ABSTRACT

This paper delves into pairs trading, a rule-based investment strategy known as statistical arbitrage, which exploits temporary price inefficiencies between two statistically similar assets. It aims to profit from deviations in the spread between a long position in an undervalued asset and a short position in an overvalued counterpart. Various techniques, including correlation, spread, cointegration, and Bollinger Bands, are employed to identify suitable pairs. Data sourced from the NSE encompasses 12 IT sector stocks and 12 Auto sector stocks, from which three pairs are selected based on correlation, beta values, and cointegration analysis. Cointegration regression serves as the spread, and trading strategies are devised using standard deviation bands, subsequently tested via back testing. Machine learning methodologies are then applied to forecast these strategies. The study aims to scrutinize the pair selection process and evaluate the accuracy of the implemented machine learning techniques. Employing Logistic Regression, Gradient Boosting Regression, Ridge Regression, and Random Forest models, our analysis reveals that Gradient Boosting surpasses other models in predictive performance.

Key words: Machine Learning, Pairs Trading, Cointegration, Logistic Regression, Gradient Boosting Regression, Ridge Regression, Random forest Regression

INTRODUCTION

Introduction to systematic investment strategy: The Evolution of pairs trading

Pairs trading, a sophisticated investment technique, has evolved from a niche Wall Street secret to a mainstream strategic approach embraced by savvy investors worldwide. This symmetric performance investment strategy transcends traditional market directions, offering a balanced act in the financial theater. Pairs trading emerged as a response to the limitations of traditional trading strategies, which often relied on predicting the direction of the market or the performance of individual securities. (Rao, 2013) Before the advent of pairs trading,

**Uma Bakshi and Sunil Rashinkar**

investors typically focused on fundamental analysis to make buy or sell decisions based on a company's financial health and market conditions. However, this approach carried significant directional risk, as it depended on the ability to forecast market movements accurately. The need for a more stable and market-neutral strategy became apparent, especially during periods of high volatility or when the market lacked a clear trend. Pairs trading, also known as statistical arbitrage, offered a solution by focusing on the relative performance of two correlated securities rather than their individual price movements (Anmol Agarwal, 2022)

Brief History

Pairs trading concept was developed by Nunzio Tartaglia and his team at Morgan Stanley in the late 1980s, later adopted by prominent hedge funds. It involves taking opposite positions (long and short) in two highly correlated assets profiting from temporary price discrepancies. It reduces arbitrage opportunities due to market evolution and technology advancements led to a decline in the early 2000s. A renewed interest emerged around a decade later, fueled by sophisticated methodologies and advanced research. Today, pairs trading is experiencing a revival as a versatile and resilient strategy with diverse applications.

REVIEW OF LITERATURE

(Titman, 1995) explores two ideas: overreaction (buying stocks that fell too much) and delayed reaction to broad factors (like interest rates). The study finds overreaction is the key driver, suggesting the market is not perfectly efficient as it overreacts to company-specific news. This challenges the prevailing view that contrarians profit from delayed reactions.

(Vapnik, 1999) The book emphasizes the importance of statistical learning theory, particularly Vapnik's work, for designing effective algorithms in financial applications like pairs trading and statistical arbitrage. The key is to develop models that can learn well from limited data and generalize to unseen data, a challenge addressed by VC theory which provides guarantees for real-world performance. (Nath, 2003) This research explores using pairs trading, a strategy that profits from price differences between similar assets, for U.S. government debt in the secondary market. It acknowledges the differences between government debt and stocks (equities) in this context. The strategy incorporates automatic risk controls and evaluates profitability considering transaction costs and other factors. It provides valuable insights for applying pairs trading to this specific asset class. (Vidyamurthy, 2004) two key pairs trading approaches for stocks: statistical arbitrage and risk arbitrage. Statistical arbitrage seeks to profit from temporary price discrepancies between similar stocks, while risk arbitrage focuses on exploiting price gaps between a target company and an acquirer before a merger is finalized. (Evan G Gatev, 2006) This research examines pairs trading, a strategy that identifies similar stocks and capitalizes on temporary price discrepancies between them. The study tests a distance-based method for pairing stocks and finds it profitable, generating excess returns even after transaction costs. Notably, these profits seem independent of overall market performance but are sensitive to factors like company size and style. The study raises the possibility that pairs trading profits go beyond price corrections and might even contribute to market stability.

(Datta Chaudhuri, 2015) This research proposes a three-indicator approach for short-term stock trading profits. It focuses on practical application and uses momentum (identifying trends), Bollinger Bands (volatility and reversal points), and MACD (momentum changes) to make trading decisions. This trader-centric approach aims for reasonable returns while managing risk (JEL codes G11 & G17). (Johannes Stubinger, 2018) The paper develops a pairs trading framework based on a mean-reverting Jump-Diffusion Model. It applies this framework to minute-by-minute data of S&P 500 oil companies spanning from 1998 to 2015. The strategy enables both intraday and overnight trading. Mean-Reverting-Jump-Diffusion Model is a 3 step calibration procedure to determine the spreads of all possible pair combinations during a formation period.

(Horta, 2020) This study investigates using unsupervised machine learning to find profitable pairs for pairs trading, along with forecasting models to reduce periods of losses. The research shows that these methods outperform traditional techniques and have the potential to significantly improve pairs trading strategies, especially for hedge

Uma Bakshi and Sunil Rashinkar

funds and investment banks. (Chun-Hao Chen, 2022) This research introduces AGBCPT, an advanced approach to pairs trading that builds upon a previous method (GBCPT). AGBCPT tackles limitations of the prior method by considering additional factors impacting profitability. It utilizes a genetic algorithm to optimize six key parameters affecting returns. The algorithm iteratively refines these parameters to find a combination that maximizes profit and minimizes risk. The study demonstrates AGBCPT's effectiveness through positive results on a set of stocks. (Y. -F. Chen, 2023) The paper proposes using proximal policy optimization (PPO) a deep reinforcement learning algorithm to optimize trading and stop loss boundaries. This is aimed at maximizing profit in pairs trading. A demonstration buffer is utilized to pre-train the model, enhancing the training efficacy. The method outperforms traditional strategies in terms of investment return and risk. It has been tested in both the Tiwan and United States Stock Markets, showing promising results.

