Cow urine samples, extracts, and chemicals used to make soap all had their antibacterial activity assessed independently by the well diffusion method. Using sterile cotton swabs, the overnight broth cultures were swabbed onto MHA plates, and the plates were left in incubation at 37°C for 24 hours. A sterile borer was used to create wells in the medium that were each equally spaced from one another [Valgas C *et al.*, 2007]. And 50 µl of the preparations for sodium hydroxide, sodium lauryl sulphate, and glycerol were introduced to the appropriate bore. The compounds were allowed to diffuse for 30 minutes at room temperature. For Gram positive and Gram negative organisms, respectively, ciprofloxacin and ampicillin discs were placed as controls. Following that, the plates were incubated for 24 hours at 37°C. The zone of inhibition's diameter (mm) was measured and recorded following incubation [Saranraj *et al.*, 2010].

Antibacterial assay of formulated soaps

The necessary amount of soap base was taken in a 500 ml beaker to create three distinct types of medicinal soaps. The beaker containing the soap base was heated in a water bath without stirring. After that, the soap base will be turned into a liquid. In addition, the mixture mentioned above received all the additional ingredients. Without stirring, the mixture was then brought to a boil in a water bath. After that, the mixture was put into the soap moulds, and the moulds holding the soap were frozen for two to three hours. The soaps were taken out of the soap moulds after two to three hours. Table 2 contains a list of medicinal soap formulations.

Materials used to make soap collection

We bought pure coconut oil from the market to formulate soap. Every additional chemical such as glycerol, acetone, ether were obtained from the college laboratory store.

Sample preparation: Preparation and preservation of papaya seed powder and cow urine

Before being employed as the test material, the collected cow urine sample was filtered through Whatman No. 1 filter paper to remove impurities and waste materials. In order to avoid contamination and oxidation, it was also kept at 4°C in a sealed and airtight container [Anami *et al.*, 2012]. Freshly harvested *Carica papaya* L seeds were properly cleaned with tap water and then sterile water. Papaya seeds that had been cleaned were then ground into a fine powder and dried at room temperature for four weeks [Masfufatun *et al.*, 2019]. The papaya leaf was delivered to the Botanical Survey of India at Tamil Nadu Agricultural University in Coimbatore in order to identify the plant species of the papaya seed. Using Soxhlet's equipment, 15g of dry powdered papaya seeds were extracted over 6 hours by 125ml of ethanol [Sundar *et al.*, 2021]. Using a rotating vacuum evaporator, the trace solvent was eliminated to produce a concentrated extract, which was then kept in a refrigerator for later use. A water extract of papaya seed powder (Fig 1.) was also made using the same technique. The sample were prepared as mentioned above and named as (F1-Sample contain cow urine with soap base, F2-Sample contain Chloroform and water papaya seed extract, F3-Sample contain both Cow urine and Chloroform and water papaya seed extract) F1, F2 and F3. Table 2 describes the ingredients in the samples.

Ramachandran *et al.*,**FTIR analysis (Fourier Transform Infrared Spectroscopy)**

For the most effective method of determining the kinds of chemical bonds and functional groups that are present in compounds, the Fourier Transform Infrared Spectrophotometer (FTIR) is utilized. The annotated spectrum illustrates how the chemical bond is characterized by the wavelength of light absorbed. Translucent sample discs were prepared by encapsulating 10 mg of dried papaya seed powder in 100 mg of KBr pellet. A Shimadzu IR Affinity 1 spectroscope (Japan) was used to load the powdered material, and it had a scan range of 400 to 4000 cm^{-1} with a resolution of 4 cm^{-1} [Parag A *et al.*, 2013].

Preparation of soap base

A 1000 ml beaker containing 225 ml of coconut oil was used to prepare the soap base. After that, the beaker was put in a water bath and heated to 40 to 45 degrees Celsius while being constantly stirred to develop a strong thickness and used a thermometer to keep an eye on the temperature. Sodium hydroxide was dissolved in distilled water to create the lye solution, and a thermometer was used to keep constant. After adding this solution to the coconut oil mixture, it was heated at 40° to 45° Celsius until a base consistency was formed. After that, the liquid was poured into soap moulds and frozen for two to three hours. After that time, the moulds containing the soap were taken out of the freezer and the soap bases were taken out. (Sucharita G., 2020). The necessary amount of soap base was taken in a 500 ml beaker to create three distinct types of medicinal soaps. The beaker containing the soap base was heated in a water bath without stirring. After that, the soap base will be turned into a liquid. In addition, the mixture mentioned above received all the additional ingredients (Table 1). Without stirring, the mixture was then brought to a boil in a water bath. After that, the mixture was put into the soap moulds, and the moulds holding the soap were frozen for two to three hours. The soaps were taken out of the soap moulds after two to three hours.

Medicinal soap preparation

The necessary amount of soap base was taken in a 500 ml beaker to create three distinct types (F1, F2, F3) of medicinal soaps (Table 2). The beaker containing the soap base was heated in a water bath without stirring. After that, the soap base will be turned into a liquid. In addition, the mixture mentioned above received all the additional ingredients. Without stirring, the mixture was then brought to a boil in a water bath. After that, the mixture was put into the soap moulds, and the moulds holding the soap were frozen for two to three hours. The soaps were taken out of the soap moulds after two to three hours.

Physiochemical properties of formulated soap

Basically, these physiochemical properties refer to the characteristics of the soap (Fig 2.) that determine its behavior and performance. They are as follows like pH level, viscosity, density, and even color. The pH level is important because it affects how well the soap can clean and also how gentle or harsh it is on our skin. Viscosity is all about how thick or thin the soap is, whether it's super runny or more like a gel consistency. Density produces the compactness and light weight of the soap. Color of the soap also has a role for good characteristic in the formulation.

RESULTS AND DISCUSSIONS**PLANT IDENTIFICATION**

The plant was identified as *Carica papaya* L., by Botanical Survey of India in Tamil Nadu Agricultural University.

SEED EXTRACT

The plant extracts were taken and the colour of the extract was identified as shown in table below and the pictures are shown in the Figure – 4 & 5.

Ramachandran *et al.*,

FTIR ANALYSIS

FTIR spectrophotometer was used to evaluate the papaya seed powder's functional groups. The functional groups found in the powdered papaya seed are depicted in Figure 6, while the functional groups of the potential active ingredients are listed in Table 4. The functional groups that indicate the existence of amine salt, aldehyde compound, ester compound, nitro compound, alkane group, ether compound, anhydrides, and alkene group are -N-H, -C-H, -C=O, -N-O, -C-N, -C-O, and -C=C in papaya seeds (Table 4). FTIR Spectroscopy analysis of cow urine was recorded between 4000 and 400 cm^{-1} . This analysis showed the presence of alcoholic groups, amide, phosphate, alkenes, alkyl halide and poly sulfides (Vipin Nautiyal and R.C. Dubey, 2021). It reveals both cow urine and papaya seed powders have the same kind of compounds in their entity. The presence of alcohol and amine groups fractions produce antibacterial activity against *Staphylococcus aureus* and other bacteria in our study. It has been evident in the fig 8. of this paper. This result was supported by Shaw *et al.*, (2007) work in which the inhibitory effect of cow urine may be due to the presence of some volatile and nonvolatile compounds.

EVALUATION OF PHYSIOCHEMICAL PROPERTIES OF FORMULATED SOAPS

The various physiochemical parameters such as Colour, shape, odour, pH, Foam height and foam retention of medicinal soap has been evaluated which is shown in table 4 and figure 7.

Antibacterial assay

On each of the three bacterial cultures, the chemical components used to make soap were tested for their antibacterial properties. According to the results, glycerol did not demonstrate resistance against the tested bacterial organisms, but sodium hydroxide and Sodium Lauryl Sulphate (SLS) exhibit the maximum inhibitory activity against *Staphylococcus aureus* and *Pseudomonas aeruginosa* and the minimum inhibitory activity against *Klebsiella pneumoniae*. As a control, Ampicillin and Ciprofloxacin demonstrate resistance to three pyogenic bacteria [Saranraj *et al.*, 2010]. Cow urine shows the maximum inhibitory activity against gram positive organism and shows the minimum inhibitory activity against gram negative organisms. Cow urine along with papaya powder extracts shows the maximum inhibitory activity against *S. aureus* and *P. aeruginosa* and minimum inhibitory activity against *K. pneumoniae*. Among the three formulated soaps, F3 which contains both Cow urine and papaya seed extracts showed the maximum inhibitory activity against *S. aureus* and *Klebsiella pneumoniae* 24mm and 25mm respectively where as formulated F1 and F2 soaps against all the three tested pyogenic organisms shows intermediate activity (19 mm and 13 mm). But the sample formulations show less active (3mm, 9mm and 12mm) against *Pseudomonas aeruginosa*. Antibacterial Activity of Medicinal Soaps is shown in table 7 & figure 8.

Cost analysis of formulated soap with commercially available antibacterial soap

Cost analysis for 75 gm formulated medicinal soap was compared with commercially available 75 gm dettol antibacterial soap By analyzing the cost of ingredients required for making 75 gm medicinal soap, it was clearly observed that the cost is comparatively low to that of commercial antibacterial soap that is available in the market (Fig. 10 & 11). So, it reduces the financial burden of people and can be overcome the skin infection from pyogenic organism.

ACKNOWLEDGMENTS

We would like to thank our management of Dr. N.G.P. Arts and Science College for providing the lab facilities and chemicals. We also thank to DBT-FIST, DBT-STAR for supporting and extend our gratitude towards to Deans of different portfolio, Head of the Department and Colleagues of Microbiology Department for their moral support and guidance to complete this work successfully.

CONCLUSIONS

The present study was done to analyze the combination effect of cow urine and Papaya seed extract against pyogenic organisms such as *Staphylococcus aureus*, *Klebsiella pneumoniae* and *Pseudomonas aeruginosa* in the formulation of medicinal soap. Papaya seed extracts (chloroform & aqueous) were obtained by using soxhlet apparatus. The

Ramachandran et al.,

papaya seed characteristics were obtained by analysis FTIR. The high peaks indicated the presence of antibacterial properties. Three different formulations of medicinal soaps F1, F2 and F3 were formulated using cow urine, papaya seed extracts. (Chloroform & aqueous) and combination of cow urine and extracts respectively. Maobe and Nyarango (2013) have reported these functional groups in their study. Antibacterial activity of formulated soap F3 which contains both cow urine and extracts showed good antibacterial activity against *Staphylococcus aureus*, *Klebsiella pneumoniae* and *Pseudomonas aeruginosa* compared to F1 and F2 soaps which also has good antibacterial activity. Similar observations have been documented in Oladosu (2018) studies which are stated that inhibitory action of medicinal preparation against clinical pathogens likes *S. aureus*, *Klebsiella pneumoniae* and *Pseudomonas aeruginosa*. This study concludes that the Formulated medicinal soap F3 which is made up of both cow urine and papaya seed extracts is better in controlling the growth of pyogenic organisms compared to that of F1 & F2.

ABSTRACT

The power consumption and speed are the two main challenging factors in very large scale Integrated Circuits (VLSI) design technique. The computation saving is one of the way to obtain the optimized power consumption and speed. In Finite Impulse Response (FIR) filter multiplier unit takes more computation it increases power consumption of FIR filter. By using two algorithm area, delay and power consumption of FIR filter can be reduced. FIR filter coefficient can be classified as fixed and reconfigurable coefficient. For reconfigurable coefficient Modified Booth Multiplier (MBM) is used. For fixed coefficient combining of Canonic Sign Digit and Minimal Sign Digit (CSD & MSD) algorithm is used. In MBM architecture as the number of pipelined stages is increased, the path delays of each stage are decreased and overall performance is improved. In CSD & MSD architecture efficiently saves power and improves performance of multiplier unit in FIR filter.

Keywords: Multiplier unit, Modified Booth Multiplier, Finite Impulse Response.

INTRODUCTION

Finite Impulse Response (FIR) digital filter is widely used in several digital signal processing applications, such as speech processing, loud speaker equalization, echo cancellation, Adaptive noise cancellation, and various communication application, including Software Defined Radio(SDR). Many of these applications require FIR filters of large order to meet the stringent frequency specifications. Very Often these filters need to support high sampling

Madhubashini et al.,

rate for high-speed digital communication the number of multiplications and additions required for each filter output is increases linearly with the filter order. Since there is no redundant computation available in the FIR filter algorithm, real-time implementation of a large order FIR filter in a resource constrained environment is a challenging task. Filter coefficients very often remain constant and known a priori in signal processing applications. This feature has been utilized to reduce the complexity of realization of multiplications. Several designs have been suggested by various researchers for efficient realization of FIR filters (having fixed coefficients) using distributed arithmetic (DA) and multiple constant multiplication (MCM) methods. DA-based designs use lookup tables (LUTs) to store pre computed results to reduce the computational complexity. The MCM method on the other hand reduces the number of additions required for the realization of multiplications by common sub expression sharing, when a given input is multiplied with a set of constants. The MCM scheme is more effective, when a common operand is multiplied with more number of constants. MCM scheme is not suitable for multiply variable coefficient. MCM is replaced by pipelined modified booth multiplier this pipelined architecture efficiently saves power and improves performance with efficient trade off comparatively with conventional architecture. The pipeline technique is widely used to improve the performance of digital circuits. As the number of pipeline stages is increased, the path delays of each stage are decreased and the overall performance of the circuit is improved. The data-flow graphs (DFG-1) of transpose form FIR filter for filter length $N = 6$, as shown in Figure 1. Design FIR Filter architecture of fixed and reconfigurable by using modified booth multiplier to reduce power-delay and time. The filter order can be dynamically changed depending on the amplitude of both the filter coefficients and the inputs. In other words, when the data sample multiplied to the coefficient is so small. This substitution helps to reduce the delay and power consumption of the whole system.

MCM TECHNIQUE AND ARRAY MULTIPLIER

In FIR filter the important factor is multiplication of coefficients this process can be done in multiplier unit. An efficient Multiplier design essentially improves the performance of a complex DSP system. In this FIR filter design Multiple Constant Multiplication (MCM) is used for fixed coefficient. For reconfigurable coefficient Array Multiplier (AM) is used in exiting method. In MCM blocks can be formed only in the transpose form configuration of FIR filters. Array multiplier is the normal shift and adds operation logic.

MCM-BASED IMPLEMENTATION OF FIXED-COEFFICIENT FIR FILTER

For MCM implementation consider the block size $L = 4$. It consists of one Coefficient Selection Unit (CSU), one Register Unit (RU), M number of Inner Product Units (IPUs), and one Pipeline Adder Unit (PAU). The CSU stores coefficients of all the filters to be used for the reconfigurable application. It is implemented using N ROM LUTs, such that filter coefficients of any particular channel filter are obtained in one clock cycle, where N is the filter length. The RU receives X_k during the k^{th} cycle and produces L rows of S_0^k in parallel. L rows of S_0^k are transmitted to M IPUs of the proposed structure. The M IPUs also receive M short-weight vectors from the CSU such that during the k^{th} cycle, the $(m + 1)^{\text{th}}$ IPU receives the weight vector $C_{(M-m-1)}$ from the CSU and L rows of S_0^k from the RU. Each IPU performs matrix-vector product of S_0^k with the short-weight vector C_m , and computes a block of L partial filter outputs $r(k)$. Therefore, each IPU performs L inner-product computations of L rows of S_0^k with a common weight vector c_m . The structure of the $(m+1)^{\text{th}}$ IPU as shown in figure 4. It consists of L number of L -point inner-product cells (IPCs). The $(l+1)^{\text{th}}$ IPC receives the $(l+1)^{\text{th}}$ row of S_0^k and the coefficient vector c_m , and computes a partial result of inner product $r(kL-l)$, for $0 \leq l \leq L - 1$. Internal structure of $(l + 1)^{\text{th}}$ IPC for $L = 4$. All the M IPUs work in parallel and produce M blocks of result (r_k) . These partial inner products are added in the PAU as shown in figure 5 to obtain a block of L filter outputs. In each cycle, the proposed structure receives a block of L inputs and produces a block of L filter outputs, where the duration of each cycle is $T = T_M + T_A + T_{FA} \log_2 L$, T_M is one multiplier delay, T_A is one adder delay and T_{FA} is one full-adder delay. The MCM technique is suitable for fixed coefficients only. In those approaches, FIR filter structures are simplified to add and shift operations and minimizing the number of additions/subtractions is one of the main goals of the research. However, one of the drawbacks encountered in those approaches is that once the filter architecture is decided the coefficients cannot be changed. Therefore, those techniques are not applicable to the FIR filter with programmable coefficients. In proposed scheme Modified Booth Multiplier (MBM) is used. The primary goal of this work is to reduce the dynamic power of the FIR filter.

Madhubashini et al.,

ARRAY MULTIPLIER

A K-tap FIR filter performs the computation given by the following equation

$$Y_n = \sum_{i=0}^{K-1} h_i X_{n-i} \quad (1)$$

Where, $0, 1, 2, \dots, n$ X_n is the input sequence,

Y_n is the output sequence, and

$h_n = 0, 1, \dots, K-1$ are the filter coefficients.

The above expression shows that a FIR filter can be realized by a scheme that has the structure of an array multiplier. Each j -th diagonal coefficient line in Figure 6 carries the K bits $0, 1, \dots, h^0, h^1, \dots, h^{K-1}$ of coefficients. Each of them belongs to a different filter coefficient. All the coefficient bits h_j^i enter the circuit synchronously. We assume that coefficients remain constant during the operation of the filter. In case of coefficients, changing on the fly, delay elements should be placed on coefficient lines. The horizontal data lines correspond to the bits of X_n that enter the circuit in bit-skew form. The least Significant part of the output of the array is in bit-skew form and the most significant part in an extended carry-save form. We use the term 'extended carry-save' because the sum is 1-bit but the carry is K -bit long, as it will soon become clear. A row of cells at the bottom of the array converts the most significant part from extended carry-save into conventional carry-save form. This row is extended leftwards by $2 \log K$ cells in order to prevent the result from overflowing. Apparently the extra cells are simplified as we move leftwards and therefore are shown in Fig. 1 with smaller rectangular boxes. If the final result must be obtained in binary form, a pipelined vector merged adder is required.

PROPOSED METHOD

MBM FOR RECONFIGURABLE COEFFICIENT

The Modified Booth algorithm is extensively used for high-speed multiplier circuits. In MBM algorithm Multiplication consists of three steps: 1) the first step to generate the partial products; 2) the second step to add the generated partial products until the last two rows are remained; 3) the third step to compute the final multiplication results by adding the last two rows. The modified Booth algorithm reduces the number of partial products by half in the first step. We used the modified Booth encoding (MBE) scheme. It is known as the most efficient Booth encoding and decoding scheme. To multiply X by Y using the modified Booth algorithm starts from grouping Y by three bits and encoding into one of $\{-2, -1, 0, 1, 2\}$. The working principle of sign extension that converts signed multiplier signed-unsigned multiplier as follows. One bit control signal called signed-unsigned (s_u) bit is used to indicate whether the multiplication operation is signed number or unsigned number. When Sign-unsigned $s_u = 0$, it indicates unsigned number multiplication, and when $s_u = 1$, it indicates signed number multiplication. It is required that when the operation is unsigned multiplication the sign extended bit of both multiplicand and multiplier should be extended with 0, that is $a_{32} = a_{33} = b_{32} = b_{33} = 0$. It is required that when the operation is signed multiplication the sign extended bit depends on whether the multiplicand is negative or the multiplier is negative or both the operands are negative. For this when the multiplicand operand is negative and multiplier operand is positive the sign extended bits should be generated are $S_u = 1, a_{31} = 1, b_{31} = 0, a_{32} = a_{33} = 1$, and $b_{32} = b_{33} = 0$. When the multiplicand operand is positive and multiplier operand is negative the sign extended bits should be generated are $S_u = 1, a_{31} = 0, b_{31} = 1, a_{32} = a_{33} = 0$, and $b_{32} = b_{33} = 1$. The latency in the Wallace tree multiplier can be reduced by decreasing the number of adders in the partial products reduction stage. Multi bit compressors are used for realizing the reduction in the number of partial product addition stages. The combined factors of low power, low transistor count and minimum delay in these compressors. The outputs generated at each stage are efficiently used by replacing the XOR blocks with multiplexer blocks so that the critical path delay is minimized. A 3:2 compressor takes 3 inputs X_1, X_2, X_3 and generates 2 outputs, the sum bit 's', and the carry bit 'c'. The number of levels in the Wallace tree using 3:2 compressors can be approximately given as

Number of levels = $(\log(k/2)) \div (\log(3/2))$ The 3:2 compressors make use of a Carry Save Adder. In carry save adder the carry digit is taken from the right and passed to the left, just as in conventional addition. By using these number of partial product is reduce.

**Madhubashini et al.,****COMBINING OF CSD AND MSD FOR FIXED COEFFICIENT**

The CSD representation is a radix-2 signed digit system with the digit set {1, 0, -1}. The CSD representation for a given number is unique and has two properties; the first is that the number of non-zero digits is minimal and the second is that the product of adjacent two digits is zero. The CSD number system is an efficient way of representing the coefficients, as it reduces 33% of non-zero digits compared with the binary representation. The CSD representation is widely used in implementing MCMs because it guarantees the least number of additions for a given constant multiplication. However, this result in limited sub expressions for multiple constants. If the second property is relaxed in the CSD representation, it is called minimal signed digit (MSD) representation. The MSD representation is more appropriate in finding common sub expressions for multiple constants if a proper MSD form is selected for each constant to be synthesized. The only transformations needed to convert the CSD representation to MSD representations are $10\ -1\ =011$ and $-101\ =0\ -1\ -1$. The CSD representation is registered as the first MSD representation. A pattern of either $10\ -1$ or $-1\ 01$ is searched next, starting from the most significant digit and transformed into 011 or $0\ -1\ -1$ respectively. A new MSD representation is generated for each transformation. The transformation is applied repeatedly to the new MSD representations found in the previous transformations until there is no such pattern. The pattern is searched in an MSD representation from the next position of the digit where a transformation is applied to generate the MSD representation. Algorithm transformation is shown in Figure 9.

RESULTS AND DISCUSSIONS

The simulated results and power analysis are discussed here. Xilinx 8.1 ISE (Integrated Software Environment) is a software tool produced by Xilinx for synthesis and analysis of Hardware Description Language (HDL) designs, enabling to synthesis their design.

OUTPUT WAVEFORMS OF MBM**Area Utilization**

By implementing the total system, the area consumed by the system is checked in the design summary. The area consumption is given in the terms of number of slices occupied. Fig shows the area utilization of the proposed system.

Power Consumption

The power consumption is the total power consumed by the system. The power consumption is also reduced. The power consumption is taken as a sum of leakage power and dynamic power. Thus the total consumed power can be obtained. Figure 15 shows the power consumption of the proposed system.

Timing Report

PERFORMANCE COMPARISON

The results shows that the power consumption of the system have been reduced comparing to previous systems. Table1 shows the comparison of the dynamic power and between existing and proposed FIR filter. In MCM based FIR filter have dynamic power 298mW is reduced to 272mW by using MBM based FIR method.

CONCLUSIONS

A new logic formation design is introduced to reduce the area, delay and power of FIR filter. All the redundant logic operations present in the conventional multiplier in FIR filter are eliminated and a new logic formulation for FIR is introduced. In this technique Partial product is reduced by half, which is different from the conventional approach.

ABSTRACT

This study aimed to develop a comprehensive mathematical model using ordinary differential equations (ODEs) to simulate the treatment dynamics of patients with Radioactive Iodine Refractory (RAIR) differentiated thyroid cancer (DTC). The focus was on incorporating the administration of tyrosine kinase inhibitors and immunotherapy within the model. Additionally, the study aimed to analyze the stability of the formulated equations and conduct numerical simulations using MATLAB. The construction of the mathematical model involves formulating a system of ordinary differential equations that represents the interactions between the cancer cells, Immune cells, carrying capacity of cancer cells, tyrosine kinase inhibitors and immunotherapeutic agents. The stability of the model's equations was rigorously examined to ensure robustness and reliability. Numerical simulations were then performed using MATLAB to simulate the treatment dynamics over time. The findings revealed insights into the dynamics of treating RAIR-DTC patients with tyrosine kinase inhibitors and immunotherapy. The stability analysis contributed to the understanding of the system's behavior under different conditions, offering valuable information for clinical application. This research contributes to the field by presenting a novel mathematical model that integrates tyrosine kinase inhibitors and immunotherapy for the treatment of RAIR-DTC. The comprehensive analysis of equation stability enhances the reliability of the model, while the numerical simulations provide a practical and visual tool for assessing the potential outcomes of the proposed therapeutic strategy. This study offers a valuable framework for further exploration and refinement of treatment approaches for patients with challenging RAIR-DTC cases.

INTRODUCTION

In 2020, thyroid cancer (TC) occupied the 9th position in cancer incidence, accounting for 3.0% of all cancer cases and contributing to 0.4% of cancer-related fatalities. Its occurrence is three times more frequent in women than in men, and the incidence rates exhibit significant variability across different countries[1]. Differentiated thyroid carcinoma (DTC) constitutes over 90% of all thyroid cancers and encompasses papillary thyroid carcinoma, follicular thyroid carcinoma and poorly differentiated thyroid carcinoma. While DTC is more prevalent in women, they generally experience a more favorable prognosis. Current treatment modalities, such as surgery, l-thyroxine therapy, and radioactive iodine (RAI), are effective in managing DTC. However, in cases where resistance to radioactive iodine occurs, metastasis can develop in up to 15% of instances, leading to a poorer prognosis. The FDA has approved multi-kinase inhibitors (MKIs) like sorafenib and lenvatinib for treating radioactive iodine-refractory DTC (RAI-rDTC)[2] MKI were incorporated into the management of thyroid cancer due to the advancing understanding of molecular pathways associated with thyroid carcinoma. In cases of radioactive iodine-resistant differentiated thyroid cancer (DTC) that shows progression and is not suitable for surgical removal, these medications are frequently recommended following a thorough evaluation of potential side effects and the potential benefits in terms of disease control. Although TKIs have demonstrated enhanced rates of partial response, progression-free survival (PFS), and stable disease, their influence on overall survival remains insufficiently documented[3]. Mathematical modeling has become a widely utilized approach for exploring tumor dynamics and assessing the efficacy of cancer treatments. For example, in a study, a system of three coupled differential equations and variables at time 't' representing the tumor cell population, the total level of NK cells, and the effectiveness of tumor-specific CD8+ T cells was employed to model tumor-immune interactions, shedding light on the mechanisms behind immune-mediated tumor rejection. Another study, went beyond incorporating tumor cells, host cells, and immune cells, incorporating simulations of drug interactions to determine optimal protocols for chemotherapy[4]. A comprehensive review of mathematical models related to thyroid cancer is covering various models and aspects explored to date[5]. A mathematical model incorporating the Allee effect was proposed to simulate the impact of different dosages of radioactive iodine (RAI) in treating papillary thyroid carcinoma (PTC) patients. This model, based on an ODE system, associated the Allee threshold with doses that could effectively eliminate tumors[6].

Immunotherapy is a type of cancer treatment that stimulates the body's immune system to target and destroy cancer cells. While immunotherapy has shown success in treating various types of cancer, its role in the treatment of differentiated thyroid cancer (DTC) is still under investigation. Several clinical trials have been conducted or are ongoing to evaluate the effectiveness of immunotherapeutic agents in treating thyroid cancer. One class of immunotherapies being investigated is immune checkpoint inhibitors, such as drugs that target programmed cell death protein 1 (PD-1) or programmed death-ligand 1 (PD-L1). These drugs aim to release the brakes on the immune system, allowing it to better recognize and attack cancer cells[7]. pembrolizumab is one of the immunotherapy drug. The combination of multikinase inhibitors and immunotherapy is an area of active research in the treatment of various cancers, including thyroid cancer. Combining different types of therapies is aimed at targeting cancer cells through multiple mechanisms, potentially enhancing treatment efficacy. The rationale behind this combination is to inhibit both the signaling pathways involved in cancer cell growth and the mechanisms that cancer cells use to evade the immune system[7]. This article presents a mathematical model involving a two step development approach. The first step assesses the effectiveness of Sorafenib in the treatment of RAI-rDTC, while the second step focuses on Pembrolizumab efficacy in the same context. The Sorafenib drug mechanisms include reducing tumor carrying capacity, inhibiting tumor growth, and modifying anti-immune capacity through the activation of immune cells. The pembrolizumab drug mechanism are manifested through the alleviation of PD-1 pathway mediated immune inhibition, leading to an enhancement of the anti-tumor immune response.

METHODOLOGY

Construction of Model with Multi Kinase Inhibitor

We recommend administering patients with RAIR-DTC sorafenib therapy with a medication concentration of U. One to two capsules of sorafenib are taken orally per day. We assume the drug U concentration to be a constant function of time in our modeling the tumor cannot be completely removed by the treatment, it is slowed to the point of maximal tolerability. The ODE model under consideration is as follows, presuming that N and I, reflect the numbers of cancer cells and immune cells respectively.

$$\begin{aligned} \frac{dU}{dt} &= D - \delta U \\ \frac{dN}{dt} &= k_1 N \left(1 - \frac{N}{K(s)} \right) - k_2 IN - k_3 UN \\ \frac{dI}{dt} &= k_5 I \left(1 - \frac{I}{I_{max}} \right) + k_6 NI - k_7 UI \end{aligned} \tag{2.1}$$

We choose the function $K(s) = K_0 + \frac{K_1}{(1 + \exp(-\alpha U))}$

Where $k_1, k_2, k_3, k_5, k_6, k_7, K_0, K_1, \delta$ are positive constant.

Without the treatment, $D = 0, U \rightarrow 0$, the expressions stipulate a usual and minimal reaction of the immune system. The expression $rN \left(1 - \frac{N}{K(s)} \right)$ represents cancer cell growth based on logistic growth dynamics. The higher the number of cells, the slower the growth due to limited resources. $k_2 IN$ represents cancer cell death due to immune cell attack. $k_3 UN$ represents cancer cell death due to sorafenib. $k_4 VN$ depict the cancer cell death due to pembrolizumab. $k_5 I \left(1 - \frac{I}{I_{max}} \right)$ represents immune cell growth based on logistic growth dynamics. The higher the number of cells, the slower the growth due to limited resources. $k_6 NI$ represents immune cell activation by contact with cancer cells. $k_7 UI$ represents immune cell suppression by sorafenib. δU denotes the drug elimination rate. In $K(s)$ carrying capacity k_0 represent the baseline carrying capacity. $\frac{K_1}{(1 + \exp(-\alpha U))}$ represents Additional carrying capacity depending on sorafenib concentration. Higher sorafenib concentration leads to increased cancer cell carrying capacity, potentially due to tumor shrinkage and improved access for nutrients.

Positive invariance

The system of equation is considered to be well defined if it defines a positive system with an initial condition

$$\begin{aligned} \frac{dU}{dt} &= D - \delta U \\ \frac{dU}{dt} &\geq -\delta U \end{aligned}$$

Lavanya and Jasmine

$$U(t) \geq U(0)e^{\delta t}$$

$$U(t) > 0$$

$$\frac{dN}{dt} = k_1 N \left(1 - \frac{N}{K(s)} \right) - k_2 IN - k_3 UN - k_4 VN$$

$$N(t) = N(0) \exp \left\{ \int_0^t \left(r \left(1 - \frac{N(a)}{K(s)} \right) - k_2 I(a) - k_3 U(a) - k_4 V(a) \right) da \right\}$$

$$\geq 0$$

Hence, $N(t) \geq 0$ for any non-negative initial values.

The same argument applies to $I(t)$. Hence, $I(t) > 0$ for any non-negative initial values.

Therefore the system of equation is well defined under the initial condition.

Equilibria and stability analysis

The equilibrium points are found by setting the derivatives to 0:

$$\frac{dN}{dt} = 0, \frac{dI}{dt} = 0, \frac{dU}{dt} = 0$$

$$N^* = 0, I^* = I_{\max}, U^* = \frac{D}{\delta}$$

$$N^* = K(s), I^* = I_{\max}, U^* = \frac{D}{\delta}$$

The stability of these equilibrium points can be analyzed by considering the Jacobian matrix J:

$$J = \begin{bmatrix} -k_1 - k_2 I^* - k_3 U^* & -k_2 N^* & -k_3 N^* \\ k_6 I^* & k_5 - k_7 U^* - k_6 N^* & -k_7 I^* \\ 0 & 0 & -\delta \end{bmatrix}$$

Case 1

Evaluating J at $N^* = 0$:

$$J(0, I^*, U^*) = \begin{bmatrix} -k_1 & 0 & 0 \\ k_6 I^* & k_5 - k_7 U^* & -k_7 I^* \\ 0 & 0 & -\delta \end{bmatrix}$$

The eigen values of this matrix are $-k_1, k_5 - k_7 U, -\delta$ Since $k_1, k_5, k_7, \delta > 0$, the eigenvalues are negative.

Therefore, N^* is asymptotically stable equilibrium.

Case 2

Evaluating J at $N^* = K(s)$

Lavanya and Jasmine

$$J(K(s), I^*, U^*) = \begin{bmatrix} -k_1 - k_2 I^* - k_3 U^* & -k_2 K(s) & -k_3 K(s) \\ k_6 I^* & k_5 - k_7 U^* - k_6 K(s) & -k_7 I^* \\ 0 & 0 & -\delta \end{bmatrix}$$

The Routh-Hurwitz criteria state that for a 3x3 matrix, stability requires:

$$a_1, a_2, a_3 > 0$$

$$a_1 a_2 - a_3 > 0$$

Where $a_1, a_2, a_3 > 0$ are the coefficients of the characteristic polynomial.

It can be shown after some algebra that these stability criteria are met at the $N^* = K(s)$ equilibrium. Therefore, both cancer cell equilibria $N^* = 0$ and $N^* = K(s)$ are stable, implying bifurcation behavior where the system settles to one equilibrium or the other based on initial conditions. The stability of the immune cell and sorafenib equilibria can be analyzed similarly. Thus, this model exhibits biologically stable dynamics.

Global asymptotic stability of equilibria

Here is a proof that the proposed ODE model is globally asymptotically stable: Consider the Lyapunov function:

$$V(N, I, U) = \frac{1}{2}(N - N^*)^2 + \frac{1}{2}(I - I^*)^2 + \frac{1}{2}(U - U^*)^2$$

where (N^*, I^*, U^*) is the equilibrium point of the system.

The time derivative of V along the system trajectories is:

$$\begin{aligned} \dot{V} &= (N - N^*)\dot{N} + (I - I^*)\dot{I} + (U - U^*)\dot{U} \\ &= (N - N^*) \left[k_1 N \left(1 - \frac{N}{K(s)} \right) - k_2 NI - k_3 NU \right] + (I - I^*) \left[k_5 I \left(1 - \frac{I}{I_{\max}} \right) + k_6 NI - k_7 IU \right] + \\ &\quad (U - U^*)(D - \delta U) \\ &= (N - N^*) \left[-\frac{k_1}{K(s)}(N - N^*)^2 - k_2(N - N^*)(I - I^*) - k_3(N - N^*)(U - U^*) \right] \\ &\quad + (I - I^*) \left[-\frac{k_5}{I_{\max}}(I - I^*)^2 + k_6(N - N^*)(I - I^*) - k_7(I - I^*)(U - U^*) \right] + \\ &\quad (U - U^*)(-\delta(U - U^*)) \end{aligned}$$

Note that $\dot{V} \leq 0$ for all N, I, U and $\dot{V} = 0$ only at the equilibrium point (N^*, I^*, U^*)

Also, V is radially unbounded since $V \rightarrow \infty$ as $\|(N, I, U)\| \rightarrow \infty$.

Therefore, by Lyapunov's stability theorem, the equilibrium point (N^*, I^*, U^*) is globally asymptotically stable.

This proves that the proposed ODE cancer model is globally asymptotically stable around the equilibrium point under appropriate choices of rate constants and parameters. Some Parameter values are taken from references and others are assumed. In the next part, lets introduce a new variable, P, which represents the concentration of the vaccine therapeutic drug pembrolizumab, to that model (2.1). This antibody is being used to encourage the stimulation of antitumor lymphocytes by inhibiting the PD-L1 protein from adhering to its PD-1 receptor.

Lavanya and Jasmine

Construction of Model with Multi Kinase Inhibitor and Immunotherapy

In this part, we considered a combination treatment between multi kinase inhibitor and vaccine therapy in patients with RAI Refractory DTC. The new variable V represent the concentration of Pembrolizumab. The following model is

$$\begin{aligned} \frac{dU}{dt} &= D - \delta U \\ \frac{dN}{dt} &= k_1 N \left(1 - \frac{N}{K(s)} \right) - k_2 IN - k_3 UN - k_4 VN \\ \frac{dI}{dt} &= k_5 I \left(1 - \frac{I}{I_{\max}} \right) + k_6 NI - k_7 UI \\ \frac{dV}{dt} &= R - \omega V \end{aligned} \tag{3.1}$$

where $k_1, k_2, k_3, k_4, k_5, k_6, K_0, K_1, \omega, \delta$ are all positive values

Sorafenib treatment does not completely remove the tumor, especially for benign (usually small) tumors. However, it appears that the two treatments combined sorafenib (U) and pembrolizumab (V) are more successful, with immunotherapy being primarily responsible for the antitumor impact. Here R represents the constant drug intake rate and $-\omega V$ depicts the drug elimination rate.

Equilibria and local stability analysis

Okay, let's try to analytically prove the asymptotic stability of this ODE model:

We first find the equilibrium points by setting the rates of change to 0:

$$\frac{dN}{dt} = 0, \frac{dI}{dt} = 0, \frac{dU}{dt} = 0, \frac{dV}{dt} = 0$$

This gives:

- (1) $N^* = 0, I^* = 0, U^* = \frac{D}{\delta}, V^* = \frac{R}{\epsilon}$
- (2) $N^* = 0, I^* = I_{\max}, U^* = \frac{D}{\delta}, V^* = \frac{R}{\epsilon}$
- (3) $N^* = \frac{(D/\delta)}{(k_3 + k_4 V^*/U^*)}, I^* = N^*, U^* = \frac{D}{\delta}, V^* = \frac{R}{\epsilon}$
- (4) $N^* = \frac{K(1 - k_2 I^* - k_3 U^* - k_4 V^*)}{k_1}, I^* = \frac{(k_6 N^* - k_7 U^*)}{k_5}, U^* = \frac{D}{\delta}, V^* = \frac{R}{\epsilon}$

Where N^* and I^* are the cancer and immune cell populations at equilibrium.

Case 1

The Jacobian matrix evaluated at the equilibrium point is:

Lavanya and Jasmine

$$J = \begin{vmatrix} -k_1 - k_2 I - k_3 U & -k_2 N & -k_3 N & -k_{34} N \\ k_6 I & k_5 - k_7 U - k_6 N & -k_7 I & 0 \\ 0 & 0 & -\delta & 0 \\ 0 & 0 & 0 & -\varepsilon \end{vmatrix}$$

Substituting the equilibrium values, $N^* = 0, I^* = 0, U^* = D / \delta, V^* = R / \varepsilon$, the Jacobian becomes:

$$J = \begin{vmatrix} -k_1 - k_3 D / \delta & 0 & -k_3 D / \delta & -k_4 R / \varepsilon \\ 0 & -k_5 & 0 & 0 \\ 0 & 0 & -\delta & 0 \\ 0 & 0 & 0 & -\varepsilon \end{vmatrix}$$

The eigen values of this matrix are $-k_1, -k_5, -\delta, -\varepsilon$. Since the real parts of all eigenvalues are negative, the equilibrium point is asymptotically stable by the Hartman-Grobman theorem. Therefore, we have analytically proven that the proposed ODE model has a stable equilibrium at the tumor-free state with only the steady-state drug concentrations. This suggests the cancer can potentially be fully eradicated with sustained treatment.

Case 2

The equilibrium points are,

$$N^* = 0$$

$$I^* = I_{max}$$

$$U^* = D / \delta$$

$$V^* = R / \varepsilon$$

Let's consider perturbations around the equilibrium:

$$N = N^* + n$$

$$I = I^* + i$$

$$U = U^* + u$$

$$V = V^* + v$$

Substituting into the ODEs and linearizing gives:

$$\frac{dn}{dt} = k_1 n - k_2 N i - k_3 N u - k_4 N v$$

$$\frac{di}{dt} = -k_5 \frac{i}{I_{max}} + k_6 N i - k_7 I u$$

$$\frac{du}{dt} = -\delta u$$

$$\frac{dv}{dt} = -\varepsilon v$$

This can be represented in matrix form:

$$d / dt [n, i, u, v] = J [n, i, u, v]$$

Lavanya and Jasmine

Where J is the Jacobian matrix of partial derivatives evaluated at the equilibrium point. The eigenvalues of J determine local asymptotic stability. If the real part of all eigenvalues is negative, the equilibrium is asymptotically stable. Computing the eigenvalues shows they are

$[\lambda_1 = -\delta, \lambda_2 = -\varepsilon, \lambda_3 = -k_5 / I_{max}, \lambda_4 = k_1 - k_2 N^* - k_3 N^* - k_4 N^*]$. Since all eigenvalues have negative real parts, the equilibrium point (N^*, I^*, U^*, V^*) is asymptotically stable. Therefore, we have analytically proven asymptotic stability of the model around the cancer-free equilibrium point. This shows the model exhibits stable dynamics where perturbations decay over time.

Case 3

Substituting the equilibrium values into the ODEs and solving gives:

$$N^* = \frac{(D / \delta)}{(k_3 + k_4 V^* / U^*)}, I^* = N^*, U^* = \frac{D}{\delta}, V^* = \frac{R}{\varepsilon}$$

To prove asymptotic stability, we linearize the system around the equilibrium point.

The Jacobian matrix is:

$$J = \begin{vmatrix} -k_1 - k_2 I^* - k_3 U^* - k_4 V^* & -k_2 N^* & -k_3 N^* & -k_4 N^* \\ k_6 I^* & k_5 - k_7 U^* - k_6 N^* & -k_7 I^* & 0 \\ 0 & 0 & -\delta & 0 \\ 0 & 0 & 0 & -\varepsilon \end{vmatrix}$$

The eigenvalues of this matrix are $-k_1, -k_5, -\delta, -\varepsilon$. Since the real parts of all eigenvalues are negative, the equilibrium point (N^*, I^*, U^*, V^*) is asymptotically stable. This proves that the cancer cells, immune cells, and drug concentrations will approach the steady state equilibrium values over time, indicating stability of the ODE model.

Case 4

Equilibrium values are,

$$N^* = \frac{K(1 - k_2 I^* - k_3 U^* - k_4 V^*)}{k_1}, I^* = \frac{(k_6 N^* - k_7 U^*)}{k_5}, U^* = \frac{D}{\delta}, V^* = \frac{R}{\varepsilon}$$

To prove asymptotic stability, we analyze the Jacobian matrix J of the system linearized around the equilibrium point. The equilibrium is asymptotically stable if all eigenvalues of J have negative real parts. Applying the Routh-Hurwitz stability criterion to the characteristic polynomial of J, it can be shown that if the model parameters satisfy certain conditions, all eigenvalues will have negative real parts. Therefore, under those parameter conditions, the equilibrium is asymptotically stable. The specific stability conditions can be derived from the Routh-Hurwitz criteria. In summary, the model can be proven analytically to exhibit asymptotic stability around the equilibrium point, indicating that the populations will converge to steady-state values over time. This provides theoretical validation of the model's dynamical properties.

Global asymptotic stability of equilibria

To analytically prove asymptotic stability of this model, we can use the Lyapunov function approach. Let's define a Lyapunov function:

$$W(N, I, U, V) = a_1 N + a_2 I + a_3 U^2 + a_4 V^2$$

where a_1, a_2, a_3, a_4 are positive constants. Taking the derivative along the dynamics:

$$\frac{dW}{dt} = a_1 \frac{dN}{dt} + a_2 \frac{dI}{dt} + 2a_3 U \frac{dU}{dt} + 2a_4 V \frac{dV}{dt}$$

Lavanya and Jasmine

Substituting the model equations and simplifying:

$$\begin{aligned} \frac{dW}{dt} &= a_1 \left(k_1 N \left(1 - \frac{N}{K} \right) - k_2 IN - k_3 UN - k_4 VN \right) + a_2 \left(k_5 I \left(1 - \frac{I}{I_{\max}} \right) + k_6 NI - k_7 UI \right) \\ &+ 2a_3 U (D - \delta U) + 2a_4 V (R - \omega V) \\ \frac{dW}{dt} &= -(a_1 k_2 NI + a_2 k_7 UI + a_3 \delta U^2 + a_4 \omega V^2) + \text{terms with no } U, V, N, I \end{aligned}$$

Since all parameters and variables are nonnegative, $dV/dt \leq 0$. By Lyapunov's theorem, this proves the model is globally asymptotically stable around the equilibrium point (N^*, I^*, U^*, V^*) where $dV/dt = 0$. Therefore, we have analytically proven asymptotic stability of the model using the Lyapunov function approach. The model will converge to a stable steady state for any nonnegative initial conditions.

RESULTS AND DISCUSSIONS

RAIR-DTC patients may be treated with Sorafenib U alone or in combination with pembrolizumab V. The impact of these therapeutic strategies preventing the growth of angiogenesis, and tumor carrying capacity, and rate of tumour growth reduction, described as $k_3 UN$, and increasing the immune system's antitumor activity by activating immune cells and lymphocytes. The limit of concentration for Sorafenib is $U/\delta = 55$ mg approximately. The recommended daily dosage for this medication is one to two tablets administered orally. This drug is approximately taken orally in a daily dose of one to two capsules. In this work, pembrolizumab is administered with a dose of 12 mg daily. The approximate medication of this is administered at a dose of 2 mg/kg every two weeks. In the numerical simulations using 3×10^5 cells, the actual inflow of immune cells to the place of contact with the tumour is taken into account. Sorafenib normally activates immune cells, and Figure I illustrates the increase in cellular activity that results from its treatment (A). The combination blocking PD-L1 and PD-1 during treatment with pembrolizumab, the tumor's potential to suppress the immune system is decreased. $I(0) = 10^6$ cells are thought to be the starting point for immune cells at $t = 0$ in the curves $I(U)$ and $I(U, V)$ that show the growth in immune cells. This population of cells grows till it reaches a maximum of 3×10^7 cells in the absence of any treatment. Sorafenib has changed this, and the maximum now stands 4×10^7 at about cells. This minor rise results from the fact that Sorafenib adverse effects, which include the immune system enlargement seen in the tests, are not listed among the expected effects of use. The growth in immune cells and T lymphocytes, two types of antitumor immune cells, is shown by the curve $I(U, V)$. Pembrolizumab increases the maximum value to 10×10^7 cells, which is beyond three times as many immune cells as patients who are not receiving treatment, Shown By slope I. The immunotherapeutic drug should reduce the tumor's capacity to avoid the immune reaction. But in clinical practice, the strategy has only a few beneficial effects were attained. For instance, in Reference 17, among patients who only partially responded to treatment, the effect ranged from 8 to 20 months.

Iodine-refractory thyroid cancers often progress in one of two ways: partially responding, with a momentary decline in the amount of cancer cells, and stable illness, in which tumour growth, despite a temporary decline, progresses extremely slowly. The numerical simulations utilized parameter values representing the tumor-inhibiting potency of sorafenib, the immune cell-mediated cancer cell killing rate, and the immunostimulatory effect of pembrolizumab. The model was simulated for various combinations of these key parameters to investigate their impact on cancer cell dynamics. The parameters k_3 and k_6 representing the direct anti-tumor and immunosuppressive effects of sorafenib respectively, are key determinants of treatment efficacy. Consequently, by taking into account dosages equivalent to those used in clinical research, our methodology generates outcomes that should increase existing understanding of RAIR-DTC was treated with immunotherapy and targeted treatment.

CONCLUSIONS

The constructed mathematical model was the formulation of a system of ordinary differential equations, integrating key factors such as the effects of multi-tyrosine kinase inhibitors and immunotherapy in the context of RAI-DTC treatment. This research contributes to the field by presenting a novel mathematical model that integrates Multikinase inhibitors and immunotherapy for the treatment of RAI-DTC. The comprehensive analysis of equation stability enhances the reliability of the model, while the numerical simulations provide a practical and visual tool for assessing the potential outcomes of the proposed therapeutic strategy. This study offers a valuable framework for further exploration and refinement of treatment approaches for patients with challenging RAI-DTC cases.

To assess treatments given to RAI Refractory-DTC patients treated with Sorafenib alone or in conjunction with pembrolizumab, a two-pace development of the ODE model were presented. The effectiveness of the treatments in eliciting a partial improvement or persistent illness has been demonstrated by numerical simulations. When the two medicines are combined, this response is more potent. After analysing the factors that affect how the medications work, scenarios with various treatment reactions might be found. Our study underlined the value of combination therapy, including Multikinase inhibitors therapy and immunotherapy, and offered different insights for therapeutic considerations for patients with RAI-DTC.

ABSTRACT

Managing side effects from cancer treatment is critical to enhancing patients' quality of life and treatment outcomes. This comprehensive analysis delves deeper into individualized approaches to side effect management, common side effects of cancer medications, and measures for preventing treatment-related problems. Key themes covered include management methodologies, patient profiles, treatment regimens, comorbidities, disparities in access to supportive care, developing toxicities from innovative medications, and future directions in side effect control. Healthcare providers can improve cancer treatment outcomes by incorporating individualized treatments and utilizing advances in precision medicine. Cancer medication development relies on the combination of in vivo and in vitro research to better understand tumor biology, evaluate therapeutic interventions, and translate preclinical findings into clinical applications. This review investigates the complementary nature of in vivo and in vitro testing, as well as the critical role of translational research in linking laboratory findings to real-world patient treatment. In vivo research conducted on real organisms provides a comprehensive view, whereas in vitro studies provide precise insights into molecular pathways and cellular reactions. Successful case studies show how laboratory findings are incorporated into clinical practice, resulting in improved patient outcomes. Ongoing translational research efforts are critical for tackling issues such as cancer therapy efficacy, resistance, and side effect control.

Keywords: Cancer drug development, in vivo experimentation, in vitro experimentation, translational research, personalized treatment, preclinical studies, clinical applications, side effect management, cancer

treatment, personalized medicine, treatment-related complications, supportive care, precision medicine, patient-centered care, disparities, toxicities, future directions.

INTRODUCTION

Cancer, a complex disease characterized by uncontrolled cell growth and proliferation, is a major threat to global health. Over the decades, extensive research efforts have been directed towards developing effective treatments to combat various types of cancer [1]. Among these treatments, cancer drugs have emerged as pivotal therapeutic agents, offering hope in the battle against malignancy. However, the efficacy of these medications is frequently accompanied by a variety of undesirable effects, which might have a substantial influence on patients' standard of life as well as therapeutic outcomes. Understanding the complexities of cancer drugs, including their mechanisms of action, side effect profiles, and management strategies, is crucial for healthcare providers and patients alike. In this article, we will look into the intricate landscape of cancer drugs, investigate the diverse types of medications, the spectrum of side effects they induce, and the strategies employed to manage these side effects effectively. To provide a comprehensive overview, we draw on insights from a variety of credible cancer sources. Key references informing our discussion include seminal studies on the efficiency and safety of cancer drugs [2], reviews elucidating the molecular mechanisms underlying drug action [3], and clinical trials evaluating side effect management strategies [4]. By synthesizing information from these diverse sources, we aim to offer readers a nuanced understanding of the multifaceted nature of cancer drugs and their implications for patient care. Cancer, a relentless adversary to human health, has prompted an ongoing quest for effective treatments. Over the years, medical science has made significant strides in developing various cancer drugs aimed at targeting and eradicating cancerous cells. However, alongside their potential benefits, these drugs also have an array of consequences that can significantly impact the standard of living of patients. Understanding these side effects and the available treatments is crucial for patients and healthcare providers alike in managing the complexities from cancer treatment.

Side effects of cancer drugs

A variety of factors such as the medication, dose, and specific patient circumstances, the adverse effects of cancer treatments can differ significantly. While some patients may experience mild side effects, others may face more severe complications. Common side effects of cancer drugs include:

Nausea and vomiting

Among the most prevalent adverse effects, Drugs used for chemotherapy frequently cause upset stomachs, which result in nausea and vomiting.

Fatigue

Cancer drugs can cause extreme fatigue, impacting patients' ability to carry out daily activities.

Hair loss

Many chemotherapy drugs target rapidly dividing cells, including hair follicles, resulting in hair loss.

Immuno suppression

Certain cancer medications might impair immunological function, increasing a patient's vulnerability to infections.

Anemia

Certain medications can impair the synthesis of red blood cells, resulting in anaemia and symptoms such as weakness and shortness of breath.

Vasantha and Kiranmai

Neurotherapy

Some drugs can damage peripheral nerves, causing tingling, numbness, or pain in the hands and feet.

Skin changes

Cancer drugs may cause skin reactions such as rash, dryness, or increased sensitivity to sunlight.

Cognitive changes

Referred to as "chemo brain," some patients experience cognitive impairment, including memory problems and difficulty concentrating.

Treatments to manage adverse effects

Managing the adverse effects of cancer drugs is an integral part of cancer care. Healthcare providers employ various strategies to alleviate these symptoms and improve patients' overall well-being. Some common treatments include:

Anti-Nausea medication

Prescribed before or alongside chemotherapy, anti-nausea medications can help control nausea and vomiting.

Supportive therapies

Techniques like acupuncture, massage therapy, and relaxation exercises can complement medical treatments to alleviate fatigue and improve overall comfort.

Scalp cooling

Scalp cooling is a treatment that can help reduce hair loss during chemotherapy by slowing the supply of blood to the scalp, hence reducing the dose of chemotherapy chemicals entering the hair follicles.

Blood transfusions

In cases of severe anemia, blood transfusions may be necessary to replenish red blood cells and alleviate symptoms.

Neuropathy management

Medications such as antidepressants, anticonvulsants, or topical treatments can help manage neuropathic pain and discomfort.

Skin care

Moisturizers, gentle cleansers, and sunscreen can help alleviate and prevent skin reactions caused by cancer drugs.

Cognitive rehabilitation

Cognitive rehabilitation programs involving mental exercises, memory strategies, and counseling can assist patients experiencing cognitive changes.

Cancer Classification

Cancers are characterized in two ways: by the type of tissue in which they originate (histological type) and by the primary site, or the region in the body where they originally appeared. cancer classification based on histological type. The International Classification of Diseases for Oncology, Third Edition (ICD-O-3) serves as the international standard for histological classification and nomenclature.

Classification by site of origin

Cancers are classified into particular categories based on their primary place of origin, such as breast cancer, lung cancer, prostate cancer, liver cancer, renal cell carcinoma (kidney cancer), oral cancer, brain cancer, and so on. Cancer is a complicated and diverse disease defined by the uncontrolled development and spread of aberrant cells. Cancer is

**Vasantha and Kiranmai**

classified into several forms, each with its own set of characteristics, risk factors, and treatment modalities. Understanding the many forms of cancer is critical for proper diagnosis and personalised options for therapy.

Mammary Cancer

As one of the most frequent diseases in women globally, breast cancer develops from cells in the breast tissue. It can affect both men and women, but it is more common in women. Breast cancer risk factors include age, family history, hormonal variables, and lifestyle choices such as obesity and alcohol intake [5]. Breast cancer treatment options include surgery, chemotherapy, radiation therapy, hormone therapy, and targeted therapy.

Lung Cancer

Lung cancer begins in the cells of the lungs and is frequently related with smoking, though nonsmokers can also get the disease. It is the largest cause of cancer-related fatalities globally. Lung cancer is divided into two categories: non-small cell lung cancer (NSCLC) and small cell lung cancer (SCLC). Tobacco smoke, secondhand smoke, radon gas exposure, and occupational carcinogen exposure all increase the risk of developing lung cancer [6]. Lung cancer treatment options may include surgery, chemotherapy, radiation therapy, targeted therapy, and immunotherapy.

Colorectal Cancer

Colorectal cancer, commonly referred to as bowel cancer or colon cancer, attacks the colon or rectum. It is the world's third most frequent cancer, impacted by age, family history, nutrition, lifestyle, and inflammatory bowel illnesses. Colorectal cancer screening, such as colonoscopy and stool-based testing, can aid in the early detection of the disease, when therapy is most effective [7]. Colorectal cancer can be treated with surgery, chemotherapy, radiation therapy, targeted therapy, and immunotherapy.

Prostate Cancer

Prostate cancer occurs in the prostate gland, a tiny gland found beneath the bladder in males. It is one of the most prevalent cancers in men and typically spreads slowly. Age, family history, race, and lifestyle variables all contribute to prostate cancer risk. Prostate cancer screening, such as the PSA test and digital rectal examination, can aid in the early detection of the disease [8]. Treatment options for prostate cancer may include active surveillance, surgery, radiation therapy, hormone therapy, chemotherapy, and immunotherapy.

Classification by tissue types

The International Classification of Diseases for Oncology, Third Edition (ICD-O-3) is the international standard for histopathological classification and nomenclature. This classification is based on ICD-O-3. Cancers can be divided into six major categories based on their tissue type. From a histological approach, there are hundreds of distinct tumors that are classified into six major categories:

1. Carcinoma
2. Sarcoma
3. Myeloma
4. Leukemia
5. Lymphoma
6. Mixed Types

Carcinoma

This type of cancer develops from the epithelial layer of cells that line the exterior of the body or the interior linings of organs. Carcinomas, or malignancies of epithelial tissue, account for 80 to 90 percent of all cancer cases because epithelial tissues are numerous throughout the body, from the skin to the covering and lining of organs and internal passages such as the gastrointestinal tract. Carcinomas most commonly affect organs or glands, capable of secretion such as the breast, lungs, bladder, colon, and prostate. Cancer is classified into two types: adenocarcinoma and squamous cell carcinoma. Adenocarcinoma arises in an organ or gland, whereas squamous cell

**Vasantha and Kiranmai**

carcinoma begins in the squamous epithelium. Adenocarcinomas may affect mucus membranes and are first seen as a thickened plaque-like white mucosa. These are rapidly spreading cancers.

Sarcoma

These malignancies arise in connective and supporting tissues such as muscles, bones, cartilage, and fat. Bone cancer is a type of sarcoma called osteosarcoma. It primarily affects young people. Sarcomas resemble the tissue in which they grow. Other examples include chondrosarcoma (of the cartilage), leiomyosarcoma (smooth muscles), rhabdomyosarcoma (skeletal muscles), Mesothelial sarcoma or mesothelioma (membranous lining of body cavities), Fibrosarcoma (fibrous tissue), Angiosarcoma or hemangioendothelioma (blood vessels), Liposarcoma (adipose or fatty tissue), Glioma or astrocytoma (neurogenic connective tissue found in the brain), Myxosar

Myeloma

These are made up of bone marrow plasma cells. Plasma cells can produce a variety of antibodies in response to infections. Myeloma is a form of blood cancer.

Leukemia

This is a type of cancer that is classified under blood cancers. These malignancies attack the bone marrow, which is responsible for blood cell formation. When the bone marrow becomes malignant, it produces an overabundance of immature white blood cells that fail to execute their normal functions, and the patient is more susceptible to infection.

Types of leukemia include

- Acute myelocytic leukemia (AML) – these are malignancy of the myeloid and granulocytic white blood cell series seen in childhood.
- Chronic myelocytic leukemia (CML) – this is seen in adulthood.
- Acute Lymphatic, lymphocytic, or lymphoblastic leukemia (ALL) – these are malignancy of the lymphoid and lymphocytic blood cell series seen in childhood and young adults.
- Chronic Lymphatic, lymphocytic, or lymphoblastic leukemia (CLL) – this is seen in the elderly.
- Polycythemia vera or erythremia – this is cancer of various blood cell products with a predominance of red blood cells. Ionizing radiation, some genetic abnormalities, and benzene and other substances are all risk factors for leukemia [9]. Leukemia treatment options include chemotherapy, targeted therapy, radiation therapy, bone marrow transplantation, and immunotherapy.

Lymphoma

Lymphomas form in the lymphatic system's glands or nodes, which is a network of channels, nodes, and organs (particularly the spleen, tonsils, and thymus) that purifies bodily fluids and produces infection-fighting white blood cells, or lymphocytes. Unlike leukemia's, which are commonly referred to as "liquid cancers," lymphomas are considered "solid cancers." Lymphomas can also develop in specific organs, such as the stomach, breast, or brain. These lymphomas are called extranodal lymphomas. Lymphomas are categorized into two types: Hodgkin lymphoma and non-Hodgkin lymphoma. The presence of Reed-Sternberg Cells in Hodgkin lymphoma distinguishes it from non-Hodgkin lymphoma.

Mixed Types

The type components may be within one category or from different categories. Some examples are:

1. adenosquamous carcinoma
2. mixed mesodermal tumor
3. carcinosarcoma
4. teratocarcinoma

Classification by Grade

Cancers can also be classed based on grade. The abnormalities of the cells in comparison to the surrounding normal tissues determine the grade of the malignancy. The grade rises from 1-4 as the degree of irregularity increases. Well-differentiated cells resemble normal specialized cells and are found in low-grade malignancies. Undifferentiated cells are severely aberrant in comparison to the surrounding tissues. These are high-grade tumors.

- **Grade 1:** cells are highly differentiated with minor abnormalities.
- **Grade 2:** cells are moderately differentiated and significantly more abnormal.
- **Grade 3:** cells are poorly differentiated and very abnormal.
- **Grade 4:** cells are immature and primitive, undifferentiated.

Understanding the different types of cancer and their associated risk factors is crucial for early detection, accurate diagnosis, and personalized treatment planning. Advances in cancer research continue to improve our understanding of the molecular mechanisms underlying different types of cancer, leading to the development of novel treatment approaches and improved patient outcomes.

Types of Cancer Drugs

Cancer treatments include a wide variety of medications that target and kill cancer cells. These medications are classified into numerous categories, each with its own mechanism of action and therapeutic approach. Further explanations of each type of cancer medicine, as well as current advances in cancer therapy, are given below:

Chemotherapy

Chemotherapy medications target quickly dividing cancer cells by interfering with important biological processes such as DNA replication and cell division. [2]. Recent advancements in chemotherapy include the development of novel agents with improved efficacy and reduced toxicity profiles. For example, liposomal formulations of chemotherapy drugs such as liposomal doxorubicin and liposomal irinotecan have been developed to enhance drug delivery and reduce side effects [10]. Combination chemotherapy regimens incorporating newer agents such as taxanes, platinum-based drugs, and targeted therapy agents have also shown improved efficacy in certain cancers.

Targeted Therapy

Targeted therapy medications selectively target specific chemicals or processes involved in cancer growth and progression, while minimizing damage to normal cells [11]. Recent advancements in targeted therapy include the development of more precise and potent inhibitors targeting specific genetic mutations or signaling pathways. For example, BRAF inhibitors like vemurafenib and dabrafenib have demonstrated success in BRAF-mutant melanoma [12]. Immune checkpoint inhibitors, a kind of targeted medication, have transformed cancer treatment by boosting the immune system's response to cancer cells. Immune checkpoint inhibitors such as pembrolizumab, nivolumab, and atezolizumab have been approved to treat various malignancies [13].

Immunotherapy

Immunotherapy medications use the body's immune system to identify and remove cancer cells [13]. Recent advances in immunotherapy include the discovery of chimeric antigen receptor (CAR) T cell treatment, which involves genetically altering patients' T cells to recognize and destroy cancer cells that express specific antigens. CAR T cell therapies such as tisagenlecleucel and axicabtagene ciloleucel have shown promising results in certain hematologic malignancies [14]. Combination immunotherapy techniques, such as using immune checkpoint inhibitors in combination with other immunomodulatory drugs or targeted therapies, are also being researched to improve treatment efficacy.

Hormone Therapy

Hormone therapy medications inhibit the generation or activity of hormones that stimulate cancer growth [15]. Recent advancements in hormone therapy include the development of novel hormone receptor modulators and degraders. For example, selective estrogen receptor degraders (SERDs) such as fulvestrant have shown efficacy in

**Vasantha and Kiranmai**

hormone receptor-positive breast cancer resistant to other hormone therapies [16]. Combination therapies that combine hormone therapy with targeted drugs or immunotherapy are also being investigated to overcome treatment resistance and improve outcomes in hormone-sensitive tumors. Each type of cancer medicine provides distinct therapeutic benefits, and recent advances in cancer therapy have led to the creation of more effective and tailored treatment choices. Ongoing research and clinical trials are looking into new therapy techniques and combination regimens to help cancer patients achieve better outcomes.

The Spectrum of Side Effects

Cancer medications are effective weapons in the fight against cancer, but they are frequently associated with a variety of adverse effects that can affect patients physically, emotionally, and psychologically. Understanding and managing these side effects is critical for providing complete cancer care to patients.

Common Side Effects Associated with Cancer Drugs**1. Chemotherapy**

- Drugs used in chemotherapy attack quickly cells that divide quickly, including tumor cells, but they may also damage normal cells in the body, which causes an array of adverse effects.
- Chemotherapy-induced nausea and vomiting (CINV) are frequent side effects that can have a major impact on patients' quality of life [17].
- **Hair Loss (Alopecia):** Many chemotherapy medicines can induce temporary or permanent hair loss, negatively impacting patients' self-image and emotional well-being [17].
- **Bone Marrow Suppression:** Chemotherapy frequently decreases the bone marrow's ability to create blood cells, resulting in anemia, increased risk of infection, and bleeding [17].
- **Anecdote:** John, a leukemia patient receiving chemotherapy, revealed his struggle with constant nausea and weariness, which impaired his capacity to do daily duties.

2. Targeted Therapy:

- Targeted therapy medications interfere with specific molecules involved in cancer growth and progression, providing a more precise treatment strategy than standard chemotherapy.
- **Cardiotoxicity:** Some targeted therapy medications, for example Trastuzumab, may induce cardiotoxicity, resulting in heart issues such heart failure or arrhythmias [18].
- Edema and muscle cramps are common adverse effects of targeted treatment medications such as Imatinib, which can compromise patients' mobility and comfort [18].
- **Anecdote:** Mary, a breast cancer patient undergoing targeted therapy, discussed her experience managing muscle cramps and exhaustion, which impacted her daily activities and quality of life.

3. Immunotherapy

- Immunotherapy medications use the body's immune system to combat cancer cells, but they can also cause immune-related adverse events (irAEs).
- Many patients have reported fatigue as a side effect of immunotherapy, which affects their energy levels and daily functioning [19].
- **Rash:** Skin-related adverse effects like as rash or itching are frequently noted with immunotherapy medications, but they are usually modest and controllable [19].
- **Autoimmune Disorders:** In some circumstances, immunotherapy can cause the development of autoimmune disorders such as thyroiditis or colitis, which require quick medical intervention [19].
- **Anecdote:** Mark, a melanoma patient undergoing immunotherapy, shared his experience of managing chronic fatigue and skin rash, which hindered his ability to work and engage in daily activities.

4. Hormone Therapy

Hormone therapy is often used in hormone-sensitive malignancies, such as breast and prostate cancer, to block hormone receptors and slow tumor growth.

**Vasantha and Kiranmai****Hot Flashes**

Hormone therapy medicines such as Tamoxifen can produce hot flashes, nocturnal sweats, and mood swings, affecting patients' comfort and quality of life [20].

Uterine Cancer Risk

Tamoxifen use is linked to an increased risk of uterine cancer, emphasizing the significance of regular monitoring and follow-up care [20].

Anecdote

Susan, a breast cancer survivor undergoing hormone therapy, related her experience with controlling hot flashes and mood swings, which impaired her sleep and everyday activities.

Managing Side Effects and Enhancing Quality of Life

- Successful management of cancer drug side effects necessitates a collaborative effort among healthcare practitioners, patients, and caretakers.
- Strategies may include pharmacological therapies, lifestyle changes, supportive care measures, and psychological assistance.
- Patient education and open contact with healthcare practitioners are critical for detecting and treating side effects quickly.
- Encouraging patients to live a healthy lifestyle that includes regular exercise, proper nutrition, and stress management can also help to reduce side effects and enhance overall well-being.

Strategies for Managing Side Effects

Managing the side effects of cancer treatment is an important element of oncological care, with the goal of improving patients' quality of life and allowing them to continue their treatment regimen efficiently. These treatments include a variety of interventions, ranging from pharmacological approaches to complementary therapies and lifestyle changes, all designed to address the specific side effects encountered by individual patients.

Pharmacological Interventions

Pharmacological therapies are the foundation of controlling treatment-related side effects, providing tailored alleviation for symptoms while enhancing patients' overall comfort. The key pharmacological methods include:

Anti-emetics

Chemotherapy-induced nausea and vomiting (CINV) is one of the most painful side effects for cancer patients. Anti-emetic drugs, such as ondansetron and metoclopramide, efficiently relieve these symptoms, allowing patients to tolerate their treatment more pleasantly [17].

Pain Management

Cancer-related pain has a major impact on patients' everyday functioning and quality of life. Opioids like morphine and oxycodone, as well as non-opioid analgesics like acetaminophen and NSAIDs, are pharmacological choices for pain control. Tailoring pain management regimens to particular patient demands is critical for enhancing pain relief while reducing adverse effects [18].

Antidiarrheal Agents

Certain chemotherapy and targeted treatment regimens frequently cause diarrhea. Loperamide and other antidiarrheal drugs assist patients continue their treatment regimen by controlling bowel movements and preventing dehydration [19].

**Vasantha and Kiranmai****Complementary Therapies**

Complementary therapies, when used in conjunction with traditional cancer treatments, help to manage treatment-related side effects while also enhancing general health. Some commonly used complementary therapies include:

Acupuncture

Acupuncture, an ancient Chinese treatment in which thin needles are inserted into specific spots on the body, has been demonstrated to reduce chemotherapy-induced nausea and vomiting while also easing cancer-related discomfort. Acupuncture stimulates the body's natural healing mechanisms, providing a non-pharmacological alternative to symptom management [20].

Massage Therapy

Massage therapy provides physical and emotional benefits to cancer patients receiving treatment. Therapeutic massage treatments can help relieve muscle tension, discomfort, and promote relaxation and sleep quality. Massage therapy also reduces stress and improves overall well-being, leading to a more positive treatment experience [20].

Mindfulness-Based Stress Reduction (MBSR)

MBSR programs, which include mindfulness meditation, yoga, and mindful movement activities, help cancer patients develop resilience and cope with treatment-related stressors. Research indicates that participating in MBSR interventions can improve psychological well-being, symptom management, and overall quality of life [20].

Lifestyle Modifications**Nutritional Support**

Proper nutrition is critical for boosting patients' immune systems, encouraging healing, and managing treatment-related adverse effects like weariness and malnutrition. Registered dietitians can provide nutrition counseling to patients to assist them make informed food choices that support their treatment goals and improve their nutritional status [17].

Physical Activity

Regular physical activity provides various benefits for cancer patients, including fatigue reduction, cardiovascular health improvement, mood enhancement, and support for general physical function. Tailoring exercise programs to specific patient capabilities and preferences is critical for increasing adherence and improving outcomes [17].

Stress Management

Techniques such as mindfulness meditation, deep breathing exercises, and progressive muscle relaxation help patients cope with treatment-related stressors and improve their overall well-being. Integrating stress management techniques into daily routines promotes resilience and supports patients in navigating the challenges of cancer treatment [20].

Personalized Approaches to Side Effect Management

Managing cancer-related side effects necessitates an individualized approach that takes into account each patient's specific needs and preferences. By adapting management procedures to each patient's unique traits and circumstances, healthcare practitioners can improve symptom control, treatment adherence, and overall quality of life. Personalized approaches to side effect management take into account a variety of criteria, including patient characteristics, treatment regimen, comorbidities, and emerging personalized medicine advances.

Emphasizing Individual Patient Needs and Preferences

Personalized approaches to side effect management focus understanding and meeting the needs and preferences of each individual patient. Effective communication between patients and healthcare providers is critical for

**Vasantha and Kiranmai**

determining individual concerns, symptom management preferences, and treatment objectives. By integrating patients in decision-making processes, healthcare providers enable them to actively participate in their care and make educated treatment choices.

Factors Influencing Personalized Approaches

Patient Characteristics: Age, gender, genetics, and psychological factors all have an impact on how treatment-related side effects appear and are managed. For example, genetic variations can influence drug metabolism and response, resulting in varying therapeutic success and adverse effect profiles. Personalized approaches take these aspects into account when developing management strategies to maximize outcomes while avoiding risks.

Treatment Regimen

The kind, dosage, and length of cancer treatment have a major impact on the nature and severity of side effects. Personalized techniques take into account each patient's individual treatment plan, which may include chemotherapy, targeted treatments, immunotherapies, and hormone therapies. Furthermore, recent advances in precision medicine, such as genetic profiling and molecular testing, enable the identification of tailored medicines that are most likely to

Comorbidities

Pre-existing medical disorders and comorbidities have an impact on therapy selection as well as the management of adverse effects. Patients with comorbidities such as diabetes, cardiovascular disease, or renal impairment may require changes to their treatment plan or increased monitoring to prevent problems. Personalized techniques evaluate comorbidities to enhance treatment outcomes while limiting hazards.

Emerging Advancements in Personalized Medicine

Advances in customized medicine have transformed cancer treatment by allowing for tailored treatments that take into account individual diversity in treatment response and sensitivity to side effects. For example, molecular profiling of cancers can uncover specific genetic alterations or biomarkers that inform treatment selection, enabling for the delivery of targeted medicines with greater efficacy and lower toxicity. Furthermore, pharmacogenomic testing can detect genetic variants that influence medication metabolism and response, allowing for tailored dosing methods to improve treatment outcomes while avoiding side effects.

Current Personalized Treatment Procedure

Consider immunotherapy as an example of a current tailored treatment approach for individuals with advanced melanoma. Recent advances in cancer immunotherapy have resulted in the creation of immune checkpoint inhibitors like pembrolizumab and nivolumab, which suppress the programmed cell death protein 1 (PD-1) pathway. However, not all patients respond equally to these treatments, and some may develop immune-related adverse events (irAEs) such as colitis, pneumonitis, or thyroid dysfunction.

To tailor treatment and reduce the risk of irAEs, healthcare practitioners may use biomarkers like programmed death-ligand 1 (PD-L1) expression levels or tumor mutational burden (TMB) to identify patients who will benefit most from immunotherapy. Furthermore, continuous monitoring of patients for early indicators of irAEs enables rapid intervention and management.

Current Challenges in Side Effect Management**Disparities in Access to Supportive Care**

Cancer patients continue to face disparities in their access to supportive care services such as symptom management, psychosocial support, and palliative care. Socioeconomic position, geographic location, cultural attitudes, and healthcare infrastructure all contribute to these inequities, which result in variances in the quality of side effect management and patient outcomes [17].

**Vasantha and Kiranmai****Emerging Toxicities from Novel Therapies**

The development of new cancer medicines, such as targeted therapies and immunotherapies, has transformed cancer treatment. However, these novel medicines provide their own set of problems, including distinct and sometimes unforeseen side effect profiles. Emerging toxicities linked with innovative medicines include immune-related adverse events (irAEs), cytokine release syndrome (CRS), and neurotoxicity, which necessitate close monitoring, early intervention, and specific management approaches [18].

Psychosocial Impact of Side Effects

Aside from physical manifestations, treatment-related side effects can have a significant psychosocial impact on patients, compromising their mental well-being, social functioning, and overall quality of life. Side effects like hair loss, fatigue, cognitive impairment, and sexual dysfunction can harm patients' self-esteem, relationships, and sense of normalcy, emphasizing the need for holistic supportive care interventions that address both the physical and psychosocial aspects of side effect management [19].

Future Directions in Side Effect Management**Precision Medicine and Biomarker-driven Strategies**

Precision medicine approaches, which use genetic profiling, molecular characterization, and biomarker identification, have enormous potential for tailored side effect treatment. By stratifying individuals based on genetic predispositions, tumor biology, and pharmacogenomic profiles, healthcare practitioners can personalize therapy regimens and supportive care measures to individual patients, maximizing efficacy while minimizing toxicity.

Integration of Digital Health Technologies

The integration of digital health technology, such as wearable devices, mobile applications, and remote monitoring platforms, provides novel approaches to real-time symptom monitoring and management. These technologies allow people to track their symptoms, connect with healthcare doctors, and access supportive care resources from the comfort of their own homes, promoting preemptive interventions and increasing patient self-care [20].

Multidisciplinary Collaborative Care Models

Multidisciplinary collaborative care models, which include oncologists, nurses, pharmacists, psychologists, dietitians, and other allied healthcare experts, allow for complete side effect treatment and supportive care delivery. These care models promote interdisciplinary communication, coordination, and shared decision-making, ensuring holistic patient-centered care that addresses the different demands and challenges of cancer treatment [20].

Patient Education and Empowerment

Empowering patients with knowledge, skills, and resources to actively participate in their own care is critical for effective side effect control. Patient education initiatives, support groups, peer-to-peer networks, and survivorship programs are critical in providing patients with the knowledge and support they need to navigate treatment-related side effects, make educated decisions, and advocate for their own well-being [17].

CONCLUSION

While cancer medications have transformed the treatment landscape, their side effects present substantial hurdles to individuals undergoing therapy. Understanding these side effects and applying appropriate treatments allows healthcare providers to reduce their impact and improve patients' quality of life throughout cancer treatment. Furthermore, continuous research into novel medicines and supporting interventions is refining cancer care, providing promise for improved outcomes and patient well-being in the fight against cancer.

Table: 1 List of drugs used in cancer treatment and their side effects.

S.No	Drug name	Type of drug	Side effects	Uses
1	Mechlorethamine	Chemotherapy	Nausea, vomiting, bone marrow suppression	Hodgkin lymphoma, leukemia
2	Methotrexate	Chemotherapy	Nausea, vomiting, mucositis	Leukemia, lymphoma, breast cancer
3	5-Fluorouracil	Chemotherapy	Nausea, vomiting, diarrhea	Colorectal, breast, stomach cancer
4	Vincristine	Chemotherapy	Peripheral neuropathy, hair loss	Leukemia, lymphoma, neuroblastoma
5	Adriamycin	Chemotherapy	Cardiotoxicity, hair loss	Breast, lung, lymphoma
6	Tamoxifen	Hormone Therapy	Hot flashes, increased risk of uterine cancer	Breast cancer
7	Cisplatin	Chemotherapy	Nephrotoxicity, ototoxicity	Testicular, bladder, ovarian cancer
8	Paclitaxel	Chemotherapy	Neuropathy, hair loss	Breast, ovarian, lung cancer
9	Rituximab	Immunotherapy	Infusion reactions, fatigue	Non-Hodgkin lymphoma
10	Imatinib	Targeted Therapy	Edema, muscle cramps	Leukemia, gastrointestinal stromal tumors
11	Pembrolizumab	Immunotherapy	Fatigue, rash	Melanoma, lung cancer
12	Olaparib	Targeted Therapy	Fatigue, nausea	Breast, Ovarian cancer
13	Trastuzumab	Targeted Therapy	Cardiotoxicity, infusion reactions	Breast, stomach cancer
14	Nivolumab	Immunotherapy	Fatigue, rash	Lung, melanoma cancer
15	Abemaciclib	Targeted Therapy	Diarrhea, fatigue	Breast cancer
16	Sotorasib	Targeted Therapy	Fatigue, diarrhea	Lung cancer
17	Trodelyv	Chemotherapy	Fatigue, diarrhea	Breast cancer
18	Infigratinib	Targeted Therapy	Fatigue, diarrhea	Gallbladder cancer
19	Durvalumab	Immunotherapy	Fatigue, cough	Lung, bladder cancer
20	Pertuzumab	Targeted Therapy	Diarrhea, rash	Breast cancer

Vasantha and Kiranmai

21	Bevacizumab	Targeted Therapy	Hypertension, proteinuria	Colorectal, lung, ovarian cancer
22	Sorafenib	Targeted Therapy	Fatigue, hand-foot syndrome	Liver, kidney cancer
23	Palbociclib	Targeted Therapy	Neutropenia, fatigue	Breast cancer
24	Ribociclib	Targeted Therapy	Neutropenia, fatigue	Breast cancer
25	Atezolizumab	Immunotherapy	Fatigue, rash	Bladder, lung cancer
26	Enzalutamide	Hormone Therapy	Fatigue, hypertension	Prostate cancer
27	Larotrectinib	Targeted Therapy	Fatigue, dizziness	Solid tumors with NTRK gene fusion
28	Encorafenib	Targeted Therapy	Fatigue, nausea	Melanoma, colorectal cancer
29	Ivosidenib	Targeted Therapy	Fatigue, nausea	Acute myeloid leukemia
30	Tucatinib	Targeted Therapy	Diarrhea, fatigue	Breast cancer
31	Sacituzumab govitecan	Chemotherapy	! Fatigue, nausea	Triple-negative breast cancer
32	Fam-trastuzumab deruxtecan	Targeted Therapy	Nausea, fatigue	HER2-positive breast cancer
33	Selpercatinib	Targeted Therapy	Fatigue, hypertension	Thyroid cancer
34	Belantamab mafodotin	Targeted Therapy	Fatigue, ocular toxicity	Multiple myeloma

ABSTRACT

The development of Artificial Intelligence (AI) and Augmented Intelligence (AUGI) technologies has guided in a transformative period in education. This paper explores An impact of AI and AUGI within the environment of advance education The integration of these intelligent into educational practices has reshaped the literacy experience, offering a unique set of openings and challenges. This study explore into the ways AI and AUGI enhance substantiated literacy, adapt to individual student needs, and provide real-time feedback, therefore improving academic outcomes. It also examines the ethical considerations and privacy concerns associated with AI-driven educational platforms. Also, the part of educators using these technologies to produce engaging, interactive, and inclusive learning environments is explored. Additionally, this paper discusses the potential implications of AI and AUGI on the future of work and the skills required for college students to flourish in an AI-driven world. As these technologies are developing in nature, it is pivotal to probe how they can foster critical thinking, problem-solving, and creativity among students. This research offers an analysis of the impact of AI and AUGI on the education field, highlighting their potential to revolutionize teaching and learning while emphasizing the importance of responsible implementation and thoughtful pedagogical strategies, especially in the college environment.

Keywords: AI – Artificial intelligence, AUGI – Augmented intelligence, Education, Information technology

**Cathrine Arputha Divya**

INTRODUCTION

The education landscape is witnessing a profound transformation with the arrival of Artificial Intelligence (AI) and Augmented Intelligence (AUGI) technologies. These intelligent systems have introduced a new dimension to tutoring and learning, revolutionizing the way knowledge is acquired, reused, and applied. As the world becomes increasingly digitized and interconnected, it's imperative to understand the far-reaching implications of AI and AUGI in the education field. Artificial Intelligence, as a broad category, encompasses a range of technologies that enable machines to imitate human-like cognitive functions such as learning, reasoning, problem-solving, and decision-making. In the environment of education, AI offers the implicit to produce personalized learning experiences, streamline administrative tasks, and provide educators with valuable insights into student performance. Augmented Intelligence, on the other hand, represents a collaborative partnership between humans and machines. It emphasizes the idea that technology should enhance human capabilities rather than replace them. In education, AUGI acts as a supportive tool for educators, helping them make further informed opinions, adapt to individual student needs, and produce engaging and effective teaching styles. The integration of AI and AUGI in education has the power to address long-standing challenges within the sector, including the need for further substantiated instruction, the demand for real-time feedback, and the necessity for efficient executive processes. By employing these technologies, educational institutions can morefeed to the different learning styles and requirement of students. This transformative shift, still, isn't without its complications. Ethical considerations, data privacy, and concerns regarding algorithmic bias must be carefully navigated. Also, the evolving role of educators in this technologically enhanced environment raises important questions about how best to leverage AI and AUGI to achieve educational goals.

OBJECTIVE OF THE STUDY

- To identify the factors, opinions of Artificial intelligence among college students.
- To know the usage of AI and AUGI by Students.

LIMITATION OF THE STUDY

- The scope of the study is limited to the students and scholars cannot be generalized.
- The study concentrated only with Artificial intelligence and augmented intelligence.

REVIEW OF LITREATURE

Aggarwal, Deepshikha and Sharma, Deepti and Saxena, Archana B. (2023)¹, In this article the author says that Artificial intelligence (AI) plays a vital role in augmenting adaptable sustainable education in numerous ways, transforming the learning experience for students, educators, and institutions. AI can analyze each student's learning style, pace, and strengths and weaknesses to provide personalized learning pathways and recommendations. Adaptive learning systems can adjust the difficulty level of content in real-time, ensuring that students are using the tools appropriately. ZhonggenYu,(2020)²,in this study the author reveals the rapid development of technology, use of artificial intelligence (AI) in education has caught much attention across the world ,it is still a young field with many under-explored research elements. This study provides references to readers in terms of mapping on the basis of keywords.This study into serious consideration when they set about researching effectiveness, efficiency, or usefulness of AI in education. More research into use of AI in education will be most likely need interdisciplinary cooperation between computer science, statistics, education, cognition, and robotics. **Seungsupaek, (2021)³**, This study aimed to explore the future direction of education by examining the current impact and predicting future impacts of AI. It also examined research trends and collaboration status by country through network analysis, topic modeling and global research trends in AI in education.

**Cathrine Arputha Divya****ARTIFICIAL INTELLIGENCE**

Artificial intelligence is the simulation of human intelligence process by machine by computer science, with specific applications of AI includes expert systems, natural language processing, speech recognition and machine vision. Its focus on cognitive skills. Learning aspect focus on acquiring data and creating rules , they provide computing services step by step instructions to complete a specific task. Reasoning this aspect of AI programming focused on choosing the right step to reach the desire outcome. Its used in various fields like AI in business, AI in finance, AI in healthcare , AI in education, AI in law ,AI in entertainment and media, AI in software coding and it processing , AI security , AI in manufacturing ,AI in banking and AI in transportation

TYPES OF AI**IMPLEMENTATION OF AI IN EDUCATIONAL SECTOR****Automated grading system**

A significant amount of time is spent for class preparation and grading the students assignments. While this AI is used to assessed the student performance and provide grades.

AI based intelligent assistants

Its an Virtual assistant it is also called as AI assistant or digital assistant, it is an application program that understand natural language voice commands and complete task the users. It is performed by a human personal assistant or secretary – includes taking notes, reading text or email message aloud , scheduling, place phone calls and giving reminder about appointments. Popular AI assistant like Amazon Alexa, Apple Siri, and google assistant.

Common Types of AI Assistant**Chatbots**

The Chatbots are computer programs that serve as virtual assistant and communicate through text based interfaces on websites or social media.

Conversational agent

it's a virtual assistant to converse like human through both text and voice interfaces.

AI Virtual Assistant

this is an advanced virtual assistants, that can perform a variety of task by working on multiple devices and platforms.

AI ChatGPT

AI based Chatbots, its released by open AI. Its spreading Like a Wildfire among the Students to submit the assignments, Its helps them to generate notes and too convert them in PPT presentations. Its main feature is Conversational Memory, its also has the feature of conversion of voice that is text to speech.

AUGMENTED INTELLIGENCE

Augmented intelligence learning tools is useful for the students to gain more knowledge. Its focus on the development of augmented human intelligence through more data, more efficiently and making life changing decisions. It make them faster, better, more confident in decision making. They help them to fits not only in the domain, based on the knowledge also. Augmented intelligence apply information process capabilities to extend the human mind through distribution cognition. They function with mechanical and electronic devices range from calculator, abacus, personal computer and smart phones. It acts as a Just in time understanding and learning to acquire relevant information and to solve the complex issues as per the need or demand. Its also used by several peoples not only the students (teachers and parents). This technology brings the insight to the users to have better understanding in learning and to create interest with this new platform. The AI in education has potential to change the environment in conventional learning process. It is a boom to the young generation.

**Cathrine Arputha Divya****FUTURE OF AI IN EDUCATION FIELD USING MOBILE APPLICATIONS**

- Smart content creation the AI tools
- AI helps students improve their visualization
- Personalized learning
- Speech recognition technology

ANALYSIS AND INTERPRETATION**Interpretation**

The above table shows that (65%) of the respondents are male and (35%) of the respondents are female

Interpretation

The above table reveals that (66%) of the respondents are saying that use AI tools (yes) and (34%) of the respondents are saying that they don't use AI tools (no).

Interpretation The above table reveals the ranking among 6 online AI tools preferred by the Students. "AI ChatGPT(openAI)" was ranked first by the selected sample respondents with the total score of 21. "Quillbot & AI for speech and audio (Otter)" was ranked second with the total score of 19. and "AI NLP (Knowji)" occupied third rank with the total score of 18.

A WAY HEAD AND CONCLUSION

The technology development and usage of internet is increasing now days. The students are always depend with gadgets because of that they come to know about the trending software and techniques. They use these types of techniques and tools to learn , write and upgrade their knowledge to achieve their goals. They use these AI and AUGI for submission of assignments and clarify the doubts after class hours. Its user friendly, they can get the answers immediately and can complete the work at once or in a fraction of second. The technology upgradation is the main reason for the updating and changes in the society among the students. To know more about the AI and Machine learning. In nearing future the usage of AI and Augmented Intelligence will be very high among the students for learning and implementing the software to learn and get placed in companies.

ABSTRACT

Annapavala chendhuram (APC) is a herbo – mineral *Siddha* internal medicine that has the indication for *kabam-related* disorders and clinically this medicine is used for thyroid disorders by many practitioners. Nowadays most the people rely on *Siddha* medicine and seek medical care in *Siddha*. So, it is necessary to ensure its safety through animal studies. This study investigated the acute and long-term toxicity of *Annapavala chendhuram* in Wistar albino rats as per WHO guidelines. In an acute toxicity study, APC was administered once at a dose of 250mg/kg/p.o body weight and 14 days observed for toxic signs. In long-term toxicity studies, APC was administered for 90 consecutive days to rats at the dose level of 25, 125, and 250 mg/kg/p.o body weights. After 90 days of feeding, animals were sacrificed and haematological, biochemical and histopathology parameters were analyzed. No mortality and/or signs of morbidity were noted in the acute toxicity study. In the long-term toxicity study, any detrimental change in body weight, biochemical, and haematological parameters were not observed for *Annapavala chendhuram* up to the high dose level when compared with the control group. From the study, it is concluded that the test drug was found to be safe at various dose levels and hence recommend for safe use in humans at therapeutic dose levels.

Keywords: Annapavala chendhuram, Toxicity study, Thyroid dysfunction, WHO guideline, Siddha.

Sabari Girija et al.,

INTRODUCTION

Siddha medicine, the traditional system of medicine is one of India's oldest systems of medicine [1]. *Chendhuram* is one among the 32 types of *Siddha* internal medicine. It is red-colored powders made from metallic substances by the process of burning or drying or keeping in sunlight or specialized tubes by the addition of any decoctions. The life period of *chendhuram* is 75 years [3]. The method of preparation of *parpam* and *chendhuram* shows the mastery of *Siddhars* in inorganic chemistry and processing herbo - mineral drugs. The herbo - mineral drugs are made into very fine particles. The finer particle has better bioavailability and effect, the minute dose is adequate for treatment [4]. *Annapavala chendhuram* (APC) is the *Siddha* internal medicine that comes under the type of *chendhuram*. It is made by the combination of *annabedhi* and *kodipavalam*. As per the reference of *Siddha* pharmacopoeia, APC indicates *kaasam*, *shayam*, *swasam*, *ratha ushnam*, *pitha ushnam* and *mega ushnam*[5]. Clinically, this medicine is used for thyroid dysfunction by many practitioners. In India, as per a population-based study conducted in Cochin, the prevalence of hypothyroidism and subclinical hypothyroidism were 3.9% and 9.4% respectively among 971 adults. In women, the prevalence was 11.4% which is higher compared with men (6.2%)[6]. Many people have done research on *annabedhi* and *kodipavalam* based *Siddha* medicines. Shanmuga sundharam et.al[7]. has carried out the anti-atherosclerotic activity and Sabari Girija et.al has proven the effect of anti-hypertensive activity [8]. But till date, there is no data available about the safety evaluation of APC. Nowadays most the people rely on *Siddha* medicine and seek medical care in *Siddha*. However, there are fears about the toxicity of *Siddha* medicines among people due to the metals in *Siddha* medicines [9]. So, it is necessary to ensure its safety through animal studies to establish strong evidence for its clinical use. Hence, this study is aimed to evaluate the safety of *Annapavala chendhuram* in Wistar albino rats.

MATERIALS & METHODS

Procurement and authentication of the raw drug

The raw drugs were procured from the authenticated raw drug shop in Chennai. Lemon was procured from the Tambaram Vegetable market, Chennai. *Kodipavalam* and *Annabedhi* samples authenticate in the Department of Geology, University of Madras, Chennai.

Purification process of raw drugs

Annabedhi and *Kodipavalam* were purified as per *Siddha* literatures.¹⁰

Preparation method of Annapavala chenduram

The trial drug APC was prepared as per *Siddha* text in the *Gunapadam* Laboratory of the National Institute of Siddha, Chennai.

Toxicity study of AnnapavalaChendhuram

Animal Ethical committee approval:

The animal study was carried out in Animal House, National Institute of Siddha, Tambaram sanatorium, Chennai after getting approval from the Institutional Animal Ethics committee, National Institute of Siddha, Chennai ((IAEC approval number: NIS/IAEC-VII/28082018/15) as per WHO guidelines[11].

Animal Care and Husbandry

Male and female Wistar rats (6-8 weeks and 140– 160 g weight) were purchased from the Laboratory Animal Medicine Centre for Animal Health Studies, Tamil Nadu Veterinary and Animal Sciences University, Chennai and acclimatized in the animal house of the National Institute Siddha, Chennai for 7 days before experimentation. Animals were housed individually in polypropylene cages in a ventilated room (air cycles: 12–15/min; 70:30 exchange ratio) under an ambient room temperature of $22 \pm 3^\circ\text{C}$ and 40– 70% relative humidity, with a 12h light/dark artificial

**Sabari Girija et al.,**

photoperiod. The animals received RO water ad libitum and were fed with Rodent pellet ad libitum. Each animal was marked on its fur for identification.

Dose calculation

The therapeutic dose of APC is 120 -260 mg. The suitable dose for rats was calculated as per Paget and Branes [12](Surface factor for 200gm rat = 0.018) and was found to be 25, 125, and 250 mg/kg body weight of rat for low dose, mid dose, and high dose groups respectively.

Acute toxicity study

A total of 20 (10 Male + 10 Female) Wistar Albino rats of both sexes were separated into two groups. For control group, 1ml/100gb.w of honey was given. The test drug was administered (250mg/kg b.wt) by mixing it with honey (Dabur India). After drug administration, food was withdrawn for further 3 hours in rats. The animals were observed for morbidity and mortality for the first 30 minutes, 1st, 2nd, 4th and 6th hour on the day of dosing and once a day thereafter up to 14 days. The body weight was recorded on the 0th, 7th, and 14th days individually. After that, on the 14th day, animals of both groups were sacrificed using the injection of thiopental sodium 100mg/kg body weight (intra peritoneal) after weighing them individually. The toxicological effect was assessed based on mortality, gross pathology, and behavioral parameters.

Long-term toxicity study

A total of 70 animals were included in the long-term study. Albino rats of both sexes were separated into four groups. The first group was treated as vehicle control and the second, third and fourth group were treated with APC at Low dose, Mid dose, and High dose respectively. The number of animals was 10, 20, 20, and 20 in the group of control, low, mid, and high doses respectively. The control animals were administered with honey as a vehicle. The other animals were treated with APC orally for 90 days and it was monitored for behavioural parameters daily after drug administration. The body weight of the animal was monitored at weekly intervals. The food and water intake were calculated daily. All animals were weighed and sacrificed at the end of the study (91 days) by using the injection of thiopental sodium. Mortality and behavioural parameters were observed throughout the study. Blood was collected from the anesthetized animals through the abdominal aorta for analysis.

Haematological and biochemical parameters

Haematological and biochemical parameters were analyzed for all animals using standard procedures.

Histopathological examinations of organs

Histopathological examination of the internal organs was done in Noble Research Solutions, Chennai, Tamil Nadu, India.

STATISTICAL ANALYSIS

Statistical analysis was performed using one-way ANOVA using the computer software program *Graph Pad Instant-3*. Dunnet's test was used to compare control and test drug-treated groups. P-value < 0.05 was considered the level of significance.

RESULTS**Acute toxicity study**

An Acute toxicity study of APC was conducted as per WHO guidelines. No mortality or treatment-related toxicity was noted in any animals during the experimental period. The animals gained bodyweight gradually. (Table 1) There was no significant difference between the control & treated groups in food and water intake throughout the study period. Normal signs were noted in the skin, fur, eyes, mucous membranes, salivation, and sleep in control

**Sabari Girija et al.,**

and treated animals. No other signs like tremors, convulsions, lethargy, coma, diarrhoea were observed during the study period. (Table 2) No pathological changes were observed in the vital organs of all groups during the necropsy.

Long-term toxicity study (90 Days)

There was no mortality and treatment-associated toxicity noted in all groups during the experimental period.

Effect of APC on body weight

The animals in all groups gradually gained body weight throughout the study period. There were no significant differences observed in the body weight of the control and the treated groups. (Table 3)

Haematological parameters

Each haematological parameter of test drug-treated animals was compared with the control group animals at end of the study respectively. No significant changes were found in all the parameters with statistical analysis. It has shown in Table 4.

Biochemical parameters

Biochemical parameters were assessed in APC treated animals at end of the study and the results were recorded. It indicates the Liver function test, Renal function test and Lipid profile of APC treated animals which were compared with the control group.

Hepatic parameters of APC

Hepatic parameters were assessed for APC treated Wistar albino rats which were compared with the control group. This result revealed no significant changes in liver parameters. All the parameters were normal in the test groups when compared with the control group. Liver function tests of APC treated animals have shown in Table 5.

Renal parameters of APC

Blood urea nitrogen (BUN) and creatinine are the indicators of renal function. This analysis was done at the end of the study. Test groups did not have any significant changes in the levels of animals when compared to the control group. BUN and creatinine levels of APC treated animals were normal compared to control group animals. It has mentioned in Table 6.

Lipid profile of APC

The lipid profile did not show significant changes in all test animals when compared to the control group. (Table 7)

Histopathological analysis

Long term toxicity study of APC did not produce any evident pathological changes in various organs such as the Brain, Heart, Lungs, Stomach, Liver, Kidney, Spleen, Testis /Uterus, and Ovary of the Control group as well as in the High dose group mentioned in Figure 1.

DISCUSSION

Annapavala chendhuram is widely prescribed by *Siddha* practitioners [13]. Although, no systematic information is available on the toxicity of APC in the current literature. Nowadays, the consciousness about the quality of the drug is rising among people [14]. Therefore, we decided to conduct a toxicity study as per World Health Organisation (WHO) guidelines in rats which will provide information about its ethnopharmacological profile and also the health hazard supposed to rise from repeated administration of the drug over a period of time. Acute toxicity was done to analyze the immediate adverse effects that occur after the administration of a single large dose of the drug [15]. The maximum dose of APC (250mg/kg) was given as a single dose through the oral route with honey. The animals were

**Sabari Girija et al.,**

monitored for any behavioural abnormalities and mortality for 14 days. All the animals were normal in the acute toxicity study of APC throughout the study period. No mortality or morbidity was noted after the drug administration and also up to the end of the study period. The gross necropsy did not show any abnormality [16]. Body weights of these animals were observed for 7 days once. There was a gradual increase in the body weight of acute toxicity animals but no statistical significance was found between control and treated groups in body weight gain [17]. In the Long - term toxicity study, the effect of APC on body weight during 90 days of treatment in rats. There was a gradual increase in the body weight of APC treated animals when compared to the control during the experimental period [18,19]. But the body weight of the treated group was not statistically significant when compared with the control groups. Blood is the main medium for the transport of many drugs in the body and it is primarily exposed to major concentrations of toxic compounds. Any harm to the blood cells is unfavourable to their normal functioning. The effect of APC on haematological and biochemical parameters was analyzed [20]. It revealed no significant changes in all experimental animals. Liver enzymes such as Serum Glutamic Oxaloacetic Transaminase (SGOT) and Serum Glutamate Pyruvate Transaminase (SGPT) are useful indicators of liver injury. These enzymes are found mainly in the liver, red blood cells, pancreas, heart, kidneys, and biliary ducts of the liver. So, the analysis of SGOT and SGPT levels in the serum helps to diagnose the conditions of body tissues particularly the heart and the liver tissues [22]. Research suggested that, when body tissues are injured, there is a raise in the serum enzyme level due to the release of excess enzymes into the bloodstream. As a result, the amount of SGOT and SGPT in the blood is directly associated with the amount of tissue damage. Parameters of liver function were within normal limits when compared with the control group. The kidney excretes urine and plays a major role in maintaining homeostasis by filtering waste products from the bloodstream and converting them to urine. Analysis of some biochemical markers can validate beneficial and pathological changes in the kidney and its function, thus serving as an indicator of renal function. It includes creatinine, urea and uric acid [23,24]. The renal parameters did not show any important changes in the test drug-treated groups when compared to the control group [25]. The histopathological analysis of the organs such as the brain, heart, lung, kidney, spleen, liver, stomach, uterus, ovary, and testes were normal in high dose groups as well as in the control group. Normal levels of liver function and kidney function tests revealed the safety of *Annapavala chenduram*.

CONCLUSION

This study results concluded that APC is not toxic on acute administration at a maximum oral dose level of 250 mg/kg in Wistar rats. In the long-term toxicity study, no significant adverse effects were noted in all observed parameters. Hence, the study proves the safety of *Annapavala chenduram*. Further efficacy studies and clinical trials on APC will be more valuable for researchers and the world.

ABSTRACT

Vulnerabilities in traditional centralized cloud storage systems include data breaches, unauthorized access, and single points of failure. This paper suggests a blockchain-based method for safe cloud data storage that allows for limited data access in order to address these issues. The suggested solution makes use of blockchain's decentralized and immutable properties to guarantee the security and integrity of data that is stored. The decentralized and unchangeable nature of blockchain technology makes it a valuable tool for improving data storage security and transparency. By distributing data over several cloud servers and encrypting it, this suggested method reduces the possibility of a single point of failure. After then, the information is stored on a blockchain as a collection of unchangeable blocks, guaranteeing data integrity and prohibiting illegal changes. The blockchain is made up of a series of blocks that are connected to each other via a hash pointer found in each block. Third-Party Auditors (TPAs) are established to assure data integrity. These impartial organizations regularly audit the data that is kept and confirm its accuracy by comparing it to hashes that are kept on the blockchain. By acting as reliable parties, the TPAs lessen the dependency on the data storage provider by guaranteeing the consistency and correctness of the data. A strong TPA verification technique that includes secret key distribution and verification methods has been put in place to reduce the possibility of any user engaging in potentially harmful activity. Additionally, a secure file sharing system is offered. The user can request file access from the data owner here. Owner may give authorization for data access and transmit a secret key. Users

Sowmiya et al.,

have verifiable access to data. This method overcomes the drawbacks of conventional cloud storage systems by utilizing the decentralized and transparent characteristics of blockchain technology, offering improved security, data integrity, and restricted data access.

Keywords: Cloud System, Blockchain implementation, Data storage, Secret key distribution, TPA verification, Data auditing, Secure data sharing.

INTRODUCTION

Data sharing is one of the most often used features of cloud storage, allowing a large number of users to share their data with others. Nevertheless, these shared cloud-stored data sets can contain some sensitive information. The data owner must first produce signatures for each block under remote data integrity auditing systems before uploading the blocks to the cloud. In this case, block chain helps generate hashes and data blocks for data sealing. The integrity auditing procedure uses these signatures to confirm that the cloud possesses these data blocks. The data owner then uploads these data blocks to the cloud along with the corresponding signatures. Here, offer a workable integrity auditing technique that makes use of an outside auditor to assist in resolving the problems with the present auditing approach.

The implementation of an effective third-party auditor (TPA) is contingent upon the fulfillment of the following two basic conditions: 1) TPA should be capable of conducting competent audits of cloud data storage without necessitating a local copy of the data or increasing the online burden on cloud users; 2) The third-party auditing technique should not uncover any new vulnerabilities related to user data privacy. This research provides a privacy-preserving public cloud data auditing system that passes all integrity checks without revealing any data by combining a novel combination of double encryption and public auditing protocols. We need look into the online signature technique more in order to extend the primary finding into a multi-user setting where TPA can manage multiple auditing tasks simultaneously. Encrypt the data that is stored on the cloud server using an encryption method. In conclusion, whereas cloud-based data outsourcing makes economic sense for large-scale, long-term storage, data availability and integrity cannot be instantly guaranteed. Cloud architecture can suffer if this problem is not properly fixed. Standard cryptographic primitives cannot be directly used to ensure data security since users no longer physically own the data they save. Specifically, downloading all the data for integrity testing is not a practical solution due to the high cost of I/O and network transmission. Furthermore, because it cannot ensure users' correctness for content they have not yet viewed and because it can be too late to reverse data loss or damage, it is frequently insufficient to detect data corruption just at the moment of data access.

During the auditing process, the TPA uses their private key to confirm that the user's actions are legitimate. Through the use of cryptographic techniques, the secret key functions as a digital signature, providing a secure means of confirming the user's authorization to do specific auditing tasks. This verification method protects the confidentiality of the cloud data auditing procedure by limiting unauthorized access and establishing an open accountability trail that enables the detection of any harmful activity. To protect the confidentiality and integrity of sensitive data, there are a number of important processes involved in encrypting data for safe cloud sharing with secret key distribution. Before the data is transferred to cloud storage, it is first encrypted using strong encryption methods like AES. The data is rendered unreadable by the encryption process, making it unavailable to unauthorized people or organizations. Simultaneously, a secret key is generated for both data encryption and decryption, acting as the foundation for data security. After that, this key is safely given to approve users via reliable channels or protocols, guaranteeing that the encrypted data may only be accessed by those who are authorized. By distributing secret keys, access controls are put in place to make sure that only authorized users may decrypt and access data stored in the cloud.

Cloud Computing

Without a question, cloud computing is a promising idea in corporate computing. It draws attention to the critical infrastructure required to enable a new model of service delivery that benefits from cost savings through the sharing of computing and storage resources. Cloud computing is a truly gigantic technology that is currently surpassing all prior computing technologies in the highly competitive and demanding information technology market.

Solutions like Software-as-a-Service (SaaS), Platform-as-a-Service (PaaS), Storage-as-a-Service, and Infrastructure-as-a-Service (IaaS) are available from a variety of prominent cloud computing providers, including Amazon, Google, Microsoft, Yahoo, and many more. The use of cloud computing is growing significantly. Additionally, cloud computing is an excellent technology since it can optimize costs and maximize both economic and operational effectiveness. Furthermore, cloud computing may significantly improve its range, speed, and collaboration, allowing an internet infrastructure that facilitates a global computing paradigm. Moreover, cloud computing has advantages in that it can provide services that are more resilient and scalable. Because cloud computing relieves the user of the task of locating resources for storage, resource management is better managed by it. If additional storage is required, the user can request it from the cloud provider. When the user is finished using the storage, they can either release it by stopping to use it or move the data to a less expensive, longer-term storage alternative. The user can also make use of more dynamic resources since they aren't worried about storage problems or related expenses anymore.

The word "cloud" as it appears in this white paper appears to have originated from network diagrams that showed the internet or other parts of it as schematic clouds. The practice of transferring services and programs into the online "cloud" gave rise to the phrase "cloud computing." The origins of cloud computing can be found in the time when computer systems exchanged programs and computational resources remotely. It is not something that arose out of nowhere one day. Currently, however, cloud computing refers to the vast array of services and applications that are made available over the internet cloud and the fact that devices used to access these services and applications often do not require the use of specific programs. Many companies are providing their services via the cloud. Some notable examples include the following:

Google

makes advantage of a private cloud to offer its users Google Docs along with a slew of additional features like email access, document applications, text translations, maps, web analytics, and much more.

Microsoft

Provides a cloud-based platform called Microsoft Office 365online that makes it possible to move content and business intelligence tools to the cloud. Office apps are currently available on Microsoft's cloud.

Salesforce.com

For its clients, the business uses the cloud to run its application suite. Its products, Force.com and Vmforce.com, provide platforms for developers to design customized cloud services.

There are some key characteristics of cloud computing as follows:

Application Programming Interface (API) – To employ interface services to allow a machine to communicate with cloud software in a manner similar to how people or users communicate with computers.

Maintenance – Since apps don't have to be installed on every client's computer, maintenance is made easier.

Performance – Loosely couple approaches, consistent structures, and monitoring systems are used in the construction of web services to enhance their quality.

Scalability and Elasticity – Nodes can be added and removed at any moment with little to no impact on the infrastructure or software. The necessary services can be obtained by the user without involving a human. Cloud systems typically scale up automatically.

**Sowmiya et al.,**

Broad Network Access – Since cloud services are accessible across a network, similar procedures are employed to deliver services across many platforms.

Location Independency – Users don't know the precise location of services, with the exception of a high degree of abstraction regarding services, like nation, state.

Reliability – For cloud computing environments, many redundant sites are created to enable business continuity and disaster recovery services.

Cost Effectiveness – Centralized infrastructure makes it possible to share costs, including real estate and electricity (by deploying cloud services close to inexpensive power plants, for example), among many customers from the same or different places.

Sustainability – Using resources appropriately for an effective system.

Security – The level of data security can be raised as a result of centralizing data centers. Today's security is superior to that of the past since service providers may supply services to address security concerns that a single customer or business may not be able to afford. However, when data is dispersed across a large network and different devices are utilized to access services, the complexity of security increases. However, the cloud computing service's private deployment architecture gives an organization control over information or data security.

Related Work

Xu, et.al,...[1] suggest a deduplicatable data auditing system based on blockchain. To ease the load on users and provider vendors, first design a client-side deduplication checking scheme based on bilinear-pair approaches. Based on this, we are able to provide an authentic and effective information auditing system that enables the testing of information integrity through the use of both the bilinear pairing cryptosystem and the blockchain approach. In both information outsourcing and auditing methods, the blockchain system is used to record the behaviors of entities. This way, the corresponding immutable information can be used to monitor untrustworthy third-party auditors in addition to ensuring the credibility of audit results. The suggested technique uses a client-side deduplication mechanism based on bilinear maps to lower the overhead associated with replica record transmission and storage inside the data uploading system. If a user uploads the same documents over and over again, they are willing to give the service provider proof of ownership instead of doing so. In the meantime, present an untrusted TPA in order to understand an effective data auditing plan and design a tracking method that is appropriate for a TPA operating in the blockchain era. According to user verification requests, the TPA will periodically issue a one-time job. The service provider must respond with an integrity proof that includes the assignment and separate data blocks. TPA will validate the evidence and publish the audit findings on the blockchain. In order to prevent file double-checking, blockchain will record data outsourcing and fact auditing to manual TPA. It will also create audit logs for client monitoring to ensure the validity of audit results. The well-known theoretical study demonstrates that the suggested approach may efficiently outsource, save duplicate data, and audit for the accuracy of outsourcing storage data while incurring an appropriate computer overhead.

Shen, et.al,...[2] Create any such plan and put forth a novel concept known as information integrity auditing without the need for private key storage. To avoid using the hardware token in this technique, utilize the consumer's fuzzy private key to be biometric data (such as fingerprint or Iris test results). Even so, the plan can effectively finish the data integrity auditing in the interim. Here, confirm the person's identity by using a linear sketch using coding and error-correction techniques. Furthermore, a new signature scheme is presented here that not only allows block less verifiability but also works well with the linear sketch. Three types of entities are involved in the proposed system model: the user, the cloud, and the TPA. A person can save a vast amount of data on the cloud. The individual needs to upload a lot of files to the cloud. The consumer appoints the TPA, a public validator, to confirm the accuracy of

**Sowmiya et al.,**

the data stored in the cloud. The person wishing to use the cloud storage provider provides biometric information (such as a fingerprint) during the user registration process. In order to add data to the cloud, a data owner must first extract their biometric information as their fuzzy non-public key and then randomly generate a signature key. The record owner then uses his signing key and authenticators for information blocks. Lastly, the data owner removes those messages from the local storage and uploads these record blocks to the cloud next to the authenticator set. Using the venture-response protocol to execute with the cloud, the TPA verifies during the information integrity audit phase whether the cloud actually retains the user's intact information or not.

Xu, et.al,...[3] developed a blockchain-based decentralized arbitrable remote data auditing system for network storage services. Here, use a smart contract to notarize integrity metadata of data that has been outsourced and verified by users and servers on the blockchain. You can also accomplish non-repudiation verification interactions by using the blockchain network as a self-recording channel. Additionally, this implementation suggests a very arbitrable information auditing protocol that guards against dishonest proves and verifiers by using the commutative hash technique. Furthermore, the clever contract method is used as a decentralized adjudication mechanism to fairly resolve information ownership conflicts in the absence of TPAs. This article describes the design of a blockchain-based community storage service system in which the issuer of the community storage provider and the customer would, in turn, provide the integrity metadata of the associated original data block and, using the blockchain method, come to an agreement on it. By examining the integrity of a small number of record blocks, the customer uses the spot checking technique to verify whether the data is being kept appropriately. To be more precise, the user creates a matching endeavor of an information block and asks the provider to vouch for it. Customers don't need to obtain the full data in order to confirm the accuracy of the outsourced records; instead, they can use the commutative hash approach to check the minimal verification information. Furthermore, without the involvement of any TPA, the blockchain data from the aforementioned transactions to provide credible arbitration decisions for data ownership conflicts. Lastly, the theoretical analysis clarifies the suggested scheme's safety.

Yang, et.al,...[4] and Ganga et al.,[7] Provide a blockchain-based, certificate-less public auditing solution with multiple replicas and clouds. To achieve dynamic updating of institution person data and identification monitoring, the dynamic hash table and modification document table are introduced in the proposed approach. Every duplicate is stored on dedicated cloud servers, allowing for simultaneous integrity audits. Furthermore, take advantage of the unpredictable nature of blockchain blocks to compile accurate venture information in this way, which will prevent dishonest TPA and cloud servers from working together to trick consumers. Because every audit result is recorded in the blockchain, clients may easily audit TPA's actions.

Vani et al [16] developed the individual bears responsibility for creating record tags, sending data to the cloud provider, and updating the cloud data dynamically. Give TPA permission to recurrently check the accuracy of cloud data in the interim. It is responsible for writing verification effects to log documents and broadcasting them to the blockchain in order to confirm the accuracy of cloud records. It is responsible for handling TPA authentication requests and providing clients with cloud storage services. It boasts enormous processing power in addition to a sizable storage capacity. Cloud servers (CS) and cloud server organizers (CO) make up CSP in this work. Moving copies to the CS and forwarding task records to the CS upon receiving task facts from the TPA are the responsibilities of the CO. The CO compiles the records and forwards them to the TPA after obtaining the proof once more through the CS. It is the responsibility of the CS to store records. It is responsible for creating a portion of the individual's personal key and transmitting it to them via a secure channel. It is accountable for assisting TPA in producing erratic undertaking records and data regarding TPA audit results. Additionally, it enables clients to confirm TPA's behavior.

Xue, et.al,...[5] Provide a cloud storage structure identification-based public auditing (IBPA) program. With IBPA, the nonces in a blockchain are employed to put together erratic and flawlessly formed undertaking messages, preventing the forging of auditing impacts with the helpful resource of malevolent TPAs to deceive clients. To guarantee the integrity of their data, which may be kept in the cloud, users must confirm the auditing impacts of

TPAs in batches. In order to ensure that the goal of inspecting the integrity of outsourced records is met, IBPA requests that the buyer examine the auditing results in bulk using the TPA's helpful resource in order to further confirm the data's integrity. The development of critical components for public auditing in IBPA is facilitated by the public blockchain mechanism of the Bitcoin machine. Here, choose venture messages for fact integrity audits based on nonce. These could be crucial components of a public blockchain that are used to crack certain hash puzzles. Because a block's nonce is effects verified rather than necessarily pre-set, it can never be examined through the person in the event that an auditing result is forged by a malicious auditor. Furthermore, in IBPA, the auditing effects of the TPA are recorded in the majority blockchain, which may provide as unquestionable evidence that the TPA completed the auditing settlement in accordance with the character specifications. Recording the auditing results inside the blockchain ensures the traceability of the TPA's auditing offers because the blockchain is intrinsically verifiable and evidence towards change.

Background of the work

In public verification systems, after data outsourcing, the user sets a verification period (i.e., the frequency at which the auditor does the verification). The auditor then verifies the accuracy of the data that was outsourced at the proper time. Actually, a verification report with multiple verification outcomes is produced by the auditor. In the event that the verification result is "Reject" at any point in time, the auditor is required to promptly notify the user because this suggests that the data may have been altered. In the event that it isn't, the auditor generates a verification log and provides it to the user at the end of every epoch. The user can designate an appropriate time for the auditor to carry out the data integrity verification, as the auditor can do so even in the absence of the user's involvement. Cloud auditing may be more convenient for auditors, but there are still issues with internal and external data security that need to be taken into consideration. Currently, the "cloud audit platform" is in charge of the centralized management of audit data collection, storage, transmission, sharing, and analysis. The public key is the foundation of most public verification systems. Infrastructure (PKI), in which the auditor must select the appropriate public key for verification by managing the user's certificate. These schemes thus encounter the costly and time-consuming certificate management issue, encompassing certificate distribution, revocation, storage, and verification.

Blockchain based Data Storage with Verifiable Data Auditing in Cloud

Ensuring the integrity and security of the auditing process is crucial when using a Third Party Auditor (TPA) for blockchain-based cloud data auditing. A strong TPA verification technique that includes secret key distribution and verification methods has been put in place to reduce the possibility of any user engaging in potentially harmful activity. Here, a network storage service verification method in a cloud system is designed using verifiable tags to enable customers to check the accuracy of outsourced data in batches, therefore lowering the overhead associated with the service verification stage. Introduce blockchain technology here as well, as it will provide reliable public audits. The user uses several CSPs to outsource his data. Next, in order to develop integrity information for data auditing, users and CSPs collaborate. The user produces a challenge nonce at random during the auditing phase, and CSPs are required to produce an integrity proof in response based on the designated data blocks. For the purpose of batch data integrity verification, the resource-constrained user can combine all CSP replies into a single value by using the TPA (Third Party Auditor), a specific cloud service provider that oversees several CSPs. Every interaction between these parties is documented on the blockchain, and in the event of a service dispute, the blockchain's smart contract is able to reliably and automatically identify infractions based on the records. The smart contract will ask the untrusted organizer to locate the malicious service providers in the event that there is data corruption. In order to assist low-income consumers, the suggested plan also promotes public auditing with the use of a TPA (Third Party Auditor). The suggested technique is more effective than the current schemes that are made to handle both public auditing and deduplication simultaneously, and it also satisfies the basic security requirements. Additionally, the suggested method implements secure data distribution features in a verifiable way. The procedures for key sharing and user requests are made to improve data integrity during transmission. The proposed blockchain based data storage with verifiable data auditing process has following modules,

Blockchain Storage

The data storage solution uses blockchain-based cloud storage technology to facilitate safe sharing and storing. In this lesson, create a local cloud and provide adequate storage services at a reasonable cost. The main transactions in the medical blockchain are data storage and access control. It would be great to have access to all medical data stored on the blockchain. Once they have space accessible in the cloud, users can upload and exchange data. This work implements cloud storage in a highly safe way by utilizing block chain technology. The cloud service provider controls the cloud server, which provides cloud storage services. It has a substantial quantity of storage capacity in addition to powerful computing capabilities.

User Enrolment

Before being able to access the system, a user must first register. Thus, a new user has to authenticate them and register with the system before they may request a server. In a straightforward authentication procedure, a user provides credentials, like their user ID, to prove they are the rightful owner of the ID. The file may be uploaded to the cloud by the data owner. The moment the file is saved to the cloud, it will become encrypted.

Data Block Creation

One kind of digital data storage concept is a blockchain. Because these blocks are linked together, the data within them is immutable. Once a data block is linked to other blocks, its data cannot be changed. It will always be available to the public for anyone who wants to view it, just as it was when it was first put to the blockchain. Features of blockchain technology can be used by the hashing crypto method, which helps create a suitable and reliable hashing code and transforms data from bits of fixed size to strings of characters. A transaction is collectively hashed prior to being uploaded to a blockchain. Hash pointers store previously hashed data that cannot be disputed, connecting each block to the one before it. Changes made to the blockchain transaction's hashing function will therefore affect all associated blocks and change the character hash string.

TPA Key Verification

This auditing technique establishes a clear and secure system to verify the legitimacy of audit requests. A shared secret key between the auditor and the server allows for mutual authentication. When an auditing request is sent, the server confirms the auditor's secret key to ensure the request is legitimate. If the key is accurate, showing that the request is authentic and allowed, the server processes the auditing request and executes data auditing operations to ensure compliance, security, and integrity. Instead, if the key is incorrect, the server flags the possible illegal or unauthorized endeavor and promptly alerts the relevant data owner of an illegal auditing procedure. This message serves as an alert, allowing the data owner to investigate the situation as soon as feasible, take the necessary steps, and minimizes any potential security risks or breaches. This method uses key authentication to safeguard the confidentiality of the auditing process and provides a robust system to detect and resolve any unwanted access attempts that may arise during the auditing phase.

Data Auditing

The user gains from TPA. When data corruption is found, it promptly notifies the user and cloud server of the verification results. Information sharing between TPA and other parties is validated. The user chooses how long the verification procedure takes. Prior to sending the challenging message to the cloud server for a time when the data integrity should be confirmed, TPA extracts the hash values of "successful blocks that are the latest ones confirmed on the blockchain," where "denotes the number of blocks deep used to confirm a transaction." After getting the challenging message, the cloud server computes the corresponding proof. TPA checks the validity of the proof in order to validate the data integrity. In the event that the checking is not successful, TPA alerts the user that the data may be contaminated.

SECURE DATA SHARING

The most crucial part in the data sharing idea is the storage server. The enormous volume of data is stored in the storage data. This data is kept safe on a server for storage. Together with the key used to encrypt data, it also stores

encrypted data. The user sends queries to the storage server when he needs his data. For the purposes of encryption and decryption, two keys are used. It is possible to share data securely. Authorized users are required to supply the relevant secret key for decryption when they request access to the encrypted data. Throughout the process, the cloud service maintains end-to-end security by retrieving the encrypted data, decrypting it with the supplied key, and delivering the plaintext data to the user. By distributing secret keys and using encryption to share data in the cloud, this method improves data security and privacy while lowering the possibility of illegal access or data breaches.

METHODOLOGY

Blockchain Technology

Blockchain is a decentralized, reliable, publicly accessible ledger of transactions over which no single person has total control. An rising amount of encrypted transaction data records are managed by this distributed database, which keeps them apart from other records to prevent alteration and manipulation. Consortium, private, and public blockchains are the three types that exist. The blockchain's cornerstone is the block. Each block has a header and a body that contains the transactions that are being written to the system. The timestamps for the block and the transactions are contained in the block's header, together with information about the block such as its prior hash, nonce value, and difficulty. It is estimated that the block's length varied from 1 to 8 MB. The header of the block to be inserted is the only thing that identifies it.

Each block in a blockchain is made up of the following headers.

Previous Hash:

This hash address identifies the preceding block.

Transaction Details:

Details about each transaction that needs to happen.

Nonce:

A random number assigned by cryptography to distinguish the block's hash address is known as a nonce.

Hash Address of the Block:

The transaction data, the nonce, and the previous hash are sent via hashing. This method yields a unique output known as the "hash address," which is a 256-bit value with 64 characters in length. As a result, it is referred to as the block hash. Many people use computer methods that satisfy predetermined criteria in an attempt to determine the correct hash value. Once the predefined condition is satisfied, the transaction is finished. To put it simply, blockchain miners attempt to solve a challenging mathematical challenge known as the proof of work problem.

Block and Hash Generation

1. A Block that includes details on current transactions.
2. Each piece of data produces a hash.
3. A hash is a combination of letters and integers.
4. Transactions are recorded in the chronological order that they took place.
5. The hash is based on both the hash of the most recent transaction and the hash of the one before it.
6. The hash is completely altered by each change made to a transaction.
7. To check that a transaction has not been altered, the nodes look at the hash.
8. If the majority of nodes approve a transaction, the transaction is included to the block.
9. The Blockchain is composed of separate blocks, each of which has a connection to the one before it.
10. A blockchain functions because copies of it exist on several computers, each with a copy of it.

CONCLUSION

In conclusion, a complete solution to improve the security and integrity of stored data is presented via the integration of blockchain technology into cloud data storage systems, Third-Party Auditors (TPA), and a strong secret key verification method. The project guarantees an unchangeable ledger that documents all transactions and alterations to the files that are kept by utilizing the decentralized and unchangeable characteristics of blockchain technology. By adding another level of monitoring, TPA ensures that data integrity can be independently and transparently audited without jeopardizing privacy. In order to further protect the system from harmful access, the secret key verification procedure makes sure that only authorized entities can interact with the TPA for auditing purposes. Thus, the project tackles the complex issues of data integrity and privacy in the digital environment by integrating blockchain, TPA, and secret key verification to create a dependable and safe framework for cloud data storage. Moreover, it offers secured and safe data exchange with enhanced secrecy and integrity.

ABSTRACT

Next-Generation Firewalls (NGFWs) revolutionize network security with features like Deep Packet Inspection, Application Control, and Threat Intelligence integration. These advancements enhance visibility and proactive threat mitigation. Challenges include complexity, potential performance impact, and adapting to evolving threats. Organizations must weigh the benefits against the challenges, ensuring skilled personnel and a proactive security approach for optimal NGFW implementation in dynamic network landscapes.

Keywords: Next-Generation Firewalls (NGFWs), Network security, Deep Packet Inspection, Firewall Technology.

INTRODUCTION

Next-generation firewalls (NGFWs) address the evolving landscape of cyber threats faced by organizations, surpassing the limitations of traditional firewalls. Unlike their static rule-based counterparts, NGFWs offer advanced security features like intrusion prevention, application control, user identification, and encrypted web traffic inspection. Operating beyond port and protocol filtering, NGFWs safeguard networks from sophisticated attacks targeting applications, users, and devices. These firewalls integrate with endpoint protection, access management, and event management systems, providing a cohesive defense against cyber threats. NGFWs adapt to modern workplace dynamics, supporting hybrid models, cloud computing, and zero-trust architectures. Compatible with various network topologies, including SD-WAN, VPNs, and cloud-based firewalls, NGFWs ensure consistent and

**Abdul Faiz et al.,**

scalable security. This paper surveys the progress and challenges in NGFW development, highlighting their critical role in contemporary network security. It explores technologies, compares leading products, and discusses both the benefits and challenges of NGFWs, concluding with recommendations for network security practitioners and researchers [1].

Basic idea behind a firewall

A security defensive tool used in computer network security is the firewall. It's used between the intranet and the extranet. It is acknowledged that the former is a secure network. It is determined that the latter network is comparatively less secure. Hardware and software make up the firewall. The firewall is the sole device through which connectivity between the intranet and extranet can and should go. The most fundamental security measure for network information is a firewall. It is really protective. At the same time, by obtaining the security policy control (approval, rejection, monitoring, and so on), the information flow into and out of the network can be released and intercepted. An analyzer is what a firewall is... possess the ability to evaluate the information flow. Additionally, you can filter the studied information flow using a separator. It also serves as a limiter, limiting the flow of data that is flagged as dangerous. Denying access to the network, authorize secure information flow into the intranet. Give the go-ahead for safe data to enter the intranet. It can therefore successfully safeguard network security. Make sure the intranet is secure. In the past, firewalls used as building partitions to stop fires from spreading. This is expanded to safeguard a protective wall's internal network security. From a physical perspective, every firewall may have a different physical implementation. However, it typically combines a number of hardware (hosts, routers) and software components. In essence, a firewall is a protective tool. be employed to safeguard the credibility of users, resources, and network data[2].

OVERVIEW OF NEXT-GENERATION FIREWALLS (NGFWs)

NGFW Architecture

Next-Generation Firewalls (NGFWs) are made to overcome the shortcomings of old firewalls and offer sophisticated security capabilities. Deep Packet Inspection (DPI) is a tool used by NGFWs to examine network traffic and spot any threats. NGFWs may examine packet contents and determine the application, protocol, and user data thanks to DPI. Based on the traffic context, security judgments are then made using this information. An application and protocol decoding engine that carries out DPI is the foundation of NGFWs. The purpose of the firewall and NAT rules is to control the flow of IPv4 and/or IPv6 application traffic between different hosts, servers, subnets, and networks. NGFWs can be implemented using a variety of methods, including cloud-based, software, and hardware[3].

NGFW Features

Beyond typical firewalls, Next-Generation Firewalls (NGFWs) offer enhanced security features. Among the main characteristics of NGFWs are:

- i) Application Awareness and Control: NGFWs are able to recognize and manage traffic according to the particular application that is being used, such BitTorrent, Facebook, or Skype.
- ii) Intrusion Prevention: By examining network traffic and spotting malicious activity, NGFWs are able to identify and stop network attacks.
- iii) Virtual Private Network (VPN): Through the internet, NGFWs can offer safe remote access to business networks.
- iv) Anti-Virus: NGFWs are capable of checking network traffic for malware and viruses.
- v) Inspection of Encrypted Web Traffic: NGFWs are capable of examining encrypted web traffic in order to identify and stop attacks[4].

NGFW Deployment

NGFWs offer diverse deployment options tailored to organizational needs and specific traffic security demands. These encompass:

- i) Hardware-based NGFWs: Physical appliances installed on-site, delivering robust security for extensive network infrastructures.

Abdul Faiz et al.,

- ii) Software-based NGFWs: Software applications deployable on servers or virtual machines, offering security solutions suited for smaller network environments.
- iii) Cloud-based NGFWs: NGFWs hosted in the cloud, designed to safeguard cloud infrastructures, remote access points, and Internet of Things (IoT) devices.
- iv) Moreover, NGFWs exhibit versatility in their deployment architectures, including centralized, distributed, combined, and isolated configurations. The choice among these architectures is contingent upon the organization's unique requirements and the nature of the traffic necessitating protection[4].

ADVANCEMENTS IN NEXT-GENERATION FIREWALLS

In order to enhance network security, Next-Generation Firewalls, or NGFWs, have seen a substantial evolution in recent years. They now integrate cutting-edge technology like artificial intelligence (AI) and machine learning (ML) algorithms. The following are a few recent developments in NGFWs:

- **Advanced threat prevention and detection:** To effectively block and identify known and undiscovered threats, NGFWs can integrate complex threat detection methods like machine learning, behavioral analysis, and AI-driven algorithms.
- **Cloud integration:** With the rising adoption of cloud services, NGFWs are projected to connect more easily with cloud environments, ensuring continual privacy policies and security for both on-premises and cloud-based assets.
- **SSL/TLS Inspection:** NGFWs should be able to perform better SSL/TLS inspection as encryption becomes more widely used. To find dangers concealed in encrypted communication, they can examine and decipher encrypted communications.
- **Zero Trust Network Access (ZTNA):** NGFWs are required to support the Zero Trust Model, which does not just rely on perimeter-based security, but rather grants access based on user verification and other contextual criteria[5].

CHALLENGES IN NEXT-GENERATION FIREWALLS

Next-Generation Firewalls (NGFWs) have undergone substantial advancements, incorporating sophisticated technologies like Artificial Intelligence (AI) and Machine Learning (ML) algorithms to enhance network security. However, despite these improvements, NGFWs still encounter various challenges that necessitate attention:

1. **Complexity:** NGFWs represent intricate systems, demanding skilled personnel for effective management and maintenance. The intricate nature of NGFWs introduces the risk of configuration errors, potentially leading to security vulnerabilities.
2. **Performance:** Resource-intensive in nature, NGFWs can impact network performance, especially when handling encrypted traffic. The processing of encrypted data poses a notable challenge and can result in performance issues.
3. **Scalability:** Scaling NGFWs, particularly in expansive and intricate networks, can pose difficulties. Additionally, incorporating new features and functionalities may exacerbate scalability issues.
4. **Interpretability:** NGFWs generate a substantial volume of alerts and logs, creating challenges in interpretation and analysis. This phenomenon can contribute to alert fatigue, making it arduous to differentiate genuine threats from false positives.
5. **Adaptability:** The adaptability of NGFWs to dynamic threats and evolving network environments is crucial. Ensuring the capability to detect and respond to new and emerging threats becomes paramount for maintaining effective network security[6].

COMPARISON WITH TRADITIONAL FIREWALLS

Traditional firewalls and Next-Generation Firewalls (NGFWs) serve as distinct types of network security devices designed to safeguard against cyber threats. While conventional firewalls offer state full inspection of both incoming and outgoing network traffic, relying on criteria such as state, port, and protocol, NGFWs go a step further by

**Abdul Faiz et al.,**

incorporating supplementary functionalities. These include features like heightened application awareness and control, integrated intrusion prevention, deep packet inspection, and the integration of cloud-based threat intelligence. The disparities between traditional firewalls and NGFWs encompass these additional capabilities and advancements in security measures: Conventional firewalls lack the sophisticated features of NGFWs, but they are less complicated and resource-intensive. Although NGFWs require more resources and are more complicated, they offer stronger protection and are more flexible against changing threats[7].

FUTURE TRENDS IN NGFWS

The NGFW market is undergoing rapid evolution with emerging trends aimed at addressing network security challenges. Key developments include:

1. **Corporate Network Shifting to the Internet:** Enterprises are increasingly adopting the internet as their corporate network, introducing new risks. NGFWs play a crucial role in defending against internet-based threats. They need to continually gather threat information from various network sources to ensure the latest security updates.
2. **Transformation of Enterprise WAN Edges:** The move away from traditional perimeter hub-and-spoke models has led to the creation of a new enterprise WAN edge. With branches requiring cloud access located where traditional cable/DSL may not be available, NGFWs with Software-defined Wide Area Network (SD-WAN) capabilities enable organizations to route traffic directly from branch locations. This facilitates secure deployment of protocols across network edges.
3. **Escalation of Advanced Threats:** The evolving, distributed nature of networks has given rise to increasingly sophisticated threats. NGFWs are integrating machine learning (ML) and artificial intelligence (AI) to proactively predict and counter advanced threats before they materialize.
4. **Hybrid Mesh Firewall Solutions:** Traditional firewalls often specialize in specific IT areas, necessitating separate cyber security solutions for corporate sites, public/private cloud environments, and remote workers. Hybrid mesh firewalls are emerging as a unified security platform that delivers high performance and seamlessly integrates with other security controls throughout the network. This solution addresses the challenge of managing diverse security needs across various IT domains.
5. In summary, NGFWs are adapting to the changing landscape of network security by addressing challenges posed by the reliance on the internet, transforming WAN edges, combating sophisticated threats through AI and ML, and introducing unified security platforms like hybrid mesh firewalls to streamline security management across diverse environments[8].

NGFWS USE CASES

Next-Generation Firewalls (NGFWs) serve diverse purposes across various scenarios. Examples of their utility include:

- Facilitating secure operation of essential applications within Enterprise Networks: NGFWs excel in detecting and countering attacks on enterprise applications, ensuring the enforcement of application-specific controls. They conduct thorough monitoring of application data, content, and protocols like HTTP, HTTPS, SMTP, enhancing overall protection.
- Robust defense against both known and unknown threats: NGFWs offer precise controls for network applications. Through deep packet inspection and real-time stateful inspection of applications, they provide formidable defense against a spectrum of threats targeting web applications.
- Providing comprehensive visibility into users, hosts, applications, and content on enterprise networks: NGFWs conduct audits on running applications, monitor content and data, identify hosts supporting applications, and recognize users associated with those applications. A single NGFW consolidates functions such as firewall capabilities, IPS/IDS, NAC, gateway antivirus, and email filtering.
- Serving as a network security platform with high performance and seamless integration with other security controls: NGFWs exhibit scalability and can incorporate threat intelligence feeds for immediate threat blocking. They seamlessly integrate with advanced security solutions such as sandboxing, malware protection, CASB, and more.

**Abdul Faiz et al.,**

- Ensuring security for cloud environments, remote access, and IoT devices: NGFWs can be seamlessly deployed in cloud environments, extending security measures to cover cloud operations, remote access points, and Internet of Things (IoT) devices[9].

NGFWs SUCCESS STORIES: CASE STUDIES IN CYBER ATTACK PREVENTION AND NETWORK PROTECTION

Here are some case studies on how organizations across different industries are employing Next-Generation Firewalls (NGFWs) to solve their network security challenges:

VR Group

Finland-based VR Group installed a next-generation firewall from Forcepoint to create high-speed network architecture, enabling zero-touch deployment and remote access to the IT staff for each train. With the NGFW, VR could connect with all three mobile operators simultaneously, ensuring high bandwidth and reduced network drops.

Pague Menos

Brazil-based Pague Menos is one of the country's largest pharmacy retail chains with 1,600 stores and over 25,000 employees. Pague Menos worked with Fortinet to deploy a next-generation firewall that could provide secure connectivity between its headquarters and stores, as well as protect against cyber threats. The NGFW also enabled Pague Menos to monitor and control network traffic, ensuring compliance with regulatory requirements.

Bausch Health

Bausch Health, a global pharmaceutical company, worked with Palo Alto Networks to deploy a next-generation firewall that could provide advanced threat protection and secure connectivity across its global network. The NGFW also enabled Bausch Health to monitor and control network traffic, ensuring compliance with regulatory requirements.

ENT Credit Union

ENT Credit Union, a financial institution based in Colorado, worked with Fortinet to deploy a next-generation firewall that could provide advanced threat protection and secure connectivity across its network. The NGFW also enabled ENT Credit Union to monitor and control network traffic, ensuring compliance with regulatory requirements.

Globe Telecom

Globe Telecom, a telecommunications company based in the Philippines, worked with Fortinet to deploy a next-generation firewall that could provide advanced threat protection and secure connectivity across its network. The NGFW also enabled Globe Telecom to monitor and control network traffic, ensuring compliance with regulatory requirements[9].

CONCLUSION

Next-Generation Firewalls (NGFWs) and network security are experiencing a changing environment with new developments, difficulties, emerging trends, and flexible use cases. Modern technologies like deep packet inspection and artificial intelligence are being included into NGFWs to improve their granular control and strong threat detection. Nonetheless, difficulties still exist in striking a balance between security and performance, integrating with various network components in a smooth manner, and handling the complexity of encrypted communication. As we look to the future, NGFWs will likely adopt trends like quantum-safe security measures, enhanced cloud integration, and the Zero Trust Network Access (ZTNA) architecture. Their many use cases include providing complete visibility, defending against known and undiscovered threats, and protecting enterprise networks. NGFWs continue

Abdul Faiz et al.,

to be essential in protecting networks from the constantly changing cyber threat landscape as businesses navigate this complex environment.

ABSTRACT

The FANETs play a major role in the network technologies. The ad hoc network is a wireless infrastructure with fewer networks. With their rapid growth, unmanned aerial vehicles become very popular. On the other hand, they are also the target of the various threats capable of exploiting different weaknesses. The main issues in FANET are handling the communication between the nodes and preventing collision among the different devices. There is no fixed routing protocol in the FANET. This paper deals with the features of FANET, MANET, and VANET and describes the various applications of FANET. In isolation, the existing Routing Protocol has been discussed. The major challenges in the FANET are surveyed.

Keywords: Unmanned aerial vehicle (UAV), FANET, Flying Ad-Hoc Network, Routing.

INTRODUCTION

FANETs, or Flying Ad-Hoc Networks, have been increasingly popular in recent years because of their affordability, performance, adaptability, and ease of installation. FANET is an ad hoc wireless network. An ad hoc network is a distributed wireless network that runs without the need for an infrastructure. Every node in a wireless ad hoc network functions as a router, sending data packets to other nodes based on requirements. It is divided into three categories: MANET, VANET, and FANET. Mobile Ad hoc Networks, or MANETs, are networks that link mobile nodes without any infrastructure [1]. Vehicle Ad hoc Network, or VANET, is the name of the wireless network that links moving and stationary automobiles. Unmanned aerial vehicle (UAV) is capable of operating remotely or on its

**Gunavathy and Ravindranath**

own without the need for human personnel [2]. There are now two different kinds of UAV systems: single and multi-UAV systems. There are some advantages of multi UAV systems over a single UAV system [3].

- Higher Speed: It has been demonstrated that using several UAVs to perform missions might result in advantages over using a single UAV system, including speedier completion times.
- Expensive: Small UAVs are far less expensive to install and maintain than large UAVs .
- Greater scalability and Flexibility: The coverage rate of a single UAV is low due to its limited coverage area . Multi-UAV systems, however, are easily able to adjust to the circumstances.
- Enhanced ability to survive: In single UAV, if the UAV fails then the mission fails. Whereas the multi UAV is able to survive with another UAV. And there are many issues in multi UAV system compared to the single UAV system. The challenges in multi UAV system are communication between the UAV, energy constraints.

APPLICATION SCENARIOS OF FANET

Due to rapid growth in technology, UAVs have become popular for monitoring, rescue, and surveillance applications [4].

Infrastructure Inspection and Maintenance

UAVs equipped with various sensors can conduct regular inspections of critical infrastructures such as bridges, roads, buildings, and utility lines. It helps to identify maintenance needs before they become major issues and enhance the safety and longevity of urban infrastructure.

Emergency Response and Disaster Management

It can rapidly assess disaster-stricken areas, provide real-time situational awareness to emergency responders, and help coordinate rescue operations. They can also assist in identifying evacuation routes and locating survivors.

Traffic Management and Monitoring

UAVs can monitor traffic flow, congestion, and accidents from above, providing real-time data to optimize traffic management and improve urban mobility. This data can be integrated into the traffic management system to enhance route planning and reduce congestion.

Surveillance and Security

It can enhance public safety by monitoring public spaces, detecting suspicious activities, and providing real-time surveillance to law enforcement agencies. They can be deployed during large events to ensure safety and security.

Waste Management

It can monitor the waste collection points, optimize waste collection routes, and identify overflowing bins, contributing to efficient waste management practices in urban areas.

Public Services and Connectivity

The UAV can serve as temporary communication relays to extend network coverage in weak or disrupted connectivity areas. This can be particularly useful during emergencies or in densely populated areas.

DIFFERENT BETWEEN FANET, MANET AND VANET

The major differences between FANET, MANET, and VANET are based on the capability, performance, and connectivity of the nodes, link of the nodes, power consumption, and computational power.

Node Mobility

In Manet, the nodes move in the definite area, and in VANET, nodes move on the road. Whereas in Multi-UAV nodes are visible in the sky. When compared to the VANET, the movement of MANET nodes is relatively slow. The mobility levels of nodes in FANET are very high compared to VANET and MANET. According to [5], a UAV has a 30–460 km/h speed.

**Node Density**

The density of nodes per unit area can be defined as the normal number of nodes in a given region. A. FANET nodes usually move in the sky and UAVs could range from several kilometers to a few miles, even for small multiUAV systems. Consequently, the density of a node in FANET is very low compared to VANET and MANET.

Topology

The UAVs are connected to the ground station. The Multi-UAV collects the information and passes the data to the ground stations. The FANET topology is changing due to an increase in mobility level and more frequently than the MANET and VANET topology. When the single UAV fails, the communication path between the UAV also fails [6].

ROUTING PROTOCOL

Routing is the process of identifying the shortest path to deliver the data from source to destination. Efficient route for higher dispatch ratio, less delivery time, fewer control messages, smaller number of relay nodes, etc [7].

Classification of Routing Protocols in FANET

There are many routing protocols used in most of the ad-hoc network. They are Static, Proactive, Reactive, Hybrid, Position and Hierarchical protocol.

Static Routing protocol

In Static routing protocol, once the routing table is defined and updated in the UAV nodes, then the routing table cannot be updated during the process. Static Routing protocol has a constant routing table that cannot be changed dynamically. If the single UAV fails or the ground station fails during the operation, then the operation cannot be updated or altered in the table dynamically. It has to be waiting until the operation is completed [8]. There are three different types of static routing protocols, they are

1. Data-Centric Routing protocol (DCRP)
2. Load Carry and Deliver Routing Protocol (LCAD)
3. Multi-Level Hierarchical Routing Protocol (MLHRP)

Proactive Routing Protocol

Proactive routing protocol is also called Table Driven routing protocol in which each UAV node separately carries the routing table that stores information about every UAV node. The routing table information is updated dynamically during the operations. If the link fails during the process, then each node has to update the routing table. As a result, it causes delays in the network and is slow. There are three types of Proactive Routing Protocols. They are

1. Directional Optimized Link State Routing (DOLSR)
2. Destination Sequence Distance Vector (DSDV)
3. Topology Broadcast Based on Reverse Path Forwarding (TBRPF)

Reactive Routing Protocol

A Reactive Routing Protocol is also defined as a demand routing protocol. As the name suggested, based on the demand the routing table is created. It works on Route-Request and Route-Reply messages. The source node will transfer the message along with the Route-Request message and the destination node will acknowledge the message with Route-Reply messages. As a result, it takes a long time to transfer the data from source to destination, which may cause high latency [9]. The three types of Reactive protocols are,

1. Dynamic Source Routing (DSR)
2. Ad-hoc On-Demand Vector Routing (AODV)
3. Time slotted On-Demand Routing (TSOD)

CONCLUSIONS

This paper discussed the features of UAVs and their applications and also discussed the difference between FANET, MANET, and VANET. FANET in the terms of node mobility, density and topology. The existing and different routing protocols and algorithms to find the shortest and most efficient path between the sources to the destination. The major issues in the FANET are communication between the nodes.

ABSTRACT

Mean hemoglobin concentration (MCHC) serves as a vital biological indicator for detecting various abnormalities, notably anemia, wherein the World Health Organization characterizes it as a condition marked by lower-than-normal hemoglobin levels in red blood cells. Anemia, affecting roughly 50 percent of India's populace, poses a significant health concern. Present clinical methodologies for hemoglobin assessment often prove invasive and resource-intensive, particularly in low-resource settings. This article proposes a non-invasive method employing conjunctival pallor and image analysis techniques. Leveraging conjunctival pallor, prevalent among anemic individuals, standard eye camera images are utilized to extract features like color and texture for paleness measurement. These features are then uploaded into an artificial neural network to determine heme concentration. This approach presents a promising avenue for anemia screening, particularly in resource-constrained regions, potentially enhancing health outcomes by offering accessible and accurate screening methods in areas with high anemia prevalence.

Keywords: Non-invasive Detection, Conjunctival Pallor, Hemoglobin Concentration, Image Analysis, Artificial Neural Network.

INTRODUCTION

Millions of people worldwide suffer from anaemia, which is especially problematic in areas with poor access to resources. Since the analysis of anaemia depends on exact measurements of hemoglobin levels in the blood, which should ideally be both accurate and accessible, the capacity to detect anaemia effectively is critical. In the past, diagnosing anaemia has required intricate processes which includes drawing blood for external study. They cannot

**Hema Priyadarshini et al.,**

be applied by limited resources as they require special equipment and experienced personnel. Point-of-care testing is a simple method designed to solve this problem. The following tests are quick and inexpensive and usually use a blood sample taken from the thumb [5]. They may require some medications and pose an infection risk to healthcare workers. Complete blood count (CBC) is also considered as the standard for determining hemoglobin level. This thorough study is difficult to conduct in areas with limited resources because it requires expert workers, specialized equipment, and access to laboratory facilities. Furthermore, some populations, including children may find the procedure of collecting blood particularly frightening as they may feel uneasy and anxious. This may make it more difficult to diagnose anaemia and manage it thereafter.

Recent developing technologies are being collaborated with innovative medical strategies offer promising opportunities for improving anaemia screening and therapy. One such emerging technology is creating an unexpected ally in the fight against anaemia: the conjunctiva, a thin membrane covering the eyelids' inner surface. Changes in conjunctival color, known as conjunctival pallor [6], have been identified as potential indicators of anaemia provides important information about the health of human blood..By leveraging the absence of melanocytes in the conjunctiva, which renders blood hemoglobin as the primary source of its coloration, the concept of an "erythema index" (EI) is introduced [7]. This index, derived from analysing the red and green components of digital photos, assists as a surrogate marker for hemoglobin content, enabling non-invasive anaemia detection [4][5]. Furthermore, the advent of smartphone-based telehealth technologies offers a transformative platform for remote healthcare delivery [1]. By integrating conjunctival EI analysis with smartphone imaging capabilities, our proposed technique eliminates the need for invasive blood tests, allowing for convenient, real-time anaemia screening in diverse clinical and community settings. Preliminary studies have established the relation between conjunctival EI and both clinical evaluations of anaemia and traditional blood-based diagnostic tests, validating the efficiency of our approach.

OBJECTIVES

- Utilizing non-invasive conjunctival images for the estimation of hemoglobin values.
- Analyzing RGB component values through a machine learning model using smartphone camera images.
- Obtaining hemoglobin (Hb) values within the range of 8 to 20.
- Developing the capability to detect anaemia based on obtained hemoglobin (Hb) values and threshold levels for different genders.

RELATED WORK

Suner S et.al [1] describes Hemoglobin level is usually measured invasively with different devices using the blood sample. In the physical interpretation, some signs are traditionally used. These signs are the palms, face, nail beds, pallor of the conjunctiva, and palmar wrinkles. This paper substantiates that conjunctival pallor can yield more operative results in detecting anaemia than the pallor of the palms or nail beds. This observation provides image-based diagnostics, which uses digital images and image processing algorithms to examine the color of the conjunctiva. By quantifying the erythema index, which measures the red and green light absorption in conjunctival images, these methods offer a promising, non-invasive alternative to traditional blood tests, providing an accessible and cost-effective solution for anaemia screening, especially in resource-limited settings.

Manisha Das et.al [2], illustrates a non-invasive procedure such as digital photographs of palpebral conjunctiva, Hb color and texture features which is done with imaging technology to measure the Hb concentration in the patient's blood. These relevant features leading to the generation of the images of palpebral conjunctiva of the patient were extracted. According to the recommendations of the WHO, this study compared the output quantity to be measured to the value of the quantity measured by the standard method (considered as index) by artificial neural network classifier. Moreover, the patients having lower level of Hb less than the lower limit of normal, According to the outcomes obtained from the classification, it was determined that the patients were anemic. Bryan Saldivar-Espinoza et.al [3], study aims to predict hemoglobin levels using a deep learning approach that offers a non-invasive, cost-effective and fast alternative to traditional methods. By analysing conjunctival images and demographic factors such as age, weight, height, and gender, the model aims to accurately estimate hemoglobin levels without generating

**Hema Priyadarshini et al.,**

medical waste. A combination of deep learning algorithms enables accurate predictions, which improves the analysis of various hemoglobin-related diseases. This strategy has a great deal of potential to increase access to healthcare, especially in areas with low resources where intrusive diagnostic techniques might not be feasible or available. The accuracy and efficiency predict hemoglobin levels may enable early detection and intervention of hemoglobin-related disorders, ultimately improving patient outcomes and reducing health disparities. Medha Sharma et.al [6] discusses on Anemia leads to a deterioration in the oxygen-carrying capacity of the blood. The diagnosis of anemia often commences with a clinical inspection. This is followed by laboratory tests such Complete Blood Count (CBC), reticulocyte count, etc. These tests fall under the invasive category as they necessitate injecting surgical instruments into the patient's body. Non-invasive methods are based on examination of tongue, conjunctiva, nail beds, etc. for pallor. This article is designed for a reliable, non-invasive method for diagnosing diabetes. A smartphone camera was used to capture the conjunctival area which is processed and the erythema index (EI) is generated. EI is utilized to determine whether a person has diabetes. Experiment results shows the developed device can identify small patients with high accuracy [1,7]. Francesco Maria Marino et.al [11] Nowadays, medicine frequently uses blood tests to measure hemoglobin content, which is important for diabetics who need blood. In this work, we introduce an additional non-invasive hemoglobin estimate technique based on conjunctival area image processing. Our primary objective is to provide a straightforward, user-friendly instrument that patients may use at home to assess their blood needs. Also, we describe our tool design and the process we used to determine important information from the color values of the collected images. Analysis of 77 anaemic and healthy patients showed a positive correlation between hemoglobin values calculated by our algorithm and actual results from blood tests.

METHODOLOGY

Components Required

- Smartphone
- Software – **MATLAB**

MATLAB conjunctive image analysis tools enable the comprehensive and detailed exploration and analysis of various image data sections with effortlessness.

A project aiming to determine hemoglobin concentration in human blood using MATLAB and image processing techniques. Here's a breakdown of the methodology along with key steps:

Image Acquisition: Better quality images of the conjunctiva are an important step in the availability of this method. Imaging was performed with a standard digital camera in good lighting conditions to ensure a sharp and accurate image of the conjunctiva[4]. It is important how the camera is positioned and focused so that you get clear images that can then analysed.

Image Processing: After capturing the images, preprocessing techniques are applied to enhance their quality and suitability for further analysis. This preprocessing stage involves various procedures such as noise reduction, contrast enhancement, and normalization [2]. These techniques address common issues like variations in lighting conditions and focus, ensuring that the subsequent analysis is based on clean and consistent data.

User Interface Development: Using MATLAB, to facilitate easy image selection and inspection, a user-friendly interface is developed using MATLAB. This interface allows users to visually review each captured image and discard those that do not meet quality criteria, such as poor lighting or focus issues. This manual inspection step ensures that only high-quality images are included for analysis, thereby enhancing the accuracy of the results.

Region of Interest (ROI) Selection: Users select a seed point on the conjunctiva of the eye for defining the ROI. This area is usually a normal-sized rectangle centered around the seminal point, occupying the most typical area of the

conjunctiva. The choice of the ROI is critical because it focuses the subsequent analysis on the corresponding part of image where the hemoglobin concentration data are most visible as shown in Fig. 3.

Feature Extraction: The feature extraction process analyses palpebral conjunctiva images to derive eight distinct features, crucial for diagnosing anaemia. These features include mean values of red, green, and blue color channels (Rm, Gm, Bm), representing overall color profile[4] Brightness (*Brt*) indicates luminance and tissue quality, while the Erythema Index (EI) measures redness, linked to hemoglobin presence. The *a** value, from the CIE Lab* color scale, gauges red-green axis presence. Texture features include High Hue Ratio (HHR), quantifying hue distribution, and Entropy (Ent), assessing texture complexity. These features collectively provide a detailed analysis of color and texture, aiding in predicting hemoglobin concentration through advanced machine-learning algorithms as portrayed in Fig. 5.

Machine Learning: An intelligent ML algorithm for learning when getting conjunctiva images with related Hb concentrations. This algorithm can learn the nonlinear interaction of the extracted features with Hb levels, which leads to predicting Hb concentration from a new image.

While training an algorithm, the data is divided into a training set (the set from which the model is built) and created to check fit and generality.

Model Validation: Trained machine learning models are validated using a precise set of tests to assess accuracy and robustness. This validation process allows the model to generalize correctly to new and unobserved data and depends on its predictive capabilities. Validation is important to ensure model reliability for real-world applications.

ANN for Hb Prediction: Specific features extracted from conjunctiva images serve as inputs to an artificial neural network (ANN) designed to predict Hb concentration. The ANN architecture typically consists of an input layer, a hidden layer, and an output layer. The hidden layer captures the complex nonlinear relations between the input functions and Hb concentration, and the output layer provides the predicted Hb value. [3]

Training and Validation of ANN: Training the ANN involves optimizing the weights associated with the connections between nodes to minimize prediction error. Levenberg-Marquardt's (LM) backpropagation algorithm is utilized for this purpose, offering efficient convergence and adaptation of learning rates. The training method iteratively adjusts the network weights based on input features and actual Hb concentrations until the prediction error is minimized. Validation is performed using a separate test set to ensure the model's performance on unseen data [3,9].

System Evaluation: The combined approach of image processing, feature extraction, and machine learning results in a robust system for predicting Hb concentration from conjunctiva images. The system's effectiveness is evaluated based on its accuracy, reliability, and generalizability. Performance metrics such as mean squared error (MSE) are used to take down measurements of the accuracy of the prediction [9], while verification of independent testing certifies that the system is suitable for the state truth layer.

A software algorithm automatically selects a test area within the conjunctiva. Starting from a user-chosen seed point (SP), it identifies pixels with similar color values, expanding outward like a crystallization process to include pixels matching the conjunctiva's color profile [8]. The taken-out features are fed into an ANN designed to predict Hb concentration. The ANN architecture consists of a single hidden layer. The input layer has eight nodes, each corresponding to one of the extracted features. The hidden layer is designed to capture the complex, non-linear relationships between the input features and the Hb concentration. The output layer consists of a single node that provides the predicted Hb concentration, and training the ANN involves optimizing the weights associated with the connections between nodes to minimize the prediction error.

**Hema Priyadarshini et al.,**

The Levenberg-Marquardt (LM) backpropagation algorithm is chosen for this purpose. The LM algorithm, combining features of gradient descent and Gauss-Newton methods[12], efficiently optimizes neural network training.

The LM algorithm adjusts the weights of the network to minimize the difference between predicted and actual hb concentrations, as measured by the mean square error (MSE). MSE is the metric used in this project and is defined as the error between the predicted value and the actual value. It provides a clear indication of the exactness of estimation and is particularly useful for continuous results such as hemoglobin concentration. The LM algorithm then iteratively updates these weights. In each iteration, the algorithm calculates the gradient of the error surface and adjusts the weights to move towards the minimum error. The key advantage of the LM algorithm is its adaptive learning rate [12], which accelerates convergence and avoids the pitfalls of simple gradient descent, such as slow convergence and getting stuck in local minima. Once trained, the neural network is validated on a different test set to make sure it generalizes well to new, unseen data. Your test set are images of your palpebral conjunctiva that were not part of the training phase [7]. How well the model might perform in the real world can be inferred from the performance on this test set.

The blend of feature extraction, ANN, and the LM algorithm creates a robust system for predicting Hb concentration from palpebral conjunctiva images [3]. The detailed color and texture characteristics which consists of information about the conjunctiva [7][12], while the ANN effectively models the complexity between the features and Hb concentration. The LM algorithm ensures efficient and accurate training, resulting in a reliable tool for non-invasive anaemia screening and diagnosis. This approach is particularly valuable in resource-limited settings, where traditional blood tests may be impractical or unavailable [10][13]. Using the best imaging and machine learning technologies to deliver effective, non-invasive diabetes monitoring and diagnosis, improving healthcare and outcomes.

This block diagram illustrates a process for detecting anemia using a smartphone and image processing techniques. This automated process enables the detection of anemia using non-invasive imaging and machine learning techniques, providing a convenient and accessible diagnostic tool.

- Capture an image of the conjunctiva using a smartphone camera.
- Process images to identify and extract regions of interest (ROIs) in the conjunctiva.
- Feature Extraction of Parameters such as R, G, B, and
- Analyse the ROI to extract color features (Red, Green, Blue) and brightness levels.
- Train the Model to Develop an Accurate Erythema Index in the
- Train the machine-learning model using the extracted features to create an erythema index, quantifying redness or paleness.
- Comparison of Acquired Image with Trained Model.
- Compare the structures of the new image with the trained model considering the evaluated hemoglobin (Hb) value.
- Determine the presence or absence of anaemia based on the expected Hb value. In other words, it is a "with anaemia" or "without anaemia" signal.

RESULTS

- An algorithm was designed to non-invasively obtain Hb values and associate them with the presence of anemia. Use smartphones combined with machine learning
- Techniques for analyzing photos and being capable of diagnosis of anemia.
- Use of minimum features and its suitability to quantitate Hb value followed by a diagnosis of anemia in a low-resource clinical environment.

Hema Priyadarshini et al.,

CONCLUSION

This study has successfully demonstrated the feasibility of non-invasive anemia detection through smartphone-based conjunctival image analysis [1]. By leveraging machine learning algorithms trained on color and texture features extracted from conjunctival images [5,7], we have developed a method that correlates well with traditional hemoglobin measurement techniques. This approach offers a cost-effective and patient-friendly alternative for anemia screening, particularly in settings where invasive methods are not practical. While the system shows promise, further research is needed to enhance its reliability and automate the image analysis process. The project lays a strong foundation for future advancements in non-invasive health monitoring technologies, with the potential to significantly impact global health outcomes. This project presents an innovative, non-invasive approach to diagnosing anemia using image processing and artificial neural networks (ANN) [2,3]. Analyzing palpebral conjunctiva images offers a cost-effective alternative to traditional blood tests [11], ideal for resource-limited settings. Leveraging digital cameras and modern algorithms, this method provides a viable anemia screening solution [12]. Advanced machine learning techniques, like deep learning, and larger, diverse datasets could further enhance accuracy and robustness. This approach represents a significant advancement in non-invasive anemia diagnosis, offering a practical and scalable solution to improve healthcare accessibility and outcomes.

ABSTRACT

Deep Neural Networks (DNNs) have revolutionised medical image analysis, offering advanced capabilities in interpreting various imaging modalities, including MRI, CT, and PET scans. The objective is to leverage DNNs for enhanced diagnostic accuracy and efficiency. **Methods:** This review examines the application of DNNs, especially convolutional neural networks (CNNs), in medical imaging. It focuses on pattern recognition tasks like registration, localisation, classification, detection, and segmentation and discusses the integration of multimodal data. **Challenges and Future Directions:** Key challenges include the need for large annotated datasets, model interpretability, and generalizability. Future research directions involve developing more interpretable models, utilising transfer learning, and integrating multimodal data for comprehensive analysis. **Results:** DNNs have shown significant improvements in medical image analysis, aiding in disease diagnosis and treatment planning and enhancing patient outcomes. **Conclusion:** DNNs are pivotal in advancing medical image analysis towards more accurate diagnostics and personalised medicine. Overcoming current challenges and exploring new AI techniques will further enhance their clinical utility.

INTRODUCTION

DNNs are a specialised category of Machine Learning, notable for their multi-layered structure of interconnected nodes.[1], [2]. These networks can model complex, nonlinear relationships in data, making them powerful tools for classification, regression, and feature extraction tasks.[6], [7]. The success of DNNs is attributed to their ability to learn and represent complex patterns in data, drawing inspiration from the construction and function of the human brain. Deep Neural Network in Medical Image Analysis[10], [12]. DNNs are capable of processing and transforming large amounts of input data into increasingly abstract features. This capacity allows them to learn intricate patterns and relationships within data.[3], [4]. They excel in various applications, including image and speech recognition, NLP - natural language Process, and medical image analysis, achieving state-of-the-art performance across these domains.[5], [8]. The hierarchical feature extraction capability of DNNs enables them to handle high-dimensional data effectively, making them well-suited for complex tasks in computer vision, healthcare, finance, and more.[9], [11]. DNNs have revolutionised multiple fields in science and technology, enabling significant advancements in areas that were once challenging for computers.[2], [5]. Their application spans diverse domains, such as computer vision, natural language processing, speech recognition, and medical data analysis.[7], [9]. By autonomously learning hierarchical representations from raw data, DNNs have opened new avenues in machine learning and artificial intelligence, tackling real-world problems with unprecedented accuracy and efficiency.[10], [12]. Deep Convolutional Neural Networks (DNNs) are a variant of DNNs characterised by their deep, multi-layered structure. These networks are particularly adept at handling tasks involving intricate and high-dimensional data, such as image and speech recognition. The convolutional aspect of these networks allows for efficient handling of spatial and temporal data, contributing significantly to advancements in fields like computer vision and natural language understanding.[7], [8], [9], [10] Figure 1 depicts a structured overview of the application of deep learning in medical imaging [1]. It is organised into three main layers, each representing a different aspect of the application process: Pattern Recognition Tasks: This is the topmost layer, showing various tasks that deep learning models perform in medical image analysis. These include: Registration: Aligning different images into a common coordinate system.

Classification: Categorising images into predefined classes.

Segmentation

Dividing images into segments to isolate specific regions of interest.

Detection/Localisation

Identifying and determining the exact location of objects or features within an image.

Anatomical Regions

This middle layer categorises medical images based on the body part or system being imaged. It lists several key anatomical regions that are commonly focused on in medical imaging: Abdomen, Brain, Bone, Breast, Chest, Eye, Miscellaneous: Other anatomical regions not explicitly listed.

Image Modality: The bottom layer categorises the types of medical imaging modalities used to capture the anatomical data. It shows X-ray, MRI (Magnetic Resonance Imaging), and Histopathology, The study of tissue under the microscope, which often involves the examination of sliced and stained tissue sections. Miscellaneous: Other imaging modalities not specifically listed.

The arrows indicate that the pattern recognition tasks are applied to various anatomical regions captured by different imaging modalities. The overall structure illustrates how deep learning integrates with medical imaging to enhance the analysis of each body part across different imaging techniques, reflecting the multidisciplinary and interconnected nature of the field.

**Prabha Kumari and Devakumari****Deep Neural Network in Medical Image Analysis****Pattern Recognition Task****Registration**

Registration Deep Neural Networks (DNNs) are being utilised to automate and enhance image registration in medical analysis [1], [2]. The registration involves aligning medical images from different modalities or time points, which is crucial for tasks like disease progression tracking and treatment planning [3], [4]. DNN techniques predict deformations or use reinforcement learning for efficient alignment, playing a vital role in integrating information for precise measurements and representations. [5]. The use of DNNs in registration significantly improves accuracy and efficiency in medical image analysis [6], [7]. It is instrumental for tasks such as tumour tracking, treatment planning, and disease progression assessment [8]. DNN-based methods offer improved robustness compared to traditional techniques, enhancing clinical decision-making and patient outcomes [9]. Reinforcement learning-based approaches are notable for improving the precision of registration tasks.[10], [12]. Recent advances include CNN-based networks with skip connections, particularly in 3D MR-TRUS prostate image registration. These advancements demonstrate enhanced similarity metric learning and optimisation strategies, highlighting the ongoing evolution in DNN applications for medical image analysis.[11]

Localisation

Localisation in DNN medical image analysis involves identifying and pinpointing specific structures or abnormalities within medical images, such as tumours, lesions, organs, and anatomical landmarks [1], [10]. This process is critical for detecting and diagnosing abnormalities or diseases, playing a vital role in medical image analysis[11], [12]. Deep Neural Networks, predominantly Convolutional Neural Networks (CNNs), are used to learn features and classify image regions, thereby enabling accurate detection, segmentation, and localisation[2], [3]. DNN-based localisation methods have shown promising results in various medical imaging applications, including mammography, computed tomography (CT), and magnetic resonance imaging (MRI) [4], [5]. These methods facilitate tasks such as tumour detection, organ segmentation, and disease diagnosis, enhancing diagnostic accuracy and treatment planning[6], [7], [8], [9]. Recent developments in DNN models have led to improved accuracy and efficiency in organ localisation across various medical imaging modalities[9]. The application of DNNs for medical image localisation significantly improves diagnostic accuracy, streamlines clinical workflows, and aids in early detection and targeted interventions [11]. By employing DNN-based localisation techniques, medical professionals can enhance the precision and efficiency of diagnostic tasks, foremost to improve patient care and treatment outcomes [12].

Classification

Classification in DNN medical image analysis involves assigning labels or groups to images based on their content, which is fundamental for diagnosing and prognosing diseases [1], [10]. DNNs, especially CNNs, have demonstrated remarkable performance in classifying medical images for various diagnostic tasks, including identifying tumours, detecting diseases, and predicting treatment outcomes[11], [12]. DNN-based classification methods, primarily using CNNs, learn features and classify images, enabling accurate diagnosis and prediction of disease states[2], [3]. These methods have shown promising results in various medical imaging applications, such as skin cancer detection, brain tumour classification, lung nodule detection, and differentiation between healthy and diseased tissues [4], [5], [6]. The automated identification of medical conditions or anomalies by these methods contributes significantly to the development of computer-aided diagnostic systems [7], [8], [9]. Leveraging DNNs for image classification enhances the potential for initial detection, treatment planning, and monitoring of diseases based on medical imaging data [4], [5]. This capability facilitates the efficient interpretation of medical images, supporting healthcare professionals in making informed decisions and improving patient care through personalised treatment strategies[6], [7], [9].

**Prabha Kumari and Devakumari****Detection**

Detection in DNN medical image analysis involves identifying and localising specific objects or abnormalities, such as tumours, lesions, and fractures, within medical images. This process is crucial for diagnosing various medical conditions [1], [10], [12]. DNN-based detection methods, particularly using convolutional neural networks (CNNs), are employed to learn features and detect objects accurately in medical images [2], [3]. These methods have shown promising results in applications like mammography, CT, X-ray imaging, and the detection of lung nodules[4], [5]. Advanced DNN architectures like Faster R-CNN and U-Net are utilised for improved diagnostic accuracy and early disease detection[6], [7]. The automated detection by DNNs contributes to the development of computer-aided diagnosis systems, enhancing the efficiency of medical image analysis [8], [9], [11]. Leveraging DNNs for detection enables medical professionals to efficiently identify and analyse critical findings within complex medical imaging data [4], [5]. This capability enhances early disease diagnosis and treatment planning and supports precision medicine initiatives, leading to improved patient outcomes[6], [7], [9].

Segmentation

Segmentation in DNN medical image analysis involves partitioning medical images into meaningful regions, such as organs, tissues, or lesions, essential for detailed analysis and aiding in diagnosis and treatment planning [1], [10]. Deep Neural Networks, particularly CNNs, have shown remarkable performance in accurately delineating anatomical structures and abnormalities within medical images [12]. DNN-based segmentation methods use advanced architectures like CNNs, RNNs, and U-Net to learn features and accurately segment images [2], [3], [4]. These methods have demonstrated success in various medical imaging applications, including brain MRI segmentation, histopathologic image segmentation, and X-ray stent segmentation[5], [6], [7]. By leveraging DNNs for segmentation, medical professionals gain valuable insights into the spatial distribution and characteristics of anatomical structures, enabling precise organ delineation, pathology localisation, and quantitative analysis [8], [9], [11]. The automated segmentation process aids in precise tumour delineation, organ volumetry, and treatment planning, contributing to improved diagnostic accuracy and personalised patient care [4], [5]. DNN-based segmentation techniques enhance the efficiency and accuracy of medical image interpretation, leading to better patient outcomes [6], [7], [9].

Anatomical Application

DNNs have been widely used in medical image analysis for organs, including the eye, chest, brain, abdomen, breast, kidney, lungs, liver, heart, and skin [1], [2], [4]. These applications involve tasks like detecting retinal diseases, lung nodule detection, brain MRI segmentation for neuroimaging studies, assessing abdominal structures, detecting tumours in mammograms, and diagnosing dermatological conditions [6], [7], [8]. DNN-based methods have shown promise in improving diagnosis and treatment planning for various medical conditions, demonstrating their versatility and potential impact across a wide range of anatomical areas[9], [10], [12]. In eye imaging, DNNs are used for retinal disease diagnosis and detection of diabetic retinopathy and age-related macular degeneration. For chest imaging, DNNs aid in lung cancer detection, pulmonary embolism identification, and pulmonary nodule detection [3]. In brain imaging, they assist in segmenting brain tumours and detecting neurological disorders. DNNs are applied in abdomen imaging for organ segmentation and detection of liver and kidney diseases [5]. Breast imaging helps in detecting and diagnosing breast cancer. For kidney and lung imaging, DNNs aid in tumour segmentation and pulmonary disease detection. In liver imaging, they are used for tumour segmentation and liver disease detection. For heart imaging, DNNs assist in cardiac structure segmentation and heart disease detection. In skin imaging, they contribute to the detection and diagnosis of skin cancer and other conditions[11]. Deep learning models, including CNNs and RNNs, play a crucial role in automating the analysis of medical images, contributing to advancements in computer-aided diagnosis and treatment planning [4]. The use of DNNs in medical image analysis holds great potential for personalised medicine and improved patient outcomes [6]. By leveraging DNNs, medical professionals achieve accurate and efficient examination of medical images, leading to improved diagnostic capabilities, treatment planning, and patient care across medical specialities [7]. These techniques are expected to continue growing, leading to more effective healthcare delivery and improved patient outcomes[9], [10].

**Prabha Kumari and Devakumari****Image modality****Digital Mammograms**

DNNs have significantly impacted the field of digital mammography, a key tool in breast cancer screening and diagnosis [1], [2]. These advanced techniques have been applied for detecting, classifying, and segmenting breast tumours and other abnormalities in digital mammograms, leading to more accurate diagnoses and predictions of disease states[3], [4]. Deep Convolutional Neural Networks (CNNs), often enhanced with transfer learning, are widely used for analysing digital mammograms. They excel in tasks such as mass detection, lesion identification, and classification of breast abnormalities[5], [6]. DNN-based methods have demonstrated potential in improving early detection and treatment planning for breast cancer, contributing to enhanced patient outcomes[7], [8]. By automating the analysis of digital mammograms, DNNs aid in early breast cancer detection and efficient treatment planning. This application is crucial for improving breast cancer diagnosis and patient care [9]. The use of DNNs in digital mammography has led to significant advancements in medical imaging technology. Deep learning algorithms, including CNNs and other sophisticated models, have been instrumental in automating the analysis of mammograms [10]. These advancements include improved detection and classification of breast tumours, aiding in early intervention and more precise treatment planning [11]. DNNs' ability to learn intricate patterns within mammograms enables accurate identification of potential indicators of breast cancer, enhancing screening and diagnostic capabilities for breast health assessment[12].

H&E stained Images

DNNs have significantly influenced the analysis of H&E stained images, a critical component in pathology and cancer research[1], [2], [3]. These advanced techniques automate the classification of cellular structures, tissue types, and pathological features in H&E stained images, enabling accurate disease diagnosis[4], [5], [6]. Deep learning models, counting convolutional neural networks (CNNs), are applied for tasks such as tissue segmentation, cell detection, cancer grading, and identifying abnormalities within these images [7], [8], [9]. DNN-based methods have shown promise in improving the accuracy and efficiency of histopathological analysis, aiding in the initial detection, diagnosis, and treatment planning of various diseases, especially cancer[10], [11], [12]. In histopathology, DNNs are effectively used for segmenting and classifying structures in H&E stained images, contributing to a deeper understanding of diseases like cancer [2], [3]. These methods enhance the accuracy and efficiency of histopathological analysis, leading to improved disease diagnosis and treatment [5], [6], [7]. The ability of DNNs to learn complex visual characteristics of H&E stained images aids in interpretation and diagnosis, enhancing pathology practice and supporting personalised medicine initiatives [9], [12]. By leveraging DNNs for H&E stained image analysis, pathologists can streamline the interpretation of tissue samples for various medical conditions, improving diagnostic capabilities[4]. The application of DNNs in H&E stained image analysis has the potential to advance precision medicine and personalised treatment strategies, contributing to better patient outcomes[8], [10]. Recent developments include the use of deep learning algorithms for the automated analysis of H&E stained images, aiming to enhance early disease detection and diagnostic accuracy[11].

X-ray images

DNNs have significantly impacted X-ray imaging, a vital modality for diagnosing various medical conditions, including bone fractures, lung diseases, and cardiac abnormalities[1], [2]. These advanced methods facilitate the automated detection, classification, and localisation of abnormalities in X-ray images[3], [4]. Tasks such as identifying lung nodules, detecting fractures, diagnosing pneumonia, and segmenting organs are being enhanced by DNN-based techniques, notably using convolutional neural networks (CNNs)[5]. The application of DNNs in X-ray analysis holds great potential for improving diagnostic accuracy, expediting clinical decision-making, and streamlining radiological interpretation[6]. By automating the analysis of X-ray images, DNNs aid in efficient diagnosis and treatment planning, significantly contributing to improved patient care and outcomes[7], [8]. DNNs enhance the accuracy and efficiency of interpreting X-ray images, leading to better patient care and reduced healthcare costs[9], [10]. Recent advancements include the use of deep learning algorithms for automated analysis of X-ray images, aiming to enhance diagnostic precision in radiology[11]. DNN-based methods demonstrate potential

**Prabha Kumari and Devakumari**

in a wide range of X-ray imaging applications, from thoracic to skeletal analysis, highlighting their versatility and significant impact on medical imaging[12].

CT (Computed Tomography) Scans

DNNs have significantly impacted the analysis of CT scans, a key modality in diagnosing various medical conditions such as tumours, fractures, internal injuries, and cardiovascular diseases[1], [2]. Employing DNNs, particularly convolutional neural networks (CNNs), enhances the detection, segmentation, and classification of abnormalities in CT images, aiding in accurate diagnosis and treatment planning[3]. DNN-based techniques have proven effective in tasks like identifying lung nodules, detecting brain tumours, segmenting organs, and classifying diverse pathologies across anatomical regions [4]. The application of DNNs in CT scan analysis holds great potential for refining diagnostic accuracy efficiency and facilitating precise treatment planning, ultimately contributing to enhanced patient outcomes [5], [6]. By automating the analysis of CT scans, DNNs aid in efficient diagnosis, supporting healthcare professionals in clinical decision-making and improving patient care in radiology, oncology, and beyond[7]. The integration of DNNs into CT scan analysis advances precision medicine and improves radiological assessment, enhancing the interpretation of complex imaging data[8], [9]. Recent developments include deep learning algorithms for automated segmentation and classification within CT scans, aiming to enhance diagnostic precision in clinical radiology[10], [11]. DNN-based methods demonstrate potential in a wide range of CT imaging applications, from thoracic to skeletal analysis, highlighting their versatility and significant impact on medical imaging [12].

PET (Positron Emission Tomography) Scans

DNNs have significantly impacted the analysis of PET scans, a medical imaging technique used to visualise metabolic activity in the body, which is crucial for diagnosing diseases like cancer and neurological disorders [1], [2]. Employing DNNs, particularly convolutional neural networks (CNNs), enhances the detection, segmentation, and classification of abnormalities in PET images[3], [4]. DNN-based techniques have proven effective in tasks like tumour detection, disease staging, treatment response assessment, and identifying abnormal metabolic activity[5]. The application of DNNs in PET scan analysis holds great probable for improving diagnostic accuracy efficiency and facilitating precise treatment planning, ultimately contributing to enhanced patient care[6]. By automating the analysis of PET scans, DNNs aid in accurate diagnosis and personalised treatment planning, significantly contributing to improved patient outcomes in oncology, neurology, and other medical specialities[7], [8]. The integration of DNNs into PET scan analysis advances precision medicine, improving radiological assessment and interpretation of complex imaging data[9]. Recent developments include deep learning algorithms for automated segmentation and classification within PET scans, aiming to enhance diagnostic precision in clinical radiology[10], [11]. DNN-based methods demonstrate potential in various applications, from functional imaging to cancer staging, highlighting their versatility and significant impact on medical imaging[12].

MRI (Magnetic Resonance Imaging) Scans

DNNs have significantly impacted the analysis of MRI scans, a crucial modality for visualising internal body structures and diagnosing various medical conditions, including neurological disorders, musculoskeletal injuries, and cardiovascular diseases [1], [2], [3]. Employing DNNs, particularly convolutional neural networks (CNNs), enhances the detection, segmentation, and classification of abnormalities in MRI images[4]. DNN-based techniques have proven effective in tasks such as tissue segmentation, lesion detection, disease classification, brain tumour segmentation, and neuroimaging[5], [6]. The application of DNNs in MRI scan analysis holds great potential for improving diagnostic accuracy and efficiency and facilitating precise treatment planning, ultimately contributing to enhanced patient outcomes[7], [8]. By automating the analysis of MRI scans, DNNs aid in accurate diagnosis and personalised treatment planning, significantly contributing to improved patient care in radiology, neurology, and other medical specialities [9]. The integration of DNNs into MRI scan analysis advances precision medicine, improving radiological assessment and interpretation of complex imaging data[10]. Recent developments include deep learning algorithms for automated segmentation and classification within MRI scans, aiming to enhance

**Prabha Kumari and Devakumari**

diagnostic precision in clinical radiology[11]. DNN-based methods demonstrate potential in a wide range of MRI imaging applications, highlighting their versatility and significant impact on medical imaging[12].

