedling establishment in saline environments [16]. Interestingly, when seeds were sown under differing salt levels, the pace of germination and the duration required for germination displayed a direct correlation. Remarkably, the priming of seeds with a 150ppm GA$_3$ solution enhanced the response of seed germination of salinity.   This observation resonates with existing reports, suggesting that GA$_3$ positively impacts germination percentage and mitigates the adverse consequences of salinity-induced stress on germination. T1- 50mM NaCl; T2-100mM NaCl; T3- GA3+50mM NaCl; T4- GA3+100mM NaCl; T5-Control [#]Each value is a mean of five replicates ±SE (standard error). This means that a column followed by the same superscript (P>0.05) differs according to Duncan's multiple range test.***, * at P<0.001 and P<0.05 respectively.

Effect of Salinity and Priming on the Seedling Growth Performance of the four seeds

Elevated levels of salt exposure exert stress on seeds, leading to a decrease in various experimental seedling parameters, including shoot and root lengths, shoot and root fresh and dry weights, as well as seedling vigor index. The growth of seedlings displays an inverse correlation with the intensity of salinity conditions. It is evident that seedling development experiences a significant decline as saline levels increase.   However, the application of priming with GA3 induces a stimulating effect on maximal physiological characteristics, particularly up to a salinity threshold of 50mM NaCl. Comparatively, lower rates of seedling performance (14%) were observed in non-primed seedlings subjected to saline water levels ranging from 50mM to 100 mM NaCl for *Majidea zangueberica*. This was followed by *Tectona grandis* (25%), *Phyllanthus emblica* (24%), and *Tabebuia aurea*(39%). In contrast, a significantly higher proportion of seedling performances (65%) were documented in primed seedling irrigated with salinity levels up to 50mM NaCl for *Tabebuia aurea*. This was followed by *Phyllanthus emblica* (54%), Tectona grandis(47%), and *Majidea zangueberica* (33%). The growth of seedlings belonging to *Majidea zangueberica*, *Phyllanthus emblica*, *Tectona grandis* and *Tabebuia aurea* exhibited significant reduction when cultivated under high saline conditions. Seedling vigor experienced a substantial decline from the control (absence of salt, GA$_3$) to the 50mM NaCl concentration. The highest seedling vigor index was observed at 50mM NaCl (1.20 to 4.56), whereas the lowest seedling vigor index was recorded at 100 mM NaCl (0.58 to 3.28). These results have been documented in tables. Consequently, these declines in seedling performance were consistent across all tested parameters, including shoot length, root length and seedling fresh and dry weight as illustrated in tables 1 & 2.

Extensive documentation supports the notion that the influences of the growth medium on salinity-induced effects results in reduced seedling characteristics among seeds as salinity levels escalate. Furthermore, it has been observed that GA$_3$'s capacity to counteract this effects diminishes as the stress reaches its peak, particularly evident at the highest salinity level (100 mM NaCl) The application of 50mM NaCl concentrations to primed seeds exerted a significant stimulatory effect on shoot and root growth in *Phyllanthus emblica, Tectona grandis*, and *Tabebuia aurea*. However, it led to a reduction in root growth for *Majidea zangueberica* both at 50mM and 100 mM NaCl concentrations. Notably, at the higher 100 mM NaCl concentration, the shoot and root lengths of all four seed types were significantly decreased. All salt treatment and control groups shows the reduction in shoot and root growth. In specific terms, *Majidea zangueberica* exhibited the highest reduction in both shoot and root length, with reductions of 8.41% (primed) 4.40% (unprimed) for shoot length, and 5.46% (primed) and 2.325 (unprimed) for root length a the 100 mM NaCl concentration. On the other hand, *Tabebuia aurea* show cased the lowest reduction, with a decrease of 25.22% (primed) and 10.75% (unprimed) for shoot length, and 16.03% (primed) and 8.11% (unprimed) for root length, respectively, at the 50mM NaCl concentration whereas the salt treatment 9.12 -15.22%. At the 50mM NaCl concentration, the highest average total fresh and dry weights were observed (see figures 1 to 3), indicating robust seedling development. Conversely, at the higher salinity level of 100 mM NaCl, there was a lesser discrepancy recorded for the total dry weight of the seedlings. In this context of 50mM NaCl, the primed seeds of *Tabebuia aurea* exhibited a more significant reduction (primed: 4.32, unprimed: 0.32), where as *Majidea zangueberica* displayed a comparatively minor reduction (primed: 2.31, unprimed: 0.24).

DISCUSSION

Germination Percentage and Mean Germination Time of the four Seeds

Seed germination is pivotal and critical phase within the plant life cycle, significantly influencing plant establishment and overall productivity. This process can be impeded by various abiotic stresses, with salt stress posing distinct challenges. Recent research corroborates earlier findings [15] suggesting that plants employ the accumulation of specific inorganic ions or organic compounds to regulate osmotic potential. This serves as a strategy to counteract the initial impediments posed by salinity, aiding in the maintenance of appropriate ion concentrations in the soil solution. Consequently, this adaptive mechanism helps safeguard against compromised water uptake by the roots, thus enabling efficient seedling establishment in saline environments [16]. Interestingly, when seeds were sown under differing salt levels, the pace of germination and the duration required for germination displayed a direct correlation. Remarkably, the priming of seeds with a 150ppm GA_3 solution enhanced the response of seed germination of salinity. This observation resonates with existing reports, suggesting that GA_3 positively impacts germination percentage and mitigates the adverse consequences of salinity-induced stress on germination. The enhancement of water absorption and cell wall flexibility, coupled with the activation of cytological enzymes, collectively contribute to the role of GA_3 in influencing germination percentage [17]. Comparable results have been documented in studies involving the germination of various other plant species, including *Avena sativa*[18], *Hordeum* vulgare [19], Lathyrus sativus[20], Ricinus communis[21], Satureja thymbra [22],Triticum aestivum[23], and Phaseolus mungo [24].

Effect of Salinity and Priming on the Seedling Growth Performance of the four seeds

Despite the favourable above-ground growth observed in the dwarf line, a study by [31]reported adverse effects of GA_3 on seedling root length in the Rht12 dwarf of bread Triticumaestivum plants. Specifically, it led to an overall reduction in root length and root dry weight, particularly evident under the influence of 100 mM NaCl. This detrimental impact was more pronounced on the root system than the shoot, attributed to the fact that plants experiencing salt stress tend to develop less water-absorbent roots that grow a slower pace[25].The potential mechanisms underlying the alleviating effects of exogenously applied GA_3 on salt stress were proposed by[26], suggesting that these effects might arise from the activation of specific enzymes involved in RNA and protein synthesis. Furthermore, a separate study by [27] noted that GA_3 treatment resulted in increased development of both shoots and roots in Glycine max plants. This trend could be attributed to the exogenous application of GA_3, which generally stimulates the development parameters of *Avena sativa* plants and mitigates the suppressive impact of salt stress to a certain extent. Additionally, GA_3 has the potential to enhance both the fresh and dry weights of seedlings, thereby accelerating the pace of photosynthetic growth [28].

This observation aligns with similar finding from a study by [29], which demonstrated that salinity led to a decrease in the fresh and dry weights of plants. Their results indicated that the decline in fresh and dry biomass at higher concentrations might result from inadequate water absorption from the growth medium due to physiological desiccation. Agricultural productivity is enhanced through the utilization of various growth promoting hormones. Among these, Gibberellic acid (GA_3) stands out as a key plant hormone that plays a significant role in governing plant growth and development. It exerts influence over crucial aspects such as seed germination, leaf growth, stem elongation, and flowering. Research has shown that gibberellins interact with other essential hormones, thereby regulating numerous metabolic processes within plants [30]. In the case of *Majidea zangueberica*, *Phyllanthus emblica*, *Tectona grandis* and *Tabebuia aurea*, the early growth of their seedlings was adversely impacted by NaCl-induced salinity. However, this negative effect was ameliorated upon the administration of GA_3.

CONCLUSION

This research has provided significant insights into the responses of salt-stressed seeds from, *Majidea zangueberica, Phyllanthus emblica, Tectona grandis* and *Tabebuia aurea* along with the impacts of growth hormone pre-treatments using GA$_3$. Both primed and unprimed seeds of these species exhibited distinct yet slightly varying responses to different salinity environments. Notably, seed priming with GA$_3$ yielded notable improvements in seed germination and seedling growth across all four tree species. Priming was particularly effective in mitigating the negative effects of salt stress on seed germination and early seedling growth, especially up to a salinity level of 50mM NaCl. Unprimed seeds displayed more pronounced decreases in seed germination percentage and seedling growth as salt stress intensified, in comparison to primed seeds. The highest salt levels resulted in substantial reductions in seed germination percentage, prolonged mean germination time, and diminished overall seedling performance with a more pronounce impact on roots compared to shoots. The application of GA$_3$ pre-treatment demonstrated enhanced seed germination percentages, reduced mean germination time, and improved seedling growth performances. This research underscores the effectiveness of seed priming strategies in mitigating the adverse effects of salinity stress on seed germination and early seedling growth under controlled conditions. However, further investigations are warranted to assess the performance of these four GA$_3$ primed tree seeds in terms of vegetative growth and yield within real world field conditions.

ABSTRACT

This research work focuses on using natural language processing (NLP) techniques to extract important information from electronic medical records (EMRs) related to adverse drug reactions (ADRs). Specifically, the goal of the research is to extract entities such as prescribed drugs with their dosage, symptoms, and illnesses mentioned in the EMRs. The extracted entities will be processed further to identify any adverse reactions that may be associated with the prescribed drugs. The proposed approach, called Named Entity Recognition using Transfer Learning on Biomedical Documents (NER-TL-BioMD), uses a dictionary-based strategy to identify adverse reactions and was found to outperform a baseline NER model in terms of F1-scores for identifying drug, disease, dosage, and Symptoms entities. This type of research is important as it can help improve patient safety by identifying potential adverse reactions to prescribed drugs. By using NLP techniques to extract information from EMRs, researchers can gain insights into patterns of adverse reactions and develop strategies to reduce their occurrence. It also highlights the potential of using advanced technology to support healthcare professionals in making more informed decisions regarding patient care.

Keywords: NLP, EMRs, NER-TL-BioMD, NER, F1

INTRODUCTION

Pharmacovigilance
In the medical field, extracting valuable information from written documents, such as medical literature, poses a challenging task for researchers and industry professionals. These documents contain rich, unstructured information.

Mala

Electronic Medical Records (EMR) provide insightful data that aids healthcare management in making informed decisions. Developers leverage advancements in Artificial Intelligence (AI) to extract hidden information from unstructured data. The medical domain encompasses a vast corpus, including literature documents, websites, forums, and EMRs, all containing text-heavy content. Text mining, a research area focused on analyzing large text corpora, plays a key role in deriving actionable insights. Natural Language Processing (NLP) is an essential concept in text mining, where AI techniques assist in extracting structured information from big data. NLP libraries are actively being developed to identify important keywords within EMRs. In the field of life sciences, the constant advancements in research and discoveries have given rise to a plethora of applications aimed at conducting diverse analyses. One notable example pertains to individuals who consume drugs, as they may encounter side effects referred to as adverse reactions (ADR) [1, 2]. ADR represents the undesirable responses that can manifest even when taking the recommended dosage of prescribed medications. The range of ADRs spans from relatively minor conditions like skin rashes to more severe complications such as renal problems, cardiovascular breakdown, and, in extreme cases, even death. Considering the substantial impact ADRs can have on a significant population, it becomes imperative to accurately identify these reactions in order to safeguard individuals from the harmful consequences that may arise from medication usage[3, 4 and 5].

The field of Pharmacovigilance (PV) encompasses various subcategories, including the identification, evaluation, and prevention of adverse drug reactions (ADR) associated with clinical medications. PV practices are carried out in two distinct phases: pre-marketing clinical trials and post-marketing surveillance. Pre-marketing trials aim to assess the positive effects of drugs and typically involve a small population over a limited duration. However, these trials often fail to capture many negative drug effects. On the other hand, post-marketing surveillance involves the collection and analysis of data related to marketed drugs and their outcomes from healthcare professionals, pharmacists, and consumers [6-8]. To facilitate data collection in this context, many countries have implemented online data collection systems. Consequently, these systems generate substantial amounts of data, and the manual analysis of such data becomes laborious and challenging. Information mining has emerged as an invaluable tool for uncovering the relationship between drugs and their associated adverse drug reactions (ADR) using post-marketing surveillance data [9-13]. One crucial step in conducting text analysis is the extraction of named entities. In the context of extracting ADR from Electronic Medical Records (EMR), the primary challenge lies in the extraction of these named entities. The techniques employed for extraction rely on curated lists of drug-related names, diseases, and symptoms, which serve as the foundation for the analysis process.

Role of NER in PV

In this research work, the major issue of NER extraction from the EMR has been focused to identify the important entities during ADR processing. The arrangement expected this research work to separate the important elements, for example, endorsed chemicals with dose. Also it extracts the manifestations and illnesses referenced in the EMRs. The separated elements will be prepared for further downstream to connect the elements. Then, it influences the word reference based strategies to hail any side effects which might actually be unfriendly medication responses of the recommended meds. A vital segment in our concocted arrangement utilized a custom-made NER model to remove the key elements from EMRs. The cutting edge Named Entity Recognition models fabricated utilizing profound taking in methods [13] remove elements from text sentences by not just recognizing the catchphrases or semantic state of substances. In addition to utilize the element in the sentence, the NER methods are being applied with profound techniques. The NER models influence the closeness of different words which show up alongside the substance in the medical literature documents with per-prepared word embedding of the language model. Among the critical difficulties in preparing NLP dependent models is the accessibility of sensible estimated, great explained datasets. Further, in a commonplace modern setting, the general trouble in gathering huge space master time, and the absence of apparatuses and methods for viable comment alongside the capacity to audit such comments to limit human mistakes, influences exploration and seat checking new learning procedures and calculations. Furthermore, models like NER frequently need huge measure of information to sum up well to a jargon and language area. Such huge measures of preparing information are frequently inaccessible or hard to fabricate or combine. To work with small datasets, transfer learning (TL) is the best alternative to train the models. Transfer learning is act like a bridge

67563

to fill the gap between the industrialists and academics. For image processing, TL strategies [3] are generally effective. Nowadays, in NLP, TL is playing a major role by means of the pre-trained models and word embedding. In the digital epoch, the arising advance leads the dominance of Artificial Intelligence (AI). Machine Learning (ML)is an unavoidable field of AI. The role of ML decreases and increases the labor and experiences respectively from the colossal measure of information. The job of AI in different area like training area, monetary administration, and transportation, medical services the board, and so forth creates part of freedoms to the AI analysts and gifted designers. IN the life science domain, medical related services are having huge innovation of progression with the AI. In the year 2020, the Covid-19 is a pandemic circumstance and AI has being assumed a significant part to discover the presence of sickness in the people. Specialists had discovered the illness via preparing information accessible by utilizing AI model and ready to foresee the existence of Covid-19. Still it is important to expand the exactness of the AI model. Then again, enormous measure of articles identified with the existence science has being distributed in the mainstream information bases like PubMed, WebMD, and so forth these articles are having parcel of covered up data. Numerous association and medication producers has contributed to remove the concealed data from the enormous measure of information. Pharmacovigilance is one of the significant region, where, it needs to screen the name record of the medication before its delivery in to the market.

Extricating the elements like sicknesses, substance compound, dynamic fixings, sex, indications, measurement levels, dose structures, course of organization, Symptoms, area, species, unfavorable response, and so forth are troublesome assignment. The enormous measure of writing reports accessible over the web are in unstructured organization. For instance, electronic wellbeing records, clinical preliminaries are has distinctive configuration dependent on the nation's guidelines. Distinguishing the mentioned substances from the un-structured record is very difficult assignments for the both analysts and engineers. From the literature documents, producing the toxicological report tremendously relies upon these elements, to remove the contextual analyses and other data. These substance extraction helps various analysts. It also helps to create report generators to diminish the human time taking for delivering the reports that are follows, clinical examination, electronic wellbeing records, toxicology reports, and so forth. Greater part of the reports are in unstructured arrangement and hard to get to the data. A few methodologies, for example, word reference based, AI based and crossover based drew nearer are proposed to extricate these substances from the immense measure of unstructured information.

Word reference based technique is more financially savvy when contrasted with the AI based methodology. Keeping up with and refreshing the corpora prompts immense equipment and capacity costs. AI [1] based strategy which is being implemented by Transfer Learning (TL) techniques have create much exactness. On the other hand, developing a model based TL technique is by and large simple by the new movement of the data set advances which simplicity to develop a gigantic measure of corpus. The corpus could be worked from data that are accessible in the drug website pages. These data can be utilized for different kinds of Natural Language Processing (NLP) applications to get the valuable insight. NLP project these difficulties and give important bits of knowledge. This arising innovation inevitably depends on life science word references and working AI model to foresee the named elements. The proposed research work has been focused on Named Entities Recognition (NER) on the writing reports accessible over the web. Cross breed based methodology has been proposed to recognize the substances. Illnesses, substance compound, manifestations, dose structures and course of organization. Separate word references has been worked for the previously mentioned substances. The unstructured reports are changed over into a design and the named substances are coordinated with the string in word references. The coordinated with words are clarified with the beginning and end position of the characters. The commented on sentences are prepared with the SciSpacy model and custom spacy model was assembled. The model was assessed with the word reference and disarray grid is determined.

Late headways in NLP otherwise called the ImageNet second in NLP [3], have shown huge enhancements in numerous NLP assignments utilizing move learning. Language models like ELMo[4] and BERT [5] have shown the impact of language model pre-preparing on downstream NLP undertakings. Language models are fit for acclimating to changes in the text based area with an interaction of adjusting. Additionally, in this self-regulated learning

situation, there is a certain explanation in sentences, for example predicts the following token (word) given a grouping of tokens showing up prior in the succession. Given this, we can acclimate to another area explicit jargon with very little preparing time and practically no management. NER pointed toward recognizing and distinguishing substance classes in text can help in removing organized data and helping upstream client encounters. The relevance of NER models are far reaching, going from recognizing Symptoms and urban communities in chatbots to open space question replying. The authors [17] have utilized task-explicit explanation apparatuses can limit an opportunity to produce excellent clarified datasets for preparing models. The customary interaction of commenting on information is moderate, however major to most NLP models. It frequently goes about as an obstacle in assessing and bench-marking numerous models, just as in boundary tuning of models. Numerous apparatuses, for example, Doccano [6] exist in the opensource local area that assistance in taking care of this issue. We fostered an in-house device which we could alter for accelerating the comment interaction.

This research work presents discoveries of tests to tackle the modern issue of preparing NER models with restricted information utilizing spaCy [7] , a cutting edge mechanical strength normal language handling bundle, alongside the most recent strategies in move learning. In this research work, we present our way to deal with extricating organized data from unstructured Electronic Health Records (EMR) [2] which can be utilized to, for instance, study unfriendly medication responses in diseases persons because of synthetic compounds in their items. Our answer utilizes a mix of Natural Language Processing (NLP) methods and an online comment apparatus to streamline the presentation of an exceptionally Named Entity Recognition (NER) [1] model prepared on a restricted measure of EMR preparing information. This work was introduced at the principal Health Search and Data Mining Workshop (HSDM 2020) [26]. It feature a mix of instruments and strategies utilizing the new progressions in NLP pointed toward focusing on space moves by applying move learning and language model prepreparing methods [3]. We present an examination of our strategy to the current mainstream approaches and show the viable expansion in execution of the NER model and the decrease on schedule to explain information. A vital perception of the outcomes introduced is that the F1 score of model 73.4% prepared with our methodology with only half of accessible preparing information beats the F1 score of the clear spaCy model without language model part 70.04% prepared with 100% of the accessible preparing information. We likewise exhibit a comment device to limit area master time and the manual exertion needed to create such a preparation dataset. Further, we intend to deliver the commented on dataset just as the pre-prepared model to the local area to additional exploration in clinical wellbeing records.

RESEARCH METHODOLOGY

Introduction

Considering the crucial role of identifying adverse drug reactions (ADR) resulting from medication on individuals with diseases, it becomes imperative for drug development in healthcare. Pharmacovigilance (PV), as defined by the World Health Organization (WHO) [21], encompasses the science and activities involved in detecting, assessing, understanding, and preventing adverse effects or any other drug-related issues. To fulfill this purpose, drug companies frequently need to incorporate conditions and preconditions of ADR after drug intake. This information assists the PV department in conducting thorough analysis of medications, ultimately reducing or preventing harm to patients. The co-occurrence of diseases and chemicals in an Electronic Medical Record (EMR) for an individual with a disease proves valuable during investigations and analysis for chemical and drug-related manufacturers. However, EMRs are unstructured documents containing valuable data that necessitate careful attention for named entity recognition (NER) extraction. Such extraction facilitates easier analysis and reduces human involvement in generating reports. Implementing an NER extraction application saves organizations significant time. Custom healthcare NER models have been developed to extract phrases related to drug chemicals, dosages, diseases, and symptoms from EMRs. Additionally, a new dictionary has been created to identify more entities. The proposed concept follows the human-in-the-loop approach, and various studies were designed and conducted to train customized NER models. The base models employed for this work include Spacy and SciSpacy [7] [8]. This research process is outlined meticulously, emphasizing the preparation of datasets for the proposed approach.

NER-TL-BioMD The research work employs the NER-TL-BioMD model to accurately identify medical entities such as drugs, dosages, Symptoms, and diseases. Figure 1 illustrates the proposed research methodology. The initial phase involves Python scripts to retrieve and organize clinical notes text obtained from the PubMed website. The work also encompasses the development of newly constructed dictionaries, which are further processed using the spacy string matcher to create newly annotated sentences. To support the annotation process, the PSL (Python-Spacy-Language) annotation tool has been developed, utilizing a "Python-Flask" based REST API as the backend [14]. This tool effectively analyzes document comments and generates the necessary formatted information for training transfer learning models using spacy. A Python module is utilized to leverage the capabilities of the pre-trained spacy language model, while another Python module builds upon the existing blank spacy model and incorporates the annotated information. By applying the TL concept, a new model is created on top of the blank model, resulting in improved performance and accuracy.

Data Collection
In this research work, a comprehensive computational corpus was constructed by analyzing openly accessible sample clinical data. The medication evaluation reports obtained from the "PubMed website" [9, 10] were utilized to prepare the datasets. Specifically, dictionaries were compiled for the identification of various entities including Drugs, Diseases, Dosages, and Symptoms. The acquired documents were subjected to preprocessing techniques to transform them into plain text format. To convert PDF documents into plain text documents, the pypdminer library was employed, ensuring the compatibility of the data for further analysis. A detailed numerical summary of the datasets utilized in this work is provided in Table 1, offering valuable insights into the composition and characteristics of the collected data. To facilitate the annotation process, a customized data annotation system was developed specifically for this research. This system enables the annotation of sentences with relevant entities. Figure 2 illustrates a sample annotation, show casing the marked entities within the annotated sentences. The annotation process involves identifying and labeling the specific entities of interest, such as drugs, diseases, dosages, and Symptoms, within the given sentences. This annotated data serves as a crucial resource for training and evaluating the performance of the NER (Named Entity Recognition) models developed in this work.

To annotate the sentences with entities, the research work employed the "spacy phrase matcher" libraries. Initially, a total of 100 sentences were annotated individually for each entity of interest. The detailed statistics regarding the number of instances for each entity are presented in Table 1, providing insights into the distribution of annotations. Subsequently, the annotated sentences were utilized to train the model using the spacy blank model as the starting point. By leveraging transfer learning techniques, the model was fine-tuned using the annotated data to improve its performance in identifying and extracting the desired entities from text. This training process enables the model to better understand the patterns and characteristics associated with the annotated entities, enhancing its ability to accurately recognize them in unseen text data. In order to train and evaluate the model, the dataset was randomly divided into two parts: 80% for training and 20% for testing. The spacy framework follows a dataset model structure, where each entry consists of a sentence followed by the positions of the entities within that sentence. To ensure that the sentences do not overlap, any redundant or duplicate sentences were removed during the data annotation process. This step was taken to reduce computational time and avoid duplication of information. Figure 3 presents the pseudo code of the proposed model, outlining the steps and procedures involved in training and evaluating the model. The code provides a clear overview of the implementation process, enabling researchers and practitioners to understand the logic and structure of the model's functionality.

The spaCy library gives an assortment of instruments to quick content preparing and model validation. It is created as a measured pipeline to validate the newly built models. The default model (blank model) has a customized NER pipeline which had to be enabled before training a new model. This customization helps the developer to build a new model from the pre-trained model. It avoids unnecessary steps that have to be taken for building a new model from the scratch. This need transfer learning to share the knowledge of the pre-trained model with the newly built datasets. The pipeline of the spacy model contains tasks like content order, POS labeling, named element acknowledgment and so on moreover, these parts can be separately refreshed for adjusting to explicit executions. For

execution of the trials it had centered onto two basic parts of the spaCy pipeline. Those pipeline are having the segments that are liable to change words to vectors and the NER acknowledgment segment. CNN-LSTM are being used by spacy to build a new model. It allows transfer learning to retrain the pre-trained model. Also spacy performs faster than any other NLP models. The execution depends on the progress based structure depicted by the author [21]. The spacy library has a function display which renders the result in the web browser. It provides API to cooperate with the NER model. This makes the developers to extend the work and based on the entity visualization. The spaCy preparing API gets mistake angles and updates the model loads utilizing back-engendering. The spacy based training model was prepared using the TL for identify the medical entities. The proposed model is worked for English language. Utilizing the model which has been prepared for perceiving a couple of covering substances is regularly helpful in the event of restricted measure of preparing information when contrasted with the clear model.

After the dataset preparation phase, this is the second phase to train the model. The tokenized word are converted into word embedding (vector) through the spacy NER pipeline. The tok2vec is the concept based on word2vec and glove [22, 23]. These strategies are being used for analyzing the word with statistical techniques. Each word are embed with a numerical value and used to find the similarities and distance between the words. It also helps to manipulate the sentences with word embedding's. Bidirectional Encoder Representations from Transformers (BERT) and Embedding's from Language Models (ELMo) are two different dynamic and word embedding respectively which are used for language models. The NER model runs on different AI based model to identify the entities are referred as dynamic embedding. It works as bidirectional methodologies. The dynamic embedding used transfer learning to reduce the model training cost. The preparation job executes on crude content corpus containing an enormous number of area explicit strings. Word Embedding's are then acquired from the prepared model that could be utilized as token vectors. spaCy has executed a profound learning execution for acquiring dynamic word embedding's utilizing a surmised language-demonstrating objective. The pretrained covering API [12] inside executes the preparation of this profound learning model given a huge corpus of area explicit content information. The yield of pre-training API is an area explicit dynamic inserting model.

This research work had planned three trials utilizing these two key segments of the spaCy NLP pipeline and prepared different NER models utilizing the clarified preparing information to get ideal execution on test information utilizing the spaCy preparing module [15]. The experimental setup which has been used for this research work is given in the following section system configuration. Blank spaCy model which was prepared with the base spacy English language model (this model has no prepared substances) utilizing commented on preparing information to perceive four custom elements. It didn't give any custom token to vector layer and set the API to utilize default execution of the spaCy NLP pipeline. As the model was at that point prepared on clinical information, we utilized it as a base model and applied exchange learning and retrained it utilizing our in-house explained information. Like the clear models, it is prepared 5 models (for 100 cycles with dropout rate, alpha=0.3) while expanding the preparation information from half to 100% of the accessible preparing information. The exhibition of the prepared models was assessed on the standard test information.

In request to work on the exhibition of move learning models further, we utilized a recently delivered spaCy bundle include, that of pre-preparing. Pre-preparing permits us to introduce the neural organization layers of spaCy's CNN layers with a custom vector layer. This custom vector can be prepared by using an area explicit content corpus utilizing the spaCy library pre-preparing order [12]. The pre-preparing API spaCy has executed a profound learning execution for acquiring dynamic word embedding's utilizing a Language Modeling with Approximate Outputs (LMAO) portrayed in spaCy Language model pre-training [25]. The proposed research work had utilized spacy NLP based data processing API. The API allowed to retrained the pre-trained model and able to overcome the catastrophic forgotten problem. It is examined the space explicit content corpus (which was made by using text sentences from 29774 sentences that has been extracted from the PubMed websites. It had checked the misfortune over age while preparing and it was seen that the misfortune slowly diminished to least around 95 age mark after which it leveled. For working with scientific NLP based problems, spacy has provided scispacy models. "en_ner_bc5cdr_md" is a model which has been trained with medium amount of datasets. This model identifies the

67567

named entities that are related to the medical terms. The prepared annotated datasets are trained over this model by retraining the pre-trained model. The NLP model is resumed from the beginning. This makes to add the new entities with the existing entities. For this research work, the model is trained with 95 epochs. The dropout rate considered for this model is 2%. Based on the dropout rate the model loss is calculated.

RESULTS AND DISCUSSION

The evaluation of the proposed model is conducted using commonly employed metrics such as precision, recall, and F-score. These metrics provide insights into the performance and accuracy of the model in classifying entities. Precision is a metric that measures the proportion of correctly classified positive labels, specifically the true positives (TP), out of all the positive labels (TP and false positives (FP)) obtained from the datasets. It is calculated using the following equation 4

$precision = \frac{True\ positives}{(True\ positives\ +False\ Positives\ )}$equation 4

Precision reflects the model's ability to accurately identify and classify the relevant entities without incorrectly classifying unrelated entities as positive. By calculating precision, we can assess the model's performance in terms of correctly identifying the desired entities, minimizing false positives, and ensuring reliable and precise result. Recall, also known as sensitivity or true positive rate, is a metric used to measure the proportion of true positive (TP) labels correctly identified by the model out of all the actual positive labels, including both the correctly classified and incorrectly classified labels (false negatives (FN)). It is calculated using the following equation 5

$Recall = \frac{True\ positives}{(True\ positives\ +False\ negatives\ )}$equation 5

Recall provides information about the model's ability to capture and correctly identify all the relevant entities, ensuring that minimal positive labels are missed or incorrectly classified as negative. It is particularly important in scenarios where the identification of all positive instances is crucial, such as in medical diagnoses or anomaly detection.

F-score: The harmonic mean of equation (4) and (5) is given in the equation 6.

$F - measure = \frac{2*Precision\ *Recall}{(Precision\ +Recall\ )}$equation 6

The overall performance for the proposed work is calculated and the results are provided in the table 2.

The results indicate that transfer learning (TL) greatly enhances the performance of named entity recognition (NER) models in the biomedical domain. TL improves accessibility to information and consistently increases model performance on test data. The proposed NER-TL-BioMD approach shows a moderate improvement compared to the existing approach. The retrained model outperforms the blank scispacy model, highlighting the effectiveness of transfer learning. However, caution must be exercised when adding new entities to existing ones, as it can lead to incorrect predictions and reduced accuracy. Additionally, the use of pre-training reduces computational time and improves the accuracy of the proposed model. Evaluation metrics such as precision, recall, and F1 score are calculated for NER models, and the proposed NER-TL-BioMD model consistently achieves higher F1 scores across different entity types (drug, diseases, dosage, and Symptoms). These findings are further supported by the bar diagrams illustrating the model's performance. The retrained scispacy model with the newly built dataset surpasses the performance of the baseline model. The proposed NER-TL-BioMD model, built upon the scispacy model, achieves a decent F1 score. Notably, the F1 scores for all entities demonstrate an approximate 4% increase compared to the baseline model. Furthermore, the custom model developed for this research work achieves an impressive F1 score of 89.28% for drug entities, surpassing the pre-trained model.

Overall, these findings highlight the significance of transfer learning, particularly in the biomedical domain. NER-TL-BioMD demonstrates superior accuracy and outperforms existing models, particularly in identifying drug entities.

Mala

The results that are shown above conveyed that with help of TL in accessibility of preparing information, the presentation of the models on test information consistently increments. It is evident that, there is a moderate increase has been seen with the proposed and existing approach. The retrained model has outperformed well than the blank scispacy model. The transfer learning which add new entity to the existing entity could be cross-over and may produce wrong prediction. This would reduce the accuracy. Moreover, execution produced an indefinite quantity which are seen during the utilization of the pre-preparing that cut down the computational time. Also it helped to increase the accuracy of the proposed model. For each prepared model in general NER assessment measurements are been calculated which incorporates Precision, Recall and F1 Score. Figure 4, 5, 6 and 7 represents bar diagram for the entities drug, diseases, dosage and Symptoms respectively. The proposed work NER-TL-BioMD is compared with blank model add the newly built model was outperformed well than baseline NER. From Figure 4, 5, 6, and 7, it is evident that there is an increase in the F1-Score metrics. The proposed NER-TL-BioMD is able to classify the True Positive and True Negative more accurately. This is happened because of the well-annotated datasets. Table 2 represents, the F1scores of the model for identifying the entities drug, diseases, dosage and Symptoms which has been produced by the NER-TL-BioMD with pre-preparing are reliably greater than other models across the same elements. The scispacy model which has been pre-trained with the "en_ner_bc5cdr_md" model that is retrained with the newly built dataset produced better results than the existing baseline model. The proposed model is added on the existing scispacy model and resulted decent F1 score. It is observed that overall percentage for all the entities have around 4 percentage of increase than the baseline model. The custom model which has been built for this research work produced 89.28 percentage as F1 score for the drug entities and leaded as better model than the pre-trained model.

CONCLUSION

The application of natural language processing (NLP) in the medical field, specifically for named entity recognition (NER), is a noteworthy development. This research work focuses on identifying crucial entities such as diseases, symptoms, drugs, and dosages. The identification of these entities holds significant value in diverse applications like medical chatbots, question-answering systems, and toxicology report generation. Remarkably, the pre-trained model is retrained using newly annotated data, resulting in improved accuracy for the newly added entities. The proposed model exhibits exceptional performance, achieving an impressive overall accuracy of 74.3%. The data utilized in this work is extracted from medical documents sourced from the esteemed PubMed website, ensuring a reliable and robust dataset. The incorporation of transfer learning in this research is an intriguing approach that proves beneficial in enhancing model accuracy, particularly when training data is limited. Furthermore, expanding the range of entities to include additional elements such as route of administration, dosage levels, species, and organs holds promise in augmenting the model's capabilities and versatility. Such advancements open up new avenues for utilizing the model in various healthcare applications. In conclusion, this research work presents promising results and demonstrates the potential to contribute to the development of effective NLP models tailored for the medical domain. The successful identification of important entities and the utilization of transfer learning techniques highlight the significance of this work in advancing the field of NLP in healthcare.

ABSTRACT

The present study deals with the physiology of cat fish *Mystus cavasius* in Tunga river of Karnataka. Protein was estimated from testes, ovary and liver at different months. The Gonado Somatic Index, Hepato Somatic Index protein content of ovaries, testis and liver of *Mystus cavasius* in Tunga river was studied during July to October 2017. The GSI values increases gradually and marked enhancement of index occurred. The increases was almost linear during September there was marked fall in GSI value and the GSI index continued to be low during remain period. The GSI value is large in August and September indicates that for is engaged in spawning activity from August to September. Higher values of HSI was found during the resting and preparatory month of October. The minimum HSI was found during in July month. The HSI value is more in male than find then also observed his was high at beginning of the gonadal development their after the value decreased to low level in mature stage. Monthly variation in protein content of the testies, ovary over to increase shows the inverse relationship i.e. increases the protein content in testes and over as during in July on the contain the liver and muscle protein decreases during July indicates their inverse relationship. The protein content in ovary, muscle and liver in more in female compared to male testis, muscle and liver. The biochemical contents are higher in females because they contain large weight and length than male.

Keywords: GSI,HIS, Protein, Ovary, liver, physiology, *Mystus cavasius*

INTRODUCTION

In the world about 22,000 species of fish have been recorded of which 24.73% belongs to fresh water, 6.5% back water and 65.45% of marine ecosystem. India has huge inland water resource interview of 29,000 km of rivers. India is home for more than 10% of global fish diversity. *Mystus cavasius* is widely distributed siloroid fish found throughout the India and Burma in rivers canals, irrigation, channels, ponds and inundated field. It belongs to family Bagridae, *Mystus auspicious cavasius* is a commercially important fishery along Bhadra river. This genera comprises same species *Mystus seenghala, Mystus tengara, Mystus montanus* etc. These fishes are differ from each other. The economic value of any fish depends upon relationship between its length and weight. The ratio of length to weight of fish is known to be a useful index to demonstrate the well being of the fish. It plays a vital rave in the fishery. It helps in establishing the yield and also in comforting, one variable into the other as is often required in during monitoring field operations. The method of studying spawning season is to followed seasonal changes in gonadal weight in relation to body weight expressed as the GSI. Gonad undergo regular seasonal cyclic changes in weight practice in female indicates the spawning season. It is one of important parameter of fish biology. It gives the detail idea regarding the fish reproduction and reproductive stages of the species and helps in ascertaining breeding period of fish. The method of studying of seasonal changes in liver weight decreases relation to body weight expressed as the HSI. Liver undergo regular seasonal cyclic changes in weight in both male and female indicate the spawning season. It is also one of the important parameter of biology. Biochemical compositions of fish tissue are of considerable interest for their specificity in relation to food values of fish and for evaluating their physiological needs at different periods of life. A number of workers have studied the depletive effects of maturation and spawning in the chemical composition of fish (Appa Rao, 1967; Pandy et al., 1976; Piska & Prasad, 1991; Kiran & Puttaiah, 2005). The seasonal bio-chemical variations correlation tests, ovaries, muscle and liver have not been given much attention of *Mystus cavasius* of Tunga river. Hence, keeping in view of the commercial importance of fish, an attempt have been made to study the storage and utilization of liver contents for testicular growth spermatogenesis and oogenesis.

Objectives of the study
➢ To give a brief account on *Mystus cavasius* and know about Scientific position morphology and habitat description.
➢ To study the identifying character of *Mystus cavasius*.
➢ To study the protein content in the liver, gonads and muscles.
➢ To study the GSI and HSI of the *Mystus cavasius*.
➢ To Study the length and weight relationship of the *Mystus cavasius*.

MATERIALS AND METHODS

Study area
The Tunga river is in Karnataka state of Southern India (Figure 1 and 1A). The river is originated born in the Western Ghats at a place called Gangamoola. From here, the river flows through two districts like Chikmagalur and Shimoga District. Tunga river is about 147 km long and merge with the Bhadra river at Koodli Sangama, a small town near Shivamogga of Karnataka. The Tungabhadra flows towards East and merges with the Krishna river in Andhra Pradesh, India. Tunga dam is built at Gajanur,

METHODOLOGY

During the study period (July to October 2017) 2 specimens of *Mystus cavasius* were collected monthly from the local fisherman. The fish were measured and weighed in the fresh condition with the help of measuring board and weighing balance the length weight relationship was estimated by using the

Ashashree

Log W = Log a + b log l

Where, W =Weight ;L = Length ; a = multiplying constant ;b = exponent of length. According to the statistical analysis, The values of an average total length were platted against their respective weights. The departure from cubic law has been tested and correlation co-efficient has also been computed to test whether regression co-efficient depart significantly from the cubic value C. The fish *Mystus cavasius* (Figure 2) were collected several time per month from Tunga river during July to October and were obtained from fisherman. They were brought in to the lobaratory and then scarified for further studies. The tissue was processed from protein estimation- GSI and HSI. The protein was estimated as method described by Lory method and to study the Gonadosomatic Index and Hepatosomatic Index. Two fishes were examined per month in 4 mounted duration. The weight of liver and gonads of individual fish was recorded and GSI and HSI was calculated by using formula.

$$GSI = \frac{\text{Weight of Gonad}}{\text{Weight of fish}} \times 100$$

$$HIS = \frac{\text{Weight of Liver}}{\text{Weight of fish}} \times 100$$

Morphological Description

Kingdom	:	Animalia
Phylum	:	Chordate
Sub phylum	:	Vertebrata
Class	:	Actinopterygii (Ray-finned fishes)
Order	:	Siluriformes (cat fish)
Family	:	Bagridae (Bagrid catfishes)
Genus	:	*Mystus*
Species	:	*Cavasius*.

Body is elongated and compressed head conical barbells 4 pair maxillary pair in adult fish reached or cross base of caudal fin but in young specimen do not external beyond the anal fin. Dorsal spine weak first ray of dorsal fin much longer than heat, Adipose fin large and originated from just behind dorsal. Dorsal adipose and caudal fins shaped with melanophore, Lateral line present and straight upper lobe of caudal fin longer than lower lobe and pointed. The male can be easily separated from female big its, It was developed urinogenital papilla.

DESCRIPTION

Grayish with a more or less well defined isolateral longitudinal strip. A dark spot emphasized by a white or pale area along it's ventral margin is just anterior to the first dorsal spine. Dorsal adipose and caudal fins shaped with melanophorer. It is elongated and can pressed body. It's depth ¼ th of standard length. Head is conical, medium longitudinal groove is present on head that extends in position. Villiform teeth are present on jaws and vomerine. 4 pair of brackets extend close to the base of caudal fin. Dorsal spine is weak and freely secreted adipose fin is large and caudal fin is forked. Dioecious, oviparous, distinct pairing and external fertilization. Maximum size: 14-22cm. Fishes are the Valuable source of the high grade protein and other organic products. Fresh water fishes provided valuable source of food supply to inhabitants of countries located in tropical region. Flesh of fish is highly nutritive with 60-80% water 13-20% protein and greater or less amount of fat. It also contain phosphorous and vitamins.

RESULT AND DISCUSSION

Result data are depicted in Table 1-6 and Figures 3-5. *Mystus cavasius* is a fresh water fish. This fish is commercially important as it consumed by large population. Although the reproductive biology of this fish has received attention in other areas by many workers. Systematic study pertaining to the biochemical changes in response to different mounts. Hence in the present investigation observation on aspects such as length weight relationship condition changes in to GSI. HSI biochemical changes during the 4 mouth reproductive cycle has been studied. The study of length weight relationship of primary importance in setting up yield equation in estimating the number of fish landed and in comparing population in time and space. The study of length weight relationship also gives an idea of their growth rate generally the length of fish increases. The weight also increases. Showing that the width of the fish is a function of its length.

Maximum length reported = Male = 20cm.
                         = Female = 21.3cm
Weight of *Mystus cavasius* = Male = 75g
                          = Female = 232.1 g

Compare to male and female the female inhaling more weight and length than male.
There was a fare degree of correspondence between maturity stages. GSI values and historical events. The GSI values increases gradually and marked enhancement of index occurred from idly. The increases was almost linear during September there was marked fall in GSI value and the index continued to be low during remain period. The GSI value is large in August and September indicates that for is engaged in spawning activity from August to September. The breeding season of the animals can be determined by several methods such as by GSI measuring gonadal weight, Ganado somatic index is a function of the breeding cycles of fishes. The gonadosomatic index involves determination of the ratio of gonadal weight to the body weight. Compare to male and female the female as high value of GSI than male. Because the female have high value of gonad and weight compared to male. The HSI also known as the hepatosomatic index. Like GSI, HSI also varies during the reproductive cycle in fishes. Because of involvement of liver is strongly correlated to vitellogenic activity. Seasonal changes in the HSI indicates that liver undergo went more or less parallel changes in weight in 4 months.

 HSI and GSI also exhibit inverse relationship suggesting that the liver supports to spermatogenesis and organic activity. Higher values of HSI was found during the resting and preparatory month of October. The minimum HSI was found during in July month. The HSI value is more in male than find then also observed his was high at beginning of the gonadal development their after the value decreased to low level in mature stage. Protein is necessary for the physiology of the cell. According to body protein reserves are utilized for gonads growth in fish. Total protein of the muscle, liver, ovary and testes showed fluctuations during the reproductive cycle. They exhibit well marked trend of build up and utilization in order to meet the needs of reproductive metabolism. In the present study the monthly variation in protein content of the testies, ovary over to increase shows the inverse relationship i.e. increases the protein content in testes and over as during in July on the contain the liver and muscle protein decreases during July indicates their inverse relationship. The protein content in ovary, muscle and liver in more in female compared to male teties, muscle and liver. The protein content in ovary is more in October in August and in tests also protein content more in October and less in August, month. And the protein content in muscle more in September and less in July compare t o male and female the protein content in more in female. The protein content in liver is more in October and less in July both in male and female and the protein content more in female to male. Norman has reported that the stage of gonads may play a great role in the biochemical composition of a fish. Hence, the observation made here is in agreement with Norman (1962); Singh et al., 1993; Dhawan and Sexena (1998); Kiran & Puttaiah (2005); Kour and Kour (2006), Joseph Marykuttu et. al., (2011), Shendge et al., (2012); Ashashree et al (2013). The proteins in the flesh of fish are important for the tissue building activity of those who consume them.

Ashashree

Protein cycle does not show any relationship with intensity of feeding. Low value of protein content in winter or post-monsoon season may be a consequence of greater utilization of protein for energy requirements in the season.

Water Analysis

The color of the water indicates it's turbidity. If the turbidity of water is high the fishes cannot survive in that region. This is because the mud particles present in that water results in bladder clot or gill dat. The water has low turbidity and it is suitable for the existence of *Mystus cavasius*. pH is the negative logarithm of hydrogen ion *Mystus cavasius* requires pH around 7-8. That mean, it requires the pH which is slightly basic or neutral. As in this study Tunga river show the pH values of 7.2 to 7.8. *Mystus cavasius* required temperature 16°-25° in the present study the observed the water temperature is around 16.4 to 17.2. All living organisms are dependent on oxygen to maintain metabolic process to produce energy. For growth and reproducing. The amount of oxygen present in the water is called as dissolved oxygen. It is by product of photosynthesis by algae and other hydrophytes. The present investigation reveals the dissolved oxygen content was range from 6.8 to 8.8mg/l. The total hardness in the Thunga river was 124.2 to 132.6mg/lFishes are the Valuable source of the high grade protein and other organic products. Fresh water fishes provided valuable source of food supply to inhabitants of countries located in tropical region. Flesh of fish is highly nutritive with 60-80% water 13-20% protein and greater or less amount of fat. It also contain phosphorous and vitamins.

CONCLUSION

The present investigation gives information about the protein content in the gonads, muscles, and liver of *Mystus cavasius*. The investigation give the protein content for 4 month duration.

- The length and weight gives the relationship of length and weight. If the fishes length increases the weight also increases. The weight is depends on length of fish and the females *Mystus cavasius* is largest than male. It indicates that the female is target than male.
- The GSI (Gonadosomatic index) gives a relationship between weight of fish. The GSI value in female fish is larger than male.
- The protein content in the testes, ovary, liver, muscles are larger in female than male. The biochemical contents are higher in females because they contain large weight and length than male.

ABSTRACT

In Siddha system of medicine, Thalisapathiri is an herbal drug which is commonly known to treat Respiratory ailments. But Thalisapathiri vadagam, an herbal formulation is indicated for renal calculi in Siddha literature. Renal calculi are an increasing urological disorder by which 12% of the world population is affected. This study is aimed to execute the in-silico computational study of phyto constituents of Siddha herbal formulation Thalisapathiri vadagam for renal calculi against Tamm-Horsfall protein. Docking calculations were carried out for retrieved phyto components against target protein Tamm–Horsfall protein. In the herbal formulation Thalisapathiri vadagam, total of 24 bioactive lead compounds were retrieved. The phyto chemicals such as Rhodoxanthin, Dio sgenin, Apigenin, Gingerol, Piperic acid, Maslinic acid, Epicatechin, Betulonic acid, Coumaric acid, Carvacrol, Germacron, α-thujene, Embelin, Elemene, Costunolide, Cinnamic acid, Elemicin, Kaempferol, piperine, β-sitosterol, glabridin, lupeol, Myrcene, and Vitexin possess maximum of 2-3 interactions accounting for 28-42 % of binding efficacy with the core active amino acid residues present on the target protein. Thereby phyto components which inhibit the target Tamm–Horsfall protein may act as a potential therapeutic agent for management of urolithiasis. The phyto chemicals present in the Siddha formulation reveals significant anti- urolithiasis activity.

It is concluded that these compounds may exerts promising anti-urolithiasis activity by preventing calcium oxalate crystallization. Further studies can be conducted to determine the efficacy of the herbal drug.

Keywords: Renalcalculi, Siddha, molecular docking, Thalisapthiri vadagam, Tamm–Horsfall protein.

INTRODUCTION

Renal calculi or Nephrolithiasis is the process of formation of stone in the kidney or bladder or urinary tract. Nephrolithiasis is derived from the Greek word meaning nephros-kidney, lithos- stone. The epidemiology of renal stone presents with global variations which depends on socio-economic, geographic, and climate factors. The prevalence and incidence of the disease depends on their age, sex, race, and diet[1].An imbalance between water handling and solute clearance by the kidneys result in meta stable state that favours crystallisation thus leads to the stone formation .Renal calculiaffect 10% of the adult population and is 8 times more common in males than females. In children, it is rare and associated with metabolic diseases. 80% of the renal calculi in adult composed of oxalate and phosphate. Nephrolithiasis is leading cause of renal failure among young and middle aged [2].In the last three decades, the prevalence of renal stones has increased worldwide. In the US population, The National Health, and Nutrition Examination Survey (NHANES) was used to determine the prevalence of renal calculi. In a comparison of NHANES II (1976–1980) and NHANES III (1988–1994), it was estimated that renal stone prevalence increased from 3.8 to 5.2% for the period of 20 years. The NHANES data from 2007–2016 reported that the overall weighted prevalence of kidney stone disease was 9.3%[1].The recurrence of renal stone varies among different patients. Approximately half of the patients will have second occurrence of renal calculi within 10 years. More than 10% experience relapses. Specific stone composition leads to recurrence upto 82.4%[3].Management of renal calculi depends on their size and where it is located. Besides the open clinical surgery now there was ESWL and ureteroscopy for the removal of renal calculi. To prevent the surgical intervention and long-term usage of diuretics there is a need of herbal medicine and dietary modification .In Siddha system of medicine renal calculi can be compared with Kalladaipu. Various herbal and herbo mineral formulations are used for the management of Kalladaipu. Thalisapathiri is an herbal drug which is commonly known to treat various respiratory ailments. But in a Siddha literature named Aathmaratchamirtham the polyherbal formulation THALISAPATHIRI VADAGAM is indicated for Kalladaipu[4].Many of the herbs included in the formulation has anti-urolithiatic and diuretic in nature. Tamm-Horsfall protein THP is produced by renal tubular cells of distal loop of Henle[5]. Tamm-Horsfall protein is a urinary defense factor, and its deficiency leads to the major contributing factor for human nephrolithiasis[6]. THP powerfully inhibits the aggregation of calcium oxalate but abnormal structural THPs may promote calcium aggregation[7]. Binding of phyto components from the herbs with the core amino acids (527, 528, 529, 534, 583, 585, 586) of the targets by forming hydrogen bond will hinder the function of the target protein Tamm–Horsfall protein (PDB) -4WRN which is involved in calcium oxalate crystallization. Thereby phyto components which inhibit the target Tamm–Horsfall protein may act as a potential therapeutic agent for management of urolithiasis and related symptoms. So, this study aims to analyse the in-silico molecular docking analysis of Thalisapathiri vadagamfor anti-urolithiasis activity against the target Tamm-Horsfall protein.

MATERIALS AND METHODS

The crystalline structure of the target protein Tamm–Horsfall protein (PDB) -4WRN Fig. I was retrieved from protein data bank and the protein clean-up process was done and essential missing hydrogen atom were being added. Different orientation of the lead molecules with respect to the target protein was evaluated by Autodock program and the best dock pose was selected based on the interaction study analysis.

METHODOLOGY

Docking calculations were carried out for retrieved phyto components Rhodoxanthin, Diosgenin, Apigenin, Gingerol, Piperic acid, Maslinic acid, Epicatechin, Betulonic acid, Coumaric acid, Carvacrol, Germacron, α-thujene, Embelin, Elemene, Costunolide, Cinnamic acid, Elemicin, Kaempferol, piperine, β-sitosterol, glabridin, lupeol, Myrcene, and Vitexinagainst target protein Tamm–Horsfall protein. Essential hydrogen atoms, Kollman united atom type charges, and solvation parameters were added with the aid of AutoDock tools[34]. Affinity (grid) maps of ×× Å grid points and 0.375 Å spacing were generated using the Autogrid program[34]. Auto Dock parameter set- and distance-dependent dielectric functions were used in the calculation of the van der Waals and the electrostatic terms, respectively. Docking simulations were performed using the Lamarckian genetic algorithm (LGA) and the Solis & Wets local search method[35]. Initial position, orientation, and torsions of the ligand molecules were set randomly. All rotatable torsions were released during docking. Each docking experiment was derived from 2 different runs that were set to terminate after a maximum of 250000 energy evaluations. The population size was set to 150. During the search, a translational step of 0.2 Å, and quaternion and torsion steps of 5 were applied.

RESULTS AND DISCUSSION

In the polyherbal formulation a total of 24 bioactive lead compounds were retrieved from the herbs (Table I). From the herbs, the phytochemicals such as Rhodoxanthin, Diosgenin, Apigenin, Gingerol, Piperic acid, Maslinic acid, Epicatechin, Betulonic acid, Coumaric acid, Carvacrol, Germacron, α-thujene, Embelin, Elemene, Costunolide, Cinnamic acid, Elemicin, Kaempferol, piperine, β-sitosterol, glabridin, lupeol, Myrcene, and Vitexin. When comparing the binding efficacies of the phytochemicals (Table III) it was found that the Rhodoxanthin which has a lowest binding affinity of -7.77 kcal/mol and had 3 interactions with amino acid residue 527 TYR,529 LEU and 534 SER (Table IV) , secondly β-sitosterol which had the binding affinity of -7.33 kcal/mol which had 2 interactions with 527TYR,528 PRO followed by diosgenin ,Glabridin, vitexin, Lupeol, Maslinic acid, betulonic acid, costunolide, Germacron which had a binding affinity of -7.28 kcal/mol, -6.90 kcal/mol, -6.90 kcal/mol, -6.70 kcal/mol, -6.65 kcal/mol, -6.65 kcal/mol, -6.56 kcal/mol, -6.07 kcal/mol respectively. The amino acid 529binds with maximum of 18bioactive compounds namely Rhodoxanthin, Apigenin, Gingerol, Piperic acid, Epicatechin, Betulonic acid, Coumaric acid, Carvacrol, Germacron, Embelin, Elemene, Costunolide, Cinnamic acid, Elemicin, Kaempferol, Myrcene and Piperine. The amino acid 527 binds with the maximum of 13 phytochemicals and the amino acid 528 and 534 binds with 11 phytochemicals present in the formulation. All the 24 phytochemicals present in the formulation possess maximum of 2-3 interactions accounting for 28 – 42 % of binding efficacy with the core active amino acid residues present on the target protein Tamm–Horsfall protein.

CONCLUSION

Based on the results of the computational analysis it was concluded that the bio-active compound's present in the herbal formulation revels significant binding against the target Tamm–Horsfall protein by interacting with active amino acid present on the active site thereby it was concluded that these compounds may exerts promising anti-urolithiasis activity by preventing calcium oxalate crystallization. It was concluded that the phytochemicals present in the siddha formulation Thalisapathiri vadagam reveals significant anti- urolithiasis activity.

ABSTRACT

Microbiome of the plant rhizosphere has great impact on plant health and results in high quality by products. Sandal is an evergreen, root parasite with slow growth plant. The present workinvestigatedwiththeassemblageofthebacterialcommunitiesassociatedwithS.albumrhizosphere soil for metagenomicstudies.9,038 bacterial communities were identified using common and unique operational taxonomicunits(OTUs)by QIIME pipe line(1.9.1).The aims were to highlight the importance of assessing the potential role of Actinobacteria using as a culture treated bio fertilizer which was basically having the capacity of inhibiting phytopathogens on rhizosphere soil which helps to improve sandal tree productivity. A field experiment was conducted to grow sandal saplings, Neem tree as host, Actinobacteria as culture treatment without host and, bio fertilizers without host and treatment. Plant morphometric analysis were determined and compared for a one year and two years old tree. The results showed that the effect of Actinobacteria treated bio fertilizer on sandal sapling having good growth on height, basal grith and leaves. Height and basal grith significantly increased when it was treated with Actinobacteria when compared with rest of two experimental saplings. The highest growth rate shows the efficiency of Actinobacteria uptake on rhizosphere level. Actinobacteria can have the ability of promoting growth on one year and two years old sandal tree. Therefore, Actinobacteria treatment should be considered when treated bio fertilizer is applied to soil as fertilizer.

Keywords: *Santalum album*, rhizosphere soil, microbiome, High-throughput　 sequencing, QIIME(1.9.1), Actinobacteria.

INTRODUCTION

Soil micro organisms have an important role on soil fertility and plant health. The differing physical, chemical and biological properties of the root associated soil, compared with those root free bulk soils are responsible for changes inmicrobialdiversityandforincreasednumbersandactivityofmicroorganismsinthemicroenvironmentofrhizosphere(Vel mourougane et al. 2017).In general, parasites uptake nutrient from their host for their growth, if a parasitic plant that has directly attaches to another plant via a haustorium which has a specialized structure that forms amorphological and physiological link between the parasite and host (Yoshida et al. 2016). *Santalum album* L. (Sandalwood) is a commercially and culturally important plant species belonging to the family Santalaceae and the genus Santalum. There are around 18 sandalwood species of genus Santalum (Baldovini et al. 2011). Among various Santalum species, Indian sandalwood (*S. album*), which is also sometimes referred as east Indian Sandalwood, stands out for its highly valued oil and aromatic wood (Arunkumar *et al*. 2016). However, there is lack of knowledge on the ecology and the distribution of this commercially valued species due to inadequate research (Subasinghe 2013). *Santalum album* L. is an important semi parasitic tree whose roots join to host roots, through haustoria, to acquire water and nutrients. Due to hemi parasitic nature, finding suitable host species is a limitation in establishment of sandalwood plantations (Teixeira et al. 2016). In India, the area under sandalwood is decreasing fast due to illegal collection and its difficulty in plantation establishment (Rocha et al. 2014). Due to over harvesting in its natural habitat in India, it is listed as vulnerable by the International Union for Conservation of Nature (IUCN) and is placed in Appendix II of CITES. Owing to the immense value and its declining population in its natural habitats, opportunity for plantation of sandalwood to satisfy its demand is huge (Jones, 2008). The bio geographical patterns exhibited by soil microbial communities has grown significantly.   This aspect of biodiversity, besides being fundamentally important for our understanding of the forces shaping the bacterial biosphere (Fierer et al. 2007)has practical value because it can provide a scientific basis for modern agriculture. With the development of sequencing technology, meta genomic analysis involves within the application of bioinformatics tools to review the genetic material from environmental, unculturable microorganisms. Considering its successful natural establishment at Sivaganga, this study aimed to identify the host species and enumerate environmental factors supporting its microbial population in the study area. The rhizosphere microbiome of *S. album* has focused on basic 16S rRNA sequencing to evaluate the bacterial diversityanddistinguishesthousandsoforganisms.Therearethreeprimaryphasesinmetagenomicdataprocessing:

1. assembly
2. annotation, and
3. statistical analysis (Thomasetal.2011). We also provided the analysis of soil physic chemical properties and themicrobiome analysis to understand the soil – microbes relationship between soil nutrients which involves in the growth of beneficial microorganisms. Furthermore, the genus of Actino bacter shows highly responsive on plant growth promotion. This will provide opportunity for the cultivation of sandal wood tree and benefits economically .In some literatures they reported that after 3–4 years, the host is no longer necessary for its growth and development. Our aim to grow the one year and two years old sandal saplings without any host. According to our results, we focused on Actinobacteria culture for the growth and development on one year and two years old sandal saplings in RBL nursery, Bharathidasan University, Tamil Nadu.

MATERIALS AND METHODS

Sample Collection and processing
S.albumrhizo sphere soil were collected from V.Pudur, Sivaganga District at 9.9726°N,78.5661° E, Tamil Nadu, India on December 2020 (Fig.1), collected sample was carried out under aseptic procedures were separated in the laboratory and stored at−20°C.

Velu Rajesh Kannan *et al.,*

Soil Physiochemical Properties

A comprehensive study of soil physicochemical and biological properties was analyzed. Soil moisture content was measured by the weighing method. The soil pH was determined using acalibrated pH meter by the microelectrode method (Zhang et al. 1999). The EC (Electrical Conductivity) (Hardie and Doyle, 2012) and organic carbon were determined (Walkley and Black, 1934; Piper, 1966). The available nitrogen was determined by kjeldal method (SubbiahandAsija,1956) available phosphorus (TaleandIngole,2015) by spectro photo meter and potassium by flame emission method (Jackson,1973). Available sulphur in the soil was extracted using 0.15% CaCl$_2$ solution (WilliamsandSteinbergs,1959). Exchangeable calcium and exchangeable magnesium by EDTA titration method (Raij,1966). Generalsoil physical profiles of texture, structure, color and density (Blake and Hartze, 1986), soil porosity, moisture content and water holding capacity (Sankaram, 1966) were determined.

