ABSTRACT

Andhra Pradesh, which is located in the middle of the eastern half of the Indian peninsula between 120 41' - 190 54' N Latitudes and 760 46' - 840 45' E Longitudes. The state's features include hills that rise almost about 1500m altitude from sea level, contain a rich and valuable flora, and forests cover 23% of the geographical land. According to Andhra Pradesh biodiversity board 22 threatened plant species are identified and enlisted based on IUCN Red List and few of them are endemic species too. There is a need to conserve the threatened, endemic plant species it is important to protect their natural habitats, and forests require further safeguards due to their rich biological variety. For the purpose of Institute and Exsited conservation, a thorough inventory of the plant diversity in the state's forests is required. The primary goal is to protect Andhra Pradesh's genetic resources and flora for future generations. In this literature we mentioned threatened Plant species of Andhra Pradesh, distribution, IUCN status and their medicinal importance and reported activities. The following points need to be focused on future work lines are contributing to the study of their protection, discovering indigenous species, their significance for trade and medicine, is described in this literature as having a list of threatened species.

Keywords: IUCN, Biodiversity, Endemic species, Threatened species, *In situ* and *Ex situ* conservation

Satya Sree Bandaru *et al.,*

INTRODUCTION

The usage of medicinal plants to prevent disease and maintain health has been mastered by cultures all around the world over the centuries [1]. For rural and indigenous people, these are a crucial source of subsistence. As medicinal plants gain more scientific and financial attention the burden on wild plant populations increased. Many species used for medicine are now in danger of extinction due to overharvesting. Need is arise to study and preserve medicinal plant species. The indigenous peoples who have relied on traditional medicines for decades or millennia often find that they are no longer available due to commercialization. The challenge is being embraced by government, Private, NGO organizations all across the world, they recommending new procedures and policies to safeguard our last remaining medicinal treasures in the wild areas so that they can protect our future generations through the Global Convention on Biological Diversity, the Convention on International Trade in Endangered Species, and non-governmental organizations like International Standard for Sustainable Wild Collection of Medicinal and Aromatic Plants (ISSC-MAP). The International Union for Conservation of Nature (IUCN), formed in 1948, is the biggest and most renowned global conservation organization. Its main office is in Gland, Switzerland [2]. Around 1,400 Member organizations, 15,000 specialists, and 11,000 volunteer experts from 160 different countries make up the IUCN, which has more than 1,200 members from governmental and non-governmental organizations. It works on studies, field projects, campaigning, advocacy, training, data collection, and analysis of endangered species. A central secretariat, which also provides a range of services and oversees initiatives for the preservation and ethical utilization of biological diversity globally, manages the IUCN Program.

IUCN's objectives [3]
The objectives pursued by the International Union for Conservation of Nature are as follows:
1. To offer scientific information on the condition of species and subspecies on a worldwide scale.
2. To address the issues and raise awareness about the extinction of species and biodiversity.
3. To design a layout for biodiversity preservation.

The IUCN Red List [4,5], which ranks the status of species around the world. The goals of these programs include global conservation of plant species, stopping habitat loss, re establishing ecosystems, and enhancing human wellbeing. Countries or organizations create a number of Regional Red Lists that evaluate the risk of extinction for species within a given political control unit. A precise set of criteria is used by the IUCN Red List to assess the rate of extinction for thousands of species and subspecies.

According to the IUCN Red List threatened plant species are categorized as [6]
- **Extinct (EX)** No one who is still alive is known
- **Extinct in the wild (EW) Only known to exist as a naturalized population outside of its historical area or in confinement.**
- **Critically endangered (CR)** Extremely high risk of extinction in the wild, population decline (greater than 90% over the past ten years), population size (less than 50 mature individuals), and quantitative analysis showing the probability of extinction in the wild in at least 50% in their ten years are all factors that contribute to this speciesgreat danger of going extinct in the wild.
- **Endangered (EN)** High risk of extinction (or) disappearance in the wild
- **Vulnerable (VU)** Potential for extinction (or) disappearance in the wild
- **Near threatened (NT)**(or)**Almost in danger** Likely to soon become critically endangered.
- **Least concern (LC) Lowest danger, doesn't meet the requirements for a riskier category. This category includes taxa that are widespread and numerous.**
- **Data lacking (DD) (or) Data deficient (DD) There isn't enough data to predict the likelihood of extinction.**
- **Not assessed (NE) (or) Not evaluated has not yet been evaluated against the demands.**
  India gained notoriety among ancient civilizations [7] as a significant source of therapeutic herbs.

Satya Sree Bandaru *et al.,*

The vast majority of the aromatic and medicinal plants used in India's forests are gathered for use as raw materials in the manufacture of pharmaceuticals and perfumery products. Ayurveda contains a list of about 8,000 herbal treatments. Unfortunately, there is a worrying rate of loss of many significant plants and much of the ancient knowledge. Traditional herbal medicine systems have reached a highly critical stage as a result of the quick deforestation that is reducing the supply of raw pharmaceuticals. Thus, it is crucial to conduct scientific research into traditional medicines, develop new medications through bio prospecting, and maintain a strict preservation program for the relevant medicinal plants. The group established by IUCN members in India is known as the Indian National Committee (INC). IUCN HQ Letter No. IN/4/NC55 dated November 14, 2001[8] provided the IUCN Council with official recognition with 31 members as of right now, the Committee is made up of representatives from the Indian government, academic institutions, and both domestic and foreign NGOs. The IUCN is a global, independent, nonprofit organization in India. India contributed significantly to the 2012 World Conservation Congress (WCC), which took place on the island of Jeju in September. The summit's agenda, which addressed every aspect of conservation, was led by Prof. MS Swaminathan, the architect of the Indian green revolution, and Dr. Ashok Khosla, president of the IUCN. Through a Memorandum of Understanding (MoU) signed with the Indian government, which joined the IUCN as a State Member in 1969 through the Ministry of Environment and Forests (MoEF). In New Delhi, the IUCN India Country Office was founded in 2007 [9].

India, which is the ninth most diverse country in the world in terms of plant species, is one of these countries. With 10 separate biogeography zones, India is also well-endowed in terms of ecological diversity. Regarding species, ecosystems, and genetic variability, India exhibits extraordinary diversity. In just 2.5% of the planet's surface, there is more than 7% of the world's biodiversity. This diversity of habitat-providing landforms and climates can be credited for this richness and offer habitats in a wide range of environments, including tropical, temperate, alpine, and desert. India is considered to be home to over 45,523 plant species, which accounts approximately 11.8% of the world's flora is found here. Among these, there are around 17,500 flowering plants, 4,950 of which are native as well. India is home to 32% of the world's endemic plants[10].Among India's 123 rich and bio-diversified states, Andhra Pradesh is regarded as one of the richest and endemic natural flora and fauna are mostly influenced by the soil, climate, and relief. The two biggest rivers flow through the state are Krishna and Godavari. Forest management, conservation, and protection are all responsibilities of the Andhra Pradesh Forest Department. The state of Andhra Pradesh is situated in the center of the eastern Indian Peninsula[11]. 22,862km²of Andhra Pradesh was covered with the forest. Tropical forests are abundant in the Eastern Ghats region, whereas shrub vegetation is more prevalent in the Deccan Plateau, where the vegetation is sparser. The Bay of Bengal borders Andhra Pradesh to the east, Tamil Nadu to the south, Karnataka to the west, and Maharastra, Chattisgadh, and Orissa to the north. Andhra Pradesh contains 26 Districts, which are grouped into three zones administratively[12]

1. Costal Andhra with 12 districts (i.e., Kakinada, Dr. B.R. Ambedkar Konaseema, East Godavari, West Godavari, Eluru, Krishna, N.T.R., Gunturu, Palnadu, Bapatla, Prakasam, Sri Potti Sri Ramulu Nellore).
2. Uttarandhra with 6 districts (i.e., Srikakulam, Parvathipuram Manyam, Vizianagaram, Alluri sitharamaraju, Anakapalle, Visakhapatnam).
3. Rayalaseema with 8 districts (i.e., Kurnool, Kadapa, Nandyala, Ananthapur, Sri Satya Sai Y.S.R., Annamayya, Tirupati, Chittoor).

In order to protect genetic resources for future generations, the Andhra Pradesh Bio Diversity Board designates 22 plant species as being under threat and requiring in-situ or ex-situ conservation[13]. Botanists, scientists, environmentalists, agriculturalists, foresters, and local people all need to pay attention for conservation of medicinal plants through suitable micro propagation methods. IUCN status, common or vernacular name, family, species and endemism of various threatened plant species of Andhra Pradesh listed in Table 1. Medicinally useful threatened plant species distribution in different regions of Andhra Pradesh and researchers proved the activities of some threatened plant species were described as follows.

Andrographis beddomei is primarily found in Prakasam district (Diguvametta), Kurnool Hills Kadapa district (Kurnool Hills) and Lankamalai[31].Traditional medicine uses andrographis species extensively for the treatment of malaria, dyspepsia, influenza and respiratory infections.

Brachystelma glabrum is primarily found in the northern most portion[32] of the Srikakulam district, in the deciduous woods and woodlands of the Donubayi, Palakonda, Seetampet regions, Jalanthrakota Reserve Forest (Srikakulam), and Pinjarikonda Reserve Forest (East Godavari), The antioxidant activity [33] of Brachystel maglabrum was reported by NqobileP. et al.

Brachystelma penchalakense is primarily found[34] in the Nellore district (Penchalakona) of and the Asia-Tropical regions. Numerous Brachystelma species are used extensively in herbal remedies because they are nutritious and primarily devoured by herbivores.

Brachystelma volubile is primarily found in the Rayalaseema (Chitoor district) Nallamalais, Lankamalleswaram, Papavinasam and Tirumala Hills, this species has a restricted range. The clinical anti diabetic activity of salam leaves (*Eugenia polyantha*) and sambiloto leaves (*Andrographis paniculata*) in Type 2 diabetic patients has been the subject of a preliminary investigation. The study of andrographolide's bioactivities in skin cancer cells and skin exposed to UV radiation as well as the optimization of production parameters for andrographolide-loaded nano emulsion creation by micro fluidization.

Bupleurum andhricum is primarily found in the Northern Eastern Ghat's, Sunkarietta, Laxmipur (Visakhapatnam District), Palakonda, Rampachodavaram (East Godavari District), and Devagiriparlakimidi (Srikakulam District). Bupleurum is used to treat respiratory illnesses such as pneumonia, bronchitis, the common cold, swine flu, and the flu (influenza). Bupleurum is sometimes used to treat gastrointestinal issues like indigestion, diarrhoea, and constipation. Bupleurum extracts or isolated components (mostly saiko saponins) were the subject of in vitro and in vivo studies[35] that shown strong anti-inflammatory, anti-ulcer, and immune modulatory effects. Hepato protective, antitussive, antispasmodic, diaphoretic, antioxidant, and antibacterial properties are among the additional activities. Due to their strong structural resemblance to podophyllotoxin, some lignans from the Bupleurum species may be effective anti-mitotic medicines in the treatment of cancer by inhibiting the production of microtubules.

Boswellia ovalifoliolata is primarily found in the Seshachalam Hills and Eastern Ghats (Palakonda). In addition to its commercial significance as a plant that produces fragrant resin, this species of plant's extract is traditionally used to treat rheumatic pain, and its wood is specifically employed in the toy business. Two novel macrocyclic diaryl ether heptanoids, ovalifolio latin A and B, were discovered by Reddy et al. in this species and demonstrated antibacterial activity. In addition to being poisonous to non-target mosquito fish, backswimmers, and water bugs, *Boswellia ovalifoliolata* essential oil is a safe larvacide[36] against six mosquito vectors that are significant for public health.

Caralluma indica is primarily found in the Nellore District which exhibit antibacterial and antioxidant properties. Additionally, a variety of Corallium species have been mentioned in traditional medicine for the treatment of various ailments[38] like antimicrobial, antifouling, antibacterial, antioxidant, anticancer antibacterial, antifungal, anti-larva,fungicide, pesticide, perfumery antihypertensive, increase HDL and decrease LDL cholesterol.

Chrysopogon velutinus majorly distributed in Kadapa district and used in Folk Medicine

Cycas beddomei. synonym is *Cycas circinalis*. Species is primarily found Seshachalam Hills[39] (Tirupati Hills), Srikakulam District, Kadapa District, East Godavari, West Godavari, Visakhapatnam, vizianagaram Districts, and Chittoor Districts are home to the only known global endemic population of this species. The male cones are removed by the local tribal because they are thought to have medicinal powers and are a key component in tonics that promote youth. This plant's male cones are used to treat rheumatoid arthritis and muscle discomfort since they are thought to have narcotic qualities. To cure skin conditions such cuts, sores, and boils, the seeds are applied as a poultice [40].

Satya Sree Bandaru *et al.,*

Cycas sphaerica **synonym** is *Cycas circinalis* Linn. var. orixensis Haines. The main distribution areas for this plant species include the [41] Nallamalai Forest Area, the Kurnool district, Srikakulam, East Godavari, and Kadapa. A significant ornamental plant is the cycad. They are frequently planted in gardens in metropolitan settings. In religious events as well as the preparation of bouquets and floral decorations, leaves are used. Leafy vegetables made from young leaflets are also consumed. Sago flour is occasionally made with piths as an adulterant in baby meals. Male cones are employed as bed bug and mosquito repellents. Idlis, cakes, and other foods are made from the endosperm of mature fruits [42].

Dicliptera beddomei this plant species majorly distributed inKurnool district

Dimorphocalyx Kurnoolens is majorly distributed in Nallamala forests, Kurnool district. This is employed as an antidote for scorpion and snake bites[43].

Eriolaena lushingtonii is mostly found in several portions of the Andhra Pradesh, Eastern Ghats, as well as some regions of the Rayalaseema, Kadapa, and Ananthapur (Chinnapalle) districts. For dog bites, a decoction is given orally and an external application of stem bark extract is made. Malaria can also be treated using stem extract. The plant's unnamed component is used as an antidote[44] for scorpion stings and snake bites.

Hildegardia populifolia this plant species majorly distributed in Srikakulam district, East Godavari.The flowers[45] are visited by several bird species, such as the red-vented bulbul, rufous-backed shrike), blue-tailed bee-eater, and stork-billed kingfisher, some of which are predators of the bee.Barks of the stem,leaves are used to treat dog bite and malaria. Paulsamy et al., reported the in vitro antifungal[46] activity of leaf and stem bark extracts.

Kalanchoe cherukondens **is** majorly distributed in [47] Cherukonda hills (Visakhapatnam district)Kalanchoe species are used to treat rheumatism[48], depression, anxiety, insomnia, inflammation.

Memecylonmadgolense majorly distributed in Batrepalli forest, (Ananthapuramdistrict) Talapula forest, Mangapatnam forest (Kadapa district), Memecylon species having anti diabetic[49],antiinflammatory, antioxidant, anticancer and antimicrobial activities.

Pterocarpus santalinus majorly distributed in the Talakona Reserve Forests, Tirumala Hills, Sesachalam Hills (Chittoor districts), Veligonda (Kadapa district). *Pterocarpus santalinus* is primarily distributed. The species is used for its timber commercially. Japanese musical instruments[51] are made from red sanders' heartwood, which is also used as an astringent, tonic, bitter, sweet, cooling, analgesic, anti-inflammatory, and febrifuge. Chronic dysentery is treated using its decoction. Additionally, it helps with leprosy, ulcers, hemorrhages, burning sensations, vomiting, and other pitta-vitiated illnesses. Traditional herbal medicine[52,53] use *Pterocarpus santalinus* as a diuretic, anti-inflammatory, tonic, hemorrhage, dysentery, aphrodisiac, and anti-hyperglycemic agent, anti helmintic, antipyretic agent.

Rhynchosia ravii [54]This plant species majorly distributed in Talakona hills of Chittoor district. Dry powder of whole plant used to treat peptic ulcers, spleen, heart and blood disorders.

Shorea tumbuggaia majorly distributed in Srikakulam district, Rampa hills of East Godavari districts, tirumala hills chittoor), seshachalam hills, veligonda (kadapa).The species is used commercially for both medicinal and timber applications. Carpentry uses the heart wood. To be utilized as an external stimulant are plant parts. the plant extracts that are used to treat ear pain. As ear drops, leaf juice is employed. The bark has anti-ulcer properties. Resin is found in the stem and is used to make incense. the resin used to treat amoebic dysentery and duodenal ulcers. Native Americans also utilize it as an alternative to arbutus for kids and as an external stimulant [55,56].

Tephrosia calophylla this species distributed in the five districts of Chittor, Kadapa, Kurnool, Nellore and Prakasham[57]. It is dispersed in Sesachalam, Veligonda, Lankamala, and Palakonda. This traditional medicinal species reffered in Charaka Samhita and Sushruta Samhita and its therapeutically used to treat Leprosy, bone

fractures, ulcers, skin conditions, high coughs that cause vomiting, and mental abnormalities. It act as anti-inflammatory agent, anti-hyperglycemic agent and diaphoretic effects. The wood is used in conjunction with other medications to treat scorpion and snake bites. Ganapaty et al. reported the bio organic fraction of the extract's usage as an anticancer and antibacterial agent [58].Adinarayana et al. revealed the acute toxicity and hepato protective impact of *Tephrosia calophylla's* methanolic extract[59]respectively.

Wendlandia gamblei distributed in the mostly north area of (Srikakulam district), deciduous forests and woodlands of Donubayi, Palakonda, Seetampet areas, Jalanthrakota Reserve Forest (Srikakulam District), and Pinjarikonda Reserve Forest (East Godaveri District).Species of Wend land is used as local medicine, source of wood[60], ornamental flower.

ABSTRACT

Natural reservoirs, usually referred to as static water bodies, are a vital component in continental regions, offering many purposes as a home for aquatic life, a supply of fresh water, and a collection tank for precipitation. They play a crucial role in sustaining the ecological system and are beneficial for climate adaption in landlocked locations. However, unsustainable human interventions are having a severe impact on these static water bodies due to the escalating urbanization, particularly the urban expansion in peri-urban regions. This research seeks to identify the primary contributors to the growing vulnerability of static water bodies. The technique comprises a comprehensive and methodical examination of relevant literature, such as research articles, that analyses the urbanization scenarios of India's peri-urban areas and the features required to assess the quality and vulnerability of static water bodies. These static water bodies, in the shape of lakes and ponds, tend to be depleted by abrupt changes in Land use, the metalling of open surfaces, the disposal of solid waste, and an excessive rate of evaporation. These static water bodies in fragile peri-urban settings might be saved with comprehensive planning incorporating the right tactics and actions of local people and expert planners.

Keywords: Water Quality of lakes, Water quality Index, Static Water Bodies assessment, Vulnerability Assessment of Surface Water Body, Water Resource Management, Water quality in peri-urban areas, Critical threats to surface water bodies.

Arundhatee Mishra *et al.,*

INTRODUCTION

Ponds, lakes, and reservoirs play a crucial role in the ecological and socioeconomic fabric of India's peri-urban areas. However, these water bodies are increasingly susceptible to a variety of threats that endanger their viability and the welfare of neighbouring communities. This in-depth study focuses on the key vulnerable factors that influence static water bodies in India's peri-urban areas, shedding light on the particular challenges encountered and examining potential mitigation strategies [1]. The primary purpose of the study was to examine the threat posed to static water bodies by urbanizations, the leading cause of their depletion and pollution [2]. The Sustainable Development Goals (SDG) 6 - Clean Water and Sanitation for all - and SDG 11 - Sustainable cities and communities - stand out in terms of their relevance to urbanization and water security as Eco-sensitive and environmental protection threat objectives. As of the 1901 census, 11.4% of India's population resided in urban areas. This proportion increased to 28.53 percent by the 2001 census and is currently 34 percent, according to The World Bank. The United Nations projects that by the year 2030, 40.76% of India's population will reside in urban areas [3]. The United Nations predicts that by 2050, 68% of the world's population will reside in urban areas. Due to urban sprawl, pollution, and environmental degradation, unplanned or inadequately managed urban expansion, coupled with unsustainable production and consumption patterns and a lack of capacity among public institutions to manage urbanization, can compromise sustainability[4].

This urban expansion is primarily due to three factors: natural increase, rural-urban migration, and the expansion of cities, which has led to the annexation and transformation of rural areas into urban settlements [5]. Rapid changes in land use, biophysical environment degradation, social and economic differentiation, and increased pressure on natural resources are some of the effects of urbanization on peri-urban areas[6]. Urbanization processes are responsible for the shift from agricultural to urban, industrial, and recreational uses of water[7]. Other indicators of peri-urban water insecurity include rural-urban water flows to quench urban thirst, the acquisition of common property water resources to facilitate urban expansion, and the discharge of urban waste into rural water bodies[8]. Due to rapid urbanization and expanding human activity, peri-urban ecosystems are more vulnerable to degrading and becoming extinct [9]. Natural resources such as agriculture, horticulture, animal husbandry, forestry, and fishing are essential to the subsistence of the peri-urban poor in developing countries, according to a United Nations study[10]. Increasing water transfer from peri-urban to inner-city areas has decreased the availability of domestic and agricultural water in peri-urban areas[11]. The unequal distribution of natural resources has increased the burden on the poor and marginalized, who depend heavily on these resources for subsistence[12]. The entire equation of inner-city water demand and supply has increased pressure and competition for peri-urban water resources[13]. There are numerous interpretations of the term "vulnerability" among researchers.

In the context of water resources, vulnerability is defined as "the characteristics of water resources system weaknesses and flaws that make it challenging for the system to function in the face of socioeconomic and environmental change[14].The volume of water in a lake or pond remains constant throughout the year. Historically, these bodies of water were maintained by local communities[15]. Transferring maintenance responsibilities from the local community to government agencies increased the risk of encroachment and mistreatment[16]. Urban and peri-urban regions are experiencing a rise in encroachment. The increase in urban population necessitates the need for more land for housing and other infrastructure[17]. Last but not least, the limited and expensive land resources strain the water bodies[18]. Even for government agencies, water bodies are a convenient source of additional land for development. Existing urban and peri-urban water bodies must be preserved and rehabilitated in this scenario[19] . In South Asia, peri-urban water security concerns have received increased attention in recent years[20]. The PUI (Peri-Urban Interface) is a "attention-seeking" space, according to[21]. It is a site of both development and the problems that accompany it[22]. Recent trends indicate that while economic growth has stalled in metropolitan areas, manufacturing and service industries have shifted to PUIs[23]. Economic activity and employment relocation to the periphery[24]. Lakes have historically provided drinking water, water for household uses such as washing, water for agriculture, fishing, and water for religious and cultural purposes[25]. Lakes are also known to recharge groundwater, channel water flow to prevent water logging and flooding, and store water for future use. Lakes are

home to an abundance of plant and animal species[26]. The capital of Uttar Pradesh has lost 46% of its water bodies as a result of rapid urbanization altering its skyline. In addition, the majority are polluted with garbage and sewage [27]. The state government and the Supreme Court have taken numerous measures to prevent land grabbing and construction over water bodies, but the situation continues to spiral out of control[28]. The Lucknow Municipal Corporation conducted a survey in 1952 that revealed the city had 964 ponds. In 2006, the number decreased to 494[29].

METHODS AND MATERIALS

METHODOLOGY

Several literatures based on Assessment of static water bodies globally for different types of water bodies for different purposes has been selected and thoroughly reviewed. This literature is available on the web with keywords like, 'Water Quality of lakes', 'Water quality Index', 'Static Water Bodies assessment', 'Vulnerability Assessment of Surface Water Body', 'Water Resource Management', 'Water resource area', 'Surface Water Catchment Areas', 'Water quality in peri-urban areas', 'Critical threats to surface water bodies', etc in the form of Research papers, authenticated reports, and other forms such as books in order to comprehend the impact of urbanization, the nature of per-urban areas of India, and the vulnerability of static water bodies[30]. In addition, efforts have been made to identify the crucial factors that make these innocent static bodies susceptible to dangerous conditions, to the point where their very existence is being called into question. Multiple papers and reports assessing the vulnerability of static water bodies have been considered for this purpose. These aspects are then derived as parameters or factors responsible for the precarious state of static water bodies.

Impact of Urbanization on Static Water Bodies in India's Urban Periphery

The urbanization of static water bodies in India's peri-urban areas has had significant and mostly negative consequences not just on the natural environment, but also on the local inhabitants. Once-thriving wetlands, lakes, and ponds are eroding and disappearing as a result of urbanization[31]. Numerous plant and animal species are threatened by the delineation and preservation of catchment regions, feeder channels, and command areas of lakes, ponds, etc., which are destroying essential ecosystems[32]. This loss of biodiversity has an adverse effect not just on the delicate biological equilibrium, but also on the essential ecological services provided by these water bodies[33]. Urbanization also causes a decline in the quality of water in static bodies of water. Due to the discharge of untreated sewage, effluents from industrial activities, and municipal trash, water bodies are becoming progressively polluted[34]. The pollution in these bodies of water endangers not just the aquatic species that inhabits them, but also the human populations who depend on them for drinking water and other purposes[35]. In addition to degrading water quality, urbanization also generates hydrological changes in the regions immediately around cities[36].

The massive and rapid change in Land use of peri-urban zones caused by the construction of structures such as buildings, roads, and pavements prevent the natural penetration of precipitation into the ground, hence increasing surface runoff. Multiple small bodies of water in the city's peri-urban areas shrunk as a result of fast real estate development[37]. This alteration to the hydrological cycle increases peak flows during rainfall events, resulting in water loss through rapid runoff, excessive extraction of fresh water, and a decrease in the quantity of water returned to the land[38]. The impacts of urbanization are not restricted to environmental issues alone; they also have an impact on the means of subsistence of local communities[39]. Many peri-urban populations depend on static bodies of water for their livelihoods, such as fishing, agriculture, and animal husbandry. These traditional means of subsistence are threatened by urbanization and the deterioration of the water supplies on which they rely, which will ultimately result in a loss of income and food security[40]. In addition, rural-urban migration exacerbates the issue, and it is not uncommon for communities to be uprooted due to their dependence on these resources[41].Another result of urbanization is the formation of urban heat islands[42]. In order to convert static bodies of water into urban infrastructure, vegetation must be removed and heat-absorbing materials, such as asphalt and concrete, must be installed[43]. Consequently, the average temperature in neighbouring cities and towns is higher than that of the

surrounding rural areas. The urban heat island effect has deteriorated since static water features no longer have the same cooling impact as before[44]. A comprehensive and ecologically sound plan is required to counteract the negative impacts of urbanization on static water bodies in India's peri-urban zones[45]. Due to the low participation of urban planning and the residents' and authorities' understanding of static water sources, ignorance is fostered, resulting in unfavourable outcomes[46]. This plan must combine environmentally responsible urban growth, effective wastewater treatment, preservation of water bodies, and community participation[47]. Implementing methods such as rainwater collection, wastewater treatment, ecological restoration, and green infrastructure building can reduce the negative effects of urbanization on static water bodies and provide a more resilient and sustainable future for peri-urban regions[48]. These methods may also assist in mitigating the negative impacts of urbanization on flowing water bodies[49].

Assessment of Vulnerability in Static Water Bodies conducted by several authors
Several authors have assessed the vulnerability of static water bodies, highlighting the potential risks and difficulties these water bodies face as a result of a variety of factors[50]. Several of the vulnerability assessments conducted specifically in Indian scenarios are explained separately. Vulnerability Assessments performed by different authors on Static Water Bodies is summarized to gain a deeper understanding of the aspects of static water bodies that are vulnerable to transformation from their original form. "Assessment of Lakes of Vadodara City in terms of Water Quality Indices and their comparison". By analyzing land-use changes, encroachments, and pollution, this study analysed the vulnerability of Bangalore, India's tiny water bodies. The authors created a vulnerability index and determined the bodies of water with the highest vulnerability. Total nine variables are taken into consideration including water temperature, pH, dissolved oxygen, conductivity, turbidity, permanganate index, etc. The study highlighted the importance of including vulnerability assessments into urban planning procedures in order to guarantee the sustainable management of these water bodies[49]. " The changing water quality of lakes—a case study of Dal Lake, Kashmir Valley ". This report describes the recent changes in the water quality of Dal Lake. The report analyses the solutions that, if executed effectively, can be used to manage the lake and restore its quality.

Essential parameters like Water quality(temperature, pH, dissolved oxygen, conductivity, turbidity, permanganate index, etc.), biological diversity(bacterial pollution indicator species), Encroachment of the lakes(Harvesting and de weeding),Role played by the local community in lake management(Dredging of lake sediments, Public awareness program), Role of government departments(Solid wastes, sewage, and their management, Shoreline development,) have been taken into consideration[32]. " Water Quality Statue of Pushkar Lake After, During and Before the Pushkar Fair ". This research is based on the lake's water quality. Due to home and agricultural output, the mixing of storm and sewage water, and excessive congestion during the Pushkar fair, the Pushkar lake faces several challenges. In this, several Water Physic-chemical Parameters for water quality like pH, Temp Turbidity, Magnesium, Total Hardness, Nitrogen, Phosphorus, Potassium, Dissolved Oxygen., Biochemical Oxygen Demand, Chemical Oxygen Demand, etc and, Existing terrestrial flora & fauna. have been taken into consideration[47]. "Water Quality Assessment of Natural Lakes and its Importance: An Overview ".

This research provides an overview and critical analysis of the literature on all elements of water quality like Physical, Chemical, Biological in order to provide an understanding of the many instruments and strategies utilized for comprehensive monitoring and management of water quality[15]. "Assessment of Lake Water Quality by using Trophic State Index Indicators Parameters like Physical, Chemical, Biological for Ecological Lake Restoration- a Case Study of Bhimtal Lake, Kumoun Region, Uttarakhand, India". This study was conducted to incentivize Lake Water Quality in relation to the Eutrophication Status of Bhimtal Lakes and to develop a conservation plan for restoring Bhimtal Lake Water Quality[23]. "Applying The Social-Ecological System Framework to the Diagnosis of Urban Lake Commons in Bangalore, India": This study uses a social-ecological system (SES) paradigm to analyze why certain places have been successful in negotiating governance shifts from community-based systems to state control following urbanization, while other lakes have deteriorated. This followed the analysis of factors like Social, Economic, and Political Settings, Related Ecosystems, Resource Systems, Resource Units, Actors, Governance Systems, Interactions, Outcome criteria[43]. " Lake Vulnerability Assessment ": This study presented the LVRI (Lake

67844

Vulnerability Resilience Indicator) based on the vulnerability assessment of climate change which includes Exposure, Sensitivity, Adaptation Indicators for an environmental risk assessment in lakes suffering from water pollution from an integrated perspective of lake watershed features[13]. " Water Bodies Protection Index for Assessing the Sustainability Status of Lakes under the Influence of Urbanization: A Case Study of South Chennai, India,". This work employs indicators, a potent decision-making tool, and proposes the Water Bodies Protection Index (WBPI), which includes Water quality(Water quality variables—physical like pH, EC, TDS, DO, temperature, hardness, chloride, alkalinity, nutrients like phosphate, nitrate and BOD), biological diversity (Plankton diversity), water spread area(Original water spread area of lakes and the area encroached), role played by the local community in lake management (Level of awareness and participation toward protection of lakes), and role of government agencies(Available acts on lake protection, level of upkeep and preservation) are the five factors chosen for formulating the Water Bodies Protection Index. A monitoring and ranking tool that may be used to prioritize conservation efforts for peri urban water bodies[44].

" Strategic environmental assessment of Pushkar Lake, Ajmer (Rajasthan) with special reference to infiltration problem ". This study focuses on the Strategic Environmental Assessment (SEA) of Pushkar Lake which includes parameters like Physic-chemical parameter, Existing terrestrial flora & fauna within The 10 kmradius of project influenced area, Socioeconomic Characteristics of the affected area, paying special emphasis to the infiltration issue that has a detrimental effect on its religious significance[40]. " Dip in a sacred lake: Divinity or Devastation Case study of Pushkar lake during the Panch Teerth Maha Snaan": This report aims to offer information on the water contamination produced by humans during the Panch Teerth Maha Snaan in the holy lake of Pushkar by assessing physio-chemical properties[36]. " Studies On Physio-Chemical Characteristics of Dal Lake, Srinagar Kashmir ". The purpose of this study was to assess the existing physicochemical features of Dal Lake in Srinagar District, Kashmir.

From January to December 2011, monthly variations in physio-chemical parameters such as water temperature, clarity, pH, conductivity, dissolved oxygen, Free Co2, Alkalinity, chlorides, Ammoniacal nitrogen, Nitrate nitrogen, and Total phosphorus were examined[32]. " Assessment of Physio-Chemical Characteristics and Suggested Restoration Measures for Pushkar Lake, Ajmer Rajasthan (India)". This report aims to offer information on the water contamination produced by humans during the Panch Teerth Maha Snaan in the holy lake of Pushkar[47]. Similarly various organizations have also done vulnerability assessments on static water bodies which can be summarized as follows; School of Planning & Architecture, New Delhi under the Namami Gange Mission, India has done 'Urban Wetland/Water Bodies Management Guidelines January 2021 Volume I A Toolkit for Local Stakeholders', in 2021 which mainly includes the Assessment on Ecosystem Services in Urban Wetlands based on Factors like Assessment of Impact of Urban Development Trends on Wetlands/Water bodies is done based which broadly includes Indicators[3]. These studies and others like them provide valuable insights into the vulnerability of static water bodies in peri-urban areas. This information helps to raise awareness and guides policymakers, researchers, and stakeholders in the development of appropriate conservation, restoration, and sustainable management strategies.

RESULTS AND DISCUSSION

In essence, eight Vulnerability Factors for Static Water Bodies have been identified that are essential for comprehending the origins of susceptible situations in static water bodies. They are listed below:

Land Use and Population Density

1. Land use generates new water needs and claims, which gradually shift from agricultural to urban, industrial, and recreational uses.
2. The increase in nutrient runoff is one of the most severe consequences of land use change on lakes.
3. High population density can raise the demand on freshwater resources, leading to their overexploitation and depletion.
4. Aside from that, a rise in population density tends to lead to an increase in solid waste creation, which may result in the partial dumping of solid waste near static water bodies and the subsequent polluting of these bodies.

Encroachment

1. In peri-urban locations, the lake margins have been encroached upon either by residents establishing new villages or by "Real Estate" developers.
2. The drainage system that originally linked these lakes has been damaged, resulting in a decrease in the amount of rainwater that flows into these bodies of water.

Community Use

Clothes washing, animal bathing or animal wading, fishing, dairy production, discharge of industrial waste, etc. degrade water quality, destroy habitat, and endanger aquatic life.

Pollution

Pollution is a major issue in Peri-Urban zones where population growth has outpaced the expansion of municipal infrastructure, such as waste disposal and management facilities. (S. Siddiqui, 2018).

Community Participation

It is extremely challenging to strike a balance between ecological concerns and social justice while fostering collaboration among a wide number of stakeholders with drastically varying socioeconomic, cultural, and political perspectives. (Mundoli et al., 2015).

Mining Activities

Illegal mining, particularly of clay soil for the production of bricks or sand on the catchment and bed of water bodies, is another factor in the degradation of numerous water bodies.

Recreational /Tourism Activities:

Unregulated and unplanned recreational activities around water bodies have resulted in the persistent dumping of trash into neighbouring water bodies and the erosion of shorelines. This has a detrimental influence on the lake and its surroundings.

Institutional Role

1. Another difficulty with PUIs is the haziness of institutions' duties (Bentinck J., 2000)
2. In addition, the volume and scope of changes occurring at the local level in the PUI frequently exceed the capacity of local administration (Thuo, 2013; Mattingly M., 1999)

CONCLUSIONS

Maintaining static water bodies is important. environmental and eco-system maintenance. India's peri-urban ecology and economy depend on ponds, lakes, and reservoirs. Lakes have supplied water for drinking, washing, agriculture, fishing, and religious and cultural purposes. Lakes replenish groundwater, prevent water logging and flooding, and store water for future use. Lakes have many plant and animal species. These bodies of water are increasingly vulnerable to a variety of threats that threaten their viability and neighbouring communities. Urban sprawl, pollution, and environmental degradation can result from unplanned or poorly managed urban expansion, unsustainable production and consumption patterns, and a lack of public sector capacity to manage urbanization. Natural increase, rural-urban migration, and city growth have caused the annexation and urbanization of rural areas. Urbanization in peri-urban areas causes rapid land use changes, biophysical environment degradation, social and economic differentiation, and natural resource pressure. Urban and peri-urban encroachment is rising. Urbanization requires more land for housing and infrastructure. Finally, expensive and scarce land resources strain water bodies. Government agencies can easily develop water bodies. This scenario requires preserving and rehabilitating urban and peri-urban water bodies. Urbanization of static water bodies in India's peri-urban areas has had major negative impacts on the environment and local residents. Urbanization is eroding wetlands, lakes, and ponds. Delineating and preserving catchment regions, feeder channels, and command areas of lakes, ponds, etc., which destroy vital ecosystems, endanger many plant and animal species. The delicate biological balance and vital ecological services provided by these water bodies are affected by this biodiversity loss. Urbanization degrades static water quality. Sewage, industrial effluents, and municipal waste pollute waterways. These bodies of water are polluted, endangering aquatic life and the people who drink their water. Urbanization alters local hydrology and water

quality. The rapid construction of buildings, roads, and pavements in peri-urban areas prevents precipitation from percolating into the ground, increasing surface runoff. Numerous city's peri-urban small bodies of water shrank due to rapid real estate development. In peri-urban areas, the crucial aspects that were derived from analysis provide valuable insights into the vulnerability of static water bodies. This information contributes to the raising of awareness and directs researchers, policymakers, and other stakeholders in the process of developing appropriate conservation, restoration, and sustainable management strategies. It is absolutely necessary to devise and put into action comprehensive plans for the preservation and administration of static water bodies in the peri-urban areas of India. The plans ought to put an emphasis on environmentally friendly urban planning, enhanced procedures for waste management, stringent compliance with regulations, and active participation from the community. In addition, it is essential to address the underlying causes, such as urbanisation and climate change, in order to ensure the long-term health of static water bodies in peri-urban areas and their ability to persist for future generations and thus actually try to achieve SDG goals, especially SDG-6 and SDG-11.

ABSTRACT

The globalised world is dominated by technology and innovation because the present generation is more tech-savvy, electronic devices specially internet enabled smart phones have become an important part of their lives. The mobile wallet sector in India has benefited from the rapid usage of smart phones and mobile internet. Mobile wallets are used for most the payments by the people which is a building block of their lives because M-wallets provide many cybernetic services ranging from utility to e-commerce activities. This study is to examine the user's perception towards the security issues of m-wallets in Bangalore rural district in the fast-paced technology era. A total of 372 respondents' responses were collected and analysed using a structured questionnaire method and found that users are still finding security issues. This study will aid smart phone manufacturers, M-wallet service providers, regulatory agencies and financial institutions to prevent security concerns through appropriate design to convince their consumers about the security of their m-wallets.

Keywords: mobile wallets, personal information, security, safety

INTRODUCTION

India's mobile wallet market has experienced growth as a result of the COVID-19 pandemic. There is a lot of room for mobile wallet adoption in this nation due to its restricted mobility and heavy reliance on banks. A lot of the previously unreceptive citizens started using mobile wallets during the outbreak. Because of the market's heavy reliance on e-commerce platforms, it experienced a notable uptick during COVID-19. Although security has emerged as a major barrier to mobile payment acceptance, the security issues in adoption of m-wallets has been not much

explored particularly from the perspective of customers. As a result, this research aims to take an empirical approach to the problem in order to gain a deeper grasp of the notion.

Significance of the Study

Mobile payments have increased as a result of the cash crisis brought on by demonetisation and COVID-19, according to reports from the Reserve Bank of India and the Indian government. Because smartphones and internet are so inexpensive, most daily payments are done through mobile devices. In India, the amount of digital payments made during the fiscal year 2021–2022 climbed by 33% year over year. The use of m-wallets has increased dramatically over time, with a total of 7,422 crore digital payment transactions reported during this period (up from 5,554 crore transactions seen in FY 2020–21, according to Ministry of Electronics and IT data). Therefore, it's critical to investigate the security concerns with m-wallet, including lost or stolen money or devices, phishing schemes,

REVIEW OF LITERATURE

Alqahtani, M. S. A., & Erfani, E. (2023) The development and implementation of security actions and controls are crucial steps in protecting an organization from external threats. Unfortunately, most of the effort toward improving cyber security is concentrated on implementing new technology solutions. This paper aims to provide policymakers and technology experts with a comprehensive understanding of the multiple factors that affect a company' cyber security compliance, as well as the steps involved in implementing effective measures. The article also explores the factors that influence cyber security. It uses the UTAUT2 model to study the relationship between technology acceptance and use. Chawla, D., & Joshi, H. (2023) This study aims to identify the various types of user segments and their maturity levels. It then constructs a model that explains how these segments view their adoption and how these constructs can influence their attitudes. It also aims to analyze the effectiveness of these constructs and identify areas where they can improve. The TAM and the UTAUT are two theories that talk about how people embrace new technology. A pilot instrument was then created using the synthesized literature review. The discussions were conducted in two focus groups. The study revealed that mobile wallet providers need to focus on the six components of their product, with SEC, LC, PU, and SEC getting the most attention.

Mew, J., & Millan, E. (2022) The services that a mobile wallet provides must be reliable, trustworthy, and always available. Issues related to its use can have an impact on the satisfaction of consumers and the value they perceive from their service providers. This study looks into the various factors that can prevent or influence the use of such technology. The study utilizes a mixed-method approach to gain a deeper understanding of the phenomena being examined. The conclusions are thus solidly based on empirical data. The conceptual model combines old and new ideas derived from the study participants' actual experiences. The results support the significance of each component taken into account in the model, as they all had indirect or direct impact on consumers' intention to adopt and use the mobile wallet and contributed significantly to its variance. BalKrishnan & Shuib (2022) The study investigated the connection between Malaysians' usage of cashless applications and their readiness for a cashless society. Specifically, a model Cashless Society Readiness-Adoption has been developed to examine driving factors in order to evaluate their direct and indirect effects. UTAUT 2 and the Technological Readiness Index 2.0 served as the foundation for the model's development. The outcomes would be advantageous to the relevant stakeholders, including service providers, financial institutions, and governmental organizations, in developing and designing strategies to effectively encourage more individuals to adopt digital payment systems.

Shobha, B. G. (2021) in their research tried to understand the "awareness" and "preferences" for using M Wallet in Bangalore's Rural Area. Using the non-probability Judgmental sampling method, 200 samples were selected. The data collected using structured questions on a Likert five-point scale. The findings showed that the favored e-wallets, such as Google Pay, Pay TM, and Phone Pe, had a moderate level of awareness. Another area of worry that the cyber law must treat carefully in order to safeguard M-Wallet users' interests is cybersecurity. Alam, M. M., et al., (2021) this research work intends to examine the difficulties and opportunities associated with using electronic wallets in

Narasimha Murthy

Malaysia, as well as how it helps for consumers and businesses. Gave some ideas for how to take advantage of your assets and opportunities while fending off dangers and shortcomings. Here are some ideas for how to take advantage of your assets and opportunities while fending off dangers and shortcomings. To evaluate Malaysian company development and to evaluate the e-wallet portent utilizing a SWOT analysis. Findings from the literature and secondary data are used to support it. The World Bank and Bank Negara Malaysia provided the pertinent secondary data. This study demonstrates that although there is great potential for e-wallets in Malaysia to succeed, they have not yet done so. The SWOT analysis revealed a number of strengths (such as financial incorporation, ease of access, protection and safety, protection and safety for other accounts, management of products and consumer services, and quick implementation/administration), weaknesses and opportunities

Daragmeh, A., *et al.,* (2021) Evaluated how The World Health Organization and other organizations urged people to use contactless payment systems rather than cash, which has the potential to spread the SARS-2 infection. The core objective of is to assess the factors which influence Generation X's in utilizing mobile m-payment services in Hungary during covid. We surveyed 1120 members of Generation X using an electronic questionnaire. Their findings endorse that perceived risk of COVID-19, usefulness, and subjective norms strongly influence Gen- X behavioral intents to utilize the services of m-payment system. Used SEM to examine the conceptual model developed for the study. Moreover, perceived usefulness worked as mediator between perceived usability and propensity to adopt system of m-payments. George, A., & Sunny, P. (2021) M-wallet service providers and researchers are investigating the adoption of mobile wallets and their continuous use, due to COVID-19, greater reliance on them, and the public's acceptance of them as well as other related e-services. Using a variety of technological adoption models and behavioral research, this study theoretically investigates aspects affecting users' actual usage of mobile wallets and behavioral intention. This research seeks to develop a thorough conception of m-payments uptake and real usage by examining the impact of many important elements based on proper literature review. The usage of mobile payment system might be successfully illustrated by the presented model, and it also provides the opportunity to draw significant managerial conclusions about efficient marketing strategies.

Lu, W., *et al*., (2021) this research evaluated the opinion of QR code mobile payment system adopters regarding continuous usage intention. The sample size of this empirical research was 215 mobile payment users. The variables considered in this study were chosen from UTAUT model. Two more factors were added to the model as moderating factors which were all the factors has significance on Unceasing use of QR code payments. Usefulness was the important influencing factor. risk had no effect on continuance usage intention. Other side Involvement had a positive and moderating effect on PE, EE on incessant usage intention. But involvement was a negative moderator between Social Influence and continuous usage intent. It was concluded that traditional payment method was too time consuming, so Chinese population were getting shifted from regular payment method to m-payment method. The study suggested m- payment system service providers to concentrate more on fast completion of transactions. Grover, P., & Kar, A. K. (2020) this research analyses how mobile wallet firms are using social media platform to promote their services and interact with their customers. It looks into the various promotional and acquisition activities that they are doing on Twitter. The study analyzed "Free-charge", "Oxigen Wallet", and India's MobiKwik. The study also proposed a social media engagement framework to study the dynamics of the service utilisers. The study suggested that mobile wallet firms should promote their services through various content types, such as entertainment, social, and informational. They should also regularly campaign to increase their network size. The outcomes of this research help wallet companies to plan effective social media campaigns.

Statement of the Problem

Technically speaking, a mobile wallet is a free download available through the smartphone play store. Various manufacturers offer a variety of m-wallets for download on the market. Since everyone has an internet-connected smartphone these days, m-wallets are a great choice for a variety of daily payments. The number of m-wallet transactions increased as a result of the central government's digital awareness campaign and demonetisation (annual report of RBI-2021). However, security concerns—such as those pertaining to confidentiality, authentication,

integrity, authorization, and non-repudiation—were the primary deterrents to m-wallet adoption (Dhingra. et al., 2020). This study aims to address these concerns at the rural district of Bangalore.

Objectives of the Study
To evaluate the demographic profile of the m-wallet users
To examine security issues faced by the m-wallet users.

METHODOLOGY OF THE RESEARCH

This empirical study is descriptive and analytical in nature, the study's primary source of data extracted from 372 m-wallet users (convenient sampling) of Bangalore rural district using five point Likert scale questionnaire and analysed, and respondents are of different gender, age, income, level of education, and place of residence. The statistical tools used in the analysis such as percentage analysis and cross tabulation for the interpretation of the data.

Data Analysis and Interpretation
This study distinguished between the two characteristics of objective and subjective security in order to focus on the crucial prerequisite of "security," which is crucial for customers to accept a mobile payment process. Similar to permission, confidentiality, authentication, integrity, and non-repudiation, objective security is a technical attribute (Merz 2002). The degree of subjective security, or "what would they require to feel secure about using m-wallets," is influenced by the objective security level, not the other way around. Data was gathered and examined using the objectivity-influenced subjectivity questions that followed. The above table is constructed to understand whether the demographic factors are influencing on adoption of m-wallets or not. Understood from the table that maximum m-wallet users are between 31 to 50 years of age category and middle age people are using more than any other age category users. Very importantly maximum users are male. Lower income group people are using the m-wallets most and their education qualification is Graduation. From the study it is understood that semi urban (taluk level) people are using more. It is understood from the available data that many users are using maximum three wallets and data also shows around 41 percent using maximum 5 different wallets and maximum users are using wallets for maximum 25 times in a month. The above table is constructed to understand the users' response about the safety of their personal data in m-wallets and found that majority users' opinion is, personal and banking details are not safe in the m-wallets and only 17 percent of the users said that the data of the users is safe whereas 50 percent of the respondents said not safe. From the analysis, overall 48 percent of the users opinion is unauthorised people cannot access to their m-wallets but 42 percent of the users says yes, unauthorised access possible to wallet. In order to understand user's awareness about data safety from service providers this table was constructed and observed there is almost mixed opinion about whether users personal information is exposed to third party or not. 56 percent of the respondents said their personal information is exposed to third party whereas 44 percent said not. From the study, it can be interpreted that, transactions failure in m-wallet are quite common and 99 percent of the users are with the same response. The data from the table says, 52 percent of the respondents are not getting immediate refund when transaction is failed amount is deducted, it is not that easy and quick of getting refund immediately but 45 percent of the respondents said yes it is easy and there is a communication about failed transactions. It can be concluded from the table; 50 percent of the respondents are getting confirmation about their payments whereas around 26 percent of the respondents are not getting any confirmation immediately after their transactions. Users perception about hacking of their wallets is, 50 percent of the users said hacking and cybercrimes are possible and only 30 percent of the respondents said it is not that easy. There is a mixed opinion about safety, security and reliability of the m-wallets in rural Bangalore, 49 percent of the respondents' opinion is, m-wallets are not safe whereas 51 percent of the respondents said m-wallets are safe.

Major findings of the study

1. From the study found that maximum m-wallet users are between 31 to 50 years of age category and middle age people are using more than any other age category users.
2. Very importantly maximum users are male. Lower income group people are using the m-wallets most and their education qualification is Graduation.
3. From the study it is found that semi urban (taluk level) people are using more.
4. Found that users are using maximum three wallets and data also shows around 41 percent using maximum 5 different wallets and maximum users are using wallets for maximum 25 times in a month.
5. Majority respondent's opinion is that, personal and banking details are not safe in the m-wallets which is a major factor may be influencing negatively on adoption of m-wallets for daily payments in Bangalore rural district.
6. Found from the study that unauthorized people cannot access to their m-wallets so easily unless user's negligence.
7. It is observed, there is a mixed opinion about whether respondent's personal information is exposed to third party or not. 56 percent of the respondents said their personal information is exposed to third party whereas 44 percent said not.
8. It is found that, transaction failures are quite common during peak hours and 99 percent of the respondents agreed for the same.
9. From the research found that users are not getting immediate refund when transaction is failed and amount is deducted because it is taking 24 hours to 48 hours for refund of deducted money. Due to this they face shortage of funds in emergency time.
10. It is found from the oral discussion with users, if the attached bank account belongs to public sector, sometimes there is no proper communication of transactions/ payments in their Bank account through SMS or mail.
11. Found evidently that hacking and cybercrimes are possible, which is stopping rural people adoption of m-wallets and only 30% of the respondents said it is not that easy
12. Over all 51% of the users said m-wallets are safe which is a positive side but 49% of respondents still feeling not safe about m-wallets

IMPLICATIONS AND CONCLUSIONS

Examining m-wallet security concerns was the goal of this study. The findings of this descriptive study indicate that middle-aged individuals are more likely than those in other age groups to embrace m-wallets. As a result, it is recommended that service providers and regulatory bodies introduce new, more user-friendly technologies to boost adoption rates in rural areas. It is recommended that service providers employ live demonstrations, digital literacy programs, or other promotional activities to raise awareness among rural customers about the benefits of m-wallet usage. It is recommended that service providers and device manufacturers enhance security features and promptly resolve grievances. Therefore, increasing adoption in rural areas and fostering user confidence are both viable. Once more, it is recommended that service providers standardize the wallets' performance, security measures, authorization, and downloading and installation processes. The conclusion is that, there are security concerns in adopting and using m-wallets, some concerns are real in practice but some concerns are misunderstood because rural people are with lack of knowledge and technological education. If policy makers, financial institutions, m-wallet service providers and smart phone manufacturers come together it is possible to overcome the security issues in m-wallets, in turn misunderstandings about m-wallets can be detached.

Limitations and Directions for Future Research
Time and financial restrictions forced this study to limit its sample size to 372 rural district residents of Bangalore. Because of timely changes, research focused on consumer behavior cannot provide results that are long-lasting. More

respondents, a comparison between urban and rural areas, districts, states, corporations and non-corporate entities, and the entire nation could all be included in an extension of this research.

ABSTRACT

Digitalization, as a concept is not restricted to urban areas but also has been making inroads into rural India and holds the prospect. It has a growing impact on micro and small-scale businesses. The advanced technology and internet accessibility has paved way for the adoption of digital operations in rural areas. This paper aims to find out the awareness and accessibility of digital adoption by micro and small entrepreneurs in their business. It also identifies the challenges faced by them in digitalisation of their businesses. The study uses the sample of 150 entrepreneurs from micro and small enterprises across Bangalore rural areas. The study tries to test the hypothesis by using regression and correlation techniques. This paper also recommends them the ways and means for the improvement of digitalisation of their business.

Key words: Digitalisation, Micro, small entrepreneurs, rural areas

INTRODUCTION

Technological revolution makes the human life very easy and simple. The rapid growth of technology has influenced the global activities and transformed the economic, social and political environment. At the same time the business world also has influenced by ICT application, which helps for the business expansions. With the help of ITC the

67861

business digitalises' its all activities and it creates opportunities and threats to the small business. The small business like micro and small enterprises take this digital inclusion as a challenge and compete with its competitors.

Digital Inclusion

Digital inclusion is the individuals and groups of people capability to access and use the information and communication technology (ICT) in various business situations on par with the technological transformations. As digital inclusion is not just about computers or the Internet, but it is the usage online and mobile technologies as channels to improve skills, to enhance quality of life, to drive education and to promote economic wellbeing across all elements of society (Australian Digital Inclusion Index, 2015). In addition, digital inclusion enables the various clusters of society, businesses and educational institutions to have access to technology which helps them to use and analyse its current information. The fast internet access enables the digital inclusion to access the information physically. Thus, it provides a bigger opportunity for economic growth with the usage of ICT and also to enhance the relationship with the support systems. (Faradillah Iqmar Omar, Ali Salman & Samsudin A.Rahim, 2015).

The usage of internet and the technological applications in the business is inevitable for the entrepreneurship. In this techno flexi business environment, their survival of the business is based on their digitalisation process and its application in business. Digital inclusion is essential for their business processes as it helps to overcome the cut throat competition by adopting cost-effective marketing techniques and expansion of the potential customers.
 According to Asian Development Bank (ADB, 2014), the small and medium-sized enterprises (SMEs) are the backbone of Asian economies and they are very important for contributing to economic development of the country. As the SMEs helping the multinational corporations by suppling its supplementary for the main products, they should be aware about the digital inclusion for dealing with the multinational companies to deliver its operations in a quick mode.

LITERATURE REVIEW

K. Suma Vally and K. Hema Divya examines the impact of adopting digital payments effects on users of banking in India. The report of their study tells us how to increase cashless payment in the country. The result specifies that the adoption of technology for digital payments improves the performance of banking sector. Also it said that banks should take effective measures to create awareness to the customer about the effective utilization of technology and security. Sudiksha Shree, Bhanu Pratap, Rajas Saroy and Sarat Dhal in their research governments, regulators & service-providers are working to improve the e-payment system. Researchers recommended that perception of digital of digital payment tools affects the payment behavior of an individual. Dr.R.KrishnaKumari, Ms.G.Pavithra said through their research said that 24*7 service, time saving, convenience and security helps to strengthen the digital payment system. It helps in cost reduction and simplifies the process of e-payment process. Public is facing fewer problem to use cashless method at present.

Dr. D. S. Borkar, Mr. Avinash Galande cleared that digital payment system is growing faster. There are lot of opportunity in India for digital payment business. Now a days due to the Government initiative in India and banks initiative to provide the awareness among the customer still proper education is required to the customer banks. Presently it has been observed that there is high cost of infrastructure and lack of financial literacy among the people. E-payment system helps the people to maintain the transparency and also helps to security. Dhruvi Bhagat said that pandemic 2020 has impacted the digital payment system and also a game changer for India for digital payments adoption ever since the demonetization in 2016. Author suggests that retail stores must adopt and influence the customer to use the E-payment transaction.

Statement of the Problem

In the current scenario internet place, a major role for the day today activities. The use of internet, digital technology such e transaction, data storage and other business activities are accepted and practices by both entrepreneurs and customers. It will increase the purchasing power of the consumers. In our country there are so many unorganized

sectors, which are mostly live in the poor economic conditions. Micro and Small-Scale Enterprises not only contribute significantly to improved living standards, they also bring about substantial local capital formation and achieve high levels of productivity and capability. Digital inclusion would influence the internal business processes of an organization as well its functions of Indian market. It has its influences to SMEs on their restricting of the infrastructure and resources, in terms of information technology systems, value chain, pricing and others[3]. In Bengaluru north, rural areas many SMEs are contributing more for the economy through their business. In this situation this study takes the initiation to analyze the opinion of entrepreneurs, in SMEs as they are one of the major players in the economic development of any industrial areas like rural areas in Bangalore North.

RESEARCH METHODOLOGY

The research design adopted in this study was a blend of analytical and descriptive in nature. Population of this study has comprised Micro and Small Enterprises (SMEs) under rural areas such as vijipura, Nelamangala, Hosakote, Chikabalapura, Dodabalapura and Kanakapura in North Bengaluru. Convenient sampling method was used to collect the data. In this method 150 registered Enterprises were taken for data collection. With the help of literature review, questions were framed on awareness and the opinion of digital inclusion in SMEs. And the responses to these questions were collected using interview schedule questionnaire method. Data were analyzed by using statistical tools such as frequency, percentage and one way ANOVA.

Objectives:
1. To study the awareness and challenges about the digital inclusion in MSMEs
2. To find the opinion about the digital inclusion among the entrepreneurs of MSMEs
3. To suggest the ways and means for the entrepreneurs about the digital inclusion

Analysis and Interpretation:
This study analyses the awareness about digital inclusion among the entrepreneurs, and the results were as followed in Table 1.

From the above Table 1, the respondents were getting highest awareness about digital inclusion from their friends and relatives. They motivate and due to their pressure others also follow the same.
Digital inclusion also such one such the second highest source is their business circle. If one businessman aware about any business techniques it will be followed by others also.
This study analysis opinion about the digital inclusion among the entrepreneur

In the above Table 2, it was found that 'p' value (level of significance) was less than 0.05 at 1 degrees of freedom. So the hypothesis was rejected for organization and the study proved that the opinion of digital inclusion among the types of organization were differing. In the micro enterprises the entrepreneurs were still in the process of the digital inclusion. Slowly they are transforming to digital inclusion. Among the male and female entrepreneurs, and married and unmarried entrepreneurs, the opinion about digital inclusion are same. The study accepts the null hypothesis for both gender and marital status of the entrepreneurs about their opinion on digital This study analysis the opinion of SMEs that the digital inclusion is benefited for the organization. The study marked their opinion and analysed as followed

In the above Table 3, it was found that 'p' value (level of significance) for income, education, age and trading period was more than 0.05 at 4,5,2 and 3 degrees of freedom. So, the hypothesis was accepted for income, education, age and trading period. The entrepreneurs having same opinion about digital inclusion for their business in spite of their age, income and education. The entrepreneurs have to accept the digital inclusion and if they deviate from the digital inclusion they will away from their business.

FINDINGS

The study has following Findings
- Friends and relatives (37%) and business circle (33%) motivates the entrepreneurs for their digital inclusion.
- The process of digital inclusion, the micro enterprises are slowly transforming their business into the digital inclusion. Most of the small enterprises are already in the process.
- The opinion about the digital inclusion for the business is accepted by both gender and the married and unmarried entrepreneurs.
- The study has found that the entrepreneurs are having the same kind of opinion about digital inclusion, that without that the business cannot move forward.

Suggestion
The government have to encourage the digital inclusion of SMEs by
- To remove the gap of technology adoption by providing SMEs with technology support and assistance.
- To involve more SMEs to adopt digitalisation by encouraging SMEs training and upskilling in the digital technology.
- To give more protection to SMEs by raising the digital security profile of SMEs.
- To access the strategic resources for the digital inclusion easily to SMEs by leveraging fintech and financial assistance

CONCLUSION

Digital transformation is an ongoing process that is constantly evolving and business enterprises that embrace digital transformation will be better positioned to compete in the future and deliver value to their customers. The SME entrepreneurs need to think quickly and adapt the changes in a dynamic way. The companies to achieve success should keep a step ahead in utilizing the opportunities arising out of the changes in the information and technology.

ABSTRACT

Over the years Multi-national Companies have been training their employees to be complaint with various laws and regulations mandated by the governing bodies. The training focusing on Code of Conduct, Privacy and Data Protection, Anti-money laundry, Anti-Fraud, Cyber Security, Profession/Role Specific statutory Training etc.., non-complaint to statutory mandated training will result in MNCs face hefty penalties, loss of license, loss of reputation, most importantly the purpose of the training to educate their employees on dos and don'ts which could harm their business. Irrespective of governing bodies and companies provide training, still the occupational discipline is lacking among some workforce which are witness over multiple corporate fraud cases. As a result of lack of occupational ethics, companies are exposed to fraud and suffer financial and non-financial loss, which raises significant question on the effectiveness of Compliance Training. This study is aiming to study the effectiveness of the compliance training provided to its employees by the multinational companies.

Keywords: Compliance, Training, Multinational Companies, Occupational Fraud, Corporate Frauds.
JEL CODE: M53, M42

INTRODUCTION

Fraud is a criminal act that is indents to deceive someone for financial and personal gain. Occupational fraud is one such fraudwhere employee of an organization deceives their organization for financial and personal gain, occupational fraud can be of internal (employee, managers, executives) and external (vendors, consultants and customers). Category of occupational fraud includes Asset Misappropriation, Financial Statement Fraud, Corruption.

67866

Association of Certified Fraud Examiners in their Report to the Nation (2022) state 86% of cases reviewed by them fall under Asset Misappropriation, 50% by Corruption and followed by 9% by Financial Statement Fraud. Combating Occupation Fraud for an organization, it is paramount task, no matter how stringent Anti-Fraud Policy in place, organization's suffer median loss of 5% as per Association of Certified Fraud Examiners. Occupational fraud does not impact just its organization where fraud as happened but it effects the industry and Country as whole and raises significant question on all the Anti-fraud Policies and all the control measures put in place by organization and governing bodies. Among the various mechanisms to fight fraud, Companies invest significant investment in Compliance Training, in educating its employees on What is Fraud, Its Impact to Self and Organization, Fraud Reporting. Governing Bodies made compulsory for organization to train their employees and conduct periodic reviews. Irrespective all this control measures, still we have witnessed multiple frauds and still many frauds are still unidentified.

REVIEW OF LITERATURE

Carolyn A. Strand, Steven L. Judd, and Kathryn A. S. Lancaster (2002): They opinioned in their paper, Manager's play crucial role in preventing fraud in an organization and they emphasis managers should ask themselves "What more we can do?" and they said employees are first to witness a suspicious activity after come the Management, Internal/External Auditors and Regulators, so it is important to train its employees on identifying the activity which is against the organization code of conduct, and training is more effective way to demonstrate Management commitment in fraud prevention and the ethical operations is organization's priority to its employees. And also, they said Case Study should part of the training curriculum because case studies allow an employee to evaluate a scenario and put the employee in a simulation-based learning which makes it more effective.

Louise Houlihan (2014): In her article on Employee Fraud, she opined that employee fraud scale is very high than the actual what most business thinks, and employee fraud is crucial which will impact the business not only in financial loss but also decrease in staff morale, reputational loss among suppliers, customers, business partners and business focus will increase on responding to fraud than accomplishing the commercial objectives. Employee fraud is a result of misplaced trust, inadequate hiring and poor internal control and she emphasis employee frauds is all about the opportunity, that is element which companies should be seeking to trim down, as a fraud prevention strategy successful implementation of strong internal control should begin with "tone at the top" and business owners and senior managers should lead by examples and any fraud identified and proved should be taken a serious action and not let the emotions take control and make way to compromise the act. And also business should balance between the risk involved and control measures and should not get into "Micro Management" of employees which affects the employees' morale.

Izedonmi, Famous, Ibadin Peter Okoeguale(2012):They opined that Frauds are widespread in modern organization, which have made the auditing and investigation inefficient and ineffective in the detection and prevention of the frauds, the fraud instants are continuing to increase across the private and public sector organization and across nations, Financial crimes happens in different shapes like employee theft, payroll frauds, fraudulent billing systems, management theft, insurance fraud, bribery, bankruptcy and so on. Financial crimes today have penetrated deep roots, and the advancement of computer software with added internet capability has doubled the problem of financial crimes. Besides, the detection or prevention of these crimes are made more difficult and committing these crimes much easier.

Association of Fraud Examiners (2016) In their report "Report to Nation on Occupational Fraud and Abuse" say that among 98 reported cases in South Asia between 2014 to 2016, Indian Contributes for 77 cases which are almost 79%, which is a very alarming number. And also, in its report says, India ranks second in terms of victim organizations reporting the cases. And in their survey conduct among the Certified Fraud Examiner's estimated that the typical organization loses 5% of revenues in a given year as a result of fraud. Asset misappropriation is common

organizational fraud. The study demands for the urgent need for regulators, professional community people to assess the risks emanating in the businesses.

Arpinder Singh(2016) In a report "Global Fraud Survey 2016" published by Ernst & Young(EY), Arpinder Singh, Head of EY Fraud Investigation & Dispute Services, India, and Bangladesh opined that corruption continues to be a significant risk for companies who deal with government bodies. Companies engaging with state-owned businesses and government departments need to have strong compliance programs in place, in order to be immune from these risks. And also he says 76% of companies have Anti-bribery and anti-corruption policies in place, but companies failed to realize that "paper-based compliance" will not suffice. And he recommends companies should use forensic data analytics to identify irregularities as a measure to prevent against fraud.

Research Gap / Statement of Problem:
During the course of my review of the literature, there is a clear understanding. Occupational fraud is most common and there is relaxed approach among the workforce, occupational fraud impacts the organizations achieving their goal and also directly it effects the country's economy at macro level. Unfortunately, effiencency of the training provided by the companies to their workforce are questionalble due to variouse reason inlcuding, Job/Grade based trainging, relvance of topic to the employee, Management role in delivering training, impact analysis on training outcome etc..

With the above discussion leads to the following research question.
1. Is there is a positive approach towards Compliance Training among the workfoce?
2. Does Complaince Training to the workforce will reduce fraud instance in the organisation?
3. Does Complaince Training help in delivering better corporate governance?
4. Does management play role in Compliance Training and its success?

Scope of the Study
This empirical study will be basically a step towards efficiency of Compliance Training on occupational fraud prevention. Since these influences, the corporate and economy in an integral part, an attempt will be made to study the effectiveness of Compliance Training as a tool to mitigate fraud and to evaluate compliance Training for better work ethics among the Multinational workforce.

Objectives of the Study:
1. To assess the process of Compliance Training provided in Multinational Companies.
2. To examine the structure and delivery of Compliance Training
3. To assess the effectiveness of compliance training in preventing occupation fraud

Hypothesis
1. There is no significant effect of employee experience on Compliance Training results
2. There is no significance of Compliance Training on employee response to react to fraudulent activities

RESEARCH METHODOLOGY

This study is to report the significance of Compliance Training for occupational fraud prevention, right education acts an integral part in any success of business, since many a times ignorance and knowledge gaps results in failure of controls. In achieving the objective of this study, primary data is used. Primary data was collected through structured questionnaire, which was designed in the five-response option of Likert-scale and administered from multinational companies' workforce covering Front Line, Managers, Audit and Control, Human Resource and Training & Development Professionals and data are analyzed through Descriptive Statistics, reliability was checked

using Crombach Alpha and it is estimated as 0.837 for content, .894 for response and .856 for environment. Structural Equation Model is used to establish the relationship

Data Analysis and Interpretation
Inference
The response profile of this research from Table 1 shows that the 67.7% of the respondents are of less than 10 years while 48.6% of the respondents are of frontline employees and 40% of them are managers. A 58.6% of the respondents are of Post graduates avnd 88.6% of the respondents are in the age group of 20-40 years.

Objective 1: To assess the process of Compliance training provided in Multinational Companies.
Inference
The table 1 shows that 60% compliance training is conducted after identifying a trend for a specific fraudulent activity or based on internal auditing or annual auditing. 40% respondents are based on routine awareness program. The response from Table 2 shows that 70.45% of the respondents attended training using a single mode while 12.27% used two modes for training. 85.45% respondents used e learning while 14.09% used video-based learning. Only 25.56% respondents experienced multimodal training in the companies. Small firms prefer single modal training and these points are discussed in learning circles as well. In companies, compliance training is encouraged in a virtual platform than in a real time format. So, e-learning is used more followed by video-based training.

Inference
The table 3 and 4 shows that all the fourteen points were discussed in only one firm has covered all points and it is clear that Organizational Anti Fraudulent Activities (69.86%), privacy and data collection (79.91%), cyber security (64.84%) and compliances in fraudulent activities are the highly discussed in training and sales compliance polices are least discussed topic.

Objective 2: Structure and Delivery of Compliance Training.
Inference
The table 5 shows that training is delivered on quarterly and annual basis prominently, E-learning is most common and training is employee centered and self-learning based, Instructor Lead is least training mode across all time interval.

Inference
The above table shows that organizational level Fraudulent activity control is more emphasized followed by cyber security and compliance regulation. The least discussed point is sales compliance across all time interval.

Hypothesis Testing
There is no significant effect of employee experience on responding to Compliance Training
Descriptive Analysis

Variable	<10 years		10-20 years		Total	
	Mean	Std. Deviation	Mean	Std. Deviation	Mean	Std. Deviation
Conduct Compliance Training?	4.23	.574	4.31	.767	4.26	.642
Frequency of Compliance Training	4.15	.623	4.31	.646	4.20	.633
Modes of Delivery	3.87	.710	3.63	1.085	3.80	.854
Topics covered	3.77	.745	3.11	1.260	3.56	.989
Appropriateness to job	4.07	.659	4.06	.984	4.07	.776

Venkataraman and M.Satish Kumar

Awareness on Purpose of the Compliance Training	4.09	.667	3.97	.971	4.05	.778
Content based Training material	4.17	.550	4.35	.635	4.23	.584
Position based Training material	4.10	.714	3.97	.654	4.06	.696

Log Determinants

Experience (Years)	Rank	Log Determinant
<10 years	8	-12.635
10-20 years	8	-8.235
Pooled within-groups	8	-9.579

The ranks and natural logarithms of determinants printed are those of the group covariance matrices.

Test Results

Box's M		358.293
F	Approx.	9.489
	df1	36
	df2	68989.652
	Sig.	.000

Wilks' Lambda

Test of Function(s)	Wilks' Lambda	Chi-square	df	Sig.
1	.813	44.248	8	.000

Inference

Wilk's Lambda is statistically significant and it shows that experience cause variance in organizing Compliance Training and benefiting from Compliance Training, hence alternate Hypothesis is accepted.

Classification Function Coefficients

	Experience (Years)	
	<10 years	10-20 years
Conduct Compliance Training?	6.096	6.779
Frequency of Compliance Training	3.121	3.824
Modes of Delivery	-.329	-.482
Topics covered	3.030	2.298
Appropriateness to job	.322	.540
Awareness on Purpose of the Compliance Training	-6.412	-7.249
Content based Training material	10.420	11.418
Position based Training material	2.413	1.750
(Constant)	-39.375	-41.264

Inference

Awareness on purpose of Compliance Training has a negative coefficient while content-based training has a coefficient. Compliance training organizing also has a coefficient,

Venkataraman and M.Satish Kumar

Structural Equation Model: Effect of Compliance Training on Response

Hypothesis: There is no significant of Compliance Training on employee response to react to fraudulent activities

There are three observed variables in this analysis: Content, Environment and Response. The response contains six variables to show how the respondents respond to the fraudulent activities. The previous results show that there is a short-term objective in developing an awareness among employees at organizational level. The content contains topics covered, appropriateness to job, awareness on purpose of the Compliance Training, Content biased training material, position-based training, assessment of compliance training, and effectiveness. Awareness on purpose of Compliance Training and position-based training have high regression coefficient.

Impact of fraud on losses, conforming to code of conduct, answering ambiguous questions and cautious work environment are the environmental factors. All have a higher regression coefficient. The responses include, zero tolerance on fraudulent activities, anonymous reporting, confidence in reporting crime, reporting fraudulent activities, seeking report and education on fraud are important. All the variables in the respondent have high regression coefficient. The covariance between content and environment positive, but low. The regression coefficient of content on response is 1 and it shows a good effect and the same of environment on response is 0.26. The SEM model is a recursive model. The model fit variables like, CMIN/DF (4.56), RMR (.064). GFI (.896) and RMSEA (.056). The model shows that the Compliance Training is effective and employees are motivated for the same.

Inference

The SEM models shows that the Compliance Training is effective and employees are motivated to report fraudulent activities, hence alternate hypothesis is accepted.

CONCLUSION

The results shows that the employers of the respondents take the compliance training serious and implement the system effectively. The high dependency on e-learning may not give the expected results since its more employee centered and evaluation mechanism is more of open book model hence, more interactive sessions needed like instructor led training which more effective also that will encourage the employees to interact better any get any question addressed. Though 14 points are considered for compliance, the respondents attended mainly only in three points, Organizational level anti fraudulent activities, cyber security and compliance regulation. Sales compliance is the least discussed. Occupation Fraud cannot be completely eradicated but can be controlled with shared effort from organization and regulators, most of the fraud are identified from the tip received from front line employees, hence educating the workforce on Fraud, Fraud Reporting and giving confidence on any the information received from internal (employee, managers, executives) or external (vendors, consultants and customers) will be dealt confidentially without any repercussion. Training is mode where organization communicate to its employees on their commitment on fraud preventions and zero tolerance on fraud, hence effective compliance training will help organization overall in fighting occupational fraud.

ABSTRACT

The current economic and social system still relies on traditional energy sources and distribution systems and takes time to allow for the acceptance of renewable energy sources by the current economic and social system. People are currently able to choose their electricity suppliers to choose between traditional and renewable sources. Industrial consumers must examine a wide variety of factors which may influence their choice. The purpose of this research is to determine which factors influence the knowledge, perception, attitude, acceptance and procurement of solar energy of industry clients both internal and external. In addition, adjustments to solar renewable energy marketing technique could be proposed in order to reach industrial masses for renewable energy products. Certainly, this analysis is descriptive in nature. Primary data is obtained from (Managers) industrial users. 112 respondents are estimated on the basis of the Cochran Method of uncertain population sample size. The questionnaire is divided into four sections including Rating scale and Likert scale questions and the questionnaire's convergent-divergent validity is also tested. The data analysis is performed by explaining the rankings and then using SPSS Version 25 Tools to test the hypothesis. The study's focus is geographically restricted to Industrial users in Bengaluru. The findings of the study show that majority of factories in Bengaluru encounter power cuts 1 to 2 times in a month and use diesel generators. A majority of the industrial users said that they use HT Power. There is a need to market the solar energy to these organizations. The various responsible and resisting factors are identified in the study. 14 responsible and 9 resisting factors influence the decision of the industrial users to adopt solar technologies The aim of this study is to develop marketing strategies that maximize solar energy products production, adoption and acquisition. The utilization of solar energy will contribute to the development of the future. It will be helpful to understand how to market Solar Energy Products, given that very few promotional and

marketing policies are currently in place in this field. As a result of research, the most important factors that influence solar marketing will be identified and marketing areas can be identified that help manufacturers and suppliers of these products to grow sales as a result of increased use of solar energy products. It will benefit the government, which is untiringly working to promote the use of renewable energy resources to achieve sustainable development over the long term. Because of their contribution to environmental preservation, the ultimate buyer will also feel a sense of achievement.

Keywords: Solar technologies, solar energy, Industrial users, Attitude, perception

INTRODUCTION

India, with a population of over 1.25 billion individuals, exhibits a substantial and pressing need for energy resources at present. India is positioned as the sixth largest country globally in terms of both power generation capacity and power consumption. In recent times, there has been a notable surge in electricity output, exhibiting a growth rate that closely approximates the corresponding growth rate observed in the nation's population. Approximately 53% of India's electrical generation is derived from coal, while the nation's coal reserves are projected to remain sufficient until the year 2050. A significant proportion of India's population primarily resides in rural regions, where a substantial majority (72%) continues to have challenges in accessing dependable energy sourcesRauf, A., Nureen, N., Irfan, M., & Ali, M. (2023). The increasing necessity to bridge the disparity between energy demand and supply has prompted a heightened interest in solar power as the most feasible resolution. India is geographically located between the Tropic of Cancer and the Equator, rendering it a favorable region for the utilization of solar energy. In this particular geographical area, the yearly mean temperature ranges from 24°C to 28°C. Consequently, an estimated quantity of 5,000 trillion kilowatt-hours of solar energy is accessible, accompanied by an excess of 300 days characterized by abundant sunshine. India has gained recognition as a prominent nation in the field of solar energy harvesting due to the implementation of numerous solar laws and programs at both the state and central government levels, as part of the National Solar MissionKhanna, M. K., Malik, S., & Kumar, H. (2023). The proliferation of solar photovoltaics in India is expected to be expedited in the coming years, as shown by a report jointly released by BRIDGE TO INDIA and GTM Research. The solar industry in India exhibits significant potential for expansion. It is anticipated that a majority of forthcoming electronics would rely on a solar-powered rechargeable battery bank for their energy supply. The increasing need for power and the growing recognition of the advantages associated with renewable energy sources have stimulated the development of novel technology capable of harnessing the ample solar radiation.Batool, K., Zhao, Z. Y., Irfan, M., Ullah, S., & Işik, C. (2023).

Presently, the prevailing economic and social framework continues to rely on conventional energy sources and distribution networksRoy, S., & Mohapatra, S. (2022). Consequently, the integration and acceptance of renewable energy within this system will require a considerable amount of time. Subsequently, consumers now have the ability to choose their electricity supplier based on their preference for either conventional or sustainable energy sources. Industrial consumers must consider several criteria in order to make a well-informed decision. Moreover, it is worth noting that renewable energy sources need a substantial initial investment Sadhu, M., Chakraborty, S., Das, N., & Sadhu, P. K. (2015). The hindrance of renewable energy marketplaces in India, which has impeded the widespread adoption of renewable energy, can be attributed to substantial state subsidies allocated to fossil fuels and the limited purchasing power of potential customers. This study aims to investigate the extent of market penetration achieved by conventional funding and financial instruments such as capital subsidies, donor grants, tax rebates, and fiscal incentives. However, the focus of this study is to analyze the widespread adoption and commercialization of renewable energy products and technologies by end usersHairat, M. K., & Ghosh, S. (2017). To achieve this, it is necessary to reassess product selection and evaluate the financial implications associated with this adoption. The objective of this study is to ascertain the internal and external factors that influence the solar energy literacy,

67877

perspective, attitude, and acceptance of industrial clients, as well as their subsequent purchase choices. In order to achieve widespread availability of solar renewable energy commodities in the industrial sector, it is imperative to propose novel strategies for advertising these products. The first section of the study gives an overview of the solar energy and its acceptance in India. The second section focusses on the review of literature. The research methods are specified in the third section and the fourth section presents the results of the study. The last section of this research concludes with limitations and scope for further research.

REVIEW OF LITERATURE

This study employed a systematic literature review approach to analyze previous scholarly works that were pertinent to the research inquiries under investigation. The articles were sourced from reputed journals and were scrutinized to determine the level of quality exhibited by each study. Elsevier database, Routledge and CRC Press Taylor and Francis database, Emerald Group Publishing database, Springer Nature database and Sage database. Several supplementary articles were acquired from reputable academic databases such as Wiley, Academia, JSTOR, and Guildford Press.

Kumar, C. M. S & et al, (2023) India is the world's fifth largest economy, and its agricultural and associated industries account for 20% of GDP. Activities such as plowing, watering, planting, harvesting, storing, and processing food are all part of the agricultural sector. Renewable solar energy has emerged as a major energy source that can minimize farmers' reliance on the usage of conventional energy sources in India, where there is a current agricultural energy need. Regular use of fossil fuels depletes these resources and emits massive amounts of carbon dioxide into the air. By 2050, it is predicted that 4 gigatons of CO_2 emissions might be avoided annually if solar power installations reached 4600 GW. Therefore, solar energy has been identified as a potentially game-changing renewable resource for the generation of thermal energy and electrical power for use in agricultural and industrial applications. Li, L., Lin, J., Wu, N., (2022) The use of renewable energy sources is increasingly being considered as a viable solution to the world's energy and environmental crises. Sustainable development calls for energy efficiency and greenhouse gas emission reduction policies and methods. Burton, N. A., Padilla, R. V., Rose, A., & Habibullah, H. (2021) The rise in human-caused disruption has resulted in a dramatic increase in worldwide demand for energy. McPherson, M., & Stoll, B. (2020) Real-world load data from Bengaluru, India is used to evaluate the proposed demand response system. By allowing for the replacement of high-marginal-cost thermal generators with near-zero-marginal-cost renewables, the results show that demand responsiveness reduces production costs. The utilization rates of demand responses are often limited by their maximum permissible daily deployment, while their operating behavior is governed by intraday recovery limitations. Furthermore, demand response aggregators might anticipate sizable income from price arbitrage on top of the huge value that demand response brings to the grid. Kabir, Ehsanul & et al (2017), the creation of innovative solar power technologies is regarded as a crucial approach to meeting the escalating global energy needs. The field of solar technologies is experiencing rapid growth, however, it is encountering several technical obstacles. These include low solar cell efficiencies, underperforming Balance-of-Systems (BOS), economic challenges such as high upfront costs and lack of financing mechanisms, as well as institutional barriers such as inadequate infrastructure and a shortage of skilled manpower. T. Hoang & X. P. Nguyen (2021) The smart city's energy system is crucial to its overall mission of creating a more sustainable urban environment. The use of renewable energy sources has also been shown to significantly contribute to lowering pollution levels and improving the quality of the surrounding environment.Nwaigwe, K. N., Mutabilwa, P., &Dintwa, E. (2019) Incorporating solar energy into non-renewable sources is important because it slows down the rates at which those sources are consumed, integration technology has become important due to the world's energy requirements, which imposed a significant need for different methods by which energy can be produced or integrated.

Gram-Hanssen, K., M. H. Jacobsen, & A. R. Hansen (2022). A big group of early adopters (annually metered) and a smaller group of later adopters (hourly/real-time metered) in Denmark have solar photovoltaics (PVs) due to lower costs and stop-go policies. Sadamoro, F., Ajayi, O. M., Ayodel, O. O., & Areola, T. O. (2023). The research suggests

Bhargavi and Usha Devi

that in order to uphold customers' trust and commitment, solar power companies should establish a clear strategic plan and an effective system for handling customer complaints. Kumar, V., Syan, A. S., & Kaur, K. (2022) The findings of the study indicate that various factors, including rising energy costs, familiarity with the product, financial assistance and incentives, and perceived expenses, have a favorable impact on consumers' inclination to acquire solar water heaters. Vuichard, Stauch, and Wüstenhagen (2021) The results indicate that social acceptance can be enhanced through the implementation of local ownership and the utilization of colored solar panels that minimize the perceived alteration of the landscape. This implies that projects should prioritize a localized and unobtrusive approachAlam, S. A & Khan, S.M. (2017). Studies have indicated that the level of approval for alpine solar projects is greater among individuals residing in the affected areas as compared to those who reside in non-alpine regions. Kumar, V., Hundal, B. S., and Syan, A. S. (2020). The dimensions encompassing environmental knowledge, promotion and advertisement, environmental concern, and peers influence were deemed insignificant in relation to the customer attitude towards solar energy products.Ali, S., Dogan, E., Chen, F., & Khan, Z. (2021).

Hypothesis development

There exist multiple factors that exert effect on industrial users' decision to use solar energy. Several causes contribute to the adoption of renewable energy sourcesÃ, J. M., & Truffer, B. (2006). These factors encompass the escalating expenses associated with conventional energy sources, the growing recognition of environmental sustainabilityAbbasi S.A., Abbasi Naseema (2001) and the accessibility of governmental incentives and tax advantages for utilizing renewable energy. Furthermore, recent progress in solar technology has resulted in increased efficiency and improved cost-effectiveness, rendering it a compelling choice for industrial consumers seeking to diminish their environmental impact and achieve long-term energy savingsAdenle, A. A. (2020). Consequently, an increasing number of enterprises are currently adopting solar energy as a feasible and enduring resolution for their energy requirements. Occasionally, the drawbacks of a particular phenomenon surpass its advantages, exemplified by the considerable upfront expenses associated with installation and the reliance on sunlight as the sole source of energy generation. Moreover, the sporadic nature of solar electricity presents difficulties for companies that necessitate a steady and uninterrupted power provisionAmbepitiya, Kalpana. (2015). Notwithstanding these obstacles, the collective advantages of solar energy, encompassing its ecological compatibility and capacity for enduring financial gains, render it a persuasive option for several sectors. Industries can effectively address the aforementioned difficulties and maximize the utilization of solar energy by making strategic investments in storage technology and integrating intelligent grid systems.

Hence, the research Question
-      What is the impact of responsible and resisting factors in adoption of solar energy?

H1 - Responsible and resisting factors influence the adoption of solar technologies by Industrial users in Bengaluru

RESEARCH METHODS

According to Haydam, N. E., and Steenkamp, P. (2021), the research process can be visualized as an onion with each layer representing a progressively more comprehensive step. Based on the research Onion model the current study is a positivism approach which is deduced from previous studies onsolar energy. Owing to its nature, the study is a mono method quantitative analysis which uses industrial power users as the participants of the study. The current study is descriptive in nature. Primary data was gathered from industrial users who are power department managers or heads; the obvious reason for choosing them is that they are the decision makers in their enterprises on whether or not solar technologies should be installed. The sample size is computed at 112 respondents using the Chaokromthong, K., and Sintao, N. (2021)Cochran Formula for an unknown population with a 95% confidence level and a 10% margin of error. The Questionnaire is built using the variables identified in the research reviewMorrison, R. L., Dillman, D. A., & Christian, L. M. (2010). The questionnaire is organized into four sections, each of which contains demographic information about the respondents, an industry profile, factors preventing (Resisting) solar energy adoption, and factors promoting (Responsible) solar energy adoption. The questionnaire uses Likert scale questions, and its convergent-divergent validity is also examined, with the statistics falling within acceptable limits.

67879

The variables in the study are divided into Dependent Variables, which represent solar technology adoption, and Independent Variables, which represent the causes preventing and causing solar technology adoption. The data analysis is completed by displaying descriptive statistics and then testing the hypothesis with SPSS Version 25 and AMOS R Version 23 softwareCollier, J. (2020). The study's geographical scope is limited to Bengaluru district in Karnataka state of India and Industrial Consumers; the study is focused on factors influencing solar energy adoption and cannot be applied to other products or services.

RESULTS AND DISCUSSION

This section presents the results obtained from the managers of industries in Bengaluru. Firstly, the demographic and the Industrial profile are discussed followed by an item analysis of the responsible and resisting factors. The SEM analysis for the factors is conducted following the exploratory factor analysis results.

Demographic profile of the Industrial Managers
A majority of 94.9% of managers in the study are male, and only 5.1% are female. This huge gender disparity is due to the fact that there are very few women employed in the factories as compared to the other service sectors, and as the study concerned managerial employees, there is very little role for women at higher levels in the factories. A majority of 62.7% of managers in the study belong to the 26–45 year age bracket, and 33.4% of managers are between 46 and 65 years old. A small percentage of 1.9% of managers are above 66 years old and below 25 years old. 41.8% are engineering graduates, and 39.2% have completed their post-graduation. Only 8% of employees had an interim diploma. 9% of managers in the study are from finance and accounting backgrounds. 39.5% of the employees in the study are utility or electrical maintenance managers; 15.4% are procurement leads or sourcing leads; 9.6% are directors, heads, or presidents of factories; and 7.4% are consultants,and 13.8% are Finance Managers or Assistant Finance Officers. A majority of the 64.3% of managers in the study have more than 16 years of experience. 13.5% of employees have 11–15 years of experience. 19.6% of employees have 5–10 years of experience in the factories. A small percentage of 2.6% of employees have less than 5 years of experience.

Profile of the Industrial users in the study
30.5% of industrial power consumers in the study are located in the urban area, 16.1% are in the semi-urban area, and 18.3% are located in the rural area. The industrial parks and industrial suburbs have 20.3% and 14.8% factories, respectively. 56.6% of industries run on a small scale and operate on a small or microscale level, engaged in the manufacturing, production, and provision of services. 33.4% are manufacturing enterprises and service-rendering enterprises. A majority of 93.9% of industrial consumers receive power supply from the licensee at a high voltage. As per the Indian Electricity Act, high-tension consumers are required to uphold a power factor range of 0.9 to 0.99, and a small 6.1% are low-tension power consumers. Only 16.7% of industrial power consumers use solar power, 32.8% use wind power, and 31.8% use both solar and wind power. 26.7% of industrial power consumers expressed that they face power cuts 1-3 times a month; another 26.7% of industrial power consumers face power cuts about 4–8 times a month, which is very high. 46.6% agreed that power cuts are very rare.
Item analysis for responsible and resisting factors

There are 9 resisting factors and 14 responsible factors identified through extensive review of literature. Industrial users show agreement towards both resisting and responsible factors which is indicated by the mean scores which are above 3.500. The standard deviations are below 1.500 indicating less variation in responses and the measures of skewness and kurtosis are within the acceptable range of -3.00 and +3.00 indicating normal distribution of data.
H1 - Responsible and resisting factors influence the adoption of solar technologies by Industrial users in Bengaluru

Bhargavi and Usha Devi

Step -1 Exploratory Factor analysis

The KMO measure of sampling adequacy, which is equal to 0.878, and Barlett's Test of Sphericity, which comes with a significance level of 5%, are statistically significant. It was found by chi-square analysis that the Chi-square value of the Bartlett test is 30209.750 with the significant value less than 0.05 and 127 degrees of freedom, which shows that correlation matrix, is not an identity matrix and that it looks to be factorable. Communalities refer to the extraction values for each of the items and should be above 0.300 and the communalities for stress items were between 0.487 and 0.879. The total of squared loadings that has been removed accumulates to about 83.737 % of the original loadings. In social sciences, a cumulative Rotation Sums of Squared Loadings is considered good if it is above 50%. 2 components are discovered while applying the approach of Factor Analysis, according to the results of the study. The rotated component matrix showed that due to the appropriate factor loadings no items were deleted in the study. 9 Resisting factors and 14 responsible factors were considered for the study.

STEP -2 Run the Model

The table above displays the essential statistics for model fit. The chi-square divided by degrees of freedom ($\chi2 / df$) falls within the acceptable range of 3 (specifically, 2.876). The observed Goodness of Fit value (0.826) surpasses the proposed attributes. The boundary estimation yields a value of 0.048 for the RMR. The model in question has garnered significant recognition within the academic community, and its measures of fit are reasonably appropriate.

The results of the structural model presented in table 2 show that -
- One unit increase in mean scores of resisting factors will lead to 30% decrease in adoption of solar technologies and this relationship is statistically significant at (B=0.296, b=0.112, p=0.000)
- One unit increase in mean scores of responsible factors lead to 12% increase in the adoption of solar energy by industrial users and this relationship is statistically significant at (B=0.116, b=0.083, p=0.000)

A one-unit rise in the average scores of factors that resist the adoption of solar technologies is associated with a 30% decrease in the likelihood of adopting those technologies. This discovery implies that persons who perceive a greater prevalence of obstacles to adoption are less inclined to embrace solar technologies. The factors that impede the adoption of solar energy can include significant upfront expenses, limited knowledge about the advantages of solar power, or apprehensions regarding the dependability of solar technology. Hence, it is imperative for policymakers and industry stakeholders to acknowledge and tackle these concerns, while offering more support and incentives to promote the extensive implementation of solar technologies. However, it should be noted that there is a positive correlation between an increase in the average scores of responsible variables and a 12% rise in the adoption of solar energy among industrial users. By acknowledging and mitigating these variables that impede progress, governments and industry stakeholders can facilitate the surmounting of obstacles hindering the widespread implementation of solar technologies. The observed increase in adoption rates among industrial users, as shown by a 12% rise in mean scores of relevant factors, suggests a potential for substantial growth in the utilization of solar energy. This underscores the significance of establishing a conducive atmosphere for the use of solar energy by means of educational initiatives, financial incentives, and technological progress. The standardized estimates indicate that the factors that oppose the adoption of solar electricity have a substantial impact on the decision-making process of industrial customers. This observation suggests that it is imperative to tackle these sources of resistance in order to enhance the uptake of solar energy among industrial consumers. Moreover, the provision of additional support and incentives has the potential to surmount these challenges and foster increased adoption of solar technologies. Through acknowledging the influence of accountable elements and effectively addressing the opposing variables, policymakers and industry stakeholders possess the ability to provide a conducive atmosphere that facilitates the extensive integration of solar energy.

CONCLUSION

The adoption of solar energy is hindered by various sources of resistance. To enhance the uptake of solar energy, marketers should prioritize the mitigation of these problems. One potential strategy is implementing educational and awareness initiatives aimed at addressing potential misconceptions and apprehensions among customers regarding solar energy. Furthermore, the provision of financial incentives and subsidies can serve as a viable approach to mitigate the initial financial burden linked to the installation of solar panels. By taking proactive measures to address these factors of resistance, marketers can contribute to expediting the process of transitioning towards a future characterized by sustainability and clean energy. The implementation of solar electricity by industrial entities not only has the potential to mitigate their carbon emissions but also offers substantial long-term cost savings. By leveraging solar energy, businesses can reduce their dependence on conventional energy sources, leading to decreased electricity expenses and enhanced financial performance. In addition, the incorporation of solar energy into many businesses has the potential to stimulate innovation and generate employment prospects within the renewable energy field. In general, the implementation of solar electricity among industrial consumers presents a mutually beneficial scenario that yields advantages for both ecological preservation and economic prosperity. The imperative for the Government to engender awareness and mitigate barriers to the adoption of solar power is evident. The government may foster the adoption of renewable energy among businesses by enacting rules and providing incentives that specifically promote the utilization of solar power in industrial sectors. One such approach involves the dissemination of knowledge to businesses regarding the enduring financial advantages and ecological merits linked to the utilization of solar energy. Furthermore, governmental entities have the capacity to offer monetary aid and tax incentives as a means of mitigating the initial capital outlay associated with the installation of solar panels. Through strategic intervention, the government can assume a pivotal position in expediting the integration of solar power within various industrial sectors, thereby facilitating the progression towards a more environmentally sustainable trajectory.

SCOPE FOR FURTHER RESEARCH

Future researchers are anticipated to focus their efforts on exploring alternative geographical areas characterized by abundant solar radiation. The study can also encompass residential power consumers. Also, it would be advantageous for forthcoming researchers to investigate the potentiality of utilizing solar energy in regions characterized by ample sunlight, such as arid deserts or tropical areas. Through the examination of these specific geographical areas, it is possible to cultivate enhanced solar energy systems that possess heightened efficiency, hence facilitating the provision of sustainable power to accommodate the expanding global populace. In addition, broadening the scope of the investigation to encompass residential power consumers would afford us the opportunity to get insights into the viability and advantages of integrating solar energy on a more localized level. This might potentially result in a reduction of carbon emissions and a decreased reliance on conventional energy sources. Future researchers have the opportunity to employ a mixed research methodology that incorporates qualitative analysis. This would entail the collection of data from inhabitants residing in these geographically sun-drenched areas via surveys and interviews, with the aim of comprehending their energy consumption patterns and requirements. Furthermore, the application of quantitative analysis can be employed through the collection of data pertaining to solar energy generation and its subsequent influence on domestic power consumption. By integrating qualitative and quantitative methodologies, forthcoming researchers can get a holistic comprehension of the prospective advantages and obstacles associated with the implementation of solar energy in diverse home contexts.

Table -1 Item analysis for responsible and resisting factors influencing adoption of solar energy by Industrial users

	Mean	Std. Deviation	Skewness	Kurtosis
Resisting_factors_1 Solar energy has become less affordable	4.36	1.124	-0.392	-0.884
Resisting_factors_2 Performance records for solar systems in India is available only for a minimal period and hence decision making is difficult	4.11	0.677	-0.134	-0.806
Resisting_factors_3 Making decisions on purchasing solar energy products is based on longevity and efficiency	3.75	0.690	0.365	-0.870
Resisting_factors_4 Larger investment on solar energy systems is a hindrance	3.25	0.876	-0.515	0.020
Resisting_factors_5 Sales promotion methods Influence the purchase decision	3.22	1.019	-0.652	-0.473
Resisting_factors_6 Previous bad experiences hinder the purchase of solar energy systems	3.71	0.794	-0.301	-0.244
Resisting_factors_7 Absence of priority sector financial assistance from Lenders and Nationalized bank is a hindrance to make quick decisions	3.26	1.046	-0.541	-0.325
Resisting_factors_8 Signing long term solar power purchase agreements under the Build, Own and Operate model is a major road block towards opting for solar power	3.48	0.923	0.046	-0.817
Resisting_factors_9 Non-availability of credible solar power players	3.30	0.941	0.190	-0.862

Bhargavi and Usha Devi

Responsible_factors_1 Prefer to use solar energy products because it is eco-friendly and reduces carbon emission.	4.21	0.863	-1.785	4.687
Responsible_factors_2 Prefer to use solar energy technology products to reduce the electricity bill to a significant extent	4.22	0.822	-1.209	1.418

ABSTRACT

News organizations shape people's perceptions of the world greatly, yet they are also disseminating false information more frequently. In order to draw viewers and increase ratings, news organizations frequently skew their stories to affect people's opinions and prioritize sensationalism over factual truth. Exaggerated, inaccurate, and biased reporting may result from this. Additionally, most news is editorialized to support the agenda or stance of the publisher. Many news organizations are affiliated with a particular political party or ideology, which is a major cause of biased reporting. News channels also exploit people's emotions by broadcasting only sensational stories that evoke emotions like fear, anger, and hatred. This can influence public opinion and persuade people to support the outlet's agenda. In their rush to be the first to report breaking news, press agencies often skip fact-checking and verification, which has led to the spread of misinformation. This is one of the biggest challenges facing society today. Propaganda spread through news outlets is a serious threat to the credibility of journalism and free societies. News organizations have a responsibility to the public to promote ethical journalism, ensure fact-checking, and provide fair news. This study examine the opinions of the public regarding the manipulation of public perception by news channels and journalists and identify alternative news sources that a general literate public may use in place of news channels which are trustworthy, objective and free of any bias or tendency to shape general perceptions, the researcher took over a quantitative method along with the use of cross-sectional survey, by the circulation of a questionnaire to 200 samples comprising college students, educators, medical professionals, lawyers and employees from IT and software firms.

Keywords: Misinformation, Propaganda, News-outlets, Sensationalism, Fact-checking.

Farha Yashmin Rohman

INTRODUCTION

False or erroneous information that is disseminated, frequently with the intention of misleading or controlling people, is referred to as propaganda, misinformation, or false news. Multiple channels, including as websites, social media, email, blogs, radio, television, and others, can be used for this (Anderson, 2021). The media's purported fourth estate role in holding the powerful accountable is largely attributed to their readiness to counteract misinformation, which is what takes us to our worry. The award-winning journalist Robert Fisk provides a clear and accurate explanation of the fourth estate mandate in action when he says that the job of the journalist is "to challenge authority - all authority - especially so when governments and politicians take us to war, when they have decided that they will kill, and others will die"(Foley,S.,2021). Spreading propaganda, misleading information, and misinformation can be greatly aided by social media and traditional media. In addition to validating preexisting attitudes and ideas, they can be utilized to motivate people to take action. Politicians can reach a wide audience through mass media and social media, which also helps spread awareness of other people's viewpoints. In other words, because they may be used to influence people's beliefs and behavior, propaganda, disinformation, and fake news pose a significant threat. Being cognizant of these issues and using discernment when consuming information is crucial. During the Great Depression, propaganda and "alternative facts" became increasingly prevalent worldwide, causing an unparalleled number of casualties. Propagandists from Britain during World War I further obstructed the view of the West for Europeans (Brendon, 2018). There has been a drop in public confidence in the media and its institutions in recent years. With the rise of social media, misinformation and propaganda have become easier to spread. It has consequently led to a decline in public trust in authorities and the media. This is a perilous tendency that could lead to increased polarization and societal instability. Our commitment to accountability and transparency in the media and in government must be reaffirmed.

Public opinion can spread widely over a big geographic area and to a huge number of individuals thanks to the media. Though on a smaller scale, word-of-mouth can serve a similar purpose in locations where social media is prohibited or mass media is not readily available, such as underdeveloped nations or nations with stringent control over print and electronic media. Large gatherings of people around a village radio or community television are commonplace in developing nations, as is the practice of literate persons reading newspapers to those who are illiterate. The influence of public opinion is important because it allows the government to make a number of policy decisions. In a democracy, the people are at the center of government policies and initiatives, and public opinion is vital to determine whether government activities can have the intended effect. The people and the government are able to communicate through the mass media. Its purpose is to supply information to the public so that they may make decisions based on that knowledge. The media's agenda-setting theory is primarily responsible for influencing public opinion (Public Opinion and Role of Media, n.d.). This agenda-setting argument has two parts: first, the media shapes and filters reality before telecasting it; instead of showing it as it is, it poses certain distortions. The public is led to believe that a select few topics are the only significant ones that need to be addressed because, second, the media does not always need to cover everything that is happening in the world. Word-of-mouth within the market or community then disseminates the information even more. A lot of information is disseminated through rumors in nations where the government censors significant news. Therefore, word-of-mouth (or other person-to-person communication channels, like text messaging) becomes the vehicle for underground public opinion in authoritarian or totalitarian countries—despite the fact that these channels are slower and usually involve fewer individuals than in nations with a densely populated and unregulated media network. When news is presented in an exciting and attention-grabbing fashion, even when it isn't true, it's known as sensationalism. News articles that focus on sensationalism frequently aim to arouse strong feelings like dread, rage, or exhilaration.

Sensationalism is a tactic used by many news organizations to draw readers and viewers to their stories, but it may also cause tension and anxiety in some. Exaggerating and overselling news items to attract more viewers is a common practice among several news networks, especially in India. This may cause false and misleading information to be disseminated to the general population. Media sensationalism involves the employment of

particular audio-visual elements, sometimes known as "formal features." Audiences are drawn in because music and certain camera angles immediately impact the human senses. The fast editing pace, voice-over narration, reconstruction of news events, zoom-in camera lens movements, eyewitness camera perspective, soundtrack, and voice-over all contribute to these shocking elements (Wang, 2012). News coverage of "crime, violence, natural disasters, accidents, and fires, along with amusing, heartwarming, shocking, or curious vignettes about people in the area" was considered sensationalism before to the 1980s. Stories about celebrities, crimes, sex, accidents, disasters, and public worries have all been tagged as sensational (Grabe et al., 2001). News reports that "violate a comfortable psychological distance between audience members and their perceptions of events in the physical world" can be classified as sensational because they have the ability to elicit stronger emotional and sensory responses than what is typically deemed appropriate for people to go through. It is difficult to define sensationalism in a way that is both precise and comprehensive because the idea of sensationalism in the news has sparked contentious debates in a number of nations, including Nigeria, the United States, Japan, India, and portions of Europe. News is a construction, packaged by news producers and journalists to advance one kind of interest or another, or one ideology over another. These viewpoints are currently gaining traction, and they must be taken into consideration when discussing the issue of sensationalism, regardless of the motivations behind it or who gets blamed in the blame game. The question of ethics, which is and ought to be the method by which media practitioners determine if a journalistic activity or performance is proper or bad, is more important in all of these cases (Uzuegbunam, 2013). The public's perception of the credibility of Nigerian media outlets and journalists are determined how they are regarded. Without exception, ethics cannot grow up to be an afterthought in the business world. It is the responsibility of media professionals to maintain discipline and avoid devaluing the profession due to the increasing number of interests that are emerging in this dynamic world. We have to maintain our feeling of accountability. Having the title of "watchdogs" nobody watches is already a terrible enough situation.A notable illustration of how the news media may sensationalize news is Republic TV, a well-known Indian news channel. The channel's chief editor, Arnab Goswami, is well-known for his sensationalistic and deceptive reporting. The most well-known fraud in which Goswami and his business have been implicated is the 2020 TRP Manipulation fraud. Thaver (2020) reported that there were allegations in 2020 that certain television broadcasters, such as Republic TV, were manipulating their viewing ratings. The way this was accomplished was by paying low-income individuals to keep Republic TV on even when they weren't watching it. Due to advertisers' willingness to pay more for a wider audience, Republic TV was able to negotiate higher advertising rates. Because it erodes public confidence in the news media, the TRP Manipulation Scam is a severe issue. It is challenging for the public to discern between news that is sensationalized and misrepresented. This may cause some people to base their decisions on false information.

A multifaceted strategy including media companies, journalists, and media consumers is needed to combat media bias. In their reporting, media outlets must place a high priority on impartiality, accuracy, and transparency. They can present a more impartial picture of the world by presenting a variety of viewpoints and encouraging critical thought (Ansh, 2023). Maintaining professional ethics and following strict journalistic standards while avoiding bias and sensationalism is the responsibility of journalists as well. However, media users need to develop their media literacy in order to actively seek out opposing views and critically assess news sources. Through active engagement with other viewpoints and meticulous fact-checking of information, individuals can both reduce and promote the impact of media bias. The way that different news sites covered the Brexit referendum in 2016 was obviously biased by the media. Certain newspapers clearly expressed their opinions on whether the UK should exit or stay in the EU, presenting their cases in an unfair way and leaving out opposing views. Throughout the referendum, voters' decisions were influenced by this skewed reporting, which also shaped public opinion. Unquestionably, media bias shapes people's perceptions by influencing the stories they read and the information they take in. Its effects are felt across society, causing division, aiding in the spread of false information, and undermining societal cohesiveness. The cultivation of an informed populace and the maintenance of a strong democratic foundation require us to actively seek out and acknowledge the existence of prejudice. In the end, a media environment that is governed by the values of openness, truth, and objectivity has the capacity to enable people to develop beliefs that are based on a thorough and fair understanding of the outside world. A video showing numerous local news presenters throughout the US presenting the same message went popular on social media in March 2018. Timothy Burke, the director of

Farha Yashmin Rohman

video for Deadspin, made the film after reading an article from CNN that listed local station anchors who appeared worried about the address. According to Fortin and Bromwich (2018), Burke ascertained that the message's script originated from Sinclair Broadcast Group, the nation's biggest broadcaster, which possesses or runs 193 TV stations. Sinclair is seeking a $3.9 billion deal to buy Tribune Media, a move that is being held up by regulators over antitrust concerns. Burke's video led to prominent criticism of Sinclair, with some commentators calling the company's actions "insidious.

REVIEW OF LITERATURE

The mainstream news media plays a significant role in the dissemination of fake news, even if they cover fake news with an intent to set the record straight and correct the fabricated information. The study Causes and consequences of mainstream media dissemination of fake news: literature review and synthesis (Tsfati et al., 2020) identifies several reasons why mainstream news media cover fake news like some fake news stories carry enormous news values, and mainstream news media feel compelled to cover them. Other news media cover fake news stories, and mainstream news media may feel compelled to cover them as well. Some fake news stories fit the ideological tendencies of mainstream news media. Fake news stories may be designed to fit important criteria of newsworthiness. The study also examines the potential influences of mainstream news coverage of fake news on their audiences. It finds that mainstream news coverage of fake news may lead to audience members internalizing the wrong information or becoming less certain regarding the truth. The study concludes by calling for more research on mainstream news media coverage of fake news and its impact on audiences. It also suggests that journalists should work with academic scholars to develop formats that will enable reporting on, and correcting fake news, without repeating the wrong information.

The Reuters Institute for the Study of Journalism's study, How China utilizes the news media as a weapon in its propaganda war against the West (Kumar, R., 2021), explores China's use of the news media as a propaganda instrument. According to the report, China has been more adept at using the news media to disseminate false information and reshape global perceptions. It illustrates a number of ways in which China uses the news media to further its propaganda: it disseminates conspiracy theories regarding the source of COVID-19, assigns blame to other nations for the coronavirus outbreak, amplifies pro-China content on social media, bans foreign journalists from China, and invests in state-run media worldwide. The impact of China's propaganda on international media coverage is discussed by the researcher. In other nations, it contends, there has been more positive coverage of China as a result of China's efforts to influence the news media. According to the study's conclusion, China poses a major threat to global democracy and free press because it uses the news media as a tool of propaganda. It exhorts media organizations and journalists to continue reporting on China fairly and accurately while also remaining watchful of China's propaganda activities.

The media has grown even more potent in the technological era, with the capacity to sway public opinion and affect governmental regulations. The public's perception of the fight and its support for the war effort are greatly influenced by the media during times of war. But by emphasizing the human cost of conflict and the significance of peaceful resolution, the media may also be utilized to advance peace. Governments and terrorist groups frequently use the media to achieve their own goals, as examined in the study War, Peace and the Media (Askerov, 2020). In an attempt to stifle criticism and advance their own version of reality, governments may attempt to exert influence over the media. In order to propagate misinformation and enlist new members, terrorist groups may use the media. Reporting on conflict can be done in two different ways: as peace journalism and as war journalism. While peace journalism concentrates on the possibility of peace as well as the human cost of conflict, war journalism emphasizes the bloodshed and drama of battle. War-related policies of the state can be supported by the media. For instance, in order to defend military action, governments may utilize the media to paint their opponents as dangerous and barbarous. The study's conclusion makes the case that the media is a potent instrument that may be applied to both

positive and negative ends. It is vital to evaluate the information we take in from the media critically and to be conscious of the ways in which the media is attempting to sway our opinions.

The concept of misinformation lacks historical contextualization and engagement with the history of propaganda. This makes it difficult to understand the problem of misinformation and to develop solutions. The study Propaganda, misinformation, and histories of media techniques forwarded by (Anderson, C. W., 2021) argues that misinformation studies have a de-structured notion of what information does. This is similar to propaganda analysis, but it also has a "radical intolerance" of sociological and Marxist perspectives that could provide a theoretical basis for understanding social influence. The study concludes by arguing that misinformation studies need to do several things to grow like being more conscious of its own history, particularly its historical conceptual predecessors, more deeply interrogating its informational-agentic concept of what pernicious media content does, more openly advancing its normative agenda and take a normative position on what a good information environment would look like. The study also acknowledges that misinformation studies could be funded by powerful state forces in Western society, but that it is up to the scholarly community to decide how they will react to these temptations.

Propaganda can reduce citizens' willingness to protest in two ways: directly influencing their preferences or beliefs about the government, and indirectly by making them think that other citizens are unwilling to protest. The study Propaganda, Presumed Influence, and Collective Protest (Huang & Cruz, 2021) experimentally shows that the indirect mechanism of propaganda is more important in authoritarian societies. According to the study, Chinese internet users think propaganda influences other people's opinions and support for the government more than it does their own. Additionally, they contend that propaganda lessens the likelihood that other citizens will protest, which lessens their own likelihood of doing so. This is true because collective action and risk-taking are necessary for protest in authoritarian systems. Individuals are less inclined to protest themselves if they think that others are not willing to stop. The results of the study show that propaganda might have more of an impact on others than on the individual. The reason behind this is because individuals often fail to recognize the degree to which propaganda has an impact on them. The study's conclusion imply that propagandizing disinformation can be used by authoritarian governments to stifle dissent by dimming the willingness of others to protest.

The way news is obtained and distributed from conflict areas has changed dramatically as a result of social media. It has become more challenging to confirm the veracity and validity of content, even while this has made the media landscape more accessible and diverse. Public opinion and policy are significantly shaped by both old and new media, yet it is now harder for the general public to obtain trustworthy information due to the abundance of news sources. In this era of rapidly evolving technologies, communication specialists must create conflict resolution and management plans. Zahoor and Sadiq (2021) examine how the link between media and armed conflicts has changed in the era of new communication platforms. Their paper, Media and Armed Conflicts: An Overview, covers this transition. It contends that social media sites have developed into indispensable resources for the collection and distribution of news, and that conventional media outlets are increasingly employing them to cover events. The study highlights the growing use of social networking platforms by traditional news organizations to cover conflicts. It then discusses the importance of new technologies in the field of journalism in general and conflict coverage in particular. The paper also discusses the adaptability of digital media as a platform for gathering and dissemination of news primarily produced by the traditional news organizations. The study concludes by arguing that despite social media's growth, traditional news organizations 'role is still pivotal in amplifying different actors' voices in the armed conflicts. The bloggers and activists (citizen journalists), in the conflict zones, still depend on coverage by the traditional news organizations. In this backdrop, access to authentic and credible news probably serves as the biggest challenge. The traditional news organizations and professional journalists can play their role in this regard and authenticate the information being generated from the conflict zones.

The study Propaganda in Journalism, Advertising, and Politics discusses propaganda and its effects on audience attitudes and behavior. It defines propaganda as a way to deliver a message that appeals to the emotions instead of presenting solid evidence to support a point (Calub & Calub, 2022). It is used by governments, advertisers, and

www.tnsroindia.org.in ©IJONS

Farha Yashmin Rohman

salespeople to manipulate people into thinking and acting in ways that benefit them. The study argues that propaganda is often used to deceive people rather than persuade them. Propagandists often use new communication technologies to reach increasingly large audiences in order to shape their views. By talking about some of the typical tactics propagandists employ, the researcher wraps up the study. Among these methods is white propaganda, which is propaganda that is not purposefully misleading and comes from a suitably acknowledged source. Black propaganda that presents a deliberately false appearance of friendliness from the sender. Propaganda that is in between white and black in color, or gray. It also covers how propagandists frequently conceal their identities and goals from the public in an effort to divert attention.

Fake news and disinformation are defined in Journalism, Fake News & Disinformation: A Handbook for Journalism Education and Training, along with a discussion of their differences. False information that is intentionally manufactured and spread with the goal of misleading is known as fake news. False or misleading material that is spread without consideration for the source is known as disinformation. This book is an anthology of essays that examine journalism's place in the era of information overload (Ireton & Posetti, 2018). In order to assist people discern between reality and fiction and make educated judgments, the authors contend that journalism is more crucial than ever. The contents also explains the various strategies that journalists can use to counteract false information and fake news, including fact-checking, confirming sources, and fostering media literacy. A variety of tips on how to teach students about false news and disinformation are included in the book's conclusion for journalism instructors and trainers. It is recommended by the authors that instructors and trainers in journalism assist students in comprehending the various forms of fake news and disinformation, as well as the intentions of those who produce and distribute it. The ability to fact-check and validate sources ought to be taught to the pupils. Assist students in developing their media literacy so they can assess the material they are exposed to critically. Urge the media practitioners to become truth-seeking, morally-responsible journalists.

Media Manipulation and Political Lobbying

The act of trying to sway government decisions by people or groups is known as lobbying. There are numerous ways to go about it, such as holding protests, corresponding with lawmakers, and mailing letters. In every political system, lobbying is a frequent. Persuasion is a critical strategy in media discourse, as it helps shape public opinion to support government or non-governmental objectives practice (Chen, 2023). Social media, advertising, and news coverage can all do this. One well-known instance of propaganda or persuasion in the media is the Radia Tapes Scandal. It involved phone discussions between A. Raja, the nation's telecom minister at the time, and political lobbyist Nira Radia, among other Indian journalists, legislators, and businesspeople (India News Desk, 2022). Conversations regarding influence-peddling and corruption were exposed on the tapes, which were released to the media. Investigations into the 2G telecom scam and Radia's previous PR firm were prompted by the crisis. Transcripts of phone calls between political lobbyist Nira Radia and prominent journalists, politicians, and businesspeople were released by OPEN magazine in 2010. The tapes exposed Radia's attempt to use media figures, including as Barkha Dutt of NDTV, to sway A. Raja's appointment as telecom minister (News Bharati, 2022). In addition, Radia attempted to set up deals related to the 2G spectrum for sale. Radia's actions were allegedly documented by 5,851 phone records that the Central Bureau of Investigation (CBI) claims to possess.

Call transcripts of Nira Radia's interactions with UPA officials showed that she campaigned against Dayanidhi Maran's reappointment as Union Minister of Information and Communications. During an interview with journalist Barkha Dutt, Radia stated that sending a message to the Indian National Congress—the party in power at the time—was "not a problem". Dutt further stated that she would speak with senior Congressman Ghulam Nabi Azad. Later, Radia spoke with Ranjan Bhattacharya, who seemed to be serving as a go-between for the Congress (Kumar & Kumar, 2018). Radia also mentioned in the conversation that Airtel CEO Sunil Bharti Mittal had been lobbying against Maran. Dutt has always denied being involved in this incident, saying that it was a case of poor judgment. However, she is still under investigation by the CBI.

Farha Yashmin Rohman

Media Negligence

Barkha Dutt made a serious mistake during the Kargil conflict. It was hoped that she would have learned from this mistake and become more mature, but she made the same mistake again during the Mumbai terror attacks on November 26, 2008. Her negligence put hundreds of civilians in danger. In one of her reports on the attacks, Dutt said that "her sources are on the 19th floor where the terrorists are currently in their murderous frenzy." She did not hesitate to share this important information live, even though it could have put the civilians and security forces at risk. In an interview, Dutt admitted that the media contributed to the risk by failing to exercise restraint during the broadcast. She also admitted that journalists made mistakes during the Mumbai siege. However, she downplayed the situation by claiming that the media was unaware that the terrorists' managers were watching news broadcasts (Saini, 2015). When questioned about her involvement in the attacks by a journalist at Newslaundry, Dutt did not apologize. She also did not acknowledge that she had made a mistake. Instead, she sent a legal notice to the journalist and threatened to remove the post. Blogger Chaitanya Kunte questioned Dutt's journalistic ethics. Dutt responded by sending him a legal letter. In an interview, she said that she did not regret sending the legal notice because the site had accused her of being responsible for the death of a Mumbai terror attack victim.

The Supreme Court of India has ruled that the media's coverage of the 26/11 Mumbai terror attacks was harmful and irresponsible. The court found that the media's reporting helped the terrorists by providing them with real-time information about the security forces' activities and put civilians in danger. Despite this, just a few months after the attacks, journalist Barkha Dutt was awarded the Padma Shri, one of India's highest civilian honours. This is a prime example of media negligence, showing how journalists and news channels sensationalize news with complete disregard for human life and emotions, all in the pursuit of viewership (News Bharati, 2022).

Objective of the Study

The study aimed to identify alternative news sources that a general literate public may use in place of news channels and to understand and examine the opinions of the public regarding the manipulation of public perception by news channels and journalists.

METHODOLOGY

To understand public opinion on how news channels and journalists manipulate public perception and to identify alternative news sources for the general public, the researcher used a quantitative cross-sectional survey and circulated a questionnaire to a specific demographic group of 200 people, including college students, educators, medical professionals, lawyers, and IT and software employees, using Google Forms.

FINDINGS AND DISCUSSION

During the process of data interpretation, figure (fig.1) below represents the first question of the survey questionnaire asked respondents if they think the concept of "media ownership" is appropriate or necessary. The majority of the respondents 82% agreed with the concept of "Media Ownership" while the percentage of people that disagreed is about 16%, while 2% of the respondents were unaware with the concept.

The figure below (Fig.2) represents the respondents that were asked whether they believed political parties have a major influence on news channels and then asked about their opinions about "Media Censorship", 97.6% of the respondents agreed and 2.4% of them disagreed.

The figure (Fig. 3) below represents the mixed responds received from the respondents on being asked about their views on media censorship in which majority of the respondents (67.4%) agreed with the concept of allowing "media censorship and 32.6% of the respondents disagreed with it.

Farha Yashmin Rohman

The figure (Fig.4) below represents the responses from the respondents about the statement that news channels having their own personal propaganda, 87.2% of the respondents agreed and 12.8% of the respondents disagreed with it. The figure (Fig.5) below represents the responses from the respondents for the statement, 'News Channels and Organizations manipulate facts and figures to favour their personal agenda' where majority (83.3%) agreed and 16.7% of the respondents disagreed. The Figure (Fig.6) below represents that 94.1% of the respondents agreed to the statement of scrutinization of Journalists and News Channels for sensationalizing information to boost their ratings, in contrast to the 5.9% of the respondents did not believe and disagreed the statement. The figure (Fig.7) below represents the responses where majority of the respondents (79.2%) of the respondents agreed to the statement that News channels misuse fear in people to endorse personal beliefs and 20.8% of the respondents disagreeing it. (Fig.7) The figure (Fig.8) below represents the responses for the statement 'News Channels only cover certain news that favour their agenda or boost their ratings and neglect other news' to which 82.6% of the respondents agreed finding it appropriate and on the contrary 17.4 % of the respondents disagreed. (Fig.8) The figure (Fig.9) below represents the responses for the statement 'News channels only cover one- side of a news story and tend to neglect the other', to which 68.4% of the respondent's showed agreement and 31.6% of the respondent's showed disagreement. The figure (Fig.10) below represents the responses from individuals' open-ended question stating their personal references for news information. The majority of results were directed towards social media (49%), newspapers (32%), YouTube Videos (10%), blogs (5%) as well as both audio and video podcasts (4%).

The information analyzed above illustrates how news outlets and channels sway public perception by disseminating false information and providing alternatives. It suggests substitute news channels for knowledgeable laypeople to access alternative news sources. It is imperative that these sources are reliable, impartial, devoid of prejudice, and do not shape public perception. Using a cross-section survey approach, 200 people from the fields of education, medicine, IT, and software participated in the study. The results indicated that social media, along with books, YouTube videos, and podcasts, is the most often used alternative news outlet. The survey also revealed that the majority of respondents think political parties have a big influence on news organizations and that most media outlets and journalists are unreliable because political lobbyists can influence them. Information can be manipulated in a number of ways by news organizations and sources to further their goals, sway public opinion, or draw in more readers and viewers. Sensationalism, prejudice, and financial interests are a few of the elements that might result in deception. A minority of respondents also think that credible sources include press conferences, radio, and TED Talks. Some individuals also think that speaking with witnesses or obtaining firsthand recollections might serve as trustworthy sources. This might not always be feasible, though.

CONCLUSION

The study concludes by asserting that finding an unbiased, reliable, and trustworthy news source is essential in today's world. It also suggests that future research can discourse the limitations of the current study by using large small sample size and restricting the population to literate people. According to the study's findings, people frequently believe that journalists and news organizations are biased and manipulative. Most respondents think that news organizations fabricate data and facts to fit their own agendas and to promote their point of view. Additionally, respondents think that news outlets only present one side of a subject and sensationalize information. The people may utilize a variety of substitute news sources in place of news channels, according to the report. The most widely used alternative news sources that the participants could find were blogs, YouTube videos, social media, and books.

The majority of respondents think that news organizations are devious and that they can falsify facts to further their own agendas, according to a study on the influence of news channels and organizations on public opinion. The most widely used alternative news medium, after social media, is YouTube videos, podcasts, books, and books. The results imply that individuals have become increasingly conscious of the possibility of bias and manipulation in the news media. This is probably caused by a number of things, such as the growth of social media, which has facilitated

Farha Yashmin Rohman

people's access to news from a multitude of sources, and the growing mistrust of established institutions. News organizations are also affected by it. In addition to being more thorough in fact-checking their reporting, news organizations should be more open about their funding and sources. Additionally, they must be more conscious of the possibility of bias in the news they cover. The study's conclusions have effects for news consumers as well. News consumers must exercise critical thinking when evaluating the material they read and be mindful of the possibility of prejudice and manipulation. Additionally, people ought to be aware of the sources from which they obtain their news and make an effort to do so from a range of sources.

Everyone has personal prejudices, it's critical to recognize them and prevent them from skewing how we perceive the news. We should also take into account the news's source and whether or not they have a reputation for objectivity and accuracy. When we come across a news article that appears too good to be true or evokes strong feelings in us, we ought to look for additional sources covering the same subject. We should also be skeptical of the evidence offered and mindful of the language employed in the news report. We can be more discerning news consumers and prevent being duped by heeding these suggestions. As a whole, this study offers insightful information on how the public views journalists and news outlets. The results imply that the media sector has to be held to higher standards of responsibility and openness. Additionally, it emphasizes how crucial critical thinking and media literacy are in the digital world.

Recommendations

The study on how news outlets and networks affect public opinion is precise and offers insightful information. The majority of the people in the present sample are academicians, IT and software workers, medical professionals, and university students. It would be intriguing to observe how the results vary among various demographic groups, such as those with varying degrees of political affiliation, income, and education. While lacking in depth, the current study offers a decent summary of the subject. It would be fascinating to find out more about how news outlets and organizations sway public opinion, how news is consumed, and how news consumption itself influences public opinion. Experimental design can be used to investigate how emerging technologies, including artificial intelligence and social media, are influencing public opinion.

ABSTRACT

An observant restating of Mahabharata from Gandhari's point of view is described in *The Curse of Gandhari* by Aditi Banerjee. The author liberates Gandhari from being summarized to an utter representation of her bandage. She builds her consciousness, as Ved Vyasa did, as an experimental female character of huge effectiveness also iron spirit - who, when negotiated, boarded upon a miscellaneous connection with Lord Krishna, in addition became the queen who annoying a deity. The Ramayana and the Mahabharata have crooked out to be an energetic slice of our soul besides our common insensibility. They have drawn attention for several illuminations and re-interpretations oblique categories from poems, plays, ballets, films also books. Realistic clarifications overlap for diverse observations and numerous vocal sounds increasing the outlooks of understanding the landmarks. On one pointer, progressive histories systematized up innovative outlooks of understanding trials while on the other, they also billet voices of up till now ancient history or marginalised typoscripts.

Keywords: Alternative, Blindfolding, Mystery, Noblewoman, Reinterpretation negotiated.

INTRODUCTION

Though Draupadi besides Sita remain adorned round popular present tale, Gandhari, wife of Dhritharastra   in *The Mahabharata*, finds diminutive reference. Aditi Banerjee, in her novel *The Curse of Gandhari*, energies afar the narrow narrative of covering her eyes herself as an action in of devotees to her spouse besides probes unrestricted into her eccentric — as a noblewoman and motherhood. Aditi, the author, an enthusiastic prosecutor in the US, was

67900

enthralled amidst the intricacy of Gandhari. "She is not a orthodox heroine, but is more complex and ambiguous than Draupadi or Kunti. She has a lot of strength and an iron will power so that even though she is the first to comprehend, when she hears that Kunti has given birth, she is so overwhelmed with emotion that she strikes her belly and she assaults it so hard that this mass of flesh comes out that ends up being her 99 sons also one daughter."

The Supplementary Cross of Blindfolding Has Been A Paradox

Nevertheless, Aditi admired Gandhari's hidden martyr covering of her eyes herself, Gandhari instabilities have been other phase of her personality which is not submissive, passive in addition to yielding. "Gandhari has the ability and voyaged toward expletive of Lord Krishna. Moreover, after the fight remains concluded, besides Gandhari knew her son and would have passed away, since   crook of Gandhari judgment her attention grabs sight prior Yudhisthira's feet and being helpless herself. Yudishtira feet became dark for the reason of she profound sourness, rage also sadness. Gandhari had an incredible power besides determination, self-exploration of her in unfortunate surroundings. Despite Gandhari being unfortunate normal sense, Gandhari being like an aristocrat and have abundance in her nature." Supplementary act of covering her eyes by Gandhari was a mystery explained in unlikely ways. Aditi explains that in one sense it is the act of a promised and reliable mate, a character of *satipratha*. In addition, Gandhari was saddened because wasn't part of the heir of the royal throne that she covered her eyes as an action of suffering grief, Withdrawing herself from human kind and her existence. Multiple absorbing questions have been raised if she had not covered her eyes then she would have been in sight of the spouse and would have been a more observant mom besides would have more influence on her male children. The other feel is that the writer says that in the modern sense, it was a work of noncompliance or outbreak as a queen who could not be in command of the circumstances of her wedding. Gandhari's method of captivating some form of her charge on her existence. The author doesn't think about The *Curse of Gandhari* is being placed as a mythic novel. "For me *The Mahabharata* is not really urban myths. The epic is tangled into our arts and progress. I think it is a true origin substance. But there is at all times some gifted freedom and imaginary in *The Mahabharata.* So, the book is a supposed fiction as the writer has taken this seed of truth from the epic and gone beyond it where it is more speculation."

The author connects the impression that the cut off from the story of her novel was placed subsequently after the warfare, when Gandhari misplaced all her male heirs, "Only her offspring girl abided. After fighting for twelve years, they verve to the wilderness then in the end expire in a fire. What I kept shimmering on is what her last minutes or her last time of her life was like? And did Gandhari, who had gone through so much pain, find serenity or justification at the end of her life?" The author depended on the proceeding of the complete paraphrase of *The Mahabharta.* It was noteworthy for the author to stay true to the example of the soul and personality of Gandhari. But the author has strained to seal in the voids because *The Mahabharata* tells us only a small amount about her and it does not provide any exploitation or calculation. It just grants the facts. So, the author has based on those proofs. It was noteworthy not to lay aside her and make an absolute declaration, because many instances she has been lessened to her blindfold. There is a shared extra distinction besides deepness to Gandhari.

Captivating Variance between Gandhari and Kunti

Talking approximately about the variance amid Gandhari and Kunti connection, Aditi says that in approximately many ways, they instituted themselves in the same circumstances, but unlike, for example, their attachment with Krishna. Their attitude to lifespan and their character has a slice of captivating variances. Kunti tags with the people around her in the jungle besides also takes care of them. So, the author concluded the relationship as a sistership, where they are frenemies. They remain the only unities who could decide what the other had suffered.

The plan to inscribe about Gandhari came out through one of her inscription programs. The author began with a small story about Gandhari; besides that story kept budding and her trainer anticipated that it would crack into a novel. So, the author toiled on it in addition that is how *The Curse of Gandhari* came to be, says Aditi. She marks abundant assemblies too –her wedding and crossing the dawn of rigid caste system, her choice of restorative takes her into the community space of the accommodations at the arena, away from the constrained secluded inland space of the fortress. In her choice of therapeutic, she cutouts fences of space and also contests feminine philosophies of

conflict and valour and offers conflict to male level headedness by spinning to curing. Her further works comprises a tale on the dearness between Shiva and Sati and a sequence on the life of Krishna from Radha's view point. The writer has paid awareness to focus on Gandhari's compensation in addition to trustworthiness, which ended her iconic charisma. We see her infrequent authority, complex opinions, wrinkled passion, besides shattered dreams. We get to decide the lesser-known structures of her personality. The writer doesn't denote Gandhari as an uncovered woman, but one with huge authority.

CONCLUSION

Gandhari being a woman of ultimate dedication. She being a well brought up, well qualified, authorized female of her times. She has been known of her own soundness and also feebleness. Gandhari agreed to her fortune besides attempting to rebuild with-trying to build it in a far better way — as a woman she was questioned by challenging choices-in an awkward phase. Ongoing the epic of Gandhari's failures, Aditi gives us the incident of Draupadi's unveiled life in self-controlled text. Over the time she has been a dim existence in her life besides the life of the Kuru clan, withdrawing the protection of the ritual and also the transparency of the godly. Gandhari can now barely impact her sons, she is condensed to be a voiceless viewer as soon as the menstruating ensemble of Pandavas is drawn to a public gathering and stripped. In her distress in foiling the unqualified violation of dharma, Gandhari is in the illustrious company – Bhishma, Kripa, Dhritarashtra, even Vidura, numerous fraternity heads also the scholars, entirely were a segment of portion in her embarrassment. Only she, in an expressive act by Aditi, where she is dishonoured ever so openly by Draupadi; Yajnaseni addresses only Kunti and sidesteps Gandhari overall beforehand disappearance for refugee. The gunshot hits the house, she being in chaos. Being too little, too late. Here, Aditi's prose is undemonstrative and also impactful, adds to the histrionic effect. Being a mother Gandhari failed, yet, under the stimulus of the author's pen, we are aggravated to deliberate the fact that feasibly Gandhari was frustrating to make the most of a wicked circumstance, possibly Gandhari was trying to prevent the predictable. Duryodhana (Suyodhana) was the well-behaved son only as long as his determination and his tactics were not complained about, it was his intrinsic nature, none could impact it. His brothers were more his brothers then being Gandhari's sons. We get the sense conceivably Duryodhana was obstinate, maybe the battle was predictable.

This study also highlights the Gig worker's nature, benefits and issues faced by gig workers, role of gig workers in Indian Economy and impact of technology on GIG workers

Keywords: GIG Workers, Technological Impact, Economic Impact, Challenges of GIG Workers

INTRODUCTION

The Indian economy has witnessed the significant transformation in the outlook of employment. In the past 10 years, the economy of India has seen remarkable changes due to digital technology, changes in consumers preferences, changes in labor market etc., This leads to the upspring of newline of workers who are called as "GIG Workers". The "GIG Workers" adopt digital platforms for their resilient labour of short term-term. The study on "GIG Workers of India" is adopted to understand the "GIG Worker" employment opportunities, problems faced by the GIG-workers, impact on labour force on the Indian economy. The topic "GIG Workers" absorbing the attention and contributing to Case-lets for scholars, Governing ruling and for growth of public.

Objectives of the Study
1.   To know the concept of "Gig Workers"
2.   To examine the nature of "GIG work"
3.   To assess the economic impact
4.   To explore technological role.

REVIEW OF LITERATURE

1.   Deepa Panchbhai and Dr. C. M. Tembhurnekar, An Analytical Study of Current Issues and Opportunities face by the Work force Engaged in the GIG Economy of India, Volume No: 38, Issue 26, Jan-March 2023, ISSN 2348-8425. In this paper, the authors have stated that a freelancer economy refers to individuals who participate in work agreements and receive money from outsourcing. These workers can be self-employed, on-call, or online platform workers. They have no boundaries and benefit both employees and companies. The contract workforce is expected to reach 23.5 million in 2029-30, accounting for 6.7% of India's non-farm workforce. India ranks fifth globally in flexible working, according to the ISF 2019 report. The research examines contract work, division, platform, and worker perspectives.

2.   Shajida Abib Kutty and Dr.S.Sundarajan, "Workforce in Gig Economy: A Descriptive Study on Indian Gig Workers", Journal of Management &Entrepreneurship, Special Issue, April 2022, ISSN: 2229-5348. In this paper, the authors have stated that the "GIG Economy" is a liberal market structure where companies hire freelancers for short-term projects and provisional jobs. The shift towards this model has been driven by factors like digitization, which has increased mobile work and remote work opportunities.

3.   Bobby Jacob and Mohsin, "Growth and Challenges of GIG Employees in India","Parikalpana" – "KIIT Journal of Management", Volume: 17(1), June 2021. In this paper, the authors have studied about the how gig economy is booming in India, its potential to significantly change the employment landscape, and the role of gigsters in enhancing their value proposition, focusing on the suitability of gig workers for job requirements. The paper discusses the obstacles of gigsters face, such as the inability to form a union, the absence of long-term economic stability, and safety concerns in the workplace.

4.   Ria Kasliwal[1], "Gender and the Gig Economy: A Qualitative Study of Gig Platforms for Women Workers", "Observer Research Foundation", May 2022, ISBN No: 359- 978-93-90159-03-1. In this paper, the author has stated that India's gig economy has grown rapidly, but women face challenges in pursuing gig work. This study explores the challenges that women workers in "GIG Work" faces, analyzes platform terms of use and privacy policies, identifies gaps in women's inclusion, and offers recommendations.

RESEARCH METHODOLOGY

This paper is purely conceptual nature of study. The data for study is from secondary sources like various articles, journals, articles, websites etc., as per the requirements of the paper.

GIG- Workers

To gain insight into the term "GIG Workers" it is relevant to known working conditions of GIG-Economy in the country. The demographic analysis gives clarity on the features of "GIG Worker" and social and economic origin. Indian country has diversified group of population which consist of younger generation, tech-savvy and including the aged group of people are attracted to the GIG work for earning additional income along with their regular income due to the advancement in digital literacy and abilities. The Indian Country's "GIG-Workers" comprises a heterogeneous population with different age groups, educational level and with different levels. The heterogenous group of population also comprises the group of people who prefer for flexible work from both rural and urban area of Indian Country. The Younger tech-savvy generation who aspires to utilize their digital skills to contributes to the maximum portion of gig workers. Now- a- days we can witness that their good portion of senior people who are into GIG Working for earning additional income and also due to the scarcity of conventional jobs. The Indian economy

67904

consists of varied range of young tech-savvy people to elderly group of workers who aspires for flexible employment. This group of workforces from both rural and urban areas who has varied range of skills including writers, translators, software developers and also who are ready to work in the service sector like housekeeping, delivery and driving etc., The GIG economy captivates individuals from different economic conditions, control over work schedules and balance of work life. A thorough knowledge of demographic profile is important for framing policies, to implement social protection measures, addressing problems and opportunities and to provide economic security for "GIG Workers" who are of different age groups, sectors and has varied skills.

Nature of GIG-Workers

The GIG Workers are very different from conventional full-time employees due to the various reasons like:

1. **Flexibility:** The "GIG Workers" have a flexibility in the schedule of work, place of work and methods of work. They select their jobs based on flexibility of timings, work mode and other factors. Thus, it is the nature of freedom which is making GIG employment more attractive and appealing.
2. **Short-term Engagement:** The "GIG Workers" prefers for short-term and project based and temporary assignment of job instead of working in a company for a longer duration. They also prefer for taking up different client's projects on ad-hoc basis.
3. **Diversity of Work:** The GIG Workers comprises of different workforce like graphic-designers, ride-hailing services, delivery partners, freelancers, consultancy services.
4. **Unconventional Contractor Status:** The "GIG Workers" are self-employed group or independent group of workers without any benefits like regular employees receives from their employers like provident fund, health care facilities and other perquisites. They are not entitled for any employment safety measures like perquisites facilities.
5. **Digital Platform Interaction:** The digital platforms and application help "GIG Workers" to find jobs, interact with clients and to explore other opportunities.
6. **Difference in Income-Level:**The "GIG Workers" face variation in their income due to unique characteristics. Sometimes they may earn more income and certain times the earning might be less due to fluctuations in the market.
7. **No Job Security:** Compared to other work group who are full time employees working under employers in conventional method the GIG Work force doesn't entitle for job security due to fluctuations in demand in the market.
8. **An Entrepreneurial Mindset:** The "GIG Economy" helps in upbringing entrepreneurial skills for young people due to various opportunities.
9. **Variety of Workforce:** The GIG Workforce comprises of varied range of people with different age, qualifications, skills and socio-economic backgrounds.
10. **Issues of Social Protection:** The GIG Workforce are denied from social protection measures like retirement plans, health insurance, unemployment benefits etc., compared to conventional jobs. This leads to financial stability.

Technology and GIG Economy

Due to the change in technology the organizations are forced to embrace this challenge by adopting the changing environment in order to stay competitive, due to this paradigm shift many jobs have become obsolete and useless. This gave rise to the gig economy many numbers of individual turning into gig work facilitated by digital labour platforms, according to the Boston consulting group report the gig economy has the potential to service up to 90 million jobs in India. This trend is indicative for evolving employment landscape in the country. According to the GOI the gig economy y is offering more employment opportunities more focused on youth seeking flexible work agreements. Many turn to platforms like ola, uber, Swiggy, Zomato, urban company, Porter, Dunzo, Blink it—these platforms categorize themselves as "tech-aggregators, mediators or facilitators.

Different types can be classified based on the nature of their work

- **Ride -hailing drivers:** this people use their vehicles to provide transportation services to the passengers by attaching to the cab aggregators like ola, uber, etc.,.
- **Delivery executives**: Food-delivery services have gained lot of popularity which led to the increased demand for delivery executives
- **Freelancers:** They are self-employed professionals who offer the skill and expertise for the projects.
- **Development of software**: gig workers assist themselves in creation of websites, software solutions and online applications.
- **Digital marketing:** individuals who are specialized in digital marketing which includes social media marketing, search engine optimization, content creation, pay per click advertising who helps in enhancing organization to increase their online presence.
- **Online tutoring and e-learning**: gig workers in India also provide online tutoring and teaching services example for this can be Unacademy, Byjus etc.,
- **Cyber-Security**: gig workers help the companies to shield the online the risk like penetration testing, vulnerability assessment and security consultation.
- In recent times, a lot of emphases is given on the collection and analysis of big data. Big Data, that is the theoretical treatment of information and Digital Intelligence that is technological tools like Artificial Intelligence (AI), Machine Learning, Internet of Things (IoT) are real game-changers.

Economic Contribution by GIG Workers in India:

According to the Niti Ayog report platform-based gig economy as rapidly grown in India. A study report released by NITI Aayog makes an estimate that in 2020-21, 77 lakh workers were engaged in the gig economy. There are about 24 million platform-based gig workers in India as of 2020-21.the gig workforce is expected to expand to 2.35 crore workers by 2029-30. About 47 per cent of the gig work under medium-skilled jobs, about 22 per cent in high skilled and about 31 per cent in low skilled jobs. It is also expected to Create up to 56 million new jobs by 2029 which adds to 1.3% to the GDP. NON-PLATFORM based gig worker creates job about 34 million new jobs by 2029-2030.

Challenges faced by GIG Workers

As gig workers are independent workers few revampcation is necessary in order to protect the interest of the gig workers which are also considered as a concern for gig workers:

1. **Labour laws**: the labour laws currently we have is designed with the view of traditional employment, slight changes are necessary to protect unique need and vulnerability of gig workers.
2. **Social Security**: GIG workers does not get the benefit of traditional employment like health benefits, retirement, regular income
3. Clear definitions are necessary for determine the eligibility for social security.
4. Gender biased working on the gig platform

CONCLUSION

After looking into the opportunities and the expected figures of raise in the gig work force undoubtedly it is gaining popularity in India specially with youth and women workers. According to the international labour organization India is the second largest gig economy in the world. It is changing the landscape of labour in India by offering flexibility but there is a raising complex question about rights, protection, and social inclusion. There is a requirement of regulatory reforms to ensure the fair compensation, social security, to voice their concern. By making the required changes India can have a balance between embracing the gig economy potential to the best advantage and safeguarding the rights and welfare of the workers through greater collaboration between the government, employers, and workers' organizations.

ABSTRACT

Withdrawal of books or weed out of books from the library and information centre is the most essential exercise of to be carried out at regular intervals. Such activity will be of most useful to develop healthy and feasible collection. The process of weeding out of old, unwanted, unused and mutilated books from the stock will help to procure a book which is of in demand and will make space for the books acquired newly.

Keywords: Collection Management, Withdrawal Policy, MUSTIE model, etc…

INTRODUCTION

The higher education system in India is at transition stage and it is more concentrated to build the strong education system keeping in mind of the global village concept. Since the implementation of National Education Policy 2020 the more emphasis will be on research and library and information centre plays vital role in catering the information need of its users. To meet the ever expanding demand on the information it is exceptional for the library and information centre to update its collection as per the demand and weed out the unwanted things from library at regular intervals. Weed out policy is an essential activity need to be drafted by any library and information centre while constituting its collection management policy to keep its collection up-to-date and remove the unwanted books from the stock. Withdrawal of unused books from the library makes space to acquire useful and updated books to the library and serve the needs of its users. The Buffalo and Erie County Public Library System, New York, USA follows a procedure called MUSTIE Model in its collection management policy to weeding of documents. In United

67908

Yeshwanth Kumar and Pavan Kumar

States Public Library System a general guidelines called CREW(Continuous Review, Evaluation, and Weeding) method adapted in collection management.

Six general criteria summarized with the acronym **"MUSTIE"** were formed for considering withdrawal of an item from the collection in the CREW method.

MUSTIE stands for

M = Misleading - factually inaccurate
U = Ugly - worn beyond mending or rebinding
S = Superseded - by a new edition of/or by a much better book on the subject
T = Trivial - of no visible literary or scientific merit
I = Irrelevant to the needs and interests of the library's community
E = Elsewhere - the material is easily obtainable from another library

Age and Usage are the two major factors to evaluate the withdrawal of the library documents. The above listed are the major criteria to identify and weed out the documents from the collection. Further the MUSTIE model emphasis on the following factors for consideration into the process of withdrawal of documents are called as "**WORST**";-

W - Worn out - cracked, scratched, grainy, fuzzy, or previously repaired
O - Out of date - dated and/or inaccurate
R - Rarely used
S - Supplied elsewhere
T - Trivial or faddish

The above methods are commonly in use in the western countries public library system to manage the library and information centres effectively. But in indian scenario there is a lapse of such model or standard to weed out the collection, still some suggestions made by the UGC Committee 1957 headed by the Chairmanship of Dr. S.R. Ranganathan published a document on "Development of university and college libraries" in 1965 deliberates on effective library management by framing the guidelines on staffing, budgeting, library collection development, Maintenance of accounts, book selection authority, promotion of reading habits through open access to stacks, norms for loss of books, weed out of unwanted and unserviceable documents, etc….

Later in 2007, the National Knowledge Commission issued guidelines keeping in view of latest ICT application in libraries with regards to collection development, monitoring and evaluation of collection and services recommends to withdrawal of library documents should be a regular process. It is very important for every library to develop a Withdrawal Policy approved by the competent authority to cater effective library service. Based on the suggestions and recommendations made by the different commissions, the following factors are taken into consideration to weed out/withdraw the documents from the library and information centres;-

Factors to be considered for withdrawal/weed-out of books
"Physical condition
The books physical condition is the major factor need to be taken into consideration for withdrawal of the document. It is recommended to weed out badly mutilated or damaged materials from the stock keeping in mind that the same copy could be procured based on its demand".

"Duplicate or multiple copies
Especially in academic libraries the practice of accumulating multiple copies of books are in common use. It is ideal for any library and information centre to withdraw the duplicate copies to make space for the new books. To avoid procuring multiple copies of books, it is recommended to purchase reference books instead of textbooks and inculcate the habit of reading of reference materials among students".

Yeshwanth Kumar and Pavan Kumar

"Use of e-resources

In view of increasing use of electronic resources through library subscriptions or consortia or open access the use of print is slowly decreasing in higher educational institutions. Thus the duplicate print can be kept aside either in passive collection or even can be weeded out ife-resources are purchased on perpetual (permanent) access basis".

"Currency

The content of the books should be accurate and up-to-date. In this respect it is taken into consideration that, the newly procured books are revised and of updated edition and the older books with same title need to be withdrawn from the stock. The books in the basic sciences such as Mathematics, Physics and Chemistry are need to be retained since the basics never loses its value".

"Usage

Usage is the major criteria to decide the retention or withdraw of the books from the library and information centre. Keeping the circulation statistics and the reports fetched by the library can be the deciding factor to withdraw the material from the stock. The least circulated books and less consulted materials can be recommended to be withdrawn".

"Uniqueness

The library and information centre is recommended to retain the unique titles of the library suppressing the fact of being old, unused and least consulted".

"Format Uselessness

Books or documents which are in obsolete format may be weeded if the content of the book is available elsewhere or if the material is in poor condition".