Multimodal MRI Scans

DNNs have significantly impacted the analysis of multimodal MRI scans, which combine different MRI sequences to provide comprehensive information about tissue structure, function, and pathology[1], [2]. Employing DNNs, particularly convolutional neural networks (CNNs), enhances tasks such as disease diagnosis, treatment planning, outcome prediction, tumour segmentation, and disease classification using multimodal MRI data[3], [4]. DNN-based techniques have proven effective in integrating and analysing multimodal MRI data, facilitating improved disease characterisation, segmentation, and fusion of complementary information from different modalities[5], [6], [7]. The application of DNNs in multimodal MRI scan analysis holds great potential for advancing diagnostic precision, therapeutic decision-making, and personalised medicine in various medical specialities, including neurology, oncology, and musculoskeletal imaging [8]. By automating the analysis of multimodal MRI scans, DNNs aid in accurate diagnosis and personalised treatment planning, significantly contributing to improved patient care and outcomes in complex medical scenarios[9]. The integration of DNNs into multimodal MRI scan analysis advances precision medicine, improving the interpretation of complex imaging data and contributing to enhanced diagnostic accuracy[10]. Recent developments include deep learning algorithms for the fusion and joint interpretation of information from different MRI modalities, aiming to enhance diagnostic precision in clinical radiology[11]. DNN-based methods demonstrate potential in various applications of multimodal MRI imaging, highlighting their versatility and significant impact on medical imaging[12].

Challenges and Future Directions**Challenges in DNN Medical Image Analysis****Lack of Annotated Data and Generalizability**

The need for large, diverse, and annotated datasets and the challenge of generalising models to unseen data is a significant hurdle [2], [3], [4], [5], [6], [7], [8], [9], [10], [11], [12].

Interpretability and Explainability

There is a crucial need for the interpretability of DNN models to understand and trust their decision-making process [2], [3], [6], [8], [10], [11], [12].

Integration with Clinical Data and Real-time Processing

Limited integration with clinical data and the need for real-time processing capabilities are major concerns [1], [6], [11].

High Training Costs and Limited Domain Integration

The high costs associated with training DNNs and limited integration with models from other domains pose challenges [6].

Future Directions in DNN Medical Image Analysis**Development of Robust and Interpretable Models**

Focus on creating more robust and interpretable DNN models that integrate domain knowledge and uncertainty estimation [3], [5], [7], [10], [11].

Use of Transfer Learning and Federated Learning

Leveraging transfer learning, federated learning, and semi-supervised learning to overcome data scarcity and enhance model training [3], [10], [11], [12].

**Prabha Kumari and Devakumari****Integration of Multimodal Data**

Exploring the potential of integrating multimodal data and novel applications in personalised medicine and population health management [2], [3], [8], [9], [10].

Advancements in AI Techniques and Model Robustness

Improving model robustness and developing explainable AI techniques, along with advancements in multi-instance learning and the integration of multimodal data for improved disease characterisation [2], [4], [8], [9], [10], [12].

Exploring Novel Architectures and Fusion Strategies

Investigating new convolutional neural network architectures and fusion strategies for multimodal data to enhance accuracy and reliability [4], [9].

CONCLUSION

Deep Neural Networks (DNNs), particularly Convolutional Neural Networks (CNNs), have significantly advanced medical image analysis, enhancing the diagnosis and treatment of various medical conditions. Their ability to process complex imaging data has led to improvements in critical tasks such as image registration, classification, and segmentation. Despite their potential, challenges like the need for extensively annotated datasets, model interpretability, and integration into clinical practice remain. Addressing these issues is crucial for the broader adoption of DNNs in healthcare. Future developments focused on enhancing model robustness, interpretability, and the integration of multimodal data promise to revolutionise medical diagnostics and patient care further, driving the field towards more personalised and efficient healthcare solutions.

ABSTRACT

"EXTORARCHI" is a system aimed at safeguarding construction integrity through real-time data monitoring and public accountability. In the context of machine learning, EXTORARCHI utilizes advanced technologies like CONTRACRAFT to collect and analyze data concerning construction projects. This innovative system employs machine learning algorithms to compare allocated funds against actual expenditures and construction progress, enabling the detection of discrepancies indicative of corruption or misappropriation. Upon identifying irregularities, EXTORARCHI triggers alarms to alert relevant authorities and initiates public disclosures through dedicated online platforms. Through the integration of machine learning methods, EXTORARCHI not only enhances transparency and accountability but also acts as a deterrent against corruption within the construction industry.

Keywords: Corruption, Real-time data monitoring, Alarms, Notifications, Data collection, Data analysis.

INTRODUCTION

The construction industry is undergoing a paradigm shift propelled by the amalgamation of highly developed technology. CONTRACRAFT, a state-of-the-art system, represents the cornerstone of this transformation, offering real-time data management capabilities that surpass conventional project management systems. Complementing CONTRACRAFT, a myriad of innovative technologies including weather sensors, biometric access control, CCTV surveillance, cloud storage, and automatic curing systems are revolutionizing construction management practices, enhancing efficiency, safety, and sustainability.

Aathika Mariyam et al.,

FEATURES OF THE PROJECT EXTORARCHI

At the heart of modern construction management lays CONTRACRAFT, a revolutionary system that utilizes real-time data management to streamline project operations. CONTRACRAFT employs air analysis to accurately determine water needs during construction, optimizing resource utilization and enhancing operational efficiency. Furthermore, CONTRACRAFT's proactive construction document management capabilities enable early identification and resolution of potential issues, ensuring seamless project execution.

Weather sensor

A weather station sensor is a device or a set of devices designed to measure various atmospheric parameters and environmental conditions at a specific location. These sensors are commonly used in weather stations to gather real-time data for meteorological analysis, climate monitoring, and environmental research. Here are some key components often found in a typical weather station. Weather station sensors are often connected to a central data logger or a microcontroller that collects, processes, and stores the data. The collected information can be transmitted to a central server or displayed locally for real-time monitoring. Advanced weather stations may also include additional sensors for specific applications, such as frost sensors, evaporation sensors, or leaf wetness sensors for agricultural purposes. The data collected by weather stations is valuable for weather forecasting, environmental research, agriculture, aviation, and various other fields where accurate weather information is essential.

- Temperature Sensor: Measures the air temperature at the location of the sensor.
- Humidity Sensor: Measures the amount of dampness in the atmosphere, providing information about humidity levels.
- Barometric Pressure Sensor (Barometer): Monitors atmospheric pressure, helping to predict short-term weather changes.
- Anemometer: Measures wind speed, often accompanied by a wind vane to determine wind direction.
- Rain Gauge: Collects and measures the amount of precipitation (rainfall).
- Solar Radiation Sensor (Pyranometer): Measures the intensity of sunlight or solar radiation.
- UV Index Sensor: Measures the level of ultraviolet (UV) radiation from the sun.
- Visibility Sensor: Measures visibility conditions, which is important for transportation and safety.
- Hygrometer: Procedures the dampness contented in the atmosphere, often used in conjunction with temperature sensors.
- Soil Moisture Sensor: Procedures the dampness contented in the loam, providing insights into soil conditions for agriculture or construction projects.
- Snow Depth Sensor: Measures the depth of snow accumulation, important for winter weather monitoring.
- Lightning Detector: Detects the presence of lightning and helps in issuing warnings for safety.
- Air Quality Sensors: Measures the concentration of pollutants in the air, providing information about the quality of the environment.
- Dew Point Sensor: Calculates the dew point temperature, which is the temperature at which air becomes saturated with moisture and dew forms.

**Aathika Mariyam et al.,****Biometric**

Iris biometrics can contribute to reliable automatic calculations in the construction industry by integrating with access control systems. This increases security measures by ensuring that only qualified and authorized personnel access specific areas, reducing the risk of accidents and unauthorized entry. It also helps maintain accurate records of attendance and movement of employees on the construction site, facilitating management and accountability.

CCTV Surveillance

CCTV maintenance in the construction industry is essential for reliable automation. Continuous monitoring ensures that inspections are appropriately tracked and documented; This results in overall safety and supervision of employees. It also increases efficiency by providing a quick overview of the construction site, helping identify risks and improving overall safety procedures. Regularly reviewing and updating your CCTV can go a long way towards promoting a safer, more efficient system.

Cloud storage

In the dynamic realm of construction management, the seamless integration of data from cloud storage services to applications in real-time has emerged as a crucial element in optimizing project work flows. Developers in the construction industry can harness the power of cloud storage APIs and webhooks to establish a fluid connection between cloud repositories and construction applications. Leveraging APIs like those provided by Google Drive, Dropbox, or Amazon S3, construction applications can gain the capability to programmatically retrieve, upload, or update project files instantly. Webhooks play a vital role in enhancing this real-time integration by allowing applications to receive immediate notifications of critical events such as document modifications, additions, or deletions in the cloud storage. Moreover, the implementation of technologies like push notifications, synchronization mechanisms, and serverless computing through cloud functions contributes to the swift transfer of construction-related data. This ensures that construction applications remain synchronized with the latest changes in the cloud storage environment, facilitating real-time collaboration among project stakeholders. This real-time data transfer paradigm, facilitated by modern cloud computing infrastructure, significantly enhances the responsiveness and agility of construction applications, providing project teams with timely access to crucial project documents and information.

Cloud Storage APIs

Most cloud storage providers proffer APIs (Application Programming Interfaces) to facilitate developers to intermingle with their services programmatically. For example, Google Drive API, Dropbox API, Amazon S3 API, etc. By integrating the appropriate API into your application, you can programmatically retrieve, upload, or update files in real time.

Webhooks

Some cloud storage services provide webhook support, allowing your application to receive notifications or callbacks whenever changes occur in the cloud storage. This can embrace proceedings such as dossier uploads erasure, or amendment.

Push Notifications

Implementing push notifications can be a way to alert your application when new data is available in the cloud storage. This can be combined with APIs or webhooks for real-time updates.

Cloud Functions

Some cloud providers offer serverless computing options, such as AWS Lambda or Google Cloud Functions. You can set up functions that are triggered by specific events in your cloud storage (e.g., file uploads). These functions can then process the data and send it to your application or perform other necessary actions in real time.

**Aathika Mariyam et al.,****Database Triggers**

If your cloud storage is integrated with a database, you can set up triggers that initiate actions in real time when specific changes occur in the database. This can be useful for applications relying on databases connected to cloud storage.

Automatic curing

In the context of construction site management, the incorporation of an automatic water irrigation system emerges as a pivotal solution for fostering a sustainable and well-maintained environment. This system, designed to address the unique needs of construction sites, seamlessly integrates advanced technologies to optimize water usage and support the growth of vegetation in the midst of ongoing construction activities. By deploying soil moisture sensors, the system intelligently monitors and adapts to the instantaneous dampness echelon of the erection spot; make certain exact and competent hose liberation to unambiguous vicinity. Weather-based controls auxiliary augment the coordination competence by animatedly fiddle with irrigation agenda pedestal on meteorological data, preventing overwatering during periods of rainfall. Automated controllers govern the irrigation process, allowing for programmable schedules tailored to diverse construction site zones. The implementation of drip irrigation or sprinkler systems caters to the specific requirements of different plant types and landscaping designs. Moreover, incorporating mobile apps or remote monitoring capabilities empowers site managers to oversee and adjust the irrigation system in real time from anywhere. Through these advancements, the automatic water irrigation system not only promotes the health of vegetation but also contributes to sustainable construction practices by conserving water resources and mitigating environmental impact. As construction industries evolve towards more environmentally conscious practices, the adoption of automated irrigation systems stands as a transformative measure in achieving both ecological resilience and operational efficiency on construction sites.

Site Analysis

Before implementing an irrigation system, conduct a thorough analysis of the construction site. Consider factors such as soil type, terrain, vegetation requirements, and the specific needs of ongoing construction activities.

Sensor Integration

Integrate soil moisture sensors to monitor the dampness echelon in the construction site. These sensors provide real-time data, allowing the irrigation system to adjust water delivery based on the actual needs of the soil.

Weather-Based Controls

Utilize weather sensors or connect to local weather forecasting services to gather data on temperature, humidity, and precipitation. This information helps the system adjust irrigation schedules based on weather conditions, preventing overwatering during rainy periods.

Automated Controllers

Install automated controllers that manage the irrigation schedule and duration. These controllers can be programmed to water different zones of the construction site at specific times, optimize hose convention and prop up efficient irrigation practices.

Drip Irrigation or Sprinkler Systems

Choose an irrigation method that suits the construction site's needs. Drip irrigation systems are efficient for targeted watering of specific areas, while sprinkler systems may be suitable for larger, open spaces. The choice depends on factors such as plant types, landscaping design, and water conservation goals.

Mobile App or Remote Monitoring

Implement a mobile app or a remote monitoring system that allows construction site managers to scrutinize and manage the irrigation scheme commencing everywhere. This enables real-time adjustments and ensures that water is applied when and where it is needed.

Aathika Mariyam et al.,

Water Recycling and Conservation

Consider incorporating water recycling systems to reuse water for irrigation purposes. Implement features like rainwater harvesting to collect and store rainwater, reducing reliance on external water sources.

Security and Durability

Ensure that the irrigation system is secure and durable, capable of withstanding the rigors of a construction site environment. Protect irrigation components from damage caused by construction activities, heavy equipment, and adverse weather conditions.

Anomaly detection

Integrating anomaly detection with an audible alarm system, such as a siren, can provide a real-time alert mechanism when corruption or fraudulent activities are detected on a construction site. Here are features and ideas to achieve this combination of anomaly detection and alarm triggers:

- i. **Real-time Anomaly Detection:** Implement real-time anomaly detection algorithms that continuously monitor various aspects of the construction project, including financial transactions, procurement processes, employee behavior, and document verification.
- ii. **Threshold Setting:** Set predefined thresholds for normal behavior in different areas, such as financial transactions, bidding processes, or employee activities. Anomalies beyond these thresholds trigger the alarm system.
- iii. **Event Correlation:** Correlate anomalies across different data sources to identify patterns that may indicate corruption. Cross-reference financial anomalies with bidding irregularities or employee behavior deviations for more accurate detection.
- iv. **Automated Notification System:** In addition to the siren, implement an automated notification system that sends alerts to relevant stakeholders via SMS, email, or a dedicated communication platform. Include details about the detected anomaly and steps to be taken.
- v. **Emergency Response Protocol:** Develop an emergency response protocol specifying actions to be taken when the siren rings. Clearly define roles and responsibilities of construction site personnel, supervisors, and management in response to corruption alerts.
- vi. **Integration with Security Cameras:** Integrate the anomaly detection system with security cameras placed strategically around the construction site. When an anomaly is detected, activate cameras to provide real-time visual confirmation of the situation.
- vii. **Geofencing for Access Control:** Implement geofencing to restrict access to sensitive areas of the construction site. Trigger alarms if there are unauthorized attempts to access restricted zones.
- viii. **Secure Communication Channels:** Ensure that the notification system uses secure and encrypted communication channels to prevent interference or manipulation by potential wrongdoers.
- ix. **Historical Analysis and Reporting:** Include features for historical analysis and reporting to track patterns of anomalies over time. This can help in identifying trends and addressing systemic issues.
- x. **Regular Testing and Calibration:** Conduct regular testing and calibration of the anomaly detection system to ensure its effectiveness. Periodically review and update thresholds based on changing project dynamics.
- xi. **Whistleblower Protection Mechanism:** Encourage and protect whistleblowers by providing a secure and anonymous reporting mechanism. Integrate whistleblower reports into the anomaly detection system for comprehensive analysis. By combining anomaly detection with an audible alarm system, construction projects can enhance their ability to detect and respond to corruption promptly. This proactive approach helps to maintain the integrity of the project and fosters a culture of transparency and accountability.
- xii. **Alarm alert:** Implementing an alarm siren for a construction site when corruption occurs involves integrating technology, anomaly detection, and a notification system.
- xiii. **Automated Alarm Trigger:** Connect the anomaly detection system to the siren system. When the anomaly detection system identifies corruption based on the predefined conditions, it should trigger the alarm automatically.

**Aathika Mariyam et al.,**

- xiv. **Manual Panic Button:** Install manual panic buttons in key locations around the construction site. Personnel who observe or suspect corrupt activities can press the panic button to trigger the alarm.

Mobile App Integration

Develop a mobile app for on-site a personnel that includes a panic button feature. If corruption is suspected, public can use the app to trigger the alarm, simultaneously alerts are send sssending alerts to designated stakeholders.

Voice Recognition Technology

Implement voice recognition technology to detect unusual or distressing conversations related to corrupt activities. When suspicious conversations are detected, activate the alarm.

Integration with Access Control Systems

Integrate the alarm siren with access control systems. Anomalies in personnel access, especially during non-working hours or restricted areas, can trigger the alarm.

Machine Learning Models for Anomaly Detection

Develop machine learning models that specialize in identifying anomalies associated with corruption. Integrate these models into the construction site's overall monitoring system to trigger the alarm when anomalies are detected.

METHODOLOGY

1. **Data Collection:** Establish a comprehensive database to store information on construction projects, including allocated funds, expenditures, and progress reports.
2. **Data Preprocessing:** Clean and preprocess raw data to remove inconsistencies and inaccuracies. Convert data into a standardized format for easy integration and analysis. Handle missing or incomplete data through imputation or other relevant techniques.
3. **Machine Learning Model Selection:** Choose appropriate machine learning algorithms for anomaly detection and pattern recognition. Train the models using historical data to enable them to learn patterns of normal construction project behavior.
4. **Algorithm Implementation:** Integrate selected machine learning algorithms into the EXTORARCHI system. Implement CONTRACRAFT for real-time data collection and feed it into the machine learning models.
5. **Threshold Setting for Irregularities:** Establish thresholds for discrepancies in allocated funds, expenditures, and construction progress that trigger alarms.
6. **Alert Mechanism:** Include multiple communication channels, such as emails, SMS, and system-generated reports.
7. **Public Disclosure Platforms:** Develop dedicated online platforms for public disclosure of detected irregularities.

ADVANTAGES**Enhanced Transparency**

By utilizing machine learning and CONTRACRAFT, EXTORARCHI offers real-time monitoring of construction projects, providing a transparent view of funds allocation, expenditures, and progress.

Early Detection of Irregularities

The use of machine learning algorithms allows for the early identification of discrepancies between allocated funds and actual expenditures, as well as construction progress. This enables timely intervention and mitigation of potential issues.

Corruption Deterrence

The integration of machine learning methods acts as a deterrent against corruption within the construction industry. The system's ability to detect irregularities and trigger alarms discourages fraudulent activities.

Public Accountability

The initiation of public disclosures through dedicated online platforms enhances accountability. Public awareness of irregularities fosters a sense of responsibility among stakeholders, encouraging adherence to ethical practices.

Timely Alerts to Authorities

The alert mechanism ensures that relevant authorities are promptly notified when irregularities are detected. This facilitates swift corrective actions and investigations.

CONCLUSION

Embracing these transformative technologies paves the way for enhanced project workflows, improved safety measures, and a commitment to sustainable practices. As we move forward, the construction industry stands poised to achieve new levels of success through the integration of these cutting-edge solutions, driving progress and excellence in every construction endeavor. Integrating multiple methods and technologies can provide a layered and comprehensive approach to corruption detection on a construction site. Combining different systems enhances the chances of early detection and a rapid response to potential issues. Regular testing and updates are essential to maintaining the effectiveness of the alarm system.

ABSTRACT

A pedometer is a step-tracking gadget that monitors your steps by detecting motion, typically using an accelerometer to measure acceleration changes that occur when steps are taken. The pedometer estimates the number of steps through tracking these variations in acceleration, and advanced models may incorporate supplementary sensors or algorithms for enhanced accuracy. Steps are usually displayed on a screen or recorded in an app to help monitor physical activity. Academics are interested in the accuracy of pedometers, which involve several key components: the accelerometer senses acceleration changes, providing data to the Arduino Uno, which processes this data to identify steps. When a step is detected, the step count is incremented, and the Arduino communicates with the LCD display via the I2C module (LCD12c), minimizing required connections. The software updates the LCD with the current step count in real-time. This system accurately tracks steps and displays the count on the LCD, combining precise step detection with real-time feedback, user engagement, and portability. Step counting has long been used to gauge distance, and using a pedometer with Arduino Uno, an accelerometer, and an LCD display offers benefits like accurate tracking, real-time feedback, and motivation to stay active, promoting a healthier lifestyle

Keywords: Arduino UNO, stepcoun, lccdisplay, accelerometer.

INTRODUCTION

A pedometer is a compact electronic device that tallies each step an individual takes and 1. Pedometers have undergone substantial advancements in recent times, displaying the overall count of steps taken, with some models capable of analyzing data, syncing with computers, or connecting to smartphone applications.[1] Pedometers function by registering movements, typically by monitoring hip movements. For optimal accuracy, pedometers worn on the belt should be positioned vertically.[2] Higher-end pedometers may be attached to shoes instead of belts, detecting vibrations when the foot hits the ground. It's important to note that pedometers cannot differentiate

between intentional steps and other movements, such as shaking the device. Placing pedometers in backpacks, purses, or pockets can lead to inaccurate readings. Pedometers have emerged as valuable tools for self-monitoring physical activity levels in various populations.[3] They provide feedback on the actions taken, distance covered, duration of activity, and approximate energy consumption. By delivering prompt feedback on the number of steps taken, pedometers assist individuals in comprehending the influence of their decisions on their levels of physical activity.[4] When combined with self-monitoring, feedback, and goal-setting procedures, pedometers supply real-time data to modify behavior and attain physical activity objectives.[5]

Types of Pedometers

Various types of pedometers are available, including traditional pendulum-style models, accelerometer-based devices, smartphone apps, and wearable fitness trackers. Each type tracks steps and often offers additional features.

Mechanical Pedometers: These are the conventional pedometers that utilize a swinging pendulum or a spring mechanism to tally steps. They are basic and do not require batteries, although they may not be as precise as modern digital pedometers.

Digital Pedometers

These utilize electronic sensors (such as accelerometers) to identify motion and count steps. They frequently come with extra features like distance tracking, calorie counting, and occasionally syncing with smartphones or fitness apps.

Smartphone App

Numerous smartphones have integrated accelerometers that can serve as pedometers. Several fitness apps utilize this technology to monitor your steps and other activities.

Fitness Trackers

These wearable devices go beyond simply counting steps. They regularly track heart rate, sleep patterns, and other metrics. They establish connections with smartphones and computers to provide users with detailed activity data.

Smart watches

similar to fitness trackers, integrate step tracking functionality alongside a range of other features such as notifications, GPS tracking, and applications. Clip-On Pedometers, on the other hand, are small gadgets that can be easily attached to your attire or worn inconspicuously. They are lightweight and easily transportable.

Shoe Pedometers: Certain pedometers are designed to fit inside your shoe, utilizing sensors for monitoring your steps as you walk or run.

Wearable Sensors

Beyond traditional pedometers, there are numerous wearable devices that can track steps and activity, frequently targeting specific sports or activities. Sports Medicine advocates a more formal, workout prescription of 20-60 minutes of continuous activity, three to five times a week (at 60%-90% of maximum heart rate reserve) and 2-3 days of resistance training. Thirty minutes of exercise is beneficial for you, but an objective measurement of your activity level can be challenging. Studies indicate that it is feasible to overestimate your activity level or calorie expenditure by up to 51%! Overestimating your level of physical activity or calorie expenditure can lead to unfavorable outcomes. It can lead individuals to mistakenly think they are participating in an adequate amount of physical activity to improve their health or to believe they are offsetting the extra calories consumed during weekends of indulgence. This overestimation of physical activity presents a dilemma for researchers in the field of exercise science, as it distorts the findings of their studies when participants overestimate the intensity and duration of their workouts .[6-8]

**Amrutha et al.,****HISTORY OF PEDOMETER**

The concept of step counting has its roots in the necessity for estimation and can be viewed as a natural progression from other measurement techniques based on the human body, such as the inch, hand, foot, cubit, and fathom. The term "mile" originates from the Latin phrase "mille passus," which translates to "one thousand paces." During Roman times, a mile was approximately equivalent to 1000 paces taken by an adult. Leonardo da Vinci is credited with inventing the first mechanical step counter. This device was worn around the waist and featured a long lever arm connected to the thigh. As the thigh moved during walking, the gears would rotate, resulting in the accumulation of steps. Thomas Jefferson requested a pedometer from a renowned watchmaker in Paris. This pedometer was designed to be carried in a vest pocket and had a lever arm connected to a string that passed through a hole at the bottom of the pocket. The other end of the string was attached to a strap below the knee, so that walking would cause it to pull on the lever arm, which was connected to gears. Jefferson utilized this pedometer to calculate the distance to various landmarks in Paris in terms of steps. He noted that an English mile equated to 20665 steps, but during a brisk winter walk, it reduced to 1735 steps. In 1788, he sent a pedometer to James Madison, along with a detailed set of instructions on a single page. In 1777, Abraham-Louis Perreault, a Swiss-born watchmaker, invented a self-winding mechanism for pocket watches. This mechanism involved an oscillating weight inside the watch that moved up and down as the wearer walked. In 1780, he further developed a self-contained pedometer that utilized a spring-suspended lever arm to count steps. In 1820, Abraham-Louis Breguet created a mechanical pedometer stopwatch for Alexandre I, the Star of Russia, to measure the distance and pace of his marching armies. In 1788, he dispatched a pedometer to James Madison, accompanied by a thorough set of instructions on a single page. In 1777, Abraham-Louis Perreault, a watchmaker born in Switzerland, created a self-winding system for pocket watches.[9,10]

DISCRIPTION OF COMPONENTS USED**Components and its usage**

- Arduino UNO
- ADXL 335 Accelerometer
- 16*2 LCD
- LCD 12c module
- Power source
- Jumper wires
- Arduino IDE

Arduino UNO

The Arduino UNO is a microcontroller board that utilizes the ATmega328P as its foundation. It is equipped with 14 digital input/output pins, out of which 6 can function as PWM outputs. Additionally, it possesses 6 analog inputs, a 16 MHz ceramic resonator, a USB connection, a power jack, an ICSP header, and a reset button.[11]

ADXL 355 Accelerometer

The ADXL335 is a low power, three-axis accelerometer sensor. It is capable of measuring acceleration in the range of +/-3g. The sensor measures acceleration along the X, Y, and Z axes and outputs a voltage proportional to the acceleration on each axis. The ADXL335 is widely used in various applications such as motion sensing, gaming, and pedometer devices. In this project, the ADXL335 sensor is used to detect the movement of the person wearing the device and send data to the Arduino UNO. The Nano employs an algorithm to determine the quantity of steps taken by utilizing the data obtained from the sensor. Due to its compact size and minimal energy usage, the ADXL335 is an excellent option for wearable gadgets like pedometers. This sensor, known for its heightened sensitivity, is capable of detecting even the slightest motions and vibrations.[12]

**Amrutha et al.,****12c module for 16*2 LCD**

The I2C module for 16×2 LCD display is a device that allows for communication between an Arduino Nano microcontroller and a 16×2 LCD display. The Two-Wire Interface (TWI), also known as the I2C interface, is a communication protocol that enables the connection of multiple devices using only two wires. This reduces the number of wires required and provides a cost-effective solution. In this particular project, the I2C module is utilized for a 16×2 LCD display to showcase the number of steps taken on the device. The Arduino Nano transmits the data to the I2C module, which then presents the information on the LCD screen. By employing the I2C interface, the necessity for numerous data and control wires is eliminated, resulting in a more compact and user-friendly device. The I2C module designed for the 16×2 LCD display facilitates effortless control of the display through simple commands for manipulating the cursor position, text alignment, and display on/off functionality. Additionally, it incorporates built-in contrast control and backlight control, ensuring optimal visibility under various lighting conditions.[13]

Arduino IDE

The Arduino Software (IDE) simplifies the process of coding and uploading it to the board without an internet connection. This software is compatible with all Arduino boards and is available in two versions: IDE 1.x.x and IDE 2.x. It is worth noting that both versions of the Arduino IDE offer offline functionality, allowing users to utilize the software even in areas with limited or no internet connectivity.[14]

METHODOLOGY**WORKING OF A PEDOMETER**

The pedometer operates as a compact wearable device designed to accurately track and display the user's step count. It achieves this by leveraging the capabilities of its integrated components. The heart of the system is the Arduino Uno microcontroller, which orchestrates the entire process. The ADXL335 accelerometer is strategically placed within the pedometer to capture real time acceleration data. By being oriented in sync with the user's motion, the accelerometer provides analog voltage outputs proportional to the acceleration along the X, Y, and Z axes. The Arduino Uno's analog pins are connected to these outputs, enabling it to continually sample the analog signals. The collected analog data is then processed by the Arduino Uno through a step detection algorithm. This algorithm analyses the acceleration values to identify patterns indicative of steps. By monitoring for specific changes in acceleration, such as peaks and troughs, the algorithm can reliably detect each step taken by the user. Various step detection techniques can be applied here, tailored to the desired accuracy and responsiveness. Once the step count is determined, the Arduino Uno employs the I2C (Inter-Integrated Circuit) communication protocol to interface with the 12C LCD module. This compact display unit provides a visual interface for the user, showing the current step count and possibly additional information. The Arduino sends commands and data to the LCD module through the I2C bus, enabling the display of relevant information in a user-friendly manner. Powering the entire system is a battery, chosen for its appropriate voltage and capacity. This battery supplies the necessary energy to the Arduino Uno, the ADXL335 accelerometer, and the 12C LCD module. Achieving the optimal equilibrium between power consumption and operational duration is of utmost importance is crucial to maintaining the pedometer's functionality without frequent recharging or battery replacement. In essence, the pedometer combines the accurate sensing capabilities of the ADXL335 accelerometer, the processing power of the Arduino Uno, the display functionality of the 12C LCD module, and the reliable energy supply of the battery. By intelligently processing acceleration data, detecting steps, and presenting the step count on a user-friendly display, the pedometer provides users with a tangible way to monitor their physical activity and encourage an active lifestyle.[15,16,17]

CONNECTIONS OF THE COMPONENTS

The ADXL335 serves as a triaxial accelerometer sensor that gauges acceleration across the X, Y, and Z axes, enabling the detection of changes in motion and orientation. Conversely, the Arduino Uno functions as a microcontroller board capable of interfacing with a variety of sensors and devices. When linking the ADXL335 to an Arduino Uno,

**Amrutha et al.,**

the standard procedure involves connecting the sensor's X, Y, and Z output pins to three analog input pins on the Arduino. In the event that the term "I2c module" refers to an I2C module, this component facilitates communication with other devices through the I2C protocol. I2C, a communication protocol, permits multiple devices to interact using solely two wires (SCL and SDA). I2C devices can be attached to the dedicated SDA and SCL pins on the Arduino Uno. Typically, a battery is utilized to power the setup, necessitating a thorough examination of the voltage requirements of all components. Given that the Arduino Uno typically functions at 5V, a voltage regulator may be necessary to reduce the voltage if the battery voltage surpasses this threshold. The process of connecting the ADXL335 accelerometer, Arduino Uno, I2C module (if applicable), and battery entails linking the sensor's outputs to the Arduino's analog pins, utilizing the I2C module for communication if required, and powering the setup with an appropriate battery while adhering to voltage specifications.[18-20]

PROTOTYPE

RESULTS

Pedometers commonly display the number of steps taken by an individual within a set period of time. In addition to step count, pedometers can also offer insights into active minutes. Users walk a specific distance, and the recorded step count is then presented on the pedometer screen. The output of a pedometer is typically the number of steps recorded within a specific timeframe pedometers can provide additional information beyond step count, active minutes. Here subjects walks for certain distance and their step count has been recorded and This information is displayed on the pedometer screen.

CONCLUSION AND FUTURE SCOPE

The integration of pedometers into clinical care presents a promising avenue for enhancing patient outcomes through increased physical activity. These devices offer an accessible, cost-effective, and user-friendly means to promote and monitor exercise, aligning with broader public health goals of reducing sedentary behavior and mitigating the risks associated with chronic diseases. Research consistently indicates that pedometers can motivate individuals to increase their daily step count, which correlates with improved cardiovascular health, better weight management, and enhanced mental well-being. By providing immediate feedback, pedometers empower patients to set and achieve realistic activity goals, fostering a sense of accomplishment and encouraging sustained behavioral change.[21] Clinically, pedometers can serve as valuable tools for healthcare providers to monitor patient activity levels objectively. This data can inform personalized care plans, track progress over time, and identify patients who may need additional support or interventions. The quantifiable data collected through pedometers enable a more precise assessment of physical activity, facilitating evidence-based adjustments to treatment plans and potentially leading to better health outcomes.[22] Moreover, the use of pedometers can bridge the gap between clinical advice and patient adherence. As part of a comprehensive health strategy, pedometers can help translate clinical recommendations into actionable steps, making abstract health advice tangible and actionable. This practical application of technology supports patient engagement and compliance, which are critical components in the management of chronic conditions such as diabetes, hypertension, and obesity.[23]

The efficacy of pedometers is also enhanced when combined with other supportive measures, such as counseling, goal-setting, and regular follow-ups. These complementary strategies can amplify the motivational impact of pedometers, ensuring that patients not only start but also maintain an active lifestyle. Furthermore, advancements in pedometer technology, including integration with smartphones and other digital health platforms, provide opportunities for more sophisticated tracking, social support, and personalized feedback, which can further enhance their effectiveness. The future scope of pedometer efficacy in clinical care is expansive and multifaceted, with significant potential to transform patient management and health outcomes. As wearable technology continues to advance, pedometers integrated with sophisticated sensors and machine learning algorithms will provide highly accurate and personalized data on physical activity. This data can be crucial for the management of chronic conditions such as diabetes, cardiovascular diseases, and obesity, by facilitating real-time monitoring and more

Amrutha et al.,

effective interventions. Moreover, the integration of pedometers with electronic health records (EHRs) and telemedicine platforms can enhance remote patient monitoring, enabling healthcare providers to track patient progress, adjust treatment plans, and offer timely support. The use of pedometers can also promote patient engagement and adherence to physical activity regimens through personalized feedback and goal-setting, supported by gamification elements. Additionally, large-scale data collected from pedometers can be leveraged in population health management and epidemiological studies to identify activity patterns, risk factors, and the impact of interventions across diverse populations. With advancements in data analytics and artificial intelligence, the predictive capabilities of pedometer data can be enhanced, allowing for early detection of health issues and proactive management strategies. Thus, the future scope of pedometer efficacy in clinical care promises to revolutionize preventive medicine, chronic disease management, and personalized healthcare.[24,25]

ABSTRACT

Reducing power consumption and prolonging the lifetime of wireless sensor networks (WSNs) are now important objectives in sensor network research. Energy-efficient communication networks are a must for a WSN. Other energy-related restrictions on WSNs include clustering, storage, communication capacity, high configuration complexity, slow communication speed, and limited computing. Furthermore, choosing a cluster head for WSN energy minimization still presents challenges. In this work, the Adaptive Sailfish Optimization (ASFO) algorithm using K-medoids is used to cluster sensor nodes (SNs). Optimizing cluster head selection through energy stabilization, distance reduction, and latency minimization between nodes is the main goal of study. Achieving effective energy resource usage is a crucial issue in WSNs due to these limits. An expedient routing system based on cross-layer technology that uses less energy (E-CERP)

Keywords: wireless sensor network; sensor nodes; clustering; cross-layer routing; adaptive sailfish optimization

INTRODUCTION

A wireless sensor network (WSN) contains affordable, tiny sensor nodes. WSNs have proven to be one of the most suitable strategies for transferring data from remote locations to a central data processing station. These sensors self-organize and form a multi-hop network capable of adapting and transmitting compressed data to a base station. Multimedia WSNs support transmitting multimedia data, such as images or videos, and can collect more data in military monitoring, agricultural and industrial monitoring, affordable healthcare, and intelligent buildings. Multimedia data is typically more extensive, and larger sensor nodes can use more resources. Some researchers have attempted to investigate and solve this issue. Energy conservation is one of the most significant aspects for sensor nodes in wireless sensor networks to extend their lifespan. Sending and receiving packets consume the majority of the energy. Sensor nodes in WSNs frequently use batteries. Because of the network of devices, charging the battery is complex, and the battery's capacity emerges as the most precious resource for WSNs. As a result, energy conservation becomes a critical issue in WSNs. A new optimization algorithm must be developed to maximize energy efficiency and network lifespan. Clustering is one of the power management functions of WSNs, which splits the network into multiple clusters, with one node in each cluster designated as the cluster head (CH). By combining the data received from each node and sending it to the base station (BS), the CH reduces the BS's overhead. Because the BS accepts data from fewer nodes, the WSN saves power in resource-constrained situations. Clustering algorithms aid in reducing power consumption in WSNs.

Related Works

A hybrid cross-layer routing protocol was inspired by WSN-assisted energy conservation in the Internet of Things (IoT). Routing is processed at three layers in the cross-layer routing strategy: the physical layer, the data link layer, and the transport layer. The protocol for Bionic Cross-Layer Routing (BiHCLR) is proposed in this paper for efficient and energy-efficient routing in WSN-IoT. Then, to conserve energy in BiHCLR, a fuzzy logic method is used to select a CH for each grid cell. The routing path is then chosen using a hybrid bionic algorithm. The proposed BiHCLR's performance is assessed using a quality of service (QoS) analysis. Latency-aware heterogeneous cluster-based data acquisition (DA-HCDA) in the IoT was proposed. A DA-HCDA algorithm is presented to ensure maximum coverage. As a result of the introduced DA-HCDA and quartile aggregation mechanisms, end-to-end latency and network lifetime are improved. A new Energy-Aware Adaptive Fuzzy Neural Clustering (EAANFC-MR) algorithm was implemented. The EAANFC-based clustering method chooses CHs based on residual energy (RE), node distance, and degree. The QOBFO algorithm is used as a multihop routing technique to select the best route to the destination. The proposed EAANFC-MR algorithm has been simulated using MATLAB. The Naive Bayes, KNN, and Support Vector Machine (SVM) classifiers are used for classification and image processing applications. The conventional algorithm has less accuracy when compared with the proposed methodology. The proposed algorithm's results show that it consumes less power than other algorithms and has a higher number of still-alive nodes than others. As a result, the ISFO algorithm demonstrates its superiority in terms of power consumption and network lifespan. The proposed method is compared with several conventional optimization algorithms, including the artificial bee colony, the whale optimization algorithm (WOA), the genetic algorithm, and the adaptive gravity search algorithm.

System Model

WSNs constantly monitor the physical conditions of their surroundings. The WSN infrastructure is composed of a base station (BS) and several SNs. WSN clustering aims to minimize energy usage by dividing sensors into clusters. Common nodes frequently monitor the environment and transmit sensory data to the cluster head. The CH node is always chosen among the common nodes. The significant role of the CH is to accumulate data from each cluster node and send it to the BS. The process of grouping aids in avoiding direct communication between receivers and sensors. The WSN system model is depicted in Figure 1. This research suggests a K-medoids algorithm for clustering in WSNs. The K-medoids algorithm splits all sensor nodes into k

Tamilarasi and Hemalatha

clusters. Each cluster is associated with a single object in the K-medoids method. The identified object is called a medoid and corresponds to the cluster's most central point. The K-medoids group is the shortest distance between clusters because the K-medoids related to the cluster node find the optimal center. It improves communication between sensor nodes, reduces energy consumption, and detects more accurate cluster centers, resulting in shorter packet delays.

The K-medoids clustering algorithm has the following steps:

Step 1: Randomly select k points from the input data (where k represents the number of clusters to form).

Step 2: Each data point is assigned to the cluster that contains the closest center point.

Step 3: For each data point in cluster ' i ', calculate and add the distance from all other data points. Specify the point of the i cluster that reduces the total calculated distance from other points as the center point of the cluster.

Step 4: Repeat steps 1 and 3 until convergence is reached, that is, until the center point stops moving. The clustering method involves grouping sensor nodes and selecting CHs for all groups in the WSN. There are multiple sensor nodes in a WSN that can be alive or dead. The proposed clustering technique identifies distances between nodes by regularly monitoring the nodes and forming clusters based on distances. The K-medoids algorithm is used to group nearby nodes into clusters, and the selection of the cluster head is based on the SN's energy usage. As CH, the energy-efficient SN is chosen, which can be changed anytime. Figure 2 depicts the transmission of data from a sensor node to the cluster head. According to the diagram, six cluster heads manage all the SNs in a cluster. Compared to existing methods, the K-medoids algorithm and E-CERP suffer from high packet loss, delivery delays, and a lack of stable power when using existing processes to transmit data. The proposed K-medoids clustering approach is compared with the K-means [18] and Fuzzy C-means approaches, which include particle swarm optimization and krill herd optimization algorithms [19–22]. The introduced ASFO method is compared with two existing optimization approaches: the krill swarm optimization algorithm [23] and the whale optimization algorithm (WOA) [24]. The proposed results were compared with cross-layer-based adaptive thresholding (CLAT) and cross-layer fuzzy logic (CLFL).

Performance Analysis of Clustering

Clustering is an essential method for ensuring efficient data transmission. The proposed work used the K-medoids approach to cluster similar data into one group based on the average energy consumption of each node [25,26]. Figure 3 and Table 2 represent the comparison graph for the average energy consumption by the proposed approach and the existing methods, K-means and Fuzzy C-means clustering. Therefore, the hybrid approach consumed 0.0196 J on average for cluster size 2, whereas the K-means method consumed 0.0245 J and the Fuzzy C-means logic approach consumed 0.0294 J.

Network Lifetime

The proposed CERP's network lifetime is compared with the conventional algorithms in Figure 6. This method attained a higher network lifetime than the remaining methods. Table 4 shows the network lifespan and energy consumption of the proposed E-CERP and conventional approaches.

From the simulation results, it is evident that the network lifetime is extended by the proposed method for 100 nodes (5908 rounds). In contrast, the lifetimes of an existing cross-layer-based adaptive threshold technique and cross-layer fuzzy logic approaches are 5395 and 4904 rounds, respectively. Moreover, as the number of nodes increases, the network lifetime decreases. Hence, data transmission efficiency is based on the increased network lifetime.

Throughput

The suggested technique is compared with a cross-layer-based adaptive threshold and cross-layer fuzzy logic techniques in Table Figures 7 and 8, and Table 5, show the evaluation of the proposed technique and the conventional algorithms with respect to end-to-end delay and throughput. The E-CERP approach's throughput was high (0.99 Mbps) in 100 nodes compared to the conventional algorithms. From Table 5, it is

**Tamilarasi and Hemalatha**

seen that the number of nodes increases as the throughput decreases. The throughputs obtained by the conventional cross-layer-based adaptive threshold technique and cross-layer fuzzy logic approach are 0.99 Mbps and 0.96 Mbps, respectively, for 100 nodes.

End-to-End Delay

The comparison of the end-to-end delays of the proposed CERP and existing approaches is represented in Figure 9 and Table 5. This method attained a lower delay in 100 nodes (0.05 s), and the time delay increased as the number of nodes increased in the WSN. For 100 nodes, the time delays of the two existing methods, the cross-layer-based adaptive threshold technique and cross-layer fuzzy logic, are 1.97 s and 2.94 s, respectively.

Packet Delivery Ratio (PDR)

Table 6 compares packet delivery and packet loss ratios to the number of nodes. Figures 9 and 10 show that the PDR decreased when the number of nodes increased. The PDRs obtained using different algorithms for 100 nodes were 97% for the cross-layer-based adaptive threshold technique and 95% for the cross-layer fuzzy logic method. If the PDR value is high, all data from the base station will be received without any data loss. Therefore, the proposed approach achieves high performance efficiency when compared to other algorithms.

Packet Loss Ratio (PLR)

The packet loss ratio (PLR) of the proposed method and other existing methods are shown in Figure 10. For 100 nodes, the proposed CERP obtained 0% PLR (i.e., there was no loss), and the existing methods, cross-layer-based adaptive threshold and cross-layer fuzzy logic approaches, achieved high PLR values of 2.58% and 4.54%, respectively. It shows that the proposed CERP is more effective for data transmission. The PLR increases when the number of nodes increases. The graph indicated that the introduced method significantly decreased packet loss compared to other energy-efficient algorithms. The comparison of jitter for the proposed technique and existing approaches is shown in Figure 11. The E-CERP algorithm obtained a low jitter value of 0.15 ms for 100 nodes. In contrast, the conventional algorithms, cross-layer-based adaptive threshold and cross-layer fuzzy logic approach, attained 0.25 ms and 0.39 ms, respectively. For 200 nodes, the jitter value of the proposed method was 0.12 ms; however, the conventional algorithms attained 0.20 ms and 0.34 ms, respectively. For 300 nodes, the jitter value obtained by the E-CERP algorithm was 0.10 ms, and the conventional algorithms attained 0.17 ms and 0.24 ms, respectively. For 500 nodes, the jitter value of the suggested approach was 0.05 ms. However, the existing approaches, cross-layer-based adaptive threshold and cross-layer fuzzy logic technique, attained 0.10 ms and 0.15 ms, respectively. As a result, by evaluating the performance of cross-layer-based adaptive threshold, cross-layer fuzzy logic, K-means, and Fuzzy C-means approaches, the introduced E-CERP algorithm performances are resolved based on the analysis of QoS parameters. Based on the simulation results, the power consumed by the network is low and the network lifetime is high for the proposed method.

Evaluation of the Proposed ASFO and E-CERP Approach with Conventional Techniques

The particle swarm optimization is utilized for the optimization problem based on fuzzy clustering. Still, it has some disadvantages, such as that it is easy to fall into local optima and the convergence rate is slow, while the HHO algorithm is simple, flexible, easy to implement, and has a high convergence rate. In fuzzy and artificial bee colony-based implementations of MAC, the clustering, routing, and data delivery (FABC-MACRD)-based cross-layered method was used for the clustering and data transmission, in which the energy consumption was high, including the energy consumed for 500 nodes. In contrast, the proposed CERP method consumed less energy (4.19 J), and the packet delivery ratio of FABC-MACRD was 79%, while the proposed CERP was 96%. Compared to FABC-MACRD, the proposed method extended the network's lifespan, and the proposed K-medoids with ASFO and E-CERP improve the reliability of the communication link and reduce packet delay.

Tamarasi and Hemalatha

CONCLUSIONS

This research develops cluster head selection using K-medoids with ASFO and clustering and multihop routing protocol (CMRP) algorithms for efficient routing in WSNs. For optimal CH selection from suitable nodes, the K-ASFO approach can be used. The outcomes were compared using three standard metrics: throughput, residual power, and first dead node. Finally, the CMRP algorithm routing protocol is used for efficient data transfer. The routing process is permitted on recognized node-to-node paths. The simulation results demonstrate that the proposed system outperforms other existing algorithms. The performance of the proposed methodology is compared to that of existing optimization-based routing algorithms. CMRP chooses the best path from the cluster head to the sink node. The proposed method is used to evaluate PDR, packet delay, throughput, power consumption, network lifetime, packet loss rate, and error estimation, and the results were superior to existing methods. PDR (100%), packet delay (0.05 s), throughput (0.99 Mbps), power consumption (1.97 mJ), network lifespan (5908 rounds), and PLR (0.5%) for 100 nodes are the performance results for QoS parameters. The proposed method has an overall accuracy of 93.19%. As a result, the proposed approach outperforms existing strategies in terms of overall performance. The proposed method produced better results in all scenarios and metrics. The proposed work was idealized, implemented, and tested against a static sensor node WSN. This research can be expanded to mobile sensor nodes or networks with sensors that can change position in real-time.

ABSTRACT

One long-standing problem in Natural Language Processing (NLP) is Word Sense Disambiguation (WSD), which is the process of identifying a word's precise meaning within its context. This paper investigates the revolutionary impact on this task using transformers, a novel neural network design. We started with outlining WSD and its significance in NLP, emphasizing the challenges associated with determining exactly what ambiguous words mean. After that, we explore the domain of transformers and describe their fundamental ideas as well as their special "attention" mechanism. Unlike conventional sequential processing techniques, this approach enables transformers to study every segment of an input sequence simultaneously. WSD benefits greatly from transformers' capacity to understand intricate word associations since it allows them to accurately capture context-dependent meanings and subtle nuances that are essential for disambiguation. We also explained the possible applications of transformer-powered WSD in the real world and imagined how it could alter a number of areas by enabling a deeper comprehension of human language. This study demonstrated the state-of-the-art results that transformers have produced. Beyond simple accuracy, the study highlights how transformers may help explain and make sense of WSD decisions, which help to build confidence and advance the developed models.

Keywords: Natural Language Processing, Word Sense Disambiguation, Transformers, Supervised Learning, etc.

INTRODUCTION

Natural language is inherently ambiguous, with many words carrying various meanings depending on context. This is a considerable barrier for Natural Language Processing (NLP) tasks that rely on accurately comprehending word meanings. Word Sense Disambiguation (WSD) is concerned with determining the precise meaning of a word in a given context, and it is used extensively in numerous NLP applications. Envision perusing a press release headed "Bank Robbed!" Immediately, a tense scene in a financial institution comes to mind. But wait, might it really be discussing an ambitious riverbank rob? This straightforward illustration demonstrates the inherent ambiguity of language, as terms such as "bank" can have several meanings depending on the situation. Word Sense Disambiguation (WSD), which is essential to many Natural Language Processing (NLP) applications, addresses this problem by determining a word's precise meaning in a given context. Imagine how annoyed a machine translation system would be upon seeing this headline. It may translate as "The riverbank was robbed last night!" without WSD, which would be a hilarious error. In many NLP applications, WSD is essential; yet determining what ambiguous words mean still presents a substantial issue. NLP research is still working to overcome these issues and create more reliable and accurate WSD techniques to improve the functionality of different NLP applications.

Overview of Historical Approaches to WSD

Computers find the natural ambiguity of human language to be an intriguing challenge. Determining a word's intended meaning in a particular context is known as word sense disambiguation (WSD), and it has captivated researchers' attention for many years. In order to fully understand the state-of-the-art, we need to take a historical tour, examining how WSD approaches have developed from their primitive beginnings to the complex techniques used today.

Early Approaches

- **Dictionary-based methods:** These depended on dictionaries that were manually written and linked words to their many senses. But they had trouble with context dependence and were constrained by the dictionary's scope.
- **Rule-based methods:** These used manually created criteria that took into account the syntactic and semantic characteristics of the surrounding text in order to determine the intended meaning. These could be more adaptable, but they would take a lot of work to develop and manage across several domains.

Advancements

- **Supervised learning:** Using massive datasets of hand annotated text, where each word sense is identified, this method trains statistical models. More precise disambiguation results from these models' ability to recognize patterns in the surrounding text that correspond with particular senses.
- **Unsupervised learning:** This method extracts word representations that capture semantic associations by using large unlabeled text corpora. After that, words in unusual circumstances can be distinguished using these representations without the need of manual annotation.
- **Knowledge-based methods:** In order to improve the accuracy of word disambiguation, these make use of outside knowledge sources such as WordNet, a lexical database of semantic links between words.

Modern Trends

- **Deep learning:** Recent developments in deep learning architectures, especially transformers, have allowed for state-of-the-art WSD performance by concurrently taking into account an entire sentence's context.
- **Multimodal WSD:** This growing research improves context awareness and disambiguation accuracy by using non-textual information, such as visuals or audio, to distinguish words.

**Chhaya S.Patil et al.,**

- Overall, data-driven strategies and complex deep learning models have replaced rule-based and dictionary-driven methodologies in WSD research. These developments help WSD become more reliable and accurate, which opens up new possibilities for a range of NLP applications.

Challenges of Word Sense Disambiguation (WSD)

Disambiguating word senses is complex for various reasons:

Polysemy

Many words have numerous unconnected meanings (for example, "bank" might refer to a financial organization or the bank of a river)[1].

Homonymy

Some words have distinct spellings or pronunciations but the same meaning (for example, "bass" might refer to a fish or a musical instrument)[2].

Context Dependence

The intended meaning of a word is strongly dependent on its surrounding context, necessitating a thorough understanding of language structure and semantics [3].

Lack of Annotated Data

Training and evaluating WSD models frequently necessitates huge amounts of manually annotated data, which can be costly and time-consuming to generate [4]. WSD is essential for many NLP activities, but detecting the intended meaning of ambiguous words remains a substantial difficulty. Advances in NLP research continue to address these challenges, with the goal of developing more robust and accurate WSD algorithms to improve the performance of diverse NLP applications.

Importance of WSD in NLP

WSD is the key to many powerful NLP applications, enabling them to reach their full potential:

- **Machine Translation:** Imagine using machine translation to translate a medical document that mentions "cells." WSD distinguishes between jail cells and biological cells, guaranteeing precise and situation-appropriate translation for important data.
- **Information Retrieval:** A Google search for "jaguar" may turn up details on the vehicle or the wildlife. WSD helps you get the results you're looking for more quickly and effectively by refining your search.
- **Machine Question Answering:** WSD enables computers to distinguish between "capital" as a city and a financial asset when asked, "What is the capital of France?", providing precise and educational responses.
- **Text Summarization:** Getting the gist of the original text is necessary to produce reliable summaries. WSD makes sure terms are picked with the intended meaning in mind, resulting in summaries that are clear and educational.

Transformers and Word Sense Disambiguation

Word sense disambiguation (WSD) is the process of determining a word's specific meaning in a given context despite its various alternative meanings. Transformers, a sort of neural network design, have gained popularity in recent years as a solution for WSD. Transformers have proven to be extremely effective in natural language processing tasks, as well as promising for WSD. Consider a neural network architecture that is not restricted by the constraints of sequential information processing. Transformers, developed in 2017, use a "attention" mechanism to analyze all portions of an input concurrently, resulting in a better grasp of complicated word relationships. In 2017 the paper "Attention Is All You Need" sparked the revolution. Pre-trained transformers such as BERT (2018) and GPT-2 (2019) pushed the bounds, while T5 (2020) demonstrated incredible versatility. The huge Megatron-Turing NLG model (2021) demonstrates the ever-changing possibilities.

Chhaya S.Patil et al.,

Architecture of Transformer

- **Attention Mechanism:** Forget about the constraints of processing data one piece at a time. Transformers "attend" to the most pertinent portions of an input sequence concurrently by using the "attention" mechanism, much like a play's performers during a scene. A richer comprehension of context and word relationships is made possible by this parallel processing.
- **Encoder-Decoder Architecture:** Transformers are basically made up of two components: an encoder that interprets and reads input, and a decoder that uses the encoded data to produce an output. Transformers' comprehension of word relationships and context is very helpful for WSD. They can accurately assist in disambiguation by capturing nuanced details and meanings that vary depending on the situation. Transformer-based models such as BERT have demonstrated outstanding accuracy, surpassing 93% in accurately recognizing word senses on benchmarks such as SemEval-2013. Transformers help explain and comprehend WSD judgments in addition to providing excellent accuracy. For these models to continue to be developed and to be trusted, this transparency is essential.

The Data-Driven Revolution

Large Language Models Transform Word Sense Disambiguation Large language models (LLMs) and data-driven approaches have brought about a paradigm shift in WSD systems, which formerly relied on handwritten rules and dictionaries. This change has completely changed WSD, stretching the bounds of precision and opening up fascinating new possibilities.

From Rules to Data

Adaptability and scalability were frequently lacking in traditional WSD techniques. Polysemy and context dependence plagued dictionary-based approaches, whereas rule-based systems required a lot of time to build and maintain across several domains. The introduction of data-driven methods, particularly supervised learning, altered the rules. Supervised learning: These techniques make use of enormous volumes of annotated data, in which every word is labeled with its precise meaning. Through examination of these patterns, statistical models acquire the ability to recognize contextual signals that have varying correlations with senses, resulting in markedly enhanced disambiguation precision.

The Rise of LLMs

Like transformers, the emergence of LLMs has accelerated WSD's evolution. Large volumes of text data are easily processed by these sophisticated neural networks, which enables them to grasp complicated correlations between words and their environment. This newly acquired knowledge corresponds to:

Enhanced Accuracy

Compared to earlier techniques, LLMs can significantly improve disambiguation accuracy by taking into account the full context of a sentence, which results in a deeper grasp of word meaning.

Decreased Data Scarcity

Although annotated data is still important, LLMs can use unlabeled text corpora to train semantic representations, which reduces the amount of manual annotation that is required and increases the applicability of working semantic domain models.

State-of-Art Work

In this section we explained the work done for word sense disambiguation using transformers. The capabilities and constraints of large language models (LLMs) for word sense disambiguation (WSD) are examined by Loureiro et al.(2021).The Key findings of this research work were Transformer-based LLMs perform well on WSD tasks, particularly those involving high-level sensory distinctions, such as BERT. Feature extraction and fine-tuning are the two primary methods for applying LLMs in WSD. While feature extraction uses the model's learnt representations for WSD tasks, fine-tuning entails modifying the model's parameters on particular WSD datasets. Even with a small

Chhaya S.Patil et al.,

amount of training data, feature extraction more specifically, the average of contextualized embedding-proves very resilient and efficient. Due to difficulties with data availability and processing resources, LLMs still have difficulty with fine-grained WSD in practical scenarios. For LLMs in WSD, sense bias where models prefer specific senses because of imbalances in training data is a concern. It seems that feature extraction is more resilient to this problem. Overall, the study recognizes the promise of LLMs for WSD while also pointing out some of their shortcomings and potential areas for development [5]. In this paper, two WSD tasks were used to compare nine alternative transformer models. The models were assessed based on how well they can distinguish between words in both Spanish and English. The transformer model ELECTRA, which has been pre-trained on a masked language modeling target, is found to be the best-performing model in the study. On both WSD tasks, ELECTRA surpasses all other models. Additionally, the performance of the transformer models is found in the paper to be much superior than that of the conventional WSD approaches. [6] Loureiro D.et.al (2022) proposed a unique method for utilizing sense embedding that come from NLMs (Neural Language Models). Using lessons from the analysis of 14 NLM variants, it makes use of data from all NLM layers. The goal of this approach is to use sense embedding' adaptability beyond the conventional Word Sense Disambiguation (WSD) requirement. Through the application of these embedding to various tasks such as semantic relatedness and WSD, the evaluation shows gains in performance over current approaches. Fascinatingly, the research shows surprising differences in layer and model performance, indicating possibilities for wider uses in a range of downstream tasks. This paper, in summary, investigates a potentially fruitful path for improving sense embedding and their influence on tasks related to natural language processing [7].

It was difficult to compare language model (LM) pre-training techniques due to high computing costs, proprietary datasets, and erratic hyper parameter selections. This work removes the haze by carefully reproducing BERT pre-training. After carefully examining a range of hyper parameters and data sets, the scientists discovered an unexpected result: BERT was noticeably undertrained! When tested harder, it outperformed newer models in terms of performance, matching even. On benchmark tasks, their optimized model even broke records. This analysis raises doubts regarding the real source of the gains purported in newer LMs and reveals the considerable impact of frequently disregarded design decisions [8]. This study explored the state-of-the-art in word sense disambiguation (WSD). It breaks into the state-of-the-art algorithms that have recently propelled the discipline and reveals the technological trends that will shape its future. The main objective is to analyze these developments, first by contrasting different algorithms according to their efficiency, approaches, and other relevant aspects, and then by investigating new developments such as the capabilities of large language models (LLMs), the incorporation of knowledge graphs, and the possibility of fine-tuning and transfer learning. The paper also explores the domain of interpretable and explainable models, guaranteeing clarity and openness in this quickly developing sector. This thorough examination opens the door for future advancement and innovation while also providing insight into the state of WSD now[9]. This study is noteworthy for reaching the highest levels of precision and accuracy in context-based word sense identification (Subtask 1). Their success depended on utilizing innovative design tactics to refine pre-trained transformer models, proving the efficacy of this method for word sense disambiguation. Beyond success, the authors express optimism in the greater potential that their ideas possess in the field of Natural Language Processing. The paper explained the details of the transformer models that were utilized, the techniques for fine-tuning that were used, and the unique architecture strategies that were put into place for the WSD work. It is also anticipated that they would evaluate their strategy against those of the other challenge participants and investigate possible uses outside of word sense disambiguation, providing insightful information to the NLP community [10].

Impact of data-driven approaches and LLMs on NLP Applications

The impact of data-driven approaches and LLMs on WSD developments is significant for a range of NLP applications.

Machine Translation

Retaining information fidelity and preventing humorous misinterpretations are made possible by an accurate grasp of word senses.

**Chhaya S.Patil et al.,****Information Retrieval**

Search engines can improve user experience and happiness by providing more exact and relevant results by accurately interpreting user queries.

Chatbots and virtual assistants

LLMs enable chatbots and virtual assistants to understand user intent and reply in a more helpful and natural way, promoting smooth human-machine interaction.

Sentiment analysis

By effectively assessing sentiment in reviews, social media posts, and other text forms, the subtleties of word meaning within context can be captured. This allows for better understanding of public opinion and brand impression. Thanks to the ongoing development of data-driven techniques and LLMs, WSD has a bright future. We anticipate more developments in:

Interpretability and Explain ability

Increasing trust and encouraging appropriate use of WSD models can be achieved by making them clear and comprehensible.

Multimodal WSD

Including non-textual data such as audio and visuals would improve the accuracy of disambiguation and contextual comprehension.

Personalization

More individualized NLP experiences will be possible by modifying WSD models to suit unique tastes and linguistic styles.

CONCLUSIONS

This paper gives an overview of word sense disambiguation and a transformer also highlights the impact of word sense disambiguation on various natural language applications using the transformers. In conclusion, WSD has changed and its potential has been unlocked across a variety of NLP applications with the emergence of data-driven methodologies and LLMs. These technologies have the potential to provide WSD that is even more precise and adaptable as they develop, thus closing the communication gap between humans and machines.

ABSTRACT

The occurrence and progression of diabetic retinopathy (DR) must be controlled strictly, as must blood pressure and glucose levels. Diabetes mellitus patients are followed up according to a plan rather than only looking for symptoms. The follow-up interval is determined by how severe the DR is staged (mild, moderate, or severe no proliferative DR vs. proliferative DR, PDR). Diabetic macular edema (DME) is the most frequent reason why diabetic individuals lose their vision. Retinal Image Analysis for the Detection of Eye Conditions Fuzzy Logic Image Processing, Blood Vessel Segmentation, and Optic Disc Segmentation. Retinal disorders of the eyes that are frequently treated. Results using bevacizumab seem quite comparable to those with ranibizumab, and the best visual results for DME currently are achieved with intravitreal ranibizumab injections focal laser photocoagulation, which not only treats DME but also seems to reduce the likelihood of DR progression. However, there is a disproportionately increased risk of glaucoma and cataract development. Selected patients may also benefit from focused laser therapy and intravitreal steroid treatment. Because of an increase in intraocular pressure inside the retina, glaucoma is a neuro-degenerative eye disease. Due to the fact that it is the second-leading cause of blindness in the world, if an early diagnosis is not made, it may result in total blindness. [It has been demonstrated that routinely testing diabetic patients for DR is an essential and cost-effective component of their management.]⁸ The visual cortex provided the idea for CNN's architecture, which is similar to the way human brain neurons connect to one another. Both the speed and accuracy of the CNN algorithm's predictions are improved.

Keywords: Diabetic retinopathy, Proliferative Diabetic retinopathy, Diabetic macular edema, ranibizumab and bevacizumab

INTRODUCTION

When the retina gets damaged as a result of diabetes, the condition is known as diabetic retinopathy or diabetic eye disease. [One of the main causes of blindness in the western world is diabetic retinopathy (DR).]⁵ It may ultimately result in blindness. It is an ocular symptom of diabetes, a systemic disease that affects up to 80% of all people with diabetes who have had the condition for 20 years or longer. There are typically no early warning signals of diabetic retinopathy. Even macular edema, which can quickly impair vision, may not exhibit any symptoms for some time. However, macular edema patients typically experience impaired vision, which makes it challenging to read or drive. Frequently during the day, the vision will either get better or worse. Non-proliferative diabetic retinopathy (NPDR), the initial stage, is characterised by the absence of symptoms, non-visually evident indicators, and 20/20 vision in the affected individuals. Fundus photography, in which tiny blood-filled bulges in the artery walls can be observed, is the only method for identifying NPDR. Fluorescein angiography can be used to see the back of the eye if there is limited vision. Retinal ischemia (lack of blood flow) is characterised by plainly visible narrowing or obstruction of retinal blood vessels. Any stage of NPDR can experience macular edema, in which blood vessels bleed their contents into the macular region. Blurred vision and darkened or distorted images that are not sharp are signs of macular edema. Macular edema-related visual loss will affect 10% of diabetes patients. Macular edema-related areas of retinal thickening (caused by fluid buildup) can be visualised using optical coherence tomography. In the second stage of proliferative diabetic retinopathy (PDR), abnormal new blood vessels (neovascularization) develop at the back of the eye. These aberrant new blood vessels are fragile and can rupture and bleed (vitreous haemorrhage), obstructing vision. When this bleeding starts, it might not be extremely bad at first. [With hopeful outcomes, extensive study has been done on the techniques for a binary categorization of DR. Gardner et al. achieved sensitivity and specificity results for yes or no categorization of DR of 88.4% and 83.5% using neural networks and pixel intensity measurements.]⁶

Most of the time, it will only leave a few blood specks or spots floating in a person's field of vision, however the spots frequently disappear within a few hours. These patches are frequently followed in a few days or weeks by a much larger blood leakage that distorts vision. In severe circumstances, a person could only be able to distinguish between light and dark with one eye. The blood may take several days to drain from the interior of the eye, or it may take months or even years. In some circumstances, the blood may not be clear at all. Large haemorrhages of this nature frequently occur during sleep and frequently occur multiple times. A doctor will identify cotton wool spots, flame haemorrhages and dotblot haemorrhages during a funduscopy examination.

Both Type I and Type II diabetics are at risk, as are all patients with diabetes mellitus. A person's likelihood of experiencing some type of ocular issue increases with the duration of their diabetes. Between 40 and 45 percent of Americans with diabetes develop diabetic retinopathy in some stage. Nearly all Type I diabetes patients and more than 60% of Type II diabetes patients have some degree of retinopathy after 20 years of diabetes; however, these results were published in 2002 using data from four years earlier, which limits the applicability of the research. Before modern quick acting insulin and at-home glucose testing, the late 1970s was when the subjects would have received their diabetes diagnosis. Microvascular alterations in the retina cause diabetic retinopathy. Vascular walls become ineffective as a result of intramural pericyte loss and thickening of the basement membrane brought on by hyperglycemia. These alterations alter how the blood-retinal barrier develops and also increase the permeability of the retinal blood vessels. Some preliminary studies have confirmed the concept that hypoxia is a cause of the retina's deterioration. Poor blood sugar (blood glucose) regulation can have a serious impact on small blood vessels, including those in the eye. The retina's minuscule blood vessels are harmed by an excess of glucose and/or fructose. Most patients do not detect any changes in their eyesight during the first stage of NPDR, which stands for no proliferative diabetic retinopathy. Sometimes called simplex retinopathy or background retinopathy, these early abnormalities are reversible and do not endanger central vision. One of the most common chronic diseases that causes disability and one of the main reasons for avoidable blindness worldwide is diabetic retinopathy. Early detection of diabetic retinopathy allows for

prompt treatment, hence screening programmes, particularly automated screening programmes, will require significant investment if this goal is to be met. The development of effective image processing and analysis algorithms is necessary for automated screening programmes to function reliably. This study reviews recent research on digital image processing for use in fundus pictures for the early identification of diabetic retinopathy. Image preprocessing, localization and segmentation of the optic disc, segmentation of the retinal vasculature, localization of the macula and fovea, and localization and segmentation of diabetic retinopathy diseases were the five divisions into which algorithms were divided.

LITERATURE SURVEY

A Survey on Diabetic Retinopathy Disease Detection and Classification using Deep Learning Techniques(2021)

Diabetes can cause a number of problems to develop throughout the body if it is not addressed. Diabetes causes diabetic retinopathy (DR), an asymptomatic eye condition that affects the retinal blood vessels. In the literature, numerous automatic diagnostic systems have been created using traditional handcrafted features. Because Deep Learning (DL) does autonomous feature extraction, it can give more accurate and promising findings, especially in medical imaging. In the processing of medical picture data, convolutional neural networks (CNNs) are the most often employed deep learning technique. In order to gain a better understanding, this work analyses and reviews a number of Deep Learning-based algorithms for diagnosing and categorising diabetic retinopathy.

Automatic Glaucoma Diagnosis Based on Photo Segmentation with Fundus Images(2021)

Medical imaging is the process of taking pictures of the human body's internal organs for diagnostic purposes. The most diverse types of eye disorders that affect the retina are readily identified by the specialists with the aid of these photos. The retinal images are recorded by the fundus camera, which also records what are known as fundus images. One of the most common diseases, glaucoma, causes loss of vision in the eyes by destroying the optic nerves. It is important to find glaucoma early since repairing the injured optic nerves is a difficult process. As a result, it is crucial to detect automated glaucoma is very difficult. It is common practise to identify the glaucoma condition utilising various machine learning approaches. A fundus picture database is used to execute the suggested photo segmentation approach for qualitative and quantitative analysis. A fundus photograph dataset with outstanding parameters, such as peak sign to noise ratio, illness detection accuracy, false-wonderful rate, and disorder detection time with regard to the number of photographs, is used for experimental evaluation.

Glaucoma detection in retinal fundus images using U-Net and supervised machine learning algorithms (2021)

In this study, an offline Computer-Aided Diagnosis (CAD) system using retinal fundus images is proposed. Machine learning, deep learning, and image processing techniques are all used in the development of this application. Region of Interest (ROI) detection is carried out using the brightest spot algorithm, and input image validation is performed using the Le-Net architecture. Additionally, the U-Net architecture is used to segment the optic disc and optic cup, and SVM, Neural Network, and Adaboost classifiers are used to classify the data.

CANet: Cross-disease Attention Network for Joint Diabetic Retinopathy and Diabetic Macular Edema Grading(2020)

Automatic grading of DR and DME is crucial in clinical practise since it aids ophthalmologists in creating patient-specific therapies. The association between DR and its complication, i.e., DME, has not been taken into account in earlier publications, which either grade DR or DME. Additionally, location data, such as macula and soft hard exhaust remarks, is frequently utilised as a prior for grading. Since these annotations are expensive to acquire, it would be advantageous to create automatic grading systems that require only image-level supervision. Using solely image-level supervision, we explore the internal relationships between the diseases in this research to introduce a unique cross-disease attention network (CANet) to simultaneously evaluate DR and DME. The disease-specific attention module, which we developed to selectively acquire useful features for certain diseases, and the disease-dependent attention module, which we developed to better understand the

**Ganga et al.,**

intrinsic relationships between the two diseases, are among our key contributions. In order to develop disease-specific and disease-dependent features and to jointly maximise the overall performance for grading DR and DME, we merge these two attention modules into a deep network. We test our network using two open benchmark datasets, namely the Messidor dataset and the ISBI 2018 IDRiD challenge dataset. The ISBI2018 IDRiD challenge results in the best performance using our approach.

Uncertainty-Aware Deep Learning Methods for Robust Diabetic Retinopathy Classification (2022)

We present novel results for 9 BNNs by systematically investigating a clinical dataset and 5-class classification scheme, together with benchmark datasets and binary classification scheme. Moreover, we derive connection between entropy-based uncertainty measure and classifier risk, from which we develop a novel uncertainty measure. We observe that the previously proposed entropy-based uncertainty measure improves performance on the clinical dataset for the binary classification scheme, but not to such an extent as on the benchmark datasets. It enhances performance for the benchmark datasets but not for the clinical dataset in the clinical 5-class classification scheme. One benchmark dataset and the clinical dataset are both applicable to our new uncertainty measure. According to our research, BNNs can be used to estimate uncertainty when categorizing diabetic retinopathy based on clinical data, however appropriate uncertainty measures are required to maximize the intended performance measure. Furthermore, techniques created for benchmark datasets may not translate to clinical datasets.

SYSTEM ANALYSIS. PROBLEM ANALYSIS

The goal of the system analysis is to create a quick analysis work as well as to establish comprehensive knowledge of the concept, behavior, and other restrictions like performance metrics and system optimization. The main goal of the system analysis is to completely specify the technical information for the key concept.

PACKAGES SELECTED

The software chosen to produce video anomaly detection is called MATLAB, and it comes with more sophisticated functionality. The chosen platform for developing the system is the MATLAB platform with a Windows application.

FEATURES OF WINDOWS XP PROFESSIONAL

Joining a Windows Server domain, a collection of PCs that are remotely administered by one or more central servers, is possible. a complex access control system that, under normal conditions, enables the granting of particular file rights to particular users. Users can change access control lists by using programs other than Windows Explorer (such as cacls or File Manager), or by restarting in Safe Mode. Using a local area network or the Internet, a PC can be controlled by another Windows XP user using a remote desktop server. Offline Files and Folders, which let the PC automatically copy files from another networked computer and access them when the network is down. Files on the computer's hard drive are encrypted by the Encrypting File System so that no one else can access them, even if they have physical access to the storage medium. Features for centralized administration, such as Roaming User Profiles, Group Policies, Automatic Software Installation and Maintenance, and Remote Installation Service (RIS). two physical central processing units (CPUs) are supported. (Multi core CPUs are supported using XP Home Edition since the number of CPU cores and Hyper-threading capabilities on current CPUs are considered to be part of a single physical processor.)Using short keywords (aliases), the Windows Management Instrumentation Console (WMIC) is a command-line tool that makes it easier to retrieve WMI information about a system.

REQUIRED RESOURCES

The availability of the resources needed to plan, develop, implement, and test the project must be examined during this phase. Manpower, time, and system requirements are the resources that need to be examined. The whole SDLC life cycle, with the exception of the testing step, is carried out by teams of two people. Before the product is implemented, the testing step is supervised by experienced testers. The project's completion time was estimated to take four months, with four hours per day, excluding weekends. The following list and analysis of system requirements.

STUDY OF FEASIBILITY

The goal of a feasibility study is to determine the problem's breadth in addition to finding a solution. The study helped to clarify the problem definition and identify the components of the problem that should be addressed by the system. Benefits are therefore calculated at this level more precisely. The following are the main factors:

- Economic feasibility
- Technical feasibility
- Operational feasibility

Economic feasibility

Economic feasibility analyses Here, benefits in the form of lower expenses are taken into account in addition to the costs of the gear and software. If implemented, this idea will undoubtedly be advantageous because it will decrease manual labor and speed up production.

Technical Feasibility

Technical Feasibility assesses the needed hardware, software, employees, etc., and if necessary, offers enough memory to store and process the data.

Operational Feasibility

The feasibility study's most crucial step is this one since it forecasts how well the system under development will work. This study also aids in the analysis of the strategy needed to create the system with the least amount of work. Proposed systems are only useful if they can be transformed into information systems that satisfy the needs of the organization. This technique facilitates good results and lessens manual labor. Only by taking the time to consider the feasibility do we lessen the likelihood of major setbacks at a later stage of the project. It is not a waste of time or effort to put effort into a feasibility study that leads to the rejection of a project proposal. In the modern world, people suffer from a variety of illnesses that might impair one body component or another and slow down their productivity. One of the causes is eye disease, which includes diabetic retinopathy and glaucoma-related vision loss. Blood vessels in the eye are damaged by DR-induced alterations. A conventional image processing procedure will be used, including picture acquisition, pre-processing, feature extraction, and precise illness detection. We will classify the retinal images into the Normal group using the Color Histogram and Skin Locus Model. In comparison to current systems, the overall classification rate of the proposed system will provide more efficiency and accuracy in recognizing the disease. The human eye is the main organ. According to medical study, high blood pressure and glucose levels are two key factors contributing to eye problems. The main signs of diabetic retinopathy are seen in the early stages, and therapy may only be beneficial when caught in time. These blood vessels change in these weak and as a result, the vessel spills lipoprotein-containing fluid and blood, which causes abnormalities in the retina. A diabetic's eye may have a variety of abnormal lesions brought on by diabetic retinopathy. The eye condition glaucoma damages the optic nerve and impairs vision. Glaucoma is one of the serious disorders associated with eyesight, however it can be effectively treated if caught early. Recently, a number of methods have been developed for the automatic assessment of retinal fundus pictures to identify glaucoma. To accurately detect glaucoma, however, fundus picture segmentation is a relatively difficult task. For the purpose of identifying ocular problems, retinal image evaluation is extensively used in the clinical setting. This makes it crucial to find the glaucoma from the attention at an early stage. As a result, segmentation is a crucial step in accurately diagnosing glaucoma automatically.

SYSTEM IMPLEMENTATION EXISTING METHOD

There are two steps to the method: coarse level and fine level. Hes candidate regions are extracted at a coarse level by fusing histogram segmentation with morphological reconstruction. [The number of persons with diabetes is expected to keep growing due to reasons like rising life expectancy, luxurious lifestyles, and other causes.]⁷ To classify retinopathy, we define 44 typical features for each candidate location at the fine level and train an SVM model. We test the suggested technique using the open diaretdb1 database. Results from the experiments demonstrate how effectively our technique can find HEs. The algorithm uses colour information to conduct the categorization of retinal

**Ganga et al.,**

exudates and is based on Fisher's linear discriminant analysis. [There has been a lot of effort done on identifying the characteristics of DR using automated techniques like support vector machines and k-NN classifiers.]9

With the help of a database including 58 retinal pictures of varying quality, colour, and brightness, we evaluated the algorithm's performance prospectively.

DISADVANTAGES OF EXISTING METHOD

- Retinopathy prediction is highly challenging, and the segmentation method could result in undesired noise.
- It solely detects diabetic retinopathy, whereas other parameters must also be detected.
- Moderate performance, evaluation, efficacy, and accuracy.

PROPOSED METHOD

Diabetic retinopathy damages blood vessels and affects the eye. A conventional image processing procedure will be used, including picture acquisition, pre-processing, feature extraction, and precise illness detection. The system can currently only identify one ailment. We have suggested an algorithm that can identify all eye conditions in a single system. The proposed block diagram as shown in figure 1. This research proposes to apply CNN algorithm for automatic eye illness identification based on the categorization of retinal images. Retinal images are one of the most crucial medical references that help to diagnose the cataract, DR, and glaucoma. There are other algorithms used for classification in deep learning, however CNN is superior to the majority of them due to its improved categorization and result accuracy. The Convolutional Neural Network Algorithm makes predictions more accurately and more quickly.

ADVANTAGES

Blood vessel segmentation is used for retinal disease prediction, and it is more effective than the current approach. When utilising this approach, accuracy, performance, and output assessment are all comparatively higher.

Description of Diabetic Retinopathy**Image Acquisition**

There is a dataset consists four different types of retinopathy (Hard exudates, soft exudates, hemorrhages and red small dots).Among those images select anyone of the image to classify.

Preprocessing

In preprocessing, two plane conversions is done by converting into gray format if the taken image as supposed to be three plane image.

Histogram Equalization

A method for changing image intensities to improve contrast is histogram equalization. Because of this enhancement visual quality will be little bit better and easy to analysis. The values will be varied upto 256.

Algorithm Implementation

To categorize the retinal images and retrieve the characteristics, a Color Histogram and Skin Locus modal algorithm is utilized.

Classifying Result

By using morphology technique the noises will be reduced for the classified images and we will obtain as desired one and text will be used to mention the classified type on images.

CONVOLUTIONAL NEURAL NETWORKS

Convolutional neural networks perform neural networks when given inputs such as images, voice, or audio, for example. There are three basic types of layers in them:

**Convolutional layer**

- Pooling layer
- Fully-connected (FC) layer

[In the 1970s, network designs for working with picture data were commonly constructed, 10 with effective applications that outperformed previous methods for difficult tasks such handwritten character recognition¹¹. However, neural networks didn't become practical for more challenging image identification issues until a number of advances in the field, including the implementation of dropout¹², rectified linear units¹³, and the ensuing rise in computing capacity via graphics processor units (GPUs).^{12 13 14 15} The convolutional layer is the first layer of a convolutional network. The fully-connected layer is the final layer, even though convolutional layers, additionally followed up by convolutional layers, or pooling layers. The CNN becomes more complicated with each layer, detecting larger areas of the image. Early layers emphasize basic elements like colors and borders. The larger features or shapes of the object are first recognized when the visual data moves through the CNN layers, and eventually the intended object is recognized.

Convolutional Layer

The central component of a CNN is the convolutional layer, which is also where the majority of computation takes place. It needs input data, a filter, and a feature map, among other things. Assume that the input will be a color image that is composed of a 3D pixel matrix. As a result, the input will have three dimensions—height, width, and depth—that are analogous to RGB in an image. Additionally, we have a feature detector, also referred to as a kernel or filter, which will move through the image's receptive fields and determine whether the feature is there. Convolution describes this process. [With a value of 0.01, the leaky rectified linear unit activation function was utilized to reduce the network's dependency on a few specific nodes. Similarly, for weight and biases in the convolution layers, L2 regularization was applied. To cut down on initial training time, Gaussian initialization was also used to initialize the network. The popular categorical crossentropy function was employed as the loss function during optimization.]¹⁰ A two-dimensional (2-D) array of weights serving as the feature detector represents a portion of the image. The filter size, which also controls the size of the receptive field, is normally a 3x3 matrix, however they can vary in size. Following the application of the filter to a portion of the image, the dot product between the input pixels and the filter is determined. The output array is then fed with this dot product. Once the kernel has swept through the entire image, the filter shifts by a stride and repeats the operation. A feature map, activation map, or convolved feature is the ultimate result of the series of dot products from the input and the filter. A CNN performs a Rectified Linear Unit (ReLU) adjustment on the feature map following each convolution operation, adding nonlinearity to the model. As was previously mentioned, the first convolution layer may be followed by another convolution layer. When this occurs, the CNN's structure may become hierarchical because the later layers will be able to view the pixels in the earlier layers' receptive fields. Let's use the case of trying to determine whether a bicycle is there in an image as an example. The bicycle can be viewed as a collection of components. It has a frame, handlebars, wheels, pedals, and other parts. The neural network's representation of the bicycle is made up of lower-level patterns for each of its component pieces and higher-level patterns for the entire bicycle.

Pooling Layer

Down sampling, sometimes referred to as pooling layers, carries out dimensionality reduction and lowers the amount of parameters in the input. The pooling operation sweeps a filter across the entire input similarly to the convolutional layer, with the exception that this filter lacks weights. Instead, the kernel populates the output array by applying an aggregation function to the values in the receptive field. There are principally two forms of pooling: Maximum pooling The filter chooses the input pixel with the highest value to send to the output array as it advances across the input. As a side note, this method is applied more frequently than average pooling.

Average pooling

The filter calculates the average value inside the receptive field as it passes across the input and sends that value to the output array. The pooling layer loses a lot of information, but it also offers the CNN a number of advantages. They lessen complexity, increase effectiveness, and lower the risk of overfitting.

Fully-Connected Layer

The full-connected layer is exactly what its name implies. As was already noted, partially connected layers do not have a direct connection between the input image's pixel values and the output layer. In contrast, every node in the output layer of the fully-connected layer is directly connected to a node in the layer above it. Based on the features that were retrieved from the preceding layers and their various filters, this layer conducts the classification operation. FC layers often utilize a softmax activation function to categorize inputs appropriately, producing a probability ranging from 0 to 1. Convolutional and pooling layers typically use ReLu functions. Convolutional neural networks and computer vision Computer vision and image recognition tasks are driven by convolutional neural networks.. Artificial intelligence (AI)'s field of computer vision enables computers and systems to extract useful information from digital pictures, movies, and other visual inputs and to behave accordingly. It stands apart from image recognition jobs in that it can make recommendations. Modern instances of typical applications for this computer vision involve:

- Marketing: Social media platforms make it easier to tag friends in photo albums by suggesting potential participants in a photo that has been put on a profile.
- Healthcare: By integrating computer vision into radiography equipment, clinicians are now better able to recognize cancerous tumors in healthy anatomy.
- Retail: Some e-commerce platforms now feature visual search, allowing firms to suggest products that would go well with an existing wardrobe.
- Automotive: Although the era of driverless cars hasn't quite arrived, the underlying technology has begun to find its way into cars, enhancing driver and passenger safety with features like lane line detection.

SYSTEM REQUIREMENTS SPECIFICATION SOFTWARE REQUIREMENT

1. Tool: Matlab 2014a
2. Toolbox : Image Processing

HARDWARE REQUIREMENT

1. SYSTEM: Pentium IV 2.4 GHz
2. HARD DISK : 40 GB
3. RAM : 2 GB
4. NodeMCU Controller
5. LCD Display

SYSTEM IMPLEMENTATION

SOFTWARE OVERVIEW

Programming, visualization, and numerical computing are all done using MATLAB, a high-level language and interactive environment. To analyze data, create algorithms, create models, and create applications, utilize MATLAB. With the language, tools, and built-in arithmetic functions, you can explore several approaches and find a solution more rapidly than with spreadsheets or traditional programming languages like C/C++ or Java. Applications for MATLAB include signal processing, communications, image and video processing, control systems, test and measurement, computational finance, and computational biology. In industry and academia, more than a million engineers and scientists use the specialized computer language MATLAB.

Key Features

- Interactive environment for iterative exploration, design, and problem solving
- High-level language for numerical computation, visualization, and application development

**Ganga et al.,**

- Numerical integration, Fourier analysis, filtering, optimization, linear algebra, statistics, and solving ordinary differential equations
- Tools for designing applications with unique graphical interfaces. Built-in graphics for visualizing data and tools for making custom plots. Development tools for enhancing code quality and maintainability.
- Tools for combining MATLAB-based algorithms with third-party software and programming languages like C, Java, .NET, and Microsoft Excel

Numeric Computation

For the purposes of data analysis, algorithm development, and model creation, MATLAB offers a variety of numerical computation techniques. Common engineering and scientific procedures are supported by the mathematical functions of the MATLAB programming language. Calculations involving vectors and matrices are carried out quickly by core math operations using processor-optimized libraries.

There are several options

- The interpolation and regression
- Differing and integrating
- Equations with linear systems
- Analyzing Fourier data
- Singular and eigenvalues
- Common differential equations
- Matrix sparse data

Specialized functionality in domains like statistics, optimization, signal analysis, and machine learning are available in MATLAB add-on products.

Data Analysis and Visualization

In a fraction of the time it would take to do so using spreadsheets or conventional programming languages, MATLAB's tools for data acquisition, analysis, and visualization help you understand your data. Plots, reports, public MATLAB code, and other forms of documentation and sharing are further options.

Acquiring Data

Data from files, other programs, databases, and external devices can all be accessed using MATLAB. Microsoft Excel, text or binary files, image, sound, and video files, as well as scientific files like netCDF and HDF, are just a few of the common file types that can have their data read. Working with data files in any format is made possible by file I/O functions. You can stream real-time, measured data straight into MATLAB for analysis and visualization using add-on packages for MATLAB, as well as collect data from hardware devices like your computer's sound card or serial port. Oscilloscopes, function generators, and signal analyzers are a few other devices with which you can interact.

Analyzing Data

Data can be organized, filtered, and prepared using MATLAB. Discovering trends, testing presumptions, and creating descriptive models are all possible using exploratory data analysis. In addition to interpolation, convolution, and fast Fourier transforms (FFTs), MATLAB also has filtering and smoothing functions. For tasks like curve and surface fitting, multivariate statistics, spectral analysis, image analysis, system identification, and other analyses, add-on solutions offer their skills.

Visualizing Data

Aside from volume visualization techniques, MATLAB also includes built-in 2-D and 3-D plotting functions. These features might help you explain results and visualize data. Interactively or through programming, plots can be altered. Examples of numerous graphic data visualization techniques in MATLAB can be found in the MATLAB plot gallery. You can read and download the source code for each example to use it in your own MATLAB program.

Documenting and Sharing Results

Plots or full reports are two ways you can present your findings. The common graphical and data file formats can be used to store MATLAB plots and modify them to suit publication requirements. MATLAB programs have the ability to generate reports automatically. Your program results, comments, and plots are included in the report along with your code. Numerous file types, including HTML, PDF, Word, and Latex, are supported for publishing reports.

Programming and Algorithm Development

With the aid of MATLAB's high-level language and development tools, you may easily create and test algorithms and software.

The MATLAB Language

The vector and matrix operations that are essential to solving engineering and scientific issues are natively supported by the MATLAB language, allowing for quick development and execution. Because you do not have to carry out low-level administrative duties like declaring variables, identifying data types, and allocating memory, you can build programs and develop algorithms faster with the MATLAB language than with traditional languages. For-loops are frequently unnecessary thanks to the support for vector and matrix operations. As a result, numerous lines of C or C++ code can frequently be replaced by one line of MATLAB code. MATLAB offers functionality found in conventional programming languages, such as flow control, error management, and object-oriented programming (OOP). You have a choice of using basic data types, sophisticated data structures, or creating your own data types. By interactively carrying out commands one at a time, you can get immediate results. With this method, you can swiftly investigate a variety of alternatives and refine your choices until you find the best one. To reuse your work and automate it, you can save interactive steps as scripts and functions. Built-in algorithms for signal processing and communications, image and video processing, control systems, and many other disciplines are provided through MATLAB add-on products. You can create sophisticated programs and applications by fusing these algorithms with your own.

Development Tools

The following are some of the tools available in MATLAB for effective algorithm development:

- You can enter data, run commands and programs, and view results interactively using the command window.
- Setting break points and walking through specific lines of code are two editing and debugging options offered by the MATLAB Editor.
- Code Analyzer, Automatically looks for errors in the code and suggests changes to improve efficiency and maintainability.
- Measures MATLAB program performance and highlights portions of code that need to be changed for improvement
- Additional tools compare the code and data files, and they produce reports with annotated notes, file dependencies, and code coverage.

Integration with other languages and applications

Applications created in several languages can be integrated with MATLAB software. Code written in C, C++, Java, and .NET can be directly called from MATLAB. You can call MATLAB code from applications written in FORTRAN, C, or C++ by using the MATLAB engine library.

Performance

In order to execute matrix and vector operations quickly, MATLAB leverages processor- optimized libraries. With its just-in-time (JIT) compilation engine, MATLAB can match the execution speeds of conventional programming languages for general-purpose scalar computations. Many multithreaded linear algebra and numerical routines are available in MATLAB to fully utilize multicore and multiprocessor systems. These functions automatically run on multiple computational threads within a single MATLAB session, allowing them to run more quickly on multi-core desktop and other high-performance computing resources like GPUs and clusters. You can further benefit from

multi-core desktop and other high-performance computing resources like clusters and GPUs with add-on parallel computing products. With just a few small modifications to the MATLAB code, these solutions offer high-level features that enable application parallelization.

Image Acquisition

With the help of Image Acquisition Toolbox™, you can import images and video captured by cameras and frame grabbers directly into MATLAB and SIMULINK. Hardware can be automatically detected, and its properties can be set. Advanced workflows allow you to synchronize sampling across several multimodal devices, trigger acquisition while processing is in-the-loop, and do background acquisition. You can employ imaging devices ranging from low-cost Web cameras to high-end scientific and industrial equipment that fulfill tough criteria for low-light, high-speed, and other factors thanks to support for a variety of hardware suppliers and industry standards.

Key features

- GigE Vision, Camera Link, and DCAM are just a few examples of the standards that are supported. the availability of Direct Show, QuickTime, and video4linux2, three popular OS webcam interfaces.
- Support for a variety of manufacturers of industrial and scientific devices possibilities for managing the buffer and various capture modes.
- synchronization of hardware triggering and multimodal acquisition devices.
- Fast hardware configuration, picture acquisition, and live video previewing with the picture Acquisition app. Simulink offers assistance for creating C code.

COLOUR HISTOGRAM

A color histogram is a visual depiction of how colors are distributed in an image used in image processing and photography. A color histogram for digital images shows the proportion of pixels that are colored in each of a predetermined set of color ranges that cover the entire spectrum of the image's color space. Although the phrase "color histogram" is more frequently associated with three-dimensional color systems like RGB or HSV, it may be created for any type of color space. The word "intensity histogram" may be used instead for monochromatic photographs. The color histogram is N-dimensional for multi-spectral images where each pixel is represented by an arbitrary number of measurements (for example, beyond the three measurements in RGB).

SKIN LOCUS MODEL

Despite the fact that every person has a unique skin tone, research have revealed that the primary distinction in skin tones is more often due to their intensity than their chrominance. Several value distribution models have been contrasted in various color spaces, including RGB, HSV, YCbCr, etc. Under specific, constrained circumstances, these distribution models have proven to be somewhat effective at extracting skin-like regions. A relative robustness against changes in intensity is attained when only the chromaticity information is taken into account. Skin chromaticities depend on the prevailing illumination and camera calibration light source, therefore this won't completely cure all of the problems linked to illumination and camera calibrations. The greater the chromatic shift, the more these two illumination parameters differ. Additionally, the color of the light may not be consistent across the face (in this situation, even thorough calibration is insufficient). We suggest using the skin locus, which has shown to be effective with photos under a wide range of situations, to address these issues.

ARDUINO SOFTWARE (IDE)

The Arduino Software (IDE), often known as the Arduino Integrated Development Environment (IDE), has a text editor for writing code, a message box, a text console, a toolbar with buttons for basic functions, and a number of menus. To upload programs and communicate with the hardware of Arduino and Genuino, a connection must be made.

EMBEDDED C

The C Standards committee developed a set of language extensions for the C programming language called Embedded C to address difficulties of compatibility between C extensions for various embedded devices. In the past, supporting exotic features like fixed-point arithmetic, several different memory banks, and fundamental I/O operations required nonstandard additions to the C language.

NECESSITY

During the early development of devices with microprocessors, programs were created using assemblers and fused into the EPROMs. The program's behavior couldn't previously be monitored. To verify that the program was running properly, LEDs, switches, etc. were employed. In-circuit Simulators (ICEs) were owned by a few "very fortunate" developers, but they were expensive and not entirely dependable. The use of microprocessor-specific assembly-only as a programming language decreased with time, and embedded systems switched to C as their preferred embedded programming language. For embedded processors and controllers, C is the most popular programming language. The majority of the time, assembly is utilized to implement those parts of the code that have the highest demands for timing accuracy, code size efficiency, etc.

ADVANTAGES

- It is easy to learn, comprehend, program, and debug since it is compact.
- When written in C, code is more dependable, scalable, and cross-platform compatible than when written in assembly language.
- Today's embedded devices can virtually all be programmed in C, and there is a sizable pool of skilled C programmers.

PROTEUS SOFTWARE

Simone Zanella developed Proteus, a procedural programming language, in 1998. Proteus is an acronym for PROcessor for TExt Easy to Use. Proteus is one of the most comprehensive languages for text manipulation since it combines numerous functions from a variety of different languages, including C, BASIC, Assembly, and Clipper/dBase. It is also particularly adaptable when dealing with strings thanks to its large number of dedicated functions.

HARDWARE OVERVIEW NODEMCU

An open-source microcontroller and firmware called NodeMCU V3 is essential for developing an Internet of Things (IoT) product using a few lines of script. In addition to being able to generate PWM, I2C, SPI, and UART serial connections, the board has other GPIO pins that we may use to link it to additional peripherals.

- The ESP8266 Wi-Fi SoC powers the module's firmware, and the ESP-12 module powers its hardware. These two components make up the interface of the module.
- If the module is functioning properly when connected to a computer, the board includes a status LED that blinks before turning off immediately. This LED will let you know the module's present state.
- The module is the best option for integrating with other embedded devices like Raspberry Pi since it can establish a faultless Wi-Fi connection between two channels.

A number of GPIO Pins are included with Node MCU V3.

- There is a clear distinction between Vin and VU where former.
- There is a clear distinction between Vin and VU; the former is the regulated voltage and can range from 7 to 12 V, while the latter is the power voltage for USB and must be maintained at or near 5 V.

WORKING

The liquid crystal molecules would align in a particular direction if the electrodes received a sufficient voltage. The polarizer would rotate the light rays as they passed through the LCD, activating or emphasizing the desired characters as a result.. The power supply should be of +5v, with maximum allowable transients of 10mv. It is

**Ganga et al.,**

important to appropriately adjust the voltage (VL) at pin 3 to produce a better/suitable contrast for the display. A live circuit shouldn't have a module removed from it. The ground terminal of the power supply must be isolated properly so that voltage is induced in it. The module is to be isolated properly so that stray voltages are not induced, which could cause a flicking display. LCD is lightweight with only a few, millimeters thickness since the LCD consumes less power. They can be powered for extended periods of time and are compatible with low power electrical circuitry. Since LCD displays do not produce their own light, light is required to read them. . [Additionally, Nayak et al. 17 used variables such the location of blood vessels and exudates in conjunction with textural parameters to classify DR into three categories using neural networks. To categorize pictures into normal, non-proliferative, and proliferative retinopathy, features are input into the neural network. These features served as the input for categorization in the neural network.]11 Reading in the dark is made feasible by the use of backlighting. LCDs last a very long time and can operate in a variety of temperatures. It is important to do correct startup before using LCD for display. The electrical contacts for each segment are separate on LCDs with a few segments, as those found in digital watches and pocket calculators. Each section is controlled by an electric charge supplied by an external, specialized circuit. More than a few display. Elements are difficult to manage in this display arrangement.

Small monochrome displays, like those in personal organizers or older laptop screens, use a passive-matrix structure that uses super-twisted nematic (STN) or double-layer STN (DSTN) technology to add color using an internal filter. The latter solves the color shifting issue with the former. The display's rows and columns each have their own individual electrical circuit. Row and column addresses are used to address each pixel individually. Because the pixel must maintain its state without the assistance of a constant electrical charge between refreshes, this sort of display is known as passive-matrix addressed. This style of display is less practical as pixels (and, consequently, columns and rows) grow in number. The reaction speeds and contrast of passive matrix addressed LCDs are often very slow. Active matrix technology is used in high-resolution color displays like those found in contemporary LCD televisions and computer monitors. In addition to the polarizing and color filters, there is a matrix of thin-film transistors (TFTs). Due to the specialized transistors that each pixel possesses, each column line may access one pixel. All of the column lines are joined to a row of pixels when a row line is activated, and the proper voltage is then applied to all of the column lines. The subsequent row line is active, and the previous row line is deactivated. During a refresh process, each row line is activated in turn. Active-matrix compared to passive-matrix addressed displays of the same size, addressed displays have "brighter" and "sharper" images, and they typically respond more quickly. a two-line, 16- character alphanumeric LCD that can be used for any purpose. As a result, the sort of LCD utilized in this project has 16 characters per line, 2 lines, 5 by 7 dots, a built-in controller, and a 1/16 duty cycle.

CONCLUSION & FUTURE SCOPE

The automatic imaging method we created and prospectively evaluated for the detection of HEs. The system identifies HE lesions by statistically classifying them based on color and measuring the sharpness of their edges using the Kirsch operator. Our findings show that the method is ideally suited to support DR screening and may be used to assist ophthalmologists in their day-to-day work. The majority of the currently used supervisory algorithms call either additional pre- or post-processing steps to identify the various phases of diabetic retinopathy. Additional algorithms that compel human feature extraction phases are required to classify the fundus images. Deep convolutional neural network (DCNN) is a comprehensive approach to all stages of diabetic retinopathy in our suggested solution. There is no need for manual feature extraction processes. With dropout approaches, our network architecture produced a considerable improvement in classification accuracy. Recall rates (or true positive rates) have also increased. Among the drawbacks of this architecture are: For photos collected from various cameras with various fields of view, an additional stage augmentation is required. Our network architecture is also intricate and computationally demanding, necessitating a powerful graphics processing unit to process the high resolution images as the layers are added.

ABSTRACT

Cultural Relativism is a qualified term which seeks to band together culture and society. In addition, it appraises the idiosyncratic norms and value systems of a culture to preserve its individual identity. In comparison, no culture is mediocre or superior to others. By and large, there is no right or wrong ethical system. In a holistic indulgence of the term, Cultural Relativism, it can be stated that it seeks to promote the understanding of the cultural practices that are unfamiliar to other cultures. This has bearing in two ways. It prevents the 'absolutism' of the Western dogmas. It also validates the persistence of the genetic culture in the multicultural environment and the diasporic calibration. Cultural Relativism has two distinct tendencies – absolute and critical. Culture and society are inseparable. Hence the three terms, society, culture and tradition, are curtly reviewed along with the identifiable phrases which go with culture i.e. proxemics and micro culture. The definitions, chronology and the allied domains like Linguistic Relativism and Epistemological Cultural Relativism of Cultural Relativism do get the due importance in this proposal. To evidence the averments, the principles and ideologies of Judith A. Boss, James Rachels and John Tully are documented which are either constant or acerbic in tone or stance. As a further cause of this proposition, Louis Gaille's inventory of the advantages and disadvantages summarizes the entire essay.

Keywords: Cultural Relativism, Culture, Society, Tradition

**Gandhimathi and Sakhivel****INTRODUCTION**

In general, cultural relativism is the ability to fathom a culture on its own terms and not to make judgments using the standards of one's own culture. The ambition of this is to foster the compassion of cultural practices that are not typically part of one's own culture. Using the perspective of cultural relativism leads to the view that no one culture is superior to another culture when equated to schemes of morality, law and politics. (Philosophy Home, 2009) Culture is embedded in the phrase 'Cultural Relativism.' Hence the term 'culture' needs an elaborate treatment.

CULTURE VERSUS TRADITION

Culture refers to the set of beliefs, practices, learned behaviour and moral values that are passed on from one generation to another. Society means an interdependent group of people who live together in a particular region and are associated to one another. A tradition is a belief or behaviour (folk custom) passed down within a group or society with symbolic meaning or special significance with origins in the past. The main difference between culture and tradition is that traditions describe a group's beliefs and behaviors that are passed down from one generation to another. Culture acts as the underlying thread that connects an individual to everyone else, with traditions acting as the events and customs to honor these.

CULTURE

The universal generalized awareness among people about culture is the cultivated facility to catalogue and exemplify experiences with symbols and play a role resourcefully and creatively. This proficiency is deemed unique to humans. Culture is an umbrella term which encompasses the social behavior and norms found in human societies, as well as the knowledge, beliefs, arts, laws, customs, capabilities, and habits of the individuals in these groups. (Tylor, Edward, 1871). Some of the other notions about culture are these. A 'culture' is the set of customs, traditions, and values of a society or community, such as an ethnic group or nation. Culture is the set of knowledge acquired over time. In this sense, multiculturalism values the peaceful coexistence and mutual respect between different cultures inhabiting the same planet. The modern term "culture" is based on a term used by the ancient Roman orator Cicero in his *Tusculanae Disputationes*, where he wrote of a cultivation of the soul or "*cultura animi*," (Cicéron, Marcus Tullius Cicero; Bouhier, Jean, 1812) The *Cambridge English Dictionary* states that culture is "the way of life, especially the general customs and beliefs, of a particular group of people at a particular time." Culture, thus, in general, denotes patterns of behaviour common within a closed group of people. (Anthropology, Cultural.) Anthropology splits this behavioural pattern into two kinds – patterns common to all groups and patterns exclusive to each group. Patterns specific to a group are known as dominant or mainstream culture with dominance reflected through power. These dominance cultures have subcultures also. Culture has levels.

CULTURE SPECIFIC TERMS

Culture is both overt and covert. These refer to specifically learnt ones and unconsciously imbibed ones. Proxemics refers to personal space. Worldview is a way of understanding how the world works and the individual's place in it. Micro or Subculture refers to discrete groups within a larger group that share some sort of common trait, activity or language that binds them together and or differentiates them from the larger group. Familial culture is how one expresses culture as a family through traditions, roles, beliefs, and other areas. Every family is different, and every family has its own culture. The process by which all humans obtain, and transfer culture is enculturation – how an individual adapts to 'proscribed' behaviours and sticks to 'prescribed' behaviours. Cultural Transmission is the passing of new knowledge and traditions of culture from one generation to the next, as well as cross-culturally. Cultural universals are common aspects in all human cultures yet vary from culture to culture such as values and modes of behaviour. Diffusion is simply the borrowing of traits. Acculturation, also associated with culture change, is the borrowing of traits. The melting pot refers to a blending of cultures. Another form of acculturation is called the Salad Bowl or cultural pluralism. Values are abstract concepts that certain kinds of behaviours are good, right, ethical, moral, and therefore desirable. There are two main categories of social control to

**Gandhimathi and Sakthivel**

maintain order in group life: norms and laws. A norm is a standard of behaviour. At some point people in the society agree that these are standards. Some people learn by being taught, but these are mostly picked up just by being exposed to them. Symbols are the basis of culture. A symbol is an object, word, or action that stands for something else with no natural relationship that is culturally defined. Language is the most often used form of symbolism. Culture and Personality draw a parallel by which an understanding of a national culture is gained through examination of individual personalities. Cultural ecology is a theoretical approach that attempts to explain similarities and differences in culture in relation to the environment. Postmodernism challenges the “dominating and bullying nature of science and reason” (Cooke, 2006). Postmodernists claim that it is impossible for anyone to have objective and neutral knowledge of another culture. This view comes from the notion that we all interpret the world around us in our own way according to our language, cultural background, and personal experiences. Ethnology is the comparative study of two or more cultures. Ethnology utilizes the data taken from ethnographic research and applies it to a single cross-cultural topic. The ethnographic approach can be used to identify and attempt to explain cross cultural variation in cultural elements such as marriage, religion, subsistence practices, political organization, and parenting. A cultural norm codifies acceptable conduct in society; it serves as a guideline for behavior, dress, language, and demeanor in a situation, which serves as a template for expectations in a social group. Accepting only a monoculture in a social group can bear risks, just as a single species can wither in the face of environmental change, for lack of functional responses to the change. (Jackson) Thus, in military culture, valor is counted a typical behavior for an individual and duty, honor, and loyalty to the social group are counted as virtues or functional responses in the continuum of conflict.

CULTURAL RELATIVISM

Cultural Relativism is also propelled as a concept that cultural norms and values obtain their worth within an exclusive social context. This is also grounded on the idea that there is no out-and-out degree of good or evil, therefore every resolution and arbitration of what is right and wrong is individually decided in each society. The concept of cultural relativism also implies that any opinion on ethics is subject to the perspective of each person within their particular culture. Overall, there is no right or wrong ethical system. In a holistic indulgence of the term cultural relativism, it can be stated that it seeks to promote the understanding of cultural practices that are unfamiliar to other cultures such as eating insects or genocides.

CULTURAL RELATIVISM - KINDS

There are two diverse classes of cultural relativism. Absolute cultural relativism refers to the concept that everything that happens within a culture must and should not be questioned by outsiders. The extreme example of absolute cultural relativism would be the Nazi party’s point of view justifying the Holocaust. Critical cultural relativism is that which creates questions about cultural practices in terms of who is accepting them and why. Critical cultural relativism also recognizes power relationships.

RELATIVISM AND REALISM

Cultural relativism is a complex concept that has its intellectual roots in discussions about relativism in the philosophy of science and the philosophy of language. (Howson, Alexandra) The accustomed hypothesis of relativism in sociology is bracketed with appraisals of positivism in science and in tandem, social science, which largely highlight the differences between the motivation and application of inquiry associated with the natural and social sciences. Relativism is customarily interpreted in contrast to realism referring to the awareness of what is true and real exists autonomously of the mind. This opposition between realism and relativism is perceived through the opinion that the material and social world is mediated through human minds: that people’s interpretation of the world is interceded through the information and accepted wisdom they hold about the world. The intellectual roots of cultural relativism within sociology lie in philosophical deliberations about distinctions between reality and

Gandhimathi and Sakthivel

relativism. Although the impression of realism has a convoluted chronicle, it is generally accepted that it refers to the existence of a reality that lies beyond human thoughts or beliefs about it. (Marshall, G. et al., 1994) Cultural relativism is linked to cognitive relativism through the claim that social science cannot identify truth, but only customs that vary from one society to another.

CULTURAL RELATIVISM – PURPOSES

Cultural relativism provides a spontaneous and decisive contrivance for sociology and other social science disciplines. Feminists have made shared reason with cultural relativism since it affords a tool for criticizing rationality and rejecting objectivity in science as a masculinist ideal and also challenges the seemingly fixed character of gender. In fact cultural relativism is in play when the Europeans, during periods of colonial expansion believe they are 'civilizing' them considering themselves superior to the nations they colonized, this view has been trenchantly criticized by scholars such as Edward Said, who have used cultural relativism as a tool to draw attention to the social and cultural drifts of colonialism. These scholars draw attention to the way in which colonialists show partiality towards Western values and ideas above ethnic values and beliefs invalidating indigenous culture. In this sense, cultural relativism becomes a tool to contest ethnocentric Western views and practices and also promote cultural diversity.

CULTURAL RELATIVISM – IMPRESSIONS

Some defining ideas of Cultural Relativism can be looked into in detail. Cultural relativism is the idea that a person's beliefs, values, and practices should be understood based on that person's own culture, and not be judged against the criteria of another. (Cultural relativism, 2017) Franz Boas first formulated the idea in 1887 as indispensable in anthropological research: "civilization is not something absolute, but...is relative, and...Our ideas and conceptions are true only so far as our civilization goes." (Boas, Franz. 1887) *Oxford English Dictionary* records this as the comment by philosopher and social theorist Alain Locke in 1924 to describe Robert Lowie's "extreme cultural relativism," found in the latter's 1917 book *Culture and Ethnology*. According to George E. Marcus and Michael M. J. Fischer, it is an attempt to preserve the distinct cultural forms of life from the clutches of global Westernization, a perception of homogenization towards a dominant Western model. This means Cultural Relativism is, in part, a response to Western ethnocentrism. (Marcus, George, and Michael M.J. Fischer. 1986) Cultural Relativism is a key concept in analyzing human rights within a social work situation. In cultural relativism, all points of view are equally valid and any truth is relative, with truth belonging to the individual or her or his culture (Reichert, 2011). All ethical, religious, and political beliefs are truths related to the cultural identity of the individual or society. (Reichert Elisabeth, 2015)

CULTURAL RELATIVISM AND ETHNOLOGY

Cultural Relativism turns out to be a heuristic tool in a scheme – ethnology. Ethnology is a stratagem through which cultures having a very wide assortment and diversity are equaled and assessed in an efficient and cogent manner. For instance, during the nineteenth century, the technique has been in use in the display of the material artifacts in museums. The artifacts stand classified in the order of families, genera and species with the order stretching from the crudest to the most refined ones. Their aim was to classify artifacts, like biological organisms, according to families, genera, and species. Thus organized museum displays would illustrate the evolution of civilization from its crudest to its most refined forms. But Boas is against such routine since each culture needs to be focused upon individually and argues that classification is not explanation. (Boas, Franz 1974) Alfred Kroeber, Boas' student, writes about the evolution of relativist perspective in his own fashion. Anthropology, in its earlier stages, holds an exotic and out of the way opinion about culture. In course of time, this estimation yields place to the diversity of cultures with incredible spread of departures. Thus culture moves away from insensible ethnocentricity towards relativity. This conspicuous shift in emphasis from imprudent self-centeredness to an objective broader perspective of relativism is beyond doubt the hallmark foremost contribution of anthropology and distinguishes it from sociology and psychology. (Kroeber, Alfred. 1948) According to Ruth Benedict, any study of culture should adopt cultural relativism since it validates the elemental merits of that culture eschewing ethnocentrism. The preferential treatment

**Gandhimathi and Sakhivel**

of one or another culture should be disregarded in the study of culture and the authentic appraisal involves taking into account all the variant specifics of all compared cultures have to be accounted for by placing them alongside one another. The biased band of analysts of social sciences has so far erroneously projected Western civilization as the role model. She insists upon the appreciation of a culture different from one's own, one can reach a valid understanding of the totality of humanity. In this context, cultural relativism is a heuristic device of fundamental importance because it calls attention to the importance of variation in any sample that is used to derive generalizations about humanity. (Benedict Ruth, 1959) Cultural Relativism does function as a cultural critique. The exemplification for this is amply illustrated in anthropology's refusal to accept Western culture's claims to universality. (Marcus, George, and Michael M.J. Fischer. 1986) Relativism does not mean that one's views are false, but it does mean that it is false to claim that one's views are self-evident. Cultural Relativism induces analysts to reexamine taken-for-granted assumptions in the approaches in analyzing cultures. John Cook rightly observes: "It is aimed at getting people to admit that although it may *seem* to them that their moral principles are self-evidently true, and hence *seem* to be grounds for passing judgement on other peoples, in fact, the self-evidence of these principles is a kind of illusion." (Cook, John. 1978) Perhaps Cook sounds illogical in equating cultural relativism to be identical to moral relativism, he approximates to the sensible and broader perspective of the term.

According to Marcus and Fischer, when the principle of cultural relativism is propagated after World War II, it is understood "more as a doctrine, or position, than as a method." (44) Cultural relativism also claims that it is unviable to morally sit in judgment between different cultures. A culture would be better than another if it were closer to the absolutely right standard than the other were, but there is no such thing as an unequivocally accurate guideline, so no culture can be better than another: "There is no single true morality. There are many different moral frameworks, none of which is more correct than the others". (Harman, Gilbert, 2008)

CULTURAL RELATIVISM – SUB-CLASSIFICATION

Depending upon the substance of the class, Cultural Relativism falls into multiple types. Descriptive cultural relativism holds that widespread and fundamental cultural differences exist over different groups. Epistemological cultural relativism holds that these differences cannot be adjudicated so that some beliefs turn out to be better or worse in terms of truth or justifiability. Normative cultural relativism holds that these differences weigh in favour of toleration, non-interference or at the very least minimal intervention in the affairs of other groups. Defenders of cultural relativism have asserted the different component views against colonialism, exploitation of developing countries and the encroachments of global capitalism. But these outlooks are set aside by critics as camouflages for the oppression of some by others within a group, debilitating the disposition to demand bias and the violation of rights by their suitable titles. The entire reality is extensively more convoluted and much dangles on how each canon is specifically verbalized and preserved.

CULTURAL RELATIVISM AND JUDITH A. BOSS

Judith A. Boss defines Cultural Relativism as a theory about the nature of morality which contends that there are no objectives, universal moral rules and the moral rules that do exist are culture-bound. Different cultures may hold varying beliefs about the morality of killing. While some may view it as universally wrong, others might deem it acceptable under particular circumstances. The rationale behind these beliefs and the specific guidelines would be shaped by the cultural, societal, and contextual norms of each group. With reference to the positive declaration, the belief of Cultural Relativism is that what is morally tolerable is what harmonizes with socially endorsed customs or ideals while what is morally wrong is what goes against the customs or standards of society. If you do an action *e* in one culture, it might be morally acceptable, whereas if you perform *e* in another culture, it would be morally wrong. Judith A Boss attempts to explain an underlying misperception regarding the tolerance factor. Cultural Relativism should not be put in tandem with the contention that everyone ought to be compliant of other cultures. This presupposes that Cultural Relativism is accepted, the implication is threadbare – denial of the presence of objective, transcultural, moral principles. In other words, in putting up with other cultures leads to the argument that cultural tolerance is a virtue or objective value that is

**Gandhimathi and Saktivel**

appropriate to all cultures. But, in real terms, Cultural Relativism has a covert proviso in sanctioning a culture the prospect that there is a culture that is intolerant to other cultures as there are no unbiased ethical rulebooks. Judith A Boss emphasizes that Cultural Relativism is a normative claim about what is right or wrong. This entails that any act cannot be emphatically demarcated as morally right or wrong independent of the culture in which act is performed. This declaration appears polemical as it attempts to postulate what in existence is morally right or wrong: moral rightness/wrongness is culture-bound.

Descriptive (sociological) cultural relativism (DCR) about morals, on the other hand, is the expressive assertion that what people accept as true to be morally right or wrong varies from culture to culture. It does not exclaim whether what they believe is true or false. To make plain the contention in determining the superior makeup of descriptive cultural relativism in comparison with Cultural Relativism, the following line of reasoning hold good. The first premise is that cultures have unlike moral conventions but many of these protocols are fallacious. The second premise is that there exists a compendium of dispassionate ethical codes that are valid to all cultures, irrespective of whether every culture believes those rubrics. The inference from these premises is drawn in the following manner. The first premise suggests that Descriptive Cultural Relativism does not deny that there is no cultural intersection. Instead the theoretical outlay projects that there is the prevalence of some dissimilarities in the thinking of people vis-à-vis morality. These differentiations in the ethical principles of culture are manifest in two slants: situational variances and divergences in beliefs about the world. All these arguments on moralistic base of cultural relativism strongly props the notion that all cultures have at least some conjoint values.

CULTURAL RELATIVISM AND JAMES RACHELS

James Rachels counters this moralistic stance of cultural relativists in no uncertain terms. (Rachels James) She puts forward his contentions in several planes. The prime idea put forward by Rachel is that “Different cultures have different moral codes” is conveniently projected as an excuse for socially approved habits. This is done by people so naturally and without an iota of inhibition that one’s own society is the best in existence and could not visualize that other societies do have diversified cultures. This “falsified” creed leads them to brand these other cultures as ‘regressive’ or even ‘aboriginal.’ The learned observers of different cultures are attuned themselves to the idea the opinions of right and wrong are comparative and be at variance from culture to culture. It is absolutely imprudent to take for granted that one’s notion of right or wrong would be acknowledged by all. The principal principle of morality or ethics is not universally valid or acceptable. It is just a figment of imagination. The customs of diverse societies exist as they are. These customs cannot be categorized as “correct” or “incorrect,” for that infers we have an autonomous and self-determining standard of right and wrong by which these may be assessed. But there is no such nonpartisan paradigm; every criterion is culture- bound. The foremost thing that needs the attention is that at the core of Cultural Relativism there is an undeniable structure of a line of reasoning. The scheme used by cultural relativists is to make a case from the essentials about the differences between cultural outlooks to a conclusion about the status of morality.

CULTURAL RELATIVISM AND LOUIS GAILLE’S INVENTORY

An inventory of the advantages and disadvantages of Cultural Relativism is attempted Louis Gaille’s assessment with a few additional inputs. (Gaille Louis) The main advantages are It is a procedure which stimulates mutual aid and fashions a social order where egalitarianism is promising. People can cultivate the habit of chasing an honest and viable ambition. Cultural Relativism fosters respect among people. It conserves the essences of all cultures in a society. It eliminates the possibility of negative judgements. It could become more acceptable if it discounts moral codes from its purview. It allows the setting up of personal ethics without prejudicing the societal norms. It eliminates cultural conditioning altogether. The opposing influences on Cultural Relativism are it leads to a formation of a society populated by personally biased individuals and would generate chaos. It is deep-seated in man’s perfection, snuffs out diversity, dismembers the society, curtails ethical evolution, dampens the credence of humanity’s evolution and spins “biases” into truths.

Gandhimathi and Saktivel

CONCLUSION

Cultural Relativism does not permit other cultures in the evaluation of its customs and standards but definitely extends a privilege in the form of self-analysis as an autonomous entity to gauge the continued existence capability of a practice or its comparative merits in relation to similar precepts in other cultures. The conservation of cultural autonomy and the allowance for change may appear incongruous. But the implication is clear. As a matter of fact, cross cultural relationship lingers as an inspiration that attempts to foster a healthy cohabitation in a multicultural society. But this inclination also presupposes that no culture can declare that it is superior to other cultures.

ABSTRACT

High quality teaching is never by chance. Some teachers are inherently inclined towards teaching than others, all successful teaching is the result of conscious efforts, self-introspection, self-evaluation, practice and hard work. Considering that all classes are heterogeneous, it is highly challenging for a teacher to gauge how students learn, what hampers their learning and how teaching can improve the learning of the student. All education system all over the world is fixated on raising student performance. If this is to succeed, then it must be recognized that the teachers play a key role in raising the performance of the students. Parents demand that their children get the best teacher which demonstrates that the quality of teaching is directly proportionate to the success of the students. The need for professional development has been the topic of much discussion because a student's learning has a direct bearing on the way he is taught. Effective mentoring is considered of prime importance for a language teacher's development and it is an indispensable aspect of language teaching as it helps the language teacher in improving his teaching. English teachers as mentors can share their teaching experiences and enhance the professional growth of the teachers.

Keywords: language teachers, mentor, performance, professional development, students

INTRODUCTION

Professional development is often discussed due to its impact on a student's learning since it affects the teaching methods used. The need for ongoing learning arises because teaching challenges do not remain static. And despite a steady stream of new educational theories, updating of degrees and technology, very little has changed in actual classroom teaching, and teachers are doing more or less the same thing they did a generation ago. But, the wide diversity of students with the pressing need for graduates with good knowledge, skills and values have necessitated a deeper look and change in our instructional practices. A shift from a tradition-based and a theoretical educational process to a more innovative process is required for learners to master high-order cognitive skills such as critical thinking, complex problem-solving skills and also interpersonal skills and ethical values. Hence, faculty development programmes of high quality for all the teachers are an urgent need and vital for educational institutions for the institutions' growth and survival.

Professional skills of teachers are need based. Teachers have to continuously reinvent themselves during different times of their career as their needs keep changing. As the education system keeps evolving, educational institutions also change to cater to the demands of the times. Hence, the more diverse the classrooms, the pressure for English language teachers to update their knowledge in curriculum framing, better assessment methods and classroom teaching is intense. The institutions play a pivotal role in offering professional development training and also providing mentors for teachers to guide through the ever evolving and dynamic curriculum.

Teacher Training and Teacher Professional Development

Teacher training and teacher professional development serve different purposes. Teacher training aims at fulfilling the immediate goals of a teacher and the short-term responsibilities. Teacher training offers support in classroom practices and encourages them to attempt new strategies and to use teaching aids and resources effectively in the classroom. Teacher training can also be curriculum specific where, teachers can be guided on the implementation of a new or updated curriculum. In the case of English language teachers, teachers can be trained on how to link and incorporate grammar with the texts and also the kind of activities that can be carried out to making learning of grammar enjoyable and interesting. Teacher development is focused on overall growth and caters to a long-term goal. It aims to expedite growth of a teacher's understanding of himself as a teacher, his responsibilities and in a broader sense of teaching itself. Professional development for an English language teacher would entail understanding how the language teacher's roles change according to the kind of learners in the classroom. Such development programmes would act as a forum for a teacher to introspect, review his own method of teaching and develop a style of teaching suited to the students. Language teachers can explore new approaches in language teaching and familiarize themselves with development in grammar and other subject-matters.

Professional Development for Teachers

"Advocates of professional development for teachers are not arguing that teaching is of poor quality and must be fixed. Their advocacy for professional development for teachers reflects the recognition that teaching is so hard that it is never perfect; no matter how good a lesson is, it could always be improved." (Danielson, Talk About Teaching (2009)). Professional development refers to various types of experiences in the field of education relevant to an employee's work. People in various sectors actively partake in professional development programmes to acquire new knowledge, to relearn and to apply the latest skills to enhance their performance at their workplace. "Effective professional development focuses on improving instructional practice by giving teachers new knowledge and techniques for assessing learning with the ultimate goal of improving the learning of students." (Wei et al., 2009) Moreover, effective professional development empowers teachers with knowledge and skills required to meet students' learning challenges.

Pramila et al.,

Research has shown that teachers who participate in well-designed professional development activities get better results from their students. A systematic, on-going teacher professional development is much more effective than traditional workshops and conferences. Teacher development programmes have now shifted from brief on campus training programmes to a series of programmes extended throughout the year. There is a powerful need for development in the field of teaching and the teachers are very clear that they do not feel adequately equipped to deal with increasing heterogeneous groups and to address the needs of the students who have some learning challenges as well as students who are gifted. Quite a compelling proportion of the educators believe that professional development programmes organized by the institutions do not meet their needs and so the authorities must ensure that the development activities organized are potent and fulfill the teachers' requirements.

Teachers' perceptions are very important and cannot be ignored as their perceptions influence their behaviour. Teachers' teaching beliefs, their teaching practices and their professional co-operation are related to their participation in different forms of professional development. Professional development has a direct bearing on student achievement. Hence, opportunities for active learning, content centered on student learning, follow-up training with support and time to practice and facilitating opportunities for collaborative work and embedded learning should be effectively addressed in teacher professional development programmes. Suitable activities that will provide teachers with opportunities to develop and deepen their professional understandings and skills must be mapped into the framework of any professional development programmes.

The following is a variety of activities based on a study in Auckland University, New Zealand:

Professional learning activities mapped onto the framework:

Activities constructed to promote learning

Professional development / professional learning activities designed to develop and deepen professional understandings and skills:

- listening;
- watching;
- being observed and receiving feedback;
- receiving student activities and materials;
- engaging with professional readings;
- discussing practice with someone more expert;
- authentic experience of subject in action;
- discussing own theories of practice and their implications;
- examining student understandings and outcomes;
- analysis of current practice and reconstruction of new practice;
- discussing self or mutually identified issues.

Teacher Professional Learning and Development Best Evidence Synthesis Iteration [BES] Pg:29

The efficacy of professional development programmes rests on how meticulously such programmes are conceived, planned and implemented. In effective professional development the college authorities/organizers must analyze the data of student achievement and find out the challenges that are commonly faced by students in a particular class or batch and ascertain the issues which need to be addressed and work out practical plans to help students overcome the challenges so that they improve their performance in their academics. The types of development activities may range from organized to structured to a more informal interactive discussion on improving teaching. Some of the activities are: individual research, study groups among peers, teachers observing other teachers, mentoring of new teachers by more experienced teachers, faculty-administrators meeting to plan lessons, problem solving and improving performance, workshops and conferences to learn from a variety of expertise from around the state or country.

The first step in creating a comprehensive professional development programme is developing a framework. There are numerous models available to replicate for all kinds of educational programmes. But the programme will be

Pramila et al.,

most effective if the planning relies on the curriculum. It is always fruitful if the academic degree offered is taken into consideration. The faculty development programme should be analogous to the academic programme offered by the department or college. "Teaching occurs in particulars: particular students interacting with particular teachers over particular ideas in particular circumstances. Teachers need to learn in and from practice" (Ball & Cohen, 1999). It gives teachers opportunity to collaborate with other teachers and address specific problems faced by teachers in their classrooms. Professional development should bring teachers and administrators together for continuous professional learning. Professional development in which educators are given the forum to learn new teaching methodologies which they can actually implement in their classrooms will be far more effective than traditional methods of professional development.

The first and foremost thing that should be focused to transform any faculty development to work is creating learning opportunities for teachers that are practically possible to be implemented in their classrooms. Virtual workshops and online learning could also be considered so teachers can learn anytime anywhere. It should involve hands-on, active learning. Such professional development programmes must be relevant and there must be an inherent value in the activities offered. The best programme is where strong relationships are developed between faculty and administrators.

Teacher burnout is a gradual process which obstructs teaching. Teaching today requires a great deal of emotional energy, and teachers need to genuinely care and connect with students especially with slow learners. Teachers must realize that their teaching promotes their acquisition of knowledge and development of skills. Faculty development programmes help faculty become better teachers who take responsibility for their students' learning. Some professional development may be provided on a mandatory basis because the skills and knowledge that they acquire enhances the teaching quality. It is commonly assumed that learning outcomes are influenced by what is taught. So, teachers must take greater responsibility for promoting the learning of all students and realize that what teachers do has an impact on how students respond and so they must develop a plan of action to address professional learning. New methods and approaches and skills have redefined teaching-learning process and teachers who don't learn and engage in them will see themselves increasingly irrelevant. Effective professional development for teachers can never be an event constrained by time. And it must be a systematic process if quality improvement in education is to be visibly seen.

Mentoring as a Positive Reinforcement for Effective Teaching

A good teacher does not need not necessarily be a mentor. A good mentor should possess both personal and professional skills to facilitate a symbiotic relationship between the mentor and his mentee. The mentor should communicate effectively and should be truthful, dedicated, tactful, and enthusiastic and possess a sense of humour. There are two types of mentors. Informal mentors are colleagues whom teachers turn to for advice. Formal mentors are those with a specific mentoring responsibility assigned by the institutions. A mentor nurtures the less experienced teacher through counselling, coaching, and allowing the teacher to observe and reflect and arrive at solutions to any problems that he may encounter in the classroom. While, mentoring is required mostly for new teachers to ensure a smooth transition into the profession, mentoring also targets teachers who have some difficulty in some aspects of their job.

As part of her doctoral dissertation psychologist Linda Phillips-Jones has given a comprehensive set of mentoring skills. The following is the mentoring skills model developed by Linda Phillips-Jones:

The mentor-mentee relationship provides an exposure to new avenues for learning and growth. Mentors should possess strong interpersonal skills and good communication skills and mentees should be intrinsically motivated and willing to learn and improve their performance. Sherman et al (2000) in their respective research identified specific skills and knowledge areas needed by competent mentors as in Table 1:

Pramila et al.,

English Teachers as Mentors

Good communication skills in the English language is a prerequisite for employability. Hence, imparting speaking skills is in the spotlight. English teachers face mounting pressures due to large class size and heterogenous classes. English teachers must cease to work in isolation as they require specialized knowledge and skills. Currently, there is a strong emphasis on teachers continuously improving their knowledge, abilities, and teaching approaches to improve students' academic achievements. Educational professionals are seeking ways to guarantee that all teachers receive proper training to achieve desired learning results. Mentorship has been crucial in educational change since the beginning of the 1980s, offering teachers a way to enhance their teaching abilities. Mentoring is a “means of fostering stronger connections among the teaching staff, leading to a more positive and cohesive learning environment for students.” (Brewster and Railsback) Mentoring is typically seen as a purposeful and nurturing process in which an older, more experienced individual guides and supports a younger, less experienced person to aid in their growth and development. These experienced mentors possess specialized knowledge and skills needed to educate students with limited English skills, making them well-equipped to guide English teachers in effective teaching methods. This collaboration often involves close interaction with seasoned educators, thereby, expanding the support available to new teachers. Effective mentoring requires the mentor to show a commitment to supporting others, being open-minded, adaptable, and empathetic. New English teachers often deal with various challenges every day, particularly in mixed-ability classrooms. The mentor should encourage opportunities for observing and discussing suitable teaching methods, second language learning, and more.

Mentoring aids in developing the mentors' supervisory skills and enhancing the teaching-learning process. The mentor needs to be highly proficient in the language and have a strong track record as a teacher. He needs to show an effective teaching method in the classroom. The mentor, who must be proficient in English, should guide their mentees in lesson planning and teaching. English teacher mentors share their teaching experiences and support professional development. The mentors need to offer guidance and support, demonstrate effective teaching methods, and give feedback on the mentees' growth and progress. In addition to training sessions, mentors should also observe mentees' classes and provide constructive feedback with suggestions for enhancement when needed. In an English class, a mentor's key responsibility is to inspire students to learn the English language effectively. It is crucial for English teachers to be proficient users of the language to fulfill this role. The mentor needs excellent communication skills to enhance teaching methods and boost learning results. Mentees depend on their mentors' English proficiency to grow personally and as educators. Mentees see mentors as role models, especially in their teaching methods and English pronunciation.

In addition to practical training sessions, the mentor should allow the apprentice to witness the mentor's teachings. Prior to class, the mentor and the mentee should communicate about the upcoming lesson to be taught. Both should also review the lesson together after class. The mentee and mentor collaborate to plan the lesson, followed by the mentor observing the mentee's class and providing feedback. The mentor is responsible for ensuring that the mentee has acquired the necessary knowledge and skills to lead lessons effectively. Teaching English to students from various backgrounds can be intimidating. The language teacher faces even more difficulty due to the high number of students, limited teaching resources, and low English proficiency levels among students. It is essential to provide intensive guidance in order to create suitable teaching materials. The mentors should motivate the teachers to utilize materials found in the local area and to effectively incorporate appropriate materials in the classroom.

The mentors need to give the mentees an overview of how to use different assessment tools such as written assignments, verbal assessments, observation, and group activities. They should teach their mentees the importance of focusing on knowledge-based teaching rather than exam-focused teaching. Mentors are responsible for helping mentees effectively manage classroom tasks. New English teachers benefit from mentoring by learning to develop effective work habits, integrating theory with practice, collaborating with experienced teachers, and observing their mentors to improve their teaching skills, strategies, and classroom performance. The mentors and mentees work together to assess their teaching experiences by discussing with teachers and reflecting on their own practices. They use different methods, techniques, and abilities to enhance learning. Through this process, mentees learn how to

Pramila et al.,

create lesson plans, conduct language activities, and assess student work effectively. Consequently, they discover their unique teaching style, personality, and establish their own teaching identity.

CONCLUSION

In all educational institutions, there will be teachers with different levels of education, experience, knowledge, skill, and expertise. In such a mixed group of professionals there is tremendous scope for sharing of knowledge and expertise and this is very beneficial for professional development. In the initial stages of their career, teachers are very keen to develop and enhance their professional skills. Language teachers need to keep learning and unlearning and updating as the language teaching is constantly evolving. Educational institutions must provide regular opportunities for language teachers to update their professional knowledge and motivate teachers to actively participate in them. There are two aspects to professional development: one can be seen from institution's perspective and the other from the individual's perspective. The individual's personal goals must align with the institution's vision and mission. Teachers feel more confident when they improve their teaching skills and it provides them a sense of fulfillment when they can produce better results with their students. Areas that require professional can be identified, like grammar, various language teaching approaches in second language acquisition and curriculum development. When the teachers are equipped with the necessary skills they feel empowered and they develop the expertise to teach different learners of various backgrounds.

Even experienced teachers need professional development as their knowledge and skills can become outdated, hence, educational institutions should organise in-service training programmes which will contribute to the professional development of the teachers. Educational institutions should consider such professional development programmes as top priority as it leads to better performance and better teacher retention. When the quality of teaching improves, the students' performance improves resulting in high student achievement rate. Professional development can be integrated into the curriculum as this will ensure a culture of professional relationship among the teachers and help in the regulation of the day-to-day activities.

Professional development can be made effective with a good mentoring programme. Teachers can be coached by mentors to apply the knowledge and skills learnt in professional development workshops in their classrooms. Mentors should pay classroom visits, provide constructive feedbacks, help their protégés with finding suitable resources and offer guidance on follow up activities. To conclude, both the educational institutions and the individual teachers must take responsibility to organise and plan professional development programmes and participate enthusiastically in order to benefit all the stakeholders.

ABSTRACT

Here the researcher focused on how to explore teacher's both perceptions and beliefs that occurred during the process of teaching English. For the respective quantitative study, researchers have selected 29 teachers from India and data has been collected through the questionnaire on the online platform (Google form) using both direct and indirect questions to get perceptions and beliefs of tertiary teachers about techertalk. Data is collected by random sampling method. After observation and study researchers have concluded that although teachers are using various techniques like questioning, paraphrasing, summarizing, etc during their lecture, but they are unfamiliar with their proper names like Scaffolding. As well as they aren't familiar with a techertalk concept properly.

Keywords: Teacher talk, Perception, Belief.

INTRODUCTION

English language teaching (ELT) is one of the important disciplines of study. It is developed in various sub-branches also. As a global language, English is used as an important medium of communication, and instruction to transfer knowledge in almost all disciplines of learning. There are many methods and approaches to learning and teaching English. Teaching and learning are interrelated processes in which classroom, teacher, learner, curriculum etc. are crucial factors.

**Abhishek D. Shriram and Mahesh B. Shinde**

In India English has been introduced from primary level to tertiary level of education. English is taught as a compulsory subject from the first standard in schools to Undergraduate level in colleges. It is introduced to various postgraduate courses also. It is taught as a second language in urban as well as semi-urban and rural regions. Though the developed technology is used to learn and teach English language, most of the times the only medium for natural and essential inputs and exposure to English is the teacher and his/her talk/speech. In such a case, the importance of teachers' talk – both in terms of quality and quantity plays a crucial role. In India, although all students are learning English from primary level to tertiary level, most of the students are unable to use the English Language with fluency and accuracy. At tertiary level, though they are grown-up learners, they try to imitate their English teachers in case of learning English. Therefore, in the proper development of ELT, research on classroom interactions will play important role. Research on teachers' classroom activities and especially their speech has not been undertaken to a sufficient extent in India. The present research tries to fill this gap through researching on perceptions and beliefs of teachers about Teacher talk at the tertiary level.

LITERARY REVIEWS

Researchers Mahesh B. SHINDE & Tripti KAREKATTI in their research Primary Teachers' Beliefs about Teacher Talk in ESL Classrooms: a Perspective from India (2010) focused on primary teachers' beliefs about teacher talk and teacher talk features in ESL classrooms. Ten in-service primary English teachers (five from English Medium and five from Marathi Medium primary schools) are the subjects of this research paper. The paper discusses these teachers' beliefs regarding the amount of teacher talk, use of mother tongue (i.e. Marathi), and some teacher talk features like questioning, paraphrasing and repetition, and feedback. Researcher Dr Mahesh Shinde (2012) in his doctoral research 'Teacher Talk In ESL Classrooms: A Comparative Study Of English And Marathi Medium Primary Teachers' studied the comparison between the formal and functional features of English And Marathi Medium Primary Teachers' Teacher Talk. As an outcome of his study, he finds that functions of the teacher talk features in the English and Marathi medium schools are different and code-switching plays a greater role in Marathi medium school teachers' talk, especially at the initial stages.

Researcher Parvathini, Sushma (2015) in her doctoral research 'Understanding the Relevance of Interaction Approach in the ESL Classroom' studied the relationship between SLA and interaction by using a descriptive classroom-based observation from the perspective of Input Hypothesis, Output Hypothesis and Collaborative Dialogue. She has concluded that teacher questions are display questions and focused on the content of the lesson. Sandy Wirawan, Sahiruddin (2020) in their research 'Teacher Talk in EFL Online Classes at Indonesian Tertiary Level' examine the nature and types of teacher talk in an Indonesian EFL tertiary setting. The research design of this study is descriptive qualitative along with naturalistic study for analysing the data. NurMutmainnaHalim, YasintaWulandari, AbdHalim (2021) in their research studied students' perception towards teacher talk that happened during the teaching and learning process, and students' ideal expectations about their English teacher. It was a descriptive qualitative research where one English teacher and one class of first year senior high students were observed. The data collected from transcribed-classroom video recording and interview to some students. It concludes students' perception towards teaching style, such as teaching method, motivating, giving feedback were almost negative and students' ideal expectations that an English teacher should be more effective, efficient interactive and creative for creating more interesting classroom atmosphere.

Objectives

Considering the dearth of research on English teacher talk, especially at the tertiary level, the present research will be carried out for the following objectives:

- To understand various Perceptions of teachers about Teacher talk at the tertiary level.
- To observe and study Teacher Talk beliefs of English teachers at the tertiary level.

METHODOLOGY

What is Teacher Talk?

In the classroom, teachers change their talking according to the level of students, the intensity of the lesson at hand, the purpose and many more things. It helps to develop various styles of teaching with a variety of language that teachers use in the classroom is, in general, called teacher talk. Many Scholars have defined TT in various ways.

Richards (2002, p. 543) in *the Longman Dictionary of Language Teaching and Applied Linguistics* defines TT as: "...that variety of language sometimes used by teachers when they are in the process of teaching. In trying to communicate with learners, teachers often simplify their speech, giving it many of the characteristics of FOREIGNER TALK and other simplified styles of speech addressed to language learners."

Data Collection

Here the researcher focused on how to explore teacher's both perceptions and beliefs that occurred during the process of teaching. According to Cambridge Dictionary, Perception is a belief or opinion, often held by many people and based on how things seem. For the respective quantitative study, researchers have selected 29 teachers from India and data has been collected through the questionnaire on the online platform (Google form) using both direct and indirect questions to get perceptions and beliefs of tertiary teachers about techertalk. It is randomly sent to all kind of English teachers all over India. But here in this paper English teachers teaching at tertiary level are subjects of this research. The data were taken by questionnaire including both close and open ended questions. Both direct and indirect questions were asked to get perceptions of teachers. Samples from the data codified as T1 to T29 to keep teachers' Identity privacy. Subsequently, the result of the research was qualitatively analysed and presented.

FINDINGS AND DISCUSSIONS

Attraining about how to teach English to younger students

Yes. More than 75% Teachers have attended training. Teachers believe that special training is needed for the improvement of teaching skills, methods and it allows an understanding of the modern teaching tools. Teaching literature and teaching language both require different skills. One fifth teachers not attended any single training in their teaching period. Although teachers want to learn how to teach English Language but it is not also a part of BA and MA programmes. As T27 suggests the trainings provide guidance on how to teach different skills and sub skills and what methods to follow, how to design tasks to make learning interactive and effective. So they suggest adding it in core syllabus part of MA. E.g. T6 suggested 'Unless you have at least 2 ELT papers in the MA syllabus, it's better to attend at least a 6 months course.'

Need of a special training about how to teach English to younger students

Although knowing an importance of training only 4% teachers think that need of a special training about how to teach English to younger students is needed most of the time. 60% teachers preferred it sometimes. 20 % teachers think that there is no any need of a special training about how to teach English to younger students.

Use of Mother tongue in the Classroom by Teacher.

While teaching English more than 60% teachers use mothertounge sometimes. Many teachers use Mothertounge to make concepts' clear understanding at the time of students are unable to understand them through English Language, to let them relate with some similarities and differences. T10 suggests multilingual classroom instructional language fosters confidence and inclusiveness among students. 20% teachers never use Mothertongeduring teaching. Because they think that use of Mothertounge will hinder the learning process of students so they never use it. Only 7 % teachers use occasionally. These teachers use it occasionally to make learners understand the difficult concepts and theories, to refer to those cultural contexts only which might be difficult for the students to understand.

Abhishek D. Shriram and Mahesh B. Shinde

The use of the Mother tongue in the English teaching should be less than half of lecture time according to more than 60 % teachers but 12 % think that it should depends on situation in the class as shown in a Chart 3.B

- As Shown in Chart 4 near about 70 % teachers always give opportunities to students to speak during their lecture. 10 % teachers never give any opportunity to students during their lecture.
- As shown in Chart 5, 60% teacher always try to understand how the students feel but 3% teachers don't try to understand.
- As shown in Chart 6, near about 90% teachers ask questions to students during lectures.
- As shown in Chart 7, near about 60% teachers tell jokes to students during lectures. It helps to reduce tension among students.
- As shown in Chart 8 keeping respect of suggestions by students during lectures 95% teachers accept them, remaining teachers neglect it. Out of these 95 % more than 75% always accept and try to use ideas of students after their suggestion.
- As shown in Chart 9 more than 80% teachers give instructions in class at the time of teaching. Only 7% teachers never give any instructions.
- As shown in Chart 10, more than 80% teachers paraphrases lesson during their lecture. Only 3 % teachers don't use this skill.
- Scaffolding refers to a variety of instructional techniques used to move students progressively toward stronger understanding and, ultimately, greater independence in the learning process. .As shown in Chart 11, more than 80% teachers use scaffolding to encourage students to answer questions. in class at the time of teaching. Only 3% teachers never used it.
- As shown in chart 12 more than 85 % teachers use various concepts to review related concepts to the topic which help students to understand the concepts.
- As shown in chart 13 almost 90 % teachers summarize key concepts after teaching for a better understanding of students. 3% never summarize key concept.
- According 69% teachers' response teaching English to students is a challenging task, while feel that it is very difficult to English subject. Only 14 % teachers consider English as a easy subject as shown in chart 14.
- Almost all of students' learning of English depends on the Teacher's Talk according to teachers but not 100 %. It may vary student to student as shown in chart 16.
- According to chart 17, the total talk time of teacher during lecture varies per teacher. But on an average they think it should be in between 50% to 90 % i.e. near about 70 % should be Teacher talk time during lecture.
- In the classroom teachers use Lecture / instruction, one on one student-teacher interaction, Feedback, In-class homework correction, Listening comprehension activities, Student pairwork / groupwork. According to collected data as shown in chart 18 they prefer pairwork/ groupworkand lecture as a most important part of classroom time. As compared to other features In-class homework correction has less importance.
- According to teachers teaching English from standard 1 is useful for following reasons
 - It familiarise them with a new language at their critical stage of language learning. Exposure to language up to 12 years of age is conducive and effective particularly with respect to Learning and listening skills.
 - It is useful because it helps student to understand basic of English. If their basic ideas of English would be clear, it will help them in learning of English.
 - Their burden in understanding subjects through English Language will be reduced.
 - Students will get more exposure to English Language.
 - To overcome the influence of Mother tongue

As an English Language teacher, more than 50 % teachers believe and strongly agree that, it is important to adapt teaching materials to meet the needs of my learners whenever possible, also speak as little as possible to maximize student to student interaction, correct students if they've made a grammatical mistake or error and to give the whole class feedback at the end of each task. They are agree up to certain limit to give students as much speaking

Abhishek D. Shriram and Mahesh B. Shinde

time as possible, regardless of the lesson plan and teach solely from the book to best prepare them for the material they will be tested on.

CONCLUSION

In the respective study researchers have collected data through a questionnaire using both direct and indirect questions to get perceptions and beliefs of tertiary teachers about Teachtalk. Data is collected by random sampling method. After observation and study researchers have concluded that although teachers are using various techniques like questioning, paraphrasing, summarizing, etc during their lecture, but they are unfamiliar with their proper names like Scaffolding. As well as they aren't familiar with teachtalk concept properly. In the English teaching, in the view of teachers many feel that they should use the Mother tongue less than half of lecture time, give opportunities to students to talk, attend training to develop teaching skills but they don't. Also they feel important to adapt teaching materials to meet the needs of my learners whenever possible, also speak as little as possible to maximize student to student interaction, correct students if they've made a grammatical mistake or error and to give the whole class feedback at the end of each task. According to teachers teaching English from standard 1 is useful.

ACKNOWLEDGEMENT

Many people assisted me successfully to collect the data for this research paper. I want to thank everyone involved in this initiative. I'd like to thank my Guide Dr. Mahesh Shinde and my mentors Dr. R. D. Dhamakale, Dr. A. J. Pawar who helped me to learn a lot about this research. Their ideas and comments aided in the completion of this research. I'd like to thank The University of The English and Foreign Languages University - Hyderabad, Telangana, India for providing me with the opportunity to work on the research Indian Tertiary Teachers' Perceptions and Beliefs about Teacher Talk in ESL classroom. Thank you very much for arranging Contact Programme for PGCTE course. Last but not least, I would like to express my gratitude to my family, siblings, and friends for their invaluable assistance, and I am deeply grateful to everyone who has contributed to the successful completion of this project.

ABSTRACT

Folktales are the mirror of society, which not only represents the sensibility of the community by explicating the culture, myth, tradition, belief, custom, ritual, practices, etc. but also shapes the cultural identity of the community. The traditional oral narrative apart from representing traditional knowledge, life, and practices also deals with moral lessons and the social issues of the community. It is a method of preserving as well as a tool for understanding a particular culture. The Assamese folktales or “sadhukotha”, similarly, represent the traditional knowledge, practices, and cultural images of the community. The practice of gender as a social construction process has always been a significant discourse in understanding the position and representation of all sex categories in different socio-cultural spaces. Folktales as a literary and cultural tool are also a significant aspect in understanding the gender and its practices in the Assamese society. The traditional practices also differentiate the sort of gender discrimination in society. However, gender issues are also significant aspects often visible in the Assamese folktales, which is a much-needed approach to deconstructing traditional practices. The role of women in the Assamese folktales is crucial in shaping society and cultural identity, preserving cultural knowledge. The folktales also demonstrate the women's conditions in a patriarchal society. This paper seeks to explore the women's representation in the select Assamese folktale *Tejimola* along with how the traditional narrative of *Tejimola* pervasively conveys gender construction processes in the Assamese society.

Keywords: Folktales, Gender, Women, Culture, Discrimination.

**Krishna Kamal Khaund and Jalendra Phukan**

INTRODUCTION

Life revolves around folktales is shaped by folk beliefs, customs, mystery and ritual practices. It constructs individuals with both social and cultural ways of life. The folktales of any community thus not only simply share a moral lesson but also it consciously and unconsciously develop the cultural mindset of the people. The cultural differences, geography, and the distinct ways of life differentiate the traditional oral narratives and folktales among the communities. Folktales are the method of preserving indigenous knowledge transmitted from generations as well as a way of shaping the socio-cultural life of the community. The elder i.e. the grandmother, grandfather to the younger, generally tells it. People do not seek any logical and philosophical enquiry in the story rather the situation and characters influence them. However, in contemporary society, people do return to their traditional past in search of their cultural roots, and identity retrieving the history, memory and any form of cultural articulation. Therefore, folktales become a tool for the generations that mirror society. The word folktale is the portmanteau of the folk-people and the tales include stories, myths, legends etc. that means the people's tales, or the tale of the people transmitted orally from generations. The subject matter of the folktales, as it mirrors the folk life includes every aspect of human life i.e. entertaining, scary, and exciting, humour, providing moral lessons, and explaining things so that the common people understand the social life and the prevalent cultural knowledge.

The re-reading of folktales establishes a notion in connection with the contemporary socio-cultural status of the people to understand the cultural values and attitudes in the dynamic process of society and culture. Thus, the retelling of the folktales gives the reader a new perspective to grasp the meaning of folktales in the dynamic process. That perspective can be social, political, cultural, psychological and gender, which opens a wider space to parse the cultural practices and social life in connecting with contemporary society. American Folklorist Alan Dundes discusses the meaning of folktales in connection with folklore. His definition of folk refers to "any group of people whatsoever who share at least one common factor. It does not matter what the linking factor is-it could be a common occupation, language, or religion-but what is important is that a group...have some traditions that it calls its own" (Dundes, 1965: 2). Thus, Dundes definition of folk represents something that belongs to the community by referring the word "own", which sketches the rootedness and identity of the community.

Folktales are the storehouse of cultural knowledge. People learn many things from the stories and the experiences shared through stories to solve the problems of their lives. It also initiates a cultural and social map in the human mind to undertake social responsibilities, folk life, and behaviour of the community. The traditional narratives of life and culture in the form of stories have been re-read and reinterpreted by scholars and intellectuals in connection with contemporary society and culture. However, the society and gender issues presented in the stories have changed with time. The normalisation of gender in comparison to the ancient society initiates a new narrative in the contemporary world.

The Assamese folktales alike other communities' folktales rooted in their social and cultural practices representing the life of the people. Similarly, the cultural worldview is also a significant aspect of the folktales of the community. Folktales a mirror of society include every aspect of human life. The pioneers of Assamese folklorists like Birinci Kumar Barua, Lakshminath Bezbarua, Prafulladutta Goswami etc.

**Krishna Kamal Khaund and Jalendra Phukan**

explore the folk culture and life of Assam. Birinci Kumar Barua published his book *Asamar Lokasamskriti* (Folklore of Assam) in 1961. However, Sadhu Kotha is a popular term widely used in Assamese literature, the term Sadhu Kotha is widely used in Assamese literature, which includes stories, legends, myths, folktales etc. It is a literary document, which preserves the cultural ethos of the community. Moreover, the social and cultural identity of the community is a major aspect represented in folktales using language associated with culture, dress, traditional and ritual practices, beliefs, customs etc.

Folktales are the cultural tool that preserves a community's cultural identity, practices, and traditional knowledge. The society represented in the folktales deals with different socio-cultural issues where gender and women representation is one of them. The conscious attempt of gender studies and women in various socio-cultural spaces has become a significant aspect of contemporary society. This article intends to explore the gender and women representation in the collection of folktales *Burhi Ai Sadhu* by Lakshminath Bezbaroa particularly focusing on the tale *Tejimola*. When the term gender comes to our mind, the particular idea appears as a social construction, which differentiates all sex categories. The unequal distribution of social status and power under gender norms therefore initiates discrimination in the society along with the roles regarding male and female. Consequently, emerging gender studies as a socio-cultural, philosophical, and political approach deconstruct those established ideas in society. Therefore, this paper has analysed the established idea of gender relating to Assamese folktales and how women are treated in the traditional Assamese society. The methodology of this paper is qualitative and interpretative. It has also used the comparative method to explore the gender and women representation in both the original and the retelling of the story.

Gender and Representation of Women in *Tejimola*

After exploring the history, culture and society of almost all the cultures of the world, a conclusion can be made regarding status and position of women who have always been playing a subversive role in the society. The suppression of women under patriarchy and any others cultural practices is not rather than a social construction from the ancient times. The social construction process and practices, therefore, is a gender discourse, which initiates division of people because of biology, sex and power. Because of these features, the role of men and women in the society is different which construct the politics of gender and its discrimination. Therefore, exploring society from the various aspects is a present need to resolve those issues that harm the human relationships. Folktales as a cultural tool are significant to understand the socio-cultural aspects of the society, which reveals the traditional principles, and practices of the society along with various issues such as gender practices. Moreover, the story telling persuade the community to continue the traditional practices as it is there in the society by construction the people's mind in a conscious way.

Assamese folktales represent women within gender norms in a relatable manner. The representation of women in Folktales is significantly related to the socio-cultural practices and its life of the community that determines both the space and status of women. The folktales not only represent women completely from negative or positive aspects rather than a combination of both which reveals the writer's ethical representation of the image of the Assamese society. Folktales generate kinds of varied emotions among the readers. The orally transmitted stories arouse emotion in the audience, primarily the children that initiate their emotional development. However, the emergence of gender studies differentiates the role

**Krishna Kamal Khaund and Jalendra Phukan**

and representation of men and women as presented in the folktales. The retelling of the stories tries to omit the gender narrative and to reduce the gender stereotypes and prejudice in the stories. It has begun the notion of equality through the stories by changing the traditional mindset of the people. Simon de Beauvoir's notion of 'other' is prominent in understanding the status of women in the Assamese patriarchal society. The social norms and practices portray women as other, counterparts of men and passive objects dominated by men, which is also visible in most of the folktales. Consequently, on the one hand, it consciously suppresses both the role and voice of women in society and on the other hand; it shapes the generation's mind to continue the same stereotypical treatment in the society. Therefore, the conscious attempt of re-reading and re-telling stories deconstructs those biased social issues presented in the folktales.

Lakhminath Bezbarua's *Burhi Ai Sadhu* is a collection of folktales (Grandmother's Tale) which represents women in varied manners in Assamese traditional society under the patriarchal system. This collection of short stories depicts Assamese culture, traditions, and rural life, often conveying moral lessons and delving into the intricacies of human relationships. The characterisation of women as good and evil is also revealed in the folktales *Burhi Ai Sadhu*. The role of stepmother is represented as a shrew woman who mistreats her stepdaughter on the one hand, and on the other hand, the image of 'Tiruta' (Woman) as Lakhimi represented as an ideal who brings prosperity to her family. Therefore, Bezbarua reveals both sides of human personality through the representation of various women characters. The wisdom and intelligence of women are also represented through the stories. In the title, *Burhi Ai Sadhu* the Assamese term *Burhi* means in English an old woman. It refers to women as traditional knowledge bearers. Apart from that, it also tries to reveal women's role in shaping culture and society by sharing and preserving cultural knowledge. Nonetheless, the woman's representation in the folktales by men introducing a woman narrator is crucial to understand from a gender perspective.

The story *Tejimola* tells the hardship and struggle of a little girl Tejimola. The frequent transformation of Tejimola into different forms is itself a voice against the cruel treatment of her stepmother. The folktale *Tejimola* begins with the line "A merchant had two wives. The elder one had a daughter Tejimola by name. The younger wife had no issue. Tejimola's mother died when she was an infant. As such, she was brought up by her step-mother" (Bezbarua 36). It represents the polygamy system in a society where the man can keep many wives he wants. Thus, the concept of power and the position of men in comparison to women as superior in society appear here and women as inferior depend on men. Moreover, another gender-biased image is also drawn in Bezbarua's folktales through husband-wife relations. The tale highlights "It was only out of fear of her husband that she brought up Tejimola" (Bezbarua 36). The term 'fear' differentiates the gender role of husband and wife, which is prevalent in society. Consequently, the gender narration method through language in society both culturally and linguistically discriminates human beings by shaping their conscience and dividing their role.

In the folktale, Tejimola, the character Tejimola is represented as innocent and pure as a little girl. Her response towards the evil deed of her stepmother determines her submissive behaviour in the tale. It was out of fear only Tejimola submit herself to the stepmother. Nevertheless, modern critics and researchers compare the Tejimola's various transformations such as gourd-plant, citrus plant, lotus-plant, saalika (Maina), and later Tejimola with the condition of Northeast people who have been trying to raise their voices against the mainland society to acquire identity and space of their own. Bezbarua draws a

**Krishna Kamal Khaund and Jalendra Phukan**

culturally populated image of the stepmother as a shrew in Assam that may not be relevant in contemporary society. The stepmother on the other hand is revealed as evil and dominative of the stepdaughter. Her representation in front of her husband is ideal, dutiful, and submissive which examines the traditional image of woman in the Assamese society. Therefore, the conventional gender division of man as superior, and strong and woman as inferior, and weak is exhibited in the tale. Moreover, the persistent existence of the images of stepmother and stepdaughter has been changing with time. Tejimola's relationship with her stepmother is pathetic which portrays the psychological state of women. The love of Tejimola's father towards her and not paying much attention to his second wife (Stepmother) can be a reason that initiate mental dissatisfaction of his wife and arouse anger and jealousy, which makes stepmother's inhuman treatment of Tejimola. Moreover, the stepmother's greed is another reason that causes her cruel treatment of Tejimola as she thinks if she ends the co-wife's daughter's life, she can send that property to her parent's house instead of sending it with Tejimola during marriage. Thus, Bezbarua not only represents what a reader can see from the outside but also the inner reality of the human mind that causes the outer conflict. Moreover, the two contrast images of stepmother in the two different spaces as submissive in front of husband and dominative in front of stepdaughter refer to the gender roles and its construction.

However, at the end of the tale, the reader notices how Tejimola regain her actual human form and her father drives his wife out of the home. Here again man as head of the family plays the authoritative role in the household which refers to the gender position of man. The re-reading of the relationship between Tejimola and stepmother can be drawn from a peaceful manner. Rather than creating a conflict between the two women characters in the tale in the absence of the male member, the narrative can be made peacefully or happily while presenting the women's relationship. It helps them both to understand each other. Moreover, it will be an example for the generations and a peaceful image of women in a space called home. Thus, this represents the significance of retelling stories and how the new narrative can reshape the generations' minds in establishing a society free from gender-based issues.

CONCLUSION

Folktales always shape the cultural and social mindset of a community. The re-reading of folktales in contemporary society initiates both social and cultural awareness among human beings. Apart from socio-cultural issues, the folktales also provide a space to trace the cultural roots and identity of the community. The conscious attempt to make a new narrative in connection with the socio-cultural changes thus assists in solving many problems. Therefore, re-reading emerges as an approach to re-think those prevalent social issues and cultural images of all gender categories. A new narrative along with a new order is possible only when people rethink their traditional past. The folktale *Tejimola* is an apt example of the representation of women and gender-biased image in Assamese society. On the other hand, the re-telling of the tale *Tejimola* tries to solve the social issues like gender and representation of woman and their relationship in the household, which shares a social message to the generations in a peaceful way.

ABSTRACT

The complex relationship dynamics in Indian culture are frequently explored in Chitra Banerjee Divakaruni's novels. By means of her works, such as *The Mistress of Spices*, *Queen of Dreams*, and *The Palace of Illusions*. The study examines the ties of family, friendship, love, and tradition, demonstrating how crucial they are to the development of human lives. The complexity and values ingrained in Indian civilization are richly portrayed in these works. The novels *The Mistress of Spices*, *Queen of Dreams*, and *The Palace of Illusions* by Chitra Banerjee Divakaruni are engrossing pieces that examine various roles of relationships in Indian culture. These novels demonstrate Divakaruni's talent for weaving together cultural details, interpersonal interactions, and personal problems to produce narratives that are both captivating and resonant.

Keywords: Indian Culture, Family Relationship, Social Structure, Myth, Immigration.

INTRODUCTION

Chitra Banerjee Divakaruni, an Indian-born author who lives in the United States, originally gained recognition for her poetry before publishing a string of acclaimed novels and short stories. Divakaruni writes about immigration, the South Asian experience, history, myth, and magic. Her writings allow for a wide range of interpretations, including

**Anu and Deepa**

feminism, transnationalism, and multiculturalism. The works of Divakaruni depict her experiences as a first- and second-generation immigrant caught between cultures and traditions.

The study of the novels of Chitra Banerjee Divakaruni, including *The Mistress of Spices*, *Queen of Dream*, and *The Palace of Illusion*, has, through their writings, addressed the terrible traumas of the search for self-identity. Interview with Chitra Banerjee Divakaruni by Mehta, Divakaruni said that, "Writing about strong women has always been important to me. I hope my female protagonists inspire my readers and break some stereotypes..." (Mehta). Divakaruni's firm assertion is that women could do a lot in listening to each other's past and present and could arrive as a common consensus in combating the problems of the family. Divakaruni's first novel, *The Mistress of Spices* (1997), is about a young Indian girl named Tilottama also known as Tilowho was born into a destitute family. Tilo assists clients in resolving issues while working as a mistress in a spice store in Oakland, USA. Tilo develops an Indian-American identity after falling in love with American Whitman Raven and uses her mystical, magical, and visionary abilities to further her service. In *Queen of Dreams* (2003), Mrs. Gupta, a mother, and her daughter Rakhi are featured. Rakhi seeks out her mother's dream journals and finds them in Berkeley, California. Rakhi's mother, who left India to avoid being imprisoned, reared Rakhi when she was born there. Rakhi and her father make an effort to interpret and comprehend her mother's journals after her death. Sonny, Rakhi's husband, is a musician. Rakhi's journey is evidence of the strength of dreams and the value of tenacity, despite her mother's advice to be resilient and not to worry too much about competition.

The Palace of Illusions (2008) explores the *Mahabharata*, an Indian epic between 5000 and 6000 BC, centred around Draupadi. The epic follows the Pandavas and Kauravas, who fight for the throne. The story revolves around the Pandavas, who are good and virtuous, while the Kauravas are evil and cruel. Panchaali marries the Pandav brothers, who love and respect her. Yudhishthir loses his kingdom to gambling, leading to her exile and the kingdom being taken over by Duryodhan. An essential component of the social system is the family. The family is made up of people with blood ties. Family is the main social unit, and members of the family share each other's joys and pains and rely on one another. They talk to each other about a variety of topics and express their feelings, including thoughts, delight, happiness, irritation, fear, and suffering.

In an Indian family, an elderly person is in charge of providing for numerous requirements, including clothing, food, and shelter. There are two types of family structures: nuclear families and joint families, the latter of which consists of three to four generations living under the same roof. The extended family system, which consists of grandparents as well as uncles, aunts, nieces, and nephews, all resides under one roof. A shared hearth, income, ownership of property, and close blood ties are all features of the joint family system. The entire extended family resides in the same home, including the mother, father, kids, grandparents, uncles, and cousins. A nuclear family is made up of a father, mother, and kids. People in Indian culture respect their elders, obey their commands, and look to them for wisdom. According to Dr. B. Karthikeyan's *A Study of Family Relationships in Chitra Banerjee Divakaruni's Fiction* "The family relationships play a key role in preparing the future generation for life in the community..." (Karthikeyan, p. 141). Karthikeyan present the importance of relationship for a healthy community. According to Benjamin, "the individual grows in and through the relationship to other subjects...mutual recognition" (Benjamin, p. 20). Benjamin places a strong emphasis on the potential for personal growth within relationships. According to Banu's *Myth and Culture in Chitra Banerjee Divakaruni's The Mistress of Spices*. It delves into the intricate dynamics of family relationships within immigrant families, emphasizing the pivotal role of cultural heritage and intergenerational interactions. The author highlights how parents, especially mothers, serve as custodians of cultural traditions, using dreams and memories to transmit these values to their children. This cultural transmission is depicted as both a source of connection and conflict, as children navigate between their inherited cultural identity and the societal norms of their new environment. The narrative underscores the symbolic importance of dreams and memories in maintaining familial bonds and shaping personal identities.

**Anu and Deepa**

According to Minny's *Magical Realism in Cultural Conflict of Rakhi in Chitra Banerjee Divakaruni's Queen of Dreams*. It examines family relationships through a literary lens, focusing on how these relationships are portrayed in literature. The author explores themes of conflict and resolution, particularly between different generations, and how these conflicts reflect broader societal and cultural issues. The depiction of gender roles and the emotional support provided by family members are also key themes. The author argues that literature serves as a mirror to real-life family dynamics, offering insights into the complexities of cultural hybridity and the evolving nature of familial roles.

It provides nuanced views on family relationships, with the first focusing on cultural and psychological aspects within immigrant families and the second on literary depictions of these dynamics. Together, they highlight the multifaceted nature of family bonds, emphasizing the importance of cultural heritage, narrative, and emotional support in shaping familial relationships. Chitra Banerjee Divakaruni in her novels, she gives a lot of attention to the relationships between sisters, parents, husbands, and wives, as well as between mother and daughter. Tilo and Raven, the major characters in *The Mistress of Spices*, have relationships akin to those of Rama and Sita. Tilo and Raven are in a romantic relationship and smitten with one another.

Tilo, a mistress and proprietor of a spice bazaar, is a lady in America who struggles with a variety of issues. Using the power of spices, she aids many characters and resolves their issues. Tilo manages her life's challenges like a man because she also makes money from her spice shop. Divakaruni presents Tilo as a remarkable woman who seeks to demonstrate her loyalty to her relationship with Raven. When Tilo encounters Raven, a lonely American, she falls in love. Tilo makes the decision to devote herself to him in his flat as an older woman. She transforms herself into a young, gorgeous woman by using Marakadwaj spices to enhance her beauty. By offering herself to Raven, "For the first time I admit I am giving myself to love. Not the worship I offered the old one, not the awe I left for the spices --- The anger of spices, their desertion. The true risk is that I will somehow lose this love". (*The Mistress of Spices*, p. 219) she violates her pledge to loyal to spices. According to Morton Marcus "The novel is a love story whose outcome keeps the reader in rapturous suspense from beginning to end, and a depiction of the harsh realities of inner-city life, mixed with a sense of a myth world paralleling this one, is nothing less than enthralling" (Marcus, p. 51). She changes her attitude after the earthquake and decides to assist people. Raven decides to follow her as she makes her way back to Oakland. Following her romance with Raven, Tilo loses her magical abilities. In the end, Raven gives her a new name Maya and replaces her previous one. Tilo agrees to use her new name, Maya, even though it has too many meanings, illusion, spell, enchantment, etc. Maya is a Hindu phrase that refers to the world's deceptive power. She wants to live her entire life with Raven; in this way, Raven is her husband. Tilo and Raven begin their married life in this manner.

In his research, Kallur N.H. focuses on the experiences of Indian immigrants Tilo, Lalita, Haroun, Geeta, and her grandfather, Jagjit, Shamsur, and Hameeda, as he examines the diasporic themes in Chitra Banerjee Divakaruni's *The Mistress of Spices*. The novel examines Indian immigrants' experiences, stressing issues with identity crisis, racial prejudice, ambivalence, nostalgia, displacement, adjustment issues, reluctance to absorb new ideals, homelessness, and rereading and rewriting. *The Mistress of Spices* illustrates both the bad and the good sides of having several identities, going through an identity crisis, and having shattered pictures. The work also examines exile or migration, with exile having a negative connotation and migration being either voluntary or involuntary. For instance, Nayan Tara's deportation from her hometown to the pirates' base was unintentional, whereas

The mother-daughter bond between Mrs. Gupta and Rakhi is shown in the novel *Queen of Dreams*. Rakhi and Mrs. Gupta are not friendly with one another. As a result of Mrs. Gupta keeping her past life secrets from her daughter, friction and distance between the two of them have grown. Rakhi, Mrs. Gupta's daughter, enjoys western culture; hence, Mrs. Gupta wants her to live a luxurious life in line with it. The fact that Rakhi is also interested in Indian cultural history suggests that Rakhi's mother's death has prompted her to ask about her mother's diaries. But she has

Anu and Deepa

a really strong desire to learn about Indian culture, and her paintings show this in terms of her creativity and cultural awareness. In *Queen of Dreams*, the main characters are Mrs. Gupta and her daughter Rakhi, born in America. Rakhi and her mother live in Berkeley, California, and their strained relationships are portrayed. Despite being influenced by American culture, Rakhi understands her mother's behaviour and work. Mrs. Gupta's numinous world of dreams has nothing to do with Rakhi's everyday concerns. Rakhi observes the strained relationships between her mother and Rakhi, highlighting the complex dynamics of family relationships. "To give my mother credit, she never tried to pressure me...Perhaps this is why she dreams and I paint" (Queen of Dreams, p. 34). Because Mrs. Gupta wants Rakhi to live her life the American way, Mrs. Gupta keeps her history a secret from her daughter. Rakhi is relieved that she did not adopt her mother's role as a dream interpreter. Mrs. Gupta dies in an accident. After the death of Mrs. Gupta, her daughter Rakhi and her husband explore Mrs. Gupta's mystery of interpreting dreams. When she reads the dream journal of Mrs. Gupta and has it translated with the help of her father into Bengali, she tries to understand her mother's life. Rakhi tries to make sense of her mother's death.

The complexity of family ties and how they are viewed differently in East and West cultures are also depicted in *Queen of Dreams*. This story makes intricate use of how social and cultural conventions are upheld, as well as how one's heritage is protected and revered. Rakhi was quite moved by the gathering of mourners present at Mrs. Gupta's daughter cremation. She had it in her head that individuals who showed up for the burial rites had a genuine relationship with her mother. Rakhi finally comes to terms with the complexities of both life and relationships. She now recognises how her motherly traits affect the affection of her daughter Jona, her husband Sonny, and her father. Rakhi notices the mysterious personality of Jona, who is Rakhi's daughter. Mrs. Gupta dilemma "I was not a good mother to Rakhi. I loved her, but not fully. To love someone fully is to give up selfhood, and I could not risk that. She knew this. Perhaps that is why she constantly longed to understand who, I am, to become who I am". (Queen of Dreams, p.328). In order to preserve her abilities as a dream interpreter, Mrs. Gupta desired a separation from her daughter, Rakhi. Her notebook reveals that she was brought out of the slums and taught how to use her skill in the dream-tellers' caverns. Rakhi's mother was against her father, whom she meets on a trip to Calcutta and falls in love with, although dream tellers are not expected to fall in love.

In addition to exploring the mother-in-law and daughter-in-law relationship, *The Palace of Illusion* also shows how Kunti and Draupadi's relationship evolves over the course of the novel's plot, moving from a hasty attitude to one of appreciation. The way the woman forces her sons to obey her orders demonstrates her courage and insanity, which Draupadi admires. Draupadi is the main character and the narrator of the novel *The Palace of Illusions*, which is written from her point of view. The linkages in the study are intricately entwined. The truth is that Panchali had five spouses, and this influences her behaviour. Approaching numerous unusual occurrences that are difficult to categorise. Despite the fact that she is at the centre of the narrative, Originality is hardly significant. She is the main character in this adaptation, and is her voice, which narrates the story of her birth by fire, her journey to Swamyavar, and She was humiliated in the Kaurava court before her marriage to the Pandavas.

Class divisions in society were more obvious at that time. However, the treatment of women by these classes was equal. For the sake of illustrating Draupadi's ties with her maid, Dai Ma, Divakaruni also emphasises the lower classes. Dai Ma can be considered Draupadi's tutor and the ideal maid from the very beginning of the novel. She therefore feels an inexplicable and tremendous love for Dai Ma. She introduces Draupadi to society and educates her on how princesses are expected to behave. Every time Draupadi asks her Dai Ma to let her help with household duties, she stops her and points out the disparity in social class. In this regard, Dai Ma and Draupadi's relationship is not a mistress-maid one. Her relationship with Kunti is really intriguing to begin with. Although she is Panchali's mother-in-law, she is also the mother of the Pandavas. As a result, Divakaruni discovers the secret narrative that exists between Kunti and Panchali. Draupadi is portrayed by Divakaruni as a princess who is willing to push over the boundaries set by social conventions. In a society where a guy is free to wed as many women as he wants, a woman who weds more than three men is regarded as whose. King Drupad hesitated when Kunti proposed that

**Anu and Deepa**

Drapaudi marry each of her five sons. He has a deep love for his daughter. Draupadi and her father have a close relationship. He was wary for that reason. Considering that he did not want his cherished daughter to practise polygamy, Draupadi frequently displays her intense devotion for her father. The bond between Draupadi and her brother is strong but also slightly tense. To study with her brother, she engages in conflict with her family members. She appears to be eager to learn the principles of statesmanship, much like her brother.

Summation

The novels by Chitra Banerjee Divakaruni provide a very incisive, realistic look at family connections, exposing the many strands and layers that entwine the relationships in a very nuanced and complex way. In the background of the immigrants' lives torn between the clash of several cultures, relationships between husband and wife, daughter and mother, daughter-in-law and mother-in-law, etc. are described in a gripping way.

ABSTRACT

This paper explores the intricate relationship between ethnocentrism and cultural hybridization in the realm of contemporary literature. As societies continue to become increasingly interconnected and diverse, literature plays a pivotal role in reflecting and shaping these transformations. Ethnocentrism, a phenomenon deeply rooted in human nature, often surfaces in literary works, reinforcing stereotypes and biases while simultaneously offering opportunities for critique and transformation. Simultaneously, contemporary literature also embraces cultural hybridization, where authors draw from multiple cultural influences to create narratives that transcend boundaries and celebrate diversity. This study employs a comprehensive literature review and analytical approach to explore how these two seemingly contrasting forces intersect and influence one another in contemporary literary works. By selecting a range of representative texts, we analyze instances where ethnocentrism and cultural hybridization coexist within the narratives. The findings of the paper will highlight the importance of recognizing and addressing ethnocentrism in literature while celebrating the potential of literature to promote cultural hybridization and diversity, fostering a more inclusive and empathetic society.

Keywords: Cultural hybridization, Ethnocentrism, Sociocultural, Syncretism, and Multicultural.

INTRODUCTION

Contemporary literature is a dynamic reflection of the rapidly evolving cultural landscapes in our globalized world. As societies intermingle, cultures collide, and boundaries blur, the written word becomes a potent medium through which to explore the multifaceted interactions of diverse communities and their shared narratives. Within this rich tapestry of contemporary literary works, two prominent themes emerge as central and intertwined: ethnocentrism

**Saravana Selvakumar et al.,**

and cultural hybridization. Ethnocentrism, a deeply ingrained aspect of human psychology, involves the tendency to perceive one's own culture as superior or as the reference point against which all other cultures are evaluated. This ethnocentric lens has often been present in literature throughout history, reflecting societal biases and reinforcing stereotypes. However, contemporary literature also exhibits a remarkable counterbalance in the form of cultural hybridization - a process by which authors draw inspiration from multiple cultural sources, transcending geographical and cultural boundaries to create narratives that celebrate diversity.

The significance of exploring these themes lies not only in their inherent value for literary analysis but also in their broader sociocultural implications. As our world becomes increasingly interconnected and multicultural, understanding the role of ethnocentrism and cultural hybridization in contemporary literature becomes essential. Literature, as a mirror and a catalyst for societal change, provides a unique lens through which we can navigate the complexities of cultural identity, challenge prejudices, and ultimately foster cross-cultural understanding.

This paper embarks on an exploratory journey into the heart of this dynamic interplay between ethnocentrism and cultural hybridization in contemporary literature. Through a combination of comprehensive literature review and critical analysis, we aim to uncover the subtleties and complexities of these themes as they manifest in selected literary works. By examining instances where ethnocentrism and cultural hybridization coexist within narratives, we seek to shed light on how authors negotiate these themes, the impact on character development and plot, and the broader implications for our evolving cultural landscape. In doing so, we hope to not only deepen our appreciation for the transformative power of literature but also to contribute to a more nuanced understanding of the forces shaping our multicultural world. As contemporary literature continues to evolve, this study serves as a testament to its capacity to both challenge and transcend ethnocentrism, fostering a literary landscape that celebrates the rich tapestry of human experience in all its diversity.

Historical Roots of Ethnocentrism in Literature

The presence of ethnocentrism in literature has historical roots dating back centuries. Throughout literary history, authors have often portrayed their own culture as superior to others, perpetuating stereotypes and biases. This phenomenon was particularly pronounced during periods of colonialism and imperialism, where European powers frequently depicted non-European cultures as exotic or inferior in their works. Such portrayals not only reflected prevailing societal attitudes but also contributed to the reinforcement of ethnocentrism. The literary canon of the 19th and early 20th centuries is rife with examples of ethnocentric perspectives. For instance, Joseph Conrad's "Heart of Darkness" exemplifies the Eurocentric view of Africa, presenting it as a dark, uncivilized place in need of European enlightenment. Similarly, Rudyard Kipling's "The White Man's Burden" serves as a stark illustration of the colonialist mindset, with its patronizing portrayal of non-European cultures.

The Emergence of Cultural Hybridization in Contemporary Literature

In stark contrast to the ethnocentrism prevalent in historical literature, contemporary literature has witnessed a flourishing of narratives that embrace cultural hybridization. Authors in the 21st century increasingly draw inspiration from multiple cultural sources, creating works that transcend geographical and cultural boundaries. This phenomenon is a testament to the interconnectedness of our modern world and the growing awareness of cultural diversity. A prime example of cultural hybridization in literature is Jhumpa Lahiri's "The Namesake," which explores the experiences of a Bengali-American family navigating the complexities of cultural identity in the United States. Lahiri skillfully blends elements of Indian and American cultures, capturing the challenges and richness of a hybrid identity. Such works challenge the binary notions of culture and ethnicity, showcasing the potential for cross-cultural dialogue and understanding.

Contemporary Literature as a Reflection of Multicultural Societies

Contemporary literature's unique contribution lies in its ability to reflect and shape the multicultural societies in which it is rooted. It acts as a mirror, allowing readers to confront the biases and prejudices that may persist in society. At the same time, it catalyzes change by offering alternative perspectives and narratives. Recent scholarship

Saravana Selvakumar et al.,

has explored how contemporary authors actively engage with issues of ethnocentrism and cultural hybridization. The works of Chimamanda Ngozi Adichie, for instance, offer powerful critiques of ethnocentrism and colonialism in Africa, challenging Western-centric narratives. Similarly, the novels of Junot Díaz, such as “The Brief Wondrous Life of Oscar Wao,” exemplify the fusion of cultures in the United States and provide a platform for exploring the complexities of identity. As the review of literature demonstrates, contemporary literature not only reflects but actively engages with the themes of ethnocentrism and cultural hybridization. These themes are not isolated but exist in a dynamic interplay, offering opportunities for introspection, critique, and transformation.

Research Approach

To investigate the interplay between ethnocentrism and cultural hybridization in contemporary literature, this study employs a qualitative research approach. Qualitative analysis allows for an in-depth exploration of the selected literary works, enabling us to uncover nuances, patterns, and themes that might not be readily apparent through quantitative methods.

Selection of Literary Works

The selection of literary works is a crucial aspect of this study. We aim to capture a diverse range of contemporary literature that addresses ethnocentrism and cultural hybridization. To achieve this, we employ purposive sampling, focusing on works that are widely recognized for their relevance to these themes.

The criteria for selecting literary works include

Relevance to ethnocentrism and cultural hybridization. Diversity in authorship and cultural backgrounds. Recognition and critical acclaim within the literary community. Representation of a variety of cultural contexts.

Data Collection

Data collection for this study primarily involves close textual analysis of the selected literary works. We read each text multiple times, focusing on identifying instances of ethnocentrism, cultural hybridization, and their intersection within the narrative. To facilitate the analysis, we create a structured coding framework. This framework allows us to categorize and code passages, dialogues, and character interactions that pertain to ethnocentrism and cultural hybridization. Additionally, we pay particular attention to authorial choices, character development, and plot dynamics related to these themes.

Data Analysis

The data analysis process is iterative and systematic. We employ content analysis techniques to extract meaning from the textual data. This involves categorizing and coding textual excerpts related to ethnocentrism and cultural hybridization, as well as identifying patterns and recurring motifs. Throughout the analysis, we maintain a reflexive approach, acknowledging our subjectivities and biases. This reflexivity allows us to critically engage with the text and remain open to diverse interpretations.

Interpretation and Synthesis

The interpretation phase involves synthesizing the findings from the data analysis. We seek to unravel the complex interplay between ethnocentrism and cultural hybridization within each literary work, exploring how authors navigate these themes and their implications for character development, plot progression, and overarching narrative.