DNA Extraction

DNA extraction using extraction buffer(10 ml) was mixed with sandalrhizo sphere soil(5g)onice and glass beads were added. The mixture was sonicated using a high intensity ultra sonic processor (VibraCell) with a standard 13mm horn soli pro befor 150 seconds. The sample was cooledinice and the sonication repeated. Sodium dodecyl sulphate (SDS) was added (3ml;20%) and blending continued for a further 5 sec. The sample was incubated at 65°C for 1 hr. transferred to centrifuge bottles (50 ml) and centrifuged at 6000g for 10 min. The supernatant was collected, and the soil pellet re-extracted with further extraction buffer (100 ml), incubation at 65ºC for 10 minutes and centrifugation as above.10 ml supernatants were transferred to centrifuge tubes (15 ml) containing a half-volume of polyethylene glycol (5 ml; 30%), and incubated at room temperature for 2 hrs. Samples were centrifuged (8000rpm for 20 min) and the partially purified nucleic acid pelletre suspended in 100 µl of TE. Potassium acetate (400 µl; 7.5 M) was added to a final concentration of 0.5 M. Samples were transferred to ice for 5min then centrifuged (8000rpm,45min) at 4°C to precipitate proteins and polysaccharides. The aqueus phase 0.5ml was extracted with phenol/chloroform and chloroform/isoamyl alcoho land DNA was precipitated by adding 2 volume(1ml) isopropanol. It was incubated at -20°C for overnight, DNA was pelleted by centrifugation (8000rpmfor 20min)and resuspended in TE(50µl) (Yeates et al. 1998).

HTS, Library preparation and Data Quality Optimization

A Qubit 2.0 fluorometer was used to measure DNA samples (Invitrogen, Carlsbad, CA, USA). A Meta Vx TM library preparation kit was used to produce amplicons from 40–50 ng of DNA(GENEWIZ, Inc., South Plainfield, NJ, USA). The hyper variable V3 and V4 regions of bacterial16S rRNA were chosen for amplicon sequencing, followed by taxonomic analysis (Caporaso et al. 2012; Gilbert et al. 2014).GENEWIZ created a set of proprietary primersaiming at the relatively conserved areas of the V3 and V4 hyper variable regions of the 16S rRNA of bacteria. The agilent 2100 Bioanalyzer (Agilent Technologies, Palo Alto, CA, USA) was used to confirm library quality control, and the Qubit 2.0 Fluoro meter was used to quantify it. Adopted the manufacturer's recommendations such as DNA libraries were multiplexed and put into an Illumina Mi Seq device(Illumina, San Diego, CA, USA). The MiSeq control software package (MCS) integrated in the Mi Seq instrument was used to sequence using a 2300 paired end (PE) configuration; image analysis and base calling were accomplished using the MCS (Caporaso et al. 2010). The metagenome sequence of *S. album* associated bacterial community was submitted in NCBI with the accession number of bio project PRJNA832090.

Statistical and Bio informatics Analysis

Sequence analysis was performed using the V search (1.9.6) (Westcott et al. 2015). To determine operational taxonomic units (OTUs), the 16S rRNA gene sequences were trimmed to a average length of 393 bp, sorted by using Cut adapt (v1.9.1). Operational Taxonomic Units were taxonomically annotated following a Basic Local Alignment Search Tool (BLAST) analysis against the Unite Database of each identified representative bacterial sequence done in QIIME software. Alpha diversity analysis was carried out to find the complexity of species diversity for each sample using 6 indices, which include observed species, Chao1 (Chao,1987), Shannon (Shannon,1948), Simpson (Simpson, 1949),abundance-based coverage estimator (ACE) (ChaoandLee,1992) and Good's coverage (Good,1953). Indices

calculation for all the samples was done using QIIME and visualized in R software (Caporaso et al. 2010). Community richness was identified with Chao indices richness estimator of the total number of species in ecology (http://www.mothur.org/wiki/Ace). An index that uses Chao1 algorithm to estimate the OUT number of samples commonly used in ecology to assess the total number of species. (http://www.mothur.org/wiki/Chao).The Shannon index commonly used to reflect the diversity index a for the estimation of microbial diversity(http://www.mothur.org/wiki/Shannon)and Simpson index (http://www.mothur.org/wiki/Simpson) indices were used for the identification of community diversity in all the samples. To characterize the sequencing depth and coverage, the Good's coverage (http://www.mothur.org/wiki/Coverage)was used. Rank abundance curve performed by using R packages and OTU clustered by V search (1.9.6) (Rand, 1971; Hubert, and Arabie, 1985).RDP classifier (Cole et al. 2014) Bayesian algorithm was used to classify the OUT representative sequences of 97% similarity level, and the community composition of each sample was analyzed and summarized at all levels. Taxon assignment was performed using the QIIME(v1.9.1). For each OTU cluster, a representative sequence was screened to perform taxo nomi cannot action. Rank Abundance Curve (RAC) is used to analyze diversity (MacArthur, 1957; Whittaker, 1965) by R packages based on the results of OTU analysis. Rank-abundance curve reflects both species abundance and species uniformity. Species uniformity is reflected by the shape of the curve. The rarefaction curve (Heck et al. 1975)is a useful tool to characterize the species composition of a sample and predicting the abundance of species in a sample. It efficiently deals with the increase of detected species due to the increase in sample size. The observed numbers of OTUs were plotted against the number of extracted sequences by QIIME(1.9.1).

Experimental site and plantation establishment

The study was carried out during one year old (2020-2021) and two years old (2020–2022) sandalwood plantations on RBL nursery field, Bharathidasan University located in Tiruchirappalli district, Tamil Nadu, India 10°40′29″N 78°44′39″E. The climate of the experimental site is semi hot, receiving 387 mm annual rainfall distributed with dryer June - September, wetter January - February, hotter April- May, and cooler October - December. The soil of the study area was low fertile, red soil, with pH (5.4). During summer, the plantation was provided with protective irrigation through the drip irrigation system. The sandal sapling considered in the study were one year and two years old with Actino bacteria culture treatments, bio fertilizers (without treatment) without any host and neem tree as host for morphology analysis.

Treatment and experimental design

The one- and two-year-old sandal tree were taken for the study. For first experiment *Santalum album* seeds were first soaked in Actino bacteria culture for 12 hrs at room temperature. Then the seeds were sown in soil in a RBL nursery, Bharathidasan University. For the second experiment only bio fertilizers are used for the growth. After seed germination and the seedlings developed at least six leaves, 12 cm tall seedlings were trans planted into grow bags (12x12 cm) filled with a mixture of green manure and vermin compost and placed in a greenhouse set up. After the growth of 1-month seedlings, they are moved to the field. As the seedlings grew to over 35 cm in height, the seedlings are directly transferred to the RBL nursery field soil. For the third experiment after sandal sapling plantation on the soil neem tree was planted at the side of sandal sapling which was taken as their host for growth. Compared to all three saplings they show differences in their height, girth and number of leaves present in the one year and two-year-old sandal tree.

RESULTS

Soil Physico chemical Profiles

The soil sample was collected upto 15cm depth and analyzed for available macro nutrients and soil physical parameters. The physio chemical properties of the rhizo sphere soil sample were presented in Table 1. The soil was red in color that has gravelly clay texture. The bulk density values were recorded as 1.34 Mgm^3. The water holding capacity of soil was recorded as 15.6%.The moisture content of the soil was recorded as 13.7%. The pH range was recorded as 5.4. The EC value was recorded as 0.14dsm^1. The organic carbon content was recorded as 6.3%. The

available nitrogen contentre corded as 204.0kgha^1. The available phosphorus content was recorded as 11.00kgha^1. Available potassium content was recorded as 72.0kgha^{-1}.Available sulphur content was recorded as 5.9 mg kg^{-1}. Calcium content was recorded as 9.35 kg ha^{-1}. Magnesium was recorded as 3.86kgha^{-1}.

Sequencing Data
A total of 7,878,805basesnumberswith alength of 235bp were obtained by sequencing16S rRNA from *S. album* rhizosphere soil sample. A total PEreadsof16,741 numbers with 393b peerage length from S.album rhizosphere soil sample. Filtration of raw read sof16Sr RNA were filtered using QIIME quality filters, followed by OTU identification, clustering and analysis (Fig.2).

Operational Taxonomic Unit(OTU)cluster and species annotation
QIIME pipeline (1.9.1) was used to analyses the bacterial diversity in the *S. album* obtained from the sivaganga forest. 16S rRNA sequences number were obtained having a combined length of200-500 base pairs (bp), and 16S rRNA V3-V4 gene profiles were generated from the *S. album* is to evaluate the diversity and abundance of bacterial association, 448 OTUs were identified. Operational Taxonomic Units identification was done with Vsearch software(1.9.6) . Based on ≥97% of sequence similarity, all the effective tags were clustered into OTUs. For each OUT cluster, are preventative sequence was screened to perform taxonomi cannotation. OTUs were taxonomically annotated following a BLAST analysis against the Unite Database of each identified representative bacterial sequenced one in QIIME software.

Diversity Index, Microbial Composition and Statistical analysis
The community compositions of annotated micro bio meindicated that there were 5 Kingdoms, 15 Phylas, 37 Classes, 62 Orders, 75 Families, 53 Genus, and 8 Species in therhizosphere soil of S. album. Alpha diversity refers to the diversity within a particular sample individually, and itis usually represented by the microbial species (i.e., species richness) enumerated in S.album. Alpha diversity analysis was done using Shannon, Simpson and Chaoindces, Rarefaction curves, Rank abundance and good's coverage for 16Sr RNA sample.Alpha diversity consists of plots displaying Shannon, Simpson, andChaoindices,builtusing16SrRNA samples(Fig.3).

Rarefaction Curve
In order to determine whether the sample size is enough and to calculate the species abundance, the rarefaction curve is frequently employed in biodiversity and community surveys. As a result, when the sample size is adequate, the rarefaction curve can forecast the species abundance in addition to determining whether the sample size is adequate. Qiime created the rarefaction curve using random sampling (1.9.1) (Fig.4).

Rank-Abundance Curve
The number of valid sequences in each OTU of a given sample was first calculated, and all the OTUs were then ranked in descending order based on their relative abundance (number of valid sequences). The result was then plotted, with OTU ranking on the X axis and the number of sequences in the OTU on the Y axis. The OTU relative abundance in % might alternatively be the Y axis. The length of the curve on the X axis reflects the number of species present. More species are present if the X axis is stretched. The curve's shape reflects the uniformity of the species. The higher the species homogeneity, the smoother the curve. (Fig.5).

Taxonomy Diversities
The abundant phyla identified in *S.album* using 16S rRNA data were Actino bacteria(23.4%), Proteo bacteria(14.9%), Acidobacteria(7.1%), Chloroflexi(4.1%), Firmicutes(2.3%), Nitrospirae(1.9%), Gemmatimonadetes(1.9%), OD1(0.1%), Armatimonadetes(0.1%), Planctomycetes (0.09%), Bacteroidetes (0.08%), WS3(0.05%), Cyanobacteria (0.04%), Spirochaetes (0.03%). The top 3 phyla present in *S. album* are Actinobacteria, Proteobacteria, Acidobacteria. The top 15 distribution of the abundant classifications of *S.album* rhizosphere soil sample atphylum level (Fig.6). The top 20 bacterial genera of 16SrRNA data based analysis were Acetobacter (2.3%), Lactobacillus (1.9%), Pseudonocardia

(1.3%), Kribbella(0.5%), Iamia(0.36%), Streptomyces(0.34%), Virgisporangium(0.30%), Mannheimi(0.29%), Mycobacterium(0.29%), Bradyrhizobium(0.27%), Rhodoplanes(0.25%), Agromyces(0.25%), Bacillus(0.22%), Mesorhizobium(0.22%), Balneimonas(0.19%), Kaistobacter(0.18%), Nitrospira(0.18%), Candidatus(0.17%), Cellulomonas(0.17%), Pasteurella(0.15%) and Pseudomonas(0.08%). The top 3 genera present in *S.album* are Acetobacter, Lactobacillus, Pseudonocardia. Species distribution using 16S rRNA sequence data based analysis were halophobica(0.7%), ochraceum(0.3%), multocida(0.1%), aureum(0.07%), vinacea(0.05%), marinus (0.04%), scabrisporus(0.04%). halophobicawere the most abundant species present in *S. album* rhizosphere soil. The distribution of the abundant classifications of *S. album* rhizosphere soil sample at species levels(Fig 7)

Treatment and untreated sandal sapling morphology analysis

The one year and two years old sandal saplings were taken for the study. Three types of sandal plantation were done. At first *Santalum album* seeds were first soaked in Actinobacteria culture. For second sapling plantation only with bio fertilizers andfor the third experiment, the sapling was planted with host (neem). The seeds were sown in soil in a RBL nursery, Bharathidasan University. After seed germination saplings were placed in a greenhouse set up. After 1 month, the seedlings are grown up to 30 - 40 cm in height, then the seedlings are directly transferred to the RBL nursery field soil. After 1 year and 2 years, treated and untreated sapling without host and with host(neem)sandal sapling shows some morphological variations in their growth. According to three saplings, the culture treated sandal sapling shows healthy with consistent growth during morphological studies. The sandal sapling was grown in a glasshouse in Bharathidasan University, Trichy with 10°40′29″N 78°44′39″E. Table 2gives the details of field treated with culture and untreated sapling morphology. Table 3 gives the details of field sapling morphology with host (neem) studied in this current experiment.

DISCUSSION

Present study needs to focused on *S. album* microbiome because of *S. album* natural habitat population has experienced substantial decrease due to extensive exploitation for commercial purposes (Teixeira et al. 2016). The conservation status of *S. album* alone has been on alevel of vulnerability as listed by International Union for Conservation of Nature and Natural Resources (IUCN) after the assessment of conservation status held in Viet Namin 1998.The growth of sandalwood is closely affected by its growth environment, especially the soil conditions and host plant because of its hemi parasitic nature (Liu et al. 2009; Ouyang et al. 2016; Teixeira et al. 2016). Sandalwood requires fertile soil with good drainage to exhibit optimum growth. The presence of a host plant for sandalwood has been proven to be essential in the root association through haustoria formation for supplying water and other available nutrients to improve morphological growth (Deepa and Yusuf, 2016).Sandal wood develops strategy by modifying the roots to form haustorium when in physical contact with the roots of the host plants. The formed haustorium would connects and al wood to the host plant, in terms of anatomically, morphologically and physiologically. That connection thus would allow the flow of water and nutrients from the host plant to the parasite plant (Teixeira et al. 2016). Within a year since sandalwood was grown with the host plants, it would manage to form the haustorium between their roots (Lu et al. 2014). Haustoria formed under root association between sandalwood and host plant showed varied growth performance of sandalwood.

The presence of host plants in sandalwood cultivation is advisory because of their role as sources of K, P, Ca, and Na, even N, and C (Lu et al. 2013; Teixeira et al. 2016). The present study was revealed on S.album species which are geographically distributed in S.Pudur, Sivaganga of Tamilnadu, India. To understand the plant growth promoting and pathogenic microbes, which are surrounded around the soil, we need to study the *S. album* rhizosphere micro biome community. Bacteria are the most abundant of all the rhizospheric micro biota, and many are known to promote plant growth (Antoun et al. 2005; VanLoon, 2007).The present study made an effort to understand the diverse and complex bacterial communities present in the rhizospheric soils of S. album. 16S rRNA sequence data revealed 446OTUs assigned to different bacterial species colonizing the rhizosphere of *S. album* species studied. Analysis of these OTUs showed that Acido bacteria has the most significant number of rhizo bacterial communities

present in *S. album* phyla were studied here. Besides this, alpha diversity analysis also predicted for *S. album* sample. Phylum level distribution studies identified the dominance of Actino bacteria, Proteo bacteria, Acidobacteria, Chloroflexi, Firmicutes, Nitrospirae, Gemmatimona detes, OD1, Armatimonadetes, Planctomycetes, Bacteroidetes, WS3,Cyanobacteria and Spirochaetes. Many of them were reported to be present in the *S. album* rhizosphere (Bing et al. 2022). The 16S rRNA gene sequence analysis had helped to identify the top twenty genera (Acetobacter, Lactobacillus, Pseudonocardia, Kribbella, Iamia, Streptomyces, Virgisporangium, Mannheimia, Mycobacterium, Bradyrhizobium, Rhodoplanes, Agromyces, Bacillus, Mesorhizobium, Balneimonas, Kaistobacter, Nitrospira, Candidatus, Cellulomonas and Pasteurella).Out of these 20 genera, most of the genera were found to be capable of fix nitrogen in *S.album* and other plants. Acetobacter is plant growth promoting Rhizobacteria (PGPR) provided a significant increase in shoot and root length and biomass (Majeed et al. 2015). In our study Aceto bacter genera shows high abundance for sandal tree growth. Azoto bacter genus is involved in atmospheric nitrogen fixation in different crops (Jiménezetal.2011). It is hard to identify and classify most bacteria in culture because of their morphological similarities. But, culture-independent methods, such as 16S rRNA sequencing, are highly efficient, cost-effective and provide accurate identification and classification of rhizo bacteria. More recently, strains of Bacillus, Pseudomonas, Glomus and others have been commercialized. The use of bacterial taxa in plant production has been reviewed previously for Bacillus (Borriss, 2011), Pseudomonas (Santoyo et al. 2012; Sivasakthi et al. 2014), Actino bacteria (Shivlataetal.2017) and Lactobacillus (Lamont et al. 2017). In addition, Acetobacter was also been shown to enhance crop production (Babalola, 2010). In our previou sstudies, we observed the occurrence of Proteo bacteria, Acidobacteria, Actinobacteria, Firmicutes, Bacteroidetes, Bradyrhizobium and Gemmatimonasin the *S. album* rhizosphere (Bing et al. 2022). Some genera, such as Bacillus and Pseudomonas known for their plant growth promoting (Ma et al. 2010; Ma et al. 2011; Wani et al. 2010) and nitrogen fixing properties, were found to be enriched in the *S. album* rhizosphere. Community composition analysis of 16SrRNA sequenced at a helped to track phylum and genus level distribution of rhizo bacteria of *S. album* species studied. The characterization of these bacteria colonizing the *S. album* rhizosphere will be beneficial to improve *S. album* tree productivity.

 Diversity among these bacteria was revealed by alpha analyses. Genera Bacillus, Pseudom on as and Strepto myces are well known for plant growth and plant disease suppression activities in other crops (Amna et al. 2020; Chandra et al. 2020; Jiao et al. 2021). Compared to previous studies Acido bacteria, Actino bacteria and Firmicutes are higher abundance at genera level in *S.album* microbiome(Bing et al. 2022). Overall, the dominant genera identified in this study are known to fix atmospheric nitrogen, facilitating to plant growth. A sandal tree can grow without the need of the host for their growth. To prove this concept we tried our experiment into three parts which was discussed above in the experimental setups. The available potassium (K) and phosphorus (P) plays important role in Bagaldhara plantations for enhancing the height and girth growth of sandal seedlings (Das et al. 2018).According to the previous report we have done our experiment without host. Instead of providing host, we applied bio fertilizers for their growth. Compared to sapling growth with host, using of only bio fertilizers shows good growth in morphology when compared to with host. Chemical elicitors are used as a treatment in one year and two years old sandal saplings to analysis the growth parameters (Yuan Li et al. 2021). Instead of using chemical elicitors our experiment carried out with Actino bacteria culture for their growth promotion. Compared with overall experiments culture treated saplings shows good morphology results for both one and two year old sandal saplings.

CONCLUSIONS

The rhizosphere microbial community is an important player in the plant-soil eco system. The approach used in this work let us recover a total of 9,038 communities. The sequencing data analysis of the V3-V4 region on the Illumina showed distributed over 15 phyla, 53 genera, and 8species. Our study is to establish a *S. album* rhizosphere having the highest relative abundance offive major phyla, Actinobacteria, Proteobacteria, Acidobacteria, Chloroflexi and Firmicutes was found to be the dominant flora in the rhizosphere soil of S.album during growth. The top-ranked communities are concerning as growth promotion in S. album. The genera identified in this work are part of the microbiome of *S. album* identified in other research works. Filling the

significant knowledge gap on soil nutrients and microbiota of *S. album* interactions is critical for exploiting these beneficial microbes for sustainable sandal tree cultivation. According to the soil nutrients morphology analysis report, the more organic carbon and macronutrients (N, P, and K) the soil contains, the better the sandalwood seedlings develop (both in height and girth) and survive without the host. Actinobacteria culture treated sandal sapling show higher height and girth when compared to soil nutrients. As per our report proves that a sandal sapling can grow without host when it is treated with culture for their growth.

Author contributions
NSB performed the lab work under the supervision of VRK. MD did the statistical analysis. All authors contributed to interpret the results, write and revise the manuscript critically. All authors agreed with the final version of the manuscript.

Declaration of competing interest
The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Data availability
Data will be made available on request.

ABSTRACT

This study uses a simple green chemistry approach to develop the Leucaena leucocephala seeds (LlSs) as a potential dye degrader. The Namakkal district contained soil that had been contaminated by textile effluent. On both control and dye polluted soil, various physic-chemical characteristics such as N, P, and K, as well as electrical conductivity, were measured above the standard permissible level, indicating high pollution. A UV-Vis spectrophotometer was used to compare the eluted dye concentration to its initial concentration. LlSs decreased BOD to 280 mg/l, COD to 698 mg/l, and Nitrate to 89 mg/l. LISs were mixed with vat dye (VD) spiked soil to assess *Eleusine coracana* seed germination compared with control soil. LISs absorbed the Vat dye and form the LIS-VD complex. *Eleusine coracana* seed germination was good in LISs mixed soil when compared to the control soil. The functional groups bonded with LlSs in remediated soil were screened as C-O,-NO$_2$ -OH, C-O-C, and C=C, etc. LlSs exhibited well potential treatment of textile effluent contaminated soil.

Keywords: *Leucaena leucocephala*, *Eleusine coracana,* Vat dye, Phytoremediation

INTRODUCTION

The health of the soil is essential to the development of vegetation, the preservation of the natural biota in the area, and ultimately the return of the ecosystem to its original state. With the knowledge that the soil contains biological components necessary for ecosystem function, soil health is defined as the soil's continued capacity to function as a vital living system within territorial limits. These activities can boost the biological production of the soil, protect the local water and air quality, and have positive effects on the health of nearby plants and animals(Agarwal *et al*, 2004).

67603

Kavitha Duraisamy *et al.,*

Human actions including industrialization, urbanization, and other disruptions to the natural terrestrial ecology are the main causes of soil contamination. Examples of this kind of pollution include broken underground storage connections, the use of pesticides, the seepage of contaminated surface water into subsurface layers, the disposal of oil and fuel, landfill leaching, and the direct release of industrial wastes into the ground(Dehpour *et al.*, 2009).The textile industry also generates a large variety of chemicals that pose a waste solution and disposal problem because they are not always contained inside the finished product. High aromatic chemical content and low biodegradability in fabric dyes and dye intermediates have been identified as major sources of pollution(Ameta *et al.*, 2003), and nearly 10%–15% of the dye is lost during the dyeing process and released into the wastewater, which is a significant source of pollution. Water is used extensively in the dyeing industry for cloth finishing and dyeing. Wastewater from fabric dyeing and dye-synthesizing processes are examples of poorly treated wastewater that contains natural dyes.Garg and Kowshik (1998) found that these wastewaters had a vibrant hue, significantly variable pH, high COD, and bio-toxicity. The fabric industry's dye pollution is a primary source of environmental contamination. It is estimated that at some point throughout the dyeing and finishing processes, 15% of the world's total dye production is lost and ends up in fabric wastewater.

Azo dyes, which comprise one or more nitrogen to nitrogen double bonds (-N,N–) and make up a significant portion of dye colorants, are widely used in the dyeing industry today. They are resistant to aerobic degradation and can degrade into potentially carcinogenic aromatic amines in anaerobic environments. Initha *et al.*, (2013) suggested that a growing green technology called phytoremediation uses plants to break down a few harmful chemicals found in soils, sediments, groundwater, floor water, and the atmosphere. It can be applied as a standalone remediation method or as a component of a larger site control solution that includes a variety of remediation methods. Evidently, plants have grown at contaminated waste sites; these plants were planted for aesthetic purposes or to stabilize the area (Vanaja *et al*, 2014). Many kinds of contaminants are currently treated using it, including radionuclides, insecticides, explosives, heavy metals, and petroleum hydrocarbons. Leucaena leucocephala has earned the moniker "miracle tree" for its widespread success and long lifespan. Contour planting has been promoted recently as a way to preserve soil fertility and conserve small-scale tropical farming buildings (Jayanthy *et al*, 2014). L. leucocephala is a colonizing plant that has spread throughout several locations, some far outside of the tropics, and that must adapt to a vast range of locations that may be more or less frost-free. At a temperature of 25–30 0C, L. leucocephala grows. In this work, we use a large number of falling seeds for the purpose of dye degradation. The purpose of the experiments is to evaluate the germination and growth potential of (*Eleusine coracana*) finger millet, as well as the phytoremediation potential of L. leucocephala for soil contaminated with dyes.

MATERIALS AND METHODS

Collection of Soil Sample Namakkal area is located with many dyeing industries and the textile dyeing process involves large volumes of water mixed with dyes. The untreated textile wastewater is being discharged, contaminating the soil around the dyeing units. Plant growth is sparse and thus this soil was identified for the study. Five locations were selected in the latitude of 11.229592 and the longitude of 78.171158**.** The soil was taken (100 kg/ha) at a depth of 0–25 cm. Composite replicates were prepared, air-dried, sieved, and stored for further analysis. In the same area unpolluted soil was used as control.

Phytoremediation The *Leucaena leucocephala* seeds (LISs) were collected in Namagiripet, Rasipuram, Tamil Nadu. *Eleusine coracana* was obtained from ICAR-Krishi Vigyan Kendra Namakkal. *L. leucocephala* seeds(LISs) were taken separately for the phytoremediation analysis. No binding agent was used to study the exact nature of *L. leucocephala* biomass.

Soil Characterization

The soil collected was cleaned of debris, shade dried, sieved to a uniform size, and used for further studies. The initial soil profile was done and the soil characteristics like N, P, K, pH, electrical conductivity, lime, and texture were assessed before and after remediation.

Dye degradation Kinetics

Vat dye was obtained from Sigma Aldrich Chemicals. The stock solution of Vat dye (1 mg/ml) was made. The stock solution was diluted with deionized water to create the various concentrations of Vat dye (100, 200, 400, 500, and 600 μg/ml). One gram of seed was put to two milliliters of dye, and the LISs and dye were combined in a 1:2 ratio. For full degradation, the combinations were well mixed and allowed to sit at room temperature. The reaction mixtures' absorbance was measured using spectrophotometry at a maximum wavelength of c max 450 nm every 24 hours. The Vat dye was allowed to completely decolorize during the incubation period. The percentage decolorization was calculated by using the following equation:

Decolorization (%) =$100(D_0 - D_1)/ D_0$

Where D_0 is the initial absorbance of the dye solution and D_1 is the absorbance after incubation at a specific time. All determinations were carried out in triplicate.

Evaluating the *Eleusine coracana (Ragi)* Seed Germination Before and After Remediation of Dye Contaminated Soil

The study's soil control was ground into a fine powder and filtered through sieves with a mesh size of 0.500 mm and 0.071 mm. Sieves with a mesh size of 0.071 mm were also used to filter potassium bromide of spectroscopic grade. Three grams of LISs powder were added to 100 grams of VD-spiked soil. Next, the germination of E. coracana seeds was evaluated in relation to the control group. *Eleusine coracana*'s capacity for germination and growth was examined in order to achieve this. As growth-inducing factors for *Eleusine coracana*, the study assessed the biometric levels of plant growth, which were then followed by biochemical and stress indicators.

Spectral Studies With Soil and Remediating Plant Material

To 100 g of dye spiked soil was added 3 g of LISs powder, mixed well, and placed on a vertical shaker for 24 h. After 24 h the corresponding solutions were equilibrated and then filtered. About 20 ml of the clear filtrate was digested with triple acid was used for Fourier Transform Infrared Spectroscopy (FTIR) analysis to compare the dyeing binding capacity with LISs and soil using Thermo Nicolet FTIR Nexus spectrometer coupled with DTGS (deuterated tri-glycine sulfate) detector.

RESULTS AND DISCUSSION

Physicochemical Characterization Of Dye Contaminated Soil And Control Soil

The physical characteristics of the soil, such as pH, electrical conductivity, and texture, remained unchanged, according to soil analysis performed on both contaminated and unpolluted soils (Table 1). Both contaminated and uncontaminated soils had different chemical compositions. In comparison to unpolluted soil, the dye-polluted soil had a higher lime content. The macronutrients, including potassium and phosphorus, were severely impacted. There was a reduction in the phosphorus concentration from 51.6 to 25 kg/ha. In a similar vein, the potassium concentration dropped from 983 kg/ha to 140. While iron and zinc dropped from 439.4 to 20.77 pm and 2.2 to 1.95 ppm, micronutrients like copper and manganese increased from 1.07 to 2.86 pm and 2.03 to 3.77 ppm. Therefore, dye contamination in soils can impact the macro and micronutrient contents of soils, according to examination of soil characteristics. According to Garg and Kowshik (2007), the soil is a complex living system whose properties determine how well it can be cleaned up and what kind of remediation is best.

Dye Degradation Kinetics

The complete decoloration of Vat dye was obtained on day 6 at 200 µg/mlof Dye concentration (Fig. 1). LlSs were degraded 89.4% of vat dye after incubating for 6 days at 400 µg/ml of Dye concentration. This result reveals that the LIPs-VD complex was formed by the action of seed absorption of Vat dye. This Vat dye degradation by Candida sp. This was confirmed by Abioye *et al*. 2015.

Evaluating the Growth Potential of *Eleusine coracana (Ragi)* before and After Remediation of Dye Contaminated Soil

The Phytoremediation phase was confirmed by establishing the seed germination study. The optimum ratio of biomass to soil was 1:100 ratio. This ratio was found to be optimum for remediation and involved the assessment of biometric levels of plant growth followed by biochemical and stress parameters as inducers of growth of *Eleusine coracana.* LlSs reduced the BOD from 1,365 mg/l to 280 mg/l, COD from 3,532 mg/l to 698 mg/l while the Nitrate was reduced from 225 mg/l to 89 mg/l. A study was conducted and compared to a reference control to determine the proportion of ragi that germinated when grown on soil tainted with dye and treated with L. leucocephala biomass powder. The third day following seeding, when maximal activity takes place, is when percentage germination was calculated. On the thirtyth day following germination in the soil, plant biomass was evaluated. displays the results of germination. Soil tainted with dyes affects seedling growth more than stabilized and remediated soil. *Eleusine coracana* germination rate increased as a result of L. leucocephala biomass treatment, which mitigated the effects of dye-contaminated soil. In *Eleusine coracana*, the application of L. leucocephala biomass as a phytoremediator increased the rate of germination and encouraged root induction. *Eleusine coracana* branch development and germination were reported by Initha *et al*. (2013). The germination of seeds is compromised by an excessive build-up of dye in the cotyledons, which interferes negatively with the mobilization of mineral and organic reserves. This modifies the physiological and biochemical processes of the developing plant and impacts the growth of the seedlings. In their 2021 study, Ekanayake *et al*. examined the effects of different dye concentrations on phytoremediation trials.

Spectral study for *L. leucocephala* biomass by FTIR

FTIR was carried out (Fig. 1) with LlSs remediated soil which revealed the presence of the functional groups bonded within remediated soil like amines (3351 cm^{-1}), alkanes (C-H; 2430 cm^{-1}), alkenes (-C=C-; 1636 cm^{-1}), ethers (=C-O-; 1000 cm^{-1}) and, (C-Br;517 cm^{-1}). These groups could be responsible for the binding capacity of the dye to plant material on phytoremediation. Swapnil *et al*. 2018, was reported that vat dye degradation studies were done by Infrared spectroscopic analysis.

CONCLUSION

The present study was done to understand the phytoremediation potential of *L.leucocephala* for the dye-contaminated soil. This was assessed on the germination and growth potential of *Eleusine coracana*(ragi). A pilot study was carried out with a varying mass of LIPs and the optimum ratio for dye contaminated soil was observed to be 3 g of plant biomass per 100g of soil.It was found that stress markers like proline methylglyoxal content of leaves and roots were increased significantly in a plant grown in the dye contaminated soil than in remediated soil using LIPsbiomass. The above observation indicates the protective effect of LIPs biomass against abiotic stress caused by dye contamination. It can function as an organic photo stabilizer that degrades naturally for dyes like Vat dye in a variety of colors. According to the study, it can clean up contaminated soil up to a 50% maximum, and ragi can be grown on the cleaned soil.

ABSTRACT

The allure of a pale complexion is nothing new; people of all time were concerned with hyper pigmentation and other skin problems and were always looking for ways to look fair. Nowadays voluntary de pigmentation is more common and people use herbal as well as chemical ways for skin lightening. This review article highlighted the skin whitening agents that can be obtained naturally and chemically. Many substances have compounds that have the property of tyros in a se inhibition and thus leading to skin whitening. The widely reported adverse effects of synthetic ingredients encourage the development of using herbal ingredients. Many compounds described in the review article are used for pigmentary disorders such as melasma and post inflammatory hyper pigmentation. In this review we present an overview of skin whitening agents that may decrease skin pigmentation.

Keywords: Anti tyrosinase activity, skin lightening, melanin, antioxidant activity

INTRODUCTION

The allure of a pale complexion is nothing new; people of all time were concerned with hype rpigmentation and other skin problems and were always looking for ways to look fair. Many people in sub-Saharan Africa use herbal tea prepared from local plants (*Tephrosia vogelii, Mirabilis jalapa, Phytolacca dodecandra*) to lighten the complexion of girls for special occasions. The use of preparations to lighten skin tone is referred to as "voluntary de pigmentation. Nowadays voluntary de pigmentation is more common and people use herbal as well as chemical ways for skin lightening. Melanocytes are the cells that produce the pigment melanin, the pigment which give colour to the skin. They are situated on the basal layer which separates dermis and epidermis. Approximately 36 keratinocytes surround one melanocyte and together, they form epidermal melanin unit. The melanin is produced in the melanosomal compartment inside the melanocyte and is transported to keratinocytes via dendrites.

The melanin pigment is a polymer synthesised from the amino acid L-tyrosine. L-tyrosine is converted to dopaquinone by the enzyme tyrosinase. This reaction continues spontaneously via dopachrome to the monomeric indolic precursors (5,6-dihydroxyindole and 5,6 dihydroxyindole 2-carboxylic acid) of the black-brown pigment eumelanin. Tyrosinase related proteins (TRP-1), dopachrome tautomerase (TRP-2) and many other enzymes also play an important role in melanogenesis. Upon reaction with cysteine, dopaquinone forms 2- or 5-S-cysteinyldopa that generates the benzothiazine precursors of the red/yellow pheomelanin polymer. In general, a mixed type of pheo- and eumelanin polymer is produced and deposited onto the melanosomal matrix proteins. Considering different people have different skin and hair colour, the composition of the mixed melanin can be regulated in many different ways. But altered production of cutaneous melanin can result in hyper pigmentary conditions, like melasma, post inflammatory hyperpigmentation, freckles or depigmenting conditions, like vitiligo. Both can affect the life of people to a vast extend. Many skins whitening agents mainly targets the enzyme tyrosinase for de pigmentation [1]. There are four types of tyrosinase inhibitors competitive, uncompetitive, mixed type and non-competitive inhibitors [2]. The nature of tyrosinase inhibition can be disclosed by measuring enzyme inhibition kinetics using Line weaver-Burk plots with varying concentrations of L-DOPA as the substrate. Tyrosinase inhibitors mainly show reversible inhibition. Irreversible inhibition causes inactivation of enzyme by altering the active site of enzyme or by conformational changes to the protein molecule. Suicide inhibition mechanism is another way of irreversible inhibition. An example of suicide inhibition is inhibition of tyrosinase by, two 8-hydroxy iso flavones iso flavones isolated from soy germ koji.

Natural agents

Mangosteen

Mango steen having scientific name *Garcinia mangostana* L. is a tropical queen of fruits, belonging to the family of Clusiaceae commonly found in throughout India and Southeast Asia, such as Indonesia, Malaysia, Myanmar, Philippines, Sri Lanka, and Thailand. The peel of mangosteen fruit contains phenolic compounds like tannins, flavonoids, xanthones, and other bioactive substances which have medicinal properties (Pothitiratet al., 2009). The mature mangosteen has higher contents of phenolics, flavonoids, and tannin significantly than the young ones. Xanthones in mangosteen peel has skin lightening property. α-mangostin, β-mangostin, and γ-mangostin are the most abundant xanthones present in the pericarp of the mangosteen (Chen et al., 2008; Pedraza-Chaverríet al., 2009; Zarena and Sankar, 2011). Researches shows that acetone with time extraction of 36 hours is the best solvent to extract mangosteen among solvents like methanol, ethanol, acetone, hexane, ethyl acetate, acetic acid, and aquades tat different times (24, 36, and 48 hours).But it was found that ethyl acetate extract the highest concentration of α-mangostin, followed by dichloromethane, ethanol, and water [3]. _Wahyu Widowati et al, characterized the magosteen peel physically and chemically, the tyrosinase inhibitory activity of Mangosteen peel measured. It was found that gamma-mangostin strong anti tyrosinaseactivity (IC50 50.35 μg mL–1) and the activity increases as follows mangosteen peel extract <garcinone D <alphamangostin <garcinone C < gamma-mangostin. This study shows that gamma-mangostin may serve as potential skin whitening agent [4]. Puay Luan Tan et al, formulated and evaluated novel herbal face creams containing mangosteen peel extract that was standardized to 10% alpha-

mangostin. The Mangosteen peel extract was weighed and incorporated into the cream bases and evaluated. Kojic acid (0.67 _g/mL to 10.66 _g/mL) was used as a positive control for testing tyrosinase inhibitory activity and it was found that Mangosteen peel extract (IC50: 1.603 _g/mL) strongly inhibits tyrosinase enzyme as compared with kojic acid (IC50: 3.57 _g/mL).[5]

Rosmarinic acid

Rosmarinic acid (RA) is an ester of caffeic acid and 3,4-dihydroxy-phenyllactic acid. It is anatural polyphenol contained in Lamiaceae herbs, such as **Perilla frutescens**, lemon balm mint, sage and sweet basil etc. Polyphenols are aromatic and slightly bitter-tasting compounds in vegetables, fruits and herbs [6]. Rosemarinic acid originates from aromatic amino acids, phenylalanine, and tyrosine, respectively and has antibacterial, antimutagenic,anti-allergenic, antiviral, antioxidant, antityrosinase and anti-inflammatory properties. In Ortensia I. Parisi et al,an innovative polymeric antioxidant was developed by the conjugation of dextran (DEX) and rosmarinic acid and inhibition of tyrosinase activity was determined by using L-tyrosine as substrate. All the results indicated that the polymeric conjugates can inhibit tyrosinase reaching inhibition percentages higher than 95% and suggesting the application of DEX-RA as a skin-whitening agent. To evaluate the whitening and lightening efficacy a placebo-controlled clinical-instrumental study was carried out on 20 female subjects with dull skin complexion and dark spots on the face and the result shows that the formulation reduces the dark spot staining and increases the skin radiance Dark Spots Intensity, Skin Lightness/Radiance, Reduction of Dark Spots and Red Component of the Skin Colour was evaluated. The clinical evaluation of the reduction of dark spots appearance and skin brightness was performed by the dermatologist and all the results indicated that the polymeric conjugates can inhibit tyrosinase reaching inhibition percentages higher than 95% and suggesting the application of DEX-RA as a skin-whitening agent. Furthermore, the active polymer, shows a long-lasting efficacy and improved performance compared to the free antioxidant [7]. Karina B. Oliveira et al, studied the melanogenic activity promoted by rosemarinic acid, and its contribution in the melanogenic effects promoted by a fluid extract and an aqueous extract prepared from dried sage leaves. The study suggests that sage extracts and RA interfere in melanogenesis at cellular melanin levels depending on their concentration. RA showed a dual behaviour on melanogenesis, acting as stimulator of melanin synthesis and cellular tyrosinase activity at low concentrations, and as an inhibitor at high levels indicating rosemarinic acid as a potential therapeutic agent for treating diseases related to skin pigmentation [8].

Cassia auriculata

Cassia auriculata Linn, Family: Fabaceae (Caesalpiniaceae) Its flowers are, bisexual with irregular and bright yellow, the pedicels glabrous and 2.5 cm long and consist of 5 sepal and 5 petals. Mostly found in India. It mainly used in Ayurveda and Siddha systems of medicine because its flower unripe fruit leave stem etc used for diabetics, anthelminthic, leprosy, conjunctivitis, and skin diseases. It is also called as *Tanners Senna*. *C. auriculata* is also called "kalpa herbal tea", major components of a beverage [9] Constituents: 3-O-Methyl-d -glucose (48.50%),α- Tocopherol-β - D-mannoside (14.22%), n-Hexadecanoic acid(3.21%), 13-Octadecenal, (Z)(2.18%), resorcinol(11.80%) and 1,2,3,4-Tetrahydroisoquinlin-6-ol-1-carboxlic acid(1.98%). Flower consists of constituent: terpenoids, tannin, flavonoids, saponin, cardiac glycosides and steroids. Ethanolic extract of Flower of *C. auriculata* as antibacterial, anti-oxidant, anti-inflammatory action [9] Antibacterial activity: Antibacterial activity against the microorganism such as *Escherichia coli, Staphylococcus aureus, Salmonella typhi, Bacillus subtilis, Pseudomonas aeruginosa, Klebsiella pneumoniae, Vibrio cholerae* and *Shigella dysentrae* and maximum inhibitory action seen in organisms except *Pseudomonas aeruginosa* and *Klebsiella pneumoniae*. The minimum inhibitory concentration (MIC) ranged between 12.5 mg/mL and 75mg/mL depending on microorganism and various extract [10]. Anti-oxidant activity: ethanolic or methanolic extract of flower of *C. auriculata* show antioxidant action, determined by DPPH assay with E50 value =19,99 microgram per ml compound by 2 positive control BHA= 23.12 microgram per ml [11]. Melanin is a type of pigment that present in our body which determine the human skin and the process of synthesis is called melanogenesis and it start from L dopa. Tyrosinase, the enzyme reason for darkening of skin. so, target is to inhibition of tyrosinase. Inhibition of tyrosinase byhydromethanolic extract of flower of *C. auriculata* is determined by antityrosinase assay with an IC50 value of

Vidya Peter *et al.,*

42.49microgram per ml and compound by positive control, ascorbic acid (IC50 -33.7) shown by Mayuri Tharanga *Napagoda* et al [11]

Aloe vera

Aloe vera having scientific name *Aloe barba densis* Mill with fam: Asphodelaceae is a flowering succulent plant. It is a traditional type medicine used mainly for skin diseases. Now it also used in food, cosmetic as cream, lotion etc. It also has a purgative action, mainly found in tropical and sub-tropical countries. [12]These A. vera-containing substances consist of 99.5% water and 0.5% active ingredients, including vitamins, polysaccharides, phenolic compounds and organic acids. The gel form present in aloe vera as variety of activity includes anti-viral, anti-bacterial, anti-inflammatory, anti-cancer, antiallergic, anti-diabetic etc.[13]The dagger-shaped leaves are the most used part of the plant traditionally as medically for various treatment include encephalitis, wound healing, diabetics. Eye infection, AIDS etc but also A. vera extract and its active constituent aloin has skin lightening property. Aloe vera extract are potent inhibitors of the enzyme tyrosinase, which plays an important role in melanogenesis by inhibit l-3,4-dihydroxyphenylalanine (L-dopa) oxidation by mushroom tyrosinase. Inhibition of tyrosinase by aloin indicates that this compound could be useful for the treatment of hyper pigmentation disorders. It also has anti-inflammatory and anti-bacterial properties.It also contains a pain-relieving compound called carbo xypeptidase, which gives us the soothing sensation we have every time we apply Aloe Vera [14].

Mr. Jeon Gibeom et al explained about the leaf skin of A. vera fermented by *L. plantarum* BN41 newly isolated from Kimchi and this fermented vegetable inhibits tyrosinase activity and skin melanogenesis was used to develop a natural cosmetic ingredient Aloesin (natural hydroxymethyl chromone), is not abundant mainly found in outer layer of skin leaves. It is an active constituent in aloe vera was also used in skin whitening cosmetic ingredient because of competitive tyrosinase inhibitor and also effective to wound healing process [15]. Mr. Mikel Añibarro-Ortega shown thatthe leaf of aloe vera contain phenolic content and the flower extract contain apigenin glycoside derivative which is effective against *Pseudomonas aeruginosa* (MIC = 0.025 mg/mL and MBC = 0.05 mg/mL) so flower extract is also good for antityrosinase activity (IC50 = 4.85 mg/mL). [16] Uses of aloe vera includes, it soothes sunburn(it contain polysaccharides, which helps in encouraging skin repair and new skin cells to set up shop), Moisturizes the skin because it contains mostly (95%) of water, it hydrates the skin with no greasy feeling, it treat mouth sores, slow down ageing of skin, it fight acne and fades blemishes, relieving from skin irritation, cleanser of skin, exfoliate skin, The salicylic acid in Aloe Vera gel can act as an exfoliator by gently sloughing off the dead skin cells.

Santalin

Santalin is a natural red constituent in the bark of Pterocarpus. Santalinus,Fabaceae family and genus Pterocarpus. These can be isolated from dried heart wood of *P. Santalinus*. It is to provide a natural extract showing an excellent whitening effect. Chemical constituent includes: Carbohydrates, flavonoids, terpenoids, phenolic compounds, alkaloids, saponins, tannins and glycosides and also contains specific bio active compounds like santalin A and B, savinin, calocedrin, pterostilbenes and petrolinus K and L. It is widely used in skin complexation and have tyrosinase inhibition action because of presence of 2 hydroxyl group in santalin, melanin biosynthesis inhibiting effect on melanocytes thereby lightening the skin colour and preventing pigmentation. It is to provide a natural extract showing an excellent whitening effect. The mode of inhibition by diphenolase activity and kinetic study. It is also used as refrigerant, astringent and sun protection agent'. Paste form santalin is useful for headache. In order to check the mechanism of santalin, melanogenesis process used B16F10 cell lines. santalin inhibited melanogenesis without any cytotoxic effects to B16F0 melanoma cells through down regulation of MITF, tyrosinase, TRP-1 and TRP-2.[17].

Anti tyrosinase action: It is determined by using UV visible double beam spectrophotometer in 475nm. The IC_{50} value of it was 15.21+- 0.326mM. so, it is in dose dependant manner, kojic acid is used as positive control IC_{50} value of it is 0.014Mm. shown by Hridya Hemachandran et al. [17] Measuring Tyrosinase Inhibitory Effect Using Mushroom Tyrosinase using 96 well plate in 490nm using a microplate to measure the inhibition rate against tyrosinase.,

Vidya Peter *et al.,*

IC 50 value is the concentration of a substance that inhibits the tyrosinase enzyme activity by 50%. It also as anti-aging property, so as to prevent premature ageing of the skin and give a glowing, fair skin. Other uses of santal wood include, antibacterial agent, antidiabetic agent, anti-inflammatory agent, anti-oxidant agent, gastro protective, hepato protection and also have wound healing property. it is usually combined honey and applied to face as a face pack.

Turmeric

Turmeric having scientific name *Curcuma longa* Linn, family zingiberaceae has been used in Asia for thousands of years in ayurveda, siddha medicine, traditional Chinese medicine, unani medicine. In ancient years it was used as dye (colouring agent) and later for its supposed properties in folk medicine. Madras" and "Alleppey" turmeric are the two main commercial types of turmeric in India (Hima Gopinath et al, 2018) [18].Turmeric is a perennial herbaceous plant reached up to height 1m tall. Yellowish orange, aromatic rhizomes. The leaves are alternate, arranged in 2 rows and divided into leaf sheath, petioles, leaf blade. Mainly found in tropical and subtropical regions of Asia and Africa [19]. Chemical constituents such as, powder consist of 60–70% carbohydrate, 6–13% water, 6–8% protein, 5–10% fat, 3–7% dietary minerals, 3–7% essential oil, 2–7% dietary fibre, and 1–6% curcuminoids. The golden yellow colour of turmeric is due to curcumin. phytochemical components: diarylheptanoid, a class including numerous curcuminoids, such as curcumin, demethoxycurcumin, and bisdemethoxycurcumin. Curcumin constitutes up to 3.14% of assayed commercial samples of turmeric powder (the average was 1.51%); curry powder contains much less (an average of 0.29%). Some 34 essential oils are present in turmeric, among which turmerone, germacrone, atlantone, and zingiberene are major constituents.

Uses

properties of turmeric include, anti-inflammatory action, reduce dark circles, protection from sun damage and UV rays, protection from aging, and reduce stretch mark, anti-bacterial action, treatment for acne, soothes dry skin. Other uses like treatment for psoriasis, vitiligo, skin cancer, scleroderma etc. The essential oils may have antioxidant, anti-inflammatory and anti-nociceptive properties [18]. The curcuminoid compounds present in the turmeric improve skin properties such as hydration and sebum content and have properties like antioxidant, anti-inflammatory and skin-lightening agents. It is a polyphenol obtained from the rhizome of turmeric plant as constituent. Curcumin is major constituent of curcuminoid having skin whitening property by inhibit melanin synthesis [20]. Also, anti-cancer, anti-inflammatory, anti-bacterial, anti-fungal, and anti-oxidant activities and it showed 75-fold more potent anti-tyrosinase activity than arbutin and kojic acid was mentioned in Jesmin Akter et al [19]. Jesmin Akter et al showed that MeOH extract of *C. amada* were fractioned with water, n-hexane and EtOA but EtOA have strong inhibitory effect as compared to other. This MeOH extract of *C. amada* showed maximum mushroom tyrosinase inhibitory effect as compared to 3 species include *C.xanthorrhiza*, *C. aromatica* and C. zedoaria with 1c50 value of c. amada is 53.4 ± 2.7.(3). So, *C.amada* show effective tyrosinase inhibitor [19]. ADR topical use of curcumin cause Contact urticaria, Allergic contact dermatitis to turmeric or curcumin with positive patch tests has been reported. It has also been reported with tetra hydro curcumin. Also cause allergic and pigmented contact dermatitis with turmeric [18].

Honey

Honey is a natural product formed from nectar of flowers by honeybees having scientific name *Apis mellifera*, family: Apidae. It composed mainly of fructose and glucose, and containing proteins and amino acids, vitamins, enzymes, minerals, and other minor components. Honey as variety of function includes treatments against tinea, pityriasis, dandruff, dermatitis, psoriasis, haemorrhoids, anal fissure etc. and also as dressing for wound. Its activities include emollient, humectant, soothing action, retards wrinkle formation, keeps the skin juvenile and in hair it is used as hair conditioner, and regulates pH and prevents pathogen infections. So, it can be formulated into variety of formulation such as hydrating cream, ointments, tonic lotion cleansing milks, shampoos, and conditioners etc. Anti-oxidant property, antimicrobial property, anti-aging effect, anti-inflammatory [21] Treatment of wound healing: honey helps to kill a wide range of wound pathogens, such as methicillin resistant Staphylococcus

aureus *(*MRSA*)*, Staphylococcus aureus, E coli, Pseudomonas aeruginosa and Acineto bacter baumannii. It promotes re-epithelialisation and angiogenesis in in vitro models of wound healing [22]. Anti-oxidant property: Kanyaluck Jantakee *et al*, show anti-oxidant activity by DPPH assay of different variety of honey such as lychee, sunflower, coffee, polyfloraetc. and the highest antioxidant action shown by honey collected from nector of coffee flower of 86.20mg gallic/kg of honey collected from it. Lowest antioxidant activity by honey collected from lychee flower (5.93mg gallic/kg of honey. [23] Antityrosinase property: range= 22.71 ± 6.82 - 87.73 ± 5.33%.The highest activity of antityrosinase action shown by honey from manuka honey of 500.15mgkoji/kg honey. However, honey from coffee flower had highest tyrosinase inhibition action compared to other type.[23] Chemical agents

Hydroquinone

Hydroquinone or 1, 4 dihydroxy benzene is a white crystalline powder formed by hydrolysis of arbutin. Sources of arbutin include leaves of several plants, berries, coffee beans, teas extracted from berries, broccoli and the bark of the pear tree, red wine, wheat germ and diet cola. Hydroquinone actby inhibiting tyrosinase which in turn prevent the conversion of L-3,4- dihydroxyphenylalanine (L-DOPA) to melanin. It was found to have its skin lightening effect when the fur of guinea pig and cat were lightened on exposure. So in vitro and invivo test were done which proved thathy droquinone can inhibit tyrosinase. Hydroquinone is not a best agent to reduce the colour of melanin that is already deposited within epidermis or dermis. Since it inhibits DNA & RNA, it can only be used to retard or stop production of new melanin. So, hydroquinone can be used for conditions like melasma or post-inflammatory hyper pigmentation [24]. Clinicallyit can be used for the treatment of Chloasma, Solar lentigines, Freckles. Hydroquinone containing product is massaged on to the face (or other affected areas) 1 to 2 times a day for 3 to 6 months. If there are no results after 2 to 3 months, hydroquinone should be discontinued. It is essential to evenly apply hydroquinone over the entire face to prevent uneven pigmentation and use concurrently with sunscreen to protect from damaging UV light, which increases pigmentation. Skin whitening effect of hydroquinone gives maximum result when it is combined with retinoid and corticosteroid and the most widely used triple combination cream is composed of hydroquinone 4%, tretinoin 0.05%, and fluocinolone acetonide 0.01%.

 When hydroquinone is applied topically 35 -40 % is absorbed to systemic circulation, due to this reason pregnant women, breastfeeding mothers and children should avoid this drug. According to the USFDA tentative final monograph for over-the-counter skin-bleaching agents in 1982, safe and effective concentration of hydroquinone was considered to be 1.5–2%. On March 27, 2020, under the US CARES (Corona virus Aid, Relief, and Economic Security) Act it is now illegal to market over the counter hydroquinone products of any concentration. the main reasons behind the ban were the fear of hydroquinone causing permanent dis colouration and ochronosis. Other adverse effects of hydroquinone application are irritant or allergic contact dermatitis, post inflammatory hyper pigmentation, hypo pigmentation and nail dis colouration. Even though regulatory authorities set a limit for hydroquinone many commercially available creams have hydroquinone content more than the permissible limit this can lead to several adverse effects such as such as erythema, oedema, inflammation, sensitization, photosensitization and itching. Studies shows that many skins lightening cosmetics did not mention hydroquinone and mercury on their ingredients list but were found to contain high levels of these two[25]. Based on the evaluation of 20 Skin lightening cream found in cosmetics shops in Lagos, Nigeria even though these 20 cream have hydroquinone as their ingredient only 7 of the creams had hydroquinone in its label with four of them actually providing the value and among these 4 , three failed the USP specification.[26]

Arbutin

Arbutin is a hydroquinone glycoside that can be found in families like Ericaceae (bearberry, strawberry tree, huckleberry, and heather), Saxifragaceae, Asteraceae, Rosaceae, Lamiaceae, and Apiaceae. It is a skin lightening agent. Peracetylated-Arbutin can be prepared by Helferich glycosylat[ion reaction of penta-O-acetyl-β-D-glucopyranoside and 4-hydroxyphenylacetate, using the catalyst (BF3·Et2O)[27]. The chemical structure of arbutin consist of onemolecule D-glucose bound to hydroquinone. D-glucose exists in alpha, beta, or gamma anomeric form in aqueous solution, with beta-anomer being a dominant form. Beta-arbutin (this stereoisomer is called arbutin) in

which the beta-anomer of D-glucose is bound to hydroquinone and is mainly found in plants, such as wheat, pear, and bearberry. [28] Arbutin inhibits tyrosinase, preventing the conversion of tyrosine to L-dopa, and thus melanin formation is interrupted [27]. There are two isoforms of arbutin namely α-arbutin (4-hydroxyphenyl-α-D-glucopyranoside) which is biosynthesized by microbial enzymes or microorganisms and β-arbutin (4-hydroxyphenyl-β-D-glucopyranoside) which is extracted from leaves of various plants and fruit peels. Both have same chemical formula but different rotation configurations. α-arbutin is more efficient in inhibiting tyrosinase activity than natural arbutin. The 50% inhibitory concentration (IC_{50}) of α-arbutin in human tyrosinase is 2.0 mM, whereas, for natural arbutin, it is higher than 30 Mm. Researches shows that α-arbutin shows no cytotoxicity while inhibiting melanin biosynthesis in culture of melanoma cell and the human skin model. α-arbutin shows greater inhibition to tyrosinase enzyme than β-arbutin as the inhibition was found to be 10 times stronger than β-arbutin on a culture of mouse melanoma. α-arbutin did not inhibit the growth of cultured human melanoma cells, HMV-II, but inhibited melanin synthesis, it leaded to the conclusion that α-arbutin can be effective and safe for treating hyper pigmentation disorders. α-arbutin works similar to hydroquinone, but with less irritation and melanocytotoxicity.

It also does not cause exogenous ochronosis and is less likely to cause irritation and sensitization. α-arbutin can be synthesized by 2 ways, one is from hydroquinone using microbes and other is by enzymatic biosynthesis. Enzymatic biosynthesis is done by using an enzyme that catalyses alpha-anomer selective transglycosylation reaction between a glucosyl donor and hydroquinone as an acceptor. Tyrosinase help in the conversion of tyrosine to L-DOPA (monophenolase activity). It also catalyse the oxidation of L-DOPA (o-diphenols) thus leading to the formation of o-quinones (diphenolase activity). α-arbutin inactivate the active site of tyrosinase as well as lags the oxidation of tyrosine during the monophenolase reaction. As concentration of α-arbutin increased the lag time shows a dose dependant increase. During the diphenolase reaction, α-arbutin interacted with the residues located at the entrance to the active site, thus it acts as an activator and no lag period was observed during the oxidation of L-Dopa. Therefore α-arbutin exhibits dual effects on monophenolase and diphenolase activities of mushroom tyrosinase. α-Arbutin is a hydrophilic compound with lesser toxicity than hydroquinone. Since it is hydrophilic, it is very difficult for the alpha arbutin to penetrate the stratum corneum so various novel delivery systems such as micro needles, nano systems etc. can serve as a promising platform for the effective delivery of α-arbutin. Researches shows that Arbutin niosomes or arbusomes has skin lightening property without any irritancy and cytotoxicity. Combination of α-arbutin, kojic acid, vitamin C, or niacinamide have been reported to show synergetic effects. Such combinations increase the skin lightening effect. A combination of 2% α-arbutin and 3% trane xamic acid, 2% galactomyces ferment filtrate, and 4% niacinamide enhance skin lightening with no significant side effects.[29] In Maeda et al. it was reported that arbutin was more potent cellular melanin synthesis inhibiter than kojic acid when compared at a fixed concentration (0.5 mM). It doses dependently reduced TYR activity in human melanocytes at concentrations between0.1 and 1.0 mM without significantly decreasing cell viability [28].

Niacinamide
It is an active form of niacin (vitamin B3) is also an important precursor of NADH (nicotinamide adenine dinucleotide) and NADPH (nicotinamide adenine dinucleotide phosphate) found in yeast, vegetables etc. Niacinamide inhibits the transfer of melanosomes from melanocytes to keratinocytes thereby increase skin whitening property. It decreases collagen oxidation products and improve aging-induced yellowing or sallow ness. Niacin amide on topical application, penetrate the human skin and increase the level of NADH. It also a good choice for oily skin type because it reduces sebum production and pore size. Functions includes improved barrier function, decreased appearance of signs of photo aging, preventing the loss of moisture by enhancing production of ceramides and fatty acids [30]. Patricia K. Farris MD show that clinical benefits of niacinamide including reducing skin redness, improving sallow ness, and lightening. Niacinamide increases collagen and glycosaminogly can production, boosting dermal matrix components that can smooth wrinkles [31]. It has been used to treat skin conditions like acne and rosacea, a facial skin disorder characterized by redness and anti-inflammatory action. NA is very stable under exposure to UV radiation, heat, oxygen, acids, and bases Bora *Kim et al, show the cytotoxic effect by treated* B16F10 melanoma cells with NNT and result show that NNT have any cytotoxic effect in B16F10 cells in the

concentration range (10–500 μM) [32] for sensitive skin causes stinging, itching, mild burning etc. It dilates the blood vessels, which brings more Side effect blood to the surface of your skin. Niacinamide used in high doses cause redness of the skin. It's caused by the dilation of blood vessels, and it can cause a tingling sensation. when niacinamide mixed with the substances like vitamin C (ascorbic acid) or derivatives like tetra hydro curcuminoids, acid, folic acid, retinoids, benzoyl peroxide azelaic acid etc cause problems. it's safe to use up to a concentration of five percent niacinamide but higher doses cause side effect.