Objectives

The primary objective of this research is to enhance the pairs trading strategy within the Auto Sector of the National Stock Exchange (NSE) by employing machine learning algorithms. The study aims to (i) Predict the future distance curve between cointegrated stock pairs using machine learning techniques. (ii) Determine optimal entry and exit points for long and short positions based on the predicted distance curve. (iii) Improve the decision-making process in pairs trading by reducing reliance on traditional static thresholds for mean reversion. (iv) Check for the accuracy levels of the machine learning models for the best fit.

METHODOLOGY

Introduction to Research Design

The paper selects 12 stocks from Auto sector from NSE. The beta values of the stocks were calculated. The stationarity of individual stock price data. Pairwise correlations were calculated and visualized using heatmaps and identified potential cointegrated pairs. A cointegration test was conducted to find statistically significant cointegration pairs. Defined the spread as the cointegration regression. Designed the entry and exit points for the trading strategy and used ML to find the accuracy of the strategies.

Calculate spread using regression

$$\text{spread} = y - (\text{beta} * x + \text{alpha})$$

where x and y are the stocks data.

The spread is visualized and potential spike highlights in the context of pairs trading. The spread represents the separation between the price movements of the two stocks. The calculated spread is plotted over time.

The cointegration of ASHOKLEY.NS AND EICHERMOT.NS IS
0.012028661205637779

Cointegration Regression:

$$y = 0.0477x + -9.9392$$

Spread was calculated based on the equation

$$\text{spread} = y - (\text{beta} * x + \text{alpha})$$

Separation Line: The separation line represents the average spread between the two normalized series (Refer Fig 2).

Standard Deviation Bands: Standard deviation bands represent the expected range around the separation line. They are typically constructed by adding and subtracting one standard deviation of the spread from the average spread. These bands capture the normal fluctuations in the difference series (Refer Fig 3).

Feature Engineering for Trading Strategies

Exploring z scores

Z-scores measure how far the spread is from its average. When the z-score is below a certain threshold (lower_threshold), it suggests a buying opportunity (buy_signal). Conversely, a high z-score (above upper_threshold) indicates a potential sell (sell_signal). Based on these signals, "trading_actions" are generated, recommending "Buy", "Sell", or "Hold" for each day (Refer Fig 4).

Simple trading strategy was implemented based on the spread trading.

- Cash : Initial cash balance was set to 0.
- Position: Initial position size was assumed to be 0 which means no position was held. Looping over trading actions: Here the loop is iterated over each trading day, where I is the index of the current day, and $action$ is the trading signal (either *Buy* or *Sell*) for that day.
- Buy and Sell Logic: If the trading signal is *Buy* and there is no existing position ($Position = 0$), it buys one unit of the *spread* (assuming *spread* is a list/array containing spread values) and deducts the purchase cost from the cash balance (cash)
- If the trading signal is *Sell* and there is an existing long position ($Position = 1$), it sells the entire position and adds the sale proceeds to the cash balance.
- Calculating total Returns: After iterating through all trading days, the total returns are calculated as the final cash balance minus the initial cash balance. Since the strategy is assumed to start with no positions, the final cash balance represents the total returns.
- Finally total returns was calculated.

Modelling

The following models were chosen for pairs trading strategies as they provide insights into market dynamics , forecasting price movements and generating trading signals based on historical data and input features. Their flexibility, adaptability and ability to handle different types of data make them valuable tools for analysts and traders in pairs trading strategies.(Siddha Raj Bhatta, 2020).

Logistic Regression:

Logistic regression is a statistical method used for binary classification tasks. It models the probability of a binary outcome based on one or more predictor variables. In pairs trading, logistic regression can be used to classify whether to take a long or short position based on input features such as spread values, moving averages or other technical indicators.

Gradient Boosting Regressor

Gradient Boosting is an ensemble learning technique that builds a predictive model in the form of an ensemble of weak learners(usually decision trees). It trains new models to correct the errors of the previous models. Gradient boosting can capture complex relationships between input features and target variables in pairs trading. It can handle non-linear relationships and interactions between features effectively.

Ridge Regressor

Ridge Regression is a regularization technique used to mitigate multicollinearity (correlation between predictors) in regression models. It adds a penalty term to the ordinary least squares objective function to shrink the coefficients

towards zero. Ridge Regression can be useful in pairs trading to handle multicollinearity between input features, especially when dealing with multiple correlated variables such as spread values, beta coefficients, and moving averages.

Random Forest regressor

Random Forest Regressor is another ensemble learning technique that constructs multiple decision trees during training and outputs the mean prediction of the individual trees for regression tasks. It captures complex non-linear relationships and interactions between input features in pairs trading.

RESULTS AND DISCUSSION

Data Acquisition and Preprocessing

For this research paper, 12 stocks chosen from Auto sector are ASHOKLEY.NS, BAJAJ-AUTO.NS, BHARATFORG.NS, BOSCHLTD.NS, EICHERMOT.NS, HEROMOTOCO.NS, M&M.NS, MARUTI.NS, MOTHERSON.NS, MRF.NS, TATAMOTORS.NS, TVS.NS.

The data includes each stock's daily opening price, high, low, closing price, adjusted close, and volume from 01-01-2015 to 01-01-2024. From that only Close Price was chosen and a data frame for all the stocks was created. It has (2221,12) observations for Auto Stocks. The cointegration for the stocks was calculated within the sector the Auto Sector. It was found that only a few pairs have the needed cointegration values less than 0.05. The selected stocks for pairs trading with cointegration less than 0.05 are Refer Table 1.

The spread, cointegration regression was calculated for each of the pairs (Refer Table 2).