Validity and Reliability

To ensure the validity and reliability of our findings, we employ several strategies. These include inter-coder reliability checks, where multiple researchers independently code and analyze portions of the text. Any discrepancies are resolved through discussion and consensus.

Ethical Considerations

This study respects ethical considerations regarding the use of literary works and their authors' rights. All citations and references are appropriately credited, and the analysis focuses on the literary elements and themes rather than the personal aspects of the authors. This methodology section outlines the research approach, the selection of literary works, data collection, analysis methods, interpretation, and considerations for validity and ethics. You can adapt and expand upon this methodology as needed for your specific research.

Ethnocentrism in Contemporary Literature

Ethnocentrism, a deeply ingrained aspect of human psychology, continues to find its place within contemporary literature. Despite the ever-increasing awareness of cultural diversity and the pursuit of inclusivity, ethnocentrism persists as a thematic undercurrent in many contemporary literary works. This section explores the manifestations of ethnocentrism in contemporary literature, illustrating its relevance and persistence in the narratives of the 21st century.

Stereotypes and Characterization

One of the most apparent ways in which ethnocentrism manifests in contemporary literature is through the perpetuation of stereotypes and biased characterizations. Authors may inadvertently or deliberately employ stereotypes when crafting characters from different cultural backgrounds. These stereotypes often serve as shortcuts to convey cultural differences but can inadvertently reinforce negative perceptions. For example, the portrayal of certain ethnic groups as exotic, dangerous, or inherently inferior can be found in contemporary novels. Such characterizations contribute to the perpetuation of ethnocentric views, hindering genuine cross-cultural understanding and empathy.

Cultural Clashes and Misunderstandings

Contemporary literature frequently explores the clash of cultures in our globalized world. These narratives may delve into the misunderstandings and conflicts that arise when characters from different cultural backgrounds interact. While this exploration is valuable for highlighting the challenges of cultural diversity, it can also reinforce ethnocentrism if handled insensitively. For instance, a novel depicting a character's discomfort or frustration when encountering unfamiliar cultural practices may inadvertently reinforce ethnocentric perspectives. The reader's sympathies may align with the character who struggles, perpetuating an "us versus them" mentality.

Cultural Appropriation

In the realm of contemporary literature, the issue of cultural appropriation often arises. Cultural appropriation occurs when elements of one culture are borrowed or used by individuals or authors from another culture, typically without permission or sensitivity to the cultural context. This practice can perpetuate ethnocentrism by treating one culture as a commodity to be consumed without understanding or respect. For example, an author incorporating elements of a marginalized culture into a story without a deep understanding of its significance or history may inadvertently reduce that culture to a mere backdrop or stereotype, reinforcing ethnocentrism.

Subversion and Critique

While ethnocentrism is indeed present in contemporary literature, it is important to note that authors also use their works to subvert and critique these biases. Many writers actively challenge ethnocentric viewpoints by presenting characters who defy stereotypes, fostering empathy for diverse cultures, and deconstructing the concept of cultural superiority. Authors such as Chimamanda Ngozi Adichie and Zadie Smith have gained acclaim for their novels that confront ethnocentrism head-on. Their works shed light on the complexities of identity and challenge readers to question preconceived notions. In conclusion, ethnocentrism remains a persistent theme in contemporary literature, reflecting the continued relevance of this issue in our multicultural world. While some works inadvertently perpetuate stereotypes and biases, others actively engage in critique and subversion, offering readers opportunities for introspection and growth. The presence of ethnocentrism in contemporary literature underscores the need for continued exploration and dialogue surrounding these complex themes.

Cultural Hybridization in Contemporary Literature

In stark contrast to ethnocentrism, contemporary literature has become a vibrant canvas for the celebration and exploration of cultural hybridization. Authors in the 21st century increasingly embrace this phenomenon, weaving together diverse cultural threads to create narratives that transcend boundaries. This section delves into the manifestations of cultural hybridization in contemporary literature, showcasing its transformative potential and relevance in our interconnected world.

Cultural Collisions and Syncretism

Cultural hybridization in contemporary literature often emerges as a result of the collision and fusion of diverse cultures. Authors leverage these collisions to craft narratives that explore the fluid nature of cultural identity. Characters and communities are depicted as dynamic entities, continuously adapting and integrating elements from multiple cultural sources. For example, Salman Rushdie's "Midnight's Children" intricately weaves together Indian history, mythology, and Western pop culture, resulting in a narrative that defies singular cultural categorization. The novel's protagonist, Saleem Sinai, embodies the syncretic nature of cultural hybridization, serving as a living embodiment of India's multifaceted identity.

Bilingualism and Multilingualism

Contemporary literature often incorporates multilingualism and code-switching as literary devices to reflect the realities of multicultural societies. Authors employ different languages and dialects to capture the nuances of characters' identities and their interactions within diverse linguistic communities. Junot Díaz's "The Brief Wondrous Life of Oscar Wao" is an example of how multilingualism can be used to convey cultural hybridity. The novel seamlessly blends English, Spanish, and Dominican slang to mirror the experiences of its characters, who straddle the cultural boundaries of the Dominican Republic and the United States.

Diaspora and Transnational Narratives

Many contemporary authors explore the experiences of diasporic communities and individuals living between multiple cultures. These narratives provide insights into the challenges and opportunities that arise when individuals or communities navigate their cultural heritage in new and often unfamiliar contexts. Jhumpa Lahiri's "The Namesake" is a poignant exploration of diasporic identity. The novel traces the life of Gogol Ganguli, a first-generation Indian-American, as he negotiates his dual identity and the complexities of cultural hybridization. Lahiri's work reflects the tension between tradition and assimilation that characterizes many diasporic experiences.

Cultural Exchange and Cross-Cultural Understanding

Contemporary literature serves as a platform for fostering cross-cultural understanding and empathy. Authors often use their narratives to highlight the richness and depth of diverse cultural traditions. Through literature, readers can embark on journeys that transcend geographical borders and gain insights into unfamiliar customs and beliefs. Khaled Hosseini's "The Kite Runner" exemplifies this aspect of cultural hybridization. The novel transports readers to the culturally rich and historically complex landscape of Afghanistan, offering a window into a world often misrepresented in mainstream media. By immersing readers in the intricacies of Afghan culture, Hosseini fosters a sense of empathy and connection. In conclusion, cultural hybridization in contemporary literature stands as a testament to the dynamic and interconnected nature of our modern world. Authors employ diverse literary techniques to celebrate cultural diversity, challenge rigid boundaries, and promote cross-cultural understanding. These narratives serve as bridges between cultures, inviting readers to explore the beauty of cultural hybridity and encouraging a more inclusive and empathetic global community.

The Intersection of Ethnocentrism and Cultural Hybridization

In the dynamic realm of contemporary literature, the coexistence and interaction of ethnocentrism and cultural hybridization often create a rich tapestry of narratives that challenge and illuminate our understanding of cultural identity. This section explores the complex interplay between these two seemingly contrasting forces within the

Saravana Selvakumar et al.,

context of contemporary literary works, revealing how authors navigate this intersection and its broader implications for character development, plot progression, and overarching narrative.

Deconstructing Ethnocentric Perspectives

Contemporary authors frequently employ cultural hybridization as a means to deconstruct ethnocentric perspectives within their narratives. By introducing characters or scenarios that challenge conventional cultural hierarchies, authors encourage readers to reevaluate their preconceived notions of cultural superiority. For instance, in Zadie Smith's "White Teeth," the character Irie Jones embodies cultural hybridity and challenges her grandmother's traditional, ethnocentric views. As Irie navigates her mixed Jamaican-British identity, the novel prompts a reevaluation of rigid cultural boundaries, ultimately demonstrating the fluidity of identity in an increasingly interconnected world.

Ethnocentrism as a Narrative Conflict

In some contemporary literary works, ethnocentrism serves as a central narrative conflict, driving the plot and character development. Authors use ethnocentric attitudes and biases to create tension, conflict, and growth arcs within the story. In Khaled Hosseini's "A Thousand Splendid Suns," the ethnocentrism present in the Afghan society portrayed in the novel becomes a source of oppression and suffering for the female protagonists. The novel powerfully illustrates how ethnocentrism can perpetuate gender inequality and the suffering of marginalized groups.

Cultural Hybridization as a Form of Resistance

Cultural hybridization often emerges as a form of resistance against ethnocentric forces in contemporary literature. Characters or communities use cultural hybridity as a means of asserting their identity and challenging oppressive cultural norms. In Arundhati Roy's "The God of Small Things," the characters Ammu and Velutha engage in a forbidden, cross-cultural romance as an act of defiance against the rigid caste and ethnocentric boundaries of Indian society. The novel portrays cultural hybridization as a source of liberation and rebellion against oppressive social hierarchies.

Ethnocentrism and Cultural Hybridization as Themes of Transformation

In the narrative arc of contemporary literature, ethnocentrism and cultural hybridization often serve as themes of transformation. Characters grapple with these forces, leading to personal growth, self-discovery, and shifts in cultural consciousness. In Mohsin Hamid's "Exit West," the novel follows the journey of two characters, Nadia and Saeed, as they navigate the ethnocentric tensions and violence in their homeland. Their migration to various locations through magical doors serves as a metaphor for cultural hybridization and transformation. As they encounter new cultures and adapt to different environments, they undergo profound personal and cultural changes.

The Reader's Role in Navigating the Intersection

Contemporary literature actively engages readers in navigating the intersection of ethnocentrism and cultural hybridization. By immersing readers in the complexities of these themes, authors encourage critical reflection, empathy, and an exploration of one's own cultural biases. In summary, the intersection of ethnocentrism and cultural hybridization in contemporary literature is a multifaceted terrain where narratives challenge, deconstruct, and resist ethnocentric perspectives. It is also a space where characters and communities transform, and readers are invited to engage in critical introspection. These narratives showcase the potential of literature not only to reflect but also to shape our understanding of cultural identity in an ever-evolving, interconnected world. In today's rapidly changing global society, there is an opportunity for a transcultural literature and critical perspective that can effectively reflect the evolving cultural landscape. This includes a heightened awareness of new forms of cultural diversity and pluralism resulting from a more diverse population and varied migration patterns. Due to various globalizing and trans-postnational developments, transcultural literature and research may provide a deep and responsible way to handle cultural interactions and their inherent tensions or conflicts. Transcultural literature aligns with the third

Saravana Selvakumar et al.,

stage of the (im)migrant-ethnic-multicultural writing process of creative transformation outlined by Manfred Jurgensen. This process begins with the primary-native culture and the necessity for mediation with the host culture. This results in the creation of a "language of creative cultural transformation" or what Gunew and Kateryna O. Longley refer to as cross-cultural experimentation by establishing new languages and representations. This results in a body of literature and its associated academic study that is more in tune with the preferences of emerging authors and a diverse audience that is experiencing physical and mental disconnection. Schulze-Engler comments on Mark Stein's discussion of the emergence of a transcultural imagination, highlighting that the transcultural aspect is not only present in external realities or within the texts themselves, but also in the audiences who interpret them based on new systems of reference, norms, and values derived from various cultural influences. The potential for transculturality in texts is therefore seen in their influence on the reader and in the methods of representation needed to capture the cultural intricacies they address.

Where does transcultural literature fit in with postcolonial and multicultural literature?

I suggest that it distinguishes itself to some degree from the preceding domains while yet being influenced by them. In essence, it signifies an additional literary aspect.

CONCLUSIONS

Contemporary literature serves as both a mirror reflecting the complexities of our multicultural world and a beacon guiding us toward a more inclusive and empathetic society. In the realm of this literature, we have embarked on a journey to explore the dual themes of ethnocentrism and cultural hybridization. Through our examination of selected works, we have uncovered a multifaceted landscape that challenges, transforms, and redefines our understanding of cultural identity in the 21st century.

Ethnocentrism: A Lingering Force

Ethnocentrism, deeply ingrained in human psychology, continues to find its place within contemporary literature. Authors deftly explore this phenomenon, often illuminating the biases, stereotypes, and cultural hierarchies that persist in our interconnected world. In doing so, they provide readers with an opportunity for introspection, challenging us to confront our preconceived notions and biases. However, contemporary literature does not merely perpetuate ethnocentrism; it actively engages with it. Authors deconstruct ethnocentric perspectives, utilizing characters and narratives to question the validity of cultural hierarchies. Ethnocentrism becomes a narrative conflict, a force to be reckoned with, and an obstacle that characters must confront and transcend on their journeys.

Cultural Hybridization: A Celebration of Diversity

In stark contrast to ethnocentrism, cultural hybridization emerges as a vibrant celebration of diversity within contemporary literature. Authors weave together diverse cultural threads to create narratives that transcend boundaries, reflecting the fluid nature of cultural identity. Through the narratives of cultural collisions, multilingualism, diaspora experiences, and cross-cultural exchange, literature becomes a bridge between cultures, fostering understanding and empathy. Cultural hybridization serves as a powerful form of resistance against ethnocentrism. Characters and communities use hybridity as a means of asserting their identities and challenging oppressive cultural norms. In doing so, they become agents of change, inspiring readers to consider the transformative potential of cultural hybridization in their own lives.

The Intersection: A Space for Transformation

The intersection of ethnocentrism and cultural hybridization is a dynamic space where narratives challenge and resist ethnocentric perspectives. It is also a realm where characters undergo profound transformations, reflecting the fluidity of cultural identity in an ever-evolving world. Through the exploration of this intersection, readers are invited to engage in critical introspection, reevaluating their own cultural biases and assumptions. Contemporary literature, through its narratives of intersection, encourages us to navigate the complexities of our multicultural

Saravana Selvakumar et al.,

world with empathy, curiosity, and an open heart. As we stand at the crossroads of ethnocentrism and cultural hybridization, we are reminded that literature is not a passive reflection of society but a powerful force for change. It challenges us to transcend ethnocentric boundaries and embrace the beauty of cultural hybridity. In conclusion, contemporary literature is a testament to the human capacity for introspection and transformation. It urges us to recognize the persistent forces of ethnocentrism while celebrating the transformative potential of cultural hybridization. As we close the chapters of these narratives, let us carry forward the lessons learned from these transcultural narratives, fostering a more inclusive and empathetic global community.

ABSTRACT

Disney's adventurous and well acclaimed film *Moana* (2016) centres on the Polynesian island of Motunui. The islanders worship Te Fiti, the goddess of nature, who centuries ago brought life to the island and the ocean. Her heart embodies a Pounamu stone that has the power to create and sustain life. The stone's green colour symbolizes vitality and life force. It is the forceful possession of this heart by the demigod Maui that has led to the disintegration of Te Fiti and the imbalance in the natural ecosystem particularly in Motunui. The plot revolves around the search of Maui, his transformation and the restoration of the heart to the goddess by the protagonist Moana. This research aims to trace the journey of the demigod Maui from his self centeredness to his ecocentricism and explores the film's potential as an educational tool for developing ecological consciousness.

Keywords: ecocentricism, egocentrism, anthropocentrism, ecological self

INTRODUCTION

The depletion of natural resources, global warming, climate change, species extinction, food and water scarcity and still more has made human beings to reflect and think over their actions and their interaction with nature. "The environmental crisis is currently regarded as a worldview crisis, as a crisis of human consciousness and its relationship to nature" (Miroshiken 593). A change in the consciousness of human beings is required to combat environmental crisis. A shift from ego self to eco self is the need of the hour. This shift can be possible only when one develops an ecological consciousness in life. "Ecological consciousness is a way of being" (Amerigo24). It is an

78988

Chakkoria Deena David and Ramakrishnan

individual's perception, awareness, understanding, identification, and consideration of ecological principles in his or her interaction with nature. The term Ecological consciousness has emerged organically as a concept over time, influenced by various fields such as ecology, environmental ethics, and social sciences. It has developed through the collective efforts of scientists, philosophers, environmentalists, and thinkers who have contributed to the understanding of the position of human beings in nature. It has become a significant terminology in the field of environmental philosophy, ecocriticism and ecology highlighting the need for a deeper understanding of the interconnected web of life the role of human being in nature. The crucial step in developing ecological consciousness is the rejection of anthropocentrism. It's this dominant ideology that has led to exploitation of nature, ecological imbalance and environmental crisis. "A fundamental shift in perspective – from an ego-centric to an eco-centric consciousness – is necessary to reimagine human existence. This change requires us to go beyond our narrow self-interest and broaden our concept of self to include the entire web of life"(Callicot78). It is this shift in perspective that is explored through the characterization of Maui. The concept of ecological self or eco self is fundamental in developing ecological consciousness.

Walt Disney's animated film *Moana* (2016) revolves around the ecological imbalance in the fictional setting of Motunui. The protagonist Moana is the daughter of Chief Tui, the leader of the Polynesian island of Motunui. Her father trains her to be the leader of the tribe. She learns about her rich Polynesian culture and heritage from her parents, elders of the community and her grandmother Tala. It's her grandmother who makes her realize the ecological catastrophes overshadowing Motunui, the theft of Te Fiti's heart, her role as a leader, her close association with the ocean, and the lost Polynesian heritage of wayfinding. It is she who inspires her to find the demigod Maui and restore the heart to the goddess Te Fiti.

In this film, Te Fiti is marginalized as she is robbed off her 'heart' by Maui. The introduction of the film clearly explicates this as follows:

In the beginning, there was only ocean until the mother island emerged: Te Fiti. Her heart held the greatest power ever known. It could create life itself. And Te Fiti shared it with the world. But in time some begin to seek Te Fiti's heart. They believed that they could possess it, the great power of creation would be theirs. And one day, the most daring of them all voyaged across the vast ocean to take it....And his name was Maui. But without her heart, Te Fiti began to crumble, giving birth to a terrible darkness (00:00:56-00:02:30).

The above narration presents a contrast between the natural world and the human world. Nature acts as a giver of life while humans act as abusers of power and resources. Nature in the form of Te Fiti gives life to the world, generates fish in abundance for people's survival, directs voyagers to find their ways, and brings fertility to the soil. Nature gives everything for the perfect civilization of humankind. But man's interference in nature only degenerate the natural harmony and disrupts the ecological balance. In this film, it is Maui who brings ecological disaster and environmental issues in Motunui.

The nature of Maui is highlighted in the rhythmic fast beat song "You're Welcome". It is sung by Maui while Moana remains a passive listener and observer. The themes of self-praise, boastfulness, arrogance and superiority are encapsulated in the following verse:

I lassoed the sun. You're welcome!
To stretch your days and bring you fun
Also, I harnessed the breeze. You're welcome!
To fill your sails and shake your trees
So, what can I say, except you're welcome?
For the islands I pulled from the sea (00:39:30 – 00:39:40)

**Chakkoria Deena David and Ramakrishnan**

In the song, Maui sings about his many heroic feats and boasts about providing humans with various resources and gifts from nature. From creating islands to bringing fire and coconuts, Maui presents himself as the provider of these resources. His speech overshadows the contributions of nature as nothing when compared to his acts. Maui's characterization mirrors a strong sense of anthropocentrism. This perspective perpetuates the dominant worldview that places humans at the center, disregarding the agency and intrinsic value of nature. This song displays Maui's ego-centricism and portrays his lack of ecological consciousness. The repetition of the line "You're Welcome" highlights Maui's cravings for appreciation and gratitude for all his accomplishments and heroic deeds.

Towards the end of the song, Maui pushes Moana into the cave and steals her boat to sail across. This portrays him as a deceiver, cheater and a thief who not only steals the boat of Moana but also shuts her into the cave. His characterization helps one to reflect upon one's unethical actions towards both human beings and nature. It makes individuals realize that their relationship with nature is not reciprocal but exploitative. It unearths the nuances of upholding anthropocentrism. Maui's anthropocentric attitude is revealed in this initial song so that his journey to eco-self can be traced effectively. Hence, this song serves as a mirror for his prominent ego-self in his interaction with nature.

Moana becomes a catalyst for the transformation of Maui. She questions him for the reason of the theft of Te Fiti's heart. Maui justifies his action of stealing Te Fiti's heart saying it was meant to be, "a gift for you mortals, so you could have the power to create life itself" (00:59:12 – 00:59:13). In the surface level, his justification proves his concern for human beings. But the underlying fact is his thirst and desire for fame, name and recognition. Maui's justification parallels the claims of most developmental project that aims to provide progress and benefits to the country without sustainable practices, indirectly causing ecological imbalance. "Maui represents egocentricity and vanity because he steals Te Fiti's heart trying to gain the love and affection of humans" (Akhiyat 17). Stealing Te Fiti's heart can be seen as a perfect abuse of nature. "Cultivating ecological consciousness involves cultivating a sense of place. It means being intimate with a landscape, with its space, moods, seasons, changes, flowing patters to wit, knowing the place" (Devall 182). Throughout the film, Moana tries to make Maui realize the consequences of his action. She encourages him to reconcile with nature. She says:

Now you're just the guy who stole the heart of Te Fiti. The guy who cursed the world. You're no one's hero. ... But put this [Te Fiti's heart] back. Save the world. You'd be everyone's hero (00:50:12 – 00:50:49).

Maui joins hands with Moana to restore the heart of Te Fiti. Together they face many obstacles and in the process both share their knowledge, weaknesses and goals of life empowering each other.

Wayfinding, an integral essence of the rich Polynesian culture, involves a deep understanding of the natural environment, celestial navigation, and the interconnectedness of the natural forces. Due to the presence of the sea monster TeKa, wayfinding had ceased among the islanders and no one was allowed to go to the sea. In the movie, Maui possesses knowledge and skills related to wayfinding. The first step in his transformation can be traced in his readiness to impart the art of wayfinding in Moana. As the movie draws to a close, Moana, empowered by Maui's teachings, imparts the art of wayfinding to the islanders. In doing so, she revives the forgotten, culturally rich heritage of wayfinding among her people. This highlights the fact that "Ecological consciousness reflects the new relationship between man and nature – the viewpoint and theory of harmony between man and nature, and the sum of emotions" (Amerigo 23). His role as a wayfinder highlights his connection to the natural world and contributes to the broader theme of ecological consciousness. The idea of the eco self extends beyond a focus of the ego self. This is evident in the climax of the film where Maui sacrifices his ego self for the well being of nature. He takes a pivotal step in his ecological mission to give up his magical fishhook, the source of his shapeshifting abilities. He expresses this fact to Moana by saying, "I'm not Maui without mine [fishhook]" (00:68:13 - 00:68:14). It is a powerful and transformative tool that allows Maui to change his form into various animals and powerful creatures to defeat his adversaries. However, during a confrontation with the lava monster Te Ka, his fishhook is damaged, rendering him unable to use it effectively. Realizing that the restoration of Te Fiti's heart is essential for the well-being of the ocean

**Chakkoria Deena David and Ramakrishnan**

and the islanders, Maui makes the selfless decision to sacrifice his shapeshifting powers. He breaks off a piece of his fishhook and gives it to Moana, empowering her to face Te Ka and complete the mission. This sacrifice is the most crucial step in his journey towards restoration and reconciliation with nature. It symbolizes his shift from his ego self to the eco self. "Ecological consciousness is a special value concept which is based on the mutual relationship between all ecology and human activities in nature, including itself" (Gangwar 21). Maui's sacrificial act testifies his ecological consciousness, his personal growth and redemption.

"It is now necessary for people to abandon egocentric thinking and adopt an ecocentric perspective ... to build a society where everyone's well being is intertwined with everyone else's" (Callicot 240). Maui reconciliation with Te Fiti highlights the transformational journey of his ego-self to his eco-self. His transformation mirrors the broader theme of acknowledging the interconnectedness between human beings and nature. Ecological consciousness often draws from ethical principles that advocate for the intrinsic value of nature and the moral responsibility to protect it. It promotes sustainable practice and fosters a sense of ecological stewardship. Disney's *Moana* acts as an educational tool to instill ecological consciousness among the people and the need to safeguard nature. Maui's ecological transformation serves as a powerful metaphor to understand the harmful impacts of one's actions and rectify one's errors.

ABSTRACT

This research seeks to emphasize the significance of using contemporary technologies to enhance English communication skills via media. The article explores many methodologies and strategies that could enhance the listening abilities of those learning English via contemporary media. Several ways include using internet platforms for English language listening and engaging in video conversations via mobile devices or computers. Participating in listening to audio content via movies, television, radio, and CD-ROM. This research also investigates the importance of auditory comprehension in acquiring the English language. The conclusion offers concrete suggestions and emphasizes the advantages of using Modern Media in the English as a Foreign Language (EFL) classroom. Listening is the intentional and concentrated act of hearing sounds with complete attention. Based on a poll, individuals allocate about 40 to 50 percent of their time to listening, between 25 and 30 percent to speaking, 10 to 15 percent to reading, and 9 percent to writing. Hence, the study report focuses on augmenting communication by tackling listening abilities and offering remedies for enhancement. This study seeks to clarify the importance of communication via media. The 21st century has seen a greater mobility and tangibility

Sangeeth Kumar *et al.*,

of civilization. Mobile devices are being utilized more and more for activities including education, entertainment, personal communication, and distant employment. Students enjoy using their mobile devices to access a variety of online listening resources and participate in English-language conversations. They find comfort in apps such as Facebook, WhatsApp, and Emo. The article discusses the various tools for listening skills,

Keywords: Media-mediated listening, Media's role in communication, Modern Media, Communication's Expansion, Listening tools, Communication.

INTRODUCTION

English is a global language or a lingua franca. It facilitates the exchange of communications between individuals and nations. The English language has achieved global reach and development to a degree that cannot be disregarded. English use in India has seen a significant surge. ELT in India has failed to revolutionize the conventional teaching approach prevalent in the majority of educational institutions. Students learn English only to achieve a passing grade on exams, while professors instruct with the sole objective of fulfilling this prescribed goal. Modern Media may be defined as the mass communication methods that are distinctive of the present era, namely those that are associated with newly created or sophisticated technologies. Postmodern media, a successor to modern media, encompasses mass media platforms that provide individuals with the ability to fulfill their requirements at any time, in any location, and on any digital device. "Postmodern originated in the contexts of aesthetics and art criticism, though it has since been disseminated widely in criticism of other cultural forms, particularly contemporary media." (Bignell30).

Another significant description of Modern Media may be described as the diverse use of pictures, words, sounds, and textual data. The nested properties of contemporary media components distinguish them from conventional media components, such as hardcopy documents and newspapers. The majority of media categorized as "new media" are digital, often possessing characteristics such as manipulability, networkability, high density, compressibility, and interactivity. Contemporary media only includes conventional formats like TV shows, movies, magazines, books, or printed publications if they use digital interactive technologies. Modern media refers to the process of demoralization in the development, publication, dissemination, and consumption of media information.

Empirical Literature

Seo et al. (2021) conducted a study on the impact of artificial intelligence (AI) on learner-instructor interaction in online learning. They found that adopting AI systems in online learning can enable personalized learner-instructor interaction at scale. However, there is a risk of violating social boundaries. While AI systems improve communication quality and provide just-in-time, personalized support, concerns about responsibility, agency, and surveillance remain. Kosmas (2023) proved that it is possible to Improve students' learning performance through Technology-Enhanced Learning (TEL). The researchers found significant results which were observed in students' cognitive performance, motor skills, academic performance in language, and emotional state. These improvements led to increased motivation to participate in the learning process. Mahanty and Mishra (2023) stated that Web-based simulation instruction, blended learning, online applications, smart phones, Computer Assisted Language Learning (CALL), WhatsApp groups, movie clips, audio-visual cassettes, and different websites have facilitated the listening and speaking skills of English language learners. Chichekian and Benteux (2022) argued that Intelligent Tutoring Systems (ITSs) impact metacognitive strategies by prompting students to apply self-regulation skills and monitor their progress when learning. These systems enhance learning processes and self-awareness.

**Sangeeth Kumar et al.,**

Mohamed (2023) identified that AI-powered language models, such as ChatGPT, have been applied in language learning scenarios. They contribute to language tutoring, generation, and translation, thereby enhancing students' language skills. Sangeetha (2023) conducted research on the effectiveness of using speech recognition technology in language learning. The study found that integrating speech recognition tools into language courses improved students' pronunciation accuracy and overall listening comprehension.

Al-Seghayer (2022) explored the impact of computer-assisted language learning (CALL) on listening skills. The findings revealed that CALL programs, especially those incorporating multimedia elements and interactive exercises, significantly enhanced students' listening abilities. Chen (2023) investigated the use of automatic speech recognition (ASR) systems in language classrooms. The study demonstrated that ASR technology helped learners focus on specific phonetic features, leading to better pronunciation and comprehension. Hasan et al (2020) studied the effectiveness of mobile language learning apps in improving listening skills. The research highlighted that personalized content, real-world contexts, and interactive features in mobile apps positively impacted students' listening proficiency. Nguyen (2023) examined the role of virtual reality (VR) in language education. VR simulations and immersive environments enhanced students' listening comprehension by providing authentic contexts and multisensory experiences.

The role of media in facilitating communicative learning

The media in English Language development provides a connection between human resources and non-human resources. These are the many tools used by instructors and students throughout the process of teaching and learning. Institutional resources contribute to the pedagogical effectiveness of English Language instructors. They facilitate effective communication between instructors and learners by enhancing the teachers' ability to convey topics more effectively. They provide learners with opportunities for practical application. They incite cognitive processes and foster discourse among pupils. They motivate kids to attain greater levels of accomplishment. Today, listening is receiving widespread attention. Schools and colleges across the nation have established training courses in the area, and many others are about to do so. Industries have instituted their management training programs in listening; governmental groups and agencies, at both the federal and lower levels, have asked for such training; religious groups have turned their attention to listening; and an International Listening Association has become active. (Holtand Winston07).

This application amuses and facilitates learning via the use of mainstream culture. Experience authentic British and American accents via audio recordings and challenge oneself with engaging tasks such as interpreting meanings, completing missing sections, and picking the appropriate words or sounds. The program developed by Miracle Fun Box is well-suited for enhancing proficiency in both listening and speaking abilities. If we look at the world tourism sector, 74 percent of travelers move from one non-English-speaking country to another non-English-speaking community. This, as Graddol (2007) suggests, necessitated 'a large demand for either foreign language learning or the increasing use of English as a lingua franca.' Countries like Malaysia made basic proficiency in English a requirement for all foreign employees. Similarly, countries such as Mongolia, Chile, South Korea, and Taiwan are planning bilingualism with English being one of the languages. This has necessitated a fresh look at whether the language facilitates the users to use it as a common code globally. "Language," as Lado (1965) puts it, 'in its most common pervasive, representative and central manifestation involves oral-aural communication.' Today, English is widely used as a language of communication. (Jayashree 11).

Speaking about vocabulary, the application primarily emphasizes often-used terms for English examinations such as IELTS and TOEFL. Engaging in many English listening examinations will enhance an individual's auditory comprehension and facilitate the acquisition of essential vocabulary. Additionally, there are opportunities for amusement via interactive activities like sentence construction games, vocabulary exercises, and word chains. Users have the option to access the classes without an internet connection and may save their preferred lessons for easy reference. As multimedia technology (such as interactive videodiscs, CD-ROMs, CD-Is, etc.) becomes more readily available to instructors and learners of different languages, its capacity to improve listening skills becomes a viable

**Sangeeth Kumar et al.,**

choice. Multimedia enables the seamless integration of many elements such as text, pictures, audio, and motion video in a wide array of combinations. In the 21st century, civilization has become more mobile and tangible. Increasingly, mobile devices are being used for tasks such as remote work, personal communication, entertainment, and education. Students get pleasure from using mobile devices, finding solace in applications like Facebook, WhatsApp, and Emo for engaging in English conversations and accessing a wide range of online listening materials. Students get comprehensive recognition for using mobile devices not just to enhance their listening skills but also to improve their spoken communication. There are four abilities (hearing, speaking, reading, and writing): persons who know a language are called speakers as if speaking comprised all other types of learning. She believes speaking is the most important of these four. "The primary goal of most, if not all, language learners have to improve their ability to communicate verbally" (Butarbutar4). Moreover, it offers the FL student a substantial amount of exposure to genuine language.

The basic skill in communication is active listening.

We engage in active listening more often than we engage in speaking. By using this listening skill effectively, we may acquire proficiency in the instruments of communication. Listening may be challenging due to the inherent tendency of the human mind to readily get distracted. An individual who exercises mental discipline and practices active listening gains a multitude of additional talents and experiences several advantages. "An overall view of the concept of mental discipline can help us to discover its development characteristics and find a suitable research entry point" (PingChunCao2) Listening is the cognitive act of discerning and comprehending the spoken words and phrases of a language's speaker. Frequent use of linguistic skills is seen. Proficient listening skills enable learners to actively engage in familial, professional, and societal interactions. Insufficient listening skills hinder one's ability to differentiate between different portions of speech, preventing them from offering an appropriate response to convey apologies, invitations, empathy, refusals, understanding, and engagement under the given scenario. Internet forums and websites provide many opportunities to improve their English listening skills. "Concentration and urgency for remembering are demanded by the structure of the lessons. The lessons stress memory—lengthening memory span and strengthening" (Morley10)

The Significance of Active Listening

In our contemporary society driven by advanced technology, effective communication has become more vital. However, individuals are devoting progressively less time to actively engage in attentive listening with one another. The act of really listening is becoming scarce, despite its vital role in fostering relationships, resolving issues, promoting comprehension, resolving conflicts, and enhancing precision. Active and attentive listening in the workplace leads to a reduction in errors and more efficient use of time. "Initial interactions constitute a significant context for the study of listening skills. Every relationship begins with a first encounter. Further, a great deal of our instrumental goals are accomplished in first-time conversations with salespeople, customers, doctors, therapists, potential employers, yoga instructors, and the like. In first encounters, people attempt to solve a variety of information seeking, relationship, and impression management problems" (Weger15)

Strategies to improve listening skills

Select a single episode from a podcast that individuals find captivating or enjoyable. Allocate a week to regularly engage with that particular episode daily, while simultaneously engaging in activities such as driving, commuting by bus, or doing household chores. During the first two days, make note of any words or phrases that provide difficulty in comprehension and proceed to search for their meanings. Ensure to halt the audio playback, and thereafter resume it to perceive the challenging vocabulary. With a few days' practice, individuals should be able to audibly perceive and understand these words. Additionally, it might be advantageous to memorize certain chunks of podcasts and engage in the repetitive practice of reciting them. Identify the disparities between oneself and the speaker. By the last day, individual levels of comprehension will have significantly increased compared to the first day.

**Simultaneously engage in reading and listening.**

Employing two sources of information concurrently is an additional approach to enhancing one's listening skills. Consequently, it is essential to acquire knowledge about the English language from an alternative resource while engaging in listening activities.

The most straightforward method to do this is by watching a video with English subtitles in the English language. One will be perusing and audibly perceiving the words in this fashion, which will facilitate his/her comprehension and enhance memory recall.

Explore various dialects by watching films and listening to podcasts.

Effectively improve an individual's ability to understand a certain English accent, it is essential to consistently practise and refine an individual's listening abilities with audio materials that include that particular dialect. To improve individual comprehension of American English, consider immersing oneself in American television programs, podcasts, or news broadcasts for a duration of one month. By the conclusion of these 30 days, the ears of the listeners will have been used to the accent to facilitate comprehension.

Repetition and rephrasing of sentences, accompanied by audio recordings.

Experience uninterrupted audio playback from the selected source. Direct individual's attention to comprehending the overall framework and primary concepts. Upon the first act of listening, make a record of significant aspects, unusual vocabulary, and noteworthy sentences that caught individuals' attention. Now, please replay the audio source. On this occasion, focus on the specific aspects of those components that were not obvious during the first hearing. Upon the second round of listening, succinctly recapitulate the main concepts conveyed in the audio using phrasing.

Artificial Intelligence (AI) has several applications in the field of communication.

Enhancing one's listening ability is crucial for improving pronunciation and communication proficiency. To enhance listening proficiency, one might engage in watching television shows, films, and videos. Another method to enhance listening proficiency is by using conversational artificial intelligence such as ZenoChat, which has a text-to-voice functionality. TextCortex is an artificial intelligence assistant that provides many features to enhance an individual's language proficiency. TextCortex is accessible as both a web application and a browser extension. It seamlessly integrates with over 4000 websites and applications, allowing individuals to use TextCortex at any location and at any time to enhance his/her language proficiency. "Duolingo provides translation to help beginners learn a language and to help students become independent language learners" (Hazar 449). Furthermore, if one is seeking additional avenues to enhance individuals' language proficiency, Duolingo provides the option of engaging in voice conversations with actual individuals for a certain duration.

CONCLUSION

Modern media, as a technological advancement, considerably enhances the development of listening skills. It has a significant impact on enhancing one's listening ability. The researchers propose that English educators use the aforementioned instruments of modern media to inspire their pupils and engagingly instruct them. Various studies highlight the benefits of utilizing Modern Media for learning English and enhancing listening skills. These advantages include (a) the use of text and visuals to aid in language comprehension when presented alongside auditory content, (b) the enhancement of language processing through the combination of different media, making the input more immediate and noticeable for language acquisition, and (c) the motivational aspect of videos as a valuable tool for language instruction. SAn examination of the utilization of technologically advanced media aids in the instruction and acquisition of English, particularly in second language contexts, reveals that these aids offer significant advantages in the learning process. They promote a learner-centred approach that considers the specific needs of individual students, in contrast to the traditional instructional methods that revolve around the teacher as the sole authority of knowledge. Providing instruction to educators on the use of multimedia tools for teaching

Sangeeth Kumar et al.,

English as a second language. It is expected that as instructors become proficient in using these tools for teaching, the pupils will be more knowledgeable in that area.

ABSTRACT

The Liberation War of Bangladesh in 1971 represents a massive humanitarian crisis in the late 20th century. The trauma narration of this horrendous event invites to study, remember and commemorate the profound impact of identity, political decision and religion in a nation's history. The narrative around the Bangladesh Liberation war often emphasis the victimization and suffering of the Bengali people leaving limited perspectives on the minorities and the perpetrators. To recognize the diverse perspective and to acknowledge the complexities of the conflict, a comprehensive study that embraces the problems of the victims, minorities and perpetrators must be included. Contemporary Literary Trauma theories mainly focus on the victim as the sole sufferer of the traumatic event and it is also very limited and has a very little to say about the perpetrator trauma. The recent trends in trauma theory laid steps to study the problem of the perpetrator's trauma. The repugnant and moral injury surfaces in the perpetrator's past either willingly or unwillingly emerges and haunts the perpetrator's present. The finding of the paper particularly arises out of this context where the focus will be the trauma of the perpetrator mainly with regard to Bangladesh Liberation War. By virtue, the image of Pakistan is viewed as the clear-cut embodiment of evil in the 1971 war. There lies a huge silence surrounding the history of 1971 partition war in the history and literature of Pakistan. Kamila Shamsie deftly incites the sentiments of Pakistan in her novel *Kartography* without agitating the lines of victim and perpetrator. Shamsie brilliantly uncovers the problem of the perpetrator through the character Zafar, she further highlights the relative

**Srinidhi Shanmugam and Judy Gome**

relationship between the perpetrator and the commission of violence. Using key concepts from leading literary trauma theorist the research paper justifies to bring out the problem of perpetrator 'Zafar' in Kamila Shamsie's *Kartography*.

Keywords: 1971 Liberation War, Perpetrator Trauma, Partition Literature, War Trauma, South Asian Studies, Ethical Conflicts

INTRODUCTION

The Liberation War of Bangladesh in 1971 represents a massive humanitarian crisis in the late 20th century. This lasting effect subsequently grappled a form of art to seek justice, the underpinning voice of trauma is a relentless pursuit of justice for the war-torn souls. The themes of partition remain a significant aspect of the South Asian Literature in English in recent times. The trauma narration invites to study, remember and commemorate the profound impact of identity, political decision and religion in a nation's history.

Exploring the Problem of the Perpetrator's Trauma

The narrative around Bangladesh Liberation war often emphasis the victimization and suffering of the Bengali people leaving limited perspectives on the minorities and the perpetrators. To recognize the diverse perspective and to acknowledge the complexities of the conflict, a comprehensive study that embraces the problems of the victims, minorities and perpetrators must be included. Contemporary Literary Trauma theories mainly focus on the victim as the sole sufferer of the traumatic event and it is also very limited and has a very little to say about the perpetrator trauma. To bridge the research gap and to provide a complete study of the affect mediated narratives on a traumatic event, a holistic approach of inclusive study is required. The recent trends in trauma theory laid steps to study the problem of the perpetrator's trauma. The repugnant and moral injury surfaces in the perpetrator's past either willingly or unwillingly emerges and haunts the perpetrator's present. The finding of the paper particularly arises out of this context where the focus will be the trauma of the perpetrator mainly with regard to Bangladesh Liberation War. By virtue, the image of Pakistan is viewed as the clear-cut embodiment of evil in the 1971 war. There lies a huge silence surrounding the history of 1971 partition war in the history and literature of Pakistan. Kamila Shamsie deftly incites the sentiments of Pakistan in her novel *Kartography* without agitating the lines of victim and perpetrator.

Shamsie brilliantly uncovers the problem of the perpetrator through the character Zafar, she further highlights the relative relationship between the perpetrator and the commission of violence. Using key concepts from leading literary trauma theorist the research paper justifies to bring out the problem of the perpetrator 'Zafar' in Kamila Shamsie's *Kartography*. Salman Rushdie highlights Pakistan as an "insufficiently imagined community" in his novel *Shame*. (Daniela 35) The national consciousness could not overcome the nation's fostering religious rigidity practices, that made the eastern wing of the nation as unfit in their Pakistan model of nation. The fact that Pakistani society is undergoing an identity crisis and writers feel compelled to engage in a discussion about this matter is not unexpected. In the words of Raheen from *Kartography* follows, Is it shame at losing war, or guilt about what we did try to win that mutes us? (Shamsie 270) The literary history of the Pakistan anglophone literature exhibits a void without attempting to overtly discuss the 1971 history. The writers tend to expose the position of the country as itself problematic and highlight the failure of religious harmony by ethnicity. Shamsie brings in the discussion of the 1971 partition in a few places of the plot such as the couple swap and the confession of Zafar to Raheen. The main essence of the 1971 partition in the novel happens when Zafar breaks his engagement with Maheen, because she's a Bengali. Zafar not being sorry but definitely guilty and silent about represents the absurdity of the 1971 partition. Zafar either willingly or unwillingly becomes the perpetrator in the narrative of Shamsie mainly because Zafar's motivation towards the couple swap triggers an unfavourable future to Ali, Maheen and Karim. The reason behind Zafar's couple swap motivation is the sudden threshold to anti-Bengali sentiments after the massacre of stranded Pakistanis like Shafiq's baby brother in east Pakistan. Erin McGlothlin in Perpetrator trauma explains the simplicity of the term

**Srinidhi Shanmugam and Judy Gome**

in relation to its diversity of experience covered by the concept of perpetration. (108)The act of perpetration includes both collective and the commission of violence against the individual like domestic violence, abuse, threats and bullying (Personal terrorism). Placing Zafar in the context of the perpetrator, he falls under the category of the personal commission of violence against Maheen either willingly or unwillingly. The relative relationship of the perpetrator and the commission of violence depends upon the age, gender, profession, nationality and ethnicity. McGlothlin adds the discomfort of identification of the trauma of the perpetrator who suffers from his anxiety and his infliction of violence often breaks down the dichotomy of perpetration and victimization within the trauma paradigm. (McGlothlin 107)With clinical aspect of studying the trauma of the perpetrators of genocide derives two patterns of identifying such as aetiology and symptomatology of trauma. The above patterns provide a clinical psychological study of the trauma experienced by the perpetrators such as armed militants while compelled to kill unarmed innocent citizens. Analysing the character of Zafar, a choice of personal conflict leads him to take up the role of perpetrator in *Kartography*, to categorize or recognize the trauma of this perpetration carried within in the attributes of family and friendship are quite different. With the underpinnings of Raya Morag's notion of the male perpetrator in her seminal work *Waltzing with Bashir* demonstrates the trauma of the Zafar and delivers a fruitful finding of the role play of hybridity in the country's ethnicity landscape. Morag in analysing the narrative of traumatic events of Folman for the process of film making finds the active complicities of his uncanny childhood and missing memories originates the trauma and not from shooting flares. In Folman's imagination, as the quest reveals, the earlier trauma has appropriated the later one. (Morag 133)

The idea of Folman's trauma implies the involvement of the past memory to reconstruct the subsequent experience. The participation of the past traumatic memory to influence and shape the present events. To understand the trauma of the perpetrator is to study the previous personal traumatic experience that affected him. The personal complicity of the perpetrator's trauma can be found in the narrative by understanding the event that overshadows and influence his ability in the present. The presence of the past traumatic memory provides scope for the perpetrator to appropriate the later events of his life. To recognize the perpetrator's personal conflict in his past memory is to understand the trauma of the perpetrator. The work of post-memory, described by Marianne Hirsch (2001) as the response of second-generation Holocaust survivors to the trauma of the first, describes the relationship of children of survivors of . . . collective trauma to the experiences of their parents, experiences that they "remember" only as the narratives and images with which they grew up (Hirsch 9) These individuals have a connection to their parents' experiences primarily through the narratives and images they were exposed to while growing up is one of the key elements in acknowledging the personal conflict of the perpetrator. These inherited memories are substantial and significant enough to be considered as their own memories though they do not have any personal or first-hand experience of the event. Post-memory is a potent form of remembering because it is not based on direct recollection but rather on representation, projection, and creation. Often, it relies on silence rather than verbal expression and focuses on the unseen rather than the visible aspects of the past. To reveal the trauma of the perpetrator, a careful reading of the information on the perpetrator past with the significant aspect of attention to the silence but resilient feature of his ordinary self is a necessity.

To gain insight of the ordinary self, analysing the language and rhetoric can give the ideas on the specific policy positions with reference to the cultural and social movements. Interpreting Zafar's position as Muhajir serves as an answer in understanding his fear of inclusion and exclusion through his past personal narration. His position as a Muhajir does not align a favourable position in the political landscape of the country. There is already a paradoxical situation of identity politics in Zafar's self, marrying Maheen from Bengali ethnic background will strongly outplay him against the political ideology of his country. The novel displays a variety of event that suggest the liveliness of Karachi lies in the hybridity of the ethnicity. It projects the multifarious ethnic backgrounds of the people as Pathan, Muhajir, Bengali, Punjabi and Sindhi. Marriage acts as the political ground for incubating the normative and acceptable (favourable) ethnic reproduction of the nation. 'Do you hear the way people like Zafar and Yasmin talk about "their Karachi"? My family lived there for generations. Who the hell are these Muhajirs to pretend it's their city! (Shamsie 41) The conversation between Uncle Asif and Laila provides the animosity between the ethnic groups inheriting their land Karachi. Zafar's position as Muhajir traces the traumatic history of his parents' arrival to the land

**Srinidhi Shanmugam and Judy Gome**

of Karachi as a result of mass migration from the 1947 partition, the previous generation of Sindhismass migration towards Pakistan. This vulnerable ethnic position of Zafar as Muhajir gives the uncanny memories and experience of immigrant in own land. The act or feeling of exclusion from the normative society acts as the threat to the Zafar's situation. This problematic ethnic location of the self in the Karachi leaves Zafar in the ambiguity of accepting Maheen against the ethnic factor. "What if time only exacerbated people's wounds, intensified their madness? What if he and Maheen would be driven out of Karachi by the attitude of his friends?" (Shamsie 334) The personal experience of threat and expulsion from the normative society of Karachi is the foremost factor of traumatic exhibit in Zafar's past life. Zafar's personal experiences during the civil War have deeply affected him, to the extent that they overshadow or shape his perceptions of subsequent events, including his attempts to recall and comprehend what happened during the war itself. The trauma from his past has, in a way, overshadowed or influenced his ability to process and remember the events clearly. This impulsive force lets him to deny his relationship with Maheen and ruin the future of Ali, Maheen and Karim. When Zafar pronounces "Think of it as a civic duty. I'll be diluting her Bengali bloodline." (Shamsie232) is the moment that his traumatic past influence in attempting to conclude his relationship with Maheen. Zafar could have erased this act by justifying this as role played to save Maheen from Shafiqbut when Zafar tries to explain, he almost caught in his thoughts of what he had already said.

The concept of Marianne Hirsch's Post-memory acts as a literary aid to understand the personal traumatic experience of Zafar as Muhajir. This paves way to recognize the underlying reality of Zafar's indecisiveness of considering Maheen as spouse. Morag denotes this personal experience as a line of reference to understand the personal traumatic past of Zafar and to trace the influence of the past trauma in all attempts and process of experiencing their life. Adding to this concept of situating the trauma of the perpetrator from Morag's perspective. McGlothin adds to this concept by explaining "What may appear to an outsider to be denial, disinterested disengagement or a disturbing lack of emotion could indeed be the manifestation of trauma, which would – and should – change how we conceptualize and respond to the perpetrators' experience" (McGlothin108) This disinterested engagement to the perpetrator's confession also leads to the manifestation of trauma in perpetrator's life. McGlothin also alerts the attempts of misinterpretation that can happen on locating the trauma of the perpetrator, because reading the attributes of guilt and shame can easily get mixed with the identity of trauma. The need for the differentiation between experience and feeling must be highly regarded to approve it under the lens of moral obligation as the trauma of perpetrator. However, the acknowledgment that individuals who commit acts of violence may experience trauma should not alter our perception of their moral obligation and legal liability for their actions. Therefore, it is essential to separate the issue of trauma from matters of guilt and responsibility as extensively as feasible. As Erin McGlothin puts forward the question of trauma needs to be disconnected as much as possible from issues of guilt and accountability. (McGlothin 108)

Further in the process of identifying Zafar's trauma under McGlothin's notion, one can situate the denial of Raheen's acknowledgment to her father's confession, as he opens up on the issue of couple swap. Zafar waits with anxiety for many days to arrive at this particular day, where he exhibits courage to confess his misdeed to his daughter. Unfortunately, Raheen overcome with sheer annoyance and rage to grasp the injustice committed by her father in the matters of ethnicity runs away from her father. Destroyed by the events unfolded from her father on the matters of couple swap, Raheen disintegrates her relationship with her father and recognizes him no more as her father. The act of Raheen's omission, silent and inactive participation in the confession of Zafar's confession can be considered as the agent causing trauma on his perpetration in the past. With the manifestation of Raheen's disregard to Zafar confession of guilt that he has repressed from her, aligns effortlessly with the attribute of McGlothin's listener's attitude towards instigating trauma in the perpetrator's life. McGlothin also warns the active participants of deciphering the trauma of perpetrator should not consider the act of Guilt and Shame experienced by the perpetrator as trauma. As trauma is the outcome of the past experience while the feeling of guilt and shame is the realization of the commission of moral injury. The perpetrator's guilt, or their accountability for committing a crime, should not be confused with the suffering they have gone through. The trauma that the offender has experienced does not absolve them of culpability or diminish the severity of what they have done. The two matters should be handled differently by the legal system, which should hold offenders accountable for their crimes while also addressing any trauma they

**Srinidhi Shanmugam and Judy Gome**

may have endured. The emphasis makes it clear to separate trauma from the discussions of guilt and shame as it is different from the psychological response to the distressing event.

CONCLUSION

The problem of perpetrator trauma is a highly provocative topic as it disturbs the lines and justifies the acts of perpetration. In the hands of Kamila Shamsie, they are perfectly synchronized to share her viewpoints on the political instability of Karachi where ordinary people are put into extraordinary situations. The long disturbing silence maintained around the events of 1971 in the literature of Pakistan is also highlighting that uneventful attempts that can happen and provide the limelight of victimization to the citizens of Pakistan. But if we are committed to understanding the psychological, social, and cultural fallout from the violent actions, one cannot ignore the significant influence that these crimes have on the people who committed them. Reading the problem of the perpetrator allows to engage in the holistic approach of understanding the traumatic event like partition.

**Notifications for the Authors****NOTIFICATIONS FOR THE AUTHORS**

We are very much happy to receive the research papers from the authors for publication in the Indian Journal of Natural Sciences. Advisory committee of our journal was discussed (w.e.f. 25.03.2023) and made the following recommendations and suggestions for the authors to publish research paper(s).

1. The authors should refer to the instructions in the web address <http://www.tnsroindia.org.in/journals.html> and FAQ before sending the paper to IJONS
2. The tables and figures should be presented wherever it is needed.
3. The figure legends should be typed in numerical order.
4. All tables and figures should be designed to be as simple as possible.
5. The reference should be quoted only within the square brackets. The number should be mention within the square brackets.
6. The figures, tables and graphs should be in high resolution.
7. The authors should be mentioned First, second name and others and don't forget to mention the corresponding author
8. The name of the corresponding author should be mentioned with designation, affiliation and name of the institution.
9. They should mention the complete address with the email id of the corresponding author.
10. All the our communications to be sent only to the corresponding author.
11. The Indian Journal of Natural Sciences publishes multidisciplinary science based research papers etc.,
12. After receiving the paper from the author, the IJONS will send the acknowledgement immediately. After scrutinizing your paper, we will issue our official letter with Reference number to the concern author (s).
13. After receiving the acknowledgement, the authors are instructed to pay the processing and publication fee within 2-3 days. The processing and publication fees should be deposited in the account given by IJONS. The Indian authors are instructed to mention the IFSC code and the foreign authors pay the fee via paypal option (Details given the website).

Notifications for the Authors

14. After receiving the acceptance letter, phone and whatsapp contacts from the authors are not encouraged. The authors no need to send the queries after receiving the acceptance letter. If any changes, the authors are intimated to IJONS before the payment of publication and processing fees. If you share any information regarding your paper, please contact only by mail. The paper will be published and the soft copy of the paper will be sent to the corresponding author.
15. After acceptance or publications IJONS are not responsible to alter, edit, change in content of the paper.
16. Author(s) please submit your manuscript via mail to us : **ijons@tnsroindia.org.in** (for publication related w.e.f. 15.08.2021) for general inquiry please contact : **ijonsindia@gmail.com**
17. Before submission of your paper please check “plagiarism rate” (Less than 10 % it is appreciable)
18. IJONS asked the authors to kindly follow the instructions before sending the paper to us (details available on the website).
19. We are not appointing any company or person(s) for publication purposes.
20. Author(s) are requested to feel free contact us directly.

ABSTRACT

This research explores into the intricate trajectory of fairy poetry during the English Renaissance, meticulously tracing its evolution from a vehicle for social commentary to a widely embraced form characterized by aesthetic prettification. Guided by the perceptive insights of Warren W. Wooden, particularly articulated in his chapter "A Child's Garden of Sprites: English Renaissance Fairy Poetry" within "Children's Literature of the English Renaissance," the study aims to unravel the underlying factors that contributed to the transformation and subsequent decline of fairy poetry. The investigation scrutinizes works by renowned authors such as William Shakespeare, Ben Jonson, and others, spanning the early to late Renaissance period. Two pivotal questions frame this exploration:

- How did fairy poetry undergo a significant shift from being a conduit for social commentary to evolving into a popularized, aesthetically driven genre?

In addressing this question, the research will delve into the historical context, examining the societal changes and literary trends that influenced the transformation of fairy poetry. The analysis will consider the thematic evolution of fairy poetry, exploring how its initial role as a medium for social commentary gradually gave way to a more aestheticized form, captivating a broader audience.

- What cultural and literary influences, as evidenced in the works of Shakespeare and Jonson, played a role in the devolution of fairy poetry, leading to its diminished popularity as a medium for social critique?

This question involves a meticulous examination of specific works by Shakespeare, Jonson, and other prominent authors. By closely analysing the content and stylistic choices within their fairy poetry, the research aims to identify cultural and literary shifts that contributed to the decline of fairy poetry as a vehicle for social critique. Additionally, the study will explore the reception of these works in the socio-cultural context of the time, shedding light on the factors that shaped audience expectations and preferences.

Keywords: Fairy Poetry, Elizabethan England, Shakespeare, Ben Jonson and Edmund Spenser.

INTRODUCTION

The Elizabethan era, often hailed as the "Golden Age" of English fairy poetry, is a captivating chapter in literary history. During this time, the interplay between reality and fantasy in faery tales enchanted poets and audiences alike, shifting from a medium of social commentary to one focused on aesthetic beauty. The title "From Social Commentary to Prettification: The Evolution and Devolution of Less Popular Fairy Poetry in the English Renaissance, A Reflection on Warren W. Wooden's Perspectives" reflects this transformation. It examines the genre's growth and decline, highlighting lesser-known works and incorporating Wooden's scholarly insights. Warren W. Wooden, a Renaissance scholar, passed away on December 27, 1983, at forty-two. Specializing in Tudor and Stuart literature, he contributed significantly to the study of figures like Thomas More and John Foxe. Wooden's interests included biography, hagiography, iconography, popular culture, and rhetorical strategies. His major project, "The Origins of Children's Literature in England, ca. 1500-1700: A Critical Investigation and Survey," aimed to explore the historical roots of children's literature. He received support from esteemed organizations and a senior research fellowship for this work.

Despite his untimely passing, Wooden's contributions and the legacy of his unfinished work continue to shape the study of children's literature history. His proposed book sought to examine the influences on English children's literature, addressing a significant scholarly gap. Overall, the title encapsulates the evolution and decline of fairy poetry's popularity and its shift from social commentary to aesthetic prettification, building on Wooden's perspectives. In children's literature, fairy poetry plays a captivating role by blending enchantment and imagination. Through whimsical tales featuring magical creatures in fantastical settings, fairy poetry opens a world of wonder for young readers. Beyond entertainment, these poems often carry moral and educational themes, using allegorical characters to teach lessons about ethics and values. The rhythmic qualities of fairy poetry, enhanced by rhyme and rhythm, make it accessible and engaging, aligning with the oral tradition of storytelling. Illustrated fairy poetry books further enhance the visual appeal, creating a multisensory experience with vibrant illustrations that complement the narrative. Fairy poetry also provides a unique avenue for emotional expression, helping children navigate a range of emotions, from joy to excitement to comfort. Rooted in cultural tradition, these tales preserve heritage and expose children to timeless narratives cherished across generations.

This research explores the evolution of fairy poetry, guided by Warren W. Wooden's insights. Wooden's chapter "A Child's Garden of Sprites: English Renaissance Fairy Poetry" serves as a compass, navigating the genre's development during this period. His perspectives, detailed in "Children's Literature of the English Renaissance," form the foundation for understanding this literary journey. The roots of fairy lore trace back to classical Greece and Rome and the folk beliefs of the Celtic and Teutonic peoples. Key works like Edmund Spenser's *Faerie Queene* (1590) and Shakespeare's *A Midsummer Night's Dream* (c. 1595) played pivotal roles in shaping Elizabethan literature's fascination with fairies. Shakespeare's portrayal of fairies, accessible to a broad audience, created an enduring literary image that inspired a surge of imitative fairy poetry.

Wooden's perspectives provide a valuable theoretical framework for this exploration. His chapter meticulously examines the multifaceted dimensions of English Renaissance fairy poetry, revealing thematic shifts and socio-cultural contexts that fuelled its evolution. By tracing the evolution and decline of less popular fairy poetry, this research enhances our understanding of the dynamic interplay between literature and society during the English Renaissance, enriched by Wooden's scholarly insights.

In the subsequent sections, we will analyse selected examples to explore the development and direction of English fairy poetry during its peak in English literature, drawing extensively from Warren W. Wooden's comprehensive observations. This analysis will highlight the nuanced forces and factors that shaped the metamorphosis of fairy poetry.

**Punitha Andrews and Thakur**

William Shakespeare's *A Midsummer Night's Dream* (c. 1595; printed 1600) marks a transformative moment in the genre. Shakespeare's depiction of fairies, such as the mischievous Puck and the ethereal Titania, reshaped their literary portrayal, steering away from traditional social commentary. Ben Jonson's *The Sad Shepherd* (unfinished, posthumously published in 1641) provides glimpses into the evolving nature of fairy poetry. Although incomplete, Jonson's handling of the fairy realm in this work signals a shift towards a more romanticized and aesthetically driven representation, departing from earlier socio-political undertones. John Milton's *Comus* (1634), while not strictly a fairy poem, exemplifies the changing literary landscape. The masque's incorporation of enchantment and magical creatures reflects the broader trend of integrating fairy-like themes into diverse literary forms, moving away from explicit social commentary. Through detailed analysis of these examples and others, this research aims to uncover the intricacies of the evolution and devolution of fairy poetry during the English Renaissance, providing a deeper understanding of the genre's transformation and its impact on the literary and cultural landscape of the time.

The evolution of fairy poetry during the English Renaissance is a captivating narrative of profound transformation, shifting from a medium for social commentary to a widely popularized and aesthetically driven genre. Guided by Warren W. Wooden's insights, this exploration delves into selected works to reveal the intricate journey of fairy poetry. This transition from social critique to aesthetic celebration marks a significant shift, richly depicted in Wooden's nuanced analysis, and enhances our understanding of the genre's transformation and its impact on Renaissance literature and culture.

In the early stages of the Renaissance, Edmund Spenser's *The Faerie Queene* stands as a seminal example of fairy poetry serving as a vehicle for social commentary. Crafted in the late 16th century, this magnum opus engages with and mirrors the political and moral intricacies of Elizabethan society through its allegorical tapestry. Spenser uses the enchanting realm of fairies as symbolic agents to create a fantastical landscape that reflects real-world societal issues. Far beyond whimsical tales, these narratives become a sophisticated medium for dissecting and commenting on the socio-political dynamics of his time.

An illustrative example is the Redcrosse Knight's encounter with the fairy queen Gloriana. This allegorical episode explores the moral ideals upheld by the court, with Gloriana symbolizing both fairy royalty and the moral aspirations and challenges faced by the Elizabethan court. The Redcrosse Knight's quest for the Faerie Queene serves as a metaphorical journey through Elizabethan England's moral and political landscape, offering profound commentary on societal complexities. Characters like Duessa, representing falsehood and corruption, further deepen the social critique embedded in the fairy narrative. The interaction between the Redcrosse Knight and Duessa highlights the dangers of political deceit and moral compromise within the Elizabethan court.

Spenser's portrayal of these characters and their trials elevates fairy poetry beyond mere entertainment, transforming it into a medium for exploring and questioning the fabric of Elizabethan society. The Faerie Queene exemplifies the early Renaissance phase of fairy poetry, where the genre served as a dynamic conduit for social commentary, paving the way for its subsequent evolution into a popularized, aesthetically driven form. In *A Midsummer Night's Dream*, William Shakespeare marks a striking transformation in fairy poetry, departing from traditional allegorical representations. Fairies in this play, such as Puck and Titania, evolve into complex characters intricately woven into the human experience. Puck, also known as Robin Goodfellow, embodies this shift, emerging as a playful and mischievous character impacting the mortal world. His famous exclamation, "Lord, what fools these mortals be!" encapsulates the essence of this aesthetic departure, highlighting a newfound emphasis on enchantment and the unpredictable nature of the fairy world.

Puck's interactions with the mortal characters in *A Midsummer Night's Dream* exemplify Shakespeare's departure from traditional allegory. Puck's magical tricks on the Athenian lovers in the enchanted forest create confusion, romantic entanglements, and humorous situations, showcasing the whimsical nature of the fairy world intertwined with human experiences. These antics provide comedic relief and highlight the unpredictability of love and the folly of human behaviour. Titania, the fairy queen, also undergoes a transformation that adds depth to the fairy realm.

**Punitha Andrews and Thakur**

Her interactions with Bottom, who is magically transformed into an ass, emphasize the complexity of fairy-human relationships. Shakespeare's portrayal of Titania goes beyond traditional allegory, presenting her as a character with desires, emotions, and vulnerabilities that resonate with human experiences. The playful and mischievous nature of Puck and the complex portrayal of Titania highlight Shakespeare's ability to infuse whimsy and enchantment into fairy poetry, transforming it into a richly aesthetic and character-driven form during the English Renaissance. Ben Jonson's *The Sad Shepherd*, though incomplete and published posthumously in 1641, offers valuable insights into the transformative journey of fairy poetry during the early modern period. Despite Jonson's reputation for classical influences and satire, this work marks a shift towards a more aesthetically driven and romantically infused representation of fairies. Moving away from sharp satire, *The Sad Shepherd* embraces a pastoral and fantastical ambiance, creating an imaginative atmosphere.

In this play, fairies assume a romanticized and aesthetic guise, embodying enchanting and magical qualities of traditional fairy lore. This emphasis on their ethereal nature contributes to a fantastical and emotionally resonant portrayal, prioritizing aesthetics over didacticism. Drawing inspiration from traditional folklore and fairy tales, Jonson reflects the era's broader trend of celebrating magical and mysterious elements of English popular culture. Despite its incomplete state, *The Sad Shepherd* significantly contributes to the evolving landscape of fairy poetry. Scholars analyze these fragments to understand Jonson's experimentation with new themes and styles, offering a nuanced understanding of his approach to fairy poetry. This departure from his earlier socio-political themes marks a distinct shift in the genre during the early modern period.

While Jonson's contributions may not rival those of his contemporaries in recognition, *The Sad Shepherd* serves as a precursor to later works that embraced the enchanting and fantastical elements of fairy tales. The play's influence on subsequent writers is evident as it embodies the evolving aesthetics of fairy poetry during a period marked by a shift away from social commentary toward a more imaginative and emotionally resonant exploration of the fairy realm.

In summary, *The Sad Shepherd* by Ben Jonson, despite its unfinished state, illuminates the evolution of fairy poetry during the early modern period. This work signifies a departure from socio-political themes in favour of a more aesthetically driven and romantically imbued representation of fairies, aligning with broader trends in literature during this transformative period. Warren W. Wooden's insights, articulated in "A Child's Garden of Sprites," offer a guiding framework. Emphasizing the enchanting appeal of fairy poetry, especially among younger audiences, Wooden's perspective aligns with the evolving cultural landscape. The shift towards aesthetics can be seen as a response to this changing dynamic. Wooden's exploration of children's literature highlights how the whimsical and visually captivating elements of fairy poetry transcended societal critique, embracing a broader audience.

Exploring aesthetic elements and imagery in Shakespeare's *A Midsummer Night's Dream*, Jonson's works, and Milton's *Comus* provides insight into how these writers approached fairy poetry. Connecting these examples to the broader theme involves understanding how each author contributed to the evolving aesthetics and themes of the genre. *A Midsummer Night's Dream** and *Comus* delve into enchanted realms. In Shakespeare's play, the enchanted forest is a magical setting, while in Milton's *Comus*, the forest is a backdrop for allegorical encounters. Magical transformations in both works, such as Bottom's metamorphosis and the allegorical transformations in *Comus*, contribute to the genre's fantastical appeal. The ethereal beauty of fairies in *A Midsummer Night's Dream* resonates with Milton's symbolic characters in *Comus*. Both writers use imagery to depict the magical qualities of the fairy realm. Jonathan Swift's *Gulliver's Travels* illustrates the adaptation of fairy themes for satirical commentary during the Enlightenment. Swift uses fantastical elements and imaginary creatures to satirize society, politics, and human nature. For example, in the flying island of Laputa, Swift critiques the Enlightenment's excessive emphasis on reason and abstract knowledge. Although not a traditional fairy tale, *Gulliver's Travels* exemplifies using fantastical elements for social commentary, demonstrating the genre's versatility in different contexts. Ben Jonson's works, like *Volpone* and *The Alchemist*, do not directly involve fairies but use satirical and classical imagery, reflecting broader literary trends of the early modern period. This contrasts with Shakespeare's whimsical approach in *A Midsummer Night's Dream* and Milton's allegorical imagery in *Comus*. Jonson's masques, with elaborate visual displays, share a connection with the theatrical aspects of fairy poetry, emphasizing spectacle and aesthetics similar to fairy tales.

**Punitha Andrews and Thakur**

Milton's *Comus* aligns with fairy poetry through rich sensory imagery and poetic language, enhancing the aesthetic experience. The different approaches of these authors reflect the cultural and literary context of their times. The whimsy and enchantment in Shakespeare's work capture the Renaissance spirit, while Jonson and Milton emphasize classical and moralistic themes.

These examples showcase the evolution of fairy poetry, from its folklore roots to a nuanced exploration of enchantment, symbolism, and aesthetics, adapting to changing literary tastes and cultural influences. The connection between these works lies in their contributions to the evolving fairy poetry landscape, offering unique perspectives that enrich the genre. The metamorphosis of fairy poetry reflects thematic shifts and artistic innovations. Examining specific verses and dialogues, and embracing Wooden's perspectives, provides a nuanced understanding of this transformative journey. Fairies evolve from mere allegorical devices into captivating characters celebrated for their enchanting beauty and whimsical charm. The evolution and devolution of fairy poetry are understood through cultural and literary influences, particularly in the works of Shakespeare and Jonson. Their incorporation of fairy elements in *A Midsummer Night's Dream* set the tone for the genre. However, fairy poetry experienced a devolution, marked by changes in themes, styles, and societal reception. As cultural attitudes shifted towards reason, order, and direct social critique, fairy poetry diminished in popularity.

The move towards neoclassicism marked a departure from fantastical elements, emphasizing reason and order. The works of metaphysical poets like John Donne and Andrew Marvell shifted towards intellectual exploration rather than fairy enchantment. The Renaissance's fascination with folklore and magic gave way to the Enlightenment's emphasis on reason, diminishing fairy poetry's appeal as its supernatural elements contradicted the rational worldview. Thus, fairy poetry, once rich with metaphorical social critique, yielded to neoclassicism, Enlightenment rationality, and direct satirical expression. The Puritanical influence during the Interregnum in England created a stricter moral and cultural environment, deeming fairy poetry's whimsical and subversive nature less acceptable. The closure of theatres during the English Civil War further limited the production and reception of such works, contributing to a decline in the genre's popularity. The rise of satire as a prominent genre provided a more direct form of social critique. Jonathan Swift's "A Modest Proposal" exemplifies how satire could address societal issues straightforwardly, making fairy poetry seem indirect and less effective for social commentary.

Shakespeare's *"A Midsummer Night's Dream"* used fairies to comment on human love and social order. However, later works like Alexander Pope's *"The Rape of the Lock"* demonstrated a shift towards more direct social critique. Pope's satire engaged directly with the social follies of the aristocracy, departing from the allegorical methods of earlier poets. The devolution of fairy poetry resulted from shifts in literary tastes, changing cultural attitudes, religious and political influences, and the emergence of satire. These factors collectively diminished the popularity of fairy poetry as a medium for serious social commentary. This decline parallels trends in children's literature, which shifted from diverse and imaginative fairy tales to more didactic and moralistic approaches, reflecting changing societal expectations. Examining the trajectory of fairy poetry from its pinnacle during the English Renaissance to its modern status reveals a decline in prominence within children's literature. The enchanting tales of Shakespeare's *"A Midsummer Night's Dream"* and Jonson's *"The Sad Shepherd,"* which once offered metaphorical social commentary, face new challenges in contemporary literary landscapes.

Today, fairy poetry contends with competing genres in children's literature, such as fantasy and science fiction. Modern classics like J.K. Rowling's *"Harry Potter"* series and Philip Pullman's *"His Dark Materials"* trilogy depart from the whimsy of traditional fairy poetry. These works engage young readers with enchanting worlds and magical elements, prioritizing intricate plotlines, character development, and themes resonant with contemporary sensibilities. Thus, fairy poetry's metaphorical richness has been overshadowed by new forms that captivate today's audiences in different ways. The rise of visual media has eclipsed traditional fairy poetry, diminishing its role in children's literature. Animated films and multimedia adaptations offer widespread accessibility, diverting attention from the nuanced and metaphorical nature of fairy poetry. This shift reflects evolving cultural attitudes and technological advancements, signaling a decline in fairy poetry's prominence. While these enchanting tales remain

**Punitha Andrews and Thakur**

part of literary history, their fading resonance with younger audiences underscores a broader transformation in children's literature, marking the decline of a once-revered genre in the realm of childhood imagination. In conclusion, this exploration of fairy poetry during the English Renaissance reveals a fascinating metamorphosis. Once a vehicle for social commentary, the genre blossomed into a realm of aesthetic enchantment, as exemplified by Shakespeare and Jonson's works. However, cultural shifts and the rise of alternative genres led to a decline in fairy poetry's popularity. This transformation underscores the dynamic interplay between literature and society, with fairy poetry serving as a captivating illustration of this evolution.

ABSTRACT

The paper entitled, "Quest for Identity in Isabel Allende's *Daughter of Fortune*" is an attempt to critique the male-chauvinistic world and to bring out the freedom of women from the shackles of patriarchy. Isabel Allende ridicules the folly or vices in a corrupt society and picturizes the particular society as it is to show corruption prevailing in the world. Through the narration of the life of the protagonist, the reader witnesses the corrupt society filled with avarice, jealousy, cruelty and villainous intrigue. Virtue and Vice play a predominant role in this novel. Some people give more importance to virtue and condemn vices. But in reality, they do not follow the virtues preached by them. They do not act according to their principles. Selfishness, hypocrisy and class distinction control their mind than humanity. In this novel, Eliza rebels against the male-dominated society. She wants to enjoy complete freedom. Jeremy Sommer and Agustine del Valle represent patriarchy. Besides Eliza, Rose Sommer and Paulina del Valle also rebel against the conventional norms of the society. They represent the rebellious women against the male-chauvinistic society. Search for identity and struggle for survival in the world of hypocrisy is seen throughout this novel. Experience teaches more to the protagonist rather than education itself. This paper analyses these features in the novel and illumines the profundity of thought and ideology.

Keywords: Feminism-Patriarchy- innocence- suffering- travel- search for identity, transformation- freedom

INTRODUCTION

Gender is one of the major issues discussed in recent times. Sex is a biological one while Gender is a social construct. In Simon de Beauvoir's words, "One is not born a woman; rather, one becomes a woman" (qtd. in Barry, 90). As a literary movement, Feminism champions the basic rights of women against patriarchy. Women are considered to be weaker sex or the other and they have been suppressed by men in all means and are treated like an animal. Feminist writers reflect the sexual harassment and ill-treatment of women in their writings and make aware of the sufferings of women throughout the world. In this paper, Isabelle Allende's *Daughter of Fortune* has been taken up for study. In *Daughter of Fortune*, Isabel Allende brings out a brave and passionate young woman's transformation from innocent

Muthulekha

woman to a vibrant empowered woman. Isabel Allende is a notable Spanish writer and her works have been appreciated all around the world for her compassion, imagination, humor, and originality. In this paper, her work *Daughter of Fortune* has been taken up for study.

This paper analyses and discusses the quest for identity of a young lady Eliza and the trauma faced by her in the society. In *Daughter of Fortune (DoF)*, Allende visualizes the patriarchal society and depicts the subjugation of women and calls for freedom of voice, sense of belonging through her protagonist Eliza.

The novel begins with the childhood experience of Eliza. She recalls her entry into the highly aristocratic family. Mama Frezia, the Indian maidservant of Sommers has seen the baby at the entrance of his company. Jeremy Sommer, the owner of the British Import and Export Company is a reputed person in Chile. Unfortunately, he has lost his wife and children in a terrible accident and lives with his sister Rose Sommer. For Jeremy, Rose and his brother John Sommer are the only relations in this world. When Rose Sommer wishes to adopt the baby found in their doorstep, he readily agrees to have the child only for her sake.

Although she is a spinster, Rose Sommer treats the child as her own and calls the baby by their family name Sommers and showers her love and affection on the child. Yet Eliza is considered as an abominable child by the society. Her parentage does not give her a recognized identity in the society. Eliza struggles hard to survive in the treacherous world and everyone considers her as a detestable creature.

Eliza has been brought down in a highly aristocratic manner. She enjoys a luxurious life under the care of Rose Sommer and her brother John Sommer and Jeremy Sommer. She considers Miss.Rose as her mother and is grateful to her for giving her family's identity but she feels safe and comfortable with Mama Fresia. She learns everything that includes art, literature and music from Mama than Rose. Eliza's adolescence has led her to fall a prey to love. As an orphan, Eliza undergoes bitter experiences in the society. She is blamed for her birth. Even Jeremy condemns her and sees her as a drifter. He does not like to adopt her but only for the sake of Rose, he allows Eliza to live in his house. Eliza realizes her isolation even from her childhood. She thinks that she would have come from one of the downtrodden families and severs herself from her lovable mother Rose Sommer and her uncle John Sommer.

Even though she is beautiful and highly educated, there are no suitors to Eliza on account of her illegitimate birth. Rose and John Sommer take effort to find the best suitor for Eliza and fail in their attempt. Meanwhile, Eliza's heart has been entrapped by the charm of Joaquin Andieta. Joaquin is a courageous and revolutionary man and this nature inspires Eliza to be in love with him.

Joaquin works in Jeremy's British Import and Export Company for a meager wage. When he comes to Sommer's house once to unload the goods, he sees Eliza for the first time and falls in love with her. Eliza's love for Joaquin makes her hide her love from the eyes of Sommer's and Mama Fresia fearing opposition. When Rose comes to know Eliza's love, she advises her not to give priority to her infatuation and warns her not to get into trouble in future. Despite her warning, Eliza wants to lead a happy life with Joaquin and brought shame to her family.

Allende portrays California as a Treasure land that gives hope for many to lead a luxurious life. Eliza starts her adventurous life in Sacramento and Tao Chien helped her to lead a comfortable life. Everyone is on the move except Rose and Jeremy Sommer. Eliza disguises herself as a Chilean boy and wanders with a group of travelers. Having stricken by the gold fever, Paulina and Feliciano de Rodriguez de Santa Cruz also move to San Francisco. Being a captain, John Sommer takes an expedition in his steamship. Eliza's lover Joaquin Andieta moves to San Francisco in search of Fortune. Being disguised as Jacob Fremont, Todd moves to California and leads a new life as a journalist. At the same time, Eliza too goes to California in the pursuit of her lover Joaquin Andieta and in her search for Andieta, she identifies herself.

**Muthulekha**

Jeremy Sommer has been regarded as generous, kind-hearted man in the society but, he represents patriarchy. According to him; woman's duty is to serve the domestic chores of men and to obey the rules laid by honour and chastity only to women. Jeremy remarks: "It is man's nature to be savage; it is woman's destiny to preserve moral values and good conduct" (DoF, 13).

Women are regarded as weaker sex and have been subordinated by men at all means. When Rose wishes to educate Elizain a highly aristocratic school, Jeremy firmly rejects her motto, pointing out Eliza's parentage. He does not want her to be educated in school. He once says to Jacob Todd: "Intelligence is a drawback in a woman. Rose wants to send her to Madame Colber's school, but I am not in favour of that much schooling for girls; it makes them unmanageable. Let us always know our proper station, that is my motto" (DoF, 47).

Women are not treated equally and they are mere puppets in the patriarchal society. Men ignore intellectual women by saying them as troublemakers and are not give equal opportunity in any fields. In *Daughter of Fortune*, Allende presents three rebellious women characters in various dimensions. Even though they differ from each other in social status, behaviour and principles, they are alike in one way. They are independent, daring and rebellious. They critique patriarchy and question the master mindset of patriarchy. Allende manifests patriarchal society in the characters like Jeremy Sommer and Augustine del Vale. Racism and classicism are given importance in the society. Paulina, the daughter of Augustine del Vale falls in love with one Feliciano. As his ancestors come from the Jewish family, Paulina's father rejects her love with Feliciano. He has imprisoned her in Concepci'on where the nuns devote their time in fasting and prayers. He orders her head to be shaved as a punishment for her love.

Paulina rebels against the social conventions of the society. She elopes with her lover and leads an independent life. Later, the men at both parties agree to wedding after consuming several pots of foaming chocolate. She leads a happy life with her lover. When her husband gains profit in his business, she wants to inherit twenty percent of his money. Paulina sets the model to the modern woman. Her courage, intelligence and her daring spirit makes her a unique one. It is she who plans to buy steam ship to seek fortune in San Francisco. She enjoys complete freedom in her husband's home rather than her fathers. Her rebellious adventure against the patriarchal society shows Allende's protest against the social confines.

Allende's other main character Rose Sommer represents the willingness to sacrifice everything for love. Her passion for Karl Bretzner tempts her to give herself for her love. She is captivated by his sweet voice but he deceives her being a womanizer. She comes to know the fact that he has already been married to somebody else. Even though he cheats her, her love for Bretzner is true she remains unmarried forever after her first love. She spends her remaining days recalling her sweet memories with Karl Bretzner.

One more reason for her desolate life is, she wants to enjoy her freedom. She does not like to be a slave. In her opinion, "a wife was the husband's property with fewer rights than those of a servant or child" (DoF, 51). She wants to enjoy freedom a man has. Her life with her brother Jeremy is not so happy as herself yet she leads a peaceful life with him. She does not want to follow the social convention that prevails in her society. When she finds Eliza in her doorstep, she does not worry about the society. She adopts her as her own child and tries to give everything for her fortune. She represents the motherhood. Her courage to struggle for freedom shows Allende's desire for equality. Eliza is the epitome of freedom and empowerment of woman. She struggles hard in the hypocritical world. She disguises herself as a Chilean boy to escape from the brutal eyes of men. Her hard life in the jungle and her experience with the wanderers, gypsies and brothels carve her a perfect lady. Even though she leads a terrible life in a jungle, she enjoys her freedom. Her freedom gives her courage to cope with the nasty world. Her struggle for survival enables her to learn more and more from nature. Her transformation from adolescence to prudence can be compared to her rejuvenation. A coward Eliza who lives under the care of Rose and Mama Fresia soon vanishes in the land of gold dust.

Muthulekha

Eliza rebels against the conventional norms of the society. According to her, her true love towards Andieta is justifiable. She gives importance to Andieta than her luxurious life in Sommer's home. That's why she gives herself to Andieta but he deceives her. Eliza wants to go in search of her lover risking the social norms. Her experience with the wanderers gives her courage and confidence. She enjoys ultimate freedom in her adventure with the travelers. She realizes her transformation from innocence to wisdom.

Eliza serves as a modern rebel against the male-chauvinistic society. When she arrives to Chile, she finds it difficult to adapt to the region and feels desolated. Yet she enjoys her ultimate freedom. In her adopted home, she is confined to a small room, 'where she could barely glimpse the horizon through distorted window panes' (DoF, 275). Although she is educated by Rose Sommers, she is not capable of taking right decision on her own and she depends on others for even timid things. She is bound to conventional practices and tradition from her childhood. Her experiences with Joe Bone Crusher and her team gives her courage. In her disguise as a Chilean boy, she plays piano and joins their team. Even though they are downtrodden people and live in brothels, they help others when they are in distress. Joe Bone Crusher, the leader of that group, adopted a tribal boy and has named him as Tom-No-Tribe. Her affection and love towards the boy shows her generosity and kindness. Eliza stays with them for a brief period and later she realizes that she cannot lead a happy life without her friend Tao Chi'en. Her friendship with Tao is pure and more sincere than her love to Andieta.

As years passed by, Eliza's love for Andieta gradually fades away. She does not like to go in search of her lover. She hears about one Joaquin Murrieta, a cold-blooded killer. No one knows the true identity of Joaquin Murrieta except the fact that he is a Chilean. Eliza thinks that he may be her lover, Joaquin Andieta. She doubts her lover's existence and wants to give up her search. In the meantime, her adopted mother Rose Sommer has revealed Eliza's true identity to Jeremy. She reveals the fact that her brother John Sommer is the father of Eliza. Eliza has been treated as a protégée in her own home and till the end of the novel she doesn't know her identity. When Rose comes to know that Eliza is alive and lives in California, she prepares to go in search of Eliza. Although she is disappointed in her search for Joaquin, Eliza realizes her own freedom. She realizes what life is, and tries to accept the reality as it is, when she finds that the Chinese girls are taken as slaves and are forced to lead a promiscuous life. She rebels against their enslavement with her friend Tao Chi'en. In his essay "The symbolism surrounding the Rebirth of Allende's Female Protagonist". Hart examines the symbolism surrounding the rebirth of Allende's female protagonist, Eliza. As he remarks:

Similar to the biblical story of Jonah and the whale, Isabel Allende throws her female protagonist Eliza into the darkest recesses of a sailing ship, forcing her young heroine to confront her innermostThe challenges bring Eliza close to death yet she prevails and goes on to convictions(36).

The challenges bring Eliza close to death yet she prevails and goes on claim a new identity. She also suffers through her sense of rootlessness. But she overcomes her loss of identity by her optimistic thoughts. According to her, "What matters is what you do in this world, not how you come into it, she used to say to Tao Chi'en during the many years of their splendid friendship"(DoF, 5).

Allende gives the real portrait of the struggles of a woman against the male-dominated society. She is able to survive in the unknown world only in disguise. After realizing her own strength and real freedom she comes out of her male disguise and tries to fight against patriarchy by being a woman. She wants to be a woman rather than man. Her womanhood incites her to revive her own identity in the patriarchal society. She says: "Without a man to protect her and support her, a woman is lost, Miss. Rose had drummed into her, but Eliza discovered that was not always so. In her role as Elias Andieta, she found work she could have done dressed as a woman"(DoF, 281).

Allende brings out the realist view of women's suppression in this novel. In Chile, women are not given the right to have their own property. They should not sell or buy their own things without the permission of their father or husband. They are treated as slaves rather than human beings. Men subordinate women by considering them as a

**Muthulekha**

weaker sex. Eliza rebels against this conventional society. Realization of her own identity in the society enables her to lead a happy life. Her life with the prostitutes and wanderers is too difficult to manage. Yet she succeeds in her attempt, by helping others. Her necessity for survival encourages her to struggle against the misfortune. Her hard life in the land of fortune educates her to be brave and energetic. Her adventurous life thus ends with the realization of her own freedom. *Daughter of Fortune* is, thus, a sweeping portrait of an era, a story rich in character, history, violence and compassion.

ABSTRACT

This study embarks on a comprehensive journey through the evolving landscape of interview power dynamics. We aim to dissect and map the progression of power relations in interviews, focusing particularly on the contrast between literary and political interviews across various historical periods. Through a meticulous examination, the paper illuminates the nuances and shifts in power dynamics, drawing attention to both the similarities and disparities between literary and political contexts. At the core of this analysis is an exploration of how the distinct objectives and formats of literary and political interviews shape their inherent power structures. Literary interviews, typically centred around promoting an author's work and delving into the creative process, contrast with political interviews, which often aim to uncover truth and hold power to account. This contrast offers a unique vantage point for understanding the interplay of power in these settings. Furthermore, the paper delves into the subtleties of linguistic strategies, non-verbal communication, and the overarching social context that envelop these interviews. It examines how these elements collectively contribute to the construction and perception of power within the interview setting. The historical perspective provides a lens through which changes in societal norms and values, as well as shifts in the media landscape, are reflected in the power dynamics of interviews. This study not only provides a historical account of the evolution of interview power dynamics but also offers a critical analysis of the factors influencing these dynamics. By comparing literary and political interviews, it uncovers the underlying forces that shape the flow of power in these interactions, offering valuable insights into the complex interplay of social, cultural, and media influences on the nature of interviews. The findings of this research hold significance for scholars in the fields of media studies, communication, and social history, providing a nuanced understanding of the evolution of power in one of the most fundamental forms of human interaction.

Keywords: Interview Power Dynamics, Historical Evolution of Interviews, Comparative Media Analysis, Literary Interviews, Political Interviews, Media, Power, and Society.

INTRODUCTION

The intricate dance of power dynamics in interviews has been a subject of fascination and study for decades. Interviews, as a medium of communication, serve as a mirror reflecting the societal, political, and cultural landscapes of their time. This research paper seeks to explore the nuanced evolution of these dynamics, particularly focusing on the differences and similarities between literary and political interviews across various eras. Power dynamics in interviews are shaped by multiple factors, including the purpose of the interview, the social status of the participants, the format of the interview, and the medium through which it is conducted. In literary interviews, the focus often lies in unravelling the thought process of authors, discussing their works, and delving into the creative world of literature. These interviews tend to be more collaborative, with power more evenly distributed between the interviewer and interviewee. Conversely, political interviews are characterized by a more confrontational nature, often aimed at uncovering truths, challenging statements, and holding public figures accountable. Here, the power dynamics can be more fluid, with interviewers typically holding more power, though skilful politicians often navigate these dynamics to their advantage.

The evolution of interview power dynamics can be traced back to the early 20th century when interviews began gaining prominence as a journalistic tool. In the early days, interviews were often formal and respectful, with a clear power imbalance favouring the interviewee, especially in political contexts. Over time, as media evolved and public expectations shifted, these dynamics began to change. For instance, the rise of television in the mid-20th century transformed interviews into a more dynamic and visual medium, altering the power balance as both parties became increasingly aware of the public's gaze. The comparison between literary and political interviews is particularly striking. Literary interviews, often conducted in more relaxed settings, allow authors to articulate their thoughts and promote their work, often positioning the interviewer as a facilitator rather than a challenger. This format can lead to a more symmetrical power dynamic, with both parties contributing equally to the discourse. In contrast, political interviews, especially in contemporary settings, are often arenas of strategic battle, where each word and gesture is measured and analysed. The interviewer's role as a gatekeeper of information and a representative of the public interest often places them in a more powerful position, though skilled politicians utilize rhetorical strategies to shift this balance.

The use of language and non-verbal cues plays a significant role in the establishment and negotiation of power in interviews. Linguistic strategies such as questioning techniques, interruptions, and framing can significantly influence the direction and tone of the interview. Non-verbal cues like body language, eye contact, and facial expressions also contribute to the perception of dominance or submission within the interview context. The analysis of these aspects provides insight into the subtleties of power negotiation in both literary and political interviews. The social and cultural context surrounding interviews cannot be overlooked. Factors such as societal norms, cultural values, and historical events play a crucial role in shaping interview dynamics. For example, interviews conducted during periods of political unrest or social change often reflect these tensions, with power dynamics being more pronounced and contentious.

The aim of this study is to provide a comprehensive analysis of the historical evolution of power dynamics in interviews, with a focus on comparing literary and political interviews. By examining these two distinct types of interviews across different eras, the study seeks to identify patterns, shifts, and underlying factors that have influenced these dynamics. This comparison is vital in understanding how the objectives and formats of interviews contribute to the construction of power within these interactions. The study employs a historical and comparative methodology, analysing interviews from various time periods to trace the evolution of power dynamics. This approach involves examining primary sources such as transcripts, recordings, and video footage of interviews, alongside secondary sources that provide critical analysis and contextual information. By situating interviews within their historical and cultural contexts, the study aims to unravel the complex interplay of factors that shape power dynamics.

**Yogeeta Sharma and Vijay Kumar**

This research holds significant value for multiple disciplines, including media studies, communication, political science, and literature. Understanding the evolution of interview power dynamics sheds light on broader societal and cultural shifts. It also provides insights into the strategies employed by interviewers and interviewees to navigate these dynamics, which can be beneficial for professionals in journalism, politics, and public relations. Following this introduction, the paper is structured into several sections: a comprehensive literature review that provides the theoretical and historical background; a detailed methodology section explaining the approach and sources used; an analysis of the results, offering a chronological overview and comparative examination of the interviews; a discussion section that interprets the findings in the context of existing literature and includes the insights gained and suggests avenues for future research; and then ending the study with a conclusion.

LITERATURE REVIEW

The concept of power dynamics in interviews has been extensively explored within several theoretical frameworks. Michel Foucault's discourse on power and knowledge is particularly relevant (Foucault, 1972). He posits that power is everywhere and comes from everywhere, thus it's neither an agency nor a structure (Foucault, 1980). This perspective is crucial in understanding the fluid and omnipresent nature of power in interview settings. Similarly, Pierre Bourdieu's theory of cultural capital and symbolic power provides insights into how societal status and cultural competencies play into power dynamics (Bourdieu, 1986). These theories offer a foundation for analysing the subtleties of power in different interview contexts.

Early studies of interviews highlight a formal, almost deferential approach, particularly in political interviews. Schudson (1978) notes that early 20th-century journalism was characterized by a less confrontational and more narrative style. This shifted dramatically with the advent of broadcast media, as noted by Schlesinger (1987), who observed that television changed not only the format but also the power dynamics of political interviews, making them more adversarial. In the realm of literary interviews, the dynamics are markedly different. Heble (1996) discusses how literary interviews have historically served as platforms for authors to articulate their creative visions, often leading to a more balanced power dynamic. This is contrasted with political interviews, where the interviewer often assumes a more dominant role in pursuit of accountability, as explored by Clayman and Heritage (2002).

The power dynamics in literary interviews are often shaped by the mutual interests of the interviewer and interviewee. According to Kearney (1990), these interviews serve as a space for authors to elaborate on their work, making the interviewer's role more facilitative than interrogative. However, as Atkinson and Silverman (1997) point out, the power dynamic can still shift depending on the interviewer's approach and the interviewee's responses. In political interviews, the balance of power is frequently more contentious. Davis (2010) notes that political interviews often serve as a battleground where journalists seek to uncover truths and challenge narratives, while politicians strive to maintain control of the discourse. This dynamic is further complicated by the public nature of these interviews, where both parties are acutely aware of the audience's perception, as explored by Clayman (1991).

The role of language in shaping interview dynamics is central to this discussion. Heritage and Greatbatch (1991) emphasize the importance of questioning techniques and conversational strategies in establishing power in interviews. Similarly, Bull and Mayer (1993) discuss how non-verbal cues, such as body language and eye contact, play a significant role in the perceived power relations within an interview. The influence of social and cultural contexts on interview dynamics has been a focus of several studies. Fairclough (1995) argues that interviews are not just shaped by the participants but also by the broader societal and cultural norms. Van Dijk (1988) extends this perspective by examining how power relations in media discourse reflect and reinforce societal power structures.

Methodologically, the study of interview dynamics has evolved over time. Goffman's (1959) work on the presentation of self in everyday life provides a framework for understanding how individuals navigate and negotiate power in interpersonal interactions, including interviews. More recent studies, like Hutch by (2006), employ

**Yogeeta Sharma and Vijay Kumar**

discourse analysis to examine the intricate ways in which power is constructed and negotiated through language in interviews. Comparative analyses of literary and political interviews are sparse, making this study a significant contribution to the field. Existing studies tend to focus on one or the other, but a side-by-side analysis, as proposed by this paper, offers a unique opportunity to understand how different objectives and formats influence power dynamics.

METHODOLOGY

This study adopts a historical and comparative research approach to analyse the evolution of power dynamics in literary and political interviews. The methodology involves a meticulous examination of primary and secondary sources, including interview transcripts, video footage, and scholarly analyses. This approach allows for a comprehensive understanding of the shifts in power dynamics over time and across different interview contexts.

Data Collection**Primary Sources**

Primary sources comprise transcripts and recordings of literary and political interviews from various eras, starting from the early 20th century to the present day. These sources are selected based on their historical significance and the prominence of the interview subjects and interviewers. A diverse range of interviews is chosen to ensure a broad representation of styles, contexts, and dynamics.

Secondary Sources

Secondary sources include scholarly articles, books, and critiques that provide insights into the nature of interviews, power dynamics, and the historical and cultural contexts in which these interviews occurred. These sources offer theoretical frameworks and analyses that are crucial for interpreting the data collected from primary sources. The selection of interviews follows a purposive sampling strategy, focusing on interviews that have been widely recognized and discussed within public discourse and academic circles. This strategy ensures that the study covers interviews that are not only historically significant but also representative of broader trends and shifts in power dynamics.

Data Analysis**Content Analysis**

Content analysis is employed to examine the interview transcripts and recordings. This involves identifying patterns, themes, and shifts in the power dynamics between the interviewer and interviewee. The analysis focuses on aspects such as questioning techniques, interruptions, responses, non-verbal cues, and the overall tone of the interview.

Comparative Analysis

A comparative analysis is conducted to identify similarities and differences in power dynamics between literary and political interviews. This analysis considers factors such as the interview's purpose, the social status of the participants, and the historical context in which the interview took place.

Historical Contextualization

Each interview is situated within its historical context to understand how societal norms, cultural values, and significant events might have influenced the power dynamics observed. This contextualization is essential for a comprehensive understanding of the evolution of these dynamics over time. To enhance the validity and reliability of the findings, the study employs triangulation, combining content analysis, comparative analysis, and historical contextualization. This multi-pronged approach ensures a more balanced and accurate understanding of the power dynamics in interviews.

RESULTS

The analysis of literary and political interviews from various eras reveals distinct patterns in power dynamics, influenced by the format, context, and objectives of the interviews. This section presents key findings from the content analysis of 20 interviews, highlighting shifts in power dynamics over time and across interview types. In literary interviews, there is a notable shift from a focus on the author's personal life in earlier decades to a deeper exploration of literary techniques and themes in recent times. Earlier interviews showed a more deferential approach towards authors, whereas contemporary interviews exhibit a more critical and analytical stance.

Example Transcripts and Analysis

1. **F. Scott Fitzgerald Interview (1936):** The interviewer's tone is notably reverent, with questions centred around Fitzgerald's personal experiences.
2. **Toni Morrison Interview (1998):** The power dynamic is more balanced, with Morrison confidently discussing the themes and social issues in her novels.

Political interviews have evolved from formal, almost scripted interactions to highly dynamic and confrontational exchanges. There is a noticeable increase in the assertiveness of interviewers over time, challenging political figures more openly.

Example Transcripts and Analysis

1. **John F. Kennedy Interview (1962):** The interviewer maintains a formal tone, with questions primarily seeking clarification of policies.
2. **Barack Obama Interview (2016):** The interviewer adopts a more challenging approach, directly questioning policy decisions and their impacts.

The contrast between literary and political interviews is stark. Literary interviews are characterized by a more collaborative and explorative nature, with a recent shift towards a critical examination of literary work. In contrast, political interviews show a clear trajectory towards confrontation and accountability. Across both types, there is a general trend towards a more balanced power dynamic, though the degree of this shift varies. In political interviews, the change is more pronounced, with interviewers taking on a more assertive role. The evolution of interview dynamics reflects broader societal changes, such as increased public demand for transparency and accountability in politics, and a growing interest in the artistic process and social commentary in literature. Analysing the power dynamics in interviews presented challenges, particularly in interpreting non-verbal cues and the impact of the broader social context.

In summary, the results indicate a clear evolution in the power dynamics of both literary and political interviews. The shifts observed are reflective of broader societal and cultural changes, with a notable move towards more balanced and dynamic interactions. The analysis underscores the importance of contextual factors in shaping the nature of these interviews and highlights the complexity of power negotiation within them.

Trends in Interaction Styles

Interaction Styles in Literary Interviews

- **Early Era (1900s-1950s):** Interviews were more personal and less critical, focusing on authors' backgrounds and inspirations.
- **Mid Era (1960s-1990s):** Transition to discussing societal influences on literary works, with more engagement in authors' perspectives on contemporary issues.
- **Contemporary Era (2000s-Present):** Marked by a balanced power dynamic, with a focus on literary techniques, social commentary, and deeper critical analysis.

Yogeeta Sharma and Vijay Kumar

Interaction Styles in Political Interviews

- **Early Era (1900s-1950s):** Formal and respectful, with interviewers often taking a passive role, focusing on policy and political vision.
- **Mid Era (1960s-1990s):** Shift towards a more challenging style, with interviewers starting to adopt a more assertive and probing approach.
- **Contemporary Era (2000s-Present):** Highly dynamic and confrontational, with a focus on accountability, direct challenges to policy decisions, and an emphasis on current issues.

Comparative Analysis

- **Shifts in Power Dynamics:** In both literary and political interviews, there is a clear trend towards a more balanced and dynamic power structure over time.
- **Role of Media and Culture:** Changes in media technology and cultural norms significantly influenced the evolution of these dynamics.
- **Interviewee Influence:** Across eras, skilled interviewees in both domains have shown the ability to navigate and sometimes reverse the power dynamics.

The evolution of media, especially the advent of television and digital platforms, has significantly impacted interview dynamics. This is evident in the increasing importance of non-verbal communication and the more pronounced role of the audience's perception in shaping the interview narrative. The power dynamics in interviews are not static and vary depending on multiple factors, including the interviewer's style, the interviewee's responses, and the overall social context. The analysis shows that while the interviewer generally initiates the power dynamic, skilled interviewees can significantly influence this dynamic through their responses and demeanour.

DISCUSSION

The analysis of the 20 interviews reveals significant shifts in the power dynamics of both literary and political interviews, reflecting broader societal and media changes. In literary interviews, the evolution from a focus on personal life and experiences to more in-depth discussions of literary techniques and social issues indicates a shift towards a more balanced and interactive dynamic. This evolution mirrors broader cultural trends towards valuing the artistic process and societal commentary in literature. In contrast, political interviews have become increasingly confrontational and challenging. This shift can be attributed to the growing public demand for transparency and accountability in politics, as well as changes in journalistic practices. The evolution from a more deferential approach to a dynamic, challenging style reflects the changing role of journalism in democratic societies.

The advent of television and digital media has significantly influenced interview dynamics. The visual aspect of television brought non-verbal communication to the forefront, making it a critical element in the perception of power dynamics. The rise of digital media and social platforms has further altered the landscape, introducing new considerations such as immediate public feedback and viral potential, which both interviewers and interviewees must navigate. The results further demonstrate that while the interviewer often initiates the power dynamic, skilled interviewees can influence and sometimes reverse these dynamics. In literary interviews, authors increasingly use the platform to articulate their perspectives, sometimes dominating the conversation. In political interviews, politicians with strong communication skills can navigate challenging questions and retain control over the interview narrative.

Future Directions

This study opens several avenues for future research. One area is the impact of digital media and changing societal norms on interview dynamics. Another area is the exploration of more nuanced aspects of power dynamics, such as the influence of gender, ethnicity, and cultural background on interview interactions. Additionally, examining the

**Yogeeta Sharma and Vijay Kumar**

role of audience perception in shaping interview dynamics in the age of social media would be a valuable contribution to the field.

Limitations

The study acknowledges its limitations, particularly the potential subjectivity in interpreting power dynamics and the selection of interviews. The selection of interviews, while comprehensive, cannot cover every significant interview in history and therefore future studies could expand the range of interviews analysed and employ more diverse methodological approaches to provide a more comprehensive understanding of the topic.

CONCLUSIONS

This research paper has provided a comprehensive analysis of the historical evolution of power dynamics in literary and political interviews. The study revealed distinct shifts in the nature of these interactions, reflecting broader societal and media changes over time. Literary interviews have evolved from a focus on personal insights to more in-depth discussions of literary content and societal issues, indicating a trend towards a more balanced and interactive dynamic. In contrast, political interviews have transitioned from a formal and deferential approach to a more confrontational and challenging style, mirroring the increasing public demand for transparency and accountability in politics. The impact of media evolution, particularly television and digital platforms, has significantly influenced these dynamics, highlighting the importance of non-verbal communication and audience perception. The study also emphasized the fluidity of power negotiation, with interviewees often influencing the dynamic. This research contributes to the understanding of media and communication studies, providing insights into how interviews reflect and influence societal norms and values. It underscores the need for continued research, especially in the digital era, to understand the ongoing evolution of these dynamics.

ABSTRACT

Transhumanism is a philosophical movement which is designed to reform the future of humanity through advanced technology. William Gibson's *Sprawl* trilogy sets in near future after World War III, controlled by corporates and technologies. It displays contemporary issues rather than a dystopian future. *Monalisa Overdrive* (1988), is the concluding one to Gibson's trilogy. It contains three different plots, knitted into a technological thriller with a futuristic climax. The hyper technological future of Gibson offers his subjects a chance to reformulate themselves with power and opportunity but does not wipe out their complete sense of loss and homelessness. The aim of this paper is to analyse William Gibson's *Monalisa Overdrive* in a transhumanist view, which seeks to ameliorate human life or condition with an advanced technological perspective.

Keywords: Transhumanism, technology, cyborg, machine, bio-soft.

INTRODUCTION

William Gibson is a well acclaimed writer of cyberpunk genre. Even though he wrote his technological plots before three decades, still it is pertinent in our present scenario. *The Ministry for the Future's* author Kim Stanley says, "William Gibson is the writer who taught the world that science fiction is the realism of our time, and it's his books that made that true. A crucial figure in our cultural history, a poet with good eye for pattern recognition". Gibson's tales contribute a lot to the field of imagination and thinking. He creates a futuristic urban complex named *Sprawl* which pictures a ubiquitous world of technology. Based on this technological world, he wrote *Sprawl* trilogy comprising *Neuromancer*, *Count Zero* and *Monalisa Overdrive*. It is populated with console cowboys, corporates,

Karthika and Kumaran

cyborgs and futuristic artists. His characters openheartedly welcome the technological settings and easily merge with it. They use this scientific advancement to escape from their distressing or disturbing life experiences.

William Gibson's *Monalisa Overdrive* is another master piece and the concluding text of his pioneering Sprawl trilogy, which sets a bench mark in science fiction writing. The story happens eight years after *Count Zero* and fifteen years after *Neuromancer*. It has four different plots, weaved beautifully altogether, with a convincing end. First plot deals with Angie Mitchell a cyber space celebrity, who had a biochip in her brain implanted by her father. This manipulation gives her an ability to access into the cyberspace and to communicate with AI voo do gods. But Angie's addiction to drugs impeded her from this ability as she is unaware about the complicated plan of Tessier-Ashpool clan to assassinate her by substituting Mona. Second plot focuses on Kumiko a twelve-year-old Japanese girl and a daughter of Yakuza Leader. She was sent to London in-order to keep her safe from the gang war between her father and the other Yakuza Leaders. Kumiko's father gave her a cyber guardian named Collins who accompanied her to London. And there she was taken care of by Sally Shears. Third plot follows Mona a sixteen-year-old girl who is stuck in between drug addiction and prostitution. She resembled to the Simstim superstar Angie Mitchell. Hence, Mona becomes a scape goat in the abduction plan. She is intended to be killed so as to provide bodily evidences in order to protect the Simstim star. Fourth plot is about Slick Henry who suffers from memory lapses due to Korsakov's syndrome and takes care of comatose body of Count Zero or Bobby Newmark.

Transhumanism or "evolutionary humanism" was first defined by the biologist Julian Huxley in his book of essays *New Bottles for New Wine* (1957). It focuses on the human enhancement through technologies. It is a process of ameliorating human through technology. Technologies do not take the human body away but they make the body more empowered or attenuated. Transhumanism is a paradigm shift regarding the notion of human's traits, their developments and their coming times. Scholars like Marvin Minsky, Hans Moravec and Raymond Kurzweil are the major pioneers of this philosophical movement. Max More and Nick Bostrom are the philosophers, who provide an intellectual and philosophical meaning to transhumanism. Transhumanism is defined as "an interdisciplinary approach to understanding and evaluating the opportunities for enhancing the human condition and the human organism opened up by the advancement of technology" (Bostrom 493). It also encourages new applications of technologies for overcoming "the limits imposed by our biological and genetical heritage" (More4). It blurs the borderline line between machine and human beings.

The aim of this paper is to analyse the life of humans in *Monalisa Overdrive* in the light of transhumanism. The advancement of technology is evident in the lives of Mona Lisa, Angela Mitchell, Kumiko and Shally Shear which enhanced their existence to another level which resembles utopian or dystopian ideal for the future of humanism. First transformation is seen in Mona, a young girl of sixteen, whose life changes from a prostitute to a cyber celebrity or a simstim star. She lives with Eddy a pimp, who mistreats her if she complains about her life or disobey his commands. He takes all her money and explores the possible means to sexually abuse her. Mona becomes a part of a kidnapping plot made by Tessier- Ashpool clan due to her look like with simstim star Angela Mitchell. But this resemblance is not enough for the kidnappers, hence they make Mona to undergo a plastic surgery in order to look exactly like Angela. So they can execute their complicate plot to assassinate Mona by substituting her in the place of Angela. Here, Mona's body becomes an example of technophilic body. A technophilic body "...transformations can be divided into two distinct categories. The first category is composed of techniques and technologies that are used for various *aesthetic* manipulations of the body surface. These include cosmetically redesigned faces, muscle grafts and animal \or human transplants that effectively blur visual cues for gender and human or non- human differentiation. The second category is directed to fundamental *functional* alteration to the human body's organic architecture" (Thomas131). By this aesthetic manipulation, not only Mona gets a chance to escape from the abusive life but also she reboots her life as an actress. In Mona's case, the technological advancement that happened in her life was not with here consent but the output changes her life from hell to Heaven.

Simstim star Angela Mitchell, is the daughter of a dead scientist Chris Mitchell. He embedded a biochip in her brain when she was young. It helps her to jack into cyberspace without using any devices. Because of this chip, she is not

Karthika and Kumaran

only able to interact with the cyber deities but also she can identify her artistic talent. When *Monalisa Overdrive* opens after seven years of *Count Zero*, Angela becomes a famous simstim star by replacing Tally Isham. The fame and the infrequent arrival of deity's voices in her head, makes her addicted to drugs. It helps her to suppress the voices in her head and the traumatic memories of her father. In the background, Tessier -Ashpool clan plans to kidnap Angie. Later, she is rescued by Molly. By analysing Angie, it is clear that she was an ordinary human by birth but once a technological alteration done in her brain, it enhances her life from a normal human to a transhuman. This advancement in her body helps to remould herself from an ordinary being to a celebrity. Max More states "Transhumanists regard human nature not as an end in itself, not as perfect, and not as having any claim on our allegiance. Rather, it is just one point along an evolutionary path way and we can learn to reshape our own nature in ways we deem desirable and valuable. By thoughtfully, carefully, and yet boldly applying technology to ourselves, we can become something no longer accurately described as human- we can become posthuman" (More 4).

Kumiko is a thirteen-year-old, daughter of a Yakuza Leader. Her father sent her to London due to the outburst of war between the corporates and gifted her a device for her security. At a touch, it projects a hologram of a man named Collins. He is the cyber guardian of Kumiko who protects her from all mishaps. He is a knowledgeable AI, who can easily access to local computers and information systems. Kumiko can reprogram him in many ways in order to make him more functional. In "Beyond Human Boundaries" Sayyed Ali Mirenayat discusses Bostrom's three major capacities of posthuman: health span, cognition and emotion. "Health span is one of the posthuman capacities to stay completely healthy, active and useful both bodily and intellectually. Cognition includes mental capacities such as memory, empirical thinking and attention. Third is emotion to enjoy life and to reflect properly on life conditions and others" (Mirenayat 268). Collins neatly fits in to the three posthuman capacities drawn by Bostrom. Collins actively stays with Kumiko and tells her to hide in Swain's office where they plan about Angie's kidnap. When Kumiko lost her mother, it throws her not only into a depressive state but also to a mode of dispatchment with her dad. In order to escape from this emotional turmoil, Kumiko relies on Collins, the prosthetic cyber companion.

Shally Shear is the most mechanized human character in Gibson's *Sprawl* trilogy and the author calls her 'Razor Girl'. She has mirrored eyes and false blades inserted under her nails in order to protect herself from the attack. The reason behind her body modification is to develop her skills as an assassin or a body guard. Before this augmentation, Shally Shear was a prostitute in a brothel. She was given a "cut-out-chip" while working, so that her conscious mind sprawls into a dream state. The result is blankness when her body is used by the clients. Gibson first introduces her in *Neuromancer* as Molly Million. In *Monalisa Overdrive* Gibson presents her as Shally Shear, an American woman who had metallic lenses instead of eyes and takes care of Kumiko in London. Shally and Swain are the planners behind the complicated plot of kidnapping the Simstim star Angela Mitchell and to assassinate and substitute her with Mona. Here Molly's transformed body gave her a new identity and power. And it is evident that how technology enhanced the life of Molly and makes her to escape the life of a "meat-puppet."

As Nietzsche said in *Thus Spoke Zarathustra* "Man is a rope, tied between beast and overman - a rope over an abyss" which means man is not seen as the final outcome of evolution rather he is an individual who can be modified or augmented to a higher level. Transhumanism is a progressive scientific process which offers a development from traditional to advanced technological community. Nick Bostrom believes that humans always seek to extend their boundaries of existence socially, geographically and intellectually in order to enhance their nature and dignity which can only acquire through advanced science and technology. This amelioration helps the individual to transform their values and goals. The transhumanistic view of Gibson's *Monalisa Overdrive* is an eye opener in the field of scientific fiction, which portrays physical, emotional and intellectual growth of human through technology. The hyper technological life in the novel gives its subjects a reformulated life and identity but still they struggle with traumatic memories.

ABSTRACT

In this research article, researchers have tried to study the beliefs, knowledge, perceptions, attitude, views, satisfaction and expectations of ESP students about the use of ICT in general and use of Flipped Classroom (FC) method. In India, 'New Education Policy 2020; brings new dimensions of teaching. Blended learning is one of the dimensions and flipped classroom can be a method of implementation, so this is very important study for upcoming teaching transformations. For the respective quantitative study, researchers have selected 1,330 students from six engineering colleges in Kolhapur district, Maharashtra, India and data has been collected through questionnaire on online platform (Google form) which has been collected in Likert scale. Researchers have concluded that ESP students have positive attitude towards the ICT and FC, also learners feel that FC method would help them to build confidence and to grasp more knowledge particularly in English language and communication skills.

Keywords-ICT, FC, Learner's perception

INTRODUCTION

21st century is an age of science and technology. ICT is a part of the age and need of the globe. ICT became integral part of everyone's lives. So it became important in each and every field. Education field is also not different from other fields, so it also needs some change in approaches and methods of teaching. Even New Education Policy 2020 (India) also states about the flipped classroom. University grants commission released concept not especially on blended learning, which talks about weight age to the blended learning and it also suggest that most of the syllabus can be taught by this method. So being part of the same method, flipped classroom can be a part of regular curriculum which we can see implemented in upcoming years. Having a need of the subject researcher is working on the same as her Ph.D. topic deals with the integration and impact of flipped classroom in engineering as English for Specific Purposes.

The concept of flipped classroom was first brought up by Jonathan Bergmann and Aaron Sams in their book: Flip your classroom: Reach every student in every class every day (2012). Flipped classroom is a "pedagogical approach in which direct instruction moves from the group learning space to the individual learning space, and the resulting group space is transformed into a dynamic, interactive learning environment where the educator guides students as they apply concepts and engage creatively in the subject matter." (The Flipped Learning Network, 2014). This teaching method or approach is comparatively new in India as researcher can see very few like approximately seven to eight research across the country and two or three related to English language and particularly in Maharashtra, and researchers had not found many research projects related to English Language and found only one research related to Nursing field. Hence, to know learners' perception, beliefs, attitude and expectations about this method is very important for the implementation of this method.

LITERARY REVIEWS

In foreign countries, many teachers are working on effective integration of flipped classroom. However, in India, except the attempts made by IIT Bombay in their workshops viz. Pedagogy for Online and Blended Teaching-Learning Process during 2016-2019 under their programme T10TK (Train 10 thousand Teachers), there were very few national attempts made to train the teachers in effective use of ICT in higher education Choe, E. & Seong, M.-H. (2016) in their case study investigated flipped classroom in a Korean university general English course. The purpose of the study was to explore students' perceptions about the flipped classroom and to provide suggestions to inform better instructional practices. The flipped learning model was based on 'the University of Texas at Austin centre for teaching and learning. For this case study qualitative and quantitative data were collected through questionnaires filled by 80 students. 15-week course was scheduled by the university for 86 students, from them 80 students were surveyed. The researcher stated that flipped learning gives more chances to communicate in English, leads to greater participation, preparedness, and feedback, as well as it leads to deeper understanding, whereas some dissatisfactory facts were stated as more time requirement, videos can be improved and students suggest how to use the flipped classroom should be taught and some instructions are given for the same reason. An overall positive response was given by the students.

In the research article 'A Flipped Classroom: Learning Experiences in Programming', the researchers Yong, Su Ting; Tiong, Kung Ming; Chan, Andy; Khiew and Poi Sim (2021) studied the perception of programming students in the flipped classroom in Malaysia. The mix method approach was used for data analysis. For data collection quantitative survey of 204 students and qualitative interviews of 7 students were taken. In this study, association between the flipped classroom and test performance, gender and impact of programming background on the students who were attending the flipped classroom are studied. All the students attended flipped classroom module two hours weekly for ten weeks, after ten weeks two and half hour's test on MATLAB consisting twenty-five multiple-choice questions with fifty percentage weightage and other fifty percentage weightage was given to survey and interview was

Mrunal R. Mohite et al.,

conducted. As a result, the researcher stated that most of the students still prefer face to face lectures and tutorials, females use more videos to learn but all the students prefer traditional classrooms over flipped classroom.

In the article written by Asiya Tabassum (2021), she analysed 'traditional flipping and virtual flipping comparatively' through quasi-experimental study. The researcher also tried to analyse the attitudes and perceptions of English language learners for the flipped classroom. The Researcher implemented writing skill course to the foundation programme level four students. As a sample, researcher selected 24 learners from Nizwa College of Technology, Oman which consisted of 10 female and 14 male learners and they belonged to 20 - 22 age category. The same group was used for both studies. Google meet and Canvas applications were used for the video teaching. Six videos were made by the researcher with the help of PPT and provided to the students. Data was collected through pre-test and post-test, also researcher used achievement test, IELTS rubrics, classroom observation and semi-structured interviews as instrument. The researcher analysed through independent and paired T test. As a result, researcher concluded that in both the classes, we could see significant and positive result in the performance but comparing both the classes traditional flip class was better than virtual flip class. The researcher stated some challenges of virtual class as internet issue, lack of interest in the students, lack of physical activity and lack of belongingness.

Busaya Santikarn and Saovapa Wichadee (2018) in their research investigated 'Learning Performance and Perceptions and Autonomy over Language Skills of English Language Learners About in The Flipped Classroom'. For the project 40 students were selected as samples from Advance English Class-Summer sessions. All participants voluntarily participated in the study. Questionnaires and assignments were given to participants as the method of data collection. As a result, researchers stated that 'FC helps students to achieve English skills; it makes students more accountable, more engaged in activities, and increases motivation to learn English'.

AIMS AND OBJECTIVE

To study the beliefs, knowledge, perceptions, attitude, views, and expectations of engineering students on use of ICT in general and use of flipped classroom method in particular for learning of English.

METHODOLOGY

Participants

For the said study, researchers have selected 1330 students from six engineering colleges by convenient sampling method. Researchers have taken basic information of students, on the basis of that information researchers state that in the said sample 64% male and 36% female learners have taken part, which also divides into the category of medium for HSC board, here most of the students, means 50% students are from semi-English medium, after that 31% students are from English medium and less means 19% students are from Marathi medium. Six colleges are codified as C1,C2,C3,C4,C5,C6. Most number of students are from C4, which has 37% of all students, whereas C2 has lower number of students which is 6% of students.

Instruments

For the purpose of data collection questionnaire is used, which is provided in the form on Google form, which consists of 41 questions with Likert scale. The questionnaire has answers divided in five responses as Strongly Disagree (SD), Disagree (D), Neutral (N), Agree(A), and Strongly Agree(SA). 1 to 5 numbers are given to the above responses. The questionnaire is made up of two parts as A and B. In the part 'A', personal data like name, gender, institute and medium of instruction is taken into account. In the part 'B' researchers made two parts where first part is consist of 28 questions based on general perceptions, beliefs, knowledge, attitude, views, satisfaction and expectations about ICT in general and FC method

Mrunal R. Mohite *et al.*,

Data collection and analysis

The questionnaire consist of 41 questions which have tried to see the percentage of students wanted to have flipped classroom as a teaching method and their beliefs, knowledge, attitude, views, satisfaction and expectations. These all question again divided into different parts according to the hypothesis. In table number 'two' we can see that how many students believe in the concept of flipped classroom. Students of Communication skills feel that incorporation of technology in teaching learning process is very important. By incorporating technology like smartphone and internet will help students as a learning aid to get good study materials for assignment and to save more time, which also help students to feel self-reliant and active. Even most of the students are not afraid of technology and they would like to spend more time on video lessons than traditional classroom and they feel that this will help them to learn faster .In the part which was completely about flipped classroom, students has believed that they can interact with the peer which will help them to build confidence and motivate to grasp more knowledge. Researchers have concluded that these all positive responses shows that 83% of the students believe that flipped classroom can be the better teaching method to learn English Communication skills. It also helps students to be more creative with better learning experience.

After the concept of 'belief' researcher have analysed the concept 'knowledge' about the integration of ICT and FC in table number 'three'. Total four questions come under this category. A question talk about the ICT available in the institution, here 30% students feel that their institution are not providing much ICT tools. When students are asked about the ICT tools that they know, 16% are neutral about this thing, it showed that these students do not know much about it. Though they are unaware of institutional ICT tools they are well familiar with smartphone, internet and various online educational and social platforms which help them to improve their communication skills. 62% students feel that their respective teachers have combined ICT aids with traditional classroom teaching. It was found that students only know about PowerPoint presentation and overhead projector but in some colleges digital boards are used which would be very helpful to implement the flipped classroom with ease. Specifically a question also talks about the understanding of meaning and structure of flipped classroom; to the response 93% students have understood the meaning of flipped classroom technique.

Here researcher stated that students are not much aware about ICT but they are familiar with other tools which can be incorporated in teaching – learning process. From these questions we come to know that new generation of students is techno-grasp and techno-savvy. So taking help of these gadgets will be much beneficial for them to be self-reliant.

Table number four talks about the concept of 'perception' which is slightly different than 'belief', belief means what students themselves feel about something and perception is about what are they perceiving about something in general. In some questions both belief and perception can be found. In this category, researchers have asked questions about teaching method of teacher, and is that giving equal importance to the each language skill that are listening, speaking, reading and writing. 55% students feel that their teacher is giving equal importance to the English communication skills, whereas 34% students feel that their teacher are not giving equal importance to the said skills Researchers concluded that 77% of the students' perceive flipped classroom will be useful and beneficial method. Through these questions researchers suggest that yet there is a scope for the teacher to improve their teaching methodology which will be helpful for the students to get equal practice of all language learning skills. By knowing about the flipped classroom, students perceive this technique (FC) as a tool to build a self-confidence and intrinsic motivation to learn new things.

In table number 'five', researchers have analysed attitude of the students about integration of ICT and flipped classroom. 81% students feel that they did not feel nervous to learn from the educational videos and they could concentrate better and understood the topic; also many students feel that watching educational videos is not frustrating and use of it will save time.

Mrunal R. Mohite et al.,

Researchers have concluded that students are not nervous about learning through this method and ready to watch educational video. so as conclusion students feel self-reliant and all these numbers shows that more than 70% students have positive attitude toward the flipped classroom and use of ICT as a tool of teaching.

In the table number six, researchers have analysed the views of students which basically talks about the general views like the importance of role of technology, ICT, Smartphones, internet, educational videos in the process of learning-teaching. Here students have stated that they carry their smartphone everywhere. Researchers state that most of the students are good with the new gadgets and they can handle very well, also they can use all these things for educational purpose. By analysing the data researchers conclude that in ESP students' view role of technology is very important in education and they will love to learn through flipped classroom which will eventually incorporates technology with education or teaching-learning process.

In table number seven we can see that researcher have analysed the satisfaction of students regarding ICT, which can be adapted well as a learning aid. 16 questions from the 41 questions directly or indirectly have talked about the satisfaction of the students. The satisfaction about the ICT aids provided by the institution, concentration on the video lessons and understanding of the topics, use of internet and its effect on education and help in educational purpose, preparation of the classes, active participation and teachers' teaching method. Researchers have concluded that more than 76% student are satisfied with the ICT tools and other technological help is available to them and they believe that having all these tools as a learning aid will make them creative and active learners.

Last concept analysed by researchers is expectations of students of improving communication skills with flipped classroom technique. 91% of the students have high expectations from the flipped classroom technique. Most of the students expect that recorded lessons on phone or laptop would be great materials to have, so if their teachers would convert the lecture into audio or video form that will be good for them to revise all the things again and again. Students expect that if they will learn through the FC they can interact with their classmates, this will help them to build confidence, motivate to be active in the class, it will also help to be creative and enhance English communication skills. They also feel that flipped classroom will provide them better learning experience which will generate self-autonomy among them and they can learn effectively. After analyzing all the concepts given in the aims and objective researcher have studied all the questions as a whole, table number nine shows all the responses given by the students to all the questions. Researchers state that 78% students are ready to flip classroom or they are optimistic about the flipped classroom method whereas 12% students did not want to change the methodology.

CONCLUSION

In the respective study researchers have studied different concepts like beliefs, perception, knowledge, view, satisfaction and expectation of ESP students in six different engineering colleges. For the said study researchers have selected 1330 students, and provide them 41 questions through online platform that is Google form, which analysed through Likert scale. Researchers have concluded that students have hands on knowledge of technology and ICT, they can use internet and other gadgets as learning aids, and also they are already using many applications to learning of newer thing. In the view of students many feel that they are ready to learn from new teaching approach that is flipped classroom. Most of the students believe and also they have high expectations from the approach that this approach have high potential to make them creative, active and self-reliant.

Annexure

Total of Items
1. In the age of technology it is essential to use technology for teaching and learning.
2. It would be great if I can listen or watch recorded lessons on my smart phones/laptops.
3. I feel that I enjoy learning when technology is incorporated.
4. My institution provides me the required ICT tools for learning.
5. I think that using smart phone as a learning aid/tool is not a good idea.
6. I become nervous when I learn from educational videos.
7. I feel that getting good study materials from internet for study is difficult.
8. Watching educational videos continuously is very frustrating for me after some time.
9. Use of technology and internet in learning saves my time.
10. I am comfortable using a mobile phone as learning aid.
11. Most of the times I carry my smartphone with me in my college.
12. I love to refer online videos while doing my assignments.
13. I could concentrate better and understand the topic when watching a video lesson.
14. I feel self-reliant when I learn on my own using digital devices and internet.
15. I think that learning from online educational videos is easier for me as compared to traditional classroom learning (chalk-board/lecturing).
16. I want my English teacher to convert lessons into audio or video lessons, so that I can listen to or watch them many times.
17. Video lessons are effective in imparting communication skills.
18. I feel more active when I learn from educational videos and other digital content.
19. I am not afraid of learning on my own with the help of digital devices.
20. I am likely to spend more time for my studies when the lessons are in video format.
21. I come prepared for the classes as the details of the lessons are given to me in advance.
22. My English teacher’s method of teaching gives equal importance to all the language skills.(listening, speaking, reading, writing)
23. My English teacher combines traditional teaching with the use of ICT aids.
24. I take active part in classroom interaction.
25. I think I learn faster by watching educational videos than by using textbooks/ notes.

Mrunal R. Mohite et al.,

26. I sincerely make an effort in understanding the lesson presented in an educational video.
27. I engage in finding new topics and often spend extra time trying to obtain more information about them through internet.
28. I generally have so much fun learning English concepts that I gladly volunteer to answers in group or discussion activities.
29. I understand the meaning and structure of flipped classroom. (Doing classwork at home and homework in the class)
30. If I will learn through the flipped classroom I can interact with my classmates, ask the topic that is not well understood, and clarify my question with the teacher.
31. I believe that flipped classroom will help me to build confidence.
32. I feel that flipped classroom will motivate me to be active in classroom.
33. I believe that flipped classroom will help me to enhance my English communication skills.
34. I would like to learn English and communication skills through flipped classroom.
35. I think that activities conducted during the flipped classroom will help me to be more creative.
36. I feel that flipped classroom method will provide me better learning experience than traditional classroom method.
37. I am motivated to learn English communication skills through flipped classroom.
38. I believe that flipped classroom will help me to grasp more knowledge/ things around me about English.
39. I will watch the educational videos given by my English teacher in advance of the lecture as a part of the flipped classroom.
40. I think the flipped classroom method is going to be more useful as the teacher will be available in the classroom during solving assignments/ doing tasks.
41. I am sure that interacting with my classmates when solving the given tasks/assignments in the classroom will help me to learn the lesson effectively.

ABSTRACT

This article seeks to conduct an extensive and comparative examination of how identity negotiation is portrayed in Indian literature, both domestically and internationally, particularly in scenarios where cultures intersect, clash, and blend. It primarily focuses on the literary works: “The White Tiger” (2008), “Water” (2006), and “The Inheritance of Loss” (2006). Each author explores identity within specific cultural contexts, addressing themes like Indian culture in foreign lands and also discusses about the Indian caste system, the varying levels of privilege among Indians, and the middle-class aspirations influencing politics and contributing to socio-cultural disparities. The complex societal framework shaped by the Indian caste system significantly influences the migrant experience, imposing constraints on their identity within society. This limitation can profoundly impact their economic well-being, thus influencing the development of their identity. The underlying premise is that protagonists, whether immigrants or locals in their homeland, aim to find a balance between economic success and cultural identity. Despite facing emotions like displacement and homelessness, the main characters in the mentioned novels succeed in forging a feeling of belonging. This accomplishment is achieved despite the presence of social, political, and cultural challenges, showcasing their resilience in challenging circumstances.

Keywords: Displacement, Rootlessness, casteism, Alienation, and Diaspora.

INTRODUCTION

This research focuses on identity crisis portrayed in Indian literature, both within the nation and in diasporic settings, as portrayed in “Water” (2006) “The Inheritance of Loss” (2006) and “The White Tiger” (2008). The choice of these novels isn't bound by a specific timeframe; instead, it is guided by investigating the themes of mobility and estrangement within and outside the borders of India. The study is finely tuned to diverse cultural and sociopolitical

**Sutharshan**

contexts, reflecting the nuanced dynamics of identity across various periods in Indian literary works. This study suggests the presence of two distinct diasporic experiences: one stems from the hierarchical caste struggles within India, leading to alienation, and the other involves physical migration. Individuals who remain in their native land often belong to ethnic minority groups, living on the outskirts of the dominant culture and grappling with challenges on its periphery. Ien Ang's assertion that aligning with the identities of "Chinese" or "Indian" shifts the individual to a symbolic space of belonging, distinct from their immediate environment, underscores the concept that these ethnic groups symbolize a feeling of absence, reaffirming a tie to a different homeland. Living in a state of exile, separated from their origins, these communities yearn for inclusion in that homeland, embodying an ongoing sense of diaspora.

In his book "Diaspora," Paul Gilroy argues that the diasporic journey isn't merely about biographical connections spanning across various locations but is moulded by diversity and characterized by contradictory feelings. This perspective validates the argument that individuals from lower Indian castes persistently exist in a diasporic state, even within the boundaries of their nation. Their narratives unveil a pervasive sense of alienation, mirroring their exclusion from the social fabric of their hometowns. These characters endure a form of dual marginalization, both within their caste and in the dominant societal group.

People who migrate to the West experience what this research terms a "double diaspora." This combined encounter transcends ethnic and national borders, resulting in individuals who identify concurrently as both Indian and American. Their country of origin evolves into an adopted nation, while the newly adopted homeland, America, amplifies their feeling of alienation. This intricate form of diaspora is marked by numerous dualities, encapsulating the complex interplay of identities as these individuals navigate the junctures of ethnicity and nationality in their pursuit of belonging.

Diaspora, essentially, captures the intricate experience of individuals or communities dispersed from their original homeland. It entails a sense of displacement, often propelled by historical, social, or economic factors. Diasporic communities wrestle with a complex interplay of identities, navigating the tensions between their native and adopted cultures. The concept extends beyond mere geographical relocation, encompassing a wider range of cultural, social, and psychological dimensions. It mirrors an ongoing negotiation of belonging, frequently characterized by ambivalence, as individuals strive to maintain ties with their roots while adapting to the challenges of their new environments. In this dynamic process, diaspora serves as a perspective through which one can comprehend the varied and evolving nature of human migration and cultural assimilation.

In today's world, diaspora has become a defining element of our interconnected and globalized society. Advancements in communication, transportation, and international relations have accelerated this trend, leading individuals and communities to increasingly move across borders in search of varied opportunities and experiences. This modern diaspora is distinguished by a diverse blend of cultural, economic, and social interactions, as individuals maintain intricate ties to their homelands while also navigating the complexities of their adopted societies. The digital era has further streamlined transnational connections, enabling diasporic communities to preserve and evolve their cultural identities in virtual realms. Within this framework, diaspora transcends mere physical relocation to encompass a dynamic process, fostering hybrid identities and challenging conventional notions of belonging. The contemporary diasporic journey involves a continual negotiation of multiple allegiances, reflecting the intricate interplay between global dynamics and individual aspirations.

The term "Indian diaspora" broadly refers to individuals who migrate, whether it's across the international borders of India or within the states and territories that constitute the Republic of India. With its twenty-nine states and eight union territories, India is a diverse nation where people may embark on journeys that take them beyond their familiar surroundings, traversing various states and territories. Interestingly, this internal migration can evoke a sense of foreignness, despite individuals remaining within the confines of national borders. The concept of

**Sutharshan**

foreignness goes beyond residing in a country outside of one's homeland; it also includes the sense of alienation felt within the familiar confines of one's own country and among different regions within the same nation.

In "The White Tiger," diasporic elements are depicted through the character Balam, the protagonist, who embarks on a journey from the outskirts of Delhi to ultimately becoming a wealthy businessman in Bangalore. The story intricately weaves diasporic themes, revealing the protagonist's evolving perceptions of location and self.

The novel "Water" portrays a diasporic voyage, particularly through the stories of characters such as Chuyia and other widows hailing from different regions and states. Left abandoned and restricted to a widows' ashram—a sanctuary for widows—these women are compelled to spend the remainder of their lives in penance. In describing Cohen's perspective on "Diaspora", which associates diaspora with collective trauma and a sense of displacement, the characters in "Water" encapsulate the bittersweet contradiction of yearning for a home they've departed from while enduring a state of exile. Cohen's assertion regarding diaspora, which incorporates both ethnic and cultural dimensions of identity, resonates with Hall's viewpoint on the dynamic and multinational nature inherent in diasporic experiences. In this context, diaspora serves as a framework through which we not only explore shared ethnic traits but also acknowledge the recognition of differences and diversity within the complex fabric of identity.

The Indian caste system significantly contributes to sustaining discrimination, leading to the marginalization and social exclusion of individuals. Caste, an intrinsic trait determined by birth, supersedes individual beliefs and establishes a rigid social hierarchy that divides Hindus into hierarchical groups. The four primary categories, with Brahmins occupying the highest position, enforce strict boundaries and customs. Brahmins, considered intellectuals, abstain from consuming food or beverages from lower castes and restrict marriage within their own caste. In rural communities, a significant divide persists between upper and lower castes, resulting in the denial of rights and social exclusion for the latter. Members of lower castes face stringent limitations, including being barred from accessing areas occupied by higher castes, resulting in complete isolation as a consequence of their inferior status in the caste hierarchy.

The dominance of the upper castes, alongside the historical legacies of the caste and colonial systems, has shaped a societal structure characterized by privilege and deprivation among Indian individuals. Within this framework, socially constructed values are deeply entrenched as accepted norms, perpetuating the hegemonic influence of the upper castes. Consequently, the less privileged and lower castes face victimization, encountering discriminatory treatment based on perceived notions of being "unclean" or "polluting" by higher caste communities. The oppressive nature of this dynamic fosters a deep-seated identity dilemma among the marginalized, as they contend with the repercussions of societal prejudices on their self-perception.

The theme of diaspora is prominently seen in Bapsi Sidhwa's "Water" and Aravind Adiga's "The White Tiger," where characters grapple with profound sensations of solitude. This sense of isolation is rooted in external factors, particularly the oppressive caste system and cultural hierarchies, which leave a lasting impact on the characters' inner selves. Balam, marginalized and mocked by the upper class society, and Chuyia, encountering dual marginalization as a woman and a widow in the Indian colonial era, experience estrangement and displacement within their native land. This extends beyond simple social discrimination; it constitutes an assault on their humanity, as they are characterized by their caste and branded as impure or pariahs, leading to a twofold marginalization that impacts numerous widows like Chuyia and lower-class individuals like Balam across India. As Safran observes, they are minorities within the borders of their nation.

Gabriel Sheffer's idea of "ethnonational diaspora" echoes the experiences of Chuyia and Balam, exemplifying dispersed ethnic communities living away from their native lands to preserve unique identities amidst the complexities of cultural, social, economic, and political hurdles. The characters in Kiran Desai's "The Inheritance of Loss" embody diasporic stories, grappling with displacement and establishing new homes while maintaining connections to distinct historical contexts. According to James Clifford, diasporas are dispersed communities united

**Sutharshan**

by shared encounters of dispossession, displacement, and adaptation, with diasporic narratives portraying the endeavor to endure and maintain identities in unfamiliar territories.

The Indian diaspora, with its transnational attributes, exhibits cultural diversity marked by differences in religion, language, and social hierarchy. Within the diaspora, communities frequently emerge around linguistic or regional affiliations, such as those of Punjabi or Bengali origin. Jen Ang emphasizes the broad and dynamically evolving essence of diasporas, defining them as socio-cultural entities that forge imagined communities upheld by ties to a native homeland. Furthermore, diasporas arise from migration, although not all migration nurtures diasporic awareness. Cultural pluralism profoundly shapes the development of identity in individuals' lives, particularly in a diverse and multifaceted country like India. With its myriad cultures, traditions, religions, languages, and customs, people frequently traverse various borders—geographical, cultural, political, or economic—both within the nation and beyond in pursuit of improved prospects, adding layers to the intricacies of the diasporic journey (Chang, 2010). Chang underscores that crossing borders not only results in racial hybridity but also cultural hybridity, intertwining culture and race in intricate ways (Young, 28). Individuals navigating diverse cultural paths, whether within or across borders, may find themselves vulnerable to different forms of displacement, encountering physical or psychological struggles as they negotiate hybrid identities to acclimate to new cultural environments.

Edward Said's observation regarding borders as both protective barriers and potential confinements strikes a chord, highlighting the struggles faced by individuals in exile, whether within their homeland or abroad, as they grapple with physical or psychological challenges stemming from social exclusion. Diasporic characters often embody marginalized and silenced voices, particularly within their homelands, as seen in figures like Balram and Chuyia. Despite feeling alienated and unheard, they engage in debates against patriarchal dominance and strive for liberation. In Kiran Desai's "The Inheritance of Loss," the profound portrayal reflects the experience of living in exile, marked by a lack of belonging, and the challenges faced by Indian immigrants in both the United States and England. Exile, in its various forms, profoundly shapes and constructs the identity of diasporic characters.

Authors who themselves hail from diasporic communities are often best equipped to capture the intricate diasporic experience. This complexity is vividly reflected in the writings of individuals who have traversed the globe, leaving behind ancestral roots and experiencing a sense of imbalance and uncertainty. Vijay Mishra highlights that the diaspora seeks to delve into the significance of hyphenated identities, often questioning the dichotomy between their origins and their present identities. Feng notes that the hyphen, often employed to define identities, serves as a symbol of displacement and the sensation of being in exile. Novels such as "The Inheritance of Loss" intricately weave the complexities of hyphenated identity into the characters' narratives, depicting the profound yearning to connect with one's roots while navigating the challenges of adapting to a new land.

The characters portrayed in these novels share a common theme of experiencing some form of exile, whether within their homeland or abroad. Balram, the protagonist in "The White Tiger," undergoes a profound transformation of his moral principles by separating himself from his village. This choice arises from a desire to liberate oneself from the entrenched moral standards and societal pressures imposed by the patriarchal caste system. Similarly, Chuyia in "Water" confronts the cruel stigma of being deemed impure or polluted within the Indian caste hierarchy, a result of societal prejudice and religious hypocrisy.

In the novel "The Inheritance of Loss," Biju arrives in America as an outsider, driven by the quest for the American dream and his own aspirations for success. However, his journey unfolds as a lifelong negotiation of the complex dynamics between his adopted home and his native land. Moments of uncertainty, periods of despondency, and an enduring longing for India define his experience. His sense of exile and isolation intensifies due to the absence and loss of family members. Jemubhai Papatlal Patel, also known as the Judge, bears the haunting recollection of leaving India for London, vividly remembering the segregated benches labeled as "Indians Only" and "Europeans Only." This encounter leaves him feeling powerless and shapes a life characterized by solitude and estrangement.

**Sutharshan**

Aspects such as race, religion, the caste system, and societal taboos play crucial roles in shaping the ethnic identity of these characters within the framework of redefining Indian diasporic identities. The overarching theme revolves around displacement, encapsulating a deep sense of isolation and the painful struggle to express one's innermost emotions. After delving into the intricacies of displacement and alienation within discussions of the diaspora, with a particular emphasis on the diversity present within ethnic minority communities, this study aims to raise important inquiries. It begins an inquiry into whether the encounters of lower caste Indians can be deemed diasporic even within their homeland, and if so, how this viewpoint contrasts with the diasporic journey of Indian women. Moreover, the research scrutinizes the potential for a dual diaspora resulting from migration. A key question is posed regarding how the encounters of non-hybrid Indians might be interpreted distinctively compared to individuals with hyphenated identities. The objective of this study is to offer deep understandings into the intricacies of identity challenges, aiming to construct a theoretical framework. Through reinterpreting notions like 'alienation,' 'belonging,' 'diaspora,' and 'displacement,' the study aims to provide new insights into these concepts and encourage nuanced reevaluation.

The study rigorously analyzes diverse facets of the Indian diaspora, spanning from experiences within the native land to those among migrants settling in the West, as depicted in three novels: "The White Tiger" (2008), "Water" (2006), and "The Inheritance of Loss" (2006). Characters journeying to the West confront a twofold experience of alienation, navigating the intricacies of belonging to minority cultures in both contexts. Despite the obstacles, this diasporic journey offers individuals a chance to redefine their cultural identity without the weight of their parental or ethnic heritage.

Conversely, characters within the homeland often experience double marginalization. The novels explore particular cultural settings, investigating the Indian community's dynamics in the United States, the significance of Brahmins within the Indian caste hierarchy, the diverse privileges among Indian individuals, and the influence of middle-class aspirations on socio-cultural disparities. The study seeks to illuminate two crucial elements within the complex social framework dominated by the Indian caste system. Firstly, it will investigate the intricate cultural and social limitations contributing to feelings of alienation within the native land. Secondly, it will examine the journeys of migrants, emphasizing the restrictions imposed by traditional societal norms in their home country that shape the development of their identities. Despite grappling with feelings of alienation, displacement, and rootlessness, the protagonists in these novels remarkably cultivate a sense of belonging, whether within the comforting familiarity of their homeland or amidst the unfamiliar terrain of the West. This resilience is evident despite the significant social, political, and cultural challenges they confront.

Dual Marginalization of Widows in Bapsi Sidhwa's *Water*

The novel named "Water," written by "Bapsi Sidhwa" she tries to project the image of women being marginalized twice. The novel delves into an examination of the religious customs and oppressive societal norms imposed upon Hindu widows, exploring a narrative that delves into self-formation and the coexistence of its characters. Against the backdrop of Gandhi's Freedom Movement, the narrative focuses on a cohort of women sentenced by Hindu law to reside in an ashram solely due to their widowhood. The protagonist, Chuyia, faces the compounded obstacles of initial marginalization as a woman followed by further marginalization as a widow. Societal expectations dictate that widows are forbidden from remarrying or experiencing love, emphasizing the necessity to maintain chastity. Chuyia's ritual head shaving after widowhood symbolizes the surrender of their lives to repentance, as dictated by the norms of that era.

In this context, widows find themselves in a paradoxical situation where they are expected to uphold chastity, yet some are objectified to satisfy the sexual needs of others. The dominance of religion in this narrative underscores a clear bias towards privileging transcendence over convergence and favoring men over women. Brahmin men, while deeming widows inauspicious and a societal curse, paradoxically exploit the sexual vulnerability of young widows for their own gratification. This ironic paradox highlights the exploitation of a widow's sexuality to suit the

**Sutharshan**

convenience of a patriarchal society, shedding light on the inherent injustices perpetuated by societal norms and religious practices.

Marginalization in Aravind Adiga's *The White Tiger*.

In his novel 'The White Tiger,' Aravind Adiga, a diasporic writer, explores the complexities of a changing Indian society, depicting how different facets of the social structure navigate diverse cultural interactions. As previously noted, cross-cultural experiences often entail engagements among individuals from distinct nations, religions, or global regions. Given India's rich mosaic of diverse civilizations spanning numerous states, cultures, religions, and languages, such encounters are inherent to its essence. Balram, originating from humble beginnings, embarks on a symbolic journey from adversity to prosperity, representing his shift from destitution to wealth. The author illustrates a stark divide in Indian society: the impoverished lower class embodies struggle and familial duties, contrasting with the affluent upper class characterized by corruption and nepotism. Similar to marginalized characters like Chuyia, Balram defies not only the oppressive caste system but also redefines his future by confronting societal and economic conventions in India. On viewing through the lens of diaspora, the character undergoes a significant transformation, raising questions such as transitioning from "Who are you?" to "What can you become?" Balram, originally a village boy, rises from a chauffeur to a successful businessman, striving to ascend the societal hierarchy. This progression emphasizes that success is not solely determined by one's origins, but rather by how individuals navigate and position themselves within the changing dynamics of their current environment.

Loss of Self Identity in Kiran Desai's *The Inheritance of Loss*

Examining the concept of Diaspora culture reveals two major themes: the quest for identity and self-discovery among diasporic immigrants. In the novel "The Inheritance of Loss," Jemubhai Popatlal Patel travels to London in 1939 to study law. Despite occupying a privileged position in Indian society, Jemubhai grapples with cultural adaptation in London, experiencing insecurity and inferiority when faced with individuals of white skin. This colonial dynamic highlights the intricate relationship between the colonized and the colonizer, as they navigate the boundaries between the Self and the Other.

Jemubhai grapples with inner turmoil, experiencing a sense of marginalization and discomfort due to his skin color. Her efforts to emulate the Other demonstrate a dual awareness, pushing back against her inherent Self. In search of an escape, he embraces European customs and culture upon returning to India, torn between his past and present, the memories of his time abroad, and his everyday life in Kalimpong. This act of imitation results in his isolation and alienation, leading to ridicule from fellow Indians. Biju, the cook's son, ventures to the US to pursue his dream but faces racial discrimination and solitude. As an undocumented immigrant, he enters the country's borders and wrestles with integrating into Western society, highlighting his struggle with identity. Many diasporic characters navigate the clash between two distinct cultures, each characterized by significant social and ideological disparities. The notion of diaspora involves being dispersed across various locations, spanning territorial, cultural, and psychological realms. These characters struggle with feelings of exile, severed communication, and a sense of not fitting in anywhere. Doubly estranged and uprooted, both psychologically and physically, characters such as Jemubhai and Biju find themselves entangled in a dual diaspora, grappling with post-traumatic stress and the intricate challenges of hybrid identity.

In examining the novels under consideration, this research asserts that the influence of caste remains potent, interwoven with post-colonialism, and the societal hierarchy continues to cast a pervasive stigma in Indian society. Lower-caste Indians experiencing diasporic journeys, as depicted in the narratives, may find their diaspora projected within the same nation, presenting a dual struggle, either under patriarchy or across borders. Characters venturing to the West encounter a twofold alienation and wrestle within the diaspora. Despite these challenges, they assert their right to American and British identities, navigating obstacles to establish themselves in new cultural landscapes. Collectively, the characters attain a sense of self-identity and worth in their pursuit of freedom. Throughout their life journeys, marked by essential facets of identity formation, they confront and surmount

**Sutharshan**

inherent pain with courage. Each novel thus explores the themes of identity and displacement, whether within or outside India. The examination of the issue of double diaspora and the unique challenges faced by minorities within the nation's space adds an intriguing dimension to the discourse.

This study aims to investigate the complexities of identity conflicts and cultural value clashes depicted among characters in Indian literature, both within their homeland and abroad. It seeks to delineate different levels of diaspora, portraying characters within India as displaced, uprooted, and devoid of a definitive sense of "home." Their concept of home is tinged with feelings of exile, stemming from experiences of exclusion by locals. Conversely, characters in the West grapple with the challenge of straddling two worlds, contending with a multitude of identities that lead to personal dilemmas. The selected novels collectively confront the trials of alienation, exile, and displacement within the framework of Indian societal norms.

This study delves into the portrayal of diasporas within and beyond India, unraveling the intricate social stratification systems that contribute to multiple forms of marginalization and oppression, particularly affecting lower castes. Women, exemplified by characters like Chuyia, endure dual marginalization—first as women and then as widows. Stranded in Ashrams with scant social support and financial security, they are dependent on charity while awaiting their uncertain fate. Characters such as Jasmine, experiencing a dual diaspora, challenge gender marginalization in India and confront societal norms by independently immigrating to the United States. Figures like Jemubhai Patel and Biju navigate the complexities of being torn between two cultures, illustrating the psychological displacement of doubly alienated diaspora in the U.K. and the U.S. Gender inequality, deeply entrenched in both biology and social hierarchy, impacts men from lower castes, subjecting them to discrimination and dehumanization. This paper explores the myriad ways in which the caste system influences Indians across diverse social, gender, and political contexts.

In summary, individuals partake in diverse intertextual processes to establish their identities and those of others in social contexts, bridging individual and societal realms. Through character expressions in Indian novels, interactions unveil personal experiences, influences, reconstructions, and submissions to the situational and structured realities they face. The theme of exile and estrangement runs throughout the novels, depicting the oppressive grip of power structures on the lives of diasporic characters. Although acknowledged as Indian minorities, they find themselves in contentious positions within the narrative of Indian national identity, yearning for acceptance and a sense of belonging. Diasporic characters, whether in their native lands or overseas, struggle with the discontent they face. India remains their birthplace, and their historical recollection of "home" becomes a conflicting realm of resistance and confinement. "Unhomeliness," distinct from mere homelessness, embodies a feeling of exile, marking their displacement and fragmentation, compelling them to construct new identities both within their home country and abroad. Within the homeland, diaspora is exemplified by characters like Chuyia in "Water," portraying the postcolonial battle against superstition. Gandhi's ideals offer the only glimpse of hope, envisioning a society that ceases to marginalize lower-caste individuals. Conversely, characters like Balram Halwai in "The White Tiger" revolt against systemic inequality, ascending the social hierarchy. "The Inheritance of Loss" exudes a pessimistic tone as characters like Jemubhai and Biju navigate the clash of Eastern and Western cultures, endeavoring to establish their identities and find a sense of belonging. Gyan resists foreign adversities to safeguard his traditional identity. The recurring themes of rejection and degradation lead to marginalization and a sense of displacement, thrusting characters into identity crises. Cultural encounters, as depicted through diasporic characters, entangle them in identity dilemmas, highlighting issues of alienation in various spheres of life, both domestically and internationally. In essence, this paper examines the intricate impacts of the caste system on Indians across social, gender, and political dimensions. It illuminates how diasporic characters navigate the complexities of dual diaspora, both at home and abroad. Each chapter showcases diverse outcomes among characters, offering insights into the multifaceted nature of identity struggles.

ABSTRACT

This study examines how integrating artificial intelligence (AI) with task-based language teaching (TBLT), in alignment with communicative language teaching (CLT) principles, can bring transformative benefits. This study investigates how integrating AI technologies with TBLT methodologies enhances the foundational role of TBLT in language education by examining its theoretical foundations and implications. Through a comprehensive literature review, this study surveys existing studies on TBLT, CLT principles, and the integration of AI in education. This study aimed to identify intersections between TBLT, CLT principles, and AI integration, highlighting gaps and opportunities for further empirical investigation. Specifically, this paper thoroughly examines the theoretical basis for integrating AI into TBLT, establishing a strong framework to grasp better and improve its influence on language learning results. This study focuses on improving communication skills and learner engagement by highlighting the benefits of combining AI with TBLT methodologies. In addressing the challenges associated with AI integration, this paper offers practical recommendations for educators to guide them in optimizing TBLT with AI technologies. By proactively addressing these challenges and strategically integrating AI, educators can leverage the transformative power of technology to effectively and engagingly enhance language learning experiences. Furthermore, this research significantly contributes to the current discussion on innovative language teaching methods by providing valuable insights and perspectives.

**Devaki**

Educators, researchers, and practitioners interested in integrating AI, TBLT, and CLT principles will provide valuable research insights.

Keywords: task-based language teaching (TBLT), artificial intelligence (AI), communicative language teaching, learner-centric language learning, alignment of AI-infused TBLT with CLT principles, implications, and practices.

INTRODUCTION

Task-Based Language Teaching (TBLT) is a significant pedagogical approach in language education that emphasizes language learning through the completion of communicative tasks, such as role-plays or problem-solving activities. As it is rooted in communicative language teaching principles, TBLT fosters practical language use and situational comprehension, contributing to a learner-centered and contextually rich educational experience (Chen). Thus, this methodology has gained prominence owing to its effectiveness in developing language proficiency and real-world communication skills. As technology continues to evolve, there is growing recognition of the potential for artificial intelligence (AI) to revolutionize language education (Belda-Medina). In addition, the integration of AI into TBLT offers exciting possibilities for optimizing language learning experiences, including providing personalized feedback, adapting learning materials to individual needs, and creating dynamic interactive environments for language practice. Recognizing this potential synergy between TBLT and AI, it is crucial to delve into the implications, challenges, and benefits associated with their integration. This study aims to explore how integrating artificial intelligence (AI) in task-based language teaching (TBLT) can improve language learning outcomes, enhance educational practices, and optimize task-based language teaching methodologies. It investigates how aligning innovative technologies, specifically artificial intelligence, with communicative language teaching principles can optimize task-based language teaching (TBLT) and enhance language-learning outcomes by exploring the implications, challenges, and benefits associated with their integration. In addition to this, the importance of this investigation lies in its potential to inform educators, curriculum developers, and policymakers about the transformative possibilities that emerge when combining TBLT and AI in language education (Chen and Wang). Through this exploration, we aim to contribute to the ongoing discourse on innovative pedagogical strategies, paving the way for a more technologically enriched and learner-centric language education.

LITERATURE REVIEW

Task-Based Language Teaching (TBLT) is a dynamic and learner-centered approach to language education. Grounded in the principles of communicative language teaching, TBLT prioritizes language acquisition through the completion of meaningful and contextually relevant tasks (Bryfonski). In addition, the extensive literature supports the effectiveness of TBLT in fostering communicative competence, language proficiency, and real-world language use, leading to improved speaking fluency and intercultural communicative competence. Studies have highlighted its adaptability to diverse learning environments and its positive impact on student motivation and engagement (Belda-Medina, 723). In addition, existing literature emphasizes the transformative potential of AI technologies in educational settings, particularly regarding their integration. Within the context of language instruction, AI offers personalized learning experiences, adaptive assessments, and interactive language practice opportunities (Belda-Medina 723). In particular, individualized content delivery facilitated by AI ensures that learning materials are curated to match the unique preferences and proficiency levels of each learner. Moreover, AI's capability to create immersive language learning environments stands out, offering learners a virtual space where they can actively engage with language content and simulate real-life scenarios, thereby enhancing their linguistic proficiency. Furthermore, existing studies highlight the benefits of AI, including real-time feedback, individualized content

**Devaki**

delivery, and the creation of immersive language learning environments. These technologies have demonstrated efficacy in enhancing language skills, providing valuable insights into the evolving landscape of language education (Guzmán-Alcón). In addition, empirical evidence from these studies collectively demonstrates the efficacy of AI technologies in elevating language skills and contributes valuable insights to the evolving landscape of language education. As educators and institutions increasingly recognize the potential of AI, these findings underscore the importance of integrating these technologies thoughtfully and purposefully into language instruction, thereby providing opportunities for more individualized, interesting, and successful language learning experiences.

While the literature on TBLT, communicative language teaching, and AI in education is abundant, there is a noticeable gap in research that addresses the specific alignment of AI-infused TBLT with communicative language teaching principles. In particular, few studies have comprehensively explored how AI technologies can be seamlessly integrated into TBLT methodologies while maintaining fidelity to communicative language-teaching tenets (Doughty). Furthermore, the literature review highlights the need for research that bridges this gap, offering insights into the potential synergies, challenges, and instructional strategies associated with combining TBLT, AI, and communicative language teaching principles in (East). This study aims to fill this knowledge gap by investigating the practical implications, challenges, and instructional strategies related to seamlessly integrating AI technologies into TBLT methodologies.

AI Integration in TBLT

The incorporation of artificial intelligence (AI) into task-based language teaching (TBLT) signifies a groundbreaking advancement in language education with the potential to transform conventional teaching practices. It explores how AI technologies can be seamlessly integrated into TBLT methodologies while considering their alignment with communicative language teaching principles. AI integration in Task-Based Language Teaching (TBLT) involves incorporating artificial intelligence technology into language learning tasks to enhance students' learning experience. This integration aims to improve task sequencing and grading by considering learners' and teachers' perceptions of the cognitive load of tasks, ensuring that tasks are neither too difficult nor too easy for the students. By leveraging AI, educators can design tasks that align with students' cognitive abilities, leading to increased task motivation, engagement, and, ultimately, better instructional outcomes.

AI can significantly enhance the design of language tasks within a TBLT framework. Natural Language Processing (NLP) algorithms can create tasks that simulate authentic communication scenarios, thereby allowing contextually relevant, engaging, and linguistically appropriate tasks. AI can also create personalized learning paths for students by assessing their proficiency levels, learning styles, and preferences (Gurzynski-Weiss). Real-time feedback mechanisms allow AI to provide instantaneous corrections, promote immediate improvement, and reinforce language acquisition. AI can dynamically adjust task difficulty levels based on learner performance, promoting an optimal zone of proximal development (Kolsut and Szumilas). AI can also create virtual language practice partners, engage learners in simulated dialogue, and extend classrooms to real-world scenarios. Data-driven insights for task refinement enable educators to refine and improve TBLT tasks based on empirical evidence, ensuring continuous optimization aligned with communicative language-teaching principles (Leeming and Harris).

AI-infused TBLT aligns with Communicative Language Teaching Principles

Alignment between AI-infused TBLT and communicative language teaching principles is imperative for the seamless and effective integration of these methodologies. By leveraging AI technologies to enhance task design, provide personalized learning experiences, and offer real-time feedback, educators can preserve the communicative nature of language teaching, while harnessing the benefits of technology. Furthermore, this alignment ensures that AI contributes to authentic context-driven language use promoted by communicative language teaching, enhancing the overall efficacy of TBLT methodologies.

Devaki

Specific AI Technologies for TBLT Integration

1. Natural Language Processing (NLP) algorithms can analyze and understand text and speech data, facilitating tasks (He and Li) such as:

- a) Automatic speech recognition: Transcribing spoken language into text, enabling learners to focus on comprehension and fluency.
- b) Text-to-speech synthesis: Converting text into spoken audio, providing accessible language models for pronunciation and listening practice.
- c) Machine translation: Supporting learners in understanding and producing text in target languages while promoting intercultural awareness.

2. Personalized Language Learning: AI-powered systems can collect and analyze learner data to personalize the learning experience:

- a) Adaptive learning platforms: Adjust content and exercises based on learner progress, tailoring the learning path to individual needs.
- b) Intelligent tutoring systems: Provide automated feedback, guidance, and support to learners, adapting to their strengths and weaknesses.
- c) Virtual language assistants: Engage learners in interactive conversations, providing personalized language practice and feedback.

3. Interactive Language Practice: AI technologies enable interactive and engaging language practice (Liu and Hwang)

- a) Virtual reality (VR) and augmented reality (AR): Immerse learners in virtual environments, creating authentic language experiences and fostering cultural understanding.
- b) Chatbots and conversational agents: Simulate human-like interactions, allowing learners to practice conversational skills and receive feedback on their responses.
- c) Language learning apps: Gamify the learning process, using AI-driven algorithms to provide personalized content and interactive exercises.

4. Language Assessment and Feedback: AI technologies can automate language assessment and provide valuable feedback

- a) Automatic text and speech assessment: Analyze learner submissions for accuracy, fluency, and language use, providing objective measures of progress.
- b) Feedback generation: Use NLP algorithms to generate personalized feedback on learner writing and speech, identifying areas for improvement.
- c) Automated grading: Reduce workload for educators by automating the marking process, freeing up time for more meaningful interactions with learners.

Integrating AI into Task-Based Language Teaching (TBLT), aligned with Communicative Language Teaching (CLT), can be achieved using digital tools and platforms. These include language learning platforms like Duolingo, Babbel, and Rosetta Stone, Task-Based language teaching apps like Linguarena, language exchange apps like Tandem, AI chatbots like Replika, virtual reality platforms like Immerse or MondlyVR, and online language teaching platforms like Verbling or italki. These tools can enhance language learning by providing authentic communication tasks.

AI-Infused TBLT Tasks Enhance Language Learning Outcomes

The integration of artificial intelligence (AI) into task-based language teaching (TBLT) can profoundly affect language learning outcomes. Furthermore, it explored the anticipated effects of the implementation of AI-supported TBLT on language proficiency, communication skills, and learner engagement. AI-supported TBLT can enhance language proficiency by providing personalized and adaptive learning experiences, tailored content delivery, real-time feedback mechanisms, and accelerated language acquisition, leading to significant improvements in language skills. AI integration also improves communication skills by providing opportunities for authentic language use and virtual language practice partners to simulate real-world conversational scenarios (Safinah et al.) This immersive experience refines communication skills, fostering fluency and confidence in language use.

**Devaki**

AI's ability to create personalized learning paths promotes individualized instruction, accommodating diverse learning styles and preferences and ensuring that tasks are tailored to match the unique preferences and proficiency levels of each learner for a more effective learning experience. This adaptive nature ensures that tasks remain challenging, yet achievable, sustaining learner interest and involvement throughout the language learning journey. Continuous progress monitoring allows educators to track individual and collective advancements in language proficiency, thus enabling targeted interventions. The personalized nature of AI-supported tasks, coupled with real-time feedback, fosters a sense of autonomy as learners take ownership of their language learning journey (Loewen and Sato; Mudra; Norris; Park). This interactive and dynamic feature creates a motivational learning environment that encourages sustained effort and engagement. AI-supported TBLT offers a holistic language-learning experience by combining task-based approaches with technological innovations. This balanced and comprehensive language education experience aligns with communicative language teaching principles, which emphasize language as a tool for effective communication and practical use.

Alignment with Communicative Language Teaching Principles

AI-infused task-based language teaching (TBLT) aligns with communicative language-teaching (CLT) principles and enhances the learning process for language learners. It emphasizes communication, task-based language learning, authentic language use, a learner-centric approach, and the maintenance of a balance between fluency and accuracy (Prasetyaningrum; Ting). AI-generated tasks prioritize real-world communicative scenarios, encouraging learners to use language effectively in real-world situations (Putri). This aligns with CLT principles, as it encourages meaningful communication and the practical application of language skills.

TBLT also aligns with CLT principles by providing dynamic and contextually relevant tasks that simulate real-world language use. AI-supported tasks offer learners practical challenges, promoting language acquisition through immersion and active participation. Authentic language use is fostered by AI technologies, which create authentic language use scenarios and provide contextual exposure (Timpe-Laughlin et al.; Chen; Van Gorp and Van den Branden). This aligns with CLT principles, emphasizing language as a tool for genuine communication. Both AI-infused TBLT and CLT advocate a learner-centric approach, with AI adapting content, providing personalized feedback, and creating tailored learning paths. This approach enhances the motivation, engagement, and overall effectiveness of language instruction. AI-powered TBLT creates interactive and dynamic learning environments, fostering peer-to-peer collaborative learning. This alignment reinforces CLT principles and amplifies the effectiveness of TBLT methodologies through the integration of AI technologies, leading to more engaging and personalized language learning experiences.

Challenges and Considerations

The benefits of integrating AI into language education include personalized learning content, translation between languages, grammatical error correction, chatbot conversations, and smart language learning platforms. The integration of artificial intelligence (AI) into task-based language teaching (TBLT) presents several challenges that educators must address. Technological accessibility, data privacy, and adaptability to individual learning styles are the key issues. Challenges include the need for teacher training in the AI age, limited research on AI trends in language education, and small sample sizes in previous studies. (Di et al.). AI-enhanced language learning can provide personalized recommendations, feedback, and assessments, effectively meeting different learners' needs. AI has the potential to address issues in language education such as personalized learning systems for learners with low proficiency levels and decontextualized learning applications (Sharifuddin and Hashim).

Limited access to technology or disparities in infrastructure can hinder the equitable integration of AI into TBLT, potentially disadvantaging certain learners. Providing alternative resources or ensuring accessibility for learners with limited technological access is essential. Data privacy and security concerns arise from the collection and storage of learner data by AI systems, necessitating robust data protection measures and transparent communication regarding data usage and security protocols. Tailoring AI-infused TBLT to individual learning styles requires sophisticated algorithms and personalized feedback mechanisms, which can be challenging. Ethical considerations

**Devaki**

and biases are also important as AI systems may introduce biases in language content or assessments. Regular audits and efforts to eliminate this bias are crucial. Maintenance of AI technologies is challenging, especially in resource-strapped educational settings. A sustainable plan for system maintenance, including regular software updates and backups and adequate technical support through dedicated IT personnel or training programs, is essential. Balancing AI-driven tasks with human interaction is crucial, and AI-infused tasks may not be generalizable across different language proficiency levels. A nuanced approach to task design ensures relevance and effectiveness across diverse proficiency levels.

Implications for Practice and Recommendations

Artificial intelligence (AI) can significantly improve language education by enhancing teaching methodologies (Guzmán-Alcón, 88; Waluyo; Mudra;i) Educators can benefit from professional development opportunities to familiarize themselves with AI technologies and their integration into language instruction. ii) Collaborative task design can ensure that AI-supported activities align with language learning objectives and are contextually relevant. iii) Tailoring AI tools to language proficiency levels can promote effective language learning. iv) Regular monitoring and evaluation of AI-supported tasks can assess their effectiveness and promptly address any issue. v) Ethical and cultural considerations should be prioritized when selecting and implementing AI tools, addressing issues of bias, and ensuring cultural sensitivity. vi) Integrating AI-supported tasks with human interaction can provide a balanced and holistic language learning experience. The implementation of AI-infused TBLT should be flexible and accommodate different learning styles. vii) Continuous professional learning about AI advancements in language education can help educators effectively adapt their practices. By conducting regular professional development workshops on AI integration and collaborating with AI developers for task design, educators can effectively incorporate AI into TBLT, creating a dynamic, adaptive, and learner-centric language-learning environment. This integration aligns with communicative language teaching principles and leverages the transformative potential of AI to optimize language education outcomes.

CONCLUSION

The integration of artificial intelligence (AI) into task-based language teaching (TBLT) presents a transformative pathway for language education. This comprehensive exploration highlighted key findings and their implications, emphasizing the potential benefits of aligning AI-infused TBLT with communicative language teaching principles. AI-infused TBLT aligns seamlessly with CLT principles, prioritizing authentic communication, task-based language learning, and a learner-centric approach, and maintains a balance between fluency and accuracy, ensuring that language use remains authentic, relevant, and applicable to real-world communication scenarios. This alignment enhances the effectiveness of the TBLT methodologies (Alignment with Communicative Language Teaching). Aligning AI-infused TBLT with CLT principles ensures that language use remains authentic, relevant, and applicable in real-world communication scenarios. Integration supports a balanced focus on both fluency and accuracy, promoting well-rounded language proficiency development (i.e., a balanced focus on fluency and accuracy). Learners benefit from personalized learning experiences that cater to their unique needs, preferences, and proficiency levels (individualized learning experiences).

Future research could explore the long-term effects of AI-infused TBLT on language proficiency and retention, specifically examining sustained benefits over time, to understand the lasting impact of AI integration on language learning outcomes. This study explored the cross-cultural effectiveness of AI-infused TBLT by considering cultural nuances and variations in language learning preferences, which can provide valuable insights into the diverse impacts of AI integration on language education. This research direction also opens avenues for investigating the specific training requirements and readiness of language educators to integrate AI tools into TBLT while identifying effective strategies for continuous professional development. Future research could focus on developing AI-powered language-learning platforms tailored for specific contexts, integrating AI into ESL pedagogy, and creating AI-based assessment tools aligned with proficiency standards. In addition, researchers could investigate strategies to ensure

**Devaki**

inclusivity and accessibility in AI-infused TBLT, addressing technological disparities and diverse learner needs. Researchers can also explore the impact of AI integration on the social and emotional aspects of language learning by considering factors such as learner motivation, collaboration, and self-efficacy (Gurzynski-Weiss).

Aligning AI-infused TBLT with communicative language teaching principles holds immense promise in language education. The synergies between AI-infused TBLT and CLT principles contribute to a more dynamic, adaptive, and learner-centric language-learning environment by fostering personalized learning experiences, promoting authentic communication, and enhancing task-based language learning. As we embark on future research endeavors, understanding nuanced interactions and optimizing the integration of AI into TBLT will continue to shape the landscape of innovative language education practices.

ABSTRACT

In the middle ages, European traders established colonies and introduced their language. In the year 1600, the Parliament of England permitted the East India Company (EIC) to transact business in the Indian subcontinent. It established factories and also started English schools for the sake of children of their employees from 1600 to 1813. Then in 1835, Lord Macaulay introduced his 'Minute on Education' which favored English as medium of instruction. After observing the implementation of education, Wood's Dispatch (1854) made several recommendations which include expansion of education. Indians used English as a lingua franca during the struggle for freedom as India is a multilingual society. After attaining independence, the 'Constitution of India' is written in English. Hindi is made the official language and English, the associate official language. Since then, several committees and commissions are appointed to oversee, implement, ameliorate and make education inclusive. Further, the position of English is strengthened with the onset of liberalization, privatization and globalization (LPG) in the 1990's and also the revolution in information, communication and technology (ICT). But the status of English is leading to rapid Anglicization of Indian languages. This paper discusses under what circumstances and with what intentions the British introduced English language in India and how the colonizers language became elitist at the cost of neglecting Indian languages and the rich literature. But at the same time, it also focuses on how the Knowledge of the English language helps the graduates to get employed in the globalized society.

Keywords: multilingual, linguistic imperialism, lingua franca, globalized society

**Goverdhan****INTRODUCTION**

This paper discusses how and with what motives the British introduced English education in India. Over the years, how the English language evolved as the lingua franca of educated Indians, its role in the struggle for independence and the use of it in the independent era. Further, it also discusses the recommendations of committees and commissions that were constituted on educational policy before and after independence with reference to language policy and how the students from rural and tribal areas are placed in a disadvantaged position as against the city bred and English medium students due to linguistic imperialism and how the English knowing Indians taking advantage of globalization.

The Pre-Transportation Stage of English

History reveals that European businessmen like the Dutch, the Portuguese, the French and the English sailed to the Indian subcontinent, described as 'the gorgeous East' for its riches. And in the process of transacting business deals, they introduced their language almost four centuries ago, wherever they formed a colony. Of the four colonizers, the British politically stabilized ahead of others after the Battle of Plassey which was fought on June 23, 1757. In fact, the transporting of English language began with the Parliament of England passing the Charter Act I on 31st December, 1600 permitting the East India Company (EIC) to transact business in India. The Company, apart from establishing factories, also started English schools for the sake of children of the employees of their company and Anglo-Indians from 1600 to 1813.

After capturing Bengal, Warren Hastings (1772-1785) was appointed as the first Governor- General of Bengal. He was vested with powers in matters pertaining to education and so to curry favor of the influential Indians, started the Calcutta Madarsa in 1781, where the Islamic Law was taught. It was the first state managed educational institution under British rule in India. And in 1791, the Governor-General of Bombay, Jonathan Duncan established the Sanskrit College at Banaras to study Hindu Law and Philosophy. This college became a university in 1974, re-named as Sampurnanand Sanskrit University. The next Governor-General of Bengal, Lord Richard Wellesley (1798-1805) established Fort William College in Calcutta on 10th July, 1800. It was an academy of Oriental studies and a training center for civil servants.

In due course of time, the EIC made representation to the House of Lords of the British Parliament for the establishment of schools. As a result, it passed Charter Act I (Renewal) in 1813 and as per the Act, it was the duty of Great Britain 'to promote the interests and happiness of the native inhabitants' and permitted the Governor-General to spend one lac rupees towards education. But then, selecting a language to educate the natives of the Indian subcontinent became a matter of controversy as scholars divided into two groups. The Orientalists supported the vernacular languages like Sanskrit or Arabic or Persian and the Anglicists preferred English as medium of instruction. Some European scholars like Dr.H.H.Wilson and H.T.Prinsep advocated for oriental languages as they were critical of the Anglicists strategy which was detrimental to the local languages and culture.

But Raja Rammohan Roy, the Social reformer who fought against superstitions felt that India should be like any European country, scientifically advanced. So in 1823, he wrote to Lord Amberst, the Governor-General of Bengal against the establishment of Sanskrit school in Calcutta, wherein he stated:

'.....Again no essential benefit can be derived by the student of *Meemamsa* from knowing what it is that makes the killer of a goat sinless on pronouncing certain passages of the Vedas....'

But the Governor-General went ahead with establishing Sanskrit college in Calcutta in 1824 upon the recommendations of Lord Macaulay and James Prinsep.

ReenaChatterjee (1983) in her book *Impact of Raja Rammohan Roy on Education in India* stated:

**Goverdhan**

'Raja Rammohan Roy wanted a more liberal and enlightened system of education including mathematics, natural philosophy, chemistry, anatomy and other useful sciences to make India a scientifically advanced country just as the countries of Europe on a permanent basis.'

Further she mentioned:

'Mayhew, in *The Education of India* (1927), shifted the responsibility of the mischief done by Macaulay onto the shoulders of Raja Rammohan Roy' (Chatterjee, 1983:36-68)

Raja Rammohan Roy, a scholar in Sanskrit, Arabic and Persian was used by the British in Anglicizing urban India as part of colonial politics. In fact, Roy advocated for the study of Western education as the key to the scientific and democratic thought of the modern West. He meant to opt for English education with a condition for a certain period so that books will be translated into Indian languages.

William Bentinck who served as Governor-General of Bengal (1828 to 1834) and then as the first Governor-General of India (1834 to 1835) invited Lord Macaulay, a lawyer by profession in London, and made him a Member of Council of India. He entrusted the responsibility of preparing the blueprint of Indian Education. William Bentinck was instrumental in introducing, along with Lord Macaulay, 'Minute on Education' on February 2, 1835. The 'Minute on Education' popularly known as 'Macaulay Minute', put an end to the Orientalist and Anglicist controversy. He stated the goals of English education in India as follows:

'We must at present do our best to form a class who may be interpreters between us and the millions whom we govern—a class of persons, Indian in blood and color, but English in taste, in opinions, in morals and in intellect; to that class we leave it to redefine the vernacular dialects, to the country to enrich those dialects with terms of science borrowed from the Western nomenclature and to render them by degrees fit vehicles for conveying knowledge to the great mass of population'

Macaulay further said:

'..... I have read translations of the most celebrated works of Arabic and Sanskrit works. I have conversed both here and at home with men distinguished by their proficiency in the eastern tongues. I have never found one among them who could deny that a single shelf of a good European library was worth the native literature of India and Arabia.'

Furthermore, Macaulay stated that all the perfumes of Arabia cannot sweeten the Oriental literature. His militant Anglicism, his remarks about Indian literature and culture, his ignorance of the riches of Oriental literature and his superficial knowledge of India, his Utopianism won and English education and the English language got entrenched into the Indian subcontinent. He argued: 'English is better worth knowing than Sanskrit or Arabic.'

The Hidden Agenda

Horace Wilson, a nineteenth century Sanskrit scholar, who called Kalidasa's *Sakuntala*, the jewel of Indian literature, opposed the education policy. He stated the hidden agenda of Lord Macaulay, in his article '*Education of Natives of India*', published in *Asiatic Journal*, 1836, 29:14:

'By annihilating native literature, by sweeping away all sources of pride and pleasure in their own mental efforts by rendering a whole people dependent upon a remote and unknown country for all their ideas and for the very words in which to clothe them, we should degrade their character, depress their energies and render them incapable of aspiring to any intellectual distinction.'

About the colonial rule, Gauri Vishwanathan argues in her book, '*The Masks of Conquest*' (1990) that there are masks behind their rule such as introduction of English in India as an effective form of political control, voluntary cultural assimilation, and to improve the moral knowledge of natives and converting them to Christianity.

The Transportation Stage of English (1835-1857)

Goverdhan

'The Transportation stage of English' (1835-1857) is a period of expansion and consolidation. Sir Charles Woods, who was the President of the Board of Control in England, sent to India to oversee the implementation of education. This Wood's Dispatch of 1854 is considered as 'Magna Carta of Education in India', making several recommendations which include a higher position of the English language over the Indian languages. Though his recommendations were progressive and secular in nature, implementation of the same was a herculean task in a vast country like India. So, it welcomed the philanthropists to come forward to start schools and colleges. He emphasized the importance of Grants-in-Aid. It recommended, linguistically stratified system of education and the same was adopted as follows:

1. Use of mother tongue as medium of instruction during primary and high school education
2. Use of English as the medium of instruction at tertiary level

Further, it recommended the establishment of a department of education and starting of three universities in Presidency towns. Consequently, the three universities were established in Calcutta, Madras and Bombay in 1857 with English as medium of education. As per Charter Act I (Renewal) of 1853, Indians were allowed to join government jobs and an open competition system was established. Later, the Macaulay education policy paved the way for the use of English in government offices and thus the bureaucracy became very powerful and their empire further held its hold on the subjects. Even the natives started using this language to get officialese favor. And thus English got entrenched into the subcontinent so much so that we can quote an instance: As Indian students studied English literature in Indian universities, as against the British students who studied Greek and Latin in universities of England, spoke fluently and that made the British officials to exclaim:

"How come the Chatterjees and Mukherjees speak better English better than the British."
University Act of 1904

The Governor-General Lord Curzon (1898-1905) was very enthusiastic to bring educational reforms but he did not give representation to Indians in the committees. He gave grants to start new schools but there was no improvement in literacy. He appointed the University Education Commission which led to the University Act of 1904 to improve the University education. The Act empowered them to have control over university education. Further, he was responsible for issuing the Resolution of the Government of India on Educational Policy, 1913. The cardinal principles of this policy include:

- a) The curricula of the primary and secondary schools should be practical and useful.
- b) Facilities should be created for students so that they do not go abroad for further studies.
- c) The standard of existing schools should be improved instead of increasing the number of schools.
- d) It was the responsibility of the government to eradicate illiteracy and provide free education for poor children.
- e) Establishment of universities in each province.
- f) The subjects of industrial importance were to be included in the syllabi.
- g) The universities were made to issue recognition to high schools.

Role of English before and after Independence

As we know, India never had a common language, since it was not a politically unified country as it is today. Before the colonial rule of the British, Sanskrit was the common language but it was not the language of the common people but the elite. It was the link language for the educated Indians but for the British educational policy, English replaced Sanskrit. But again the same situation prevails as common people do not use English even today as a link language. Mahatma Gandhi himself stated in 1946:

"Only the language which the people of a country will themselves adopt can become national."

India being a multilingual society, English language was the lingua franca during the struggle for independence. Gandhiji and Nehruji wrote articles in English to rouse the nationalistic feelings. One way, it united all Indians to fight against the British. English, the utilitarian language has become racy. The colonizers kept language in the hands of the subjects to enlighten them but the colonized used the same language to dethrone them. As in Shakespeare's play, 'Tempest', where the banished King goes to an island and makes Caliban, the native to learn his

**Goverdhan**

language and to be his servant but the same native curses the King in his language similarly Indians were made to learn English but in the same language they questioned the British.

During the transition of power from the British to the Indians, some of the leaders wanted the Indian government to throw away the English language into the Bay of Bengal along with the British. But the then Governor-General of India, C.Rajagopalachary said:

‘English language is the gift of Goddess Saraswati to India and throwing the English language into the Bay of Bengal along with the British is like throwing the baby with the bath water.’

Speaking on the importance of this language, Jawaharlal Nehru said:

“English is the window on the world.”

The Language Policy of India

After independence again a question arose as to which language should be made national language, Hindi or English. The University Education Commission (1948-49) which was constituted after independence under the chairmanship of Dr.S.Radhakrishnan recommended the learning of Indian languages and also the study of English at the school level at least to read books in English. Further, he recommended that the medium of instruction be English at the higher education level and the study of at least three languages -the regional, the federal and English. In fact, India has a liberal language policy as it could not adopt one language policy as it is a multilingual society. It allows all cultures and languages to grow. It respects all languages equally. In North India, Hindi is widely spoken but in south India there are four states where four different languages of Dravidian origin are spoken as mother tongue and only the educated speak English. Hence, Hindi which is spoken by the majority of people, is designated as India's official language not as a national language by the Indian Constitution, which came into existence on 26th January, 1950.