Mercury

Mercury is a heavy metal that exists in three forms: elemental, inorganic and organic[33]. Inorganic form of mercury mainly ammoniated mercury, mercury iodide, mercurous chloride, mercurous oxide, or mercuric chloride is used for cosmetic purpose as it has skin lightening property. Mercury compounds, including ethyl mercury, methyl mercury, and phenyl mercuric salts, may be used as preservatives in mascara and eye makeup cleansing products [34] Mercury inhibits melanin by inactivating sulfhydryl mercaptan enzymes this in turninactivates tyrosinase, an important catalyst in melanin production. Mercury ions replace tyrosinase enzyme anions, which inhibit the formation of melanin producing the whitening and anti-freckle effects. According to the Minamata Convention on Mercury the limit of mercury is 1ppm for skin lightening products but in order to increase the skin whitening efficiency many companies use mercury more than the limit which will lead to mercury poisoning effect. Since mercury can be absorbed through sweat glands and hair follicles it can cause many adverse effects such as damage to the skin, kidneys, and nervous system[33]. The pathway of mercury poisoning is that mercury reaches the liver via skin and after metabolism it goes to the bile duct and the part of this is re-adsorbed the remaining mercury goes out from the kidney. In this way continuous use of mercury containing products willlead to toxicity or poisoning over the period of time. Adverse health effect includes kidney damage, skin rashes, skin dis colouration and scarring, reduction in the skin's resistance to bacterial and fungal infections, anxiety, depression, psychosis and peripheral neuropathy.

In 2019, a case report from California states that a woman was hospitalised with blurred vision, weak muscles, and motor and speech difficulties due to mercury poisoning from a skin whitening cream[35]. In 2017 and 2018 Zero Mercury Group conducted a study on 338 samples of skin lightening creams from 22 countries with mercury as active ingredient. Among them thirty-four creams were found to have high mercury levels. Studies shows that nephrotic syndrome was mainly a problem among African women who uses ammoniated mercuric chloride–containing skin lightening creams for periods ranging from one month to three years. Studies on 16 skin-lightening creams from the local market of Jamaica were investigated and Six skin lightening products were found with mercury concentrations above the FDA allowable limit of 1 ppm and varied between 878 and 36,000 ppm[36]. Miserable pain, and limb, head, abdomen, or lumbosacral pain with poor response for nonsteroidal anti-inflammatory drugs, anti-epileptic drugs, and serotonin- nore pine phrine reuptake inhibitors, renal damage with proteinuria was the main complaints of 16 female patients diagnosed with chronic mercury intoxication from skin lightening products which had immediate and dramatic whitening effects[37].

ABSTRACT

Nowadays object detection and segmentation which follows the algorithms of Feature extractions has become one of the most popular are a sin the field of image processing. A small feature gap exists between satellites or camera captured images and natural images. Therefore, deep learning and neural network algorithms could be applied to recognize images. Also it can be able to detect and identify the images. A Novel approach which is improved from Mask R-CNN model is developed to enhance the detection effect in the high-resolution camera captured, natural and remote sensing images which contain the dense targets and complex background. Our model can perform object recognition and segmentation in parallel. We also tried to work with WFA-1400 based on the DOTA dataset, remote sensing images too.

INTRODUCTION

With the development of the deep learning and neural network technology, researchers can detect the images and they can obtain higher-resolution remote sensing images. It is very useful in broad application prospects in civil and

67619

military applications. Since there is large set of input images and dense targets, object detection and segmentation in high-resolution images have always been a puzzle. There are some disadvantages when using traditional object detection algorithms, such as weak generalization ability and poor rotation invariance. The rapid development of deep learning (DL)algorithms such as convolution neural network(CNN) provides a best solution to this problem. It has excellent effects in object detection, image generation, segmentation, and high resolution image reconstruction. Various classifications of CNN based object detection techniques implements good results. We test our proposed algorithm on the WFA-1400 input dataset.

Related Work

The R-CNN is a deep learning approach which is a two phase detection algorithm. That is in this methodology, it identifies a subset of regions with convolutional neural networks (R-CNN). According to this technique, it accepts the input image and identifies the object. It also extracts many region proposals. It executes on forward propagation algorithm. On each region proposal it tries to extract its features. In this way it is used to analyze and predict the features of an image. By identifying the detected image with bounding box, region-based Convolution Neural Networks are included in the family of Deep learning paradigms. They are used in various applications of computer vision and image processing. [1].R-CNN is used to sketch the boundaries of an image and it detects the image.

Traditional Methods

Customary Deep learning algorithms follows the four steps given below to identify the object: region abstraction; feature analysis and extraction; feature dispensation; and taxonomy of the regions and objects. To extract and analyze the features of the region, the sliding window algorithm is proposed. The various regions and phases are extracted from images of different sizes. Aspect ratios are calculated from the entire image. A few specific optimization algorithms can be suggested to extract the features of region. According to Liu et al, he proposed a feature extraction method combining sparse coding and radial gradient transform. He derives poor detection results in the case of aircraft rotation.[2].In this article, Feature or region extraction processing includes two basic and fundamental methods such as feature synthesis and feature dimension saving. In many of the object detection algorithms, principal component analysis, Fisher discriminant analysis, and linear discriminant analysis are commonly implemented to detect the region. The classification process is derived and implemented with the use of support vector machine, Ada Boost, and conditional random field methods but professional knowledge is required to predict the features of region. But scheming a suitable, efficient, and robust features for the region of an image is a tedious process [4][5].Parameter adjustment is also critical and notable value in these types of paradigms.

Deep Learning Methods

Deep learning optimization algorithms are introduced to eliminate the problems occurred when abstracting the strong features. High accuracy is the important factor in many of object detection methods based on deep learning and neural networks. The deep learning neural network mechanisms helps to relieve the laborious hand-crafted features. They also overcome the problems of data annotations. According to object detection and segmentation methodologies, networks can be partitioned into single- and two-stage models,[6]where the division is carried out based on the generation stage of the candidate region. Our Proposed system works on hands on experiences of the theories to detect the object and segment it's features. Instance segmentation work is done with the help of bounding box mechanisms and the background pixels are identified with the pixels which are present within the bounding box. The rest of the part is belonging to the foreground [7]According to semantic segmentation each and every pixel in the detected object region are classified into a single class and it is used to distinguish each individual object in the given picture. In our proposed model, each bounding box is calculated to segment an object from the scene and to classify it. The bounding-box regression is applied to whole picture to identify the background of the model and front end elements of the image.[8]In traditional CNN, to extract the features of an region of the image, the classification, bounding- box regression, mask branch algorithms are used.

Sometimes it is observed that extracting rich features are very difficult due to the small targets in remote sensing images. In many cases it may lead to an inaccurate judgment and prediction. If the network has deep architecture and construction, complex functions and procedures are required to implement it. Also there are different levels of abstraction and various methods of extraction is needed to learn all the features that are identified. The learning process starts from the edge that is a lower level to very complex features which are in deeper level. Increasing the number of hidden layers of the network, in various deep network may affect higher experiment requirements on the hardware conditions. Also it targets and impacts the phenomenon of gradient disappearance. Our proposed strategy avoids all such complex method of changing the network structure and eliminates it very accurately. A huge resource over headed to implement it. The improved CNN paradigm helps to self-calibrate the feature information to supplement the missing targets' edge information in the feature map. [9][10].

CNN Model

A convolutional neural network (CNN or ConvNet), which is one of the current deep learning emerging network. It is based on the concept of deep learning constructions. It uses various techniques and directly involves in learning data. CNN architecture is evolved to find patterns in images. It also recognizes objects, classes, and categories. They can also use widely to classify and process audio, time-series, and signal image data. Convolutional Neural Networks are particularly used in image processing to recognize and analyze the patterns of the images. because they use various algorithms to extract features from images and learn to recognize patterns. It also well-suited for tasks such as object detection, image segmentation, and classification of various image sets.

R-CNN Model

R-CNN, a variation of convolutional neural network stands for Region-based Convolutional Neural Network. It mainly focuses on region proposals. Region proposals are the concepts that are used to localize objects within an image. In typical CNN, the class of the objects are identified. According to this environment, it is possible to regress bounding boxes directly. but it cannot able to locate it where it is. And it can also only happen for one object at a time. The R-CNN algorithm identifies where it is located and thus it can be easily identified. The Fast R-CNN methodology is faster than the R-CNN which shares computations across multiple proposals. The advantage of using R-CNN is that it samples a single ROI from each image. But Fast R-CNN samples multiple ROIs from the same image. For example, R-CNN selects and classifies a batch of 128 regions from 128 different images. The disadvantage of this method is that data requirements. They are the main challenges of Faster R-CNN and Mask R-CNN when it applied to real-world scenarios. These models of algorithms require huge amounts of annotated data to train the network and fine-tune it's regions. But it is a costly process. Also it is time-consuming methodology. Also these algorithms are very prone to errors.

Proposed Model

In a standard CNN model, the 3X 3-sized convolution kernel is used. It is implemented to integrate feature information [3]. But the kernel size of SC-con varies from the convolution 3 X 3 kernel size. Before convolution, the feature map A with a HXC X W shape must be evenly cropped into two branches according to the number of channels. We refer to them as A1 and A2, respectively, with the C/2 shape. The SC-conv structure can flexibly control the manner of feature extraction in space by cropping the feature map and setting the convolution kernel size. The A2 branch like the 3 X 3-sized convolution kernel with the same resolution as the input is used to extract the original spatial context information, called B2. B1 is obtained after self-calibration through the A1 branch. At the end of the SC-conv structure, B1 and B2 are concatenated together to obtain a feature map with more discriminative feature information.[11][12]. The 3X 3 kernel size can obtain only limited spatial information due to the limitation of the convolution kernel size, thereby ignoring the information in the larger field of view. This information loss will not have a significant effect in the recognition of natural images, but it appears to be very important in the recognition of small targets in remote sensing images. A small aircraft target may only occupy 32 X 32 px in a remote sensing image, which measures approximately 4000 X 4000 px. Thus, a large loss of learnable features will be observed for networks. We assigned more channels of feature maps to the A1 branch to weaken this problem.

67621

Rajeswari Joe *et al.*,

Increasing the number of channels in A1 will extract richer semantic information to supplement the missing target edge information in B1, enhance the target features in B1, and obtain a more discriminative feature map between the foreground and the background. For (P2, P3, P4, P5) , the network will gradually lose low-level feature information (e.g., outline and texture) as the number of layers increases, which is critical for semantic segmentation. Therefore, the self-calibration intensity must be increased to accurately locate the aircraft targets without losing basic spatial context information. We denote the channel ratio between A1 and A as ϕ, $\phi = 0.8$, corresponding to (P2, P3, P4, P5) . or the A1 branch, we first go through an average pooling operation with a size of r X r and a stride of r to obtain the spatial information F1 of a larger field of view, as shown in (1):

$$F1 = Avg Pooling_r (A1)$$

Second, F1 passes through K2 convolution and up-sampling in sequence then performs element-wise summation with A1 before passing through the sigmoid function. This output performs element-wise multiplication with F2 obtained by K3 convolution with A1, as shown in (2):

$$B' = (A1 * K3) \bullet \sigma(A1 + Up(F1 * K2)) \qquad (2)$$

where,* and σ represent convolution and sigmoid function, respectively. Third, B1 is
obtained by convolution K4, as shown in (3):

$$B1 = B' * K4 \qquad (3)$$

We use the improved SC-conv to extend the 3 X 3 kernel size to two spatial scales: the first is the A2 branch with the same resolution as the input X just like a 3X 3 kernel size; the second is the small size F1 after average pooling. In the A1 branch, self-calibration does not pay attention to global information because it inevitably contains information with a negative impact on the current spatial position. On the contrary, the self-calibration focuses on the information around the current spatial position through adjustable scale average pooling. It can obtain a larger field of view to effectively capture the informative context information, fill in the missing low-level feature information, and enhance high-level semantic information for each spatial position. Furthermore, each spatial position can reflect the dependence between channels in a greater extent, as shown in Equation (2). The improved SC-conv specifically increases the self-calibration convolution intensity in high-level feature maps to strengthen the connection between contexts. In this way, each spatial location contains more informative information and enhances the acquisition of low-level feature information (e.g., clearer texture) in the feature maps.

RESULT AND ANALYSIS

We used ResNet101 as the backbone network to extract features and the standard metrics to evaluate our results, including AP (average precision), AP50, and m IoU (mean intersection over union), and ensure the result validity. They are widely used to judge a deep network model's performance in object detection and instance segmentation. AP50 is the IoU threshold set from 0.52 to 0.97 with a step of 0.05. Table 2 presents the experiment results. The value of ϕ is set from 0.5 to 0.9 with a step increment of 0.1. We derived the comparison model with $\phi = 0.8$ as R-CNN+05SC. The outcome value increases, when the value of ϕ increases between 0.5–0.9.Slight advancement is recognised when SC R-CNN is compared with R-CNN+07SC. The outputs of SC R-CNN and R-CNN+09SC is observed almost the same when $\phi = 0.9$.

Loss and Training Time

Training our own model took an average of 3800 s and 3–4 s of each epoch and iteration, respectively. [13][14].When training the original R-CNN model, training the model of each epoch took 3600s. The time consumed for every iteration was almost the same as that of the proposed model. The training time comparison between SC R-CNN and Our proposed model illustrated that we controlled the increased time of training the model within an acceptable range and obtained better detection results than the original model. Our model reached a trade-off between time consumption and accuracy. Our proposed model is a multi-task model. The loss value is composed of the classification loss, bounding-box loss from the RPN structure, classification loss, bounding-box loss, and mask loss from the backend of the model. The experiment showed no satisfactory classification performance for many objects when it is detected using R-CNN, Fast R-CNN, and SC R-CNN. The classification performance is strongly related to the each and every object structure.[15][16].

CONCLUSIONS

This advanced proposed methodology is used to detect and segment the objects in various images. The WFA-1400 datasets are also incorporated to test modified SC-Faster RCNN.   Our model successfully obtained an improvement of about 2% in the accuracy compared to the basic network. Our study has practical significance for the research on various objects in the image dataset. In this work, we have proposed a model to distinguish the weapons by handling the on-going video and advising the client by means of an email and this can be utilized with caution-based frameworks in utilization of observation.[17][20]. We exploited one of the most up to date models, for example. The most encouraging outcomes are acquired from the YOLO-v5 model prepared on the 3000-gun picture data-set with the option of 12,000 negative class pictures. The prominent outcomes accomplished 93% accuracy with the speed per outline with 0.01s which is quicker than the Faster R-CNN model utilized by any other examination. [18].In future, we will pivot upon this model by utilizing other pre-processing methods like splendor control, we additionally found few regions where the presentation of the model is frequently expanded by taking care of the issues such as weapons which fluctuation [19]. Some other events such as cartheft detection, unauthorized presence in restricted area can be implement edin future

ABSTRACT

Large amounts of wastewater are produced by the growing world population, which also results in high energy demand. The present study aims to investigate the potential of macro algal biomass for the textile effluent treatment. The macroalgae taken for the present investigation is Sargassum natans. The effects of various process parameters, namelysorbent dosage, pH and temperature on adsorption were optimized using batch mode operation under the optimized condition. The biosorbent- adsorbate interactions were characterised using UV-Visible Spectrophotometer, FTIR (Fourier Transform Infrared Analyser) and SEM (Scanning Electron Microscope). Optimum conditions for dye removal Percentage (75.65%) from real effluent were obtained as sorbent dosage of 3 g/L, at pH 7 with contact time of 96 h and temperature at 45℃ with effluent concentration of 50% (mL). Based on the estimated characteristics, it is revealed that the real effluent is not suitable for direct discharge into water stream and need a suitable technology for the treatment before discharge. The results obtained in this work indicated that the potential use of macro algal biomass as a bio sorbent is feasible in the treatment of real textile effluent.

Keywords: Biosorption, Macroalgae, Textile dye, Real Effluent, Sargassum natans,

INTRODUCTION

Water pollution is one of the environment problems which causes severe impact to living organisms. South India is well known for textile industry. Coimbatore, Tirupur, Salem and Erode, these four districts are known as textile belt of South India and based on literature survey, the export revenue generates more than 25,000 crores. This industry was the main contributor of wastewater effluent due to high consumption of water during dyeing, washing and finishing processes. Industries release waste water contaminated with heavy metals, chemicals, dyes, oils and many other hazardous substances directly released into water bodies without any treatment [1].All of the dye wastes, which are generated by many types of enterprises, could have negative effects on the microbial population and be dangerous or even lethal to animals. These colours have been linked to cancer, skin rashes, mutations, and allergic eczema etc. Few chemicals that are utilized to make dye are extremely poisonous, cancer-causing and hormonally disruptive. In addition to prevent sunlight from penetrating water and reducing photosynthetic activity, this also affects the atmosphere, creating problems. The life cycle of aquatic creatures and plants is hampered by dye released into water bodies because it blocks sunlight from penetration [2]. They contribute to the scarcity of dissolved oxygen by simultaneously increasing the biological oxygen demand (BOD) needed to support aquatic life. Some dyes inflict direct harm to cells or hinder their ability to respond chemically because they are extremely cyanogenic. As intended, dyes loaded in effluent are extremely stable compounds built to fend against deterioration by light, biological, chemical and other factors [3].Thus, it is necessary to develop an effective and efficient method to remove the toxicants from wastewater before being discharged into natural water stream. With the search of a new dimension of treatment methods; adsorption treatment for the control of water pollution is less investment in terms of initial development cost, simple design, easy operation, no generation of toxic substance sand safe recovery of the adsorbent. Macroalgal biomass which is popularly known as seaweed biomass will be used as the adsorbent in the treatment of textile effluent.

It was chosen as it is a ubiquitous biological resource and is most predominant that contains alginate gel in their cell walls which offers a convenient basis for the production of bio sorbent particles that are suitable for sorption processes and also the presence of abundant dye uptake functional groups [4]. The growing human population has posed numerous challenges to the global economy particularly in terms of environmental conservation. Textile wastewater treatment appears to be the biggest challenge to textile sectors. The application plays an imperative role in bio monitoring; accordingly, this project study targets to overview simultaneous bioremediation of textile effluent and the macroalgal biomass with textile dye molecules, which can be useful in biogas production. Previous research works were established only for the removal of synthetic synthetic textile effluent using algal-biomass [5]. Few research works were established on real industrial effluent using algal biomass. Keeping in view the significance of textile effluent and their environmental problems, the current study was undertaken to explore the bio sorption potential of two macro algal biomass for the removal of dye molecules from effluent and the feasibility of treated macro algal biomass with dye molecules in the production of biogas.

MATERIALS AND METHODS

Effluent and reagent
The effluent was collected from a small-scale dyeing unit at Sirumugai, Coimbatore district, Tamil Nadu. Coimbatore is famous worldwide for its handloom textile products. The sample was collected in pre-cleaned 20L polythene bottles from the point of discharge of the industry and preserved in a refrigerator at 4º C till the completion of the investigation. All other chemicals used in the present study were of analytical grade. De ionised water was used for all dilutions.

Collection and identification of algal sample

Seaweed (Figure 1) was collected from Mandapam, a small panchayat town in Rameswaram district, Tamil Nadu, India (98.28°N 79.12°E). The live and healthy macro algal sample was collected by handpicking method at a depth of 1-2 m. Algal species was identified and taxonomic classification of the algal species was made. The identification was based on (a) morphological, using external and internal characteristics and (b) ecological distribution and habitat.

Preparation of adsorbent

The collected seaweed (Sargassum natans) was washed several times to remove dust and was shade dried until all the moisture evaporated. It was cut into small pieces and ground to a fine powder in an electric grinder. The powder was sieved through a mesh to get fine particles of size 150μm. The material was stored in an airtight container for further use.

Batch adsorption studies

The batch adsorption experiments were conducted to optimize the various operational parameters namely adsorbent dose, initial pH, temperature and contact time to obtain optimum colour removal from the effluent. Batch studies were conducted with fixed amounts (1 to 5 g/L) of adsorbents which were shaken separately in a rotary orbital shaker at 150rpm in 100ml of the diluted effluent of 50% concentration at different temperatures (25,35,45, 55 and 65ºC) and pH (3-10) for definite time periods (96 h). At the end of the predetermined time intervals, samples were withdrawn from the shaker and the adsorbents were separated from the solution in a centrifuge at 12,000 rpm for a period of 5 minutes. The absorbance of the supernatant solution was read by UV-Visible Spectrophotometer at 340nm to estimate the final effluent concentration. All experiments were carried out thrice with respect to each condition.

Colour removal efficiency was computed with the following formula

$$(\%) \text{ Color removal} = \frac{\text{Initial concentration} - \text{Final concentration}}{\text{Initial concentration}} \times 100$$

Physicochemical characterization of raw and treated textile dyeing effluent

The raw and treated effluents were subjected to various physicochemical analyses according to the methods of APHA 2005 (American Public Health Association2005).

Analytical studies

The dye solution before and after adsorption was characterized for neutralization of pH and further the biomass was characterized by FT-IR (Perkin Elmer PE 1600)for analysing functional groups.Adsorbate concentration was analysed by UV-Visible spectrophotometer (Schimadzu UV-1800). The surface morphology of the sorbent was documented by SEM (Model JSM-6100).

RESULTS AND DISCUSSION

Adsorption optimization studies
Effect of adsorbent dosage

The effect of adsorbent dosage (1- 6 g/L) for the removal of dye in effluent using S. natansis shown Figure2. The maximum removal was observed as 48.34% at 3.0g/L. When the adsorbent dose was further increased from 3.0g/L to 5.0g/L there was a decrease in the bio sorption capacity of adsorbent. At the adsorption dose of 5.0g/L the percentage removal was 36.64% for S. natans. Adsorption efficiency decreased with increase in the bio sorbent dose. The percentage removal of dye increases with increase in the adsorbent dosage up to a point but after that there is no significant increase in the removal. This can be explained by the fact that on increasing adsorbent dosage, the surface area of the adsorption sites increases. But there is no significant increase in adsorption capacity further even after adding more adsorbent which might be due to the interactions between particles within themselves[6].

From the results, it can be observed that the removal efficiency of the dye generally improved with increasing algal biomass and reached equilibrium at 3.0 g of biomass. Ruangsomboonetal., (2013) reported that the removal of textile effluent using macroalgae decreased from 8.60 to 0.77 mg/g when the Padina sp. biomass was increased from 0.5 to 6 g/L [7]. Naveenet al. (2011) reported that the amount of dye adsorbed varied with initial adsorbent (Hydrilla verticillata) dosage [8]. Although it is simple to understand, the biosorption process is significantly impacted by the dose of the bio sorbent. Bio sorbent dose plays a very important role in the process of biosorption. The dye bio sorption capacity decreased at higher bio sorbent doses due to the aggregation of the biomass which results in a decrease in active sites on the surface of the bio sorbent available for the attachment of dye molecules[9]. Another important factor is that at high bio sorbent doses, the available dye molecules are insufficient to completely cover the available binding sites on the bio sorbent, which usually results in low solute uptake [10]. Thus, the most efficient operational parameters in the current study were maintained as pH of 8, temperature of 35ºC and contact time of 98 hfor the treatment of textile effluent of 50% dilution using Sargassum natansas an adsorbent. The removal of pollutants is dependent on the dye concentration, biomass concentration, pH and temperature.

Effect of pH

The effect of pH on textile dye adsorption on Sargassum natansis shown in Figure3. The effect of pH was studied by varying the pH from 3.00 to 9.00. At pH 3.0, the minimum adsorption of 25.00% using S. natans was recorded. With further increase in pH, a gradual increase in percentage colour removal was observed with 35.00% using S. natans at pH 4.00 and 45% using S. natans at pH 5.00, which recorded a maximum of 55 % using S. natans at pH 6.00. pH 7.00 recorded a slight increase in adsorption (65% using S. natans). Above pH 7, the adsorption percentage was gradually decreased and recorded at 52% using S. natans at pH 10.00. The present study clarified that the removal of textile effluent by using algal biomass is affected by pH. The textile dye removal was increased to some extent by increasing the pH. Maximum dye removal was observed at pH 7.0. On the other hand, high pH values deprotonate hydroxyl, amine, and carboxyl functional groups which promotes the formation of hydroxide anionic complexes that tends to precipitate and impeding effective adsorption [11]. Thus, the pH value of the solution is an important process parameter controlling the adsorption of dye. The initial pH values of the dye solutions affect the surface charge of the adsorbent and thus the adsorption of charged dye groups on it. At an acidic pH condition, the hydroxyl and carboxyl groups on the surface of macroalgae are protonated, and they inhibit the binding of the dye cation and promote the binding of the dye anion [12]. In the present study, neutral conditions (pH 7) favour dye adsorption from the textile effluent.

Effect of temperature

The effect of temperatures was studied in the range from 25°C to 45°C (Figure 4). The percentage of dye removal was increased for the rise in temperature from 25°C to 45°C (48.15 - 75.65 for S. natans). Further increase in temperature from 45°C to 65°C (75.65 – 59.68 for S. natans) could not increase removal percentage, rather a decrease was observed. Therefore, the maximum removal of dye from effluent was achieved at 45°C which is recorded as the 75.65% using S. natans. This was achieved because as temperature increases from 25°C to 45°C, a slight increase in the surface area of the adsorbent could be possible but a further increase in temperature above 45°Cresults in the loss of active surface area resulting reduction in the colour removal percentage. Hence, the adsorption was slow at high temperatures. The optimum temperature was 45°C at which the adsorption was very effective and the present study shows the exothermic nature of adsorption. The results of the present investigation are in accordance with Renganathan et al., (2008) who observed that the optimum temperature was 30°C at which the adsorption was very effective[13].Renganathanet al., (2008) also reported the highest efficiency of dye removal at 30ºC with a decrease in bio sorption below 30ºC [14].

The decrease in viscosity of the solution caused by an increase in temperature can improve the diffusion of adsorbates over the bio sorbent's superficial layer and inner pores. It can also increase the number of active sites available for adsorption and improve the stability of the connections between dyes and the functional groups of the biomass [14].

Analytical studies (characterization of adsorbent and dye solution)
SEM (Scanning Electron Microscopy)
The surface features and morphological characteristics of the bio sorbent was studied using SEM (Scanning Electron Microscopy) analysis. The study was useful in determining the particle shape and porous structure of the adsorbent for S. natans. SEM micrographs of the algal biomass and textile dye-loaded biomass are presented in Figure 5. From the micrographs, it was evident that before adsorption, the structured arrangement of the seaweed showed that the interconnected tube cells is visible and the cell wall of the intercellular matrix remains almost intact. The pores within the seaweed particles are assorted, the surface was rough and irregular in shape which might be indicated that there is an adequate space for dye adsorption [15]. Whereas after adsorption, a significant change was observed in surface of the adsorbent, which clearly indicated the porous and fibrous texture of the bio sorbent with homogeneity that could contribute to the bio sorption of the dye. The morphological changes of the seaweeds surface after dye adsorption may be attributed to the differences in pores, morphology, and structure of the cell walls of algae [16]. The cell wall of S. natans before adsorption was very porous and easily permeable to ions. This may explain the highest affinity of S. natans biomass for the removal of pollutants from the effluent.

FT-IR Analysis (Fourier Transform Infrared Spectroscopy)
FT-IR spectra of seaweeds particles before and after the adsorption of textile effluent were analyzed to determine the vibration frequency changes in their functional groups within the range of 4000 to 600 cm^{-1}. The FTIR spectrum aids in the identification of the molecular components and their structures. In this study, FT-IR spectrum is able to predict the main chemical constituents in S. natans before and after adsorption of the textile dyes from effluent [17]. The absorbance at 3294.42, 1635.63, 1527.62, 686.65, 601.79, 555.49, 493.77, 447.48 and 416.62cm^{-1} are seen in the spectrum of biomass before adsorption (Figure 6). The major peaks are at 3294.42, 1635.63 and 1527.62cm^{-1}. The peak at 3294.42 cm^{-1} indicates the presence of free and intermolecular bonded hydroxyl (-OH) of cellulose, hemicelluloses, and pectin. The peak at 1635.63 cm^{-1} reveals the existence of C=O from esters probably of lignin and hemicelluloses [18]. On the other hand, the absorbance at 3741.90, 3263.55, 1643.35, 686.65, 601.79, 555.49, 486.06, 462.915 and 416.62 cm^{-1} are seen in the spectrum of biomass particles after adsorption using *Sargassum natans* (Figure7). The major peaks are at 3741.90, 3263.55, and 1643.35 cm^{-1} which includes hydroxyl, amine, and an ester group. The remaining peaks include halogens or ether groups. IR spectra for textile effluent treated with S. natans were observed on the cell surfaces of 3741.90 cm^{-1} (OH, CONH, and NH), and 3263.55cm^{-1} (-OH). Several indicator bands that are pertained to functional groups represent chemical components or metabolic products [17].

CONCLUSIONS

Real textile effluent treatment is difficult because it contains toxic compounds that have low biodegradability. Finally, more efforts are needed by water technologists and textile industrial experts to reduce water pollutants produced from industry and in the urge to decolourize before discharge to the environment. In the present study, Sargassum natansspecies acted as the adsorbent and was used successfully as a low-cost and effective adsorbing agent for the removal of dyes and pollutants from textile effluent, which could be used for textile wastewater treatment at an industrial scale. From the study, it could be concluded that the studied textile effluent has high pollution potential and warrants an urgent need to follow adequate effluent treatment methods before discharged into surface water for reducing potential environmental hazards. It is also evident that the macroalgae (S. natans) as an adsorbent may provide a promising approach towards textile wastewater treatment.

ABSTRACT

In recent years, the demand for vegetable milk has experienced a significant surge in consumption. This growing trend reflects a shifting preference towards plant-based alternatives as a nutritious and sustainable choice for individuals. The present study focused on the effect of processing on the nutritional and structural characteristics of milk extracted from sprouted and non-sprouted Moth Beans (*Vigna aconitifolia*).The milk was extracted from the sprouted and non-sprouted moth beans. The nutritional composition including moisture, ash, pH, carbohydrate, protein, fat, fiber, calories, and iron was analyzed. Additionally, the morphological structures of both sprouted and non-sprouted were studied. The results demonstrated that the sprouted milk exhibited higher protein content, moisture, and ash whereas carbohydrates and calories were lower compared to the non-sprouted milk. The morphological study revealed that both types of milk had oval and hexagonal shapes with a ruptured surface. Therefore, this study concluded thats prouted Moth bean milk may have the ability to reduce the anti-nutritional properties and enhance the bioavailability of amino acids and other nutraceutical elements.

INTRODUCTION

In India, milk production ranks as the topmost in the country, with a significant number of people depending on milk as a vital dietary component. However, despite the importance of milk, some individuals face complications in incorporating it into their regular diet due to lactose intolerance, hypercholesterolemia, hormone imbalances, and other factors. As a result, there is a growing demand for alternative options to fulfil their nutritional needs. Exploring and promoting these alternative sources can provide a valuable solution for individuals seeking dairy-free or modified dairy options that address their specific dietary concerns. Legume beverages, resembling cow's milk in appearance and consistency, are colloidal suspensions consisting of dissolved and disintegrated plant material in water [1].However, various technological challenges often arise in the processing and preservation of these plant-based beverages. Legume beverages offer a well-balanced composition, being rich in proteins and minerals, and boasting a low glycemic index. Their protein content, approximately 3-4%, is comparable to that of cow's milk, which typically falls within the range of 3.3-3.5%. In contrast, cereal and nut-based beverages typically exhibit protein values ranging from 0.1% to 1.0%. Among legume beverages, soy milk stands out as the most widely consumed, sharing similar protein content to that of milk, with a minimum of 3% [1].

Several pulse crops, such as pea, faba bean, lentil, lupin, chickpea, and common bean, show potential as alternative protein sources in the development of milk alternatives and related products. Pea protein-based milk substitutes with high protein content have already become commercially available for the vegan market [2]. However, compared to soybeans, most pulses contain higher levels of starch and other carbohydrates [3]. To achieve milk alternative formulations that approach the nutritional value of cow's milk, it is likely that protein isolation/concentration steps would be necessary for most pulses. Currently, the most widely accessible pulse protein concentrates or isolates are derived from peas [4]. Moth bean serves as a versatile crop, providing food, fodder, feed, and serving as a green manure and pasture. Its green pods are delicious and a valuable source of vegetables. As a pulse, moth bean offers an affordable vegetable protein option to address nutritional deficiencies, particularly in areas with less productive soils where many financially disadvantaged individuals rely on it for their livelihood. Moth bean is renowned for its high proportion of albumin and glutamine protein fractions and is also rich in lysine and leucine amino acids. Moreover, the dry seeds of moth beans are widely used in the preparation of various delectable confectionery items such as papad, mangori, mogar, and bhujia-namkins, which are commonly enjoyed as daily snacks. These industries have experienced significant growth, exporting these commercial edible products and creating employment opportunities in the agro-based sector [5].The bean is also rich in resistant starch, vitamins, and fructo-oligosaccharides. These components have been shown to provide protective effects against oxidative stress, heart disease, diabetes, cancer, and metabolic syndrome (MetS) [5].Therefore, considering the increasing demand and the potential it holds, the present study aimed to find the effect of sprouting on the nutritional and structural characteristics of milk extracted from sprouted and non-sprouted Moth beans.

METHODOLOGY

Sample Collection and Authentication
The moth beans were procured from the local market, in Salem, Tamil Nadu and it was authenticated by the Indian Botanical Survey (Tamil Nadu).

Extraction of Milk from Sprouted and Non-Sprouted Moth Bean
Sprouted Milk
To disperse the protein fraction and starch granules, facilitating protein denaturation and starch gelatinization, 100 grams of moth beans were soaked in water for 12 hours. This soaking process helps soften the texture of the legumes. After draining the water, the soaked moth beans were placed in a wet cloth and hung for an additional 48 hours to

allow sprouts to form. The sprouts were then ground with water using a 1:2 ratio and the milk was extracted using a muslin cloth and stored in an airtight container for later use.

Non-Sprouted Milk
Similar to the process mentioned in section 2.2.1., the soaked moth beans (100 grams) were ground with water (1:2 ratio) to form a mixture. The mixture was then strained using a muslin cloth to extract the milk and stored in an airtight container for later use.

Nutritional Composition
Proximate Composition and pH
The proximate analysis such as moisture, total ash, carbohydrate, calorific value, protein, fiber and fat of the sprouted and non-sprouted moth bean milk was analysed by the AOAC method. The pH was determined using the Electrometric method for both extracted milk.

Iron Estimation
The total Ironcontent of sprouted and non-sprouted moth bean milk was determined by the AOAC method and compared with each other.

Morphological Study (Scanning Electron Microscopic with EDAX)
The morphology study of sprouted and non-sprouted moth bean milk was analysed using a scanning electron microscope (SEM) (EVO 18: UK with SE, BSE, VPSE, and EDS detectors). For analysis, the samples were mounted on circular aluminum stubs using double-sided sticky tape. The milk was placed on the tape's surface. Subsequently, a 12 nm gold coating was applied to the samples. The samples were then examined and photographed at an accelerating voltage of 5 kV with a magnification ranging from 1x to 1,000,000x.The EDAX was performed using a Hitachi S-3000N microscope. The analysis demonstrates the presence and location of the elemental constituents of additives like calcium carbonate.

RESULTS AND DISCUSSION

Nutritional Composition
Proximate Composition and pH
The effect of sprouted moth bean millet on nutritional composition is shown in Table 2. The moisture content of sprouted milk significantly increased compared to non-sprouting moth bean milk. After water entry into the seed coat, seed swelling starts and initiates sprouting. During sprouting, the water intake of the seed varies. A similar trend was observed in recent studies [6 & 7] in in soybean (5.4 to 56.1 % after 48 h of sprouting) and cowpea (15.6 to 17.6 % after sprouting) respectively. Usually during sprouting, seeds absorb water by a process called imbibitions[8 & 9]. Ash is a non-organic compound continuing mineral contents in food and nutritionally aid in the metabolism of organic compounds such as fat and carbohydrate. The sprouted moth bean milk observed ash content was significantly lower compared to non-sprouted moth bean milk as reported by [10 & 11] in chickpea and mung bean respectively after germination.

Sprouted moth bean milk had 4.56 g/100 g of carbohydrates whereas non-sprouted was noticed to 6.40 g/100g. A significant reduction in carbohydrates was observed during sprouting, this could be due to enhanced hydrolytic enzyme activities that promoted starch digestibility[12]. A decrease in carbohydrates during germination made the sprouts popular in developed countries due to their low carbohydrates and rich in vitamins [13]. The calorific value also followed the same trend of reduction during sprouting it may be due to low levels of fat and carbohydrates as opted by [14]. Non-sprouted moth bean milk (35.80 kcal) was a significantly higher calorific value than the sprouted moth bean milk (28.76 kcal).

The report on sprouted soybean milk (7.47–9.54%), the protein level of both sprouted milks was between 2.55–2.63 g/100 g [15], while the fat content was less than 0.1 g/100 g in both cases. Protein and fat results revealed that moth

bean milk, whether sprouted or not, is an excellent source of protein due to its high biological value and when compared to seed. The processes which promote the biochemical mechanisms in the human body during germination include the breakdown of polysaccharides into oligo- and monosaccharides, free fatty acids, free amino acids, and oligopeptides. They therefore increase the effectiveness of the enzymes that break down carbohydrates, fatty acids, and proteins.

Iron Estimation

The total iron content of sprouted and non-sprouted Moth bean milk ranged between 1.09 mg/g and 1.66 mg/g. The results indicate that there are slightly significant variations noticed among the samples. However, when comparing the samples, it is noted that non-sprouted milk (1.66 mg/g) has higher iron content than sprouted milk (1.09 mg/g). Similarly, [16] reported that there were no significant variations in the iron content of soaked faba bean and mung bean, but azuki bean showed a significant ($P < 0.05$) reduction in iron content when soaked. Sprouting or controlled germination of legumes reduces anti-nutritional factors and improves their overall nutritional quality [17]. During germination, minerals like calcium, zinc, and iron are released from their bound form, and phytic acid is reduced, resulting in increased availability of minerals [18].

M. Sativa sprouts were found to have three times the iron content compared to dry seeds. On the other hand, during the sprouting process of soybeans, the iron concentration decreased, while no significant changes were observed in wheat grain. This observation was supported by [19], who demonstrated that the trend and level of mineral composition variation between untreated and sprouted soybean seeds depended on the plant's genotype. In the case of sprouted seeds of *Phaseolus vulgaris* and *Cajanus cajan*, [20] discovered that the content of calcium and zinc was higher, while the concentration of iron was lower compared to raw seeds. The study of [21 &22] observed a negligible increase in iron content in sprouted seeds of cowpea genotypes. The study of [23] also reported that soaking and different sprouting periods did not result in significant variation in the iron content of mung beans and cowpeas, while chickpeas experienced a reduction in iron content when soaked and germinated. The authors noted a significant decrease in calcium and zinc levels in soaked and germinated mung bean and cowpea seeds. Therefore, the difference in iron content between sprouted and non-sprouted moth bean milk may depend on the plant's genotype, and there is no mandatory requirement for a natural increase in iron content during sprouting based on previous evidence.

Scanning Electron Microscopic with EDAX Analysis

The morphological structure of sprouted and non-sprouted moth bean milk is depicted in Figures 1 and 2, respectively. Fig. 1 shows particles of sprouted milk with oval shapes, rough surfaces, and occasional smooth areas, which are typical features associated with sprouting. In contrast, Fig. 2 displays non-sprouted milk particles with very rough surfaces and a hexagonal shape. Both the sprouted and non-sprouted milk predominantly exhibit granules with pitted surfaces, which could be attributed to amylase activity. This finding is consistent with previous studies conducted by [24 & 25]. Additionally, porous surfaces were observed in the particles. The results of EDAX (Fig. 3, 4 and Table 3) revealed that the elements such as carbon (C), oxygen (O), Magnesium (Mg), Phosphorus (P) and Potassium (K) were noticed in both the sprouted and non-sprouted milk. The other elements such as Nitrogen (N), Sodium (Na), Aluminium (Al), and Chloride (Cl) were recorded by the Sprouted Milk alone. The elements present are expressed in weight percentage and in proportion to the total elements of the area analysed.

CONCLUSION

The present study highlights the potential of moth bean as a versatile and nutritious crop for the development of milk alternatives. The nutritional analysis revealed that both sprouted and non-sprouted moth bean milk offer a balanced composition, with protein content comparable to cow's milk, making them suitable protein sources for individuals with dietary restrictions. Additionally, sprouting was found to have positive effects on the nutritional profile of moth bean milk, leading to reduced carbohydrates and increased protein content. Moreover, the presence

of iron in both sprouted and non-sprouted moth bean milk indicates its potential as a valuable source of this essential mineral. Although the iron content was slightly higher in non-sprouted milk, further investigation into the genotypic differences might shed more light on this aspect. The morphological analysis using scanning electron microscopy demonstrated the characteristic granular appearance of both sprouted and non-sprouted moth bean milk, with indications of amylase activity, which contributes to the digestibility of starch during germination. Moreover, promoting and utilizing legume-based milk alternatives can have a positive impact on sustainable agriculture and the agro-based industry.

ABSTRACT

Teachers' positive attitude towards teaching is one of the significant factors of pedagogical enrichment. In today's high-tech world teachers' attitude towards use of technology during classroom sessions is a matter of concern. This study focuses to differentiate teachers' attitude towards teaching mathematics with and without using technology during teaching. Adopting descriptive survey method Kolmogorov-Smirnov Normality test for normal distribution; Mann Whitney Test for testing the significance of difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom; Tukey Post Hoc test for finding out the paired mean difference and level of significance are run. Under both of the government and private sectors, teachers' attitude towards teaching mathematics does not matter whether it is digital or traditional approach within the domain of study.

Keywords: Teachers' attitude, teaching and learning, pedagogy, ICT

INTRODUCTION

According to the National Policy of Education (1968), the most essential component determining the quality of education and its contribution to national development is the teachers. Teachers are more than just teachers; they are also organizers, controllers, and motivators."A new teacher is put at the epi centre of educational transformation," according to the International Commission for the Development of Education [1].The teacher of the new millennium has to be able to in still in his or her students' fundamental competencies and attitudes such as creativity, receptivity

67641

Gunendra Chandra Das and Devajit Sarmah

to change and innovation, knowledge versatility, adaptability to changing situations, discerning capacity, critical attitude, problem identification, and solution." 'Techniques and Time' defines technology as "organized inorganic matter"[2]. Technology is most broadly described as the material and immaterial entities formed by the application of mental and physical effort to accomplish some value. Technology refers to the application of scientific knowledge to everyday tasks. Technology is the science of procedures, or methods of doing and getting things done, in relation to any art, science, or profession. It is not just a specified methodology, but also a scientific method for developing new approaches. So, technology is more than simply machines and equipment; it is the expansion of human abilities, competencies, and talents in using machines and equipment to obtain information while overcoming time, space, cost, and effort barriers[3]. Teachers must be knowledgeable in the areas of technology, topic, curriculum, teaching methods, classroom management, learners and their characteristics, student learning evaluation, and techniques to evaluate instructional approaches [4]. The Technology, Pedagogy, and Content Knowledge (TPCK) theoretical framework provided by Mishra and Koehler supports this claim[5].

For effective technology adoption in the mathematics classroom, Mishra and Koehler advocated for instructors to have a well-developed integrated knowledge of technology, pedagogy, and subject. One of the most important steps in improving teachers' knowledge and skills in using technology to teach mathematics is to implement a professional development model in which they engage in technology-oriented activities[6][7]. Zhao, Tanand Mishra offered evidence to support the importance of teachers' attitudes regarding computer usage in the classroom and provided evidence to demonstrate that teachers' attitudes are directly related to use of computer in the classroom[8]. The attitudes of teachers, as well as their readiness to accept technology, will be critical to the success of student learning with computer technology[9]. The NCTM established the "Technology Principle" as one of the six principles of high-quality mathematics education, with recommendations and support for its usage[10].According to Principles and Standards of School Mathematics, "Technology is fundamental in the teaching and learning of mathematics; it changes the role of mathematics that is taught and promotes students' learning (p.24),"Teachers should use technology to improve their students' learning chances by selecting or inventing mathematical assignments that take use of what technology can accomplish efficiently and well-graphing, visualising, and computing. Furthermore, according to NCTM, appropriate use of technology can facilitate such applications by providing ready access to real data and information, making the inclusion of mathematics topics useful for applications and more practical (e.g. regression and recursion), and making it easier for teachers and students to combine multiple representations of mathematics topics.

Overview of teachers' attitude

The pedagogies used in the classroom are heavily influenced by teachers' attitudes regarding teaching mathematics at the secondary level. The inner perspective, opinion, ideas, feelings, and beliefs of a teacher are simply defined as their inner view, opinion, ideas, feelings, and beliefs regarding a specific phenomenon. The Kothari Education Commission correctly stated in its report that "India's destiny is being moulded in her classroom."It's not surprise that the teacher takes centre stage in India's vast opera of learning, which is performed virtually daily in Indian classrooms. There is a strong relationship between teachers' attitudes toward mathematics and students' attitudes toward the subject. If the teachers have a repulsive or negative attitude towards the subject, then that radiates a similar unfavourable attitude in the minds of the students as well as such negative attitude of the teacher might not only harm a pupils' academic performance but also heightens their psychological illnesses and physical stress symptoms.

Teachers' attitude towards mathematics

Teachers' attitudes about mathematics have a significant impact on their students' achievement. Teachers' pedagogy is influenced by experience, self-confidence, and motivation to teach the subject, according to the literature. Mathematical learning is influenced by a variety of circumstances. Three elements that influence teachers' opinions of mathematics teaching are- students have specific mathematical beliefs; second, they create views when they are frequently confronted with mathematics issues; and third, they experience interruptions and blocks when learning mathematics and this may result in both negative and good responses from the students[11]. The Attitudes Towards

Gunendra Chandra Das and Devajit Sarmah

Mathematics Inventory (ATMI) is a well-known attitude detection tool [12]. The ATMI was designed by J. E. Schackow for mathematics teachers[13].Value (whether mathematical skills are worthwhile), enjoyment (if mathematical problems are fun to work with), self-confidence (how quickly mathematics is mastered), and motivation (the desire to acquire more understanding about the subject) are the four underlying dimensions.

Many studies have been, and rightfully continue to be, focused on the relationship between students' attitude toward mathematics and achievement [14][15][16][17][18]."Students' perceptions on learning this subject settled in their minds have to be changed by the concerned teachers and parents to develop a positive attitude towards the subject"[15] Despite the fact that mathematics is widely recognized as important, many people have a good or negative attitude toward it. Attitudes are an important aspect of a person's personality. To have feelings of love and hatred, preference and despise, favour and opposition, agreement and disagreement, argument and persuasion is perfectly normal. All these responses are directed towards an idea that can be evaluated. As a result, attitudes might be described as a general assessment of an object[19]. Attitudes toward mathematics encompass beliefs, talents, and perspectives on the subject's utility [20]. Beliefs to be rational in nature, with attitudes based on beliefs requiring the development and maintenance of mathematical and pedagogical knowledge and teachers must provide excellent instruction to their students. Teachers always involve by seeking out new sources of information, forming professional networks, and participating in professional development grows as professionals [10].

Teachers' attitude towards use of ICT

ICT (Information and Communication Technology) in education refers to the manner of education in which information must be generated and exchanged from people to people, and machines to machines. Any communication device, such as a radio, television, mobile phone, computer and network hardware and software, satellite system, and so on, as well as the numerous services associated with them, such as video conferencing and distance learning, are included in ICT. All human performances and interactions require communication in the form of transfer of thoughts, information, and commands between two or more individuals using the various infrastructure available, whether vocal (Oral) or non-verbal (Technological). Literacy in ICT is a current technology in the kingdom of education. ICT is a necessary tool in the modern classroom since it improves the efficiency of the teaching and learning process and allows material to be accessible and shared instantaneously. Teachers must be well-equipped with the knowledge they require in order to successfully convey knowledge to students.

The primary question is whether or not teachers have the necessary ICT skills. According to certain research, teachers do not obtain the requisite degree of knowledge. Rosnaini and Mohd Arif found that only a small percentage of teachers were proficient in fundamentals of ICT [21]. The majority of them only had a basic understanding of ICT or none at all. This example clearly demonstrates that improving teacher ICT knowledge is critical to the success of ICT programmes in schools[22]. The role of the teacher in a technology-based classroom is more difficult. The mindset and willingness of teacher educators to use ICT tools are critical to the effectiveness of ICT implementation and student achievement. The majority of research demonstrates that government interventions and training programmes help the teachers to develop the positive attitude toward ICT. Teachers were enthusiastic about using computers in the classroom[9]. This result is also consistent with the findings of several studies [23][24][25]. They looked at how potential secondary teachers felt about using computers and the Internet in general. The use of ICT in the classroom, particularly in the integration of a positive outcome, will be determined by the following factors: teachers' perceptions of ICT's contribution to mathematics education, students' perceptions of ICT's role in mathematics education, and arithmetic teachers' willingness to employ ICT in the classroom, Teachers' self-esteem and classroom administration's ability to incorporate ICT in education for teachers and attractions were positively affected by the presence of ICT in the classroom. According to Kumar and Kumar most teachers believe that computer expertise has a beneficial impact on attitudes toward computers[26].It is necessary for teacher educators to comprehend the factors that influence pre-service teachers' attitudes toward computers in order to build effective teacher training curricula that will educate teachers to confront the challenges of the information age [27]. In a study it was proposed that a positive attitude toward computer technology use had a positive link with intention

and, subsequently, real computer use in the classroom[28]. Teachers' attitudes regarding computer use will be the most important factor of technology use in the classroom in the future [29]. In a study of secondary school instructors, it was found that ICT usage in instruction leads to general usefulness; affective attitudes, behavioural control, and pedagogical use are all important factors in influencing ICT use[30].Teachers' perceptions and attitudes have been identified in the research as a key component in the integration of ICT in teaching and learning [31]. Teachers are expected to accept and use ICTs appropriately in their classrooms, thereby implementing the pedagogical improvements expected. Thus, the attitudes, perceptions, and skill of instructors in integrating ICT into the teaching process are crucial to its effectiveness. The present study is going to investigate the teachers' attitude towards teaching mathematics in digital and traditional classroom of secondary schools of Guwahati city.

MATERIALS AND METHODS

Hypotheses
H_{01}There is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom.

H_{02}There is no significant difference between the teachers' attitude   towards teaching mathematics in digital and traditional classroom of SEBA (Board of Secondary Education Assam) school.

H_{03}There is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom of CBSE (Central Board of Secondary Education) school.

Research method
The researcher adopted descriptive survey method to measure the attitude of mathematics teachers towards their teaching activities. The schools of Guwahati city are divided in two groups: Digital classroom and Traditional classroom. Digital classroom refers those schools where teachers use digital board and computer during teaching mathematics. Traditional classrooms are those where teachers use chalk board, textbook, models and charts during teaching. A5-point Likert Scale questionnaire comprising 20 items were administrated among the teachers for gathering the information regarding the teachers' attitude towards teaching mathematics. Responses are rated from five possible choices: strongly agree-5, agree-4, neutral-3, disagree-2and strongly disagree-1. In this way, the scores range from 20 to 100, a high score indicates higher level of positive attitude towards teaching mathematics in digital and traditional classroom.

Total Population of Teachers
The population of the present study are constituted working in both Government and Private schools under SEBA (Board of Secondary Education, Assam) and CBSE (Central Board of Secondary Education) (private only) belonging to Guwahati city of Kamrup (M) District, Assam. The four CBSE schools under central Government of Guwahati city are not taken into consideration because the teachers of these schools are not stable due to their transferrable job.

Sample Size Determination
In this present study, sample size for teachers is determined by using Cochran's formula at 95% confidence level with ±5% margin of error. In the study, 17 schools were already selected to study the students' attitude. But the teachers of these schools were not sufficient for the study to be undertaken. Therefore, the researcher had selected another 23 schools from Guwahati city to study the teachers' attitude towards teaching mathematics. In the present study, overall, 40 schools are selected randomly from each category such as SEBA(Govt.), SEBA(Pvt.) and CBSE(Pvt.) in which 14 are from Government SEBA; 12 are from Private SEBA and 14 are from Private CBSE schools in Guwahati city. The sample of 180 teachers (digital classroom=83, traditional classroom=97) selected from 40 schools is considered for the study.

Statistical tools Used

Gunendra Chandra Das and Devajit Sarmah

Keeping in view the nature of the hypotheses of the study, the researcher used the following statistical techniques for analysing the data and testing of hypotheses.

1. One sample Kolmogorov-Smirnov Normality test, for testing if the data follows normal distribution or not.
2. Percentage analysis, in making comparison between two series of data.
3. Mean and Standard Deviation, to study the levels of teachers' attitude.
4. Mann Whitney Test, for testing the significance of difference between the teachers' attitude towards teaching in digital and traditional classroom.
5. Tukey Post Hoc test, to find out the paired mean difference and level of significance.

ANALYSIS AND DISCUSSION

The data are classified and then analyzed systematically and synthesized in such a way that the proposed hypothesis may be accepted or rejected. The final result may be considered as a new principle or generalization. In this study the researcher has presented the collected data and its interpretation by using statistical calculations with the help of Statistical Package for the Social Sciences (SPSS) and the required analysis was observed. From the table-3, it is observed that the data found are not normally distributed ($p < 0.05$). Histogram in figure-1 and box plot in figure-2confirms that the data is not normal which implies that resultant mean is not a representative value of our data. Therefore, non-parametric analysis is conducted which does not assume normality. The Man Whitney U test is used to compare two different groups.

Interpretation of Hypothesis H_{01}
There is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom. The table-5 reveals the level of teachers' positive attitude as High, Moderate and Low in digital and traditional classroom. From the table, it is observed that 25.8% of teachers had high positive attitude, 45.4% had moderate positive attitude and 28.9% had low attitude in traditional classroom. Respectively 37.3% of teachers had high attitude, 37.3% had moderate attitude and 25.3% had low attitude in digital classroom. The table indicates that majority of teachers of digital classroom had high attitude than traditional classroom towards teaching mathematics. This implies that teachers in digital category had more positive attitude towards teaching mathematics. The table-6 reveals the mean Rank of teachers' attitude towards teaching mathematics in digital and traditional classroom.

From the table, it is observed that for97 observations in traditional category ,the sum of Ranks is 8419.50 and this result in a mean rank of 86.80. Respectively for 83 observations in digital category, the sum of Ranks is 7870.50 and this result in a mean rank of 94.83. From the table, it is clear that teachers of digital category have the higher mean rank than the traditional category. But the sum of Ranks in traditional category is higher than the digital category. Now the Test Statistics table will decide whether this difference in mean Ranks is significant or not in digital and traditional classroom. The table-7 indicates the U test statistic value as 3666.500. Wilcoxon W statistic quoted here represents the maximum of the two rank sums which is 8419.500. Here the calculated Z-value is -1.032and the p-value, quoted next to Asymp. Sig. (2-tailed) is 0.302 which is greater than 0.05.So, there is sufficient evidence to accept the null hypothesis that there is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom.

Interpretation of Hypothesis H_{02}
There is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom of SEBA schools. The table-9 reveals the mean Rank of teachers' attitude towards teaching mathematics in digital and traditional classroom of SEBA schools. From the table, it is observed that for 64 observations in traditional category, the sum of Ranks is 3645.50 and this result in a mean rank of 56.96. Respectively for 52 observations in digital category, the sum of Ranks is 3140.50 and this result in a mean Rank of 60.39. From the

Gunendra Chandra Das and Devajit Sarmah

table, it is clear that teachers of digital category have the higher mean Rank than the traditional category. But the sum of Ranks in traditional category is higher than the digital category. Now the Test Statistics table will decide whether this difference in mean Ranks is significant or not in digital and traditional classrooms of SEBA schools. The table-10 indicates the Mann-Whitney U test statistic value as 1565.500. Wilcoxon W statistic quoted here represents the maximum of the two rank sums which is 3645.500. Here the calculated Z-value is -0.548 and the p-value, quoted next to Asymp. Sig. (2-tailed) is 0.584 which is greater than 0.05. So, there is sufficient evidence to accept the null hypothesis that there is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classrooms of SEBA schools.

Interpretation of Hypothesis H$_{03}$

There is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom of CBSE schools. The table-12 reveals the mean Rank of teachers' attitude towards teaching mathematics in digital and traditional classroom of CBSE schools. From the table, it is observed that for 33observations in traditional category, the sum of Ranks is 1011.50 and this result in a mean rank of 30.65. Respectively for 31 observations in digital category, the sum of Ranks is 1068.50 and this result in a mean Rank of 34.47. From the table, it is clear that teachers of digital   category have the higher mean Rank than the traditional category. The sum of Ranks in digital category is also higher than the traditional category. Now the Test Statistics table will decide whether this difference in mean Ranks is significant or not in digital and traditional classroom of CBSE schools. The table-13 indicates the Mann-Whitney U test statistic value as 450.500. Wilcoxon W statistic quoted here represents the minimum of the two rank sums which is 1011.500. Here the calculated Z-value is -0.822 and the p-value, quoted next to Asymp. Sig. (2-tailed) is 0.411; which is greater than 0.05. So, there is sufficient evidence to accept the null hypothesis that there is no significant difference between the teachers' attitude towards teaching mathematics in digital and traditional classroom of CBSE schools.

CONCLUSION

Several studies reveal the importance of teachers' positive attitude towards teaching mathematics in primary and secondary level and how it plays a significant role in pedagogical enrichment. Moreover, use of ICT in teaching and learning lead classroom sessions more effective, and thus teachers' engagement in this transition from traditional classroom to digital one matters their attitude towards respective type classrooms. In the study, under both of the government and private sectors, teachers' attitude towards teaching mathematics does not matter whether it is digital or traditional approach within the domain of study as no significant difference observed. However, junior teachers with an experience of 2 to 5 years have been found possessed positive attitude towards teaching mathematics in digital mode.

ABSTRACT

Xerostomia, a subjective feeling of dry mouth, is a serious concern with many ramifications observed in the oral cavity. Recognition of the features of xerostomia early by the dentist can help relieve the discomfort of the patient. Advances in research have made saliva to be used as a diagnostic fluid, as many of its components are considered potential biomarkers. The advantages of saliva testing over blood analysis involve the ease of collection, the non-invasive nature and the collection of multiple samples of saliva. This cross sectional study was carried out in Department of Prosthodontics at JSS dental college & hospital, Mysuru. A questionnaire was utilized to assess the perception of xerostomia in partially and completely edentulous patients. Random selection of 30 participants from xerostomia and non xerostomia group was done. Un stimulated whole saliva was collected from the participants. Biochemical assay of saliva samples for calcium, phosphorus and alkaline phosphatase was carried out in the Department of Biochemistry, JSS Medical Hospital, Mysuru. Lower mean values of salivary calcium and alkaline phosphatase levels were found in xerostomia participants than in non xerostomia participants and was statistically significant. Salivary phosphorous levels were higher in xerostomia but was statistically not significant. The variations in the levels of salivary calcium, phosphorus and alkaline

phosphatase in partially and completely edentulous patients were observed and xerostomia could have been one of the contributing factors.

Keywords: xerostomia, saliva, calcium, phosphorous, alkaline phosphatase.

INTRODUCTION

Saliva, produced by the major salivary glands – the parotid, sublingual & sub mandibular and the minor salivary glands, plays a vital role in the maintenance and preservation of oral health.(1) The composition of saliva consists of 99% water and other components. The other constituents include calcium, sodium, magnesium, potassium, bicarbonate, phosphates, proteins, immune globulins, enzymes like alkaline phosphatase, mucins, urea and ammonia. The estimated daily salivary flow ranges between 0.5 to 1.5 litres. (2) Xerostomia represents a subjective feeling of dry mouth whereas, hypo salivation represents an objective sign of dryness of mouth caused by hypofunction of salivary gland leading to production of decreased quantity of saliva. The quantity of saliva produced is assessed by sialometry. (3) Xerostomia has been associated with many factors. The most common ones are medications, psychological conditions, such as stress and anxiety; systemic diseases like diabetes, hypertension, cardiovascular disorders, head and neck radiotherapy and salivary gland disorders. The other causes include systemic sclerosis, rheumatoid arthritis, primary and secondary Sjogren's syndrome, HIV, systemic lupus erythematosus, chronic active hepatitis, renal dialysis and graft v/s host disease.(4-11)

The restorative needs of the geriatric patients provided by fixed and/or removable prosthodontics through rehabilitative procedures is dependent on the quality and quantity of available bone. Calcium, phosphorus and alkaline phosphatase, the chief mineral components of the skeletal system are also found as components of saliva. All these can serve as indicators of osteoblast function essential for bone formation. These salivary components have also been used to detect caries and periodontal disease activities. Salivary calcium has been used for screening osteoporotic patients for bone mineral changes and was proved to be an important tool. Salivary alkaline phosphatase has been tested as an additional tool in jaw growth predilection and oral potentially malignant disorders.(12-15) The quality and quantity of the available bone dictates the prosthodontic rehabilitation in case of the geriatric population. The conventional diagnostic procedures to assess the status of bone have utilized urine analysis or radiographic bone densitometry. A non-invasive approach to detect and assess the bone condition has remained a challenge for the health-care researcher. The increasing research on saliva as a diagnostic fluid in the recent years fulfills this criteria. Analysis of saliva for calcium, phosphorus and alkaline phosphatase, may be used as an effective diagnostic and screening procedure. This would aid in an early diagnosis and intervention strategy contributing to better and more predictable treatment outcomes. Hence the aim of the present study is to assess and compare the calcium, phosphorus & alkaline phosphatase levels in saliva in xerostomia and non xerostomia patients.