Stationarity tests were conducted to check whether the "spread" is stationary. Then Z-scores, a statistical measure that indicates how many standard deviations a data point is from the mean of a data set was found. These are used to assess the relative position of individual data points within a distribution. The trading strategies was then applied to find the total returns of the strategy with initial cash value equal to zero. In all the three cases we got the positive values. Then Machine learning models Logistic Regression, Gradient Boosting Regressor, Ridge Regressor, Random Forest Regression were applied to analyse the pairs trading forecasting (Refer Table 3 and Table 4).

Comparing the four models for predicting pairs trading: Logistic Regression, Gradient Boosting Regression, Ridge Regression, and Random Forest Regression, it is summarized as :

- **Gradient Boosting Regression** emerged as the winner with the lowest error metrics (MSE, RMSE, MAE) and the highest R-squared (0.86), indicating the best fit to the data.
- **Logistic Regression** and **Random Forest Regression** performed similarly, achieving reasonable accuracy but with a slight edge to Logistic Regression in terms of R-squared (0.83).
- **Ridge Regression** lagged behind in all metrics, suggesting a weaker fit (R-squared of 0.69) compared to the other models (Refer Table 5).

For ASHOKLEY.NS-EICHERMMOT.NS

The Sharpe ratio of 1.5694 indicates that the risk-adjusted return of the portfolio is favourable. The Treynor Ratio 432.6864 suggests that the excess return per unit of systematic risk (beta) is relatively high. The Jensen's Ratio of 106,2809 indicates that the portfolio has outperformed its expected return based on the CAPM(Capital Asset Pricing Model).

This code essentially simulates a trading strategy that buys and sells based on predefined signals (trade_actions) and tracks the resulting cash balance to calculate the total returns. However, it is important to keep in mind that this is a

simplistic representation and may not capture all aspects of real-world trading, such as transaction costs, slippage, or market impact.

ABSTRACT

In '*The Binding Vine*' Shashi Deshpande portrays the women's life in India through the female characters like Vanna, Mira, Sakuntai and Kalpana. All of them though being wronged by the patriarchal society and its conventional moralities never lose hope. All of them in their own way struggle hard for their existence and to prove their self-prestige. Shashi Deshpande aims to criticize the society through different female characters. She is not against the society but against the unacceptable viewpoints of society. They always accept a ray of hope even amidst chaotic and pathetic situations of their lives. They struggle hard for survival and sanity in the psycho- emotional world of the Indian women. This paper portrays the women who have great inner strength and resilience, and parade with elegance and grace out of turmoil.

Keywords: Moralities, Inner strength, Resilience, Patriarchy, Emotional, Psychological, Emancipation, Catalysts.

INTRODUCTION

Normative deconstruction" in Shashi Deshpande's work, particularly in her novel "The Binding Vine," involves a critical examination of how her female protagonists challenge traditional gender roles and expectations, leading to their psychological liberation. Deshpande's portrayal of women grappling with oppressive familial structures, societal pressures regarding marriage and motherhood, and the suppression of their identities sheds light on the complexities of women's lives in a patriarchal society. The term "heroines" refers to these female protagonists who serve as agents of change, questioning norms and asserting their autonomy. Analyzing Deshpande's depiction of these characters involves exploring how their actions contribute to their psychological emancipation, as they

**Sarathalakshmi**

negotiate relationships, pursue personal goals, and assert their right to self-determination. Deshpande's exploration of these themes illuminates the ongoing struggle for women's liberation within patriarchal systems.

Each and every living being on this earth is struggling for existence. They struggle to affirm their existence through various methods. The exploration of moral and psycho dilemmas and repercussions of the women characters of Shashi Deshpande provide them success only after the hard struggle for existence. They never accept secondary position as their fate. The crisis of value adaptation and attachment with the family and society pulls them down. Shashi Deshpande seems to grapple with the identity crisis of the Indian women. She always deals with the middle class Indian woman who struggles to emerge out of the cocoon of self-pity, to spread her wings of self-confidence. For many centuries the Indian women have been the silent sufferers. Playing multi-tasking roles – as a wives, mothers, sisters and daughter, they have never been able to claim their own individuality.

The heroines of Shashi Deshpande strive to obtain autonomy through which they try to realize their immense potentialities for action and self-actualization. They learn to live in the patriarchal society with self-identity and self-realisation. In the conventional Indian society, a woman is essentially acknowledged as a shadow of male identity with little scope for the assertion of her choices. Traditional images of women essentially affirm the subjugated status of women, but Shashi Deshpande categorically tries to establish that woman is endowed with inherent potential to recognize her feminine and to assert her inward powers as individual. Her protagonists obviously venture to discover their self-identity Elaine Shawvalter calls it, "the female phase" which is a phase of self-discovery, a turning inward, freed from the dependence of opposition and a search for identity" (Shawvalter – *A literature of their own*). She explores and reveals the long smothered wait of the fragmented psyche of her female protagonists imprisoned within the shades of domesticity, drifting between tradition and modernity. In spite of her concern with the traditional position of women, she portrays them as living individuals, struggling and endeavoring to make spaces of their own in the existing social order. Shashi Deshpande depicts the anxiety of the educated independent middle class Indian women who search for a balance between their familial bonds and their self-identities in a predominantly patriarchal society.