"Completeness

If library has procured a book that is part of the multi volume set and the library does not have all the set may be weeded out from the stock. Which doesn't fulfils the completeness".

Standard Procedure to Withdraw the Books

Standard procedure to withdraw the books from the library stock revolves majorly on library staff and it comprises the staff and students of the institution.

➤ A Committee comprises of faculty members from all disciplines, members of the library committee and librarian will be formed by the Head of the Institution to identify the documents to be withdrawn from the library stock.
➤ Proper assistance from the library staff to be provided to the committee and the librarian to identify and make list of the documents which are old, out of syllabus, less circulated and multiple copies acquired in same title to propose for withdrawal from the library.
➤ The books purchased for all students under book bank books can be proposed to be withdrawn from the stock if the syllabus is revised.
➤ In such instance in which new policies or rules were incorporate to the content every year e.g. Titles in General Management, Taxation the earlier editions can be proposed for withdrawal.
➤ The physical condition of the document is one major factor considered for withdrawal. Pages torn, mutilated or damaged publications can also be listed for withdrawal.
➤ In streams such as Computers and Information Technology the titles procured earlier were with superseded technologies, software or hardware will also be considered for withdrawal from the library stock.
➤ It is the responsibility of the library staff to produce report with complete details of the document such as Title, Accession Number, Year of Purchase, Price, Number of copies and reason for considered for withdrawal need to be furnished before the Withdrawal Committee members.
➤ The Committee formed by the Head of the institution will inspect the list proposed for withdrawal and examine and recommend that the books listed can be reused in future or can be used for other courses of the institute and

suggest to retain in the library. The publication which never lose its value and content which never gets obsolete such books to be excluded from the withdrawal list.

➢ It is the responsibility of the committee to verify the each document proposed to be withdrawn from the library and no other books such as missing books, books due from students and staff not added in the withdrawal list. Subject experts in the committee need to validate the list proposed for withdrawal is appropriate and can be considered for further process.

➢ The final list recommended by the committee will be presented to the Head of the Institution for necessary approval. The Head of the Institute will have the complete authority to accept or reject the committee recommendations fully or partially by keeping interest of the institute in mind.

➢ Once the Head of the Institute is satisfied with the list, the same will be forwarded to the management to sanction necessary approval to withdraw the documents from the library stock.

➢ After getting proper approval from the management, the library staff will separate the books listed in the withdrawal from library stock and make necessary arrangements to discard them off.

➢ Once the books are withdrawn, the same need to be updated in the accession register and library management software at the appropriate entries to refine search results.

➢ It is also suggested that, the dailies subscribed to libraries such as newspapers, magazines and journals which serves immediate requirement need to be withdrawn at regular intervals to make space for forthcoming issues in the dedicated shelves. Advised to keep atleast last one year issues of magazines and journals before consideration for withdrawal.

➢ The documents withdrawn from the library may be disposed as per the policy of the institute or can be donated to other institution where it is used for some extent.

Advantages of Weed out of books

➢ Active and useful collection management.

➢ Space to newly acquired books.

➢ Weed out of books will provide clear picture of library collection.

➢ Weed out of books will encourage the use of current collection by its users.

➢ The books weeded out can be donated to any other institution which can be utilised for their need to some extent.

➢ In some cases the contents of the books withdrawn from one institution can be of use for other institution. In such cases the books can be reutilised by the needy institution will achieve the goal of procuring book even after its withdrawal.

CONCLUSION

As per the 5th Law of library science Library is a growing organism the library and information centre keep on expanding its collection day by day. Hence it is very essential to weed out the unused, mutilated, unwanted books and materials from the stock at regular intervals. Collection management policy need to be incorporated with weed out policy to regulate the active and useful collection development and meet the need of its users.

ABSTRACT

The current age is greatly impacted by electronic media, and within this framework, websites have a big impact on how online shoppers behave when making purchases. The notion of social presence in the context of e-commerce refers to the extent to which users feel a sense of engagement and connection with other users when interacting on the platform. This study's goal is to examine how consumer demographics affect how social presence is perceived on buying websites, with a focus on Amazon Services. The current study is descriptive in nature and is based on deductive approach, the study is carried out across Bangalore city. The study is limited to the users of online shopping, specifically Amazon services. A convenience sample of 170 online consumers of Amazon website was selected. A well structured questionnaire was prepared by adapting to the previous studies. The items for Social presence- Integrity and benevolence were adopted from previous studies. The statistical method for the study was the ANOVA test since it focuses on understanding perception and anticipation based on demographic characteristics. The results demonstrate how a variety of criteria, including age, gender, education, and employment, affect a person's feeling of social presence on the website, especially when it comes to Amazon services. It is recommended that online websites tailor their user interface and experience to align with the demographic characteristics of their intended audience. Personalized recommendations based on past purchases, a dashboard that can be customized so that customers may choose the areas and hobbies they are interested in, and the ability to switch between other language versions of the website are all suggested enhancements for Amazon services.

Keywords: Customer demographics , Social interaction , Shopping website, Amazon Services.

INTRODUCTION

The concept of social presence applies to the subjective experience of the presence of individuals within the specific context of communication Bickle, J. T., *et al* (2019). This concept comprises the subjective phenomenological encounter of individuals in the presence of one another, as well as the collective perception of unity and connectedness Jiang, C., *ET AL* (2019).Lowenthal, P. R. (2010)propose that the social presence theory asserts that various communication media play a role in establishing a feeling of presence for both parties engaged, hence influencing their interpersonal connections. Based on the theoretical framework , it is posited that various communication technologies, including text messaging and video conferencing, has the capability to cultivate a sense of social presence. This is achieved by allowing users to perceive the other party as genuine and actively engaged in the interaction. Gefen, D., & Straub, D. W. (2004).A positive association exists between the perceived the degree of social presence and the probability of individuals experiencing A feeling of connection and engagement in the process of communication. The concept presented carries substantial consequences for our understanding and application of various communication modalities in both personal and professional settings Chen, J., & Liao, J. (2022).

The phenomenon being examined primarily entailed a sustained interpersonal interaction with either an individual or an organization, extending over a considerable period of time. Trust is a frequently seen phenomenon that is typically cultivated through prolonged interactions, enabling individuals to form reliable anticipations regarding the behaviors of others, be they humans or entities Cui, G., *et al* (2013). One noteworthy aspect of e-commerce is the absence of in-person interactions, which brings an intriguing dimension that will be investigated in the current study. The lack of face-to-face interaction in electronic commerce poses a significant challenge in cultivating trust between vendors and purchasers Lu, B., *et al* . (2016). When faced with a lack of regular face-to-face interactions, individuals are driven to rely on other indicators of reliability, such as ratings and reviews of sellersShen, J. (2012). In light of the e-Commerce sector's ongoing expansion, it is imperative to look into cutting-edge strategies for building and preserving online transaction trust.

This research examines the manner in which customers perceive the social interaction of e-commerce platforms, with a focus on how these perceptions may vary dependent on demographic factors. The researchers obtained data from a heterogeneous sample of participants, encompassing individuals of varying ages, genders, and income brackets. The objective of this study was to ascertain whether there exist any notable disparities in the perception of social interaction among different demographic groups towards e-commerce platforms. The findings of this study will improve understanding of consumer behaviour in the context of online shopping and help companies tailor their platforms to meet the unique needs and preferences of different customer segments. An outline of the study is provided in the first part. The review of the literature is the main topic of the second segment. The third portion contains information on the research methodologies, while the fourth section contains the study's findings. This study's final section offers its limits and areas for future investigation.

REVIEW OF LITERATURE

This study employed a systematic literature review approach to analyze previous scholarly works that were pertinent to the research inquiries under investigation. The articles were sourced from reputed journals and were scrutinized to determine the level of quality exhibited by each study. Elsevier database, Routledge and CRC Press Taylor and Francis database. Emerald Group Publishing database, Springer Nature database and Sage database. Several supplementary articles were acquired from reputable academic databases such as Wiley, Academia, JSTOR, and Guildford Press.

Dhakshitha and Lavanya Kumari

The review of literature is presented as:

- Cyr, D., *et al* . (2007). When comparing offline buying to online shopping, the latter is often perceived as lacking in human warmth and friendliness due to its impersonal nature, anonymity, automation, and limited face-to-face encounters. Hence, comprehending the intricacies involved in fostering client loyalty in online contexts, commonly referred to as e-Loyalty, is a multifaceted undertaking. This study presents a proposed model for e-Loyalty and applies it to investigate the impact of different levels of social presence in a B2C e-Services environment on e-Loyalty and its underlying factors of perceived utility, trust, and enjoyment. The present work used structural equation modeling approaches to investigate the aforementioned model, with a sample size of 185 participants. Additional study is undertaken to unveil gender disparities pertaining to hedonic factors inside the e-Loyalty model.

- Lu, B., *et al* . (2016). One significant impediment to the expansion of e-commerce is purportedly the absence of human and social factors. The advent of social commerce has the potential to improve this predicament. Social commerce is an emerging phenomenon within the realm of electronic commerce (e-commerce), wherein social technologies are integrated into e-commerce platforms to facilitate the convergence of commercial and social activities. Social commerce is a phenomenon that seeks to restore the social element of buying inside the realm of e-commerce, hence enhancing the level of social interaction in the online environment. This study utilizes the social presence theory as a framework to examine the characteristics of social interaction in online social commerce marketplaces. It introduces a conceptual framework consisting of three social presence factors. It is predicted that these variables have a beneficial influence on trusting beliefs, which subsequently lead to online buying behaviors. The study model is evaluated by analyzing data obtained from a representative e-commerce platform in China. The results of our study indicate that the existence of social variables facilitated by social technologies plays a key role in the establishment of reliable online relationships for exchanging goods or services. This study substantiates the beneficial influence of the social dimension on molding online purchasing behaviors, hence offering theoretical support for the integration of social and commercial activities. This study presents a novel perspective on the field of e-commerce, highlighting the emerging phenomena of social commerce and emphasizing the need for increased attention towards it.

- Weisberg, J., Te'eni, D., & Arman, L. (2011). The act of online purchasing possesses certain characteristics that set it apart from conventional retail practices, notably in terms of its social dynamics. The objective of this study is to examine the correlation between previous online transactions and purchasing intentions, with a focus on the social context as represented by the concepts of social interaction and trust. A cohort consisting of 115 MBA students who were actively employed participated in a study where they engaged in an online shopping experience. However, their progress was halted at the payment stage. Subsequently, these participants were requested to answer a questionnaire that assessed their perceptions of social presence and trust. The findings indicate that prior purchasing behavior is a significant predictor of future purchase intentions. Additionally, trust and social presence play a role in somewhat mediating this relationship. The consideration of social context is crucial in comprehending the impact of prior behavior on subsequent purchasing decisions. Consequently, it is imperative that designs are optimized to augment social presence and foster confidence. Furthermore, it could prove advantageous to closely observe these mediators in order to identify any potential issues. This study elucidates the significant influence of social context on the phenomenon of internet shopping. The present study aims to ascertain the influence of trust mediation and social presence on the relationship between past purchase behavior and future purchasing intentions.

- Ganguly, B., Dash, S., & Cyr, D. (2011). The primary factor contributing to the aversion towards online shopping, as identified by previous experts, is the absence of confidence in online transactions. The primary aim of this research paper is to establish a comprehensive framework for examining the impact of website characteristics on Trust in online travel portals, and subsequently validate this framework through empirical analysis. During the initial stage, a causal model is constructed to identify the relative significance attributed to various website characteristics in generating confidence inside online travel portals. In the subsequent stage, a series of models have been put up, which center on the personal variables of customers, namely demographic and psychographic factors, that serve as moderators in the association between the aforementioned trust antecedents and trust itself. The empirical model provides insights into the relative significance of website elements that contribute to trust in travel portals among customers with varied psychographic and demographic values in India.

- Li, H., Kuo, C., and Rusell, M. G. (1999). The present study introduced and empirically examined a theoretical framework pertaining to the purchasing behavior of consumers in online contexts. The theoretical framework suggests that the online purchasing behavior of consumers is influenced by factors such as demographics, knowledge of online channels, perceptions of the usefulness of these channels, and individual shopping orientations. The data were gathered by a research organization through the implementation of an online survey targeting a sample of 999 individuals who are Internet users residing in the United States. To ensure the reliability and validity of the data, it underwent a process of cross-validation with other comparable nationwide surveys prior to its utilization for model testing. The study's results revealed that several factors, namely education, convenience orientation, experience orientation, channel knowledge, perceived distribution utility, and perceived accessibility, consistently predict the online buying behavior of Internet users. These variables establish if people are regular online shoppers, infrequent online shoppers, or non-online shoppers. The ramifications of the results and possible directions for future research were covered in the debate.

Research Gap

The existing body of research indicates a scarcity of studies examining the influence of demographic characteristics on individuals' experience of social interaction on online shopping websites. The aforementioned research gap is quite significant since demographic variables like age, gender, and income may have an effect on people's experiences with online buying. Understanding how these traits affect how people perceive your social media presence can help marketers and web developers tailor their strategies and platforms to better serve a variety of clientele.. Hence, it is imperative to do additional research in this domain in order to attain a full comprehension of online customer behavior.

RESEARCH METHODS

The current study is descriptive in nature and is based on deductive approach, the study is carried out across Bangalore city. The study is limited to the users of online shopping , specifically Amazon services . A convenience sample of 170 online consumers of Amazon website was selected. A well structured questionnaire was prepared by adapting to the previous studies. The items for Social interaction- Integrity and benevolence were adapted from the study of Gefen, D., & Straub, D. W. (2004).Since the study is based on understanding the perception and expectation based on demographic variables, ANOVA test was used as the statistical technique for the study McHugh, M. L. (2011). To determine whether there are statistically significant differences in means between two or more independent (unrelated) groups, one-way analysis of variance, or ANOVA, is utilised. It is usually used with three or more groups Kim, T. K. (2017). The following assumptions of ANOVA test assumptions are confirmed.

1. It is appropriate to evaluate continuous dependent variables at the interval or ratio level.
2. Two or more categorical, independent categories should be present in an independent variable. An independent-samples t-test is most commonly used for two categorical, independent groups, although a one-way ANOVA can be used for three or more.
3. Observations are independent, meaning there is no relationship between or within groups. Each group must have unique participants, with no repeats.
4. No notable outliers. Outliers are singular data points that deviate from the norm.
5. Dependent variable should be approximately regularly distributed for each independent variable category.
6. Variances must be homogeneous.

The ANOVA test was carried out using the SPSS software. George, D., & Mallery, M. (2003).

RESULTS AND DISCUSSION

Demographic profile of the respondents

The target demographic comprises a predominantly female population, accounting for 53% of the total, while males make up the remaining 47%. Around 40% of the population falls within the age bracket of 18 to 24 years, whereas

Dhakshitha and Lavanya Kumari

approximately 28% can be categorized as belonging to the age group encompassing the late 30s and early 40s. A subset of the intended recipients has a minority proportion of individuals who are 55 years of age and older. The data concerning the marital status of the target demographic reveals that 42% of respondents are in a married state, whereas the remaining 55% are categorized as unmarried. The remaining portion consists of persons who are either separated or widowed. A small proportion of the participants demonstrate a lack of literacy skills, whilst only 12% have achieved the acquisition of a Secondary School Leaving Certificate (SSLC). The data indicates that a considerable segment of the population, precisely 29%, has attained a graduate degree, while an additional 35% have engaged in postgraduate studies. The significance of education is of utmost importance in understanding the benefits of organic food items and serves as a vital socio-demographic factor within the scope of this research. Regarding occupation, the data indicates that 35% of respondents classified themselves as students, 12% as homemakers, 26% as employees in private enterprises, and 16% as self-employed individuals. The majority of the target population falls between an income range of INR 20,000 to INR 40,000, with 19% earning above INR 40,000.

Item analysis for Social Interaction

The results of the study show that the average scores above 4.00 suggest a strong influence of the social interaction of the shopping website, namely in terms of integrity (mean = 4.12, standard deviation = 0.876) and benevolence (mean = 4.07, standard deviation = 1.100), on the impulsive online customers of essential products. This suggests that consumers place considerable significance on the dependability and standing of the e-commerce platform while participating in impromptu purchases for vital commodities online. The average ratings indicate a significant impact of these factors on the decision-making process and their contribution to the overall satisfaction received from the online shopping experience. The importance of prioritizing the development and maintenance of a strong social interaction that reflects values such as integrity and kindness is significant for businesses, as it enables the recruitment and retention of spontaneous customers.

Testing of Hypothesis

H1 – Demographic factors have a major influence on how social interaction is perceived on buying websites, particularly with regard to Amazon Services. The objective of the hypothesis is to examine the influence of age, gender, qualification, and occupation on perception of social interaction in shopping website – with special reference to Amazon Services. Given that the demographic variables are categorical in character and the social presence – Integrity and Benevolence are continuous in nature, it is deemed most suitable to employ an analysis of variance (ANOVA) test. By employing an analysis of variance (ANOVA) test, it is possible to evaluate the degree to which these variables exert an influence on perception of social interaction, thereby offering useful insights for enhancing customer satisfaction. The table shows the ANOVA Results inform of F statistics and p values. The F statistics indicate the significance of the differences between the groups in the study. A higher F statistic suggests a greater likelihood that the observed differences are not due to chance. On the other hand, the p values offer proof for adopting or rejecting the null hypothesis. When a p value is smaller than the predefined alpha threshold, which is usually set at 0.05, it signifies that the observed differences are statistically significant and unlikely to be the result of chance.

H1	Age	→	Perception of social interaction	Accepted

The perception of social interaction in the website of Amazon services is substantially influenced by age. The measurement of social interaction is based on the attributes of integrity and benevolence. Younger persons exhibit a tendency to sense a heightened degree of social interaction on the website of Amazon, thereby establishing an association with a platform that is perceived as more reliable and compassionate. Conversely, individuals of advanced age may exhibit a more suspicious perspective, wherein they perceive the social presence of the website to be less authentic and lacking in altruistic intentions. The variation in impression may stem from differing levels of familiarity and ease with online platforms across various age cohorts.

Dhakshitha and Lavanya Kumari

H2	Gender	→	Perception of social interaction	Accepted

The perception of social interaction in the website of Amazon services is substantially influenced by gender. The measurement of social interaction is based on the attributes of integrity and benevolence. The findings of a study examining users' impressions of Amazon's website indicate that gender significantly influences consumers' perception of the platform's social interaction. The investigation assessed the level of social presence by considering two distinct dimensions: integrity and compassion. The findings of the study revealed that male participants had a stronger inclination to identify elevated levels of integrity with the website, whereas female participants reported a heightened perception of compassion. This finding implies that the perception and assessment of the social dimensions of Amazon's online presence are influenced by gender.

H3	Qualification	→	Perception of social interaction	Rejected

The qualification of customers has a notable influence on the perception of social interaction within the website of Amazon services. The measurement of social interaction is based on the attributes of integrity and benevolence. Customers who possess a high level of qualifications and hold a favorable view regarding Amazon's trustworthiness and compassion are more inclined to experience a pronounced sense of social presence when navigating the website. The customers place their trust in the company's actions and have confidence in its adherence to ethical standards, thereby augmenting their overall experience and level of happiness. In contrast, those with lesser levels of educational attainment may possess distinct perspectives of social interaction. This is due to their susceptibility to having their trust and confidence in a company's ethical conduct and goodwill more readily persuaded or undermined. Hence, it is important to comprehend the qualifications of clients in order to efficiently manage and enhance the social interaction on Amazon's platform.

H4	Occupation	→	Perception of social interaction	Accepted

The consumers' occupation has a substantial influence on the perception of social interaction within the Amazon services website. The measurement of social interaction is based on the attributes of integrity and benevolence. Customers employed in professional industries such as law or medicine exhibit a propensity to perceive a heightened degree of integrity in Amazon's online platform, as they place significant importance on trustworthiness and credibility. In contrast, individuals employed in altruistic professions such as social work or teaching tend to exhibit a greater inclination to perceive a sense of kindness. These individuals appreciate the endeavors of companies in terms of social responsibility and community assistance. In general, the occupation of individuals significantly influences their feeling of social interaction, underscoring the significance of customizing online experiences to cater to diverse occupational cohorts.

CONCLUSION

The sense of social interaction on the website, particularly Amazon services, is influenced by various factors such as age, gender, qualifications, and occupation. It is recommended that online websites tailor their user interface and experience to align with the demographic characteristics of their intended audience. For example, it is possible that younger users may exhibit a preference for an interface that is characterized by increased interactivity and visual attractiveness, whereas elderly users may demonstrate a preference for a layout that is simpler and more straightforward to traverse. Furthermore, the customization of website content and language to accommodate diverse educational backgrounds and professional jobs has the potential to augment user engagement and overall pleasure. By comprehending and mitigating these aspects, digital platforms such as Amazon have the potential to cultivate a more individualized and all-encompassing consumer experience. The suggested improvements for Amazon services encompass personalized recommendations derived from prior purchases, a customisable

dashboard enabling users to select their chosen categories and interests, and the provision to move between several language versions of the website. These innovations have the potential to not only boost user happiness but also foster repeat visits and bolster consumer loyalty. In addition, Amazon may contemplate the provision of specialized sections or filters tailored to certain professions or educational backgrounds, so enhancing the convenience for customers in locating products that are pertinent to their specific requirements. In order to consolidate its standing as a prominent e-commerce platform, Amazon may enhance its position by accommodating the varied interests and needs of its user base.

Scope for Further Research

Future research can focus on how personality factors affect the experience of social presence in online shopping websites, given the current study is dependent on demographic variables. Examining how characteristics like neuroticism, extraversion, and openness to new things affect how people perceive their social presence when they purchase online could be one way to do this. In addition, to further understand the intricate relationship between personality and social presence in online buying, future research might examine how various personality traits interact with other elements, like website design and interactivity. Researchers can obtain a more comprehensive grasp of the elements that contribute to a successful online shopping experience by broadening the scope to include personality attributes.

ABSTRACT

The biological atrocity that the world underwent during be covid-19 has resulted in new dimensions of human existence in the future, the overwhelming adaptation to the technology has open the door for research and most of the countries wanted to stamp their authority at the time of Covid to prove their pharmaceutical competencies. This has resulted in one sector dominating the overall earnings for almost two to three years with thick size balance sheet. This has promulgated to take this study with an objective of providing the most competent company in the context of India. The tools used to analyze the secondary data based on the published financial statements are management ratios. The rankings of the top 5 pharmaceutical companies are based on the Standard deviation, which significantly prove the strategical force of these companies.

Keywords: Consistency analysis, Financialratios, Covid-19

INTRODUCTION

The drug manufacturing industry in India is apparently showcasing its strong presence in overseas pharmaceuticals market. India is the largest supplier of generic medicines globally, securing a 20% share in worldwide supply by volume, and also caters 62% of global demand for vaccinations (https://www.ibef.org/industry/pharmaceutical-india). India has secured3rdrankworldwide in terms of production by volume and 14th by value (https://www.pib.gov.in/PressReleasePage.aspx?PRID=1821747). India is the only country at the global level with a

67921

huge number of US-FDA compliant drug manufacturing plantsand has more than 2000 WHO-GMP approved drug manufacturing Plants, 253 European Directorate of Quality Medicines (EDQM) approved plants with modern cutting-edge technology (https://pharmaceuticals.gov.in/pharma-industry-promotion). India's in house drug market turnover have reached Rs 1.4 lakh crores, which is equivalent to $ 20.03 billion in 2019. This is a 9.8% hike from Rs 1.29 lakh crores (US$ 18.12 billion) in 2018. Healthcare services in our country is available in both private and public domains. The annual turnover of the pharmaceutical industry in India in the year 2018-19 was estimated at INR 2.5 lakh crores.   India experienced an increase of 10.72% in pharmaceutical exports in 2018-19, which are evaluated at INR 1.33 lakh cr. As per the Govt of India Budget 2020-21, the allocation to the Department of Pharmaceuticals has been marked at USD 44.47 million (Government of India).

REVIEW OF LITERATURE

Akanksha pawar , Kashish Jalan and Ashim Garg (2016) , IIT Delhi
Examined the impact of financial analysis of pharmaceutical companies in India
Secondary data was collected using secondary sources. The study examined through bar diagrams, some of the important efficiency ratios, solvency ratios and profitability ratios to gauge the financial analysis of prominent 12 Indian pharmaceutical companies for an extensive period covering from 2007 to 2016 using DUPONT 3 POINT ANALYSIS and DUPONT 5 POINT ANALYSIS. The study concluded that TORRENT COMPANY tops in the financial performance and SUN PHARMA is in the last position.

Endri, Desi susanti and 3 others ,(June 2020) , University of Jakarta, Indonesia
Examined the impact of Financial Performance Evaluation : Empirical Evidence of Pharmaceutical companies in Indonesia The study considered secondary data examined the financial performance considering prominent 9 pharmaceutical companies of Indonesia listed in Indonesian stock exchanges during the period from 2014-2018 for their study through line diagrams. The study encompassed the financial performance of considered companies using the ratios of liquidity ratio, activity ratio, solvency ratio, profitability ratio and dupont analysis and have concluded that MERCK SHARP DOHME PHARMA is the best in terms of overall financial performance and financial performance of PIRIDAM PHARMA is pathetic and the company really need to improve its financial performance from all the angles.

Dr Abhishek Daddich(April 2020) Asst. Professor at IIHMR university jaipur,
Examined the impact of   The COVID-19 pandemic on Indian Pharmaceutical industryThe study took into consideration only secondary data and using 2D diagrams,   and revealed how Indian Pharma companies are relying upon Chinese pharma companies on APIs(ACTIVE PHARMACEUTICAL INGREDIENT) for their production of medicine formulations and suggested strategies for promoting Indian API production with numerical data.

Nayyareh Ayati and two others(July 2020) , School of Pharmacy , University of Tehran , Iran Examined the impact of short and long term impacts of COVID- 19 on the pharmaceutical sector of Iran The study mainly aimed at studying pharmaceutical market crisis due to COVID induced pandemic using secondary data both in short and long term and has pin pointed that Short-term impacts of COVID-19 pandemic includes demand changes, regulation revisions, research and development process changes and the shift towards tele-communication and tele-medicine, long term impact includes industry growth slow down, approval delays and ethical dilemmas

Chinmaya Behera and Badari Narayan Rath (March 2021) , Department of liberal arts , IIT Hyderabad Conducted an event study analysis and Examined the impact of The COVID -19 pandemic and Indian pharmaceutical companies-An event study analysis The study considered secondary data and revolves around stock returns of Indian pharmaceutical companies in the wake of COVID-19 pandemic by employing event study methodology. Study indicate that the average returns of the pharmaceutical sector are positive during the COVID-19 phase

although mixed evidence is found at the company level. This fnding is also robust to alternative model specifications.

Deeksha Rani (October 2020) ,Punjab university , Patiala

The study Examined the impact of COVID -19 pandemic on Indian pharmaceutical industries and the study show cased how pharma companies are responding to the challenges posed by pandemic and pin pointed on the unprecedented changes in supply chain management of medicines and business processes especially because of too much dependency on Chinese companies API and outcome of research paper is that Several key representatives from the pharmaceutical industry and NITI Aayog suggests that fostering the approvals of pharmaceutical infrastructure developments, clearance from the environment ministry and providing tax exemptions and subsidies for the development and promotion of the pharmaceutical industry hubs could all benefit the marketby using only secondary data

Dr Sujith Varma (February 2021), HOD, dept of pharmaceuticals , KMCT PHARMACY college , mempara , kerala state

The study show the impact of COVID 19 impact on Indian pharmaceutical industries Study pin pointed using secondary data that how COVID 19 pandemic has turned out to be a boon in disguise to the Indian pharma companies in comparison with a big blow suffered by other line of industries due to slow down of economy because of pandemic induced lockdown. But at the same time researcher points out that in generic market, India is facing high competition from China for the supply of APIs at lower cost. India imports 70 per cent of the API needs from China. This created a lot of hardship to some of the domestic pharmaceutical firms manufacturing certain key APIs. India's health security was under threat due to heavy dependence on China coupled with shortage in supply of key APIs.

Research Gap

The review of literature clearly identifies the gap, which this study seeks to address. Lot of research studies has been undertaken to study the performance and growth of pharmaceutical firms over the period of time. But the impact of the recent pandemic Covid -19 on the financial performance of these firms still needs to be determined. The study further extends to the post pandemic situation of theses industries.

Statement of the Problem

Novel corona virus from November 2019 created serious health hazards among the masses throughout the world leaving no country as an exception. The global mortality rate map consistently maintained an upward index in which India's contribution was also sizeable, it is from this point, to save the Indian citizens from the clutches of death, the Indian pharmaceutical companies geared up to discover the medicine and vaccination for novel corona virus and had to channelize huge funds towards R&D and merchandise of medicines. This particular phenomenon of channelizing huge funds on R&D and magnanimous merchandise of medicines had its own positive and negative implications on the financial wellbeing of pharmaceutical companies. The positive implications on the financial wellbeing of a company can be by and large attributable to a sharp increase in the merchandising of medicines , due to which the revenue of the companies grown substantially and the negative implication on the financial wellbeing by and large attributable to huge expenditures expended by the company on R&D ie towards manufacturing of vaccinations and other allied activities and therefore there raised the need to study the implications of Covid 19 on the financial performance of Indian pharmaceutical companies.

Scope of the Study

The term consistency is a broad concept, the study is restricted to the consistency based on the financial data, the financial analysis covers a spectrum of analysis of which the ratio analysis is considered for the study and of the plethora of ratios only 4 management accounting rations which are considered. The study is based on the published financial data of past 3 years. The study is confined to top 5 Indian pharmaceutical companies, the selection of the top 5 companies is based on its capital employed.

Objective of the Study
1.   To study the consistency based on financial performance of pharmaceutical companies of India.
2.   To derive the suggestions based on the analyzed data.

RESEARCH METHODOLOGY

Paper is descriptive in nature, the study is confined to the published sources of the data in the website of the companies, the pharma companies are taken as the basis for the study and the comparison is made for 5 best companies. The data is analyzed using the accounting ratios and the standard deviation. From the analysis inference is drawn based on the thumb rule of higher the standard deviation, higher the risk and higher rank, lower the standard deviation, lower risk and lower rank. The formula used is as under:

Standard deviation $\sigma = \sqrt{\frac{(X - meanX)^2}{n}}$

Data Analysis and Interpretation
Indian pharmaceutical sector is expected to grow up to US$ 100 billion, while medical equipment's market is expected to grow up to US$ 125 billion by 2025. Export of pharmaceuticals from India stood at US$ 20.70 billion in FY 2019-2020. From the above facts and numbers, we can infer that the Indian drug manufacturing companies have grown magnanimously during the last two decades and are leaving a strong foot print in the global drug market. All Though there are as much as 30 giant pharmaceutical industries in India, only a few of them are magnanimous in terms of their big manufacturing plant establishments, cutting edge technology, turnover, market share, profitability, solvency, higher dividend payout ratios, EPS etc. In this research paper the top 5 pharmaceutical companies based on their profitability and sales has been considered and 5 such top pharmaceutical companies which have listed at the top in terms of their turnover and profitability are SUN PHARMA, AUROBINDO PHARMA, CIPLA PHARMA, LUPIN PHARMA AND Dr REDDY'S LABORATORIES. These companies have a consistent track record of highest turnovers and profits from a decade whose dividend payout ratio is almost a constant and has almost a constant figure of EPS from the last decade.

Inference
The pandemic created by novel corona virus in November 2019 till today, at the global outset did turned out to be a boon for these pharmaceutical companies to multiply their turnover many folds both by in land and overseas sale of drugs. These companies wasted no time in encashing the situation and have grown exponentially despite the other line of industries are badly hit by the COVID induced lockdown. But in this phase of Covid, majority of the companies was able to do well and their profit earning capacity increased and at the same time some of the companies were not able to do well in terms of augmentation in its profit earning. During this time there was an acute need to study the consistency of these top 5 Pharmaceutical companies as how they have maintained consistency with regard to sustenance of net profit, turnover, Return on Equity and Current ratio sustenance.

CONCLUSION AND SUGGESTIONS

COVID-19 was presumed as a century's opportunity for these pharmaceutical industries; as it increases the demand for prescription of medicines, vaccines and medical devices. This can be seen as one of the main short-term effects of COVID-19 epidemic Induced demand. Panic among the COVID patients induces them to buy medicines, medical devices and allied products whether they are in really need of it or not presuming there would be acute shortage of availability and supply of medicines. COVID morbidities also added fuel to the fire which resulted in increased purchase of medicines by the general public and hospitals which resulted in increased demand to be catered by the pharmaceutical companies. The companies have to take necessary measures to ensure the balance of the medicines they produce and sell in the markets. The post covid scenario of the medicines and the stiff competitions from the different companies across the globe cannot be ignored. The overall conclusions based on the facts is positive for the

present scenario and with the growing population around the world the demand for the pharma products if innovated will be on a positive trend.

ABSTRACT

Fifty-one per cent of individuals are using social media more frequently in 2021 than in 2011. This is notably true for platforms like Facebook, Twitter, WhatsApp, and Instagram. Businesses must comprehend how social media users act and what motivates them to buy things. As a final goal, client pleasure is where all marketing efforts converge. What happened in the preceding two years set the stage for this development. Customers rely heavily on social networks to counteract, involve, and control the effects of social isolation and remote work. Social media, often known as digital media, is a subfield of communication studies distinguished by its focus on the intersection of technology and user experience. Marketers can carry out digital campaigns more effectively thanks to cloud computing, data management, and automation developments. This article will explore how social media influences consumers' actions and what those changes represent for a brand's social strategy.

Keywords: Lifestyle, Emotion, Attitude, Household, Global Market.

INTRODUCTION

The media's expanding clout has impacted customers in India, creating more opportunities for goods that meet their needs. The social networking platform facilitated communication between the two parties. Educating and interacting with brands comes at a far more convenient pace for customers. Marketers can now hone in on each customer's specific concerns and respond accordingly. The way customers live their lives is shifting as a result. The relationship between the company and the client has gotten a boost from social media. Customers can learn more about a company's core beliefs, current offerings, and approach to customer service by exploring the brands' social media presence. Individuals, corporations, and brand marketers have all found the social media industry welcoming and

straightforward. The tactics they employ additionally range widely. Some people believe B2C (Business-to-consumer) social media marketing is about establishing connections. In contrast, others hold that it is more about reaching consumers at the right time in the product lifecycle and in the right market.

Customer Behaviour

A historical perspective reveals striking similarities between social media marketing and "Word of Mouth" marketing, which Kozinets *et al*. (2010) define as "The international influence of consumer-to-consumer communication by professional marketing strategies." Similar to other forms of marketing, word-of-mouth promotion has developed over time. Customers used to go to physical stores to buy goods they planned to order online before the advent of social media. Customers can now complete their purchases in less time than it takes to send a tweet. And they want the same level of service from the seller or marketer even after the product has been purchased, in the form of after-sale support. Advertising on social media and other digital platforms has simplified the buying process for consumers. Customers can now shop from anywhere in the world, not just within their own country, thanks to the expansion of e-commerce, in a way that influences either the customer's ability to pay or his decision to buy the product. But what does consumer behaviour entail regarding how customers analyse the market and make decisions? Customers in the modern era are regular people who are only emotionally invested in a product or service if they are swayed on every level (both internally and outside). Influences within the consumer's control include things like their financial situation, personal preferences, social circle, and ability to purchase the goods. Price, brand, quality, quantity, and other external variables are explored. What, when, how, and where of a customer's purchase choice matters. The primary duty of any marketer is to study and comprehend the psyche of their target demographic.

Objectives
1. To understand the concept of consumer behaviour.
2. To study the influence of customer behaviour through advertisement.
3. Factors determining the lifestyle of the consumer.
4. To study the significance of the positive effect of social media.

REVIEW OF LITERATURE

People who buy and use the goods and services on sale are known as consumers. Purchasing patterns among consumers can take time to decipher. The transparency and clarity of information have significantly impacted the dynamic process. Therefore, looking at what factors prevent interested parties from becoming buyers or cause current purchasers to hesitate before making a repeat purchase is essential. As a result, the consumer decision-making process reveals important characteristics of individual consumption behaviour. As reported by Sternthal and Craig (1982) "Social Media Ads and the Impact on Consumer Intention to Buy," by Sriram K V, Namitha KP, and Girish B Kamath. The way people feel about commercials is crucial to their effectiveness. Previous research has sought to identify what factors lead to favourable customer views of internet advertising, and this correlation has been confirmed by subsequent studies (Nasir *et al*., Citation 2021). This result demonstrated a significant positive relationship between online advertising and how consumers felt about it. It was also shown that all of the sub-dimensions of customer perception positively and substantially affected internet advertising and its dimensions (Haur *et al*., Citation2017). Persuasion is at the heart of advertising. To make an effective ad on social media, it is essential to understand what features of an ad can persuade a user (Ahmad *et al*., Citation2019; Lee & Hong, Citation2016). Consumers' attitudes and preferences regarding a particular brand of washing machines in Udumalpet were studied by Suganthi.V. and Mohan S. (2014). Sixty participants were surveyed using a simple random selection technique. Quantitative evaluation Chi-square tests of association were run on the data, and the results showed no correlation between the respondent's age, education level, marital status, or income and their level of satisfaction with the product. Consumer behaviour is affected by social media marketing, according to Anvi Jain and Preeti. Social media marketing aims to increase sales by educating and entertaining consumers so that they feel

more inclined to make a purchase. Brand loyalty and increased purchase intent are two beneficial results of customer interaction. Long-term success depends on the quality of the relationships built with customers, which directly results from brand loyalty. Kim and Ko (2012) found this to be the case. By utilising channels such as online communities, interaction, content sharing, accessibility, and credibility, social media marketing aids in establishing and maintaining fruitful relationships with target audiences. Brand value is significantly affected by these social media advertising tools. (As' ad, Alhadid, 2014) Customers' purchase, loyalty, and involvement intentions can all be affected by the quality of the relationships they have with a company, which is why Wibowo *et al.*, 2021 looked at both SMMA and CE to gauge that quality. Their findings suggest that SMMA and CE each have a substantial role in shaping the quality of romantic partnerships. They have also stressed the significance of using the appropriate marketing content on SNS to obtain long-term business success. Their research proved the importance of excellent relationships by showing that consumers are less likely to buy competing products if the marketing manager assists them in identifying with the company's brand culture.

Suggestions

1. When purchasing, consumers should ensure that the product has been tested for quality and reliability and has been officially certified.
2. To keep consumers interested, businesses must consistently introduce novel goods and services.
3. Customer service and support that ends up convincing buyers.
4. maintaining the product's reputation for quality, quantity, price, and dependability.

CONCLUSION

According to the evaluations above, you should ensure that your Price, Features, and Payment choices are safe. Discounts, seasonal offerings, holiday sales, and product quality all have a role in determining whether or not a customer would make a purchase. Because of the dynamic nature of social media, social proof is becoming an increasingly important part of consumers' decision-making processes. 51% of consumers say they consult social media evaluations before purchasing. One or two unhappy reviewers can turn off a potential buyer. The most expensive television commercial can't compete with the free resources provided by social media. Consumers voice their opinions about brands and services on social media and review sites. Customers are more likely to trust reviews written by those who have used the product or worked with the company in question in the past. Marketing on social media is having a beneficial effect on consumers since it makes it easier for them to find what they're looking for and saves them time and money in the process. As a result, consumers' daily routines are shifting as they have access to products worldwide and enjoy lower pricing than ever before. The costs of various goods can be compared. Social media marketing lets businesses reach and interact with their target audience. Anytime, anywhere, the client can access the supplier's website and communicate with them.

ABSTRACT

Retail and Wholesale: the former is the trade of goods and services to end users and latter is trade to retailers or institutional customers. Retailers purchases goods from either manufacturer or from wholesaler in large numbers and sells the same in small quantities to end users for a profit margin. In the chain of distribution from manufactures to end users, retailers is the last link who sells goods to final users. The objective of this research is to study customer's insight and preference towards Departmental Stores.

Keywords: Customers, Perception, Preference, Retailers

INTRODUCTION

Store in common is known as a place where inventories are stored. A Departmental Store is a retail outlet which offers various categories of products to consumers. The main motto of a departmental store is to provide wide variety of goods under different product categories at a single place and also to provide qualitative goods and services to their customers. The concept was first started in France Department stores were started with the main intention of providing products to customers at a single place rather than them visiting multiple stores.It has multiple departments based on different types of goods sold. Products include household items, groceries, packed food, cutlery, cosmetics, medicines, clothes, toys, electronics, furniture and much more. Presently Departmental stores are focused towards offering personal shopping experience to their customers for which they are also expanding their presence in online to make shopping easier for their customers.

REVIEW OF LITERATURE

P.Jayanthi, C. V.(2018),The article studied the customers shopping behavior and was objected to check the reasons for departmental stores preference of customers. The author suggested that departmental stores must increase their sales customer to minimize the waiting time and they must also allow sufficient parking facilities. Dr. R.Venkatesh, D. Sripriya (2016),In this paper, the authors study factors that influence the customers towards purchase of household articles in a particular town and their needs at the venue of purchase. The authors have opined that the customers would like to have the physical experience of touch and feel of the product before they purchase and customers are satisfied and they prefer departmental stores that other stores. K. Jegan, D.K.(2016), The article studied the perception of consumers to purchase from different retails sectors and also the factors that effects such purchase. The authors have concluded that Departmental stores are at advantage compared to other retail sectors in terms of locational factors, cost structure, customer acquaintance.

M R Chandrasekhar, S.D.(2021), : In this paper, the authors have studied customers opinion on various factors considered for departmental store. The authors have opined that the departmental stores must intensively work on advertising their stores to reach large numbers of customers. The authors have also given suggestions to increase their sales. Ms N Sasikala, M. R.(2012),: The authors have studied the demographic profile of respondents and their preference and perception on the retail shopping. The findings of the paper exhibit that most of the customers were females and suggests that the stores must sell at reasonable price to attract their customers. M Nithyapriya, H. G.(2016), : The study recognized the profile of customers and determine buying behaviour of consumers in the city Coimbatore. The authors have suggested retailers to continuously review the customers satisfaction level and make efforts to improve condition. The article has collected the data from primary source.

Mr.S. Venkatachalapathy, M.A.(2021), : This paper studies the satisfaction level of consumers on departmental stores and discover the problems usually confronted at departmental stores. The results shows that most of the customers belonged to middle age and they spent their time once in month. P. Annal Lourdhu Regina, R.I.(2019), : The paper studies customer's opinion and ideas on various aspect like price, quality and services provided by departmental stores. It also checks the after sales services given by the stores. The authors have also studied the problems faced by the customers. The findings of the study shows that majority of customers were satisfied with the services.

Objectives of the Study
- The study customer's insight and preference towards Departmental Stores
- To investigate the factors that the customers consider to purchase household items from departmental stores.
- To recognise the consumers thoughts and viewpoint about the price, quality and services provided by the departmental stores.

Need of the Study
- To overview the exploration of Departmental store.
- The main aphorism of this research is to know the customers preference towards departmental stores.
- To explore briefly towards departmental store in day to day life.
- To get to know the purchasing behavior in departmental stores by the customers.

RESEARCH METHODOLOGY

The current study is based on primary data. The data required is been collected through questionnaire from the customers in view to study the customer's preference and perception as regards to departmental stores. Data required for the study has been retrieved from 106 respondents. The questionnaire contains question like social profile, shopping behavior etc. Also the respondents include both male and female.

Poornima and Reshma

Data Analysis and Interpretation

The data collected is represented in the form of pie chart. A brief analysis is done and interpretation is given as follows:

Interpretation

As per above the figure 1, it can be observed that among all the respondents more than 61.3% respondents are female. And 37.7% of them are male respondents.

Interpretation

The data was collected from various age groups. From the above figure 2 it is concluded that more than 75.5% of the respondents belongs to the age group of 18-30, 17% of them belongs to the age group of 31-50 and 7.5% of them belongs to the below 18 category.

Interpretation

per figure 3 we can see that the respondent income varies from each other. More than 44.9% of them earn the income of below 25000. 29.6% of the respondents earn the income of RS 25000-50000. 17.3% of the respondent earns the income of above 75000. And only 8.2% of the respondent earns the income of Rs 50000-75000.

Interpretation

per figure 4 the data says the qualification of the respondents varies from one to other. More than 60.4% of them are undergraduates. 26.4% of the respondents qualified as post graduate. And 13.2% of the respondents are qualified as PU.

Interpretation

The data collected from the respondent are shown in the above figure 5. More than 33.3% of them visit the departmental store on weekly basis. 24.8% of them visit the departmental store of monthly basis. 17.1% of the respondent visits the departmental store rarely. 15.2% of them visit the departmental store daily. And 9.5% of them visits the departmental store monthly twice.

Interpretation

per figure 6 we can say that 37.1% of them gave ratings of 3 out of 5 which means they are little satisfied. 29.5% of them gave the rating of 4 out of 5 which means they are satisfied very good rather than 3 out of 5. And there is a tie between the ranking of 2 and 5, which means some respondents are satisfied extremely and some or not.

Interpretation

per figure 7 displayed the customer expectation towards departmental stores are as follows. More than 60.4% of them expect to provide offers and discounts. 38.7% of them expect to be available or opened 24*7. 33% of them expect to have door to door delivery option. And 29.2% of the respondent expects to provide parking facility in the departmental stores.

Interpretation

As per Fig 8, the data collected from the respondent says that 66% of them choose the factor of quality of products to be provided. 39.6% of them choose the factor of fair price to be allotted while purchasing. 32.1% of them choose the factor of wide range of products to be available in the departmental stores. 30.2% of them choose the factor of customer service when the products have been purchased. And 28.3% of them expect or choose the factor of fair value.

Interpretation

As per Fig 9, the data collected from the respondent says that 43.4% of them face the problems of waiting for longer time. 36.8% of them face the challenges of crowded aisles. 34% of them face the challenges of inadequate assistance from the staff. 33% of them face the challenge of stock items. 23.6% of them face the challenge of confusing store layout.

Interpretation

The data collected from the respondents in the above figure 10 says that more than 60.7% of them have not faced any issues with the behavior or service rendered by the departmental store staff. And 39.3% of them states that they have faced issues with the behavior or service of the departmental store staff.

Interpretation

As per Fig 11, the data collected from the respondent says that the reasons behind visiting departmental store are for many purposes. 57.9% of them visit the store for groceries. 50.5% of them visit for clothing and fashion. 32.7% of

them visit electronics. 31.8% of them visit for beauty and cosmetics. 23.4% of them visit the departmental store for furniture and home decor. And 19.6% of them visit the departmental stores for the purpose of toys and games.

Findings of the Study

- The study says that customers prefer to visit the departmental store and expect a wide range of choices has to be provided.
- More than 75.5 percent of them belong to the age group of 18-30.
- More than 61.3% of the respondents are females and whereas 37.7% of them are male respondent.
- More than 37.7% of them are slightly satisfied the departmental store.
- 60.7% of the respondents have not faced any kind of issues with the departmental store staff also 39.3% of them have faced issues with the departmental store staff.
- Majority of the respondent income are below 25000.

CONCLUSION

The departmental store is convenient for the customers and they expect it to be available 24*7, also to render customer services, and make offers and discounts for the products they have purchased. Also the customer expect to charge a fair value for the products they have been purchased.

ABSTRACT

This research paper describes a cybercrime investigation on e-commerce social engineering fraud, focusing on intellectual property (IP) infringements that happen from data exfiltration, data breaches, and trade secret exfiltration, which in turn have a direct impact on trademark infringements, brand infringements, and different modes of IP damages. Advancing an e-crime investigation procedure and framework to protect IP assets can be made possible by constructing different approaches like a systematic approach, an analytical approach, an audit approach, data protection impact assessment, and a historical evidence collection approach for reactive crimes. Constructing a proactive cybercrime-hunting approach can help to remediate IP violations. The advanced legal sciences modules incorporate a step-by-step process identification of the evidence, collecting, preservation, safeguarding, examination, documentation, and presentation. Measurable scientific methods can improve computerized verification and optimize complex examinations. Case studies on e-crime in e-commerce, which has the potential to damage IP assets through social engineering fraud (SEF) reveal the different modes of cybercrime and their possible effects on individuals and corporations. The universal characteristics of e-crime make collecting digital evidence for e-commerce crimes a challenging task. Digital evidence collection has various challenges, including admissibility, rapid technological improvements, and practical and lawful difficulties. E-crime investigation plays a pivotal role in investigating IP infringements in cyberspace which arises through data breaches which jeopardizes further trademark infringement, trade secret exfiltration, patent infringement, and various other IP damages. The e-crime investigation procedure lays out a mechanism for reactively implementing detective control, corrective control, and proactively laying

out a mechanism for implementing deterrent controls, preventative controls, and other compensatory controls in e-commerce Social Engineering fraud IP infringements.

Keywords: Digital forensics, Social Engineering Fraud, Ecommerce, cyber-crime, Forensic investigation, Investigative Forensic Journalism

INTRODUCTION

Ecommerce is a combination of multiple integrated businesses such as manufacturing, logistics, supply chain management, and digital marketing, which includes all sorts of FinTech transactions with the assistance of the Internet[i] platform[ii]. Multiple sources of business assistance exist betwixt vendors, merchants, buyers and customers, sellers, and other third-party service partners, and multiple sources of technologies like cloud, mobile, IoT, artificial intelligence, etc. are also involved. Various processes, like operational, technical, technological, legal, and policy gaps, pave the way for bad actors to perform various sorts of crimes damaging IPR. Data is the primary source for committing a crime. Therefore, it has to be protected in this online business, which indirectly damages various sources of IP for an organization like trademarks, trade secrets, patents, etc. In many ways, this data exfiltration infringes on e-commerce IP like trademarks, patents, trade secrets, and data breaches due to a lack of control measures and cyber security policy lacunae. Threats to damage intellectual property through data leakage are possible internally within organizations through process non-compliance and theft. Internally, supply chain activities involve products of transshipments and trans-handoff between warehouses from vendors, merchants, sellers, delivery partners, and other third-party sources. Internally, under the roof process, noncompliance occurs by bad actors alongside data exfiltration and trade secret exfiltration. In a country like India, where cash plays a major role in business out on the road, scams happen by delivery agents and, in some cases, by abusive customers. The fraud motto of bad actors is not only for their financial benefit but also for damaging IP.

In many circumstances, bad actors are involved in espionage and sabotage, together with data exfiltration, trade secret exfiltration, impersonation, identity pilferage, and fraud and theft through many forms of cybercrime. These abusive activities will directly affect intellectual properties like trademarks, brand infringement, data leakage, and, in some cases, damaging copyrights, software patents, utility patents, process patents, product patents, etc. when it comes to public global forums. The cyberspace has no unique rules across the world, and this paves the way for social engineering fraud to damage IP across borders through data leakage. This article focuses on the protocols to be followed in a cybercrime investigation in the e-commerce industry. The investigation involves collecting the evidence in a forensically sound manner with the help of various tools and techniques, and a forensic report is drafted using the investigative forensic journalism method. These forensic reports go to legal, litigation, law enforcement agencies (LEA), and finally to court proceedings. All digital evidence in the form of technical logs and traces is to be converted into legal terms like facts of the case, men's rea, modus operandi, cause of action, parties to the case, findings, substantial evidence, prima facie in law enforcement, and court-understandable language connecting facts. Evidence with corrective Implementation of internal and external corrective controls and other controls like preventive controls, detective controls, and deterrent controls has to be carried out proactively.

PROBLEM AREA Lack of control measures, detective and corrective mechanisms for intellectual property damages caused by social engineering fraud (SEF) in the e-commerce industry.
PROPOSED SOLUTION cybercrime investigation framework as a control methodology to be included in the cyber security policies to safeguard intellectual property infringement in cyberspace.

RESEARCH QUESTION
a.   What laws and arrangements have been put in place in India to combat cybercrime in which there are intellectual property infringements, and how do web-based corporate enterprises handle these security issues?

b.   What are the prospective research directions and management consequences in the area of cybercrime and e-commerce intellectual property damages?

c.   How can a business prevent the most prevalent types of cybercrime, such as phishing emails, malware infections, phishing calls, and other potential e-commerce social engineering fraud that directly infringes on intellectual property?

d.   How could the challenges associated with identifying, prosecuting, and preventing cybercrime causing intellectual property damages be overcome?

RESEARCH OBJECTIVES

a.   To analyse the cyber security issues faced by e-commerce enterprises causing intellectual property infringement and the laws and policies implemented in India to regulate cybercrime.

b.   To evaluate the effects of cybercrime on managers and to determine the future paths for study in the area of cybercrime and intellectual property infringement in e-commerce.

c.   To research the difficulties in detecting, prosecuting, and preventing cybercrime causing intellectual property infringements and to provide ways to overcome them.

d.   To evaluate the legal measures taken against cybercriminals in India and the legislation implemented to control cybercrime in e-commerce and safeguard intellectual property infringements

CHALLENGES IN INTELLECTUAL PROPERTY INFRINGEMENT IN CYBERSPACE

Identify the person of interest, bad actor, or suspect. Tracing the geolocation, confirming the Act of Guilt (Mens Rea), and tracing the parties to the case are the primary challenges in a cybercrime that causes intellectual property infringements. Since all social engineering frauds are being operated remotely from cross-jurisdictions using VPN's advanced forensics tools and techniques, highly skilled forensics investigators are the need of the hour. Proving the potential impact, damage, or loss to law enforcement agencies, or in the court of law, reproducing the fact, damages, needs high-tech tools and skills. In today's era, proving the cybercrime infringement and recognizable offense/blue collar crime with Mens Rea and providing substantial evidence with Primafacie has become a tug of war.

SOURCES OF SOCIAL ENGINEERING FRAUD IN CYBERSPACE

In the cyber space, bad actors mostly attack through social media channels like Facebook, Twitter, Instagram, LinkedIn, YouTube, etc. by using multiple fake social media channels, social media pages, and social media groups. Bad actors rely on fake websites and fake domains for fintech transaction routing to a payment gateway in a hidden way. Messaging channel platforms like WhatsApp, Signals, Mobile Messages, and Telegram also act as the source of attack vectors. Bad actors do data exfiltration, trade secret exfiltration by espionage, sabotage, insider threats, and external bad actors do impersonation with identity theft through attack vectors in internet layers like the Surface Web, Deep Web, and Dark Web, which have multiple social media channels, messaging platforms, posts, blogs, forums, etc., which make it very difficult to track the person of interest or parties to the case involved in the act of guilt. Bad actors play the act of trade secret filtration, data filtration, reputation damage through data leakage by espionage, and sabotage, which causes data breaches, trade secret leakages, and impacts intellectual property like trade mark infringement, brand infringement, and data breaches through this social engineering fraud.

CASE STUDIES: PRESENTATION OF ECOMMERCE CYBER CRIME CASES

Here are some cybercrime case studies involving e-commerce that occurred between 2018 and 2023:

Fraud at the Pune Citibank MphasiS Call Center: In 2018, former employees of MPhasiS Ltd's Msourc E BPO cheated US Citibank customers out of 1.5 million dollars. The violation was committed via "unapproved access" to the clients' "Electronic Record Space." This situation raised questions about the competence of "information security" and fell under the category of "digital violations." In addition to Sections 43(a) and 66 of the Information Technology Act of 2000, the defendants were also charged with violating Sections 420, 467, 468, and 471 of the Indian Penal Code. The act entailed unlawful access to clients' electronic accounts, so the court determined that it constituted cybercrime and should be prosecuted under the IT Act. The accused, who were once employed at MphasiS BFL's Pune Call Centre, were given instructions to have cordial interactions with international Citibank callers who had inquiries

67941

Prabhu Rajasekar and Vezhaventhan

regarding their credit cards and bank accounts. To prevent them from writing down duplicate account numbers, representatives entering and departing the call centre were inspected. The accused were implicated under sections 420, 467, 468, and 471 of the IPC,1860, as well as under sections 43(a) and 66 of the IT Act 2000.

THE CYBERFORENSICS AND E-DISCOVERY STRATEGIES USED IN THIS CASE ARE

a. The investigators captured the computer systems at the call centre using a write-blocker. This guaranteed the integrity of the original data.
b. Using a range of technologies, the detectives analysed the data from the call centre's information pricing systems. This includes tools for tracing data transfers, retrieving deleted files, and detecting viruses.
c. The experts compiled a summary of their findings. The prosecution used the report to convict the con artists.

MEESHO CASHBACK FRAUD: In 2021, there was a cybercrime called the Meesho Cashback Fraud. The main elements of the fraud were the bogus Meesho cashback websites that promised users money for Meesho purchases. However, when visitors submit their personal information on these websites, bad actors scam the customers. As a result of this extortion, the clients of Meesho lost around 100,000 INR (about $13,000).

DIGITAL FORENSICS AND E-DISCOVERY TECHNIQUES USED IN THIS CASE ARE

* The factfinders were able to recover an image of the Meesho servers by using a write blocker. This guaranteed the integrity of the original data.
* Using a variety of tools, the experts reviewed the data obtained from the Meesho servers. This includes tools for tracing data transfers, retrieving deleted files, and detecting viruses.
* The experts compiled a summary of their findings. The prosecution used the report to convict the con artists.

EBAY INVOICE FRAUD: In 2022, an eBay invoice fraud cybercrime occurred. Sending emails that seemed to be from eBay was part of the hoax. The emails contained links that, if activated, opened a fake eBay invoice. The bill would refer to the victim's debt to eBay. However, if the casualty paid the fee, the cybercriminals would take possession of the assets. As a result of this fraud, nearly 250,000 eBay consumers lost their money, of $32,500.

THE CYBERFORENSICS AND E-DISCOVERY STRATEGIES USED IN THIS CASE ARE

* The investigators employed a write-blocker to take a photo of the victims' PCs. The company guaranteed the integrity of the original data.
* The experts dissected the information taken from the subjects' PCs using a variety of tools. This includes tools for tracing data transfers, retrieving deleted files, and detecting viruses.
* The experts compiled a summary of their findings.The prosecution used the report to convict the con artists.

THE FOLLOWING LEGAL ACTIONS WERE TAKEN AGAINST THE ABOVE-STATED CASES

Two individuals involved in the Meesho cashback extortion and eBay invoice fraud were apprehended by the Delhi Police's cybercrime unit. Two people, Rahul Verma and Aman Kumar, are thought to be responsible for the crime. The perpetrators of the Meesho cashback fraud and the eBay invoice fraud were obligated to provide restitution to both the accused and the victims under Sections 66C, 66D, and 420 of the Indian Penal Code (IPC) and also under Section 66F of the IT Act of 2000. The court of law calculated compensation in accordance with the amount of money the victims lost.

The Information Technology (Amendment) Act of 2008 is the law governing this e-crime legislation. This legislation revised the IT Act of 2000, which included provisions associated with e-crime. Among the rule's major implementations are:

i.   Section 66C: This clause makes it illegal to cause the delivery of property by fraud. Under this clause, the perpetrators of the Meesho reimbursement fraud and the eBay invoice fraud were prosecuted.
ii. Section 66D: Fraud is now considered a crime under Section 66D. Additionally, this approach was utilized to convict the perpetrators of the Meesho payback scam and eBay invoice fraud.

iii.   Section 66F: This section outlaws cyberstalking. Even though Meesho payback scammers and eBay invoice fraud were not charged under this clause, they might have been if they had followed their victims around with private information.

LEGAL PROVISIONS FOR PROTECTING INTELLECTUAL PROPERTY INFRINGEMENTS IN CYBERSPACE

i.   Introduction of recent new amendments in the Indian Penal Code, 1860, which is renamed to Bharatiya Nyaya Sanhita 2023; the Criminal Procedure Code, 1973, renamed to Bharatiya Nagarik Suraksha Sanhita (BNSS) Bill, 2023; the Indian Evidence Act, 1872, renamed to the BharatiyaSakshya (BS) Bill; and the 2023 New Bill on Digital Personal Data Protection Act, 2023 brings many provisions to accept digital evidence and paves the way for considering digital evidence as primary evidence.

ii.   The admissibility of electronic records as per Section 65B (4) of the Indian Evidence Act, 1872, are Section 65A and Section 65B, namely subsections 65B (2), 65B (3), and 65B (4), and also Section 14 of the Information Technology Act of 2000 for securing electronic evidence.

iii.   Section 499, 500 of the Indian Penal Code for Defamation, Section 416 of the IPC for Impersonation, Section 40 of the IPC for Offense, and its damages

iv.   Section 28(1), Section 27(2), and Section 134(c) of the Trademark Act, 1999, provide a right to get relief against the infringement of trademarks in accordance with the provisions of the Act. The acts of trademark infringement under Section 29 and passing off under Section 27 can raise a legal cause of action, which may be pursued by filing a lawsuit under Section 134. In light of the facts gathered, we need to establish the presence of several factors, such as loss of reputation, possibility of confusion or deception, misleading designation of origin or association, fraudulent advertising, and others, in order to substantiate our claims. The Trademarks Act of 1999 has two key provisions, namely Section 27, which addresses the concept of passing off, and Section 29, which deals with infringement.

v.   Section 66D for impersonation and Section 66C for identity theft of the Information Technology Act of 2000.

PROCEDURAL STEPS IN CYBER CRIME INVESTIGATION AND LAW ENFORCEMENT ACTION

i.   As a first step, a cybercrime investigation starts with reactive measures, implementing detective control, investigating an intellectual property infringement by performing cybercrime intelligence, building a profile as a forensics investigation report, and collecting all sources of evidence.

ii.   Secondly, based on the use case, modus operandi key words, and watch words through cybercrime research, we need to set up a mechanism for manual analysis, human intelligence, and open source intelligence using freeware tools and techniques. Once we find a mechanism to investigate reactively, this has to be built as proactive preventive control, deterrent control, converting the investigation methodology embedding into an AI/ML expert system, and developing an algorithm during the cybercrime research to hunt all ongoing true positive cyber threats.

iii.   Thirdly, this proactive measure of preventive control and deterrent control by detecting ongoing cybercrimes that may potentially impact has to be identified proactively and necessary corrective controls taken through AI/ML model expert systems developed and configured as a software-as-a-service (SaaS)-based platform.

iv.   In cybercrime investigation during intelligence, research, and hunting, various forms of evidence like direct evidence, documentary evidence, material evidence, and circumstantial evidence are collected using the following 5 approaches:

a. A systematic approach to the collection of evidence is the process of conducting an interview, like the PEACE, REID technique, or Wicklander-Zuwalski (WZ) method of interview, which involves gathering comprehensive information by addressing the fundamental synergy of questions of how, when, where, who, why, and what (often known as the 5W+H) with the geographical location, date, and timestamp of the incident. Additionally, it entails thoroughly reviewing all audit reports and prevailing industrial legislation pertaining to governance, risk, and compliance. This helps to understand the facts of the case.

b. The analytical approach employed in this study involves an analysis of the use case and modus operandi through the utilization of business analytics, data analytics, and data science techniques, with a focus on identifying data

67943

trends and patterns of a crime's past, current, and future projections relating to the use case and confirming the modus operandi.

c. Audit evidence helps to understand the gap and cause of action by performing a risk management framework and various integrated forensic audits like process, operational, functional, and technical audits to identify gaps and find the cause of action. The Risk Management Framework and the execution of an integrated information systems audit are employed to ascertain the MensRea, potential impact, damage, loss, financial theft, loss, issue, problem, root cause of the issue, and solution in relation to governance, risk, and compliance (GRC). The Risk Management Framework application includes the utilization of a risk register, which comprises many key stages: risk identification, risk analysis, risk evaluation, risk treatment, and risk monitoring. This will aid in the compilation of audit evidence and the identification of any deficiencies or gaps both internally within the organization and externally in the cyber space.

d. Performing a data protection impact assessment to find the data security lacuna and develop a data protection policy. The purpose of conducting a Data Protection Impact Assessment (DPIA) is to identify any deficiencies in data control, establish appropriate security measures, and determine the necessary controls to be implemented at the data level.

e. Finally, collect all historical evidence, like computer forensics, mobile forensics, IoT forensics, semiconductor chip-off forensics, open source intelligence, social media forensics, email forensics, network forensics, database forensics, multimedia forensics, and biometrics forensics, and collect various forms of evidence that are left as traces.The historical approach employed in this investigation involves the utilization of vendor AI-driven tools, open source tools, manual analysis, and human intelligence. These methods are employed with cross-examination to confirm the presence of true positive artifacts in the evidence and to determine the parties involved in this case, the cause of action, the person of interest, the victim, substantial evidence, and the prima facie elements of the case.

MECHANISM OF EVIDENCE COLLECTION IN IP INFRINGEMENT CYBER CRIME

The mechanisms of evidence collection include direct evidence, document evidence, material evidence, and circumstantial evidence of the facts of the case.

a. All the evidence collected is to be substantiated by verifying that the evidence collected is only true positive evidence by performing cross-examination in the cybercrime investigation lab through manual analysis examination, open-source tool and technique examination, and AI/ML-based tool and technique examination to prove the prima facie.

b. Building the facts of the case has three steps: collection of evidence, recording psychological factors of the crime scene, and recording panchanama, which is the post-crime effect of the crime scene, alongside the chain of custody (condition of evidence, who collected it with a date and timestamp, and who is currently holding it), and the chain of evidence (order and manner of evidence handled) for law enforcement actions.

c. Law Enforcement Referral Action Protocols like filing a Community Service Report (CSR), a police complaint, a First Information Report (FIR), and a Charge Sheet are to be given with an investigation report and further moved into court for prosecution and conviction.

d. The zero FIR process for cross-jurisdiction FIR filing, along with raising an online police complaint to the Indian Cyber Crime Coordination Center of the Ministry of Human Affairs Cyber Crime, expedited the process of law enforcement actions.

e. A corrective control mechanism to be implemented within the organization, both internally and externally, in the government, public sector, and private sector, like TRAI, IANA, ISP, cloud service provider, and NPCI, controls

f. Evaluate the corrective controls statistically, studying through data analytics andforecasting through data science, and evaluating key risk indicators vs. key performance indicators on reactive measures vs. proactive measures as continuous monitoring.

g. Implementing defense-in-depth controls to protect intellectual property in the Internet and cyberspace, like preventive controls, deterrent controls, detective controls, and corrective controls, by continuously monitoring all social engineering frauds in cyberspace to protect intellectual property damages and all FinTech crimes

h.　This diligent cybercrime investigation will help the Law Enforcement Agency (LEA) conduct easier interrogation and enable the preparation of a comprehensive cybercrime investigation report to prove the prima facie.

i.　All evidence should be generated with a master copy and a working copy, employing authorized tools and processes alongside the forensics investigation report, annexing the chain of custody report, and the chain of evidence report.

j.　The Cyber Crime Investigations report should be written in an active voice and narrative in a sequential presentation that is to be conclusive and supported by augmented data. It should address internal investigations within business and propose internal corrective controls, as well as external investigations in the cyber space and recommend external corrective controls through collaboration with law enforcement agencies and courts. The Cyber Crime Investigation report should have Fact of the Case, Modus Operandi, Mens Rea, Parties to the Case, Cause of Action, Findings, Substantial Evidence, Primafacie, and conclude with recommendations, suggestions, and a prayer from technical logs to be converted in a legal language with forensically sound evidence.

CORRECTIVE REGULATORY MEASURES

Corrective regulatory protection from intellectual property Infringement on the internet can be classified into two categories: internal corrective control and external corrective control.

INTERNAL CORRECTIVE CONTROL WITHIN THE ORGANIZATION

i.　**ADMINISTRATIVE CORRECTIVE CONTROL**: Internal managerial corrective control refers to the implementation of organizational policies that are not adequately monitored. These procedures encompass the evaluation of governance, risks, compliance, and the regular conduct of forensic auditing. Additionally, the practice of assessing governance, risk, and compliance (GRC) is done promptly and without delay.

ii.　**Technical Corrective Control**: Internal technical corrective controls include various measures such as threat hunting, threat intelligence, threat research, vulnerability assessment, penetration testing, and addressing other technical vulnerabilities in infrastructure, coding, and cyber security to enhance security.

iii.　**Remedial Corrective Control**: Internal Remedial has two parts: Relief Corrective regulation refers to the steps taken within the firm to address and rectify any losses incurred. These steps may include conducting interviews and interrogations, recovering losses as clawbacks, and punishment like separating employees involved in malpractice and closing accounts of abusive customers, as well as seller accounts and other corrective actions.

EXTERNAL CORRECTIVE CONTROL IN THE CYBERSPACE

I. ADMINISTRATIVE CORRECTIVE CONTROL: One potential approach to resolving the matter of IP damages caused by data exfiltration on the internet is the implementation of external managerial corrective measures. These measures involve the identification of individuals engaging in malicious activities, supported by solid evidence and monitoring their online activities. By doing so, it becomes possible to refine existing policies, rules, regulations and laws governing the internet. This approach aims to mitigate the risks associated with the exfiltration of data and safeguard IP. Public sectors and government organizations, such as the Indian e-Crime Coordination Centre (IeCC), the National Payments Corporation of India (NPCI), the Reserve Bank of India (RBI), the Telecom Regulatory Authority of India (TRAI), the Internet Assigned Numbers Authority (IANA), the National Cyber Crime Cell, Interpol, the legislature, and the judiciary, should possess knowledge of prevailing trends and patterns of Modus Operandi. This awareness guides the implementation of managerial corrective steps in strategies, rules, regulations and laws.

II.TECHNICAL CORRECTIVE CONTROL: Managerial measures such as the takedown of impersonating entities, brand violations, trademark violations, fake URLs, fake websites, fake social media pages, bad actor cell phone numbers, bank accounts, and email addresses should be executed. Additionally, robust internet security controls and exfiltration of data checks should be put in place to protect against potential threats on the internet. Furthermore, it is crucial to incorporate effective awareness into training, awareness, and education programs to mitigate the impact on vulnerable individuals.

Prabhu Rajasekar and Vezhaventhan

III.REMEDIAL CORRECTIVE CONTROL: It involves the creation of a digital forensics investigation report that includes factual information about a case involving a blue-collar crime and the mental state of the perpetrator, known as Mensrea. This report provides evidence supporting the occurrence of various IP damages, such as brand infringement, trademark infringement, impersonation, identity theft, defamation, social engineering fraud, and financial loss. Create a comprehensive profile and submit the investigation report to law enforcement agencies for the purpose of implementing remedial measures like punishment and relief measures through court trial, prosecution, and conviction. These measures aim to establish deterrent controls, provide continuous observation, and execute checks and balances, to address all cybercrimes related to data exfiltration and IP damages in electronically connected environments. The e-Crime Investigation Report should encompass all instances of cybercrime, ensuring that it adheres to the principles of secrecy, uprightness, and availability (SUA), and there should not be any tampering with evidence like disclosure, alteration, and destruction (DAD). This report should be comprehensible and acceptable to Law Enforcement Agencies (LEA) and courts, enabling the filing of a Community Service Register (CSR), a police complaint, and subsequently converting it into a First Information Report (FIR). The report should also facilitate the creation of a charge sheet, which can be utilized in the prosecution and conviction of the perpetrator during the trial. This comprehensive approach aims to protect IP assets, facilitate the remediation and recovery of damages, and impose appropriate penalties and punishments. This encompasses several forms of control, including preventive control, deterrent control, investigative control, remedial measures, and compensatory measures that are compensatory in nature and work in conjunction with each other to protect intellectual property infringements on the internet.

INFERENCE FROM THE ABOVE CASE STUDIES

i. The modules of advanced legal sciences encompass several components, such as the identification, collection, preservation, safeguarding, investigation, documentation and presentation of evidence. The acquisition and evaluation of digital evidence at every level are crucial in cases of cybercrime pertaining to e-commerce.

ii. Standard forensic science procedures, such as fingerprint analysis, hand geometry analysis and other biometric forensic and cognitive analyses, have the potential to augment digital evidence. The aforementioned statement underscores the need to employ recognized procedures from the field of legal science in the context of complex criminological investigations.

iii. Case studies investigating instances of cybercrime in the realm of e-commerce provide valuable insights into the diverse manifestations of cybercriminal activities and their impact on individuals and enterprises. The need to employ advanced criminology and e-discovery methods to collect and assess digital evidence in such scenarios is further elucidated by these contextual studies.

iv. The contextual studies offer an illumination of the process involved in acquiring and evaluating intricate evidence in such instances through the use of computerized criminology and e-disclosure methodologies. The potential solutions put forth to address these concerns may potentially give rise to further challenges pertaining to the preservation of the rule of law and the protection of fundamental rights.

v. Hence, it is necessary to adhere to a specified cybercrime investigation procedure in investigating intellectual property infringements resulting from a data breach through social engineering fraud in the e-commerce business.

IMPLICATION

The phases of the digital forensic framework include identification, collection, acquisition, preservation, analysis, documentation and presentation. Computerized evidence can be supported by standard, measurable scientific methodologies and sophisticated exams can benefit from the use of criminological science techniques. It is significant to apply well-established legal science methodologies to sophisticated criminology investigations. A significant barrier to the collection of digital evidence in cases of online commercial cybercrime is the global nature of cybercrime. It is crucial to address these issues and challenges in e-commerce cybercrime investigations to gather and examine digital evidence efficiently. Digital evidence is crucial to criminal investigations and prosecutions for intellectual property infringements in cyberspace, but it is laden with challenges, such as the admissibility of digital evidence, the integrity of digital evidence, the rapid evolution of technology, practical and legal challenges. The use of digital evidence in criminal investigations is rising across the board, not just for e-crimes. Investigate the

application of new technical developments and how they affect the reduction of cybercrime and enhance police effectiveness in governing. Intellectual property infringements in cyberspace

CONCLUSION

The cybercrime investigation procedure is crucial for gathering and evaluating digital evidence in e-commerce intellectual property infringement cybercrime cases, which are caused through data filtration and constitute a serious threat to intellectual property rights. This article helps to review the current security policy, procedures and technical weaknesses to take remedies like relief and punishment theory to balance various controls as intellectual property protection measures. Advanced legal sciences include identifiable evidence, assortment, securing, protection, examination, documenting and presentation in their modules. Science-based methods can be used to enhance advanced investigations and computerized proof can be supported by quantifiable science techniques. Case studies of e-commerce cybercrime shed light on the many forms of cybercrime and their possible consequences for both individuals and businesses. For obtaining and analysing digital evidence in situations involving e-commerce cybercrime, digital forensics and e-discovery techniques are crucial. The computerized legal sciences approach is used in a few steps, including identification, collection, procurement, security, safeguarding, investigation, documentation and presentation, to be followed in e-commerce social engineering fraud and intellectual property damages. Digital evidence can be subjected to forensic science procedures and forensic science methods can enhance digital investigations and thereby protect intellectual property rights in cyberspace.

Suggestion

Future cybercrime investigation procedure studies should integrate digital forensics practices into online governance frameworks for data protection regulations and establish effective cyber security policies that protect intellectual property assets like copyrights, trademarks, patents, trade secrets, semiconductor chips, industrial layout designs, geographical indications, and other intellectual property rights. Ecommerce involves FinTech transactions between vendors, merchants, buyers, sellers, and other third parties. This complicated network of interactions allows cybercrimes in organizations online to impact intellectual property damages. These cybercrimes can cause trademark infringement, brand infringement, reputational damage through impersonation, identity theft, and data breaches via social media channels, messaging channel platforms, blogs, forums, fake websites, and fake social media pages through social engineering fraud on the surface web, deep web, and dark web. These damages usually result from unauthorized data harvesting and breaches. Copyright, patents, trademarks, trade secrets, industrial and layout designs, geographical indications, and other intellectual property rights should be authorized and governed by cyber security policies to keep them aligned with enterprise policy along with national and international laws.

ABSTRACT

PCOS affects millions of women without their knowledge. In fact, PCOS is considered to be the most common cause of infertility in women today (Diamanti- Kandarakiset al., 1998).**Aim**: To develop various visual aids for PCOS. To generated various visual aids for PCOS aimed to impart nutrition education for emerging adult women 'at risk' of PCOS. It's a Prospective study done in 2016. Nutrition education materials including Pamphlets, Charts, Model and PowerPoint presentation was created for emerging adult women 'at risk' of PCOS. An instructional pamphlet was prepared for the participants of the study which mainly highlighted the importance of good nutrition during PCOS condition. A chart with the details of characteristics, signs, symptoms and diet for PCOS was prepared. The Food Guide Pyramid helps to promote the THREE basic rules for a healthy diet: Variety, Balance and Moderation. Overview of PCOS and its management were included in slides. Education has helped to change the attitude of the individual thus making effecting changes in the dietary pattern and lifestyle. Developed power point presentation gave an over view of the importance of nutrition for PCOS, whereas, chart and pamphlet are a comprehensive resource of characteristics, signs, symptoms associated with PCOS. The models help in good food selection for emerging adult women 'at risk' of PCOS.

Keywords: PCOS, Visual aids, Nutrition education, Pamphlets, emerging adult women.

INTRODUCTION

PCOS affects millions of women without their knowledge. A PCOS woman experiences many symptoms that can have a significant and long-term impact on their self-esteem and body image and they are at a higher risk for developing an eating disorder **(1).** Estimates range anywhere from 6 to 20 % of the female reproductive population, and the number may be even higher among younger women, since infertility is the primary clue that leads to most diagnoses. In fact, PCOS is considered to be the most common cause of infertility in women today **(2).**Diet and exercise are important parts of managing PCOS. This is because young women with PCOS often have higher levels of insulin in their blood, and many have trouble maintaining a healthy weight. Knowing the right foods to eat as well as the kinds of food to limit can improve the health status and also help to lose weight. Eating well, staying active, and maintaining a healthy weight or losing even a small amount of weight in overweight condition can improve PCOS symptoms **(3).**Community trails suggests that nutrition education is an accessible effective tool in health promotion programs with a focus on the development of healthy eating practices(4).

METHODOLOGY
Aim
To develop various visual education aids for PCOS subjects.
Objective
To generated various visual aids for PCOS aimed to impart nutrition education for emerging adult women 'at risk' of PCOS.
Research Design
It's a Prospective study, performed in the year 2016.Nutrition education materials including Pamphlets, Charts, Models and Power point presentation was created for emerging adult women 'at risk' of PCOS.
NUTRITION EDUCATION MODULES

RESULTS AND DISCUSSION
Effective Nutrition education sessions can be provided for emerging adult women 'at risk' of PCOS, with the help of pamphlets, charts, models and power point presentation. Created visual aid semphasized the importance of nutrition in PCOS condition. The prepared pamphlets can be distributed as educational aids to understand the concept of PCOS nutrition.
Pamphlets
 A pamphlet is a folded paper that has information about the particular subjects. The definition given is that a pamphlet is an unbound booklet. It may consist of a single sheet of paper that is printed on both sides folded in half, in thirds or in fourths to make a simple book **(5).**An instructional pamphlet was prepared for the participants of the study which mainly highlighted the importance of good nutrition during PCOS condition and which also has the pictorial representations of the major sources of each nutrient beneficial for PCOS[Plate 1 (a,b)]. A colorful, informative, attractive and easy to carry pamphlet was prepared focusing on the following:
1.　What is PCOS?
2.　Common symptoms
3.　Health risks
4.　Management of PCOS
5.　Dietary and Lifestyle Guidelines for PCOS
6.　Exercise

The pamphlets provided easy to follow food and nutrition tips in a convenient format for emerging adults.

Preetha and Lalitha Ramaswamy

Charts

A chart was prepared with the details of characteristics, signs, symptoms of PCOS and that can be explained to the respondents gathered at different venues. The created chart is shown in Plate 2.

Models

The Food Guide Pyramid [Plate 3]helps to promote the THREE basic rules for a healthy diet: Variety, Balance and Moderation. **Variety** means many different foods from each level of the Food Pyramid because no single food can supply all the nutrients. **Balance** means, eating right amounts of foods from all levels of the Food Pyramid to meet the calories and other nutrients required for proper growth and development. **Moderation** means that one is careful not to eat too much of any one type of food. Each day, the right amounts of servings from each of the food groups depend on the age, sex, and activity level. were used to serving size demonstration can be done with the help of measuring cups and spoons [Plate 3 (a,b)].

Power Point Presentations

A power point is a complete presentation graphics package. It is a slide-based presentation program which offers enormous customized scope for word processing, graphics and animations. It is a powerful visual aid that helps to reach out to the masses [Plate 4 (a,b)]. Informatory power point was prepared with 20 slides containing the following

1. PCOS – An overview
2. What Causes PCOS? Diagnostic criteria for PCOS
3. Clinical presentation of women with PCOS
4. PCOS: Signs and symptoms
5. Consequences of PCOS
6. Treatment
7. Nutrition therapy for PCOS
8. Exercise

CONCLUSION

Nutrition education for women 'at risk' of PCOS is mandatory and the facts can reach effectively among the target population when it has been conducted with appropriate education material. In that aspect, the power point presentation prepared for an over view of the importance of nutrition for PCOS with relevant pictures and animations, reinforced with vivid explanation. The chart and pamphlet are a comprehensive resource of characteristics, signs, symptoms and role of nutrition in PCOS. The food pyramid helps the selected emerging adult women 'at risk' to choose foods based on the nutrient content. Finally, the models can teach them the THREE basic rules for a healthy diet: variety, balance and moderation.

ABSTRACT

In this modern era, Ulcer is the most common gastro intestinal disorder which seen among many people. It is basically due to inflamed break of skin or mucous layer. It occurs due to regular usage of drugs, stress, spicy or junk food and irregular food intake. In Siddha literature, Ulcer (Gunmam) is a clinical entity which depresses both body and mind. There are many herbs in the management of ulcer. In Siddha medicine contain 64 therapies were divided into 32 internal and 32 external therapies. Among them Legium is one of the internal medicine which is sweet and palpatable by the patient. Karanthai legium(KL) is one of the herbo mineral drug for kunmam,soolai, yoniputru. In this study, we assessed for anti-ulcer activity by invitro method of acid neutralizing capacity(ANC) and H^+/K^+-ATPase inhibition activity. In ANC, the extract of KL significantly reduced ANC to 14 at a concentration of 1000mg as compared to 15.7 with standard Aluminium hydroxide + Magnesium hydroxide (500mg). While in H^+/K^+ - ATPase inhibition activity, the extract showed maximum percentage inhibition of 67.86% at the concentration 500µg as compared to 70.2% with standard Ome prazole.

Keywords: Anti- ulcer, Gunmam, Siddha medicine, Karanthai Legium, Peptic ulcer

INTRODUCTION

Peptic ulcer (PU) is a common, chronic and occasionally life- threatening disease of poorly defined pathogenesis among human population [1, 2]. The prevalence of Peptic ulcers is now a day increasing among the population due to the unhealthy food habits of the people. It is a break in the lining of the stomach, the first part of the small intestine, or occasionally the lower esophagus due to contact with the chloride peptic secretions [3]. PU manifest as a non-fatal disease, majorly represented by periodic symptoms of epi gastric pain, which are often relieved by food or alkali, besides to trigger much discomfort to patients, disrupting their daily routines and also causing mental agony [4]. All ulcers of the upper gastrointestinal tract were originally thought to be caused by the aggressive action of pepsin and gastric acid on mucosa. Increase in gastric acid and pepsin secretion, decrease in gastric blood flow, suppression of endogenous generation of prostaglandins, inhibition of mucosal growth and cell proliferation, and alteration of gastric motility have been implicated in the pathogenesis of gastric ulcer [5]. However, the denomination "peptic ulcer" has lately pointed to Helicobacter pylori infection, where the chronic use of non-steroidal anti-inflammatory drugs (NSAIDs) and acetylsalicylic acid (ASA) are some of the disease-causing factors [6].Due to the occurrence of many side effects by use of synthetic drugs for many diseases. The herbal medications are considered as the main source of drugs for ulcer, as they have less or no side effects. In Siddha literature, Ulcer (Gunmam) is defined as a clinical entity which depresses both body and mind. Karanthai legium (KL) is one of the herb mineral preparation mentioned in bogar aruliya vaithiya saram 700,indicated for 8 types of Gunmam(ulcer), kiranthi, karappan, soolai(Pain), kanna putru,linga putru,yoni putru, pilavai putru(cancer). Legium which is sweet and palpatable by the patient. Hence this study, to validate the anti-ulcer activity of Karanthai legium by in-vitro method of acid neutralizing capacity(ANC) and H^+/K^+-ATPase inhibition activity.

MATERIAL AND METHODS

The raw drug was purchased in Ramasamy Chettiyar, Paris, Chennai and autheniticated by botanist and from Department of Gunapadam ,National Institute of Siddha ,Chennai. The root of karanthai was collected from thiruvanmalai district.

INGREDIENTS

Thirikadugu (*Zingiber officinalis*,*Piper nigrum*,*Piper longum*),*Kadukkai*(*Terminalia chebula*),*Thandrikai*(*Terminalia bellirica*),*Vasambu* (*Acorus calamus*),*Indhuppu* (Rock salt),*Valuluvai* (*Celastrus paniculatum*),*Kostam*(*Saussurea lappa*),*Karunjeeragam*(*Nigella sativa*),*Omam* (*Trachyspermum ammi*),*Arasu*(*Ficus religiosa*),*Elam*(*Elettaria cardamom*),*Manjal*(*Curcuma longa*),*Karboga arisi* (*Psoralea corylifolia*),*Seviyam*(*Piper nigrum* – black peper root), *Vaividangam* (*Embelia ribes*),*Anai thipilli*(*Scindapsus officinalis*),*Jathikai* (*Myristica fragrans*),*Shenbaga poo*(*Michelia champaca*),

PROCEDURE

All above raw drugs expect karanthai were purified, grind and made into a fine powder. Root of Karanthai was cleaned, dried and made into a powder. To the net weight of above raw drug powder, add equal quantity of karanthai root powder and mixed well. Ghee was melted and add these powders gently and mixed well. Finally add honey and stirred it completely [7].

IN-VITRO EVALUATION OF ANTIULCER ACTIVITY
Acid Neutralizing Capacity

The aqueous extract of acid-neutralizing capacity value is 100mg, 500mg, 1000mg . The aluminium hydroxide and magnesium hydroxide (500mg) have compared for the standard. The total volume was 70ml with the addition of 5ml of a quantity of the mixture and remaining with water to make up the total volume; mix this for one minute. To the standard and test preparation, the 30ml of 1.0 N HCl was added and stirred for 15 minutes after that phenolphthalein was added and mixed. With 0.5N Sodium hydroxide, the excess HCl was immediately titrated until the pink colour is attained 15[8]. The moles of acid neutralized is calculated by, Moles of acid neutralized = (vol. of HCl × Normality of HCl) - (vol. Of NaOH × Normality of NaOH) Acid neutralizing capacity (ANC) per gram of antacid = moles of HCl neutralized divided by Grams of Antacid/Extract.

H+/K+ - ATPase Inhibition Activity
Preparation of H+/K+ - ATPase Enzyme

To prepare H+/K+ - ATPase enzyme sample the fresh goat stomach has purchased from the local slaughterhouse, the gastric mucosa of the fundus was cut-off and opened, the inner layer of the stomach has scrapped out for the parietal cell. The parietal cell obtained from the stomach has homogenized in 16mM Tris buffer with PH of 7.4, which has 10% Triton X-100 and centrifuged at 6000 rpm for 10mins after centrifuged the supernatant solution has used for the H+/K+- ATPase inhibition Protein content are used to find out according to Bradford's method were BSA are used for standard.

Assessment of H+/K+ ATPase inhibition

Per-incubated for 60 min at 37 °C for the reaction mixture of the sample containing 0.1ml of enzyme extract (300µg) and plant extract with different concentration (20µg, 40µg, 60µg, 80µg, 100µg). The reaction was initiated by adding substrate 2 mM ATP (200µL), in addition to this 2mM MgCl2 (200µL) and 10mM KCl (200µL) has added. After 30 min of incubation at 37 °C the reaction was stopped by 4.5% ammonium molybdate, and 60% perchloric acid was added and centrifuged at 2000rpm for 10 min, and in spectro photo metrically inorganic phosphate was released and measured at 660nm by following the Fiske-Subbarow method. Briefly, at 10 min at room temperature, 1ml of supernatant 4ml of Millipore water, 1ml of 2.5% of ammonium molybdate, 0.4ml of ANSA was added. At 660nm inorganic phosphate, absorbance has been measured at various doses of the extract; the enzyme activity has been calculated as micromoles of Pi released per hour [9].Results were compared with the known anti-ulcer PPA inhibitor Omeprazole and expressed as Mean ± SEM 16 % enzyme inhibition has calculated using the formula:
Percentage of inhibition = [Activity (control) - Activity (test)/Activity (control)] × 100

RESULTS

Acid Neutralizing Capacity

The neutralizing effect of KL was studied for concentration (100mg,500mg,1000mg) and standard Aluminium Hydroxide + Magnesium Hydroxide [Al(OH)3+Mg(OH)2](500mg). The results obtained envisage that the extract VOK at concentration100mg, 500mg,1000mg showed a significant reduction in acid neutralizing capacity (ANC), i.e.,119,14,10.5 respectively, as compared to standard Al(OH)3+Mg(OH)2 (500 mg) which is 15. The extract of VOK at a concentration of 500 mg has been found to neutralize acid more significantly as compared to standard. The results have shown in Table 1 & Fig 1

H+/K+ - ATPase Inhibition Activity

The H+/ K+ - ATPase inhibition activity of aqueous extract at a various concentration (100μg, 200μg, 300μg, 400μg, and 500μg) has compared with Omeprazole as standard. The extract significantly showed activity in a dose dependent manner. Maximum percentage inhibition of has been observed for extract KL 67.86% at a concentration of 500μg is and standard Omeprazole showed 71.43 %. The results have been tabulated in Table 2 &Fig 2.

DISCUSSION

The causes of peptic ulcer is unclear in most of the patients it may results of imbalance between aggressive factors and the maintenance of mucosal integrity through the endogenous protection system [10]. Peptic ulcer disease (PUD) has various causes includes Helicobacter pylori-associated PUD and NSAID-associated PUD account for the majority of the disease etiology [11]. Eating spicy food substances increases the symptoms of ulcers; the other symptoms are nausea, vomiting, and weight loss. Although patients with gastric ulcers have normal or diminished acid production, yet ulcers may occur even in the complete absence of acid [12].Acidity is a common gastrointestinal problem due to excessive secretion of gastric acid or stomach acid inflames the stomach lining mucosa and produces ulceration [13]. Antacids act by neutralizing gastric acid and thereby reduce the gastric pH [14]. The acid neutralizing capacity of an antacid is the amount of per gm of acid that it can neutralize [15]. In Siddha medicine, Karanthai legium is one of the herbomineral medication inclicated for 8 types of gunmam(ulcer). The entire drugs in Karanthai legium have individual anti-ulcer activity mentioned in previous studies. The phytochemical analysis of the Spaeranthus amaranthoides revealed the presence of saponins and flavonoids, substances known to affect the integrity of mucous membranes. Flavonoids have also been reported to offer some protection in ulcer development by increasing capillary resistance and improving microcirculation [16]. From this study, In Acid neutralizing capacity (ANC), the extract at 500mg concentration showed a significant reduction in ANC of 14. H^+ -K^+ ATPase is a key enzyme in inducing acidity; in this study, the ability of Karanthai legium (KL) to inhibit H^+ -K^+ ATPase in vitro isolated from goat stomach was studied. Enzyme H^+ -K^+ ATPase is an important enzyme system located on apical secretory membrane of partial cell [17]. In this study, dose-dependent inhibition of enzyme by omeprazole and extract KL was observed, suggesting that the Karanthai legium (KL) was significantly able to inhibit enzyme H^+ -K^+ ATPase, responsible for the secretion of acid and effect was comparable to omeprazole.

CONCLUSION

The results of our study prove that the Karanthai legium possess antiulcer activity by Acid neutralizing capacity and H+/K+ - ATPase inhibition activity Hence, it can be suggested that the antiulcer activity of the karanthai legium , as a natural herbal remedy in the treatment and management of ulcer. This is a premilinary study and to validate the siddha literatue and clinical trials to be conduct in future.

ABSTRACT

Science reveals that Vibration is an elemental property, all matters exist in a state of vibration, and sound is a phenomenon associated with vibration. Indian Vedic spiritual scriptures ascribe that sound is the foremost qualitative phenomenon that appears in the very process of creation of this universe. Sound is a natural factor like light, water, air, nutrients, etc and with the development in acoustic science, its role in plant growth and development is gaining a gradual impetus. Studies available so far indicate that sound too play an important role in growth, development, and plant communication like other natural factors; and rhythmic sound or music has a better prospect for its application. Experimental research on the stimulation of Mung bean (*Vigna radiata*) seed germination with devotional music to this prospective revealed that devotional music had a positive effect on Mung bean seed germination in terms of germination percentage and germination index when administered in an optimum dose. An exposure of Mung bean seeds to devotional music with a sound pressure level of 90-100dB for 2hours per day resulted in significant improvement in radicle development and overall seed vigour index in comparison to the control group not exposed to devotional music. Radicle development and seed vigour index of Mung bean seeds exposed to devotional music increased by 101.1% and 110.48% respectively.

Keywords: mung bean, seed germination, seed vigour index, devotional music

INTRODUCTION

Vibration and sound are integral parts of the environment. It is present, in the form of vibration as a state of matter (Biard, 2014; Shabda Brahman - Wikipedia, n.d.), as natural forces acting on matter, present in the life-building processes from the cellular action (Jaross, 2016) to thoughtful activities of higher living beings. Sound is happening naturally in this creation; sound is also happening in the developmental activities of human beings (Goswami and Swain, 2017). Therefore, all organisms, plants and animals are existing and thriving somewhat in a direct and continuous interaction with the sound phenomena. Then, what role does this sound play in the life and development of a living beings become a matter of very genuine query and has great potential (Gagliano, 2013a). While interaction of plants with the natural factors like Light, Temperature, Air, Water, Nutritional Elements etc, has received much attention in the science and scientific communities, the study of Sound as naturally occurring stimuli remains undervalued (Mishra et al., 2016). However, with the developments in acoustic science, it is evident that studies of the acoustic impact on plants have gained rapid attention from plant and behavioural scientists in last few decades (Gagliano, 2013b). Studies in the past have given a definite direction to the fact that sound as stimulation to plants has a definite impact on the growth and development of plants at physical, physiological, biochemical, molecular, and genetic levels (Mishra et al., 2016; Chowdhury et al., 2014). The sound impact on plants is both negative and positive in terms of the development of plants. The impact of sound has varied with the composition of sound, quality, strength, duration of exposure, and obviously the specific subject, the plants being studied. However, definite consensus could be arrived at only when the minimum required systematic research is directed in the varied aspect of each specific question that needs to be answered.

The present study was directed to find the impact of devotional singing (Devotional Music) as a quantified and qualified sound stimulus for the germination of Mung bean Seeds. The rational for such a study was drawn from the review of the past scientific research as well as the importance of devotional singing and the glorification of God's name as given in Indian spiritual scriptures. Srila Vrindavandas Thakur in Chaitany Bhagbatam proclaims that lower beings who can't chant by themselves are also benefited when exposed to loud chanting of god's name by human beings (Vrindavandas, 1995). Srila Krishnadas Kabiraj in Chaitany Charitamrita writes plants and creepers were exuberant with joy and ecstasy upon the presence of the divine personality of Sri Chaitany Mahaprabhu and by his melodious chanting of god's name (Kabiraj, 1993). Sri Kripaluji Maharaj in his book Glories of Divine Name explains Astapadi (a conclave of eight verses) composed by Sri Chaitanya Maha prapbhu and writes that god's name is the very life of all transcendental knowledge. Every utterance of the divine name gives a full taste of its nectarine sweetness that swells in the heart of the chanter, like a surging ocean of everlasting Bliss and Peace (Maharaj, 2009). In Indian scripture it has been repeatedly pointed out that God's name is as powerful as God himself, God resides in each and every name of God, and Chanting of God's name aloud is beneficial to all beings. Haid & Huprikar, reported that seed germination and growth of Seedlings were affected by watering them with meditative intents. Germination of pea seeds was significantly higher when watered with intent of stimulation and germination of wheat seeds was significantly lower when watered with intent of inhibition. Biomass production of wheat seedlings on the tenth day was reported to be significantly lower when compared with untreated one. Thus, it was concluded that the meditative intent behind an action had an effect on the outcome of the action and human interaction via ceremony and rituals can affect the natural world (Haid & Huprikar, 2001). Thus, rationality rested on the hypothetical thought that when sound stimuli exhibit an impact on the plant, that impact could be regulated and enhanced by means of incorporating the essence of devotion, contemplation and power of God's name into it and then suitably manipulating the stimulus over other factors other factors of strength of music in terms of sound pressure level, duration of exposure, time of exposure etc.

MATERIALS AND METHODS

Locale of Study

Research was conducted in the serene spiritual atmosphere of Braj Gopika Seva Mission situated at Tetumberpalli, Khurda, Odisha, India in February 2022. Control condition for the experimental research was created with the construction of a polyhouse (20mt x 16mt) and ten numbers of specially designed acoustic growth chambers with an internal dimension of 40 x 40 x 72 inches. Acoustic growth chambers were fitted with speakers for audio output and connected to a control panel with music players. Acoustic growth chambers were so designed that all the treatments could be played simultaneously in a single poly house without any acoustic interference.

Selection of Seed and Growth Condition

Mung Bean seed germination test was conducted in petri dishes with 25 numbers of seeds in each petri-plates. PDM 139 (Samrat)Variety Mung bean was selected for the experiment for its availability and for the matters of an established variety for a long. Twenty-five numbers of seeds were arranged uniformly in a 5 x 5 layout on double layers of pre-soaked germination papers inside the sterilized petri-plates (Figure 1). Distilled water was used to maintain the moisture condition of the petri-plates. Seed germination parameters were recorded at an interval of 12hrs i.e., twice daily once at 5 am in the morning and another at 5 pm in the evening till 48th hours from initiation of the germination test. The petri-plates were kept in dark beyond the treatment hours.

Selection of devotional songs and formulation of treatment levels

Devotional Music was the main independent variable whose effect on dependent variables i.e., germination parameters were to be studied in the experiment. Six devotional songs were purposively selected from devotional compositions and practices of Sri Kripaluji Maharaj and soundtracks were prepared for definite time period of 10 minutes, 20 minutes, and 30 minutes each. this line may kindly be removed (it has been mentioned at a later line) Apart from being semi classical in nature, the composition had a special attribute of contemplative mediation upon God's name, glories, and pastime. Soundtracks were combined as per the playing hours and single track consisting of two songs each were prepared and recorded in separate pen-drives. Details of the devotional songs used for soundtracks are presented in Table 1. Soundtracks were played over three ranges of sound pressure levels (SPL) that is 70-80 dB(A), 80-90 dB(A) and 90-100 dB(A) and over three levels of duration of exposure i.e., 1 hour, 2 hours, and 3 hours per days and thus constituted nine experimental groups. There was one group, which was not exposed to devotional music to form a control group, making a total of ten numbers of treatment levels. Details of formulation of treatment levels are presented in Table 2. Treatments were executed thrice a day first in the early morning from 5:30 am to 6:30 am, second in the daytime from 8:00 am to 9:00 am, and third in the evening from 4:00 pm to 5:00 pm inside the acoustic growth chambers and from a height of three feet from the base where petri-plates were placed.

Research Design, Germination Tests, and Statistical Analysis

Completely Randomised Design (CRD) was employed to run the experiment with ten different levels of treatments with four replications in each. Seed germination data were recorded for each experimental unit on every 12 hours and continued for 48 hours for germination. Length of Root and Shoot was also measured and recorded at 48 hours from the initiation of the germination test. Final Germination Percentage (FGP), Mean Germination Rate (MGR) was measured in reference to the formula reported by Al-Ansari and Ksiksi (Al-Ansari & Ksiksi, 2016), Germination Index (GI) as per the formula reported by Andrew et al., (Andrew et al., 2021), Seed Vigour Index (SVI) was calculated using the formula reported by Zhu et al. (Zhu et al., 2010). Mathematical formulas used for the measurement of different germination parameters:

i.   Final Germination Percentage (FGP) = the total seed germinated at the end of a trial or experiment/ number of initial seeds used X 100

ii. Mean Germination Rate (MGR) = 1/T; where T is mean germination time (Mean germination time = Σ Fx /Σ F; where F is the number of seeds germinated on day x)

iii.   Germination Index (GI) = ∑ Gt / Dt where Gt = is the number of germinated seeds on day t and Dt = is the time corresponding to Gt in days.

iv.   Seed Vigour Index (SVI) = S × Σ (Gt / Dt); Where, S is seedling length = Root length + Shoot length and Σ (Gt / Dt) is Germination Index.

RESULTS

Effect of devotional music on germination percentage (GP)

One-way analysis of variance for final germination percentage of Mung bean seed under the treatment of devotional music (Table 3) after 48 hours of initiation of the germination test resulted with a 'F' value of 2.44, and the same was significant at p < 0.05.

Effects of devotional music on mean germination rate (MGR) and germination index (GI)

Table 3 presents that variance in the mean germination rate of Mung bean seed among the treatment groups were non-significant (F = 1.43, p = 0.22) when germination data was recorded at an interval of 12 hours. The difference in the germination index was significant with an F value of 2.19 and $p \leq 0.05$ (Table 3). Germination index was highest in T7 and lowest in T1. The germination index of T2, T4, T5, T7, T8, and T9 was higher in comparison to the control group but not statistically significant (Table 5) .

Effect of devotional music on radicle development (RD) and seed vigour index (SVI)

Analysis of variance in the radicle development among the treatment groups was highly significant with an F ratio of 6.38 and $p < 0.001$ (Table 3). Table 6 shows that mean lengths of radicle were higher in all the experimental groups (T1, T2, T3, T4, T5, T6, T7, T8, & T9) in comparison to the control group not exposed to devotional music, and was significantly higher for T2, T3, T4, T6, T8, and T9. The highest radicle development was observed in T8 with a difference of 101.1% in comparison to the control group (Table 6. Figure 2). Differences in seed vigour index (SVI) among the treatment levels were found to be highly significant with an F ratio of 4.72 and $p < .001$ (Table 3). SVI for all the experimental groups (T1, T2, T3, T4, T5, T6, T7, T8, and T9) were found to be higher in comparison to the control group and the variations were statistically significant for T3, T4, T7, T8, and T9. The highest SVI was observed in T8 with a difference of 110.48% in comparison to the control group (Table 6, Figure 3).

DISCUSSION

Results of the present study reflect that devotional music had a definite and promising effect on seed germination parameters. The final germination percentage of Mung bean seed was higher in most groups exposed to one or other levels of devotional music. The final germination percentage was highest in the group exposed to devotional music at 90-100 dB(A) for a duration of one hour per day. Chandrakala & Trivedi, (2019) reported that Music positively impacts on seed germination thorough enhancement of metabolic rate. Frequencies in musical vibration facilitate physiological activities like nutrient uptake, photosynthesis, and protein synthesis and result in the overall development of healthier plants with better yield prospects. The positive impact of green music, classical music, Gayatri mantra, Pirith and nature sounds has been observed in Wheat, spinach, horse gram, soya, and paddy. Music has immense potential in breaking seed dormancy and enhancing crop yield. Creath & Schwartz, (2004) reported that that musical sound had a statistically significant effect on numbers of okra and zucchini seed sprouted compared to untreated control as well as noise. Healing energy also had a significant effect on seed germination compared to untreated control. But no significant difference was reported between seeds exposed to noise and untreated control. Munasinghe et al., (2018) reported that a significant difference in the germination of rice was observed when seeds were treated with sound rhythm treatment at 55-60 dB(A) for 7 days in comparison to control and out of two sound rhythms used i.e., Buddhist Pirith chanting and Pop music, germination percentage was higher in Pirith treatment.

Earlier Cai et al., (2014) reported that an audible sound with an intensity of around 90 dB(A) and frequency of around 2000 Hz reduced the germination period of Mung Bean as well as improved its growth. However, in the present study, no significant difference is observed in the mean germination rate of Mung bean seed in the groups exposed to devotional music. Here it may also be speculated that the measurement of germination rate could be improved by reducing the time interval of measurement of the germination counts when the total germination period itself is short. The most relevant findings in the present study were obtained for radical development and overall seed vigour index. The most groups exposed to devotional music had significantly higher radicle growth and higher seed vigour index in comparison to the control groups. Some of the mid-experimental groups had shown higher but non-significant results which may be attributed to depression from unaccounted biotic or abiotic stress conditions. Exposure of Mung bean seeds to devotional music at 90-100 dB(A) for 2 hours per day had resulted in the highest and most significant increase in radicle development and overall seed vigour index. Chowdhury & Gupta, (2015) in their germination experiment on Cicer arietinum (chickpea) exposed to Light Indian Music, found that throughout the period of germination and development of the saplings, the ones exposed to Indian Light Music were having higher germinated seedlings and seedlings were blooming better compared to the control saplings. They also stated that soft rhythmic audible frequencies (that is music) must have affected the absorption of nutrients and formation of metabolites in the plants and thus expediting the germination of seeds, growth, and development of plants.

It may be concluded that exposure of Mung bean seeds to devotional music resulted in the higher final germination percentage and germinaiton index in comparision to the control group. An exposure of Mung bean seeds to devotional music with a sound pressure level of 90-100 dB(A) for 2hours duration resulted in the highest and most significant improvement in radicle development and seed vigour index in comparison to the control group not exposed to devotional music. Radicle development and overall seed vigour index of germinated Mung bean seeds were enhanced by 101.1% and 110.48% respectively after 48 hours of germination test. Thus it is revealed that Mung beans preferred a high sound pressure level of 90-100 dB(A) and an exposure of 1 to 2 hours per day to bring about significant improvement in the germination parameter like final germination percentage, germination index, radicle development, and overall seed vigour index. Considering seed vigour index as an overall germination parameter and based on the experimental findings related to seed vigour index, it may be generalized that for optimum germination of Mung bean seeds, the selected devotional music could be applied either for 70-80 dB(A) for 2 to 3 hours or for 80-100 dB(A) for 1 to 3 hours however for the maximization of impact of devotional music on Mung bean seed germination a sound pressure level of 90-100 dB(A) and duration of 2 hours could be preferred. The findings of the study being verymuch encourging it is being replicated over different seasons, crops and its appliction in the rest of the growth and development phases of the crop along with germination of seeds. It seems that an extended package of practice is possible towards seed germinaton, crop growth and development, and a better harvest with the application of devotional music.

ABSTRACT

Cancer is a dreadful disease. Conventional methods used for the treatment of cancer is painful it causes physical, and mental effects on patient's health and could be toxic and hazardous in nature. Plants are considered to be safer and effective for the treatment as it contains natural, non-toxic, biologically active compounds which are safer to mankind. *Withania somnifera* is an important medicinal plant which is widely cultivated in various parts of India. Several studies indicate that *Withania somnifera* possess anti cancerous activity. In this present study four plant extracts- leaves ethanol (LE), leaf aqueous (LW), root aqueous (RW) and root ethanol (RE) extracts were used against Vero cell linage to check the cell cytotoxicity effects. MCF 7 Breast cancer cell lines were used to check the efficacy of *Withania somnifera* against breast cancer cell lines. Leaf ethanolic extract lysed 21.31% -81.70 % of MCF7 Breast cancer cells. LW lysed 50.79 %- 88.41% of MCF 7 cancer cells the other hand root extracts of *Withania somnifera* – RE lysed 7.86%-60% of MCF 7 cancer cells and RW lysed 9.02%- 66.43% of MCF 7 cancer cells. Results indicated that the *Withania somnifera* plant contained certain potential molecules to cure breast cancer without causing any harmful side effect on the growth of normal cells. This anti-cancer study encourages us to use plant-based medicines for the treatment of breast cancer, other cancer treatments.

Keywords: *Withania somnifera*, MCF 7 Breast cancer, Anticancer activity

Neha Singh and Anita R. J. Singh

INTRODUCTION

Cancer is a group of diseases which involves abnormal and uncontrolled growth of cells with the potential to spread to other parts of body (1, 2).It also affects the functioning of various parts of the body. The most common types of cancer in males are: lung cancer, prostate cancer, and colorectal cancer..Breast, lung and cervical cancer are very common in females (3). Cancer is often treated by chemo and radiation therapy which causes pain, psychological distress and various side effect such as hair fall, skin problems , patches, itchiness etc. Various medicinal plants contain anti cancer activities. Indian ginseng – *Withania somnifera* also known as Ashwagandha, Asgandh,   and winter cherry, belongs to the plant family Solanaceae (4). It grows in countries such as India, Nepal, Bangladesh, Sri Lanka, Pakistan, Afghanistan, parts of the Middle-East, Africa, Canary Islands and Spain (5).It is an important medicinal Kharif crop widely cultivated in various parts of India such as Gwalior, Guna, Jabalpur, Narsinghpur, Neemuch, Bhind, Mandasaur (Madhya Pradesh), Anand, Vadodara, (Gujrat), Udaipur,Nagour and Jodhpur (Rajasthan) and several other parts of Madhya Pradesh, Uttar Pradesh, Rajasthan, Gujarat, Punjab, Haryana and Maharashtra. This crop does not require high amount of water and can be easily cultivated in drysoil, sandy loam, and at tropical region at pH 7.5 -8. It grows up to 1.5 meters in height (6). Ashwagandha roots are an important part in the medicinal system of Ayurveda for over 3000 years in the preparation of liver tonic and analgesics. Some research work confirms that the whole plant and plant parts specifically root and leaf extracts have very important medicinal properties like – neurasthenic, astringent, anti-inflammatory, antidepressant, anti-stress and anti-oxidant activity (7). Additionally this plant was effective as an anti-tumour, anti-cancer and immune modulating activity (8).

Root contains Glyco with anolides which were anxiolytic and antidepressant in nature (9). *Withania somnifera* extracts were found to be more effective than ranitidine to treat stress induced gastric ulcer (10). Extracts of *Withania somnifera* was found to inhibit the haloperidol or respine induced catalepsy which showed its potential to treat Parkinson disease(11) Extracts of *Withania somnifera* has anti venom property (12), anti inflammatory (13), antiangiogenic (14) effects. Root extracts of *Withania somnifera* has been used by the major ayurvedic medicine companies as a diuretic, hypo cholesterolemic and hypo glycaemic agent (15). *Withania somnifera* extract have potential to stop the growth of cancer cell and also it produces reactive oxygen species so that cell can perform apoptosis (16).*Withania somnifera* extract does not affect the functioning of normal and healthy cells. In some in vivo studies it is found that the extract of *Withania somnifera* has potential to induce the programmed cell death of various cancer cells and modulate immune regulation (17, 18, and 19).*Withania somnifera* extract can reduce the succinate dehydrogenase activity, inhibits 35S ribosome incorporation and significantly increases Mg^{2+} activity in granulomas (20) which indicates the potential of *Withania somnifera* extract against tumour cells. Several studies associated the anti cancer effect of *Withania somnifera* (Ashwagandha) is due to the presence of bioactive compound Called With enolides. This was isolated from the leaves sample of *Withania somnifera* and it was called as With enolide A (4β,5β,6β,22R-4,27-dihydroxy-5,6-22,26-diepoxyergosta- 2, 24-diene-1,26-dione) (21).Withanolide A possesses antistress (22), antioxidant (23), immunomodulatory activity and can increase the WBC count , alpha esterase (24)and anti angiogenesis activity (25). Several studies indicates that Withenolide A has pharmacological potential to affect various cell activities like, cell motility, survival ability, proliferation, metastasis and chemo sensitization towards drug resistance *in vitro* and *in vivo*, which indicates that Withenolide A is a reliable anti cancer phytochemical (26, 27).

MATERIAL AND METHOD

Aqueous and ethanolic root and leaves extracts of *Withania somnifera*, 96 well micro plates, conical flasks, MTT solution, Phosphate buffer Saline (PBS- pH 7.4), DMSO, test tubes, conical flasks, micropipettes, micropipette tips, Digital inverted Microscope, Spectrophotometer and CO_2 Incubator.
Cytotoxicity effect

Neha Singh and Anita R. J. Singh

Ethanolic and aqueous extracts of root and leaves were prepared by Soxhlet distillation. The sample was allowed to cool and dry for 7-8 days at room temperature. After the evaporation of solvent dry plant extract was obtained. This crude extract was used against the Vero Cell lines and MCF 7 Breast cancer cell lines to check the anti-cancer activity of other compounds present in *Withania somnifera.* Four samples namely- root ethanolic (RE), root aqueous (RW), leaf ethanolic (LE) and leaf aqueous (LW) extracts were selected for the study of cytotoxic effect against MCF -7 breast cancer cell lines and Vero cell lines by using MTT assay (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide assay (34). 1×10^6 cells/well concentration of cells were seeded in 96 well micro plates in sterile conditions then incubated at 37°C for 48 h in 5% CO_2 incubator as it provided optimum conditions for the growth of mammalian cell lines. After 48 hrs cells confluence was checked. After observing the 70-80% confluence, the culture medium was replaced. The cells were treated with different concentrations- 50μg/ml, 100 μg/ml, 150 μg/ml and 200 μg/ml of samples and incubated for 24 hrs in optimum conditions. After the 24 hrs morphological changes of untreated (Control) cells and treated cells were noted under the digital inverted microscope (20 X magnifications) and photographed. The cells were then washed with Phosphate Buffer Saline (PBS, pH -7.4). 20 μl of MTT solution (Concentration- 5 mg/ml in PBS) was added in each well. Then the plates were kept in dark for 2 hrs at room temperature (24°C). Formazan crystals were dissolved in 100 μl DMSO and the absorbance was recorded at 570nm. Cell viability percentage (%) was calculated by using the formula-
Cell viability (%) = (Absorbance of sample/Absorbance of control) X 100.

RESULT AND DISCUSSION

Different concentrations-50 **μ**g/ml, 100 **μ**g/ml, 150 **μ**g/ml, 200 **μ**g/ml of all 4 samples namely leaf ethanolic (LE), leaf aqueous (LW), root ethanolic (RE) and root aqueous (RE) used against Vero cell lines showed nil or negligible cytotoxic effect at 50 **μ**g/ml, 100 **μ**g/ml and 150 **μ**g/ml. Leaf aqueous extract (LW) showed 91.50% viability at 50 **μ**g/ml, 75.67% cells were viable at 100 **μ**g/ml, 55.165% cells were viable at 150 **μ**g/ml concentration (Graph 1). Leaf ethanolic extract (LE) showed 93.81% cell viability at 50 **μ**g/ml , 77 .89% cells viability at 100 **μ**g/ml, and 59.81% cells were viable at 150 **μ**g/ml concentration(Graph 2). Against root ethanolic extract (RE) 94.41% cells were viable at 50 **μ**g/ml, 76.35% cells were viable at 100 **μ**g/ml, and 58.73% cells were viable at 150 **μ**g/ml concentration (Graph 3). Against root aqueous (RW) 90.752% cells were viable at 50 **μ**g/ml, 71.89% cells were viable at 100 **μ**g/ml and 52.37% cells were viable at 150 g/ml concentration (Graph 4). **Against MCF-7** breast cancer cell lines- Various concentrations- 50 g/ml, 100 g/ml, 150 g/ml, 200 g/ml of leaf ethanolic (LE), leaf aqueous (LW), root ethanolic (RE) and root aqueous (RW) extracts showed significant efficacy against the MCF-7 breast cancer lines. Images clearly indicate that all 4 extracts LE, LW, RE and RW can control / restrict the growth of breast cancer cell lines. Leaf ethanolic (LE), extract showed 78.68% viability at 50 g/ml, which means 21.32% cells lysed at 50 g/ml, 54.851% viability (45.15% lysed of MCF 7 breast cancer cells) at 100 g/ml, 32.723% viability shows the lysed of 67.277% of MCF 7 breast cancer cells lysed at 150 g/ml, only 18.297% viability recorded (lysed/ reduction of 81.297% of MCF7 breast cancer cell) at 200 g/ml concentration (Graph 6).

Leaf aqueous (LW) extract of *Withania somnifera* showed 49.202% viability (50.798% lysed of MCF 7 breast cancer cells) at 50 g/ml concentration, 32.035% viability of cancer cells showed the lysed of 68% of MCF 7 breast cancer cells at 100 g/ml concentration, 15.431 % viability showed the lysed of 84.569% MCF 7 breast cancer cells at 150 g/ml concentration, 11.8% viability proved the reduction of 88.41% of MCF 7 Breast cancer cell line (Graph 7) which is highest among all four extracts (Graph 10). On the other hand root extracts also showed significant effects. Against root ethanolic (RE) extract of *Withania somnifera* – 92.133% viability showed the lysed of 7.87% of MCF 7 breast cancer cells at 50 g/ml, 76.317 % viability showed the 23.683% of lysed of MCF 7 breast cancer cells at 100 g/ml concentration, 58.855% viability showed the lysed of 41.145% MCF 7 breast cancer cells at 150 g/ml, 39.99% viability of cells showed the lysed of 60% MCF 7breast cancer cells at 200 g/ml concentration(Graph 8). Against Root aqueous extract 90.975% viability showed 9% lysed of MCF 7 breast cancer cells at 50 g/ml concentration, 78.599% viability showed 21.40% reduction/ lysed of MCF 7 breast cancer cells at 100 g/ml concentration, 55.006%

Neha Singh and Anita R. J. Singh

viability showed 45% reduction of MCF 7 breast cancer cell at 150□g/ml concentration, 33.562% viability of cells proved the reduction / lysed of 66.438% of breast cancer cell line (Graph 9).

CONCLUSION

Leaf ethanolic extract lysed 21.31% -81.70 % of MCF7 Breast cancer cells , LW lysed 50.79 %- 88.41% of MCF 7 cancer cells the other hand root extracts of *Withania somnifera* – RE lysed 7.86%-60% of MCF 7 cancer cells and RW lysed 9.02%- 66.43% of MCF 7 cancer cells. Previous investigations also support these results and show the efficacy of *Withania somnifera* extracts against breast cancer cell lines. It boosts immunity of females, can prevent the tumour development and can be used for the treatment of breast cancer disease. Present investigation will encourage the use of plant based natural substances to cure cancer and other associated diseases.

ABSTRACT

Voice-coding has been foremost problem in the vicinity of next generation modern wireless communication and digital audio as well as voice processing. voice-coding is the art of renovating the voice signal in a more dense form, which can be broadcasted with a small numbers of binary digits. Linear Predictive Coding (LP) is an extensively utilized technique in audio as well as Voice signal processing. It has create particular use in voice-signal Compression, allowing for very high density rate. This Paper expose the novel approach based on QMF and Source filter Model where QMF filter employed to break up the wideband speech into LF & HF part and processing it individually so that without wideband(WB) coder at source side the near perfect original WB voice has been recovered. Subsequently obtained voice signal can be further processed through source filter model for evaluating signal based on voice quality. From the obtained voice signal at the time varying synthesis filter it can be concluded that source filter model can requires fewer number of bits compared to whole original voice signal transmission at the cost of degradation in voice quality. One can notify the significant changes in original voice quality by observing the spectrogram of voice signal. Less number of bit representation can help in reducing the storage requirement and bandwidth (BW).

Keywords: Quadrature Mirror Filter, Wideband, Public switched telephone systems, reflection co-efficient.

INTRODUCTION

Wireless communication is an emerging field which has seen enormous growth in last few years. The huge uptake rate of mobile phone technology and exponential growth of the Internet of Things have resulted in the increasing demand of the Voice coder which can compress the data & transmit it with a fewest number of bits. As far as Growth in Next generation modern wireless technology connected with the up gradation in voice coder, 4th & 5th generation wireless system is popular in world market due to their low bit rate voice coder only. In digital telecommunication systems it is always necessity to transmit voice signal (speech signal) strongly[1,12].Public switched telephone systems (PSTN) shrivel the bandwidth (B.W.) of the transmitted voice signal from an effective frequency range of 50 Hz to 7 KHz to the range of 50 Hz to 3.4 KHz. The condensed BW leads to a slim and muffled sound. As per the recommendation of ITU-T conducted Listening tests speech BW affects the perceived voice quality[2]. Introduction of wideband communication system aggravated the transmission of wideband signal having cutoff frequency of at least 7 kHz for improved voice quality in form of the intelligibility and naturalness. the restricted access problem in the employment of Wideband coders and communication is up gradation of current NB coders and transmission to WB system where hardware and software up gradation and compatibility is forever a major issue[13].

Better voice signal (speech signal) quality performance offered by Wideband coders, at rest hasty alternate of complete NB coding and transmission systems is not sufficient due to remarkable infrastructure expenses incurred to network operators and also for the customers who wants to make use of the system. One decade has been departed been departed for changeover existing NB systems to fully WB compatible systems. Terminal and network must be changed to make NB system compatible to WB system. During that span novel approach have been urbanized urbanized to widen the Narrowband BW of speech (voice) signal at handset end (receiver) for humanizing final voice(speech) quality[3]. Bandwidth extension (BWE) system for speech signals is a compelling, reasonable option to acquire wideband speech with excellent quality sound for the existing wireless communication infrastructures, like PSTN and global system for mobile communication (GSM)[13]. Bandwidth extension techniques of voice(speech) are mostly categorized into two classes. In one class the missing frequency component is achieved from the available NB speech component with not necessary to transmit data about the stolen frequencies because of the expansion is wholly w.r.t. NB speech signal, these techniques can be done at the enviable end of the channel.

The other depends on data hide method. The greater part of the prior strategy make WB speech by source filter model (LP) demonstrate [4],excitation signal and LPC coefficient for spectral envelope. The BWE techniques of speech in view of data hiding method insert High frequency segments data into the NB speech bit stream, and then at the user end terminal the WB speech is recuperated w.r.t. High frequency data. The techniques are without charge and can be utilized with any NB speech codecs. A limitation of BWE technique with side data is that their abuse requires that a similar technique is bolstered at the two ends of the transmission line [5,6]. Then again, the execution of such techniques can clearly be better than that of prior extension techniques. In this paper QMF and source filter model based bandwidth extension and quality evaluation of speech signal is carried out. In QMF's, the whole signal could be partitioned into two parts meaning that full band voice signal(speech signal) is partitioned into two half band signal. The extraordinary properties of these channels permitted the half band signals to be sampled at half rate to the original sampled rate and then reproduced effectively. This disclosure offered ascend to an entire generation of speech sub band coders. the obtained speech signal can be further processed through source filter model for evaluating the performance of the speech signal in terms of speech quality, frequency domain spectrogram etc.. to judge the speech signal compression. This paper is organized as follows:-Sect.2. describes the problem. Sect.3. thrash out about theory related to novel approach for bandwidth extension based on QMF and source filter model(SFM). The results obtained through series of simulation in MATLAB has been reported in this section. Finally the concluding remarks are given in Sect.4.

PROBLEM DEFINITION

In recent scenario of technological advancement in modern wireless communication systems, surrounded by plentiful reasons for on the whole degradation of recovered voice signal quality at receiver end, major reasons to be considered is the utilization of Narrow Band (NB) end devices and NB transmission medium supporting BW of 300 Hz-3.4KHz. The intrinsic negative aspect of such voice signal is that sounds quality appeared is stifled and thin because of absence of HB spectral components[1].The limited frequency band trim down both quality and intelligibility of speech due to the missing high frequency components that are significant cues especially inconsonant sounds[6]. Factors which may affect the quality of recovered voice signals(speech signals) are limited acoustic bandwidth, acoustic background noise, quantization noise due to source coding and residual error after channel decoding. Fricatives like /s/, /z/ and partly /f/, /S/, /Z/ are not easy to recover using only NB speech as considerable energy of these fricatives are located in Extension band (HF band) thus restrict quality of recovered voice(speech) signal[9].To get better quality, intelligibility of speech(voice) degraded by narrow bandwidth(NB),researchers have almost concentrate on top of standardize the telephonic networks by introducing WB (50-7KHz) voice(speech) encoder. WB speech transmission requires the transmission network and terminal devices at both ends to be upgraded to the WB that turns out to be time-consuming[7].Software/hardware upgradation, compatibility are major issues to abruptly substitute entire existing NB coding system.[8].This paper focus on the novel approach based on QMF filter to separate out the wideband speech into LF and HF part and processing it individually so that without wideband coder at transmitter side the near perfect original wideband speech has been recovered and the obtained speech signal can be further processed through source filter model for evaluating the performance of the speech signal.

BWE BASED ON QMF AND EVALUATION OF VOICE SIGNAL THROUGH SFM

The BWE system based on QMF is shown in Fig. 1,which containing Hi band and low band analysis sub-band coder, down sampler, G.711 encoder at transmitting terminal, G.711 decoder, up sampler, Hi band and low band synthesis sub and coder. At user end terminal, from Fig. 1, to start with, original WB speech signal through 16 KHz sampling frequency is place into two channel QMF bank [10]. Then channel bank's outcomes are decimated by two. In this way both HF and LF segments through 8 KHz sampling frequency are acquired. Next, LF parts are encoded by the NB encoder which is G.711 encoder[11]. the HF part is transmitted without changes at the transmitter side to the receiver through transmission channel. At the user end, NB speech signal is decoded through NB speech decoder and HF is restored as it is. Finally the signal is synthesized by Hi band and low band synthesis sub-band coder and near perfect reconstruction of original signal is obtained at output which can be observed on spectrum analyzer and listen speech file played on Audio device writer. Performance evaluation of speech signal based on Source filter model, Source Filter model based Analysis Source Filter model based Synthesis are shown in Fig. 2, Fig. 3 and Fig.4 respectively.

As shown in Fig.2 the original speech signal is pass through LPC analysis block to separate out LPC co-efficient and residual component which is further processed by bit stream quantization to make quantized signal level which is processed by LPC synthesizer to make compressed original speech signal[14].As exposed in Fig.3.the speech signal (wave file) is break up into frames of size 20 ms (160 samples), with an overlap of 10 ms (80 samples). Each frame is windowed using a Hamming window. Then Eleventh-order autocorrelation coefficients are initiate, and then the reflection coefficients are calculated from the autocorrelation coefficients using the Levinson approach. The original speech signal is conceded via an analysis filter, that is an all-zero filter with coefficients as the reflection coefficients obtained above. The output of the filter is the residual signal. As revealed in Fig. 4 LPC Synthesizer that is time varying filter found in the receiver section of the system, reconstruct the original signal using the reflection coefficients and the residual signal. This is played through the Audio player. Fig. 5 & 6 shows the input and output time domain waveform of the wave file "OMSHRI GANESHAY NAMAH". Fig. 7 & 8 shows the input and output frequency domain waveform of the wave file "OM SHRI GANESHAY NAMAH". from the waveforms it is clearly

identified that the signal looks very different in time domain but in frequency domain it is looks like same because of the nearly same power distribution at the same frequency will be observed in the waveform which can be heard on audio player. the result displayed on each stage by using spectrum analyzer or time scope or display is taking some time because in our simulation 1536 samples need to be updated for displaying result at each stage once the required number of samples are acquired there is no issue regarding results. One other noticeable remarks from viewing various time/frequency domain waveform is that at each stage of the source filter model approach the sampling frequency is changing so variation in signal waveform can be obtained. Pre-Emphasized Speech signal, hamming windowed Speech signal, LPC analyzer output, LPC synthesizer output & Auto cor-relation co-efficient (ACF), Reflection co-efficient (RC) and LPC co-efficient are depicted as shown in Fig. 9 to 13. The values of Reflection co-efficient (RC) must not exceeds 1 for stability point of view as depicted in Fig.13.

COCLUSION

The Novel approach presented in the paper can attain the required Bandwidth extension to improve stifled and thin speech quality. without wideband coder at transmitter side the near perfect original wideband speech has been recovered and the obtained speech signal can be further processed through source filter model intended for evaluating signal based on speech quality, frequency domain spectrogram etc.. to judge the speech signal compression. by employing source filter model in place of 160 samples only 10 LPC co-efficient, 01 bit for voiced/Unvoiced Design 01 Bit- for gain are needed so large signal compression achieved which helpful in memory and storage requirement. due to technological advancement the author is target to develop MATLAB code for supre-wideband signal from wideband signal and compare the performance analysis of the signal with Real super wideband EVS coder and AMR-WB coder. Also the stability consideration of RC co-efficient is the targeted by author for future work.

ABSTRACT

This study aims to detect the bioactive components in the Seenthil kudineer that have the therapeutic potential to combat one of the enzymes present in the dengue virus. The protein to be targeted has been chosen from the protein data bank as NS5 RNA-dependent RNA polymerase. According to Siddha literature, numerous fevers that cause mild to moderate acute hemorrhagic signs are managed with *Seenthil Kudineer*, a conventional Siddha formulation. Objective: This research article attempts to carry out the molecular docking analysis of the chosen herbal bioactive components against the target enzyme Tyrosinase in Vitiligo. Methods: Docking calculations were done for the obtainedbio-active compounds, including Tinosporide from *Tinospora cordifolia* (Thunb.) Miers, Santalic acid from *Santalum album (Linn.)*, Gingerenone-Afrom *Zingiber officinale* (Roscoe), Vasicin one from *Sida cordifolia* (Linn.), Beta-santalol from *Cyperus rotundus* (Linn.), Rutin&Geniposide from *Hedyotis corymbosa* (Linn.), Thymol from *Plectranthus vettiveriodes* (Jacob)and Ascorbic acid and Gamma-Himachalene from *Chrysopogon zizanioides* (Linn.)against Tyrosinase (PDB)-1WX3, the intended protein.The calculated energy of binding appeared to be a magnitude in kcal/mol as follows: Rutin -10.28, Geniposide-7.90, Gingerenone-7.14, Santalic acid-

Ethel Shiny *et al.,*

6.09, Gamma Himachalene-5.91, Beta-Santalol-5.80, Tinosporide-5.43, Ascorbic acid-5.32, Vasicinone-5.12 and Thymol-4.22, respectively, towards the target PDB-2J7U.Conclusion: The exploratory findings from this study corroborate the bioactive molecules present in the ingredients of Seenthil Kudineer, which have remarkable anti-viral activity for combating the dengue virus.

Keywords: *Seenthil Kudineer*, Dengue, Instrumental analysis, Molecular docking, Siddha medicine, Anti-viral

INTRODUCTION

Dengue is a common hemorrhagic viral illness that results in severe complications if not treated properly. Early diagnosis and preventive methods only protect human society from these most dangerous vector-borne illnesses. Every year, more than 1,00,000 infections and around 200 to 400 deaths occur due to this dengue virus throughout India [1]. In 2017, around 1,88,000 infections and 300 deaths were recorded by the NVBDCP. Being a multi systemic illness, the signs and symptoms of dengue progress within 1-2 days, which may result in death due to dengue shock syndrome arising from thrombocytopenia [2]. There are so many active enzymes present in the dengue virus that are capable of adhering to the host cells and causing the disease [3,4]. Among those enzymes, NS5 RNA-dependent RNA polymerase (2J7U) [5] was selected as the target to find out the interaction between the bioactive components of the ingredients of the decoction. In Siddha medicine, the *Pithasuram* mentioned in the classical Siddha textbook, *Siddha maruthuvam*-Pothu can be correlated with dengue fever [6]. So this preliminary docking study is needed to evaluate the antiviral properties of the ingredients of Seenthil kudineer, which is indicated in *Gunapadam Mooligai Vaguppu* for the treatment of *pitha suram* [7].

MATERIALS AND METHODS
Review about the drug - *Seenthil Kudineer* [7]
The drug has the following 8 herbals such as *Tinospora cordifolia* (Thunb.) Miers *(Seenthil), Santalum album (Linn.)(Santhanam),Zingiber officinale* (Roscoe.)*(Chukku), Sida cordifolia* (Linn.) *(Sittramutti), Cyperus rotundus* (Linn.) *(Korai kizhangu), Hedyotis corymbosa* (Linn.) *(Parpadagam), Plectranthus vettiveriodes* (Jacob) *(Vilamichuver) and Chrysopogon zizanioide* (Linn.)*(Veetiver).* The selected compounds from each herb were tabulated in **Table.1**

Objective of the study
The research's main objective is to track down prospective lead compounds that may adhere to essential bioactive amino acid residues.

Preparation of the Target protein-PDB ID: 2J7U [16,17]
The structure of the target protein PDB ID: 2J7U (Fig. 1), was extracted from the data bank for protein and performed a cleansing process. The Auto dock technique investigated each of the lead molecule configurations in relationship with the selected protein, and the most effective docking posture was determined considering the interaction findings from the study.

Preparation of the Ligand [18]
The herbs were selected as per the Siddha classical textbook *Gunapadam mooligai vaguppu* with the indication for *Pitha suram* (Dengue fever). The following 8 herbs were included by reviewing the previous research articles in Table 1 which had showed their bio-active molecules such asTinosporidefrom*Tinospora cordifolia* (Thunb.) Miers, Santalic acidfrom *Santalum album (Linn.),* Gingerenone-Afrom *Zingiber officinale* (Roscoe), Vasicinonefrom *Sida cordifolia* (Linn.), Beta-santalol from *Cyperus rotundus* (Linn.), Rutin & Geniposide from *Hedyotis corymbosa* (Linn.), Thymol

from *Plectranthus vettiveriodes* (Jacob)and Ascorbic acid and Gamma-Himachalene from *Chrysopogon zizanioides* (Linn.). They were retrieved from a systematic literature review and IMPAAT database.

The objective and methodology of Molecular Docking [19,20]

The binding of phyto chemicals with the core amino acids (Ser-710, Arg-737and Arg-729) of the targets by hydrogen bond formation will block the function of the enzyme since these are the prime mediators for dengue viral replication. Thereby, phyto chemicals that inhibit this enzyme may act as good therapeutic agents for the prevention, treatment, and management of dengue fever and can be assessed by this method. For the retrieved bioactive components Tinosporide from*Tinospora cordifolia* (Thunb.) Miers, Santalic acidfrom *Santalum album (Linn.),* Gingerenone-Afrom *Zingiber officinale* (Roscoe), Vasicinonefrom *Sida cordifolia* (Linn.), Beta-santalol from *Cyperus rotundus* (Linn.), Rutin&Geniposidefrom *Hedyotis corymbosa* (Linn.), Thymol from *Plectranthus vettiveriodes* (Jacob)and Ascorbic acid and Gamma-Himachalene from *Chrysopogon zizanioides* (Linn.)r was tested against the target using software the Auto Dock 4. The 2D & 3D structures of the ligands of phytochemicals selected from the ingredients of Seenthil Kudineer have been presented in **Figure.1** and the properties of the ligands have been tabulated in **Table.2.**

RESULTS AND DISCUSSION

The results revealed that the bioactive components in the Seenthil kudineer formulation showed better interaction with the target-PDB 2J7U. The Total Interaction Surface, Inhibition constant, , Electrostatic energy, Binding Free energy and Intermolecular energy of all the compounds have been tabulated in Table.3

Rutin - Binding with target PDB - 2J7U

From the table.3, the Rutin possesses an intense interaction bond with the 729 ARG, 737 ARG and 710 SER. The Rutin's binding score found to be -10.28kcal/mol. Figure 3 displays the hydrogen bond plot and interaction ligand of the compound Rutinin 2D &3D.

Geniposide - Binding with target PDB - 2J7U

From the table.3, the Geniposide possesses an intense interaction bond with the 729 ARG, 737 ARG and 710 SER. The Geniposide's binding score found to be -7.90kcal/mol. Figure 4 displays the hydrogen bond plot and interaction ligand of the compound Geniposidein 2D &3D.

Gingerenone-A-Binding with target PDB - 2J7U

From the table.3, the Gingerenone-A possesses an intense interaction bond with the 729 ARG, 737 ARG and 710 SER. The Gingerenone-A's binding score found to be -7.14kcal/mol. Figure 5 displays the hydrogen bond plot and interaction ligand of the compound Gingerenone- A in 2D &3D.

Santalic acid- - Binding with target PDB - 2J7U

From the table.3, the Santalic acid possesses an intense interaction bond with the 729 ARG, 737 ARG and 710 SER. The Santalic acid's binding score found to be -6.09kcal/mol. Figure 6 displays the hydrogen bond plot and interaction ligand of the compound Santalic acidin 2D &3D.

Gamma- Himachalene- Binding with target PDB - 2J7U

From the table.3, the Gamma- Himachalene possesses an intense interaction bond with the 710 SER and 729 ARG. The Gamma- Himachalene's binding score found to be -5.91kcal/mol. Figure 7 displays the hydrogen bond plot and interaction ligand of the compound Santalic acidin 2D &3D.

Ethel Shiny *et al.,*

Beta-santalol - Binding with target PDB - 2J7U
From the table.3, the Beta-santalol possesses an intense interaction bond with 729 ARG and 737 ARG. The Beta-santalol's binding score found to be -5.80kcal/mol. Figure 8 displays the hydrogen bond plot and interaction ligand of the compound Beta-santalolin 2D &3D.

Tinosporide - Binding with target PDB - 2J7U
From the table.3, the Tinosporide possesses an intense interaction bond with 729 ARG, 737 ARG and 710 SER. The Tinosporide's binding score found to be -5.43kcal/mol. Figure 9 displays the hydrogen bond plot and interaction ligand of the compound Tinosporidein 2D &3D.

Ascorbic acid - Binding with target PDB - 2J7U
From the table.3, the Ascorbic acid possesses an intense interaction bond with the 710 SER and 729 ARG. The Ascorbic acid's binding score found to be -5.32kcal/mol. Figure 10 displays the hydrogen bond plot and interaction ligand of the compound Ascorbic acidin 2D &3D.

Vasicinone - Binding with target PDB - 2J7U
From the table.3, the Vasicinone possesses an intense interaction bond with the 729 ARG. The Vasicinone's binding score found to be -5.12kcal/mol. Figure 11 displays the hydrogen bond plot and interaction ligand of the compound Vasicinonein 2D &3D.

Thymol - Binding with target PDB - 2J7U
From the table.3, the Thymol possesses an intense interaction bond with the 729 ARG. The Thymol's binding score found to be -4.22kcal/mol. Figure 12 displays the hydrogen bond plot and interaction ligand of the compound Thymolin 2D &3D.

CONCLUSION

Recent therapeutic management available for dengue is only effective in controlling the further severity of symptoms. Hence, in recent times, people have most on integrative treatments for the prevention of dengue. With the help of already published research articles, an array of 10 bioactive components are found in the selected8 herbs in the poly herbal formulation Seenthil kudineer which is indicated for the treatment of Pitha suram (Dengue fever in modern medicine), etc., in the AYUSH system of medicine. Rutin showed a maximum affinity for binding of -10.28kcal/mol, according to the given data in the Table . At -7.90 kcal/mol, Geniposide exhibited the second-highest binding capacity to the amino acids Arg-737, Arg-729, and Ser-710, followed by Gingerenone-A, Santalic acid, Gamma- Himachalene, Beta-santalol, Tinosporide, Ascorbic acid, Vasicinone, Thymol with binding energies in the units of kcal/molof -7.14, -6.09, -5.91, -5.80, -5.43,-5.32, -5.12, and -4.22, respectively (Table 3). Three active sites of amino acids are shared by Rutin, Geniposide, Gingerenone-A, Santalic acid and Tinosporide, whereas two are shared among Gamma- Himachalene, Beta-santalol and Ascorbic acid. Only one active site amino acid is shared by Vasicinone, Thymol(Table 4). This study concluded that the bio-active compounds like Rutin, Geniposide, Gingerenone-A, Santalic acid, Gamma- Himachalene, Beta-santalol, Tinosporide, Ascorbic acid, Vasicinone and Thymol in *Seenthil kudineer*possess significant binding against the amino acid residues . So, the exploratory findings from this study corroborate the bioactive molecules in *Seenthil kudineer,* which have remarkable anti-viral activity for combating the dengue virus.

ABSTRACT

Mikhail Bakhtin is famous for his dialogism. In his dialogic theory, Bakht in has explained many parts covering language polyphony, heteroglossia, and carnivalesque. Moreover, postmodern research also focuses on *dialogism* in texts written in the past. The research paper endeavorsto delve deep into the tragic theories and pull out the dialogic concept of Bakhtinin Shakespearian plays especially *King Lear and Macbeth.* The term 'Dialogism' comes from dialogue which is an integral part of plays. Bakht in in his theory of dialogism hasside-stepped the use and implication of *dialogism* in drama. In fact,*dialogism* is the grounding element of drama but Bakhtin unfortunately inhabited its significance only in novels. Itis a bid to explain the use of *Dialogism*in various Shakespearian plays. The paper explores the meaning of dialogism and the use of the idea in different tones, either in verbal or written. In dialogic culture, the emphasis is placed on individual traits at play within between cultural groups. Bakhtin opines every dialogue human possesses the capacity to resist, confront and make personal meanings out of change. The paper deduces the fact that dialogic interpretation has extensive scope apart from novels.

Keywords: Dialogism, Polyphony, Heteroglossia, carnivalesque, confront.

Kuriakose Varkey and Parul Mishra

INTRODUCTION

Dialogism is used in many literary works of Mikhail Bakhtin. The particular study focuses on how William Shakespeare's [7] plays are the abundant warehouses of the concept of dialogism. Graham Peachey [6] says, "Mikhail Bakhtin is one of the most influential theorists of philosophy as well as literary studies. His work on dialogue and discourse has changed the way in which we read texts – both literary and cultural – and his practice of philosophy in literary refraction and philological exploration has made him a pioneering figure in the twentieth-century convergence of the two disciplines"(Taylor & Francis). Bakhtin was born in Oryol, Russia in 1895. His works inspired many writers in the field of philosophy, sociology, anthropology, psychology, linguistics, and many other disciplines. He was associated with Russian Formalism, a school of literary criticism that emphasized the functional role of literary devices. Bakhtin's theories were unknown to Western literary scholars. He became famous posthumously. Bakhtin's earlier works stressed ethics and aesthetics. His notion was that a literary work was a crafted idea and the unity of a technical implement. A literary theory that analysis of various levels of communication between works of literature and other authors. In his 1984 study, 'Problems of Dostoevsky's Poetics', Bakhtin states that life expands from one mass to another and one context to another, one social context to another, and from one generation to another. The world is a bridge between myself and another.

 Just as structura lists, Bakhtin's ideas can be said to have sprung from the Russian formalist movement by sharing an interest in the methods of narrative and literary styles (189- 190). But where the formalists' scientific and historical outlook led them to exclusively focus on the technicalities, and the methods of mystification, of texts, Bakhtin, much like the New Historicists, also acknowledged the social and ideological dimension of language (90). Thus, for Bakhtin, Holquist [4] says, "words in literature are not part of the impersonal code of language but as discourse directly dependent on "particular subjects in specific situations"(68). Consequently, literature is a form of communication rather than an independent object, as it, like other types of expressions, depends on the sociohistorical context "at work when the text is produced and when it is consumed"(68-69). The situation that operates the meaning of utterances in literary texts, Bakhtin calls it as heteroglossia; It is a situation in which the subject is "surrounded by the myriad responses he or she might make at any point, but any of which must be framed in a specific discourse selected from the teeming thousands available" (69). Moreover, what can be seen as central to idea of heteroglossia is the notion that the meaning of a word just uttered will be dependent on the circumstantial and unstable conditions of that specific time and place (70). Taghizadeh and Faizi [8] quote in his research, "The fact that it is nearly impossible to decipher all the details that might influence the meaning of dialogues in plays such as Hamlet, for example tone of voice and subtle body language, gives further emphasis to the Bakhtinian notion of literature as essentially finalize – that is, constantly developing, out of reach for any one-sided interpretation (110).

RESEARCH METHODOLOGY

To letter this research paper, the Qualitative Approach of research is followed, wherein the primary sources of selected texts by William Shakespeare like Macbeth, King Lear, and more plays have been analyzed and studied to extract the use of dialogism. To further validate the resources secured by the critical study of various papers written on similar topics.

Dialogism

The word 'Dialogism' extracted from 'dialogue and Bakhtin compared monologue with dialogue. Many poets like Jonh Donne and Robert Browning are the masters of monologue. Browing's 'My last Duchess and Porphyria's Lover are more fascinating works. Bakhtin believe if a person has something in his mind, it is monologue. It was certain that Bakhtin's deep awareness about social, cultural relations and knew language is the only way to express his themes. He puts forward this theory in his "Problems of Dostoevsky's poetics". In dialogism, there is always a room for debate since inquiry is approached ontological emphasizing point of view rather than truth. (67) According to

67994

Kuriakose Varkey and Parul Mishra

Bakhtin, every human possesses the capacity to resist, confront and make personal meanings out of social change. In dialogism, emphasis is placed on individual personalities at play within and between cultural groups (Bakhtin 1985) rather than seeking consequences as a necessary outcome of Dialogism of Bakhtin. Postmodern writers believe poetry is monologic, it has no social connections. In prose, words are dialogical, there is an engagement of different characters, views, voices and world views. Dialogues are generally double-voiced, ironic, parodies or words used in quotations. Double words contain two meanings, one literal and monologic meaning.

Heteroglossia
A dialogue contains conventions, discussions, and views. Bakhtin used the term 'heteroglossia'. which is the use of multiple variations of language and ideas within the language. People use words differently; the same words are used in different circumstances differently. As the speaker is a social person, speaks the same matter, and when he speaks to children, wives, parents, and friends, there is a variation of expression. A village inhabitant expresses his notions using local dialects that might not be the language of a city dweller even though the idea must be similar. Only the way of expression is different. Shakespearian dialects are not commonly used in England. In all his texts, a different kind of diction is casted-off. Heteroglossia is well established in Virginia Woolf's *'Mrs. Dalloway'*, Clarissa Dalloway is the female protagonist and a fictional high-class society lady in the English post-world war. Mrs. Dolla way said she would buy the flowers herself; it seems a very trivial act. But the single line provokes the readers to keep the multiple thought. Readers of various sections of society imbibe it differently.

Polyphony-it is related to music composition in which more than one melodious lineis sung simultaneously in a harmonic way refers to the polarity of independent unmeshed voices or consciousness, different word views but interact with each other they don't change their worldview, they remain independent. We as readers, while reading feel that it is not written by a single author but rather too many characters. Bakhtin says Tolstoy's works are monologic. All characters have their dialogue but they merge in the authors' view it becomes monologic. Dostoevsky's characters are not objective but plural. If the voices of the characters are merged the voices of the author, it does not become dialogic but the polyphonic

Carnivalesque This term is developed from the carnival. In the medieval period, during the time of Christmas, common people used to drink, enjoy and have merriment, sex, sing and dance and have fun free, a kind of democratic culture, social hierarchy was free, people of different culture engaged in different activities irrespective of their social status. People of opposite nature tried to interact with each other. The word 'carnival' in literature refers to the movement in literature or literature as whole when such types of situations are oriented. Shakespeare is "Carnivalesque" than polyphonic. One may, however, think otherwise, and Knowles (1998:11) and also believes that "The oddest thing of all is that is the opposite seems self-evident". "Here hung lips that I have kissed I know not how oft"-HamletAct5(seen1 -175), the grave digger sees one skull (grave digger's scene), the gravedigger is indifferent to that but Hamlet identifies that the skull is the skull of York He found it meaningless whether it was the skull of Julius Caesar, Alexander, or a beggar, all are meaningless.