METHODOLOGY

This cross sectional study was carried out in Department of Prosthodontics at JSS dental college & hospital, Mysuru. Salivary analysis was carried out in laboratory at Dept. of Biochemistry, JSS Medical College, Mysuru. All the patients who gave informed consent were included for the study. Prior to the start of the study ethical clearance was obtained from Institutional Ethical Committee. A questionnaire was utilized to assess the perception of xerostomia in partially and completely edentulous patients. The following inclusion & exclusion criteria were considered for the selection of study sample. The inclusion criteria were Individuals aged 18 years or older, patients who gave informed consent, patients who had the ability to understand & provide answers to the questionnaire and Patients who were partially or completely edentulous. The exclusion criteria were patients diagnosed with salivary gland disorders and Sjogren's syndrome, patients with history of any radiation therapy and patients who could not understand the

questionnaire. A total of 234 participants answered the questionnaire. Participants answering 'yes' to dry mouth question were considered as xerostomia (test) group and those answering 'no' as non xerostomia (control) group.

Saliva collection and storage

Random selection of 30 participants from xerostomia and non xerostomia group was done. Unstimulated whole saliva was collected while the participants sat upright. The head was slightly tilted forward and the eyes open. The participants refrained from eating, smoking, or drinking for 1-2 hours before collection of saliva in a quiet room between 9.00 AM and 11.00 AM under resting conditions. They were instructed to use water to rinse the mouth with prior to the collection of saliva to remove any debris. Unstimulated salivary samples were collected by draining method (passive drooling). 2ml of whole saliva was collected in a dry and sterilized plastic centrifuge tube. (16) (Figure -1) After collection of saliva the tubes were fastened with a cap, labelled and were put into a zip lock pouch and placed in a freezer (2^0C to 4^0C). After 1 hour, all the samples in the zip lock pouch with ice cubes were shifted into a freezer and stored at - 80^0C (Dept. of Biochemistry, JSS Medical College, Mysuru) until analysis(Figure -2).

Biochemical analysis of saliva

Biochemical assay of saliva samples for calcium, phosphorus and alkaline phosphatase was carried out in the Department of Biochemistry, JSS Medical Hospital, Mysuru. The samples were removed from the refrigerator and thawed (Figure-3). Saliva was centrifuged at 2000 rpm for 10 min and the clear supernatant was obtained and subjected to biochemical analysis (Figure -4 - 6). The results were interpreted by a semi auto analyzer.

Estimation of in organics a livary calcium (colorimetric method) (17,18) –

Salivary calcium was assessed by modified Arsenazo III method. Calcium forms complex with arsenazo III dye, which is measured spectro photo metrically at a wavelength of 650 nm. The amount of the colored complex formed is proportional to the calcium concentration in the sample.

Estimation of inorganic salivary phosphorus by colorimetric method (19-22)

Salivary phosphate was measured using phosphomolybdate methodology. Inorganic phosphorus reacts with ammonium molybdate to form ammonium phosphomolybdate, which is measured at a wavelength of 340 nm.

Estimation of salivary alkaline phosphatase (23,24)

Salivary alkaline phosphatase was assessed by kinetic method. Alkaline phosphatase reacts with para nitrophenyl phosphate to form p-nitrophenol and inorganic phosphate, which is measured at a wavelength of 405 nm. The values of salivary calcium, phosphorus and alkaline phosphatase levels obtained were collated into excel sheet and statistical analysis was done. The mean values of salivary calcium, phosphorus and alkaline phosphatase of test group (non xerostomia) were compared with the mean values of control group(xerostomia).

Statistical methods

Mean, standard deviation, frequencies and percentage were used for descriptive statistics. Normality of the data was assessed using Kalmogorove Smirnove test and Shapiro-wilk test. Independent sample't' and test Chi-square test were applied. $P<0.05$ was considered to be statistically significant. Statistical analysis was done using SPSS software (version 23).

RESULTS

Table 1 describes the study sample characteristics of the study population. For the comparison purpose we have selected similar age group. The mean age and gender were found to be statistically not significant. Other variables smoking, alcohol, medication between xerostomia and non xerostomia was statistically not significant.

Thippeswamy *et al.*,

The differences in the mean values of salivary calcium and alkaline phosphatase levels between xerostomia and non xerostomia groups were statistically significant. The mean salivary calcium level was 7.87 mg/dl in participants with xerostomia which was lower when compared to non xerostomia participants (8.92 mg/dl). The mean salivary phosphorus level in xerostomia group (5.61mg/dl) was higher when compared to non xerostomia group (4.50 mg/dl) but was not statistically significant. Salivary alkaline phosphatase values were statistically significant when compared between xerostomia (18.76 IU/L) and non xerostomia (38.45IU/L) groups. It was lower in participants with xerostomia compared to non xerostomia group(Table 2a & 2b).

DISCUSSION

Principally, saliva which is an indispensable fluid in the human body is frequently forgotten and people try not to look for help for it until the basic day-to-day functions like eating and speaking are affected. This study defined xerostomia as a subjective feeling of dryness of mouth in which hypo salivation may be one of the components However, it can also be accompanied by normal salivary flow rate. Hypo salivation was defined as a definitive decrease in salivary flow rate which is an objective measure. Calcium and phosphorus, the inorganic components of saliva, account for the main mineral component of the human skeletal system. Alkaline phosphatase which is secreted into the saliva also serves as a biochemical marker for bone turnover. (25) Xerostomia encompasses changes in composition of saliva and normal/reduced salivary flow rate. As the composition of saliva changes, it was assumed that the levels of these salivary biomarkers may also vary. Hence, an attempt was made to evaluate any changes in the levels of salivary calcium, phosphorus and alkaline phosphatase in partially and completely edentulous participants with xerostomia. This study involved collection of unstimulated saliva from the participants using the passive drool method. In a study by Navazeh et al it (26) was found that spitting and passive drool (draining) methods provided similar type of information about unstimulated whole saliva. Both these methods were found to be reliable and reproducible. After the collection of saliva, the samples were stored at -80⁰C until analysis was done. According to Bhattaraj KR et al (27) in their review state that samples can be stored at -80ºC for several years. They also mention that many samples stored properly for more than four years had shown little or no degradation. In the present study, it was found that salivary phosphorus was higher(statistically non significant), salivary calcium & alkaline phosphatase were lower(statistically significant) in participants with xerostomia(test group) when compared to non xerostomia(control group) participants.

To the best of our knowledge, the present study is the first study to assess salivary levels of calcium, phosphorus and alkaline phosphatase in partially and completely edentulous participants with xerostomia. The variations in the levels of salivary calcium, phosphorus and alkaline phosphatase could be secondary to the compositional change in saliva. It may also be attributed to many risk factors like systemic diseases, hormones (Eg: estrogen, PTH), medications, number of intact teeth present, salivary flow rate and salivary p^H . The management of xerostomia involves i) detecting and treating the causative factor if possible, ii) palliative treatment – local / systemic to increase the salivary flow iii) enforcing a dental program to decrease or completely remove the clinical consequences of xerostomia. (27) Guggneheimer et al suggested that the effects of xerostomia could be managed by combination of treatments and there was no one common cure to it. Various management techniques were collected and placed under three groups – palliative treatment, use of saliva substitutes, and cholinergic drugs. Palliative treatments included the use of salivary slow stimulants such as sugarless chewing gum, alcoholic beverages and mouth rinses, humidifiers when sleeping, Lozenges and sugarless hard candies. Saliva substitutes including carboxy methyl or hydroxyl methyl cellulose as contents were recommended. Cholinergic drugs were listed last, because they are not indicated in patients with cardiac disease, since they alter the cardiac conduction frequencies. (28) The limitations of the study were biochemical analysis of saliva with relation to calcium, phosphorus and alkaline phosphatase was carried out in a small sample. Research related to the estimation of salivary biomarkers in patients with xerostomia related to edentulism is further recommended. This is to establish the cause for the variations in the levels of salivary calcium, phosphorus and alkaline phosphatase.

CONCLUSION

The variations in the levels of salivary calcium, phosphorus and alkaline phosphatase in partially and completely edentulous patients were observed and xerostomia could have been one of the contributing factors. Further research is required to substantiate this finding.

ABSTRACT

Pelvic floor muscles are the only muscles capable of increasing urethral closure pressure, lift the pelvic floor, and improve structural support. A correct pelvic floor muscle contraction (PFMC) may be difficult to perform. Several studies have shown that >30% of women are unable to contract their PFMs on their first attempt. Eleven primipara and multi para women with mean age participated in this study**.** A 6 MHz 35-mm curved linear array ultrasound transducer (Mindray M5) was placed in the transverse plane, supra pubically over the lower abdomen and angled at 15-30° from the vertical depending. Each participant received three verbal instruction s as to how to correctly contract the PFMs. The ANOVA show**s** that there exist no statistical significant difference in bladder neck movement between rest and Hold Urine instruction($p > 0.05$). there is a statistical significant difference in bladder neck movement between rest and Hold Urine and Hold motion instruction($p < 0.05$). there exist a statistically significant difference in bladder neck movement between rest and Hold urine, motion, contract vagina and lift up($p < 0.01$) **.**The findings suggest that out of the three verbal cues, best verbal instruction is" Tighten up and lift the muscles around the anus, vagina and urethra "which produces a statistically significant pelvic floor muscle function than the other two verbal cues. This study can influence and assist women's health and can produce more better result when done with a large sample size.

Keywords: Trans abdominal Ultrasound , pelvic floor muscle contraction..

Ponmathi and Uma

INTRODUCTION

Pelvic floor is a group of muscles comprising two layers , superficial perineal muscles and deep pelvic diaphragm that forms a sling at the base of pelvis. Pelvic floor muscles (PFM) plays an important role in supporting abdominal viscera other than its sexual and sphincter functions [1].PFM are capable of improving the urethral closure pressure and thereby increase the support [2]. .Pelvic floor muscle becomes disrupted during childbirth, constipation etc, also sedentary lifestyle, menopause also have an impact on function of pelvic floor(3).PFM muscles can voluntarily contract [3] and contraction of it elevates the bladder neck efficiently [4]. In 1948,PFM exercises was first introduces by Arnold Kegel and he found a good outcome with pelvic floor muscle function. He argued that restoring the function of pelvic floor would in turn increase the urethral closure pressure, thus preventing the involuntary loss of urine (5).It has the highest level of evidence in strengthening pelvic floor muscle. Women's health physiotherapist find making women to contract the muscle efficiently and correctly to be the most challenging aspect in training. Many researches have contributed to the lack of (4)awareness of the women in recruiting the muscle appropriately. Bo et al comments that PFM contracts in a mass, where as shafik, 1998 commented that there happens a compartmental recruitment of PFM [6].Different clinical methods have been used in pelvis floor muscle training across the literature, few are PFM contract is lift up not a depression. Few contractions encouraged are tuck in the abdominals, anal contraction and contraction of hip adductors. whereas in few research suggest gluteal contractions are inappropriate in pelvic floor muscle training(7–10). linically. PFM contraction may be facilitated through verbal cues. Till now there are lot of controversy regarding the appropriate cue used to facilitate a good pelvic floor muscle contraction. There are different published literature on this, Few important evidence on the cues used throughout the world are as below

	UK	USA	SOUTHERN HEMISPHERE
National surgical colleges	The Royal College of Obstetrics and Gynaecology "No public information on pelvic floor muscle contraction instruction" available www.rcog.org.uk	The American College of Obstetrics and Gynecology "squeeze the muscles that you use to stop the flow of urine'.	The Royal Australian and New Zealand College of Obstetrics and Gynecology "These muscles are the ones you normally squeeze when you try to stop wind escaping" www.ranzcog.edu.org UrinaryIncontinence A Guide for Women. Leaflet to order
National physiotherapy association	The Chartered Society of Physiotherapy "You should imagine that you are trying to stop yourself from passing urine and at the same time trying to stop yourself from passing wind"	The American Physical therapy Association "try stopping or slowing the flow of urine" www.apta.org "You can do something about incontinence. A Physical Therapists Prospective"	The Australian Physiotherapy Association "Tighten up and lift the muscles around the anus, vagina and urethra"
Published physiotherapists	"squeeze and lift the pelvic floor muscles as if preventing the escape of flatus and/or urine" (Laycock et al.)10	"pucker the anus, vagina, and urethra" (Carrie` re)11	"draw in, close around the vagina and lift the pelvic floor towards your head" (Sapsford et al.)7 "squeeze and lift your pelvic floor" (Frawley et al.)12

There is a wide variety of belief and question exist on appropriate verbal cue instruction around the world .Different thoughts like if verbal cues should involve pelvic floor muscles contraction around vagina, rectum and urethra or should involve only one region like contraction around urethra or vagina or rectum or whether trans versus ab dominis or breathing to be incorporated in cues and so on [11]. In India there is no common cue followed in common and lot of different thoughts exist. Pelvic floor muscle function is commonly assessed by digital palpation and clinical observation(12)With evolving research two dimensional ultrasound provided a better understanding of pelvic floor muscle function [13]. Trans abdominal ultra so no graphy (TAUS) is found to be safe and cost effective. It is also a quick and reliable method of assessment of pelvic floor muscle function [14]. In this study, three different

cues were chosen to find their individual effectiveness over the pelvic floor muscle function. Various verbal instructions prevailing globally to make the patient contract pelvic floor muscles, In India also diverse verbal cues exist, yet it is still under debate in research literature to say which verbal cue better recruit the pelvic floor and least studies exist among Indian population. Hence this study is performed to promote the awareness and improve pelvic floor muscle function, further this would help physiotherapist to instruct for better outcome of the patient.

MATERIALS AND METHODS

Observational study design The patients were recruited from the outpatient department of Obstetrics and Gynaecology , SRIHER G block, Chennai. A total of 11 participants were included in this study. Convenient sampling was done. Primipara and multipara women. Age- 20 to 40 years were included in this study ,patients with congenital anomalies, pregnancy and neurological conditions were excluded from this study.

PROCEDURE

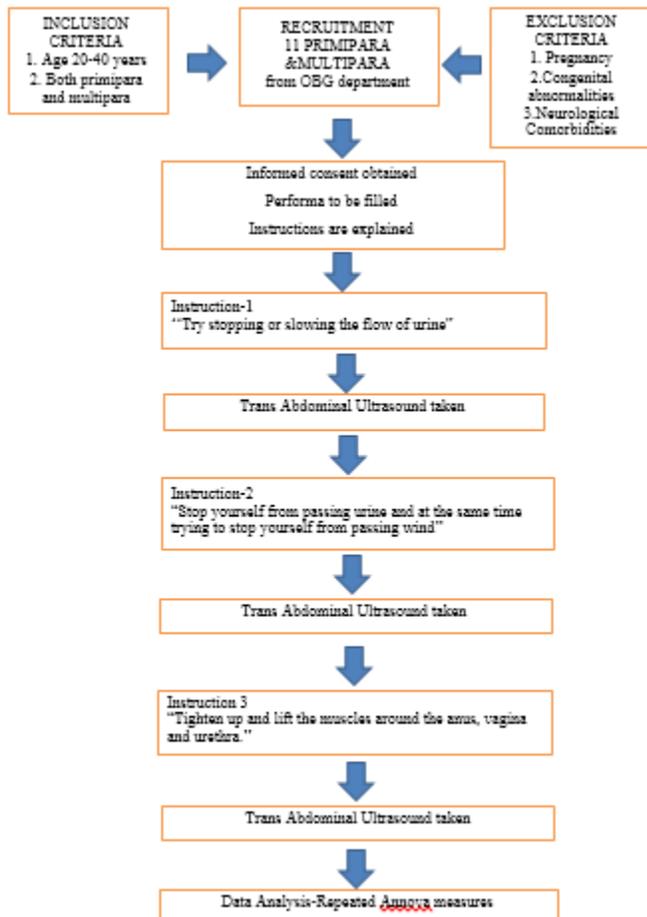
In this study, 11 postnatal women both primi and multipara who fulfilled the inclusion and exclusion criteria were recruited from OBG department, G block, Sri Ramachandra hospital for this study. All the women were explained about the importance of the study and investigation procedure and informed consent was obtained. The rights of the subjects were protected. Then the women were asked to complete a self reported questionnaire and were explained about the three different instructions and was made sure that all the women understood the instructions properly and then all the women were made to undergo a non- invasive trans abdominal ultrasound (TAUS) with three appropriate different instructions. First resting bladder neck was measured with TAUS and then first instruction was verbalized and scan was taken once the women did it and second verbal cue was said and scan followed it, then at third verbal instruction was given following which scan was taken.

Procedure of TAUS
This procedure was done by Radiologist, G block,Sri Ramachandra Hospital. To image the pelvic floor, a 6MHZ 35-mm curved linear array ultrasound transducer (Mindray M5) was placed in transverse plane, supra pubically over the lower abdomen, and then angled at 15-30° from the vertical line. A bladder filling protocol was implemented to ensure that the patients had sufficient fluid in their bladders to allow clear imaging. This entailed subjects consuming 600-750 mL of water during a 1-h period and completing the task half an hour prior to the testing time.

Instructions
The patients were given three different verbal instructions as to how to contract their PFMs.

Instruction 1: ''Try stopping or slowing the flow of urine"

Instruction 2 :You should imagine that you are trying to stop yourself from passing urine and at the same time trying to stop yourself from passing wind''

Instruction 3 :Tighten up and lift the muscles around the anus, vagina and urethra''


RESULTS

- 11 samples are recruited and demographic details are tabulated in Table 1
- Mean baseline value ,movement with three different instructions are documented in Table 2 .
- Table 3 shows that there exist no statistical significant difference in bladder neck movement between rest and Hold Urine instruction($p>0.05$).
- Table3 shows that there is a statistical significant difference in bladder neck movement between rest and Hold Urine and Hold motion instruction($p<0.05$).
- Table 3 shows that there exist a statistically significant difference in bladder neck movement between rest and Hold urine, motion, contract vagina and lift up($p<0.01$)
- Table 4 shows the mauchly's sphericity as non-significant ($p>0.05$)
- Figure1:Transabdominal Ultrasound findings after three different verbal cues for pelvic floor muscle contraction
- Figure 2 shows the mean distribution of the age <25 is 9.09%, 25-30 is 27.27%, 31-35 is 45.45, 36-40 is 18.18%.
- Figure 3 shows the mean distribution percentage of BMI 20-27 is 81.82%, 28-35 is 9.09%, 36-40 is 9.09%.
- Figure 4 shows the mean distribution percentage of parity primipara is 45.45%, multipara is 54.55%.
- Figure 5 shows the mean distribution percentage of mode of delivery SVD is 81.82%, LSCS is 18.18%
- Figure 6 shows the mean distribution percentage of number of deliveries 1 is 54.55%, 2 is 27.27%, 3 is 18.18%

DISCUSSION

According to research ,most of the women contract PFM wrongly and lack of awareness about the importance of pelvic floor is quite high, so while incorporating PFMT verbal cues become one of the important section in the success of the training imparted. Still an uncertainty prevails worldwide regarding the correct verbal cue to facilitate effective pelvic floor muscle function. So this study is done to find the effectiveness of three different verbal cues coined by three different societies of physiotherapy- American Physical Therapy Association ("Try stopping or slowing the flow of urine"),Chartered Society of Physiotherapy("Imagine to stop yourself from stopping urine and at the same time trying from passing wind"),Australian Physiotherapy Association("Tighten up and lift the muscles around the anus, vagina and urethra")(15) over the pelvic floor muscle function. Taking into considerations all the literature data, as well from our observations, we have made an attempt to evaluate demographic factors which influence the pelvic floor function. we had considered Body mass index, Mode and number of delivery. Women with different categories of BMI were included in this study, on comparing various categories of BMI with the bladder neck mobility the obese population showed a less bladder neck mobility which is supported by Edyta Horosz et al, in 2020 who documented that Lower bladder neck mobility is associated with increased BMI and urethral length, but with such small sample we cannot derive any conclusions, It shows the way for future research. Vaginal delivery is associated with the increased bladder neck mobility when compared to the LSCS. And also Multi para shows poor pelvic floor muscle function than primipara . In this study out of 11 samples , 5 primi para and 6 multipara women were recruited, out of which three women did not show any pelvic floor muscle function(i.e)no bladder neck displacement even with all three instructions. Physiologically parity place an undue stress over pelvic floor muscle function which demands other pelvic floor muscle training protocol other than voluntary contraction like stimulation or biofeedback to benefit the patient. In comparison with the mode of delivery and the contractions there were a greater number of vaginal delivery than the Lower Segment Cesarian section in this study.

There is a mounting evidence that some cases of pelvic organ prolapse may be caused by trauma to the levator ani muscle(16). These injuries are not evident at the time of vaginal delivery. Literature quotes that compared to the spontaneous vaginal delivery, cesarean delivery was associated with significantly lower hazard for pelvic floor muscles while vaginal delivery was associated with significantly associated with anal incontinence and pelvic organ prolapse due to the pelvic floor muscle weakness. But in this study women with LSCS also shows poor pelvic floor muscle function which needs further research with a greater sample sizeThe results of this study shows that Hold Urine instruction cannot produce a significant difference in pelvic floor contraction than rest (p>0.05).The result of this study is in contradictory with Henderson et al, who documented that women are able to better contract the pelvic floor muscles with a simple cue of "Hold Urine". This can be better explained by that pelvic floor muscles is a sling based arrangement with puboviscertalis and puborectalis,this verbal cue only recruits the pubovis ceralis and leaving puborectalis and iliococcygeus to be recruited sub maximally which may influence the pelvic floor muscle function. Hold Urine and Motion widely accepted by CSP(Chartered Society of Physiotherapy) gave a good difference in bladder neck mobility after contraction(p<0.05). In this cue ,pubovisceralis and puborectalis are recruited maximally(12).When contracting rectum, iliococcygeus produce cranial lift of posterior region of levator ani thus producing effective pelvic floor muscle function than the first verbal cue. Third instruction "Tighten up and lift the muscles around the anus, vagina and urethra.'' is found to elicit a significant bladder neck movement than the other two cues thus able to produce a better pelvic floor function than the other verbal cues(15).This result goes in hand with KayCrotty who concluded that angle of urethral inclination is more acute when Posterior or posterior with anterior cue given. Thus with the above comment both pubovisceralis and puborectalis contract together effectively giving an efficient recruitment of pelvic floor muscles completely(4). Through out the world different cues are followed to enhance pelvic floor muscle function. This study will surely add benefit to the patient by better influencing pelvic floor muscle function and adding quality to their life.

CONCLUSION

Our findings suggest that out of the three verbal cues, best verbal instruction is" Tighten up and lift the muscles around the anus, vagina and urethra "which produces a statistically significant pelvic floor muscle function than the other two verbal cues. This study can influence and assist women's health and can produce more better result when done with a large sample size.

ABSTRACT

Antimicrobial utilization research is critical, especially in the general intensive care unit of hospital setting where the risk of bacterial resistance establishment and transmission is greatly increased. Long-term surveillance and stewardship of antimicrobial agents will reduce resistance while increasing effectiveness. However, Indian literature on this subject is scarcely available. Thus, the current research study was designed to assess the antibiotic utilization in a seven-bedded general intensive care unit of a secondary referral healthcare setting in south India. Measuring drug utilization in prescribed daily dose corresponded to the defined daily dose is proposed by the WHO to analyze and compare the utilization of drugs. Our study observed two-third distribution of female with mean age of 35 years. The study included 100 patient prescription with a total of 216 antimicrobial agents in orthopaedics, obstetrics and gynaecology, general medicine and general surgery as indications for admission; with mean antimicrobial per prescription of 2.01. 96.35% of antimicrobial agents were generic prescription with 93.81% of parenteral route of administration. The most common antimicrobial agent prescribed in our study on an average was ceftriaxone (34.97%)found no discrepancies between prescribed daily doses and WHO defined daily doses.

Keywords: Antimicrobial agents, General Intensive Care Unit, Defined Daily Dose, DUS metrics, Pharmaco surveillance.

INTRODUCTION

The introduction of antibiotics into clinical practice revolutionized the treatment and management of infectious diseases. Before the introduction of antibiotics, these diseases were the leading cause of morbidity and mortality in human populations [1].In addition to treating infectious diseases, antibiotics made many modern medical procedures possible, including cancer treatment, organ transplants and open-heart surgery. However, misuse of these valuable compounds has resulted in the rapid rise of antimicrobial resistance (AMR) with some infections now effectively untreatable [2] and hampered by the lack of access to essential antibiotics in many low-income and middle-income countries (LMICs) [3,4]. The burden of infectious diseases in India is among one of the highest in the world [5]. Appropriate antimicrobial therapy is essential to ensuring positive patient outcomes. Inappropriate or suboptimal utilization of antibiotics can lead to increased length of stay, multidrug-resistant infections, and mortality [6]. It is axiomatic that hospital admissions increase risks of healthcare-associated infections (HCAIs), leading to a noticeable increase in antibiotic consumption [7]. In the hospital's intensive care units (ICU), the severity of the diseases treated and the multiple interventions to the patients are expected a high antimicrobial use [8]. However, Indian literature on this subject is scarcely available. Thus, the current research study was designed to assess the antimicrobial utilization in a seven-bedded general intensive care unit of a secondary referral healthcare setting of south India.

MATERIALS AND METHODS

Study design
Prospective Observational drug utilization study
Study site
Seven-bedded general intensive care unit(GICU) of 340 bedded secondary referral hospital in south India.
Study duration
Six months (October 2022 to March 2023)
Study Criteria
Patient of both genders of age 15 years and above admitted in GICU, in whom at least one antibiotic is prescribed with following indications (OBG, Orthopaedics, General Medicine and General Surgery).
Sample size
Fischer's exact formula was used to calculate the sample size of 100 in a 7 bedded GICU of our study.
Formula $n = z^2 X\ pq\ /\ d^2$
Z = Level of confidence, p = Expected prevalence, q = (1-p), and d = precision.

Study Procedure
Data collection
The study was approved by the institutional review board (IRB) (RIPER/IRB/PP/2022/004) and hospital's ethics committee (IEC). During the study period (October 2022 - March 2023) patient admitted in GICU as per study criteria particulars are retrieved from medical record through obtaining informed consent explaining the merits and demerits of study. Patients showing willingness are included for antimicrobial agent sutilization during the length of stay. All the data obtained are documented in the data collection form. Particulars of data collected from individual patient (prescription) are the following: patients age, gender and registration number; diagnosis, prescription details like number of drugs, names of individual drugs (generic/brand or both), any fixed dose combination (FDC) prescribed, whether the prescribed drug(s) was available from the hospital pharmacy, dose, dosage form, dosing schedule, and duration of treatment.

Mohanraj Rathinavelu *et al.*,

Data analysis
The data analysis was done as follows**:** (a) Assessment of prescription patterns as per the WHO-INRUD drug use indicators [9], (b) Pattern of antimicrobial agents used as per DUS metrics [10], (c) The prescribed drugs will be classified according to The Anatomical Therapeutic Chemical (ATC) - Defined Daily Dose (DDD) classification [11], (d) The Prescribed Daily Dose (PDD) will be calculated by taking the average of the daily doses of the antibiotic drugs as the PDD. The PDD to DDD ratio will be then calculated.

RESULTS

Characteristics of study participant
In our prospective observational study of a 7 bedded general intensive care unit, the distribution of patients with indications of orthopaedics, obstetrics and gynaecology, general medicine and general surgery were 3 (3%), 28 (28%), 46 (46%), and 23 (23%) respectively. Out of 100 patients admitted in the general intensive care unit two-third (66%) were female population, majorly distributed with all indications except orthopaedics. The mean age distribution were observed more with indications of general medicine and general surgery, results of which are thoroughly analyzed and the relative distribution is reported in Table 1.

Pattern of antimicrobials utilization
In our study a total of 216 antimicrobials were prescribed out of 100 prescriptions. The distribution of antimicrobial utilization with general medicine indication was more (44.91%) with a mean of 2.1% per prescription, followed by general surgery indication with (28.7%) antimicrobial utilization and a mean of 2.7 per prescription. The percentage of antimicrobial as generic and as injections was well established with all indications of admissions; results of which are summarized in Table 2.

Antimicrobials utilization
Out of 216 antimicrobials utilized in our study, ceftriaxone was the most commonly used antimicrobial agent in all indications orthopaedics (75%), obstetrics and gynaecology (45.28%), and general medicine (19.59%); followed by piperacillin and tazo bactum with a distribution of 30.65% and 19.59% in general surgery and general medicine indications; results of which are thoroughly analyzed, and the relative distribution is reported in Figure 1.

Pattern of antibiotics utilization as per the WHO ATC/DDD classification
Bacterial resistance occurs in a higher proportion when they are administered in inadequate doses (e.g., when posology was prescribed in doses below the therapeutic ranges or during periods too short) [12]. As previously stated, these two components of prescription posology are dependent on both the prescriber and the patient; thus, this study evaluates the prescriber indirectly by comparing PDD values to their equivalent DDD values. Detailed quantitative and qualitative knowledge of antimicrobial use is essential to implement approaches for limiting deviations and threats in utilization of antimicrobials. The Prescribed Daily Dose (PDD) was calculated by taking the average of the daily doses of the antibiotics as the PDD. The PDD to DDD ratio was then calculated. In our study, the average PDD corresponded to the DDD for antimicrobials utilized in the general intensive care unit, results of which thoroughly analyzed and reported in Table 3.

DISCUSSION

Antimicrobials use data must be validated in order to identify high-use areas and provide feedback to prescribers [13], to research the relationship between antibiotic use and resistance, to develop and evaluate medicines, and to identify which intervention is most likely to be beneficial in a healthcare setting [14]. Benchmarking is an important initial step to identify problem areas and needs for improvement [15]. Despite its shortcomings, an international antimicrobial utilization unit, the WHO-defined DDD, is a useful tool for comparing local, national, and international

Mohanraj Rathinavelu *et al.,*

antimicrobial use densities in hospitals. The demographic distribution observed in the general intensive care unit showed two-third distribution of female (66%) than male (34%), findings of which are similar with study performed by Demoz et al.,2020 [16] and contrast with other findings [17-20]. The mean age of patients was around 35 years which was nearly equal for both males and females. Studies done previously in Nepal in 2002 [17], Bengaluru in 2006 [18], and Dehradun in 2012 [19]. In the prescription audit, the average number of drugs per prescription is an essential measure. To decrease the likelihood of drug interactions, the number of drugs per prescription should be kept to a minimum. It will help reduce hospital costs and bacterial resistance [21].

A total 216 antimicrobial agents prescribed in our study during the whole study period, by taking an average it comes 2.01 per patient in the general intensive care unit. Other studies support our finding with an average of 2.09 [22] and 1.74 [19] respectively. In our study, majority of the antibiotics were prescribed as generics (96.35%) which helped in decreasing the overall cost of therapy; which washighest in comparison to study performed by Sushmita Ann et al., 2020 [23]. Antibiotics are commonly administered intravenous (IV) medications and is advantageous in the intensive care unit. In our study 93.81% of antibiotics were administered by intravenous route, relatively higher in comparison to study performed by Anand et al., 2016 [24].The most common antimicrobial agent prescribed in our study on an average was ceftriaxone (34.97%) in the general intensive care unit, this is in accordance with the similar studies by John et al., [18] 23.8% and Anand et al., [24] 22.77%. In our study, the ratio of PDD: DDD of antimicrobials prescribed in the general intensive care unit with indications of orthopaedics, obstetrics and gynaecology, general medicine and general surgery of admissions found no discrepancies between prescribed daily doses and WHO defined daily doses.

CONCLUSION

In conclusion, our study showed that the number of DDD correctly reflect the number of antimicrobial therapies at the general intensive care unit of our hospital. Long-term surveillance and stewardship of antimicrobial agents will reduce resistance while increasing effectiveness.

ABSTRACT

Lycopersicon pimpinellifolium L commonly known as "wild tomato" has significant nutritional and medicinal values. The plant has remarkable industrial application. The aim of this work is to assess the pharmacognostical, phytochemical screening and *in-vitro* antioxidant activity of fruit extract of *Lycopersicon pimpinellifolium* L .The methanolic extract of *Lycopersicon pimpinellifolium* L was screened for its pharmamacogonostical properties. The extract was further evaluated for the presence of phenols, flavonoids, saponins and tannins. The *in-vitro* antioxidant activity of fruit extract was evaluated by using DPPH, Hydrogen peroxide (H_2O_2) and Reducing power free radical scavenging assay. The fruit extract of *Lycopersicon pimpinellifolium* L showed presence of phenols, flavonoids, saponins and tannins. The total phenolic and flavonoid content of the extract were found to be 19.86mg GAE/g and 21.25mg QUE/g, respectively. The drug BHT was used as a standard. In DPPH a strong antioxidant effect is indicated by the highest 42.38% inhibition reported at 100μg/ml concentration. In Hydrogen Peroxide scavenging activity, the IC_{50} value of standard (BHT) and extract is found to be 69.65μg/ml and 242.20μg/ml, respectively. In Reducing assay method, reducing power of extracts and standard increases with the increase in amount of sample and standard concentrations. According to our research, methanolic extract

Ramen Kalita *et al.,*

of *Lycopersicon pimpinellifolium* L showed potential antioxidant activity and this would be due to the presence of polyphenols and flavonoids and may one day be the basis for new medications.

Keywords: DPPH, phenol, flavonoid, *Lycopersicon pimpinellifolium* L , H_2O_2.

INTRODUCTION

In contemporary times, medicinal plants have been widely employed for both preventive and therapeutic purposes. Herbal medicine possesses lesser negative effects than synthetic drugs which has evolved researchers to investigate developing new drugs made from plant species to treat various diseases. Numerous chemical constituents that are termed as phytochemicals or secondary metabolites are present in the plant species including flavonoids, phenols, alkaloids, steroids, tannins, sugars, and glycosides. These phytochemicals of plant contribute as defense against infections, microorganism and stresses related to an environmental. So, phytoconstituents/phytochemical are essential in the production of pharmaceutical products and serve as a starting point for the development of novel drugs as they possess a variety of pharmacological effects including those that are anti-cancer, anti-mutagenic, anti-inflammatory, wound-healing, anti-diabetic, and anthelmintic [1].

An antioxidant is a naturally or artificial occurring compound that is helpful in preventing oxidative damage. An antioxidant is a substance that has ability to preserve cells by scavenging and neutralizing dangerous free radicals and regulates Reactive Oxygen Species. Antioxidants have a significant role in the organism's defence mechanism against diseases linked to the attack of free radicals [2,3]. Oxidative stress acts as one of the key initiating factors in the occurrence of a variety of chronic and degenerative diseases, including immunological dysfunction, cancer, Parkinson's disease, diabetes mellitus, atherosclerosis, and diabetes. Synthetic and natural antioxidants can be used to scavenge free radicals, promote their elimination, and reduce those diseases. The use of herbal sources as natural antioxidants has gained prominence. The wide range of the antioxidant capacity of many plants is considered to be contributed by phenolic chemicals, which are rich in many fruits, vegetables, and tea [4].

Lycopersicon pimpinellifolium L (Family- Solanaceae) popularly called as Currant Tomato *Lycopersicon pimpinellifolium* L has overgrown bushes, small red fruit distributed across the dry coastal region of Peru, Ecuador, and northern Chile, where plants frequent exposure to salt-laden mist, brackish groundwater, and other unfavourable conditions. The fruits of *Lycopersicon pimpinellifolium* L are spherical, crimson in colour and sweet in taste, however they are much smaller and lighter than the larger, cultivated tomatoes. One of the most potent naturally occurring antioxidants i.e., lycopene is present in the *Lycopersicon pimpinellifolium* L (fruits). Lycopene, an antioxidant present in cooked tomatoes has reported to protect against prostate cancer cause due to Ultra Violet (UV) radiation. Over 40 times more lycopene is present in *Lycopersicon pimpinellifolium* L than in cultivated tomatoes [6]. *Lycopersicon pimpinellifolium* L (fruit) is abundantly consumedand flavoured vegetable crops worldwide both for the fresh fruit market and the processed food business. Its ability to adapt to a wide range of uses and habitats is a tribute to the genus Solanum's considerable genetic variety, which can be applied in breeding programmes. The systematic study and assessment of tomato germplasm is vital for the crop's current and future agricultural and biological development. The tomato fruit includes a variety of bioactive substances that have beneficial effects for individual health, including lycopene (LYC), beta-carotene (b-CAR), total polyphenols (TP), and ascorbic acid (vitamin C) Numerous carotenoids (CARs) are found in *Lycopersicon pimpinellifolium* L [7].

The main source of LYC in the human diet is found in tomatoes most likely prevent and lower the occurrence of chronic degenerative diseases through the antioxidant qualities of LYC and -carotene in connection to quenching reactive oxygen species (ROS). In addition to CARs, a variety of phenolic compounds enhance the functional and sensory properties of tomatoes as well as their health value [8].

MATERIALS AND METHODS

Collection and identification of the plant material

Fresh fruits of *Lycopersicon pimpinellifolium* L were collected from the district of Morigaon, Assam in the month of February. The authentication was carried out by preparing standard herbarium specimen and authenticated by scientist, Dr.N.Odyuo, Botanical Survey Of India, Eastern Regional Centre, Laitumkhrah, Shillong, Meghalaya with accession/No:BSI/ERC/Tech/2023-24/962. Fruits were washed thoroughly with running tap water, chopped into two equal halves, shade dried, pulverized and sieved with 60 number mesh size. The samples were stored in a sealed protected plastic container.

Extraction

The extraction was carried out by maceration method. The pulverized powder was extracted with 100% methanol (50g dried powder in 500ml methanol) which was then allowed to stand for 4-7 days at room temperature. The aqueous methanolic extract was filtered and concentrated to semisolid mass by using rotary vacuum evaporator and kept at 4∘C. The concentrated extracts were re-dissolved in aqueous methanolic solvent & subjected to chemical test for the identification of the various phytochemical screening [9].

Determination of total ash value

An estimated 2gm of *Lycopersicon pimpinellifolium* L powder were placed in a tarred silica crucible dish that had been weighed previously and was incinerated at temperature at 450∘C in a muffle furnace until it was white, signifying the lack of carbon [10, 11, 12]. Three instances of the process were completed with an estimated average. The percentage of total ash was calculated using the formula below.

% (w/w) Total ash = $Fw - Pw / W \times 100$

Where, Fw = Final weight of crucible with total ash Pw = Pre-weight of crucible W = Total weight of powdered plant material.

Determination of water-soluble ash value

The ash obtained from total ash was boiled in 25ml of 2 M hydrochloric acid for 5 minutes. The insoluble materials were then collected by using the ash-less filter paper, further rinsed with hot water, ignited, cooled in a desiccator, and weighed. Using the following formula, the amount of acid-insoluble ash relative to the air-dried medication is calculated as:

% (w/w) Acid insoluble ash = $Fw - Pw / W \times 100$

Where, Fw = Weight of dish + Ash (After complete incineration) Pw = Weight of the empty dish W = Total ash

Determination of water-soluble ash value

The whole ash was heated for five minutes in 25 ml of water, and the insoluble material was then collected on ash less filter paper, cleaned with hot water, and ignited for 15 minutes at 450°C. By subtracting the weight of the insoluble portion from the total weight of ash, the weight of the soluble component was calculated:

% (w/w) Water soluble ash = $(X - Y) / X \times 100$

Where, X = Total ash Y= Water insoluble ash

Transverse section of plant

Preparation of section and staining Whole or quarter parts of fresh fruit were sectioned into thin circular slice by using thin slice was treated with diluted safranin and observed under microscope [13, 14].

Histological evaluation

The epicarp, mesocarp, and endocarp are three distinct zones that make up the pericarp.

Ramen Kalita *et al.,*

Epicarp

The cuticle is typically thick and smooth, but it can vary greatly. The epidermis is made up of densely packed, isodiametric cells. In the hypodermis region, one can see one to two layers of thick-walled sub rectangular collenchyma cells packed closely.

Mesocarp

There are nine to twelve juicy parenchymatous layers in the internal part of the mesocarp, each made up of spherical cells with thin walls and internal gaps. Crystals of calcium oxalate are present in some cells. Greater size exists between inner and outer cells. Just below the hypodermis, in the mesocarp's outer area, are sclereid cells.

Endocarp

Vascular bundles (scalariform) vessels are seen in this region.

Phytochemical screening [15, 16]

Test for Carbohydrate

Mayer's test

Mayer's reagent (Potassium mercuric iodide solution) was added to 3ml of extract results in the formation of a white or cream-colored precipitate was observed.

Wagner's test

To 3ml of filtrate, few drops of Iodine in Potassium Iodide (Wagner's Reagent) were added and observed, resulting in the formation of a red brown precipitate.

Molisch's test

Few drops of Molisch reagent was added to 3-4 ml of aqueous extract and shaken, to above solution concentrated H_2SO_4 was added from side of the test tube, a violet ring is formed at the junction of two liquids indicate the presence of carbohydrate.

Fehling's Test

1ml of Fehling's solution A and 1 ml of Fehling's solution B were mixed and boiled for one minute. To this, equal volume of test solution was added and boiled for 5- 10 minutes. Initially yellow then brick red precipitate is observed.

Tests for anthraquinone glycosides

Modified Borntrager's test

To 5 ml extract, add 5ml of 5% ferric chloride and 5ml of dilute HCL. Boil for 5 minutes then allow cooling. Add chloroform or any organic solvent. Shake continuously. Separate the organic layer and add an equal volume of diluted ammonia. The ammoniacal layer indicates pink red colour.

Test for flavonoids

Alkaline Reagent Test

3-4 ml of aqueous extract solution was added to a 10% ammonium hydroxide solution. Yellow colour is observed indicates the presence of flavonoid.

Test for tannins and phenols

Lead acetate solution

A few drops of lead acetate solution were added to 23mL of alcoholic extract, a white precipitate is seen.

Dilute Nitric acid

A few drops of dilute nitric acid was added to 3 ml of alcoholic extract, first reddish then yellow colour is observed.

In-vitro antioxidant activity

In-vitro antioxidant activity of the methanolic extract of *Lycopersicon pimpinellifolium* L   (fruit) was carried out by using DPPH, Ferric reducing and H_2O_2 assays.

DPPH antioxidant assay

3ml of plant extract or standard of different concentration solution (20μg/ml- 100μg/ml) was taken in a test tube and to this 1ml of 0.1mM DPPH solution is added [17, 18, 19]. After that test tube were incubated for 20 minutes at room temperature at dark place. The decrease in absorbance was measured at 517nm using a UV-VIS spectrophotometer. The percentage inhibition of ridiculous was calculated by using the following formula-

% inhibition= (**A**control−**A**sample) /**A**control ×100

Ferric reducing power assay

2ml of plant extract or standard of different concentration solution (20μg/ml -100 μg/ml) was taken in a test tube and to this 2ml of 0.2M phosphate buffer (PH 6.6) and 2ml of 1% Potassium ferricyanide solution is added [20, 21, 22]. The reaction mixture was vortexed well and incubated it for about 20 minutes at 50∘C. After that 2ml of 10% trichloroacetic acid was added to it and centrifuged at 3000rpm for 10 minutes. 2.5ml of supernatant fluid is mixed with 2.5ml distilled water and 0.5ml of 0.1% Ferric chloride. The absorbance of the mixture was measured at 700nm using a UV-VIS spectrophotometer. A blank was prepared without adding extract/ standard.

Hydrogen peroxide scavenging activity

0.4ml of plant extract or standard of different concentration solution (20μg/ml -100 μg/ml) was taken in a test tube and to this 2.4ml hydrogen peroxide (2mM) and 1.6ml Phosphate buffer (40mM) is added [23, 25] after that test tube were incubated for 10 minutes at room temperature. Absorbance of hydrogen peroxide was taken at 230 nm against a blank solution containing the phosphate buffer without hydrogen peroxide.

Total phenolic content

The total phenolic content of extract was determined by using Folin-Ciocalteu method. 0.5ml of crude extract (200μg/ml) was taken in a test tube and to this 2.5ml of 10% FCR reagent and 2.5ml of 7.5% Na_2CO_3 solution was added [26]. After that the test tube was incubated for 1 hour at 25∘C to complete the reaction. Then Absorbance of the solution was measured at 760nm using a UV spectrophotometer against blank consists of 5ml methanol, 2.5ml FCR reagent and 2.5ml Na_2CO_3. The total phenolic content was determined using a standard curve with gallic acid (20-100μg/ml). The total phenolic content was expressed in mg of gallic acid equivalents (GAE) / g of extract.

Total flavonoid content

1ml of plant extract (200μg/ml) was taken in a test tube and to this 0.1ml of 10% (w/v) AlCl3 and 0.1ml of 0.1mM potassium acetate solution and 2.8ml distilled water is added [26]. Then the mixer was kept at room temperature for about 30 minutes. The maximum absorbance of the solution mixture is measured at 415 nm in UV spectrophotometer against a blank sample containing 1 mL extract solution, 0.1ml of potassium acetate, 2.8 ml distilled water without $AlCl_3$. The total flavonoid content was determined using a standard curve with quercetin (20-100μg/ml). The Total flavonoid content was expressed as mg of quercetin equivalent (QE) /g of extract.

RESULTS AND DISCUSSION

Physicochemical evaluation of fruit extract of *Lycopersicon pimpinellifolium* L was analysed and represented in Table 1. Transverse section of *Lycopersicon pimpinellifolium* L (Fruit) showed presence of Epidermis, Epicarp, Mesocarp, Endocarp, Parenchyma; Trichomes ,Septa,Placenta,Outer pericarp, Mesophyll tissue (Figure 1). The preliminary phytochemical studies show the presence of Carbohydrate, Flavonoids Tannins, saponins and Phenols (Table 2). The presence of chemical components demonstrates that the plant may have valuable medical characteristics. The calibration curve (y = 0.0137x - 0.0105; R² = 0.9867) obtained from the gallic acid concentrations and expressed in mg of gallic acid equivalence (GAE) per gram was used to calculate the TPC of the extracts (Figure 7). A regression model was used to calculate the amount of phenolic compounds present in extract and value was found to be 19.86mg of gallic acid equivalent/g of phenols. The calibration curve (y = 0.0097x - 0.0072; R² = 0.9971) obtained from the quercetin concentrations and expressed in mg of quercetin equivalence (QUE) per gram was used to calculate the

TFC of the extracts (Figure 8). A regression model was used to calculate the amount of flavonoid compounds present in extract and amount was found to be 21.25mg of quercetin equivalent/g of flavonoid. In this method BHT is used as a standard. Figure 9 demonstrated that 100μg/ml concentration of extract showed highest antioxidant activity which is 42.38% inhibition whereas the BHT at 20μg/ml concentration showed 62.98% inhibition. The strong scavenging activity of the extract of fruit *Lycopersicon pimpinellifolium* L on DPPH was possibly due to the hydrogen donating ability of the poly phenolic compound present in the extract. Reducing power assay method is based on the principle that substances, which have reduction potential, react with potassium ferricyanide (Fe^{3+}) to form potassium ferrocyanide (Fe^{2+}), which subsequently combine with ferric chloride to form ferric-ferrous complex, which has an absorption maximum at 700 nm. With an increase in sample and standard concentration, the reduction power of the extracts and standard also increases (Figure 10, 11). The scavenging ability of fruit extracts of *Lycopersicon pimpinellifolium* L on H_2O_2 shown in Figure 12. The principle of this activity is absorbance of Hydrogen peroxide is decrease upon oxidation by phytocompounds. In this method BHT is used as a standard. The 80μg/ml concentration of extract showed highest antioxidant activity which is 15.65% inhibition, whereas the BHT at 20μg/ml concentration showed 11.88 % inhibition. IC_{50} value for the extract and BHT was found to be 69.65 and 242.20 respectively.

CONCLUSION

From the result of preliminary phytochemical study, it can be concluded that the crude extract of fruit consists of carbohydrates, alkaloids, flavonoids, tannins, saponins and phenols and this indicates that the plant may have valuable medicinal characteristics. The methanolic extract of *Lycopersicon pimpinellifolium* L (fruit) has shown considerable amount of antioxidant activity that may help in the treatment of various diseases.

ABSTRACT

In this paper, we introduce the new concept of closed sets called Beta generalized I- closed sets in ideal topological spaces are defined and some of their properties are discussed with few examples. Also we introduce the concept of Beta generalized I- continuity in ideal topological spaces and discussed their properties.

Keywords: Closed set, Open set, βg-closed set, β-open set, βgI-closed set, βgI-continuous set.

INTRODUCTION

In 2022, Kavitha and Sasikala[1] introduced beta generalized closed sets. Levine[9] generalized closed sets in topology. Levine(1960) introduced and studied the concepts of semi-open sets in topological spaces and investigated semi-open sets, semi generalized open sets, generalized open sets, semi-open sets, pre-open sets and alpha-open sets which are some of the weak forms of open sets and the complements of these sets are called closed sets of the same type. In the year 1999, Dontchev proved that a mapping f: $(X,\tau,I) \rightarrow (Y,\sigma)$ is continuous if and only if it is pre-I-continuous, which is an idealized version of gensterreilly decomposition theorem.

An ideal I is an nonempty collection of subsets of X closed with respect to finite union. (X,τ, I) is an ideal topological space and it is called as an ideal space. For a subset A of X, the local function of A is defined as: $A^* = \{x \in X: U \cap A \notin I$ for every $U \in \tau(x)$, where $\tau(x)$ is the collection of all nonempty open sets containing x. From this simply write A^* instead of $A^*(I)$ to avoid any chance of confusion. A Kuratowski closure operator $cl^*(.)$ for a topology $\tau^*(I,\tau)$ termed

Gowri and Pankajam

as *-topology, finer than τ is determine cl*(A) = A ∪ A*. If A contained in X, cl(A) and int(A) will denote the closure and interior of A in (X, τ) respectively and cl*(A) and int*(A) will denote the closure and interior of A in (X, *τ) respectively.

PRELIMINARIES

Throughout this paper (X,τ) represent topological spaces. For a subset A of a space (X,τ), cl(A), int(A) denote the closure of A and the interior of A respectively. We recall the following definitions.

Definition 2.1 Let (X,τ) be a topological space. Let I be an ideal defined on X. Then the space (X,τ,I) is termed as ideal topological space, which satisfies the following two conditions:
1. If A ∈ I and B ⊆ A⟹B ∈ I.
2. If A ∈ I and B ∈ I, then A∪ B∈ I.

Definition 2.2 A subset A of a topological space X is said to be
1. a generalized closed (g-closed) set if cl(A)⊆ U whenever A is a subset of U and U is open in the space X.
2. a semi generalized closed (sg-closed) set if scl(A) ⊆ U whenever A is a subset of U and U is semi open in the space X.
3. a generalized semi closed (gs-closed) set if scl(A) ⊆ U whenever A is a subset of U and U is open in the space X.
4. an α generalized closed (αg-closed) set if αcl(A) ⊆ U whenever A is a subset of U and U is open in the space X.
5. an generalized α closed (gα-closed) set if αcl(A) ⊆ U whenever A is a subset of U and U is α-open in the space X.
6. a generalized semi-pre-closed (gsp-closed) set if spcl(A) ⊆ U whenever A is a subset of U and U is open in the space X.
7. a generalized pre-closed (gp-closed) set if pcl(A) ⊆ U whenever A is a subset of U and U is open in the space X.
8. a regular generalized closed (rg-closed) set if cl(A) ⊆ U whenever A is a subset of U and U is regular open in the space X.
9. a generalized preregular-closed (gpr-closed) set if pcl(A) ⊆ U whenever A is a subset of U and U is regular open in the space X.
10. a weakly closed (w-closed) set if cl(A) ⊆ U whenever A is a subset of U and U is semi-open in the space X.
11. a weakly generalized (wg-closed) set if cl(int(A)) ⊆ U whenever A is a subset of U and U is open in the space X.
12. a strongly g-closed (g*-closed) set if cl(A) ⊆ U whenever A is a subset of U and U is g-open in the space X.
13. a generalized star pre-closed (g*p-closed) set if pcl(A) ⊆ U whenever A is a subset of U and U is g-open in the space X.
14. a regular weakly generalized (rwg-closed) set if cl(int(A)) ⊆ U whenever A is a subset of U and U is regular-open in the space X.
15. a g$^{\#}$-closed set if cl(A) ⊆ U whenever A is a subset of U and U is αg-open in the space X.

Definition 2.3
A subset A of an Ideal topological space (X,τ,I) is termed as
1. pre-I-closed set if cl*(int(A)) ⊆ A. If A ⊆ (int(cl*(A)) then A is called as pre-I-open set.
2. semi-I-closed set if int(cl*(A)) ⊆ A. If A ⊆ (cl*(int(A)) then A is called as semi-I-open set.
3. α-I-closed set if cl*(int(cl*(A))) ⊆ A. If A ⊆ (int(cl*(int(A))) then A is called as α-I-open set.
4. β-I-closed set if (int(cl*(int(A))) ⊆ A. If A ⊆ (cl*(int(cl*(A))) then A is called as   β-I-open set.
5. regular-I-closed set if A = cl*(int(A)). If A = (int(cl*(A)) then A is called as   regular-I-open set.

Definition 2.4 A function f : (X,τ) →(Y, σ) is said to be
1. a g-continuous if f⁻¹(Z) is g-closed in the space X for every closed set Z of (Y,σ).
2. a gpr-continuous if f⁻¹(Z) is gpr-closed in the space X for every closed set Z of(Y,σ).
3. a g*- continuous if f⁻¹(Z) is g*-closed in the space X for every closed set Z of (Y,σ).
4. a g- continuous if f⁻¹(Z) is g-closed in the space X for every closed set Z of (Y,σ).
5. a g$^{\#}$- continuous if f⁻¹(Z) is g$^{\#}$-closed in the space X for every closed set Z of (Y,σ).

Lemma 2.5 Let A, B be subsets of X. Let (X, τ, I) be an Ideal topological space. Then the following properties are:

1. $A \subseteq B \Longrightarrow A^* \subseteq B^*$,
2. $A^* = cl(A^*) = cl(A) = cl^*(A)$,
3. $(A \cup B)^* = A^* \cup B^*$,
4. $(A \cap B)^* \subseteq A^* \cap B^*$,
5. $(A^*)^* \subseteq A^*$.

βgI - Closed Sets in Ideal Topological Spaces

Definition 3.1 A subset B of an ideal topological spaces(X, τ , I) is called an beta generalized ideal (βgI) - closed set, if $B^* \subseteq D$ whenever B is a subset of D ($B \subseteq D$) and D is g-open in ideal topological space (X, τ, I). The complement of an βgI - open set is βgI - closed set in ideal topological space.

Example 3.2 Let X = {u, v, w}, I = {ϕ, {v}} and τ = {ϕ, {v}, {v, w}, X}. The βgI closed sets of X are {ϕ, {u}, {v}, {u, v}, {u, w}, X}.

Theorem 3.3 Every βg-closed set in the ideal topological space (X, τ, I) is an βgI - closed set. **Proof:** Let B be a βg-closed set in the ideal topological space (X, τ, I). Let D be any g-open set in X such that $B^* \subseteq D$. Since every g-open set is $B^* \subseteq cl(B) \subseteq D$. Now, $B^* \subseteq cl^*(B) \subseteq cl(B) \subseteq D$. This shows that B is an βgI- closed set in ideal topological space. Henceforth every βg-closed set in ideal topological space is a βgI - closed set. In general, the converse of this theorem does not hold.

Example 3.4 Let X = {u, v, w}, I = {ϕ, {v}} and τ = {ϕ, {v}, {v,w}, X}. The βgI closed sets of X are {ϕ, {u}, {v}, {u, v}, {u,w}, X}. Here B = {v} is βgI - closed set but it is not a βgI -closed set.

Theorem 3.5 Every g#-closed set in the ideal topological space (X, τ, I)is an βgI - closed set.
Proof: Let B be a g#-closed set in the space (X, τ, I). Let D be any g-open set in X such that $B^* \subseteq D$. Since every g-open set is αg-open, $B^* \subseteq cl(B) \subseteq D$. Now, $B^* \subseteq cl^*(B) \subseteq cl(B) \subseteq D$. This shows that B is an βgI - closed in ideal topological space. Henceforth every g#-closed set in ideal topological space is anβgI - closed set. In general, the converse of this theorem does not hold.

Example 3.6 Let X = {u, v, w}, I = {ϕ, {u}} and τ = (ϕ, {u, v}, X}. The βgI - closed sets of X are {ϕ, {u}, {w}, {v, w}, {u, w}, X}. Here B = {u} is βgI - closed set but it is not a g#-closed set.

Theorem 3.7 Every r - closed, α - closed, β - closed, pre - closed, g*- closed, α g - closed,   g α - closed, wg - closed, sg - closed, gs - closed sets in the space is βgI - closed set in the ideal topological space (X, τ, I).

Proof: It follows from that, every open set is g-open set in the space (X, τ, I). In general the converse of this theorem does not hold. This is shown in the following example.

Example 3.8
1. Let X = {u, v, w}, I = {ϕ, {w}} and τ = {ϕ, {v}, {w}, {v, w}, {u, v}, X}. The βgI closed sets of X are {ϕ, {u}, {w}, {u, v}, X}. Here B = {u} is βgI - closed set but it is not a r - closed set.
2. Let X = {u, v, w}, I = {ϕ, {u}} and τ = {ϕ, {v}, {u, v}, X}. The βgI closed sets of X are {ϕ, {u}, {w}, {v, w}, {u, w}, X}. Here B = {v, w} is βgI - closed set but it is not a α - closed and β - closed set.
3. Let X = {u, v, w}, I = {ϕ, {v}} and τ = {ϕ, {u}, {v}, {u, v}, X}. The βgI closed sets of X are {ϕ, {v}, {w}, {v, w}, {u, w}, X}. Here B = {v} is βgI - closed set but it is not a pre-closed set.
4. Let X = {u, v, w}, I = {ϕ, {w}} and τ = {ϕ, {u}, {v, w}, X}. The βgI closed sets of X are {ϕ, {u}, {w}, {v, w}, X}. Here B = {w} is βgI - closed set but it is not a g*-closed set.

5. Let X = {u, v, w}, I = {ϕ, {u}} and τ = {ϕ, {u, v}, X}. The βgI closed sets of X are {ϕ, {u}, {w}, {v, w}, {u, w}, X}. Here B = {u} is βgI - closed set but it is not a α g and g α-closed set.

6. Let X = {u, v, w}, I = {ϕ, {u}} and τ = {ϕ, {u}, {w}, {u, v}, {u, w}, X}. The βgI closed sets of X are {ϕ, {u}, {v}, {w}, {u, v}, {v, w}, X}. Here B = {v, w} is βgI-closed set but it is not a wg -closed set.

7. Let X = {u, v, w}, I = {ϕ, {v}} and τ = {ϕ, {v}, {v, w}, X}. The βgI closed sets of X are {ϕ, {u}, {v}, {u, v}, {u, w}, X}. Here B = {v} is βgI - closed set but it is not a sg and gs - closed set.

Theorem 3.9 The class of βgI - closed set in the ideal topological space (X, τ, I) is independent of the class of rwg - closed, rg - closed, gp - closed, gpr - closed, g*p - closed and gsp - closed sets in the space (X, τ, I).

Proof: It follows from that, every open set is g-open set in the space (X, τ, I). In general the converse of this theorem does not hold.

Example 3.10
1. Let X = {u, v, w}, I = {ϕ, {v}} and τ = {ϕ, {u}, X}. The βgI closed sets of X are {ϕ, {v}, {v, w}, X}. Here B = {u} is rwg - closed set but it is not a βgI - closed set.

2. Let X = {u, v, w}, I = {ϕ, {w}} and τ = {ϕ, {w}, {u, w}, X}. The βgI closed sets of X are {ϕ, {v}, {w}, {u, v},{v, w}, X}. Here B = {u, w} is rg – closed set but it is not a βgI - closed set.

3. Let X = {u,v,w}, I = {ϕ, {v}} and τ = {ϕ, {w}, {u, v}, X}. The βgI closed sets of X are {ϕ, {v}, {w}, {u, v}, X}. Here B = {u, w} is gp - closed set but it is not a βgI -closed set.

4. Let X = {u, v, w}, I = {ϕ, {w}} and τ = {ϕ, {v}, {w}, {v, w}, X}. The βgI closed sets of X are {ϕ, {u}, {w}, {u, v}, {u, w}, X}. Here B = {v, w} is gpr - closed set but it is not a βgI - closed set.