In Indian society the tradition recommended by legends and religious canons are the foundation of man and woman relationship. The epic figures like Sita and Draupadi are glorified as the idealized beings endowed with exceptional power of endurance to sustain their identity beyond the deals of society. In Indian social life, a woman is conditioned to survive with the support of male desires only. Shashi Deshpande tries to establish that in the scheme of things, women are not weak and insensitive. A woman can recognize her energy to resist the forces which are hostile to her respect and freedom. Shashi Deshpande is one of those sensitive thinkers who perceive the various dimensions of human experiences. She tries to establish serious conclusions about the plight of individuals against the unbearable conventions of the society. The novel 'The Binding Vine' was published in 1993 which is basically concerned with the obsession of a young mother Urmil who is the chief narrator in the novel. She appears as an agonized mother craving for the loss of her own daughter. Urmil is a lecturer in a college by profession. The untimely death of her daughter, Anu comes as a serious shock to the maternal sensibility of Urmil. A sense of guilt grips her conscience after Anu's death. The idea of personal happiness without Anu becomes a betrayal for her. Beneath the anguish of lost motherhood of Urmil, Shashi Deshpande reflects on the issue of undesirable and torturous sexual relationship, the apathy of society, the horrors of rape and the hollowness of the institution of marriage. Urmil articulates the voice of other women characters who lead invisible existence in the shadows of shame and silence. Shashi Deshpande controls the narrative seeking a balance of past and present revealing the predicament of the women representing three generations and three destitute classes. Urmil is herself a victim of personal loss but she analyses her loss in the background of the life condition of two women of her own family, Mira her own mother-in-law and Kalpana an unfortunate teenage girl who becomes the victim of rape. Present is represented by Urmil but the past echoes in the silence of Mira and future is focused in the suffering of Kalpana. There is an extension of Shashi Deshpande's vision, asserting that woman is expected to register her voice of protest to shatter the bondages of patriarchal conversions. Shashi Deshpande admits that maternal instincts are invariably integrated in feminine sensibility and to impose them as societal obligation is undesirable and irrational. Urmil is endowed with excessive love for her lost daughter but she is not ready to bear the sight of humiliation of human in the name of feminine virtues. Urmil believes that women

Sarathalakshmi

have rights over their body and that cannot be violated even in marriage. Urmi tries to find out common grounds of justification in the suffering of Mira, her mother-in-law and Kalpana the rape victim. In order to reveal her vision at a common point Shashi Deshpande brings two generations together. Mira who suffers out of bridal veil tries to affirm her existence through her poems. The imaginative perception revealed in the poetry of Mira becomes the reality of the life of Kalpana. In most of her poems, Mira exhibits her strong aversion against the sexual relationship with her husband. When physical violence occurs in the life of a young girl, it is treated as a shame but when the same thing is forced upon her in the name of marriage; it is acknowledged as the fulfillment of life. Mira's poem clearly exhibits her hatred towards conjugal life. In one of her poems she says:

"Talk, he says to me, why don't you say something why don't you speak to me? What shall I talk about, I ask him stupidly. "What did you do today? Where did you go? What have you been thinking about all evening and so he goes on dragging my day, my whole self out of me. But I have my defenses; I give him the facts nothing more, never my feelings. And so it begins 'please' he says, 'please I love you.' And over and over again until he has done, 'I love you.' Love! How I hate the word. If this is love it is a terrible thing. What is there in me? Why does it have to be me? Why can't they leave me alone? (p-66- 67).

For Shashi Deshpande, the forced sexual relationships without the emotional involvement are nothing but 'rape' though it is within or beyond marital relationship. The sexual violence against women is a method of taming woman into passivity. Urmi shares the anguish of both Mira and Kalpana.

Each and every female character in *The Binding Vine* is endowed with a never ending fighting quality irrespective of their generation and status. All of them struggle and fight for their existence and none accepts their life as it is. The protagonist Urmi struggles to overcome her sadness of her daughter's death through all means. Her motherhood sensibility doesn't allow her to lead a normal life after her daughter Anu's death. She suffers the turmoil out of grief and inability but never gives up. Even when her brother tries to console her after her hysteric behavior she asks him to give her some time to recover from sadness. She never thinks of surrendering her to the clutches of grief. The novel opens with the confident words of Urmi which exhibits her determined mind when she says,

'That's why they want Kishore to be here – to pick up the bits and pieces. And put them together again? All the kings' horses and all the kings' men could not put Humpty – Dumpty together again. What's broken can't be mended. But I am not broken; I am not going to break.....were connected to our physical selves by the fragile thread snaps that it's all over. That hasn't happened to me, not as yet. I want to live. And I won't break down; I am in full control of myself.' (19-20)

People around her expected her to cry, 'become hysterical and behave like those who beat at their breasts and tear their hair in their grief (96). Of course, Urmi is depressed and an emptiness is engulfing her but she knows how to control her emotions. She is in anguish, which leads to an attack of asthma, leaving her breathless. Her struggling for breath is enough for everyone to decide that she is unbearable. But Urmi is tough. She is a new woman who is emotionally and intellectually balanced. Shashi Deshpande's women are realistic and aware of the inevitability of life and death. Women who are provoked to the extent of becoming hysterical are thought to be weak. Her women are strong. Women in the middle class milieu are tough as they experience both joys and sorrows simultaneously. They also know that nothing is too prolonged as life changes quickly. Urmi's fighting quality with which she tries to compromise is revealed through her words:

"No I must reject these memories, I have to conquest them. This is one battle I have to win if am to go on living. And yet my victory will carry with it the taint of betrayal. To forget is to betray. But to go on living like this is to wrong the living Karthick above all, Karthick who watches me so anxiously, so fearfully. I cannot wrong him. I must let Anu go." (21).

Sarathalakshmi

The story follows the moods, activities and memories of Urmi. All along her life she has to cope with herself. Grown up entirely under the care of grandparents, Urmi has developed a free and independent nature and thinking ability of her own. Both the grandparents have doted on her and obliged her always. Her marriage with Kishore is her own decision and it is a love marriage. Her grandmother Bajajji has died when she was only fifteen years old. She boldly managed everything along with grandfather adopting his emotional and psychological strengths. She was shocked when grandfather committed suicide. Very early in life Urmi has learnt to manage the family. Later after marriage, the responsibility of the family fell on her because her husband, a naval officer is away from home most of the time.