It is important to know the difference between national language and official language. While the national language is used most widely in cultural, political and social areas, an official language is the language used for all government administrative purposes. And in the case of English, because of historical reasons and due to advantages of English language, we adopted English treating it as one of the Indian languages, it was made the official associate language for a period of 15 years i.e., up to 1965, during which period Hindi would be developed as the national language to take its place. But the states like Tamil Nadu opposed making Hindi a national language and ‘Hindi Hatao’ agitation under the leadership of the then Chief Minister of Tamilnadu, KarunaNidhi, resulted in amendment of Constitution whereby the Official Language Act of 1963 amended in 1967 wherein section 3 (1) deals with the continuation of English language in addition to Hindi for official purposes of the union and for use in Parliament. Hence, India will have to use English for an indefinite period or rather say forever with the changed global scenario. At the time of adoption of the Indian Constitution, there were 14, but now 22 languages are recognized as official languages, in addition to Hindi. Further, a precautionary step is taken not to impose Hindi in non-Hindi speaking states. Thus, in 1968, a resolution was passed in Parliament, it states:

‘Intensive and comprehensive programmes should be prepared and implemented by the Government of India (GOI) for accelerating the spread and development of Hindi in collaboration with the state Governments.’

The Kothari Commission was constituted in the year 1964 under the chairmanship of D.S.Kothari who recommended the three language formula whereby students in schools should learn three languages viz., the mother tongue or a regional language, the official language of the state and English. Accordingly, the National Policy Resolution (1968) notified a three language formula:

1. Hindi speaking states study Hindi, English and a modern Indian language.
2. Non-Hindi speaking states study Hindi, English and a regional language.

In order to promote Hindi and English languages, a ‘Central Institute of Hindi’ at Shimla and a ‘Central Institute of English’ (CIE) at Hyderabad were started in 1958. In 1972, the ‘Central Institute of English’ (CIE) became ‘Central

Goverdhan

Institute of English and Foreign Languages' (CIEFL) by offering courses in foreign languages like German, Japanese, French, Arabic, Persian and Russian. Then a student innocently raised a question four decades ago, 'Is English not a foreign language?' for which still the answer is 'eluding'. In due course of time, the CIEFL became a Central University by an Act of Parliament in 2007, rechristened as 'The English and Foreign Languages University'.

The Study Group Report on the Teaching of English (1969-71)

Several Committees and Commissions were constituted before and after independence on bringing reforms in the Indian Education system but for the first time a committee of English teachers was constituted in 1969 under the chairmanship of Prof. V.K.Gokak which studied the place of English in our education system. After two years, it tabled its report, 'The Study Group Report on the Teaching of English (1969-71)'. It examined the teaching of English in different stages, its role in school and college education, the number of periods it needs to be allotted, and its contribution in the teaching of other subjects. The Committee, among others, found the reasons like lack of Men (teachers to teach English), Materials and Methods for proper implementation of English education throughout India. Thus, there are three important functions for the right use of English:

1. English for career and mobility.
2. English for the governance and welfare of the people.
3. English for projecting our identity.

Use of English: A boon or bane

The forceful usage of colonizers' language by the natives is suggestive of subjugation of the colonized mind. This was illustrated by Daniel Defoe in his novel, 'Robinson Crusoe' (1719), which is considered to be the first novel in English. The protagonist, Crusoe categorically states why and how he taught Man Friday English:

'I was greatly delighted with my new companion and made my business to teach him everything that was proper to make him useful, handy and helpful: but especially to make him speak and understand me when spake, and he was the aptest scholar that ever was.' (Robinson Crusoe, 1719) Whatever Daniel Defoe visualized and recorded in the form of a novel is proved to be true and as Robert Philpson in his book 'Linguistic Imperialism' (1992), says:

"The English linguistic imperialism is that the dominance of English is asserted and maintained by the establishment and continuous reconstitution of structural and cultural inequalities between English and other languages". Further he says: "the structural and cultural inequalities ensure the continued allocation of more material resources to English than no other languages and benefit those who are proficient in English".

As stated by Philipson, English education is encouraged and local languages are neglected as a result the English-knowing miniscule enjoy power and fruits of learning at the cost of people hailing from rural and tribal areas. Because of the language policy of the British the oral tradition of passing on knowledge is no longer in vogue. The percentage of literacy in rural areas is not at all encouraging. Even in urban areas the percentage is not even 50%. Out of this percentage only a miniscule are English educated. Thus, the patronage to English education is ever growing and neglect of regional languages is still continuing. English: an Intellectual Language

In the nineteenth century, we have seen Indians like Toru Dutt, Henry Derozio writing poetry but in the early part of twentieth century it was novelists like Mulk Raj Anand, R.K.Narayan and Raja Rao. These novelists, who are considered the triumvirate, wrote novels in English though their mother tongue is not English. They are considered to be beginners of 'Indian Writing in English', which emerged as a separate branch from Commonwealth Literature. Raja Rao, on Indians using English stated: 'The Indians speak and write in English for communication purposes but they do not lose their identity and culture.'

Thus, it can be stated that English is our intellectual language but not an emotional language as we do not weep or laugh in English. Further, Raja Rao in the 'Foreword' to his novel, 'Kanthapura' (1937) stated:

'I use the word 'alien', yet English is not really an alien language to us. It is the language of our intellectual make-up like Sanskrit or Persian was before-but not of our- emotional make-up. We are all instinctively bilingual, many of us

Goverdhan

writing in our own language and in English. We cannot write like the English. We should not. We have grown to look at the large world as part of us.'

Reverence and Abhorrence

It is a boon and also a bane to accept English. We accept that English education is a blessing in disguise. We learn English, a global language, as it gives us power to interact and connect with individuals worldwide. In the Age of Information, communication skills in English are a must to get a job in the global market. On a war footing, at all levels of educational institutions, English medium is being implemented and thus the place of English in India is at a high pedestal. But at the same time, local languages are not being encouraged. So we abhor this language.

It is the skill of language that helps to market oneself in the job market and get an opportunity for mobility. As Mitchell Obama, the wife of ex-President of the US, on a visit to a school in slum area of Mumbai, told the poor children,

“Learn English, it takes you to places.”

But, for the children of the rural and tribal areas, they hardly have exposure to the English language. Even their English teacher is not well trained. Hence, their performance in competitive examinations is poor whereas the city bred and English educated are getting more job opportunities. But equally intelligent students, but from a remote rural and tribal area do not get encouragement for studies and job opportunities simply because they are not well versed in English language. This is gross injustice to the students hailing from rural and tribal areas because of language policy.

CONCLUSION

To conclude, colonialism is not just a political domination. It can be seen in many forms and one of them is the imposition of the colonialist's language on natives, which is nothing but linguistic imperialism. The colonial rule gave Indians a language to communicate with each other and others around the globe. It is a boon for us as it gives Indians new insight and new perspectives. Through English education, we got ideas of freedom and democracy. Thus, Indian nationalism and renaissance of arts and sciences is an unexpected development of British education. Further, globalization has become a boon for the English educated as there are immense job opportunities which are making them to be globalized citizens.

ABSTRACT

Literary Stylistics is a dynamic and operational research tool in unraveling the mysteries embedded in a literary text. This technical device sorts out the conspicuous details in the text through stimulating appraisal of its language. It is scientific in spirit and application. It is a fail-safe system since it adopts linguistic apparatuses for analysis. At the same time, it does have its own antagonists who challenge its use citing certain irrationalities. They maintain that the choice of linguistic items for analysis is biased since it may be tinted with one's prejudices. Nevertheless, style plays a significant role in reading the thought processes of the novelist and establishes the interconnectedness between the premise, articulation and implication in the work of art. Stylistics permits the study of the text's language from multiple facets. The two foremost dimensions are the initial response of the readers and the examination of the language elements with the assistance of linguistic principles. In order to substantiate the claims regarding the feasibility of this inquiry, archaisms in Markandaya's select novels, *Nectar in a Sieve* and *The Coffer Dams* are taken up for review. For the second kind of inquiry, structural nuances and vocabulary are the focussed categories followed by images and symbols pattern. Even characters fall within the ambit of symbols. Even irony and humour do have their due places in the hierarchy of analysis. All these analyses lead to one potent factor – decryption of the consciousness of the characters in Markandaya's chosen narratives.

Keywords: Literary, Stylistics, vocabulary images, style, symbols, irony, humour

INTRODUCTION

Among the multiple modes of interpretations of a literary text, a strategy is adopted in the scrutiny of the linguistic and tonal aspects or style with the advent of the fresh insights in the realm of the association between linguistics and literature. This system of study is the discipline known as Stylistics. Bridging the two disciplines, linguistics and literary criticism, it envisages pooling together the resources in the enlightenment of the subtleties and nuances of a text. The style of a text is studied through features like dialogue, accents, idioms, idiolects and registers. This conceptual discipline is skilfully adopted in establishing the correlation between form and effects.

LITERARY STYLISTICS – A FEW DESIGNS

As a definition, it is suffice to remember that it is a system of probing the language of literary texts through the application of linguistic concepts and categories such as identifiable language choices and patterning as linguistic foregrounding for unearthing the distinct literary meanings and implications. In spite of the claims of the veracity of this scheme with qualities associated with it such as objectivity, replicability, verifiability and thoroughness, this technique is not without its pitfalls. This approach is censured for the presence of the element of subjectivity in textual analysis. “Nevertheless, the best stylistic analyses, which productively demonstrate direct relations between prominent linguistic forms and patterns in a text and the meanings or effects of readers’ experience, are explicit in their procedures and argumentation, systematic, and testable by independent researchers.”(M. Toolan) The twenty first century has brought in its wake the newest development in literary stylistics– the investigation of an assortment of iconicity, the correlation between form and meaning, in passages in literary texts. In fact, “there is no limit beyond which the student of style is forbidden to go.” (Graham Hough, 79) Another question arises regarding the stylistic features and the linguistic features to be handled as the criteria for style analysis. M. Riffaterre and H. Babb are specific: “It is necessary to gather first of all those elements which present stylistic features and secondly, to subject to linguist analysis only those to the exclusion of all others which are stylistically irrelevant. Then and only then, will the confusion between style and language be avoided.” (412) As regards approaching the text through style, two suggestions remain obvious. In the first approach, the literary attribute of a text together with the absolute accolades it receives among the readers is the priority rather than the stylistic elements taken up for analysis. The second line of advance takes into account the study of the prominent linguistic features to correlate their causal relationship to the deep seated central principle. The concept of style is ambivalently spelt out by linguists as well as literary critics. While old school of thought, classical rhetoricians, argues it as a separation between form and meaning, the romantic school of thought puts it as an organic nature of expression. There is one more perception which construes style to be a conjectural construct between the meaning and the writer.

LITERARY STYLISTICS AND ITS APPLICATION

With these skeletal details of stylistics and its relevance in the study of a literary text, the study of Kamala Markandaya’s novels is undertaken from the perspective of style. A creative artist explores the functional resources of language for a fusion of theme and style and in this process, a deliberate choice is made of semantic and syntactic elements. In the analysis of Markandaya’s novel, three levels relating to style are taken up for inquiry to identify the consciousness of the characters. At the first level, the initial response to the novel is taken up. This diagnostic as well as decisive estimate is the pedestal of ideas on which the edifice of stylistic features is built. The ageless woe of landless farmers facing starvation are pitted against the vagaries of nature and people still retain the basic human traits of love, compassion and enjoyment of the small acts of pleasures. People grow vegetables “gazing at the paddy fields spreading rich and green...and ...beautiful...going to a village fair...buying a dum-dum cart” (*Nectar in a Sieve*, 73) Compassion is countless – Ira turning a prostitute to take care of her dying brother, Old Granny, parting with the last coin despite her own starvation and Rukmani, adopting a waif, Puli. Rukmani is the established prototype of the mother of a poor household, accepting every misfortune bravely: “No fault of yours, or the girl’s or her husband’s...it is Fate.” (66) Ira accepts her reality easily since “there is now no more fear, no more necessity for lies and concealment.” (54) Rukmani could mutter these words on seeing Ira’s albino child: “Not hers (Granny’s) not Nathan’s, not mine or Ira’s...Whose the blame then? ...Blame the wind and the rain and the sun and the earth: they

Sangeetha and Kavitha

cannot refute it, they are the culprits.” (121) The killing of her son Raja and the callous attitude of the factory officials do not provoke her: “You should not care...It does not matter.” (95) Even her husband’s infidelity does not shake her: “It is as you say a long time ago...that she is evil and powerful I know myself. Let it rest.” (90) Dr. Kenny’s goads fall on deaf ears. Rukmani is a resigned lot: “What profit to bewail that which has always been and cannot change?” (115) Kenny introduces the western attitude to life. The tannery pollutes the village ambiance by dislodging the villagers off their livelihood. The younger generation leaves the village in search of greener pastures. This is the human and social consciousness about the effect of change on a custom-bound uncontaminated countryside with rustic inhabitants accepting with an equanimity the trivial pleasures and atrocious sorrows, manmade and nature-induced, in life. Every single incident in the text forms a relationship to Rukmani. The very nature of description lends it a state of timelessness. Rukmani can be the wife of any hapless tenant farmer of a south Indian village. The characters are prototypes rather than individuals. The village itself remains unidentified to give it the hue of universality. At another level, Markandaya has a two-fold struggle in the exercise of the function of language – Rukmani’s Indian sensibility is to be delivered in English with no loss of flavour even in rumination and the dialect is to be represented in English with credibility. How the novelist achieves a solution to this conundrum is illuminated through the tertiary level analysis.

FORM AND STYLE – ARCHAISMS

The lyricizing of the story of Rukmani not only blends form and style but also solves the issue of expression of a peasant’s dialect. This is where precisely the interplay of linguistic element comes to the fore. The narrator and the narrative are kept apart with a crafty blend of poeticism, marginally formal and archaism in style. The use of archaic style in a novel has its own ideals. At the thematic level, the characters are elevated to a higher plane. With an element of antiqueness, it could lend a charm and also mark the distinction between different classes of people i.e. rustic people and urban elite. The work is accorded a ‘timeless’ and ‘space less’ eminence to make it archetypal in quality. All these merits are embedded in the novel of Markandaya, *Nectar in a Sieve*. Rukmani’s archaic language categorizes her as any representative peasant woman of ‘timeless past’ with generations of wisdom implanted in her. The theme of the novel also gets illuminated and fortified through the simplicity and directness of the archaic style – the simple rustic villagers entrenched in poverty enduring a fatalistic life. The stylistic features – syntactic, lexico-semantic, phonological and graphological – thus make it unusual and lyrical in consonance with the pastoral Indian soil bolstering the narrative’s quality of trustworthiness.

FORM AND STYLE – VOCABULARY AND SYNTAX

The vocabulary of *Nectar in a Sieve* is soft and simple. The only retort by Rukmani that could be termed as discordant and coarse is when Biswas teases her that Kenny is more than a friend to her: “...foul mouthed pig” and “...a carrion crow.” (109) In divergence, the very fabric of *The Coffer Dams* is full of offensive vocabulary with tempers running at hysterical levels. Some of the impolite and foul expressions are: “milk-sop sahib” (20), “silly buggers” (88), “you idle son of a bitch” (94), “lousy bastard” (95) and “right up your arse.” (147) Another perceptible technique in making the theme and language consonant, Markandaya uses weaker verbs in *Nectar in a Sieve* and stronger verbs are the norm in *The Coffer Dams* to be in tune with the struggle and conflict in the theme and between the characters. The examples are galore in *The Coffer Dams*: “It had savaged him...” (7) “gouged and blasted...” (8), “...suddenly the warning exploded in Clinton’s mind.” (28), “Rawlings rumbled on” (20), “...she pelted out” (25) and “...with patient tenacity, he wrested it.” (16)

The syntactic structures too play a soft pedal in *Nectar in a Sieve* which are conveniently absent or comfortably unnoticed by the readers since they are stylistically insignificant.

- To + be + past participle

“Villagers...were converging towards the bonfire to be lit there” (45-46)

Passivity is an aspect with which the novelist bequeaths his characters inaction or lack of volition. The aesthetic response to the text is greatly aided by the linguistic elements linked in the text i.e. process-type verbs and the participant roles. (S.K. Wali, 21) The study of this attribute becomes all the more interesting when it is realized that Kamala Markandaya lingers with specific structures and lexical items which communicate least volition on the

Sangeetha and Kavitha

part of the characters. Her choice seems to suggest that more a state or condition is perceptible rather than action on the part of a character.

It is true that paratactic sentences have more pauses while hypotactic sentences have more cohesion of clauses with fewer pauses: "The wedding guests departed, the throng melted." (42) Parenthesis has a similar force of slowing down the rhythm of the narrative: "...and the marriage, in the second year after Sacrabani's birth, was solemnized." (131) Sometimes, the novelist has the tendency to place the adjective after the noun, the head word, to produce the same effect: "A large building, spruce and white." (7) The mix of tenses produces a transitory lull in her thinking. This mingling of tenses coupled with generalizations becomes reflective in tone. Rukmani describes her sisters' weddings in the past tense. She shifts to present tense when talking about her own wedding and utters a sweeping statement in general: "A woman, they say, always remembers her wedding night." (8) The random exercise of 'historical present' makes the narrative intense and graphic. She laments the death of her son Raja: "For this I have given you birth, my son, that you should lie in the end at my feet with ashes in your face and coldness in your limbs." (94) As the entire narration is in the form of a sad reminiscence of Rukmani, all these linguistic details afford the novelist to render the narration as a reverie. (S.K. Wali, "Reverie Realized in Syntax....,"84)

FORM AND STYLE – IMAGES AND SYMBOLS

Literary stylistics includes images and symbols. The images and symbols do offer the reader some coherence in meaning which is consciously or unconsciously exploited by the novelist to give special associations to the principal theme or highlight certain attributes of the characters. An image is by and large defined as one that is by design espoused by the writer to stand for an object, action, feeling, thought, idea, state of mind and experience – sensory and extra sensory. (J.A. Cuddon, 316) If an image gets repeated in a work functioning as the logo of the theme, then that image becomes a symbol. Rene Welleck and Austin Warren write: "...an image...if it persistently recurs both as presentation and representation, it becomes a symbol." (189) A symbol always remains on focus and every element of the work of art, design, characters and locale, revolve around this to conjure the central premise of the work. A study of the images of Kamala Markandaya exposes the pattern of continuity throughout her novels. They portend the strategy of the novelist to suggest the psyche and makeup of the characters in the novels. One such image pattern is light and dark colour schemes. Light signifies life, hope and happiness but dark stands for disease, death, gloom, misery and frustration. For instance, the yellow light in *Nectar in a Sieve* leads Nathan and Rukmani into the temple: "...helped by the yellow flare." (144)

In some novels, characters become symbols. For instance, Srinivas in *The Nowhere Man* is a Christ figure. His religion tells men not to split or separate since each isolated part is a member of all other parts and all is one in the divine. Hence there is no need for human beings to fight among themselves on the basis of caste, creed, race or religion. He never endorses the disruptive culture: "...grids which it laid upon natural patterns...white man...and other men..." (225-226) The images and symbol patterns so far reviewed remains global in perspective. It is pertinent to recall the words of Ernest Hemingway at this juncture concerning the use of symbols in a work of art: "The dignity of movement of an iceberg is due to only one-eighth of its being above water." (Ernest Hemingway, 192) The symbols in a work of art are to be hidden for the reader to excavate it.

FORM AND STYLE - IRONY

Irony is also a component of literary stylistics. Irony plays important roles such as ripening, sustaining and repeating the several key issues in the novel. Irony varies in kinds – verbal irony, structural irony, Socratic irony, cosmic irony, romantic irony, dramatic irony and tragic irony. In order to comprehend the dexterity with which the novelist applies irony in her works, it is proposed to make a profound analysis of her classic novel, *Nectar in a Sieve*. Even here, much attention is devoted to four types of irony – structural irony, dramatic irony, tragic irony and cosmic irony and their interconnectedness. The very title of the novel and the couplet accompanying it is ironical – work without hope draws nectar in a sieve. It is true also that even with hope eventually leads to the same conclusion. (Prof.U.S. Rukhaiyar, 51) This is the irony of ironies in the novel – the theme. The theme is the narration of the life of a tenant farmer in a village tossed by every conceivable element. The vagaries of nature coupled with

Sangeetha and Kavitha

the blood sucking landlords are their woes. Floods or drought, the hapless farmer has to shell out the landlord's share and in the bargain, sell his meagre precious possessions. In addition, the burden of debt is transferred through generations multiplied several times based on the whims and fancies of the landlords. They develop a defeatist tendency and drag on irrespective of the piling misfortunes. Rukmani, the tenant farmer Nathan's wife and the central character of the novel as well as the narrator, sums up the two persistent companions of the Indian farmer – fear and hunger. About fear, she says: "Fear, constant companion of the peasant. Hunger, ever at hand to jog his elbow should he relax. Despair, ready to engulf him should he falter. Fear for the dark future, fear for the sharpness of hunger, fear for the blackness of death."(79) In most of the postcolonial novels, the English are portrayed as callous and cruel, crushing the natives to extract whatever they want. But Dr.Kenny is an exception in this novel. He is juxtaposed with the landlords who are vindictive in squeezing the tenant farmers despite the dire straits they are in with nature playing truant through famine and floods.

FORM AND STYLE - HUMOUR

Humour as a literary device could comfortably be brought within the ambit of literary stylistics. Although humour is not Markandaya's forte, there are sporadic occasions when humour rears its head. Even a very dry novel like *A Handful of Rice* with only the hunger and anger of the protagonist are in focus, the reader could discern humour in circumstances. Ravi's love at first sight with Nalini is not without its itches: "All the time he worked he had been hoping for a glimpse of her, this young beauty whose looks made a man's day as her mother's marred it." (24) When Ravi and the nephew of Apu quarrel, Ravi tells him: "I'm not a parasite." Pat comes the reply: "Something of a leech though, aren't you?" Ravi's stroll with Nalini begins with buying her ice-cold cola. "From Kolas, they went on to ice-fruit" and "The ice-fruit walks became routine." (41) When the "threesome," Ravi, Nalini and Jayamma, Nalini's mother, decide to go to the theatre as an extension perhaps of the ice-fruit walk, the efforts made by Ravi to get Nalini seated in the middle is comical: "Ravi, determined not to be beaten on every point, had engineered this after some thinly disguised shuffling, so that he did not have to ford the mother when he wanted to reach the daughter." (44)

CONCLUSION

Thus this paper has undertaken the function of Literary Stylistics in the analysis of a literary creation to unearth the hidden references which have been embedded consciously or unconsciously by the writer. There are ever two opinions on its use – positive and negative. Nevertheless, style plays a significant role in reading the thought processes of the novelist and establishes the interconnectedness between the proposition, expression and allusion in the work of art. The style of a text is approached from several perspectives. Of these, the initial response of the readers and the examination of the language elements with the assistance of linguistic principles are the two foremost tactics. In the present chapter, the first tenet analysed is archaisms in Markandaya's novels with special reference to *Nectar in a Sieve*. The study of structural nuances and vocabulary comes second. The consideration shifts to images and symbols in the next plane. Irony is the asset of the novelist in the elucidation of the principles and this forms the next level of analysis. Humour is taken up for a brief review in the final stage to show that this aspect could assist the novelist in the presentation of her ideas. Thus the theoretical outlay of Literary Stylistics is exemplified through the study of Kamala Markandaya's works.

ABSTRACT

Deception novel is one of the most important Jewish American postmodern novels, and critics have praised it for its experimentation with postmodernism. It looks at every kind of storytelling imaginable and the dynamic between the storyteller and the told. Philip Roth's emotional and social rebellion served as the foundation for his writing's sincerity and creative force. Philip Roth's transgression pierces limitations that are exclusive to his father's generation, much as resistance or disobedience requires moving beyond these limitations. In his work, second-generation Jewish American novelist Philip Roth presents himself as an artist and a revolutionary who exploits his gift to further his literary goals by expressing Jewish desire, aspirations, and frustration, only to face backlash, accusations, and regrets from the public. The goal of this research paper is to examine what deception means in relation to the book. In addition, it examines how the plot and dialogue are put together to determine the type of narrative Philip Roth creates.

Keywords: Deceit, Jewish, Philip Roth, Deception, imagination, biography

INTRODUCTION

The first significant ethnic literary movement to gain widespread popularity in the US is Jewish American literature. Once a widely read work, it served as a catalyst for the development of other literary subgenres, including African-American and post-colonial. The new order of Jewish-American writing has always existed on the fringe, despite its development. Its place in the annals of American literature will always be unique. One of America's best writers is Philip Roth. In 1997, he was awarded the Pulitzer Prize for his book *American Pastoral*. In addition to capturing the agonizing complexities of romantic and familial love, his works also depict Jewish bourgeois life. A few of his pieces satirically address sexual and political subjects. The theme of an idealistic, secular Jewish American who tries to keep him away from Jewish rituals and traditions is entwined with his authorship. His characters eliminate the oppressive effect of communal leaders, rabbis, fogeys, etc.

There are significant autobiographical motifs in Roth's fiction. He dramatizes post-war American life in retrospect while including elements of autobiography. In the novels, he also includes political satire and social commentary. His writings humorously and self-consciously draw parallels between the imaginary lives of the novelist Philip Roth and themselves. These include the protagonists and narrators, including Nathan Zuckerman, David Kepesh, and the made-up figure Philip. Roth's characters are isolated from the rich sources of Jewish identity and frequently resemble him. They were familiar with American culture and could even explain the rules of baseball, the nation's favorite pastime, in a few words in Yiddish and Hebrew, but not rabbinical law.

The well-known autobiographical book *Deception: A Novel* was released in 1990. A novel appears to be either a notebook or a novel that is a notebook in Roth's book. It could also be seen as mimetic drama. It can also be interpreted, in a typically self-conscious and technically postmodern way, as a lighthearted or cunning parody of the accepted conventions of narrative fiction. It is regarded as representative of the author's interest in "characteristics generally associated with postmodernist writing," according to Brauner (51). "Deception may not even be a novel – rather, it's an autobiographical narrative of a portion of Roth's life told through nearly verbatim recordings of real conversations," claims Tuerk (136). Even though the subtitle refers to "A Novel," Philip Roth's almost entirely dialogue-based book *Deception* is among his most experimental and avant-garde pieces. Roth, the protagonist of this tale, also betrays his friend. Claire Bloom, the partner, shares the same name as Roth's then-girlfriend. As Kauvar put it so succinctly: "The self as Roth envisions it and as he imagines it, flourishes in numerous forms and thrives precisely because of their competing impulses and clashing encounters, however ambivalent, however fractured, however problematic" (443). More profound existential issues regarding the definition of subjectivity, selfhood, and identity were examined by Roth.

Deception

Philip Roth demonstrates his extraordinary talent as a writer in "Deception," which explores themes of love, treachery, and the elusive nature of truth via daring experiments with narrative form. "Deception" sticks out because of its peculiar structure, which is a series of conversations between two unnamed characters who are simply called "He" and "She." By distilling the narrative to its most fundamental components, this storytelling style highlights the dialogue between the two lovers as they navigate their relationship's challenges. Roth's ability to accurately and vividly capture the intricacies of interpersonal relationships is a testament to his brilliance. Through the intimate talks between "He" and "She," Roth delves into the psychology of desire, jealousy, and deceit, emphasizing the nuances of their affair and the ensuing emotional pain. The identities of the characters are as jumbled as the storyline of the book since they cannot decide what is genuine and what is fiction. The major characters are a Polish woman, a man from the Czechoslovak Republic, two ladies, and a Jewish American novelist named Philip. According to Philip's assertions in the book, he writes *The CounterLife* in his studio and falls in love with an Englishwoman named Maria as a result of "cultural dislocation" (47) and tradition subversion. She took solace in his presence from the problems in her unhappy marriage. Although the novel doesn't mention her

**Chrispin Antonieta Dhivya et al.,**

name, it is later revealed that she portrayed Maria in the movie *The CounterLife*. The dialogue is revealed to have been derived from the author's notebook notes, which include both real and imagined exchanges. When Philip's spouse discovers these conversations in her spouse's notebook and charges him of sleeping with a different woman. At this point, Philip makes a rather strange statement in which he says he has an imaginary relationship with a character he is developing for his novel. As it is, no one is sure what to believe. Therefore, the term "Deception" equally refers to Philip's deception of both his wife and the readers.

Owing to Philip Roth's removal of the first-person pronoun, onomastic recognition has become a misnomer. There's no usage of 'I'. Deception is a "novel in the style of a novelist's notebook," according to Alan Cooper, with the author "denarrating the novel into notebook entries" (241). It is revealed at the end of the text that the protagonist's book manuscripts served as inspiration for the entire work. David Brauner observes that Deception "purports to be a sequence of dialogues from one of Roth's notebooks," while Gooblar claims that "Deception reads like a writer's notebook" (119). (85). The current text is characterised in both explanations as either a novel that is thought to be a notebook or a notebook that is thought to be a novel. Although deception can be understood as a play in the mimetic sense, it can also be distinguished from malicious or purposeful manipulation of the strict guidelines of a storyline. The reader perceives deceit as usually self-aware and postmodern philosophy describes deception as such.

The postmodernist propensity to embrace narrative interpretation by "making it appear as natural or common sense" is demonstrated by the novelistic hero and the author's shared contextual and narrative parallels (Hutcheon 40). The protagonist's father is named Herman, and like Roth, he invents two fictional characters: Zuckerman and Lonoff. Parts of the book that mention Philip's stay in England are taken from a diary that author Jonathan Roth wrote while chronicling his own life. In this sense, "deception" refers to marital adultery, but it also includes other forms of deception, like fusing reality and fiction. There is dishonesty in the book's format in addition to marital deception. The author plans to trick people in a number of ways. The title "serves as a caution against the credibility of any allegedly authorial voice," according to Brauner (85). Furthermore, Shostak went on, "The epistemological betrayal that readers feel when a writer inserts autobiographical details into a fictional storey is symbolised by the erotic betrayal, and both betrayals are combined in the figure of 'deception'" (175).

The text's final section considers whether Philip, a character that seems to be based on a true event in Roth's life, is a realistic figure. The storey, "by which writers of history, fiction, or even theory render their materials coherent, continuous, unified—but always with an eye to the control and mastery of those elements," was obviously recounted by Roth in the first person (Hutcheon 62). In addition, Philip claims that Deception is a work of fiction, but his wife says that readers would consider this information to be true, as if it were written by her. "Let them decide what it is or it isn't," Philip replies, pointing out that they are so intelligent and I am so ignorant. I'm told that the fiction I write is autobiography, even though I write fiction (184). Because he sounds so much like the actual Roth, no one can be certain if Roth is speaking in his own voice, assuming the identity of a made-up character, or adopting a phoney identity under the name Philip. "The protagonist of Deception is thinly veiled Philip Roth himself, an American-Jewish novelist who resides in London for the majority of the novel's present," claims G. Neelakanta (41).

Up until 1990, British actress Bloom was the real-life partner of Philip Roth. They were eventually divorced in 1995 after getting married. In her memoirs, Bloom also states that she read Deception and changed her identity from being a British woman to that of a wife, Claire. The book is a transcription of a genuine journal that Philip Roth kept, in which he describes things that he experienced. What distinguishes it from previous books by Roth is the 'form' of Deception. The entire book consists of isolated monologues with no background information or insights. Philip and his English lover are involved in these chats, but they are not married.

Philip is talking to the two Czechoslovakian women. One of these women he had met before on a trip to Czechoslovakia, and the other was Philip's wife. After he returns from America, his wife finds a script that she believes exposes Philip's affair with another lady. She observes that the text does not contain many embarrassing passages. As to Johnson's statement, "Roth's latest work is about adultery, in a sort of speaking" (8), the plot revolves

Chrispin Antonieta Dhivya et al.,

around the adulterous relationship between Philip and Maria. Being unfaithful and penning a novel both indicate acceptance of lying. Nothing in the process of creating art is sacred or valued when the creator consistently deceives others. Philip has a lovely charm that accentuates the captivating flow of the storey. Maria's criticisms and complaints never occur to him, and he consistently answers her, "I pay attention. I learn. I'm an ecouteur and an audiophile. Talking is a fetish of mine " (42). When Philip communicates his libidinal needs through listening, Maria is always observant enough to detect them. "It's sensual, you just sit there and listen," she comments (42). Philip is more than just a hearer. He tends to make fiction out of the things he observes. Understanding Philip better requires challenging his Jewish heritage and his compulsive fictionalisation. His complete estrangement from his Jewish background and culture led him to enter a relationship with Maria. "So our tale isn't a love storey, really— its culture storey," Maria rightly deduces (47). In England, his Jewish identity is disrespectfully forced upon him. The hateful insults spoken against him while he was a Jew in England fueled his passion for Newark, the real Zion.

With vivid and distinct possibilities, the plot would emerge in Roth's invented works. Such "blatantly fictionalising" (91), which Philip does, exposes him to criticism. His imagination is so abundant that it makes any problem seem carnivalesque. As Philip has acknowledged, I present myself as involved since mere presence is insufficient. That's not how I approach things. I can't go where I want to be by compromising some "character." I'm compromising myself, which makes things hotter. It kind of besmirches me and makes the indictment more juicy. (177-78) Furthermore, it's clear that one of the best illustrations of this is the anticipated altercation between Philip and another character, Ivan, over Olina's betrayal of Ivan. Ivan, a friend of Philip's, is a refugee and is married to Olina. Olina departs from Ivan in order to start again with a large black man. Ivan accuses Philip of betraying him and "rotten fictionalising" in the book (Philip 90). Philip's cultural displacement caused him to become more familiar with the discomforts experienced by several women. The girl from Czechoslovakia, who approaches him for help to become published, did so because she too felt uncomfortable with her cultural dislocation and disarticulation. After the Russian tanks arrived in 1968, she immigrated to the US and struggled to make ends meet by taking on jobs as a call girl, babysitter, model, and apartment decorator. All of her desires leave her feeling dissatisfied and troubled as she looks for true love.

This Polish woman was deeply interested in politics. Philip knows how miserable and agonising being lost can be for her. Philip leads her, but he also leads himself: "He tells her it's not hard to get you to blow up. or walk out. The average person's situation is ten times better than yours. Compared to the ordinary individual who stays two weeks (or longer) in a new environment, you are more vulnerable " (169). As a result, when Philip awakens, he knows and fears that, as a Jew, he is unique and out of place in English culture, and that his fate is connected to that of the larger Jewish community. Besides, he could not understand why the "two biggest scourges" (Roth 79) of the world, Israel and America, should be held accountable for sowing such discord and hatred in England. He also admits to Maria that he is having trouble assimilating: "I'm becoming a very contentious man because I'm an American Jew living in your nation. I honestly hadn't remembered about either. I moved to England after that and started attending fancy dinner parties " (84). At some point, Philip tells her straight out that he thought Christianity was overpowering in England. He would have told her how happy he was to be among the Jews in New York. Philip's Jewish features stick out in a powerful and vibrant way.

Making a Narrative

The claim that novelists and other writers generally draw inspiration for their work from their own experiences is not too controversial. Some writers write only about themselves, while others draw a great deal of inspiration from their own experiences. Some of these writers expressly write autobiographically in their works. One such writer whose works are inseparable from him is Philip Roth. The main theme of Philip Roth's whole body of work is the connection between life and literature, which is most apparent in the novels in which his alter ego Nathan Zuckerman makes appearances. Both Philip Roth's protagonist and his alter ego are represented by the character Nathan Zuckerman, who makes regular appearances in his works. Through Zuckerman, Roth explores issues of identity, desire, and the complexities of the Jewish-American experience.

Novelist Zuckerman often finds himself enmeshed in the existential and moral dilemmas that his characters confront as he grapples with the tensions that occur between life and art. Roth investigates the essence of narrative in general and the role of the writer in society via the lens of Zuckerman. In all of Roth's books, Zuckerman is a guy seeking self-awareness while navigating the turbulent post-war American landscape and dealing with personal problems. The boundaries between autobiographical and creative writing are often blurred in Philip Roth's novels, which typically combine reality and fiction. The main characters in Roth's books typically have the same professions, experiences, ages, cultural backgrounds, and origins as the writer.

Each novel is unique because the author employs a variety of strategies to increase the impact of their work. Symbols and motifs are effective devices that writers use to express a great deal of meaning in a small amount of pages. There may be underlying meanings in objects, people, themes, recurring words or phrases, and a host of other things. Scholars have carried out investigations to uncover the implicit significance of these symbols and patterns. As a result, it has long been customary in the world of literature to examine the meanings concealed behind these themes and symbols. The purpose of this chapter is to identify the narrative style and devices used by Philip Roth in his books.

Phenomenal storyteller Philip Roth skilfully wove the complex networks of stories that explored the darkest recesses of the human brain. His narrative approaches are notable for their unrelenting examination of identity, frequently obfuscating the boundaries between the real and the imagined. Through a sharp sense of reflection, Roth draws readers into the thoughts of his characters as they struggle with their wants, anxieties, and flaws. Through the use of literary devices like metafiction, stream-of-consciousness, and unreliable narration, he skilfully conveys the complexity that underlies the lives of his characters. Through narratives that pulse with an innate intensity that surpasses.

Philip and Maria play a game called "reality shift" (62) in the storey to pass the time and keep themselves busy. It involves moving to a different area and speaking from a fictional character or another's perspective afterwards. In a particular episode, Maria is shown pretending to be Philip Zuckerman's biographer and conversing with him to find out more about Zuckerman. In her capacity as a biographer, Maria gains knowledge from a discussion she had with Nathan Zuckerman regarding the life narrative of the reclusive writer E. I. Lonoff. The biographer is working on Nathan Zuckerman's life in order to get rapid cash.

In this way, Philip has attempted to draw attention to the problems that postmodern writers—especially biographers—face. It is the writer's job to tell the story of the individual self, and this young man cannot find consistency in his subject's ceaseless changes. All biographers, though, are impacted by this problem. Everyone experiences an unending change of the self; nobody chooses to go through it. "The entire game of nature is becoming somewhat else, and the punishment of remaining still is death," wrote Emerson (524).

A little scene in *Deception* does a good job of explaining Roth. Philip, a well-known American author of Jewish descent who resides in London, urges his partner to take part in "reality shifts," or the impersonation of fictional characters, as a way to resolve the problem. He says that Philip's character, Zuckerman, passes away at 44 years old and that the young biographer, who the lover is supposed to be, has already started writing Zuckerman's biography. After spending five years working on a critical biography titled *Between Worlds: The Life of E. I. Lonoff*, he thought the job would be simple and quick, but it seemed like it will be harder than he expected. The biographer's worst nightmare, that "everyone tells him a different account," is what binds him (Zuckerman 515).

Chrispin Antonieta Dhivya et al.,

CONCLUSION

The novel's author doesn't come across as a sensible individual. The fact that the man is only seen in the distance worries the biographer about his endeavour even after extensive research. The primary focus of the writer's argument is not his upbringing in Newark, but rather the "awful ambiguity of the 'I,' the process by which a writer develops a storey of himself" (515). It should be observed that in the reality shift between Philip and his sweetheart, the problem of all the distinct personalities that arise from Zuckerman's acts is not even addressed. But this is a crucial point because Roth and Philip note that the biographer finds it hard to see how all of Zuckerman's impersonations relate to one another.

The plot revolves around the protagonists' quest for fulfillment and meaning in their relationships, which usually leads them down a confusing path riddled with conflicting emotions and moral dilemmas. The protagonists, who stay nameless and are just called "He" and "She," start a passionate, enigmatic, and longing love. But beyond the appearance of their strong friendship, there's a web of deception and self-delusion as they battle their own desires and concerns. By exploring his characters' most personal psychological domains, Roth exposes the weaknesses, anxieties, and deepest thoughts of his characters. He illustrates the nuances of human emotion and how people deal with the difficulties of love and connection via his inner monologues and private conversations.

The novel "Deception" in social interactions is just an investigation into the nature of reality and illusion. The main characters constantly struggle with telling the truth and lying to each other while trying to make sense of their objectives in the context of their circumstances. Roth urges readers to look at the sincerity of human connection in addition to considering how we construct and comprehend reality in our interactions.

The book tempts readers to try and discern reality from fiction, but this endeavour is bound to fail from the start. In the postmodernist universe, reality and the observation of these facts are inextricably linked, according to Roth. Derek Parker states that "we could end up running in circles if we indulge in the game of ferreting out 'the real' from the imagined" (88). "[Given the nature of autobiographies, it doesn't matter," he asserts (88). Because of this, the realities themselves are ambiguous, susceptible to modification, and amenable to several explanations. Because it highlights how fictitious modern life is, the storey is therefore incredibly genuine and accurate. Consequently, Roth challenges the assumptions and advances the study of how individuals shape their reality. Philip focused on the way those storey structures—which heavily rely on the imagination—play a major impact in how individuals comprehend reality.

The narrative's fragmented dialogue and structure have been enhanced by the author's metafictional observations. This actually signifies that these lines should be interpreted as part of the notebook and the early chapters. In addition, in the final chapter of the novel, the main character Philip speaks with his imagined and actual English mistresses. There are recordings of hypothetical discussions in this chat. Deception thus criticises the reader for making an effort to discern between the real and the imagined, as well as between multiple ontological levels within the narrative.

ABSTRACT

In this dynamic era, Top information technology services firms no longer assume that individuals with conventional managerial pedigrees will succeed. Hence the priority falls on soft skills in the selection process. An increasing number of job offers require speaking a second language that employers find attractive in potential hires. This article studies how language has become an employability factor in the interview selection process of engineering colleges of Kurnool, Andhra Pradesh. Hence the results revealed that the students with good language skills have a higher probability of clearing the interviews compared to the students with poor language skills. The conclusions/outcomes disclosed that the proficiency in English language is considered a significant skill set influencing employability. This study used a qualitative approach. This research used a stratified sampling method for data collection. Data was collected through semi-structured interviews with 80 final-year Engineering undergraduates (both selected and rejected) from two private Engineering colleges who appeared for campus recruitments at Kurnool in Andhra Pradesh. Six employers' perspective on the significance of language in hiring a fresher at the interview was taken through a questionnaire. The conclusions collected would be discussed in the further part of the paper.

Keywords: Employability skills, qualitative, language skills

INTRODUCTION

Amid the contemporary globalized era, the English Language has evolved into a vital resource for efficient communication across various professional domains. The ability to effectively communicate in English is notable for engineering graduates who aspire to enter the globalized job arena. This research paper aims to explore the perspectives of both students and employers regarding the impact of English language skills in promoting the employability of engineering graduates. Engineering education equips students with the technical knowledge and skills required in their specific domains. Nevertheless, the demand for engineering professionals goes beyond technical expertise. Employers increasingly prioritize the importance of soft skills, embracing communication, teamwork and adaptability. Within the range of skills proficiency in English is held in high regard as it fosters effective collaboration, illustration of ideas and interaction with heterogeneous stakeholders in multinational companies.

In the last couple of decades, Andhra Pradesh has been synonymous with an active IT sector. Now arrives the most critical aspect: employability. According to NASSCOM survey conducted in 2019 out of approximately 1.5million produced by India annually, only 250,000 secure employment. The National Employability Report for Engineers 2019 published by SHL, reveals that the employability rate for engineers in IT services companies is merely 16.25% and 3.4% for IT products. It is reported that students from Bihar, Jharkhand, Delhi, Haryana and West Bengal exhibit the highest employability in IT services roles. Odisha, Telangana, Uttarakhand and Uttar Pradesh form the next tier in employability. Chhattisgarh, Karnataka, Punjab and Rajasthan fall in the third category. Tamil Nadu, Gujarat, Andhra Pradesh, Madhya Pradesh and Maharashtra were in the bottom 25 percentile brackets. According to India's Skills reports Andhra Pradesh ranks seventh in terms of employability. To perceive the worth of English language skills from multiple perspectives, this study brings together the voices of both engineering students and employers. By considering the data collected through the questionnaires we aim to provide a comprehensive analysis of the role of English language proficiency in determining the employability of engineering graduates.

This research employed a mixed methods approach, combining quantitative surveys and qualitative interviews. A questionnaire was sent to employers from different multinational companies to gain insights into their expectations in terms of English language proficiency among job applicants and their assessment of the impact on employability. It also intends to know how integral language skill in the workplace is. Additionally, semi-structured interviews with 80 students from two Engineering colleges in the local area were conducted online aiming to determine the language skills' role in deciding their employability status.

The English Language is the combination of four crucial skills which in turn must be precisely imbibed in every interviewee. They are Listening, Speaking, Reading and Writing: if we first talk about listening skills during the interview they are essential to fully understand the interviewer's questions and instruction, so active listening demonstrates your attentiveness and helps you to provide relevant and well-thought-out responses. It can help an individual adapt her answers accordingly.

Speaking Skills help the interviewee express his/ her thoughts experiences and qualifications during the process of selection. To be confident in conveying the ideas, a graduate must make sure their speaking skill should be concise and must have appropriate language, tone and relevant style of communication so that it must match the interviewers.

Reading Skills are essential before an individual attends his interview. This skill of no doubt helps an interviewer answer any kind of questions posed by an interviewer.

Writing Skills: It is an acceptable fact that writing is the first step by which a person's attitude and ability is lucidly seen that is in terms of email writing, Resume making or so on. We are aware of how written assessments or follow-

up emails will leave a great impact on an individual's selection. Strong writing skills enable you to convey ideas concisely in fact focus must be on proper grammar and punctuation which showcase your professionalism Honing LSRW can help a graduate get through the process of an interview. Objectives which every graduate must acquire:

- ◆ Practice active listening, good eye contact avoid interruptions.
- ◆ Take so many mock interviews and seek feedback from experts
- ◆ Scan and skim for at least few minutes to improve comprehension, learn new vocabulary and reach out to industry trends
- ◆ Improve writing skills by journalizing and so on.

The findings of this study will contribute to the current and pre-existing knowledge repository by providing insight into the specific English language requirements in the engineering employment arena. The results will assist educational institutions, notably the Training and Placement team in framing English language skills building syllabus that cater for the needs of engineering students ultimately progressing their employability prospects. Eventually, this research paper aims to reinforce the call for engineering graduates to place emphasis on English language learning as a means to upgrade their employability. And also how language education can be integrated into engineering programs to bridge the gap between technical skills and industry needs.

The questionnaire used in the survey is sourced from a report titled "**English at Work: a global analysis of language skills in the workplace**". This report was conducted by Cambridge English Language Assessment which offers a detailed comparison of English Language proficiency in different countries specifically focusing on the workplace.

METHODOLOGY

Semi structured interviews were conducted with a sample of 80 students from two different Engineering colleges.

Introductory questions

Introductory questions were asked to assess candidate's communication skills, including how well they express themselves and their ability to articulate their thoughts clearly.

Ex: Can you please introduce yourself?

How would you describe your strengths and areas for development?

Follow-up questions

Follow-up questions were asked to explore the candidate's responses in more detail and gain deeper insights into their skills and experiences.

Ex: Candidate's response: "One of my strengths is adaptability."

Follow-up question: "Adaptability is valuable in our dynamic work environment. Can you share an instance where you had to adapt to a challenging situation, and how did your adaptability contribute to a successful outcome?"

Spirals and probes

Spirals and probes serve to dig deeper into the candidate's responses, which allowed to gain a more comprehensive understanding of the candidate's skills

Ex: What skills do you think are most important for this position?

Behavioral interview questions

Behavioral questions were asked in order to assess soft skills like communication, teamwork, leadership, and problem-solving, which are essential for success in many roles.

Ex: Tell me about a situation where you had to make a tough decision with limited information. How did you approach the decision-making process?

Scenario-Based Questions

These questions helped to gauge the candidate's ability to respond in English.

Ex: You are a customer service representative, and a customer is upset about a product issue. How would you handle this conversation?"

Assessment criteria employed to evaluate English language proficiency are as follows:

Fluency: The ability to speak English smoothly and without hesitations or significant pauses.

Pronunciation: The accuracy and clarity of the candidate's pronunciation in English.

Grammar and Syntax: The candidate's use of proper grammar and sentence structures in spoken English.

Vocabulary: The range and appropriateness of the candidate's vocabulary in English.

Listening and Following Instructions: Assessing the candidate's ability to listen carefully to instructions and follow them accurately in various scenarios.

Conversation Management: Evaluating how well the candidate participates in conversations, asks relevant questions, and responds appropriately to different conversational topics.

Functional Language Use: The candidate's ability to use English language skills in practical situations relevant to the job role, such as in customer interactions, presentations, or negotiations.

Appropriateness of Language: Evaluating whether the candidate uses language appropriately for the context, such as using formal language in professional settings and informal language in casual settings.

FINDINGS

From semi structured interview

English language proficiency is crucial for engineering graduates' employability:

The major finding of this study is that students who were proficient in English reported more confidence during interviews. Approximately 85% of the students who demonstrated a high level of proficiency in English language succeeded in the interviews during campus recruitment. Based on the insights gathered from semi structured interview it can be inferred that the students' English language skills play a vital role in students' success in campus recruitments and in shaping their employability.

From questionnaire

Employers' expectations and requirements:

Based on the responses received from the six employers' it is evident that the English language proficiency plays a crucial role at workplace and significantly impacts the hiring process. They prospect string English language skills as a critical asset, enabling effective communication, successful client interactions and participation in international projects. Employers' often assess candidates' language abilities during job interviews and consider them as a decisive factor in the hiring process.

Educational institutions and the role of language training:

The findings suggest that educational institutions need to address the gap between students' English language skills and employers' expectations. Institutions should incorporate comprehensive English language training programs within the engineering curriculum to equip graduates with necessary language skills for the job market. These programs should focus on developing technical vocabulary, improving oral and written communication skills and providing opportunities for real-world language practice.

Limitations

- **Sample Size:** The samples for data collection are limited to 80 students from two engineering colleges.
- **Language Domains:** Language proficiency assessments might not fully cover all language domains, such as receptive skills (listening and reading) and productive skills (writing), leading to an incomplete assessment of overall language proficiency.

Ancha Jerusha and Syeda Ayesha Jahan

- **Limited Scope:** Mightfocus on specific aspects of language skills, such as pragmatics or cultural appropriateness
- **Sample model:** semi structured interview where the focus is only on English language proficiency

CONCLUSION

By recognizing and addressing the need for English language proficiency in engineering graduates, stakeholders can contribute to the overall success and employability of graduates in today’s globalized job market. This research provides valuable insights for future endeavors encouraging further investigation into specific language skills required in different engineering disciplines, the effectiveness of language training programs, and the impact of language proficiency on career progression and job performance.

Ancha Jerusha and Syeda Ayesha Jahan

Majority of the roles need the English language skills at work place

- ❖ Consider English language certifications
- ❖ Larger number of employers conduct interviews in English
- ❖ Assess English language through Standard English language tests during the interview.

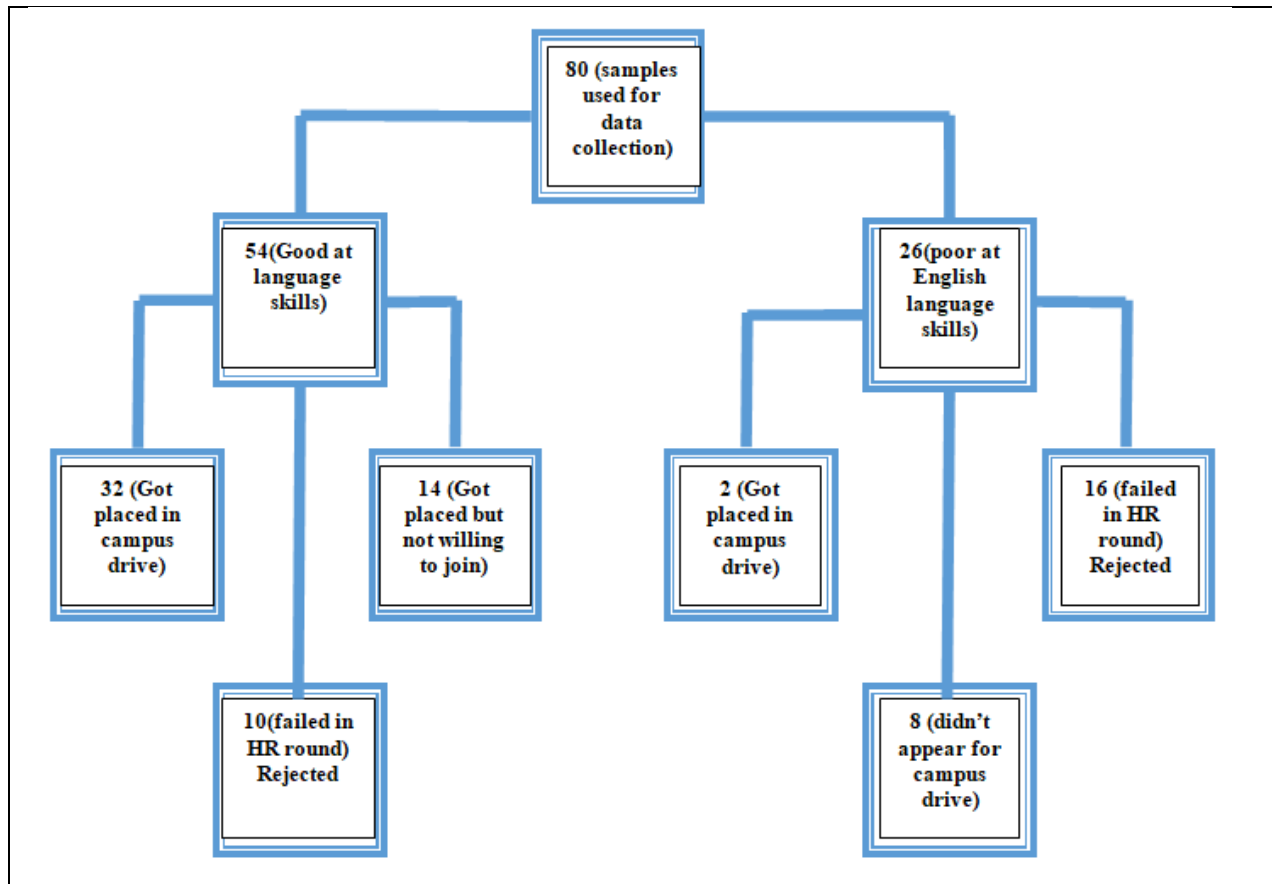

- ❖ Larger number of employers' top priorities is speaking, listening and writing.

ABSTRACT

This paper investigates the complicated web of the collective unconsciousness rooted within the American psyche, using Carl Jung's archetypes and collective unconsciousness as a theoretical framework. Drawing inspiration from the rich and evocative narratives of renowned author Stephen King, the research seeks to illuminate the archetypal elements and collective symbols that resonate within the collective American mind. By examining King's literary work, *The Dead Zone*, the study explores how these narratives act as mirrors reflecting the deeper, shared fears, desires, and cultural motifs that pervade the American collective unconscious. Through an incorporation of Jungian theory and other textual analysis, this interdisciplinary approach bridges the realms of psychology and literature, offering a nuanced understanding of the collective unconsciousness in the context of American society, as illuminated by the dark and fantastical worlds crafted by Stephen King.

Keywords: shared fears, cultural motifs, American collective unconscious, collective symbols

INTRODUCTION

Stephen King's novels have a combination of fearful elements with psychopathic characters and deep-rooted history. The research paper aims to bring out racial memory as a primordial element of collective unconsciousness present in American society in Stephen King's novel *The Dead Zone*. The memories and tendencies a person inadvertently occupy from his older generations, play a greater role in shaping his basic personality traits as Jung believes.

**Muthukannan et al.,**

The collective unconscious is not so much a 'geographical location', but a deduction from the alleged ubiquity of archetypes over space and time. For Jung, the psychological archetypes which dredge out of the darker part of human mind the depth of consciousness, is the symbol of once-primitive thoughts. The actions that happen in the dream are within the layer of depth unconsciousness of one's inner selves. In the complicated needlepoint of human consciousness, the concept of the collective unconscious, as proposed by Swiss psychiatrist Carl Jung, serves as a profound lens through which to examine societal dynamics and individual behavior. This research paper delves into the depths of the collective unconsciousness, seeking to unravel its influence on the mindset of the American general public and the resultant political movements that shape the nation's destiny. By understanding the shared symbols, archetypes, and latent memories that reside within the collective unconscious, it aims to illuminate the underlying currents guiding the collective psyche of the American people and influencing their political unity.

The Colossal Influence of Collective Unconsciousness in American Society.

The American author Stephen King a well known horror writer of the era has used history and political situation of America as a background for his horror novels. The new land paves way for a new form of literature. The society and its collective emotions acts as a major part in the American soil. Thus, psychologist Bernard Rime explains about the group psyche, from his point of view the synchrony with others through actions, and common feelings also bring people together, whether through religious ceremonies, concerts, or protests. Strikingly related psychosocial consequences arising from several interpersonal and group contexts are proposed in recent studies. American Physical Society member Bernard Rime, an emeritus professor of psychology at the Universite Catholique de Louvain in Belgium, has used theories from sociology and psychological science to examine the mechanisms that allow us to encounter this blurring of individual borders in so many contexts.

Rime argues that interactions of synchrony and mutual emotion cause a change between two simultaneous neural "modes" in individuals, building on these sociological hypotheses.

The "individual" executive mode, well-documented by experimental psychology, underlies purposeful activities and includes executive functions such as management of concentration, setting goals, cognitive flexibility, and retrieval of information. Rime claims that the "communal" mode, which psychological research has generally ignored, encompasses our long-standing links to family members, friends, culture, and society, as well as the collectively transmitted cultural awareness extracted from these relationships.

Adding some points to him in 1893, Emile Durkheim, a French sociologist, published his theory of collective consciousness, explaining how two types of consciousness exist within each person: an individual consciousness that stresses our uniqueness and distinctiveness, and a collective consciousness that contains the mutual ideals, thoughts, and convictions that are universal to the whole community or society.

By engaging in collective emotions through social media, individuals were able to synchronize their thoughts and emotions, stimulating a sense of social belonging and shared beliefs. "In line with a central tenet of Durkheim's model, these effects were mediated by participants' perceived emotional synchrony with other people," Garcia and Rimé write. "Our findings support the conclusion that collective emotions after a disaster are associated with higher solidarity, revealing the social resilience of a community."

Team sports and group physical activity is proving to be a rich area for studying the impact of shared emotion and social support on the body. "In team sports, and group physical activity more generally, the social and the physiological are functionally and inextricably interlinked," explains Emma Cohen, a professor of cognitive anthropology. "Movement, emotion, and performance bind together at the individual level, but also at the collective level." (Cohen 67)

The paper analyses the novel *The Dead Zone*, the hero Johnny Smith is a school teacher who gets involved in a car accident. He wakes up from a five-year coma after the accident. In the due time he has lost his love life – his sweetheart is married to another man while he was in coma. But he discovers a new ability after the coma, that he

Muthukannan et al.,

can see people's future and past when he touches them. He helps many people by the power he possesses. He is faced with many problems due to this power. People treat him as a superstitious person. Once Johnny shakes the hand of an ambitious and amoral politician, Greg Stillson and realizes the evil intentions in Stilton's mind. He must decide if he should take drastic action to change the future. Eventually, he decides to change the future by preventing Stillson from reaching the position he desires.

Gregory Ammas Stillson is a full time politician elected as a Mayor of Castle Rock now seriously working for becoming a US Senatorial Candidate. Apart from that the most important thing about Mr Stillson is that he is a terrorist. He is highly skilled and over ambitious and he uses his eloquence to attract people, the most common weapon used by every politician in the world. He is so loved by the town's people; it helps him to gain more power. Other aspects of his charisma such as his high intelligence and trustworthy nature make him reach the summit of his political power. His only goal is to become the US President so he will be able to start a nuclear strike against Russia. Johnny knows this incident by his power. Johnny takes the drastic measure to assassinate him in order to avoid the nuclear war. He tries to shoot Stillson at the time of a public rally. He misses the target. To escape from the bullets, Stillson grabs a child and uses it as a human shield. Even though subdued by the guards Johnny is satisfied that his effort has found its mark – he foresees the future - in which Stillson's reputation and political career is ruined after the publication of a photograph showing his cowardly act of protecting himself by using a toddler as a human shield. In the final moments of his life Johnny is happy that he has helped the world from an impending danger and doomsday.

The political portrayal of Stillson by King closely resembles the views expressed by Douglas E. Winter in his *The Art of Darkness*;

"conspiratorial totalitarianism", where candidates for high office are decided not by the exercise of free choice, but "by factors as diverse as video images . . . media access and dirty tricks, untimely remarks . . . In such a system [the individual] becomes an observer, and choice seems a meaningless myth" (Winter 47)

But Johnny simple common sense and intuition tells him that Stillson is a person to be watched out. This realization comes to Johnny even before he shakes his hands with Stillson in the New Hampshire Rally. He is convinced that Stillson poses a greater threat to the world than he is to America and he begins to collect information about Stillson from all the possible sources. Stillson and their brief encounter becomes a recurring nightmare to Johnny and he becomes obsessed with the idea of eliminating the threat. An utter despair is the feeling he experiences during these bad dreams.

The sudden blackness. The feeling of being in a tunnel filled with the glare of the onrushing headlight, a headlight bolted to some black engine of doom. The old man with the humble, frightened eyes administering an unthinkable oath of office. ... The only clear image in these dream-replays came near the end: the screams of the dying, the smell of the dead. And a single tiger padding through miles of twisted metal, fused glass, and scorched earth. (TDZ 407)

These images and the thoughts about Stillson suffocate Johnny and they point to only one conclusion. Stillson is pure evil, some instances in his life in the past have shown how cruel and rude he could be. A dog has been beaten to death by him, a disobedient little boy has been bullied by him and a senator has been terrorized by him for not obeying his orders. Just evil and malevolent is the nature Stillson secretly possesses. But Johnny's realization and its confirmation while shaking his hands with Stillson sets the stage for the final encounter. A bad man he is and must be stopped at any cost. As a person awakened from a five year coma to see his life disarrayed – future does not hold Johnny anything great or exuberant to cling to. He finds this as an opportunity to add some meaning to his existence. As a commoner he feels that his certain death in the near future – due to his medical situation – would yield a better satisfaction if it is spent for a noble cause – like sacrificing his life while eliminating a world threat.

Muthukannan et al.,

When backed with such an intention he does not find it very difficult to reach in his decision. “Kill Greg Stillson”. The author has skillfully portrayed the transformation of Johnny’s life from an easy going, lovable, mediocre school teacher to a maniacal, depressed and melancholic killer of some sort. A believable explanation and justification for this transformation is presented – a tale that a reader could easily relate to. Jonny’s thoughts, reactions, motivations and impulses are very real to the reader like he is the one taking the full blast of the heat of Johnny’s misfortune.

King is master in presenting his ideas in simple terms – nothing too complicated about his character’s thoughts and actions. An organic development and growth in the circumstances – a natural growth – can be seen in his narrative process. The reason for the universal acceptance of his characters is the archetypal feelings involved in the character formation. For Johnny, this growth is to carry his wounded yet illuminated self all along – living as alien in the society in which he was a part of the mainstream. For Stillson, it is his growth from the meager existence to the most powerful position of the powerful nation – the presidency of USA. For the heroine Mrs. Bracknell, living the life of double jeopardy – as a faithful wife to one man and as a devoted lover to another. These feelings and the dilemmas encountered by them and the final road they all reach is so natural which is easily recognized and empathized by everyone irrespective of the race, nationality or the age group one belongs to. This can be linked to the collective unconscious of the general mass. Likewise, the initial love and admiration of the people surrounding Stillson turns in to acute hate and disgust in the due course. The same parameter can be employed to measure the intensity of love and the intensity of hate people express on the same person in a matter of days. This is the result of the collective unconsciousness. Love and admiration for the savior of the masses whereas, fear and disgust for the child murderer. The cowardly act of using a child to protect himself shatters the confidence of the people in him as the new Messiah. The following excerpt from the novel, the testimony of the photographer, Mr. Stuart Clawson who took the picture of Stillson in his cowardly act shows the change in the mindset of the people towards him;

R: You just snapped the photo when Stillson picked up the child?

Cohen: Young man, I’d like to suggest that you won the most important footrace of your life when you outran those two thugs.

C: Thank you, Sir. What Stillson did that day... maybe you had to be there, but ... holding a little kid in front of you, that’s pretty low. I bet the people in New Hampshire wouldn’t vote for that guy for dog-catcher. Not for...(TDZ 235)

Thus, comes the end of a charismatic egoist with a strong will to reach his goal. The findings on the effect of collective unconscious in the mass psychology are very relevant in today’s world. New tools supported by the modern technology have helped in reaching cemented conclusions about mass psychology in these days. Spread of the hate politics through mass media and social media platforms by the politicians plays a crucial role in the shaping up of the collective unconscious, thus achieving a desired goal –like winning an election or formulating a favourable opinion about a particular subject.

An interesting study conducted by Paolo Gerbaudo, a senior lecturer in digital culture and society at King’s College London shows that this trend has far reaching consequences in mobilizing political movements using the unethical practice of spreading hate and disgust through the effective use of media platforms. According to Gerbaudo, the attempts to use social media platforms such as Facebook and Twitter by political personalities like Matteo Salvini, the former Minister of the Interior of Italy, to induce deep resentment among the general public against minority communities such as migrants and immigrants, women, and the LGBTQ community have been very fruit bearing in terms of his ascension to power. His media Salvini method included making his Facebook page a place to paste hate messages – and the viewers were encouraged to add emojis at the comment section. Two of the most popular emotions extensively used by the users were that of ‘Furious’ and ‘Ha-ha’ – denoting anger and insult. It expressed the tell-tale signs of the general attitude of Salvini’s followers -these communities are to be hated or to be humiliated – nothing more nothing less. The comments sections were added for the convenience of the readers to post their opinions – thus giving an extra leverage to the real issue by adding more and more hateful messages under the original message. Those who have only a vague idea about the issue suddenly becomes the experts by reading the

Muthukannan et al.,

comments posted by the others which is often misleading and magnifying. Even the ones with a favorable attitude towards the marginalized become extremists because of the feeling of belonging to the community. They favor them because they don't want to be considered as pariah, so they take sides with the major group. They don't find many others supporting these 'weirdos'. As the end result of all these manipulations, a new political movement is achieved by transforming the hatred of a small group into mass movement. Most of the time the hatred expressed by the far-right followers are more complex than the views they express in the contemporary scenario. It is primordial. The hatred is rooted in them for generations – race supremacy, pride about the intellectual capacity and social status. Not just based on feelings of instant toxic emotions but a deep rooted conviction. This conviction is more and more hardened by joining in the bandwagon of the similar minded people united under the social media platforms. The mouthpiece speakers are considered as semi gods and lauded – praising the achievements blindly. These are not simple places where the hate is communicated but where the hate is originated and nurtured.

CONCLUSION

The theories of Bernard Rime, Emile Durkheim, Garcia and Rime, Emma Cohan, Douglas E Winter, Paolo Gerbaudo and Matteo Salvini states that the primitive thoughts and collective unconsciousness of the people of the land had a great influence over their geographical and historical incidents. The present study of archetypes in the King's novels has formulated a theory that could be practiced for the well-being of the future generations – harness the potential of the collective unconscious to produce better minded citizens in the future by inducing them with images of positive emotions and attitudes. As a nation marked by its diversity, the United States stands as a captivating case study for exploring the interplay between individual and collective mental landscapes. This research endeavors to dissect the intricacies of the American mindset, drawing connections between the shared unconscious elements that contribute to a collective identity and the subsequent political mobilization that arises from this unity.

ABSTRACT

Art is a product of a human mind to convey a select idea or emotion in a conducive form of the artist. Selectivity is the key factor of an art because the artist, in order to convey his intention clearly, selects the idea or the subject and the style with due care. The artist, then, attends to the clarity of his creation. If he fails in clarity, the purpose of his creation will be lost. Hence, he applies his intelligence to shape and hove for accuracy. Later, he integrates the subject and style to present it beautifully to the reader or audience. Thus, art conveys the taste of an artist. J M Coetzee, a Noble Prize winner, is a South African writer. He uses various narrative techniques in his text to make the reader engaging. Literature is an evergreen art, thanks to the writers like him who show novelty in every work they write. *Disgrace* is his most famous novel for which he has been awarded with the Booker Prize. This paper discusses the basic artistic values and tries to trace down it from the novel *Disgrace*.

Keywords: Artistic values, exposition, symbols, narration and myth

INTRODUCTION

The creation of an artist has to be recreated by the reader or spectator to understand and appreciate it. It is considered that any work of art is complete on its own. It has the harmony in it so one cannot alter with addition and subtraction with it which may lead to destruction of it. Art has that finality which is not possessed by science. Science consents the alteration in order to grow as well as glow for centuries to come. Sometimes, the work of art may be irrelevant from the life of the spectator. Unfamiliar ideas, affairs and emotions can, in all possibility, emerge as dominant elements shut off from human interests. Here, art expects the spectator or the reader to exalt from the

Ravindran et al.,

ordinary and enter into its own sphere. Hence, art need not reflect or 'imitate' life. It can become a dream as both art and dream are expressions of emotions and thus, symbolic. Anyhow, one cannot accept the consideration of art as a dream because art is a conscious attempt to present the emotions, may be, symbolically but dream remains unconscious. Some consider art as illusion but it is revelation of reality. The aspects of strangeness and other-worldliness of an art cannot hold the artist responsible. It is the artist's imagination that reveals itself and he revels in it.

Faculty of imagination is greater in artists than in ordinary men. Therefore, the spectator has to free his mind from all his impediments to comprehend the artist. Art becomes an expression also. Art is essentially a form of expression is a common notion; it may be a symbol and when it is so, it implies four factors: the symbol, the person who makes the symbol, the person who interprets it and an image of feeling of which symbol is an expression. Art expresses feeling also and it expresses pleasure, unpleasure, sadness, happiness, disgust, terror, grief and depression. Art communicates feelings of an artist through certain external signs. The signs may be words, paint, music, etc., for example lyrical poetry of Wordsworth. *Daffodils*, Wordsworth describes a routine action of appreciating beauty. Sometimes he remains without thinking and at some other times he is 'pensive' when the poet is in such an unhappy mood the happy daffodils flashes through his mind and opens his 'inward eye to get a spiritual vision which later becomes bliss'. Now the daffodils have become an ideal company and so his heart starts to dance along with the cheerful daffodils. Therefore, art is an expression of intense feeling which makes the artist restless until the feelings take the form of art. When art becomes objectification of subject or subjective reality it projects virtue.

Literature is one of the forms of art is different from other forms such as painting and music because its emphases on thought content. Music and painting can create a mood but cannot arise any thought. Since art is the virtue of the intellect, it demands to communicate with the entire universe. For example, Shakespeare entertains as well as portrays with great insight human psychology, human impulses and motivations. His characters are easily comprehensible because they reflect actual human beings. Bernard Shaw pictures social evils and drives to reform the society. Charles Dickens also attacks the social evils of his time.

Victor Hugo, Maxim Gorki, Bulzac Tolstoy, Keats, Tennyson, George Eliot, Thomas Hardy, D.H. Lawrance, T.S.Eliot and many other literary personalities are glorified even today, because of their sublimity. Longinus finds five principle sources of the sublime: grandeur of thought, capacity for strong emotion, appropriate use of figures, nobility of diction and dignity of composition. These five can be brought together with the comment of language. Grandeur of thought for Longinus is the stately thoughts of the lofty minds.

Aristotle's 'cathartic effect' as well as Longinus's 'capacity for strong emotion' aim at moral upliftment of the reader or spectator. Appropriate use of figure of speech elevates the style of writers. The chief figures that Longinus consider have the capacity of sublimity are: rhetorical question, asyndeton, hyperbaton and periphrasis. These can produce grandeur by satisfying a basic demand of human nature as one hears something new from the routine and at the end it gives a pleasant surprise and these figures Longinus thinks, "is effective only when it appears in disguise". Therefore, dignity of composition can exalt the soul and sway the heart of men with its natural power of persuasion and pleasure. Quintilian asserts that style is the product of both nature and art. It prefers language of daily life. Since, his treatise is primarily prose, like Aristotle he trusts in everyday subject and language of daily life. However, by language of daily life, he does not mean the language of the masses. He prefers the language of educated men. Therefore, the insistence lays on choice of words and their arrangement. Only when the words are chosen carefully they can be arranged properly. Apart from popular words of common usage of educated men newly coined words may be used where the popular words cannot serve the purpose but sparingly. Archaic words can also be used to impart dignity to style.

**Ravindran et al.,**

Rhythmic prose is different from rhythm of verse where each line has a metrical composition. In prose, the rhythm is subtle. Longinus and Quintilian were ruling English literary trends until the romantic emergence. Romantics brought changes and developed literature on the whole. They opposed all regimentation in literature and proposed to 'please always and please all'. Wordsworth and Coleridge ascertained that language of the middle and the lower classes can provide poetic pleasure. Wordsworth considers the language of the layman is more permanent and philosophical. Wordsworth accepts that good prose can also sound as poetry because common men cannot spare time for metrical composition.

John Maxwell Coetzee, South African writer, literary critic, essayist, linguist and translator, was born in 1940 at Cape Town. He is the son of Zacharias Coetzee who was an attorney and partly government employee and Vera Coetzee, a school teacher. Having born in an educated family, his family members talk only in English but Coetzee, inspired by his mother tongue, speaks Afrikaans with other relatives. He studied at St Joseph's College and completed his bachelor of arts with honors in English and Mathematics from University of Cape Town. He moved to the University of Adelaide in Australia where he is currently working as a professor of English now. Coetzee, being a prolific writer, introduces himself as a writer to the literary world with his first novel *Dusklands* (1974). In the year 2003, to glorify literary contribution, he was honoured with the Nobel Prize for Literature. Coetzee in his novels delves into the themes of racism, imperialism, colonial impacts on culture and the sufferings of groundlings. Coetzee, interested in politics, projects the limitations of African society in his novels and criticizes them with his literary talents.

Coetzee's novel *Disgrace* (1999) traces the life of David Lurie, the protagonist, professor of English, a twice divorced man. The novel exhibits the inordinate sexual desires of David who seduces his own student, Melanie and is expelled from his institution. The setting of the novels is the country land of Salem in Eastern Cape where the cruel apartheid system prevails all over the land. Lucy, the daughter of David Lurie who lives in Salem, a village of Eastern Cape, is brutally gang raped by three strangers. Moreover, they severely attacked David and loot everything from their home. When policemen investigate Lucy about the incident, she shadows the rape event and only tells about her and robbery. After this event, there is a rift between the father- daughter relationship. David starts to spend his time with Bev Shaw, the friend of his daughter, in her Animal Welfare Clinic.

Later, David repents to Mr. Issac, father of Melanie, for seducing his daughter. In the meantime, David comes to know that Petrus, neighbour of Lucy, is the one who has assigned the strangers to molest his daughter in order to occupy her land as well as marry her. David smites Pollux, one of the strangers and reason for his daughter's pregnancy. At end of the novel, David accepts his life as disgraced and he does not want to change it anyway. He continues his job in the Animal Welfare Clinic. The sub plot of the novel deals with David's project on the love affairs of Byron and his mistress Teresa Guiccioli.

Coetzee uses Oedipus myth as exposition to introduce the background of the story. Coetzee uses exposition in *Disgrace* as a literary device in order to introduce backdrop details on characters, events, settings and other information to the readers. Coetzee pictures one Professor David Lurie to take advantage of one of his students and so disgraced to calamity. David is considered as a fallen angel as he has been thrown out from the university. He is compared to Lucifer and he would have been apologized by the committee if he had asked for it. His racist thought never let him to ask apology and accepts his fall. As Oedipus, he has been arrogant during the liaison and he is self-centric egoist person. Being a Professor, he failed to be professional but romantic which leads to his tragic fall. Every Thursday afternoon, he visits Soraya, a prostitute. Though the sexual relationship is complacent, he never tries to change his temperament, especially his sexual temperament.

David is employed at the Cape Technical University teaching Romantic poets initially and now teaches communication skills. He has published three books on Opera, Eros (God of love) and Wordsworth. Opera is a musical drama set for singers and instrumentalists; Eros is a God of love, son of Aphrodite; Wordsworth is a

Ravindran et al.,

romantic poet and the writing the history of Wordsworth projects the degradation of a romantic poet to historian as he teaches communication skills. Through this Coetzee establishes Lurie's temperament, not an effective teacher because of his sluggishness. He gloats even at the time of inquiry which leads to his resignation. At the end of the novel he becomes undignified. David Lurie drives home the humiliation of David. His degradation, thus conceived by Coetzee is not lesser than Oedipus. Coetzee undertakes the myth of Origen to underline the character of Coetzee and his disgrace. Origen in *Ecclesiastical History* 6.8 of Eusebius mentions Origen's castration. He was a theologian who taught women Greek literature to support his family.

David Lurie is faithless and self-indulgent. His relationship with Soraya breaks up immediately after Lurie meets Soraya's family that is Soraya with her two children. His snake totem does not leave him ideal. He picks up a relationship with Dawn, another prostitute. Unable to forget Soraya or having expected Soraya in Dawn, Lurie cuts a sorry face in sexual relationship with Dawn. He is scolded by Dawn and her masturbation at the end of intercourse makes him repulsive. Coetzee analysis his mind,

He ought to give up, retire from the game. At what age, he wonders, did Origen castrate himself? Not the most graceful of solutions, but then ageing is not a graceful business. A clearing of the decks, at least, so that one can turn one's mind to the proper business of the old: preparing to die. (Coetzee 9)

Impotent and ineffective but an insatiate David Lurie selects his student Melanie as the next tool for his sexual escapade. This poor and unethical move has ensued the loss of her playful smile "The pentameter, whose cadence once served so well to oil the serpent's words, now only estranges." (Coetzee 16) The rhythmical and metrical pattern of language that has served as a cadence, as a tone, to seduce girls now has turned out to be disaffected. It is an extension of snake totem and concentration of Origen. The words once lit up the emotions of, now estranges in spite of that Lurie's temperament never changes. The seduction process continues in the classroom also a simple thought. A man looking at Alps mountain becomes a complicated imagery.

Lurie teaches *The Prelude Book six* that talks about the early literary face of simplicity of Wordsworth. Critics consider the first face as glorious because of Wordsworth's inductive surrender to nature. Face of the mountain that has taken Wordsworth over to different worlds of thought, is the theme in the class of David Lurie. Mont Blanc, a potential World Heritage Site known for its unique beauty. The meaning of Mont Blanc is White Mountain. A simple idea of Wordsworth that the scenic beauty of nature, Mont Blanc, the white mountain takes Wordsworth to different worlds is speculated for a long time in the class room by David Lurie: Especially an ordinary verb Usurp meaning take over, is meditated throughout, to suggest Melanie that like Mont Blanc, she takes Lurie over to distant spheres of the cosmos. David Lurie conveys that 'mere sense-image' of Melanie imports to his memory the 'great archetype' and 'pure ideas'. The sense-image is related to 'being in love' and students are advised to keep the sense-image 'alive in the archetypal, goddess like form'. In yet another class, David gives a lecture on Byron. Here, Coetzee prefigures the fate of David Lurie as Byron. Byron did face many allegations for his affairs. He had his affair with Mary, wife of the English poet Percy Bysshe Shelley and with Claire Clairmont, a stepsister of Mary. Even Byron involved affair with his own half-sister Augusta and others named Lady Oxford, Lady Caroline Lamb and Lady Byron whose name was Anne Isabella Milbanke.

As Byron had too many affairs so does David Lurie. He is twice- divorced; he has affairs with Soraya, Dawn, Melanie Issac and Bev Shaw. Being highly impulsive, David has little concern for morality. He wants to understand and sympathize Byron. Unconsciously in the course of lecture David speaks about solitude. His unethical temperament leaves him shameless and so he never admits his rape nor eager to hear the verdict of the inquiry committee. David escapes to the town of Salem, Eastern Cape. There, Coetzee parallels Melanie's rape to the gang rape of Lucy, David's daughter. David is attacked and the rape becomes a privacy matter for Lucy. By saying the rape can be brought to the public notice in another time, in another place, Lucy refers to Melanie's rape. Lucy goes to the extent of marrying Petrus who is doubted to have relationship with the attackers. Thus, Coetzee proves the

Ravindran et al.,

distinction in cultural assimilation of the city 'Cape Town' and the village "Salem, Eastern Cape". The alterity becomes a very powerful mode of transferring Coetzee's ideas as the novel progresses to the end. Many pages are dedicated to opera now the story is not about Byron but about Teresa, Byron's old lover. Gradually the elegy becomes comic as David's life has turned from romantic to tragic.

Coetzee mentions the Casanova myth when David Lurie receives a letter during his final face of tenure in the university. Unable to control his sexual desire David Lurie has an affair with his own student Melanie Isaac. It is soon learnt by her lover Ryan and her parents. They complain to the university authorities that David Lurie has raped Melanie. When the inquiry goes on, the university advises David Lurie to undertake counseling. A pamphlet is issued in due course.

On campus it is Rape Awareness Week. Women Against Rape, WAR, announces a twenty-four-hour vigil in solidarity with 'recent victims'. A pamphlet is slipped under his door: 'WOMEN SPEAK OUT'. Scrawled in pencil at the bottom is a message: 'YOUR DAYS ARE OVER, CASANOVA'. (Coetzee 43)

Coetzee mentions Casanova who is more than a womanizer of Venice. A good example of Casanova is 'Don Juan', a Spanish legend popular for his seduction. David Lurie is no less a Casanova than a Don Juan through whom Coetzee demonstrates the sin of womanizing. David Lurie is forced to resign and at the end of the novel he becomes an employer of Bev Shaw's Animal Welfare Club. David Lurie is the architect of his own destiny - the Disgrace caused to him because he failed to realize the moral truth that womanizing is a sin. Coetzee's narrative techniques of using exposition and myth add artistic values to the novel *Disgrace*.

ABSTRACT

Learner engagement is important in EFL classrooms to ensure effective learning, active participation and cultivate motivation towards learning. There are various strategies that can be employed to boost learners' engagement such as the use of game-based learning for vocabulary instruction. This study aims to analyze the effectiveness of Quizizz as a teaching and learning tool to teach vocabulary in EFL classroom. The analysis was conducted with 40 participants, and they were divided into two groups, a control group, and an experimental group. Before the study commenced, a pretest on vocabulary was conducted for both groups to assess the participants knowledge. Following the pretest both the groups had two distinct types of teaching. The control group received traditional vocabulary instruction while the experimental group was taught using Quizizz, a game-based learning tool. After completing 10 sessions of teaching vocabulary the two groups took a posttest on vocabulary to measure their progress. The results showed that there were significant differences between the pretest and the posttest scores favoring the experimental group. This study was conducted to explore how Quizizz can enhance EFL learners' engagement and learning. The findings of the study show that educators can achieve better learning outcomes by integrating Quizizz into their teaching process. Furthermore, this study shows that participants are motivated to utilize Quizizz as an effective learning tool even beyond the confines of the classroom.

INTRODUCTION

Acquisition of vocabulary skills plays an important role in improving language proficiency, especially in the field of teaching English as a Foreign Language (EFL). Possessing strong vocabulary skills are essential for learners as it enables them to expand knowledge in all aspects of language proficiency, be it listening, speaking, reading or writing. In the fast-paced modern world, both the educators and the learners are actively seeking various educational tools to simplify the learning process. Teaching vocabulary using traditional methods in EFL classrooms has limitations and there is a necessity for innovative teaching methods to motivate and engage learners. These limitations in traditional teaching emphasize the importance of finding engaging strategies for vocabulary learning. Traditional approaches to vocabulary instruction often face challenges in engaging and motivating learners effectively. Recognizing the importance of learners engagement in learning a language, educators are increasingly using innovative methodologies as a supplementary tool in the classroom that integrate technology and gamification to enhance learning. One such tool that has gained attention among learners and educators is Quizizz. It is a gamified platform that offers interactive quizzes and diverse learning experiences.

This study aims to investigate the effectiveness of Quizizz as a gamification tool for enhancing the vocabulary learning in English as a Foreign Language (EFL) Classrooms. The integration of technology and gamification in education has become increasingly popular due to its easy-to-use application, ability to encourage active participation, create a collaborative learning environment, and maintain learners' interest in learning, which are often lacking in traditional teaching methods. This research aim is to bridge the gap in vocabulary learning and contribute to the advancement of more engaging and effective vocabulary learning practices in EFL classrooms. As an EFL learner, it is important to have strong vocabulary skills for learning and understanding a language. It helps the learners to improve their reading and writing skills. Also, it helps the learners to communicate effectively.

Gamification is an innovative approach that aims to increase users' engagement and motivation and provide sustainable experiences (Bozkurt and Durak). Gamification is a fun way of learning by adding game elements to it and it makes learning more engaging and interactive. It speeds up the response time of the learners, stimulates creativity and focus. The interactive tool allows the learners to work out their best strategy and experiment through trial-and-error methods. Apart from helping team building, the game based interactive tool also allows the learners to find a solution to a problem by visual memory and critical thinking resulting in building of confidence and new skills.

Quizizz is a game-based learning tool that allows educators to customize interactive quizzes, and lessons as per their learners and classroom needs. It makes learners feel like playing a game while learning vocabulary with points, leader boards, and immediate feedback. This tool makes the learners feel more enjoyable and remember what they learn. This research is to evaluate the effectiveness of Quizizz on EFL learner's vocabulary learning. This study aims to explore the effectiveness of Quizizz as a gamification tool for making vocabulary learning more engaging in EFL classrooms. By exploring the effectiveness of Quizizz in transforming traditional vocabulary instruction methods and its ability to create more enjoyable and successful learning practices.

The methodology included in this study is a pretest-posttest design to collect data on the impact of Quizizz on vocabulary learning. The participants' initial vocabulary proficiency will be assessed by conducting a pretest to both control and experimental group. Following the pretest, the experimental group participants will engage in vocabulary learning activities using Quizizz for the planned session and the control will be taught vocabulary by the traditional methods. Posttest will be conducted after the completion of the learning activities to both control and experimental group to measure the outcome of the results. By comparing the pretest and posttest results, the study aims to evaluate the effectiveness of Quizizz as a game-based learning tool for enhancing vocabulary learning in EFL classrooms. The study's intended result is to demonstrate the effectiveness of Quizizz as a gamification tool for improving vocabulary instruction in EFL classrooms. It is expected that the participants who use Quizizz will show

**Hasheena Bagem and Geetha Yadav**

an increase in vocabulary proficiency compared to their pretest high level of confidence. Also, it is expected that the participants will demonstrate a high level of interest, enthusiasm, engagement and enjoyment in learning vocabulary.

LITERATURE REVIEW

In recent times, the integration of technology in educational environments has become a popular approach to improve vocabulary learning, especially in English as a Foreign Language (EFL) classrooms. Gamification involves implementing elements of game design in contexts outside of gaming to motivate learners through interactive and enjoyable experiences (Li et al.). According to Suzanne Holloway, to enhance participation, engagement, loyalty and competition, gamification employs game design principles and mechanics with non-game environments. Many studies have shown that using gamification in language learning has positive effects on language learning outcomes and can transform traditional teaching methods. In terms of vocabulary learning, researchers have explored the effectiveness of various gamified platforms, and Quizizz is a popular tool because it is easy to use, the educators can customize their lessons and it offers interactive engaging quizzes. Using an integrated approach in EFL classrooms has many benefits including achieving higher test scores, enhancing critical thinking, and positive atmosphere toward learning (Yimwilai).

Many studies have examined the integration of Quizizz as a gamification tool in the field of education. According to Handoko et al. Quizizz has a positive impact on learners' engagement and learning. Authors' findings indicated that learners preferred Quizizz over traditional teaching methods and it positively influenced their performance when Quizizz was used as an assessment tool. Researchers Permana et al. in a study aimed to examine learners' perceptions of Quizizz as a formative tool in classrooms. The findings showed that Quizizz was user-friendly, allowed for customization and positively impacted learners' learning experience. Many researchers have conducted studies to explore the impact of Quizizz gamification features on learners' learning experience and motivation level. According to Pitoyo et al. the gamification features of Quizizz including leaderboards, music, time limit, and test reports had a positive impact on learners' engagement, motivation and learning experience.

These findings strongly support that Quizizz serves as a valuable gamification tool in educational settings. It has a positive impact on learners' engagement, motivation and learning. The integration of Quizizz's gamification features has created a dynamic and interactive learning environment that captivate learners' attention and interests. It can be an effective tool for gamifying education and impactful learning experiences for learners.

Benefits of Quizizz**Enhances Learners' Involvement**

Quizizz can enhance learners' engagement by utilizing game-based learning, where learners can actively participate in real-time quizzes and compete with each other. The interactive approach to learning is fun and engaging and motivates learners to participate actively in their learning. Leaderboards are one of the ways to promote learners' involvement and provide a visual representation of learners' performance and encourage healthy competition among learners.

Immediate Feedback

Immediate feedback is another benefit of using Quizizz. Quizizz offers the advantage of immediate feedback enabling learners to know their results after answering each question. Feedback helps learners to determine the area of improvement. This kind of feedback is important for formative assessment as it allows educators to adapt their teaching strategies based on learners' performance feedback. Positive feedback builds the learners sense of being valued. It also aids in boosting positive habits and inspires the learners for better performance. Additionally, it provides educators with detailed reports of learners' performance.

**Hasheenaa Bagem and Geetha Yadav****Personalized Assignments**

Educators can use Quizizz to tailor lessons and assignments according to their learners' needs and their classroom. This platform allows educators to create customized assignments that include a variety of questions such as multiple choice, fill in the blanks, true or false, and more. Moreover, it also helps novices in developing the ability to become self-directed learners. By providing these advantages, Quizizz supports educators in developing and designing teaching materials that are relevant to their classrooms which promotes active student participation.

Collaborative Learning

Quizizz supports both individual and team-based learning and develops a collaborative learning environment. It helps the learners understand an extensive range and depth of the subject knowledge. Learners can work in teams to discuss answers, to solve questions and to learn from one other. It promotes peer interaction, communication, memory retention and enhances the overall learning experience.

Data-driven Insights

Quizizz provides educators with data on learners' performance, including individual or group reports. The data is obtained rapidly providing accurate results to plan and evaluate learners' performance. This data can also be used to find solutions to the shortcomings of the learners. This enables educators to identify the strengths and weaknesses of individual learners, allowing them to adopt their instructions and provide support accordingly.

Flexibility and accessibility

This game-based learning app Quizizz can be accessed on various electronic devices like laptops, tablets, and smartphones. It offers the flexibility of various class formats including remote, hybrid and offline learning environment. This allows learners to practice language skills both inside and outside the classroom.

Research goals, questions and approach

The study aims to explore the impact of Quizizz on various aspects of teaching and learning, including learning performance, classroom atmosphere, and the views of both learners and educators. The study aims at:

- i) To examine the effectiveness of Quizizz in teaching vocabulary
- ii) To examine the effectiveness of Quizizz on the achievement of learners' learning

RESEARCH DESIGN

The sample for this study consisted of learners who are enrolled in language learning educational programs. The study's intended participants were 40 learners from University of Technology and Applied Sciences, Al Musanna, Oman. A total of 40 participants were selected by random sampling and divided into two groups, a control group and an experimental group. Both groups participated in a pretest and a posttest to assess their vocabulary learning progress through a set of 10 questions that included multiple-choice and cloze test formats. The pretest was conducted in the same week for both the groups and focused on the vocabulary items from their Reading and Listening books. The participants from the experimental group had not previously used Quizizz. However, to familiarize themselves with gamification technology, the participants in this group took part in the Kahoot! Sessions. Between the pretest and posttest assessments, vocabulary lessons were taught to control group and experimental group using traditional teaching methods and Quizizz platform respectively. The experimental group was engaged in ten consecutive sessions, where vocabulary was taught using Quizizz. A posttest was administered after the final intervention to measure the effectiveness of Quizizz on vocabulary learning.

As part of the study, the researcher used Quizizz, a gamification tool, to teach the experimental group some concepts. The participants from the experimental group were given multiple-choice tests and fill in the blank tests. The tests required learners to make guesses, choose the correct answers for the multiple choice, and fill in the blanks with correct answers. Learners from the experimental group engaged in several activities using Quizizz platform which

**Hasheena Bagem and Geetha Yadav**

consists of 36 multiple-choice and 32 fill in the blanks exercises focused on vocabulary from their reading and listening materials. After all the learners had responded and made their selections, the quiz results were displayed revealing the highest scorer and the winner of the game. The control group received traditional teaching methods for vocabulary instruction. They were given explanations of vocabulary and PowerPoint presentations were used to help them to understand better. The same set of vocabulary items which were taught to the experimental group was also taught to the control group in each session. Both groups took the immediate posttest after learning all the vocabulary from their Reading and listening material to assess their comprehension of the vocabulary. The main purpose of the posttest was to assess the effectiveness of Quizizz on the improvement of learners' understanding of the vocabulary.

Analysis

This analysis examined the pretest and posttest scores of a control group that did not undergo any experimental intervention. The focus was to assess changes in scores between the two tests. The pretest scores ranged from 2 to 5 with an average score of 3.6 and in the posttest, the scores ranged from 4 to 6 with an average score of 4.6. This shows an overall increase in the average posttest score compared to the pretest score. It is important to note that the improvement may not be attributed to any specific intervention or treatment. It can be other factors, such as the participant's familiarity with the vocabulary or practice effects. It is also important to consider the variations in individual scores during this analysis. Some participants maintained the same score while others showed improvement in their scores. The changes in scores are likely due to random fluctuations or individual differences without an experimental intervention. To summarize, the pretest and posttest results of the control group show minimal variation in scores. The experimental group received a pretest, posttest, and experiment conducted using the gamified tool Quizizz. The pretest scores for this group ranged from 2 to 5 with an average of 3.5 and in the posttest, the scores ranged from 5 to 9 with an average score of 6.8. The data suggests that the intervention involving the Quizizz tool had a positive impact on the participants in the experiment group. There was an improvement in their posttest scores compared to their pretest scores. This shows that the intervention helped in enhancing their performance in the assessment.

Integrating gamification through Quizizz played an important role in boosting participants engagement, motivation and active involvement. This approach created a more enjoyable and effective learning environment leading to improved test scores. However, it is important to consider individual variations within the experimental group. Although the average scores showed an increase, it is important to note that the improvement varied among individual participants. Participants prior knowledge, learning styles and individual effort might have influenced these variations. To summarize, the experimental groups' pretest and posttest results demonstrate a significant improvement in their performance after the implementation of Quizizz. This suggests that incorporating gamification in the learning process can be an effective strategy for enhancing learner engagement and learning.

**Hasheenaa Bagem and Geetha Yadav**

The analysis of both the control group and experimental group shows the notable difference in the outcomes. The control group which did not receive any intervention demonstrated a degree of slight variability in the scores. On the other hand, the experimental group which underwent the intervention using Quizizz, showed a significant improvement in scores. The above chart shows that the experimental group's engagement with the Quizizz contributed to enhanced learning outcomes compared to the control group.

CONCLUSION

According to the findings of the current study, the group of learners who used Quizizz to learn vocabulary performed better than the control group that didn't use it. Both groups got similar scores in the pretest, but after the intervention the experimental group showed higher scores. This study suggests using Quizizz as a learning tool improved the learners' vocabulary learning. The findings of this study examined the impact of using Quizizz's, a game-based learning tool on vocabulary learning. The results showed that integrating Quizizz as a method of instruction is successful and useful for vocabulary learning. The overall findings of this study emphasize the importance of integrating Quizizz as a supplementary to traditional resources while learning vocabulary. Research has consistently shown that game-based teaching and learning should be given priority in any language program due to its positive and significant impact on vocabulary learning. Therefore, using games in the learning process can help to reduce anxiety, feel more comfortable and become motivated to learn more. The use of gamification techniques and interactive tools appears to have a positive impact on learners' performance and highlights the advantages of integrating these approaches in the educational environment.

However, further research should be conducted to explore the impact of game-based training on various English Language skills. In this study, data collection relied only on pretest and posttests. Therefore, it is recommended that future research may include qualitative tools such as interviews to gather more reliable and comprehensive data.

ABSTRACT

This research seeks to emphasize the significance of using contemporary technologies to enhance English communication skills via media. The article explores many methodologies and strategies that could enhance the listening abilities of those learning English via contemporary media. Several ways include using internet platforms for English language listening and engaging in video conversations via mobile devices or computers. Participating in listening to audio content via movies, television, radio, and CD-ROM. This research also investigates the importance of auditory comprehension in acquiring the English language. The conclusion offers concrete suggestions and emphasizes the advantages of using Modern Media in the English as a Foreign Language (EFL) classroom. Listening is the intentional and concentrated act of hearing sounds with complete attention. Based on a poll, individuals allocate about 40 to 50 percent of their time to listening, between 25 and 30 percent to speaking, 10 to 15 percent to reading, and 9 percent to writing. Hence, the study report focuses on augmenting communication by tackling listening abilities and offering remedies for enhancement. This study seeks to clarify the importance of communication via media. The 21st century has seen a greater mobility and tangibility of civilization. Mobile devices are being utilized more and more for activities including education, entertainment, personal communication, and distant employment. Students enjoy using their mobile devices to access a variety of online listening resources

Sangeeth Kumar *et al.*,

and participate in English-language conversations. They find comfort in apps such as Facebook, WhatsApp, and Emo. The article discusses the various tools for listening skills,

Keywords: Media-mediated listening, Media's role in communication, Modern Media, Communication's Expansion, Listening tools, Communication.

INTRODUCTION

English is a global language or a lingua franca. It facilitates the exchange of communications between individuals and nations. The English language has achieved global reach and development to a degree that cannot be disregarded. English use in India has seen a significant surge. ELT in India has failed to revolutionize the conventional teaching approach prevalent in the majority of educational institutions. Students learn English only to achieve a passing grade on exams, while professors instruct with the sole objective of fulfilling this prescribed goal. Modern Media may be defined as the mass communication methods that are distinctive of the present era, namely those that are associated with newly created or sophisticated technologies. Postmodern media, a successor to modern media, encompasses mass media platforms that provide individuals with the ability to fulfill their requirements at any time, in any location, and on any digital device. "Postmodern originated in the contexts of aesthetics and art criticism, though it has since been disseminated widely in criticism of other cultural forms, particularly contemporary media." (Bignell30).

Another significant description of Modern Media may be described as the diverse use of pictures, words, sounds, and textual data. The nested properties of contemporary media components distinguish them from conventional media components, such as hardcopy documents and newspapers. The majority of media categorized as "new media" are digital, often possessing characteristics such as manipulability, networkability, high density, compressibility, and interactivity. Contemporary media only includes conventional formats like TV shows, movies, magazines, books, or printed publications if they use digital interactive technologies. Modern media refers to the process of demoralization in the development, publication, dissemination, and consumption of media information.

Empirical Literature

Seo et al. (2021) conducted a study on the impact of artificial intelligence (AI) on learner-instructor interaction in online learning. They found that adopting AI systems in online learning can enable personalized learner-instructor interaction at scale. However, there is a risk of violating social boundaries. While AI systems improve communication quality and provide just-in-time, personalized support, concerns about responsibility, agency, and surveillance remain.

Kosmas (2023) proved that it is possible to Improve students' learning performance through Technology-Enhanced Learning (TEL). The researchers found significant results which were observed in students' cognitive performance, motor skills, academic performance in language, and emotional state. These improvements led to increased motivation to participate in the learning process. Mahanty and Mishra (2023) stated that Web-based simulation instruction, blended learning, online applications, smart phones, Computer Assisted Language Learning (CALL), WhatsApp groups, movie clips, audio-visual cassettes, and different websites have facilitated the listening and speaking skills of English language learners. Chichekian and Benteux (2022) argued that Intelligent Tutoring Systems (ITSs) impact metacognitive strategies by prompting students to apply self-regulation skills and monitor their progress when learning. These systems enhance learning processes and self-awareness. Mohamed (2023) identified that AI-powered language models, such as ChatGPT, have been applied in language learning scenarios. They contribute to language tutoring, generation, and translation, thereby enhancing students' language skills.

Sangeetha (2023) conducted research on the effectiveness of using speech recognition technology in language learning. The study found that integrating speech recognition tools into language courses improved students'

Sangeeth Kumar *et al.*,

pronunciation accuracy and overall listening comprehension. Al-Seghayer (2022) explored the impact of computer-assisted language learning (CALL) on listening skills. The findings revealed that CALL programs, especially those incorporating multimedia elements and interactive exercises, significantly enhanced students' listening abilities. Chen (2023) investigated the use of automatic speech recognition (ASR) systems in language classrooms. The study demonstrated that ASR technology helped learners focus on specific phonetic features, leading to better pronunciation and comprehension. Hasan et al (2020) studied the effectiveness of mobile language learning apps in improving listening skills. The research highlighted that personalized content, real-world contexts, and interactive features in mobile apps positively impacted students' listening proficiency. Nguyen (2023) examined the role of virtual reality (VR) in language education. VR simulations and immersive environments enhanced students' listening comprehension by providing authentic contexts and multisensory experiences.

The role of media in facilitating communicative learning

The media in English Language development provides a connection between human resources and non-human resources. These are the many tools used by instructors and students throughout the process of teaching and learning. Institutional resources contribute to the pedagogical effectiveness of English Language instructors. They facilitate effective communication between instructors and learners by enhancing the teachers' ability to convey topics more effectively. They provide learners with opportunities for practical application. They incite cognitive processes and foster discourse among pupils. They motivate kids to attain greater levels of accomplishment.

Today, listening is receiving widespread attention. Schools and colleges across the nation have established training courses in the area, and many others are about to do so. Industries have instituted their management training programs in listening; governmental groups and agencies, at both the federal and lower levels, have asked for such training; religious groups have turned their attention to listening; and an International Listening Association has become active. (Holtand Winston07).

This application amuses and facilitates learning via the use of mainstream culture. Experience authentic British and American accents via audio recordings and challenge oneself with engaging tasks such as interpreting meanings, completing missing sections, and picking the appropriate words or sounds. The program developed by Miracle Fun Box is well-suited for enhancing proficiency in both listening and speaking abilities. If we look at the world tourism sector, 74 percent of travelers move from one non-English-speaking country to another non-English-speaking community. This, as Graddol (2007) suggests, necessitated 'a large demand for either foreign language learning or the increasing use of English as a lingua franca.' Countries like Malaysia made basic proficiency in English a requirement for all foreign employees. Similarly, countries such as Mongolia, Chile, South Korea, and Taiwan are planning bilingualism with English being one of the languages. This has necessitated a fresh look at whether the language facilitates the users to use it as a common code globally. "Language," as Lado (1965) puts it, 'in its most common pervasive, representative and central manifestation involves oral-aural communication.' Today, English is widely used as a language of communication. (Jayashree 11).

Speaking about vocabulary, the application primarily emphasizes often-used terms for English examinations such as IELTS and TOEFL. Engaging in many English listening examinations will enhance an individual's auditory comprehension and facilitate the acquisition of essential vocabulary. Additionally, there are opportunities for amusement via interactive activities like sentence construction games, vocabulary exercises, and word chains. Users have the option to access the classes without an internet connection and may save their preferred lessons for easy reference. As multimedia technology (such as interactive videodiscs, CD-ROMs, CD-Is, etc.) becomes more readily available to instructors and learners of different languages, its capacity to improve listening skills becomes a viable choice. Multimedia enables the seamless integration of many elements such as text, pictures, audio, and motion video in a wide array of combinations. In the 21st century, civilization has become more mobile and tangible. Increasingly, mobile devices are being used for tasks such as remote work, personal communication, entertainment, and education. Students get pleasure from using mobile devices, finding solace in applications like Facebook, WhatsApp, and Emo for engaging in English conversations and accessing a wide range of online listening materials. Students get

**Sangeeth Kumar et al.,**

comprehensive recognition for using mobile devices not just to enhance their listening skills but also to improve their spoken communication. There are four abilities (hearing, speaking, reading, and writing): persons who know a language are called speakers as if speaking comprised all other types of learning. She believes speaking is the most important of these four. "The primary goal of most, if not all, language learners have to improve their ability to communicate verbally" (Butarbutar4). Moreover, it offers the FL student a substantial amount of exposure to genuine language.

The basic skill in communication is active listening.

We engage in active listening more often than we engage in speaking. By using this listening skill effectively, we may acquire proficiency in the instruments of communication. Listening may be challenging due to the inherent tendency of the human mind to readily get distracted. An individual who exercises mental discipline and practices active listening gains a multitude of additional talents and experiences several advantages.

"An overall view of the concept of mental discipline can help us to discover its development characteristics and find a suitable research entry point" (PingChunCao2) Listening is the cognitive act of discerning and comprehending the spoken words and phrases of a language's speaker. Frequent use of linguistic skills is seen. Proficient listening skills enable learners to actively engage in familial, professional, and societal interactions. Insufficient listening skills hinder one's ability to differentiate between different portions of speech, preventing them from offering an appropriate response to convey apologies, invitations, empathy, refusals, understanding, and engagement under the given scenario. Internet forums and websites provide many opportunities to improve their English listening skills. "Concentration and urgency for remembering are demanded by the structure of the lessons. The lessons stress memory—lengthening memory span and strengthening" (Morley10)

The Significance of Active Listening

In our contemporary society driven by advanced technology, effective communication has become more vital. However, individuals are devoting progressively less time to actively engage in attentive listening with one another. The act of really listening is becoming scarce, despite its vital role in fostering relationships, resolving issues, promoting comprehension, resolving conflicts, and enhancing precision. Active and attentive listening in the workplace leads to a reduction in errors and more efficient use of time. "Initial interactions constitute a significant context for the study of listening skills. Every relationship begins with a first encounter. Further, a great deal of our instrumental goals are accomplished in first-time conversations with salespeople, customers, doctors, therapists, potential employers, yoga instructors, and the like. In first encounters, people attempt to solve a variety of information seeking, relationship, and impression management problems" (Weger15)

Strategies to improve listening skills

Select a single episode from a podcast that individuals find captivating or enjoyable. Allocate a week to regularly engage with that particular episode daily, while simultaneously engaging in activities such as driving, commuting by bus, or doing household chores. During the first two days, make note of any words or phrases that provide difficulty in comprehension and proceed to search for their meanings. Ensure to halt the audio playback, and thereafter resume it to perceive the challenging vocabulary. With a few days' practice, individuals should be able to audibly perceive and understand these words. Additionally, it might be advantageous to memorize certain chunks of podcasts and engage in the repetitive practice of reciting them. Identify the disparities between oneself and the speaker. By the last day, individual levels of comprehension will have significantly increased compared to the first day.

Simultaneously engage in reading and listening.

Employing two sources of information concurrently is an additional approach to enhancing one's listening skills. Consequently, it is essential to acquire knowledge about the English language from an alternative resource while engaging in listening activities. The most straightforward method to do this is by watching a video with English subtitles in the English language. One will be perusing and audibly perceiving the words in this fashion, which will facilitate his/her comprehension and enhance memory recall.

Sangeeth Kumar *et al.*,

Explore various dialects by watching films and listening to podcasts.

Effectively improve an individual's ability to understand a certain English accent, it is essential to consistently practise and refine an individual's listening abilities with audio materials that include that particular dialect. To improve individual comprehension of American English, consider immersing oneself in American television programs, podcasts, or news broadcasts for a duration of one month. By the conclusion of these 30 days, the ears of the listeners will have been used to the accent to facilitate comprehension.

Repetition and rephrasing of sentences, accompanied by audio recordings.

Experience uninterrupted audio playback from the selected source. Direct individual's attention to comprehending the overall framework and primary concepts. Upon the first act of listening, make a record of significant aspects, unusual vocabulary, and noteworthy sentences that caught individuals' attention. Now, please replay the audio source. On this occasion, focus on the specific aspects of those components that were not obvious during the first hearing. Upon the second round of listening, succinctly recapitulate the main concepts conveyed in the audio using phrasing.

Artificial Intelligence (AI) has several applications in the field of communication.

Enhancing one's listening ability is crucial for improving pronunciation and communication proficiency. To enhance listening proficiency, one might engage in watching television shows, films, and videos. Another method to enhance listening proficiency is by using conversational artificial intelligence such as ZenoChat, which has a text-to-voice functionality. Text Cortex is an artificial intelligence assistant that provides many features to enhance an individual's language proficiency. TextCortex is accessible as both a web application and a browser extension. It seamlessly integrates with over 4000 websites and applications, allowing individuals to use TextCortex at any location and at any time to enhance his/her language proficiency. "Duolingo provides translation to help beginners learn a language and to help students become independent language learners" (Hazar 449). Furthermore, if one is seeking additional avenues to enhance individuals' language proficiency, Duolingo provides the option of engaging in voice conversations with actual individuals for a certain duration.

CONCLUSION

Modern media, as a technological advancement, considerably enhances the development of listening skills. It has a significant impact on enhancing one's listening ability. The researchers propose that English educators use the aforementioned instruments of modern media to inspire their pupils and engagingly instruct them. Various studies highlight the benefits of utilizing Modern Media for learning English and enhancing listening skills. These advantages include (a) the use of text and visuals to aid in language comprehension when presented alongside auditory content, (b) the enhancement of language processing through the combination of different media, making the input more immediate and noticeable for language acquisition, and (c) the motivational aspect of videos as a valuable tool for language instruction. An examination of the utilization of technologically advanced media aids in the instruction and acquisition of English, particularly in second language contexts, reveals that these aids offer significant advantages in the learning process. They promote a learner-centred approach that considers the specific needs of individual students, in contrast to the traditional instructional methods that revolve around the teacher as the sole authority of knowledge. Providing instruction to educators on the use of multimedia tools for teaching English as a second language. It is expected that as instructors become proficient in using these tools for teaching, the pupils will be more knowledgeable in that area.

ABSTRACT

This paper advocates incorporation of MELTS (Motivational English Language Teaching Sources) in the English language curriculum for effective language acquisition and learning. This is primarily suitable for the Indian context. To substantiate the argument, a survey was carried out among the engineering aspirants of two colleges in South Tamil Nadu, India. The objective were (1) to analyze whether the social media platforms are used by students for learning English after the college hours and (2) to register their opinions on introducing modern contents like songs and stories in the English language curriculum. The result of the survey favours MELTS to be included in the English curriculum. Hence, exploitation of any suitable content into a productive ELT means is the key area of discussion. Further, the teaching fraternities of English are appealed to always go the extra miles in creating fun English learning materials (Chetan Bhagat, 2012.p114.) and thereby making an essential base for language acquisition and learning. Revamping English Language curriculum from time-to-time has been a constant initiative in the English academia and ELT research studies. In the line of creating and discovering many ELT contents, exploitation of social media contents has become a new add-on research in today's language learning scenario.

Keywords: Revamping English Curriculum, Motivational English Language Teaching Sources, innovative elt practices, exploitation of social media platforms for elt. and appeal to the English teachers.

Suresh et al.,

INTRODUCTION

Student motivation is an important focus of research in education for preferred “academic excellence”, (Zulfiqar Ali, 2010) and thereby it is obvious that the inclusion of motivational sources is essential in the English curriculum. Though the syllabi prescribed by university and autonomous institutions are excellent with teaching modules that are good enough to cater the language needs of the learners, notable aversions are found among the L2 learners in general. The syllabi may be competent to cater the language learning but not inspiring enough to keep the learners to be highly motivated towards language acquisition. The present learning generation belongs to ‘netizens community’ who wish to have more and more active English classes beyond books and classrooms. Motivational agents should be a primary part of every elt classes. Due to the competitive academic scenario, students get overwhelming academic commitments which over the period raise as uninteresting chores. Though students go ahead with those unavoidable responsibilities, a psychological burden due to these stereotypical academic routine makes them mentally so down. Both learning and teaching become pressure than pleasure. To address such challenges, inclusion of motivational sources/contents are ideal and they can positively build an active language learning ambience.

Background Study

The literature review is carried out to zero in on the research articles and studies that are in favour of motivational means and methods essential for English language acquisition and learning. M. Ryan and Edward L. Deci (2000) have coined the terms called intrinsic motivation and extrinsic motivation. Zulfiqar Ali, (2010), and Shabaz Khan, et al.(2013) defend student motivation is an important focus of research in education for preferred academic excellence. This places a clear call to the teaching fraternity to create or design an out and out student oriented curriculum. Saeed & David Zyngier (2012) highlight that intrinsic motivation produces authentic learning. Yes! Intrinsic motivation is vital for kindling the learning interest among L2 learners. Chetan Bhagat (2012.p114) in his book “What Young India Wants” underlines the need of “creating fun English learning materials” in the Indian English classroom context. Khan Shahbaz, et.al, (2013) emphasize on uninteresting contents or obsolete factors that can obviously demotivate students learning condition and this is the key area of discussion in the paper. Wong, R. (2013) underlines the need of enhancing student motivation which can stimulate the mind to language acquisition in a productive manner and it is quite obvious that the motivated learners are sure to produce the expected outcome. Alrabai, F. (2014) calls for teachers’ in-class motivational intervention. Teachers need to keenly watch the attention habit of every student and put him/her on the right track of learning when they tend to deviate from the learning track. Elana Enache, (2015) advocates maintaining the learners’ interest as one of a primary goals and this is the crucial area to be monitored by every teacher. Bhuvaneshwari R & Poomathi P, (2015) highlights the effective use of mobile to motivate students. Needless to underline the role of mobile phones in students’ life today. They are indeed the six fingers that should be productively exploited for effective learning. Kim Bower, (2017) introduced the term called Content and Language Integrated Learning (CLIL) which focuses on formulation of blended elt sources. Khansir Akbar Ali, et al. (2018) argues that motivation as a learning strategy. Afroza Mili, (2020) puts the emphasize on songs and stories in ESL classrooms as motivational agents that hold relevant and crucial value in learning a second language”

Survey

Social media platforms utilization by college students

The following is a short survey conducted with 535 First Year B.E./B.Tech (academic year 2023- 2024) students of Kongunadu College of Engineering and Technology, Trichy, Tamil Nadu, India. 401 students belong to English medium and 135 are from Tamil medium. They belong to the following disciplines: IT, CSE, ECE, AI & DS, EEE, AGRI, BME and MECH. The objective of the survey is to find out how they use their social media platforms like WhatsApp, YouTube, Facebook, and Twitter.

Title: The influence of social media on enhancing English language skills (LSRW) among the First Year (2023-2024) students of Kongunadu College of Engineering and Technology, Trichy.

Suresh *et al.*,

The questionnaire

1. Videos, talk shows, and various other interesting texts/content that you view in socialmedia platforms mostly capture your attention. Have you ever realized that these contents could be helpful in honing your English communication skills?
2. Besides viewing the social media platforms for entertainment, how often do you use them for language learning purposes?
3. Which one of the following social media platforms do you find the most effective for improving your English skills?
4. Do you follow English language learning pages or accounts on social media?
5. How confident are you in your English language skills after using social media for learning?
6. Have you ever participated in online English language challenges or contests on socialmedia?
7. Have you noticed an improvement in your vocabulary through social media engagement?
8. Do you interact with native English speakers on social media to enhance your languageskills?
9. How often do you share English language content on your social media profiles?
10. Has social media helped you improve your English writing skills?
11. Do you feel that using social media for English language learning is a productive use of your time?
12. Do you think that social media content encourages you to speak in English more often?
13. Have you ever taken online English language courses or lessons recommended on socialmedia?
14. What type of English content do you find most engaging on social media?
15. Do you use language learning apps or tools promoted on social media?
16. Has social media helped you build your confidence in speaking English in public?
17. How often do you watch live English-speaking events or webinars on social media?
18. Have you ever received constructive feedback on your English language skills through social media interactions?
19. Do you believe that social media can replace traditional language learning methods for engineering aspirants?
20. How do you manage your time between social media and other language learning activities?
21. Have you used social media to connect with other engineering aspirants for English language discussions?
22. Are you eager to use any attractive content from media like silver screen stories, etc. for developing your English communication skills ?
23. Which is your favorite topic to deliver a one-minute talk on?
Topic 1: Leo - review; Topic 2: Technology Today - Your view
24. My choice for learning English is - a BOOK or MOBILE for learning English or a faculty?

The following diagrams are a few responses by the students showing their utilization of social media platforms both for entertainment and learning aspects.

SUMMARY

Students actively utilize social media platforms at their leisure mostly for entertainment aspects. But they also pay attention to contents pertaining to English learning activities. Que. 1 makes it clear with 67% responses that the youngsters are well aware the contribution of social media contents in developing their English skills. In Que.2, it is learned that students use social media for language learning purposes daily and weekly in a positive manner. In Que.3, 61.5% votes YouTube as the favourite platform for English learning endeavour. At the same time only 23 % regularly follow English learning pages. Que.4 writing skill also could be considerable developed through social media. Students seem to have gained confidence after using social media shows Que.5. Surprisingly, there is a notable development in vocabulary skill due to the usage of social media registered in Que.7 with 74%. Using social media platform for English learning has been very productive only and if the students are guided properly

Suresh et al.,

it is quite easy to make them learn the language. Que.12 presents a positive response on the role of social media in developing Speaking

ABSTRACT

As globalisation opens doors for many to seek opportunities abroad, the dream of a better life can come with a hidden burden. Navigating a new culture, language, and customs can create a clash of identities, leaving immigrants feeling like outsiders. Jhumpa Lahiri, herself the child of immigrants, explores this complexity in *The Namesake*. Characters like Ashoke and Ashima grapple with nostalgia for their homeland even as they build a new life, highlighting the sense of disconnection that haunts them. The novel further delves into the identity crisis faced by both generations the first struggles with language barriers, cultural norms, and fitting in, while the second deals with reconciling their personalities with a culture that feels both familiar and foreign. This paper will explore the multifaceted experience of migration, particularly the theme of diaspora in *The Namesake*, analysis the challenges immigrants face.

Keywords: Diaspora, Colonialism, Migration, identity, dilemma, immigrant, diaspora, and alienation

INTRODUCTION

Over the past few centuries, there has been a notable flow in literature both within racial and ethnic communities within academic circles, all centered around the profound concept of diaspora. The term "Diaspora" finds its roots in the Greek word "diasperio," which denotes the act of distribution. It is a compound term, with "sperio" representing the act of sowing or scattering like seeds, and "dia-" signifying movement from one end to another. The genesis of diaspora can be traced back to the earliest chapters of human history, particularly in the biblical narrative of Adam and Eve's expulsion from the Garden of Eden, marking the commencement of this enduring journey of diasporic

**Aujo Philip et al.,**

experiences. Millions of people moved around the world in the 1900s. Some were forced to leave because of bad weather or wars. Others, like people in Russia or India and Pakistan when they became separate countries, moved looking for a better life. When people move somewhere new, they are called a diaspora. This can happen because they are forced to leave or because they want to. These groups bring their old traditions with them and mix them with the new ones, creating a whole new culture.

Colonialism adds another layer to the idea of diaspora. Europeans moved all over the world, sometimes for a short time, to stay forever. This led to colonies being built. As these colonies got bigger, they needed more workers than the people already living there. Thus, diaspora became intertwined with the enslavement of Africans, their forced migration, and subsequent resettlement in regions like the British colonies. “Diasporic Consciousness” is a term of profound complexity, encompassing a range of sentiments and experiences. It includes the notion of living in exile, a deep sense of loss, the realization of being an outsider, an enduring longing for one’s homeland, a constant sense of dilemma, the weight of exile’s burden, dispossession, and the necessity of relocation. The initial step taken to leave one’s homeland is an act of courage, laden with risks, as it is a prerequisite for any hope of a better future. Immigrant’s lives are rarely linear, they traverse centuries of history within a single lifetime, experiencing numerous relocations and transformations. They face a persistent sense of uprootedness and a feeling of not truly belonging in their host countries. Despite their sincere efforts to assimilate, they often find themselves on the periphery, perpetually viewed as outsiders. Diasporic communities emerge from a fusion of narratives recounting journeys from the old country to the new, with first-generation immigrants tending to hold onto memories of their homeland more fervently than their children, who are born in the host country.

In his collection of essays and criticism from 1981-1991, Salman Rushdie eloquently describes immigrants as individuals who straddle two cultures and often find themselves caught between two worlds. “They endure a triple disruption, encompassing the loss of their roots, linguistic displacement, and social dislocation” (Rushdie 5). This predicament can be likened to that of Trishanku, an epic character from the Ramayana, who was neither accepted in heaven nor on earth, ultimately settling in a liminal space between two realms. Trishanku’s plight serves as a poignant metaphor for modern-day emigrants who navigate the complex and contested terrain of their universal native identity.

Even when they move far away, immigrant groups hold onto their roots. They keep speaking their home languages, practicing their religions, and celebrating their traditions. They tell stories and remember their history to keep their unique cultures alive, even in their new homes. However, this pursuit can lead to a profound sense of being “individuals without an anchor, without a horizon, colorless, stateless, and rootless - a race of angels” (Hall 226).

The diaspora phenomenon has significantly enriched the world of literature. Many Indian writers residing abroad or in foreign lands have channeled their experiences into creative writing. This marks a notable shift from earlier times when Indian writers seeking insights into creative writing often relied on interactions with foreign visitors to India. Indian diaspora writers have explored themes such as the loss of identity, feelings of isolation, the sense of constant change, adaptability, and movement. The theme of diaspora holds a prominent place in Indian literature, contributing to a broader understanding of cultural dynamics between different countries. It provides valuable insights into diverse customs and traditions, enriching our knowledge of global multiculturalism.

Literature, as a reflection of culture, serves as a powerful source for understanding the world’s current affairs and multiculturalism. It offers a unique blend of facts and captivating narratives that engage readers and raise awareness about contemporary society. Moreover, the study of diaspora themes in literature raises essential questions about the distinction between one’s homeland and foreign land. Thus, literature, as a cultural creation, becomes an invaluable tool for comprehending global realities and the complexities of multicultural societies. Jhumpa Lahiri, an Indian-American author born in London, made a huge splash with her first book. *Interpreter of Maladies*, a collection of short stories, won the Pulitzer Prize in 2000, a first for a South Asian writer. Translated into 29 languages and a bestseller everywhere, the book launched her award-winning career. Jhumpa Lahiri’s literary work appears to convey a fundamental message, the differences among human cultures are primarily shaped by human desires and

**Aujo Philip et al.,**

experiences. Her writing style, characterized by its simplicity and clarity, predominantly explores the lives of Indian immigrants in America, individuals caught in the complex web of cultural influences, and their quest to find a place in their new homeland. Lahiri's unique ability to juxtapose historical cultural conflicts with contemporary cultural dynamics and to give voice to a diverse array of characters has garnered widespread attention and acclaim.

Jhumpa Lahiri, renowned for her Pulitzer Prize-winning short stories, expanded her literary repertoire with her debut novel, *The Namesake*, which was published in 2003. Originally conceived as a novella published in *The New Yorker*, it transformed into a full-length novel. The narrative centers around the fictional Ganguli family, spanning over three decades. Ashoke and Ashima, the parents, both hailing from Calcutta, make the life-altering decision to migrate to America following their marriage. Their two children, Gogol and Sonia, were born and raised in the United States. The novel delves into the complexities of navigating two divergent cultures, marked by distinct social, religious, and philosophical differences. It serves as a profound exploration of cultural identity, integration, and assimilation, using Gogol's struggle with his name as a poignant entry point.

Gogol, named after a Russian writer his dad loved, hated his name. He didn't like being named after someone who wrote a story his dad thought saved him from a train crash. Even when he turned 14, he didn't care about the book of stories his dad gave him by the same author. As Gogol grew up, he went to college, fell in love with Maxine, and moved to New York to be an architect. But things weren't always easy, especially after his dad died. Later, he enters into a relationship with Moushmi, introduced to him by his mother, and they marry, though their union faces its own set of challenges. Ultimately, Gogol's journey leads him to a profound reconciliation with his name and his cultural heritage. The role of fate, particularly the loss of his father, plays a pivotal role in reshaping his perspective. This transformative journey culminates as he returns home for a Bengali Christmas and rediscovers his father's gift a collection of Gogol's short stories bringing the narrative full circle.

Jhumpa Lahiri's first novel follows the journey she started with her award-winning short stories, the experiences of Indian immigrants. These immigrants often face challenges due to cultural differences and feeling alone in a new country. Immigrant families, across generations, struggle with figuring out who they are in this new culture. Language barriers, different foods and clothes, and even personal identity all play a role in this confusion. For Gogol, this struggle is clear even in his name, which he doesn't feel connected to. The feelings of missing their old home, loneliness, and not feeling like they truly belong anywhere are strong and deep. Ashima feels out of place because of the move itself, stuck between two worlds. Gogol and his sister Moushmi have an even more complex issue - they're a mix of cultures, which makes them feel even more isolated. Ashoke and Ghosh gave up their old life to find a new one, but they'll always feel like they're not quite settled anywhere.

Jhumpa Lahiri, a writer of the Indian diaspora, delves deep into the issues of identity, nostalgia, alienation, and the clashes between divergent cultures. Drawing from her own experiences as an Indian immigrant, she skillfully portrays these challenges through her characters. Lahiri's recurring theme revolves around the bittersweet experiences of emigrants from India to America. Her narratives predominantly feature characters who immigrate to foreign lands, where they find themselves caught in the clash of cultures. Although they may be initially enthralled by their new surroundings, they are unable to escape the haunting loss of their original homeland. Gogol's vehement disdain for his name epitomizes this struggle: "But instead he takes a deep breath and tells the people in the courtroom what he has never admitted to his parents. I hate the name Gogol. I've always hated it" (Lahiri 102). By this point, Gogol detests everything associated with his name, considering it both absurd and obscure.

The novel *The Namesake* explores the struggles of immigrants living between two cultures. The parents, Ashima and Ashoke, miss their Indian life and customs, while their children, Gogol and Moushmi, feel like outsiders in both America and India. Even though they try to fit in, they still feel a sense of loneliness and never quite feel at home, no matter where they are. This is shown by Gogol not even liking his Indian name. *The Namesake* delves into the depths of cultural displacement. For example, Ashima's distress surfaces when Gogol informs her that he has rented a room for three months, and she struggles with the distance her children now maintain:

Aujo Philip et al.,

Having been deprived of the company of her own parents upon moving to America, her children's independence, their need to keep their distance from her, is something she will never understand. (Macwan 122)

When people move to new countries, they often write stories about their experiences. These stories can be sad because they miss their old home, but they can also be creative and teach us about different cultures. Novels like *The Namesake* show how Indian families living abroad connect back to India while also building new lives in other places, like America. This mixing of cultures helps us understand each other better and creates a more peaceful world.

Through *The Namesake*, Lahiri lays bare the trauma and hardships of migrating to a foreign land, offering a stark message to those who harbor dreams of a better life abroad. Lahiri keenly observes that many individuals, in their pursuit of a luxurious life overseas, often overlook the profound impact of displacement, which requires a remarkable adaptability to new climates and cultures. Conversely, the issue of one's identity cannot be neatly resolved by a mere name on record. Identity quandaries faced by individuals take shape through introspection and self-discovery. For those born in their homeland, the question of identity seldom arises, as they are nurtured within the familiar embrace of their society. They are sons and daughters of a place where their social status is defined. Their identity is seldom a matter of concern because they are known and recognized by the people in their society. However, for those born in foreign lands, the question of identity becomes an ever-present companion. They feel like complete strangers in their new environment, where differences in skin color, language, and culture form a complex blend that compels them to embark on a journey of self-discovery. For second-generation immigrants, the crisis of identity persists throughout their lives. Gogol's quest to find his identity embodies the essence of diasporic awareness. When people move to new countries, it can be a chance for them to learn and grow as individuals. It can also help them figure out who they are in this new world. These stories of people moving around are like a history book, showing how a culture changes and grows over time.

ABSTRACT

Teaching and learning are two sides of the same coin -Education. However, what aligns teaching – learning and creates a bridge between them is assessment. Every educator, regardless of the module he/she teaches is fully aware of as assessment is the most important tool with which to measure teaching and learning. Assessment, whether it is formative or summative, is very helpful in determining how far the teaching-learning process has been successful. Assessment not only helps in demonstrating the areas of excellence, but it also directs us towards the points of weaknesses. This is helpful in reflecting on specific strategies and methods that need to be continued and improved upon, and those ways and strategies that need to be discontinued to allow more suitable and result-oriented approaches to be developed. Assessment as a feedback tool is highly important to identify high achievers and subsequently reward them- be it a student or a member of teaching faculty. Additionally, assessment as a feedback tool also demonstrates a link with the curriculum and provides appropriate feedback on the curriculum devised for a particular level of the foundation program. Armed with this feedback, curriculum can be changed, improved, or adapted as per the needs of the learners.

Keywords: Analysis, ELT, Learning Outcomes, Feedback, Curriculum, Assessment.

INTRODUCTION

The importance of Assessment

It is an undeniable fact that assessment greatly influences the learning process. However, a more important aspect to consider is, to what extent is the teaching-learning process influenced by assessment and if this influence is negative or positive. Assessment provides feedback to students on how far they were successful in learning and improving their language skills, to teachers, as to how fruitful their teaching strategies and methods were in the classroom including specific curriculum designed to achieve desired results. Assessment offers students information on how well the learning has taken place and this is called “feedback”. Additionally, it offers students ideas on how to improve next time, which is “feed forward”. It also provides students with information on how their course learning outcomes contribute to the achievement of higher-level program outcomes, which is “feed up”. Here comes into picture the very vital curriculum, the course material, and the tools of assessments. It is worth mentioning that course books chosen as well as the assessment tools designed must be based on certain specific learning outcomes of a particular course that are aligned with the learning outcomes of the program. The narrative begs a question, “do students really learn what we teach in the classroom”. The answer might surprise and create resentment in us as teachers, but the fact is, if students are really learning all that is taught to them in the classroom, then we would not need assessment at all. We could just pile up all the learning experiences and the exchanges that took place between the teacher and the student and the students themselves in a portfolio and be done. However, the reality is further from the truth. It is impossible to predict with certainty if learning has taken place, no matter how well the material is designed and implemented during the instruction. Here comes assessment as a bridge between teaching and learning to find out if the teaching-learning activities that students were engaged in resulted in the achievement of intended learning outcomes.

Assessments in ELT

Having established the need for assessment, it is imperative to identify the type of assessment that is needed based on the learning outcomes intended for achievement. Broadly, there are three different types of assessments which are usually employed to gauge the level of the students in any ELT setting. They are diagnostic, formative, and summative assessments. Diagnostic tests as the word suggests are the tests that identify a students’ current knowledge in a specific learning skill of Language Teaching, whereas formative assessment is the feedback that is taken during the process of instruction and while the teaching learning is taking place. On the other hand, summative assessment is the feedback given after the learning has been completed which pretty much sums up the process of teaching and learning.

Diagnostic Tests

Diagnostic tests identify the key skilled areas and capabilities of a student and give educators a broad picture of a students’ strengths and weaknesses. Awareness of a students’ abilities and learning level helps in planning the instructional material and activities suitable to the level of the student. The GFP in the Language Centre of Muscat College uses standardized tests from Pearson called Pearson Level Test as the diagnostic tests based on which students are placed into different levels. These tests are composed of questions that target individual as well as integrated language skills of a student. Questions in this test range from gap filling to completing reading comprehension questions and describing a picture as well as responding to spoken prompts. The scores of Level Test are based on the Pearson Global Scale of English (GSE) 10-90 as well CEFR A1-C2. The scores are given in a descriptive manner enumerating the performance of the students in each skill as well as in GSE range and CEFR score.

Once the students are placed in a group as per their performance in the level test, instruction is easily delivered by following the learning outcomes that are spelled out for that specific level. The language center of Muscat College delivers the General Foundation Programme in three levels, English 1, English 2, and English 3 with the duration of each level being ten weeks.

**Nuzhath Fatima****Formative Assessment**

Formative assessment is one of the most important components of assessments at Muscat College Language Center. As we all know, the main aim of formative assessment is to measure a students' progress while the learning is taking place. Additionally, it also provides valid feedback on the instructional process as well as the instructor. Formative assessment leads to the identification of areas in teaching and learning that need improvement. These areas might be the methods of teaching, activities employed during this process, and strategies used to impart instruction. If a weakness is noticed, then it is easy to fix the gap by changing the method of teaching utilizing a variety of activities to gauge the effectiveness of teaching. In addition to collecting feedback, another important component of formative assessment is the evidence that is collected. For the feedback to be effective and qualitatively valid, right questions need to be asked and the right time. It is commonly observed that teachers administer formative assessments and have a meeting to discuss the implications of the data collected. By this time, the teaching "has moved on" to another item of language learning or to a different unit in the course book. To overcome this, we at the Language Centre of Muscat College plan and carry out formative assessment activities spread over the semester, so that, students' feedback is timely available to make necessary modifications in the teaching strategies and course material can be adapted where needed to fix the deficiencies as we progress into the semester.

Muscat College Language Center uses a variety of well-prepared formative assessment tools which are in complete alignment with our learning outcomes which in turn aligns with the learning outcomes specified by the Oman Academic Standards (OAS).

In addition to periodic feedback from students on teaching instruction and the instructor, we also include peer tutoring, discussions between the teacher and the student during office hour, one-to-one tuition to explain and clarify any difficulty in a specific language item, and other teaching-learning related issues. Formative assessment also includes power point presentations on specific topics related to the coursebook, group discussions, debate, and essay writing on a variety of genres depending on the level being taught. Power point presentations and group discussions incorporate the learning outcomes of developing cooperative and collaborative learning among the students, while encouraging critical thinking and problem-solving abilities. Essay writing on topics of current issues promotes professional, ethical, and social responsibility among the learners while encouraging the spirit of teamwork. Research carried out by students towards the completion of their ESP projects helps in not only developing their research and writing skills but also enhances their domain knowledge and allows students to assume responsibility as a global citizen. Additionally, it inculcates an attitude of accountability in students whereby they adhere to the principles of academic integrity and claim the rightful ownership of their work.

Summative Assessment

Summative assessment is the feedback which sums up the teaching and learning process. It takes place after the completion of teaching-learning and provides valuable information on how far the learning process was successful. At this stage of assessment, no formal learning will take place except maybe the completion and submission of assignments and projects. Summative assessments are usually developed around an established set of standards or expectations that are formulated in the form of rubrics. Having a set of well-drafted rubrics helps the instructor to be objective in his/her assessment of students' work whereas the same rubrics provide students with a specific criterion with which to work on a particular project. Summative assessments usually test the acceptable level of knowledge gained by the student so that he/she can progress to the next level. Typically, summative assessment is given at the end of a semester, or a term and the intended outcome is to assess how effectively teaching learning has taken place. It must be noted that summative assessment is more product based as it evaluates the final product, be it in the form of student's learning or teaching strategies, whereas formative assessment is process based as it assesses the process of teaching learning.

The foundation programme of Muscat College uses the standardized Pearson Benchmark Test as summative assessment for all the levels. We have sort of become the pioneers in administering the online benchmark test as a tool for our summative assessments. In addition, the reliability and validity of these tests is well established in the educational circle. The level of the test to be administered to a specific group of students is decided on the learning

**Nuzhath Fatima**

outcomes the test assesses with the learning objectives put forth for that group or level. For example, for EN3 students we administer test B1 where there is absolute alignment between the outcomes assessed to the objectives of the course.

The above data is from the benchmark results of test takers who were assigned the B1 test. As is seen, the results of this test are very comprehensive in the form of a graph and table which is followed by a written description of a students' performance. This gives us a complete picture as to where a particular student is with regards to his/her level of English. This is also helpful to us in making a comparative study of the improvements that a student has made in learning the language since taking the diagnostic test. For most students with few exceptions, a comparison between the results of diagnostic test and the benchmark test shows a satisfactory level of improvement in the language learned.

CONCLUSION

An EFL classroom is a diverse, and complex setting. This diversity is what lends a classroom its dynamism in terms of students with extremely varied learning preferences and styles, teachers with different educational backgrounds and teaching styles influencing the classroom setting and the students' learning and behavior. Every teacher wants to know the magic formula that works in a classroom. But the fact of the matter is that every activity that is used in the classroom works by enriching students' knowledge of the language. However, not everything works for everyone and in every classroom. The complexity of a classroom makes it difficult for one prescription that works as a success formula. A strategy that worked wonders in the context of one classroom might be disastrous in another classroom setting. Hence, it is the discretion of a teacher to adapt teaching strategies and testing methods that best suit their own teaching styles to benefit students maximally as per their learning styles. Proponents of formative assessment spell out innumerable advantages of this type of assessment whereas those who back summative assessment preach the benefits of summative assessment. Each has its own benefits and drawbacks. Some aspects of formative assessment are workable while some other aspects of summative assessment work for others. It is entirely up to teachers to choose the type of assessment to be employed and how best to adapt it for their teaching style, students' learning preference, learning outcomes to be achieved, curriculum and the context provided. There can never be one successful model of assessment, but a combination of both types will help in bringing back to the learner and the learning set up which forms the crux of any educational setting.

Course Outline 2023-2024

Module Code & Title	CEFR Level	Contact Hours/Semester	Assessment Methods	Reference Materials
EN3-English Level 3	B1+	Full-time: 200 Part-time: 120 Independent Study Hours: 45	Formative and Summative	<ul style="list-style-type: none"> Course Book -New Language Leader-intermediate Supplementary material & Authentic Materials

Learning Outcomes - Teaching weeks – 10 weeks

- Listen to a conversation between two or more speakers and be able to answer questions in relation to context.
- Be able to transfer specific information from a listening text into a table/diagram.
- Read and respond to a 1-2 pages (350-450 words) text in a given time frame.
- Match vocabulary by guessing the meaning through context.
- Be able to extract information to answer different types of questions.
- Be able to analyze a text or an article.
- Produce texts of 250 words showing control of the organization and layout as well as grammar and vocabulary.
- Produce a written report showing evidence of research, note-taking, paraphrasing and summarizing.
- Be able to look at data in graphs and write a report describing them.
- Prepare and deliver a talk of at least 3 minutes. Speak clearly and confidently, make eye contact and use body language to support the delivery of ideas.
- Be aware of plagiarism and how to avoid it.
- Discuss different types of sources in presentation and writing.
- **The able to work in a team, share ideas and express opinions**
- **Actively participate in a discussion, share ideas and express opinions**
- **Acquire and be able to use 21st Century Skills (Problem solving, Critical Thinking, Negotiating and Decision making, professional skills)**

Listening: 16

PERFORMANCE SUMMARY
The student can identify everyday objects, people or animals in their immediate surroundings or in pictures from short, basic descriptions, if spoken slowly and clearly. They can understand simple questions asking for basic information about objects in their immediate surroundings or in pictures.

RECOMMENDED ACTIVITIES
Extend the range of vocabulary and language they can use to describe the world around them (e.g. family, pets etc). Introduce them to listening tests beyond a few sentences.

SUGGESTED GSE LEARNING OBJECTIVES
Can understand very basic common classroom instructions.
Can understand the time of day when expressed in full hours.

Reading: 14

PERFORMANCE SUMMARY
Students at this level can generally recognise familiar names, words and very basic phrases. They can recognise basic plural forms of nouns (e.g. cars, books).

RECOMMENDED ACTIVITIES
Organise activities where students have to recognise words; could be done as a group activity; words can be written on the board, students are given cards with words on them and they have to pick the right one. Have them read aloud to increase knowledge of words.

SUGGESTED GSE LEARNING OBJECTIVES
Can recognise familiar names, words and very basic phrases on simple notices.
Can identify very common food and drink on a menu.

(A descriptive analysis of students' performance)

Adaptive Multiband Patch Antenna with Circular Slots, Applications in WLAN, WiMax and UWB

ABSTRACT

This paper presents an innovative adaptive multiband patch antenna with circular slots for wireless applications. The antenna design is straightforward, featuring a defected ground structure (DGS) formed by circular slots of varying radii, a 50-ohm feeding line serving as the radiator, and a rectangular slit coupled to the circular slots on the ground plane. Furthermore, reconfigurable multiband resonances are achieved by strategically placing PIN diodes at the circular slots on the defected ground plane and toggling them as needed. The proposed antenna features three tunable resonant frequency bands at 2.5, 3.5, and 5.7 GHz, suitable for WLAN, WiMax and UWB applications. Designed on an FR4 substrate, the antenna design is compact, measuring $28 \times 16 \times 0.8 \text{ mm}^3$. Its ability to reconfigure resonant frequency bands across a wide spectrum makes it well-suited for various wireless communication applications.

Keywords: WLAN, Wi Max, ultrawide band (UWB), defected ground structure (DGS), PIN diodes

INTRODUCTION

The adaptive antenna is a more attractive design choice than fixed antennas due to its ability to offer variable radiating properties, such as resonance for wireless communication systems. This additional level of control enables field adjustments to meet specific standards, compensate for manufacturing defects, and Resilient systems against evolving standards. Tuning sensitive wireless configuration devices often involves using a varactor diode or a tuned resistance. Recently, adaptive antennas have large attention for their possible uses in communications, electronic

Kavitha et al.,

surveillance and countermeasures. In Adaptive antennas, switching allows for the alteration of the radiating element's shape. Antennas capable of supporting multiple wireless protocols will be essential for future cognitive communication systems. [1]-[5]. Multiband antennas are extremely beneficial in contemporary wireless applications because they are able to function across multiple frequencies with a single antenna. However, fixed multiband antennas often require sophisticated filters with strict criteria to enhance their ability to reject out-of-band interference. These filters can significantly increase the complexity of any communication system due to their size. Adaptive antennas offer a solution by improving out-of-band noise rejection, potentially overcoming these limitations. Adaptive antennas are capable of dynamically adjusting their operating frequencies, pattern, polarization and other properties in response to external stimuli. Depending on the application, adaptive ability may involve multiple distinct features. Adaptive antennas can generally be classified into three categories, beginning with reconfigurable frequency. The primary goal is to optimize the antenna's operational frequency, creating a compact terminal with an adaptable antenna appropriate for several applications [6]-[10]. Newly, there has been concentration in frequency reconfiguration, driven by revolutionary concepts in wireless communication such as cognitive radio, which utilizes wideband sensing and programmable narrowband transmission. The second category of reconfigurability involves altering the pattern while sustaining the same frequency range to meet specific system requirements. The third category focuses on polarization reconfigurability, allowing switches from linear to circular polarization. Various switching technologies enable reconfigurability, including optical switches, field-effect transistors, PIN diodes, and RF MEMS switches [11]-[15]. The antenna design under consideration covers essential frequency bands required for Wireless Local Area Network (WLAN), Worldwide Interoperability for Microwave Access (WiMAX) and Ultra-Wideband (UWB) applications. This antenna can resonate at three frequencies simultaneously. Adaptive antennas proposal substantial advantages for modern communication systems by providing versatility in operating frequency, polarization and radiation pattern. The radiation of an antenna can be utilized for signal localization, interference avoidance and noise mitigation, thereby enhancing communication security. These antennas play crucial roles in radar systems, satellite communications, wireless communications and related industries driven by the increasing demands in these fields [16]-[20].

The Microstrip Patch Antenna (MPA) was initially conceptualized in the 1950s and became practical in the 1970s. It consists of a radiating patch, a dielectric substrate, and a ground plane. Figure 1 illustrates the basic construction of the MPA. The radiating patch, printed on the dielectric substrate, forces the EM waves to radiate at a specific frequency. The patch can take various shapes and sizes, such as rectangular, circular, slotted, triangular, and more. The substrate and patch dimensions are chosen according to the frequency of operations and the features of the dielectric substrate material utilized. The antenna's physical attributes, including patch length and width, substrate length and width, feed location, and feed length, can be considered using various mathematical equations. Each dielectric solid has its own characteristics, dielectric constants, and conduction properties, which affect the fringing waves in the patch antenna. Common dielectric materials include FR4 Glass Epoxy, Bakelite and Roger RT/Duroid, selected based on the antenna application and cost. Various feeding techniques, such as microstrip line, proximity coupling, inset feed, aperture coupling, and coaxial probe feed, accustomed to deliver the signal to the antenna for transmission via EM waves. This paper introduces a miniaturized adaptable multiband antenna design. The designed antenna features a tunable resonant frequency with good matching ($S_{11} \leq -10\text{dB}$) across 2.5, 3.5, and 5.7 GHz. A DGS is employed on the reverse side of the substrate using circular slots of varying radii. Positive-Intrinsic-Negative diode (PIN) are utilized as switches within these circular apertures in the ground plane to achieve different resonant bands. Specifically, the antenna offers tunable band-pass characteristics centered at 2.5 GHz (for WLAN), 3.5 GHz (WiMAX), 5.7 GHz (WLAN), and 6.5 GHz (C-band).

ANTENNA DESIGN

Antenna Components

The physical arrangement of the antenna design under consideration is illustrated in Figure 2. This design is simulated on a low-cost FR4 substrate through a relative permittivity of $\epsilon_r = 4.4$ and a depth of 0.8 mm. The antenna takes a compacted total size of $28 \times 16 \text{ mm}^2$. The antenna's feeding line is located on the top side of the laminate, while the ground plane is positioned at the underside of the substrate. The radiating component is a 50-ohm fed

Kavitha et al.,

microstrip antenna with dimensions of 18.4 x 1.6 mm². It features a rectangular profile achieving impedance matching across a broad range of frequencies. The antenna design under consideration demonstrates effective impedance matching across the 2 GHz to 7 GHz spectrum. The design parameters are detailed in Table I.

Design of DGS

DGS refers to Defected Ground Structure, where the metal ground plane of a microstrip circuit is intentionally altered to improve its performance. The fundamental component of DGS is a resonant gap or slot in the ground metal, strategically positioned beneath a transmission line to optimize coupling with the line. Figure 2(c) illustrates the arrangement of a ground structure for a multiband antenna. Achieving resonance across multiple frequency bands is facilitated by integrating a ground plane with intentional defects on the reverse side. The antenna element, originally designed for wideband operation, is tuned to operate across several narrow and wide frequency bands using circular slots in the DGS. These circular slots have radii R1, R2, and R3, and are supplemented by a rectangular-shaped slit coupled to the circular slots on the ground plane. The overall arrangement of the defected ground plane enables triple-band operation with central frequencies at 3.5 GHz, 5.8 GHz, and 6.5 GHz.

MULTIBAND ADAPTABILITY

The range of frequencies in which operation is desired is determined by the effective dimensions (length and width) of the resonant structure and the precise positioning of this structure. Through the use of equations(1) and (2), one can derive the resonance characteristics needed for the preferred ranges of frequencies.

$$W_{1,2,3} = \frac{c}{2f_o \sqrt{\epsilon_r + 1}} \quad (1)$$

$$L_{1,2,3} = \frac{c}{2f_o \sqrt{\epsilon_r}} \quad (2)$$

Adaptability is facilitated by employing three PIN diodes for switching purposes at the circular slots of the ground plane. The following three scenarios are provided:

Situation I

When switches S1 and S2 are in the 'OFF' state, and SW3 is in the 'ON' state, the outer circular slot with radius R3 in the defected ground exhibits capacitive behavior, while the radiating patch introduces inductive effects. This configuration forms a band-pass filter for WLAN 2.5 GHz, as showed in Figure 3.

Situation II

Dual-band operation for WiMAX and C-band frequencies is accomplished as in Figure 3, when switches S1 and S3 are in the 'OFF' state, and switch S2 is in the 'ON' state. This configuration enhances the capacitive impact of the slot on both sides of the connection.

Situation III

Triple-band operation is achieved by activating switches S1 and S2 while deactivating S3. The operational bands, namely WiMAX, WLAN, and C-band, are illustrated in Figure 3.

OUTPUT DISCUSSION

S-parameter and VSWR

The proposed design is simulated on an FR4 laminate with a depth of 0.8 mm, ϵ_r of 4.4, and a tangent of loss of 0.02, as represented in Figure 3. The outcomes specify that the antenna achieves good return loss ($S_{11} < -10$ dB) across multiple resonant frequency bands, specifically 2.5 GHz, 3.5 GHz, and 5.8 GHz, employed in WLAN, WiMAX, and UWB applications. In Figure 4, the designed antenna's Voltage Standing Wave Ratio (VSWR) is displayed., demonstrating that it meets the required criteria ($VSWR < 2$) for the bands that resonate.

Kavitha et al.,

CONCLUSION

This paper presents a miniaturized multiband antenna with the capacity to be reconfigured suitable for WLAN, WiMAX, and UWB applications. Multiband operation is enabled through a defected ground structure (DGS). Furthermore, the antenna offers tunability and reconfigurability across WLAN, WiMAX, and C-band frequencies, with central frequencies of 2.5 GHz, 3.5 GHz, 5.7 GHz, and 6.5 GHz respectively. These features highlight the suitability of the antenna that was created specifically for use in portable wireless communication.

ABSTRACT

Now a day's the quality of indoor environmental(IEQ) is considered to be great concern for its adverse impact on the human health. In India, there aren't many research on the interior air quality of institutional buildings. Children spend around 40% of their time in the institutional room for this reason concentration of interior air quality parameters great effects than outdoor concentration. This study examines on the institutional building Navsari, Gujarat during pre-monsoon season. Data on the quality of the indoor air was gained from five places classroom, canteen, laboratory, seminar hall and staff room of the institutional building. The target pollutants were two comfort parameters and five common indoor air quality parameters. In all the location PM_{2.5} (7µg/m³ -21µg/m³), PM₁₀ (8µg/m³ -24µg/m³), and PM₁ (5µg/m³ -15µg/m³), formaldehyde (0.019mg/m³- 0.027mg/m³), carbon dioxide (521ppm – 533ppm) was recorded lower than the standards. Excluding seminar hall all the location concentration of carbon monoxide (11ppm-15ppm) was recorded much higher and the concentration of TVOC (0.3mg/m³) also higher at classroom, staff room and seminar hall. Additionally, the temperature and relative humidity levels exceeded the Indian Society of Heating, Refrigerating and Air Conditioning Engineers' (ISHRAE) recommended limits.

Keywords: Indoor environmental quality, Institutional room, Comfort Parameters, TVOC, PM, Formaldehyde

INTRODUCTION

Air pollution, both indoor and outside, is frequently taken into consideration the main motive of environmental health problems. Even few years returned, the troubles connected to air pollution outside were nicely publicized since the prominence of main pollutant resources like site visitors, commercial, creation, combustion assets and etc. However, in latest years, public issues on indoor air first-class (IAQ) have drawn an amazing deal of attention, as the isolation of indoor from outside surroundings end up out of the ordinary with the great deliver of tight-sealed buildings and the related sick building syndrome (SBS) [1]. Air pollution has emerged as a first-rate situation in the India in latest years both because the fact it is now clean that massive portions of the Indian urban population are uncovered to some of the best pollutant stages within the global and also because new studies round the area at the health results of various air pollutants have multiplied confidence in estimates of the dangers posed by air pollutants exposures. The state of affairs in country China and several of other developing international locations is comparable[2]. The significance of a suitable first-rate of indoor air in occupied spaces can't be overemphasized. Among the phenomena that have giant effect at the health of an average human is the satisfactory of the air we breathe both outside and indoor[3]. More emphasis is right here being laid on the indoor air pleasant because examine has verified that a common human spends at least 90% of his time indoor. Often times, some health signs had been said via occupants of sure homes for no without difficulty identifiable reason in place of their being exposed to the bodily situations inside the buildings. Such fitness signs and symptoms consist of inflammation of the eyes, nostril and throat, lethargy, complications, nausea, dizziness, bronchial allergies, itchy eyes, itchy nostril, dry pores and skin, among others[4]. Although the excellent of the indoor air might not be the singular purpose for such commentary, Nonetheless, it's been discovered that indoor air constitutes a dominant or crucial avenue of exposure for these fitness signs [5]. This pattern is perceptible now not most effective in loose going for walks building but additionally inside mechanically ventilated areas. While a filtering mechanism for the outside air that enters indoor areas may additionally lessen the health risks of these contaminants in routinely ventilated areas, in free going for walks buildings, concentration often reach uncontrollable degrees especially whilst outside conditions aren't beneficial. A perfect indoor air which has none acknowledged contaminants at dangerous concentrations as decided via recognize authorities. The collection of these indoor air contaminants is nearly inexhaustible. fortunately, a number of investigations demonstrated that numerous organic materials have been discovered in indoor air at exceptional ranges of concentration that can generate a health problem[6]. Each of those contaminants has different resources from the indoor spaces. These resources variety from indoor finishing materials, furniture, disinfectants, household home equipment furthermore activities being accomplished within the area.

This consequently suggests that throughout specific varieties of buildings and one kind of climatic regions, the nice of the indoor air as compared with stipulated requirements may range, and that these variations can be very extensive to generate extensively numerous bodily fitness consequences in occupants[7]. Airtight homes have grown rapidly so one can conserve energy, to decrease the infiltration of outdoor air and to make movement of inside air in occupied quarter. Although such improvement became a success in sure respects, it became also hampered by means of other elements like the degradation of air excellent [3]. The scale of publicity to indoor air pollutants can be regulated via interplay among their indoor supply strengths and the entrapped time in indoor environments. As people commonly stay in indoors for as much as 22 h per day, people are at a chance of destructive health consequences via their exposure over a sustained duration [8]. Indoor air pollutants are generally released from numerous indoor things like waxes, paints, furnishing, clothing, building materials, etc. Indoor environment was hence favorable to emit a massive amount of air pollutants consisting of particulate depend (PM), formaldehyde (HCHO), bio-aerosol, carbon monoxide (CO), carbon dioxide (CO₂) and many others [9]. The provision of diverse creation techniques has been the main reason to sell the maximum intake of synthetic constructing material. In addition, improper control system also led to increases in indoor air pollution (IAP) from indoor resources and air flow systems. If the heating, ventilation, and airflow (HVAC) system is not properly maintained it can directly increase the indoor air pollution. Biological contamination also can proliferate in wet components of the system at some stage in the constructing. As most indoor air pollution at once has impact on the respiratory and cardiovascular

**Hemina Z. Patel and Neeraj D. Sharma**

systems, certain elements of the population (like young and aged) can suffer from respiratory sickness extra critically [5]. Air quality at these facilities is of unique problem, as children can be affected greater sensitively by means of modifications in air pleasant because of their weaker resistance[10]. However, indoor air troubles are not continually effortlessly recognizable to take preventive measures.

MATERIAL AND METHODS**Study area or Site Location**

The measurement of indoor quality of air took place for the different group of student's age between 18 to 28 years for institutional building. The investigation took place in the Navsari city which is located in the state of Gujarat, India. The institutional building is located far from the urban area having greenery around the college campus and also more no. of trees, gardens, small plants available in the college campus. There are no major origins of air pollution available around the institutional campus. An assessment was conducted for pre-monsoon season. It is the point in time at which every semester student has attended the college[11]. A sample of the inside air was conducted at five locations Classroom, canteen, laboratory, seminar hall and staff room.

Target Pollutants

The target pollutants were two comfort parameters and five common quality of indoor air parameters. Comfort parameters are Temperature(T), Relative Humidity (RH) and common parameters of indoor air quality are Particulate matter (PM_{2.5}, PM₁₀, and PM₁), Carbon Dioxide (CO₂), Carbon Monoxide (CO), Formaldehyde (HCHO) and Total Volatile Organic Compound (TVOC).

Sampling

Assessments were taken one day a week for a one location during the regular classes' hours. Which is from 9:00 am to 4: pm for 7 hours periods in a day[2]. In the three locations classroom, canteen and staff room there are natural ventilation system during the class's hours. In the laboratory and seminar hall they had to provide mechanical ventilation arrangement (Air conditioning system). The application of a real-time monitoring system to measuring the quality of the indoor air parameters. Intelligent air quality detector was accustomed to quantify a level of pollutants with range Particulate matter PM_{2.5}, PM₁₀, and PM₁ (0-999 µg/m³), CO₂ (0-5000ppm), CO (0-2400ppm), HCHO (0.000-1.999 mg/m³) VOC (0.000-9.999 mg/m³), Relative humidity (20% - 85%) and Temperature (-20 °C - 50 °C). Sampling equipment was placed in the middle of every location, not closer than 1m to the wall, at the height of the breathing zone about 1.5 meter above the ground to get a reliable measurement. Before the measurement start calibration of the instruments was done according to the instrument manual [12]. All the comfort and common parameters of indoor air quality like Particulate matter (PM_{2.5}, PM₁₀, and PM₁), Carbon Dioxide (CO₂), Carbon Monoxide (CO), Formaldehyde (HCHO) and Total Volatile Organic Compound (TVOC) are measured in every 30-minute interval [13].

Analysis

The readings have been analyzed and for different location in institutional building like Classroom, canteen, laboratory, seminar hall and staff room the graph of concentration versus time periods are plotted [14]. The various standards of indoor environment quality like World Health Organization (WHO), "Environmental Protection Agency" (EPA), "Occupational Safety and Health Administration" (OSHA), "National Institute of Occupational Safety and Health" (NIOSH), "American Society of Heating Refrigerating and Air-Conditioning Engineers" (ASHRAE), "Indian Society of Heating, Refrigerating and Air Conditioning Engineers" (ISHRAE) have been utilized for the health risk caused due to the gases for longer duration will be correlated [15].

Hemina Z. Patel and Neeraj D. Sharma

RESULTS AND DISCUSSIONS

Indoor air temperature varied in the different season[16]. Summer has the highest indoor temperature and lowest in the winter also the indoor temperature varied with the different location in particular one area. As show in fig. 1, During the sampling periods the result in educational building average temperature varies between 30°C and 32°C. In the educational building highest indoor temperature found in the canteen area which was a 32 °C and lowest in the class room and the staff room. This was above the ISHRAE Standards. The study observed that the minimum and maximum indoor relative humidity in the different locations was 85% in the seminar hall and 62% in the canteen respectively. Excluding the seminar hall all another location relative humidity above the ISHRAE standards. The indoor concentration levels of particulate matters of three different sizes in the occupied spaces were assessed. These were PM10, PM2.5 and PM1. Figure 2 displays the range of minimum and maximum concentration level of PM10, PM2.5 and PM1 in different location of educational building[17]. It was noted that the maximum level of all the particulate matters found in the canteen (21µg/m³, 24µg/m³ and 15µg/m³) due to maximum moments of students and lower concentration found in the staff room (7µg/m³, 8µg/m³ and 5µg/m³). But all the locations rage of particulate matter within the WHO standards. Figure 3 represented the concentration in ppm versus different location like classroom, canteen, laboratory, staff room and seminar hall in the educational building. It clearly shows that maximum concentration of carbon dioxide in the seminar hall around 533ppm as compared to the other locations which are more specious with less students and well ventilation system[14]. As stated by the ASHRAE 62 standards maximum exposure of CO₂ in the indoor air is 1000 pmm for the duration of 8-hr exposure. This study has demonstrated that in all the location the CO₂ Concentration was below the 1000ppm. so, the health effects as a result of this parameter are negligible. According to this study, the maximum and minimum concentration value of carbon monoxide in the study location was 15 ppm and 8 ppm respectively are appeared in figure 4. The concentration was higher in the canteen as a result of the cooking activities and lower in the seminar hall. As per the WHO standards maximum exposure of CO is 9ppm for the duration of 8-hr exposure as stated by the findings of the above investigation excluding seminar hall all the location the concentration of the carbon monoxide higher than the WHO standards. It tends to generate health effects like headache, breathing issues etc.[18]. The formaldehyde concentration during the sampling time in all the location below the WHO standards as shown in figure 5. But in all the location higher concentrations of HCHO found in the staff room around 0.027mg/m³ as a result of the paper products, wood furniture and storing some cleaning product. Therefore, it may be practical to provide opening to more windows in the staff room during the institute hours [19] Figure 6 clearly shows that in the classroom, staff room and seminar hall higher level of TVOC around 0.3mg/m³ available inside the air as a result of the wood furniture, computer, markers, cleaning products, deodorants etc.[20] As per the WHO the limitation of TVOC in the interior air is higher for the 8-hr exposure condition. Therefore, it may be practical to apply well ventilation to overcome this situation.

CONCLUSIONS

Many non-residential buildings are where students and working adults spend the bulk of their hours. Maintaining the quality of indoor air (IAQ) in the institutional building is crucial for both staff and students to be able to work at their best and concentrate. According to research, ventilation and occupant density are key factors in regulating the amount of indoor environment quality in a structure. Also, from the preceding results, it can be clearly seen that different human activities mostly increase the amount of gas parameters. In this investigation, the amount of the both comfort parameters are higher in all study location as per the standards. Concentration of particulate matters of three different sizes, HCHO and CO₂ lower in all the locations. Amount level of TVOC found higher in canteen, seminar hall and classroom and for the concentration of CO excluding seminar hall it found higher in all the location as per the standards. These finding provide certain guidance in improvement of IEQ in institutional building.

ABSTRACT

Dashanglepa one of the mixtures of ten very effective and common indigenous drugs for local application in many superficial inflammatory conditions as described in many Ayurvedic texts. In this study a report of rare case of cutaneous adverse drug reaction (ADR) in the form of skin rash seen after the local application of *DashangaLepa*. A 65-year-old male patient developed skin rashes over knee joint following the local application of *DashangaLepa*. Rashes resolved after immediate stopping the use of drug and application of *Panchtiktaghrita*. No such drug reaction was noticed by any other patient during treatment.

Keywords: Cutaneous adverse reaction, *Dashanglepa*, Inflammation, Skin rash, *Panchtiktaghrita*.

INTRODUCTION

Adverse drug reaction is harmful or seriously unpleasant effects occurring at doses anticipated for therapeutic effect and which call for reduction of dose or withdrawal of the drug or indicate caution in future use of the same drug. *Dashanglepa* is a polyherbal preparation and used as a topical treatment in conditions like *Vishavisphota* (skin eruptions due to poison), *visarpa* (herpes), and *Dushtavrana* (non-healing wound).^[1]This formulation is found to be safe and dermatological manifestations are extremely rare. In this article a patient who has applied *DashangaLepa* on both the knee joints. This kind of reaction with *DashangaLepa* was rare and unexpected. Rashes resolved after application of *Panchatiktaghrita* which contains 5 active compounds that give the formulation its anti-inflammatory

Pawar Chandrakant et al.,

and antimicrobial properties. These are *Azadirachta indica* (stem bark), *Tinosporacordifolia* (stem), *Adhatodavasica* (root), *Solanumxanthocarpum* (root) and *Trichosanthesdioica* (aerial parts). Recurrence of such a type of reaction is avoidable by properly detecting and reporting such an event. Dashanglepa is mentioned in many Ayurvedic texts [2, 3, 4, 5].

MATERIAL AND METHOD

Dashanglepa is a powdered form herbal preparation made by ten indigenous drugs. [6] These drugs and their properties are

1. *Shirish* (*Albizzialebeck* Benth.) Kashaya Laghu, Ruksha Ishad-Ushna Katu Tridosahara.
2. *Madhuyasthi* (*Glycyrrhizaglabra* Linn.) Madhura Guru, Snigdha Sheeta Madhura Vata-Pittashamak. *Tagar* (*Valerianawallichii* DC.) Tikta, Katu, Kashaya Laghu, Snigdha, Ushna, Katu, Kapha-Vatashamak
3. *Raktachandan* (*Pterocarpussantalinus* Linn.) Tikta, Madhura Guru, Ruksha Sheeta, Katu, Kapha-Pitta shamak.
4. *Ela* (*Eletteriacardamomum* Linn. Maton) Katu, Madhura, Laghu, Ruksha, Sheeta, Madhura, Tridosahara.
5. *Jatamansi* (*Nardostachysjatamansi* DC.) Tikta, Kashaya, Madhura, Laghu, Snigdha, Tikshna, Sheeta, Katu, Kapha-Pittashamak. *Haridra*
6. (*Curcumalonga* Linn.) Tikta, Katu, Laghu, Ruksha, Ushna, Katu, Kapha-Vatashamak, Pittarechak. *Daruharidra* (*Berberisaristata* DC.) Tikta, Kashaya, Laghu, Ruksha, Ushna, Katu, Kapha-Vatashamak.
7. *Kushta* (*Saussurealappa* C.B. Clarke) Tikta, Katu, Laghu, Ruksha, Ushna, Katu, Kapha-Vatashamak. *Hrivera* (*Pavoniaodorata* Willd.) Tikta, Katu, Kashaya, Laghu, Snigdha, Sheeta, Katu, Kapha-Vatashamaka.
8. *Dashanglepa* is used as *Vranasophaghna* (anti-inflammatory) remedy for local application. [7]

CASE REPORT

A 65-year-old male patient with a *VataKaphaj* (constitution) was admitted for complaints of osteoarthritis and mild swelling over bilateral knee joints. The patient was advised to apply *Dashanglepa* for 7 days continuously. After 7 days patient complained of pain and swelling got reduced. After seven days patient discharged and advised to continue local application of *Dashanglepa* along with oral medication for next 7 days. After 5 days, patient came with the complaints of skin eruption, redness and cracking of skin on both the knee joint, also complaining itching at local part. After careful history taking patient has not applied any other medication over knee joints or no any history of burning by hot lepa or water. A *lepa* (semisolid paste) was prepared by mixing the *Churna* (Powder) of *DashangaLepa* (purchased from a Good Manufacturing Practices (GMP) certified company) with warm water. Presentation of condition was on 12th day morning, after the application of *DashangaLepa*, with itching, redness and rashes on and around the site of the application. The application of *DashangaLepa* was stopped immediately. The rashes were treated with a local application of *Panchtiktagrita*^[8] twice daily. No change was made in other treatment. Within 7 days of treatment, the patient was completely relieved from the skin eruption, itching, rashes, and redness. Informed consent was obtained from the patient for documentation and publication. A copy of the written consent is available for review with the Editor-in-Chief of this journal.

DISCUSSION

Adverse drug reaction to *DashangaLepa* is very rare. This case report elaborates a case of skin rash on the site of application of *DashangaLepa*. Skin eruption is a commonly seen as a cutaneous adverse drug reaction. [9] There has been a temporal relationship towards an association between the suspected formulation and the event. Causality Assessment Scale and Naranjo's Adverse Drug Reaction (ADR) Probability Scale; the scores of which are Possible and Probable (Score 8) with *DashangaLepa* administration, respectively and severity was moderate. No such reaction was noticed by any other patient on the application of *DashangaLepa* and this point towards the susceptibility of the patient toward the reaction. The technique of preparation of the *Lepa*, which the physician has followed is bit a different from the standard reference. As per classics all the 10 ingredients need to be powdered and made into a *Kalka* (semisolid paste) form and during application it is to be mixed with *Ghritha* (Ghee). *Ghritha* has an

Pawar Chandrakant et al.,

antidotal effect in *Pittaprakriti*.^[10] Here *Ghritha* may help in preventing the toxic effects of the formulation and moreover. Many of ingredients of *DashangaLepa* have not been reported for their toxicity. However, Veleriane alkaloid, which is an active chemical constituent of *Tagara (Valerianawallichi)* and *Jatamanshi (Nardostachysjatamansi)* has been reported to produce allergic reactions and contact dermatitis.^[11] Furthermore, Costus oil (*Kushta*) has been seen to result in allergic contact dermatitis when used externally. Hence, in this case, we believe that the event may have occurred because of improper selection of the treatment vehicle or sensitivity of some ingredients of the *DashangaLepa*. The present case shows that such rare and unpredictable adverse reactions are possible with Ayurvedic medications and the physicians need to be more vigilant to try and understand such reactions, so as to prevent its recurrence. This may be a good example for an unexpected or idiosyncratic reaction. Such unpredictable adverse reactions are not necessarily due to errors or negligence. It is difficult to predict host susceptibility to such a response and thus, it becomes very important to document, evaluate and report such reactions. Such reports show the importance of the establishment of a pharmacovigilance cell in all Ayurvedic hospitals, so that information regarding ADR related to Ayurvedic formulations can be generated to study the ADR of Ayurvedic single herbs and formulations effectively.

Conflict of interest: None

ABSTRACT

For thousands of years, traditional medicine has employed edible mushrooms, which are prized for their immense health benefits. The beneficial effects of Indian mushrooms on human health are the topic of this review paper. Some of the biological substances contained in mushrooms have been shown to help human health. Among the bioactive components of Indian mushrooms include tri-terpenoids, low molecular weight proteins, glycoproteins, polysaccharides, and compounds that modulate immune response. A small number of studies have shown that mushrooms can promote the body's detoxification process, lower inflammation, boost immunity, prevent cancer, and limit the formation of tumor cells in addition to helping to balance blood sugar. They also offer defense against several microbes, including viruses, fungus, and bacteria. There is mounting evidence that a variety of illnesses may be treated with mushrooms.

Keywords: edible mushrooms, human health, Indian mushrooms, biochemical compounds, illness.

Sivadharani et al.,

INTRODUCTION

Numerous fungal species have therapeutic use in addition to plants. Mushrooms are used as medicine in traditional medicine practices (Patel et al., 2012). They were considered the "food of the gods" by the Romans. As a health food and "elixir of life," mushrooms are highly valued in Chinese culture (Valverde et al., 2015). Although there are more than 2,000 varieties of mushrooms in the wild, only around 25 are commonly used as food and very few are grown for profit. Because of their nutritional, therapeutic, and organoleptic qualities, edible mushrooms are prized as a delicacy. Furthermore, it is well-known for having therapeutic qualities and for having bioactive substances (Colunga et al., 2020). Mushrooms contain several types of vitamins that have the beneficial effect of lowering the risk of numerous diseases in humans. Studies have shown that mushrooms are effective in preventing cancer, lowering cholesterol, stress, sleeplessness, asthma, allergies, and diabetes. It might also be used as a substitute biosorbent to get rid of artificial dyes from aqueous settings. The mushrooms are usually large enough to be seen with the unaided eye, and they are joined laterally on the surface. It has a large number of bioactive components, including phenols, proteins, and polysaccharides. In an effort to enhance consumer health, mushrooms have also been utilized as dietary supplements and prebiotics more recently due to the availability of these active components (Yu et al., 2023).

Oyster mushroom (*Pleurotus species*)

The oyster mushroom was first recorded in 1775 by the Dutch naturalist Nikolaus Joseph Freiherr von Jacquin. Kadam and associates, 2023). The oyster mushroom (*Pleurotus species*) is one of the most widely cultivated types of mushrooms in the world. It is the second-largest mushroom farmed for commercial reasons in the world, after *Agaricus bisporus*. Of all the mushroom species, oyster mushrooms make up more than 200 categories (Lesa et al., 2022). There are several benefits to cultivating oyster mushrooms as opposed to other edible mushrooms. Lallawmsanga et al. in 2019. In temperate and tropical forests, it grows naturally on decaying and dead timber logs, often on the dying trunks of deciduous or coniferous woods. It is called "dhingri" in India. Oyster mushrooms grow best in the months of March/April through September/October.

Different species of oyster mushroom

- *Pleurotus ostreatus*
- *Pleurotus florida*
- *Pleurotus sajor-caju*
- *Pleurotus sapidus*
- *Pleurotus eous*
- *Pleurotus membranaceus*
- *Pleurotus flabellatus*

Medicinal value and properties of oyster mushroom (*Pleurotus species*)

It is estimated that between 6% and 10% of edible oyster mushrooms contain therapeutic qualities. Because of these qualities, these mushrooms are used as valuable natural ingredients in pharmaceutical goods. Numerous bioactive compounds with significant pharmacological properties are present in it, including those that modulate immune response, inhibit HIV-1 reverse transcriptase, promote eye health, inhibit protein synthesis, inhibit a proteolytic enzyme, are antibacterial, anti-inflammatory, anticancer, antihyperglycemic, antiatherogenic, anticancer, anti-hypercholesterolemic, antitumor, and antiviral (Lesa et al., 2022). The stimulatory activity of the dietary oyster mushroom extract allows for the isolation of specific components that have direct or indirect antiviral activities. Viral nucleic acid synthesis, viral enzyme adsorption, and viral uptake into mammalian cells can all be directly inhibited by them. Polysaccharides and other complex compounds have immune-stimulating properties, which leads to indirect effects of antivirals. "Ubiquitin," an antiviral protein, was extracted and identified from the oyster mushroom fruiting body. Water-soluble sulphated derivatives of water-insoluble β -glucans that were isolated from *P. tuberculum sclerotia*, "known as the king tuber oyster mushroom," demonstrated anti-herpes simplex virus activity against both type-1 and type-2 (Patel et al., 2012 & Anjana and Savita 2017 & Lesa et al., 2022). Natural antioxidant

Sivadharani et al.,

qualities and strong free-radical scavenging activity were present in medicinal mushrooms. Comparing Pleurotus fruiting bodies to other commercial mushrooms, a higher content of antioxidants was found. Owing to the presence of β -glucan, a carbohydrate component, it demonstrated enhanced antioxidant characteristics, which appeared to be the cause of the antioxidant activity. Some studies have found that the purification. Compared to the original crude extracts of mushrooms, mushroom polysaccharides exhibited reduced antioxidant activity (Anjana and Savita 2017). The research conducted in 2020 by Gashaw et al. to determine the antimicrobial activity of Pleurotus spp. (P. Ostreatus and P. Florida) demonstrates the development of inhibition against five pathogenic bacteria: Salmonella typhi, Bacillus subtilis, Escherichia coli, Streptococcus faecalis, and Pseudomonas aeruginosa. Sutthisa et al.'s 2023 study shows that oyster mushroom extract has the potential to be antimicrobial against P. Aeruginosa and S. marcescens, but it also suggests that greater extract concentrations could be required to completely suppress or destroy these dangerous bacteria. According to a 2009 study by Jedinak et al., P. Ostreatus, or oyster mushroom, was found to be the most effective in suppressing the growth of colon cancer (HT-29, HCT-116) and breast cancer (MCF-7, MDA-MB-231) cells while having no effect on the growth of normal colon FHC and epithelial mammary MCF-10A cells. Using flow cytometry, it was possible to determine that P. Ostreatus's suppression of cell proliferation was linked to the G0/G1 phase cell cycle arrest in MCF-7 and HT-29 cells.

According to a review updated in 2021 by Mishra et al., extracts from various Pleurotus species have been shown to suppress the cell cycle, cause apoptosis, and restrict the development of cancer cells in vitro and in vivo. It has been discovered that gold and silver nanoparticles made from Pleurotus extracts are strong anti-cancer agents with little negative effects on healthy cells. Bioactive macromolecules, including β -glucan, are powerful immunomodulators that trigger the activation of natural killer cells and macrophages in opposition to tumor cells. Oyster mushrooms are used in dermatology and cosmetology because they contain components that are anti-aging, anti-wrinkle, skin-whitening, and moisturizers. According to Taofiq et al. (2016), the mushroom pleuran (β -glucan) employed in skin-based atopic dermatitis cream has demonstrated promising outcomes. Manikandan (2011) said that Pleurotus species, or oyster mushrooms, are a good option for heart patients and the treatment of cardiovascular disease because of their low-fat content, increased production of unsaturated fatty acids, and lack of cholesterol. The high potassium and low salt contents of mushrooms help to maintain human blood circulation and promote salt balance.

Milky mushroom (Calocybe Indica)

Introduction

After Button and Pleurotus Mushrooms, Milky mushroom (*Calocybe indica*) has become the third commercially grown mushroom in India. A genus of mushrooms known as milky mushrooms have a white or milky appearance, medium to large fruiting bodies, an elongated, thick stipe, and, when dried, are claimed to smell like milk powder (Gosh and Acharya 2022). *Calocybeindica's* crown is white, umbrella-shaped, or convex in shape, with an average diameter of 10 to 14 cm. They smell strongly of farinaceous material. In tropical regions of Africa, China, Malaysia, Singapore, Indonesia, and India, *calocybe indica* flourishes.

Nutrients in milky mushroom

Milky mushroom (*Calocybe indica*) has become the third commercially grown mushroom in India subsequent to button and oyster mushrooms. Thymine, riboflavin, nicotinic acid, pyridoxine, biotin, and ascorbic acid can all be found in abundance in milky mushrooms. The vitamins C, D, E, B complex, and A are all abundant in them. All of the mineral salts that the human body needs, including potassium, sodium, phosphorus, iron, and calcium, should also be added. People who suffer from hyperacidity and constipation can benefit greatly from it because of its alkaline and increased fiber content (Maurya et al., 2020).

Medicinal value and properties of Milky mushroom (*Calocybe indica*)

Numerous bioactive compounds with potent antibacterial activity against both Gram-positive and Gram-negative bacteria are found in milky mushrooms. It has been demonstrated that numerous extracellular secretions from the

**Sivadharani et al.,**

mushroom mycelium suppress both viruses and bacteria. The production and binding of catechin and hexadecenoic acid to the bacterial cell wall is the mechanism by which the antibacterial activity against *Staphylococcus aureus* and *Escherichia coli* is mediated. The majority of researchers and inflammatory disorders believe that one of the reasons of inflammation is protein denaturation, which can be inhibited and autoantigen synthesis suppressed by a methanolic extract of *Calocybe indica*. A methanolic extract of milky mushrooms contained flavonoids and polyphenols, which may be the source of their anti-inflammatory qualities (Shashikant et al., 2022). A 2016 experimental study by Anju and Ukkuru demonstrates the potential of milky mushrooms to cure hyperglycemia, hyperlipidemia, and elevated blood sugar. According to this study, two separate individuals with high blood sugar, hyperlipidemia, and hyperglycemia who received a milky mushroom supplement in their diet without taking any medicine for treatment showed progressive improvement after 45 days of observation. Polysaccharide-derived milky mushrooms have strong anticancer activity against various tumor metastasis cells. They also showed enhanced efficacy when combined with chemotherapy (Natraj et al., 2022). The inhibitory or cytotoxic properties of water and methanolic extracts are compared using conventional tamoxifen for the MCF-7 cell line and vincristine for the MHH-ES-1 cell (Gosh et al., 2015).

Button mushroom (*Agaricus bisporus*)

Introduction

One of the biggest genera of macrofungi, *Agaricus* has a number of edible species with great nutritional and therapeutic potential. Over the past six to seven decades, there has been a steady increase in both the production and consumption of this particular mushroom. With the highest production of *A. bisporus*, China comes in first. *A. Bisporus*, commonly known as button mushrooms, are an excellent dietary source that contain a number of significant bioactive substances. *A. Bisporus* has a lot of potential in terms of nutrition, medicine, and appearance.

Nutrients in button mushroom

When compared to several other commonly consumed species, *A. Bisporus* is comparatively rich in lipids, proteins, and carbs. Aspartic acid, serine, glycine, threonine, glutamine, valine, cysteine, alanine, leucine, isoleucine, lysine, histidine, proline, arginine, tyrosine, and norleucine are among the many types of amino acids that are abundant in *A. Bisporus*. Stearic acid, palmitic, linoleic, caprylic, oleic, erucic, and eicosanoic acid were the main fatty acid contents among the 13 samples (Ushman et al., 2021).