The social hierarchy has no meaning. Death is the great equalizer; Prince Hamlet realizes it. This moment can be termed as carnivalesque in drama. Bakhtin argues that carnivalization reached its highest peak in Farva Revile and Theodore Dostoevsky. His characters line in a border of its opposites, they have opposite world views and contrast in their views but they interact with each other, they compete with each other and some of his characters are low and some are high, and some are lofty and some are destructive, but they compete with each other, they do not change their world views but they try to understand each other and came to a consensus. Dostoevsky does not come to a finalization of his character's consensus because he realizes it has to be put for the future. He possessed a negative capability. Bakhtin traduces the term 'Heteroglossia' to mention the plurality of independent, autonomous, merged voices in literary texts, be it novel, drama or any other narrative texts. Dialogic criticism refers to as type of criticism which is based on the unique concepts introduced by Bakhtin in his literary studies.

Kuriakose Varkey and Parul Mishra

William Shakespeare

Ben Johnson [5] calls Shakespeare, "not of an age but for all time". Shakespeare, the dramatist of all time, seasons that world has ever produced. He is mostly quoted immediately after the Bible. His works have been produced in almost all the languages. Shakespearian plays are modified in many languages. His characters have social realities rather than theatrical realities, characters like Julius Caesar, Hamlet, King Lear, Othello, Macbeth, Shlock and many. At the early stages of his career, Shakespeare himself was an actor, and be loyal to the Queen Elezabeth and wanted get the patronage from the queen. In his life time, Shakespeare, had seen the age of Elizabeth and Jacobean. In 1585, he started his career and opened a drama company named 'Lord Chamberline's man' and this company was known as Kings Man. Up to 1613, he extended his writings and at the age of 49, he took retirement from writing.The years in between 1585 and 1592 have been called "the lost years" as there was no record of his life was not known to the world. At the outset, Shakespeare wrote comedies and then historical plays and tragedies. At the last stage of his writings, Shakespeare wrote romantic plays. Shakespeare never wrote anything for become famous but for money. There were two actor friends, John Hemmings and Henry Condell in his drama company, and they published his first folio in 1623. And the preface of these first two folios were written by Ben Johnson. In 1603, queen Elizebeth died and King JamesI came in to the throne and he gave the Royal Patent to Shakespeare's company and the name became King's Man. In 1599, Shakespeare opened a theatre named Globe Theatre in partnership. This theatre was opened for all classes, neglecting the social status. He wanted his plays should be attracted to all classes. By then, Shakespeare became rich and bought lot of properties in London and his birthplace Stort ford. In1610, Shakespeare retired form his public life as an early age. It was the time of plague in London it might be the reason for the early retirement form the public life, not from writing. But he wrote in collaboration with John Fletcher. In 1613 he completed his writings, and he spent his remaining life in his native village Stratford-up on Avon and in April,1616, he took his last breath and buried in his nearby country churchyard. It was written on his tomb, "Good friend for Jesus' sake forebear. To dig the dust enclosed here. Blessed be the man that spares these stones. And cursed be he that moves my stones". Shakespeare always wrote on fashion prevailed in the market. His best works were written in Jacobean Age nevertheless he was known as an Elizabethan playwright.

Shakespearean Plays

Shakespearian plays are unmatchable, which are classified as comedies, historical plays, tragedies and tragicomedies. There are 37 plays altogether. Shakespearian plays were written mainly in Elizabethan and Jacobean Age. His well-known tragedies are Hamlet, Julius Caser, king Lear, Macbeth, Antony and Cleopatra, Coriolanus, Othello and many. Shakespearean comedies are sub divided into tragicomedies, romances and problem plays, which are the dramas have elements of tragedies, humour and complex plots, an important play in this category is "All well that end well" and was written in between (1601-1605).And "As You Like It" is one of the most important comic plays (1598-1600). Another important problem play is "Measure for Measure" (1603-1604) Merchant of Venice(1596-1597), and Mid-Summer Night's Dream(1595-1596) "The Tempest" is the tragi- comedy or late romances, written in the year1611.Historical pays or chronical plays are Henry IV(I), Henry IV(II), and also HenryV, and Henry VI(III), king John and so on they all belong to the real king of England. Shakespearean tragic characters are generally isolated ones. They are socially broken down like Hamlet and King Lear. Occurrences are inseparable and indispensable. The central characters are generally nobles but due to the flaw of the characters lead them to the drastic end. Most of the historical characters are English monarchs, they glorify and propagate king or queen's vitality and courage. Many historians opine that Shakespearian characters are real like beings, and powerful presentation of images but Dr, Johnson's view is something different "[S]spectators are always in their senses, and know, from the first act to the last, that the stage is only a stage, and that the players are only players." Shakespeare extracted plots for his plays from the known areas with good reasons. It was for the situations, To establish Scottish history he plotted 'Macbeth' and published in the 'First Folio' by his friends.

Dialogism in King Lear

Dialogism is the term used specially by Mikhail Bakhtin, the Russian formalist. Bakhtin used this term in his works "Problems of Dostoevsky's Poetics" and "Rabelais and His World", but do not have the connections with plays. Bakhtin never talked about dialogism in plays. Writer speaks through characters. When they speak, there is a

Kuriakose Varkey and Parul Mishra

diversification of meaning. It is not only the character, but the author's view is there, and justification of the reader, and the look out of the audience, all are different. The study attempts to establish major implications of *dialogism* in King *Lear*. Michael Gardiner [3] distinguishes dialogism and monologismin two respects. Monologic world is always gravities itself only and is a referential object. But the dialogic aspect is locked into an intense relationship with the world the of others. It is having an address towards someone- a listener, an arbitrator or simply anyone. There is always a chance of response. Dialogue is a passive vehicle of neutrality of information or description. It is designed to provoke a response and it gives the chance of initiating another dialogue or to initiate a dialogue, it is a coliseum for the battle between different voices and is charged with hostile, burlesque, appraisal and many more. What Bakhtin means is that dialogue utterances isas 'double – voiced', 'vari -directional, and 'multi accented'. (28-29). Shakespearean plays have instances of dialogism. Many of his plays can be studied in light of the theory of Dialogism. King Lear addressing the elements in another part of the Heath and The Fool listens the talk. King Lear is caught in the trouble of dangerous storm, thunder and lightning. He is left with two of his daughters Goneril and Regan, and the youngest daughter Cordelia is married to the King of France and he became alone and curses himself about his for his wrong decision to leave Cordelia with bare hands. He was fallen into the craft of the other daughters and vexed to take the right decision.

Lear:"Blow, winds, and crack your cheeks! rage! blow!
You cataracts and hurricane, spout
Till you have drench'd our steeples, drown'd the cocks
You sulphurous and thought-executing fires,
Vaunt- couriers of oak-cleaving thunderbolts,
Singe my white head! And thou,all-shaking thunder,
Strike flat the thick rotundity o'th' world!
Crack Nature's moulds, all German spill at once
That makes ingrateful man!" (Ac. III sc. II 1-10)

King Lear's incoherent mad words show the pride of a King though he lost his wit.A king can never lose his natural rights. No natural power can defeat and challenge him. When the king transfers his power and authority to the daughters, marks the beginning of the downfall his personality.

Lear:"Nature's above art in that respect. There's you
Press- money. That fellow handles his bow like a
Crow- keeper: draw me a cloth's yard. Look, look!
A mouse, Peace, peace! This piece of toasted cheese
Will don't. There's my gauntlet; I'll prove it on a giant.
(Ac. IV sc. VI 86-91)

King Lear's character has a marked development. It is treated as the greatest portrayal of the dual character of a hero in the same play. In the beginning, Lear strikes as haughty, cocky, egoistic, self-centred, conceited, and smug, buttowards the end, became benign, compassionate, merciful, and reticent. Humility is the striking characteristic of Lear in Acts IV and V. Misfortune can be the ultimate reason for this behavioural change. It is the redemption of Lear's character when he happens to see his youngest daughter as a prisoner with him.

Lear. No, no, no, no! Come, let's away to prison:
We two alone will sing like bird i'th' cage:
When thou dost ask me blessing, I'll kneel down,
And ask of thee forgiveness: so we'll live,
And pry and sing, tell old tales, and laugh
At glided butterflies, and hear poor rogues
Talk of court news; and we'll talk with them too,

Kuriakose Varkey and Parul Mishra

Dialogism in Macbeth

Bost ad [2] said that Drama is more dialogic than any other forms of literature if spite of the unjust view of Bakhtin towards drama. In drama, author's view, more confrontation of characters and readers view is established well. There is 'polyphony 'of language and manipulation of ideas arise as the 'dialogic' establishment is more prevalent in drama. Human relations are equipped with conflicts and charges. But not aimed for others. In such interactions, sounds are signs [which are] in this seen as an open meaning resource; their actual meaning can emerge in situated, specific social interaction (7), Like any of other Shakespearian plays, 'Macbeth' is a warehouse of Bakhtinian concept of dialogism. Bakhtin supports his peer A.V. Lunacharsky that "Shakespeare is polyphonic to the extreme"(32) He writes: "Lunacharsky is correct in the sense that certain elements, embryonic rudiments, early buddings of polyphony can indeed be detected in the dramas of Shakespeare" (33). However, this statement is immediately undermined when he thinks that "but to speak of a fully formed and deliberate polyphonic quality in Shakespeare's drama is in our opinion simply is impossible"(33) Mikhail Bakhtin's [1] dialogism is well established in William Shakespear's 'Macbeth'. Shakespearean plays dramatize human relations, conflict-ridden contexts and provide space for dialogue as prescribed by Bakhtin. In 'Macbeth', William Shakespeare picturised the protagonist Macbeth and his progression is being like a valiant undefeatable warrior, and then in due course a conspirator and then to a cold-blooded murderer. But he some time becomes a philosopher in the way of his intellectual dialogues. The greed for power and witch craft leads his wit to a treacherous dictator and plot the murder of his own King by plotting with some hired murders. It became a need for him due to not only his inner turmoil but also his excessive greed for power belief in witches' phony. Depth of psychology is traced in the 'scene of dagger and porter'. The scene depicts the destructive nature and the travel of Macbeth towards the self-entity and psychological blood shed of King Duncan. Lady Macbeth quotes, "Infirm of purpose! Give the daggers" (255). The fulfilment of the prophecy turns Macbeth into covetous and gluttonous and the thought of murdering his own pious king. When the noble, Ross calls him 'thane of Cawdor', Macbeth's mind yearned for the power of throne but he is sceptic of the prophecy.

Macbeth. Stay, you imperfect speakers, tell me more
By Sinel's death I know I am Thane of Glaimis;
But how of Cawdor? The Thane of Cawdor lives,
A prosperous gentle man; and to be king
Standsnot within the prospect of belief,
No more than to be Cawdor, Say from whence
You owe this strange intelligence? or why
Up on this blasted health you stop our way
With such prophetic greeting? Speak. I charge you.
(Ac. I sc. III70-78)

Another instance of dialogic eloquence is seen Act IIIof Macbeth. The wicked state of utterance, despite of the murderer- self of Macbeth expresses the quality of a warrior. The mental state of Macbeth becomes irrational, and Lady Macbeth tries to sooth him.

Macbeth. We have scotch' the snake, not kill'd it:
Sh'll close and be herself, whilst our poor malice
Remains in danger of her former tooth.
But the frame of things disjoints, both the worlds suffer,
Ere we will eat our meal in fear, and sleep
In the affliction of these terrible dreams
That shake us nighty. Better be with the dead,
Whom we, to gain our peace, have sent to peace,
Than on the torture of the mind to lie
In restless ecstasy. Duncan is in his grave;
After life's fitful fever he sleeps well;

Kuriakose Varkey and Parul Mishra

Treason has done his worst: nor steel, poison,
Malice domestic, foreign levy, nothing
Can touch him further:
(Ac. III sc.II 14-27)

In its richness of importance and complexity of dialogism, Macbeth becomes philosophical when he hears about the death of his wife Lady Macbeth, and thinks about the trifling nature of life. The analogy of life and his greed for power still makes him more philosophical. Ambition, violence, fate, natural and unnatural incidents, and the reflection of manhood.

Macbeth. She should have died hereafter.
There would have been a time for such a word.
Tomorrow, and to-morrow, and to-morrow,
Creeps in this pretty pace from day to day,
To the last syllable of recorded time;
And all our yesterdays have lighted fools
The way to dusty death. Out, out, brief candle!
Lif's is but a walking shadow, a poor player
That struts and frets his hour upon the stage,
And then is heard no more; it is a tale
Told by an idiot, full of sound and fury,
Signifying nothing.
(Ac.V Sc. V 16-28)

FINDINGS

In the research, it is found that William Shakespeare used dialogism, carnivalesque, heteroglossia, and polyphony in almost all the plays. Mikhail Bakhtin emphasized these terms in his novels only and never tried to use these terms in plays. Shakespeare had experimented with all these terms many years before. The characters like Hamlet, Macbeth, King Lear, and Julies Caesar and their dialogues are real-like figures. The speeches of these characters are addressed to someone. Shakespearian characters have a perpetual existence away from the writer.

CONCLUSION

The study focuses on Michail Bakhtin's dialogism in William Shakespeare's two plays, "King Lear and Macbeth." Bakhtin emphasized the theory of dialogism in novels. Dialogue is a fundamental part of drama, but Bakhtin side-lined the necessity of dialogues in plays. Bakhtin's *dialogism* is an extract from dialogue, which is the core of all plays especially in Shakespearean plays. Shakespearean characters live through their dialogues. Shakespeare as a writer is the embodiment of human freedom. This paper fully focuses on the multiple theories of Mikhail Bakhtin's 'Dialogic theory and its various dimensions and an attempt at the Bakhtini an theory of dialogism in Shakespearian plays especially *King Lear and Macbeth.* The dialogues used in Shakespearean plays are addressed to someone. The language of *King Lear and Macbeth* are *dialogic* in multiple scenes and are both the fulfillment of desired intentions and communication. *Polyphony* of language emerges due to conflict and tension. Language is never a simple means of extracting the world of abstract ideas into extensive forms. It is deeply charged with significance; it stays even beyond the scope and control of the speaker. The interpretations of language are multi-dimensional.

ABSTRACT

The study explores the landscape of parent brand and brand extension literature, employing bibliometric analysis, performance analysis, science mapping, and network analysis to unveil trends and future research directions. Analyzing 195 articles from Scopus, the research reveals a burgeoning trend in collaborative research, with the United States, China, and Spain leading in both individual and collaborative contributions. Key journals include the "*Journal of Product and Brand Management," "Journal of Brand Management,"* and "*Journal of Business Research.*" The study identified 'brand extension' as the most frequently used keyword in the domain. The study also identifies annual publication trends, most prolific subject areas, top authors, institutions, themes, references, publications, sources, and emerging trends in the domain. Additionally, the study examines the collaboration patterns among countries and the collaboration output of different nations. The study also creates a three-field plot and references spectrography of documents for an in-depth analysis of the domain. Practical implications span academia, businesses, and marketers, providing insights into research gaps and areas requiring further investigation. The study's uniqueness lies in its comprehensive methodology, utilizing advanced tools like Biblioshiny, VOSviewer, and MS Excel to offer an in-depth understanding of the domain.
Keywords- Literature Review, Bibliometric Analysis, Parent Brand, Brand Extension, Network Visualization, Core Brand.

INTRODUCTION

The changing market dynamics have a significant influence on business decisions. To stay ahead of the competition in this tumultuous, intricate, and competitive economic environment, organizations must implement a variety of marketing methods. One of the key methods most corporations use is the frequent development of new products and their launching to keep up with the competition. There is a significant risk involved for many businesses when they introduce new goods or services or enter new markets (Bousch & Loken, 1991). It is very risky for corporations to bet on new brands or products that are entirely new to the market. In such a situation, corporations leverage their old brands that are already established in the market. The use of an existing brand name while permitting an established brand to enter a completely new product class is referred to as a 'brand extension strategy' (Aaker & Keller, 1990; Tauber, 1981). It should come as no surprise that companies selling consumer products are lining up to capitalize on the value of well-known brands through expanded launches. This is most preferred by corporations to leverage already established, profitable, trusted, and lovable brands rather than to launch an entirely new brand. This preference is mostly due to the parent brand's advantages in terms of brand equity, providing protection against a hazardous and likely failed brand launch. There is a widespread idea that brand extension techniques strengthen and convey strong brand positioning, raise awareness and quality associations, and boost the likelihood of trial by lowering customer risk for new products. Brand extensions, or the use of well-known brand names for new product debuts, are such highly common branding strategies among corporations that almost 80% of new product debuts in some product categories are brand extensions (Keller, 2003). So, it can be concluded evidently that the brand extension strategy is a very pertinent and crucial strategy for corporations in this era, but its success, failure, and acceptance depend on the brand that owns these extensions. The present study will look into the domain of extended brands as well as the parent brand's literature published in the Scopus database. Various strategies, as well as techniques, are used in the following analysis. A description of all these elements as well as their results and findings will be presented in upcoming sections using graphs, tables, and diagrams.

BACKGROUND OF THE STUDY

The study of brand extensions has been a topic of interest among academics and researchers for several decades. The foundation for this research area was established in the 1960s and 1980s, with a focus on semantic generalization and the transfer of perceived similarity between parent brands and extended brands (Boush et al., 1987). The categorization approach developed by cognitive psychology, specifically the work of Rosch & Mervis (1975), provided the basis for advancements in understanding brand extensions (Boush et al., 1987). Building on the groundwork laid by previous studies, Aaker and Keller (1990) made significant contributions by examining the three essential elements of perceived similarity: complementarity, substitutability, and transferability, as well as the overall quality of the original brand and the perceived difficulty of the extension. These findings served as the basis for subsequent studies and further contributed to the field (Aaker & Keller, 1990). Researchers explored various methodologies, such as the theory-based approach, which incorporated contextual influences in the evaluation process (Barsalou, 1982; Cohen & Basu, 1987; Murphy & Medin, 1985; Sujan, 1985).The study of brand extensions gained momentum in the 1990s. Loken and Roedder John (1993) provided empirical evidence on the detrimental effects of brand extensions on the core brand image, focusing on specific attributes rather than the brand image as a whole. Further investigations into brand extension typology and evaluation methods were conducted by Boush and Loken (1991), who examined the breadth of psychological processes and the range of a brand's existing offerings (Boush & Loken, 1991). Their research highlighted the two-stage evaluation process utilized by consumers when assessing reasonably common extensions, involving classification attempts followed by piecemeal processing (Boush & Loken, 1991).

RESEARCH OBJECTIVES

This research study aims to guide future research in core brand and brand extensions by uncovering trends and research gaps. The objectives of this study include analyzing annual publication patterns, subject area contributions, leading journals, prolific authors, and prominent sources. It also explores global scientific collaboration, highly cited

publications, frequently cited references, keywords, and the most used research themes in the domain. The study further analyses the literature using a three-field plot and referencespectrography for a more comprehensive analysis. Utilizing Biblioshiny, VOSviewer, and MS-Excel, the study conducted performance analysis, science mapping, and network analysis. These objectives collectively offer a nuanced understanding of the domain, providing a valuable roadmap for researchers in this field.

RESEARCH METHODOLOGY AND TECHNIQUES

This study utilizes a comprehensive bibliometric analysis methodology to examine the literature on "Parent brand" and "Brand extensions" using mathematical and statistical techniques within the field of bibliometrics (Rodriguez et al., 2020). The analysis incorporates performance analysis and scientific mapping for better bibliometric analysis, following the recommendations of Cobo et al. (2011). Performance analysis aims to measure the output and impact of scientific publications, providing insights into the productivity and influence of authors, universities, and countries. Scientific mapping analysis helps identify structural and dynamic patterns in research. Moreover, the "PRISMA flowchart also used in the presented study, PRISMA" likely refers to the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) framework. PRISMA is a widely accepted set of guidelines used in academic research for conducting systematic reviews and meta-analyses."Computer tools such as VOSviewer and Biblioshiny are utilized to construct bibliometric networks for journals, authors, specific papers, bibliographic coupling, co-citation, or co-authorship analysis.

Search Strategy and Search String

The bibliographic information for this research was collected using the Scopus database, which was chosen due to its vast collection of publications. Scopus is widely recognized as the largest database of journals, surpassing other databases like "Web of Science" in terms of the number of publications it includes. This vast coverage makes Scopus an ideal choice for conducting this bibliometric analysis. PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) flowcharts provide a standardized graphical representation of the systematic review process. Covidence, a tool designed to streamline and manage systematic review workflows, including the creation of PRISMA flowcharts, was utilized for screening purposes in this study. Figure 1 illustrates the various search strings used to ensure comprehensive coverage of articles related to core brand, parent brand, brand extensions, extended brands, and brand stretching. Keywords such as core brand, parent brand, brand extensions, extended brands, and brand stretching were included in the search query: '(TITLE-ABS-KEY("CORE BRAND") OR TITLE-ABS-KEY("PARENT BRAND") AND TITLE-ABS-KEY("BRAND EXTENSION") OR TITLE-ABS-KEY("EXTENDED BRANDS") OR TITLE-ABS-KEY("BRAND STRETCHING"))'. The Scopus database's title-abstract-keywords column was searched using these keywords. The search was further narrowed down to English articles published between 2004 and 2023: '(LIMIT-TO(LANGUAGE, "English") AND PUBYEAR > 2003 AND PUBYEAR < 2024)'. Only journals and sources related to business, management, accounting, social sciences, psychology, arts, and humanities were included in the analysis: '(LIMIT-TO(SUBJAREA, "BUSI") OR LIMIT-TO(SUBJAREA, "SOCI") OR LIMIT-TO(SUBJAREA, "PSYC") OR LIMIT-TO(SUBJAREA, "ARTS"))'. Initially, 269 articles were extracted from Scopus, with the subsequent exclusion of 74 studies due to their irrelevancy,after screening titles, abstracts, and full-length articles, and the elimination of one article due to itsduplicity. Covidence software facilitated this screening process. Following these steps, the analysis focused on 195 articles, and the results are detailed in the subsequent sections of the study.

DATA ANALYSIS AND RESULTS

The analysis is focused solely on 195 articles that appeared in 92 different sources. Table 1 provides all pertinent information about the publications, such as the average age of papers (9.38 years), the average number of citations per document (27.64), and the annual growth rate (-1.5). There were a total of 23 single-authored documents and the remainder were co-authored. 401 authors worked on these articles, and 507 authors' keywords were used. Based on 8647 references, these articles were compiled.

Mohit *et al.,*

Figure 2 displays the annual trend of papers published between 2004 and 2023. After reaching a peak in 2010, the number of publications in the domain decreased. From 2006 to 2010, the number of research articles in the field increased significantly. The number of scientific papers was at its lowest in 2023 since 2003, but it can't be denied that the data for 2023 is only up to April 20, 2023. The graph above illustrates all variations in the number of publications for the selected years. The proportion of publications across various subjects is illustrated in Figure 3. The primary influence on the topic at hand was "Business Management and Accounting," constituting 61.9% of all research articles. This was followed by subject areas in "Economics, Econometrics, and Finance," "Social Sciences," and "Psychology. The analysis of all top sources is presented in this section. The results of the analysis revealed that the *'Journal of Product and Brand Management'* is at the top with 17 documents in the domain, 432 total citations, an 11 h-index, a 17 g-index, and an average citation of 25.4 per publication. Following this, the *"Journal of Brand Management"* ranks second with a total of 9 documents in the domain, a 7 h-index, a 9 g-index, a .467 m-index, 140 total citations, and an average citation of 15.6 per publication. The third rank is held by the *'Journal of Business Research'* with an 8 h-index, a 9 g-index, a .5 m-index, 9 publications in the domain, and an average citation of 19.2 per publication. The fourth rank is occupied by the '*InternationalJournal of Research in Marketing'* with 7 documents, a 6 h-index, a 7 g-index, a .333 m-index, 334 total citations, and an average citation of 47.7 per document.

The contribution of a country can be evaluated using the number of publications published in the domain area. The collaboration network depicted in Figure 6 indicates that the United States has the highest number of articles (34) in which it has the most independent articles (25) and the rest 9 are multiple collaboration publications, accounting for the highest percentage of total publications. China came in second with a total of 18 publications in total from which,12 papers are single-authored, and 6 are multiple authors collaborations, Spain is ranked next with 6 and 6 single and multiple collaboration publications. Germany followed the rank next with 10 publications in total and 5 and 5 publications as SCP and MCP respectively. India followed ranked with 10 papers and all publications made are single-authored only. There is no multiple collaboration publication by India in the domain. The international research partnership is represented by the map's blue tint and a description of that is given in above table 4. The degree of author collaboration may be seen in the pink ring that links the various nations. It is intriguing to see how the nations with the greatest number of publications on the topic area worked together in this manner. The frequency of collaboration between the United Kingdom and Spain is the greatest at 5. The United States collaborated with China, Chile, Canada, and the Netherlands for 4 publications each.

The analysis of leading authors has been conducted, and the results revealed that "Sattler H" is the most productive author in the domain. The author has 6 documents in the domain, a 6 h-index, a 6 g-index, a .333 m-index, 785 total citations, and an average citation of 130.83 per publication. The second rank is occupied by "Boisvert J" with 5 documents, a 4 h-index, a 5 g-index, a .267 mindex, 81 total citations, and an average citation of 16.2 per publication. Following this, the third rank is held by "Dwivedi A" with 5 documents in the domain, a 5 h-index, a 5 g-index, a .357 mindex, 94 citations in total, and an average citation of 18.8 per publication. The analysis is further followed by "Merillees B" with 5 documents, a 5 h-index, a 5 g-index, a .357 m-index, 94 total citations, and an average citation of 18.8 per publication.

In this section of the research, several academic institutions from across the globe are evaluated for their studies on parent brands and brand extensions. The top institutions in the subject field from 2004 to 2023 with the most research articles published are shown in the aforementioned table. The study's findings showed that while all of the top institutions produced the same amount of articles in the field there is a great disparity in citations. "The University of Southern California, in the United States", came out on top when it came to citations with 2 papers and 276 authors citing it and the institution has 138 average citations per publication. The second position is held by the "Cass Business School, City University, London, United Kingdom" with 2 documents with 148 citations and 74 average citations per publication. "NHH, Norwegian School of Economics and Business Administration, Bergen, Norway" is at 3rd rank with 2 documents, 93 citations, and 46.5 average citations per publication.

Mohit *et al.,*

Due to the tremendous growth of papers in this field over the past 20 years, studies related to brand extensions and parent brands have made significant advancements. This section evaluates the most cited documents in the subject area. The caliber, authority, and significance of a research paper published are determined by the volume of citations it receives. The analysis table consists of the top 3 documents, and the analysis revealed that "Drivers of Brand Extension Success (2006)" by Völckner and Sattler receives the highest number of citations, with 394 citations, and is published in the "*Journal of Marketing*." This study investigates the success factors of an extended brand under a parent brand. Other publications, along with their publication years and the number of citations they obtained, are depicted in the table above.

The graph above depicts the co-citation of the most cited references using VOSviewer for the analysis. Two papers are considered to be co-cited if at least one other document references them both. The selection criteria were at least 10 citations to the cited reference and out of 8575 cited references only 68 meet the threshold. The study revealed that "Aaker D.A., Keller K.L., Consumer Evaluations of Brand Extensions, *Journal of Marketing*, 54, 1, pp. 2741, (1990)" is the most cited reference with a citation of 95, followed by "Keller K.L., Aaker   D.A., The Effects of Sequential Introduction of Brand Extensions, *Journal of Marketing Research*, 29, 1, pp. 35-50, (1992)" with 34 citations, and "Broniarczyk S.M., Alba J.W., The Importance of the Brand In Brand Extension, *Journal of Marketing Research*, 31, 2, pp. 214- 228, (1994)" is at the 3rd rank with 32 citations while "Czellar S., Consumer Attitude Toward Brand Extensions: An Integrative Model and Research Propositions, *International Journal of Research in Marketing*, 20, 1, pp. 97-115, (2003)" follows the ranking.

The main components of the three fields plot (e.g. authors, keywords, journals) and their relationships are illustrated in the above diagram using a Sankey diagram with arrow widths and flow rates. The height of the rectangle represents the sum of the relationships that have occurred between the object represented by the rectangle and other elements of the diagram. The size of the rectangle determines the number of relationships for each object. The present study revealed the research topics explored by the researchers and the factors on which the researchers relied heavily. The results revealed that "Brand Extensions" is the most important node with a 13 flow count while the 2nd highest related node is "Brand Extension" with an 11 flow count followed by "Brand Equity" with a 10 flow count and "Brand Image" with a flow count of 10. "Dwivedi A." is the most productive author in the domain while "Merrilees B." is the 2nd highest in the productivity and consumer evaluation of brand extension by "Aakar D.A" is the most cited publication in the domain. While "Journal of Marketing" and the "Journal of Marketing Research" are among the top journals.

Each reference referenced in a scientific paper is shown on a histogram in RPYS and then has its publication year smoothed down using a mathematical formula. The resultant curve shows how the article was referenced, with the tallest peaks denoting the sources that were cited the most frequently and the curve's shape denoting the sources' age distribution. And the data showed that the greatest amounts of research were conducted in 2000. There was no particular research conducted in the field of brand extensions between 1838 and 1950. However, studies continued after that, grew slightly, and created an impact. In 2000, these studies had the greatest impact, and it was the year in the domain where most publications cited them. After that, there was a continuous decline year after year, and the number of citations and the total number of citations both declined steadily.

The keyword analysis table reveals the prominence of certain terms in the domain of brand extension. "Brand Extension" and "Brand Extensions" hold the top positions with frequencies of 64 and 58, respectively, indicating their central role in the literature. "Brand Equity" follows, appearing 17 times, emphasizing the significance of assessing brand value. Additionally, terms like "Brand Image" and "Brand Management" both occur 15 times, underscoring the attention given to the perception and strategic handling of brands. Other relevant keywords include "Consumer Behaviour," "Perceived Fit," "Brand Loyalty," and "Advertising," shedding light on diverse aspects within this research field. The words that are not used frequently are the research gaps for future research studies.

Cluster 1,"Brand Strategy and Extension Factors," delves into the forces that impact a brand's expansion and influence, encompassing concepts such as advertising, brand extension, and perceived fit. This cluster scrutinizes strategic planning and determinants of brand growth.

Cluster 2, "**Strategic Brand Ecosystem: Leveraging Identity, Innovation, and Spillover Effects**," centers on the interplay between brand identity, innovation, and the holistic brand environment. It explores how these elements collaboratively shape a brand's strategic positioning and its cross-effects.

Cluster 3, "**Brand Metrics Insights**," concentrates on quantifiable measures that facilitate an in-depth comprehension and assessment of brand performance. Key indicators such as brand attitude, equity, loyalty, and perceived quality are investigated here.

Cluster 4, "**Exploring the Interplay of Brand Personality, Brands, and Consumer Behavior**," delves into the complex dynamics between brand personality, consumer perception, and resultant behaviors. This cluster investigates how a brand's personality influences consumer interactions.

Cluster 5, "**Brand Image and Service**," examines the dimensions of brand image and service quality, highlighting their interconnectedness. This exploration sheds light on how a brand's image is reflected through its services.

Cluster 6, "**Feedback Effects of Brand Extension**," revolves around the repercussions of extending a brand's offerings. It scrutinizes how such extensions can impact the original brand and its existing products or services.

In summary, these clusters collectively provide a comprehensive understanding of different facets of brand management, encompassing strategic growth, identity, metrics, consumer behavior, service quality, and the dynamics of brand extensions.

DISCUSSION

The data analysis and results of this study provide valuable insights into the evolving landscape of parent brands and brand extensions. Examining 195 articles from 92 sources spanning from 2004 to 2023, the study reveals a fluctuating annual publication trend, with a notable peak in 2010 followed by a subsequent decline, signaling dynamic shifts in research focus over time. The dominant influence on the subject matter was "Business Management and Accounting," comprising 61.9% of all research articles. Subsequent significant contributions came from subject areas such as "Economics, Econometrics, and Finance," "Social Sciences," and "Psychology." Leading sources such as the *"Journal of Product and Brand Management,"* and *"Journal of Brand Management,"* emerge as influential contributors to the field, underscored by key metrics like h-index, g-index, and total citations. RPYS of the data showed that the greatest amounts of research were conducted in 2000. There was no particular research conducted in the field of brand extensions between 1838 and 1950. The study revealed that "Aaker D.A., Keller K.L., Consumer Evaluations of Brand Extensions, *Journal of Marketing*, 54, 1, pp. 2741, (1990)" is the most cited reference with a citation of 95, followed by "Keller K.L., Aaker D.A., The Effects of Sequential Introduction of Brand Extensions, *Journal of Marketing Research*, 29, 1, pp. 35-50, (1992)" with 34 citations. The frequency of collaboration between the United Kingdom and Spain is the greatest. The United States collaborated with China, Chile, Canada, and the Netherlands for 4 publications each. The exploration of international collaboration highlights the United States as a major player, fostering global partnerships with China, Chile, Canada, and the Netherlands. In authorship and institutional contributions, "Sattler H" stands out as the most prominent author, while institutions like the University of Southern California and Cass Business School demonstrate significant productivity and citations. The study identifies impactful publications, with "Drivers of Brand Extensions Success" leading in citations. Keyword analysis emphasizes the central themes of "Brand Extension" and "Brand Extensions," while thematic clusters unravel six major domains, including brand strategy, ecosystem dynamics, metrics insights, consumer behavior interplay, brand image and service, and feedback effects of brand extension.

CONCLUSION

In conclusion, our thorough bibliometric examination has revealed a comprehensive overview of parent brand and brand extension research, illuminating its evolving landscape. We have observed the dynamic nature of this field through annual publication trends and the various approaches employed by researchers, evident in the balance between collaborative and individual publications. These findings provide valuable guidance and a rich reservoir of knowledge for researchers, practitioners, and academics navigating the ever-changing realm of brand strategy and innovation.

Implications and Future Directions

The study's findings are pertinent for academics and marketing professionals who are developing branding policies and analyzing consumer behavior, responses, and choices related to branding, brand extensions, and their relationships with parent brands/ core brands. There should be more study regarding the subject, and there is still a lot of uncharted territory to be discovered.

Limitations

In this study, we solely utilized the Scopus database. However, future researchers are encouraged to expand their analysis by utilizing other relevant databases such as "Web of Science." Additionally, some important research may have been overlooked during the database filtering process. Furthermore, incorporating a quantitative content analysis in future studies can provide a comprehensive and theory-driven analysis. Researchers can also explore the use of other tools, approaches, and software such as Gephi, Bibexcel, and others to enhance their research methodologies.

ABSTRACT

Predictive analytics has emerged as a crucial field for leveraging historical and present data to forecast future trends, behaviors, and outcomes. This paper provides an overview of various techniques employed in predictive analytics, showcasing their application across diverse domains. Techniques such as machine learning algorithms, regression analysis, time series analysis, and data mining play pivotal roles in uncovering patterns, correlations, and insights from vast datasets. The discussion encompasses the strengths, limitations, and real-world applications of these techniques, illustrating how predictive analytics aids decision-making processes in finance, healthcare, marketing, and other industries. Furthermore, the paper explores challenges related to data quality, model interpretability, and ethical considerations, underscoring the importance of responsible use of predictive analytics. Ultimately, the work underscores the significance of predictive analytics in harnessing the power of data-driven insights to facilitate informed decision-making and strategic planning in various domains. The review presents an extensive analysis of the diverse techniques employed in predictive analytics, illuminating their evolution, applications, strengths, and limitations. Predictive analytics, a burgeoning field, utilizes a multitude of methodologies including machine learning algorithms, regression analysis, time series forecasting, and data mining.

Keywords: analytics, predictive, techniques, algorithms, finance, healthcare, marketing.

INTRODUCTION

A comprehensive analysis of past data and patterns to forecast future trends, behaviors, and outcomes. Predictive analytics leverages various methodologies and tools to extract insights from data, enabling organizations to anticipate potential scenarios, make informed decisions, mitigate risks, and identify opportunities. By utilizing statistical algorithms, machine learning models, and AI methods and forecasting analytics examines existent data to uncover correlations, patterns, and relationships. Predictive models are then developed using these insights to foretell future trends, behaviors, or trends. These models can be applied across numerous fields, such as finance, marketing, healthcare, cyber security, weather forecasting, and more.[1] For instance, predictive analytics can be used by a fast-food chain to enhance drive-thrus and shorten wait times for patrons. One such system was effectively created by Folio3 for a client. Their Automated Drive-Thru Verification. The company "Dashcode," which requested the automated system, hoped to apply deep learning and break down each task to increase the workflow efficiency in Drive-Thrus. By doing this, in order to save order time, the system would be able to forecast what customers are likely to order and suggest it first. The use of predictive analytics in e-retailing is not restricted.

It is applicable in numerous fields. To determine the types of working professionals who might be interested in various insurance plans, insurance companies obtain working professional data from external sources. Then, they reach out to these professionals, enticing them with their offerings [2].Banking institutions use predictive analytics models to identify fraudulent customers and credit card risks so they can take the necessary action. Financial investment companies find stocks that have the potential to yield a high coming back to investing, and they even forecast future stock performance based on historical and instant execution data. If they are investing in manufacturing in this way, a lot of other businesses use predictive models to forecast the sales of their products. Pharmaceutical companies can determine which medications are less popular in a specific region and receive alerts when those medications expire. [3] In order to find new trends and patterns, predictive analytics manipulates data from preexisting data sets in specific ways. Future results and trends are then predicted using these patterns and trends. We are able to forecast performance and trends for the future by using predictive analysis.

 Another definition for it is prognostic analysis, where prognostic refers to prediction. Utilizing data, statistical algorithms, and machine learning techniques, predictive analytics determines the likelihood of future events based on past data. Predictive models can anticipate market trends, consumer behavior, and demand patterns, aiding in strategic planning, inventory management, and marketing campaigns. By analyzing historical data, organizations can assess potential risks and mitigate them by making proactive decisions. Predictive analytics helps in understanding customer preferences, enabling personalized recommendations, targeted marketing, and improving overall customer experience. It assists in optimizing processes and resources by predicting equipment failure, optimizing supply chain logistics, or identifying cost-saving opportunities. Predictive analytics plays a vital role in healthcare by predicting disease outbreaks, identifying high-risk patients, and enhancing treatment plans. It also helps in predicting market trends, stock prices, and assessing credit risks. Overall, predictive analytics empowers organizations to anticipate future scenarios, make data-driven decisions, and gain a competitive edge in their respective industries by leveraging the power of data and technology.

PREDICTIVE ANALYTICS PROCESS
Statistical algorithms and machine learning methods are used in predictive analytics to examine past data and forecast future occurrences or results. There are usually multiple steps in the process:

Problem Definition
Clearly state the issue or desired result in your prediction. This step entails figuring out what you want to predict, defining objectives, and comprehending the business problem.

Meenakshi Sharma and Shikha Verma

Data Collection
Collection of applicable data from various sources. This can include unstructured data from sources like text, photos, or videos, as well as structured data from databases, spreadsheets, or APIs.

Data Preprocessing
To ensure its quality, clean the data and get it ready for analysis. In this step, handling missing values, eliminating duplicates, converting data types, and handling outliers are all involved..

Exploratory Data Analysis (EDA)
Explore the data to understand patterns, relationships, and trends. Visualization techniques and statistical analysis help in gaining insights into the data and identifying important variables.

Feature Selection/Engineering
Select the most applicable properties (variables) that are intended to be used to build the predictive hypothesis. Feature engineering may involve creating new features or modifying current ones to enhance model functionality.

Model Selection
Select the right predictive modeling technique based on the nature of the problem and the available data. Common techniques include linear regression, decision trees, random forests, support vector machines (SVM), neural networks, etc.

Model Training
Use historical data to train the selected model. This involves feeding the algorithm with labeled data (input and output pairs) to learn patterns and relationships.

Model Evaluation
Assess the performance of the trained model using evaluation metrics suitable for the specific problem (e.g., accuracy, precision, recall, F1-score, ROC curves). This step helps in understanding how well the model generalizes to new, unseen data.

Model Tuning
Fine-tune the model parameters or hyper parameters to modify its execution. To identify the ideal parameters, methods such as grid search and cross-validation can be applied.

Deployment
Put the model into use so that it can forecast fresh data when it arrives in production. This can entail building an interface through which users can communicate with the model or integrating it into already-existing systems.

Monitoring and Maintenance
Endlessly supervisor the model's performance in real-world scenario. Periodic modification and retraining might be necessary to ensure the model's accuracy and relevance as new data becomes available or the business environment changes. To make sure the model solves the business problem and offers insightful information for decision-making, domain experts, data engineers, data scientists, and business stakeholders must work together throughout this iterative process.

LITERATURE REVIEW

An important area of research is predictive analytics of energy usage by Internet of Things-based smart home appliances, for green urban development. Various machine learning techniques and algorithms have been used to

68016

Meenakshi Sharma and Shikha Verma

develop predictive models for energy consumption in sophisticated arrangements. These models consider variables like overall energy consumption, energy demand, and weather. The aim is to find the best-suited technique with a low error rate for predicting energy consumption in smart homes. The use of renewable energy sources and micro grids in institutional settings has also been explored to optimize energy usage and reduce carbon emissions. These studies offer important new insights for accurately predicting and controlling building and urban areas.[4] A prediction model for building energy consumption is built using a multi-optimization model. The model makes use of several optimization algorithms, including the Bayesian Optimization Algorithm (BOP), Particle Swarm Optimization (PSO), Simulate Anneal Arithmetic (SAA), and Sparrow Search Algorithm (SSA).[5] Another approach involves using a recurrent neural network and a multi-task learning model to predict building energy consumption. This method allows for the parallel prediction of multiple types of energy consumption, improving prediction precision and speed [6] Predictive analysis using machine learning has gained significant attention in recent years. It entails analyzing past data and forecasting future results using machine learning algorithms.. Various methods and trends have been identified in this field. For example, decision trees (DT) and artificial neural networks (ANN) are commonly used in education . By application area, the study focuses on the most widely used techniques: LR, RF and DT in building, DT and ANN in education, RF in social science, RF in medicine, and DT in botany..[7]. By application area, the author focuses on the most widely used techniques: LR, RF and DT in building, DT in botany, RF in social science, and RF in medicine. In construction, random forests (RF), logistic regression (LR), and decision trees (DT) are widely used. [8] Using the Random Forest and Support Vector machine learning algorithms, the authors' machine learning prediction of loan approval and credit card fraud detection achieved 92% accuracy.[9] A machine learning algorithm was developed that used feature selection and ensemble techniques to yield positive results, with an accuracy rate of 90.24 percent achieved. This demonstrates the potential of predictive analysis in cardiology and the significance of utilizing patient data to create more effective treatment regimens..[10]

The authors proposed a model that utilizes actual datasets, which In order to forecast the unemployment rate. The datasets were examined using machine learning models such as LSTM and Linear Regression..[11] The provided paper is about the development and evaluation of machine learning algorithms for predicting adverse drug reactions. It does not provide information about other research papers on predictive analysis using machine learning. A paper explores the use of machine learning algorithms, including SVM, Random Forest, and Gradient Boosted Trees, to predict adverse drug reactions using databases such as SIDER and OFFSIDES.[12] The paper discusses how predictive analytics, machine learning, and deep learning are used together to automate predictive modeling and identify patterns, trends, or future outcomes. Predictive analytics has revolutionized various sectors, such as finance, healthcare, retail, and manufacturing. Machine learning and deep learning algorithms automate predictive modeling for future outcomes.[13]

CONCLUSION

A review of the literature on ML trends and techniques for predictive analysis is provided in this study. We used a method that allowed us to choose only the most recent studies in order to conduct a reevaluation that accurately reflects the current state of the field.

ABSTRACT

The intersection of social networks and the Internet of Things (IoT) has given rise to a technology known as the Social Internet of Things (SIoT). Basically, Social Internet of Things isa concept which establishes connections between objects and human beings based on the principles, set by their respective owners. In this context, users within social networks assume the dual role of both service demanders and providers. In contemporary applications, maintaining trust among interconnected devices is a complex undertaking; crucial for the development and establishment of trust management system. This work introduces architecture of Quality of Services to effectively manage trust between IoT devices. The proposed framework focuses on enhancing the current process of trust and reputation building. Furthermore, service context parameters will be employed to standardize the judgement behavior. Alongside, this study presents co-location, co-device and co-work metrics such as delay, demand-supply accuracy, feedback etc. Further, an optimization approach is implemented to enhance the performance of the trust management system.

Keywords: Social Internet of Things, Internet of Things, Artificial Intelligence, Quality of Service, Feedback, Optimization.

INTRODUCTION

The Internet of Things (IoT) refers to a network comprising of interconnected and diverse devices, objects, and machines, each of which are uniquely identifiable. This network facilitates the transfer of data autonomously, eliminating the necessity for direct human-computer or human-human interaction. The utilization of Internet of Things has broadened its scope across various sectors, including consumer, commercial, and industrial domains. Within the consumer realm, IoT applications have prominently found their place in smart home systems, innovative healthcare solutions, and wearable devices [1].Future IoT applications are expected to be developed using a service-oriented architecture, wherein each device has the capability to function as a service requester or service provider. IoT can be characterized as collection of devices with the ability to communicate using diverse protocols. IoT is evolving towards a paradigm where interconnected entities seek one another to deliver composite services for

68019

human beings benefit. In this interaction model, it is crucial to understand how information from individual entity can be automatically processed by any peer within the system. The convergence of social networks with the Internet of Things (IoT) has led to the emergence of a technological concept known as the Social Internet of Things (SIoT) [2,3]. The Social Internet of Things establishes connections between objects and human beings. The architecture of Social IoT has obtained a significant popularity due to its service-oriented architecture and feedback-based design. Social IoT represents a community of users interconnected within a social environment obtaining services from trusted individuals. The architecture of Social Internet of Things (SIoT) can be perceived as a network comprising n users, where each user has access to k services and is subject to t policies for the selection of services from other users. Due to large number/ of services exchanged among devices poses a challenge in selecting appropriate services, leading to the emergence of service recommendation systems.

Conversely, researchers have shown considerable interest in leveraging social relationships among humans to construct sophisticated recommendation systems. Individuals are inclined to share resources with members of their social circles, location or relation and may rely on recommendations received from another entity, particularly those who share similar interests [4].The seeker will broadcast its requirements as a service request to nearby individuals. Each user on the list is already associated with a specific service orientation in the queue and has multiple sets of queries to process.The service requester will transmit a request which contains a two-bit message. The first bit indicates the action's state, with 0 representing rejection and 1 representing acceptance, while the second bit signifies the processing cost. The service provider's selection will depends upon various factors such as co-location, co-relation, co-work, feedback etc.If two devices are situated in close proximity, the service provider will gain advantage of one units..in the overall system. In the initial stage, when the service seeker lacks any record of the service, service orientation is carried out comprehensively. As the SIoT network is activated and service contexts are generated, the records reflect the performance in terms of Quality of Service and a feedback-based mechanism. This information is then used to provide positive or negative rewards to the service provider, forming a system known as reward generation or trust evaluation. In this work, the social relationships, same location, feedback (direct/ indirect), demand and supply accuracy etc are used to create service recommendations among devices, thereby improving service discovery and composition.

LITERATURE REVIEW

A solution for users to choose services from their peers can be found in the architecture of the Social Internet of Things. The existing work focused on obtaining a comprehensive range of services with a strong emphasis on trustworthiness some of the studies are discussed in this section to find out the facts. **Chen et.al .**have introduced and explored the concept of Adaptive Trust Management (ATM) design for SIoT systems [5], where social interactions among IoT device owners evolve dynamically. In this design of the ATM protocol, the authors demonstrated the correlation between convergent value and fluctuation resulting from trust. The adaptive TM protocol can be utilized by the developed IoT application to flexibly determine the appropriate configurations of trust parameters, ensuring accurate trust assessments and optimal application performance. Additionally, the practicality of the proposed technique is evident through the table-lookup method for dynamically analyzing results, considering real-case scenarios. While the results were noteworthy, achieving convergence trust remains challenging due to fluctuations. Um et.al. have presented a framework based on trust-oriented technique for converged management [6]. This work outlines an architecture focused on trust management, incorporating a comprehensive reference model based on IoT. This platform incorporates trust agents, brokers, and management systems to facilitate reliable and secure interactions between individuals and real-world objects. By reducing transaction costs and removing uncertainties in data transactions, the platform enables the creation of a trustworthy environment, fostering the activation of social IoT enterprises. However, this model is applicable for limited applications.

Sagar et.al. introduces a mathematical model for trust. The extraction of specific trust aspects within an S-IoT environment and the determination of an average percentile rank involve aggregating all trust features using a

machine learning-based algorithm [7]. Simulation results demonstrate the effectiveness of the proposed trust-based paradigm in effectively distinguishing between the network's trusted and unreliable nodes in the S-IoT. In this context, IoT devices operate as autonomous agents intelligently exchanging information and discovering new services through the establishment of social connections with each other and their respective hosts. Additionally, the trust model aids in developing trusted links between physical items and mitigating potential risks during the decision-making process. Gheisari et.al. proposed a three-module architecture based on ontology is to address trust and heterogeneity issues. To manage these concerns while safeguarding private information, the initial module is employed for data storage [8]. The second module integrates semantics to identify abnormal patterns and simultaneously deals with service quality. The third module encompasses a security system that tackles the privacy challenges of IoT devices by dynamically adjusting the privacy behavior of these devices. Simulation results on a dataset illustrate that the proposed approach surpasses current solutions.

Guo et.al. have categorized trust evaluation models for managing services in service-oriented Internet of Things (IoT) systems [9]. This study classifies existing model based on five design dimensions: composition, propagation, update, aggregation, and formation. This work also presents a summary of the advantages and disadvantages associated with each dimension and demonstrate the effectiveness of defense mechanisms against malicious attacks. The primary focus of this work lies in illustrating the social relationships among distributed IoT entities and their impact on trust relationships. Parveen et.al. have proposed framework aimed at ensuring secure communication within social networks to establish a reliable and protected user environment. This research utilizes the relationship attribute to assess interactions among virtual objects, specifically designed for security, with feedback analysis conducted on-demand by users. The hybrid ontology-based framework, incorporating kernel functions, undergoes evaluation against two prevalent attack scenarios: DDoS and Malware. The assessment criteria encompass successful communication, observed success rate, trustworthiness, and execution time [10]. The proposed framework exhibits promising potential for future developments, particularly in terms of refining the training architecture and selecting attribute sets for training purposes. A noteworthy avenue for exploration involves introducing neural networks with increased data, achievable through Monte Carlo simulation, to gauge potential quantitative parameter variations. Perera et. al. have examined various research projects in the field of context-aware computing and assessed their capabilities in addressing issues raised in the Internet of Things (IoT) [11].

Out of these, 15 research projects specifically consider the quality of context as a feature. These projects emphasize context-awareness from an IoT perspective, providing insights into the background of the IoT model, context-aware fundamentals, and their connections to sensor networks. This work focuses into the basics of context-aware management design by comprehensively reviewing various methods, approaches, models, functionalities, and applications. Context-aware computing enables users to store context information related to sensor data. Notably, the analyzed articles lack specific coverage of techniques related to data processing and management, which are fundamentally crucial for embracing IoT. The role of sensor networks in the IoT is extensively examined, with a focus on the relationship between IoT and sensor networks. It is worth noting that all these studies primarily concentrate on academic research rather than market solutions. Liu et al. have addressed the challenge of addressing Service Composition (SC) has been effectively tackled through the integration of diverse Quality of Service (QoS) parameters. Additionally, an algorithmic simplification has been achieved by employing a hybrid version of multiple group Genetic Algorithms (GAs) [12]. This process entails transforming the population into subgroups, thereby streamlining the algorithm. Researchers have implemented an enhanced GA algorithm, which combination of Genetic Algorithms with Ant Colony Optimization (ACO) algorithms, to more efficiently tackle SC problems. The results indicate that the proposed improved GA not only resolves SC issues within the context of the Internet of Things (IoT) but also exhibits superior convergence speed when compared to a straightforward ACO approach. It has been found that the trust management system has obtained popularity because of presence of large number of Internet of Things systems in the communication [13]. Within the service-oriented paradigm, there typically exists a seeker and a supplier. In scenarios where a single supplier is available, the seeker is obligated to obtain services from the sole provider. However, in situations involving multiple service providers offering the same service, it becomes

imperative for the network to discern and select the optimal provider [14,15]. If the service provider is unable to provide the suitable service the seeker's requirements could result in a significant waste of time and energy[16].

Proposed Methodology

The assessing of trust model will require feedback architecture as high positive feedback will lead to more trust but when include parameters such as co-work, co-location, co-device and co-relation, the equation will change automatically. Further, the usage of Swarm Intelligence (SI) results in betterment of existing architecture. The proposed work is divided into two parts. The first part represents the separation of data which is done on evaluation of Quality of Service (QoS) and the second part is training and classification of data set. The three levels of methodology are as follows:

1. First the collected data set is analyzed on the basics of Quality of Service (QoS).
2. Secondly, the data is aggregated.
3. Thirdly, the trust is generated using the Machine leaning approach.

The work flow of the proposed methodology is illustrated as below: In order to furnish services to the system, parameters such as co-work, co-location, co-device, co-relation, feedback, QoS, etc., are considered. If more than two users share the same location, the provider will receive a contribution of 0.10 points toward the total rewards. Similarly, the co-work parameter signifies users working in the same location. Co-device refers to two or more users employing the same device, and co-relation indicates that two or more users are already acquainted through some reference. For each type of co-relation, the service provider will be rewarded with 0.10 points. In the simulation of ten thousand service orientations for a sample of 50 services, a total submission request of 530,000 has been generated. In the proposed work, Artificial Bee Colony (ABC) represents a meta-heuristic approach primarily designed to seek out food sources abundant in nutrients and close to the hive. So ABC approach is applied for formation of clusters. From these clusters, groups are formed and labeling (Good and Not recommended) is done. The classification and training is performed with the help of Machine Learning (ML) approaches such as Support Vector Machine (SVM), K-Nearest Neighbor (KNN) and Artificial Neural Network (ANN).The ABC processing architecture that is illustrated as follows: In ABC approach, number of Employed Bees are same as number of food sources. Each solution gets equal opportunity to generate new solution. So, first the objective function is evaluated and fitness vector is generated for the new solution. If the newly generated solution, is optimal solution then pass the results to ML approaches to get better result in case, the solution is not optimal then we will iterate to select random variable and partner so as to get new location of the food source and the iteration repeats until we get best optimal solution.

RESULTS

The results have been evaluated by assessing the rank through the implementation of the Artificial Bee Colony algorithm, metrics like true positive (tp), false positive (fp), and class accuracy comprising of tp, true negative (tn), false negative (fn), and fp are computed to evaluate the algorithm's performance, distinguishing between high and low categories. These metrics are widely employed in the realm of machine learning and classification to measure the efficacy of an algorithm. It quantifies the ratio of accurate predictions (including True Positives and True Negatives) to the overall number of instances in the dataset. The accuracy is computed using the formula:

$$\text{Class Accuracy} = \frac{(tp+tn)}{(tp+fp+tn+fn)} * 100$$

Thus, the accuracy is obtained by adding the count of true positives and true negatives and then dividing this sum by the total number of instances. It yields a singular percentage, serving as a comprehensive measure of the ABC algorithm's proficiency in classifying ranks. A higher accuracy signifies that the ABC algorithm is effectively working

well in classifying as high rank and low rank instances. Accuracy may not suffice for evaluating metric performance. So, additionally include supplementary metrics such as precision, recall and F1-score are included to achieve a more thorough comprehension of the algorithm's performance. These metrics offer insights into the algorithm's capacity to manage fp and fn, contributing to a more subtle assessment of its effectiveness.

CONCLUSION

Social Internet of Things is a concept that establishes connections among objects and human beings, based on the principles set by their respective owners. This work presents architecture and uses various relationship attributes and feedback for reward generation which is inspired by the natural computing framework. Various Machine Learning approaches are used for the classification and training. The proposed framework is optimized using Artificial Bee Colony Approach. The result clarifies that the accuracy alone may not work well for estimating the metric performance. So, additional metrics such as precision, recall, F1-score etc help to achieve the better performance.

DECLARATION OF CONFLICTING INTERESTS

ABSTRACT

Biodiesel has replaced conventional petroleum and diesel oil due to less emission of carbon dioxide gas. Several methods are known for biodiesel production using vegetable oil, viz: palm, jatropha oil, etc., which are expensive sources for its production. So, in search of an affordable option, castor oil and waste cooking oil have been used for biodiesel production. In this study, a comparison between castor and sunflower waste cooking oil is reported for biodiesel production using a trans esterification process showing desirable properties. Several fuel properties such as viscosity, density, aniline point, acid value, flash, fire point, pour & cloud point, and calorific value were also compared, for which ASTM standards were considered. The catalyst cerium (IV) tinmolybdo phosphate [CeSnMoP] was used in 3(w/v)% having an oil(v) to methanol(V) ratio (1:9) to represent optimized parameters. The catalyst CeSnMoP has a surface area of 194.302 m²/g, which was determined using the BET equation in nitrogen adsorption. The observed calorific values of castor (CS) sunflower waste cooking oil (SWCO), biodiesels were 3207 and 5204 Kcal/kg, respectively. A remarkable % yield of the biodiesel derived from sample oil (CS & SWCO) was ~ 89.95% and ~ 94.05%, respectively.

Keywords: Cerium (IV) tinmolybdo phosphate, Trans esterification, Sunflower waste cooking oil, Castor oil, Catalyst loading, Biodiesel

INTRODUCTION

In green chemistry, biofuel is the easiest and purest available fuel on Earth. Bio-fuel can be produced by various organic matter like agricultural wastes, straw, sludge, waste vegetable oils, sewage, etc. through the process of either digestion or fermentation [1-2]. Out of all these fuel types; biodiesel is considered the most reliable one. It is considered a handy and viable fuel as it enhances the power, performance, and economy of the nation [3], It also has very less emissions of greenhouse gases, particularly CO_2 gas thus helping in reducing global warming. Moreover, it is found to be non-toxic at all and very safe to use. It brings a healthy balance in energy and security for fuel [4]. It is biodegradable and the former wastes can be recycled. Biodiesel helps in the economic development of the community by saving money utilized on other fuels [5-6]. Numerous options for the raw materials of biodiesel are available from which castor and waste cooking oil are better options. Castor oil is a non-edible vegetable oil that is low in cost and high in quality such as; it has a high amount of ricinoleic acid ($C_{18}H_{34}O_3$) possessing ~80-90% fatty acid, and its trans esterification can be completed with methanol which results in low production cost and low emission of greenhouse gases [7-8]. Waste cooking oil has proven to be another great option for biodiesel production as it leads to environmental and waste management which is a very serious discussion nowadays.

This management further leads to economic benefits [9]. The biodiesel produced using waste cooking oil through a trans esterification process has been found better in terms of properties; density, viscosity, acid value, pour, cloud point, flash, fire point, etc [10-12]. Therefore, researchers are engaged in the mentioned activity using different types of homogeneous and heterogeneous catalysts like alkaline, acidic, nanomaterial, etc. A homogenous alkaline transesterification process of castor at ~ 65°C temperature and the time for reaction is ~ 8 h giving a yield of ~ 73.62% (w/w) stated by Dias et al [13]. Similarly, Karmakar et al reported the use of a homogeneous acid catalyst where ~ 90.83% FFA conversion was attained under these optimized conditions; reaction temperature ~ 50°C, duration of 1 hour, concentration of catalyst ~ 1% w/w, methanol to oil ratio of 20:1 and agitation speed of 700 rpm [14]. Gohar Khan et al reported the mussel shell-based CaO nano-catalyst which was doped with praseodymium to improve the production of biodiesel yield of 87.42% by 7 % by trans esterification of methanol and castor oil [15]. Other renewed technology includes hydrodynamic cavitations with a yield of 92.3% using castor oil [16], Blend of fish along with castor oil to produce biodiesel [17], blending of oil-suitable blends in castor oil-based biodiesel to enhance the engine performance [18]. Similarly, CaO heterogeneous catalyst derived from waste chicken eggshells gave a yield of ~ 98.62% using waste cooking oil [19].

A lipase enzyme biocatalyst with a magnetic hybrid sol-gel nano composite was successfully employed by Parandi et al to derive biodiesel using a waste form of cooking oil [20]. On the other hand, Farvardin et al followed an ultrasonic-hydrodynamic combined cavitations system to increase the yield of biodiesel [21]. $MgO/MgSO_4$ nanocatalysts were utilized by Bora and his team members to yield ~98.8% biodiesel thiourea-nitrate solution [22]. Heteropoly acids/ salts are strong Bronsted acids having marvelous catalytic features. Biodiesel production using heteropoly acid salts includes: tin exchanged heteropoly acid supported by titania nanotubes were procured to produce biodiesel from levulinic acid and furfuryl alcohol [23]. Sn(II) supported Kegginheteropoly acid was used for the etherification of glycerol along with tert-butyl alcohol [24]. $Cs_2H_4PV_3MoW_8O_{40}$ catalysts were used in a trans esterification reaction where methanol/oil molar ratio of 30:1 leads to a conversion rate up to 92.2% [25]. Phosphotungstic acid submerged in a framework of zirconium metal-organic nano composite and whole set was co-doped with ammonium and silver-catalyzed Lauric acid trans esterification giving a yield of 75.6% [26]. Therefore, in this report, biodiesel production from CS, as well as SWCO oil in the presence of CeSnMoP, a heterogeneous catalyst utilizing the transesterification process, has been carried out. Their corresponding properties have been analyzed to explore the best preparatory conditions. The focus of this study is biodiesel production with maximum % yield under operational conditions and at the best standards. A comparison of these two types of oils is also described to derive optimum conditions for biodiesel using the mentioned heteropoly acid salt as a catalyst.

Sonia Yadav, Nadeem Sharma *et al.,*

MATERIALS AND METHODS

Required materials and instruments

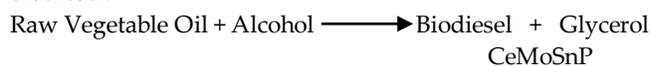
Sunflower waste cooking oil (collected from a local shop), Castor oil (Nice chemicals pvt. ltd.), methanol (CDH), synthesized heteropoly acid salt [CeSnMoP] as a catalyst, Ostwald's viscometer, Pensky Martin's close cup flash point apparatus standard: IP 34, ASTM D 93, IS 1448 (P-21), ISO 2719, Bomb calorimeter (Test method: ASTM-D5865-98a), Pour point analyzer (IS 1448, P:10), BET surface area analyzer (AutosorbiQ Station 1) with accuracy > 0.15% of reading.

Preparation of stock feed

SWCO was purified via filtration and then other sticky wastes were removed using starch as a coagulant [27]. Castor oil was used as it was available without any adulterations.

Trans-esterification Process

In this process, biodiesel is produced by transesterification of triglycerides and alcohol in the presence of heteropoly acid salt, CeSnMoP. A generalized procedure followed in the present report: Raw vegetable oil was mixed with a calculated quantity of catalyst and methanol, then refluxed for a specified period. Each refluxed mixture was kept in a separating funnel overnight. Two distinguished layers appeared containing biodiesel as the upper one and (glycerol + catalyst) as the lower layer. FTIR of the samples was done at the initial stage to confirm the formation of biodiesel.

Raw Vegetable Oil + Alcohol $\longrightarrow$ Biodiesel + Glycerol
$$\text{CeMoSnP}$$


Fatty acid methyl esters (FAMEs) possess properties similar to diesel. The production of FAMEs results in the production of glycerol as a side product, which is an essential ingredient in the production of soaps, lubricants, and similar products. The production methodology for biodiesel is presented in Figure 1, which provides a detailed overview of the process. By analyzing the impact of diverse variable parameters on two distinct types of oil processing, we were able to optimize the reaction conditions. This careful approach allowed us to achieve the utmost efficiency in our process, ensuring that we produce high-quality biodiesel with the lowest possible environmental footprint.

Catalyst loading

The amount of Catalyst employed in a reaction always affects the rate of reaction as it offers the surface area to the reactant. Therefore, this parameter was optimized. Different % ages of catalyst varying from 1% to 5% were tried for a ratio 1:9::oil: alcohol to sort out the appropriate condition for biodiesel production. Then all these five samples were refluxed for a reaction time of 6 hrs at the reaction temperature of 80℃. Relevant outputs for the selected samples in the case of CS and SWCO are given in (Figure 2) and when the reaction was over, bio-fuel was separated by following the already mentioned procedure. The catalyst used in the reaction rejuvenated after filtration and was followed by required washing.

Reaction temperature and oil: methanol ratio

Excess methanol is found good for breaking fatty acids and glycerin linkages, hence higher oil: methanol ratio was found better for more conversion of alkyl esters in very less time. So, it could be observed that the oil: methanol ratio plays a vital role in the trans esterification of biodiesel. In this report, the selected ratio of oil: alcohol with catalyst proportion 3(w/v) % was subjected to study the effect of variable reaction temperatures i.e., 60, 70, and 90℃ on each ratio of (oil: methanol) (1:7;1:8;1:9;1:10) for a constant duration of 6 hrs. A similar procedure was followed for both types of oil and then the impact of reaction temperature was also considered to optimize the reaction parameters by adopting the methodology as given in figure 1 and the results are represented in {Figure 3 (a & b)}.

Sonia Yadav, Nadeem Sharma *et al.,*

Reaction time

The fourth parameter is reaction time (hrs) whereas the oil: methanol: catalyst, reaction temperature(℃) and catalyst % were kept constant. The effect of various reaction times (4,5,6 and 7 hrs) was observed for these two types of biodiesels. The resultant data is expressed in (Figure 4).

Various characteristics of biodiesel under study (Figure 5)

1. Density of biodiesel can be determined using a pycno meter (25 ml) at room temperature ~ 23℃ on those days. Density was calculated in units gm/ml.
2. Dynamic viscosity: This property of biodiesel was determined w.r.t. distilled water by using Ostwald's viscometer. By using the formula and technique described by Camas-Anzueto et al. [28].
3. Acid value: Titration of biodiesels (CS and SWCO) for each ratio was done to find their respective acid values using standard NaOH [29].
4. Aniline point: It is the minimum temperature at which equal volumes of oil and aniline form a single phase [30]. In the present study, a minimum temperature point was noticed where two distinguished phases were observed on cooling a preheated equal-volume mixture of oil and aniline.
5. Flash point & Fire point: These properties of biodiesel indicate the temperature tolerance and the condition to ignite fuel in an engine. The higher the temperature higher the vapour pressure which increases the concentration of vapours of combustible liquid in the air [31-32]. Both these properties were determined with the help of "Pensky Marten's Flash Point Apparatus"
6. Cloud point & Pour point: Generally, it is termed as the temperature at which there is an appearance of cloudiness in the biodiesel. Lower is the cloud point of biodiesel, the better it is considered [33]. On the other hand, the pour point of a fuel is considered the temperature at which it solidifies and is not capable of flowing anymore [34]. This parameter was also studied to prove its viability.
7. Calorific value: Calorific value is the amount of heat a substance produces after complete combustion [35]. It is measured and calculated using the bomb calorimetric technique.

RESULTS AND DISCUSSION

Trans-esterification reaction was carried out several times under variable conditions i.e., catalyst loading, oil to alcohol ratio, temperature, and reflux time. Observations regarding the various properties of prepared biodiesel are given as:

Effect of catalyst loading

After conducting extensive testing on five different catalyst conditions, it was determined that the composition with 3% (w/v) was the clear winner in terms of percentage yield. As a result, this composition was immediately selected for further studies. The percentage yield of biodiesel was meticulously observed for CS and SWCO biodiesels, with catalyst loadings ranging from 1% to 5% (w/v), as detailed in (Figure 2).

Reaction temperature and oil: alcohol optimization

Optimization of reaction temperature and ratio of oil: alcohol variation on various properties was done keeping the reaction time (6 hrs) and catalyst loading 3 (w/v)% fixed in the case of both CS and SWCO biodiesels. Four different temperatures were tried i.e., 60, 70, 80, and 90℃ on every ratio of oil: methanol i.e.,1:7;1:8;1:9;1:10. % yield of biodiesel was also measured during this variation; in the case of CS, it was observed that with the increase in alcohol content, the % yield increased up to 1:9 ratio and then again showed a downfall in case 1:10 ratio as seen in {Figure 3(a)}.Almost similar are the results for SWCO, although the % yield did not show much variation. The Results are given in {Figure 3(b)}.

Impact of reaction time

Reaction time is also a parameter to define the quality as well as yield of the biodiesel. As observed by the above study the ratio 1:9 of CS and 1:10 of SWCO gave the best results and hence these are selected for further study. The reaction time of the trans esterification reaction was kept variable (4, 5, 6 and 7 hours) for both types of biodiesel synthesis and was attained by keeping a constant reaction temperature of 80°C along with subjecting the reaction mixture to trans esterification for a different period at a constant ratio of catalyst i.e., 3%. Results are represented in (Figure 4). By looking at these graphs it can be observed that most of the properties have shown better response for SWCO than CS at different times of reaction. An increase in reflux (reaction time) also increased the % yield of these products.

FTIR of these trans-esterified oils

 FTIR of the trans-esterified product after purification indicates the presence of characteristic peak of ester (biodiesel) 1720 cm⁻¹. This proves that the catalyst is working efficiently in the described reaction. Results are given in (Figure 6; a & b). Hence confirm the formation of desired product validate the path followed to obtain the product.

Analysis of various properties of resultant biodiesel

The resultant selected biodiesel samples were tested for different properties like Density, Dynamic viscosity, Acid value, Cloud point, Pour Point, Fire pint and Flash Point. A low value of Density, viscosity and acid value favours the formation of biodiesel from waste cooking oil. Similarly, a lower temperature for cloud and pour point also points towards SWCO. Although the fire point did not show any discrimination in values. Studies for cloud points were done to verify the oil legality. The cloud point of the SWCO biodiesel was too low to measure by thermometer and hence measured by using an ultra cool refrigerator available in the lab. For SWCO pour point of a selected ratio was determined with the help of the Pour Point Analyzer (IS 1448, P:10) using the test method. In conclusion, we can say that the oil: alcohol (1:9) for CS and for SWCO were found with the best of it and hence selected for further analysis. It was also observed here that the % yield of biodiesel production was increasing w.r.t rise in reaction temperature and oil: alcohol.

Calorific value

The gross calorific values of the finally selected samples of both types of biodiesels were determined by using test method ASTM-D5865-98a in unit Kcal/kg. The combustion bomb can withstand a pressure of 20Mpa possessing more than 99.5% oxygen. The Calorific values of CS and SWCO biodiesel was found to be 3207 and 5204 Kcal/kg respectively. The higher the statics for calorific values more efficient are the biodiesel. So, these results clearly show that the SWCO biodiesel is showing more competent results than CS biodiesel.

Percentage Yield of biodiesel

The percentage yield of a sample explains the total percentage production of the required biodiesel. The formula used for the following calculation is as under [36]: Biodiesel % age yield = (weight of biodiesel / weight of initial oil sample) ×100 in the case of castor oil (CS) biodiesel, the overall highest % yield obtained (for the selected ratio) is ~ 89.95% while for sunflower waste cooking oil (SWCO) biodiesel the % yield (for the selected ratio) is ~ 94.05% which also indicates about more efficiency of waste cooking oil biodiesel (SWCO). In other ratios the % yield variation in the range of ± 1%.

BET surface area analysis

To find the adsorption rate of the same catalyst and the gas-solid interface of the resulting products, the surface area of the catalyst was measured [37]. BET surface area analyzer (AutosorbiQ Station 1) was used here in a nitrogen adsorption which was calculated as 194.302 m²/g for this catalyst cerium (IV) tinmolybdo phosphate. Sample weight was found 0.2478 g under nitrogen atmosphere and the bath temperature noted was ~ 77.35 K. Langmuir isotherm is one of the simplest technique for monolayer physical adsorption of liquids or gases applicable only in ideal conditions [38]. The Langmuir plot describing the surface area of this catalyst which is given below in (Figure 7).

Sonia Yadav, Nadeem Sharma *et al.,*

Rejuvenation of catalyst

Upon completion of the trans esterification process, the catalyst used in the reaction becomes exhausted and requires immediate separation. The separated catalyst should be washed thoroughly with warm distilled water to preserve its effectiveness. To regenerate the catalyst, it must be soaked in hydrochloric acid (HCl) for 24 hours. After this step, the catalyst was completely dried before it was used again. This process was repeated five times, and the catalyst's characteristics remained almost unchanged during each use. However, the %yield will decrease with each reuse. For CS biodiesel, the %yield decreased to 89.95%, 88.20%, 80.48%, 75.60%, and 72.00% respectively for each use. Similarly, for SWCO, the %yield reduced to 94.05%, 93.54%, 90.08%, 88.76%, and 84.50% respectively for each of its five uses. The graphs provided below in (Figure 8) will give a clear visual representation of these observations.

CONCLUSION

This report aims to demonstrate the efficacy of sunflower waste cooking oil (SWCO) over castor oil (CS) to produce biodiesel via trans esterification, using CeSnMoP as a catalyst. To this end, various properties were examined for each oil type separately, followed by a comparative analysis of the resulting biodiesels. Our findings indicate that, in most cases, SWCO exhibited superior outcomes when combined with the catalyst cerium (IV) tinmolybdo phosphate [CeSnMoP], as compared to CS. Moreover, the percentage yield and calorific values of SWCO were significantly higher than those of CS biodiesel, with a ratio of Oil: alcohol::1:9 at a temperature of 80°C. Thereby validating the superiority of sunflower waste cooking oil over castor oil in terms of producing biodiesel using HPAs as a catalyst.

ABSTRACT

The Green Chemistry approach represents a paradigm shift in the field of chemistry, emphasizing the design and implementation of processes that minimize environmental impact while maximizing efficiency. Green Chemistry, at its core, aims to mitigate pollution by creating products and processes that are intrinsically less hazardous. This entails substituting toxic substances with environmentally friendly alternatives, minimizing waste generation, and utilizing renewable resources. This abstract provides an overview of the principles and applications of Green Chemistry, highlighting its significance in mitigating the adverse effects of traditional chemical practices on human health and the environment. The adoption of Green Chemistry principles extends across diverse sectors, including pharmaceuticals, agrochemicals, materials science, and beyond. Case studies illustrating successful applications of these principles showcase the economic viability and innovation potential associated with environmentally conscious practices. In conclusion, the Green Chemistry approach offers a comprehensive and forward-looking strategy to address the environmental challenges posed by traditional laboratory practices. By embracing this framework, the scientific community can pave the way for a more sustainable and harmonious relationship between chemistry and the environment, contributing to a healthier planet for current and future generations.

Keywords: Green Chemistry, environment, hazardous, pharmaceuticals, agrochemicals etc.

Aarti Trehan *et al.,*

INTRODUCTION

Chemicals are essential for economic growth and human well-being, but if handled improperly, they can pose serious health concerns to people. Many chemicals end up in the environment like in water or in the air by intentional release during use, which are very catastrophic to the environment. More than seventy thousand chemicals are utilized on a daily basis all around the world, and they have an impact on our lives. They even impact the environment and the ecosystems that support human life. Such chemicals can affect human health in various ways, depending on the type, amount and duration of exposure. Chemicals released into the environment have far-reaching health consequences through pollution of air, water, and soil. This can affect ecosystems and the health of both humans and wildlife. Many chemicals are toxic to humans and can cause acute or chronic health problems. The severity of the toxicity depends on factors like the chemical's toxicity level, the route of exposure (e.g., inhalation, ingestion, dermal contact), and the dose. Exposure to specific chemicals, such as heavy metals (e.g., lead, mercury), can damage organs like the liver, kidneys, and heart. According to Chang and Lamm (2003), the impact of hazardous chemicals in laboratory on health and environment is a serious issue that requires attention and action.

Some of the hazardous chemicals found in laboratory and their effects have been given in Table1. In most laboratory and non-laboratory operations, education and research-related institutions contribute to the generation of small amounts of waste, many of which are highly toxic, and the environmental impact produced by that chemical waste is of increasing concern. Experiments are an essential component of the curriculum, and it is of utmost need to make laboratories a place with safe learning environment. Developing a sustainable framework for eco-friendly laboratory practices is a crucial and pertinent issue for both the scientific community and the general public. Laboratories play a vital role in research, analysis and education, but they also pose a considerable environmental challenge due to their intensive use of energy, water, chemicals and other resources. Hence, it is essential to embrace and apply sustainable practices that can minimize the environmental impact of laboratories, while preserving or improving the quality and safety of research. This paper presents a review of the current status and the challenges of eco-friendly laboratory practices, and suggests a comprehensive and integrated framework that encompasses four main aspects: conservation, waste minimization and resource management, hazardous waste management, and education and awareness. The framework follows the principles of green chemistry. The framework aims to offer a practical and flexible tool that can assist laboratory users to evaluate their current practices, find areas for improvement, and apply changes that can result in significant environmental and economic benefits.

OBJECTIVE OF STUDY
Due to the dangers associated with chemicals and chemical reactions, motivation to develop methodologies and formulate strategies to carry out chemical reactions in a safe and environmentally benign manner, gave birth to green chemistry which in turn is compatible with the goals of sustainable development. The objective of present study is to protect and benefit the environment using green chemistry principles by finding ways to reduce waste, conserve energy, and replace the hazardous substances through green practices in laboratories. Such practices have the potential to create a more sustainable environment capable of protecting human health.

REVIEW OF THE LITERATURE

People use chemicals in vast quantities, resulting in a large volume of chemical waste, which includes poisonous and destructive waste. They increase the quality of life when used and disposed of appropriately; nevertheless, when used and dumped poorly, they have a substantial influence on humans, plants, and animals. According to Singh et al. (1999), even micro-scale procedures, which are meant to be more ecologically friendly by minimizing the amount of chemicals used, have an inherent risk of exposure due to the nature of the chemicals being utilized. Green chemistry, which is a technique for reducing risk and avoiding pollution by addressing the inherent dangers of chemicals, is also necessary at all levels, both environmentally and economically. The American Chemical Society

(ACS) designed and endorsed a framework of 12 Principles developed by Dr. Paul Anastas and Dr.John Warner (1998) to guide chemists in thinking about how to reduce the risk that chemical interactions pose to human health and the environment. For a holistic safety culture to exist, Orgill et al. (2019) stated that a system thinking approach to incorporate green chemistry and safety into laboratory culture must be embraced at all educational stages. This is required since, if academic institutions establish a green and safety culture, then that will be carried over into subsequent career paths. As we look to the future, Zimmerman et al. (2020) emphasized that we must ensure that chemistry not only does no harm but also promotes life. Kümmerer (2017) said that the expansion of the 12 green chemistry principles to wider dimensions with the label sustainable chemistry education in university and other curricula is a more recent phenomenon. The objective of the green lab program, according to Wis singer (2018), is to inform stakeholders about the lab's environmental effects and to help them select safe, sustainable practices that they may include into their work. According to Noce (2018), chemists will be involved at the molecular level of the solutions to our global problems; as a result, they must have the education, expertise, and culture to support these goals in the safest manner possible. Methods for integrating green chemistry into laboratory practices should be researched to assist stakeholders in creating a learning environment that is free from health hazards and strong on safety.

Green Chemistry

Risk, or the probability of a harmful event, is a function of both exposure and hazard, and green chemistry plays a role in improving laboratory safety by addressing the hazard component of the function. Green chemistry's approach to reducing risk through the elimination of hazards and toxic chemicals is more effective than trying to lower exposure through the use of personal protective equipment. It can catalyse green technological innovations that result in less hazardous materials, products and processes in support of a sustainable, healthy society. Green chemistry is not only a scientific discipline, but also a philosophy and a practice that can be applied to any field of chemistry and beyond. By following the principles of green chemistry, we can create solutions that are beneficial for both people and the planet. Anastas said, "Green chemistry is powerful because it starts at molecular level andultimately delivers more environmentally benign products and processes." Through the integration of green chemistry within higher education, students can be trained to recognize and design-out molecular hazards at the earliest stage of a molecule or material lifecycle. Many green laboratory practices can be accomplished among students in the institutions to develop their proactive attitude toward environmental conservation and protection.

Principles of Green Chemistry

Green chemistry emerged from the need to find safer and more eco-friendly ways to conduct chemical reactions, as chemicals and their reactions can pose serious risks. Anatas & Warner (1998) defined green chemistry as the creation of chemical products and processes that minimize or avoid the use or production of harmful substances. To guide chemists in reducing the harm of chemical interactions to human health and the environment, the American Chemical Society (ACS) adopted a set of 12 Principles developed by Dr. Paul Anastas and Dr. John Warner and are described as under:

Prevention It is better to prevent waste than to treat or clean up waste after it has been created.
Atom Economy Synthetic methods should be designed to maximize the incorporation of all materials used in the process into the final product.

Less Hazardous Chemical Syntheses Wherever practicable, synthetic methods should be designed to use and generate substances that possess little or no toxicity to human health and the environment.

Designing Safer Chemicals Chemical products should be designed to effect their desired function while minimizing their toxicity.

Safer Solvents and Auxiliaries The use of auxiliary substances (e.g., solvents, separation agents, etc.) should be made unnecessary wherever possible and innocuous when used.

Design for Energy Efficiency Energy requirements of chemical processes should be recognized for their environmental and economic impacts and should be minimized. If possible, synthetic methods should be conducted at ambient temperature and pressure.

Use of Renewable Feed stocks A raw material or feedstock should be renewable rather than depleting whenever technically and economically practicable.

Reduce Derivatives Unnecessary derivatization (use of blocking groups, protection / deprotection, temporary modification of physical/chemical processes) should be minimized or avoided, if possible, because such steps require additional reagents and can generate waste.

Catalysis Catalytic reagents (as selective as possible) are superior to stoichiometric reagents. Example: Synthetic reagents, organo metallics and building blocks

Design for Degradation Chemical products should be designed so that at the end of their function they break down into innocuous degradation products and do not persist in the environment.

Real-time analysis for Pollution Prevention Analytical methodologies need to be further developed to allow for real-time, in-process monitoring and control prior to the formation of hazardous substances.

Inherently Safer Chemistry for Accident Prevention Substances and the form of a substance used in a chemical process should be chosen to minimize the potential for chemical accidents, including releases, explosions, and fires.

Green Laboratory Practices

Waste has a growing environmental impact since many of them are highly toxic. Education and research-related institutions also produce waste in most laboratory and non-laboratory operations, but they differ from industrial institutions in that the waste produced is smaller, more varied, and dispersed across multiple laboratories, and also, it is managed by students in different settings. Many green laboratory practices aim to reduce laboratories' environmental impact by lowering energy and water use as well as waste production. Wissinger (2018) states that the purpose of green lab program is to inform stakeholders about the lab's environmental consequences and to help them find safe, sustainable practices that they can incorporate into their work. Green Laboratories principles lead to significant reductions in the amount of energy and water used, as well as the amount of chemical and solid waste produced. Green practices at labs at all levels are also necessary from an environmental and economic perspective, as a way of addressing risk reduction and pollution prevention.

The aim of such practices is to cultivate clear awareness, attitude, commitment and skills among stakeholders to safeguard and enhance the environment. The framework for green lab practices should concentrate on three main areas: improving lab procedures to boost efficiency, choosing products that produce less waste, and conserving energy. To implement the framework in the laboratory, the strategy should begin by using a checklist or a tool to assess the lab's environmental performance in all areas of operations. Then, from analysis of assessment results, note the strengths and weaknesses. Further, based on the results, SMART goals and objectives should be set to improve the environmental performance. After that, green chemistry principles should be used to design strategies and action plans to achieve the goals and objectives. Following that, roles and responsibilities should be allocated lab staff and stakeholders to carry out your strategies and action plans. Subsequently, progress should be tracked using relevant indicators and metrics. Later, review and assessment of the outcomes and impacts should be obtained using stakeholder feedback. The three main types of green practices that can be implemented in laboratories based on the twelve principles of green chemistry are: 1. Eco-friendly Methods, 2. Waste Minimization, 3. Pollution Prevention

Eco-friendly Methods

To foster curiosity and innovation in the subject and to expose students to a variety of methods, laboratories should adopt greener experiments. Green practices should be the main focus, and traditional processes that are necessary should be modified to be more eco-friendly, if possible. Schulte et al. (2013) suggested that removing or substituting a hazard with a safer option is the best way to lower risk. Aubrecht et al. (2019) concluded that greener experiments make chemistry safer by reducing the exposure to harmful substances. To implement eco-friendly methods in the lab, some of the examples are:

1. Use safer or non-toxic alternatives that are widely available and cheap.
2. Avoid experiments that require long or high-temperature reactions.
3. Use advanced instruments, such as spectrophotometers, for analysis and measurement, and skip the conventional methods that involve many dangerous chemicals.

Waste Reduction

One of the main objectives of sustainable lab practices is to minimize the amount of hazardous chemical waste that needs to be disposed of. This can be achieved by considering the following factors in the lab:

1. All labs should use semi-micro or micro-scale methods for analysis. • Spot testing should be preferred whenever feasible.
2. Preparation of large-scale derivatives should be avoided.
3. Use TLC to check the purity of a molecule instead of using obsolete techniques.
4. Chemical reagents used in labs should be monitored and managed better.
5. Solvent recycling should be practiced.
6. Pollution Prevention

Pollution Prevention

Pollution prevention helps achieve environmental goals and also benefits in other ways, such as reducing waste, increasing efficiency, saving money, minimizing potential liabilities, and protecting against hazardous exposures. Analytical methods need to be enhanced to allow real-time, in-process monitoring and control before pollutants are formed. Some of the measures that can be taken in labs to prevent pollution are:

1. Use organic solvents that are not hazardous.
2. Recycle and save water.
3. Build green infrastructure.
4. Buy mercury-free electronic components such as switches, relays, and bulbs.
5. Select products with less harmful, bio-based ingredients that create less pollution.
6. Use fume hood in the lab to perform chemical tests releasing fumes.
7. Ensuring enough exhaust fans in the labs.
8. Pass the gases from the exhaust through alkali solution for absorption.
9. Perform dissolution of ores/alloys for preparing solution for analyses in the fume hood.

DISCUSSION AND CONCLUSION

The strategic framework for green labs can help laboratories to lower their environmental impact, save money and avoid hazards, boost their image and edge, and join the worldwide fight against environmental degradation and global warming. Key initiatives based on green chemistry principles for sustainable frame work of laboratories are outlined in Table: 2. Adopting green practices is a key way to act in harmony with life on Earth. By applying systems thinking to green practices, we can foster a culture of safety in the lab. Stakeholders are involved in finding creative solutions to our environmental issues, so they need to use systems thinking to combine green practices and safety in the lab. Niel et al. (2021) argued that effective communication and collaboration between environmental health and safety (EH&S) and sustainability experts are essential for the success of these efforts. Stakeholders need to be trained in the skills and culture that enable them to perform this task safely and efficiently. This can change the safety culture

from being compliance-based to being proactive towards environmental sustainability. The benefit of a green practice is that it helps one to care for the environment while also achieving one's goals. Green practices will help the institution's stakeholders to learn, adopt, and practice eco-friendly behaviour. The aim of the integrated green lab practice approach is to develop a comprehensive environmental awareness and sensitivity in young learners. It will also equip future caretakers of the Earth with the necessary knowledge of the whole ecosystem, both natural and social, and the skills to solve problems in a positive and sustainable way. To promote sustainability in labs, education on green practices should never stop. Stakeholders should keep learning and exchanging their ideas and knowledge, so that they can constantly improve the lab practices and make the laboratories eco-friendlier. Therefore, academic institutions should implement green lab methods for environmental sustainability, as these practices will also influence their future careers.

Table 1: Hazardous substances in laboratories

Type of Chemicals	Effect	Examples of Chemicals
Dangerous chemicals	Harmful to the human body and environment	Acetonitrile, chloroform, formaldehyde, sodiumazide, sodium hydroxide, etc.
Oxidizers	React violently and cause fires or explosions	Nitrates, perchlorates, permanganates, chromates, peroxides, etc.
Flammable liquids	Ignite easily and burn rapidly	Methanol, ethanol, acetone, xylene, toluene, etc.

Water-reactive	Release flammable or toxic gases on exposure to moisture or water	Alkali metals, metal powders, carbides, boranes, etc.
Pyrophoric	Spontaneously ignite in air or oxygen	Metal alkyls and aryls, nonmetal alkyls, phosphorus (white), etc.
Poisons	Cause acute or chronic toxicity to the human body or the environment	Acrylamide, cyanides, sulfides, mercury compounds, etc.

Table 2: Framework for Lab practices and Action to be taken

Green Practice	Action to be Taken
Use of Safer Chemicals	▪ Choose less toxic and hazardous chemicals whenever possible. ▪ Replace hazardous substances with safer alternatives.
Chemical Inventory Management	▪ Maintain an up-to-date inventory of chemicals to prevent unnecessary purchases and waste. ▪ Properly label and store chemicals to prevent spills and accidents.
Minimize Chemical Use	▪ Use chemicals in the smallest quantities necessary to achieve the desired results. ▪ Design experiments and processes to minimize chemical consumption.
Solvent Selection	▪ Choose green solvents (e.g., water, ethanol) over hazardous or volatile organic solvents. ▪ Employ solvent recycling and recovery.
Energy Efficiency	▪ Use energy-efficient equipment in laboratory. ▪ Turn off equipment when not in use, and optimize experimental setups to reduce energy consumption.
Waste Reduction:	▪ Implement techniques such as microscale chemistry to reduce waste generation. ▪ Recycle and reuse chemicals and materials when possible.
Catalysis	▪ Employ catalytic processes to reduce the need for reagents and minimize waste.
Green Synthesis	▪ Use environmentally friendly synthesis
Green Equipment	▪ Invest in energy-efficient equipment
Education and Training	▪ Provide training for environmentally friendly techniques and technologies to stakeholders
Safety Practices	▪ Prioritize safety by following established safety protocols

ABSTRACT

The endocrine system comprises of a vast complex arrangement of glands for the production as well as release of hormones and plays a crucial role in vital body functions, converts calories into indispensible amount of energy, which fuels the body's cells and organs. A unique different category of hormone is released into our bloodstream by each specific endocrine gland. These hormones circulate in our blood and transported to other cells where they assist in regulating and coordinating a variety of bodily functions. The complex endocrine feedback mechanism aids in the regulation of hormone levels in the bloodstream. If our body produces either high or too low of a certain particular hormone, the feedback system sends a signal to the suitable glands to address the issue. Diabetes is a carbohydrate, lipid, and protein metabolic condition that affects a considerable proportion of the world's population. Adrenal glands generate hormones that are required for regular body functioning and lack of these hormones is termed as adrenal insufficiency. Adrenal insufficiency can manifest in diverse ways, from mild nonspecific symptoms to life-threatening shock. Cushing's syndrome is a condition that happens when your body overproduces an unusual high level of the hormone cortisol for a prolonged period of time. Unless the patient is declared unfit, surgical removal of the enlarged tumor is the suggested initial line of treatment. As long as the tumor is accessible, it remains the chosen technique for recurrence.

Keywords: hormone, symptoms, bloodstream, Diabetes, cortisol, endocrine.

INTRODUCTION

The endocrine system comprises of a vast complex arrangement of glands for the production as well as release of hormones and plays a crucial role in vital body functions, converts calories into indispensible amount of energy, which fuels the body's cells and organs. Our heart rate, the overall growth of our organs, development of our bones, body tissues, coordination of body processes, metabolic rate, repair of damaged cells are all accomplished by the endocrine system. It is quite evident of developing diabetes, thyroid disease, development problems, sexual dysfunction, and a variety of other disorders linked to over or under secretion of hormones in case of endocrine dysfunction. Preventive therapy should be mostly recommended by evidence-based guidelines since patients suffering from diverse endocrine diseases usually run the risk of unfavorable outcomes brought on by their underlying endocrine pathy or secondary complications. An endocrine disorder is the consequence of the endocrine system's imperfection, which includes failure of the glands for the secretion of hormones, the receptors responding to those hormones, and lastly the organs which are directly affected. Medical conditions that can lead to dysfunction at any one of these steps can produce extensive consequences for the particular affected individual.

Glands of Endocrine System

A unique different category of hormone is released into our bloodstream by each specific endocrine gland. These hormones circulate in our blood and transported to other cells where they assist in regulating and coordinating a variety of bodily functions.

Endocrine glands include
Adrenal glands

Adrenal glands, additionally referred to as suprarenal glands, are quite small triangular in shape that are found in topmost position of both kidneys. Adrenal glands generate hormones that aid in regulating metabolic rate, immune system, development of sexual characteristics, normal blood pressure, managing stress, and other vital activities. An important glucocorticoid hormone cortisol is produced by these two adrenal glands during stress and emergency conditions.

Hypothalamus

The hypothalamus, a deep brain region that directs the release of hormones by the pituitary gland, acts as our body's sophisticated centre for control and coordinates the endocrine system. Its crucial role is to regulate heart rate, blood pressure, temperature, sleep, growth, mood, hunger thereby accomplishing a balance termed as homeostasis. Neuro hormones produced in the hypothalamus either directly alters our autonomic nervous system or may regulate the secretion of hormones from the anterior pituitary gland.

Ovaries

Ovaries are paired vital organ in the primary female reproductive system that produces ovum and sex hormones such as estrogen, relaxin, in hibin and progesterone. These are two tiny ductless oval-shaped glands lying on each side of the uterus. They develop store and release eggs and produce vital group of hormones that control our fertility, menstrual cycle and pregnancy. During ovulation one of the ovaries releases a mature egg which enables it to be fertilized by the male sperm cells.

Islet cells in the pancreas

The islets of Langer hans are pancreatic cell clusters that manufacture hormones. Islets contain four types of cells:

1. Alpha cells: Glucagon
2. The beta cells: Insulin
3. Delta cells: Somatostatin
4. PP cells: Pancreatic polypeptide

The hormones insulin and glucagon are released under the control of special islet cells confined in the pancreas.

Parathyroid

The parathyroid glands are tiny endocrine glands in the neck that regulate the body's calcium and phosphorus levels and play a major role in bone development. They are situated directly beneath the thyroid glands. Normally, there are four parathyroid glands, two beneath each thyroid gland. They are pea-sized and mediates release of parathyroid hormone (PTH) whenever calcium levels are low in the blood. PTH is a polypeptide hormone that regulates serum calcium, phosphorus and magnesium levels in the bones and blood.

Pineal gland

A tiny pea-shaped organ in the brain that can be discovered close to the brain's center and may be connected to control and monitor sleep cycles producing melatonin. It is located in the center of the brain, beneath the corpus callosum. The pineal gland's primary job is to regulate the waking and sleeping cycle. Melatonin, which governs circadian cycles, is secreted by it.

Pituitary gland

The pituitary gland termed as master gland is a pea sized gland, is located behind the sinuses near the centre at the base of the cranium below hypothalamus. It is responsible for the production of adrenocorti cotropic hormone (ACTH) and numerous other hormones such as Thyroid-stimulating (TSH), Luteinising hormone (LH), Follicle-stimulating hormone (FSH), Prolactin (PRL), Growth hormone (GH) and Melanocyte-stimulating hormone (MSH). ACTH signals the adrenal glands to produce cortisol. Because it affects numerous other glands, particularly the thyroid, it is frequently referred to as the "master gland". Pituitary gland issues can have an impact on bone development, regulates menstrual cycle, and the production of breast milk during lactation.

Testes

The testes constitute the male reproductive glands responsible for the production of sperm and testosterone. They are similar to female ovaries. The testes are mixed glands that perform both exocrine and endocrine activities. The testes are in charge of sperm production, androgen production, and testosterone secretion.

Thymus

The thymus gland is a tiny organ in the chest that is placed beneath the breastbone and between the lungs. It is essential for the development of the immune system. The primary purpose of the thymus gland is to mature T cells, often termed as T lymphocytes. These are white blood cells that aid in the fight against infections and cancer cells. The thymus gland is also involved in the production of hormones like insulin. A gland in the upper chest that aids in early immune system development.

Thyroid

The thyroid is a vital small endocrine gland in the shape of a butterfly in the lower part of the neck. The thyroid hormone aids in controlling metabolism, growth rate, and a variety of other bodily functions by comprising a self-regulatory circuit termed as hypothalamic-pituitary-thyroid axis with anterior pituitary gland, and hypothalamus. The most important hormones produced by the thyroid gland includes thyroxine or tetraiodothyronine (T4) and triiodothyronine (T3). The slightest malfunction of any of these glands can upset our body's fragile hormonal balance thereby resulting in a complicated medical condition termed as endocrine disorder or illness.

Etiology of Endocrine Disorders

The endocrine system majorly influences the development of the heart, bones and tissues, fertility, possibility of diabetes, thyroid illness, abnormalities in growth pattern, sexual dysfunction, and a number of other disorders related to hormones. Increase or decrease in levels and a total imbalance in the hormone produced by endocrine glands can be due to the following reasons:

1. The endocrine feedback system is malfunctioning
2. Disease or illness of some type
3. Disability of one gland to stimulate another gland for the release of hormones (for example, an impairment in the brain might affect pituitary hormone production)
4. A hereditary condition, such as multiple endocrine neoplasia termed as MEN or congenital hypothyroidism
5. Cases of Infection and/or inflammation
6. Injury or trauma to any particular endocrine gland
7. Tumor

Classification
Endocrine disorders are typically grouped into two categories

HORMONE IMBALANCE
The complex endocrine feedback mechanism aids in the regulation of hormone levels in the bloodstream. If our body produces either high or too low of a certain particular hormone, the feedback system sends a signal to the suitable glands to address the issue. A hormone imbalance can arise if there is a discrepancy in the feedback system in maintaining the normal quantity of hormones released into the body or if our body is not able to effectively clean them from the bloodstream. Imbalance causes endocrine illnesses when a specific gland accelerates or inhibits the production of endocrine hormone. The emergence of lesions in the form of nodules or tumors developed in the endocrine system causes endocrine illness, which may or may not alter hormone levels. A significant rise or decline in the hormones produced by endocrine glands can be the outcome of a flaw in the endocrine feedback mechanism and in some cases deficiency of one gland affects an additional gland to release hormones.

DEVELOPMENT OF LESIONS
Multiple endocrine neoplasia or MEN or congenital hypothyroidism are included in the category of hereditary disorders. The majority of endocrine tumors and nodules (tumors) are benign and they rarely spread to other parts of the body. A tumor or nodule on the endocrine gland itself, on the other hand, can interfere with the gland's capacity of hormone synthesis.

Types
There are many different types of endocrine disorders which include

Diabetes Mellitus
Diabetes is a carbohydrate, lipid, and protein metabolic condition that affects a considerable proportion of the world's population. Diabetes mellitus is a collection of metabolic disorders characterized by chronic hyperglycemia caused by abnormalities in either insulin secretion, insulin action, or in rare cases both. It is the most often diagnosed endocrine condition in the United States. Long-term glycemic management has been shown to reduce the development of various diabetic complications [1]. An increasing body of research recently supports the benefits of euglycemia in certain individuals, including critically ill cardiac surgery patients and patients with CNS or myocardial ischemia or infarction. The consequences of persistently high blood glucose levels are widely recognized, and they include atherosclerosis and neuropathy. This can prove to be fatal resulting in a extensive range of organ damage, including coronary artery disease, skin infections, and strokes, as well as micro vascular consequences such as diabetes, peripheral neuropathies, and retinopathies [1].

Adrenalin sufficiency
Adrenal glands generate hormones that are required for regular body functioning and lack of these hormones is termed as adrenal insufficiency. Adrenal insufficiency can manifest in diverse ways, from mild nonspecific symptoms to life-threatening shock. The decline in adrenal function can be overlooked until stress or sickness precipitates an adrenal crisis. The adrenal gland is divided into two distinct parts: the outer cortex and the inner medulla. Adrenal insufficiency occurs when the adrenal cortex fails to produce hormones required for proper

68046

Anjali Mishra *et al.,*

physiological function. The adrenal gland produces inadequate amounts of an important hormone cortisol and aldosterone. Fatigue, weakness, stomach upset, dehydration, and skin pigmentation are some of the evident symptoms which are manifested. Adrenal insufficiency including Addison's disease is rare and occurs when adrenal glands are damaged. Pituitary hormone overproduction results in overactive adrenal glands [2].

Cushing's disease

Cushing's syndrome is a condition that happens when your body overproduces an unusual high level of the hormone cortisol for a prolonged period of time. Cortisol, basically a steroid in the glucocorticoid class is known as the "stress hormone" since it manages our body's response to stress and can suppress the immune system. Cortisol is also beneficial in keeping stable blood pressure, managing blood glucose levels, maintain cardiovascular function, minimize inflammation, and convert food into energy. This disease is a rare endocrine sickness caused by a pituitary tumor characterized by too much production of anterior pituitary adrenocorticotropic hormone (ACTH), resulting in an excess release of cortisol. Cushing's syndrome is a collection of hormonal illness that can arise in persons, particularly children, who consume high dosages of corticosteroid medicines. This is frequently caused by a pituitary adenoma or by excessive hypothalamic production of corticotropin-releasing hormone (CRH). Generalized weakness, high blood pressure, diabetes, menstruation irregularities, and psychological disorders are all symptoms of the condition. Raised cortisol levels can cause rounded moon face, fatty hump, easy bruising, depression, thin skin, acne, abdominal striae, obesity, facial plethora, and hirsutism [3].

Etiology

The most prevalent explanation of this rare syndrome is long-term, administration of cortisol-like gluco corticoids in high-dose which are meant to treat other medical conditions. Patients almost invariably have a pituitary adenoma (non-cancerous growth on pituitary gland), which is not usually visible on imaging and produce excess ACTH, thereby prompting the adrenals to over produce cortisol. Rare occurrences of widespread corticotroph cell hyperplasia may occur even without ectopic release of corticotropin-releasing hormone (CRH). The tumors are often micro adenomas (less than 10 mm in size), with only 5 to 10% being macro adenomas. Macro adenomas are more likely to occur than micro adenomas to produce excessively high concentrations of ACTH. These adenomas are caused by a number of genetic abnormalities. Ubiquitin specific peptidase 8 is the most prevalent mutation. These mutations cause aberrant growth factor expression, which, when combined with ACTH, raises cortisol levels. A tumor on the adrenal gland might cause excessive cortisol production. Adrenal tumors are usually benign, but they can be malignant.

Differential Diagnosis

Ectopic ACTH secretion, exogenous corticosteroid use, pseudo-Cushing syndrome, and physiologic hyper cortisolism are all possible diagnoses for Cushing disease [4].

Prognosis

Cushing disease is ultimately lethal if not treated. The excessive production of gluco corticoids causes mortality, which may result in a variety of medical issues, including cardiovascular problems and immune function impairment. For individuals who have surgery, gluco corticoids must be taken for the rest of their lives [4].

Treatment/Management

Depending on the etiology, treatment may involve surgery, radiation, chemotherapy and medications for lowering cortisol level. If long-term administration of glucocorticoids to treat other illness is the reason, doctor can progressively minimize your prescription that can control that disorder [3]. Glucocorticoid-treated illnesses can sometimes be treated with a non-glucocorticoid drug instead.

Gigantism and Acromegaly

A person bones and body parts may grow abnormally fast and appear peculiarly odd if the pituitary gland release sexcess quantity of growth hormone. On the contrary if growth hormone levels are quite low, he or she may stop

attaining height and may turn dwarf. Both acromegaly and gigantism are growth hormone overproduction diseases. The most prevalent cause is a pituitary adenoma secreting growth hormone (GH). Gigantism is manifested by tall stature and develops when there is hypersecretion of growth hormone before the union of the long bone epiphysis. Acromegaly develops on the contrary when there is hyper secretion after epiphysis fusion, resulting in huge extremities and a distinctive facies. A high level of insulin-like growth factor-1 (IGF-1) confirms the diagnosis of these two. Surgical excision of the tumor is the preferred first line of treatment; however, this seldom results in permanent cure, and additional treatment with somatostatin analogs or radiation is frequently required [5].

Etiology

A GH-secreting adenoma in the pituitary gland is responsible for approximately 95% of cases of acromegaly and gigantism. Acromegaly can also be caused by growth hormone-releasing hormone (GHRH) secretion from a hypothalamic adenoma or from lung or pancreas neuroendocrine tumors. Acromegaly can be caused by ectopic growth hormone release as a result of abdominal or hemopoietic malignancies. Multiple endocrine neoplasia-1 (MEN-1), neurofibromatosis, Carney complex, and McCune-Albright syndrome are multiple genetic syndromes associated with GH hyper secretion. Familial idiopathic pituitary adenomas (FIPA) caused by aryl hydrocarbon protein-interacting (AIP) mutations have been linked to acromegaly. Approximately 25% of cases of acromegaly manifest as teenagers with gigantism.

Gigantism Characteristics

Gigantism is particularly uncommon and should be examined if the patient's height reaches three standard deviations above the standard mean height or two standard deviations greater than the corrected mean parental height. Because gigantism is related to a number of diseases such as neurofibromatosis, Carney complex, and McCune Albright syndrome, it is imperative to screen for neurofibromas with cafe au lait spots, ocular gliomas, and skin lentigines.

Acromegaly Characteristics

1. Increased extremity size: Enlargement and growth of the both hands and feet is observed as a result of both bone expansion and soft tissue swelling.
2. Because of the swelling in the soft tissue, the extremities may possess"dough" like consistency which resolves with treatment; however, skeletal alterations are quite permanent.
3. Hyper hidrosis and skin tags (in approximately 98% of cases) are caused by GH-induced epithelial cell hyper proliferation.
4. Acromegalic flora: Acromegalic facial traits include a prominent supraorbital ridge, a broad nose, acne, huge lips, an overbite, prognathism, tongue enlargement, and coarsening of facial features.
5. Musculoskeletal symptoms include generalized weakness and tiredness.
6. Teeth malocclusion, joint pain in the temporomandibular region, and a distinctive inter dental separation can all result from jaw elongation.
7. Carpal tunnel syndrome affects approximately 60% of patients and is caused by median nerve enlargement as opposed to extrinsic compression.
8. Acromegaly has also been associated with kyphoscoliosis.
9. Soft tissue thickening of the upper airway and big tongue can cause deep voice and obstructive sleep apnea.

Differential Diagnosis

Acromegaly is a disorder in which patients have distinctive acromegaloid facial traits or a large stature and physique, yet laboratory tests for GH and IGF-1 are observed to be normal. In these circumstances, pituitary imaging is quite unremarkable and average. Soto's syndrome is a congenital syndrome featuring overgrowth distinguished by large build, acromegaloid facial features, intellectual and logical impairments, macrocephaly, and advancement in bone age. Further clinical characteristics include neonatal hypotonia, cardiac abnormalities, strabismus, scoliosis, and susceptibility of cancer. It is caused by chromosome 5 haploin sufficiency of the NSD1 gene. The measurement of

IGF-1 and GH levels in the laboratory is found to be normal. To distinguish it from acromegaly, detailed genetic studies are required [5].

Treatment/Management

Surgery, medicinal therapy, and radiation are the three basic treatment techniques available, all having their own pros and cons but the usage of these modalities is decided on a case-by-case basis.

Surgery

Unless the patient is declared unfit, surgical removal of the enlarged tumor is the suggested initial line of treatment. As long as the tumor is accessible, it remains the chosen technique for recurrence. The trans sphenoidal method involves entering the sphenoid sinus by a nasal or sublabial technique and thereby removing the sellar floor to access the tumor. This method can be used to remove malignancies with suprasellar extension. Endoscopic transsphenoidal resection is superior to microscopic resection in terms of tumor removal, morbidity, and sequelae. Diabetes insipidus and anterior pituitary hormone deficits are common post-surgical consequences. IGF-1 as well as levels of GH must be monitored every 12 weeks following surgery with the goal of normalizing IGF-1 and to achieve an unnoticeable GH level.

Medical Treatment

There are several medicinal medications accessible to treat growth hormone problems. They are used to treat illness that persists after surgery. Dopamine agonists like Cabergoline; Somatostatin receptor ligands including Octreotide and Pasireotide; GH receptor antagonist like pegvisomantare amongst the preferred line of treatment.

Radiation

Radiation therapy is frequently utilized as an adjuvant management for chronic disease following surgical operation; on rare occasions, it may be utilized as first-line therapy in individuals who are unable to undergo surgery. External and stereotactic single high-dose irradiation are two extensively utilized radiation therapy methods.

Hyperthyroidism

Hyperthyroidism, termed as overactive thyroid, is the condition when the thyroid gland produces excess thyroid hormones more than the body actually requires resulting in weight loss, rapid heart rate, perspiration, and anxiousness [6]. Many of our body's physiological activities accelerate at a high speed when there is high concentration of thyroid hormone. Grave's disease, an autoimmune condition, is the most widespread and prevalent outcome of an overactive thyroid gland.

Symptoms

The symptoms of hyperthyroidism can vary from individual person and may include notwithstanding increased appetite, loss in weight, heartbeat that is too fast or too irregular, nervousness, irritating behaviour, difficulty in sleeping, exhaustion shaky hands, muscular weakness, perspiration or difficulty with heat tolerance bowel movements on a regular basis, goiter, a lump or swelling in the neck area causing enlargement [6]. Hyperthyroidism is sometimes misdiagnosed in elderly as sadness or state of dementia. Older adults with hyperthyroidism may experience varied symptoms, including total loss of appetite or withdrawal from people as compared to younger adults.

Etiology

There are multiple manifestations of hyperthyroidism, including [6]:

1. **Graves' disease** Graves' disease is an autoimmune syndrome that becomes the most prevalent reason for hyperthyroidism. Due to this, the immune system attacks and weakens the thyroid gland, thereby it starts producing a disproportionate amount of thyroid hormone.
2. **Overactive thyroid nodules** These are common and usually non-malignant. However, a few or all of the nodules may become hyperactive and release excessive thyroid hormone especially common in older people.

3. **Thyroiditis** Thyroiditis refers to inflammation of the thyroid gland causing can leakage of thyroid hormone out of the gland into the bloodstream in some cases of thyroiditis. As a result, you may experience hyperthyroidism symptoms.
4. **Excessive use of thyroid hormone medication** Some hypothyroid patients may take excessive amounts of thyroid hormone medication leading the hormone levels and manifest hyperthyroidism.
5. **Noncancerous tumor** A noncancerous growth of the pituitary gland, can induce hyperthyroidism in rare situations.

Treatment/management

Treating the condition will avoid lasting health issues and at the same time can alleviate unpleasant symptoms. There is not a single separate treatment that can work for every individual. The management can be determined by the exact cause and severity of the hyperthyroidism. Medicines, radioiodine therapy, and lastly `thyroid surgery are the common treatment options.

Hypothyroidism

Hypothyroidism, or in other words underactive thyroid, is an endocrine disorder where thyroid hormone production is insufficient, resulting in fatigue, constipation, dry skin, and depression [7]. This condition is the outcome of when there is inefficiency of thyroid glands to produce enough amounts of hormones for meeting the body's needs. In youngsters, an underactive gland can cause developmental delays.

Symptoms

Many symptoms of hypothyroidism might differ from person to person. Some frequent hypothyroidism symptoms include exhaustion, unusual weight gain, difficulty in coping up with cold temperatures, joint and muscle pain, thin hair, dry skin, heavy or irregularity in menstrual periods, fertility issues and state of depression caused by decreased heart rate. Because hypothyroidism develops gradually, you may not notice symptoms for several months or even for few years [7]. A number of these symptoms, particularly weariness and particularly gain in weight, are widespread and do not always surely indicate a thyroid disease.

Etiology

1. **Hashimoto's disease** This autoimmune condition is the most common cause of hypothyroidism. The body's weakened immune system targets the thyroid gland in this condition making it inflamed and weakens its ability to produce adequate amounts of thyroid hormone.
2. **Thyroiditis** Thyroid inflammation leads to thyroid hormone stored to seep out of the thyroid gland. Primarily, this leakage elevates the concentration of these hormones in our blood, resulting in thyrotoxicosis, a medical disorder with raised abnormally high levels of thyroid hormone. Following that, thyroid gland becomes underactive, leading to a permanent condition, which requires thyroid hormone replacement.
3. **Congenital hypothyroidism** In some cases babies are born with an immature thyroid gland that is not functioning properly. Congenital hypothyroidism, if left ignored and untreated, can result in academic impairment and failure to grow at a normal pace.
4. **Surgical removal** When a portion of the thyroid gland is detached due to reasons like hyperthyroidism, goiter, tumors, etc. the remaining portion can generate standard quantities of hormones. However, some patients who undergo this operation may develop hypothyroidism. Hypothyroidism is invariably the result of removing the entire thyroid [7].

Treatment/management

Hypothyroidism is treated by supplementing hormones that our thyroid no longer produces. One can take levothyroxine, a popular thyroid hormone medication that is quite similar to the hormone produced by a healthy normal thyroid. It is typically administered in pill form, and also available in other forms such as liquid and a soft gel capsule [7]. These improved marketed formulas may assist persons with digestive issues in absorbing thyroid hormone as prescribed by their doctor.

Hypopituitarism

The pituitary gland (consisting of anterior and posterior lobes) is in charge of manufacturing and secreting hormones that play an important role in regulating endocrine function in the body. Growth hormone (GH), luteinizing hormone (LH), prolactin (PRL), thyroid-stimulating hormone (TSH), adrenocorticotropin hormone (ACTH), and follicular-stimulating hormone (FSH) are all hormones generated by the anterior lobe of the pituitary [8]. The posterior part stores and releases antidiuretic hormone (ADH) and oxytocin. Hypopituitarism is characterized as a lack of one or more of the pituitary gland's hormones. In various ways, an inadequate supply of hormones can impact how the body functions. These include, among other things, growth, blood pressure, and the ability to bear children. Women suffering from this illness may experience a cessation of menstruation cycle making the condition worse. Because of the modest presentation, hypopituitarism is associated with greater mortality due to increased cardiovascular and respiratory disorders, and early detection is critical to prevent further morbidity.

Etiology

Hypopituitarism can be caused by either a pathology of the hypothalamus inhibiting the synthesis of trophic hormones that act on the pituitary gland or a pathology of the pituitary gland itself [8].

1. Pituitary tumors are the most prevalent reason of hypopituitarism (61%). Pituitary tumors can induce an increase in one hormone, resulting in a shortage in the other pituitary hormones, as in acromegaly (excess GH with hypopituitarism from the macroadenoma). The majority of pituitary tumors are benign, and they can be secretory or non-secretory.
2. Secondary metastases from malignancies such as the breast, colon, and prostate are less prevalent. Hypopituitarism can also be caused by hypothalamic and para-pituitary malignancies such as supra sellar meningiomas, gliomas, and craniopharyngiomas.
3. Hypopituitarism can also be caused by inflammatory disorders in the pituitary gland.
4. Infiltrative disorders such as sarcoidosis, hemochromatosis, and histiocytosis may be linked to hypopituitarism.
5. Other causes include pituitary gland injury as a result of a traumatic brain injury, or iatrogenic injury through surgery or cranial irradiation [8].

Differential Diagnosis

In complex scenarios where seemingly healthy pituitary hormone levels are misconstrued in the setting of poor target organ hormone levels, a diagnosis of hypopituitarism may be missed or delayed. Adrenal insufficiency, on the other hand, should be treated based on clinical suspicion rather than waiting for laboratory evidence [8]. Following are some differential diagnoses that may be examined while making a diagnosis of hypopituitarism

Treatment/Management

The cause of hypopituitarism must be addressed. The primary goal of treatment should be to address the underlying cause of hypopituitarism. Mass lesions should be surgically removed, and associated medical issues should be treated properly. Hormone replacement therapy may be required for many people.

1. **TSH Deficit** Replacement of thyroid hormone (L-thyroxine) is essential, especially in the elderly and individuals with heart illness.TSH is no longer a valid measurement, hence peripheral hormone levels (T4 free or total) must be assessed.
2. **ACTH Deficit** To avoid an adrenal crisis, corticosteroid replacement should be started before thyroid hormone replacement. Corticosteroid dosages must be increased during times of stress, anxiety, surgical procedures, and pregnancies.
3. **Growth Hormone Deficit** GH replacement has not been well established in the treatment of adult GH deficit, unlike in children with short stature due to GH deficiency. Synthetic growth hormone replacement, such as somatotrophin, is used in children for this reason. IGF1 levels are titrated during replacement therapy. Following puberty, another examination is performed to decide if GH replacement is necessary throughout adulthood.
4. **ADH Deficit** ADH replacement with intranasal or the oral desmopressin (synthetic vasopressin) aids in the stabilization of the water balance and polyuria. Sodium levels must be kept within normal limits, and osmolality and urine specific gravity can be evaluated to ensure proper ADH replacement.

5. **FSH/LH Deficit** In men, testosterone can be administered via gel, a patch, orally, or intramuscular (IM) injections, with PSA and hemoglobin levels carefully monitored. In women, estrogen/progesterone hormone replacement treatment (HRT) can be administered orally, intramuscularly, or trans dermally.

Polycystico vary syndromeor PCOS
PCOS is a multifacetedmost prevalent condition affecting women with many clinical manifestations. It usually begins in adolescence, but symptoms might change with time. Androgen overproduction interferes with egg formation and also inhibits their liberation from the female ovaries. PCOS is one of the most common primary causes and reason for infertility. PCOS affects 8-13% of reproductive-aged women, according to estimates. Worldwide, up to 70% of affected women go misdiagnosed. PCOS is linked to a number of long-lasting health issues that can have a great impact on both physical and emotional well-being of the individual [9]. PCOS is very common and runs in most of the families, however there are ethnic differences in how it appears and affects people. It can eventually result in hormonal abnormalities, irregularity in menses, elevated testosterone levels, and cysts in the ovaries. Unstable periods, which are frequently followed by a lack of ovulation, create difficulty in pregnancy. PCOS has turned out to be a chronic disease that has actually no cure. Its symptoms, can somehow be reduced to an extent with conscious modifications in lifestyle, intake of relevant drugs, and undergoing fertility treatments. Although the etiology of PCOS is still ambiguous, women with a family history or suffering from type 2 diabetes are at a higher risk.

Etiology
PCOS is an oligogenic manifestation in which a multitude of genetic and environmental factors interact with each other to define the clinical phenotype. The exact genetic etiology is unknown and in definate, a PCOS family history is rather frequent and familial inheritance of PCOS is quite ambiguous [9]. Further a formal segregation study is not possible because of lack of phenotypic information. Nonetheless, recent research ascertains that PCOS clustering in families is quite similar in an autosomal dominant pattern. Poor dietary intake and substantial physical activity might elevate environmental factors which can aggravate PCOS in case of obesity), along with exposure to pathogenic agents and chemicals which can also play an imperative role. PCOS's reproductive and metabolic aspects are potentially treatable with lifestyle modifications that include weight loss and exercise.

Symptoms of PCOS
Symptoms of PCOS generally vary amongst individuals and can also alter unpredictably over time and frequently occur without a clear cause. Most common symptoms involve heavy, long time period, intermittent, random or irregular cycle of periods, chances of infertility, acne and greasy, oily skin, presence of excessive hair on the face or even body, male-pattern baldness or thin hair, unusual weight gain, especially confined to the belly region. Anxiety, despair, and a negative body image can all result from PCOS. Some symptoms, such as infertility, obesity, and excessive hair growth, may result in societal stigma. This can have an impact on other aspects of one's life, such as family, relationships, employment, and community activity [9].Individuals facing PCOS are likely to have the following comorbidities.

1. Hypertension
2. Type 2 diabetes
3. Heart ailments caused by excessive cholesterol
4. Endometrial cancer (cancer of the uterine lining)

Diagnosis
When making a diagnosis, clinicians consider if irregular periods and ovulation are a natural part of puberty or menopause, whether polycystic ovaries run in families, and whether women with a consistent family history of either PCOS or type 2 diabetes have more chances of developing PCOS. Furthermore, the ultrasound image can be unclear, and some PCOS women ultrasound scan may not show polycystic ovaries. PCOS shall be diagnosed by the

Anjali Mishra *et al.,*

presence of at least two of the following: Blood tests can detect specific variations in hormone levels, albeit these changes are not uniform. Women with PCOS may have higher levels of the following hormones [9]:

1. Testosterone, a specific androgen hormone released from the ovaries that increases hair growth
2. Oestrogen that stimulates growth of the womb lining sorrounding endometrium
3. Insulin another important hormone that is primarily responsible for energy utilization from food
4. Anti-müllerian hormone for the fertility of ovaries and
5. Luteinising hormone secreted from the pituitary hormone that can affect hormone production and is important for normal ovulation process

Management of PCOS

Although there is no cure for PCOS, medications can alleviate symptoms. People who have irregular periods, difficulty getting pregnant, or significant acne and hair growth should see a doctor without any delay in diagnosis and get a professional opinion as soon as possible. Some PCOS symptoms can be alleviated by making lifestyle adjustments. Eating a nutritious diet and doing adequate exercise can help you in losing weight considerably and lowers the chances of developing type 2 diabetes. Birth control pills (contraception) can definitely help in regulating the menstrual cycle and alleviate signs and symptoms [9]. Additional medications can help minimize acne trouble or excessive hair growth due to PCOS. Infertility caused by PCOS can be treated with lifestyle modifications, medications, or surgery to encourage regular ovulation. In-vitro fertilization (IVF) is an option, although it comes with significant hazards.

Precocious puberty

Precocious puberty of a child can be understood as the development of particular abilities or tendencies at a younger age than is typical or expected and is considered as a complex transitional period that includes growth at an accelerated rate along with development of secondary sexual characteristics. It is considered as a time of both physical and psychological growth. Numerous genetic, environmental and dietary factors play a major role in the onset, inception and progression of puberty. Early puberty happens when specific glands instruct the body for releasing sex hormones quite early in their life time. The accelerated growth rate in girls before the age of eight, and development of genital organs in boys before the age of nine, indicate precocious puberty. This type of puberty in boys poses a significant risk of underlying pathology and necessitates immediate referral to a specialist paediatric endocrinologist [10]. Several cases of early puberty in girls beyond the age of six have benign origins, but in certain situations, precocious puberty might signify significant pathology.

Etiology

Precocious puberty is classified into following two main classes on the basis of indication's etiology as follows [11]:

Management of Precocious Puberty
Central Precocious Puberty

The decision to treat cases of precocious puberty is influenced by the child's age and its rate of progression. Its recommended to consider treatment if the manifestation of child's symptoms are fast increasing or if bone age is greatly complex. The primary purpose of treatment is to maintain height of the individual appropriately and to relieve the related psychosocial stress and stigma associated with it. GnRH agonists are the time-tested gold standard of treatment. Long and short-acting GnRH agonists are available in a variety of formulations (intranasal, intramuscular, and subcutaneous). The formulation is chosen based on the preferences of the patient and the practitioner. The most common in the United States is leuprolide acetate which is a depot injection that is given every three months [10]. Recommended GnRH agonist therapy is usually regarded as secure, with no severe undesirable effects observed. Localized skin reactions such as intramuscular discomfort, sterile abscesses and post-menopausal symptoms such as hot flushes are the most common side effects. While on medication, pubertal progression, growth velocity, and skeletal maturation must be monitored on a regular basis.

Peripheral Precocious Puberty

The treatment of peripheral precocious puberty is mainly intended towards eradicating the basic source of sex steroids. In extreme cases surgery is recommended in both gonadal and adrenal tumors. If exogenous sources of these sex steroids are exactly recognized, there should be an attempt to eliminate them completely. Classic congenital CAH can be treated with specific therapy with glucocorticoids. In McCune-Albright syndrome also termed as CAH, some benefit can occurby blocking the synthesis of estrogen using aromatase inhibitors such as anastrozole, letrozole and selective receptor modulator like tamoxifen. The best possible management for familial male-limited precocious puberty is still not well recognized, but the best preferred treatment using a combination of an androgen antagonist (spironolactone) along with an aromatase inhibitor (anastrozole, testolactone) gives satisfactory results [10].

Differential Diagnosis

1. Premature Thelarche is defined as the premature unilateral or may be bilateral maturity of breast in girls aged 12 to 24 months. There are no further pubertal changes connected with this condition. Normal bone ages, growth rates, and biochemical tests can be performed. It is frequently an exclusionary diagnosis. Frequent clinical follow-up and check upis essential to assess growth, maturation and pubertal progression.
2. Premature Adrenarche is mainly characterized by the early before time synthesis of adrenal androgens. Before the age of eight years, it manifests as pubic and axillary hair, body odor, acne and many similar symptoms. Females have no breast development, and males have no testicular hypertrophy. It is critical to rule out miscellaneous androgen sources such creams or gels, adrenal tumors, and late-onset CAH.
3. Premature Menarche: Premature menarche can be understood as the development of vaginal bleeding in young girls even before seven. They can be present either with a single episode or may be a few repeated cycles which can be less than 3 and develop normally till the child reaches puberty. Current research clearly ascertains that there will be no effect observed on adult height. Cases of sexual abuse, vaginal foreign bodies, and vulva and vaginal diseases must be ruled out.

Prognosis

Early therapy usually results in better success in retaining final adult height. The outcomes are determined by variety of reasons such as the progression of bone change, the age of initiating precocious puberty, the time of beginning, and the total duration for treatment. After medication is discontinued, the hypothalamic-pituitary-gonadal (HPG) axis returns back to normal, and the children suffering from it usually develop through puberty normally. There is little known about the long-term endocrine, metabolic, reproductive, and psychological effects. Peripheral precocious puberty prognosis differs according to the etiology [11].

Herbal Approach for Treating Endocrine Disorders

Endocrine disorders like diabetes mellitus, adrenal insufficiency, cushing syndrome, growth hormone disorders, hyperthyroidism, hypothyroidism, hypopituitarism, PCOS, precocious puberty, etc. are expanding daily because of numerous contributing factors such as environmental contaminants, endocrine disrupting substances from food, and unhealthy life styles. Millions of people's lives can be severely impacted by hormonal abnormalities. Spices, herbs, medicinal plants tend to bring the disturbed hormone levels back to normal by various mechanisms. There are various factors that can affect the hormonal balance in the modern day lifestyle of a regular human being like stress reduction, herbal treatment, sound sleep, healthy food choices, physical and emotional health. The primary messengers that regulate practically every bodily system are hormones. Hormonal imbalance is a troublesome illness that has negative consequences on mind frame, metabolism, appetite, mental health and finally aging. Herbs known as adaptogenic are special medicinal plants that support immune system function, balance hormones, and lessen mental tension. There are numerous herbs that help remove toxins from the body and cleanse the liver of dangerous and hormone-disturbing substances. Hormonal problems may be treated with the aid of modern herbal infusions and essences.

Table 1. Following is a list of medicinal plant species/ herbs used for endocrine disorders

S No	Herb	Botanical Name	Impact on Endocrine Hormones
1	Bladder Wrack	*Fucus vesiculosus*	This seaweed is an immense source of dietary iodine having the potential to alleviate thyroid gland issues resulting due to pituitary imbalances.
2	Nettle	*Urtica dioica*	It is possible to reverse iodine deficit using this powerful herb. It also enhances the activities of the thyroid and renal glands.
3	Irish Moss	*Chondrus crispus*	It is recognized for further developed creation of T3 and T4 and furthermore known as plant thyroid.
4	Ashwagandha	*WithaniaSomnifera*	White cherry or Indian ginsengis a saponin glycoside has a place with Solanaceae family. Additionally, it works on thyroid capabilities because of its enemy of oxidant properties. Guggul assists with expanding T3 creation as well as advance the change of T4 to T3.
5	Cumin seeds	*Cuminum cyminum*	The phenolic contents and flavonoids in this herb strengthen the production of insulin helping in obesity and decreasing plasma glucose levels.
6	Cinnamon	*Cinnamomum zeylanicum*	The powdered extract of this bark helps control insulin production thereby alleviating type 2 diabetes.
7	Curry leaves	*Murrayakoenigii*	These easily available leaves helps in the improvement of blood glucose levels and in recuperation of tissue injury because of diabetes.
8	Garlic	*Allium sativum*	This spice is widely known for its anti-obesity properties by keeping blood glucose in control and lowering cholesterol in body.
9	Onion	*Allium cepa*	This widely used cooking essential is a great sulphur containing herb which activates insulin delivering cells by pancreas.
10	Turmeric	*Curcuma longa*	Turmeric being a strong powder extract have solid cancer prevention agents of turmeric hostile to diabetic power by expanding insulin creation.
11	Milk Thistle	*Silybum marianum*	It is one of the best spices for liver detoxification and adjusting the additional number of chemicals created in the body. It can reduce the estrogen strength issue and furthermore accommodating in administration of progesterone in ordinary reach.
12	Black Cohosh	*Actaea racemosa*	This extract supports solid advances from menstruation to severance of monthly cycle or menopause.
13	Licorice	*Glycyrrhiza glabra*	This herb has an adaptogenic quality that directs pressure chemicals, for example, adrenaline, and that implies that it can counter adrenal weakness and energize hormonal equilibrium.

Anjali Mishra *et al.,*

14	Ginseng	*Panax ginseng*	Ginseng has been utilized for millennia to deal with issues such as adrenal insufficiency, weariness and absence of energy.
15	Fennel	*Nigella sativa*	Also known as kalonji. This herb is rich in antioxidants. This seed's extracts help control testosterone, insulin, thyroid hormone, and luteinizing hormone levels, among others. Nigella sativa extricate displays estrogenic movement, in basically the same manner to the chemical estrogen in our body.
16	Chasteberry	*Vitex agnus-castus*	Theses berries contain diterpenoid compounds, which might be answerable for this supplement's expected impacts on hormones like prolactin and the synapse dopamine. It's frequently synergistically used with black cohosh and showcased as a solution for side effects of menopause and backing women's regenerative wellbeing. This herb may help alleviate PCOS and precocious puberty symptoms.
17	Burdock Root	*Arctium*	One of the extremely well known and successful natural medicines for Cushing's condition because of its effect on hormonal levels. Burdock root tea can be arranged effectively and can assist with tweaking adrenal capability, subsequently disposing of a large number of the side effects of this condition.
18	Dandelion	*Taraxacum officinale*	The antioxidant compounds intensifies tracked down in dandelion, including luteolin and luteolin-7-O-glucoside, assist the liver, kidneys and adrenal organ with operating ideally, as opposed to siphoning out a lot of cortisol into the body.
19	Spinach	*Spinacia oleracea*	Spinach can counter the imbalances in electrolytes that are a typical result of Cushing's syndrome because of its high potassium, calcium, and magnesium content. It is a rich wellspring of antioxidants and has been connected to controlled hormonal levels in the body.
20	Punarnava	*Boerhaviadiffusa*	This herb is extremely accommodating in the treatment of edema, liver issues, pallor and so on, which are the fundamental side effects of hypopituitarism. Punarnava has astringent, pungent and cooling properties. It is likewise viewed as a very rejuvenative spice.
21	Gotukola	*Centella asiatica*	Gotukola spice is valuable in mind and sensory system problems as well as temperament issues in which there is a determined sensation of trouble and loss of interest. Hormonal changes in the body additionally add to gloom so gotukola is suggested in hypopituitarism patients.

Fig.1. Endocrine disorders

- Type I: β-cell destruction, mediated through either immune mediated or idiopathic
- Type II: Insulin resistance or relative insulin deficiency
- Lifestyle factors
- Genetics

Causes

- Type I: Also known as Juvenile Diabetes Mellitus *(It is Insulin Dependent Diabetes Mellitus)*
- Type II: Also known as Adult Type *(It is non-Insulin Dependent Diabetes Mellitus)*
- Gestational: associated with pregnancy
- Neonatal diabetes: affecting first 3 months of neonatal's life

Diabetes Mellitus

- Tiredness
- Thirst
- Blurred vision
- Weight loss
- Skin infections

Headaches
Hunger
Increased urination
Pain or tingling sensations

Symptoms

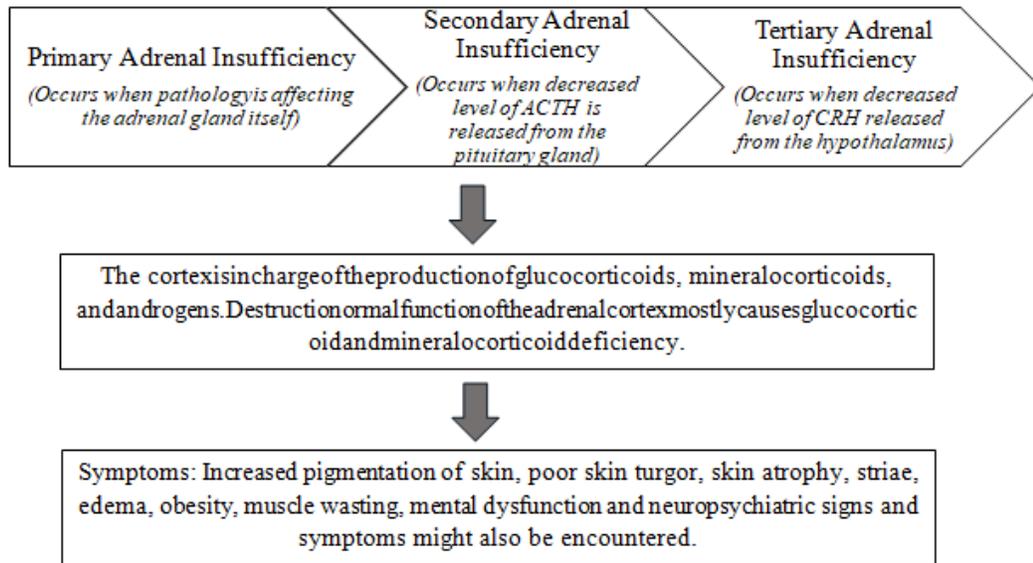
Fig.2 .Lack of Glucose Regulation


Fig. 3. Adrenal insufficiency

Fig. 4. Differential Diagnosis

High androgens - *post ruling out other possible causes of this*

Absence or irregular menstrual cycle - *post ruling out other possible causes of this*

Ultrasound scan showing polycystic ovaries

Fig. 6 .Diagnosis

Precocious Puberty

Central precocious puberty (Gonadotrophin dependent)

- Idiopathic—the most common cause of premature puberty. Both genetic and environmental variables are likely to play a role. There could be a family history of early puberty.

- CNS reasons, such as hypothalamic tumors (e.g., hamartoma or glioma), hypothalamic abnormalities, germinomas, other space-occupying lesions, congenital brain condition, acquired damage or infection

- Neurofibromatosis type 1 and Sturge-Weber syndromes, as well as tuberous sclerosis, exhibit distinct presentations and are linked to gonadotrophin dependent precocious puberty.

Peripheral precocious puberty (Gonadotrophin independent)

- Virilizing tumors include androgen-producing ovarian or adrenal malignancies, testicular Leydig cell malignancies, and human chorionic gonadotrophin-producing malignancies.

- Congenital adrenal hyperplasia—increased testosterone production may be virilizing in both males and girls.

- McCune Albright syndrome—a genetic mosaicism (ie, non-inheritable). The hormonal secretions of autonomous ovarian cysts cause gonadotrophin independent precocious puberty. Skin lesions associated with café au lait.

ABSTRACT

This paper investigates the field of pedestrian detection in photos or videos, which is an important component of many applications including event counting, surveillance, and fall detection for the elderly. The author explores the difficulties caused by elements such as different positions, attire, occlusion, and surroundings. The review emphasizes the significance of feature extraction and classification in the process of highlighting current pedestrian detection techniques. There is a detailed discussion of various feature types, such as gradient-based, shape-based, texture-based, motion-based, and part-based features. Wear ables, occlusion, and the variety of pedestrian poses are among the difficulties in pedestrian detection that are discussed. The two steps of pedestrian detection—feature extraction and classification—are shown in the paper's flowchart. It also discusses the applications of pedestrian detection, which include traffic safety, surveillance, and fall detection for the elderly. This paper offers insights into benchmark datasets such as the INRIA, Caltech, TUD-Brussels, Daimler-Pedestrian Detection, and ETH datasets that are frequently used to assess pedestrian detection techniques. Measures of performance evaluation are described, including Precision-Recall (PR) curves and Receiver Operating Characteristic (ROC). The paper concludes by highlighting the difficulties still facing pedestrian detection while acknowledging the progress made in the last ten years. The author makes some suggestions for possible future research paths, such as improving occlusion handling and detection accuracy for non-upright poses.

Keywords: Pedestrian Detection, Computer Vision, Feature Extraction, Benchmark Datasets, Performance Evaluation.

INTRODUCTION

One important aspect of computer vision is pedestrian detection, which is the automatic recognition and localization of people in pictures and videos. This work is extremely important for many different applications, such as public safety, autonomous cars, and surveillance(Ma & Wang, 2022). The inherent difficulties stem from the variations in the appearance, poses, occlusions, and surroundings of pedestrians. Strong detection systems are imperative because pedestrian safety is a pressing issue, especially when it comes to roads. This introduction highlights the critical role pedestrian detection plays in today's technological landscapes while offering a glimpse into the complex field of pedestrian detection. The work explores the intricacies of the assignment, covering everything from feature extraction strategies to classification algorithms, clarifying the changing field of pedestrian detection approaches(Dalal & Triggs, 2005). The study examines current datasets, performance assessment metrics, and suggests possible future paths for the field's advancement as pedestrian detection remains a research focus. Essentially, the goal of this review is to provide a thorough overview of pedestrian detection, including its methods, challenges, and broad implications for improving efficiency and safety across a range of industries. Figure 1 indicates Pedestrian and other object detection using technology.

Challenges in Pedestrian detection

Pedestrian detection in computer vision faces several intricate challenges that demand sophisticated solutions. Firstly, the diversity in pedestrian poses and appearances poses a substantial hurdle, requiring algorithms capable of recognizing individuals across a range of stances and clothing styles(Geiger et al., 2012). Occlusion, where pedestrians are partially or fully hidden from view, further complicates the task, impacting the system's ability to accurately identify individuals in obstructed scenarios. Illumination changes present another significant challenge, as varying lighting conditions can alter the appearance of pedestrians, necessitating algorithms robust enough to handle such fluctuations. Cluttered backgrounds, common in crowded urban environments, introduce complexity by requiring systems to distinguish pedestrians from a multitude of objects and surroundings(Park et al., 2018). Additionally, low-resolution images create challenges in extracting detailed features, affecting the precision of identification. Dynamic environments, marked by moving pedestrians and vehicles, demand real-time processing capabilities for timely decision-making. Adverse weather conditions, such as rain or snow, can obscure visibility, requiring pedestrian detection systems to be resilient under challenging weather scenarios. Successfully addressing these challenges is crucial for the development of robust and reliable pedestrian detection systems with broad applications in surveillance, autonomous vehicles, and public safety(L. Zhang, Paik, et al., 2019).

Why Pedestrian Detection

Road traffic accidents are a major public health concern worldwide, resulting in significant loss of life and injuries. According to the World Health Organization (WHO), an estimated 1.35 million people are killed in road traffic crashes each year, with millions more injured.

United States

In the United States, the number of road traffic fatalities has been declining in recent years. In 2020, there were an estimated 38,824 traffic fatalities in the United States, a 4.8% decrease from 2019. However, the number of fatalities increased slightly in 2021 to 39,210(L. Zhang, Liu, et al., 2019).

India

India has one of the highest rates of road traffic fatalities in the world. In 2020, there were an estimated 1,51,113 road traffic fatalities in India, a 2.7% increase from 2019. The number of fatalities has been increasing in India for several years, due to several factors, including rapid urbanization, increasing vehicle ownership, and poor road infrastructure.

China

China has made significant progress in reducing road traffic fatalities in recent years. In 2020, there were an estimated 108,829 road traffic fatalities in China, a 10.2% decrease from 2019. This decrease is due to several factors, including stricter traffic laws, improved road infrastructure, and increased public awareness of road safety(Kim & Kim, 2018).

Global Trends

The global trend in road traffic fatalities is mixed. While there has been progress in reducing fatalities in some countries, the number of fatalities continues to increase in others. The WHO has set a target of reducing road traffic fatalities by 50% by 2030. Achieving this goal will require a comprehensive approach that includes improvements in road infrastructure, vehicle safety, and driver behavior. Factors Contributing to Road Traffic Accidents There are several factors that contribute to road traffic accidents. Some of the most common causes include:

1. Speeding
2. Drunk driving
3. Distracted driving
4. Fatigue
5. Poor road infrastructure
6. Vehicle defects

Pedestrian detection plays a crucial role in addressing the alarming global trend of road traffic accidents, which claim millions of lives annually. In countries like India, with soaring fatality rates due to factors like rapid urbanization and poor road infrastructure, effective pedestrian detection becomes imperative. The technology aids in mitigating common accident contributors such as speeding, drunk driving, and distracted driving. Achieving the World Health Organization's goal of a 50% reduction in road traffic fatalities by 2030 necessitates comprehensive solutions, making pedestrian detection a pivotal component in enhancing road safety worldwide.

Research Organization

This study deftly traverses the terrain of pedestrian detection, starting with an extensive introduction that emphasizes the critical role this technology plays in a variety of applications, from autonomous vehicles to public safety. We then examine the difficulties associated with pedestrian detection, clarifying the complex obstacles caused by variables including different body positions, occlusions, and changing surroundings. The importance of efficient pedestrian detection is highlighted by presenting a global perspective on traffic accidents and fatalities. After that, a comprehensive review of the literature is presented in a comparative table that breaks down important research and their approaches. The emphasis on utilizing various imaging modalities for improved detection accuracy is crystallized in the problem definition section. A thorough comparison of the most recent methods, together with performance indicators, illuminates the developments in the field. Key findings are summarized, advancements are acknowledged, and future study directions are suggested as the work comes to a close. A smooth transition through the intricacies and advancements in multispectral pedestrian detection is guaranteed by the business.

Literature Survey

The literature is presented in the form of comparative table 1

Problem Definition

The problem addressed in the literature is the challenging task of pedestrian detection, particularly under varying and adverse conditions, such as day and nighttime scenarios. Computer vision has significantly advanced driving assistance systems, but detecting pedestrians remains a complex issue due to factors like varying lighting conditions. The literature focuses on leveraging different imaging modalities, including visible and far infrared (FIR) cameras, to enhance detection accuracy. Specifically, the research aims to assess the effectiveness of various pedestrian models (holistic, part-based, patch-based) when trained with images in the far infrared spectrum. The combination of visible and non-visible imaging modalities, especially with the critical role played by the infrared spectrum, is explored.

Tanya Gupta and Neera Batra

Additionally, the study delves into the use of deep convolutional neural networks (CNNs) to exploit multispectral information for robust pedestrian detection in both daytime and nighttime scenarios. Challenges such as insufficient illumination, small-sized pedestrian instances, and occlusion are addressed through innovative methodologies, including pixel-level image fusion, novel fusion architectures, and attention mechanisms. The overarching problem definition involves developing advanced pedestrian detection systems that can operate seamlessly in diverse environmental conditions, thereby enhancing safety in applications like advanced driver-assistance systems, autonomous vehicles, and video surveillance. The research contributes novel approaches, frameworks, and architectures to overcome the inherent challenges in pedestrian detection, providing valuable insights for the development of more reliable and effective computer vision systems.

Techniques Comparison in terms of Metrics

Many novel techniques have been investigated in the field of pedestrian detection to improve resilience and accuracy, particularly in difficult situations like changing lighting and multispectral scenarios. The "Pedestrian Detection (Visible and FIR)" study employs a novel evaluation method by utilizing the Far Infrared (FIR) spectrum to assess pedestrian models. This approach, which makes use of both visible and non-visible imaging modalities, achieves a remarkable 95% day/night detection accuracy(González et al., 2016). In "Thermal-Visible Video Fusing," the fusion of color and thermal data presents a fusion-tracker and classifier. With a 96 percent accuracy rate, the method shows strong performance and can handle a variety of scenarios, even when the dataset utilized is not stated explicitly. Using pixel-level fusion on the KAIST multispectral dataset, the "Multispectral Pedestrian Detection (CNNs)" study explores the use of Convolutional Neural Networks (CNNs) for pedestrian detection. The 2.43 percent reported log-average miss rate highlights how well this method works to provide precise identification in a range of spectral channels(Ding et al., 2020a). Another study uses illumination-aware deep neural networks to investigate "Fusion of Multispectral Data (Illumination)".

This technique achieves an outstanding 94 percent accuracy on the KAIST dataset by integrating illumination information into the learning process, highlighting the significance of lighting conditions in multispectral pedestrian recognition(Z. Cao et al., 2021). With a 95% accuracy rate, "Box-Level Segmentation (Real-time Identification)" uses a unique box-level segmentation technique for real-time multispectral pedestrian detection on the KAIST dataset(Y. Cao et al., 2019). This approach improves computational efficiency and solves problems related to hyper parameter settings, which makes it appropriate for uses in autonomous driving, among other applications. The last study is "Attention Fusion (One-Stage Detection)," which presents a multispectral channel fusion one-stage YOLOv4 technique(L. Zhang, Liu, et al., 2019). This approach demonstrates its efficacy in multispectral pedestrian detection with competitive log-average miss rates of 2.43 percent for color and 3.42 percent for thermal channels when tested on the KAIST and Utokyo benchmarks. In brief, by utilizing cutting-edge methods like multispectral fusion, deep learning, and segmentation to improve accuracy and robustness under varied datasets and situations, these works jointly boost pedestrian detection systems. The overall result description is given in table 2

Approaches for Pedestrian detection

CNN

Convolutional Neural Networks (CNNs) have revolutionized computer vision tasks, and one of their notable applications is pedestrian detection. Pedestrian detection involves identifying and locating individuals within an image or video frame, a crucial task in various domains like autonomous vehicles, surveillance, and robotics. Let's delve into the architecture and workings of a CNN tailored for pedestrian detection, emphasizing its key components and their roles in achieving accurate and robust results. The input layer in a Convolutional Neural Network (CNN) serves as the gateway for information from the raw image data into the neural network. In the context of pedestrian detection, the input layer plays a pivotal role in transforming the visual information captured by an image into a format that the network can comprehend and analyze(Saeidi & Ahmadi, 2018). Consider an image as a grid of pixels, where each pixel represents a tiny unit of information. In the input layer, these pixels act as individual nodes, forming the foundation of the neural network. Each node corresponds to the intensity or color value of the respective pixel, encapsulating the visual features of the image.