Urmi loves Kishore very much. His job in the navy is an obstacle for her. She wants him to stay with her always like Vanna's husband. Urmi always got what she desired. She did not bargain for anything less. She is overconfident that Kishore loves her very much. She is taken aback at his behavior on the first day of their marriage. For him marriage is a forced binding whereas for Urmi it is a binding of love. She wants to tell him, 'Don't leave me and go. Each time you leave me, the parting is like death' (84). But sensing his detachment she is afraid to speak out. Silence distances them. A fear engulfed her. The same fear she experienced on the day of grandfather's death. She heard a noise "A kind of irregular, rhythmic heavy sound from the passage" (85). She turned cold with fear. Though fear syndrome is present in Urmi she also has the ability to overcome the fear, as she is a rational thinker. Similarly she accepts the death of Anu as inevitability but takes her own time to overcome it. She realizes that however painful the experience may be, one can never give up. As Urmi says, "We struggle to find something with which we can anchor ourselves to this strange world we find ourselves in. Only when we love do we find this anchor." (86)

The novel 'The Binding Vine,' is a bold attempt of the novelist to portray the agony of a wife who is the victim of marital rape. Urmila is completely a different version from the earlier female protagonists. The early protagonists like Saritha, Jaya and Indu fight for themselves while Urmi tries to help other women and fight for them. As an upper middle-class career woman she is highly sensitive to the suffering of other women. Urmila does not want to leave that person who has wronged Kalpana. In spite of the bitter fact the victim's mother wishes for the death of her daughter in order to avoid social scandal, Urmila decides to fight for her. In her attempt to find solace out of grief Urmi is drawn into the lives of three women of different character. But all have the similar never ending fighting attitude who all never accepts their life as it is and struggle for their existence.

The first woman is Urmila's dead mother-in-law Mira who exists only in the notebooks that she has found from a dusty storage trounce. Urmi tries to identify her own life in the life of Mira who lived and died in silence but made a desperate burial of her suppressed consciousness in her unexplored letters and diaries. Mira had died in Urmi's husband, Kishore's birth. Urmi was highly shocked and excited to read the poems of Mira who exhibited her rebellious nature through her poems. Urmi gets lots of papers and unpublished poems. Mira's dairies were written in English, but poems were written in Kannada. Mira's creative writings were in Kanada but her diary was written in English. Mira's personal diary bears the 'mark strictly private and confidential.' It was a personal communication within herself, an account of her daily routine of life. This obviously evinces that each woman has her own private world and tries to find an outlet of it in the world which is adverse and hostile to her imagination. Urmi is reluctant to read her dead mother –in-laws diaries. Urmi herself is a victim of personal loss. She tries to analyse her loss in the background of the life condition of her own mother-in-law. In the novel 'The Binding Vine' there is an extension of her vision asserting that woman is expected to register her voice of protest to shatter the bondage of patriarchal conventions.

Mira's poems and diaries reveal the distress of a vibrant young, educated woman who is trapped in an unhappy marriage. She is gifted with excellent writing skills through which she tries to express her protest against the tradition of marriage and the evil clutches of the patriarchal society. Being the silent sufferer of her conjugal life and the restrictions, it has imposed upon her, Mira's life is a tale of grief full of submission and unhappiness. She desired to be free from the rules of tradition or the clutches of unban marriage. Though a submissive wife to her husband she never accepted her slavery. Her poems expressed her struggles for existence. The education which she got offers a

Sarathalakshmi

means of escape from the oppression and loneliness. Writing was a means of finding freedom for Mira. She was highly shocked and stunned when she was named Nirmala after her marriage (101).

'A glittering ring gliding on the rice
Carefully traced a name 'Nirmala'
Who is this? None but I,
My name here, bestowed upon me.
Nirmala, they call, I stand statue still
Do you build the new without racing the old?
A tablet of rice, a pencil of gold
Can they make me Nirmala? I am Mira.' (p. 54)

Writing is a means of finding freedom for Mira. According to Mira writing is not only a self-expression but also freeing the captive imagination. Mira has written poems about her own life. Her suppressed anger and agonies are expressed through her poems. In *'The Binding Vine'* Shashi Deshpande portrays the women's life in India through the female characters like Vanna, Mira, Sakuntai and Kalpana. All of them though being wronged by the patriarchal society and its conventional moralities never lose hope. All of them in their own way struggle hard for their existence and to prove their self-prestige.

Not only the protagonist but each and every minor character reveals their struggles for their existence. They always accept a ray of hope even amidst chaotic and pathetic situations of their lives. They struggle hard for survival and sanity in the psycho- emotional world of the Indian women. The theme of survival may not be applicable to everyone. Sulu commits suicide. This is an extreme step taken by Sulu when life loses its importance. Mira would have struggled to survive if she did not die in her delivery. Akka, Urmi, Vanna and Sakuntai relent to the situation because they want to survive. They are born warriors who embrace their inner strength gracefully and face their challenges head-on. They never allow challenges thrown at them to hold them back and have an irresistible confidence to conquer anything that comes in their way.

ABSTRACT

In recent years drug stability problem is catching attention. The stability of pharmaceutical products play important role in quality of drugs and in economic point of view especially after exceeding the expiry dates. The shelf-life obtained determines the expiry date, which is typically between 1 and 5 years and commonly set in a conservative manner. In the past years, the FDA has launched several programs for shelf-life extension in order to defer replacement costs and to prevent drug shortages due to supply disruption. However, there are not many studies reported on the stability of dosage forms past their expiration dates. The aim of the review was to bring together the available literature for a stability of expired dosage forms. It seems to be reasonable for a large portion of dosage forms to extend the expiry dates far beyond the five years.

Keywords: Drug Stability, Expiry date, Shelf life, Long-term stability

INTRODUCTION

The stability studies must be in accordance with the International Conference on Harmonization (ICH) guidelines on testing of new drug substances and products Q1A(R2) [1]. Pharmaceutical manufacturers have to provide stability data of the active drug substance (API) and the finished pharmaceutical product (FPP) when they ask regulatory authorities for market authorization. The content of the API has to be within the specification of 95–105% during the time available on the market. Based on the results of real-time and accelerated stability tests, a shelf-life is assigned to the FPP, typically set in a range of 1-5 years [2]. Drugs stored under labelled conditions retain stability and potency throughout their shelf life. If they were subjected to stress in other words not stored under required storage conditions may lose their potency even within their shelf life period. Liquid orals (antibiotics, analgesics etc.), Insulin and Nitroglycerin tablets are not stable past their expiry date.