5. Let X = {u, v, w}, I = {ϕ, {v}} and τ = {ϕ, {u}, X}. The βgI closed sets of X are {ϕ, {v}, {v, w}, X}. Here B = {w} is g*p - closed set but it is not a βgI - closed set.

6. Let X = {u, v, w}, I = {ϕ, {v}} and τ = {ϕ, {u}, {v}, {u, v}, X}. The βgI closed sets of X are {ϕ, {v}, {w}, {v, w}, {u, w}, X}. Here B = {u} is gsp - closed set but it is not a βgI - closed set.

Theorem 3.11 Union of two βgI - closed sets are βgI - closed set in any ideal topological space (X, τ, I).

Proof: Let M and N be two βgI - closed sets in the ideal topological space. Let D be any g-open set in X such that M ∪ N ⊆ D. Then, M ⊆ D and N ⊆ D, M and N are βgI - closed sets. Since M* ⊆ D and N* ⊆ D whenever M* ∪ N* ⊆ (M ∪N)*⊆ D, D is g-open. Henceforth M ∪ N is βgI - closed set in ideal topological space.

Remark 3.12 The intersection of two βgI - closed sets need not be a βgI - closed set.

Theorem 3.13 For an element x ∈ X, then the set X - x is a βgI - closed set (or) g-open set.
Proof: Let x ∈ X suppose that X - x not g-open set. Then X is the only g-open set containing X - x. This implies that B*(X - x) ⊆ X. Hence X - x is βgI - closed set in X.

Theorem 3.14 If B is both open set and g-closed set in X, then B is βgI - closed set in X.

Proof: Let B ⊆ D and D be g-open set in X. Now B ⊆ B, by hypothesis αcl(B) ⊆ B. Since every closed set is a β - closed set, βcl(B) ⊆ cl(B). Thus βcl(B) ⊆ B ⊆ D. Hence B is βgI - closed set in X.

Theorem 3.15 A subset B is βgI - open in the ideal topological space (X, τ, I) iff E ⊆ int*(B) whenever E is g-closed set and E ⊆ B.

Proof: Suppose that B is βgI - open set in the ideal topological space (X, τ, I). Let E ⊆ B and E be a g-closed set. Then X - B ⊆ X - E and X - E is g-open. Since X - B is βgI - closed, then (X - B)*⊆ X - E and X - int*(B) = cl*(X - B) = (X - B) ∪ (X - B)* ⊆ X - E and henceforth E ⊆ int*(B). Conversely, let X - B ⊆ D where D is g-open. Then X - D ⊆ B and X - D is

67686

g-closed. By hypothesis, we have X - D ⊆ int*(B) and henceforth (X - B)*⊆ cl*(X - B) = X -int*(B) ⊆ D. X - B is βgI - closed set and B is βgI - open.

Theorem 3.16 Let B be a βgI - closed set in (X, τ, I). Then B is β - closed set if and only if B*- B is g-closed set.
Proof: Suppose B is a βgI - closed set in X. Then B* = B and B*- B = ϕ which is a g-closed set in X. Conversely, supposed B*- B is g-closed set in X. Since B is βgI - closed set, B*- B does not contain any non-empty g-closed set in X. That is B*- B = ϕ. Henceforth B is β -closed.

Theorem 3.17 If B is βgI - closed in (X, τ, I) and if B ⊆ C ⊆ B* then C is also βgI - closed set in (X, τ, I).
Proof: Let D be an g-open set of (X, τ, I) such that C ⊆ D. Since B ⊆ D and B is βgI - closed set, B* ⊆ D. Since C ⊆ B*, C* ⊆ B* = B*. Thus C* ⊆ D. Henceforth C is a βgI - closed set of (X, τ,I).

βgI - Continuity in Ideal Topological Spaces
Definition 4.1 A function h : (X, τ, I) → (Y, σ) is called a βgI - continuous if $h^{-1}(z)$ is βgI -closed set of the space (X, τ, I) for every closed set z of (Y, σ).

Theorem 4.2 Every continuous map in the ideal topological space (X, τ, I) is βgI - continuous.
Proof: Let h be a continuous and let z be a closed set of (Y, σ). Since h is continuous, then $h^{-1}(z)$ is closed in the space (X, τ, I). But every closed set in ideal topological space is βgI -closed set. Henceforth $h^{-1}(z)$ is βgI - closed set in ideal topological space (X, τ, I). Thus h is an βgI - continuous in the ideal topological space. In general the converse of this theorem does not hold. It is shown in the following example.

Example 4.3 Let X = {u, v, w}, τ = {ϕ, {v}, {v, w}, X} and Y = {u, v, w}, σ = {ϕ, {u, w}, {u}, X} and I = {ϕ, {v}}. Let h : (X, τ, I) → (Y, σ) be the identity function defined by h(u) = u, h(v) = v, h(w) = w. Therefore Z is a βgI - continuous but it is not a continuous.

Theorem 4.4 Every g-continuous function is βgI - continuous.
Proof: Let h be a continuous function and let z be a closed set of (Y, σ) then $h^{-1}(z)$ is g-closed set in (X, τ, I). Since every g-closed set is βgI - closed set, $h^{-1}(z)$ is βgI - closed set in the space (X, τ, I).Therefore h is βgI - continuous.

Example 4.5 Let X = {u, v, w}, τ = {ϕ, {v}, {w}, {v, w}, X} and Y = {u, v, w}, σ = {ϕ, {w}, X} and I = {ϕ, {v}}. Let the function h : (X, τ, I) → (Y, σ) be the identity function. Then the function h is βgI - continuous but it is not a g-continuous.

Theorem 4.6 Every g#- continuous function is βgI - continuous.
Proof: Let h be an continuous function and let z be a closed set of (Y, σ) then $h^{-1}(z)$ is g# -closed set in (X, τ, I). Since every g#- closed is βgI - closed set. Henceforth $h^{-1}(z)$ is a βgI -closed set in the space (X, τ, I). Therefore h is a βgI - continuous.

Example 4.7 Let X = {u, v, w}, τ = {ϕ, {v}, {w}, {v, w}, X} and Y= {u, v, w}, σ = {ϕ, {w}, X} and I= {ϕ, {v}}. Let the function h : (X, τ, I) → (Y, σ) be the identity function. Then the function h is a βgI - continuous but it is not a g# - continuous.

Theorem 4.8 A map h : (X, τ, I) → (Y, σ) is βgI - continuous if and only if the inverse image of every closed set in (Y, σ) is βgI - closed in (X, τ, I).
Proof: Necessary: Let z be a closed set in (Y, σ). Since h is βgI - continuous, $h^{-1}(z^c)$ is βgI -closed in (X, τ, I). But $h^{-1}(z^c)$ = X – $h^{-1}(z)$. Henceforth $h^{-1}(z)$ is βgI - closed in (X, τ, I).
Sufficiency: Assume that the inverse image of every closed set in (Y, σ) is βgI - closed in (X, τ, I). Let z be a closed set in (Y, σ). By our assumption $h^{-1}(z^c)$ = X – $h^{-1}(z)$ is βgI - closed in (X, τ, I)which implies that $h^{-1}(z)$ is βgI - closed in the space (X, τ, I). Henceforth his βgI -continuous.

CONCLUSION

In this paper an attempt was made to study about the new class of generalized closed sets via ideal topological spaces. This paper focuses on βgI - closed sets in ideal topological spaces and also some of their properties were discussed. The continuity of βgI - function was also defined and its properties were discussed.

ABSTRACT

The objective of this study was to evaluate the positive antimicrobial properties of ethanol extract of *Tephrosia pulcherrima.* The extracts were investigated individually for in vitro antibacterial activity by cup plate (well diffusion) method against five pathogenic bacteria. It was observed that ethanolic extract (50 mg/well) was the most potential antimicrobial activity against all tested bacteria strains with zone of inhibition between 11 to 18mm. However their antimicrobial effects were found to be less potent than the reference antibiotics. Under crude Ethanol extract against *E.coli* shows (18mm), *Streptococcus* shows (18mm), *Staphylococcus aureus* shows (15mm), *Pseudomonas aerginosa* shows (16mm) and *Salmonella* shows (15mm) their respective inhibition under Crude Ethanol extract. They are more then antimicrobial principle of the plant extract inhibited the growth of both the bacterial test organisms employed in the study, as evidenced from the clear zones formed around the disc. The antibacterial activities of the investigated plants could make it useful in microbial infections.

Keywords: *Tephrosia pulcherrima* stem extract, Antimicrobial activity.

Anbukkarasi *et al.,*

INTRODUCTION

The extensive use of antibiotics in clinical medicine, veterinary medicine, and agriculture all contribute to the development of antibiotic resistance in pathogenic microbial strains, which ultimately represents a very severe challenge in the management of pathogenic bacteria (Kapil, 2005). This has prompted researchers to look for new antimicrobial agents, mostly in plant extracts, in an effort to identify novel chemical structures that might address the aforementioned drawbacks (Lewis, 2006). Numerous studies that attempt to understand the various antimicrobial components of medicinal plants and use them for the treatment of microbial diseases as potential substitutes for synthetic medications to which many pathogenic bacteria have developed resistance have been documented. In addition to being a significant source of novel antimicrobial medicines, plants have long been utilized to treat infectious disorders. The antimicrobial benefits of herbal plant extracts, including roots, stems, leaves, or flowers, have been the subject of several studies (Abu-Shanab, 2005). In order to verify the antibacterial activity of plants used in traditional medicine and explore the possibility of include them in basic healthcare, several nations in Africa and other regions of the world have continued to support screening initiatives. (Baker,1978). The oldest and still the most important source of new and potent medications are medicinal plants. The capacity to use active plant chemicals or their synthetic equivalents in medicine has improved with the development of phyto chemistry and pharmaceutical chemistry. This is mostly due to the fact that medicinal plants have a greater degree of chemical variety and originality than any other sources (Harvey, 2001; Chin et al., 2006).

Several studies have shown that plant extracts have antibacterial action against microorganisms that cause food poisoning (Duine et al., 2005; Alzoreky and Nakahara, 2003; Verma et al., 2012; Akinpelu et al., 2015). (Gupta et al., 2010) investigated antibacterial activity of five ethanolic and aqueous plant extracts against S. aureus, Pseudomonas aeruginosa and Bacillus subtilis and their results showed that the ethanolic extracts of four plants (Achyranthes as per a, *Cynodon dacynodon dactylon, Lantana camara* and *Tagetes patula*) were effective against all tested microorganisms with MIC's ranged from 25 to 125 mg/ml. According to (Saldaha,1984) investigation on the antibacterial effects of guava leaves, garlic, and ginger against a variety of human microbes, ginger was only effective against S. aureus whereas guava and garlic were effective against all tested microorganisms. (Akinpelu et al., 2015) According to several studies, ethanolic clove extract was ineffective against *E. coli* and Salmonella enteritidis but showed potential activity against *S. aureus, Vibrio parahaemolyticus,* and *P. aeruginosa* (Mahfuzul Hoque et al., 2007). *While Vibrio cholera, S. typhi, and Klebsiella pneumonia* were shown to be resistant to aqueous clove extract, other researches confirmed the efficacy of clove oil against all tested harmful bacteria (Singleton, 1999).; Saeed et al., 2013). Additionally, a MIC range of 0.1 to 2.31 mg/ml for the methanolic clove extract was shown to be possibly effective against *S. aureus, P. aeruginosa,* and *E. coli* (Pandey and Singh, 2011).

In accordance to many studies (Ansari and Ali.,1996; Shan et al., 2007; Chaudry and Tariq, 2008), the antimicrobial activity of cumin seeds (*Cuminum cyminum*) extract may be effective against a number of types of Gram positive and Gram negative bacteria linked to food poisoning with varying MICs. The potential antibacterial properties of the selected Thai medicinal herbs were examined using two distinct bacterial strains. While Escherichia coli, a Gram negative bacillus, causes serious infectious diseases like urinary tract infections and bloodstream infections, *Staphylococcus aureus* is one of the most prevalent Gram positive bacteria that causes common infectious diseases like soft tissue infection and community associated bloodstream infection (Pandey., 2011). The Leguminosae family's Tephrosia genus has more than 350 species, many of which have significant traditional medicinal benefits for the treatment of several ailments. Tephrosia is a large pantropical genus. The Indian subcontinent is home to wild indigo, purple tephrosia, and fish poison. This genus' plants are extensively dispersed in various tropical and subtropical nations throughout the world. This study also gives an overview of various pharmacological activities like antioxidant, antimicrobial, anticancer, antiplasmodial, anti-inflammatory, larvicidal and toxicity studies of extracts and fractions.

MATERIALS AND METHODS

Plant materials

Fresh, healthy and mature plant of *Tephrosia pulcherrima.* were collected from Pachaimallai Hills and authenticated by Dr. Soosairaj at Department of Botany St. Joseph's College Trichy, Tamil Nadu, India.

Extraction

Dried and coarsely powdered plant materials, (25 gm of each sample) were individually extracted in muslin bags with various solvents such as methanol by using continuous hot extraction with Soxhlet extractor, for 18 hrs. The crude extracts obtained were filtered through What man paper no .1 and the filtrates were evaporated under reduced pressure and low temperature to give a gummy solid residue. The dried extracts were weighed and stored in labelled sterile screw capped bottles in refrigerator.

Culture media

Antibiotics are one of our most important weapons in fighting bacterial infections and have greatly benefited the health-related quality of human life since their introduction. However, over the past few decades, these health benefits are under threat as many commonly used antibiotics have become less and less effective against certain illnesses not, only because many of them produce toxic reactions, but also due to emergence of drug-resistant bacteria. It is essential to investigate newer drugs with lesser resistance. Drugs derived from natural sources play a significant role in the prevention and treatment of human diseases. In many developing countries, traditional medicine is one of the primary healthcare systems. Herbs are widely exploited in the traditional medicine and their curative potentials are well documented. About 61% of new drugs developed between 1981 and 2002 were based on natural products and they have been very successful, especially in the areas of infectious disease and cancer. Recent trends, however, show that the discovery rate of active novel chemical entities is declining. Natural products of higher plants may give a new source of antimicrobial agents with possibly novel mechanisms of action.

Final pH 7.3 ± 0.1 at 25ºC

Mueller and Hinton developed Mueller Hinton Agar (MHA) in 1941 for the isolation of pathogenic Neisseria species. Nowadays, it is more commonly used for the routine susceptibility testing of non-fastidious microorganism by the Kirby-Bauer disk diffusion technique. Mueller Hinton Media contains Beef Extract, Acid Hydrolysate of Casein, Starch and Agar. Beef Extract and Acid Hydrolysate of Casein provide nitrogen, vitamins, carbon, amino acids, sulphur and other essential nutrients. Starch is added to absorb any toxic metabolites produced. Starch hydrolysis yields dextrose, which serves as a source of energy. Agar is the solidifying agent. Suspend 38 gm of the medium in one liter of distilled water. Heat with frequent agitation and boil for one minute to completely dissolve the medium. Autoclave at 121°C for 15 minutes. Cool to room temperature. Pour cooled Mueller Hinton Agar into sterile petri dishes on a level, horizontal surface to give uniform depth. Allow to cool to room temperature. Check for the final pH 7.3 ± 0.1 at 25ºC. Store the plates at 2-8 ºC.

Inoculum Preparation

From a pure bacterial culture (not more than 48 hours, old except for slow growing organisms), take four or five colonies with a wire loop. Transfer colonies to 5 ml of Trypti case soy broth or 0.9% saline. Incubate the broth at 30°C or at an optimum growth temperature until it achieves or exceeds the turbidity of 0.5 Mac Farland standard (prepared by adding 0.5 ml of 0.048 M $BaCl_2$ to 99.5 ml of 0.36 NH_2SO_4; commercially available). Compare the turbidity of the test bacterial suspension with that of 0.5 MacFarl and (vigorously shaken before use) against a white background with contrasting black line under adequate light. Arrow points to tube with correct turbidity. Reduce turbidity by adding sterile saline or broth.

Inoculation of plates

Dip a sterile cotton swab into the standardized bacterial suspension. Remove excess inoculum by lightly pressing the swab against the tube wall at a level above that of the liquid. Inoculate the agar by streaking with the swab containing the inoculum. Rotate the plate by 60° and repeat the rubbing procedure. Repeat two times. This will ensure and even distribution of the inoculum. Allow the surface of the medium to dry for 3-5 minutes but not longer than 15 minutes to allow for absorption of excess moisture.

Antimicrobial disks

The number of antimicrobial agents to be tested should be limited. To make the test practical and relevant, include only one representative of each group of related drugs; those indicated for veterinary use to control or prevent disease, and those that can be useful for epidemiological or research purposes. Use antibiotic disks purchased from a reputable manufacturer. The disk diameter is approximately 6 mm. Disks should be properly stored in a tightly sealed container with desiccant at 2-8°C. Expired disks should not be used. Using sterile forceps or disk dispenser, place antibiotic disk on the surface of the inoculated and dried plate. Immediately press it down lightly with the instrument to ensure complete contact between the disk and the agar surface. Do not move a disk once it has come into contact with the agar surface since some diffusion of the drug occurs instantaneously.

Incubation

Incubate plates in an inverted position at 30°C or at an optimum growth temperature. Observe for the zone of inhibition after 16 to 18 hours. Slow growing organisms may require longer incubation period.

Zones of Inhibition

The zone of inhibition is the point at which no growth is visible to the unaided eye. Read and record the diameter of the zones of inhibition using a ruler graduated to 0.5 mm. Round up the zone measurement to the nearest millimeter. The antibacterial activity against gram- negative bacteria (klebesiella pneumonia, Echerichia coli, pseudomonas aureus) gram- positive bacteria (Staphylococcus aureus, Bacillus thuringiensis).The effect of extract shows more effective antimicrobial activity.

RESULT AND DISCUSSION

Antimicrobial activity of *Tephrosia pulcherrima* extracts

In the present study, the antibacterial activity of *Tephrosia pulcherrima* was evaluated against *E. coli, S. aureus, P. aeruginosa* and *Salmonella* sp, ethanol, solvents were used for getting fractions of *Tephrosia pulcherrima*. A microorganism that has the ability to cause disease is called pathogen. There are a wide range of microorganisms that can cause severe harm to the body become lethal infectious disease still remains the topmost cause of death in world. The discovery of antibiotics has long been regarded as one of the most significant medical achievements of the twentieth century. Antibiotics have saved millions of lives and enabled important medical procedures, including surgery and cancer chemotherapy. The emergence and spread of antibacterial resistance in all geographical areas, including in bacteria that cause hospital- and community acquired infections, is, however, jeopardizing the effectiveness of these potentially lifesaving treatments. The threat includes the spread of multidrug-resistant bacteria, and infections with no therapeutic options have been reported. (Unemo et al, 2012). The antibacterial activity of *Tephrosia pulcherrima* extract on Escherichia coli was given in table 1 and shown in plate:1. Different concentrations of ethanol extract of *Tephrosia pulcherrima* showed high antibacterial activity against E. coli. However, the 30µ showed high antibacterial activity on *E. coli, S. aureus, P. aeruginosa* and *Salmonella* sp, with a mean zone of inhibition of 18 mm. The ethanol extract of *Tephrosia pulcherrima* showed the high antibacterial activity against the bacterial strain *E. coli, S. aureus, P. aeruginosa* and Salmonella sp, Results obtained in the current investigation revealed that studied herbal extracts possess potential antibacterial activity against *B. cereus* and *E. coli, S. aureus, P. aeruginosa* and

Salmonella sp, The high concentration (10µl, 20µl, 30µl) of the *Tephrosia pulcherrima* root used against the above four pathogenic organisms has showed varied degree of antibacterial activity.

CONCLUSION

It may conclude that the *Tephrosia pulcherrima* are very useful plant. It is used in the treatment of some common and other various dangerous diseases. There is a need to explore its maximum potential in the field of medicinal and pharmaceutical sciences for novel application. From the results it is concluded that the ethanol extracts *Tephrosia pulcherrima* of possess remarkable antimicrobial activity.

ABSTRACT

News comprises a compilation of current events covering a wide array of topics, including finance, agriculture, business, economics, education, employment, entertainment, health, politics, technology, and global affairs, among others. Occasionally, when events unfold unjustly, this type of information is referred to as 'crime news.' Crime news serves as a means to provide awareness and knowledge to help prevent unlawful activities. In the realm of digital advancement, key research areas include enlargement, classification, and prediction. While many studies on news classification have focused solely on news headlines, our system emphasizes the main stories within news articles for classification purposes. Our approach involves evaluating the efficacy of the Naïve Bayes (NB) machine learning algorithm to automatically categorize news articles into 'Crime' and 'Non-Crime' segments. Raw real-world data is unsuitable for direct use in classification algorithms due to noise, missing elements, and outliers. Any of these factors can have a detrimental impact on the quality of outcomes. Thus, we have implemented text pre-processing techniques to cleanse the text. Alongside Linguistic Analysis of Text (NLP), such as the elimination of stop words and lemmatization, aimed at enhancing the dataset. The subsequent stage encompasses Feature Extraction, where we employ techniques like Counter Vectorization, N-grams, and TFIDF Vectorization to extract meaningful features from the news data. Following this, the NB algorithm is deployed to classify the news articles. The results generated by the classifier are then evaluated using measures, including precision, recall, accuracy, and the F1 score.

INTRODUCTION

The internet's rapid advancement has effectively interconnected communities worldwide. This expansion is also evident in the realm of news media. As Philip Leslie Graham, a distinguished American newspaper publisher associated with 'The Washington Post,' astutely stated, 'News represents the initial, unpolished version of history.' News plays an indispensable role in human civilization, encompassing diverse categories such as agriculture, business, economy, education, employment, entertainment, health, politics, technology, world affairs, religion, and crime, among others. In the contemporary era, the Internet's advancement empowers individuals to access their preferred news content from virtually anywhere. Every news piece contributes to revitalizing individuals and keeping them informed about ongoing events in their local vicinity. Among various news categories, crime stands as an inevitable and persistent subject. Analogous to weeds in a field, crime has become an inseparable facet of our present reality. Engaging in actions that breach established laws constitutes a crime [10], subjecting such transgressions to legal consequences [9]. The extent of penalty for an offense is established based on its inherent nature and seriousness, following the guidelines set by the existing legal structure. While legal systems exhibit variations among countries, the foundational notion of crime remains universally relevant, even if with distinct occurrence frequencies across global regions. For instance, the illustration of India's system for dispensing justice in cases of criminal offenses is presented in Figure 1. According to this framework, promptly reporting any crime is crucial at the victim's local police station. Subsequent actions, such as investigation, arrest, and the submission of an FIR, depend on the nature and seriousness of the reported crime. The process entails meticulous interrogation and documentation, culminating in a charge sheet submission and ultimately leading to a court trial. The court plays a pivotal role in adjudicating the case, weighing aspects like bail applications and delivering a verdict after hearing both the accused and the victim [11]. Throughout these legal proceedings, news outlets provide comprehensive coverage of crime-related matters.

RELATED WORK

This phase intends to provide a succinct overview of the prior research conducted in the domain of Crime News classification Researchers have utilized a range of techniques for news classification, including procedures such as refining text, extracting features, and employing algorithms for text classification. Shilpa Singh Hanswal et al., in 2021 [5], presented a study that utilized three classification algorithms—SVC, NB, and LR—to categorize student sentiment polarity in E-learning tweets as Positive or Negative. The classification accuracy was observed as 61% for NB, 63% for LR, and 49% for SVC. The authors suggested alternative algorithms such as Multinomial NB, Bernoulli NB, SGD, and Linear SVC to potentially improve classification accuracy. Lu Wang et al., in 2020 [16], introduced an enhanced NB algorithm for distinguishing between spam and non-spam emails. Their approach combined the random forest and naive Bayesian algorithms, resulting in an improved NB algorithm with an accuracy of 85.86%.

This marked a 1.01% enhancement compared to the original NB algorithm's accuracy of 84.85%. Aashish Agarwal et al., in 2019 [1], explored the use of Krippendorf's alpha and Fleiss kappa statistical scales to classify news articles as good, neutral, or bad. They evaluated several algorithms, including SVM, LR, LSDM, and Naïve Bayes, with Naive Bayes outperforming the other classifiers. Umid Suleymanov et al., in 2018 [14], developed an automatic news classification framework for Azerbaijani news datasets. The study proposed the application of classification algorithms such as NB, SVM, and ANN. Their findings suggested that ANN exhibited superior performance compared to SVM. Mykhailo Granik et al., in 2017 [4], introduced an approach for Fake news detection in Face book news posts using the Naïve Bayes Classification algorithm, achieving an accuracy of 75.40%. The authors provided suggestions for enhancing classifier performance. José Antonio Iglesias et al., in 2016 [6], proposed an Evolving classifier based on fuzzy rules to categorize news articles into distinct categories such as health-science, arts, science-technology, and sports. They employed the Weka and Lib SVM libraries for implementation. Additionally, a web-based crime analysis system for crime hotspot detection was suggested by Jayaweera, Isuru et al., in 2015 [7]. In summary, this overview underscores the diverse methodologies employed in crime news classification and highlights the performance and potential improvements of various classification algorithms.

Sukumar and Robert

METHODOLOGY

The comprehensive structure of the framework for crime classification is illustrated in Figure 2. The proposed framework consists of two significant phases: the training phase and the prediction phase. The first phase encompasses four key segments: data preparation, text pre-processing, feature extraction, and model classification. The second phase replicates the sections from the training phase, excluding the elements of data preparation and the Model Classifier. Each of these sections is succinctly addressed in the subsequent part.

Training Phase
Data Preparation: The commencement of any data analysis involves data preparation [16]. For this study, we opted for news articles from Indian Cropus. A sum of 2,781 articles was gathered for this dataset, all of which is accessible publicly. Subsequently, the acquired data was classified manually into two categories: crime and non-crime. The dataset comprises a total of 31,235 sentences and 983,256 words. Table 1 illustrates the distribution, depicting the proportion of crime and non-crime news within our dataset.

Text Pre-processing
The quality of the output is ultimately determined by the standard of the data [3]. However, in the real world, data often contains inconsistencies, missing values, outliers, and duplicates. Such data is unsuitable for algorithmic analysis. Data pre-processing represents the longest and most critical phase of the data mining and analysis process [13]. Data cleaning primarily involves removing non-textual elements from the data [15]. Within this segment, our approach initially involved mapping contractions within the text and subsequently eliminating them. The subsequent step entailed tokenization, wherein sentences were divided into distinct words. Following this, all words were converted to lowercase to achieve text normalization. The subsequent step involved removing punctuation from the normalized text. In the subsequent segment, we employed NLP techniques to eliminate stop words from the text. Finally, we applied Lemmatization techniques to transform various word forms into their base or source words, thereby reducing word dimensions [2].

Feature Extraction
Extracting correct features has a profound impact on the data analysis process. Text feature extraction involves converting text into a numerical vector format, which is a crucial step in the entire classification process. Feature extraction provides a numerical representation of text, and reducing text dimensionality significantly contributes to the enhanced performance of classification algorithms [8]. In our approach, we applied feature extraction to the pre-processed text. This phase encompassed the utilization of various feature extraction methods, including Count Vectorizer (CV), N-Grams, and Term Frequency-Inverse Document Frequency (TFIDF) Vectorizer. These methods were employed to transform text into a machine-readable vector format, thereby effectively reducing the dimensions of words.

Model Classification
Classification holds paramount importance in the entire data analysis process. Text classification involves categorizing documents into predetermined classes without the need for human intervention; this process is referred to as classification. Naïve Bayes, a probabilistic machine learning (ML) algorithm based on Bayes' Theorem, finds application in a diverse array of classification tasks [12].

$$P(y \mid X) = \frac{P(X \mid y)P(y)}{P(X)}$$

In this paper, we have employed a supervised learning approach utilizing the binary classification algorithm of Naïve Bayes to categorize news articles into crime and non-crime segments. News articles typically encompass a wide range of categorized information; for the purpose of our research, we divided the news articles into two classes:

crime and non-crime. In the first phase, we created histograms for all the words within both classes and computed the probabilities associated with each word in normal news articles. In the subsequent Naïve Bayes model formula (1), 'P' denotes probability, 'X' signifies news articles, and 'y' represents a given word in a news article. In this formula, P(y|X) indicates the probability of a word, P(X|y) denotes the probability of "y" given by X, P(y) represents the probability of 'y' occurring across all news articles, and P(X) signifies the total number of words in all news articles. We calculated the likelihoods within the histograms of words for both crime and non-crime categories. Subsequently, we compared the scores between crime and non-crime, classifying them into their respective segments if the values exceeded a certain threshold.

Algorithm 1.LexiJustice
The algorithm classifies news articles into crime-related or non-crime-related categories using text processing and machine learning. It preprocesses text, extracts features, trains a classifier, and evaluates its performance. This automates article categorization based on content.

Predication Phase
During the Prediction phase, news articles undergo classification using the output obtained from the trained classifier. This output is utilized to sort and categorize documents. In this paper, we employ real-time news articles as input for the text pre-processing segment, which processes the raw news articles. The results of the text refine segment are then subjected to extraction of features methods, converting the text pre-processed text into a vector format. The outcomes of the feature extraction phase are fed into the model classifier. Ultimately, the Model Classifier categorizes the news articles as either crime-related or non-crime-related.

EXPERIMENT AND EVALUATION
This paper presents the experimentation and evaluation results of the NB classification algorithm along with feature extraction methods. The first segment outlines the data information, followed by the classifier's most informative features, crime classification evolution metrics, confusion matrix, prediction phase results, and finally, a discussion of the overall findings. The entire experimental work was implemented using Python version 3.9.1 in Jupyter Notebook 6.0.3, alongside MS Excel.

Data Information
To align with the research objectives, this paper undertook the manual compilation of diverse data from a range of public news sources within India. For the purpose of model classification, the complete dataset was subdivided into two distinct segments: 70% designated for Training and the remaining 30% reserved for Testing. The pertinent details of this partitioning strategy are succinctly encapsulated in Table 2.

Confusion Matrix
The Confusion Matrix is a tool used to evaluate the performance of a classification algorithm. By analyzing the Confusion Matrix, one can obtain a comprehensive insight into the accuracy of the classification model and the types of errors it might produce. In Table 3, you'll find the values for metrics such as True Positive (TP) rate, False Positive (FP) rate, True Negative (TN) rate, and False Negative (FN) rate. The outcomes of the confusion matrix are outlined in Table 4. The experimental results for precision, recall, f1-score, and accuracy rates are visually depicted in a line chart shown in Figure 3.

Classifier's Most Informative Features
In this study, the most informative features of the NB Classifier are presented and depicted in Table 5. Additionally, N-Grams with the most informative features of the NB Classifier are displayed in Table 6.

Prediction Phase Result

This paper utilizes current news headlines to evaluate the trained classification classifier's performance in classifying news article headlines into crime and non-crime categories, as detailed in Figure 4.

INSIGHTS AND FINDINGS

1. When comparing the precision rate of 100% achieved by the CV with NB classifier to other models, it does not necessarily indicate that the model is performing well. This particular model misclassified 73 non-crime news articles as crime, resulting in a recall rate of 79.20%.
2. In crime news prediction, the recall (sensitivity) rate holds more significance than the precision rate. The recall rates for TFIDF with NB and N-Grams with NB are 85.11% and 85.28%, respectively. These values effectively reduce the False Negative (FN) rate.
3. Combining the NB classification algorithm with TFIDF and N-Gram Feature Extraction leads to more effective performance, yielding accuracies of 93.25% and 93.05%, respectively. TFIDF outperforms N-Gram Feature Extraction by 0.24%.
4. Feature words such as "Sexually" and "murder" exhibit high crime probability scores.
5. The feature word "covid" holds a high non-crime probability score.
6. Certain Unigrams words like 'ipc', 'sexually', 'murder', 'injuries', and 'investigating' demonstrate high crime probability scores.
7. The Bi-Grams word "('police', 'arrested')" showcases a high crime probability score.
8. The Tri-Grams word "('bench', 'madras', 'high')" attains a high crime probability score.
9. The 4-Grams word "('bench', 'madras', 'high', 'court')" achieves a high crime probability score.

CONCLUSION AND FUTURE DIRECTION

In conclusion, this study introduces a novel and effective approach to classifying crime-related news articles by combining feature extraction methods with the Naïve Bayes algorithm. Unlike conventional methods, which often rely solely on headlines, our approach harnesses the entirety of the main story text for more accurate classification. By manually tagging news articles and employing advanced text processing techniques, we prepare the data for feature extraction using CV, N-Gram, and TFIDF methods. The subsequent application of the Naïve Bayes algorithm, with a focus on various feature combinations, highlights the superiority of TFIDF, achieving an impressive accuracy of 93.29%. Our research provides not only valuable practical insights, such as the influence of hardware limitations and the importance of careful sampling, but also a foundational framework for news article classification within the realm of machine learning. As we look ahead, this work opens doors to further exploration, including the integration of sentiment analysis to personalize news recommendations and the adoption of cross-validation techniques to bolster model accuracy. Ultimately, our approach offers a significant contribution to the field, driving advancements in the classification of news articles and inspiring future research endeavors.

ABSTRACT

A different parts of the world are developing in agriculture based on the quality of water and soil. These qualities can be evaluated by using different method for selecting the preferences of the selected areas. Considering the soils for some regions which has different chemical parameters and their parameters can be computed by using the TOPSIS Method. Here, the solution of Fuzzy TOPSIS method is got by evaluating from fuzzy positive and fuzzy negative ideal solutions in various characteristics of soil from different locations, in which the Updated Fuzzy TOPSIS Method obtained by updating the procedure for Fuzzy TOPSIS Method, gives the moderate solution for the problem. Our objective of the paper is to determine the selection of the place with high quality soil among the twenty five different locations given.

Keywords: Chemical parameters, Multi Criteria Decision-Making, Fuzzy TOPSIS, Updated Fuzzy TOPSIS Method.

INTRODUCTION

Soil are mixture of different things; rocks, minerals and dead decaying plants and animals. Although the composition of soil can vary from one place to another, it typically consists of water, air and both organic and inorganic materials. The inorganic materials are the rocks that have been broken down into smaller pieces. It may appear as pebbles, gravel, or as small as particles of sand clay. The organic material is decaying living matter. This could be plants or animals that have died and decay until they becomes part of the soil. The amount of water in the soil is closely linked with the climate and other characteristics of the region. The amount of water in the soil is one thing that can affect the amount of air. Very wet soil each are found in a wetland probably has very little air. A different parts of the world are developing in agriculture based on the quality of water and soil . These qualities can be evaluated by using different method for selecting the preferences of the selected areas. Considering the soils for some regions which has different chemical parameters and their parameters can be computed by using the TOPSIS Method. Here, the solution of Fuzzy TOPSIS method is got by evaluating from fuzzy positive and fuzzy negative ideal solutions in various characteristics of soil from different locations, in which the Updated Fuzzy TOPSIS Method obtained by updating the procedure for Fuzzy TOPSIS Method, gives the moderate solution for the problem. Our objective of the paper is to determine the selection of the place with high quality soil among the twenty five different locations given. Mixtures of mineral and organic particles of varying size compose of soil. The particles occupy about 50 per cent of the soil's volume. The remaining soil volume composed of pores of varying shapes and sizes.

The pore spaces contain air and water and serve as cannels for the movement of air and water. Pore spaces are used as runways for small animals and are avenues for the extension and growth of roots. Roots anchored in soil support plants and roots absorb water and nutrients. For good plant growth, the root-soil environment should be free of unwanted factors. The three essential things that plants absorb from the soil are: *(1) water* that is mainly evaporated from plant leaves, *(2) nutrients* for nutrition, and *(3) oxygen*for root respiration. Such challenges are solved using MCDM techniques while taking into account a wide range of variables[Yu et al. 2011(11); Nillsson et al. 2016(9)]. Due to its benefits, such as case of execution regardless of the number of alternatives and criteria as well as its ability to yield effective result, the methodology for order preference by similarity to an ideal solution in (TOPSIS) method is extensively used in the MCDM process. The TOPSIS techniques is based on the premise that different solutions should be ranked in accordance with specific criteria and between the maximum and minimum values that the criterion can have in accordance with the optimal solution. Determining attribute weights is a step that must be taken when using TOPSIS [Hwang and Yoon 1981(5)]. To identify this flow in the standard TOPSIS the fuzzy TOPSIS technique was suggested in which the weights of criteria and ratings of alternatives are evaluated by linguistic variables represented by fuzzy integers. Numerous industries, including those in the sectors of energy, the environment, industrial process and climate change, have successfully used the fuzzy TOPSIS Techniques [Beskese, A.; Demir, H.H.; Ozcan, H.K.; Okten, H.E. 2015(1), Cavallaro, F.; Zavadskas, E.K.; Raslanas, S. 2016(2), Guo, S.; Zhao, H. 2015(4)]. The evolution of soil quality during the process of land reclamations is still unknown, despite widespread reporting of temporal fluctuations in soil quality on farmlands, forests, and wetlands[Raiesi and Kabiri 2016(10); Nabeollahi et al. 2017(8); Yang et al. 2017(11); Zhang et al. 2019(14)].

The changes in soil characteristics caused by anthropogenic activity can be seen in the quality of the soil[Karlen et al. 1993(6)]. Due to the growing focus on sustainable land use and food security, assessments of soil quality have drawn a lot of attention [Liu et al. 2015(7)]. To assess the progress and success reclaimed coastal saline soil, it is crucial to identify the representative indicators, which should contain the basic physical, chemical, and biological aspects[Zhang et al. 2011(13)]. The soil systems are complex and variable, the accuracy of assessment results is heavily dependent on appropriate analysis techniques [Guo et al. 2017(3)]. After each cropping system was finished seasonal estimates of the available N, P, K and soil organic C were made 25 areas in Thanjavur town. For each of the twenty-five areas in Thanjavur town, soil quality criteria were examined. From soil samples, it was also possible to estimate the concentration of soil organic C, available N, and available P. In the present investigation, twenty five ground water resources were selected to study the quality of groundwater to subject to analysis using UPDATED

67704

Usharani and Marimuthu

FUZZY TOPSIS Method (UFTM).Due to population growth, the intensive agricultural production plan can be updated by adopting the methods in using chemical quality and extrapolated parameters of soil *viz.,* EC, pH, N,P and K. Analysis of soil was carried out at Agricultural College And Research Institute, Tamil Nadu Agricultural University Eachangkottai, Thanjavur. The soil parameters*viz.,* EC, pH, N,P and K were analyzed. The places were selected in and around Thanjavur at a distance of 25km from the heart of the city and chosen for conducting the study. The samples were collected from the following 25 places *viz.,* 1.kattur,2,.Raramuthraikottai,3.Oolur,4.Villar, 5.Kulichappattu,6.Duraioor,7.Thalavapalayam,8.Marungulam,9.Vandaiyaruppu,10.Valamarakottai,11.Thiruvonam,12.Vadakkupattu,13.Kattuthottam,14.Kalakudi,15.Medicalcollege,16.Ponnapoor,17.Branthai,18.Kattukurichi,19.Saliya mangalam,20.Puliyakkudi,21.Kollangkarai,22.Nellupattu,23.Marungai,24.Nangikottai,25.Mariyammankovil.Afterup dating the formula in TOPSIS named UPDATED FUZZY TOPSIS in the normalized fuzzy decision matrix and fuzzy +ve and fuzzy –ve ideal solutions in different quality parameters of groundwater, the best preference place among twenty five selected places was identified.

Procedure of Updated Fuzzy TOPSIS Method

Making choices among numerous alternatives that are characterized by multiple, typically competing criteria is a common step in the decision- making process. The representative decision matrix $\mathbb{P}$ used in MCDM. Where C_j represent the decision criteria(j=1,2,3,4,…n) B_i represent the alternatives (i=1,2,3,4…m), and q_{ij} represent the value of the ith alternative under the jth criteria w_j(j=1,2,3,4…n) are the criteria fuzzy weights indicating the relative importance among them.

STEP 1

The Fuzzy Normalized Decision Matrix in TOPSIS the performance of each alternative needs to be graded with equation

$$Pij = \frac{q_{ij}}{\sum_{i=1}^{m} q_{ij}}\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots \tag{1}$$

With $\mathbb{P}$ decision matrix, is $\mathbb{P}= [p_{ij}]$; where $\mathbb{P}$ =

$$\begin{array}{c} C/A \quad C_1 \quad C_2 \quad \cdots \quad C_n \\ \begin{matrix} B_{11} \\ B_{12} \\ \cdots \\ B_{1n} \end{matrix} \begin{bmatrix} p_{11} & p_{12} & \cdots & p_{1n} \\ p_{21} & p_{22} & \cdots & p_{2n} \\ \cdots & \cdots & \cdots & \cdots \\ p_{m1} & p_{m2} & \cdots & p_{mn} \end{bmatrix} \end{array}$$

i=1,2,3,4……..m and

j=1,2,3,4,…..n. where B is a alternative and C is criteria.

STEP 2

Obtain the fuzzy weight W_j from the given the normalized decision matrix under the following conditions.

$$\sum_{j=1}^{n} W_j = 1,\text{with j=1,2,3,4,……n.}\dots\dots\dots\dots \tag{2}$$

Where fuzzy weights $w_j = \frac{w_j}{\sum_{j=1}^{n} w_j}$

STEP 3

The fuzzy weighted normalized decision matrix as follows.

$$N_{ij}=w_j(p_{ij}); \text{ with i=1,2,3,….m and j=1,2,3,4,….n…} \tag{3}$$

STEP 4

Determine +ve and -ve ideal Solution. Positive ideal solution B^+ and negative ideal solution B^- can be determine based on the fuzzy weighted normalized (N_{ij}) as:

$B^+ = (n_1^+,n_2^+,………n_n^+)$ where $n_j^+ = (\max N_{ij}/j\epsilon J)$and

67705

B⁻ = (n₁⁻,n₂⁻…………..nₙ⁻)   where $n_j^- = (\min N_{ij}/j \epsilon J)$

STEP 5

The distance of each alternative from Positive and Negative ideal solution. The distance alternatives B⁺ with Positive ideal solution can be formulated with equation.

$$T_i^+ = \sum_{j=1}^n |n_{ij} - n_j^+| ; i=1,2,3,\ldots\ldots m,\ldots\ldots\ldots\ldots\ldots \tag{4}$$

The distance between alternative B⁻ with negative ideal solution can be formulated with equation.

$$T_i^- = \sum_{j=1}^n |n_{ij} - n_j^-| ; i=1,2,3,4,\ldots\ldots m \ldots\ldots\ldots\ldots.. \tag{5}$$

Where $n_{ij} = N_{ij}$ is the fuzzy weighted normalized decision matrix.

STEP 6

Determining the values of preference for each alternative(C_i) is given as:

$$(BATD)C_i = \frac{T_i^-}{T_i^+ + T_i^-} \qquad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \tag{6}$$

Since $T_i^- \geq 0$ and $T_i^+ \geq 0$, then $C_i \epsilon[0,1]$ Where BATD is best area in thanjavur district.

Normalizing the vectors for each of the above mentioned quantities. Fuzzy weights are calculated by dividing the sum of each soil parameter by the grand total of all components. Multiply the fuzzy weights of each parameter with the quantity of normalization of each parameter of soil. T_i^+ has to be evaluated by using the equation (4) and T_i^- has to evaluated by using the equation(5). Finally the value of the preference must be calculated and they find out the order of preferences for these values.

CONCLUSION 1

Soils from 25 different places of agricultural land were tested using Updated Fuzzy TOPSIS method(UFTM). The samples are preference values from cultivated land must be evaluated by using fuzzy +ve and fuzzy –ve ideal solutions and then soil of cultivated land can be added by taking the ranking of the criteria(C_i's) values for all these places. This methods can be followed for any samples parameter of cultivated lands such as temperature, quality of seeds, manure, water samples etc…, by taking their preference. This method can be used to obtain the best preference of the analysis samples.

CONCLUSION

From the fact and procedure above among 25 soil samples of cultivated land, the alternatives A₂₃rd places viz., kattithotam, ranked first and it is selected as best preferences, A₄th alternatives places is kalakudi ranked second, and it is selected as next preferences, and vice versa. Finally the alternatives 15th area the vandaiyaruppu ranked 25th and it is selected as last preferences.

ABSTRACT

Formulation of the SNEDDS can be the potential product of oral pharmaceutics with a higher capacity for drug loading. This can improve the dissolution of drugs, can increase gut permeation, no or reduced RBC toxicity in humans as well as enhanced oral bioavailability. Another major advantage of the drug is found in its solidification compound state, which helps in the drug delivery system. Instead of fragile system delivery, this concerned system helps in delivering water-soluble compounds through is solidified form. The composition of oil-in-water nano emulsion helps to increase bioavailability. It also helps in preventing gastric irritation and enzymatic degradation via stability and low permeability. Apart from that, it makes the overall drug delivery system less costly and more convenient.

Keywords: Self-emulsifying drug, Hydrophilic, Nano emulsions, Lipophilic drugs

INTRODUCTION

Lipid-based preparation like "self-emulsifying drug delivery systems" or SEDDS, "self-nano emulsifying drug delivery systems" or SNEEDS has been explored in several studies to the argument on the bioavailability of the high lipophilic drugs [2]. The below figure depicts the entire drug delivery system of nano emulsion. SNEDDS can encompass the mixtures of isotropic of surfactants and oils with one or several "hydrophilic" co-surfactants or co-solvents. This preconcentrate of nano emulsion systems can emulsify while dispersed within an medium of aqueous under minimum confrontation for forming O/W nano emulsion along with globule and the size can be < 100 nm [1][3]. SNEEDSs mixture of anhydrous and homogenous liquids is consisting of surfactant, oil, drug, or the

67711

solubilizer and co-emulsifier. These can outward appearance oil in the water nanoemulsion spontaneously of nearly 200mm on dilution along with the water under the mild stirring.

AIM

The aim of this objective is to determine the formulation with the evaluation of SNEDDS.

OBJECTIVES

- To identify the concept of the SNEDDS
- To determine the advantages of the SNEDD
- To evaluate the applications of the SNEDDS

ADVANTAGES OF THE SNEDDS

"Self nanoemulsifying formulations" or SNEF can improve the solubility of low aqueous, gastric irritation, low permeability, stability, and, enzymatic degradation. Delivery of targeted drug and site specificity can be successfully achieved by SNEF [4][5].The key advantages of nanoemulsions are huge surface area, low viscosity, and the translucent or transparent, capacity of high solubilization as well as protection of the active compounds encapsulated. From the below figure, it can be seen that there are different phases in the "Water in-oil nanoemulsion" like the oil phase, and water phase. Nanoemulsion has rapid digestibility, good stability, and effective protection against degradation, as well as it, is highly capable of enhancing the bioavailability of drugs. Furthermore, nanoemulsion may be fabricated with great flexibility for delivering various drug moieties along with several characteristics [7]. The oil phase can be developed through using various types of oils and lipids like essential oils and triglycerides for producing nanoemulsions of different biological and physicochemical properties. The water phase of the"Water in-oil nanoemulsion" can be manipulated by adding different types of components that can be water-soluble [8][9].

APPLICATION OF THE "NANOEMULSION DRUG DELIVERY SYSTEMS"

Nanoemulsion has various applications that have been given in the below picture such as targeted therapy, topical delivery, oral, parental delivery, and others [10]. SNEDDS is considered the advanced method to deliver and improve the bioavailability of hydrophobic drugs as well as other drugs that have higher "first-pass metabolism". Nanoemulsion can be formulated by both low-energy and high-energy methods. This sustained delivery of drugs can decrease toxicity related to drugs and can increase compliance of the patient with less but fewer dosing. This technology has already proven effective in the treatment of AIDS, cancer, and several diseases [11].This Nanotechnology can provide advancement within diagnostic testing. SNEDDS formulated different types of formulations like foams, liquids, sprays, and gels. This is used as the Nanoemulsion within the pharmaceutical field and for systems of drug delivery such as topical, parental nutrition, and oral.

METHODOLOGY

Design of formulation of the Nano emulsifying liquid
The formulation of the self-emulsifying was prepared by using various semi-synthetic or natural oil, hydrophilic or lipophilic surfactants as well as cosolvents that are water-soluble. There are several variants of excipients that were made for establishing a range of "self-emulsifying compositions" [12]. The entire range of the alternative formulation or the formulation from LFCS I type to type IV was studied by using various components like M812, COFA,CMCM, and TC through changing a single excipient at a moment.

Method of visual assessment

This method can be used for determining various properties of self-emulsification in the formulation. For the competence of self-emulsifying, the visual method of assessment has the strength to minimize the extreme consumption of chemicals. On the other hand, the size of the droplet, PDI, or "poly dispersity index" as well as the zeta potential of every representative that diluted formulation or alternative formulation systems [15][13]. These were measured by the analysis of"laser light diffraction".

"Transmission electron microscopy analysis" or TEM

The study was of the TEM, samples had appropriately diluted in water. A drop of diluted samples was placed upon a 300-mesh copper grid that was coated by carbon (Ted Pella).The grid had left for a minimum of 5 minutes for setting down droplets and then 1 percent phosphotungstic acid was added to the grid [12]. In the end, the dried grid had visualized beneath theJEM1010, Jeol TEM at the in use voltage of 80kv.

RESULT AND DISCUSSION

Design for the SNEDDSs

SNE nature of the different formulations on the water diffusion shows various degrees of lucidity that is ranging from the clear to milky suspension of formulations. Store formulations had optimized based on the efficiencies of "self-emulsification" or SE [12].The composition of every formulation as well as the appearance of water dispersion is presented in the below figure [10].The system shows the composition of the excipients used in every formulation on the water dispersion. F and AF refer to the formulation and alternative formulation in the below figure [14]. This assessment had done under a specific to visualize the condition system of self-emulsification.

The consequence of the hydro philicity formulation on the size of droplets

The impact of the components that are water soluble in various AF As well as F formulations is based on the disparity of the size of the droplet as well as PDI that have already been given in the below figure. Formulation of type IV continued the highest concentration of the components that are water-soluble produced the minimum droplets that is F7, 32.57 nm on the dilution along with the water. The major size of droplets was formed with the formulation of type I, which is AF1, 1274 nm, PDI- 0.88 as this contained 100 percent oils as well as formulation, had poorly dispersed into the water [14].Type II or AF2 formulation contained zero to two percent materials that are soluble in water. The droplet size dropped to 231.42 nm and the value is low of PDI 0.22 that is mono dispersed. However, for the increased amount of "water-soluble materials" from 40 to 80% within types IIIB and IIIA formulations .Here the size of the droplets was reduced to the range of 62 to 35nm [15].Among every formulation system, F6 can be considered the more stable system as its small size of droplets, which is 35.99 nm as well as the lower value of PDI.

Visual assessment method

In the below figure, it can be seen that the visually milky, with the lipophilic surfactant, is higher in size than the droplet. These samples can be used in drug-loaded formulations. The method of Visual assessment was utilized as the guideline to evaluate the homogeneity, miscibility, and appearance of every formulation.This assessment of every type of III and IV formulations determined that emulsion could form on dilution along with the water that can be physically stable intended for months [15].Both hydrophilic and lipophilic surfactants with the HLB10 to 14 were able to uphold the SE of oils. On the other hand, emulsions of resulting related to F2,AF2, F3, and Type II appeared in the crude.

CONCLUSION

SNEDDS approach can be used for the improvement of solubility of low water-soluble drugs like sertraline. Initially, the screening of the formulation of the nanoemulsion had carried out by the influence of surfactant, oils as well as co-surfactant upon the efficiency of dissolution, size of the globule including time of self-emulsification. The below results show that LFCS type III B is SNEDDS, which is liquid-based and can be determined as the potential vehicle to get the high-loading drums, improvement of dissolution, digestion, and permeation of the drugs that are poorly soluble.

ABSTRACT

In today's world of expanding environmental concerns and rising oil prices, the importance of and interest in EVs is growing. Electrifying the conventional transportation system can help to reduce the usage of dwindling fossil fuels while also improving performance and lowering emissions. Power electronics will be critical in developing highly efficient electric vehicles with reduced emissions and improved fuel efficiency. This study provides a detailed assessment of current power electronics technology in electric vehicles, concentrating on both semiconductor devices and material technologies. It also goes through the various power electronics systems seen in electric vehicles. The examination of anticipated future trends in power electronics technology that will enhance the markets for electric vehicles in the upcoming years finishes the study.

Keywords: Power electronics, electric vehicles, semi-conductor devices, wide band gap semiconductors

INTRODUCTION

ICE) vehicles during the first few decades of the 19th century Electric cars coexisted peacefully with traditional Internal Combustion Engine (Ilah, 2023). Due to a number of factors, including improved ICE vehicle research and development, the discovery and exploration of new oil reserves that lowered oil prices, improved ICE vehicle performance, immature EV technology, etc., the popularity of electric vehicles (EVs) has drastically decreased over the years. Due to a variety of factors, such as the harm that ICE engines caused to the environment, the steady depletion of fossil fuels that resulted in an increase in oil prices, the rise in the number of vehicles on the road that caused significant air and water pollution, etc., EVs once more attracted interest by the 1970s. There are also strict

67717

rules in place. Power electronics will play a significant role in the development of future energy technologies [1]. In areas like entertainment, safety, sensors for smooth operation, battery charging, etc., electronics have always been a part of the vehicle system over time. However, recent years have seen enough interest in the use of electronics in power trains for better engine propulsion and their control. It was observed that an EV's efficiency was significantly increased by switching from traditional mechanical and hydraulic systems to electric systems. This has prompted extensive research on the subject of power electrical components in electric cars. The areas where power electronics and semiconductor devices have been heavily utilized in an EV are briefly examined below.

Electric propulsion

Through several phases of power conversions, the electric supply from the source (batteries, ultra capacitors, fuel cells, etc.) is transmitted to the wheel and vice versa. This section, which is frequently referred to as the heart of EVs, has a significant amount of power electronics components. You can further divide electric propulsion into the following groups:

1. Electric sources (Batteries, ultra capacitors, fuel cells, etc., are examples of electric sources.
2. Power converters (such as inverters and DC-DC converters)
3. Transmission and Motor (DC motor, induction motor, etc.)

A battery serves as the vehicle's only power source in a BEV. The literature [3] has a study on various battery types appropriate for EV applications. The source does not contain any power electronic components; instead, it produces electricity exclusively using the electrochemical (for batteries and fuel cells) or electrostatic (for ultra-capacitors) qualities to move the vehicle. A battery has the capacity to store a lot of energy, but it's not designed to deliver a lot of power quickly. This is brought on by a poor power output density. A small amount of energy can be stored in an ultra-capacitor, but it can deliver a lot of power in a short period of time [2].

Systems for Hybrid Energy Storage in EVs

The difficulty that the majority of manufacturers encounter when choosing the source for EVs is the lack of high-specific energy and high-specific power devices that can meet all the performance requirements. For the majority of EVs, creating a hybrid energy storage system (HESS) that combines two or more storage units and modules to realize the necessary energy and power characteristics would be the best option[2]. How to connect battery and ultra-capacitor units to the DC bus presents one of the major challenges in a HESS design. For vehicular applications, which are covered in the literature [4], various converters, including Buck-Boost, Cuk, SEPIC, Half-Bridge, and Full-Bridge, may be used as the interface in HESS. Different HESS

Power converters (inverters, DC-DC converters, etc.)

Complex automotive electrical systems with many forms of energy conversion are present. An EV needs both On-Board (placed in the vehicle) and Off-Board (installed outside the vehicle, typically at charging stations and power distribution networks) power electronics. Converters are essential for operating and managing the electric motor, which drives the wheel. In essence, an electric vehicle (EV) requires a DC-DC converter, a DC-AC inverter, and an AC-DC rectifier. Figure 3 illustrates and further explores the specific applications of power electronic converters in EVs. Power electronics converters unquestionably increase the volume and weight of an EV. Therefore, the choice of any converter and its architecture should be made to reduce these characteristics without sacrificing the vehicle's performance. Plug-in Hybrid Electric Vehicles (PHEVs) are often charged using a bidirectional AC-DC converter [4]. Integrating the onboard charger with the bidirectional DC-DC converter is one way to reduce the number of switches and passive components . In order to integrate an onboard charger and a DC-DC converter with fewer switches and greater performance than current charger topologies, Dusmez et al. suggested a new interface [5]. There are various bi-directional AC-DC and bi-directional DC-DC converter topologies for EV chargers available in

Dual-direction AC-DC converters

The weight and volume of an EV are undoubtedly increased by power electronics converters. Therefore, it is important to choose any converter carefully and consider its topology in order to reduce these characteristics without

sacrificing the vehicle's performance. For plug-in hybrid electric vehicle (PHEV) charging, a bidirectional AC-DC converter is typically utilized [4]. By combining the on-board charger with the bidirectional DC-DC converter, you may cut down on switches and passive parts. A new interface that delivers greater performance in comparison to current charger topologies was proposed by Dusmez et al. for the combination of an on-board charger and a DC-DC converter with fewer switches [37]. various converter topologies for EV chargers, including bidirectional AC-DC and bidirectional DC-DC kinds.

Converters from one DC source to another

As with the back-end DC-DC converter previously described, a bi-directional DC-DC converter connects the AC-DC converter (from the onboard charger) to the energy storage unit [4]. It transforms the AC-DC converter's DC output voltage into a voltage that is adequate for charging batteries and converting battery power. based on the requirements of the system, for transmission. There are many topologies for DC-DC converters that can be found in the literature [5]. For DC-DC converters, full-bridge converters with high efficiency and a wide output voltage range are frequently used [6]. Additionally, input and output are isolated when a transformer is present, which is a benefit. The Half-bridge type converter topology, which has lower switching losses, is another often-used converter topology

Induction Motor

Traditional DC motors have been widely used in EV propulsion because of their straightforward control strategy. Due to the armature and field fluxes' intrinsic decoupling, speed, and torque control in separately excited DC motors was achievable on an individual basis. Recent technical advancements have brought about a new era for AC motors, giving them distinct advantages over DC motors like improved efficiency, higher power density, cheaper cost, more reliability, and nearly maintenance-free operation. Induction motors are the greatest option for EV propulsion, according to research on several EV motor types and their evaluations [7] Figure 4 depicts various standard electric motor types. Due to the armature and field fluxes' inherent connection, controlling AC motors like DC motors was previously not possible. However, technologies like vector control have made this possible. Additionally, ac machines completely eliminated the issues that commutator machines had. Ac induction motors are gaining popularity because they offer excellent durability and maintenance-free operation, two important factors in EV propulsion. In recent years, attention has also been drawn to the usage of Permanent Magnet (PM) motors and Switched Reluctance Motors (SRM) in EVs. Power electronics play an indirect influence in motor design because it is difficult to visually observe any power electronics components connected to electric motors. However, in the current environment, motor control without power electronics is virtually unthinkable. Schael et.'s comparison of electric vehicle power train designs using distributed induction motors revealed that the performance of the power train concept utilizing two doubly-fed induction motors is superior.

Energy Management and Their Control Methods

An effective EV design relies heavily on control. In the literature, there are numerous control methods that can be applied to EV applications. A very small amount of an energy management control method directly involves power electronics components. In order to regulate the operation of the system's available converters and equivalent power circuits, the control techniques instead use low-power analog or digital electronic systems. New applications can now be created thanks to technological developments in power electronics, and old applications can perform better as well. These developments heavily rely on the efficacy of the controls; as a result, in order to get the converter to operate as wanted and the system to function as intended, the proper control scheme must be used. Depending on a number of factors, including switching frequency, heating effects, the type of power semiconductor device being utilized, preferred architecture, etc., a suitable control strategy must be implemented. The main function of control circuits is to generate gate signals for turning on and off power semiconductor switches, detect and analyze feedback signals, control and safeguard the electrical vehicle system, etc. Control circuit creation typically makes use of contemporary microelectronic components including digital signal processors (DSPs), microprocessors, and microcontrollers. Proper software technique selection is just as important to the successful operation of EVs as choosing the right hardware.

Mallikarjun *et al*.,

V. Power Semiconductor Device Version

One of the important components that affect how well hybrid electric cars (HEVs) and pure electric vehicles (EVs) function is a power-switching device. A power electronic switching device's performance is generally determined by its switching frequency, switching losses, operating temperature, range of operation (both in terms of voltage and current), and other factors. It also depends on the device technology and semiconductor material used in its fabrication. Below, both of these factors are briefly explored.

Power semiconductor switches

In converters for electric vehicles, semiconductor switches with high operating temperatures, high voltages, high powers, quick switching, and extremely low on-resistance are of utmost importance. The development of the thyristor, also known as a silicon-controlled rectifier, in the late 1950s gave rise to the solid state power electronics. Other semiconductor devices including the insulated gate bipolar transistor (IGBT), static induction transistor (SIT), and static induction thyristor (SITH) will gradually be added. It was first introduced to use MOS-controlled thyristors (MCT) and integrated gate-commutated thyristors (IGCT). Chan et al. 1996 [14] performed a comparison of EV power devices. The majority of power semiconductor switching devices on the market are silicon-based. The power devices GTO, BJT, MOSFET, IGBT, and MCT are readily available and are particularly well-suited for EV propulsion. Because it combines the conductivity of a BJT with the high input impedance and quick speed characteristics of a MOSFET, the IGBT is now the most attractive device. MOSFET and IGBT comparisons were done. Shenai . studied power devices for vehicle electronics together with their packaging and thermal considerations. Discrete power device methods and other low-power microelectronics were briefly explained. Nakayama et al. also addressed the problems with thermal management for electrical and electronic components in a vehicle environment. . Kumar et al. [8] compared power semiconductor devices for various components of an electric vehicle system.