The power of the input layer lies in its ability to retain spatial relationships within the image. Unlike traditional neural networks that treat input as a flattened vector, CNNs maintain the 2D structure of the image. This preservation of spatial information is vital for tasks like pedestrian detection, where the relative arrangement of pixels carries essential cues for recognizing human figures within the scene. Furthermore, the input layer is not limited to a single channel in the case of colored images. It accommodates multiple channels corresponding to different color channels (such as red, green, and blue). This multichannel representation enriches the network's ability to discern intricate details and color variations, enhancing its capacity to identify pedestrians amidst diverse visual backgrounds(Ding et al., 2020b). As the initial layer in the CNN architecture, the input layer serves as a canvas upon which subsequent layers will extract hierarchical features. Through convolutional operations, the network can capture local patterns and textures, gradually piecing together a complex representation of the input image. The input layer, thus, acts as the fundamental interface where the neural network begins its journey to understand and interpret the visual world, with each pixel contributing a unique piece to the puzzle of pedestrian detection. The first layer of the Convolutional Neural Network (CNN) is a Conv2D layer, a fundamental component for image feature extraction. This layer is characterized by 32 filters, each a 3x3 matrix, applied to input images with dimensions 64x64 pixels and 3 color channels (RGB). These filters, serving as learnable weights, convolve across the input image, systematically capturing spatial patterns and features. The activation function used is Rectified Linear Unit (ReLU), a non-linear operation that introduces non-linearity to the network. ReLU replaces all negative pixel values with zero, enabling the model to learn intricate representations and complex relationships within the data. By applying 32 such filters, the layer generates feature maps that highlight relevant patterns, edges, and textures, contributing to the hierarchical learning process of the entire CNN(P. Zhang & Wang, 2017). The choice of 32 filters allows the network to learn diverse features in parallel, providing a richer representation of the input. As the initial convolutional layer, it plays a crucial role in extracting low-level features, paving the way for subsequent layers to capture more abstract and high-level representations as the data progresses through the network. The ROC curve corresponding to CNN is given in figure 2

VGG16

The VGG16 model, which stands for the Visual Geometry Group 16-layer model, is a deep convolutional neural network architecture made to sort images into different groups. VGG16 was first made for general image recognition tasks, but it has since been used in other areas of computer vision, such as finding people walking on the street. Knowing how it works and what it can do will help you figure out how to use it effectively for these kinds of tasks.

The architecture of VGG16 is simple and uniform, which makes it stand out. There are 16 layers in it, mostly convolutional layers, max-pooling layers, and three fully connected layers. It is famous for having a deep stack of 3x3 convolutional filters, which is an important part of the VGG architecture(Yoshikawa &Premachandra, 2022). The architecture starts with a stack of convolutional layers, and then there is an activation function called a rectified linear unit (ReLU) for each layer. These convolutional layers are very important for picking up small details and patterns in the input image. VGG16 uses many convolutional layers, and each one has a small receptive field (3x3). By stacking these layers, the network can learn more complex representations.

Max-pooling layers come after the convolutional layers. They reduce the number of spatial dimensions and add a type of translation invariance. Additionally, this step helps the network keep its ability to spot patterns no matter where they are in the image. As you go deeper into VGG16, you can learn more abstract and high-level features. The network gets smarter about these features as it goes deeper into the hierarchy of representations. Finally, there are fully connected layers at the top that sort the learned features into groups (Bell et al., 2016). Through transfer learning, VGG16 can be used to find pedestrians. The VGG16 model, which has already been trained on big image datasets like Image Net, pulls out features. Once VGG16's convolutional layers have learned a lot of hierarchical features, they can be fine-tuned on a smaller dataset that has been labelled specifically for detecting pedestrians. Fine-tuning means making changes to the last few layers of the VGG16 model that has already been trained so that it can do the pedestrian detection task. The output layer is changed to show whether the object is a pedestrian or not, and the model is trained on a dataset that only contains pedestrians(Dai et al., 2016).

Tanya Gupta and Neera Batra

VGG16's strength is that it can capture detailed spatial information by using small convolutional filters. This makes it good for tasks where complex patterns are important, like finding people on the street. Even though VGG16 might not use as few resources as more modern architectures like ResNet or Efficient Net, it is still a good choice when resources are available because it is easy to use and good at learning features. The architecture of the VGG16 model that was used is shown in Table 6. In conclusion, the VGG16 model, with its deep convolutional architecture and hierarchical feature learning, can be effectively used for pedestrian detection through transfer learning. Its adaptability and ability to capture complex spatial patterns make it a reliable choice for various computer vision applications, including the detection of pedestrians in images. A Convolutional Neural Network (CNN) is said to be 90% accurate at finding pedestrians, while the VGG16 model is considerably more accurate at 95%. This means that the VGG16 model is better than the standard CNN at correctly identifying people walking in pictures.

The reported accuracy values show how well the models correctly labelled situations as either pedestrians or non-pedestrians. If there is a 5% difference in accuracy, it means that the VGG16 model is much better than the CNN. The VGG16 architecture, which is known for its many convolutional layers and hierarchical feature learning, shows that it can effectively capture complex patterns and representations that are useful for detecting pedestrians. This isn't true for the CNN, which may have a simpler architecture but still gets 90% accuracy, which is better than the VGG16 which is more complex. These accuracy metrics are important for testing how well the models work in real-life situations where finding pedestrians accurately and reliably is important for safety and security, like in self-driving cars or surveillance systems. Because the VGG16 model is more accurate, it might be good for situations where a high level of accuracy is needed when identifying pedestrians.

CONCLUSION

Finally, this work explores the challenging field of pedestrian detection in images and videos, tackling issues caused by different lighting, stance, and occlusion scenarios. The extensive review of the literature delves into several techniques for extracting features and classification algorithms that are essential for reliable pedestrian identification. The comparative study of cutting-edge methods, which is shown in Table 2, emphasizes the importance of multispectral fusion, deep learning, and segmentation techniques by showcasing their distinct strategies and outstanding results. The results demonstrate the progress made in pedestrian detection, including noteworthy successes like a 95% accuracy rate for day/night detection in the "Pedestrian Detection (Visible and FIR)" study and a strong 96% accuracy rate in the "Thermal-Visible Video Fusion" study. The "Multispectral Pedestrian Detection (CNNs)" study demonstrates the effectiveness of CNNs and pixel-level fusion with a low log-average miss rate of 2.43 percent. "Fusion of Multispectral Data (Illumination)" uses illumination-aware deep neural networks to achieve an astounding 94 percent accuracy. The "Box-Level Segmentation (Real-time Detection)" study addresses the real-time applicability of pedestrian detection, improving computational efficiency and reaching 95% accuracy. Finally, a competitive one-stage YOLOv4 technique with log-average miss rates of 2.43 percent for color channels and 3.42 percent for thermal channels is shown in the "Attention Fusion (One-Stage Detection)" study. These developments have a substantial impact on a wider range of applications, including event counting, safety, and surveillance—particularly about traffic accidents. The paper's conclusion acknowledges both the issues that still exist and the progress that has been accomplished over the past ten years. To facilitate the ongoing advancement of pedestrian recognition technologies, it makes recommendations for future research topics, such as enhancing occlusion handling and detection accuracy for non-upright stances.

ABSTRACT

Agricultural wastes are byproducts of the production and processing of agricultural products. Many sources, such as crop residues, agro-industries, livestock and aquaculture contribute to the generation of agricultural wastes. To meet the growing demands of the rapidly expanding population, an abundance of agricultural wastes are produced daily throughout the world. They may contain useful materials, but their economic worth is less than the expenses associated with gathering, transporting and preparing them for human use. Efficient and timely disposal is essential for the proper use of organic materials in agricultural waste and for reducing the impact of pollution to the environment. The rate at which organic fertilizer is given to the soil must be improved gradually in order to reduce the usage of chemical fertilizers. Agricultural wastes account for a significant portion of the world's overall waste production in wealthy economies. The uncontrolled use of chemicals in agriculture and the unreasonable application of intensive farming techniques often result in wastes that accompany agricultural development, which has a significant impact on both the global environment and rural ecosystems in particular. According to the "3R" waste management approach, these wastes are used for a variety of purposes that includes different agricultural waste management solutions based on the circular bio-economy, which increase sustainable agriculture and reduce environmental pollution by "reducing," "reusing" and "recycling" agricultural wastes.

Keywords: waste management, recycle, reduce, reuse, agriculture, environment

INTRODUCTION

Modern agriculture differs greatly from our traditional methods in that it uses technology, fertilizers, pesticides, fungicides, raw food processing, transportation, preservation, and consumption (Tubiello*et al.*, 2015;Baker *et al.*, 2017; Amorim 2023). Although modern farming technology has made a substantial contribution to a boom in the world's

68074

food supply, agriculture has also been an important contributor of waste and pollution(Atinkut*et al.*, 2020; Hsu 2021, Yang *et al.*, 2022).These operations produce numerous, varied waste streams, both bio-degradable and non-biodegradable, which have a substantial negative influence on the environment(Hurni *et al.*, 2015).The term "agro-waste" encompasses all residues, both bio-degradable and non-biodegradable, produced at the farm level during the vegetable production, processing, storage, and marketing processes (Pardo *et al.*, 2017; Dai *et al.*., 2018).It also refers to unnecessary waste produced by farming operations, including plastic, crop leftovers, garbage, packaging materials or cartons, containers for pesticides and fertilizers, weeds, leaf litter, sawdust, etc. (Baker *et al.*., 2017).

Reduced water holding capacity, changed soil biological metabolisms, unbalanced nutrient cycles, uneven organic matter distribution, and the production of greenhouse gases like N_2O, SO_2, CH_4, and smoke are a few of the environmental issues that can result from improper waste management and disposal (Josimovic*et al.*, 2015; Steinmetz *et al.*, 2016; Pardo *et al.*, 2017 and Dai *et al.*, 2018).As per Oyedotun*et al.*(2021), emissions of greenhouse gases cause climate change, which has detrimental effects on the environment, the economy, and human health. He *et al.* (2019) found that burning farm waste is a typical practice in developing nations that contributes significantly to air pollution.It was observed by Atinkut*et al.* (2020) that burning of crop residue has a variety of negative effects on farms, such as decreased soil organic matter and nutrients, decreased production and productivity, worse air quality, reduced biodiversity, reduced water and energy efficiency, and negative health effects on people and animals. Samiha (2013)and Anwarul and Jahiruddin(2015) found that polythene is a material that farmers use to irrigate crops, store and sell their harvested goods, preserve soil moisture, and shield their crops from intense heat and precipitation. Sarangi *et al.* (2023) concluded that there is an urgent need for long-term solutions to the dire state of agro-waste management, since it poses a major risk to human health as well as the environment.

The concept of the 3Rs approach
Reducing, reusing, and recycling are commonly referred to as the "3Rs," primarily in relation to production and consumption. It advocates for a higher proportion of recyclable materials, more recycling of production waste and raw materials, and a general decrease in the amount of energy and resources required(Balls,2009).As per observations of Atinkut*et al.*, 2020; Das *et al.*, 2019 and Abadi *et al.*, 2021, sustainable agro-waste management based on the reduce, reuse, and recycle (3Rs) principles is difficult to execute in many developing countries due to farmers' lack of sustainable waste management behaviour. Any waste management strategy's real implementation, meanwhile, is contingent upon people's capacities. Numerous nations have implemented initiatives and programs to involve farmers in environmental management tasks, acknowledging the significance of perception and capability (Atinkut*et al.*., 2020; Mills *et al.*, 2017).He *et al.*, (2019) found that several waste management techniques have arisen and are being supported globally, including fertilization, energy utilization, matrix utilization, materialization, fodder use, and complete waste utilization. Agricultural waste management has been the focus of circular economy and bio-economy frameworks in recent times(Duque-Acevedo *et al.*., 2020).The decision to engage in the management of 3Rs based (reduce, reuse, and recycle) agro-waste is taken by individual farmers based on their perceptions and current capacity. Additionally, as per Abadi *et al.*,(2021) it is argued that sustainable behavioural changes can effectively address global environmental issues. Since it will decide whether any suggested strategy is successful, it is vital to comprehend how individual farmers perceive and are able to effectively manage agro-waste(Abadi *et al.*., 2021; Ananno*et al.*, 2021). Balwan *et al.*, (2022) noted that by consistently using this methodology to waste reduction and recycling initiatives, landfill waste will be minimized, which is an important approach in lowering emissions of greenhouse gases. The following brief discussion of the 3Rs hierarchy of waste management represents an upstream approach for minimizing waste's negative effects on the environment and economy while conserving resources.

(i) **Reduce** Simply means to avoid waste since preventing waste from being created in the first place is the most effective strategy for avoiding it. Reduce in the 3Rs also refers to using less, either by using resources more effectively or by using them in the first place (Fahzy, 2014). This can involve actions like putting off lights while leaving a room, restoring rather than replacing products, and using reusable shopping bags instead of disposable ones. Initiatives for waste source reduction, such as avoidance, reduction, and reuse, seek to cut

Babita Bharti *et al.,*

waste at its source by altering manufacturing and consumption patterns or redesigning products. (Adedipe*et al.,* 2005).

(ii) **Reuse** As per Arenibafo (2023), Reuse is any method of operation whereby components or objects that are not waste are put to new uses for the original purposes for which they were initially intended and built. In waste management, the term "reuse" can also refer to recovery efforts, which involve inspecting, cleaning, or repairing waste items or parts so they can be used again without requiring additional preparation.Adedipe*et al.,* (2005) noted that Reuse centres have been built in many nations. These facilities aim to break the short product-towaste cycle by fixing the items and selling them for a fair price. The reuse centres provide employment assistance to individuals who are having difficulty breaking into the workforce or who have been unemployed for an extended period of time. In Japan and other developed countries, company clusters have emerged where the deemed waste of one industry is the valuable resource of another.

(iii) **Recycle** Most industrialized nations define "recycling" as the widespread collecting and reuse of common waste products, including empty beverage containers (Arenibafo, 2023). Collection, Sorting, Cleaning, Crushing or Grinding, Melting and Forming, and Reprocessing into a New Product are the typical steps in the recycling process. Hoornweg*et al.* (2012) states that Recycling and recovery have two main benefits: they minimize the amount of garbage that is disposed of and bring materials back into the economy. Recycling can only be done on substances or things that are selected as waste. To recover a large percentage of thrown objects, individual waste pickers in many developing countries engage in informal waste sorting and collection at municipal collection stations and disposal sites. Without a doubt, recycling boosts the economy, adds jobs, and preserves the environment. Christy *et al.,* (2014) and Li *et al.,* (2014) concluded that anaerobic digestion is known as the degradation of organic compounds to simple substances by microorganisms which live as syntrophy under the lack of oxygen with releasing biogas.The treatment of animal manure and slurries by anaerobic digestion process has the beneficial outcomes of producing quality fertilizer, reduction of odors and microbial pathogens with the sustainable production of energy source as biogas (Nasir *et al..*, 2013; Ch'ng *et al..*, 2013). Anaerobic digestion has been found as a biological process for the transformation of waste materials to energy sources through the treatment of various organic waste such as municipal solid waste, food waste, industrial waste, sewage sludge, animal manure and agricultural residues (Yong *et al..*, 2015; Celik and Demirer, 2015; Huang *et al..*, 2015; Nitsos*et al..*, 2015 and Shen *et al..*, 2015). Furthermore, Nasir *et al.,* (2013) and Ounnar*et al.,* (2012) found that the treated organic waste (digestate) is used as an organic fertilizer for arable land instead of mineral fertilizer as well as an organic substrate for green house cultivation.

CONCLUSION AND RECOMMENDATION

The issue of waste management in developing nations is made worse by the following factors: a lack of understanding and direction, corruption, fast urbanization, the dumping of used goods into developing nations by the developed world, and a lack of resources and funding. Nevertheless, this research has been able to shed more light on the existing state of affairs and the detrimental effects of careless trash disposal in developing nations. It has also suggested a sustainable alternative strategy for progressively achieving a good amount of waste reduction. The 3Rs—Reduce, Reuse, and Recycle—are a comprehensive strategy that anybody can readily implement to daily objects which have the potential to produce trash. Environmental education is necessary, nevertheless, as it imparts important knowledge about waste management to both children and adults by using the 3Rs, which promote moral and sustainable environmental behaviour. And educate everyone in the community on the benefits of recycling, reusing, and reducing trash. We should strive to incorporate recycling, reducing, and reusing habits into our daily routines and lifestyles so that they become the norm rather than the exception, in addition to employing awareness and caution in all that we do. Local governments should take more steps to encourage the implementation of the 3R principle by setting up Drop-off programs for collection through the use of containers on streets, planning waste management events and rallies, and providing financial incentives to homeowners that can increase participation and recycling rates. Additionally, by promoting the idea that people pay less if they recycle, they can also help to increase recycling rates. Also, everyone, businesses, and organizations can help achieve the sustainable development

objective of zero waste and environmental preservation by providing practical answers to the What and How questions related to day-to-day operations and by putting the 3Rs waste prevention strategy into practice.

ABSTRACT

Polycystic ovarian syndrome (PCOS) is a prevalent complex endocrine condition among reproductive women. The luteinizing hormone chorionic gonadotropin receptor (LHCGR), which is its receptor, and the related downstream signaling cascade are crucial in the origin of PCOS. Although PCOS risk has been linked to genetic polymorphisms in the LHCGR, evidence to support this remains disputable. The study aims to investigate the impact of single nucleotide polymorphisms (SNPs) in the LHCGR gene on protein function, structure, and stability. The findings revealed that out of 637 missense SNPs in the LHCGR gene, 16 were deleterious to the protein. These SNPs were found to be destructive to the structure and function of the LHCGR molecule and may play a crucial role as molecular determinants of PCOS development.

Keywords: Polycystic ovarian syndrome (PCOS), luteinizing hormone chorionic gonadotropin receptor (LHCGR), single nucleotide polymorphisms (SNPs)

INTRODUCTION

Polycystic ovarian syndrome (PCOS) increases the risk of significant problems in women. One in every 5-6 females is dealing with major difficulties related to infertility and irregular menstrual cycles [1]. As a complex endocrine condition, the pathogenesis of polycystic ovarian syndrome (PCOS) is still unclear. It is characterized by low gonadotropin levels, large multi-follicular ovaries, infertility, and obesity. This complicated pathology has an association with hyper and rogenism [2]. Although it is almost certain that elevated androgen levels had a part in the development of PCOS, the patho physiology of the condition is not fully understood. A dysfunctional hypothalamic-

68079

Dolly J Patel and Kinnari N Mistry

pituitary-gonadotropin (HPG) axis is a major contributor to ovarian failure. Many potential genes have been examined along the HPG axis, including follicle-stimulating hormone (FSH), FSH receptor, luteinizing hormone (LH), LH receptor (LHCGR), androgen receptors, and sex-hormone binding globulin [3]. The LH receptor gene contains a substantial number of single nucleotide polymorphisms (SNPs) [4]. Several studies have been conducted to investigate the relationship of susceptible SNPs, which may alter gene expression or protein function in LHCGR and PCOS [5]. The LHCGR gene is a single-copy gene with 11 exons and 10 introns identified on the short arm of chromosome 2 (2p16.3) [6]. The mature form of the LHCGR that is visible on the cell surface is a polypeptide with 675 residues and a prominent molecular mass of 85–95 kDa [7]. LH mediates the subsequent cellular processes when it attaches to its receptor, the luteinizing hormone chorio-gonadotrophin receptor (LHCGR). The function of both LH and choriogonadotropin during the production of steroid hormones is regulated by a G-protein coupled receptor known as the LHGCR, which is expressed on the theca cells of the ovaries. The ovary's ability to function and the diseases that they are linked to, including PCOS, will be affected by any mutations that alter the LHCGR protein's structure or function [8]. Further research is necessary to determine whether polymorphism may play a role in additional steroid hormone-related disorders, as LH is one of the most significant regulators of ovarian steroid hormone production.

METHODOLOGY

Data Mining

The human *LHCGR* gene accession number (NCBI Gene ID: 3973), missense SNPs, and amino acid changes were obtained from the NCBI dbSNP database (https://www.ncbi.nlm.nih.gov/snp/?term=LHCGR) database. The UniProt (https://www.uniprot.org/) database was used to produce the FASTA format sequence for the protein with the UniProt entry name (LSHR_HUMAN) and UniProtKB number (P22888) of Lutropin-choriogonadotropin hormone receptor. Free online software tools were utilized to analyze if an amino acid change impacts the targeted protein, as well as to identify deleterious/damaging SNPs and 3-D models of the mutated protein (FIG 1) [15]. The functional study of missense SNPs was performed using five software programs. The SIFT (https://sift.bii.a-star.edu.sg/) determines the amino acid effects on protein function using specific characteristics of amino acids and homology [16]. PolyPhen-2 (http://genetics.bwh.harvard.edu/pph2/) analyzes amino acid substitutions in a sequence and provides information on their evolutionary and structural relationships [17]. SNPs & GO (https://snps.biofold.org/snps-and-go/) calculates whether a variant is potentially linked to a disease or is neutral [18]. The SNAP2 server (https://rostlab.org/services/snap/) uses a "neural network," a machine learning tool, to anticipate the functional impact of mutations [19]. The PANTHER (https://www.pantherdb.org/)tool forecasts the negative consequences of missense SNPs. It uses the Hidden Markov model (HMM) to calculate the substitution position-specific evolutionary conservation (sub-PSEC) ranking to determine whether the Amino Acid replacement leads to any functional changes [20].

Prediction of Protein Stabilization Alteration
I-Mutant 3.0 and MUpro, two SVM-based predictors, were used to forecast changes in protein stability [15], [16].

Prediction of Biophysical and physiochemical properties
Project HOPE was used to create 3D models of mutant proteins and their amino acid sequences in order to analyze the variations in size, charge, hydro phobicity, and other properties of these proteins [17].

3D structure generation and validation

Homology modeling is the technique for creating the three-dimensional structure of a completely novel or altered protein (the "target protein") by utilizing information about the structure of a protein that resembles it (the "template protein"). I-TASSER software is being used for homology modeling. It is an approach for modeling the hierarchical organization of proteins that is based on secondary structure enhanced Profile-Profile threading Alignment (PPA) and the iterative Threading Assembly Refinement (TASSER) algorithm [18]. The Galaxy program was used to enhance the protein model after the 3D structure synthesis. It increases the global and local structure quality of the average model created by three-dimensional prediction servers [26]. Validation of the generated model: The model selected is subsequently run through PROCHECK's stability analysis to generate a Ramachandran plot [19].

RESULTS

Results obtained for *LHCGR* using functional analysis tools

The data of the *LHCGR* gene were collected from dbSNP (NCBI), a widely used database. It has total 30396 SNPs out of which 637 missense SNPs selected and analyzed using functional and structural analysis tools. The following are the results obtained for *LHCGR* Gene with protein id: NP_000224.2. The protein sequence of the *LHCGR* gene was derived using UniProt and the FASTA sequence so obtained was analyzed using different tools. The different variants were analyzed using Polyphen-2 out of which 369 variants were obtained as probably damaging. SIFT signifies the results in the form of deleterious or tolerated. 54 variants were obtained as deleterious. The variants were further analyzed using SNPs and GO. 50 of them were found to be disease. On analyzing all the variants with Panther 74 variants were found to be probably damaging. SNAP2 gives the results in the form of effect and neutral. 83 variants were obtained as effect. Considering results obtained from all of the functional analysis tools 16 variants were selected which were probably damaging, disease, effect, and deleterious individually shown in **Table I**.

Results obtained for LHCGR using structural analysis tool.

I-mutant and Mu-PRo are used to predict the structural stability of the SNPs. It gives the value of the free energy(ddG) and the stability of the variant. Using these 16 variants were obtained with free energy <0 and decreased stability as shown in **Table II**.

Results of project HOPE

Project Hope server revealed the structural characteristics of a single amino acid change in the mutant protein. All 16 ns SNPs are predicted by HOPE to have imperfections in size, charge, hydro phobicity, and all of which are located in highly stable regions **(Refer to Table III).** The normal residue is represented in green colour and the abnormal residue is represented in red colour.

Results of Modelling and structure validation.

The structural integrity of proteins can be significantly changed by altered SNPs. In order to investigate the structural stability, three-dimensional models of mutant proteins were built. I-TASSER was utilized to anticipate the LHCGR 3D structure (Fig 2). The Ramachandran plot shown in FIG 3, which investigated overall structure geometry, was used to assess the mutant model reliability encapsulated in Table IV. Table IV encapsulates the results of the Ramachandran plot which showed that out of 699 residues, 450 (71.2%) were in the regions that were most favored,

146 (23.1%) were in regions that were additionally allowed, 23 (3.6%) were in regions that were generously allowed, and 13 (2.1%) residues were in regions that were disallowed.

DISCUSSION

PCOS is distinguished by hyper and rogenism, obesity, polycystic ovaries, and irregular menstrual cycles/anovulation [20]. Numerous potential genes have been suggested as significant PCOS contributors [21]. In PCOS genetic association studies, many researchers chose genes that regulate steroid production, the Hypothalamic-Pituitary-Gonadal system, obesity, and inflammatory processes [3]. In Silico screening can identify the phenotypic impact of missense variations on the biological and chemical properties of a particular protein. The data gathered assists in understanding the involvement of the *LHCGR* gene in a therapeutic condition. In the current study, we assessed the significant *LHCGR* variants as an associated risk factor for PCOS. SNPs have associations with both phenotypic and genotypic traits that differentiate people. In the codon-rich regions of the human genome, there are about 500000 SNPs that are very important [22] Among these, missense SNPs play an essential role in human disorders because they account for a single amino acid variation that may contribute to a functional alteration in a protein [23]. SNPs that cause functional alterations may have an adverse or minimal impact on the protein structure [24]. The pathogenic effect of variations was responsible for a modification in protein structure [25] . This adverse impact led to changes in protein hydrophobic nature and energy [26]as well as disrupting connections between and within the proteins [27]. As a result, the structural stability of the cell is compromised [28]. Based on the information presented above, we can conclude that nsSNPs play an important role in numerous human disorders. The present study unveiled that 16 SNPs have affected the structure and functionality of the LHCGR protein A593P T577I S616Y M398T C131R A373V E354K I625K I542L D578H A568V L457R C343S C543R L502P G504S.

Toledo and his colleagues explained that the Ala593 to Pro alteration in the sixth trans membrane segment most likely causes the receptor molecule to fold abnormally during its formation and alterations in the endoplasmic reticulum and Golgi apparatus. This might lead to poor trafficking, which would then cause less expression at the plasma membrane. In such a situation, ovarian LH resistance is connected with regular growth of female genitals on both sides and Ovulation fails to occur, followed by possible infertility [29]. Another study done by Byambaragchaa et al.,2021 demonstrates that in humans, naturally occurring mutations such as M398T, L457R, D564G, and D578Y are known to exhibit continuous activation, resulting in a hike in the basal cAMP response and a faster loss of the cell-surface receptor[30]. A human LHR mutant lacks hormone binding due to the Cys131Arg mutation. Unexpectedly, the stimulating effect of interacting structures and wild-type human LHR with either hLH or hCG exhibited variations in the trans-activation and cis-activation mechanisms of the two hormones. Grzesik et al. 2014 showed that neither the point mutations that were introduced, such as Cys131Arg and Lys605Glu, nor the absence of exon 10 altogether had a substantial impact on receptor oligomerization. These outcomes demonstrated that exon 10 is not necessary for the oligomerization of hLHR-delExon10. Furthermore, it rules out the idea that the observed decline in hLH-mediated signaling in comparison to hCG or wild-type hLHR is caused by reduced oligomerization of hLHR-delExon10.Contrary to hCG, the absence of exon 10 significantly affects how hLH stimulates cAMP. Cys131Arg inserts into the hormone-binding region and the significant positive charged side chain of arginine is likely to disrupt the pattern of corresponding receptor-hormone interaction [31].

Dolly J Patel and Kinnari N Mistry

Two homozygous inactivating nonsense and missense variants of the LH-receptor gene were reported by Latronico and his companions in 1996 —Arg 554 stop codon 554 (TGA) and Ser 616 Tyr 616, respectively—were discovered in a 46, XX sister with amenorrhea [32]. According to Oliveira et al. 1994 the stop codon present in the 3rd intracellular loop of the LH receptor might prematurely halt the translation of the receptor's mRNA and, as a result, remove a significant portion of the receptor. This abbreviated mutant receptor would not be able to transmit the hormone signal even if it were expressed in the membrane of the target cells [33]. Latronico et al. 1996 in their study reported a patient having ovaries with cysts of different diameters and a small uterus. The former suggested a reduced systemic estrogenic influence on the uterus, and the latter could be an indication of non-luteinized degenerating follicles. On molecular analysis, the Tyr 616 alteration was found in this critical area of the LH receptor. His findings may explain the LH-receptor gene abnormality which rendered the receptor inability to bind LH effectively [32]. *LHCGR* mutations are not prevalent compared to other genetic and non-genetic causes of hypergonadotropic hypogonadism with similar symptoms. However, it is essential to keep these disorders in mind while making a differential diagnosis for empty follicle syndrome, oligoamenorrhea, and infertility [34]. Finally, it is worth noting that most LHCGR mutations have no or limited effects on the reproduction process in females. However, some suppressing polymorphisms have been linked to polycystic ovarian syndrome [35], empty follicle syndrome [36], infertility [37], oligo/amenorrhea [38], and infertility [37], [39]. The In-silico approach is mainly to narrow down the lab-based studies. The findings of this study need to be confirmed by research experiments to mitigate the possibilities of increasing the clinical and reproductive health conditions associated with the PCOS phenotype.

CONCLUSION

In genetic correlation studies, computational methods are highly useful since they reduce the expense of SNP genotyping. In the *LHCGR* gene, the current investigation found a total of 16 non-synonymous/missense SNPs: A593P T577I S616Y M398T C131R A373V E354K I625K I542L D578H A568V L457R C343S C543R L502P G504S having a deleterious impact on each of the 10 computational tools for both structure and function. Our findings lead us to believe that these non-synonymous SNPs may be responsible for the etiology of PCOS. In summation, LHCGR variants might be significantly linked to risk for disease, and LHCGR polymorphisms contribute to a significant difference in the phenotype of PCOS, suggesting that the LHCGR polymorphisms could be used as a molecular marker to identify women at risk of developing PCOS in our population.

ABSTRACT

In this study, social media addiction in young people was explored, along with the role of self-confidence as a mediating factor and any potential negative effects. There has been a decline in the previous 10 years and significant growth in research on social networking addiction. This study's objective was to more clearly and thoroughly analyze the relevance of self-confidence, social networking sites, and the reasons for social media addiction among those who identify as such. The study also revealed that there is a start phase and a continuation phase to social media addiction. It has been shown that young people in the initial stages of using social media did so for a variety of reasons, including boredom, loneliness, and a lack of social interaction. In the continuation stage of young people's addiction, they claimed to utilize social media to safeguard their existing social relationships and to meet obligations. The urge to socialize was friends than female participants were in talking to their friends.

Keywords: social media, addiction, social networking, youths.

INTRODUCTION

Internet use is a knowledge technology that has impacted many facets of society by facilitating communication, trade, and information. Although its development was intended to provide safe, quick, affordable information and to ease communication, it has now evolved into a tool for bringing about enormous changes in people's lives and society. The internet's ability to be used anywhere, at any time, in a virtual setting has changed how people communicate. Additionally, social media, a development of internet technology, alter how individuals communicate with one another. The usage utilizes social media expanding globally, particularly among young people who have a keen interest in it. The usage of social media in daily life has increased during the past ten years. On the other hand, when people spend a lot of time online, internet-related activities might stop functioning as intended, which can have negative effects including troublesome and addictive behaviours (Griffiths; LAROSE, KIM and PENG). Among the different study areas looking at online addictive behaviours, social networking site addiction has received greater attention recently (SNSs). SNSs are online communities where users may build public profiles, communicate with friends in real life, and connect with others who share their interests to maintain both online and offline connections (D. Griffiths; Kuss and Griffiths; Kuss and Griffiths). The components model of addiction included six criteria that could also be applied to SNS addiction, including mood modification (i.e., engagement in SNSs leading to a favourable change in emotional states), salience (i.e., behavioural, cognitive, emotional, and SNS use obsession), tolerance (i.e. the ever-increasing SNS usage over time), and withdrawal. The paradigm of Internet-related diseases, which highlighted how commonplace actions tend to be overly anthologized and treated as addictions, has drawn some criticism, though (Kuss and Griffiths).

The Significance of Self-confidence
Self-esteem is one aspect that could contribute to the harmful impacts of social media addiction. Although looking at or changing one's internet presence boosts confidence, according to the hyper-personal Model, Users of social media are regularly exposed to others' carefully curated and glorified online self-presentations, which may diminish their interest. Self-confidence for example, when they don't know the other users well, regular Face book users tend to think that others are happier and more successful than they are offline. They also suggest that the extent of higher social comparisons based on Face book is greater than the extent of downward social media, comparisons and upward social comparisons may lower self-esteem. This idea has received support from empirical investigations. For example, a study showed that the use of Face book usage was linked to lower self-esteem, thus those who used it more frequently had lower self-esteem of time on Face book per session and those who made a greater number of Face book logins per day had lower self-esteem. Another study discovered that teenagers' self-esteem decreased after hearing unfavourable feedback on social media. Moreover, recent studies have revealed a negative relationship between social media use which is compulsive and self-esteem. A considerable number of studies have shown that low self-esteem is associated with many psychological dysfunctions such as depression and anxiety. Self-esteem has also been shown to be positively associated with academic performance and further serves as a protective factor against adversities in aiding academic and emotional resilience. It's likely that social media addiction makes people feel less confident about themselves, which in turn affects their mental health and academic performance. Otherwise put, self-confidence may play a mediating role in the relationship between the impact of social media addiction on academic performance and mental health (Rosenberg and Egbert; Raskauskas, Rubiano and Offen).

Social Media Addiction
Although the usage of mobile social media as a whole was not specifically included in any of the earlier research, it is reasonable to infer that the findings of computer-based Internet addiction also apply to mobile Internet since they fundamentally employ the same medium. Mobile phones are now identical to personal computers in terms of Internet addiction thanks to the inclusion of always-on Wi-Fi and the proliferation of free social networking apps. Additionally, mobile phones, as their name suggests, are portable and offer simple access to the Internet whenever and wherever. They are the perfect medium for Internet junkies because of this.

Shumpenthung Ezung and Allah Baksh

From a psychological perspective, social media provide a diverse array of experiences, each with potent components that may encourage problematic behaviour. For instance, an extrovert could spend a lot of time on Face book and compulsively check their page to see how many people "liked" their most recent post. Insta gram may prove to be an addicting platform for those with narcissistic tendencies to use to show off their appearance to others by taking "selfies." using social media excessively also be fuelled by social anxiety. The primary driver of excessive social media use, regardless of the time of day and at the detriment of other pursuits, may be FOMO (Przybylski, Murayam and DeHaan). Sometimes the term "mobile phone addiction" is used to set it apart from the idea of Internet addiction. The majority of conventional research on online addiction ignores problematic mobile phone use. In addition to voice and video conversations, text messaging, video recording, and a wide variety of entertaining apps made specifically for small displays, mobile phones currently provide access to nearly all Internet applications. Additionally, any screen can display their findings.

They also have the advantage of constantly being accessible, unlike a desktop or even a laptop. You may use your phone while driving, taking public transit, or even when you're out and about. Before this, consumers could not participate in a diverse array of online activities within these "micro periods." This can result in compulsive mobile phone use, disrupt in-person interactions, and impair academic achievement (Al-Menayes). Although there is little research on problematic mobile media use, interest has lately grown. For instance, a study of female Taiwanese college students indicated that those who performed well on a test for smart phone addiction had higher levels of extraversion and anxiety as well as a little decline in self-esteem. Compared to males, women appear to be more susceptible to smart phone addiction (Hong, Chiu and Huang). Another use of mobile phones, "texting," which can be done directly or through social media sites like Twitter and similar apps, may prove to be particularly significant for addictive behaviour. Recent polls show that young people are beginning to use Twitter instead of Face book, especially as their parent's accounts and request to be friends. Such programmes are expanding and enabling an increasing number of features, such as Vine, which enables users to produce six-second films to share with followers. The main characteristic of these programmes is their stickiness, or their inclination to be often used by users. Their business models, which rely on the expanding volume of data on user activity to share with advertisers for targeted marketing, are the cause of their stickiness (Madden, Lenhart and Cortesi).

The Negative Outcomes of Social Media Addiction
One type of Internet addiction is social media addiction, which manifests as a need for using social media excessively. People who have a social media addiction frequently have excessive social media anxiety and are motivated by an overwhelming want to access and utilize social media. According to studies, social media dependency causes issues with emotion, mental acuity, physical and emotional reflexes, interpersonal relationships, and psychological well-being (Alabi; Wolniczak, Cáceres-DelAguila and Palma-Ardiles; Wu, Cheung and Ku). Numerous social media usage and mental health research have found a negative correlation between long-term well-being and media use, as well as a positive correlation between mental health issues including stress, anxiety, and depression. For instance, high school students in Central Serbia and young people inside the United States both showed a positive correlation between the amount of time spent on social media and depression symptoms. Furthermore, it has been demonstrated that some types of using social media are linked to poorer academic achievement. For instance, (Lau) discovered that while social media use for academic reasons did not predict academic success as measured by the cumulative grade point average, social media use for non-academic purposes (particularly video gaming) likewise, social media multitasking. Additional support for the inverse relationship between academic usages of social media outcomes has been offered by laboratory studies. Weibo, Twitter's counterpart in China, was discovered by (Jiang, Hou and Wang) to have detrimental consequences on information comprehension. It is important to note that frequent social media use does not always imply addiction, and that usage of social media often does not always have a detrimental impact on people's mental health or academic performance. One important contrast between regular overuse of social media, which many people may experience periodically, and reliance on social media is that the latter is linked to negative outcomes when online social networking becomes obsessive and uncontrolled. Social Media addiction has been a major subject of studies. It has been demonstrated that social media addiction is adversely connected with subjective well-being, subjective vigour,

68092

Shumpenthung Ezung and Allah Baksh

and life satisfaction and is favourably associated with sadness, anxiety, and sleeplessness. Additionally, studies have revealed that social media addiction has a detrimental effect on academic achievement.

CONCLUSION

By this study, social media addiction is caused by a lack of friends, the perception that using social media is an activity, the need to complete a task, they want to keep up with current events, and the desire to mix social media with real life. There was no difference in the study between men and women. For females, however, the demand for sociability manifests itself through communication with actual friends. This circumstance has been seen to lead to guys creating more new buddies. The starting and continuation phases of addiction to social media have also been identified. People who are in the early stages of addiction have been discovered to frequently use social media to pass time when they are bored, lonely, or unable to make friends. Individual who is in a period of continuity addiction utilises social media to keep up with happenings, feel like they have fulfilled their obligations, safeguard their social connections, and other things.

ABSTRACT

Iron Oxide (Fe_3O_4) nano particles are synthesized via the sol-gel method. The functional groups, crystal structure and surface morphologies of the ZnO nano particles are investigated by Fourier transform infrared spectroscopy (FTIR), X–ray powder diffraction and scanning electron microscopy (SEM) respectively. The thermo electrical properties were also analyzed. From SEM observations, spherical particles are noticed for nano particles. As the temperature increases from 30°C to 90°C, the electrical conductivity of the nano particles increases from 8.75 to 22.07mS/cm and the thermal conductivity decreases from 0.976 to 0.664 $Wm^{-1}K^{-1}$. Here, as the annealing of zinc oxide increases, the thermoelectric properties of the nano particles improve.

Keywords: Iron oxide, Nano particles, Electrical conductivity, Thermal Conductivity

INTRODUCTION

Thermoelectric (TE) materials have received a lot of attention recently due to their potential usage in the electricity generation refrigeration, and thermal sensing [1]. Low temperature variations, albeit frequently available in the environment (such as from solar and geothermal energy) or produced from various power generating or consuming systems, are insufficient for the production of electricity using conventional systems [2]. The conversion of waste heat to electric power by means of thermoelectric devices has grown more urgent and significant, especially since the combustion of fossil fuels has generated highly worrisome environmental problems [3]. High electrical conductivity and low thermal conductivity is the significant for good thermoelectric materials [4]. Traditional inorganic semiconductors with excellent thermoelectric characteristics, such as Bi_2Te_3, PbTe, SiGe, $CoSb_3$, and SnSe have

garnered the most interest. However, the expensive price and challenging processing prevent these inorganic thermoelectric materials from being used widely [5]. Due to their inherent low thermal conductivity, light weight, low processing cost, and mechanical flexibility, some nano particles are viewed as suitable replacements [6]. The thermoelectric properties of Fe_3O_4 have been studied well in the literature. The addition of iron oxide to the corresponding conducting polymer further enhances the thermoelectric properties of the nano composite [7]. In this study, Fe_3O_4 nanocomposites were fabricated by sol – gel method at room temperature and the nano particles were characterized by conventional technologies. The electrical conductivity and thermal conductivity were also calculated. The TE properties of the nano composites were measured from 30°C to 90°C.

Experimental Procedure
Materials
Ferric sulphate ($Fe_2(SO_4)_3$) ≥99% purity (HmbG Chemicals), Ammonia solution (NH_4OH) ≥98% (Sigma Aldrich), Ethanol (CH_2COOH) HmbG Chemicals) and distilled water. All reagents were analytical grade and directly used without further purification.

Synthesis of iron oxide nano particles
Ferric sulphate (2.6g) was dissolved in 20mL of distilled water. 20mL of ammonia solution is taken in a beaker. This ammonia solution is added drop wise to the ferric sulphate solution. This mixture is stirred for three hours. The Solution is allowed to rest for few minutes till the white precipitate forms. Finally, the collected precipitate was filtered using what man filter sheet. Then it is transferred to a petri dish and dried in oven at 80°C.

RESULTS AND DISCUSSION

Fourier Transform Infra-Red Spectroscopy
The FTIR is the best tool to analyze the functional groups of nano composites and it has been recorded at the region of 4000-400 cm^{-1}. Figure 1 displays the FTIR of iron oxide nano particles as a red line. The distinctive peak of C-H bond in FTIR spectra is the peak with wave number 2922 cm^{-1}. The bonds in the region 1627 cm^{-1} corresponded to the polyester resins. The peak at 3429 cm^{-1} was attributed to the O-H stretching vibration arising from the hydroxyl group. The peak 2853 cm^{-1} is associated with the vibration of CH_2. The stretching vibrations of Fe-O are corresponding to 472 and 547 cm^{-1}. These peaks provide evidence that the particles being studied are Iron Oxide nano particles [8].

Scanning Electron Microscopy
Scanning electron microscopy is the best tool to analyze the surface morphology of the samples. The SEM image of iron oxide is shown in figure 2. The morphology of the nano particles was observed to be spherical. The figure showed the particle size ranging from 85 to 95nm. The SEM image of iron oxide nano particles confirmed it consists and spherical shaped nano particles [9].

X-Ray Diffraction
Structural analysis was performed using X-ray diffraction technique. Figure 3 shows the X-ray diffraction pattern of iron oxide annealed at 300°C. The major XRD peak is observed at 2θ value of 33.04° while the secondary major peak is recorded at 35.51°. Other peaks are found at 2θ = 53.93° and 62.47°. These peaks corresponds the iron oxide with the hkl values of (104), (311), (116) and (214). The hematite structure could be identified by the XRD patterns of Fe_3O_4 nano particles. The hematite phase is more prominent phase of iron oxide nano particles [10]. The primary measurement to examine the thermo electrical properties is electrical conductivity. This allows for an assessment of the quality of the created nano composites. As the temperature increases from 30°C to 90°C, the electrical conductivity of the nano composites was evaluated. Figure 4 displays the electrical conductivity of iron oxide nano particles. It has been shown that electrical conductivity increases with increasing temperature. The electrical conductivity for iron oxide is 22.07 mS/cm. At 90 °C, all of these results were obtained. Here, when the temperature rises, the ions move more quickly due to their increased kinetic energy. They conduct their bearing charge faster

rapidly, increasing electrical conductivity as a result. So the electrical conductivity increases as the temperature and weight ratio increases [11].

Thermal Conductivity

When analyzing the thermoelectric characteristics of nano composites, thermal conductivity is a vital factor to comprehend. The measurement of thermal conductivity was done between 30°C to 90°C. Figure 5 illustrates the thermal conductivity of iron oxide nano particles. As the temperature is increased, the thermal conductivity of iron oxide nano particles reduces. The thermal conductivity of iron oxide is 0.976 Wm-1K-1 at 30 °C. It has thermal conductivity of 0.664 Wm-1K-1 at 90 °C, respectively, and these values decrease as temperature increases. As the weight percentage rises, the thermal conductivity of nano composites diminishes. Because an harmonic scattering is inversely proportional to temperature changes, it causes the thermal conductivity of Fe_3O_4 nano particles to decrease at higher temperatures [12].

CONCLUSION

Iron oxide nano particles were synthesized by sol-gel method. Iron oxide has sphere nanostructure. Electrical and thermal conductivity were characterized. As the temperature increases from 30°C to 90°C, the electrical conductivity of the nano composites increases from 8.75 to 22.07mS/cm and the thermal conductivity decreases from 0.976 to 0.664 $Wm^{-1}K^{-1}$. We have concluded that the zinc oxide nano particles can be used to make thermoelectric materials.

ABSTRACT

The application of Machine Learning (ML) and Artificial Neural Networks (ANNs) in the field of thermal engineering has emerged as a transformative approach to address complex challenges associated with energy efficiency, sustainability, and system optimization. Thermal engineering encompasses a wide array of applications, from heating, ventilation, and air conditioning (HVAC) systems to power generation, refrigeration, and industrial processes. ML and ANN techniques are being leveraged to revolutinize these domains. ML also aids in fault detection in HVAC systems, green building design for sustainable architecture, and nuclear reactor safety through condition monitoring. This article tries to cover how ML and ANN have become indispensable tools in the field of thermal engineering, offering innovative solutions to optimize energy use, improve system reliability, enhance sustainability, and drive progress toward a more efficient and environmentally responsible future.

Keywords: Thermal, AI, ML, ANN, Applications

Nithish Reddy *et al.,*

INTRODUCTION

Machine learning (ML) and artificial neural networks (ANNs) have numerous applications in thermal engineering, enhancing the design, operation, and optimization of thermal systems. In HVAC systems, ML algorithms are deployed to optimize energy consumption by learning from real-time data and adapting system parameters for efficient operation while maintaining occupant comfort. Predictive maintenance models based on ANN predictions enable proactive component monitoring and reduce downtime, thereby improving system reliability. ML plays a pivotal role in load forecasting for power generation and distribution, contributing to the efficient utilization of resources and reducing greenhouse gas emissions. Heat exchanger design benefits from ML-driven optimizations, leading to enhanced heat transfer efficiency and reduced costs. Moreover, thermal comfort prediction models assist in designing indoor spaces that provide ideal comfort levels. Industrial processes, such as combustion systems, are being optimized using ML algorithms, resulting in improved efficiency and reduced emissions. Fluid flow simulations are expedited through neural networks, enabling faster and cost-effective analysis of thermal systems. ML's ability to predict thermal stresses is invaluable in ensuring the safety and longevity of critical components. Renewable energy sources like solar power benefit from ML models that predict solar radiation and energy generation, optimizing energy production and consumption. Cryogenic systems, essential for liquefied natural gas (LNG) plants, are enhanced through ML-driven temperature and pressure predictions, as well as insulation material optimization

The following some of the notable applications
Energy Efficiency Optimization
ML algorithms can optimize the operation of heating, ventilation, and air conditioning (HVAC) systems in buildings. They can learn patterns in energy consumption and adjust system parameters in real-time to minimize energy usage while maintaining comfort levels.

Predictive Maintenance
ML models can predict when components of thermal systems, such as boilers, heat exchangers, or turbines, are likely to fail. By analyzing sensor data, these models can provide early warnings, reducing downtime and maintenance costs.

Load Forecasting
ML algorithms can forecast energy demand, which is crucial for power plants and utility companies. Accurate load forecasting helps in efficient power generation and distribution.

Heat Exchanger Design
ML can assist in the design of heat exchangers by optimizing their geometry and material selection to maximize heat transfer efficiency while minimizing pressure drop and cost.

Thermal Comfort Prediction
ML models can predict thermal comfort levels in indoor spaces based on factors like temperature, humidity, and occupancy. This is useful for designing buildings that provide a comfortable environment.

Combustion Optimization
In industrial processes, ML can optimize combustion systems by adjusting fuel injection rates, air-fuel ratios, and other parameters to maximize efficiency and minimize emissions.

Fluid Flow Simulation
ML can accelerate fluid flow simulations, making it easier to analyze complex thermal systems. Neural networks can learn to predict flow patterns and heat transfer rates, reducing the need for computationally expensive simulations.

Thermal Stress Analysis

ML can predict thermal stresses in materials and components subjected to varying temperatures. This is essential for ensuring the longevity and safety of equipment.

Solar Energy Prediction

ML models can predict solar radiation and energy generation from solar panels. These predictions are valuable for optimizing the deployment and operation of solar energy systems.

Cryogenic Systems

ML can help optimize the design and operation of cryogenic systems, such as liquefied natural gas (LNG) plants, by predicting temperature and pressure profiles and optimizing insulation materials.

Refrigeration Systems

ML can optimize the performance of refrigeration systems by adjusting compressor settings, temperature setpoints, and defrost cycles based on real-time conditions and energy costs.

HVAC Fault Detection

ML algorithms can detect faults in HVAC systems by analyzing sensor data for anomalies. This helps in maintaining system reliability and reducing energy waste.

Heat Recovery Systems

ML can identify opportunities for heat recovery within industrial processes and design systems to capture and reuse waste heat efficiently.

Green Building Design

ML can assist in the design of sustainable, energy-efficient buildings by optimizing insulation, window placement, and HVAC system sizing.

Nuclear Reactor Safety

ML can play a role in predicting and monitoring nuclear reactor conditions to enhance safety and prevent accidents.
In all these applications, ML and ANN techniques can analyze large datasets, model complex nonlinear relationships, and provide valuable insights for improving the efficiency, safety, and performance of thermal engineering systems.

LITERATURE

In recent times the applications of multiphase flow simulation using other techniques such as machine learning and artificial intelligence have increased numerously. One of the common ultimatums in power plants is liquid and vapor in complicated phases where mass, momentum, and energy interact. In this process, FSM (feature similarity measurements) is implemented to predict the data using a coarse mesh. The FSM is preloaded with low and high-fidelity data. Low fidelity data refers to the boundary conditions. The high fidelity data consists of experimental values and values of fine mesh CFD simulation results. The FSM uses DFNN (Direct Feed forward Neural Network), which forms a connection between the nodes and predicts the behavior of liquid and vapor at particular sections. The change in boundary conditions, i.e., low fidelity data, does not affect the results[1]. As the world economy increases, the energy demand also increases. Across the globe, to meet this necessity, nearly 50% of energy production is dependent on coal, and there is an increased concern over carbon footprints. The simulation of coal combustion and the implementation of solid fuel kinetics in CFD uses Large Scale LES (Large Eddy simulation). Though the Large Scale-LES is improved and accurate, the process is not convenient, and the computational cost is high. A machine learning model is implemented along with a database To overcome the computational cost.

Nithish Reddy *et al.,*

This database consists of detailed kinetic characteristics of single combustion over a vivid range of operating conditions on a novel gas of coal combustion chamber. The model is evaluated using the test database, and this model proves to be an optimistic tool for a computationally efficient model for managing the chemistry of coal combustion. The traditional way (using the LES method), which relies on ODE (ordinary differential equation), consumes more time, and the computational cost is high[2]. In semiconductor industries, an atomic layer deposition method is vastly used because of its high-quality outputs, and the process of atomic layer deposition of silicon oxide consumes more time. A machine learning model is developed using first-principle-based models to overcome this problem. The development process is expensive and time-consuming. A multi scale data-driven model is designed to identify the microscopic process domain dynamics for linear parameter varying models and distinguish the domain film growth. This process is achieved by using the ANN (feed forward artificial neural network). The multi scale data-driven model uses four parameters: precursor feed flow rate, operating pressure, surface heating, and transient film coverage to envision the transient deposition rate. This model can reduce the computational time from 0.6 to 1.2h for every time step, which is essential for the first-principles-based multi scale computational fluid dynamics (CFD) model. This principle made it a real-time feasible process. The prediction outcome for deposition completion time being less than 10%, and the data mismatch did not affect the accuracy, and the cycle continued to work. This eventually reduced the operational cost and time [3]. The safety of the Nuclear Power Plant depends on the study of containment thermal-hydraulics(CTH). Computational fluid dynamics is one of the important approaches to identify the CTH parameters. The cost for computation will be very high for critical models to capture the simulation flow and different values. An alternative method using machine learning is proposed on a coarse grid. This will eradicate the errors and predict the appropriate values for that simulation. The machine learning method is equipped with two other algorithms: Artificial Neural network(ANN) and Random Forest(RF). This is stored with experimental data of fine mesh; based on these values, the algorithms remove the flaws in the coarse grid and forecast sensible results for new cases irrespective of different Reynolds numbers, mesh sizes, and large geometrical models[4]. The thermo physical properties of hybrid fluids such as dynamic viscosity, density, and thermal conductivity largely affect their behaviour in engineering systems. So, to overcome this drawback, few machine learning algorithms have been developed to predict the properties this includes artificial neural networks. Akbar Maleki et al.[2020] comprehensively reviewed several machine learning approaches.

That includes Multilayer perceptron Artificial Neural Network, Adaptive neuro-fuzzy inference system, Radial basis function network, Least square support vector machine, Machine learning-based methods in thermal conductivity modelling, and dynamic viscosity modelling[5]. It is censorious to develop energy-efficient heating, ventilation, and air conditioning systems to maintain a dynamic environmental condition for automotive vehicle cabins. A machine learning model with three algorithms, namely Artificial Neural Network(ANN), Random Forest(RF), Linear Regression with Stochastic Gradient Descent, was included to forecast the Equivalent homogeneous Temperature for every passenger in the cabin. The data for the algorithm is driven from a vehicle cabin CFD model, which is experimented with against the environmental conditions in a wind tunnel with different boundary conditions. The results are satisfying with less than 5% error and providing thermal comfort for different passengers with unique metabolic rates and clothing size or thickness. This also decreased the contemporaneous high-cost CFD simulations[6]. Yaomin Zhao et al.[2020] focused on modifying one of the turbulence models in CFD simulations. They worked on improving the RANS(Reynolds Averaged Navier-Stokes) turbulence model. The conventional RANS model utilizes algebraic methods to analyze the characteristics of flow. The developed RANS model using the machine learning algorithm is implemented on wake mixing regions in the turbo machines. This method was applied to the other three cases with different conditions all results show improvement in the wake prediction[7]. The solar still is a process of purifying saline water. The tubular solar still is one of the types to desalinate the water.

This process is widely applied in geographical locations where the temperatures are high. In this journal, four Machine Learning algorithms Random Forest, Artificial Neural Network, Bayesian Optimization Algorithm for Random Forest, and Bayesian Optimization Algorithm using Artificial Neural Network are implemented to predict the hourly production of water. The experiment is conducted for 16 days and 8 hours each day, making up to 144 hours. During the experiment, it has been noticed that it is workable to forecast the hourly production and efficiency

Nithish Reddy *et al.,*

of the Random Forest and Artificial Neural Network is improved by 35% by implementing the Bayesian Optimization Algorithm[8]. To analyze the effects on the thermohydraulic performance of heat exchangers, a better machine learning method is introduced to forecast the fluid characteristics in the domain. Generally, large mathematical models are used for this analysis, and this consumes a lot of computational time. To cut computational time, a machine learning method with four predictive algorithms is introduced: random vector functional link, support vector machine, social media optimization, and K-nearest neighbour algorithm. These algorithms include the experimental data for testing. And the experimental data contains inlet and outlet boundary conditions. In the end, the prediction capabilities of outlet temperatures through random vector functional link are compared with the other three algorithms to calculate the mean square errors. The error proves to be minimal[9]. To confront the rigid environmental conditions penned by the European Nations on the production of cleaner energy. The thermal power plants that rely on fossil fuels increase the carbon footprints and nitrogen oxide percentage in the atmosphere. To reduce the nitrogen oxide below 200 mg/m^3, a machine learning algorithm and Artificial Neural Network, and local linear neuro-fuzzy models are equipped to direct urea injection into the firebox in a controlled manner. This resulted in the reduction of nitrogen oxide but increased the greenhouse effects and coal combustion[10]. In recent times, there is increased research in nanofluid heat transfer machine learning algorithms to be applied in renewable energy sources. Many factors influence the characteristics of nanofluids; machine learning methods are used to overcome few problems and give optimum solutions. Firstly, the thermo physical properties of nanofluids are tough to calculate, and to tackle this, an Artificial Neural Network is implemented. This method could give accurate predictions of these properties, including size, shape, density, etc. In renewable energy sources like solar, wind, and geothermal energy, the nanofluids can improve the heat exchanger's efficiency. The performance can be accurately predicted using ANN, ANN-GA, ANN-LINMP. During the suspended period, these nanoparticles form clusters and will be problematic for finding the radioactive properties. A discrete dipole approximation is used to avoid this situation and predict large clusters' particle size and shape. Machine learning models like ANNs and ANN-based hybrid approaches can give exact values for the performance of nanofluid in solar energy, which is responsible for high thermal conductivity and optical characteristics. The ANN algorithm does not always give the exact values, so this is integrated with other intelligent algorithms like PSO, SA, and AC to improve the predictions. On the other hand, Ting Ma et al.[2020] discussed the contradictions of the ANN in nanofluid heat conductivity[11].

A conservative method is used for thermal conductivity modelling, which depends on the theoretical framework, which controls the microstructural evolution during the neutron irradiation. A similar method is developed using deep neural network algorithms that do not rely on previous information about the material microstructural system to predict the thermal conductivity on different operating and material conditions. A study is conducted on uranium molybdenum fuels, and irradiation test data is held to develop this model. The work represents the possibilities and restrictions in the field of materials science and material property modelling[12]. The study concentrates on the flow boiling/condensation in mini channel offset fins. An experiment is conducted on R134 refrigerant, and the data driven from this experiment is used to build an Artificial Neural Network for analyzing the heat transfer coefficient. This model forecasted a mean absolute relative deviation of 11.4% and 6.06% for boiling and condensation. The different dimensionless conditions have different influences on heat transfer coefficient; the ANN-based model gave sensible accurate results. The data obtained through an improved ANN model could be transferred to different datasheets for the same domain, but this could give a poor performance while transferring the datasheet[13]. Two important developments are made by introducing porous foam in an internal combustion engine. This reduced the carbon footprints and also increased thermal efficiency. These values are obtained through SOPHT software, which is used for modelling the porous foam internal combustion. The SOPHT uses large-scale differential equations for thermal circuits in the engine. With the recovered heat from the exhaust gas, less fuel is used, and this also oxidizes the unburnt particles in the chamber[14]. A study is conducted based on the machine learning program to reduce the pollutants from the CI-Engines. The program used other algorithms like Deep Learning, Artificial Neural Network, Support Vector Machine, and K-Nearest Neighbour. Nano particles with good oxygen contents are injected directly into combustion chambers, which helps complete fuel combustion.

Further, the experiment focused on carbon dioxide (CO), nitrogen oxide (NOx), exhaust gas temperature (EGT), brake specific fuel consumption (BSFC), and brake thermal efficiency (BTE). This experiment is carried on different engine speeds between 1500 and 3400 rotations per minute with uniform intervals of 100 rpm. The results for neat diesel fuel show the reduction in NOx is found to be 3.28, 7.53, and 10.05%, and the reduction in CO is found to be 8.3, 11.6, and 15.5% for TiO2, Al2O3, and CuO test fuels, respectively [15]. Using numerical methods may not give accurate thermal transport mechanism simulations results due to the lack of physical resources. A machine learning-based algorithm is developed to predict the structural effects of thermal transport in porous media. The ML is equipped with all the necessary physical properties and boundary conditions, predicting accurate results. A piece of comprehensive knowledge is required in thermal transport mechanisms for different engineering and industrial applications[16]. It is necessarily better to understand the thermal conductivity of amorphous coal ash to design a gasification system. A machine learning model uses Artificial Neural Network, Random Forest, and other techniques to forecast accurate results based on the available experimental data. These techniques have found that higher amounts of CaO and lower volume of silicon dioxide and aluminium oxide have high thermal conductivity during the process. In conclusion, this journal provides effective policies for thermal conductivity prediction of amorphous CSA ternary systems and the mechanism research.[17]. A machine learning model with a self-adaptive differential evolution algorithm is proposed to analyze the 2-Butanone reduced mechanism. This mechanism contains certain characteristic features that include 50 species and 190 reactions for the first time. These are initially divided into three parts based on their chemical parameters, and in the next step, a set of 31 reactions are optimized using algorithms. This algorithm predicts the ignition delay times and laminar flame speeds of 2- butanone. This model could be used to find out the solution for global problems[18].It is hard to find the exact thermal conductivity of material for both experimental and theoretical ways. In general, there is a method to evaluate the conductivity. An alternative method is initiated using a machine learning algorithm to determine the intermolecular potentials using the first-principles estimation of thermal conductivity. The major obstacle is to find a method to acquire the an harmonic interatomic force constants using computationally demanding DFT calculations. Numerous data is driven from various experiments and two-dimensional simulations. This process could be utilized as a standard tool for predicting lattice thermal conductivity compared to the commonly used full-DFT solution[19]. In civil industries, it is important to know the thermal conductivity of the concrete structure. The thermal conductivity of each structure is unique, and to evaluate the thermal conductivity of every structure a machine learning method is developed with a data-driven model. This method showed the temperature gradient and provided the concrete mixing data for different structures. This model could be improved by using a large training dataset[20].

In the steel plate producing industries, the process parameters and steel grade composition significantly affect steel production's micro structural and mechanical properties. It is difficult to identify the exact composition to maintain these properties to meet the industrial standards in traditional ways. A deep neural network method is designed to predict the parameters and properties of steel plate industries. This algorithm is formulated in a pattern that takes 27 input parameters, two hidden layers, 200 nodal points, and four output parameters. In other words, these can also be termed as initial conditions. This process will give the steel plate mechanical properties that include yield strength, ultimate tensile strength, elongation, and impact energy. This modified Dynamic Neural Network has a root mean square error of 21.06 MPa, 16.67MPa, and root means square percentage error of 4.7%, 2.9%, 7.7%, and 16.2%, for yield strength, ultimate tensile strength, elongation and impact energy, respectively. This DNN method is the most efficient and accurate compared to other online services. This method helps maintain the exact mechanical properties and guides the worker to change the composition to get the desired outputs [21]. Arun C. Ravindran et al.[2021] worked on the reduction of computational time for simulating an Internal Combustion engine using a machine learning method. Among the different IC Engine solvers, the Gaussian Progress Regression is the most used method. In this process, computational modelling with the GPR solver-based machine learning technique is developed. The model consists of a cold start fast idle phase of gasoline direct injection spark ignition (GISI).

The process considers the following parameters to clinch the cold start condition. (1) A fixed IMEP of 2 bar (BMEP of 0 bar), (2) A stoichiometric exhaust equivalence ratio (based on carbon-oxygen atoms), (3) adequate exhaust heat flux to ensure a rapid light-off of the after-treatment system, and lastly (4) decreased NOx and HC emissions. These

68104

parameters are considered to have a greater impact on the cold start engine performance. The parameters mentioned above are linked to the fuel injection, combustion procedure and intake airflow. Running the multiple cycles in any conventional CFD software would be difficult, and it will take a long time. To attain the results mentioned above, IMEP (Indicated Mean Effective Pressure) of 2 bars could be made easy and reduced time using the GPR-ML algorithm. Normally, the 3D-CFD would take no less than six days, and this algorithm could complete the case in a few minutes[22]. Han Bao et al.[2020] developed Feature Similar Measurement(FSM) technique to identify the errors in two-phase flow simulation using coarse mesh. This FSM captures the coarse mesh errors and uses the physics-guided data-driven method to achieve a comparable accuracy as fine mesh simulation with fast-running features. High-fidelity data and low-fidelity data are used to identify the underlying information relevant to the main simulation errors and the effect of phenomenological scaling. Using the previous simulation data, an alternate model called Deep Feed Forward Neural Network was trained and developed. In this process the two phases of bubbly flow method is developed to measure the unphysical "peaks" in the velocity and void fraction profiles near the wall in the coarse-mesh configuration ny Han Bao et al.[2020]. This physics-guided method in coarse mesh-CFD simulations plays a significant role in industrial designs[23]. The zinc chloride ($ZnCl_2$) and other alkali chlorides are convenient thermal storage and heat transfer fluid materials in the future generation of concentrated solar thermal power Gechuanqi Pan et. al [2020]. Understanding the cavernous properties of the $ZnCl_2$ is necessary to maximize the thermal storage and high-order mixture. The microstructure information and the thermodynamic properties of the materials are to be recognized. This is the first time an intermolecular potential of $ZnCl_2$ based on neural network machine learning is developed. The technique uses partial radial distribution function, coordination number, and partial structure factors with AMID and PIM potential. In the end, this method provides detailed information on the microstructures than the PIM potential, which suffers from the analytical form. This method will give an accurate molecular simulation of structures and dynamics of molten $ZnCl_2$ mixtures [24]. To solve a conductive heat transfer partial differential equation that uses convective heat partial differential equation as boundary conditions in the manufacturing process, a physics-informed neural network is developed. The conventional trial and error finite element simulations are very slow. The prognosis of one-D and two-D are validated by comparing with Finite Element results. In conclusion, only by using physics-informed activation functions, the heat transfer beyond the training zone can be accurately predicted. These models were successfully tested and used for real-time evaluation of thermal responses of parts subjected to a wide range of convective boundary conditions only [25].

Searching for new material is important to meet the growing industrial needs and decrease the increasing pollution. Pollution can also occur through the improper handling of E-waste and other waste. To overcome these problems, research institutes and government bodies invest heavily in finding new materials. The conventional method uses a trial and error mechanism, which consumes a lot of time. It is not easy to process; this process has been made easy after introducing the big-data era. Then a Machine-Learning based algorithm is developed that takes the frequently used data are classified and compared. The current applications of this is seen in metal materials, battery materials, and metallic glass are reviewed [26]. The cities are expanding, and the buildings are constructed closer to meet the increasing population. Due to this, air circulation becomes slower. This inferiority could be enhanced by making good urban planning and building design. On the other hand, indoor natural ventilation requirements in current building standards only define absolute indoor airspeed without considering the outdoor parameters. A Machine-Learning algorithm is designed based on the 3,480 computational fluid dynamic simulations to tackle this situation, and this method is called Gradient Booster. This model showed an improved building design correlation of $R^2(0.2)$ compared to other linear regression models [27]. The present thermal-hydraulic system of simulation is restricted to its best performance even in the real-time industrial works for testing large scale geometries and boundary conditions. This is due to the size of the mesh, the mesh induced error, and the model error is connected. This makes it difficult to estimate the model scalability independently. Han Bao et al.[2020] used a Machine-Learning data-driven technique to build a Similar Feature Measurement to eradicate these problems.

A set of physical features that embody the information from a set of physical systems of interest, empirical correlations, and the effect of mesh size are taken into consideration and simulated the parameters. At the end of the simulation, an error database is constructed using the deep learning method. With the help of the deep learning

technique, the relation between physical error and simulation errors are estimated. This helps in predicting even the large scale gaps in the grids [28]. It is laborious to guess the performance of a base cycle power plant. Predicting the malfunctions of materials in a prompt period is an arduous task that depends on complex thermodynamics. Here, many Machine-Learning methods are used to test the performance and identify all the abnormal activities of a combined cycle power plant of five years of recorded data. A modelled total load power output of the plant using ambient pressure, atmospheric temperature, relative humidity, and exhaust vacuum pressure these parameters are used as the input features for a combined Machine-Learning method that includes linear regression, support vector machines, random forest, and artificial neural network. The obtained through all the techniques turned out to be accurate with greater than 92%. This method drives data through the small sensors and gives detailed information that is incomprehensible to humans and becoming a potential game-changer monitoring health [29]. Four powerful Machine-Learning methods, namely, the ordinary kriging method, adaptive neuro-fuzzy interference system, a multilayer artificial neural network, and a Hybrid of Fuzzy logic and Genetic Algorithm along with thermodynamics based approach of Van der Waals - Platteeuw are confronted for CO2 gas hydrate formed in the presence of thermodynamic promoters as well as for semi-clathrates formed from CO2. The methods are collated together because of their potentials in capturing CO2, which are computationally challenging and time-consuming. To estimate the equilibrium, correlation coefficient, minimum and maximum errors are included for testing. The artificial neural fuzzy interference system estimated the accurate values with the highest accuracy among all four methods. This method could be used as the alternative to the traditional van der Waals-Platteeuw method and can be easily coupled with industrial, commercial software to reduce calculation times while maintaining accuracy[30]. Bin Xu et al.[2020] constructed a herculean method for the real-time realization of the Dynamic Programming algorithm for streamlining the Organic Rankine Cycle waste heat recovery system. For the first time the Machine-Learning algorithm, single state proper orthogonal decomposition, and Galerkin projection-based reduced order models are combined with the Dynamic Programming to optimise the power generation, extracting rules through offline and this provides high accuracy with low computational cost. In this method, a total of 11 Machine-Learning algorithms are selected for this study and Random Forest is selected for its better performance in forecasting the accurate pump speed. This method can be conducted using steady-state and transient conditions, and the results do not hold the same for both cases. The problem for the low accuracy is time in exhaust gas mass flow rate and exhaust temperature. This study found that the Random Forest model accuracy is improved by including a rule-based method. By adding the rule-based method, the prediction is increased from 66.5% to 97.2%. This process can be applied for extracting Dynamic Programming rules in real-time application due to its high accuracy [31].

The machine-Learning method with dingle-hidden layer feed forward neural networks (SLFN) process is applied to alter the SI-Engine that uses octane as fuel. With five different engine speeds ranging between 1000 to 3000rpm, crankshaft angle from -360 degrees to 360 degrees without exhaust gas being recirculated. The extreme learning machine can identify the combustion parameters used to bounce the pressure information for the entire cycle in a single-cylinder compression ignition engine. ELM method solves the mathematical models faster, and the hidden layers of the SLFN's need not be changed for each simulation. It is necessary to set up the initial condition like velocity, simplicity, accuracy, and the appropriate node to initiate it. An experimental data sheet is used to train the ELM models and compare two case studies based on performance criteria related to accuracy, sparsity and complexity. In conclusion, the results showed that the proposed model could predict the mean effective pressure in agreeable regularity using the experimental results[32]. Estimating the residual life of an aircraft turbine engine plays an important role in assuring aircraft safety. Yet, several types of research are conducted on estimating the turbine engines' life, and some are based on ensemble learning methods. Jiyan Zeng et al.[2020] Introduced an ensemble Machine-Learning based methods to calculate the outstanding life of the air-craft. These Machine-Learning methods {Stacked Autoencoder(SAE), Convolution Neural Network(CNN), & Long Short-Term Memory (LSTM)} considers the euclidean distance weight of the air-craft turbine engine for calculations. The weight of each member algorithm is allotted based on the Euclidean distance between the predicted and real Remaining helpful Life.

A group of datasets is provided for the RUL simulation obtained from the aero-propulsion simulator C-MAPSS. This method surpasses other member algorithms [33]. To find out the defects in two-wheelers using an upgraded version

Nithish Reddy *et al.,*

of Convolution Neural Network(CNN). This method begins with the acquisition of vibration data, and next, time-domain signals are transformed to the angular domain. Later, random distribution of angular domain signals is done to set training and test data. A set of time-frequency images are generated using the wavelet synchro-squeezed technique. These images are used to tailor the CNN method to improve CNN model in identifying the flaws in the internal combustion engine of two-wheeler vehicles[34]. It is always a difficult task to find the characteristics of gasoline direct-injection engines. The air-fuel mixture and nozzle sprays are responsible for combustion and emission characteristics. Although several spray models and computational fluid dynamics simulations are tested to identify the air-fuel mixture, these simulations are restricted only to single axial-nozzle injectors and a limited range of ambient conditions. A sequence of spray experiments is conducted in a constant-flow spray vessel coupled with high-speed diffused back-illumination extinction imaging to generate a data set for algorithm training. Different fuels are tested, such as iso-octane(ic8) and multi-component EEE gasoline, which cover a wide range of fuel properties were injected using Engine Combustion Network (ECN) Spray G injector under ECN G2 (50 kPa absolute), G3 (100 kPa absolute), and G3HT (G3 with 393 K ambient temperature) conditions. The Machine-Learning algorithm includes IC8IB2 (IC8 80%, Iso-Butanol 20% v/v) and EEE gasoline are termed as the target fuels from the above mentioned fuels to predict the spray. This method is capable of estimating the spray 3D topology for various fuels and ambient conditions. This system represented a consistent tendency in experimental data showing slight rise in the movement for IC8IB2 despite complete spray collapsing EEE gasoline fuel. This Machine-Learning algorithm is capable of forecasting spray performance, and it is better than CFD simulation [35].Knowing the mechanical properties of any composite mixture or material is always helpful. But it could be hard to calculate these properties. Similarly, finding the properties of cement composite takes more time and laborious using the conventional model. A predictive model is designed and trained using the experimental data. The sensitivity analysis indicates that having the maximum influence on compressive strength is the length of CNTs, whereas having the maximum influence on flexural strength is the curing temperature. The results show that this Machine-Learning model predicts more accurate values than the other regression methods[36]. An algorithm is structured to study the large scale discretized physical system's relevant variables and estimate its time evolution using thermodynamically consistent deep neural networks. This method initially depends on a sparse autoencoder, which decreases the dimensionality of the full order model to a set of sparse latent variables with no preliminary understanding of the coded space dimensionality. Later, a second neural network is trained to learn the metriplectic structure of those reduced physical variables and forecast the time required with a structure-preserving neural network. This data set promises to conserve the total energy of the system and the entropy inequality[37].

A Machine-Learning based Bayesian approach is designed to decrease and indirect measuring of unpredict abilities in multiphase fluid dynamics simulations for bubbly flows. High-resolution two-phase flow measurements with double-sensor conductivity probes, high-speed imaging, and particle image velocimetry are included in this process. To support the Bayesian inference, the local distributions of key physical quantities of interest (Qols) combine the void fraction and phasic velocities. This process includes three types of machine-Learning methods: Feed forward neural network, principal component analysis for surrogate modelling, and Gaussian process for model form uncertainty modelling. In this entire procedure, an open-source deep-learning library, PyTorch, with graphical processing is used to ensure the efficiency of the computation. In this method, a group of uncertainties is passed through the multiphase computational fluid dynamics solver to acquire the unpredict abilities from the Qols and validate these qualms; a probability box is developed. With the help of the high-resolution data, the qualms of the MCFD are reduced[38]. In present days, nanofluids are widely used for several engineering and industrial purposes that include heat exchangers, nuclear power plants, and air-conditioning. These are few areas where the nanofluids are currently being used. This study identifies the Nusselt number by including the Prandtl number, volumetric concentration, and helical number of the helically coiled heat exchanger as input data.

Seventy-two experiments are conducted on a group of Machine-Learning models, a multilayer perceptron artificial neural network (MLP-ANN), adaptive neuro-fuzzy inference system (ANFIS), and Least squares support vector machine (LSSVM) out of them LSSVM approach showed the best performed [39]. The main aim of this work is to reclaim the data at any time instance. The data input-output constitutes a remarkable constriction in large-scale CFD

simulations. Thus, a user would like to significantly reduce the number of times the solution is saved to disk yet retain the ability to recover any field quantity. In this process, a high-order discretization is considered with two-stage methodology:1) dimensionality reduction and 2) dynamics learning. In dimensionality reduction, firstly, it decreases the number of degrees of freedom using auto encoders from deep learning. Secondly, it applies an analysis to compress the global vector of encodings. A regression technique is appertain to study the discrete-time velocity characterizing the time growth of low-dimensional state in dynamics learning. An example of CFD simulation with 13 million degrees of freedom demonstrates an appropriate method for an industrial setting[40].

CONCLUSIONS

The application of Artificial Intelligence (AI) and Machine Learning (ML) in thermal engineering has ushered in a new era of innovation and efficiency in the field. There are several key points:

Improved Energy Efficiency AI and ML algorithms have demonstrated their effectiveness in optimizing the operation of thermal systems, such as HVAC and industrial processes.

Predictive Maintenance ML models empower thermal engineers to transition from reactive to proactive maintenance strategies

Enhanced Sustainability The optimization capabilities of AI and ML contribute significantly to sustainability efforts.

Design and Simulation ML-powered simulations and design optimizations streamline the development process of thermal systems.

Safety and Reliability Predictive capabilities of AI and ML extend to thermal stress analysis and nuclear reactor safety.

Real-time Monitoring and Fault Detection ML-driven fault detection systems enhance the reliability of thermal systems by identifying anomalies and issues as they occur.

Resource Optimization AI and ML contribute to resource optimization in thermal engineering, as they help allocate resources like energy, materials, and labor more efficiently, thereby reducing waste and costs.

Data-Driven Decision Making The wealth of data generated by thermal systems is harnessed for informed decision-making. AI and ML enable engineers to extract valuable insights from data, leading to more effective strategies and system improvements.

Challenges Remain Despite the significant progress, challenges like data quality, model interpretability, and integration with legacy systems persist. The application of AI and ML in thermal engineering has brought about transformative changes, resulting in enhanced energy efficiency, sustainability, reliability, and safety. As these technologies continue to evolve and integrate with traditional thermal engineering practices, they hold the potential to reshape the industry, making it more efficient and environmentally friendly. Continued research, development, and collaboration between experts in thermal engineering and AI/ML practitioners are essential to further unlock the benefits of these technologies in this field.

ABSTRACT

The geophysical method which is dominant by geophysicists become one of the most popular methods applied by Geological surveys. Electrical Resistivity Method (ERM) is one of the geophysical tools that offer a very attractive technique for subsurface profile characterization in larger areas. Applicable alternative techniques in groundwater exploration such as ERM which complement the existing conventional method may produce comprehensive and convincing output thus effective in terms of cost, time, data coverage, and sustainability. ERM has been applied in various applications in groundwater exploration. This review paper was carried out to expose the application of ERM in groundwater exploration. The result from ERM could be additional information to respective experts for their problem solving such as the information on groundwater pollution, leachate, underground, and source of water supply. Vertical Electrical Sounding (VES) using a Schlumberger array was carried out perpendicular to the ground in the Bandalli watershed to study the subsurface geological formation and delineation of freshwater aquifers at fifteen (15) VES stations. The field data obtained have been analyzed using computer software (IPI2WIN) which gives an automatic interpretation of the apparent resistivity. Lithology and Soil data were used to integrate the results. The geologic sequence beneath the study area is composed of topsoil, weathered layer, and clayey mixed as well as rocky land. The IPI2WIN program is a tool created to automatically or semi-automatically evaluate data from 1D geo-electric measurements on a single piece to determine the inaccuracy with the least possible margin.

Keywords: Vertical Electrical Sounding (VES), IPI2win Program, Bandalli watershed, Schlumberger array, Aquifer.

INTRODUCTION

s Water is a renewable resource that occurs in three forms liquid, solid, and gaseous. The groundwater is essential for irrigation, industry, and domestic purpose. Groundwater is the main source of potable water supply, for domestic, industrial, and agricultural uses. Groundwater is becoming more and more scarce as a result of urbanisation, growing populations, industrial and agricultural activity, natural disasters, etc. Any activity related to human life can benefit greatly from an understanding of groundwater geology. Compared to surface water, groundwater has more advantages. The water scarcity problem affects the human chain and other living things. To meet the water demand, people are depending more on aquifers. There are two end members in the spectrum of types of aquifers; confined and unconfined (with semi-confined aquifer being in between them) (Ogungbel A.S, 2010). For identifying the groundwater potential in the hard rock aquifer terrain the main target is the fractured zone. The present study focuses on the identification of the fracture zone and its thickness by using the geoelectrical resistivity method. With the advent of powerful and high-speed computers, efficient techniques for groundwater exploration and management have evolved, of which remote sensing and GIS are of great significance (Chowdhury et.al., 2009). The global world is currently confronting a significant problem in the form of securing water for sustainable development. At present, developing countries face environmental pressure induced by high-population communities, rapid urbanization, and deficient water sector services reflecting improper management of water resources (UN, 2003; WHO, 2006). Groundwater aquifer salinization is a problem that affects coastal regions because excessive groundwater well pumping from unrestrained coastal aquifers causes seawater intrusion. Many places throughout the world have documented this harmful consequence of human activity. Hence, this problem is likely to arise in areas like the Bandalli watershed that have poor water resources (low precipitation and high evaporation) and has mismanagement of water resources (Abu Heen *et al*., 2008; Abu Mayla *et al*., 2010). Bandalli watershed is classified as a semi-arid region and suffers from water scarcity. Groundwater is the main source of water in the Bandalli watershed. Water analysis results revealed that more than 90% of the water wells are unsuitable for domestic use according to WHO standards. The water sector suffers a lot of problems in terms of quantity and quality (Abu El-Naeem *et al*., 2009). The Bandalli watershed water supplies are stable or even declining as a result of urban expansion, but water demand is rising continuously due to economic growth, population growth brought on by natural growth, and returnees. (Hamdan, 2006). DC surface resistivity methods have been used for groundwater research for many years. It can be used to map the freshwater-saltwater interface and for studying conductive bodies of hydrogeological interest (Keller and Frischknecht, 1966; Zohdy *et al*., 1974; Batayneh *et al*., 2010; Chitea *et al*., 2011; Satriani *et al*., 2011; AL-Khersan,2012; Olympia *et al*., 2013; Thabit *et al*., 2014; Basheer *et al*., 2014; Kalisperi *et al*., 2015).

MATERIALS AND METHODS

Study Area
Bandalli watershed is roughly in the southwestern part of the Hanur taluk and Chamarajanagar District, Karnataka. It comes under the Survey of India toposheet numbers 57H/4 and 57H/8 on a scale of 1:50,000. The geographical study area falls into the Archean-Proterozoic gneiss of southern Karnataka state between 12°09'56.3" North latitude and 77°21'06.5" East longitude (Fig.1). The lithology of the study area is underlain by hard rock terrain consisting of Peninsular gneiss, Charnockite, Epidote/Hornblende Gneiss, Migmatites & Granodiorite and Pink granulite (Fig.2). Soil types and texture are the preliminary role of infiltration and transmission of surface water into a subsurface of aquifer system (Fig.3). The Relief ranges from 290m to 700m above MSL. The minimum and maximum temperature ranges between 20°C to 36°C in the month of January and May respectively.

Geophysical prospecting of groundwater comes under both surface and subsurface exploration. Under geophysical prospecting, one of the electrical methods is the Schlumberger array of electrical resistivity methods. The Schlumberger array was used to ensure deep penetration and for logistics of limited manpower in the field.

Schlumberger configuration using processor-based signal stacking digital resistivity meter of CRM 20 model of Aquameter. Both the survey procedures resistivity profiling and resistivity sounding (VES) have been carried out. Resistivity profiling has been conducted in a grid pattern. The total study area of 100 Sq.km. has been divided into square grids of 2.0 Sq.km and 6 resistivity profiles were conducted with a station interval of 2 Km. Resistivity profiling with AB/2 10, 20, 30, 40, 50, 60, 70, 80, 90& 100 m has been carried out. VES has been conducted at 15 locations and the resistivity data have been qualitatively and quantitatively interpreted and analyzed by IPI2WIN software packages.

Measurement of Resistivity

In general for measuring the resistivity of the subsurface formation four electrodes are required. The current of electrical intensity (I) is introduced between one pair of electrodes called current electrodes, which can be identified as A & B. The potential difference produced as a result of current flow is measured with the help of another pair of electrodes called potential electrodes represented as M&N. Let's represent the potential difference. The apparent resistivity measure is K*Dv/I, where K represents the geometrical constant, which can be calculated if we know the electrode arrangements. The basic needs for the resistivity survey are the power source, meter to measure current and potential, electrodes, and cables. Resistivity of the ground is measured by injecting direct currents or very low frequency alternating current into the earth through pair of electrodes and the measuring resulting potential differences between another pair of electrodes at a multiplicity of locations at the surface. These measurements are inverted into a distribution of electrical resistivity in the subsurface. Ohm's law serves as the basis for the interpretation of resistivity boundaries in terms of lithological boundaries. The current flow radially out from the current source in a homogeneous ground (half space), and the resulting equipotential surfaces run perpendicular to the current flow lines, forming half spheres. The equipotential surfaces and current flow lines get more complex in the typical scenario including both a current sink and a current source (Kirsch, 2009). Geoelectrical data are commonly expressed as apparent resistivity and given by the equation: $\varrho a = K (\Delta V/I)$. Where ΔV is the measured potential, I is the transmitted current, and K is the geometrical factor. Many electrode configurations have been proposed for electrical resistivity surveys. The kind of structure to be mapped, the resistivity meter's sensitivity, and the amount of background noise all influence which array is appropriate for a field survey. In practice in a 1-D sounding survey, the arrays that are most commonly used for hydrogeology surveys are the Schlumberger and Wenner arrays (Dahlinand Zhou, 2004; Loke, 2011). A vertical electrical sounding survey (VES) is used to determine the resistivity variation with depth. It's common in geoelectrical hydrogeological studies to use the ohm resistivity meter as a field instrument and the Schlumberger configuration as a ground electrode array.

Schlumberger Configuration

In Schlumberger configuration, all four electrodes are kept in a line similar to that of Wenner but the outer electrode spacing is kept large compared to inner electrode spacing usually more than five times. For each measurement, only the current electrodes are moved to keep the potential electrodes at the same locations. The potential electrodes are moved only when the signal becomes too weak to be measured. The apparent resistivity for this configuration is computed with the formula; $\varrho = \{[(AB/2)2 - (MN/2)2)/MN]* \pi R\}$, (Keller, 1966). Vertical electrical sounding (VES) with Schlumberger array as a low-cost technique and veritable tool in groundwater exploration is more suitable for Hydrogeological survey of the sedimentary basin (Nejad *et al.*, 2011; Egbai, 2011; Adeoti *et al.*, 2010). The main goals of the work are to determine the subsurface aquifer layers' thickness and Resistivities of the Bandalli watershed.

Resistivity and Thickness

The resistivity of the first layer of topsoil ranges from 20 to 60Ωm as observed, with low resistivity to indicate sand saturated with water. A good conductive low resistivity range indicates the presence of rocks (Fig.5). A second layer with resistivity values of 1200 to 3600 Ωm was observed in the above high resistivity zones, low resistivity zones (Fig.6). A third layer with resistivity values from <150 to >450 are seen in the (Fig.7). In Fig.8, 9, 10. it can be seen that with a thickness low resistivity values from less than 4 to greater than 8 occurs in almost all the areas covered.

RESULTS AND DISCUSSION

To determine the resistivity values of various subsurface layers and their related thickness, partial curve matching techniques and computers were used to evaluate and process the field data in both a qualitative and quantitative manner. Table 1 is several results of VES data interpretations with classifications of groundwater types.

CONCLUSION

Vertical Electrical Sounding using Schlumberger electrode configuration was conducted in and around Bandalli watershed to determine the underground water potential and the lithological setting in terms of aquifer distribution. The study has shown that the region is underlain by 2 to 3 geoelectric layers within the depth penetrated. The groundwater potential in and around the Bandalli watershed (Table 1) reveals three distinct classes (zones) representing 'Very good', 'good', and 'Moderate' groundwater potential in the area. The Very good groundwater potential zone mainly encompasses good recharged along the River alluvium.

ABSTRACT

This study examined the effects of a 10-week in-session resistance training program on the explosive strength of adolescent male basketball players aged 14 to 17. The participants were divided into two groups: one group underwent the resistance training program in addition to their regular basketball practice, while the other group continued with their standard basketball training. The results indicated significant improvements in both vertical jump height and Medicine ball throw distance among the participants who completed the resistance training program. These improvements are critical in the context of basketball, as they directly impact a player's ability to jump, accelerate, and generate explosive force during the game. Notably, the resistance training program did not place excessive stress on the skeletal muscle development of the adolescent athletes. This finding is particularly important, as it ensures that the training regimen is both effective and safe for young athletes. In summary, incorporating a well-structured resistance training program into the training routine of adolescent male basketball players can lead to significant enhancements in explosive strength, which is vital for improved basketball performance. This study provides valuable insights for coaches and trainers working with young basketball athletes, highlighting the potential benefits of including resistance training in their training protocols.

INTRODUCTION

In the realm of athletic performance, the pursuit of excellence is a relentless endeavor, especially for adolescent athletes aspiring to elevate their game to the highest level. Among these young athletes, basketball, with its dynamic blend of sprinting, jumping, and quick directional changes, stands out as an immensely demanding sport[1]. The efficacy of training methods in enhancing athletic performance has long been a subject of intrigue, and one aspect that has garnered significant attention is the development of explosive strength. This crucial attribute, defined by the ability to generate rapid, forceful muscle contractions, plays a pivotal role in an athlete's capacity to outmaneuver opponents, dominate the court, and excel in various aspects of the game[2]. In the context of adolescent basketball players, the quest to improve explosive strength takes on particular significance. This period of physiological development represents a critical juncture in an athlete's journey, where the right training interventions can have a profound and lasting impact on their athletic potential. The incorporation of resistance training into the regimen of these young athletes has been a topic of growing interest and debate among coaches, trainers, and researchers[3, 4].

The question at the heart of this discussion is whether resistance training, designed and implemented with precision, can be a catalyst for substantial gains in explosive strength among adolescent basketball players[5, 6]. This research paper delves into the multifaceted realm of adolescent athletic development, specifically focusing on the effect of resistance training on increasing explosive strength in basketball players within the age range of 14-17. Through a comprehensive exploration of existing literature, empirical studies, and a rigorous examination of training protocols, this study aims to shed light on the potential benefits, risks, and optimal practices associated with resistance training in this demographic. By elucidating the intricacies of resistance training and its influence on explosive strength in adolescent basketball players, this research endeavors to contribute valuable insights to the fields of sports science, coaching, and athletic development. Ultimately, the knowledge gained from this investigation holds the promise of guiding coaches, trainers, and athletes themselves in making informed decisions regarding training strategies that can unlock the full athletic potential of the next generation of basketball stars.

METHODS

Sample Size

This study included a cohort of five male basketball players, ranging in age from 14 to 17 years.

Study Duration

The resistance training program spanned a duration of 10 weeks, with participants engaging in workouts twice a week on non-consecutive days.

Tools and Tests

To assess explosive strength, the following evaluations were employed

1. Vertical Leap Test (Sargent Jump Test)
2. Medicine Ball Throw

Inclusion Criteria

Inclusion criteria for participants were as follows

1. Male basketball players aged 14-17 years.
2. Absence of previous training in plyometrics or other strength-enhancing programs.

Exclusion Criteria

Exclusion criteria encompassed the following

1. Individuals not actively participating in basketball.
2. Age exceeding 18 years.
3. No history of prior injury.

Procedure

To investigate the hypothesis, two distinct groups were established: an experimental group and a control group. The experimental group completed a 10-week resistance training regimen, involving twice-weekly sessions on non-consecutive days, in addition to their regular basketball practice. Both groups underwent assessments using the seated medicine ball throw test to measure upper limb strength and the Sargent jump test to assess lower limb strength before and after the training period.

Materials Used

The following materials were utilized in the assessments:

1. Medicine ball
2. Stopwatch
3. Vertec apparatus for the Sargent Jump Test

Resistance Training Program

The resistance training program, initiated prior to the competitive season, featured the following exercises:

1. Upper Limbs: Decline Press, Pull Over, Lat Pull Down
2. Lower Limbs: Leg Press, Leg Extension, Leg Curl

The program commenced with two sets of 10 repetitions at 30-50% of the 1 repetition maximum (1 RM) and progressed to 80% of 1 RM. Each exercise consisted of 2-3 sets of 10-12 repetitions, with 2-3 minutes of rest between sets and 3-5 minutes following each exercise. After completing the resistance training, participants resumed their regular basketball training program.

Control Group

The control group engaged in a warm-up session followed by their customary basketball training routine, which comprised five sessions lasting approximately 30 minutes each week, along with two official games, each spanning 45 minutes and divided into four quarters of 12 minutes each.

Testing Procedure

Maximal Strength Assessment: All male participants underwent an assessment to determine their maximal strength, which was based on their one-repetition maximum (1 RM) in the decline press and leg press exercises. The 1 RM values were determined following the protocol established by Ramsay et al. (15). These assessments were conducted under supervision and with verbal encouragement. Each measurement was taken using a medicine ball, and for both upper limb and lower limb strength assessments using the Sargent jump test, three trials were conducted. In the Sargent jump test, participants were instructed to touch the Vertec, and corresponding marks were made. The best result from the three attempts was selected for subsequent analysis.

Seated Medicine Ball Power Throw Test

This test was used to assess upper body (arm) strength and explosive power while ensuring that the participant's back remained in contact with a wall. The equipment employed included a 4 kg (~8 lb) medicine ball, a wall, and a tape measure. The athlete assumed a seated position on the ground with legs fully extended and feet approximately 24 inches (~60 cm) apart, maintaining firm back contact with the wall. The athlete held the medicine ball with hands on the sides, slightly toward the center, with the rear of the ball against the center of the chest. Forearms were positioned parallel to the floor. The athlete executed a forceful throw of the medicine ball as far forward as possible while keeping their back in contact with the wall. The distance covered by the ball was recorded.

Scoring

The distance between the wall and the point where the ball landed was measured and recorded to the nearest centimeter. The best result from three throws was chosen for analysis.

Vertical Jump Test (Sargent Jump)

This test aimed to evaluate lower limb explosive power by measuring the height achieved in a vertical jump.

Equipment required
Measuring tape or a marked wall
Chalk for marking the wall (alternatively, 'Vertec' equipment could be used, as shown in the adjacent image).

Procedure
The participant stood beside a wall, facing it, and executed a jump using the hand closest to the wall.
While keeping both feet flat on the floor, the tip of the participant's finger was marked or recorded on the wall, representing the standing reach height. Chalk was applied to the participant's fingertips to mark the wall at the highest point of their vertical jump. The participant then positioned themselves away from the wall and executed a vertical jump, using both arms and legs to propel their body upward. The goal was to reach and touch the wall at the highest point of the jump. The score was determined by calculating the difference in distance between the standing reach height and the jump height.

Scoring
The best result from three jump attempts was selected for analysis.

STATISTICAL ANALYSIS
To evaluate the training's effectiveness within each group, a series of statistical analyses were carried out. Descriptive statistics, encompassing measures such as means and standard deviations, were employed to provide a summary of the dataset. To investigate changes over time and specifically to detect any significant interaction between groups and time, a repeated measures analysis of variance (ANOVA) was utilized. In this analysis, the significance level was set at $p < 0.05$, indicating that statistical significance was deemed achieved if the p-value was less than 0.05. This statistical approach facilitated the assessment of how both groups responded to the training intervention and whether any observed alterations were statistically significant.

RESULTS

Medicine Ball Throw Test Analysis
The outcomes of the Medicine Ball Throw Test provide a comprehensive overview of the data distribution, the correlation between pre-test and post-test scores, and the statistical significance of any observed changes. The mean values of the pre-test and post-test measurements serve as indicators of the central tendency within the dataset, while the variance offers insights into the dispersion or spread of the data points. Moreover, the Pearson correlation coefficient quantifies the degree of association between pre-test and post-test scores. (Table 2) For evaluating whether there exists a statistically significant difference between the pre-test and post-test scores, the t-statistic and its associated p-value are of paramount importance. In this specific instance, the calculated t-statistic (-0.88854) fall below the critical t-value (1.710882) for a one-tailed test, yielding a p-value of 0.191536. Given that the p-value exceeds the chosen significance level ($p < 0.05$), there is insufficient evidence to warrant the rejection of the null hypothesis, which posits that the mean difference is equal to zero. These findings strongly suggest that, in the context of the variable under investigation, no statistically significant difference existed between the pre-test and post-test measurements.

SARGENT JUMP TEST
The t-statistic, in conjunction with its associated p-value, plays a pivotal role in determining whether a statistically significant difference exists between the pre-test and post-test scores. In this particular case, the calculated t-statistic (-0.81088) fall below the critical t-value (1.710882) for a one-tailed test. The resultant p-value (0.2127) surpasses the chosen significance level ($p < 0.05$). Consequently, there is inadequate evidence to justify the rejection of the null hypothesis, which posits that the mean difference between the pre-test and post-test scores is equal to zero. (Table 2)
In light of these findings, it can be concluded that, within the scope of this study, there is no statistically significant distinction between the pre-test and post-test measurements for the variable under scrutiny. (Table 3)

Senthil Kumar *et al.,*

Analysis of the Medicine Ball Throw Test

The mean values for the pre-test and post-test measurements offer insights into the central tendencies of the dataset, demonstrating an increase from 4.7176 to 5.7792. These means represent the average values and suggest a noticeable improvement. Variance, in contrast, provides information about the spread or dispersion of the data points. In this case, both pre-test and post-test scores exhibit relatively low variances. The Pearson correlation coefficient, registering at 0.904638, indicates a robust positive correlation between the pre-test and post-test scores, signifying a strong association between the two. The t-statistic, in conjunction with its corresponding p-value, is used to evaluate the statistical significance of the observed difference between the pre-test and post-test scores. Remarkably, the calculated t-statistic (-9.90397) is substantially lower than the critical t-value (1.710882) for a one-tailed test. Additionally, the resulting p-value (2.97E-10) is markedly smaller than the chosen significance level ($p < 0.05$), indicating an exceptionally significant finding. Based on these compelling results, it can be confidently concluded that there exists a statistically significant difference between the pre-test and post-test measurements for the variable under examination in this study. The substantial increase from the pre-test to the post-test is statistically significant, suggesting that the intervention or treatment had a substantial and noteworthy effect on the variable being measured.

Analysis of the Sargent Jump Test

The mean values for the pre-test and post-test measurements provide insights into the central tendencies of the data, showcasing an increase from 20.68 to 23.56. Variance values reflect the spread or dispersion of the data points, with relatively similar variances for both pre-test and post-test scores. The Pearson correlation coefficient (0.850631) signifies a strong positive correlation between the pre-test and post-test scores, indicating a robust association. The t-statistic, along with its associated p-value, is crucial for assessing the statistical significance of the observed difference between the pre-test and post-test scores. In this case, the calculated t-statistic (-5.90673) is significantly lower than the critical t-value (1.710882) for a one-tailed test. Furthermore, the resulting p-value (2.14E-06) is much smaller than the chosen significance level ($p < 0.05$), indicating an extremely significant result. Based on these results, it can be concluded that there is a highly statistically significant difference between the pre-test and post-test measurements for the variable examined in this study. The increase from the pre-test to the post-test is statistically significant, suggesting that the intervention or treatment had a substantial and meaningful impact on the variable being measured.

Interpretation for Medicine Ball Throw Test

The results clearly indicate that there is no statistically significant difference between the pre-test and post-test measurements in the control group. However, in the experimental group, there is a highly statistically significant difference, suggesting that the Medicine Ball Throw exercise had a substantial and meaningful effect on the variable being measured.

Interpretation for Sargent Jump Test

The analysis reveals a highly statistically significant difference between the pre-test and post-test measurements in both the control group and the experimental group. This suggests that the Sargent Jump exercise had a substantial and meaningful impact on the variable being measured in both groups.

Comparison between Control and Experimental Groups for Medicine Ball Throw Test

In comparing the two groups, the mean value for the control group is 3.0712, while the mean value for the experimental group is 5.7792, indicating a substantial difference in means between the two groups. The variances for both groups reflect the spread or dispersion of the data points, with a higher variance in the experimental group. The t-statistic (t Stat) is employed to assess whether the difference in means between the control and experimental groups is statistically significant. In this case, the calculated t-statistic (-9.41237) is significantly lower than the critical t-value (1.684875) for a one-tailed test. The resulting p-value (6.91E-12) is much smaller than the chosen significance level ($p < 0.05$), indicating an extremely significant result. Based on these results, it can be conclusively stated that there is a

Senthil Kumar *et al.,*

highly statistically significant difference in means between the control group and the experimental group for the Medicine Ball Throw exercise.

Comparison between Control and Experimental Groups for Sargent Jump Test

In comparing the two groups, the mean value for the control group is 20.16, while the mean value for the experimental group is 23.56, indicating a difference in means between the two groups. The variances for both groups reflect the spread or dispersion of the data points, with a higher variance in the experimental group. The t-statistic (t Stat) is employed to assess whether the difference in means between the control and experimental groups is statistically significant. In this case, the calculated t-statistic (-2.91633) is significantly lower than the critical t-value (1.677927) for a one-tailed test. The resulting p-value (0.002707) is less than the chosen significance level ($p < 0.05$), indicating a statistically significant result. Based on these results, it can be concluded that there is a statistically significant difference in means between the control group and the experimental group for the Sargent Jump exercise.

DISCUSSION

The primary objective of this study was to investigate the impact of resistance training on explosive strength in adolescent basketball players. Upon analyzing the data, it was revealed that there is a significant difference between those who underwent the resistance training program and the control group. Furthermore, it was observed that the players in the study were subject to certain influences. Research has indicated that the use of medicine balls in training may have the potential to limit the development of explosive force in the upper extremities (Gambetta, 1986)[7]. In basketball, passing techniques vary, including chest passes, overhead passes, and side passes. These aspects play a crucial role in a player's defensive abilities and decision-making on the field. Another noteworthy aspect is the impact of maturation and growth on the enhancement of explosive power in male athletes. During this developmental phase, there is a positive correlation between chronological age, physical development, and explosive strength. Various body weights and physical attributes may influence these factors[8]. Consequently, after conducting group analyses, disparities in the assessment of explosive force were observed, underscoring the importance of considering male growth, development, and maturation factors in this context. Explosive power is vital for basketball players as it is utilized for actions such as jumping, quick acceleration, rapid changes in direction, deceleration, and precise ball passing. Numerous studies have delved into this area, emphasizing the significance of explosive power in basketball performance [9-12]. According to research, players with higher competence levels tend to exhibit greater jumping abilities compared to their less skilled counterparts [13-15]. Furthermore, it is suggested that incorporating plyometric training following resistance training may yield even better results. Plyometrics, a widely used method in practice, is unsurprisingly popular as it involves exercises that transition the natural muscle contractions from eccentric to concentric, often involving jumps. Such exercises align with the demands of various sports, including basketball [16]. Plyometric training is characterized by a stretch-shortening cycle (SSC), which involves reversible contractions. This type of training has the potential to significantly improve change of direction speed in basketball players. In summary, this study sheds light on the importance of resistance training and its potential combination with plyometric training to enhance explosive strength in adolescent basketball players. It underscores the influence of growth and maturation factors in this context, emphasizing the multifaceted nature of developing explosive power in athletes.

CONCLUSION

This study highlights the positive impact of a 10-week in-season resistance training program targeting both upper and lower body strength on the vertical jump and Medicine ball throw performance of adolescent male basketball players. These improvements hold significant clinical relevance as they contribute to enhanced basketball performance. Importantly, it's worth noting that this program did not place additional strain on the skeletal muscle development of adolescents.

ABSTRACT

This study evaluated the performance of several textile layers and fibre types, including basalt and AR-glass fibres, when employed as mortar reinforcement (TRM) in an effort to improve the flexural behaviour of reinforced concrete beams. Six RC beams in total were cast and tested using just two points of bending. Two beams without TRM layers were employed as control beams. The remaining four beams were strengthened using externally bonded textile reinforced cement that had two kinds of textile fibres and unique textile layers. The load is gradually introduced using a hydraulic jack with a 500kN capacity, and it is then evenly distributed on the beam specimen using an I-section steel spreader. It was revealed that the reinforced beams with Basalt textile layers greatly outperformed the control beams in terms of first fracture stress, ultimate strength, flexibility, and reduced crack width. The overall improvement in flexural capacity brought about by TRM strengthening ranged from 22.72% to 31.81% for all strengthened beams. When compared to the control beam, all strengthened beams behaved stiffer, with the benefit being most apparent when the steel reinforcement failed due to the full activation of the textile fibres under tension. The overall increase in Stage II flexural stiffness (cracked portion, prior to yielding) was 8.33-18.43%.The basalt TRM specimen with six layers of textile fibres displayed higher bending strength than the more AR-glass textile fibers.

Keywords: AR-glass, Basalt, Textile Reinforced Mortar, Flexural behaviour.

INTRODUCTION

Existing reinforced concrete (RC) structures require structural retrofitting due to ageing, environmental deterioration, lack of maintenance, the need to follow current design specifications for the duration of their service life, or any combination of these problems. Engineers have embraced fiber-reinforced polymers (FRPs), an externally bonded composite material, more and more as a retrofitting technique over the past two decades. FRPs do, however, have some drawbacks, many of which are connected to the use of epoxy resin. They are expensive, cannot be used in cold climates or on damp surfaces, have low water vapour permeability, and operate poorly at high temperatures, among other drawbacks. Later, TRM steadily attracts the attention of the structural engineering community. TRM is an inexpensive fire-resistant material that clings well to masonry and concrete substrates and may be applied to cold or wet surfaces. For the reasons mentioned above, TRM makes more sense than the more widely used fiber-reinforced polymers (FRPs) for strengthening pre-existing concrete and masonry structures. How to evaluate the FRCM's uniaxial tensile characterization [1] Modern cement-based materials called Fabric Reinforced Cementitious Matrix (FRCM) composites, which are constructed of dry-fiber fabric embedded in an inorganic matrix, are designed to be retrofitted into masonry or concrete structures. The tensile behaviour characteristics of this composite under varied boundary conditions were examined using two test rigs. A clevis grip (pin action) was used to model the field boundary conditions of a typical installation in order to get design parameters.

By causing tensile failure in each of the component materials, a clamping grip was employed to entirely define the composite. The experiment made use of a number of FRCM systems, including those made of glass, carbon, poly paraphenylene benzobisoxazole (PBO), and carbon. In textile-reinforced concrete (TRC), a type of reinforced concrete, fibres or textiles are utilized in place of traditional reinforcement. Strong textile threads are used to create flexible and long-lasting concrete structures. In the literature, TRC is only applied for nonstructural and retrofitting purposes. Test textile reinforced mortar system testing procedures is the second goal of this article. Describe how the research on the usage of TRC as a structural member has changed. The tensile and bond behaviour of TRM was described in [3]. Textile-Reinforced Concrete (TRC), a cementitious composite material, is reinforced with a carbon or glass fabric. TRC makes it possible to build structures that are light and thin with reduced concrete covers and enhanced lifespan because there are no corrosion problems. The behaviour of TRC components that have been under tension is examined in this article via an experimental and theoretical investigation. The failure load of the composite might be less than the failure load of bare textile [4]. The effects of the reinforcing ratio, steel fibre volume %, and prestressing on the uni axial tensile behaviour of carbon textile reinforced mortar (CTRM) are investigated in this paper using uniaxial tensile testing. Using the tried-and-true anchorage techniques, the composite specimens' peak strength and breaking strength could be increased to 66.1 and 97.9%, respectively [6].

A description of modern technologies [7]. Flexural Behaviours of a Sandwich Panel Made of EPS, Foam, Concrete, and Glass Fibre [8]. The flexural behaviour of TRM-enhanced beams was assessed in this study while taking the likelihood of intermediate crack debonding into account [9]. Flexibility of TRC after carbon and glass fibres is added [10]. RILEM TC 232-TDT recommends test procedures for the design of textile reinforced concrete [11]. Basalt textiles rein forced's tensile characteristics(BTRM) [12]. The creation of textile-reinforced self-stressing concrete, which boosts concrete's resistance to cracking, combines self-stressing concrete and textile. The confinement effect of textile can cause self-stresses to form in the concrete matrix, considerably boosting crack resistance [13]. Numerical models are developed for RC beams with TRC composite fixes [14]. The mechanical bending behaviour of mineral matrix composite beams with textile reinforcement is studied. The two types of E-glass fiber-based textile reinforcement that are taken into consideration (CSM) are unidirectional rovings and chopped strand mat. The mineral matrix made of inorganic phosphate cement (IPC) has the advantage of not being alkaline [15]. Constructions that require reinforcement and are susceptible to quasi-static loads are particularly well suited for TRC. The best technique for sustaining structures during impact is SHCC. By repairing or strengthening layers constructed of TRC or SHCC, RC constructions can be made to last for a very long time. Numerous microscopic fissures exist throughout TRC and

Nivethitha and Vidivelli

SHCC, and it is essential that they have the ability to seal off and permit the passage of liquids and gases. Practical applications show that the TRC and SHCC have a huge potential for rehabilitating concrete structures [16]. Basalt cloth reinforced mortar-based composites are subjected to uniaxial tension using a nonlinear analytical model [17], [18]. Sandwich TRC panels are constructed using multis cale mechanical textile reinforced concrete models [19].Rigidity TRC efficiency ratios are higher than strain strength TRC efficiency ratios. An inventive in-plane shear test was developed to evaluate TRCs. TRC with aramid fibres had much better in-plane shear behaviour when compared to glass [20]. Tensile properties of the BTRM [21] and the impact of the TRC's short-dispersed carbon and glass fibres [22].Concrete and TRM are combined [23].

MATERIALS USED IN CONCRETE

OPC 53grade, which complied with IS 12269-2013, was used in the experimental examination. The fine aggregate is made out of naturally occurring river sand that may be easily found nearby and that can pass through a 4.75mm screen. With a specific gravity of 2.61 and a fineness modulus of 2.88, it complies with zone II. Crushed, angular coarse material was separated based on size. It was sieved and divided into five groups in line with IS 383-1970: passing through 10mm retained on 4.75mm, similarly 12.5-10mm, 16-12.5mm, 20-16mm, and 20-4.75mm. Water is an essential component of concrete because it actively participates in the chemical reactions involving cement to produce the hydration product, calcium-silicate-hydrate (C-S-H) gel. Potable water that was on hand in the lab and complied with IS: 456-2000 standards had a pH value between 6 and 8 and was used for mixing the concrete and curing the specimens. The super plasticizer also produces homogenous, cohesive concrete that is frequently devoid of bleeding and segregation problems. The chemical admixture "CONPLAST SP 430," which is based on sulphonated naphthalene formaldehyde, was used in this study. The concrete was made using traditional techniques, and its 28-day compressive strength was 30 MPa

Mechanical properties of conventional concrete
The most common test is the compressive strength test, which was carried out on cube specimens with dimensions of 150 mm x 150 mm x 150 mm utilizing a 3000 kN AIMIL digital compression testing apparatus. At room temperature, three samples of each mix combination were examined. The splitting tensile strength tests were carried out on concrete cube specimens with dimensions of 150 mm x 150 mm x 150 mm at a 28-day age using a compression testing machine with a 3000 kN capacity. In order to determine the flexural strength in line with the specifications of IS: 516-2004, flexural strength tests were carried out on the prisms at a 28-day old utilising a 1000 kN capacity flexural testing machine. The E for concrete values is computed in accordance with (IS 456, 2000) using cylindrical specimens with a dimension of 150 mm x 300 mm. In order to conduct this test, a total of three cylinders of the standard mixture were cast and given a 28-day curing period.

Reinforcement
Rebars with diameters of 12 mm at the bottom (tension zone), 10 mm at the top (compression zone), and stirrups with diameters of 8 mm spaced 150 mm c/c in the beam were used as reinforcement; Table 2 lists the mechanical characteristics of these reinforcements. Testing for reinforcement is shown in Figure 2.

Mortar
A ready-mix polymer mortar [9] with a w/p ratio of 0.24 was used as the mortar to achieve the plastic consistency required by TRM. The mortar's compressive and tensile strengths were calculated using cube and cylinder measurements of 70.6x70.6x70.6mm and 100x200mm, respectively. The mortar had an average compressive strength of 45 N/mm2 and an average tensile strength of 4.5 N/mm2 after 28 days. A textile with roving fibres woven in the warp and weft orientations with a mesh size of 5x5mm composed of glass and basalt. The textile fibre mesh inside the plate specimen acts as interior reinforcement. A product data sheet that describes the mechanical properties of the textile fibre used in the production process is shown in Figure 3.

PREPARATION OF SPECIMEN AND TEST METHOD
Preparation of specimen

Six beams that measured a combined 3000 mm in length, 250 mm in depth, and 150 mm in width were cast and tested. Four points of loading on each beam were put to the test over a real span of 2800 mm. The remaining four beams, beams 3 to 6, were strengthened with TRM using two different textile reinforcing materials, AR-Glass and Basalt fibre, with various amounts of textile layers (4 and 6). Two of the six beams, beams 1 and 2, were employed as ideal beams (reference beams). The overall thickness of the TRM strengthening was 10mm. The number of layers was determined based on the strength demonstrated in the uniaxial tensile and flexure behaviour of TRM plate. Before casting the beam, moulds are assembled and their insides are oil-coated. The next step is to insert the reinforcement structure into the mould, and then add cover blocks measuring 25 mm to the bottom and side sides of the reinforcement. To prevent bulging when the concrete is being poured, the top of the mould is next fastened with an angled piece of steel. Following the operations, new concrete is poured into the beam mould. The side shutters are removed after 24 hours, and the beams are then left to cure for 28 days while being protected by a gunny sack.

Textile Reinforcement Ratio, P_f (%) = A_f/bh

Where, b and h = width and depth of the beam, A_f = cross-sectional area of textile fibres (= txb).

Strengthening procedure

The TRM strengthening element was externally attached to the bottom of the RC beams across a length of 2700mm. A grinding machine was used to roughen the surface and create a grid of grooves with a depth of around 3 mm in order to strengthen the binding between the old and new reinforcing material. Prior to laying down the mortar layer, water should be applied to the concrete surface. TRM plate has four textile layers that support the top, bottom, and centre mortar layers, which are each 2 mm thick. The mortar thickness in TRM with six textile layers is 1 mm between layers and 2.5 mm on top and bottom. The first stage in creating TRM was applying a mortar layer with the proper thickness. To ensure mortar impregnation, the textile layers were then placed on top of the mortar layer and carefully pressed into place by hand. Apply a second mortar coat after that. Additional layers of material were added and the same process was repeated. Before being inserted into the mould for 24 hours, the last layer of fabric was evened up and given the proper amount of cement. After a total of 28 days of curing, all of the beams were removed for testing.

Test Set-Up

Before placing the beam specimen into the loading frame, the length of the beams is measured and divided into three portions (L/3). Then, grid patterns are formed in the beam's flexural zone to measure the fracture diameters. Based on the length of the beam specimen, the loading frames' hinged and roller supports are positioned suitably. After that, the beam is set up in the loading frame. A two-point loading scenario was employed to gauge the simply supported beams' strength. The laboratory's setup for loading the beam is shown in Figure 8. A 500kN capacity hydraulic jack is used to progressively introduce the load, and an I-section steel spreader is then used to distribute it to the beam specimen. Demec gauge pellets are placed to the concrete surface to measure the surface strain manually. A 0.01 least count dial gauge was used to measure the deflection at mid span. Figure 8 illustrates the use of a mechanical dial gauge to determine the ultimate deflection after the beam has reached its maximum load. After the load has been imposed by the hydraulic jack at 2.5kN intervals, it is deliberated using a proving ring

TEST RESULTS AND DISCUSSION

Observations such deflections, concrete surface strain, and beam face cracks are noted at each load increment. The initial fracture load, final crack load, failure type, and load bearing capability are all closely observed and recorded. The load, deflection, moment, fracture breadth, and failure type are all listed in the final experimental observations for each group in the Table.3. Figure 9 compares the responses of the reinforced specimens and the control specimen (CON) as it depicts the behaviour of the specimens in terms of load against mid span deflection curves. All specimens exhibit a three-staged flexural response up to the peak load, as shown in Fig. 9, which corresponds to three almost linear branches of the load-deflection curves. Uncracked beam in Stage I. Stage II: cracks growth and steel reinforcement yielding. Stage III: the post-yielding reaction and failure.

1. A first branch from the unloaded state to the point of initial flexural cracking of concrete; this branch corresponds to Stage I: uncracked section (elastic);
2. A second branch from the point of initial flexural cracking of concrete to the point of yielding of the tensile steel reinforcement; this branch corresponds to Stage II: cracked section (still elastic but with reduced stiffness);

And a third branch that originates at the point of tensile steel reinforcement. Or, in the case of the retrofitted beams, complete activation of the TRM composite.

Figure 9 illustrates how the addition of TRM-strengthening enhanced the strengthened beams flexural response when compared to the performance of CON beam. Stage I were very little impact from the strengthening layers. However, Stages II and III were when the TRM reinforcement was most apparent. Particularly, during Stage II, the progressive development of the flexural cracks activated the TRM composite under stress, resulting in an increase in its flexural stiffness and yield load. All strengthened beams failed as a result of the strengthening operation dropping out, which showed up in various forms as shown in Figure 11. Fibre rupture, or FR, is the term used to describe the rupture of textile fibres in the region of maximum bending moments (Fig. 11). This failure pattern was present in specimens made of basalt textile and glass textile fibre. The TRM's bottom face showed multiple cracks, but only one noticeable crack that was substantially bigger occurred where thefibres were ruptured (Fig. 11)..

The cracks that begin in the strengthening layers and spread to the beams (Figure 12) demonstrate the increased compatibility of the matrix within the textile fibre and with the beam, which increases the beams stiffness, enhances flexural strength, and slows the development of cracks compared to control beams. Additionally, TRM raises initial fracture load from 15kN to 22.5kN compared to the control beams 15kN.

Bending stiffness

The pre cracking, cracking, and post-yielding bending stiffness of the tested beams are all listed in Table 4. It was calculated using the load at mid-span deflection curves. As shown in Table 4.20, the use of TRM strengthening increased the cracking and post-yielding stiffness in comparison to the reference beam. It should be noted that the researched parameters, including the strengthening system (TRM), the quantity of TRM layers, the type of fibre used in the textile, and the strengthening configuration, had an effect on the rise in the cracking and post-yielding stiffness.

CONCLUSION

The effect of TRM composites on RC elements when applied externally to increase their flexural capacity was investigated experimentally by altering the type of textile fibre and the number of layers. Six RC beams in all were built, and their resistance to simple 4-point bending was tested. Two beams served as the control specimen and were studied in their unenhanced, as-built state while four beams underwent TRM strengthening. Four vs. six reinforcing layers, a basalt and glass fibre textile with a small mesh size of 5mm, and these were the variables considered

The important conclusions of this inquiry are listed in the list below

The volume percent of the fibres, the number of textile layers, and the type of fibre are the three main determinants of TRM strength. The vertical strands in the weft filament yarn of the textile fibre known as the warp support the majority of the tensile load during testing. The majority of the flexure stress is carried by the weft of the horizontal strands. Strength is influenced by the volume % of the warp and weft as well as the number of textile layers. When compared to control beams, the experimental results of undamaged reinforced beams revealed a considerable delay in the development of the initial cracking and a large reduction in crack breadth. The overall enhancement in flexural capacity brought about by TRM strengthening ranged from 22.72% to 31.81% for all strengthened beams. Overall, the type of mortar significantly influenced how well TRM enhanced flexural performance of RC beams. All strengthened beams behaved stiffer when compared to the control beam, with the benefit being most noticeable when the steel

reinforcement went out as a result of the full activation of the textile fibres under tension. Stage II flexural stiffness (cracked section, before yielding) increased overall by 8.33-18.43%, whereas Stage III stiffness (cracked section, after yielding) increased by 551.16-1520.15%. Both AR glass and basalt textile performed better in terms of flexure strength due to the enhanced compatibility between the old and new TRM strengthening procedures. Basalt has a greater moment-carrying capacity than AR glass. When the maximum stress is reached, basalt textile breaks down ductile whereas glass breaks down brittlely. This serves as an illustration of how TRM can be applied as a motivating technique for creating and enhancing structures. A few tests employing two different types of textile fibre materials led to the conclusion. To strengthen the trust in the results, additional research is needed, including on substitute textile fibre kinds that would have the same volume proportion of fibres.

ABSTRACT

One of the leading technologies in the computing field is Human-Computer Interaction (HCI). Many industries are trying to use the advantages of this digital technology by integrating it into different functions. This paper presents a survey of Traditional Healthcare based on HCI aspect. This survey proposes the essential background by outlining the HCI paradigms and Human-Computer Interaction fundamentals at the outset. Then the Traditional Healthcare life cycle is extensively analyzed. We also review various concepts and results from different authors, which incorporate extensive research and suggestions made in traditional healthcare. Eventually, based on the assessment, we spotlight possible future research directions, especially in Siddha medicine pulse diagnostics and Manikkadainool. The study covers a broad spectrum of middleware solutions, devices, applications, features, approaches, models and sensors developed in the base of HCI for Traditional Healthcare industry, called the Human-Computer Interaction in Traditional Healthcare (HCITH). Our objective involves not just evaluating, contrasting, and amalgamating prior research efforts, but also appraising research discoveries and scrutinizing their importance for Human-Computer Interaction (HCI).

Keywords: Human-Computer Interaction, Traditional Healthcare, Siddha medicine, traditional diagnosis, pulse diagnostics.

INTRODUCTION

There has been a sustained and enduring fascinationin Human-Computer Interaction (HCI), a notion used in 1980 to describe the scheme of computer technology. The textbook "The Psychology of Human-Computer Interaction" uses a phrase Human-Computer Interaction, which became generalized at 1983 [1]. Computing technology has the domain of "Human-Computer Interaction" (HCI) has applications that investigate how human (users) communicate with systems by creating, assessing, and implementing user interfaces for computers that are delicate to the requirements and behaviour of a particular user. It lies at the juncture of several fields, including psychology, computer vision, artificial intelligence, facial recognition, motion tracking, scientific technology, and so on. It is an interdisciplinary area that includes computer science, cognitive science, behavioural science, design, and other disciplines. A specific underlying purpose of HCI is to design better user-friendly as well as effective computing systems. The client collaborating with computers via a user interface that allows them to alter the plan and communicate information. HCI places a high priority on user interface design, implementation, and evaluation [2]. Since then, HCI research has become a well-known research topic in computer science. As we'll see in Section III, several academics have given definitions and explanations for various aspects of HCI. Researchers and engineers have used HCI advanced developed techniques to create many prototypes, systems, and solutions over the previous two decades [3]. There has been an increasing emphasis in recent years on enhancing all aspects of Human-Computer Interaction.

 To achieve genuinely successful Human-Computer Intelligent Interaction (HCII), the computer must engage quickly with the user, as human-human interaction occurs [4]. The extensive use of the internet and interfaces has had an influence on the era of personal computing. Even though accessing the Internet quadrupled yearly with great frequency, it took decades- for the Internet to reach a significant portion of the population. *The first outcome product is The Xerox Star provides a complete Graphical User Interface* (GUI) in 1981 [5]. Traditional medicine has been practiced for and embraces knowledge passed down via multiple means. "The World Health Organization (WHO) defines Traditional Medicines (TM) as a wide array of health practices, approaches, knowledge, and beliefs that encompass the use of plant, animal, and spiritual therapies, as well as manual techniques, either individually or in combination, with the aim of promoting well-being and addressing the treatment, diagnosis, and prevention of illnesses"[6]. Some TM systems have been noted, and they explain complex medical treatments ,based on ideas and significant experience. Such methods are commonly employed both inside and outside country limits. Some of the Asia's significant Traditional Medicine Systems (TMS) are Ayurveda, Kampo, Thai medicine and Chinese traditional medicine. Traditional healers use some oral and non-written traditions known as "folk medicine" on a small number of people in their community. [7].

Chemical industries, which formed as the first pharmaceutical firms, drove TMS out of the market in industrialised countries from the nineteenth century forward. By leveraging academic discoveries and technological breakthroughs, these chemical businesses ventured out to produce more standardized and effective pharmaceuticals. Given the phenomenal rise of the pharmaceutical sector manufacturing contemporary allopathic drugs in India during the 1980s, it would have been easy to assume that the TM sector would have also died a natural death there [7].Most developing countries have two types of healthcare systems: One is 'modern' and 'scientific' in character, and they originated in the West. The other is traditional, time-tested, and originated in the country. TMS is based on practices throughout the world. TMS has an extensive heritage in India and utilizes locally available natural ingredients. India has developed five major traditional medical systems: Ayurveda, Siddha, Unani, Yoga, and Homeopathy. According to the WHO, the amount and quality of data on the safety and performance of TM are lacking to fulfill the conditions for its worldwide use. The need for healthcare is increasing, driving the development in healthcare technologies [8], [9], [10]. This survey focuses on the fundamentals of the HCI paradigm, fundamentals of traditional medicine, characteristics, types and classification, levels and life-cycle, existing research prototypes, HCI approach for Traditional Healthcare, etc. This section discusses the HCI paradigm briefly. We are not only conducting a study of the HCI, but we are also providing some basic information that helps in understanding the historical significance and current direction of technology, such as HCI's evolution, statistics related to HCI,

highlighted technologies, characteristics, and research gaps in the HCI paradigm. The theories and attributes are defined in the HCI paradigm. It also shares key concepts with other branches of computer science. We utilize current technology based on the HCI's characteristics and requirements.

Human-Computer Interaction Paradigms
Evolution of Human-Computer Interaction
Before delving deeply into the realm of HCI, it proves advantageous to delve into its evolutionary journey. Preceding the advent of the Internet, the primary focus of researchers in the realm of Human-Computer Interaction (HCI) revolved around providing appropriate input and output interfaces for personal computers. The public's desire was for these interfaces to possess utmost simplicity and clarity. Consequently, HCI has evolved into a multidisciplinary domain spanning realm from electronics and computer science to sociology and psychology. The fruits of this research materialized as hardware and software components that have now become ubiquitous in our everyday lives – examples include keyboards, mice, graphic tablets, touch screens, speech and audio devices, among others. These innovations paved the way for the extensive integration of computers into daily use and their widespread adoption across the globe. [11].

Graphical User Interfaces
The most significant HCI standard is graphic user interfaces (GUI). It had a huge influence on the next generation of computer users, resulting in the development of countless new applications. A Graphical User Interface (GUI) provides users with the means to engage with an extensive array of devices, spanning from computers, mobile phones, and portable media players to game consoles, home appliances, office furnishings, and beyond. Unlike text-based interfaces, a GUI provides graphical client elements and visual pointers such as windows, symbols, and menus. Exercises in a GUI are frequently accomplished by manipulating graphical things, using a mouse, and less frequently by using a console. Its ability to make the computer operation plain, straightforward, and easy to comprehend and use is a big benefit.

Tangible User Interfaces
Users may prefer to operate with "analogue" real-world tools rather than existing digital technology. Tabletop displays and touch pens, as well as other big surfaces, have been selected. Bridging the divide separating the virtual realm from the tangible reality, Ishii and Ullmer [12] unveiled a novel incarnation of HCI titled "Tangible User Interfaces" (TUIs) in 1997. Rooted in Weiser's concept of ubiquitous computing, their vision involved enhancing the physical world by seamlessly embedding digital information into ordinary objects and scenarios. This approach facilitates the provision of real-world mechanisms to manipulate virtual data, conceptual abstractions, and various functionalities.

Voice-based User Interfaces
Voice User Interfaces (VUI) provide users to converse using natural language. Users can connect with computers using a voice-to-speech engine. The "conversational PC" has been a focal point for artificial consciousness research in speech innovation (simulated intelligence). The idea is to transform human intelligence into computer by enabling users to interact with computer-based applications using everyday spoken language. When a voice is employed as a means of contact, two symmetric computing concerns arise: automated text rendering and human speech recognition. [13,14]

Intelligence - Computer Interfaces
A technology that allows the human brain to communicate directly with one or more external systems is called Intelligence-Computer Interface [15]. The majority of research has been on utilising BCI to control rehabilitation, and interfaces in order to assist, improve, or restore human cognitive or sensory-motor skills. A combined set of software, sensors, and actuators can monitor and use human brain impulses and activities. Because the activities have the potential to support, enhance, or restore human cognitive or sensory-motor functions, natural human-to-

Jeevarathinam *et al.,*

human connections may become easier. Simultaneously, mind-based exercises can be used for virtual informal organisations and game collaborators.

What is Human-Computer Interaction

Along with sociology, cognitive science, psychology and human factors engineering and design, HCI loomed as discipline of computing technology in the early 1980s. HCI has evolved rapidly and consistently over the last three decades, recruiting people from a large range of areas and incorporating broad ideas and techniques. HCI currently comprises various semi-autonomous fields of study and practice in human-centered informatics. *Definition by [16]:* "According to the Association for Computing Machinery (ACM), human-computer interaction is a field of study that focuses on the design, evaluation, and implementation of interactive computing systems meant for human use. Additionally, it involves the examination of significant phenomena related to these systems."*Definition by [17]: "As defined by Alan Dix, Human-Computer Interaction (HCI) is the exploration of the impact of computer technology on human work and activities." Definition by [18]: "Human-Computer Interaction (HCI) is a specialized area within computer science that focuses on examining how people (users) interact with computers. It involves the design, evaluation, and implementation of user interfaces for computer systems, aiming to accommodate the user's needs and behaviors."* End-User Level contentment in Computing, often known as user contentment, is an essential aspect of HCI. The way humans interact with a computer system is the user interface. A computer system's user interface allows users to engage with the plan to use it and achieve their goals [19]. The interface is important in the numerous ways in which humans and computers connect with one another. HCI (human-computer interface) is also known as HMI, MMI, and Computer-Human interface (CHI). Desktop programmes, web browsers, mobile PCs, and computer kiosks all employ graphical user interfaces (GUIs) today [20]. Good HCI design hides all operational complexity and simplifies and simplifies the user experience. The user will feel at ease and find exactly what they are seeking for because of their clear and logical reasoning. VUIs (voice user interfaces) and emerging multi-modular frameworks are synthesizing and speech recognition [21]. The interaction loop is of streaming information which is made up of several components, including:

1. Oriented on Vision: Human-Computer Interaction provides a broader variety of expressive input capabilities by analyzing data from one or more cameras using Vision-based HCI approaches. For the reliable anticipation of crucial visual user information, computer vision can serve as an unobtrusive, non-contact input channel within the framework of HCI. [22].
2. Audio-based interaction: The critical interaction between the machine (AI based auditory device) and the user is termed as Audio-based interface systems. This file contains data received from a number of audio streams. The user-imposed circumstances and objectives comprise the user's task environment. The machine environment is the computer's operating environment. Human and computer processes, rather than interacting, focus on non-overlapping interface zones [28].
3. Intelligent personal assistants such as Siri from Apple, Google Now from Google, and Amazon Echo from Amazon are examples of a new generation of audio-based human-computer interaction. One shortcoming of intelligent personal assistants (IPAs) is that their speech is "emotionless" [25].

HCI Application Domains

The subject of human-computer interaction (HCI) is quickly evolving due to the advent of unique multi-sensory user interfaces. Intelligent gadgets, data processing engines, and huge interactive screens are becoming increasingly popular [23]. In addition to the keyboard and mouse, multimodal interfaces (two or more inputs) are being employed. Among these are handheld controllers, multi touch models, gesture recognition, voice and translation, emotional detection, various display technologies, collaboration technology, mixed reality, and context-sensitive interfaces [23,24]. The most recent breakthroughs include wireless, wearable, and virtual reality technology. HCI aspires to blend cutting-edge technology like as animation and networking, with time-tested interaction tactics [25]. HCI is becoming more integrated in fields like as entertainment, education, and healthcare. Generally used application fields include integrating HCI into the workplace, electronic business, group collaboration, culture and

globalization, client learning and preparation, framework improvement, and medical services. The widely acknowledged components of the interaction will be the major emphasis of this research.

HCI Devices
A wide range of devices function as user and computer interfaces.

Discrete input via a keyboard
Connected keyboards tied to computers, terminals, or workstations are one of the most frequent forms of input devices now in use. The majority utilize a "QWERTY" keyboard layout, which is akin to a typewriter and contains extra keys for moving the cursor, inputting numbers, and other functions [26].

Continuous Input through Mouse
For continuous hand input, a much larger range of devices is used. Several studies and taxonomies [Foley et al. 1990; MacKinlay, others 1990] [26,27] have attempted to categorize this vast array of possibilities.

Voice
The user's speech provides another sort of input. Because speech is a robust, continuous process that requires user attention, it is the most effective form of communication [28]. Current technology breakthroughs allow you to speak with a machine in the same way that you would with a person. A few examples of voice recognition gadgets include Amazon's Alexa and Apple's Siri, which are the created inventions in speech recognition devices. The problem with natural language processing occurs if the computer can recognize all of the words in continuous speech [26].

Virtual Reality and Augmented Reality
In computer-produced simulation frameworks, a glove or other 3D hand input gadget is commonly used to enable the client to venture into and cooperate with the extended environment, as well as an appealing tracker to detect head movement and gap the virtual camera for scene presenting [27]. Expanded reality (AR) operates in the real environment with computerized goods, music, or other tactile information by utilizing technological breakthroughs [29]. Augmented reality applications include smart glasses, medical imaging, entertainment apps, navigation, and sensor detection.

HCI Related Statistics
HCI's fundamental idea is to provide safe, user-friendly, and effective technology to individuals of all abilities, experience, and expertise. To the greatest extent possible, people with disabilities shall be able to utilize any system developed utilizing HCI user-centered approaches and concepts. The adoption of HCI principles and user-centered design has significantly increased in various industries, including healthcare, education, finance, and technology. Many companies have realized the importance of delivering user-friendly products and services [30].

The Essential Components of HCI
HCI, as the name implies, is made up of three parts: user, system and their interconnection as mentioned in [31,32].

User
The term "user" refers to an individual client or a group of clients who work together. The system is used by the user in accordance with their planned duties. It may vary from person to person. Understanding how people's senses of sight, hearing, and touch convey information is essential.

Computer
A broad variety of technologies, ranging from small desktops to massive computer systems, are referred to as "computers." If we were looking at a site's layout, we may refer to the site as "the PC" in our conversation. "Computers" include cell phones, desktops, and VCRs.

Interaction

Individuals and machines have distinct characteristics. HCI, on the other hand, goes to great lengths to ensure that they get along and operate well together. Utilize your understanding of both humans and computers to craft a viable system, and engage with end-users consistently throughout the design phase. In practical scenarios, time constraints and budget considerations hold utmost significance, underscoring the need to find equilibrium between user requirements and practical implementation. The realm of human-computer interaction (HCI) comprises three interconnected elements: a computer, an individual, and the dynamics of their interactions. People leverage computer capabilities to accomplish an array of tasks. A means through which users can interact with a system is recognized as a computer interface, a pivotal aspect within this field.

Principles of HCI

The eight guidelines are referred to by Shneiderman as the "golden rules." HCI is founded on four essential principles. Behaviour, perception, and descriptive modelling are all examples of models. The book "Designing the User Interface" by Ben Shneiderman is the source. Shneiderman assembled a collection of key user interface principles and ideas. These concepts may benefit any well-designed user interface.
Each of the 'Golden Rules' [33] is listed below.

1. Attempt consistency
2. Enable typical customers to use alternate routes
3. Provide instructional critique
4. Plan exchange to produce
5. Provide uncomplicated error handling
6. License simple inversion of activities
7. Support within the locus of control
8. Decrease brief memory load

Middleware Support for HCI

The point at which humans and machines communicate in human-computer interaction through an interface is called as user interface (UI). A Human-Machine Interface (HMI) is made up of layers that connect machines to actual information devices such as consoles, mice, gaming pads, and result items such as PC screens, speakers, and printers. A Human Interaction Gadget (Stowed) is a device that performs a Human-Machine Interaction (HMI). The following are additional levels of user interfaces (UI) that interact with one or more human senses:

1. Tangible UI (touch).
2. Viewable UI (sight).
3. Phonic UI (sound).
4. Odoriferant UI (smell).
5. Equipoise UI (balance).
6. Gustative UI (taste).

UIs that function with two or more senses is known as Composite user interfaces (CUIs). The Graphical User Interface (GUI) stands as the most widespread CUI, seamlessly blending visual and tactile elements to present graphics. On the other hand, a Multimedia User Interface (MUI) takes it a step further by incorporating sound into the Graphical User Interface, enhancing the user's experience. CUI comes in three varieties: standard, enhanced, and virtual. A typical CUI employs human-computer interface devices such as consoles, mouse, and computer screens. A virtual reality interface is utilized when the actual environment is sieved out. When the CUI does not totally shut out the natural environment then Augmented Reality is used. Within the realm of Human-Computer Interaction (HCI), middleware assumes a crucial role by facilitating smooth interactions between users and digital systems, leading to enhanced user experiences and improved system performance [33].

Factors in HCI

There are some intriguing elements to consider while utilizing HCI standards to break down and grow a framework. The following are the most fundamental elements. Here are some important factors in HCI [34-39].

Usability

Usability stands as a cornerstone in HCI, guaranteeing that interfaces are readily graspable, operate with efficiency, and deliver a favorable user experience.

User Experience (UX)

User experience goes beyond usability and considers users' emotions, attitudes, and perceptions during interaction with technology.

Accessibility and Inclusivity

Ensuring that interfaces are accessible to users with disabilities and diverse needs is crucial in HCI design.

User-Centered Design

User-centered design entails engaging users within the design process and customizing interfaces to align with their needs and preferences.

Cognitive Load

Understanding users' cognitive load during interaction is essential for designing interfaces that are cognitively efficient and reduce mental burden.

Error Prevention and Handling

The implementation of proficient error prevention and handling mechanisms holds vital importance in minimizing user frustration and enhancing system reliability.

Visual Design

Visual design considerations, such as aesthetics and layout, play a significant role in user engagement and satisfaction.

Goals of HCI

To discover how to create user-friendly interactions and interfaces is the intention of HCI. As a consequence, we will obtain information [34-39].

1. Understand User Needs
2. Improve Usability
3. Enhance User Experience
4. Ensure Accessibility and Inclusivity
5. Optimize task performance
6. Support User-Centered Design
7. Address Ethical Concerns
8. Adapt to user context
9. Evaluate and improve Interfaces
10. Keep pace with emerging technologies
11. Facilitate collaborative interactions

Challenges in HCI

There are several challenges in HCI that researchers and practitioners face. Below are some of the key challenges in HCI [34-40].

Usability and User Experience

Ensuring that interactive systems are usable and provide a positive user experience is a fundamental challenge in HCI. This includes designing interfaces that are intuitive, efficient, and enjoyable for users.

Accessibility and Inclusivity

Making interactive systems accessible to all users, including those with disabilities, is a significant challenge in HCI. Ensuring that interfaces are inclusive and accommodate diverse user needs is essential for equitable technology use.

Privacy and Security

Protecting user privacy and maintaining the security of personal information within interactive systems is a pressing challenge. Users must feel confident that their data is safeguarded and used responsibly.

Cognitive Load and Information Overload

Designing interfaces that minimize cognitive load and prevent information overload is a challenge, as users have limited cognitive resources to process information.

Multi-Platform and Cross-Device Interaction

With the proliferation of various devices and platforms, ensuring seamless interaction across different devices is a significant challenge. Designing interfaces that adapt to different screen sizes and interaction modalities is crucial.

Research Gaps

Professionals and scientists in the Human-PC Collaboration (HCI) convenience component and programming (SE) have lately begun to connect these two domains in a number of scenarios. HCI believes that by bringing this essential work to CHI, it will be continued and that academics and practitioners will be included in all elements of UID, such as usability, SE, Interface plan, similitude plan, route plan, mental model plan, and visual plan are all examples of plans. In view of authentic contextual analyses of professional and amateur researchers, it was found that:

1. people collaborate when there aren't enough instances of each other's work, and
2. people collaborate when there aren't enough good examples of each other's work.
3. Effective collaboration requires the use of diverse analytical units, data aggregation methodologies, and abstractions.
4. work together despite having different audiences, aims, timetables and staff.
5. Gaining insight into the process of designing and adapting user interfaces for emerging technologies like virtual reality (VR), augmented reality (AR), and wearable devices.

Traditional Medicine Fundamentals

This section discusses definitions of traditional medicine, its features, types, and classifications. It emphasises features or characteristics, types of various countries and classifications, levels of Traditional medicine and their combinations in the healthcare domain. Traditional Medicine (TM), the oldest type of health treatment, is also termed as Complementary and Alternative Medicine (CAM). Some other terms are ethno medicine or folk medicine or native healing. People used such treatment procedure to deal with many ailments that endanger their survival. Physical and mental diseases can be prevented and treated with them [41]. Most countries like Asia, Europe and America use orthodox medicine, makes a vital part of healthcare. Examples are Chinese Acupuncture and Indian Ayurveda medicines. Traditional Medicines are readily accessible and reasonably priced, and accessible to most people, even in remote locations [41]. Diverse cultures have developed over time. A traditional healer is an individual acknowledged by their local community as possessing the expertise to provide healthcare services utilizing substances from plants, animals, minerals, and other methods rooted in social, cultural, and religious traditions [42]. The majority of Traditional Medicine (TM) drugs are formulated using common ingredients. Clinical trials within the realm of TM have been conducted since its inception. The utilization of TM has proven advantageous for modern medical practices. TM holds an edge over other forms of medicine due to its reliance on natural components, spanning areas like the discovery of lead compounds and potential medications, the assessment of drug-like effects, and the investigation of

physicochemical, biochemical, pharmacokinetic, and toxicological aspects. If effectively harnessed, TM could potentially contribute to the advancement of new drugs, resulting in various benefits, including substantial cost savings [43]

Traditional Medicine-Related Fundamentals
Traditional Medicine – Definition
According to the World Health Organization (WHO), "traditional medicine encompasses a diverse array of knowledge, skills, and practices originating from the specific theories, beliefs, and experiences of different cultures. It serves the purpose of promoting health and preventing, diagnosing, improving, or treating physical and mental illnesses" [44]. Traditional medicines (TMs) rely heavily on natural ingredients and are extremely valuable [43]. Folk medicine is a phrase used to characterize practices that accompany among organized, evidence-based, institutionalized approach of therapeutic practice symbolized by alternative medicine in many nations [45]. Folk medicine medical traditions include Traditional Chinese medicine, Conventional medicine of Korean, Arabic native medical practices, Uyghur medical practices, Japanese Kamp medical practice, Bush aboriginal medical procedures, Native Lau lapaau of Hawaii, and Georgian traditional medical practices [46].

Traditional Medicine Features
Due to the more expensive nature of contemporary scientific health care, traditional medicine serves a vital complementary role in the delivery of healthcare and its use is on the rise. Traditional medicines (TMs) are very important and use natural ingredients. Products and procedures that have been developed over many years of practice, continuous experimentation, and finally integrating into a wide range of human experiences are referred to as TM [47,48]. Traditional medicines are readily available and reasonably priced, especially in rural locations, and are typically accessible to the majority of people. Even though they contain shortcomings in their many incarnations, they remain a vital source of human knowledge. Natural goods have been utilized for a long time and are critical in the creation of new drugs. Natural ingredients have greatly benefited several types of pharmaceuticals, including those used to treat cancer, hypertension, and migraines. [49,50].

Most commonly used Traditional Medicine Types and Schemes
Traditional Chinese Medicine

The effectiveness of medicine is the secret to its success. A famous Chinese saying states, "Excellence is from experience" [66]. TCM (Traditional Chinese Medicine) evolved over decades and decades of time. TCM was the major healthcare system in the country until the eighteenth century [66]. TCM has a wealth of knowledge and is founded nearly 5 millennia for medical practice and experience, ensuring the efficacy and value of its "clinical trials." TCM clinicians utilize a wide range of cognitive and/or tangible treatments (namely tai chi, acupuncture) and herbous medications to address health conditions [67].
 Types of Traditional Chinese Medicine

Acupuncture

Acupuncture is another alternative treatment and the subset of Chinese Traditional Medicine which is most frequently used to relieve pain, and it can also be used to treat a variety of other illnesses. Usually, acupuncture is used in conjunction with other types of therapy [68]. During acupuncture treatments, skin-piercing fine needles are introduced into the body. It might also include the use of heat, pressure, or laser light [69]. In 2017, the worldwide acupuncture market was valued at $24.55 billion USD. Europe had 32.7% of the market, followed by Asia-Pacific (29.4%), the Americas (25.3%), and the outside world. Over the year 2023, the sector remains anticipated to be valued $55 billion [70].

Moxibustion

In Traditional Chinese Medicine, a category of external therapy by burning mug wort leaves (a traditional Chinese herbal) or moxa wool on acupuncture points also called as acupoints is called Moxibustion. For more than 2.5 millennium years, moxibustion is used to detoxify channels and balance qi-blood that treat and prevent diseases. A significant scale of diseases can be treated by moxibustion. According to a scholarly review of studies published in China between 1954 to 2007 expose to cure nearly 364 forms of ailments with moxibustion. Some of the most relevant signs of moxibustion are diarrhoea, colitis, tissue injury, heel pain, asthma, age and weakness. It can be categorised into three classes [71,72].

1. Traditional moxibustion
2. Drug moxibustion
3. Modern moxibustion

Tui-Na Massage

In Eastern traditions, Tui-Na massage therapies have been used extensively for more than 4000 years. It is the ancient therapy system that comes under the category of Traditional Chinese Medicine. The combination of the body's energy and manual massage is applied in Tui-Na. As a traditional therapy, it is highly eminent at easing the way for muscles, tissues and bones and for aiding movement of joints. Therapists use this kind of healing energy (also called Qigong) using their hands in the points of muscles and bones. Tui-Na is highly aggressive and extremely active and relies on the needs of the treatment and approach of the therapist [73,74].

Cupping therapy

An age-old healing technique presently used to treat a large number of health disorders by applying cups to specific locations on the skin while providing pressure through heat or suction is known as cupping. The cups is made of glass, bamboo, silicone and brass. This traditional procedure is practiced throughout the world for curing of range of diseases like lack of appetite, poor digestion and headache, anxiety, depression and high blood pressure [75,76]. The two major types of cupping techniques are:

1. Wet cupping – non-invasive with no bloodletting
2. Dry cupping – invasive with bloodletting [77].

Tai chi

Tai-chi is a traditional Chinese healing/martial and therapeutic practice that integrates martial skills with Qi (vital energy) techniques. It is a practice with a sequence of slow, soft physical postures and a peaceful state of mind with yogic breathing. It is frequently referred to as "meditation in motion". The effectiveness of this mind-body technique, which is evolved in China, treats a variety of health conditions and psychological issues like depression, anxiety, stress, and mood disorders, as well as enhances balance, aerobic capacity, muscular strength, and flexibility. By using its biological and emotional advantages, it improves the standard of life for several kinds of people. Over the course of evolution, Tai-chi has transformed into five distinct styles, namely Chen, Yang, Sun, Wu and W'u [78,79].

Herbal medicine

One of the underlying vital methods of Traditional Chinese Medicine is Chinese herbology (Chinese herbal products) which includes major varieties of Therapies for medical issues such as coronary artery disease, stroke, psychological disorders, and respiratory problems. According to a nationwide poll, about one in every five Americans uses Chinese herbal treatments. Almost 100,000 medical formulae are preserved in ancient Chinese literature, and there are over 13,000 different medicines are utilized. The majority of materials used to treat are plant components and extracts. [80,81].

Traditional Indian Medicine

Ayurveda

Ayurveda is the most ancient traditional healthcare medicine and has a history of 5000 years old science. It is elicited out of the Sanskrit phrase "Ayur", which denotes "life", plus "Veda" which denotes "knowledge." Ayurveda is a medical science that focuses on the human life cycle and the meaning of life. It gains a profound understanding of the physical, mental and emotional level of an individual combined with nature. With this collective intelligence, we can discover the activities, circumstances, herbal products and nutrients which keep our health balanced one. One of the distinct aspects stated in Ayurveda is Prakriti which is called three doshas. 1.Vata 2. Pitta 3. Kapha Prakriti is governed by a single dosha or a mixture of two or three doshas. We can analyse the disease by examining the Prakriti that determine the unbalanced dosha in the body. The Tri-Doshas in an individual cooperate to maintain homeostasis over the course of their existence, beginning with fertilisation. Each Dosha has been given unique attributes and roles. For instance, Vata is involved in the manifestation of shape, cell division, signalling, movement, waste excretion, and cognition, and it also controls Kapha and Pitta's functions. Kapha is in charge of anabolism, growth, and the upkeep of stability, storage, and structure. The primary functions of Pitta are host surveillance, pigmentation, vision, energy balance, metabolism, and thermoregulation[82-84].