Medicinal value of button mushroom

A. Bisporus has a somewhat larger capacity for antioxidants than other significant edible mushrooms. Brown and white *A. Bisporus* also contain ergothioneine, which functions as an antioxidant. Serotonin is another significant biochemical substance with strong antioxidant potential, according to Sarikaya & Gulcin. Owing to its antioxidant properties, serotonin derived from mushrooms may be able to avert Alzheimer's. A class of fat-soluble vitamins called tocopherol is a significant antioxidant that is used by the body for numerous processes. β -tocopherol was discovered to be abundant in White *A. Bisporus*. According to Manikandan (2011), oligosaccharides and fermentable fibers from mushrooms function as prebiotics in the intestine, anchoring good bacteria in the colon. This fiber supports regular bowel movements and digestion. The button mushroom is a rich source of antioxidants, including vitamin C, D, and B12. It also contains dietary fiber, polyphenols, and folates, all of which have inhibitory effects on diabetes and cardiovascular diseases. The polysaccharides found in mushrooms have a strong anticancer effect, inhibiting cancer cell types. It may affect cancer cells by boosting immunity within cells. By enhancing the body's antioxidant defense system and halting the spread of malignant cells, lectins proved efficient against lung cancer cells. Arginine stops tumor cells from growing. However, their impact on colorectal carcinoma, sarcoma, gastric cancer, and prostate cancer was not statistically significant (Ushman et al., 2021). Because it reduces estrogen production and aromatase enzyme activity, it is beneficial in the case of breast cancer (Bushan et al., 2018). Manikandan (2011) claimed that white button mushrooms have the potential to prevent breast and prostate cancer. Fresh mushrooms have the ability to detect the activity of chemicals called 5-alpha-reductase and aromatase, which

Sivadharani et al.,

are involved in the establishment of malignant tumors. Polysaccharides obtained from button mushrooms also have the potential to lessen the negative effects of chemotherapy and radiation. The development of button mushroom-produced nanoparticles has several advantages for the treatment of viral, bacterial, fungal, and malignant diseases. This kind of nanoparticle synthesis by edible and medicinal mushrooms is affordable and suitable for use in nanomedicine because so many fruiting bodies are generated globally (Bushan et al., 2018). Both plasma and LDL cholesterol are decreased by it. According to a 2010 study by Jeong et al., rats fed button mushroom powder that were hypercholesterolemic showed much lower levels of total plasma cholesterol and low-density lipoprotein (LDL) than control rats. Furthermore, compared to normal hypercholesterolemic rats, greater HDL concentrations were seen in hypercholesterolemic rats administered ABP.

CONCLUSION

Indian mushrooms have gained significant importance in the modern era due to their abundance of bioactive chemicals, which are utilized to treat a wide range of serious illnesses and lower the expense of more expensive therapies. However, because people are not as aware of the benefits of mushrooms as they should be, they are not a common food in our diets. As a result, there is a need to raise public awareness of mushrooms, as well as to deepen our understanding of the subject and expand research. Investigation into the Indian mushroom's possible mechanisms of action in relation to several diseases that impact human health is necessary. The current state of research on the bioactive components of Indian mushrooms is inadequate. The fungus has a variety of potential uses, including nutritional and physiological advantages that call for more research.

ABSTRACT

This research paper conducts a comprehensive analysis of the interaction between Academic Self-Efficacy Beliefs (ASEB), Metacognitive Awareness (MA), and the personality trait of Openness in high school students. The study aims to explore how these factors influence each other within the context of academic performance and confidence. Utilizing data from a sample of high school students, the study employs various measures including the Academic Self-Efficacy Scale, Metacognitive Awareness Inventory, and assessments of Openness trait. Statistical analyses are conducted to examine the correlations and interactions among ASEB, MA, and Openness. The findings shed light on the intricate relationship between these variables, highlighting the role of the Openness trait in shaping academic self-efficacy and metacognitive awareness. This thorough examination contributes to a deeper understanding of how personality traits intersect with cognitive and motivational factors in the academic domain. It provides valuable insights for educators and researchers seeking to enhance student learning experiences and outcomes.

Keywords: Metacognitive Awareness Inventory, and assessments of Openness trait.

**Kriti Bhargava and Mridula Sharma**

INTRODUCTION

In the realm of education, understanding the factors that contribute to academic success and student well-being remains a central focus for educators and researchers alike. Among these factors, Academic Self-Efficacy Beliefs (ASEB), Metacognitive Awareness (MA), and personality traits have garnered significant attention due to their potential impact on student learning outcomes and overall academic experience. This research aims to delve into the intricate interplay among these variables, with a specific focus on the personality trait of Openness, within the context of high school students. Numerous studies have highlighted the importance of Academic Self-Efficacy Beliefs in predicting academic achievement and performance across various educational settings (Zimmerman, 2000; Bandura, 1997). Defined as individuals' beliefs in their ability to succeed in academic tasks, ASEB influences students' motivation, persistence, and goal-setting behaviors (Pajares & Schunk, 2001). Similarly, Metacognitive Awareness, which refers to the knowledge and regulation of one's cognitive processes, has been linked to academic success by facilitating effective learning strategies, problem-solving skills, and self-regulation (Flavell, 1979; Schraw & Moshman, 1995). Moreover, researchers have increasingly recognized the role of personality traits in shaping individuals' academic attitudes, behaviors, and outcomes (Poropat, 2009; Trapmann et al., 2007). Of particular interest is the trait of Openness, characterized by curiosity, creativity, and willingness to explore new ideas and experiences (McCrae & Costa, 1997). Studies have suggested that Openness may influence learning approaches, information processing styles, and receptiveness to academic challenges (Chamorro-Premuzic & Furnham, 2003; Paunonen & Ashton, 2001). In a study conducted by Koyuncuoğlu (2023), the connections among metacognition, general self-efficacy, and academic achievement among university students were explored, alongside an examination of the mediating function of general self-efficacy in these associations. The results indicated favorable correlations between academic success and both metacognition and general self-efficacy. Moreover, it was revealed that general self-efficacy played a partial mediating role in the link between metacognition and academic success. Overall, recent literature underscores the importance of considering the interaction among ASEB, MA, and Openness trait in understanding student learning and academic success in high school settings. These studies provide valuable insights into the complex interplay of cognitive, motivational, and personality factors that contribute to student outcomes, offering implications for educators and policymakers aiming to support student development and achievement. While previous research has examined the individual effects of ASEB, MA, and personality traits on academic performance, limited attention has been paid to their combined influence and interactive effects, especially concerning Openness trait. Therefore, this study seeks to fill this gap by conducting a thorough examination of the interaction among Academic Self-Efficacy Beliefs, Metacognitive Awareness, and Openness trait in high school students. By elucidating the complex dynamics among these variables, this research aims to provide insights that can inform educational practices and interventions aimed at promoting student success and well-being.

Method

This research will utilize a cross-sectional approach to investigate the correlations among academic self-efficacy beliefs, metacognition awareness, and the personality trait of openness among high school students. Data will be gathered through a quantitative survey administered to the participants.

Participants

The study will involve high school students from varied backgrounds and academic environments. To ensure diversity, a purposive sampling method will be employed, aiming for representation across genders and academic achievement levels. The target sample will comprise around 100 students aged between 14 and 16 years old.

Instruments

The survey tool will incorporate standardized assessments for evaluating academic self-efficacy beliefs, metacognition awareness, and Openness personality traits. Academic self-efficacy beliefs will be gauged using the scale devised by P. Muhammed Ashraf and Abdul Gafoor K. (2006). Metacognition awareness will be measured

Kriti Bhargava and Mridula Sharma

through the Metacognitive Awareness Inventory for Adolescents (MAIA), and Openness personality traits will be assessed using the NEO Five-Factor Inventory (NEO FFI).

RESULT AND DISCUSSION

	Variables	N	M	SD	1	2	3
1	Openness	100	33.9	7.9	-	.090	.533**
2	Academic Self Efficacy	100	87.6	24.2		-	.148
3	Metacognition	100	21.8	6.5		.148	-

Table 01 indicates the correlation values of the openness personality traits with metacognition and academic self-efficacy beliefs. The findings from the analysis reveal a noteworthy association between Openness and metacognition, with a correlation coefficient of .533, significant at the 0.01 level. This indicates that individuals characterized by a propensity for exploring new experiences tend to exhibit a greater capacity for reflective thinking and strategic planning in their learning endeavors. Moreover, a positive correlation of 0.90 is evident between Openness and academic self-efficacy belief, suggesting that individuals possessing a high degree of openness tend to harbor stronger convictions regarding their capability to achieve academic success. The correlation coefficient of .148 between metacognition awareness and academic self-efficacy beliefs indicates a positive but relatively weak association between these two variables. This suggests that there is a discernible relationship between students' awareness of their cognitive processes (metacognition) and their beliefs in their ability to succeed academically (academic self-efficacy). However, the strength of this association is modest, implying that while there is some connection between metacognition and academic self-efficacy, other factors may play a more significant role in shaping students' confidence in their academic abilities.

CONCLUSION

The analysis underscores the significant role of personality traits, particularly Openness, in shaping key cognitive and motivational factors among students. The strong positive correlation between Openness and metacognition highlights how individuals inclined towards novel experiences tend to engage in reflective thinking and strategic planning, enhancing their learning processes. Moreover, the robust association between Openness and academic self-efficacy belief underscores the importance of personality traits in fostering confidence and conviction in academic pursuits. However, the relatively weak correlation between metacognition awareness and academic self-efficacy beliefs suggests a nuanced relationship between cognitive awareness and academic confidence. While students with higher metacognitive awareness may exhibit a positive inclination towards their academic abilities, other factors may contribute more substantially to their overall confidence level. These findings emphasize the complex interplay of individual characteristics, cognitive processes, and beliefs in shaping students' academic experiences. Understanding these dynamics can inform educational practices aimed at fostering a conducive learning environment and supporting students in realizing their academic potential. Further research could delve deeper into the nuanced interactions among personality traits, metacognition, and academic self-efficacy to elucidate their implications for student success and well-being.

ABSTRACT

One of the most prominent skin conditions affecting youngsters is acne. It is a pilosebaceous unit disease. Acne is caused by Propionibacterium acnes colonization and blocked sebaceous glands. Consideration should be given to the patient's kind of acne, degree, competence to use the treatment and psychological response. Most of the treatment for moderate acne is topical medication. More than 85% of teenagers suffer from acne, making it one of the most common skin conditions. Acne typically develops during puberty and gradually disappears when a person is 20 years old, though some people experience acne well into their 40s and 50s. Acne is rarely dangerous and is frequently written off as a self-limiting condition. Despite appearing purely aesthetic, its effects can extend far beyond the skin's surface and burden the patients with a heavy emotional and psychological burden. Despite appearing cosmetic, its effects can penetrate far deeper than the skin's surface and cause patients to experience severe emotional and psychological distress. The alteration in the appearance of the skin could result in a modified body image, which is known to provoke emotions such as rage, shame, anxiety, melancholy, embarrassment, bullying and stigmatization among peers, low self-esteem, social retreat, feelings of inadequacy and inferiority, functional and interpersonal issues, and suicidal thoughts. According to estimates, the decline in quality of life is comparable to that caused by epilepsy, asthma, diabetes, or arthritis.

Keywords: Acne, Propionibacterium, self-limiting, inflammation, psychological.

Srikala Kamireddy et al.,

INTRODUCTION

The body parts where acne is most prevalent are the face, forehead, chest, shoulders, and upper back. Some causes include genetics, hormonal fluctuations, Stress, excessive humidity, and the use of greasy or oily personal care products. Although it may occur at any age, acne affects teens most.

Reasons for Acne

Four main factors cause acne.

- Excessive production of oil (sebum)
- Oil and skin cells clogging hair follicles
- Bacteria
- Inflammation

Certain things may aggravate or induce acne

Changes in hormones. Both boys and girls have an increase in androgens throughout puberty. They cause the sebaceous glands to expand, which increases sebum production. Midlife hormonal changes, particularly in women, can result in breakouts. [1-2]

Specific medicines. Examples include corticosteroids, testosterone, and medications containing lithium.

Diet. According to studies, eating certain foods, such as carb-heavy foods like bread, bagels, and chips, may worsen acne. More study is required if adhering to dietary limitations will help those with acne.[2]

Stress. Although Stress does not cause acne, it might exacerbate it if you already have it.

Medications. Certain medication induces acne aggregation and severity. Here are a few medications that induce acne production (**table 1**)

More Common	Less Common
Anabolic steroids (danocrine, testosterone)	Immune suppressive agent (Azathioprine)
Bromides	Cyclosporine (Sandimmune, Neoral)
Corticosteroids (prednisolone, deltasone)	Disulfiram
Corticotropin	Phenobarbital
Isoniazid	Quinidine
Lithium	Tetracycline
Phenytoin	Vit B6, B12 &D2

Mechanisms involved in acne development:

The Sebaceous glands

Sebaceous glands contain the receptors which are involved in inducing sebum production.[3] Recent research describes that histamines activate histamine receptors, the hormonal DHT receptor is activated by androgens and the other three newly identified triggering receptors are activated by dietary sources.[3-5]. The connection between Diet and acne-triggering factors is further proved and reported in a case-control study in recent times.[6].

Body mass index also greatly impacts the production of acne in people and this generation, mainly in adults. [7] Additionally, although the evidence is insufficient, a population-based study of adolescent acne and BMI found a possible association between obesity and acne in 18- to 19-year-old women.[7] However, this relationship has yet to be proven.

**Srikala Kamireddy et al.,****Development of inflammatory lesions: comedogenics**

Inflammatory lesions develop from comedones that result from an abnormal keratinization pattern of sebaceous follicles.¹ Comedogenesis was once thought not to be part of the inflammatory process. Still, detailed immunohistological studies after the development of inflammatory acne lesions have shown that it is the first step to the inflammatory process, i.e., lesion formation.^[8] Microcomedone is currently believed to be the earliest type of subclinical acne lesion.

Controversy regarding the initial cellular infiltration in inflammatory acne lesions has continued since the first histological studies 30-40 years ago. The results of some early studies concluded that lymphocytes are an inflammatory cell type^{20,21,22}.^[8-9] Kligman's 1974 study¹⁰ concluded that the initial stage was neutrophil infiltration, followed by microscopic destruction of the sebaceous follicle wall and subsequent follicle formation.^[9]

P. Acne species

Studies on antibiotic resistance have shown the relationship between *P. acnes* and inflammatory acne. However, it has not been proven that this bacterium causes the disease or contributes to the development of inflammation. There is no relationship between the number of viable bacteria in the follicles and the level of inflammation, and some inflammatory lesions lack viable *P. acnes*. However, viable species cells stimulate the immune system by producing many enzymes. ^[10]

Immune system

Innate immunity is our first line of defense against pathogens (pathogen-associated molecular patterns (PAMPs)) and threats (danger-associated molecular patterns (DAMPs)). PAMP and DAMP responses are mediated by germline-encoded pattern recognition receptors (PRRs). Among the PRRs, certain members of the Nod-like receptor (NLR) family, including NLRP1, NLRP3, NLRC4, and AIM2, can mediate responses to PAMP and DAMP reactions and then accumulate to form high-molecular-weight caspase-1 activation. Activation and secretion of the proinflammatory cytokines IL-1 β and IL-18 are regulated by molecular platforms called inflammasomes. ^[11]Based on the findings that dysregulation of inflammation and IL-1 β is associated with a rare genetic autoinflammatory syndrome of pyogenic arthritis, pyoderma gangrenosum and acne called PAPA syndrome and, in addition, acne characterized by neutrophilic infiltration of the skin, which is in transgenic specificity of mice with a mutation in the NLRP3 gene corresponding to a mutation associated with human Muckle-Wells syndrome, we hypothesized that inflammation and IL-1 β might be directly involved in the pathogenesis of acne.

Treatment**Pharmacological treatment****Topical retinoids**

Retinoids were first shown to be useful in treating acne in the 1970s; they are derivatives of vitamin A that prevent the formation of comedones by normalizing the exfoliation of the follicular epithelium. ^[12] The three most important topical retinoids are tretinoin, adapalene, and tazarotene. Tretinoin has long been considered the gold standard against which new products are compared. A meta-analysis of five randomized, multicenter trials involving 900 patients confirmed a reduction of total lesions of 53% with tretinoin 0.05% gel and 57% with adapalene 0.1% gel.

Tretinoin is available as a liquid (0.05%), cream (0.025%, 0.05%, and 0.1%), and gel (0.01% and 0.025%). Redness, peeling, and swelling of the skin caused by tretinoin are dose-dependent side effects. ^[13] Adapalene 0.1% is available as a cream, gel and solution, all of which have comparable efficacy. Tazarotene is available as a cream or gel at a concentration of 0.1%.

Oral antibiotics

Antimicrobial and anti-inflammatory properties are common to systemic antibiotics used to treat acne vulgaris. They reduce follicular *P. acnes*, which prevent the synthesis of inflammatory cytokines caused by bacteria.^[14] Minocycline and doxycycline inhibit cytokines and matrix metalloproteinases involved in inflammation and tissue degeneration; tetracycline and erythromycin inhibit leukocyte chemotaxis activity and bacterial leukocyte. Chemotaxis. ^[15]

**Srikala Kamireddy et al.,**

Tetracycline, doxycycline, minocycline and erythromycin are the most commonly used systemic antibiotics for treating acne vulgaris. [16]

Topical antimicrobials

Clindamycin, erythromycin, tetracycline, and benzoyl peroxide are some of the topical antimicrobial agents currently available. Since azelaic acid has shown antibacterial activity against follicular P acnes, it can also be included in this category. [17] Our discussion focuses on five carefully designed, randomized, double-masked studies investigating topical antibiotics' effectiveness in treating acne. The most extensive studies have been done on the newer dosage forms.

Non-pharmacological treatment

Milk and its products: The oemogenic effect of milk and milk products is still controversial. However, the most likely reason for the comedogenic effect is the presence of insulin-like growth factor (IGF)-1 and hormonal components in Milk produced during pregnancy in cows. Substantial evidence indicates that excessive consumption of whole Milk (> two glasses per day) is associated with moderate to severe acne, with no association between consumption of low or fat-free dairy products or yogurt/cheese. [18] Adilson and That found that hormonal imbalance (decreased estrogen content) and changes in physiologically active molecules (glucocorticoids, transforming growth factor [TGF]-) caused by the processing of skimmed Milk make it more comedogenic than whole Milk. [19]

Omega 3 fatty acids: An important dietary modulator of inflammation is the consumption of omega-6 and omega-3 polyunsaturated fatty acids. [20] Compared to the hunter-gatherer diet, rich in fish, wild animals and wild flora, the traditional Western Diet has a higher ratio of omega-6 to omega-3 fatty acids.

Staying hydrated: Dry skin has a higher risk of irritation and damage, exacerbating acne. Keeping hydrated also helps wounds heal, and new cells form properly.

CONCLUSION

Here, we conclude that systemic treatment for acne remains a milestone, particularly in treating moderate- to severe scarring kinds of the illness, despite the interest in developing topical treatments for acne in recent decades. Developing new systemic acne medications is based on past triumphs and failures and developing future information. Inflammation appears to be rediscovered as one of the pathogenic causes of acne, and anti-inflammatory principles appear to be the newest trend in systemic and topical acne treatments. Also, changes in lifestyle modifications and food habits have a great impact on acne-triggering as well as suppressing acne.

ABSTRACT

The present study was undertaken to observe prevalence of gastro-intestinal parasites (GIP) in wild herbivore at Girnar Wildlife Sanctuary, Junagadh, Gujarat. A total of 224 samples were collected of Nilgai, Sambar and Spotted Deer. Collected samples were analysed by direct Smear, sedimentation and floatation methods. The overall prevalence of GI parasites was reported 33.03% (n=224) in wild herbivores. The parasitic prevalence was highest 42.04% (n=88) in Spotted Deer followed by 28.12% (n=96) in Nilgai and 27.5% (n=40) in Sambar. The highest prevalence was recorded for *Strongyle spp.*, (14.73%), followed by *Trichuris sp.* (09.38%), *Strongyloides sp.* (4.46%), *Paramphisopmum sp.* (2.67%) and *Coccidia oocyst* (2.23%). Parasites plays important role in host behaviour as they exhibit behavioural strategies for clearing or avoiding parasites in their natural habitat. For the conservation of wildlife, it will crucial to understand the relationship between parasites and host behaviour.

Keywords: Herbivores, Gastrointestinal parasites, Prevalence, Faeces, Wildlife

Riddhi Kanabar et al.,

INTRODUCTION

Wild animals are integral parts of biological world. Continuous observation of wild animals is necessary to access the impact of wild animals on natural environment [1]. India is unique in having immense natural beauty and possessing a rich and diverse wildlife. Wild animals suffer from a wide range of various infectious agents like bacteria, viruses and parasites from time to time. A number of factors threaten the existence of wild animals in our country including wildlife diseases, in particular those arising from gastrointestinal parasites [2]. India is unique because of its great natural beauty and diverse, abundant wildlife. Wild animals can be infected with a variety of infectious diseases from parasites, viruses and bacteria [3]. Animals are living in a natural state uniformed parasites are always present but usually in small number with balanced system, but change in environment, stress, nutrition and water intake level might increase sensitivity of animal with parasite infection [4]. Survey of faecal material for parasitic prevalence plays an important role in wildlife management. Data on parasitic diseases in wild animals are relatively scarce in India. Keeping in view the importance of parasitic infections in wild herbivores, the study has been conducted to investigate the occurrence of various gastrointestinal parasitic infections in different species of herbivore; Nilgai (*Boselaphus tragocamelus*), Spotted Deer (*Axis axis*) and Sambar (*Rusa unicolor*) at Girnar Wildlife Sanctuary, Junagadh, Gujarat, India. However, no systematic study was carried out on GI parasites of wild animals in natural habitat in Gujarat.

MATERIAL AND METHODS

Study site

Girnar Wildlife Sanctuary, Gujarat, Western India (Latitude North 21°25' and 21° 35' and meridians of Longitude East 70° 30' and 70° 40') is well known for its rich biodiversity, which covers 178.8 km² area (Data derived from PCCF-Gujarat Forest Department, website: <https://forests.gujarat.gov.in>) (Figure 1). Forest type of this region is mixed deciduous forest along with thorny scrub forest. The study was conducted with appropriate permissions granted by the Forest Department of Gujarat state under permit number WLP/RTC/28/C/356-357/2021-22 in accordance with Indian Wildlife Protection Act, 1972.

Collection of Samples

The present study was carried out for one year (Jan-Dec, 2022). Dropped fresh faecal samples of Nilgai (*Boselaphus tragocamelus*), Spotted Deer (*Axis axis*), Sambar (*Rusa unicolor*) were collected randomly in poly zip locked bag. A total of two hundred twenty-four (n=224) samples were collected. Sample bags were marked by date, host animal and area of Girnar wildlife Sanctuary. The labelled samples were kept with ice bag gel in icebox and transported to the laboratory for further microscopic examination.

Microscopic examination

Collected faecal samples were analysed by qualitative examination using direct smear, sedimentation and floatation technique. Stoll's dilution method was used for a quantitative examination to determine the number of eggs per gram (EPG) of infection. The level of severity of infection was graded into categories on EPG of faeces viz; below 500 (+), 500 to 1000 (++) and more than 1000 (+++) [5].

RESULT AND DISCUSSION

The overall 33.03% prevalence was recorded in wild herbivores viz., Nilgai, sambar and spotted deer (Table 1). *Strongyle spp.*, *Trichuris sp.*, *Strongyloides sp.*, *Paramphistomum sp.*, and *Coccidia oocyst* were recorded in herbivore animals (Figure 2). The findings are quite similar with prevalence (38.17%) of GI parasites in herbivore animals of Van Vihar National Park [6]. The average temperature and humidity condition of sanctuary might be favourable to the survival of eggs and free-living stages of parasites. The similar study was also reported at Kanpur Zoological

**Riddhi Kanabar et al.,**

Park, Uttar Pradesh with 25% prevalence of GI parasites in Herbivore animals [7]. Prevalence of GI parasites in captive herbivores documented at Nandankan Zoological Park [8] and Bir Moti Badh Mini Zoo [9] 41. 26% and 68% respectively. Eggs of *Trichostrongylus sp.*, *Strongyloid sp.*, *Balantidium coli* and *Coccidia* in captive herbivore animals of Municipal Zoo at Rajkot [10]. The Parasitic infection could be higher in captivity as wild animals are enclosed in captive areas, also environmental conditions could be through contaminated water or fodder and even zoo workers have played a role as vectors or transmitting parasites through their shoes, hands, food or any working tools [11].

The parasitic prevalence was highest 42.04% in Spotted Deer, followed by 28.12% in Nilgai and 27.5% in Sambar (Table 1). The highest parasitic prevalence was recorded 39.45% in Sambar and 36.84% in Nilgai at Van Vihar National Park, Bhopal [6]. Herbivores around forest of Jabalpur were also infected by GI parasites and the prevalence was 90% in Sambar, 86.67 % in Nilgai and 80% in Spotted Deer [12]. The variation found in number of parasites may be due to the distribution of animals, variation in topography and climatic factors. Also, Nilgai and Sambar have much better physical conditions in comparison to Spotted deer. The host immune level also affects the prevalence of infection, which caused weak natural defence and the ability of parasitic worms to prevent defensive-specific host. The weaker host body's resistance, the more it is likely to be infected [13].

The highest prevalence was recorded for nematode infection of *Strongyle spp.* (14.73%), followed by *Trichuris sp.*, (9.38%), *Strongyloides sp.*, (4.46%), trematode infection of *Paramphistomum sp.*(2.67%), and *Coccidia oocyst* (2.23%) for protozoa. Eggs of *Strongyle sp.*, *Fasciola sp.*, and *Trichuris sp.* were recorded in herbivores at Barnawapara Wildlife Sanctuary [14]. *Strongyle sp.* (41.67%) had the highest occurrence among wild herbivores at Madumalai wildlife Sanctuary [15], followed by *Amphistomes sp.* (15.63%), *Fasciola sp.* (13.54%), *Strongyloides sp.* (11.46%) and *Ascaris sp.* (5.29%). Highest prevalence of *Strongyle spp.*, (67%) were also recorded in herbivores of Bir Moti Bagh mini Zoo, Punjab [9]. *Strongyle sp.*, and *Strongyloid sp.* infections were wide spread in herbivores due to direct life cycle and survivability of the infective larval stage (L3) [16] and they are also prevalent in livestock. *Strongyloides spp.* and *Strongyle sp.* were also recorded in livestock of Junagadh District area [17]. While life cycle of *Trichuris sp.* is direct; eggs with characteristic bi-polar plugs are passed in the faeces and take two or three weeks to become infective stage [18].

In ungulates, behavioural strategies may be found for parasitic control like defecating in clumps and avoid foraging close to faeces. But parasite larvae may be found on grass and other plants at a level above to ground where the parasite larvae could be picked up [19, 20]. In this study, incidence of *Paramphistomum sp.* (2.67 %) was recorded during post monsoon, in which metacercaria is infective stage. When eggs come out through the faeces, it may enter to the suitable snail (intermediate host) and miracidium develops inside the body. Infection may occur when animals eat grass or drink water containing metacercaria [21]. Oocysts of *Coccidia* were also found from faeces of Nilgai and spotted deer, which can survive for long periods under suitable environmental condition [18]. Seasonal variation also effects on prevalence of parasites. In present study prevalence was highest in month of October-December.

Herbivores of Girnar Wildlife Sanctuary shares some common parasites that may be due to human dominated landscape in fringe area of sanctuary. Domestic animals sometimes share the same grazing land with wild animals. Hence, chances of interspecies transmission take place due to the interaction of animal in a common environment [22]. The infection of these parasites might be due to the existence of suitable microclimate for the survival and propagation of free-living larval stages of parasites at several places [6]. The nematodes and some coccidian oocyst parasites have a direct life cycle, they do not involve any intermediate host and they are transmitted by feco-oral route through contaminated feed, water, and soil [2]. However, wild herbivores of Girnar Wildlife Sanctuary had low intensity or parasitic load of GI parasites but that should not be neglected as parasites are important component of ecology as well as health of wild animals.

Riddhi Kanabar et al.,

CONCLUSION

The overall prevalence of GI parasites in wild herbivore animals was recorded 33.03%. Among different helminthic infections, the prevalence of nematodes was higher than trematodes. The occurrence of GI parasites in free-ranging herbivores might be due to the presence of infective stages of parasites in grazing land or water sources, as these parasites have a direct life cycle. The present study suggests regular screening of faecal samples in free-ranging wild animals and observation of sickness behaviours such as lethargy, avoid social interactions and feeding as a link between parasites and host behaviour, it will help in regular health monitoring and thus it will help in wildlife conservation.

ACKNOWLEDGEMENT

The authors are grateful to PCCF, Wildlife and Chief Wildlife Warden, Gujarat State, Gandhinagar for the permission granted to work in Girnar Wildlife Sanctuary. Also the authors would like to thank CCF Junagadh, DCF Junagadh, Forest staff of the Department. The authors would like to express an immense amount of gratitude towards the Principal Dr. R.P Bhatt for providing laboratory facilities and all staff members of Bahauddin Government Science College, Junagadh. The authors acknowledge Namrata Hun and Usha Zala, for their help throughout the fieldwork. Also, the first authors express their sincere thanks to SHODH - ScHeme of Developing High Quality Research for its financial support in the form of stipend.

ABSTRACT

A nucleoside analogue, 3'-deoxyadenosine (cordycepin), has been isolated from the mushroom, *Cordyceps militaris*. Due to its unique medicinal efficacy and several pharmacological whereabouts, it is regarded to be an exceptionally treasured fungus. Many countries employ Cordyceps extensively due to its effectiveness in the field of medicine as an antioxidant, anticancer, anti-inflammatory, anti-aging agent, etc. Therefore, this review emphasize predominantly on the biological potential of cordycepin in relation to osteoarthritis, an ailment characterized by progressive joint degeneration. The manuscript centers around the unique therapeutic potency of cordycepin on the cytokines (IL-1 β and TNF- α), nuclear localization factor (NF- κ B), and polyadenylation factors to mitigate the severe effects of these inflammatory modulators in relation to osteoarthritis and groundbreaking preclinical analysis. PRISMA 2020 guidelines were implemented; 162 articles assessed, 60 articles finalized. A myriad of studies authenticate the significance of cordycepin in various treatments related to joint disorders and synovial inflammations in humans as well as in animal models. Cordycepin has shown a promising nutraceuticals competence. In the near future, the scientific fraternity should focus more on the incognito compounds from *C. militaris* and explore its probable targeted drug delivery process to ameliorate its bioavailability.

Keywords: *Cordyceps militaris*; Cordycepin; Cytokines; Inflammation; Osteoarthritis

Diksha Dutta et al.,

INTRODUCTION

Osteoarthritis (OA) is a chronic degenerative disease affecting the musculoskeletal system, particularly the hip and knee joints [1]. Elderly individuals, especially women, are the most affected [2]. Aging leads to changes in joint tissues, increasing susceptibility to OA. Besides aging, environmental, biochemical, and mechanical factors also contribute to joint tissue deterioration. The key theories for the degeneration of articular cartilages include abnormal metabolic processes, hereditary disorders, and developmental issues. The overabundance of cytokines in the synovial fluid, including prostaglandins (PGE-2), nitric oxide (NO), interleukin-1 (IL-1), tumor necrosis factor alpha (TNF- α), and interleukin-6 (IL-6), is believed to cause OA-related joint tissue damage [3,4]. Reduced growth factors and mesodermal tissues further decrease matrix formation and repair [5]. In addition to joints, OA also impacts subchondral bone remodeling, osteophyte formation, medial meniscus, infra-patellar fat pad (IFP), and synovial joint modifications [6]. However, our lifestyle has a great impact on treating various musculoskeletal disorders along with few non-steroidal anti-inflammatory drugs (NSAIDs) or opioids to relieve pain. As medicinal mushrooms contain high antioxidants, adopting a mushroom-rich diet can prevent more than two-thirds of cancer-related deaths [7,8]. The well-known traditional Chinese medicinal mushroom *Cordyceps militaris*, an entomopathogenic fungus that parasitizes lepidopteron insects and larvae [9], is notable for its bioactive compound, Cordycepin. Cordycepin offers numerous health benefits, including anti-viral [10], anti-bacterial [11], anti-fatigue [12], anti-hyperglycemic [13], anti-inflammatory [14], and anti-tumor [15] properties. OA is considered a significant issue due to its increasing pervasiveness worldwide mainly in the older populations. Recently trivial therapies have been into limelight that includes symptoms relieving drugs but doesn't benefit the person with a permanent remedy. While cordycepin is recognized for its anti-inflammatory effects, the key players and the precise mechanisms remain uncertain. Therefore, a thorough understanding of this nucleoside analogue is essential to identify the biology underlying the anti-inflammatory properties and the development of novel therapeutic strategies. Thus, the goal of this article was to provide an overview of cordycepin's potential as an anti-inflammatory drug in the revival of OA therapies.

METHODOLOGY

In this study, various issues related to the OA in the elderly populations and implementing the nucleoside analogue, cordycepin as a remedial integrant were specified for review using "Preferred Reporting Items for Systematic Reviews and Meta-Analyses" (PRISMA) 2020 guidelines [16]. The subsequent inclusion requirements guided the choice of studies: (i) articles related to the cause of inflammation in OA and the use of natural herbal medicines having the inherent potency as therapy which were barely investigated were adopted, and (ii) articles with full text availability in English were selected for the review. Studies whose full texts are not available were excluded from this Review. Papers were searched in NCBI, PubMed, Google Scholar and Scopus databases using the keywords "*Cordyceps militaris*", "cordycepin", "anti-inflammation", "osteoarthritis", "cytokines", "nuclear localization factor", "polyadenylation factors" and "articular cartilage". Over the course of over six decades, a comprehensive literature survey was conducted, resulting in the identification of 162 studies from various databases that were deemed appropriate for review. Of these, 37 were determined to be duplicates and thus excluded, 35 studies were excluded due to the unavailability of full text, 30 articles were removed because the information provided was insufficient, and overall 60 papers were finalized for review. The flow diagram constructed using the PRISMA tool reveals identified records, screening process and selected studies for systematic review (Figure 1).

Cordyceps: A Medicinal Herb

C. militaris is a well-known entomopathogenic fungus, named from two Latin words "*cord*" and "*ceps*" meaning 'club' and 'head', respectively [17]. It typically falls under the family Cordycipitaceae and order Hypocreales within the phylum Ascomycetes [18]. Cordyceps predominantly occupies insect intestine during winter, and its fruiting bodies sprout out during summer, hence the name "winter-worm summer-grass". Highly host-specific and rare, it has been a treasured mushroom traditionally used as a medicine in India and China since long back. Cordyceps are also known as Himalayan Gold because it is often being harvested in high-altitude subalpine regions of grassy lands

**Diksha Dutta et al.,**

of Himalayas approximately 14,000 feet including Nepal, China and Tibet [19]. Of the estimated 1200 entomopathogenic fungal species, over 750 species belong to the Cordyceps genus [18].

Chemistry of Cordycepin

Cordycepin, a bioactive component of *C. militaris*, is a purine nucleoside analogue structurally identical to adenosine (Figure 2). Also known as 3'-deoxyadenosine, it replaces the OH group at the 3' position with a hydrogen atom in the ribose sugar moiety [20,21]. The cordycepin structure is portrayed by the adenine nucleotide attached to the ribofuranose moiety via a β -N9-glycosidic bond. It influences various biochemical processes, including nucleic acid synthesis [22], purine biogenesis [23], mTOR (mammalian target of rapamycin) signaling [24], apoptosis, cell cycle arrest, anti-metastasis, anti-pathogenic, antioxidant effects, inhibition of platelets aggregation and inflammatory mediator signaling [25].

Anti-Inflammatory Property of Cordycepin

OA is the most common form of arthritis, characterized by the breakdown of joint cartilage and changes in the underlying bone with symptoms such as stiffness of joints, swelling, pain, warmth, and redness. Also known as degenerative joint disease or wear-and-tear arthritis, there is currently no cure for OA. Treatments like non-steroidal anti-inflammatory drugs (NSAIDs) or opioids can alleviate symptoms but may lose effectiveness and cause side effects with long-term use. To minimize these effects, people predominantly fascinated towards a beneficial, economic and risk-free conventional herbal medications. According to reports, NF- κ B activation significantly up-regulates inflammatory mediators such as NO, COX2, TNF- α , and IL-1 β [26]. Cordycepin has been shown to suppress cytokine expressions like IL-1 β and TNF- α in LPS-stimulated macrophages, reducing nitric oxide production [25]. It also helps prevent cartilage deterioration and inflammation in OA patients by minimizing inflammatory cell infiltration and downregulating specific gene expressions [27,28]. Thus, cordycepin shows promise as an anti-inflammatory treatment for arthritis.

OA models

Elderly populations face a growing burden of diseases, notably OA, necessitating multiple animal models for studying its progression [29]. While aging mice models provide genetic coherence but take about a year to develop OA, Dunkin-Hartley guinea pigs mimic aging-related OA in less than three months, resembling human OA closely [31]. Live animal models, following ethical norms, are used to assess the therapeutic potential of cordycepin in OA. The destabilizing medial meniscus (DMM) model aids in studying OA's inception and progression, offering insights into knee joint structures and facilitating tissue studies for potential therapies (Figure 3) [32].

Effect of Cordycepin on IL-1 β and TNF- α Induced Factors

The key inflammatory cytokines, interleukin-1 beta (IL-1 β) and tumor necrosis factor alpha (TNF- α) play pivotal roles in OA-related inflammatory signaling. IL-1 β predominantly synthesized as a cytosolic precursor protein which upon proteolytic cleavage becomes active and triggers inflammatory responses via its receptors, IL-1R1 [33]. Conversely, TNF- α acts through membrane-bound receptors, TNF-R1 and TNF-R2, mediating signals upon ligand binding [34]. These cytokines, along with IL-6, IL-8, CCL5, VEGF, NO, COX-2, PLA-2, PGE-2, exacerbate inflammation in OA patients. [35]. Studies have shown elevated IL-1 β and TNF- α levels in OA tissues, leading to cartilage degradation through MMPs 1-13, and ADAMTS 4 and 5 synthesis while inhibiting aggrecan and collagen production (Figure 4) [36]. Cordycepin shows promise in mitigating these effects by reducing inflammatory mediators [37].

Effect of Cordycepin on NF- κ B Nuclear Localization

The NF- κ B is a universally expressed transcription factor involved in immune responses, inflammation, stress, cell proliferation and cell death [38]. In the absence of any signals, the NF- κ B heterodimers are positioned in the cytoplasm in an inactive form along with I κ B molecules. Upon stimulation, NF- κ B activation involves I κ B phosphorylation by I κ B kinases (IKKs) followed by 26S complex proteasomal degradation with ubiquitin tags [39]. Active NF- κ B heterodimers then translocate to the nucleus, promoting the expression of cytokines, proteases,

**Diksha Dutta et al.,**

immunomodulatory molecules, and chemokines [40]. Articular cartilage cells manifest mechanical receptors, TNF-R, TL-R and cytokine receptors that retaliate to certain pro-inflammatory proteins like TNF- α or IL-1 β , triggering the NF- κ B signaling [41]. This activation triggers the secretion of matrix metalloproteinases (MMPs) and impede chondrocyte metabolic functions [42]. In OA, NF- κ B transcription factors drive the progression of MMPs, cytokines and chemokines, leading to joint degradation [43]. Synovial cells in OA activate NF- κ B pathways, which deals with the conglomeration of cytokines (IL-1 β , TNF- α , RANKL, IL-6), chemokines (CCL5, IL-8), MMPs1-13, PGE2, ADAMTS4, ADAMTS5, few angiogenic agents (VEGF, bFGF), and provoke bone regression, neo-angiogenesis and synovitis [44,45]. OA also involves lymphocytes, mast cells, macrophages, and NK cells infiltration, causing swelling and stiffness [46]. The subchondral bone, beneath the articular cartilage, is protected by osteoblast-mediated bone formation and osteoclast-mediated bone resorption via the RANK/RANKL signaling pathway [47]. Basically, certain chondrocytes give rise to cytokines which induce the release of RANKL, leading to the activation of NF- κ B transcription factors for bone resorption to sustain the blood calcium level [48]. OA disrupts this balance, leading to osteoporosis and cartilage compaction (Figure 5). Furthermore, Li et al. (2016) found that cordycepin significantly reduced IL-1 β and TNF- α expression in LPS-induced macrophages by inhibiting I κ B phosphorylation and NF- κ B nuclear translocation [49]. Moreover, cordycepin also restricted osteoclast differentiation and abnormal bone resorption. Recent studies confirmed cordycepin's effectiveness in inhibiting NF- κ B expressions and I κ B phosphorylation in the aged mice [50]. Cordycepin appears to be a potent bioactive compound which has the zeal to hinder various pro-inflammatory mediators via NF- κ B nuclear localization.

Effect of Cordycepin on Polyadenylation in Macrophages

Polyadenylation involves adding a poly (A) tail to the 3' end of an mRNA transcript, which occurs inside the nucleus prior to translocation to the cytosol where it protects the 3' end from enzymatic degradation. In OA, inflammatory mediators accumulate in various tissues, causing abnormal amplification of 3' end of mRNA transcript by poly (A) polymerases (PAP). These polymerases add adenosine triphosphate (ATP) with the help of poly (A) binding protein (PABP) to stabilize the transcript in healthy individuals. In OA patients, inflammation leads to unstable transcripts. Hence, removing the poly (A) tail destabilizes mRNA. Kondrashov et al. (2012) found that cordycepin prevents inflammation by inhibiting polyadenylation [51]. The mRNA transcripts in the cytoplasmic are bound by poly (A) binding protein (PABPC1) at the 3' end, while translation initiation factors (eIF4E, eIF4A and eIF4G) binds the 5' end [52]. eIF4G connects the ends, forming a closed-loop complex crucial for translation initiation [53]. Few polyadenylation markers like CPSF4 and WDR33 monitor mRNA in healthy individuals, but in OA, LPS-stimulated macrophages cause marker translocation to the nucleus, producing inflammatory signals. Later, siRNA studies showed that inhibiting these markers affects NF- κ B localization [54]. Moreover, LPS induced mediators such as IL-1 β , TNF- α and NK- κ B showed analogous features to that of cordycepin assisting gene expressions in OA inflammation [55]. Consequently, it can be summarized that expressions of macrophages in respect to inflammation are greatly enhanced by involvement of nuclear polyadenylation factors at an intensifying rate which eventually gets hindered by cordycepin (Figure 6). Due to its structural similarity to ATP, cordycepin, or cordycepin triphosphate (CTP), disrupts polyadenylation in precursor mRNA, reducing macrophage inflammation in cartilage [56]. Unlike other adenosine analogs, cordycepin shortens poly (A) tails, reducing mRNA cleavage effectiveness [57]. Thus, cordycepin inhibits polyadenylation and serves as a therapeutic agent in OA.

Existing Therapies and Current Research Goals

The prevailing OA therapies include behavioral interventions, palliative drugs, NSAIDs, intra-articular jab, and joint replacement surgery [58]. However, these treatments often lack effectiveness and have unpleasant complications, prompting a need for better medical approaches as pharmaceutical companies shift to a non-research-based work cautious of investing in identifying OA-related treatments manifesting their potential in clinical trials. While identifying pro-inflammatory cytokines helps mimic OA pathogenesis *in vitro*, certain anti-inflammatory mediators used in other diseases have yet to show productive results against OA [59]. Preclinical studies, by Wang et al. (2013), highlighted MMP-13 as a crucial target for preventing cartilage erosion in OA [60]. Despite high specificity, treatments targeting enzyme catalysis or signaling pathways often fail due to inadequate side effects. As a result, many clinical aspects addressing OA therapies were discontinued, leading academia to seek novel strategies.

Diksha Dutta et al.,

CONCLUSION

Over the past few years, people have shown confidence and trust in naturally occurring food-based products such as nutraceuticals, for managing various diseases. Medicinal mushrooms, notably *Cordyceps militaris*, have demonstrated effectiveness against various serious complications and have been used in traditional Chinese medicine for centuries. *C. militaris* holds a rich source of bioactive ingredients, with cordycepin showing the greatest nutraceuticals potential. Research indicates cordycepin's efficacy in treatment of joint disorders and synovial inflammations in both rodent models and humans. Future research should focus on uncovering other innominate compounds in Cordyceps and their therapeutic potential. Likewise, it is equivalently important for the scientific community to explore the possibilities of nanobiotechnology-mediated targeted drug delivery systems for cordycepin and enhance its bioavailability. Further experimental studies and clinical trials are requisite to identify cordycepin's exact mechanisms, efficacy, and safety. Being a fungus, Cordyceps holds supreme role in the prevention and cure of various ailments caused by metabolic disorders and infectious diseases, establishing it as a novel bioactive source.

ACKNOWLEDGEMENTS

We would like to acknowledge the Council of Scientific and Industrial Research-Human Resource Development Group (CSIR-HRDG), Government of India, for providing SRF-NET fellowship to Diksha Dutta {File No. 09/1236(15458)/2022-EMR-I} which helped her in this work. The authors also acknowledge the Department of Biotechnology (DBT), Government of India for using resources of ongoing DBT project (No. BT/INF/22/SP45376/2022) in the present work.

AUTHORSHIP CONTRIBUTIONS

DD contributed to the study conception and design of the manuscript. Manuscript preparation, literature survey and data analysis were performed by AKV and DD. NSS and TB assisted in drafting the manuscript and data interpretation. MD and BB performed the proofreading of the manuscript. All authors read, revised and approved the final manuscript.

ABSTRACT

In this paper introduce binary multiset (bms) α -open, bms α -interior, bms α -closure, bms semi open and bms preopen on bms topological space and study some of their properties are given investigate the concepts of bms α -continuous and bms α -open functions and discuss their relationships with bms continuous. Also counter examples are given show their properties of these functions.

Keywords: open bms, bms α -open, bms α -closed, bms α -interior, bms α -closure and bms α -continuous function.

Mathematics Subject classification: 00A05, 03E70, 54B10, 54G20.

INTRODUCTION

The initiated a theory of notion multiset, which was first studied by Blizard[5,6] in the year of 1989. Boundary and exterior of a multiset topology Das [5] boundary exterior, Multiset topology. Dontchev [7] presented by note on some application on semi-pre-open set. [8] Levine introduced semi open and semi-continuity in topological space [1] Abd El-Monsef introduced β^* -open sets and β^* -continuity in topological space [9] Mashhour and Hasanein established the concepts of a α -continuous and α -open mapping. [10] Mashhour presented by on pre-continuous mapping and weaker pre-continuous mapping. Surekha and Sindhu introduced the new class of binary open sets in binary topological space, introduced by α gs-closed sets, α gs-open sets, α gs-closure set in 2022, [12]. [2] Andrijivic presented semi pre-open set. Biswas investigated the some mappings in Topological spaces and characterization of semi-continuous mapping. [15,16] Girish presented multiset in topological space the number of occurrences of the element

Priyalatha and Sowndariya

x in the mset M . We present the mset M drawn from the set $X = \{X_1, X_2, \dots, X_n\}$ as $M = \{m_1/x_1, m_2/x_2, \dots, m_n/x_n\}$. Where m_i is the number of occurrences of the element $x_i = 1; 2, \dots, n$ in the mset M . The M -topological space was investigated by closure, interior, continuous function. [11] Priyalatha introduced the binary multiset concept for the open bms, closed bms of their properties and examples [14] Das established generalized multiset function in open, preopen, semi open, β -open function in continuous generalized ideal continuous function. [13,20] Nithayanatha Jothi introduced binary multiset topological space, a single structure which carries the subsets of X as well as the subsets of Y studying the information about the ordered pair of (A, B) of subsets of X and Y and on generalized binary topological space satisfies the condition of intersection element of subsets in binary topological space. In this paper, we introduce some new concepts in bms topological space such as bms α -open, bms α -closed bms α -continuous function, bms pre continuous, bms semicontinuous with their properties and theorem with examples are discussed.

PRELIMINARIES AND BASIC DEFINITIONS

Definition 2.1. [7] An mset M drawn from the set X is represented by a function count M or C_M defined as $C_M \rightarrow N$. Where N represents the set of non-negative integers. Here $C_M(x)$ is the number of occurrences of the element x in the mset M . We present the mset M drawn from the set $X = \{X_1, X_2, \dots, X_n\}$ as $M = \{m_1/x_1, m_2/x_2, \dots, m_n/x_n\}$. Where m_i is the number of occurrences of the element $x_i = 1, 2, \dots, n$ in the mset M . However those elements which are not included in the mset M have zero count.

Definition 2.2. [7] A domain X , is defined as a set of elements from which mset are constructed. The mset space $[X]^w$ is the set all msets whose elements are in X such that no elements in the mset occurs more than w times. The set $[X]^\alpha$ is the set all msets over a domain X such that there is no limits on the number of occurrences of an elements in an msets. If $X = \{x_1, x_2, \dots, x_k\}$ then $[X]^w = \{m_1/x_1, m_2/x_2, \dots, m_k/x_k\}$.

Definition 2.3. [7] Let $M \in [X]^w$ and $\tau \subseteq P^*(M)$. Then τ is called a multiset topological space of M if τ satisfies the following properties.

- (i) The mset M and the empty mset φ are in τ .
- (ii) The mset union of the elements of any sub collection of τ is τ .
- (iii) The mset Intersection of the elements of any finite sub collection of τ is in τ .

Definition 2.4. [7] A sub mset N of M -topological space M in $[X]^w$ is said to be closed if the mset N is open. In discrete M -topological space every mset is an open mset as well as a closed mset. In the M -topological space $PF(M) \cup \varphi$, every mset is an open mset as well as a closed mset.

Definition 2.5. [7] Given a submset A of an M -topological space M in $[X]^w$, the interior of A is defined as the mset union of all open mset contained in A and it's denoted by $\text{Int}(A)$. i.e., $\text{Int}(A) = \cup\{G \subseteq M : G \text{ is an open mset and } G \subseteq A\}$ and $C_{\text{Int}(A)}(x) = \max\{C_G(x) : G \subseteq A\}$.

Definition 2.6. [7] Given a submset A of an M -topological space M in $[X]^w$, the closure of A is defined as the mset intersection of all closed mset containing A and its denoted by $\text{Cl}(A)$. i.e., $\text{Cl}(A) = \cap\{K \subseteq M : K \text{ is a closed mset and } A \subseteq K\}$ and $C_{\text{Cl}(A)}(x) = \min\{C_K(x) : A \subseteq K\}$.

Definition 2.7. [13] Let X and Y be any two non empty sets. A binary topological space X to Y is a binary structure $M \subseteq \mathcal{P}(X) \times \mathcal{P}(Y)$ that satisfies the following axioms.

- (i) (φ, φ) and $(X, Y) \in M$.
- (ii) $(A_1 \cap A_2, B_1 \cap B_2) \in M$ whenever $(A_1, B_1) \in M, (A_2, B_2) \in M$.
- (iii) If $\{(A_\alpha, B_\alpha) : \alpha \in \Delta\}$ is a family of members of M , then $(\bigcap_{\alpha \in \Delta} A_\alpha, \bigcap_{\alpha \in \Delta} B_\alpha) \in M$.

Definition 2.8. [15] Let (M, τ) be a multiset topological space on $[X]^w$ and N sub-mset of M . We define the following definition:

Priyalatha and Sowndariya

- (i) A Semi-open if $A \subseteq \text{cl}(\text{int}(A))$ with $C_{A(x)} \leq C_{\text{cl}(\text{int}(A))(x)}, \forall x \in X$.
- (ii) A semi-closed if $\text{int}(\text{cl}(A)) \subseteq A$ with $C_{\text{int}(\text{cl}(A))(x)} \leq C_{A(x)}, \forall x \in X$.
- (iii) A semi-pre-open (β – open) if $A \subseteq \text{cl}(\text{int}(\text{cl}(A)))$ with $C_{A(x)} \leq C_{\text{cl}(\text{int}(\text{cl}(A)))(x)}, \forall x \in X$.
- (iv) A semi-pre-closed (β – closed) if $\text{int}(\text{cl}(\text{int}(A))) \subseteq A$ with $C_{\text{int}(\text{cl}(\text{int}(A)))(x)} \leq C_{A(x)}, \forall x \in X$.
- (v) A pre-open if $A \subseteq \text{int}(\text{cl}(A))$ with $C_{A(x)} \leq C_{\text{int}(\text{cl}(A))(x)}, \forall x \in X$.
- (vi) A pre-closed if $\text{cl}(\text{int}(A)) \subseteq A$ with $C_{\text{cl}(\text{int}(A))(x)} \leq C_{A(x)}, \forall x \in X$.
- (vii) An α -open if $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$ with $C_{A(x)} \leq C_{\text{int}(\text{cl}(\text{int}(A)))(x)}, \forall x \in X$.
- (viii) An α -closed if $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ with $C_{\text{cl}(\text{int}(\text{cl}(A)))(x)} \leq C_{A(x)}, \forall x \in X$.
- (ix) A regular-open if $A = \text{cl}(\text{int}(A))$ with $C_{A(x)} = C_{\text{cl}(\text{int}(A))(x)}, \forall x \in X$.
- (x) A regular-closed if $\text{int}(\text{cl}(A)) = A$ with $C_{\text{int}(\text{cl}(A))(x)} = C_{A(x)}, \forall x \in X$.

ON BMS α -OPEN SETS

Definition 3.1.[11] Let U, V be two non-empty sets, $[U]^w, [V]^r$ be two multiset spaces on U and V respectively. The ordered pair (M_1, M_2) is called a binary multiset (or bms) where $M_1 \in [U]^w, M_2 \in [V]^r$ are two multisets drawn from U and V respectively.

Note 3.2.[11] We know that, the power set of a multiset M_1 (resp. M_2) is the support set of the power multiset of M_1 (resp. M_2), is symbolized by $P^*(M_1)$ (resp. $P^*(M_2)$). We can define $P^*(M_1) \times P^*(M_2) = \{(A_i, B_i) : A_i \in P^*(M_1), B_i \in P^*(M_2)\}$. According this definition, the ordered pair (A, B) is called a bms from M_1 and M_2 where $A \subseteq M_1$ and $B \subseteq M_2$. That is, the bms (A, B) is an element in $P^*[M_1] \times P^*[M_2]$.

Definition 3.3.[11] Let $M_1 \in [U]^w, M_2 \in [V]^r$ be two multisets drawn from U and V respectively. A binary topological space (briefly, bms-topology) from M_1 to M_2 is a binary multiset structure $\tau_b \subseteq P^*(M_1) \times P^*(M_2)$ that satisfies the following axioms:

- (i) $(\varphi, \varphi), (M_1, M_2) \in \tau_b$.
- (ii) If $(A_1, B_1), (A_2, B_2) \in \tau_b$, then $(A_1 \cap A_2, B_1 \cap B_2) \in \tau_b$.
- (iii) If $\{(A_\lambda, B_\lambda) : \lambda \in J\} \subseteq \tau_b$, then $(\cup A_\lambda, \cup B_\lambda) \in \tau_b$.

In this case, the structure (M_1, M_2, τ_b) is called bms-topological space (or bms-space).

Note that τ_b is an ordinary set whose elements are bms.

Definition 3.4.[11] For a bms-space (M_1, M_2, τ_b) , we have

- (i) Each element in τ_b is called an open binary multiset (or open bms) and the complement of open bms is named a closed binary multiset (or closed bms).
- (ii) A sub-bms (A, B) of a bms-space (M_1, M_2, τ_b) is said to be closed bms if the bms $(A, B)^c = (M_1 \setminus A, M_2 \setminus B)$ is an open bms.

Definition 3.5.[11] Let (M_1, M_2, τ_b) be an bms topological space and $A \subseteq M_1, B \subseteq M_2$. Then (A, B) is closed bms in (M_1, M_2, τ_b) if $(M_1 \setminus A, M_2 \setminus B) \in \tau_b$, the complement of closed Bms τ_b^c .

Example 3.6. Let $M_1 = \{2/a, 1/b, 2/c\}, M_2 = \{1/d, 3/e, 2/f\}$ be a two m-set. Consider, the bms topological space $\tau_b = \{(\varphi, \varphi), (M_1, M_2), \{2/a\}, \{3/e\}, \{1/b\}, \{2/f\}, \{2/c\}, \{2/b\}, \{1/a\}\}$ is an binary multiset topological space. Now $(\{2/a\}, \{3/e\}), (\{1/b\}, \{2/f\}), (\{2/c\}, \{2/b\}, \{1/a\})$ is an open bms. Since $(\{1/b, 2/c\}, \{1/d, 2/f\}), (\{2/a, 2/c\}, \{1/d, 3/e\}), (\{2/a, 1/b\}, \{2/a, 1/b\}, \{1/a, 1/b, 2/c\})$ are closed bms.

Definition 3.7.[11] The ordered pair $(A_1, B_1)^*, (A_2, B_2)^*$ is called bms closure of (A, B) is defined as the intersection of all closed bms containing in (A, B) denoted by $\text{cl}_b(\{A, B\})$ is bms topological space (M_1, M_2, τ_b) where $(A, B) \subseteq (M_1, M_2), \text{cl}_b(\{A, B\}) = \cap \{(G, H) \subseteq (M_1, M_2) : (G, H) \text{ is a closed bms and } (A, B) \subseteq (G, H)\}$.

Priyalatha and Sowndariya

Definition 3.8.[11] An ordered pair $(A_1, B_1); (A_2, B_2)$ is called bms interior, its defined as union of binary multiset open contained in (A, B) . Its denoted by $\text{int}_b(A, B)$. It's defined $\text{int}_b(A, B) = \cup \{(G, H) \subseteq M : (G, H) \text{ is open bms an and } (G, H) \subseteq (A, B)\}$.

Example 3.9. Let $M_1 = \{1/p, 1/q\}$, $M_2 = \{1/p, 2/q, 1/r\}$ be a two m-set. We consider the bms topological space $\tau_b = \{(\varphi, \varphi), (M_1, M_2), (\{1/p\}, \{2/q\}), (\{1/p, 2/q\}, \{1/p, 1/r\}), (\{1/r\}, \{1/p\})\}$. Clearly, τ_b is an bms-topological space and the ordered pair $(M_1 \times M_2, \tau_b)$. Also the collection of τ_b and τ_b a subbms of $(A, B) = \{1/p, 1/r\}$ then $\text{int}_b(A, B) = \{1/p, 1/r\}$, $\text{cl}_b(A, B) = \{1/p, 1/r\}$.

Definition 3.10.[11] A bms (G, H) of a bms topological space (M_1, M_2, τ_b) is called bms α -open if $(G, H) \subseteq \text{int}_b(\text{cl}_b(G, H))$. The complement of bms α -open is called bms α -closed.

Definition 3.11.[11] A bms (G, H) is called bms preopen (resp. bms semiopen) in a bms topological space (M_1, M_2, τ_b) if $(G, H) \subseteq \text{int}_b(\text{cl}_b(G, H))$ [resp. $(G, H) \subseteq \text{cl}_b(\text{int}_b(G, H))$]. We will denote the family of all bms α -Open (resp. bms α -Closed and bms preopen) of a bms topological space (M_1, M_2, τ_b) by $\text{bms}\alpha\text{O}(M_1, M_2, \tau_b)$ (resp. $\text{bms}\alpha\text{C}(M_1, M_2, \tau_b)$ and $\text{bmsPO}(M_1, M_2, \tau_b)$).

Proposition 3.12. Let (M_1, M_2, τ_b) be a bms topological space, then we have (i) arbitrary union of bms α -open is a bms α -open. (ii) Arbitrary intersection of bms α -closed is a bms α -closed.

Proof. Let $\{(G_i, H_i : i \in \Lambda)\}$ be a collection of bms α -open. Then, for each $\{i \in \Lambda, (G_i, H_i) \subseteq \text{int}_b(\text{cl}_b(\text{int}_b(G_i, H_i)))\}$. Now $\cup(G_i, H_i) \subseteq \cup \text{int}_b(\text{cl}_b(\text{int}_b(G_i, H_i))) \subseteq \text{int}_b \cup \text{cl}_b(\text{int}_b(G_i, H_i))$ which is equal to $\text{int}_b(\text{cl}_b(\cup \text{int}_b(G_i, H_i))) \subseteq \text{int}_b(\text{cl}_b(\text{int}_b \cup (G_i, H_i)))$. Hence $\cup(G_i, H_i)$ is a bms α -open.

(ii) Subsequent (i) by taking complement.

Example 3.13. Let $M_1 = \{3/a, 2/s\}$, $M_2 = \{2/a\}$, $\tau_b = \{(\varphi, \varphi), (M_1, M_2), (\{2/s\}, \{2/a\}), (\{2/s\}, \{2/a\})\}$ and $\tau_b = \{(\varphi, \varphi), (M_1, M_2), (\{3/a\}), (\{1/a\}), (A, B) = (\{1/a\}), \text{int}_b(A, B) = (\{1/a\}), \text{cl}_b(A, B) = (\{1/a\})$. Since $\text{int}_b(\text{cl}_b(\text{int}_b(A, B))) \subseteq (\{1/a\})$ is a bms α -open and $\text{cl}_b(\text{int}_b(\text{cl}_b(A, B))) \subseteq (\{1/a\})$ bms α -closed.

Remark 3.14. It is obvious that every open bms (resp. closed bms) is a bms α -open (resp. bms α -closed). Similarly, every bms α -open is bms semiopen and bms preopen. Thus we have implication as shown in Figure 1. The example given below show that the converse of these implication are not true

Example 3.15. Let $M_1 = \{1/a, 2/b, 3/c, 4/d, 5/e\}$ and $M_2 = \{1/x, 1/y, 1/z\}$ and $(G, H) \subseteq (M_1, M_2)$, $\tau_b = \{(\varphi, \varphi), (M_1, M_2), (G_1, H_1), (G_2, H_2), (G_3, H_3), \dots, (G_{15}, H_{15})\}$, where $(G_1, H_1), (G_2, H_2), (G_3, H_3), \dots, (G_{15}, H_{15})$ are bms over (M_1, M_2) , defined as follows: Then τ_b defines a bms topological space on (M_1, M_2) and thus (M_1, M_2, τ_b) is a bms topological space over (M_1, M_2) . Clearly the closed bms are $(M_1, M_2)^c, (\varphi, \varphi)^c, (G_1, H_1)^c, (G_2, H_2)^c, (G_3, H_3)^c, \dots, (G_{15}, H_{15})^c$. Then, let us take (I, J)

Definition 3.16. Let (M_1, M_2, τ_b) be a bms topological space and let (G, H) be a bms over (M_1, M_2) .
 (i) bms α -closure of a bms (G, H) in (M_1, M_2) is denoted by $\text{bms}\alpha\text{cl}_b(G, H) = \cap \{(P, Q) : (P, Q) \text{ which is a bms } \alpha\text{-closed and } (G, H) \subseteq (P, Q)\}$.
 (ii) bms α -interior of a bms (G, H) in (M_1, M_2) is denoted by $\text{bms}\alpha\text{int}_b(G, H) = \cup \{(R, S) : (R, S) \text{ which is a bms } \alpha\text{-closed and } (R, S) \subseteq (G, H)\}$. Clearly $\text{bms}\alpha\text{cl}_b((G, H))$ is smallest bms α -closed over (M_1, M_2) which contains (G, H) and $\text{bms}\alpha\text{int}_b((G, H))$ is largest bms α -open over (M_1, M_2) which contains in (G, H) .

Proposition 3.17. Let (M_1, M_2, τ_b) be a bms topological space and (G, H) be a bms over (M_1, M_2) , then
 (i) $(G, H) \in \text{bms}\alpha\text{C}(M_1, M_2, \tau_b)$ iff $(G, H) = \text{bms}\alpha\text{cl}_b(G, H)$.
 (ii) $(G, H) \in \text{bms}\alpha\text{O}(M_1, M_2, \tau_b)$ iff $(G, H) = \text{bms}\alpha\text{int}_b(G, H)$.

Proof. (i) Let $(G, H) = \text{bms}\alpha\text{cl}_b((G, H)) = \cap \{(P, Q) : (P, Q) \text{ be a bms } \alpha\text{-closed set and bms } \alpha\text{-cl}_b(G, H) \subseteq$

Priyalatha and Sowndariya

(P, Q) . This shows that $(G, H) \in \{(P, Q) : (P, Q) \text{ is a bms } \alpha\text{-closed and } (G, H) \subseteq (P, Q)\}$. Hence (G, H) is bms α -closed. Conversely, let (G, H) be a bms α -closed. Since $(G, H) \subseteq (G, H)$ and (G, H) is a bms α -closed and $(G, H) \in \{(P, Q) : (P, Q) \text{ is a bms } \alpha\text{-closed and } (G, H) \subseteq (P, Q)\}$. Further, $(G, H) \subseteq (P, Q)$ for all such (P, Q) . $(G, H) = \cap\{(P, Q) : (P, Q) \text{ is a bms } \alpha\text{-closed and } (G, H) \subseteq (P, Q)\}$. (ii) In Contrast(i).

Proposition 3.18. In a bms space (M_1, M_2, τ_b) , the following hold for bms α -closure.

- (i) $bms\alpha cl_b(\varphi, \varphi) = (\varphi, \varphi)$.
- (ii) $bms\alpha cl_b((G, H))$ is bms α -closed in (M_1, M_2, τ_b) for each subbms (G, H) of (M_1, M_2) .
- (iii) $bms\alpha cl_b((G, H)) \subseteq bms\alpha cl_b((I, J))$, if $(G, H) \subseteq (I, J)$.
- (iv) $bms\alpha cl_b(bms\alpha cl_b(G, H)) = bms\alpha cl_b((G, H))$.

Proof. Out from the definition.

Theorem 3.19. Let (M_1, M_2, τ_b) be a bms topological space and let (G, H) and (K, L) be two bms over (M_1, M_2) ; then

- (i) $(bms\alpha cl_b(G, H))^c = bms\alpha int_b(G, H)$
- (ii) $(bms\alpha int_b(G, H))^c = bms\alpha cl_b(G, H)^c$.
- (iii) $(G, H) \subseteq (K, L) \Rightarrow bms\alpha int_b(G, H) \subseteq bms\alpha int_b(K, L)$.
- (iv) $bms\alpha cl_b(\varphi, \varphi) = (\varphi, \varphi)$ and $bms\alpha cl_b(M_1, M_2) = (M_1, M_2)$.
- (v) $bms\alpha int_b(\varphi, \varphi) = (\varphi, \varphi)$ and $bms\alpha int_b(M_1, M_2) = (M_1, M_2)$.
- (vi) $bms\alpha cl_b((G, H) \cup (K, L)) = bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L)$.
- (vii) $bms\alpha int_b((G, H) \cap (K, L)) = bms\alpha int_b(G, H) \cap bms\alpha int_b(K, L)$.
- (viii) $bms\alpha cl_b((G, H) \cup (K, L)) \subseteq bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L)$.
- (ix) $bms\alpha int_b((G, H) \cup (K, L)) \subseteq bms\alpha int_b(G, H) \cap bms\alpha int_b(K, L)$.
- (x) $bms\alpha cl_b(bms\alpha cl_b(G, H)) = bms\alpha cl_b(G, H)$.
- (xi) $bms\alpha int_b(bms\alpha int_b(G, H)) = bms\alpha int_b(G, H)$.

Proof. Let (G, H) and (K, L) be two bms over (M_1, M_2) .

- (i) $(bms\alpha cl_b(G, H))^c = (\cap\{(P, Q) \mid (G, H) \subseteq (P, Q) \text{ and } (P, Q) \in bms\alpha C(M_1, M_2, \tau_b)\})^c = \cup\{(P, Q)^c \mid (G, H) \subseteq (P, Q) \text{ and } (P, Q)^c \in bms\alpha C(M_1, M_2, \tau_b)\} = \cup\{(P, Q)^c \mid (P, Q)^c \subseteq (G, H)^c \text{ and } (P, Q)^c \in bms\alpha O(M_1, M_2, \tau_b)\} = bms\alpha int_b(G, H)^c$. (ii) Identical to (i).
- (iii) If follows from Definition 3.7.
- (iv) Since (φ, φ) and (M_1, M_2) are bms α -closed so, $bms\alpha cl_b(\varphi, \varphi) = (\varphi, \varphi)$.
- (v) Since (φ, φ) and (M_1, M_2) are bms α -open so, $bms\alpha int_b(\varphi, \varphi) = (\varphi, \varphi)$.
- (vi) We have $(G, H) \subseteq ((G, H) \cup (K, L))$ and $(K, L) \subseteq ((G, H) \cup (K, L))$. Then by the Proposition 3.9 $bms\alpha cl_b(G, H) \subseteq bms\alpha cl_b((G, H) \cup (K, L))$ and $bms\alpha cl_b(K, L) \subseteq bms\alpha cl_b((G, H) \cup (K, L)) \Rightarrow bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L) \subseteq bms\alpha cl_b((G, H) \cup (K, L))$. Now, $bms\alpha cl_b(G, H), bms\alpha cl_b(K, L) \in bms\alpha C(M_1, M_2, \tau_b) \Rightarrow bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L) \in bms\alpha C(M_1, M_2, \tau_b)$. Then $(G, H) \subseteq bms\alpha cl_b(G, H)$ and $(K, L) \subseteq bms\alpha cl_b(K, L)$ implies $(G, H) \cup (K, L) \subseteq bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L)$. That is, $bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L)$ is a bms α -closed containing $(G, H) \cup (K, L)$. But $bms\alpha cl_b((G, H) \cup (K, L))$ is the smallest bms α -closed containing $(G, H) \cup (K, L)$. Hence $bms\alpha cl_b((G, H) \cup (K, L)) \subseteq bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L)$. So, $bms\alpha cl_b((G, H) \cup (K, L)) = bms\alpha cl_b(G, H) \cup bms\alpha cl_b(K, L)$.
- (vii) Similar to (vi). (viii) We have $((G, H) \cap (K, L)) \subseteq (G, H)$ and $((G, H) \cap (K, L)) \subseteq (K, L) \Rightarrow bms\alpha cl_b((G, H) \cap (K, L)) \subseteq bms\alpha cl_b(G, H)$ and $bms\alpha cl_b((G, H) \cap (K, L)) \subseteq bms\alpha cl_b(K, L) \Rightarrow bms\alpha cl_b((G, H) \cap (K, L)) \subseteq bms\alpha cl_b(G, H) \cap bms\alpha cl_b(K, L)$.
- (ix) Similar to (viii). (x) Since $bms\alpha cl_b(G, H) \in bms\alpha C(M_1, M_2, \tau_b)$ so by proposition 3.18(i), $bms\alpha cl_b(bms\alpha cl_b(G, H)) = bms\alpha cl_b(G, H)$.
- (xi) Since $bms\alpha int_b(G, H) \in bms\alpha O(M_1, M_2, \tau_b)$ so by proposition 3.18(ii), $bms\alpha int_b(bms\alpha int_b(G, H)) = bms\alpha int_b(G, H)$.

Theorem 3.20. If (G, H) is any bms in bms topological space (M_1, M_2, τ_b) , then following are equivalent:

- (i) (G, H) is a bms α -closed.

Priyalatha and Sowndariya

- (ii) $\text{int}_b(\text{cl}_b(\text{int}_b(G, H)^c)) \supseteq (G, H)^c$.
- (iii) $\text{cl}_b(\text{int}_b(\text{cl}_b(G, H))) \subseteq (G, H)$.
- (iv) (G, H) is a bms α -open.

Proof. (i) \Rightarrow (ii) If (G, H) is a bms α -closed, then $\text{cl}_b(\text{int}_b(\text{cl}_b(G, H))) \subseteq (G, H) \Rightarrow (G, H)^c \subseteq \text{int}_b(\text{cl}_b(\text{int}_b(G, H)^c))$.
 (ii) \Rightarrow (iii) $(\text{int}_b(\text{cl}_b(\text{int}_b(G, H)^c))^c \supseteq ((G, H)^c)^c \Rightarrow \text{cl}_b(\text{int}_b(\text{cl}_b(G, H))) \subseteq (G, H)$.
 (iii) \Rightarrow (iv) It is obvious from Definition 3.11.
 (iv) \Rightarrow (1) It is obvious from Definition 3.11.

ON BMS α -CONTINUITY

Throughout in this section, the spaces (M_1, M_2) and (N_1, N_2) (or (M_1, M_2, τ_b) and (N_1, N_2, σ_b)) stands for bms topological spaces assumed unless otherwise stated.

Definition 4.2. A bms mapping $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is said to be bms α -continuous if the inverse image of each bms open subset of (N_1, N_2) is a bms α -open in (M_1, M_2) .

Example 4.3. Let $M_1 = \{1/a, 1/c\}$, $M_2 = \{1/b, 1/d\}$, $N_1 = \{1/p, 1/q\}$, $N_2 = \{1/r, 1/s\}$ be abms topological space on (M_1, M_2) , $\tau_b = \{(\varphi, \varphi), (\{1/a\}, \{1/b\}), (\{1/a\}, \{1/b\}), (\varphi, M_1), (\varphi, \{1/d\}), \{1/s\}, \{1/r\}, \{1/s\}\}$. Let $f : (M_1, M_2) \rightarrow (N_1, N_2)$ be a mapping defined as follows $f(\{1/a\}) = \{1/p\}$, $f(\{1/a\}, \{1/b\}) = (\{1/p, 1/r\})$, $f(\{1/c\}) = \{1/s\}$. The inverse images of the Open bms is subbms of (N_1, N_2) is a bms α -open in (M_1, M_2) . Then f is said to be bms α -continuous but need not to be in bms continuous. The following examples shows that bms α -continuous mapping need not to be bms semi-Continuous.

Theorem 4.4. Let $f : (M_1, M_2) \rightarrow (N_1, N_2)$ be a mapping from a bms space of (M_1, M_2) to bms space (N_1, N_2) . Then the following statements are true;

- (i) f is a bms α -continuous.
- (ii) for each bms singleton (S, T) in (M_1, M_2) and each open bms (L, O) in (N_1, N_2) and $f((S, T)) \subseteq (L, O)$, there exists a bms α -open (V, D) in (M_1, M_2) such that $(S, T) \subseteq (V, D)$ and $f((V, D)) \subseteq (L, O)$.
- (iii) The inverse image of each closed bms in (N_1, N_2) is a bms α -closed in (M_1, M_2) .
- (iv) $f(\text{cl}_b(\text{int}_b(\text{cl}_b(G, H)))) \subseteq \text{cl}_b(f(G, H))$, for each bms $(G, H) \in (M_1, M_2)$.
- (v) $\text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}(C, F)))) \subseteq f^{-1}(\text{cl}_b(C, F))$, for each bms $(C, F) \in (N_1, N_2)$.

Proof. (i) \Rightarrow (ii) Since (L, O) is open bms in (N_1, N_2) and $f((S, T)) \subseteq (L, O)$, so $(S, T) \subseteq f^{-1}((L, O))$ and $f^{-1}((L, O))$ is a bms α -open in (M_1, M_2) . Put $(V, D) = f^{-1}((L, O))$. Then $(S, T) \subseteq (V, D)$ and $f((V, D)) \subseteq (L, O)$. (ii) \Rightarrow (i) Let (L, O) be an open bms in (N_1, N_2) such that $(S, T) \subseteq f^{-1}((L, O))$ and there exist $(V, D) \in \text{bms}\alpha S(M_1, M_2)$ such that $(S, T) \subseteq (V, D)$ and $f((V, D)) \subseteq (L, O)$. Then $(S, T) \subseteq (V, D) \subseteq f^{-1}((L, O)) = \cup(V, D) \in \text{bms}\alpha O(M_1, M_2)$. Hence $f^{-1}((L, O)) \in \text{bms}\alpha O(M_1, M_2)$ and therefore f is bms α -continuous. (i) \Rightarrow (iii) Let (H, I) be a closed bms in (N_1, N_2) . Then (H, I) is a Open bms in (N_1, N_2) . Thus $f^{-1}((H, I)^c) \in \text{bms}\alpha O(M_1, M_2)$; that is binary multiset $(M_1, M_2) - f^{-1}((H, I)) \in \text{bms}\alpha O(M_1, M_2)$. Hence $f^{-1}((H, I))$ is a bms- α open in (M_1, M_2) . (iii) \Rightarrow (iv) Let (P, J) be a bms in (N_1, N_2) . Then $\text{cl}_b(f(P, J))$ is a closed bms in (N_1, N_2) , so that $f^{-1}(\text{cl}_b(P, J))$ is a bms α -closed in (M_1, M_2) . Therefore, we have $f^{-1}(\text{cl}_b(P, J)) \supseteq \text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}(\text{cl}_b(P, J)))) \supseteq \text{cl}_b(\text{int}_b(\text{cl}_b(\text{cl}_b(P, J)))) = \text{cl}_b(\text{int}_b(\text{cl}_b(P, J)))$. (iv) \Rightarrow (v) Since (C, F) be a bms in (N_1, N_2) , then $f^{-1}((C, F))$ is a bms in (M_1, M_2) , thus by hypothesis we have $\text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}((C, F)))) \subseteq \text{cl}_b(f(f^{-1}((C, F)))$ or $\text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}((C, F)))) \subseteq \text{cl}_b((C, F))$; that is, $\text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}((C, F)))) \subseteq f^{-1}(\text{cl}_b((C, F)))$. (v) \Rightarrow (i) Let (L, O) be a open bms in (N_1, N_2) . Let $(V, L) = (L, O)^c$, and $(E, F) = f^{-1}((V, L))$. By (v) we have $\text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}((V, L)))) \subseteq \text{cl}_b(V, L) = (V, L)$, hence $\text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}((L, O)))) \subseteq f^{-1}((L, O)^c)$. Therefore $f^{-1}((L, O))$ is a bms α -open in (M_1, M_2) . Hence f is a bms α -continuous function.

Corollary 4.5. Let $f : (M_1, M_2) \rightarrow (N_1, N_2)$ be a bms α -continuous mapping. Then

- (i) $f(\text{cl}_b(G, H)) \subseteq \text{cl}_b(f(G, H))$, for each $(G, H) \in \text{bmsPO}(M_1, M_2)$.

Priyalatha and Sowndariya

(ii) $cl_b(f^{-1}((C, F))) \subseteq f^{-1}(cl_b(C, F))$, for each $(C, F) \in bmsPO(N_1, N_2)$.

Proof. Since for each $(G, H) \in bmsPO(M_1, M_2)$ by the definition, $cl_b((G, H)) = cl_b(int_b(cl_b((G, H))))$, therefore the proof follows directly from statements (iv) and (v) of theorem 4.4.

Remark 4.7. It is clear that every bms α -continuous map is bms semicontinuous and bms precontinuous. Every bms continuous map is bms α -continuous. Thus we have implications as shown in Figure 2.

The converses of these implications are not true, which is clear from the following examples.

Example 4.8. Let $M_1 = \{1/p, 3/q, 2/u\}$, $M_2 = \{1/r, 5/s, 2/t\}$, $N_1 = \{2/a, 6/c, 1/b\}$, $N_2 = \{2/d, 1/e, 7/f\}$ and $\tau_b = \{(\varphi, \varphi), (M_1, M_2), \{1/q\}, \{1/p\}, \{2/u\}\}$ be a bms topological space (M_1, M_2) , $\sigma_b = \{(\varphi, \varphi), (N_1, N_2), \{1/f\}\}$ be a bms topological space (N_1, N_2) , then $f : (M_1, M_2) \rightarrow (N_1, N_2)$ are $bmsSO(N_1, N_2) = \{(N_1, N_2), (\varphi, \varphi), \{1/f\}, \{1/a\}, \{1/e\}, \{1/d\}, \{1/c\}\}$ define a function (M_1, M_2, τ_b) and (N_1, N_2, σ_b) . Then f is called bms semi-continuous map, since the inverse image of bms open in (N_1, N_2) in bms semiopen in (M_1, M_2) , $f(1/p, 1/t) = \{1/f\}$, $f(1/q, 1/s) = \{1/a, 1/e\}$, $f(1/r, 1/u) = \{1/d, 1/c\}$ but the f is not bms α -continuous function but also bms semiopen and bms semicontinuous.

Definition 4.6. A bms mapping $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is called bms precontinuous (resp., bms semicontinuous) if the inverse image of each open bms in (N_1, N_2) is bms preopen (resp., bms semiopen) in (M_1, M_2) .

Theorem 4.9. Let $(G, H) \in bmsPO(M_1, M_2)$ and $(I, H) \in bms\alpha O(M_1, M_2)$. Then $(G, H) \cap (I, H) \in bmsO(M_1, M_2)$.

Proof. Since $(G, H) \cap (I, H) \subseteq int_b(cl_b(G, H)) \cap int_b(cl_b(I, H)) = int_b(int_b(cl_b(G, H)) \cap int_b(cl_b(I, H))) \subseteq int_b(cl_b((G, H) \cap int_b(I, H))) \cap (G, H) = bms\alpha int_b(int_b(cl_b((G, H) \cap int_b(I, H))) \cap (G, H)) \subseteq bms\alpha int_b(cl_b((G, H) \cap int_b(I, H)) \cap (G, H)) = bms\alpha int_b(bms\alpha cl_b((G, H) \cap (I, H))) = bms\alpha int_b(bms\alpha int_b((G, H) \cap int_b(I, H))) \subseteq bms\alpha int_b(bms\alpha cl_b(bms\alpha int_b((G, H) \cap (I, H))))$. Therefore $(G, H) \cap (I, H)$ is a bms α -open of (G, H) .

Theorem 4.10. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -continuous mapping and $(G, H) \in bmsPO(M_1, M_2)$, then $f|(G, H)$ is a bms α -continuous mapping.

Proof. Let (I, H) in (N_1, N_2) be an open bms. Then $f^{-1}((I, H)) \in bms\alpha(M_1, M_2)$ and since (G, H) is a bms preopen in (M_1, M_2) , by Theorem 4.4, we have $(G, H) \subseteq f^{-1}((I, H)) = (f|(G, H))^{-1}((I, H)) \in bms\alpha O(M_1, M_2)((G, H))$. Therefore $f|(G, H)$ is a bms α -continuous map-pings.

Theorem 4.11. A bms function $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -continuous iff $f(bms\alpha cl_b(P, Q)) \subseteq cl_b(f((P, Q)))$ for every bms (P, Q) of (M_1, M_2) .

Proof. Let $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -continuous. Now $cl_b(f(P, Q))$ is a closed bms of (N_1, N_2) . so by bms α -continuity of f is, $f^{-1}(cl_b(f(P, Q)))$ is bms α -closed and $(P, Q) \subseteq f^{-1}(cl_b(f(P, Q)))$. But $bms\alpha cl_b(P, Q)$ is the smallest α -closed set containing (P, Q) . Hence $bms\alpha cl_b(P, Q) \subseteq f^{-1}(cl_b(f(P, Q))) \Rightarrow f(bms\alpha cl_b(P, Q)) \subseteq cl_b(f(P, Q))$. Conversely, let (E, C) be any closed bms of (N_1, N_2) . Thus $f^{-1}((E, C)) \in (M_1, M_2)$ and by hypothesis $\Rightarrow f(bms\alpha cl_b(f^{-1}((E, C)))) \subseteq cl_b(f(f^{-1}((E, C)))) \Rightarrow f(bms\alpha cl_b(f^{-1}((E, C)))) \subseteq cl_b(E, C) = (E, C) \Rightarrow bms\alpha cl_b(f^{-1}((E, C))) = f^{-1}((E, C))$, Hence bms α -closed. Consequently, f is bms α -continuous.

Theorem 4.12. A bms function $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -continuous if and only if $f^{-1}(int_b(K, H)) \subseteq bms\alpha int_b f^{-1}(K, H)$ for every bms (K, H) of (N_1, N_2)

Proof. Let $f : (M_1, M_2) \rightarrow (N_1, N_2)$ be a bms α -continuous. Now for any bms (E, G) in (M_1, M_2) , $int_b(f((E, G)))$ is an open bms in (N_1, N_2) ; since f is bms α -continuity, then $f^{-1}(int_b(f((E, G))))$ bms α -open, $f^{-1}(int_b(f((E, G)))) \subseteq (E, G)$. As

Priyalatha and Sowndariya

$bms\alpha int_b(E, G)$ is largest bms α -open contained in (E, G) , $f^{-1}(int_b(f(E, G))) \subseteq bms\alpha int_b(E, G)$. Conversely, a open bms (I, G) in (N_1, N_2) . Then $f^{-1}(int_b(I, G)) \subseteq bms\alpha int_b f^{-1}(I, G) \Rightarrow f^{-1}(I, G) \subseteq bms\alpha int_b f^{-1}(I, G) \Rightarrow f^{-1}(I, G)$ is bms α -open.

BMS A-OPEN AND BMS α -CLOSED MAPPINGS

Definition 5.1. A bms mapping $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is called bms α -open (resp., bms α -closed) mapping if the image of each open bms (resp., closed bms) in (M_1, M_2) is a bms α -open(resp., bms α -closed) in (N_1, N_2) .

Definition 5.2. A bms mapping $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is called bms preopen (resp., bmssemiopen) if image of each open bms in (M_1, M_2) is bms preopen (resp., bms semiopen) in (N_1, N_2) . Clearly an open bms map is bms α -open and every bms α -open map is bms preopen as well as bms α -open. Similar implication hold for closed bms mappings.

Theorem 5.3. A bms mapping $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -closed if and only if $bms\alpha cl_b(f(G, H)) \subseteq f(cl_b(G, H))$ for each bms (G, H) in (M_1, M_2) .

Proof. Let $bms\alpha cl_b(f(G, H)) \subseteq f(cl_b(G, H))$. BY the definition of bms α -closure, we have $f((G, H)) = f(cl_b(G, H))$ and so $f(cl_b(G, H))$ is a bms α -closed and f is a bms α -closed mapping. Conversely, if f is bms α -closed, then $f(cl_b(G, H))$ is a bms α -closed containing $f((G, H))$ and therefore $bms\alpha cl_b(f(G, H)) \subseteq f(cl_b(G, H))$.

Theorem 5.4. A bms function $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -open if and only if $f(int_b(P, Q)) \subseteq bms\alpha int_b(f(P, Q))$ for every bms (P, A) in (M_1, M_2) .

Proof. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -open, then $f(int_b(P, Q)) = bms\alpha int_b f(int_b(P, Q)) \subseteq bms\alpha int_b f(P, Q)$. On the otherhand, an open bms (E, G) in (M_1, M_2) . Then by hypothesis, $f((E, G)) = f(int_b(E, G)) \subseteq bms\alpha int_b(f((E, G))) \Rightarrow f((E, G))$ is bms α -open in (N_1, N_2) .

Theorem 5.5. Let $f : (M_1, M_2) \rightarrow (N_1, N_2)$ be a bms α -open (resp., bms α -closed) mapping. If (C, F) is a bms in (N_1, N_2) and (G, H) is a closed bms (resp., open bms) in (M_1, M_2) , containing $f^{-1}((C, F))$; then there exists a bms α -closed (resp., bms α -open) (D, F) in (N_1, N_2) , such that $(C, F) \subseteq (D, F)$ and $f^{-1}((D, F)) \subseteq (G, H)$.

Proof. Let $(D, F) = (f(G, H))_c$. Since $f^{-1}((C, F)) \subseteq (G, H)$, we have $f((G, H)_c) \subseteq (C, F)_c$. Since f is bms α -open(resp., bms α -closed), then (D, F) is a bms α -closed (resp., bms α -open) if $f^{-1}((D, F)) = (f^{-1}(f((G, H)_c)))_c \subseteq ((G, H)_c)_c = (G, H)$ and hence $(C, F) \subseteq (D, F)$ and $f^{-1}((D, F)) \subseteq (G, H)$.

Corollary 5.6. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms α -open mapping, then

- (i) $f^{-1}(cl_b(int_b(cl_b(f^{-1}((C, F)))))) \subseteq cl_b(f^{-1}((C, F)))$, for every bms (C, F) in (N_1, N_2) .
- (ii) $f^{-1}(cl_b(D, F)) \subseteq cl_b(f^{-1}((D, F)))$, $(D, F) \in bmsPO(N_1, N_2)$.

Proof. (i) $cl_b(f^{-1}((C, F)))$ is closed bms in (M_1, M_2) , containing $f^{-1}((C, F))$ for a bms (C, F) in (N_1, N_2) . By theorem 5.5, there exists a bms α -closed (E, C) in (N_1, N_2) , and $(C, F) \subseteq (E, C)$ such that $f^{-1}((E, C)) \subseteq cl_b(f^{-1}((C, F)))$. Thus $f^{-1}(cl_b(int_b(cl_b(B, C)))) \subseteq cl_b(f^{-1}(cl_b(int_b(cl_b(P, Q)))))) \subseteq f^{-1}((E, C)) \subseteq cl_b(f^{-1}(C, F))$.

(ii) Follows easily from (i).

Theorem 5.7. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms precontinuous and bms α -open mapping, then $f^{-1}(C, F) \in bmsPO(M_1, M_2)$ for each $(C, F) \in bmsPO(N_1, N_2)$.

Proof. We have $f^{-1}((C, F)) \subseteq f^{-1}(int_b(cl_b((C, F)))) \subseteq int_b(cl_b(f^{-1}(int_b(cl_b((C, F)))))) \subseteq int_b(cl_b(f^{-1}(cl_b((C, F)))))$. Since f is a bms α -open map, we have, by corollary 5.6, $f^{-1}((C, F)) \subseteq int_b(cl_b(f^{-1}(cl_b((C, F)))))) \subseteq cl_b(int_b(f^{-1}(cl_b((C, F)))))) = cl_b(int_b(f^{-1}((C, F))))$. Therefore $f^{-1}((C, F))$ is bms preopen in (M_1, M_2) .

Priyalatha and Sowndariya

Theorem 5.8. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms precontinuous and bms semicontinuous, then f is bms α -continuous.

Proof. Let (C, F) be any open bms in (N_1, N_2) . Then $f^{-1}((C, F))$ is a bms preopen as well as bms semiopen in (M_1, M_2) . We have $f^{-1}((C, F)) \subseteq \text{cl}_b(\text{int}_b(f^{-1}((C, F))))$ and $(f^{-1}((C, F))) \subseteq \text{int}_b(\text{cl}_b(\text{int}_b(\text{cl}_b(f^{-1}(C, F)))) = \text{int}_b(\text{cl}_b(\text{int}_b(f^{-1}(C, F))))$. Hence f is a bms α -continuous mapping.

Theorem 5.9. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is a bms preopen mapping, then for each bms (C, F) in (N_1, N_2) , $f^{-1}(\text{int}_b(\text{cl}_b(C, F))) \subseteq \text{cl}_b(f^{-1}((C, F)))$.

Proof. It follows immediately from Corollary 5.6.

Theorem 5.10. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is bms α -continuous and bms preopen, then the inverse image of each bms α is a bms α -open.

Proof. Let (C, F) be any bms α -open in (N_1, N_2) . Then $f^{-1}((C, F)) \subseteq f^{-1}(\text{int}_b(\text{cl}_b(\text{int}_b((C, F)))) \subseteq \text{int}_b(\text{cl}_b(\text{int}_b(f^{-1}(\text{int}_b(\text{cl}_b(\text{int}_b((C, F))))))) \subseteq \text{int}_b(\text{cl}_b(\text{int}_b(f^{-1}(\text{cl}_b(\text{int}_b(C, F))))))$. By the-orem 5.8 we have $f^{-1}((C, F)) \subseteq \text{int}_b(\text{cl}_b(f^{-1}(\text{int}_b((C, F))))$. Since f is a bms α -continuous mapping, by theorem 4.4 (v), $f^{-1}((C, F)) \subseteq f^{-1}(\text{int}_b(\text{cl}_b(\text{int}_b((C, F))))$. Hence $f^{-1}(C, F)$ is bms α -open.

Corollary 5.11. If $f : (M_1, M_2) \rightarrow (N_1, N_2)$ is bms α -continuous and bms preopen mapping, then one has the following:

- (i) The inverse image of each bms α -closed and bms pre continuous, bms semicontinuous are bms α -closed.
- (ii) $f(\text{bms } \alpha \text{ cl}_b(G, H)) \subseteq \text{bms } \alpha \text{ cl}_b(f(G, H))$ for each bms (G, H) in (M_1, M_2) .

Proof. It follows immediately from the previous Theorem 5.10.

Theorem 5.12. Let $f : (M_1, M_2) \rightarrow (N_1, N_2)$ and $g : (N_1, N_2) \rightarrow (O_1, O_2)$ be two bms mapping. If f is bms preopen and bms α -continuous and g is bms α -continuous, the $g \circ f$ is bms α -continuous.

Proof. It follows immediately from 5.10.

CONCLUSION

In this paper a concept of on bms α -open and bms α -continuous function is introduced in binary multiset topological space and some of its properties are studied. Also we gave some examples and theorems of these concepts.

ABSTRACT

Animal models are widely employed in diabetes research to study the mechanism of cellular function as many researchers have confirmed that diabetes is caused due to glucose homeostasis which lead for the discovery and purification of insulin. Cell line is a tissue or individual cell, as cell lines act as alternative method for animal studies. Numerous studies have used clonal beta cells generated from various rodents and animals (rat, mouse, hamster) insulinomas. As they act as alternative to animal or primary tissue in diabetes research or other disease research, *in vitro* medication testing and beta cell physiology studies. Choosing the appropriate cell line is quite difficult task as no one cell line fully replicate or resemble human cell features. Stable cell lines serve as good source for research. As diabetes is characterized by destruction of insulin secreting beta cells in the pancreatic islets of Langerhans. Considerably the efforts have been made to know the physiology of insulin production and secretions from the cells. In this review we discuss about the diabetes pathogenesis and various cell lines available for diabetes which are derived from various animals and human derived cell lines as this kind of therapy can help us in the treatment of diabetes and applications of cell lines in research.

Keywords: Diabetes, Cell lines, Insulin, Insulin secreting cells, pancreas.

**Bala Tripura Sundari et al.,**

INTRODUCTION

Diabetes Mellitus

Diabetes mellitus is a condition that causes the body to produce less or use less insulin [1], which results in an increase in blood sugar levels this condition is defined as hyperglycemia [2]. The pancreas secretes insulin, a hormone that uses glucose as a fuel source. One of the most prevalent health issues in the globe is diabetes mellitus (DM) [1]. Diabetes is related with abnormal glucose and lipid metabolism, and one component of the illness that may be assessed is oxidative stress. Oxidative stress is defined as an "imbalance of oxidant and antioxidant levels." Superoxide anion (O_2^-), hydroxyl radical (OH), alkoxy radical (RO), peroxy radical (ROO), hydrogen peroxide (H_2O_2), and oxygen singlet (O_2) are examples of reactive oxidant species (ROS). Because of their highly reactive nature, an imbalance in favor of ROS in the human system has negative consequences, such as the breakdown of protein pathways involved with age-related muscle wasting. The mitochondria in T2D patients become dysfunctional due to a shortage of glucose within the cell to make energy, and the presence of ROS causes apoptosis and cell death [3]. Numerous novel medicines have been identified and put to use in recent years to treat diabetes mellitus. As a result, it controls blood glucose levels. Frequent urination, an increase in appetite, and an increase in thirst are all signs of diabetes mellitus. Numerous problems, including ketoacidosis and hyperosmolar hyperglycemia, are brought on by diabetes mellitus. Long-term side effects, however, can include stroke, renal damage, eye disease, and cardiovascular disease.

There are three primary kinds of diabetes mellitus, 1) Type-1 diabetes mellitus, 2) Type-2 diabetes mellitus 3) gestational diabetes mellitus. In Type-1 diabetes mellitus the inefficient synthesis of insulin by the pancreas can lead to type 1 diabetes. It stops the T-cell-mediated autoimmune assault and causes B cell insulin to stop functioning. The patient must take insulin every day to maintain their health if they have type I diabetes mellitus. According to studies, Type 1 DM patients enjoy a higher quality of life than Type 2 DM patients. Type-2 diabetes mellitus is a chronic metabolic disease known as type 2 diabetes can result from both insulin synthesis and action problems. As a result, this kind of DM is known as non-insulin dependent diabetic mellitus. Obesity, dyslipidemia, and type 2 diabetes are regarded as separate risk factors for CHD and cerebrovascular disease. Gestational diabetes mellitus, most often, this kind of diabetes mellitus develops during pregnancy in some women. There is a high likelihood that type-2 diabetes mellitus will manifest in the patient later in life if gestational diabetes mellitus is present. Medical supplies must be purchased during pregnancy, and blood sugar levels must be checked frequently. A modification in diet and the use of insulin are occasionally necessary. Skeletal muscle abnormalities and congenital cardiac defects are part of the gestational diabetes mellitus syndrome. GD can occasionally lead to placental malfunction, which harms the foetus [1,4,5].

Physiology of beta cells

A mature mammalian pancreas is made up of an exocrine and an endocrine portion, the latter of which contains clusters of cells called the islets of Langerhans that are essential for preserving the appropriate level of nutrients in the blood and cellular depots [6–8]. A human pancreas weighs 91.8 g (varying between 40.9 and 182 g based on an examination of 30 samples). It includes around one billion β cells, which translates to one gram of tissue and ten milligrams of insulin enough to control blood glucose levels for two weeks. It is estimated that a single cell produces 1 million molecules of insulin each minute and contains 10 pg of insulin packed into 10,000 granules [9]. The islets of Langerhans are made up of pancreatic polypeptide-producing PP-cells (1%), glucagon-releasing alpha cells (15–20%), somatostatin-producing delta cells (3–10%), and insulin-releasing beta cells (65–90%), which form the islet's core. The most commonly researched of these are beta cells, which control the synthesis and release of insulin by coupling food metabolism with electrical activity [6].

INSULIN

Since the peptide hormone insulin is only produced by β -cells of the pancreatic islets of Langerhans in adult mammals, these cells are crucial for preserving blood glucose homeostasis. In order to maintain blood glucose levels within specific ranges, β -cells not only generate insulin but also secrete the hormone in amounts appropriate to the

**Bala Tripura Sundari et al.,**

blood glucose concentration. The development of so-called non-insulin-dependent diabetes, often known as type 2 diabetes mellitus, the most prevalent metabolic condition in men, is mostly attributed to pancreatic β -cell dysfunction [10]. Under both basal and glucose-stimulated conditions, the presence of many signals from various sources ensures proper β -cell function. These signals come from a variety of sources, including as humoral elements (hormones, vitamins, minerals, ions, etc.), nerve stimulation, and intra-islet cell-cell communication elements. While glucagon, which is secreted from pancreatic beta cells and stimulates insulin release, and somatostatin, which is secreted from δ -cells and inhibits insulin release. Recent research shows that insulin plays a beneficial role in a number of cellular functions, including the control of gene transcription, translation, Ca^{2+} flow, insulin secretion, and maybe cell survival [11–17].

Insulin biosynthesis

Insulin is produced by beta cells in response to an increase in blood nutrient concentration. The insulin gene has four exons and two introns with 1150 Da, the hormone's precursor (preproinsulin) carries a signal peptide that sends the peptide chain to the interior of the endoplasmic reticulum (ER) and consists of four peptides: an N-terminal signal peptide, a B chain, a C chain, and an A chain. The signal peptide is cleaved and disulfide bonds are formed in the ER to create proinsulin [18]. Proinsulin is transported to the Golgi apparatus and packaged into vesicles. After the C peptide is cleaved, mature insulin is produced in the vesicles and kept as zinc-containing hexamers until release [6,19].

Insulin Release

The primary physiological insulin secretagogue is glucose. When the glucose concentration was raised from 3 to 9 mM, electrical activity was recorded from a beta cell in an intact islet. Extensive experiments have revealed that a glucose concentration greater than 7 mM results in depolarization of the cell membrane from the resting potential (about -70 mV) up to a threshold from which a rhythmic electrical activity known as bursting is elicited. Bursting is composed of an active period of Ca^{2+} -dependent action potentials followed by a hyperpolarized silence phase. The duration of the active phase increases as the glucose level rises. An increase in cytoplasmic calcium concentration - $[\text{Ca}^{2+}]$ - initiates insulin secretion. The cytoplasmic ATP content is too low in the absence of glucose to keep the ATP-sensitive K-channels (KATP) closed. When the extracellular glucose concentration rises, glucose enters the cells via GLUT2 transporters, and metabolic breakdown of glucose increases ATP generation, which is responsible for cell closure. KATP in the plasma membrane depolarizes it, resulting in the opening of voltage-gated Ca^{2+} channels and an increase in external Ca^{2+} inflow. Bursts of electrical activity and Ca^{2+} influx result in insulin release [20].

CELL LINE

Cell line consist of biological tissue and an individual cell. Cell lines act as an alternative method instead of performing animal studies. It also helps in studying the particular activity of drugs. Newer drugs and toxins can be tested using various types of cell lines. Cell culturing is highly reliable as it has direct access and has easy evaluation of tissues, and it act as a tool for:

- Studying diseases
- Studying Cellular toxicity
- Studying Cellular mechanism

The study of cellular mechanisms can lead to the discovery of new molecular drug targets [21–23].

Cell line are of three types***In-vitro* cell line**

In-vitro methods or techniques play an important role in confirming a particular biological activity of a synthetic or natural compounds before animal experiment. *In-vitro* cell line studies should be supported with certain special conditions for the cells to survive. This includes:

- Media supplements
- Growth media

Bala Tripura Sundari et al.,

- Collagen
- Other complex substances[1].

IMPORTANCE OF CELL LINES IN RESEARCH

Animal models play a crucial role in the development of new drugs and effective treatment for specific diseases.

As animals and humans are biologically similar.

Use of animal models during preclinical studies can be:

- Time consuming
- High maintenance in case of cost
- Housing and breeding facilities
- Can raise ethical concerns regarding animal handling
- There may be opposition for the use of animals in research by animal right activists.

To overcome all the above issues, the new *in vitro* techniques were implemented in drug development studies. Benefits of cell line models are:

- Reducing the usage of animal models
- Results can be obtained Rapidly
- Lowering the cost of research
- Simple and easy to follow
- Less time consuming
- It follows 3R Principles (Reduction, Refinement, Replacement) [24].

DIFFERENT TYPES OF CELL LINES USED IN VARIOUS DISEASES

Breast cancer

Breast cancer is a type of cancer which originate from the tissues of breast mostly from the milk ducts inner lining, it is most common cancer in women as it can lead to death [25]. Cell lines are extensively used for research purpose particularly in cancer as it has a greater number of advantages like handling is easy. They can be stored in cell banks for many years [26].

Prostate cancer

Prostate cancer is the second most common cancer as first stands lung cancer, it is seen in men it may lead to death [34,35]. It can be asymptomatic at early stages which can be cured with or without treatment. Mostly caused symptoms are difficulty in urination with increased frequency and nocturia and prostate hypertrophy [36].

Parkinson's disease

Parkinson's disease is a degenerative disease it causes disability in the individual. This disease was caused due to loss of neurons in the substantia nigra pars compacta (SNpc) which leads to dopamine deficiency [59].

CELL LINES USED IN DIABETES MELLITUS RESEARCH

An illness that may benefit from cell therapy is insulin-dependent diabetes mellitus (IDDM). An autoimmune illness called IDDM is brought on by a variety of largely unidentified genetic and environmental factors. The destruction of the insulin-producing cells in the pancreatic islets of Langerhans by lymphocytes, which results in an insulin shortage, is the cause of the condition. Insulin injections are currently used to treat IDDM. However, it can be challenging to calculate the precise insulin dosage, which can result in episodes of hyperglycemia or hypoglycemia. Many IDDM patients experience serious consequences over the long run as a result of hyperglycemia. If insulin delivery could be continuously modified according to evolving physiological needs, insulin delivery to IDDM patients would be much enhanced. Several organizations have tried to create insulin gene therapy. By introducing the ability to create proinsulin and convert it to mature insulin into non- β cells like pituitary cells or hepatocytes, a number of groups have sought to develop insulin gene therapy for diabetes. The main benefit of using autologous insulin-producing non- β cells is that they do not cause immunological issues such transplant rejection or

**Bala Tripura Sundari et al.,**

autoimmune to β cells. But the biggest challenge with this strategy has been recreating in non- β cells the tightly controlled insulin secretion of normal cells. They not only do the islet cells make insulin, but they also include sensing and coupling mechanisms that allow them to control its release in response to variations in the blood content of a number of substances, most notably glucose. Therefore, replacing the damaged cells with intact cells is considered to be the best course of action for treating IDDM[67].

Different types of cell lines available**In vitro cell lines**

- 1) Pancreatic
 - ✓ RIN m5F
 - ✓ HIT T15
 - ✓ BRIN BD 11
 - ✓ INS 1
- 2) Adipocyte
 - ✓ 3T3 L1
- 3) Hepatic
 - ✓ Hep G2
 - ✓ H 4 IIE
- 4) Muscle
 - (a) Skeletal muscle
 - ✓ L6
 - ✓ C2C12
 - ✓ BC3H1
 - (b) Smooth muscle
 - ✓ Caco2 [68].

Insulin secreting cell lines Derived from Rodents and Insulin secreting cell lines Derived from Humans

These are the various cell line which are derived from various resources [68,95].

Applications of insulin secreting cell lines in research

- (a) It is used to study the beta cell physiology
 - ✓ Used in studying cell mechanism
 - ✓ Used in studying cell secretions
 - ✓ Used in studying about cell proliferation
 - ✓ Used in studying about cell defence
 - ✓ Used in studying about cell death
- (b) It is used to study test models
 - ✓ Used to study drug targets
 - ✓ Used to study drug screening
 - ✓ To study beta cell cytotoxicity [95].

RESULTS**Cell lines derived from rats**

This cell lines help in the studying the mechanism of insulin and somatostatin secretion. In GLP-1 (glucagon-like peptide-1) it increased the capacity and affinity to insulin binding in time to time [96]. Using rat insulinoma cell line, RIN m 5 F cell line it was observed that it shows Anti diabetic activity of plant extract (*Scoparia dulcis*)[97]. The BRIN-BD 11 cell lines have responded to various stimuli of insulinotropic including glucose, amino acids, hormones. Drugs and neurotransmitter and it is also used for screening of anti-diabetic activity of plant materials and novel insulin releasing natural products insulin secretions have been reported [98–100].

**Bala Tripura Sundari et al.,****Cell lines derived from hamster**

HIT-T15 cell line was employed to study the protein kinase c effect up on change in ca^{+2} ions, results states that the protein kinase C activation leads to release of insulin by glucose induction and thus modulating K^{+} channels functioning in the cells [101]. Other study reveals that acetyl choline induced insulin released by signal transduction pathway [102]. The above cells were used to evaluate the hypoglycaemic effect of herbs. In *Tinospora crispa* it shows insulinotropic action was investigated using the above cell lines [103].

Cell lines derived from mouse

MIN6 cell lines was used for studying the importance of mitochondria DNA and ATP production in insulin secretion which are induced by glucose and leucine. It is also used to screen hypoglycemic agents through insulin action [104,105].

Cell lines derived from humans

The CM cell lines are derived from humans these cells grow slowly and lost their characteristics rapidly. The HIN-D8 cells are also human derived insulinoma they are sensitive to glucose, these cultures have shown effective insulin secretions from human derived cells (106). Endo C-beta H1 cell line by transduction of foetal pancreatic bud with SV40 under insulin promotor implanted into severe combined immunodeficiency mice for expression and formation of cell line. These cells exhibit high expressions of beta cell markers and was responsive to glucose same as primary islet cell do [91]. As islet transplantation is an evolved method for treatment of diabetes in early 1970s due to some immense research work. These include standard method for isolation of islets cell and injected with immunosuppressant drugs to prevent tissue rejection as host mechanism would not accept the isolated cells. As survival of the cell in long run can be a suspense as many factors like immunorejection, autoimmunity, drug toxicity and poor revascularisation can obstruct the transplantation as a result patient may need go through multiple transplants and insulin therapy to cover the need of the body metabolism[107–109].

CONCLUSION

Several animal models ha cell lines been made available for various diseases. As diabetes is a globally widespread disease and most common disease various animal models like rats, hamster, mouse and human derived cell lines were established for research purpose. The development of stable and functioning of insulin releasing cell lines would allow the generation of more suited models for research of human beta cell physiology while potentially providing an unlimited source of cells for anti-diabetic cell treatment many activities and experiments have been conducted to know the mechanism of cellular function, genetic, endocrine, metabolic changes underlying etiopathogenic mechanism. Many of the scientists have got positive results using the vitro cell lines and they have various applications in research. So, cell lines are an added advantage for proving *in vitro* and *in vivo* studies.

ABSTRACT

Seaweeds are commonly known as Marine macroalgae. Marine macroalgae shall thrive horizontally in an abundance of zonations, including brackish water environments, seas, estuaries, and the supra tidal (sub littoral) intertidal(littoral) and subtidal regions (sub littoral) where dead corals, rocks, stones, pebbles, and other appropriate substrata are available for their attachment. seaweed diversity was studied in the two explored coastal areas in Mandapam and Rameshwaram Island in south coast of India. The predominant diversity data were analysed with totally 30 species including 7 species of Chlorophyceae, species of 15 Phaeophyceae and 8 species of Rhodophyceae were recorded. The study areas are flourishing with 20–30 seaweed species. It is inferred that the seaweeds are well diversified in the month of December to February. The baseline data generated through this project is going to promote indigenous seaweed conservation efforts.

Keywords: Rhodophyceae, Chlorophyceae, Rameshwaram, Marine macroalgae

INTRODUCTION

Algae are Thallophytes (plants lacking roots, stems and leaves) which have chlorophyll A as their primary photosynthetic pigment which lack a sterile covering of cells around reproductive cells. Algae is derived from the Latin word meaning alga –it washes away from the plants or simply known as seaweeds. The Chinese term is

**Manikandan Murugesan and Priya**

referred as Tsau. The Hawaii term is Limu. Romans called as Fucus. In Tamil, it is called as Pasigal. Algae are extremely diverse group of organisms consisting predominant in aquatic plant kingdom. The wide spread overall view of taxonomy is essentially retrogressive. Sea water algae (marine) popularly known as Seaweeds, it can be grown in solid state such as rocks, pebbles, shells, corals and ped rocks(22). Hence it also found in coastal litters such as ropes, nets, and decaying wooden pieces in the sea, and epiphytes on other plants like seagrasses and shallow in mangroves, intertidal and sub – tidal zones and deep waters of sea, even the depth of 150 m.

Seaweeds belongs to the division thallophyta (plant bodies contain thalloid in nature).Sub kingdom Cryptogamae. Seaweeds are classified into three classes via. Chlorophyceae(green) Phaeophyceae (brown) Rhodophyceae (red). Based on this colour and type of photosynthetic pigments they can vary in size, difference ranging from unicellular organisms for instance (*Acetabularia*) to multicellular forms example (*Sargassum*, *Ulva*). In the marine resources, seaweeds is important one. In current period (raw materials) were used in many other industries such as textiles, pharmaceuticals, dairy, manure, paper, rubber products and fodder for domestic animals. Nowadays various pharmaceutical companies are concentrating in seaweeds. Marine biodiversity comprises the earth surface of about 70% of hydrosphere (aquatic habitat) it occupies 3% of fresh water and 97% of marine water. Marine ecosystem is the largest one and supports innumerable plants and animals. Taxonomically, the marine algae plants are very diverse and it include four groups. Such as macroscopic algae, microscopic free floating phytoplanktons, Mangroves, Sea grasses.

India is the 7th largest country in the world global geographical area, and it contains the coast line of 7,500 sq. km. Indian coast has a massive network of creeks, cliffs, mangroves, coral reefs, backwaters, bays, estuaries and lagoons .and it supports the marine flora and fauna. Geographically, it is divided into two major groups namely the east coast and west coast. In worldwide, 45,000 species of algae are nearly reported so far, and seaweeds represent about 11,500 species. In the seaweeds, Rhodophyceae is dominant and about 6,500 species, followed by Phaeophyceae with 2,000 species and Chlorophyceae contains 1,500 species (9). In India, a total 860 species of seaweeds have been reported and it includes of 430 Rhodophyceae, 286 Chlorophyceae and 185 Phaeophyceae (25) showing the seaweed diversity and variations. The algal resources can be explored in Mandapam, Ramanathapuram district by various persons in intensive manner. The predominant taxonomical works of the seaweeds will help to assess the conservation status of seaweed resources in our country.

The Rameshwaram is considered the icon for algal species and species diversity. The distribution of seaweeds is significantly influenced by the habit and habitat, due to tidal exposure period and human interface(24). In India, it has nearly 770 species of seaweeds have been reported from the Indian maritime environments(18). Algal diversity is rich in this Island. In this area it consists of plants and animal weed and well known for pilgrim places. The temple and the town are considered as a holy pilgrimage site for Shivas and Vaishnavas and the seaweeds is mostly used for food products and cosmetics items. Seaweeds are one among the renewable and economically valuable marine resources (3).Some algae are edible to eat and cook. The utilization of seaweed extracts in pharmaceuticals, nutraceuticals, and soil enhancers. Additionally, they contain more and more valuable as a food source or “sea vegetable” as a result of improving the advantages of consuming seaweed and its extracts: enhanced loss of weight (17). Combating mineral deficiency (11), antioxidant (12) and anti-tumour properties (26). The diversity and distribution of seaweeds along the Indian coast is not constant in all the states, they have huge or minor variations in the term of seaweed diversity.

ECONOMIC IMPORTANCE OF ALGAE

For food and energy algae is the primary source. *Porphyra* is the most important red algae used as a human food. Agar is a gelatinous, clear, nitrogen free extract from the above-mentioned genera of red algae. Agar is used in cosmetics, paper textile, leather industry, food industry and many commercial products. The alginates are used as thickeners in food industry, cosmetics and textile industry in printing pastes, production of plastics, artificial fibres, rubber industry and in latex production, gelling agents in confectionary, dental impression, powders, paints

**Manikandan Murugesan and Priya**

and ice creams. Carrageenin is used to stabilize emulsions and as remedy for cough hand clearing agent in juices, liquors, beet sugar, food industry, emulsifier in dairy products. Some seaweeds contain rich source of iron, copper, manganese, boron, and iron substances. Several brands of liquid fertilizers were prepared from the seaweeds are now available in market. Brown algae is used as anticoagulant of blood, antibiotics, laxatives, stops bleeding. Biological warfare against mosquitos. It is used in the role of water supply.

MATERIALS AND METHODS**STUDY AREA**

The present study area Mandapam and Rameshwaram belongs to Ramanathapuram district located nearly 34 km away from the central town. In this area, the algal communities are highly rich in number, and we can see various varieties of algae is not static. It changes according to the waves and tides, and climate too.

MANDAPAM- WORK AREA**FIELD SURVEY**

The study area covers the Mandapam and Rameswaram region. Three field surveys were done during the period of December to February. More information was collected from the local people. The present study mainly concentrated in the algal communities to know about the status of seaweeds including collection and preservation for future studies.

METHOD OF COLLECTION

The present taxonomic study of the algae on Mandapam coast is mainly based on collection of seaweeds through field surveys. Thirty algal specimens were collected through polythene bags. During this field surveys, the habit and habitat of the seaweeds were noted. The latitudes and longitudes of the collection areas were monitored. The seaweeds were photographed using the canon digital camera. For preservation techniques, we collected the ocean's water to preserve. In addition, collecting the filtered samples using a mixture of 4% formalin and 96% of double distilled ocean water.

RESULTS

The present study contains the algal specimens belonging to the systematic position, general characteristics and economic values of the species. And it reveals that the 30 kinds of seaweed species consist of Rhodophyceae, Chlorophyceae, Phaeophyceae and Myxophyceae that were available in Mandapam and Rameswaram coast. The diversity of coastal habit and habitat such as rocks, bedrocks, estuaries, backwaters, cliffs, calcareous and designing stones consists a wide range of algal vegetation.

Table:1 -List of Algal species

Table:2 -Preserved Specimens.

Table:3- List of algal specimens collected from Mandapam and Rameswaram region, Ramanathapuram district, Tamil Nadu. It denotes that the algal specimens, descriptive part and its economic values of algae.

The result shows that the predominant study parameters were been recorded during the month of December to February. Economically important algae are used for various process, the seaweeds can be utilized by the local fisher peoples for their business and giving the seaweeds to the industries for their financial conditions.

**Manikandan Murugesan and Priya**

DISCUSSION

The collection processes of algae encompasses series of activities, Field sampling is the first step in a sequence of actions that make up the algal gathering process. All of these proven approaches need patience, time, and adequate ability. likewise, some lab supplies are required in order to cultivate the algae. (Anderson 2005). (Friedmann & Ocampo-friedmann 1984, Flechtner et al.1998, Budel et al.2009).Approximately thirty unique seaweed species have been revealed in my research. Majorly it belonging to the class of Rhodophyceae, Chlorophyceae, Phaeophyceae and Florideophyceae that were available in the Mandapam coastal regions. Among these classes Rhodophyceae and Phaeophyceae comprises the algal flora, mostly Phaeophyceae comprises the seaweed classification. In the Mandapam coast region contain the habitats such as laid stones, estuaries, calcareous, bedrocks, backwaters and cliffs exhibit a wide range of seaweed vegetation in different seasons. During the climate conditions the P_H can be varied. It also consists of water salinity level and temperature level.

The distribution of a number of species was common, that it expanded with time, that some species were fairly spread, and that some species were randomly distributed. my present studies also show that various endemic and commercially significant seaweed species can be found along the Mandapam shoreline in the Ramanathapuram district. Out of about thirty seaweeds present on Indian shores, some indigenous taxa have been identified through an investigation Some of the fauna I have collected economically significant in the region of Mandapam, and Rameswaram Ramanathapuram district. Algae can provide a wide range of economic advantages. The people who reside in the Mandapam region can cultivate algae. Many of the pharmaceutical and cosmetics industry can be collected the algae by using the local people for their adaptability of people financial position(18).Majorly, it based on the climate factor.

The “Direct collecting method” is one of the best methods to know the algal diversity. It could be applied to all the macro and micro algae. Saunders and Hommers and reported that the wondrously diverse eukaryotes that constitute the red algae have been the focus of numerous recent molecular surveys and remain a rich source of un described and unknown species for the traditional taxonomist. We provide a comprehensive review of the literature pertaining to the antiquity, diversity, and systematics of the red algae and propose a contemporary classification based on recent and traditional evidence. The current system of red algal classification creates the illusion that this lineage is relatively limited in its diversity when compared to chlorophytes and chromophytes, the wide range of morphology observed among red algae and a wealth of contemporary ultra structural and molecular data that speak to the antiquity and diversity within Rhodophyta.

CONCLUSION

The predominant diversity of seaweeds in two stations viz. mandapam and Rameshwaram, Gulf of Mannar was investigated during 2020. Totally 30 species including 7 species of Chlorophyceae, 15 species of Phaeophyceae and 8 species of Rhodophyceae were recorded. Seaweed diversity in Rameshwaram coastal areas were satisfactory when compared with earlier reported works. An effort was made to briefly study the algae, their status, and some algae can be mentioned as rare and endemic in nature. Finally, algae were important to human, plants and animals. Most of the algae were very useful and economically important one. Basically, algae are rich in proteins, carbohydrates, oils, vitamins and minerals. The exploitation, utilization and conservation of seaweeds achieved effectively and well documented.

Manikandan Murugesan and Priya

ACKNOWLEDGEMENTS

The authors extend their regards to the local peoples for permitting us to perform this work. Our sincere gratitude to Department of Botany, PSG College of Arts & Science, Coimbatore, for assistance and all who assisted in our field surveys and samplings.

FUNDING

No grants/funds were received for this project.

Declaration of competing interest

The authors declare that they have no conflict of interest.

Table: 3 List of algae collected from Mandapam region, Ramanathapuram district, Tamil Nadu.

S.NO	BOTANICAL NAME Vernacular name	DESCRIPTION	ECONOMIC VALUES
1	<i>Ulva lactuca</i> Linn.,	Thallus looks like light, flat and thin yellowish green, membranous, ovate to roundish. In apical portion cells are regular. In middle portion, it is irregular. In basal region it is round.	It is used in cooking vegetable soups and salads. <i>Ulva lactuca</i> contains the cobalamin or vitamin B12.
2	<i>Halimeda gracilis</i> Harvey ex J. Agardh	Thallus is mostly large, prostrate, moderate, but slightly calcified (up to 24cm long.) and intricate populations forming thick cushion on the substratum. The upper margin segments are entire generally trilobed or slightly undulate. Attached with multiple holdfast. Branching cannot be seen in the basal portion.	It is used as fertilizers and animal feeds. It consists antifungal and anti-bacterial properties.
3	<i>Halimeda tuna</i> (J. Ellis & Solander) J.V. Lamouroux	Thallus erect, single, moderate to lightly calcified. Thallus are whitish green up to 10-20cm long. Sub cuneate to sub cylindrical. Peripheral utricles are hexagonal in surface view.	It is used as animal feed and acts against the bacterial diseases.
4	<i>Stoechospermum marginatum</i> (C. Agardh) Kützinger	Thallus erect, flat, spatulate with dichotomously branched fertile plants without midrib. Plants have large tufts, consists a length of 40cm, and 12-15cm or more in height. Numerous rhizoids from the base attaining the plants to the substratum. Thallus are brown in upper parts, and dark brown in the basal portion.	It is used as a source of alginates. It is used as fertilizer for food products.
5	<i>Gracilaria edulis</i> Greville	Thallus is reddish brown in colour. It grows up to 30cm tall, with discoid substratum. Cylindrical ending in pointed apexes. sub-dichotomous in nature, and branching pattern is 3-4 order. Branching dense, fasciate, divaricate, up to 7 orders and with long branch intervals, branches 1-1.5 mm in diameter. They form clump with attenuated base and they are attached to coral stones or to the substratum.	<i>G. edulis</i> is used as fertilizer and animal feed. It is also used in the waste water purification process.
6	<i>Portieria hornemanii</i> (Lyngbye) P. Silva	Thallus are erect, tall reddish to coralline in colour. Flattened branches. In the base portion, thallus	<i>P. hornemanii</i> is also used for human food as vegetable salads.

Manikandan Murugesan and Priya

		is broad. Irregular branches, divaricate, pinnate, alternate and subopposite in upper portions. Margin entire, uniaxial structure, forming arcs, branching tips are slightly pointed and curled.	It is a source of carrageenan related to lambda carrageenan, which can be 35% of dry weight.
7	<i>Dictyota dichotoma</i> (Hudson) Lamouroux	Fructiferous structures, on the middle thallus portion, leaving a narrow sterile margin on both sides. Dichotomously branched with parallel sides, forming a large or small tufts and entangled masses. Branches more profuse towards upper reaches of fronds and narrow extremities.	It is used in making the fruit juices, beer production, ice creams flavouring sauces, milk shakes, pastries, salads and extract is used in gelling agents and also stabilizers.
8	<i>Dictyota bartayresiana</i> J.V. Lamouroux	Blades are flat and slightly branched dichotomously, equal angled. Margin entire, apex acute. Sometimes, it is broadly rounded. Tetrasporangia on both sides, either it is solitary. Gametangia on both sides, either solitary or few together scattered over the whole surface.	It is used as anti -microbials, as larvicides and cytotoxins.
9	<i>Ulva reticulata</i> Forsskal	Thallus looks like reticulate or net liked, pale green in colour. It grows up to the height of 8-15 cm in length and 10-20 cm width. It is attached to the substratum. Disc like hold fast. Thallus texture is delicate and smooth. Each cell contains single parietal chloroplast.	It is used for jellies production, medicine, food and animal feed.
10	<i>Hypnea valentiae</i> (Turner) Montagne	Thallus looks like dark-red brown in colour. Thalli are 10-15 cm in height, erect and long percurrent, lateral branches with irregular radial laterals becomes gradually shorter and it have numerous fine lateral branches and few branched with the pointed tips. Several axes with sparse branches, spinous ramuli throughout the length.	It is edible and used for the salads. Chemical waste containing chromium can be removed by using the species. It is abundant and ch available. Carrageenan yielding plant.
11	<i>Turbinaria conoides</i> (J.Agardh) Kützinger	Thallus erect, yellowish brown or dark-brown in colour attached by a branched holdfast. It is compact, cone-like radially organised plant. Main axis and branches are slightly compressed. Branches dentate, turbinate, numerous. Vesicles inflated in the	It is used for fever, as a fertilizer. It is an insect repellent, pesticide and antibacterial. It has a dietary fibre content.

Manikandan Murugesan and Priya

		distal margin of the blade.	
12	<i>Caulerpa racemosa</i> (Forsskal) J. Agardh	The chloroplasts containing the chlorophyll are free. It consists a single cell with large number of nuclei. It possess a rhizome with creeping, cylindrical and highly branched. It is found in rocks, sand and slit- covered substrate attached by the numerous rhizoids arising from the creeping stolon.	It is edible and rich in ascorbic acid, folic acid, proteins, minerals, vitamin A and vitamin, B1. In Japan and Philippines, it is used as salads.
13	<i>Gracilaria salicornia</i> (C.Agardh)	Thallus consists of brittle, cylindrical to compressed branches 25mm in diameter. In shady places, and looks like brownish or dark green in colour. In sunny spots, it looks yellowish in nature. It grows on reefs and forms thick intertwining mats up to 6 inches. Both axes and branches are regularly or irregularly constricted. Plants often prostrate and overlapping with lateral branches.	It is used as the substitute for wild <i>G.coronopifolia</i> . It crunchiness is gaining favour.
14	<i>Ulva flexosa</i> J.Agardh	It consists of smooth and tubular thallus. Chloroplasts is present in the outer region of cells. Small rhizoidal region. It is differentiated into the branches. It is attached to the substratum by a round basal disc. Thallus may grows up to 25cm long.	It is used as a bio-indicator for metal contamination. It is used in waste water treatment in dye manufacturing, tannery, textile and cosmetic industry.
15	<i>Padina gymnospora</i> Kutzing	Thallus looks like olive brown in colour. Both sides of the thallus hairy substances are present. In TS the thallus is composed of 4-6 layers of cells in mid region it consists of 9 layers near to the base portion. It is attached by the small stupose rhizoidal base, fabelate and composed of several lobes with inrolled (slightly to moderately calcified).	It is used as fertilizer, animal feed, traditional medicine, and a source of the phycocollaid alginates. It is used as a substitute for salts for high Blood Pressure patients.
16	<i>Kappaphycus alvarezii</i> (Doty) <i>Doty ex silva</i>	The thalli are smooth, cylindrical, cartilaginous and bushy with multi axial prostrate or erect branches. Sometimes branching is irregularly pinnate, opposite or falsely dichotomous. Secondary branches are common on the older segments. Primary branches arise one at a time	It is used as a stabilizer and emulsifier in ice creams, instant puddings, chocolate milk, coffee creamer. In ancient times, Chinese have used carrageenan for gelling of milk.

Manikandan Murugesan and Priya

		from near the tip of non – damaged axis.	
17	<i>Jania adherans</i> J.V Lamouroux	Thallus are mostly tall, epiphytic, consisting a calcified crustose holdfast. Branches arising from the holdfast or stolon with or without secondary holdfast. It arises from the main axis or other lateral branches. It consists of globular and wedge-shaped cells.	It is used in cosmetics and natural beauty products and moisturizing the skin.
18	<i>Halymenia floresia</i> (clemente) C.Agardh	Thallus looks like slightly red, and somewhat rose-red in colour. It reaches to 15-40cm in height, 3cm broad, mucilaginous, tapered towards to the acute spines. Discoid holdfast. Inner cells are ovoid and becoming stellate. In the outer cortex, spermatangia is present.	<i>H.floresia</i> is very palatable and readily eaten by both tangs and angel fish. It is used in animal fertilizer. In animal feed and health, it includes water extraction under high pressure, while algal fertilizers prepared.
19	<i>Spatoglossum variabile</i> Figari & De Notaris	Thallus branched, filamentous, matted holdfast, linear and membranous. It consists of rough surface. In medullary part it consists of two layers of cells. Dichotomous Branches In that proliferations are present, usually present in the apical part. It consists of polygonal in shape.	N-butyl and isopropyl 3,5-dimethoxy-4-hydroxyxinnamate were isolated from <i>Spatoglossum variabile</i> .
20	<i>Sargassum tenerrimum</i> J.Agardh	Pyramidal in shape with basal adhesive disc -shaped holdfast. The axis is rounded and glabrous. It reaches up to 30-40cm height, Leaves are wide and tapering at the end and thin, translucent and linear-lanceolate, with toothed margin. The midrib is indistinct.	It is used as a natural fertilizer. It forms a source of production of animal feed, fertilizer, sodium alginate and medicine.
21	<i>Sargassum plagiophyllum</i> C.Agardh	Flask shaped receptacles are found and consists the specialized branches. It consists of highly branched thallus and toothed edges. It reproduces through the process of fragmentation. It is erect, flat or cylindrical in structure. The leaf structure is flat with dentate and distinct midrib. Margin is entire, with acute apex. It consists of air bladders. It helps to swim in water.	It is used in numerous ways such as a source of food, feed, fertilizer, medicine, antioxidant and heart related diseases.
22	<i>Sargassum myriocystum</i> J.Agardh	It consists of pyramidal in shape with basal disc or holdfast arises from the short primary axis. They are thin,	It is used for the biosynthesis of silver and gold nanoparticles by the

Manikandan Murugesan and Priya

		translucent and linear-lanceolate, with toothed margin. The midrib is indistinct. Leaves are tapered at the ends.	reduction of chloroauric acid.
23	<i>Sargassum muticum</i> (yendo) fensholt	Thallus is bushy, elongated, cylindrical, alternately pinnately branched, whorl of distinctly flattened sculpted leaves at the base. it looks like brown to yellowish in colour, a length up to 10 to 15 cm each. Life span consists of the is 3- 4 years. Air bladders were present and it is elliptical in manner. Basal holdfast penetrating and conical form.	In agriculture it is used as a source of nitrate and potash varieties for fertilization, pharmaceuticals, cosmetics and health fields. It also carries the process of bio-sorption of heavy metals such as cadmium.
24	<i>Sargassum vulgare</i> C.Agardh.	Leaves become crowded, partly twisted, linear lanceolate to linear, long and 2-4 mm broad with irregularly serrate margins, leaf or ribbon shaped pedicels. Reproductive branches were short up to 7 mm long. In sometimes, dichotomously branched or cylindrical receptacle.	It has commercial significance due to their physical properties such as gelling, water-retention and emulsifiers. High commercial value.
25	<i>Gelidiella acerosa</i> (Forsskal) Feldmann & G. Hamel	Thallus looks like purplish, cartilaginous in texture, formed by the several tufts. It is erect and cylindrical axis erect up to 5-7 cm high with a basal portion. It can be attached to the substratum by rhizoids on rock region, dead corals with basal creeping rhizome. In that, branches usually distichously opposite or sub opposite pinnate one.	In Philippines and Vietnam, it is used in the preparation of agar forming hard jellies. It can be eaten as vegetable or salads and with mixed rice items.
26	<i>Liagora ceranoides</i> J.V. Lamouroux	Rhizoidal filaments cut off from the basal cells. Thalli is bushy, stiff and heavily calcified. Cylindrical branches 0.5-1.5 mm diameter, stiff hair like filaments, inconspicuous hold fast and it forms hemispherical mounds.	It is used in pharmaceutical industry.

ABSTRACT

This research paper focuses on $n^*\mu$ -closure and $n^*\mu$ -interior under certain conditions. Then introduce $n^*\mu$ -continuous maps and $n^*\mu$ -irresolute maps. Then present contra $n^*\mu$ -continuous map and discuss some of their properties. Finally, obtained decomposition of nano continuity.

Keywords: $n^*\mu$ -closed set, $n^*\mu$ -closure, $n^*\mu$ -interior, $n^*\mu$ -continuous maps, $n^*\mu$ -irresolute maps and contra $n^*\mu$ -continuous.

INTRODUCTION

Several authors [1,2,3,4,5,6] working in the field of general nano topology have shown more interest in studying the concepts of generalizations of nano continuous maps. Nano continuous maps have been introduced in [5]. A weak form of nanocontinuous maps called ng-continuous maps have been presented in [1]. Afterwards, [7] has propounded $n^*\mu$ -closed sets. The main objective of this study is to introduce a new hybrid intelligent structure called $n^*\mu$ -continuous map. The significance of introducing hybrid structures is that the computational techniques, fuzzy and soft topological spaces. The rest of this article is organized as follows. Some preliminary concepts required in our work are briefly recalled in section 2. In section 3, 4, and 5 the concept of $n^*\mu$ -continuous maps and discuss lemma, propositions, theorems with suitable examples.

PRELIMINARIES

Definition 2.1. [8] If $(K, \tau R(U))$ is the nano topological space with respect to U where $U \subseteq K$ and if $S \subseteq K$, then

(1) The nano interior of the set S is defined as the union of all nano open subsets contained in S and it is denoted by $nint(S)$. That is, $nint(S)$ is the largest nano open subset of S .

(2) The nano closure of the set S is defined as the intersection of all nano closed sets containing S and it is denoted by $ncl(S)$. That is, $ncl(S)$ is the smallest nano closed set containing S .

Definition 2.2. A subset S of a space $(K, \tau R(U))$ is called:

(1) ng -closed set [9] if $ncl(S) \subseteq P$ whenever $S \subseteq P$ and P is nano open in $(K, \tau R(U))$.

(2) nag -closed set [10] if $n\alpha cl(S) \subseteq P$ whenever $S \subseteq P$ and P is nano open in $(K, \tau R(U))$.

(3) $n^*\mu$ -closed [7] if $ncl(S) \subseteq P$ whenever $S \subseteq P$ and P is n^*gs -open in $(K, \tau R(U))$.

(4) $n^*\mu\alpha$ -closed set [7] if $n\alpha cl(S) \subseteq P$ whenever $S \subseteq P$ and P is n^*gs -open in $(K, \tau R(U))$.

(5) $n^*\mu p$ -closed set [7] if $npclo(S) \subseteq P$ whenever $S \subseteq P$ and P is n^*gs -open in $(K, \tau R(U))$. The complement of above mentioned nano closed sets are called their respective nano open sets.

Definition 2.3. A map $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is called

(1) nano continuous [5] if $f^{-1}(W)$ is a nano closed set of K for every nano closed set W of V .

(2) nano α -continuous [11] if $f^{-1}(W)$ is a nano α -open set in K for every nano open set W of V .

(3) ng -continuous [1] if $f^{-1}(W)$ is a ng -closed set of K for every nano closed set W of V .

(4) nano αg -continuous [12] if $f^{-1}(W)$ is a nag -closed set of K for every nano closed set W of V .

Definition 2.4. [7] For a space $(K, \tau R(U))$ is called $Tn^*\mu$ -space if every $n^*\mu$ -closed set is nano closed.

Proposition 2.5. [7]

(1) Every nano closed set is $n^*\mu$ -closed set but not conversely.

(2) Every $n^*\mu$ -closed set is ng -closed set but not conversely.

(3) Every nano α -closed set is $n^*\mu\alpha$ -closed but not conversely.

(4) Every $n^*\mu$ -closed set is $n^*\mu\alpha$ -closed but not conversely.

(5) Every $n^*\mu\alpha$ -closed set is $n^*\mu p$ -closed but not conversely.

(6) Every $n^*\mu\alpha$ -closed set is nag -closed but not conversely.

(7) Every nano open set is $n^*\mu$ -open set but not conversely.

Definition 2.6. [13] A map $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is called contra nano continuous if $f^{-1}(W)$ is a nano closed set of $(K, \tau R(U))$ for every nano open set W of $(L, \tau' R(V))$.

Definition 2.7. [14] A function $f : (O, N) \rightarrow (P, N')$ is said to be nano contra g -continuous if $f^{-1}(V)$ is a ng -closed set of (O, N) for every n -open set V of (P, N')

$n^*\mu$ -interior and $n^*\mu$ -closure

Definition 3.1. For any $M \subseteq K$, $n^*\mu$ -inte(M) is defined as the union of all $n^*\mu$ open sets contained in M . i.e., $n^*\mu$ -inte(M) = $\cup\{G : G \subseteq M \text{ and } G \text{ is } n^*\mu\text{-open}\}$.

Lemma 3.2. For any $M \subseteq K$, $inte(M) \subseteq n^*\mu$ -inte(M) $\subseteq M$. Proof. The proof follows from Proposition 2.5 (7).

Proposition 3.3. For any $M \subseteq K$, the following holds.

(1) $n^*\mu$ -inte(M) is the largest $n^*\mu$ -open set contained in M .

(2) M is $n^*\mu$ -open if and only if $n^*\mu$ -inte(M) = M .

Sandhya and Annadurai

Proposition 3.4. For any subsets M and P of $(K, \tau R(U))$, the following holds.

- (1) $n^*\mu\text{-inte}(M \cap P) = n^*\mu\text{-inte}(M) \cap n^*\mu\text{-inte}(P)$.
- (2) $n^*\mu\text{-inte}(M \cup P) \supseteq n^*\mu\text{-inte}(M) \cup n^*\mu\text{-inte}(P)$.
- (3) If $M \subseteq P$, then $n^*\mu\text{-inte}(M) \subseteq n^*\mu\text{-inte}(P)$.
- (4) $n^*\mu\text{-inte}(K) = K$ and $n^*\mu\text{-inte}(\phi) = \phi$.

Definition 3.5. For any $M \subseteq K$, we define the $n^*\mu$ -closure of M to be the intersection of all $n^*\mu$ -closed sets containing M . i.e., $n^*\mu\text{-clo}(M) = \cap\{F : M \subseteq F \in n^*\mu\text{-closed}\}$.

Lemma 3.6. For any $M \subseteq K$, $M \subseteq n^*\mu\text{-clo}(M) \subseteq \text{nclo}(M)$.

Proof. The proof follows from Proposition 2.5 (1).

Remark 3.7. Both containment relations in Lemma 3.6 may be proper as seen from the following example.

Example 3.8. Let $K = \{21, 22, 23, 24\}$, with $K/R = \{\{21\}, \{23\}, \{22, 24\}\}$ and $U = \{21, 22\}$. Then, the nano topology $\tau R(U) = \{\phi, \{21\}, \{22, 24\}, \{21, 22, 24\}, K\}$. Then, $n^*\mu$ -closed sets are $\phi, \{23\}, \{21, 23\}, \{22, 23\}, \{23, 24\}, \{21, 22, 23\}, \{21, 23, 24\}, \{22, 23, 24\}, K$. Let $A = \{22\}$. Here, $n^*\mu\text{-clo}(\{22\}) = \{22, 23\}$ and so $A \subseteq n^*\mu\text{-clo}(A) \subseteq \text{nclo}(A)$.

Proposition 3.9. For any $M \subseteq K$, the following holds.

- (1) $n^*\mu\text{-clo}(M)$ is the smallest $n^*\mu$ -closed set containing M .
- (2) M is $n^*\mu$ -closed if and only if $n^*\mu\text{-clo}(M) = M$.

Proposition 3.10. For any two subsets M and P of $(K, \tau R(U))$, the following holds.

- (1) If $M \subseteq P$, then $n^*\mu\text{-clo}(M) \subseteq n^*\mu\text{-clo}(P)$
- (2) $n^*\mu\text{-clo}(M \cap P) \subseteq n^*\mu\text{-clo}(M) \cap n^*\mu\text{-clo}(P)$

Proposition 3.11. Let M be a subset of a space K , then the following are true.

- (1) $(n^*\mu\text{-inte}(M))^c = n^*\mu\text{-clo}(M^c)$
- (2) $n^*\mu\text{-inte}(M) = (n^*\mu\text{-cl}(M^c))^c$
- (3) $n^*\mu\text{-clo}(M) = (n^*\mu\text{-inte}(M^c))^c$

Proof. (1) Clearly follows from definitions.

(2) Follows by taking complements in (1).

(3) Follows by replacing M by M^c in (1).

$n^*\mu$ -Continuous Maps and Irresolute Maps

Definition 4.1. A map $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is called $n^*\mu$ -continuous if $f^{-1}(W)$ is a $n^*\mu$ -closed set of $(K, \tau R(U))$ for every nano closed set W of $(L, \tau' R(V))$.

Proposition 4.2. Every nano continuous is $n^*\mu$ -continuous but not conversely.

Proof. The proof follows from Proposition 2.5 (1).

Proposition 4.3. Every $n^*\mu$ -continuous is ng-continuous but not conversely.

Proof. The proof follows from Proposition 2.5 (2).

Definition 4.4. A map $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is called $n^*\mu\alpha$ -continuous (respectively $n^*\mu\beta$ -continuous) if $f^{-1}(W)$ is an $n^*\mu\alpha$ -closed (respectively $n^*\mu\beta$ -closed) in $(K, \tau R(U))$ for each nano closed W of $(L, \tau' R(V))$.

Proposition 4.5. (1) Every nano α -continuous is $n^*\mu\alpha$ -continuous but not conversely.

Sandhya and Annadurai

- (2) Every $n^*\mu$ -continuous is $n^*\mu\alpha$ -continuous but not conversely.
- (3) Every $n^*\mu\alpha$ -continuous is $n^*\mu p$ -continuous but not conversely.
- (4) Every $n^*\mu\alpha$ -continuous is $n\alpha g$ -continuous but not conversely.

Theorem 4.6. If $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is $n^*\mu$ -continuous and $g : (L, \tau' R(V)) \rightarrow (M, \tau * R(W))$ is nano continuous then $g \circ f : (K, \tau R(U)) \rightarrow (M, \tau * R(W))$ is $n^*\mu$ continuous.

Proof. Let G be nano closed set in M . Since g is nano continuous, $g^{-1}(G)$ is nano closed in L . Since f is $n^*\mu$ -continuous, $(g \circ f)^{-1}(G) = f^{-1}(g^{-1}(G))$ is $n^*\mu$ -closed in K . Therefore, $g \circ f$ is $n^*\mu$ -continuous.

Proposition 4.7. A map $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is $n^*\mu$ -continuous if and only if $f^{-1}(W)$ is $n^*\mu$ -open in $(K, \tau R(U))$ for every nano open set W in $(L, \tau' R(V))$.

Proof. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be $n^*\mu$ -continuous and W be a nano open set in $(L, \tau' R(V))$. Then, W^c is nano closed in $(L, \tau' R(V))$ and since f is $n^*\mu$ -continuous, $f^{-1}(W^c)$ is $n^*\mu$ -closed in $(K, \tau R(U))$. But $f^{-1}(W^c) = f^{-1}((W)^c)$ and so $f^{-1}(W)$ is $n^*\mu$ -open in $(K, \tau R(U))$. Conversely, assume that $f^{-1}(W)$ is $n^*\mu$ -open in $(K, \tau R(U))$ for each nano open set W in $(L, \tau' R(V))$. Let F be a nano closed set in $(L, \tau' R(V))$. Then, F^c is nano open in $(L, \tau' R(V))$ and by assumption, $f^{-1}(F^c)$ is $n^*\mu$ -open in $(K, \tau R(U))$. Since $f^{-1}(F^c) = f^{-1}((F)^c)$, we have $f^{-1}(F)$ is nano closed in $(K, \tau R(U))$ and so f is $n^*\mu$ continuous.

Theorem 4.8. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be an $n^*\mu$ -continuous map. If $(K, \tau R(U))$, the domain of f is an $Tn^*\mu$ -space, then f is nano continuous.

Proof. Let W be a nano closed set of $(L, \tau' R(V))$. Then, $f^{-1}(W)$ is a $n^*\mu$ -closed set of $(K, \tau R(U))$, since f is $n^*\mu$ -continuous. Since $(K, \tau R(U))$ is an $Tn^*\mu$ -space, then $f^{-1}(W)$ is a nano closed set of $(K, \tau R(U))$. Therefore, f is nano continuous.

Definition 4.9. Let $(K, \tau R(U))$ be a nano topological space. Let k be a point of K and G be a subset of K . Then, G is called an $n^*\mu$ -neighbourhood of k (briefly, $n^*\mu$ -nbhd of k) in K if there exists an $n^*\mu$ -open set S of K such that $k \in S \subseteq G$.

Proposition 4.10. Let M be a subset of $(K, \tau R(U))$. Then, $k \in n^*\mu$ -clo(M) if and only if for any $n^*\mu$ -nbhd G_k of k in $(K, \tau R(U))$, $M \cap G_k \neq \emptyset$.

Proof. (\Rightarrow): Assume $k \in n^*\mu$ -clo(M). Suppose that there is an $n^*\mu$ -nbhd G of the point k in $(K, \tau R(U))$ such that $G \cap M = \emptyset$. Since G is $n^*\mu$ -nbhd of k in $(K, \tau R(U))$, by Definition 4.11, there exists an $n^*\mu$ -open set S_k such that $k \in S_k \subseteq G$. Therefore, we have $S_k \cap M = \emptyset$ and so $M \subseteq (S_k)^c$. Since $(S_k)^c$ is an $n^*\mu$ -closed set containing M , we have by Definition 3.5, $n^*\mu$ -clo(M) $\subseteq (S_k)^c$ and therefore $k \notin n^*\mu$ -clo(M), which is a contradiction. (\Leftarrow): Assume for each $n^*\mu$ -nbhd G_k of k in $(K, \tau R(U))$, $M \cap G_k \neq \emptyset$. Suppose that $k \notin n^*\mu$ -clo(M). Then, by Definition 3.5, there exists an $n^*\mu$ -closed set F of $(K, \tau R(U))$ such that $M \subseteq F$ and $k \notin F$. Thus, $k \in F^c$ and F^c is $n^*\mu$ -open in $(K, \tau R(U))$ and hence F^c is a $n^*\mu$ -nbhd of k in $(K, \tau R(U))$. But $M \cap F^c = \emptyset$, which is a contradiction.

In the next theorem, we explore certain characterizations of $n^*\mu$ -continuous functions.

Theorem 4.11. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be a map from a nano topological space $(K, \tau R(U))$ into a nano topological space $(L, \tau' R(V))$. Then the following statements are equivalent.

- (1) The function f is $n^*\mu$ -continuous.
- (2) The inverse of each nano open set is $n^*\mu$ -open.
- (3) For each point k in $(K, \tau R(U))$ and each nano open set C in $(L, \tau' R(V))$ with $f(k) \in C$, there is an $n^*\mu$ -open set B in $(K, \tau R(U))$ such that $k \in B, f(B) \subseteq C$.
- (4) The inverse of each nano closed set is $n^*\mu$ -closed.
- (5) For each k in $(K, \tau R(U))$, the inverse of every neighbourhood of $f(k)$ is an $n^*\mu$ nbhd of k .
- (6) For each k in $(K, \tau R(U))$ and each neighbourhood N of $f(k)$, there is an $n^*\mu$ nbhd G of k such that $f(G) \subseteq N$.
- (7) For each subset M of $(K, \tau R(U))$, $f(n^*\mu$ -clo(M)) \subseteq nclo($f(M)$).
- (8) For each subset Q of $(L, \tau' R(V))$, $n^*\mu$ -clo($f^{-1}(Q)$) $\subseteq f^{-1}(nclo(Q))$.

Sandhya and Annadurai

Proof. (1) \Rightarrow (2) This follows from Proposition 4.9. (1) \Rightarrow (3) Suppose that (3) holds and let C be an open set in $(L, \tau' R(V))$ and let $k \in f^{-1}(C)$. Then, $f(k) \in C$ and thus there exists an $n^*\mu$ -open set B_k such that $k \in B_k$ and $f(B_k) \subseteq C$. Now, $k \in B_k \subseteq f^{-1}(C)$ and $f^{-1}(C) = \cup_{k \in f^{-1}(C)} B_k$. Then, arbitrary union of $n^*\mu$ -open set is $n^*\mu$ -open, $f^{-1}(C)$ is $n^*\mu$ -open in $(K, \tau R(U))$ and therefore f is $n^*\mu$ -continuous.

Conversely, suppose that (1) holds and let $f(k) \in C$. Then, $k \in f^{-1}(C) \in n^*\mu\tau R(X)$, since f is $n^*\mu$ -continuous. Let $B = f^{-1}(C)$. Then, $k \in B$ and $f(B) \subseteq C$.

(2) \Rightarrow (4) This result follows from the fact if A is a subset of $(L, \tau' R(V))$, then $f^{-1}(Ac) = (f^{-1}(A))c$.
 (2) \Rightarrow (5) For $k \in (K, \tau R(U))$, let N be a neighbourhood of $f(k)$. Then, there exists an nano open set C in $(L, \tau' R(V))$ such that $f(k) \in C \subseteq N$. Consequently, $f^{-1}(C)$ is an $n^*\mu$ -open set in $(K, \tau R(U))$ and $k \in f^{-1}(C) \subseteq f^{-1}(N)$. Thus, $f^{-1}(N)$ is an $n^*\mu$ -nbhd of k .

(5) \Rightarrow (6) Let $k \in K$ and let N be a neighbourhood of $f(k)$. Then, by assumption, $G = f^{-1}(N)$ is an $n^*\mu$ -nbhd of k and $f(G) = f(f^{-1}(N)) \subseteq N$.

(6) \Rightarrow (3) For $k \in (K, \tau R(U))$, let C be an nano open set containing $f(k)$. Then, C is a neighborhood of $f(k)$. So by assumption, there exists an $n^*\mu$ -nbhd G of k such that $f(G) \subseteq C$. Hence, there exists an $n^*\mu$ -open set B in $(K, \tau R(U))$ such that $k \in B \subseteq G$ and so $f(B) \subseteq f(G) \subseteq C$.

(7) \Rightarrow (4) Suppose that (4) holds and let M be a subset of $(K, \tau R(U))$. Since $M \subseteq f^{-1}(M)$, we have $M \subseteq f^{-1}(nclo(f(M)))$. Since $nclo(f(M))$ is a nano closed set in $(L, \tau' R(V))$, by assumption $f^{-1}(nclo(f(M)))$ is an $n^*\mu$ -closed set containing M . Consequently, $n^*\mu\text{-clo}(M) \subseteq f^{-1}(nclo(f(M)))$. Thus, $f(n^*\mu\text{-clo}(M)) \subseteq f(f^{-1}(nclo(f(M)))) \subseteq nclo(f(M))$.

Conversely, suppose that (7) holds for any subset M of $(K, \tau R(U))$. Let F be a nano closed subset of $(L, \tau' R(V))$. Then, by assumption, $f(n^*\mu\text{-clo}(f^{-1}(F))) \subseteq nclo(f(f^{-1}(F))) \subseteq nclo(F) = F$. i.e., $n^*\mu\text{-clo}(f^{-1}(F)) \subseteq f^{-1}(F)$ and so $f^{-1}(F)$ is $n^*\mu$ -closed.

(7) \Rightarrow (8) Suppose that (7) holds and Q be any subset of $(L, \tau' R(V))$. Then, replacing M by $f^{-1}(Q)$ in (7), we obtain $f(n^*\mu\text{-clo}(f^{-1}(Q))) \subseteq nclo(f(f^{-1}(Q))) \subseteq nclo(Q)$. i.e., $n^*\mu\text{-clo}(f^{-1}(Q)) \subseteq f^{-1}nclo(Q)$. Conversely, suppose that (8) holds. Let $Q = f(M)$ where M is a subset of $(K, \tau R(U))$. Then, we have $n^*\mu\text{-clo}(M) \subseteq n^*\mu\text{-clo}(f^{-1}(Q)) \subseteq f^{-1}(nclo(f(M)))$ and so $f(n^*\mu\text{-clo}(M)) \subseteq nclo(f(M))$.

This completes the proof of the theorem.

Definition 4.12. A map $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is called $n^*\mu$ -irresolute if $f^{-1}(W)$ is a $n^*\mu$ -closed set of $(K, \tau R(U))$ for every $n^*\mu$ -closed set W of $(L, \tau' R(V))$.

Theorem 4.13. Every $n^*\mu$ -irresolute map is $n^*\mu$ -continuous but not conversely. Proof. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be a $n^*\mu$ -irresolute map. Let W be a nano closed set of $(L, \tau' R(V))$. Then, by the Proposition 2.5 (i.), W is $n^*\mu$ -closed. Since f is $n^*\mu$ -irresolute, then $f^{-1}(W)$ is a $n^*\mu$ -closed set of $(K, \tau R(U))$. Therefore, f is $n^*\mu$ -continuous. **Theorem 4.16.** Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ and $g : (L, \tau' R(V)) \rightarrow (M, \tau * R(W))$ be any two maps. Then,

- (1) $g \circ f$ is $n^*\mu$ -continuous if g is nano continuous and f is $n^*\mu$ -continuous.
- (2) $g \circ f$ is $n^*\mu$ -irresolute if both f and g are $n^*\mu$ -irresolute.
- (3) $g \circ f$ is $n^*\mu$ -continuous if g is $n^*\mu$ -continuous and f is $n^*\mu$ -irresolute. **Definition 4.17.** A map $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is called contra $n^*\mu$ -continuous if $f^{-1}(W)$ is a $n^*\mu$ -closed set of $(K, \tau R(U))$ for every nano open set W of $(L, \tau' R(V))$.

Proposition 4.14. Every contra nano continuous is contra $n^*\mu$ -continuous but not conversely. Proof. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be a contra nano continuous map and let G be any nano open set in $(L, \tau' R(V))$. Then, $f^{-1}(G)$ is nano closed in K . Since every nano closed set is $n^*\mu$ -closed, $f^{-1}(G)$ is $n^*\mu$ -closed in K . Therefore f is contra $n^*\mu$ -continuous.

Proposition 4.15. Every contra $n^*\mu$ -continuous is nano contra g -continuous but not conversely. **Proof.** Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be a contra $n^*\mu$ -continuous map and let G be any nano open set in $(L, \tau' R(V))$. Then, $f^{-1}(G)$ is $n^*\mu$ -closed in K . Since every $n^*\mu$ -closed set is Ng -closed, $f^{-1}(G)$ is Ng -closed in K . Therefore, f is nano contra g -continuous.

Sandhya and Annadurai

Remark 4.16. $n^*\mu$ -continuity and contra $n^*\mu$ -continuity are independent.

Remark 4.17. The composition of two contra $n^*\mu$ -continuous maps need not be contra $n^*\mu$ -continuous.

Theorem 4.18. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be a map. Then, the following conditions are equivalent:

- (1) f is contra $n^*\mu$ -continuous.
- (2) The inverse image of each nano open set in P is $n^*\mu$ -closed in K .
- (3) The inverse image of each nano closed set in P is $n^*\mu$ -open in K .
- (4) For each point k in K and each nano closed set G in P with $f(k) \in G$, there is an $n^*\mu$ -open set U in K containing k such that $f(U) \subset G$.

Proof. (1) \Rightarrow (2) Let G be nano open in L . Then $L - G$ is nano closed in L . By definition of contra $n^*\mu$ -continuous, $f^{-1}(L - G)$ is $n^*\mu$ -open in K . But $f^{-1}(L - G) = K - f^{-1}(G)$. This implies $f^{-1}(G)$ is $n^*\mu$ -closed in K . (2) \Rightarrow (3) Let G be any nano closed set in L . Then $L - G$ is nano open set in L . By the assumption of (2), $f^{-1}(L - G)$ is $n^*\mu$ -closed in K . But $f^{-1}(L - G) = K - f^{-1}(G)$. This implies $f^{-1}(G)$ is $n^*\mu$ -open in K .

(3) \Rightarrow (4) Let $k \in K$ and G be any nano-closed set in L with $f(k) \in G$. By (3), $f^{-1}(G)$ is $n^*\mu$ -open in K . Set $U = f^{-1}(G)$. Then, there is an $n^*\mu$ -open set U in K containing k such that $f(U) \subset G$.

(4) \Rightarrow (1) Let $k \in K$ and G be any nano-closed set in L with $f(k) \in G$. Then $L - G$ is nano-open in L with $f(k) \in G$. By (4), there is an $n^*\mu$ -open set U in K containing k such that $f(U) \subset G$. This implies $U = f^{-1}(G)$. Therefore, $K - U = K - f^{-1}(G) = f^{-1}(L - G)$ which is $n^*\mu$ -closed in K .

Theorem 4.19. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ and $g : (L, \tau' R(V)) \rightarrow (M, \tau * R(W))$. Then, the following properties hold:

- (1) If f is contra $n^*\mu$ -continuous and g is nano continuous, then $g \circ f$ is contra $n^*\mu$ -continuous.
- (2) If f is contra $n^*\mu$ -continuous and g is contra nano continuous, then $g \circ f$ is $n^*\mu$ -continuous.
- (3) If f is $n^*\mu$ -continuous and g is contra nano continuous, then $g \circ f$ is contra $n^*\mu$ -continuous.

Proof. (1) Let G be nano closed set in M . Since g is nano continuous, $g^{-1}(G)$ is nano closed in L . Since f is contra $n^*\mu$ -continuous, $(g \circ f)^{-1}(G) = f^{-1}(g^{-1}(G))$ is $n^*\mu$ -open in K . Therefore $g \circ f$ is contra $n^*\mu$ -continuous.

(2) Let G be any nano closed set in M . Since g is contra nano continuous, $g^{-1}(G)$ is nano open in L . Since f is contra $n^*\mu$ -continuous, $(g \circ f)^{-1}(G) = f^{-1}(g^{-1}(G))$ is $n^*\mu$ -closed in K . Therefore $g \circ f$ is $n^*\mu$ -continuous.

(3) Let G be any nano closed set in M . Since g is contra nano continuous, $g^{-1}(G)$ is nano open in L . Since f is $n^*\mu$ -continuous, $(g \circ f)^{-1}(G) = f^{-1}(g^{-1}(G))$ is $n^*\mu$ -open in K . Therefore $g \circ f$ is contra $n^*\mu$ -continuous.

Theorem 4.20. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is $n^*\mu$ -irresolute map and $g : (L, \tau' R(V)) \rightarrow (M, \tau * R(W))$ is contra nano continuous map, then $g \circ f : (K, \tau R(U)) \rightarrow (M, \tau * R(W))$ is contra $n^*\mu$ -continuous map.

Proof. Since g is contra nano continuous from $(L, \tau' R(V)) \rightarrow (M, \tau * R(W))$, for any nano open set in m as a subset of M , we get $g^{-1}(m) = G$ is a nano closed set in $(L, \tau' R(V))$. By Proposition 2.5 (i), it implies that $g^{-1}(m) = G$ is $n^*\mu$ -closed in $(L, \tau' R(V))$. As f is $n^*\mu$ -irresolute map. We get $(g \circ f)^{-1}(m) = f^{-1}(g^{-1}(m)) = f^{-1}(G) = S$ and S is a $n^*\mu$ -closed in $(K, \tau R(U))$. Hence, $g \circ f$ is a contra $n^*\mu$ -continuous map.

Theorem 4.21. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ is $n^*\mu$ -irresolute map and $g : (L, \tau' R(V)) \rightarrow (M, \tau * R(W))$ is contra $n^*\mu$ -continuous map, then $g \circ f : (K, \tau R(U)) \rightarrow (M, \tau * R(W))$ is contra $n^*\mu$ -continuous map.

Proof. Since g is contra $n^*\mu$ -continuous from $(L, \tau' R(V)) \rightarrow (M, \tau * R(W))$, for any nano open set in m as a subset of M , we get, $g^{-1}(m) = G$ is a $n^*\mu$ -closed set in $(L, \tau' R(V))$. As f is $n^*\mu$ -irresolute map. We get $(g \circ f)^{-1}(m) = f^{-1}(g^{-1}(m)) = f^{-1}(G) = S$ and S is a $n^*\mu$ -closed in $(K, \tau R(U))$. Hence $g \circ f$ is a contra $n^*\mu$ -continuous map.

Theorem 4.22. Let $f : (K, \tau R(U)) \rightarrow (L, \tau' R(V))$ be a map and $g : (K, \tau R(U)) \rightarrow ((K, \tau R(U)) \times (L, \tau' R(V)))$ the graph map of f , defined by $g(k) = (k, f(k))$ for every $k \in K$. If g is contra $n^*\mu$ -continuous, then f is contra $n^*\mu$ -continuous.

Proof. Let G be an nano open set in $(L, \tau' R(V))$. Then, $((K, \tau R(U)) \times G)$ is an nano open set in $((K, \tau R(U)) \times (L, \tau' R(V)))$. It follows from Theorem 4.27, that $f^{-1}(G) = g^{-1}((K, \tau R(U)) \times G)$ is $n^*\mu$ -closed in $(K, \tau R(U))$. Thus, f is contra $n^*\mu$ -continuous.

Sandhya and Annadurai

Decomposition of Nano Continuity Map

Definition 5.1. A subset D of a space $(K, \tau_R(U))$ is said to be $n^*\mu lc^*$ -set if $D = E \cap F$, where E is N^* gs-open set and F is nano closed set $(K, \tau_R(U))$.

Proposition 5.2. Every nano closed set is $n^*\mu lc^*$ -set. Proof. This is obvious.

Remark 5.3. $n^*\mu$ -closed sets and $n^*\mu lc^*$ -sets are independent of each other.

Proposition 5.4. Let $(K, \tau_R(U))$ be a nano topological space. Then, a subset D of $(K, \tau_R(U))$ is nano closed set if and only if it is both $n^*\mu$ -closed set and $n^*\mu lc^*$ -set.

Proof. Case (1) Necessity is trivial. Case (2) To prove the sufficiency, we assume that D is both $n^*\mu$ -closed set and $n^*\mu lc^*$ -set. Then, $D = E \cap F$, where E is N^* gs-open set and F is nano closed set in $(K, \tau_R(U))$. Therefore, $D \subseteq E$ and $D \subseteq F$, and so by hypothesis, $ncl(D) \subseteq E$ and $ncl(D) \subseteq F$. Thus, $ncl(D) \subseteq E \cap F = D$ and hence $ncl(D) = D$ i.e., D is nano closed set in $(K, \tau_R(U))$.

Definition 5.5. Let $f : (K, \tau_R(U)) \rightarrow (L, \tau' R(V))$ is called $n^*\mu lc^*$ -continuous map if $f^{-1}(W)$ is $n^*\mu lc^*$ -set in $(K, \tau_R(U))$ for every nano closed set W of $(L, \tau' R(V))$.

Proposition 5.6. Every nano continuous map is $n^*\mu lc^*$ -continuous map.

Proof. It follows from Proposition 5.2.

Remark 5.7. $n^*\mu$ -continuity map and $n^*\mu lc^*$ -continuity map are independent of each other.

Theorem 5.8. Let $f : (K, \tau_R(U)) \rightarrow (L, \tau' R(V))$ is nano continuous map if and only if it is both $n^*\mu$ -continuous map and $n^*\mu lc^*$ -continuous map.

Proof. Case (i) We assume that f is nano continuous map. Then, by Proposition 4.2 and Proposition 5.8, f is both $n^*\mu$ -continuous map and $n^*\mu lc^*$ -continuous map. Conversely, Case(ii) We assume that f is both $n^*\mu$ -continuous map and $n^*\mu lc^*$ -continuous map. Let W be a nano closed subset of $(L, \tau' R(V))$. Then $f^{-1}(W)$ is both $n^*\mu$ -closed set and $n^*\mu lc^*$ -set. By Proposition 5.6, $f^{-1}(W)$ is a nano closed set in $(K, \tau_R(U))$ and so f is nano continuous map.

CONCLUSIONS

Characterizations and properties of $n^*\mu$ -closed sets and $n^*\mu$ -open sets are given. A characterization of $n^*\mu$ -continuous maps and $n^*\mu$ -irresolute is given in terms of $n^*\mu$ -closed sets. Also, it is established that an contra $n^*\mu$ -continuous and to obtained decompositions of nano continuity in nano topological spaces. The results of this study may help in many researches.

ABSTRACT

Pre-diabetes is an intermediate state of hyperglycaemia with glycemic parameters above normal but below the diabetes threshold. In view of increasing prevalence of Diabetes mellitus (DM) across the globe, which is greater in India, it is important to focus on prevention of conversion of pre-diabetic population to Diabetes. Although theorized to be effective for pre-diabetes, Nisha Amalaki Yoga (NAY) has not been studied in this population. The purpose of this article is to report the results of a case in which a patient with prediabetes was treated with the NAY. A 38-year-old female was diagnosed as a case of pre-diabetes with HbA1C 6.2%. Even after 2 months of consistent lifestyle modifications, her HbA1C did not show reduction, and thus medicinal management was indicated. As patient was willing to take herbal medicine, she was started NAY capsule 1gm twice in a day along with lifestyle modification. 4 weeks later, she noted improvements in blood sugar. After 12 weeks of treatment, her HbA1C decreased to normal range (5.6%). Although human studies about management of pre-diabetes with herbal formulations are lacking, the available experimental studies have shown improvements in β -cell function and postprandial and fasting glucose levels. Furthermore, it has shown a delay in progression of prediabetes. No case reports have been found on use of NAY in prediabetes. NAY along with lifestyle modification may have a role in management of pre-diabetes and should be further studied in large sample.

INTRODUCTION

“Prevention is better than cure” this phrase is deeply rooted in Ayurvedic system of Medicine. Pre-diabetes is initial stage of Diabetes mellitus, if it is reversed in its early stage may prevent its conversion into DM(1).Pre-diabetes is an intermediate stage of dysglycemia with conversion from normoglycemia to hyperglycemia i.e. diabetes. Prediabetes is diagnosed by laboratory investigation of fasting blood glucose (FBG-100-125 mg/dl), glyated hemoglobin (HbA1C-5.7-6.4%), or 2-h postprandial blood glucose (2hBG-140-199mg/dl) (2).5-10% of pre-diabetics get converted to DM each year, while the same proportion converts back to normoglycaemia by lifestyle modification and drug-based interventions. (3)Worldwide prevalence of prediabetes is increasing rapidly and it may cross 470 million prediabetic people by 2030.(3)Insulin resistance and β -cell dysfunction-abnormalities are simultaneously occurring in Prediabetes prior to the glucose changes are detectable. (4)Multi factorial risk scores using non-invasive methods and blood-based metabolic traits along with glycemic values, could improve the estimation of diabetes risk. Lifestyle modification is the key factor of diabetes prevention, with evidence of a 40-70% relative-risk reduction in pre-diabetics. (5)The term pre-diabetes is a term used to identify individuals who are at risk for future diabetes, but it is also accompanying with a high burden of cardio-metabolic risk factors, early forms of nephropathy, chronic kidney disease, small fiber neuropathy, diabetic retinopathy and is also associated with poor outcomes.(6) The prevalence of prediabetes and diabetes increases noticeably with age.(7)*Pramehais* commonly correlated with diabetes, so *Pramehapurvarupa* (Prodromal symptoms) can be correlated with symptoms of pre-diabetes. A pre-diabetic if left untreated becomes diabetic, in the same way in Ayurveda *Pramehapoorvarupa* converts into *KaphajaPrameha*. *KaphajaMeha* getting converted into *Vataja meha in long run due to Dhatukshaya* and succeeding *Vataprakopa*.(8) *Prameha* is a chronic persistence and perpetuation of disease(*PramehoAnushanginam*). (9) It reappears again and again and continues in generations due to *BeejaDushti* (seeds-sperm, ovum affected by *Dosha* causing disease) (10) In this study, the best medicine (*Agryadraya*) mentioned by *Acharya Vagbhata* for diabetes i.e. *Nisha Amalaki Yoga*, combination of *Haridra*(*Curcuma longa Linn*)and *Amalaki* (*Emblia officinalis Gaertn*)was selected.(11) Here a case of Vadodara based patient who was diagnosed as a pre-diabetes, treated with Ayurvedic herbal drugs combination along with lifestyle modification.

PATIENT PROFILE

A 38-year-old female, a non-vegetarian, non-alcoholic, and non-smoker with no family history of Diabetes mellitus, came in the Kayachikitsa OPD of Ayurved Hospital for the management of obesity in January 2021. She presented with symptoms of *Kshudhadhikya* (polyphagia), *Trishmadhikya* (polydipsia), *Mutradhikya* (polyuria), *Daurbalya* (weakness) heaviness of body, and mild itching at vaginal region from 2 years intermittently. Considering suspicion about polycystic ovarian disease due to mild itching at vaginal region and heaviness of body, detail history of menstruation and weight gain was taken. History revealed the regularity of menses and chronic history of weight gain. There were no associated symptoms in patient, which needs further evaluation for PCOS. Thyroid profile was done by patient previously considering hypothyroidism, which was normal. She was advised to do various laboratory investigations considering suspicion of DM and metabolic syndrome (MetS) such as fasting blood sugar, post-prandial blood sugar, glyated haemoglobin, lipid profile, renal function test, liver function test, urine-routine-microscopic and complete blood count. For diagnosis of MetS, the presence of basic criteria-obesity (waist circumference > 35 inches in female and >40 inches in male)or body mass index >30 kg/m²and two of the three following criteria: high blood pressure, impaired glucose metabolism, elevated non-high-density lipoprotein (non-HDL) cholesterol level is mandatory.(12)Patient was not fulfilled basic criteria (patients waist circumference<35 inches and BMI <30) of MetS, which rule out the possibility of metabolic syndrome. Considering her fasting blood sugar level-120 mg/dl, post-prandial blood sugar-146 mg/dl, HbA1C-6.2%,patient was diagnosed as Pre-diabetes as per American Diabetic Association criteria.(13)Before inclusion in the study, patient have followed Dixit diet for 2 months along with cycling 8-10 km/day for pre-diabetic condition. Dixit diet comprise of only two meal a day i.e. fasting of 12 hours. Overall concept behind keeping only two meal a day is to regulate insulin secretion in blood, which usually increases after meals, triggers obesity, insulin resistance and type 2 DM. (14)

Nisha Munishwar et al.,

Despite of lifestyle modification, her glycated haemoglobin was not reduced significantly. HbA1C was reduced to 6.2% from 6.3% i.e. still in pre-diabetic condition. So, to get desired outcome she was treated with NAY along with strict diet control and regular exercise for 3 months.

Nidana found in patient

- *Hetu* (etiology or causative factors) a) *Ahara: Madhuar, Lavana, KatuRasatmakaAhara, Navannapana* since long period (Consumption of newly prepared dhanya), *Paya- Dadhisevana* (Regular practice of milk and curd) Intake of Sweet, salty, and spicy food items.
- b) *Vihara: Asayasukham* (Habituation to sitting on soft cushions for long periods), *Swapnasukham* (excessive sleeping), *Divaswapa* (day sleep). All these causative factors closely resembles with classical description of *Nidanain* Ayurveda. (16)
- *Poorvarupa* (Prodromal symptoms): Heavyness of body, Excessive urination (on/off), *kshudhadhikya* (excessive hunger), Vaginal region itching (on/off), *Maladhikya*

AYURVEDIC MANAGEMENT

Capsule NAY was given in the dose of 1 gm twice a day for the period of 3 months. Strict diet control and regular exercise was also advised to the patient.

Outcome

Vaginal itching was subsided within 15days if treatment. *Maladhikya* was reduced completely after 1 month of treatment. After 1 month, symptoms like heaviness of body, *mutradhikya, kshudhadhikya, alasya, daurbalya* were significantly reduced. All symptoms were subsided completely after 90 days of treatment. NAY didn't show an adverse drug event during three months (90 days). Initial 75 kg weight was reduced to 70 kg, reducing the BMI from 28.6 kg/m² to 26.7kg/m². Very significant results were seen in subjective as well objective parameters. Patient felt healthy and more energetic after three months of treatment.

DISCUSSION

Pre-diabetes is an intermediary stage of hyperglycemia with glycemic parameters above normal but below the diabetes threshold. The diagnostic criteria's of pre-diabetes are not uniform according to various international professional organizations, still it remains a state of high risk for developing diabetes with yearly conversion rate of 5%-10%. (19) The universal prevalence rate of IGT in 2010 was estimated to be 343 million (7.8%) ranging from 5.8% in South East Asia to 11.4% in North American and Caribbean Countries of the nation's population (20). International Diabetes Federation projects an increase in prevalence of prediabetes to 471 million globally by 2035 (21) According to the principles of Ayurveda, *Prameha* is one of the *Astamahagada*, i.e. diseases which are difficult to treat. (22) Hence, it has been suggested that the disease may be treated in its *Purvarupavastha* (23). Hence, treating at pre-diabetes stage, which may be considered as the *Purvarupavastha*, will be more beneficial and NAY has shown very promising results in doing this. Modern science has not mentioned any specific symptoms of Pre-diabetes but Ayurveda have elaborated various symptoms such as *Mukhamadhurya, Kar-padadaha, Nidradhikya, Kshudhadhikya, Shithilangata (Laxity of body)* etc. (24) A hypothesis was made on the basis of exploration of pre-diabetic features as are identified in ayurveda as *Prameha Purvarupa*, a more realistic sensitization among pre-diabetes people may be done. After identification, these pre-diabetics can be warned and prompted for steps to prevent the disease by showing the proximity of their pre-diabetes features with clinical diabetes (25). In this study, patient was diagnosed as pre-diabetes based on investigations (Blood parameters) fasting blood sugar, post-prandial blood sugar and glycated hemoglobin. (Table 4) The patient was showing some symptoms of *Prameha Purvarupa* (Table 2). NAY is a drug combination mentioned under *Agryadravya* for *Prameha*. Various researches are available on NAY in the management of DM. Hence, this drug combination was used along with dietary and physical activities regimen for pre-diabetes. Daily dose of NAY was 2 gm in capsule form two times in day before food. Initially the patient got symptomatic

Nisha Munishwar et al.,

relief in first month of treatment but bio-chemical parameters was not significantly reduced. Symptoms such as heaviness of body, excessive micturition, *kshudhadhikya* was significantly reduced after three months of treatment. FBS, PPBS and HbA1C were significantly reduced and normalized the symptoms.

Probable Mode of Action of NAY

Pharmacology

Curcuma longa linn contains curcuminoids, which improves insulin resistance, decrease glucose and insulin levels, increase adiponectin release, and reduce the levels of leptin, resistin, interleukin (IL-6) IL-1 β , and tumor necrosis factor- α patients with T2DM (26). Compounds containing *Curcuma longa* can affect glucose homeostasis and diabetic complications, and the vascular risk of patients with T2DM (27). Some studies have found that supplementation of curcuminoids improves the lipid profile and increases the total antioxidant capacity of T2DM patients. Curcumin specifically improves insulin resistance, serum glucose levels, HbA1c, lipid profile, and inflammatory biomarkers in patients with T2DM. (28) Ellagic acid in *Embllica Officinalis gaertn* exerts anti-diabetic activity through stimulation of β -cells of pancreas to secrete insulin and decreases glucose intolerance. (29)

Therapeutic properties of NAY

- a) *Curcuma longa linn*: It is having *Laghu*, *Ruksha* properties, *Tikta* (Bitter), *Katu* (Spices) *rasa*, *KatuVipaka* and Hot potency. Due to these properties, it acts as *Kaphaghna*, *Kledahara* and improves glucose intake metabolism. (30)
- b) *Embllica officinalis Gaertn*: It is good anti-oxidant and has rejuvenation properties. It acts as immunity booster, reduces stress levels, and improves glucose intake metabolism. It is *Amlapradhanadravya* (predominance of sour taste amongst five). It possesses *Guru* (heavily digesting), *Ruksha* (Dryness) and *Sheeta* (Cold) properties. It pacifies *Tridosha* and act as *Vatanulomana*. (31)

Combination of NAY is *Tridosahara* and it reduces the vitiated *Kapha*. Its act on vitiated *Kapha*, *Meda* and *Kleda*. It has capacity to improve tone of *Saptadhatus* and reduces *Dhatushaithilya* (Laxity of *dhatu*). Due to its *Deepana* and *Pachana* properties, acts on *Jatharagni* (Digestive enzymes) and *Dhatwagni*, removes *Ama* and *Kleda*. It corrects the function of *Dhatwagni*, henceforth regulates deranged metabolism. It has *Deepana*, *Pachana* and *Anulomana* properties, hence re moves *Srotoavarodha* (obstructed body channels) and improves glucose intake metabolism. *Rukshaguna* acts as *Kledshoshana* (drying of excessive moisture and regulating the excessive formation of *kleda*) and helps to break the pathology of *Prameha*. (31) (Table 7)

Importance of Diet

Non-communicable diseases remain the leading cause of death worldwide, with approximately 38 million global deaths annually. Half of these deaths can be prevented, by taking urgent measures, including changing lifestyle and adapting a healthy and balanced nutrition. (32) *Yavapradhana Ahara* is mentioned in Ayurveda for *Prameha*. (33) *Yavapradhana* diet along with other food items which are indicated in DM was advised to the patient. (Table 6) Oat, barley contains beta-glucans. Oat beta-glucans have been widely used in several clinical trials to prove its action of glucose reduction. Studies showed that oat beta-glucan lowered postprandial glycemia. (34) Beta-glucans acts by reducing blood glucose possibly by delaying stomach emptying so that dietary glucose is absorbed more gradually. (35)

Importance of Exercise

Exercise plays a key role in the management of lifestyle diseases. Aerobic type of exercise in the form of cycling and walking was advised and it was well followed by the patient. (Table 5) Insulin action in muscle and liver can be modified by acute bouts of exercise and by regular physical activity. (36) Acutely, Aerobic exercise through insulin-independent mechanisms increases muscle glucose uptake up to fivefold through. After exercise, glucose uptake remains elevated by insulin-independent (~2 h) and insulin-dependent (up to 48 h) mechanisms if exercise is prolonged. (37) The effects of a single bout of aerobic exercise on insulin action vary with duration, intensity, and subsequent diet; a single session increases insulin action and glucose tolerance for > 24 h but < 72 h. (38) Lipid profile was done before and after the treatment which was normal. Normal values of liver function test, kidney function test and urine analysis suggesting the safety of NAY. In complete blood count, hemoglobin % was improved. (Table

Nisha Munishwar et al.,

4) Hence, present case study showed the combined significant effect of NAY, diet regimen and regular exercise in the management of pre-diabetes without any adverse events or adverse drug reaction.

CONCLUSION

Pre-diabetes can be correlated with *PramehaPurovaroopa*. But evidences are necessary to prove the theory. Most of the subjects with pre-diabetes do not show any symptoms but showing changes in blood investigation. Glycated hemoglobin should be done regularly to reduce accidental diagnosis of Pre-diabetes and to increase awareness in society. NAY along with dietary regimen and exercise is better choice for pre-diabetic condition. Significant reduction was noted in fasting blood glucose, post prandial blood sugar and glycated hemoglobin in present case report along with improved quality of life. There was no any adverse effect while using NAY. The clinical trial shall be conducted on large sample to establish the efficacy and safety of NAY.

ABSTRACT

Dam is a vital Civil Engineering structure. The assessment of an earth dam during an earthquake is imperative because its failure can result in noteworthy human and monetary losses and severe environmental influence. This paper presents a deterministic seismic hazard analysis for Major Dams of Chhattisgarh. Chhattisgarh comes under Peninsular India which is tectonically identified as an intraplate region of Indian plate. Due to the convergent movement of Indian plate with Eurasian plate, along major intraplate, faults may result the seismic activity in the region. For deterministic hazard analysis the linear seismic sources within a region bounded by Latitude:18° 0' 0"-24° 0' 0" to Longitude:78° 0' 0"- 85° 0' 0" was considered and the peak ground acceleration (PGA) at bed rock level for 50 & 84 Percentile were evaluated for major dams of Chhattisgarh. The attenuation relations proposed by Iyengar and Raghukanth (2004), was used in the investigation. The effects of variation of focal depth over maximum PGA (g) values at bed rock level were reported for major dams Ravishankar Sagar, Sikaser, Kodar and Sondur.

Keywords: Dam Site, Deterministic Seismic Hazard Analysis (DSHA), Faults, Peak Ground Acceleration (PGA), Seismic Parameters.

INTRODUCTION

In seismology, the depth of focus is the depth at which an earthquake occurs. About 10 per cent of all major earthquakes are acknowledged to originate below the "crust" of the earth at depths ranging up to 700 km. For Earthquakes occurring at a depth of less than 70 km (43 mi) are classified as shallow-focus earthquakes, while those with a focal depth between 70 km (43 mi) and 300 km (190 mi) are commonly termed mid-focus or intermediate-depth earthquakes. Evidence for deep-focus earthquakes was discovered in 1922 by H.H. Turner of Oxford, England. Previously, all earthquakes were considered to have shallow focal depths. The existence of deep-focus earthquakes was confirmed in 1931 by studying the seismograms of several earthquakes, which in turn led to the construction of traveltime curves for intermediate and deep earthquakes. The most obvious indication of a seismogram that a large earthquake has a deep focus is, the small amplitude or height, of the recorded surface waves and the uncomplicated character of the P and S waves. Although the surface-wave pattern does generally indicate that an earthquake is either shallow or may have some depth, the most accurate method of determining the focal depth of an earthquake is to read a depth phase recorded on the seismogram. Occasional shallow earthquakes—those that originate within 60 km of the Earth's superficial surface are seen to affect most of the parts of the world. In fact, the large majority of earthquake foci are known to be shallow. It should be noted however that, the geographic division of smaller earthquakes is fewer completely determined than more severe earthquakes, partly because the accessibility of relevant data is needful on the distribution of observatories. As observed from the past frequently occurring earthquakes, it is becoming obvious that, due to rapid urbanization, many big cities are becoming prone to earthquake hazard. In this study the main target is to study the seismicity and to calculate the seismic hazard in the study area. Newly born Chhattisgarh state, covered by 4 major water-systems of India: Ganga, Mahanadi, Narmada and Godawari. Mahanadi is the lifeline of Chhattisgarh. Water is a catalyst for development state. All major dams are constructed on Mahanadi. Chhattisgarh has fairly good rainfall, but proper Irrigation system and water management bring the people have agro-based livelihood. For fulfil the demand of irrigation the major dams were constructed. The present study is giving emphasis on the consequence of variation of focal depth over maximum peak ground acceleration at bed rock level. Four major dams Ravishankar Sagar, Sikaser, Kodar and Sondurare considered to verify the effect of variation of focal depth over maximum peak ground acceleration for using deterministic approach.