Materials for Power Semiconductors

The material qualities of the semiconductor used to construct a power semiconductor device have an impact on both the device's performance and its capabilities[14] . Its theoretical limits of operation, including those related to higher thermal conductivity, higher breakdown strength, higher maximum operating junction temperature, higher switching frequency, etc., have forced researchers to look into newer wide band-gap semiconductor materials for production. electrical switching devices for power .Stefanskyi et al. explored the effects of semiconductor material qualities on the operation of power devices and looked at the benefits of employing silicon carbide (SiC) in power electronics. SiC is shown to have an advantage over other power semiconductor materials in the future.SiC is shown to have an advantage over other power semiconductor materials in the future . Majumdar et al. reviewed recent technologies and trends in power devices and discussed several power module technologies, concluding that the 4H-SiC MOSFET is the best switching device for future applications. Acharya et al. have presented a bidirectional DC-DC converter for PHEVs that uses SiC devices and delivers greater performance at higher operating temperatures and switching frequencies [10]. Kachi et al. investigated the automotive applications of gallium nitride (GaN) power devices and determined that while the technology currently requires significant advancement, it may one day provide an alternative. Letellier et al. [11] compared a conventional Si-based semiconductor switch to a GaN-based switch and discovered that the latter exhibits superior performance. compared SiC and GaN power electronics for automotive systems and determined that both are promising materials for upcoming HEVs and EVs. Gueguen examined the market shares and industrial trends of SiC and GaN devices and predicted a bright future for these technologies [13]. For wide band-gap power semiconductor devices, there are still issues with cost and wafer quality, steady processing, and performance reliability of the devices.

CONCLUSION

This work discusses in detail the various power electronics converters used in EVs, including as DC-DC converters, inverters, and their topologies. The numerous converter topologies and power electronic devices are also reviewed in

Mallikarjun *et al.,*

the literature. With a focus on power electronics for EV propulsion, battery charging, and power accessories, this article has assessed the current state of interdisciplinary technologies in EVs. That means power electronics. The development of EVs is greatly influenced by technology. IGBTs (Insulated Gate Bipolar Transistors) are projected to fundamentally alter on-board converter technology in switching devices. IGBTs will be able to replace GTOs and enable manufacturers to create better, more affordable inverters with less harmonics thanks to three primary advantages: high switching frequency, straightforward gate control, and maybe a lack of snubber circuits. IGBT usage lowers switching losses and harmonics. Wide band-gap semiconductor materials like SiC and GaN will decrease loss in the HEV power circuit and increase overall efficiency when used as semiconductor switches[18] .

ABSTRACT

Obesity is the unwanted excess of body fat percentage. It is known to be the main risk factor for a number of non-communicable diseases like cardiovascular diseases, type 2 diabetes, hypertension, coronary heart diseases, or certain types of cancers. Also, Obesity is linked to an increased risk of kidney disease. A total number of 85 samples from the students of Assam downtown University were collected for this study. We measured height and weight to find the body mass index of the subject and followed by the estimation of biochemical test of renal function like serum uric acid, serum creatinine and blood urea nitrogen. In the study, it is reported that 24% were obese and 76% were overweight. Among the obese students 37% were male and 63% were female students and among the overweight 44% were male and 56 % were female students. We found that there was statistically positive correlation of BMI and renal function test. Out of 85 participants, 17 were found as high serum uric acid level, 19 were high serum creatinine level. This study can be concluded that sustaining a high BMI can alter the serum uric acid, serum creatinine and urea level.

Keywords: Body Mass Index, Obesity, Uric acid, Creatinine, Urea, Kidney disease.

Akoijam Herojit Singh *et al.,*

INTRODUCTION

Body mass index (BMI) is a statistical index that uses a person's weight and height to calculate body fat in males and females of any age. It is determined by dividing a person's weight in kilogrammes by their height in metres squared. This equation's output is then used to calculate an individual's BMI [1]. The National Institute of Health (NIH) now classifies individuals as underweight (BMI <18.5 kg/m2), normal weight (BMI 18.5 to 24.9 kg/m2), overweight (BMI 25 to 29.9 kg/m2), or obese (BMI ≥30 kg/m2) [2].

BMI and Obesity/Overweight
Obesity and overweight are defined as abnormal or excessive accumulation of fat that can be harmful to health. Body mass index (BMI) is recommended by the World Health Organization (WHO) to classify obesity and is used as a tool to identify patients or individuals at risk for adverse health outcomes [3]. According to the WHO (2022), Obesity affects more than one billion people worldwide, including 650 million adults, 340 million adolescents, and 39 million children. WHO estimates that by 2025, approximately 167 million people will be less healthy as a result of being overweight or obese. [4]. The risk factors of obesity/ overweight include lack of physical activity,unhealthy eating behaviours, not getting enough good-quality sleep, high amounts of stress, genetics, use of medicines like Antidepressants, Antipsychotics, Beta-blockers etc[5].

Kidney Diseases and Obesity/Overweight
Obesity is a serious health issue that has a negative impact on all body systems, particularly the cardiovascular and endocrine systems [6]. Kidney problems have recently begun to attract more attention as one of the negative consequences of obesity. With increased obesity prevalence over the last 30 years, there has been a significant increase in the prevalence of chronic kidney disease and end-stage renal failure [7]. The kidney is responsible for the elimination of 70% of the daily uric acid production. However, in recent years it has been suggested that uric acid itself plays a causal role in the pathophysiology of chronic kidney disease and possibly acute kidney injury [8]. Creatine is a nitrogenous organic acid that is generated predominantly in the kidney and liver and it is the end product of creatine and creatine phosphate metabolism [9]. It is widely accepted that serum creatinine is excreted mainly by the kidney, in the setting of kidney insufficiency, creatinine appears to have an altered rate of production and alternative routes for degradation and elimination [10]. Serum creatinine is the most commonly used biomarker of kidney function [11]. Increased serum creatinine and/or blood urea nitrogen (BUN) levels, as well as decreased urine output, can be used to diagnose kidney function. Changes in BUN and serum creatinine may indicate not only renal injury, but also normal kidney responses to extracellular volume depletion or decreased renal blood flow [12]. Obesity/overweight is associated with an increase of BUN [13].

MATERIALS AND METHODS

Study Area A prospective study was carried out in the Department of Medical Laboratory Technology, Assam down town University, Guwahati, Assam. Ethical clearance for this study was obtained from the ethical clearance committee of Assam downtown University **(Memo No.: AdtU/Ethics/stdnt-lett/2023/011)**.

Study Subjects In this study, 85 randomly selected subjects who were normal, overweight, or obese by measuring their BMI level were selected. BMI= Weight (Kg)/ Height² (m²).

A questionnaire was used to collect the data and information about the subjects, which includes name, age, sex, and lifestyle, use of tobacco and alcohol, and health disorders like hypertension, cardiovascular diseases, gout, and arthritis.

Inclusive criteria
- Students having a higher BMI than normal.
- Students who were above age of 17 years.

Exclusive criteria

- Students having a lower BMIthan normal and below the age of 17 years.
- Students having hypertension, cardiovascular diseases, gout, arthritis.

Method of Sample Collection

Blood sample of 5ml from the median cubital vein was collected in a plain vial.

Biochemical Estimation

Estimation of Uric acid by Enzymatic Uricase PAP method according to Prietest clinical chemistry reagent, ROBONIK (INDIA) Pvt. Ltd. Serum creatinine by kinetic test without deproteinization according to the jeff method, ROBONIK (INDIA) Pvt. Ltd. Blood Urea Nitrogen (BUN) by Photometric test Enzymatic according to modified Berthelot, ROBONIK (INDIA) Pvt. Ltd.

Statistical Analysis

All the Statistical analyses were done using GraphPad Prism 9.5.1 (GraphPad Prism Inc., San Diego, CA). One-way analysis of variance (ANOVA) and the t-test were used to determine the significance of differences and comparisons between the different study populations.

RESULT AND DISCUSSION

Body Mass Index (BMI)

A person is considered as obese if he has a body mass index of 25kg/m2 or higher that accumulates excessive unwanted body fat and increases the risk of several health problems such as heart disease, diabetes, high blood pressure, and several types of cancer [14]. In our study **(Fig.1 and Table No. 1)**, we have classified the individuals as overweight or obese according to their BMI. Our findings reported that the prevalence of overweight was 76% and that of obesity was 24%. Among the obese, 37% of the subjects were male and 63% were female. Again, among the overweight, 44% were male and 56% were female **(Table No. 2)**. Women are more likely than men to be overweight or obese. Karnik *et al*. [15] reported similar findings in their previous study.

Renal Function Test and BMI

Serum Uric Acid Level

In this study, the data in **Fig. 2** reported that there was no statistically significant difference in the uric acid level of overweight and obese subjects compared to controls when the significance level was set @ <0.05, p = 0.6740 and p = 0.3657, respectively. Though no significant changes were observed, there was a gradual increase of 9.67% in overweight and 17.27% in obese when compared to the control group. A similar finding was reported in a previous study[16].

Serum Creatinine Level

Data summarized in **Fig. 3** showed no significant change in serum creatinine levels in overweight and obese individuals when compared with the control group. The significance level is set @ < 0.05, p = 0.5578, and p = 0.1423, respectively. This study reported a gradual increase of 12.74% in overweight and 27.85% in obese when compared to the control group. A similar finding was reported by Salman, D *et al* [17]. Another previous study, Akkasilpa *et al* [18], reported similar findings.

Blood Urea Nitrogen

Again, the data in **Fig. 4** reported that there was no significant change in the BUN of overweight and obese individuals when compared with the control group. Though there was a marginal decrease of 6.20% in overweight and 5% in obese when compared to the control group, the significance level is set @ < 0.05, p = 0.5271, and p = 0.6347, respectively.

Akoijam Herojit Singh *et al.,*

Correlation between BMI and Renal Function tests

In **Table No. 3**, we also analysed the data to look at the correlation between BMI and serum uric acid in this group of subjects. It was found to be positively correlated; the significance level is set @ < 0.05 (p = 0.2308 and r = 0.1313). A similar study previously reported that the overproduction and secretion of uric acid in subjects with obesity and reduced clearance of uric acid through the urinary tract were also observed in subjects with obesity [19]. According to this study, the correlation between the BMI and serum creatinine level was observed as statistically significant with a positive correlation; the significance level is set @ < 0.05 (p = 0.0356* r = 0.2282). A similar finding was reported by Quinones *et al*. and Wingrove *et al*. [20] [21]. Again, a positive correlation was observed between BMI and serum urea level; the significance level is set @ < 0.05 (p = 0.5644, r = 0.06338). The main finding of this study is that subjects in the study population with a higher BMI were likely to have a risk factor for kidney damage, as this is positively correlated with serum uric acid, serum creatinine, and serum urea levels. Similarly, the same finding was demonstrated by a previous study [22].

CONCLUSION

This study shows that high BMI is associated with impaired kidney function, not vice versa. Individuals with overweight or obesity should be more aware of the risk of developing renal dysfunction and other non-communicable diseases such as diabetes, hypertension, coronary heart disease, strokes, etc. From the findings of this study, it can be concluded that sustaining a high BMI can alter serum uric acid, serum creatinine, and BUN levels, and hence determining BMI can potentially be used as a novel clinical indicator for identifying patients at high risk of hyperuricemia or renal dysfunction. Further studies can be done for a more accurate evaluation, as this study has limitations due to its small sample size.

ABSTRACT

Groundwater (GW) is the sustainable source of fresh water. GW constitutes about 30% of the world's fresh water. There are a number of factors, including population growth, urbanization, and industrialization, that pose a significant threat to GW sources. Both the amount and nature of GW sources are altogether affected by environmental change. This study has also emphasized the necessity of employing sustainable water management strategies to ensure the long-term viability of GW resources for irrigation. With the identified prospective zones serving as critical sources of irrigation water. Integrating these water-saving methods into agricultural practices can boost crop yields while reducing overall impact on GW resources in this sub-basin. Furthermore, the factors influencing GW re-energize are altogether affected by environmental changeability. The groundwater possible zone (GPZ), which can be utilized to enhance the GW supply, should thusly be distinguished and characterized. The research is carried out in the Kuzhithurayar sub-basin of the Kanyakumari district. In this area, GW, as opposed to surface water, serves as the primary source of water for agricultural and residential uses. Numerous factors, such as geology, DEM, lineament density, geomorphology, soil, slope, drainage density, rainfall, LULC, and aspects, are generated as distinct layers in the GIS background in order to identify potential GW zones. The weighted overlay analysis of these layers follows. The analytical hierarchy method and the multi-criteria decision-making technique, which enables pairwise evaluation of the criteria affecting

the potential zone, were used to establish the weights for the various layers. The GW Potential guide has also been divided into five categories: extremely high, high, moderate, low, and extremely low. According to the study's findings, the very high potential zone accounts for 25.68 percent of total land area (90.295 km2), the high 24.18 percent of total land area (85.004 km2), the moderate 21.11 percent of total land area (70.713 km2), the low 18.05 percent of total land area (63.422 km2), and the very low 11.98 percent of total land area (42.130 km2). Moreover, it was found that the outcomes had areas of strength for a with well yield information as well as pre-and post-rainstorm water level information. Future management plans, including natural and artificial recharge practices, can be efficiently formed in these locations because the methods used produced reliable results.

Keywords: Groundwater potential zone (GPZ), Geographic information systems, Weighted overlay, Analytical hierarchy process (AHP) and Kuzhithuraiyar sub basin

INTRODUCTION

For every living thing, water is a gift. In a nation like India, where agriculture accounts for a significant portion of the economy, water is essential to development. In addition to the residential and irrigation industries, its use benefits the majority of businesses. Surface-obtained water should be treated before utilization, yet GW is significant for its new newness. India has a potential water supply of commonly 1999.20 billion cubic meters (BCM), which normally streams into the streams. It makes up slightly more than 4% of the world's river water. In any case, something like 1123 BCM of the all-out yearly water potential can be used productively in light of the fact that to various geographical limits and lopsided dissemination over existence. 433 BCM of GW and 690 BCM of usable surface water can be used to accomplish this CWC, 2022.

According to (Reddy *et al.*, 1996) GW is used by nearly 30% of the urban population and more than 90% of the rural population in India for drinking and domestic purposes. GW is bound to happen because of the collaboration of climatic, land, hydrological, organic, and physiographic factors than by some coincidence (Arkoprovo et al., 2012).As a result, increased consumption leads to overexploitation of various water sources, which in turn results in a water shortage. Individuals began using GW assets since surface water assets were turning out to be scant and contaminated (Bharti et al., 2011). By properly managing its use and preventing contamination, GW's continued importance as a component of ecosystems and human activities can be ensured. The rate at which GW flows is determined by the rock's porosity and permeability. Pumping, evaporation, and wastewater seepage into streams and lakes are the primary causes of GW discharge. The essential wellsprings of GW re-energize are precipitation and stream. Roughly 33% of the total populace is projected to drink GW. (Jose et al., 2012).

The Dumka district of Jharkhand, India, uses an integrated strategy of RS, GIS, and AHP method to determine GW potential zones. The GW potential zones were defined using a variety of data sets, including lithology, lineament density, geomorphology, slope, soil, rainfall, drainage density, and land use/land cover (Murmu *et al.*, 2019). All of the aforementioned criteria were constructed as spatially distributed maps or thematic layers in a GIS environment utilising both ground and remotely sensed data. This study provides a convenient method for delineating the potential availability of GW resources, which will ultimately aid in better GW resource planning and management. Geographical Information System (GIS) and remote detection are useful tools for characterizing potential GW zones. The extensive use of satellite data, conventional maps, and corrected ground truth data in recent years has made developing the baseline data for GPZ easier (Chowdhury *et al.*, 2010). As well as giving a wide reach size of the space-time scattering of perceptions, remote detecting likewise assists set aside with timing and cash (Tweed *et al.*, 2007). Many researchers around the world have used remote sensing (RS) and geographic information systems (GIS)

to investigate potential GPZ. They discovered that the elements used to define the zones varied, which explains why the results varied (Teeuw *et al*., 1995).

(Subbarayan *et al*., 2020) the Gundihalla watershed in Karnataka's Bellary district's hard rock region was identified as the GPZ. Pre- and post-monsoon groundwater fluctuation data, as well as geomorphology, lithology, LULC, soil, drainage density, lineament density, rainfall, and slope, were used to validate the results. Put together groundwater investigation just with respect to lineaments, while others consolidated lineaments with different boundaries, for example, seepage thickness, geomorphology, geography, slant, land use, precipitation power, and soil surface (Ganapuram *et al*., 2008). The logical pecking order method and GIS have been joined to direct a few explorations on this setting all through the world. It is preferable to use a combination of technical and expert methods to calculate weights rather than assigning them at random, as the study takes a variety of influencing factors into account. According to (Gupta *et al*., 2018) AHP was found to be an effective method for deciding on solutions to problems involving multiple criteria.

The integration of RS and GIS will make identifying potential GW zones easier by preparing several thematic layers with weighted spatial domains for lithology, drainage density, lineament density, rainfall, slope, soil, and land use (Magesh *et al.,* 2012) and (Pandey et al., 2015). To design, use, make due, and direct GW assets, the current study centres around the recognizable proof of GW possible zones in the Kuzhithurayar subbasin of the Kanyakumari area, Tamil Nadu. By identifying the drilling sites and man-made reservoirs that are required for the replenishment of GW resources, the study hopes to provide policymakers and decision-makers with useful data for sustainable GW management. The current study is essential for the administrative staff to better manage the socioeconomic aspects of GW resources because no similar studies have been reported in the study area to date.

Study Area

The greater Kodayar River Basin, which is located in India's Kanyakumari district of Tamil Nadu, includes the Kuzhithuraiyar Subbasin. Kuzhithuraiyar is one of the numerous subbasins of the Kodayar River, a significant river in the region. The 351.564 square kilometers of the Kuzhithuraiyar subbasin are the primary focus of this investigation. The Kuzhithuraiyar sub bowl will probably be situated between scopes 77°05' and 77°23' East and longitudes 8°11' and 8°26' North. The Kanyakumari Locale's regulatory boundaries basically encompass the entire basin. The Kodayar basin includes the Kuzhithuraiyar subbasin. The Kuzhithuraiyar subbasin of the Kodaiyar basin has the highest population density (2230 inhabitants per square kilometer). This is the second-biggest Sub-bowl of the Kodaiyar Bowl. Subsequent to starting in the Western Ghats and streaming west through the Kanyakumari district, the channel discharges into the Middle Eastern Ocean close to Thengapattinam. The main drainage basin in Tamil Nadu is connected to the discharge from the Arabian Sea. GW is crucial for supporting crop irrigation in the Kuzhithuraiyar subbasin, which is primarily an agricultural region. Ranchers depend on GW wells and cylinder wells to enhance precipitation for supported farming creation, particularly during droughts or when surface water sources are deficient. The geography of the Kuzhithuraiyar subbasin in Kanyakumari region can be depicted as a mix of uneven territory and waterfront fields. The study area's location is depicted in Fig. 1.

MATERIALS AND METHODS

The Kuzhithuraiyar Subbasin was the focal point of the review, which incorporated the appraisal of GPZ utilizing numerous datasets and consecutive methodologies. The objective of the current examination study was to foster a scientific ordered progression process AHP model utilizing remote detecting, geographic data frameworks, and cartographic techniques with ArcGIS 10.8.1 as displayed in Fig. 2.

Belfin Raj *et al.,*

Thematic Layer Preparation

Ten distinct topical layers, which could incorporate DEM, Geography, lineament thickness, geomorphology, soil, slant, waste thickness, precipitation, LULC, and Angles, have been created utilizing remote detecting and traditional/existing information with the guide of ArcGIS 10.8 programming for the evaluation of GW possible zones. The geomorphological features and lines were identified using Landsat 8 (30-m resolution) imagery downloaded from the US Geological Survey's Earth Explorer website (www.earthexplorer.usgs.gov). To recognize the geomorphological landforms and lineaments, the bogus variety composite (FCC) picture was outwardly assessed utilizing picture translation keys such as shape, size, tone, surface, example, and affiliation. Digital Elevation Model (DEM) data with a resolution of 30 meters were used to create the study area's slope and drainage pattern using the USGS Earth Explorer https: Earth Explorer https://earthexplrer.usgs.gov// earthexplrer.usgs .gov/was utilized to extricate the seepage design, and the line thickness apparatus in ArcGIS was utilized to make guides of waste thickness and lineament thickness from DEM. The computerized soil guide of the planet was downloaded in vector design from https://www.fao.org/. Utilizing the Opposite Distance Weighted (IDW) spatial addition strategy in ArcGIS, Indian Meteorological Division (IMD) https://www.imdpune.gov.in/Establishment of water studies (IWS) to gauge the typical complete yearly precipitation in view of 30 years (1991-2020) of information of 4-point areas. All subject layers were delivered, changed over completely to raster design, projected to UTM Projection, Zone 44 Northern, Datum WGS 84, and given a 30-m spatial goal.

Assignments of weight and weights normalization using AHP

The weighting of each class is the most important step in an integrated analysis because it determines how accurate the result is (Muralitharan and Palanivel, 2015). Index models, frequency ratio (FR), certainty factor (CF), weights-of-evidence (WOE), fuzzy logic, and multi-influencing factor (MIF) are all weight-calculating methods have been used to define the GPZ. One of these methods, analytical hierarchy process (AHP), is emerging as a leader in GW prediction modelling and has the potential to provide findings quickly, accurately, and at an affordable cost. The mathematical mean and standardized load of a solitary boundary are figured utilizing an AHP strategy, which is a couple wise lattice scientific technique (Chowdhury *et al.*, 2009; Jha *et al.*, 2010; Kaliraj and other, 2014). As per Saaty (1990), it produces relative proportion scales for matched examination Table 2. The current investigation utilized Saaty's (1980, 1990) AHP strategy. It is used to make decisions about the final weights that will be given to various thematic layers and the attributes that go with them. The first steps of the AHP technique are used to organize the problem into a hierarchy by defining the purpose of the problem and determining the criteria and sub-criteria that are most important to the occurrence of GW (Muralitharan & Palanivel, 2015). According to Saaty (1990), one advantage of hierarchy is that it enables us to concentrate our judgment on specific aspects of a number of attributes, each of which is necessary for making a sound decision.

Assessment of Groundwater Potential Zones

According to Kumar and Krishna (2018), the Groundwater Potential Index (GWPI) is a dimensionless variable that promotes in determining the existence of GPZ. To detect feasible GW zones, the weighted linear combination approach was utilized. According to Muralitharan and Palanivel (2015), the Total Scores (TS) were calculated by adding the products of all the attributes and then multiplying the weights of the thematic layers by the weights of the features within each thematic layer:

$$TS = \sum W \times R \qquad (1)$$

where TS is short for "Total Score," W is short for "Thematic Layer Weights," and R is short for "Feature Layer Weights." Utilizing the correlation lattice between the other options and the information on the positioning of the rules, AHP gives a general positioning of the arrangements Table 2. According to Muralitharan and Palanivel (2015), the most important choice is the one made. Concurring on the leader's pairwise examinations of the assessment rules, the AHP makes a load for every evaluation measure. The consistency ratio's accuracy has been confirmed. The following equation would be used to verify the table's consistency ratio:

$$CR = CI/RI \qquad (2)$$

Where CI is Consistency Index and

RI is Random Index

CI = λmax-n/n-1

Where λmax is the principle eigen value and n is the no. of comparisons

Groundwater Potential Index

As thematic layers, each of the aforementioned parameters was created. In addition, its weight and ranking are determined by the nature of its influence. Using the AHP Technique, weights have been assigned. Priorities determine the ranking. The weighted and ranked layers of Arc GIS 10.8 Software were incorporated into the GIS environment. Table 5 provided the weighting and ranking information.

GW Potential index can be calculated as follows

GWPI= $(W_r \times R_r) + (W_e \times R_e) + (W_s \times R_s) + (W_g \times R_g) + (W_{lu} \times R_{lu}) + (W_{dd} \times R_{dd}) + (W_{gm} \times R_{gm}) + (W_{ld} \times R_{ld}) + (W_{st} \times R_{st}) + (W_a \times R_a)$

Where,

W – Weightage

R- Rank

r- Rainfall

e - Elevation

s - Slope

g - Geology

lu- Land use Land cover

dd- Drainage Density

gm – Geomorphology

ld – Lineament Density

st- Soil Type

a - Aspects

Groundwater potential zones can be delineated from the calculated potential Index. According to its sum-up values, the added Potential index can be classified into four categories: excellent, beneficial mild, poor, and very poor.

RESULTS AND DISCUSSIONS

The Kuzhithuraiyar sub-basin's groundwater potential zones have been assessed using GIS-based AHP, which has produced illuminating results that fully comprehend the groundwater potential's spatial distribution. The groundwater potential map produced by the AHP analysis included high, moderate, and low potential zones based on lithology, land use, slope, rainfall, soil properties, and drainage proximity. High potential zones coincide with naturally occurring vegetation and permeable geological formations, which improves recharge. By using the right techniques, moderate zones with moderate permeability, mixed land use, and intermediate slopes provide opportunities for sustainable extraction. Urbanization and impermeable lithology are indicators of low potential zones, which call for cautious exploitation. The reliability of the AHP-based approach was confirmed by field validation. Planning for resources, prioritizing sustainable development, promoting favourable land use policies, and recognizing constraints are all influenced by the results. This section presents the key findings and discusses their implications for sustainable groundwater resource management. Table 5 depicts the thematic layers with class influences and weighting clearly.

Digital Elevation Model (DEM)

An advanced rise model (DEM) is a computerized representation of the height of the ground surface for any upward datum. A DEM is a computer-generated representation of a geographical surface. Table 5 and Fig. 3. The most basic type of digital topographic representation is a DEM (Sudalaimuthu, K *et al.*, 2022). In terms of the overall direction of GW flow and its impact on GW recharge and discharge, elevation is related to relief setting at the local and regional levels.

Lineament Density

Lineaments go about as a channel for the progression of spillover into underground springs. These are the bent or straight shapes that arose as a statement of geographical highlights like creases, cracks or blames that are subsurface. These lineaments in satellite information by and large show linearity and curvilinear associations with vegetation, seepage, soil resonances, and alleviation as investigated by (Manimaran et al., 2013).

Lineaments are direct or curvilinear bigger breaks or blame that are primarily controlled. The auxiliary porosity for water permeation is given by the lineaments. The all-out length of lineament crossing per unit region is utilized to register lineament thickness. The opportunities for GW are expanded when the lineament thickness is higher has been displayed in Fig. 4.

Geomorphology:

One of the main factors influencing the GW potential is geomorphology. Geomorphology, the scientific study of landforms, includes all aspects of landforms, including their origins and development, the processes that create them, and the materials that they eventually deposit. This study takes a gander at scenes to find how air, water, and ice could influence the landscape. These processes on the earth's surface, which transport and deposit rock and sediment in a variety of locations before eroding it, result in the formation of landforms. Geomorphology is an important factor in determining GPZ. (Palaka et al., 2015; Rajasekhar et al., 2022)Fig. 5 and Table 5 of the geomorphological map of the research area were downloaded from the Bhukoash website; they should be clipped using the ArcGIS 10.8. software's extracting tool. It is separated into five layers: the Pediment Pedi plain, which includes water bodies and a river as well as Dissected Hills and Valleys, Coastal Hills and Valleys, and more. The majority of the study area is occupied by the Pediment Pedi plain, followed by water bodies and rivers, dissected hills and valleys, and coastal hills, and valleys. The landforms and water retention capacity of each layer are used to rank them.

Soil

Soil texture has a big impact on surface runoff and GW recharge. (Jasrotia *et al.,* 2016), GW re-energize is impacted by soil types, penetration rates, permeation rates, and penetrability. Fig. 6 depicts the five types of soil that make up the majority of the research area: Clay, Sandy Clay Loam, Sandy Loam, Clayey Sand, and Sand.

Slope

The accessibility and re-energize states of GW in a specific area are profoundly subject to a slant. As per (Dawoud *et al.,* 2005), (Vittala *et al.,* 2005), Solomon and Quiel (2006), the slant is communicated in degrees. As per slant, the locale is partitioned into five classifications: Table 5 includes very steep, steep, moderately steep, moderately sloping, and gentle slopes. Since they are thought to have good potential, gentle slopes received the highest score of 5 points. Extremely steep slants with significant degrees of surface spillover are remembered to have restricted GW potential, and the most minimal score of 1 was given in Fig. 7.

Drainage Density

Any territory's waste example uncovers both the surface elements and the underground designs. This characteristic is recognized by the underlying lithology, which is a key indicator of the pace at which water percolates (Shaban *et al.*, 2006). Seepage thickness is a converse capability of porousness, so it is a significant boundary in assessing the GW zone. When compared to zones with low drainage densities, high drainage densities indicate less infiltration and, as a result, serve as poor GW potential zones—implying an opposite relationship between the two. A low organization of waste course demonstrates the presence of exceptionally safe and porous stone while a high seepage course shows profoundly feeble and impermeable rocks (Karanth 1999). Low drainage density zones received a higher rank for GW prospecting, while high drainage density zones received a lower rank. Fig. 8 shows that the drainage density of the entire study area ranges from 1 to 290 km/km^2.

Rainfall

Rainfall is the primary source of water for runoff above the surface of the earth, which floods lowland areas. Runoff occurs when rainfall is greater than the soil's (soil and articulated weathered rock) capacity to absorb it. GW assets are essentially re-energized by precipitation. Precipitation in the district comes from both the upper east and Southwest storms. For this study, Rangarajan *et al*. used data from the Indian Meteorological Department (IMD) to create the rainfall map. After that, the data were imported into a GIS system, and a method of spatial interpolation known as IDW was used to create a map of rainfall. The area's precipitation is separated into five classifications to rank. There are five different kinds. Extremely low to high Fig. 9, as a matter of fact. The rainfall data for the 30 years (1991-2020) were generated using the mean monthly data from four rain gauge stations in the research area. The four distinct seasons of pre-monsoon, southwest monsoon, northeast monsoon, and post-monsoon were discovered after analysis. Maps of the spatial distribution for each of the four seasons were created using ArcGIS. The pattern of the rain was determined using this rainfall data. The locale gets a normal of 1456.78 mm of precipitation every year, with the post-storm, pre-rainstorm, southwest rainstorm, and upper east rainstorm each contributing 32.87 mm, 335.28 mm, 538.67 mm, and 549.97 mm, separately.

Land Use/ Land Cover (LULC)

Using land cover data, one can calculate the proportion of a given area that is made up of different types of land and water, such as forests, wetlands, impermeable surfaces, agricultural land, and other types of land and water. There are two types of water: open water and wetlands. Displays how people use the landscape for development, conservation, or a combination of the two. The land sat 30 m global land cover time dataset (Karra, K., *et al*.) was used to create land use and land cover. Fig. 10 and Table 6 depict the area use/landcover attributes that are available in the examination district.

Aspects

Due to its overall effects on adjacent soil water balances, the slope affects the amount of water available for infiltration (Mallick *et al*., 2021). Aspect is a crucial topography feature that has an impact on a basin's capacity for GW recharge. It is the slope's direction, typically measured in the clockwise direction from 0 to 360 degrees. Zero, 90, 180, and 270 are the angles that point north, south, and west, respectively. Development of drainage basins and slope exposure orientation influence microclimatic variations in arid and semi-arid environments. Perspective so straightforwardly influences the microclimates (Hadley 1961). A viewpoint guide of the review region is displayed in Fig. 11. North (0 – 22.50), Northeast (22.50 – 67.50), East (67.50 – 112.50), Southeast (112.50 – 157.50), South (157.50 – 202.50), Southwest (202.50 – 247.50), West (247.50 – 292.50), and Northeast (292.50 – 337.50) are the four directions in which the aspect of the Kuzhithuraiyar subbasin is trending.

Geology

GW dispersion and events are essentially affected by an area's land structure, as is notable (Krishnamurthy and Srinivas, 1995). Geography had given the loads close to lineament thickness, as a result of their porousness and invasion limit. Concerning the concentration in Tiruttani by (Kolandhavel and Ramamoorthy 2019). The geography of the review region was digitized from the toposheet and was sorted into five primary gatherings say Charnockite gneissic, Khondalite, Migmattie, Late Cretaceous and Warkali which are displayed in Fig. 12

Groundwater Potential Zone

The weighted overlay techniques in the IDW method's spatial analysis tool were used to overlay the cumulative weights assigned to each of the thematic layers (Geology, DEM, lineament density, geomorphology, soil, slope, drainage density, rainfall, LULC, and Aspects) to create the GPZ map. During the weighted overlay analysis process, each theme layer was given a ranking and weighting based on how much water it might contain. Higher and lower weights were doled out, individually, to GW with high and low potential. In the wake of positioning and weighting each layer, the amount of those values was ordered into a forthcoming GW zone. After rasterizing each layer, it was combined. The review region was separated into five classes (Table 7) in light of weighted overlay examination: generally excellent (25.68%), great (24.18%), moderate (20.11%), poor (18.05%), and exceptionally poor (11.98%).

Belfin Raj *et al.,*

That's what the outcomes show, with an all-out area of 351.564 km², most of the district is classed as an excellent likely zone (90.295 km²), great possible zone (85.004Km²) trailed by a moderate (70.713 km²), low (63.422 km²), and poor (42.130 km²) expected zone. Fig. 13 depicts the potential zone on the GW map.

CONCLUSION

The current study focused on a probabilistic strategy that used both GIS and RS satellite imageries to identify potential GW zones in the Kanyakumari District, Tamil Nadu, India's Kuzhithuraiyar Sub-basin. The identification of GW zones is frequently required as the population and development grow. Because of the surface water of the Kuzhithuraiyar River, agricultural activity in the study area is dependent on GW. Its purpose was to identify which GPZs could be useful for household and irrigation purposes. The potential of GW in distinct zones is shown by the spatial distribution of the area's water levels. The Kuzhithuraiyar Sub-bowl GW potential area has been reviewed as awesome (25.68%), great (24.18%), moderate (20.11%), low (18.05%), and poor (11.98%) in view of the joined weighted topical outlines. Artificial recharge operations in low and poor potential zones, as well as GW prospecting and resource development, will benefit from these newly discovered GW potential zones. The study concluded that gathering rainfall and runoff from surplus to deficit areas can be used to regulate sources. Based on the study's findings, concerned decision-makers can devise an effective GW management strategy for the research area. The GIS-based AHP used in this study provides a solid approach for evaluating GPZ and informing effective decision-making for long-term water resource management. This research contributes to a better understanding of GW availability, vulnerability, and utilization in the Kuzhithuraiyar sub-basin, laying the groundwork for prudent water management practices and protecting this vital resource for current and future generations.

ABSTRACT

The consumption of insects, known as entomophagy, is a topic that has gained significant attention due to its potential health, environmental, and economic benefits. Eating insects has been practiced by various cultures for centuries, but it has gained renewed interest on a global scale due to the recognition of its potential benefits. Edible insects are shown to have comparable or even superior nutritional profiles compared to traditional protein sources like birds and mammals. They are often rich in protein, healthy fats, vitamins, and minerals, making them a valuable dietary option. Insect farming is often touted as a more sustainable form of protein production compared to conventional livestock farming. Insects require less land, water, and feed to produce the same amount of protein. This can potentially reduce the environmental impact of food production and alleviate resource scarcity issues. The review discusses the multifaceted aspects of entomophagy, ranging from nutritional benefits and environmental advantages to challenges related to consumer perceptions and food safety. The potential of edible insects to

contribute to food security and sustainability is being explored, but overcoming obstacles such as cultural resistance and regulatory hurdles remains a crucial part of realizing these benefits.

Keywords: Edible insects, entomophagy, nutritional benefits, economic benefits

INTRODUCTION

Regular insect consumption has been estimated to form part of traditional diets of over two billion people worldwide (Van Huis et al., 2013). While some edible insect species, such as grasshoppers and locusts, require the removal of legs and wings prior to consumption, many edible insect species can be consumed whole, but may also be processed into powder or paste. Lepidopterans, Orthopterans, Isopterans and Hymenopterans are all regarded as common food sources in many areas. Culturally and religiously, entomophagy is particularly popular in tropical and subtropical regions due to the warm and moist climate (Jongema et al., 2017). Tropical insects are generally large in size with stable life history, which can facilitate harvesting (Gaston & Chown, 1999). The immature forms of insects (pupae and larvae) are preferred for their abundant amino acids and fatty acids, which not only ensure the nutritional value, but also provide a unique and splendid flavour. Insects were unable to offer the same benefits and were uncertain staples due to their seasonality. This may have contributed to a decrease in interest in insects as a food source (DeFoliartet al., 1999) [4]. Insect eating has recently captured public attention worldwide. Edible insects have the potential to become a major global future food (Caparros Megido et al., 2018)[5]. due to the presence of high-quality protein, vitamins and minerals as well as economic and environmental benefits. Edible insects could become part of a strategy for achieving food security worldwide (Van Huis et al., 2017) . Great attention has been paid to the utilization and production of edible insects. The production of animal protein is under huge pressure as the world population is rapidly increasing (Gerland et al. 2014).Consequently, people are facing the enduring protein undernourishment and seeking alternative protein resources Increasing number of people are joining the industry. However, the industrial chain of edible insects, from fundamental research to marketing, still needs to be developed.

Nutritional value of insects for human consumption
The nutritional content of edible insects can vary significantly based on factors such as species, metamorphic stage, habitat, and diet. This variability is especially pronounced in holo metabolous species like ants, bees, and beetles. While insects' amino acid compositions are similar to those of traditional animal foods, they can provide essential amino acids at ideal levels. This contributes to their potential as a high-quality protein source for both humans and animals. (Raubenheimer & Rothman, 2013).Edible insects are generally rich in protein. The proportion of crude protein in insects ranges from 40% to 75% on a dry weight basis. Comparatively, this protein content is higher than that found in conventional meat sources. Insects' proteins are highly digestible, with values ranging from 76% to 96%. This means that the nutrients present in insects are efficiently absorbed by the human body, further enhancing their nutritional value(Nowak et al., 2016). In addition to their potential benefits for human nutrition, edible insects can also be valuable as a source of nutrients for poultry. They offer a sustainable alternative to conventional feed sources. (Lange et al.,2021). Edible insect species are good source of essential amino acids that humans need for proper growth and functioning (Belluco et al., 2013).

The consumption of insects, also known as entomophagy, has been gaining attention as a potential solution to various global challenges, including improving the nutritional quality of human diets. Insects are a highly sustainable and efficient source of protein, and they offer a range of nutritional benefits (Bukkens et al.,1997). The nutritional composition of insects as a potential food source, particularly in terms of amino acids. The balanced diet requirements when insects constitute a significant portion of a meal and mentions that insects generally meet the World Health Organization's (WHO) recommendations for essential amino acids. most insect species can provide sufficient essential amino acids by consuming a reasonable combination of foods. All insect groups seem to be eligible sources of amino acids like isoleucine, leucine, lysine, phenylalanine, threonine, valine, arginine, histidine,

and tyrosine. The Blattodea group of insects tends to be particularly rich in lysine, valine, methionine, arginine, and tyrosine compared to other insects. Coleoptera, or beetles, are highlighted for having higher amounts of leucine compared to other protein sources, including livestock. Hemiptera, a group that includes true bugs, typically contains higher levels of phenylalanine compared to other protein sources. Nymphs are particularly rich in arginine, which is beneficial for heart and blood vessel conditions and can boost the immune system. In fact, the passage indicates that nymphs of certain cockroach species (Blatta lateralis) have more than twice the amount of arginine compared to beef and pork. Insects are generally abundant with fats. Lepidopteran and Heteropteran larvae (caterpillars and nymphs, respectively) often have higher fat contents compared to other stages of insects.

 Larvae are good source of fatty acids or oil related with other stages of insects. As for adult insects, they generally have lower fat content, often less than 20% of their body weight. The main storage form of fat in insects is triacylglycerol, also known as triglycerides (Arrese & Soulages, 2010). The content of saturated fats (SFAs) is often higher than that of monounsaturated fats (MUFAs) in the diets of many adults, MUFAs are generally considered healthier for human diets due to their positive effects on heart health (Sales-Campos et al. 2013). Insects are indeed rich sources of various vitamins and micronutrients, and they can provide a valuable nutritional resource for human consumption. Insects can provide a range of vitamins essential for human health, including vitamin A,B,C,D,E and K, which are needed for normal development and body function. For example, caterpillars can be a good source of certain B vitamins, including B1 (thiamine), B2 (riboflavin), and B6 (pyridoxine), as well as other essential nutrients. (Rumpold & Schluter, 2013). While crickets and termites are containing high concentrations of Zinc and Iron. Copper, magnesium, manganese and zinc levels in grasshoppers and mealworms are higher than those in beef (Christensen et al., 2006) certain insects like grasshoppers and mealworms can contain higher levels of certain minerals like copper, magnesium, manganese, and zinc compared to beef(Latunde-Dada).

Current entomophagy

The most prevalent commercial edible insect species are *Bombyx mori* (farmed silkworm),*A. mellifera* (honeybee), *Tenebrio molitor* (yellow meal worm), Imbrasia*belina* (mopane caterpillar), and Rhynchoporus *phoenicis* (African palm weevil) at the moment. These insects are being explored and utilized as alternative sources of protein and nutrition in various parts of the world. the industrial production of Tenebrio Molitor (mealworms) and orthopterans (such as crickets) as a potential food source. Mealworms are often used in various applications, including animal feed and even human consumption due to their high growth rate and ability to thrive on low-nutritional waste. Crickets are also considered as a potential food source, particularly their adult stages, and are easy to harvest when they swarm. However, there are concerns about the safety of consuming insects like crickets that might have been exposed to pesticides. Pesticide residues can accumulate in the insects if they are exposed to pesticides during their life cycle. These residues can potentially pose risks to human health if the insects are consumed, especially in large quantities (Ramos-Elorduy & Moreno, 2002). Honeybees are indeed important pollinators and honey is a well-known food product derived from their activities, the consumption of bee brood extracts as luxury nourishments is a cultural practice that varies by region and is not a common or mainstream food source (Chen et al. 1998). Entomic sugars are sweet substances produced by insects, and honey is one of the most well-known examples.

Lerp contains various components including monosaccharides and water-insoluble carbohydrates, as well as minerals like potassium and phosphorus, making it a potentially valuable nutritional source. However, lerp's production process currently relies on nature, as it can only be collected from host plants that are infected with the corresponding psyllids. This suggests that there might be some challenges associated with the scalability and reliability of lerp production, as it is dependent on the presence of specific insects and their interaction with plants (Van Huis et al. 2013).Edible insects are increasingly being recognized as a valuable source of nutrition for both human consumption and animal feed, including livestock and aquaculture (Józefiak et al. 2016). Feeding insects to livestock and aquaculture is seen as a way to enhance the nutritional value of the final products, such as meat or fish. Insects are rich in protein, essential amino acids, and other nutrients, making them a viable alternative to traditional feed sources like grains and soy. Feeding insects to livestock and aquaculture is seen as a way to enhance the nutritional value of the final products, such as meat or fish. Insects are rich in protein, essential amino acids, and

Veera Nagendra Kumar *et al.,*

other nutrients, making them a viable alternative to traditional feed sources like grains and soy. Additionally, certain types of insects, such as the pupae of Chironomidae and Muscidae, are utilized as fishing bait and feed for aquatic animals. This further highlights the versatility of insects in various applications within the animal industry. Insects can be raised on organic waste and agricultural byproducts, reducing the environmental impact and creating a more sustainable protein source ((Liu et al. 2010).

Food security

The FAO has indeed projected that the global population will reach over 9 billion by the year 2050. This population growth will undoubtedly put significant pressure on the agricultural sector to increase food production to meet the rising demand. (Belluco et al., 2013).The increase in human population indeed places greater demands on our global food supply, while various factors such as urbanization, deforestation, and climate change contribute to the decrease in available land for agriculture (Premalatha et al., 2011). As agricultural productivity decreases due to climate change, the availability of food can be compromised. This can lead to food shortages, higher food prices, and increased competition for limited resources. Vulnerable populations, particularly in low-income countries, are more likely to face difficulties in accessing sufficient and nutritious food. Enhanced socioeconomic situations and food access will therefore be desirable worldwide. Edible insects have gained attention as a potential solution to addressing malnutrition and food insecurity, particularly in regions where traditional food sources are limited or scarce. Edible insects are rich in essential nutrients such as protein, vitamins, minerals, and healthy fats. They can provide a well-rounded nutritional profile, contributing to human health and well-being. For example, insects like crickets and mealworms are high in protein and contain valuable amino acids. Establishing insect production sectors can create new economic opportunities for communities, from farming and processing to distribution and marketing of insect-based products (Kalemu et al., 2015).Insects are indeed rich in nutrients and can provide a suitable environment for microorganisms to thrive. This is due to factors like their high protein content and moisture levels.

As a result, the risk of parasites and microbial contamination in insect products is a concern. Microbial hazards, including various types of bacteria like Entero bacteriaceae and sporulating bacteria, can be present in insects. These microorganisms can pose a risk to human health if ingested. Simply boiling or cooking insects might not be enough to completely eliminate these microbial risks. (Klunder et al., 2012). Preventive measures are essential throughout the stages of insect production and storage to ensure the safety of insect-based products for consumption. Climate change can have a significant impact on insect populations, just as it does on other species. Sustainable harvesting practices are crucial to ensure that insect populations aren't overexploited, which can lead to cascading effects in ecosystems. The example of the African Goliath beetle you mentioned is interesting. It showcases how shifting from harvesting insects directly from nature to rearing them can contribute to the conservation of both the insects and their habitats. By cultivating these insects in controlled environments, their populations can be better managed, and the potential threats they pose to their natural hosts can be mitigated (Neuenschwander et al., 2011).

Environmentally and economically benefits

Insects are often used as food due to their low cost. Wild species that are abundant can be harvested at minimal expense. Farming species tend to feed on inexpensive feed sources, which contributes to cost-effective production. Insects, such as Tenebrio molitor (mealworm), exhibit a high efficiency of converting ingested food into usable energy. The efficiency of conversion of ingested food (ECI) for T. Molitor is notably higher (53-73%) compared to other animals (Morales-Ramos & Rojas, 2015). This high conversion efficiency makes insects an efficient source of nutrition. Insects have lower carbon and water footprint, as well as lower ammonia emissions, compared to traditional livestock. This can be beneficial for both the economy and the environment. Insects generally have shorter life cycles compared to other traditional protein sources (Wilkinson, 2011). This means they can be bred and harvested more quickly, requiring less breeding space. This efficiency in production can contribute to a more sustainable food supply. Despite the low cost of production, edible insects are often sold at high prices in the market. This presents significant income opportunities for individuals and communities globally. This economic potential can contribute to livelihoods and development (Payne, 2014). Insect consumption could lead to a decreased demand for traditional chemical pesticides. Edible insects that are considered pests of economic plants could be harvested

67748

and used as a food source, thereby managing their populations. This approach has the potential to mitigate the damage caused by these pests without resorting to chemical treatments. By artificially harvesting edible insects, there's the potential for generating additional profits (Kouřimská & Adámková., 2016). One significant advantage of reduced pesticide usage is the potential for slowing down the development of pesticide resistance in insects. The principles of IPM, which is a holistic approach to pest management that combines various methods, including biological control, cultural practices, and the limited use of pesticides when necessary. The goal of IPM is to manage pests in an environmentally sensitive and economically viable manner (DeFoliart, 1997).

The primary idea behind using edible insects as a food source is to reduce the environmental impact of conventional livestock farming, which often requires significant resources such as land, water, and feed. However, in order for edible insects to have a meaningful impact, they need to be produced on a large enough scale to partially replace traditional protein sources like meat. This involves establishing insect farming operations that can meet the demand. The methods used for insect farming and processing could potentially have hidden or unforeseen environmental costs. These might include energy consumption for climate control in insect farming facilities, the sourcing of feed for the insects, the energy and resources needed for processing, and the transportation of insect products. edible insects could be a panacea for various challenges (climate change, resource scarcity, health issues) might be oversimplified. While edible insects offer potential benefits, they might not be a silver bullet solution to all these complex problems. It's important to approach their use with a balanced understanding of their advantages and limitations. the need for further research to comprehensively assess the environmental impacts of large-scale insect farming.

This research should consider the entire lifecycle of insect production, from rearing to processing to transportation, and compare it to existing livestock and farming practices. The potential of edible insects as a sustainable food source to meet the nutritional needs of a growing global population. The potential socio-economic benefits of insect gathering and farming in improving food security, particularly in low-income settings, need further exploration and clarification. The environmental impacts and sustainability of rearing, harvesting, and producing insects are highlighted as areas of concern. Comparisons with traditional farming and livestock raising are suggested to understand the potential environmental benefits of insect-based food sources. While insects are seen to involve fewer animal welfare issues compared to traditional livestock, there's a need to better understand the extent to which insects might experience discomfort or pain. the International Centre of Insect Physiology and Ecology (ICIPE) in Nairobi, Kenya, as an example of multidisciplinary research in the field of edible insects. ICIPE's mission is to ensure food security and enhance the health status of people in tropical regions through insect management strategies. Comprehensive legal frameworks at national and international levels are deemed necessary for producing and trading insect products. These frameworks would help secure investments and establish appropriate business structures (Erens et al., 2012).

CONCLUSION

The use of edible insects as a sustainable food source has indeed gained significant attention worldwide. Many insect species are rich in protein, healthy fats, vitamins, and minerals. They can provide a highly nutritious food source that can help address malnutrition and protein deficiency, especially in regions where access to traditional protein sources is limited. Edible insects can be utilized in various ways beyond direct consumption. The development of modern insect-based products demonstrates the versatility of these resources. Moreover, the growing popularity of consuming insects goes beyond just their nutritional benefits, extending into the realm of novelty and enjoyment. The discrepancy between the potential benefits of edible insects and their current market status is an important observation. Effective strategies for promoting and producing insect-based products are essential to bridge this gap. Semi-cultivation is proposed as an approach to boost insect production efficiently, which could help meet the rising demand for insect-derived products. Standardization is emphasized both in farming and processing to maintain the quality and safety of insect products. Consistent quality control measures are necessary to build consumer trust and ensure that insect-based foods are safe for consumption. Promoting communication and collaboration between insect

farms and processing industries is a sound recommendation. Efficient cooperation can lead to higher profits and a more streamlined supply chain. Lastly, the concept of agricultural-industrial integration is a valuable insight. As new insect products are developed, cultivation techniques improve, and production processes are optimized, the entire industry can benefit from a holistic approach that maximizes the potential of edible insects to address global nutritional challenges.

ABSTRACT

In a living system lots of biochemical reactions are running which simultaneously may generate various free radicals and reactive oxygen species. Their elimination must be required for the survival of the organism. For the accomplishment of this task the body has its antioxidant mechanism but it may collapse when free radicals are generated in huge amounts. The higher concentration of ROS and free radicals may lead to disturbance in physiology ultimately leading to a pathological condition. The present review describes the cause, and impact of oxidative stress in the body. In the modern age due to the limitation of synthetic drugs, researchers are centric on to use of medicinal plants to avoid oxidative stress in normal conditions as well as in pathological conditions. Plants possess various phyto constituents which may have a therapeutic effect on the body. These phyto constituents are also considered phyto medicine because of possess medicinal activity. There view also focuses on phyto medicine's use to get rid of oxidative stress

Keywords: Oxidative stress, free radicals, ROS, cancer, phyto medicine, medicinal plant

INTRODUCTION

Reactive oxygen species (ROS) and free radicals contribute to oxidative stress. Molecules are stable with paired electrons, but a single electron in an orbital makes them highly reactive. Those with unpaired electrons seek to fulfill their deficiency by capturing electrons from external substances. The oxygen triplet, with two unpaired electrons, is a

Abhishek Kumar Pandey *et al.,*

significant source of free radicals, and although reactions are slow, they can still generate ROS when interacting with other molecules [1].Electron deficiencies in molecules negatively affect living systems, causing abnormalities in function and physiology. Reactive oxygen species (ROS), with unpaired electrons, have a crucial role in limited quantities for cell signaling but become harmful in excess. Various sources and causes in the human body lead to the production of free radicals, as outlined in the next section.

Production of free radicals species

Reactive Oxygen Species (ROS), notably the highly reactive oxygen triplet, can damage cells and DNA through oxidation. Mitochondria are a major source of ROS in both normal and pathological conditions. Enzymatic processes, like those in the respiratory chain and cytochrome P450 system, contribute to ROS production. External factors like UV radiation and pollutants also trigger ROS. The body's internal defenses neutralize ROS, but external antioxidants may be needed if the defense system fails [2, 3, 4]. Living systems release reactive oxygen species (ROS) through enzymatic processes like phagocytosis, cytochrome P450, prostaglandin production, and the respiratory chain system. Superoxide radicals, formed by these processes, can further produce diverse free radicals, with enzymes like peroxidases, nicotinamide adenine dinucleotide phosphate oxidase, and xanthine oxidase contributing to superoxide radical production, and non-enzymatic reactions generating free radicals during mitochondrial respiration[5]. Internal processes such as immune cell activation, oedema, ischemia, infection, cancer, physical exertion, mental stress, and aging generate free radicals[6, 7].External factors like environmental pollutants, heavy metals (e.g., Arsenic, Iron, Cadmium, Lead Mercury), certain medications (gentamycin, bleomycin, tacrolimus, cyclosporine), chemical solvents, smoking, alcohol, and radiation exposure can generate exogenous free radicals. Metabolism or breakdown of these substances within the body produces free radicals as byproducts.

Free radicals' physiological activities

Free radicals in biological systems play vital roles in defending against pathogens by contributing to the formation of cellular structures, with phagocytes producing and storing them, releasing when needed to eliminate invading microbes. [8, 9].Free radicals are crucial in the immune system, evident in individuals with granulomatous disease susceptible to chronic infections due to a defective NADPH oxidase system. Beyond immune function, they serve as key regulators in cellular signaling pathways, influencing intercellular signaling in various tissues such as fibroblasts, thyroid tissue endothelium, vascular smooth muscle cells, and cardiovascular myocytes, and are integral to nitric oxide signaling pathways, contributing to non-specific host defense and cellular responses. [10, 11, 12].

Free Radicals' Negative Effects on Human Health

Biological oxidizers consist of many ROS, but oxygen stands out as the most abundant and effective oxidant. It has an increased oxidation capacity when a proton is added to it Here, we will discuss the functions and structures of some essential oxidizers. Table 1 demonstrates the Source and physiological response of various types of ROS The metabolic processes of cells can be negatively affected by the products of free radicals, which may ultimately lead to cellular harm.

1.   Lipid peroxidation caused by free radicals can decrease the flexibility of polyunsaturated membrane walls, ultimately resulting in cell lysis[13].
2.   Free radicals can negatively impact cellular metabolism and cause damage to cells by decreasing the fluidity of polyunsaturated membranes, resulting in lipid peroxidation and eventual cell lysis[14].
3.   Several important proteins may become inactivated or denatured due to the actions of free radicals[15].
4.   Free radicals can cause mutations and carcinogenic effects by modifying the bases that make up nucleic acids[14].

Abhishek Kumar Pandey *et al.,*

Free radical-related physiological and physio pathological phenomena (FR)

Excessive free radical production, stemming from physical or biochemical activity, can lead to various pathological conditions in the human body, including cell aging, diabetes, coronary artery disease, inflammatory illnesses, cancer, mutations, cell transformation, and myocardial infarction. Beyond a certain threshold, the accumulation of free radicals and oxidants induces oxidative stress, negatively impacting cellular structures. Oxidative stress occurs when the body's enzymatic defense system fails to eliminate radicals like hydroxyl radicals and peroxynitrite, causing lipid peroxidation and damaging cell membranes and lipid proteins. This process leads to the rise of cytotoxic and mutagenic compounds like malondialdehyde and conjugated dienes within the cell, initiating a radical chain reaction that swiftly affects multiple lipid molecules[7].Oxidative stress can modify proteins, altering their structure and diminishing enzymatic activity. Additionally, it damages DNA, causing lesions like 8-oxo-2'-deoxyguanosine (8-OHdG), a highly harmful lesion capable of inducing mutagenesis and mutation[16]. Additionally, it can cause a loss of epigenetic information, which is likely due to a deficiency in the methylation of CpG islands in gene promoters [17]. Researchers have proposed 8-OHdG levels in tissues as a biomarker of oxidative stress, highlighting its significance. Cells possess various defence mechanisms against DNA damage, including antioxidants and base excision repair (BER)[18,9,5,11]. DNA, highly vulnerable to oxidative stress, can result in the hazardous DNA lesion 8-oxo-2-deoxyguanosine (8-OHdG), causing detrimental mutations and loss of epigenetic information through CpG methylation in gene promoters. Researchers use 8-OHdG levels as a tissue biomarker for oxidative stress[19]. The cell employs repair mechanisms, like base excision repair and antioxidants, to mitigate oxidative stress. Unregulated oxidative stress can lead to chronic diseases, accelerated aging, and acute pathologies such as stroke and trauma.

Oxidative Stress and Oncology

Cancer, influenced by internal and external factors like genetics and the environment, often arises from DNA damage. Oncogene activation and chromosomal abnormalities, key drivers of cancer, result from a redox imbalance caused by DNA hydrolysis by-products. This hydrolysis induces oxidative stress and chemical carcinogenicity, disrupting normal cell growth and causing mutations that alter the transcriptosome profile. Oxidative stress leads to various DNA modifications, including base and sugar lesions, DNA protein crosslinks, strand breaks, and base-free sites, promoting tumor growth. Sources of DNA damage contributing to tumorigenesis include tobacco smoking, environmental pollutants, and chronic inflammation [20,21]. The development of cancer can also be attributed to oxidative stress induced by unhealthy lifestyle choices and behaviours.

Cardiovascular diseases (CVDs)

Factors like hypercholesterolemia, hypertension, smoking, and stress-related illnesses contribute to severe complications in cardiovascular diseases. Recent research emphasizes oxidative stress as a primary or secondary factor in their pathogenesis, promoting atherosclerosis.

Atheromatous plaque induces endothelial inflammation, triggering ROS production by macrophages that oxidize LDL, leading to foam cell formation and lipid deposition, contributing to atherosclerotic plaque development. Oxidative stress is identified as a major underlying cause of diseases, including congestive heart failure, cardiomyopathy, atherosclerosis, ischemia, hypertension, and myocardial infarction[22, 23, 24]

Oxidative stress and neurological disorders

Neurological conditions like Parkinson's, Alzheimer's, ALS, depression, and memory loss are associated with redox imbalance. In Alzheimer's research and clinical trials, oxidative damage has been linked to neuronal destruction, increasing dementia risk. The generation of beta-amyloid, a harmful peptide prevalent in Alzheimer's patients and a key factor in neuro degeneration, is thought to be driven by free radicals. [25].

Oxidative Stress and Pulmonary Disease

Several researchers have noted the association between oxidative stress and conditions such as asthma and other chronic obstructive pulmonary diseases[26,27]. Oxidants trigger the activation of multiple kinases and transcription factors, including NF-kappa B and AP-1, thereby accelerating the inflammatory process. [28, 29].

Abhishek Kumar Pandey *et al.,*

Oxidative Stress and Osteoarthritis

Arthritis is a chronic inflammatory condition affecting both the tissues surrounding the joint and the joint itself. The presence of macrophages and activated T cells within these tissues provides insight into the nature of this disorder[30, 31].Free radicals at inflammation sites contribute to disease progression by increasing isoprostane and prostaglandin levels in synovial fluid, acting as inflammatory mediators that intensify the inflammatory response[30].

Oxidative Stress and Renal Disease

Oxidative stress can trigger a range of kidney and nephron-related disorders, such as glomerulonephritis, kidney failure, proteinuria, and interstitial nephritis[31]. Oxidative stress negatively impacts kidneys, stimulating pro-inflammatory cytokines' production by free radicals, initiating inflammation, and leading to renal failure through a process involving TNF-alpha, IL-1b, NF-κB, kb, TGFβ, and medication-induced elevation of free radical levels and lipid peroxidation. [32, 33]. Nephron-related diseases and cancers can arise from exposure to heavy and transition metals inducing significant oxidative stress [3, 4].