Yoga and Naturopathy

Nearly a three millennium-old tradition aiming to balance and improve a person's physical, mental, emotional and spiritual well-being is called Yoga. It was elicited from the Sanskrit word "yuj", which denotes yoga signifies unification, to unite as well as to focus and guide one's concentration. It is a type of mind-body exercise that incorporates physical workouts with an Inner conscious attention on self-awareness, breath, and energy. Patanjali introduced yoga theory and practise for the first time in the classic literature, Yoga Sutras, which is widely regarded as the canonical source on yoga. The frequent habit of yoga stimulates qualities of openness, empathy and self-discipline and also boosts stamina, endurance and agility [85,86].

Yoga comprises eight phases as described in [87].

1. Asanas
2. Pranayama   Samadhi
3. Pratyahara   Yamas
4. Dharani   Niyamas
5. Dhyana

Unani

Ayurveda, Unani, Siddha, Homeopathy, Yoga and Naturopathy are all traditional Indian medical systems acknowledged by the Ayush Ministry. The In dian Government has included Unani medicine as part of its national healthcare system. With increased research, Unani medicine is gaining popularity outside of South Asian countries like Bangladesh, India, Pakistan and Iran, where it is now a regular part of the medical system. One of the oldest medical systems, the Unani System of Medicine, focuses on maintaining health, treating illnesses, and re-establishing a healthy lifestyle. With a comprehensive approach, it delivers healthcare that is preventive, promotive, curative, and rehabilitative. This system's basic tenets are founded on scientific ideas, such as the Hippocratic doctrine of the four senses of humour:

1. Safra (Yellow Bile),
2. Dam (Blood),
3. Sawda (Black Bile).
4. Balgham (Phlegm),

The 'Six Essential Factors' stated below are not only utilised for sustaining wellness along with disease prevention, but also for disease treatment. [88,89]

1. Air
2. Diet (food habits)

3.   Body activity and repose
4.   Psychic activity and serenity
5.   Sleep and attentioness
6.   Withholding and elimination

Siddha

A system of traditional medicine known as Siddha Medicine has its roots in ancient Sri Lanka and Tamil Nadu in South India. According to conventional wisdom, the Siddhars provided the groundwork for this medical system. The master of all Siddhar and the first Siddhar is thought to be Agastyar. According to the Siddha procedure, the human anatomy is made up of trio humours as well as seven fundamental constituents. The three tri-humours are:

1.   Vatham
2.   Pitham
3.   Kapham

provide life to the human body. Over the world, many different traditional systems are in practice. The Government of India's Ministry of AYUSH is authorized for the Siddha system. Other nations, including Malaysia, Singapore, and Sri Lanka, also practice Siddha medicine.   The Siddha system is helpful in treating all acute and chronic ailments through thousands of plants and minerals incorporated with it. While its therapeutic procedures are focused on dietary changes and lifestyle adjustments, the Siddha system is also known as the "science of longevity." [90]

Homeopathy

A homoeopathy is a form of treatment that makes use of formulations of chemicals whose effects, when given to healthy persons, correlate to the symptoms, clinical signs, and pathological conditions that the particular patient experiences as a result of their particular ailment. Samuel Hahnemann (1755–1843) created the technique, which is today used all around the world [91]. The three main ideas in homoeopathy were referred to as a triade (Fig. 1). These three ideas form a triangle, with complexity and individuality, similarity and dilutions as its vertices (clockwise from the top).

Phases of Traditional medicine

In order to attain the minimized time, cost and toxicity the 3 different phases are used. They are [92]:

Observational phase

This is the first phase in which the various scientific observations which are robust in nature are documented. These are the previous findings or experiments which are implemented successfully through clinical trials followed by proper guidelines and policies to document.

Investigation phase

This is the middle phase after the observational phase. This phase ensures the capability, dosage range in patients, the interval between doses and determining the focus activity using vitro and vivo tests (a lab test).

Experimental/Testing phase

This is the last phase of levels of traditional medicine. This is the study phase of the basic and clinical trial research activities. These three phases combinedly drives the discovery of traditional medicine.

Traditional Medicine Design Principles

There are various design principles to be considered for Traditional Medicine.
1.   Selection and Identification
2.   Screening process
3.   Clinical trials
4.   Standardization

5.   Quality control
6.   Regulatory Affairs and Guidelines

Traditional Medicine Life Cycle
Levels of Traditional Medicine
Diagnosis
The first step towards the Traditional Medicine life cycle is Diagnosis. Finding the causes of an illness is part of the diagnosing process. Detection of the various factors involves checking the pulse, the urine, the eyes, the voice, the colour of the body, tongue along with the digestive system condition. The Siddha medical procedure has developed the specialized examining method of urine that includes examining its colour, odour, density, amount, and pattern of oil drop spreading. This method not only provides illness diagnoses but it also provides prognosis information. Several diagnostic techniques are used in the Siddha system. One of the diagnostic tools is Manikadainool. A patient's wrist circumference is measured using an inelastic thread, the measurement is expressed in the patient's own finger breadth units, and the result is used to interpret a prognosis or diagnosis of a condition [93].

Pulse Change
Pulse diagnosis is used to diagnose health ailments in Traditional Indian medicine. The foundation of pulse diagnostic is based on three radial pulses.
1.   Vatha
2.   Pitha
3.   Kapha
These 3 pulses can be able to diagnose the diseases in the human body [94].

Treatment
Treatment of diseases can be given according to pulse classification based on the Pulse changes.

Life cycle stages
The life cycle of traditional medicine typically involves several stages, from its historical origins and development to its integration into modern healthcare systems. Each stage plays a crucial role in shaping the use and acceptance of traditional medicine. Below are the common stages in the life cycle of traditional medicine [95-100].

Historical Origins and Traditional Knowledge
Traditional medicine has its roots in ancient practices and knowledge passed down through generations. This stage involves the historical development of traditional medicine systems based on cultural beliefs, observations, and experiences.

Ethnobotanical and Ethnopharmacological Studies
Ethnobotanical and ethnopharmacological studies examine how medicinal plants and traditional remedies are used by different indigenous communities. These studies provide valuable insights into the therapeutic properties of traditional medicines.

Documentation and Traditional Medicine Systems
This stage involves the documentation of traditional medicine practices, knowledge, and treatment methods. It helps preserve and disseminate traditional medical knowledge for future generations.

Integration into Modern Healthcare
In this stage, traditional medicine may be integrated into modern healthcare systems, either as complementary or alternative therapies. Governments and health organizations often regulate and standardize traditional medicine practices during this phase.

Research and Evidence-Based Validation

As traditional medicine gains recognition, there is increasing emphasis on conducting scientific research to validate its efficacy, safety, and potential interactions with modern medicine.

Education and Training

To guarantee the safe and effective utilization of traditional medicine, educational and training programs are essential and are developed for practitioners and healthcare providers. These programs aim to enhance knowledge and skills in traditional medicine practices.

The definition and idea of Naadi (Pulse)

The ultimate diagnosis of the disease is determined by Naadi's evaluation and is based on Yen vagaithervu. The only things in the Naadi are vatham, pitham, and kabam. The word "Naadi" is Thathu. It displays the blood vessels' pulses (arteries & veins). The heart and the Naadi (Pulse) are connected. Naadi (Pulse) allows us to investigate how the heart works [6]. The alignments of the afflicted outrageous determine the course of treatment, so mukkutram (vatham, pitham, kabham) is a crucial diagnostic characteristic. Similar to how naadi, neerkuri, and neikuri are founded on kutrams, so are other crucial parameters [94,95].

7. Moolai
8. Vinthu

Existing research Prototypes and Systems in Traditional medicine

Sensors, Technology and Device Findings for Traditional Medicine

Optical Sensor

The pulse has been used in traditional Indian medicine as a method of disease diagnosis. The three radial pulses known as vata, pitta, and kapha constitute the foundation of this pulse diagnostic. A *photoplethysmographic sensor* for pulse diagnostics is presented in this study. The blood flow rate is monitored using a PPG sensor. The sensor is positioned at the vatta, pitta, and kapha-corresponding determined radial locations. Lab VIEW software is used to analyse the sensor's output.PPG measurements are made at the wrist of subjects in various age groups. The subject's vata, pitta, and kapha types are determined by comparing the obtained PPG signal to the values recorded by the Siddha Practitioner [93].

Electronic nose

E-nose technology outperforms traditional analytical methods such as gas chromatography-mass spectrometry (GC-MS) in terms of its user-friendly nature, high sensitivity, real-time detection capability, and non-destructive attributes. Although E-nose techniques have been extensively developed in various other fields, their application in the quality control of Chinese Herbal Medicine (CHM) has received limited research attention. The current study seeks to investigate the practical benefits of E-nose technology in the reliable and effective detection of aromas within CHMs. It employs E-nose technology to explore the impact of diverse factors, including cultivation locations, identification strategies, manufacturing processes, and storage durations, on CHMs. Furthermore, the study addresses the challenges and potential advantages associated with employing E-nose technology for the identification of CHMs. As technology continues to advance, odor detection through E-nose technology could potentially emerge as a novel quantitative parameter for ensuring the quality control of CHMs and the development of pharmaceuticals. However, a more extensive inquiry is necessary to comprehensively evaluate its potential and utility in this particular domain [101].

Sensor Based Classification and Evaluation Methods using Machine Learning Algorithm

The hardware configuration suggested in this research encompasses a Raspberry Pi 3b, linked to multiple sensors such as a camera, color sensor, moisture sensor, and pH sensor. The primary aim of this configuration is to employ machine learning algorithms like Support Vector Machine (SVM) and Random Forest (RF) for color value classification and identification of "Churnas." Upon carrying out experimental trials, the findings indicate that the RF Classifier exhibits superior performance compared to the SVM Classifier in terms of accuracy, sensitivity, and specificity when distinguishing the attributes linked to Churnas [102].

IoT Based Automatic Medicinal Herbs Monitoring and Controlling

Based on ecological reasonableness, agronomic efficiency, calculated suitability, and quality appropriateness, a strategy for establishing acceptable maps for medicinal herbs can be developed and implemented. However, these plants' growth is essential for the preservation of their natural populations. Therefore, indoor climate observing and control might be found anyplace, from open working environments to private homes. This strategy aims to develop an automated framework for monitoring medicinal herbs through sensing and automation. The fixation of carbonic corrosive gases in internal environmental variables would be balanced out by a massive plant divider framework, as previously demonstrated by research. This would effectively reduce the groups of stuff and unexpected natural mixes. This article presents a plant-explicit remote review and controlling structure. The framework modifies the administration system, increases quantifyability, enhances plant division customer experiences, and adapts the unpractical interior environment by utilizing open cloud stages and IOT innovation [103].

Traditional Chinese Medicine modernization for Biosensors application

Bio sensing technology has helped fundamental studies of traditional Chinese medicine (TCM) as well as its targets, separation and purification, mechanism, quality control, and active component detection. Biosensor technology has become a hotspot for future research and has made a significant contribution to current herbal medicine research [104].

Indian Traditional Medicine Methods: Siddha Diagnosis Methods-Traditional way

Diagnosis still relies heavily on traditional Siddha diagnostic methods. The diagnostic method of the Siddha system stands out because it diagnoses not only ailments but also their potential causes. The eight diagnostic procedures handed down by the Siddhars are referred to as **EnvagaiThervu**[105].

Naa (Tongue)

The tongue-related signs and symptoms are taken into consideration. The tongue's thickness, coating and patches, longitudinal and transverse tongue fissures, taste sensation, and saliva production are all considered. Oral aphthous ulcer, oral hairy leukoplakia, oral candidias is, and other conditions may be identified by examining the tongue.

Mozhi (Speech)

The Siddha practitioner notices clearly the difference in the change of actual sound of the voice, the pitch and the tone of the voice. While in conversation with the patient, the behavioural and mental status is also observed and indicated.

Niram (Color)

The skin color is indicated in the color tool. The color may be dark in vatham, yellow or red in pitham and pale in kapham.

Kan (Eye or Sight)

The variables considered include the shade of the eye, warmth in the eye, a devouring feeling, disturbance in the eyes, visual discernment, and so on.

Sparism (Touch)

Warmth, sensory impairment, skin texture, pain, hardness, and dullness are all measured when the patient is touched as part of the diagnosis. During contact, physical anomalies such as lumps, nodes, and edematous or common swellings are seen.

Malam (Stool)

The amount, hardness (difficulty in moving), colour, and odour of the patient's excrement are all evaluated.

Siruneer (Urine)

The patient's urine is monitored and collected for investigation in the early morning. If a urine test reveals any of the following characteristics: tone, amount, explicit gravity, scent, frothy quality, or stores. In general, saffron-colored urinating indicates jaundice, straw-coloured urine, constipation, and reddish-yellow urine, excessive heat. The Neykuri Analysis is yet another unique diagnostic process used only by Siddha Medicine. A fresh sample of a few drops of early morning urine is acquired using this unique process. A little amount of sesame oil has been applied to the surface of this sample. The oil spreads throughout the urine test, displaying various instances for each individual.

Naadi (Pulse)

When the index and middle fingers are united and softly placed on the blood artery below the thumb, pulse beats can be felt. A person's heart rate or pulse rate may be measured and felt by everyone. Only a trained Allopathic or Siddha practitioner, however, can detect disorders based on the rhythmic patterns of the pulse. The degree of distortion or rhythmic shifts in a vatham, pitham, and kapham pulse can usually be interpreted by skilled Siddha practitioners. *Modern diagnosis methods involve blood tests and scan reports.*

Pulse Diagnostics

Three humors or thathuvams are associated with Vali (air), Azhal (fire), and Aiyam (water). These humors are called Vatham, Kapham, and Pitham. These three humors constantly interact with the five fundamental elements of the outside world or the cosmos to determine the state of the body and mind [93]. For a sickness free, solid presence, the proportion between the three should be kept consistent at 4:2:1. The three humors—Vatham, Kapham, and Pitham— are believed to cause illness or ill health when disturbed [94]. Siddha claims that if the three humours are interrupted, the seven essential physical components of the human body—namely, Enbu (Bone), Saaram (Chyle), Kozhuppu (Fat), Moolai/Nalli (Marrow), Senneer (Blood), Oon (Muscle), and Sukkilam/Suronitham (Sperm and Ovum)—are also impacted. The Siddha Medical system also believes that food is a medication, according to the Unave Marunthu idea. According to this logic, any dish with a high concentration of one Suvai (taste) is considered to upset the three humours. Sweeter meals, such as sweets, are more detrimental than good. Simply defined, Siddha Medicine believes that the environment, climate, nutrition, physical activity, stress, and other variables all have a part in illness formation. (AIR) VALI Space and air have an impact on Vatham, also known as Vali.FIRE (AZHAL) Azhal and Kapham are affected by fire and water. WATER (AIYAM) Aiyam, or Pitham, is affected by the elements of earth and water. The five primal elements of nature—Earth, Water, Air, Fire, and Space—must coexist with the three humours. Changes in the responses of three thathuvams to these five early stage components might cause discord. Disease and illness come from the changed harmony and imbalance of the three thathuvams [91,93,94]. Pulse diagnosis is an essential diagnostic technique used in Siddha medicine, a traditional system of medicine that originated in ancient South India. In Siddha medicine, the pulse is considered a valuable source of information about the state of the body's health and the balance of its vital energies or doshas (known as Vata, Pitta, and Kapha) [91]. Here's how pulse diagnosis works in Siddha medicine [91,93,94]

Location

In Siddha medicine, the pulse is typically felt at the radial artery on the wrist. Practitioners use three fingers (index, middle, and ring fingers) to palpate the pulse gently.

Interpretation

The practitioner observes various factors while feeling the pulse, such as the rhythm, speed, strength, and overall qualities of the pulse. They also pay attention to the presence of any specific sensations, such as throbbing or irregularities.

Dosha Assessment

Siddha medicine is based on the concept of doshas, which are the fundamental energies or humors that govern the body's functions. The pulse diagnosis helps the practitioner determine the balance or imbalance of Vata, Pitta, and Kaphadoshas.

Subtypes of Doshas

Within the three main doshas, there are several subtypes. The pulse diagnosis helps identify the specific subtype of each dosha that might be affected.

Disease Diagnosis

Based on the pulse findings and the dosha assessment, the practitioner can identify the presence of any imbalances or diseases in the body.

Individualized Treatment

Siddha medicine emphasizes individualized treatment approaches. Once the practitioner determines the dosha imbalances, they tailor the treatment plan to bring the doshas back into balance. This may include herbal remedies, diet recommendations, lifestyle changes, and therapeutic practices.

Follow-up

Pulse diagnosis is not a one-time event but an ongoing process. The pulse is regularly monitored throughout the treatment to assess the progress and adjust the treatment plan accordingly.

Manikkadainool

Anthropometry is the study of the methodical measuring of the person body, its dimensions in particular. Thread measures are used in Traditional Siddha Medicine to quantify wrist circumference measurement through the number of fingerbreadths of the same person. This idea of measurement is based on its interaction with a variety of elements, such as the individual's fundamental diet, psychological circumstances, environmental and seasonal impacts, and illnesses. For successful expectations and conclusion, spellbinding components of separate finger input received are connected among the clinical image of an individual [93,109]. The unique diagnosing method for diseases was said in Agaththiyarsudaamanikairu suththiram also phrased as Manikkadai Nool. Sage Agathiyar produced the book SoodamaniKayaruSoothiram in Siddha medicine, the number of Finger Breadths is used to make diagnostic predictions by measuring a person's wrist circumference. eleven finger width inputs offer a total of 26 finger measures with sub divisions of 1/4, 12, 34, and full FB [90,108]. Manikkadainool, according to Pathinen Siddhar Naadinool, is also useful for diagnostics. This Manikkadainool is used to diagnose the ailment by measuring the wrist circumference with a thread and dividing the result by the patient's fingers. This measurement can be used to make a diagnosis. When he reaches 11 FB, the Manikkadainool will be powerful and enjoy a long and healthy life. When the Manikkadainool score falls between 4 and 6, the disease's prognosis is bad, and the condition is severe enough to cause death [90,93,110,111].

Human–computer interaction approach for Traditional healthcare

The most worthwhile medical system in China is the TCM. The applications of TCM is examined by utilizing in computing technology. The integration of the computing technology and TCM will asisst to the modernization of TCM foster the international standard [112]. Traditional Healthcare has its benefits over a long period of time. The medicine's quality, safety, and efficacy of dose are the current level of information falls short in meeting the demands necessary for global application. There is also an inadequate description and lack of standardization in terms of adverse effects and treatment methodologies. Despite the fact that certain systems, such as Ayurveda and Traditional Chinese Medicine (TCM), have undergone rigorous testing, in-depth scrutiny of Traditional Medicine formulations remains uncommon. Both the healer and the patient actively participate in the healing process. In contrast, modern medicine adheres to thorough standardization, possessing a structured system with comprehensive details on precautions and adverse effects. The safety, efficacy, and quality of medicines are firmly established, and their mechanisms of action are well comprehended. Practitioners also undergo substantial training, while patients are required to collaborate in the diagnosis, treatment, and follow-up by adhering to prescribed medications. [113,114,115].

PROBLEMS NEED TO BE ADDRESSED

Traditional medicine, despite its significance and widespread practice in various regions, encounters several challenges and concerns that must be tackled to ensure its responsible integration into modern healthcare systems and to harness its full potential benefits. Some of the primary issues faced by traditional medicine are as follows [116]:

Insufficient Scientific Validation

A prominent challenge for traditional medicine lies in the lack of substantial scientific validation and evidence-based research supporting the effectiveness and safety of numerous traditional treatments. To gain acceptance within modern healthcare, traditional medicine should undergo rigorous scientific scrutiny through comprehensive studies and research.

Quality Control and Standardization

The quality and potency of herbal remedies and traditional treatments can vary significantly, as there is often no standardized manufacturing process. Ensuring consistent quality and safety across traditional medicine product is essential.

Intellectual Property Rights

Traditional knowledge, including medicinal plant information and treatment methods, is vulnerable to misappropriation and exploitation. Protecting the intellectual property rights of traditional healers and indigenous communities is crucial to prevent the unauthorized commercialization of their knowledge.

Regulation and Licensing

In some regions, traditional medicine may lack proper regulation, leading to unqualified practitioners offering treatments without adequate training. Establishing regulatory frameworks and licensing requirements is essential for ensuring patient safety.

Integration with Modern Healthcare

Integrating traditional medicine into mainstream healthcare systems can be challenging due to differences in terminology, diagnostic methods, and treatment approaches. Finding ways to bridge the gap between traditional and modern medicine is essential for collaborative patient care.

Safety and Side Effects

Certain traditional remedies have the potential to interact with modern medications or produce adverse effects if not administered properly. Educating both practitioners and patients about these potential risks and ensuring their appropriate usage is essential.

Cultural Sensitivity

Traditional medicine has its foundations deeply embedded in cultural and spiritual beliefs. Therefore, it is of utmost importance to approach its integration into modern healthcare with cultural sensitivity and a profound respect for the diverse traditions and practices it entails.

Education and Training

Enhancing the knowledge and skills of traditional healers through proper training and education is crucial. By incorporating modern medical concepts and evidence-based practices into traditional medicine training, its effectiveness can be significantly improved.

Access and Affordability

In certain regions, traditional medicine proves to be more accessible and cost-effective than modern healthcare. Nevertheless, in other areas, access to traditional medicine may be limited. Ensuring equitable access to traditional medicine for all communities is of utmost importance.

Sustainability and Conservation

The overexploitation of medicinal plants and natural resources for traditional medicine can threaten biodiversity. Promoting sustainable practices and conservation efforts is necessary for the long-term availability of medicinal resources.

Public Awareness and Education

Educating the public about the benefits and limitations of traditional medicine is crucial. Raising awareness can help individuals make informed decisions about their healthcare choices. Addressing these problems and issues requires collaborative efforts among governments, healthcare institutions, researchers, traditional healers, and communities. By recognizing the value of traditional medicine and working towards evidence-based integration, we can create a healthcare system that combines the strengths of both traditional and modern approaches to benefit individuals and communities worldwide.

Challenges and Future Research Directions

In the study presented above, we investigated the need for digitization of Traditional Healthcare in means of HCI technologies and applications. The gathered information of usual traditional medicine methods is lacking of accuracy, low frequent of reoccurrences, inadequate consistency, reliability and non-standardization. And to enhance this, HCI applications plays a major role in forming a digitization and modernization of traditional healthcare. The existing research improves step by step process of digitalization in data quality, data preservation, making regulations and standardization, design and development of prototypes of various modern devices, diagnosing of diseases using modern automated devices, data handling using Big Data and Machine Learning algorithms for traditional healthcare. The study has limitations which will be considered for future research work. The most important limitations are expensive in price, small quantity of sample data, inaccuracy and less reliability. Future research should focus on the cost-effective, getting more larger samples of data to examine, accuracy, standardization and high reliability. Taken altogether, the Indian Traditional Healthcare should be given extended importance in future research as compared to Chinese Traditional Healthcare as it is well-developed. By investigated the present article, we also extend our work on Manikkadainool as one of the oldest methods in diagnosing diseases in Indian Siddha Medicinal system. Secondly, the unawareness in computing technology, less short of knowledge, lack of specialists in technology and weak commitment are also its limitations. To gain keen interest with traditional medicine along computing technology can be resolved by conducting training sessions, lectures speeches, symposium, conferences, workshops, etc.

DISCUSSION AND CONCLUSION

HCI enables the creation of user-friendly interfaces that facilitate easy access to traditional medical knowledge, herbal remedies, and cultural health practices. Through mobile apps, telemedicine platforms, and digital records, traditional healers and patients can connect and communicate seamlessly, transcending geographical barriers and improving healthcare accessibility. The preservation and documentation of traditional medical knowledge are facilitated by HCI-driven efforts to create digital repositories and interactive archives. By safeguarding this invaluable knowledge, we ensure that it remains accessible for future generations and contributes to the sustainability of traditional healthcare systems. Furthermore, HCI enables collaboration and knowledge-sharing between traditional healthcare practitioners and modern medical professionals. Bridging the gap between these two systems fosters a better understanding of traditional healing practices and promotes the incorporation of proven and effective traditional remedies into modern medical treatments. However, while embracing HCI for traditional healthcare development, it is crucial to approach the integration with cultural sensitivity and respect for the unique values and practices of diverse communities. Ethical considerations, data privacy, and inclusivity must be at the

Jeevarathinam *et al.*,

forefront of design and implementation. In the pursuit of enhancing traditional healthcare through HCI, research, collaboration, and continuous feedback from users are essential. Governments, healthcare institutions, researchers, and communities must work together to create an ecosystem that nurtures the growth and evolution of traditional healthcare, ensuring its relevance and efficacy in the ever-changing healthcare landscape. Ultimately, HCI for traditional healthcare represents a remarkable opportunity to combine the wisdom of ancient healing systems with the power of modern technology. Embracing this synergy can lead to a future where individuals benefit from comprehensive, culturally sensitive, and effective healthcare solutions that respect and preserve the rich heritage of traditional healing practices. It should be emphasized that pulse diagnosis in Siddha medicine demands considerable experience and expertise. Siddha practitioners undergo extensive training to cultivate a profound comprehension of the pulse's intricacies and its correlation with the overall health of the body. While pulse diagnosis is a valuable tool in Siddha medicine, it is typically used in conjunction with other diagnostic methods to provide a comprehensive assessment of a person's health. In conclusion, Human-Computer Interaction (HCI) holds immense potential for revolutionizing traditional healthcare practices and advancing the integration of ancient healing systems into modern healthcare. By leveraging technology to enhance the interaction between humans and traditional medical practices, we can achieve a more holistic and patient-centered approach to healthcare. The constant pessimistic perspective is necessary to transform as portrayed by Western medicine towards conventional medicine in order to gain advantageous alliances. Numerous modern concepts and theories have been developed by many researchers related to computing technology in field of traditional healthcare system especially in Ayurveda, Siddha, TCM, and so on. Standardization and policy making process are very complicated in Traditional Medicine systems.

Table 1.1: General Features of Various Major Traditional Healthcare Systems in Different Countries

Name of the Traditional Medicine	Developing Country	Characteristics	Types/methods used
I. Chinese Traditional Medicine (TCM) [51,52,53,65]	China	▪ According to the notion of Yinyangism (Yin and Yang) (water and fire) ▪ Basic concept is called Qi, which means vital breath surges through the body. ▪ 5000 years of medical practice and experience.	Acupuncture Moxibustion Tui-Na Massage Cupping therapy Tai chi Herbal medicine
II. Kampo (Traditional Japanese Medicine) [54,55,65]	Japan	▪ Originated in China, which is later adapted by Japan and modified according to its traditions and culture. ▪ Adapted and used nearly 1500 years ago. ▪ Integrated into modern medicine due to high quality and safety measures.	Mostly uses all the methods that are available in the Traditional Chinese Medicine system. ▪ Acupuncture ▪ Shiatsu – Japanese massage therapy ▪ Seitai – Japanese chiropractic
III. Koryo (Traditional Korean Medicine) (TKM), (hanyak) [56,57,65]	Korean	▪ Medicinal plants were used as remedial treatments like soothing pain or joint injuries in addition to nutrient foods which were beneficial at the time. ▪ Developed its own distinctive traditions and has absorbed those of other	▪ Herbal medicine ▪ Moxibustion ▪ Acupuncture

		• civilizations like wormwood and garlic which are not included before. ▪ Created their own medicine rather than using Chinese medicine as their model. ▪ Invented medications that was best suited to their genetic characteristics and way of life.	
IV. Traditional Aboriginal medicine [58,65]	Australia	▪ Complex system and have different cultures and approaches for health. ▪ Uses native Australian flora and fauna as medical plants. ▪ Also called as bush medicine.	▪ Ngangkayi ▪ Yawulyu ▪ Herbal Medicine
V. Traditional African Medicine [59,65]	Africa	▪ Based on spiritual aspects. ▪ Three phases of expertise make up the integrated health care system: divination, spiritualism, and herbalism. ▪ Includes a herbal therapy believed to have medicinal properties as well as symbolic and spiritual value.	▪ Divination ▪ Spiritualism ▪ Herbalism
VI. Iranian Traditional Medicine [60]		▪ Also called as Persian Traditional Medicine. ▪ It is founded on the concept of four humours as a therapeutic method: phlegm, blood, yellow bile, and black bile.Built on the idea of "Mizaj," or temperament, which refers to individual variances. ▪ Collection of mental and physical traits that are indicated by specific physical and mental symptoms.	▪ Earth, Air, Fire, and Water are the four elements. ▪ Four temperaments (body and personality types) are: melancholic, sanguine, phlegmatic and choleric. ▪ Four qualities are hot, old, wet and dry.
VII. Islamic Traditional Medicine (Arabic) [60,61]		▪ Originated in 7th century. ▪ Often referred to as "Medicine of Prophet" ▪ Amplifying existent theoretical medical ideas into a comprehensive system of medicine	▪ Medicinal plants ▪ Dietary practises ▪ Mind-body treatment ▪ Applied therapy ▪ spiritual healing
VIII. American Traditional	Native America	▪ Thousand years ago. ▪ Native diets, and the usage	▪ Cupping ▪ Leeching

	Medicine [62]		of local flora for healing have all been utilized. ▪ Enhance health through associating with the environment. ▪ Ceremonial gatherings also play a role in healing process.	
IX.	Tibetian Traditional Medicine [63]	Tibet	▪ Centuries old traditional medicinal system. ▪ Also referred to as Sowa-Rigpa medicine. ▪ Uses a complex method of diagnosis. ▪ To treat sickness, uses behavioural and food change, natural medications and tangible treatments. (For example, Tibetan acupuncture, moxabustion, and so forth.)	Four tantras: ▪ root ▪ exegetical ▪ instructional ▪ subsequent
X.	Indian Traditional Medicine [64]	India	▪ Traced back to Indus Valley Civilization. (Rig-Veda era) ▪ The medicinal plants is used for treatments and cosmetic ingredients. ▪ A big part of contemporary medical knowledge has developed via trial and error across many cultures and areas.	▪ Ayurvedha ▪ Yoga&Naturopathy ▪ Unani ▪ Siddha ▪ Homeopathy

Table 1.2: Traditional Diagnostic methods/Tools

Diagnostic methods/Tools	Vatham	Pitham	Kapham
Naa (Tongue)	Black color	Yellow or red color	Pale color
Mozhi (Speech)	Standard-pitched tone	Sharp-pitched tone	Deep-pitched tone
Niram (Color)	Dark color	Yellow or red color	Pale color
Kan or Vizhi (Eye or sight)	Muddy conjunctive	Yellow or red color	Pale color
Sparism (Touch)	Dry	Warm	Chill
Malam (Stool)	Black color	Yellow or red color	Pale color
Siruneer (Urine)	Pattern of a snake	Ring shape pattern	Pearl shape pattern
Naadi (Pulse)	Vatham (degree of distortion)	Pitham (degree of distortion)	Kapham (degree of distortion)

ABSTRACT

India's large coastline enables significant exploitation of marine resource. Because of the high profit margins on prawns owing to their high export value. Between 1991 and 1994, brackish water prawn aquaculture expanded, particularly around the coast. The formation of the Aquaculture Authority of India in compliance with Supreme Court orders for granting licenses and general control has regulated shrimp cultivation. Because of their international appeal, unique taste, high unit value, and expanding global demand, shrimp are regarded as the "Pinkish Gold" of the sea. Following the Green and White Revolutions in India, the Blue Revolution is currently underway to capitalize on the immense potential in the fisheries industry. Overfishing of shrimp from natural sources, along with a rising demand for shrimp products on the worldwide market, has resulted in a significant gap between demand and supply shrimp in the international market. As a consequence, new avenues for increasing Prawn productivity must be explored. The estimated brackish water area suitable for shrimp aquaculture in India is around 11.91 lakh hectares. The 1.2 lakh hectares are scattered throughout 10 states and union territories and include West Bengal, Orissa, AP, Tamil Nadu, Pondicherry, Kerala, Karnataka, Goa, Maharashtra, and Gujarat. Right present, there are several opportunities for entrepreneurs to join the shrimp farming sector. In the research, the "Case Study of Hitide Sea Farms (Prawn Farming) in Sirkazhi Taluk of Nagapattinam District - An Economic Analysis" was assessed. The BCR value is more than one, suggesting that the unit is lucrative, according to the research. The financial study for the entire shrimp

farming system produces the following results: BCR - 1.28. Because shrimp have a strong export potential, it is advised that shrimp farms be built in the way indicated in this case study for bank financing consideration. Shrimp farming will be more lucrative in the future, according to the study.

Keywords: Prawn, Brackish Water, Shrimp Farming, Technical Feasibility, Income Statement, Benefit Cost Ratio and Financial Ratios.

INTRODUCTION

India has a long coastline, which allows for extensive exploitation of marine wealth. Because of the enormous profit margins on prawns due to their export value. During 1991-1994, brackish water prawn aquaculture boomed, particularly in coastal districts. The formation of the Aquaculture Authority of India in compliance with Supreme Court orders for granting licenses and general control has regulated shrimp cultivation. Because of their international appeal, unique taste, high unit value, and expanding global demand, shrimp are regarded as the "Pinkish Gold" of the sea. Following the Green and White Revolutions in India, the Blue Revolution is currently underway to capitalize on the immense potential in the fisheries industry.

Brackish Water shrimp farming Scope
Overfishing of prawns from freshwater sources, along with increased global demand for shrimp products, has resulted in a considerable disparity between demand and supply of prawns in the global marketplace. As a result, new routes for expanding Prawn output must be explored. In India, the estimated brackish water area suitable for shrimp agriculture is roughly 11.91 lakh ha. West Bengal, Orissa, AP, Tamil Nadu, Pondicherry, Kerala, Karnataka, Goa, Maharashtra, and Gujarat make up the 1.2 lakh ha spread across 10 states and union territories. There is a lot of opportunity for entrepreneurs to enter the shrimp farming industry right now.

Location of the Project
The first and most significant condition for commencing on any enterprise is the purchase of adequate land. The data of identified/surveyed land in coastal districts is available from the relevant state government's department of fisheries and the MPEDA Regional offices functioning in India's coastal states. An appropriate location is one that can provide optimal conditions for shrimp growth at the desired production level. The state government owns the majority of the land along the coast. In other circumstances, the entrepreneur must obtain a long-term lease from the state government's revenue agency. If it is private land, it should better be purchased outright. When choosing a location for the project, the entrepreneur should consider the following

1. Even during the rainy season, this region should be accessible, ideally by road.
2. No mangrove area with huge tree trunks is chosen.
3. There is a clean water supply on the site, which includes both freshwater and brackish water.
4. The water quality parameters required for optimum feed efficiency and development of Penaeus monodon are stated below (Table – 1).
5. The locations are not prone to flooding.
6. Choose a location with a natural slope for good drainage.
7. Social issues arising from conflicting uses of water resources and waste water drainage must be addressed.
8. The availability of appropriate infrastructure, such as energy, an ice plant, cold storage, and communication facilities, among other things, is required for effective administration.

Azhagesan and Pounraj

Profile of the Firm
Details of the Entrepreneurs

        Name of the Entrepreneur : Mr. Suryakumar
        Age   : 53
        Educational Qualification : Master of Science (M. Sc)
 Mechanical Engineering,
  B.Tech (1970-1945).

Culture/ Fresh Water: Prawn culture.
History of the Firm:

        Name and Address of the Enterprises   : **HITIDE SEA FARMS [Prawn]**
                                                                        Mahendrapalli, [Kattur],
                                                                        Sirkazhi [TK], Nagapattinam [Dt].
        Year of Start   : 1989
        Nature of Business   : Producers
        Nature of organization   : Individual.

Technical Feasibility of the Project
Technical Requirements for Establishing a Large Shrimp Farm
Shrimp Farm Design and Construction
A large shrimp farm should cover between 0.4 and 0.5 hectares of land and, ideally, be drainable. Concrete dikes, raised concrete supply canals with separate drain gates, and sufficient equipment such as generators and aerators are common features of ponds. The water canals' design, height, and direction must be suited to the elevation of the region, with special care given to the mean range of tidal fluctuation. Canals and dikes may be built as close together as undulation allows saving money on construction.

General Earth Work
It is normally carried out in the following order;
1. Cleaning up the site.
2. Removal of top soil.
3. Marking out the center of templates and lines.
4. Dike foundation preparation.
5. Drainage canal excavation.
6. Dike development (peripheral and secondary).
7. Dike farming and deformation.
8. Pit excavation for fences.
9. Pond bottom equalization.
10. Gate construction and pit replenishing.
11. Dike protection works.
The top soil may be kept and reused to maintain the pond bottom fruitful.

Shrimp Farm's Essential Components
1. Ponds
2. Structure for water input.
3. A location for harvest cleaning.
4. A pump house and a workshop.
5. A watch and ward room, as well as an office and a small laboratory.

Ponds

Ponds of 0.4ha to 0.5ha size are preferable from a management standpoint. These ponds can be entirely drained. Primary and secondary dykes separate the ponds. A perimeter dike may also be built to provide total protection to the cultured stock and any connected infrastructure. The height of the perimeter dike will be determined by the following factors:

1. Water level in the level
2. Elevation above mean sea level
3. Free board height
4. The percentage allowed for soil shrinkage

Each grows out pond's size and limits are regulated by the partition dykes, and its height is governed by the following elements:

1. The height of the water column in the pond
2. Free board
3. Wave action
4. Shrinkage factors

The shrinkage factor is determined by the kind of soil, which might be heavy, medium, or light.

Gates

They are in charge of managing the pond's input and outflow of water, as well as maintaining the proper water column in the pond. The main gates are built on dykes and separate ponds. It might be made of concrete, PVC, or asbestos-containing pipe.

Drain Canals

They have a trapezoid, and the area of their and the velocity of the water's flow define their discharge capacity.

Pond Preparation

Pond preparation will result in increased output. The primary goals of pond preparation are:

1. To eliminate weed fishes and creatures.
2. To eliminate unpleasant gases.
3. To eliminate the pond ecosystem's inherent production.
4. Maintaining excellent water quality for healthy development and survival.
5. Unwanted species are often eradicated by emptying the whole pond and drying the pond bottom until it cracks.
6. It also aids in the elimination of poisonous gases and oxygenation of the pond bottom.

It also increases the fertility of the soil. Liming is a procedure used to balance pH and destroy dangerous bacteria and viruses. To get rid of weed fish in non-drainable ponds, use   200 ppm Mahua oil. Organic and inorganic fertilizers are utilized to replace the soil and water after about two weeks. The water level increases as the thick lab-lab is created, and the pond is ready for stocking.

Selective Stocking

The Indian white prawn Penaeus indicus and the Tiger Prawn Penaeus monodon are the best species to rise in India. Traditional shrimp farming is permitted inside the CRZ, with production ranging from 1 to 1.5 tons per acre each crop and stocking density ranging from 40000 to 60000 tons per acre per crop, depending on the kind of system employed and the species. Outside the CRZ, extensive shrimp farming with an output range of 100,000/ha/crop may be authorized. It is often necessary to utilize hatchery seeds to guarantee that the cultured animal develops evenly.

Food and Feeding

Shrimp diets may be either supplemental or comprehensive. In a large system, shrimp need a diversity of feed. Natural foods have high conversion values, but they are difficult to manufacture and store in big quantities. The bulk

of aquaculture farms now depend on necessary feed at a 1:1.5-1.8 ratio. Feeding may be accomplished via the use of automatic feed dispensers or manually dispersing feed throughout the pond. Feeding waste may be reduced by placing feeding trays in certain locations of the pond.

Harvesting
Emptying the pond and manually plucking with a bag net allows for complete harvesting. The usual culture period is 120-150 days, during which time the Prawns develop to be 20-30 grams in size (depending on the species). Two crops may be harvested in the same year. Before shipping shrimp to market, place them between layers of crushed ice.

RESULT AND DISCUSSION

Physical and Financial Outlay
The physical and financial outlays for establishing a 1ha brackish water prawn farm are detailed below. The overall cost of growing the first harvest for a 1ha Prawn farm, including working capital charges, comes to Rs. 27 lakhs. Invoices for different purchases will be attached. (Table - 2).

Benefit Cost Ratio
Fixed Cost

    1. Land Lease Amount   = Rs. 1,00,000
    2. Value of Aerator   = Rs. 2,00,000
        Total   **= Rs. 3,00,000**

Variable Cost

    1. Pond Preparation (1ha) = Rs.30,000
    2. Value of Seed   = Rs. 2,00,000
    3. Value of Feed   = Rs. 10,40,000
    4. Value of Labour   = Rs. 1,50,000
    5. Value of Fertilizer   = Rs. 40,000
    6. Value of Electricity   = Rs. 4,50,000
    7. Miscellaneous   = Rs. 40,000
        Total   **= Rs. 19,50,000**

Interest on Working

Capital @ 12%   = 12/100 * 19,50,000
        = Rs. 2,34,000

Total Variable Cost= 19,50,000+2,34,000
        = Rs. 21,84,000

Total Cost of Cultivation (TCC)   = Fixed Cost + Variable Cost
        = 3,00,000 + 21,84,000
        = Rs. 24,84,000

Cost of Production /Kg   = Total Cost / Qty. of Production
        = 2484000/30000 = 248.4

Prawn Sales (10000kg* Rs. 320)   = Rs. 32,00,000
Gross Income   = Rs. 32,00,000
Net Income   = Gross Income / TCC
        = 32,00,000 / 24,84,000
        = Rs. 7,16,000

Benefit Cost Ratio (BCR)   = Gross Income / TCC
        = 32,00,000 / 24,84,000

BCR   **= 1.28**

Inference

Since, the BCR value is greater than one, so the unit runs profitably.

Income Statement
Receipts

Returns from the Prawn	= Rs. 32,00,000
Gross Cash Income	= Rs. 32,00,000
Gross Income	= Rs. 32,00,000

Expenses
Fixed Expenses

Land Lease Amount	= Rs. 1,00,000
Value of Aerator	= Rs. 2,00,000
Total Fixed Expenses	= Rs. 3,00,000

Operating Expenses

Pond Preparation	= Rs. 30,000
Seed Cost	= Rs. 2,00,000
Feed Cost	= Rs. 10,40,000
Other Inputs	= Rs.40,000
Labour Cost	= Rs.1,50,000
Electricity	= Rs.4,50,000
Miscellaneous	= Rs.40,000
Total	= Rs. 19,50,000

Interest on Operating

Expenses @12%	= 12/100 * 19,50,000
	= Rs. 2,34,000
Total Operating Expenses	= 19,50,000+2,34,000
	= Rs. 21,84,000
Net Cash Income	= Gross Cash Income - Total Operating Expenses
	= 32,00,000 - 21,84,000
	= Rs. 10,16,000
Net Operating Expenses	= Gross Income - Total Operating Expenses
	= 32,00,000 - 21,84,000
	= Rs. 10,16,000
Net Farm Income	= Net Operating Income - Fixed Expenses
	= 10,16,000 - 3,00,000
	= Rs. 7,16,000

Financial Ratios

1. Operating Ra = Total Operating Expenses / Gross Income
= 21,84,000 / 32,00,000
= 0.683
2. Fixed Ratio = Total Fixed Expenses / Gross Income
= 3,00,000 / 32,00,000
= 0.093

Total Expenses =Total Fixed Expenses + Total Operating Expenses
= 3,00,000 + 21,84,000
= Rs. 24,84,000
3. Gross Ratio/Input-Output Ratio   = Total Expenses / Gross Income

= 24,84,000 / 32,00,000
= 0.776

Financial Viability

The following assumptions have been established for undertaking shrimp culture inside and outside the CRZ were presented in table – 3, The financial analysis for extensive system of shrimp farming results is as under BCR-1.28.

Marketing

Because of the large difference between supply and demand for shrimps in both the domestic and foreign markets, selling the same may not be an issue. Farmers may sell shrimp directly to the market or to exporters for processing before shipping. Shrimps may be delivered frozen, with or without heads, battered and breaded, IQF, or in any other value-added form. The prawn must be packaged in accordance with importing countries' norms, which should be decided after a comprehensive market investigation. It is usually a good idea to contact local distribution agents in the customer's nation. The hygiene packing, presentation, and look of the package are important considerations in attracting importing country customers.

CONCLUSION

According to the study, the BCR value is more than one, indicating that the unit is profitable. The financial study for the whole shrimp farming system generates the following results: BCR - 1.28. Because shrimp have a high export potential, the building of shrimp farms in the manner described in this case study is suggested for bank funding consideration. According to the research, shrimp farming will be more profitable in the future.

ABSTRACT

The utilization of natural sources to extract dyes serves as a means to mitigate environmental issues. Natural dyes primarily consist of extracts derived from agricultural products or insects, which are combined with mordants to effectively dye natural fibres with excellent colour fastness. These dyes can be categorized into three main types based on their origin: vegetable (plant), animal, and mineral-based dyes. The demand for natural dyes is on the rise due to their eco-friendly nature, providing a viable alternative to petrochemical-derived dyes. Plant-based dyes, which make up a significant portion of natural dyes, are extracted from various sources such as roots, wood, bark, berries, lichen, leaves, flowers, nuts, and seeds. Other natural dye sources include insects, shellfish, and mineral compounds. Natural dyes find applications in colouring textiles, leather, basketry, food products, cosmetics, and more. Additionally, natural dyes contribute to the sustainable development of rural areas, as they are renewable resources that help stimulate economic growth. An important advantage of natural dyes is

68175

Avinash K. Gavit *et al.,*

their lack of adverse effects on human health. Moreover, waste generated from the natural dye industry is biodegradable and can be utilized as natural fertilizer, further enhancing its eco-friendly characteristics.

Keywords: Natural Dye, Mordants, textiles, biodegradable, eco-friendly.

INTRODUCTION

The art of dyeing textiles has a rich history that spans thousands of years, and its evolution has been shaped by the discovery and utilization of various natural dye sources. In recent times, there has been a renewed interest in exploring sustainable and eco-friendly alternatives to synthetic dyes. Natural dyes derived from plant sources have gained significant attention due to their potential to provide vibrant colors while minimizing environmental impact. Furthermore, understanding the effects of mordant combinations on the dyeing process can enhance the colorfastness and durability of dyed fabrics. This comprehensive study aims to investigate the effects of different mordant combinations on the dyeing process of cotton fabric using natural dyes extracted from marigold flower, blueberries, beetroot, and blue butterfly pea flower. Mordants play a crucial role in the dyeing process by forming a complex with the dye molecules and facilitating their bonding to the textile fibers. They not only improve colorfastness but also influence the shade, intensity, and color variations obtained. Previous studies have explored the dyeing properties of individual natural dyes, but limited research has focused on investigating the effects of mordant combinations on multiple natural dyes. By examining various mordant combinations and their impact on different natural dyes, this study aims to provide a comprehensive understanding of the dyeing process and its outcomes. Recent advancements in dyeing technology, coupled with increasing environmental concerns, have emphasized the need for sustainable textile practices. By utilizing natural dyes and exploring optimal mordant combinations, textile industries can minimize their ecological footprint and offer consumers environmentally friendly options.[1] Furthermore, understanding the interplay between natural dyes and mordants can provide insights into the preservation and revival of traditional dyeing techniques. By harnessing the knowledge from traditional practices and combining it with scientific understanding, we can create a bridge between the past and the future, revitalizing age-old dyeing traditions while embracing modern sustainable approaches. In conclusion, this comprehensive study aims to contribute to the body of knowledge on natural dyeing by examining the effects of various mordant combinations on cotton fabric dyed with natural dyes derived from marigold flower, blueberries, beetroot, and blue butterfly pea flower. By elucidating the impact of mordant combinations on the dyeing process, this research has the potential to enhance the quality and sustainability of textile dyeing practices.[2]

MATERIALS

Cotton fabric: A fabric made from cotton fibers, which will serve as the substrate for dyeing experiments. Natural dyes: Extracts or pigments derived from marigold flowers, blueberries, beetroot, and blue butterfly pea flowers. These natural dyes will be used to impart color to the cotton fabric. Mordants: Substances used to enhance the affinity of the natural dyes for the cotton fabric and improve colorfastness. Different mordants, such as Aloe-Vera, Cream of tartar (C.T) Alum Eucalyptus Vinegar + C. TAlum + Vinegar + C. T, can be used in various combinations to explore their effects on the dyeing process and color outcomes. Stainless steel pots: Containers made of stainless steel, used for preparing dye baths and mordant solutions. Source of heat: A heat source, such as a Bunsen burner or hot plate, pH indicators, Stirring rods or utensils, Water, Measuring equipment, Labels and markers, Safety equipment:

METHODS
Step 1- Extraction Method
A] Extraction of dye from Marigold Flower (Tageteserecta L.)

To extract dye from marigold flowers, follow these steps: Collected fresh marigold petals and separate them from the flowers. Take the separated marigold petals and boil them in a pot containing three times the amount of water as compared to the petals. Allow the petals to boil in the water until the solution reaches the desired color. This process helps to extract the dye from the petals. As the boiling progresses, the volume of the solution will reduce. Continue boiling until the extract becomes approximately one-fourth (¼) of the initial amount of water used. Once the desired color is achieved and the extract has reduced to the desired volume, remove the pot from the heat source. Filter the extract to separate it from any residue or solid particles. This can be done using a fine mesh strainer, cheesecloth, or a coffee filter. Carefully pour the extract through the filter, allowing it to pass through while retaining any solid materials. Discard the residue that remains in the filter, as it contains the plant material that has been separated from the dye extract.[3]

Extraction of Dye from Blueberries & Beetroot

First, collect a batch of vibrant, blue-colored wild blueberries and place them in a pot. Ensure they are clean and free from any impurities. Next, wash the blueberries thoroughly to remove any dirt or debris. Once the blueberries are cleaned, gently crush them using a blender or a similar crushing device. This step helps to break down the berries and release their natural dye content. After crushing the blueberries, carefully filter the mixture to separate the liquid dye from the solid residue. The residue, consisting of the leftover berry pulp and skin, can be discarded, as we are only interested in the dye extract. The extracted dye is now ready to be used for various purposes, such as dyeing fabrics or creating artistic projects that require a beautiful blue hue. Similarly, the extraction process can be applied to beetroot to obtain its natural red dye. Wash the beetroot thoroughly, peel if necessary, and then crush it to release the dye. Filter the mixture to collect the vibrant red dye, which can be utilized for dyeing or other creative endeavors.[4]

C] Extraction of Dye from Blue butterfly pea flower(Clitoriaternatea)

To extract dye from Blue Butterfly Pea flowers (Clitoriaternatea), collect and chop the flowers into small pieces. In a pot, combine the chopped flowers with water at three times the flower volume and add 1 teaspoon of salt per cup of water. Boil the mixture until the desired color is achieved. Once boiled, allow it to cool slightly, then filter the extract to separate the liquid from the flower residues. Store the extracted dye in a glass jar or bottle in the refrigerator for later use as a natural coloring agent for fabrics.[5]

Mordanting

Mordanting is a crucial process in natural dyeing that enhances the color fastness and affinity of the dye to the fabric. It involves three stages:

Premordating

In this stage, the fabric, usually cotton cloth, is prepared by boiling it in a solution of alum and water, with a ratio of 5 grams of alum per liter of water, for about 10 to 15 minutes. This step helps the fabric to absorb and retain the dye more effectively.

During Extraction

Sometimes, mordants are added directly to the dye bath during the extraction of the dye from the source material (e.g., Blue Butterfly Pea flowers). Common mordants used at this stage include vinegar, alum, salt, among others. These mordants assist in binding the dye to the fabric and improve color intensity.[6]

Post Mordanting

Also known as washing, post-mordanting is the final stage of the mordanting and dye extraction process. After dyeing the fabric, it is thoroughly washed to remove any excess dye and mordants that have not been fixed to the fabric. This step helps to ensure that the colors remain vibrant and that the fabric is safe to use.

Drying

Remove the cotton cloth from the dye bath & leave it to dry at room temperature.

Washing & Post mordanting

The dried colored cotton cloth is then rinsed in a mordant solution of alum &water & leave to dry. After the fabric has been dyed using the extracted dye from Blue Butterfly Pea flowers (Clitoriaterna tea), the drying process is carried out as follows

Drying

Once the fabric has absorbed the dye and achieved the desired color, it is removed from the dye bath. The dyed cotton cloth is then taken out and left to dry naturally at room temperature. During this stage, the dye molecules further bond with the fabric fibers, resulting in better color fastness and fixation.

Washing & Post Mordanting

After the fabric has dried, it is essential to wash it to remove any excess dye that did not bind to the fibers during the dyeing process. The dried, colored cotton cloth is rinsed in a mordant solution containing alum and water. This post-mordanting step ensures that any remaining unbound dye is removed from the fabric and helps enhance the color's stability and permanence. After washing in the mordant solution, the fabric is once again dried, completing the dyeing process.[7]

RESULT AND DISCUSSION

Initially, the cotton cloth was subjected to dye extraction without any mordant, resulting in poor coloration, and the color quickly faded upon washing. To improve the dyeing process, the cotton cloth was pre-mordanted with alum before being dipped into the dye bath. The observations revealed significant improvements compared to the samples without any pre-mordanting. The cotton exhibited richer coloration than the untreated samples, and even after washing, it retained a relatively higher level of color intensity. Subsequently, the cotton cloth was pre-mordanted with alum and then immersed in a dye bath already treated with various mordants such as salts, vinegar, and alum. This combination produced even better results, with the cotton achieving a deeper and more vibrant color than the previous samples, and the color remained darker even after washing. These findings clearly demonstrate the positive impact of using mordants in the dyeing process. Furthermore, the effectiveness of different mordant strengths and application methods was evident, with stronger mordants and specific application techniques yielding superior outcomes compared to untreated samples. Thus, the strategic use of mordants plays a crucial role in achieving successful and long-lasting dyeing results on cotton fabrics.

CONCLUSION

In conclusion, the use of mordants significantly enhances the dyeing process of cotton cloth with Blue Butterfly Pea flower extract. When the cotton cloth was pre-mordanted with alum before dyeing, it showed a considerable improvement in coloration compared to samples without any mordant. Additionally, the post-mordanting process, where the fabric was immersed in a dye bath already containing mordants like salts, vinegar, and alum, resulted in even more vibrant and long-lasting colors. The strategic application of mordants demonstrated that stronger mordants and specific mordanting techniques yield better results. Overall, mordanting plays a crucial role in achieving superior dyeing outcomes, ensuring that the colors adhere well to the fabric and remain vivid, even after washing. By understanding and employing appropriate mordanting techniques, one can achieve high-quality and durable-colored textiles, showcasing the versatility and beauty of natural dyes.

CONFLICT OF INTEREST

All the authors declared that there is no any conflict of interest.

ABSTRACT

Rich spectrum information can be extracted from targets using multispectral imaging, substantially enhancing the capabilities of conventional imaging technologies. In the fields of agriculture, the military, medicine, industry, and meteorology, multispectral imaging is frequently utilized. Multispectral images have redundant information, thus pre-processing is required to decrease the dimension. Most researchers now use pre-processing techniques before classifying data in recent years. This study suggested a unique deep learning model-based method for extracting multispectral picture features. Here, noise removal and smoothing pre-process the raw multispectral image. The retrieved features from the processed images are then classified using the arbitrary object indexing model (ANGCBF_AOI), Adapted Normalized Graph cut Boundary Fuzzy Classifier, and Q-reinforcement with kernel component (QRKC). Multispectral data have grown in size as a result of the increased need for information about objects and advances in sensor resolution. For the multispectral picture collection, experimental analysis is done in terms of accuracy, precision, recall, and F-1 score.

Keywords: multispectral image, feature extraction, deep learning model, kernel component, arbitrary object indexing.

Arun Prasad and Subiramaniyam

INTRODUCTION

The development of sensor technology has allowed multispectral sensors to currently record earth's surface reflectance in hundreds of frequency bands. Multispectral images can therefore be utilized for a variety of tasks, such as environmental monitoring as well as categorization. According to the Hughes phenomenon, for instance, classification accuracy decreases as dimensionality increases and the number of training samples is constrained. Strong correlations between [1] neighbouring and nonadjacent bands in multispectral images are possible, which reduces the amount of data is utilized for further analysis, such as categorization. The extraction of certain properties is necessary for accurate categorization. This work introduces the novel unsupervised feature extraction method known as Band Correlation Clustering (BCC). Proposed technique consists of three main steps: calculating bands' correlation coefficient; clustering bands using correlation coefficient matrix; calculating means of every cluster using a novel feature extraction method. Real-time multispectral image classification is aided by having a large set of picture classifications, which is only achievable using a "machine learning approach"[3].

Convolutional Neural Networks (CNN) have received accolades for being the best in class in a relatively short period of time due to its exceptional performance in terms of accuracy as well as dependability[4]. In comparison to traditional learning procedures, deep learning profound multiple levelled depictions necessitates an incredibly larger arrangement of the image collection. Regardless of the fields, multispectral pictures are being used in many different applications. The image-based Authentication System (AS) is one of the programmes that is commonly utilized. These days, there is a lot of concern about image uprightness validation because advanced photographs can be successfully altered and the adjustment is difficult to spot. Currently, a growing number of tactics are being researched to handle the problems with image correction. Because sophisticated images can be easily altered and because the RGB (Red, Green, and Blue) adjustments might vary, image-based identification and verification systems are becoming more and more popular. Iris and fingerprint pictures are used in biometric authentication systems to verify users [5]. SVM approach is evaluated in terms of classification accuracy and processing speed. The generated features are fed into two supervised classifications—the nonparametric Support Vector Machine (SVM) and parametric Machine Learning (ML)—for evaluation procedure. Use of unsupervised feature extraction by clustering yields comparable outcomes. An analysis of the data shows that suggested BCC performs well in terms of computing costs to improve classification step accuracy [6].

Related works

Several ML techniques, like as RF, SVM, ANN, decision trees, and Max Ent, are widely applied in wildfire science [7]. Furthermore, burned sites were identified utilizing dense harmonic time-series of Land sat data[8]. Additionally, RF as well as seed-growing method based on time-series Landsat-8 photos and GEE were used to map all burned areas worldwide [9]. For burned-area mapping in Mediterranean region using one post-fire Landsat-5 TM image, author [10] examined a number of ML methods, including ANN, SVM, and Ada Boost Classifier (Ada Boost), and discovered that all methods demonstrated comparable accuracy. Variance imposed by approaches is less than variance imposed by regionally distinct factors in research sites, according to work [11] that examined 10 categorization methods. Additionally, study [12] employed LR to determine with tolerably high accuracy the probabilities of burned scars from a single post-fire Land sat 7 ETM+ image. In the Mediterranean region, author [13] suggested a (semi)-automated multi criteria technique for burned area mapping using uni-temporal Landsat TM photos. In spite of its ability to minimize commission errors by roughly 21%, this soft aggregation method could only reduce omission errors by less than 3%. According to work [14], informative channels were recalibrated with greater weights employing FC layers and channel-wise attention to recalibrate various feature channels. Convolutional layers were used by the author [15] to suggest a spatial attention mechanism, and the learnt attention map can be used to identify informative regions in every feature map. In [17], a simplified version of [16] was put out, in which FC layers as well as dilated convolutional layers, created channel and spatial attention maps. In [18], they suggested creating a symmetric network employing spatial un pooling as well as de convolution layers to enhance the FCN

model. This improved efficiency when categorising things in the image at different resolutions, but it still created a coarse label map. The categorization limits were refined by authors using a conditional random field (CRF) in post-processing stage. The main drawback of this de convolution network was that it took longer to train and used more memory than [19]. Using the Res Net DCNN, the Deep Lab semantic segmentation network was created.

Deep Lab uses arous convolutions in place of traditional convolution layers to reduce the effects of down sampling and improve the definition of segmentation boundaries. Although effective size of an convolution filter rises, number of trainable parameters stays constant since the space in between the sample points is filled with zeros. SVM was utilized in [20] to produce binary pictures, and linked component labelling, parametric contour tracing, and piecewise linear polygonal approximation were all employed to evaluate lake shapes for change detection analysis. A moderate-resolution image spectrora diometer (MODIS) dataset was used to extract and track lake surface dynamics when the SVM classifier was introduced in [21]. The Adaptive Boosting (Ada Boost) technique was suggested in Work [22] as a means of extracting the surface water bodies. Findings demonstrate that Ada Boost outperforms RF and DT both qualitatively as well as quantitatively. In [23], a Random under sampling boosting technique was put forth as well as used to extract the river network from Cyclone Global Navigation Satellite System (CYGNSS) data. With inclusion of further under sampling in every iteration, it is comparable to the Ada Boost method. The integrated pixel as well as object-based ML architecture was put forth by author [24] for the extraction and identification of water bodies.

System model
This section discuss novel technique for multispectral image feature extraction and optimization is estimated using Q-reinforcement with kernel component (QRKC) with Adapted Normalized Graph cut Boundary Fuzzy Classifier and the arbitrary object indexing model (ANGCBF_AOI). Feature is extracted in terms of SIFT, GLCM, geometric, and other features that are optimized with the BFMOA (boundary fuzzy model based in object arbitrary indexing) model. Proposed architecture is shown in figure-1. To increase quality for a more efficient process of picture enhancement as well as analysis, data is first level-0 preprocessed. To increase the size of this dataset as well as lessen classification issues around edges, training images were randomly cropped into patch tiles of 256 256 pixels. There are 197 validation patches and 1837 training patches altogether. As seen in Table 3, data augmentation was used to improve data set as well as prevent over fitting. On the input images, we performed rotation, area crop, aspect, colour jitter, step-scaling resize between 0.7 and 1.2 with step 0.1, flip operation with probability 0.5, mirror operation with probability 0.5, and additional operations. In order to standardize these augmented images between 0 and 1, the mean was subtracted, and the scale was set to unit variance.

Q-reinforcement with kernel component (QRKC)
In RL, the agent constantly engages with the world and gains knowledge through "trial and error," or the rewards provided by the environment. The agent "exploits" and "explores" during the learning process, adjusting the evaluation value of each action based on feedback from the environment, discovering the best course of action that would ultimately yield the most amount of word. The primary distinction between RL and supervised learning is that, as opposed to being given the right response, the agent in RL receives a reward signal from environmental feedback that signals the effectiveness of the action. This model's distinguishing feature is that the relationship between the reward and the subsequent state only applies to current state and action, not to previous state and action. A Markov decision process can be used to model a classification problem. The state s can be viewed as a sample, and the action to ascertain the class to which the sample belongs can be viewed as the state a. The environment will present a sample to the agent at each phase, and the agent will then decide on an action. Then, as illustrated in formula (1), the environment feeds back the reward to the agent based on the action the agent chose:

$$r_{t+1} + \gamma^* \max Q_t(s_{t+1}, a_{t+1}) \tag{1}$$

where the t-th sample's label, t l, is. Finding the best technique to earn more rewards is the agent's aim. Fig. 1 depicts the overall flow of the Markov decision process for the categorization problem.

State S Representative state space. The training samples determine how the environment is in its current state. The agent receives the first sample X1 as its initial state 1 s at the start of training, and state j s at time j corresponds to the j-th sample X j.

Action A Action is connected to the sample's label. The agent's chosen course of action is to forecast a class label. P stands for the likelihood that the existing condition will change once an action is taken. The transition probability p in this study is deterministic. Order of data set determines the agent's subsequent condition.

Policy π The chance of performing different actions at state t s is represented by the probability distribution function.

Reward R The instantaneous reward provided by the environment, which can gauge whether an agent's activities were successful or unsuccessful. Agents choose the appropriate policy based on the potential payoff.

Return G The cumulative reward, where is the discount factor, reflects a long-term advantage. To maximize profits is the goal of RL.

Q-learning function

The predicted reward of the agent executing the action t at the state t s is represented by the Q function in Q-learning by eqn (2)

$$Q_{t+1}(s_t, a_t) = Q_t(s_t, a_t) + \alpha^*\big(r_{t+1} + \gamma^*\max Q_t(s_{t+1}, a_{t+1}) - Q_t(s_t, a_t)\big) \tag{2}$$

The Bellman equation allows for the following expression of the Q function by eqn (3)

$$Q_{t+1}(s_t, a_t) = \alpha^*\big(r_{t+1} + \gamma^*\max Q_t(s_{t+1}, a_{t+1}) - Q_t(s_t, a_t)\big) \tag{3}$$

By resolving the ideal Q function, we can arrive at the ideal tactic π*. The greedy strategy can be used to find the best strategy if the best Q function is known. The following updates to the strategy are made by eqn (4)

$$\pi(a, s) = \{1 \text{ if } a = \arg\max Q(s, a) \tag{4}$$

To obtain the Q-learning formula's most recent version by eqn (5):

$$Q_{t+1}(s_t, a_t) = Q_t(s_t, a_t) + \alpha^*\big(r_{t+1} + \gamma^*\max Q_t(s_{t+1}, a_{t+1}) - Q_t(s_t, a_t)\big) \tag{5}$$

where γ is learning rate, and $r_{t+1} + \gamma^*\max Q_t(s_{t+1}, a_{t+1}) - Q_t(s_t, a_t)$ is Temporal-Difference Learning(TD) error, $r_{t+1} + \gamma^*\max Q_t(s_{t+1}, a_{t+1})$ is target evaluate of Q value. The goal of the Q function's update is to have $Q_t(s_t, a_t)$ roughly match the target estimate of Q. First, even for simple real-world issues, keeping a precise table for Q-function is impractical due to magnitude of S. Second, because it partially derives from a linear optimization, transition from one state to next is too complex to be represented by a model. To get around these issues, we use a NN Q that is parametrized by and optimized using a specific gradient method, similar to DQN (Deep Q Network) method, to approximate Q-function. The policy produced by Q-network is defined as πθ(s) = arg min a∈A Q̂(s, a; θ). In that scenario, standard Temporal Difference loss applied to train the Q-Network can be expressed using the straightforward formula by eqn (6).

$$L(\theta) = \mathbb{E}_{s, a \sim \rho(-)}\Big[\big(Q^{\pi_\theta}(s, a) - \hat{Q}(s, a; \theta)\big)^2\Big]_X \tag{6}$$

where the agent's behaviour distribution is. It should be noted that in eqn (3), parameter naturally affects observed Q-values through policy μ. Such a loss is quite intuitive: if L(θ) = 0 and Qπθ is consistent with Q(), then any B&B tree constructed by agent Q()is optimal with respect to Q() with probability 1.

Kernel component network

An 8-layer neural network is the proposed Kernel component. Figure 3 depicts the network architecture, and the following describes how each layer operates:

First layer (input layer) Although this layer doesn't perform any operations, it is in charge of pre-processing the input game graphics, which entails enlarging the images to 80 × 80 and timing the convolution procedure.

Second and third layers Convolutional layers make up both of these levels. The second layer has eight convolutional layers, and the third layer has four. Convolution kernels are 5 × 5 with a 1 step in size. Parameters of convolution kernels on both layers are obtained utilizing PCA evaluations, in contrast to parameters of convolution kernels in conventional CNN that are acquired from methods. First, images were gathered through game play as well as methods of random actions served as training examples before the convolution kernel parameters were calculated. There were n training samples in all, as shown by X = x1, x2, x3,..., xn. After then, additional samples are taken in the same manner to create the training set $X = \{\overline{x_1}, \overline{x_2}, \overline{x_3}, \dots, \overline{x_n}\}$ by eqn (7).

$$(k_h \times k_w) \times \left(\left(\frac{h-k_h}{s}+1\right) \times \left(\left(\frac{w-k_w}{s}+1\right)\right)\right) \tag{7}$$

Calculating xe1's covariance matrix is the next step. First, mean m of eX is determined with a size of 1×5776. Next, the new $\overline{x_n}$ is created by subtracting m from the original $\overline{x_n}$, and last, the new $\overline{x_n}$ is multiplied by its own transport. The same procedure is carried out on further training samples, and $\overline{x_n}$ is then calculated using the formulas in eqn (8). Covariance matrix is 25 × 25 in size.

$$\sigma = \frac{\sum_{i=1}^{n} \overline{x_i}\overline{x_i}^T}{\left(\left(\frac{h-k_h}{s}+1\right) \times \left(\left(\frac{w-k_w}{s}+1\right)\right)\right)} \tag{8}$$

Calculations of the aforementioned stages can also be used to derive the parameters of the four convolution kernels on third layer. However, a 2-layer convolution operation is performed on X = x1, x2, x3,..., xn to obtain XL2 = x11, x12,..., x18, x21, x22,..., x28.

Fourth layer Original input image will result in 32 feature maps (1 × 8 × 4) after second as well as third layers have undergone convolution operations. By superimposing the second and third layers, effects resembling those of multi-layer CNN are generated. But in order to produce a nonlinear change of the original activation function layer, we utilized block-wise histograms. The detailed operating procedure is displayed below. Feature map is utilized for binarization once third layer is convolved and is expressed as XL3, XL3 = x11, x12,..., x14, x21, x22,..., x24,...,..., x24,..., x84. The first step is to group the XL3 every four pieces, resulting in a total of n groups of feature maps, where n is number of convolution kernels on second layer. According to operation depicted in eqn (9), $\overline{x_n}, \overline{x_n}$ is 72 × 72. The next step is to divide xen into four blocks, each 18 by 18, denoted by $\widetilde{x_{1n}}, \widetilde{x_{2n}}, \widetilde{x_{3n}}, \widetilde{x_{4n}}$... The four blocks are combined into a 1024-dimensional vector and utilized for histogram statistics. Then, similar operations are performed on further collections of feature maps, and as this layer's output, all of them are combined into an 8192-dimensional eigenvector by eqn (9).

$$\widetilde{x_n} = \sum_{i=1}^{4} 1^{4-i} x_{ni}. \tag{9}$$

Fifth, sixth, and seventh layers Activities of fifth, sixth, and seventh layers, which are full connection layers with dimensions of 8192, 4096, and 512, respectively, are same as those of other typical, CNN.

Eighth layer Output layer is eighth and final layer. Output dimension, which in this paper was fixed at 2, is maximum number of actions that are managed by games.

Arun Prasad and Subiramaniyam

Adapted Normalized Graph cut Boundary fuzzy estimation

The segmentation utilizing adaptive normalized graph cuts based on divisions for inverse shape determination is part of the initial phase. Instead than concentrating on limited features and consistencies, adaptive normalized cut is a global measure for segmenting graph utilized in road picture data. This technique is employed as a criterion to assess total similarity and total dissimilarity between several sets of road photographs. The segmented road photos are classified in the second stage using a boundary fuzzy classifier to determine the boundary in reverse. In order to develop a classification algorithm with a large capacity for simplification, boundary fuzzy classifiers are utilized. In order to demonstrate the border fuzzy classifier's generalizability in road photos, a large number of computational experiments are conducted. Classification assurance measures how accurately a border fuzzy classifier classifies an input segmented road image. An input road image is sent to class with highest product of compatibility as well as certainty factor by the fuzzy conjecture procedure. The final stage involves the recognition of images and location determination using an arbitrary object indexing. The road photos constitute the object, and utilize ing arbitrary object indexing, the precise location is examined. The constant vector's indexing information is all contained in the index table by equation (10).

$$\bar{R}(f) = \sum_{p \in P} E_p(f_p) + \lambda \sum_{p,q \in N} W_{pq}(f_p, f_q) \tag{10}$$

Where N is region method, Ep(fp) is result of giving the tag $f_p \in T$ to p, $\overline{Wp}$, $q(fp, fq)$ is result of giving pair p and q the tags fP, ƒq∈T to identify shape after segmentation. If and only if pair wise interfaces probable Wp, q fulfils, Equation (11) employs adaptive normalized graph cuts.

$$Wp, q(0,0) + Wp, q(1,1) <= Wp, q(0,1) + Wp, q(1,0) \tag{11}$$

By figuring out the forms, the minimum R(f) can be calculated quickly with modified normalized graph cuts. Equation 1 is referred to as a statistical term. Statistics term presupposes that entity consequence for allocating pixel 'P' to "backdrop" and "item" respectively. Smooth term indicates the shape of the next quantity in Equation 1. The "boundary" characteristics of segmentation are included in the smooth term. Wp, q should be understood as the result of a break between p and q. Since fuzzy logic can grade truth values, its values will fall between 0 and 1. This approach can be used to derive fuzzy rules in the IF... THEN format.

Definition 1 Let X be a set with elements x. Now, it is given as, X = {x : x ∈ X}.
Definition 2 Assume X has a subset A. A is referred to as a fuzzy set if it functions according to a membership dependent on circumstances.

Rules Nothing but IF...THEN sentences constitute rules.
Fuzzy Rules Rules create qualitative judgements using a scale of truth values. They contain IF and THEN sections.
Rough sets that are fuzzy-oriented enclose linked data in uncertainty. The need for user-supplied data is not necessary, but fuzzy-rough set feature choosing aids in significantly reducing the separate or real-valued crying knowledge. This technique can be used to continuous data and is inherently useful for categorizing datasets by eqn (12). $\mu R_p X(x) = \inf_y \Psi(\mu R_p(x, y), \mu X(y))$ $\mu R_p X(x) = \sup_y \gamma(\mu R_p(x, y), \mu X(y))$

$$P: \mu R_p(x, y) = \gamma_a \in p\{\mu R_a(x, y)\} \tag{12}$$

Similarity of objects x and y on feature an is a subset of feature μRa. In a conventional rough set, the relation is used to define μRp(x, y) crisp positive region by eqn (13).

$$\mu R_p(x, y) = \gamma_a \in p\{\mu R_a(x, y)\}_{\gamma_P'(D)} \tag{13}$$

Fuzzy oriented rough degree on dependency of $\gamma_P'(D)$ to subset P is given as $\gamma_P'(D) = \frac{\sum_x \mu_{POS, P(D)}(x)}{|U|}$

68186

Arun Prasad and Subiramaniyam

A fuzzy oriented rough reduced set R is subset of C and D∈ R such that for all $a \in R, \gamma'_R(D) = \gamma'_C(D)$ and $\gamma'_{R-\{a\}}(D) \neq \gamma'_R(D)$

Arbitrary Object Indexing

Consider the predictable groups of multispectral images on the image plane, α where I1, I2, and I3, β are the group's multispectral images, and J1, J2, and J3 are the group's image points. The angle created from the point and the picture as well as the ratio of length to discover location denoted by a1/a2 and b1/b2 are used to locate multispectral images. Both ratio and value of affect the apex impact α. A technique to locate objects using an indexing table and image groups is developed using the probabilistic apex effect. For various arbitrary criteria, performance of image group arbitrary indexing of road photos is evaluated. To isolate image plane, image point, and group, utilize image group mentioned above. After classification, the arbitrary object indexing system efficiently recognizes the multispectral images.

RESULTS AND DISCUSSION

The major estimations considering separating surveyed are analyzed in the principal subsection of this portion. The nuances of the used datasets are given in the resulting portion. Then, the settings of estimations to show up at the arranged preliminaries are moreover given in this part. Finally, the preliminary outcomes are presented and inspected. The primary measurements in view of apportioning assessed are talked about in the main subsection of this segment. The subtleties of the utilized datasets are given in the resulting segment. Then the settings of calculations to arrive at the detailed trials are likewise given in this part. At last, the exploratory outcomes are introduced and talked about. In this part, we present revelations of various tests to condemn show of proposed method. A PC with going with features was utilized to test proposed creamer method: With a 32-bit working framework, an Intel(R) Core(TM) i5-7500 central processor, 4 GB of Smash, Windows 7, NumPy, SciPy, Pandas, Keras, and Matplotlib systems, and the Python 2.7 programming language, Dataset description This data set comprises of 7 items obtained in apparent, close infrared and warm range. Each subject is caught in an alternate center position with the goal that the data set can be utilized for an improvement of auto-center calculations. An aggregate sum of pictures is 420. Photos gained in apparent range are separated into 7 sets, while each set contains 12. There are incorporated these articles: earphones, console, keys, amplifier, blender, shades and guitar. Pictures in data set of pictures in visual range were procured utilizing Nikon D80 camera with 50 mm f/1.8D AF Nikkor focal point. We moved physically centering ring in 5 mm steps. No extra lighting was needed thusly we didn't utilize streak light. Photos obtained in close infrared range are partitioned into 7 sets, while every set contains 21. There are incorporated these articles: building, vehicle, hall, head, console, office work area as well as pens. All pictures in data set of infrared pictures were caught with Group EOS 350D camera with Ordinance EF-S 18-55 mm, f/3.5-5.6 focal point. Camera was acclimated to catch EM radiation in NIR range by eliminating infrared channel before CMOS picture sensor. We mounted a B+W 093 infrared channel on focal point. This channel impedes all noticeable light as well as permits just infrared light over 850 nm to pass. We moved physically the centering ring in 1 mm steps in this analysis which brought about 21 pictures in every set. We utilized implicit glimmer to light indoor scenes. Open air scenes were shot without extra lighting. The above table-1 shows processing of various dataset based on segmentation and classification using proposed techniques. the input image of various dataset has been segmented and classified multispectral image is shown using proposed technique. Confusion matrix for proposed model based on both testing and training model of the input multispectral dataset is shown in figure 4 (a), (b).To process the last presentation of a bunching calculation as far as exactness, one can first relabel its result parceling so as to have maximal coordinating with the ground genuine names and afterward count the level of the genuine grouped examples. So the blunder rate not set in stone subsequent to tackling the correspondence issue between the marks of determined and known groups. The precision recall analysis of proposed model for training and testing is shown in figure 5 (a), (b).The misfortune is a summation of mistakes created by every cluster in preparing or approval sets, which demonstrates how appropriately or severely a prepared method performs after every cycle of enhancement.

Arun Prasad and Subiramaniyam

A weighted scanty soft max cross-entropy misfortune capability is utilized to follow presentation in preparation stage. It especially picks loads as indicated by the ongoing marks and applies them as group loads, and afterward joins the computation of soft max activity as well as cross-entropy misfortune capability to give an all the more mathematically stable inclination. It very well may be seen that the preparation misfortune steadily diminishes with an expansion in preparing steps. All organizations show combination towards zero with some negligible jitter somewhere in the range of 0.01 and 0.05. ROC analysis for proposed model for testing and training model is shown in figure 6 (a), (b) which has been analyzed for input dataset. Here, the outcomes were addressed by "1" and "0", "- 1", "1" implies that the order (mean) precision got by proposed model is fundamentally higher than those of different strategies. " 0" really intends that there is no massive contrast between them. " -1" implies that the exhibition of proposed model is fundamentally more awful than those of different strategies. Table-2 shows analysis based on testing and training data. Here parameter analyzed are accuracy, precision, recall, f-1 score. For test data proposed technique accuracy 95%, precision 91%, recall 99.5%, f-1 score 90.13%; while existing ANN attained accuracy 85%, precision 80%, recall 70%, f-1 score 69%, FNN accuracy 88%, precision 85%, recall 76%, f-1 score 73%. The proposed technique accuracy 95%, precision 90%, recall 99.5%, f-1 score 89.78%; while existing ANN accuracy 86%, precision 81%, recall 72%, f-1 score 70%, FNN accuracy 89%, precision 86%, recall 76%, f-1 score 75% for training dataset as shown in figure 7 (a), (b). These samples, which are ground truth labels that assess the suggested recognition system, are produced from the photo interpretation result.

 For training and classification purposes, the dataset is randomly split into two equal portions. The term Principal Feature (PF) can be used to denote those features contributing to the best answer, as goal of study is to determine combination of features that performs better during classification. The elements chose in every DL method can reflect various degrees of semantic data from low to high. Profound convolution layers during encoder branch progressively separate low-goal portrayals. Different amounts of semantic data, ranging from low to high, can be reflected in features chosen in every DL method. The encoder branch's deep convolution layers gradually extract high-level characteristics, such as contour features as well as hotspot distribution brought on by burned areas, from low-resolution representations (or representations at a low level). Decoder branch with up sampling subnet work plans to recuperate high-goal portrayals (i.e., exact division) like copied certainty, precise copied outline, and unburned regions around copied regions. Note that not every one of the highlights can be pictured well or seen naturally, so here we select main component in a few regular layers in element representation results, which are typical peculiarities in DL field.

CONCLUSION

This research propose novel technique in multispectral image feature extraction using deep learning model based on Adapted Normalized Graph cut Boundary estimation with Q-reinforcement with kernel component (QRKC)will be implemented for the feature extraction. Through the extracted features Objects are indexed means we need to assign the attributes to the variables we extracted in the images. Those indexed features are optimized for dimensionality reduction to increase the processing time. The division capacity of 25 elements was inspected and a blend of 9 highlights was viewed as extremely productive with generally speaking order precision of 84.4%. The outcomes are very reassuring on the grounds that the proposed highlight blend accomplishes higher order precision than standard consecutive choice techniques. It is worth focusing on that the order exactness rises when a piece of 25 elements is utilized. This finding adjusts to past perceptions that highlight determination can bring about exactness improvement. The preliminary discoveries show that the calculation acts in accordance with the prescribed procedures. Thus, a general model is made, and it very well may be utilized for an assortment of picture informational collections. In like manner, we will actually want to isolate the more unambiguous classes like volume all the more precisely. later on scope isolation of blended class gatherings, it has not yet been explored alongside profound learning method, and it very well may be considered for future exploration headings.

ABSTRACT

Chronic kidney disease (CKD), also referred to as chronic renal disease, is a condition resulting from prolonged kidney damage persisting over months or years. Typically, the identification of this ailment involves screening individuals recognized to be susceptible to kidney issues. Early detection holds paramount importance in managing and treating the disease effectively. This research introduces machine learning methodologies, encompassing K-nearest neighbor (KNN), decision tree (DT), naive Bayes (NB), and support vector machine (SVM) algorithms, aiming to predict CKD in its early stages. The proposed approach seeks to enhance the timely recognition of kidney diseases, facilitating prompt intervention and elevating the quality of patient care.

Keywords: SB classifiers, Chronic kidney, NB, and KNN, DT.

INTRODUCTION

In the contemporary context of public health, chronic kidney disease (CKD) stands out as a significant threat. Routine laboratory tests play a crucial role in identifying CKD, and available treatments can not only prevent its onset but also slow down its progression, mitigate complications arising from reduced Glomerular Filtration Rate (GFR), reduce the risk of cardiovascular disease, and enhance both survival rates and overall quality of life. Factors such as inadequate water intake, smoking, poor dietary habits, insufficient sleep, and various other elements contribute to the development of CKD. In 2016, a staggering 753 million individuals worldwide were affected by this condition, with 417 million being female and 336 million male. Unfortunately, CKD is often diagnosed in its advanced stages, occasionally leading to renal failure. The prevailing diagnostic method relies on urine analysis, incorporating serum creatinine levels and employing diverse medical techniques such as ultra sonography and

screening. Screening processes target individuals with hypertension, a history of cardiovascular disease, existing illnesses, or a family history of renal disease. This diagnostic method involves assessing the albumin-to-creatinine ratio (ACR) in a first-morning urine sample and estimating GFR based on the serum creatinine level. To enhance prediction accuracy, this research focuses on leveraging machine learning techniques such as ACO and SVM, emphasizing feature reduction and selection for optimal results.

MATERIALS AND METHODS

Research methodology and techniques are described below for future proposed work.

LITERATURE REVIEW

[J. Snegha, 2020][10] suggested a research using back propagation neural networks and the Random Forest algorithm, among other data mining approaches. Here, they evaluate the two algorithms and discover that the BackPropagation technique produces the greatest results since it makes use of the Feed forward Neural Network, a supervised learning network [Mohammed Elhoseny, 2019] This paper proposed is designed for the selection of features related to chronic kidney disease (CKD), and it employs a combination of Density-based feature selection and Acute Component Optimization (ACO) techniques. Additionally, the system incorporates wrapper methods to facilitate feature selection. [Baisakhi Chakraborty, 2019][9] The proposal entails the development of a CKD prediction system using a range of machine learning methods, such as K-Nearest Neighbor, Logistic Regression, Decision Tree, Random Forest, Naïve Bayes, Support Vector Machine, and the Multi- Layer Perceptron Algorithm. These techniques will be applied and assessed based on accuracy, precision, and recall metrics. Following a comprehensive evaluation, the Random Forest algorithm is chosen as the optimal solution for implementing this CKD prediction system. [Arif-Ul-Islam, 2019] The proposed system involves disease prediction using Boosting Classifiers, Ant-Miner, and the J48 Decision Tree. The primary objective of this research is twofold: first, to assess the effectiveness of boosting algorithms in the detection of CKD, and second, to extract rules that elucidate the relationships among CKD attributes. The experimental findings demonstrate that Ada Boost performed slightly less effectively than LogitBoost in terms of performance. [Nilesh Borisagar, 2017] Outlined is a research work that employs the Back Propagation Neural Network algorithm for predictive purposes. This system explores the use of various algorithms, including Levenberg, Bayesian regularization, Scaled Conjugate, and resilient back propagation. For implementation, MATLAB R2013a is utilized. After considering training times, it is observed that both the scaled conjugate gradient and resilient back propagation algorithms exhibit greater efficiency compared to Levenberg and Bayesian regularization.

[S.Belina V, 2018] A proposed research work has been put forth, which combines the use of Extreme Learning Machine (ELM) and Ant Colony Optimization (ACO) for predicting Chronic Kidney Disease (CKD). The classification process is carried out using the MATLAB tool, with ELM featuring some specific constraints in the optimization process. This approach represents an enhancement within the context of Sigmoid additive types of Single Layer Feed forward Networks (SLFNs). [Siddheshwar Tekale, 2018][8] A research work has been detailed, employing machine learning techniques such as Decision Trees and Support Vector Machines (SVM). After a thorough comparison of these two methods, it was ultimately determined that SVM yields the most favorable outcomes. Furthermore, the prediction process is notably time-efficient, enabling doctors to promptly assess patients' conditions within a shorter timeframe. [Guneet Kaur, 2017][7] A research work has been suggested for the prediction of Chronic Kidney Disease (CKD) using Data Mining Algorithms within the Hadoop framework. This system leverages two data mining classifiers: K-Nearest Neighbor (KNN) and Support Vector Machine (SVM). In this system, predictive analysis relies on the manual selection of specific data columns. Notably, the SVM classifier demonstrates superior accuracy compared to KNN.[Neha Sharma, 2016] A research work has been put forward to analyze a patient's kidney disease and automatically compute results based on the patient's dataset. This system employs a rule-based prediction method and utilizes a neuro-fuzzy approach to derive outcomes through

mathematical calculations. [Kai-Cheng Hu, 2015][6] A research work has been suggested that employs an Ant Colony Optimization (ACO) approach for clustering, utilizing multiple pheromone tables. In this system, the problem is segmented into various patterns based on their distinct features. Two separate pheromone tables are utilized: one for tracking promising information and the other for storing unpromising details. This dual-table approach enhances the likelihood of exploring different search directions.

DATASET AND METHODS

Dataset

The dataset we utilize in this context is sourced from the publicly available CKD Dataset found in the UCI repository. This dataset comprises 400 samples, categorized into two distinct classes. Among its 25 attributes, 11 are numeric, 13 are nominal, and one serves as the class attribute. It's important to note that this dataset contains instances with missing values. The dataset's information is derived from patient data, including details such as age, blood pressure, specific gravity, albumin, sugar, red blood cells, and more. Chronic Kidney Disease (CKD) can be attributed to conditions like diabetes and hypertension. Diabetes has a significant impact on multiple organs, often leading to elevated blood sugar levels. Detecting the disease in its early stages is crucial. This study enhances several machine learning techniques to improve disease prediction. CKD is caused due to diabetes and high blood pressure. Due to Diabetes our many organs get affected and it will be followed by high blood sugar. So, it is important to predict the disease as early as possible. This study improvises some of the machine   learning techniques to predict the disease.

METHODS

Proposed System Architecture

After this all-procedure classification and scaling machine learning algorithms will be applied for acquire desirable results. Following testing, result analysis and comparison will be done for proposed research work. Same methodology will be applied for training dataset. As delineated in the previously presented system architecture, the chronic kidney disease (CKD) dataset undergoes a division into two components: the training set and the test set. Within the test dataset, the Synthetic Minority Over-sampling Technique (SMOTE) is utilized for sampling. This technique introduces additional diversity to the dataset, serving to mitigate the risk of over fitting and address potential challenges associated with biased decision boundaries that may arise in the presence of imbalanced data. Following the application of SMOTE, the Min-Max normalization technique is implemented—also recognized as feature scaling. In the realm of machine learning, Min-Max normalization transforms numerical values into a predefined range, typically spanning from 0 to 1, while preserving the original relationships among values. Following this, a comprehensive process involving the application of classification and scaling machine learning algorithms is executed to yield desirable outcomes. Upon the conclusion of the testing phase, an analysis of results and comparisons will be undertaken for the proposed research work. The same methodology is consistently applied to the training dataset to ensure uniformity and reliability in the assessment of outcomes.

Pre-Processing

Data Pre-Processing is that stage where the data that is distorted, or encoded is brought to such a state that the machine can easily analyze it. A dataset can be observed as a group of data objects. Data objects are labelled by a number of features, that ensures the basic features of an object, such as the mass of a physical object or the time at which an event ensured. In the dataset there may be missing values, they can either eliminated or estimated. The most common method of dealing with missing values is filling them in with mean, median or mode value of respective feature. As object values cannot be used for the analysis, we have to convert the numeric values with type as object to float64 type. Null values in the categorical attributes are changed with the most recurrent occurring value current in that attribute column. Label encoding is done to translate categorical attributes into numeric attribute by conveying each unique attribute value to an integer. This automatically changes the attributes

Ronak Bhalala *et al.,*

to int type. The mean value is premeditated from each column and is used to replace all the missing values in that attribute column. For this function we are using a function called imputer which is used to find the mean value in each column. After the replacing and encoding is done, the data should be trained, validated and tested. Training the data is the part on which our algorithms are actually trained to build a model. Validation is the part of the dataset which is used to validate our various model fits or improve the model. Testing the data is used to test our model hypothesis. Various applied classifiers for proposed work is examined below.

KNN

In pattern recognition, the K-Nearest Neighbor algorithm (K- NN) is a non-parametric method used for classification and regression. In both cases, the input consists of the K closest training examples in the feature space. K-NN is a type of instance-based learning. In KNN Classification, the output is a class membership. Classification is done by a majority vote of neighbours. If K = 1, then the class is single nearest neighbor. In a common weighting scheme, individual neighbour is assigned to a weight of 1/d if d is the distance to the neighbour. The shortest distance between any two neighbours is always a straight line and the distance is known as Euclidean distance [7]. The limitation of the K-NN algorithm is it's sensitive to the local configuration of the data. The process of transforming the input data to a set of features is known as Feature extraction. In Feature space, extraction is taken place on raw data before applying K-NN algorithm. The steps involved in a K-NN algorithm. In summary, the K-NN algorithm involves the following steps:

1. Determining the K nearest neighbors based on the chosen distance metric.
2. Assigning class membership through a majority vote among these neighbors.
3. Potentially using a weighted scheme to account for neighbor distances.
4. Recognizing that K-NN's performance can be affected by local data configurations.

Optionally, performing feature extraction to enhance the input data representation before applying the algorithm.

NB

Naive Bayes is a classification method based upon Bayes Theorem which computes the likelihood for every attribute. It selects the outcome with highest probability. This classifier assumes the features are independent and that the existence of a specific feature in a class is not linked to the existence of any other feature. All the properties independently make a contribution to the probability, even if the features are dependent on other features. Naïve Bayes technique is mostly applicable for big datasets. It is elementary known to give exceptionally good results. Bayes theorem works on conditional probability. Conditional probability is the possibility of an occurrence to happen, given that some other event has already occurred. The equation to calculate conditional probability is given as

P(Hyp|Evi)=P(Evi|Hyp)*P(Hyp)/P(Evi)   *(1)*

Where, P (Hyp) is the possibility of hypothesis Hyp being true. P (Evi) is the possibility of the evidence (unrelated to the hypothesis). P (Evi|Hyp) is the possibility of the evidence when the hypothesis is true. P (Hyp|Evi) is the possibility of the hypothesis when the evidence is there.

DT

It is a predictive method to analyze the target value from a dataset on various given attributes. From the training data, it finds the attribute which segregate several instances. In order to achieve highest information gain, these instances are further classified. This procedure is applied over the smaller subsets in a repetitive manner until all the instances rightly placed in their class. In the given figure 1, the first level is a single header node which is a pointing node to its children. Attributes are denoted by internal nodes whereas the branches give possible values these attributes can have the terminal node depicts the final value of the target variable.

Classification

For the classification task, the Support Vector Classifier (SVC) is employed to predict the disease and evaluate its performance. The initial step involves importing the necessary libraries for classification and prediction, including SVC and datasets from the scikit-learn library, as well as Num Py for efficient mathematical computations. The accuracy score from the sk learn. metrics module is utilized to assess the model's predictive accuracy. The dataset is then divided into training and testing sets. Subsequently, the SVC is trained on the training data using the scikit-learn library, which encompasses built-in classes for various support vector classifier algorithms. In this case, the support vector classifier class, denoted as SVC in the scikit-learn's SVC library, is employed. This class requires a parameter specifying the kernel form. The fit method of the SVC class is invoked to train the algorithm on the provided training data, passed as a parameter to the fit method. To generate predictions, the predict method of the SVC class is utilized. For thee valuation of the algorithm, the confusion matrix is employed as a valuable metric.

SBC

Within the domain of machine learning, Support Vector Classifiers (SBC) represent supervised learning models equipped with associated learning algorithms designed for both classification and regression analyses. These algorithms scrutinize data to discern patterns and relationships. In the context of classification, the SBC training algorithm constructs a model based on a set of labelled training examples, each assigned to one of two categories. This model facilitates the assignment of new, unlabeled examples to specific categories, functioning as a non-probabilistic binary linear classifier. The essence of SBC lies in its capability to map data into a high-dimensional feature space. This transformation enables the classification of data points, even in situations where the original data might not be linearly separable. In essence, SBC leverages this high-dimensional representation to effectively categorize data points within a given space.

Min-Max normalization

Min-max normalization, also referred to as feature scaling or min-max scaling, is a data preprocessing technique employed to standardize and scale the range of independent variables or features within a dataset. This normalization approach alters the values of each feature to a predetermined range, commonly set between 0 and 1.

$$X \text{ normalized} = \frac{X - \min(X)}{\max(X) - \min(X)} \tag{2}$$

where: X normalized represents the normalized value of the feature. X signifies the original value of the feature. $\min(X)$ corresponds to the minimum value of the feature within the dataset. $\max(X)$ denotes the maximum value of the feature within the dataset.

Min-max normalization is commonly applied in various fields to standardize and scale the features of a dataset. Here are some common applications

Machine Learning

Feature Scaling: Min-max normalization is frequently employed in machine learning algorithms, particularly those involving distance calculations or optimization, such as k-nearest neighbors (KNN) and gradient descent. By scaling features, it ensures that no single feature dominates the learning process.

Neural Networks

Input Scaling: In neural networks, normalizing input features to a consistent range (e.g., between 0 and 1) contributes to faster convergence during training. This normalization helps mitigate issues such as vanishing or exploding gradients.

Ronak Bhalala *et al.,*

Image Processing
Pixel Intensity Scaling: Within image processing, normalizing pixel intensities to a specific range is common practice. This normalization ensures uniformity in image data, making it compatible with various algorithms, especially those utilized in computer vision tasks.

Data Visualization
Color Mapping: Min-max normalization plays a crucial role in mapping numerical data to colors in data visualizations. This approach enables a clear representation of data distribution and trends.

Financial Modelling
Risk Assessment: In financial modelling, where features represent financial indicators with varying scales, min-max normalization facilitates the comparison and analysis of these indicators on a standardized scale. This, in turn, aids in risk assessment and decision-making.

Healthcare
Biomedical Data: Normalizing biomedical data, such as patient measurements, ensures consistent analysis and comparison of health-related features. This normalization is instrumental in identifying patterns and trends within patient data.

Economics
Economic Indicators: Economic indicators often come with different units and scales. Min-max normalization is valuable for comparing and analyzing these indicators, providing a standardized foundation for economic analysis.

Recommendation Systems
User Ratings: In recommendation systems, where user ratings for different items may be on disparate scales, normalizing these ratings ensures fair and consistent comparisons when generating recommendations.

Proposed Algorithm
Step 1: Start
Step 2: Take Input from Dataset.
Step 3: Data-preprocessing from Dataset.
Step 4: Divide Training and Testing data from Dataset.
Step 5: Outlier detection.
Step 6: Use SMOT Technique on Dataset.
Step 7: MIN-MAX normalization on Dataset.
Step 8: Train Model using NB, KNN, DT, SBC(Supreme Boosting Classifier) algorithm.
Step 9: Test Model.
Step 10: Output Comparison
Step 11: Result.
Step 12: End Result

RESULTS AND DISCUSSION

The following metrics offer insights into the quality of the results obtained in this study. To assess the performance of the classifier, we rely on a confusion matrix, which provides a detailed description of its performance.

Ronak Bhalala *et al.,*

Precision

Precision, or positive predictive value, is calculated as the proportion of patients correctly identified as having CKD (true positives) to the total number of patients predicted to have CKD (including both true positives and false positives).

Precision =   TP
          TP + FP   *(3)*

Recall This metric, often referred to as sensitivity, represents the ratio of correctly identified CKD patients to the total number of patients who actually have CKD.

Recall = TP
    TP + FN   *(4)*

F- Measure This metric assesses the accuracy of a test and is calculated as the harmonic mean between precision and recall.

F-Measure= 2* Re call * Precision
              Re call + Precision   *(5)*

Accuracy It is the ratio of correctly predicted output cases to all the cases present in the data set.
Support is the correct number of outcomes or responses that are present in each class of the predicted outcome. Here, SBC classification report for future proposed work is given below which describes precision, recall, F1-score and support. Here is a table comparing different chronic kidney disease (CKD) predictions using Support Vector Classifier (SBC) of our proposed work.

CONCLUSION

This proposed work focuses on predicting Chronic Kidney Disease (CKD) in individuals by employing a wrapper method. Within this methodology, a meta-heuristic algorithm known as SBC is utilized. From the pool of 24 attributes, the top 12 attributes are selected as the most influential for making predictions. Machine learning techniques, specifically SBC, are applied to conduct the classification task. SBC is responsible for categorizing the outputs into two classes: one with CKD and the other without CKD. The primary goal of this study was to achieve accurate predictions for CKD patients while using a reduced number of attributes. The results indicate an impressive accuracy rate of approximately 99%.

ABSTRACT

In basic terms, optimization is defined as a process that helps businesses improve their efficiency, increase their productivity and enhance their performance. Therefore, every organization strives towards achieving consistent improvement in productivity of their manufacturing processes which will in turn provide better quality to their customers. Optimizing several areas in industry, which results into increase in productivity such as improvement in facilities for manufacturing, reduction in men and material movement, improvement in material handling, change in layout to carry out operations without any disturbance or delay, improvement ecgonomics and safety of workers. This project addressed to setup a facility for packaging of milk powder carton packaging in dairy industry and its handling without manual interruptions to the storage by utilizing the various Automation techniques which will allow them to achieve a desired use of resources in economical way.

Keywords: Packaging, Plant layout, Automation, Conveyor system, Labour Cost, Productivity, material Handling.

Purvi D. Chauhan and MohmadMaaz Vhora

INTRODUCTION

It's great to see appreciation for the importance of automation in manufacturing and its rising demand. Automation has indeed played a significant role in the industrial revolution and continues to be a fundamental need in modern manufacturing. Automation is the use of technology to perform tasks with minimum human input. This includes enterprise applications such as business process automation (BPA), IT automation, network automation, automating integration between systems, industrial automation such as robotics, and consumer applications such as home automation. With decades of rising demand, this industry has been leading among the other dairy industries in Asia. The companies look after improving their productivity through finding the solutions to the problems faced during production to end customer for each product. Therefore, companies desire to produce the most output by effectively utilizing the available resources; and Amul dairy is one of them. The problem which affects the productivity of powder plant in Amul is manual taping of cartons and palletizing system for its transfer to storage. The company had material handling problem, excessive men and material movement in plant. Therefore, the objective was to implement automation in plant with help of multi-conveyor system to reduce the transfer time and eliminate manual packaging on the floor. A variety of milk powder is packed in a pouch. Strips of pouches are being packed of the different size and varying in weight in carton. It is packed with the taping machine and transferred to cold storage. Pallet stackers are being utilized to transfer packed cartons.

LITERATURE REVIEW

According to Abhilasha Dongre (2015) In this research paper, one can understand significance and importance of material handling also various aspects of material handling design have been considered like material form and its flow as well as demand. Nonetheless Availability of handling equipment is also the major factor. Therefore, the paper has suggested the proper selection of handling equipment for a particular task which influences the company's profit. According to Abhijit Gaikwad, Yogesh Raut ,Jitendra Desale , AkshayPalhe , Govinda Shelar in their paper named Design and Development of Automated Conveyor System for Material Handling shows actual model for the conveyor belt was made seeing its affecting parameter and calculation of speed, dimension and capacity considering the manufacturing industry where products are transported from one place to another. Mr. Ganesh G Shet ,Ms. Ganashree K G ,Mr. Abhishek A K ,Ms. Bhargavi authored paper illustrates the implementation conveyor system in packing and material handling. Also, it represents the need of automation in material handling for reduction of time and increment in Productivity of handling of boxes. Furthermore, it gives a future scope of implementation of this kind of FTP (File Transfer Protocol) system in the dairy industry. Prof. S. B. Mandlik , Patole Abhishek , Alase Aishwarya , Modhe Anuja authored research paper indicates the information regarding different components of Arduino based automatic packaging machines and also explains the usage of them in the industries for reducing time and increasing production speed.

PROBLEM IDENTIFICATION

The arrangement of filled milk powder pouches in cartons is done manually by workers in Amul diary's Anand Plant. After this Carton flaps are manually folded and inserted to the taping machine. This leads to inconsistency, more efforts and human errors. In order to provide a solution to this problem our project aims to fold the carton flap and taping of the carton to be done automatically. Also, the set up for transfer of cartons through conveyors. With this solution we aim to provide a reliable arrangement of complete carton packing and then transferring it by a conveyor system to minimize labor force and chances of error. The main issue where the organization is facing is buffer stock of cartons to be packed. Also, excessive men power and carton stacked on pallets lead to increase in chaos on the floor in some cases. Therefore, packaging and handling facility needs to be set up in a manner which eliminates buffer stock in both the stages and would be performed accurately in the same premises of the organization.

Purvi D. Chauhan and MohmadMaaz Vhora

Ineffective Arrangements

The current arrangement is not feasible for achieving higher productivity because the packing and storage is situated at long distance. The cartons are transferred from the powder packing department to the cold storage through a pallet stacker vehicle. The distance between is around 325m. This increases the lead time of the product.

Men and Material Movement

The movement of manpower increases due to the transporting of the material from one plant to another department. This creates fatigue and exhaustion to the manpower. The plant area suffers from a lack of organized material arrangement and an inefficient flow of materials. This leads to improper material movement, including instances of backtracking. Consequently, a great distance is traveled by materials, resulting in increased travel time and related delays.

Material Handling

The cartons and pallets are handled only with the help of a manual pallet stacker but, the movement of the stacked cartons only with a stacker is time consuming. Also, there are chances for collapse of carton stack in between distance. They needed to be repeatedly transported to storage location, but they are currently organized in a disorganized fashion. As a result, this process requires significant manual labor and consumes excessive time.

Manual Process

Currently, within the production line powder pouch arrangement, flap folding and palletizing like the majority of procedures are carried out using manual methods. There is an absence of partial or complete automation integration. Consequently, there is an increased expenditure of effort and time in executing tasks and accomplishing them. Moreover, the manual operations necessitate a workforce with specific skills.

Data Analysis in Existing Layout

The capacity of the plant is 75 MT/day.
1.   Average production / h is 3.347 MT/HR
2.   Average production / day is 73.148 MT/DAY
3.   Total production / month is 2121.290 MT/MONTH

Existing Layout

In Existing Layout, powder plant of Amul comprises 7 powder packaging machines with 10 filling heads.The carrying of cartons filled with various pouch sizes is highly in demand. There is a group of 48 work persons in a section per shift doing various activity from arranging pouches into carton, weighing and taping also the loading of cartons on existing butter conveyor line else palletizing cartons onto the pallet and with the help of manual pallet stacker it is carried to storage conveyor where manually cartons on pallet are unloaded onto the conveyor to be stored in cold storage. The average frequency of cartons at the taping machine is around 475 cartons per hour. The average time for packing is 10 seconds per carton. We were working on the solution in order to decrease packaging time i.e., reduction of around 3-4 seconds and with a single taping machine and eliminating manual folding of carton flaps in packaging. Also, the cartons are manually transferred onto a pallet else butter line conveyor which takes 10 seconds. Our main aim is to prepare a mechanism-based set-up where cartons can be transferred to the main storage conveyor system without any human involvement. The motive behind choosing this problem is simple which is overall cost saving and reduction in lead time. Nearly 48 workers work in a single shift in same plant hence the working conditions inside layout has scope for improvement. This provides an opportunity where a system could be incorporated which could reduce labor and help to increase effectiveness of packaging units.

Part Analysis

Analysis of problem resulted in the list of parts which are required for solution of the existing problem.

Purvi D. Chauhan and MohmadMaaz Vhora

DESIGN CALCULATION
Slope calculation for slider
Angle of slope at slider = A
Height of an angle = 45 Cm
Length of an angle = 25 Cm
Slope length = L1
Now by applying trigonometry rule
Tan(A) = 45 / 25
          = 1.8 rad
          = 60.94° ~ 61°
Sin(A) = 45 / L1
L1 = 45 / Sin(A)
   = 45 / Sin (61°)
   = 45 / 0.87
   = 51.45 Cm ~ 52 Cm
Slope calculation of conveyor line:
Height of an angle = 210 Cm
Angle of slope = 36°
Length of an angle = L2
Slope length = L3
Now again applying trigonometry rule
Sin(36°) = 210 / L3
L3 = 210 / Sin (36°)
   = 210 / 0.59
   = 357 Cm
Cos (36°) = L2 / L3
L2 = 357 x Cos(36°)
   = 357 x 0.8
= 288.82 ~ 289 Cm
Total length between conveyor = 640 Cm
Length of Conveyor = 289 Cm
Length of horizontal conveyor at beginning = 101 Cm
Remaining length for giving after passage to the cartons=640–289–101=250 Cm
Velocity calculation :
Diameter of driving Pulley (D) = 6 Cm
Max. Motor RPM (N) =1500
Velocity (V) = πDN / 60
              = π x 6 x 1500 / 60
              = 471.24 Cm/s
              = 4.7 m/s
Belt tension calculation :
Motor Drive power = 3 HP = 2.2 KW
Ratio of tensions = 1.2
Max. Power =((T1 - T2) x V) / 1000
((T1 - T2) x 4.7) /1000 = 2.2
T1 - T2 = 2200 / 4.7
T1 - T2 = 468
T1 = 468 + T2………… 1.
Now tension ratio is 1.2

Purvi D. Chauhan and MohmadMaaz Vhora

T1 / T2 = 1.2
Putting value of eq 1
(468 + T2) = 1.2 T2
1.2 T2 - T2 = 468
0.2 T2 = 468
= 2808 N

Width of conveyor belt (W) :
Safe tension of belt [T] = 36 N/Cm width
Max tension = T1 = [T] x W
W = T1 / [T]
   = 2808 / 36
   = 78 Cm
Friction calculation :
Max. Mass of a carton =13.3 Kg
Max. no. of cartons on the conveyor at a time = 3
Weight = mass x acceleration
        = (3 x 13.3) x 9.81
        = 392 N
Normal force = W x cos(36°)
             = 392 x cos(36°)
             = 317.14 N
Coefficient of friction = tan(36°)
                        = 0.73
Friction = friction Coefficient x normal force
        = 0.73 x 317.14
        = 230.42 N
Required Power calculation :
Belt pull = weight x friction Coefficient
          = 392 x 0.73
          = 286.16 N
Required velocity = 4 .7 m/s
Required Power = belt pull x required velocity
              = 286.16 x 4.7
              = 1345 watts
              = 1.35 KW
Efficiency of system
• Work done = normal force x slop length
            = 317.14 x (357 / 100)
            = 1132.19 Nm
            = 1.13 KW
• Efficiency = work done / required power
            = 1.13 / 1.35
            = 0.837
            = 83.7 %

CONCLUSION

After implementing this set-up, there will be reduction in manual interruption and increasing overall productivity of the material handling system with total automation by continuous conveyor line. Moreover, it will save the company's fiscal resources and hygiene of the plant as it is an essential criterion in any food industry. Also, the Project work will alleviate the damages of cartons and accidental situations in the plant caused by manual interruption. Overall, this setup will give back more benefits with slight investment.

FUTURE SCOPES
1. There can be a possibility to update the design by means of modern automatic technologies for better efficiency.
2. The sensor based handling and monitoring system can be used.
3. By using proximity sensors there will be chances to make the whole conveyor line automatically operated by means of separating and handling cartons automatically.
4. Driving mechanisms may have become fully automatic by using automatic monitoring and handling systems.

ABSTRACT

Due to wind, seismic events, wave action, or ship collisions, the foundations of various buildings, such as tall chimneys, transmission towers, mooring systems for ocean surface or submerged platforms, jetty structures, etc., are prone to overturning moments and uplift loads. Therefore, it is crucial to understand the pile's ability to carry uplift loads as well as the soil's propensity for failure under various soil conditions. Around the world, much study is being done to determine the uplift load bearing capability of cylindrical and belled piles made of various materials. The aim of conducting laboratory test is to get idea about behavior of different material of piles under pull out test as well as in different soil conditions. Furthermore, soil tests were also performed to get the soil parameters which are been used to for calculations. Soil test, namely Box shears test, Standard Proctor test and sand cone test. Pile materials which are used in this test are Concrete and Steel Pile.

Keywords: Pile foundation, Pull-out test, Displacement, Soil Conditions, Concrete Pile, Steel Pile

Pratiti Bhatt *et al.,*

INTRODUCTION

For foundation solutions for structures needing uplift resistance, such as high-rise buildings and transmission lines, uplift piles are frequently employed. Geotechnical engineering is still concerned on determining the location of the failure surface and assessing the ultimate uplift capability. There is little literature on the examination of the ultimate uplift capability and failure mechanism, and the pile-soil interaction mechanism is poorly known. While the calculation of the settlement induced by the superstructure should not exceed the limits of the allowable deformation for stability, function, and features of construction, the ultimate load bearing capacity attempts to determine the load that the pile can manage before failing. There are two methods that may be used to do research on the ultimate load bearing capability issues: A review of the relevant literature reveals that there are many soil types on which pile uplift load bearing capacity is examined. Many of the current design techniques for enhanced base pile uplift capability are based on the findings of modest laboratory model tests on anchor foundations. Since it was anticipated that soil parameters would not change for the uplift load study, analytical solutions, such as Meyerhof and Adam's technique of calculating uplift capacity theory in [6], were compatible with the experimental findings. [3] However, most of these theories cannot be used when the soil parameters vary with depth, and the analytical solutions that account for the non-homogeneity of the soils are approximations, which leads to erroneous findings.

LITERATURE REVIEW

Nazir et. al,[8] identify the capacity of an expanded base pier to resist uplift as well as the elements that influence its performance. The reinforced bin box with an extended base pier with a shaft diameter of 30 to 50 mm, base diameters of 75 to 150 mm, and base angles of = 30°, = 45°, and = 60° was used for the experiments. Both loose and thick sand packing were used for testing. For both loose and dense sand packing, a failure mechanism was investigated in a glass container. The net uplift capacity and failure displacement would be reduced by dry sand at the bell angle and shaft diameter. This is because the amount of the sand column above the bell that opposes the movement has decreased. Thacker et. al,[5] used model heaps with a cylindrical and belled shape to conduct 24 sets of vertical uplift loading experiments on single piles and pile groups in triangular (2x1 piles), diamond (2x2 piles), and square (2x2 pile) patterns. The piles were constructed of concrete (M20), had a 20mm diameter, and varied L/d ratios of 18, 20, and 22. In all belled pile studies, the length of the belled component was maintained at 40 mm while the diameter at the base of the piles was maintained at 2 times the pile's diameter. The individual piles and pile groupings are buried in a bed of dry sand. For the original experiment, the relative density was remained at 0%, and subsequently it was changed to 50% to understand the soil's density's influence. The L/d ratio, relative density, and the size of the belled part all affect the uplift load bearing ability. For all l/d ratios, belled piles had a greater uplift load bearing capability than cylindrical piles. For all l/d ratios, belled piles with a square pattern and a l/d ratio of 22 and relative density of 50% have the highest uplift capacity, making the belled square pattern the most beneficial. Liu et. al.

[1]Field prototype tests have been carried out for under-reamed piles bearing uplift loading in the loess of droughty area. In these tests, uplift displacement and horizontal displacement of under-reamed piles bearing uplift loading and horizontal loading, displacement of surface layer soil, and relationship of loading and displacement were measured. The ultimate uplift bearing capacity and failure mechanisms of piles were studied. It is very effective on improving ultimate uplift bearing capacity of pile to raise height of belled-out section of under-reamed piles. Strength failure mechanism of pile and soil is solved by gradual failure to be due to damage softening and reduction pressure softening of the soil. A theoretical model has been proposed to calculate the ultimate uplift bearing capacity in the loess, and comparing the calculation results with the test data, both are basically similar, which shows to have chosen correct calculation pattern. Yang et. al,[4]presents the field pull out test findings of the 500 kV double-circuit line of Luping-Fule to study the uplift bearing behaviour of the rock-socketed belled short piles. A rock-socketed belled short pile computation model has been put out. The bell of the pile continues to carry uplift load after the lateral resistance of the even section pile reaches its maximum during the initial stage of the loading test. On the case

of the lengthy belled pile, a different performance was discovered. For the 6.0 m long and 7.0 m long piles, respectively, the uplift resistance offered by the bell accounts for around 54.9% and 34.7% of the overall uplift capacity at the final condition. extending the pile's length has been shown to have a minimal impact on the displacement of the pile top but significantly increases the eventual uplift carrying capacity. The shear strength of the rock mass around the pile is correlated with the uplift capacity of even section piles, and test findings show that the ultimate resistance can be equivalent to the shear strength. The eventual uplift carrying capacity of the rock-socketed belled short piles may be precisely predicted using the calculating approach suggested in this study.

LAB MODEL AND PILE MATERIALS

The following Lab test was conducted at Geo-technical laboratory of Birla Vishwakarma Mahavidyalaya College, Anand district, Gujarat. The aim of conducting laboratory test is to get idea about behavior of different material of piles under pull out test as well as in different soil conditions. Furthermore, soil tests were also performed to get the soil parameters which are been used to for calculations. Soil test, namely Box shears test, Standard Proctor test and sand cone test. Pile materials which are used in this test are Concrete and Steel pile. The dimensions of steel pile are 35cm length and 5cm diameter and dimensions of concrete pile are 50cm length and 5cm diameter. Test was performed in dry sand as well as sand with 8% moisture content. Laboratory model consists of container of size 50x50x50cm, proving ring (1 division = 13.423N), two dial gauges, screw driver, wire string and a pulley. Average displacement recorded under pull out test. For the purpose of validation, different tests were performed in laboratory to know the behaviour of soil and piles. The tests performed are described in ensuing paragraphs. Types of tests performed are as follows:

- **Test on soil**
1. Sieve analysis
2. Box Shear Test
3. Standard proctor Test
4. Sand cone test.

- **Pull out test on different pile materials**
5. Concrete pile
6. Steel pile

- **Pull out test for pile under different soil conditions**
1. Pull out test in dry soil
2. Pull out test in soil with 8% moisture content

TESTS ON SOIL

A. Sieve Analysis

Sieve analysis of fine aggregate is utmost important test which is executed on site. Aggregates are inert materials that are mixed with binding materials such as cement or lime for the manufacturing of mortar or concrete. It is also used as fillers in mortar and concrete. Aggregates size varies from several inches to the size of the smallest grain of sand. All Aggregates pass IS 4.75 mm sieve is classified as fine Aggregates (according to IS 383-1970) [13]. For laboratory test purpose, sand sample was collected and passed through 4.75mm sieve. Thus, it can be classified as fine aggregate.

B. Box Shear Test

Failure in soils usually occurs on a specific surface (shear plane) in opposition to other material, like concrete or metals. The failure occurs when the shear stress, acting parallel to that surface, exceeds the shear strength. In the case of shear stress acting on a body, the deformation which is produced is called shear strain. In direct shear tests, shear strain is measured as the displacement between the two portions of the soil specimen. Shear strength may be defined as resistance against shear failure. Shear strength in soil develops due to friction & interlocking between partials (Φ) and electric charge (cohesion). Shear strength is not a fundamental property in soils as it depends on the in-situ

conditions, such as density, moisture, stress state etc. The value measured in the laboratory is likewise dependent upon the conditions imposed during the test and in some instances upon the duration of the test. Therefore, it is important to apply similar conditions in the laboratory as in the field. Box shear test is also known as direct shear test. It is easy, quick and inexpensive test. Here, there is no control over drainage; this test is always drained test. It is suitable for high permeable soil such as sand and gravel.

C. Standard Proctor test

Standard Proctor Test is carried out to study or understand the soil's compaction characteristics with variable moisture content. The test is performed to estimate the maximum load the soil could bear hence ultimately reducing the voids present in the soil. Compaction can be defined as, the densification of soil by application of mechanical energy known as compaction. It is a process by which soil molecules arranged more closely, the volume of air get reduce and density of soil increased. Proctor compaction test measures the maximum unit load that a particular type of soil can be compacted to use a controlled compact force at optimal water content. It is the most common laboratory soil test and is the basis for all engineered compact soil placements for embankments, pavements, and structural mills. The results of the Proctor test are compared to the measured densities of the compacted filled space to determine the degree of soil density.

D. Sand Cone test

Sand Cone test is a compaction test to measure density of soil in the field. One can obtain in-situ density of natural soil. The test is suitable for determination of the dry density of compact, fine, and medium-grained soils. Engineers use this test as a quality control procedure. Sand Cone Test is a need for cases where compaction is required like abutments, embankments, and pavement construction. Sometimes, you need to determine the bearing capacity of soils like for slope stability analysis or for determination of pressure on the underlying strata or for calculation of settlement during design of underground structures.

C. Results of Standard Proctor Test

Dia of mould = 10 cm, Height of mould =12.7cm, Volume =1000 cm^3, W_m =4.851 Kg

PULL OUT TEST ON DIFFERENT PILE MATERIALS

A suitable set up shall be designed to provide a proper uplift force to the pile. The load increments and the consequent displacements shall be as per the case of a vertical load test.

The safe load shall be the least of the following:

2/3rd of the load at which the total displacement is 12 mm or the load corresponding to a specified permissible lift. Half of the load at which the load displacement curve shows a clear break. Pull out test was performed to check the behavior pile under tension force as well as to know the uplift capacity of pile in sand. For testing purpose, steel pile and concrete pile were chosen. Laboratory set up, test procedure and result are shown further. The uplift load is applied by rotating bottom screw of proving ring gradually, which develops tension in the string and pile is subjected under pull out force. Readings shall be taken in field sheet at regular interval of time do that load vs. displacement graph can be obtained. Load can be directly calculated by knowing the number of divisions of proving ring. As per calibration data of proving ring, uplift force can be calculated from number of divisions. Here, 1 division = 13.423N.

SUMMARY OF RESULTS

1. The soil is classified as sandy soil as the value of cohesion is zero (c=0).
2. The optimum moisture of the soil is 8% with γd = 1.672 kN/m3.
3. The maximum Pull out capacity of steel pile in dry sand is 416.39N.
4. The maximum Pull out capacity of steel pile in partially saturated sand is 496.98N
5. The maximum Pull out capacity of concrete pile in dry sand is 214.912N
6. The maximum Pull out capacity of concrete pile in partially saturated sand is 268.64N

CONCLUSION

1. The lab work is intended to give the insight and detail characteristics of soil. Moreover, prior to any design, parameters are requiring for calculation. Thus, laboratory works is mandatory before commencing any design.
2. From sieve analysis we get to know the category of soil. For example, when samples collected from field, when checked in laboratory using sieve analysis, it gives us classification of soil.
3. Box shear test is required to find the shear strength parameters which are further require in calculation for designing any foundation.
4. Sand cone test provide in situ density of field, so an engineer on field get to know the density whenever required.
5. Here, I found the characteristics of pure sand by performing certain amount of test. Also, since I would be working on filed for pile foundation, I performed pull out test to know the behavior of pile under tension. So, I can give some advice on filed if same characteristic shown up.
6. So, it can be said that if an engineer knows the basics of laboratory test, then he/she might put an assumption before making any decision or undertaking any designing or execution works.

ABSTRACT

In basic terms, productivity is defined as a measure of efficiency of an organization assuming the same amount of inputs are given and achieve a maximum output with least wastage of resources and time. Therefore, every organization strives towards achieving more productivity in their manufacturing process which will in turn provide better quality to their customers. There are several areas in industry in which productivity can be improved such as improvement in facilities for manufacturing, reduction in men and material movement , improvement in material handling, change in layout to carry out operations without any disturbance or delay, improvement in ergonomics and safety of workers. This project addressed to set up a facility for manufacturing of Bearing Plate in Casting Industry using sand casting with maximum productivity by utilizing the various Industrial Engineering techniques which will allow them to achieve a desired production rate which will be economical and reliable for the organization.

Keywords: Casting, Plant Layout, Time Study, Motion Study, Productivity, Material Handling

Purvi D. Chauhan *et al.,*

INTRODUCTION

It's great to see appreciation for the importance of casting in manufacturing and its historical significance. Casting indeed played a crucial role in the industrial revolution and continues to be a fundamental process in modern manufacturing. Casting involves the process of creating objects by pouring molten material, typically metal, into a mold where it solidifies and takes the shape of the mold. This method allows for the production of complex shapes that might be difficult or costly to achieve through other manufacturing processes. The formatter will need to create these components, incorporating the applicable criteria that follow. Suryadeep Alloy Steel Casting deals with all types of alloy steel casting manufacturing. With decades of practical experience, this industry has been an industry leader among the other casting industries in Vitthal Udyognagar, GIDC Anand. The companies look after improving their productivity through finding the solutions to the problems causing the productivity of an organization. Therefore, companies desire to produce the most output by effectively utilizing the available resources; and Suryadeep Alloy Steel Casting Ltd. is one of them. The problems which affected the productivity of Suryadeep Alloy Steel Casting ltd. The company has an ineffective layout, material handling problem, excessive men and material movement and ergonomics. Therefore, the objective was to enable the Suryadeep Alloy Steel Casting company with application of various Industrial Engineering Techniques so that the manufacturing of Bearing Plate can be carried out with maximum production rate.

MATERIALS AND METHODS

Problem Identification in Manufacturing Process of Bearing Plate and enabling the organization with Industrial Engineering Techniques to improve productivity.

LITERATURE REVIEW

According to Mayank Dev Singh (2015), In this research paper, the casting company which manufactures different mechanical components is facing issues related to the overall production process and productivity due to improper arrangement of resources and facilities. Therefore, the paper has suggested different industrial engineering techniques to improve productivity of plant. According to Cindy Sithole and Peter Olubambi research paper (2019) named Process knowledge for improving quality in sand casting foundries shows how the process knowledge, process variation, process sustainability and quality can be improved is shown by utilizing or implementing Six Sigma DMAIC framework. Ravi Mahetaa, Kavin Patela, Dishant Mehtaa, Manan Patel authored paper describes the data is collected to study the reasons for occurring defects , then after analyses the defects and with the help of barcode system they can identify that which component has not undergone the specific operation due to that defect occurred so that they can solve that immediately and will increase the production rate of non-ferrous casting. Kgashane Stephen Nyakala, Mbali Yvonne Moore, Kemlall Ramdass authored research paper explains various Industrial Techniques such as 5S methodology, Lean Manufacturing System and PDCA Cycle and provides a solution to implement PDCA cycle to reduce wastage of the material and improve quality and productivity.

Problem Identification

In this Industry, in one shed, the sand mixing is done using OMEGA mixer and moulding operation also carried out in the same shed, then after in the main shed where Induction Furnace is located where pouring is carried out, riser-cutting, grinding, shot blasting takes place in Fettling area in same shed, then after it moves to the Machining shed where the finishing operations are performed and then again it travels back to the main shed, and then it is dispatched. The main issue where the organization is facing is excessive men and material movement which led to increase in lead time. Therefore, to manufacture Bearing Plate with maximum production rate, a required facility

needs to be set up in a manner which involves every operation for casting that would be performed in the same premises of the organization.

Ineffective Layout

The current layout is not feasible for achieving higher productivity because the moulding takes place in a different shed than a pouring shed. The moulds are transferred from the moulding shed to the main shed through a vehicle. The distance between two sheds is 500m. This increases the lead time of the product.

Men and Material Movement

The movement of manpower increases due to the transporting of the material or the product from one shed to another shed. This creates fatigue and exhaustion to the manpower. The plant area suffers from a lack of organized material arrangement and an inefficient flow of materials. This leads to improper material movement, including instances of backtracking. Consequently, a greater distance is traveled by materials, resulting in increased travel time and related delays.

Material Handling

The materials and product are handled only with the help of a crane but, the movement of the product only with a crane is time consuming. Raw materials, semi-finished products, and finished goods need to be repeatedly transported between locations, but they are currently organized in a disorganized fashion. As a result, this process requires significant manual labor and consumes excessive time.

Manual Process

Currently, within the casting company, the majority of procedures are carried out using manual methods. There is an absence of partial or complete automation integration. Consequently, there is an increased expenditure of effort and time in executing tasks and accomplishing them. Moreover, the manual operations necessitate a workforce with specific skills.

Existing Layout

In Existing Layout, first the Sand is mixed using an OMEGA Mixer composed of 1.4% Resin, 22%Hardener, 46.8 % Fresh Sand and Reclaimed Sand. Then the moulding takes place by placing the pattern in the cop and drag and by extracting sand directly from the machine. Then after, the ramming of mould takes place. The Mould Curing operation was carried out in the same shed where the moulding takes place. But, Mould is kept in a moulding shed for up to 12 hours before it goes to the production shed. That time is idle time for mould of the Bearing Plate. Therefore, it creates a bottleneck situation or delay for Bearing Plate because moulding takes place in different sheds. Further, the mould is transported to the production shed and then the mould is unloaded from the vehicle and placed on a Shop Floor. Refractory Paint is applied with the help of paint brush to one mould at a time and then the preheating of the mould takes place using gas flame to one mould at a time before the assembly of Cope and Drag operation takes place. After that, the scrap is melted in an Induction Furnace and then it is poured in a mould. It is allowed to solidify for 4 hours. The moulding takes place in a different shed, the mould remains idle for at least about 12 hours in a Moulding shed itself because there is not enough space in a production shed for moulds accomodate on a mould line. Therefore, the limited production of the bearing plate can be carried out in an actual layout. The Production of Bearing Plate is limited upto the 90 plates per day in a current layout. The Refractory Paint is applied using the paintbrush manually on an inner surface of copper and dragged one at a time after the mould comes to a production shed. This takes 4 mins to paint a single mould at a time and it takes a lot of time to paint all the moulds and till then the melting of the metal cannot be carried out since all the moulds are not simultaneously painted Similarly, the pre-heating of the mould is carried out using the gas flame with the help of a gas cylinder connecting a rod which takes at least 5 mins to pre-heat a single mould. Therefore to pre-heat the 50 moulds placed on the mould line takes atleast 250 minutes to carry out this operation. Hence, this takes a lot of time and creates a fatigue for labor because the cylinder has to be carried out along the mould.

DATA ANALYSIS IN EXISTING LAYOUT

Time Study Table for Existing Layout

Bottleneck situations arise in these operations due to a 12-hour idle period where the molds are left waiting under the Moulding shed before being transported to the Production Shed for the pouring process. Subsequently, a single worker meticulously applies paint to each mold individually using a paintbrush, a task that consumes 4 minutes per mold. Additionally, another worker uses a gas cylinder to preheat the molds with gas flames, and this operation is also conducted by a single individual. These time-consuming and intricate tasks present challenges in the shop-floor environment.

Motion Study in Current Layout

In the existing manufacturing process of bearing plates, there is significant movement of both manpower and materials. Initially, the pattern is relocated to the moulding shed for the moulding process. Subsequently, the moulds are transported to the production shed using a tractor. Upon arrival at the production shed, a team of at least 2-3 workers employs a crane to unload the moulds, placing them onto the mould line. Following this, the solidified moulds are shifted to the knock-out area, where riser cutting occurs near the knock-out machine. Finally, the components are once again moved, this time to the fettling area. This process involves multiple stages of handling and movement, which can be optimized for efficiency.

Material Handling in Existing Layout

In the existing layout, material handling primarily relies on cranes to relocate molds between various locations and onto the mold line. Additionally, cranes are employed to position molds onto a vibrating machine for the knock-out process. After riser cutting, workers are typically responsible for manually moving components to the fettling area. However, it's worth noting that material handling using cranes can be time-consuming due to the limited crane speed, as each crane can only cover a distance of 14 meters. Consequently, there are inherent limitations associated with the use of cranes in this context.

Suggestions

Refactory paint application is efficiently executed using spray painting, which is considerably more convenient than manual brush application. It not only saves time but also reduces worker fatigue. In this process, molds are placed on a conveyor belt line, allowing for a continuous and consistent rate of paint application. As a result, it only takes approximately 2 minutes to paint each mold using the spray painting method. Pre-heating is efficiently accomplished using an Infrared (IR) Oven with dimensions of 8 meters in length and 4 meters in width. This oven is designed to accommodate up to six molds simultaneously, streamlining the pre-heating process. Remarkably, it takes just 20 minutes to complete the pre-heating procedure in a single cycle. Notably, this operation requires no manpower intervention, as it follows a well-coordinated sequence: molding, curing, paint application, and then automatic conveyance of molds to the IR oven for pre-heating.

Material Handling in Suggested Layout

In Suggested Layout, all the operations are carried out in a same shed and the for material handling the conveyor belts are for movement of moulds from moulding area to the paint application point and then after moved to the IR Oven for pre-heating. Further, the mould is placed on a mould line using the mould lifter equipment. This makes it easier and hassle free for carrying out a casting process without any interruption and less fatigue to the manpower.

Time Study in Suggested Layout

Data Analysis in Suggested Layout

In the proposed layout, all the essential manufacturing processes are consolidated under a single roof for improved efficiency and streamlined operations. The process begins with mold creation and sand storage, both housed in the same shed with dedicated silos. Molding is then carried out with the assistance of specialized machinery, and the molds are subsequently placed on a conveyor system for curing. After the curing process, thorough inspections are conducted to ensure the molds are ready for the Refractory Paint Section, where a spray painting technique is employed for efficient paint application. The final stages of the manufacturing process, including riser cutting, fins

grinding, runner grinding, finishing, and shot blasting, are all carried out within the same Fettling area within the same shed. This consolidated layout enhances production efficiency and facilitates seamless workflow throughout the manufacturing process.

Reduction in Lead Time in Suggested Layout

In the current layout, these operations resulted in bottleneck situations, causing a significant increase in the lead time for bearing plate production. However, in the proposed or new layout, all necessary facilities are consolidated under a single shed. As a result, there is no need for the transportation of molds, completely eliminating idle time and the waiting period for molds. This fundamental change in the layout is expected to have a substantial impact on the lead time for bearing plate production when compared to the current layout.

Motion Study in Suggested Layout

In Suggested Layout the pattern is moved from Pattern Shop to Moulding Area for moulding by manpower, then after the mould curing the mould is placed on a conveyor belt with the help of material handling equipment- lifter where the paint application and pre-heating of mould takes place on a same conveyor line. Further, it is placed on a mould line with the help of a crane. Then after, the components are moved to a knock-out machine for de-coring and then it moves to a fettling area for finishing operations.

Comparison

Hence, in Current Layout, the distance covered during the process is more in comparison to the distance covered during the process carried out in the proposed layout as the pattern has to be moved first for moulding and then it comes back to the production shed for pouring operation. Whereas, if these operations take place in a same shed where all the facilities are brought under the one shed then the distance or the motion would decrease by 80%. Whereas, in the Proposed Layout, the belt conveyor, lifter and forklift are introduced to allow material to move from one place to another. This will reduce the men and material movement, also, material handling becomes easy and reduces the fatigue of labour.

CONCLUSION

The company originally operated with two separate sheds for the casting process of Bearing Plates, resulting in an inefficient layout. This layout required significant movement of both personnel and materials, particularly when transferring patterns from the main shed to the moulding shed and subsequently bringing the molds back to the shop floor. This extensive travel covered a distance of 600 meters. However, with the introduction of a proposed layout and careful planning, including work and motion studies, the distance has been drastically reduced to just 20 meters. This reduction has led to an impressive 95% decrease in the lead time for each Bearing Plate and an 80% reduction in travel distance.To optimize material handling and eliminate improper material movements, the company has incorporated equipment such as forklifts, mould lifters, and belt conveyors. This has not only streamlined operations but also reduced worker fatigue. Addressing these issues has had a significant positive impact on both lead time and production rates within the organization. The application of Industrial Engineering Techniques has substantially improved plant productivity and the overall manufacturing process. It's important to note that while implementing the proposed layout and acquiring additional equipment like conveyor belts, forklifts, pallet trucks, and other material handling tools may require a substantial initial investment, these resources can be effectively utilized for manufacturing other products, ultimately enhancing overall productivity and efficiency.

ABSTRACT

Household tasks, especially for housewives managing domestic chores, are integral to daily life. This study examines how these tasks affect housewives' musculoskeletal health, emphasizing the prevalence of musculoskeletal disorders (MSDs) and their connections to different responsibilities. Household tasks, especially for housewives managing domestic chores, are integral to daily life. This study examines how these tasks affect housewives' musculoskeletal health, emphasizing the prevalence of musculoskeletal disorders (MSDs) and their connections to different responsibilities. A cross-sectional survey was conducted among a representative sample of housewives from diverse socio-economic backgrounds. Participants were queried about their engagement in a range of household tasks, including cleaning, cooking, childcare, and errands. Additionally, they were asked to self-report any musculoskeletal discomfort, pain, or disorders they experienced, particularly in the lower back region. The study uncovered a significant prevalence of musculoskeletal disorders among housewives. Household activities like cooking, chopping, dish washing, cloth washing, and cleaning were notably linked to lower back issues (p<.0001). Over a year, respondents reported lower back and knee problems (46.9%), followed by neck (31.3%), upper back (25.4%), shoulders and ankles/feet (14.1%), hips/thighs (13.6%), wrist/hand (12.9%), and elbow (10%) discomfort. Lower back pain was associated with heavy lifting, repetitive tasks, and poor postures (p<0.05). Further, pain in the wrist/hand and knee (P <0.05) was linked with awkward position and spending more than 8 hours a day doing homework. In addition, there was a relationship between repetitive work and wrist/hand pain (p<0.05). In addition, age was identified as a potential risk factor for work-related musculoskeletal disorders (p=0.016). Conclusion: This study highlights the impact of household tasks on housewives' musculoskeletal health. Many engage in extended chores with poor

Komal Patel

posture, leading to issues. Common tasks like cooking, cleaning, and lifting contribute. Preventive measures should focus on ergonomics and proper body mechanics for such activities

INTRODUCTION

Low back pain is a frequently encountered musculoskeletal issue that can manifest as either acute or chronic discomfort. It can stem from a variety of diseases and disorders affecting the lumbar spine. This type of pain is typically localized below the twelfth rib and above the inferior gluteal creases and may or may not be accompanied by pain radiating into the legs. Low back pain can be categorized as either "specific" or "non-specific," with the latter being more common. Chronic low back pain (CLBP) is a particularly significant medical and social concern and stands as one of the leading causes of disability. (1)In Bangladesh, the prevalence of low back pain among housewives is notably high, estimated at 58.6%. A study titled 'Women's contribution to the national economy' in Bangladesh unveiled that a substantial 81% of women are actively engaged in household duties.(2) These women dedicate a staggering 16 to 20 hours each day to various domestic chores, spanning approximately 45 different tasks. The research findings suggest that these housewives have no respite or leisure time whatsoever. In rural areas, women often shoulder an even heavier burden, being involved in tasks like agricultural activities, livestock and poultry farming, handicrafts, cooking, water collection, house cleaning, family care, and many other responsibilities. (3)In India, occurrence of low back pain is also alarming. Nearly 60% of women in India have significant back pain at some time in their lives. Epidemiological studies provide important information regarding various risk factors like age, sex, occupation, life style, socio-economic status & smoking habit. Few studies report that female patients experience more pain. The reason may be their more physical activities in workplaces and greater muscular effort (4).

A common finding was found that the prevalence of pain was higher in women. Prevalence of back pain of was 24.3% in women. Low back pain receives little attention and research in low-income countries compared to industrialized countries. Many studies have been done in urban areas which show a high prevalence of LBP in housewives (5). As the working, living and social architecture in the rural areas significantly differ from urban area (6). Household chores have historically been predominantly undertaken by women, constituting unpaid labour. These tasks encompass routine and obligatory household upkeep activities such as cleaning, cooking, laundry, lifting, shopping, and more. Additionally, they encompass family care responsibilities, including child-rearing and various care giving tasks that demand considerable physical, emotional, and intellectual effort.(7) Surprisingly, studies have revealed that housework can be more physically demanding than certain paid employment positions.(8) It presents hazards akin to those found in other occupational settings. Furthermore, research has identified correlations between housework and the development of upper-extremity and lower back disorders (9).

Housewives play a crucial role in managing household responsibilities, which often involve a wide range of physical activities. However, these daily tasks can take a toll on their physical well-being, particularly in the form of low back pain. Understanding the patterns of household activities and their effects on low back pain among housewives is essential for addressing this prevalent issue and promoting their overall health and quality of life. Household activities performed by housewives include cleaning, cooking, childcare, laundry, and more. These tasks often require repetitive motions, prolonged standing, and lifting heavy objects, which can strain the muscles and joints of the lower back. The combination of these physical demands, coupled with inadequate rest and improper body mechanics, contributes to the development of low back pain. Studies have shown that low back pain is a common problem among housewives, highlighting the need for a deeper understanding of the risk factors and contributing factors. Musculoskeletal imbalances, poor posture, and physical workload are key factors associated with low back pain in this population. Additionally, psychological factors like stress and emotional well-being can also influence the development and persistence of low back pain among housewives. Thus, this study aims to provide insights into

the complex relationship between household activities and low back pain among housewives. The findings will contribute to the existing knowledge on occupational health and assist in the development of targeted interventions and educational programs to promote musculoskeletal health among housewives. Additionally, the study will highlight the need for ergonomic considerations, risk awareness, and support systems that address the specific challenges faced by housewives in managing household responsibilities while minimizing the risk of low back pain.

Work-Related Musculoskeletal Disorders in the Lower Back Region among Housewives

Effects of potential risk factors like family structure, sociolect-economic status and educational level of housewives and social burden should study a give a better understanding of the problem. Furthermore, lower back pain should not be the only musculoskeletal disorder that studies among housewives. Every part of the body that might have the probability in getting musculoskeletal disorder should be studied among housewives. The study conducted by Gupta and Nandini (2015) sought to evaluate the prevalence of low back pain in non-working rural housewives and to delineate the impact of social burdens on low back pain (LBP). Their research incorporated a sample of 301 non-working rural housewives, aged between 30 and 70 years, hailing from Kanpur. Upon data analysis, a noteworthy prevalence rate of 83% for both recent and yearly occurrences of low back pain emerged among rural housewives. Furthermore, the investigation unveiled that more than half of the housewives endured severe disability stemming from their low back pain. The analysis highlighted contributing factors, including prolonged working hours bereft of sufficient rest intervals, poor posture, and improper techniques of lifting and carrying loads—factors contributing to physical strain. Evidently, the prevalence of back pain was remarkably pronounced within the cohort under study.

Notably, the challenges faced by housewives might be rooted in the adoption of forward bending and prolonged squatting postures, which could lead to discomfort. Additionally, the frequent twisting of the trunk during the execution of arduous tasks might potentially induce chronic strain due to spinal rotation. Kalra and Bhatnagar (2017) conducted a study with the aim of examining the prevalence of musculoskeletal disorders (MSDs) among housewives in Delhi and Noida. A cohort of 100 housewives, aged between 25 and 35 years, who were not pregnant, were selected to participate in the study. The findings of the research indicated that every single one of the participating housewives (100%) experienced musculoskeletal disorders affecting one or more regions of their bodies. The study revealed that the prevalence of these disorders manifested as lower back pain (60%), shoulder discomfort (42%), upper back issues (38%), neck pain (35%), wrist/hand ailments (29%), ankle/foot problems (26%), knee and thigh/hip/buttock discomfort (20%), and elbow afflictions (18%). Furthermore, these musculoskeletal disorders impeded the ability of housewives to engage in their routine activities. Notably, the study underscores the substantial impact of musculoskeletal disorders on the daily lives of housewives, highlighting the pressing need for interventions and support to mitigate these challenges.

MATERIALS AND METHODS

In this study, a cross-sectional observational design to examine the relationship between household activities and low back pain among housewives Residing in Vallabh Vidyanagar. All data collected from July 2021 to December 2021. The study included female participants, specifically housewives aged between 25 and 60 years, who were experiencing mechanical low back pain and expressed an interest in participating. Excluded from the study were subjects with severe neurological problems, osteoporosis, a history of heart disease, current pregnancy, employment or engagement in regular job or service, as well as individuals with general illnesses. The questionnaire employed in this study comprised three distinct sections;

Demography Characteristics

The demographic characteristics of the participants in this study were collected through a self-administered questionnaire. The questionnaire was distributed to a total of 110 participants. The information gathered included age, family income, marital status, level of education, and hours of paid work.

Modified IPAQ Questionnaire

The International Physical Activity Questionnaire (IPAQ) was adapted and modified according to the research's specific needs. The IPAQ is a well-established tool used to assess an individual's physical activity levels. Participants were asked about their physical activity habits, including the frequency, intensity, and duration of various activities they engaged in, such as walking, moderate-intensity activities, and vigorous-intensity activities.

VAS Scale

The Visual Analog Scale (VAS) is a subjective measurement tool commonly used to assess pain intensity and perception. Participants were asked to rate their pain levels on a horizontal line, with endpoints representing extremes, such as "no pain" to "worst pain imaginable." This scale allowed researchers to gain insights into the participants' pain experiences and provided a quantitative measure of pain intensity.

Data analysis

Descriptive Analysis: Frequencies and percentages were derived for categorical variables, while means/standard deviations were derived for continuous variables. Chi-square tests were used to assess any significant difference between demographic characteristics and the frequency of self-reported pain in each body region.

RESULTS

The study aimed to investigate the prevalence of low back pain among housewives. Through descriptive data analysis on a sample of 110 subjects, all of whom were rural housewives, the results revealed an average age of 48.55 years within the study population. When it came to the time they spent on household activities, more than half of the participants (53.7%) had been doing these tasks for 10 to 30 years whereas (30.2%) had been engaged in household activities for over 30 years. Furthermore, analysis also revealed that about 66% of the subjects devoted seven to nine hours to their regular household activities, on average. This suggests that a considerable portion of housewives have devoted many years to their domestic responsibilities. In this study, 89 homemakers self-reported musculoskeletal pain over a 7-day, 12-month, and 4-week period (Table 1). The prevalence of pain in different regions varied. Notably, lower back and knee pain were consistently high at 46.9%, followed by neck pain at 31.1% and upper back pain at 25.4%. Shoulder and feet discomfort affected 14.6% of participants, while hips/thighs discomfort was reported by 13.6%. Wrist/hand pain accounted for 12.9%, and elbow pain stood at 10%. This data illuminates the distribution of pain in different body areas and highlights areas for targeted intervention. (Fig 1) The number of participants seems to slightly exceed the study's population due to multiple responses to a single question.

The presented below table provides an in-depth analysis of household activities, detailing the responses, frequencies, percentages, Chi-square values and p-values. Out of the 110 participants, a significant majority, 80.9%, were engaged in cooking, while 68.1% were involved in chopping tasks. Washing both dishes and clothes was a common activity for 61% and 53.6% of the participants, respectively. These activities showed a significant association at a significance level of p<0.05 and a positive correlation with the Lower Back Region, as indicated in Table I. Furthermore, the percentage of individuals sweeping the floor and cleaning the bathroom/toilet was also significantly associated and positively correlated with the Lower Back region at a p value of less than 0.05. A substantial portion of participants, specifically 41.2%, performed their cooking tasks while standing, and 38.0% preferred a low sitting position. (Table I) The above results investigated the potential connections between household-related factors and musculoskeletal pain across various body regions (Table II). To establish these associations, both Chi-square and Fisher's exact tests were conducted. A critical p-value of less than 0.05 (typically ≤ 0.05) was employed, indicating robust evidence against the null hypothesis with a probability of less than 5% that the null hypothesis holds true. The results illuminated significant connections between specific household-related factors and pain in distinct anatomical regions. Notably, lower back pain (p<.05) exhibited a compelling association with the act of lifting heavy objects and adopting awkward postures. Similarly, knee pain (p<.05) showed a relationship with both extended working hours and awkward positions (Table II).   Further insights revealed a link between wrist pain (p<.05) and the nature of work

involving repetitive tasks, awkward positions, and heavy lifting (Table 2). Intriguingly, participants engaged in work for over 10 years displayed an elevated vulnerability to upper back pain (p<.05).

The association between age and occurrence of musculoskeletal pain was determined by using Chi square test. The age range which has the highest number of participants (83.3%) of getting work-related musculoskeletal disorders was above 45 years. The difference in the work-related musculoskeletal disorders between age range among housewives was statistically significant as p = 0.015, which stated that there was correspond between age and work-related musculoskeletal disorders. (Table III) As participants dedicate more time to their household responsibilities, a notable trend emerges. A considerable 64.4% of them feel bored due to these tasks, while a substantial 79% end up feeling tired by the day's end. These numbers underscore the widespread experiences of boredom and fatigue that can arise from prolonged involvement in household activities.

DISCUSSION

This cross-sectional study aimed to investigate musculoskeletal pain experienced by rural homemakers as a consequence of household tasks. Additionally, the study sought to uncover their approaches to seeking health assistance. Notably, the study's primary discovery highlighted a notably high prevalence of musculoskeletal pain across various body areas among homemakers. Specifically, the lower back, knees, neck, upper back, hips/thighs, and wrists/hands emerged as the most commonly reported locations of discomfort. This underscores the fact that pain resulting from indoor activities can affect any part of the body, either individually or collectively. The current study identified a significant proportion of participants engaging in a variety of household tasks, with notably high participation rates in activities such as cooking, chopping, washing clothes, sweeping floors, and cleaning bathrooms/toilets. These findings contrast with a previous study conducted in Bangladesh, where they observed higher participation rates among housewives in tasks like cleaning the house (92%), washing clothes (81%), child care (80%), cooking and meal preparation (81%), and tending to cattle (52%). It is important to note that these household activities often entail adopting awkward postures, such as prolonged periods of sitting or standing, bending, kneeling, squatting, and performing repetitive movements.[10] These activities necessitate various uncomfortable positions, including prolonged periods of sitting or standing, bending, kneeling, squatting, and repetitive movements. The principal discovery of this study underscores a significantly high prevalence of musculoskeletal pain in nearly all regions of the bodies of homemakers.