METHODOLOGY

The first step in seismic hazard analysis is to characterize the various seismic sources in the area which may affect the site of a structure. The seismic sources are generally defined from the spatial distribution of past earthquakes or from knowledge of various faults in the area. In the deterministic approach, the focus is on the largest possible earthquake event, including all earthquake sources capable of producing damaging ground motions at a site. Faults may be earthquake sources, which are typically planar surfaces, identified through various means such as observations of past earthquake locations and geological evidences. In the present study, DSHA was applied to major dams Ravishankar Sagar, Sikaser, Kodar and Sondur of Chhattisgarh. The literature review reveals the information regarding different parameters, for assessment of seismic hazard. The hazard at the site is defined in terms of ground motion, induced at the site due to the earthquake that can occur, on the already identified sources. Different values of ground motion will be obtained from different sources at the site under investigation. In the Deterministic approach of hazard estimation, the minimum source to site distance is taken as the distance parameter in the attenuation equation. A set of possible values of PGA at the site due to the various sources is computed with the help of the attenuation equation given by Iyengar and Raghukanth (2004). The maximum of this set of values, is chosen as the quantified hazard and estimates the effect when the focal depth is increasing. The known seismic sources those which are adequately near the site as shown in Fig. 1, along with available historical seismic and geological data.

Ashish Kumar Parashar

COMPUTATION OF SEISMIC HAZARD PARAMETERS

In the context to estimate the peak ground acceleration for major dams Ravishankar Sagar, Sikaser, Kodar and Sondur of Chhattisgarh, it is indispensable to estimate seismic hazard parameters (a & b value) for particular site. The “b” Value is the measure of the frequency of the occurrence of earthquakes of different sizes. There are two techniques, currently used for determination of seismic hazard parameters (a & b-value).

- Linear Least-Squares Fit [Stepp, 1972]]
- Maximum-Likelihood Estimation (Utsu, 1965)

In Linear Least-Squares Fit, the earthquake data analysis is used to investigate the accessible data set, to assess its nature and degree of completeness. The incompleteness of the available earthquake data, makes it difficult to attain the fits of the Gutenberg-Richter recurrence law is believed to signify the true long term recurrence rate. There are many recurrence laws that help describe the uncertainty in the size of earthquakes produced by each source zone. To account for minimum and maximum magnitudes, Gutenberg-Richter recurrence law assumes an exponential distribution of magnitude, which is used with modification and is given by:

$$\text{Log } N = a - b \cdot M \quad \text{----- (1)}$$

As recommended by Stepp (1972), the problem data incompleteness can be overcome by a method of analysis, which involves the grouping of earthquake data into several magnitude classes. By taking the help of the property of statistical estimation that, variance of the estimate of a sample mean is inversely proportional to the number of observations in the sample (Stepp, 1972). The b value is obtained from Linear Least-Square Fit for major dams of Chhattisgarh. Another method is Maximum-Likelihood Estimation, that was applied over major dams Ravishankar Sagar, Sikaser, Kodar and Sonduras:

$$b = \log_{10} e / (M_{av} - M_{min}) = 0.43 / (M_{av} - M_{min}) \quad \text{----- (2)}$$

where M_{av} is the mean of the observed magnitudes and M_{min} is the minimum or threshold magnitude, for present study the value is taken as 3.0.

Estimation of Maximum Magnitude

In seismic hazard analysis, the acquaintance of estimating the maximum magnitude is used as one of the key input parameters in the seismic design. The highest potential of accumulated strain energy is signified by this, which is to be released in the region or a seismic source/fault. Alternatively, the M_{max} is an upper limit or the largest possible earthquake that may produce the highest seismic hazard scenarios of the region. For estimation of M_{max} two methods were used as Wells and Coppersmith (1994) and Gupta (2002). Wells and Coppersmith (1994) method, has given a relation between M_w and the surface rupture length (SRL), that was developed using reliable source parameters and this is further applicable to interplate or intraplate earthquakes, shallow earthquakes, and all types of faults.

$$\text{Log (SRL)} = 0.57 M_w - 2.33 \quad \text{..... (3)}$$

The above equation was used to estimate M_{max}

Gupta’s (2002) method was applied to estimate $M_{max} = M$, by equation given as below:

$$M_{max} = M = M_{obs} + 0.5 \quad \text{..... (4)}$$

$M_{max} = M = \text{Maximum Magnitude}$

$M_{obs} = \text{Observed Moment Magnitude (} M_w \text{)}$.

ATTENUATION RELATIONSHIP FOR PENINSULAR INDIA REGION

From review of literature of attenuation relationship for Peninsular India region, in the present research an attenuation relationship proposed by Iyengar and Raghukanth (2004), has been adopted. The proposed equation for peak ground acceleration (PGA), under bed rock conditions, is given as below

$$\ln Y = C1 + C2 (M-6) + C3 (M-6)^2 - \ln(R) - C4(R) + \ln(\epsilon) \quad \text{..... (5)}$$

where refer to $Y = \text{PGA (g)}$, $M = \text{Magnitude}$, and

$R = \text{Hypo-central distance Peninsular India: } C1 = 1.6858;$

$C2 = 0.9241; C3 = -0.0760; C4 = 0.0057$

Assuming Focal Depth = 10 km

Ashish Kumar Parashar

Above attenuation relationship is used to find out Peak Ground Acceleration (PGA) at bed rock level for major dam site of Chhattisgarh. For DSHA application over major dam sites like Ravishankar Sagar, Sikaser, Kodar and Sondur the total numbers of 16 faults are considered. The Maximum PGA (g) value 0.0266g for 50 Percentile was reported for Ravishankar Sagar dam for fault F12, fault length 58 km with minimum map distance of 105.192 km as shown in Table 2. When focal depth is increasing with increment of 5 km the PGA (g) values reduces as shown in Appendix I, Table 1 and variation in Fig.4(i)(a). For the focal depth 50 km the PGA (g) value reduces as reported 0.0227g. On the other-hand the Minimum PGA(g) value for having map distance 167.008 km for Sikaser Dam 0.0124g for 50 Percentile reduces and reported 0.0114g shown in Appendix I, Table 1 and variation shown in Fig.4(i)(b). For rest two dam sites the PGA(g) values reported between above stated values. For 84 Percentile the Maximum PGA (g) value 0.0423g was reported for Ravishankar Sagar dam for fault F12, fault length 58 km with minimum map distance of 105.192 km as shown in Table 2. When focal depth is increasing with increment of 5 km the PGA (g) values reduces as shown in Appendix I, Table 1 and variation shown in Fig.4(ii)(a). For the focal depth 50 km the PGA (g) value reduces as reported 0.0361g. On the other-hand the Minimum PGA(g) value for having map distance 167.008 km for Sikaser Dam 0.0197g for 84 Percentile reduces and reported 0.0182g shown in Appendix I, Table 1 and variation shown in Fig.4(ii)(b). For rest two dam sites the PGA(g) values reported between above specified values.

CONCLUSIONS

An attempt has been made to estimate the variation to estimate the variation of increment in focal depth over PGA(g) values for major dams Ravishankar Sagar, Sikaser, Kodar and Sondur of Chhattisgarh. The DSHA is used to find out the PGA (g) values at bed rock level for above stated major dams of Chhattisgarh. As the focal depth increase 5 times the PGA (g) value for 84 Percentile is decreases to 14.66 % for Ravishankar Sagar dam site having minimum map distance 105.192 km and 7.62 % for Sikaser dam site having minimum map distance 167.008 km. The present study outcome highlights the fact that fault no F12 having fault length 58 km it the nearest fault for all four major dams of Chhattisgarh and is the key fault.

ABSTRACT

Image registration plays a pivot role in various remote sensing image processing applications such as image interpolation, image segmentation, image fusion, image mosaicing etc. It is the process of finding sub-pixel accuracy between two images. The primary objective of image registration is the geometric alignment of two images and to remove geometry deformation between two images. This paper focus on the brief introduction about various methods of image registration. This paper provides a thorough overview of methods for remote sensing image registration. In the initial section of this paper, we delve into classical approaches for image registration, aiming to highlight their key characteristics and functionality. In the second part, all the traditional method is discussed we then discussed recently developed method Convolution neural network with deep learning algorithms with various feature based algorithm to boost the overall performance is discussed In the Last we compare the methods based on the registration accuracy.

Keywords: Remote-sensing, CNN, DNN, Multi-sensor image registration

INTRODUCTION

Image registration involves alignment of two images capturing the same scene but acquired at varying times or viewpoints, utilizing either the same or different sensor [1, 2, 18]. Image Registration is a key step in various image processing applications such as Image restoration, Image Segmentation, weather forecasting, agriculture monitoring, security, and surveillance military operations [1, 2, 17,18]. In image registration, one image acts as a reference image and the other as a sensed image [1,2]. The main objective of the image registration is to geometrically align the sensed image with the reference image and to remove distortion between two images [1,2]. Image registration can be

**Kinjal Parmar and Sudhir Vegad**

categorized based on simultaneity into two types synchronous and asynchronous image registration [3]. Synchronous image registration involves aligning image acquired simultaneously, while asynchronous image registration pertains to the alignment of images obtained at different time intervals [3]. Single sensor images are comparably consistent, while multi-sensor images are more variant and have more transformation which lead to higher complexity of image. Image registration of multi-source images is generally more challenging than single-sensor images [3]. Typically passive optical sensors are responsible for capturing remote sensing optical images, while active Synthetic aperture radar (SAR) sensors are utilized for capturing SAR images [1]. The Synthetic aperture radar is capable of offering high resolution remote sensing images under various weather conditions. Additionally it possesses robust anti-jamming capabilities [21]. In recent years, lots of research has been done in the field of image registration on remote sensing images [3]. Image registration is performed between the images captured at different times, it is called multi-temporal image registration. When registration is performed between the images captured by different sensors is called multi-model image registration and registration is performed between the images taken from multiple viewpoints it is called multi-view image registration [1, 3, 18]. Remote sensing is spell out as the process of gaining information about an object by a visualizing system without being in physical contact with the object [1,2,18] The Earth-observing satellites and airborne-based imaging systems regularly capture images of the Earth surface by using single or multiple sensors these images are known as remote-sensing images[1,3]. In the past twenty years, manual image registration involved a process where humans visually identified ground control point(GCP) on both sensed and reference images. This approach relied on human assessment for feature detection and matching. However conducting manual image registration for remote sensing images became an arduous task due to the high-resolution nature of these image. Several challenges emerged, including difficulties in accuracy identifying points, the necessity for numerous GCPs to enhance precision, and the requirement for an expert human operator to perform this task. This problem leads to the development of a fully automated image registration. Registration methods which can be divided into two categories: area-based and feature-based [1, 2, 3,17]. Area-based method mostly works on intensity value. This method first normalized the data into grayscale images. Subsequently, computations such as cross-correlation and mutual information (mi), to identify matching points within an image [1,3]. These methods can achieve higher accuracy but also they have higher computational time [3,4]. Feature-based methods are basically divided into four steps feature detection, feature descriptor, feature matching, and lastly the sensed image is aligned with the reference image. Feature based method achieves higher accuracy compare to area based methods. Recently, deep-learning algorithms have gained significant attention within the machine-learning field for their capability to learn hierarchical representative features from data. These dl methods have also found their way into the geoscience and remote sensing community [16].

Dataset analysis based on application

Various types of input images are used in the image registration process according to the applications.

1. Multi-temporal images: same or different images captured from different sensors at different times [2,3].
2. Multi-sensor images: the same images captured from different sensors such as synthetic aperture radar (SAR), hyperspectral and multispectral optical images and panchromatic images can enhance the analysis of specific regions of an image [2]. According to available information, more than 700 remote-sensing satellites are available in space. Images taken by different sensors improve the accuracy of registration [3]. The different sensor gives different information about various bands and it can work on infrared, near-infrared, microwave, and other bands [2].
3. Multi-view images: images are taken by the same sensor from different viewpoints [2].

METHODOLOGY**Area-based image registration and overview**

Image registration using area-based method works on image intensity value. When the image is gray scale or with color intensities with a lack of significant details such as shape and structure area [2,20]. Area area-based method works on the small size of the image block of both images and compare the intensity values of both images. These

**Kinjal Parmar and Sudhir Vegad**

intensity values are used to measure the similarity between the two images and to measure the similarity cross correlation (CC) and mutual information (MI) is used. Fourier based method are more suitable to remove the frequency dependent noise and non-uniform illumination variation according to time. Centre point of block of image was consider Control point for similarity measure. This leads to less accuracy and it affects many factors such as sensor used, illumination, time of acquiring image, image shadow, angle of object also affects the pixel value of image. Area based method is not more suitable for remote sensing image registration due less accuracy. Also the computational time is increased when more deformation are available. Area based image registration using deep learning approach involves training the network layer to calculate similarity and add layer to estimate the similarity. [2,7].

Feature-based Image Registration and Overview

Image registration using a feature-based method works on various salient features of images such as region, line, points, corner, contour, etc. Feature-based methods are mostly concerned with features. The feature-based image registration method is divided into four different steps:

Feature detection

feature detection is the key step in feature-based image registration to detect various features like edges, corners, etc. Harris corner detection algorithm proposed by c. Harris and j. Stephens in 1988 is best suited and gives accuracy to extract corner points from both images. [7,8,9,20] Canny edge detection algorithm is used to detect the edges of an image. The modified HARRIS corner detection algorithm is used in remote sensing image registration to reduce the computation time it ignores the low gradient value.[9,20] Laplace of Gaussian detector is applied for the line detection[8]. Region detection method using affine is introduced in 2010. Region feature has a high variance of a closed boundary. Sift can extract local features of the image with scale and rotation invariant this is the advantage of sift that makes it most popular pre-processing and key step to extract features in many sift has a disadvantage in that it gives the Unevenly Distributed Image Feature And Concerns About Local Features [2]. 91% Of Sift Feature Points are broken down by the Rotation Invariance Which Affects Registration. SURF is also used to extract the image features and it is faster than SIFT and has good results Compared to SIFT [2]. The SUSAN Corner Detection Algorithm is determined by comparing the corner point, center point and the Pixel Value of the Detected Region and It Takes More Computational Time [10]. Feature Matching: in feature matching it finds correspondence of detected features in both images are calculated based on various feature descriptor methods such as sift, surf, hog, and freak. Sift extracts invariant features [8].surf is a local robust feature detector and it uses haar response-based descriptor. Hog is used as a feature descriptor and it is used because it is more illumination invariant compared to surf [8].

A freak descriptor is a binary descriptor and it has a significant advantage of speed in generating feature vectors and matching. Transform model estimation: The transformation function is used to remove the geometry distortion between the two images [1]. The coordinates of the matching pairs are used to estimate the transformation function parameters [1]. Zitova and Flusser (2003) introduced two transformation functions such as local and global [1,8,20]. Affine, Projective, and polynomial are well-known global transformations. Global geometric difference such as rotation, scaling, and different view angles are present in input image then these types of transformation is generally used in local transformation, it calculates based on a combination of patches and it depends on the location of images[8]. In a Cartesian coordinate system, affine transformation are employed, which consist of rotation, scaling, and translation operation. Affine transformation are less susceptible for distorted images. These are globally used transformation in image registration. Projective and perspective transformation are used to remove distortion due to different projections of the sensor at varying distances [2]. Bajcsy et al[2] introduces elastic registration approach which is not using mapping function and it is less efficient in that image is considered as rubber sheet, where external forces for stretching and internal force of smoothing are applied to align both image.

Resampling and Outline Remover

In the process of model estimation, a mapping function is determined through translation. Subsequently, every point within the captured image undergoes translation according to calculated mapping function. The computational

Kinjal Parmar and Sudhir Vegad

procedure can be intricate, posing challenges and potentially introducing imperfections into the result image [3]. This approach is known as the forward approach. On the other hand, the backward approach is widely used to compute the inverse of the mapping function. Various interpolation methods are applied such as bilateral, bilinear, bicubic, cubic B-spline, and Gaussian. Additionally, resampling employs functions like sine as described by J. Parker and R. Kenyon. [2,8]. Furthermore, the feature-based image registration method is less suitable for remote sensing image registration. Limited applicability found in feature-based method. They perform well solely on specific images with suitable feature representation. RMSC is used to measure the accuracy of the image [4,17].

DEEP LEARNING ALGORITHMS

Recently, different deep learning architectures have flourished, finding applications in diverse domains like audio recognition, natural language processing and numerous classification tasks. These architectures commonly surpass traditional methods in performance [1,16,20]. The inspiration behind this concept stems from the structure of the mammalian brain, which is organized in a deep architecture [16,18,20]. Drawing from the depth of the human brain architecture, researchers in the field of deep learning have innovated novel deep architectures as a departure from shallower designs [16,18,20]. Additionally, in visual recognition tasks, most algorithms have been outperformed by convolution neural networks (CNNs) considered the most representative supervised deep learning model. The deep structure of CNNs enables highly abstract feature detectors to be learned by the model and allows the input features to be mapped into representations that can clearly enhance the performance of subsequent classifiers [1,16].

Convolution Neural Networks

The CNNs is multi-layer architecture designed for training, consisting of several stages of feature extraction. Each stage is constructed with three layers: 1) a convolution layer, 2) a nonlinearity layer, and 3) a pooling layer. Basically one, two, or three feature-extraction stages typically compose a CNNs, followed by one or more traditional, fully connected layers, and concluding with final classifier layer [1, 7, 16, 17, 20]. Each Layer Described in the Following Section:

Convolution Layer

The convolution layer receives a three-dimension array comprising r two-dimensional feature maps of size $m \times n$ as its input. Each element is represented as $x_{i,m,n}$, and each feature map is denoted as x^i . The resulting output consists of a three-dimensional array with k feature maps of size $m \times n$, where k denotes the number of feature maps generated. This layer employs k trainable filters, also known as the filter bank w , sized $l \times l \times$ which establish a connection between the input and output feature maps. The computation of the output feature map is performed by the convolution layer $z^s = \sum_i^s * x^i + b_s$, where $*$ is a two-dimensional discrete convolution operator and b is a trainable bias parameter [16].

CNNs model [16]:

- Input layer
- Convolution layer + activation function
- Pooling layer
- Fully connected layer

Nonlinearity Layer

- The nonlinearity layer in traditional CNNs is comprised of a pointwise activation function applied to each component in a feature map. The output feature map, denoted as $[a]_{fij} = f([z]_{fij})$. The activation function f is typically chosen to be a rectified linear unit (ReLU) $f(x) = \max(0, x)$ [16].

Pooling Layer

The pooling layer is defined by executing a maximum operation over the activations within a small spatial region of each feature map, represented as PGa . To provide greater precision, one can conceptualize the pooling layer as being comprised of a grid of pooling units spaced s pixels apart. Each unit serves to summarize a small spatial region of size $p \times p$ centered at the location of the pooling unit. Following multiple feature-extraction stages, the entire network

Kinjal Parmar and Sudhir Vegad

undergoes training through backpropagation of a supervised loss function, such as the classic least-squares output. The target output y is expressed as a 1-of- K vector, Where K represents the number of output and L significant number of layers:

$$J(\theta) = \sum_{i=1}^N \left(\frac{1}{2} \|h(x, \theta) - y\|^2 \right) + \lambda \sum_l \text{sum}(\|\theta(l)\|^2) \text{----- (1)}$$

Where, l indexes the layer number. Our goal is to minimize $J(\theta)$ as a function of θ . To train the CNN, we can apply stochastic gradient descent with back propagation to optimize the function. Recently, CNNs, have gained popularity as deep learning method and have demonstrated significant success in large-scale visual recognition. This success has been facilitated by the availability of extensive public image repositories, exemplified by ImageNet [16].in the remote sensing community, there have been recent endeavors in CNNs based remote sensing image pixel classification [1,16,19], target recognition [16], and scene understanding[16]. CNNs methods are used for image registration [2, 16, 17, 19]. CNNs have a wide scope in computer vision applications due to higher accuracy. CNNs automatically detects the correlated features from two images. CNNs consist of consecutive layers of trained convolution filters and these filters learn stratified dependent image features, which are common steps of deep learning networks. The CNNs features are built according to a neural network. So, the features that are created are directly generated design from image pixels. In cnn low-level features are trained in the first layer and high-level features are trained in deeper according to the image data set. So, the network learns the different levels of valuable contribution in remote sensing images [6,17]. Feature Extraction network such as AlexNet, VGGNet, GoogleNet remote sensing image registration based on deep learning has achieved acceptable outcome [18]. Neural Network) achieved great success in the field of computer vision because they are adept at identifying low-level and abstract features [2]. The basic framework of remote sensing data analysis is mainly divided into three main components, the input dataset, the core deep network, and the expected output data. The input and output image dataset always depends on the application. Multi-model image registration is done using CNNs which is used for image extraction in that Region-based evolution, and point-based evolution are done on various image datasets and remove the transformation using MI [3]. CNNs (convolution neural network) and DNN (Deep Shuang Wang et. al. [11] introduce DNN to extract affine transformation and with the use of a mapping function it finds image matching pair to register an image. CNNs can automatically acquire high-level or silent features than statistical methods. VGG16 also gives accuracy in registration with SIFT [12]. A full convolution neural network (FCN) is applied on multimodal images with average pooling to generate scaler matric values for SAR-optical which predicts whether the image is aligned or not. FCN which only trained, aligned, or displaced multi-model patches [15]. Still, there is a challenge in remote sensing image analysis due high Quality of RS images, time complexity, and low availability of training dataset [2].

CONCLUSION

Various work has been done in Remote sensing image registration in the last two decades but there are various challenges faced due to sensors, illumination, etc. From various kinds of literature, it has been found that area-based methods work on the image intensity value and it takes more computation time. Feature-based methods give good results but they also found challenges in remote sensing images. SIFT and SURF work as feature extractors and also generate feature descriptors and histograms of matching point pairs. SIFT also faces problems such as insufficient feature points, and a higher outlier ratio under rigid and non-rigid images. SURF is robust and faster than SIFT. To find the correct matching point pair of both images that focuses on local and global features of an image. Transformation estimation is also a challenging task in remote-sensing image registration. So, various deep learning methods are introduced such as CNN, and DNN which combine with traditional methods for better results and to reduce computational time. It is also necessary to work with other traditional deep-learning methods. All the work has been done on a single-sensor image. So, it is required to work on Multi-sensor images such as SAR, Panchromatic, and optical which have more details such as transformation, deformation, and illumination changes helps to get better results on remote sensing image registration.

ABSTRACT

In this paper we introduce Soft pre g^* -closed sets in soft topological spaces which are defined over an initial universe with a fixed set of parameters. Also we investigate about the relationship of soft pre g^* -opensets.

Keywords: soft pre g^* -closed set, soft pre g^* -open set

INTRODUCTION

Molodstov [6], presented the theory of soft sets. Kannan [3], described soft generalized closed sets in soft topological spaces. Muhammad shabir and Munazza Naz [8], investigate about the soft topological spaces. Levine [4], showed on generalized closed sets in topological spaces. Selvi and Arockiarani [7], explained about soft- πg closed sets in soft topological spaces. Maji, Biswas and Roy [5], were defined the concept of soft set theory and their properties. Arockiarani and Arockia Lancy [1], were characterized soft β separation axioms. Also they are explained about generalized soft $g\beta$ closed sets and soft $gs\beta$ closed sets in soft topological spaces. Yuksel, Tozlu and Ergul [10], were showed Soft Regular Generalized Closed sets in soft topological spaces. In this paper, $\text{int}(S,E)$ and $\text{cl}(S,E)$ represents the interior of (S,E) and closure of (S,E) respectively. In this paper we introduced some new concepts in soft topological spaces such as soft pre g^* - closed sets and soft pre g^* -opensets and derive some of its properties.

PRELIMINARIES

Definition :2.1. [6] Let U be the initial universe and $P(U)$ denote the power set of U . Let E denote the set of all parameters. Let A be a non-empty subset of E . A pair (F,A) is called a soft set over U , where F is a mapping given by $F : A \rightarrow P(U)$. In other words, a soft set over U is a parameterized family of subsets of the universe U . For $\varepsilon \in A, F(\varepsilon)$ may be considered as the set ε – approximate elements of the soft set (F,A) .

Definition :2.2. [6] For two soft sets (F,A) and (G,B) over a common universe U , we say that (F,A) is a soft subset of (G,B) if (1) $A \subset B$ and (2) for all $e \in A, F(e)$ and $G(e)$ are identical approximations. We write $(F,A) \subset (G,B)$. (F,A) is said to be a soft super set of (G,B) , if (G,B) is a soft subset of (F,A) . We denote it by $(F,A) \supset (G,B)$.

Definition :2.3. [5] Two soft sets (F,A) and (G,B) over a common universe U are said to be soft equal if (F,A) is soft subset of (G,B) and (G,B) is a soft subset of (F,A) .

Definition :2.4. [5] The union of two soft sets of (F,A) and (G,B) over the common universe U is the soft set (H,C) where $C = A \cup B$ and for all $e \in C$,

$H(e) = F(e)$ if $e \in A - B$

$G(e)$ if $e \in B - A$

$F(e) \cup G(e)$ if $e \in A \cap B$

We write $(F,A) \cup (G,B) = (H,C)$

Definition :2.5. [6] The intersection (H,C) of two soft sets of (F,A) and (G,B) over the common universe U denoted $(F,A) \cap (G,B)$, is defined as $C = A \cap B$ and $H(e) = F(e) \cap G(e)$ for all $e \in C$.

Definition :2.6. [7] Let τ be the collection of soft sets over X , then (X, τ, E) is said to be a soft topological space over X if

(1) Φ, X belong to τ ,

(2) The union of any number of soft sets in τ belongs to τ ,

(3) The intersection of any two soft sets in τ belongs to τ . The triplet (X, τ, E) is called a soft topological space over X .

Let (X, τ, E) be a soft space over X , then the members of τ are said to be soft open sets in X .

Definition :2.7. [8] A subset (A,E) of a topological space X is called soft regular closed (soft r - closed), if $\text{cl}(\text{int}(A,E)) = (A,E)$. The complement of soft regular closed is soft regular open set.

Definition :2.8. [10] The finite union of soft regular open sets is said to be soft π -open. The complement of soft π -open is said to be soft π -closed.

Definition :2.9. [3] A subset (A,E) of a topological space X is called a soft generalized closed (soft g -closed) if $\text{cl}(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft open in X .

Definition :2.10. [10] A subset (A,E) of a topological space X is called a soft πg -closed in a soft topological space (X, τ, E) if $\text{cl}(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft π -open in X .

Definition :2.11. [10] A subset (A,E) of a topological space X is called a soft πsg -closed in a soft topological space (X, τ, E) if $\text{scl}(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft π -open in X .

Definition :2.12. [10] A subset (A,E) of a topological space X is called a soft gpr -closed in a soft topological space (X, τ, E) if $\text{pcl}(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft regular open in X .

Kalaiselvi and Anitha

Definition :2.13. [8]A subset (A,E) of a topological space X is called a soft regular generalized closed (soft rg-closed) in a soft topological space (X, τ, E) , if $cl(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft regular open in X .

Definition :2.14. [1]A subset (A,E) of a topological space X is called a soft generalised-semi closed (soft gs-closed) in a soft topological space (X, τ, E) , if $scl(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft open in X .

Definition :2.15. [1]A subset (A,E) of a topological space X is called a soft α generalised closed (soft α g-closed) in a soft topological space (X, τ, E) , if $\alpha cl(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft open in X .

Definition :2.16. [1]A subset (A,E) of a topological space X is called a soft generalized β closed (soft g β -closed) in a soft topological space (X, τ, E) , if $\beta cl(A,E) \subset (U,E)$ whenever $(A,E) \subset (U,E)$ and (U,E) is soft open in X .

Definition :2.17. [9]Let (F_E, τ) be a soft topological space, a soft set F_A is said to be soft pre-open set (soft P-open) if there exists a soft open set F_0 such that $F_A \tilde{\subset} F_0 \tilde{\subset} \overline{F_A}$. The set of all soft P-open set of F_E is denoted by $G_{sp}(F_E, \tau)$ or $G_{sp}(F_E)$. Then F_A^c is said to be soft pre-closed. The set of all soft P-closed set of F_E is denoted by $F_{sp}(F_E, \tau)$ or $F_{sp}(F_E)$.

Proposition :2.18. [9]

- (i) Every soft openset is a soft pre-open set.
- (ii) Every soft closed set is a soft pre-closed set.

Definition 2.19.[3]A soft set (A,E) is called a soft generalized open (soft g-open) in a soft topological space (X, τ, E) iff $(F,E) \subset \text{int}(A,E)$ whenever $(F,E) \subset (A,E)$ and (F,E) is soft closed in X .

SOFT PRE g^* - CLOSED SET

Definition 3.1. A subset (S,E) of soft topological space (X, τ, E) is called a soft pre g^* closed set if $pcl(S,E) \subset (U,E)$ Whenever $(S,E) \subset (U,E)$ and (U,E) is soft g-open in X .

Theorem 3.2. Every soft preclosed set is soft pre g^* - closed.

Proof

Let (S,E) be soft pre closed set in (X, τ, E) and (U,E) be soft g-open in X , such that $(S,E) \subset (U,E)$. Then by the definition 3.1., $pcl(S,E) = (S,E) \subset (U,E)$ Hence (S,E) is soft pre g^* closed set in soft topological space (X, τ, E)

Theorem 3.3. Every soft pre g^* -closed set is soft pre g-closed.

Proof

Suppose (S,E) be soft pre g^* -closed set in (X, τ, E) .

Let (U,E) be soft open in X such that $(S,E) \subset (U,E)$. Since every soft preopen set is soft g-open, we have $pcl(S,E) \subset (U,E)$. Therefore (S,E) is soft pre g-closed.

Theorem 3.4. Every soft pre g^* -closed set is soft pre gs-closed.

Proof

Let (S,E) be soft pre g^* -closed set in (X, τ, E) .

Let (U,E) be soft open in X such that $(S,E) \subset (U,E)$. Since every soft preopen set is soft g-open, we have $pcl(S,E) \subset (U,E)$ Now $scl(S,E) \subset pcl(S,E) \subset (U,E)$ Therefore (S,E) is soft pre gs-closed

Theorem 3.5. Every soft pre g^* -closed set is soft pre rg-closed.

Proof

Let (S,E) be soft pre g^* -closed set in (X, τ, E)

Let (U,E) be soft regular open in X such that $(S,E) \subset (U,E)$. Since every soft pre regular open set is soft g-open, we have $pcl(S,E) \subset (U,E)$ Hence (S,E) is soft pre rg-closed

Kalaiselvi and Anitha

Theorem 3.6. Every soft pre g^* -closed set is soft pre gpr-closed.

Proof

Let (S,E) be soft pre g^* -closed set in (X, τ, E)

Let (U,E) be soft regular open in X such that $(S,E) \subset (U,E)$.

Since every soft pre regular open set is soft g -open, we have $pcl(S,E) \subset (U,E)$ Now $pcl(S,E) \subset cl(S,E) \subset (U,E)$

Hence (S,E) is soft pre gpr-closed.

Example 3.7. Suppose that there are five trees in the Universe. Let $U = \{t_1, t_2, t_3, t_4, t_5\}$ under consideration, and $E = \{p_1, p_2, p_3, p_4, p_5, p_6, p_7, p_8\}$ is a set of parameters then $p_i (i=1,2,3,4,5,6,7,8)$ stands for the parameters “strong wood”, “medicinal use”, “beautiful flower”, “tasty fruit”, “speed growth”, “slow growth”, “small tree”, “big tree”, respectively. In this case, to define a soft set means to point out strong wood, medicinal use and so on. Consider the mapping f_E given by “trees(.)” where (.) is to be filled in by one of the parameters $p_i \in E$, For instance, $f_E(p_i)$ means “tree have (strong wood)”, and its functional value is the set $\{t \in U: t \text{ have strong wood}\}$ and so, let $A \subset E$, the soft set F_A that describes the “Best of trees” in the opinion of the forest officer say Kumar, may be defined like, $A = \{p_2, p_3, p_4, p_5, p_7\}$, $F_A(p_2) = \{t_2, t_3, t_5\}$, $F_A(p_3) = \{t_2, t_4\}$, $F_A(p_4) = \{t_1\}$, $F_A(p_5) = \{U\}$ and $F_A(p_7) = \{t_3, t_5\}$. The soft set F_A as consisting of the following collection of approximations: $F_A = \{(p_2, \{t_2, t_3, t_5\}), (p_3, \{t_2, t_4\}), (p_4, \{t_1\}), (p_5, \{U\}), (p_7, \{t_3, t_5\})\}$.

Theorem 3.8. Every finite union of soft pre g^* closed set is soft pre g^* closed set.

Proof

Let (S,A) and (S,B) be two soft pre g^* -closed sets in soft topological space (X, τ, E) .

Let (U,E) be a soft g -open set in (X, τ, E) such that $(S,A) \cup (S,B) \subset (U,E)$

Then $pcl(S,A) \subset (U,E)$ and $pcl(S,B) \subset (U,E)$ Therefore $pcl((S,A) \cup (S,B)) \subset pcl(S,A) \cup pcl(S,B) \subset (U,E)$

$\Rightarrow pcl((S,A) \cup (S,B)) \subset (U,E)$ Therefore $(S,A) \cup (S,B)$ is soft pre g^* closed.

Example 3.9. Let $X = \{a, b\}$, $E = \{e_1, e_2\}$ $X = \{(e_1, \{a, b\}), (e_2, \{a, b\})\}$. Then the soft sets are written by $F_{E1} = X, F_{E2} = \phi, F_{E3} = \{(e_1, \{a\})\}, F_{E4} = \{(e_1, \{b\})\}, F_{E5} = \{(e_1, \{a, b\})\}, F_{E6} = \{(e_2, \{a\})\}, F_{E7} = \{(e_2, \{b\})\}, F_{E8} = \{(e_2, \{a, b\})\}, F_{E9} = \{(e_1, \{a\}), (e_2, \{a\})\}, F_{E10} = \{(e_1, \{a\}), (e_2, \{b\})\}, F_{E11} = \{(e_1, \{a\}), (e_2, \{a, b\})\}, F_{E12} = \{(e_1, \{b\}), (e_2, \{a\})\}, F_{E13} = \{(e_1, \{b\}), (e_2, \{b\})\}, F_{E14} = \{(e_1, \{b\}), (e_2, \{a, b\})\}, F_{E15} = \{(e_1, \{a, b\}), (e_2, \{a, b\})\}, F_{E16} = \{(e_1, \{a, b\}), (e_2, \{b\})\}$.

Theorem 3.10. If (S,E) is a soft pre g^* closed set of X such that $(S,E) \subset (T,E) \subset pcl(S,E)$ then (T,E) is a soft pre g^* closed.

Proof

Let $(T,E) \subset (U,E)$ where (U,E) is soft g -open

Then $(S,E) \subset (T,E)$

$\Rightarrow (S,E) \subset (U,E)$

Since (S,E) is a soft pre g^* -closed set,

$pcl(S,E) \subset (U,E)$

Given $(T,E) \subset pcl(U,E)$

Hence $pcl(T,E) \subset pcl(pcl(S,E))$

$\subset pcl(S,E)$

$\subset (U,E)$

$\Rightarrow pcl(T,E) \subset (U,E)$

Therefore (T,E) is a soft pre g^* closed set.

Example 3.11. Let us consider the soft sets of F_E that are given in example 3.5., Then the topologies are written by $\tau_1 = \{X, \phi, F_{E11}\}; \tau_1^c = \{X, \phi, F_{E4}\}; \tau_2 = \{X, \phi, F_{E9}\} \tau_2^c = \{X, \phi, F_{E13}\}$ and so on.

Theorem 3.12. A soft set (T,E) is soft pre g^* -closed if and only if $pcl(T,E) - (T,E)$ contains only null soft g -closed set.

Proof

Necessity Part: Let (T,E) be a soft pre g^* -closed set.

Let (S,E) be soft g -closed such that $(S,E) \subset pcl(T,E) - (T,E)$

Kalaiselvi and Anitha

Then $(S,E) \subset \text{pcl}(T,E)$ and $(S,E) \subset (T,E)^c$
 $\Rightarrow (T,E) \subset (S,E)^c$
 Then $\text{pcl}(T,E) \subset (S,E)^c$ as $(S,E)^c$ is a soft g-open set
 $\Rightarrow (S,E) \subset \text{pcl}(T,E)^c$
 Therefore $(S,E) \subset \text{pcl}(T,E) \cap (\text{pcl}(T,E))^c$
 Hence (S,E) is a null soft g-closed set.

Theorem 3.13. If (S,E) is soft g-open and soft pre g^* -closed then (S,E) is soft closed.

Proof

The Proof is obvious.

SOFT PRE g^* -OPEN SET

Definition 4.1. A subset (S,E) of a soft topological space (X, τ, E) is called soft pre g^* -open if $(U,E) \subset \text{pint}(S,E)$ whenever $(U,E) \subset (S,E)$ and (U,E) is soft g-closed in X .

Theorem 4.2. If (S,E) is a soft pre g^* -open set of soft topological space (X, τ, E) and $\text{pint}(S,E) \subset (T,E) \subset (S,E)$ then (T,E) is also soft pre g^* -open set of X .

Proof

Let (S,E) be soft pre g^* -open set in soft topological space (X, τ, E) .
 If (G,E) is soft g-closed set such that $(G,E) \subset (T,E)$
 Since $(T,E) \subset (S,E)$ we have $(G,E) \subset (S,E)$
 Since (S,E) is a soft pre g^* -open set,
 $(G,E) \subset \text{pint}(S,E)$
 Then $\text{pint}(\text{pint}(S,E)) \subset (T,E)$
 $\Rightarrow \text{pint}(S,E) \subset \text{pint}(T,E)$
 Hence $(G,E) \subset \text{pint}(S,E) \subset \text{pint}(T,E)$
 $\Rightarrow (G,E) \subset \text{pint}(T,E)$
 Then (T,E) is soft pre g^* -open set of X .

Example 4.3. Let us consider the soft sets of F_E that are given in example 3.9,

Let $F_{E9} = \{(e_1, \{a\}), (e_2, \{a\})\}$ be soft open set. Then soft pre open sets are $\phi, X, F_{E3}, F_{E5}, F_{E6}, F_{E8}, F_{E9}, F_{E10}, F_{E11}, F_{E12}, F_{E14}, F_{E15}, F_{E16}$.

Soft pre closed sets are $\phi, X, F_{E3}^c = F_{E14}, F_{E5}^c = F_{E8}$,

$F_{E6}^c = F_{E16}, F_{E8}^c = F_{E5}, F_{E9}^c = F_{E13}, F_{E10}^c = F_{E12}, F_{E11}^c = F_{E4}, F_{E12}^c = F_{E10}, F_{E14}^c = F_{E3}, F_{E15}^c = F_{E7}, F_{E16}^c = F_{E6}$.

Therefore soft pre closed sets are $\phi, X, F_{E3}, F_{E4}, F_{E5}, F_{E6}, F_{E7}, F_{E8}, F_{E9}, F_{E10}, F_{E12}, F_{E13}, F_{E14}, F_{E16}$.

Soft g-closed sets are $F_{E9}, F_{E11}, F_{E13}, F_{E14}, F_{E15}, F_{E16}$.

Soft g-open sets are $F_{E13}, F_{E4}, F_{E9}, F_{E3}, F_{E7}, F_{E6}$.

Soft pre g^* closed sets are F_{E13} and F_{E9} .

Example 4.4. Let us consider the soft sets of F_E that are given in example 3.9,

$$F_{E13} \cup F_{E9} = \{(e_1, \{b\}), (e_2, \{b\})\} \cup \{(e_1, \{a\}), (e_2, \{a\})\}$$

$$= \{(e_1, \{a,b\}), (e_2, \{a,b\})\} \subset X$$

SOFT PRE $T_{1/2}^*$ -SPACE AND SOFT PRE $T_{1/2}^*$ -SPACE

Definition:5.1. A Soft topological space (X, τ, E) is called a soft $T_{1/2}^*$ space if every soft g^* -Pre closed set is soft closed.

Theorem :5.2. Every soft $T_{1/2}$ space is soft $T_{1/2}^*$ space.

Proof : Let (X, τ, E) be a soft $T_{1/2}$ space and let (S,E) be soft g^* -Pre closed set in (X, τ, E) . By proposition 3.3, (S,E) is soft g-closed. Since (X, τ, E) is soft $T_{1/2}$ space, (S,E) is soft closed.

Theorem :5.3. For a space (X, τ, E) the following conditions are equivalent.

Kalaiselvi and Anitha

- 1) (X, τ, E) is a soft $T_{1/2}^*$ space
- 2) Every singleton of X is either soft g -closed set or soft open.

Proof : (1) \Rightarrow (2) Let $x \in X$ and suppose $\{x\}$ is not soft g -closed set of (X, τ, E) . Then $X - \{x\}$ is not soft g -open. This implies X is the only soft set containing $X - \{x\}$. So $X - \{x\}$ is a soft g^* -Pre closed set of (X, τ, E) . Since (X, τ, E) is a soft $T_{1/2}^*$ space, then $X - \{x\}$ is soft closed or equivalently $\{x\}$ is soft open in (X, τ, E) **(2) \Rightarrow (1)** Let A be a soft g^* -Pre closed set of (X, τ, E) Trivially $(S, E) \subset \text{cl}(S, E)$. Let $x \in \text{cl}(S, E)$. By (2), $\{x\}$ is either soft g -closed or soft open.

Case (i) : Suppose $\{x\}$ is soft g -closed. If $x \notin A$, then $\text{cl}(A, E) - (A, E)$ contains a non – empty soft g -closed set. But this is not possible according to the Theorem 3.8. as A is a soft g^* -Pre closed set. Therefore $x \in A$.

Case (ii) : Suppose $\{x\}$ is soft open. Since $x \in \text{cl}(S, E)$, then $\{x\} \cap A \neq \phi$. so $x \in (S, E)$

Therefore $x \in (S, E)$. So in any case $\text{cl}(S, E) \subset (S, E)$. Thus

$\text{cl}(S, E) = (S, E)$ or equivalently (S, E) is a soft closed set of (X, τ, E) .

Definition:5.4. A Soft topological space (X, τ, E) is called a soft $1/2^*T$ space if every soft g^* -Pre closed set is soft g -closed.

Theorem :5.5. Every soft $T_{1/2}$ space is soft $1/2^*T$ space.

Proof : Let (X, τ, E) be a soft $T_{1/2}$ space. Let (S, E) be soft g -closed set of (X, τ, E) . Since (X, τ, E) is soft $T_{1/2}$ space, (S, E) is soft closed in (X, τ, E) . By Theorem 3.2, (A, E) is soft g^* -Pre closed.

Therefore (X, τ, E) is a soft $T_{1/2}$ space.

Theorem :5.6. If (X, τ, E) is a soft $1/2^*T$ space, then $x \in X$, $\{x\}$ is either soft closed or soft g^* -Pre open.

Proof : Suppose (X, τ, E) is a soft $1/2^*T$ space. $x \in X$ and assume that $\{x\}$ is not soft closed.

Then $X - \{x\}$ is not a soft open set. This implies $X - \{x\}$ is a g -closed set since X is the only soft open set which contains $X - \{x\}$. Since (X, τ, E) , then $X - \{x\}$ is a soft g^* -Pre closed or equivalently $\{x\}$ is a soft g^* -Pre open.

CONCLUSION

In this paper we defined g^* Pre closed sets, Pre open sets and their properties. Also we defined soft $T_{1/2}$ space and soft $1/2^*T$ space.

ABSTRACT

This research explores how changes in rainfall and the availability of irrigation affect rice yields across various districts in Haryana. As rice is predominantly grown during the kharif season, it relies heavily on adequate rainfall. The analysis indicates that from 2011 to 2020, rainfall patterns were inconsistent and varied widely. An examination of the area, production, and yield of rice in different districts shows that the number of districts reporting high to moderate rice yields increased over the decade. Specifically, districts with high rice yields doubled, rising from four in 2011 to eight in 2020. The districts with moderate yield of rice decreased from nine in 2011 to five in 2020. This is because of increase in artificial means of irrigation such as tube-wells, pump-sets and expansion of canal network in these districts and hence, the impact of variation of quality and quantity of rainfall get lessened by use of irrigation facilities. The districts with poor yield had underdeveloped irrigation infrastructure. Hence, it becomes crucial to investigate alternative irrigation methods to ensure the stability of rice production and yield, and to mitigate the risks associated with variations in natural and monsoon rainfall patterns. Further, the analysis of irrigational facilities revealed a marked growth in irrigation services throughout Haryana. However, despite the overall increase in irrigation, there were regional disparities in the availabilities of irrigation amenities within the state.

INTRODUCTION

The 2020 Food and Agriculture Organization (FAO) report reveals that in 2019, about 750 million individuals globally were severely food insecure, which represents almost 10% of the global population [1]. Ensuring food security is crucial for the sustainable growth of the global economy and societal well-being. Rice ranks among the top three staple crops worldwide, cultivated in 122 countries and serving as the primary dietary staple for over half the world's population [2,3]. Any future shifts in rice cultivation are poised to significantly influence global grain production trends and overall food security [4]. India holds the distinction of being the second largest rice producer globally, with the most extensive rice cultivation area, approximately 43 million hectares [5]. Rice accounts for over 40% of India's total grain output. During the 2019–2020 period, rice fields covered 43.7 million hectares, producing 118.4 million tonnes, and achieving an average yield of about 2,705 kg/ha. Notably, Kharif rice, grown during the summer monsoon season, constitutes a significant portion of the country's rice output, with production reaching 102.4 million tonnes in 2019–2020 [5]. In India, Haryana ranks as one of the smaller states with a land area of 4.4 million hectares, which constitutes 1.34 percent of the country's total geographical area. Around 80 percent of this area is cultivated, with 84 percent benefiting from irrigation, resulting in a cropping intensity of 184 percent as per the Haryana State Agriculture Policy (HSAP). Since its establishment in 1966-67, Haryana has seen significant advances in food grain production and is now a key contributor to India's central food-grain pool. The cultivation of rice and wheat significantly boosts the state's agricultural output. Additionally, the productivity of crops in Haryana is influenced by various climatic factors such as temperature, drought, and rainfall during their growth phases [6,7,8]. Given that rice requires a significant amount of water, rainfall is a critical factor that greatly influences its production [9,10]. Rainfall naturally hydrates plants, and since rice requires more water than crops such as maize, barley, and sorghum, irrigation methods like tube wells, pumps, and canal networks become essential to maintain productivity during periods of low rainfall. Variations in rice yields from year to year [5] are often attributed to fluctuations in monsoonal rains [11,12]. Additionally, rice production differences can arise from diverse irrigation systems, technological advances, and crop management strategies [13]. Variability in rainfall impacts groundwater levels, which in turn influences irrigation that predominantly relies on this groundwater source. Moreover, the cost and accessibility of groundwater differ across various districts of Haryana due to distinct irrigation infrastructures. This study, therefore, examines how patterns of rainfall and the presence of irrigation facilities affect rice production across different districts in Haryana.

METHODOLOGY

STUDY AREA

This study was carried out at the district level in Haryana, which is situated between latitudes 27° 30' and 30° 35' N, and longitudes 74° 28' and 77° 36' E, in the northwest part of India. Haryana lies in the North Western arid and semi-arid plains and receives an average annual rainfall of 545 mm, predominantly through the southwest Monsoon. The state is divided into four distinct regions: Northern, Eastern, Western, and Southern. The Northern region features hilly terrain, while the Eastern region benefits from higher rainfall and fertile soil, sloping from north to south at elevations between 700 and 900 feet. Groundwater depletion is a significant issue in both the northern and southern regions, while the central areas, including parts of Rohtak, Jhajjar, Jind, Hisar, and Sirsa, experience problems with rising groundwater levels, leading to waterlogging and salinization. The southwestern region is characterized by its dry, sandy, and barren landscape. Despite lacking perennial rivers, Haryana has developed a robust agricultural sector, supported by fertile lands and an extensive canal irrigation system, including the western Yamuna canal and Bhakhra canal systems. The map of Haryana and its location in India is shown in the figure 1.

RESULTS AND DISCUSSION

Study of area, production and yield of rice cultivation in Haryana:

**Disha Chahal and Krishna Kumar**

The figure 2 illustrates the area of cultivation of rice in Haryana over the years 1966-67 to 2019-20. This data shows a persistent increase from 192 thousand hectare in 1966 to 1559 thousand Hectare in 2020. Figure 3 illustrates the progression of rice production in Haryana from 1966 to 2020, where it escalated from 2.23 lakh tonnes in 1966 to 51.98 lakh tonnes in 2020, with a notable decline from 48.8 lakh tonnes in 2017-18 to 45.16 lakh tonnes in 2018-19 Figure 4 traces the changes in rice yield per hectare, beginning with 1161 kg in 1966 and rising to 2775 kg in 1991. However, the yield experienced a downturn to 2557 kg per hectare by 2001, followed by an increase to 3422 kg per hectare in 2018. Subsequent years saw a dip to 3121 kg per hectare in 2019, before rising again to 3334 kg per hectare in 2020. These figures indicate that the improvements in rice yield in Haryana have been subject to significant fluctuations over the years.

Analysis of rainfall impact on yield of rice in different districts of Haryana

The map (figure 5) shows the impact of rainfall on yield of rice in different districts of Haryana, 2011. Panchkula received low average annual rainfall and had moderate yield of rice. Being a kharif crop rice requires good rainfall. Usage of high yielding variety of seeds, technological inputs and artificial means of irrigation leads to high yield of rice even at places receiving less rainfall (table 1). Ambala and Yamuna-Nagar received high rainfall and had high yield of rice. Karnal, Mahendragarh, Rewari and Palwal received moderate average annual rainfall and had moderate yield of rice. Faridabad, Jind, Panipat and Sonapat received moderate average annual rainfall but had low yield of rice. Less technological inputs, usage of seeds with low yield and fewer artificial means of irrigation leads to less agricultural yield of rice. Hisar, Bhiwani, Rohtak and Jhajjar received low average annual rainfall and had low yield of rice. Fatehabad and Kurukshetra received low average annual rainfall but had high yield of rice. Sirsa, Kaithal, Gurgaon and Mewat received low average annual rainfall but had moderate yield of rice. In 2011, only four districts of Haryana had high yield of rice, nine had moderate yield of rice and eight had low yield of rice. The figure 6 shows impact of rainfall on yield of rice in Haryana, 2020. In the year 2020, Panchkula, Ambala, Yamuna-Nagar and Karnal received high average annual rainfall and had high yield of rice. Hisar, Bhiwani, Jhajjar and Rewari received low average annual rainfall and had low yield of rice. Fatehabad received low average annual rainfall but had high yield of rice. Sirsa received low average annual rainfall and had moderate yield of rice. Sonapat, Rohtak, Mewat and Faridabad received moderate average annual rainfall but had low yield of rice. Gurgaon, Kaithal and Kurukshetra received moderate average annual rainfall but had high yield of rice. Jind, Panipat, Mahendragarh and Palwal received moderate average annual rainfall and had moderate yield of rice.

In 2020, Haryana had eight districts with high rice yields, five districts with moderate yields, and another eight with low rice yields. The number of districts with high yield of rice increased from four in 2011 to eight in 2020. The districts with moderate yield of rice decreased from nine in 2011 to five in 2020. This is because of increase in artificial means of irrigation such as tube-wells, pump-sets and expansion of canal network in these districts (table 1 & figures 7,8,9). The table 1 highlights the progressive changes in the extent of irrigation across districts in Haryana. It indicates a positive trend towards increased irrigation coverage and improved access to water resources for agricultural purposes. Grasping these shifts can guide policymakers and stakeholders to pinpoint regions needing more aid in developing irrigation infrastructure and managing water resources, thereby boosting agricultural productivity and promoting sustainable development in the state. The research highlights that rice, as a kharif crop, relies heavily on adequate rainfall, with the amount and quality of rainfall significantly influencing the area, production, and yield of the crop. However, due to global warming, the patterns of rainfall and monsoon in Haryana are becoming erratic. The yield is also determined by the use of high-yielding seed varieties, fertilizers, pesticides, and, crucially, the irrigation facilities available in each district. The impact of rainfall variability can be mitigated by the prudent use of these irrigation systems. Thus, it is essential to invest in artificial irrigation methods to ensure the stable production and yield of rice, safeguarding against the variability caused by changes in natural and monsoon rainfall patterns.

Status of irrigation facilities in Haryana

The study of pattern of irrigational development reveals a marked growth in irrigation facilities throughout Haryana (table 1 & figures 7,8,9). This expansion can be attributed to various factors, including the implementation of irrigation projects, the construction of canals and tubewells, and the utilization of groundwater resources. However,

**Disha Chahal and Krishna Kumar**

despite the overall increase in irrigation, there remains a regional imbalance in the development of irrigation facilities within the state. This imbalance can be attributed to the prevailing physio-socio-economic conditions that pose restrictions and challenges to irrigation development in certain area. Mathauda et al. (2000) reported that the chemical composition of the atmosphere is getting altered [14]. The main causes of these are fuel combustion, burning of biomass, deforestation, manufacturing of synthetic chemicals. These causes are enhancing the greenhouse effect in the atmosphere. Abbas and Mayo (2021) stated that global warming is rising which in turn leads to variation in the rainfall and temperature patterns [15]. Rice being a kharif crop requires good rainfall but due to global warming and climate change the rainfall and monsoon pattern in northwest India is getting altered and disturbed. Therefore, it is very important to also invest in artificial means of irrigation to secure the production and yield of the rice crop and prevent its failure due to change in the pattern of natural and monsoon rainfall. Mahajan et al. (2009) said that it is very important to adopt water saving management practices because they lead to increase in yield and water productivity and a sustainable production of rice [16].

CONCLUSIONS

Observations of how rainfall variations affect rice yields in Haryana clearly indicate that there are shifts in climatic conditions over time. The patterns of rainfall are evolving, with its distribution becoming increasingly irregular recently. Farmers in Haryana rely on rainfall for crop cultivation, yet the recent irregularities in rainfall patterns have heightened dependence on artificial irrigation methods. This increased reliance on artificial irrigation has led to groundwater depletion and the emergence of dark zones in water levels across north-western India. In response to acute water shortages, the Haryana government has imposed restrictions on paddy cultivation in the most affected areas. The agricultural system in Haryana is under strain due to the disproportionate use of fertilizers, prevalent crop residue burning in the rice-wheat cropping system, and the limited availability of resources in each designated ecosystem. This situation underscores the necessity for crop diversification to enhance both ecological and human health. The cultivation of citrus fruits, like Kinnow, is gaining popularity in several districts, driven by benefits such as reduced reliance on monsoon rains, the creation of sustainable livelihoods, higher farmer incomes, and greater efficiency in resource usage. Horticulture, encompassing the growing of fruits, vegetables, spices, and other plantations, is emerging as a vibrant and sustainable economic pursuit for Haryana's farmers, who are being urged to diversify into crops like vegetables, fruits, cotton, maize, pulses, and more. One of the popular crop diversification schemes is 'Mera Pani Meri Virasat' to make farmers diversify to less water-consuming crops. This scheme encourages farmers to shift from water-guzzling paddy to cultivation of maize, pulses, fruits & vegetables. The government can introduce more such schemes and crop insurance policies to further motivate and support farmers to diversify crop for sustainable livelihood and sustainable agricultural practices.

ABSTRACT

In this study, we propose the introduction of a novel classification of antimagic labeling known as palindromic antimagic. In the context of graph theory, a palindromic antimagic labeling of a graph $G = (V, E)$ with p vertices and q edges can be defined as an invertible mapping from the set of edges can be defined as an invertible mapping from the set of edges $\{e_1, e_2, \dots, e_q\}$ to the set of palindromic numbers $\{p_1, p_2, \dots, p_q\}$. This labeling also involves an injective mapping of vertex labeling, where each vertex is assigned a label equal to the sum of its incident edges. It is important to note that these vertex labels are distinct from one another. This article examines the palindromic antimagic properties of certain sets of graphs, such as the diamond and gem graph, the house, and kite graph. It provides proof that the join of these graphs, as well as the fusion of non adjacent vertices in the join graph, exhibit palindromic antimagicness.

Keywords: Palindromic Antimagic Labeling, Operations of graphs, Diamond and Gem graph, House and Kite graph.

Mathematical subject classification: 05C78, 05C76

Reka and Soundariya

INTRODUCTION

In this study, we investigate the concept of a palindromic antimagic labeling for a graph

$G = (V, E)$ with p vertices and q edges, the edge set E assure an invertible mapping

$\varphi: (G) \rightarrow \{p_1, p_2, \dots, p_q\}$ where $\{p_1, p_2, \dots, p_q\}$ is a palindromic number (Numbers remain carbon copy when its terms are overturned) that launch an injective mapping

$\theta: (G) \rightarrow Z^+$ defined

$$(V(G)) = \sum_{e \in E} \psi(Z^+) \varphi(e)$$

where $\psi_G(Z^+)$ is an incidence function associated with corresponding v and those vertex labelings are incompatible with each other. Let G_1 and G_2 denote two disjoint graphs. The join of these two graphs $G_1 + G_2$ is formally described as a mathematical structure consisting of a set of vertices $(G_1 + G_2)$ and the set of edges $(G_1 + G_2)$ are

$$(G_1 + G_2) = V(G_1) + V(G_2)$$

$$(G_1 + G_2) = E(G_1) + E(G_2) + N(u) + N(v)$$

For every vertex u in G_1 , the neighbourhood of u , denoted by $N(u)$, is the set of vertices located adjacent to u in G_1 , and similarly for any vertex v in G_2 .

The fusion operation in graph theory involves merging two vertices, u and v in a graph G to create a new vertex w . This process implies reassigning any edges that were originally connected to either u or v , or both, to the newly created vertex w . Following the process, the number of vertices in graph G is reduced by one, while the number of edges in graph G remains unchanged.

A Diamond graph is a type of planar undirected graph that consists of four vertices and five edges, arranged in a manner that resembles the shape of a diamond. The structure is comprised of a fully connected graph, denoted as K_4 , with the removal of a single edge. The given structure exhibits isomorphism with the entire tripartite graph $K_{1,1,2}$. This graphical representation is occasionally referred to as a double triangle graph.

A Gem graph is a fan graph $F_{1,4}$ which acquire by join a graph K_1 and path P_4 which have the appearance of gem stone. A House graph is a type of planar undirected graph that consists of 5 vertices and 6 edges. It is formed by the union of a cycle C_3 and a cycle C_4 .

The term "House graph" is derived from its visual resemblance to a schematic illustration of a house, that includes a roof.

A Kite graph is a simple planar undirected graph with 5 vertices and 6 edges, bear semblance to Shape of kite which is achieved by linking a diamond graph and a K_1 graph via a bridge.

In 1990, Hartsfield and Ringel[4] introduced the idea of antimagic. They made the inference that every connected graph, except for K_2 , and every tree, except for K_2 , are antimagic. Additionally, they provided a proof that every path ($n \geq 3$), cycles C_n ($n \geq 3$), complete graph K_n ($n \geq 3$) are antimagic. In a publication from 1996, Joseph A. Gallian[3] conducted an in-depth investigation of the topic of Graph Labeling. In this study, Gallian provided evidence to support the assertion that the join of two graphs can exhibit graceful, harmonious, and antimagic properties. In 2004, Alon et al.[1] put up a hypothesis suggesting that dense graphs possess antimagic properties. They subsequently provided a proof demonstrating that all graphs with a maximum degree of at least $n - 2$ are antimagic. Yilma[6] expanded upon the findings on antimagic graphs that involve vertices of significant degree by providing a proof that establishes the antimagic property of a connected graph with $\Delta(G) \geq |V(G)| - 3, \forall |V(G)| \geq 9$. In a study conducted in 2013, Wang et al.[5] demonstrated that if G and H are graphs with the same order, then the graph obtained by combining G and H , denoted as $G + H$, exhibits antimagic properties. In a study conducted by Baca et al.[2] in 2015, it

Reka and Soundariya

was demonstrated that some join graphs and incomplete join graphs possess antimagic properties. Let us examine the primary findings of the article.

Main Result

In this section, the major result is demonstrated through the utilization of two subsections

Palindromic Antimagic of some operations in Diamond and Gem graph

In this section, it is necessary to assign labels to the first set of base graphs, such as Diamond and Gem graphs. Consider a graph G , referred to as a Diamond graph, which consists of p vertices and q edges. Similarly, let H be a graph known as a Gem graph, with \bar{p} vertices and \bar{q} edges, the vertex set of G and H , $V(G) = \{t_a: 1 \leq a \leq p\}$, $V(H) = \{s_b: 1 \leq b \leq \bar{p}\}$ and the edge set of G and H , $E(G) = \{e_a: 1 \leq a \leq q\}$, $E(H) = \{e_b: 1 \leq b \leq \bar{q}\}$. Consequently, the edge labeling of graph G and H may be determined.

$$\begin{aligned} 1. \varphi: E(G) &\rightarrow \{p_1, p_2, \dots, p_q\} \text{ defined} \\ 2. \varphi(e_1, e_2, \dots, e_q) &= (p_q, p_{q-1}, \dots, p_1) \end{aligned} \tag{1}$$

$$\begin{aligned} 3. \bar{\varphi}: E(H) &\rightarrow \{p_1, p_2, \dots, p_q\} \text{ defined} \\ \bar{\varphi}(e_1, e_2, \dots, e_{\bar{q}}) &= (p_q, p_{q-1}, \dots, p_1) \end{aligned} \tag{2}$$

where $\{p_1, p_2, \dots, p_q\}$ is a palindromic number. The vertex labeling of graph G and H becomes

$$\begin{aligned} \theta: (G) &\rightarrow Z^+ \text{ defined} \\ (V(G)) &= \sum_{eg} \psi(Z^+) \varphi(e_a) \end{aligned} \tag{3}$$

$$\begin{aligned} \bar{\theta}: (H) &\rightarrow Z^+ \text{ defined} \\ \bar{\theta}(V(H)) &= \sum_{eg} \psi_H(Z^+) \bar{\varphi}(e_b) \end{aligned} \tag{4}$$

where ψ is an incidence function of corresponding vertex and also which is couplet disparate.

Lemma 2.1. Let G be a simple planar undirected Diamond graph with p vertices and q edges, which satisfy palindromic antimagic labeling, then for any vertex t_i in $V(G)$,

$$\frac{p+q+\delta(G)-1}{\Delta(G)-1} \leq t_i \leq \frac{p+q+\delta(G)-1}{\Delta(G)-1} + \frac{p+q+\Delta(G)+\delta(G)}{\delta(G)} \text{ and let } t_i, t_j \text{ be any two vertices of } G \text{ such that if } t_i > t_j \text{ then } \frac{p+q+\delta(G)-1}{\Delta(G)-1} - [\delta(G)]^2 \leq t_i \leq \frac{p+q+\Delta(G)+\delta(G)}{\delta(G)}. \text{ Hence } t_i \text{ is distinctive from each other.}$$

Lemma 2.2. Let H be a simple connected undirected gem graph with \bar{p} vertices and \bar{q} edges, which satisfy palindromic antimagic labeling, then for any vertex s_i in $V(H)$,

$$\frac{\bar{p}+\bar{q}+\Delta(H)+\delta(H)}{\Delta(H)-1} \leq s_i \leq \frac{\bar{p}+\bar{q}+\Delta(H)+\delta(H)}{\Delta(H)-1} + \frac{\bar{p}+\bar{q}+\Delta(H)+\delta(H)}{\delta(H)} \text{ and let } s_i, s_j \text{ be any two vertices of } H \text{ such that if } s_i > s_j \text{ then } \frac{\bar{p}+\bar{q}+\delta(H)}{\Delta(H)-\delta(H)} - \frac{\bar{p}+\bar{q}+\Delta(H)+\delta(H)}{\Delta(H)-1} \leq s_i - s_j \leq \delta(H) \left[\frac{\bar{p}+\bar{q}+\delta(H)}{\Delta(H)-\delta(H)} \right]. \text{ Hence } s_i \text{ is distinctive from each other.}$$

Theorem 2.3. The join of two palindromic antimagic labeled graph (G and H) is a Palindromic antimagic

Proof. Let G represent a Diamond graph and H represent a Gem graph. $G + H$ denotes the join of two graphs G and H , the vertex set $(G + H) = (G) + V(H)$, and the edge set

$$(G + H) = (G) + E(H) + N(t_i) + N(s_i) \text{ where } t_i \text{ and } s_i \text{ are any vertices and } N(t_i) \text{ and } (s_i) \text{ are a neighbourhood of those vertex in graph } G + H, \text{ has } |V| = p + \bar{p}, |E| = q + \bar{q} + p\bar{p}.$$

Let us call the vertices of $G + H$ the same as the vertices of G and H , which are represented by r . Edges of $G + H$ are labeled the same as edges of G and edges of H , and the edges that connect the vertices of these two graphs are named ε_1 to ε_q . Let us see how to name the edges

ε_i , name ε_1 to ε_q to the edges those incident with $(G+H)-\bar{p}$, clepe ε_{q+1} to ε_{2q} to the edges whose incident with $t_{\delta(G)}$,

clepe ε_{2q+1} to ε_{3q} to the edges which is incident with $t_{\Delta(G)}$, clepe ε_{3q+1} to $\varepsilon_{p\bar{p}}$ to the edges whose incident with $t_{\Delta(H)}$, all in clockwise order.

Reka and Soundariya

In order to establish the palindromic antimagic attribute of the labeled graph $G + H$, it is necessary to assign labels to the edges of $G + H$.

$\varphi'' : E(G + H) \rightarrow \{p_1, p_2, \dots, p_{q+\bar{q}+p\bar{p}}\}$ defined

$$E(G + H) = \begin{cases} e_a = \{e_1, e_2, \dots, e_q\} = \{p_q, p_{q-1}, \dots, p_1\} \text{ by eqn (1)} \\ \bar{e}_b = \{\bar{e}_1, \bar{e}_2, \dots, \bar{e}_{\bar{q}}\} = \{p_{q+\bar{q}}, p_{q+\bar{q}-1}, \dots, p_{q+1}\} \\ \varepsilon_i = \{\varepsilon_1, \varepsilon_2, \dots, \varepsilon_{q+\bar{q}+p\bar{p}}\} = \{p_{q+\bar{q}+1}, p_{q+\bar{q}+2}, \dots, p_{q+\bar{q}+p\bar{p}}\} \end{cases} \quad (5)$$

The vertex labeling of the graph $G + H$ is determined by summing the incident edges of the corresponding vertex. Let r_{ij} represent any vertex of the vertex set $V(G + H)$ then

$$\begin{aligned} \{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} &\leq r_{ij} \\ &\leq \{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} + \{\Delta(G + H)\{\Delta(G)^{\delta(H)} q(\Delta(H) - \delta(H)) \\ &\quad + [\delta(G + H) - \bar{p}]\} \end{aligned}$$

and let r_{ij} and r'_{ij} be any vertices of $G + H$ such that if $r_{ij} > r'_{ij}$ then

$$t_{\Delta(H)} > t_{\Delta(G)} > s_{\delta(G+H)-\bar{p}} > s_{\delta(G)} > s_{\Delta(G)} > t_{\delta(G)} > s_{\Delta(H)} > s_{\bar{p}} > t_{\delta(G+H)-\bar{p}} \text{ thus,}$$

$$\begin{aligned} \left[\delta(G)^{\delta(H)} \frac{\Delta(G + H)}{\delta(H)} \right] + [\delta(G + H) - \bar{p}] &\leq r_{ij} - r'_{ij} \\ &\leq \{\Delta(G + H)\{\Delta(G)^{\delta(H)} q(\Delta(H) - \delta(H)) + [\delta(G + H) - \bar{p}]\} \end{aligned}$$

As a result, the labeling of $G + H$ is distinct from one another. Consequently, the join of two Palindromic antimagic graphs (G and H) is also Palindromic antimagic.

Theorem 2.4. The Fusion of non adjacent vertices of Palindromic antimagic labeled joining graph ($G + H$) is a Palindromic antimagic.

Proof. The objective of this theorem is to establish the palindromic antimagic property of the fusion of non-adjacent vertices in the graph $G + H$. Fusion is an operation in which two vertices are replaced by a single new vertex has $|V| = p + \bar{p} - 1$, $|E| = q + \bar{q} + p\bar{p}$. Prior to demonstrating the palindromic antimagic property, In this inquiry, we aim to determine the adjacency function of the combined graph $G + H$.

$$\begin{cases} N(t_{\delta(G+H)-\bar{p}}) = t_{\delta(G)}, t_{\Delta(G)}, t_{\Delta(H)}, V(H) \\ N(t_{\delta(G)}) = t_{\delta(G+H)-\bar{p}}, t_{\Delta(G)}, V(H) \\ N(t_{\Delta(G)}) = t_{\delta(G+H)-\bar{p}}, t_{\delta(G)}, t_{\Delta(H)}, V(H) \\ N(t_{\Delta(H)}) = t_{\delta(G+H)-\bar{p}}, t_{\Delta(G)}, V(H) \\ N(s_{\delta(G+H)-\bar{p}}) = V(G), s_{\delta(G)}, s_{\bar{p}} \\ N(s_{\delta(G)}) = V(G), s_{\Delta(G)}, s_{\delta(G+H)-\bar{p}}, s_{\bar{p}} \\ N(s_{\Delta(G)}) = V(G), s_{\delta(G)}, s_{\Delta(H)}, s_{\bar{p}} \\ N(s_{\Delta(H)}) = V(G), s_{\Delta(G)}, s_{\bar{p}} \\ N(s_{\bar{p}}) = V(G), s_{\delta(G+H)-\bar{p}}, s_{\delta(G)}, s_{\Delta(G)}, s_{\Delta(H)} \end{cases} \quad (6)$$

where $N(t_i)$ and $N(s_i)$ is a neighbourhood of those vertices. By the eqn(6) the fusion does not take place to the vertices $t_{\delta(G+H)-\bar{p}}, t_{\Delta(G)}, s_{\bar{p}}$ because $\psi_{G+H}(t_{\delta(G+H)-\bar{p}}) = \psi_{G+H}(t_{\Delta(G)}) = \psi_{G+H}(s_{\bar{p}}) = p + \bar{p} - 1$. To demonstrate the palindromic antimagicness of $G + H$ fusion, we must first label the edges as in eqn(5). The vertex labeling of new fused graphs is the sum of the edges that touch it.

Case(i):

Let $Fu_1(G + H)$ be a fused graph of $G + H$ formed by replacing the vertices $t_{\delta(G)}, t_{\Delta(H)}$ into $t_{\delta(G)}, t_{\Delta(H)}$ with $p + \bar{p} - 1$ vertices $q + \bar{q} + p\bar{p}$ edges, then for any vertex r_{ij} in $Fu_1(G + H)$, $\{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} \leq r_{ij} \leq \{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} + \{\delta(G)[(q, \delta(H)^{\Delta(G)}[\bar{p} + \bar{q} + 1]) - [\delta(G + H) - \bar{p}]]\}$. Let r_{ij} and r'_{ij} be any two vertices of $Fu_1(G + H)$ such that $r_{ij} > r'_{ij}$ then $\delta(G)[\delta(G + H) + \Delta(G + H) + \Delta(G) + \delta(H)] \leq r_{ij} - r'_{ij} \leq \{\delta(G)[(q, \delta(H)^{\Delta(G)}[\bar{p} + \bar{q} + 1]) - [\delta(G + H) - \bar{p}]]\}$. From the above inequality the vertex labelling of $Fu_1(G + H)$ is couplet disparate. Hence $Fu_1(G + H)$ is palindromic antimagic.

Reka and Soundariya

Case(ii):

Let $Fu_2(G + H)$ be a fused graph of $G + H$ formed by replacing the vertices $s_{S_{\delta(G+H)-p}, S_{\Delta(G)}}$ into $s_{S_{\delta(G+H)-p}, S_{\Delta(G)}}$ with $p + \bar{p} - 1$ vertices $q + \bar{q} + p\bar{p}$ edges, then for any vertex r_{ij} in $Fu_2(G + H)$, $\{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} \leq r_{ij} \leq \{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} + (\delta(G) + 1)\{\Delta(G)[(\Delta(G))^{\delta(H)}[\bar{p} + \bar{q} + 1]] - [\delta(H) - 1] + [\delta(G + H) - \bar{p}]\}$. Let r_{ij} and r'_{ij} be any two vertices of $Fu_2(G + H)$ such that $r_{ij} > r'_{ij}$ then $[\delta(G + H) + \Delta(G) + \Delta(G)] \leq r_{ij} - r'_{ij} \leq (\delta(G) + 1)\{\Delta(G)[(\Delta(G))^{\delta(H)}[\bar{p} + \bar{q} + 1]] - [\delta(H) - 1] + [\delta(G + H) - \bar{p}]\}$. From the above inequality the vertex labelling of $Fu_2(G + H)$ is couplet disparate. Hence $Fu_2(G + H)$ is palindromic antimagic.

Case(iii):

Let $Fu_3(G + H)$ be a fused graph of $G + H$ formed by replacing the vertices $s_{S_{\delta(G+H)-p}, S_{\Delta(H)}}$ into $s_{S_{\delta(G+H)-p}, S_{\Delta(H)}}$ with $p + \bar{p} - 1$ vertices $q + \bar{q} + p\bar{p}$ edges, then for any vertex r_{ij} in $Fu_3(G + H)$, $\{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} \leq r_{ij} \leq \{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} + \{\bar{p}\bar{q}\Delta(G)^{\delta(H)+1}\}$. Let r_{ij} and r'_{ij} be any two vertices of $Fu_3(G + H)$ such

that $r_{ij} > r'_{ij}$ then $p \leq r_{ij} - r'_{ij} \leq \{\bar{p}\bar{q}\Delta(G)^{\delta(H)+1}\}$. From the above inequality the vertex labelling of $Fu_3(G + H)$ is couplet disparate. Hence $Fu_3(G + H)$ is palindromic antimagic.

Case(iv):

Let $Fu_4(G + H)$ be a fused graph of $G + H$ formed by replacing the vertices $s_{S_{\delta(G)}, S_{\Delta(H)}}$ into $s_{S_{\delta(G)}, S_{\Delta(H)}}$ with $p + \bar{p} - 1$ vertices $q + \bar{q} + p\bar{p}$ edges, then for any vertex r_{ij} in $Fu_4(G + H)$, $\{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} \leq r_{ij} \leq \{\bar{q}[\delta(G)^p \Delta(G)] + [\delta(G + H) - \bar{p}]\} + \delta(H)\{(\delta(G)[\Delta(G)q[\delta(G + H) + q]] - 1) - [\delta(G + H) - \bar{p}]\}$. Let r_{ij} and r'_{ij} be any two vertices of $Fu_4(G + H)$ such that $r_{ij} > r'_{ij}$ then $p \leq r_{ij} - r'_{ij} \leq \delta(H)\{(\delta(G)[\Delta(G)q[\delta(G + H) + q]] - 1) - [\delta(G + H) - \bar{p}]\}$. From the above inequality the vertex labelling of $Fu_4(G + H)$ is couplet disparate. Hence $Fu_4(G + H)$ is palindromic antimagic.

As a result of the preceding four cases, the fusion of non-adjacent vertices of a palindromic antimagic labeled join graph $(G + H)$ is palindromic antimagic.

2.2 Palindromic Antimagic of some operations in House and Kite graph

In this section, it is recommended to designate the next collection of base graphs as the House and Kite graphs. Let G^* , denote a House graph, with p^* vertices and q^* edges, and let H^* be a kite graph, with \bar{p} vertices and \bar{q} edges, the vertex set of G^* and H^* , $V(G^*) = \{l_a: 1 \leq a \leq p^*\}, V(H^*) = \{m_b: 1 \leq b \leq \bar{p}\}$ and the edge set of G^* and H^* , $E(G^*) = \{e_a^*: 1 \leq a \leq q^*\}, E(H^*) = \{\bar{e}_b: 1 \leq b \leq \bar{q}\}$. Consequently, the edge labeling of graph G^* and H^* is determined.

$$\begin{aligned} \varphi^*: E(G^*) &\rightarrow \{p_1, p_2, \dots, p_{q^*}\} \text{ defined} \\ \varphi^*(e_1, e_2, \dots, e_{q^*}) &= (p_{q^*}, p_{q^*-1}, \dots, p_1) \end{aligned} \tag{7}$$

$$\begin{aligned} \tilde{\varphi}: E(H^*) &\rightarrow \{p_1, p_2, \dots, p_{\bar{q}}\} \text{ defined} \\ \tilde{\varphi}(\bar{e}_1, \bar{e}_2, \dots, \bar{e}_{\bar{q}}) &= (p_{\bar{q}}, p_{\bar{q}-1}, \dots, p_1) \end{aligned} \tag{8}$$

where $\{p_1, p_2, \dots, p_q\}$ is a palindromic number. The vertex labeling of graph G and H becomes

$$\begin{aligned} \theta^*: V(G^*) &\rightarrow Z^+ \text{ defined} \\ \theta^*(V(G^*)) &= \sum_{e \in \psi_{G^*}(z^*)} \varphi^*(e_a^*) \end{aligned} \tag{9}$$

$$\begin{aligned} \tilde{\theta}: V(H^*) &\rightarrow Z^+ \text{ defined} \\ \tilde{\theta}(V(H^*)) &= \sum_{e \in \psi_{H^*}(z^*)} \tilde{\varphi}(\bar{e}_b) \end{aligned} \tag{10}$$

where ψ is an incidence function of corresponding vertex and also which is couplet disparate.

Lemma 2.5. Let G^* be a simple planar undirected House graph with p^* vertices and q^* edges, which satisfy palindromic antimagic labeling, then for any vertex l_i in $V(G^*)$, $\frac{p^*+q^*+\delta(G^*)+1}{\Delta(G^*)-1} \leq l_i \leq \frac{p^*+q^*+\delta(G^*)+1}{\Delta(G^*)-1} + \frac{p^*+q^*+\Delta(G^*)}{\delta(G^*)}$ and let l_i, l_j be any two vertices of G^* such

Reka and Soundariya

that if $l_i > l_j$ then $\frac{p^*+q^*+\delta(G^*)+1}{\Delta(G^*)-1} - [\delta(G^*)]^2 \leq l_i - l_j \leq \frac{p^*+q^*+\Delta(G^*)}{\delta(G^*)}$. Hence l_i is distinctive from each other.

Lemma 2.6. Let H^* be a simple connected undirected kite graph with \tilde{p} vertices and \tilde{q} edges, which satisfy palindromic antimagic labeling, then for any vertex m_i in $V(H^*)$, $\frac{\tilde{p}+\tilde{q}+\delta(H^*)}{\Delta(H^*)-1} - \frac{\tilde{p}+\tilde{q}+\delta(H^*)}{\delta(H^*)+1} \leq m_i \leq \frac{\tilde{p}+\tilde{q}+\delta(H^*)}{\Delta(H^*)-1} + \Delta(H^*)[\delta(H^*)+1]$ and let m_i, m_j be any two vertices of H^* such that if $m_i > m_j$ then $\frac{\tilde{p}+\tilde{q}+\delta(H^*)}{\Delta(H^*)-1} - \frac{\tilde{p}+\tilde{q}+\delta(H^*)}{\delta(H^*)+1} - \frac{\tilde{p}+\tilde{q}+\delta(H^*)}{\delta(H^*)+1} \leq m_i - m_j \leq \frac{\tilde{p}+\tilde{q}+\delta(H^*)}{\Delta(H^*)-1} + \frac{\tilde{p}+\tilde{q}+2[\Delta(H^*)]-\delta(H^*)}{\delta(H^*)-1}$. Hence m_i is distinctive from each other.

Theorem 2.7. The join of two palindromic antimagic labeled graph G^* and H^* is a Palindromic antimagic.

Proof. Let G^* represent a House graph and H^* represent a Kite graph. The join of two graphs G^* and H^* is represented as $G^* + H^*$. The vertex set of $G^* + H^*$ is the combination of the vertex sets of G^* and H^* , denoted as $V(G^* + H^*) = V(G^*) + V(H^*)$. Similarly, the edge set of $G^* + H^*$ is the combination of the edge sets of G^* and H^* , along with the neighborhoods of any vertex l_i and m_i in the graph $G^* + H^*$, indicated as $E(G + H) = E(G) + E(H) + N(l_i) + N(m_i)$. The given graph, denoted as $G^* + H^*$, has a vertex set of size $p^* + \tilde{p}$ and an edge set of size $q^* + \tilde{q} + p^*\tilde{p}$. We shall assign the identical names to the vertices of $G^* + H^*$ as the vertices of G^* and the vertices of H^* , which will be represented by o_{ij} . The edges of $G^* + H^*$ are named the same as the edges of G^* and H^* . The edges that connect the vertices of these two graphs are labeled ε_i^* for all values of i such that $1 \leq i \leq p^*\tilde{p}$. In this discussion, we shall examine the process of assigning labels to the edges in graphs. We will name the edges ε_i^* , name ε_1^* to $\varepsilon_{\tilde{p}}^*$ to the edges whose incident with $l_{\delta(H^*)}$, clepe $\varepsilon_{p^*+1}^*$ to $\varepsilon_{p^*[\delta(G^*)]}^*$ to the edges whose incident with $l_{\delta(G^*)}$, naming $\varepsilon_{[p^*(\delta(G^*)+\delta(H^*))]}^*$ to $\varepsilon_{[p^*(\delta(G^*+H^*)-\Delta(G^*))]}^*$ to the edges whose incident with $l_{\delta(G^*+H^*)-\Delta(G^*)}$, baptite $\varepsilon_{[p^*(\delta(G^*+H^*)-\Delta(G^*))+\delta(H^*)]}^*$ to $\varepsilon_{[p^*(p^*-\delta(H^*))]}^*$ to the edges whose incident with $l_{(p^*-\delta(H^*))}$, name $\varepsilon_{[p^*(p^*-\delta(H^*))+\delta(H^*)]}^*$ to $\varepsilon_{p^*\tilde{p}}^*$ to the edges whose incident with $l_{\Delta(G^*+H^*)-\Delta(H^*)}$. All of these names will be assigned in a clockwise direction.

To establish the palindromic antimagic property of the labeled graph $G^* + H^*$, it is necessary to provide labels to the edges of $G^* + H^*$.

$$\varphi''': E(G^* + H^*) \rightarrow \{p_1, p_2, \dots, p_{q^*+\tilde{q}+p^*\tilde{p}}\} \text{ defined}$$

$$E(G^* + H^*) = \begin{cases} e_a^* = \{e_1^*, e_2^*, \dots, e_{q^*}^*\} = \{p_{q^*}, p_{q^*-1}, \dots, p_1\} \text{ by eqn (7)} \\ \tilde{e}_b = \{\tilde{e}_1, \tilde{e}_2, \dots, \tilde{e}_{\tilde{q}}\} = \{p_{q^*+\tilde{q}}, p_{q^*+\tilde{q}-1}, \dots, p_{q^*+1}\} \\ \varepsilon_i^* = \{\varepsilon_1^*, \varepsilon_2^*, \dots, \varepsilon_{q^*+\tilde{q}+p^*\tilde{p}}^*\} = \{p_{q^*+\tilde{q}+1}, p_{q^*+\tilde{q}+2}, \dots, p_{q^*+\tilde{q}+p^*\tilde{p}}\} \end{cases} \quad (11)$$

The vertex labeling of the graph $G^* + H^*$ is sum of the incident edges of the corresponding vertex. Let o_{ij} represent any vertex of the vertex set $V(G^* + H^*)$ then

$$p^*[(\Delta(H^*)\delta(G^*)(\tilde{p} + q^*)) + \delta(H^*)] \leq o_{ij} \leq p^*[(\Delta(H^*)\delta(G^*)(\tilde{p} + q^*)) + \delta(H^*)] + \{\delta(G^*)[p^*(\Delta(G^*) - \delta(H^*))](q^* + \delta(H^*)^{\delta(G^*)}) + \delta(H^*)\} + \delta(H^*)$$

and let o_{ij} and o'_{ij} be any vertices of $G^* + H^*$ such that if $o_{ij} > o'_{ij}$ then

$$l_{\Delta(G^*-H^*)-\Delta(H^*)} > l_{p^*-\delta(H^*)} > w_{\delta(H^*)} > w_{\delta(G^*)} > w_{\delta(G^*-H^*)-\Delta(G^*)} > l_{\delta(G^*-H^*)-\Delta(G^*)} > w_{p^*-\delta(H^*)} > w_{\Delta(G^*-H^*)-\Delta(H^*)} > l_{\delta(G^*)} > l_{\delta(H^*)} \text{ thus,}$$

$$\delta(G^* + H^*) \leq o_{ij} - o'_{ij} \leq \{\delta(G^*)[p^*(\Delta(G^*) - \delta(H^*))](q^* + \delta(H^*)^{\delta(G^*)}) + \delta(H^*)\} + \delta(H^*)$$

Reka and Soundariya

Therefore, the distinction between the labeling of $G^* + H^*$ is evident. The join of two Palindromic antimagic graphs, designated as $(G^*$ and $H^*)$ results in an entirely Palindromic antimagic graph.

Theorem 2.8. The Fusion of non adjacent vertices of Palindromic antimagic labeled join graph $(G^* + H^*)$ is a Palindromic antimagic.

Proof. This theorem aims to establish the palindromic antimagic property of the fusion of non- adjacent vertices in the graph $G^* + H^*$. The fusion of graph $G^* + H^*$ has $|V| = p^* + \tilde{p} - 1$, $|E| = q^* + \tilde{q} + p^*\tilde{p}$. Prior to demonstrating the property of palindromic antimagicness, We aim to determine the adjacency function of graph $G^* + H^*$,

$$\begin{cases}
 N(l_{\delta(H^*)}) = l_{\delta(G^*)}, l_{\Delta(G^*-H^*)-\Delta(H^*)}, V(H^*) \\
 N(l_{\delta(G^*)}) = l_{\delta(H^*)}, l_{\delta(G^*-H^*)-\Delta(G^*)}, l_{\Delta(G^*-H^*)-\Delta(H^*)}, V(H^*) \\
 N(l_{\delta(G^*-H^*)-\Delta(G^*)}) = l_{\delta(G^*)}, l_{p^*-\delta(H^*)}, V(H^*) \\
 N(l_{p^*-\delta(H^*)}) = l_{\delta(G^*-H^*)-\Delta(G^*)}, l_{\Delta(G^*-H^*)-\Delta(H^*)}, V(H^*) \\
 N(l_{\Delta(G^*-H^*)-\Delta(H^*)}) = l_{\delta(G^*)}, l_{\delta(H^*)}, l_{p^*-\delta(H^*)}, V(H^*) \\
 N(m_{\delta(H^*)}) = V(G^*), m_{\delta(G^*)}, m_{\delta(G^*-H^*)-\Delta(G^*)}, m_{p^*-\delta(H^*)} \\
 N(m_{\delta(G^*)}) = V(G^*), m_{\delta(H^*)}, m_{\delta(G^*-H^*)-\Delta(G^*)} \\
 N(m_{\delta(G^*-H^*)-\Delta(G^*)}) = V(G^*), m_{\delta(H^*)}, m_{\delta(G^*)}, m_{p^*-\delta(H^*)} \\
 N(m_{p^*-\delta(H^*)}) = V(G^*), m_{\delta(H^*)}, m_{\delta(G^*-H^*)-\Delta(G^*)}, m_{\Delta(G^*-H^*)-\Delta(H^*)} \\
 N(m_{\Delta(G^*-H^*)-\Delta(H^*)}) = V(G^*), m_{p^*-\delta(H^*)}
 \end{cases} \tag{12}$$

where $N(l_i)$ and $N(m_i)$ is a neighbourhood of those vertices. In order to determine the palindromic antimagic attribute of the fusion of $G^* + H^*$, it is necessary to assign labels to the edges in accordance with equation (11). The vertex labeling of newly fused graphs is determined by summing the edges incident to each vertex.

Case(i):

Let $Fu_1(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $l_{\delta(H^*)}, l_{\delta(G^*-H^*)-\Delta(G^*)}$ into $l_{\delta(H^*)}, l_{\delta(G^*-H^*)-\Delta(G^*)}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_1(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{\delta(G^*)[\delta(G^*)\Delta(H^*)((\Delta(H^*)^{\Delta(G^*)}\delta(G^*)) - \delta(H^*))]\} +$

$(\tilde{q} + p^*)\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_1(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $\delta(G^*) \leq o_{ij} - o'_{ij} \leq \{\delta(G^*)[\delta(G^*)\Delta(H^*)((\Delta(H^*)^{\Delta(G^*)}\delta(G^*)) - \delta(H^*))]\} + (\tilde{q} + p^*)\}$.

From the above inequality the vertex labelling of $Fu_1(G^* + H^*)$ is couplet disparate. Hence $Fu_1(G^* + H^*)$ is palindromic antimagic.

Case(ii):

Let $Fu_2(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $l_{\delta(H^*)}, l_{p^*-\delta(H^*)}$ into $l_{\delta(H^*)}, l_{p^*-\delta(H^*)}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_2(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{\delta(G^*)[\delta(G^*)\Delta(H^*)((\Delta(H^*)^{\Delta(G^*)}\delta(G^*)) - \delta(H^*))]\} +$

$(\tilde{q} + p^*)\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_1(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $\Delta(H^*) \leq o_{ij} - o'_{ij} \leq \{\delta(G^*)[\delta(G^*)\Delta(H^*)((\Delta(H^*)^{\Delta(G^*)}\delta(G^*)) - \delta(H^*))]\} + (\tilde{q} + p^*)\}$.

From the above inequality the vertex labeling of $Fu_2(G^* + H^*)$ is couplet disparate. Hence $Fu_2(G^* + H^*)$ is palindromic antimagic.

Reka and Soundariya

Case(iii):

Let $Fu_2(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $l_{\delta(G^*), l_{p^*-\delta(H^*)}}$ into $l_{\delta(G^*), l_{p^*-\delta(H^*)}}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_2(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{[\tilde{p}^{\delta(G^*)}\delta(G^*)\Delta(H^*)(\tilde{q} + \delta(H^*))] + (q^* - \tilde{p})\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_2(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $\{(q^* + \delta(H^*))p^*\} \leq o_{ij} - o'_{ij} \leq \{[\tilde{p}^{\delta(G^*)}\delta(G^*)\Delta(H^*)(\tilde{q} + \delta(H^*))] + (q^* - \tilde{p})\}$. From the above inequality the vertex labeling of $Fu_2(G^* + H^*)$ is couplet disparate. Hence $Fu_2(G^* + H^*)$ is palindromic antimagic.

Case(iv):

Let $Fu_4(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $l_{\delta(G^* - H^*)-\Delta(G^*), l_{\Delta(G^* - H^*)-\Delta(H^*)}}$ into $l_{\delta(G^* - H^*)-\Delta(G^*), l_{\Delta(G^* - H^*)-\Delta(H^*)}}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_4(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{\delta(G^*)^{\delta(H^*)+1}[\delta(G^*)^{\delta(H^*)+1}[(\delta(G^*)p^*\Delta(H^*)) + \delta(H^*)]] - (q^* - \tilde{p})\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_4(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $\{\Delta(G^* + H^*) + \delta(G^* + H^*) + \tilde{p}\} \leq o_{ij} - o'_{ij} \leq \{\delta(G^*)^{\delta(H^*)+1}[\delta(G^*)^{\delta(H^*)+1}[(\delta(G^*)p^*\Delta(H^*)) + \delta(H^*)]] - (q^* - \tilde{p})\}$. From the above inequality the vertex labeling of $Fu_4(G^* + H^*)$ is couplet disparate. Hence $Fu_4(G^* + H^*)$ is palindromic antimagic.

Case(v):

Let $Fu_5(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $m_{\delta(H^*), m_{\Delta(G^* - H^*)-\Delta(H^*)}}$ into $m_{\delta(H^*), m_{\Delta(G^* - H^*)-\Delta(H^*)}}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_5(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq$

$o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{\delta(G^*)[p^*\delta(G^*)^{\Delta(H^*)+\delta(H^*)}\Delta(G^*)^{\delta(H^*)}] + (q^* - \tilde{p})\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_5(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $(q^* + \tilde{p}) \leq o_{ij} - o'_{ij} \leq \{\delta(G^*)[p^*\delta(G^*)^{\Delta(H^*)+\delta(H^*)}\Delta(G^*)^{\delta(H^*)}] + (q^* - \tilde{p})\}$. From the above inequality the vertex labeling of $Fu_5(G^* + H^*)$ is couplet disparate. Hence $Fu_5(G^* + H^*)$ is palindromic antimagic.

Case(vi):

Let $Fu_6(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $m_{\delta(G^*), m_{p^*-\delta(H^*)}}$ into $m_{\delta(G^*), m_{p^*-\delta(H^*)}}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_6(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{(\delta(G^*)^{\delta(H^*)+1}\tilde{p}[(\delta(G^*)\tilde{p}(q^* + \delta(H^*))) + \delta(H^*)]) + (q^* - \tilde{p})\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_6(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $(q^* + \tilde{p}) \leq o_{ij} - o'_{ij} \leq \{(\delta(G^*)^{\delta(H^*)+1}\tilde{p}[(\delta(G^*)\tilde{p}(q^* + \delta(H^*))) + \delta(H^*)]) + (q^* - \tilde{p})\}$. From the above inequality the vertex labeling of $Fu_6(G^* + H^*)$ is couplet disparate. Hence $Fu_6(G^* + H^*)$ is palindromic antimagic.

Reka and Soundariya

Case(vii):

Let $Fu_7(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $m_{\delta(G^*)}, m_{\Delta(G^* - H^*) - \Delta(H^*)}$ into $m_{\delta(G^*)}m_{\Delta(G^* - H^*) - \Delta(H^*)}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_7(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{[\delta(G^*)^{\tilde{p}}[(\delta(G^*)\Delta(H^*)(q^* + \delta(H^*)) + \delta(H^*))]] + (\tilde{q} - p^*)\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_7(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $(\tilde{q} + p^*) \leq o_{ij} - o'_{ij} \leq \{[\delta(G^*)^{\tilde{p}}[(\delta(G^*)\Delta(H^*)(q^* + \delta(H^*)) + \delta(H^*))]] + (\tilde{q} - p^*)\}$. From the above inequality the vertex labeling of $Fu_7(G^* + H^*)$ is couplet disparate. Hence $Fu_7(G^* + H^*)$ is palindromic antimagic.

Case(viii):

Let $Fu_8(G^* + H^*)$ be a fused graph of $G^* + H^*$ formed by replacing the vertices $m_{\delta(G^* - H^*) - \Delta(G^*)}, m_{\Delta(G^* - H^*) - \Delta(H^*)}$ into $m_{\delta(G^* - H^*) - \Delta(G^*)}m_{\Delta(G^* - H^*) - \Delta(H^*)}$ with $p^* + \tilde{p} - 1$ vertices $q^* + \tilde{q} + p^*\tilde{p}$ edges, then for any vertex o_{ij} in $Fu_8(G^* + H^*)$, $\{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} \leq o_{ij} \leq \{\tilde{p}\delta(G^*)^{\Delta(H^*)}(\Delta(G^* + H^*) + \tilde{p})\} + \{(\delta(G^*)p^*[\tilde{p}\delta(G^*)\tilde{p}(p^* + q^* + \delta(G^*)) + \delta(H^*)]] + (\tilde{q} - p^*)\}$. Let o_{ij} and o'_{ij} be any two vertices of $Fu_8(G^* + H^*)$ such that $o_{ij} > o'_{ij}$ then $(\tilde{q} + p^*) \leq o_{ij} - o'_{ij} \leq \{(\delta(G^*)p^*[\tilde{p}\delta(G^*)\tilde{p}(p^* + q^* + \delta(G^*)) + \delta(H^*)]] + (\tilde{q} - p^*)\}$. From the above inequality the vertex labeling of $Fu_8(G^* + H^*)$ is couplet disparate. Hence $Fu_8(G^* + H^*)$ is palindromic antimagic.

Therefore, based on the aforementioned eight cases, it can be concluded that the fusion of non-adjacent vertices of a Palindromic antimagic labeled join graph $(G^* + H^*)$ results in a Palindromic antimagic graph.

CONCLUSIONS

This article presents a conclusion regarding the join operation applied to two palindromic antimagic labeled graphs, G and H . Additionally, it explores the fusion of non adjacent vertices within these graphs and establishes that the resulting graphs likewise exhibit palindromic antimagic properties. Furthermore, consider two additional graphs, G^* and H^* . In this study, we propose the introduction of a novel concept known as palindromic antimagic labeling. By combining this idea with graph operations on certain classes of graphs, we are able to identify numerous open problems. It is evident that these findings can be further developed and extended to various additional classes of graphs.

ABSTRACT

A novel mathematical method for analyzing uncertainty is the generalization of soft sets in soft lattices. Extension of a soft lattice L and a set of fixed parameters A is Soft L -topological spaces. The mapping of soft L -topological spaces continuity has also been researched. It is known how to invoke the function $f: L_1 \rightarrow L_2$ is Contra-Continuous if the pre-image of every open set is closed. By using this fundamental idea, we create the Soft L -contra continuous and relate it to the Soft L -kernel set of Soft L -topological Spaces. We have now seen several soft L -kernel set notions. We also achieved novel interactions between such notions. The logic of Soft L -contra continuous mapping in Soft L -topological spaces is also investigated in this study.

Keywords: Soft sets, soft lattice, Sub lattice, soft L -mapping, soft L -continuous, soft L -contra continuous.

INTRODUCTION

Molodtsov[8], first put forward the system of soft theory in 1999 as a framework for mathematics that addresses doubtfulness while illustrating hurdles in science and technology cases such as the field of physics, science of computers, economics, and other disciplines. Maji et al.,[7] 2003 the core concepts of soft theory were developed and debated. Shabir and Naz,[14] 2011 began the study of soft topological spaces (on short SLTS). Following the

Hari Siva Annam and Abinaya

presumption of soft sets, soft lattices (on short SL) as a layout has emerged. F. Li [6] investigated, outlined, and provided the fundamental principles of soft lattices. Additionally, E. Kuppuswamy [9] used soft sets to lattices in 2011. As a supplement to what F. Li has done, E. Kuppuswamy has taken a new approach to SL. Operations on SL and their characteristics were examined in 2013 by V. D. Jobish, K. V. Babitha, and Sunil Jacob John [5]. Numerous theorems about different kinds of unions, intersections, and complements are established, notably De Morgan’s Laws. Modern topology heavily relies on the concepts of soft theory. In 2016, soft continuous mappings (on short SCM) emerged by Cigedem Gunduz Aras, Ayse Sonmez, and Husey in Cakalli. Numerous writers have investigated some of its characteristics. With their qualities, H. Hazra, P. Majumdar, and S. K. Samanta defined the continuity of soft mapping (on short SM) in 2012. Yang et al. pioneered the idea of SCM between two STS. for the first time in 2015. Soft lattice topological spaces (on short SLTS), which are declared over a SL L with a given set of parameters A and are also a generalization of STS, were recently developed in 2021 by Sandhya S. Pai and T. Baiju [10]. The thoughts of soft lattice continuous mapping (on short SLCM) (soft L-continuous mapping) in SLTS was also covered indepth, along with the concepts of SL-open and closed sets (on short SLO and SLC), SL-closure, SL-interior point, and SL-neighborhood (on short SLN), in the year 2022. Then, in 2023[1], we keep looking into a SL-interior, SL-exterior, and SL- border in the work extension of SL-sets which is essential for more study on soft lattice topology. Dontchev [3] first presented the contra continuous functions in 1996. Contra-open and Contra-closed were familiarised by Baker in 1997[2]. In the final analysis, we argued soft lattice contra continuous conclusions in SLTS in this study. On specified SLTS, we additionally conversed SL contra-open and SLT contra-closed mapping, and some intriguing results resulted. The basic point of the theory of SLTS will be strengthened as a result.

PRELIMINARIES

Definition 2.1: [12] Consider (L, θ, A) be a STS, G_A^L be a SL and $x \in L$. G_A^L is stated as SLN of x if \exists a SLO set $F_A^L \ni x \in F_A^L \subseteq G_A^L$.

Proposition 2.1:[12] Consider (L, θ, A) be a SL- space. The set $\theta_a = \{f(a) \mid F_A^L \in \theta\} \forall a \in A$ conveys a topology on L.

Definition 2.2:[12] Consider (L, θ, A) be a SLTS and Z be a non-empty subset of L. Then $\theta_Z = \{ZF_A^L \mid F_A^L \in \theta\}$ is stated to be the soft relative lattice topology on Z and (Z, θ_Z, A) is called a SL-subspace of F_A^L .

Definition 2.3:[12] We have F_A^L as a SL which is a SL- point expressed (l_a, A) for the element $a \in A$, $f(a) = \{l\}$ and $f(a') = \emptyset \forall a' \in A - \{a\}$.

Definition 2.4:[12] Let $\gamma_g: L_1 \rightarrow L_2$. Then

- 1) The SL-set mapping induced by γ_g , denoted γ_g^{\rightarrow} is a SM from $S_{L_1}(X)$ to $S_{L_2}(Y)$ that maps F_A^L to $\gamma_g^{\rightarrow}(F_A^L) = (\gamma_g^{\rightarrow}(F^L), A)$, where $\gamma_g^{\rightarrow}(F_A^L)$ is defined by $\gamma_g^{\rightarrow}(F^L)(\zeta) = \{\gamma_g(l) \mid l \in (F^L)(\zeta)\} \forall \zeta \in A$.
- 2) The inverse SL-set mapping induced by γ_g denoted by the notation γ_g^{\leftarrow} , that maps G_A^L to $\gamma_g^{\leftarrow}(G_A^L) = (\gamma_g^{\leftarrow}(G^L), A)$, where $\gamma_g^{\leftarrow}(G_A^L)$ is defined by $\gamma_g^{\leftarrow}(G^L)(\zeta) = \{l \mid \gamma_g(l) \in (G^L)(\zeta)\} \forall \zeta \in A$.

Example 2.1:[12] Suppose $L_1 = \{U_1, U_2, U_3\}$, $L_2 = \{W_1, W_2, W_3\}$, $A = \{Q_1, Q_2\}$. The γ_g is conveyed by $\gamma_g(U_1) = W_1$, $\gamma_g(U_2) = W_3$, $\gamma_g(U_3) = W_2$.

- 1) If $F_A^L \in S_{L_1}(X)$ is defined by $\{\gamma(Q_1) = \{U_2\}, \gamma(Q_2) = \{U_1\}\}$, then $\gamma_g^{\rightarrow}(F_A^L) = (\gamma_g^{\rightarrow}(F^L), A) = \{\gamma_g^{\rightarrow} f(Q_1) = \{W_3\}, \gamma_g^{\rightarrow} f(Q_2) = \{W_1\}\} \in S_{L_2}(Y)$.
- 2) If $G_A^L \in S_{L_2}(X)$ is defined by $\{g(Q_1) = \{W_2\}, g(Q_2) = \{W_1\}\}$, then $\gamma_g^{\leftarrow}(G_A^L) = (\gamma_g^{\leftarrow}(G^L), A) = \{\gamma_g^{\leftarrow} g(Q_1) = \{U_3\}, \gamma_g^{\leftarrow} g(Q_2) = \{U_1\}\} \in S_{L_1}(X)$.

Proposition 2.2: [12] Let us consider $\gamma_g: X \rightarrow Y$, $F_{1A}^L, F_{2A}^L \in S_{L_1}(X)$. then

- 1) $\gamma_g^{\rightarrow}(\phi_A^L) = \phi_A^L$

Hari Siva Annam and Abinaya

- 2) $F_{1A}^L \subset F_{2A}^L \Rightarrow \gamma_g^{\rightarrow}(F_{1A}^L) \subset \gamma_g^{\rightarrow}(F_{2A}^L)$
- 3) $\gamma_g^{\rightarrow}(F_{1A}^L \cup F_{2A}^L) = \gamma_g^{\rightarrow}(F_{1A}^L) \cup \gamma_g^{\rightarrow}(F_{2A}^L)$
- 4) $\gamma_g^{\rightarrow}(F_{1A}^L \cap F_{2A}^L) \subset \gamma_g^{\rightarrow}(F_{1A}^L) \cap \gamma_g^{\rightarrow}(F_{2A}^L)$

Proposition 2.3: [12] Let us consider $\gamma_g: X \rightarrow Y, G_{1A}^L, G_{2A}^L \in S_{L_2}(Y)$. then

- 1) $\gamma_g^{\leftarrow}(\phi_A^L) = \phi_A^L, \gamma_g^{\leftarrow}(L_2) = L_1$
- 2) $G_{1A}^L \subset G_{2A}^L \Rightarrow \gamma_g^{\leftarrow}(G_{1A}^L) \subset \gamma_g^{\leftarrow}(G_{2A}^L)$
- 3) $\gamma_g^{\leftarrow}(G_{1A}^L \cup G_{2A}^L) = \gamma_g^{\leftarrow}(G_{1A}^L) \cup \gamma_g^{\leftarrow}(G_{2A}^L)$
- 4) $\gamma_g^{\leftarrow}(G_{1A}^L \cap G_{2A}^L) \subset \gamma_g^{\leftarrow}(G_{1A}^L) \cap \gamma_g^{\leftarrow}(G_{2A}^L)$
- 5) $\gamma_g^{\leftarrow}(G_{1A}^L)^c = (\gamma_g^{\leftarrow}(G_{1A}^L))^c$.

Proposition 2.4: [12] Consider $\gamma_g: X \rightarrow Y, F_A^L \in S_{L_1}(X)$ and $G_A^L \in S_{L_2}(Y)$. Then

- 1) $\gamma_g^{\leftarrow}(\gamma_g^{\rightarrow}(F_A^L)) \supseteq F_A^L$. If γ_g is injective, then $\gamma_g^{\leftarrow}(\gamma_g^{\rightarrow}(F_A^L)) = F_A^L$.
- 2) $\gamma_g^{\rightarrow}(\gamma_g^{\leftarrow}(G_A^L)) \subseteq G_A^L$. If γ_g is surjective, then $\gamma_g^{\rightarrow}(\gamma_g^{\leftarrow}(G_A^L)) = G_A^L$.

SOFT LATTICE CONTRA CONTINUOUS

Definition 3.1: Let (L_1, θ_1, A) and (L_2, θ_2, A) be two SLTS, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$, where $\gamma: L_1 \rightarrow L_2$ and $g: A \rightarrow A$ be a mapping. If the Inverse-image of each SLO set F_A^L over L_2 is SLC set in L_1 , then γ_g is soft L-contra continuous (on short SLCC) function.

Theorem 3.1: Let us consider the two SLTS (L_1, θ_1, A) and (L_2, θ_2, A) . The mapping γ_g is called a SLM from $L_1 \rightarrow L_2$ denoted by $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$. For each SLN (G_A^L) of $(\gamma(L_1), A)$, \exists a SLC (F_A^L) of $(l_a, A) \ni \gamma_g(H_A^L) \subseteq G_A^L$, if and only if γ_g is said to be SLCCM at (l_a, A) .

Proof: To prove: γ_g is SLCC. Consider G_A^L be a SLO set over L_2, \exists SLC set $(l_a, A) \in F_A^L \ni \gamma_g(F_A^L) \subseteq G_A^L, F_A^L \subseteq \gamma_g^{-1}(G_A^L). \gamma_g^{-1}(G_A^L) = \cup_{\gamma_g^{-1}(l_a, A) \in G_A^L} \{F_A^L \mid F_A^L \text{ is SLC in } L_1\}$. Hence, $\gamma_g^{-1}(G_A^L)$ is SLC in L_1 . As a result, γ_g is SLCCM at (l_a, A) .

Conversely, let us G_A^L be a arbitrary SLN in L_2 containing $(\gamma(l_a), A)$. Then $(l_a, A) \in \gamma_g^{-1}(G_A^L)$ is a SLC and $\gamma_g(\gamma_g^{-1}(G_A^L)) \subseteq G_A^L, \gamma_g(H_A^L) \subseteq G_A^L$ where, H_A^L is a SLC in L_1 .

Theorem: 3.2: Let $\gamma_g: L_1 \rightarrow L_2$ be a function. Then as a result of are equivalent.

- (1) γ_g is a SLCC function.
- (2) On every SL-point (l_a, A) and each SLC set G_A^L in L_2 containing $(\gamma(l_a), A) \exists$ a SLO set F_A^L in L_1 containing $(l_a, A) \ni \gamma_g(F_A^L) \subseteq G_A^L$.
- (3) The inverse image of every SLC set in L_2 is SLO set in L_1 .
- (4) $\overline{(\gamma_g^{-1}(F_A^L))} = \overline{(\gamma_g^{-1}(F_A^L))}$ as an each SLC set F_A^L in L_2 .
- (5) $\overline{(\gamma_g^{-1}(G_A^L))} = \overline{(\gamma_g^{-1}(G_A^L))}$ as an each SLO set G_A^L in L_2 .

Proof: (1) \Rightarrow (2) Let $\gamma_g: L_1 \rightarrow L_2$ be SLCC. Let (l_a, A) be a SLO set and G_A^L be a SLC set in L_2 containing $(\gamma(l_a), A)$. Then H_A^L is a SLO set in L_2 not containing $(\gamma(l_a), A)$. γ_g is SLCC. i.e., $(\gamma_g^{-1}(H_A^L))$ is SLC set in L_1 not containing (l_a, A) . Thus, $F_A^L = (\gamma_g^{-1}(G_A^L))$ is the SLO set in L_1 containing $(l_a, A) \ni \gamma_g(F_A^L) \subseteq G_A^L$. This proves the statement (2).

(2) \Rightarrow (3) Let G_A^L be a SLC set in L_2 . Let SL point $(l_a, A) \in \gamma_g^{-1}(G_A^L)$, then $(\gamma(l_a), A) \in G_A^L$. Aside (2), there is SLO set F_A^L in L_1 containing $F_A^L \ni (l_a, A) \in \gamma_g^{-1}(l_a, A) \subseteq G_A^L$. i.e., $F_A^L \subseteq \gamma_g^{-1}(G_A^L)$. Hence, $\gamma_g^{-1}(G_A^L) = \cup_{(l_a, A) \in \gamma_g^{-1}(G_A^L)} \{F_A^L \mid F_A^L \text{ is a SLO set containing } (l_a, A)\}$. Therefore, $\gamma_g^{-1}(G_A^L)$ is SLO in L_1 . This proves the statement (3).

(3) \Rightarrow (4) Let F_A^L be a SLC set in L_2 . $\gamma_g^{-1}(F_A^L)$ is SLO in L_1 . $(\gamma_g^{-1}(F_A^L))^{\circ} = \gamma_g^{-1}(F_A^L)$. Taking closure, $\overline{(\gamma_g^{-1}(F_A^L))} = \overline{(\gamma_g^{-1}(F_A^L))}$. This proves the statement (4).

Hari Siva Annam and Abinaya

(4) ⇒ (5) Let G_A^L be a SLO set in L_2 . Then $L_2 \setminus G_A^L$ is SLC in L_2 . According to (4),

$(\overline{\gamma_g^{-1}(L_2 \setminus G_A^L)})^\circ = \overline{L_1 \setminus \gamma_g^{-1}(G_A^L)}$. By taking complements, we get

$(\overline{\gamma_g^{-1}(G_A^L)})^\circ = (\gamma_g^{-1}(G_A^L))^\circ$. This proves the statement(5).

(5) ⇒ (1) Let G_A^L be a SLO set in L_2 , to prove, $\overline{\gamma_g^{-1}(G_A^L)}$ is SLC in L_1 . Then we take

$(\overline{\gamma_g^{-1}(G_A^L)})^\circ = (\gamma_g^{-1}(G_A^L))^\circ \Rightarrow \overline{(\gamma_g^{-1}(G_A^L))^\circ} = \overline{\gamma_g^{-1}(G_A^L)}$. This implies $\overline{\gamma_g^{-1}(G_A^L)}$ is a SLC set in L_1 . Hence γ is SLCC This proves the statement (1).

Definition 3.2 We consider (L, θ, A) as a SLTS and F_A^L be a SL set. Thereafter the SL kernel of F_A^L indicated by $SL \ker F_A^L$, is the intersection of all SLO super sets of F_A^L . $SL \ker (F_A^L)$ is the smallest SLO set over L which contains F_A^L .

Theorem: 3.3

- (1) $F_A^L \subseteq SL \ker F_A^L$.
- (2) F_A^L is the SLO set if and only if $SL \ker F_A^L = F_A^L$.
- (3) $F_A^L \subseteq G_A^L$ which implies $SL \ker F_A^L \subseteq SL \ker G_A^L$.

Proof

- (1) is Obvious.
- (2) If F_A^L is a SLO set then, F_A^L is itself SLO set containing F_A^L . So, F_A^L is the smallest SL-set containing F_A^L and $F_A^L = SL \ker F_A^L$. Conversely, suppose that $F_A^L = SL \ker F_A^L$. Since, intersection of all SLO set is SLO. So, $SL \ker F_A^L$ is SLO over L .
- (3) Suppose that $F_A^L \subseteq G_A^L$. Then every SLO super set of G_A^L will also contain F_A^L . Which implies every SLO super set of G_A^L is also SLO super set of F_A^L . Hence, the intersection of SLO super set of F_A^L is contained in the intersection of SLO super sets of G_A^L . Thus, $SL \ker F_A^L \subseteq SL \ker G_A^L$.

Theorem: 3.4 We know that (L_1, θ_1, A) and (L_2, θ_2, A) are two Soft Lattice Topological Spaces, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$ be a mapping. Then as a result of are equivalent.

- (1) $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$ is soft lattice contra continuous mapping.
- (2) On every SLC set G_A^L over L_2 , $\gamma_g^{-1}(G_A^L)$ is a SLO set over L_1 .
- (3) On every SL-set F_A^L over L_2 , $\gamma_g(SL \ker F_A^L) \subseteq \overline{\gamma_g(F_A^L)}$
- (4) On every SL-set G_A^L over L_2 , $SL \ker (\gamma_g^{-1}(G_A^L)) \subseteq \overline{\gamma_g^{-1}(G_A^L)}$.
- (5) On every SL-set G_A^L over L_2 , $(SL \ker (\gamma_g^{-1}(G_A^L)))' \supseteq \overline{\gamma_g^{-1}(G_A^L)}^\circ$.

Proof:

- (1) ⇔ (2) are obvious.
- (2) ⇒ (3) Let $y \notin \gamma_g(F_A^L)$. $y \notin H_A^L$ for some SLC set H_A^L , $\exists \gamma_g(F_A^L) \subseteq H_A^L$. $\gamma_g^{-1}(y) \notin \gamma_g^{-1}(H_A^L)$ for some SLO $\gamma_g^{-1}(H_A^L)$, $\exists F_A^L \subseteq \gamma_g^{-1}(H_A^L)$. $\gamma_g^{-1}(y) \notin SL \ker(F_A^L)$, $y \notin \gamma_g(SL \ker(F_A^L))$, which implies $\gamma_g(SL \ker(F_A^L)) \subseteq \overline{\gamma_g(F_A^L)}$.
- (2) ⇒ (4) consider, $y \notin \gamma_g^{-1}(G_A^L)$, $\gamma_g(y) \notin \overline{(G_A^L)}$. $\gamma_g(y) \notin$ intersection of all SLC set H_A^L , $\exists (G_A^L) \subseteq H_A^L$. $\gamma_g(y) \notin H_A^L$ for some SLC, $(G_A^L) \subseteq H_A^L$. $y \notin \gamma_g^{-1}(H_A^L)$ (for some SLO set $\gamma_g^{-1}(H_A^L)$, $\exists \gamma_g^{-1}(G_A^L) \subseteq \gamma_g^{-1}(H_A^L)$. $y \notin SL \ker(\gamma_g^{-1}(G_A^L))$. which implies $SL \ker(\gamma_g^{-1}(G_A^L)) \subseteq \overline{\gamma_g^{-1}(G_A^L)}$.
- (4) ⇒ (5) By using (4), $SL \ker (\gamma_g^{-1}(G_A^L)) \subseteq \overline{\gamma_g^{-1}(G_A^L)}$. By taking complements on both sides we get, $(SL \ker (\gamma_g^{-1}(G_A^L)))' \supseteq \overline{\gamma_g^{-1}(G_A^L)}^\circ$.
- (4) ⇒ (2) Let G_A^L be a SLC set in L_2 . $\overline{(G_A^L)} = G_A^L$. which implies, $\gamma_g^{-1}(\overline{(G_A^L)}) = \gamma_g^{-1}(G_A^L)$. i.e., $SL \ker(\gamma_g^{-1}(G_A^L)) \subseteq \overline{\gamma_g^{-1}(G_A^L)}$, then, $SL \ker(\gamma_g^{-1}(G_A^L)) = \overline{\gamma_g^{-1}(G_A^L)}$. Therefore, $\overline{\gamma_g^{-1}(G_A^L)}$ is SLO set in L_1 .
- (5) ⇒ (2) Let G_A^L be a SLC in L_2 . Let to prove, $\overline{\gamma_g^{-1}(G_A^L)}$ be a SLO set in L_1 . (5) ⇒ $[SL \ker (\gamma_g^{-1}(G_A^L))] \supseteq \overline{\gamma_g^{-1}(G_A^L)}^\circ$. Taking complements, $SL \ker(\gamma_g^{-1}(G_A^L)) \subseteq \overline{\gamma_g^{-1}(G_A^L)} = \overline{\gamma_g^{-1}(G_A^L)}$, ($\because, \overline{(G_A^L)} = G_A^L$) i.e., $SL \ker(\gamma_g^{-1}(G_A^L)) \subseteq \overline{\gamma_g^{-1}(G_A^L)}$. Hence, $\overline{\gamma_g^{-1}(G_A^L)}$ is SLO set in L_1 .

Hari Siva Annam and Abinaya

(3) ⇒ (4) Let $G_A^L \in L_2, \Rightarrow \gamma_g^{-1}(G_A^L) \in L_1$. By(3), $\Rightarrow \gamma_g(\text{SL ker } (F_A^L)) \subseteq \overline{\gamma_g(F_A^L)}$, $\Rightarrow \gamma_g(\text{SL ker } (\gamma_g^{-1}(G_A^L))) \subseteq \overline{\gamma_g(\gamma_g^{-1}(G_A^L))}$. $\gamma_g(\text{SL ker } (\gamma_g^{-1}(G_A^L))) \subseteq \overline{(G_A^L)}$, $(\because, \gamma_g(\gamma_g^{-1}(G_A^L)) = \overline{(G_A^L)})$. Hence, $\text{SL ker } (\gamma_g^{-1}(G_A^L)) \subseteq \gamma_g^{-1}(\overline{(G_A^L)})$.

PROLONGATIONS OF SLCC MAPPING

We investigate the linked characteristics of the Soft Lattice Contra Continuous Mapping between two SLTS right below the segment. 'A' should be the non-void parameter whereas X and Y are the two initial universe sets. The sequence of all SL-sets over X is refers $S_{L_1}(X)$. Also, the sequence of all SL-sets over Y is meant $S_{L_2}(Y)$.

Definition 4.1 Let (L_1, θ_1, A) and (L_2, θ_2, A) be two SLTS, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$ act as mapping. Further,

- (1) If the image $\gamma_g(F_A^L)$ of every SLO set F_A^L over L_1 is a SLC set in L_2 , then γ_g is said to be a SL-Contra Open Mapping.
- (2) If the image $\gamma_g(H_A^L)$ of every SLC set H_A^L over L_1 is a SLO set in L_2 , then γ_g is said to be a SL-Contra Closed Mapping.

Definition 4.2 Consider (L_1, θ_1, A) and (L_2, θ_2, A) be two SLTS and $\gamma_g: L_1 \rightarrow L_2$. If $\forall G_A^L \in \theta_2, \gamma_g^{-1}(G_A^L) \in \theta_1'$, then γ_g is called Soft Lattice Contra Continuous Mapping from (L_1, θ_1, A) and (L_2, θ_2, A) .

Example 4.1 Let us assume that $L_1 = \{u_1, u_2, u_3\}$, $L_2 = \{h_1, h_2, h_3\}$, $A = \{Q_1, Q_2\}$ and $\theta_1 = \{\phi_A, L_1, F_{1A}^L, F_{2A}^L\}$ is a SLTS over X, where F_{1A}^L, F_{2A}^L are SL over X defined by $F_{1A}^L = \{(Q_1, \{u_2\}), (Q_2, \{u_1\})\}$, $F_{2A}^L = \{(Q_1, \{u_2, u_3\}), (Q_2, \{u_1, u_2\})\}$. Then θ_1 is SLT on X.

Figure.1: Complete Lattice

Also $\theta_2 = \{\phi_A, L_2, G_{1A}^L, G_{2A}^L\}$ is a SLTS over Y, where G_{1A}^L, G_{2A}^L are SL over Y defined by, $G_{1A}^L = \{(Q_1, \{h_1, h_2\}), (Q_2, \{h_1, h_3\})\}$, $G_{2A}^L = \{(Q_1, \{h_2\}), (Q_2, \{h_1\})\}$.

If $\gamma_g: L_1 \rightarrow L_2$ as $\gamma_g(u_1) = h_2, \gamma_g(u_2) = h_3, \gamma_g(u_3) = h_1$. Here $\gamma_g^{-1}(G_A^L) \in \theta_1' \forall G_A^L \in \theta_2$. Therefore SLCC, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$.

Proposition 4.1 We have $\gamma_g: (L_1, \theta_1, A)$ and (L_2, θ_2, A) as the two SLTS over X and Y accordingly. If SLCC Mapping, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$, then SCCM, $\gamma_g: (L_1, \theta_{1c}) \rightarrow (L_1, \theta_{2c}) \forall c \in A$.

Proof

Here we have, (L_1, θ_{1c}) and (L_1, θ_{2c}) are two SLTS, $\forall c \in A$. If $A' \in \theta_{2c}$, then \exists a SL-set $G_A^L \in \theta_2 \ni A' = g(c)$.

We know that γ_g is SLCCM from (L_1, θ_1, A) to (L_2, θ_2, A) , further $\gamma_g^{-1}(G_A^L) \in \theta_1'$. $\Rightarrow \gamma_g^{-1}(A') = \gamma_g^{-1}(g(c)) = \{I | \gamma_g(I) \in g(c)\} = \gamma_g^{-1}(g(c)) \in \theta_{1c}'$. As per the explanation of SCC, γ_g is a SCCM, from $(L_1, \theta_{1c}) \rightarrow (L_1, \theta_{2c}) \forall c \in A$. This claim states that a SLCCM originates in a parameterized set of SCCM.

Example 4.2 The complete lattice from the aforementioned Example: 4.1 is depicted in Figures: 4.1, Assume $L_1 = \{u_1, u_2, u_3\}$, $L_2 = \{h_1, h_2, h_3\}$, $A = \{Q_1, Q_2\}$ and $\theta_1 = \{\phi_A, L_1, F_{1A}^L, F_{2A}^L\}$ is a SLTS over X, where F_{1A}^L, F_{2A}^L are SL over X defined by $F_{1A}^L = \{(Q_1, \{u_2\}), (Q_2, \{u_1\})\}$, $F_{2A}^L = \{(Q_1, \{u_2, u_3\}), (Q_2, \{u_1, u_2\})\}$. Then θ_1 is SLT on X. Also $\theta_2 = \{\phi_A, L_2, G_{1A}^L, G_{2A}^L\}$ is a SLTS over Y, where G_{1A}^L, G_{2A}^L are SL over Y defined by, $G_{1A}^L = \{(Q_1, \{h_2\}), (Q_2, \{h_3\})\}$, $G_{2A}^L = \{(Q_1, \{h_2, h_3\}), (Q_2, \{h_1, h_3\})\}$.

Hari Siva Annam and Abinaya

If $\gamma_g: X \rightarrow Y$ as $\gamma_g(u_1) = h_2, \gamma_g(u_2) = h_1, \gamma_g(u_3) = h_3$. Now, $\gamma_g^{\leftarrow}(G_A^L) \in \theta'_1 \forall G_A^L \in \theta_2$. Hence SLCC, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$. Using way of Theorem, $\theta_{1\rho_1} = \{\phi_A, L_1, \{u_2\}, \{u_2, u_3\}\}$, and $\theta_{1\rho_2} = \{\phi_A, L_1, \{u_1\}, \{u_1, u_2\}\}$ are two topologies on X. $\theta_{2\rho_1} = \{\phi_A, L_2, \{h_2\}, \{h_2, h_3\}\}$, and $\theta_{2\rho_2} = \{\phi_A, L_2, \{h_3\}, \{h_1, h_3\}\}$ are two topologies on Y. Consequently, SCCM $\gamma_g: (L_1, \theta_{1\rho_1})$ to $(L_2, \theta_{2\rho_1})$ and also a SCCM, $\gamma_g: (L_1, \theta_{1\rho_2})$ to $(L_2, \theta_{2\rho_2})$. The example below demonstrates that the opposite of the statement of proposition: 4.1 is not always true.

Example 4.3 In accordance with Figures: 4.1 of the complete lattice from the preceding example 4.1, Assuming $L_1 = \{u_1, u_2, u_3\}, L_2 = \{h_1, h_2, h_3\}, A = \{Q_1, Q_2\}$ and $\theta_1 = \{\phi_A, L_1, F_{1A}^L, F_{2A}^L\}$ is a SLTS over X, where $f_1(Q_1) = \{u_2\}; f_1(Q_2) = \{u_1, u_2\}$ $f_2(Q_1) = \{u_2, u_3\}; f_2(Q_2) = \{u_1\}$ $f_3(Q_1) = \{u_2\}; f_3(Q_2) = \{u_1\}$. Then θ_1 is a SLT on L_1 and for that reason (L_1, θ_1, A) is a SLTS over X. For $L_2 = \{h_1, h_2, h_3\}$; and let $\theta_2 = \{\phi_A, L_2, G_{1A}^L\}$, in which SL-set G_{1A}^L over Y stated by $g_1(Q_1) = \{h_1\}; g_1(Q_2) = \{h_2\}$. Here γ_g is a mapping from (L_1, θ_1, A) to (L_2, θ_2, A) as $\gamma_g(u_1) = h_1; \gamma_g(u_2) = h_3; \gamma_g(u_3) = h_2$. Here, by above proposition, $\theta_{1\rho_1} = \{\phi, L_1, \{u_2\}, \{u_2, u_3\}\}, \theta_{1\rho_2} = \{\phi, L_1, \{u_1\}, \{u_1, u_2\}\}$ are two topologies on X. Also, $\theta_{2\rho_1} = \{\phi_A, L_2, \{h_1\}\}, \theta_{2\rho_2} = \{\phi_A, L_2, \{h_2\}\}$ are two topologies on Y.

Thus, γ_g is a Contra Continuous Mapping from $(L_1, \theta_{1\rho_1})$ to $(L_2, \theta_{2\rho_1})$ and also from $(L_1, \theta_{1\rho_2})$ to $(L_2, \theta_{2\rho_2})$. However, $\gamma_g^{\leftarrow}(G_{1A}^L) = \{\gamma_g^{\leftarrow}(g_1)(Q_1) = \{u_1\}, \gamma_g^{\leftarrow}(g_1)(Q_2) = \{u_3\}\} \notin \theta'_1 \Rightarrow \gamma_g$ is not a SLCCM from (L_1, θ_1, A) to (L_2, θ_2, A) . The aforementioned statement describes SLCC in some terms that are equivalent.

Theorem: 4.1 Let (L_1, θ_1, A) and (L_2, θ_2, A) be a SLTS, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$ be a mapping a bijection. Then, the subsequent statement holds true.

- (i) γ_g and γ_g^{-1} both are SLCC on SLTS,
- (ii) γ_g and γ_g^{-1} both are SLCC and Soft contra closed mapping on SLTS,
- (iii) γ_g and γ_g^{-1} both are SLCC and Soft contra open mapping on SLTS.

Theorem: 4.2 Let γ_g be a bijection SLCCM, γ_g is a SL-contra openif and only if $\overline{\gamma_g(F_A^L(\alpha))} = \gamma_g(\text{SL ker}(F_A^L(\alpha)))$

Proof: Let $y \in \overline{\gamma_g(F_A^L(\alpha))}$
 $\Leftrightarrow y \in \cap$ of SLC set $H_A^L, \exists \gamma_g(F_A^L) \subseteq H_A^L$.
 $\Leftrightarrow y \in H_A^L, \gamma_g(F_A^L)(\alpha) \subseteq H_A^L$.
 $\Leftrightarrow \gamma_g^{-1}(y) \in \gamma_g^{-1}(H_A^L)$, for each SLO set $\gamma_g^{-1}(H_A^L), F_A^L(\alpha) \subseteq \gamma_g^{-1}(H_A^L)$.
 $\Leftrightarrow \gamma_g^{-1}(y) \in \cap$ SLO set $H_A^L, F_A^L(\alpha) \subseteq \gamma_g^{-1}(H_A^L)$.
 $\Leftrightarrow \gamma_g^{-1}(y) \in \text{SL ker}(F_A^L(\alpha))$
 $\Leftrightarrow y \in \gamma_g(\text{SL ker}(F_A^L(\alpha)))$. Then, $y \in \gamma_g(\text{SL ker}(F_A^L(\alpha))) \Leftrightarrow y \in \overline{\gamma_g(F_A^L(\alpha))}$.

Hence, $\overline{\gamma_g(F_A^L(\alpha))} = \gamma_g(\text{SL ker}(F_A^L(\alpha)))$.
 Conversely, Suppose $\overline{\gamma_g(F_A^L(\alpha))} = \gamma_g(\text{SL ker}(F_A^L(\alpha)))$. To prove: Image of SLO is SLC set. Let $F_A^L(\alpha)$ be a SLO in $L_1 \Rightarrow \text{SL ker } F_A^L(\alpha) = F_A^L(\alpha)$. Therefore, $\gamma_g(\text{SL ker}(F_A^L(\alpha))) = \gamma_g(F_A^L(\alpha)) \Rightarrow \overline{\gamma_g(F_A^L(\alpha))} = \gamma_g(F_A^L(\alpha))$. Hence, $\gamma_g(F_A^L(\alpha))$ is SLC in L_2 .

Proposition 4.2 If $\gamma_g: L_1 \rightarrow L_2$ is SLCC and F_A^L is SLC set in L_1 , Then the restriction $\gamma_g | F_A^L$ is SLCC.

Proof: Let G_A^L be any SLO set of L_2 . We have $[\gamma_g | F_A^L]^{-1}(G_A^L) = \gamma_g^{-1}(G_A^L) \cap F_A^L$ is SLC in L_1 . Hence, $\gamma_g | F_A^L$ is SLCC.

Proposition 4.3 We have $\gamma_g: L_1 \rightarrow L_2$ is SLCC. If L_3 is a subspace of L_2 containing the image SL-set $\gamma_g(L_1)$, then the following $\Omega_g: L_1 \rightarrow L_3$ obtained by restricting the image of γ_g is SLCC.

Proof: Consider as H_A^L be a SLO subset of L_3 . Then, $H_A^L = L_3 \cap F_A^L$, where $F_A^L \in L_2$. On the premise of $\gamma_g(L_1) \subseteq L_3$, thus we Conclude, $\gamma_g^{-1}(F_A^L) = \Omega_g^{-1}(H_A^L)$. γ_g is SLCC, $\gamma_g^{-1}(F_A^L)$ is SLC in L_1 . Therefore, $\Omega_g^{-1}(H_A^L)$ is also SLC in L_1 . Hence, Ω_g is the SLCC.

Theorem: 4.3 We have (L_1, θ_1, A) and (L_2, θ_2, A) be two SLTS, $\gamma_g: (L_1, \theta_1, A) \rightarrow (L_2, \theta_2, A)$. Then,

Hari Siva Annam and Abinaya

- (a) γ_g is SL-contra open if for every SLO set F_A^L over L_1 , $SL \ker (\gamma_g (F_A^L))^c \subseteq [\gamma_g(F_A^L)]^c$
- (b) γ_g is SL-contra closed if for every SLC set F_A^L over L_1 , $SL \ker(\gamma_g(F_A^L)) \subseteq [\gamma_g(F_A^L)]$.

Proof:

- (a) Let, F_A^L be a SLO set in L_1 . $\Rightarrow (F_A^L)^o = F_A^L$. By given, $SL \ker (\gamma_g (F_A^L))^c \subseteq [\gamma_g (F_A^L)]^c = (\gamma_g (F_A^L))^c \Rightarrow [\gamma_g (F_A^L)]^o$ is SLO $\Rightarrow \gamma_g (F_A^L)$ is SLC.
- (b) Let, F_A^L be a SLC $\Rightarrow F_A^L = \overline{F_A^L} \Rightarrow SL \ker (\gamma_g (F_A^L)) \subseteq \overline{\gamma_g (F_A^L)} = \gamma_g (F_A^L)$. $\Rightarrow \gamma_g (F_A^L)$ is SLO set in L_2 .

Theorem: 4.4 If $\gamma_g: L_1 \rightarrow L_2$ is SLCM and $\Omega_g: L_2 \rightarrow L_3$ is SLCC, then $\Omega_g \circ \gamma_g: L_1 \rightarrow L_3$ is SLCC.

Proof: Let M_A^L be a SLO set in L_3 . Ω_g is SLCC function. $\Rightarrow \Omega_g^{-1}(M_A^L)$ is SLC in L_2 . γ_g is SLCM function. $\gamma_g^{-1}(\Omega_g^{-1}(M_A^L))$ is SLC in L_1 . Therefore, $(\Omega_g \circ \gamma_g)^{-1}(M_A^L)$ is SLC in L_1 . Hence, $(\Omega_g \circ \gamma_g)$ is SLCC.

Theorem: 4.5 If $\gamma_g: L_1 \rightarrow L_2$ is SLCC and $\Omega_g: L_2 \rightarrow L_3$ is SLCM, then $\Omega_g \circ \gamma_g: L_1 \rightarrow L_3$ is SLCC.

Proof: Let (M_A^L) be as SLO set in L_3 . Ω_g is SLCM. $\Rightarrow \Omega_g^{-1}(M_A^L)$ is SLO set in L_2 . γ_g is SLCC. $\gamma_g^{-1}(\Omega_g^{-1}(M_A^L))$ is SLC in L_1 . Therefore, $(\Omega_g \circ \gamma_g)^{-1}(M_A^L)$ is SLC in L_1 . Hence, $(\Omega_g \circ \gamma_g)$ is SLCC.

Theorem: 4.6 If $\gamma_g: L_1 \rightarrow L_2$ is SLCC and $\Omega_g: L_2 \rightarrow L_3$ is SLCC, then $\Omega_g \circ \gamma_g: L_1 \rightarrow L_3$ is SLCM.

Proof: Let M_A^L be a SLO set in L_3 . Ω_g is SLCC $\Rightarrow \Omega_g^{-1}(M_A^L)$ is SLC set in L_2 . γ_g is SLCC. $\gamma_g^{-1}(\Omega_g^{-1}(M_A^L))$ is SLO in L_1 . Therefore, $(\Omega_g \circ \gamma_g)^{-1}(M_A^L)$ is SLO in L_1 . Hence, $(\Omega_g \circ \gamma_g)$ is SLCM. This statement is true.

CONCLUSIONS

Our focus in this work is on the analysis of SLCC on SLTS. We have introduced SLCC functions and SL-contra open, and SL-contra closed associated with SLTS. The conceptual framework of SLCCM in SLTS, specified using a set of parameters across a universal set, is covered in this study. The SLCC receives findings from this study that were achieved using a SL kernel in SLTS.

ABSTRACT

The aim of this paper is to study and investigate different types of semirings namely Neumann regular semirings, weakly regular semirings, reduced semiring and P - regular semirings with different properties and conditions. We have done an intensive study on P -regular semirings using k- ideals , quasi ideal and extended well known theorems.

Keywords: Semiring, ordered semiring, reduced semiring ,regular and P -regular semiring.

Mathematics Subject Classification:16Y99,16Y60

INTRODUCTION

H.S.Vandiver proposed the idea of semiring in 1934.Semiring is a natural topic in mathematics and it is broad and diverse mathematical topic, this issue has a significant impact on both mathematics and computer science. In this paper we have charac- terised different classes using different ideals and structural properties. Throughout this paper $(S, +, \cdot)$ stands for semiring and (S_1, S_2, S_3) represents sveral types of semiring namely reduced semiring,regulr semiring and P -regular semiring. Here we have introduced essential ideals, k-ideals, quasi-ideals and bi-ideals in semirings to characterise them and on the basis of structural properties and different ideals results have been proved.

PRELIMINARIES

Definition 2.1. [1, 3] A semiring $(S, +, \cdot)$ is an algebraic system having two bilateral operations $+$ and \cdot such that $(S, +)$ is commutative semigroup and (S, \cdot) is semigroup and following properties hold.

$$x(y + z) = xy + xz \text{ and } (y + z)x = yx + zx \quad \forall x, y, z \in S.$$

Definition 2.2. [8, 9] A non-empty subset A of a semiring S is called (left, right) ideal in S if $x, y \in A$ and for all $r \in S$ then $x + y \in A$ and $(rx, xr \in A)$.If A is both left and right ideal than it called two sided ideal or simply ideal.

Muddsar Yaseen Malik and Sivakumar

Definition 2.3. [13, 14] An ideal A of a semi ring S is called subtractive ideal or k -ideal if $x, x + y \in A, y \in S$ than $y \in A$

Definition 2.4. [2] A semiring S is cancellable if for every $x, y, z \in S$ we have $x + z = y + z$ than $x = y$.

Reduced semiring

In this section S_1 stands for a semiring having both multiplicative identity ($1 \neq 0$) and additive identity. Here we discuss few results and examples of reduced semiring.

Definition 3.1. [10] A semiring S_1 is said to be reduced if S_1 doesn't contain non- zero nilpotent elements.

Example:- Integer modulo 6 i.e Z_6 is reduced semiring, while Z_8 is not reduced because 2, 4, 6 are nilpotent elements in Z_8 .

Definition 3.2. [1] An ideal A of a semiring S_1 is said to be essential if $A \cap H \neq \{0\}$ for every nonzero ideal H of S_1

Example: Z_8 be the semiring and $A = (2), B = (4)$, then A and B are essential ideals in Z_8 . Suppose Z_6 be the semiring then $A = (2)$ is not essential in Z_6

Definition 3.3. [12] In a semiring S_1 right annihilator of a non-zero element x is defined by $r(x) = \{y \in S : xy = 0\}$. A left annihilator $l(x)$ is defined by

$$l(x) = \{y \in S : yx = 0\} .$$

Definition 3.4. [1] Suppose a be an element of semiring S_1 than a is said to be right singular iff $r(a)$ is essential in S_1 . The set of all right singular elements is denoted by $rZ(S_1)$ left singular set is denoted by $lZ(S_1)$.

Example: Z_{12} be the semiring. Clearly $r(6)$ and $r(0)$ are the only essential ideals in Z_{12} . So $rZ(Z_{12}) = lZ(Z_{12}) = \{0, 6\}$

Example: Z_8 is semiring with integer modulo 6 which is reduced while Z_8 is not reduced, since 2, 4, 6 are nilpotent elements of Z_8 .

Theorem 3.5. If $lZ(S_1)$ contains no nonzero nilpotent elements than $lZ(S_1) = (0)$

Proof: Suppose $lZ(S_1) \neq 0$ than $\exists 0 \neq z$ such that $l(z)$ is essential in S_1 . Thus $l(z) \cap S_1x \neq 0$ for each $x \in S_1$.

Inparticular for $x = z$ than $\exists rz \in l(z) \cap S_1z$ with $rz \neq 0$.

Now $(rz)^2 = (rz)(rz) = r(zrz) = 0 \Rightarrow (rz) \in Z(S_1)$ and rz is nil potent

REGULAR SEMIRINGS

In this section S_2 stands for a semiring having both multiplicative and additive identity. Here we discuss few results and definitions.

Definition 4.1. [3] A semiring S_1 is said to be regular if for any $a \in S_2 \exists b \in S_2$ such that $a = aba \forall a, b \in S_2$.

Definition 4.2. [14] A semiring S_2 is said to be strongly regular if for each $a \in S_2 \exists b, c \in S_2$ such that $a = a^2b = ca^2$.

Definition 4.3. [14, 9] A semiring S_2 is said to be left(right) weakly regular if $K^2 = K$ for each left(right) ideal K of S_2 . If it is both left right weakly regular than it is weakly regular.

Definition 4.4. [9] A semiring S_2 is said to be left(right) duo if every left(right) ideal of S_2 is two sided ideal.

Definition 4.5. [14] An element a of a semiring S_2 is unit element if \exists some unique $b \in S_2$ such that $ab = 1$.

Definition 4.6. [10, 11] A semiring S_2 is unit regular if $\forall a \in S_2 \exists$ unit $b \in S_2$ such that $a = aba$.

Definition 4.7. [9] A semiring S_2 is yorked if for every $x, y \in S_2$ we have $x + l = y$ or $x = y + l$ for some $l \in S_2$.

Muddsar Yaseen Malik and Sivakumar

Theorem 4.8. Let S_2 be semiring then given below conditions are equivalent.

(a) S_2 is Neumann regular. (b) $\forall a \in S_2 \exists$ an idempotent $e \in S_2$ such that

$$\text{Now } eS_2 = (ab)S_2 \subseteq aS_2$$

Proof: (a) implies (b) Suppose S_2 is Neumann regular semiring than $\forall a \in S_2 \exists b \in S_2$ such that $a = aba$.

Now we suppose $e = ab$ which gives $e = e^2$ for some $e \in S_2$.

Since S_2 is Neumann regular semiring we can write

$$aS_2 = (aba)S_2 = eaS_2 \subseteq eS_2$$

$$\text{Now } eS_2 = (ab)S_2 \subseteq aS_2$$

$$\text{Hence } aS_2 = eS_2.$$

(b) Implies (a) Let $aS_2 = eS_2$ and e is the element with idempotence than $a = ey$ for some $y \in S_2$.

$$\text{Now } a = ey = e^2y = ea.$$

Let $e = ab$ (since $e \in aS_2$ implies $e = ab$).

We obtain $a = aba$. Therefore S_2 is Neumann regular.

Theorem 4.9. Suppose that S_2 is a right weakly regular, cancellative and yoked semiring. Than $S_2aS_2 = S_2$ for any right non-zero divisor element a of S_2 .

Proof: Assume a be a right non-zero divisor of S_2 than $aS_2 = (aS_2)^2$ (because $a \in (aS_2)^2$)

Let $rat \in S_2aS_2$, then by yoked property either $1 + h = rat$

or $1 = rat + h$ implies $1 \in S_2$(1)

implies $a + ah = arat$ or $a = arat + ah$

since $(a, arat \in (aS_2)^2$ then by subtractive property we obtain $ah \in (aS_2)^2$

$$\Rightarrow ah = auav \text{ for some } u, v \in S_2$$

Again, by yoked property either $h = s + uav$ or $h + s = uav$ for some $s \in S_2$

$$\Rightarrow as + auav = auav \text{ or } ah + as = ah$$

By cancellative property, we have $as = 0 \Rightarrow s = 0$ Because (a is non - zero divisor)

$$\Rightarrow h = uav \in S_2ah$$

$$\text{Now by (1) } 1 \in S_2aS_2 \Rightarrow S_2aS_2 = S_2.$$

Theorem 4.10. Suppose $x \in S_2$, if x is unit regular , then $x = cb$ for some idempotent element c and some unit element b .

Proof: Assume that y is a unit regular. Then \exists a unit $x \in S_2$ such that $xyx = y$. Suppose $c = yx$. Then $c^2 = yxyx = yx = c$, so c is an idempotent element of S_2 . Suppose $b = x^{-1}$ so we obtain $y = cb$.

Theorem 4.11. Suppose S_2 be a right duo semiring than the below mentioned statements are equivalent.

(a) S_2 is right weakly regular semiring

(b) S_2 is strongly regular semiring

(c) S_2 is Neumann regular semiring.

Proof: (a) implies (b) By theorem 4.6 $S_2 = S_2aS_2$

implies that $1 = rat \Rightarrow a = arat$ implies $a = a(as)t$ for some $s \in S_2$ than we have $a = a^2st \Rightarrow a = a^2b$ where $b = st$.

Muddsar Yaseen Malik and Sivakumar

(b) implies (c) Assume that S_2 is strongly regular than $\forall a \in S_2$.
 $\exists b, c$ such that $a = a^2b = ca^2 \Rightarrow a = aab = aba$ ($ab = ba$ because S_2 is right duo semiring).

$\Rightarrow S_2$ is Neumann regular.

(c) Implies (a) $\forall a \in S_2 \exists b \in S_2$ such that $a = aba \Rightarrow ar = abar$

implies that $a \in aS_2aS_2$

This shows that S_2 is right weakly regular semiring.

P-Regular semirings

In this portion, we investigate the concept of P-regular semiring and few properties regarding to the P-regular semiring.

Note:- S_3 stands for semiring having additive identity only.

Definition 5.1. An additive subsemigroup Q of S_3 is referred as quasi ideal of S_3

if $S_3Q \cap QS_3 \subseteq Q$.

Definition 5.2. [6] Let S_3 be a semiring and P be a right k- ideal of S_3 . Then semiring S_3 is called P-regular if for every $\alpha \in S_3 \exists \beta \in S_3$ such that $\alpha + p_1 = \alpha\beta\alpha + p_2$ for some $p_1, p_2 \in P$ and $\alpha\beta P \subseteq P$.

Example:- $Z_4 = \{0, 1, 2, 3\}$ under addition and multiplication modulo 4 is semiring and $A = \{0, 2\}$ is right k-ideal of Z_4 . Here Z_4 is not regular because $2 \neq$

$2 \cdot x \cdot 2$ for any $x \in Z_4$ but it is P-regular.

Definition 5.3. [5, 6] A semiring S_3 is said to be weak P-regular

if for each $\alpha \in S_3, \exists \beta \in S_3$ such that $\alpha = \alpha\beta\alpha + p_1$ for some $p_1 \in P$ and $\alpha\beta P \subseteq P$.

Definition 5.4. [5] Suppose S_3 be a semiring and P be a right k- ideal of S_3 . An element $a \in S_3$ is called idempotent relative to P if $a + p_1 = a^2 + p_2$ for some $p_1, p_2 \in P$ and $aP \subseteq P$.

Theorem 5.5. Let P is any right k-ideal of S_3 and H is any ideal of S_3 such that $P \subseteq H$. If S_3 is p-regular than H is p-regular.

Proof: Let S_3 is P-regular and H is an ideal of S_3 such that $P \subseteq H$. Then

for each $\alpha \in H \exists \beta \in S_3$ and $p_1, p_2 \in P$ such that $\alpha + p_1 = \alpha\beta\alpha + p_2$ and $\alpha\beta P \subseteq P$.

Let $\gamma = \beta\alpha\beta \in H$.

Then $\alpha\beta\alpha + p_1\beta\alpha = \alpha\beta\alpha\beta\alpha + p_2\beta\alpha$.

This implies $p_2 + \alpha\beta\alpha + p_1\beta\alpha = \alpha\gamma\alpha + p_2\beta\alpha + p_2$.

$\Rightarrow \alpha + p_1 + p_1\beta\alpha = \alpha\gamma\alpha + p_2\beta\alpha + p_2$

$\Rightarrow \alpha + p' = \alpha\gamma\alpha + p''$ for some $p', p'' \in P$

Also $\alpha\gamma P = \alpha(\beta\alpha\beta)P = \alpha\beta(\alpha\beta P) \in \alpha\beta P \subseteq P$.

Thus H is a P-regular.

Theorem 5.6. Suppose S_3 be a weak P-regular semiring and A be any right ideal of S_3 . Then the following holds:

(i) $A + P = A^2 + P$

(ii) if $A^2 \subseteq P$ than $A \subseteq P$

Proof: (i) Since S_3 is a weak P-regular so for each $\alpha \in S_3 \exists \beta \in S_3$ and some $p \in P : \alpha = \alpha\beta\alpha + p$ and $\alpha\beta P \subseteq P$.

Muddsar Yaseen Malik and Sivakumar

Let $\alpha \in A$.

Then $\alpha = (\alpha\beta)\alpha + p \in A^2 + P \Rightarrow A \subseteq A^2 + P \Rightarrow A + P \subseteq A^2 + P$.

But $A^2 + P \subseteq A + P$ (always)

Therefore $A + P = A^2 + P$

(ii) Given that $A^2 \subseteq P$ so $A^2 + P \subseteq P$. This shows $A + P \subseteq P$.

Therefore $A \subseteq P$ (as P is a right k -ideal of S_3). Hence proved

Theorem 5.7. If S_3 is weak P -regular, then every element of a quasi-ideal A can be shown as the sum of two elements of P and A .

Proof: Assume S_3 be a weak P -regular semiring and A be a quasi-ideal of S_3 . Then any $a \in A$ can be written as $a = axa + p$ and $axP \subseteq P$ for some $p \in P$ and $x \in S_3$.

Given A is a quasi-ideal of S_3 therefore $axa \in AS_3A \subseteq AS_3 \cup S_3A \subseteq A$ and therefore we have $a = p + axa \in P + A$. statement follows.

Theorem 5.8. Suppose S_3 be a weak P -regular semiring and A, B are quasi-ideals of S_3 . If $a \in A \cap B$, then this element a can be expressed as $a = p + a_1xa_2$ for some $p \in P, x \in S_3, a_1 \in A$ and $a_2 \in B$ and also $a_1xa_2xP \subseteq P$.

Proof: Let $a \in A \cap B$. Since S_3 is a weak P -regular then $\exists x \in S_3$ such that $a = axa + p$ for some $p \in P$ and $axP \subseteq P$. Since $A \cap B$ is a quasi-ideal of S_3 so the element $a \in A \cap B$ can be expressed as in two ways $a = p_1 + a_1 \in A$ and $a = p_2 + a_2 \in B$ for some $p_1, p_2 \in P, a_1 \in A, a_2 \in B$. Since S_3 is a weak P -regular therefore the element $a \in S_3$ can be written as $a = p_3 + axa$ for some $p_3 \in P$ and $axP \subseteq P$.

Now we have $a = p_3 + axa = p_3 + (p_1 + a_1)x(p_2 + a_2) = p_3 + a_1xp_2 + a_1xa_2 + p_1xp_2 + p_1xa_2 = p_6 + a_1xa_2$ where $p_6 \in P$ because $axp_2 = p_1xp_2 + a_1xp_2 \in P$ and P is a right k -ideal of S_3 , therefore $a_1xp_2 \in P$.

Again, $axP = p_6xP + a_1xa_2xP \subseteq P$. Since P is a right k -ideal of S_3 therefore $a_1xa_2xP \subseteq P$.

CONCLUSION

This study introduces different properties and ideals in different semirings namely regular semirings, reduced semiring. P -regular semirings have been described using quasi-ideal and bi-ideal features. We have focused and investigated the characterisation of P -regular semiring and representation of elements in terms of quasi ideals of weak- P -regular related to right k -ideal.

ABSTRACT

This study examines the probability of the vertex switching operation results from various graphs being product binary L-cordial graphs. The graphs under investigation include the Path graph (P_n), Helm graph (H_n), Wheel graph ($W_n; n > 3$), Cycle graph ($C_n; n > 3$). The application of product binary L-cordial labeling demonstrates that these analyzed graphs exhibit characteristics of product binary L-cordial Graphs.

Keywords: L-cordial graph; Binary L- cordial graph; Product binary L- cordial labeling; Product binary L- cordial graph; Vertex Switching.

2020 AMS Classification: 05C78.

INTRODUCTION

A graph labeling involves assigning distinct labels to the edges and vertices of a graph. For standardized terminology and notations in graph theory, the work of Clark and Holton [2] is consulted. Gallian [1] provides a comprehensive survey with extensive bibliographic references on various graph labeling problems. To conduct our analysis, we begin with a simple, finite, con- nected, and undirected graph denoted as $G = (V(G), E(G))$. The subsequent section provides a concise overview of definitions and relevant information essential for the current investigation.

PRELIMINARIES

L-cordial labeling was introduced by M. Bapat [3] and is described in Definition 2.1. He also shown [3, 4, 5] that the triangular snakes, Star, Path and Cycle are L-cordial graphs. Then, he extended his research to include $FL(C_n)$, C_n , Bull (C_n) , Shell graph S_n , S_n^+ and S_n^{+t} , demon- n stating that these graphs are likewise L-cordial.

Definition 2.1 [3] A graph $G(V, E)$ possesses an L-cordial labeling if there exists a bijection function r from $E(G)$ to $\{1, 2, 3, \dots, |E|\}$. Each vertex u is labeled 0 if the highest label on its incident edges is even and 1 otherwise. The terms $v_r(1)$ and $v_r(0)$ denote the total count of vertices u 's labeled as 1 and 0, respectively. The labeling function r is considered an L-cordial labeling of the graph if the absolute difference between $v_r(1)$ and $v_r(0)$ is less than or equal to 1. It's important to note that isolated vertices are not included in this labeling process. Steffi and Subhashini [6] have introduced binary L-cordial labeling and product binary L-cordial labeling, detailed in Definition 2.2 and Definition 2.3, respectively. They have explored the product binary L-cordial labeling of graphs such as Path, Comb graph $P_n \odot k_1$, Dumbell graph, Flag graph and Crown graph $C_n \odot k_1$.

Definition 2.2 [6]

A graph $G(V, E)$ featuring a binary operation exhibits a binary L-cordial labeling when there exists a bijective function r from $E(G)$ to $\{1, 2, 3, \dots, |E|\}$. In this scenario, each vertex u is assigned the label 1 or 0 based on a binary operation $*$, where uv_i , uv_j possess the smallest and greatest r values, respectively. Label 1 is assigned if $r(uv_i) * r(uv_j)$ is odd, and 0 is assigned otherwise. The quantities $v_r(1)$ and $v_r(0)$ denote the total number of vertices labeled as 1 and 0, respectively. The labeling function r is deemed a binary L-cordial labeling of the graph if the absolute difference between $v_r(1)$ and $v_r(0)$ is less than or equal to 1. This labeling scheme is represented by the acronym $BLCL$ and graph which hold the said labeling viz., binary L-cordial graph is represented by the acronym $BLCG$.

Definition 2.3 [6]

A graph $G(V, E)$ featuring a binary operation exhibits a product binary L-cordial labeling when there exists a bijective function r from $E(G)$ to $\{1, 2, 3, \dots, |E|\}$. In this scenario, each vertex u is assigned the label 1 or 0 based on a multiplication binary operation \cdot , where uv_i , uv_j possess the smallest and greatest r values, respectively. Label 1 is assigned if $r(uv_i) \cdot r(uv_j)$ is odd, and 0 is assigned otherwise. The quantities $v_r(1)$ and $v_r(0)$ denote the total number of vertices labeled as 1 and 0, respectively. The labeling function r is deemed a product binary L-cordial labeling of the graph if the absolute difference between $v_r(1)$ and $v_r(0)$ is less than or equal to 1. This labeling scheme is represented by the acronym $PBLCL$ and graph which hold the said labeling viz., product binary L-cordial graph is represented by the acronym $PBLCG$.

Definition 2.4 [7] A graph obtained by selecting a vertex u from graph G , removing all edges connecting u to its neighboring vertices, and introducing new edges connecting u to vertices in G that were not originally adjacent is termed the vertex switching G_u of G . Now, the descriptions of graphs used in the present investigation are provided below.

Definition 2.5 Path graph (P_n) is a type of walk in which $v_i \neq v_j$ for any pair of distinct indices i and j . In simpler terms, a path is a walk that traverses each vertex at most once.

Definition 2.6 Cycle graph (C_n) is a particular kind of path graph P_n that begins and ends at the same vertex.

Prajapati and Patel

Definition 2.7 Helm graph (H_n) is derived from an wheel graph (W_n) by adding a pendant edge at every node of the cycle.

Definition 2.8 Wheel graph (W_n) is created by linking each vertex of a cycle graph (C_n) to an extra vertex identified as the center. In mathematical terms, $W_n = C_n + K_1$ with the graph having $n + 1$ vertices and $2n$ edges.

RESULTS AND DISCUSSIONS

Theorem 3.1 Applying switching operation on pendant vertex in Path graph (P_n) is a PB_{LCC} .

Proof. Let $u_1, u_2, u_3, \dots, u_n$ denote the vertices of the path graph (P_n) and consider the graph P_n^* obtained by performing a switching operation on a pendant vertex in the path graph (P_n). For the sake of simplicity, let's assume, without loss of generality, that the vertex switched is denoted as u_1 . Thus, $V(P_n^*) = \{u_k : 1 \leq k \leq n\}$ and $E(P_n^*) = \{u_1u_k : 3 \leq k \leq n\} \cup \{u_{k+1}u_{k+2} : 1 \leq k \leq n-2\}$. In the context where $|V(P_n^*)|$ equals n and $|E(P_n^*)|$ equals $2n-4$. Labeling function $r : E(P_n^*) \rightarrow \{1, 2, 3, \dots, |E(P_n^*)|\}$ is defined as follows:

Case 1: $n \equiv 1 \pmod{4}$
Subcase 1: For $n = 3$,

$$r(p) = \begin{cases} 1 & \text{for } p = u_2u_3; \\ 2 & \text{for } p = u_1u_3. \end{cases}$$

Subcase 2: For $n = 5$,

$$r(p) = \begin{cases} 1 & \text{for } p = u_2u_3; \\ 2 & \text{for } p = u_3u_4; \\ 3 & \text{for } p = u_4u_5; \\ 5 & \text{for } p = u_1u_3; \\ 4 & \text{for } p = u_1u_4; \\ 6 & \text{for } p = u_1u_5. \end{cases}$$

Subcase 3: For $n > 5$,

$$r(p) = \begin{cases} 2k - 1 & \text{for } p = u_{k+1}u_{k+2}, \quad 1 \leq k \leq \frac{n-3}{2}; \\ 2k & \text{for } p = u_{\frac{n-1}{2}+k}u_{\frac{n-1}{2}+k+1}, \quad 1 \leq k \leq \frac{n-3}{2}; \\ n - 2 & \text{for } p = u_{n-1}u_n; \\ n + 2k - 2 & \text{for } p = u_1u_{k+2}, \quad 1 \leq k \leq \frac{n-5}{2}; \\ n + 2k - 3 & \text{for } p = u_1u_{\frac{n-1}{2}+k}, \quad 1 \leq k \leq \frac{n-1}{2}; \\ 2n - 5 & \text{for } p = u_1u_n. \end{cases}$$

Consequently, $v_r(1) = \frac{n-1}{2}$ and $v_r(0) = \frac{n+1}{2}$.

Case 2: $n \equiv 0 \pmod{4}$

Subcase 1: For $n = 4$,

$$r(p) = \begin{cases} 2k - 1 & \text{for } p = u_{k+1}u_{k+2}, \quad 1 \leq k \leq n - 2; \\ 2k & \text{for } p = u_1u_{k+1}, \quad 1 \leq k \leq n - 2. \end{cases}$$

Subcase 2: For $n > 4$,

$$r(p) = \begin{cases} 2k - 1 & \text{for } p = u_{k+1}u_{k+2}, \quad 1 \leq k \leq n - 2; \\ 2k & \text{for } p = u_1u_{k+2}, \quad 1 \leq k \leq \frac{n-2}{2}; \\ 2n - 2k - 2 & \text{for } p = u_1u_{\frac{n}{2}+k+1}, \quad 1 \leq k \leq \frac{n-2}{2}. \end{cases}$$

Prajapati and Patel

Example 3.1 P_7^* is a PB_{LCC} which is shown in Figure 1.

Figure 1: P_7^* with its PB_{LCL} .

Theorem 3.2 Applying switching operation on a middle vertex in helm graph (H_n) is a PB_{LCC} .

Proof. Consider a cycle with a central vertex denoted as v and alternating n vertices labeled as $u_1, u_2, u_3, \dots, u_n$. Additionally, there are pendant vertices $v_1, v_2, v_3, \dots, v_n$. Let H_n^* represent the graph formed by applying a switching operation to the middle vertex v in the helm graph (H_n). So, $V(H_n^*) = \{v, u_k, v_k : 1 \leq k \leq n\}$ and $E(H_n^*) = \{v v_k, u_k v_k : 1 \leq k \leq n\} \cup \{u_k u_{k+1} : 1 \leq k \leq n-1\} \cup \{u_n u_1\}$. In the context where $|V(H_n^*)|$ equals $2n + 1$ and $|E(H_n^*)|$ equals $3n$. Labeling function $r : E(H_n^*) \rightarrow \{1, 2, 3, \dots, |E(H_n^*)|\}$ is defined as follows:

Case 1:

Subcase 1: For $n = 3$,

$$r(p) = \begin{cases} 9 & \text{for } p = u_1 u_2; \\ 6 & \text{for } p = u_2 u_3; \\ 8 & \text{for } p = u_1 u_3; \\ 1 & \text{for } p = u_1 v_1; \\ 3 & \text{for } p = u_2 v_2; \\ 2 & \text{for } p = u_3 v_3; \\ 5 & \text{for } p = v v_1; \\ 7 & \text{for } p = v v_2; \\ 4 & \text{for } p = v v_3. \end{cases}$$

Consequently, $v_r(1) = 4$ and $v_r(0) = 3$.

Subcase 2: $n \equiv 1 \pmod{2}$

$$r(p) = \begin{cases} 2n + 2k + 1 & \text{for } p = u_k u_{k+1}, \quad 1 \leq k \leq \frac{n-1}{2}; \\ 2n + 2k - 2 & \text{for } p = u_{\frac{n-1}{2}+k} u_{\frac{n-1}{2}+k+1}, \quad 1 \leq k \leq \frac{n+1}{2}; \\ 2k - 1 & \text{for } p = u_k v_k, \quad 1 \leq k \leq \frac{n+1}{2}; \\ 2k & \text{for } p = u_{\frac{n+1}{2}+k} v_{\frac{n+1}{2}+k}, \quad 1 \leq k \leq \frac{n-1}{2}; \\ n + 2k & \text{for } p = v v_k, \quad 1 \leq k \leq \frac{n+1}{2}; \\ n + 2k - 1 & \text{for } p = v v_{\frac{n+1}{2}+k}, \quad 1 \leq k \leq \frac{n-1}{2}. \end{cases}$$

Case 2: $n \equiv 0 \pmod{2}$

$$r(p) = \begin{cases} 2n + 2k + 1 & \text{for } p = u_k u_{k+1}, \quad 1 \leq k \leq \frac{n-2}{2}; \\ n + 2k & \text{for } p = u_{\frac{n-2}{2}+k} u_{\frac{n-2}{2}+k+1}, \quad 1 \leq k \leq \frac{n+2}{2}; \\ 2k - 1 & \text{for } p = u_k v_k, \quad 1 \leq k \leq \frac{n}{2}; \\ 2k & \text{for } p = u_{\frac{n}{2}+k} v_{\frac{n}{2}+k}, \quad 1 \leq k \leq \frac{n}{2}; \\ n + 2k - 1 & \text{for } p = v v_k, \quad 1 \leq k \leq \frac{n+2}{2}; \\ 2n + 2k + 2 & \text{for } p = v v_{\frac{n+2}{2}+k}, \quad 1 \leq k \leq \frac{n-2}{2}. \end{cases}$$

Consequently, $v_r(1) = n$ and $v_r(0) = n + 1$.

The observation of $|v_r(1) - v_r(0)| \leq 1$ in all the cases in theorem 3.2 highlights that the H_n^* is in fact a PB_{LCC} .

Prajapati and Patel

Example 3.2 H_5^* is a PB_{LCC} which is shown in Figure 2.

Figure 2: H_5^* with its PB_{LCL} .

Theorem 3.3 Applying switching operation on a rim vertex in wheel graph $(W_n; n > 3)$ is a PB_{LCC} .

Proof. Consider u as the central vertex and $u_1, u_2, u_3, \dots, u_n$ as the alternating n rim vertices in a cycle. Let W_n^* denote the graph obtained by applying a switching operation to a rim vertex in the wheel graph W_n , where $n > 3$. Without loss of generality, applying switching operation on vertex u_1 . So, $V(W_n^*) = \{u, u_k : 1 \leq k \leq n\}$ and $E(W_n^*) = \{uu_{k+1}, u_{m+1}u_{m+2}, u_1u_q : 1 \leq k \leq n-1, 1 \leq m \leq n-2, 3 \leq q \leq n-1\}$. In the context where $|V(W_n^*)|$ equals $n+1$ and $|E(W_n^*)|$ equals $3n-6$. Labeling function $r : E(W_n^*) \rightarrow \{1, 2, 3, \dots, |E(W_n^*)|\}$ is defined as follows:

Case 1: $n \equiv 0 \pmod{2}$

$$r(p) = \begin{cases} 2k+1 & \text{for } p = u_{k+1}u_{k+2}, 1 \leq k \leq n-3; \\ n & \text{for } p = u_{n-1}u_n; \\ 1 & \text{for } p = uu_2; \\ 2n+2k-5 & \text{for } p = uu_{k+2}, 1 \leq k \leq \frac{n-2}{2}; \\ 2k & \text{for } p = uu_{\frac{n+2}{2}+k}, 1 \leq k \leq \frac{n-2}{2}; \\ n+2k & \text{for } p = u_1u_{k+2}, 1 \leq k \leq n-3. \end{cases}$$

Consequently, $v_r(1) = \frac{n+2}{2}$ and $v_r(0) = \frac{n}{2}$.

Case 2: $n \equiv 1 \pmod{2}$

$$r(p) = \begin{cases} 2k+1 & \text{for } p = u_{k+1}u_{k+2}, 1 \leq k \leq \frac{n-1}{2}; \\ n+2k-1 & \text{for } p = u_{\frac{n+1}{2}+k}u_{\frac{n+1}{2}+k+1}, 1 \leq k \leq \frac{n-3}{2}; \\ 1 & \text{for } p = uu_2; \\ n+2k & \text{for } p = uu_{k+2}, 1 \leq k \leq \frac{n-3}{2}; \\ 2k & \text{for } p = uu_{\frac{n+1}{2}+k}, 1 \leq k \leq \frac{n-1}{2}; \\ 2n+2k-3 & \text{for } p = u_1u_{k+2}, 1 \leq k \leq \frac{n-3}{2}; \\ 2n+2k-4 & \text{for } p = u_1u_{\frac{n+1}{2}+k}, 1 \leq k \leq \frac{n-3}{2}. \end{cases}$$

Consequently, $v_r(1) = n+1 = v_r(0)$.

The observation of $|v_r(1) - v_r(0)| \leq 1$ in all the cases in theorem 3.3 highlights that the W_n^* is in fact a PB_{LCC} .

Prajapati and Patel

Example 3.3 Wn^* is a PB_{LCC} which is shown in Figure 3.

Figure 3: $W7^*$ with its PB_{LCL} .

Theorem 3.4 Applying switching operation on a vertex in cycle graph $(C_n; n > 3)$ is a PB_{LCC} .

Proof. Consider the vertices $u_1, u_2, u_3, \dots, u_n$, which alternate in cycle C_n . Now, let C_n^* be the graph obtained by performing a switching operation on a vertex in the cycle graph C_n , where n is greater than 4. Without loss of generality, applying switching operation on vertex u_1 . So, $V(C_n^*) = \{u_k : 1 \leq k \leq n\}$ and $E(C_n^*) = \{u_k u_{k+1} : 2 \leq k \leq n-1\} \cup \{u_1 u_{k+2} : 1 \leq k \leq n-3\}$. In the context where $|V(C_n^*)|$ equals n and $|E(C_n^*)|$ equals $2n - 5$. Labeling function $r : E(C_n^*) \rightarrow \{1, 2, 3, \dots, |E(C_n^*)|\}$ is defined as follows:

Case 1: $n \equiv 0 \pmod{2}$,

$$r(p) = \begin{cases} 2k - 1 & \text{for } p = u_{k+1}u_{k+2}, \quad 1 \leq k \leq \frac{n-2}{2}; \\ 2k & \text{for } p = u_{\frac{n}{2}+k}u_{\frac{n}{2}+k+1}, \quad 1 \leq k \leq \frac{n-4}{2}; \\ 2n - 5 & \text{for } p = u_{n-1}u_n; \\ n + 2k - 3 & \text{for } p = u_1u_{k+2}, \quad 1 \leq k \leq \frac{n-4}{2}; \\ n + 2k - 4 & \text{for } p = u_1u_{\frac{n}{2}+k}, \quad 1 \leq k \leq \frac{n-2}{2}. \end{cases}$$

Consequently, $v_r(1) = \frac{n}{2} = v_r(0)$.

Case 2: $n \equiv 1 \pmod{2}$,

Subcase 1: For $n = 5$,

$$r(p) = \begin{cases} 3 & \text{for } p = u_1u_4; \\ 5 & \text{for } p = u_1u_3; \\ 1 & \text{for } p = u_2u_3; \\ 4 & \text{for } p = u_3u_4; \\ 2 & \text{for } p = u_4u_5. \end{cases}$$

Subcase 2: For $n > 5$,

$$r(p) = \begin{cases} 2k - 1 & \text{for } p = u_{k+1}u_{k+2}, \quad 1 \leq k \leq \frac{n-1}{2}; \\ 2k & \text{for } p = u_{\frac{n+1}{2}+k}u_{\frac{n+1}{2}+k+1}, \quad 1 \leq k \leq \frac{n-5}{2}; \\ 2n - 5 & \text{for } p = u_{n-1}u_n; \\ n + 2k - 2 & \text{for } p = u_1u_{k+2}, \quad 1 \leq k \leq \frac{n-5}{2}; \\ n + 2k - 5 & \text{for } p = u_1u_{\frac{n-1}{2}+k}, \quad 1 \leq k \leq \frac{n-1}{2}. \end{cases}$$

Consequently, $v_r(0) = n-1$ and $v_r(1) = \frac{n+1}{2}$.

The observation of $|v_r(1) - v_r(0)| \leq 1$ in all the cases in theorem 3.4 highlights that the C_n^* is in fact a PB_{LCC} .

Example 3.4 $C9^*$ is a PB_{LCC} which is shown in Figure 4.

Prajapati and Patel

Figure 4: C_9^* with its PB_{LCL} .

CONCLUSIONS

The study you described investigates the potential application of vertex switching graphs from various types of graphs, including the Path graph (P_n), Helm graph (H_n), Wheel graph ($W_n; n > 3$), and Cycle graph ($C_n; n > 3$), as product binary L-cordial graphs. Through the utilization of product binary L-cordial labeling, the study confirms that these analyzed graphs demonstrate the characteristics of product binary L-cordial graphs. The utilization of this type of labeling extends beyond theoretical implications; it finds relevance in several practical domains including Network Analysis, Computer Science, Telecommunications, Bioinformatics, Operations Research, Cryptography, Data Science, and Mathematics Education. By demonstrating the applicability of product binary L-cordial labeling to diverse graph structures, the study contributes to advancing knowledge in these fields and potentially inspires further research and applications in related areas. This research presents opportunities for further exploration, suggesting that similar methodologies could be employed in other graph operations such as Shadow, Mirror, etc., and across different categories of graphs.

ABSTRACT

One of the main topics of research in graph theory is graph labeling. A graph's labeling is the assignment of a number, under particular conditions, to a vertex (dots), edge (lines), or both. Important information about what the data in the graph represents is enhanced by the addition of labels. The literature defines a wide variety of labeling techniques. The most popular labeling patterns are graceful labeling, harmonious labeling, edge graceful labeling and so on. Our central focus in this paper is prime graceful labeling on shadow graphs, split graph, diamond graph, house graph, tetrahedral graph, tent graph.

Keywords: Prime labeling, Graceful labeling, Prime graceful labeling, Shadow graph and Split graph.

MSC 2010 :05C78

INTRODUCTION

Alexander Rosa initially proposed the graph labeling in 1967. α -labeling, β -labeling, and q -labeling are the three types of labeling that Rosa identified. Solomon Golomb later renamed β -labeling as "graceful" in 1972. More than 3000 studies have examined more than 200 graph labeling approaches throughout the internship years. A prime graceful labeling is a mathematical concept used in graph theory. Tout, Dabboucy, and Howalla invented prime labeling in 1982. While the prime graceful labeling was introduced by T.M.Selvarajan and R.Subramaniam. The study of prime graceful labeling contributes to a deeper understanding of graph properties and their mathematical structure. A graph G with p vertices and q edges is said to be prime graceful labeling, if there is an injection ϕ from the vertices of

Bharani Pradeebha and Mythili

G to $\{1, 2, \dots, m\}$ where $m = \min(2p, 2q)$ such that $\gcd(\varphi(v_i), \varphi(v_j)) = 1$ induced injective function φ^* from the edge of G to $\{1, 2, \dots, m - 1\}$ defined by $\varphi^*(v_i v_j) = |\varphi(v_i) - \varphi(v_j)|$, the resulting edge labels are distinct. The labeling is considered "graceful" because it exhibits a harmonious distribution of labels across the graph's vertices, creating an aesthetically pleasing structure. Numerous fields, including coding theory, x-ray crystallography, communication networks, and others, use graph labeling. Prime graceful labeling finds application in various areas such as coding theory, network design and scheduling problems. In this paper we focus on prime graceful labeling which is a combination of both prime labeling and graceful labeling. The definition of both labeling are varied from each other

PRELIMINARIES

Definition 2.1

Let $G = (V(G), E(G))$ be a graph with p vertices. A bijection $f: V \rightarrow \{1, 2, \dots, p\}$ is called a prime labeling if for each edge $e = uv$, $\gcd(f(u), f(v)) = 1$. A graph which admits a prime labeling is called prime graph.

Definition 2.2

Let $G = (V(G), E(G))$ be a simple, finite and undirected graph with $|V| = p$ and $|E| = q$. An injective function $f: V \rightarrow \{1, 2, \dots, p\}$ is called graceful labeling of G if all the edge labels of G given by $f(uv) = |f(u) - f(v)|$ for every $uv \in E$ are distinct. A graph which admits a graceful labeling is called graceful graph.

Definition 2.3

A graph G with p vertices and q edges is said to be prime graceful labeling, if there is an injection φ from the vertices of G to $\{1, 2, \dots, m\}$ where $m = \min(2p, 2q)$ such that $\gcd(\varphi(v_i), \varphi(v_j)) = 1$ induced injective function φ^* from the edge of G to $\{1, 2, \dots, m - 1\}$ defined by $\varphi^*(v_i v_j) = |\varphi(v_i) - \varphi(v_j)|$, the resulting edge labels are distinct.

Definition 2.4

A connected graph G 's shadow graph $D_2(G)$ is created by making two copies of G , say G' and G'' , and joining each vertex V' in G' ; to the neighbors of the corresponding vertex V'' in G'' .

Definition 2.5

In order to obtain the split graph of a graph G , a new vertex V' must be added to each vertex V so that every vertex adjacent to V in G is adjacent to V' . $\text{spl}(G)$ represents the resulting graph.

MAIN RESULTS

Prime Graceful Labeling on some graphs :

Theorem 3.1

$D_2(C_n)$ admits prime graceful labeling.

Proof

The shadow graph $D_2(C_n)$ has $2n$ vertices and $4n$ edges.

$$m = \min(2p, 2q)$$

$$= \min(2(2n), 2(4n))$$

$$= \min(4n, 8n)$$

$$m = 4n$$

The vertices of $D_2(C_n)$ are labeled from the set $S = \{1, 2, 3, \dots, 4n - 1, 4n\}$. Choose an arbitrary vertex in $D_2(C_n)$ and label it with 1. Choose last two integers from the set S . i.e. $4n - 1$ and $4n$ label it to the adjacent vertices of vertex label 1. Choose the integers from the beginning of the set S and label with the vertex adjacent to the vertex $4n - 1$ or $4n$. So that the gcd of a two consecutive vertices is 1 and edge labels are distinct.

Bharani Pradeebha and Mythili

Example

Shadow graph of $D_2(C_4)$ is a prime graceful labeling.

Prime graceful labeling of $D_2(C_4)$

Shadow graph of $D_2(C_5)$ is a prime graceful labeling.

Prime graceful labeling of $D_2(C_5)$

Theorem 3.2

$D_2(K_{1,n})$ admits prime graceful labeling.

Proof

The shadow graph $D_2(K_{1,n})$ has $2n+2$ vertices and $4n$ edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(2n + 2), 2(4n)) \\
 &= \min(4n + 4, 8n) \\
 m &= 4n + 4.
 \end{aligned}$$

In $D_2(K_{1,n})$ two vertices are adjacent with remaining n vertices. Let us label the vertices of degree n with 1 and 2 and remaining with $3, 5, 7, \dots, 2n+2$. The gcd of the end vertices of each edge is 1. The edge labels $1, 2, 3, 4, \dots$ are distinct.

Example

The shadow graph of $D_2(K_{1,2})$ permits prime graceful labeling.

Bharani Pradeebha and Mythili

Prime graceful labeling of $D_2(K_{1,2})$

The shadow graph of $D_2(K_{1,4})$ permits prime graceful labeling.

Prime graceful labeling of $D_2(K_{1,4})$

Theorem 3.3

Diamond graph permits prime graceful labelling.

Proof

The diamond graph D is a planer undirected graph with 4 vertices and 5 edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(4), 2(5)) \\
 &= \min(8, 10) \\
 m &= 8.
 \end{aligned}$$

The vertices of the graph is labeled from the set $D = \{1, 2, 3, 4, 5, 6, 7, 8\}$. Choose an arbitrary vertex in diamond graph and label it as 1. And label the other vertex by a prime number. So that the gcd of two consecutive vertices is 1 and edge labels are distinct.

Example

Prime graceful labeling of Diamond graph

Bharani Pradeebha and Mythili

Theorem 3.4

House graph permits prime graceful labeling.

Proof

The house graph H is a simple graph with 5 vertices and 8 edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(5), 2(8)) \\
 &= \min(10, 16) \\
 m &= 10.
 \end{aligned}$$

The vertices of the graph is labeled from the set $H = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$. Label the vertex, roof of the house graph H with 9 from the vertex set. And label the other vertices with prime number like 1, 3, 5, 7. So that the gcd of two consecutive vertices of each edge is 1 and resulting edge labels are distinct.

Example

Prime graceful labeling of House graph

Theorem 3.5

$Spl(K_{1,n})$ permits prime graceful labeling.

Proof

The $Spl(K_{1,n})$ contains $2n + 2$ vertices and $3n$ edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(2n + 2), 2(3n)) \\
 &= \min(4n + 4, 6n) \\
 m &= 6n.
 \end{aligned}$$

Label the vertex having degree $2n$ of $K_{1,n}$ with 1 and label the vertex having degree n with $(6n - 5)$. And label the remaining vertices with remaining numbers from the set $2, 3, \dots, 6n$. Hence the gcd of two adjacent vertices of each edge is 1. And then edges labels are $1, 2, 3, \dots, 6n$ are distinct.

Example

The $Spl(K_{1,3})$ is a prime graceful labeling.

Bharani Pradeebha and Mythili

Prime graceful labeling of $Spl(K_{1,3})$

The $Spl(K_{1,4})$ is a prime graceful labeling.

Theorem 3.6

Tetrahedral graph permits prime graceful labeling.