Oxidative Stress and Biological Age

The impact of oxidative damage on sexual maturation and the onset of puberty has been acknowledged by multiple scholars. [34, 35].Prepubertal exposure to heavy metals like cadmium and pregnancy can lead to the generation of free radicals in children, causing oxidative stress. The imbalance between pro-oxidants and antioxidants characterizes oxidative stress, marked by an excessive increase in reactive oxygen species (ROS) due to inadequate antioxidant defense or a breakdown in the cells' buffering system. These changes in biomolecules define the disease condition [36]. Molecular damage and/or disruption of redox signalling and regulation were used to redefine oxidative stress, which was previously thought to be "a disturbance in the prooxidant - antioxidant balance in favour of the former" [37, 38].

Oxidative stress and free radicals pose a significant and widespread risk to human health, evident in their involvement in various clinical disorders affecting multiple tissues and systems.

Antioxidants' function

Biological systems under oxygenated conditions deploy both pharmacological and physiochemical defense mechanisms. Physiologically, oxygen levels in tissues and cells are maintained, while the biochemical defense system employs specific enzymes to counteract free radicals and oxidative stress. Non-enzymatic processes may also be involved, utilizing molecules that function as antioxidants.

Endogenous system of Antioxidant

Living systems have antioxidant enzymes like catalase, glutathione peroxidase, superoxide dismutase (SOD), and DT-diaphorase. Notably, SOD, an endogenous enzyme, is crucial for neutralizing oxygen radicals by interacting with hydrogen, playing a dominant role in eliminating free radicals. Various types of SOD differ based on the metal cofactor they use[39, 40]. This enzymatic reaction leads to the formation of hydrogen peroxide, which is subsequently broken down into water and oxygen by catalase (CAT). In this manner, the detoxification and elimination of free radicals occur [41].Catalase (CAT) efficiently breaks down H_2O_2 into H_2O and O_2 within seconds. Glutathione peroxidase (GPx), a crucial intracellular enzyme, degrades lipid peroxidation products into alcohols and hydroxyl radicals, mainly in mitochondria and occasionally in the cytosol [42]. Selenium plays a vital role in the GPx mechanism. The human body harbours between eight and ten different types of GPx enzymes, ranging from GPx1 to GPx8 [43]. The selenoperoxidase GPx1 is the most prevalent among them and is found in all cells. To prevent oxidative stress on cells, the GPx1 enzyme slows the process of lipid peroxidation [44].Insufficient levels of GPX1 render cells more susceptible to oxygen-induced damage and the degradation of functional proteins. This can result in the destruction of proteins within the plasma membrane, leading to detrimental effects on the cell. According to Torayman[45], GPX1 is a crucial enzyme for both physical growth and the prevention of various disorders, including

67755

cancer and cardiovascular disease. The reduction of the quinone-containing medication and the reduction of quinone from quinol are both catalysed by DT diaphorase[46]. All these enzymes are regulated and synthesized by special genes present in DNA.

Exogenous system of Antioxidant and its types

Exogenous antioxidants, acquired from food or nutrients, neutralize existing free radicals by donating electrons. This generates less reactive free radicals within the antioxidants themselves, efficiently eliminated in the body. Antioxidants like vitamin E, carotene, ferritin, reduced glutathione, manganese, ubiquinone, zinc, flavonoids, and melatonin are easily eliminated. We'll explore these exogenous antioxidants, their therapeutic activities, and protective functions in the following discussion.

Vitamin E

Vitamin E includes lipophilic substances such as α, β, gamma, and δ-tocopherol, as well as α, β, gamma, and δ-tocotrienol, found in plants, edible oils, and seeds. α-tocopherol is the primary constituent. As an antioxidant, vitamin E counters chain reactions initiated by peroxy radicals, with its antioxidative properties extensively studied by researchers[47, 48, 49, 50].Vitamin E, with lipophilic substances like α, β, gamma, and δ-tocopherol, and α, β, gamma, and δ-tocotrienol, found in plants, oils, and seeds, is primarily composed of α-tocopherol. It acts as an antioxidant, countering chain reactions initiated by peroxy radicals, with antioxidative properties extensively studied by researchers[51,52]. The early development of an atherosclerotic lesion involves the conversion of macrophages into foam cells through oxidized low-density lipoprotein (LDL) uptake by the CD36 receptor. Vitamin E inhibits CD36 expression, thereby impeding foam cell formation. RRR γ-Tocopheral displays efficient pro-Inflammatory activity during allergic Inflammation.

Phenolic Compounds

Phenolic compounds, varying in size and biological activity, are natural or semi-synthetic substances characterized by phenolic structural units. Dietary sources of polyphenols include fruits, vegetables, cereals, and beverages, found in berries, grapes, apples, pears, cherries, byproducts, red wine, tea, coffee, chocolate, cereals, dry legumes, flowers, stems, spices, and herbs. Regularly consumed in many nations, polyphenols are potent antioxidants, with approximately 8000 types of phenolic compounds obtained through dietary intake.One gram per day or more of these substances may be consumed[53]. Synthesized in plants for defense, phenolic compounds are now used in drug manufacturing for therapeutic effects. They act as hydrogen donors, chelating metal ions like copper (Cu) or iron (Fe), inhibiting low-density lipid oxidation, and reducing the risk of neurodegenerative diseases. Phenolic compounds also show potential in treating various cancers and coronary heart disease[54-57]. According to Sakakibara et al., 2003. phenolic compounds also possess vasorelaxant and anti-allergic properties [58]. In vitro studies have demonstrated that phenolic substances can prevent the oxidation of low-density lipids [59]. The antioxidant properties of phenolic compounds decrease with solvents forming hydrogen bonds. For instance, alcohol and peroxy radicals act as hydrogen bond acceptors, and ionization forms phenoxide anions reacting with peroxy radicals, facilitating electron transfer. Solvents determining antioxidant capacity effectively ionize phenolic compounds.

Carotenes

Carotene compounds, present in plants, animals, and micro-organisms, boast around 700 identified variations. [60]. Carotenes typically exhibit a symmetrical tetraterpene framework, featuring a flexible 40-carbon straight hydrocarbon structure susceptible to morphological changes. These alterations include hydro-generation, geometrical isomerization, and the addition of cyclic or side groups post-glycosylation. Through diverse complexations, the linear skeleton transforms into a tetraterpene structure with approximately 50 carbons. Some carotenes, with a carbon count of 30, result from the condensation of two farnesyl units [61]. Carotenes, consistently identified in various studies, serve as precursors to vitamins and play a crucial role in shielding the animal body

from photo-oxidation by effectively neutralizing singlet oxygen species[62, 63, 64].Carotenes play a pivotal role in mitigating oxidative stress, offering protection against severe health issues like cardiovascular diseases, cancer, neurological disorders, and sight conditions associated with Reactive Oxygen Species (ROS). Their diverse physiological functions in the biological system encompass immune system stimulation and modulation of intracellular signaling pathways, including gap junction communication [65],Carotenes also regulate cell cycle progression and apoptosis, impacting the activity of growth factors and cellular proliferation [66], Carotenes also influence various receptor and adhesion molecules[67]. Carotenoids, particularly noteworthy for their potential in preventing bladder cancer, have been extensively studied epidemiologically. The findings suggest that specific carotenoids and carotenoid-rich diets may lower the incidence of bladder cancer[68,69].Carotenoids, being lipophilic, eliminate ROS from hydrophobic cell membrane and lipoprotein regions, reducing the risk of membrane oxidation and morbidity rates [70]. Carotenoid-rich diets have demonstrated a decrease in morbidity and mortality rates associated with atherosclerosis, a condition arising from oxidative changes in low-density lipoprotein within artery walls leading to cardiac disorders. Numerous studies support carotenoids' protective impact in various cardiovascular diseases, including atherosclerosis [71, 72,73].

Repair System

This process repairs biological molecules damaged by free radicals, including lipids, proteins, and DNA under oxidative stress. Without a repair mechanism, damaged DNA can lead to mutations, resulting in negative or positive evolution. In negative conditions, the organism may face extinction. A robust repair system is crucial, with cells containing essential DNA repair enzymes like nuclease, polymerase, and glycosylase. Proteolytic enzymes, including proteinases, proteases, and peptidases, play a vital role in protein metabolism. Specific enzymes like GPX, glutathione reductase, and methionine sulfoxide repair biological molecules damaged by free radicals.

Attributes of Antioxidants

An effective antioxidant efficiently neutralizes free radicals, responsible for oxidative stress, by detecting them within the biological system [74]. According to Gordon's classification, antioxidants are categorized as primary and secondary antioxidants [75]. Primary antioxidants intercept and actively neutralize free radicals, preventing oxidative chain reactions. In contrast, secondary antioxidants deactivate harmful metals, hindering lipid hydroperoxide formation. They suppress unnecessary volatile generation and promote primary antioxidant production, eliminating singlet oxygen. Overall, antioxidants impede oxidation in biological molecules, cells, and tissues, even in minimal amounts.[76].

Antioxidant's mechanism of action

Antioxidant effectiveness in test tube experiments may not always translate to in vivo conditions. Free radicals, with rapid diffusion and a short lifespan, pose a challenge for efficient trapping and neutralization by antioxidants. In such circumstances, significant oxidative damage can occur. The efficacy of antioxidants is influenced by factors such as free radical concentration and chemical properties, the surrounding medium, and prevailing reaction conditions

Potent Antioxidant Plant

Recent research has shown that certain plants effectively alleviate oxidative stress in the body [77- 93]. Table no.2 lists the plants which show significant antioxidant potential. These plants, whether consumed as food or used for medicinal purposes, have shown promising results

Table 1: Various Kinds of ROS, their source and functions.

Species	Source	Function
Dioxygen (O^{2-})	Non-enzymatic electron transport reactions, autoxidation reactions, and enzymatic reactions	It acts as an oxidizing agent for ascorbic acid and tocopherol and a reducing agent for iron clusters like cytochrome-C.
Hydroperoxy radical	O^{2-} Protonation	HO_2 starts the oxidation of fatty acids.
Hydroxide (HO)	Through the metal-catalyzed Fenton reaction, H_2O_2 produces Ho.	Both inorganic and organic compounds, such as proteins, Fats DNA and carbohydrates are affected by HO's reactions.
Nitric Oxide	Utilizing arginine as a substrate and NADPH as an electron source, nitric oxide synthase produces nitric oxide.	NO is a second messenger that activates proteins, carbohydrates, guanylate cyclase and lipids inside cells.
Nitrogen dioxide (NO_2)	hemolytic disintegration of $ONOOCO_2$ or protonation of ONOO	Ascorbate and alpha-tocopherol levels in plasma are decreased by this radical's impact on the antioxidant system.
Carbonate (CO_3)	Superoxide dismutase (SOD) Cu^{2+} OH intermediates combine with bicarbonate to produce CO_3.	Biomolecules including proteins and nucleic acids are oxidized by Carbonate.
Nitrosoperoxycar bonic acid ($ONOOCO_2^-$)	The interaction of ONOO with Carbon dioxideproduces the peroxynitrite Carbon dioxide adducts.	Through FR, this anion encourages the nitration of oxyhemoglobin's tyrosine fragments.

Table 2: The following are examples of antioxidant plants and their corresponding phytochemicals that contribute to their antioxidant properties.

Botanical Name	The method used to evaluate antioxidant property	Result and reason behind possible antioxidant compound present in the plant	References
Bacopa monnieri (L.) Pennell	DPPH	Bacoside and Bacopasaponin	[77]

ABSTRACT

Plaque psoriasis, a persistent autoimmune skin condition marked by elevated, reddened, and flaky patches on the skin's surface, shares resemblances with *Ek Kuṣṭha* in Ayurveda. classification based on its clinical appearance. This study primarily aimed to evaluate the efficacy of a personalized traditional Ayurvedic treatment protocol in managing plaque psoriasis in a 49-year-old male patient. The approach involved bio purification through therapeutic emesis and purgation, coupled with oral and topical Ayurvedic remedies. Assessment of treatment effectiveness was based on the Psoriasis Area and Severity Index [PASI] score, Subjective criteria, and photographic evidence before and after the intervention. Results indicated a remarkable 95% decrease in the PASI score, an 82% enhancement in Subjective criteria, and noticeable photographic improvements. These positive outcomes can be attributed by the anti-inflammatory and antioxidant properties of the ayurvedic medications, supported by the facilitating impact of the therapeutic bio-cleansing processes. Consequently, this innovative personalized Ayurvedic strategy can holds promise for the management of plaque psoriasis

INTRODUCTION

Psoriasis is a common, persistent Papulosquamous skin condition that affects people of all ages and causes significant burdens on individuals and society [1] and it has a wide range of cutaneous symptoms, with individual lesions ranging from minuscule to massive plaques, and even generalized erythroderma. Most common and well-organized form of psoriasis is plaque psoriasis. [2] It affects approximately 0 % to 11.8 % in different population. [3] Precise Etiology is still uncertain however; it is speculated to be an autoimmune illness mediated by T lymphocytes. The pathogenesis includes activated T lymphocytes infiltrating to the skin and stimulating keratinocyte growth. this dysregulation results in the production of thick plaques along with hyperplasia and parakeratosis. [4] common clinical features include dry, itchy and raised skin patches covered with scales. Psoriasis Area Severity Index [PASI] is common tool to assesses the severity of the condition and treatment strategies includes Emollients, moisturizers and topical therapy like coal tar, dithranol, vitamin D analogues, keratolysis, corticosteroids and targeted phototherapy etc are in practice. [5] Ayurveda deals Plaque psoriasis as *Ek-Kuṣṭha* [EK]with vitiated *Kaphā- Vāta Doṣas* predominantly and clinical features includes *Asvēdanam* [~anhydrosis] *Mahāvastu* [broad based], *Maṇḍalālotpatti* [~Round patches], *Ṛukṣa* [Dry], *Matsyaśākolapam* [Silvery scale like fish]. The Present case report will explore the efficacy of Ayurvedic treatment in management of *Ek-Kuṣṭha* [Plaque Psoriasis]

Patient and Methods
A moderately built 49 years old male farmer patient came in hospital with a complaint of elevated white-scaly skin lesions present on both upper and lower limbs, abdomen, and external pinna of both ears since one and half years.

Case Details
He was also having severe itching over these lesions which was causing discomfort, and is disrupting his daily routine activities. He was apparently healthy before one and a half years. Firstly, he developed a small circular patch on his abdomen which later increased in number along with severe itching and white scaling. He took medicines for it and they got subsided for a while. But in February 2023, he developed the same complaints for which he consulted a dermatologist and was later diagnosed with psoriasis. He was prescribed medicines like corticosteroids, anti-histamine, and local ointments for 3 months. but recurrence of symptoms was seen when the medicines were stopped. Hence, he came to in our hospital for Ayurvedic management.

Clinical Findings
On examination, his general condition and nourishment were moderate. He was afebrile and his blood pressure, heart rate and respiratory rate was within normal limits. On systemic examination no abnormality was found in the cardiac, respiratory and central nervous system.

Dermatological Examination
Lower Limbs: Generalized severe pruritic, whitish plaque lesions overlapped with irregular marginated scaly eruptions on both lower limbs.
Upper Limbs: Generalized moderate pruritic, whitish plaque associated with scaling more on extensor side of both upper limbs.
Back: Patchy mild pruritic lesion with small size comparatively
Abdomen: Large pruritic plaque lesion mostly below the umbilical with scaling.
Diagnostic focus
Patient was diagnosed case of Psoriasis in March 2023 but no any relevant data available. Further reports were not done due to financial problem. So based on the clinical features he was diagnosed as *Ek-Kuṣṭha* [~Plaque Psoriasis]
Therapeutic Interventions
The intervention was adopted in the form of Ayurvedic oral medication and topically along with purificatory measures based on status of *Doṣas*. Initially, patient's primary complaints were unable to sleep at night due to itching over the abdomen and both upper-lower limbs. Suggestive of vitiation of *Kaphā* and *Rasa-Rakta.* Also, his dry scaly

Kajal R Senghani *et al.,*

plaques pointed involvement of *Vāta* and *Māṃsa* [~Muscle tissue]. and involvement of area is more [Figure 1, Before Treatment] so the condition was assessed as EK with *Bahu-doṣa āvastha* [Involvement of more morbid Doṣas] of *Vāta-Rasa-Māṃsa-Kaphā* Predominance. Thus, the Ayurvedic principle of *śodhana* [Purificatory measures] along with *Āmpāchana*, [~Detoxification of metabolic toxins] *Kuṣṭhagna, Kaṇḍugna* [To relieve itching] and *Raktaśodhaka* [blood purifier] was adopted. The whole treatment strategy was planned for 70 days under 5 different stage including hospital stay around for 26 days. [Stage2 and stage 3]. Initially in stage 1, [Table 1] *Mañjiṣṭādi Kaṣāya* is a popular medicine for *Kuṣṭha* among ayurvedic clinicians. It has *Kaphā-pitta Śamaka, Rakta Śodhaka* [blood purifier] and *Āmpāchana* properties. [6] *Nimbādi Guggulu* which also has *Kaphā Vāta Śamaka* [~alleviation of *Kaphā Vāta Doṣas*] action and most of its ingredients possesses the *Tikta-Kaṣāya rasa*, [Bitter- astringent in taste] helps in relieving the itching. [7] *Nimbādi* and *Karañja Taila* has the *Kuṣṭhagna* and *Kaṇḍugna* properties and also helps as moisturizer. [8] and After 15 days, there were mild reliefs in itching, but no improvements in lesions were seen. Due to *Bahudoṣa āvastha*. and severity of symptoms, *Vāmana* and *Virechana* therapies were chosen in stage 2 and stage 3 respectively. For *Vāmana*, [Stage2] treatment protocol was planned as *Dīpana, Pāchana* with *Āmpachaka Vati* 500 mg twice in a day and *Muṣṭa*, [Cyperus rotundus] *Suṇṭhi Churna* [Zingiber officinale Powder] 10 gm in 2 litre of warm water as a drinking water for whole day for 3 days. After assessing proper *Nirāma Lakṣaṇa*.[~ Optimal digestion symptoms] and then patient was given *Snehāpāna* [internal oleation] with *Pañcatikta Ghṛta* [medicated ghee] in increasing dose starting from 50 ml to 140 ml [Table 1, Stage 2] followed by *Sarvāṅga Abhyaṅga* [Whole body oil massage] and *Bāṣpa Sweda*.[~ Sudation] On the 2nd day in the early morning around 7:00 AM after *Sarvāṅga Abhyaṅga* and *Bāṣpa Sweda, Vāmana* therapy were done, and *Madhyama Śuddhi* [medium bio purification*]* was observed. Accordingly, for 5 days, *Sansarjana Karma* [Special dietetic schedule] advised. In stage 3 [Table 1] domain, *Virechana* were planned and for that *Aam-Pāchana* was performed for 2 days with *Muṣṭa śuṇṭhi jala* in prescribed dosage. *Snehāpāna* with *Pañcatikta Ghṛta* with dose of 50 ml, 100 ml, and 150 ml based on his digestive capacity. For three days*, Sarvāṅga Abhyaṅga* and *Bāṣpa Sweda* were done, followed by *Virechana* with 50 gm *Trivruta lehyama. Sansrajana karma* [Special dietary schedule] was also performed for four days in accordance with *Madhyama Śudhhi.* Later, patient was discharged from the hospital with oral and topical Āyurvedic medicines for 7 days. Then patient came for follow-up after 7 days, all clinical features were significantly improved; however, some skin discoloration at lesion site still left. [Figure 1, After Treatment] Thus, *Mañjistādighana vati as a Raktaśodhaka* [Blood Purifier] was prescribed, and lotion were advised as per the requirement of affected area.*"*

RESULT

During each follow up the patient improved. But after the *Vāmana,* [Therapeutic emesis] itching were reduced but there was still some itching during night and scaly lesions showed mild response, directed need of more *Śodhana* [Bio purification] so in stage 2 *Virechana* [Therapeutic purgation] were planned, he stated that itching had completely subsided, the presence of scaly lesions had significantly decreased, and only skin discolouration at lesion site were remained so in further follow up he treated with oral and topical ayurvedic medication. [Table1, Stage 3 and 4] detailed outcome is assessed through the subjective criteria, [10] [Table 2] photographic evidence [Figure 2] and PASI [Psoriasis Area Severity Index] Score. [11] [Table 2]

DISCUSSION

Psoriasis, an enigmatic and multifaceted chronic inflammatory skin disorder and it goes beyond its visible manifestations, impacting not only the skin but also the overall quality of life of those who bear its burden. [12] Current psoriasis treatments encompass topical agents, phototherapy, systemic therapies [including biologics], and emerging small molecule inhibitors. While these offer relief, limitations persist. Topicals target localized areas, and long-term use can lead to skin thinning or systematic side effect. [13] Phototherapy demands frequent clinic visits and carries skin cancer risks. [14] Systemic therapies may have side effects and Biologics provide efficacy but come with high costs and infection risks. Thus, an effective alternate treatment is necessary for Psoriasis.

In Ayurveda, EK comes under the umbrella of *Kuṣṭha.* It is primarily attributed to an imbalance in the *Vāta* and *Kaphā Doṣas*, often accompanied by vitiation of *Rakta Dhātu* [blood tissue] these imbalances lead to specific symptoms based on the predominance of these Doṣas and involvement of *Dhātu.* [15] Its ayurvedic management involves *Śodhana* [detoxification] therapies to eliminate vitiated *Doṣas* followed by *Śamana* [Pallative] therapies to balance the *Doṣas* and restore the skin health.

In the current case of *EkKuṣṭha* [Psoriasis] characterized by a predominance of *Vāta* and *Kaphā Doṣas*, coupled with *Bahudoṣa āvastha*. In response, a treatment approach involving sequential *Śodhana* [detoxification] followed by *Śamana* [balancing] therapies was selected. *Panchiktaka Ghrita,* the medicated ghee administered during *Snehāpāna*, possesses *Vāta Kaphā hara* properties akin to the chemical and physiological composition of both ghee and the human cell membrane. This synergy enhances the penetration of *Sneha* [ghee] into the tissues, facilitating partial rejuvenation of cells. [16,17] Furthermore, it aids in the elimination of excessively vitiated *Doṣas* from the *Śākha*, promoting the smooth transfer of *Doṣas* from the *Śākha* to the *Koṣṭha*, subsequently expelling them through the processes of *Vāmana* and *Virechana*. *Abhyaṅga* and *Swedana* were administered to support the aforementioned *Śodhana* process, while *Nimbādi Taila* and *Karañja Taila* exhibits *Kuṣṭhagna* properties as well as *Vraṇāropana*, *Śothahara* [anti-inflammatory], and *Tridoṣahara* [18,19]. Through these qualities, coupled with the oil's moisturizing and emollient effects, they may alleviate itching, dryness, and helped in elimination of lesion scaling. *Pañcatikta Kaṣāya* [20] and *Ārogyavardhini Vati*, [21] mentioned in Ayurvedic texts as *Kuṣṭhagna* medicines, exhibit anti-inflammatory, immunomodulatory, anti-histaminic, and anti-microbial properties. *Gandhaka Rasāyana* [22] act as *Agnīdīpaka, Pācaka, Rasāyana, Kaphāgna, Krimighna, and Raskaprasādaka* thus it aids in management of EK. Cadipsor ointment is a dermatological Ayurvedic Proprietary formulation, created from *Charmarognāśaka taila*. [Oil which having skin disease healing properties] This ointment effectively alleviates itching, while also providing moisturization for the skin.

CONCLUSION

This case study highlights the promising results of a personalized ayurvedic treatment in Psoriasis, which offers insights into future directions for skin disorder management. The combined protocol of *Shodhan* and *Śamana* appears potent for EK management. For further studies, randomized clinical trials are required to be done to assess ayurvedic sustained benefits in different chronic skin conditions.

ABSTRACT

Wetlands are the connecting link between the land and water. They are considered to balance the ecosystem as they are productive with diverse biological organisms. Pallikaranai marsh is an urban wetland of Chennai which shows the importance of species diversity and water quality management. In this study various physico chemical parameters of water body was analyzed and phytoplankton study was reported. Phytoplankton is the key tool to assess the water quality status of any ecosystem. By observing the phytoplankton community, dominant pollution indicator species such as Nitzschia, Navicula and Synedra, were reported along with the other species. Nutrient status of the aquatic system showed high eutrophication levels. The study shows the urgent need to monitor and conserve the wetland from anthropogenic activities and nutrient load.

Keywords: Wetland, Diatom, Phytoplankton, Pallikaranai, Water quality, Ecosystem

INTRODUCTION

Wetlands are defined as transitional areas of land covered by saturated water for varying periods of time [1]. It is estimated that freshwater wetlands alone support 20 percent of the known range of biodiversity in India [2]. They occupy 58.2 million ha in India, including areas under paddy cultivation [3], however development in urban areas has led to the loss of more than 60% of national wetlands [4]. The influence of physical factors such as temperature, salinity, pH, nitrate, nitrite, ammonia and silicate on the phytoplankton community alters species composition and their diversity in the marine ecosystem [5, 6]. The qualitative and quantitative studies on phytoplankton have been utilized to assess the quality of water [7, 8]. Phytoplankton, especially diatoms, respond rapidly to the changing physico-chemical conditions of the aquatic environment coupled with the varying nutrient content [9, 10]. The distribution of phytoplankton varies considerably with respect to different seasons and pollution load. They are the primary producers in most of the aquatic ecosystems and regarded as important food and energy sources for other organisms [11, 12]. They also play an important role in maintaining the biological balance and quality of water [13]. Their biological effects and prediction of impacts are helpful in restoration measures for reversing the process of eutrophication in water bodies. The necessity of using phytoplankton as an effective and appropriate method of bio monitoring for evaluation of water quality has been emphasized [14].

Bio-indicators can be defined as "living organisms including microorganisms, plants and animals which are used to measure the healthiness of the natural habitat". The environmental pollution can be measured using the phytoplankton community because they are the best indicators [15]. Diatoms are widely used for monitoring environmental contamination and serve as bio-indicator of water quality and pollution status [16]. Diatoms, considered as one of the major, diverse and ecologically important phytoplankton groups, form nearly 20% of global primary productivity [17]. Most importantly, diatoms are the primary producers of any aquatic ecosystem [18, 19]. They are the major component and dominant life form of the phytoplankton community. However, in India, very few reports correlated diatoms with water quality and community analysis [20, 21, 22]. They are an important indicator of environmental changes where individual species respond directly or indirectly and sensitively to changes in chemical, physical parameters [23]. The siliceous bodies of diatom have a long history of exploitation and acquire many features valued in ecological indications and extended their uses in various fields [24]. They are used extensively in palaeo-ecological studies because they are excellent indicators of past environmental conditions. Phytoplankton serve as bio-indicators with reference to water quality and thus serve as a tool for assessing the health of the aquatic ecosystems. Studies on planktonic composition and physico-chemical characteristics of water are necessary to acquire basic knowledge on the biodiversity status of any water body. Hence the present study was undertaken to know the influence of physio-chemical parameters of water on phytoplankton, especially the diatom diversity in Pallikaranai Marshland. Pallikaranai marsh is one of the few natural coastal aquatic habitats of India with diverse species of flora and fauna. This study attempts to determine the water quality conditions and phytoplankton composition status of the wetland ecosystem and also helps to understand the interaction between physicochemical parameters of the water and phytoplankton diversities of Pallikaranai marsh during the summer.

METHODS AND MATERIALS

Study Area
Pallikaranai marshland is the only urban wetland of Chennai city located near the Coromandel Coast at the south side of the Adyar estuary bound by Velacherry in the North, Kovilambakkam in the West and Okkiyum Thoraipakkam in the East and its catchment area is nearly 235 square kilometres. Athough a vast portion of the marsh was declared as a reserve forest in 2007 under the Tambaram forest range department, ironically these protected lands are being encroached for urban development.

Field Water Sampling

Duplicates of water samples were collected from the field site to understand the water quality variables like pH, salinity, total dissolved solids, water temperature and dissolved oxygen were measured. The samples were collected early in the morning and transported to the laboratory and analysed for nitrates, inorganic phosphates/or phosphorous, total hardness, chlorides, alkalinity

Analysis of Physio-chemical Parameters in Water Sample

Water samples were collected from Pallikaranai marshland in the month of february 2023. One litre polypropylene bottle which was previously cleaned, rinsed and washed with distilled water was used for collection. The water samples were analyzed for physio-chemical parameters viz., Colour, Odour, pH, DO, Alkalinity, Hardness, Chloride, Total dissolved solids (TDS), Fluoride, Iron, Ammonia, Nitrite, Nitrate, Phosphate and Residual chlorine using field water testing kit purchased from TWAD (Tamil Nadu Water Supply and Drainage Board) Chennai. The kit used were of precise accuracy and the chemicals used were listed in the Table. 1. All the analyses were done in duplicates. The final values were expressed in milligram/litre.

Nutrient Analysis

pH

The pH of the water was tested using the pH paper and the colour intensity was compared with the pH chart and the values were recorded.

Dissolved Oxygen

DO was done according to Winkler's method. 1 ml of Manganese chloride and 1 ml of Alkaline Iodine was added to the water sample and made to settle down. 1 ml of conc. sulphuric acid was added to the solution and slowly the reagent bottle was shaken to mix the contents well. Further 50 ml was drawn from the reagent bottle into a conical flask and titrated against Sodium thio sulphate using starch as an indicator. The end point is the disappearance of blue colour and the corresponding burette reading was noted and calculated accordingly.

Alkalinity

20 ml of water sample was taken in a beaker and 5 drops of AL1 solution was added to it which changed the colour of the sample to blue. AL2 was taken upto the mark of 40 in a syringe and was added drop by drop to the beaker containing sample. The sample turned into an orange colour. Its corresponding markings present in the syringe was noted and calculated for the total Alkalinity by multiplying with 10.

Hardness

20 ml of water sample was taken in a beaker and 5 drops of TH1 solution was added to it. After the addition of TH1 the sample turned into wine red colour. Then TH2 solution was taken up to the mark of 40 in the syringe and added drop by drop into the beaker. Colour changed from wine red to blue colour was observed. After it changed to blue colour the final marking was noted down and calculated for the total hardness by multiplying with 10.

Chloride

20 ml of water sample was taken in a beaker and 5 drops of CL1 solution was added to it. The sample turned into a lemon yellow colour. After this CL2 solution was added drop by drop which was filled up to the mark of 40 in the syringe. The solution then turned into brick red. The colour change and its corresponding markings on the syringe was noted. Total chloride content was calculated by multiplying the value with 10.

Fluoride

5 ml of water sample was taken in the given glass bottle and 5 drops of FL solution was added and gently shaken. The colour change was compared with the standard colour chart provided in the kit and the values were recorded respectively.

67774

Ammonia
10 ml of water sample was taken in the given glass bottle and 5 drops of AA solution was added to it and gently shaken. The sample was observed for any change in colour and corresponding values were recorded according to the standard colour chart.

Nitrite
10 ml of water sample was taken in the given glass bottle and 2 drops of NO_2 solution and 2 drops of NO_3 solution was added and shaken well. The colour change was compared with the standard colour chart and the values are noted down.

Nitrate
9 ml of water sample was taken in the given glass bottle and 1 ml of distilled water was added to it. Mixture of NO1 was added using the given spatula and 2 drops of NO_2 and 2 drops of NO_3 were added and gently shaken. The colour change was compared with the standard colour chart and the values were noted.

Iron
10 ml of water sample was taken in the given glass bottle and 5 drops of IR1 solution, 1 drop of IR2 and 5 drops of IR3 solution was added and shaken well. The sample was kept undisturbed for 5 to 10 minutes until the turbidity turned into a clear solution. Presence of any colour change was compared with the standard colour chart and the values were noted.

Phosphate
10 ml of water sample was taken in the given glass bottle and 5 drops of PO1 solution and 1 drop of PO2 solution was added. The colour change in the sample was compared with the standard colour chart and the values are noted.

Residual Chlorine
10 ml of water sample was taken in the given glass bottle and 5 drops of RCL solution was added and gently shaken. The colour change in the sample was compared with the standard colour chart and the values were noted.

TDS
Total Dissolved Solid value was calculated by adding the total alkalinity, total hardness and chloride values and then multiplying it with 1.3.

Diatom collection and Identification
The collection of Diatom samples have been done by using plankton net of 200 μm mesh and the samples have been preserved simultaneously by adding formaldehyde (4%) and allowed to stand for 24 hours. The samples were then transferred to the laboratory for observation and identified following taxonomic literatures [25, 26,27].

Microscopic Study of Diatoms
The samples were centrifuged and thoroughly rinsed to remove any debris and about 0.5 ml of sample was transferred to a clean microscopic slide for observing the diatom morphology under the Stereomicroscope at a magnification of 40x and 60x respectively (Fig. 3, 4 & 5)

RESULTS AND DISCUSSION

The water quality parameters which were analyzed from Pallikaranai wetland waters are shown in the Table. 2 with the standards of each. The following graph (Fig. 6) shows alkalinity (380 mg/L) was very high followed by total hardness and chloride levels at 250 mg/L. Very low amount of fluoride levels were recorded in the site at 1.5 mg/L

Diatoms are photosynthetic and commonly seen in golden brown, abundant in both freshwaters as well as the marine environment [28]. The diatom cell is known as frustules and its characteristic feature is possession of a silica cell wall. This structure is highly ornamental, which is species specific and often used as means of identification. It is composed of two overlapping halves like a pill box or a pair of petridish. Diatoms are divided into order centrales and pennales based on symmetry[29]. Table 3 shows the list of diatoms identified up to genus level in the Pallikaranai wetland The abiotic components give information about the type of a substance or pollutants and its concentration, while biological components show the degree of ecological imbalance, which has been caused. Growth, oxygen demand, food requirements and food conversion efficiency of the various biotic communities are directly affected by the temperature **[30]**. Many researchers proved that aquatic organisms are affected by pH since most of their metabolic activities are pH dependent [31, 32]. The pH was high in the water sample indicating high alkaline nature. Toxicity increases as the pH and temperature increases and we could see both were in increased levels in the site. Dissolved oxygen was very low in the wetland which may affect the growth of fish and lead to fish mortality. High amount of total hardness in the sample is resultant impact could be due to regular addition of domestic sewage, and detergent which has increased the hardness of water in the site. The high amount of chloride ions is an important indicator suggesting organic pollution. Phosphate is an important nutrient maintaining the fertility of the water body. High phosphate levels in the summer shows the eutrophication status of the water body. From the inferred results, it can be concluded that groundwater around Pallikaranai marsh possesses high values of TDS, anions and cations which make the water non-potable and the operation of dumpsite from Perungudi is mostly responsible for accelerating the groundwater contamination in the area. Increased concentration of ammonia was reported may be due to the incursion of terrestrial runoff and decomposition of phytoplankton **[33, 34].** Increased ammonia content may alter or change normal tissue, development of gills, liver and kidneys of fishes.

The phytoplanktonic study is a very useful tool for the assessment of water quality in any type of water body and also contributes to understanding of the basic nature of lakes **[35].**Phytoplankton species can be very sensitive to slight modification in its environment and hence, it provides good insight about water quality before it reaches extreme visible conditions like eutrophication **[36].** In this study phytoplankton assemblages were reported in the wetland waters with abundance in the Bacillariophyceae group. Diatoms are one of the most important and interesting groups of phytoplankton. The assemblage of diatoms reveals the quality of the aquatic environments. The alkaline condition of water could also influence the diatom abundance. Many diatom species such as *Gomphonema, Nitzschia, Melosira, Stauroneis, Caloneis, Cyclotella, Synedra, Cymbella,* and *Fragilaria* are reported to be indicators of the high nutrient conditions [37].According to the study by **[38]** a number of pollution indicator genera such as *Navicula, Nitzschia, Cymbella* and *Melosira* were documented in the study. Due to a lot of growing problems, degradation of the wetland ecosystem has necessitated the monitoring of water pollution and water quality to evaluate their production, capacity, utility potential and to plan restoration measures. The quality of any water can be analyzed by the changes in the physico-chemical and biological properties. The values of certain parameters are giving us an alarm towards its pollution level. With the industrialization, increasing population and anthropogenic factors there is an urgent need of continuous monitoring, conservation and scientific management of the wetland and to protect its biodiversity.

CONCLUSION

Water is the most abundant and renewable resource, which helps to maintain the earth's climate and dilute environmental pollution. The present study incorporates the various physico-chemical aspects and biological components of the Pallikaranai wetland. Dominant species such as *Nitzschia, Navicula* and *Cymbella* can be used as a pollution indicator to monitor and evaluate the lotic and lentic water bodies. However, further studies are needed to focus on the seasonal variation of diatom species, in addition to the water parameters for the better conservation and management of the wetland ecosystem.

ABSTRACT

This paper reports the consequences of the lichen growth on some architectural structures of monuments in Udaipur, Bharatpur, Jaipur, districts of Rajasthan studied with the help of electron microscopy and petrography methods. Two lichen species *Phylliscum indicum* and *Leprocaulon coriense* were selected for SEM-EDX, and for petrographic studies one epilithic lichen *Endocarpon subrosettum* growing on brick, and one endolithic lichen *Naetrocymbe saxicola* growing on marble were selected. Epilithic and endolithic growth were seen in petro graphic slides, and in SEM-EDX, mineral particles along with peaks of various elements is visible

Keywords: Bio deterioration, Electron microscopy, Lime plaster, Lithobiont, Petrography

INTRODUCTION

The colonization of the lithobiontic community depends on the relationship between the monument's construction material and environment [1]. The lithobiont known to affect the durability of cultural heritage stones [2]. Lichen is one of them and has long been known to cause bio deterioration [3],[4]. However, the process of bio deterioration occurring in nature ever since life originated on the earth, but this area of research drew the attention of researchers only in the mid-20th century [5],[6],[7],[8],[9],[10],[11],[12],[13], [14],[15]. It is evident that microorganisms cause both physical and chemical damage [16], [17],[18]. Lichens are known to secrete various secondary metabolites, of these, oxalic acid is predominantly known to cause the bio deterioration of stones. Moreover, lichens producing carbonic acid as a consequence of respiration, contraction and expansion of the lichen thallus by absorption and desorption of

67782

moisture is another strong bio deterioration as well. The bio deterioration by *lichen* has been analyzed by using various techniques like SEM (scanning electron microscopy), SEM-EDX (scanning electron microscopy equipped with energy dispersive X-ray), TEM (transmission electron microscopy), AAS (atomic absorption spectroscopy), IR (infrared spectroscopy), etc. [19],[20],[21],[22],[23]. Monuments are the representatives of our history and culture, and are built with the help of various types of construction material like stones, marbles, granites, lime, mud etc.[24],[25],[26],[27]. In this study, we tried to estimate the effect of lichen growth on monuments with the help of SEM-EDX, and Petrography. The SEM + EDX not only gives microscopic images but also provides elemental analysis [28], and is also helpful in environmental monitoring studies, The petro graphs will provide the penetration of fungal mycelia in the substratum. This information will be helpful for assuring the bio deterioration and conservation of archaeological sites.

MATERIALS AND METHODS

Sampling
The lichens samples utilized in the present study were collected from the abandoned monuments, and road side structures in Jaipur, Udaipur, Bharatpur districts of Rajasthan during 2017 to 2019.

SEM-EDX
For SEM-EDX analysis, two samples *Phylliscum indicum* Upreti, and *Leprocaulon coriense* (Hue. Lendemer & B.P. Hodk) which were growing on the lime plaster. (JSM 6490LV) SEM equipped with an EDX (JEOL, Japan) utilized for the experiment. Samples were coated with Pt(Platinum) before the experiment.

Petrography
Petro graphic studies, two species, *Endocarpon rosettum* Ajay Singh & Upreti growing on brick and *Naetrocymbe saxicola* A.Massal & R.C.Harris on a lime plaster, were selected. Two substrata (a marble piece and a brick) were selected to estimate the hyphal penetration. Samples first embedded in resin, and prepared by following [29]. The thin cross sections of approximately 40 μm, petro graphic slides were investigated under electron microscopes.

RESULTS AND DISCUSSIONS

SEM – EDX
Various patterns of lichen growth could be observed (Fig.1), (A), (B), (C), (D),and (E). Here, (Fig.1) (A),(C),(D),(E), were epilithic lichen species while, (E) is endolithic species. All these species were growing on Calcium rich substratum. The hyphae within the substratum were also visible (Fig. 2) (A), that shows lichen species *Leprocaulon coriense* hyphae penetrating the lime plaster, and for this reason, the substratum provides a suitable environment for the lichen growth also. Therefore, both biological and non-biological agents like sunlight, air, rainfall play a role in the degradation of stones [30]. Some mineral particles are also visible. (Fig.2) (B), (C). In EDX (Fig. 3),(A),(B),(C) we can see the peaks of Ca, C, O, Al, Si, and Mg that represent the presence of calcium oxalate (Ca, C, O) [31].Carbonic acid, that is a consequence of respiration, and produced with the reaction of H_2O and CO_2, that show chelating activity and deteriorate the calcium-rich substrate, The peaks of Al Si and Mg shown in (Fig. 3) (A),(B),(C) represent that lichen colonization have positive correlation with its silica rich substratum. Some amount of Ti and, S also present in (Fig. 4) (B) that represents the presence of anthropogenic activity in the particular area. [22].

Petro graphic studies
In petro graphic images, in the case of epilithic lichens, apothecia of *Endocarpon subrosettum* can be observed on the upper surface of the brick (Fig.3). (A), (C), and spore-like structure are also visible in the middle part of the section (Fig.3), (D). While in the case of endolithic lichen, *Naetrocymbe saxicola* clear cavities are visible throughout the thin

sections (Fig.3), (B), (E). Hyphae are also visible through the thin section of marble (Fig.3), (F). In the case of endolithic lichen species that are growing in the marble cavities, which can be seen throughout the thin sections, these cavities are varied in their size (186.76μm- 707.18μm) and could be the result of chemical activities of lithobiont (Fig. 3), (B),(E). The colonization of endolithic lichen is very well distributed on the surface, and inside the stone as well. Moreover, the nature, and chemical composition of the substratum also play key role in the deterioration of it, if the substratum has loosely arranged particles in it then it will provide a good environment to the organisms as well [32].

CONCLUSION

There is not much information available regarding studies on bio deterioration of monuments by lichens in India. However, some researchers reported about bio deterioration on monuments in some states[33],[34],[35]. The present study on lichens causing bio deterioration will act as a baseline data that can be used as a useful tool for future lichenological studies on monuments in the study area, and helpful to develop conservation strategies of monuments, may also support bio monitoring studies [36],[37]. Although some studies report lichens as a bio-protective agents rather than bio-deteriorative [38], but role of lichens as a bio-deterioration or protector depends on many aspects like chemical composition, and texture of substratum and chemical compounds produced by lichen. Many conservation strategies such as treatment with plant extracts, chemical treatments have been suggested by researchers for the conservation of monuments [39],[40],[41]. Indian subcontinent is rich in ancient heritage of monuments thus there is a need of cost effective approach to deal with their bio deterioration problems.

ABSTRACT

In order to improve the employability skills and make the students ready for industry, the government of Tamil Nadu has initiated Naan Mudhalvan massive up skilling platform. This platform enables the students to get training in the chosen field of interest and helps them to achieve their career goals. Various courses are offered particularly to the students of engineering colleges in Tamil Nadu. One such course is professional development course. In this course, the students are being taught Microsoft office fundamentals. In order to measure the effectiveness of this course, a study was conducted among the engineering college students of Tamil Nadu and regulatory fit theory was used to analyse the data. The study reveals that the students have benefitted by this course.

Keywords: Regulatory fit theory, Employability skill, Correlation Coefficients, ANOVA,SPSS software

INTRODUCTION

In India, both the central and state governments are taking serious efforts to bridge gap between the industry and the educational institution. Particularly, the Government of Tamil Nadu has initiated "Naan Mudhalvan" massive up skilling platform to make the students industry ready. Through this programme, the students of Engineering Colleges in Tamil Nadu are being taught varies courses, to say a few, AI &ML, Cloud Computing etc. These courses are offered via online mode or offline mode or in hybrid mode (online as well as offline). Every institution deputes one instructor to each course; industry person or expert first gives hands on training to course instructors. The

67788

instructors of courses concerned in turn monitor the students, help them to learn the course, to do assignments and projects. Some of these courses are mandatory and some are offered as value added courses. After successfully completing these courses, students can drop one or two professional or open elective papers and the credit earned through Naan Mudhalvan courses can be transferred and considered for awarding Degree to the student concerned according to the academic regulations. The professional development course is being offered in 3rd semester to engineering college students (Regulations-2021; Anna University) via online mode; through which the students are being taught Microsoft Office fundamentals. The purpose of this course is to make the students to learn and utilise Microsoft word document, Excel, Power point, Outlook, Access, Publisher and One note. The students can access the course contents which are recorded videos via the link provided to them. At the end of each session (some number of videos), the students have to do assignments and these are uploaded. At the end of the course, they have to submit a project assigned to them. The students were assessed by both the internal and external instructors and final score is calculated by the marks awarded by the instructors. As it is an online course and the score obtained by them can be transferred and considered for awarding Degree, it helps to know how students perceive the course and to measure the outcome of the course. A study among engineering college students was carried out for this purpose, and the regulatory fit theory was adopted. The data were analysed using SPSS software. As stated by the regulatory focus theory [1-2], there are two different motivational systems that control all goal-directed activity .Each of these two survival-related processes, referred to as promotion and prevention, has a specific purpose.

Promotion-focused people pay more attention to information about positive outcomes and favour eager strategies to gain advantages; prevention-focused people, on the other hand, typically pay more attention to information about negative outcomes and favour vigilant strategies to prevent potential losses [3].According to Wang et al. [4] intrinsic motivation serves as a bridge between promotion focus and creativity. Regulatory fit theory and cultural values orientation were applied by Chan et al. [5] to forecast the efficacy of public service advertising appeals. Yang [6] showed that the prevention regulatory focus fit strengthened the positive association between the prohibitive voice and safety performance evaluation. This finding is consistent with a considerable amount of literature and suggests that promotion focus can expand a person's attention and is helpful in acquiring of more extensive cognitive elements, which benefit fluency and flexibility [7-8]. According to the regulatory fit theory, a person who is more focused on advancement will be driven to reach important goals and be aware of opportunities for development. A person who is more concerned with prevention will be attentive to the occurrence of hazards and motivated to avoid security dangers. This relates to the requirement for regulatory fit. As a result, we suggest the two following hypotheses that are connected to the condition of regulatory fit:

H1: A person with a high promotion focus can perceive course material far more clearly than a person with a low promotion focus.

H2: A person with a strong focus on prevention will significantly better understand the course material than a person with a low focus on prevention.

MATERIALS AND METHODS

A total of 140 engineering college students currently in their 4th semester, in Tamil Nadu, were informed about the study. They were informed that the details will be kept in secret and those did not want to participate could withdraw from the survey. The questionnaires with three parts were distributed to the students:

Part-1 asks the personal details of the students like name, age, date of birth, branch of study etc.Part-2 contains the Regulatory Focus Questionnaire: six numbers of promotion focused questions and 5 numbers of preventive focused questions as in [3].Part-3 contains questions that ask the students about the level of knowledge they have acquired after this course such as: "After this course, your knowledge level in Microsoft word document" in 5-point scale ranging from 5 (Excellent) to 1(Not Satisfactory).Finally, 91 students responded, of which 53% are male and 47% are female. First the individuals were divided into 8 sub-groups as follows and for each group, correlation analysis was made between the scores obtained by the individuals in Part-2 and Part-3.

Group 1: Low Promotion Score and new to Microsoft Office Fundamentals.
Group 2: High Promotion Score and new to Microsoft Office Fundamentals.
Group 3: Low Promotion Score and not new to Microsoft Office Fundamentals.
Group 4: High Promotion Score and not new to Microsoft Office Fundamentals.
Group 5: Low Preventive Score and new to Microsoft Office Fundamentals.
Group 6: High Preventive Score and new to Microsoft Office Fundamentals.
Group 7: Low Preventive Score and not new to Microsoft Office Fundamentals.
Group 8: High Preventive Score and new to Microsoft Office Fundamentals.
Secondly, ANOVA tests were conducted to test the aforementioned hypotheses.

CORRELATION ANALYSIS

The Table1 shows the correlation coefficients between the individual's promotion score, preventive score and the subject score. It shows that there is a low positive correlation between promotion score and subject score and there is a very low negative correlation between preventive score and the subject score. Assuming that the promotion scores between 0 to 20 as Low Promotion Score (LPS), the correlation coefficient is found between the LPSs and the Subject Scores (Subs) of the individuals who were new to the course. Table 2 Shows that there is a very low negative correlation between them. Assuming that the promotion scores between 21 to 30 as High Promotion Score (HPS), the correlation coefficient is found between the HPSs and the Subject Scores (Subs) of the individuals who were new to the course. Table 3 Shows that there is a low negative correlation between them. From Table 2 and Table 3, it is seen that whether the promotion score is low or high, if the individual is new to the course, there is a negative correlation between the promotions score and the subject score. The correlation coefficient is found between the LPSs and the Subject Scores (Subs) of the individuals who were already familiar to the course. Table 4 Shows that there is a very low positive correlation between them. So, the individual motivated himself to learn further about the course.

The correlation coefficient is found between the HPSs and the Subject Scores (Subs) of the individuals who were already familiar to the course. Table 5 shows that there is a negligible correlation between them. Table 5 shows that the course does make any changes in the individual. Assuming that the preventive scores between 0 to 20 as Low Preventive Score (LPreS), the correlation coefficient is found between the LPreS and the Subject Scores (Subs) of the individuals who were new to the course. Table 6 shows that there is a moderate positive correlation between them. The correlation coefficient is found between the LPreSs and the Subject Scores (Subs) of the individuals who were already familiar to the course. Table 7 shows that there is a low negative correlation between them. Assuming that the preventive scores between 21 to 25 as High Preventive Score (HPreS), the correlation coefficient is found between the HPreSs and the Subject Scores (Subs) of the individuals who were familiar to the course. Table 8 shows that there is a perfect positive correlation between them.

ANOVA

ANOVA Test 1

Subject scores of 6 individuals with high promotion score and subjects scores of 8 individuals with low promotion score are taken. ANOVA test for single factor is conducted at 5% level of significance and displayed in Table 9 and Table 10. Since P-value(0.740683) is much higher than $\alpha = 0.05,$ we have to discard our hypothesis that a person with high promotion focus will perceive the content of the course more effectively than a person with low promotion focus in a significant way.

ANOVA Test 2

Subject scores of 2 individuals with high preventive score and subjects scores of individuals with low preventive score are taken. ANOVA test for single factor is conducted at 5% level of significanceand displayed in Table 11 and Table 12. Since P-value(0.624195) is much higher than $\alpha = 0.05,$ we have to scrap our hypothesis that a person with

high prevention focus will perceive the content of the course more effectively than a person with low prevention focus in a significant way.

CONCLUSION

In the present study, the ANOVA test for 1 factor at 5% level of significance reveals that there is no significant difference between the promotion focused and preventive focused individuals in perceiving the course. However, the correlation analysis shows a moderate positive association with low preventive score (new to the course) and the corresponding subject score. That is, an individual with low preventive score who is new to the course, may be cautious that he/she should not be rejected while appearing for the interview and to become an employable graduate, is motivated to learn the course. Also, there is a low positive correlation between low promotion score (familiar to the course) and the corresponding subject score. That is, an individual with low promotion score who is already familiar with the course, may be motivated to gain the satisfaction of becoming an employable graduate and getting job. In future, a greater number of colleges and a greater number of factors may be analysed to know the outcome of the course.

LIMITATIONS
Only one Engineering College students were taken for the survey. The gender, studied in a school located at Rural/Urban, etc., of the participants have not been considered.

DATA AVAILABILITY STATEMENT
The authors will freely share the unfiltered raw data that supports the results of this article.

ABSTRACT

Diabetic Retinopathy (DR) is a complication that occurs due to diabetes and leads to abnormalities on the retina. The person may loss vision if they are not treated in the early stage. Various research article has contributed detection tools based on the machine learning architecture for ophthalmologists to diagnose the disease and categorizes the disease stages in the fundus images. A novel Discriminative Convolution Neural Network 121 layer architecture has been architected to diagnose the DR. In the first phase of the proposed architecture, the retinal images are enhanced using different techniques, from the pre-processed images, the features are extracted using Orient Fast and Rotated Brief technique. Feature of the retina covers Blood Vessels, Fovea, Optic distance, Blot Haemorrhages, LBP energy Exudate number and its area, Macular Edema, Micro aneurysms, and LBP Entropy. On obtaining those features, the inferential model causes false results on processing it. Hence, feature reduction has to be influenced in this work through Linear Discriminant Analysis that excludes the extraneous features before the segmentation process. Further, the selected features are segmented as normal and abnormal features employing the Fractional order Particle swarm optimization model. Finally, the segmented abnormal features are fed into the Discriminative Convolution Neural Network-121 architecture that detects retinal infection development and the stages of the disease. The outcome of the proposed system has been evaluated by using MESSIDOR and Image-Ret Database. The proposed architecture produces good results compared with the existing method.

Keywords: Discriminative Convolution Neural Network, Diabetic Retinopathy, Oriented Fast and Rotated Brief, Linear Discriminant Analysis, Particle Swarm Optimization

INTRODUCTION

Diabetic Retinopathy (DR) occurs due to the variation in the blood vessels. The size of the blood vessels may be changed due to DR in terms of length, width and diameter [1]. DR has created new, small and abnormal blood vessels that may cause bleeding in the retina called neovascularisation, if it goes unnoticed in the early stage, the person may lose vision. Health experts refer to the DR as two types, Proliferative Diabetic Retinopathy (PDR) and Non-Proliferative Diabetic Retinopathy (NPDR). PDR is the final stage of DR. Small fragile vessels are grown in the retina. Sometimes the PDR is diagnosed by the presence of blood in the vitreous cavity. The early stage DR is known NPDR; our proposed system aims to detect the lesions in the initial phase and to avoid vision loss. The final stage of NPDR is diagnosed by the bleeding in the retinal area and the presence of a new tiny blood vessel branch. The aforementioned abnormalities are identified during pathology and anatomy study of the retinal images, it will grade the existence of lesions -like Microaneurysms, haemorrhages and exudates[2]. Figure 1 represents the different symptoms of DR. These complications may occur at any stage of DR. According to the World Health Organisation (WHO), health reports and journals, the number of people affected the diabetes increased four times within 35 years of time and in India number of persons with diabetes may be 120 million by 2023. In manual observation of the retina, the tiny vessels may go unnoticed also it is a time-consuming process. Hence, health experts are in need of a computer-aided diagnosis system to diagnose the DR in order to provide the correct treatment in the early stage. In this article, a novel Discriminative Convolution Neural Network 121 layer has been proposed with different steps, which includes (i) pre-processing, (ii) Feature Extraction, (iii) Feature reduction, (iv) Segmentation and (v) Classification. The prediction of the lesions and severity of the DR is derived from the prognostic factor, which is based on DR lesions and the ground truth data of the retina. The second segment describes the study of existing learning methods for diabetic retinopathy classification, third section describes the current architecture, fourth section presents the outcomes of the proposed method using multiple different datasets, and summarises the overall proposed system in the final section.

Related Works
The following section discuss about the existing learning architectures to predict the DR as well as the classification of color fundus images.

Machine Learning
Many studies have been carried out to diagnose and classify DR using Machine Learning techniques. Ab Kader *et. al*, presented a paper to find the optimal performance in DR classification. In this study, 3 classes such as patients who do not have DR, PDR and NPDR are considered [4]. Du J *et al*, proposed a model, which differentiate the DR lesions effectively using descriptors. Shailesh Kumar *et al*, contributed a model for classification using Radial basis function [6]. Yadav *et al*, extracted the features from the segmented region using statistical technique and the features were fed into the different classifiers, which classify the retinal lesions [7]. Zhang *et al*, characterized the new candidates and classified the lesion [8]. Kaur presented a technique that segment the DR lesions using dynamic thresholding irrespective of bright and weak boundaries [9].

Deep Learning
Deep Learning (DL) methods require fewer human interventions since these methods learn the appropriate features directly from the data, and no handcrafted features are generated. Many researchers have developed many DL algorithms for diagnosing and classifying retinal lesions in medical images DL is learn from a large dataset. Many researchers for better classification and diagnosis of DR on disease pathology and anatomy have presented the deep learning models. These architectures are able to identify and learn the retinal features and severity of the diseases by grading the lesions. GoogLeNet and AlexaNet are suitable CNN architectures for exploring the disease type, also locating the optic disc without reducing the three-dimensional arrangement of the information [10].

Wang *et al*, proposed a deep model namely DCNN that automatically learns the deep facts of retinal lesions and the Random Forest method is employed to identify the DR lesions [11]. Yaqub *et al*, have presented DL-based image reconstruction for different retinal images modalities [11]. Kalyani *et al*. presented a Capsule network to detect and classify DR [13]. Heydon *et al*, proposed Artificial Intelligence and DL methods for clinically equivalent and speedy diagnosis of DR, especially for the large set of databases [14]. Ting *et al*, have diagnosed the DR using the DL system, that system was trained for different ophthalmological diseases such as DR and glaucoma [15]. Oh *et al*, presented ultra-wide-field fundus photography techniques [16]. Gaurav *et al*, presented different CNN learning models for DR detection [17]. Diabetic Retinopathy disease classification based on the lesion appearance and its characteristics is carried out using deep learning architecture termed Dense CNN. It has been exploited, as it is more advantageous in discriminating the lesion's features efficiently and accurately in order to prevent the disease from multiplying and spreading.

From the above study of deep learning and machine learning models, these models first pre-process the fundus images then features are extracted from the enhanced image. Further, the features are segmented and fed into different classifiers. The effective utilization of relevant features is not concentrated in the existing models. Hence, we need an automatic diagnosis system to identify the relevant features for diagnosing the DR lesions. There is a need to diagnose the DR lesions at an initial stage, hence the experts can provide the treatment at the right time and avoid vision loss, Also accuracy of the DR detection system to be improved. The proposed Deep learning architecture follows the feature reduction process and utilizes the relevant features for DR classification.

Proposed Model
For detecting diabetic retinopathy disease, a new deep learning architecture called the Discriminative Convolution Neural Network framework has been developed. Microaneurysms, haemorrhages, hard exudates, and soft exudates are just a few of the imaging elements that can grade the different stages of the lesion and aid in diagnosis. These lesions are predicted using various processes as illustrated in Figure 2.

Image Pre-processing
In this stage, the color fundus images are enhanced using different pre-processing techniques. Image Denoising – The non-linear filter called the Median filter can denoise the image and sortspixels in the neighbourhood according to the gray level. The result of Median filter is illustrated in Figure 3[18].

Contrast Enhancement
The Contrast Limited Adaptive Histogram Equalization (CLAHE) method can work on the minor section of the images and the performance can be computed through image histograms. Figure 4 represents the CLAHE result.

Feature Extraction
The output of the CLAHE method is the input of the Feature extraction process, features are extracted from the image using the Oriented FAST and Rotated BRIEF (ORB) method. It is used for texture analysis of the fundus images. ORB is a combination of Feature Accelerated Segment Test (FAST) and Binary Robust Independent Elementary Feature (BRIEF). The FAST method detects the edges and the BRIEF method provides the descriptor. The FAST method does not compute the location of the fundus image, this limitation is overcome by the ORB method [20]. Figure 5 represents the different features of retinal fundus images.

Feature Reduction: Linear Discriminant Analysis
Extracted features through the ORB technique are given to the Linear Discriminant Analysis (LDA) process for feature reduction. This process extracts only the important discriminative features that are relevant for DR detection. In this proposed work, linear discriminant analysis is used to reduce the number of retrieved features for diabetic retinopathy using the ORB technique. It represents a vector made up of variation structures, which is an aggregation of detected variables with the best weights. Additionally, it shows how the Fisher criteria function's picture variation varies in terms of variance. The most variation is shown in each aspect of the photograph. Since patterns in high-

dimensional data can be difficult to identify, LDA does not reduce the significant information instead the number of dimensions are reduced. The feature vectors of the blood vessel patterns make up the final component [20].Feature reduction process result shown in Figure 6

Fractional order Particle Swarm Optimisation Segmentation
The normal and abnormal features are segmented by using the Particle Swarm Optimisation (PSO) technique from the selected discriminative features. The PSO fitness function utilizes function particle and velocity study using the obtained discriminative features. Fractional order PSO fitness function is applied to segment the retinal lesions effectively for the investigation.

Lesion Particle Analysis
Particle is a parameter used to differentiate between normal and pathological macular edema. Macular edema makes up a Particle of the PSO Model. When there is a slight variation between the image area of the edema section and the image of the edema reflected from the major axis, a particle has been obtained. The four axes—vertical, horizontal, and two diagonal—are suitable for indicating the rate of symmetry [21]. Figure 7 displays the fundus image's asymmetry analysis. Border Irregularity is the important parameter that computes the edge type of edema on a range of sizes.The radial distance of the determined section will be computed with a large variance for the edema with irregular boundaries. M depicts the Centroids' g and the average distance d between boundary points.

$$R_d = \frac{1}{m} \sum_{k=0}^{n} p\varepsilon C(d(p,g) - m))$$

Colour Texture Analysis is used as a parameter for identifying color and textural variations in the edema area.