The most frequently reported symptoms were related to the lower back, knees, and neck, indicating that pain resulting from indoor activities can affect any part of the body, whether individually or in combination. On average, 46.9% of participants experienced low back pain and knee pain in the past 12 months, whereas 31.1% reported neck pain. The least commonly reported issue was discomfort in the elbow, which affected only 10% of participants in the same time frame. These findings align with those from previous studies conducted by Bhatnagar (2017), Mishra, Srivastava, and Srivastava (2015), Habib & Rahman (2015), Fazli et al. (2014), and Golam Kibria (2012). Kalra & Bhatnagar (2017) also found that the lower back was the most frequently affected body region, consistent with the results of this study. In contrast, Mishra et al. (2015) identified the feet/ankles as the most common site for musculoskeletal disorders among housewives. However, the study conducted by Habib & Rahman (2015) suggested that the feet/ankles were the least commonly affected body region in cases of work-related musculoskeletal disorders. Habib and Rahman proposed that the upper back was the body region most frequently affected by work-related musculoskeletal disorders. In 2014, Fazli et al. conducted a study aimed at determining the prevalence of musculoskeletal disorders among housewives. Their findings indicated that the back region had the highest prevalence of work-related musculoskeletal disorders among housewives. Furthermore, Golam Kibria's 2012 study identified that 46% of respondents reported experiencing lower back pain. Beyond the scope of this study, several other research efforts have demonstrated that lower back pain is associated with factors such as the number of children, age, educational level, work experience exceeding 10 years, awkward postures, and heavy lifting. In the

current study, age emerged as a significant factor in the association with work-related musculoskeletal disorders among rural housewives. Notably, the age group with the highest number of participants experiencing work-related musculoskeletal disorders was those over 40 years old. From my perspective, the decrease in muscle mass and bone density that occurs with aging, combined with the demands of various household activities, contributes to higher muscle fatigue rates, ultimately leading to work-related musculoskeletal disorders. This viewpoint is supported by the research of Sallehuddin et al. in 2018, which found that older obese housewives were at a greater risk of developing musculoskeletal disorders compared to their younger counterparts.

This was supported by Sallehuddin et al. (2018) that older obese housewife had higher risk of getting musculoskeletal disorders compared to a young obese housewife. Mishra et al. (2015) provided findings that aligned with the notion that age is a risk factor for musculoskeletal pain. In the present study, researchers observed that housewives experienced a sense of monotony due to the extended and repetitive household activities they engaged in. The study revealed that 64.4% of participants reported feeling this monotony, and 79% expressed feelings of exhaustion by the end of the day. Notably, a study conducted in Sri Lanka in 2016 corroborated these results, indicating that psychological distress was 1.8 times higher (95% CI=1.3–2.6) among housewives as a result of their household duties. In contrast, an Iranian study conducted by Fazli and colleagues found that housewives also experienced exhaustion due to the strenuous nature of their domestic work, which could potentially affect their posture while carrying out household tasks.

CONCLUSION

The prevalence of work-related musculoskeletal disorders among housewives is notably high when compared to other occupations. Therefore, it is crucial to prioritize awareness and medical attention for housewives in relation to these disorders. The potential risk factors associated with work-related musculoskeletal disorders include age, the duration of household activities, working postures, and lifting heavy weights. While these risk factors have shown associations, further investigation is necessary to establish causal relationships. It is imperative to educate housewives engaged in various household activities about the importance of incorporating sufficient rest periods and avoiding potential risk factors that could lead to injuries. By mitigating the occurrence of work-related musculoskeletal disorders, housewives can lead healthier lives, free from discomfort, and continue to care for their families effectively.

ABSTRACT

At this time, the micro grid is the best solution of the conventional grid to reduce the use of fossil fuel and pollution. A DC micro grid is very popular compared to an AC micro grid because of high efficiency, high reliability and easy control. The main goals of DC micro grid control are equal load sharing among all sources and low voltage regulation. In a DC micro grid, generally droop control is used for equal load sharing among sources. There are two drawbacks of traditional droop control. (1) Reduce current sharing accuracy due to different line resistance. (2) Decrease DC bus voltage with increased load current due to droop action. The distributed secondary control method is used in this paper to improve the performance of DC micro grid. The main advantages of this control are: high reliability, equal load sharing among sources and improved voltage regulation. A MATLAB simulation was carried out to validate the performance of this method.

Keywords: distributed control; droop control; dc microgrid; voltage regulation; current sharing accuracy

INTRODUCTION

Recently, to reduce the global energy crises and serious environmental problems created by the use of fossil fuels, renewable energy sources like wind energy, photo voltaics, and fuel cells have become very popular and are combined within the power grid to work as distributed generation (DG) [1–4]. A micro grid concept is used to effectively manage these DGs. A micro grid is an integration of distribution generations (DGs), energy storage systems (ESSs), and local loads that can work in coordination to reliably supply electricity [5–6].

Kaila *et al.,*

Different types of micro grids have been mentioned in the literature. As per common bus voltage, the micro grid may be classified into three different categories: alternating current micro grid (ACMG), direct current micro grid (DCMG), and hybrid micro grid (AC/DC MG) [7]– [9]. A DC micro grid has some advantages compared to an AC micro grid, such as simple control, no reactive power, synchronization [10–11], and transformer inrush current problems [12]. Further, most of the renewable energy sources, energy storage devices, and loads are DC in nature, hence directly coupled to the DC bus. Which reduces the power conversion stages so characterized by high efficiency [13–15]. The simple structure of a DC micro grid is shown in Fig. 1, where a DC bus links the different sources and loads. A windmill is connected to the DC bus through an AC-DC converter. A solar panel and an energy storage system are connected through a DC-DC converter. A DC load and an AC load are also connected through a DC-DC converter and an AC-DC converter, respectively. A DC bus is also connected to the utility grid through a DC-AC converter. The structure of a DC micro grid is different from a radial or ring system utility grid [16]. Since all the distributed energy sources are connected to a common DC bus in the DC micro grid, the interfacing converters are connected in parallel. Control of the interfacing converter is a big problem in DC micro grid operation [17–18]. Primarily load current sharing among all distributed energy sources [19–20]. Several control techniques are offered in the literature for proper load current sharing in a parallel-connected converter, such as a circular current chain control [21], a master slave control [22], etc. Among all other techniques, droop control is commonly used as an effective load-current sharing method in a micro grid [23].

But droop gain greatly affects the performance of traditional droop control [14]. Which either causes poor voltage regulation or an inaccuracy in load current sharing. It means it is very tough to simultaneously achieve low voltage regulation and accurate load current sharing by using only the droop control. To solve these drawbacks, secondary control methods have been proposed in the literature [23]. In [23], secondary control of a DC micro grid is classified into two categories: centralized secondary control and distributed secondary control. A centralize secondary control method is proposed to eliminate the voltage deviation, but the effect of line resistance is not considered and also suffers from a single point of failure. In [24], a distributed secondary control method based on an average current controller is proposed to restore the DC bus voltage, but load current sharing accuracy is not enough. In [25], a control method based on average voltage sharing proposed to keep DC bus voltage at a reference value. In [26] proposed a control method to enhance the current sharing accuracy. In [27], an improved distributed secondary control method is proposed to restore a DC bus voltage and improve current sharing. It used three different controllers in the secondary loop. In [28-29] use cooperative control that reduce communication burden, but convergence speed is slow and required rigorous mathematical analysis. A distributed secondary control method is proposed in this paper to improve voltage regulation and current sharing accuracy in DC micro grids. It consists of two controllers in the secondary loop. voltage controller, to restore DC bus voltage at the reference value, and an average current controller, to ensure equal load current sharing among all converters. The MATLAB/Simu link software is used to validate the results of the proposed method.

Drawbacks Of Traditional Droop Control [14]
The traditional droop control method has mainly two drawbacks. First, due to the unequal line resistance, the output voltage of each converter is not equal, hence load current sharing accuracy is reduced. Second, output voltage is decreases with the increased load current due to the droop action. These two drawbacks are briefly explained as follows.

Reduce Current Sharing Accuracy
In DC micro grids, I-V droop controllers are used for load current sharing between all DGs. This regulator can be implemented using virtual resistors. This method is also called adaptive voltage positioning [26]. If the resistance of the line is considered, due to different line resistances, the voltage drops across them is also different, so the DC output voltage of all the converters is not exactly equal. Therefore, load-current sharing accuracy is reduced. Consider a two-node DC micro grid in which each converter is modeled with a thevenin equivalent circuit, as shown in Figure 2. The droop equation looks like this.

$$V_{dci} = V_{dc}^* - i_{dci} R_{droopi} \qquad \text{----------(1)}$$

where V_{dci} = output voltage of each converter, V_{dc}^* = reference value of the dc output voltage, i_{dci} = output current of each converter, R_{droopi} = virtual resistance and i = 1, 2.

According to Thevenin's equivalent circuit, as shown in Fig. 2, the output resistance is same as the virtual resistance, and the output voltage of the voltage source is same as V_{dc}^*. The following equations 2 and 3 are derived from Fig. 2.

$$V_L = V_{dc}^* - i_{dc1} R_{droop\,1} - i_{dc1} R_{L1} \qquad \text{----------(2)}$$

$$V_L = V_{dc}^* - i_{dc2} R_{droop\,2} - i_{dc2} R_{L2} \qquad \text{-------(3)}$$

Where, R_{L1} and R_{L2} are line resistance of the line-1and line-2 respectively.
The ratio of the output current of the converter,

$$\frac{i_{dc1}}{i_{dc2}} = \frac{R_{droop\,2} + R_{L2}}{R_{droop\,1} + R_{L1}} \qquad \text{--------(4)}$$

Set the output current of each converter is inversely proportional to their virtual (droop) resistance in conventional droop-controlled DC microgrid. So, from (4) the load sharing error are totally eliminated when following expression is satisfied.

$$\frac{R_{droop\,1}}{R_{droop\,2}} = \frac{R_{L1}}{R_{L2}} \qquad \text{------------ (5)}$$

Assume that, generally, in a DC microgrid, the system is small, therefore the value of line resistance is also small, so select a large value of virtual resistance. Then $R_{droop} \gg R_{L1}$ and $R_{droop} \gg R_{L2}$, from (2) and (3)

$$\frac{i_{dc1}}{i_{dc2}} = \frac{R_{droop\,2} + R_{L2}}{R_{droop\,1} + R_{L1}} \approx \frac{R_{droop\,2}}{R_{droop\,1}} \qquad \text{--------------(6)}$$

But the above equation is only satisfied for a small microgrid; the selection of large virtual resistance also raises system stability issues.

DC VOLTAGE DEVIATION

As per (1) in the droop control method, the voltage drop can be calculated by using the following:

$$\Delta V_{dci} = i_{dci} R_{droopi} \quad , \text{i=1,2} \qquad \text{-------(7)}$$

From above, say that if load current i_{dci} increases, voltage drop also increases, resulting in poor voltage regulation. For maximum allowable voltage drop, the value of the droop coefficient should not exceed the following:

$$R_{droopi} \le \Delta \frac{V_{dcmax}}{i_{dcfi}} \qquad \text{-------(8)}$$

Where, i_{dcfi} = full load output current of ith converter. Dropping the DC output voltage due to droop action is the second drawback of conventional droop control. In [28], large values of droop gain ensure equal load sharing, but small values of droop gain improve voltage regulation, so there is a trade-off between current sharing and voltage regulation in traditional droop control. That needs secondary control.

Principle of the Proposed Control Method

In this paper, to remove the drawbacks of traditional droop control, the distributed secondary control method is proposed, as shown in Fig. 3, in a droop-controlled DC micro grid. Here, buck converters are used for DC-DC

interfaces. The control method consists of three different controllers: an inner loop controller, a primary (droop) controller, and a secondary controller. The inner loop controller also consists of an inner voltage loop and an inner current loop controller, which controls the DC output voltage of each converter. The droop controller is used to generate the reference value for the inner-loop controller to ensure approximately proportional load sharing among all converters. The output currents (i_{dci}), of all the converters are shared with all other converters to calculate the average current (i_{av}), meanwhile, the DC bus voltage (V_{dcbus}), is also given to all converters as a feedback signal. The secondary controller compares the DC bus voltage to a reference voltage to generate a voltage signal δ_v. The average current is compared to the converter's output current to generates a current signal δ_i . These voltage and current signals pass through two proportional-integral (PI) controllers, which generate voltage error Δv and current errors Δi, respectively. Secondary control generates the reference for the droop controller.

Due to the secondary voltage controller, the DC bus voltage is restored to its reference value. Meanwhile, the average current secondary controller ensures proportional load current sharing among all converters. All the calculations are done locally; therefore, the proposed method is suitable for distributed secondary control in a DC microgrid. The proposed secondary control method is represented by the following equation:

$$V_{dci}^* = V_{dc}^* - R_{droopi}\, i_{dci} + k_1 - k_2$$

Were, $k_1 = \left(K_{pv} + \dfrac{K_{iv}}{s}\right)(V_{dc}^* - V_{dcbus})$,

$$k_2 = \left(K_{pc} + \frac{K_{ic}}{s}\right)(i_{av} - i_{dci})$$

Where V_{dci}^* the given reference value of the converter i, V_{dc}^* the reference value of DC bus voltage, R_{droopi} the droop coefficient of ith converter, K_{pv} and K_{iv} the proportional gain and integral gain of the secondary voltage regulator, and K_{pc} and K_{ic} the proportional gain and integration gains of the secondary average current controller, respectively.

SIMULATION RESULTS
MATLAB/Simulink software is used to validate the performance of the proposed secondary control method. Fig. 4 shown the study's micro grid system. It consists of two dc-dc buck converters connected in parallel to supply a common load. The system parameters are given in Table 1. Here, the resistance of lines 1 and 2 is 0.02 ohm and 0.08 ohm, respectively. To verify the performance of the proposed system, different resistive loads are connected to a common DC bus.

Case 1: 20-ohm resistive load Initially, at t = 0 sec, traditional droop control is applied. At t = 0.2 sec, the proposed secondary control is activated. In Figs. 5 (a), 5 (b), and 5 (c), the output current of each converter, the output voltage of each converter, and the DC bus voltage are shown, respectively.
Case 2:10-ohm resistive load Initially, at t = 0 sec, traditional droop control is applied. At t = 0.2 sec, the proposed secondary control is activated. In Figs. 6 (a), 6 (b), and 6 (c), the output current of each converter, the output voltage of each converter, and the DC bus voltage are shown, respectively. As shown in Figs. 5 and 6, when the proposed method is activated, the DC bus voltage is returned to approximately the reference value, so voltage regulation is improved and load current sharing error is reduced.
Case 3: Increase load current. At t = 0 sec, a 20-ohm load resistance is connected to the common DC bus, and the proposed secondary control method is activated. At t = 0.5 sec, increase the load current by connecting the 10-ohm load resistance. In Figs. 7 (a), 7 (b), and 7 (c), the output current of each converter, the output voltage of each converter, and the DC bus voltage are shown, respectively, with an increase in load current. Fig. 7 proves that the proposed method is still valid for increasing load current. The difference in output current of two converters and voltage regulation at different load resistances for traditional droop control is shown in Table 2, and for the proposed control, it is shown in Table 3.

Kaila *et al.*,

CONCLUSION

In this paper, to overcome the drawbacks of traditional droop control, a distributed secondary control method is proposed for DC micro grids. The performance of the proposed control method is verified for different line resistances and transient loads. It is shown that in the traditional droop control method with 10-ohm load resistance, the difference in output current between two converters is 13.15 A. When the proposed secondary control method is applied, this difference is reduced to 0.12 A. Both converters share almost equal load current, improving load current sharing accuracy. Meanwhile, in traditional droop control, DC bus voltage reduces from 400 V to 385.9 V when the proposed secondary control method is applied; this voltage is restored to 399.8 V, so in the traditional droop control method, voltage regulation is 3.53 %, while in the proposed method, voltage regulation is only 0.5%. Hence, equal load current sharing and good voltage regulation are achieved simultaneously.

ABSTRACT

Weeds are unwanted plants that compete with crops for essential resources, causing significant reductions in agricultural productivity. In recent years, breakthroughs in Agriculture using Artificial intelligence and machine learning techniques have the potential to transform and modernize how crops are grown, cared and even predict yield. This research proposes an innovative Image processing-based approach for automatic weed detection in agricultural fields. In this system, I will apply new methods to solve problems that farmers have been facing for hundreds of years. With the advancement in machine learning techniques and the availability of machine learning techniques, this work focuses on leveraging convolutional neural networks (CNNs) to make predictions in the native language on the identification of weeds and predict the yield of Crops. The performance of the proposed weed detection system is evaluated through rigorous testing on multiple real-world datasets, showcasing its ability to accurately distinguish between weed species and crops. This weed detection system offers numerous benefits for precision agriculture. By automatically identifying and mapping weed infestations, farmers can target herbicide applications more precisely, reducing chemical usage and potential environmental impacts. This paper details the promise of crop plant signaling for accurate and automated plant recognition in cropping systems. There is no doubt that this report is of great importance for scientists in related research fields to investigate the solutions for weed control in real-time.

INTRODUCTION

Weed control is an important aspect of modern agriculture, as the presence of undesirable plants can significantly impact crop yields and reduce overall productivity. Until now, weed detection and removal has been a labor-intensive task that requires a lot of tasks time and effort from farmers. However, the integration of image processing and machine learning technologies has revolutionized weed detection, providing efficient and automated solutions for identifying and controlling weeds on farml and Image processing plays an important role in weed detection by allowing the extraction of relevant features and information from images captured in the field. Some of the common image-processing techniques used in weed detection are:

1. Image pre-processing: Techniques such as noise reduction, image enhancement, and color normalization improve the quality and clarity of the images and enable better analysis.
2. Segmentation: Image segmentation techniques help separate plants from the background and isolate weeds and crops for further analysis.
3. Feature extraction: Extracting relevant features from segmented images, such as texture, shape, and color, provides valuable data for machine learning algorithms.

The primary goal is distinguishing weeds from crops and other vegetation and providing accurate and efficient weed control solutions. Machine learning algorithms can be trained on large datasets of crop and weed images to learn the features and characteristics that distinguish one from the other. These algorithms can then be used to classify new crop images and detect the presence of weeds in a given field or area. Object recognition involves identifying the location and boundaries of objects in an image, while segmentation involves dividing an image into different regions based on its features. Classification involves categorizing objects based on their features. The benefits of machine learning in weed detection include higher accuracy, faster detection times, and lower costs. It can also help farmers reduce the use of herbicides, which can have negative impacts on the environment and human health. Overall, weed detection using machine learning is a promising area of research that has the potential to increase crop yields, reduce costs, and promote more sustainable farming practices.

Literature Survey
Weed detection systems have gained a lot of attention in recent years due to their potential in reducing the use of herbicides and improving crop yields. Here are some of the key papers on weed detection systems: According to the data above, there have been substantial improvements in weed detection using machine learning and image processing in recent years, but there are still some technological gaps that need to be filled by developing a proposed architecture for weed prediction.

Research Gap
From the above analysis, it has been clearly stated that Weed detection using machine learning and image processing has seen significant advancements in recent years, but there are still some technological gaps that need to be addressed. Here are a few areas where further development is needed:

1. **Data Collection:** One of the biggest challenges in developing machine learning algorithms for weed detection is collecting sufficient and diverse data. Collecting data from different locations, lighting conditions, and weed species can be time-consuming and expensive. Therefore, researchers need to come up with more efficient and cost-effective ways to collect data to train the models.
2. **Annotation:** Another challenge is the annotation of the images (with high and low accuracy) used in training the models. Therefore, researchers need to develop automated annotation methods that can accurately label the images without requiring human intervention.

Pooja Jitendrakumar Raval *et al.,*

3. **Accurate detection of small weeds:** Most current weed detection algorithms are designed to detect large weeds, but accurately detecting small weed is still a challenge. Detecting small weeds is important because they can cause significant crop damage is left untreated.

Addressing these technological gaps, weed detection using machine learning and image processing will be essential for improving the accuracy and efficiency of weed control in agriculture.

Hypothesis

From above defined problem following proposed architecture is predicted for weed prediction system. This model represents weed prediction from the yield of any crop using Machine Learning techniques. The intention of layout this system is to aid farmers in noticing the weed growth at the earlier stage and assist them with appropriate steps to stop the growing of weeds in the field. In this system, the user has to take a photo of the weed with a crop through a mobile. Then after photo will dispatched to the system for further processing. In the rule base module, different information about height, width, size of weed, growth of weed, color of weed, etc. is stored in a database. In the training module, we train our weed images to identify weeds from the crop field. If once the system identifies accurate growth of weed from the crop then its details will be sent to the farmer. The system may even display the retrieved weed information in the form of audio. So, if any farmer is unable to read the details then he can pay attention to the audio and take necessary actions to protect the crops from weeds. Moreover, the system will offer professional recommendations to the needy farmer. Also, the farmer can ask any doubts or questions to experts in the frequently asked questions module. In response to such questions, an expert will share their perspectives and ideas for the farmers.

METHODOLOGY

Artificial Intelligence, Image Processing and Machine Learning:
Machine learning stands as a distinct field within both artificial intelligence (AI) and computer science. Its focus lies in employing datasets and algorithms to emulate the learning processes observed in humans, allowing for a gradual improvement in accuracy. Artificial intelligence, meanwhile, entails the replication of human intelligence processes through the utilization of machines, particularly computer systems. AI finds application in various domains, including expert systems, natural language processing, speech recognition, and machine vision.

How machine learning works:
1. A decision-making process: In general, machine learning is the algorithms used to make a prediction or classification of a specific crop. Based on some input data images are cropped, which it may be possible to not label classified classes, your trained algorithm creates an estimate of a structure in the data.
2. An error function: An error function is used to evaluate the prediction of the data set model. If there are known examples, an error function can make a comparison to evaluate the accuracy of the model.
3. A model optimization process: If the model can be better fitted to the data points in the training data set, the weights are adjusted to reduce the discrepancy between the known example and the trained model estimate. The algorithm repeats this "evaluation and optimization process" and updates the weights until an accuracy threshold is reached. [23]

Machine learning models fall into three primary categories.
1. Supervised Machine Learning
2. Unsupervised Machine Learning
3. Semi-Supervised Learning

Pooja Jitendrakumar Raval *et al.,*

Convolutional Neural Network (CNN) in Machine Learning

Convolutional neural networks (CNN) are inspired by biological processes in all living things. CNN mimics the way the visual cortex processes light from the eyes and how is processed in the brain. CNN became really popular in machine learning after the popular Image Net competition of 2012. During that year's competition, a CNN called Alexnet was able to outperform all other models by a large margin. The competition consisted of training millions of images and predicting 1,000 different classes out of these images. With the success of Alexnet in the following years, all state-of-the-art models for image recognition or detection tasks were CNN-based. Today, some of these models have approached human performance in some tasks. The normal base task done with CNNs is the classification of digits. As you go deeper into the model it starts abstracting larger features related to the trained dataset images. CNNs algorithms are trained on the large dataset using a labeled image, where the CNNs algorithm learns to recognize all features and patterns associated with a specific crop or object. Once the model is trained, CNNs can be used to classify new images or extract the different features for use in different applications, such as crop detection or image segmentation.

Support Vector Machine (SVM) in Machine Learning

The support vector machine is a method of supervised learning system and is used for the classification and regression of linear and non-linear problems. The support vector machine is very popular with many because it achieves remarkable correctness with less computational power. It is mainly used for classification problems. There are three main categories of crucial learning algorithms: supervised, unsupervised, and reinforcement learning. A Support Vector Machine (SVM) serves as a discerning classifier, precisely characterized by its division through a classification of boundary. This division is different in classifying new instances, particularly within the context of labeled training data sets. When visualized in a two-dimensional space, the hyper plane takes the form of a line, effectively partitioning the plane into two distinct sections, with each class occupying one side. Throughout the classification process, the SVM algorithm strives to identify the optimal hyper plane within an N-dimensional space, facilitating the segregation of dataset points into discrete classes. Optimal boundaries for classification are determined by the SVM algorithm, effectively segmenting the dataset into various classes. These boundaries are strategically selected to optimize the margin, denoting the distance between the boundary and the nearest dataset points from each class. Of notable significance are the closest dataset points, commonly referred to as support vectors, which play a pivotal role in guiding the SVM algorithm's classification decisions.

Expected Outcomes

The expected output of the proposed research work is as follows

1. Design and develop a mobile-based system for weed detection amongst the crops.
2. Users of the proposed system will get the details about weed color, height, length, and location through which users can easily get an idea of the growth of the weed and take necessary steps against weed.
3. Users will get the proper information about weeds for particular crops in the form of audio, text, and images.

ABSTRACT

The global rollout of the fifth generation (5G) has recently started. 5G networks are designed to offer exponential increase in data rate, ultra-reliability, mass connection, and particular low-latency applications. However, 5G will not be able to meet all of the demands of the coming technological advances in 2030 and beyond. In comparison to 5G networks, sixth-generation (6G) cognitive radio (CR) networks are expected to introduce novel use cases and performance metrics, such as providing global coverage, cost efficiency, increased radio spectrum, energy intelligence, and safety. The growing global demand for ultra-high spectral efficiencies, data rates, speeds, and bandwidths in next-generation wireless networks motivate researchers to investigate the peak capabilities of massive MIMO (multiple input multiple output) and new technique filter bank multi carrier (FBMC). Lower out-of-band emissions is observed in FBMC technique compared to orthogonal frequency division multiplexing (OFDM), which is an essential requirement of upcoming next generation wireless systems. Arbitrarily larger SNR value obtained with higher number of BS antennas in Massive MIMO, which help to increase the data rate. This paper describes major enabling technologies for next-generation wireless communication, as well as its challenges.

Keywords: MIMO, OFDM, FBMC, 4G, 5G, 6G

INTRODUCTION

Analog voice communication capabilities were simple yet revolutionary in the first generation of cellular systems. In comparison to the previous generation, the second generation has digitalized voice to boost capacity, better battery life of device and quality of Service (QoS). At the time, the third generation enabled mobile Internet connectivity and data rates that were comparable to wired systems. Smart phones with massive storage and processing capabilities, as

well as high-definition cameras, together with social networks turning mobile users into content providers, have pushed fourth generation devices even further towards higher speeds. The fifth generation (5G) targets an exponential increase in data rate, device to device (D2D)communication, machine to machine (M2M) and the health sector [1],[2]. Fifth-generation cellular technology will replaced by sixth-generation wireless, or 6G in future. The bandwidth and latency of 6G [3],[4] networks will be significantly higher than 5G networks due to their ability to operate at higher frequencies. The 6G computational infrastructure, in conjunction with artificial intelligence (AI), will be able to decide where computing should take place, including decisions regarding data storage, processing, and sharing. It is important to keep in consideration that 6G is still a developing technology and some companies are making investments in the sixth-generation.

Key Enabling Technologies for 5G

Enhanced mobile broadband, massive machine-type communication, ultra-reliable and low latency communication have been identified as the requirement to be supported by the fifth generation. 5G networks will require a major paradigm shift to satisfy the increasing demand for higher data rates, lower network latencies, better energy efficiency, and reliable ubiquitous connectivity. The major technological breakthrough requires to bring 5G into practice are new waveforms, Massive MIMO, new radio access techniques, millimeter wave, the internet of things etc. Massive MIMO uses a higher number of antennas to achieve massive spatial multiplexing benefits, resulting in a multi-fold increase in cellular network capacity. Fig. 1 shows essential techniques specified to achieve the 5G specification into reality [5],[6],[7]. The network speed of 5G will be around 20 times faster than that of 4G. It will provide up to 10 Gbps download and 1 Gbps upload speeds. This will provide seamless data connectivity and permit real-time data sharing across billions of connected devices. This will revolutionize the agriculture industry and positively affect customers, farmers, agribusiness firms, and others. Due to the high bandwidth of 5G services, 5G powered drones will provide high-quality visual data that can detect pests and diseases and apply pesticides to the target areas based on real-time data. 5G technology will revolutionize the health sector with higher speed, low latency and improved data accuracy. It will make it possible for healthcare professionals to easily access and accurately analyze patient data. Particularly in rural places, 5G will make remote learning more interactive. With IoT devices in mind, 5G connects a greater density of devices at faster rates, almost eliminating lag. Therefore, 5G delivers a fantastic user experience regardless of the application, device you use.

Beyond 5G

India, like the rest of the globe, is thinking about the next generation of telecom technologies and the transformations they are expected to bring. Since wireless communication technology requires many resources, more spectrum is required to handle higher data rates. This is especially true as the technology advances. The utilization of spectrum is expanding to higher frequency bands as mobile communication technologies advance to new generations. While 5G was the first to employ mm Wave frequency bands, 6G is anticipated to investigate even higher frequency bands, such as (sub-) THz. Although low- and mid-band frequencies are crucial for mobile communication systems to attain widespread coverage. The mm Wave band has greater technical challenges compared to low- and mid-bands because of more severe radio propagation characteristics. By using Massive MIMO networks and sub-THz transmission with maximum bandwidth, spectral efficiency can be improved. Table 1 and Table 2 indicate the critical parameters such as bandwidth requirements, data rates, and features for each generation. Figure 2 depicts technological progress from 2010 to 2030.

Cognitive Radio

Currently, the information and communication business is experiencing global challenges such as the creation of new services with improved quality of service (QoS).There appears to be a fear that an impending spectrum crisis may arise, in which the increased demand from smart mobile devices would soon exceed wireless capacity. The challenge is the lack of additional spectrum in cellular data carriers. The CR concept was proposed to evaluate the efficiency of the spectrum consumption problem. Cognitive Radio, a technology optimizes the utilization of radio frequency spectrum, which is currently facing increasing demand but limited availability. Recent times have

witnessed a surge in wireless applications, predominantly driven by mobile users. However, the majority of the radio spectrum is already allocated, leaving only a small portion available for licensing to new wireless services. The Spectrum Policy Task Force (SPTF) within the Federal Communications Commission (FCC) conducted research on frequency bands and made some noteworthy findings. They observed that in specific geographical areas and timeframes, several frequency bands experience low occupancy. Conversely, certain frequency bands are heavily utilized by licensed systems. To illustrate, in the United States [8], [9],[10] cellular network spectrum bands are extensively used during regular working hours but remain largely unused between midnight to early morning.

In the current spectrum licensing approach, the allocation of radio frequencies operates under a command and control model. Unfortunately, this model results in suboptimal utilization of the available radio spectrum. Under this system, if a licensed user doesn't fully utilize their allocated spectrum, it remains inaccessible to unlicensed users and their applications [11]. Consequently, only those with dedicated spectrum licenses can employ the radio spectrum, and these licenses do not allow for adaptive adjustments based on varying environmental conditions. For instance, if a wireless system is using a specific frequency band extensively, it cannot switch to another less congested band, even when that option might be more efficient. Under the current spectrum licensing system, when a license is granted to a particular entity, it comes with specific conditions pertaining to parameters such as power, space, frequency, the intended purpose, and the duration of the license. What is important to note is that in this scheme, licensees are typically not allowed to modify the intended use or transfer these rights to another entity. This rigid framework results in a restricted utilization of the frequency spectrum, leading to its underutilization. This situation gives rise to what are known as spectrum holes or spectrum opportunities. Spectrum holes refer to frequency bands that have been officially allocated to licensed users but remain underutilized at certain times and in specific locations as shown in fig.3. Interestingly, these frequency bands could potentially be used by unlicensed users [12].

To avoid this limitation and to increase utilization of available spectrum, modification in spectrum licensing scheme is necessary. This will also increase the system efficiency. This become possible if unlicensed users can also access the available spectrum with certain restrictions. This is possible only if access of available radio spectrum is flexible. Currently, a particular wireless system can access only dedicated radio spectrum which is assigned to that system. It is not flexible. The improved flexibility by the spectrum licensing scheme will not be used by them. With this concept, Cognitive Radio is introduced. Cognitive Radio improves the performance of wireless transmission system with dynamic access of radio spectrum by users. In addition, Optimum utilization of frequency spectrum is possible with this concept of Cognitive Radio. With the help of spectrum sensing, cognitive users can identify the current activity on target spectrum if it is in use by licensed user or not. After spectrum sensing, the information regarding the spectrum is passed to Spectrum Management. Here decisions on spectrum access are made based on spectrum opportunities. During transmission of cognitive users if there is any change in that particular spectrum, the frequency band of cognitive user is changed by next stage of Spectrum Mobility. The main functions of cognitive radio are given below.

Spectrum Sensing

Spectrum Sensing serves the purpose of assessing the status of a specific frequency range, primarily to determine the activity of licensed users. It involves regular monitoring of the desired frequency band. In this process, Cognitive Radio systems [13] ,[14] play a pivotal role in identifying unused spectrum, known as spectrum holes. Furthermore, these cognitive radios also determine how to access this spectrum, considering factors like transmission power and access duration, all without causing interference to licensed users. Spectrum sensing can be categorized into two approaches: centralized and distributed. In centralized spectrum sensing, a sensing controller (like an access point or base station) is responsible for monitoring the target frequency band. The data collected is then shared with other nodes in the system. Centralized sensing simplifies the involvement of user terminals but may pose challenges related to location diversity. For instance, the centralized sensing controller might not effectively reach an unlicensed user at the periphery of the coverage area. In contrast, distributed spectrum sensing [15] involves unlicensed users autonomously conducting spectrum sensing. The data they collect can be used individually by cognitive radios which is called non-cooperative method or shared with other users which is known as cooperative sensing.

Haresh L. Judal *et al.,*

Cooperative sensing add over head in terms of communication and processing but generally results in more reliable spectrum sensing compared to non-cooperative methods.

Spectrum Analysis

Spectrum management primarily revolves around two key aspects: spectrum analysis and spectrum access optimization. In spectrum analysis, valuable insights are gleaned from spectrum sensing data. This includes information about spectrum holes, such as when they are available, estimations of potential interference, and the likelihood of collisions with licensed users due to sensing errors. This analysis forms the foundation for making informed decisions regarding spectrum utilization. The process of gaining access to the spectrum involves making decisions that improve system performance while achieving desired outcomes, such as maximizing the output of unlicensed users. This decision-making encompasses various parameters like bandwidth, modulation mode, geographical location, time duration, and frequency assignment. All of these choices are made with the overarching goal of ensuring that interference to licensed users remains below specified target levels.

Spectrum Access

Once a decision is reached through spectrum analysis, unlicensed users can access spectrum holes. This access is facilitated by a cognitive Medium Access Control (MAC) protocol, which is designed to prevent collisions both among unlicensed users and with licensed users. To ensure smooth coordination and synchronization of transmissions, cognitive radio transmitters communicate with cognitive radio receivers. This coordination is crucial for effective data transmission. The choice of MAC protocol can be based on either random access (e.g., ALOHA, CSMA/CA) or fixed allocation (e.g., FDMA, TDMA, CDMA) principles. These MAC protocols serve as the foundation for how cognitive radios access and utilize the available spectrum, ensuring efficient and interference-free operation.

Spectrum Mobility

Spectrum Mobility is the term used to describe the ability of cognitive radio users to adapt and switch their operating frequency bands as needed. When a licensed user begins using a radio channel that is currently being used by an unlicensed user, the unlicensed user must perform what is known as a spectrum handoff. During a spectrum handoff, several protocol parameters across different layers of the protocol stack must be adjusted to align with the new operating frequency band. It is crucial to ensure that the unlicensed user's data transmission seamlessly continues in this new spectrum band. In essence, spectrum handoff is the process of smoothly transitioning to a different frequency band to accommodate changing spectrum usage conditions.

Components of Cognitive Radio

As per changing environment, there are mainly four functions performed by cognitive radio to adapt the transmission parameters. These four functions of cognitive radio are shown in   fig.4.

Decision Making

In the stage of Decision Making, the information about spectrum Occupancy is used to take the decision about spectrum access. The behavior of unlicensed user is also taken into consideration. Their behavior can be competitive or cooperative. Various techniques are available to get the optimal solution. Optimization theory is one of the techniques. Optimization Theory is suitable if there is single entity with a single objective. Although, Game theory is applicable if there are multiple entities with its own objective. Stochastic optimization is suitable for decision making for random systems.

Wireless Transmitter/Receiver

Signal transmission and reception is the main responsibility of Transmitter/Receiver. In addition, it is also used for the purpose of Spectrum Sensing. It checks the frequency spectrum activity. It changes its parameters dynamically if required as per higher layer protocol instructions

Spectrum Analyzer

The job of Spectrum Analyzer is to find the spectrum vacancy for unlicensed users by checking the presence of a signal by a licensed user. Spectrum Analyzer also ensures that due to spectrum usage by unlicensed user, the licensed user transmission is not affected. Various signal processing techniques are available to get the information about spectrum occupancy.

Learning / Knowledge Extraction

licensed users use Learning and knowledge extraction for understanding the spectrum utilization. To optimize and adapt the transmission parameters, a base is built and maintained which contains spectrum access environment so that the desired objective under various constraints is achieved. Various Machine-learning algorithms are used for this purpose.

OFDM and FBMC

The 4G mobile communication system employs OFDM modulation technology. Due to higher out of band emissions, OFDM is unlikely to be considered for the next-generation wireless communication systems. In OFDM, rectangular shape filter used which is replaced by a new waveform in FBMC technique. OFDM filters the entire band while FBMC, which is the generalization of OFDM, filters each subcarrier independently. FBMC is proposed as an alternative to OFDM, which does not use a cyclic prefix (CP), hence, it is more spectrally efficient than OFDM. Power spectral density comparisons of OFDM and FBMC that can be used in the CR network and future generation wireless systems are carried out. The difference between OFDM and FBMC lies in the choice of the transmitter and receiver prototype filters. OFDM uses rectangular filters at the transmitter and receiver end while FBMC uses non-rectangular filters, so different characteristics could be obtained according to the filters used. The choice of pulse width parameter in transmitter and receiver prototype filters are different in OFDM and FBMC techniques. In comparison among FBMC using PHYDYAS, conventional FBMC using a Hermite, and OFDM with rectangular, FBMC with PHYDYAS has shown the best performance as depicted in Fig. 5. Comparatively 50 dB lower out of band emissions are noticed with FBMC using PHYDYAS than CP-OFDM.

Massive MIMO

5G was the first to use millimeter Wave frequency bands, while 6G is expected to study even higher frequency bands, such as (sub-) THz. THz improves the potential and high frequency problems in CR communication systems. THz communication has a few basic characteristics such as high frequency causing high path loss and broadly available bandwidth to support high data rate. Interferences are reduced using highly directed narrow bandwidth antennas. Massive MIMO with a huge number of BS antennas will allow for arbitrarily high SNR values, which will be particularly useful in 6G communication networks. Massive MIMO extends the MIMO system by including a significantly greater number of antennas on the base station. The "massive" number of antennas help focus energy, which brings drastic improvements in throughput and efficiency. The Massive MIMO model is described as shown in Fig. 6, where BS contains M antennas that serve K single antenna users where $M \gg K$[16],[17].Tens of mobile terminals (MTs) are being served simultaneously by the base station (BS), which has a huge number of antenna elements about hundreds or more. By coherently combining signals at BS antennas, uncorrelated noise and the multiuser interference effect can be reduced[18],[19], [20]. In Massive MIMO, the number of BS antennas will enable the achievement of arbitrarily high SNR values as shown in fig.7. Massive MIMO technology will therefore be beneficial in 6G communication networks.

CONCLUSION

There are several large cities in developed nations that are using 5G network connection, and it is expanding world wide. However, the needs of users and industries for the CR network in 2030 are not being met by 5G. A high capacity and low latency 6G wireless network is anticipated to support client applications and improve communication latency. FBMC is more suitable in next-generation wireless communications compared to OFDM

because it will achieve lower out of band emission, which is one of the requirements of next generation wireless communications. In a Massive MIMO, adding more BS antennas will help to raise the average SNR value, which will help to improve spectral efficiency.

ABSTRACT

This review paper delves into the spheroidization processes employed in steel treatment to achieve softening of the initial structure for improved formability and machine ability. Various methods are explored, with subcritical and inter critical annealing being the most common, either in a single cycle or multiple treatment cycles. Crucially, these treatments are executed at temperatures slightly below Ac1 or above it. Spheroidization is attained through the cooperative growth of ferrite and cementite in laminar fashion from austenitized steel or by inducing a divorced eutectoid transformation, which involves non-cooperative movement of ferrite and cementite resulting in a divorced eutectoid structure. Deformation itself enhances spheroidization, and when coupled with appropriate annealing treatment, it leads to reduced annealing times and increased levels of spheroidization. In hypereutectoid steels, the divorced eutectoid transformation (DET) takes precedence over the pearlite reaction at lower austenitizing temperatures and slower cooling rates. Finally, the initial structures of steel play a pivotal role in all spheroidizing processes. This review provides comprehensive insights into the intricate processes, mechanisms and microstructures involved in achieving spheroidization in steel treatment.

Keywords: Heat treatment, Spheroidization annealing, Pearlite, Cementite, Eutectoid temperature, SA/V ratio, D.E.T., Hypereutectoid steel, Effects of Alloying Element on Spheroidization

INTRODUCTION

Heat treatment of metals, dating back to antiquity, involves controlled heating and cooling to enhance physical and mechanical properties. Annealing, a vital process, entails heating, soaking, and slow cooling, reducing stresses and refining the microstructure for improved machinability and ductility. Pearlite steel's alternating ferrite-cementite layers pose machining challenges, including tool wear, irregular surface finish, erratic chip formation, and tool failure due to inherent brittleness. Spheroidization annealing transforms steel's microstructure into globular cementite in a ferrite matrix, enhancing machinability, ductility, and tool life by reducing built-up edges during machining, ensuring smoother finishes.

PEARLITE STEEL

Austenite is an interstitial solid solution of 0.8% carbon and F.C.C. gamma iron. After eutectoid reaction & phase transformation austenite is to change to alpha ferrite. Ferrite having B.C.C. crystal structure has less vacant space, however dissolves very little carbon. Change in microstructure cannot happened until carbon atoms come out of solution. Therefore, the first step is the precipitation of carbon atoms to form plates of cementite (iron carbide). Immediate adjacent side of cementite plate, iron is depleted of carbon and the atoms may now rearrange themselves to form B.C.C. ferrite. Thin layers of ferrite are formed on each side of the cementite plate. The process continues by the formation of alternate layer of ferrite and cementite, give fine fingerprint mixture known as pearlite.[1-2]

Spheroidization Annealing

Spheroidizing annealing is a heat treatment process used for steel to change its microstructure and make it easier to work with. This is done by heating the steel to temperatures just below or above the Ac1 temperature (the eutectoid temperature) and then slowly cooling it down. Before this process, the steel's microstructure can be ferrite-pearlite (for low-carbon steels), pearlite (for medium-carbon steels), or cementite-pearlite (for high-carbon steels).[2]
There are three main methods for achieving spheroidization

1. Subcritical Annealing: This method involves holding the steel at a temperature just below the Ac1 point for an extended period. It is most effective for low-carbon steels (hypoeutectoid) and helps transform the microstructure into a more desirable form.
2. Inter-critical Annealing: In this approach, the steel is heated to a temperature just above the Ac1 point and then cooled very slowly in a furnace or kept at a temperature just below Ac1. This method is often used for high-carbon steels (hypereutectoid) and achieves the desired structural changes with greater certainty.
3. Cyclic Annealing: Cyclic annealing involves alternating between temperatures just above and below the Ac1 point. This method is particularly useful for accelerating the transformation of cementite (a hard and brittle phase) into a globular form within the steel's structure. By increasing the temperature above Ac1, the cementite dissolves, and upon subsequent cooling below Ac1, it re-forms in a more desirable globular shape. This globular cementite within the ferritic matrix is the preferred structure because it has the lowest energy content in the iron-carbon system. The rate of carbon diffusion during this process depends on factors such as temperature, time, and the presence and amount of alloying elements in the steel.

Subcritical annealing shown in Fig. (2a) is the most efficient process for hypoeutectoid steels, while in hypereutectoid steels, the morphological change is achieved with greater security through inter-critical treatment, or cyclical treatment shown in Fig.(2b) and (2c).[3] Cyclic process shown in Fig. (2c) is used to speed up the transformation of cementite lamellas (thin layers of a specific compound in steel) into a rounded or globular shape. To make this happen, we raise the temperature above a critical point called Ac1. This higher temperature helps dissolve the cementite lamellas. Then, when we cool the material back down below Ac1, the dissolution process is interrupted, causing the lamellas to break into smaller pieces. These broken pieces, which have lower resistance and surface energy, come together more easily and quickly. The reason behind this is that they tend to coalesce or clump together within the ferrite matrix (the surrounding material). This entire process is driven by the movement or diffusion of

68262

Mayur H. Mandviwala and Purvi D. Chauhan

carbon atoms. When the cementite particles take on a globular shape within the ferrite material, it results in the structure with the lowest energy content among all possible structures in the iron-carbon system.The speed and success of this transformation depend on factors like temperature, time, and the type number and amount of alloying elements present in the steel being used.[4]

Surface Area / Volume (Sa/V) Ratio of Globular Cementite

When cementite particles are spheroidized, the lamellar structure breaks down into smaller, rounded particles with increased surface area due to the spherical shape. The SA/V ratio increases because the surface area of the particles increases while their volume remains relatively constant. This altered microstructure has favorable effects on mechanical properties as it reduces stress concentration points and enhances overall material performance. The specific SA/V ratio of globular cementite after spheroidization will depend on factors such as the initial microstructure, spheroidization temperature, duration of treatment, and the composition of the alloy. Generally, a higher SA/V ratio indicates a finer and more uniform microstructure, which can lead to improved mechanical properties [2].

Divorced Eutectoid Transformation (DET)

Normally, when certain materials go through a transformation called the eutectoid reaction, they form a structure called lamellar pearlite, which isn't always ideal. But with the right conditions (specifically, the right parameters), we can make sure that this eutectoid reaction leads to a different structure called spheroidized cementite within a material called austenite. This process is known as the "Divorced Eutectoid Transformation" or DET. During DET, the cementite particles change into a spherical (or divorced) shape directly within the austenite material. These particles grow in a particular way, moving along the boundary between austenite and ferrite, two different phases of the material. Here's how the process works step by step:

1. First, the material is heated to a high temperature where it consists of only austenite and cementite.
2. Then, it's slowly cooled down. This controlled cooling is crucial because it allows the material to undergo eutectoid decomposition, but instead of forming the undesirable lamellar pearlite structure, it creates a mixture of spheroidized cementite within the austenite.
3. During this transformation, the proeutectoid cementite particles (the ones that were there before the transformation) grow and absorb excess carbon as the austenite turns into ferrite.
4. This results in a final microstructure where the cementite particles are spherical and embedded within the ferrite, making the material stronger and more suitable for certain applications.

Importantly, this transformation only happens at temperatures just below a specific point called Ac1, and at slightly lower temperatures, it changes into the lamellar pearlite structure instead. So, controlling the temperature is crucial to achieving the desired spheroidal cementite structure.[5] To quickly achieve the spheroidization of cementite, the key is to change how the transition from austenite to pearlite occurs. This involves controlling the thermodynamics (how energy is distributed) and kinetics (how fast reactions happen) of the phase transition. In this case, we want to shift from the traditional lamellar mechanism to a mechanism known as the Divorced Eutectoid Transformation (DET). The DET process involves carbides settling around the original granular cementite and transforming into spherical shapes. So, the formation of spherical cementite happens in two main stages:

1. **Dissolution and Granulation:** This occurs during the process of austenitization, where the original cementite begins to dissolve and granulate within the material.
2. **Spheroidization and Growth:** After the material has been supercooled (cooled below its usual transformation temperature), the remaining austenite undergoes spheroidization and growth through the DET process. This leads to the formation of spherical cementite within the material.

This process has been extensively studied and documented in the literature for eutectoid transformations in steels. It results in the transformation of the material into a mixture of spheroidal cementite and ferrite, with the

68263

Mayur H. Mandviwala and Purvi D. Chauhan

transformation front progressing through the material in a specific manner, as illustrated in Figure 4. This transformation typically starts from a normalized structure, which is an initial condition used to prepare the material for these changes.[6]

Spheroidized Hypereutectoid Steels

There are two ways to change the structure of hypereutectoid steels to make them more useful:

1. Method 1: Heat the steel just below a specific temperature (called Ac1), which causes the existing structure (pearlite) to change into round shapes (spheroids). This change happens because the energy at the interfaces between different parts of the steel decreases. This method is called "spheroidizing."
2. Method 2: Heat the steel to a high temperature where it turns into a different structure called austenite, but some parts (cementite) remain as round particles. Then, cool the steel down through another specific temperature (eutectoid), which causes the remaining particles to grow, absorbing extra carbon. As this transformation happens, you end up with big round cementite particles in a matrix of a different material called alpha-ferrite. This final product is called "divorced eutectoid" because the phases no longer grow together.

In hypereutectoid steels, the second method is usually used. This method involves heating the steel above the Ac1 temperature to change the structure and partially dissolve the cementite particles at the grain boundaries. The end result is a structure with two different sizes of cementite particles, with the larger ones mainly located at the grain boundaries of the austenite. It's also worth mentioning that if you heat the steel above Ac1 but below another temperature called Acm, you get a different result. In this case, the cementite doesn't completely dissolve, and you end up with fine cementite particles in the austenite. These particles can then transform into a mixture of ferrite and cementite through two different reactions: one called the pearlitic reaction and the other called the divorced eutectoid transformation reaction (DET). The key difference between these two reactions is that pearlitic reaction leads to the growth of a combined structure of ferrite and cementite, while DET doesn't combine them but results in a densely distributed pattern of cementite particles in the austenite. This gives a soft structure with round cementite particles in a ferritic matrix. [8-12]

Influence of Deformation on the Spheroidization

When you subject a steel material to deformation, whether it's done at low or high temperatures, it actually makes the material stronger and changes the way certain structures within the steel look. Specifically, it makes something called cementite become more rounded. The more you deform the steel, the more rounded the cementite becomes when you later heat it up (anneal it), and this means you don't need to heat it for as long as usual. Research [13] found that when they deformed low-alloy, medium carbon steels to a certain extent (a strain of at least 0.3), they could end up with steel that had almost completely rounded structures when they annealed it. This rounding was so thorough that over 90 percent of the structures became rounded, even if they originally looked like something called pearlite, which has a different shape.

1. Deformation: Deformation, whether done at low or high temperatures (cold or hot), helps to speed up the spheroidization process of cementite in the steel. The more deformation is applied, the more effective the spheroidization becomes after annealing, which means the required time for this process is shorter compared to the traditional method.
2. Effect of Deformation-Induced Carbides (DIC): The presence of deformation-induced carbides (DIC) significantly affects spheroidization. Carbides that form at grain boundaries and in areas where deformation occurs help the spheroidization process. However, if carbides form networks due to deformation, it can hinder the process. DIC serves as starting points for new carbide particles, which transform into ferrite, leading to the formation of a ferrite matrix and spheroidized carbides instead of the usual lamellar pearlite.
3. Cold Deformation: Cold deformation done prior to the spheroidization process notably accelerates the rate at which pearlite-ferrite microstructures transform into spheroids. In cases where the steel hasn't been deformed beforehand, the process of spheroidization is still effective because the austenite formed during heating directly

68264

produces ferrite and spheroidal cementite particles, making the process even faster than when cold deformation is involved [14].

EFFECTS OF STARTING STRUCTURES ON SPHEROIDIZATION
Spheroidization of cementite in steel is influenced by various factors, such as time, temperature, and the initial microstructure of the steel.

1. Initial Microstructure: The starting condition of the steel matters. Spheroidization can occur when starting from different steel structures, including laminar pearlite (resulting from eutectoid annealing), martensite, coarse pearlite, fine pearlite, and bainite. Each type of initial structure requires a different treatment process.
2. Effect of Initial Microstructure: According to research by Arai et al., the fastest spheroidization occurs when starting from the most unstable initial microstructure, primarily martensite. The rate of spheroidization in these unstable microstructures depends on how quickly carbon atoms move within the microstructure and come together.
3. Spheroidization in Pearlite: When the initial structure is pearlite, spheroidization happens through the coagulation (coming together) of the cementite lamellae (thin layers). This process has two stages. In the first stage, the cementite lamellae change shape to become knuckle-like. In the second stage, they form globules at their ends, and due to surface energy considerations, these globules eventually turn into rounded spheroids, known as spheroidal cementite.
4. Diffusion Control: The speed at which spheroidization occurs in both stages is controlled by the diffusion of carbon atoms within the microstructure. Essentially, the carbon atoms need to move to specific locations for the cementite transformation to take place.
5. Lamellar Cementite Thickness: The thickness of the initial cementite lamellae affects the energy required for the spheroidization process. Thicker lamellae require more energy to transform into spheroids. [15-19]

Effects of Alloying Element on Spheroidization
Alloying elements can have different effects on spheroidization. The addition of chromium (Cr) refines the particle size of spheroidized cementite, making it smaller. On the other hand, the addition of certain alloying elements like titanium (Ti), vanadium (V), niobium (Nb), and others, which are strong carbide formers, can slow down the spheroidization process by reducing the diffusion of carbon in the ferrite phase of the steel. [20-28]

Chromium Effect on Spheroidization
Chromium plays a significant role in the spheroidization process of steel. The addition of chromium extends the range of temperature and time during the austenitization phase, facilitating the Diffusional Exchange Transformation (DET) reaction upon cooling. In steels with low chromium content or no chromium at all, promoting the DET reaction becomes challenging. However, by carefully controlling the spacing of cementite particles during the austenitizing treatment and adjusting the cooling rate, it's possible to overcome this challenge and achieve a sufficiently spheroidized structure in low-chromium steels. A study by N.V. Luzginova et al. [30] explored the impact of chromium on the spheroidization process in medium carbon steels. They examined three types of steel samples: 0.5% chromium, 1.5% chromium, and 2.5% chromium. Specific process parameters, including time and temperature, were selected to encourage the Diffusional Exchange Transformation (DET) reaction. The results indicated that the addition of chromium allowed for the formation of a spheroidized structure at higher austenitization temperatures and longer annealing times compared to low-chromium steel. Additionally, the DET reaction occurred at a lower subcooling temperature compared to the pearlitic reaction. Micro structural analyses revealed distinct differences among the steel samples. Steel with 1.5% chromium and 2.5% chromium content exhibited well-spheroidized structures, as depicted in Figures 6 (c) and (d). In contrast, the steel with 0.5% chromium content displayed incomplete spheroidization of the cementite, as shown in Figure 6 (b). This incomplete spheroidization was evident in non-spheroidized areas, such as the one highlighted within the red circle.[31]

Mayur H. Mandviwala and Purvi D. Chauhan

Aluminum Effect on Spheroidization

In their study, H.L. Yi and colleagues (Yi et al., [32]) delved into the process of expediting spheroidization in eutectoid steel through the addition of aluminum. Their investigation unveiled a two-stage definition for the spheroidization process, involving the breaking of cementite lamellae and the thickening of cementite particles. The introduction of aluminum was found to elevate the spheroidization temperature by raising the initial austenite temperature, which in turn refined the interlaminar spacing. To elucidate, the authors initially established the correlation between annealing temperature, interlaminar spacing, and the two stages of spheroidization. Subsequently, they elucidated the mechanism behind how aluminum accelerates spheroidization. Aluminum functions as a potent ferrite stabilizer, augmenting the eutectoid temperature during the cooling phase. Consequently, this refinement occurs due to increased subcooling during the eutectoid transformation, which hampers lamellar growth through the overall diffusion of aluminum into the cementite. This refined interlaminar spacing expedites the disintegration of cementite flakes during the initial stage of spheroidization but is less effective in thickening cementite particles, a process solely reliant on diffusion. Moreover, aluminum enhances the initial austenite temperature during heating, thus expanding the potential spheroidization annealing temperature. The heightened heat treatment temperature plays a pivotal role in spheroidization acceleration by enhancing the diffusivity of the alloying elements and exerts a significant influence on the thickening of cementite particles during the second stage of spheroidization.[18]

CONCLUSION

After conducting a thorough review of the processes involved in spheroidization treatment of steels, along with an examination of mechanisms and microstructure changes, the following key findings and conclusions have been reached

1. Improved Cold Forming and Machinability: Spheroidization treatment enhances the cold forming and machinability characteristics of steels. It achieves a spheroidized structure comprising cementite carbides within a ferrite matrix. This structure can be achieved through two primary methods: cooperative growth of ferrite and cementite in laminar form from austenite or by inducing a divorced eutectoid transformation (DET). However, DET, while faster, does not optimize the distribution of proeutectoid cementite particles in the austenite.
2. Spheroidization Mechanisms: Several models have been proposed to explain the spheroidization mechanism of pearlite. These models typically focus on the extent of lamella rupture. However, this scope is limited as it does not consider the thickening of cementite particles observed in soft annealing treatments.
3. Microstructure Influence: The initial microstructure plays a significant role in the spheroidization process. Various studies have been conducted using different starting structures, often achieved through continuous cooling from a specific austenitization temperature. It's important to note that continuous cooling leads to phase transformations occurring over a temperature range determined by the cooling rate. As a result, micro structural characteristics related to temperature, such as inter laminar spacing and cementite thickness or length, vary and are not homogeneous.
4. Deformation Effects: Deformation accelerates spheroidization kinetics and increases the degree of spheroidization. Several phenomena occurring during spheroidization treatment contribute to matrix softening. Combining deformation with annealing treatments results in shorter annealing times and higher levels of spheroidization.
5. Hypereutectoid Steels: In the spheroidization processes of hypereutectoid steels, the divorced eutectoid transformation reaction (DET) dominates over the pearlite reaction at lower austenitizing temperatures and slower cooling rates. This finding highlights the importance of temperature and cooling rate control in achieving the desired spheroidized structure in hypereutectoid steels.

ABSTRACT

Women are the essential pillar of the family and society as they can shape the future of the entire society. Developing country like India consists of a significant amount of rural area. Because of a lack of education, socio-economic status, and other factors awareness about one's health is overlooked, generally in the case of rural women. This study demonstrates the development of an intelligent healthcare system, especially for rural women. In the era of technology, it is possible to reach millions of women nationwide and educate them about their health issues. The major objectives of this study are to identify basic women's health issues like menstruation, pregnancy issues, sanitation, malnutrition, etc., and to provide awareness regarding these health issues in rural areas using intelligent technology such as fuzzy logic. Further, this study focuses on finding out various government schemes and experts' advice for tackling health issues in rural areas. This paper presents objectives, a literature review, a generic architecture of the system, fuzzy rules, and other details related to the system.

Keywords: Artificial Intelligence, Fuzzy Logic, Rural Women, Health Awareness, Menstruation, Pregnancy Issues

INTRODUCTION

Great well-being is a key measure, which adds to human prosperity and financial development. For any nation, dealing with ladies' health and life must be one of the precedence. Acceptable nutrition for ladies would assist them to serve as productive members of society to develop the consequent health generations. In 2023, Gujarat had 52.11% male population while the female population was 47.88%. Women face extreme changes in and outside of their bodies as they mature, making every stage of their lives feel like an uphill battle. Nowadays women are more empowered than men. But in a rural part of Gujarat women are not aware of the health awareness campaigns. In a time when rural women are susceptible to countless ailments, it is crucial to motivate them to take responsibility for their health and hygiene. From working women to housewives, from poor to richest women, illiterate to educated women all are not aware of common health issues that are phased by most women. Because of lifestyle decisions and ignorance, women's health conditions have recently leaped. A woman's hectic daily schedule may cause healthy living to be neglected. In this modern era women may suffer from common health issues like Menstruation problems, Fertility issues, Thyroid problems, Breast cancer, Depression, Sexual health and bladder issues, Hormonal imbalance, Malnutrition, **Heart diseases,** Maternal mortality, reduction in bone density, etc. women in rural areas have to experience many health-related issues due to poverty, illiteracy, poor quality health facility as well as less knowledge about common health issues. Therefore, to support a woman in a health crisis it is advisable to develop an intelligent healthcare system that will accommodate their specific needs. Additionally, this system will educate women on the importance of encouraging healthy lifestyle choices, which are the best approach to preventing disease, lengthening life, and enhancing quality of life. To fulfill this requirement this research paper will focus on the most common women's issues such as Menstruation problems and Maternal mortality[1][2].

LITERATURE SURVEY

A study by Thane locale in Maharastra shows that a large portion of the juvenile young ladies had a lack of knowledge and awareness about menstruation before menarche. This study has proven that mothers played the most prominent role in providing information to their daughters about menstruation. This research also makes the case that although many of the girls intended to use sanitary napkins during their monthly periods, many were unwilling to do so caused of budgetary limitations. Additionally, several of the study's female participants reported having significant menstrual anxiety, irregular periods, excessive bleeding, and white discharge. The findings of this study should demonstrate various solutions to aware adolescent girls about menstruation and give them special care and support regarding menstruation [3]. The reason for this study is to reveal insight into the feminine state of juvenile young ladies who live in rustic regions near Bhopal as well as their menstrual health-seeking behavior. This study demonstrated that most of the adolescent girls did not take any medical treatment due to feeling shameful and discomfort, lack of proper medical facilities and poor attitude of healthcare workers, cost of treatment, gynecological morbidities, etc. Moreover, this research illustrated common menstrual complaints and healthcare-seeking behavior among adolescent girls[4].The creation and usage of smart healthcare bidets to help avoid numerous human ailments are discussed in this article.

A medical bidet platform and app software based on the Internet of Things (IoT) were created to employ sensors to track users' health data including oxygen levels, pressure, temperature, and pulses. This bidet is used to detect human diseases at early stages. The created medical bidet platform is capable of measuring and transmitting a variety of physiological information that can aid in the early diagnosis of human medical conditions[5]. The possibility for an AI system to provide health awareness messages is introduced and examined in this work. Folic acid was used as a test case since it is a nutrient that is essential during pregnancy. To determine if a cutting-edge AI system is capable of producing health messages to raise awareness about this crucial problem, this project will employ folic acid (FA) as a test case. In particular, the produced messages were assessed as clearer and of greater quality compared to even the most widely shared human communications, were simple to use, and were typically on par with human messages in terms of quantitative attributes. Consequently, the message engine might be utilized to

Monika Patel and Priti Srinivas Sajja

reduce the bottleneck in the process of creating health awareness messages[6].This paper demonstrates IOT and Mobile health care. Online personal health records (PHR), SMS treatment and appointment reminders, the emailing of private clinical information, and specialist directing are all features of mobile health care. IoT medical services will complete a reasonable part, for example, RFID labels, sensors or locators, insight hardware, and so on. This framework empowers online interaction with patients, recognizing the patient's form, verification of the patient's mentality, following patients, doctors, and medical equipment shipping, drug management, drug discoveries, and so forth[7].This paper surveys various kinds of conversational specialists utilized in medical services for constant circumstances, looking at their fundamental correspondence innovation, assessment measures, and Artificial intelligence strategies. This paper showed that various advancements have upheld CAs, including autonomous stages, applications conveyed through web or cell phones, short message administrations (SMS), and phones[8].This paper demonstrates the role of AI in healthcare. It likewise shows how Artificial intelligence is valuable in medical care by mining clinical records; planning treatment plans; forecasting health events; helping with tedious tasks; conducting online consultations; aiding clinical independent direction; prescription administration; drug creation; pursuing better decisions and choices; what's more, tackling general medical conditions and so on.

It also reports the AI policies and initiatives taken by the Indian state government. Also shows how AI has become a helping hand during the COVID pandemic. It also lists the various Mobile applications for COVID-19 contact tracing and further investigation[9].This study explores how rural women in India's Tamil Nadu province observe and are aware of health concerns. The study's findings revealed that the respondents had a thorough understanding of health-related issues and were aware of the numerous government efforts and programs aimed at assisting rural women and children in leading healthier lives. The study aims to identify the demographic profile of the women and the awareness of key health issues related to women in rural areas[10]. The many AI technologies employed in healthcare are highlighted in this study. Particularly in the healthcare sector, AI technologies like machine learning, IoT, algorithms, and robotics are used for surveillance, evaluation, cure, and assessment of hazards and advantages. AI may be used for a variety of health-related tasks, including diagnosis, treatment, exchange of information, privacy, assistance, inspection, gathering data, and remote surgical procedures. A knowledge of current AI research and its practical use in the healthcare industry is provided by this review study[11].

This investigation offers advice on how to create an application called Smart Care that will aid pregnant women during a sensitive and important time in their lives. This application provides personalized dietary guidelines, and necessary advice for pregnancy stages and uses its intelligence to take such suggestions to an advanced level. Smart Care also reduces pregnant women's stress and guides them toward a healthy maternity period. The main aim of this development is to help out any woman who is expecting a baby in rural areas[12]. The article describes a system that employs the use of the Internet of Things to track pregnant women's health. The goal of the initiative is to develop a system that can gather and send crucial biometric data about pregnant women's health to a database, make predictions from the data, and let medical professionals treat pregnant patients remotely. The smartphone application's main goals are to employ sensors to monitor a pregnant woman's activity level and to present them with a way to regularly and remotely connect with medics about major concerns relevant to their pregnancies and health[13]. From these literatures survey we have observed the following outcomes shown in given Table 1:

LIMITATIONS AND OBSERVATION

From the above analysis, it has been clearly shown that one intelligent healthcare system is required for rural women to make them aware of health-related issues. From the given literature survey it has been observed that still some research is needed to develop an intelligent system for rural women to make them aware of the most common issues such as Menstruation problems and Maternal mortality. To work in this direction, we can list out the basic aims of this research.

1.　　To develop user user-friendly application for providing basic information about women's health issues.
2.　　To provide expert advice for health and hygiene
3.　　Women can get prompt messages or remindersto take medicines

Monika Patel and Priti Srinivas Sajja

4. To provide a proper diet plan for pregnant women.
5. To get reminders for the menstruation cycle
6. To assist women with different health problems and guide them in their very own language in the form of audio, textual content, and images.

PROPOSED MODEL

The following Figure 1 represents the proposed model which is designed to fulfill the above aims. The purpose of the proposed model is to provide expert knowledge and awareness information to pregnant women and young girls about sanitization, menstruation, pregnancy, and gynec related issues.

Users

The users of the proposed model are women, government representatives, social service agents, NGOs, experts, and admin. Women like pregnant ladies and adolescent girls can use this system to get solutions to health-related issues. Government representative, social service agent or NGOs can access this system for any schemes or campaigns for health improvement and nutrition-related helps to women. Experts are doctors who provide different solutions to women's health issues. Admin can update the entire system according to the needs of users.

User Interface

It is a user-friendly application that will be developed using Mobile technology or Web Technologies. Through the user interface users can create their profile to access this system. In the profile module users can input personal, educational, social, and assets information and medical history. To get accurate results through this system user has to provide location information like village, district, season, etc. In government schemes modules, different health-related help as well as financial help is provided to the user. The "Mukhyamantri Matrushakti Yojana" has been introduced by the Gujarat government [14]. Pregnant and nursing ladies will receive nourishing food through this program. The user interface takes basic information such as personal information, professional information, social or family information as well as facilities as input from any woman which is shown in figure 2

Fuzzy System

According to the user's health issues different advisory or fuzzy rules are generated. The proposed model is trained in such a way that according to the health issue, an appropriate solution is generated in the form of multimedia like image, audio, video, or text.

Advisory Rules

To support the proposed model, various fuzzy rules are designed. Here we design the fuzzy rules in Sanitization, Menstruation Period, and Pregnancy and Gynec factors. For Sanitization, we consider three parameters toilet facility, basic medicine, and Sanitary pads available at home or not. If not available, then different awareness related to this is given to the user. Similarly, if a user does not have proper awareness regarding the Menstruation Period, Pregnancy, and gynecology then government-related help and advice from Gynaecologist is given to them. Moreover, the awareness information is given in the form of video, audio, images, or text. The fuzzy rules and their output are shown below:

1. If the marital status is "Single" and Education is "Low" and Age is "Very Low" and Sanitary_facility is "Medium" and Medical_history is "No" and Symptum_intensity is "High" then Young_Adult_Advisory is "True"
2. If the marital status is "Married" and Education is "High" and Age is "High" and Sanitary_facility is "High" and Medical_history is "No" and Symptum_intensity is "High" thenYoung_Adult_Advisory is "True"
3. If the marital status is "Divorcee" and Education is "Medium" and Age is "Middle" and Sanitary_facility is "Low" and Medical_history is "Yes" and Symptum_intensity is "Low" then Young_Adult_Advisory is "True"

4. If the marital status is "Widow" and Education is "Medium" and Age is "High" and Sanitary_facility is "High" and Medical_history is "No" and Symptum_intensity is "Low" then Young_Adult_Advisory is "False"

From the above fuzzy rules, fuzzy membership functions are developed shown as in Figure 3

CONCLUSION

With the widespread use of the Internet, this work focuses on the implementation of an intelligent health system for rural women that would communicate through the Internet for better health. A smart health system guides and informs about healthy lifestyles to support women in every health crisis. Basically, this study aims to highlight the basic factors like disinfection, menstruation and pregnancy and gynecological problems among rural women. In addition, the government should allocate more budget funds and focus on village infrastructure to ensure equitable health care for rural women. In the future, we can develop a model that covers more women's health problems such as breast cancer identification, malnutrition, iron deficiency anemia, reduction in bone density etc. Such a health system is also suitable for men, children and the elderly in a certain area. Also it becomes further helping hand during uncertain epidemic like Covid- 19.

ABSTRACT

The term infertility is disease of the male or female reproductive system defined by failure to achieve a pregnancy after 12 months or more of sexual intercourse. It is major health problem affecting 15% of couples worldwide. About 9% of male and 10% of female aged between 22- 44 reported infertility problems. Approximately 10-15% of infertile men are azoo spermic. Y-chromosome micro deletions represent the absence of DNA segments from the Y- chromosome especially azoo spermia factor (AZF) and is considered the most common genetic cause of male infertility.In the present study genomic DNA was isolated by using phenol/chloroform mextraction protocol. Molecular genetic analysis using STS-PCR helps us to identify micro deletions in Y chromosome specifically in AZFa sub-region. Total 50 samples analyzed for sperm morphological defects and Y-chromosome micro deletions. The prevalence of deletion at AZFa sub region was 0% in the present study due to limited numbers of STS markers and sample size.

Keywords: Male infertility, Y chromosome micro deletions, STS-PCR

Mansi Dadhania and Jenabhai Chauhan

INTRODUCTION

Infertility is one of the major health problems affecting about 10-15% of couples [1]. About 9% of male and 10% of female aged 22 to 44 reported infertility problems. Large scale studies have shown that about half of all cases of infertility occur due to female factors, 20-30% male factors and 10-20% due to common causes of both gender [2]. Infertility classified into two types, primary infertility and secondary infertility. Primary Infertility refers to couples who have no previous pregnancy and secondary infertility refers to couples who have history of previous pregnancy. Infertility cause by Lifestyle factors, Environmental factors, Genetic factors, Hormonal factors, Pathological causes and Unknown causes. Due to the existence of both male and female factors that complicate any estimate that may simply focus on the woman and a result of a pregnancy diagnostic or live delivery, determining the prevalence rates of infertility throughout the world is challenging. One in every four couples in developing countries had been found to be affected by infertility[2]. Approximately 10-15% of infertile men are azoo spermic. Y-chromosome micro deletions represent the absence of DNA segments from active part of the Y chromosome [3].On the Y-chromosome, micro deletion of azoo spermia factor (AZF) is located and it is considered the most common genetic cause of male infertility. AZF subdivided into four non-overlapping sub-regions:-

1. AZFa (Proximal),
2. AZFb (Middle),
3. AZFc (Distal),
4. AZFd (Between AZFb and AZFc).

On the Y chromosome, several sequence tagged sites (STS) have been created and mapped for the above AZF region [1]. STS are known sequences of genomic DNA that can be amplified by PCR [5-6].After Klinefelter syndrome, Yq chromosomal micro deletions are the second most significant genetic cause of spermato genic arrest in male infertility[7]. as it contain several genes which are involved in spermatogenesis [8-1]. A chromosomal deletion that covers many genes is referred to as a micro deletion, but not large enough to be detected by standard cytogenetic techniques. Micro deletions are more common in azoos permic and severely oligozoo spermic males, according to studies. [9]. Different testicular histology profiles, such as Sertoli cell-only syndrome (SCOS), hypo spermatogenesis (HS), spermatogenic arrest (SGA), and SCO type II syndrome, are linked to these micro deletions[8-1]. In order to better understand how this type of defect may contribute to male infertility, we are examining the functions of numerous genes on the Y chromosome in this study.

MATERIALS AND METHODS

After extensive survey samples from Oligozoo spermia, Azoospermia and Normozoospermia individuals was collected after explaining study purpose and getting written consent. Research study ethically approved from institute ethical committee S.G. Patel Ayurveda Hospital & Maternity Home, New Vallabh Vidyanagar, Anand. Oligozoo spermia and azoo spermia samples between age group 22-45 years, from different areas of Rajkot district and men with primary infertility and person attending IVF clinics. Person with proven immunological, hormonal or other causes of male infertility, males having age above 45 years. Analysis of Y-chromosome micro deletions was carried out by using polymerase chain reaction(PCR). The genomic DNA from the infertile as well as normal subjects was isolated by using phenol/chloroform extraction protocol. Subsequently, the isolated genomic DNA concentration was measured by using Nanodrop spectrophotometer at 260 nm and the quality of the DNA were checked on 1.8 %agarosegel.DNA was extracted from semen according to standard procedure and the presence of microscope deletions of the AZF a region on the Y chromosome long arm was analyzed using a STS-PCR for Y-Specific markers, including sY81(AZFa) and sY84(AZFa). PCR was carried out in a 25 µl reaction volume. The reaction mixture contained 5 µl of template DNA, 5.4 µl of nuclease free water, 1.0 µl of each primer, 12.5 µl of PCR master mix(2X),

Mansi Dadhania and Jenabhai Chauhan

0.1 µl of 5 % DMSO. The genomic DNA of females was used as a negative control. Polymerase chain reaction were performed by denaturing DNA for 5 min at 94°C. Thirty-five cycles consisting of 30 second denaturation at 94°C, 45 seconds annealing at 57°C and 60 seconds extension at 72°C were performed to amplify the specific STS. 60 seconds finally extension at 72°C was performed. On a 2% agarose gel,microscopic PCR products were examined, stained with ethidium bromide stain (0.5 µg/ml), and then seen under UV illumination. Under the same laboratory conditions, single-primer pair PCR verified the deletion at each STS. In case of presence of micro deletions in STS, PCR was repeated thrice to confirm the deletions.

RESULTS AND DISSECTION

Total of 50 semen samples were obtained from Bliss IVF Laboratory, Rajkot. Information related to routine analysis of semen samples like semen volume, colour, viscosity, motility, concentration etc received from the collection place. The age of the men ranged between 21-40 years and majority of them between 25-35 years. On the basis of semino graph result especially sperm counts, samples were characterized as Normozoospermia, Oligozoospermia and Azoospermia. In all this samples, 29(58%) samples were Normozoospermia, 17(34%) samples were Oligozoospermia and 04(8%) samples were Azoospermia. Samples were labelled with the unique ID number. DNA was isolated from semen samples using standard phenol-chloroform methods. It was subjected to qualitative analysis using agarose gel electrophoresis. All the isolation DNA were separated on 1% agarose gel that shown DNA bands of variable size, due to different concentration. Out of 50 samples, 17(34%) showed less than 40% motility, which is well below to the semen analysis manual's standard normal level and is classified as asthenozoospermia [19].One of the most fascinating and relevant findings from all of the samples was that 8(16%) sample had abnormalities in all the three structural part of the spermatozoa, severely lowering motility and the sperm count of this sample was also quite low. The motility value of that sample was barely 5%. Many studies have found that morphologically abnormal spermatozoa have low motility and fail to reach their target, resulting in infertility. [19].

To confirm presence of Y chromosome and distinguish a negative result from technical failure an STS for SRY (sY14), which is localized on Yq. While observing the PCR products under 2 % agarose gel the product bands were falling within ladder marked region of 100 bp, SRY gene indicate that DNA is present on Y chromosome which is of 472bp shown in **Figure 3**. Among the 50 patients included in this study, 29(58%) patients were Normozoospermia, 17(34%) patients were Oligozoospermia and 04(8%) pateints were Azoospermia. In 50 infertile males, we were not found any Y chromosome micro deletion. While observing the PCR products under 2% agarose gel the product bands were falling within ladder marked region of 100 bp, Bands which indicates the normal sY 81 gene which is of 209 bp and sY84 gene which is of 326 bp. The result of 2% gel electrophoresis of PCR product shown in **Figure 4 and Figure 5** respectively sY81 and sY84. In most investigations, sperm abnormalities have been linked to male infertility and sterility. Environmental, genetic, or a mix of these factors can cause sperm structural defects. The morphological faults that are visible on clinical inspection that are more significantly deficient examples of sperm abnormalities. The AZF micro deletion in the Yq chromosome is the second cause of spermatogenic stoppage after Klinefelter syndrome [11]. One Oligozoospermia sample had greater morphological abnormalities and a sperm count that was below the normal range. Various morphological deformities were identified, including spermatozoa with tapering heads, spermatozoa with bent necks, two-tailed spermatozoa, and short-tailed sperinatozoa [2].

Khabour et al, evaluated micro deletions in the AZF region of the Y chromosome in 100 men who were infertile for unclear reasons. Micro deletions in the AZF region were found in 3 out of 36 azoospermic infertile males, whereas no micro deletions were found in oligozoospermic infertile guys. The prevalence of AZF micro deletion among azoospermic males was found to be around 8.3% in this study. Our current findings are in agreement with the prevalence that was reported from chine (8.6%) and Netherland (8.1%). The prevalence of AZF micro deletions (8.3%) observed in this study is higher than that was reported (7.6%) in India, due to limited STS. The value of micro deletion in this study (8.3%) is 3% lower than that was found in Tunisia (11.8%), Japan (11.7%) and United State (11%).All revealed a relatively low incidence of AZF micro deletions. The technique used to identify deletions, the

Mansi Dadhania and Jenabhai Chauhan

inclusion criteria, and sample sizes may all have an impact on the measured frequency of AZF micro deletions among azoospermic infertile guys. In their study sample, no micro deletions were detected among 64 oligozoospermic infertile males [12]. Mushtak et al, studied 46 patients, Only one of these 46 patients (2.2%) with primary infertile azoospermia had a full AZFa deletion; the remaining 45 patients (97.8%) had partial deletions. Their study was able to incorporate more information concerning the incidence of AZFa in Iraq, which had previously been scarcely recorded. They discovered a substantially greater prevalence of AZF a micro deletions in their region than in other prior studies from various nations. The incidence of AZF a micro deletions was found to be 61.3 percent in 75 infertile guys with azoospermia and severe oligozoospermia (46 patients) [13]. AZFa micro deletions were not discovered in any patients in earlier Iraqi investigations [14-15]. One of the most prevalent molecular genetic causes of male infertility is submicroscopic deletions in the AZF zone of the long arm of the Y chromosome [16]. The majority of these micro aberrations recur as a result of inter chromosom alhomologous recombination inside the area, according to research [17]. They damage one or more genes, resulting in a variety of spermatogenesis abnormalities. It's been proposed that genes in the AZF region have a regulatory role in the germ cell cycle and meiosis. When evaluating the literature data on micro deletions in the AZF sub regions, differences in the reported frequencies were discovered [18]. Dzhglovet et al, discovered micro deletions in the Y chromosome were discovered in 12% of 100 males with azoospermia. 66.7% of these micro deletions were detected in the AZFb area, 41.7 % in the AZFc region, 33.3 % in the AZFd region, and 8.3 % in the AZFa region, according to the authors [19]. Micro deletions were found in 4 (9.75%) AZFa patients, 5 (12.19%) AZFb patients, and 9 (21.95%) AZFc patients among the 41 azoospemia patients. Similarly, micro deletions were found in 5 (5%) of AZFa patients, 8 (8%) of AZFb patients, and 15 (15%) of AZFc patients out of 100 oligozoospermia patients [11].

CONCLUSION

Characterization of 50 semen samples of fertile and infertile males (Normozoospemic, Oligospermic and Azoospermic), morphological profile revealed that there is a involvement of morphological defects in the normozospermic (4% or more) samples also. Genomic DNA isolated from 50 samples were of good quality confirmed by agarose gel electrophoresis. SRY gene fragment amplified was of 472 bp in all the samples which indicate that gene was present on Y chromosome. sY81 gene fragment amplified was of 209 bp which indicate no micro deletion on Y chromosome and sY84 gene fragment amplified was of 326 bp which indicate no micro deletion on Y chromosome. If bands were absent it indicates micro deletion of Y chromosome. Genetic evolution of AZFa sub region by using STS-PCR technique showed deletion in AZFa sub region. AZFa sub region micro deletion among 29 Normozoospermia, 17 oligospermic and 4 Azoospermic samples revealed absence of deletion in sY81 gene and sY84 gene. The prevalence of deletion at AZFa sub region was 0% in the present study due to limited numbers of STS markers and sample size. Based on the results of this study that infertility in selected population has independent effect of both sperm morphological defects and micro deletion, as no clear-cut correlation was observed between micro deletion and morphology of sperm. The Y chromosome deletion has a diagnostic, prognostic and preventive value. The analysis are very important in infertile males to avoid empirical and expensive treatments for the improvement of fertility. Development of such a new molecular technique and standardized protocols may provide reliable results with cost effective analysis of Y chromosome micro deletion. This study together with other STS markers may help in developing in vitro screening test for Y chromosome micro deletions at fertility clinic.

ABSTRACT

Soil is important to humans and all life on earth as it serves as a source of agriculture, food and medicines. There are different types of soil, each with different mineral, humus and organic matter compositions and different properties that can be used to grow different crops. Proposed work implements a system for farmers to recommend crops based on weather forecasts and suitable soils. This proposed system will help farmers accurately identify crops without worrying about future weather or suitable soil. Through this system, farmers can get more profit. The system will help farmers by prediction of yields depending on soil parameters such as pH, nitrogen, phosphorus, potassium, temperature, humidity and precipitation soil type & various machine learning algorithms such as Convolutional Neural Network (CNN), Random Forest Model, Gradient Boosting, decision tree, GB will be used in the proposed research work

Keywords: Machine learning, crop, soil, humidity, rainfall

INTRODUCTION

Agriculture is the mainstay of the Indian economy. India is also known as an agricultural country. 50% of the workforce in India is engaged in agriculture [1]. Soil is the most important and necessary in agriculture. But now farmers also use traditional methods. Traditional methods do not bring good results to the farmers and do not increase the yield. High yield requires good soil. For this reason, a land survey was carried out. Soil science is more important to him than the main business of agriculture. Productivity and good harvest depend on the soil. Soil tests are important because they provide information about all the nutrients found in the soil, such as Ca (calcium), K (potassium), and N (nitrogen). Farmers in many parts of India, especially in the state of Maharashtra, are facing disruptions in their crops and yields [2]. They do not care about the availability of nutrients in their fields. They

Mahek Gohil and Namrata Pandya

cannot pay the loan because the success rate is low. We are committed to creating this system to help farmers decide which crops to plant for their profit. This information includes nutrients found in the soil and rainwater of farmers in an area. Based on its nutritional value, our body can predict the type of soil. A list of crops that can be expected to grow in a soil based on soil type systems. As a result, yields increased and farmers made more money with this new method. We produce machines with advanced technology. We use machine learning to build the system. Machine learning focuses on building computer programs that can access data and use it to learn from it. Machine learning allows models to be built from data models and can make decisions based on experience [3].

Motivation

Today's trend is precision agriculture. Precision farming is a modern farming technique that uses information about soil, soil type, crop yield, weather and tells farmers to plant the best farms. This machine can reduce crop spoilage and help farmers make informed decisions about their farming strategy. To solve the current agricultural problem, a good consulting system is needed to help farmers make informed decisions before they start planting.

LITERATURE SURVEY

Vrushali C. Waikar, Sheetal Y. Thorat, et al. proposed a land classification based on crop prediction using machine learning with classification [1]. Therefore, the main goal of the system is to create a model that will help farmers understand what crops should grow in a particular soil type. In this process, we use machine learning techniques to help identify crops based on soil distribution or soil series. The model only shows the soil type and shows suitable crops according to the soil type. Different classifiers are used here and products are recommended according to the model. Both of these datasets are used in this document. The first dataset is the soil dataset and the crop dataset. The soil dataset contains attributes such as PH, conductivity, nitrogen, phosphorus, potassium, soil type, and the product dataset includes attributes such as soil type and product names in this form. Mahendra N, Dhanush Vishwakarma et al. reported on machine learning for crop forecasting [2]. Most suitable product for a particular soil is recommended by this proposed work taking into account parameters such as annual precipitation, temperature, humidity and soil pH. Of these, the annual precipitation is estimated by the system itself using the data of the previous year by the other parameters, including the SVM method, must be provided by the user. The system uses the NPK value from the description entered to present the NPK requirements for the suggested crops in the Output section. The system also uses the market value and expected yield of the crop. Data about crops is gathered from the Kaggle website. 22 distinct products and 7 attributes, including temperature, humidity, and precipitation, and N, P, K, and PH, make up the 2196-byte tag file. Girish L, Gangadhar S, Bharath TR and others. A method has been proposed to predict crops and precipitation in the Tumakuru region using machine learning [4]. In this article, they discuss the performance of several learning machines, such as linear regression, SVM, KNN techniques, and decision trees, as well as different learning approaches for forecasting precipitation and crop yields. They came to the conclusion that SVM is the best technique for forecasting precipitation throughout this phase. In this post, we run a prediction test utilizing real-time information gathered from government and agricultural websites. By performing a predictive analysis of the data collected, we can help farmers choose whether crops are suitable for rainfall and crop prices. Suruliandi, G. Mariammal, and S.P. Raja proposed a crop prediction method based on the characteristics of the soil environment using a special selection tool [5].Selecting the right traits for the right crop is an important part of the selection process, especially for forecasting. In this study, different package options were examined compared to crop forecasting using a classification system that indicates the crop suitable for the land. Experimental results show that recycling eliminates the bag changing process more efficiently than other methods. The dataset for this article was collected from the website: www.tnau.ac.in and Ministry of Agriculture, Sankarankovil Taluk, Tenkasi District, Tamil Nadu, India. The database contains 1000 events and 16 features, 12 of which are location features and 4 are environmental features. Ph, EC, OC, N, P, K, S, Z, B, FE, MN, CU, precipitation, texture, season.

Jitendra Chavan, Nagesh Pawade et al. He proposed a method for product prediction using the Naive Bayesian algorithm [6]. In this project, use machine learning techniques to create a web application that will predict crop yields by applying machine learning algorithms to historical crop data using Python libraries such as Pandas, NumPy, Matplotlib, seaborn, and sklearn. Data collection is the most important part of this project. There is a lot of information from various websites used to train models. Our database contains more than 10,000 records related to crops, including state, region, season, temperature, precipitation, region, crop, soil, soil. Completed applications will help farmers decide which crops to plant in the field. This project is used to find information about crops that will be used to produce good and profitable crops. This improves our Indian economy by maximizing crop yields. This article focuses on crop forecasting and yield calculation with the help of machine learning techniques. There are many machine learning methods to calculate accuracy. Use a system to forecast crops by collecting historical data. Technology helps farmers decide which crops to plant in the field.

Sachithanandam, Vidhya, T. Sasilatha presented soil and weather-based crop growing recommendations [7]. Analysis of the weather forecast using data mining techniques has achieved good results and can be considered as an alternative to traditional measurement methods. This study describes the ability of various algorithms to predict various weather events (eg temperature, hurricane) and concludes that important techniques such as progression, clustering, forecasting and classification algorithms are required to predict weather events. As the size of the training set increases, the accuracy first increases and then decreases up to a certain limit. The results show that the proposed model produces very good results compared to other data mining prediction techniques. Although we only present the results for the minimum and maximum values, the model is able to predict all available features. The efficiency and simplicity of the model make it suitable for use in short-term electronic equipment and management organizations.

Prasad Gavas, Mrunal Jamsandekar et al. prepare the recommended crops [8]. Analysis of soil data to control for nutrients such as N, P, K and pH values and predicted precipitation for the area using C 4.5 and multiple linear regression algorithms, respectively. The system recommends crops based on the two criteria above.On the front end we share different models for farmers and managers. In the future, we may plan to create recommendations for products that take temperature into account. The system will suggest suitable products for soil conditions based on nutrients, rainfall and temperature. Sk Al Zaminur Rahman, Kaushik Chandra Mitra, proposed a method for soil classification using machine learning and soil series based crop recommendations [9]. The study was carried out on the land registry records of 6 upazillas in the Khulna region. The model has been tested using different types of machine learning algorithms. Bag tree and K-NN showed good accuracy, but among all classifications, SVM has the highest accuracy for soil classification. The proposed model is characterized by developing appropriate data and machine learning algorithms. The accuracy of land classification and recommendations for specific crops are better than many available methods. In the future, we will focus on providing recommendations on fertilizers and add information from other regions to make these models more reliable and accurate. We created a data collection using Upazilla codes, map cells, and lecture notes. Two datasets are used: the soil dataset and the crop dataset. The soil dataset contains class-labeled chemical signatures for the 12 soil chemical properties of the soil used in our method

Dharavath Ramesh, Sonal Jain, proposed an integrated machine learning [10] method for climatebased crop selection in two stages: 1) seasonal climate and 2) required crop production analysis. It uses a recurrent neural network (RNN) for seasonal weather forecasting. After that, eligible crops are classified according to the random forest classification algorithm. Meteorological data is collected from NRSA Hyderabad station and includes five years of data on weather parameters such as temperature, humidity, sunshine hours, wind speed, wind direction and other things. This scheme represents a new weather-based crop selection method for cropland selection based on weather forecast and soil availability. M.Kalimuthu, P.Vaishnavi, M.Kishore proposed supervised machine learning using Naive Bayesian Gaussian classifier and supported algorithm [11] to predict crop yield. Therefore, the seed input parameters are estimated based on the given output. This program can be of great help to poor farmers who have no knowledge of predicting the future of crop growth. In the future, it will continue to recommend recommended fertilizers, field instructions and suitable products. Additionally, monitoring of sunlight and the health of crops is thought to be

www.tnsroindia.org.in ©IJONS

Mahek Gohil and Namrata Pandya

considered to achieve a better harvest. In the naive Bayes approach, the model is 97% correct. Support method is used to increase accuracy. In the promotion process, weak rules should be found and these rules should be given in a way that strengthens them. Weak rules are found through an iterative process. Weak rules are found by the distribution of the Naive Bayes algorithm. Maaz Patel, Anagha Rane and Vansh Patni developed an intelligent system that can recommend suitable products for farmers in India [12]. The system will help farmers choose the best crop based on factors such as nitrogen, phosphorus, potassium, pH, humidity, temperature and precipitation. By using this research we can make the country efficient and benefit from this technology. This research can increase the country's products and profits through the use of this technology. In this way, farmers can grow the necessary crops, increasing their income and the total income of the country. We evaluated machine learning algorithms and found that decision trees and Gaussian NB have the highest accuracy.

Purposed Work
We propose a crop recommendation which takes into consideration all the appropriate parameters including N, P, K, PH, temperature, Humidity, rainfall, and soil condition, to predict crop suitability. In our proposed system it recommends crops with weather forecasting and soil matching.

Data Collection
 The data we use are fertilizer data, crop data. First we will import the file. There are two datasets in this project, the first one is the crop dataset which includes the characteristics such as temperature, humidity, precipitation and crop type. The second is the Fertilizer dataset, which provides information about soil quality, such as the amount of phosphorus, nitrogen, and potassium in the soil. It also gives information about the pH value of the soil.

Data Preprocessing
Data preprocessing is a process used to transform raw data into clean data. This step is a very important step in machine learning. Preprocessing includes interpolation of missing values, capital letters, spaces, appropriate data, and subtraction functions. The type of dataset is very important f or analysis. The first step is data preparation, which includes several steps to clean up the data. Here we check for an empty value and discard it if it does. We will also convert the data of word from uppercase to lowercase. The next step is to find the unique items in the two datasets, then we will feed these unique items into the two newly created variables. Now that our data has been s successfully processed, we will save two sets of data for later use.

Data Integration
Data integration is the process of merging data from several disparate sources. In data integration we are merging our two data sets Crop and fertilizer data. After merging of crop data and fertilizer data then we identify unique label (crops) in dataset.

Data Visualization
Data visualization refers to the graphical representation of data in a visual format such as charts, graphs, maps, or diagrams. It is a powerful tool that helps analysts and decision-makers understand data patterns, relationships, and trends more easily and intuitively. Here are some commonly used data visualization techniques: Bar chart, Line chart, Heat chart, Pie chart etc. Correlation visualization of feature.

Feature Extraction
A special label with the name of the product is reserved, taking into account features such as nitrogen, phosphorus, potassium, temperature, humidity, pH, precipitation. The algorithm used in this project will use the tag names to predict the crop. This step involves training and testing the input data. Loading data is divided into 2 groups such as training data set and test data set with 80% or 20% separation such as 0.8 or 0.2. Classes are used as input data in the education system. In this step, supporting information for forecasting and classifying work and estimates for classification are generated. Test the data during the test section. The final data is generated during the preprocessing

and processed by the machine learning module. Separate characteristics (N, P, K, temperature, humidity, ph, precipitation) and plot (crop).

RESULT

The model was trained and tested using a total of 5 machine learning algorithms on the prepared data. These 5 algorithms are supervised algorithms that will make binary classification. In our project, we use gradient boosting as it is, as the name suggests, a combination of decision trees and clustering models. The Gradient Boosting model collects the training data from each node of the tree and separates the weak training data from the training data for higher prediction. Reinforcement is a learning process that trains models in the order that each new model tries to fix the previous model. It turns a weak student into a strong student. We can solve the classification and retrieval problem using the gradient boosting method [14]. We employed different Machine Learning algorithms and their corresponding outcomes are presented in Table 5.1. Among the algorithms, gradient boosting demonstrated the highest accuracy of 0.9931%. When compared to Gaussian naive Bayes, Decision Tree, Support Vector Machine, KNN, and Random Forest, gradient boosting outperformed them in terms of accuracy. From the above mentioned comparison Fig 5.1 shows Gradient Boosting Algorithm gives 99.9931% while comparing with other algorithm. When comparing the Gradient Boosting accuracy with the other algorithm's accuracy in table 5.1.

CONCLUSION AND FUTURE SCOPE

The proposed machine learning algorithm gradient boosting can predict the crop with high accuracy compared to other classification methods. We present the analysis of soil data and climate data, respectively, using gradient boosting algorithms to analyse nutrients such as N, P, K and pH levels, humidity, temperature and cloud weather forecast for the area. There is still a lot to explore in machine learning because there may be new algorithms and ideas in the future. Our article is a simple concept for crop forecasting. This article focuses on crop yield and crop yield prediction with the help of machine learning algorithms. The system was created in response to rising suicide rates among farmers and to help farmers become financially strong. Collect, learn, and train on relevant data using machine learning tools. We need to gather all necessary information by providing GPS location of the land and we can predict the crop by providing GPS location field to get access to rain gauge from government.

ABSTRACT

A metal oxide semiconductor (MOS) gas sensor has the capability to detect volatile and dangerous gases in the environment. This type of sensors has been extensively utilized in environment monitoring, healthcare, food industry and other areas. One such MQ-2 gas sensor is highly sensitive to LPG, propane, smoke, and methane gases but need the calibration. There are different ways to calibrate the gas sensor, but they are quite expensive and time-consuming. To find the optimized way 2-point and 4-point calibration methods were used to observe the sensor response using the Arduino Uno module and found to be quite satisfactory. Data acquisition system implemented here was used for monitoring gas response to study homely gases and hence preventive actions could be taken. With PLX-DAQ software, the system was able to collect and store data in spreadsheet.

Keywords: Arduino UNO, Data Acquisition, MQ-2 gas sensor, PLX-DAQ software

INTRODUCTION

The gas sensors are becoming the intangible part of human's need in their living spaces. This has increased rapidly in recent years, but in turn environment around us is adversely affected [1]. Inhaling toxic gases can lead to problems like lung cancer, headaches, vertigo, asthma, and other cardiovascular problems [2]. In view of the mentioned causes a need arises to study the adverse effects of it and to how resolve it. An attempt is made to study the MQ-2 gas sensor for homely gases and consider its behaviour for the development of a sensor and system to monitor pollutant gases.

Ankita J. Mahaliya *et al.,*

The MQ-series sensors have good potential in gas sensing. They are made up of metal oxide (MOX) semiconductor. Because of good sensitivity and economical **[3]**. It has tin dioxide (SnO$_2$) sensitive layer and Nickel-Chromium heater within micro-ceramic tube. Among 6 pins two connects heating coil and four for electrodes **[4]**. Mainly, MOS gas sensors have been used to assess pollutant in the ambient air. To assure accuracy and performance, gas sensor must be calibrated in proper way which is complex task. The calibration of MQ-2 gas sensor with standard calibration gas and apparatus is costly process. The previous work done on sensors only describes data generation by different sensors and calibration of sensors by using different methods **[5-7].** To simplify the process in economical way authors have calibrated MQ-2 sensor using Arduino Uno module. It is an open-source platform and makes easy debugging. Although the Arduino Integrated Development Environment (IDE) software is better at acquiring data, but lacking the tools that are suitable for storing and evaluating the data in real time. There are few softwares available for data acquisition through Arduino for real time data analysis **[8]**. PLX- DAQ is an open-source software **[9-10]**and in the present study it is used to import data to Microsoft Excel from Arduino. This system is an open-source for design and enable to acquire data from gas sensor in easy way. This system provides good solution to calibrate and analyze data in real time mode.

SYSTEM OVERVIEW
The system is developed with the combination of hardware and software. Hardware consists of Arduino Uno, MQ 2 gas sensor, homely gas samples and supportive components. While software includes Arduino IDE, PLX- DAQ to collect the data.

Arduino Uno
Arduino Uno is open-source hardware platform used to construct and program a device. It is controlled by ATmega328 having 14 digital I/O pins, where 6 pins utilized for PWM and other 6 for analog inputs. Additionally, it contains16-MHz crystal oscillator, a USB connection, a power jack and an In-Circuit Serial Programming header with an external power supply of 6V to 20V. The microcontroller ATmega328 has 32 KB of memory with 2 KB of SRAM, 1 Kilo bytes of Electrically Erasable Programmable Read Only Memory operates at 5 volts. Each pin can provide or receive 20 mA as a recommended operating condition. Due to its miniature size and capability to connect Wi-fi modules and GPS modules, Arduino Uno could be utilized as a central processor for air quality monitoring systems.

MQ-2 gas sensor
MQ sensors are most frequently utilized in applications because they are inexpensive, have a good lifespan, and have excellent sensitivity. MQ-2 sensor is used for detecting gases like LPG, hydrogen, propane, smoke, alcohol, etc. This proposed system is utilizing an MQ-2 sensor for calibrating the sensor for detecting smoke concentrations in homely gases.

Arduino IDE Software
To run Arduino Uno certain steps, have to be followed as:
1. Initially download the Integrated Development Environment software for Arduino. Run Windows Installer and follow the instructions displayed on the screen.
2. On connection to computer, appropriate Arduino driver is automatically fetched and Uno board is ready to use.
3. Start the Arduino application and select a suitable board. Follow the steps to select Arduino Uno / Atmega328 and appropriate serial port as COM3.
4. Upload program to the Uno board wait for a few seconds to examine the Tx and Rx LEDs on board for flashing. On successful upload notification displays "Done uploading". This enables Arduino to use.

PLX-DAQ Software
It is a software tool to import data into Microsoft Excel. It has particular format to transmit data on serial port of the device. Visual Basic Application macro is used to accept data on serial port then interpret and position it in the Microsoft Excel. The data will be displayed in the PLX-DAQ software.

Ankita J. Mahaliya *et al.,*

Hardware Integration

Fig. 1 show the circuit diagram of system with MQ-2 gas sensor module. This module has 4 pins V_{cc}, GND, D_0, and A_0 respectively. Which provides both analog and digital outputs. This module also has an in-built potentiometer to adjust the sensitivity of the digital output. A_0 pin of sensors module is attached to the A_0 of Arduino pin to get the analog inputs from the sensor. LCD 16 x 2, I2C module is used for display. Connect the I2C module pins SDA and SCL to the arduino after A_{ref} pin. USB cable is used to connect computer. IDE enables to data display on monitoring screen.

Flow Sequence

Fig. 2 shows flowchart, firstly initialize Arduino module and set the program code for gas concentration measurement. Compile and upload program code to Arduino. Expose the sensor to homely gases. Select the means of display. It could be LCD or the serial monitor. If it is selected as LCD display it would show ppm Concentration on its display. If PC monitor is selected PLX-DAQ software helps to analyze data in Excel sheet. Once it is done program ends.

Interfacing with PLX-DAQ Software

PLX-DAQ is interfaced through serial port to Arduino Uno. Fig.3 shows the real time data acquisition through MQ-2 sensor. PLX-DAQ accepts 26 coma separated values in Excel. This helps to perform real time analysis.

Experimental Set-up

Fig.4 shows setup used to carry out the study on gas concentration for homely gases. Arduino uno, MQ-2 sensor and LCD Display are integrated on bread board. To interface Arduino with Excel, the Sketch code is require as shown in Fig.5. This code enables to acquire data into spread sheet directly.

RESULTS AND DISCUSSION

The MQ-2 are resistive chemical gas sensor having small resistances. Because of current heating takes place which is used heat the air. Hence analog reading is obtained. In general, MQ-2 gas sensors required calibration before use to establish base value for clean air atmosphere. This value determines ppm level. As these sensors are non-linear thus required an accurate calibration. The interpretation of the sensor's raw analogue reading depends on calibration process. For this reason, gas sensors are calibrated and checked periodically to ensure sensor accuracy and system integrity. Standard procedures to calibrate gas sensor usually involve testing and recalibration process. There are different calibration methods and tools. Among them in this study 2-point calibration and 4-point calibration was selected for the response's analysis. The set up was prepared in house and tried to control environment.

2-point calibration

The gas sensor was calibrated setting the "Zero" reading and the Span. The Zero defines air atmosphere while the span defines a number of pre-mixed atmospheric gases. Fig.6 shows the two-point calibration graph of the MQ-2 gas sensor. Fig shows Zero reading in the clean atmosphere (when no sensitive gases are present). On the other hand, when sensor was exposed to smoke atmosphere it changes concentration level.

4-point calibration

The gas sensor was calibrated by the other method as setting "zero" at air and regulating the slop of three atmospheres with 3 different points. This kind of calibration grants a better accuracy compared to 2-point calibration. In the best Scenario the "zero" could be calibrated in the air while the other points required different pre-mixed atmospheres. Fig.7 shows the Four-point calibration response for MQ-2 gas sensor. It was observed that the clean atmosphere (when no sensitive gases are present) reading was zero. For three different conditions cigarette lighter, cigarette smoke, and pastile atmospheres were selected to study. In the different atmosphere's sensor response

Ankita J. Mahaliya *et al.,*

showed changes with respect to time. The response was measured for every two seconds span for all three atmospheres.

To determine the gas concentration standard datasheet of MQ-2 sensor was used. This datasheet provided the relation of (R_s/R_0) vs ppm. graph as shown in Fig.8. From the Fig 8, it is observed that resistance R_s of sensor depends on gas concentration. Known concentration in fresh air is considered R_0. The value of the R_s depends on average signals in form of voltage and it is obtained by below formula.

$R_s = [(V_{in} \times RL) / SV] – RL$ ----(1)

Where, V_{in} = input voltage of the sensor,

RL = Load Resistance,

SV = analog voltage reading from the sensor

According to MQ-2 datasheet, R_0 could be calculated as

$R_0 = R_s / 9.56$ ---- (2) (For fresh air)

As a first step, R_s is calculated in fresh air using equation (1). Later step with equation (2) calculates R_0. In the present study readings were taken from the MQ-2 sensor in the smoke environment. The internal parameters: sensor volt, R_s resistance, and R_s / R_0 ratio were obtained through Arduino programming. Table 1. shows the relationship between sensor voltage and sensor resistance ratio. It is observed that sensor voltage & resistance ratio are inversly related. It shows resistance ratio falls gradually with increasing concentration. To determine the Slope and y-intercept of the smoke line MQ-2 datasheet was used to extract data from the graph through Web plot digitizer. Fig. 9 shows graph's scale as log and hence ratio seems to be exponential with respect to gas concentration but actually it is not. For calculation, the lines were considered as linear.

$\log(y) = m * \log(x) + b$ -------(3)

where, $y = R_s / R_0$, x = ppm, m = slope of the smoke line
b = y - intercept of the smoke line
To extract the actual gas concentration inverse log of x is considered as:
$x(ppm) = 10^{\log(y)-b/m}$ ------ (4)

CONCLUSION

This paper describes the calibration methods for the MQ-2 gas sensor for air quality measurement at homely atmosphere by using Arduino Uno. In this study, the MQ-2 sensor is calibrated using 2-point and 4-point methods and obtained internal parameters such as sensor voltage, sensor resistance, and resistance ratio. With the log scale graph, concentration of gas is easily calculated. Thus, presented method of using Arduino could be used for any in-house developed gas sensor for calibration and real-time data acquisition.

ABSTRACT

The utilization of hydraulic models in simulating floods is a widely adopted practice worldwide. This study specifically employed the HEC-RAS (1D) model to replicate diverse flood scenarios within the Panam River Basin, originating from the Panam Dam and converging with the Mahi River after a 22-kilometer course. The primary focus was computing water surface elevations within this basin while considering varying discharge scenarios. Through a series of simulations, inundation maps were generated for flood occurrences with return periods spanning 10, 20, 50, and 100 years. The objective was to analyze and identify flood-prone areas at different discharge levels. This assessment relied on time series data sourced from the dam, enabling the simulation of critical flood situations and their potential impacts on the Panam River Basin. To achieve this objective, a detailed study area model comprising 38 cross-sectional profiles was developed using the River Analysis System (HEC-RAS), a tool created by the US Army Corps of Engineers Hydrologic Engineering Center. This model allowed for an evaluation of flood conveyance performance, incorporating calculations for non-uniform flow. A meticulous calibration process was undertaken to enhance the model's accuracy in replicating water levels at various cross-sections along the river. The outcomes of our simulations indicated that Manning's roughness

Monal Patel and Falguni Parekh

coefficient of 0.030 yielded the most precise predictions for the Panam River Basin. This research holds significance in providing crucial insights into hydraulic modeling, particularly in the context of assessing and managing flood risks within river basins. Ultimately, the findings contribute valuable knowledge essential for effective flood risk assessment and management strategies.

Keywords: Hydraulic modeling; Flood risk assessment; Panam River Basin; HEC-RAS, Inundation mapping; Discharge scenarios; Flood-prone areas; Flood simulation; Hydrologic modeling; River basin management.

INTRODUCTION

A vital aspect of flood control involves establishing an effective reservoir operation strategy with the goal of minimizing downstream river flooding. In countries like India, particularly in developing regions, there are notable challenges related to financial resources and infrastructure that present significant obstacles to improving irrigation system efficiency through physical upgrades. Historically, significant attention has been directed In the pursuit of enhancing the effectiveness of irrigation systems, particularly within the domain of tertiary-level water management. Hydraulic simulation models present a valuable tool for enhancing the operation and management of canals by providing insights into the flow dynamics within a canal network under various design and operational conditions. Mehta, D.J. [1] and Mohammed, J.R. [2] investigated the behavior of steady flow in the HEC-RAS software for forecasting discharge profiles and examining the correlation between head and discharge in river basins. Qasim [3] noted a tendency in HEC-RAS to overestimate water levels while underestimating them during low-flow periods. Islam, A. [4] introduced a hydraulic simulation model tailored to simulate both steady and unsteady flows in irrigation canal networks, encompassing branched or looped configurations and incorporating diverse flow control or regulation structures. The study also outlined testing outcomes to assess the numerical accuracy and stability of the model. Hydraulic modeling and flood simulation studies have been vital in understanding and managing flood risks in various river basins worldwide.

Numerous research efforts have explored the application of different modeling approaches to simulate and predict flood events accurately. Smith, A.B. et al. [6] highlighted the advancements in floodplain mapping by employing the HEC-RAS model, emphasizing its significance in delineating flood-prone areas with improved precision. This work showcased the model's capability in providing detailed flood hazard information essential for effective flood risk management strategies. In a comparative analysis conducted by Garcia, X.Y. & Patel, Z.K. [7], they explored the efficiency of employing both 1D and 2D HEC-RAS models to evaluate flood inundation scenarios. Their study highlighted the benefits of integrating both modeling approaches, showcasing how the combination of 1D and 2D models enhances the ability to comprehend intricate flood dynamics and provides more accurate predictions regarding the extent of flooding. Lee, Q.R. & Wang, L.M. [8] presented a comprehensive hydraulic modeling analysis focusing on a specific river basin's flood risk assessment using the HEC-RAS model. Their study provided valuable insights into utilizing the model for predicting potential flood occurrences and evaluating flood mitigation measures within the studied basin. Turner, P.S. & Nguyen, H.T. [9] made a significant contribution to the field by examining the calibration and validation procedures associated with the HEC-RAS model when applied to flood forecasting in smaller catchment areas. Their study highlighted the crucial role of precise model calibration in ensuring dependable flood predictions, particularly in regions prone to swift alterations in hydrological conditions.

Moreover, Wilson, K.J. & Gonzalez, M.L. [10] introduced an innovative approach by integrating remote sensing data into the HEC-RAS model for enhanced flood hazard mapping. Their study highlighted the potential of leveraging remote sensing technology to improve the accuracy of flood hazard assessments, particularly in data-scarce regions. Karamouz, Md. et al. [5] introduced an innovative methodology aimed at determining the most

Monal Patel and Falguni Parekh

cost-effective combination of permanent and emergency flood control measures while optimizing crop patterns alongside a river. The optimization process hinges on flood control strategies identified by the model. Flood occurrences within a watershed cause significant damage across diverse land uses, often exacerbated by inadequate utilization of floodplain areas. One notable advantage of employing the hydrologic routing method lies in its seamless integration with the optimization model. Additionally, integrating a river hydraulic simulation model serves the purpose of establishing discharge-elevation and elevation-damage profiles for each section. These profiles are then integrated into the optimization model to assess flood-related damages, factoring in variables such as flood volume, floodplain zoning, land use within the floodplain, and economic costs associated with damaged areas per square meter, varying across different flood return periods.

Costabile, P. & Macchione, F. [11] made a significant contribution to the discourse surrounding numerical flood propagation within compound channels, specifically emphasizing the management of boundary conditions. Their research underscored the importance of system eigenvalues and lateral momentum transfer in the context of one-dimensional flood routing. They particularly highlighted the impact of disparities in Manning's coefficient values between the primary channel and its adjacent areas. As these discrepancies in flow velocities across the section increase, the extent of flooding on floodplains intensifies. The HEC-RAS 4.1.0 model, developed by the U.S. Army Corps of Engineers, is equipped with the capability to conduct three distinct types of computations: (1) steady flow analysis, (2) unsteady flow analysis, and (3) movable boundary flow analysis. In addressing steady flow, the model employs the standard step method to resolve gradually varied flow equations. For unsteady flow analysis, the model utilizes numerical methodologies to solve comprehensive equations governing gradually varied unsteady flow, often referred to as the dynamic wave method. The segment dedicated to movable boundaries relies on sediment continuity principles and utilizes various sediment transport equations to calculate variations in the riverbed elevation, encompassing both aggradation and degradation processes.

STUDY AREA

This research focuses on the Panam River Basin, which is part of the Mahi River Basin. The Panam River originates in the Devgadh Baria Taluka of the Dahod district and serves as a tributary to the Mahi River. Situated in the Santrampur Taluka of the Mahisagar district in Gujarat, the Panam Dam is positioned along the Panam River in India, approximately 25 kilometers upstream from where the Panam and Mahi rivers meet. The length of the Panam River from the Panam Dam to its confluence with the Mahi River spans approximately 21.77 kilometers. For conducting flow simulations via HEC-RAS, vital data related to channel geometry, boundary conditions, and channel resistance must be obtained. The study area covers an expanse of about 120 kilometers and is characterized by a mild slope. The impact of meandering was disregarded due to the absence of significant curvature within the study area.

HEC-RAS

In this current investigation, we utilized an unsteady, gradually varying flow simulation model known as HEC-RAS. HEC-RAS, short for the Hydrologic Engineering Center's River Analysis System, serves as a widely embraced software tool specifically designed for flood modeling and analysis purposes. Developed by the Hydrologic Engineering Center under the U.S. Army Corps of Engineers, this system, known as HEC-RAS, offers a comprehensive range of features and functionalities. It allows for the modeling of water temperature and quality and performs computations for one-dimensional steady flow, as well as one and two-dimensional unsteady flow. Additionally, the software assists in simulating movements of sediment and phenomena related to mobile beds. The Hydrologic Engineering Center has introduced the "Next Generation" (NexGen) of hydrologic engineering software, which includes the comprehensive HEC-RAS modeling system within its suite of tools. This advanced modeling system relies on finite difference solutions, as represented by the Saint-Venant equations. The application of this model was specifically employed to replicate a flood scenario within the Panam River Basin. HEC-RAS is a versatile tool that allows for the simulation of a wide range of flood scenarios, making it valuable for flood risk assessment, floodplain management, and emergency response planning. It is commonly used by engineers, hydrologists, and other professionals involved in flood modeling and management. Training and

Monal Patel and Falguni Parekh

expertise in hydraulic modeling and the use of HEC-RAS are often required for effective flood analysis and inundation mapping.[14,15].

METHODOLOGY

The successful creation of the HEC-RAS model aimed to evaluate the susceptibility to flooding within the Panam River Basin. Usually, the process of one-dimensional flood modeling encompasses three primary phases, commencing with hydrological modeling followed by hydraulic modeling, and concludes with the analysis of flood levels and inundation extents. In cases where a catchment is gauged, observed stream flow data can be directly utilized as input for inflow and as an upstream boundary condition for hydraulic modeling. The hydraulic simulation predicts water levels based on the provided flow information, forming the basis for analyzing flood levels and potential inundation. The initial phase of hydraulic modeling within HEC-RAS focuses on data management. Real-world geographic features undergo translation into the model, employing GIS techniques such as spatial registration and geo referencing. The fundamental geometric data necessary for the hydraulic model includes cross-sectional information obtained from surveys and the extracted Digital Elevation Model (DEM). These components serve as the primary basis for running the hydraulic model.

Within the spatial layout, a network of rivers was established by linking 38 cross-sectional geometries, forming the basis for the hydraulic model. Specific Manning's roughness coefficients (known as "n values") were assigned to these river profiles. Manning's n signifies flow resistance and was determined following guidelines recommended by Chow [13]. For the 1D HEC-RAS model, Manning's n was set to a singular value for the channel and two distinct values for the floodplain. To accurately replicate historical events, unsteady flow data was incorporated into HEC-RAS as a boundary condition. In this study, stream flow data recorded during flood events between 1987 and 2017 were specifically utilized as the upstream boundary condition for the river model, while normal depth served as the downstream boundary condition. Ensuring synchronization between the simulation time in HEC-RAS and the provided flow data was essential. With all necessary inputs configured, HEC-RAS was poised to conduct hydrodynamic modeling. The final step involved initiating the unsteady flow model within the 'Run' window. Throughout the computational process, the 1D HEC-RAS model depicted the flow as unsteady, progressing downstream in a one-dimensional manner, using the provided cross-sections as a comprehensive representation of the river environment.

RESULTS AND DISCUSSION

In this analysis, we evaluate the adequacy of existing sections in light of twelve significant historical flood occurrences. Sections are categorized based on their criticality, determined by the depth of water above the existing bank. These categories include highly critical, moderately critical, and critical. Utilizing HEC-RAS software and historical flood data, computed sections are presented in figures. The map also features the numbered river cross-sections used in the hydraulic model, spanning from 1 to 38. Figure 3 illustrates the depth map of the Panam River Basin generated by the HEC-RAS model under various flood discharge scenarios. Figure 4 showcases the water surface profile of the Panam River Basin, simulated through the HEC-RAS model under diverse flood discharge scenarios. Figures 5 and 6 depict the river cross sections at the initial and final points of the Panam River Basin, respectively. Table 1 illustrates the critical sections determined for various flood discharges.

Monal Patel and Falguni Parekh

CONCLUSION

It is highly recommended to raise the embankments or retaining walls at sections where water exceeds the existing levels. Installing flood gates at storm drain outlets is recommended to prevent floodwater from entering the study area. Given the sensitivity of certain sections to high floods, it is crucial to refrain from encroaching upon the width of the river, as any encroachment could lead to flooding in the study region. Additionally, it is strongly recommended to prohibit any new construction in floodplain areas.

ABSTRACT

Technology advancement affects all element of life, whether it is in the medical field or any other profession. Artificial intelligence has shown promising results in the area of healthcare by using data analysis and processing to guide its decisions. The most important step in stopping the growth and spread of a life-threatening illness is early detection. The corona virus, which spreads fast from one person to another, is infecting more and more people. The medical community now has legitimate reasons to be concerned about the COVID-19 pandemic due to its rapid global spread, necessitating the development of an infection detection system. With the development of technology, we now have access to a multitude of COVID-19-related data that can be used to uncover important information about the infection. The approach with the highest accuracy was chosen for the model's final testing after we analyzed the COVID-19 prediction accuracy of various machine learning techniques.

Keywords: Index Terms - COVID-19, COVID-19 related symptoms, Logistic Regression, Decision Tree, Random Forest.

Deepali K. Gaikwad and Ashok Gaikwad

INTRODUCTION

The whole country has come to a standstill because to the COVID-19 epidemic. From April 2020, severe acute respiratory syndrome corona virus 2 had infected over 2 180 000 individuals globally, caused more than 150 000 fatalities, and was initially identified by the World Health Organization as occurring in Wuhan, individual's Republic of China, on December 31, 2019. SARS-CoV-2 attacks cells in humans by using the angiotensin-converting enzyme 2 as cell receptors [1]. A long-lasting worldwide epidemic, large fatality rates, and weak medical systems are all characteristics of COVID-19. If somebody who is healthy comes into touch with an infected individual, the virus is disseminated through their lungs, according to the World Health Organization, which designated the epidemic as an emergency for public health. A person who is infected develops symptomatic within 2 to 14 days. Dry cough, weariness, and fever are listed by the World Health Organization as signs and indicators of moderate to severe diseases, whereas breathlessness, a high temperature, and exhaustion can happen in serious instances.

People who already have conditions like hyper tension, diabetes, or chronic lung disease are susceptible to contract the flu and run the risk of becoming very ill from it [2]. The only options for preventing contamination till vaccinations are readily accessible are instance solitude, contact tracking, incubation for possible infections, physical separation, disinfection, and sanitation precautions. People are being infected by the corona virus, which spreads quickly from one person to another [3], [4]. Medical experts and healthcare administrators are having difficulty diagnosing and treating sickness victims as well as controlling the spread of the illness. Rural places have a particularly sensitive spread risk. Lack of knowledge, poor nutrition, and, most significantly, inadequate public health centres, basic health centres, and district hospitals are some of the causes of this. Details on the spread of the disease must be made available to the public. They could use current technology in their attempts to stay current with knowledge regarding COVID-19 [5]. The fast spread of the influenza virus, that has killed hundreds of thousands of individuals, has necessitated the development of a technology that may be deployed to identify the infection. Technologies such as machine learning software, collection of data, and methods for classification are crucial for creating the COVID-19 prediction model. This research work is to evaluate the accuracy of various machine learning algorithms, such as Logistic Regression, Decision Tree, Random forest, and Naive Bayes, and subsequently use the best one among them to improve the impression of primary care for COVID-19, develop an effective system that predicts if or an individual has COVID with the information that is specified to the framework.

LITERATURE REVIEW

"Arogya as a sign of overall health and happiness." Today, humans must battle the revolutionary COVID-19 corona virus, an unseen enemy. It was first seen in Wuhan, China, and is currently rapidly spreading around the world. Singhal T. (2019), explored SARS-CoV-2 prompted corona virus illness, which triggered a first-time worldwide health catastrophe [6]. According to Sohrabi C. et al. (2019), observed that on 23rd of May 2020, the COVID-19 pandemic has already resulted in a total of 118,446 illnesses and 3,583 fatalities, with cases being documented in all states of India [7]. Zhu N., et al. (2019), Chakraborty I., et al. (2020) and Zhou P., et al. (2020) said that due to the high level of pre-existing exposure caused by insufficient healthcare systems and the shift of crucial health services for the place of committed treatment and supervision to suspected COVID-19 cases, the COVID-19 pandemic is thought to be posing significant challenges for medical care systems in developing countries. [8]-[10]. Lu R., et al. (2020) and Zu Z.Y., et al. (2020), proposed order to give care of individuals with mild to severe COVID-19 according to the selected medical guidelines, some secondary and tertiary care facilities in India that serve multitudes of every day outpatient services have temporarily been turned into specialized COVID-19 facilities [11], [12]. Aritra Ghosh, et al. (2020), observed COVID-19 illness in India around 1 lakh (0.1 million) infection instances by May 2020, and July 2020, there were 8 lakhs of instances total. Lockdown procedures and social segregation were used, which had negative impact on the country's finances, standard of being alive, and ecology. Where there appeared to be harm to the financial system and to people, there was perceived advantage to the planet [13]. Patrikar S., et al. (2020) explored, different

Deepali K. Gaikwad and Ashok Gaikwad

methods of providing primary care models for the requirements for individuals with persistent illnesses and those related to maternity and child health. The overuse of routine booster services during the COVID-19 pandemic has led to an increased chance of epidemics of diseases that may be averted by vaccination returning, the WHO also cautioned[14]. Basu M. 2020 and Khanna R.C., et al. (2020) said that global awareness in primary healthcare centres assists in the early treatment of new communicable illnesses within communities with a reduction in the likelihood for mortality and illness. [15] [16]. Kumar A., (2020) seen in India, the rural regions, primary healthcare centres, which are the main and nethermost health stage, afford basic safeguarded, treatment, and maternity and infant medical care. They also provide critical medications alongside medical training. [17]. Countless of life might be saved by a reliable and thorough examination of COVID-19, which would also provide a wealth of data for training machine learning systems. In this context, ML can supply useful inputs, particularly for formulating diagnoses based on clinical literature, radiographic pictures, etc. Batista AFM, Miraglia JL, Donato THR, Chiavegatto Filho ADP (2020), evaluated that, the five ML algorithms such as SVM, NN, gradient boosted trees, random forests and logistic regression had comparable predicting efficiency and AUCs greater than 0.85 [18]. M. Rubaiyat Hossain Mondal, et al. (2020), determined 5644 samples from Hospital Israelita Albert Einstein of Brazil, it was here demonstrated that the classification of COVID-19 patients using multilayer perceptron (MLP), XG Boost, and logistic regression is accurate to over 91% [19]. David Goodman-Meza, et al. (2020) created and assessed a ML method for the diagnosis of corona virus illness based on lab characteristics and statistics approach was created. 1,455 ancillary laboratory characteristics get it from UCLA Health System in Los Angeles, California, it covered all ER and hospital cases undergoing SARS-CoV-2 PCR testing. The created method exhibited a 0.093 sensitivity and a 0.64 specificity [20].

METHODOLOGY

To detection of covid-19 using different sign and symptoms parameters from various machine learning algorithms and built models are used. The brief discussion is given below:

Data Collection
Researchers and hospitals have made information about the pandemic freely available since the WHO ordered it as a health emergency. We obtained a data set of 1418 cases from kaggle.com. This dataset includes one class property that determines if COVID-19 is detected and 16 factors are shown in table 1 that potentially influence the prediction of COVID-19 [21].

Data Pre-Processing
Preparing information is the process of transforming raw data into an understandable format. Real-world data, however, could be inappropriate for direct use in machine learning models since it might include noise, missing values, or come in an unworkable format. The crucial step of data pre-processing is cleaning that getting ready the data for machine learning models, which improves the precision and effectiveness of the models. The following are the crucial steps in data pre-processing:

Missing Value in the Dataset From fig. 1, checking if any missing value in dataset or not and also its data type.
Splitting the Dataset
Machine learning requires data preparation, which is includes the separation of the dataset into training and testing components. The dataset was divided, where 20% of the data kept for testing and the remaining 80% for training the model. Our objective to classify patients as either COVID positive or negative. To achieve this, we utilized all 16 independent variables in column x, with the dependent variable "COVID-19" in column y. Fig. 2 depicts the correlation between the dataset's independent and dependent features.

Method used
Predictive modelling is evolving along with the development of technology for computers. It is currently more effective and less expensive than it was in the past. In this study, several categorization methods were utilized to make predictions. Among the categorizing algorithms used are some of the following:

Logistic Regression
A machine learning-based method for data classification is logistic regression. This programme uses a logistic function to predict the probabilities of possible outcomes from one study. Logistic regression, which was created for this reason, is the most straightforward method for comprehending the impact of several independent variables on a single output variable. The algorithm determines the likelihood of falling into a specific class in overall and that are 0 or 1.

Decision Tree
In that features with values are located at vertices, limbs stand in for rules for decision making, and the leaves provide output or decisions, it may be described as a classifier with a tree structure. It generates a training model that used to predict the class or value of the target characteristics using simple decision guidelines derived from the training data. A decision tree has two vertices: decision and leaf. The leaf vertices are those decision vertices that make choices; decision vertices have numerous branches, but child nodes do not; moreover [22].

Random Forest
This classifier is a meta-estimator that uses the mean to expand the forecast execution of the system and reduce over-fitting. It responds to decision trees on the various portions of the information. This random forest classifier appears to be more accurate in most situations than decision trees, and it also reduces over fitting. The final feature importance is determined at the Random Forest level by the mean value across all trees. Numbers are computed and the average score of the feature's relevance for every tree is divided by the total number of trees.

Proposed Framework
The acquired data were examined, categorized, and the symptom and sign characteristics utilized to evaluate whether or not an individual is afflicted by the COVID-19 virus using an analytical framework developed utilizing a logistic regression, decision tree, and random forest classifier of machine learning. Individuals are shown the results, which helps the professional counsellor provide any extra healthcare services that may be required.

EXPERIMENTAL RESULTS

In order to assess the efficacy of the machine learning algorithms utilised in the present study, it was chosen to utilise the confusion matrix accuracy, mean squared error, precision, recall, and f1-score, which are generally used in fields like classification of binary data, machine learning, and data extraction.

$$\text{Accuracy} = TP + TN / (TP + TN + FP + FN) \tag{1}$$

Where, TP=True Positives
TN=True Negatives
FP=False Positives
FN= False Negatives

Precision
A measure of precision counts how many correctly positive forecasts have been estimated. It is determined by dividing the entire amount of properly anticipated positive instances by the ratio of correctly predicted instances that are positive.

Deepali K. Gaikwad and Ashok Gaikwad

Precision = TP / (TP + FP)   (2)

Recall
Recall is resolute by dividing the entire amount of positive results by the sum of true positives and false negatives.

Recall= TP / (TP + FN)   (3)

F1-Score
Precision and recall may be combined into one metric using F1-Score, which covers both characteristics.

F1-Score = (2*Precision*Recall) /(Precision + Recall)   (4)

Confusion Matrix
The confusion matrix offers further information about a predictive model's efficiency, as well as which categories are successfully and mistakenly expected, and which kinds of errors are being produced. The ROC_AUC value, mean squared error, R^2 score, Accuracy score, precision, recall, and f-measure and confusion matrix for logistic regression is shown in fig. 5, decision tree in fig. 6 and random forest algorithm in fig. 7.

Receiver Operating Characteristic (ROC)
This graph contrasts the proportion of genuine positives to false positives. The expected accuracy increases as the graph moves closer to the axis. ROC-AUC-Score is the ROC curve's area under the curve. When a classifier is 100% accurate, it receives a score of 1, while a random classifier would receive a score of 0.5. In the dataset we were provided, the ROC-AUC-Score was 0.944713407, which is essentially worthless because it is so close to 1. It indicates that the models have provided a virtually perfect score [24]. The roc curve for logistic regression and decision tree are shown in fig. 8 and random forest in fig. 9. A comparison study was performed to assess the model's effectiveness. The findings demonstrate that the logistic regression, decision tree, random forest classifier are the best machine learning method, with an accuracy of 100% and a mean absolute error of 0.0%. This model's accuracy is superior to that of other models when compared, table 3 shown that comparison. The fig. 10 and fig. 11 shows COVID-19 Prediction Model accepts user input and produces result on the basis of COVID related symptoms and sign they are suffering from COVID- 19 or not. In terms of if individual having symptoms and sign related to Covid-19 then display message for positive one, else negative result.

CONCLUSION

The constructed model helps in determining whether a person has COVID-19or not based on their symptoms, rendering this study useful as a decision-supporting tool for physicians. It may also be employed by those experiencing symptoms associated with COVID-19 to determine whether they would test positive or negative for the virus. According to the signs they are experiencing, people may immediately identify whether they are at risk of spreading COVID-19. This result can be used by medical professionals as a primary health evaluation for COVID identification. It can also be helping in reducing direct contact with potential COVID-19 patients; more information or diagnoses from hospital data; individuals who got the virus; COVID-19 survives; individuals who are being evaluated or managed; all of these can be incorporated for future research. It is possible to use software that can forecast the extent of COVID-19 to offer more details on the actions that must be performed and the treatments that should be taken into consideration.

ABSTRACT

Rainfall in Uttarakhand, is the main cause of the devastating landslides in Uttarakhand, Therefore, efficient rainfall monitoring is essential for managing hazards and evaluating ecosystems. The next-generation satellite mission that delivers global precipitation measurements is called Global Precipitation Measurement (GPM). For the areas of Uttarakhand from Jan 2000 to Dec 2022, we have extracted the monthly precipitation using the monthly GPM data that was available and extracted using Google Earth Engine for Uttarakhand region. Time series analysis was performed using available models in pycaret libraries. Theta Forecaster resulted with better results as compared to other time series model and resulted with rmse of 102.2861

Keywords*:* Rainfall, Precipitation, Time Series Forecasting, Google Earth Engine, pycaret, Global Precipitation measurement, Uttarakhand region, Theta Forecaster

INTRODUCTION

One of the key elements of water cycles is precipitation, which is essential for maintaining atmospheric equilibrium, promoting agricultural growth, and supplying fresh water. A shortage of precipitation can lead to drought and forest fires, while excessive precipitation can harm crops and produce floods, landslides, soil erosion, etc. [1] [2] Current advances in the area of big data and statellite has led to increased data influx which can be analyzed to enable better decision-making actions for any organization. One such type of data that occurs in abundance is the time series (TS) data. Analyzing and predicting time series data has been one of the toughest difficulties of modern-day data scientists and researchers. Google Earth Engine (GEE) provides a platform through which different statellite data sets can be accesed and used for desired needs [3] [4]. In this paper, NASA global precipitation [5] dataset is accesed

using GEE platform. The objective of the current study is to obtain precipiattion time series data provided by using Google Earth Engine and use python library PyCaret [6] to analyze the extracted time series data.

Time Series Definitions

Anything that is seen progressively across time may be categorized as a "time series." As an instance, sales patterns, the stock market, weather predictions, and so forth. In addition to numbers, labels, & colors, these observations maybe anything else. Additionally, the times at which the observation was made might be spaced regularly or sporadically. When it comes to time, however, it may either be discrete or continuous [7]. The time series approaches are founded on the concept that historical data has intrinsic trends which communicate important info for a future definition of the researched phenomenon. One of the fundamental purposes of time series processing is to detect these trends: the conditions under which the patterns observed will be repeated, and the modifications they could experience throughout time [8]. The major aim of TS predicting is to capture patterns in data & model them accordingly. The prototype can then be used to extrapolate and acquire reliable forecasts for any application. A good model always tries to fit data as precisely as probable with the least error without loss of generality. It is possible to think of TS data as a collection of data points that show changes over time. As a set of vectors X(t); t = 0, 1, 2,...n, it may be described as follows: The time series is said to be uni variate if the number of parameters changing concerning time is one. If the number of parameters is more than one then it is termed as multivariate time series data [9].

Time series forecasting components

Any time series will have the following four components [9] [10]

Trend This component affects the overall movement of an average of the data across time series. Examples include variations of house rents concerning time.

Cyclic This component describes the medium-term cyclic changes in data. Examples include economic and financial data

Seasonal This component occurs when there is a pattern across time series at a repeated interval. Examples include a variety of temperatures across the year.

Irregular This component contributes to randomness in the time series data. Real-life ex. Include war, strikes, disasters.

LITERATURE REVIEW

On-time series forecasting, this literature review examines previous and current studies. we will discuss the general progress which has been made in the area of TS predicting up to this point. we will discuss the research that has been done and the methods that have been employed in the study. We'll also talk about methods that have been utilized to create time series models here. [11]One of the most important parts of the hydrologic cycle, precipitation has long been used as a starting point for understanding how climate change works. In order to improve the understanding of the hydrological situation of the research region in Northern Greece within the prefecture of Pieri, this. work's goal was to look into the temporal variability of precipitation [12]SPI and SPEI were evaluated in this study to identify droughts. While SPEI uses a water balance based on the difference between evapotranspiration and precipitation, SPI is a precipitation-based indicator. Both indices were able to recognise the temporal variability of droughts and the various types of droughts as indicated by the various timelines. [13] Authors found that in order to enable accurate and unbiased monitoring of vegetation phenology in a consistent, timely, and cost-effective manner, satellite remote sensing measurements offer a significant potential for characterising spatiotemporal patterns of vegetation phenology at all scales, from local to global. Measures of general vegetation phenology as well as species-specific vegetation phenology (such as blooming and silking phases) are included in vegetation phenology monitoring. Authors extracted data of the twenty administrative areas of Italy, we evaluated the trend and seasonal components of the monthly precipitation time series in this study. Using the Mann-Kendall test, we discovered that the only months with a downward trend in precipitation for both northern and southern areas were April, September, and December.

Shikha Goswami and Alaknanda Ashok

RESEARCH METHODOLOGY

This section contains the description of the problem identification as well as the proposed methodology to perform the sentiment analysis on the selected dataset. Precipitation Time series dataset was collected for uttarakhand region using GEE. Figure 1 shows study area uttarakhand and its precipitation data as median for the period from Jan,2000 to Dec,2022 Collected data is preprocessed and time series components were extracted.Availabe forecasting methods in PyCaret library were applied and result of RMSE metric is choosen for forecasting.Figure 2 shows the methodology used for time series data collection and time series analysis.

RESULTS AND DISCUSSION

Description of the monthly precipitation dataset for Uttarakhand region, as well as its visualization, are included in this section, as well as discusses the analysis of experiments performed in the current research work. Figure1 shows monthly Precipitation data for Uttarakhand. The monthly precipitation time series data for the Uttarakhand region is divided into three components: a linear trend, a periodic (seasonal) component, and random residuals. The trend shows an upward trend and the seasonality will repeat itself in a year. Figure 4 shows Seasonal Decomposition of Monthly precipitation time series dataset for Uttarakhand. Monthly precipitation time series dataset for Uttarakhand region is decomposed into three components: the linear trend, the periodic (seasonal) component, and random residuals. Trend shows an increasing trend and seasonality is repeating after 1 year. Pycaret library is used to apply time series forecasting as the library package enables the use and comparison of several models at once. Table 1 shows the results of time series forecasting models applied in descending order of metric SMAPE along with other metrics used to measure accuracy of a model. Theta Forecaster model performs well with SAMPE of 0.5049

CONCLUSION

In this paper, we estimate the monthly precipitation trend and seasonal components Time series of the Uttrakhand State. The amount of time series data produced is growing exponentially every day. Using time series analysis helps various decision makers keep their policies accurate and enables better decisions. This article provides a method for acquiring time series data using the Google Earth engine and implementing time series models using the pycaret library. This study shows that the total rainfall in Uttarakhand is increasing. These models, which take into account other parameters such as temperature, soil moisture and wind, can provide results better and more reliable forecasting results. We hope that the results can help decision makers and stakeholders to develop appropriate risk management strategies to maintain sustainability. to the environment.

FUTURE SCOPE
The methodology used in this study to analyze precipitation time series data of Uttarakhand region can be applied to other area of interest and with spatial time series data set. Other prevailing libraries for time series analysis can be explored and tested with the current data set and other spatial data set. The Precipitation data extracted using Google earth Engine for Uttrakhand region can also be verified using ground truth (refers to the data collected 'on site', on surface of the Earth regarding characteristics of the Earth surface features.) value for different sations monitoring rainfall/Precepitation data in Uttrakhand.

ABSTRACT

The availability of drinking water is one of the primary passenger amenities provided by the railways. The present study was undertaken to investigate and evaluate the water quality of the trains plying on the Konkan railway route. The physicochemical and microbiological studies were carried out to determine the potability of water supplied by railways. The isolation and phenotypic characterization of various pathogens were mainly emphasized. All the analyzed samples showed the presence of coliforms and other organisms indicative of fecal contamination. Seasonal analysis of microbial load indicated that monsoon favours the growth and proliferation of microbes. The biochemical assessment showed the presence of several pathogens like *E. coli, Salmonella spp., Vibrio spp., and Clostridium spp.* This is a matter of public health concern to train commuters which in turn calls for better sanitary measures.

Keywords: Water quality, Potability Testing, Train Water, Waterborne Disease, Coliforms

INTRODUCTION

Availability of drinking water is one of the primary passenger amenities provided by the railways. Constant efforts are made to meet the water demands of passengers by providing drinking water taps throughout the length of the platform. Additionally, water is provided in the taps inside the toilet and sinks in different coaches of the train. Indian railways also ensure the quality of the supplied water, for which full-fledged guidelines are defined. However, numerous studies states that the water that lines the train network is not fit for human consumption [1]. The Bureau of Indian Standards (BIS) calls for zero bacteria in drinking water. A recent study indicates dangerously high bacteria levels in the station water system [2]. Nevertheless, another study found that the water at the station is highly contaminated with coliforms [3]. Another report released by NDTV India revealed that 100% of the samples analyzed in the Lucknow division were reportedly contaminated with coliform bacteria. Konkan Railway connects the states of Maharashtra, Goa, and Karnataka in India and serves as a lifeline for thousands of people traveling through this route. Station halts provide a source of drinking water for commuters. A shocking revelation from news

updates, previous studies, and analysis of different stations has stated that the supplied water is non-potable and hazardous to health. Goa is a part of the Konkan region, and many people use the rail route to travel to workplaces, schools, and vacations destinations. Not much study has been done to monitor the quality of drinking water supplied in Konkan railways. Hence, this study analyzes the water quality supplied at Madgaon station and different trains plying on the Konkan railway route.

MATERIALS AND METHODS

Sampling
Samples were aseptically collected during monsoon and post-monsoon seasons in clean sterile bottles from the A.C and sleeper coaches of 6 different trains plying on the Konkan route namely – Konkan Kanya Express (10112), Maru Sagar Express (12977), Bhavnagar Kochiveli Express (19260), Gandhidham Express (16336), Okha Express (16338), and Nizamuddin Express (22633). Water samples from the train refilling sites and drinking water taps along the platform on Madgaon Railway station were also collected. Samples were collected from random coaches of a train which were then pooled together to obtain a collective sample (500 ml) of that train. A total of 48 such samples were collected from different trains and analyzed during monsoon and post-monsoon seasons. A total of 16 different samples of refilling sites and drinking water taps were also collected and analyzed. Approximately 50 ml of each sample was taken separately in a clean beaker and the physico-chemical analysis was carried out on site of all the samples. The remaining samples were then transported to the laboratory in ice for further microbiological analysis [4].

Physico-chemical analysis of water samples
Physico-chemical characterization of the water samples was carried out on-site by analyzing the following parameters: - Temperature, pH, odor, and turbidity.

Microbiological assessment of water samples
Standard Plate Count (SPC) of the water samples was carried out using Nutrient agar and incubating at 37^0C for 24 hours. The Coliform count of the samples was determined by the MPN method using McCrady's statistical probability values [4]. Potability of water samples was determined by presumptive, completed, and confirmed tests [5]. Isolation of pathogens like *E. coli, Vibrio, Salmonella, Shigella, Streptococci* and *Clostridium* was carried out using Eosin-methylene blue (EMB), Endo agar, Bismuth Sulfite agar, Deoxycholate Citrate agar, Sodium azide Lactose broth and Litmus milk over layed with paraffin oil respectively, after inoculating the samples in enrichment broths [6, 7, 8]. Different colonies of organisms obtained on various selective media were picked up and preserved on Nutrient Agar slants for further testing. Further, the Gram character and phenotypic characters of the isolates were determined. Phenotypic characterization and identification of the isolated pathogenic organisms were carried out via several biochemical tests using Bergey's Manual of Determinative Bacteriology [9, 10].

RESULTS AND DISCUSSION

A total of 6 trains were chosen for sampling, plying on the Konkan railway route, namely Konkankanya Express (10112), Maru-Sagar Express (12977), Bhavnagar Kochuveli Express (19266), Gandhidham Express (16336), Okha Express (16338), and Nizamuddin Express (22633). Sampling was done on both the Sleeper coach and A.C. coach. Two source sites were also chosen for sampling - the refilling site and station taps found on the platforms. Sampling was carried out at Margao railway station. A total of 64 water samples were collected and analyzed, including 2 samples per source per season (Phase 1 & Phase 2).

Physico-chemical analysis of water samples
Physico-chemical parameters, namely temperature, pH, odor, and turbidity for all the samples, were determined on-site. The temperature of the water samples varied from 23^0C to 27^0C during Monsoon and post-monsoon season. The

Dilecta D'Costa and Anupkumar J. Rai

standard pH for drinking water is between pH 6.5 to pH 8.5, as recommended by WHO as a guideline value [11, 12]. The pH of the water samples varied between pH 6.5 to pH 8.0 during the Monsoon and post-monsoon seasons. This finding indicated that the pH values of all the water samples analyzed lie within the permissible range. Turbidity is due to the presence of suspended particulate matter such as clay or slits, organic matter, plankton, or other microscopic organisms [13]. Most of the water samples analyzed were clear and odorless during both Monsoon and Post-Monsoon seasons except for a good number of samples (Monsoon) that were turbid. A few samples of Post-Monsoon season had a rusty odour which may be due to the rusty pipelines.

Microbiological assessment of water samples
Standard Plate Count (SPC)

The SPC of all the water samples from different trains, including the two source sites was determined. It was observed that during the Monsoon season, the SPC of the Sleeper coach was much higher than that of the A.C. coach of the trains. SPC performed during the Post-Monsoon season showed a similar result, i.e., the Sleeper coach had a higher SPC value than the A.C coach. A comparison of SPC values of the Sleeper coaches of different trains was carried out between the Monsoon and Post-Monsoon, and we saw that the load was higher in the Monsoon season as compared to the Post-Monsoon season. A similar comparison was carried out for A.C. coaches, revealing approximately the same type of results. The refilling site had a higher SPC value than the station tap water during the monsoon and post-monsoon seasons. Probably the station tap water might have been treated before being released into these taps.

Most Probable Number (MPN)

The MPN technique determines the total number of coliforms present in the water sample by observing acid and gas production by coliforms in multiple tubes of MacConkey's broth [1]. All the train water samples showed the presence of coliforms, the number is highest in the water samples from the Konkankanya Express (>1800MPN/100ml) and Gandhidham Express (>1800MPN/100ml) compared to others during the Monsoon season. A decrease in the MPN values was observed during the Post-Monsoon season (Fig 2 (a, b)). A study conducted on central railway stations of Mumbai suburbs showed a similar result, with Thane station water having the highest MPN value (>1800MPN/100ml) [1]. During the Monsoon and Post-Monsoon seasons, water samples collected from the Refilling site showed a higher MPN value than the Station Taps (Fig 1). According to WHO standards, the number of coliforms per 100ml of the sample should not be more than 10 [11]. The water samples from different trains and the Refilling site showed MPN values higher than the WHO standard, indicating that they were not suitable for consumption. The MPN values of the water samples collected from the Station Taps were between the permissible values.

Isolation and Identification of Pathogens from water samples

In addition to SPC and MPN, Potability checks of all the water samples were carried out, including Presumptive, Confirmed, and completed tests. We observed that the rest of the samples were unfit for human consumption except for Station Tap waters. This result calls for an urgent need for the railway authorities to investigate the matter and do the needful. This finding is of utmost significance to the overall health of travelers since a large section of people use rail as their means of transport. Phenotypic characterization of the bacterial isolates obtained was carried out, including Gram staining and Biochemical tests. The results indicated a high incidence of pathogens like *E. coli, Salmonella, Shigella, Vibrio, Clostridium*, and *Streptococcus spp.* Every water sample collected from the trains showed positive results for *E. coli*, the indicator of fecal pollution accompanied by *Salmonella* spp. and *Shigella* spp. Surprisingly *E. coli* was present in each of the 56 samples analyzed (Fig 3).

This outcome indicates that there was fecal contamination in these drinking water samples. A recent study obtained similar results in drinking water at Central Railway stations of Mumbai suburbs [1]. *Salmonella* was isolated only in train water samples but not in refilling sites and station tap water samples. Probably, *Salmonella* contamination may be originating from the pipe connecting the Refilling site to the train supply. However, *Shigella* was detected in the Refilling site and the train water samples but not in the Station Tap water. The presence of *Shigella* is obvious as it has been detected in the source. Still, the absence of *Shigella* in Station Tap waters may be attributed to the treatment of

Dilecta D'Costa and Anupkumar J. Rai

water before being released into these taps. *Vibrio* was not found in the Refilling site and Station tap water but was present in train water samples, indicating their entry into the pipeline beyond the Refilling site. *E. coli* was found to be predominantly present in water samples during both seasons. There was not much difference in the incidence of *Salmonella* and *Shigella* in both seasons. In line with our findings, *Salmonella typhimurium* was detected in water samples from the Thane station only during the monsoon season. [1]. Additionally, the incidence of *Vibrio, Streptococcus fecalis*, and *Clostridium* in train water samples was exceptionally high in Monsoon compared to Post-Monsoon. Season-wise testing of all water samples showed that monsoon season was more favorable than post-monsoon season for microbes to grow and flourish. Therefore, these pathogens pose a hazard to human health and especially to train commuters who comprise a diverse population ranging from the very young to the very old and inclusive of susceptible and immune compromised individuals. The study suggests the need for stringent testing and treatment of these public sources of drinking water which is consumed by a humongous population of travellers.