Solid dosage forms, such as tablets and capsules, are most stable past their expiration date. Drugs that exist in solution or as a reconstituted suspension may not have the required potency if used when outdated. The best evidence of acceptable potency of the medications beyond their expiration date is provided by the Shelf Life Extension Program (SLEP) undertaken by the FDA for the Department of Defense. The aim of the SLEP program was to reduce medication costs for the military. SLEP has found that 88% of 122 different drugs stored under ideal conditions should have their expiration dates extended more than 1 year, with an average extension of 66 months, and a maximum extension of 278 months.

Certain medications have a narrow therapeutic index and little decreases in the pharmacological activity can result in serious consequences for patients. Monoclonal antibodies should be included in this group. These drugs should not be used beyond the expiry date. SLEP (Shelf life extension Programme) installed by FDA sponsored by US DOD (Department of Defence), about 122 drugs different medication products, nearly 90% met the requirements for an extension and all lots tested by SLEP when approaching their expiration dates met the criteria for initial shelf life extension. Whereas the shelf life of most medications in the United States is 1 to 5 years, the average additional extension length by SLEP was 5.5 years, and some lots were extended by more than 20 years Markus Zilker et.al [3]. analyzed the ampoules of 40 years age and they were found to retain their stability. There is no evidence of adverse effects of taking expired dosage forms except Tetracycline is known to be harmful when it expired, causes fanconi syndrome [4], and this is a rare form of kidney damage. The occurrence of chemical, physical, and microbiological instabilities is affected by environmental factors during storage of various dosage forms i.e. solids, liquids and injectables e.g. heat, relative humidity, light, and oxygen. Figure-1 shows the hydrolysis of Lidocaine degradation of epinephrine and epimerization of Doxycycline [5].

Physical stability is crucial for the quality of FPPs. Suitable attributes like the dissolution rate, the hardness, and the friability are very important for solid dosage forms where the appearance, the pH, and the presence of any precipitation must be considered in liquid dosage forms. The efficacy and safety of sustained release tablets and capsules or depot dosage forms could be affected in a highly negative manner because of too much or too little of API release per unit time. In addition, the chemical instability is characterized by the decay of the active pharmaceutical ingredient (API), typical degradation reactions occurring during long-term storage are hydrolysis, oxidation, photolysis, polymerization, and isomerization [6-7]. A very common pathway of API degradation is hydrolysis of esters, amides, and carbamates, which are prone to hydrolysis resulting in compounds containing a carboxylic acid group [6-7] where as any photon affects the chemical bonds of a molecule, likely happening in Dipyrindamole, Nifedipine, and Aztreonam solutions [8-9]. Racemization and epimerization are typical degradation reactions being usually observed when finished pharmaceutical products (FPP) are manufactured with isomerically pure compounds. Our present review emphasizes on the work done on stability of expired dosage forms and their analytical approaches to find out the purity and stability of expired dosage forms in their unopened form. In addition, the FDA updated the expiry dates of auto-injectors used as nerve agent antidotes in emergency situations [10].

**Jhansi Rani Vasa et al.,**

Certain lots of Atropen (atropine), CANA (diazepam), DuoDote containing atropine and pralidoxime chloride, morphine sulfate, and pralidoxime chloride injectors all manufactured by Meridian Medical Technologies were declared to be eligible for use by up to six years beyond their original expiry dates. In a further issue, the FDA alerted health care professionals of new extended shelf-lives for various injection solutions manufactured by Baxter Healthcare Corporation, e.g. saline, sterile water, potassium chloride etc [11].

Short expiry dates of drugs are costly challenge for hospitals, nursing homes and agencies which stockpile large quantities of medicines in US Department of Defense (US-DOD) and German armed forces. India's Pharmaceutical industry is losing around 500 crores annually on account of destruction of expired drugs. The healthcare systems around the world would highly benefit if expired drugs are extended beyond expiry date. The attributes tested for a drug product [12] varied depending on the dosage form. For solid oral drug products, the attributes were potency (assay), impurities, water content, dissolution, and physical appearance. For reconstituted dry powders, the attributes were potency, pH, water content, and physical appearance. For injectable solutions, the attributes were potency, impurities, pH, preservatives, and physical appearance (color, particulates). For creams and ointments, the attributes were potency, pH, and physical appearance. For auto injectors, the attributes were potency (assay), degradants, pH, preservatives, injection mechanics, and physical appearance. In recent years the FDA issued guidance for federal agencies [13-14], state and local governments on testing to extend shelf-life of emergent medicines like antivirals, doxycycline, nerve agent antidotes, and potassium iodide.

REVIEW ON SHELF-LIFE EXTENSION PERIOD OF PHARMACEUTICAL DOSAGE FORMS

DISCUSSION

Roger Bate *et.al* [15], reported a weak linear association ($R^2 = 0.33$) was between the age of samples and their state of degradation relative to brand-identical samples on Raman spectrometry. Sixty- eight samples were retested in February 2009 using Raman spectrometry, between eight and 65 months post-expiry. 66 of 68 (97%) samples passed Raman spectrometry retesting. The data indicate that FDC-ALU is chemically and physically stable well beyond its stated shelf-life in uncontrolled, tropical conditions. Method: Seventy samples of expired FDC-ALU were collected from private pharmacies and malaria researchers in seven African countries. The samples were subjected to thin-layer chromatography (TLC), disintegration testing, and near infrared Raman spectrometry for ascertainment of active ingredients, tablet integrity, and chemical degradation of the tablet formulation including both active ingredients and excipients.