Proof

The tetrahedral graph, T is a graph with four vertices and six edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(4), 2(6)) \\
 &= \min(8, 12) \\
 m &= 8.
 \end{aligned}$$

The vertices of the graph is labeled from the set $\{1,2,3,4,5,6,7,8\}$. Label the center vertex of the graph with number 7 and labeling the remaining vertices with prime numbers from the set. Eg: 1,2,3,5. So that the gcd of a consecutive vertices is 1 and each edges are labeled with distinct numbers.

Example

Prime graceful labeling of Tetrahedral graph

Bharani Pradeebha and Mythili

Theorem 3.7

Tent graph permits prime graceful labeling.

Proof

The graph is an undirected graph with six vertices and nine edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(6), 2(9)) \\
 &= \min(12, 18) \\
 m &= 12 .
 \end{aligned}$$

The vertices of the graph are labeled from the set $T = \{1,2,3,4,5,6,7,8,9,10,11,12\}$. Three vertices are of the degree four and the remaining three vertices are of degree three. The vertices with degree 4 are labeled by a prime number i.e., 1,2 and 5. The vertex with degree two are labeled by odd numbers i.e., 7,9 and 11. Hence the gcd of the any two adjacent vertices is 1 and each edges is labeled by distinct numbers from the set.

Example:

Prime graceful labeling of Tent graph

CONCLUSION

In this paper the concept of the prime graceful labeling and proof of the existence of prime graceful labeling for graphs such as shadow graph $D_2(C_n)$, shadow graph $D_2(K_{1,n})$, split graph $Spl(K_{1,n})$, diamond graph, house graph, tetrahedral graph, tent graph.

ABSTRACT

Micro Topological Spaces introduced by S.Chandrasekar and introduces a new type of $O(X)$ (open sets) . Regular- $O(X)$, $-O(X)$, $eI-O(X)$, $I-O(X)$, Somewhat-I-continuous functions, Almost somewhat -continuous functions, somewhat eI_r -continuous functions introduced by P.L.Powar, W.AI-Omeri, Shikha Bhadauria. In this paper we introduce MIC - $eI-O(X)$, Relatively -MIC-r-continuous functions, Relatively -MIC- eI -continuous functions, almost relatively MIC-continuous functions, relatively MIC--continuous functions , relatively MIC- β_r -continuous functions also, find part of their required resources in MTS.

Keywords: MIC-regular $O(X)$, MIC- $eI -O(X)$, Relatively -MIC- eI -continuous functions , almost relatively -MIC-continuous functions, relatively - MIC - -continuous functions relatively - MIC - β_r -continuous functions.

INTRODUCTION

R.Vaidyanathaswamy [1] proposed the localization theory in set topology in 1944 . S.Ganesan [2] has developed a new concept of Micro topological space through smaller systems, in 2018. Regular- $O(X)$, $-O(X)$, $eI-O(X)$, $I-O(X)$ somewhat-I-continuous functions, Almost somewhat-continuous functions, Somewhat eI_r -continuous functions introduced by P.L.Powar, W.AI-Omeri, Shikha Bhadauria[3] in 2020.S.Selvaraj Ganesan [4] proposed a MIC-G-c(x) and MIC-G-Continuous in MTS in 2020. In 2022 M.Josephine Rani and R.Bhavani[5] MIC-Ig and MIC-Ig Closed Sets in Micro Ideal Topological Spaces In this paper Proposed MIC - $eI-O(X)$, relatively - MIC --continuous functions,

Bhavani and Josephine Rani

relatively - MIC - β r -continuous functions, almost relatively MIC-continuous functions, relatively MIC - eI-continuous functions in MTS and some of its structures are being investigated.

PRELIMINARIES

Explication 2.1[4]

Start U as a set of horizontal instruments called the Universe and R as the equivalent relationship with U , which is called the relation of ignorance.

This couple (U, R) is said to be the space of enterprise. Enable $X \subseteq U$.

i) The minimum X relative to R is the set of all the details, which is set for the object divided by X relative to R and denoted by $L_R(X)$. That is,

$L_R X = \{x \in U \mid \exists R(x) \subseteq X\}$ Where $R(x)$ represents the equivalent class determined by X .

ii) The maximum X value relative to R is $U_R(X) = \{x \in U \mid \{R(x) \subseteq X\}$.

iii) The boundary area of X with respect to R is a set of all objects which is intermediate or non- X with respect to R and is defined as $B_R(X)$. That is, $B_R(X) = U_R(X) - L_R(X)$. and their complement is called micro closed sets.

Explication 2.2[5]

$(U, \tau_R(X))$ is a Nano topological space then $R(X) = \{N \cup (N' \cap \mu) : N, N' \in \tau_R(X)\}$ and called it Micro topology of $\tau_R(X)$ by μ where $\mu \notin \tau_R(X)$.

Explication 2.3[5]

Micro topology $R(X)$ satisfies the following theories

(i) $U, \phi \in R(X)$

(ii) A combination of any of the elements the group is $R(X)$ in $R(X)$

(iii) The intersection of parcels of any finite subdivision of $R(X)$ in $R(X)$. Also $R(X)$ is called the micro topology in relation to X in U . Triplets $(U, \tau_R(X), R(X))$ are called micro topological spaces and the bases of $R(X)$ are called micro open sets and their complements are called micro closed Sets.

Explication 2.4

A subset A of an ideal topological spaces (IDTS) (U, τ, ID) is said to be R -ID- $O(X)$ (resp. R -ID- $C(X)$) if $A = \text{Int}(\text{clr}^*(A))$ (resp. $\text{clr}^*(\text{Int}(A))$). The $-ID$ -interior of A is the union of all R -ID- $O(X)$ of X contained in A and is denoted by $-IntI(A)$.

Explication 2.5

A subset A of an ideal topological space (U, τ, ID) is said to be

1. Regular $O(X)$ if $A = \text{Int}(\text{clr}(A))$

2. $-O(X)$ if $A = \text{clr}(\text{Int}(\text{clr}(A)))$

The family of regular $O(X)$ (ie. $RO(X)$), β - $O(X)$ respectively.

Explication 2.6

A subset A of an ideal topological space (U, τ, ID) is said to be $eI - O(X)$ $A = \text{clr}(\text{IntI}(A)) \cap \text{Int}(\text{clrI}(A))$

Explication 2.7

A function $f : (U, \tau_1) \rightarrow (U, \tau_2)$ is said to be relatively continuous if for each V_2 and $f^{-1}(V_2) \neq \emptyset$ there exist $U_1 \subseteq U$ and $U_1 \neq \emptyset$ and $U_1 \subseteq f^{-1}(V_2)$.

Explication 2.8

A function $f : (U, \tau_1, ID_1) \rightarrow (U, \tau_2, ID_2)$ is said to be relatively eI -continuous if for each V_2 and $f^{-1}(V_2) \neq \emptyset$ there exist $U_1 \subseteq U$ and $U_1 \neq \emptyset$ and $U_1 \subseteq f^{-1}(V_2)$.

Bhavani and Josephine Rani

Generalized Relatively Micro Continuous Functions

In this section, we have introduced the generalized versions of relatively continuous function with illustrative examples.

Relatively-r-Continuous Functions

Definition 3.1.1

A function $f : (\mathcal{U}_1, \mathcal{U}_1) \rightarrow (\mathcal{U}_2, \mathcal{U}_2)$ is impart to be relatively $-r$ -MIC-continuous if for each $V_2 \in \mathcal{RO}(\mathcal{U}_2)$ and $f^{-1}(V_2) \neq \emptyset$, there exist $U \in \mathcal{U}_1$ such that $U \neq \emptyset$ and $U \subset f^{-1}(V_2)$.

Remark 3.1.2

Each relatively continuous function is relatively-MIC-r-continuous functions yet the converse may not hold necessarily.

Illustration: 3.1.3

Enable $\mathcal{U}_1 = \{e_1, e_2, e_3, e_4\}$ be a non-empty set with the Micro topology $\mathcal{U}_1 = \{\emptyset, \{e_1\}, \{e_2\}, \{e_1, e_2\}, \{e_1, e_2, e_3\}\}$, $\mathcal{U}_1R(X_1) = \{\{e_3\}, \{e_4\}, \{e_1, e_2\}\}$ and $X_1 = \{e_1, e_2\}$, $\mu = \{e_3\} \notin R(X)$, $R(X_1) = \{\emptyset, \{e_1, e_2\}\}$, Consider $\mathcal{U}_2 = \{l_1, l_2, l_3, l_4\}$, $\mathcal{U}_2R(X_2) = \{\{l_1\}, \{l_2\}, \{l_3, l_4\}\}$ and $X_2 = \{l_1, l_3\}$, $R(X_2) = \{\emptyset, \{l_1\}, \{l_3, l_4\}, \{l_1, l_3, l_4\}\}$, $\mu = \{l_2\} \notin R(X_2)$, $\mathcal{U}_2 = \{\emptyset, \{l_1\}, \{l_2\}, \{l_1, l_2\}, \{l_1, l_3, l_4\}, \{l_3, l_4\}, \{l_2, l_3, l_4\}\}$, $I = \{\emptyset, \{l_3\}\}$,

The function $f : (\mathcal{U}_1, NA, MIC) \rightarrow (\mathcal{U}_2, NA, MIC)$ is defined by $f(e_1) = l_3$, $f(e_2) = l_4$, $f(e_3) = l_1$, $f(e_4) = l_2$. First, we show that the function f is relatively $-MIC - r -$ continuous functions.

Enable $V_1 \in \mathcal{MIC-R-O}(\mathcal{U}_2)$ and $f^{-1}(\{l_1\}) = \{e_3\} \neq \emptyset$ and there exists $U_1 = \{e_3\} \in \mathcal{U}_1$ and $U_1 \subset f^{-1}(V_1)$. Similarly, for the other regular open sets of \mathcal{U}_2 , there exists $U_1 \in \mathcal{U}_1$ such that the condition $U_1 \subset f^{-1}(V_1)$ holds. So, the function f is relatively-MIC-r-continuous. Next we show that the function f is not relatively-MIC-continuous function. For $V_1 = \{l_2\} \in \mathcal{U}_2$, $f^{-1}(V_1) = \{e_4\}$ but there does not exist any $U_1 \in \mathcal{U}_1$ such that $U_1 \neq \emptyset$ and $U_1 \subset f^{-1}(V_1)$. Therefore, the function f is not relatively-MIC-continuous function.

Remark: 3.1.4

Relatively-MIC-r-continuous functions and Relatively-MIC-e-I-continuous functions are independent of one another. The examples below support this statement.

Illustration: 3.1.5

Enable $\mathcal{U}_1 = \{5, 6, 7, 8\}$ be a non-empty set with the Micro topology $\mathcal{U}_1 = \{\emptyset, \{5\}, \{6, 7\}, \{6, 7, 8\}\}$, $\mathcal{U}_1R(X_1) = \{\{5\}, \{6, 7\}, \{8\}\}$, $X_1 = \{6, 7\}$ and $\mu = \{8\}$. Enable $\mathcal{U}_2 = \{p_1, q_1, r_1, s_1\}$ consider $\mathcal{U}_2 = \{\emptyset, \{p_1\}, \{q_1\}, \{p_1, q_1\}, \{p_1, q_1, r_1\}, \{p_1, q_1, r_1, s_1\}\}$ with the Micro topology $\mathcal{U}_2 = \{\emptyset, \{p_1\}, \{q_1\}, \{p_1, q_1\}, \{p_1, q_1, r_1\}, \{p_1, q_1, r_1, s_1\}\}$, $\mathcal{U}_2R(X_2) = \{\{p_1, q_1\}, \{r_1\}, \{s_1\}\}$, $X_2 = \{p_1, s_1\}$, $\mu = \{q_1\}$, $I_2 = \{\emptyset, \{r_1, s_1\}\}$. The collection of closed set is $F_2 = \{\emptyset, \{p_1\}, \{q_1\}, \{p_1, q_1\}, \{p_1, q_1, r_1\}, \{p_1, q_1, r_1, s_1\}\}$. The function $f : (\mathcal{U}_1, \mathcal{U}_1) \rightarrow (\mathcal{U}_2, \mathcal{U}_2)$ is defined by $f(5) = p_1, f(6) = q_1, f(7) = r_1, f(8) = s_1$. Now we show that the function f is Relatively-MIC-r-continuous. Enable $V_2 = \{q_1, s_1\} \in \mathcal{MIC-R-O}(\mathcal{U}_2)$ and $f^{-1}(\{q_1, s_1\}) = \{6, 8\} \neq \emptyset$ and there exists $U_1 = \{6, 8\} \in \mathcal{U}_1$ such that $U_1 \subset f^{-1}(V_2)$. So f is Relatively-MIC-r-continuous. Similarly, it has been verified for the other MIC-regular- $O(X)$ V_2 of \mathcal{U}_2 there exist $U_1 (\neq \emptyset) \in \mathcal{U}_1$ the function f is Relatively-MIC-r-continuous. But for $V_2 = \{p_1\} \in \mathcal{U}_2$, $f^{-1}(\{p_1\}) = \{5\}$, there does not exist any $U_1 \in \mathcal{MIC-eIO}(\mathcal{U}_1)$ such that $U_1 \neq \emptyset$ and $U_1 \subset f^{-1}(V_2)$. Therefore, the function f is Relatively e-I-continuous.

Illustration 3.1.6

Enable $\mathcal{U}_1 = \{n, o, p, q\}$ be a non-empty set with the Micro topology $\mathcal{U}_1 = \{\emptyset, \{n\}, \{o\}, \{n, p\}, \{n, o, p\}\}$, $\mathcal{U}_1R(X_1) = \{\{n\}, \{o, q\}, \{p\}\}$, $X_1 = \{n, p\}$, and $I_1 = \{\emptyset, \{o, p\}\}$, $\mu = \{o\}$. consider $\mathcal{U}_2 = \{1, 2, 3, 4\}$ with the Micro topology $\mathcal{U}_2 = \{\emptyset, \{1\}, \{2\}, \{3\}, \{4\}, \{1, 2\}, \{1, 3\}, \{1, 2, 3\}, \{1, 3, 4\}\}$, $I_2 = \{\emptyset, \{6\}, \{7, 8\}\}$, $\mu = \{2\}$. The collection of closed set is $F_2 = \{\emptyset, \{1\}, \{2\}, \{3\}, \{4\}, \{1, 2, 3\}, \{1, 3, 4\}\}$. The function $f : (\mathcal{U}_1, \mathcal{U}_1) \rightarrow (\mathcal{U}_2, \mathcal{U}_2)$ is defined by $f(n) = 1, f(o) = 2, f(p) = 3, f(q) = 4$. Now we show that the function f is Relatively-MIC-e-I-continuous. For $V_2 = \{2\} \in \mathcal{U}_2$ and $f^{-1}(\{2\}) = \{o\} \neq \emptyset$ and there exists $U_1 = \{o\} \in \mathcal{MIC-eIO}(\mathcal{U}_1)$ such that $U_1 \subset f^{-1}(V_2)$ and

Bhavani and Josephine Rani

$U_1 f^{-1}(V_2)$. Similarly, for the other MIC-regular- $O(X)$ of U_2 there exist $U_1 (\neq \emptyset) \in \tau_1, U_1 \neq \emptyset$ and $U_1 f^{-1}(V_2)$ holds. So, the function f is Relatively-MIC-e-I-continuous functions. Next, we show that the function f is not Relatively-MIC-r-continuous. For $V_2 = \{2\} \in R-O(U_2)$, $f^{-1}(\{2\}) = \{n\}$, but there exists no $(U_1 \neq \emptyset) \in \tau_1$, satisfying the condition $U_1 f^{-1}(V_2)$. Therefore, the function f is not Relatively-MIC-r-continuous.

Relatively-MIC--continuous functions

Definition 3.2.1

A function $f : (U_1, \tau_1) \rightarrow (U_2, \tau_2)$ is called as Relatively-MIC--continuous functions if for every $V_2 \in \tau_2$ and $f^{-1}(V_2) \neq \emptyset$ there exists $U_1 \in MIC-\beta O(X_1) \ni U_1 \neq \emptyset$ and $U_1 f^{-1}(V_2)$.

Remark 3.2.2

Each relatively continuous function is relatively- β -continuous although the converse may not be valid always.

Example 3.2.3

Enable $U_1 = \{d_1, d_2, d_3, d_4\}$ be a non-empty set with the Micro topology $\tau_1 = \{\emptyset, U_1, \{d_3\}, \{d_1, d_2\}, \{d_1, d_2, d_3\}\}$, $MIC-c(x) = \{\emptyset, U_1, \{d_4\}, \{d_3, d_4\}, \{d_1, d_2, d_4\}\}$, $U_1 R(X_1) = \{\{d_1, d_2\}, \{d_3\}, \{d_4\}\}$, $X_1 = \{d_1\}$, and $I_1 = \{\emptyset, \{d_1\}, \{d_2\}, \{d_1, d_2\}, \{d_3\}\}$, consider $U_2 = \{i_1, i_2, i_3, i_4\}$ with the Micro topology $\tau_2 = \{\emptyset, U_2, \{i_1\}, \{i_2\}, \{i_1, i_2\}, \{i_2, i_3\}, \{i_1, i_2, i_3\}\}$. The collection of closed set is $F_2 = \{\emptyset, U_2, \{i_2, i_3, i_4\}, \{i_1, i_3, i_4\}, \{i_3, i_4\}, \{i_1, i_4\}, \{i_4\}\}$, $U_1 R(X_2) = \{\{i_2, i_3\}, \{i_1\}, \{i_4\}\}$, $X_2 = \{i_1, i_3\}$,

$\{i_2\}, I_2 = \{\emptyset, \{i_4\}\}$. The function $f : (U_1, \tau_1) \rightarrow (U_2, \tau_2)$ is defined by $f(d_1) = i_4, f(d_2) = i_1, f(d_3) = i_2, f(d_4) = i_3$. Now we show that the function f is Relatively-MIC- β -continuous. For $V_1 = \{i_2\} \in \tau_2$ and $f^{-1}(\{i_2\}) = \{d_3\} \neq \emptyset$ and there exists $U_1 = \{d_3\} \in MIC-O(U_1) \ni U_1 \neq \emptyset$ and $U_1 f^{-1}(V_2)$. Similarly it has been verified that for the remaining $O(X)$ of U_2 there exist $U_1 \in MIC-O(U_1)$ such that the condition $U_1 f^{-1}(V_2)$ holds. Hence the mapping f is Relatively-MIC- β -continuous. Next, we show that the function f is not Relatively-MIC-continuous. For $V_2 = \{i_1\} \in \tau_2$, $f^{-1}(\{i_1\}) = \{d_2\}$, but there exists no $(U_1 \neq \emptyset) \in \tau_1$, satisfying the condition $U_1 f^{-1}(V_2)$. Therefore, the mapping f is not Relatively-MIC-continuous.

Remark 3.2.4

It has been noted that relatively- r-continuous functions and relatively- β -continuous functions are independent of one another.

Example 3.2.5

Enable $U_1 = \{n_1, o_1, p_1, q_1\}$ be a non-empty set with the Micro topology $\tau_1 = \{\emptyset, U_1, \{q_1\}, \{o_1, p_1\}, \{o_1, p_1, q_1\}\}$, $U_1 R(X_1) = \{\{n_1, q_1\}, \{o_1\}, \{p_1\}\}$, $X_1 = \{o_1, p_1\}$, and $I_1 = \{\emptyset, \{o_1\}, \{p_1, q_1\}, \{q_1\}\}$. consider $U_2 = \{1, 2, 3, 4\}$ with the Micro topology $\tau_2 = \{\emptyset, U_2, \{1\}, \{2\}, \{1, 2\}, \{3, 4\}, \{1, 3, 4\}, \{2, 3, 4\}\}$, $U_1 R(X_2) = \{\{1\}, \{2\}, \{3, 4\}\}$, $X_2 = \{1, 3\}$, $I_2 = \{\emptyset, \{3\}\}$. The function $f : (U_1, \tau_1) \rightarrow (U_2, \tau_2)$ is defined by $f(n_1) = 1, f(o_1) = 4, f(p_1) = 3, f(q_1) = 2$. Now we show that the function f is relatively-MIC- r-continuous. For $V_1 = \{2\} \in MIC-R-O(U_2)$ and $f^{-1}(\{2\}) = \{q_1\} \neq \emptyset$ and there exists $U_1 = \{q_1\} \in \tau_1 \ni U_1 \neq \emptyset$ and $U_1 f^{-1}(V_2)$. Similarly it has been verified that the condition $U_1 f^{-1}(V_2)$ for all $V_2 \in MIC-R-O(U_2)$ and for some $U_1 \in \tau_1$ holds. Hence the mapping f is relatively-MIC- r-continuous. Next, we show that the function f is not Relatively-MIC- β -continuous. For $V_2 = \{1\} \in \tau_2$, $f^{-1}(\{1\}) = \{n_1\}$, but there exists no $U_1 \in MIC-\beta O(U_1)$ such that $U_1 \neq \emptyset$ and $U_1 f^{-1}(V_2)$. Therefore, the function f is not Relatively-MIC--continuous.

Example 3.2.6

Enable $U_1 = \{h_1, h_2, h_3, h_4\}$ be a non-empty set with the Micro topology $\tau_1 = \{\emptyset, U_1, \{h_3\}, \{h_1, h_2\}, \{h_1, h_2, h_3\}\}$, $U_1 R(X_1) = \{\{h_1, h_2\}, \{h_3\}, \{h_4\}\}$, $X_1 = \{h_1\}$, and $I_1 = \{h_3\}$, consider $U_2 = \{d_1, e_1, f_1, g_1\}$ with the Micro topology $\tau_2 = \{\emptyset, U_2, \{d_1\}, \{e_1\}, \{d_1, e_1\}, \{e_1, f_1\}, \{d_1, e_1, f_1\}\}$, $U_1 R(X_2) = \{\{e_1, f_1\}, \{d_1\}, \{g_1\}\}$, $X_2 = \{d_1, f_1\}$, $I_2 = \{e_1\}$. The function $f : (U_1, \tau_1) \rightarrow (U_2, \tau_2)$ is defined by $f(h_1) = g_1, f(h_2) = d_1, f(h_3) = e_1, f(h_4) = f_1$

Bhavani and Josephine Rani

Now we show that the function f is relatively-MIC--continuous. For $V_1 = \{d_1\} \in \mathcal{U}_2$ and $f^{-1}(\{d_1\}) = \{h_2\} \neq \emptyset$ and there exists $U_1 = \{h_2\} \in \text{MIC-}\beta\mathcal{O}(\mathcal{U}_1)$ $U_1 \neq \emptyset$ and $U_1 \cap f^{-1}(V_2)$. Similarly, for the remaining open sets of \mathcal{U}_2 , there exists $U_1 (\neq \emptyset) \in \text{MIC-}\beta\mathcal{O}(\mathcal{U}_1) \ni$ the condition $U_1 \cap f^{-1}(V_2)$ holds. Hence the mapping f is relatively-MIC- β - continuous. Next, we show that the function f is not Relatively-MIC- r -continuous. For $V_2 = \{d_1\} \in \text{MIC-R-O}(\mathcal{U}_2)$, $f^{-1}(\{d_1\}) = \{h_2\}$, but there exists no $U_1 \in \mathcal{U}_1$ such that $U_1 \neq \emptyset$ and $U_1 \cap f^{-1}(V_2)$. Therefore, the function f is not Relatively-MIC- r -continuous.

Relatively-MIC- β - r -continuous functions

Definition 3.3.1

A function $f : (\mathcal{U}_1, \tau_1) \rightarrow (\mathcal{U}_2, \tau_2)$ is known as Relatively-MIC- β - r -continuous functions if for every $V_2 \in \text{MIC-R-O}(\mathcal{U}_2)$ and $f^{-1}(V_2) \neq \emptyset$ there exists $U_1 \in \text{MIC-O}(\mathcal{U}_1) \ni U_1 \neq \emptyset$ and $U_1 \cap f^{-1}(V_2)$.

Remark 3.3.2

Each relatively- r -continuous function is relatively- β - r -continuous but it is not necessary that the converse be true and its validation has been assured by the following counter example.

Example 3.3.3

Enable $\mathcal{U}_1 = \{p_1, q_1, r_1, s_1, t_1\}$ be a non-empty set with the Micro topology $\tau_1 = \{\emptyset, \mathcal{U}_1, \{t_1\}, \{p_1, q_1, r_1, s_1\}\}$, $\text{MIC-c}(x) = \{ \emptyset, \mathcal{U}_1, \{t_1\}, \{p_1, q_1, r_1, s_1\} \}$, $\mathcal{U}_1 R(X_1) = \{ \{p_1, q_1\}, \{r_1, s_1\}, \{t_1\} \}$, $X_1 = \{d_1\}$, and $I_1 = \{\emptyset, \{p_1, q_1, r_1\}\}, = \{t_1\}$, we obtain, consider $\mathcal{U}_2 = \{a_2, b_2, c_2, d_2, e_2\}$ with the Micro topology $\tau_2 = \{\emptyset, \mathcal{U}_2, \{a_2\}, \{a_2, b_2\}, \{a_2, e_2\}, \{c_2, d_2\}, \{a_2, b_2, e_2\}, \{a_2, c_2, d_2\}, \{a_2, c_2, d_2, e_2\}\}$, $\mathcal{U}_2 R(X_2) = \{ \{a_2\}, \{b_2\}, \{c_2, d_2\}, \{e_2\} \}$, $X_2 = \{a_2, d_2, e_2\}$, $I_2 = \{\emptyset, \{b_2\}\}$, The function $f : (\mathcal{U}_1, \tau_1) \rightarrow (\mathcal{U}_2, \tau_2)$ is defined by $f(p_1) = b_2, f(q_1) = c_2, f(r_1) = d_2, f(s_1) = e_2, f(t_1) = a_2$. Now we show that the function f is Relatively-MIC- β - r -continuous. For $V_1 = \{a_2, b_2, e_2\} \in \text{MIC-R-O}(\mathcal{U}_2)$ and $f^{-1}(\{a_2, b_2, e_2\}) = \{p_1, s_1, t_1\} \neq \emptyset$ and there exists $U_1 = \{p_1, s_1, t_1\} \in \text{MIC-O}(\mathcal{U}_1)$ $U_1 \neq \emptyset$ and $U_1 \cap f^{-1}(V_2)$. Similarly it has been verified that for the remaining $\mathcal{O}(X)$ of \mathcal{U}_2 there exist $U_1 \in \text{MIC-O}(\mathcal{U}_1)$ such that the condition $U_1 \cap f^{-1}(V_2)$ holds. Hence the mapping f is Relatively-MIC- β - continuous. Next, we show that the function f is not Relatively-MIC- β - r -continuous. For $V_2 = \{a_2, b_2, e_2\} \in \text{MIC-R-O}(\mathcal{U}_2)$, $f^{-1}(\{a_2, b_2, e_2\}) = \{p_1, s_1, t_1\}$, but there exists no $(U_1 \neq \emptyset) \in \mathcal{U}_1$, satisfying the condition $U_1 \cap f^{-1}(V_2)$. Therefore, the mapping f is not Relatively-MIC- r -continuous.

Remark 3.3.3

Each relatively-MIC--continuous function is relatively-MIC- β - r -continuous but the converse might not be essentially true. So as to support this statement, the subsequent example could be referred.

Example 3.3.4

Enable $\mathcal{U}_1 = \{5, 6, 7, 8\}$ be a non-empty set with the Micro topology $\tau_1 = \{\emptyset, \mathcal{U}_1, \{8\}, \{6, 7\}, \{6, 7, 8\}\}$, $\mathcal{U}_1 R(X_1) = \{ \{5, 8\}, \{6\}, \{7\} \}$, $X_1 = \{6, 7\}$, and $I_1 = \{\emptyset, \{6\}, \{7, 8\}\}$. consider $\mathcal{U}_2 = \{11, 12, 13, 14\}$ with the Micro topology $\tau_2 = \{\emptyset, \mathcal{U}_2, \{11\}, \{12\}, \{11, 12\}, \{11, 13, 14\}, \{13, 14\}, \{12, 13, 14\}\}$, $\mathcal{U}_2 R(X_2) = \{ \{11\}, \{12\}, \{13, 14\} \}$, $X_2 = \{11, 13\}$, $I_2 = \{\emptyset, \{13\}\}$, The function $f : (\mathcal{U}_1, \tau_1) \rightarrow (\mathcal{U}_2, \tau_2)$ is defined by $f(5) = 11, f(6) = 13, f(7) = 14, f(8) = 12$. Now we show that the function f is Relatively-MIC--continuous. For $V_2 = \{12\} \in \mathcal{U}_2$ and $f^{-1}(\{12\}) = \{8\} \neq \emptyset$ and there exists $U_1 = \{8\} \in \text{MIC-}\beta\mathcal{O}(\mathcal{U}_1)$ $U_1 \neq \emptyset$ and $U_1 \cap f^{-1}(V_2)$. Similarly, the condition $U_1 \cap f^{-1}(V_2)$ for all $V_2 \in \text{MIC-R-O}(\mathcal{U}_2)$ and for some $U_1 (\neq \emptyset) \in \text{MIC-}\beta\mathcal{O}(\mathcal{U}_1) \ni$ the condition $U_1 \cap f^{-1}(V_2)$ holds. Hence the mapping f is relatively-MIC- β - r - continuous. Next, we show that the function f is not Relatively-MIC- β - r -continuous. For $V_2 = \{11\} \in \mathcal{U}_2$, $f^{-1}(\{11\}) = \{5\}$, but there exists $U_1 (\neq \emptyset) \in \text{MIC-}\beta\mathcal{O}(\mathcal{U}_1)$ satisfy the condition $U_1 \cap f^{-1}(V_2)$. Therefore, the function f is not Relatively-MIC--continuous.

Bhavani and Josephine Rani

SOME IMPORTANT RESULTS

In this section, we have proved that for all \mathcal{U}_1 belonging to \mathcal{U}_1 , there exists a set B which is a member of $MIC-\beta O(\mathcal{U}_1)$ such that \mathcal{U}_1 belongs to B. Certain composite maps of various relatively functions have been also discussed.

Theorem 4.1 Let $(\mathcal{U}_1, \mathcal{U}_1)$ be the Micro topological space and $MIC-\beta O(\mathcal{U}_1)$ be the collection of $MIC-\beta$ -open sets. Then for each \mathcal{U}_1 belonging to \mathcal{U}_1 , there exists at least one $MIC-\beta$ -open set containing it.

Proof. Let \mathcal{U}_1 be a nonempty set with the Micro topology \mathcal{U}_1 (\mathcal{U}_1). The collection of open sets is $\{U\}_{\alpha \in K}$ and the collection F of closed sets is $\{V\}_{\delta \in k}$.

Now, we consider the following cases for the desired result.

Case I For each $\mathcal{U}_1 \in \mathcal{U}_1, \exists$ an index $\beta \in J$ such that $U \in \mathcal{U}_1$ (\mathcal{U}_1) and $\mathcal{U}_1 \in U$. We know that \mathcal{U}_1 (\mathcal{U}_1) $\subset MIC-\beta O(X)$. Hence, for each $\mathcal{U}_1 \in \mathcal{U}_1, \exists$ one $MIC-\beta$ -open set containing it.

Case II Let $\mathcal{U}_1 \in \mathcal{U}_1$ and $x \notin U$ ($\neq X$) for each $\alpha \in J$

Now, we construct $U \cup \{\mathcal{U}_1\} = W$ (say) (4.1)

We show that $W(\neq \mathcal{U}_1) \in MIC-\beta O(\mathcal{U}_1)$

For $V \in F$, if $W \subseteq \mathcal{U}_1(V) = \mathcal{U}_1$, where \mathcal{U}_1 is the smallest closed set containing W), then trivially $W \in MIC-\beta O(X)$. Next, we consider $W \subseteq V \in F$ (since, $V \subset \mathcal{U}_1$).

In view of Explication 2.5, it is enough if we show the following:

$$W \subseteq MIC-cl(MIC-Int(MIC-cl(W))) \quad (4.2)$$

Now, by construction, we have, $MIC-cl(W) = V$. By taking MIC -interior on both the sides, we have, $MIC-Int(cl(W)) = MIC-Int(V) = U$ (cf. relation (4.1))

Now, by taking MIC -closure on both the sides, we get,

$$MIC-cl(MIC-Int(MIC-cl(W))) = MIC-cl(U) = V.$$

Since, $W \subseteq V$, hence, relation (4.2) follows directly,

Finally, we conclude that W is a $MIC-\beta$ -open set containing $\mathcal{U}_1 \in \mathcal{U}_1$.

Remark 4.2

If functions $g: (\mathcal{U}_1, \mathcal{U}_1) \rightarrow (\mathcal{U}_2, \mathcal{U}_2)$ and $h: (\mathcal{U}_2, \mathcal{U}_2) \rightarrow (\mathcal{U}_3, \mathcal{U}_3)$ are $MIC-\beta$ -continuous then it is not necessarily true that $h \circ g$ is relatively $MIC-\beta$ -continuous function.

CONCLUSION

The concept of relatively- MIC -continuous function has been generalized in the form of relatively – MIC - r -continuous functions, relatively- MIC - β -continuous functions and Almost relatively - MIC -continuous functions. These relatively functions were further generalized in the context of MIC - regular open, $MIC-\beta$ -open sets. Finally, It is also proved that for all \mathcal{U}_1 belonging to \mathcal{U}_1 , there exists a set B that is a member of $MIC-\beta O(X)$ such that \mathcal{U}_1 belongs to B. In addition, various composite maps of relatively functions were discussed. We can extend the notion of relatively e - I -continuous

Bhavani and Josephine Rani

functions to define relatively ϵ - I -homeomorphism to obtain relatively ϵ -I-homeomorphic image of the Micro topological space $\mathcal{U}1$.

ABSTRACT

In the present world, some incidents have happened without anyone knowing beforehand. In this instance, industrial peoples and our entire human society (survival, health, etc.) are impacted in numerous ways. The most crucial daily necessity is transportation in particular. Therefore, we take into consideration the afore mentioned scenario in this research and examine the optimum range value of the neutrosophic translation problem. The goal of this paper is to build the transportation problem algorithm in a neutrosophic setting. There is an example provided.

Keywords: Neutrosophic, beforehand, algorithm, world, problem.

INTRODUCTION

In December 2019, a novel corona virus(COVID-19) was discovered in Wuhan, China, and has spread to different cities in China as well as many other countries day to day affected in this cases. Such a situation many countries had declared the lockdown and to taken the precatation measure for the purpose of controlled level. Such a cases, many country economic level are also decreased for particularly affected to the industry production and transporstation. For the uncertain situation Fuzzy set theory gives to the exact optimal solution. Many research has

Andal et al.,

declared various algorithms and results. But Fuzzy set theory failed to indeterminate or inconsistent information problem. To overcome of such problem Neutrosophic set has been derived from a new branch of philosophy, namely Neutrosophy. Neutrosophic set is capable of dealing with uncertainty, indeterminacy and inconsistent information. Neutrosophic set approaches are suitable to modeling problems with uncertainty, indeterminacy and inconsistent information in which human knowledge is necessary, and human evaluation is needed. Neutrosophic set theory was proposed in 1998 by Florentin Smarandache, who also developed the concept of single valued neutrosophic set, oriented towards real world scientific and engineering applications. Since then, the single valued neutrosophic set theory has been extensively studied in books and monographs introducing neutrosophic sets and its applications, by many authors around the world. Also, an international journal - Neutrosophic Sets and Systems started its journey in 2013. In neutrosophic logic a proposition has a degree of truth (T), a degree of indeterminacy (I), and a degree of falsity (F), where T, I, F are standard or nonstandard subsets of $] - 0, 1+ [$. Multi-objective linear programming problem (MOLPP) a prominent tool for solving many real decision-making problems like game theory, inventory problems, agriculture based management systems, financial and corporate planning, production planning, marketing and media selection, university planning and student admission, health care and hospital planning, air force maintenance units, bank branches etc. Neutrosophic theory was introduced by Smarandache [8]. Recently some author has stated results in Neutrosophic transportation model. Particularly, Thamaraiselvi and Santhi (2016) [10] proposed the approaches for solving neutrosophic transportation problem of Type I (transportation problem in which cost for transporting unit quantity of the product is represented as trapezoidal neutrosophic number, whereas availability and demands are represented as real numbers) and neutrosophic transportation problem of Type II (transportation problem in which cost for transporting unit quantity of the product, availability of a product, and demand of the product are represented as trapezoidal neutrosophic numbers). Thamaraiselvi and Santhi [10] pointed out that neutrosophic set [9], one of the extensions of fuzzy set, is used in different research areas. However, till now no one has used the neutrosophic set in transportation problems, while several researchers have used fuzzy numbers for representing various parameters of transportation problems [8]. In this paper, we proposed an algorithm to minimize the transportation cost on neutrosophic environment. A numerical example included.

Preliminaries

Definition

A fuzzy set \bar{A} in X is a set of ordered pairs $\bar{A} = \{(x, \mu_{\bar{A}}(x)) / x \in X\}$, where X is a collection of objects denoted generically by x and $\mu_{\bar{A}}(x): X \rightarrow [0,1]$ is called the membership function or grade of membership of x in \bar{A} .

Definition: Neutrosophic Set

Let X be a space of points with a generic element in X denoted by x . A neutrosophic set (NS) \bar{A}^N in X is characterized by a truth membership function $\mu_A(x)$, an indeterminacy membership function $\sigma_A(x)$ and a falsity membership function $\nu_A(x)$ and having of the form

$\bar{A}^N = \{ \langle x, \mu_A(x), \nu_A(x), \sigma_A(x) \rangle / x \in X \}$, Where $\mu_A(x), \nu_A(x)$, and $\sigma_A(x)$ are real standard or non-standard subsets of $] 0^-, 1^+ [$, i.e. $\mu_A(x): X \rightarrow] 0^-, 1^+ [$, $\nu_A(x): X \rightarrow] 0^-, 1^+ [$

$\sigma_A(x): X \rightarrow] 0^-, 1^+ [$, There is no restriction on the sum of $\mu_A(x), \nu_A(x)$, and $\sigma_A(x)$.

So, $0^- \leq \sup \mu_A(x) + \sup \nu_A(x) + \sup \sigma_A(x) \leq 3^+$.

Definition: Single-valued neutrosophic set [12]

Let X be a space of points with a generic element x in X . A single-valued neutrosophic set (SVNS) \bar{A}^N in X is characterized by $\mu_A(x), \nu_A(x)$, and $\sigma_A(x)$, and having the form $\bar{A}^N = \{ \langle x, \mu_A(x), \nu_A(x), \sigma_A(x) \rangle / x \in X \}$, Where $\mu_A(x): X \rightarrow [0,1]$, $\nu_A(x): X \rightarrow [0,1]$, $\sigma_A(x): X \rightarrow [0,1]$, With $0 \leq \mu_A(x) + \nu_A(x) + \sigma_A(x) \leq 3$ for all $x \in X$.

Proposed Algorithms

Step 1: Construct the Neutrosophic Transportation problem.

Step 2: Convert Neutrosophic cost value into Crisp value with the help of single valued function.

Andal et al.,

Step 3: Find the penalty cost for each row and each column

(It is difference between the smallest and next smallest cost value)

Step 4: Consider the maximum penalty value and allocate as much as possible in the lowest rank cell of the row or column chosen in the step (3)

Step 5: If the allocation is made fully to a row or column then the future consideration regarding ignore the entire row or column.

Step 6: continue the procedure for step (2) to step (5) until all the demands are satisfied.

The feasible solution thus obtained is the initial basic feasible solution.

Neutrosopic optimality test can be conducted to any NBFS of a NTP problem provided such allocation has exactly an $(m + n-1)$ non-negative allocation, where “m” is the number of origins and “n” is the number of destinations. Also these allocations must the independent positions- which is the optimality finding procedure that is given below

Step 7: Find the set of Neutrosopic numbers $u_i + v_i = c_{ij}$ for each occupied cells (i, j) received allocations.

Step 8: To start with zero Neutrosopic number to any row (or) column having maximum number of allocations. If the maximum number of allocations is more than one, and then choose any one arbitrary.

Step 9 : For each unoccupied cell (i, j), find u_i and v_j .

Step10: Calculate the net evaluation $z_{ij} = u_i + v_i = c_{ij}$. Then to find the S (N) of the net evaluation z_{ij} , this step gives the optimality conclusion is:

- (i) If $S(N) < 0$ for all (i, j), then the optimal allocation is made as it is a unique optimal solution.
- (ii) If $S(N) > 0$ for atleast one (i, j), then the solution is optimal but an alternate optimal solution exists.
- (iii) If $S(N) = 0$ for all (i, j), then the solution is not optimal.

Step 11: Select the un occupied cell having the most positive value of S (N). From this cell draw a closed loop path consists of successive horizontal and vertical segments whose corner cells are occupied cell which starts and ends at the designated unoccupied cell. This loop is unique and this process is summarized by positive and negative signs in the appropriate corners; this change will keep the supply and demand restrictions satisfied.

Step 12:The above step yield a better solution by making one (or) more basic cell as unoccupied cell. For the new set of NBFS allocation, repeat the above procedure from case (ii) step 1, until a NBFS obtained.

Numerical Example

Calculate the score value of each neutrosopic cost by the score function of the trapezoidal neutrosopic number to obtain the crisp transport problem.

Hence the minimum total neutrosopic cost is Minimize $= \sum_{i=0}^3 \sum_{j=0}^4 x_{ij} \bar{c}_{ij}^N$
 $= 3(3,5,6,8);0.6,0.5,0.4 + 23(5,8,10,14);0.3,0.6,0.6 + 14(0,1,3,6);0.7,0.5,0.3 +$
 $10(9,11,14,16);0.5,0.4,0.7 + 28(5,7,8,10);0.5,0.4,0.7 + 2(5,9,14,19);0.3,0.7,0.6 = (364,537,682,908);0.3,0.7,0.7$

RESULTS AND DISCUSSIONS

In the above Section, the neutrosopic optimum solution (488, 947.5 1586); 0.4, 0.8, 0.7 is better than the neutrosopic initial basic feasible solution. In the optimum solution, the total minimum transportation cost will be greater than 488 and less than 1586. And as the total minimum transportation cost lies in 947.5, the overall level of acceptance or satisfaction or the truthfulness is 30%. Also for the remaining values of total minimum transportation cost, the degree of truthfulness is $\mu(x) \times 100$ where x denotes the total cost and $\mu(x)$ is given by

$$\mu(x) = \begin{cases} 0.4 \left(\frac{x - 488}{947.5 - 488} \right) & \text{for } 488 \leq x \leq 947.5 \\ 0.4 \left(\frac{1586 - x}{1586 - 947.5} \right) & \text{for } 947.5 \leq x \leq 1586 \end{cases}$$

In the optimum solution, the degrees of indeterminacy and falsity are the same. Hence, degree of indeterminacy and falsity for the minimum transportation cost are

Andal et al.,

$$v(x) = \begin{cases} \frac{947.5-x+0.8(x-488)}{947.5-488} & \text{for } 488 \leq x \leq 947.5 \\ \frac{x-947.5+0.8(1586-x)}{1586-947.5} & \text{for } 947.5 \leq x \leq 1586 \end{cases}$$

$$\lambda(x) = \begin{cases} \frac{947.5-x+0.7(x-488)}{947.5-488} & \text{for } 488 \leq x \leq 947.5 \\ \frac{x-947.5+0.7(1586-x)}{1586-947.5} & \text{for } 947.5 \leq x \leq 1586 \end{cases}$$

respectively. Hence, a decision maker can conclude the total neutrosophic cost from the range 488 to 1586, with its truth degree, indeterminacy degree, and falsity degree. Based on the above result, he may schedule the transportation and budget constraints.

$$\mu_{\bar{a}}(x) = [x_L, x_U] = \left[\frac{\alpha(459.5)+195.2}{0.4}, \frac{634.4-\alpha(638.5)}{0.4} \right]$$

ABSTRACT

A graph G is said to be M modulo N Graceful then there is an one to one function f from the vertex set of G to $\{0, M, N, N + M, 2N, \dots, (q - 1)N, (q - 1)N + M\}$ and f induces a bijection f^* from edge set of G to $\{M, N + M, 2N + M, \dots, (q - 1)N + M\}$ where $f^*(u, v) = |f(u) - f(v)|$, for all $u, v \in V(G)$. In this paper, it is shown that H – class graph and $H_{(n)}^m$ graph are M modulo N graceful for all positive integers N and $M = 1$ to N and also its C programming algorithm is described.

Keywords: Graceful Labeling, M modulo N Graceful Labeling, H class graph, Algorithm

INTRODUCTION

Graph labeling is known as the vertices are assigned values subject to certain conditions that have been motivated by the practical problem. Labeled graphs serve as useful mathematical models for a broad range of applications such as coding theory, including the design of good radar type codes, missile guidance codes and convolution codes with optimal auto correction properties. Labeled graphs have also been applied in determining ambiguities in X-ray crystallographic analysis, design a communication network addressing system, determining optimal circuit layouts and radio astronomy problems etc. Graph labeling introduced by Rosa in 1967 and defined labeling of a graph G with q edges if f is an injection from the vertices of G to the set $\{0, 1, 2, \dots, q\}$ such that when each edge xy is assigned the label $|f(x) - f(y)|$, the resulting edge labels are distinct. The above said labeling is known as graceful and this is now a popular term [5]. Joseph A. Gallian, presented surveyed numerous graph labeling methods for various graphs

Velmurugan and Ramachandran

[1] and Golomb S. W, explained how to number a graph with examples [3]. Perumal etc. talked about and proved super graceful labeling for H-class of graphs[4]. Gnanajothi. R .B, discussed that one modulo 2 gracefulness of various graphs[2]. Ramachandran. V and Sekar. C are showed that one modulo N gracefulness of H - class of graphs and acyclic graphs [6, 8] and Sekar. C proved that one modulo 3 gracefulness of various graphs [7]. Velmurugan. C and Ramachandran. V, introduced M modulo N Graceful Labeling and showed that arbitrary supersubdivision of ladder graph, path union and join sum of complete bipartite graphs are M modulo N graceful with corresponding algorithms[9, 10].

In this paper, H – class graph and $H_{(n)}^m$ graph are M modulo N graceful for all positive integers N and $M = 1$ to N is showed and also its C programming algorithm is described.

M modulo N Graceful Labeling of H - Class Graph

Definition: 2.1 Let $P_1 (u_1, u_2, \dots, u_n)$ and $P_2 (v_1, v_2, \dots, v_n)$ be two paths of length n. The graph obtained by joining $u_{(n+1)/2}$ and $v_{(n+1)/2}$ (or $u_{n/2}$ and $v_{n/2+1}$), if n is odd (or even) is called as H - class graph of length n.

Theorem: 2.2 A H – class graph is M modulo N graceful for all positive integers N and $M = 1$ to N.

Proof: It is clear that H - class graph is bipartite. Hence the vertex set can be partitioned into two disjoint vertex sets say A and B having same cardinality such that every vertex in A is adjacent to atleast one vertex in B. Let $A = \{\alpha_1, \alpha_2, \dots, \alpha_n\}$ and $B = \{\beta_1, \beta_2, \dots, \beta_n\}$. And also H – class graph have 2n vertices and 2n – 1 edges.

Define M modulo N graceful labeling of vertices of H – class graph as follows:

$$f(\alpha_\tau) = (\tau - 1)N, \tau = 1 \text{ to } n.$$

$$f(\beta_\tau) = (2n - \tau - 1)N + M, \tau = 1 \text{ to } n.$$

From the definition of f, its clear that $\{f(\alpha_\tau), \tau = 1 \text{ to } n\} \cup \{f(\beta_\tau), \tau = 1 \text{ to } n\} = \{0, N, 2N, \dots, (n - 1)N\} \cup \{(2n - 2)N + M, (2n - 3)N + M, \dots, (n - 1)N + M\} = \{0, N, 2N, \dots, (2n - 2)N + M\} \subseteq \{0, M, N, N + M, \dots, (2n - 2)N + M\}$. Hence, vertices of H- class graph have distinct labels.

Define M modulo N graceful labeling of edges of H – class graph as follows:

$$f^*(e_i) = (2n - 1 - i)N + M, i = 1 \text{ to } n - 1.$$

$$f^*(e_n) = (n - 1)N + M,$$

$$f^*(e_{n+i}) = (n - 1 - i)N + M, i = 1 \text{ to } n - 1.$$

It is clear that $\{f^*(e_i), i = 1 \text{ to } n - 1\} \cup \{f^*(e_n)\} \cup \{f^*(e_{n+i}), i = 1 \text{ to } n - 1\} = \{(2n - 2)N + M, (2n - 3)N + M, \dots, nN + M\} \cup \{(n - 1)N + M\} \cup \{(n - 2)N + M, (n - 3)N + M, \dots, M\} = \{M, N + M, 2N + M, \dots, (2n - 2)N + M\}$. Hence, edges of H- class graph have distinct labels.

Therefore H – class graph is M modulo N graceful labeling for all positive integers N and $M = 1$ to N.

Example. 1 5 Modulo 6 graceful labeling of H – class graph.

Velmurugan and Ramachandran

Example. 2 6 Modulo 10 graceful labeling of H – class graph.

M modulo N Graceful Labeling of $H_{(n)}^{(m)}$ Graph

Definition: 3.1 The graph $H_{(n)}^{(m)}$ is obtained from the H- class graph by attaching m number of pendant vertices at each vertex on the two paths with n vertices, where m is fixed. Hence, graph $H_{(n)}^{(m)}$ has $2n(m + 1)$ vertices and $2n(m + 1) - 1$ edges.

Figure. 2 The graph $H_{(3)}^{(3)}$

Theorem: 3.2 A $H_{(n)}^m$ - graph is M modulo N graceful for all positive integers m, n and N where $M = 1$ to N.

Proof: It is clear that $H_{(n)}^m$ - graph is bipartite. Hence the vertex set can be partitioned into two disjoint vertex sets, say A and B having same cardinality. Let $A = \{ \alpha_1, \alpha_2, \dots, \alpha_{n(m+1)} \}$, $B = \{ \beta_1, \beta_2, \dots, \beta_{n(m+1)} \}$ and $H_{(n)}^m$ - graph has $2n(m + 1)$ vertices and $2n(m + 1) - 1$ edges.

M modulo N graceful labeling of vertices of $H_{(n)}^m$ - graph as follows:

$$f(\alpha_\tau) = (\tau - 1)N, \tau = 1 \text{ to } n(m + 1).$$

$$f(\beta_\tau) = (2nm + 2n - \tau - 1)N + M, \tau = 1 \text{ to } n(m + 1).$$

From the definition of f, it is clear that $\{f(\alpha_\tau), \tau = 1 \text{ to } n(m + 1)\} \cup \{f(\beta_\tau), \tau = 1 \text{ to } n(m + 1)\} = \{0, N, 2N, \dots, (nm + n - 1)N\} \cup \{(2nm + 2n - 2)N + M, (2nm + 2n - 3)N + M, \dots, (nm + n - 1)N + M\} = \{0, N, 2N, \dots, (2nm + 2n - 2)N + M\}$. Thus vertices of $H_{(n)}^m$ - graph have distinct labels.

M modulo N graceful labeling of edges of $H_{(n)}^m$ - graph as follows:

$$f^*(e_i) = (2nm + 2n - 1 - i)N + M, i = 1 \text{ to } n(m + 1) - 1.$$

$$f^*(e_{n(m+1)}) = (nm + n - 1)N + M.$$

$$f^*(e_{n(m+1)+i}) = (nm + n - 1 - i)N + M, i = 1 \text{ to } n(m + 1) - 1.$$

It is clear that $\{f^*(e_i), i = 1 \text{ to } n(m + 1) - 1\} \cup \{f^*(e_{n(m+1)})\} \cup \{f^*(e_{n(m+1)+i}), i = 1 \text{ to } n(m + 1) - 1\} = \{(2nm + 2n - 2)N + M, (2nm + 2n - 3)N + M, \dots, (nm + n)N + M\} \cup \{(nm + n - 1)N + M\} \cup \{(nm + n - 2)N + M, (nm + n - 3)N + M, \dots, M\} = \{M, N + M, 2N + M, \dots, (2nm + 2n - 2)N + M\}$. Hence, edges of $H_{(n)}^m$ graph have distinct labels.

Velmurugan and Ramachandran

Figure. 3 (i) $H_{(n)}^m$ – graph when n is odd and m is even and (ii) $H_{(n)}^m$ – graph when n is even and m is odd.

Therefore, $H_{(n)}^m$ - graph is M modulo N graceful for all positive integers m, n and N where $M = 1$ to N.

Example. 3 3 modulo 11 graceful labeling of $H_{(3)}^3$ - graph

Example. 4 4 modulo 7 graceful labeling of $H_{(4)}^2$ - graph

Velmurugan and Ramachandran

4. Algorithm for M modulo N graceful labeling of $H_{(n)}^m$ – graph

Algorithm: 4.1 C programming algorithm of M modulo N graceful labeling of $H_{(n)}^m$ – graph for all positive integers N and M = 1 to N.

In that algorithm put m = 0 we get on H - Class graph

```
#include<stdio.h>
int main()
{
int i,j,k,l,m,n,M, N,u[100],v[100],e[100];
clrscr();
printf("Enter m,n,N:");
scanf("%d %d %d",&m,&n,&N);
printf("m = %d, n = %d, N = %d",m,n,N);
for(M=1;M<=N;M++)
{
for(i=1;i<=n*(m+1);i++)
{
u[i]=N*(i-1);
v[i]=N*(2*n*(m+1)-i-1)+M;
if(i<=n*(m+1)-1)
{
e[i]=(2*n*(m+1)-1-i)*N+M;
e[n*(m+1)+i]=(n*(m+1)-1-i)*N+M;
}
}
e[n*(m+1)]=(n*(m+1)-1)*N+M;
printf("\n %d modulo %d graceful labeling on vertices:", M, N);
for(k=1;k<=n*(m+1);k++)
{
printf(",%d",u[k]);
}
for(j=1;j<=n*(m+1);j++)
{
```

Velmurugan and Ramachandran

```
printf(,"%d",v[j]);
}
printf("\n %d modulo %d graceful labeling on edges:", M, N);
for(l=1;l<=2*n*(m+1)-1;l++)
{
printf(,"%d",e[l]);
}
}
getch();
}
```

ABSTRACT

Acne vulgaris is the most common chronic inflammatory skin disease, affecting about 85% of young people globally. Recent studies have pushed the extraction of phytochemicals from plants as a means of treating acne; however, very few have examined the effects of these phytochemicals on the activity of the bacteria's transporters or enzymes. Therefore, the goal of this work is to determine the mode of action of a few anti-acne phytoconstituents that were extracted from *Curcuma longa* using a computational method. Swiss ADME was used in order to ascertain the selected phytoconstituents' physicochemical characteristics. The result shows that all the four compounds have a high potential as an antibacterial compound against MMP2 Receptor and less potential towards PPARA receptor.

Keywords: Acne, Turmeric, Curcumin, ADME, Molecular docking

INTRODUCTION

Acne vulgaris is the most common skin disorder that results from chronic inflammation of sebaceous follicles which is characterized by tender inflammatory papules and nodules. Acne typically appears on the face, forehead, chest, upper back, and shoulders because these areas of skin have the most oil (sebaceous) glands [1]. The pathogenesis of acne is multifaceted and includes inflammation, hyper colonization of bacteria like *Propionibacterium acnes* (*P. acnes*), hyperkeratosis, and hyper seborrhea [2]. Environmental and genetic variables are known to play a role in the

**Kinjal Rajendrakumar Patel and Manisha Chandrakant Kotadiya**

development or worsening of acne. Last many decades, oral and topical antibiotics have been the most effective therapy for acne treatment, by inhibiting the production of inflammatory factors but they produce a high incidence of side effects and symptoms, some of them also lead to skin dryness, peeling and skin irritation, or bacterial resistance. Thus herbs and naturally derived compounds, have received considerable interest as they have fewer adverse effects than synthetic agents [3-4]. Turmeric (*Curcuma longa*), a widely used spice throughout the world has a long history of use in Ayurvedic medicine for the treatment of inflammatory conditions [5]. Turmeric constituents include pale yellow to orange-yellow volatile oil (6%) made up of several monoterpenes and sesquiterpenes, such as zingiberene, curcumene, α - and β turmerone. The coloring agents (5%) are curcuminoids, of which 50–60% are a combination of curcumin, demethoxycurcumin, and bisdemethoxycurcumin [6, 7]. It possesses anti-inflammatory, antibacterial, antioxidant, and anti-neoplastic properties. Curcumin, one of turmeric's active ingredients, may be used medically to treat several dermatologic conditions, according to growing research [8, 9]. In the present study, we have selected four Phytoconstituents for ADME analysis and recognize the mechanism of action of four phytoconstituents obtained from *Curcuma longa* for acne treatment with the computational approach of phytochemical search, molecular docking simulation to predict the pocket region of the protein, and binding conformations of ligands with the receptor protein [10].

MATERIALS AND METHODS

Software and Tools [11]

Protein Data Bank (PDB), Pub Chem, SwissADME, Chem Draw Ultra 12.0, AutoDockTools- 1.5.7, Discovery Studio Visualizer v21.1.020298.

ADME and other pharmacokinetic properties

Based on Lipinski's rule of five (Lipinski 2004), the drug-likeness analysis was conducted [12]. A ligand's pharmacokinetic features called absorption, distribution, metabolism, and excretion (ADME) principally relate to how the ligand is absorbed, distributed, processed, and excreted by the body. For determining the pharmacological significance, SwissADME was used to generate the key parameter, Lipinski's rule of five [13, 14]. The ligands were converted from the PDB format to the canonical SMILES format and uploaded to SwissADME prediction.

Docking studies

Ligand preparation

The 2D and 3D structures of the Phytoconstituents were obtained from the PubChem database (<https://pubchem.ncbi.nlm.nih.gov/>) in SDF format. Discovery Studio Visualizer was used to convert the SDF file into a PDB file (Figure 1) [15].

Protein preparation

The protein was retrieved from Protein database (<https://www.rcsb.org/>) in PDB format (Figure 2). The retrieved PDB structures contain water molecules, heavy atoms, cofactors, metal ions, etc. and these structures do not have information about topologies, bond orders, and formal atomic charges. By eliminating all ligands, water molecules, and other heteroatoms from the structures, the target proteins were made ready. The atoms received hydrogen atoms to fulfill their valences. The CHARMM force field was then applied to the structures to eliminate steric conflicts between the atoms and achieve stable conformation. Receptor files in the PDB file format were converted to the PDBQT file format [16, 17].

Docking studies using AutoDockTools

Low-energy substances in the pdbqt format were simulated molecular docking with target proteins using AutoDockTools- 1.5.7. The docking procedure takes place in receptors with a box spacing of 1 Å. Because the molecules that interact are still flexible, this seeks to maintain the receptors stiff and the ligand flexible. The

**Kinjal Rajendrakumar Patel and Manisha Chandrakant Kotadiya**

interaction energy between the ligand and receptor for each binding site is used to calculate a binding affinity score (kcal/mol) [18, 19, 20].

Protein-ligand interactions

AutoDockTools- 1.5.7 software was employed to explain interactions between target receptors and ligands. 3D interactions were used to visualize docking result files. Receptor ligand interactions can assess intermolecular interactions, such as hydrogen and hydrophobic bonding types that attach to the receptor binding pocket's active side [21, 22].

RESULTS AND DISCUSSIONS

Turmeric root extract contains active compounds such as curcumin, demethoxycurcumin, bisdemethoxycurcumin, alpha turmerone that have antimicrobial and antibacterial activity. A drug-likeness test was conducted to determine the similarity properties of the drug in the four selected active compounds of *Curcuma longa*. Through this test, the potential of a compound as a drug candidate can be identified. The results of the drug-likeness test in Table 1 showed that four compounds of *Curcuma longa* extract have a molecular weight (MW) less than 500g/mol indicating all compounds comply with Lipinski's first rule which means it has the potential to be a drug candidate. Compounds with a small molecular weight will be easier to pass through the cell membrane. Conversely, if the molecular weight is more than 500 g/mol, it will cause molecular absorption to fail or the body will have difficulty being able to absorb it completely. Curcumin, demethoxycurcumin, bisdemethoxycurcumin, alpha turmerone have H-bond acceptors (HBA) <10 H-bond donors (HBD) <5 both of which met Lipinski's rules. The low number of H-bond acceptors and H-bond donors indicated that the energy required in the absorption of molecules is also low and vice versa. Log P indicates the lipophilic properties of a molecule; this property indicated the ability of a molecule to dissolve in fat. Molecules are categorized as having good lipophilicity if the Log P value < 4.15. The lower the log P value, the higher the hydrophilic properties of a molecule and lower the hydrophobic properties. Table 1 showed that all four active compounds of *Curcuma longa* comply with the Lipinski rule. Then it can be concluded that the four compounds have good lipophilic properties as drug candidates. A drug molecule can function properly if its hydrophobicity is not too high so that it can be widely distributed in the body. On the other hand, high Log P values are more hydrophobic. This causes drug compounds to tend to be toxic because they will be retained longer in the lipid bilayer so that they are less distributed in the body which results in the bond to the target enzyme being reduced.

Molecular docking is one of the in silico methods applied at several levels in drug development for three main purposes, namely, the search for new ligands, predicting the bond model of active ligands, and predicting their affinity and conformation. This method is one of the more concise and simple methods of approach. The results of molecular docking analysis were presented in Table 2. All Four compounds have the lowest binding affinity energy for MMP2 receptor. In addition, they also have an RMSD value of less than 1Å. The more negative the affinity energy indicates a more stable bond. It can be claimed that low-affinity energy suggests a molecule has a stronger ability to interact with the target protein because low affinity signifies a molecule takes less energy to bind. Likewise, the RMSD value was declared valid to use if the value < 2Å. The greater the RMSD value, the greater the deviation that occurs. The low RMSD value indicates that the docking ligand poses closer to the natural ligand pose. The lower the RMSD value the closer the position of the native ligand of the docking result to the native ligand of the crystallographic result. Thus, all the four compounds have a high potential as an antibacterial compound against MMP2 Receptor and less potential towards PPARA receptor. Important parameters in predicting the potential of a compound to the interacting target proteins (receptors) can be seen from the type of bond and amino acid residues at the binding site. Through the visualization stage, the type of bond and amino acid residue can be determined (Figure 3-7). The type of amino acid residue at the binding site with target proteins (CYP1A2, MMP2, PPARA, SELE, TNFRSF1A, MMP3) are shown in Table 3.

Kinjal Rajendrakumar Patel and Manisha Chandrakant Kotadiya

CONCLUSIONS

All the four phytoconstituents (curcumin, alpha turmerone, demethoxycurcumin, bisdemethoxycurcumin) have a high potential as an antiacne compound against MMP2 receptor. While curcumin, demethoxycurcumin, bisdemethoxycurcumin have less potential towards PPARA receptor and alpha turmerone has less potential as an antiacne compound against CYP1A2 receptor.

ABSTRACT

Kim Stanley Robinson, a prominent contemporary author, stands out for his meticulous exploration of climate change. With a body of works spanning nearly four decades and encompassing twenty novels, Robinson consistently delves deep into topics like social justice, political and environmental economy, and the potential for utopian ideals. Within his literary repertoire, *The Ministry for the Future* stands as an exceptional accomplishment. This novel is positioned in the foreseeable future, commencing a few years ahead and extending over multiple decades. It addresses the pressing issue of global warming and the strategies available to prevent an impending climate catastrophe. Amidst the challenges posed by climate change disasters, the importance of maintaining optimism and hope cannot be emphasized enough. These elements serve as powerful drivers for action, cultivate resilience, facilitate collaboration, enhance mental well-being, and ignite inspiration among future generations. Amidst the challenges posed by climate issues, these optimistic perspectives motivate both individuals and communities to actively pursue remedies, adjust to evolving situations, collaborate effectively, manage feelings of unease, and empower the younger generation to initiate transformative actions. While they might not offer distinct solutions, optimism and hope serve as essential drivers for fostering positive transformations and laying the foundation for a sustainable tomorrow. This article investigates the significance of maintaining optimism and hope in the face of climatic disasters, drawing inspiration from Kim Stanley Robinson's novel, *The Ministry for the Future*. The novel illustrates how these mindsets can act as potent stimulants for proactive engagement, spurring both individuals and communities to actively explore inventive remedies. Instead of succumbing to despondency, individuals are urged to acclimate to evolving situations and devise strategies to alleviate the impact of climate shifts. This united endeavor gains

**Swarna and Santhosh Kumar**

pivotal importance in constructing a sustainable tomorrow, fostering teamwork and harmonious interaction across a variety of factions.

Keywords: Climate change, Climate fiction, Catastrophe, Environmental change, Optimism, Postmodernism

Climate change is undeniably reshaping our world for the worst, leading to an increase in natural disasters and extreme weather events on a global scale. One alarming consequence is the rapid warming of our oceans, driving coral reefs to the brink of extinction and compelling marine life to seek refuge in cooler waters. Wildfires, growing in frequency and intensity, are blanketing vast regions in thick smoke, severely impacting air quality. Moreover, the unpredictability of weather patterns, such as El Niño, is on the rise. The occurrence of the global tsunami following the eruption of the Hunga Tonga-Hunga Ha'apai volcano in early 2022 served as a vivid illustration of the intricate interconnectedness of our planet. Drought-induced record-low river levels, devastating hurricanes, and cyclones have become distressingly common. These occurrences underscore the immediate necessity for resolute measures to address climate change and mitigate its extensive repercussions. The Paris Agreement, a pact endorsed by 195 nations in 2015, is a critical step toward limiting global temperature increases to well below 2 degrees Celsius. It seeks to expedite the peak of global emissions and subsequently attain a delicate equilibrium between human-generated emissions and the removal of greenhouse gases from the atmosphere, ultimately achieving "net zero emissions." The imperative to act on climate change has never been more pressing. In addition to the Paris Agreement, there has been a growing call for immediate and ambitious action from scientists, activists, and concerned citizens worldwide. Climate marches, youth-led movements, and environmental advocacy have gained momentum, pressuring governments and corporations to accelerate their efforts to reduce emissions, and moving towards transition to renewable energy sources, and implement sustainable practices. The consequences of inaction are stark, affecting not only ecosystems but also food security, human health, and global stability. As we have been witnessing the increasing frequency and severity of climate-related disasters, the need for a collective and sustained response becomes ever more apparent. It is a reminder that climate change is not a distant threat but a present reality that requires coordinated global efforts to mitigate its impacts and safeguard our planet for future generations.

Fiction serves as a potent catalyst for igniting awareness about climate change. Story telling engages readers and viewers on both emotional and intellectual levels, making the complex issue of climate change relatable and personal. Fiction explores the multifaceted dimensions of this challenge, from its environmental impacts to its social, political, and economic ramifications. It encourages audiences to connect with characters facing the consequences of environmental degradation, fostering empathy and a sense of shared responsibility. Climate fiction also sparks critical thinking, inspiring discussions and asks questions about ethics, human agency, and the path forward. By offering imaginative visions of the future potential solutions, it motivates individuals and communities to take initiatives. With its wide-reaching influence and capacity to shape public opinion, fiction plays a crucial role in driving awareness, bring policy changes, and make people to take collective efforts to combat climate change. Majority of the contemporary climate fiction tends to delve into climate catastrophe from a dystopian perspective, vividly portraying the grim visions of the future (Heise and Robinson 17). For instance, Cormac McCarthy's *The Road* (2006) paints a harrowing post-apocalyptic landscape where environmental decay has triggered societal collapse, forcing its characters into a desperate struggle for survival. Paolo Bacigalupi's *The Water Knife* (2015) unfolds in a future southwestern United States crippled by severe drought and water scarcity, where powerful factions tightly control access to water, leading to widespread violence and chaos. Octavia E. Butler's *Parable of the Sower* (1993) is set in a climate-ravaged America during the 2020s, marked by dwindling resources and societal unrest disintegrating once-stable institutions. These examples collectively highlight the prevailing trend in cli-fi literature, focusing on the darker consequences of environmental crises and the urgent need to attend to such crisis for change. In contrast, Kim Stanley Robinson's *The Ministry for the Future* takes a more optimistic and utopian approach by exploring practical solutions to collectively address climate change and its associated challenges.

**Swarna and Santhosh Kumar**

The first chapter of *The Ministry for the Future* depicts a disastrous and realistic weather event in excruciating detail. Recent scientific research indicates that human survival becomes unfeasible when exposed to a wet-bulb temperature exceeding 35 degrees Celsius, which measures the combined impact of heat and humidity (Raymond et al.). In a situation of extreme heat and humidity, human body reaches a point where it can no longer regulate its temperature effectively. Even individuals in good health, with access to water and shelter, themselves become unable to maintain a balanced body temperature. In the opening chapter of the novel, this scenario is envisioned in the Indian state of Uttar Pradesh, resulting in the unfortunate demise of 20 million people within a few days. At the story's outset, the impact of the climate crisis is witnessed through the perspective of an individual, Frank May, a central figure in the novel, confronting a perilous life-threatening situation. We perceive events through Frank's perspective: "The heat coming from it was palpable, a slap to the face. Solar radiation heating the skin of his face, making him blink. Stinging eyes flowing, he couldn't see much" (Robinson 1). This passage combines his visual impairment with its impact on his sense of touch. Subsequently, the influence of the high bulb temperatures on his respiratory system is evidenced: "The air, already bad, would soon be a blanket of exhaust. Like breathing from the exhaust pipe of an old bus. Frank coughed at the thought of it. . ." (Robinson 2). After the intense beginning, the novel delves into how people respond and what happens as they realize the pressing importance of dealing with climate change. The story revolves around two main characters. Frank May, an American aid worker based in India, is one of the rare survivors of the climatic catastrophe described in the initial chapter. Understandably, he suffers from Post Traumatic Stress Disorder (PTSD) and carries a heavy burden of guilt for having survived. Mary Murphy, the other protagonist, is an Irish politician appointed as the leader of *The Ministry for the Future*, a UN agency established to uphold the Paris Agreement and other global climate agreements. Not only is the agency underfunded and lacks the authority to deploy military or police forces in penalizing nations or corporations that disregard the agreements, but also it is handicapped in providing financial assistance to small-scale climate initiatives and exert moral influence on governments and financial institutions. *The Ministry for the Future*, unlike most of Robinson's previous novels, exhibits a more loosely structured narrative. While it consistently follows the journeys of Frank and Mary, it also presents a diverse array of perspectives and voices. Robinson's approach is different from the typical focus on individual middle-class experiences often seen in literary novels, even ones with elements of science fiction. Contrarily, the primary characters are deliberately depicted as ordinary and emblematic. The individual characteristics come to the fore through intricate interactions among the economic, social, political, and technological forces within their environment.

Apart from the initial catastrophic event encountered by Frank, the lives of Frank and Mary in general are relatively uneventful. A genuine dramatic essence is revealed through the occurrences that take place in their vicinity - incidents possessing worldwide consequences yet frequently unfolding on a local and modest scale. The narrative of the novel is composed of numerous succinct chapters, with an average length of approximately three pages. While a portion of these chapters presents third-person perspectives centered on Frank and Mary, the majority introduce diverse voices. These voices range from straightforward information dumps to descriptions of local occurrences presented in diverse and often collective perspectives, frequently using the pronoun "we" rather than "I." For instance, in chapter 88 of the novel, the collective voices of animals in the forest is presented in the following manner:

We are a herd made of individuals. We move in lines one after another. "The land we walk over is mostly water. When we walk on water we grow frightened and hurry to return to land. Some of us lead astray the stupid, others urge fools to rash adventures. If we follow the wrong leader we die. If we panic we die. . . . We are caribou, we are reindeer, we are antelope, we are elephants, we are all the great herd animals of Earth, among whom you should count yourselves." (443)

Within the novel, we are introduced to a diverse range of individuals and entities, including climate refugees who flee from developing nations that are devastated due to extreme climate events and seek refuge in Switzerland and the Western world, enduring years in refugee camps; engineers stationed in Antarctica, conducting experiments and exploring various techniques aimed at slowing down the glacial melting process; economists and lawyers advocating for the adoption of climate-friendly policies by the world's central banks; terrorist groups engaging in targeted

**Swarna and Santhosh Kumar**

assassinations of wealthy individuals, such as oil company executives, who bear direct responsibility for exploiting the climate for immediate financial gain; exploited workers who rise up against oppressive conditions akin to modern-day slavery in mining industry; and nonhuman entities like glaciers and photons contributing to climate crisis. The narrative encompasses the experiences and perspectives of these diverse characters and entities as they navigate the challenges and complexities of the climate crisis.

The copiousness of chapters within the novel enriches its expansive and multi-dimensional essence. Robinson skillfully manages various storylines without aiming at merging them into a tightly structured narrative. This approach mirrors the complexity and openness of the real world, which defies simplistic organization. *The Ministry for the Future*, paying homage to Fredric Jameson, offers a thoughtful solution to the challenges outlined by Jameson in his exploration of postmodernism years ago. It grapples with the task of granting individuals a heightened awareness of their position within the intricate and interconnected global system, which resists conventional modes of representation (Jameson 54). Robinson acknowledges the inherent limitations of capturing the experiential and cognitive complexities of the world system in its entirety. As a result, he presents us with multiple perspectives that are only loosely connected. Each perspective is rooted in specific yet incomplete experiences, but its impacts extend far beyond the immediate individuals involved. Throughout the novel detailed descriptions of local places and actions are provided, which carry implications that transcend immediate contexts. Instead of trying to make everything fit perfectly together, the novel has a disconnected structure. Robinson shows that a too carefully arranged and organized description is not enough. It is precisely the openness, expansiveness, and ongoing nature of the endeavor that renders science fiction writing the realism of our time, as Robinson asserts in his essays and interviews. Through its multiplicity, the novel grants us a heightened awareness of both the tangible reality and the boundless potentiality of our approaching social reality.

In a certain aspect, *The Ministry for the Future* serves as a practical handbook on how we can confront the devastating effects of global warming and prevent a catastrophic climate crisis. Unlike a lofty and idealized depiction of revolution, the novel approaches things differently. It thoroughly examines practical policies that can actually be put into action in our current world, providing valuable insights and producing important positive results. Through thoughtful discussions, the book presents actionable strategies that can make a meaningful difference in addressing the urgent challenges we face. The prospective policies encompass: implementing a blockchain-regulated "carbon coin" system where entities that effectively sequester carbon instead of emitting it receive financial rewards, including states, corporations, and individuals; exploring geo engineering techniques to enhance the reflectivity of Arctic waters, mitigating global heating once the inevitable melting occurs; conducting drilling operations in Antarctica to access liquid water beneath glaciers, reducing the amount of water trapped in ice form when extracted and refrozen on the surface; establishing rewilding corridors globally to support the growth of animal populations and facilitate the circulation of biotic products without releasing carbon into the atmosphere; replacing traditional gasoline-powered airplanes with airships (large helium- or air-filled balloons) and introducing new types of clipper ships that combine sail power with solar energy harnessed through photovoltaic cells; and transitioning from monopolistic private platforms such as Facebook and Google to a publicly owned Internet organization that safeguards the privacy of individuals.

While each of these technologies, representing various approaches, cannot individually prevent the climate catastrophe, using them together and fostering a supportive social environment for continued research and development can help reduce the worsening effects of global warming and potentially lessen its seriousness. Detailed explanations of these processes in the novel show that they can work within our current technology, society, and politics. Robinson is open about the fact that making these realistic policies happen will require not only large protests worldwide but also planned acts of environmental activism. A notable instance is the shift from conventional airplanes to environmentally friendly airships. The change is prompted by eco-terrorist drone attacks that instill fear in people about flying in regular planes. The novel portrays violence against big oil and gas companies caused by less wealthy nations as something reasonable and needed, a way to fight against imperialism and find a survival. However, the author, possibly is aiming more at readers from wealthier countries, concentrating

**Swarna and Santhosh Kumar**

on ways to change the core power structures, particularly the American financial and monetary systems. Amitav Ghosh's *The Great Derangement* conveys a perspective akin to this: "To look at the climate crisis through the prism of empire is to recognise, first, that the continent of Asia is conceptually critical to every aspect of global warming: its causes, its philosophical and historical implications, and the possibility of a global response to it" (87). Additionally, the novel indicates that influencing central bankers, who wield significant power on global matters, involves a mix of pressure, persuasion, and coercion. They will be motivated to guide the world's economies toward more favorable arrangements when they realize that continuing with current policies will lead to a global economic collapse and currency devaluation.

Filled with authentic scientific examples and principles, *The Ministry for the Future* presents a scientifically grounded and thought-provoking exploration of the worldwide climate crisis and potential solutions. Kim Stanley Robinson, has extensively incorporated real scientific examples and concepts into the novel. Robinson's narrative is firmly rooted in scientific realism, and he draws upon current scientific understanding of climate change, ecology, economics, and technology to construct a compelling and plausible vision of the future. This integration of scientific principles and ideas is the central aspect of the novel, helping to make the global climate crisis and its potential solutions comprehensible and accessible to readers. Throughout the novel, Robinson refers scientific phenomena and theories, such as the impact of greenhouse gas emissions on global temperatures, the consequences of melting glaciers and rising sea levels, and the potential for geoengineering projects to address climate issues. These scientific elements are woven into the narrative to provide a firm foundation for the speculative aspects of the story. Moreover, the novel explores various technological solutions and innovations, often rooted in real-world scientific research. Examples include the use of AI technology to enhance sailships, the concept of carbon quantitative easing, and the development of sustainable energy sources. These elements are presented in a way that aligns with current scientific debates and discussions surrounding climate change mitigation.

Engaging with central banks aside, Mary actively shapes the decisions of leaders in fossil fuel corporations. The early stages of the narrative provide readers with a depiction of the top-ranking figures steering the fossil fuel industry. This portrayal sets the scene for her subsequent encounters with leaders working in this industry. After an informative note that elucidates how humanity currently consumes 40 gigatons of fossil carbon annually (Robinson 27) and underscores the calculation that permits only an additional 500 gigatons of consumption in total before breaching a 2-degree Celsius increase in the average global temperature compared to pre-industrial levels, the novel goes on to provide a succinct depiction of corporate executives:

They will be good people. Patriotic politicians, concerned for the fate of their beloved nation's citizens; conscientious hard-working corporate executives, fulfilling their obligations to their board and their shareholders. Men, for the most part; family men for the most part: well-educated, well-meaning. Pillars of the community. Givers to charity. . . They will want the best for their children. (30)

In a profoundly impactful way, *The Ministry for the Future* tells an optimistic story. It believes that those in charge of the capitalist system can be convinced to make the changes needed to save humanity from disaster. Rather than advocating for revolution, the novel takes a reformist stance, recognizing the unyielding grip of corporates but offering the prospect of social transformations that may partially reduce its influence and affluence. This hopeful vision seeks to avert what Marx and Engels referred to as "the common ruin of the contending classes" (36). The novel also presents the hope of international progress. By referring a little about the United States, the novel suggests that the conditions there are so irreparably degraded and bleak. However, it highlights positive ecological endeavors at the state level, particularly in California, which holds significance in many of Robinson's works. Although Robinson envisions the catastrophic flooding of Los Angeles, he also visualizes a progressive California that leads the way in rewilding initiatives, despite opposition from the federal government.

However, in the novel's perspective, other parts of the world fare significantly better than the United States. In many European countries, even though right-wing, anti-immigrant parties continue to exist after four decades, they are unable to take control or disrupt the enlightened internationalism that has its origins in Europe's more progressive

**Swarna and Santhosh Kumar**

traditions. In short, *The Ministry for the Future* presents an optimistic scenario, albeit not without its challenges. Even though there are problems and violent incidents, when the novel ends, it seems like the world has avoided a climate catastrophe, although the improvements made are still delicate. In the global scenario, ongoing hard work and international solidarity are imperative for the foreseeable future, given the precarious environmental and social situations. While the ultimate salvation of the world is not guaranteed, the worst-case scenario has been temporarily averted. This kind of hopeful speculation serves as a necessary counterbalance to the prevailing trend of dystopian narratives.

The Ministry for the Future is considered offering the best-case scenario, but it must be acknowledged that if events in the near future do not unfold favorably, the consequences could be dire. The novel emphasizes that it is highly improbable for all the necessary factors to align as depicted within its narrative. While it showcases the potential for a better and achievable world using existing resources and technologies, it is difficult to ignore the realization that without these politically challenging advancements, the situation is indeed bleak and hopeless.

ABSTRACT

Antibiotic resistance has emerged as a pressing global health concern that demands immediate attention. Historically, antibiotics have been instrumental in combating various infectious diseases caused by pathogenic bacteria. However, the current rapid rise in antibiotic resistance is alarming, primarily due to the misuse and indiscriminate application of antibiotics across ecosystems and communities. The synthesis of new antibiotics has failed to keep pace with the emergence of increasingly virulent and resistant bacterial strains. Among the potential solutions to this challenge, nanoparticles have shown significant promise as both delivery systems and nanoantibiotics. This review explores the use of nanoengineered systems to overcome antibiotic resistance, providing insights into the interactions between bacteria and nanomaterials. Growing evidence supports the application of nanoantibiotics as an alternative strategy for treating clinical infections, potentially mitigating the reliance on conventional

**Naresh Kumar Nirmal et al.,**

antibiotics. The review highlights the current progress, challenges, and future directions in the development of nanomaterials for combating antibiotic resistance. By examining the potential of these innovative approaches, this review aims to contribute to a better understanding of how nanotechnology can be harnessed to address the urgent problem of antibiotic resistance.

Keywords: Antibiotic resistance, Nanoparticles, Nanoantibiotics, Nanomaterials, Bacterial infections,

INTRODUCTION

Nanomaterials (NMs) and nanostructures, having dimensions in nano-range (1-100 nm), exhibit unconventional properties and have found extensive applications in various fields, such as electronics, catalysis, textiles, and biomedicine. Biomedical applications of nanotechnology include targeted drug therapy, diagnostics, tissue regeneration, cell culture, and biosensor development [1,2]. One emerging application of special significance is the use of NMs with antimicrobial properties, often referred to as 'nAbts' [3]. Rise of antibiotic resistance has seriously limited the use of popular antibiotics. Combating multidrug resistance with traditional antibiotics is becoming increasingly challenging. Therefore, searching for more effective alternatives has become a top priority [4]. The use of NMs as antibiotics, conveniently termed nanoantibiotics (nAbts), has emerged as a potential solution to address the challenge of antibiotic resistance. Studies have demonstrated that nAbts possess remarkable biocidal properties against various pathogenic and non-pathogenic bacterial strains. Various metal oxide nanoparticles have been reported to exhibit broad-spectrum antimicrobial activity [5]. Silver based nanoparticles (Ag-NPs) are already established as potential nanoparticles and these are being utilized in various drugs and consumer products [6]. Despite a very effective demonstration of antibacterial effect, *in-vivo* use of NMs is considerably less popular in current scenarios owing to various reasons which will be discussed in this review. Broadly, there are two potential approaches to develop antibacterial nanomaterials. The first approach involves NMs possessing inherent bactericidal properties, while the second approach combines NMs with conventional antibiotics to enhance their effects [7]. In this review, we critically discuss the features, types and properties of potential NMs and nanostructures which act as antibiotic agents. We also present recent studies demonstrating the effectiveness of nAbts and various approaches against resistant bacterial strains. Finally, we explore the future directions to overcome the challenges in the development of effective nAbts.

FEATURES OF NANOANTIBIOTICS

Nanoantibiotics offer several advantages over conventional antibiotics, making them more effective in combating drug resistant bacteria. The physico-chemical features of NMs, like size, shape, surface area, aqueous dispersibility, functional group chemistry all play crucial roles in the design of nAbts. Nanoparticles are inherently small, with dimensions ranging from 1-100 nm, which endow them with novel structural, electronic, and optical properties [8]. Their small size allows them to penetrate bacterial cell walls and membranes more efficiently than conventional antibiotics, potentially leading to higher efficacy. In a recent investigation conducted by Osonga et al. 2020, the effectiveness of luteolin tetraphosphate (LTP) synthesized AgNPs and gold nanoparticles (AuNPs) in combating bacteria and fungi was evaluated [9]. The nanoparticles were synthesized with varying shapes and sizes, wherein the LTP-AgNPs exhibited better results in comparison to the LTP-AuNPs. The study also conclusively demonstrated that smaller sized particles with quasi-spherical shape possessed stronger effects against tested microbes. It reflects the impact of type of functional group, nature and size of nanoparticles on efficacy of nAbts. Nanoparticles come in various shapes, such as spheres, discs, hemispheres, cylinders, tubes, cones, and wires. These diverse shapes can influence the interaction between nAbts and bacteria, potentially enhancing their antimicrobial properties [10]. One of the advantages that nanoparticles offer is their high surface area. The extremely small size of nanoparticles leads to an exponential increase in surface area, which in turn results in a greater proportion of atoms localizing on the particle's surface compared to the core. This makes nAbts more reactive than conventional antibiotics, increasing their ability to interact with and disrupt cellular and subcellular structures [11]. The design and small size of

**Naresh Kumar Nirmal et al.,**

nanoparticles enable them to cross physiological barriers for effective delivery of various drugs. For example, AgNPs cause noticeable damage to bacterial cell membranes at sublethal concentrations. The increased penetrance inside the bacterial cells also leads to the synergistic and additive effects of combining AgNPs with certain antibiotics, such as kanamycin and chloramphenicol, helping to combat antimicrobial infections more efficiently [12]. Nanoparticles can be functionalized to enhance their water dispersibility. Non-polar poorly soluble drugs can be conjugated with nanoparticles. Suitable functional groups can then be added to these conjugate nanomaterials for enhanced solubility [13]. Improved solubility can enhance the bioavailability of antibiotic agents, increasing their effectiveness against bacterial infections. Nanoantibiotics can also be designed to carry multiple therapeutic agents, allowing for the simultaneous delivery of different antibiotics or the combination of antibiotics and other antimicrobial agents. This multifunctionality can improve treatment efficacy and potentially reduce the likelihood of bacteria developing resistance. A recent study has revealed that the effectiveness of AuNPs against microbes is heavily influenced by their surface characteristics. By producing AuNPs with a range of cationic functional groups, including different lengths of chains and aromatic properties, the researchers found a strong correlation between structure and activity. The study demonstrated that hydrophobic AuNPs were more successful in inhibiting *E. coli* growth, with the most hydrophobic nanoparticle, AuNP-3 (which had an n-decane end group), being able to prevent *E. coli* proliferation at a concentration of only 32 nM. [14]. This facile functionalization also allows the design of nanostructures which can mediate controlled and sustained release of the antibiotic agents, maintaining therapeutic concentrations over an extended period. This feature can improve treatment efficacy, reduce the frequency of administration, and minimize potential side effects associated with high antibiotic doses [15].

Targeted delivery can increase the selectivity and effectiveness of the antibiotic agents while minimizing collateral damage to the host's healthy cells and microbiota [16]. Nanoantibiotics can be designed with adaptive properties that enable them to respond to changes in the local environment, such as pH, temperature, or the presence of specific bacterial biomarkers. These adaptive features can enhance the antimicrobial activity of nAbts under specific conditions, ensuring optimal performance in the infection site [17]. Combining nAbts with other antimicrobial agents or treatment strategies, such as photodynamic therapy or antimicrobial peptides, can result in synergistic effects. These combinations can enhance the overall antimicrobial activity and overcome the limitations of individual agents, providing a more effective approach to combat antibiotic-resistant bacteria [18]. Due to their unique properties, nAbts can potentially act through multiple mechanisms, such as disrupting bacterial cell membranes, inhibiting enzymes, or interfering with bacterial communication. This multi-targeted approach can make it more challenging for bacteria to develop resistance, as they would need to simultaneously acquire resistance mechanisms against multiple modes of action [11]. Overall, these features further highlight the potential advantages of nAbts over conventional antibiotics, offering innovative and promising solutions to address the growing problem of antibiotic resistance.

MECHANISM OF ACTION

Nanoantibiotics represent a new avenue for combating antibiotic resistance. Researchers have proposed that bacteria cannot develop resistance against nAbts due to their multiple mechanisms of action. A single nanoparticle can act via different ways. Nanoparticles can physically adsorb and damage cell wall and membrane, inhibit enzymes, prevent DNA replication, lead to generation of reactive oxygen species (ROS) and reactive nitric oxide (NO). Further, nAbts may interrupt the transmembrane electron transport chains to impair energy transfer, and release of heavy metal ions with harmful effects [19]. Nanoantibiotics can inhibit the function of crucial enzymes and disrupt DNA synthesis in bacterial cells. By targeting enzymes responsible for cell division, replication, and essential metabolic pathways, nAbts hinder bacterial growth and proliferation. For example, AgNPs have been shown to bind with bacterial DNA, interfering with replication and transcription processes, ultimately leading to cell death. The study by Keskin et al. aimed to synthesize AgNPs using chestnut honey (CH) at different temperatures (30, 60, and 90 °C) and investigate their antioxidant, enzyme inhibition, and antibacterial properties. The results revealed that as the temperature increased during the green synthesis process, the nanoparticle sizes decreased, ranging from 55 nm to 27 nm. Furthermore, a decrease in particle size led to an increase in the inhibition rates of myeloperoxidase (from 34.0% to 36.4%) and collagenase enzymes (from 68.7% to 74.2%). These findings suggest that smaller CH-AgNPs

**Naresh Kumar Nirmal et al.,**

have a stronger enzyme inhibitory effect on bacteria [20]. Nanoantibiotics can induce the generation of ROS and reactive NO in bacterial cells. These highly reactive molecules can cause oxidative stress, damaging cellular components like proteins, lipids, and nucleic acids. This oxidative damage can lead to a loss of cell function, structural integrity, and eventually cell death. For instance, metal oxide nanoparticles, such as zinc oxide and titanium dioxide, are known to generate ROS, causing oxidative stress and bacterial cell damage [21]. They can interact with the bacterial cell membrane or cell wall, causing structural damage and compromising its integrity. This interaction can lead to the leakage of cellular contents, increased membrane permeability, and ultimately cell lysis. Some nanoparticles, such as AgNPs and AuNPs, are known to interact with the negatively charged bacterial cell membrane, disrupting its function and causing cell death [22,23] They can interfere with the bacterial electron transport chain, a vital process for energy production in cells. By disrupting the flow of electrons across the membrane and inhibiting the generation of adenosine triphosphate (ATP), nAbts deprive bacterial cells of the energy required for growth and survival. For example, some metal nanoparticles, such as copper and silver, have been reported to interact with the electron transport chain, causing dysfunction and energy depletion in bacterial cells [24]. Some nAbts, particularly metal-based nanoparticles, can release heavy metal ions that have toxic effects on bacterial cells. These ions can bind to cellular components like proteins and enzymes, disrupting their function and causing cellular damage. In addition, the released ions can trigger the production of ROS, further exacerbating oxidative stress and cell damage. For instance, silver nanoparticles can release silver ions, which can bind to bacterial proteins, disrupt cellular processes, and lead to cell death [25].

CURRENT PROGRESS

Indiscriminate use of antibiotics has led to a situation where most antibiotics are rendered ineffective. This phenomenon is expected to increase in magnitude in coming years. Therefore, it requires urgent attention [26,27]. In order to tackle the issue, there is a pressing need to develop antibiotics that are efficient against many bacterial targets, have the capacity to impair pathogen resistance systems, and are less likely to result in the establishment of multi-drug resistant (MDR) infections [28]. Nanoantibiotics are a promising solution due to their distinct pharmacokinetic and dynamic properties that enable efficient medication administration to the target region. They can also serve as nano-carriers, ensuring the general efficacy and safety of antibiotics. The unique physicochemical properties of nAbts enable them to overcome multidrug resistance and act in novel and multiple pathways. For instance, nAbts can connect with microbial cellular membranes and rupture their integrity, leading to the release of cytoplasmic components [29]. After entry into the cell, nAbts may bind with biomolecules like DNA, enzymes and disrupt the cellular functions. Inhibition of these vital physiological processes results in an electrolyte imbalance, oxidative stress, and cell death. Silver-based nAbts, for instance, release Ag⁺ which disrupt microbial membranes which impairs electron transport and leads to DNA damage, culminating in cell death. Copper-based nAbts, on the other hand, release Cu²⁺, interfere with bacterial metabolism and lead to oxidative damage. Similarly, TiO₂ and ZnO-based nAbts also mediate their effects via oxidative damage. Metal-based nAbts have been reported to possess strong affinity for phosphorus and sulfur-containing biomolecules. It is also reported that nAbts also hinder microbial cell signalling by blocking the dephosphorylation of proteins specifically on tyrosine residues [30].

Various recent studies have highlighted the effectiveness of nAbts in combating antibiotic-resistant bacteria. Dzuvor et al. 2022, engineered protein-only nanoparticles against resistant Gram-positive bacteria, specifically methicillin-resistant *Staphylococcus aureus* (MRSA) strains. The engineered endolysin nanoparticles demonstrated significantly increased antibacterial effect when compared to monomeric protein molecules [31]. Hetta et al. 2023 conducted a comprehensive review on the advances in nanotechnology for combating multidrug-resistant bacteria and biofilm infection. The study highlighted the development of nanomaterial-based therapeutics and the difference between free antibiotics and nAbts [32]. Abeer Mohammed et al. 2022 investigated antibacterial efficacy of AgNPs which showed that the minimum inhibitory concentration was 1 mg/ml against multidrug-resistant bacteria [33]. Haji et al. 2022 tested AgNPs synthesized using biological materials against carbapenem-resistant Gram-negative bacilli. The group also used a combination of carbapenem and AgNPs. The study clearly demonstrated the synergistic action against the resistant bacteria [34]. Piktel et al. 2022 conjugated AuNPs with N-acetyl-L-cysteine (NAC) to derive Au-NAC. Au-NAC had significantly higher antibacterial effect against biofilm producing *Pseudomonas aeruginosa* [35].

Naresh Kumar Nirmal et al.,

Similarly, Diksha et al. 2023 synthesized AuNPs from leaf extract of *Syzygium cumini* and tested their antibacterial potential against multidrug-resistant urinary tract pathogens [36]. Patwekar et al. 2022 capped silver nanoparticles with vancomycin to enhance the antibacterial potency against both *Staphylococcus aureus* and *Escherichia coli* [37]. Apparently, several nAbts have been shown to be effective against MDR bacteria, but not with limitations. Nano-based antibiotics may have narrow-spectrum activity and may also cause toxicity to non-target cells. Therefore, there is great scope to improve their surface chemistry to overcome these limitations [38]. Following description presents a thorough discussion of progress in the field for various prominent nanoparticles.

SILVER NANOPARTICLES

Antibacterial effects of AgNPs are well established [39]. Research has shown that silver nanoparticles have the strongest antibacterial activity when compared to other metal nanoparticles [40]. AgNPs can act as potent bactericidal agents due to their small size and large surface area, which facilitate the release of silver ions (Ag⁺), interaction with lipids and proteins, and DNA damage and generation of ROS that all combine to produce profound toxicity to the bacteria [41,42]. Owing to strong bactericidal properties, AgNPs are variously used to prepare antibacterial and deodorant fabrics, nanogels, and nanolotions, as well as for the healing of burns, surgical masks, medical instrument coatings, and ointments [43,44]. Latest research in the field has shown promising use of AgNPs based drug conjugates against drug-resistant bacteria. In one study, AgNPs synthesized using carbapenem-degrading *Acinetobacter baumannii* were tested against other similar carbapenem resistant bacteria. The study demonstrated that the combination of Ag NPs and antibiotics showed significant reduction in antibiotic concentrations against the bacteria [34]. In another study, AgNPs were conjugated with the antibiotic ciprofloxacin (CIP) and poly-ethylene glycol (PEG). These PEGylated conjugates exhibited remarkable inhibitory effects of Gram-negative and Gram-positive pathogens. The approach offers the additional advantage of higher aqueous solubility and lesser side effects due to PEGylation [45]. A similar conjugate was created by Patwekar et al. 2022. The group conjugated AgNPs with vancomycin. Antibacterial effects improved significantly in the study. Another important development in this regard is the innovative synthesis approaches [37]. Researchers are using diverse biological source materials during the synthesis procedure. Several microorganisms and plants have been used for the production of silver nanoparticles such as *Pseudomonas rhodesiae* [46], *Stenotrophomonas sp* [47], *Aspergillus niger* [48], *Penicillium duclauxii* [49], *Piper nigrum* [50], *Citrus maxima* [51], and *Artemisia absinthium* [52]. In a recent study 'biomass-free filtrate of *Aspergillus flavus*' was used for the synthesis of AgNPs. The particles showed very good broad-spectrum activity against all tested bacterial strains. Moreover, considerable synergistic effect was also observed with various antibiotics [53].

CHITOSAN NANOPARTICLE

Significant antibacterial activities have been demonstrated for chitosan (-N-acetylglucosamine) and its nanoscale derivatives [54]. Chitosan (CS), a cationic polymer that is degradable, is created by partially acetylating chitin. The mechanism of action of CS is based on the electrostatic interaction between the negatively charged cell wall polymers and the polycationic chitosan macromolecule [55]. It has been demonstrated that these particles have better antibacterial action against gram-positive bacteria as compared to gram-negative bacteria. The antibacterial action of CS is highly influenced by molecular weight, organism type, pH, degree of polymerization, and other factors, such as the microbial surface's lipid and protein content [54]. Additionally, chitosan causes the chelation of metals in minute levels, which prevents enzyme function and microbial development. Chitosan nanoparticles (CNPs) have advantage of being highly biocompatible. Due to its safe nature, it is being widely used as a bioadhesive polymer to treat the oral mucosa because of its biologically safe nature [56]. One limitation of CNPs is their less water solubility [57]. Efforts to improve the solubility and efficacy, CNPs are being synthesized using biogenic sources. These CNPs exhibit rich functional group chemistry which enhances the solubility and antibacterial effect. For instance, El-Naggar et al. 2022 biosynthesized CNPs using the aqueous extract of fresh *Eucalyptus globulus Labill* leaves as a bio-reductant. The biosynthesized CNPs had positively charged surface moieties. The CNPs were also found to exhibit antibacterial activity against pathogenic multidrug-resistant bacteria, *Acinetobacter baumannii* [58] Another approach is to combine various antibiotics with CNPs. β -lactam antibiotic-loaded CNPs, for instance, are substantially more

Naresh Kumar Nirmal et al.,

effective at inhibiting growth of MRSA strains of *Staphylococcus aureus* [59]. Additionally, iron-loaded CNPs exhibited antimicrobial effects on *E. coli*, *S. aureus*, *Candida albicans* [60].

COPPER OXIDE NANOPARTICLES

The use of copper-containing nanoparticles as antimicrobial coatings has been demonstrated to inhibit the growth of MDR biofilms and be effective against bacteria. Cu₂O nanoparticles (CuO-NPs) create holes in bacterial cell membranes [61]. The release of metallic ions by CuO-NPs produces ROS, which can accelerate DNA damage. The entry of CuO-NPs inside the bacteria affects metabolic processes such as nitrogen metabolism, active transport, and electron transfer [62]. Kruk et al. 2015 found that copper NPs were successful in preventing the growth of MRSA and *Pseudomonas aeruginosa* [63]. Zhang et al. 2019 observed a significant synergistic antibacterial activity against *E. coli* when CuO-NPs were conjugated with aminoglycoside antibiotics. The inhibition zone area increased by 59% when CuO-NPs were combined with neomycin [61]. Researchers have recently used CuO-NPs to create nanocomposites with superior activity. For instance, Umoren et al. 2022 synthesized chitosan-copper oxide (CH-CuO) nanocomposites using olive leaf extract (OLE) as a reducing agent and copper sulphate as a precursor. The nanocomposite significantly inhibited bacterial growth [64].

ZINC OXIDE NANOPARTICLES

Zinc oxide nanoparticles (ZnO-NPs) have antimicrobial properties and can kill various bacteria and fungi. Like Ag NPs, ZnO-NPs induce the production of free radicals, which trigger cell death. They might even compromise the integrity of the bacterial cell membrane, causing leakage and eventual bacterial death. Cao et al. 2019b found that ZnO-NPs can arrest *Streptococcus pneumoniae* from producing biofilms at low concentrations (as low as 12 g/mL). ZnO-NPs can damage oral biofilms in multiple ways, including disrupting EPS and separating individual bacteria from the biofilm, inducing the production of ROS, and interacting with DNA and enzymes to impair their normal function [65]. Furthermore, Agarwal et al. concluded that in addition to blocking or inhibiting the zinc ion efflux pump, zinc oxide nanoparticles also aid in increasing local zinc ion concentration in a vulnerable condition [66]. Zinc oxide nanoparticles also have the potential to prevent the formation of biofilms caused by uropathogenic *E. coli* strains. Recent studies show that the shape of ZnO-NPs can influence the antibacterial activity. ZnO-NPs in the shape of nanorods exhibited stronger antibacterial activity against *E. coli* and *S. aureus* [67]. There is a great scope for designing better, safer and improved nanocomposites of ZnO-NPs that can be employed against drug resistant bacteria.

IRON OXIDE NANOPARTICLES

In the biomedical field, iron oxide is known for its biocompatibility and magnetic qualities. Recent research has revealed that reduced iron and iron oxide nanoparticles (IONPs) have antibacterial capabilities that break down bacterial membranes and instigate oxidative stress within the cell thereby killing bacterial cells [68]. In relation to this, Taylor et al. found that *Staphylococcus* and antibiotic-resistant biofilms can be effectively inactivated by IONPs [69]. IONPs have recently gained attention as potential antibiotic agents against antibiotic-resistant bacteria. Several studies have reported the development and investigation of IONPs and their conjugates for their antibacterial efficacy against various bacterial strains, including *Staphylococcus aureus*, *Escherichia coli*, and other multidrug-resistant bacteria. Guo et al. 2022 synthesized IONPs that were safe, had good photothermal sensitivity and catalytic activities. IONPs catalysed formation of hydroxyl free radicals from H₂O₂ under an acidic environment. This activity was enhanced at increased temperature. The IONPs showed a very strong antibacterial effect against *E. coli* and *S. aureus*, promoting wound healing in mice [71]. Sharaf et al. 2022 developed rhamnolipid-coated Fe₃O₄ nanoparticles combined with p-coumaric acid and gallic acid antimicrobial drugs using polyvinyl alcohol as a coating. These nanoparticles showed significant inhibition of bacterial growth and biofilm formation in *S. aureus* and *E. coli*, suggesting they could be potential multitarget antivirulence candidates [72]. Abdulsada et al. 2022 investigated the antibacterial properties of IONPs conjugated with polyethylene glycol and gentamicin against MDR bacteria. They found a significant improvement in antibacterial activity and biofilm inhibition, particularly for IONPs with PEG and gentamicin composites [72]. Faisal et al. 2022 synthesized iron nanoparticles using a microwave-induced

Naresh Kumar Nirmal et al.,

precipitation method and functionalized them with p-amino benzoic acid and anthranilic acid. The functionalized nanoparticles showed greater inhibition zones against *Staphylococcus aureus*. Anthranilic acid-functionalized IONPs were found to be the most effective against the Gram-positive bacterium [73]

GOLD NANOPARTICLES (AuNPs)

AuNPs have shown metabolic disruption in bacteria by altering energy mechanisms and protein synthesis. For instance, AuNPs suppressed ATPase synthesis and inhibited the ribosome binding component to tRNA [74]. Additionally, Shamaila et al. 2016 hypothesized that the antibacterial properties of gold might cause AuNPs to disrupt bacterial respiratory chains by degrading nicotinamide [75]. Gold and platinum bimetallic nanoparticles have antibacterial effects against multidrug-resistant *E. coli* by reducing bacterial membrane potential and increasing ATP levels [76]. Alafnan et al. 2022 explored the use of AuNPs as a drug delivery vehicle to enhance the potency of antibiotics against clinical Gram-negative pathogens. They synthesized AuNPs reduced and stabilised by cefoxitin, and found that cefoxitin-loaded AuNPs were effective against cefoxitin-resistant *E. coli* and *K. pneumoniae* [77].

TITANIUM DIOXIDE NANOPARTICLES

Titanium dioxide nanoparticles (TiO₂-NPs) function as photocatalysts and can produce oxidizing agents that destroy *Listeria monocytogenes* bacteria when exposed to UV light [78]. They also potentially reduce bacterial growth and biofilm formation in pathogens such as *Pseudomonas aeruginosa*, *Enterococcus faecium*, *Klebsiella pneumoniae*, and *Staphylococcus aureus* via several mechanisms including generation of ROS, DNA damage, damaging cell membrane and disrupting cellular respiration [79]. The generation of reactive oxygen species, especially hydroxyl free radicals, is primarily responsible for the antimicrobial activities of TiO₂-NPs [80]. Mirković et al. 2022 fabricated hydroxyapatite/titanium dioxide NMs with good structural and antimicrobial properties. The composite material exhibited superior photocatalytic properties [81]

ENCAPSULATED NANOPARTICLES

Nanoparticles can be variously encapsulated with liposomes, lipid monolayers, dendrimers etc. They exhibit unique features like amphiphilic nature, greater loading capacity which make them more effective against bacteria [82,83]. Liposomes can easily be packed with lipid soluble antibiotics. Liposomes are stable structures which release the drug at desired sites [84]. This approach offers another advantage. It minimizes the release of pure antibiotics into the environment further preventing emergence of antibiotic-resistant bacterial strains [85]. Liposomes used for drug delivery are typically 50-200 nm in size. An example is the conjugation of liposomes with vancomycin (Van) to target *Staphylococcus aureus*. The self-assembly of DNA nanostructured liposomes enhances Van's loading capacity and allows for extended-release and continuous ROS production [86]. Specialized liposomes and micelles are made in such a way that they contain only one lipid bilayer. Micelles used for drug delivery are typically 5-100 nm in size. An example is the conjugation of micelles with vancomycin and ciprofloxacin to target *Escherichia coli* and *Pseudomonas aeruginosa*. Synthesized micelles successfully carried the drugs to infection affected areas, releasing drug conjugates in large amounts when needed through interactions with bacterial lipid membranes and target-specific adhesion processes [87]. Dendrimers are another popular smaller sized nanoparticles having unique surface features.

They consist of a central core surrounded by numerous layers with surface groups that can be functionalized in a facile manner [88]. They also have multiple hydrophilic or hydrophobic pockets that can enclose one or more drugs [89]. Lipid-coated nAbts can effectively entrap amphiphilic antibiotics due to their hydrophilic and hydrophobic cores. An example is the conjugation of dendrimers with vancomycin to target drug resistant bacterial strains including MRSA [90]. Researchers have also used CNPs as a polymeric material to encapsulate antibiofilm agents such as antibiotics and natural phytochemicals. The positively charged chitosan shows affinity towards negatively-charged bacterial cell membranes, which increases the efficacy of encapsulated drugs/phytochemicals due to higher rate of delivery [91]. Similarly, Abo-zeid et al. 2022 used poly(lactic-co-glycolic acid) (PLGA) to encapsulate azithromycin. Authors wanted to create a larger sized antibiotic without affecting efficacy to resist the efflux mechanism of drug resistant bacteria. The antibacterial activity of AZI-PLGA NPs was evaluated against AZI-

Naresh Kumar Nirmal et al.,

resistant bacteria, including MRSA and *Enterococcus faecalis* (*E. faecalis*). Interestingly, the results showed that AZI-PLGA NPs were successful in overcoming the efflux-resistant mechanism of the test bacteria, as demonstrated by the four-fold reduction in the minimum inhibitory concentration (MIC) of AZI-PLGA NPs compared to free AZI. The report opens new dimensions to create efficient NMs that act against various mechanisms of drug resistance [92].

CARBON-BASED NANOPARTICLES

Carbon-based nanoparticles have not been extensively explored, and there is limited information on them in the literature. However, they are excellent drug delivery vehicles due to their high adsorption capabilities. Graphene and carbon nanotubes (CNTs), for instance, physically penetrate the cell membrane, they become trapped inside, preventing the ejection of drug-carrying nAbts through efflux pumps [93]. A study by Stegarescu et al. 2022 investigated the antibacterial properties of different nanocomposites based on functionalized multi-walled carbon nanotubes (MW-CNTs) against four common bacterial strains. The nanocomposites were created by combining two metal oxides (CuO and NiO) and two antibiotics (azithromycin and ciprofloxacin). The results indicated that the nanocomposites functionalized with ciprofloxacin were most effective against all tested bacterial strains. One very interesting approach to use CNTs for dealing antibiotic resistance is worth mentioning here [94]. Cruz-Cruz et al. (2023) recently reviewed the possibility of carbon-based materials such as biochar, CNTs, activated carbon, and graphene to be used as agents which can adsorb antibiotics from water [95].

SILICA NANOPARTICLES

Another development is the use of mesoporous silica nanoparticles (SNPs), which are considered excellent nanocarriers and provide ideal nanoplatforms for designing targeted and stimulus-responsive release systems for various antimicrobial drugs. These multifunctional nano systems are anticipated to be effective antibacterial nano formulations for therapeutic use in personalized treatments. The development of nano systems like these offers a novel approach with improved efficacy, increasing the local concentration of the medication in the biofilm without significantly harming healthy tissues and causing fewer side effects. Such nanocarriers have a substantial impact on infection treatment, as they can alter the *Staphylococcus aureus* bacterial biofilm's structure and inhibit its growth [96]. Recent approaches utilize advanced nano-structures having unique features. Ni et al. 2022 demonstrated the co-delivery of vancomycin and AgNPs through silica nano pollen with a pollen-like morphology. The unique spiky morphology provides adhesive properties to the nanoparticle. Increased adsorption onto the bacterial surface promotes localized drug release for bacterial killing. The nano pollen significantly improved the antibacterial effect [97].

NANOZYMES

Nanozymes are fascinating broad-spectrum nAbts with low biotoxicity and potent antibacterial activity. Researchers are becoming increasingly interested in nanozymes, inorganic nanostructures with inherent enzyme activity, due to their unique advantages. Nanozymes can kill more bacteria than natural enzymes, bridging the gap between biology and nanotechnology [98]. In a recent study, Guo et al. 2023 utilized a unique approach for synthesizing a versatile and comprehensive antimicrobial system. The group employed cationic polypeptides functionalized with meso-tetra(4-carboxyphenyl)-porphine (TCPP-PG) nanoparticles [99]. The researchers synthesized TCPP-PG nanoparticles that were water-soluble and had reduced self-aggregation of porphyrins, thereby enhancing their dispersion in aqueous solutions. This strategy not only allowed bacterial inhibition but simultaneous imaging of bacteria was also possible.

SYNERGISTIC EFFECTS OF NANOPARTICLES: EXAMINING THE CASE OF SILVER AND ZINC-BASED NANOPARTICLES (ZNPs) IN COMBATING ANTIBIOTIC RESISTANCE

In recent years, the synergistic effects of nanoparticles, particularly AgNPs and ZNPs, have been increasingly explored to enhance the antimicrobial properties of these materials. By combining these nanoparticles with other antimicrobial agents, such as antibiotics or other nanoparticles, researchers aim to increase the effectiveness of the treatment while simultaneously reducing the likelihood of bacterial resistance. This approach has shown promising

**Naresh Kumar Nirmal et al.,**

results in various studies, with synergistic effects being observed in enhanced antibacterial activity, reduced MIC, and increased eradication rates of drug-resistant bacterial strains. Abo-Sharma et al. 2020 reported that increasing the concentration of both AgNPs and zinc oxide nanoparticles (ZnO-NPs) enhanced their antibacterial activity against Gram-positive bacteria like *S. aureus* and Gram-negative bacteria such as *E. coli* and *Salmonella sp.* Since AgNPs, ZnO-NPs, and antibiotics work well together, a potential combination therapy against pathogenic bacteria could be proposed [100]. Multiple antibiotics loaded onto nanoparticles synergistically increase the effectiveness and rate of bacterial eradication. Ag and Zn nanoparticles combined with streptomycin demonstrated a synergistic effect against *S. aureus*, which had previously been resistant to streptomycin but became susceptible after being used in combination with nanoparticles [101]. Heidary et al. 2019 showed that drug-resistant *M. tuberculosis* strains exhibited bacteriostatic effects in exposure to Ag and ZnO-NPs, indicating that these NPs could be viewed as promising antimycobacterial nanomedicines [102]. However, further research is required to validate the bactericidal effects of these NPs against TB. Zeidan et al. 2022 found that when Ag and ZnO-NPs were used for coating orthodontic brackets, they depicted stronger antibacterial activity against *Streptococcus mutans* and *Lactobacillus acidophilus* compared to uncoated or single-coated brackets [103]. Visnapuu et al. 2018 conducted a study on the synthesis of ZnO/AgNPs coated surfaces and assessed their antimicrobial activity towards *E. coli*, *S. aureus*, and *C. albicans* in dark and UV-A illumination conditions. After numerous usage cycles, surfaces still had substantial antibacterial and photocatalytic characteristics [104]. Dove et al. 2023 investigated the antimicrobial activity and safety of AgNPs against various antibiotic-resistant bacteria. The AgNPs did not cause toxicity to non-target mammalian cells and demonstrated synergy with aminoglycoside antibiotics, reducing their MIC by approximately 22-fold [105].

Adeniji et al. 2022 synthesized and examined the antibacterial properties of AgNPs and ZnO-NPs against multidrug-resistant bacteria and explored combination antibiotic therapy involving these nanoparticles. The results showed that AgNPs exhibited strong antibacterial effects against tested bacterial strains, while ZnO-NPs showed moderate antibacterial effects against Enterococcus species. Combination activities of AgNPs and ZnO-NPs demonstrated synergistic and additive effects [106]. In a contrasting note, Zhang et al. 2022 investigated the effect of nanoparticles on bacterial persistence, finding that a wide range of NPs promoted the formation of bacterial persistence by exerting hyperosmotic pressure around the cells. The researchers discovered that this persister promotion effect occurred through the induction of the aggregation of outer membrane proteins OmpA and OmpC [107]. This finding raises concern that widespread use might support the bacterial antibiotic tolerance. In conclusion, studies have shown that AgNPs and ZnO-NPs can be effective against various drug-resistant bacterial strains, and their combination with antibiotics can lead to synergistic effects in bacterial eradication. However, some research also indicates that nanoparticles can promote bacterial persistence, which could be a concern for their use as antimicrobial agents. Therefore, further research is needed to understand the mechanisms of antibiotic resistance and nanoparticle use better. This will help develop a more comprehensive understanding of the interaction between nanoparticles and bacterial cells, enabling the development of more effective antimicrobial strategies that can tackle both antibiotic resistance and persistence.

CHALLENGES IN THE DEVELOPMENT OF NANOANTIBIOTICS

Nanoantibiotics have emerged as a promising alternative to traditional antibiotics due to their enhanced antimicrobial properties and potential to overcome bacterial resistance. However, several challenges, including purity, toxicity, delivery, stability, and unintended effects, need to be addressed before these novel therapeutics can be successfully implemented in clinical settings. Most materials used to create nano systems may be hazardous for use in clinical settings [107]. Moreover, the nanoparticulate components and structural properties of nanoparticles made from pure molecular antibiotics using different pharmacological or engineering methods are still not well understood [108]. Inorganic materials that are not biodegradable and magnetic nanoparticles may have unfavourable characteristics in humans, raising safety concerns regarding renal excretion. Even though the materials used to manufacture nanocarriers are typically biodegradable, biocompatible, and non-toxic, some reagents used during the preparation, such as surfactants or solvents, may have a negative effect on human health. The limitation of tissue specificity is a significant issue in targeted drug delivery, such as in tumour treatment, where drugs must be delivered to both cancer cells and healthy organs [109]. Similarly, targeted release of antibiotics to infection sites

Naresh Kumar Nirmal et al.,

remains a major challenge, despite considerable progress [110]. The efficacy and effectiveness of a drug-loaded nano-formulation are significantly influenced by drug release kinetics. Slow release of drugs from the carrier is important to ensure that sufficient drugs reach the desired site [111]. Despite the numerous advantages of nAbts, there are challenges in transitioning from laboratory to clinical applications, and their use in real-life situations. Moreover, some studies have found that certain nanoparticles can promote antibiotic resistance phenomena [24]. Although nAbts offer significant potential in combating antibiotic-resistant bacteria, several challenges must be addressed to ensure their safe and effective application in clinical settings. Future research should focus on overcoming these challenges by developing novel materials, optimizing drug release kinetics, improving tissue specificity, and thoroughly investigating the unintended effects of nAbts on bacterial persistence and resistance.

Future Perspectives on Overcoming Nanoantibiotics Challenges

Developing advanced green synthesis methods and optimizing existing ones can improve the purity of synthesized nanoparticles. Additionally, thorough characterization and quality control techniques should be employed to confirm the purity and effectiveness of the particles. Aljeldah et al. 2023 conducted a recent investigation into the synergistic antibacterial effects of AgNPs and fosfomycin against various nosocomial bacterial pathogens. In this study, AgNPs were synthesized using an eco-friendly method that utilized *Hibiscus sabdariffa* flower extract. The results revealed that the biogenic AgNPs exhibited potent antibacterial activity against *Enterobacter cloacae*, MRSA, *Klebsiella pneumoniae*, and *Escherichia coli* strains. The green synthesis approach employed in this study contributes to the development of safer and more environmentally friendly nanoantibiotics. Further research and optimization of such nanoparticle-antibiotic combinations may lead to the development of more effective, safer, and targeted treatments against antibiotic-resistant bacteria in clinical settings [113]. To reduce toxicity, future research should focus on developing targeted drug delivery systems that ensure nanoparticles reach the specific site of infection. This could be achieved by attaching specific ligands to nanoparticles, allowing them to selectively target and bind to bacterial cells, minimizing damage to healthy host cells. A new study by Sun et al. 2023 reports on the development of a photoresponsive antibacterial platform that utilizes polydopamine-functionalized selenium nanoparticles loaded with indocyanine green. Under 808 nm laser irradiation, the platform displayed 100% antibacterial activity against *Staphylococcus aureus* and *Escherichia coli*, while also promoting wound healing in a mouse wound infection model. These results suggest that the platform holds promise for use in biomedical applications, reflecting recent advancements in the development of safer and more effective nAbts [113].

Nanoparticle formulations, such as incorporating hydrophilic coatings or using amphiphilic polymers can be used to enhance water solubility. Furthermore, developing nanoparticle carriers or controlled release systems can ensure the optimum delivery of nAbts to the target site. Devlin et al. 2023 have demonstrated the efficacy of enzyme-functionalized mesoporous SNPs in treating *Staphylococcus aureus* biofilms. The nanoparticles were modified with three enzymes, namely lysostaphin, serrapeptase, and DNase I, which significantly improved the treatment's effectiveness against both methicillin-resistant and methicillin-sensitive *S. aureus*. The findings suggest that these enzyme-functionalized nanoparticles could be a promising therapeutic option for *S. aureus* infections with a biofilm component [114]. This study underscores the potential of NMs for delivering antibiofilm agents and targeting biofilm-related infections with greater efficiency. Bioaccumulation, biodegradable and eco-friendly NMs should be prioritized. These materials will break down into non-toxic components after their therapeutic action, reducing the potential for accumulation and adverse environmental impacts. By addressing these challenges through innovative research and development, nAbts have the potential to revolutionize the fight against antibiotic resistance. A multidisciplinary approach, combining expertise in microbiology, nanotechnology, materials science, and pharmacology, will be essential for designing and developing more effective nAbts to combat resistant bacterial infections.

Naresh Kumar Nirmal *et al.*,

CONCLUSIONS

In conclusion, antibiotic resistance is a pressing issue that demands immediate attention. While nanoparticles show promise as an alternative solution to address this challenge, recent studies have presented conflicting results. For instance, a recent study found that nanoparticles could promote the formation of bacterial persistence, thus enhancing the resistance capacity of bacteria. Given these contradictory findings, it is crucial to study the interaction of nanoparticles with bacteria in greater detail. This will enable researchers to develop a more comprehensive understanding of the effects of nanoparticles on bacterial cells and develop more effective antimicrobial strategies. One potential approach is to design functionalized, tailor-made nanostructures and particles that selectively target and kill specific pathogens without exacerbating their antibiotic tolerance. By creating nanoparticles that are specifically engineered to combat particular bacterial strains, we can minimize the risk of inadvertently promoting antibiotic resistance and persistence. In light of these considerations, extensive research on the potential of nAbts is essential to prevent future pandemics caused by antibiotic resistance in various microbial pathogens. Developing a deeper understanding of the interactions between nanoparticles and bacteria will be crucial for designing effective therapeutic strategies that can tackle both antibiotic resistance and persistence.

Table 1. Summary of nanoparticles used as nanoparticles.

S.No.	Nanoparticle	Use as Antibiotics	Reference
1	Silver Nanoparticles	Act as potent bactericidal agents due to their small size and large surface area. Used to	[39],[40],[41],[42],[43],[44],[34],[45],[37]

Naresh Kumar Nirmal *et al.*,

		prepare antibacterial fabrics, nanogels, and nanolotions. Also used for healing burns, surgical masks, medical instrument coatings, and ointments. Showed significant reduction in antibiotic concentrations against drug-resistant bacteria in conjunction with antibiotics. Conjugated with antibiotics like ciprofloxacin and vancomycin for improved antibacterial effects.	
2	Chitosan Nanoparticles	Demonstrated antibacterial activities, especially against gram-positive bacteria. Used as a bioadhesive polymer to treat the oral mucosa. Antibiotic-loaded CNPs showed higher effectiveness. Iron-loaded CNPs exhibited antimicrobial effects on <i>E. coli</i> , <i>S. aureus</i> , <i>Candida albicans</i> .	[54],[55],[56],[57],[58],[59],[60]
3	Copper Oxide Nanoparticles	Used as antimicrobial coatings to inhibit the growth of MDR biofilms and be effective against bacteria. Found to prevent the growth of MRSA and <i>Pseudomonas aeruginosa</i> . Showed significant synergistic antibacterial activity against <i>E. coli</i> when conjugated with aminoglycoside antibiotics.	[61],[62],[63],[64]
4	Zinc Oxide Nanoparticles	Showed antimicrobial properties against various bacteria and fungi. Blocked the production of biofilms at low concentrations. Impaired the normal function of DNA and enzymes. Prevented the formation of biofilms caused by uropathogenic <i>E. coli</i> strains. Nanorods shaped ZnO-NPs exhibited stronger antibacterial activity against <i>E. coli</i> and <i>S. aureus</i> .	[65],[66],[67]
5	Iron Oxide Nanoparticles	Demonstrated antibacterial capabilities by breaking down bacterial membranes and instigating oxidative stress within the cell, effectively inactivating <i>Staphylococcus</i> and antibiotic-resistant biofilms, and showing a strong antibacterial effect against <i>E. coli</i> and <i>S. aureus</i> .	[68, 69, 71, 72, 73]
6	Gold Nanoparticles (AuNPs)	Shown to disrupt metabolic activity in bacteria by altering energy mechanisms and protein synthesis, effective against multidrug-resistant <i>E. coli</i> , and successfully used as a drug delivery vehicle to enhance the potency of antibiotics against clinical Gram-negative pathogens.	[74, 75, 76, 77]
7	Titanium Dioxide Nanoparticles	Act as photocatalysts and produce oxidizing agents that destroy <i>Listeria monocytogenes</i> bacteria when exposed to UV light, also reduce bacterial growth and biofilm formation in	[78, 79, 80, 81]

Naresh Kumar Nirmal *et al.*,

		various pathogens such as <i>Pseudomonas aeruginosa</i> , <i>Enterococcus faecium</i> , <i>Klebsiella pneumoniae</i> , and <i>Staphylococcus aureus</i>	
8	Encapsulated Nanoparticles	Liposomes, lipid monolayers, dendrimers etc. used to encapsulate nanoparticles offer greater drug loading capacity, stability, and can easily deliver antibiotics at desired sites, hence are more effective against bacteria. Liposomes with vancomycin (Van) used to target <i>Staphylococcus aureus</i> , micelles with vancomycin and ciprofloxacin used to target <i>Escherichia coli</i> and <i>Pseudomonas aeruginosa</i> , dendrimers with vancomycin used to target drug resistant bacterial strains including MRSA	[82, 83, 84, 85, 86, 87, 88, 89, 90]
9	Chitosan Nanoparticles (CNPs) as Encapsulation Material	CNPs used to encapsulate antibiofilm agents such as antibiotics and natural phytochemicals, show affinity towards negatively-charged bacterial cell membranes, hence increase the efficacy of encapsulated drugs/phytochemicals	[91]
10	Poly(lactic-co-glycolic acid) (PLGA) Nanoparticles	Used to encapsulate azithromycin to create larger sized antibiotic to resist efflux mechanism of drug resistant bacteria, were successful in overcoming the efflux-resistant mechanism of bacteria like MRSA and <i>Enterococcus faecalis</i> (<i>E. faecalis</i>)	[92]
11	Carbon-based Nanoparticles	Excellent drug delivery vehicles due to their high adsorption capabilities, graphene and carbon nanotubes physically penetrate the cell membrane, preventing the ejection of drug-carrying nanoparticles through efflux pumps, nanocomposites created by combining metal oxides and antibiotics were effective against various bacterial strains	[93, 94, 95]
12	Silica Nanoparticles (SNPs)	Considered excellent nanocarriers and provide ideal platforms for designing targeted and stimulus-responsive release systems for various antimicrobial drugs, nanosystems like these offer a novel approach with improved efficacy, can alter the <i>Staphylococcus aureus</i> bacterial biofilm's structure and inhibit its growth	[96, 97]
13	Nanozymes	Fascinating broad-spectrum nanoparticles with low biotoxicity and potent antibacterial activity, nanozymes can kill more bacteria than natural enzymes, in a recent study, cationic polypeptides functionalized with nanoparticles were synthesized that not only allowed bacterial inhibition but simultaneous imaging of bacteria was also possible	[98, 99]

Nutritional and Phytochemicals Profile of *Cassia tora*, *Moringa oleifera* and *Asparagus racemosus* Pellets Formulation

ABSTRACT

Asparagus racemosus, *Cassia tora*, and *Moringa oleifera* are just a several of the therapeutic herbs native to the Indian subcontinent. The primary goal of this study is to formulate pellets and to determine them for its nutritional value and phytochemical contents. *Asparagus racemosus*, *Moringa oleifera*, and *Cassia tora* have a lot of phytopharmacological activity. Pellets were made by Extrusion / Spheronisation is a multistage process of individual herb and evaluated for its nutritional value. Three different batches of pellets were prepared from the extracts, and it was found that the F1 batch of all the three extract shows good flow properties of pellets. So the F1 batch were selected for nutritional evaluation. These studies refer to a good prospect for herbal research to improve their contribution to the study of a drug's nutritional significance, which might help to resolve the nutritional deficiencies due to unhealthy lifestyle. In pre formulation study the crude drug, extracts were evaluated for its phytochemical screening, physicochemical parameters.

Keywords: nutritional, pellets, *Asparagus racemosus*, *Cassia tora*, *Moringa oleifera*

INTRODUCTION

Ayurveda is derived from the ancient Sanskrit terms 'ayur' (life) and 'ved' (medicine). It is one of the world's oldest surviving systems of health care (knowledge). Ayurveda is a holistic healing system based entirely on plants. These herbs have been used since Prevedic times because they are safe, affordable, and convenient [1]. Ayurveda is

**Vijaya Rabade et al.,**

achieving popularity around the world. It has an ancient legacy of herbal medicine. Ayurveda is naturally derived healing system that is based mainly on herbal medicines as its foundation. Ayurveda has turned into a mainstream healing approach in current history. The majority of disorders for which there is no treatment in the allopathic system can be successfully treated with traditional medicines[2]. *Asparagus racemosus* has been indicated as uterine tonic, thus it cleanses, nourishes, and strengthens the female reproductive system and so it is traditionally used for amenorrhea[1]. Ayurvedic literature introduce Shatavari as the major Rasayan medication. In folk medicine, it is also known as the Queen of Herbs. [2] The roots of this plant are used as a uterine tonic, galactagogue, hyperacidity treatment, and rejuvenator[1]. Moringa oil which is extracted from seeds of *Moringa oleifera* is also called as ben oil, as it has a high amount of behenic acid. It is good for topical use on the skin and the hair[3]. Flavonoids, alkaloids, saponin, and phenolic acid are some of the phytoconstituents found in *Moringa oleifera*[4]. *Cassia tora* (*Cassia obtusifolia*) is a common annual herb that grows as a weed in India. A natural gelling agent which has industrial and food application. Cassia contains sugars, resins, and mucilage, as well as cinnamaldehyde, gum, tannins, mannitol, coumarins, and essential oils (aldehydes, eugenol, and pinene)[5]. Pelletization is an agglomeration (size-enlarging) process that converts fine powders or particles of bulk pharmaceuticals and excipients into small, free-flowing, more or less spherical units known as pellets. Pelletization is a size-enlargement process that involves the production of agglomerates with a relatively limited size range, usually with a mean size of 0.5 to 2.0 mm, which are referred to as "pellets" Most pharmaceutical industry use Extrusion-Spheronization technique to produce pellets[6].

EXPERIMENTAL WORK

Extraction process

Extraction of *Cassia tora*:-[8]

35 grams of coarse powder of Chakramarda seeds (*Cassia tora* Linn) was placed inside a thimble made from thick filter paper which was loaded into the main chamber of the Soxhlet extractor. 350ml of Ethanol as extraction solvent was taken in a distillation flask and Soxhlet extractor was placed on the flask. The 4 cycle was carried out. After extraction, the Ethanol was removed and it was later dried over water bath. The final product obtained was 2.67 gram of alcoholic extract of Chakramarda. It was solid in nature.

Extraction of *Moringa oleifera* :-[9]

In the first stage of the investigation, the dried powdered leaves were macerated with (1:10) dried powdered leaves to extraction solvent ratio for 48 hours with either 95 percent ethanol, 50 percent ethanol, or water. A glass flask was filled with 100 grammes of powdered leaves, 1000 ml of either extraction solvent, and the flask was wrapped with aluminium foil and transferred to a water bath with occasional shaking. The extracts were filtered using Whatman No.1 filter paper and concentrated by rotary evaporator to around 10% of their original volume at the end of the maceration period. The marc was extracted three times using the same procedure and solvent, and the concentrated extracts were mixed. The concentrated extracts were then dried in a drying oven at 45 °C until the dry mass weight was constant. The optimal extraction solvent was determined using the dried extracts collected.

Extraction of *Asparagus racemosus*:[10]

250 g tuberous roots of *Asparagus racemosus* were pulverised, defatted with Hexane, and macerated with 90% methanol at room temperature for 24 hours. The whole methanolic extract was evaporated over a water bath to produce a concentrated liquid syrupy mass (100 mL) that was dissolved in 10% methanol.

Phytochemical evaluation: - [11]

The obtained extract were evaluated for its phytochemical screening for carbohydrates, proteins, amino acids etc.

Vijaya Rabade et al.,

TLC (Thin Layer Chromatography): [12]

The Principle of TLC is the distribution of a compound between a solid fixed phase (thin layer) placed on a glass or plastic plate and a liquid mobile phase (eluting solvent) moving across the solid phase is the basic premise of TLC.

PELLETS

Pellets are small, free-flowing, spherical particles made by agglomerating fine powders or granules of drug component and excipients with the help of appropriate processing equipment. [14]

FORMULATION OF PELLETS[6]

Extrusion / Spheronisation is a multistage process for obtaining pellets with uniform size from wet granulates (extrudates). The method involves the following main steps:

- The dry mixing of the ingredients, in order to achieve homogenous powder dispersions wet massing, in which the powders are wet mixed to form a sufficiently plastic mass.
- An extrusion stage, in which the wet mass is shaped into cylindrical segments with a uniform diameter;
- The spheronisation stage, in which the small cylinders are rolled into solid spheres (spheroids);
- The drying of the spheroids, in order to achieve the desired final moisture content;
- Screening (optional), to achieve the desired narrow size distribution.

EVALUATION OF PELLETS [8]:

Pellets are evaluated for their flow properties

Bulk density

Bulk density is defined as the total mass of the powder divided by the bulk volume and is expressed as gm/ml. This was calculated by using the formula:

$$BD = \frac{\text{Weight of powder (in gm)}}{\text{Bulk Volume of Powder (in ml)}}$$

Tapped density

It is the ratio of the powder's total mass to its tapped volume. The following calculation was used to calculate tapped density:

$$TBD = \frac{\text{Weight of powder (in gm)}}{\text{Tapped Volume of Powder (in ml)}}$$

Angle of Repose

The funnel method was used to determine it. The powder was weighed and placed in a funnel. A funnel is attached to the graph paper and fastened with its tip at a height (h) of 2 cm above the horizontal surface. The powder was carefully weighed and poured into the funnel. The powder mixture was allowed to run freely through the funnel onto the surface. The angle of repose was computed by multiplying the diameter and height of the powder cone by the following equation.

$$\theta = \tan^{-1}(h/r)$$

Where;

θ = Angle of repose

h = Height of pile cone, pile(cm)

r = Radius of the powder pile

Compressibility index /Carr's index

The Carr's index of the powder blend was determined by using the formula:

$$\text{Carr's index} = \frac{\text{tapped density} - \text{bulk density}}{\text{tapped density}} \times 100$$

**Vijaya Rabade et al.,****Hausner's ratio**

If the hausner's ratio is less than 1.25, the material is free flowing; if it is greater than 1.25, the material has poor flow ability. It was calculated using the formula:

$$\text{Hausner's ratio} = \frac{\text{tapped bulk density}}{\text{bulk density}}$$

RESULT AND DISCUSSION

All the three extracts were evaluated for phytochemical screening and it shows positive results for carbohydrates, proteins, tannins and phenolic content and alkaloids, but only *Asparagus Racemosus* shows foam test positive for saponin glycosides.

CHROMATOGRAPHIC EVALUATION OF EXTRACT

The Rf is calculated by dividing the distance the compound travelled from the original position by the distance the solvent travelled from the original position (the solvent front).

$$\text{Rf} = \frac{\text{Distance of Centre of spot from starting oint}}{\text{Distanant from solvent front from starting point}}$$

MORPHOLOGICAL EVALUATION

Crude fibre content more present in *Asparagus racemosus*(17.4%) than that of cassia tora (13.9%) and *Moringa oleifera* (7.71%). Crude protein more present in cassia tora (18.35%) than that of the *Moringa oleifera* (16.5%) and *Asparagus racemosus* (6.88). Ether extract content more present in *Cassia tora*(5.54%) than *Moringa oleifera*(2.5%) and *Asparagus racemosus*(2.14%). Total ash more present in *Cassia tora*(4.88%)and nitrogen free extract more present in *Asparagus racemosus* is about 69.52.

SUMMARY AND CONCLUSION

The detailed literature survey was done and it was found that the herbal pellets having nutritional value can be an interesting topic of research. Here nutritional pellets were prepared individually from *Cassia tora*, *Moringaoleifera* and *Asparagusracemosus* which having high nutritional profile and lower side effects. These herbal drugs are collected from DadasahebBalpande College of Pharmacy,Besa, Nagpur and authenticated from botany department Nagpur. Three batches of pellets were prepared of each drug extract and evaluated for its morphological, phytochemical, physicochemical and quantitative determination. Out of these three batches, batch F1gives best result than F2 and F3 batch. The nutritional profile of *Asparagusracemosus* contain high content of crude fibre (i.e 17.1) and *Cassia tora* has high content of crude proteins(i.e18.35).

ABSTRACT

Within this paper, the contraction circumstances will be examined in detail and investigate the fact that there is unique common fixed point for self- mappings in Probabilistic Metric space through the current generalization of contraction type condition.

Keywords: PM-space, Contraction, Fixed point, Distribution function, Weakly compatible mapping.

INTRODUCTION

Several generalizations of metric space have been published in the literature since the French mathematician M. Fréchet established metric space in 1906. In 1942, K. Menger [12] stated an influential generalization called Probabilistic Metric spaces (shortly PM-space), via non-negative real numbers substituting for the conceptual framework of distribution functions. It plays an important role in stochastic analysis. As an extension for the prominent Banach contraction principle, H. Sehgal and A. T. Bharucha-Reid [10] established contraction mapping on PM- space. and derive many theoretical frameworks for single and multi-valued mappings. T.L. Hicks [11] introduced a convenient and similar explanation of contraction in metric space, whereby numerous contraction conditions in PM-space are able to be efficiently explored. Jungck [13] introduced compatible mappings and Mishra [14] extended his work. Concept of weakly compatible mapping given by Jungck and Rhoades [15], which is more general than that of compatibility. The present research explores an original class of probabilistic contractions, motivated by the contractively requirement of Hicks [11] and available literature of M. Stojaković [1].

Kirty Jadhav et al.,

MATERIALS AND METHODS

To begin with, we review through basic terminology and theories from the theory of PM-spaces that we are going to apply in the sequel.

Definition[9]: Let $f: X \rightarrow X$ describe a mapping corresponding to the non-empty set X . If $fx = x$, then a point x in X is a fixed point of f .

Definition[4]: If a mapping $F: R \rightarrow R_+$ is left continuous, non-decreasing, and includes a value that is $\inf \{F(t) : t \in R\} = 0$ as well as $\sup \{F(t) : t \in R\} = 1$, it is often referred to as a distribution function. Where R_+ indicates a set of real numbers which can't be negative and R indicates the set for real numbers.

Δ_+ symbolizes the collection of all distribution functions.

The value of F at $(x, y) \in X \times X$ is written as $F_{x,y}$ and $F: X \times X \rightarrow \Delta_+$ is usually referred to indicate a probabilistic distance on X if X is non-empty set.

Definition[2]: On a given set X , a metric d is a function $d: X \times X \rightarrow [0, \infty)$ such that for every $x, y \in X$

- (i). If x equals y , then $d(x, y) = 0$ and $d(x, y) \geq 0$
- (ii). Symmetry dictates that $d(x, y) = d(y, x)$
- (iii). According to triangle inequality, $d(x, y) \leq d(x, z) + d(z, y)$.

A set X carrying a metric d mentioned on it constitutes a metric space (X, d) . It is aware of the distance $d(x, y)$ that exists among every pair of points in X .

Definition[2]: If d defines the mapping $d: X \times X \rightarrow \Delta_+$ and X is a non-empty set, then a pair of ordered elements (X, d) is called a PM-space. When $x, y \in X$, we define $F_{(x,y)}$ to represent the distribution function $d(x, y)$, and $F_{(x,y)}(\epsilon)$ to indicate the value of $F_{(x,y)}$ at $\epsilon \in R > 0$. We assume the following conditions have been fulfilled by the functions $F_{(x,y)}$:

- (i). $F_{x,y}(\epsilon) = 1 \iff x = y$
- (ii). $F_{x,y}(0) = 0$
- (iii). $F_{x,y}(\epsilon) = F_{y,x}(\epsilon)$
- (iv). $F_{x,y}(\epsilon) = 1, F_{y,z}(\lambda) = 1 \implies F_{x,z}(\epsilon + \lambda) = 1$ for $\forall z \in X$ and $\lambda > 0$.

Definition[9]: For each $\epsilon > 0, \lambda \in (0, 1)$, an integer $n_0(\epsilon, \lambda)$ such that $f_{(x, x_n)}(\epsilon) > 1 - \lambda$ for all $n > n_0$, indicates that a sequence $\{x_n\}$ in PM-space has converged to a point $x \in X$.

A convergent sequence's limit in PM-space is observed to be unique at all times.

Definition[9]: When an integer $n_0(\epsilon, \lambda)$ occurs such that $f_{x_n, x_m}(\epsilon) > 1 - \lambda$ for every $n, m > n_0$, then the sequence $\{x_n\}$ in PM-space is considered to be a Cauchy. Also, the Cauchy sequence in a PM-space that converges to a single point in the space qualifies it as complete.

Definition.[8]. If two self mappings of a non-empty set X , A and S , commute over a set of coincidence points, meaning that $Ap = Sp$ for each $p \in X$ implies that $ASP = SAP$, then the pair is considered weakly compatible.

Lemma[5]. For every function $\phi: R^+ \rightarrow R^+$, let ϕ^n be the n^{th} iterate of ϕ . Then the subsequent statements are true:

- (i). For every $\epsilon > 0$, if ϕ is nondecreasing, then $\phi(\epsilon) < \epsilon$
- (ii). This means that $\lim_{n \rightarrow \infty} \phi^n(\epsilon) = 0$ if ϕ is right continuous.

Proposition[1]. Let M represent the family of continuous transformations $m: R_+ \rightarrow R_+$ that are such that

- (i). $m(\epsilon + \lambda) \geq m(\epsilon) + m(\lambda)$, for all $\epsilon, \lambda > 0$,

Kirty Jadhav et al.,

(ii). $m(\varepsilon) = 0 \Leftrightarrow \varepsilon = 0$.

The following definition relates to H. Sehgal and A. T. Bharucha-Reid's [10] introduction of the contraction condition over PM-space.

Definition[10]: Consider the PM-space (X, d) . When $\lambda \in (0, 1)$ exists, then a mapping $f: X \rightarrow X$ such that $F_{fx, fy}(\varepsilon) \geq F_{x,y}(\varepsilon / \lambda)$ where $x, y \in X$ and $\varepsilon > 0$ is a contraction mapping (also known as a B-contraction, Sehgal-contraction, or just C-contraction) on (X, d) .

T. L. Hicks [11] has introduced another extension of probabilistic contractions, which have been extensively explored for the fixed point theory of PM-spaces.

Definition[11]: Let d represent a metric on X that is probabilistic. If $\lambda \in (0, 1)$ such that the following implication holds for each $x, y \in X$ and $\varepsilon > 0$, then the mapping $f: X \rightarrow X$ is known as the Hicks C-contraction (H-contraction or C-contraction).

$$F_{fx, fy}(\lambda\varepsilon) > 1 - \lambda\varepsilon \text{ whenever } F_{x,y}(\varepsilon) > 1 - \varepsilon.$$

RESULTS AND DISCUSSION:

Based on findings from [3], we may infer that the function $d_{m_1, m_2}: X \times X \rightarrow R$ represents a metric on X and is defined by

$$d_{m_1, m_2}(x, y) = \sup_{\varepsilon > 0} \{g \cdot F_{x,y}(m_2(\varepsilon)) \geq m_1(\varepsilon)\}$$

$$d_{m_1, m_2}(x, y) \Leftrightarrow g \cdot F_{x,y}(m_2(\varepsilon)) < m_1(\varepsilon)$$

M. Stojaković[1] worked over this result and derives a new generalization of Hicks-type contraction. In following theorem we modify both concepts and derive a novel fixed point theory for self mappings in PM-spaces that have generalized contraction.

Theorem. Let (X, d) represent a complete PM-space in which the family of self weakly compatible mappings $\{f_i\}_{i \in N}$ of X be holds following implications:

$$(i). d_{m_1, m_2}(x, y) = \sup_{u, v \in \{x, y, f_i^{n_i} x, f_j^{n_j} y\}} \{g \cdot F_{u,v}(m_2(\varepsilon)) > m_1(\varepsilon)\}$$

$$\Leftrightarrow g \cdot F_{f_i^{n_i} x, f_j^{n_j} y}(m_2(\varphi(\varepsilon))) > m_1(\varphi(\varepsilon))$$

$$(ii). x_{i+1} = f_i^{n_i} x_i$$

Where $\{n_i\}_{i \in N}$ the sequence of natural numbers and g is additive generator [7].

Then the set $\{f_i\}_{i \in N}$ has a unique common fixed point.

Before we start main theorem to show the completeness of X , it is required to demonstrate that the series $\{x_i\}_{i \in N}$ forms a Cauchy sequence. For this let us state a lemma which gives a sufficient condition. Later we make use of this lemma in main theorem.

Lemma. A series $\{x_i\}_{i \in N}$ is said to be Cauchy if, for each $x_1 \in X$ the family of self mappings $\{f_i\}_{i \in N}$ satisfy inequality (i).

Proof: To prove the lemma we proceed as follows

From (ii), it is clear that $x_{i+1} = f_i^{n_i} x_i$.

Suppose that a generalization of generator g , defined as

$$g \cdot F_{x,y}(\varepsilon + \lambda) \geq g \cdot F_{x,z}(\varepsilon) + g \cdot F_{z,y}(\lambda)$$

Since $\lim_{\varepsilon \rightarrow \infty} m_1(\varepsilon) = \infty$ and

$$g(0) \geq \infty + g \cdot F_{z,y}(\lambda)$$

Kirty Jadhav et al.,

$g(0) \geq \infty$
 We get $g(0) > m_1(\epsilon)$.

After changing the identification of x, y with elements of sequence $\{x_i\}$ we obtain from (i) for all $i, j \in \{1, 2, \dots\}$ and $\epsilon > 0$

$$d_{m_1, m_2}(x, y) =_{u, v \in \{x_i, x_j, f_i^{n_i} x_i, f_j^{n_j} x_j\}} \min \{g \cdot F_{u, v}(m_2(\epsilon)) \geq g(0) > m_1(\epsilon)\} \dots (iii)$$

$$\Leftrightarrow g \cdot F_{f_i^{n_i} x_i, f_j^{n_j} x_j}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon))$$

$$\Leftrightarrow g \cdot F_{x_{i+1}, x_{j+1}}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon)) \text{ (by (ii))}$$

Therefore, from (iii) we receive

$$d_{m_1, m_2}(x, y) =_{u, v \in \{x_i, x_j, x_{i+1}, x_{j+1}\}} \min \{g \cdot F_{u, v}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon))\}$$

Similarly for $i, j \in \{2, 3, \dots\}$, we have

$$\Leftrightarrow g \cdot F_{x_{i+1}, x_{j+1}}(m_2(\varphi^2(\epsilon))) > m_1(\varphi^2(\epsilon))$$

If we continue the whole process then for $i, j \in \{k + 1, k + 2, \dots\}$

$$\Leftrightarrow g \cdot F_{x_i, x_j}(m_2(\varphi^k(\epsilon))) > m_1(\varphi^k(\epsilon))$$

There may be an integer $k_0(\epsilon, \lambda)$ such that all values $\epsilon > 0$ and $\lambda \in (0, 1)$

$$m_1(\varphi^k(\epsilon)) > g(1 - \lambda) \text{ and } m_2(\varphi^k(\epsilon)) > \epsilon, \text{ for all } k > k_0 \dots (iv)$$

Now for all $i, j \in \{k_0 + 1, k_0 + 2, \dots\}$

$$\Leftrightarrow g \cdot F_{x_i, x_j}(m_2(\varphi^k(\epsilon))) > m_1(\varphi^k(\epsilon)) > g(1 - \lambda)$$

$$\Leftrightarrow g \cdot F_{x_i, x_j}(m_2(\varphi^k(\epsilon))) > g(1 - \lambda)$$

$$\Leftrightarrow g \cdot F_{x_i, x_j}(\epsilon) > g(1 - \lambda)$$

$$\Leftrightarrow F_{x_i, x_j}(\epsilon) > (1 - \lambda)$$

Thus proven that the Cauchy sequence $\{x\}_{i \in \mathbb{N}}$ exists.

Proof of theorem: Since $\{x\}_{i \in \mathbb{N}}$ is a Cauchy sequence, it can be assumed for completeness that it converges to a point $z \in X$, where $\lim_{i \rightarrow \infty} x_i = z$.

In order to prove that z is a unique fixed point of $\{f_i\}_{i \in \mathbb{N}}$ we have to show that $f_i^{n_i} z = z$. For this we proceed as follows.

From (iii)

$$d_{m_1, m_2}(x, y) =_{u, v \in \{x_j, z, f_j^{n_j} x_j, f_i^{n_i} z\}} \min \{g \cdot F_{u, v}(m_2(\epsilon)) \geq g(0) > m_1(\epsilon)\}$$

Where $j \in \mathbb{N}, j \in \{1, 2, \dots\}$

$$\Leftrightarrow g \cdot F_{f_j^{n_j} x_j, f_i^{n_i} z}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon))$$

$$\Leftrightarrow g \cdot F_{x_{j+1}, f_i^{n_i} z}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon)) \text{ (by (ii))}$$

As $j \in \mathbb{N}$, taking $j \rightarrow \infty$

$$\Leftrightarrow g \cdot F_{z, f_i^{n_i} z}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon))$$

Similarly for $j \in \{2, 3, \dots\}$

$$\Leftrightarrow g \cdot F_{z, f_i^{n_i} z}(m_2(\varphi^2(\epsilon))) > m_1(\varphi^2(\epsilon))$$

This continuity for $j \in \{k + 1, k + 2, \dots\}$ give us

$$\Leftrightarrow g \cdot F_{z, f_i^{n_i} z}(m_2(\varphi^k(\epsilon))) > m_1(\varphi^k(\epsilon))$$

This is similar situation arises in previous lemma. By applying condition (iv) over here, we obtain

$$\Leftrightarrow g \cdot F_{z, f_i^{n_i} z}(m_2(\varphi^k(\epsilon))) > m_1(\varphi^k(\epsilon)) > g(1 - \lambda)$$

$$\Leftrightarrow g \cdot F_{z, f_i^{n_i} z}(m_2(\varphi^k(\epsilon))) > g(1 - \lambda)$$

Kirty Jadhav et al.,

$$\Leftrightarrow g. F_{z, f_i^{n_i} z}(\epsilon) > g(1 - \lambda)$$

$$\Leftrightarrow F_{z, f_i^{n_i} z}(\epsilon) > (1 - \lambda)$$

This inequality means that $f_i^{n_i} z = z$. The existence of a common fixed point z for a set of self mappings $\{f_i\}_{i \in N}$ is implied by this necessary condition in PM-spaces.

Uniqueness: We suppose that $z \in X$ is another fixed point for same set of mappings, such that $f_i^{n_i} w = w$.

From (i)

$$d_{m_1, m_2}(x, y) = \min_{u, v \in \{z, w, f_i^{n_i} z, f_i^{n_i} w\}} \{g. F_{uv}(m_2(\epsilon)) > m_1(\epsilon)\} \\ \Leftrightarrow g. F_{f_i^{n_i} z, f_i^{n_i} w}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon))$$

Since z and w , both are common fixed points, then

$$\Leftrightarrow g. F_{z, w}(m_2(\varphi(\epsilon))) > m_1(\varphi(\epsilon))$$

After completing the whole procedure in same manner we can have

$$\Leftrightarrow g. F_{z, w}(m_2(\varphi^k(\epsilon))) > m_1(\varphi^k(\epsilon))$$

$$\Leftrightarrow F_{z, w}(\epsilon) > (1 - \lambda)$$

i. e. $z = w$

Thus, it is apparent z is the only fixed point in $f_i^{n_i}$. As mappings are also weakly compatible, then

$$f_i^{n_i} f_i z = f_i f_i^{n_i} z = f_i z \text{ and also } f_i^{n_i} z = z.$$

So that $f_i z = z$.

This concludes the proof.

CONCLUSION

This paper derives new result concern with unique fixed point, governed by a group of self-mappings in the PM-space field. The preceding section generalizes and improves properties of contradiction.

ABSTRACT

Continued fraction is one of the most notable concepts in mathematics. Using Continued fractions, in this paper we have produced a way to generate specific perfect squares. A nice recurrence relation is obtained in determining these perfect squares. Illustrations has been provided for verification of the results obtained.

Keywords: Continued fractions, Convergents, Perfect square, Pell's equation.

INTRODUCTION

In 17th century, the theory of continued fraction has begun to bloom as a field in number theory and started to grow progressively. Most common usage of continued fractions is solving Diophantine equations and approximation of irrational numbers. In this paper, we have applied continued fractions to generate specific perfect squares using Pell's equation in section 3 and also we have formed a recurrence related to generating those square numbers. Finally, few examples were provided for verifying the results derived.

Preliminaries

In this section let us provide some basic definitions.

Jayamari and Sivaraman

Definition:A finite continued fraction is an expression of the form

$$a_0 + \frac{1}{a_1 + \frac{1}{a_2 + \frac{1}{\ddots + \frac{1}{a_{n-1} + \frac{1}{a_n}}}}} \tag{2.1}$$

Where a_0, a_1, \dots, a_n are real numbers and a_1, a_2, \dots, a_n are positive. The a_i 's are called the partial quotients of the continued fraction. If the partial quotients are all integers, then the continued fraction is simple. We use the notation $[a_0; a_1, \dots, a_n]$ to represent the continued fraction given in equation (2.1). When $n = 0$ we write $[a_0]$

Definition: For $1 \leq k \leq n$, the k^{th} convergent C_k of a continued fraction $[a_0; a_1, a_2, \dots, a_n]$ is the continued fraction $C_k = [a_0; a_1, a_2, \dots, a_k]$

We extend this definition to include $k = 0$ and so we set $C_0 = a_0$.

Definition: A Pell's equation is a quadratic Diophantine equation of the form $x^2 - dy^2 = 1$ where $x, y \in \mathbb{Z}$ and d is a given natural number which is not a square.

Definition :Perfect squares are the numbers of the form $n^2, n \in \mathbb{N}$.

Generating Particular Perfect Squares

Theorem

There exists infinitely many whole numbers n such that both $kn + 1$ and $(k + 1)n + 1$ are perfect squares where $k \in \mathbb{N}$.

Proof:

Since both $kn + 1$ and $(k + 1)n + 1$ are perfect squares where $k \in \mathbb{N}$, let us assume that $kn + 1 = x^2$ and $(k + 1)n + 1 = y^2$ (3.1)

From (3.1), $n = \frac{x^2-1}{k} = \frac{y^2-1}{k+1}$, that is $\frac{x^2-1}{k} = \frac{y^2-1}{k+1}$ (3.2)

On simplifying equation (3.2) we obtain,

$$(k + 1)x^2 - ky^2 = 1 \tag{3.3}$$

Let $z = x\sqrt{k + 1}$ (3.4)

then equation (3.3) becomes $z^2 - ky^2 = 1$ (3.5)

The trivial solution of equation (3.5) is $(z, y) = (1, 0)$

To solve equation (3.5), let us first find the continued fraction expansion for \sqrt{k} in terms of $\sqrt{k + 1}$

Consider $(\sqrt{k + 1} - \sqrt{k})(\sqrt{k + 1} + \sqrt{k}) = 1$

$$\begin{aligned} \sqrt{k + 1} - \sqrt{k} &= \frac{1}{\sqrt{k+1} + \sqrt{k}} & (3.6) \\ &= \frac{1}{\sqrt{k + 1} + \sqrt{k} + \sqrt{k + 1} - \sqrt{k + 1}} \\ &= \frac{1}{2\sqrt{k+1} - \frac{1}{\sqrt{k+1} + \sqrt{k}}} \quad (\text{by equation (3.6)}) \\ &= \frac{1}{2\sqrt{k+1} - \frac{1}{2\sqrt{k+1} - \frac{1}{2\sqrt{k+1} - \dots}}} \end{aligned}$$

Jayamari and Sivaraman

$$\sqrt{k} = \sqrt{k+1} - \frac{1}{2\sqrt{k+1} - \frac{1}{2\sqrt{k+1} - \frac{1}{2\sqrt{k+1} - \dots}}} \quad (3.7)$$

Using convergent definition, the convergents of the continued fraction (3.7) are given below,

$$C_0 = \sqrt{k+1}$$

$$C_1 = \frac{2k+1}{2\sqrt{k+1}}$$

$$C_2 = \frac{(4k+1)\sqrt{k+1}}{4k+3}$$

$$C_3 = \frac{8k^2+8k+1}{(8k+4)\sqrt{k+1}}$$

$$C_4 = \frac{(16k^2+12k+1)\sqrt{k+1}}{16k^2+20k+5}$$

$$C_5 = \frac{32k^3+48k^2+18k+1}{(32k^2+32k+6)\sqrt{k+1}}$$

$$C_6 = \frac{(64k^3+80k^2+24k+1)\sqrt{k+1}}{64k^3+112k^2+56k+7}$$

...

From the above convergents, the solution of equation (3.5) are given below,

$$\begin{aligned} (z, y) = & (1,0), (\sqrt{k+1}, 1), (2k+1, 2\sqrt{k+1}), ((4k+1)\sqrt{k+1}, 4k+3), \\ & (8k^2+8k+1, (8k+4)\sqrt{k+1}), ((16k^2+12k+1)\sqrt{k+1}, 16k^2+20k+5), \\ & (32k^3+48k^2+18k+1, (32k^2+32k+6)\sqrt{k+1}), \\ & ((64k^3+80k^2+24k+1)\sqrt{k+1}, 64k^3+112k^2+56k+7), \dots \end{aligned} \quad (3.8)$$

From equation (3.4) $x = \frac{z}{\sqrt{k+1}}$

By substituting the second, fourth, sixth, ... values of (3.8) in the above equation, we will get the following solutions for equation (3.3)

$$\begin{aligned} (x, y) = & (1,1), (4k+1, 4k+3), (16k^2+12k+1, 16k^2+20k+5), \\ & (64k^3+80k^2+24k+1, 64k^3+112k^2+56k+7), \dots \end{aligned} \quad (3.9)$$

Jayamari and Sivaraman

From equation (3.1), $n = \frac{x^2-1}{k}$ and $n = \frac{y^2-1}{k+1}$

From (3.9), using the values of x in $n = \frac{x^2-1}{k}$ or values of y in $n = \frac{y^2-1}{k+1}$, we will obtain the following values of n ,

$$n = 0, 16k + 8, 256k^3 + 384k^2 + 176k + 24, \\ 4096k^5 + 10240k^4 + 9472k^3 + 3968k^2 + 736k + 48, \dots \quad (3.10)$$

Observe that the values of n from (3.10) are whole numbers since k is a natural number

For the values of n in (3.10), the values of $kn + 1$ and $(k + 1)n + 1$ are perfect squares that are given below,

$$kn + 1 = 1, (4k + 1)^2, (16k^2 + 12k + 1)^2, (64k^3 + 80k^2 + 24k + 1)^2, \dots \quad (3.11)$$

$$(k + 1)n + 1 = 1, (4k + 3)^2, (16k^2 + 20k + 5)^2, (64k^3 + 112k^2 + 56k + 7)^2, \dots \quad (3.12)$$

Hence there exists infinitely many whole numbers n such that both $kn + 1$ and $(k + 1)n + 1$ are perfect squares when k is a natural number.

Recurrence Relation

In this section we will provide the recurrence relation to generate the perfect squares which we obtained from the above theorem.

Let S_m be the square root of m th perfect square of the sequence (3.11) or (3.12). Then for a given natural number k we can define,

$$S_m = (4k + 2)S_{m-1} - S_{m-2}, m \geq 2 \quad (3.13)$$

Where $S_0 = 1$ and $S_1 = 4k + 1$ or $4k + 3$

Case (i): If we choose $S_0 = 1$ and $S_1 = 4k + 1$, from the recurrence relation (3.13) we will obtain the m th perfect square of the sequence (3.11), i.e. $(S_m)^2$ for $m = 0, 1, 2, 3 \dots$

Therefore, from (3.13) we will obtain the following sequence of perfect squares which are nothing but the values of $kn + 1$ given in (3.11).

$$\{(S_m)^2\} = 1, (4k + 1)^2, (16k^2 + 12k + 1)^2, (64k^3 + 80k^2 + 24k + 1)^2, \dots$$

Case (ii): If we choose $S_0 = 1$ and $S_1 = 4k + 3$, from the recurrence relation (3.13) we will obtain the m th perfect square of the sequence (3.12) i.e. $(S_m)^2$ for $m = 0, 1, 2, 3 \dots$

Therefore, from (3.13) we will obtain the following sequence of perfect squares which are nothing but the values of $(k + 1)n + 1$ given in (3.12).

$$\{(S_m)^2\} = 1, (4k + 3)^2, (16k^2 + 20k + 5)^2, (64k^3 + 112k^2 + 56k + 7)^2, \dots$$

We can observe that, if we know the first two perfect squares of (3.11) and (3.12), we will generate infinitely many such perfect squares using the recurrence relation (3.13).

Jayamari and Sivaraman

Illustration

There exists infinitely many whole numbers n such that both $kn + 1$ and $(k + 1)n + 1$ are perfect squares for $k = 1,2,3$.

Solution

From the above theorem, there exists infinitely many whole numbers n such that both $kn + 1$ and $(k + 1)n + 1$ are perfect squares for $k = 1,2,3$.

By substituting $k = 1$ in (3.10) we will get the following values of n such that both $n + 1$ and $2n + 1$ are perfect squares,

$$n = 0, 24, 840, 28560, \dots$$

Table 1 Verification for $k = 1$:

n	$n + 1$	$2n + 1$
0	1	1
24	$25 = 5^2$	$49 = 7^2$
840	$841 = 29^2$	$1681 = 41^2$
28560	$28561 = 169^2$	$57121 = 239^2$
...

For $k = 1$, from the case (i) of the recurrence relation (3.13), we will obtain the following sequence of perfect square which are nothing but the values of $n + 1$ given in table 1.

$$\{(S_m)^2\} = 1, 5^2, 29^2, 169^2, \dots$$

For $k = 1$, from the case (ii) of the recurrence relation (3.13), we will obtain the following sequence of perfect square which are nothing but the values of $2n + 1$ given in table 1.

$$\{(S_m)^2\} = 1, 7^2, 41^2, 239^2, \dots$$

By substituting $k = 2$ in (3.10) we will get the following values of n such that both $2n + 1$ and $3n + 1$ are perfect squares,

$$n = 0, 40, 3960, 388080, \dots$$

Table 2 Verification for $k = 2$:

n	$2n + 1$	$3n + 1$
0	1	1
40	$81 = 9^2$	$121 = 11^2$
3960	$7921 = 89^2$	$11881 = 109^2$
388080	$776161 = 881^2$	$1164241 = 1079^2$
...

For $k = 2$, from the case (i) of the recurrence relation (3.13), we will obtain the following sequence of perfect square which are nothing but the values of $2n + 1$ given in table 2.

$$\{(S_m)^2\} = 1, 9^2, 89^2, 881^2, \dots$$

For $k = 2$, from the case (ii) of the recurrence relation (3.13), we will obtain the following sequence of perfect square which are nothing but the values of $3n + 1$ given in table 2.

Jayamari and Sivaraman

$$\{(S_m)^2\} = 1, 11^2, 109^2, 1079^2, \dots$$

By substituting $k = 3$ in (3.10) we will get the following values of n such that both $3n + 1$ and $4n + 1$ are perfect squares,

$$n = 0, 56, 10920, 2118480, \dots$$

Table 3 Verification for $k = 3$:

n	$3n + 1$	$4n + 1$
0	1	1
56	$169 = 13^2$	$225 = 15^2$
10920	$32761 = 181^2$	$43681 = 209^2$
2118480	$6355441 = 2521^2$	$8473921 = 2911^2$
...

For $k = 3$, from the case (i) of the recurrence relation (3.13), we will obtain the following sequence of perfect square which are nothing but the values of $3n + 1$ given in table 3.

$$\{(S_m)^2\} = 1, 13^2, 181^2, 2521^2, \dots$$

For $k = 3$, from the case (ii) of the recurrence relation (3.13), we will obtain the following sequence of perfect square which are nothing but the values of $4n + 1$ given in table 3.

$$\{(S_m)^2\} = 1, 15^2, 209^2, 2911^2, \dots$$

CONCLUSION

In this paper, in theorem, we have constructed infinitely many whole numbers n such that both $kn + 1$ and $(k + 1)n + 1$ are perfect squares where $k \in \mathbb{N}$ and we have provided the recurrence relation (3.13) to generate infinitely many perfect squares of the form $kn + 1$ and $(k + 1)n + 1$ obtained in theorem when we know the first two such perfect squares. Also we have verified the result for the cases $k = 1, 2, 3$ in tables 1, 2, 3 respectively. Thus using the continued fraction expansion we have obtained particular perfect squares for any given natural number k .

ABSTRACT

Chlorella sorokiniana is an industrially important microalgae due to its lipid profile and therefore in this study an attempt was made to improve growth and enhance production of photosynthetic pigments and lipids by supplying iron oxide nanoparticle (FeO NP) in the culture/growth medium. The effect of iron oxide nanoparticles on growth of the microalgae was evaluated in terms of cell density and microalgae biomass, which was comparatively higher in FeO NP containing growth medium. Growth parameters of microalgae exhibited a concentration dependent increase and maximum growth with cell density of 34.7×10^3 cells/ μ L and biomass of 2.6 g/L was obtained at 8 ppm after 35 days of incubation. Further, chlorophyll content exhibited similar trend such that maximum content of both chlorophyll *a* (16.9 g/L) and chlorophyll *b* (19.99 g/L) was also recorded at 8 ppm but after 35 days and 27 days of incubation, respectively. Lipid profile, however exhibited slight variation such that the relative abundance of the lipid compounds that were commonly present was higher than control only at 8 ppm after 15 days of incubation, which thereafter decreased in comparison to control at all FeO NP levels after 35 days of incubation. Presence of some lipid compounds exclusively in algal cells harvested from FeO NP containing medium was also noted. Therefore, based on the findings of the present study it can be concluded that metal oxide nanoparticles can be used to enhance overall growth and production of important metabolites in microalgae which can be further optimised at commercial scale to meet the industrial need, and these microalgae can be converted into single cell bioreactors for production of lipids used in various applications.

Keywords: Microalgae; Metal oxide nanoparticle; GC-MS; Chlorophyll content; Lipid profiling

INTRODUCTION

Microalgae play a crucial role in our ecosystem and have garnered increasing attention in recent years due to their remarkable importance in various fields. These microscopic photosynthetic organisms are essential for the planet's health as they are responsible for a significant portion of the Earth's oxygen production and carbon dioxide

**Rajnandinee Sharma et al.,**

absorption. Moreover, microalgae are a valuable source of biofuels, capable of generating renewable energy while mitigating greenhouse gas emissions[1]. They also serve as a fundamental component of aquatic food chains, supporting marine life and fisheries. In addition to their environmental significance, microalgae have found applications in industries such as pharmaceuticals, cosmetics, and food production, owing to their rich nutritional profile and potential for producing bioactive compounds [2], [3]. Their versatility and adaptability make microalgae a key player in addressing some of the pressing challenges of our time, including climate change, energy sustainability and food security. One such non-motile & unicellular freshwater microalga, *Chlorella sorokiniana* is the only known species of *Chlorella* that is capable of growing at higher temperatures (38°C – 42°C)[4]. This species is renowned for its ability to accumulate substantial quantities of protein and lipid, and thus holds a prominent place in the realm of microalgae due to its multifaceted importance [1]. This species of *Chlorella* is valued for its exceptional growth rate, high lipid content, and versatility. Its rapid growth makes it an ideal candidate for biofuel production, as it offers a renewable and sustainable source of energy. Moreover, it has a remarkable ability to remove pollutants from water, contributing to its role in bioremediation and environmental conservation. Furthermore, its nutritional value, rich in proteins and other essential nutrients, makes it a promising resource in the development of functional foods and dietary supplements[5]. Thus, applications of this *Chlorella* sp. span from renewable energy solutions to environmental remediation and human nutrition, making it a microalga of significant interest in various fields. However, there are still numerous questions to be answered and challenges to be overcome. Research in *Chlorella* can help us unlock its full potential by optimizing growth conditions, enhancing lipid, carbohydrate and protein contents for biofuel and food production, and improving its efficiency in environmental clean-up. Furthermore, as climate change and resource scarcity continue to pose threats, *Chlorella* research becomes even more critical in our quest for sustainable and environmentally friendly solutions. The application of nanobiotechnology has shown remarkable potential in improving the growth, lipid, and carbohydrate profiles of microalgae. Nanomaterials, such as nanoparticles and nanocarriers, can be used to enhance the efficiency of nutrient delivery to microalgae cultures. By encapsulating essential nutrients or growth-promoting substances within nanocarriers, they can be precisely targeted to microalgae cells, promoting faster growth and improved biomass production.

Additionally, nanoscale sensors and monitoring systems can provide real-time data on the culture conditions, allowing for precise adjustments to optimize growth parameters like temperature, pH, and light intensity. Furthermore, nanotechnology-assisted genetic engineering techniques enable the creation of microalgae strains with enhanced lipid and carbohydrate content, making them more suitable for biofuel production and other applications. These advancements in nanobiotechnology hold great promise for increasing the overall efficiency and sustainability of microalgae-based industries while addressing global challenges related to renewable energy and sustainable resource utilization. Iron nanoparticles have found promising applications in enhancing the growth and biochemical properties of microalgae. Iron is an essential micronutrient for microalgae, playing a critical role in photosynthesis and other metabolic processes. Nanoparticles can improve iron uptake efficiency by microalgae due to their high surface area and reactivity. When appropriately engineered and applied, iron nanoparticles can act as efficient iron fertilizers in microalgae cultures, alleviating iron deficiency and promoting robust growth. Moreover, these nanoparticles can be used to enhance the production of valuable biochemical compounds in microalgae, such as lipids and antioxidants. Iron nanoparticles can act as catalysts in certain biochemical reactions within microalgae cells, thus boosting the synthesis of desired compounds. This innovative application of iron nanoparticles holds significant promise for optimizing microalgae cultivation for biofuel production, pharmaceuticals, and various biotechnological processes, ultimately contributing to sustainable and economically viable solutions. Therefore, in present study effect of iron oxide nanoparticles on growth and metabolic activity in terms of lipid content of *C. sorokiniana* was evaluated with an aim to identify optimum levels of the aforementioned metal oxide nanoparticle for enhancing lipids produced by microalgae.

MATERIAL AND METHODS

Microalgae Growth and Culture conditions

C. sorokiniana stock culture was procured from Banaras Hindu University (BHU), India and was grown on BG-11 medium (SRL, India) devised by ². For optimum growth, algal cultures were kept on a rotary shaker (100 rpm) in

**Rajnandinee Sharma et al.,**

plant growth chamber maintained at 25°C having 20W lights with ~2000 photon lux which were timed for 16/8 h photoperiod.

Preparation of Nanomaterial (NM) Solution

Stock solution (10 mg/ml) of iron oxide (FeO) NP was prepared by dissolving 100 mg in 10 ml sterile distilled water followed by continuous shaking until homogenous suspension is formed. The resulting stock solution was then used to prepare working concentrations (2 ppm, 4 ppm, 6 ppm, 8 ppm & 10 ppm) of NMs in 100 ml culture medium.

Experimental Design

FeO NP stock solution was added to 250 ml Erlenmeyer flasks containing 100 ml BG-11 broth in different volumes so as to obtain the aforementioned final concentrations of the FeO NP in the culture medium. Culture medium without FeO NP was used as control. Culture medium with and without FeO NP was then sterilised using autoclave at 121°C and 15 psi for 20 minutes. All the treatments including control were prepared in triplicates. 1 ml of algal culture (20 days old) was added to each flask as inoculum and the inoculated flasks were then incubated in plant growth chamber for 5 weeks. To avoid aggregation of the algal cells, all the cultures were continuously agitated at ~100 rpm on a rotary shaker (Orbitek, India). Further, aliquots were collected from each flask every week to determine algal growth. For lipid profiling, algal biomass of each treatment was harvested through centrifugation at 10,000 rpm for 20 min at 25°C and was oven dried at 30°C. The dried cell biomass was then used for biochemical analysis as described in subsequent sections.

Determination of Cell Growth

Cell growth was determined in terms of cell count per unit volume of algal culture. 10 µl algal culture from each treatment was loaded into Neubauer chamber and the algal cells were visualised and counted at 40 x magnification using compound light microscope (Olympus, India). Further, cell density was calculated as per following standard formulae used for cell counting in Neubauer chamber:

$$\text{Cell density (cells/}\mu\text{l)} = \frac{\text{number of cells counted in outer/inner square}}{\text{ccf}}$$

where,

ccf = chamber conversion factor *i.e.* volume of the chamber

Determination of Microalgae Biomass

Microalgal biomass was estimated in terms of dry cell weight (DCW) as per method given by Liu *et al.* [6]. Absorbance of 1 ml algal culture was recorded at 680 nm using UV-2600 UV-Vis spectrophotometer (Shimadzu, Japan) and DCW was calculated as per following formulae [6]:
DCW (g/L) = 0.2662 x A₆₈₀ + 1.5796

Determination of Chlorophyll Content

Extraction of chlorophyll pigments was done as per method reported by Ritchie *et al.*[7] with slight modifications. Briefly, 1 ml of algal culture was withdrawn from each treatment and were centrifuged at 10,000 rpm for 15 minutes at 25°C. Supernatant was discarded and the algal cell pellet was resuspended in chilled 90% (v/v) acetone (Rankem, India) followed by overnight incubation at -20°C. The extract was then centrifuged at 10,000 rpm for 10 min at 4°C, supernatant was collected in a separate vial and the pellet was re-extracted with chilled 90% acetone thrice to ensure maximum recovery of the pigments in the acetone and the supernatant thus obtained from each extraction was collected in a single vial for each treatment/sample. Absorbance of pigment extract thus obtained was recorded at 630 nm, 647 nm, 664 nm and 691 nm using UV-2600 UV-Vis spectrophotometer (Shimadzu, Japan) and content of different chlorophyll pigments was calculated as per formulae given by Ritchie *et al.* [7].

Rajnandinee Sharma et al.,

Lipid Profiling using GC-MS

Extraction of lipids was performed as per method given by Bligh and Dyer [8] with slight modifications. Lipids were extracted from dried algal biomass (~100 mg) using chloroform: methanol (2:1) at 25°C for 24 h with intermittent mixing. The extracts were centrifuged at 10,000 rpm for 15 min at 25°C and the lower (non-polar) layer thus obtained was collected in a fresh vial. The extracts were concentrated by evaporating the solvent at 70°C in water bath and the dried extract was weighed to determine total lipid content. Further, the dried extract was reconstituted in 1 ml HPLC grade ethyl acetate (Merck, India), filtered with 0.2 µm membrane filter (Axiva, India) and was then subjected to GC-MS analysis. For GC-MS analysis, single quadrupole GCMS QP-2020 Plus (Shimadzu, India) equipped with Rxi®-5Sil MS (Crossbond®, 5% diphenyl/95% dimethyl polysiloxane) column of 30 m length, 0.25 mm internal diameter and 0.25 µm film thickness was used. The filtered samples were injected into the column at 280°C in split mode and the flow rate of the carrier gas (helium) within the column was maintained at 1.02 ml/min. The oven temperature was maintained at 80°C with 1 min hold and the oven column temperature increased at the rate of 20°C/min upto 280°C, at which was kept on hold for 6 min. Ion source & interface temperature was maintained at 280°C, the solvent cut time was set at 3 min and the mass scan range was set between m/z 40 to m/z 500. The compounds were identified based on the similarity of their mass spectrum with NIST17 library.

STATISTICAL ANALYSIS

All the tests were conducted in triplicates and mean values along with the standard error was calculated using MS Excel. Further, means of different treatment were compared through ANOVA and Duncan's post-hoc test using IBM SPSS software.

RESULT AND DISCUSSION

Effect of FeO NP on Cell Density

Algal cell count increased with increasing incubation time in all treatments and was recorded maximum in all treatments after 5 weeks of incubation/inoculation (Table 1). In control group, cell count increased at the rate of 17.8 cells/day, 372.8 cells/day, 186.4 cells/day, 392.8 cells/day and 1794.6 cells/day during 1st, 2nd, 3rd, 4th and 5th week, respectively after inoculation/of incubation (Figure 1). On the contrary, cell count increased at the rate of 35.7 – 156.1 cells/day, 371.8 – 564.3 cells/day, 142.9 – 1874.6 cells/day, 187.5 – 812.5 cells/day and 776.8 – 2142.9 cells/day during 1st, 2nd, 3rd, 4th and 5th week, respectively in algal cultures grown on FeO NP containing medium (Figure 1). Maximum growth rate was recorded of 2142.9 cells/day was noted at 4 ppm FeO NP during 5th week of incubation, while during 1st to 4th weeks of incubation maximum growth rate was noted at 8 ppm FeO NP (Figure 1). Further, cell density was upto 3.5 times higher FeO NP supplemented medium than that in control and was maximum in culture medium containing 8 ppm FeO NP followed by 6 ppm FeO NP, 4 ppm FeO NP and 10 ppm FeO NP (Table 1). Maximum fold increase in cell count was recorded during 3rd week at higher FeO NP levels, and during 2nd and 1st week at 4 ppm and 2 ppm FeO NP, respectively (Table 1).

Effect of FeO NP on Microalgae Biomass

Microalgae biomass was determined in terms of dry cell weight (DCW), and it was comparatively higher in FeO NP containing medium than in control (without FeO NP) (Figure 2). Though DCW increased with time in all treatments irrespective of the treatment, but maximum rise was recorded at 8 ppm (1.36 folds) followed by that at 6 ppm & 4 ppm (1.31 folds), 10 ppm (1.3 folds), 2 ppm (1.26 folds) and control (0.3 folds) (Table 2). Trends in DCW were similar to that obtained for cell density as maximum DCW (2.156 ± 0.01 g/L) was also recorded at 8 ppm. Like in case of cell density, DCW also increased with increasing concentration of FeO NP in the culture medium upto 8 ppm, and a slight decline was noted at 10 ppm (Table 2).

Effect of FeO NP on Chlorophyll Content

Since *C. sorokinianais* a photosynthetic alga, therefore Chla and Chlb pigments are dominantly present than other types of chlorophylls, thus in present study content of these pigments was measured and was used as an indicator of photosynthetic efficiency of the microalgae studied. Chlorophyll *a* (Chla) content was higher than control at all levels of FeO NP, and showed a concentration dependent increase upto 8 ppm, wherein slight decline was recorded at maximum (10 ppm) FeO NP level (Figure 3a). Increase in Chla content was in accordance with the algal growth pattern, such that it increased with increasing cell density and biomass. Time dependent increase in chlorophyll *a* content was recorded at all treatments, though maximum increase of upto 10.9 folds was recorded at 10 ppm followed by 4 ppm, 6 ppm, 8 ppm and 8 ppm (Figure 3a). Throughout the incubation cycle, chlorophyll content was upto 3.1 times higher (maximum) than control. Chlorophyll *b* (Chlb) content exhibited concentration dependent increase upto 8 ppm FeO NP, while a sharp decline was recorded at maximum (10 ppm) concentration of FeO NP (Figure 3b). However, unlike chla, chlb content exhibited variable pattern *w.r.t.* time interval such that maximum chlb content in all treatments except 8 ppm was maximum at 35 days. Further, comparison of chlb content of every week elucidated that the content was maximum at 8 ppm during all 4 weeks, while during 5th week it was maximum at 10 ppm (Figure 3b).

Effect of FeO NP on Total Lipid content and Lipid Profile

Total lipid content was determined in terms of yield of lipid extract per unit weight of algal biomass. After 15 days, a sharp increase of upto 4.7 times *w.r.t.* control was recorded at higher (8 ppm & 10 ppm) FeO NP levels, while at lower FeO NP levels, total lipid content increased around 1.4 times to 2.5 times *w.r.t.* control (Figure 4). A similar trend was recorded even after 35 days such that total lipid content increased slightly (~1.5 – 1.6 times) at 2 ppm and 4 ppm, while at levels \geq 6ppm, it was atleast 3 times more (Figure 4). Further, it is also noteworthy that although lipid content exhibited a significant rise with increasing FeO NP concentration at both 15 days and 35 days, but overall rise in lipid content after 35 days *w.r.t.* 15 days ranged from 1.1x to 1.7x at all concentrations except at 6 ppm with a rise of ~2.2 times (Figure 4). Lipid profiling of algal samples harvested after 15 days and 35 days of incubation was done using GC-MS. In 15 days' samples, from all the compounds detected in each extract, total 42 compounds were present in two or more extracts. Majority (60%) of the compounds detected in control were also present in lipid extracts of FeO NP treated algal culture, while around 36% to 42% of the compounds detected in FeO NP treated samples were exclusive to these extracts and were not detected in control samples (Table 3).