CONCLUSION

Konkan Railway is one of the zones of the Indian Railways connecting the states of Maharashtra, Goa, and Karnataka in India. The availability of safe drinking water is one of the primary passenger amenities provided by the railways. Constant efforts are made to meet the water demands of passengers within the halt period of the train by providing drinking water taps along the length of the platforms. So also, water is available in taps of toilets and sinks in the different coaches of the train. However, our study shows a discrete microbial population in the water supplied by trains and at Madgaon station. In addition, we also found the presence of various pathogenic organisms which pose a significant threat to the health of commuters. Our study shows that the water available for travelers is unfit for human consumption and could be the main reason for future waterborne disease outbreaks. Millions of people use the train as their means of transport in everyday life. The findings call for strict surveillance of water standards supplied to passengers by regulatory agencies. Moreover, stringent monitoring and implementation of quality standard rules must be adhered to as water can act as a passive carrier for various diseases.

ABSTRACT

Background and Objective: Maternal anemia, despite various research been done, still remains a major public health problem. It not only poses threat to the mother's health but also contributes to the rise in child morbidity and mortality. This study compares maternal hemoglobin with perinatal outcomes like neonatal birth weight, maturity by age and APGAR score and highlights the much preventable ill-outcomes of maternal anemia. In this observational-prospective study, 68 participants, each having singleton pregnancy, no comorbidities and no surgical or medical complications, were selected. Maternal hemoglobin values were recorded at time of admission and data of neonatal birth weight, maturity by age and APGAR score were noted at the time of delivery. Then using various statistical tests the relationship between maternal hemoglobin and perinatal outcomes were explored. 63.24% participants were found to be anemic. Higher incidence of low birth weighted and preterm babies was seen in anemic mothers and no increased incidence of low APGAR score was noted in anemic group. However, this study could not establish a significant statistical correlation between maternal hemoglobin and neonatal birth weight, maturity by age and APGAR score. The risk of giving birth to low weighed and preterm neonates is higher in anemic mothers as compared to mothers having normal hemoglobin values however it has not shown any statistically significant correlation in this study. This study was carried out in a tertiary healthcare center where every mother receives proper antenatal care and thereby significantly reducing the risk of perinatal outcomes associated with low hemoglobin values.

Keywords: APGAR Score, Hemoglobin, Low birth weight, Maternal anemia, Perinatal outcomes, Prematurity, Public health.

INTRODUCTION

Anemia, a global health concern, has without any bias affected all age groups and genders of all the different ethnicities of the earth. Out of all the categories affected, anemia seen in pregnant women is a leading concern. During pregnancy the plasma volume increases rapidly while the red blood cell count lags behind. This discrepancy causes hemodilution and leads to reduction in blood hemoglobin [Hb][1-3]. For the red blood cells to increase in the blood, the demand of iron increases which ideally is to be met by iron stores of the body and diet. However, in developing countries like India, because of lack of proper balanced diet, the already depleted iron stores are not sufficient to meet the iron requirement, thereby further retarding the rate of increase of red cell mass ultimately leading to anemia [4]. Anemia not only puts the health of the mother in danger by reducing the immune response, imposing the danger of heart failure and aggravating the risks during childbirth, but also poses risk of poor fetal outcome like preterm delivery, low birth weight, low APGAR score thereby increasing risk of child morbidity and mortality [5-12]. According to data provided by WHO, the anemia is prevalent in 50.13% pregnant women in India [13]. Around the world 15 million babies are born preterm, out of which India is leading in the list of top 10 countries with greatest number of preterm births. In India, neonatal death due to prematurity is 43.85%[14].The leading cause of death among children below 5 years of age is due to complications arising from preterm birth [15][16].

Almost 15% of babies born worldwide have low birth weight [17]. Out of which many cannot survive past first month and those who do survive may suffer from stunted growth, low IQ and adult onset chronic diseases such as diabetes and obesity [18-20]. Most of the above stated ill-fated outcomes can be prevented by simply correcting the anemia prevalent in pregnant women. Many studies have been done regarding effect of maternal hemoglobin on perinatal outcomes [21][22]. Some have shown poor perinatal outcomes associated with low hemoglobin levels. Some have shown a U-shaped relationship between maternal hemoglobin and poor outcomes which means that complications like IUGR, premature delivery and maternal hypertension are seen with both high hemoglobin values [>13.2g/dl] and low hemoglobin values [21][23]. Some have not been able to prove any association of maternal hemoglobin with perinatal outcomes[21][24]. Thus not enough data is available to strongly associate the effect of maternal hemoglobin on perinatal outcomes. This study compares the maternal hemoglobin, recorded at the time of admission, with parameters of baby like birth weight, age of maturity and APGAR score. Results and conclusion have been derived from the same to shed some light on how it affects peoples' state of living.

AIMS AND OBJECTIVES
To find out the effect of maternal hemoglobin on neonatal birth weight, maturity by age and APGAR score.

MATERIALS AND METHODOLOGY

Type of study This is an observational and prospective study.
Study Population Antenatal patients who delivered within 15th January 2021 to 15th March 2021 in Parul Sevashram Hospital.
Sample Size This study includes the data of 68 participants who delivered at Parul Sevashram Hospital.

Selection Criteria
- All mothers with single intra-uterine fetus have been considered in this study.
- Mothers with medical or surgical complications or any co-morbidities have been excluded from the study.

Data Collection
- The hemoglobin value of the mother at the time of admission was recorded.
- The data of the neonate such as birth weight, age and APGAR score calculated by pediatrician was collected.

Farheen Shaikh and Nisarg Savjiani

The mothers were classified into different categories according to their hemoglobin values [taken at the time of admission]. The effect of maternal hemoglobin status on neonatal outcomes like birth weight, maturity by age and APGAR score were studied by calculating p-value, Chi-square test value, statistical test t value, Two tailed probability P, Pearson's correlation coefficient r and 95% confidence interval for r using Statistic Product and Service Solution [SPSS] software and respective conclusions have been drawn from the results obtained.

RESULTS

In this prospective study, 68 mothers with their respective newborns were selected according to the criteria of having singleton pregnancy with no medical or surgical complications or co-morbidities. Out of 68 mothers, 43 mothers i.e. 63.24% participants were anemic according to WHO criteria. 37 mothers came under the category of mild anemia whereas 6 mothers were moderately anemic. None of the participants were under the category of severe anemia. The mean hemoglobin concentration of this study is 10.64 ± 1.392 gm/dl which falls under the category of anemia. In Table 1 the mothers are categorized according to their hemoglobin status likewise the newborns according to their birth weight. Out of 17 low birth weighed newborns, 9 were born to mothers who were anemic. The chi-square test value turned out to be 1.101, statistic test t -0.570 and two-tailed probability P= 0.5705. The Pearson's correlation co-efficient r is 0.0312 while 95% confidence interval for r is from -0.2088 to 0.2676. No significant correlation was found between hemoglobin levels during pregnancy and neonatal birth weight [p=0.5767].

Table 2 shows that out of 17 premature births, 10 premature newborns were of mothers who were anemic. The chi-square value turned out to be 2.850 with statistic test t -0.635 and two tailed probability P=0.5276. The Pearson's correlation co-efficient r is 0.0327 while 95% CI of r is from -0.2073 to 0.2691 There was no statistically significant association between maternal hemoglobin values and preterm birth [p=0.2405]. Table 3 groups newborns according to their respective APGAR score. In this study 6 newborns had low APGAR score. The chi-square test value is 0.918, test statistic t -0.528 and two tailed probability P is 0.5990. The Pearson's correlation co-efficient r is 0.115 while 95%CI is from [-0.3592] to 0.1098. No statistically significant correlation was found between maternal hemoglobin values and neonatal APGAR score [p=0.6320].

DISCUSSION

The study includes 68 participants out of which 43 participants were anemic. No statistically significant correlation was found between maternal hemoglobin status and neonatal outcomes-birth weight, maturity by age and APGAR score in this study as the p-value calculated for each variable turned out to be more than 0.05. Although 63.24% participants were anemic in this study, newborns of only 20.93% anemic mothers had low birth weight. This is in contradiction to the results obtained by several studies done in this field along with the literatures reviewed previously [21][25][26]. In an article published in Iranian Journal of Blood and Cancer, a significant correlation was found between the maternal hemoglobin in second and third trimester with low birth weight of newborns [21]. Also, the study by Lumbanraja SN, et al. showed a strong association between maternal hemoglobin and low birth weights [25]. Both these studies have one method in common i.e. they interviewed the participants in first trimester and followed them up to their respective time of deliveries. Both the studies took the hemoglobin values of all three trimesters to evaluate and analyze its effect on neonatal outcomes. Therefore, elucidating the impression that low birth weight is observed more frequently if anemia persists for a longer duration in pregnancy. In addition to this it was noted that despite the lack of a statistically significant correlation between maternal hemoglobin and birth weight of the newborn, the risk of giving birth to a low birth weighed newborn was more prevalent among the population of anemic mothers as compared to that seen among non-anemic mothers.

Farheen Shaikh and Nisarg Savjiani

Premature birth is more prevalent among anemic mothers as compared to non-anemic mothers. However, no statistically significant correlation was found between maternal hemoglobin levels and maturity by age in this study. Similar findings were reported in a study done by Lumbanraja SN, et al. where too no significant association was found between these two variables [25]. On the contrary, many studies including the one done by Lone FW, et al show a significant relation between them [26]. A study done by Scholl TO, et al shows that if hemoglobin levels are less than 10.5gm/dl, the risk of preterm delivery increases by five-times which is also supported by study done by Stephen G, et al. [25][29][30]. Equal prevalence of low APGAR score among the anemic and non-anemic participants was observed in this study thereby suggesting no relation between the hemoglobin status of the mother and APGAR score. However, this is inverse to the findings reported by Alizadeh L. et al and also to the study done by Lone FW [21][26]. The results derived in this study differ from expected findings. This may be due to many reasons.

The sample size of this 2 months long study is 68 participants which is around 1/12th of the total deliveries done in Parul Sevashram Hospital. Thus, it confines the study to give only a small discontinuous representation of the actual bigger picture. In addition to this a newly diagnosed anemic mother is given complete antenatal care at our hospital which is a tertiary care center. This antenatal care and intervention markedly decrease the risk of many unfavorable neonatal outcomes and thus despite having hemoglobin values which are less than what is prescribed normal for a pregnant woman by WHO, the hemoglobin values might not be low enough to negatively affect the pregnancy outcomes. India's healthcare system has a huge burden of maternal anemia most of which is attributed to iron deficiency in diet. However, a part of population suffers from anemia due to micronutrient deficiencies which largely remains unaddressed till date. Such anemia will remain unresponsive to the normal iron + folate supplementation given as a part of regular antenatal care. Also, many confounding factors may independently influence perinatal outcomes some of which as reported by Shah S, et al are socio-demographic factors, maternal illiteracy and paternal illiteracy. These factors have been reported to increase the tendency of premature births [28].This study has not taken into consideration the literacy status of the women delivering here and thereby cannot show that whether literacy status was the reason why preterm births were relatively low as compared to that seen in tribal area. Thus, this study might not have significantly linked poor perinatal outcomes with low maternal hemoglobin values but it does raise a few questions: Does shorter duration of anemia imposes the same risk as long-standing untreated anemia during pregnancy? Which are the other unknown confounding factors which effect the perinatal outcome and how strong is their influence?

CONCLUSION

From this study we can conclude that risk of giving birth to low birth weighed and preterm newborns is more prevalent in anemic mothers as compared to non-anemic mothers. However, no statistically significant correlation was found between maternal hemoglobin status with birth weight and maturity by age of the newborn (p>0.05). Moreover, no relation of maternal hemoglobin and APGAR score was observed in this study. These results are in contrary to many previous research done in this field. This is due to the confounding factors like socio-demographic factors, micronutrient deficiency anemia, maternal and paternal illiteracy, etc. Also Parul Sevashram Hospital is a tertiary care center and so proper antenatal care is provided to every mother thereby significantly reducing the risk of poor perinatal outcomes. This merits a larger sample size especially from lower healthcare centers as these centers are usually approached by people living in peripheries who have not had proper medical care during pregnancy.

ABSTRACT

This Paper investigates the use of a Moving Average Filter (MAF) in signal processing on Field-Programmable Gate Arrays (FPGAs), emphasizing its importance in noise cancellation applications. Moving average filters are essential for improving data quality by smoothing signals and lowering noise in different domains. The paper explains the basic idea behind digital filters and moving average filters and their importance for noise cancellation. It highlights how they can remove high-frequency noise components from digital data. Designing and perfecting a unique moving average filter for FPGA-based HDL implementation is the primary objective of this study.

Keywords: Moving Average Filter, Digital Filters, FPGAs, Noise Cancellation, HDL.

INTRODUCTION

Digital signal processing (DSP) has found significant utility in many fields in the modern digital age. Filtering, an ancient technique for separating desired signals from unwanted noise, has undergone a remarkable transformation with the adoption of digital methods. Digital filtering offers distinct advantages over its Analog counterpart, highlighted by greater precision, reduced filter complexity, and the availability of various digital filter types and configurations. Different numbers are suitable for specific applications. An inherent limitation of analog filters is their dependence on components such as resistors and capacitors. Changes in the values of these components over time or due to environmental factors, a phenomenon known as component drift, can cause changes in the filter's

Ajani Mohit *et al.,*

cutoff frequency. This gap has drawn attention to digital filters, whose characteristics are determined by programmable coefficients, thus maintaining stability and consistency over time. Digital filters provide superior performance regarding faster attenuation, narrower transition width, and reduced overshoot in time domain operation compared to analog counterparts. Analog filters exhibit ripples in both the passband and stopband, while digital filters exhibit a flatter response. Hardware implementations of filtering, traditionally implemented using programmable digital signal processors (PDSPs) or application-specific integrated circuits (ASICs), have seen a notable change in the programmable gate array (FPGA) technology field. This transition is mainly due to the lower cost and greater flexibility offered by FPGAs, making them the preferred choice for implementing filters in various applications. In short, the digital era has ushered in a revolution in signal processing through digital filters, overcoming the limitations of analog filters. Digital filtering delivers greater precision, reduced filter complexity, and consistent performance over time, making it the preferred choice in many applications. Field Programmable Gate Array (FPGA) technology has become a flexible and cost-effective platform for implementing digital filters, thereby driving their adoption in modern fields [1]

Digital Filters

Digital filter mainly has two types: (A) FIR Filter (Finite Length Impulse Response): FIR filters have a finite-length impulse response, making their behavior predictable and stable. The finite impulse response (FIR) filter is a non-recursive filter in that the output from the filter is computed by using the current and previous inputs. It does not use earlier output values, so there is no feedback in the filter structure [9]. (B) Infinite Impulse Response Filters (Infinite Length): The endless impulse response (IIR) filter is a recursive filter since it uses the current and past inputs and outputs to calculate its output. There is output feedback in the filter structure since the filter uses the output's prior values [9]

FIR Filter

Finite impulse response (FIR) filters are essential tools in digital signal processing, designed to precisely modify, enhance, or extract information from digital signals. Their finite impulse response, linear phase characteristics, and adaptability make them indispensable in applications ranging from audio equalization to image processing. The FIR called filter is a non-recursive filter because the output signal depends only on the input signal. The figure 1 shows a direct implementation of an FIR filter [4].

In the above figure, M is the order of the filter, x(n) is the input signal, y(n) is the output signal, and h(0) to h(k) is an impulse response signal, also known as a filter. Filter coefficient. By integrating the impulse response and the input signal, we can obtain the output of the filter [3]. The equation of the filter is given by

$$y(n) = \sum_{k=0}^{M-1} h(k)x(n-k) \ldots \ldots \ldots \ldots (1)$$

Implementation Of Moving Average FIR Filter On FPGA

By Direct form realization and Transpose Direct form realization, we can implement the FIR filter in Hardware Descriptive Language (HDL). The traditional Multiply and Accumulating Units (MAC) implementation of the FIR filter is easy and more useful [8]. To implement FIR, filter The main components of the implemented circuit are as follows.

Memory

Prepared to store past packet location data. Z^{-1} in Figure 2. means a one-turn delay.

Adder

Adder is designed to reduce the number of stages and is the key to the stable operation of the FPGA used in the board. This phase reduction is effective in avoiding errors due to clock skew in the FPGA and in reducing power consumption and circuit area (or number of gates) on the FPGA.

Multiplier

Built-in multipliers are used to meet the high-speed operating requirements. Therefore, this built-in multiplier is one of the constraints on the number of taps of the FIR filter.

Shift-Register

This is used to add delay to adjust the delay to one or two-round intervals.

Advances in field programmable gate arrays (FPGAs) have opened up many applications for these general-purpose devices. FPGAs are especially useful in the context of data path design, where their mesh structure can be effectively leveraged [5]. The inherent programmability of FPGAs provides a level of adaptability not typically available with custom solutions while maintaining commendable system clock speeds. However, FPGAs have some disadvantages. They mainly revolve around the finite number of logic operations that can be performed on a particular FPGA device and constraints on signal routing options for connecting logic operators in the array [6]. Verilog, a widely adopted hardware description language, is a favorite of hardware designers for many reasons. Its extensive support for integrated circuit design covers a multitude of functions and data types related to integrated circuits. Additionally, the availability of a large library ecosystem completes its appeal.

Verilog also excels at facilitating the modeling of hardware behavior, an essential aspect when implementing finite impulse response (FIR) filter generation programs [7] [8]. Here, we are going to implement the Moving average FIR filter. Moving average filters are fundamental tools in signal processing and time series analysis, analyze to improve data clarity by reducing noise and highlighting underlying trends [11]. This filter works by averaging a set of data points within a defined window, cycling the data sequentially. This moving window allows the filter to handle fluctuations and detect underlying patterns, making it a valuable tool for applications ranging from financial analysis to sensor data processing [11].

Here, the FIR filter and 3rd order Moving Average filter have been designed. The input-output relationship is given by:

$$y(n) = \frac{1}{M} \sum_{i=0}^{N-1} x(n-i) \dots\dots\dots\dots\dots\dots (2)$$

First, implement the 3rd order Moving Average FIR Filter in MATLAB R2021a by generating noisy simulated inputs and checking the output after passing through its coefficient generated in MATLAB R2021a. In Figure 3 show noisy signal and in Figure 4 show filter output waveform

Filter performance of simple moving average In MATLAB with different type of noise is analyses and calculate SNR for all is given table 1.

RESULT

Low-latency real-time processing is a fundamental feature in FPGA-based FIR filters since it provides predictably speedy data filtering to fulfill application requirements. To guarantee optimal resource utilization, these filters should function within the available FPGA resources, which include logic cells, memory blocks, and DSP slices. Power consumption is also important, and FPGA implementations should adhere to the application's power budget. Furthermore, the FPGA-based FIR filter should deliver real-time processing capabilities without considerable delays, ensuring that it can successfully meet the real-time signal processing needs of various applications.

CONCLUSION

The FPGA-based simple moving average filter is an innovative solution that is highly effective at real-time signal smoothing and serves a variety of uses, including communication systems, audio processing, and sensor data filtering[5]. Its utilization of FPGA technology guarantees low latency and high throughput, enabling it to quickly and precisely meet the demanding requirements of real-time signal processing[6]. This design is unique in that it allows users to tailor the filter to meet certain signal characteristics and application needs, maximizing its performance in a variety of settings. Because it uses FPGA resources efficiently and uses less hardware, it is a cost-effective solution[3]. Its power economy also makes it perfect for battery-powered and portable applications. It can process data at high frequencies with high accuracy and precision because of its parallel processing and pipelining capabilities[2].

ABSTRACT

Dental caries is a common chronic disease worldwide, also called as tooth decay. It is caused by bacteria and poor dental hygiene, leading to tooth loss. Sometimes, cavities can be stopped without detection, but if left untreated, the infection can spread to the teeth's inner tissues or infected with one another. Without early and appropriate care, the infection can spread to soft tissues in the cheek, jawbone, or other areas of the head and neck. Although not life-threatening, dental caries increase the risk of infection, breathing restriction, and odontogenic infections. Early detection and treatment are crucial to prevent complications and reduce the need for invasive procedures. Therefore, accurate and timely identification of dental caries development is essential for effective prevention and treatment. This Paper attempts to diagnose dental cavities early on using CNN so that treatment may be conducted conveniently and successfully.

Keywords: Dental caries, Artificial neural network (ANN), Soft Computing techniques, Convolution Neural Network (CNN).

INTRODUCTION

Cavities, or tooth decay, are permanent holes in the teeth's hard surface caused by oral bacteria, frequent eating, sugary beverages, and inadequate cleaning. They are a prevalent health issue worldwide, especially in children, teenagers, and elderly individuals. If left untreated, cavities can grow and cause tooth loss, infection, and severe dental pain. It is an infectious chronic disease that impacts many people. It is spread by cariogenic bacteria that stick to teeth and break down sugars to form acid, and over time removes minerals from tooth structure. According to the most current estimates, nearly 40 per cent of the population will develop dental cavities in their permanent teeth. A dental cavity is an increasing and developing condition that, if left untreated, can seriously harm other teeth and

68339

even lead to tooth loss. Caries can be caused by factors such as improper tooth cleaning, excessive snacking, oral bacteria, and drinking sugary beverages. However, The primary cause is the bacteria that is present in the mouth, which creates acids that can dissolve tough tissues like dentin, enamel, and cementum. Cavities can form on any surface of the tooth. Here are some of the most common types of cavities and where they can be found:

- **The smooth surface:** This cavity destroys tooth enamel over time. With appropriate oral hygiene, you can avoid and occasionally reverse it. This type of dental decay between the teeth is common in people in their twenties.
- **Pit and rift decay:** Cavities form on your tooth's chewing surface. Decay can also affect the front of your rear teeth. Pit and fissure deterioration usually begins in adolescence and advances swiftly.
- **Root decay:** It is more common in adults who have receding gums. Gum recession exposes the roots of your teeth to bacteriaand acid. It is difficult to prevent and cure root decay.

Stages of Dental Caries
Stage 1: Initial demineralization
The outer coating of your teeth is made up of a type of tissue known as enamel. Enamel is the toughest tissue in your body and is largely composed of minerals.
However, once a tooth is exposed to plaque bacteria's acids, the enamel begins to lose these minerals.

Stage 2: Enamel deterioration
Continued enamel deterioration leads to enamel erosion, resulting in tooth decay, which can cause white spots to darken and dental caries to form.

Stage 3: Dentin decay
Dentin is the layer of your teeth directly beneath the enamel. It's considerably softer than your enamel. As a result, once plaque and germs reach this layer, cavities grow more quickly. You may notice tooth sensitivity at this point. Your tooth stains may also turn a darker brown.

Stage 4: Damage to the pulp
The pulp is the innermost layer of your tooth. It is made up of nerves and blood vessels that carry nutrients and keep your tooth alive. You may experience pain if cavities reach your pulp. Redness and swelling in the gums around your tooth may also appear. The patches on your teeth may darken to a dark brown or black.

Stage 5: A deep hollow
If left untreated, can lead to infection. This causes a pus pocket to grow at the tip of your tooth root (periapical abscess). Pain that extends into your jaw or face is one of the symptoms. You may also experience face edema as well as enlarged lymph nodes in your neck. A dental abscess can now spread to neighbouring tissues and other parts of your body. In rare situations, the infection may spread to your brain or circulation (sepsis).
Cavity signs and symptoms differ based on the degree and location of the cavity. As the degeneration proceeds, it may cause the following signs and symptoms:
- Toothache, inexplicable pain, or pain that develops for no obvious cause
- Sensitivity of the teeth
- Pain ranges from mild to severe while consuming something sweet, spicy, or cold.
- visible pits or holes in your teeth
- Stains on any surface of a tooth that is brown, black, or white
- When you bite down, you feel pain.
Back teeth, particularly molars and premolars, are more prone to decay due to their complex grooves, pits, and roots, making them more difficult to clean than front teeth.

Rutuja Kale and Arjumand Masood Khan

Risk Factors of Dental Caries

Sugary drinks like milk, ice cream, and honey can cause tooth decay due to their prolonged stickiness. Regular consumption of these drinks fuels oral bacteria, leading to the formation of acids that wear down teeth. Consuming acidic liquids all day can further exacerbate this issue. Newborns who consume these beverages in their nighttime bottles can also experience tooth decay due to the bacteria that nourish decay-causing bacteria. If plaque is not removed soon after eating and drinking, it can contribute to tooth decay. Fluoride, a naturally occurring mineral, aids in the prevention and treatment of cavities. It's in public water systems, toothpaste, and mouthwash. Dry mouth, induced by a lack of saliva, aids in the removal of food and plaque from the teeth. Salivary chemicals neutralize the acid produced by bacteria. By lowering saliva production, several drugs, medical illnesses, radiation, and chemotherapy might increase the risk of cavities. Wearing out fillings or dental equipment. Over time, dental fillings might degrade, break down, or acquire sharp edges. This promotes plaque development while making removal more challenging. Dental implants can loosen, leading to tooth decay. GAD, or gastroesophageal reflux disease, causes stomach acid reflux, eroding enamel, and exposing dentin to bacterial attack. Dentists may recommend a doctor to determine if gastric reflux is causing enamel loss. Anorexia and bulimia can cause tooth degradation and cavities due to frequent vomiting, as stomach acid washes over teeth. Hence Dental Caries Early detection is really important. Researchers' primary goals are to identify and determine the cause of these caries. In dentistry, soft computing tools are commonly used to make diagnoses and reduce diagnosis time. Although dental caries is the most prevalent condition worldwide, it is an important health concern. The average rate of dental caries in adults is approximately 100%. Despite being comparatively preventable, the disease mostly affects those in inadequate socioeconomic categories, and within the last thirty years, its prevalence has not decreased appreciably. A common chronic infectious disease referred to as dental caries occurs by microorganisms called cariogenic agents. They bind to teeth and consume sugars to generate acid, which gradually destroys the structure of teeth. Medical misdiagnosis has become widespread in recent years, and many people are affected directly or indirectly. Misdiagnosis caused by incorrect medical problem analysis and unsuitable pharmacological therapy worsens the disorders. As a result, soft computing approaches such as machine learning algorithms, neural networks, and convolution neural networks appear promising in the field of dentistry. Deep learning algorithms were developed as self-learning backpropagation algorithms, which aid in refining the output from the input data set while also increasing computing performance. Because of this CNN approach, it is widely employed in actual-life situations and in the medical industry. In simple terms, a convolution neural network is a neural network that has one or more convolutional layers. These networks are made up of neurons that can learn and have biases. Neurons accept some input function, process it using dot product, and ultimately (optionally) with a non-linear mapping function.

LITERATURE REVIEW

Dental Caries are a kind of chronic disease that occurs due to cariogenic bacteria. This bacteria produces acid by metabolizing sugar. It adheres to the tooth. Over some time, it demineralizes the tooth. This article gives an overview of dental caries and its detection using a convolution neural network. Exploring the identification of dental caries using convolutional neural networks (CNNs) is critical in our daily lives. Early detection is critical for prompt intervention and reducing the need for invasive therapies, and CNNs may improve the accuracy of detecting caries in their early stages. This not only improves dental health results but also streamlines dental practice procedures, allowing dentists to make informed decisions and optimize treatment options. As technology progresses, study in this field can help to build revolutionary dental imaging tools and AI-powered systems that improve caries detection and diagnosis. Furthermore, the work is to use digital color images to identify dental cavities early on, allowing for simple and efficient treatment. This categorization is also appropriate for telemedicine, such as telehealth informatics.

(Adnan Qayyum. *et. al,* 2023) This study proposed that early detection of dental caries can prevent invasive treatment and enable preventive treatment. Dental radiography is a widely used tool for detecting and diagnosing caries. Deep learning techniques for caries detection require large-scale annotated data, which is scarce in clinical

Rutuja Kale and Arjumand Masood Khan

settings. An efficient self-training-based method for caries detection and segmentation uses a small set of labelled images and a large collection of unlabelled images. The proposed self-supervised learning strategy improves performance by 6% and 3%.(Yılmaz, Hülya, and Sultan Keleş 2018)This review's objective is to provide broad information on current techniques for detecting dental cavities and to highlight the advantages of using them in addition to more established techniques. the author has concluded that None of the individual's listed methods on its own are enough for diagnosing dental caries. Future developments in diagnostic equipment may bring about slight modifications to the tooth's structure. A dental caries diagnosis will be made, and preventive measures will be taken to safeguard the tooth structures. (Vincent Majanga and Serestina Viriri 2022) This survey covers methods and strategies for segmenting and detecting dental pictures, including databases, performance evaluation protocols, segmentation techniques, and algorithms based in academia and industry. Dental radiography may be useful in identifying dental images, however the methods in place now concentrate mostly on segmentation. Automatic blob detection approaches have the potential to enhance dental detection systems and enable human-based dental caries diagnosis.(Shashikant Patil and Vaishali Kulkarni b 2019). The author created an architectural assessment of the new caries sites model to have an accurate recognition of dental cavities. Adaptive dragonfly computation and NN classifier were used to complete the component extraction and placement.

METHODOLOGY

The use of Convolutional Neural Networks (CNNs) has been growing in many fields of research, such as dental caries detection and medical imaging. Here are several popular CNN techniques along with some current findings in this field of study that have been shown to have accurate results:
The above methods give different results which elaborate the importance of cnn in this research area. the results of this method are as follows: Depending on the dataset and particular application, U-Net-based techniques have shown encouraging results in dental imaging when it comes to segmenting dental caries and obtaining accuracies of 85% to 95% or higher. When used for dental caries detection tasks, ResNet variants have shown accuracy levels above 90% in certain experiments. ResNet architectures' efficacy in this field has been aided by their ability to handle intricate dental picture elements. Using the features from the pre-trained models and the process of fine-tuning dental pictures, transfer learning approaches have made it easier to construct strong dental caries detection models, with reported accuracies in the range of 85% to 95%.

Opportunities
Finding dental caries can lead to a number of benefits that have a big impact on people's oral health and larger healthcare systems. Early detection makes it easier to act quickly, enabling dentists to apply fluoride treatments or dental sealants, for example, which can stop or reverse the progression of caries and reduce the need for more invasive procedures like fillings or root canals.This not only retains more natural tooth structure, but also adds to improved long-term oral health and patient care experiences. The focus on dental caries detection propels technological advancements in dental imaging, diagnostic tools, and AI-driven techniques, boosting collaboration among dental practitioners, researchers, and technologists. These developments not only foster innovation, but also address oral health inequities, promoting equitable access to high-quality dental care and education for people of all backgrounds.

Key Disclosure of the Review
According to the above report, researchers in the area of dentistry are using CNN models for various types of imaging data sets to detect dental illness. The performance of each model varies based on the data set and model. So, in the proposed effort, we will use the CNN architecture to identify dental cavities early. According to the force's assessment, the deep learning approach is used for object localization the most. In the private sector, virtually little effort is made on dental issues. It is in our best interests to concentrate on clearly defined dental diseases using various techniques such as caries extraction and particular. A portion of CNN models are excellent for precise carry detection.

Rutuja Kale and Arjumand Masood Khan

CONCLUSION

Dental plaque is a risk factor for dental diseases like caries, gingivitis, and periodontitis. Detecting dental plaque early is crucial for maintaining oral health. This research aims to promote early diagnosis of tooth decay using multiple Convolutional Neural network models. Caries detection technologies aim to identify caries early and prevent it from progressing to cavitation. The article presents a deep convolutional neural network-based technique for automatically identifying dental caries.

ABSTRACT

The intricate phenomena of indoor air pollution arise from the ever-changing interplay of several indoor and outside environmental elements. This research was conducted in office buildings during pre-monsoon season. Relative humidity and temperature, particulate matter (PM2.5, PM10, PM1), carbon dioxide, formaldehyde and total volatile organic compound (TVOC) were measured throughout each building five days a week, at 30-minute intervals between 9:00 AM and 5:00 PM. Regarding thermal characteristics, the temperature in each building is marginally higher and relative humidity within the limits than the Indian Society of Heating Refrigerating and Air Conditioning Engineers (ISHRAE) standards. Notably, the average concentration of particulate matter, CO_2, HCHO and TVOC were recorded and compared with the standards establish by World Health Organization (WHO) and American Society of Heating Refrigerating and Air conditioning Engineers (ASHRAE) with building characteristics.

Keywords: Indoor air quality, Thermal characteristic, Environmental element, Office buildings, Standards

INTRODUCTION

The indoor air quality best (IAQ) depends at the awareness of pollutants released to air in relation to the dilution factor determined by means of alternative with fresh air. The indoor pollutants are able to affecting human fitness in a mess of methods (from pain felt a sensory stage to the extreme illnesses of the country of health), relying on the contaminant[1]. There are literally hundreds of air contaminants, each having various effects on the human body. From a World Health Organization estimation, it seems that a big percent of homes, in developed countries, have a high stages of toxic indoor air contaminants. Indeed, one of the reasons of the prevalence of certain illness (allergic

Hemina Z Patel and Neeraj D Sharma

reactions, poisoning, migraines, most cancers, and so forth.) seems to lie inside the degree of pollutants present within the environments in which normally spends most of the day [2]. Office homes that rating excessive in power and environmental overall performance have now grow to be flagships of sustainability inside the built surroundings as worldwide efforts are made to reduce carbon emissions. In the United Kingdom about 70% of power utilized in workplaces is channeled in the direction of making sure comfort for occupants. The fine of the indoor air surroundings relies upon at the layout and process of constructing structures that manipulate thermal consolation, IAQ, acoustics and illuminance. as per ISHRAE Providing and maintaining acceptable stages whilst preserving electricity costs and carbon emissions low is an electricity annoying workout that requires designers, owners and customers of homes to make the right stability among power saving imperatives and presenting comfort. Research has shown that IEQ is fundamental to the health and nicely being of the occupants specially in the UK in which many humans spend a huge share of their operating lives indoors. A poor first-class indoor environment might have a negative influence on any person's capacity to generate money as an employer because the expenses of absenteeism and occasional productivity most usually exceed the fee of power use related to maintaining applicable standards. On the other hand, true indoor environment excellent could enhance normal work overall performance by minimizing the outcomes of constructing related ailments and absenteeism [3].

Office buildings have significantly developed to grow to be controlled environments with advanced ventilating and air-conditioning systems. In latest years, workplace homes have no longer been considerably studied as compared to other similarly crucial indoor environments regarding the amount of time spent among the general population, which includes dwellings and faculties[4]. Moreover, similarly to the described fitness results because of indoor air contamination, the indoor environmental exceptional in offices may also have an impact on cognitive function and even subclinical disturbances might also and even mild abnormalities may cause productivity losses. Problems inside the indoor air of workplaces are problems which occupational health care frequently desires to do not forget when comparing the health risks of a work surroundings, but, in the intervening time, there may be very little information on the causal members of the family of indoor air difficulties and the mechanisms at the back of them. There is a growing studies interest on a part of occupational hygienists, air best in restrained areas, due to the fact the arrival of electronic gadgets in workplace environments has stepped forward the efficiency of the paintings at the expense of air first-rate. An increasing number of massive use of photocopiers and printers has been related to the constructing unwell syndrome (SBS) and their use is a major supply of threat to be taken into attention for an ok evaluation of chemical hazard inside the workplace[2]. Australian scientific studies, posted inside the magazine of American Chemical Society, says that running subsequent to a printer or copier in operation, it's miles equivalent to inhale cigarette smoke or to breathe exhaust fumes of traffic jam, for our lungs there may be little distinction.

In the final decades, the air excellent of indoor regions became of primary importance due to its effect on human fitness. The closure of natural openings of homes for power saving an experimental learning of the indoor air quality 193 functions, the procedure of untested new substances in addition to the negative air change affect extensively the indoor air pleasant[5]. An end result of this interference is the increase of many pollutants concentrations interior, consisting of CO, CO_2, PM10, PM2.5 and total VOCs. Researchers have centered at the measurement of pollutants' concentrations in houses, places of work, shopping shops and restaurants in which people occupy most in their normal time, with a purpose to examine the distinct indoor atmospheres and pick out pollutant's assets[6]. A first-rate part of particulates originates from the outdoor air and enters the indoor surroundings thru the ventilation structures, physical openings and cracks, whilst tobacco smoking, terrible cleansing behavior, resuspension and bad renovation of the air flow machine filters result in even higher levels. It must be referred to that emissions from elderly substances normally account for up to 30% of the full VOCs, at the similar time as those generated from activities, office equipment, building upkeep and cleansing merchandise account for practically all of VOCs [7]. Additionally, numerous educations have confirmed that the indoor air nice depends on the vicinity of the homes, the ventilation traits and the resources of air pollution, which exist at the area, while it became tested that indoor air pollution tiers can often exceed the out of doors degrees [3]. In this paper, the objective of the present work become to take a look at experimentally the indoor air excellent fame regarding PM1, PM2.5, PM10, CO_2, HCHO and TVOC

Hemina Z Patel and Neeraj D Sharma

in decided on differently office areas for evaluation functions. The experimental campaigns protected several days in each building to be able to include one-of-a-kind indoor conditions. All measurements were collected within the duration of the pre monsoon period.

MATERIAL AND METHODS

The four office buildings are situated on the first floor of the different commercial complex. which is in a suburban area close to moderate traffic roads. In offices around 15 to 20 peoples work on their regular office time 09:00 am to 05:00 pm [6]. All the buildings equipped with electronic computers, printers and furniture. Office 1 and 4 covers an area of 40 m² and office 2 and 3 covers 100 m² and 300 m². It must be noted that smoking is not permitted in any office. Measurements were taken in all the offices building at every 30 min interval [7]. The present work aims to contribute, through an initial learning phase, to the quantitative characterization of Particulate matter (PM2.5, PM10, and PM1), Carbon Dioxide (CO_2), Formaldehyde (HCHO) and Total volatile organic compound (TVOC) emitted from the office building without a filtering system also here are two comfort parameters Temperature and Relative Humidity also quantifying[5]. The sampling procedure continued for five days from Monday to Friday from around 9 a.m. to 5 p.m. in four various locations within each building. except in the case of PM2.5 (one site per building) According to the World Health Organization. The sample devices were strategically positioned on four separate levels and in four distinct orientations across the building: north, south, east, and west. Additionally, if the building had both types of working spaces, the variety of rooms had been considered, specifically the open spaces and cellular offices[8]. The sample period was chosen to strike a balance between the desire to define average concentrations in office buildings to be able to estimate long-term worker exposure and technological feasibility. Similarly, the quantity of sample points per building was determined by balancing detailed IAQ characterization for the whole structure with financial and feasibility concerns [9].

The samplers were positioned in the central of each room, at a height of around 110 cm, which is the breathing zone of sitting inhabitants, and not closer than 1 meter from the wall. Ventilation routes and heating sources, such as the sun, were excluded. Whenever possible, VOC-emitting adhesives and materials were scrupulously avoided while installing the samplers [4]. Utilizing a real-time monitoring system to measuring the indoor air quality parameters. Intelligent air quality detector was used to measure a level of pollutants with range Particulate matter PM2.5, PM10, and PM1 (0-999 µg/m3), CO_2 (0-5000ppm), HCHO (0.000-1.999 mg/m3) TVOC (0.000-9.999 mg/m3) Relative humidity (20% - 85%) and Temperature (20 °C - 50 °C) [10].

RESULTS AND DISCUSSION

The Thermal Environment
Throughout the sample time, the average inside temperature of building 1, building 2, building 3 and building 4 were 28°C, 27°C, 29°C and 30°C. Relative humidity were 47%, 58%, 65% and 49%. In all the buildings average temperature slightly above the ISHRAE standards and relative humidity within the prescribed limits [5]. It was a pre monsoon time so the outdoor temperature is also higher.

Indoor Air Quality
PM1, PM2.5 and PM10 Concentration Inside Office Buildings
The amounts of particulate matter present in indoor air of three different sizes in the occupied spaces were assessed. These were PM1, PM2.5 and PM10. The World Health Organization notes that complete protection for every individual against all possible adverse health effects of PM is unlikely to be guaranteed by any limit value due to the considerable inter-individual variability in exposure and in the response to a given exposure. As a result, the lowest concentrations feasible should be achieved in the context of local constraints, capabilities, and public health priorities[8]. During the research period, there were notable changes in the concentrations of PM1, PM2.5, and PM10

in every office building. During a 24-hour period, the concentrations of PM1, PM2.5, and PM10 in all office buildings were found to be below the WHO guideline value. Regular cleaning operations are conducted in all office buildings.

CO_2 Concentration Inside Office Buildings

One simple and reasonably priced method to address the degree of outside air missing from the recirculated air inside a building is to monitor the CO_2 concentration in the air under the building's interior. Human breathing causes CO_2 to be created inside the structure. About 100 times as much CO_2 is present in each expelled breath as intake breath [11]. If an inhabited indoor area has a CO_2 concentration, it may be used to determine if the building's air exchange balance is suitable, meaning that the right quantity of filtered outside air is being mixed with the air that has been flowing inside the structure. For any office building, the American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE) advises that the interior air CO_2 levels be below 1000 parts per million ppm.

HCHO Concentration Inside Office Buildings

In every building HCHO concentration were measured. Building 2 had a greater concentration of HCHO than the other buildings. These sources include ornamental woodwork found on ceilings and walls. High furniture density resulted in a greater HCHO concentration regardless of the building's age [12]. The primary source of HCHO emissions in the indoor workplace was furniture, namely the adhesives employed in the medium density fiberboards. Overall, these data suggested that interior decoration and furniture were more likely to be the main sources of HCHO emissions than other factors [13].

TVOC Concentration Inside Office Buildings

An assessment of the indoor concentration levels of the total volatile organic compounds (TVOCs) was also carried out. This investigation was unable to assess the different organic compounds separately. The assessment was based on the concentration degree of several organic compounds combined [14]. Among Four buildings, noticeably less TVOC concentration (0.3 mg/m^3) found in the building 1. building 3 and building 4, however, considerably greater (0.5 mg/m3) concentration was noted in the office building 2. The notably reduced density of wooden furniture in buildings 1, 3, and 4 in comparison to other buildings may be related to a lower concentration of volatile organic compounds (VOCs) in those particular buildings. Furthermore, the building only included a single laptop computer, one printer, and no copier, in contrast to building 2's abundance of desktop PCs, printers, and copy machines. The increase in TVOC concentration in the afternoon may have been caused by the employees of all office buildings using personal care products and scents. According to earlier research has also showed that using these items may cause the TVOC content in a poorly ventilated environment to progressively rise. The operation of floor doors to allow office personnel entrance may be the cause of the morning decrease in TVOC concentration across all levels. Due to a brief increase in airflow, this may have reduced the TVOC concentrations inside the floor. Building 2 had a substantially higher TVOC content (0.5 mg/m^3) than the other building. This might be explained by the fact that there were more freshly varnished hardwood furniture and wooden cubicle per unit area of a floor during the sample period.

CONCLUSION

The quality of the air inside four office buildings was assessed during two experimental campaigns performed and the data obtained were very interesting. Most working persons spend their days in various office buildings. From the standpoint of optimal productivity and the wellbeing of the employees working there, it is critical to maintain the IAQ in office buildings. According to research, one of the most important factors in regulating the amount of indoor air pollution in air-conditioned office buildings is the occupant density of the space. Considerable amounts of various air pollutants (PM2.5, PM10, PM1, CO_2, HCHO and TVOC) were noted in each of the four buildings included in the current investigation. Furthermore, PM2.5, PM10, PM1 and CO_2 concentrations in the all-office buildings were significantly lesser than its standards limitations which may be attributed to the type of activities that took place in the office buildings, especially good cleaning activities and less no. of visiting people in the offices.

ABSTRACT

Indoor localization system (ILS) is the method of finding out the position of the object, people, and equipment etc in the indoor area system. The ultra-wideband(UWB) system is a favourable solution for high data rate in wireless communication for the purpose of Localization. The UWB transmission scheme proposed two major approaches that are single band approach and multiband approach. Here in this paper, the two pulses(Gaussian and Rectangular) are taken into consideration for ILS. Both these two received pulses under go the operation of averaging and correlation with that of the original transmitted signal for getting the time of arrival (TOA)data in order to locate the position of target in the indoor area system.

Keywords: ILS, Localization, TOA, UWB, Correlation

INTRODUCTION

Now a days the utilization of wireless communication increases rapidly,so the requirement of high data rate also increases,for this there is a need increased data rate capacity, which can satisfy the user's demands fruitfully.The data rate can be increased by increasing the signal bandwidth.The ultra-wideband (UWB) is a type of wireless technology, which plays a vital role in the field of localization for its several features like wide spectrum that is the frequency range is 3.1GHz-10.6GHz, the duty cycle is very less that is maximum on time 5ms to off time 38ms, the ranging accuracy is very high (cm), the pulses used are very small (ns), ability of penetration to the obstacles, capable of avoiding the multipath fading etc. The Federal Communications Commission (FCC) has assigned (In February 2002) the spectrum in range 3.1 GHz - 10.6 GHz as unlicensed indoor UWB application and also defined as this signals having -10 dB bandwidth is higher than 500 MHz [1-4]. Generally the UWB transmitters operate by dispatching billions of pulses through a large spectrum having 7.5GHz wide bandwidth. Modern UWB systems use two technical proposals, one is divide the total of 7.5 GHz spectrum through some 528 MHz bands, which allows the

proper execution of bands in definite frequency ranges, on the other hand leaving the rest portions of the spectrum remain unused and other is introducing OFDM modulation scheme and is referred to as UWB-OFDM or multi-band orthogonal frequency division multiplexing (MB-OFDM), which can be contemplated as strong applicant for high-speed WPAN standardization, which come up with high data rate without ICI and ISI technology[5-8]. In this technique, due to the overlapping of sub channels, hence the transmission rate also increases. The requirement of modulators and filters at the transmitter side and similarly the demodulator and complementary filter at the receiver side can be reduced by advanced digital signal processing applications like implementation IFFT and FFT method for modulation and demodulation operation, which make the system more efficient [9].This paper includes the Gaussian pulses and Rectangular pulses for finding out the channel area for the purpose of localization in Indoor area system. The main objective is to look over the distance value for localization in Indoor area system by considering the Gaussian pulse and Rectangular pulse signal in a typical Indoor area system. The distance of a target is estimated by the time of flight (ToF) calculation that can be obtained from a correlation receiver and use this information to identify the channel type the device is operating in.

LITERATURE SURVEY

The ultra-wide band communication technology acts as an emerging technique for the high data rate, low range wireless communication. The UWB transmission scheme proposed two major approaches that are single band approach and multiband approach. Each approach has some merits and demerits .To nullify the limitations of single band technique the multiband were taken into consideration. In this technique rather than taking the total spectral range of UWB for transmission of the information, divide the UWB band in sub bands. Each of the sub bands takes a range of bandwidth of more than 500 MHz. the information has transmitted through the different sub bands at different instant of time. The main advantage of multiband approach is information has to be operated on a very small range of bandwidth [10-12]. The multi band OFDM UWB proposal given by IEEE802.15.3a standard, the whole spectrum split into 14 number of sub bands having 528 MHz of bandwidth shown in fig. 1. All of these sub bands uses OFDM modulation for the transmission of the information. These 14 sub bands are combined in five groups named by group A, B, C, D and E. The 3 initial sub bands with spectrum of 1.8GHz (3.1GHz-4.9 GHz) are called mandatory mode or group A shown as in fig. [13-14]. As the MB-OFDM Signal is generated by Rectangular pulse signal, but its spectrum includes the side lobes, which may create interference in IPS. On the other hand a Gaussian waveform is a bell shaped function and is normally distributed with equal number of measurement with respect to its mean value (upper and lower of mean). Its spectrum does not contain any side lobes; hence this signal is immune to interference in the area of localization. It can also be used for clustering, that is a set of data points can be grouped into a cluster and it allows an efficient calculations in statistical analysis. So we simulate here both Rectangular pulse and Gaussian pulses to carry out the operation of localization in Indoor area system.

Proposed System Model for TOA (Time of Arrival) Estimation

The proposed system to investigate the suitability of these two different pulses is shown in Fig.2. Here, a UWB transmitter generates very short duration pulses that are passed inside indoor area channel. In the Receiver section the UWB receiver processes the transmitted signal along with noise. To remove noise at the receiver side, the average of the noisy signal is taken into consideration and it is passed through the correlation block, where the operation of correlation is performed between the received signal with that of the referenced signal. Now the output is passed through a peak detector, which determines the information about To A of the UWB signal for Localization in Indoor area system. The UWB simulation parameter values to study the suitability of the rectangular pulse and the Gaussian pulse are listed in Table-1. The simulation is done using MATLAB. Fig.3 represents the Gaussian pulse simulation. In Fig. 4, the convolution operation is done in between the UWB signal and that of the channel. After that the transmitted signal is added with noise as shown in Fig.5. Now the noisy signal is delayed as shown by Fig.6. In Fig.7, it represents the Averaging operation at the Receiver side. Finally the peak detection occur by the operation of correlation, the peak detection occurs at 600numbers of samples as shown in Fig.8, the 600 samples correspond to a ToA of 10ns. This results in a ranging of 3m. These results correspond to a channel type primarily of the CM2 (0 to

4mt with NLOS), the ranging information so obtained is used further to locate the coordinate of target unit in the area of localization.

Simulation Result for Rectangular Pulse Signal

Fig.9 represents the Rectangular pulse simulation. In Fig. 10, the convolution operation is performed between the rectangular signal and that of the channel. After that the transmitted signal is added with noise as shown in Fig.11. Now the noisy signal is delayed as shown by Fig.12. In Fig.13, it represents the Averaging operation at the Receiver side. Finally the peak detection occur by the operation of correlation, the peak detection occurs at 1000numbers of samples as shown in Fig.14, the 1000 samples correspond to a ToA of 16.66 ns. This results in a ranging of ranging 5m. which corresponds to a channel type of the CM3 (4 to 10mt with NLOS).

CONCLUSION AND FUTURE WORK

This paper analyzes the Gaussian signal and Rectangular signal for finding out the time information, which is required for estimating the Indoor area for UWB localization.From the different output results, it is come to an end that the simulated output for Gaussian pulse represents a smooth representation of distance estimation, but the range of area for experimentation is low. On the other hand the estimated distance for localization using Rectangular pulse increases, but its output representations signifies slightly complex delegation. Further, a Gaussian pulse is more suitable for a CM2 channel while CM3 channel type is better served by a rectangular pulse. The future work is to carry out the localization in indoor area system through these distance values by the application of machine learning techniques.

ABSTRACT

Artificial Intelligence (AI) is an emerging field with the potential to enhance various processes and outcomes. AI, particularly Machine Learning (ML), can simulate human-like thinking and intelligence through artificial systems. Within AI, Machine Learning involves creating models using data. In the pharmaceutical industry, drug formulation is a complex and resource-intensive process. AI, especially ML, offers a solution to streamline this process by optimizing cost, time, and accuracy. AI tools can be applied to catalyze drug formulation. Machine Learning algorithms can predict drug permeation through the skin, aiding the selection of optimal drug-delivery system combinations. ML can optimize transdermal formulation design by identifying the best mix of ingredients and delivery methods for desired therapeutic results. By analyzing data on drug properties, skin physiology, and more, ML expedites formulation development, reducing time and costs associated with traditional trial-and-error approaches. Machine Learning models can predict potential adverse effects of drug permeation and recommend formulations for improved efficacy and safety. Recent research has shown various machine learning algorithms, including Artificial Neural Networks, Convolutional Neural Networks, and Random Forest, being used for drug formulation optimization over the past decade. This highlights the current importance of AI in pharmaceutical research and its potential to reshape drug development.

Keywords: Algorithm, Machine Learning, Artificial Neural Network, Supervised Learning, Unsupervised Learning, Drug Formulation.

INTRODUCTION

This review focuses on the vital role of Artificial Intelligence (AI) in modern drug formulation research. It addresses the lack of a thorough exploration of machine learning's impact on this field. Through exploring algorithms, methodologies, and accomplishments, the review aims to reveal the true potential of AI in drug formulation. AI's roots extend to the 1956 Dartmouth Conference, led by John McCarthy, setting the stage for exploration. Advancements emerged in the 1970s-80s with human-like decision-making, while 1986's neural network breakthrough propelled AI. IBM's 1997 Deep Blue victory over Kasparov marked a pivotal AI-human milestone. The real catalyst for AI's advancement came with Machine Learning (ML). Unlike early AI, which followed fixed rules, ML combined computer science and statistics, triggering a new era. Algorithms began learning and adapting, surpassing rule-based constraints. This shift led to remarkable AI improvements, where data became the vital resource for effective learning. In today's data-driven age, copious information is produced daily in various sectors, including pharmaceuticals. Data quality is crucial for gauging drug effectiveness and safety. Big data analysis is vital, revealing chemical traits, drug performance, and their therapeutic or harmful effects on patients. Patient-specific data, such as age, gender, weight, and doses, further enhance our grasp of drug impacts. The use of machine learning in drug formulation has the power to revolutionize the process. By leveraging vast data and adaptable algorithms, it aims to expedite drug development, improve formulation accuracy, and cut costs. This review delves into existing literature and algorithms to deeply analyze the progress achieved in merging machine learning and drug formulation.

Machine Learning
Machine learning is a branch of AI that employs data and algorithms to mimic human learning and enhance accuracy. ML trains machines to efficiently manage data using algorithms, enabling computers to decide and generate patterns within specific contexts.

Machine Learning Types
Machine Learning involves non-living entities learning from data to provide specific predictions. Algorithms process and understand data, a process known as "training a model."Víctor Gallego [1] discussed the utilization of diverse machine learning algorithms to forecast drug development through AI; however, there remain opportunities for enhancing the prognostic accuracy in this domain. Given the abundance of data, there's no universal approach for managing unique datasets. Machine Learning addresses this through its various types, as follows:

Supervised Machine Learning
Here, the machine learning takes place in a supervised manner. In other words, we know what the output will be for the input we provide. This type of machine learning is generally preferred when the dataset is clear and labeled. I.e. the dataset is more in a structured format. Supervised learning is categorized in two different types, depending on the outputs: Classification: This type of learning is used when the expected output can be categorized into distinct results like a specific colour, name of a city, a specific education branch, a gender etc. Sub parts of this learning method are as below: Random Forest Algorithm creates decision trees through multiple rounds of random subset selection from the dataset. These subsets generate new trees, and their predictions are merged for the final result. Decision Tree Classification is a machine learning method that constructs a tree-like model to make decisions from input data. It's widely used for classification and regression. The technique divides the dataset into subsets by analyzing input features, forming a tree. Internal nodes decide using features, while leaf nodes denote class labels/outputs. It's user-friendly, interpretable, and suits numeric/categorical data. Yet, it may over fit intricate data. Logistic Regression Algorithm is a core machine learning method for binary classification. Despite its name, it focuses on classification, not regression. It predicts the likelihood of an input belonging to a class by using the logistic function on input features. This transforms the output into a probability between 0 and 1, with values above 0.5 indicating the positive class and below as the negative class.

Hetalbahen Kiritkumar Dave *et al.,*

Logistic Regression is a simple, interpretable, and efficient method, ideal for scenarios with roughly linear input-target relationships. Yet, it could face challenges with intricate data patterns needing more advanced algorithms. To counter over fitting and boost results, techniques like L1 and L2 regularization can be employed. Support Vector Machine(SVM) is a potent machine learning algorithm for classification and regression tasks. It seeks the optimal hyper plane to separate classes in data by maximizing their margin. SVM transforms input data into a higher-dimensional space to find this hyper plane, making it adept at handling intricate relationships and various data types through kernel functions. Its strength lies in achieving robust generalization on new data, especially in high-dimensional scenarios or when distinct class boundaries are crucial. Run Han [2] et al. have developed a novel prediction model using Random Forest (RF) algorithm, for the physical stability of solid dispersion formulations using machine learning techniques. This improved maximum dissimilarity algorithm (MD-FIS) model has achieved 82.5% accuracy, among the other eight machine learning approaches. Regression: This type of learning is used when the expected output is not distinct but rather continuously changing values like weather prediction, price variation in real-estate sector, sales trends in a company etc. Sub parts of this machine learning are Simple Linear Regression Algorithm, Multivariate Regression Algorithm, Decision Tree Regression, Lasso Regression

Decision Tree Regression algorithm uses a tree-like model with a root node, intermediate nodes, and leaf nodes. It divides data into smaller subsets based on feature values through recursive splitting. Each split preserves important data or minimal impurity. Splitting halts, when a stop criterion is met. When the tree is built, new data traverses nodes from root to leaf, selecting branches based on node values. Predictions rely on majority matches or calculated average values. Pauric Bannigan [3] et al. has created a tree based Light Gradient Boosting Machine (LGBM) model. This model has provided the most accurate prediction accuracy with MAE values of 0.125 and 0.114, for the inner and outer loops, respectively for fractional drug release in long-acting injectable in comparison of other eleven ML algorithms. The LGBM model afforded the narrowest distribution in absolute error values for the test data. As per G.P. Moss [4] the study compares discriminant analysis (DA) and various machine learning methods for classifying chemical enhancers of percutaneous absorption and predicting enhancement ratios (ER). DA provided reasonable classification accuracy but lacked consistent ER estimates. Machine learning, including Gaussian process (GP) regression and K-nearest-neighbor (KNN) regression, improved ER prediction accuracy. The SVM classifier with oversampling achieved the best classification result, while GP yielded accurate ER estimates for both strong and weak enhancers. Machine learning methods offer enhanced classification and prediction abilities compared to discriminant analysis, facilitating more accurate and reliable assessment of enhancer characteristics and capabilities.

Unsupervised Machine Learning
Unsupervised learning doesn't need supervision or labeled data. It's used for unclassified data. The model trains without supervision, grouping data into categories, patterns, etc. Subcategories include: **Clustering**: This unsupervised technique groups similar data together, forming clusters based on shared behavior. For instance, it can identify popular food items or common OTC medicines for headaches. Clustering includes various types as well like K-Means clustering, Mean-shift clustering, DBSCAN algorithm, Principal Component Analysis, Independent Component Analysis **Association**: This unsupervised learning technique; find the relation between the entities in the large dataset. It then finds the dependency or link of one entity with the other and then maps them to optimize the output. A common example of association is optimizing in-continuous production. Association can be classified into different types viz. Apriori Algorithm, Eclat, FP-growth Algorithm.

Semi-supervised Machine Learning
This technique, called semi-supervised learning, optimizes the use of mixed labeled and unlabeled data. Solely relying on supervised learning may lead to discarding unlabeled data, while using only unsupervised learning risks losing labeled information. This algorithm addresses this by first applying unsupervised learning to form clusters from unlabeled data. These clusters then help label the unlabeled data, resulting in an augmented dataset that's larger in labeled samples without sacrificing its original size.

Laura E [5] is the first one who has applied emerging machine learning technique, active ML to micro biome science. Active ML predicts how excipients at pharmaceutically relevant concentrations affect the intestinal proliferation of a common probiotic, Lactobacillus paracasei. The average certainty of the final model was 67.70% and experimental validation demonstrated that ¾ excipient-probiotic interactions could be correctly predicted. Traditional ML techniques, such as ANN and tree-based methods, require large datasets, while active ML can be employed as a tool for small datasets for accurate in silico predictions.

Reinforcement Machine Learning
Reinforcement learning involves strengthening a model by rewarding successful actions. Imagine a person learning from mistakes and self-rewarding upon achieving goals. For instance, a computer playing a video game learns by rewarding itself for positive moves against opponents and aiming to enhance its gameplay.

Artificial Neural Network
Artificial Neural Network is a part of machine learning which resembles with the neural network found in human brain, generally known as Biological Neural Network. The strong part of ANN is that is does not need an explicit program but it learns from the data rather. The delta between the predicted output and actual output is reduced by changing the factors viz. weights and biases. These cycles of training goes on till the network is able to generate an accurate output for the new test data. As ANN learns from its data, the drawback of this type of learning is that it needs a very large set of data to reach accuracy. Handling such a large set of data also needs an expensive hardware resource, which actually is not a challenge now days. Hao Lou [6] has reviewed the commonly used machine learning algorithms in solid oral dosage form development. These machine learning algorithm were written using known programming languages like Python, Java, R etc. The software used to run these algorithms could be SAS, JMP, MATLAB, WEKA etc. According to the review, it is ANN which is extensively used since last few years esp. from 2015 to 2019. The count of the published paper during this period was more than 30. The statistical data mentioned in the review that around 67% of algorithm used was ANN. While remaining 33% of algorithm were other machine learning algorithm. Manoj Kumar Ananthu [7] have reviewed that how ANN algorithms are more benefitted over mathematical method of RSM, to optimize different pharmaceutical formulations. They developed a multi-objective parallel optimization strategy to overcome the limitation of RSM using ANN.

Junhuang Jiang [8] has concluded that In pharmaceutical research, ANN models have been effectively employed to optimize transdermal drug delivery formulations. These models accurately predict response variables and demonstrate good agreement with experimental results. Furthermore, neural networks are integrated with other techniques like Gaussian mixture models and quantitative structure-property relationship models to develop intelligent systems for predicting drug release profiles. This approach shows promise for enhancing transdermal drug delivery optimization and prediction processes. Shan Wang [9] has discussed the advanced role of artificial neural networks (ANNs) in pharmaceutical research. ANNs are explored as powerful tools for predicting, characterizing, and optimizing various aspects of pharmaceutical formulation. This review highlights the application of ANNs in modeling complex relationships within formulation data, enabling accurate predictions of formulation properties, and facilitating optimization processes. The abstract emphasizes the significance of ANNs in advancing pharmaceutical formulation techniques and their potential to enhance efficiency and precision in drug development. According to Hao Lou [10] the study investigates enhancing powder compactability using the core/shell technique through systematic experimentation. A Design-of-Experiment (DoE) is conducted to evaluate the effects of core and shell materials on strength and brittleness. Various machine learning algorithms, including RSM, SVM, and different ANN types, are utilized to model relationships between product outputs and material inputs. Results indicate improved compatibility with core/shell approach, and all algorithms demonstrate predictability and generalization, with ANNs handling complex patterns effectively. These models unveil and visualize relationships between product profiles and material attributes. Nitin S. Parmar [11] reviewed the utilization of artificial neural networks (ANNs) as a powerful technique in optimizing controlled release drug delivery systems, surpassing limitations of response surface methodology (RSM). ANNs simulate human brain processes to process information, learning from patterns in data rather than being programmed. The review covers the basic structure and development of ANN models for

controlled release formulations, emphasizing the impact of neuron transfer functions, learning rules, and architecture. Applications of ANN in pharmaceutical sciences, from interpreting analytical data to drug and dosage form design, are explored, highlighting its wide potential in enhancing various aspects of controlled release drug delivery.According to Parichehr Hassanzadeh [12] this abstract highlights the application of artificial neural networks (ANNs) in optimizing transdermal hydrogel formulations for drugs like ketoprofen and melatonin. For ketoprofen, an ANN model was developed to optimize gel composition, with the optimal formulation matching the model's predictions. ANNs and response surface methodology (RSM) were employed to optimize the composition of a transdermal vehicle for melatonin delivery. The focus was on enhancing melatonin flux and reducing lag time through solvent mixtures. A multi-layer feed forward back propagation network identified suitable solvent mixtures and assessed inter-relativity between responses, with experimental results aligned with predictions. A screening algorithm integrating neural networks, genetic algorithms (GAs), and structure-property relationship models was developed to identify chemical penetration enhancers for transdermal drug delivery. The algorithm, validated with melatonin permeability and toxicity assessments, demonstrated potential for enhanced skin permeation enhancer development.

Convolutional Neural Network

CNN is a deep learning algorithm for image/video detection. It uses layers of neurons to extract info from data, leading to predicted output. Current capsule defect detection relies on slow, error-prone human assessment. An automated system would enhance accuracy and speed. Junlin Zhou [13] proposed a new capsule detection algorithm that is based on improved CNN, where the qualified and defective capsule images are collected from an existing production cycle. Now deep learning model based on improved CNN is trained to identify the defective and qualified capsule. This new improved CNN algorithm is named as RACNN. Where RA stands for Regularization and Adam optimizer. The Adam optimizer is used to increase the model training. The parameters used to tune this algorithm are 'batch size' and 'learning rate'. By adjusting these parameters the best combination achieved has an accuracy of 97.56% which makes this model concise and efficient enough to identify defective capsules from the production cycle. Xiangyu Ma [14] have developed a tool using deep learning convolutional neural networks which detect internal crack detection of oral tablets through XRCT images, with an average accuracy of 94%. The deep learning tool is fully automated and capable of analyzing hundreds of tablets. According to Aliasgar F Shahiwala [15] machine learning approach employs optimize drug formulations, utilizing a neural network model to predict particle size and drug entrapment for niosomes. The model achieves high prediction accuracy, highlighting key factors affecting these properties. The network showed the highest prediction accuracy of 93.76% and 91.79% for % drug entrapment and particle size prediction. Validation with experimental batches demonstrates the superiority of the neural network over response surface methodology, emphasizing its potential for designing effective drug niosomal formulations. S. Agatonovic-Kustrim [16] has proved that using back-propogation ANN has achieved 84.5% accuracy in protein recognition in protein side-chain-side-chain contact maps.

Machine learning tools

In the previous topic, we emphasized the types of machine learning algorithms. Pauric Bannigan [17] et al. has stated about readily availability of large number of machine learning algorithm via well-established libraries and software packages. To use these algorithms, there are some tools available in the market. Below is the list of widely used tools:

Weka

WEKA (Waikato Environment for Knowledge Analysis) is well-known open-source software for machine learning and data mining. It offers a user-friendly interface and a variety of algorithms for tasks like data preprocessing, classification, regression, clustering, and association rule mining.

Tens or Flow

It is, an open-source ML framework by Google, is popular for creating diverse deep learning models, using data flow graphs for efficient computation. It's favored by researchers for scalability, distributed support, and cross-platform deployment, covering image recognition, NLP, and more.

Hetalbahen Kiritkumar Dave *et al.,*

Py Torch

It is, an open-source machine learning framework from Facebook's AI Research lab, stands out for its dynamic computation graph system, offering intuitive and flexible model building unlike static graph frameworks. It's popular for neural network development, seamlessly integrating tensor computations and automatic differentiation. Researchers favor PyTorch for its user-friendly experimentation, aided by its dynamic nature, easing debugging and prototyping.

Scikit Learn

Scikit-Learn, or sklearn, is a widely used open-source Python library for machine learning. It provides efficient tools for data analysis and mining, offering algorithms for classification, regression, clustering, dimensionality reduction, and more. With a user-friendly API, it suits both beginners and experts, seamlessly integrating with popular libraries like NumPy, pandas, and Matplotlib.

Amazon Machine Learning

It is provide by Amazon Web Services (AWS) is a cloud service that lets users easily create, train, and deploy machine learning models without extensive expertise. It streamlines predictive model development for tasks like fraud detection, customer churn prediction, and demand forecasting.

Steps involved in machine learning

Like any other complex activity, machine learning seems to be a difficult ride, but it actually is simple if the principal of – divide and rule. Let's see how we can divide the whole activity into different steps:

Data Collection

The key to a successful machine learning algorithm is the prime ingredient: accurate predictions. Achieving high accuracy relies on quality data. It must originate from valid, reliable sources, be free of redundancy and missing values, and exhibit clear patterns or clusters.

Data Preparation

Even after making immense efforts it is inevitable to get a perfect set of data. Thus whatever data is collected that needs to be prepared in following manner Remove redundant information, Remove unwanted data, Remove missing values, Converting data types, Grouping into patterns/cluster, Split – Test dataset & Training dataset

Model Selection

The data is prepared, but knowing its type and our goal is crucial. Understanding this aids in selecting an appropriate model for improved predictions. Various industry models can align with your measurements.

Model Training

This model enhances prediction, much like human improvement through practice. By training it with diverse datasets, its predictive prowess improves.

Model Evaluation

During training, the model processed the test dataset and matured. With training complete, it's now time for evaluation. The test dataset is applied to the model to assess its performance with this fresh data.

Parameter Tuning

After evaluation, improving model accuracy becomes the focus. By adjusting data characteristics, parameter tweaks can enhance accuracy, though excessive tuning might harm performance. Balancing these factors requires managing trade-offs.

Predictions
Once you collect and prepare the data, select, train, evaluate, and tune the model for the highest accuracy, it is time to do final predictions.

APPLICATION OF MACHINE LEARNING IN TRANDERMAL DRUG FORMULATION
The traditional drug formulation lacks modern software-based decision-making. Termed "conventional method," it lacks software integration yet remains crucial in understanding drug formulation. Choosing a drug's administration form (injections, tablets, patches) is a key consideration, determined by its unique properties. While maintaining quality, this method has drawbacks: trial and error, high resource and time costs, affecting drug cost, production, and efficiency in commercialization. In Table 1, we summarize the use of machine learning in transdermal formulation.

Future Perspective and Challenges
At present, the Artificial Neural Network algorithm is commonly used in pharmaceutical science mainly includes the multilayer perceptron, generalized regression neural network etc. while in future advances in optimization algorithms, model design and upstream disciplines will improve the performance of ANNs. [18]
Machine learning is making its mark in the pharmaceutical industry, with a promising future in drug formulation as below:

Improved Drug: Not just patient-drug data, but also the vast information about chemical drugs and their biological effects can be analyzed to improve drug quality.

Drug Personalization: Tailoring drugs to individual impact based on patient's clinical history is achievable for maximum effectiveness.

Fast Drug Discovery: Assuming better data access from various sources, drug discovery can improve, cutting costs and risks linked to conventional methods. Drug Quality Integrating machine learning into the production chain enables consistent drug quality, controlled impurities, and improved production cycles. Despite its promising benefits, machine learning also presents intriguing challenges, outlined below:

Insufficient Data: Data is crucial for machine learning. In some cases, there might be insufficient or limited data, making it challenging to train models effectively.

Quality of Data: If a dataset is available, the next challenge is its quality, concerning variety, accuracy, drug properties, etc. Large data simply does not guarantee a better-trained model, if the quality of the data is not as expected.

Over & Under Fitting: If a complex model trains on limited data, it predicts broadly, causing Data Over-fitting. Conversely, a simple model trained on complex data yields irrelevant conclusions due to insufficient information extraction.

High-dimensional modeling: Studies should perform appropriate feature engineering, feature selection and dimensionality reduction. [19]

Regulatory Limitations: Drug formulation requires adherence to strict norms and guidelines. The machine learning model must comply with these limits, providing clear and industry-accepted predictions.

CONCLUSION

This review underscores the critical need to improve transparency, reliability, and accuracy in machine learning (ML) models within the realm of drug formulation. While acknowledging that optimal methodology is just one aspect of a broader narrative, the integration of expertise from drug formulation scientists and empirical data from both in vivo and in vitro experiments with ML-generated predictions is suggested to address uncertainties throughout drug product development. Envisioning a future where computers guide the entire process, there is a prospect of realizing an end-to-end *in silico* approach for generating medicines from diseases through ML. The literature consistently highlights the significant contributions of ML techniques in various aspects of drug formulation, such as design streamlining, property prediction, and controlled drug release, thereby enhancing overall product performance. Diverse algorithms, ranging from neural networks to support vector machines and Gaussian processes, are employed to address intricate challenges. Despite the promises, ongoing research is pivotal to tackle concerns related to data quality, model interpretability, and validation across diverse compounds. In summary, the review underscores the transformative impact of machine learning on innovating drug formulation, with the evolution of technologies like fuzzy logic and genetic algorithms poised to further streamline drug design, formulation, and manufacturing processes.

ABSTRACT

The field of clinical psychology requires a thorough investigation in order to effectively diagnose women with sadness and anxiety. Therefore, the use of Artificial Intelligence and Machine Learning Techniques in the field of mental healthcare has the potential to generate substantial advancements, enabling comprehensive preventive measures and management of depression symptoms especially for women. Therefore various hybrid models have been proposed as a means to mitigate risk of depressive symptoms. The rationale for this observation is in the greater influence of social and economic variables on females relative to males. The effects linked to this phenomena might manifest as both immediate and potentially long-lasting. Various factors such as postpartum depression, gender bias, genetic complexity in shared and non shared environment which can be natural or conventional, widowhood, adulthood, separation, loneliness, single marital status and posttraumatic events which may affect mental state of woman. The study focuses on the application and integration of various machine learning methodologies, including LSTM (Long Short Term Memory), Bi-Directional LSTM (BiLSTM), Local Interpretable Model-Agnostic Explanations (LIME)on Convolutional Neural Networks (CNNs), Deep Neural Networks (DNNs) and Recurrent Neural Networks (RNNs). The main objective of this study is to emphasize the identification of distinct indicators of depression in women and the capacity to process diverse forms of data within this domain, while integrating various components of Artificial Intelligence and Machine Learning.

Keywords: clinical psychology, Artificial Intelligence, LIME(Local Interpretable Model-Agnostic Explanations), Machine Learning, rationale.

Bhoomi Parikh and Zankhana Shah

INTRODUCTION

Mental healthcare is a crucial element of holistic health and wellness, with a primary emphasis on the identification and treatment of mental and emotional health issues. The field of mental health covers a diverse array of services and interventions aimed at promoting and preserving mental well-being, preventing the onset of mental diseases, and offering support to individuals grappling with mental health challenges. The importance of mental healthcare within contemporary healthcare systems has gained growing recognition in recent times. It is imperative to recognize that mental healthcare does not adhere to a universal solution for all individuals. The treatment and support provided to individuals might exhibit significant variability in terms of their nature and duration, contingent upon their unique requirements and circumstances[1].The implementation of a comprehensive approach that takes into account the physical, psychological, and social dimensions of an individual's well-being and is frequently the most efficacious strategy for managing mental health issues. In recent times, there has been a notable acknowledgment of the significance of mental healthcare, accompanied by heightened endeavours to diminish the social disapproval associated with mental health concerns and enhance the availability of related resources[2]. Nevertheless, there are persistent issues that need to be addressed in the field of mental health. These challenges encompass discrepancies in the availability of healthcare services, the scarcity of mental health specialists, and the imperative for continuous education and heightened awareness. As societies undergo ongoing transformations, the field of mental healthcare will also progress, placing emphasis on enhancing the well-being of persons with mental health difficulties.

Symptoms of Mental Illness
As shown in fig.1. primary signs of depressive symptoms range over varied aspects of human body which give rise to mild, moderate and acute symptoms of depression.

Feeling anxious
Experiencing anxiety is a prevalent aspect of the human condition, encompassing a spectrum of emotions that span from a subtle feeling of discomfort to an overpowering state of apprehension and terror.

Digestive Problems
Digestive disorders, often referred to as gastrointestinal or GI disorders, involve a diverse array of illnesses that impact the functioning of the digestive system. The digestive system comprises a sophisticated arrangement of organs and physiological mechanisms that collaborate harmoniously to facilitate the breakdown of ingested food, assimilation of essential nutrients, and expulsion of waste materials. .

Dizziness and Fatigue
Dizziness and weariness are frequently encountered symptoms observed in individuals across diverse contexts, and can arise from a myriad of etiological factors.

Difficulty Sleeping
This prevalent sleep condition can significantly affect an individual's physical, mental, and emotional well-being, rendering it a subject of significant concern in the contemporary fast-paced and high-stress society[3].

Feminity Disorder
The presence of sexual dysfunction resulting from depression is a multifaceted and frequently distressing matter that can have a substantial impact on an individual's general well-being and intimate partnerships.

Low Energy
Individuals with depression may encounter a significant decline in their energy levels, leading to a perception of even basic chores as formidable obstacles. The absence of energy might further intensify the already profound emotions of sadness, helplessness, and worthlessness that are inherent to depression.

Grinding Teeth

Bruxism, sometimes referred to as teeth grinding, is a prevalent disorder that can be influenced or intensified by a range of variables, such as stress and sadness.

Menstrual Distress

The experience of monthly misery, commonly known as premenstrual syndrome (PMS) or premenstrual dysphoric disorder (PMDD), can be intensified by the presence of depression, resulting in an intricate interaction between mental and physical states of health.

Genetics

The etiology of depression is multifactorial, with genetic, environmental, and psychological variables all contributing to its manifestation. However, it is noteworthy that hereditary predisposition can exert a substantial influence on the development of depression[4].

Hypertension

Hypertension, also referred to as high blood pressure, is a complex medical disorder that can be impacted by a range of factors, encompassing lifestyle choices, genetic predisposition, and underlying health conditions.

Migraine

Migraines and depression are discrete medical diseases, albeit with potential interconnections that are intricate and multifaceted in nature. Although depression does not directly induce migraines, there exists much data indicating a robust association between these two conditions.

Rapid Heart Beat

Tachycardia, which refers to an elevated heart rate, can indeed manifest as a symptom or outcome of depression from a medical perspective.

Chronic pain

The association between chronic pain and depression is complex and bidirectional, with each illness often exacerbating or influencing the other. The concurrent presence of these two disorders can have a substantial impact on an individual's overall well-being.

Acne

Acne is a prevalent dermatological problem that can be influenced by a multitude of elements, encompassing hormone fluctuations, genetic predisposition, dietary patterns, and psychological stress. Although a clear causal relationship between depression and acne is not established, a multifaceted association exists between these two conditions, whereby depression might potentially contribute to the onset or aggravation of acne.

Mood Swings

The disorder is characterized by enduring emotions of melancholy, hopelessness, and a diminished engagement in previously pleasurable activities, with mood fluctuations being an additional prominent feature[5].

Clammy or Sweaty

Perspiration is an inherent physiological reaction aimed at maintaining thermal equilibrium and facilitating the dissipation of surplus heat, predominantly triggered by physical activity or elevated ambient temperatures.

Diabetes

This may be a pursuit of medical intervention for depression, the adoption of a health-conscious lifestyle, and the diligent surveillance of blood glucose levels in individuals with diabetes or those susceptible to its onset.

Furthermore, it is imperative for healthcare providers to take into account the potential interaction between depression and diabetes during the evaluation and management of patients.

Diarrhea

Diarrhea is a prevalent gastrointestinal disorder defined by the frequent occurrence of loose and watery stool motions. Although diarrhea is commonly attributed to physical factors such as infections, food poisoning, or nutritional problems, emerging research indicates that mental health disorders, such as depression, may also play a role in the onset or worsening of this ailment.

Factors affecting Women Mental Health
Gender Discriminability

Femininity and Masculinity are two sides of a socially balanced nationality. However, bias is still done on a false notion that women are weaker than men on the basis of physique and psyche. This falsehood is noted in society, at workplace and often upto some extent in healthcare diagnosis at various stages of womanhood like adult, postpartum, menopause amongst others. This bias can affect mental health of a woman which shows chronic signs of stress and if not detected and prevented timely can lead to acute stress[6].

Effect of Postpartum Depression in Women

Postpartum depression (PPD) is a significant mental health disorder that frequently elicits misconceptions, impacting a subset of women subsequent to childbirth. Postpartum depression, a variant of clinical depression, manifests within the initial year after childbirth, with a higher incidence observed within the initial three months postpartum. Postpartum depression (PPD) is a separate condition from the "baby blues," which is a less severe and more prevalent mood disorder experienced shortly after giving birth[7].

Genetic Factors responsible for Depression

The gene responsible for maintaining level of serotonin is 5-HTTLPR. Serotonin is responsible for mood stability as well as sleep mechanisms and digestive systems of an individual. However various environmental factors such as genre, race, ethnicity and society impact genetics. Correlation of these factors with other conventional entities caused due to presence in a shared environment can also affect gene structure[8]. These standard factors can be adaptable or non-adaptable to human body viz cigarette smoking, alcohol consumption, drug addiction, drug abuse can cause severe effect on gene structures which in turn can trigger disequilibrium of chemicals and pervasiveness to chronic stress is found. Thus working in a shared environment where there is non-adaptability to foreign condition can cause depression.

Polycystic Ovarian Syndrome causing Anxiety and Depression

Polycystic ovarian syndrome (PCOS) is a hormonal disorder that manifests during the reproductive years. Individuals diagnosed with Polycystic Ovary Syndrome (PCOS) may experience infrequent menstrual cycles. Alternatively, it is possible to experience prolonged intervals lasting several days. Excessive levels of androgen hormone may also be present in your body. Polycystic ovarian syndrome (PCOS) is characterized by the formation of several tiny fluid-filled sacs along the periphery of the ovary. These structures are commonly referred to as cysts. The cysts are characterized by their small size and fluid-filled nature, and they contain eggs that are in an immature state. These structures are commonly referred to as follicles. The follicles exhibit irregularity in the release of eggs. The precise etiology of polycystic ovary syndrome (PCOS) remains uncertain[9]. The implementation of timely identification and intervention, along with the achievement of weight reduction, has the potential to mitigate the likelihood of enduring problems, including type 2 diabetes and cardiovascular ailments.

Maternal Single Status ,Widowhood as well as Separation

Circumstantial changes occuring in life of a woman can cause separation, death of loved one or even loss of partner in old age. All these conditions can trigger depression owing to burden of varied responsibilities in these distinguished walks of life[10]. However, rendering a child by a single mother is challenging in its own way. Owing

to disparity, distress occurs which can be acute. Taking care of an infant right from birth, puberty, adulthood and giving a robust itself is a major concern which needs to be addressed by single mother[12]. Also loss of a loved one, leads to emptiness in life which can be seen in behaviour, routine, emotions affecting total health of an individual. Amidst all these, breakup, disturbed relationship, disputes in marriage can also severely affect mental health of women[11].

Post-traumatic Depression in Woman

Post-traumatic stress disorder (PTSD) is a psychiatric condition that arises as a result of exposure to a traumatic or unfavourable environmental experience, which has caused significant pain or injury. The structured interview is currently the predominant therapeutic method utilized for diagnosing post-traumatic stress disorder (PTSD)[13]. However, it is important to acknowledge that this approach is not without its drawbacks, one of which involves the stigma that is sometimes attached to individuals suffering from this condition.

Markers for Stress Detection

ECG(Electrocardiogram)

Heart Rate Variability (HRV) plays a crucial function in the identification of stress[14]. The RR/NN interval refers to the time duration between two consecutive heartbeats.The identification of variations in normal beat rates (RR interval) can be quantified through the application of statistical metrics such as standard deviation (SDNN), the average of all standard deviations of heartbeats (AVNN), the square root of the mean of squared differences of successive RR intervals (RMSSD), and pNN50 (the percentage of differences between successive RR intervals that are larger than 50s). All of these metrics fall within the category of time domain characteristics. HRV features such as NN, AVNN, SDNN, RMSSD achieved sensitivity score of 80% using Multilayer Perceptron Algorithm(MLP)[14]

EEG(Electroencephalography)

The ratio of low to high frequency can also be considered as a relevant statistic for EEG(Electroencephalography) [15].Hormonal imbalances resulting from chemical changes in the brain can lead to the emergence of undesired stimuli that impact the flight or fight response mediated by the sympathetic nervous system. The detection of curve anomalies can be accomplished through the utilization of Fractal dimension techniques such as Higuchi, Katz, and Permutation Entropy. These approaches are employed for the purpose of extracting features. By employing these techniques, it is possible to do dimensionality reduction, a process that aids in the regulation of brain activities. The EEG signal, derived from Electroencephalography, is considered an optimal non-invasive modality that poses no harm to the human body[16]. Using the Higuchi's Fractal Dimension technique, accuracy of 100% is achieved using Multilayer Perceptron (MLP) classifier. Also using Sample Entropy technique accuracy of 97.56% is achieved [17].

EDA (Electrodermal Activity)

The measurement of skin susceptibility can be conducted through the utilization of a photoplethysmogram (PPG) technique, which involves the implementation of a pulse oximeter to identify alterations in the blood volume beneath the skin tissue. The quantification of the oxygen absorption ratio in blood vessels inside skin tissue can be achieved through the utilization of light radiation. According to [18], application of GSR(Galvanic Skin Response) was done using EDR(electrodermal response) and results were obtained using different criteria like eating disorders, somatoform disorder, ADHD (Attention - Deficit Hyperactivity Disorder) , Obessive Compulsive Disorder. Evaluation was done using statistically proven t-test and significance was obtained with p-value < 0.01.

Role of Linguistics and Phonetics Aspects of Speech

The vitality of speech signal can be obtained through Trier Social Stress Test which includes delivery of speech on a particular topic, for perusal of job in a company. On the basis of audio information, detection of depression is done using physiological markers like heart beat, respiratory rate and steroid based cortisol hormone which is released by adrenal glands on top of kidneys[19][20]. As per the research work proposed in [21], approach used was Bi-LSTM (bidirectional Long-Short Term Memory) with an implementation of multimodality. Data was collected over 59

interviews which involved 29 depressed patients and 30 control participants. Accuracy of 80% was achieved which also showed that multimodal approaches outperformed unimodal behaviour of datasets.

Questionnaires and Tests
Beck Depression Inventory
It is a crucial instrument within the realm of mental health, facilitating the comprehension and evaluation of depression symptoms in individuals by specialists. Nevertheless, it is vital to utilize it in conjunction with a thorough clinical evaluation to guarantee a more precise diagnosis and formulation of a treatment strategy. Beck Depression Inventory (BDI) comprises of Numerical and Statistical Methodologies. Various methods are used to monitor mood swings, irritations, negative thought processes and physical complexities using a 0-3 point scoring system. Labels are generated by summing up the scores which can be bifurcated into mild, moderate and severe levels of depression. An attempt is made to provide comparisons based on different frameworks like CNNs, RNNs. Testing was done on AVEC 2013 and AVEC 2014 datasets. The discussed method is quite remarkable and promising results can be obtained for future diagnosis [22].

Patient Health Questionnaire (PHQ-9)
There is use of scale ranging from 0-3 for detection of stress primarily, more recurrently occurring not less than 2 weeks. With a more comprehensive outlook a follow up containing 27 questions is also surveyed for precision in diagnosis. This classification is based on point system where categories of mood swings range from minimal, mild, moderate and severe. With PHQ-9 (score >9) (no of patients=1076) were diagnosed. Out of which 23.1% were susceptible to diagnosis by doctor. With (score >=15), 30.8% were diagnosed with depression and with (score>=20), 49.4% were found to be depressed [23].

Hamilton Rating Scale for Depression (HAM-D)
The primary method employed by the Hamilton Rating Scale for Depression involves conducting a structured clinical interview with the individual. This interview is typically administered by a healthcare professional who possesses specialized training, such as a psychiatrist or psychologist. During the interview, the professional assesses the patient's behavioural patterns, emotional state, and physical manifestations of symptoms experienced within the preceding week. The healthcare professional assigns a numerical value to each item, taking into account the patient's replies and their own observations. The severity of depression is deemed to be greater as the overall score increases. The scale is widely available and has two common versions with either 17 or 21 items and is scored between 0 and 4 points. Scoring is based on the 17-item scale and scores of 0-7 are considered as being normal, 8-16 suggest mild depression, 17-23 moderate depression and score over 24 are indicative of severe depression [24].

Stroop Color Word Test
It is a clinically proven psychological test used to detect anxiety. It is an illusionary test where words are written in various colors like red, green and blue. The Stroop effect is a well-documented psychological phenomena that provides empirical evidence of interference in reaction time during a cognitive task. The phenomenon under consideration arises when the written representation of a color is presented in a hue that does not correspond to the semantic meaning of the color term viz red, green and blue, hence impeding participants' ability to promptly and properly identify the actual color being depicted[25].

VIML and Attention based AI Techniques for Regulating Mental Health in Woman

Wholesome Approach for Model Building:Machine Learning
It is possible to utilize diverse data sources in order to identify and detect instances of depression[26]. The sources encompass a variety of data types, such as text data derived from social media posts, electronic health records, audio recordings, and other relevant sources. In the context of text data analysis, potential methodologies encompass sentiment analysis, keyword identification, and linguistic pattern recognition. In the context of audio data, characteristics commonly encompass pitch, tone, and speech pace[27].Numerous systems for detecting depression

Bhoomi Parikh and Zankhana Shah

employ supervised learning methodologies. This process entails training the model using a labeled dataset in which individuals are categorized as either experiencing depression or not experiencing depression. According to [28], obtained results show that variance and standard deviation coupled with SVM classifier based on supervised Machine Learning technique achieved AUC(area under the curve) of 0.97.

Natural Language Processing

The application of natural language processing techniques is prevalent in the analysis of textual material for the purpose of detecting depression. Natural Language Processing (NLP) algorithms have the capability to examine the textual content found in many sources such as social media posts, online forums, and clinical notes[29]. By doing so, these algorithms can identify language clues and sentiment patterns that are indicative of depression. Sentiment analysis, topic modeling, and word embeddings are among the natural language processing (NLP) approaches employed in the field. The transformer-based approach for Natural Language Processing (NLP), achieved precision, recall and F1-score of 0.82, 0.81 and 0.82 respectively[29].

A Multifaceted Convolutional Neural Network Based Approach

According to [30] utilization of an attention-based Convolutional neural network (CNN) and long short-term memory (LSTM) technique is ensemble to integrate non-invasive data, including eye data, vehicle data, and environmental data obtained from sensors. There is autonomous extraction of information from individual modalities and varying levels of features are merged from distinct modalities using a self-attention function, to obtain specificity[31]. The study offers an automated methodology for gathering and assessing tweets using self-reported comments. Additionally, a multimodal framework has been proposed to predict symptoms of sadness based on user profiles. Findings include n-gram language models, LIWC dictionaries, automatic picture tagging, and bag-of-visual-words techniques to obtain relevant feature set according to[32].The correlation-based feature selection strategy in combination with nine distinct Machine Learning classifiers exhibit efficacy to generate class labels pertaining to depressive or non depressive symptoms [33]. Additionally, a Multimodal Hierarchical Attention (MHA) model is introduced for the purpose of detecting depression in social media content. The model receives multimodal data and applies the attention mechanism simultaneously within and across modalities. After applying distribution normalization, the MHA model can achieve accuracy and F1-score of 92.84% and 92.78% respectively[34].

Machine Learning and Wearable Sensors

In this study, a range of Machine Learning models have been utilized for the identification of stress in individuals. These models are applied to a publically accessible multimodal dataset known as WESAD[35][36]. The collection of sensor data, such as electrocardiogram (ECG)[14], body temperature (TEMP), respiration (RESP), electromyogram (EMG)[16], and electrodermal activity (EDA)[18], is conducted for the purpose of studying three distinct physiological states: neutral (baseline), stress, and amusement[37]. The F1-score and accuracy metrics were calculated for both three-class (amusement vs. baseline vs. stress) and binary (stress vs. non-stress) classifications[38][39]. These classifications were performed using various machine learning approaches, including k-NN, Linear Discriminant Analysis, Random Forest, AdaBoost, and Support Vector Machine. For both binary and three fold classification, Random Forest achieved F1 score of 83.34% and 65.73%[35].

Hybrid Deep Learning Model Based on social media

According to [31], user posts have been enhanced with supplementary attributes derived from Twitter. There is employment of a two-tier attention mechanism to encode user posts. This mechanism operates at both the tweet-level and word-level, allowing determination of relevance of each tweet and individual words. By doing so, extraction of semantic sequence patterns from the user timelines was available, thereby enhancing detailed understanding of posts. The hierarchical attention model was capable to effectively catch patterns, hence enabling the generation of explainable outcomes. The proposed model is a fusion of two deep learning architectures, Convolutional Neural Network(CNN) and bi-directional Long Short-Term Memory (biLSTM) which provides

optimized result upto 94.28%. Relevance of literature work Is obtained, out of which comparisonshave been annotated as shown in table I

CONCLUSION

The proficient utilization of technology in the treatment of mental illness among women holds the capacity to fundamentally transform our approach to mental healthcare. In addition to this, the utilization of machine learning and artificial intelligence enables the analysis of extensive datasets, facilitating the prediction of prospective mental health issues. This, in turn, facilitates the implementation of timely interventions and preventive measures. Throughout the course of this discourse, there is enhancement of mental health treatments for the mitigation of societal stigmatization. In addition, the advancement of technology has facilitated the creation of evidence-based therapies and assessment instruments in form of questionnaires and tests that may be tailored to address the unique requirements of women with mental health challenges.

Future Work
Pertaining to the written discussions above, it can be seen that the corpus collected is based on realistic data which depicts the emotions and sentiments of depressed patients on an instance or over a period of time. Owing to the applicability of sensing devices variance is obtained in detection of physiological signals which may affect accuracy and precision in detection of class labels, whether depressed or not depressed. In addition to the above, future work will provide a seamless approach which will provide accurate and promising results for depression detection among female patients by developing a collaborative methodology based on Artificial Intelligence and Machine Learning that supports multimodal behaviour of dataset, as well as extracting relevant features from human naturalistic data using sensor based techniques.

Table 1. Comparisons have been annotated based other survey papers

Author, Year	Area of Focus	Techniques introduced in survey	Outcome of Survey
Aleem *et.al.*(2022)[40]	Diagnosis of MDD, anxiety, bipolar disorder, migraine, stress, schizoprenia	Use of various machine learning algorithms like naïve bayes, support vector machine, random forest , Decision Tree	Efficacy of various Machine Learning algorithms was rationalized and it was found that SVM classifiers developed an accuracy of 75%
Joshi *et.al.*(2022)[41]	Detection of depression from emotional behaviour using facial expressions, images, emotional chat bots and texts on social media platforms.	Use of various Artificial Intelligence and Machine Learning techniques like ANN(Artificial Neural Network), Naïve Bayes, Logistic Regression, Support Vector Machine respectively	According to analysis of work done, SVM performs better but for more precise results in future, for precision, recall and F-measure, decision tree performs better.
Habtamu *et.al.*(2023)[42]	Preferred Reporting Items for Systematic Reviews and Meta Analysis(PRISMA) was implemented.	A data extraction form was prepared based on studies like population, sample size, gender, age.	Out of 23,305 records collected using varied types of questionnaires, more relevance of results was obtained from educational background
Fekadu *et.al.* (2022)[43]	Attempt is made to generalize survey of depression diagnosis in low and middle income countries	Diagnosis was done based on 9 item PHQ-9 with a cut off score of 5 and 10. Analysis was done on datasets like PubMed, PsycINFO, MEDLINE.	Survey indicated that extremely detection of depression was not upto the mark for diagnosis in low and middle income countries.
Babu *et. al.*(2022)[44]	Attempt is made to perform sentiment analysis of individuals based on social media data	Social media data containing text, emoticons and emojis were utilized for identification using Artificial Intelligence techniques.	It was found that multi class classification with Deep Learning algorithm showed higher precision value during analysis

ABSTRACT

The term "green purchasing behavior" describes the practise of buying goods that are kind to Mother Earth, easy to recycle or reuse, and considerate of environmental safeguards. A sampling technique is a method for selecting a subset of a population to serve as a representative sample for the whole. For the purpose of selecting organic consumers, the researcher employed convenience sampling. Research samples should be large enough to be statistically valid representations of the target population. The connection between product choices, environmental sustainability, and individual health is becoming more apparent in today's consumer landscape. Organic product sales and health consciousness are positively impacted by consumer education and environmental consciousness. As consumers learn more about the effects of their food choices on ecosystems and human health, they are increasingly looking for organic options. Notably, factors such as perceived cost, organic product certification, and labelling do not seem to significantly influence customer purchasing decisions.

Keywords: Environmental Sustainability, Green Purchase Behaviour, Organic consumers, Organic Products, Purchase Intention.

INTRODUCTION

Environmental and health concerns are rising in the minds of today's consumers. People are starting to shift their buying habits and are increasingly seeking for organic products, which are made with minimal environmental impact. Sustainable, created with natural resources, packaged simply, and free of pesticides are the hallmarks of

organic products. To sum up, organic consumers are people that think about the environmental impact of what they buy and how they throw it away, as well as the products themselves, before making a purchase.

LITERATURE REVIEW

The term "green purchasing behaviour" was coined by Mostafa (2007) to describe consumers who actively seek out and buy eco-friendly goods that are also easy to recycle or preserve. The trend toward "becoming green" is indicative of a societal concern for the future of Earth's natural resources, which Clem (2008) argues must be safeguarded for the benefit of humankind. The need for eco-friendly goods has grown as people's consciousness about environmental problems has grown. Green goods sales are positively correlated with customer attitudes toward environmental protection. Consumers' opinions and purchasing intentions may also shift in response to the ongoing environmental crisis. In marketing literature, the idea of consumer purchasing intention has been significant. Consequently, a customer's likelihood of making a decision to acquire environmentally friendly products is positively impacted by purchasing intention. The desire to buy environmentally friendly products is heavily influenced by consumers' concerns about the environment. Therefore, people buy eco-friendly products for reasons other than environmental concerns. Other things also contribute to the buying. When compared to conventional products, consumers are less likely to buy environmentally friendly options if they are more expensive and of worse quality.

According to what Denise Rennie and Farah Ayuni Shafiea have said If we want to know if the organic industry can sustain its rapid expansion and become a true mainstream market, we need to know what drives people to buy organic food, what they believe in, and how their demographics affect their purchasing decisions. Human health, food safety, environmental concerns, and sensory qualities including nutritional content, flavour, freshness, and beauty are just a few of the reasons why there have been numerous studies comparing organic versus conventional food. Everyone has their own opinion when it comes to organic food. Dantasetal. (2004) states that there are a mere few seconds for a product's label and packaging to make an impression on a buyer. In that little window, the product must captivate the eye and persuade the purchaser that it is the best choice available (Rowan, 2000). The following characteristics were selected for this study as influencing customers' purchasing behaviours for environmentally friendly items based on the literature review.

Objective of the Study
1. To explore the influence of Health consciousness and its impact on consumer buying intentions towards organic products.
2. To investigate the impact of consumer environment concern on consumer behavior towards purchase of organic products.

RESEARCH METHODOLOGY

A Quantitative study on consumers to explore the buying intentions of organic products was conducted. The researcher has collected data from 142 consumers of Bengaluru City through a structured questionnaire.

Population of Organic Consumers in Bengaluru
Organic Consumer's Average footfall in Organic Retailer's Stores in Bengaluru Districts.

Taluk	Population of Organic Consumers
Bengaluru South Taluk	36
Bengaluru East Taluk	37
Bengaluru North Taluk	42
Bengaluru North(Additional) Taluk	27
Total	**142**

Swaroop and Nandini

Sampling Method

The sampling technique infers to the process by which a representative sample is selected from the population. The researcher used convenience sampling for selecting the organic consumers. The sample size selected for study must be appropriate to represent the population of the study.

HYPOTHESES OF THE STUDY

Ha1: Consumer awareness will have a positive impact on consumer's purchase intentions towards organic product.

Ha2: Environmental concern will have a positive impact on consumer's purchase intentions towards organic product.

Ha3: Health consciousness will have a positive impact on consumer's purchase intentions towards organic product.

Ha4: Perceived expensiveness will have a impact on consumer's purchase intentions towards organic product.

Ha5: Labelling and certification on organic products, have a positive impact on consumer's purchase intentions towards organic product.

Data Validation and Reliability test

The fundamental ideas that defy reduction to a single measurable variable are represented by factors. The method of maximum likelihood with promax rotation was used. We checked if the things could be factored. We used the Kaiser-Meyer-Olkin measure and Bartlett's test of sphericity to determine if our samples were large enough. Both the KMO test value (.933) and Bartlett's test of sphericity (significant) were determined to be more than the suggested value of 0.6. Eigen values were used to extract six elements. We only kept the components whose Eigen values were greater than 1.

Extraction Method: Principal Component Analysis.
Rotation Method: Varimax with Kaiser Normalization.
a. Rotation converged in 6 iterations.

There are six components that make up consumer awareness as a whole. These include: an exceptionally high degree of knowledge regarding organic products; an equally high degree of knowledge regarding the health and environmental benefits of organic products; an exceptionally high degree of knowledge regarding the availability and point of purchase of organic products; and an exceptionally high level of knowledge regarding the various brands' offerings. Loadings of 0.820, 0.839, 0.786, 0.802, 0.790, and 0.791 indicate that consumers have a high level of knowledge regarding organic products and certifications. The first component, "Consumer awareness," explained 20.801% of the total variation. The second component, "Environmental Attitude," which consists of five items, explained 18.612 percent of the total variation. I am really worried about the damage that pollution is doing to plant and animal life, and I think that environmental pollution is a major problem. I like to think I'm more eco-aware than the average person, but I still think the government should do more to protect the environment. A lower carbon footprint is associated with organic food (loadings of 0.813, 0.853, 0.842, 0.862, and 0.807, respectively). Items with loadings of 0.837, 0.844, 0.825, and 0.822 from the third factor include: the nutritional value of organic food is higher than that of conventionally grown food; the health benefits of organic food outweigh the risks to human health; the safety of consuming organic food; and the fact that organic food tastes better. "Health Consciousness" was the factor's name, and it explained 16.648 percent of the variation. The fourth component includes item loadings Factor loadings for organic food were 0.867, 0.879, and 0.815, respectively, suggesting that only customers with higher incomes could purchase it. A total of 13,550 percent of the variance was explained by the "Perceived Expensiveness" component. The fifth factor includes seven items that have loadings. These include: I will continue to buy organic products regardless of price changes, I am willing to pay more for them, I don't mind spending more time looking for organic food, I think it's right to buy organic food regardless of price, I would still buy organic food even if my options are limited, I would buy organic food even if conventional alternatives were on sale, and finally, I think the benefits of buying organic food are worth the price. has collectively explained 10.613% of the variation, with loadings of 0.708, 0.799, 0.813, and 0.818. The "Willingness to Pay" metric represents this component. The sixth factor includes three items with loading values of 0.748, 0.809, and 0.735, respectively, regarding factors such as "I will only purchase organic products with organic certification or organic labelling," "Organic label is affecting my willingness to pay for organic products," and the importance of organic certification and labelling for recognising organic products. An element known as "Labelling and Certification" describes it.

Confirmatory Factor Analysis
Six latent constructs—Consumer Awareness, Environmental Concern, Health Consciousness, Perceived Expensiveness, Willingness to Buy Organic Products, Labeling, and Certification—and their corresponding manifest variables were subjected to Confirmatory Factor Analysis (CFA) in order to assess the measurement model's uni-dimensionality. To confirm the association between the latent and manifest variables, Hair et al. (2006) proposed using Goodness of Fit (GOF) indices, namely absolute fit indices, parsimonious fit indices, and incremental fit indices.

According to the measurement model fit indices table, the cut off value is 2.135, which is lower than what is considered acceptable. It is necessary to employ numerous measures concurrently in order to determine the appropriate model from the acquired data (Hooper, et al., 2008). Therefore, there are additional goodness-of-fit indices that are considered. The calculated CFI value of 0.934 is more than the minimal cutoff value of 0.9. (Arbuckle, 2010). Seems like RMSEA = 0.090 is higher than the cutoff of 0.08.

Suggestion

The goal of educational campaigns like Campaigns for Awareness and Education is to get the word out about the health benefits of organic products. Bring awareness to the fact that eating organic food has long-term, nutritional, and scientific advantages. Promote the environmental advantages of purchasing organic products, including less pesticide use, better soil, and more biodiversity. Affordable Rates work toward bringing the price of organic goods down to a level where they are competitive. Consider ways to reduce marketing, distribution, and production costs so you can pass the savings on to your customers. Loyalty programmes, rebates, and promotions are all viable incentives that could boost the economic attractiveness of organic options. Offering a diverse range of organic products allows you to cater to your consumers' diverse wants and tastes. Make it easy for consumers to personalise their purchases or offer affordable trial packages of several products. Working Cooperate with Influencers team up with influential people whose beliefs align with your company's. With their large followings and honest reviews, influencers can boost the trustworthiness of your organic products. Comments and Acceptances regularly solicit input from customers to gain insight into their expectations, concerns, and preferences. Always be ready to adjust your strategy based on what your customers tell you and how the market is changing.

CONCLUSION

There is a growing awareness in today's consumer culture of the interconnectedness of product choices, ecological sustainability, and individual well-being. Organic product sales and health consciousness are positively impacted by consumer education and environmental conscience. A growing number of consumers are considering the effects of their purchasing habits on future generations' health and the planet, driving up demand for organic goods. Fascinatingly, factors including perceived cost, organic product certification, and labelling don't seem to be nearly as influential on customers' purchasing decisions. This shows that consumers are shifting their focus from price and confusing product labels to the more basic advantages of being environmentally conscious and healthy. Customers seem to put more stock in the obvious benefits of organic products, viewing them as a way to show their support for sustainable practises while also investing in their health. Understanding the nuanced factors that influence customer choices is crucial for businesses and sectors as they adapt to the new normal. Businesses could stand a greater chance

of attracting and retaining customers if their marketing campaigns highlighted the organic products' inherent health and environmental benefits rather than the items' perceived price or complicated certifications. Modern consumers are more aware than ever before of the ways in which their purchasing habits can have far-reaching effects on ecosystems and communities. In order to cater to the evolving tastes of a more knowledgeable and conscientious market, it is crucial to prioritise openness, sustainability, and consumer education in light of this new reality.

ABSTRACT

Trunk muscle strength is impaired in children with cerebral palsy thus influencing their functional balance. Forward reaching is an important test and an essential component of daily life activities. However, there is paucity of literature determining the relationship between trunk muscle strength, balance and forward reaching ability in children with CP. The study intends to assess relationship between trunk muscle strength, balance and forward reaching ability in children with cerebral palsy from Surat city. This cross-sectional observation study included 47 children with cerebral palsy from physiotherapy and rehabilitation setups of Surat. Children with CP were assessed using stabilizer pressure biofeedback equipment and trunk control muscle scale for muscle strength; pediatric balance scale for balance and forward reach test for reaching ability after signing informed consent from their parents. The data was analysed using Microsoft Excel and SPSS 20.0.The findings are suggestive that there is moderately strong correlation between the isometric trunk muscle strength and balance; the isometric trunk muscle strength and forward reaching ability or balance and forward reaching ability. The study implicates use of trunk control and strength measures in rehabilitation of CP children to improve balance and functional independence.

Keywords: Balance, cerebral palsy, functional reach, physiotherapy, trunk muscle strength.

INTRODUCTION

Cerebral palsy [CP] is one of the commonest causes of motor disability in children with some amount of dysfunction of posture and movement [1]. Because ability to control posture is an integral part of all movements, deficits in the postural control system contribute to the challenges in body structure and function, daily activities, and participation of children with CP [2]. Balance dysfunction associated with impairment in trunk control is usually reported in children with CP who have lower levels in Gross Motor Function Classification System [GMFCS], suggesting probable relationship between trunk control and balance with functional abilities in these children [3].Children at GMFCS levels IV–V have undeveloped postural control and require contextual modifications to enable opportunities for basic acquisition and practice of head and trunk control [4]. Trunk muscle strength is an important factor influencing the balance in normal individuals as well as in children with CP [5]. The purpose of this study was to find relationship between the isometric trunk muscle strength, balance and forward reaching ability among CP child.

MATERIALS AND METHODS

- **Study Setting** The Study was conducted at various hospital, neuro-rehabilitation centers, and physiotherapy departments in Surat city of Gujarat.
- **Sample Population** Children with CP attending in neuro-rehabilitation centers, hospital, and physiotherapy department in Surat.

Inclusion Criteria
Children with CP from both genders were included if they fit following criteria-
1. Age of 5 to 15 years of age.
2. GMFCS level I, II and III.
3. Children able to understand the test instruction, able to sit and stand.
4. Parents of child who willingly consents for their child's participation in the study.

Exclusion Criteria
Children with CP were excluded if they fit following criteria
1. Parents of child not willing for their child's participation in the study
2. Children who prescribe with the botulinum toxin in the last six month or intrathecal baclofen pump implantation.
3. Child who has a history of injury to spine and pelvis, on medication like antiepileptic and anti spastic drugs.
4. Children who have progressive neurological disorder, genetic or metabolic disorder and severe concurrent and illness or diseases not typically associated with CP or other than CP. [e.g., traumatic brain injury or acute pneumonia].

Procedure
Data was collected from various hospital, neuro rehabilitation centers and physiotherapy departments of Surat. Parents were invited and explained about the study. After that parents who were willing to participate were asked to sign all informed consent form. Children with CP were screened and selected, based on inclusion and exclusion criteria through convenience sampling .Children were assessed for isometric trunk muscle strength using core stabilizer [6];forward reaching ability by Functional Reach Test [FRT] [7]; and balance by Pediatric Balance Scale [PBS][8]. Results were analysed using SPSS 20.0 and Microsoft Excel for Windows.

Krishna Variyavwala *et al.,*

RESULTS

The demographic data were analysed using frequency distributions. Correlations between the outcomes were evaluated using Pearson's correlation co-efficient as comparison of baseline data showed normal distribution using Kolmogorov–Smirnov test. Demographic distribution of the subjects in the study sample is shown in table-1. Mean age of the children included in the study was 9.17± 2.58 years and most of the children [n=31] were from 5-10 years' age group. It is also evident that most of the children included were diagnosed as diplegic [n=21] or hemiplegic [n=21] type of CP. Table-2 shows the correlation co-efficient values for average core muscle strength [mm Hg], pediatric balance scale score, and average functional reach distance [cm]. Values of correlation coefficients for all the variables considered, showed positive correlation with each other as the values are all greater than 0 [9]. The findings are suggestive that there is moderately strong correlation between the isometric trunk muscle strength and balance; the isometric trunk muscle strength and forward reaching ability; and balance and forward reaching ability.

DISCUSSION

As the studies from Gujarat including CP children and correlating trunk muscle strength and balance in them are not available, the discussion will present unique findings with probable justifications keeping in mind the objectives of the study. Demographics of the participants from the present study are in concurrence with other studies showing that most of the children with CP were primarily diagnosed as diplegic or hemiplegic type of CP [11,12]. Present study shows moderately strong positive correlation between the isometric trunk muscle strength and PBS scores as well as FR distance; which is supported by previous studies [13,14].Monica *et. al*. [2021]; Lim, Lee, and Lim [2021]; and Kim, An and Yoo [2018] have concluded that trunk control and trunk muscle strength are important factors affecting the balance activities including functional reach activities [3,12,15].

Static, active, and reactive postural control involves complex neural processes coupled with biomechanical and environmental constraints. As postural control during all the movements is integral to daily life activities, deficits in the posture system can contribute to the challenges in body structure and function, daily activities, and participation [4,16]. In addition, impaired trunk control in children with spastic CP is associated with balance dysfunction [3].It has been documented that, children with CP at GMFCS levels IV–V have under-developed postural control and therefore require contextual modifications to enable opportunities for acquisition and practice of head and trunk control [16].The reason for the moderately strong correlation found in this study can be attributed to the fact that all the participants belonged to GMFCS levels I, II and III and were all able to sit and stand. The findings in this study indicate that the correlation between the balance and forward reaching ability is moderately strong. Postural trunk control during frontal plane movements is suggested to be more difficult than while performing trunk movements in the sagittal plane [13]. Based on the motor involvement, children in the lower GMFCS level have profound impairment of trunk control affecting forward reaching abilities of child and suggesting that there is relationship between functional abilities and trunk control.

Limitations and Further Recommendations

The sample size covered for the study was smaller when we consider the strength of population of children with CP in India. As only smaller geographical region of Surat city was studies, the sample shall be representative and future study can include more subjects stratified based upon the type, geography, age, and gross motor function levels. It is also recommended to use more stringent outcome to assess trunk muscle strength such as EMG to quantify the strength and make study robust.

ABSTRACT

Allium cepa L. of family Liliaceae is a wide-reaching therapeutic spice known as onion. Onions are extensive used in different cuisines around the world. This research establishes relative use of manure (M), Vermicompost (VC), Urea (UR), Muriate of potash (MOP), Single Superphosphate (SSP), Copper Sulphate ($CuSO_4$) and Mercuric chloride ($HgCl_2$) under different stress conditions to assess the yield and biochemical activity of their leaves. The range of biochemical parameters was recorded as Carbohydrate0.348±0.160 mg/ml (MOP)to0.170±0.136mg/ml (50mM $CuSO_4$); Protein0.069 ±0.0115 mg/ml (VC) to 0.0080±0.0040mg/ml (M), Free fatty acid 0.85±0.0288mg/ml (SSP)to0.3±0.0577mg/ml (10mM $HgCl_2$), fiber content1.82±0.008g (VC) to 0.91±0.061g (50mM $CuSO_4$), Ash content3.62±0.009g (20mM$HgCl_2$)to 1.81±0.005g (control soil) respectively. The highest scavenging activity of 82.46% in vermin compost by DPPH and minimum by Total Antioxidant Capacity of 10.17±0.829 (10mM $HgCl_2$) was recorded. Highest and lowest ascorbic acid value was recorded as3.89mg/100g (M) and 1.18mg/100g (10mM$HgCl_2$). For enzymatic antioxidant assay maximum value of 1.2±0.03 was recorded for Ascorbate oxidase in normal soil and minimum 0.001 ±0.05 (10mM $HgCl_2$) for catalase. The supplementary data acquired on yield and biochemical activity under different stress will contributes resource for

agricultural implementation and future references. The best combination of growth regulators can increase the productivity and yield of onion.

Keywords: Onion, Stress, Nutritional, Antioxidant, DPPH, catalase.

INTRODUCTION

Onion is the main part of human diet in different forms. It is commonly considered as the source of various medicinal properties in normal day to day life. Asaduzzaman et al., 2012 reported that Onion belongs to the family Amaryllidaceae or Liliaceae which is a cross pollinated crop. The growth and productivity of onion is the important concern as it can be affected by various environmental conditions. Vermi compost and manure are playing important role in enhancing the growth and quality of plants and onion is among them. However, there are some chemical factors which can inhibit the onion growth. As reported by Ansari, 2007 onions can be grown without heavy rainfall and extreme environment and can nicely grow in mild conditions under a wider range of climatic conditions. Therefore, the environmental condition plays the key role in productivity and yield of onion. In addition to the yield the quality of the onion which is grown is very important. As, the quality will decide various biochemical and medical property of onion. Onions are not only a part of food; they are used as a medicinal ingredient in different forms. It is widely famous as a condiment in all over globe mainly in Latin America, Africa, and Asia. Jila and Ghaffoor, 2003 reported that people use onion as an indispensable part of the human diet and are consumed both by rich and poor. Onion has taken place in everyone's kitchen irrespective of any class and economic status.

The economy is directly proportional to the quality, production and consumption of onion by the consumers. Tareke and Zena, 2008 have cited that since ancient times, onion has been of great economic importance for its medicinal and dietetic values. In addition, the they have reported the cultivar like Adama red, Melkam, Bombay red are well recognized and widely accepted for their good yielding potential. The flavor and color are also the point of attraction along with the taste of onion. As onions are eaten raw as well as as a part of cooked food, the flavor is at most important. Different cultivars have their own physical quality which makes onion more active. Onions can have mild or strong flavour, it may be white, pink or reddish pink in colour. Many cultivars have developed different colors and flavors for different regions of Northern and Southern Area (Tareke and Zena, 2008). Onions are good for health as they are rich in many therapeutic compounds. They are rich in many bioactive compounds which are responsible for medicinal property. Onions can be considered as good source of nutraceuticals because of its nutritional as well as antioxidant properties. Onions have antioxidant properties are important for its health beneficial activities and thereby contribute to its therapeutic characteristics (Lau et al., 1997 and Kyo et al., 1999).

Antioxidants are the compounds present in the food which helps to prevent and reduce oxidative damages to our body cells. These agents are able to counter the deleterious effects of free radicals (O_2, H_2O_2, $\cdot OH$) generated during respiration and metabolic process (Lobo et al., 2010). Free radicals can bind to nucleotides of DNA and RNA, oxidize proteins and lipids and therefore can damage cells. Plant cells generate sufficient number of enzymatic antioxidants such as superoxide dismutase, catalase, as corbate and glutathione peroxidase, glutathione reduct ase to combat the oxidative stresses(Kurutas, 2016). In recent times, a considerable focus has been given on the development and evaluation of natural antioxidants and free radical scavengers of plant materials or fruits that are enormously rich in polyphenolic compounds. Griffiths et al., 2002;Dini et al., 2008 and Singh et al., 2009 reported the antibacterial, antioxidant and anti mutagenic properties of onions. Beside these, onions also have the property to protect and reduce cardiovascular diseases and diabetes which were studied in animal models(Kumar et al., 2010). Growth of plant is proportional to the amount of nutrition, light, water and all the basic environmental conditions which can alter the growth rate. Different factors such as light, temperature, nutrients, oxygen supply and stimulants such as hormones are responsible for the growth of onion (Bulgari et al., 2019). In recent times, the soil lacks sufficient nutrients which are responsible for the better growth and development of crops and this is due to extensive

cultivation (White and Brown, 2010). Soil is the base from which onions can take and utilize the correct amount of nutrients. However, the addition of external nutrient can enhance the quali and yield of onions. In contrast, growth and yield can be inhibited by various contaminants and pollutants from the environment. Both organic and inorganic fertilizers are used to meet the nutrient demands of the crops. The release of phyto hormones from living organisms present in manure of soil is activated by organic manures and it also enhances the plant growth and nutrients absorption (Arisha et al., 2003). The comparable outcome was also described by (Boyhan et al., 2007). The root rhizospheres conditions are improved by the use of organic fertilizers (structure, humidity, etc.) which helps to promote root growth and thus encourages the growth of plants resulting in increase in the population of microorganisms (Khokhar, 2019). The decomposition of organic fertilizer is increased by the use of Organic acids which further increases the benefits of nutrients (Yoldas et al., 2011). Additionally, chemical fertilizers enhanced the growth of onion. Inspite of separate use of chemical or any bio fertilizer, the use of organic inputs in combination with chemical fertilizer was found better over the single(Mohanty et al., 2015). The present investigation was intended to analyze the influence of supplementation of fertilizers (both organic and inorganic fertilizer). Under these conditions, both oxidative stress and its anti-oxidative activities were studied. The impact of fertilizers on the genomic DNA contents, total soluble proteins, carbohydrates and fatty acids of *Allium cepa* were recorded. The enzymatic activity was also determined by ascorbate oxidase activity and catalase activity under the same conditions.

MATERIAL AND METHOD

Growth condition for onion
The bulb of Pusa Ratnar variety of onion was grown under controlled condition in the University campus. Different types of environmental growth conditions were used for analyzing the growth of onions. The control was grown in normal soil without addition of any fertilizer or chemicals. The other sets of onion were grown in different growth effecters like Manure, MOP (Muriate of potash), Urea, SSP (Single Superphosphate), Vermi compost, Normal (Water), Normal (Soil), Copper Sulphate of various concentrations in soil and water form, and 10mM HgCl$_2$ and 20mM HgCl$_2$ concentrations in soil.

Sample preparation
Leaves of onion grown under different stress conditions were dried in hot air oven at 50° C overnight and crushed and fine powder was used for sample preparation. Aqueous extract of the powder was prepared by using soxhlet apparatus and kept at -20^0 C for further analysis.

Total soluble carbohydrate
The estimation of total soluble carbohydrate was carried out as per the method given by (Clegg, 1956). The 0.05ml extract was digested with 2N HCl and neutralized followed by centrifugation at 8000 rpm for 5 min. The supernatant was collected and treated with Anthrone reagent. The absorbance was measured at 630 nm.

Total soluble protein
Total soluble protein was estimated as per the method of Abdul-Fadl (1949).0.05ml extract was treated with 5ml of solution C (50ml solution A: 2% sodium carbonate in 0.1N NaOH) + 1ml solution B: 0.5% CuSO4 in 1% sodium potassium tartrate) followed by addition of 0.5ml Folin-Ciocalteu reagent. The dispersion was mixed and incubated in dark for half an hour and absorbance was measured at 660nm.

Free fatty acid (acid value)
Free fatty acid was estimated as per the protocol of Pearson and Cox, 1962. 1ml of the extract was treated with 25ml of neutral solvent followed by addition of few drops of phenolphthalein and the resultant solution was titrated against 0.01N potassium hydroxide.

$$FFA \left(\frac{mgKOH}{ml}\right) = \frac{(Titre\ value\ \times Normality\ of\ KOH\ \times 56.1)}{(Amount\ of\ sample\ in\ ml)} \times 100$$

Crude fiber

The method of AOAC, 2005 was used for crude fibre content estimation. Defatted and fat free sample (2g) was transferred to pre -weighed capsules, fixed in the capsule tray and placed in extraction vessel (carousel). The sample was washed with boiling dilute H_2SO_4 (1.25% v/v) to remove carbohydrates till it turned transparent followed by washing with hot water to remove acid. The sample was then washed with (1.25%w/v) hot NaOH which was followed by hot water washing. Finally, capsule washing was done with petroleum ether (99%) to remove all organic compounds. It was followed by hot water washing. The capsules were then dried for 1-2 hrs in hot air oven at 100º C. Brought to room temperature & weighed. The percent loss in weight was expressed as crude fibre.

$$\%Crude\ Fibre = \frac{Loss\ in\ weight\ of\ sample - Loss\ in weight\ of\ blank}{Weight\ of\ sample} X100$$

Ash content

The method of AOAC 2005was followed for ash determination. Two gram of sample taken in a silica crucible was ignited on a heater and shifted to a muffle furnace until clean ash was obtained. The temperature of furnace was raised to 550º C ± 15º C. The weight of residue was noted and the percent ash was calculated as follows:

$$\%\ Ash = \frac{Weight\ of\ residue}{Weight\ of\ sample} x100$$

Assessment of antioxidant properties

The antioxidant activity of the extracts was determined by different enzymatic and non-enzymatic assays.

DPPH scavenging activity (%)

The antioxidant scavenging activity was estimated as per the method of Kekuda et al., 2016. The extract was prepared in methanol and DPPH was mixed with different concentration of fruit juice and incubated at room temperature for 30 min. The absorbance was studied at 517 nm. The scavenging activity of the extract was calculated using the following formula:

Scavenging activity (%) = [(A-B) /A] × 100

Where, A is the absorbance of DPPH and B is the absorbance of extract combination.

Total poly phenolic Content

The total phenolic content was estimated by the method of AOAC, 2011. 0.05ml of the extract was treated with folin-ciocalteau reagent followed by addition of 7% Na_2CO_3within 5 minutes and incubated in dark for 60 mins. The absorbance was recorded at 765 nm. The total polyphenol was calculated by following formula:

$$Polyphenol = \frac{(SampleOD - Intercept\ value)XSampleextractionvolume}{Slope\ X\ MassingmoftestsampleX10000Xwt.\ indrymatter} x100$$

Total antioxidant capacity (TAC)

The total antioxidant capacity was determined by the phosphor molybdenum method according to the procedure described by Prieto et al., 1999. 0.5ml of the extract was treated with 4.5ml of phosphor molybdenum reagent and was incubated at 90ºC for 90min. The optical density was measured at 695nm and ascorbic acid (0.25mg/ml) was used as a standard. Total antioxidant capacity was calculated by using the following formula:

$$Total\ antioxidant\ capacity(\%) = \{(As - Ac)/(Aaa - Ac)\}x100$$

Where Ac = control absorbance; As = sample absorbance; Aaa = Ascorbic acid absorbance

Ascorbic acid

Ascorbic acid content was estimated using titrimetric method (Barakat et al., 1952).By adding oxalic acid and titrated against the dye (V1: against the ascorbic acid & V2: against the sample extract), determination of end point can be

detected by tracking the appearance of slight pink colour which persists for few minutes. Amount of ascorbic acid (mg/100g sample) was calculated by using formula:

$$\frac{0.5 mg}{V1} X \frac{V2}{5ml} X \frac{100 ml}{Wt. of the sample} X 100$$

Assay of as corbate oxidase activity
As corbate oxidase activity was measured by following the method of Diallinas et al., 1997. Reaction mixture contained potassium buffer (pH 7) and ascorbic acid. The reaction was initiated with the addition of pure juice or different extracts. The decrease in absorbance was observed for 3min at 265nm due to as corbate oxidation and calculated using extinction coefficient $14mM^{-1}cm^{-1}$.

Assay of catalase activity
Catalase activity was determined by following the method of (Aebi, 1984). The reaction mixture contained potassium buffer (pH 7), extract and H_2O_2 to initiate the reaction. The reaction was measured at 240nm for 3min and H_2O_2 consumption was calculated using extinction coefficient $39.4mM^{-1} cm^{-1}$.

RESULTS AND DISCUSSION

Onion growth and yield is depended on the environmental condition in which it is grown. The positive and negative growth can be observed as reported in the present study (Figure 1). Organic and bio fertilizers are the key requirements for fast growth of onions in turn which shows high content of various bioactive compounds. The report of Shedeed et al., 2014 also suggests the improved quality of onion grown on bio fertilizer. In contrast the heavy metals which are the common pollutants lowers down the yield and biochemical property on onion. Protection of the environment is the most vital issue today. Sarma et al., 2001 reported that population fast rate growth, Science and technology fast growth, use of chemicals in agriculture etc. are some of the life-threatening factors. Masih and Bhadauria, (2010) reported that heavy metals compete with micronutrients and inhibit their uptake thus disturbing the growth and physiology of the plants. In the present study the treatment of onion with different growth environmental factors indicated variation in the growth patterns as heavy metals plays an important role in the growth and development of plant. Heavy metals form a major group of toxic pollutants as they have the potential to tamper the harmony of the ecosystem (Rao and Patnaik, 1999). The phyto chemical analysis of all the treated plants were performed and recorded in all the conditions. The effect of heavy meal in plants is the major cause of health issues because of biomagnification Consumption of food crops contaminated with heavy metals is a major food chain route for human exposure (Ashiq et al., 2013). The growth of the onion under different growth conditions was monitored using yield and biochemical quality attributes.

Nutritional Analysis
Total soluble carbohydrate content exhibits a lot of variation in treated samples of onion as indicated in Figure 2. Total soluble carbohydrate content recorded highest in onions grown on soil treated with MOP as 0.348mg/ml±0.2 mg/ml and the lowest level of total soluble carbohydrate was found to be 0.17±0.1 mg/ml in onions grown on soil treated with 50mM $CuSO_4$. Onions are the good source of carbohydrate. Yahaya et al., (2010)study on crude extract of onion bulb found to have carbohydrate content of 64.5±0.98(g/100g dry mass). Application of organic fertilizers and/or bio fertilizers to the soils promoted nutrients availability, plant uptake, increased crop yield and quality (Shaheen et al., 2007; Shedeed et al., 2014). The enhanced and reduced amount of carbohydrate in the treated onions may be due to increase and decrease rate of chlorophyll synthesis during photosynthesis. The total soluble protein content was recorded for all the treatments and a wide variation was recorded in the range from vermin compost and manure treated soils. However, the protein content of metal treated soil was more than the manure treated soil. The value of 0.069 ±0.0115 mg/ml in onions grown on vermin compost was highest among all the treatments and 0.0080±0.0040mg/ml, i.e. the lowest value was recorded in onions grown manure as depicted in the Figure3.Yahaya et al., (2010)on crude extract of onion reported 6.5±1.2 (g/100g dry mass off the protein content.

Free fatty acid content is expressed as oleic acid equivalent as indicated in the **Figure 4.** The lowest amount, of 0.3mg/ml was found in the onions grown in 10mM $HgCl_2$ treated soil and highest value of free fatty acid was recorded as 0.85mg/g in single super phosphate treated onions in soil. Study done by Ogbonna et al., (2016)showed total fat and saturated fat (0.17±0.01, 0.03±0.01). Organic manure contains nutrient elements that can support crop production and enhance chemical and physical properties of soil (Monira et al., 2019). The fat content is the major macromolecule which is the indication of nutritional quality of a food. Hence, the study showed a significant amount of fats in the form of free fatty acid which is the absorbable for of total fat. Total fiber content for all the treatments were recorded in wide variation. The highest value was found to be 1.82±0.008g in vermin composting and 0.91±0.061g was the lowest value recorded for50mMCuSO₄ treated water among all the treatments as shown in the **Figure 5.** Rahman et al., (2013)reported that 0.6g of fibre is present in onion and it is also a good source of various macromolecules including vitamins and minerals. Samples with higher amount of crude fibre improve protection against constipation and it also prevents cardiovascular disease because studies have shown that soluble fibre lowers levels of artery-clogging cholesterol in the blood stream (Krishnamurthy et al., 2012).

The ash content among all the treatments was also found to be significant. The highest and lowest values were recorded as 3.62±0.009g and 1.81±0.005g in 20mM$HgCl_2$ treated soil and Normal soil respectively as noted in the Figure 6. Dinkecha and Muniye, (2017)reported that red onions are good source of nutrition and they are rich in ash content. Onion bulbs used in the study infect have high levels of ash, fiber and protein, but comparatively low moisture content, carbohydrate and energy value. Ash content is very important parameter for estimating the inorganic mineral constituent of Onion. High content of ash is important in that it involves higher value of inorganic material (Dinkecha and Muniye, 2017).

Antioxidant profiling

In order to access the antioxidant property of the grown onions at different growth conditions both the non-enzymatic and enzymatic assays were performed. The scavenging activity were recorded in a wide variation The DPPH free radical scavenging activity was found to be 82.5% which is highest in onions treated with vermicompost treated soil and lowest scavenging value of 32.1% was recorded in onions treated with 10mM $HgCl_2$ treated soil in the **Figure 7.** Liguori et al., (2017)reported the antioxidant activity varied from 19.00 to 21.27 mg of extract/m in five different white landraces of *Allium cepa.* Liguori et al., (2017) also reported the importance of phenolics and flavonoids in human health. The bioactive compounds which are rich in antioxidants are important to fight against the free radicals and protect human from different health problems. The work of Fredotovíc et al., (2017) in two species of *Allium* i.e. *Allium cepa and Alluim cornutum* showed that DPPH activity is higher on methanolic extract at the concentration of 100μg/ml which was reported as 64.8±5.3 and 60.50±3.8 for *Allium cepa and Alluim cornutum* respectively. The DPPH assay is the common method which is followed by for different varieties of plant extracts. Total antioxidant activity of pomegranate juice was determined by the 1,1-diphenyl-2-picrylhydrazyl (DPPH) method(Elfalleh et al., 2009). However, Total Antioxidant Capacity (TAC) is equally important to access the scavenging activity of plant extracts. The Total Antioxidant Capacity (%) is shown in the **Figure 8.**

Among all the treatments, 79.1% of highest TAC was observed in muriate of potash (MOP) treated onions and 6.5% was recorded as lowest value of TAC in 50mM CuSO₄ water treated onions. The antioxidant activity of onion skin is also important in addition to the antioxidant properties bulb and leaf. The study of Stoica et al., 2021 on the skin of red onion variety after 30 min of reaction reported antioxidant activity of 436.25 ± 3.51 mM TE/g DW. The physical treatments are also reported to check the antioxidant property of onion. The ultrasound treated onions were also found to have antioxidant property. Antioxidant activity (490.54 ± 9.43 mM TE/g DW) for the ultrasounds treated red onion skins extract was determined by Prokopov et al., (2018). Antioxidants are of endogenous and exogeneous types. The antioxidants are abundant in natural products. Several studies reported the antioxidant activities of *A. cepa* and its constituents and introduced the plant as a potential source of natural antioxidants (Razavi and Kenari, 2016; Ola-Mudathir and Maduagwu, 2014). Some of the important enzymes are key indicators or antioxidant property of plant. Superoxide dismutase and catalase are two of the main enzymatic antioxidants.

The main activity of SOD is to dismute the superoxide anion to hydrogen peroxide, which is reduced by CAT to water and molecular oxygen (Galadari et al., 2017), thereby preventing the formation of a highly reactive hydroxyl radical (HO·) (Lubrano, 2015). The ascorbic acid content was recorded in wide range as shown in **Figure 9.**The ascorbic acid concentration was maximum at vermicompost treated soil and minimum at 50mM $CuSO_4$(0.6±0.04 μg/ml and 0.07±0.009 μg/ml respectively. Kandoliya et al., (2015) reported worked on different varieties of onions and reported ascorbic acid (1.18 to 3.89 mg.100g-1) of ascorbic acid along with other nutritional assays. Ascorbic acid is one of the important vitamins which contribute for the antioxidant property in any plant. Phytonutrients like phenolics and flavanoids present in onion have been found to act as antioxidants to lower blood pressure and prevent some kinds of cancer(Yang et al., 2004; Slimestad et al., 2007).Ascorbate oxidase activity as depicted in Figure 10.The highest value is recorded in normal soil grown onion and lowest in 20mM $HgCl_2$ treated soil which was recorded 1.2±0.03 and 0.03±0.004 respectively. **Figure11**.explains the catalase activity of the treated onions and was found to be lowest among 10mM $HgCl_2$ treated soil onions and highest in onion grown in normal water which is recorded as 0.001 ±0.0003 and 0.167±0.002 respectively. The work of Ece et al., 2007 on Banko, Kes, Valencia and Kapidag have also reported the high catalase activity.

CONCLUSION

The current study has shown the effect of various environmental conditions on various biochemical properties and yield of onion. Based on the study it can be said that vermin compost and manure are the growth supplements for onion growth. Its application can increase the nutraceutical property of onion leaf. In addition, the information regarding the application of various metal treatments is also of great concern as their application can inhibit the health beneficial property of onion. Hence, to enhance the sufficient onion production the use of vermin compost can be recommended. The soil having heavy metals can be checked and avoided to increase the growth yield. It is evident that the presence of heavy metals has many toxic effects on plant physiology and its growth. Thus, it can be concluded that there is a need of intensifying the programs which are involved in the study related to the use of vermin compost and related bio fertilizers, heavy metal toxicity on plants and to prevent environmental stresses.

ABSTRACT

The present work investigates the δ*-closed sets in nano ideal topological space using the ñδ*-local function $S_{ñδ*}(I, N) = \{x \in U: \text{n-int(n-cl}_δ(O_n)) \cap S \notin I \text{ for every } O_n \in N(x)\}$ and ñδ*-closure operator defined by: $cl_{ñδ*}(S) = S \cup S_{ñδ*}$. We extensively study the properties of both $S_{ñδ*}(I, N)$ and $cl_{ñδ*}(S)$. We establish that $cl_{ñδ*}(S)$ follows the kuratowski conditions so that the set discuss here forms topology. Further, we introduce the notions ñδ*-interior, ñδ*-closure, ñδ*-exterior, ñδ*-frontier, ñδ*-derived set and ñδ*-border and discuss its various properties.

Keywords: ideal topological space, nano ideal topological space, ñδ*-closure function, ñδ*-closed sets, ñδ*-open sets.

1. INTRODUCTION

Kuratowski [4] and Vaidhyanathaswamy [10] initiated and studied the concept of ideals in topological spaces. A non-empty sub-collection I of P(U) is called an ideal [4] if it satisfies: (i) Heredity: S ∈ I and T ⊆ S implies T ∈ I, and (ii) Finite additivity: S ∈ I and T ∈ I implies S ∪ T ∈ I. For a given topological space (U, τ) combined with ideal I the local function [2, 10] $(.)^*$: P(U) → P(U), $S^*(I, τ) = \{x ∈ U: O ∩ S ∉ I$, for every O ∈ τ, x ∈ O} and the Kuratowski closure operator $cl^*(S) = S ∪ S^*(I, τ)$ for S ⊆ U were studied extensively. The topology obtained by establishing these operators are called $*$-topology or simply $τ^*$ which is finer than τ and the open sets belonging to $τ^*$ are called $*$-open sets. Dontchev and Ganster [1] studied further properties and applications in various fields of the ideal topology. In 2013, Lellis Thivagar et.al [3] introduced the field of nano topology denoted by the pair (U, N) in terms of the theory approximations on X ⊆ U using the equivalence relation called indiscernibility relation on it. The open sets in (U, N) are called the nano open sets and associated closed sets are nano closure. M. Parimala et.al., [5, 6, 7] introduced nano ideal topological space by defining the local function S_n^* called nano local function by: $S_n^*(I, N) = \{x ∈ U: O_n ∩ S ∉ I$, for every $O_n ∈ O_n(x)\}$ where $O_n(x) = \{O_n: x ∈ O_n$ and O_n is n-open} and the closure operator $cl_n^*(S) = S ∪ S_n^*(I, N)$ for S ⊆ U and established its significant properties. We simply write S_n^* for $S_n^*(I, N)$. The topology obtained through these operator is known as the nano ideal topological space mentioned by (U, N, I). After this the nano form of several existing closed and open sets were studied by the researchers in nano ideal topological space. We simply denote a nano ideal topological space as NITS. For instance Parimala et.al, [8] established and studied the nano form of δ-open sets namely nδ-closed set in the same space. A subset S of U is known as nδ-closed if $n\text{-}cl_δ(S) = S$, where $n\text{-}cl_δ(S) = ∪ \{x ∈ U: n\text{-}int(n\text{-}cl(O_n)) ∩ S ≠ ∅, O_n$ is n-open and $x ∈ O_n\}$. In this article we introduce and investigate the nano form of δ*-closed [9] sets in nano ideal topological space. Further we introduce and study the notions ñδ*-interior, ñδ*-closure, ñδ*-exterior, ñδ*-frontier, ñδ*-derived set and ñδ*-border of a subset of U.

2. ñδ*-OPEN SETS

2.1 Definition

Let (U, N, I) be an NITS and S ⊆ U. An operator called nano local δ*- closure function of S simply $S_{ñδ^*}$ with respect to I and N is defined by $S_{ñδ^*}(I, N) = \{x ∈ U: n\text{-}int(n\text{-}cl_δ(O_n)) ∩ S ∉ I$ for every $O_n ∈ N(x)\}$. Where $N(x) = \{O_n: O_n$ is n-open, x ∈ O_n}. We simply write $S_{ñδ^*}(I, N)$ by $S_{ñδ^*}$. For Example, Let U = {g_1, g_2, g_3, g_4}, X = {g_1, g_4} ⊆ U, U/R = {{g_2}, {g_4}, {g_1, g_3}}, N = {U, ∅,{g_4}, {g_1, g_3, g_4}, {g_1, g_3}} and the ideal I = {∅, {g_2}}. Take S = {g_1} then $S_{ñδ^*}$ = {g_1, g_3}.

2.2 Remark

Always, $∅_{ñδ^*} = ∅$. In general neither $S ⊆ S_{ñδ^*}$ nor $S_{ñδ^*} ⊆ S$.

2.3 Theorem

Let (U, N, I) be an NITS with ideals I_1 and I_2 on U. Then for S, T ⊆ U, the given below are holds:

(i) $∅_{ñδ^*} = ∅$.

(ii) If S ⊆ T, then $S_{ñδ^*} ⊆ T_{ñδ^*}$.

(iii) $S_{ñδ^*} = n\text{-}cl(S_{ñδ^*})$, $S_{ñδ^*}$ is n-closed.

(iv) If S ∈ I then $S_{ñδ^*} = ∅$.

(v) If $I_1 ⊆ I_2$ then $S_{ñδ^*}(I_2) ⊆ S_{ñδ^*}(I_1)$.

(vi) $(S ∪ T)_{ñδ^*} = S_{ñδ^*} ∪ T_{ñδ^*}$.

(vii) $(S ∩ T)_{ñδ^*} ⊆ S_{ñδ^*} ∩ T_{ñδ^*}$.

(viii) $(S_{ñδ^*})_{ñδ^*} ⊆ S_{ñδ^*}$.

Proof

(i) The proof is clear.

(ii) Suppose that $x ∉ T_{ñδ^*}$. Then there is an $O_n ∈ N(x)$ such that $T ∩ n\text{-}int(n\text{-}cl_δ(O_n)) ∈ I$. Since, S ⊆ T, $(S ∩ n\text{-}int(n\text{-}cl_δ(O_n))) ⊆ (T ∩ n\text{-}int(n\text{-}cl_δ(O_n))) ∈ I$ and hence $S ∩ n\text{-}int(n\text{-}cl_δ(O_n)) ∈ I$, $x ∉ S_{ñδ^*}$. A contradiction. Hence, $S_{ñδ^*} ⊆ T_{ñδ^*}$.

(iii) We have $S_{ñδ^*} ⊆ n\text{-}cl(S_{ñδ^*})$. Let $x ∈ n\text{-}cl(S_{ñδ^*})$. Then $O_n ∩ S_{ñδ^*} ≠ ∅$, for every $O_n ∈ N(x)$ and hence $n\text{-}int(n\text{-}cl_δ(O_n)) ∩ S_{ñδ^*} ≠ ∅$. Therefore, there exists a $y ∈ n\text{-}int(n\text{-}cl_δ(O_n)) ∩ S_{ñδ^*}$. Since $y ∈ S_{ñδ^*}$, $n\text{-}int(n\text{-}cl_δ(O_n)) ∩ S ∉ I$ and hence $x ∈ S_{ñδ^*}$.

(iv) Suppose that $x \in S_{ñδ*}$. Then for any $O_n \in N(x)$, $S \cap$ n-int(n-cl$_\delta$(O_n)) $\notin I$. But since $S \in I$, $S \cap$ n-int(n-cl$_\delta$(O_n)) $\in I$ for every $O_n \in N(x)$. There is a contradiction. Hence, $S_{ñδ*} = \emptyset$.

(v) If $x \notin S_{ñδ*}(I_1)$. There is an $O_n \in N(x)$ with $S \cap$ n-int(n-cl$_\delta$(O_n)) $\in I_1$. Since $I_1 \subseteq I_2$, $S \cap$ n-int(n-cl$_\delta$(O_n)) $\in I_2$ and $x \notin S_{ñδ*}(I_2)$. Therefore, $S_{ñδ*}(I_2) \subseteq S_{ñδ*}(I_1)$.

(vi) By (ii), $S_{ñδ*} \cup T_{ñδ*} \subseteq (S \cup T)_{ñδ*}$. Now, let $x \in (S \cup T)_{ñδ*}$. Then for every $O_n \in N(x)$, (n-int(n-cl$_\delta$(O_n)) $\cap S$) $\cup$ (n-int(n-cl$_\delta$(O_n)) $\cap T$) = ($S \cup T$) $\cap$ (n-int(n-cl$_\delta$(O_n))) $\notin I$. Therefore, n-int(n-cl$_\delta$(O_n)) $\cap S \notin I$ or n-int(n-cl$_\delta$(O_n)) $\cap T \notin I$. Hence $x \in S_{ñδ*} \cup T_{ñδ*}$.

(vii) The proof is clear by (ii).

(viii) Let $x \in (S_{ñδ*})_{ñδ*}$. Then for every $O_n \in N(x)$, n-int(n-cl$_\delta$(O_n)) $\cap S_{ñδ*} \notin I$ and hence n-int(n-cl$_\delta$(O_n)) $\cap S_{ñδ*} \neq \emptyset$. Let $y \in$ n-int(n-cl$_\delta$(O_n)) $\cap S_{ñδ*}$. Then $y \in$ n-int(n-cl$_\delta$(O_n)) and $y \in S_{ñδ*}$. Therefore, n-int(n-cl$_\delta$(O_n)) $\cap S \notin I$ and hence $x \in S_{ñδ*}$. The given below Example 2.4 illustrates the Theorem 2.3 (vii) do not imply the reverse.

2.4 Example

Let $U = \{g_1, g_2, g_3, g_4\}$, $X = \{g_1, g_4\} \subseteq U$, $U/R = \{\{g_2\}, \{g_4\}, \{g_1, g_3\}\}$, $N = \{U, \emptyset, \{g_4\}, \{g_1, g_3, g_4\}, \{g_1, g_3\}\}$ and the ideal $I = \{\emptyset, \{g_2\}\}$. Let $S = \{g_2, g_4\}$, $T = \{g_1, g_2, g_3\}$ then $S \cap T = \{g_2\}$, $S_{ñδ*} = \{g_2, g_4\}$, $T_{ñδ*} = \{g_1, g_2, g_3\}$, $S_{ñδ*} \cap T_{ñδ*} = \{g_2\}$ and $(S \cap T)_{ñδ*} = \emptyset$. Therefore, $(S \cap T)_{ñδ*} \not\supseteq S_{ñδ*} \cap T_{ñδ*}$.

2.5 Theorem

[7] In an NITS (U, N, I) the ñδ*-closure operator cl$_{ñδ*}$(S) = $S_{ñδ*} \cup S$, satisfies the following for S, T $\subseteq$ U:

(i) cl$_{ñδ*}(\emptyset) = \emptyset$ and cl$_{ñδ*}$(U) = U.

(ii) $S \subseteq$ cl$_{ñδ*}$(S).

(iii) If $S \subseteq T$ then cl$_{ñδ*}$(S) $\subseteq$ cl$_{ñδ*}$(T).

(iv) cl$_{ñδ*}$(S $\cup$ T) = cl$_{ñδ*}$(S) $\cup$ cl$_{ñδ*}$(T).

(v) cl$_{ñδ*}$(S $\cap$ T) $\subseteq$ cl$_{ñδ*}$(S) $\cap$ cl$_{ñδ*}$(T).

(vi) cl$_{ñδ*}$(cl$_{ñδ*}$(S)) $\subseteq$ cl$_{ñδ*}$(S).

Proof

(i) cl$_{ñδ*}(\emptyset) = \emptyset_{ñδ*} \cup \emptyset = \emptyset$ and cl$_{ñδ*}$(U) = $U_{ñδ*} \cup U$.

(ii) $S \subseteq S_{ñδ*} \cup S =$ cl$_{ñδ*}$(S).

(iii) Let $S \subseteq T$, cl$_{ñδ*}$(S) = $S_{ñδ*} \cup S \subseteq T_{ñδ*} \cup T =$ cl$_{ñδ*}$(T), by Theorem 2.3 (ii).

(iv) By Theorem 2.3 (vi), cl$_{ñδ*}$(S $\cup$ T) = (S $\cup$ T)$_{ñδ*} \cup$ (S $\cup$ T) = ($S_{ñδ*} \cup T_{ñδ*}$) $\cup$ (S $\cup$ T) = ($S_{ñδ*} \cup$ S) $\cup$ ($T_{ñδ*} \cup$ T) = cl$_{ñδ*}$(S) $\cup$ cl$_{ñδ*}$(T).

(v) Since $S \cap T \subseteq S$ and $S \cap T \subseteq T$ then by (iii), cl$_{ñδ*}$(S $\cap$ T) $\subseteq$ cl$_{ñδ*}$(S) and cl$_{ñδ*}$(S $\cap$ T) $\subseteq$ cl$_{ñδ*}$(T) and hence cl$_{ñδ*}$(S $\cap$ T) $\subseteq$ cl$_{ñδ*}$(S) $\cap$ cl$_{ñδ*}$(T).

(vi) cl$_{ñδ*}$(cl$_{ñδ*}$(S)) = cl$_{ñδ*}$($S_{ñδ*} \cup$ S) = ($S_{ñδ*} \cup$ S)$_{ñδ*} \cup$ ($S_{ñδ*} \cup$ S) = (($S_{ñδ*}$)$_{ñδ*} \cup S_{ñδ}$) $\cup$ ($S_{ñδ*} \cup$ S) = $S_{ñδ*} \cup$ ($S_{ñδ*} \cup$ S) = $S_{ñδ*} \cup$ S = cl$_{ñδ*}$(S) by Theorem 2.3 (vi) and (viii).

2.6 Remark

By Theorem 2.5, (i), (ii), (v) and (vi) cl$_{ñδ*}$(S) = $S_{ñδ*} \cup$ S forms topology. The topology created by cl$_{ñδ*}$(S) is indicated and defined by $N_{ñδ*} = \{O_{nδ*} \subseteq U:$ cl$_{ñδ*}$(U $- O_{nδ*}$) = U $- O_{nδ*}\}$. If $O_{nδ*} \in N_{ñδ*}$ then $O_{nδ*}$ is a ñδ*-open set and U $- O_{nδ*}$ is ñδ*-closed set. We denote $N_{ñδ*}$(x) = $\{O_{nδ*}: O_{nδ*}$ is ñδ*-open and $x \in O_{nδ*}\}$. The given example 2.7 (i) and (ii) reveals that the reverse implication of Theorem 2.5 (iii) and (v) fails in some time.