Raman G. Kutty *et.al* [16], reported novel, method to measure concentrations of albuterol and montelukast using HPLC. A novel method to collect and measure concentrations of albuterol in pre-packaged oral inhaler devices. Both montelukast and albuterol retain their potency for many years beyond their listed "expiry" dates. These data may serve to guide pharmacists, physicians, and patients in the decision-making process of using "expired" medications at home, in free clinics, in national defense, and in international humanitarian efforts.

Method: Two HPLC methods were developed, validated, and applied to achieve this goal. Quantitative analysis of each drug was performed using two different reversed phase C18 columns with a linear gradient of acetonitrile in 0.1% aqueous formic acid at a flow rate of 1 mL/min for both methods. Detection wavelength for montelukast and albuterol was 280 and 277 nm, respectively.

G.Vidyasagar *et.al* [17], Frovatriptan is a selective 5-HT_{1B/1D} – receptor agonist that has chemical structure susceptible to degradation and therefore in this work forced studies of drugs were carried out by a validated stability indicating liquid chromatographic method. The results of performed study might suggest that storage of analyzed batches of tablets over time period exceeding the expiry date given by the manufacturer did not influence their contents.

**Jhansi Rani Vasa et al.,**

Method: Drug was subjected to all stress conditions such as hydrolysis (acidic and alkaline), oxidation, photolysis, thermal degradation and humidity study. Content determination was performed using RP-HPLC method; the percent of dissolved substance from tablets was also performed. All stressed samples were successfully analyzed on C18 column using mobile phase acetonitrile: methanol: 0.1% orthophosphoric acid 45:15:40 (v/v/v) mobile phase (pH 5.6). A flow rate was maintained at 1 mL/min and detection was made at 245 nm. The proposed method was validated with regard to linearity, sensitivity and accuracy and precision.

Emma Browne *et.al* [18], assessed the stability of five emergent expired drugs (atropine, nifedipine, flucloxacillin, naproxen, and bendroflumethiazide) returned from Antarctic bases. Drugs were opportunistically obtained and tested using stability-indicating assays and all tested drugs were stable. The results suggest that the studied drugs may be stable beyond expiry, even when not maintained in strictly temperature-controlled conditions

Method: Stability-indicating reverse-phase HPLC analysis was used for each agent. Each drug was compared to a within-date batch of the drug; where a within-date version of the drug with the same formulation could not be obtained, an equivalent drug formulation and a pure drug sample were used. Calibration plot was linear over the range of 5 to 40 micrograms per mL ($y = 80,178x - 6187$; $R^2 = 0.999$; $n = 8$). Precision at 5, 20, and 40 micrograms per mL was 1.6, 1.4, and 1.2%, respectively ($n = 5$). Samples were diluted 1:10 in water for HPLC analysis ($n = 3$).

Magdalena Jasinska *et.al* [19], determine tablet content of expired tablets and tablets with expiry date has not been exceeded. The analyzed tablets contained metoprolol tartrate (50 mg) and propranolol hydrochloride (10 mg), respectively. Content determination was performed using HPLC method with UV detection. The results of performed study might suggest that storage of analyzed batches of tablets over time period exceeding the expiry date given by the manufacturer did not influence their contents.

Method: The column used for chromatographic separations was Supelcosil TM LC-18-S (250 mm × 2.1 mm, 5 μm). Mobile phase was pumped in gradient mode at a flow rate of 0.3 mL/min at 25°C. The analytical wavelength was set at 275 nm for metoprolol and 290 nm for propranolol, respectively, indicated by the UV spectra. Samples of 125 μL were automatically injected. In addition, Whatman No. 45 filter paper and single use syringe Minisart filters, pore size 0.2 μm (Supelco, USA) were used. Buffers, the following solutions were used: buffer A - the 0.1 M ammonium acetic solution (pH adjusted to 4.0 with acetic acid), buffer B - the mixture of buffer A and acetonitrile (ratio 50/50). The concentration of buffer B was risen up to 100% in 20 min.

Zilker *et.al*, [20], determine the content of nine expired ampoules manufactured in the last century and identifying the impurity profile by means of HPLC-UV and HPLC-MS respectively. The ampoules are part of the “PEAK-collection” of long expired finished pharmaceutical products at IBMP, Nürnberg-Heroldsberg, and consists among others of epinephrine (Suprarenin and Adrenalin in Oil), etilefrine (Effortil®), synephrine (Sympatol®), caffeine and procaine (Impletol), caffeine and sodium salicylate (Caffeinum Salicylicum), dipyridamole (Persantin®), furosemide (Lasix®), and metamizole (Novalgin). The results were compared to current reference ampoules. Five out of nine ampoules were still within the specified content limits.

Method: For chromatographic investigations, methods of the European Pharmacopoeia for related substances were used; for determining the content, they were validated for linearity, precision, and accuracy.

Sushil Sharma *et.al*, [21] the drugs selected for study were analgesics. The parameters investigated were chemical potency, physical stability, and analgesic efficacy. The active ingredient in all the drugs were within the accepted range as per IP during the study period indicating that they retained their potency up to a period of two years post expiry.

Methods: Chemical potency: The study drugs were subjected to analytical assays to estimate the active ingredient in the pharmaceutical preparations. The estimation of chemical potency was performed as per IP by using the High-

Performance Liquid Chromatography (HPLC) method. Ten samples of each study drug were tested, initially during the shelf life, then once immediately after the expiry, followed by every six months beyond the expiry date. The chemical potency was considered acceptable if the test results were within the acceptable ranges (lower and upper) as per Indian Pharmacopoeia

Physical stability: Disintegration time and dissolution time are well accepted and validated tests to estimate the changes in physical parameters, which are crucial for the absorption and bioavailability of an oral pharmaceutical formulation. Six tablets of each formulation were tested as per IP. The tablets were considered to have passed the test if they disintegrate within 30 min. The dissolution time was tested using the Digital tablet dissolution rate test apparatus, as per USP/IP standards. The tablets were kept in the inner fine mesh basket, which was rotated at a defined RPM, and the time taken for the entire tablet to pass through the inner basket and disappear into the beaker was taken as the surrogate marker for 100% dissolution of that tablet.