Among all the common compounds identified, only 5 of them were present in all treatments, while rest of the compounds were present in either two or more of the treatments (Table 3). Content of the lipid compounds identified in all treatments was determined in terms of their relative abundance in each extract. Relative abundance of Neophytidine which belongs to the class of prenol lipids decreased *w.r.t.* control at all treatments except at 8 ppm FeO NP at which it was around 17.2% higher than that in control (Table 3). Similar pattern was also noted for 3,7,11,15-Tetramethyl-2-hexadecen-1-ol (chlorophyll component, lipophilic fatty chain), Hexadecanoic acid, ethyl ester (long chain fatty acid), such that their relative abundance was ~67.7% and 47.9% higher than that in control at 8 ppm FeO NP whereas at other FeO NP levels it was lesser than control (Table 3). On the contrary, relative abundance of hexadecanoic acid, methyl ester (fatty acid methyl esters) was lowest (54.7 % lesser than control) at 8 ppm and was highest at 10 ppm (47.6% higher than control) followed by 6 ppm (4.8% lesser than control). Heneicosane (also known as white wax) was relatively more abundant (upto 12.5 times) in all FeO NP treatments (except at 4 ppm and 10 ppm) than in control (Table 3). Overall, total relative abundance of these 5 common lipid compounds constituted 41.1%, 34.8%, 35.3%, 42.4%, 53.8% and 37.4% of the total lipid compounds identified in extracts obtained from algal cultures grown on culture medium containing 0 ppm, 2 ppm, 4ppm, 6 ppm, 8 ppm and 10 ppm FeO NP, respectively, thus indicating significant enhancement in overall levels of these lipid components at 8 ppm which aligns with the outcomes of other physiochemical and cell growth parameters discussed in previous sections.

In 35 days' samples, total 61 compounds were identified to be common in two or more treatment extracts and out of these only 4 compounds were present in all treatments, while around 27 (44.3%) compounds were exclusive to FeO NP treated algal samples and were not present in control (Table 4). From the four compounds present in all 6 samples, relative abundance of Neophytadiene (prenol lipid - sesquiterpenoid) was higher (2.3x to 3.3x) than control

**Rajnandinee Sharma et al.,**

in all FeO NP levels (except 4 ppm and 10 ppm) with maximum abundance at 8 ppm followed by 2 ppm and 6 ppm, whereas at 10 ppm its relative abundance reduced ~3.6 times and at 4 ppm it was nearly same to that in case of control (Table 4). Further, relative content of Eicosane and Glycidyl palmitate was ~14.3% to 74.3% and 1.2 times to 39.6 times higher than control at all treatments, respectively. On the contrary, levels of Hexadecanoic acid, methyl ester was lesser than control at all treatments and it reduced upto 3.9 times with minimum abundance at 4 ppm followed by 10 ppm, 2 ppm, 6 ppm and 8 ppm (Table 4). However, it is noteworthy that unlike in 15 days samples, in this case the total relative abundance of the four common lipids constituted around 18.7%, 28.6%, 31.8%, 28.2%, 33.9% and 27.1% of the total lipids identified in extracts of 0 ppm (control), 2 ppm, 4 ppm, 6 ppm, 8 ppm and 10 ppm FeO NP, respectively (Table 4).

CONCLUSION

Present study aims to study the effect of iron oxide nanoparticle and growth and physiochemical properties of an important photosynthetic microalgae, *Chlorella sorokiniana* which is known for its high lipid content and capability to tolerate high temperatures. Findings of the present revealed that all the concentrations tested in the present study had more or less positive impact on both growth and physiochemical properties of the microalgae, and in fact all the tested parameters improved when algal cultures were grown in presence of FeO NP than that raised in culture medium without FeO NP. However, best optimum response in terms of cell density, microalgae biomass, chlorophyll content, and lipid content (15 days) were obtained at 8 ppm FeO NP and therefore, it can be concluded that since Fe plays crucial role in various metabolic processes of a living cell, therefore its presence in the growth medium would have in some way promoted the metabolic processes that must be either directly or indirectly involved in growth, chlorophyll production, and biosynthesis of lipids. The findings of this study are intriguing and could be used as foundation stone to further dwell deep into the various mechanisms through which metal oxide NPs affect growth and metabolic processes of these single cell microorganisms. In fact, findings of this study could also be used further to develop methods to enhance production of important metabolites in microalgae at commercial scale, thereby meeting the industrial demand for the raw materials produced by these single celled factories.

ABSTRACT

This paper aims to define and study the notion of connectedness to nano soft ideal topological space. Further we define \star - nano soft $s(J)$ separation, \star - nano soft $s(J)$ connected space. Also their properties and characterization are discussed.

Keywords: Nano Soft $s(J)$ Separation, Nano Soft $s(J)$ Connected, \star - Nano Soft $s(J)$ Separation, \star - Nano Soft $s(J)$ Connected.

AMS Subject Classification 2010 MSC: 54A10, 54C50, 54G20

INTRODUCTION

The soft set theory was developed by Molodstov[12] in 1999 to solve the problem in a mathematical model to the uncertainty. M. Shabir and M. Naz[14] introduced the soft topological spaces. They defined basic notion of soft topological spaces such as open soft and closed soft sets, soft subspace, soft closure, soft neighbourhood of a point, soft separation axioms and established their several properties. The soft open(closed), soft neighbourhood and soft closure was investigated by Hussain and Ahmad[3]. They also discussed the properties of soft interior and soft exterior and soft boundary. The notion of soft ideal is initiated by Kandil et. al[4]. The nano topology was produced by Lellis Thivagar[8] in 2013. Jankovic and Hamlett[2] was developed the ideal topological space in 1990. The nano soft ideal topology was introduced by S. P. R. Priyalatha et. al[13]. The notion of soft connectedness to soft

79383

Priyalatha and Vanitha

topological space with soft ideals was introduced by A.Kandil et. al[5]. Applications to various fields were further investigated by Kandil et. al[6]. In this paper we introduce nano soft $^s(\mathcal{J})$ connectedness with soft ideals and discuss their properties. Furthermore, \star - nano soft $^s(\mathcal{J})$ separation, \star - nano soft $^s(\mathcal{J})$ connected with soft ideals.

Preliminaries

Definition 2.1:[8]

Let \tilde{U} be a non empty finite set of objects called the universe, R be an equivalence relation on \tilde{U} named as the indiscernibility relation. Elements belonging to the same equivalence class are said to be indiscernible with one another. The pair (\tilde{U}, R) is said to be approximation space. Let $X \subseteq \tilde{U}$.

The Lower approximation of X with respect to R is the set of all objects, which can be for certain classified as X with respect to R and it is denoted by $L_R(X)$.

That is, $L_R(X) = \left\{ \bigcup_{x \in \tilde{U}} \{R(x) : R(x) \subseteq X\} \right\}$, where $R(x)$ denotes the equivalence class determined by x .

The Upper approximation of X with respect to R is the set of all objects, which can be for possibly classified as X with respect to R and it is denoted by $U_R(X)$.

That is, $U_R(X) = \left\{ \bigcup_{x \in \tilde{U}} \{R(x) : R(x) \cap X \neq \emptyset\} \right\}$.

The Boundary region of X with respect to R is the set of all objects which can be classified neither as X nor as not X with respect to R and it is denoted by $B_R(X) = U_R(X) - L_R(X)$.

Definition 2.2:[8,9] Let \tilde{U} be the universe, R be an equivalence relation on \tilde{U} and $\tau_R(x) = \{\tilde{U}, \tilde{\emptyset}, L_R(X), U_R(X), B_R(X)\}$ where $X \subseteq \tilde{U}$ and $\tau_R(X)$ satisfies the following axioms.

- i. \tilde{U} and $\tilde{\emptyset} \in \tau_R(X)$.
- ii. The union of the elements of any subcollection $\tau_R(X)$ is in $\tau_R(X)$.
- iii. The intersection of the elements of any finite sub collection $\tau_R(X)$ is in $\tau_R(X)$.

That is, $\tau_R(X)$ forms a topology on \tilde{U} and it is called as the nano topology on \tilde{U} with respect to X . The elements of $\tau_R(X)$ are called as nano open sets.

Definition 2.3:[11,12]

A soft set $\mathcal{F}_{\mathcal{A}}$ on the universe \tilde{U} is defined by the set of ordered pairs $\mathcal{F}_{\mathcal{A}} = \{(e, F(e)) : e \in E, F(e) \in P(\tilde{U})\}$, where $F: E \rightarrow P(\tilde{U})$ such that $F(e) = \emptyset$, if $e \notin \mathcal{A}$ and $\mathcal{A} \subseteq E$.

Definition 2.4:[14]

Let $\tilde{\tau}$ be the collection of soft sets over \tilde{U} , then $\tilde{\tau}$ is said to be soft topology on \tilde{U} if

- i. $\tilde{U}, \tilde{\emptyset} \in \tilde{\tau}$
- ii. Union of any number of soft sets in $\tilde{\tau}$ belongs to $\tilde{\tau}$.
- iii. Intersection of any two soft sets in $\tilde{\tau}$ belongs to $\tilde{\tau}$.

The triplet $(\tilde{U}, \tilde{\tau}, E)$ is called soft topological space over \tilde{U} . The members in $\tilde{\tau}$ are said to be soft open sets in \tilde{U} .

Definition 2.5:[14]

A soft subset $\mathcal{F}_{\mathcal{A}}$ of a soft topological space \tilde{U} is said to be soft closed if $\tilde{U} - \mathcal{F}_{\mathcal{A}}$ is soft open.

Definition 2.6:[14]

Let $(\tilde{U}, \tilde{\tau}, E)$ be a soft topological space over \tilde{U} and $\mathcal{F}_{\mathcal{A}}$ be a soft set over \tilde{U} . Then the soft closure of $\mathcal{F}_{\mathcal{A}}$, denoted by $\overline{\mathcal{F}_{\mathcal{A}}}$ is the intersection of all soft closed supersets of $\mathcal{F}_{\mathcal{A}}$.

Priyalatha and Vanitha

Definition 2.7:[14]

Let $(\tilde{U}, \tilde{\tau}, E)$ be a soft topological space over \tilde{U} , \mathcal{F}_A be a soft set over \tilde{U} and $u \in \tilde{U}$. Then u is said soft interior of \mathcal{F}_A if there exists a soft open set \mathcal{G}_A such that $u \in \mathcal{G}_A \subset \mathcal{F}_A$.

Definition 2.8:[7]

An ideal \mathcal{J} on a topological space $(\tilde{U}, \tilde{\tau})$ is a non empty collection of subsets of \tilde{U} which satisfies

- i. $A \in \mathcal{J}$ and $B \subseteq A$ imply $B \in \mathcal{J}$
- ii. $A \in \mathcal{J}$ and $B \in \mathcal{J}$ imply $A \cup B \in \mathcal{J}$.

Definition 2.9:[4]

Let \mathcal{J} be the non empty collection of soft sets over \tilde{U} , with the same set of parameters E . Then $\mathcal{J} \subseteq SS(\tilde{U})_E$ is called a soft ideal on \tilde{U} with the same set E if,

- i. $\mathcal{F}_E \in \mathcal{J}$ and $\mathcal{G}_E \in \mathcal{J}$ implies $\mathcal{F}_E \cup \mathcal{G}_E \in \mathcal{J}$.
- ii. $\mathcal{F}_E \in \mathcal{J}$ and $\mathcal{G}_E \subseteq \mathcal{F}_E$ implies $\mathcal{G}_E \in \mathcal{J}$.

Definition 2.10:[13]

Let \tilde{Y} be non empty finite universe, \mathcal{F}_A be a soft set over \tilde{Y} and ${}^s(\mathcal{J})$ be a SI over a universe \tilde{Y} . Let \mathcal{R} be a soft equivalence relation on $\mathcal{F}_A \subseteq \mathcal{F}_B$. Elements belonging to the soft equivalence class of $\mathcal{F}(a)$ denoted by $[\mathcal{F}(a)]$ are said to be soft indiscernible with one another. The ordered pair $(\tilde{Y}, \mathcal{F}_A, {}^s(\mathcal{J}))$ is said to be SIAS. Let ${}^s(\mathcal{J}) \subseteq \mathcal{F}_E$.

- (i) If $\mathcal{L}_{\mathcal{R}}({}^s(\mathcal{J})) = \bigcup_{a \in A} \{[\mathcal{F}(a)]: [\mathcal{F}(a)] \subseteq ({}^s(\mathcal{J}))\}$ is a SI L-approximation of \mathcal{F}_A with respect to ${}^s(\mathcal{J})$.
- (ii) If $\mathcal{U}_{\mathcal{R}}({}^s(\mathcal{J})) = \bigcup_{a \in A} \{[\mathcal{F}(a)]: [\mathcal{F}(a)] \cap ({}^s(\mathcal{J})) \neq \emptyset\}$ is a SI U-approximation of \mathcal{F}_A with respect to ${}^s(\mathcal{J})$.
- (iii) If $\mathcal{B}_{\mathcal{R}}({}^s(\mathcal{J})) = \mathcal{U}_{\mathcal{R}}({}^s(\mathcal{J})) - \mathcal{L}_{\mathcal{R}}({}^s(\mathcal{J}))$.

Definition 2.11:[13]

Let \tilde{Y} be a universe, $\mathcal{F}_A \subseteq \mathcal{F}_E$ is a soft set over \tilde{Y} and ${}^s(\mathcal{J})$ is a SI on \mathcal{F}_E . Then, $(\tilde{Y}, \mathcal{F}_A, {}^s(\mathcal{J}))$ is an triplet ordered pair of SIAS and $\tilde{\tau}_R({}^s(\mathcal{J})) = \{\tilde{Y}, \emptyset, \mathcal{L}_{\mathcal{R}}({}^s(\mathcal{J})), \mathcal{U}_{\mathcal{R}}({}^s(\mathcal{J})), \mathcal{B}_{\mathcal{R}}({}^s(\mathcal{J}))\}$ is forms a topology on \tilde{Y} . We say that $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ is known as nano soft ideal topological space (NSIT) over \tilde{Y} with respect to ${}^s(\mathcal{J})$, then the members of $\tilde{\tau}_R({}^s(\mathcal{J}))$ are said to be NSIO sets in \tilde{Y} .

Definition 2.12:[13]

Let $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ be a nano soft ideal topological space over \tilde{Y} . Then nano soft ideal closure of soft set \mathcal{F}_E over \tilde{Y} is denoted by $\mathcal{N}_{SI}Cl(\mathcal{F}_E)$. Thus $\mathcal{N}_{SI}Cl(\mathcal{F}_E)$ is the smallest nano soft ideal closed set which containing \mathcal{F}_E and is defined as the intersection of all nano soft ideal closed supersets of \mathcal{F}_E .

Definition 2.13:[15]

The soft set $\mathcal{F}_E \in SS(X)_E$ is called a soft point in X_E if there exist $x \in X$ and $e \in E$ such that $\mathcal{F}(e) = \{x\}$ and $\mathcal{F}(e') = \emptyset$ for each $e' \in E - \{e\}$, and the soft point \mathcal{F}_E is denoted by x_e .

Definition 2.14:[15]

The soft point x_e is said to be belonging to the soft set \mathcal{G}_A denoted by $x_e \in \mathcal{G}_A$, if for the element $e \in A$, $\mathcal{F}(e) \subseteq \mathcal{G}(e)$.

Definition 2.15:[15]

A soft set \mathcal{G}_B in a soft topological space $(X, \tilde{\tau}, E)$ is called a soft neighborhood (briefly: nbd) of the soft point $x_e \in X_E$ if there exists an open soft set \mathcal{H}_C such that $x_e \in \mathcal{H}_C \subseteq \mathcal{G}_B$. A soft set \mathcal{G}_B in a soft topological space $(X, \tilde{\tau}, E)$ is called a soft neighborhood of the soft set \mathcal{F}_A if there exists an open soft set \mathcal{H}_C such that $\mathcal{F}_A \in \mathcal{H}_C \subseteq \mathcal{G}_B$. The neighborhood system of a soft point x_e , denoted by $\mathcal{N}_{\tilde{\tau}}(x_e)$, is the family of all its neighborhoods.

Definition 2.16:[10]

Let (X, τ, E) be a soft topological space. A soft separation on X is a pair of non null proper open soft sets such that $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$ and $X = \mathcal{F}_E \cup \mathcal{G}_E$.

Definition 2.17:[10]

A non null soft subsets $\mathcal{F}_E, \mathcal{G}_E$ of a soft topological space (X, τ, E) are said to be soft separated sets if $Cl(\mathcal{F}_E) \cap (\mathcal{G}_E) = (\mathcal{F}_E) \cap Cl(\mathcal{G}_E) = \emptyset$.

Definition 2.18:[10]

A soft topological space (X, τ, E) is said to be soft connected if and only if X can not expressed as the soft union of two soft separated sets in (X, τ, E) . Otherwise (X, τ, E) is said to be soft disconnected.

Definition 2.19:[1]

Let (X, τ, E) be a soft topological space. A soft semi separation on X is a pair of non null proper semi open soft sets $\mathcal{F}_E, \mathcal{G}_E$ such that $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$ and $X = \mathcal{F}_E \cup \mathcal{G}_E$.

Definition 2.20:[1]

A soft topological space (X, τ, E) is said to be semi soft connected if and only if there is no soft semi separations on X . Otherwise (X, τ, E) is said to be soft semi disconnected.

Definition 2.21:[5]

Let (X, τ, E) be a soft topological space. A \star - soft separation of X is a pair of non null proper soft sets with $\mathcal{F}_E \in \tau$ and $\mathcal{G}_E \in \tau^*$ such that $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$ and $X = \mathcal{F}_E \cup \mathcal{G}_E$.

Definition 2.22:[5]

A soft topological space with soft ideal (X, τ, E, I) is said to be \star - soft connected if and only if there is no \star - soft separations on X . If (X, τ, E, I) has such \star - soft separations, then (X, τ, E, I) is said to be \star - soft disconnected.

Definition 2.23:[15]

Let (X, τ, E) and (Y, τ^*, E') be soft topological spaces. Let $u: X \rightarrow Y$ and $p: E \rightarrow E'$ be mappings. Let $f_{pu}: SS(X)_E \rightarrow SS(Y)_{E'}$ be a function and $e_f \in X$.

- (a) f_{pu} is soft pu - continuous at $e_f \in X$ if for each $\mathcal{G}_{E'} \in N(f_{pu}(e_f))$ there exists a $\mathcal{H}_E \in N(e_f)$ such that $f_{pu}(\mathcal{H}_E) \subseteq \mathcal{G}_{E'}$.
- (b) f_{pu} is soft pu - continuous on X , if f_{pu} is soft pu - continuous at each soft point in X .

Nano Soft $^s(\mathcal{J})$ Connectedness Spaces

In this section, we define nano soft $^s(\mathcal{J})$ connectedness with soft ideals and the properties are discussed. Throughout this paper we represent nano soft ideal topological space by NSITS, nano soft ideal by $NS^s(\mathcal{J})$, soft set by SS, soft ideal by $S^s(\mathcal{J})$.

Definition 3.1:

Let $(\tilde{Y}, \tilde{\tau}_R(^s\mathcal{J}))$ be a nano soft ideal topological space with soft ideal $^s(\mathcal{J})$ over \tilde{Y} . Two soft ideals \mathcal{F}_E and \mathcal{G}_E are said to be soft ideal disjoint if $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$. That is, $\emptyset = \mathcal{F}(e) \cap \mathcal{G}(e)$ for all $e \in E$.

Definition 3.2:

Let $(\tilde{Y}, \tilde{\tau}_R(^s\mathcal{J}))$ be a NSITS and $^s(\mathcal{J})$ be a soft ideal over \tilde{Y} . A nano soft $^s(\mathcal{J})$ separation of \tilde{Y} is a pair of disjoint non empty soft ideal subsets \mathcal{F}_E and \mathcal{G}_E such that $\mathcal{F}_E \cup \mathcal{G}_E = \tilde{Y}$ and $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$.

Priyalatha and Vanitha

Definition 3.3:

A nano soft ideal topological space $(\tilde{Y}, \tilde{\tau}_R({}^s\mathcal{J}))$ with soft ideal ${}^s(\mathcal{J})$ is said to be nano soft ${}^s(\mathcal{J})$ connected if there does not exist a $NS^s(\mathcal{J})$ separation on \tilde{Y} .

If $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ has such $NS^s(\mathcal{J})$ separation then $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ is said to be $NS^s(\mathcal{J})$ disconnected.

Example 3.4:

Let $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ be a nano soft ${}^s(\mathcal{J})$ topological space where $\tilde{Y} = \{a, b\}$,
 $\mathcal{A} = \{p_1, p_2\}, \mathcal{F}_{\mathcal{A}} = \{(p_1, \{a\}), (p_2, \{b\}), (p_1, \{b\}), (p_2, \{a\})\}$ where ${}^s(\mathcal{J}) = \{\emptyset, (p_2, \{b\}), (p_2, \{a, b\})\}$ such that $\mathcal{F}(p_1) = \{a\}, \mathcal{F}(p_2) = \{b\}, \mathcal{F}(p_1) = \{b\}, \mathcal{F}(p_2) = \{a\}$ and $\mathcal{R} = \mathcal{F}(p_1) \times \mathcal{F}(p_1), \mathcal{F}(p_2) \times \mathcal{F}(p_2), \mathcal{F}(p_1) \times \mathcal{F}(p_2), \mathcal{F}(p_2) \times \mathcal{F}(p_1),$
 $\tilde{\tau}_R({}^s(\mathcal{J})) = \{Y, \varphi, \{p_2, \{b\}\}, \{p_1, \{a\}, p_2, \{b\}\}, \{p_2, \{a, b\}\}$ where $\mathcal{L}_R({}^s(\mathcal{J})) = \{p_2, \{b\}\}, \cup_R({}^s(\mathcal{J})) = \{p_1, \{a\}, p_2, \{b\}\}, \mathcal{B}_R({}^s(\mathcal{J})) = \{p_2, \{a, b\}\}$. Consider $\mathcal{F}_E = \{(p_2, \{b\})\}$ and $\mathcal{G}_E = \{(p_2, \{a, b\})\}$, there does not exist $NS^s(\mathcal{J})$ separation. Clearly $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ is a nano soft ${}^s(\mathcal{J})$ connected.

Definition 3.5:

Let $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ be a nano soft ideal topological space and ${}^s(\mathcal{J})$ be a soft ideal over \tilde{Y} . A soft ideal subset \mathcal{F}_E of a nano soft ideal space is nano soft ${}^s(\mathcal{J})$ connected, if it is $NS^s(\mathcal{J})$ connected as a soft subspace.

Theorem 3.6:

A NSITS $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ with soft ideal ${}^s(\mathcal{J})$ is $NS^s(\mathcal{J})$ disconnected if and only if there exists non empty soft ideal subsets \mathcal{F}_E of $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ which is both soft ideal open and soft ideal closed in $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$.

Proof:

This proof is obvious from the definition nano soft ${}^s(\mathcal{J})$ disconnected.

Theorem 3.7:

The union of a collection of $NS^s(\mathcal{J})$ connected subspaces of \tilde{Y} with soft ideal ${}^s(\mathcal{J})$ that have a point in common is $NS^s(\mathcal{J})$ connected.

Proof:

Let $\{\mathcal{F}_\alpha\}$ be a collection of $NS^s(\mathcal{J})$ connected subspaces of \tilde{Y} with soft ideal ${}^s(\mathcal{J})$. Let p be a point of $\cap \mathcal{F}_\alpha$. We prove that $Z = \cup \mathcal{F}_\alpha$ is $NS^s(\mathcal{J})$ connected. Suppose that $Z = \mathcal{F}_E \cup \mathcal{G}_E$ is a $NS^s(\mathcal{J})$ separation of Z . The point p is in one of the sets \mathcal{F}_E or \mathcal{G}_E . Suppose $p \in \mathcal{F}_E$. Since \mathcal{F}_α is $NS^s(\mathcal{J})$ connected, it must lie entirely in either \mathcal{F}_E or \mathcal{G}_E and it cannot lie in \mathcal{G}_E because it contains the point p of \mathcal{F}_E . Hence $\mathcal{F}_\alpha \in \mathcal{F}_E$ for every α , so that $\cup \mathcal{F}_\alpha \in \mathcal{F}_E$ contradicting the fact that \mathcal{G}_E is non empty.

Theorem 3.8:

Let $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ be a nano soft ideal topological space and ${}^s(\mathcal{J})$ be a soft ideal over \tilde{Y} . Two soft ideals \mathcal{F}_E and \mathcal{G}_E be a $NS^s(\mathcal{J})$ disconnected in $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ and \mathcal{H}_E be a $NS^s(\mathcal{J})$ connected subspace of $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$. Then \mathcal{H}_E is contained in \mathcal{F}_E or \mathcal{G}_E .

Proof:

Let $(\tilde{Y}, \tilde{\tau}_R({}^s(\mathcal{J})))$ be a NSITS with soft ideal ${}^s(\mathcal{J})$. To prove \mathcal{H}_E is contained in \mathcal{F}_E or \mathcal{G}_E . Suppose \mathcal{H}_E is neither contained in \mathcal{F}_E nor in \mathcal{G}_E . Then $\mathcal{H}_E \cap \mathcal{F}_E, \mathcal{H}_E \cap \mathcal{G}_E$ are both non empty soft ideal open subsets of \mathcal{H}_E such that $(\mathcal{H}_E \cap \mathcal{F}_E) \cap (\mathcal{H}_E \cap \mathcal{G}_E) = \emptyset$ and $(\mathcal{H}_E \cap \mathcal{F}_E) \cup (\mathcal{H}_E \cap \mathcal{G}_E) = \mathcal{H}_E$. This gives that pair of $(\mathcal{H}_E \cap \mathcal{F}_E)$ and $(\mathcal{H}_E \cap \mathcal{G}_E)$ is a $NS^s(\mathcal{J})$ disconnected of \mathcal{H}_E . This contradiction proves this theorem.

Priyalatha and Vanitha

Definition 3.9:

Let $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ and $(\tilde{Z}, \tilde{\tau}_{2R}({}^s\mathcal{J}))$ be two NSITS with soft ideal ${}^s\mathcal{J}$ and $p: \tilde{Y} \rightarrow \tilde{Z}$ and $q: E \rightarrow E^*$ be mappings, where E and E^* be the set of parameters. Let $f_{pq}: SS(\tilde{Y})_E \rightarrow SS(\tilde{Z})_{E^*}$ be a function and $x_e \in \tilde{Y}$.

- (a) f_{pq} is soft ideal continuous at $x_e \in \tilde{Y}$ if for each $\mathcal{G}_E \in N(f(x_e))$ there exists a $\mathcal{H}_E \in N(x_e)$ such that $f_{pq}(\mathcal{H}_E) \subseteq \mathcal{G}_E$.
- (b) f_{pq} is soft ideal continuous on \tilde{Y} , if f_{pq} is soft ideal continuous at each soft point in \tilde{Y} .

Theorem 3.10:

Let $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ and $(\tilde{Z}, \tilde{\tau}_{2R}({}^s\mathcal{J}))$ be two NSITS with soft ideal ${}^s\mathcal{J}$ and $p: \tilde{Y} \rightarrow \tilde{Z}$ and $q: E \rightarrow E^*$ be mappings, where E and E^* be the set of parameters. Also the mapping $f_{pq}: SS(\tilde{Y})_E \rightarrow SS(\tilde{Z})_{E^*}$ is soft ideal continuous and surjective. If $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ is NSI connected then the image of $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ is $NS^s(\mathcal{J})$ connected.

Proof :

Let a soft mapping $f_q: SS(\tilde{Y}) \rightarrow SS(\tilde{Z})$ be soft ideal continuous and surjective. Contrarily, suppose that $(\tilde{Z}, \tilde{\tau}_{2R}({}^s\mathcal{J}))$ is $NS^s(\mathcal{J})$ disconnected with soft ideal ${}^s\mathcal{J}$ and pair \mathcal{F}_{E^*} and \mathcal{G}_{E^*} is a soft ideal discontinuous of $(\tilde{Z}, \tilde{\tau}_{2R}({}^s\mathcal{J}))$. Since $f_{pq}: SS(\tilde{Y})_{E^*} \rightarrow SS(\tilde{Z})_{E^*}$ is soft ideal continuous, therefore $f_{pq}^{-1}(\mathcal{F}_{E^*})$ and $f_{pq}^{-1}(\mathcal{G}_{E^*})$ are both soft ideal open in $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$. Clearly the pair $f_{pq}^{-1}(\mathcal{F}_{E^*})$ and $f_{pq}^{-1}(\mathcal{G}_{E^*})$ is soft ideal disconnection of $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ a contradiction. Hence $(\tilde{Z}, \tilde{\tau}_{2R}({}^s\mathcal{J}))$ is $NS^s(\mathcal{J})$ connected. This completes the proof.

***- Nano Soft ${}^s\mathcal{J}$ Connectedness Spaces**

In this section, we extend the nano soft ${}^s\mathcal{J}$ connected to *- nano soft ${}^s\mathcal{J}$ connected with soft ideals and study some of the basic properties.

Definition 4.1:

Let $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ and $(\tilde{Y}, \tilde{\tau}_{2R}({}^s\mathcal{J}))$ be two nano soft ideal topological space. A *- nano soft ${}^s\mathcal{J}$ separation of \tilde{Y} is a pair of proper soft ideals with $\mathcal{F}_E \in \tilde{\tau}_{1R}({}^s\mathcal{J})$ and $\mathcal{G}_E \in \tilde{\tau}_{2R}({}^s\mathcal{J})$ such that $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$ and $\tilde{Y} = \mathcal{F}_E \cup \mathcal{G}_E$.

Definition 4.2:

A nano soft ideal topological space with soft ideal $(\tilde{Y}, \tilde{\tau}_R({}^s\mathcal{J}))$ is said to be *- nano soft ${}^s\mathcal{J}$ connected if and only if there is no *- nano soft ${}^s\mathcal{J}$ separation on \tilde{Y} . If $(\tilde{Y}, \tilde{\tau}_R({}^s\mathcal{J}))$ has such *- $NS^s(\mathcal{J})$ separation, then $(\tilde{Y}, \tilde{\tau}_R({}^s\mathcal{J}))$ is said to be *- $NS^s(\mathcal{J})$ disconnected.

Example 4.3:

Let $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ and $(\tilde{Y}, \tilde{\tau}_{2R}({}^s\mathcal{J}))$ be two nano soft ${}^s\mathcal{J}$ topological space where $\tilde{Y} = \{a, b, c\}$, $\mathcal{A} = \{p_1, p_2\}$, $\mathcal{F}_{\mathcal{A}} = \{(p_1, \{a\}), (p_2, \{b\}), (p_2, \{c\}), (p_1, \{a, b\}), (p_2, \{a, b\})\}$ where ${}^s\mathcal{J} = \{\emptyset, (p_2, \{b\}), (p_2, \{a, b\})\}$ such that $F(p_1) = \{a\}, F(p_2) = \{b\}, F(p_2) = \{c\}, F(p_1) = \{a, b\}, F(p_2) = \{a, b\}$ and $\mathbb{R} = \{\mathcal{F}(p_1) \times \mathcal{F}(p_1), \mathcal{F}(p_2) \times \mathcal{F}(p_2), \mathcal{F}(p_1) \times \mathcal{F}(p_2), \mathcal{F}(p_2) \times \mathcal{F}(p_1)\}$, $\tilde{\tau}_{1R}({}^s\mathcal{J}) = \{\tilde{Y}, \emptyset, (p_1, \{a\}), (p_2, \{b\}), \{(p_1, \{a\}), (p_2, \{b\})\}\}$ where $\tilde{\mathcal{L}}_{\mathcal{R}}({}^s\mathcal{J}) = \{p_2, \{b\}\}$, $\tilde{\mathcal{U}}_{\mathcal{R}}({}^s\mathcal{J}) = \{p_1, \{a\}, p_2, \{b\}\}$, $\mathcal{B}_{\mathcal{R}}({}^s\mathcal{J}) = \{p_1, \{a\}\}$ and $\tilde{\tau}_{2R}({}^s\mathcal{J}) = \{\tilde{Y}, \emptyset, (p_1, \{b\}), (p_2, \{a\}), \{(p_1, \{b\}), (p_2, \{a\})\}\}$, $\mathcal{L}_{\mathcal{R}}({}^s\mathcal{J}) = \{p_2, \{a\}\}$, $\mathcal{U}_{\mathcal{R}}({}^s\mathcal{J}) = \{p_1, \{b\}, p_2, \{a\}\}$, $\mathcal{B}_{\mathcal{R}}({}^s\mathcal{J}) = \{p_1, \{b\}\}$. Consider $\mathcal{F}_E = \{(p_1, \{a\})\}$ and $\mathcal{G}_E = \{(p_2, \{a\})\}$, there does not exist *- $NS^s(\mathcal{J})$ separation. Therefore clearly it is *- $NS^s(\mathcal{J})$ connected.

Theorem 4.4:

Let $(\tilde{Y}, \tilde{\tau}_{1R}({}^s\mathcal{J}))$ be a NSITS with soft ideal and $(\tilde{Y}, \tilde{\tau}_2, E)$ be its *- soft topological space, then the following are equivalent.

- (i) \tilde{Y} is *- nano soft ${}^s\mathcal{J}$ connected.

Priyalatha and Vanitha

- (ii) \tilde{Y} cannot be expressed as a soft ideal union of two disjoint soft ideal subsets $\mathcal{F}_E, \mathcal{G}_E$ of \tilde{Y} which are $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal open and $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal open respectively.
- (iii) \tilde{Y} cannot be expressed as a soft ideal union of two non null disjoint soft subsets $\mathcal{F}_E, \mathcal{G}_E$ of \tilde{Y} which are $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal closed and $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal closed respectively.
- (iv) There is no proper soft ideal subset \mathcal{F}_E of \tilde{Y} which is neither $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal open and $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ soft ideal closed, nor $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal closed and $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ soft ideal open.

Proof

- (i)⇒(ii) By the definition of \star - nano soft ${}^s\mathcal{J}$ connected, \tilde{Y} cannot be expressed as a soft ideal union of two disjoint soft ideal subsets $\mathcal{F}_E, \mathcal{G}_E$ of \tilde{Y} which are $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal open and $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal open respectively.
- (ii)⇒(iii) Suppose that $\tilde{Y} = \mathcal{F}_E \cup \mathcal{G}_E$ for some $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal closed set \mathcal{F}_E and $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal closed set \mathcal{G}_E such that $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$. Then $\mathcal{F}_E = (\mathcal{G}_E)^c$ which is $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal open and $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal open, $\tilde{Y} = \mathcal{G}_E \cup (\mathcal{G}_E)^c$ and $\mathcal{G}_E \cap (\mathcal{G}_E)^c = \emptyset$, which is a contradiction to (ii).
- (iii)⇒(iv) Suppose that there is a proper soft ideal subset \mathcal{F}_E of \tilde{Y} , which is either $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal open and $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal closed or $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal closed and $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal open. Then \mathcal{F}_E^c is $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal closed and \mathcal{F}_E is $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal closed with $\tilde{Y} = \mathcal{F}_E \cup \mathcal{F}_E^c$ and $\mathcal{F}_E \cap \mathcal{F}_E^c = \emptyset$, which is a contradiction with (iii).
- (iv)⇒(i) Suppose that $\tilde{Y} = \mathcal{F}_E \cup \mathcal{G}_E$ for some $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal open \mathcal{F}_E and $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal open \mathcal{G}_E such that $\mathcal{F}_E \cap \mathcal{G}_E = \emptyset$. Then $\mathcal{F}_E = \mathcal{G}_E^c$ and $\mathcal{G}_E = \mathcal{F}_E^c$. Then \mathcal{F}_E is $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - closed soft and $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal open and \mathcal{G}_E is $\tilde{\iota}_{2_R}({}^s\mathcal{J})$ - soft ideal open and $\tilde{\iota}_{1_R}({}^s\mathcal{J})$ - soft ideal closed, which is a contradiction with (iv).

Theorem 4.5:

If $(\tilde{Y}, \tilde{\iota}_R({}^s\mathcal{J}))$ be a \star - NS ${}^s\mathcal{J}$ connected topological space with soft ideal, then $(\tilde{Y}, \tilde{\iota}, E)$ is soft connected.

Proof :

Let $(\tilde{Y}, \tilde{\iota}_R({}^s\mathcal{J}))$ be a \star - NS ${}^s\mathcal{J}$ connected space with soft ideal ${}^s\mathcal{J}$. From the definition of \star - NS ${}^s\mathcal{J}$ connected, $(\tilde{Y}, \tilde{\iota}, E)$ is soft connected.

Theorem 4.6:

Let $(\tilde{Y}, \tilde{\iota}_{1_R}({}^s\mathcal{J}))$ and $(\tilde{Z}, \tilde{\iota}_{2_R}({}^s\mathcal{J}))$ be two NSITS with soft ideal ${}^s\mathcal{J}$ and $p: \tilde{Y} \rightarrow \tilde{Z}$ and $q: E \rightarrow E^*$ be mappings, where E and E^* be the set of parameters. Also the mapping $f_{pq}: SS(\tilde{Y})_E \rightarrow SS(\tilde{Z})_{E^*}$ is soft ideal continuous and surjective. If $(\tilde{Y}, \tilde{\iota}_{1_R}({}^s\mathcal{J}))$ is \star - NS ${}^s\mathcal{J}$ connected then the image of $(\tilde{Y}, \tilde{\iota}_{1_R}({}^s\mathcal{J}))$ is \star - NS ${}^s\mathcal{J}$ connected.

Proof :

Let the mapping $f_q: SS(\tilde{Y}) \rightarrow SS(\tilde{Z})$ be soft ideal continuous and surjective. Contrarily, suppose that $(\tilde{Z}, \tilde{\iota}_{2_R}({}^s\mathcal{J}))$ is \star - NS ${}^s\mathcal{J}$ disconnected with soft ideal ${}^s\mathcal{J}$ and pair \mathcal{F}_{E^*} and \mathcal{G}_{E^*} is a soft ideal discontinuous of $(\tilde{Z}, \tilde{\iota}_{2_R}({}^s\mathcal{J}))$. Since $f_{pq}: SS(\tilde{Y})_{E^*} \rightarrow SS(\tilde{Z})_{E^*}$ is soft ideal continuous, therefore $f_{pq}^{-1}(\mathcal{F}_{E^*})$ and $f_{pq}^{-1}(\mathcal{G}_{E^*})$ are both soft ideal open in $(\tilde{Y}, \tilde{\iota}_{1_R}({}^s\mathcal{J}))$. Clearly the pair $f_{pq}^{-1}(\mathcal{F}_{E^*})$ and $f_{pq}^{-1}(\mathcal{G}_{E^*})$ is soft ideal disconnection of $(\tilde{Y}, \tilde{\iota}_{1_R}({}^s\mathcal{J}))$ a contradiction. Hence $(\tilde{Z}, \tilde{\iota}_{2_R}({}^s\mathcal{J}))$ is \star - NS ${}^s\mathcal{J}$ connected. This completes the proof.

Remark 4.7:

In NS ${}^s\mathcal{J}$ connectedness, there exists disjoint soft ideals from only one NSITS, but in the \star - NS ${}^s\mathcal{J}$ connectedness we consider the disjoint soft ideals from two NSITS.

Priyalatha and Vanitha

Definition 4.8:

Let $(\tilde{Y}, \tilde{\tau}_R({}^s(J)))$ be a nano soft ideal topological space and $\tilde{Z}_E \subseteq \tilde{Y}$ with $y \in \tilde{Z}_E$. Then \tilde{Z}_E is said to be $NS^s(J)$ component with respect to y is the maximal of all $NS^s(J)$ connected subspaces of $(\tilde{Z}, \tilde{\tau}_R({}^s(J)))$ containing y and denoted by $C[\tilde{Z}_E, y]$. That is, $C[\tilde{Z}_E, y] = \cup \{\tilde{X}_E \subseteq \tilde{Z}_E : y \in \tilde{X}_E, \tilde{X}_E \text{ is } NS^s(J) \text{ connected}\}$.

Theorem 4.9:

Every $NS^s(J)$ component of a nano soft ideal topological space $(\tilde{Y}, \tilde{\tau}_R({}^s(J)))$ is a maximal $NS^s(J)$ connected subset of \tilde{Y} .

Proof :

This proof is obvious from the definition 4.8.

Theorem 4.10:

Every $NS^s(J)$ component of a nano soft ideal topological space $(\tilde{Y}, \tilde{\tau}_R({}^s(J)))$ is a closed set.

Proof :

From the definition of $NS^s(J)$ component and from the fact that the $NS^s(J)$ closure of a $NS^s(J)$ connected space is a $NS^s(J)$ connected. Hence $(\tilde{Y}, \tilde{\tau}_R({}^s(J)))$ is a closed set.

Theorem 4.11:

Let $(\tilde{Y}, \tilde{\tau}_R({}^s(J)))$ be a NSITS. Then

- (i) Each element $y \in \tilde{Y}$ is contained in exactly one component of \tilde{Y} .
- (ii) Any two $NS^s(J)$ components with respect to two different elements of \tilde{Y} are either disjoint or identical.

Proof :

(i) Let $y \in \tilde{Y}$ and consider the collection, $C = \{Z_E \subseteq \tilde{Y} : y \in Z_E, Z_E \text{ is } NS^s(J) \text{ connected}\}$. Then we have

(a) $C \neq \emptyset$, for the singleton soft point y_E is a $NS^s(J)$ connected subset of \tilde{Y} containing y .

Then $y_E \in C$.

(b) $\cap \{Z_E \subseteq \tilde{Y} : y \in Z_E, Z_E \text{ is } NS^s(J) \text{ connected}\} \neq \emptyset$, since $y \in Z_E \forall Z_E \in C$.

(c) The soft set $\cup \{Z_E \subseteq \tilde{Y} : y \in Z_E, Z_E \text{ is } NS^s(J) \text{ connected}\}$, having a non null soft intersection is $NS^s(J)$ connected subset of \tilde{Y} containing y .

(d) $\cup \{Z_E \subseteq \tilde{Y} : y \in Z_E, Z_E \text{ is } NS^s(J) \text{ connected}\}$ is the largest $NS^s(J)$ connected subset of \tilde{Y} containing y , which is the $NS^s(J)$ component $C(\tilde{Y}, y)$ of \tilde{Y} with respect to y and containing y from the definition 4.8. Now, suppose $C_1(\tilde{Y}, y)$ be another $NS^s(J)$ component containing y , then $C_1(\tilde{Y}, y)$ is a $NS^s(J)$ connected subset of \tilde{Y} containing y , but $C(\tilde{Y}, y)$ is $NS^s(J)$ component then $C(\tilde{Y}, y)$ is the largest $NS^s(J)$ connected subset of \tilde{Y} containing y , consequently $C_1(\tilde{Y}, y) \subseteq C(\tilde{Y}, y)$. Similarly $C(\tilde{Y}, y) \subseteq C_1(\tilde{Y}, y)$ and hence y is contained in exactly one $NS^s(J)$ component of \tilde{Y} .

(ii) Let $C(\tilde{Y}, y_1), C(\tilde{Y}, y_2)$ be the $NS^s(J)$ components of \tilde{Y} with respect to two different elements y_1, y_2 of \tilde{Y} with $y_1 \neq y_2$ respectively. If $C(\tilde{Y}, y_1) \cap C(\tilde{Y}, y_2) = \emptyset$, then we get the proof. Let $C(\tilde{Y}, y_1) \cap C(\tilde{Y}, y_2) \neq \emptyset$, we may choose $y \in C(\tilde{Y}, y_1) \cap C(\tilde{Y}, y_2)$. Clearly, $y \in C(\tilde{Y}, y_1)$ and $y \in C(\tilde{Y}, y_2)$, which mean that $C(\tilde{Y}, y_1)$ is the largest $NS^s(J)$ connected subset of \tilde{Y} containing y , $C(\tilde{Y}, y_2)$ is the largest $NS^s(J)$ connected subset of \tilde{Y} containing y . Therefore $C(\tilde{Y}, y_1) = C(\tilde{Y}, y_2)$ and hence $C(\tilde{Y}, y_1)$ and $C(\tilde{Y}, y_2)$ are identical. This completes the proof.

CONCLUSION

This paper introduced the concept of nano soft ${}^s(J)$ connectedness with soft ideals. Also their characterization are discussed. Furthermore, we defined \star - nano soft ${}^s(J)$ separation, \star - nano soft ${}^s(J)$ connected with properties and examples.

ABSTRACT

Asparagus racemosus, *Cassia tora*, and *Moringa oleifera* are just a several of the therapeutic herbs native to the Indian subcontinent. The primary goal of this study is to formulate pellets and to determine them for its nutritional value and phytochemical contents. *Asparagus racemosus*, *Moringa oleifera*, and *Cassia tora* have a lot of phytopharmacological activity. Pellets were made by Extrusion / Spheronisation is a multistage process of individual herb and evaluated for its nutritional value. Three different batches of pellets were prepared from the extracts, and it was found that the F1 batch of all the three extract shows good flow properties of pellets. So the F1 batch were selected for nutritional evaluation. These studies refer to a good prospect for herbal research to improve their contribution to the study of a drug's nutritional significance, which might help to resolve the nutritional deficiencies due to unhealthy lifestyle. In pre formulation study the crude drug, extracts were evaluated for its phytochemical screening, physicochemical parameters.

Keywords: nutritional, pellets, *Asparagus racemosus*, *Cassia tora*, *Moringa oleifera*

INTRODUCTION

Ayurveda is derived from the ancient Sanskrit terms 'ayur' (life) and 'ved' (medicine). It is one of the world's oldest surviving systems of health care (knowledge). Ayurveda is a holistic healing system based entirely on plants. These herbs have been used since Prevedic times because they are safe, affordable, and convenient [1]. Ayurveda is

**Vijaya Rabade et al.,**

achieving popularity around the world. It has an ancient legacy of herbal medicine. Ayurveda is naturally derived healing system that is based mainly on herbal medicines as its foundation. Ayurveda has turned into a mainstream healing approach in current history. The majority of disorders for which there is no treatment in the allopathic system can be successfully treated with traditional medicines[2]. *Asparagus racemosus* has been indicated as uterine tonic, thus it cleanses, nourishes, and strengthens the female reproductive system and so it is traditionally used for amenorrhea[1]. Ayurvedic literature introduce Shatavari as the major Rasayan medication. In folk medicine, it is also known as the Queen of Herbs. [2] The roots of this plant are used as a uterine tonic, galactagogue, hyperacidity treatment, and rejuvenator[1]. Moringa oil which is extracted from seeds of *Moringa oleifera* is also called as ben oil, as it has a high amount of behenic acid. It is good for topical use on the skin and the hair[3]. Flavonoids, alkaloids, saponin, and phenolic acid are some of the phytoconstituents found in *Moringa oleifera*[4]. *Cassia tora* (*Cassia obtusifolia*) is a common annual herb that grows as a weed in India. A natural gelling agent which has industrial and food application. Cassia contains sugars, resins, and mucilage, as well as cinnamaldehyde, gum, tannins, mannitol, coumarins, and essential oils (aldehydes, eugenol, and pinene)[5]. Pelletization is an agglomeration (size-enlarging) process that converts fine powders or particles of bulk pharmaceuticals and excipients into small, free-flowing, more or less spherical units known as pellets. Pelletization is a size-enlargement process that involves the production of agglomerates with a relatively limited size range, usually with a mean size of 0.5 to 2.0 mm, which are referred to as "pellets" Most pharmaceutical industry use Extrusion-Spheronization technique to produce pellets[6].

EXPERIMENTAL WORK

Extraction process

Extraction of *Cassia tora*:-[8]

35 grams of coarse powder of Chakramarda seeds (*Cassia tora* Linn) was placed inside a thimble made from thick filter paper which was loaded into the main chamber of the Soxhlet extractor. 350ml of Ethanol as extraction solvent was taken in a distillation flask and Soxhlet extractor was placed on the flask. The 4 cycle was carried out. After extraction, the Ethanol was removed and it was later dried over water bath. The final product obtained was 2.67 gram of alcoholic extract of Chakramarda. It was solid in nature.

Extraction of *Moringa oleifera* :-[9]

In the first stage of the investigation, the dried powdered leaves were macerated with (1:10) dried powdered leaves to extraction solvent ratio for 48 hours with either 95 percent ethanol, 50 percent ethanol, or water. A glass flask was filled with 100 grammes of powdered leaves, 1000 ml of either extraction solvent, and the flask was wrapped with aluminium foil and transferred to a water bath with occasional shaking. The extracts were filtered using Whatman No.1 filter paper and concentrated by rotary evaporator to around 10% of their original volume at the end of the maceration period. The marc was extracted three times using the same procedure and solvent, and the concentrated extracts were mixed. The concentrated extracts were then dried in a drying oven at 45 °C until the dry mass weight was constant. The optimal extraction solvent was determined using the dried extracts collected.

Extraction of *Asparagus racemosus*:[10]

250 g tuberous roots of *Asparagus racemosus* were pulverised, defatted with Hexane, and macerated with 90% methanol at room temperature for 24 hours. The whole methanolic extract was evaporated over a water bath to produce a concentrated liquid syrupy mass (100 mL) that was dissolved in 10% methanol.

Phytochemical evaluation: - [11]

The obtained extract were evaluated for its phytochemical screening for carbohydrates, proteins, amino acids etc.

Vijaya Rabade et al.,

TLC (Thin Layer Chromatography): [12]

The Principle of TLC is the distribution of a compound between a solid fixed phase (thin layer) placed on a glass or plastic plate and a liquid mobile phase (eluting solvent) moving across the solid phase is the basic premise of TLC.

PELLETS

Pellets are small, free-flowing, spherical particles made by agglomerating fine powders or granules of drug component and excipients with the help of appropriate processing equipment. [14]

FORMULATION OF PELLETS[6]

Extrusion / Spheronisation is a multistage process for obtaining pellets with uniform size from wet granulates (extrudates). The method involves the following main steps:

- The dry mixing of the ingredients, in order to achieve homogenous powder dispersions wet massing, in which the powders are wet mixed to form a sufficiently plastic mass.
- An extrusion stage, in which the wet mass is shaped into cylindrical segments with a uniform diameter;
- The spheronisation stage, in which the small cylinders are rolled into solid spheres (spheroids);
- The drying of the spheroids, in order to achieve the desired final moisture content;
- Screening (optional), to achieve the desired narrow size distribution.

EVALUATION OF PELLETS [8]:

Pellets are evaluated for their flow properties

Bulk density

Bulk density is defined as the total mass of the powder divided by the bulk volume and is expressed as gm/ml. This was calculated by using the formula:

$$BD = \frac{\text{Weight of powder (in gm)}}{\text{Bulk Volume of Powder (in ml)}}$$

Tapped density

It is the ratio of the powder's total mass to its tapped volume. The following calculation was used to calculate tapped density:

$$TBD = \frac{\text{Weight of powder (in gm)}}{\text{Tapped Volume of Powder (in ml)}}$$

Angle of Repose

The funnel method was used to determine it. The powder was weighed and placed in a funnel. A funnel is attached to the graph paper and fastened with its tip at a height (h) of 2 cm above the horizontal surface. The powder was carefully weighed and poured into the funnel. The powder mixture was allowed to run freely through the funnel onto the surface. The angle of repose was computed by multiplying the diameter and height of the powder cone by the following equation.

$$\theta = \tan^{-1}(h/r)$$

Where;

θ = Angle of repose

h = Height of pile cone, pile(cm)

r = Radius of the powder pile

Compressibility index /Carr's index

The Carr's index of the powder blend was determined by using the formula:

$$\text{Carr's index} = \frac{\text{tapped density} - \text{bulk density}}{\text{tapped density}} \times 100$$

**Vijaya Rabade et al.,****Hausner's ratio**

If the hausner's ratio is less than 1.25, the material is free flowing; if it is greater than 1.25, the material has poor flow ability. It was calculated using the formula:

$$\text{Hausner's ratio} = \frac{\text{tapped bulk density}}{\text{bulk density}}$$

RESULT AND DISCUSSION

All the three extracts were evaluated for phytochemical screening and it shows positive results for carbohydrates, proteins, tannins and phenolic content and alkaloids, but only *Asparagus Racemosus* shows foam test positive for saponin glycosides.

CHROMATOGRAPHIC EVALUATION OF EXTRACT

The Rf is calculated by dividing the distance the compound travelled from the original position by the distance the solvent travelled from the original position (the solvent front).

$$R_f = \frac{\text{Distance of Centre of spot from starting oint}}{\text{Distanant from solvent front from starting point}}$$

MORPHOLOGICAL EVALUATION

Crude fibre content more present in *Asparagus racemosus*(17.4%) than that of cassia tora (13.9%) and *Moringa oleifera* (7.71%). Crude protein more present in cassia tora (18.35%) than that of the *Moringa oleifera* (16.5%) and *Asparagus racemosus* (6.88). Ether extract content more present in *Cassia tora*(5.54%) than *Moringa oleifera*(2.5%) and *Asparagus racemosus*(2.14%). Total ash more present in *Cassia tora*(4.88%)and nitrogen free extract more present in *Asparagus racemosus* is about 69.52.

SUMMARY AND CONCLUSION

The detailed literature survey was done and it was found that the herbal pellets having nutritional value can be an interesting topic of research. Here nutritional pellets were prepared individually from *Cassia tora*, *Moringaoleifera* and *Asparagusracemosus* which having high nutritional profile and lower side effects. These herbal drugs are collected from DadasahebBalpande College of Pharmacy,Besa, Nagpur and authenticated from botany department Nagpur. Three batches of pellets were prepared of each drug extract and evaluated for its morphological, phytochemical, physicochemical and quantitative determination. Out of these three batches, batch F1gives best result than F2 and F3 batch. The nutritional profile of *Asparagusracemosus* contain high content of crude fibre (i.e 17.1) and *Cassia tora* has high content of crude proteins(i.e18.35).

ABSTRACT

One of the main topics of research in graph theory is graph labeling. A graph's labeling is the assignment of a number, under particular conditions, to a vertex (dots), edge (lines), or both. Important information about what the data in the graph represents is enhanced by the addition of labels. The literature defines a wide variety of labeling techniques. The most popular labeling patterns are graceful labeling, harmonious labeling, edge graceful labeling and so on. Our central focus in this paper is prime graceful labeling on shadow graphs, split graph, diamond graph, house graph, tetrahedral graph, tent graph.

Keywords: Prime labeling, Graceful labeling, Prime graceful labeling, Shadow graph and Split graph.

MSC 2010 :05C78

INTRODUCTION

Alexander Rosa initially proposed the graph labeling in 1967. α -labeling, β -labeling, and ρ -labeling are the three types of labeling that Rosa identified. Solomon Golomb later renamed β -labeling as "graceful" in 1972. More than 3000 studies have examined more than 200 graph labeling approaches throughout the internship years. A prime graceful labeling is a mathematical concept used in graph theory. Tout, Dabboucy, and Howalla invented prime labeling in 1982. While the prime graceful labeling was introduced by T.M.Selvarajan and R.Subramaniam. The study of prime graceful labeling contributes to a deeper understanding of graph properties and their mathematical structure. A graph G with p vertices and q edges is said to be prime graceful labeling, if there is an injection ϕ from

Bharani Pradeebha and Mythili

the vertices of G to $\{1, 2, \dots, m\}$ where $m = \min(2p, 2q)$ such that $\gcd(\varphi(v_i), \varphi(v_j)) = 1$ induced injective function φ^* from the edge of G to $\{1, 2, \dots, m - 1\}$ defined by $\varphi^*(v_i v_j) = |\varphi(v_i) - \varphi(v_j)|$, the resulting edge labels are distinct. The labeling is considered "graceful" because it exhibits a harmonious distribution of labels across the graph's vertices, creating an aesthetically pleasing structure. Numerous fields, including coding theory, x-ray crystallography, communication networks, and others, use graph labeling. Prime graceful labeling finds application in various areas such as coding theory, network design and scheduling problems. In this paper we focus on prime graceful labeling which is a combination of both prime labeling and graceful labeling. The definition of both labeling are varied from each other

PRELIMINARIES

Definition 2.1

Let $G = (V(G), E(G))$ be a graph with p vertices. A bijection $f: V \rightarrow \{1, 2, \dots, p\}$ is called a prime labeling if for each edge $e = uv$, $\gcd(f(u), f(v)) = 1$. A graph which admits a prime labeling is called prime graph.

Definition 2.2

Let $G = (V(G), E(G))$ be a simple, finite and undirected graph with $|V| = p$ and $|E| = q$. An injective function $f: V \rightarrow \{1, 2, \dots, p\}$ is called graceful labeling of G if all the edge labels of G given by $f(uv) = |f(u) - f(v)|$ for every $uv \in E$ are distinct. A graph which admits a graceful labeling is called graceful graph.

Definition 2.3

A graph G with p vertices and q edges is said to be prime graceful labeling, if there is an injection φ from the vertices of G to $\{1, 2, \dots, m\}$ where $m = \min(2p, 2q)$ such that $\gcd(\varphi(v_i), \varphi(v_j)) = 1$ induced injective function φ^* from the edge of G to $\{1, 2, \dots, m - 1\}$ defined by $\varphi^*(v_i v_j) = |\varphi(v_i) - \varphi(v_j)|$, the resulting edge labels are distinct.

Definition 2.4

A connected graph G 's shadow graph $D_2(G)$ is created by making two copies of G , say G' and G'' , and joining each vertex V' in G' to the neighbors of the corresponding vertex V'' in G'' .

Definition 2.5

In order to obtain the split graph of a graph G , a new vertex V' must be added to each vertex V so that every vertex adjacent to V in G is adjacent to V' . $\text{spl}(G)$ represents the resulting graph.

MAIN RESULTS

Prime Graceful Labeling on some graphs :

Theorem 3.1

$D_2(C_n)$ admits prime graceful labeling.

Proof

The shadow graph $D_2(C_n)$ has $2n$ vertices and $4n$ edges.

$$\begin{aligned} m &= \min(2p, 2q) \\ &= \min(2(2n), 2(4n)) \\ &= \min(4n, 8n) \\ m &= 4n \end{aligned}$$

The vertices of $D_2(C_n)$ are labeled from the set $S = \{1, 2, 3, \dots, 4n - 1, 4n\}$. Choose an arbitrary vertex in $D_2(C_n)$ and label it with 1. Choose last two integers from the set S . i.e, $4n - 1$ and $4n$ label it to the adjacent vertices of vertex label 1. Choose the integers from the beginning of the set S and label with the vertex adjacent to the vertex $4n - 1$ or $4n$. So that the gcd of a two consecutive vertices is 1 and edge labels are distinct.

Bharani Pradeebha and Mythili

Example

Shadow graph of $D_2(C_4)$ is a prime graceful labeling.

Prime graceful labeling of $D_2(C_4)$

Shadow graph of $D_2(C_5)$ is a prime graceful labeling.

Prime graceful labeling of $D_2(C_5)$

Theorem 3.2

$D_2(K_{1,n})$ admits prime graceful labeling.

Proof

The shadow graph $D_2(K_{1,n})$ has $2n+2$ vertices and $4n$ edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(2n + 2), 2(4n)) \\
 &= \min(4n + 4, 8n) \\
 m &= 4n + 4.
 \end{aligned}$$

In $D_2(K_{1,n})$ two vertices are adjacent with remaining n vertices. Let us label the vertices of degree n with 1 and 2 and remaining with $3, 5, 7, \dots, 2n+2$. The gcd of the end vertices of each edge is 1. The edge labels $1, 2, 3, 4, \dots$ are distinct.

Bharani Pradeebha and Mythili

Example

The shadow graph of $D_2(K_{1,2})$ permits prime graceful labeling.

Prime graceful labeling of $D_2(K_{1,2})$

The shadow graph of $D_2(K_{1,4})$ permits prime graceful labeling.

Prime graceful labeling of $D_2(K_{1,4})$

Theorem 3.3

Diamond graph permits prime graceful labelling.

Proof

The diamond graph D is a planer undirected graph with 4 vertices and 5 edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(4), 2(5)) \\
 &= \min(8, 10) \\
 m &= 8.
 \end{aligned}$$

The vertices of the graph is labeled from the set $D = \{1,2,3,4,5,6,7,8\}$. Choose an arbitrary vertex in diamond graph and label it as 1. And label the other vertex by a prime number. So that the gcd of two consecutive vertices is 1 and edge labels are distinct.

Example

Bharani Pradeebha and Mythili

Prime graceful labeling of Diamond graph

Theorem 3.4

House graph permits prime graceful labeling.

Proof

The house graph H is a simple graph with 5 vertices and 8 edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(5), 2(8)) \\
 &= \min(10, 16) \\
 m &= 10.
 \end{aligned}$$

The vertices of the graph is labeled from the set $H = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$. Label the vertex, roof of the house graph H with 9 from the vertex set. And label the other vertices with prime number like 1, 3, 5, 7. So that the gcd of two consecutive vertices of each edge is 1 and resulting edge labels are distinct.

Example

Prime graceful labeling of House graph

Theorem 3.5

$Spl(K_{1,n})$ permits prime graceful labeling.

Proof

The $Spl(K_{1,n})$ contains $2n + 2$ vertices and $3n$ edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(2n + 2), 2(3n)) \\
 &= \min(4n + 4, 6n) \\
 m &= 6n.
 \end{aligned}$$

Label the vertex having degree $2n$ of $K_{1,n}$ with 1 and label the vertex having degree n with $(6n - 5)$. And label the remaining vertices with remaining numbers from the set $2, 3, \dots, 6n$. Hence the gcd of two adjacent vertices of each edge is 1. And then edges labels are $1, 2, 3, \dots, 6n$ are distinct.

Example

The $Spl(K_{1,3})$ is a prime graceful labeling.

Bharani Pradeebha and Mythili

Prime graceful labeling of $Spl(K_{1,3})$

The $Spl(K_{1,4})$ is a prime graceful labeling.

Theorem 3.6

Tetrahedral graph permits prime graceful labeling.

Proof

The tetrahedral graph, T is a graph with four vertices and six edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(4), 2(6)) \\
 &= \min(8, 12) \\
 m &= 8.
 \end{aligned}$$

The vertices of the graph is labeled from the set $\{1,2,3,4,5,6,7,8\}$. Label the center vertex of the graph with number 7 and labeling the remaining vertices with prime numbers from the set. Eg: 1,2,3,5. So that the gcd of a consecutive vertices is 1 and each edges are labeled with distinct numbers.

Example

Prime graceful labeling of Tetrahedral graph

Bharani Pradeebha and Mythili

Theorem 3.7

Tent graph permits prime graceful labeling.

Proof

The graph is an undirected graph with six vertices and nine edges.

$$\begin{aligned}
 m &= \min(2p, 2q) \\
 &= \min(2(6), 2(9)) \\
 &= \min(12, 18) \\
 m &= 12.
 \end{aligned}$$

The vertices of the graph are labeled from the set $T = \{1,2,3,4,5,6,7,8,9,10,11,12\}$. Three vertices are of the degree four and the remaining three vertices are of degree three. The vertices with degree 4 are labeled by a prime number i.e., 1,2 and 5. The vertex with degree two are labeled by odd numbers i.e., 7,9 and 11. Hence the gcd of the any two adjacent vertices is 1 and each edges is labeled by distinct numbers from the set.

Example:

Prime graceful labeling of Tent graph

CONCLUSION

In this paper the concept of the prime graceful labeling and proof of the existence of prime graceful labeling for graphs such as shadow graph $D_2(C_n)$, shadow graph $D_2(K_{1,n})$, split graph $Spl(K_{1,n})$, diamond graph, house graph, tetrahedral graph, tent graph.

ABSTRACT

Plastic waste contributes to the major part of environmental pollution. In order to reduce the use of single use plastic this work has been conducted. Jackfruit is consider to cure various health issues. The raw material was collected and made into fine powder for further processing. The processed jackfruit flour was studied for both physical and functional properties. The conversion process allows the bio-degradable product to withstand the mechanical properties.

Keywords: Jackfruit seed powder, Bio-degradable, Cytotoxicity, Anti-microbial, NMR

INTRODUCTION

Plastic cutlery are produced in a large scale to meet the worldly demand of plastic utensils. About 350 million tons of plastic are produced every year world wide using the raw materials like coal, natural gas, salt and crude oil which as the great impact on environment and out of which India produces 3.4 million tons of plastic waste and only 30% of them are treated and recycled. Biodegradable plastic was one of the best alternative for plastic as they are produced using raw materials like vegetable oils and fat, corn starch, rice straw, recycled food waste and wood-chips. Bio-plastic are eco-friendly as they degrade completely when treated in a proper compost.

Sources used for biodegradable, edible Cutlery

The common food sources are basically used for production edible cutlery, some of the common raw materials include rice flour, wheat flour, corn flour, sorghum, millet and so on.

Jenifer Suyaraj and Priya R. Iyer

Spoon making

The raw material and binding agent was collected and suspended in water. It is made by the method of casting or suspending the flour paste over the spoon mold and subject it to baking process. Spoon are commonly used for holding and handling the food particles. It can also be used to increase the nutritional value on bases of need, further can be developed into fork, chop sticks, plates, bowls, cups.

MATERIALS AND METHODOLOGY

Collection of the sample

The jackfruit is considered to be the largest fruit in India, and available almost in many places. It is consumed in both the form either raw or ripened. It has so many health benefits. The jackfruit seed was purchased online and then dried and made into fine powder. The binding agent gum acacia was also purchased on amazon. The binder is commonly used preparing food items to maintain the binding capacity, one of the examples include ladoo.

Preparation of sample

The jackfruit seed powder and the binder were treated using the drinking water in order to make them into a fine homogeneous mixture and the sample was casted over the mold and subjected to baking.

Phytochemical analysis

The sample plant extraction was subjected to both qualitative and quantitative analysis.

Preparation of the plant extract

The sample were extracted in two ways one was cold extraction where the sample was soaked in distilled water over night for aqueous extraction. The second is the heat extraction where the sample is subjected to heat along with the solvent ethanol, using the soxhlet and the temperature was set at 65°C. The extraction were used to study the phytochemical analysis for both qualitative and quantitative

Qualitative Analysis

Detection of alkaloid- The extract was treated with Dragendroff's reagent. Formation of red precipitate indicates the presence of alkaloids

Detection of carbohydrates- The extract was treated with 2 drops of alcoholic α -naphthol solution in a test tube. Formation of the violet ring at the junction indicates the presence of carbohydrates

Detection of glycosides- To 2ml of the extract, the glacial acid containing a drop of FeCl_3 is added in drops. Formation of brown colour ring indicates the presence of glycoside.

Detection of cardiac glycosides- The extract was treated with sodium nitropruside in pyridine and sodium hydroxide. Formation of pink to blood red colour indicates the presence of cardiac glycosides.

Detection of saponins- The froth test was done by diluting the sample with 20ml of distilled water and shaken in a cylinder for 15 minutes. Formation of 1cm layer of foam indicates the presence of saponins.

Detection of phytosterols- The extract were treated with chloroform and filtered. The filtrates were treated with few drops of conc. Sulphuric acid. The mixture was shaken and allowed to stand. Appearance of golden yellow colour indicates the presence of triterpenes.

**Jenifer Suyaraj and Priya R. Iyer**

Detection of phenol- The sample was treated with few drop of ferric chloride solution. Formation of bluish black colour indicates the presence of phenols.

Detection of tannins- The gelatin solution containing sodium chloride was added to the extract. Formation of white precipitate indicates the presence of tannins.

Detection of flavonoids- The extract was treated with few drops of sodium hydroxide solution. Appearance of intense yellow colour, which becomes colourless on addition of dilute acid. Indicates the presence of flavonoids.

Detection of amino acid- The extract was treated with ninhydrin reagent and kept in the boiling water bath for few minutes. Appearance of blue colour indicates the presence of amino acid.

Detection of protein- The extract was treated with few drops conc. nitric acid. Formation of yellow colour precipitate indicates the presence of proteins.

Detection of diterpenes- The extract was treated with 3-4 drops of water. To which the copper acetate solution was added. Formation of emerald green colour indicates the presence of diterpenes.

Quantitative Analysis

Total tannin content determination- To 0.5ml of sample, 3ml of distilled water and 0.5ml of Folin's reagent was added. The extract was treated further with 0.5ml sodium carbohydrate and incubated for 10 minutes at room temperature. Absorbance read at 725nm

Total protein content determination- The sample was taken in an amount 0.1ml and made up-to 1ml using phosphate buffer. To which about 5ml of Bradford reagent was added. The absorbance read at 595nm

Total alkaloid content determination- To 1ml of the sample, 2ml of Dragendroff's reagent was added and centrifuged at 10,000 rpm for 10 minutes. After which thiourea is added to 1ml of the supernatant. The absorbance was read at 435nm

Total phenol content determination To 0.2ml of sample, 0.8ml of folin ciocalteu and 2ml of 7.5% sodium carbonate were added. Dilute the sample to 7ml using distilled water. Incubate the samples to dark for 2 hours. Absorbance read at 765 nm.

Total amino-acid content determination-0.2ml of the sample was made up-to 2ml using distilled water. To which 2ml of ninhydrin was added and placed on the water bath for 15minutes. After cooling to normal temperature add 3ml ethanol. The O.D was read under 570nm

Total steroid content determination- To 1ml extract, 2ml of sulphuric acid, 2ml of iron III chloride and 0.5 ml of potassium hexa cyanoferate III was added. Kept in water bath for 30 minutes. The O.D is read at 780nm.

Total flavonoid content determination- To 1ml of the sample, 4ml of distilled water, 0.3ml of sodium nitrite, 2ml of sodium hydroxide were added. The content was diluted in 10ml distilled water. And the absorbance was read at 510nm.

**Jenifer Suyaraj and Priya R. Iyer**

Total terpenoid content determination- To 2.5ml of the extract, 2.5ml of phosphomolybdic was added. The content was incubated for 30 minutes, and then made upto 12.5ml using ethanol. Absorbance read at 700nm.

Total glycoside content determination- To 1ml of the extract, 4ml of alkaline picrate. was added. The content was boiled for 5 minutes. The absorbance was read at 490nm

Total carbohydrate content determination. The extract was treated with 5ml of anthrone reagent and mixed well. The tubes were incubated in boiling water bath for about 10 minutes. Absorbance was read at 620 nm.

Total saponin content determination- The 0.1g of freeze dried sample was diluted in methanol. To which 0.2ml of aliqurot was added for determination. After which 2.5ml of vanillin reagent and 2.5ml sulphuric acid was added to the content mixed well. Kept in water bath for about 10minutes. The content is cooled and then read at 544nm.

Preparation of the spoon

Jackfruit seed powder + acacia gum powder + water

Cast over the spoon mould

Baked at 120°C for 5-8 minutes

Anti-microbial testing

The product was tested against five different organisms to check for the potential of the product to withstand against the microbes. The MHA media was prepared in a sterile condition. All the glassware required were sterilized using autoclave. The media was poured onto the petri plates left to solidify and later streaked with the organisms. The sample were placed along the side with control Meropenem. Incubated overnight for about 24hrs, after which the result were studied.

Interaction with water

The stability of the product was tested by keeping the spoon immersed in both the hot as well as normal water and the changes occurring were noted periodically by checking the time at which it turns to be soggy. The spoons were soaked in two different beaker one having hot water and the other with normal water. The time was checked periodically to note down the stability of the spoon.

Fourier transform infrared

It is the most common type of spectroscopy that runs on the principle of infrared radiation. The IR passes through the sample and the observed radiation is recorded. The analysis was preformed to study the characteristics of the functional group present in the sample.

Nuclear mass resonance

The solid state NMR is basically used to study the structure of the compounds. It results in the orientation-dependent interaction. It runs on the principal of every magnetic spin is coupled to every other magnetic spin. The

**Jenifer Suyaraj and Priya R. Iyer**

proton and carbon resonance frequencies were 400.07 and 100.61 MHz respectively. (Sundarraj, A.A., and Ranganathan, T.V., 2017). The sample was packed 4mm diameter zirconia rotor with Kel-F cap. Magic Angle Spinning (MAS) spectra of the sample were recorded at room temperature using a double resonance 4mm MAS probe, cross polarization or total side band suppression experiment was performed at a spinning speed of 5 kHz for the sample to get side band free spectrum. Typically, 1024 scans were acquired with a relaxation delay of 3.5s. The contact time of 3 ms and a H 90° pulse length of 4 μ s were used, SPINAL-64 decoupling sequence was used to decouple protons during the acquisition by employing radio frequency field strength of 83 kHz.

Tensile strength

The tensile strength were studied to check the period of elongation and the ability of the product to withstand the breaking force, breaking strength using the uni-axial tensile test (Perotto, G., et al 2018).

Chemical characteristics

Detection of lipid- 2 ml of the sample was taken in a test tube. To which few drops of Sudan black was added. Appearance of black colour indicates the presence of lipid

Anti-oxidant

It is to analyse the neutralizing chemicals that reduce the oxidative damage by reacting with the free radicals and letting them pass through without any harm to the biological system. About 20 μ l of sample extract was taken in an eppendorf. The extract was made up-to 40 μ l using DMSO and 2.96ml of DPPH(0.1mM). The mixture was incubated in dark at room temperature for 20 minutes. And the absorbance was read at 517nm for the sample using 3ml of DPPH as control

Cytotoxicity

The cells were maintained in minimal essential media in a humidified atmosphere of CO₂ at 37°C. 1 mg of sample dissolved in 1 ml of serum free MEM/DMSO. The stock is prepared fresh and filtered through 0.45 μ filter before each assay. Working concentration of the sample was prepared at the range between 1000 μ g - 7.8 μ g. Cells were plated in 24 well plates and incubated at 37°C with 5% CO₂. After incubation sample were removed from the well and washed using phosphate buffered saline or MEM was incubated for 4 hours. To which 1 ml of DMSO was added in all the wells. The absorbance was read at 570 nm with ELISA reader using DMSO as the blank

Bio-degradation analysis

The soil was taken out and a small size pit was made. The spoon was kept inside and covered with soil.

RESULTS AND DISCUSSION**Collection of sample**

The sample jackfruit seed powder was collected from the online mart. The jackfruit seed of 500kg was collected and acacia powder of 250kg was collected.

Preparation of sample

The sample jackfruit seed powder was mixed with acacia gum resin powder using drinking water and made into a homogeneous mixture.

Phytochemical extraction

The sample was extracted in both cold extraction, by overnight and heat extraction using soxhlet apparatus.

Jenifer Suyaraj and Priya R. Iyer

Qualitative Analysis

The sample was checked for the presence alkaloid, carbohydrates, glycoside, cardiac glycoside, saponins, phytosterols, phenols, tannises, flavonoid, protein, amino acid, diterpes, are the result are tabulated below.

Quantitative analysis Table 2

Preparation of spoon

The spoon was prepared using the homogeneous mixture of the jackfruit seed powder, acacia gum and water. The mold was subjected to baking.

Anti-microbial Testing

The anti-microbial activities of jackfruit seed was evaluated by swab method against five different organisms, and found to be positive. The sample showed zone of clearance for *E.coli* 10 mm, *Aspergillus* species 14 mm, *Pseudomonas* species 6 mm. *Streptococcus* species and *Staphylococcus* species were found to be negative. The results were similar to the studies reported by (Thevivasanthi, T., et al 2011)

INTERACTION WITH WATER

The spoon was kept immersed in the hot and normal (chill) water and results were found to be positive.

Fourier transform infrared

The sample jackfruit seed was analyzed for FTIR spectrum. The peak for the functional group was obtained. The result was similar to the study obtained using nano sized powder of jackfruit seed. (Thevivasanthi, T., et al 2011).

Nuclear mass resonance

The sample jackfruit seed was subjected to C13 solid state NMR, the proton and carbon resonance frequencies were 400.07 and 100.61 respectively. The result obtained was similar to the study done using jackfruit peel. (Sundarraaj, A.A., and Ranganatham, T.V., 2017).

Tensile strength.

Tensile strength is the maximum force material can withstand when being stretched with full force. Width of the spoon was found to be 10 mm. The breaking force of the sample is 4.45 kgf, breaking strength is 4.36 mm, the extension at break is 3.85%. The work is similar to the work reported, using a universal testing machine for the bio-film produced. (Perotto, G., et al 2018)

Chemical characteristics

Detection of lipid:

The sample was tested for the presence of lipid and to be positive

Anti-oxidant

The sample was tested for anti-oxidant property and found to be 19.4%.

$$\% \text{RSA} = \frac{b_{oto} - b_{ape}}{b_{oto}} \times 100$$

Cytotoxicity

The sample was tested for cytotoxicity property and found to be 75.6%. This work is similar to the study reported for toxicity using jackfruit seed. (Efendi, K., et al 2020).

$$\begin{aligned} \% \text{ Cell viability} &= \text{A570 of treated cells} / \text{A570 of control cells} \times 100 \\ &= 0.09 / 0.119 \times 100 \\ &= 75.6\% \end{aligned}$$

Jenifer Suyaraj and Priya R. Iyer

Bio-degradation testing

The sample was kept inside the soil and tested for degradation time. The time taken for the spoon to degrade was 3 weeks.

CONCLUSION

The sample of jackfruit seed powder was collected. The sample and binder was taken in correct proportion and mixed with drinking water. The homogeneous mixture was then applied on the spoon mold by applying oil, to avoid stickiness. Then the mold with sample was subjected to baking for about 5-8 minutes at 200°C. A proper spoon was made. A water absorbance test was done and the spoon was able to withstand in hot water for 20 minutes and 25 minutes in normal chill water. The spoon was further subjected to anti-microbial, anti-oxidant, and cytotoxicity. Characteristics of the spoon were analyzed through FTIR, NMR. At last the bio-degradation time for the spoon was tested by burying the spoon in soil and it took completely 3 weeks to degrade.

ACKNOWLEDGEMENT

We extend our heartfelt thanks to Dr. Anitha R. J. Singh, Dr. Anchana Devi and Dr. Preethi Jeyakumar for their wholehearted support. We also thank Dr. Lillian I. Jasper, the Principal of Women's Christian College for providing this opportunity. We would finally like to thank our families and friends for their support.

ABSTRACT

In this article, the researcher has tried to bring the notice on "Problems and Challenges faced by the Farmers in using Biofertilizers: A Study of Birbhum District of West Bengal." Researchers conducted the study in the three blocks of Birbhum district of West Bengal. The sample size for this research was 150 including both male and female farmers. The researcher has used a questionnaire as a tool for data collection in his research. Questionnaire was divided into three main parts: - 1. General section (includes general information about farmers) 2. Chemical fertilizer (awareness and use by the farmers) 3. Biofertilizer (awareness and use by the farmers). Findings of this research are; people are more aware about using chemical fertilizer than bio-fertilizer. Here, chemical fertilizers were easily available as compared to biofertilizers and only a few of the biofertilizers were used by a lesser number of farmers. In this research the participation of male farmers is higher in overall sample and very lesser farmers having soil test card means not interested for soil health checkup.

Keywords: Problems, Challenges, Bio fertilizer, Chemical fertilize.

**Rajesh Ekka**

INTRODUCTION

Agriculture plays a pivotal role in the growth and survival of nations in maintaining its quantity and quality is essential for feeding the population and economic exports. Over the years, agriculture has undergone various scientific innovations in order to make it more efficient (Ajmal et al., 2018). Modern agriculture involves the usage of pesticides and chemical fertilizers with an essence of increasing the world's food production, as these serve as fast food for plants causing them to grow more rapidly and efficiently. Continuous use of chemical fertilization leads to the decay of soil quality and fertility and might lead to the collection of heavy metals in plant tissues; affecting the fruit nutritional value and edibility (Farnia et al., 2015) from long time, the chemical pesticides and fertilizers have played a vital role in improving agricultural production. Although they have a short history in modern agriculture, their instant action and low cost managed to bring them quickly into the center of attention. Thus, their adverse effects on the environment, plant, animal and human life have diverted the priority to eco-friendly plant protection (Patel et al., 2014). Agriculture is the primary source of human nutrition, and rapid human population growth has led to the extreme intensification of agricultural systems. To address the increasing yield demand with a decrease in available agricultural land, farmers practicing conventional agriculture have been compelled to apply continually higher doses of harmful chemical fertilizers and pesticides (Foley et al., 2011). Soil pollution, particularly, that is caused by the excessive application of fertilizers and pesticides, has been identified as a priority that requires resolution within the next decade (Wardle et al., 2004). One of the present-day challenges in agriculture is eco-friendly practices. While the benefits of the green revolution have been reaped by us in terms of production, the other side of it, i.e., over usage of chemical fertilizers and its subsequent deterioration of soil health, has been realized these days. Hence, awareness of practicing organic agriculture has been taken to various spheres and products of organic agriculture are fetching up huge market. One of the organic agriculture practices includes the usage of biofertilizers in farming. Biofertilizers are likely called bioinoculants as they are the preparations containing living or latent cells of microorganisms that facilitate crop plants uptake of nutrients by their interactions within the rhizosphere once applied through seed or soil. Agriculture continues to be a main occupation for the livelihoods of rural people.

REVIEW OF RELATED LITERATURE

The term "Biofertilizers" or more appropriately "microbial inoculant" can be generally defined as preparations containing live or latent cells of efficient strains of nitrogen-fixing, phosphate solubilizing or cellulolytic microorganisms used for application to seed, soil or composting areas with the objective of increasing the numbers of such microorganisms and accelerating certain microbial processes to augment the extent of the availability of nutrients in a form which can be easily assimilated by plants. (Dogra, R. C., & Dudeja, 1993) added also that, in a larger sense, the term may be used to include all organic resources (manures) for plant growth which are rendered in an available form for plant abstraction through microorganisms or microorganisms plant associations or interactions. Recently, (SubbaRao et al., 1999) mentioned that biofertilizers are carried based preparations containing beneficial microorganisms in available state intended for seed or soil application and designed to improve soil fertility and help plant growth by increasing the number and biological activity of desired microorganisms in the root environment. Biofertilizers are ecofriendly and cannot at any rate replace chemical fertilizers that are indispensable for getting maximum yield from crops. In general, biofertilizers are environmentally friendly, low-cost agricultural inputs with maximum output. These biofertilizers are to play an important role in enhancing crop productivity through nitrogen fixation, phosphate solubilization, plant hormone productivity, ammonia excretion, siderophore formation and to control various plant disease (Tiwari et al., 1990). Agriculture is the primary source of human nutrition, and rapid and ever-increasing human population growth has led to the extreme intensification of agricultural systems. To address the increasing yield demand with a decrease in available agricultural land, farmers practicing conventional agriculture have been compelled to apply continually higher doses of harmful chemical fertilizers and pesticides (Foley et al., 2011). Soil pollution, particularly, that is caused by the excessive application of fertilizers and pesticides,

**Rajesh Ekka**

has been identified as a priority that requires resolution within the next decade (Wardle et al., 2004). In other words, there is much concern to further preserve environmental integrity and public health through the use of less intensive and more sustainable agricultural practices by reducing the inputs of chemical fertilizers, pesticides, and energy demand in general (Gomiero et al., 2011) (Pineda et al., 2010). Although mycorrhizal fungi and arbuscules have long been acknowledged to increase plant growth, (Van der Heijden et al., 2008), more recent evidence highlights the roles of plant growth-promoting rhizobacteria, root endophytic fungi, and plant growth-promoting fungi for increasing plant performance (Compant et al., 2005). Therefore, integrating beneficial microorganisms as biofertilizers is attracting growing interest in sustainable agriculture (Javaid et al., 2010). Numerous studies have additionally demonstrated that the association with soil-containing microbes can increase the resistance of plants against below-ground attack, such as that caused by soilborne fungi, bacterial pathogens, and nematodes, or aboveground herbivore attack and shoot pathogens (reviewed in Azcón-Aguilar and Barea, 1996; Pozo and Azcon-Aguilar, 2007; Pineda et al., 2010). Agriculture plays a pivotal role in the growth and survival of nations; therefore, maintaining its quantity and quality is essential for feeding the population and economic exports. Over the years, agriculture has undergone various scientific innovations in order to make it more efficient (Ajmal et al., 2018).

Modern agriculture involves the usage of pesticides and chemical fertilizers with an essence of increasing the world's food production, as these serve as fast food for plants causing them to grow more rapidly and efficiently. Continuous application of chemical fertilization leads to the decay of soil quality and fertility and might lead to the collection of heavy metals in plant tissues, affecting the fruit's nutritional value and edibility (Farnia and Hasanpoor, 2015). Hence, in recent years, many organic fertilizers have been introduced that act as natural stimulators for plant growth. A particular group of organic fertilizers includes outcomes based on plant growth-promoting microorganisms identified as 'Biofertilizers'. These biofertilizers comprise efficient strains of nitrogen fixing or phosphate solubilizing microorganisms. Organic farming has appeared as a prime concern area globally in aspect of the growing demand for safe and healthy food, durable sustainability and issues on environmental pollution associated with random use of agrochemicals (Ghany et al., 2013). The intensive agricultural farming system as practical in Egypt, where the crop rotation consists of 2 or 3 crops per year, are main reasons for the high consumption of chemical fertilizers. Intensive methods of farming and food production are having unfavorable consequences on the quality of food, the environment and on animal and human health. In these systems, agriculture is treated like other industries, with an emphasis on efficiency and maximum productivity regardless of their impacts on human health and ecology. The amount of nitrogen applied to the soil in intensive agricultural systems varies considerably, depending upon the crop being grown, the soil type, and the previous cropping history of the soil. Nowadays, the harmful effects on the environment of heavy use of N-fertilizers are becoming more evident. Furthermore, the fossil fuels which are used in the production of N-fertilizers are becoming scarcer and more expensive. Therefore, there is a great need to search for all possible avenues to improve biological nitrogen fixation and its use by farmers through bio-fertilization process (Hussein et al., 1997).

Objective of the study- To find out the awareness and usage of biofertilizers and chemical fertilizers among farmers.

MATERIALS AND METHODS

Methods: - Survey and Experiments were used for Research.

Sampling: -Survey and Soil samples were collected from three different blocks of three sub – divisions of Birbhum District; namely: -

- Muhammad Bazar Block representing Suri Sub - division
- Bolpur- ShantiniketanBlock representing Bolpur Sub - division
- Rampurhat- IBlock representing Rampurhat Sub - division

The Birbhum District is situated between 23° 32' 30" (right above the tropic of cancer) and 24° 35' 0" north latitude and 87° 5' 25" and 88° 1' 40" east longitudes, and about 4,545 square kilometres (1,755 sq. mi) in area, this district is triangular. River Ajay forms the southern base and the apex of the triangle points north. The river forms the

**Rajesh Ekka**

boundary between the districts of Birbhum and Bardhaman. The state of Jharkhand is at the northern and the western border of Birbhum and Murshidabad is at the east. Soil samples collected from three different agriculture fields from the rhizosphere region for physico-chemical analysis and pot experiment were laid out in order to study the impact of chemical and biofertilizers on the soils of three Blocks of the district covered to study the effect on growth of crop. Soil samples were collected at 15 cm depth and aseptically placed in the polythene bags, and transported immediately to the laboratory for the analysis of Physico-chemical properties like pH, EC, Organic carbon, and portion of soil was given to soil testing laboratory of agriculture deptt. Surfer for the test of N, P, K analysis. The Pot experiment was also established to study the effect of different types of chemical and biofertilizers on the germination and growth of Mung bean in plastic pots filled with different districts, soils covered under study. The above mentioned experiments were conducted in the Education Department laboratory at Vinaya Bhavana, Visva – Bharati University, Shantiniketan, India.

Tools: - A Questionnaire was used as a tool for research which was prepared researcher. Before using the tool reliability and validity was checked by the researcher.

The questionnaire was divided into three main parts

1. General section: - includes general information of farmers.
2. Chemical fertilizer, awareness and use: - by farmers of different districts.
3. Biofertilizer, awareness and use: - by farmers of different districts.

RESULTS AND DISCUSSION

In table-1: showing the survey data of farmers by gender, age and soil test. Total sample taken was 150, which contains 50 farmers from each considered block from the three Blocks of Birbhum district, of which 84% were Male and 16% were Female from Muhammad Bazar Block. Similarly, 76% were Male and 24% were Female from Bolpur-Shantiniketan Block and from Rampurhat-I Block; 64% were Male and 36% were Female farmers. So, it concludes that participation of males was higher in the overall sample. In age group of range 20-40; 40-60 and above 60 shown in table-2 indicated, 36% of 20-40 age group, 56% of 40-60 age group, 8% of above 60 ages from Muhammad Bazar Block were doing farming; Similarly, 30%, 60% and 10% of respective age groups in Bolpur-Shantiniketan Block were farmer and from Rampurhat-I Block 40%, 45% and 10% of different age group were farmer which reveal that major age group of 40-60 age people were more as compared to other two age group. From table-1, it can be concluded that soil test performed in Muhammad Bazar Block; in which 90% people responded "No" and only 10% responded "Yes" and in Bolpur-Shantiniketan Block 84% responded "No" and only 16% responded "Yes"; similarly, in Rampurhat-I only 12% responded "Yes". Hence concluded that very lesser farmers having soil test card means not interested for soil health checkup. The data depicted in Table-2 indicated that awareness about using of chemical fertilizer was 92% in Muhammad Bazar Block, 88% in Bolpur-Shantiniketan Block and 96% in Rampurhat-I Block; beside this use and awareness about biofertilizer was 4% in Muhammad Bazar, 12% in Bolpur-Shantiniketan and 4% in Rampurhat-I which was very less in number out of overall sample. Hence, found that all three blocks were more aware about using chemical fertilizer than biofertilizer. It is seen from the table-3 that the chemical fertilizers used locally in Muhammad Bazar Block mostly; Urea, Dap (di-ammonium phosphate), Bolpur-Shantiniketan Block usually; Urea, Dap, SSP (single super phosphate) and in Rampurhat-I Block; NPK, Urea, Dap, Potash is used. Similarly, In Muhammad Bazar Block Vasundhara, Bhu-shakti in Bolpur-Shantiniketan Block Rhizobium, PSB (phosphate solubilizing bacteria), Azotobacter and in Rampurhat-I Block Rhizobium, Trichoderma were some of the biofertilizers used by less number of farmers.

CONCLUSION

In developing countries, the most important challenge is to produce sufficient food for the growing population from inelastic land areas. In modern agriculture, due to heavy usage of chemical fertilizers and harmful pesticides on the

**Rajesh Ekka**

crops, sustainability of the agriculture system collapsed, cost of cultivation soared at a high rate, income of farmers stagnated, and food security and safety became a challenge. Chemical fertilizer has very toxic effects on soil properties chemical pesticides and the unavailability of organic manures have led to considerable reductions in soil health. Biofertilizers are becoming increasingly popular in many countries and for many crops. Often organic food is included to help the microbes get established. In India, soil fertility is diminishing gradually due to soil erosions, loss of nutrition, and accumulation of toxic elements, water logging and unbalanced nutrient compensation. Organic manure and biofertilizers are the alternate sources to meet the nutrient requirements of crops. The role of biofertilizers in agriculture production is of great importance. But farmers are not aware of the toxic effects of chemical fertilizer on soil and the benefits of using biofertilizers and its productivity; lack of knowledge and availability from nearby sources, and also the cost is another obstacle to use biofertilizer by farmers in place of chemical fertilizers. So, there is a need to enhance the knowledge and skill about use and benefits of using biofertilizer and about policies and subsidies related to use of biofertilizers by government.

ABSTRACT

This paper presents the development and working prototype based on ESP-32 for real-time monitoring of diverse agri-environmental variables using cost-effective sensors. Temperature, humidity, CO₂, light intensity, and rainfall are continually monitored using this system, which enables easy analysis and preventive actions for unfavourable conditions. Different sensors acquire data and broadcast it through the internet. The system is reliable and cost-effective for real-time monitoring of Agri-environment parameters.

Keywords: ESP-32, MQ-135, DHT22, LDR, Rain Sensor-KG004, IoT.

INTRODUCTION

The Earth's environment determines all living beings' health and long-term viability. Temperature, humidity, and air quality are examples of physical environment variables. Quality light and rain considerably impact health, lifestyles, and surrounding factors. These are also related to several aspects of the environment. Human health is intertwined with agri-environmental health. From various perspectives, habitat for safe living is critical, and its monitoring cannot be overstated [1]. When nations locked down and economies paused, CO₂ emissions decreased by a historic 1.9 billion tonnes in 2020, a 5.4% decrease. The World Carbon Project's research predicts that emissions will have increased by 4.9% in 2021. The study estimated that 36.4 billion tonnes of CO₂ would be emitted globally [1][2]. Worldwide, intercontinental travel and ozone-induced hemisphere air pollution put agricultural and natural

**Bhavesh Pithadiya et al.,**

ecosystems in danger and significantly impacted climate. Globally dispersed aerosols have a significant regional imbalance that alters the environment through direct and indirect radiative forcing effects [3]. Apart from that, the issues mentioned earlier significantly impact agriculture and associated fields. Temperature, humidity, air pollution, light intensity, and rain are all studied using conventional methods, which take longer, cost more and are frequently inaccurate. Furthermore, such monitoring may not be carried out on a single platform. As mobile communication networks have expanded into rural areas, real-time monitoring of environmental variables, including temperature, humidity, air pollution, light intensity, and rain, has been an economically and technologically viable option. Suppose the ecological characteristics are effectively monitored using an integrated system. In that case, it will have a wide range of applications, including agriculture, for monitoring crop health and helping make more straightforward decisions for better yields.

The Internet of Things (IoT) is rapidly growing, enabling the creation of intelligent environments, bright cyber worlds, and innovative applications [4]. The number of connected IoT devices is increasing from 9 % to 12.3 % billion globally, and cellular IoT is now surpassing the 2 billion mark [5]. This advancement is due to wireless devices, which have given rise to the Internet of Things (IoT) and allow systems to be connected and data to be communicated between them. The ability of IoT to be used for continuous observation is one of the reasons for its recent growth and appeal. This is the cornerstone for the promising work on an Internet of Things-based system for monitoring specific environmental parameters, including temperature, humidity, air pollution, natural light intensity, and rain. The proposed system acquires values of different parameters, making them accessible online as a web application. All parameter values are pushed on the web application in real-time.

SYSTEM HARDWARE

The system monitors environmental conditions and transmits the data to the cloud. More importantly, the real-time environmental parameter values are shared. Any deviation in the environmental parameters can be updated in the cloud, and anyone online can view the status. If the environmental conditions deteriorate, this mechanism can be exploited for human intervention

The block structure of the system is shown in Figure 1(a). In contrast, the circuit diagram of the system, which includes a microcontroller board, sensors, and a wireless communication protocol, is shown in Figure 1(b). At the core of the system lies the ESP-32 module. It is the only controlling component of the system and is responsible for periodic data acquisition from sensors and transmission of the same to web applications through the API gateway. Four sensors, namely, a rain sensor, a CO₂ sensor, a Light Dependent Resistor, and a temperature cum humidity sensor DHT22 are interfaced with the ESP-32 controller. Data from all sensors are read periodically and sent to the server for further visual and data analysis. The system consists of sensor networks, a processing unit, and a web server to store data that can further help enable decision-making. A description of various hardware components used is given below:

ESP-32

One of the development boards made to test the ESP-WROOM-32 module is the ESP-32 (devkit) v1. It is based on the ESP-32, a 32-bit microprocessor boasting low power consumption radio supporting Wi-Fi, Bluetooth, and Ethernet in a single chip. ESP-32 contains an on-board RF antenna, balun, power amplifier, low noise amplifier, filter, and power management module, making it a fully autonomous system [6]. The board adopts TSMC's 40nm low power technology 2.4GHz dual-mode Wi-Fi and Bluetooth chip, with the best power and radio frequency characteristics. It is safe and reliable and can be employed for various applications. Its specifications are as follows: Ten silica 32-bit Single-/Dual-core Xtensa CPU, 25 Digital I/O Pins, 6 Analog Input Pins (ADC), 2 Analog Outputs Pins (DAC), 3 UARTs, 2 SPIs, 3 I2Cs, 4 MB Flash Memory, 520kB SRAM, 80-240 MHz Clock Speed, Wi-Fi: IEEE 802.11 b/g/n/e/i.[6]

**Bhavesh Pithadiya et al.,****DHT-22**

DHT-22 comprises a high-performance 8-bit microcontroller, a humidity sensor, and an NTC-based temperature sensor. It offers excellent quality, quick response time, interference resistance, and cost-efficient temperature and humidity measurement. The measured temperature and humidity are converted to digital and calibrated before sending the duplicate serial data packets to the user. This eliminates the requirement for data conversion from analogue to digital form and calibration and, in turn, saves time and money in the process. The operating range for humidity is 0-100%RH, and for temperature, it is 40°-80°Celsius. Accuracy of humidity is $\pm 2\%$ RH and temperature ± 0.5 °Celsius [7]. The application is simple, but the data collection requires careful planning.

Light Dependent Resistor

"Photo resistor" refers to a light-activated variable resistor, an LDR or photo-conductive cell. When the intensity of the incident light increases, a photo resistor's resistance decreases(photoconductivity). A photoresistor is built of semiconductors such as Cadmium selenide or Cadmium sulphide, which have a high resistivity when not energised (with illumination). Still, the electrons are quickly activated when photons are incident, and the resistance drops [8].

MQ-135

MQ-135 Gas sensor for air quality detection or NO_x, NH₃, CO₂, Benzene, Alcohol and smoke measurement. The sensor has a digital output pin that allows the sensor to be used with or without a microcontroller, which is ideal for use with a specific gas. To measure gas in PPM, an analogue pin must be used. The sensor operates at 5 V to be used with most common microcontrollers [9].

Rain sensor-KG004

The rain sensor module includes a sensing pad and two copper tracks coated with nickel. This pad contains two header pins, which are connected internally to the copper tracks of the pad. The primary function of these two header pins is to connect the Sensing Pad with the rain sensor module with the help of two wires. Here, the rain sensor module's one pin provides a +5 V power supply toward the one path of the sensing pad, whereas the other pin gets the return power from another path of the pad[10].

SOFTWARE

Software significantly impacts the integration and operation of embedded hardware designs. Our software development is divided into hardware initialisation, configuration, and user interface development. Programming of the microcontrollers was executed in embedded C using Arduino IDE. The flow chart, shown in Figure 2, initialises sensors and then processes and conditions the signal with data acquisition. A Wi-Fi-enabled microcontroller is used as an edge device for communication with the cloud. Online monitoring systems using Wi-Fi serve as the central controller. Even by creating an HTTP link between the cloud and the edge device, measurements from multiple sensors were analysed, sampled, and saved in the server—an API [11] concatenated for sending data to web servers. The website's programming used HTML, CSS, PHP, and JAVA SCRIPT. We have used APACHE architecture MySQL for the database [12], APACHE for designing the web server and C-Panel as an operating system for the web server. It is considered the data repository, and devices with specific credentials—which establish the data's access rights—can access it. The data on the page is local and stored in the database.

RESULT

According to the input of different sensors, the results of other environmental conditions, such as rain, temperature, humidity, CO₂ gas, and light intensity, can be measured. Table 1 shows real-time values of the sensors that will help to take further action.

The results of different environmental conditions, such as temperature, humidity, CO₂ and light intensity, can be monitored based on inputs from various sensors.

**Bhavesh Pithadiya et al.,**

Table 1 depicts the response values of sensors monitored in a closed environment on the 8th day of February 2022. All stabilised points are considered to understand the adequate response. It is a continuous observation for about 20 minutes. Data was recorded by the system for a constant temperature of 24°C with 56% humidity. The highest CO₂ concentration within this duration is 342 ppm at 4:47, while the lowest was at 15:01 with 309 ppm concentration. The light variation was also monitored, with values reaching 4095 lux. Table 2 depicts the response values of sensors monitored in the closed environment at specific intervals of 24 hours for 5 consecutive days in April 2022. All stabilised points are considered to understand the adequate response. It is continuous observation, and data is recorded by the system for temperature and humidity variation. The highest CO₂ concentration within this duration was 449 ppm on 17-4-2022 at 13:30, while the lowest was on 16-4-2022 at 13:30 with 190 ppm concentration. The light variation was monitored with values almost the same for three days, 4095 lux.

CONCLUSION

The present work is based on ESP-32 module which enables wireless connectivity for monitoring different agri-environment parameters. The results obtained from the measurement have shown promising capability to monitor temperature, Relative humidity, CO₂ and rain remotely; apart from that, the system performance is quite reliable with low power consumption to monitor multiple parameters of agri-environmental. Overall, the system is simple and cost-effective, providing flexibility with the Internet of Things.

ABSTRACT

Artificial Intelligence (AI) presents immense potential for transforming the field of social work by enhancing efficiency, improving decision-making processes, and extending services to more individuals. This work explores the opportunities and challenges associated with integrating AI into social work practice. The prevalence of artificial intelligence (AI) in social work is on the rise, with applications ranging from risk assessments and crisis intervention to strengthening preventive measures and identifying biases in social service delivery. AI is also playing a role in social work education, predicting outcomes, and addressing issues like burnout among social workers. While there is a substantial body of literature detailing how AI aids human service professionals in assisting vulnerable populations, the ethical dimensions of practitioners' AI use within social work have not been extensively explored. This article aims to fill this gap by delving into the ethical considerations associated with the use of AI by social workers. By examining key ethical issues, such as informed consent, client autonomy, privacy, confidentiality, transparency, client misdiagnosis, abandonment, surveillance, plagiarism, dishonesty, fraud, misrepresentation, algorithmic bias, unfairness, and the use of evidence-based AI tools, we seek to shed light on the ethical implications. The article also endeavours to apply relevant ethical standards and outline a strategic framework for social workers to ensure the ethical use of AI in their practice. Through this exploration, we aim to contribute to a more comprehensive understanding of the ethical dimensions surrounding the integration of AI in social work.

Keywords: AI use within social work have not been extensively explored.

INTRODUCTION

Artificial Intelligence (AI) is increasingly permeating various facets of social work practice, presenting both opportunities and challenges. While AI holds promise in streamlining processes, improving service delivery, and enhancing outcomes for vulnerable populations, its integration raises important ethical considerations that demand careful examination. Despite the growing presence of AI in social work, there remains a notable gap in the literature regarding the nuanced ethical implications of its use by practitioners. This paper aims to address this gap by exploring the emerging ethical issues associated with the incorporation of AI in social work practice. By delving into key ethical dimensions, such as informed consent, privacy, transparency, bias, and accountability, we seek to provide insight into the complexities inherent in the intersection of AI and social work. Through an analysis of relevant literature and case studies, we aim to elucidate the ethical dilemmas faced by social workers utilizing AI tools and technologies. Furthermore, we endeavour to propose strategies and guidelines for navigating these ethical challenges, promoting responsible and ethically sound AI integration in social work practice. As AI continues to evolve and shape the landscape of social work, it is imperative for practitioners, researchers, policymakers, and stakeholders to engage in critical dialogue and reflection on the ethical implications of its use. By fostering a deeper understanding of these issues, we can strive towards harnessing the potential of AI to advance social justice, equity, and well-being while upholding the ethical principles fundamental to the profession of social work.

History and Development of AI

The history and development of artificial intelligence (AI) trace back to ancient times, but significant advancements have occurred in the past century. Here's a condensed overview of key milestones: Early Concepts (Antiquity to 20th Century): The idea of artificial beings with human-like intelligence dates back to ancient civilizations, with myths and folklore featuring automatons. In the 17th century, philosophers like René Descartes pondered the concept of mechanical thought. However, it wasn't until the 20th century that AI as a field began to take shape. Foundational Concepts (20th Century): The birth of modern AI can be traced to the Dartmouth Conference in 1956, where the term "artificial intelligence" was coined. Early pioneers like Alan Turing developed theoretical frameworks for machine intelligence, while others, such as John McCarthy, proposed the concept of AI as a scientific discipline. Early AI Systems (1950s-1960s): The 1950s and 1960s saw the development of the first AI programs, including programs that could play games like chess and checkers. The Logic Theorist, developed by Allen Newell and Herbert A.

Simon in 1956, was one of the first AI programs capable of proving mathematical theorems. Expert Systems and Knowledge Representation (1970s-1980s): In the 1970s and 1980s, AI research focused on expert systems, which utilized rules and knowledge bases to simulate human expertise in specific domains. This era also saw advancements in natural language processing and knowledge representation techniques. AI Winter (1980s-1990s): Despite initial optimism, AI research faced setbacks in the 1980s and 1990s due to overhyped expectations and underwhelming results. Funding for AI projects dwindled, leading to a period known as the "AI winter." Revival and Machine Learning (1990s-Present): The late 1990s and early 2000s witnessed a resurgence of interest in AI, driven by breakthroughs in machine learning and neural networks. Innovations such as deep learning, reinforcement learning, and big data fueled advancements in AI applications, including image recognition, natural language processing, and autonomous vehicles. Current Trends and Challenges: In recent years, AI has become increasingly integrated into various aspects of society, from healthcare and finance to transportation and entertainment. However, ethical concerns, such as bias in algorithms and the impact on employment, have emerged as significant challenges facing the field. Future Prospects: Looking ahead, the future of AI holds immense potential, with ongoing research in areas like explainable AI, AI ethics, and human-AI collaboration. As AI continues to evolve, it is poised to shape the future of technology and society in profound ways. Overall, the history of AI reflects a journey marked by innovation, setbacks, and resurgence, ultimately leading to the development of increasingly sophisticated AI systems with diverse applications and profound implications for humanity.

**Subhasheni and Sahana Fathima****AI In Social Work**

AI holds significant promise for revolutionizing various aspects of social work practice, offering opportunities to enhance efficiency, effectiveness, and accessibility of services. Here are several ways AI is being applied in social work:

1. **Risk Assessment:** AI algorithms can analyze large datasets to identify patterns and indicators of risk factors such as child abuse, domestic violence, or substance abuse. By predicting potential risks, social workers can intervene proactively to prevent harm and provide targeted support to at-risk individuals and families.
2. **Crisis Intervention:** AI-powered chatbots or virtual assistants can provide immediate support and resources to individuals in crisis, such as those experiencing mental health crises or facing homelessness. These virtual agents can offer empathetic listening, crisis de-escalation techniques, and referrals to appropriate services.
3. **Case Management:** AI systems can assist social workers in managing caseloads by automating administrative tasks, scheduling appointments, updating records, and organizing documentation. This allows social workers to focus more on direct client engagement and intervention.
4. **Decision Support:** AI-driven decision support systems can help social workers make informed decisions by analyzing complex data and providing evidence-based recommendations. For example, AI can assist in matching clients with appropriate interventions, services, or resources based on their unique needs and circumstances.
5. **Predictive Analytics:** AI algorithms can analyze historical data to predict outcomes such as recidivism rates, foster care placements, or service utilization. By forecasting future trends, social workers can allocate resources more effectively, prioritize interventions, and tailor services to meet emerging needs.
6. **Natural Language Processing (NLP):** NLP techniques can be used to analyze text data from client interviews, case notes, or social media to extract valuable insights. This can help social workers identify emerging trends, understand client sentiments, and tailor interventions accordingly.
7. **Training and Education:** AI technologies can enhance social work education by providing simulated learning environments, virtual case studies, and interactive training modules. This allows students to develop clinical skills, practice decision-making, and engage in realistic scenarios before entering the field.
8. **Ethical Considerations:** While AI offers numerous benefits, it also raises important ethical considerations in social work practice. These include issues related to privacy, confidentiality, transparency, algorithmic bias, accountability, and the potential for dehumanization or displacement of human workers.

Overall, AI has the potential to transform social work practice by improving outcomes for individuals and communities, enhancing the effectiveness of interventions, and promoting social justice and equity. However, it is essential for social workers to approach the integration of AI with careful consideration of ethical principles, human-centered values, and the unique needs and circumstances of the populations they serve.

CONCLUSIONS

In conclusion, the integration of artificial intelligence (AI) in social work holds immense potential to revolutionize the delivery of services, enhance client outcomes, and address pressing societal challenges. From risk assessment and crisis intervention to decision support and predictive analytics, AI offers a diverse range of applications that can streamline processes, improve efficiency, and expand access to resources for vulnerable populations. However, as social workers navigate the adoption of AI technologies, it is imperative to remain vigilant about the ethical considerations inherent in their use. Issues such as privacy, confidentiality, transparency, algorithmic bias, and accountability must be carefully addressed to ensure that AI interventions uphold the values of social work practice and prioritize the well-being and dignity of clients. Furthermore, social workers must approach the integration of AI with a critical lens, acknowledging its limitations and potential pitfalls. While AI can augment human capabilities and support informed decision-making, it should not replace the essential role of human empathy, compassion, and cultural competence in social work practice. As AI continues to evolve and shape the landscape of social work, ongoing research, collaboration, and dialogue are essential to navigate the complex ethical, social, and legal

Subhasheni and Sahana Fathima

implications of its use. By leveraging AI responsibly and ethically, social workers can harness its transformative potential to create positive change, promote social justice, and empower individuals and communities to thrive. In essence, AI in social work represents a powerful tool for advancing the profession's mission of promoting human well-being, social justice, and systemic change. By embracing innovation while upholding ethical principles, social workers can leverage the benefits of AI to better serve the needs of those they support and advocate for a more equitable and inclusive society.

ABSTRACT

In this paper, the FM/M/2/∞ interdependent stochastic feedback arrival model with catastrophic effect is considered. The transient solution, busy period analysis, and system characteristics are derived for this model. Using Maple software, the analytical results are numerically proven. The impact of the nodal parameter on the system's features and graphical representation is investigated.

Keywords: interdependent feedback arrival rate, interdependent catastrophic effect, infinite capacity, two-server.

INTRODUCTION

The mathematical analysis of waiting lines or queues is known as "queueing theory." In general, it is considered a branch of operations research. Data transmission, telecommunications, and so on are the applications of queueing theory. When arrival and service rates are correlated, the queueing model is said to be an "interdependent queueing model." Antline Nisha and Thiagarajan obtained results for the single server finite capacity queueing model [1]. Rakesh Kumar and Bhavneet Singh Soodan introduced the concept of correlated reneging and obtained a transient solution using the Runge-Kutta method [8]. Sasikala and Thiagarajan studied a multi-server model with finite

Gayathri and Rani

capacity in steady-state behaviour [11]. In this paper, we consider the whole system as a feedback queueing system. Also, the expected length and busy period are analysed for this model.

DESCRIPTION OF THE MODEL

$p(\lambda - \epsilon) > 0$ (average feedback arrival rate) denotes the feedback customers arrive at a counter. While the system is not empty, $(v - \epsilon)$ (average rate) denotes the interdependent catastrophic effect according to the feedback Poisson process. $2(\mu - \epsilon)$ (independently identically distributed random variables) denotes the service rates. The system's state is zero when the service begins at time $t=0$. The occurrence of the catastrophe destroys all of the available customers and has an impact on the system. The system's correlated and bivariate feedback Poisson processes are $\{X_1(t)\}$ and $\{X_2(t)\}$. The feedback Poisson distribution is,

$$Pr\{X_1(t) = px_1, X_2(t) = x_2\} = e^{-(p\lambda_i + 2\mu_i - \epsilon)t} \sum_{j=0}^{\min(px_1, x_2)} \frac{(\epsilon t)^j (p(\lambda_i - \epsilon)t)^{px_1-j} (2(\mu_i - \epsilon)t)^{x_2-j}}{j! (px_1 - j)! (x_2 - j)!}$$

$$x_1, x_2 = 0, 1, 2, \dots, i = 1, 2, \dots, 0 \leq p \leq 1$$

- (a) When the system size increases to $R-1$ from below, the feedback arrival rate is $p(\lambda_0 - \epsilon)$.
- (b) When the system size increases from R to ∞ , the feedback arrival rate is $p(\lambda_1 - \epsilon)$.
- (c) When the system size decreases from above to $r+1$, the feedback arrival rate is $p(\lambda_1 - \epsilon)$.
- (d) When the system size decreases from r to 0 and decreases from $r+1$ to $R-1$, the feedback arrival rate is $p(\lambda_0 - \epsilon)$. This process is repeated.

" $X(t)$ denotes the number of customers in the system at time t and $Q_n(t) = Pr\{X(t) = n\}$ "

The differential-difference equations of $Q_n(t)$ are,

$$Q'_0(t) = -(p(\lambda - \epsilon) + (v - \epsilon))Q_0(t) + (\mu - \epsilon)Q_1(t) \tag{1}$$

$$Q'_1(t) = -(p(\lambda - \epsilon) + (\mu - \epsilon) + (v - \epsilon))Q_1(t) + p(\lambda - \epsilon)Q_0(t) + (2(\mu - \epsilon))Q_2(t); n = 1 \tag{2}$$

$$Q'_n(t) = -(p(\lambda - \epsilon) + 2(\mu - \epsilon) + (v - \epsilon))Q_n(t) + p(\lambda - \epsilon)Q_{n-1}(t) + (2(\mu - \epsilon))Q_{n+1}(t); n \geq 2 \tag{3}$$

Let $Q_n^*(z)$ denote the Laplace transform of $Q_n(t)$.

From the equations (1), (2) and (3),

$$(z + p(\lambda - \epsilon) + (v - \epsilon))Q_0^*(z) = (\mu - \epsilon)Q_1^*(z) \tag{4}$$

$$(z + p(\lambda - \epsilon) + (\mu - \epsilon) + (v - \epsilon))Q_1^*(z) = (p(\lambda - \epsilon))Q_0^*(z) + (2(\mu - \epsilon))Q_2^*(z) \tag{5}$$

$$(z + p(\lambda - \epsilon) + 2(\mu - \epsilon) + (v - \epsilon))Q_n^*(z) - \delta_{2n} = (p(\lambda - \epsilon))Q_{n-1}^*(z) + (2(\mu - \epsilon))Q_{n+1}^*(z); n \geq 2 \tag{6}$$

From the equations (4) and (5), we get

$$Q_1(t) = \begin{cases} (p(\lambda - \epsilon))e^{-(p(\lambda - \epsilon) + (\mu - \epsilon) + (v - \epsilon))t} Q_0(t) \\ + ((2\mu - \epsilon))e^{-(p(\lambda - \epsilon) + (\mu - \epsilon) + (v - \epsilon))t} Q_2(t) \end{cases} \tag{7}$$

$$Q_2(t) = \left(\left(\frac{e^{(2(p(\lambda - \epsilon) + (v - \epsilon)) - (\mu - \epsilon))t}}{2((\mu - \epsilon))^2} \right) - \left(\frac{p(\lambda - \epsilon)}{2(\mu - \epsilon)} \right) \right) Q_0(t) \tag{8}$$

From the equation (6), we get

$$Q_{c+r}(t) = \left(\frac{1}{(p(\lambda - \epsilon))^2 I_0(at)} \right) \left((2(\mu - \epsilon))Q_c(t)C - (1 + (p(\lambda - \epsilon))Q_{c-1}(t)D) \right) \tag{9}$$

$$C = \left((2(\mu - \epsilon))^{r+1} \frac{\sqrt{\pi}}{\Gamma^{\frac{r+1}{2}} \left(\frac{t}{2a} \right)^{\frac{r}{2}} I_{\frac{r}{2}}(at)} \right)^{-1}; a = 2\sqrt{(p(\lambda - \epsilon))(2(\mu - \epsilon))}$$

Gayathri and Rani

$$\begin{aligned}
 D &= \left((2(\mu - \varepsilon))^r \frac{\sqrt{\pi}}{\Gamma(\frac{r}{2})} \left(\frac{t}{2a}\right)^{\frac{r-1}{2}} I_{r-1}(at) \right)^{-1}; c = 2; r = 1, 2, 3, \dots \\
 Q_0(t) &= \left(1 + \left(\frac{e^{(p(\lambda - \varepsilon) + (v - \varepsilon))t}}{(\mu - \varepsilon)} \right) + E \right. \\
 &\quad \left. + \left(\frac{1}{(p(\lambda - \varepsilon))^2 I_0(at)} \right) \left((2(\mu - \varepsilon))EC - (1 + (p(\lambda - \varepsilon)) \left(\frac{e^{(p(\lambda - \varepsilon) + (v - \varepsilon))t}}{(\mu - \varepsilon)} \right) D) \right) \right)^{-1} \\
 E &= \left(\left(\frac{e^{(2(p(\lambda - \varepsilon) + (v - \varepsilon)) - (\mu - \varepsilon))t}}{2((\mu - \varepsilon))^2} \right) - \left(\frac{p(\lambda - \varepsilon)}{2(\mu - \varepsilon)} \right) \right)
 \end{aligned} \tag{10}$$

ASYMPTOTIC BEHAVIOR OF THE EXPECTED LENGTH

Theorem 1

If $(v - \varepsilon) > 0$, the expected length's asymptotic behavior of $L_{S(p_i)}(t)$ is

$$L_{S(p_i)}(t) = \left(\frac{1}{v - \varepsilon} \right) \left((2n - 3)(\mu - \varepsilon) \frac{(p(\lambda - \varepsilon))^n}{n!} Q_0 \right); n \geq 2, i = 0, 1$$

$$Q_0 = \left(\sum_{n=0}^1 \frac{(p(\lambda - \varepsilon))^n}{n!} + \frac{(p(\lambda - \varepsilon))^2}{2!(\mu - \varepsilon)^3((\mu - \varepsilon) - (p(\lambda - \varepsilon)))} \right)^{-1}$$

as $t \rightarrow \infty$

Proof

The expected length $L_{S(p_i)}(t) = \sum_{n=0}^{\infty} nQ_n(t) = Q(x, t)$ at $x = 1$

Denote $Q(x, t) = \sum_{n=0}^{\infty} Q_n(t)x^n$

Adding equations (1), (2), multiplying by x^n and taking summation from $n = 0, 1$, we get

$$\sum_{n=0}^1 Q_n'(t)x^n = \begin{cases} -(p(\lambda - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon)) \sum_{n=0}^1 Q_n(t)x^n \\ + (p(\lambda - \varepsilon))x \sum_{n=0}^1 Q_{n-1}(t)x^{n-1} + (n - 2)(\mu - \varepsilon) \sum_{n=0}^1 Q_n(t)x^n \\ + \frac{(n + 1 - 2)(\mu - \varepsilon)}{x} \sum_{n=0}^1 Q_{n+1}(t)x^{n+1} + \frac{2(\mu - \varepsilon)}{x} \sum_{n=0}^1 Q_{n+1}(t)x^{n+1} \end{cases} \tag{11}$$

Multiplying equation (6.3) by x^n and taking summation from $n = 2, 3, 4, \dots$

$$\sum_{n=2}^{\infty} Q_n'(t)x^n = \begin{cases} -(p(\lambda - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon)) \sum_{n=2}^{\infty} Q_n(t)x^n \\ + (p(\lambda - \varepsilon))x \sum_{n=2}^{\infty} Q_{n-1}(t)x^{n-1} + \frac{2(\mu - \varepsilon)}{x} \sum_{n=2}^{\infty} Q_{n+1}(t)x^{n+1} \end{cases} \tag{12}$$

Adding equations (11), (12), and using the final value theorem, we get

$$L_{S(p_i)}(t) = \left(\frac{1}{v - \varepsilon} \right) \left((2n - 3)(\mu - \varepsilon) \frac{(p(\lambda - \varepsilon))^n}{n!} Q_0 \right); n \geq 2, i = 0, 1$$

$$Q_0 = \left(\sum_{n=0}^1 \frac{(p(\lambda - \varepsilon))^n}{n!} + \frac{(p(\lambda - \varepsilon))^2}{2!(\mu - \varepsilon)^3((\mu - \varepsilon) - (p(\lambda - \varepsilon)))} \right)^{-1}$$

as $t \rightarrow \infty$

Gayathri and Rani

DIFFERENTIAL DIFFERENCE EQUATIONS FOR THE BUSY PERIOD ANALYSIS

"Probability that n feedback utilities exist in the system at times t_0 and t_1 when the feedback arrival rates in faster and slower are $q_n(t_0)$ and $q_n(t_1)$ respectively. While $n = 0, 1, \dots, r - 1$, $q_n(t_0)$ exists; While $n = r + 1, r + 2, \dots, R - 1$, both $q_n(t_0)$ and $q_n(t_1)$ exist; While $n = R, R + 1, \dots$, $q_n(t_1)$ only exists. $q'_0(t_0)$ and $q'_{r+1}(t_1)$ (faster and slower rates of feedback arrivals) denote the probability density function of the busy period."

"The differential-difference equations control the system size with absorbing barriers established at zero and $r+1$ (faster and slower rates of feedback arrivals)."

$$q'_0(t_0) = -(2(\mu - \varepsilon))q_1(t_0) \tag{13}$$

$$q'_1(t_0) = -(p(\lambda_0 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_1(t_0) + 2(\mu - \varepsilon)q_2(t_0) \tag{14}$$

$$q'_n(t_0) = -(p(\lambda_0 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_n(t_0) + 2(\mu - \varepsilon)q_{n+1}(t_0) + p(\lambda_0 - \varepsilon)q_{n-1}(t_0), \quad n = 2, 3, \dots, r - 1 \tag{15}$$

$$q'_r(t_0) = -(p(\lambda_0 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_r(t_0) + 2(\mu - \varepsilon)q_{r+1}(t_0) + p(\lambda_0 - \varepsilon)q_{r-1}(t_0) + 2(\mu - \varepsilon)q_{r+1}(t_1) \tag{16}$$

$$q'_n(t_0) = -(p(\lambda_0 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_n(t_0) + 2(\mu - \varepsilon)q_{n+1}(t_0) + p(\lambda_0 - \varepsilon)q_{n-1}(t_0), \quad n = r + 1, r + 2, \dots, R - 2 \tag{17}$$

$$q'_{R-1}(t_0) = -(p(\lambda_0 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_{R-1}(t_0) + p(\lambda_0 - \varepsilon)q_{R-2}(t_0) \tag{18}$$

(because of the absorbing barrier)

$$q'_{r+1}(t_1) = -(2(\mu - \varepsilon))q_{r+2}(t_1) \tag{19}$$

(because of the absorbing barrier)

$$q'_{r+2}(t_1) = -(p(\lambda_1 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_{r+2}(t_1) + 2(\mu - \varepsilon)q_{r+3}(t_1) \tag{20}$$

(because of the absorbing barrier)

$$q'_n(t_1) = -(p(\lambda_1 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_n(t_1) + 2(\mu - \varepsilon)q_{n+1}(t_1) + p(\lambda_1 - \varepsilon)q_{n-1}(t_1), \quad n = r + 3, r + 4, \dots, R - 1 \tag{21}$$

$$q'_R(t_1) = -(p(\lambda_1 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_R(t_1) + 2(\mu - \varepsilon)q_{R+1}(t_1) + p(\lambda_1 - \varepsilon)q_{R-1}(t_1) + p(\lambda_0 - \varepsilon)q_{R-1}(t_0) \tag{22}$$

$$q'_n(t_1) = -(p(\lambda_1 - \varepsilon) + 2(\mu - \varepsilon) + (v - \varepsilon))q_n(t_1) + 2(\mu - \varepsilon)q_{n+1}(t_1) + p(\lambda_1 - \varepsilon)q_{n-1}(t_1), \quad n = R + 1, R + 2, \dots \tag{23}$$

Let $\rho_0 = \frac{p(\lambda_0 - \varepsilon)}{2(\mu - \varepsilon)}$ and $\rho_1 = \frac{p(\lambda_1 - \varepsilon)}{2(\mu - \varepsilon)}$ (faster and slower rates of feedback arrivals) denote the traffic intensities.

Multiplying (13) to (18) by z^n , and taking the summation from 0 to $R-1$, it is found that

$$E(T_0) = \frac{1}{\left(1 + \frac{v - \varepsilon}{2(\mu - \varepsilon)}\right) - \rho_0} \left(\frac{1}{p(\lambda_0 - \varepsilon)} + r \left(\frac{1}{\rho_0}\right)^r \right) \tag{24}$$

Multiplying (19) to (23) by z^n , and taking the summation from $r+1$ to ∞ , it is found that

$$E(T_1) = \frac{1}{2(\mu - \varepsilon) \left(1 + \frac{v - \varepsilon}{2(\mu - \varepsilon)}\right) - \rho_1} \left((r + 1) \left(\frac{1}{\rho_1}\right)^{r+1} + p(\lambda_0 - \varepsilon) \left(\frac{1}{\rho_1}\right)^R R \right) \tag{25}$$

PARTICULAR CASE

"Ignoring the interdependent catastrophic effect and the feedback arrival rate $p(\lambda - \varepsilon) = \lambda$, service rate $2(\mu - \varepsilon) = 2\mu$, and $p=1$, the transient solution of this model will become the M/M/2/ ∞ model."

NUMERIC EXAMPLES

EXPECTED LENGTH

FASTER RATE OF FEEDBACK ARRIVALS

"By changing the values of p and n , $L_{s(p_0)}(t)$ are calculated."

SLOWER RATE OF FEEDBACK ARRIVALS

"By changing the values of p and n , $L_{s(p_1)}(t)$ are calculated."

Gayathri and Rani

BUSY PERIOD ANALYSIS

FASTER RATE OF FEEDBACK ARRIVALS

"By changing the values of p and r , $E(T_0)$ are calculated."

SLOWER RATE OF FEEDBACK ARRIVALS

"By changing the values of p and R , $E(T_1)$ are calculated."

CONCLUSION

It is observed from the tables 2, 3, 4, 5, 6, 7, 8, and 9 that the asymptotic behaviour of expected length increases for both faster and slower rates of feedback arrivals by increasing the values of p and n while keeping the other parameters fixed. It is observed from the tables 10, 11, 12, and 13 that the expected length of the busy period decreases in a faster rate of feedback arrivals by increasing the values of p and r while keeping the other parameters fixed. It is observed from the tables 14, 15, 16, and 17 that the expected length of the busy period decreases in a slower rate of feedback arrivals by increasing the values of p and R while keeping the other parameters fixed.

ABSTRACT

Using a predetermined set of cities and their bilateral distances, the Shortest Cycling Route Problem (SCRP) seeks for the shortest route that stops in each city exactly once. Following the issues with transportation and assignment, the difficulty of the travelling salesman is covered in the assertiveness hypothesis. The shortest cycle route problem can be used to shorten a network's path. With the simplified matrix technique employed in this research, the shortest cyclic route problem with crisp, fuzzy, and intuitionistic fuzzy numbers as cost coefficients was resolved. A numerical problem is resolved by using technique, and its effectiveness is illustrated.

Key words: Type-3 Fuzzy Shortest Cyclic Route Problem, Triangular intuitionistic fuzzy numbers, and mixed constraints

Mathematics Subject Classification: 90C05, 90C10, 90C70, 03E72, 94D05

INTRODUCTION

The first person to initiate SCRPs was W.R. Hamilton in the 19th century. A sizable SCRPs has been identified as the solution by Dantzig and Fulkerson [5]. The Ones Assignment Method was introduced by Hadi Basirzadeh [6] to tackle the travelling salesman problem. In order to solve SCRPs, Sudhakar and Navaneetha Kumar [15] developed an innovative technique called as the zero-suffix technique. The SCRPs has many engineering implementations,

Ramachandran and Krishna Prabha

including communications in the design of computing networks, radio electronic devices, and planning hardware devices.

Uncertainty and exactness are triggered by variations in measurement, deviations in precision, and computation inaccuracies. We use fuzzy assignment issues rather than traditional assignment problems to distribute with this uncertainty. The extension of Zadeh's [16] fuzzy set is the intuitionistic fuzzy set (IFS) proposed by Atanassov [3,4]. Angelov[2] predicted optimization in intuitionistic fuzzy domains. The Intuitionistic fuzzy set can be utilized if it is not feasible to clarify an unclear concept by manipulating the typical fuzzy set. An element's membership in a fuzzy set is represented as a single value with an acceptance level between zero and one. Vimala et al[8] suggested three distinct approaches to explain the intuitionistic fuzzy assignment problem. Nirmala and Anju [10] developed the Traveling Salesman Problem (SCR) using Fuzzy Quantifier. Sagaya Roseline and Henry Amirtharaj [11] gave new ranking of Intuitionistic.

FuzzyNumbers.Genetic algorithms were utilized by Shweta Rana [14] to tackle the Traveling Salesman problem. Assignment and travelling salesman problems were tackled by Amit Kumar and Anila Gupta [1] leveraging coefficients as LR Fuzzy parameters. A novel method was offered by Senthil Kumar and Jahir Hussain[12,13] for tackling the Type-3 fuzzy assignment problem. Jeyalakshmi et al [7, 9] proposed RMM and OAM for disentangling Type-3 Fuzzy Shortest Cycle Route Problem.

The structure of this article is as follows. Section 1 gives an intro about SCR and literature review. Basic definitions are provided in Section 2, along with some basic interpretation on TrIFN'S, and IFS. Algorithm to Type-3 Fuzzy Shortest Cyclic Route Problem has been explained in Section 3. The aforementioned procedure is illustrated with a numerical example in section 4. The paper is concluded in Section 5.

Preliminaries

Intuitionistic fuzzy number:

Sorted exactitudes for Intuitionistic fuzzy sets were delineated from[3,4,11,12,13].

Definition 2.1.1: An IF Set Γ in X is given by $\Gamma = \{ x, \mu_{\Gamma}(x), \nu_{\Gamma}(x) / x \in X \}$ where the functions, $\mu_{\Gamma}, \nu_{\Gamma} : X \rightarrow [0, 1]$ are functions such that $0 \leq \mu_{\Gamma}(x), \nu_{\Gamma}(x) \leq 1, \forall x \in X$. For each, the numbers $\mu_{\Gamma}(x)$ and $\nu_{\Gamma}(x)$ portray the degree of membership and degree of non-membership of the element $x \in X$.

Definition 2.1.2:

A TrIFN $\tilde{\Gamma}^f$ is an intuitionistic fuzzy set in R with the subsequent membership function $\mu_{\Gamma}(x)$ and non membership function $\nu_{\Gamma}(x)$

$$\mu_{\Gamma}(x) = \begin{cases} 0 & \text{if } x \leq \alpha \\ \frac{x-\alpha_1}{\alpha_2-\alpha_1} & \alpha_1 \leq x \leq \alpha_2 \\ 1 & x = \alpha_2 \\ \frac{\alpha_3-x}{\alpha_3-\alpha_2} & \alpha_2 \leq x \leq \alpha_3 \\ 0 & x > \alpha_3 \end{cases} \quad \text{and} \quad \nu_{\Gamma}(x) = \begin{cases} 1 & x < \alpha' \\ \frac{\alpha_2-x}{\alpha_2-\alpha_1} & \alpha_1 \leq x \leq \alpha_2 \\ 0 & x = \alpha_2 \\ \frac{x-\alpha_2}{\alpha_3-\alpha_2} & \alpha_2 \leq x \leq \alpha_3 \\ 1 & x \geq \alpha_3' \end{cases}$$

Where $\alpha_1' \leq \alpha_1 \leq \alpha_2 \leq \alpha_3 \leq \alpha_3'$ and $\mu_{\Gamma}(x), \nu_{\Gamma}(x) \leq 0.5$ for $\mu_{\Gamma}(x) = \nu_{\Gamma}(x), \forall x \in R$.

This TrIFN is represented by $\tilde{\Gamma}^f = (\alpha_1, \alpha_2, \alpha_3) (\alpha_1', \alpha_2, \alpha_3')$

Definition 2.1.3: The SCR is supposed to be Type-3 F SCR or mixed FSCR if all the parameters of the TSP are crisp numbers, triangular fuzzy numbers or intuitionistic triangular fuzzy numbers.

Ranking Techniques:

Defuzzification: Defuzzification is the procedure of detecting singleton value (crisp value) which delineates the average value of the TrIFNs.

Ramachandran and Krishna Prabha

Yager’s Ranking Technique

Yager’s ranking technique which gratifies recompense, linearity, additivity properties and presumes verdicts which consists of human intuition. For a convex fuzzy number \tilde{a} , the Robust’s Ranking Index is interpreted by,

$$R(\tilde{a}) = \int_0^1 (0.5)(a^L_\alpha, a^U_\alpha) d\alpha \dots\dots\dots (1)$$

Where $(a^L_\alpha, a^U_\alpha) = \{(b - a)\alpha + a, c - (c - b)\alpha\}$ which is the α – level cut of the fuzzy number \tilde{a}

Ranking of triangular intuitionistic fuzzy numbers

The Ranking of a TrIFN $\tilde{\Gamma}^I = (\alpha_1, \alpha_2, \alpha_3) (\alpha'_1, \alpha'_2, \alpha'_3)$ is expounded by

$$R(\tilde{\Gamma}^I) = \frac{1}{3} \left[\frac{(\alpha'_3 - \alpha'_1)(\alpha_3 - 2\alpha'_1 - 2\alpha'_3) + (\alpha_3 - \alpha_1)(\alpha_1 + \alpha_2 + \alpha_3) + 3(\alpha'_3 - \alpha'_1)}{\alpha_3 - \alpha_1 + \alpha_3 - \alpha_1} \right] \dots\dots\dots (2)$$

The ranking technique [4] is: If $\mathcal{R}(\tilde{\Gamma}^I) \leq \mathcal{R}(\tilde{\Upsilon}^I)$, then $\tilde{\Gamma}^I \leq \tilde{\Upsilon}^I$ i.e, $\min\{\tilde{\Gamma}^I, \tilde{\Upsilon}^I\} = \tilde{\Gamma}^I$

Mathematical Formulation of SCRP

Mathematically a SCRP can be framed as given bellow:

Optimize

$$\sum_{i=1}^n \sum_{j=1}^n d_{ij} x_{ij} \quad (i)$$

subject to

$$\sum_{j=1}^n x_{ij} = 1, i = 1, 2, 3, \dots, n.$$

$$\sum_{i=1}^n x_{ij} = 1, j = 1, 2, 3, \dots, n.$$

$$x_{ij} = 0 \text{ or } 1, i=1, 2, 3, \dots, n. j = 1, 2, 3, \dots, n. \quad (ii)$$

Where d_{ij} is the distance from the city ‘i’ to city ‘j’, and x_{ij} is to be some positive integer or zero, and the only possible integer is one, so the condition of $x_{ij} = 0 \text{ or } 1$, is automatically satisfied .

Intuitionistic Fuzzy Branch and Bound (Penalty)

Step 1: Use the outlined ranking algorithms (1) and (2) to defuzzify the Type-3 fuzzy cost matrix (T-3 FCM) for the specified SCRP and convert the cost to precise integers..

Step 2: Locate the lowest element in each row, then take it away from that row. Row minimum refers to each element in a row that is minimum. Locate the lowest element in each column, then take it away from that row. Column minimum refers to each element in a row that is minimum.

Step 3: lower bound = row minimum + column minimum.

Step 4: Calculate the penalty of all 0’s

penalty (of each 0) = minimum element of that row + minimum element of that column.

Step 5: Find the highest possible penalty from all of these. And this will be the starting point for the new branch. If there are multiple such places, pick whichever one you want at random.

Step 6: Let branch will occur at XA, D .

There are two branches.

1. If $XA, D=0$, then we have an additional cost of say t and the lower bound becomes $LB + t$

2. If $XA, D=1$, then we can go $A \rightarrow D$

So we can't go $D \rightarrow A$, so set it to M .

Now we leave row A and column D .

Repeat steps 2 and 3 using the smaller matrix until the entire path is determined..

Step 7: Hence, we ultimately determine the final path and distance.

Ramachandran and Krishna Prabha

Arithmetical Exemplar:

Consider the given example,

	<i>P</i>	<i>Q</i>	<i>R</i>	<i>S</i>	<i>T</i>
<i>P</i>	–	(17,37,57)	(45,65,85)(25,65,105)	25	(17,37,57)
<i>Q</i>	37	–	(35,55,75)	25	37
<i>R</i>	(45,65,85)	(37,57,77)(17,57,97)	–	(45,65,85)(25,65,105)	45
<i>S</i>	25	25	(45,65,85)	–	(45,65,85)(25,65,105)
<i>T</i>	(15,35,55)	35	(27,47,67)(17,47,77)	(45,65,85)	–

Step 1:

The fuzzy numbers are renovated to crisp numbers by applying (1) and (2),

$$\begin{pmatrix} \infty & 37 & 65 & 25 & 37 \\ 37 & \infty & 55 & 25 & 37 \\ 65 & 57 & \infty & 65 & 45 \\ 25 & 25 & 65 & \infty & 65 \\ 35 & 35 & 47 & 65 & \infty \end{pmatrix}$$

The number of rows = 5 and columns = 5

	A	B	C	D	E
A	∞	37	65	25	37
B	37	∞	55	25	37
C	65	57	∞	65	45
D	25	25	65	∞	65
E	35	35	47	65	∞

We know that the sum of row minimum gives us the lower bound.

Step-2: Find out the each row minimum element and subtract it from that row

	A	B	C	D	E	
A	∞	12	40	0	12	(-25)
B	12	∞	30	0	12	(-25)
C	20	12	∞	20	0	(-45)
D	0	0	40	∞	40	(-25)
E	0	0	12	30	∞	(-35)

So, row minimum will be 155. (25+25+45+25+35=155)

Find out the each column minimum element and subtract it from that column

	A	B	C	D	E
A	∞	12	28	0	12
B	12	∞	18	0	12
C	20	12	∞	20	0
D	0	0	28	∞	40
E	0	0	0	30	∞
	(-0)	(-0)	(-12)	(-0)	(-0)

So, column minimum will be 12. (0+0+12+0+0=12)

Step 3: we get the lower bound = 155+12=167

Step 4: Calculate the penalty of all 0's

Ramachandran and Krishna Prabha

	A	B	C	D	E
A	∞	12	28	0(12)	12
B	12	∞	18	0(12)	12
C	20	12	∞	20	0(24)
D	0(0)	0(0)	28	∞	40
E	0(0)	0(0)	0(18)	30	∞

Step 5: Here maximum penalty is 24, occur at XC,E , so we choose XC,E to begin branch

Step 6: There are two branches.

1. If XC,E=0, then we have an additional cost of 24 and the lower bound becomes 167+24=191

2. If XC,E=1,

we can go C→E

So we can't go E→C, so set it to M.

Now we leave row C and column E, so reduced matrix is

	A	B	C	D
A	∞	12	28	0
B	12	∞	18	0
D	0	0	28	∞
E	0	0	∞	30

Find out the each column minimum element and subtract it from that column

	A	B	C	D
A	∞	12	10	0
B	12	∞	0	0
D	0	0	10	∞
E	0	0	∞	30
	(-0)	(-0)	(-18)	(-0)

So, column minimum will be 18. (0+0+18+0=18)

we get the lower bound = 167+0+18=185

Calculate the penalty of all 0's

	A	B	C	D
A	∞	12	10	0(10)
B	12	∞	0(10)	0(0)
D	0(0)	0(0)	10	∞
E	0(0)	0(0)	∞	30

Here maximum penalty is 10, occur at XA,D or XB,C , so we choose XA,D to begin branch

There are two branches

1. If XA,D=0, then we have an additional cost of 10 and the lower bound becomes 185+10=195

2. If XA,D=1,

we can go A→D

So we can't go D→A, so set it to M.

Now we leave row A and column D, so reduced matrix is

	A	B	C
A	∞	12	10
B	12	∞	0
C	10	0	∞

Ramachandran and Krishna Prabha

B	12	∞	0
D	∞	0	10
E	0	0	∞

Here we have 0 in every row and column. So, the lower bound remains the same i.e, $185+0=185$
Calculate the penalty of all 0's

	A	B	C
B	12	∞	0(22)
D	∞	0(10)	10
E	0(12)	0(0)	∞

Here maximum penalty is 22, occur at XB,C , so we choose XB,C to begin branch

There are two branches.

1. If $XB,C=0$, then we have an additional cost of 22 and the lower bound becomes $185+22=207$

2. If $XB,C=1$,

we can go $B \rightarrow C$

Now we leave row B and column C , so reduced matrix is

	A	B
D	∞	0
E	0	0

Here we have 0 in every row and column. So, the lower bound remains the same i.e, $185+0=185$
Calculate the penalty of all 0's

	A	B
D	∞	0(0)
E	0(0)	0(0)

we can go $D \rightarrow B$

and $E \rightarrow A$

Step 7: So our final path is $C \rightarrow E \rightarrow A \rightarrow D \rightarrow B \rightarrow C$

and total distance is $45+35+25+25+55=185$

CONCLUSION

A Type 3 IFSCR in the midst of crisp, fuzzy and Intuitionistic fuzzy is explored in this exertion. The fallouts disclose that the proposed strategies can effectively unravel the Type 3 IFSCR. This scheme is effortless to recognize and it gives a systematic procedure for unraveling SCR. These routines can be implemented in postal deliveries, television relays, job scheduling, to assign fleets of aircrafts, or assigning routes, or networking computers etc.

ABSTRACT

Antiulcer activity of a poly-herbal combination (PHCE) containing extracts of *Gymnema sylvestre*, *Momordica charantia*, *Syzygium cumini*, *Trigonella foenum*, *Psidium guajava*, *Tinospora cardifolia*, *Boerhavia diffusa*, *Coriandrum sativum*, *Andrographis paniculata*, *Mixture of Haritaki*, *Bibhitaki* and *Amalaki*, *Mixture of black pepper*, and *dry ginger* and *Withania somnifera* was assessed in rats' model. The antiulcer activity of the poly-herbal combination extract (PHCE 300 and 500 mg/kg) was tested, as well as the therapeutic efficacy of PHCE. When the results of the evaluations were compared to the control group and standard medicine, PHCE (300 and 500mg/Kg-1, p.o.) dose was found to be particularly protective against ethanol-induced, indomethacin-induced, and aspirin-induced ulcer models. *Gymnema sylvestre*, *Momordica charantia*, *Syzygium cumini*, *Trigonella foenum*, *Psidium guajava*, *Tinospora cardifolia*, *Boerhavia diffusa*, *Coriandrum sativum*, *Andrographis paniculata*, *Mixture of Haritaki*, *Bibhitaki* and *Amalaki*, *Mixture of black pepper*, and *dry ginger* and *Withania somnifera* were discovered to have antiulcer action in PHCE. According to the findings, the PHCE can be employed in the treatment and management of stomach ulcer illness.

Keywords: Gastric ulcer; Ulcer index; Poly-herbal formulation; Indomethacin; Ethanol

Rama Shankar Dubey et al.,

INTRODUCTION

People are currently taking interest towards herbal medicine due having low toxicity, low cost, and ease of access to herbs. Allopathic medications, on the other hand, have a long list of drawbacks, including stomach ulcers, liver toxicity, skin rashes, and other side effects [1]. The gastrointestinal condition of peptic ulcer disease is fairly frequent. It is caused by an imbalance between greater stomach acid secretion and defensive gastric mucosal protective function, as well as an irregular lifestyle. The goal of peptic ulcer treatment is to either reduce excess acid output or strengthen the protective effect of the stomach's gastric mucosal layer [2]. Commonly proton pump inhibitors and H₂ receptor antagonists' medicines are highest selling drugs in market which is using for the treatment and management of gastric ulcer disorders; however, both drugs have a high rate of recurrence, adverse effects, and drug interactions [3]. Ayurvedic practitioners have employed bioactive ingredients for the treatment and management of gastric ulcer disease. Secondary metabolites of natural plants, such as flavonoids, saponins, tannins, gums, and mucilage, are all bioactive substances [4]. To treat ulcers, natural medications are very effective, safer, and cost-efficient [5]. In rats, the antiulcer activity of a poly-herbal combination extract (PHCE) containing leaf extracts of *Gymnema sylvestre*, *Momordica charantia*, *Syzygium cumini*, *Trigonella foenum*, *Psidium guajava*, *Tinospora cardifolia*, *Boerhavia diffusa*, *Coriandrum sativum*, *Andrographis paniculata*, Mixture of Haritaki, Bibhitaki and Amalaki, Mixture of black pepper, and dry ginger and *Withania somnifera* was assessed [6]. Selected poly-herbal combinations have never been employed before by any researcher, and there are currently no research publications available from a literature survey. As a result, these PHCE were chosen for the treatment and management of ulcer disease. These PHCE contain a variety of therapeutically active compounds. All of these putative bioactive compounds may have good stomach ulcer protective effect and can be utilised for the management or prevention of gastric ulcer disease, according to the hypothesis behind the selection of this combination

(List of potential antidiabetic bioactive molecules having plants were given in Table 1)

MATERIALS AND METHODS

All the chemicals were analytical grade.

Collection of plant material

The plant materials like *Gymnema sylvestre*, *Momordica charantia*, *Syzygium cumini*, *Trigonella foenum*, *Psidium guajava*, *Tinospora cardifolia*, *Boerhavia diffusa*, *Coriandrum sativum*, *Andrographis paniculata*, Mixture of Haritaki, Bibhitaki and Amalaki, Mixture of black pepper, and dry ginger and *Withania somnifera* were purchased from the local market of Mandsaur, Madhya Pradesh. The plant material was authenticated by Pharmacognosist, Dr. Sandeep Kumar Singh. Plant materials were used for poly-herbal formulation (entral Ayurvedic Research Institute, Jhansi, Uttar Pradesh). Plant material was collected and washed under tap water and shade dried.

Extraction of poly-herbal formulation

Dried plant materials were coarsely grinded into a coarse powder. The coarse powder of plant material was macerated in an airtight container in 70:30 ratio of ethanol to distilled water for 15 days with regular shaking. The resulting solvent was filtered and evaporated at 40 degrees Celsius using a rotary vacuum evaporator, resulting in a poly-herbal hydroalcoholic crude extract of 150 grams after filtering and concentration of the residue. The extracted substance was chosen for the study of hepato-protective activity and stored in a cool place for further analysis. The composition of the poly-herbal materials used in the extraction process is provided below [16-18] (composition of herbal plants given in table -2)

Preliminary Phytochemical Screening

Herbal plants comprise a diverse array of bioactive compounds, such as alkaloids, glycosides, volatile oils, tannins, saponins, flavonoids, and other secondary metabolites, which are responsible for their therapeutic effects. In order to

Rama Shankar Dubey et al.,

identify the presence of both primary and secondary metabolites, the extract was subjected to a series of chemical tests [19-20].

Experimental animals

The experimental protocol involving the use of male albino Wistar rats weighing between 200 and 230 g was approved by the Institutional Animal Ethics Committee. The animals were housed in an animal facility that was sanctioned by the Committee for Control and Supervision of Animal Experiments.

Screening Models for Anti - ulcer Activity Evaluation

Acute Toxicity Studies

In compliance with animal ethical guidelines, an acute toxicity study of PHCE was conducted on adult Wistar rats. Three rats were administered a single oral dose of PHCE at a concentration of 2000 mg/kg, p.o body weight. The rats were then monitored for 1, 2, 4, 8, and 24 hours for any toxicological manifestations such as changes in behaviour, locomotion, convulsions, or mortality. Subsequently, the rats were observed for 14 days, during which their behaviour and activity patterns were closely scrutinized. No signs of toxicity were detected during the course of the study [21].

Antiulcer activity

To evaluate the antiulcer activity, the animals were divided into eight groups, each group consisting of six animals (n=6).

Ethanol-induced gastric ulcers model [22-24].

The experimental animals were allocated into four groups, each comprising six rats. Gastric ulceration was induced by administering absolute ethanol (1ml/200gm), and to prevent coprophagy, the animals were placed in specially designed cages.

Group I (Control) received 1% SCMC and ethanol.

Group II (Standard) received 10mg/kg of Omeprazole.

Group III received 300mg/kg of ethanolic polyherbal extract orally.

Group IV received 500mg/kg of ethanolic polyherbal extract orally.

Albino Wistar rats weighing between 180-250gm were individually housed in separate cages, with each cage containing six rats. The animals were fasted for 24-36 hours with unrestricted access to water before ethanol administration. Peptic ulcers were induced by administering total ethanol (1ml/200gm). Group 1 was administered only 1% SCMC, while group 2 received regular omeprazole at a dose of 10mg/kg. The third and fourth groups were given the poly-herbal hydroalcoholic extract of the polyherbal formulation at doses of 300mg and 500mg/kg, respectively. The treatment was repeated for seven days to evaluate the antiulcer activity of the compounds. On the 8th day, the drugs were orally administered 30 minutes before the administration of ethanol. After 6 hours, the rats were anesthetized with ether, and the stomach and greater curvature were incised. The stomach was then gradually cleaned under fresh water, and the inner surface was checked for any signs of ulceration. The frequency and rating of ulcers were determined microscopically using a 10X magnification lens. The mean ulcer score for each animal was expressed as the ulcer index [25] [Table 4].

Calculation of Ulcer index (UI) and percent inhibition (% I)

$$\text{Ulcer Index (UI)} = \frac{\text{Number of ulcer in control} - \text{Number of ulcer in test}}{\text{Number of animals}}$$

$$\text{Percent Inhibition (\% I)} = \frac{\text{UI of control} - \text{UI of test}}{\text{UI of control}} \times 100$$

**Rama Shankar Dubey et al.,****Indomethacin-induced gastric ulcers model**

The experimental animals were allocated into four groups, each comprising six rats. Gastric ulceration was induced by administering absolute ethanol (1ml/200gm), and to prevent coprophagy, the animals were placed in specially designed cages.

Group I (Control) received 1% SCMC and ethanol.

Group II (Standard) received 10mg/kg of Omeprazole.

Group III received 300mg/kg of ethanolic polyherbal extract orally.

Group IV received 500mg/kg of ethanolic polyherbal extract orally.

In the pre-treatment phase, omeprazole (20 mg/kg) or an extract at a dose of 300mg and 500mg/kg was administered orally (gavage) to rats daily for 21 days. On the final day, these rats were given indomethacin, a single gavage of 3mg/kg body weight for ulcer induction, 2 hours after the omeprazole or extract dose. Rats in Groups 1 and 2 were respectively dosed with vehicle or indomethacin in parallel (on the final day). Prior to indomethacin oral treatment, all rats were fasted for 24 hours and kept in wide wire mesh-bottom cages to avoid coprophagia. In addition, water access was prevented for 2 hours prior to indomethacin dosing. Four hours after the indomethacin/vehicle gavage, all rats were euthanized by chloroform and their stomachs were excised [Table 4].

Aspirin Induced Model [26-27]

The experimental animals were allocated into four groups, each comprising six rats. Gastric ulceration was induced by administering absolute ethanol (1ml/200gm), and to prevent coprophagy, the animals were placed in specially designed cages.

Group I (Control) received 1% SCMC and ethanol.

Group II (Standard) received 10mg/kg of Omeprazole.

Group III received 300mg/kg of ethanolic polyherbal extract orally.

Group IV received 500mg/kg of ethanolic polyherbal extract orally.

The animals were administered with aspirin (150 mg/kg) orally to induce ulcers, followed by 45 minutes of PHCE and the administration of omeprazole to selected animal groups as a standard medication for ulcer protection. After 5 hours, the animals were euthanized, and lesions in the gastrointestinal mucosa were observed and recorded using a microscope (10x). Gastric mucosa samples were subjected to histopathological tests, and the ulcer index was calculated to determine the ulcer score. The results obtained are presented in the table below [Table 4] [Figure 1, 2 and 3].

Histopathology

After collecting the gastric mucosa contents from each group of animals and cutting them into small pieces, the stomachs were cut into little pieces. Small stomach fragments were encased in paraffin wax and implanted. Microtome was used to cut 5m thick stomach sections, which were then mounted on glass slides using normal procedures. The tissues on the mounted slide were stained with hematoxylineosin stain (H&E), and the resulting slides were examined under a light microscope.

Statistical Analysis

The data was presented as Mean SEM. One-way ANOVA multiple comparison tests were used to analyse the results.

RESULTS AND DISCUSSIONS**Phytochemical screening [28]**

Carbohydrates, proteins, saponins, flavonoids, tannins, and glycosides were discovered in preliminary phytochemical screening of the PHCE. The outcomes are listed in the table below [Table 3].

Pharmacological Activities [29-30]**Acute Toxicity Studies**

**Rama Shankar Dubey et al.,**

Acute Toxicity Studies under observation study no signs & symptoms of toxicity were found during the acute toxicity study of PHCE after oral administration of dose up to 3000 mg/kg.

Effect of poly-herbal formulation (PHCE) on ethanol-induced gastric ulcers

Acute Toxicity Studies under Observation During the acute toxicity investigation of PHCE following oral administration of doses up to 3000 mg/kg, no signs or symptoms of toxicity were seen.

Gastric lesions induced by ethanol

PHCE concentrations of 300 and 500 mg/kg were used in the experiments. The ulcer index and % inhibition were used to calculate the anti-ulcer (ulcer preventive) activity. In comparison to control, an acute dose of PHCE 300 and 500mg/kg of body weight inhibited ulcers by 63.42 and 69.80 percent, respectively, and the ulcer index was found to be 14.700.036 and 7.0180.248. The anti-ulcer activity of the PHCE was comparable to that of a conventional medication. The conventional Sucralfate (100 mg/kg p.o.) significantly (P0.05) reduced ulcer formation, with an ulcer inhibition rate of 76.29 percent and a UI of 5.5080.164, which was similar to the PHCE 500mg/kg treated group. The PHCE-treated group had a UI of 7.0182.48 and 69.80 percent inhibition. These results indicated that PHCE was most potent as compared to other treated groups; results are shown in [Table 4] [Figure 1].

Effect of poly-herbal formulation (PHCE) on indomethacin-induced gastric ulcers [31-34]

Gymnema sylvestre, Momordica charantia, Syzygium cumini, Trigonella foenum, Psidium guajava, Tinospora cardifolia, Boerhavia diffusa, Coriandrum sativum, Andrographis paniculata, Mixture of Haritaki, Bibhitaki and Amalaki, Mixture of black pepper, and dry ginger and Withania somnifera were studied for their pharmacological potential. When PHCE and standard misoprostol (100 mcg/kg, p.o) were compared to control, the ulcer index PHCE and standard misoprostol (100mcg/kg, p.o) revealed a substantial reduction in ulcer index. The conventional misoprostol considerably (P0.05) reduced ulcer formation, with a 65.30 percent ulcer inhibition rate and a UI of 7.980.249, which was very close to the PHCE 500mg/kg treated group. The PHCE group had a 64.23 percent inhibition rate and a UI of 8.2260.231.

The anti-ulcer activity of PHCE was investigated, and it was found to be suitable for the treatment and management of GIT problems. The outcomes of the investigation backed up PHCE's pharmacological potential. The purpose of the trial was to see if PHCE could protect against gastric/peptic ulcers, the results are shown in [Table 4].

Aspirin Induced Model

The emergence of stomach lesions was suppressed in a dosage-dependent manner when PHCE was given orally at various dose levels. When compared to the negative control group, a higher dose of PHCE at 500 mg/kg b.w. showed 52.87 percent ulcer prevention with a higher dose, there was an increase in ulcer prevention. The conventional omeprazole considerably (P0.05) reduced ulcer formation, with an ulcer inhibition rate of 63.85% and a UI of 7.6850.248, which was similar to the PHCE 500mg/kg treated group. The PHCE-treated group had a UI of 8.2260.231 and a 59.96 percent inhibition. The outcomes are listed in the table below [Table 4].

Histological results [35-37]

The antiulcer efficacy of PHCE was further validated by histopathological study of rat stomach samples, which showed that it reduced congestion, oedema, and bleeding in the gastric mucosa (Figure 1). The protective effect of PHCE was investigated using histopathology of an isolated stomach. All animal groups of lesion and epithelial erosion had their histological results examined. The histological tissue observation investigation revealed that PHCE was shown to be significantly ulcer protective when compared to conventional treated animals. The number and severity of stomach ulcers in treated mice treated with PHCE extract (500 mg/kg) were compared to control and PHCE (300 mg/kg) in untreated animals, and after standard medication, histopathology results showed that PHCE 500mg provided the highest protection. The outcomes are listed in the table below [Figure 1].

PHCE 500mg has been shown to have strong ulcer-protective properties. The phytochemical analysis of PHCE revealed that it includes a wide range of beneficial chemicals. The inclusion of phenolics, flavonoids, saponins, and tannins in this PHCE may explain its anti-ulcer preventive properties. In general, we've discovered a slew of anti-

**Rama Shankar Dubey et al.,**

ulcer bioactive chemicals that have been previously identified in studies. Ethanol is often used to produce gastric ulcers in albino rats. When ethanol reaches the location of gastric mucosa, it causes vascular injury and triggers cell necrosis via increasing mucosal permeability and the release of bioactive chemicals. The effects of PHCE and standard on ethanol- and stress-induced gastrointestinal damage were studied. PHCE reduced gastrointestinal damage caused by ethanol and stress. In hcl-ethanol; indomethacin; and aspirin produced ulcer models, PHCE showed the best gastro-protection of ulcers at different doses of 300 mg/kg and 500 mg/kg, respectively. In a hcl-ethanol generated ulcer model at 500mg/kg, the best meaningful protective ulceration inhibition findings were determined to be 69 percent. The outcomes of the stomach mucosa tissue protection were validated by histological investigation. The outcomes are listed in the table below [Figure 1].

A stomach ulcer is caused by anti-*Helicobacter pylori* bacteria. It has been observed that several bioactive substances such as genistein, hesperidin, pancreatin, irisolidone, and cabreuvin have anti-ulcer action. The presence of flavonoids in PHCE could explain its gastroprotective properties. The flow of sodium and potassium ions in the lumen is increased by flavonoids, which improves ulcer healing. The tannin concentration of PHCE-500mg had an astringent effect and helped ulcers heal faster. Both of these phytoconstituents work together to improve anti-ulcer healing and protection, and tannins may compete with H₂ receptor antagonists. PHCE-500mg lowers gastric secretion and prevents acid secretion triggered by histamine production and gastric hormone in the same way that H₂ receptor antagonists like Ranitidine do. The anti-ulcer activity of PHCE could be mediated in part by its anti-acid secretion and protective effect, according to the results of the experiments. Thus, the anti-secretory and cytoprotective effect of PHCE extract can be explained in part by the presence of flavonoids and tannins. Finally, the findings of the anti-ulcer activity investigation revealed that PHCE-500mg can help with the treatment and management of gastric and intestinal ulcers [38-41].

CONCLUSION

It has been established that peptic ulcers are primarily caused by an imbalance between protective and destructive biological components. Gastric ulcers, in particular, are attributed to the misalignment of protective biological components. Based on the results of the ulcer model investigation, PHCE has demonstrated potential as a therapeutic agent in various ulcer-induced models. The cytoprotective properties of PHCE are believed to stem from the presence of bioactive chemicals with potentially therapeutic effects. However, a comprehensive investigation is necessary to elucidate the actual mechanism responsible for PHCE's antiulcer efficacy.

ACKNOWLEDGEMENT

We are grateful to the Department of Pharmaceutical Sciences, Mandsaur University, Mandsaur, Madhya Pradesh (M.P), India, for providing laboratory facilities that allowed us to conduct our research in a timely and efficient manner.

Conflict of interest

All of the authors disclose that they have no competing interests.

Table 1 List of potential antidiabetic bioactive molecules having plants

Name of plants	Phytochemicals	Pharmacological properties
<i>Gymnema sylvestre</i>	flavones, anthraquinones, d-quercitol, gymnemic acid, gymnemosides, gymnemasaponins, lupeol, β-amyrin related glycosides and stigmasterol	Antidiabetic, hepatoprotective and anti-inflammatory activities, etc [9, 10].
<i>Momordica charantia</i>	triterpenoids, saponins, polypeptides, flavonoids, alkaloids and sterols	Antifertility, antiulcer, antihyperglycemic, hepatoprotective immunomodulation, antioxidant, antimutagenic, antilipolytic, etc [11-13]
<i>Syzygium cumini</i>	anthocyanins, glucoside, ellagic acid, isoquercetin, kaemferol and myrecetin	Antidiabetic, throat infection, asthma, hepatoprotective, dysentery and ulcers, etc [14-15].
<i>Trigonella foenum</i>	ederagin glycosides. Alkaloids such as	Antidiabetic, antioxidant, anticarcinogenic,

Rama Shankar Dubey et al.,

	trigocoumarin, nicotinic acid, trimethyl cou-marin and trigonelline	hypocholesterolemic, hepatoprotective, and immunological activities, etc [16-17].
<i>Psidium guajava</i>	iso-caryophyllene, veridiflorene, farnesene, dl-limonene, δ-cadinene, α-copaene, α-humulene, τ-cadinol .	Used in problems of dental, sleeping, liver, convulsion, respiratory, wound healing, pain and treatment of diabetes mellitus, etc [18-19].
<i>Tinospora cardifolia</i>	Alkaloids, Terpenoids, Lignans, Steroids and others	Reported antioxidant, hepatoprotective, anticancer, wound treatment, anticancer and immunomodulating activity, etc [20-21].
<i>Boerhavia diffusa</i>	Alkaloids (punarnavine), rotenoids (boeravinones A to J) and flavones.	Reported used in treatment of inflammatory, stone, microbial, asthma, urine, liver, and diabetic treatment, etc [22-23].
<i>Coriandrum sativum</i>	Linalool, α-Pinene, β-Pinene, γ-Terpinene, α-Cedrene, α-Farnasene, p-Cymene, Limonene, Citronellal, Camphor Geraniol, Anethole.	Reported activity against of microbial, liver toxicity, diabetic, fatty condition, convulsion, cancer, and inflammation [24-25]
<i>Andrographis paniculata</i>	Andrographolide, and 14-deoxy-11, 12-didehydroandrographide, etc.	It is having anti-inflammatory, liver protective and management of blood pressure property, etc [26-27].
Mixture of Haritaki, Bibhitaki and Amalaki	flavonoids, alkaloids, phenols	Cardiovascular disease, blood pressure disease, poor liver function, large intestine inflammation, hepatoprotective and ulcerative colitis [28-29].
Trikatu (Mixture of <i>Piper nigrum</i> (kali mirch), <i>Zingiber officinale</i> (adhrakh) and long <i>Piper longum</i> (pippali)	Piperine, gingerols, shogaols, and paradols, oleoresins, and alkaloids.	Bioavailability enhancer, fevers, gastric and abdominal disorders, urinary difficulties, hepatoprotective, neuralgia and boils etc [30-33].

Table: 2 Composition of herbal plants for Poly-herbal extraction

Name of plants	Biological name	Quantity
1. Gudmar leaves	<i>Gymnema sylvestre</i>	100gm
2. Karela seed	<i>Momordica charantia</i>	100gm
3. Jamun seed	<i>Syzygium cumini</i>	100gm
4. Methi seed	<i>Trigonella foenum</i>	100gm
5. Amruda leaves	<i>Psidium guajava</i>	100gm
7. Giloya	<i>Tinospora cardifolia</i>	100gm
8. Punarnava	<i>Boerhavia diffusa</i>	100gm
7. Coriander leaves	<i>Coriandrum sativum</i>	100gm
8. Kalmegha leaves	<i>Andrographis paniculata</i>	100gm
9. Triphala	Mixture of Haritaki, Bibhitaki and Amalaki	100gm
10. Trikatu	Mixture of black pepper, and dry ginger	100gm
11. Aswagandha	<i>Withania somnifera</i>	100gm

ABSTRACT

The study attempts to explore the agricultural practices in early medieval Kashmir with special reference to the Karkotas, which were based on a diverse range of crops, including rice, barley, pulses, oilseeds, saffron, vegetables, grapes, and cotton. It explores the irrigation system in Kashmir, which was based on the use of rivers, lakes, and springs. The earliest irrigation systems in Kashmir were relatively simple, but they became more sophisticated over time. The early medieval period saw significant advancements in irrigation, with the construction of canals, dams, and embankments. The study provides an examination of the implications of these irrigation enhancements on agricultural output in Kashmir, asserting that the expansion of irrigation methods facilitated the cultivation of an augmented array of crops while simultaneously amplifying yield rates. It posits that the implementation of these irrigation systems provided a safeguard against the detrimental effects of droughts and flooding on agricultural produce. The study explores the significance of these irrigation systems in bolstering agricultural productivity within the valley. It provides an examination of the progressive advancements in irrigation practices, elucidating the transformation from basic to advanced irrigation structures over time.

Keywords: Kashmir, agriculture, irrigation, early historical period, early medieval period

Rashid Manzoor Bhat and Rajeshwari

INTRODUCTION

In the realm of historical studies, the agrarian economies of ancient civilizations provide a rich reservoir of data and inference. The present study takes an in-depth look at one such example, the early medieval Kashmir, which was characterised by a robust agricultural system. The essence of this study is to reconstruct the agrarian economy of that era with a particular focus on crop cultivation and irrigation techniques. The era is known for some of the revolutionary rulers like Lalitaditya, Avantivarman and their agricultural measures. With the agrarian economy being the bedrock of this society, understanding the intricacies of crop cultivation and irrigation techniques employed is critical. The agricultural practices of the period under review were well-developed and intricate, characterised by a wide array of crops and efficient irrigation methods. Through a rigorous examination of historical texts, archaeological records, and palynological evidence, this study aspires to draw a comprehensive picture of the early medieval Kashmiri agrarian economy.

Agrarian Practices and Cultivation

The prevalence of agricultural practices held significant sway in the valley, a fact derived from the manifold agricultural rituals delineated in the Nilamata Purana. It imparts a comprehensive description of various ceremonies and rites intimately linked with agricultural undertakings. Sources like *Nilamata Purana* and *Ksriparasara* mention several rituals associated with agriculture. *Ksriparasara* refers to the rituals related to the use of manures in fields and the auspicious dates for ploughing [1]. Following this, offerings were made to an extensive pantheon of deities prior to the initiation of the ploughing process in rice fields. [2] The act of sowing paddy was also interwoven with the performance of a myriad of rituals. Notably, the paddy seeds were subject to a unique purification process before sowing, involving their immersion in water, and gold was also put there for some time for the purification of the seed [3]. Analysing the agricultural potential of the valley, it becomes apparent that the terrain was highly conducive to such activities. From a literary standpoint, it is indicated that the agrarian window was predominantly limited to the summer season due to the climatic conditions of the region [4]. Despite this restriction, the valley proved remarkably prolific, producing all crops within this single season. Diversification in the type of agricultural land found in the valley is observed, reflected by the varying produce it offered [5]. The Nilamata Purana paints a vivid picture of the Kashmiri land as *adevamatrka*, signifying its potential to yield a multitude of grains without the necessity of rainfall and being resistant to the threat of famines [6]. This depiction may seem somewhat hyperbolic given the existence of references to famines [7], yet it serves to underline the extraordinary properties of certain parts of the land capable of retaining moisture, even in the absence of rains.

It is of particular interest that both the *Rabi* (winter) and *Kharif* (summer) crops in Kashmir are cultivated within the same period, commencing in March and concluding in November. This practice yields a unique agricultural framework, referred to as *ekfasli*, wherein only a single crop is harvested annually [8]. With the onset of heavy snowfall during the winter months, agricultural pursuits are restricted from March to October. Kashmir's fertile soil and plentiful water resources have long established it as a notable contributor to agricultural output, producing a surplus of food to sustain its inhabitants. Studies investigating the land system of Kashmir suggest that the valley exhibited superior agricultural conditions during the early medieval periods compared to subsequent eras [9]. This is attributed to a more efficient irrigation system during the aforementioned periods [10], resulting in reduced impact from famines [11]. It should be recognised that the aforementioned factors contributed to a higher population density and an increased number of villages during the early medieval period of Kashmir compared to later eras [12]. The process of rice cultivation involved an initial ploughing of the fields [13], with seeds sown in March and harvesting carried out in September or October [14]. Following the harvest, the valley was typically abandoned by its inhabitants [15]. The techniques employed in rice husking remain remarkably consistent with contemporary practices. Prior to the removal of the outer husk, the paddy must undergo a drying process. Evidence of this can be sourced from the Rajatarangini, where a woman is depicted observing rice drying under the sun in an outdoor courtyard [16]. Besides, the Kuttanimata refers to the *dehusking* of *sali* utilising a pestle [17] Barley, referred to as *Yava*, is among other notable crops cultivated in the valley. Unlike paddy, barley cultivation does not require particular

**Rashid Manzoor Bhat and Rajeshwari**

attention and typically thrives on higher mountain slopes.¹ Its sowing season spans from October to December, with harvesting usually taking place in June and July [18]. Other prominent agricultural products include pulses, oilseeds, saffron, vegetables, grapes, and cotton, as referenced extensively in Kashmiri texts [19]. Despite the lack of detailed references in early texts regarding the cultivation of these products, late accounts attest to their presence. The fact that these crops are frequently mentioned in regional texts indicates their cultivation during the early medieval periods. A comprehensive account is provided by Walter Lawrence, who chronicled the valley in the nineteenth century. He details the sowing of *mung* (*Phaseolus aureus*), *mah* (*Phaseolous mungo*), and *mothi* (*Phaseolus aconitifolius*) in the months of April and May [20]. These crops were often planted in rice fields not currently used for rice cultivation and ripened in September [21]. Oil seeds, particularly *tila* (*Sesamum indicum*), were sown in April and did not require manure [22]., although their yield was contingent upon soil fertility and moderate rainfall [23].

The cultivation of saffron, one of the valley's most valued crops, was largely limited to a specific area. This region, known as Padmapura (presently Pampore) [24], remains the exclusive saffron producing area, despite advances in agricultural technology. The reason for this can be attributed to the particular type of soil required by saffron plants, comprising a light ferruginous clay near the river Jhelum [25]. The Nilamata Purana employs the term 'Sa' as a general term for vegetables [26]. However, the available texts do not provide comprehensive details regarding the different varieties of vegetables cultivated in the valley during the early medieval periods. Nevertheless, the high consumption of vegetables leads to the assumption that a diverse array of leafy vegetables was grown, including cauliflower, carrot, leafstalks of the Pamposh, nymphaea lotus, and horned walnuts, among others[27]. Regarding grape cultivation, the Martand region was the primary grape-growing area in earlier times, although this later shifted to the Dal shores [28]. Cotton is mentioned in the Kuttanimata by Damodaragupta [29], but most references to its cultivation pertain to more recent periods[30]. It is grown, albeit on a smaller scale, in May, predominantly on the *Udars*, as it doesn't require significant irrigation [31] Harvesting usually occurs in September and October. It is understood that during the earlier period, cotton was produced in considerable abundance and was generally of good quality.

Advancements in Irrigation and Agricultural Practices

The agricultural output in early India was primarily reliant on the monsoon season, and irregular and insufficient rainfall led farmers to rely on irrigation. Irrigation involves the artificial application of water to soil in regions with inadequate rainfall. It reduces farmers' dependence on rainwater for agricultural purposes and plays a crucial role in the agricultural production process. Storage facilities such as large tanks and reservoirs have existed since ancient times to meet the water requirements of cultivators in different seasons. The erratic and inequitable distribution of precipitation necessitated the excavation of wells and the establishment of water conduits for irrigation purposes. In Kashmir, irrigation systems have a long-standing historical presence. The cultivation of agricultural land necessitated a systematic water infrastructure. Fortuitously, the valley is rich in water resources, which are instrumental in its economic advancement. The ancient text, *Nilamata Purana*, indicates the absence of a systematic irrigation network in Kashmir[2]. However, the phrase '*adevamatrika*' used within the text implies that the predominant sources of irrigation in the valley were lakes, rivers, and springs[3] The physical geography of Kashmir likely simplified land irrigation due to the plentiful availability of water. Supporting this notion, Lawrence observes that "due to the elevations from which water can be derived, there is scarcely any portion of the valley which cannot be irrigated" [4]. Notwithstanding this, water shortages were experienced in certain areas. Seasonal flooding in the valley, often occurring in summer when snowmelt resulted in a surge of water from the mountains, led to the banks of the river being overflowed. This resulted in the destruction of field crops, precipitating famines[5].The rulers of Kashmir took measures to protect cultivable lands from flood disasters and conserve water for irrigation. King Suvarna built the *Suvarnamanikulya* canal [6], which irrigated part of the *advin pargana* on the alluvial plateau south of the *Ramgar* river in the Kulgam district. His successor, King Damodar II, extended the irrigation system by building long stone dykes to protect against inundations[7] and constructing the *guddasetu*[8] dam to bring water into the town he built on the Damodara Suda [9]. Embankments were also erected by a minister of King Baladitya[10]to guard cultivable lands against floods, and the water was later used for irrigation. Artificial irrigation channels from ancient times can also be found on other alluvial plateaus, mainly on the *udars*[11] of Martand and Zainpur[12].

**Rashid Manzoor Bhat and Rajeshwari**

However, the work of irrigation was impeded when Mihirkula, the ruler of the sixth century AD, redirected the Chanderkulya river due to rocks in the river's course[13]. Raja Baka also built the Bakavati canal for irrigation purposes[14]. The early medieval period in Kashmir's history is renowned for significant advancements in irrigation systems, primarily driven by the region's various rulers. Among these, Lalitaditya of the Karkota dynasty has a prominent place in the annals of Kashmir for his innovative irrigation methods. His reign was characterised by the initiation of numerous schemes aimed at developing agriculture, safeguarding the country from recurring floods, and boosting production activity. Although existing historical sources do not provide a detailed account of the canals constructed during Lalitaditya's reign, they do indicate that the flourishing agriculture of the period relied heavily on regular water streams. As such, it is reasonable to conclude that Lalitaditya was instrumental in advancing the management of these water resources to enhance agricultural productivity[15]. The rulers of Kashmir faced a considerable challenge due to the region's geographical constraints, which made it challenging to create canals in certain areas. To overcome these obstacles, they sought alternatives and introduced new technological methods for water management and distribution. Lalitaditya, in particular, developed special provisions for irrigating Chakradhara (modern Tasakdar) Karewa, which involved lifting water from the river Jhelum. Kalhana, provides additional insights into these arrangements. He refers to the specific measures taken to channel the water of the Vitasta at Chakradhara [16] Moreover, he offers a comprehensive account of the construction and distribution of a series of water wheels, known as 'arhatta,' to various villages [17] These measures were conceived to augment agricultural productivity, thereby shielding the country from the devastating effects of frequent floods. Lalitaditya's wife, Ishanadevi, also contributed to the welfare of the people by digging a well known for its therapeutic properties, thereby providing relief to those afflicted with various diseases [18]. Unfortunately, the successors to Lalitaditya's throne did not continue his legacy of improving irrigation systems. This neglect led to a resurgence of flooding in the valley, highlighting the importance of sustained attention to irrigation systems for maintaining agricultural productivity and preventing natural disasters.

The significant strides made during Lalitaditya's reign in managing water resources have left an indelible mark on Kashmir's history. His innovative approaches to irrigation, combined with the implementation of new technologies, paved the way for a vibrant agricultural sector despite the region's challenging geographical constraints. Moreover, his measures to protect the country from recurring floods underscore the importance of a proactive and strategic approach to managing natural resources. Although the successors to Lalitaditya's throne failed to uphold his commitment to improving irrigation activities, the developments during his reign provide a valuable blueprint for managing water resources in regions with similar geographical constraints. Thus, Lalitaditya's contributions extend beyond the historical context, offering insights and lessons for modern resource management practices. During the Utpala Dynasty, King Avantivarman implemented a series of changes to help the suffering people. He brought the water of the Vitasta river under control to save the valley from depletion. His rule was known for introducing an agricultural revolution to the region, which had previously suffered from insufficient production and frequent floods. Suyya, the irrigation minister of King Avantivarman, made significant changes to the irrigation system. He was called the Lord of Food (annapati)[19] and was responsible for draining the Vitasta river and controlling it by constructing a stone dam and clearing its bed. This allowed him to shift the junction of the Vitasta and the Sindhu rivers[20]to their current position near Srinagar and combine the two rivers that flow through Wular lake.

Suyya built protective stone embankments for seven yojanas along the river and circular dykes to protect villages[21] His efforts, under King Avantivarman, brought new lands under cultivation and increased production, benefiting both the state and the people. They also saved the country from recurring floods and famines[22]. Frequent famines were a grim consequence of recurring floods in Kashmir. As previously mentioned, King Lalitaditya made commendable efforts to manage and utilise the accumulated water. Regrettably, his successors disregarded these public welfare initiatives, leading to devastating floods that ravaged the region. The scarcity of resources caused the price of a khari of rice to inflate to 1050 dinars in famine-stricken areas, a sum far beyond the reach of an ordinary citizen[23]This grim situation persisted until Suyya intervened. Suyya discerned that the valley's flooding was primarily due to the inadequate flow of the Vitasta river through the constricted passage near Baramulla, which was persistently being obstructed by debris falling from the adjacent hillside. The challenge lay in clearing these

**Rashid Manzoor Bhat and Rajeshwari**

obstructions and widening the river passage. To address this issue, Suyya employed a straightforward strategy. He filled many pots with money (dinars) and set sail towards Madavarajya[24] Upon reaching a village named Nandaka, which was submerged in floodwaters, he threw some of the money into the water and retreated.[22] He repeated this action at another location, Yakshadara, dispensing a large sum of money into the river[25] His actions were deemed irrational by the ministers and the public[26] However, this unusual strategy provided an unexpected opportunity for the local people to acquire money. Therefore they jumped into the river and searched for money while doing so dragged out of the river rocks[27] In a critical juncture in Kashmir's history, the region's inhabitants, spurred on by their quest for fortune, inadvertently participated in a large-scale engineering endeavour, designed and led by the clever Suyya. Enticed by pots of money that Suyya had strategically deposited in the river, people willingly plunged into the water. In their frantic searches for this unexpected windfall, they removed rocks and other debris obstructing the river's flow, clearing the mud, slush, and stone from its banks. This process was repeated for several days, gradually reducing the impediments in the river. Suyya, recognised for his engineering acumen, then constructed a temporary dam made of stones at a particular location, which allowed for the removal of the silt from the river[28] To further prevent debris from falling back into the water, embankments were erected on both sides of the river[29] This phase of the operation took an additional week, culminating in the destruction of the temporary dam[30]. Upon completing these tasks, new river beds were designed and constructed in places frequently impacted by flooding. This redirected the flow of the river towards the Mahapadma lake (known today as Wular Lake), thereby lowering the water levels. As a result, the irrigation system was enhanced, ensuring that all inhabitants received an equitable distribution of water.

Kalhana's historical account reveals that Suyya first surveyed different types of land and the specific needs of the villages, particularly those areas that were no longer reliant on rainfall [2]. This resulted in an efficient water allocation system, providing each area with water according to its unique needs and requirements. This well-planned initiative boosted agricultural output considerably[2] Suyya's efforts were not merely aimed at preventing famines but also sought to increase agricultural production on a large scale. Kalhana's records indicate a significant decrease in the price of dhanya (rice) from two hundred dinaras to just thirty-six dinaras during Avantivarman's reign, marking the lowest price ever witnessed in the valley[3] Kalhana praises Suyya's ingenuity and virtue, stating, 'neither Kashayapa nor Samkarsana (Balabhadra) bestowed those benefits which the virtuous Suyya produced with ease in that land.'[4] Moreover, Harsha, from the Lohara dynasty, is credited with the creation of Pampa Lake, identified by Stein with the present-day Pampasar[2]. This lake, home to diverse species of birds and animals, extended to the curved shores of the horizon, symbolising a milestone in the region's progress toward managing its water resources effectively[2]. The collective efforts of visionary leaders and active participation of the local people transformed the land, overcoming geographical challenges and turning them into agricultural opportunities. This period marked significant advancements in irrigation and agricultural practices, playing a pivotal role in shaping the socio-economic fabric of Kashmir.

CONCLUSIONS

The agricultural practices in Kashmir have evolved over time, with a diverse range of crops being cultivated. The irrigation system in the valley also evolved, with significant advancements being made during the early medieval period. Irrigation allowed farmers to grow a wider range of crops and increased crop yields. Irrigation also helped to protect crops from drought and flooding. The study explored the importance of astrological considerations in determining the auspicious time for commencing agricultural operations. The study analysed the role of various rituals and ceremonies in the agricultural process, including the purification of paddy seeds, the offerings to deities, and the ploughing of fields. The study finds the advancements that have been made in irrigation over time, particularly during the reigns of Lalitaditya, and Avantivarman and the measures taken by Suyya. These rulers made significant contributions to the development of irrigation in Kashmir, and their efforts helped to improve agricultural productivity and food security in the valley.