2.7 Example

Let $U = \{g_1, g_2, g_3, g_4\}$, $X = \{g_1, g_4\} \subseteq U$, $U/R = \{\{g_2\}, \{g_4\}, \{g_1, g_3\}\}$, $N = \{U, \emptyset, \{g_4\}, \{g_1, g_3, g_4\}, \{g_1, g_3\}\}$ and the ideal $I = \{\emptyset, \{g_2\}\}$.

(i) Let $S = \{g_1, g_4\}$ and $T = \{g_1, g_2, g_3\}$ then cl$_{ñδ*}$(S) = \{U\} and cl$_{ñδ*}$(T) = \{g_1, g_2, g_3\}. Therefore, cl$_{ñδ*}$(T) $\not\supseteq$ cl$_{ñδ*}$(S).

(ii) Let $S = \{g_1\}$, $T = \{g_2\}$. Then $S \cap T = \{\emptyset\}$, cl$_{ñδ*}$(S) = \{g_1, g_2, g_3\}, cl$_{ñδ*}$(T) = \{g_2\}, cl$_{ñδ*}$(S) $\cap$ cl$_{ñδ*}$(T) = \{g_2\} and cl$_{ñδ*}$(S $\cap$ T) = \{$\emptyset$\}. Therefore, cl$_{ñδ*}$(S $\cap$ T) $\not\supseteq$ cl$_{ñδ*}$(S) $\cap$ cl$_{ñδ*}$(T).

2.8 Definition

Let (U, N, I) be an NITS and $S \subseteq U$. A point $x \in U$ is known as a ñδ*-accumulation point of S if for each $O_{nδ*} \in N_{ñδ*}$(x), $O_{nδ*} \cap (S - \{x\}) \neq \emptyset$. The collection of all ñδ*-accumulation points of S is called ñδ*-derived set of S. We simply write dr$_{ñδ*}$(S).

2.9 Theorem

Let S, T be the subsets of U, the given below are hold:

(i) If $S \subseteq T$, then $dr_{ñδ*}(S) \subseteq dr_{ñδ*}(T)$.

(ii) $dr_{ñδ*}(S) \cup dr_{ñδ*}(T) \subseteq dr_{ñδ*}(S \cup T)$.

(iii) $dr_{ñδ*}(S \cap T) \subseteq dr_{ñδ*}(S) \cap dr_{ñδ*}(T)$.

(iv) $dr_{ñδ*}(dr_{ñδ*}(S)) - S \subseteq dr_{ñδ*}(S)$.

Proof

(i) If $x \notin dr_{ñδ*}(T)$ then x is not a ñδ*-accumulation point of T and so there is a ñδ*-open set $O_{nδ*}$ with $O_{nδ*} \cap (T - \{x\}) = \emptyset$. But $O_{nδ*} \cap (S - \{x\}) \subset O_{nδ*} \cap (T - \{x\}) = \emptyset$. Hence, $x \notin dr_{ñδ*}(S)$.

(ii) Since $S \subseteq S \cup T$ and $T \subseteq S \cup T$ by (i), $dr_{ñδ*}(S) \subseteq dr_{ñδ*}(S \cup T)$ and $dr_{ñδ*}(T) \subseteq dr_{ñδ*}(S \cup T)$. Hence $dr_{ñδ*}(S) \cup dr_{ñδ*}(T) \subseteq dr_{ñδ*}(S \cup T)$.

(iii) Since $S \cap T \subseteq S$ and $S \cap T \subseteq T$ again by (i) the proof is completes.

(iv) If $x \in dr_{ñδ*}(dr_{ñδ*}(S)) - S$ and $O_{nδ*} \in N_{ñδ*}(x)$ then $O_{nδ*} \cap (dr_{ñδ*}(S) - \{x\}) \neq \emptyset$. Let $y \in O_{nδ*} \cap (dr_{ñδ*}(S) - \{x\})$. Since $y \in (dr_{ñδ*}(S) - \{x\})$ and $y \in O_{nδ*}$, $(S - \{y\}) \cap O_{nδ*} \neq \emptyset$. Let $z \in (S - \{y\}) \cap O_{nδ*}$. Then $x \neq z$ for $x \notin S$ and $z \in S$. Therefore $x \in dr_{ñδ*}(S)$. The given below Example 2.10 illustrates that the reverse implication of the Theorem 2.9 (iv) is fails in some time.

2.10 Example

Let $U = \{g_1, g_2, g_3, g_4\}$, $X = \{g_1, g_4\} \subseteq U$, $U/R = \{\{g_2\}, \{g_4\}, \{g_1, g_3\}\}$, $N = \{U, \emptyset, \{g_4\}, \{g_1, g_3, g_4\}, \{g_1, g_3\}\}$ and the ideal $I = \{\emptyset, \{g_2\}\}$. Take $S = \{g_2, g_4\}$. Then $dr_{ñδ*}(dr_{ñδ*}(S)) - S \nsupseteq dr_{ñδ*}(S)$.

2.11 Definition

A point $x \in U$ is known as a ñδ*-interior point of S if there exist $O_{nδ*} \in N_{ñδ*}(x)$ such that $O_{nδ*} \subseteq S$. The collection of all ñδ*-interior points of S is said to be ñδ*-interior of S. We simply write $int_{ñδ*}(S)$.

2.12 Theorem

Let $S, T \subseteq U$, the given below are true:

(i) $int_{ñδ*}(S)$ is the for most ñδ*-open set contained in S.

(ii) S is ñδ*-open set $\Leftrightarrow S = int_{ñδ*}(S)$.

(iii) $int_{ñδ*}(int_{ñδ*}(S)) = int_{ñδ*}(S)$.

(iv) $int_{ñδ*}(S) = S - dr_{ñδ*}(U - S)$.

(v) $U - int_{ñδ*}(S) = cl_{ñδ*}(U - S)$.

(vi) If $S \subseteq T$, then $int_{ñδ*}(S) \subseteq int_{ñδ*}(T)$.

(vii) $int_{ñδ*}(S) \cup int_{ñδ*}(T) \subseteq int_{ñδ*}(S \cup T)$.

(viii) $int_{ñδ*}(S) \cap int_{ñδ*}(T) \supseteq int_{ñδ*}(S \cap T)$

Proof

(i) Let $O_{nδ*}$ be a ñδ*-open subset of S and if $x \in O_{nδ*}$ then $x \in O_{nδ*} \subseteq S$. Since $O_{nδ*}$ is ñδ*-open set, x is the ñδ*-interior point of S. Therefore, for $x \in O_{nδ*}$ implies that $x \in int_{ñδ*}(S)$. This implies that every ñδ*-open subset of S is contained in $int_{ñδ*}(S)$. Therefore, $int_{ñδ*}(S)$ is the for most ñδ*-open set contained in S.

(ii) Necessity: Let S be a ñδ*-open set. Since $S \subseteq S$, S is the for most ñδ*-open subset of S. Hence the proof completes by (i).

Sufficiency: Let $S = int_{ñδ*}(S)$. Since $int_{ñδ*}(S)$ is ñδ*-open set, the proof is clear.

(iii) Since $int_{ñδ*}(S)$ is ñδ*-open set, the proof is clear by (ii).

(iv) If $x \in S - dr_{ñδ*}(U - S)$, then $x \notin dr_{ñδ*}(U - S)$. Therefore there is an $O_{nδ*} \in N_{ñδ*}(x)$ for which $(U - S) \cap O_{nδ*} = \emptyset$. Then $x \in O_{nδ*} \subseteq S$ and so $x \in int_{ñδ*}(S)$. Therefore, $S - dr_{ñδ*}(U - S) \subseteq int_{ñδ*}(S)$. Alternatively, If $x \in int_{ñδ*}(S)$, then $x \notin dr_{ñδ*}(U - S)$, since $int_{ñδ*}(S)$ is ñδ*-open set and $int_{ñδ*}(S) \cap (U - S) = \emptyset$. Hence, $int_{ñδ*}(S) \subseteq S - dr_{ñδ*}(U - S)$. Therefore, $int_{ñδ*}(S) = S - dr_{ñδ*}(U - S)$.

(v) $U - int_{ñδ*}(S) = U - (S - dr_{ñδ*}(U - S)) = (U - S) \cup dr_{ñδ*}(U - S) = cl_{ñδ*}(U - S)$.

(vi) Let $S \subseteq T$. Then $x \in int_{ñδ*}(S)$ implies that there is an $O_{nδ*} \in N_{ñδ*}(x)$ with $x \in O_{nδ*} \subseteq S$. Therefore, $x \in O_{nδ*} \subseteq S \subseteq T$ that is $x \in O_{nδ*} \subseteq T$. Hence $x \in int_{ñδ*}(S)$.

(vii) Since $S \subseteq S \cup T$ and $T \subseteq S \cup T$ by (vi), $\text{int}_{ñδ^*}(S) \subseteq \text{int}_{ñδ^*}(S \cup T)$ and $\text{int}_{ñδ^*}(T) \subseteq \text{int}_{ñδ^*}(S \cup T)$. Therefore $\text{int}_{ñδ^*}(S) \cup \text{int}_{ñδ^*}(T) \subseteq \text{int}_{ñδ^*}(S \cup T)$.

(viii) Since $S \cap T \subseteq S$ and $S \cap T \subseteq T$, the proof is clear by (vi).

2.13 Definition

$\text{br}_{ñδ^*}(S) = S - \text{int}_{ñδ^*}(S)$ is said to be the ñδ*-border of S.

2.14 Theorem

Let (U, N, I) be an NITS. Then for $S \subseteq U$.

(i) $\text{int}_{ñδ^*}(S) \cap \text{br}_{ñδ^*}(S) = \emptyset$.

(ii) S is ñδ*-open set $\Leftrightarrow$ $\text{br}_{ñδ^*}(S) = \emptyset$.

(iii) $\text{br}_{ñδ^*}(\text{int}_{ñδ^*}(S)) = \emptyset$.

(iv) $\text{int}_{ñδ^*}(\text{br}_{ñδ^*}(S)) = \emptyset$.

(v) $\text{br}_{ñδ^*}(\text{br}_{ñδ^*}(S)) = \text{br}_{ñδ^*}(S)$.

(vi) $\text{br}_{ñδ^*}(S) = S \cap \text{cl}_{ñδ^*}(U - S)$.

(vii) $\text{br}_{ñδ^*}(S) = \text{dr}_{ñδ^*}(U - S)$.

Proof

(i) $\text{int}_{ñδ^*}(S) \cap \text{br}_{ñδ^*}(S) = \text{int}_{ñδ^*}(S) \cap (S - \text{int}_{ñδ^*}(S)) = \text{int}_{ñδ^*}(S) \cap (S \cap (U - \text{int}_{ñδ^*}(S))) = \text{int}_{ñδ^*}(S) \cap \emptyset = \emptyset$.

(ii) The proof is obvious.

(iii) $\text{br}_{ñδ^*}(\text{int}_{ñδ^*}(S)) = \text{int}_{ñδ^*}(S) - \text{int}_{ñδ^*}(\text{int}_{ñδ^*}(S)) = \text{int}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S) = \emptyset$.

(iv) If $x \in \text{int } ñδ^* (\text{br } ñδ^* (S))$, then $x \in \text{br } ñδ^* (S)$. Since $\text{br } ñδ^* (S) \subseteq S$, $x \in \text{int } ñδ^* (\text{br } ñδ^* (S)) \subseteq \text{int } ñδ^* (S)$. Hence $x \in \text{int } ñδ^* (S) \cap (\text{br } ñδ^* (S)$, which contradicts (i). Thus $\text{int } ñδ^* (\text{br } ñδ^* (S)) = \emptyset$.

(v) $\text{br}_{ñδ^*}(\text{br}_{ñδ^*}(S)) = \text{br}_{ñδ^*}(S) - \text{int}_{ñδ^*}(\text{br}_{ñδ^*}(S)) = \text{br}_{ñδ^*}(S)$.

(vi) $\text{br}_{ñδ^*}(S) = S - \text{int}_{ñδ^*}(S) = S - (U - \text{cl}_{ñδ^*}(U - S)) = S \cap \text{cl}_{ñδ^*}(U - S)$.

(vii) $\text{br}_{ñδ^*}(S) = S - \text{int}_{ñδ^*}(S) = S - (U - \text{dr}_{ñδ^*}(U - S)) = \text{dr}_{ñδ^*}(U - S)$.

2.15 Definition

$\text{fr}_{ñδ^*}(S) = \text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S)$ is said to be the ñδ*-frontier of S.

2.16 Theorem

For any subset S of an NITS (U, N, I), the given below are holds:

(i) $\text{cl}_{ñδ^*}(S) = \text{int}_{ñδ^*}(S) \cup \text{fr}_{ñδ^*}(S)$.

(ii) $\text{int}_{ñδ^*}(S) \cap \text{fr}_{ñδ^*}(S) = \emptyset$.

(iii) $\text{br}_{ñδ^*}(S) \subseteq \text{fr}_{ñδ^*}(S)$.

(iv) $\text{fr}_{ñδ^*}(S) = \text{cl}_{ñδ^*}(S) \cap \text{cl}_{ñδ^*}(U - S)$.

(v) $\text{fr}_{ñδ^*}(S)$ is ñδ*-closed.

(vi) $\text{fr}_{ñδ^*}(\text{fr}_{ñδ^*}(S)) \subseteq \text{fr}_{ñδ^*}(S)$.

(vii) $\text{fr}_{ñδ^*}(\text{int}_{ñδ^*}(S)) \subseteq \text{fr}_{ñδ^*}(S)$.

(viii) $\text{int}_{ñδ^*}(S) = S - \text{fr}_{ñδ^*}(S)$.

Proof

(i) $\text{int}_{ñδ^*}(S) \cup \text{fr}_{ñδ^*}(S) = (\text{int}_{ñδ^*}(S)) \cup (\text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(S)$.

(ii) $\text{int}_{ñδ^*}(S) \cap \text{fr}_{ñδ^*}(S) = (\text{int}_{ñδ^*}(S)) \cap (\text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S)) = \emptyset$.

(iii) $\text{br}_{ñδ^*}(S) = S - \text{int}_{ñδ^*}(S) \subseteq \text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S) = \text{fr}_{ñδ^*}(S)$.

(iv) $\text{fr}_{ñδ^*}(S) = \text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S) = \text{cl}_{ñδ^*}(S) \cap \text{cl}_{ñδ^*}(U - S)$.

(v) $\text{cl}_{ñδ^*}(\text{fr}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(S) \cap (U - \text{int}_{ñδ^*}(S))) = \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(S) \cap (\text{cl}_{ñδ^*}(U - S))) \subseteq \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(S)) \cap \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(U - S)) = \text{cl}_{ñδ^*}(S) \cap \text{cl}_{ñδ^*}(U - S) = \text{cl}_{ñδ^*}(S) \cap (U - \text{int}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S) = \text{fr}_{ñδ^*}(S)$. Always, $\text{fr}_{ñδ^*}(S) \subseteq \text{cl}_{ñδ^*}(\text{fr}_{ñδ^*}(S))$. Therefore, $\text{cl}_{ñδ^*}(\text{fr}_{ñδ^*}(S)) = \text{fr}_{ñδ^*}(S)$. Hence $\text{fr}_{ñδ^*}(S)$ is ñδ*-closed.

(vi) $\text{fr}_{ñδ^*}(\text{fr}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(\text{fr}_{ñδ^*}(S)) - \text{int}_{ñδ^*}(\text{fr}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S)) - \text{int}_{ñδ^*}(\text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(S) \cap (U - \text{int}_{ñδ^*}(S))) - \text{int}_{ñδ^*}(\text{cl}_{ñδ^*}(S) \cap (U - \text{int}_{ñδ^*}(S))) = (\text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(S)) \cap \text{cl}_{ñδ^*}(\text{cl}_{ñδ^*}(U - S))) - (\text{int}_{ñδ^*}(\text{cl}_{ñδ^*}(S)) \cap \text{int}_{ñδ^*}(\text{cl}_{ñδ^*}(U - S))) \subseteq (\text{cl}_{ñδ^*}(S) \cap \text{cl}_{ñδ^*}(U - S)) = \text{cl}_{ñδ^*}(S) \cap (U - \text{int}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S) = \text{fr}_{ñδ^*}(S)$.

(vii) $\text{fr}_{ñδ^*}(\text{int}_{ñδ^*}(S)) = \text{cl}_{ñδ^*}(\text{int}_{ñδ^*}(S)) - \text{int}_{ñδ^*}(\text{int}_{ñδ^*}(S)) \subseteq \text{cl}_{ñδ^*}(S) - \text{int}_{ñδ^*}(S) = \text{fr}_{ñδ^*}(S)$.

(viii) $S - fr_{ñδ*}(S) = S \cap (U - fr_{ñδ*}(S)) = S \cap (U - (cl_{ñδ*}(S) - int_{ñδ*}(S))) = S \cap (U - (cl_{ñδ*}(S) \cap (U - int_{ñδ*}(S)))) = S \cap((U - cl_{ñδ*}(S))\cup (int_{ñδ*}(S)))) = \emptyset \cup int_{ñδ*}(S) = int_{ñδ*}(S)$. The given below Example 2.17 illustrates that the reverse implication of Theorem 2.16 (iii) fails in some situations.

2.17 Example

Let $U = \{g_1, g_2, g_3, g_4\}$, $X = \{g_1, g_4\} \subseteq U$, $U/R = \{\{g_2\}, \{g_4\}, \{g_1, g_3\}\}$, $N = \{U, \emptyset, \{g_4\}, \{g_1, g_3, g_4\}, \{g_1, g_3\}\}$ and the ideal $I = \{\emptyset, \{g_2\}\}$. Take $S = \{g_1, g_4\}$. Then $fr_{ñδ*}(S) = \{g_1, g_2, g_3\}$ and $br_{ñδ*}(S) = \{g_1\}$. Therefore, $br_{ñδ*}(S) \not\supseteq fr_{ñδ*}(S)$.

2.18 Definition

$ext_{ñδ*}(S) = int_{ñδ*}(U - S)$ is said to be a $ñδ*$-exterior of S.

2.19 Theorem

Let (U, N, I) be an NITS and $S \subseteq U$, the given below are holds:

(i) $ext_{ñδ*}(S)$ is $ñδ*$-open set.

(ii) $ext_{ñδ*}(S) = U - cl_{ñδ*}(S)$.

(iii) $ext_{ñδ*}(ext_{ñδ*}(S)) = int_{ñδ*}(cl_{ñδ*}(S))$.

(iv) If $S \subseteq T$, then $ext_{ñδ*}(S) \supseteq ext_{ñδ*}(T)$.

(v) $ext_{ñδ*}(S \cup T) \subseteq ext_{ñδ*}(S) \cap ext_{ñδ*}(T)$.

(vi) $ext_{ñδ*}(S \cap T) \supseteq ext_{ñδ*}(S) \cup ext_{ñδ*}(T)$.

(vii) $ext_{ñδ*}(U) = \emptyset$.

(viii) $ext_{ñδ*}(\emptyset) = U$.

(ix) $ext_{ñδ*}(S) = ext_{ñδ*}(U - ext_{ñδ*}(S))$.

(x) $int_{ñδ*}(S) \subseteq ext_{ñδ*}(ext_{ñδ*}(S))$.

Proof

(i) By Definition 2.18, the proof is clear.

(ii) $ext_{ñδ*}(S) = int_{ñδ*}(U - S) = U - cl_{ñδ*}(S)$.

(iii) $ext_{ñδ*}(ext_{ñδ*}(S)) = ext_{ñδ*}(int_{ñδ*}(U - S) = ext_{ñδ*}(U - cl_{ñδ*}(S)) = int_{ñδ*}(U - (U - cl_{ñδ*}(S))) = int_{ñδ*}(cl_{ñδ*}(S))$.

(iv) Since $S \subseteq T$, $int_{ñδ*}(U - T) \subseteq int_{ñδ*}(U - S)$. Hence, it is clear by Definition of border.

(v) $ext_{ñδ*}(S \cup T) = int_{ñδ*}(U - (S \cup T)) = int_{ñδ*}((U - S) \cap (U - T)) \subseteq int_{ñδ*}(U - S) \cap int_{ñδ*}(U - T) = ext_{ñδ*}(S) \cap ext_{ñδ*}(T)$.

(vi) $ext_{ñδ*}(S \cap T) = int_{ñδ*}(U - (S \cap T)) = int_{ñδ*}((U - S) \cap (U - T)) \supseteq int_{ñδ*}(U - S) \cup int_{ñδ*}(U - T) = ext_{ñδ*}(S) \cup ext_{ñδ*}(T)$.

(vii) The proof is obvious.

(viii) The proof is obvious.

(ix) $ext_{ñδ*}(U - ext_{ñδ*}(S)) = ext_{ñδ*}(U - ext_{ñδ*}(U - S)) = int_{ñδ*}(U - (U - int_{ñδ*}(U - S))) = int_{ñδ*}(int_{ñδ*}(U - S)) = int_{ñδ*}(U - S) = ext_{ñδ*}(S)$.

(x) $int_{ñδ*}(S) \subseteq int_{ñδ*}(cl_{ñδ*}(S)) = int_{ñδ*}(U - int_{ñδ*}(U - S)) = int_{ñδ*}(U - ext_{ñδ*}(S)) = ext_{ñδ*}(ext_{ñδ*}(S))$.

RESULTS AND DISCUSSION

In this article we explored the nano form of $δ*$-closed sets namely $ñδ*$-closed sets in nano ideal topological space. We investigated $ñδ*$-local function $S_{ñδ*}$ and the associated closure operator $cl_{ñδ*}(S)$ of a subset S of the universe. Also proved $S_{ñδ*}$ is a $ñδ*$-closed set and $int_{ñδ*}(S)$ is the format $ñδ*$-open set in S. The correlation of $int_{ñδ*}(S)$ with $cl_{ñδ*}(S)$ also deduced. Remarkably it is established that the closure operator studied here fulfills the kuratowski axioms and so the collection of $ñδ*$-open sets forms topology. $ñδ*$-derived set of S is defined as the collection of $ñδ*$-accumulation point of S and studied its important properties. Also discussed the exterior, frontier and border of the $ñδ*$-closed set and its properties.

CONCLUSIONS

Having been defined the ñδ*-closed sets in nano ideal topological space we see that this can be extended to other areas like ñδ*-interior, ñδ*-closure, ñδ*-exterior, ñδ*-frontier, ñδ*-derived set and ñδ*-border of a subset S of U in the same space. Thus the present work gives a base for further studies in this area of research. Presently we are working towards the development of this work.

ABSTRACT

Curcuma caesia Roxb, a member of the Zingiberaceae family and one of the rarest medicinal herbs, is traditionally used to cure a number of illnesses. Kali haldi is another name for it. Leucoderma, asthma, tumors, piles, bronchitis, bruising, antiparasitic, diuretic, hepatoprotective, laxative, and sedative disorders have all been treated with the herb, according to ethnobotanical usage. The extractive values of the non-aerial section (rhizome) of *Curcuma caesia* are identified in the current study. Water, methanol, acetone, hexane, and chloroform each had a percentage yield of 18.7, 10.1, 1.5, 3.4, and 3.2%, respectively. The rhizome of the plant extracts contained a range of phytoconstituents, including alkaloids, saponin, quinones, terpenoids, steroids, tannins, flavonoids, cardiac glycosides, and coumarins, according to the qualitative chemical investigations. In this article, a number of verified facts about the plant *Curcuma caesia* have been compiled in order to validate its traditional use and open the door for a source of potential treatments in the near future.

Keywords: *Curcuma caesia*, Zingiberaceae, phytoconstituent, coumarin, cardiac glycosides.

INTRODUCTION

Many pharmacologically active principles and compounds, which are often used in home remedies for a variety of ailments, are thought to be abundant in Indian medicinal plants [1]. The management of human health and disease is improved by traditional medicine and its applications, which are founded on ancient knowledge, skills, and practices

[2]. They are the best substitute for modern medicine because they have no negative side effects, rely on nature, and are inexpensive [3]. The medicinal plant products, which are derived from plant parts such stems, bark, leaves, fruits, and seeds, have been used in phytomedicine and have a particular physiological impact on the human body [4]. Plant-based herbal medicine has been thoroughly investigated by the traditional medical system, and it has been demonstrated that these remedies have significant therapeutic potential. Plants phytochemical composition is what gives them their anti-oxidant, anti-microbial, anti-pyretic, anti-inflammatory, and anti-tumor properties [5]. The important genus Curcuma Linn belongs to the Zingiberaceae family. It is comprised up of over 70 different species of rhizomatous plants, both wild and domesticated, that are spread out over Southeast Asia. Curcuma species have been employed for their therapeutic properties by Indian ethnic communities for a very long time [6].Different dialects of India have different names for *Curcuma caesia*, including Kali haldi (Hindi), Kola halodhi (Assamese), Shyrmitiong (Khasi), Nallapasupu (Telugu), Kariarishina (Kannada), Aihang (Mizo), Yaingangamuba or yaimu (Manipuri), Kala haldi (Bengali), Yakanekeliti (Adi tribe), Homen (Khamti tribe), and black turmeric in English signifying its bluish-black rhizome [7]. Black zedoary or black turmeric, also known as *Curcuma caesia* Roxb., is a species of the Curcuma plant that is distinguished by rhizomes that are deep bluish black or grayish black in color, have a strong aroma, and have a fiery, bitter flavor [8]. Its leaves exhibit an all-over, intense reddish-violet blotch. Native to Northeast India, the plant species is also found in Java and Myanmar. In the Andhra Pradesh districts of East Godavari, West Godavari, and Khammam, black turmeric is also uncommon. Due to its alleged medicinal qualities, the kali haldi rhizomes are of great commercial value [9]. The rhizomes are used to cure a variety of ailments, including gonorrheal discharges, hemorrhoids, leprosy, asthma, cancer, epilepsy, fever, wounds, vomiting, and menstrual abnormalities [10]. The paste is applied on bruises, contusions, and rheumatic ailments in Manipur [11]. To treat diarrhea, the Adi tribes of Arunachal Pradesh prepare a decoction of fresh rhizome. The Lohit area of Khamti tribe administered a paste produced from fresh rhizomes in cases of snake and scorpion bites [12]. In Madhya Pradesh, the plant is revered as being exceedingly auspicious and is thought to grant its owner a never-ending supply of food and cereal. Rhizomes of the plant have a pleasant scent. The interior of the rhizome is bluish-black and emits a characteristic, pleasant smell because it contains essential oil [13].

MATERIALS AND METHODS

Collection of Plant Material
The entire plant material used in the current study was collected in the Indian state of Manipur Bishnupur District between the months of March and April 2023.

Processing of Plant Materials
The gathered rhizome were washed, dried in the shade until all the water had drained, and then cleaned. The dried plant material (rhizome) that had been shed was then removed and processed into a coarse powder. The powdered samples were stored neatly in an airtight glass container with appropriate labeling for examination.

Preparation of Plant Extracts
Different solvents, including methanol, hexane, chloroform, acetone, and water were used to create the plant's rhizome extracts. 500ml of each solvent were used to extract 100g of the dried and powdered plant material (rhizome). For 24 hours or until the solvent in the extractor's siphon tube turns colorless, the extraction process is carried out. Through the use of a rotating vacuum evaporator, all of the extracts were concentrated and dried. Dried extract was stored in a 4°C refrigerator for use in a phytochemical examination later on.

Percentage Yield of Extract (%)
The percentage of extraction yield (%) was calculated by dividing the weight of the crude extract that was obtained after extraction by the weight of the plant powder that was weighed prior to extraction and multiplying the result by 100. The resultant extract was weighed, and each solvent's extractive value was determined as follows:

$$\text{Percentage of yield (\%)} = \frac{\text{weight of extract}}{\text{weight of dry plant powder}} \times 100$$

Screening of Phytochemicals

Phytochemical analysis was done in accordance with standard procedures to identify alkaloids, saponins, quinones, tannins, terpenoids, flavonoids, phenol, phytosterol, coumarin, amino acid, carbohydrate and cardiac glycosides. Using the recommended techniques, the extracts were examined for the presence of bioactive components.

Alkaloids Test

A dull white precipitate formed after adding 2 ml of Mayer's reagent to 1 ml of the extract revealed the presence of alkaloids.

Saponin Test

A test tube containing crude extract was filled with five milliliters of distilled water, the mixture was quickly agitated, and then a few drops of olive oil were added. Saponin is present when a consistent foam is produced.

Quinones Test

1 ml of the extract was mixed with 1 ml of concentrated H_2SO_4, and when the reddish colour formed, quinones were present.

Terpenoids Test

2 ml of extract was mixed with 1 ml of chloroform, then a few drops of strong H_2SO_4 were added. The formation of a reddish-brown precipitate instantly revealed the presence of terpenoids.

Carbohydrates Test

A few drops of plant extract were added to 5 ml of Benedict's reagent, heated for 2 minutes, and then cooled. Red precipitate formation shows the presence of carbohydrates.

Steroids Test

2 ml of chloroform were combined with 0.5 ml of plant extract in the test tube. Carefully adding 3ml of concentrated H_2SO_4 from the test tube wall created a lower layer. The presence of steroid was revealed by the reddish-brown color that occasionally appeared at the interface.

Tannins Test

A precipitate formed after a few ml of potassium dichromate were added to the plant extract, confirming the presence of tannins and phenolics.

Amino acid and protein

2 ml of filtrate was treated with 2–5 drops of ninhydrin solution and placed in a boiling water bath for 1–2 minutes. Formation of purple colour indicates the presence of amino acid and protein.

Flavonoids Test

After adding the stock solution (1 ml) to the test tube, a couple of drops of diluted NaOH solution were added. Bright yellow coloration changed in the test tube. It turned colorless after being added a few drops of diluted HCl, proving the presence of flavonoids.

Cardiac Glycosides Test

A drop of ferric chloride and concentrated H_2SO_4 were added to the plant extract in a test tube along with a few ml of glacial acetic acid. The presence of cardiac glycosides is indicated by the color green.

Coumarins Test

1 mL of extract and 1 mL of 10% NaOH were added. It is known that coumarins are present when a yellow color forms.

RESULTS AND DISCUSSION

Extractive Values of Different Solvents

Table 1 provides information about the extractive value of the solvent *Curcuma caesia.* Water extract clearly had the highest value, followed by methanol extract, while acetone extract had the lowest value. The extraction of bioactive substances should be effective when using solvents with high extractive properties. The majority of active compounds are polar in nature, hence polar solvents are anticipated to have high extractive properties.

Qualitative Phytochemical Screening

The results of the qualitative phytochemical screening performed on the solvent-extracts of *Curcuma caesia* are displayed in Table 2. During extraction, methanol, acetone, chloroform, hexane, and water are used as solvents. Nine of the eleven phytochemicals that were examined for presence in different solvent extracts were found. According to the results of this study, there are phytochemicals that are believed to be the active chemical components of pharmaceuticals. Significant medicinal phytochemicals like coumarins, alkaloids, saponins, quinones, terpenoids, steroids, tannins, flavonoids, cardiac glycosides, and saponins were present in the rhizome of *Curcuma caesia*. This shows that the rhizomes contain a variety of possible phytochemicals. There were no proteins, amino acids, or carbohydrates in the current investigation. The presence of tannins, alkaloids, saponins, quinones, terpenoids, and steroids was discovered in a water extract from the rhizome. Methanol and acetone, on the other hand, contained cardiac glycosides, coumarin, tannins, steroids, flavonoids, alkaloids, and terpenoids.

Numerous phytochemicals have been found to engage in a variety of activities that may help prevent disease. Alkaloids aid in the prevention of chronic diseases. Saponins have antimicrobial properties and lower cholesterol levels. Steroids and terpenoids have analgesic effects on central nervous system functions [16]. These phytochemicals suggest that the solvent extracts of *Curcuma caesia* have some physiological and therapeutic activity; however, as can be observed from the data collected in the aforementioned tables [16,17], this differs from solvent to solvent and from plant to plant. The cholesterol-lowering effects of steroids are thought to be caused by steroids, whereas saponins are the only substances that can precipitate and coagulate red blood cells [18]. Steroids also help to regulate the immune system's reaction [19]. Tannins are incredibly stern in nature. They are known for hastening the healing of sores and swollen mucous membranes. Flavonoids, which are potent water-soluble antioxidants and free radical scavengers that lessen oxidative cell damage [20,21]. It also helps manage the oxidative stress brought on by diabetes. It has been found that terpenoids can be useful in the treatment and prevention of a variety of diseases, including cancer. Terpenoids also possess anti-allergenic, anti-spasmodic, anti-hyperglycemic, anti-inflammatory, and immunomodulatory properties [22,23].

CONCLUSION

It is clear from the current investigation phytochemical analysis that it provided valuable information about the various phytoconstituents found in the plant. This information will be helpful to future researchers as they choose which extract to use for additional research isolating the active ingredient. It also provided insight into the various phytochemicals that have been discovered to have a variety of activities. Alkaloids, flavonoids, terpenoids, tannins, etc. are examples of secondary metabolites that are found in plant extracts. The phytochemical study of *Curcuma caesia* is significant and of economic importance to both research institutions and pharmaceutical corporations for the production of new medications for the treatment of various ailments.

ABSTRACT

Agriculture is a necessary means of subsistence. In India, this industry offers significant chances for villages to work on a vast scale. A poll revealed that approximately 70% of the Indian population relies on agriculture. Agriculture in this region consists of various crop compositions that vary according to weather conditions. However, most Indian farmers lack technical information, such as which crop is best suited to their acreage. Numerous diverse diseases adversely impair agricultural yield, resulting in a loss of profit. This article discusses pest illnesses in detail and their effect on the crop's present productivity. Additionally, it displays survey results generated using various image recognition methods. It is critical to seek and develop more strategies for identifying pest diseases before they cause significant agricultural production losses. Currently, the only way to control insect illness is to use pesticides. However, this process has a detrimental effect on human health, either directly or indirectly. Early detection strategies may reduce the requirement for pesticide spraying. The image detection technology demonstrates its efficacy as a measuring tool in the battle against infestation. This technology enables more efficient crop management and production by providing optimal crop protection. Additionally, these systems decrease human error and labor by including the capability of autonomous monitoring across wide areas.

Senthilkumar *et al.,*

INTRODUCTION

Agriculture is critical to the evolution of human civilization. Agriculture research is focused on enhancing production and food quality. Environmental and biological elements affect the quality and quantity of agricultural produce. Pests and plant diseases are the primary biological parameters. In agriculture, the primary issues are diseases and insect pests. These need a meticulous diagnosis and prompt treatment to avoid significant crop losses. Observation with the naked eye is the most often used approach for detecting pests and diagnosing plant diseases. This requires constant monitoring. However, this is impractical for vast farms. Additionally, it is not an accurate, costly, or time-consuming way of integrated pest management (IPM) intended to control pests with the least environmental effect. IPM consists of three steps: detection, identification, and implementation of proper management. Pests are a significant source of agricultural loss [1]. Insects may be especially destructive because they graze on plants, impair photosynthesis, and act as carriers for various deadly illnesses [2]. Several chemical and biological pest control approaches [3], but regular monitoring of the whole property is often necessary to maximize their efficiency. Monitoring is often carried out passively by personnel as they do their regular tasks. The disadvantage of this strategy is that significant harm may have already been done by the time an infestation is discovered. Early detection of pests needs a more methodical approach, which is especially important on large farms. Without a doubt, traps are the most widely utilized form of systematic pest monitoring [4, 5].

When utilized properly, this kind of equipment may efficiently sample insect populations over a vast area. However, without automation, traps must still be placed and collected manually. Infestation evaluation requires visual examination, which adds subjectivity and may result in a biased appraisal of the problem [5, 6]. Thus, regardless of whether traps are employed or not, systems capable of promptly, accurately, and autonomously assessing the health of pests are required. Significant effort has been made to enhance pest detection and classification. While direct detection is the most prevalent method, numerous other ways focus on identifying associated damage rather than pests [7–9]. Numerous early studies sought to locate and identify insects by analyzing the sounds they emitted. However, interest in this technique seems to have declined during the last decade [10]. Nowadays, the majority of research accomplishes this goal via the use of digital photos [10, 11]. While aerial photographs taken by unmanned aerial vehicles (UAV) are increasingly being studied [12, 13], they often lack the resolution required to identify minute species, and plant canopies may hinder detection. As a consequence, proximal images remain dominating. While researchers are investigating multispectral [14, 15], hyperspectral [16, 17], thermal [18], and X-ray [10] sensors, RGB (Red-Green-Blue) sensors continue to dominate due to their low cost, portability, and versatility [19]. Researchers may use image processing tools to solve complex problems. It is an indication of how rapidly digital technology has advanced in agricultural research. Automated detection of insect pests is a potential solution for image analysis. Numerous papers enhance the implementation methodologies by assessing insect populations in rice fields using an automated detection system. Rice production (both in terms of quality and quantity) rises when agricultural technicians use suitable pest management measures and count pests from collected specimens. Establishing a highly efficient monitoring system becomes straightforward when using an automated system. Cameras are a great monitoring and detection technique for rice infestations.

BACKGROUND STUDY

Agarwal et al. [11] created a CNN model consisting of three convolutional layers, three maximum pooling layers, and two fully connected layers. Each layer had unique filters that allowed for the detection of nine separate tomato leaf diseases. The experimental results demonstrated that the proposed model had an average accuracy of 91.2 percent on the test set, outperforming VGG16, Mobile Net, and Inception. Hu et al. [12] sought to address the dearth of methods for diagnosing _ne-grained tomato diseases. We employed five distinct tomato-damaged leaves in their

early and late stages as research objects. The authors proposed a unique convolutional neural network model called ARNet that is based on the principles of attention and residuals. In classification, ARNet outperformed known models such as VGG16, with an average recognition accuracy of 88.2 percent. Guo et al. [13] developed a multi-receptive field recognition model based on Alex Net (Multi-Scale Alex Net) by eliminating the Alex Net network's local response normalization layer, modifying the network's fully connected layers, and extracting features using a multi-scale convolution kernel. The study's components include the Plant Village dataset and seven distinct varieties of diseased tomato leaves that I collected personally. The model reduced the original Alex Net's memory requirements by 95.4 percent while raising the average accuracy of tomato leaf diseases and disease stages to 92.7 percent. Fan et al. [14] enhanced the Faster R-CNN model's convolutional layer with a batch standardization layer, incorporated a central cost function to generate a mixed cost function, and improved the training model using a stochastic gradient descent technique. They investigated nine separate maize leaf diseases, each with a unique field history. When utilized in the same experimental scenario, the new technique boosted average accuracy by 8.86 percent. In comparison to the SSD technique, the time required to identify a single image was decreased by 0.139 s; the average accuracy was enhanced by 4.25 percent; and the time required to detect a single image was reduced by 0.018 s. Zhang et al. [15] addressed the problem of an Alex Net model with an excessive number of parameters and a single feature scale by using expansion convolution and global pooling. They introduced an Alex Net-based extended convolutional neural network with global pooling (GPD CNN). Following the expansion, a dataset of six common cucumber leaf diseases obtained in the field achieved 95.18 percent accuracy.

RELATED STUDY TO PEST DETECTION

Current Methods Used by the Crop Technicians in Sampling Insect Pests in the Paddy Fields

At the moment, insect pest populations and damage to rice are often dispersed haphazardly and eventually clumped [16]. That is why farmers used a sampling strategy to attain this goal; they gathered, numbered, and examined a small percentage of the insect population. It develops patterns in the population of an organism. The sampling technique is employed primarily for two purposes: research and pest control decision-making, both of which often require significant time, effort, and price. There are no standard sample methodologies; instead, sampling is carried out using a number of techniques and devices, depending on the job at hand. Among them is the effective use of pest surveillance and monitoring systems, which results in more precise intervention timing and reduced production costs. According to Carino, Kenmore, and Dyck [17], the following sample methods and technologies may be used to make pest control decisions: The light trap, which collects samples of varying sizes, is useful for comparing seasonal and annual insect catches, but catches are subject to changes in insect behavior and do not capture flying insects; the sweep net (collecting insects with a fishnet) is a simple, cost-effective method for sampling arthropods that remain in the canoe. Arthropods are rapidly identified and counted in the field upon tapping; visual counting and data recording may also be accomplished in the field but are subject to human error and are very labor-intensive; Additionally, the sticky trap is economical; it monitors insect movement and colonization but excludes non-flying insects. The yellow pan trap is similarly cost-effective; it records insect movement and facilitates sample sorting and counting; however, the attraction is based on color stimulation and does not catch flying insects.

Feature Extraction and Image Processing

Image processing is the analysis and manipulation of graphical images collected from a variety of sources, including photographs and motion pictures. The three basic stages of image processing are as follows: transforming gathered images to binary values that a computer can process; augmenting and compressing the image; and last, displaying or publishing the processed image. Image processing is used in satellite weather mapping, machine vision, and computer-based pattern recognition. Phinyomark, Limsakul, and Phukpattaranont [18] pioneered a novel feature extraction approach for Electromyography data by representing interference with white Gaussian noise. For robust feature extraction, we supplied two distinct mean and median frequencies. Alsmadin, Omar, Noa, and Almarashdeh [19] showed utilizing robust feature extraction, a system capable of identifying discrete patterns of interest in images. The approach was used as a classifier to classify and categorize fish into deadly and non-poisonous families.

Real-Life Application of Image Processing in the Fields of Agricultural Research

Numerous attempts have been undertaken to build automated insect identification systems that are image-based. Samantha and Ghosh's study [20] examines eight major insect pests utilizing data from tea farms in India's North Bengal area. The authors collect and reduce features using correlation-based approaches then classify using an incremental back propagation neural network methodology. Do, Harp, and Norris [21] created a non-specialist-friendly automated pattern recognition approach for identifying arachnids and other arthropods. The researchers recommend early pest detection in greenhouse crops in order to limit pesticide use. The purpose of this approach is to identify pests on plant organs such as leaves. Their project aims to build an innovative decision support system for in-situ early pest detection by analyzing and interpreting video data from several cameras. They utilized the apriori algorithm to classify whiteflies and aphids in their research and used a broad approach to developing a system that is easily extensible to different sorts of progressors. Al-Saqer [22] developed a neural network-based approach for detecting pecan weevils. They were able to identify the pecan weevil by feeding visual descriptions into a neural network. The authors took photographs of pecan weevils and other insects that they discovered in paddy fields. They converted the pictures to binary and scaled them to 114134 pixels after obtaining them. They used a variety of image processing techniques, including Regional Properties and Zernike Moments, to analyze the data. Zhu and Zhang [23] presented a report in which they described their development of a novel method for recognizing insects. They used integrated region matching and the dual-tree complex wavelet transform to match pictures. The acquired lepidopteran insects' photographs were shrunk to 248200 pixels and filtered using the mean shift method. Using the color feature and a k-mean approach, the processed image is divided into sections. They used pixel-wise segmentation to classify pixels into sections based on their color properties

COMPARATIVE ANALYSIS OF SURVEY
DISCUSSION

The primary challenge is to provide reliable detection results for illumination changes. Changes in lighting may occur due to changing weather conditions or the earth's rotation. Due to variations in the weather, visual characteristics such as color, intensity, and contrast will fluctuate. There are many plant species and several pests. Thus, the plant database has several big picture bases (image databases). Image categorization using high-speed image processing is a complicated task.

CONCLUSION

Several image processing techniques are discussed in this article, including feature extraction and automatic detection. The survey illustrates the effectiveness and ease with which presently available options may be used. Numerous ways for acquiring knowledge about background modeling for pest identification are discussed here, including picture filtering, median filtering for noise reduction, image extraction, and detection through scanning. This article discusses some promising studies that exhibit improved methodology and tools for fully automated pest identification, including extraction and detection. Viruses, illnesses, animal pests, and weeds all wreak havoc on agricultural output worldwide. Pest group attacks result in both relative and absolute losses. In high-production tropics and subtropics, conditions support fast crop growth. However, in certain areas, owing to favorable weather conditions, the bug may inflict severe damage to the crop. As a result, crop protection strategies are required to prevent pest proliferation. Additionally, farmers should be familiar with such practices. The study's future possibilities might include developing more sophisticated image processing systems that are both accurate and efficient. Additionally, it may be developed to provide an effective object extraction identification system.

ABSTRACT

Piston Ring of an I C Engine experiences wear as is usually experienced by all the components of an I C Engine. But the contribution of friction in a piston ring assembly is the maximum. Most wear models, have quantified wear of a piston ring in terms of total wear volume (Archard's wear equation), total weight loss or depth of the wear scar with an underlined assumption that wear is uniform along the circumference. This research work presents the comparison of results of wear calculation of the top piston ring of an IC Engine by measuring piston ring profile at 9 different angular sections, constituting 8 sectors of piston ring. Piston ring profile was measured over axial width of the worn-out piston ring at 13 different locations along the axial direction for each of the 9 sections. Volume loss for each of the 8 sectors is calculated by comparing piston ring profile of worn-out piston ring with profile of new piston ring of same type. The results have been compared with the software results (calculations done by CREO). The wear volume loss calculated by the analytical method has been compared with the results of CREO. The pattern of the wear volume loss in both the cases is the almost similar. It is observed that the wear volume loss is different for different sectors.

Keywords: Piston ring, Wear, Piston ring profile, Wear volume.

Mukesh A. Bulsara and Kirti H Niralgikar

INTRODUCTION

A piston ring experiences wear due to the asperities contact between piston ring and the cylinder liner. Wear of piston ring has been considered as uniform along the circumference by many researchers in past. Pike W.C and Spillman D.T [1] have measured total wear rate at different torques of motored engines. T. H. C. Childs and F. Sabbagh [2] have simulated the real engine conditions by   pin-on-disk tests and have calculated that total wear volume loss in a top piston ring. P. C. Nautiyal et al [3],have given a theoretical model for piston ring wear rate in terms of energy of absorption, the material properties, and the operating conditions. Priest et al.[4] have developed a numerical model that predicts wear of piston ring at one particular point on the circumference of the piston ring and these results has been compared with the experimental results. Simon Tung & Y Huang[5] have developed a three body wear abrasion model for the piston ring. Combining the effects of surface roughness and oil degradation, the total wear volume loss due to the abrasive wear has been investigated. There has been no mention of variation in wear of the piston ring in the research. Truhan J.J &Blau P.J [6] have developed a test method to evaluate wear behaviour of candidate piston ring and cylinder liner materials for heavy duty diesel engine applications with realistic lubricants. The authors have measured the wear scar geometry at a particular crank angle and calculated the total wear volume loss rather than the variation. Bulsara M.A et al [7] have measured wear profile along a circumference of the piston ring of different makes and have compared it with a new piston ring. The authors have mentioned about the variation of wear volume along the circumference of the top piston ring. Smith E [9] showed through design of experiments (DOE) that the oil film thickness gives an inference of total wear of the piston ring. Zheng M et al [10] have quantified total wear using Archard's wear equation. Mishra P.C [11] has given a contact conjunction of a piston ring-pack and rough out-of-round cylinder is modelled to analyze the sources of the total wear rate. Research done up till now has emphasized on total wear volume or wear depth at a particular region of the piston ring. This research focuses on the variation of the wear volume along the circumference of the top piston ring.

Experimental Setup
Volumetric wear of piston ring was calculated by comparing volume of worn piston ring with volume of new (unworn). Volume of worn piston ring was calculated by measuring piston ring axial profile at 9 different sections along the circumference and calculating the volume by interpolation between two successive sections. Volume of new (unworn) piston ring was calculated based on the ring face profile of new piston ring of same make. A worn-out piston ring from Hero Honda Splendor has been selected for the study as the motorbike is the bestselling motorbikes with consistent sales of 2 lakh units in India every year. The specifications of the engine are:
Engine capacity: 97.2 cc, 4 stroke, single cylinder, OHC
Bore Diameter: 50 mm
Stroke Length: 49.5 mm
Piston Ring outer diameter: 50 mm
Piston ring inner diameter: 47 mm
Piston Ring Number: 100, Usha Make
Piston Ring axial thickness: 1mm

Figure 1
a)Schematic diagram for measuring profile of piston ring. b) The schematic diagram of the fixture for measuring the profile of the piston ring. c) Photograph of the measurement setup. A fixture was designed and manufactured for the purpose of measurement of the piston ring profile as in figure 1(a).The fixture consists of shaft, collar, clamp-plate and spacer rings. The shaft was machined and ground between centres on cylindrical grinding machine. Outer diameter and inner diameter of the collar was also machined and ground between centres on cylindrical grinding machine to have tight fit between shaft and collar. A shoulder is provided on the collar so that the piston ring can rest against the shoulder when clamped with clamp-plate with required number of spacer rings. The collar is

Mukesh A. Bulsara and Kirti H Niralgikar

assembled with shaft with tight fit assembly. Piston ring under test is mounted on the collar such that it rests on the shoulder, along with spacer rings. Both are fastened as one unit, together with clamp-plate screwed to the collar as shown in figure 1(b). The fixture along with piston ring is mounted between centres on centre lathe. Two dial gauges are used 'Dial Gauge A' and 'Dial Gauge B' for the measurement of piston ring axial profile. 'Dial Gauge A' has least count of 0.001 mm and that of 'Dial Gauge B' is 0.01 mm. Piston ring is mounted on the collar such that the inner diameter of piston ring rests on the collar to ensure same datum for every measurement. Stylus of 'Dial Gauge A' is mounted on specimen piston ring as shown in figure 1(a) such that it can measure the variation in piston ring profile in radial direction.

Measuring the ring profile along the axial direction of the piston ring
It was decided to measure piston axial ring profile at 9 angular sections at angle 10°, 45°,180 90°, 135°, 180°, 225°, 270°, 315°, 350°, as shown in figure 2. This way the piston ring is divided into 8 sectors S1 to S8. The angular positions were marked on the piston ring before beginning of measurements. To measure the axial profile of piston ring at any angular section, measurement begins with one of the faces of the ring, 'Ring Face-1' shown in figure 3 and continues up to 'Ring Face-2' .Stylus of 'Dial Gauge A' is fixed at point 1 (on piston ring) and scale of dial gauge is adjusted such that 'zero' mark of scale coincides with the pointer. Base of the 'Dial Gauge A' is mounted on the lathe bed so that the dial gauge A is stationary. Base of 'Dial Gauge B' is also mounted on the lathe bed but the stylus of the dial gauge is adjusted such that it senses the movement of carriage. Now, the carriage is manually moved along axial direction incrementing 0.0091 mm at a time and corresponding radial deflection of 'Dial gauge-A' due to variation of ring profile is recorded. The measurements were taken at 13 points along the axial width of piston ring on each section. The piston ring was rotated to next section, after 13 reading were taken at a given section, to maintain the same datum (see figure 1) with respect to dial gauge. The datum for measurement is the outer diameter of the collar as shown in Figure 1.The axial profile readings are taken at 9 sections viz. 10^0, 45^0, 90^0, 135^0, 180^0, 225^0, 270^0, 315^0 and 350^0 angles along the circumference of the piston ring (see figure 2).

Experiment and Measurement
The research work focuses on calculating degree of wear at different sectors along the circumference of the top piston ring. Wear of piston ring can be quantified as difference in volumes of a new piston ring and worn-out piston ring by measuring the piston ring profile.

Calculation of wear volume of the piston ring along the circumference
In order to calculate wear volume along the circumference, the piston was divided into eight sectors S1, S2, S3,S4,S5,S6,S7, S8 as shown in figure 2 by way of 9 sections. Consider sector 1 which is enclosed by section-1 and section-2. Each section on new piston ring as shown in figure 4(a) is represented by M_i (where i=1 to 9) sections. Thirteen measurements of ring profile were taken along axial direction on section-1. These measurements are represented by $M_{1,1}$, $M_{1,2}$, ..., $M_{1,13}$ ($M_{i,j}$, where i = 1 and j = 1 to 13). Similarly, points $M_{2,1}$, $M_{2,2}$, ..., $M_{2,13}$ ($N_{i,j}$, where i = 2 and j = 1 to 13) can be identified on section 2. Analogous points $H_{1,1}$, $H_{1,2}$, ..., $H_{1,13}$ (H_{ij}, where i = 1 and j = 1 to 13) on section 1 and points $H_{2,1}$, $H_{2,2}$, ..., $H_{2,13}$ (H_{ij}, where i = 2 and j = 1 to 13) can be identified on section 2 of worn out piston ring as shown in figure 4(b).To calculate the volume for any sector of worn out ring, it is assumed that profile between points $M_{i,j}$ on section 'i' varies linearly up to corresponding point to $N_{i+1,j}$ on the subsequent section 'i+1'. Wear of the piston ring is calculated by finding the difference between the volume enclosed by curved profile of new piston ring L1-N1-O1-L2-N2-O2-L1, indicated as W_1 (see figure 4a). Volume enclosed by the curved profile J1-K1-I1-J2-K2-I2 indicated as W_2 (see figure 4b) is the volume left over after wear of the piston ring. The process is repeated for each of the 8 sectors. The process of calculating volume for worn out ring is elucidated in the subsequent text. Volumetric wear can be calculated by determining the difference between W_1 and W_2 for each sector.

Volume calculation for new piston ring (V_N)
Methodology adopted to determine volume enclosed between two sections of the new piston ring is illustrated in figure 5 and figure 6. Profile of new piston ring is measured at 13 equi-distant divisions along axial width of piston ring by dividing each section into 12 equal parts as shown in figure 5. Volume of each of the 12 parts is calculated

68425

Mukesh A. Bulsara and Kirti H Niralgikar

separately. For example, consider two divisions say 10 and 11 between section 1 and 2 respectively, they are $P_{1,10}$ & $P_{1,11}$ on section-1 and correspondingly $P_{2,10}$ & $P_{2,11}$ on section-2 (highlighted), on the axial width of the piston ring. Volume enclosed by profile of piston ring between two points on section-1 and two corresponding points on section-2 is calculated as the volume of the solid '$P_{1,10}$-$P_{1,11}$-$P_{2,11}$ -$P_{2,10}$- $P_{1,10}$-D-C-B-A-D' as shown in figure 9 (enlarged view is shown in figure 6). The volumes of the 12 axial parts are calculated as above and the volumes are summated to get the total volume $V_{N,1}$ of sector-1. The exercise is repeated for remaining 7 sectors. Total volume of piston ring profile for new piston ring is sum of all eight volumes. ($V_N = V_{N,1} + V_{N,1} + ... + V_{N,8}$) between two sections (figure 3, figure 4) on the circumference of the new piston ring

Volume calculation of wear volume for worn out piston ring (V_W)

Axial profile of worn out piston ring was measured at 13 points in axial direction, at each of 9 sections and the results are tabulated in table 1. The readings are average of three measurements taken by the dial gauge. The volume of piston ring profile in a sector enclosed by two sections of worn out piston ring is illustrated as. Each sector is divided into 12 parts in axial direction by measurements of profile at 13 axial divisions on the profile at each section(figure 7(a)). For example, profile between two axial positions 10 and 11 (highlighted) on each section 1 and 2 is shown in figure 7(b). The volume enclosed by points '$P_{1,10}$-$P_{1,11}$-$P_{2,11}$ -$P_{2,10}$- $P_{1,10}$-D-C-B-A-D' is divided further into two parts as shown in figure 7(c). The volume of each half solid is calculated separately by approximating the volume as trapezoids as shown in figure 7(c). Volume of solid represented by points '$P_{1,10}$-$P_{1,11}$-$P_{2,11}$-$P_{2,10}$-$P_{1,10}$-D-C-B-A-D' is calculated by summing up the volume of 10 trapezoids. Likewise volume has been calculated for all the 12 axial parts on the profiles between two sections. Volume of sector 1 represented as $V_{W,i}$ is calculated by taking sum of volume of each of the 12 parts. Total volume enclosed by worn profile in a sector bound by two sections is calculated by summing the volumes of 12 such parts. The volume calculations have been done by a code generated in MATLAB. Summation of volume of all 8 sectors $V_{W,1}$ to $V_{W,8}$ gives the total volume of worn piston ring W_2.

RESULTS AND DISCUSSIONS

Wear Volume Analysis

Wear volume at each sector for worn out piston ring is calculated by subtracting volume of each sector of worn piston ring $V_{W,i}$ from corresponding volume $V_{N,i}$ of New piston ring for a sector i.Volumetric wear in each sector can be represented as percentage of volume of new piston ring of the respective sector. Percentage wear of a sector P_i = ($V_{N,i}$ - $V_{W,i}$)/ $V_{N,i}$ Volumetric wear in each sector as percentage of volume of new piston ring of the respective sector is graphically represented below in fig. 8: It can be observed from table-2 along with Fig.8 that the wear of piston ring is not uniform throughout the circumference. The wear is more near the end gap (10° to 45° and 315° to 350°). Wear is least at about 180° from end gap. As wear is caused due to friction which is caused due to lack of lubricant, it can be inferred that oil film thickness formed along the circumference is not uniform. It is likely that portion of ring near end gap undergo boundary lubrication for most of the part of stroke whereas the remaining portion of piston ring experiences hydrodynamic lubrication for most of the part of stroke.

Validation by software

The volume loss due to wear has been a validated by a modelling software creo 3.0. The volume between section 1 and section 2 is calculated by the software and the modelling is shown in fig 9. The volume of a between section 1 and section 2 of a new piston ring is calculated by the software and the modelling is shown in Fig 10.

CONCLUSION

The volume loss due to wear near the end gap (sector 1 and sector 8) is more as compared to the other sectors of the piston ring as illustrated. A non uniform wear pattern has been observed by the above study (see figure 8) for longer period of stroke. This leads us to infer that the piston ring experiences boundary lubrication near the end gap of the

Mukesh A. Bulsara and Kirti H Niralgikar

piston ring till 45^0. It experiences mixed lubrication regime from 45^0 to 180^0 and from 135^0 to 180^0 from the centre of the gap it experiences hydrodynamic lubrication. The behaviour is symmetrical about the end gap. The piston ring experiences boundary lubrication from 350^0 (near the end gap) till 315^0, mixed lubrication from 315^0 to 180^0 and hydrodynamic lubrication from 180^0 to 225^0(opposite the gap of the piston ring). The software results show a similar behaviour of the wear volume loss pattern as the analytical calculations, along the circumference of the piston ring. It can be inferred from both the results that the piston ring experiences hydrodynamic lubrication from 180^0-225^0 from the centre of the end gap of the piston ring.

ABSTRACT

A graph G with p points and q lines is known as root square mean graph if it is possible to value the points $y \, \epsilon \, V$ with different lables $f(y)$ from $1,2,\ldots,q+1$ so that when every line $e = sr$ is valued with $f(e = sr) = \left\lfloor \sqrt{\frac{f(s)^2+f(r)^2}{2}} \right\rfloor \, or \, \left\lceil \sqrt{\frac{f(s)^2+f(r)^2}{2}} \right\rceil$, then the resulting line values are different. f is known as root square mean labeling of G. During this paper, we prove that disconnected graphs such as $(C_n@P_m) \cup L_g, (C_n@P_m) \cup TL_g, (C_n@P_m) \cup T_g, (C_n@P_m) \cup D(T_g), (C_n@P_m) \cup Q_g, (C_n@P_m) \cup D(Q_g)$ are root square mean graphs.

Keywords: Root square mean labeling, Ladder, Triangular snake, Quadrilateral snake, Dragon.

INTRODUCTION

S.S.Sandhya.et.al [8] introduced this root square mean labeling of graphs and they also proved that some disconnected graphs are root square mean graphs in [9]. Meena. S and Mani. R [3,4,5,6,7] investigated this labeling for some cycle related graphs.

Definition 1.1

68431

Meena and Mani

A graph G with p points and q lines is known as root square mean graph if it is possible to value the points $y \epsilon V$ with different lables $f(y)$ from $1,2,...,q+1$ so that when every line $e = sr$ is valued with $f(e = sr) = \left\lfloor \sqrt{\frac{f(s)^2 + f(r)^2}{2}} \right\rfloor$ or $\left\lceil \sqrt{\frac{f(s)^2 + f(r)^2}{2}} \right\rceil$, then the resulting line values are different. f is known as root square mean labeling of G.

Definition 1.2   "
A triangular ladder TL_m is a graph got from ladder L_m by connecting the lines s_i and $s'_{i+1}, 1 \le i \le m-1$, where s_i and $s'_i, 1 \le i \le m$ are the points of L_m such that $s_1 s_2 ... s_m$ and $s'_1 s'_2 ... s'_m$ are two paths of length m in the graph L_m.

Definition 1.3
A triangular snake T_m is got from a path $s_1 s_2 ... s_m$ by connecting s_i and s_{i+1} to a new points s'_i for $1 \le i \le m-1$.

Definition 1.4
A double triangular snake $D(T_m)$ consists of two triangular snakes that have a common path.

Definition 1.5
A quadrilateral snake Q_m is got from a path $s_1 s_2 ... s_m$ by connecting s_i and s_{i+1} to a new points s'_i and s''_i for $1 \le i \le m-1$ respectively and then connects s'_i and s''_i.

Definition 1.6
A Double Quadrilateral snake $D(Q_m)$ consists of two quadrilateral snakes that have a common path.

Definition 1.7
The union of two graphs $P_1 = (V_1, E_1)$ and $P_2 = (V_2, E_2)$ is a graph $P = P_1 \cup P_2$ with point set $V = V_1 \cup V_2$ and the line set $E = E_1 \cup E_2$.

Definition 1.8
A dragon is formed by attaching the end node of a path to a cycle. It is denoted by $C_n @ P_m$."

Notations
Here $[h]$ is the least integer greater than or equal to h and $[h]$ is greatest integer less than or equal to h.

Main Results
The root square mean labeling of some disconnected graphs were presented in this paper.

Theorem 2.1
$(C_n @ P_m) \cup L_h$ is a root square mean graph.

Proof
Let $G = (C_n @ P_m) \cup L_h$
Let $a_1 a_2 ... a_n$ be the points of cycles C_n in G and let $a'_1 a'_2 ... a'_m$ be the points of the path P_m attached at cycle C_n with $a_n = a'_1$.
  Let $c_1 c_2 ... c_h$ and $d_1 d_2 ... d_h$ be the points of ladder L_h.
  Let $V(G) = \{a'_i /1 \le i \le m\} \cup \{a_i / 1 \le i \le n\} \cup \{c_i, d_i / 1 \le i \le h\}$
  $E(G) = \{a_i a_{i+1} / 1 \le i \le n-1\} \cup \{a'_i a'_{i+1} / 1 \le i \le m-1\}$
    $\cup \{c_i c_{i+1} / 1 \le i \le h-1\} \cup \{d_i d_{i+1} / 1 \le i \le h-1\} \cup \{d_i c_i / 1 \le i \le h\}$.
Define a mapping $f: V(G) \to \{1,2,...,m+n+3h-2\}$ by
  $f(a_i) = i$ for $1 \le i \le n$

68432

$$f(a_i^{'}) = n + i - 1 \qquad \text{for } 2 \le i \le m$$
$$f(c_i) = n + m + 3i - 2 \qquad \text{for } 1 \le i \le h$$
$$f(d_i) = n + m + 2i - 2 \qquad \text{for } 1 \le i \le 2$$
$$f(d_i) = n + m + 3i - 4 \qquad \text{for } 3 \le i \le h$$

Then the line values are different. Hence f is a root square mean labeling of G.

Theorem 2.2

$(C_n @ P_m) \cup TL_h$ is a root square mean graph.

Proof

"Let $G = (C_n @ P_m) \cup TL_h$

Let $a_1 a_2 \dots a_n$ be the points of cycles C_n in G and let $a_1^{'} a_2^{'} \dots a_m^{'}$ be the points of the path P_m attached at cycle C_n with $a_n = a_1^{'}$.

Let $c_1 c_2 \dots c_h$ and $d_1 d_2 \dots d_h$ be the points of triangular ladder TL_m.

Let $V(G) = \{a_i^{'}/1 \le i \le m\} \cup \{a_i/1 \le i \le n\} \cup \{c_i, d_i/1 \le i \le h\}$

$E(G) = \{a_i a_{i+1}/1 \le i \le n-1\} \cup \{a_i^{'} a_{i+1}^{'}/1 \le i \le m-1\}$
$\cup \{c_i c_{i+1}/1 \le i \le h-1\} \cup \{d_i d_{i+1}/1 \le i \le h-1\} \cup \{c_i d_i/1 \le i \le h\}$
$\cup \{c_i d_{i+1}/1 \le i \le h-1\}$.

Define a mapping $f: V(G) \to \{1, 2, \dots, m + n + 4h - 3\}$ by

$$f(a_i) = i \qquad \text{for } 1 \le i \le n$$
$$f(a_i^{'}) = n + i - 1 \qquad \text{for } 2 \le i \le m$$
$$f(c_i) = n + m + 4i - 3 \qquad \text{for } 1 \le i \le h$$
$$f(d_i) = n + m + 3i - 3 \qquad \text{for } 1 \le i \le 2$$
$$f(d_i) = n + m + 4i - 5 \qquad \text{for } 3 \le i \le h$$

Then the line values are different. Hence f is a root square mean labeling of G.

Theorem 2.3

$(C_n @ P_m) \cup T_h$ is a root square mean graph.

Proof

Let $G = (C_n @ P_m) \cup T_h$

Let $a_1 a_2 \dots a_n$ be the points of cycles C_n in G and let $a_1^{'} a_2^{'} \dots a_m^{'}$ be the points of the path P_m attached at cycle C_n with $a_n = a_1^{'}$.

Let $c_1 c_2 \dots c_h$ be the path P_h. Let T_h be the triangular snake got from P_h by connecting c_i and c_{i+1} to a new point $d_i, 1 \le i \le h-1$.

Let $V(G) = \{a_i/1 \le i \le n\} \cup \{a_i^{'}/1 \le i \le m\} \cup \{c_i, d_i/1 \le i \le h\}$

$E(G) = \{a_i a_{i+1}/1 \le i \le n-1\} \cup \{a_i^{'} a_{i+1}^{'}/1 \le i \le m-1\}$
$\cup \{c_i c_{i+1}/1 \le i \le h-1\} \cup \{d_i c_{i+1}/1 \le i \le h-1\} \cup \{c_i d_i/1 \le i \le h-1\}$.

Define a mapping $f: V(G) \to \{1, 2, \dots, m + n + 3h - 3\}$ by

$$f(a_i) = i \qquad \text{for } 1 \le i \le n$$
$$f(a_i^{'}) = n + i - 1 \qquad \text{for } 2 \le i \le m$$
$$f(c_i) = n + m + 2i - 1 \qquad \text{for } 1 \le i \le 2$$
$$f(c_i) = n + m + 3i - 3 \qquad \text{for } 3 \le i \le h$$
$$f(d_i) = n + m + 4i - 4 \qquad \text{for } 1 \le i \le 2$$
$$f(d_i) = n + m + 3i - 2 \qquad \text{for } 3 \le i \le h-1$$

Then the line values are different. Hence f is a root square mean labeling of G.

Theorem 2.4

$(C_n @ P_m) \cup D(T_h)$ is a root square mean graph.

Proof

Let $G = (C_n @ P_m) \cup D(T_h)$

Let $a_1 a_2 \ldots a_n$ be the points of cycles C_n in G and let $a_1' a_2' \ldots a_m'$ be the points of the path P_m attached at cycle C_n with $a_n = a_1'$.

Let $c_1 c_2 \ldots c_h$ be the path P_h. Let double triangular snake $D(T_h)$ got by joining c_i and c_{i+1} to two new adjacent points d_i and d_i' $1 \le i \le h - 1$.

Let $V(G) = \{a_i / 1 \le i \le n\} \cup \{a_i' / 1 \le i \le m\} \cup \{c_i, d_i, d_i' / 1 \le i \le h\}$

$E(G) = \{a_i a_{i+1} / 1 \le i \le n - 1\} \cup \{a_i' a_{i+1}' / 1 \le i \le m - 1\}$

$\qquad \cup \{c_i c_{i+1} / 1 \le i \le h - 1\} \cup \{c_i d_i, d_i c_{i+1} / 1 \le i \le h - 1\}$

$\qquad \cup \{c_i d_i', d_i' c_{i+1} / 1 \le i \le h - 1\}.$

Define a mapping $f : V(G) \to \{1, 2, \ldots, m + n + 5h - 5\}$ by

$f(a_i) = i$	for $1 \le i \le n$
$f(a_i') = n + i - 1$	for $2 \le i \le m$
$f(c_i) = n + m + 5i - 5$	for $1 \le i \le h$
$f(d_i) = n + m + 5i - 4$	for $1 \le i \le h - 1$
$f(d_i') = n + m + 5i - 3$	for $1 \le i \le h - 1$

Then the line values are differet. Hence f is a root square mean labeling of G.

Theorem 2.5

$(C_n @ P_m) \cup Q_h$ is a root square mean graph.

Proof

Let $G = (C_n @ P_m) \cup Q_h$

Let $a_1 a_2 \ldots a_n$ be the points of cycles C_n in G and let $a_1' a_2' \ldots a_m'$ be the points of the path P_m attached at cycle C_n with $a_n = a_1'$.

Let $c_1 c_2 \ldots c_h$ be the path P_h. Let Q_h be the qadrilateral snake got by connecting c_i and c_{i+1} to two new adjacent points d_i and d_i' $1 \le i \le h - 1$ respectively.

Let $V(G) = \{a_i / 1 \le i \le n\} \cup \{a_i' / 1 \le i \le m\} \cup \{c_i, d_i, d_i' / 1 \le i \le h\}$

$E(G) = \{a_i a_{i+1} / 1 \le i \le n - 1\} \cup \{a_i' a_{i+1}' / 1 \le i \le m - 1\}$

$\cup \{c_i c_{i+1} / 1 \le i \le h - 1\} \cup \{c_i d_i, d_i d_i', d_i' c_{i+1} / 1 \le i \le h - 1\}.$

Define a mapping $f : V(G) \to \{1, 2, \ldots, m + n + 4h - 4\}$ by

$f(a_i) = i$	for $1 \le i \le n$
$f(a_i') = n + i - 1$	for $2 \le i \le m$
$f(c_i) = n + m + 2i$	for $1 \le i \le 2$
$f(c_i) = n + m + 4i - 4$	for $3 \le i \le h$
$f(d_i) = n + m + 5i - 5$	for $1 \le i \le 2$
$f(d_i) = n + m + 4i - 3$	for $3 \le i \le h - 1$
$f(d_i') = n + m + 5i - 4$	for $1 \le i \le 2$
$f(d_i') = n + m + 4i - 2$	for $3 \le i \le h - 1$

Then the line values are different. Hence f is a root square mean labeling of G.

Theorem 2.6

$(C_n @ P_m) \cup D(Q_h)$ is a root square mean graph.

Proof

Let $G = (C_n @ P_m) \cup D(Q_h)$

Let $a_1 a_2 \ldots a_n$ be the points of cycles C_n in G and let $a_1' a_2' \ldots a_m'$ be the points of the path P_m attached at cycle C_n with $a_n = a_1'$.

Let $c_1 c_2 \ldots c_h$ be the path P_h. Let $c_i, d_i, d_i', g_i, g_i'$ be the points of double quadrilateral snake $D(Q_h)$.

Meena and Mani

Let $V(G) = \{a_i/1 \le i \le n\} \cup \{a_i'/1 \le i \le m\} \cup \{c_i, d_i, d_i', g_i, g_i'/1 \le i \le h\}$

$E(G) = \{a_i a_{i+1}/1 \le i \le n-1\} \cup \{a_i' a_{i+1}'/1 \le i \le m-1\}$

$\qquad \cup \{c_i c_{i+1}/1 \le i \le h-1\} \cup \{c_i d_i, d_i d_i', d_i' c_{i+1}/1 \le i \le h-1\}$

$\qquad \cup \{c_i g_i, g_i g_i', g_i' c_{i+1}/1 \le i \le h-1\}.$

Define a mapping $f: V(G) \to \{1, 2, \ldots, m+n+7h-7\}$ by

$f(a_i) = i$	for $1 \le i \le n$
$f(a_i') = n+i-1$	for $2 \le i \le m$
$f(c_i) = n+m+7i-7$	for $1 \le i \le h$
$f(d_i) = n+m+7i-6$	for $1 \le i \le h-1$
$f(d_i') = n+m+7i-5$	for $1 \le i \le h-1$
$f(g_i) = n+m+7i-4$	for $1 \le i \le h-1$
$f(g_i') = n+m+7i-3$	for $1 \le i \le h-1$

Then the line values are different. Hence f is a root square mean labeling of G."

CONCLUSION

It is very interesting to find whether a graph admits root square mean labeling or not. We present six new results on root square mean labeling of some disconnected graphs.

ABSTRACT

Anaerobic treatment of domestic wastewater is recently gained worldwide attention due to its effectiveness, low cost and low energy requirements. In this study, wastewater from textile industry was selected for the anaerobic treatment with UASB reactor. Generally, the UASB reactor is better removal efficiency for pollutants such as chemical oxygen Demand (BOD), Biological Oxygen Demand (BOD), Total Suspended Solids (TSS), Volatile Suspended Solids (VSS) and Hydrogen – ion Concentration. Further studies are required for the optimization of Biogas generation. UASB reactors effectively reduced the TDS from 4500 mg/lit to 2750 mg/lit. Its removal efficiency is 48.61%. Our Project comprised of environmental friendly waste water purification processing single stage set upper formed gave efficiency. The percentage of removal is 77.43%. COD level also decreased from 1300 mg/lit to 250 mg/lit and the removal efficiency is 80.77 mg/lit.

Keywords: Anaerobic Process, BOD, COD, UASB Reactor.

INTRODUCTION

Anaerobic process is an attractive technology for waste water treatment. The high costs of aeration and sludge handling associated with aerobic sewage treatment are dramatically lower as no oxygen is need and production of

sludge is 3 – 20 times lower. However, its use is usually limited to high strength industrial waste water with soluble substrates. Domestic waste water has typically low concentration of COD, resulting in relatively small methane production that is insufficient to heat the reactor to more favorable mesospheric temperatures. The UASB Reactor An up flow anaerobic sludge blanket reactor is basically a tank that has a sludge bed in which organic material dissolved in the wastewater is degraded, and as a consequence of this digestion, biogas is produced. Wastewater enters at the bottom of the reactor. At the top, biogas is collected and the effluent of treated water leaves at the upper part of the reactor, above the sludge bed, a blanket zone is formed where some particles of biomass are suspended.

REVIEW OF THE LITERATURE

In this chapter, literature pertaining to anaerobic treatment of organic wastewater in the production of various industries such as textile, dairy, sugar, distillery, etc., under various heads are critically reviewed, and their salient features are discussed. Application of UASB reactor, containing mixed population of bacteria , helps in bacterial immobilization of bio film on a support medium in the reactor which overcomes the problem of biomass washout. The wastewater characteristics, kinetics, and mathematical modeling facilitate better understanding and evaluation of the performance of the reactor.

EXPERIMENTAL METHODOLOGY
In the present study an experimental model of up flow anaerobic sludge blanket reactor was constructed to conduct an experiment for simulated the waste stream of textile industry to evaluate the treatment efficiency under varying experimental conditions.

EXPERIMENTAL SETUP OF UASB REACTOR
The present research work is to be carried out to evaluate the performance of Up Flow Anaerobic Sludge Blanket (UASB) reactor for the removal of textile wastewater. The size of the Up Flow Anaerobic Sludge Blanket (UASB) reactor was height 70cm, dia 9cm, packed bed 35 cm, packing material PVC, and working volume of the reactor was 3 liters. A proper construction of the blanket allowed wastewater to flow through the sludge bed from bottom up.

RESULT AND DISCUSSIONS

INITIAL CHARACTERISATION
The raw wastewater and treated wastewater are tested for their physical and chemical characteristics. Results are given below. Waste water discharges from the textile dyeing units degrade the water quality of both the surface and subsurface levels of the surrounding areas. Untreated textile dyeing effluents released from industries on open land and receiving streams increase the concentration of pollutants in the environment.

Initial Characterization of untreated sample
This causes damage to crops, humans, and the aquatic environment. Physicochemical treatment by their toxic by-products and expensiveness got away from the treatment of textile dyeing industries effluent.

Final Characterization of untreated sample
The biological treatment process of its cost-effectiveness and harmless by-products play a vital role in the treatment of textile dyeing industries effluent though the biodegradability of the textile dye effluent is below 0.5.

DISCUSSIONS

The higher TDS of the real textile dye waste water exceeds the permissible Indian effluent standards of 2100 mg/L for the disposal of the inland surface sources. The high pH which exceeds the permissible limit of Indian effluent disposal standards of 5.5-9.0 by IS-10500. The highly coloured characteristic of the textile ye waste water affects the transparency and the permissible limit of the colour is 5 in Hazen units as per the Indian standards.

CONCLUSIONS

Our Project comprised of environmental friendly waste water purification processing single stage setup performed gave efficiency. UASB reactors effectively reduced the TDS from 4500 mg/lit to 2750 mg/lit. Its removal efficiency is 48.61%. BOD and COD are important parameters of wastewater and their values indicate the organic pollution concentration. In this treatment BOD is removed effectively with the initial value of 257 mg/lit to the final value of 58 mg/lit. The percentage of removal is 77.43%. COD level also decreased from 1300 mg/lit to 250 mg/lit and the removal efficiency is 80.77 mg/lit. Its low operating power cost makes it worthwhile to consider. If power failure occurs, then process that not suffer, as it was already anaerobic in nature. Earlier study suggests that the UASB reactor is effective when it is used for treatment of low strength waste water. The sulphate removal ranges from 545 mg/lit to 300 mg/lit having the efficiency of 46.41%. The removal chloride ranges from 765 mg/lit to 365 mg/lit. The percentage of removal is 52.29%. The effective removal of phosphate in this treatment varies from 0.186 mg/lit to 0.02 mg/lit. The efficiency is 89.24%. There is an effective removal of oil which varies from 0.416 mg/lit to 0.05 mg/lit. The removal percentage is 87.98%. The pH value varies from 12.32 to 7.9 and the efficiency is35.87%. The total amount of biogas recovered during the whole project was 0.13 m^3 by the water displacement method. However in our project it is evidence that UASB reactors can also be used for treating the highest strength waste water such as textile industry waste water.

ABSTRACT

The aim of this study was to determine the *in vitro* antibacterial activity of the chloroform extract of *Bixa orellana* L. leaves against some pathogenic bacterial strains viz. *S. aureus* and *P. aeruginosa* by disc diffusion assay method. The zone of inhibition produced by chloroform extracts of the plant comparing with standard antibiotics discs showed moderately significant antibacterial activity. MIC was calculated. Quantitative estimation of total phenol content also has been done using Folin- Ciocalteu method in which Gallic acid was used as standard. Also antioxidant study has been done with peroxide method. Herbal extract gel has been formulated with the evaluation of its physicochemical properties. The molecular docking of the reported phyto chemicals with the enzyme was studied using biovia discovery studio. The strength of the interaction was evaluated with the help of HDOCK server. Lowest docking score gives an idea about ligand receptor binding process.

Keywords: Lipstick Plant, HDOCK, In-silico, Herbal extract, docking.

INTRODUCTION

Bixa orellana L. from the Bixaceae family, which accumulates several carotenoid derivatives, terpenoids and flavonoids in the seeds and leaves [1]. The medicinal uses of annatto seeds include the treatment of diabetes, skin infections, burns, fever, measles,gonorrhoea, diarrhoea and asthma [2]. In addition to their antimicrobial properties,

68444

Anindya Bagchi *et al.,*

the polyphenol content of annatto leaf extracts has shown other biological properties including antioxidant activity [3, 4]. However very few reports have been seen involving antibacterial activity of chloroform extract from the leaves of *Bixa orellana* L. The antioxidant study mainly has been done with DPPH method of assay. Also the in-silico study of the isolated active constituents responsible for the antibacterial and antioxidant activity from the plant extract have been reported in less numbers. Hence, considering the information mentioned above, this study was designed to evaluate antioxidant study with peroxide method and antibacterial activity of chloroform extract of the plant material followed by the in-silico study of the reported active constituents responsible for the activity.

MATERIALS AND METHODS

Materials

Methanol (Merck, India), Ethanol (Lobachem, India), Chloroform (Lobachem, India) were used during the extraction process. Gallic Acid (Lobachem, India) and Folin- Ciocalteu Reagent (Lobachem, India) had been used for the phenolic content estimation of the extract and Hydrogen Peroxide (Merck, India) was used for the antioxidant study by peroxide method. Hydroxy Propyl Methyl Cellulose (Lobachem, India), Propylene Glycol (Lobachem, India), Propyl Paraben (Lobachem, India), Methyl Paraben (Lobachem, India) were used for the formulation of herbal extract. The plant sample i.e. leaves were collected and air dried under shade at room temperature, ground with electric grinder intofine powder and stored in air tight container for further use. Powdered sample was mixed with methanol: water of 4:1 ratio (solvents) for extraction in 1:1 ratio. After that the material was filtered by using Whatman No.1 filter paper and the filtrate was mixed with (2-3) drops of 2M HCl and then mixed with the equal volume of chloroform as same as of filtrate. After the formation of bottom organic layer, it was taken and separated followed by evaporation of the solvent for obtaining the dried residue. The resulting chloroform extract solution was used for further antibacterial and antioxidant activity [5].

Phyto chemical screening of Extract

Following phyto chemical tests has been carried with the extract:

Terpenoids Test
Salkowski test

Dry extract was mixed with chloroform and few drops of conc. $H_2SO_4$was added, if red-brown colour formed at the interface can confirm the presence of triter penoid.

Alkaloid's Test
Dragendorff test

Few drops of Dragandroff's reagent was added to the 2 ml of the filtrate containing the extract, the formation of a reddish brown precipitate can signified positive result.
Wagner's test: Small amount of extract was mixed with few drops Wagner's reagent where formation of reddish brown precipitate can confirm positive result.

Hager's test

Small amount of extract was mixed with few drops of Hager's reagent and the formation of yellow colour precipitate may indicate signified positive result.

Mayer's test

Few ml of extract was mixed with few drops of Mayer's reagent where the formation of a creamy precipitate may confirm positive result.

Glycosides Test

If the extract gives positive result to Fehling (Fehling test A and Fehling test B) solutionthen it can confirm the presence of glycoside part.

Flavonoids Test

Ammonium test

Small amount of extract was mixed with dilute ammonia solution (1 ml, 1% v/v) and it was allowed for layer separation. If yellow colour is seen in the ammonia layer it may signified positive result.

Alkaline test: If small amount of extract was treated with a few drops of 20% (w/v) sodium hydroxide solution, the generated dark yellow material, which becomes colourless by the addition of dilute hydrochloric acid may signified positive result.

Steroids Test

Salkowski test

Small amount of extract was mixed with 2 ml of chloroform and 2 ml of concentrated sulphuric acid, if the generated chloroform layer was red coloured and the acid layer was yellow-green fluorescence in appearance it can signified positive result.

Phenols Test

Ferric chloride test: Small amount of extract was treated with 3-4 drops of 10% (w/v) ferric chloride solution and the formation of black green colour may signified the presence of phenolic compound [6].

Quantitative analysis of total Phenolic content

Quantitative analysis of total phenolic in extracts was determined with the Folin- Ciocalteu reagent. Standard used for the analysis was Gallic acid. Concentration of (10-50) mg/ml of gallic acid was prepared in methanol. Concentration of 1mg/ml of plant extract was prepared in methanol and from that 0.5ml of sample was introduced into test tubes and mixed with 2 ml of Folin- Ciocalteu reagent and 2ml of 10% of sodium carbonate solution. The tube was covered and allowed to stand for 30 min at room temperature before the absorbance was measured at 760 nm spectrometrically. The Folin- Ciocalteu reagent is sensitive to reducing compounds including polyphenols, thereby producing a blue colour upon reaction. This blue colour is measured spectrophotometrically. Accordingly, total phenolic content was determined [7].

Antioxidant activity of the plant extract

A solution of H_2O_2 (40 mM) was prepared in phosphate buffer (100 mM, pH 7.4). Extract (1mg/ml) was added to a H_2O_2 solution (0.6 mL) and absorbance was measured. Ascorbic acid was used as standard/positive control. Samples without hydrogen peroxide were used as a negative control. Absorbance was determined spectro photometrically at 230 nm. The abilities to scavenge the hydrogen peroxide were calculated using the equation: % scavenged (H_2O_2) = $(A_o - A_1)/A_o \times 100$ Where A_o is the absorbance of the control and A_1 the absorbance of the sample[8].

Antimicrobial assessment

The antibacterial activity was carried out using disc diffusion method. Bacterial strains viz*S. aureus* and *P. aeruginosa were* purchased from Microbial Type Culture Collection and Gene Bank (MTCC) Chandigarh. Bacteria was cultured in sterile nutrient broth medium which had been autoclaved at 121°C under a pressure of 15 atmospheres for 15min. and left to grow for 48 h at 37°C in an incubator. The bacterial cultures obtained were diluted with autoclaved Nutrient. This culture served as the inoculums for the antimicrobial experiments. For the evaluation of antibacterial property nutrient agar plates were prepared by mixing (28 g) in 1000 ml distilled water boiled to dissolve the medium completely. Nutrient agar solution was sterilized by autoclaving at 121°C for15 min at 15 lb pressure. After cooling (45°C), agar solution (25 ml)were poured into sterilized Petri dishes and left to solidify. Agar plates were inoculated with an overnight bacterial culture, using spread plate method after appropriate serial dilutions. The plant extract was aseptically put into the wells (100 µl approx.) made in agar plates making lawns of different test cultures viz.*S. aureus* and *P. aeruginosa*. The Nutrient agar plates were then incubated at 37°C for 24 h. The diameter of inhibitory zone surrounding disc and antimicrobial activity of the plant extract solution (2mg/ml and 3mg/ml) was then measured after 24 hours. Two cross sectional points and the average was taken as the inhibition zone and the

size ofthe zone diameter was measured in millimetres. The plates were then photographed individually. The results were compared with the standard drug, Streptomycin. [9-11].

In-silico study

Molecular docking method has been used to identify the phytoc hemical from the plant extract that act as a ligand and form a strong covalent bond with the microbial protein to successfully inhibit the microbe. The discovery studio module of the biovia software is using for identify molecular interaction and perform molecular docking. In this process, first the pdb files for the phyto chemicals (Kaempferol) found in the *Bixa orellana* plant were downloaded from the website drug bank .The protein3-oxyacyl-[acyl carrier protein] reductase (FabG) for unknown ligand data base code(4BNW)was collected fromRCSB protein data bank. Molecular docking was done using the HDock Server.The enzyme molecule was treated as the receptor molecule and the phyto chemical was treated as the ligand. The high positive value of those indicators presented a good interaction between the ligand and the receptor. Thus, the interaction with high values might indicate the major phyto chemical responsible for curing the disease [12]. Kaempferol interact with3-oxyacyl-[acyl carrier protein] reductase (FabG) therefore inhibiting the biosynthesis of fatty acids by Pseudomonas aeruginosa and responsible for antibacterial activity.

Method of formulation of herbal extract gel

The required amount of gelling agent was accurately measured and dispersed in a small amount of water with continuous stirring to produce a uniform dispersion. Then the drug was dissolved in a suitable solvent here using propylene glycol and added to the above dispersion. Other substances such as methyl paraben and propyl paraben were also added with continuous stirring. The final weight of the gel formulation was adjusted to 10 g with distilled water. The gel was stored in container with wide mouth.

Evaluation of gel formulation
Physical Characterizations

The composition of gel using different gelling agents tested for colour, odour, homogeneity, in which the gels were placed in containers.

Measurement of Surface pH

The pH formation of gel was measured using a digital pH meter. 1 g of gel was dissolved in 25 ml of distilled water in a beaker. The electrode was then immersed in the beaker solution and allowed to simmer for 1 minute and further reading was observed.

Spread ability

Indicates the level of area where the gel spreads easily when applied to the affected skin. The therapeutic potential of the gel also depends on its spreading value. It is periodically displayed in seconds taken by two slides to move from the gel placed between the slides under the direction of a specific load (20 g). The formula for calculating gel spread ability is: $S = M * (L / T)$
Where,
M = Weight tied to the top slide (20 g)
L = Length of the glass slide slipped
T = Time taken to split the slides.

Tube Extrudability

In this experiment was taken a closed folding tube containing the composition of the ciprofloxacin gel. The gel was pressed tight at the end and a clamp was placed at the end of the tube to prevent any loosening. A weight of 500 g was placed on tube and removed from the cap. The gel was pulled out. The formula for calculating tube extrudability is: $E = (M / A)$

Where,
E = Tube extrudability
M = Weight applied on tube (500 g)
A = Extrude gel area [13].

RESULTS AND DISCUSSIONS

Phyto chemical Screening
The result showed that the chloroform extract has primarily flavonoids and phenolic part which is generally important for antibacterial and antioxidant activity. *Ocimum tenuiflorum* was used as positive control to find out the validity of the reagent used for phyto chemical screening.

Quantitative estimation of phenolic content
The absorbance value of the plant material is 0.911Now by plotting the value on the equation the conc. was found out to be is 63.26 ug/ml.

Antioxidant assessment
Percent Scavenged; % $(H_2O_2) = [(A_0 - A_1)/A_0 \times 100]$
Ao= Absorbance of the control = 0.515
A1= Absorbance of the plant sample = 0.235
So according to equation
0.515- 0.235 = 0.28/0.515=0.5436×100 = 54.36%.
From the above result it has been seen that the plant extract has showed significant effect in the dose 2mg/ml.

In-silico Study
These are docking score of 10 modules involving docking of ligand and receptor. Module 1 shows the least value so it could be judge as the best fit.

CONCLUSION

According to the results obtained in this investigation, it can be concluded that the chloroform extract of the selected plant entity is having the moderate antibacterial activity in two different pathogenic species. Also the plant extract shows the antioxidant activity have been measured spectro photometrically which may cause scavenging of free radicals forms inside the biological systems. Total phenolic content have been measured which may influence the both antimicrobial and antioxidant activity. Insilco study has been done for a specific pathogenic bacteria enzyme whose activity can be blocked by a reported phyto constituents leading to the antibacterial activity. Herbal extract formulation has been prepared with its evaluation of physicochemical properties. In future the herbal formulation can be tested for the antibacterial activity and further Insilco study can be done with different phyto constituents responsible for the different activities if the protein/enzyme structure of the pathogenic entity is known, responsible for the different types of diseases.

ABSTRACT

Early and correct diagnosis of Tuberculosis (TB) are very important to end TB. Chest X-ray (CXR) is an important tool for screening TB and confirm the diagnosis in fewer situations. Greater Chennai Corporation using Mobile Diagnostic Units (MDUs) fixed with Xray-with AI. The objectives of the study were to find out the X-Ray screening performance in MDU vans using AI tools in GCC, Tamil Nadu. Artificial intelligence (AI) used to increase access to quality TB screening diagnostics in high-risk locations. Genki-AI powered Public Health Screening Solution from Deeptek was used for TB screening after uploading CXR images from MDU. X-rays taken have been uploaded in AI software and the results been available immediately after uploading. A radiologist reports also generated to take further course of

68453

action. There were 79462 CXR taken from April 2019 to April 2022 from 7 MDU vans. Among 3.4% were identified as suggestive of TB, 1.4% as old TB, 0.89% as COVID (from 2020) and 7.2% with other chest abnormalities. All positive reports by AI were supplemented with radiologist's report. AI helps in faster screening for further public health action and eliminates the challenges of availability of functional X ray, interpretation, and reporting.

Keywords: Tuberculosis (TB), Chest X-ray (CXR), screening, Artificial intelligence (AI), Machine learning, Public Health program, NTEP

INTRODUCTION

Tuberculosis (TB) is a public health problem which needs sensitive tools and technology for early diagnosis and treatment. Artificial Intelligence (AI) is defined as algorithms encoded in technology to learn from the given data which are given to a system to do automated tasks without every step in the process having programmed explicitly by a human [1]. AI systems gained more importance in the last decade because of their vast potential in improving economic value and helps to alleviate the social challenges. Currently India doesn't have an AI framework. The concept of responsible AI for all is made in India as an ethically sound and ready to implement to benefit the community at its best [2]. Many countries use AI for screening the diseases, rapid diagnosis, clinical care, discovery of drugs and management of public health.[3]. Tuberculosis (TB)remains the leading cause of morbidity and mortality in developing countries, including India[4]. Because of high TB burden in India many interventions are underway to eliminate TB. In India in 2021 there were 2.14 million TB cases notified which was 18% more than 2020 but 18% less from the baseline data [5]. Various intervention simplemented by the National TB elimination program (NTEP) of India to increase case detection by intensified door-to-door Active Case Finding helps to screen more presumptive patients and ensure no missing of any household, increased diagnostic capability to strengthen detection efforts through molecular and digital tools [6].

Undiagnosed pulmonary TB contributes significantly to transmission, and delayed diagnosis also worsens treatment outcomes of patients, both will increase mortality and morbidity[7].For TB Chest X-ray (CXR) is one of the screening tools to increase the sensitivity of diagnosing TB [8].Limitations of using CXR in the community setting includes functional X ray availability, interpretation, and reporting, mobilizing the beneficiaries, cost of tests. The usage of chest x-ray as a screening tool has been limited by high inter-reader and intra-reader variability and moderate specificity, as well as limited availability of radiologist [9]. As mentioned above, usage of AI in public health programme is very much limited. In high-risk locations of Chennai Greater Chennai Corporation (GCC) has started programmatic intervention "TB Free Chennai Initiative" (TFCI) to increase access to quality TB screening diagnostics[10]. The intervention includes digital chest x-ray via mobile diagnostic unit (MDU) vehicles followed by artificial intelligence-assisted interpretation of the digital chest x-ray. The objectives of the study were to determine the X-Ray screening performance in MDU vans using AI tools in GCC, Tamil Nadu.

MATERIAL AND METHODS
Setting and Participants
The type of study was a cross sectional retrospective study. Duration of the study was one year with data extracted from April 2019 to April 2022. This study extracted the information of X-rays which were taken in Mobile Diagnostic Vans (MDU) of Greater Chennai Corporation (GCC). Both the X-ray results and results of Artificial intelligence data were compiled.
Process
For presumptive TB cases and high-risk groups of populations, MDU set of arrangement is used to screen in uncontrolled diabetes patients, smokers, people who have HIV/AIDS, Slum dwellers, chronic diseases, old TB cases and who are identified during vulnerability mapping. The vans are fixed with portable X ray. An artificial

Intelligence system was installed in this was to enable the screening of X-ray so the X ray's which has high index of TB in AI results, will be sent for other tests for TB without any time delay. A radiologist reports were also arranged for cross confirmation of the positive results of AI. People with negative X-ray results were being followed up and X-ray suggestive of TB were subjected for other sputum test (NAAT).Based on the sputum test results the patients were started on TB treatment as microbiologically confirmed TB case or clinically diagnosed TB case after medical consultation. The process of MDU operation is given in the schematic diagram (Figure 1). Based on the vulnerability mapping and landscape of TB data, the micro plans for each van were developed. For community preparation, the visit plans were shared to the field staff and front-line workers well head of visit. Field staff conducted the public announcement and household visits before. The eligible persons were invited to the camp. Direct walk-in clients were screened for TB and X ray was taken. In the MDU camp registers, all the process was well documented. X-rays taken for the day were uploaded in the cloud system of AI in DICOM image format and the AI results were available immediately. The AI was assisted by Deeptek uses the special technology called Genki public health screening Solution, Edge. It is called "AI+Expert in the loop" and gives an "end-to-end imaging workflow". It covers 17 chest pathology types, including TB and COVID 19 like infections. Three key highlights were classified, localize, and quantify lesions. The other cloud techniques named Augmento, an extended cloud-based AI system is also available[11].

Data collection and statistical analysis
MIS system of AI was given with the demographic details of the beneficiaries, X-ray images, AI results and Radiologist opinion. All the above information was downloaded as per the given timeline. The downloaded information was categorized as TB suggestive and TB non suggestive. Descriptive statistics were applied.

Ethical and administrative approval
Ethical approval was obtained from the Institutional Ethics Committee of Madha Medical College and Hospitals, Chennai. The administrative approvals were obtained from the Commissioner of GCC Tamil Nadu.

RESULTS

Demographic details of beneficiaries
In total 79,464 beneficiaries availed X-ray services in the MDU vans. Among them 52% females and 48% were males. Among attendees 80% were availed X-ray services in morning camps only. Children and old age person's count were low. The maximum attendees were between 40 to 60years. Operational pattern of MDU In 2009, total 7 vans were in the field and 27714 people utilised services; In 2020,5944 beneficiaries availed services through 5 vans; There were 34936 participants in 2021 availed services through 6 vans and 10868 utilized services in partial 2022 through 4 MDU vans.

Pattern of disease spectrum in CXR–AI
AI gave results of various chest abnormalities including Tuberculosis and old Tuberculosis. The pattern of diseases identified through AI is given in Table 1. COVID-19 disease pattern was introduced from 2020 onwards. Out of all X-rays taken, 56.83% (n=69004) were normal, 3.46%(n=2750) suggestive of TB, 1.4%(n= 1122) old TB, 0.48%(n=378) poor quality images, 0.89%(n=4650) COVID-19 suspected X rays and 7.2% (n=5743) having other chest abnormalities (Table 1). COVID-19 was inbuilt in AI system from 2020 onward only.

Pattern of TB and old TB
Among all, 0.5 % of images taken were excluded from analysis because of poor quality. The TB positivity rate pattern in various years is given in Figure 3. The TB positivity rate from 2019 to 2022 was 5.95%, 1.08%, 1.96% & 3.26% respectively. The overall TB positivity rate was 3.48%. Old TB positivity rate was 1.42% (Figure 2).

DISCUSSION

Current study demonstrates the usage of AI for X-ray screening of Tuberculosis in public health programme setting. Greater Chennai Corporation with the help of partner agencies taken care in selecting and evaluating the AI system for tuberculosis. The involvement of health system staff is the key in imposing the latest technologies to the common public. The current model is continuing in Chennai and adopted in few other locations of Tamilnadu and other parts of country [12,13].Their radiologist helped in giving the specialist report, so the patients were able to start on treatment without any time delay. The availability of early AI reports enables the health system to undertake various other tests without any time delay. GCC is keen to provide continuous improvement in quality of care, including treatment prescription for TB care [10]. The current model is the best example for decentralization of diagnostics to the community level. The sensitivity of TB tests is increased when we add Chest X-ray with another diagnostic tool [14].CXR plays an important role in triaging the individuals along with symptoms screening. The other tests usually in use are Sputum Smear microscopy or NAAT. This method of screening is known as targeted screening of symptomatic individuals where it yields superior result and cost-saving.ACF is one of the key approaches that can address the challenges of TB among tribal communities [15]. For diagnostic decision-making, WHO recommend computer-aided detection software like AI to read X-ray images [16].

DeepTek Genki v2 performed on a par with Expert and Intermediate Readers [17]. AI products including qXR (Qure.ai, India)) is more than 80% sensitive [18]. National Strategic Plans to eliminate TB (NSP) is ready to invest in research to develop additional new tools required to end TB and in the rapid uptake of available new tools such as automated digital chest x-ray interpretation [19].Many start-ups started supporting AI X-ray screening. [20]. Central TB division of GoI. is exploring various new interventions to address the challenges in the TB treatment cascade and improve processes and management of TB cases using AI with machine learning[21]. NITI Aayog has decided to focus AI on health care sector. Some of the high-level issues in AI usage are lack of data eco system, cost, low awareness to adaptation, privacy, and security. Most of the time it stops at academic or at research levels. Many start-ups are helping the society with low-cost technologies [22]. The current study had certain limitation and challenges. All the MDU vans were not continuously functional due to HR and other administrative problems. Few numbers of poor-quality images were reported because of poor understanding of the beneficiaries on the prerequisite of chest X ray posture. Male attendees are less in the MDU camp as they go to work outside during the camp timings. So, majority of the camps were planned in the early morning or late evenings and holidays.

CONCLUSION

In the scarcity of radiologist availability, AI helps in early case-finding using X-ray screening which helps in early public health action. With the provision of MDU services, access, and availability of resources for X-ray were further reduced.

ABSTRACT

With the corporate world going through tough competition, business units need to constantly innovate and upgrade using the latest technology. This goes well not only with large-scale and medium-scale enterprises, but also those small-scale as well as micro-enterprises and cottage industries, mostly run by women entrepreneurs. While these women entrepreneurs are playing a vital role in the development of the Indian economy, they need to ensure they are ready to be the game-changers by moving with the time and are implementing the best practices in their business. Such technologies help in ease of production process, improvement and standarization of quality as well as wastage of resources. Also, technology can also be used for identifying newer markets and the means to reach there. With the world that has now become a global village, technology has also become the backbone of supply chain management. the Hence, the more use of technology, the higher the benefits for the entrepreneur.

Keywords: MSME, Small Scale Industries, Women Entrepreneurs, Entrepreneurship, Technology in women enterprises

INTRODUCTION

Entrepreneurship has been one of the oldest professions in the world. According to the Global Entrepreneurship Report 2023 Global Report, the number of entrepreneurs in the world is approximately 594 Million, which constitutes 7.4% of the overall global population. The number of women entrepreneurs worldwide is approximately 252 Million, which accounts for 43% of the total entrepreneurs. India leads all other countries with approximately 105 Million entrepreneurs, out of which around 15 Million are females. Therefore the proportion of female entrepreneurs in India is about 14%, which is very less as compared to the global rate. Most of the large-scale and medium-scale enterprises in India are owned by men, and the proportion of female entrepreneurship is slightly higher in Small-scale and

Aadarsh Pillai and Rina Dave

Micro-enterprises, which is about 20%. These female entrepreneurs provide employment to about 25 Million persons in India. Female entrepreneurship is also higher in rural areas, as compared to the urban parts of India. With a major chunk of these units belonging to the Micro-units and Cottage Industries mostly operating from home or from unorganized set up, use of technology and process automation remains a challenge. This is also triggered by the low literacy level of such female entrepreneurs in the rural areas. With the market continuously evolving amidst increasing competition, and customers demanding better quality products, business units need to evolve by embracing technology not only to improve their production process, but also to innovate and develop newer products.

REVIEW OF LITERATURE

In [1] **Gulia, Suman (2022)**has done a detailed study on the problems faced by Indian female entrepreneurs and has also enlisted the various schemes designed by the Government of India, to provide financial assistance to female entrepreneurs. In [2] **Aggrawal, Artee; Carick, Jon; Kennedy, Jeffrey and Fernandez, Giovanni (2022)** have conducted an exploratory study to understand the plight of women entrepreneurs in India, having done indepth interviews of ten women entrepreneurs to come to their conclusions . In [3] **Saraswat, Ritwik and Lathabahvan, Remya (2020)** haveconducted an extensive study on the factors affecting entrepreneurship amongst females in India, and to understand the mindset of the people of various strata of the society, regarding female entrepreneurship. In [4] **Arya, Sadhana; Panda, Shiba and Kaur, Gurveen (2017)**have elaborated on the status of female entrepreneurs in India and they have also done a study to understand the reasons behind females taking up the role of entrepreneurs in the country. In [5] **Rajalakshmi, A. (2014)**has highlighted the role of women entrepreneurs in the development of the Indian economy, and felt the need to provide more resources to the female entrepreneurs so that they can take their businesses to greater heights.

OBJECTIVES
This study focuses on the women-led micro-enterprises and cottage industries thriving in Uttarsanda area of Kheda district in Gujarat :-
1. To understand the level of technology and automation used by them in their business set-up
2. To identify the challenges they face on ground, to adopt new technologies.
3. To ascertain whether the production capacity is being fully utilized and what can be done to overcome any underutilization.

RESEARCH METHODOLOGY
In order to have an indepth knowledge about the role of women entrepreneurs, and the overall common challenges faced by them, secondary data has been used. This is mainly through study of previous research papers on this topic, as well as information released by the Government of India. As regards to the on-ground performance of the female entrepreneurs in Uttarsanda, the authors have conducted personal interviews of 5 of the top entrepreneurs of that area. Since there is no analysis of data involved in this study, no statistical tools have been used in this context

STUDY FINDINGS
Uttarsanda village lies under Nadiad Taluka in Kheda District of Gujarat. As per the Census conducted by the Government of India in 2011, the population of Uttarsanda was 10,616 and it is estimated that the present population is upto 12,950. The literacy rate of this village was 90% as per the 2011 census, which is much better than the state literacy rate of 78% and the national literacy rate of 74%. Uttarsanda is also known for the various varieties of Papads being manufactured in about 35 micro-enterprises that have been operational in this area, most of them have been around for more than 30 years. The main speciality of these units is that most of them are run by women entrepreneurs, and it also employs a nearly 95% female workers in the entire production process. It is estimated that the total turnover of these units is Rs. 70 crores per annum. 80% of the households in this village have their relatives

Aadarsh Pillai and Rina Dave

staying abroad, mainly in the USA and UK, and these NRIs/PIOs have made it a point to carry back a fair quantity of these local papads, whenenver they visit India. It is also estimated that 20% of the products manufactured here are exported. However, with all these fanfares, where does Uttarsanda stand as compared to the overall market size in the country? As per the Forst and Sullivan Analysis, the papad market in India was of Rs. 74 Billion in the year 2021, out of which 32% was catered by the organized sector whereas remaining 68% by the unorganized sector. The papad market is estimated to grow at a CAGR of 7.6%, which means reaching a market size of Rs. 100 Billion by the year 2023. Therefore the total market share of these units in Uttarsanda is roughly 1%. There is an ample scope of expanding the market share by concerted efforts. Detailed discussion and probing during the interviews of the entrepreneurs (including the units that are operational now, as well as those who operate in seasons) have come out with some interesting results.

The ground reality inUttarsanda is that only 7 units operate throughout the year. Remaining 28 units operate seasonally, mostly during the Diwali season when they consider the demand to be high. Therefore 80% of the units remain shut for most part of the year. As for these 7 units which operate throughout the year, there are some similarities in them :-

1) They have semi-automatic papad making machines of various capacities installed.
2) They have also expanded their product range by introducing various flavours and types of papads and other snacks.
3) They have their websites through which they are also catering to their online orders as well as export enquiries.
4) They use modern marketing techniques in order to promote their products through social media. Therefore they have succeeded in promoting their brand.

None of these units have any dedicated R&D activities, therefore the chances of product innovation, new product development, etc. is very bleak.
With such a huge market lying open, the main reasons why other units are still operating only during seasons, thereby causing huge capacity underutilization,are :-

1) Sticking to the some old conventional product range
2) Not willing to upgrade their production process from manual to automatic or semi-automatic
3) Lack of proper understanding of the overall market size within the country
4) Reluctance in using modern marketing techniques such as online marketing, social media marketing, etc
5) Considering exports as a cumbersome process and an activity of high risk.
6) Lack of a formal association or group that could keep them in loop with the market trends as well as other factors.

None of these entrepreneurs were in favour of creating an association or society, as they believed in operating independently. And none of them cited financial difficulties as a reason for their underperformance.
Therefore the willingness to share knowledge or to create avenues of expansion through cooperation, was totally absent.

CONCLUSION

India has been a very good market for processed food and more players are now entering the market, as these organized sector units invest in new technologies, automation, quality enhancements, etc. Papad and similar snacks have been a regular part of the Indian food habit. With such a huge market for this item, and such big scope for the organized sector to play within, the overall performance of these women-led enterprises in Uttarsanda, is not upto the mark. The need of the hour for them is to embrace technology to automate their production process, focus on R&D of newer products and variants, as well as tap the market using proper technological tools to promote their

Aadarsh Pillai and Rina Dave

products. Sticking to conventional products and conventional production process would not be helpful in the long run.

ABSTRACT

Aravind Adiga's *The White Tiger* is a debut novel published in 2008. He portrays the socio-economic condition of modern Indian society. Adiga has tried to paint a realistic picture of contemporary India. He speaks of various issues prevalent in Indian society. India is free now but people belonging to poor communities are exploited and humiliated and are still deprived of their rights. As in the jungle timid and weaker animals are hunted similarly down trodden poor people become prey to the powerful and rich people. Through the protagonist of this novel Balram Halwai, Adiga has depicted the class struggle, poverty, and social injustice. This struggle is longing from many epochs in various forms. People rebel against such suppression and revolution brings hope of freedom. Similarly, the hero of this novel tries to break the chains of servitude. Adiga presents his hero, Balram as the face of every Indian working class who undergoes various sufferings and exploitation in contemporary India. The novel represents the journey from rags to riches of an innocent rural youth transforming into a corrupt rich businessman. Through this paper, it is an attempt to depict the traumas created socially and economically. This novel presents the quest of a man longing for freedom who becomes the victim of poverty and discrimination and finally, chooses the unethical path to get his rights by murdering his boss, runs away with the stolen money ends up with a successful rich entrepreneur.

Keywords: Struggle, Rags to riches, Exploitation, Social injustice, Poverty

Mamta Chaudhary and Mursalin Jahan

INTRODUCTION

The White Tiger won the Man Booker Prize in 2008 and was adopted in a Bollywood movie directed by Ram Bahrani. This novel reflects various hypocrisies prevalent in our society. In today's era, people are moving toward development but on the other hand, some people who are deprived and underdeveloped still exist. People from weaker sections are exploited and suffer various miseries after toiling hard. Their socio-economic conditions have made them crippled. Karl Henrich Marx, the German philosopher along with his collaborator Friedrich Engels published a pamphlet *The Communist Manifesto* in 1848to serve the rights of proletariats. Marx has discussed various consequences of proletariats, and how they are being exploited, humiliated, and alienated. In capitalist society, bourgeoises are becoming richer and proletariats are becoming poorer, due to the social structure created according to their interest. Karl Marx gave the theory of Marxism. Marxism was against capitalist society as it did not provide equal opportunities. He emphasized an equality-based classless society as the capitalist society lives for its own sake with ruling behaviour considering vermins that can be easily crushed. It becomes evident that the bourgeoisieis unfit any longer to be the ruling class in society."It is unfit to rule because it is incompetent to assure an existence to its slave within his slavery, because it cannot help letting him sink into such a state that it has to feed him instead of being fed by him. Society can no longer live under this bourgeoisie. ((The Communist Manifesto 53)

Aravind Adiga's novel *The White Tiger* deals with the themes of poverty, exploitation, social injustice, and deprivation and portrays the social and economic context of contemporary Indian society. He unveils Indian culture based on the division of class. The hero of this novel cannot put up with social injustice and inequality and comes out from the pit of slavery. His journey begins with the intolerant drowning phase, so he grabs it ferociously, making his life move like a boom reaching its horizon from rags to riches. Balram Halwai, the protagonist of this novel lives in a village, Laxmangarh in Gaya, Bihar. He belongs to a marginalized community who has to toil hard to earn his livelihood and face deprivation in terms of basic rights like education, and health. Balram's father, Vikram is a rickshaw puller. He wanted to give education to his children but his condition never allowed and was helpless. Due to the inadequacies of the medical department, he had to pay for the ignorance of his life. He didn't get proper treatment to cure tuberculosis and died with his barren hopes. He always wanted his sons to study and come out from this trench as many fathers like him had spent their whole lives like donkeys carrying out the burden. He was aware that education is the medium to remove ignorance and can uplift them."My whole life, I have been treated like a donkey. All I want is that one son of mine - at least one - should live like a man." (Adiga 30).

People of lower strata are maltreated by the greed of higher-class people. In childhood, Balram was compelled out of poverty to abandon his education and work in the fields. Poverty didn't give him a chance to study and uplift his upcoming generation. Being a vivacious boy since childhood gained him nothing. Due to his intelligence and cleverness, he was named as "White Tiger" by the Education officer. His high spirit has pushed him forward as he has a strong urge to attain the desires of his life by crossing the boundaries of slavery. The history speaks about the profession associated with caste and economic status. In today's era, every citizen wants to educate their children to have better opportunities and a good life, belonging to any strata. According to article 12 to 35 contained in part 3 of the Indian constitution, the Government has guaranteed individuals, the fundamental rights acts and can exercise them. The scenario of rural is unspeakable. The peasants who used to feed the people by means of agriculture are now finding difficulty in their survival. This is unfortunate that peasants who are the producers and agriculture base of our country come to the city to work and fetch humiliation and exploitation. Social and economic inequality is like a quagmire where the poor once entangled will never come out. They become prey to the capitalist class. In greed of achieving more, their desires become limitless and result in the exploitation of workers. After working hard with no fixed hours, workers receive meagre wages which are not sufficient to fulfil their basic needs. This is a pitiful condition for workers who are deprived of basic needs. Adiga has depicted exploitation by landlords, where Balram along with his family was also exploited by the landlords. This oppression is mentioned by Karl Marx and Friedrich Engels in *The Communist Manifesto*, "It has but established new classes, new conditions of oppression, new forms of struggle in place of the old ones."(32) The landlords are four brothers and are the chips of the same block. The whole

Mamta Chaudhary and Mursalin Jahan

family works in the field of Stork to repay the loan amount. The amount of loan takes a gigantic form which is easy to disburse but cannot be closed quickly. This is a thirst for greed to gain more and more with less investment. These landlords exploit peasants and poor workers differently. They are no less than the Britishers who left our country long ago but their existence has not faded as the place has been taken by the rich people. According to Balram poor cannot be free until they are in the clutches of the corrupt hypocrites. "only a moron would think that we became free then." (Adiga 63). Many Indian renowned writers have tried to highlight severe issues in our society through their literature. Munshi Premchand's *Godaan*, based on the theme of socio-economic deprivation, *Kafan* highlights the realities of poverty and the struggle of the lower class. Mulk Raj Anand's *Two Leaves and a Bud* presents the real picture of the sufferings and exploitation of a labour class at the hands of Britishers and Landlords. A few more novels like *Coolie* and *Untouchable* are also based on themes of poverty, exploitation, and social injustice. The novelist Kamala Markandaya's *A Handful of Rice* also portrays poverty and discrimination in Indian society where rural youth Ravi Shankar migrates to the city in the hope of better opportunity but his condition deteriorates and even unable to arrange food for his family. Later, Balram started working with his brother at a tea stall.

Balram has a hope to get equality and believes in himself to accomplish it. However, he could not study much but believes in gathering knowledge. So, he usually eavesdrops on the conversations of customers and keeps himself updated. He has always kept his hopes high and greed to have a better future. Balram indifferent to others adopts all means in his life that can be fruitful to him. Balram learned to drive. Along with this skill, he learned the art to survive in the jungle. The skill of driving fetches him a job at Stork's house as a driver. These Stork brothers are the dictator landlords of the village. They didn't leave any means to exploit villagers. Adiga through these landlords has portrayed landlords as an agent to exploit peasants. Like other peasants, Balram and his family were also the victims at the hands of the landlord. Due to social dominance people rebel out of tyranny. Soon he realized that the reality of the ruthless place is that people with wretched poverty cannot survive in the jungle. One has to be a sycophant and follow the corrupt life to survive. Balram also does the same by taking an unethical path. After getting a job as a driver, Balram shifted to Delhi where he lived in a servant quarter along with an old driver, Ram Prasad. This driver also suffers and becomes the victim of racism. He hides his religion and works at Stork's house. Being capable and skilful he had to hide his identity to save his job. This is the reality of haves-not, having no rights of their own, where caste and religion are superior to their skills. In *Marx and Marxism*, the writer expresses his thoughts regarding religion, "Religion is not merely a ruling-class invention foisted onto a passive and innocent people. To abolish religion, one had to abolish an irrational and unjust society." (PW 19 Chapter 1). Apart from driving these servants do other menial work. The novelist has depicted various issues in our society by emphasizing caste, religion, poverty, and orthodox which is a trap of bondage. Through the characters in the novel, he has also brought racism to light, one of the most vogue issues in our society.

In *The Communist Manifesto*, Marx and Engels stated about the treatment of the poor, "for exploitation, veiled by religious and political illusions, it has substituted naked, shameless, direct, brutal exploitation." (36) Adiga has presented two sections of society through his characters Balram(poor villager servant) and Ashok(corrupt businessman) who contrast in every manner. "Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other: Bourgeoisie and Proletariat." (*The Communist Manifesto* pp. 33). The author brings this corruption into the limelight where people belonging to the affluent class commit crimes and servants and drivers are put behind bars in their places. He shares that in Delhi majority of jails are filled with these victims and real culprits are roaming freely. These rich culprits believe that if they pay, they own the servants. Such incidents are a bitter truth of our society which is casually practiced in our society. This is indirect exploitation and humiliation of the lower class by upper-class people. Our country is free but people have not been freed completely. Today people are suppressed in many ways. Usually, rural people migrate to the city in the hope of a better life but are unaware of the fact, that due to their migration cities are overflowed and face severe economic issues that affect migrants adversely as said by Paul Kurtz, in the book *Humanist Manifesto 2000.*This is an instance to show the extent of suppression and rule over the proletariats. These upper starta are like vultures, always seeking a chance to grab their prey. Adiga describes the dual sides of India: Dark and Light. Darkness is where unprivileged people live and is associated with the struggles and miseries of workers. It is a place where children are born but

Mamta Chaudhary and Mursalin Jahan

there is no one to take care. The protagonist of this novel has no name in the beginning. His parents paid no attention to naming him as earning to survive was a priority than naming the child as belonging to darkness. And those who are rich by money live in light with all sorts of comforts. The people belonging to darkness do all the basic work which may called menial work. The novel shows the lifestyles where the rich enjoy a luxurious life with air conditioning, living in apartments and enjoying other luxuries, whereas the poor are staying under bridges with no roof above them. "you can tell by their bodies, filthy faces, by the animal like way they live under the huge bridges and overpasses, making fires…." (Adiga 119-120) According to Adiga, people migrate from villages to cities seeking employment, where they work as drivers, cooks, maids, labourers, and do other work with little amount. "These people were building homes for the rich, but they lived in tents covered with blue tarpaulin sheets, and participated into lanes of sewage. It was even worse than Laxmangarh…The slum ended in a sewer…." (Adiga 260) The author of *The White Tiger* sarcastically shows when the rich go for dieting and fasting to be lean and thin but the irony is that the poor are already thin and curved out of poverty. On one side India is moving towards development with an increasing economy but on the other hand conditions of the poor are stagnant.

In this novel, Balram becomes the victim of the ruling class. It is believed that the poor are not masters of their mind and those who pay them are their masters and considered as God. "We have left the villages, but the masters still own us, body, soul, and arse. Yes, that's right. We all live in the world's greatest democracy here. Doesn't he have the right…? He has no sense of privacy." (Adiga 169,189) Balram refuses to live in a rooster coop where people like him are suffering from poverty, deprivation, and various miseries. He wishes to move beyond the social ladder by breaking the orthodoxy of traditions and free from the fetters of bondage. As Balram takes a step forward to break slavery, he is pushed back in a reversed direction toward deteriorating conditions. Balram was asked to accept a crime which he did not commit. His corrupt boss, Ashok allures him with different offers, and other Stork members threaten him indirectly. In reality, the crime was committed by an American lady, the wife of his master Ashok. She runs over a child with her car in a drunken state. It is the same thing as paying the bill in someone else's name, instead of realizing the guilt, Stork's family uses hook and crook to force Balram to accept this crime and try to frame him as a murderer as Go to old Delhi, behind Jama Masjid… Hundreds of pale hens and brightly coloured roosters, stuffed tightly into wire-mesh cages, packed as tightly as worms in a belly, peeking each other…, the whole cage giving off a horrible stench- the stench of terrified feathered flesh. On the wooden desk above this coop sits a grinning young butcher, showing off the flesh and organs of recently chopped-up chickens, still oleaginous with a coating of dark blood. The roosters in the coop smell the blood from above. They see the organs of their brothers lying around them. They know they're next. Yet they do not out of the coop (Adiga 173)

Balram has tried to fulfill his desires by being honest but the dominancy of the capitalist class keeps no means to crush his desires. He kept his spirit high and tried hard to become successful. He was an innocent youth belonging to a rural area who simply came to the city to have a better life. But this society has snatched his innocence and taught him social hypocrisy by leaving him corrupt. He therefore justifies his motive by writing a letter to the Chinese premier, Wen Jiabao declaring not to live whole his life like an underdog. "I cannot live the rest of my life in a cage." (Adiga 278). So, he rejects the tyranny of these rich hypocrites and stands rebellious against them to fight for a better life as the limit of tolerance was crossed and he cannot stand up more with injustice and poverty. He also follows the same path of corruption as seen and learned earlier to fill his appetite starving for his own identity. Soon he gets the chance, and his anger bursts on his boss Ashok. He picks the wrong way by killing his master and running away with his money to Bangalore where he converts into a rich successful entrepreneur. Out of compulsion, Balram accepts the corrupt ways of life, which is well depicted from the statement "I was corrupted from the sweet innocent village fool into the citified fellow full of the debauchery, depravity and wickedness." (Adiga 167) Balram always observes his boss, Ashok bribing corrupt politicians to run his work without hindrance. His mind always raises a question…why can't he benefit financially like others opting for corrupt means…Adiga emphasizes the incidents occurring and how they affect the protagonist. Balram was always seeking the chance to break all social fetters escape from the suppression of this society and finally become part of this ruthless society. In his journey, he encounters the social structure and its contrite practices, which affect workers adversely. Balram revolted against the capitalist society as the revolution was only the way to move out of it. "Only by revolution, he now believed, could

capitalism be overthrown; only the proletariat was capable of undertaking that action."(PW21 Chapter 1). Balram after being surrounded by the clutches of his master and escaping from being hatched by conspiracy, didn't find any way out. So, he justified himself by murdering tyranny in the form of Ashok because his fight was against exploitation and poverty. His desires are now endless as money has given him feathers to reach the top strata and believes in changing his destiny by himself. He never wanted to be swamping like fishes and ultimately, escaped from the rooster coop and saved himself from being butchered at the hands of butchers. Finally, Balram shows his power and proves his name "White Tiger" by hunting the lamb (Ashok) as this Tiger has a quest for freedom and wants to be independent. White Tiger has taken a leap of success. This transformation from Halwai to a rich businessman with a new identity, who once was a driver of his master and is now the master of all drivers. "a driver to a master but now a master to a driver" (Adiga 302). He is the same child who was once scared of small reptile lizards on the wall of a classroom and now he becomes a monster who can gulp a man also.

Balram has defined the society as a jungle that is full of wild animals, strong, ferocious, and dangerous where weaker and timid get hunted. People with big bellies have been denoted with wild animals who keep eating and growing up their bellies. This law of the jungle applies in the real world with two destinies eat or get eaten up. At the beginning of narration by the narrator, Balram asserts "I am tomorrow" (Adiga 04), and proves himself as "I am light now, but I was born and raised in darkness." (Adiga 14) This novel is a journey full of struggles of a poor innocent villager who did not compensate for his desire to reach a higher social status. He proved that rights can't be begged, sometimes revolution is important to start. His rebellion was not for a single person but against the tyrant sections. He achieved climbing the social ladder but has paid huge for it. His success has paid him isolation with no companions and left him with the dark secret behind his successful career. He is now rich with no morals as his hands were stained with blood.

CONCLUSION

Aravind Adiga's *The White Tiger* is the portrayal of the dark side of Indian society through the narration of a village boy Balram Halwai and his journey from rags to riches. Rousseau has stated well that, Man is born free but everywhere in chains. Adiga depicted the voices of a darker phase of the underclass and broke the myth that social evils have no existence in our society. The roots of these evils are scattered all over and are affecting our society. This novel portrays a similar picture of underclass people who suffer various issues like poverty, exploitation, and social injustice. Adiga has portrayed a real picture of Indian society through his hero Balram Halwai, the journey of darkness from the darkness of the village to the light of richness as an entrepreneur in Bangalore. His journey from rags to riches, who runs from poverty to have a better future, undergoes various ups and downs in his job and faces social injustice. Finally, he vented out the anger in his heart by ending his source of torture and exploitation by murdering his boss, stealing a bag full of money, and becoming a rich entrepreneur in the city of Bangalore by bribing police to make a final escape from poverty.

ABSTRACT

The cultivation of fruits and vegetables, commonly called horticulture has been quite successful in Lakhimpur district of Assam. The paper is an attempt to study the status of horticulture in Lakhimpur with special reference to Agricultural Development Office circles, Laluk and Narayanpur. The study looks into the factors that have contributed to the growth of horticulture in the two areas, as well as the problems that stand in the way of development of horticulture. An attempt has also been made to make a comparison of the two ADO circles. The study is based on observation and direct interview method. The data has been collected from primary as well as secondary sources. It has been found that there is disparity in the development of horticulture in the two areas. However, there is ample scope of horticulture to boost the economy of the areas.

Keywords: Horticulture, Development, Disparities, Government

INTRODUCTION

Horticulture is a science and an art of production, use, and enhancement of horticultural crops such as fruits, vegetables, spices, sauces, decorative, plantation, medicinal, and fragrant plants [1]. Horticulture is a combination of the Latin words "hortus", which means "garden"and, "cultura", which means "cultivation". Nearly 58% of India's population relies on agriculture and its related activities, including horticulture, as their main source of income [2]. Around 30% of the nation's total agricultural production is produced by the horticulture industry, which makes a significant contribution to the expansion of the agricultural sector in 2019-20. After China, India is the world's second-largest fruit and vegetable grower. The nation has become the world's top producer of tea, cashews,

68469

Pranamika Bora *et al.,*

coconuts, and areca nuts [3]. With a share of 52.0% in total agricultural exports and 18.8% in total agricultural production, horticulture has become a well-known industry with a lot of potential for agricultural diversification [4]. Until recently horticulture was carried out as a non-commercial activity. but now it has emerge as an important sector of the state of Assam. Recent success in horticulture has promoted private investment. As it is a profitable activity, horticulture has transformed from a rural occupation to a commercial one that attracts young people to engage. The following crops and activities are covered under the horticulture sector in Assam. (1) Fruits (2) Vegetables (3) Spices (4) Floriculture (5) Potato (6) Onion (7) Medicinal & Aromatics (8) Mushroom cultivation (9) Fruits & vegetable preservation and processing (dirhorti.assam.gov.in, 2023). Important fruit crops of the state are- Banana, Pine apple, Assam lemon, Papaya, Orange, Guava, Litchi, Jack fruit and Mango.

But recently parts of Assam have started growing high value fruits like Dragon fruit, Strawberry, Passion fruit and Apple ber, seedless lemon in different parts of the state. Besides different fruit crops, tuber crops, spices, Kharif and Rabi vegetables that are grown in Assam. For unemployed youths, growing mushroom is considered s a lucrative farming endeavour. It is found that total area of rice is decreasing year by year in Assam. Area of rice in the year 2014-15 was 2495297 hectare [5] and it was decreased to 2360470 hectares in 2020-21[6]. The horticultural crop area of Assam is increasing gradually. It was 644397 hectares in 2014-15 [5] and increased to 663717 hectares in 2020-21 [6]. In Assam due to the state's diverse climate and soil numerous horticultural crops, including fruits, vegetables, spices, potatoes and other tropical tuber crops, mushrooms, ornamental, medicinal, and fragrant plants, plantation crops, cashews can be grown. About 15% of the state's gross cultivable area is dedicated to horticulture crops, which produce more than 76 lakh MT of various horticultural products each year [2]. In Assam there are up to 17 species, 53 varieties, and 7 hybrids of citrus. Mango species that are wild or semi-wild as well as temperate fruits, notably those from the Rosaceae family, are found in the state [7]. Lakhimpur district is located on the north bank of the River Brahmaputra in a remote area in North East India in the state of Assam. Lakhimpur has sub tropical humid climate with high rainfall. Average annual rainfall is about 2830 mm, temperature ranges from 8-35 degree Celsius and humidity is 74-89%. The location map of the study area is shown in fig 1.

 Lakhimpur's economy is primarily agriculture and is suitable for various types of horticultural crops due to its climatic condition. Due to its proximity to Arunachal Pradesh Lakhimpur get a market to sale the horticulture products and moreover there exists a favorable climate with required rainfall to grow horticultural crops in Lakhimpur. The horticulture crops covered in the area are fruits & vegetables. There are nine development blocks in the district. These are Narayanpur, Bihpuria, Karunabari, Nowboicha, Telahi, Lakhimpur, Boginodi, Ghilamora and Dhakuakhana Development Blocks. The study areas are Laluk ADO circle of Karunabari Block and Narayanpur ADO circle of Narayanpur Block of Lakhimpur District of Assam. In Laluk ADO circle seven farms from three villages namely Pachim Laluk, Harmoti and Merbeel are selected for the study. In Narayanpur ADO circle six farms from six villages namely Nimuri, Tatibahar, Rangoti, Bholabori, Madhupur, Bahupathar are selected which are shown in the figure 1. Selection of these two areas for the study is because of development differences and differences in the way of growing horticulture crops between these two areas.

OBJECTIVES
1. To examine horticulture farming in Lakhimpur district with special reference to Laluk and Narayanpur ADO circles.
2. To examine important factors that contributes to the growth of horticulture in these areas.
3. To find out difficulties faced by farmers to grow horticulture crops.
4. To make a comparison of the two regions regarding horticulture.

DATABASE AND METHODOLOGY
For the preparation of this paper, observation and direct interview methods are used. To prepare this paper seven horticulture farms in Laluk ADO circle and six farms in Narayanpur ADO circle are surveyed. To study about the various processes involved in production of horticulture crops, and the challenges faced by horticultural crop growers, observation and interview method have been used. The data has been collected from mainly two sources- primary sources and secondary sources. Primary data are collected by conducting field survey, direct interview and by observing the study area. Primary sources for the study are the horticultural crop growers, farm owners,

68470

Pranamika Bora *et al.,*

employee of horticultural farms, government officers. And the secondary sources are government reports, research papers, journals, statistical handbook of Assam, District Agriculture Office, North Lakhimpur; Krishi Vigyan Kendra, Lakhimpur; ADO Office, Narayanpur.

RESULTS AND DISCUSSION

The major farming systems in Lakhimpur district are Agri-Horti-Animal Husbandry, Agri-Seri-Animal Husbandry, Agri-Fish-Animal Husbandry, Agri-Horti-Seri-Animal Husbandry-Fishery, Agri-Animal Husbandry [8]. The district Lakhimpur has a total geographic area of 2277 square kilometers. Around 9% of the district's gross cultivated area is covered by plantation and horticulture crops [9]. Various kinds of spices, fruits and vegetables has grown in the district. Areca nut, Banana, Coconut, Betel Vine and Assam Lemon are the important plantation and horticulture crops in the district. The high value crops like strawberry, dragon fruit, apple berry, seedless lemon, guava, mushroom etc. are also grown in the district. Around 11698 hectare area was covered by horticulture crops in the year 2019-20 in Lakhimpur district. And the total production was 827226 million tonnes in 2019-20 (District Agriculture Office, Lakhimpur). Among the nine blocks of Lakhimpur district, Laluk ADO circle of Karunabari block and Narayanpur ADO circle of Narayanpur block has been taken for the study. These regions have high potential for horticulture crops because of the excellent geographic location and climate. In these two areas the high value crops like strawberry, apple berry, dragon fruit, king chilli, mushroom, banana, seedless lemon etc. are grown. This study focuses on the analysis of various kinds of horticultural crops grown in the study areas, including production, the factors why horticulture crops are grown in the area, various issues related to the horticulture sector, and the role of government on the growth of the horticulture sector. This study will provide us a clear picture of the horticulture development and the scope of horticulture in the region.

Horticulture in Laluk ADO circle of Karunabari Block
The study area Laluk is situated along the Dikrong River in northern Assam, India, a very small municipality. It is around 35 miles southwest of North Lakhimpur city. Laluk ADO circle falls under Karunabari Block of Lakhimpur district of Assam. This circle is one of the highly developed horticulture area of the district. It has been possible due to government support to farmers to grow horticulture crops.

Variety of horticultural crops grown
The villages where the horticulture crops grown are Garmurh, Ratnapur, Torajuli, Ratnapur, Kutubpur, Fenkhati, Pndhuwa village [8]. Banana variety Amrit Sagar and G9, high yielding pumpkin variety Arjuna F-1, strawberry variety Sweet Charlie, Winter dawn and Early dawn, high yielding berry variety Apple ber, papaya variety Red lady, tomato variety Arka Rakshak and Roky (Check), brinjal variety PH-5, chilli variety G-4, potato variety Kufri jyoti, cabbage variety NSC-103 B, carrot variety Pusa Rudhira etc. are grown in the region [10]. Moreover among fruits thailand berry, dragon fruit, orange, Assam lemon; among kharif vegetables ridge gourd, sponge gourd, bitter gourd, bottle gourd and rabi vegetables like cabbage, cauliflower, carrot, knokhol, raddish etc. and among spices turmeric, ginger, black pepper etc. are grown.

Fertilizers use in Laluk ADO circle
Most of horticulture crops grown in the region using synthetic fertilizers by farmers. Organic fertilizers are also used by the farmers who grow horticulture crops in small patches of land. For growing tomato variety Arka Rakshak and Roky they use NPK in 150:70:140 kg/ha, for growing pumpkin variety Arjuna, use fertilizer: 75:80:80 NPK kg/ha. For growing different fruits and vegetables different amount of nitrogen fertilizer, phosphorus fertilizer, urea etc. are use by the farmers to enhance productivity. There are some reasons for of using synthetic or chemical fertilizers. These are availability of fertilizers at subsidized rate from government, quality of soil needs enrichment because of the previous practice of monoculture which left the soil infertile. Productivity is higher when synthetic fertilizers are used for high value crops like dragon fruit, strawberry, apple berry, etc.

Use of technology

Machineries like Ring cutter (ring like structure having curved blade attached) is use. It is used for harvesting of horticultural crop like brinjal and okra. Harvesting efficiency per hour manually is 28 kg but by using ring cutter it is 36 kg per hour. Availability of ring will cater to more market demands. Use of Pulverizer machine for grinding spices are mostly used for turmeric in this area. Other machineries like tractors, power tillers are used for growing horticulture crops. For irrigation, farmers use sprinkler and drip irrigation system successfully, which is provided under Pradhan Mantri Krishi Sinchayee Yojana (PMKSY). Farmers use sprinkler irrigation in the study area to irrigate leafy vegetables. To irrigate high value crops like straw berry, dragon fruit, citrus, and also for tomato, and king chilli, drip irrigation is used.

Other equipments available

Other equipments such as Poly house, Shade net, Mulching sheets are used. Poly houses are the most demanding type of greenhouse. Poly house technology is used for growing king chilli mostly and also used for growing strawberry. Shade net develops a suitable microclimate that is beneficial to the growth of the plants. Apple berries, strawberries and some vegetables like onions and tomatoes are grown under shade net in the study area by the farmers. Mulching is the technique of covering the top of the soil to prevent weed growth and keep the soil moist so that plants can grow. Mulching process is used for growing high value crop like strawberry.

Market

The output of horticultural products is sold in local market, Harmoti. The market is located 31 km towards west from district headquarters of North Lakhimpur. Most of the buyers are from nearer state Arunachal Pradesh. In Arunachal Pradesh there is a high demand for fruits like oranges, berries, bananas, straw berries and all types of vegetables. Due to the hilly terrain agricultural productivity is very low in Arunachal Pradesh and so, people come to buy agricultural products from Harmoti market. Some amount of horticultural output is also sold in Guwahati market and other parts of Assam. Some products are also exported to Arabian countries. Pumpkin, seedless lemon, Assam lemons are exported to Arabian countries.

Role of government in development of horticulture

Government of Assam has taken different initiatives for the development of horticulture in Laluk as it is an important area for horticulture development due to its proximity to the hilly state of Arunachal Pradesh, which provide favorable climate for the growth of horticultural crops. Government has provided fertilizers, pesticides, irrigation (sprinkler and drip), high yield seeds variety of fruits such as banana (Amrit Sagar and G9), pumpkin (Arjuna F-1), strawberry (Sweet Charlie, winter dawn and early dawn), brinjal (PH-5), chilli (G-4) and so on. Moreover government has provided training to farmers for spice production under the title of Management Practices of Black Pepper and Improved Cultivation Practices & Management of Ginger and Turmeric. Training is also given for strawberry production under the title of Scientific Cultivation and Management Practices of Strawberry. It is noted that the number of beneficiaries of government assistance in Laluk is quite high. So, the area has been able to make quite a progress in horticulture development.

Factors that contribute to the development of horticulture in Laluk ADO circle

Most important factor is the higher income or higher profitability. Farmers get more benefit by growing horticulture crops than cereals. Horticulture crops have very high demand in market. Another factor is the availability of market. There is a local market named as 'Harmoti market'. Most of the buyers from Arunachal Pradesh come to the market to buy fruits, vegetables and spices. Besides this, nearby people are also come to this market. Suitability of geo-climatic conditions is also one of the factors. Laluk ADO circle is suitable for horticulture due to its proximity to hilly state Arunachal Pradesh which provide favorable climate such as sufficient amount of rainfall and temperature required for horticulture. Government support to grow high value crops has helped the horticulture development in Laluk. The government contributes significantly to the growth of horticulture by giving farmers access to infrastructure, inputs and services. Some training about cultivation of exotic crops is also been provided.

Pranamika Bora *et al.,*

Problems faced by the farmers in Laluk region
The primary problem is the problem of processing. The success of cultivating fruits and vegetables is highly dependent on the presence of processing facilities. There is now no cold storage facility accessible, and there are no fruit processing facilities at all. Another set of urgent issues standing in the way of horticulture development is the scarcity of skilled or trained labour and insufficient extension support. Additionally, the majority of farmers are uneducated. Problem of pest attack and disease is also unavoidable. Attacks by pests, particularly those that target citrus trees, is one of the major issues that growers face and can result in significant losses. Citrus borer, fruit sucking moth, citrus butterfly, and fruit fly are the main attackers. Lack of training facilities hinders the growth of horticulture farms of small farmers. There are some small farmers aspiring to develop their own horticulture but they lack in skill due to lack of knowledge of scientific techniques of cultivation. Much more improvement will come in horticultural development in Laluk with the help of little scientific intervention in the area.

Horticulture in Narayanpur ADO circle of Narayanpur Block
The other area is Narayanpur. It is situated 54 km west of the district headquarters of North Lakhimpur. The greater Narayanpur area contains very fertile soil that is good for agricultural production. This land is best suited for growing crops like rice, lentil, and horticultural crops like potatoes, garlic, ginger, tomatoes, cauliflower, brinjal, and other vegetables. Different fruits including bananas, berries, mangoes, coconuts, guavas and many more are grown.

Variety of horticulture crops grown
Villages where horticultural crops are grown are Rangati, Madhupur, Kamalpur, Sesa Missing gaon, Pichola, Kachua, Major Chapori, Nimuri, Jalukota, Gobinpur village [8]. Most of the horticultural crops grown are of local variety. Some high value crops like strawberry variety (winter dawn, sweet Charlie), cabbage (NSC-103 B), pumpkin (Arjuna F-1) are grown by few farmers in the study area. Among fruits areca nut is dominant here (198 ha) followed by banana (151 ha) and least area is covered by thailand ber (6 ha only) other fruits such as coconut, pineapple etc. are also grown here. Among vegetables pumpkin is dominant here (136 ha), followed by cabbage (95 ha), ridge gourd (73 ha), tomato (45 ha) other vegetables such as cauliflower, carrot, knolkhol, bitter gourd etc are also grown. Spices such as turmeric (90 ha), ginger (83 ha), chilli (42 ha), garlic (35 ha) are also grown [11]. The fruits like dragon fruit, berry variety, Apple ber which are grown in Laluk ADO circle are yet to be introduced here.

Fertilizers use in Narayanpur
Most of the crops in Narayanpur are grown using organic fertilizers. Organic fertilizers used in the horticultural farms in Narayanpur ADO circle are obtained from agricultural wastes and livestock manures. Reason for using organic fertilizers is because of the rich quality of soil. Crops can be easily grown using organic fertilizers. Therefore requirement of synthetic fertilizer is less. Of course, another cause is that the farmers in the Narayanpur area are poor and don't have ability to buy fertilizers. Synthetic fertilizers are hardly provided by the government in Narayanpur ADO circle.

Use of technology
If we talk about machineries there is lack of availability of machineries required for growing and harvesting horticultural crops in Narayanpur. Most of the farm activities are done with the help of human labours and animals. However machineries like tractors, power tillers are used to perform activities like ploughing, tilling, sowing, and harrowing. Areca nut harvester is use for harvesting areca nut. In absence of rainfall farmers irrigate their farms with the help of bore well and installed by their own efforts. In some farms drip irrigation is installed by the government but have not been worked successfully. There is absence of sprinkler irrigation here.

Other equipments available
Equipment such as mulching sheets are used here. Most of the horticultural crop which require mulching are grown using organic mulch materials like plant grasses, leaves and woodchips in Narayanpur. Mulching sheets which are artificial or obtained from plastic or other equivalent materials are used by the farmers in the study area to grow strawberry. There is lack of facilities like poly house, shade net in horticultural farms in Narayanpur.

68473

Market

The agricultural outputs in the study area are sold in local market Bihpuria, located 34 Km south from the district headquarters North Lakhimpur. Some products are also sold in local Market Harmoti and Narayanpur. Harmoti market is about 23 km away from the study area. Only a few farmers send goods to Dubai, such as seedless lemons, however this practice has eventually been stopped due to inadequate transportation facilities.

Role of government in development of horticulture

Government has provided trainings to a few farmers for production of vegetables under the title of Commercial cultivation of summer vegetable in August 2020, for plantation crop- Scientific cultivation practices & management of Coconut and Areca nut etc. [8]. Nevertheless, most of the farmers are unaware about such trainings. There is also some help received in the form of HYV seeds, fertilizers, pesticides and irrigation facilities like drip irrigation etc. However, there is less number of beneficiaries of these benefits. Moreover Irrigation system does not work properly in most of the farms.

Factors contributing to the development of horticulture in Narayanpur

The horticulture crops fetch a higher income than other crops. Employment generation is another factor of horticulture development. Horticultural farms generate women employment in the study area as they are engaged in works like planting, plucking of fruits and vegetables in the horticulture farms. The soil and climate is good. Quality of soil is fertile in this area and so suitable for growing horticulture crops easily without using synthetic fertilizers.

Problems faced by the farmers in Narayanpur

The primary problem of the farmers is lack of marketing facilities. There is no organized marketing system. The producers encounter significant marketing challenges for practically all commodities, especially for selling products like seedless lemon, sweet lemon, ginger, guava etc. The farmers sell their produce to the middleman at throwaway prices because of the perishable nature of the goods and the lack of proper market support. Lack of processing units also creates difficulties. There is currently no cold storage facility available, and the complete lack of fruit processing facilities leads to tonnes of fruit being wasted. The success of horticulture crops depends on the use of appropriate pre and post harvest practices. There is lack of irrigation facilities in Narayanpur. Water scarcity of crops during the dry season, which lasts from October to February, is one of the major issues. The government provided drip irrigation system is not functional. Some crops, such as pineapple, banana, and green leafy vegetables, can produced year-round if there is proper irrigation system in place. Keeping intruders away from the crops is one of the problems that farmers have to deal with. Unfortunately, fences made of bamboo, wood does not persist for very long and begins to disintegrate after one year, and animals can easily enter to the farms.

Government schemes currently available in Laluk and Narayanpur ADO circles

Some important schemes are currently in operation for horticultural development in Laluk and Narayanpur. The Centrally Sponsored Schemes are

Rastriya Krishi Vikash Yojana: The Department of Agriculture & Cooperation (DAC), Ministry of Agriculture, Government of India, established the Rastriya Krishi Vikash Yojana (RKVY) in 2007-08 with the goal of achieving 4% annual growth in the agriculture sector.

Objectives

1. To ensure the preparation of agriculture plans for the districts and the states based on Agro-climatic conditions, availability of technology and natural resources.
2. To maximize returns to the farmers in agriculture and allied sectors.
3. To ensure that the local needs/crops/priorities are better reflected in the agricultural plans of the states.

Horticulture Mission for North-East and Himalayan States (HMNEH)
The Government of India, Ministry of Agriculture has implemented a centrally sponsored scheme, Horticulture Mission for North-East and Himalayan (HMNEH) States for overall development of horticulture.

Objectives
1. To improve the production and productivity of horticultural crops by harnessing the potential of the region.
2. Horticulture based farming system to be developed, thereby providing viable and ample opportunities for employment, especially for women, besides improving the productivity of land.

Pradhan Mantri Krishi Sinchayee Yojana (PMKSY)
It is a centrally sponsored scheme and was launched during the year 2015-16.

Objectives
1. Improving physical access to water on farms and increasing the cultivable area under assured irrigation.
2. Enhance the adaptation of precision-irrigation and other water saving technologies (More crops per drop).
3. Introduce sustainable water conservation practices.

However, in Laluk the beneficiaries of the above schemes are large in number compared to the Narayanpur.

Comparison of horticulture in Laluk and Narayanpur ADO circles
There are differences in how horticulture has developed in Laluk ADO circle of Karunabari block and Narayanpur ADO circle of Narayanpur block of Lakhimpur district. Although located in the same district, there are differences in crop variety, the utilization of technology, government support, and challenges faced by farmers. Compared to Narayanpur , Laluk is more advanced. Farmers in Laluk use technologies for horticulture farming. Moreover government support is more in Laluk than Narayanpur in terms of providing inputs like HYV seeds, synthetic fertilizers, irrigation, machineries and other services like trainings for horticulture development. On the other hand, horticulture is not much advanced in Narayanpur as compared to Laluk. There is less of use of technology like machines for ploughing, tilling, harvesting of horticultural crops. Tractors and power tillers used are less in number. There is absence of proper irrigation system in Narayanpur. They also use homemade organic fertilizers and not synthetic fertilizers as used in Laluk. Here the involvement of government is negligible for horticulture development. Government has provided drip irrigation facilities in the study area but they are not functional due to the ignorance of people involved in maintenance work. In Narayanpur, government schemes beneficiaries are less compared to Laluk. The farmers in Narayanpur are poorer and have not been able to avail themselves of technology or policies.

CONCLUSION

Lakhimpur district is suitable for growing horticultural crops due to its favorable climate. Both the study areas Laluk and Narayanpur ADO circle have immense scope for the development of horticulture but there are disparities between the study areas in terms of horticulture development. Laluk is more developed than the Narayanpur in terms of technology use in horticultural farms, irrigation facilities, government support for providing seeds, pesticides, and fertilizers. Horticulture in Narayanpur is done in a traditional way and is a technology deficit area. However, the common problems seen in both areas are lack of availability of processing units, unorganized market and irregular irrigation facilities. Of course horticulture is generating employment opportunities in both the study areas. Horticultural farm work, such as picking fruits and planting horticultural crops has also been a source of income for women. It has supported women financially. It is seen that given the geo-climatic conditions, there is also enormous scope in the Narayanpur ADO circle for sustainable horticulture development because production is possible with organic manures. A little help from the government in terms of training the small farmers and popularizing the schemes as well as setting up processing units will boost production in the study area.