Correlation
It is calculated using the pair wise associations of the features that were taken from the variance of the color texture's edema region. It is calculated as follows,

$$Ci = \frac{1}{n} \sum_{x\varepsilon C}^{1} (x - m\,i)(x - mj)^T$$

Contrast is calculated as follows

$$\boldsymbol{Cr} = \frac{1}{n} \sum (mi - mj)(mi - mj)^T$$

To produce the segmentation results as normal or abnormal features, the value of all particles is aggregated according to the fitness function on maximizing pair wise correlation.

Discriminative Convolution Neural Network
In this section, a 121-layered Discriminative Convolution Neural Network is used to segregate abnormal characteristics associated with diabetic retinopathy. Through prognostic factors of pictorial and functional results in several retinal infections in different stages based on detection of DR lesions. Discriminative Convolution Neural Network determines the progression of the disease and the severity of the disease. With the help of the LDA and PSO Approaches, GoogLeNet architecture will provide feature maps with the minimum possible resolution and contextual information about each feature.   The DCNN-121 network design includes five convolutional layers with 5 x 5 x 5 element kernels. To identify the various types of diabetic retinopathy conditions, it learns the edema-targeted aspects.

Max pooling Layer
A 2x 2x2 max-pooling layer is used for observing the underlying connections between the ensembles of features with desired properties that have been rendered as parameters with spatial invariance calculation of the disease characteristics. The severity of diabetic retinal edema is identified with the existence of different DR lesions. It improves the model's ability to generalize even further.
The mapping of features is provided $F \varepsilon R^{C*H*W}$

Network Layer

Through their inherent processes, the network layers obtain the global spatial imaging features of attributes as well as the distinguishing characteristics between the various phases of diabetic retinopathy on the ReLu algorithm function of activation function. The network layers manage low-level to abstract aspects hierarchically. [22].

Activation Function

The activation function for the rectified linear units (ReLU) in the architecture causes nonlinearity in the model. The batch normalization process improves the system generalization. The Figure 8 illustrates the CNN GoogLeNet Architecture to recognize disease classes,

Data Prediction

Coloured saliency map technique is used for data prediction. The color depicts the system's stage representation location, which is largely discriminative. The Saliency Map displays relatively distinct significant abnormal regions (such as the prognostic region's peak point). The proposed DCNN-121 model highlights the abnormalities in the retina for easy identification of DR. Instead of using the random parameters, the model uses the discriminative features to identify the abnormalities in the retina. We would anticipate the system to highlight the potential areas of diabetic retinopathy in diseased instances.

EXPERIMENTAL RESULTS

MAT LAB (version 2019b) simulates the model that uses the MESSIDOR and ImageRet fundus image dataset to assess the model. It is quite difficult to train and validate the system because of the processing of the image. The proposed model validated 20% of the data and 80 % of data are used to train the appropriate expert lesion characterization. In the training process, the dataset is divided into 60% for training and 20 % for validation. To stop data leakage and improve the training model's accuracy, 5-fold cross-validation is used in this instance. The proposed model uses the training parameters such as MRP Volume as 3*3*100 pixels, Learning rate as 10^{-4},Cross entropy loss function, Batch size is 25 and finally 50 Max epoch.

Median Filter

Peak Signal to Noise Ratio (PSNR) indicates the pre-processed image's quality after the median filter has been applied. Using mean square error, the PSNR value is obtained [23]. Structured Similarity Index Measure (SSIM)calculates the structure similarity between the original and contrast improved image [24]. Table 1illustrates the outcome of the PSNR and SSIM values for median filter outcomes.

CLAHE Process

The projected contrast enhancement process results in the figure demonstrate how well this technique works to save important image details while sharpening fundus features. Additionally, it improves the accuracy of the classification steps based on the DCNN-121. Figure 9 illustrates the CLAHE output [25].

Feature Detectors

Execution time and error rate have been used to calculate the rate at which the feature descriptors perform in terms of identifying the critical spots. The proposed system effectiveness is estimated based on the variance in pixel values for the descriptor features is determined by the error rate.

$$Error\ Rate = (FP + FN)/Total$$

Table 2 represents the result of the feature descriptors represented error rate.

Classification

At each fold of validation, the proposed model utilized texture level information to estimate the classification performance. Correlation is a performance indicator used to calculate classification performance. The model

Geethalakshmi and Meenakshi

provides 0.90 correlation value. The similarity of an image instance inside the class was evaluated using the correlation coefficient. The following equation represents the correlation coefficient.

$$corr\left(\frac{A}{B}\right) = \frac{\sum_{i=1}^{M} \sum_{j=1}^{N} (A_{i,j} - \bar{A})(B_{i,j} - \bar{B})}{\sqrt{\sum_{i=1}^{M} \sum_{j=1}^{N} (A_{i,j} - \bar{A})^2 \sum_{i=1}^{M} \sum_{j=1}^{N} (B_{i,j} - \bar{B})^2}}$$

The results were cross-validated using ground truth images for lesions. The performance of the proposed model has been measured with Dice Similarity Coefficient, sensitivity, specificity, precision, F1 score, Recall and accuracy, represented in Table 3. Performance analysis of the proposed model on two dataset against the different lesion produces with 99.83% and 99.28% Accuracy. The average performance metrics values of the proposed model for two datasets are represented in TABLE 4. Based on the classes generated for the classification of DR lesions, the performance outcomes of the accuracy of the current architecture and the existing model are estimated. The proposed model is compared with the existing Dense CNN models and the results are illustrated in Table 5 and Figure 10. Discriminative CNN 121 layered architecture learning methods perform better than the existing disease analysis method. It proves that high true positive values represent the lesion appearance related to diabetic retinopathy. The proposed model provides improved performance with reduced features using linear discriminant analysis. The performance produces the nearest results on validating with ground truth data. Classification of deep features that reduce over fitting.

CONCLUSION

This work utilizes GoogLeNet Architecture to design and implement a discriminative Convolution Neural Network 121 layer towards screening of DR with identification, classification and forecasting of abnormality grading in retinal fundus pictures of the retina on MESSIDOR Dataset and Image-Ret Dataset. The DCNN-121 architecture is employed to design and implement many processing steps. This includes the CLAHE technique to enhance picture contrast, the ORB technique for extracting features, the LDA technique for reducing features, and the PSO fitness method for segmenting the normal and abnormal features. In the final analysis, the DCNN-121 architecture is used to assess diabetic retinopathy disease together with patient prognosis. It has been demonstrated through experimental research that the proposed architecture outperforms the existing deep learning model in comparing with different parameters such as accuracy, Sensitivity, Specificity and Dice Coefficient.

ABSTRACT

Adrenal insufficiency (AI) is an endocrine disorder manifested by adrenal hypo function, which results in insufficient glucocorticoids and mineral ocorticoids, particularly cortisol. It is a frequent ailment with a variety of causes that can be classified as primary, secondary, and tertiary. 21 alpha-hydroxylase deficiency and 17-hydroxylase deficiency, congenital isolated ACTH deficiency and congenital ACTH deficiency, and an excess of adrenal steroid hormones as well as adrenal medulla dysfunction are the main causes of primary, secondary, and tertiary adrenal insufficiency, respectively. AI symptoms overlap with those of other somatic diseases, which are often missed or misunderstood. The adrenal corticosteroid hormones, their regulatory peptide hormones, and stimulation tests are used to make the diagnosis. The goal of treatment is to use glucocorticoid and mineralocorticoid hormone replacement to personalise the patient's daily demands. In this review, we have discussed the aetiology, pathophysiology, diagnosis, and management of AI.

Keywords: Adrenal insufficiency; Cortisol; 21 alpha-hydroxylase deficiency; 17- hydroxylase deficiency; Glucocorticoid; and Mineralocorticoid

INTRODUCTION

Adrenal insufficiency (AI) is an endocrine disorder manifested by adrenal hypo function, which results in insufficient glucocorticoids and mineral ocorticoids, particularly cortisol [1, 2]. The symptoms are frequently nonspecific and subtle and include fatigue, unexplained weight loss, anorexia and nausea, postural dizziness, and hyper pigmentation [3, 4]. Electrolyte imbalances (hyponatremia and hyperkalaemia) are also possible [5]. It can cause significant morbidity and mortality in both children and adults [6–11]. It is classified as primary, secondary, or tertiary based on its cause. The autoimmune destruction of the adrenal cortex is the cause of primary adrenal insufficiency (PAI), also known as autoimmune adrenalitis or Addison's disease. PAI is rare, with only 10–20 cases for every 100,000 people. The most common inherited type of PAI is congenital adrenal hyperplasia (CAH). CAH is a group of auto somal recessive disorders caused by an enzyme deficiency that results in defects in the biosynthesis of steroid precursors. The most frequently detected deficiency is 21-hydroxylase (21-OHase) [2, 12, 13]. In the first instance, hyponatremia, hypoglycaemia, and hyperkalaemia in the first few weeks of life indicate adreno-cortical insufficiency caused by CAH [13]. Secondary adrenal insufficiency (SAI) is caused by pituitary gland function defects such as pituitary adenomas or their therapies, resulting in a decrease in adreno corticotrophin hormone levels (ACTH) [2, 14]. SAI has an incidence of up to 42 cases per 100,000 people. Cancer immunotherapy and long-term opioid use have been associated with an increased risk of SAI. Tertiary adrenal insufficiency (TAI) is caused by a decrease in the level of corticotrophin-releasing hormone (CRH) released from the hypothalamus, and exogenous steroid use is considered a common cause [2, 14]. Depending on the route of gluco corticoid administration, TAI risk is reported to be 4.2% for intranasal delivery, 20% for inhaled glucocorticoid therapy, 49% for oral preparations, and 52% for intra-articular administration [1]. In this overview, we explained the hypothalamic-pituitary-adrenal (HPA) axis, aetiology, patho physiology, clinical presentation, diagnosis, and management of adrenal insufficiency.

Hypothalamic-Pituitary-Adrenal (HPA) Axis
External physiological stimuli such as changes in the light/dark cycle or the presence of real or perceived stress activate the parvocellular neurons (PVN), which are a densely packed set of neurons located in the hypothalamus [15,16]. PVN secretes corticotropin-releasing hormone (CRH), arginine, and vasopressin to regulate adreno corticotropin (ACTH) secretion (Figure 1). It also regulates hunger and autonomic functions, inhibits nociception, and promotes analgesia [17]. The secreted hormones in the hypothalamus will be carried through the median eminence capillaries and magno cellular neurons, a part of the portal system, into the pituitary gland. The median eminence capillaries carry CRH from the PVN into the anterior pituitary to produce ACTH in corticotroph cells. where magno cellular neurons carry arginine and vasopressin into the posterior pituitary to produce vasopressin and oxytocin [18, 19]. This travels through the bloodstream to the adrenal cortex's zona fasciculata, where it activates the production and subsequent release of gluco corticoids [20].

Aetiology of Adrenal insufficiency
Primary adrenal insufficiency (PAI) is a rare but potentially fatal illness caused by a number of factors. The most common aetiologies are haemorrhage, infiltrative disorders or metastases, infection, and drug effects. However, congenital adrenal hyperplasia is due to 21 alpha-hydroxylase deficiency, 11 beta-hydroxylase deficiency, 17 alpha-hydroxylase deficiency, P450 oxidoreductase deficiency, steroidogenic acute regulatory protein deficiency, cholesterol side-chain cleavage deficiency, and 3 beta-hydroxysteroid dehydrogenase deficiency [21–23]. SAI can be caused by congenital isolated ACTH deficiency, congenital ACTH deficiency in combination with other pituitary deficiencies, anterior pituitary function deficit, variable immune deficiency syndrome, or acquired ACTH deficiency. TAI can be caused by an excess of adrenal steroid hormones as well as adrenal medulla dysfunction. Excess adrenal steroid hormones are seen in cases of Cushing syndrome, adrenal androgen excess, premature adrenarche, idiopathic excess, and mineralocorticoid excess. TAI with disorders of the adrenal medulla is present in adrenal medulla hormone deficiencies, primary tumours in the adrenal medulla, tumours (http://www.icped.org). The recent study focused on a genetic defect as a possible cause, such as nicotinamide nucleotide transhydrogenase (NNT),

minichromosome maintenance 4 (MCM4), thioredoxin reductase (TXNR2), and glucocorticoid resistance (GR, NR3C1) [24].

Pathophysiology

The adrenal cortex is regulated by two separate regulatory circuits: the HPA axis and the renin-angiotensin-aldosterone system (RAAS). Any external or internal factors that affect the regulatory circuits will compromise the adreno cortical zones of the adrenal cortex. which results in the depletion of glucocorticoids and mineralocorticoids. Depletion of glucocorticoids and mineralocorticoids also results from a lack of ACTH activation, as stimulation of ACTH will secrete adrenocortical hormones from the zona fasciculata and zona reticularis [1]. In the steroid biosynthesis pathways, the 17-hydroxylase enzyme is required for the production of cortisol and sex steroids. After the formation of pregnenolone and progesterone from cholesterol, the 17-hydroxylase enzyme is responsible for converting them into 17-hydroxypregnenolone and 17-hydroxyprogesterone, respectively. 17-hydroxypregnenolone and 17-hydroxyprogesterone are the precursors to cortisol, estrone, and estradiol. A deficiency in 17-hydroxylase by a genetic mutation in the gene CYP17A1 also causes lower glucocorticoid and androgen production [25].

Clinical presentation

The clinical manifestation of adrenal insufficiency varies depending on the hormone deficiency, i.e., glucocorticoid deficiency and mineralocorticoid deficiency [2, 3, 5, 6, 26].

Gluco corticoid deficiency

The most common signs and symptoms of glucocorticoid deficiency are fatigue, weakness, anorexia, weight loss, nausea, vomiting, abdominal pain, arthralgia, myalgia, salt craving, dizziness, fever, skin pigmentation, hypotension, hypo glycaemia, and dehydration.

Mineralo corticoid deficiency

The most common signs and symptoms of mineralocorticoid deficiency are anorexia, weight loss, nausea, vomiting, abdominal pain, arthralgia, myalgia, salt craving, dizziness, skin pigmentation, hypotension, and dehydration.

Diagnosis of adrenal insufficiency

Adrenal insufficiency is under diagnosed because of the symptoms that overlap with other somatic diseases. Two-thirds of patients presenting with signs and symptoms of adrenal failure had multiple hospital visits before receiving an accurate diagnosis. Tests for blood cortisol, ACTH stimulation, insulin tolerance, CRH stimulation, and blood tests for autoimmune Addison's disease are used to differentiate the types of adrenal insufficiency. Computed tomography (CT) scans and magnetic resonance imaging (MRI) can be used to detect changes in the pituitary and adrenal glands. Along with these are routine blood tests for infections and serum electrolyte dis balance [27–29].

Management of adrenal insufficiency

Management must be targeted based on the cause of adrenal insufficiency. It is necessary to conduct a thorough investigation to determine the types and causes of adrenal insufficiency. Factors associated with developing adrenal disease *(haemorrhage, infiltrative disorders or metastases, infection, and drug effects)* should be identified and eliminated, as these will correct the condition on their own.

Glucocorticoid (GC) replacement therapy

Usually, oral hydrocortisone (15–25 mg twice or three times daily) is used as the primary treatment regimen for some time. The dosage is customised depending on the individual patient's requirements and the severity of their condition. Morning administration of half to two-thirds of the daily dose is recommended. Alternatives such as prednisone/prednisolone, cortisone acetate, and dexamethasone can also be used [30, 31]. Hydrocortisone is usually preferred above other alternatives because it closely mirrors the body's naturalcortisol production and has both glucocorticoid and mineralocorticoid properties [31, 32]. To avoid the potentially fatal condition known as an adrenal

crisis, stress dosage is necessary in situations like illness, injury, surgery, severe trauma, emotional stress, or other conditions that greatly raise the body's demand for cortisol. The precise stress dose regimen may vary depending on the individual, the strength of their initial medicine, the kind and length of the stressor, and other factors. Patients are advised to take their regular dose of glucocorticoids in double, triple, or more frequent doses throughout the day [21, 33, 34]. Hormone levels and clinical symptoms must be periodically observed to assess the efficacy of glucocorticoid replacement therapy and to avoid using excessive doses that could have undesirable side effects. An excessive dose or use for an extended period of time may cause adverse effects such as weight gain, high blood pressure, osteoporosis, mood changes, and an increased vulnerability to infections [32]. The patients are advised to adopt specific food and lifestyle adjustments, stress reduction methods, and exercise regimens.

Mineral ocorticoid (MC) replacement therapy

The synthetic mineralocorticoids fludro cortisone and fludro cortisone can successfully replicate the effects of cortisol in the body since they contain mineralocorticoid properties that are identical to those of natural mineral ocorticoids with greater potency and a longer duration of action. The two natural MCs, 11-deoxycortisol and aldosterone, are ineffective in the treatment of AI [35]. The starting dose of FC is 50 to 200 mcg per day in a single dose and then titrated to 25 to 50 mcg per day [21, 33, 35, 36]. Fludrocortisone therapy requires adjustments for each patient to attain ideal blood pressure and electrolyte balance. To compensate for sodium loss brought on by an aldosterone deficit, patients should be encouraged to consume more salt in their diet [37]. AI patients require lifelong steroid therapy, and careful monitoring is required to avoid under- or over replacement. The patients should be assessed carefully by measuring BP, inquiring about salt carving, and identifying the presence of peripheral oedema [33].

Gene therapy and gene editing currently under the clinical development
Adeno-Associated Virus (AAV) Vectors for Gene Replacement

The use of adeno-associated virus (AAV) vectors in gene replacement therapy for adrenal insufficiency appears promising. To re-establish regular hormone production, functional genes are delivered by AAV vectors into the adrenal glands. Research in preclinical animals suggests that AAV-based gene therapy may provide a safe and durable treatment option for genetic causes of adrenal insufficiency. Although this method of treatment is still in development, it offers hope to individuals who have specific genetic abnormalities that result in adrenal insufficiency [38].

CRISPR-Cas9 gene editing

With its ability to precisely fix mutations associated with adrenal diseases, CRISPR-Cas9 holds hope for individualised therapy. In animal trials and preclinical research, it has shown promise in treating a few inherited types of adrenal insufficiency. However, further research is required before adopting this strategy in therapy due to important issues about safety, delivery modalities, and unintentional genetic modifications [39].

Gene therapy for congenital adrenal hyperplasia (CAH)

This strategy focuses on the underlying aetiology of CAH and involves delivering functioning genes into the body. Although the research is still in the experimental phase, encouraging outcomes in preclinical tests and animal models give optimism for possible therapeutic uses. Prior to gene therapy becoming an effective treatment for people with CAH, challenges, including guaranteeing precise gene delivery and long-term safety, must be addressed.

Surgery

Surgery for adrenal insufficiency is usually only performed in cases where there are particular underlying diseases, like adrenal tumours or some forms of congenital adrenal hyperplasia (CAH). Adrenalectomy (removal of one or both adrenal glands) or corrective surgery for congenital adrenal hyperplasia are the two main surgical procedures [40, 41]. When previous therapies fail to control severe cases of adrenal insufficiency, bilateral adrenalectomy (removal of both adrenal glands) may be considered the last option. This unusual treatment seeks to control excessive cortisol [21].

CONCLUSION

Adrenal insufficiency is a disorder that affects the glucocorticoid and mineralocorticoid synthesis or supply. Obstacles in the steroidogenic pathway, such as CRH and ACTH hormones deregulation, may have an effect on the enzymes 21 alpha-hydroxylase and 17-hydroxylase leads to decrease or no production of endogenous corticosteroids. The treatment must be targeted based on the cause of adrenal insufficiency and many glucocorticoids and mineralocorticoids replacement therapy are used.

ABSTRACT

Super disintegrants play a pivotal role in the realm of fast-dissolving tablets (FDTs), arrange swift and efficient disintegration. These remarkable agents exhibit extraordinary absorption capabilities and elevate swelling properties. When an active ingredient, residing within a solid unit dosage form, come into contact with saliva, it undergoes rapid dissolution, bypassing the requirement for water or mastication – a phenomenon accordingly describe as super disintegration. Utilize the prowess of super disintegrants activate tablet disintegration within mere seconds, fostering heightened bioavailability within a short timeframe and reduced concentration. Among these, modified starch emerges as a prominent contender, adroitly serving as a super disintegrant in the formulation of fast-dissolving tablets. A diverse array of starches, to come from sources such as beans, sweet potatoes, potatoes, cassava, sorghum, wheat, and rice, can be treat with chemical and physical modifications to yield their enhanced counterparts. The characteristic attributes of modified starches encompass swifter disintegration, superior flow ability, direct compressibility, and versatile gelation across varying temperature regimes. Within the realms of pharmaceutical and medical domains, the utility of modified starches burgeons, as they are increasingly embraced as essential excipients and pivotal constituents in drug synthesis. By embracing modified starches, the solubility of otherwise recalcitrant drugs is magnified, precipitating a reduction in disintegration time. The discernible disparity in compressibility between native and modified starches further underscores their transformative potential. Notably, modified starches shine as super disintegrants in the construction of fast-dissolving tablets (FDTs), oral

Anilkumar Vadaga *et al.,*

disintegrate tablets, and rapid-release tablets, amplifying the solubility of challenging pharmaceutical agents.

Keywords: Fast dissolving tablets, Modified starches, Super disintegrants, Solubility enhancer

INTRODUCTION

Starch stands as the preeminent exemplar of a naturally abundant, biodegradable, cost-effective, and ubiquitously accessible polysaccharide and carbohydrate reservoir within the plant kingdom. This versatile biomolecule pervades various botanical components including leaves, flowers, fruits, seeds, assorted stem varieties, and roots. Comprising an exclusive assembly of glucose molecules, starch unites as a dynamic union of two distinct polymers – Amylose and Amylopectin. These intricate structures coordinate the plant's resource allocation and energy management, playing a pivotal role in the orchestration of metabolic processes essential to the plant's survival and prosperity.[1]. Starch assumes a ubiquitous role as an essential excipient in the fabrication of solid dosage forms, functioning as a versatile filler, disintegrant, and binder. Through meticulous modification, starches undergo transformative alterations to their inherent physical and chemical attributes, a metamorphosis that finds its application as potent disintegrants and superdisintegrants within solid dose formulations. The realm of solid oral dosage forms has witnessed the extensive incorporation of oral disintegrating tablets over multiple decades, embodying a dynamic evolution in pharmaceutical design and delivery. This enduring practice has contributed to clarify patient experiences and therapeutic outcomes [2]. Within the realm of disintegrants, a panorama of options unfolds, encompassing both natural and synthetic sources. Natural polymers like starches and gellan gum perform admirably in this capacity, facilitating efficient disintegration. In parallel, a collection of synthetic polymers, including polyvinylpyrrolidone, modified starches, cellulose derivatives, primogel, and cross povidone, stand as exemplars of ingenuity, propelling pharmaceutical innovation forward. This diverse spectrum of disintegrants empowers pharmaceutical formulators with a rich toolkit to tailor drug delivery systems for optimal efficacy and patient compliance.[2]. Superdisintegrants represent a specialized subset within the realm of disintegrants, carefully engineered to enhance the process of disintegration. These extraordinary agents possess excellent absorbent properties, fostering remarkable swelling attributes. Among the notable champions of super disintegration, Crospovidone (cross-linked povidone), Croscarmellose sodium (cross-linked cellulose), and Sodium starch glycolate stand as exemplars, each contributing to the art and field of rapid tablet breakdown [3]. Superdisintegrants have emerged as active components in the realm of fast-dissolving dosage forms, facilitating expeditious dissolution. A comprehensive survey of literature reveals a diverse array of both synthetic and natural superdisintegrants already established within the market landscape. Among these, starch, a versatile polymer, has garnered significant attention due to its accessible attributes, biodegradability, and biocompatibility. This polymorphic achiever has express the attraction of several researchers who have ingeniously modified its properties to unlock new dimensions of utility utility.[4],[5],[6].Upon extraction or isolation from plants, starch assumes two distinct forms: its unaltered, native state or as a modified derivative. In its native guise, starch retains its pristine, botanical essence. However, when it undergoes modification, intentional physicochemical adjustments are enacted, imparting fresh attributes to fulfil specific requisites. This deliberate transformation aims to bestow novel characteristics, tailored to meet desired benchmarks. This approach of modification is necessitated by the inherent limitations of natural starch. The unmodified variant often falls short of compatibility with various industrial processes and applications, primarily due to its incapacity to dissolve within solvents and maintain its integrity under the rigors of harsh industrial environments. Consequently, the tracking of tailored, modified derivatives arises as an imperative response to bridge the gap between natural starch's limitations and the demands of modern industrial exigencies.[7]. Starches undergo strategic modifications to usher in transformative alterations to their fundamental physical and chemical attributes. These purposeful modifications pave the way for a range of desirable traits in the resulting modified starches, including heightened flow ability, accelerated disintegration times, enhanced direct compressibility, and the remarkable ability to gel in both cold and hot water environments.[2]. In recent times, the pharmaceutical and

medical sectors have witnessed a marked upsurge in the utilization of modified starches, both as pivotal excipients and integral components in drug manufacturing. These tailored starch variants exhibit a remarkable capacity to enhance the solubility of poorly soluble drugs while concurrently curtailing disintegration time, thereby coordinate a harmonious synergy between efficacy and efficiency. Distinguished by their heightened compressibility compared to their native counterparts, modified starches hold the key to uniform product quality, underpinned by their consistent and reliable properties. In the dynamic domain of fast dissolving tablets (FDTs) and oral disintegrate tablets, these modified starches assume the role of superdisintegrants, wielding their transformative influence to elevate the solubility of challenging pharmaceutical agents. The ensuing cascade of benefits includes increase patient compliance, prevent the need for water consumption and expediting the onset of therapeutic action. Furthermore, the realm of FDTs unfolds as a promising alternative dosage form, proving particularly invaluable for geriatric and paediatric populations, as well as individuals with mobility limitations, cognitive impairments, or aversions to swallowing. The versatility of modified starches extends beyond these roles, encompassing five distinct categories: fat replacer, fat mimetic, texture improver, and high nutritional value, each contributing to the diverse spectrum of applications in the food industry.[8]. The integration of modified starch within disintegrants serves as a pivotal catalyst for the fragmentation of tablets and capsules into smaller fragments, facilitating the subsequent release of drugs for efficient absorption. Notably, starches exhibit rapid water absorption capabilities, further enhancing their role in promoting effective tablet breakdown.

This multifaceted modified starch serves as a versatile cornerstone, seamlessly transitioning between roles as a binder, disintegrant, and diluent within tablet formulations, all the while augmenting cold-water swell ability. Its influence extends to enhancing flow properties and serving as an integral component of direct compression processes. Notably, its solubility in cold water adds to its adaptability and utility. Functioning as a transformative agent, this modified starch also finds application as a lubricant and diluent, culminating in an overall enhancement of product performance. The integration of modified starch brings about notable advancements, particularly in elevating the solubility of poorly soluble drugs. Furthermore, the inclusion of modified starch leads to a reduction in tablet disintegration time, optimizing drug delivery. Diverse in its characteristics, this modified starch exhibits a gamut of attributes including heightened digestibility, adeptness as an emulsifying agent and emulsion stabilizer, proficiency as an encapsulating agent, capacity for cold-water swell ability, presence of charged starch molecules, refinement of cooking properties, facilitation of film formation, and contribution as encapsulation wall materials. Ultimately, the incorporation of modified starch signifies a pivotal step towards optimizing product performance and refining drug delivery modalities.

Types of Modified Starch [9].
Cationic starch.
Etherified starch.
Esterified starch.
Resistant starch.
Pre-gelatinized starch.

Cationic Starch
Cationic starches find their primary application as wet-end starches. Their versatile nature enables a diverse array of applications, notably as effective flocculants in water treatment, as well as valuable additives within industries such as textiles, paper manufacturing, and cosmetics. These starches are highly sought after for these specific functions owing to their affordability, exceptional compatibility, biocompatibility, and remarkable rate of degradation.[10].

Etherified Starch
Starches undergo etherification processes to yield products exhibiting exceptional pH stability. Among these, hydroxyalkyl starch derivatives play a pivotal role in various commercial applications. Notably, Hydroxypropyl starch, a significant derivative, finds its principal market in the realm of food applications, adding value and versatility to culinary endeavours.

Esterified Starch

Esterified starch, a prominent variant of modified starch, finds significant applications in both the food and adhesive industries. This distinctive category of starch is commonly generated via esterification or Trans esterification processes, wherein hydroxyl groups are strategically substituted with larger functional entities derived from free fatty acids or their derivatives. This transformative alteration grants esterified starch its notable attributes and renders it a valuable asset in diverse industrial domains [11].

Resistant Starch

The modification of resistant starch (RS) holds the potential to exert control over calorie and glucose intake.

Pre-gelatinized Starch

Pre-gelatinized starch (PGS) is the result of subjecting starch to a meticulous cooking process that culminates in complete gelatinization, coupled with a simultaneous drying procedure. This hybrid transformation is achieved through versatile drying methods such as extrusion, spray drying, and drum drying.[10].

Superdisintegrant

Superdisintegrants surpass traditional disintegrants by significantly enhancing disintegration time, even when employed at minimal concentrations ranging from 1 to 10% of the total weight of the dose unit. This class of agents serves to elevate the overall effectiveness of solid dose forms, ushering in enhanced therapeutic outcomes.

Superdisintegrants Provide the Following Advantages

Less concentration is required.

Compatible with a wide range of drugs and excipients.

It has no effect on compressibility or flowability.

Superdisintegrants Have the Following Disadvantages

They are sensitive to moisture, which causes instability.[12].

Expensive.[13].

Ideal Properties of Superdisintegrants [13].,[14].,[15].

1. It should disintegrate quickly.

2. It should have an excellent moulding and flow property.

3. It must have a good particle size, hydration capacity, and compressibility index.

4. It should be insoluble in water.

5. It should generate compactable and less friable tablets.

6. Effective at very low concentrations and should have higher disintegration efficiency.

7. Nontoxic and should have a pleasant mouth feel.

8. It should not form compounds with the medications.

9. It must be compatible with the other excipients and have desirable tableting qualities.

Starch Modification Methods
Chemical Modification of Starch
Cross-linking

The most common modified version used in industry is cross linking. It involves replacing the hydrogen bonds contained between starch chains with stronger, permanent covalent bonds. The most often utilised cross-linked starches are distarch phosphate or adipate. Cross-linked starches outperform native starches in acid, heat, and shear stability [16],[17], [10],[18].

Stabilization

This method is used in conjunction with cross-linking. Stabilisation is used to improve shelf life by allowing it to withstand temperature variations.[19].

Conversion

This is the general term for a variety of starch chain cleavage methods. Typically consists of acid hydrolysis, enzyme hydrolysis, and oxidation [20],[21].

Acid Hydrolysis

The acid reacts with and depolymerizes the amorphous areas of the granules, causing the granules to rupture fast when the starch is heated above its gelatinization temperature. This results in a hot, lower viscosity cooked starch that forms a stronger gel after heating than the native parent starch [20],[21],[22]

Enzyme Hydrolysis

Starch modified by the amylase enzyme yields a derivative with good adhesive properties. The extent of enzyme hydrolysis determines the range of chain lengths produced, such as glucose, maltose, oligosaccharides, and polysaccharides. Amylases preferentially and randomly target the 1 4-linkages of starch to create maltodextrins [20]., [23].

Oxidation

This is made by reacting native starch with sodium hypochlorite or peroxide. Oxidised starch products are primarily employed as surface sizing agents or coating binder and are available in a variety of viscosity grades **[20].,[21].,[24].**

Physical Modification of Starch
Pregelatinization of Starch

It is the most basic starch modification, made by heating the slurry, roll drying, spray drying, or extrusion. It keeps starch intact while enhancing cold water thickening. This method is intended to improve the adhesiveness of starches. Pregelatinized starches have good flow, binding, and compressibility [20],[21],[18]5,[25].

Annealing

This is done by soaking the native starch in excess water at temperatures ranging from 40 to 60% w/w between gelatinization. Annealed starch is less prone to swelling [20].And the resulting improved crystalline structure does not rupture the starch granules.[26].,[21].

Preparation of Modified Starches
Cross-linking of Maize Starch

To make it reactive, 20 g of dried maize starch was treated with 30 ml of ethanol. The slurry was then filtered to recover the starch residue. A slurry of reactive starch was prepared in an alkaline medium with 0.5% NaOH and various amounts of sucrose and formaldehyde as crosslinking agents [2.5, 5,10, 20,and 40%].. The mixture was held at 40 °C for 30 minutes with constant stirring. The pH of the mixture was then adjusted to roughly 5.0 with 0.1 N HCl before being rinsed and dried to recover the cross-linked maize starch. After drying, the particle size of the maize starch was decreased by passing it through a 0.17-mm mesh. This method was repeated for both T [27].

Preparation of Starch Glutarate

Santosh kumar *et al* discussedinitially, 10g of glutaric acid and 10g of potato starch were dissolved in 25ml of distilled water. The pH of the solution was then adjusted to 3.5. This dispersion was conditioned for 16 hours. The dispersion was dried in an oven at 60° C after conditioning. To eliminate any unreacted glutaric acid, the material was washed with distilled water. The product was dried in an oven at 60°C. The obtained product was crushed and sieved (# 120). Starch glutarate is an effective superdisintegrant for tablets that dissolve fast [28].

Preparation of Starch – Urea – Borate

Santosh Kumar *et al* developedgelatinizing potato starch in the presence of borax and urea resulted in the formation of starch-urea-borate. To make a starch slurry, 50 g of potato starch was dispersed in 100 ml of water that had been purified. Separately, 10.0 g of borax and 15.0 g of urea were dissolved in 400 ml of purified water and the solution was heated to boiling. The starch slurry was added and stirred in while the water was boiling. For 10 minutes, mixing while heating was continued to gelatinize starch and generate starch-urea-borate polymer. The resulting mass was placed onto a stainless steel plate and dried at 80°C for 6 to 8 hours. The powdered polymer was passed through mesh no. 120 [29].

Anilkumar Vadaga *et al.,*

Preparation of Modified Starch Acid

Santosh Kumar *et al* prepared initially, 10 g of glutaric acid were dissolved in distilled water, and the pH was corrected to 3.5 using 10M sodium hydroxide before a final volume of 25 ml was produced. 25 g potato starch was added to the previously mentioned mixture and conditioned for 16 hours at room temperature before being baked at 600 c for 6 hours. The mass was washed to remove unreacted glutaric acid. The goods was washed and dried at 600c. The finished product was powdered and sieved (# 100) Modified starch is an effective superdisintegrant for tablets that dissolve fast. The drug release time from the produced tablets was 10 minutes and depended on the tablet composition, i.e., the concentration of modified starch, croscarmellose sodium, and crospovidone [30].

Preparation of Starch Glycolate

Hariomprakashrao *et al* discussed initially, 10 parts potash starch were slurred in 10 parts distilled water and 10 parts starch glycolate were dissolved in distilled water. Both are stirred constantly for 30 minutes. pH was adjusted to 3.5 using 10M NaOH and stirred for 16 hours at 25 °C. After 16 hours, it was filtered and rinsed with distilled water. For 2 hours, the product was baked at 60 °C. The final product was ground and sieved [31].

Preparation of Starch Phthalate

Santosh kumar *et al* developed initially, 3 parts phthalic anhydride were dissolved in 2 parts dimethyl sulphoxide (DMSO). The pH of the solution was then adjusted to 3.5 using 10M sodium hydroxide (NaOH), and it was ultimately made up to 50 ml. 5 parts potato starch were added and conditioned for 16 hours. After conditioning, the dispersion was held in an oven at 60 ° C for one hour. The product was then mixed with acetone for 15 minutes before being rinsed with isopropanol to eliminate any unwanted phthalic anhydride. Following washing, the resulting product (starch phthalate) was dried in an oven at 60 °C. The resulting product was crushed and sieved (# 120). Starch phthalate is an effective superdisintegrant for tablets that dissolve fast [32].

Preparation of Starch Valerate

Santosh kumarrada *et al* discussed in a beaker, potato starch was blended with distilled water, and valeric acid was added while stirring frequently to ensure that the potato slurry was thoroughly mixed. The pH should then be tested and adjusted to 3.5 by adding 10M sodium hydroxide solution and conditioning for 16 hours at 60°C. As a result, following conditioning, the unreacted valeric acid is drained, washed with distilled water, and dried in an oven at 60o C for approximately 2 hours. The dried solid material was then sieved with sieve #120. The resultant fine powder is then starch valerate [33].

Preparation of Starch Tartrate

Santosh kumar *et al* prepared initially, 10 parts tartaric acid were dissolved in 25 ml of distilled water. The pH of the dispersion was determined. If the pH was not 3.5, a 10 (M) sodium hydroxide solution was added to adjust it to 3.5. This dispersion was condition for 16 hours. It was dried in the oven at 60 °C for 16 hours. The material was washed with distilled water to remove the unreacted tartaric acid. The product was dried in a 60 °C oven. The final product was powdered and sieved (# 80).Starch tartrate is an effective superdisintegrant for tablets that dissolve fast [34].

Preparation of Starch Glutamate

Santosh kumar *et al* developed the starch slurry was made by dissolving starch in distilled water. Glutamic acid was dissolved in distilled water before being added to the pre-prepared starch slurry. The pH of the glutamic acid and starch slurry was adjusted to 3.5 with 10 mL sodium hydroxide. This slurry was conditioned for 16 hours after pH adjustment, and unreacted glutamic acid was removed by washing it with distilled water. The resulting solid mass was dried at 60 °C to create starch glutamate. Dried starch glutamate was passed through a #120 sieve and stored in a desiccator [35].

Anilkumar Vadaga *et al.,*

Preparation of Starch Malonate
Annu kumara *et al* prepared esterification was used to create starch malonate from potato starch and malonic acid as starting materials(6). In 25 parts distilled water, 10 parts malonic acid and 10 parts potato starch were dissolved. By adding 10 M NaOH solution to the solution, the pH was changed to 3.5. The final mixture was conditioned for 16 hours. Following conditioning, the finished product was dried in an oven at 60 °C. The mass was washed with distilled water to eliminate the untreated malonic acid. Again, the product was dried in an oven at 60 °C until it was completely dry. The obtained product was crushed and sieved using sieve no.120#.Starch malonate, a modified starch, is an effective superdisintegrant for tablets that dissolve fast [36].

Preparation of Starch Crotonate
Hariom Prakash rao *et al* discussed to begin, dissolve 10 g of crotonic acid in 10 mL of distilled water, then add 10 g of potato starch in 25 mL of distilled water. Both were continuously swirled for 30 minutes. Increase the pH to 3.5 with 0.1N NaOH and stir for 16 hours at 25 °C. To extract unreacted crotonic acid, it had been purified and rinsed with distilled water after 16 hours. The product was then kept in a 60oC oven. The goods obtained were ground and sieved [37].

Preparation of Starch Tartrate
Santosh Kumar et aldeveloped initially, dissolve 10g tartaric acid in 25ml distilled water. To achieve dispersion, potato starch was added. The pH of the solution was then adjusted to 3.5 by adding 10M sodium hydroxide. For 16 hours, the solution was conditioned. It was dried in the oven at 600c. The material was rinsed with distilled water after drying to eliminate the unreacted tartaric acid. The product was dried in an oven at 600c. The obtained product was ground up and sieved through sieve no. 80.Starch tartrate is an effective superdisintegrant for tablets that dissolve fast.[38].

Preparation of Starch Citrate
Santosh Kumar *et al*[39].prepared citrate was made by dissolving 10 g of citric acid in 25ml of distilled water. The pH of the citric acid solution was corrected to 3.5 by adding drop wise 10M sodium hydroxide, and the volume of this solution was increased to 50 ml by adding distilled water. Following that, 25 g of potato starch was added to the previously produced solution and left to cure at room temperature for 16 hours. After 16 hours, the mixture was dried for six hours at 60°C in a hot air oven. The unreacted citric acid was removed by washing the mixture with distilled water and then drying at 50°C, which resulted in complete moisture removal [40]., [21].

Preparation of Starch Hyaluronate
Anusha kusuma *et al* discussed10 g of potato starch was suspended in 15 mL of distilled water in a beaker. 10g of hyaluronic acid were weighed and added to the starch slurry; the pH of the slurry was then adjusted to 3.5 with 10 mL sodium hydroxide and left idle for the esterification reaction. The mixture was then treated with distilled water to eliminate any leftover hyaluronic acid before being dried at 60°C to generate a dry bulk. The dried starch hyaluronate was filtered with a #120 sieve to obtain uniform-sized particles before being stored in a desiccator.[41].

Applications of Modified starches in Pharmaceuticals and Medical Industries
In recent years, pharmaceutical companies all over the world have made extensive use of various types of modified starches in various stages of drug the production or development technologies. Excipients contribute significantly to the mechanical strength, stability, and tablet disintegration qualities of solid dose formulations [20].

CONCLUSION

Various approaches can be performed or used to improve the dissolution of poorly soluble drugs in an oral solid dosage form, ranging from incorporation in modified starches, which are widely used as superdisintegrants, in future trends in drug delivery systems, and in the production of oral disintegrating or fast dissolving tablets. Further

research is needed to demonstrate the application of functional and multi-functional excipients to improve the solubility or dissolution, and hence the bioavailability, of an extensive variety of poorly soluble drugs. Considering that up to 40% of current medicine products contain drugs with low aqueous solubility, and up to 90% of newly discovered therapeutic compounds in the development phase have poor aqueous solubility. In the future, identifying the best formulation and development of modified starches as an excipient in relation to new medications may result in successful drug delivery with considerable lower economic charges.

ABSTRACT

This in-depth article delves into the complex and ever-evolving landscape of regulatory requirements for Over-the-Counter (OTC) drugs in Australia. OTC medications are essential to health care since they are available to consumers without a prescription. It provides an in-depth analysis of the complex procedures and methods required for getting approvals for OTC pharmaceuticals, including critical elements such required documentation, stringent quality controls, and thorough safety evaluations. Additionally, it clarifies the complex responsibilities of producers, importers, and sponsors with regard to complying with Australia's regulatory framework while highlighting the crucial part that ongoing post-market surveillance plays in guaranteeing the long-term safety and effectiveness of OTC medications made available to Australian consumers.The Therapeutic Goods Administration (TGA) is the regulatory body in charge of policing over-the-counter medications in Australia. Through the whole clearance process, safety issues are given the utmost priorications,ity. Each OTC medicine is subject to a thorough risk and benefit analysis by the TGA, which takes into account the drug's intended usage,

Arjun *et al.,*

potential adverse effects, and the targeted customer base. under the direct supervision of a medical expert.Manufacturers, importers, and sponsors all play crucial responsibilities in ensuring that the legal framework is followed. They are accountable for continued post-market monitoring in addition to providing accurate and thorough paperwork.In conclusion, navigating Australia's OTC medicine regulations is a complex procedure that needs painstaking attention to detail, observance of quality controls, and a dedication to continual safety monitoring. This page promotes a better awareness of the stages and responsibilities involved in providing safe and effective pharmaceuticals to consumers in Australia, serving as a helpful resource for anyone working in the OTC drug sector.

Keywords: OTC medications, TGA, Safety, Documentation, Post market surveillance

INTRODUCTION

The pharmaceutical industry plays a vital role in ensuring the health and well-being of individuals worldwide. Over-the-counter (OTC) drugs, also known as non-prescription drugs, are an integral part of this industry, providing consumers with accessible and self-administered treatments for common ailments. In Australia, the regulation of OTC drugs is a crucial aspect of safeguarding public health and maintaining high standards of safety and efficacy.(1) The Australian regulatory framework for OTC drugs is designed to protect consumers from potential risks associated with the use of these medications. It ensures that only products meeting stringent quality, safety, and efficacy standards are available without a prescription. The Therapeutic Goods Administration (TGA), Australia's regulatory authority for therapeutic goods, plays a central role in overseeing the registration and regulation of OTC drugs in the country.(2) As per the report of 2018 by Association of the European Self-Medication Industry, Facts and Figures, Australia has been recognized as world's 3rd highest rising marketplace in sales of self-medication and the market is valued at over AUD 2 billion. For minor health conditions medication such as ache, fever, nose congestion, sore throat, fungal infection and stomach upset are sold under the name of OTC.(2) OTC medications are sold in Australia in three distinct ways in accordance with Australian law. Those are

1. **Pharmacist only:** E.g.:Mild steroid-containing creams for skin irritations and inhalers.
2. **Pharmacy medicine:** E.g.: Symptoms of allergy and diarrhea.
3. **Medicine for general sale:** E.g.: Cough and cold remedies

On the Australian Register of Therapeutic Goods (ARTG), some medications are "registered," while others are "listed," "listed assessed," or other variations. OTC medications are evaluated for quality, safety, and efficacy and registered and certified by the Australian Therapeutic Goods Administration (TGA) with an AUST R (AUST Registered) number. OTC drug registration application levels: N1, N2, N3, N4, and N5. Numerous factors play a role in application-level choice. These medications often have an intermediate degree of risk and make therapeutic claims for the treatment or prevention of illness. (3) In this article, we will explore the current regulatory requirements for filing OTC drugs in Australia. We will examine the key steps and processes involved in obtaining approval for these medications, including the necessary documentation, quality controls, and safety considerations. Furthermore, we will discuss the responsibilities of manufacturers, importers, and sponsors in complying with the regulatory framework, as well as the ongoing post-market surveillance to ensure ongoing safety and efficacy.

TGA therapeutic classification of medicine
ARTG Registered or ARTG R
OTC medications are examined for quality, safety, and efficacy and registered with and certified by the Australian TGA. They have an AUST R number. Registered medications include chemicals that pose a higher risk. Antihistamines and medications for minor discomfort are a few examples of registered over-the-counter medications.

ARTG Listed or ARTG L

These are pre-approved and contain low-risk ingredients with low-risk health privileges.Drugs that do not comply with guidelines may suspend or cancel their listing. For instance, OTC medicines include some toothpaste and sunscreens(4).

TGA ORGANIZATIONAL CHART

Classification of OTC medicine application form for registration

Applications for OTC medications are divided into risk categories. For applications of novel medications, there are five risk levels: N1, N2, N3, N4, and N5. The numerous OTC medicine application levels and the important application requirements are defined by the OTC application classification.

N1 application

This level of application comprises of 'clones' and flavor/fragrance and color variants. They have to get registered in ARTG. This application has reduced requirements for supporting data as the proposed medicine to an original medicine. (Refer table No. 1)

Criteria

1. Authorization for TGA to access the parent medicine information from file and TGA records.
2. Details on the permitted difference from the parent medicine and approval from parent medicine sponsor
3. Evaluation of safety, efficacy and safety data
4. Product is identical to parent medicine
5. Assurance to comply for N1 application in an OTC medicine
6. Product name does not include an umbrella segment specified as requiring a higher level of assessment.
7. The evaluation includes compliance with RASML (Required Advisory Statements for Medicine Labels) and/or Med Safe Labelling Statements Database.

N2 application

OTC monograph is applied under the application, OTC New Medicine N2 applications can be filed with fewer criteria for data evaluation if they meet the standards of a product-specific OTC medicine monograph and the requirements outlined in this document. According to the Australian Regulatory Guidelines for OTC Medicines (ARGOM), sponsors are obliged to provide a comprehensive data set for their product. Only medications that contain the exact Australian Approved Name (AAN) component stated in the monograph are covered under the monograph. In case of N2 application, the shelf life of the finished product, direction for use and warning, should be as per the OTC monograph (Refer table No. 1). Drugs falling under N2 category might comprise those medicine which is used for cough, pain relief and antiseptic creams and cold, etc. This application involves the minor necessities for data assessment by the agency and subsequently less time for evaluation. Along with the supporting data with an application, the sponsor needs to finish an "Assurance to comply with an OTC new medicine N2 application" approving that the product meets the defined requirements. And OTC drug monograph does not include the risk associated with the umbrella branding segment. (8)Active premixes are not allowed unless specifically indicated in the OTC medication monograph for that product.

a. The active ingredient premix finished product manufacturer acceptance standards must be in compliance with those detailed in the pertinent specialized OTC medication monograph.
b. The supplier is required to control the individual components in any active premixes in accordance with pertinent and up-to-date BP, Ph. Eur., or USP/NF monographs.(9)

For OTC N2 applications, the following must be submitted:

1. A completed application form via TGA eBusiness Services (eBS)
2. completed product specifications at release and expiration
3. Colour label(s) (as stated under labelling)
4. Completed assurances document • Certificates of analysis (C of A) for two batches of the completed product
5. Details of calibrations used on any supplied measuring device (if relevant) Post-market monitoring of medicines is accepted via the N2 route will be conducted by the TGA to increase the assurance about the sponsor's compliance with requirements. (10)

N3 application

This is other than those, a new generic drug application in levels N1, N2 or N4. These are the OTC generic medicines which do not require safety and efficacy data in support of medicine. In some cases, it's mandatory to provide therapeutic equivalence data or bioequivalence data to validate therapeutic equivalence data or bioequivalence data with the parent drug. But this application requires the documents of quality data. (11)

N4 application

Application for a generic medicine which demands evidence of supporting safety and effectiveness, or an explanation for not providing such evidence. This must be included with a risk related to a segment of umbrella branding (higher level of assessment). Evaluation of quality data is mandatory; efficacy and safety data have to be provided or justification for not providing the data. (12)

N5 application

The application for a novel drug that is an expansion of a "generic category" must include the following:
1. API
2. Innovative drug indications
3. New strength
4. New dosage form
5. New combination medicine
6. Various patient populations

This application requires an efficacy and safety data and the quality data of the medicine which has been previously assessed by the agency. (13)

DISCUSSSION

Stringent Regulatory Standards

The Therapeutic Goods Administration (TGA) has set strict rules for the regulatory procedures for submitting OTC medications in Australia. Before being made available to the general public, OTC medications must adhere to the appropriate quality, safety, and efficacy requirements. The TGA uses a risk-based methodology to assess the advantages and dangers of each product, taking into account a number of elements including the active components, dosage forms, indications, and planned labelling.(14)

Quality standards

In order to guarantee that pharmaceutical goods, including OTC medications, are consistently manufactured and regulated to satisfy their quality requirements, GMP is a set of quality assurance and control principles and practices. GMP regulations include a range of manufacturing-related topics, including facility design and upkeep, employee training, equipment calibration and maintenance, documentation procedures, quality control testing, and storage and distribution conditions. The TGA demands that OTC medications satisfy high quality requirements, and following good manufacturing practices (GMP) is essential to guaranteeing that quality is maintained throughout the production process. The manufacturing facility for OTC pharmaceuticals must be planned such that the goods are produced in a sterile and regulated environment. This covers factors like controlling the temperature, humidity, and air quality. To guarantee that they understand and can successfully follow GMP rules, all people engaged in the manufacturing process must get the proper training. Every machinery utilized in the production process has to be routinely serviced and calibrated to guarantee that it is operating properly and delivering consistent results. All components of the production process, including batch records, test findings, and quality control procedures, must be thoroughly documented by manufacturers. To guarantee that the goods fulfill the requirements for safety, quality, and efficacy, manufacturers must conduct routine quality control testing. OTC medications must be kept in the proper conditions to guarantee that they are stable and effective for the duration of their shelf life.(15)

Safety standards

In Australia, OTC drug regulation is primarily focused on safety. On the basis of the active components, dosage forms, and suggested indications, the TGA assesses the safety profile of each product. The findings of preclinical and clinical trials, as well as any complete information on the product's safety, must be provided by the manufacturer. The TGA assesses this information to decide if the product's advantages exceed any possible hazards. The TGA evaluates the safety information to decide if the product's advantages exceed any possible hazards. To ensure safe use, extra cautions, warnings, or contraindications may be required. After a product is registered, the TGA uses post-market surveillance to keep an eye on its efficacy and safety. This makes it more likely that any safety concerns will be found and quickly resolved. OTC medications that have been registered and approved by the TGA have an AUST R number that is used to identify the product and must appear on the labelling and packaging of that product.(16)

Efficacy Standards

To make sure that OTC medications are successful in treating the illnesses for which they are prescribed, the TGA evaluates their efficacy. Scientific proof of the drug's efficacy must be provided by the manufacturer, often through carefully planned and monitored clinical studies. To ascertain if the product has shown a statistically significant and clinically relevant impact, the TGA assesses this evidence. The therapeutic category and the specific claims made by the product influence the effectiveness requirements.(17)

REGISTRATION PROCEDURE

OTC medicine licensing in Australia is a thorough and meticulous process that entails numerous crucial procedures. A thorough dossier covering scientific information, preclinical and clinical trial findings, details on the product's composition, the manufacturing process, and quality control procedures must be assembled by manufacturers, importers, or sponsors. The Therapeutic Goods Administration's (TGA) review is predicated on this dossier.

Creating a dossier

It is necessary for manufacturers, importers, or sponsors to put up a thorough dossier that contains extensive information on the OTC medication. This contains information on the active components, dose options, suggested usage, intended use, and any side effects of the medication. Additionally, details on the drug's formulation, manufacturing procedure, stability tests, packaging, labelling, and product information should be included in the dossier.

Determination of precise application level for OTC medicine submission

Applications for OTC medications are categorized based on their level of risk. Each of the risk levels has a corresponding application category and evaluation process. Less supporting information is needed for applications with lower risk levels than for applications with higher risk levels. There are a number of advice tools available to control the application category/correct risk level, including the following:

1. OTC application categorization framework
2. OTC application route for umbrella branded medicine
3. Flowchart for OTC application placement
4. A placement question and response tool for OTC applications (19)

Manufacturers' Responsibilities

OTC medicine manufacturers in Australia are held accountable for adhering to the legal requirements. They are in charge of making sure that their goods adhere to the essential requirements for quality, safety, and efficacy. To produce the scientific evidence needed to back the claims made for the product, rigorous research and development, including preclinical and clinical studies, must be conducted. Good manufacturing practices (GMP) must be followed by manufacturers as well to guarantee the reliability and consistency of their goods' quality. Additionally, it is the duty of producers to put together thorough dossiers that include all pertinent details about the medicine, such

as its composition, the manufacturing process, stability studies, and quality control procedures. The Therapeutic Goods Administration's (TGA) review is built on the information included in these dossiers. Additionally, manufacturers must continue to help the TGA in its post-market surveillance of their goods by quickly reporting any adverse occurrences or safety concerns.(22)

Importers
Importers are required to confirm that the goods they bring into the country were produced in GMP-compliant facilities. This guarantees that the goods adhere to the same high standards as those produced locally. The implementation of suitable quality control procedures throughout the production of imported goods is the importers' responsibility. This promotes the effectiveness and safety of over-the-counter medications. Importers are responsible for making ensuring that the imported items' labelling, packaging, and product information adhere to Australian regulatory standards. Ingredients, dosage forms, indications, and any applicable cautions or warnings must all be correctly represented. Before items may be sold and distributed in Australia, importers must work closely with manufacturers to gather all required paperwork and make sure the products are registered with the Therapeutic Goods Administration (TGA).(23)

Sponsors
In Australia, sponsors are essential to OTC medicine regulation compliance. On behalf of the producer or importer, sponsors are in charge of filing the product registration application to the TGA. Sponsors are responsible for making certain that the product's registration dossier is correct and comprehensive and contains all the TGA-required scientific data, paperwork, and information. Sponsors must make sure that continuing compliance with regulatory standards is maintained. This involves immediately informing the TGA of any updates or changes, such as adjustments to the product's composition, production method, labelling, or safety information. The TGA examines pertinent scientific evidence, and its main duty is to assess the product's safety. The Australian Regulatory Guidelines for OTC Medicines (ARGOM) were created by the TGA to help sponsors of OTC medications comply with regulatory obligations. These guidelines offer comprehensive details on the necessary conditions for a successful OTC drug application. Sponsors can guarantee that OTC medications sold in Australia adhere to the TGA's regulations and meet the essential criteria for safety, quality, and efficacy by carrying out their obligations. Sponsors must also actively monitor the product's safety and effectiveness in order to assist post-market surveillance initiatives. Monitoring adverse event reports, responding to any product complaints or concerns, and working with customers and healthcare providers to maintain product safety and quality are all part of this process.(24)

Labelling
The General requirements for the labels of OTC medicine must fulfil the requirements of TGO 90 as it is considered as a means of consumer advertising. A list of medications coupled with an advisory statement is supplied in RASML. The advice or warning statement must be on the pharmaceutical label.

Basic Requirements for Label
1. Text: English and unmistakable and unobscured
2. Text size: not less than 1.5mm
3. Color: Contrasting colors with the background
4. Unit of measurements: Metric unit (25)

CHI (Critical Health Information) for Registered OTC Medicine
CHI is compulsory for registered non-prescription medication, but CHI is not mandatory for listed non-prescription medicine. The CHI must be represented in subsequent order: (Illustrated in figure 5 and 6)
1. Active ingredients
2. Indications
3. Warning

4. Direction for use
5. Storage information e.g.: Keep out of children's reach, and do not take
6. Storage condition e.g.: store below 25°C in tamper-proof pack
7. Details of sponsors and distributors
8. Other information (as per the requirements): "Pharmacist Only Medicine", "Pharmacy Medicine" and allergic condition
9. CHI must be displayed in one color—black or another dark shade—against a backdrop of either white or shrinking pixels.
10. While medication labels for registered complementary medicines are submitted and assessed by TGA, labels for listed complementary medicines are not submitted at the time the drug is listed. A sponsor must make sure the image, logo, comparative promotional statement, and expert suggestions comply with TGCA. A disclaimer like "gluten-free" or "sugar-free" needs to be accurate. In addition, label claims like "new" or "advance" are permitted for a maximum of 12 months after the product debut.(26)

Registration of OTC drugs
The OTC application levels have defined timeline and submission requirements. The supporting documents and the timelines will apply based on the risk of OTC medicine (Higher risk and lower risk).The application is submitted electronically through Business services, then it the application get registered as the OTC medicine. The applications are screened to determine whether it is complete and meets the requirements for an effective application. If the application is effective, it is accepted for evaluation. The agency might request information from the applicant to address issues that are identified. Based on the evaluation the delegate of the TGA decides whether to register the medicine on ARTG or not. [18]Safety of OTC medicine product in Australia: The TGA has a complex mechanism for keeping track of medicinal goods available on the market. in order to reduce the risk and get most of the benefits to the consumer. The programs are as follows:

1. The mechanism for reporting issues allows for the reporting of product flaws and drug side effects.
2. TGA labs' random and focused sampling of permitted items
3. Desk-based audits of listed items that are random and focused
4. GMP audits
5. Controls for advertising of pharmaceutical products (29)

POST MARKET SURVEILLANCE
The TGA encourages manufacturers, sponsors, healthcare providers, and consumers to report any adverse events or side effects related to OTC medications. Identification of possible safety issues requires the use of this information. To make sure OTC medications fulfill quality criteria for purity, potency, and stability, the TGA randomly samples and tests them. In the event that quality problems are found, the required measures are followed, which may involve product recalls. The TGA supervises OTC medicine labelling and packaging to make sure it complies with legal standards. This contains precise component lists, understandable usage guidelines, and pertinent cautions. The TGA performs post-market evaluations of particular OTC medication classifications or specific products on a recurring basis. These evaluations evaluate the products' continued safety and efficacy and, if required, may result in regulatory measures including label revisions, safety alerts, or withdrawal from the market. The TGA also keeps an eye on OTC medicine advertising and promotion to make sure that no fraudulent claims are being made or that customers are being misled. If a problem with an OTC drug's safety is discovered, the TGA may issue recalls and safety alerts to take the product off the market or warn the public and medical professionals of possible dangers.(30)

Advertisement
Australian Self Medication Industry (ASMI) controls OTC drug advertising in Australia. The Therapeutic Goods Act 1989 and Regulations, the Competition and Consumer Act 2010, and the TGACC (Therapeutic Goods Advertising Code Council) all specify the requirements for therapeutic good advertisements in Australia. According to the current regulations, in order to be promoted on Australian websites, therapeutic products must adhere to the

Therapeutic products Advertising Code (TGAC). The WHO: Ethical Criteria for Medicinal Drug Promotion 1988, which TGAC is dependable with, calls for the submission and approval of ads.In contrast, dangerous signs cannot be marketed unless a previous exemption clearance has been acquired. TGAC sets required standards such as brand name, list of components, permitted indications, cautious remarks, and warnings for insertion in advertisements(31)

CONCLUSION

TGA is enhancing its flexibility with regard to the registration or listing of OTC medications as a result of the overview of reorganizations made in response to the MMDR through public, targeted consultation, and internal consultation for registered and listed medicines by introducing approval process, combined lists of approved, list of allowable indications, permitted ingredients, overview of timeframes for the approval, guidelines for labelling, CHI for registered OTC medicine, stability and usage of the advertising material to designate a invention has been measured as safe and effective Hence by understanding the classification and criteria involved in OTC applications, the selection of an appropriate application for particular OTC drugs can be made in Australia.