Analgesic efficacy: was analyzed in two animal models, viz tail-flick method and acetic acid-induced writhing method. Six albino mice of either sex were used to estimate analgesic efficacy for each drug initially before expiry and subsequently every six months, till two years after the expiry date.

K Kudlacek *et.al* [22] reported that Two injection solutions of quinine 79, 77 resp. years were analyzed using RP-HPLC. The conditions of separation were optimized. The quinine content is decreased about 13% for 79-year-old sample and about 8% for 77-year-old sample, respectively. Quinotoxine has been found as the decomposition product. The compounds were identified by MS, and the ESI fragmentation mechanisms of compounds found were proposed.

Method: Isocratic elution by the mixture of 0.02 M acetate buffer (pH = 4.00) and acetonitrile (80:20, v/v) was adopted for analysis. The mobile phase flow rate was 1.0 cm³ /min. The separation was performed on a Zorbax Eclipse C18 column (150 x 4.5 mm i.d., particle size 3.5 μm; Agilent); the column oven temperature was maintained at 30°C. A 5 μl sample was injected. The compounds were detected using DAD (at 254 nm) and mass spectrometer. Ionization of the analytes was performed in the positive ion mode at capillary voltage 4.5 kV. The pressure of the nebulizing gas (nitrogen) was set to 0.30 bar. Nitrogen (3.5 dm³ /min) was used as drying gas at 200°C. Quinine and quinotoxine were quantified using calibration curves of the standards in the concentration range of 20–100 mg/dm³. Pentamethylene tetrazole quantified using calibration curves of the standards in the concentration range of 50–200 mg/dm³.

K Nesmerak *et.al* [23] reported that, Pharmaceutical preparations of heroin and cocaine more than seventy years old were analyzed using RP-HPLC. Heroin was found to be quantitatively decomposed to morphine, the small amount of codeine (<4%) was probably present in the sample from beginning. No decomposition product of morphine was found; this agrees with the long-term study of the stability of morphine injection solution which were found not to decompose for 7, 11, or 37 years.

Method: A HP 1100 series liquid chromatograph (Hewlett/Packard, Germany) with an internal diode-array detector was used, followed by a Bruker Esquire 3000 mass spectrometer (Bruker, Germany) with ion-trap and APPI ionization. The separation was performed on a Supelco RP C18 column (150 x 4.6 mm i.d., particle size 5 μm); the column oven temperature was maintained at 25°C. A 10 μl sample was injected. The compounds were detected using mass spectrometer. Ionization of the analytes was performed in the positive ion mode under atmospheric pressure at capillary voltage 1.5 kV, and at a source temperature of 400°C. The pressure of the nebulizing gas (nitrogen) was set to 30 psi. Nitrogen (5.0 L/min) was used as drying gas at 250°C. Lee Cantrell *et.al*²⁴, findings were, 12 of the 14 drug compounds tested were present in concentrations at least 90% of the labeled amounts, the generally recognized minimum acceptable potency. Three of these compounds were present at greater than 110% of the labeled content. Two compounds (aspirin and amphetamine) were present in amounts of less than 90% of labeled content.

**Jhansi Rani Vasa et al.,**

One compound (phenacetin) was present at greater than 90% of labeled amounts from 1 medication tested, but less than 90% in another medication that contained that drug

Method: Tablets or capsule contents were dissolved and sonicated in methanol, reconstituted in analysis buffer (10% methanol) and analyzed with Liquid Chromatograph (Agilent Technologies) Time-of-Flight Mass Spectrometer (Agilent) using electrospray ionization in negative and positive polarities. Chromatography was run with gradient elution using Eclipse Plus C18 column (Agilent). Data analysis was performed using Mass Hunter Qualitative and Quantitative Analysis (Agilent). Quantification was performed by isotope dilution method with a 6-point calibration curve.

R German *et.al* [25], conducted a study to investigate the quality of reference substances which were produced long before the introduction of advanced analysis and purification techniques. The quality and antimicrobial activity of WHO and EP oxytetracycline, doxycycline, colistin and spiramycin reference standards were assessed. The oldest substance was stored for 54 years in a freezer. Assay and purity tests were conducted according to Ph. Eur. 6.0. Additionally, the results of the study show that several of the tested substances remained stable for over 40 years and one for over 50 years of storage. Investigation of antibacterial activity, purity and the potential usefulness for microbiological or chemical analysis (HPLC) of the official reference substances stored for over 40 years in a freezer.

Method: All chromatographic conditions had been set precisely in accordance to the corresponding Ph. Eur. monographs. Following are the monograph numbers and the columns used. Oxytetracycline: monograph 01/2008:0198, column: divinyl benzene copolymer 250 mm × 4.6 mm, particle size 8 μm (Polymer Laboratories, Church Stretton, UK). Doxycycline: monograph 01/2008:0272, column: divinyl benzene copolymer 250 mm × 4.6 mm, particle size 8 μm (Polymer Laboratories, Church Stretton, UK). Colistin monograph 01/2008:0320, column: C18 BDS Hypersil 250 mm × 4.6 mm, particle size 5 μm (Thermo scientific, Waltham, MA, USA). Spiramycin monograph 01/2008:0293, column: Symmetry Shield RP18 250 mm × 4.6 mm, particle size 5 μm (Waters Corporation, Milford, MA, USA).

C Scholtissek *et.al* [26], Amantadine and Rimantadine hydrochloride were tested for stability after storage at different temperatures and under different conditions for extended periods of time. Both compounds were quite stable after storage for at least 25 years at ambient temperature; they both retained full antiviral activity after long-term storage or after boiling and holding at 65–85°C for several days. Thus, amantadine and Rimantadine could be synthesized in large quantities and stored for at least one generation without loss of activity in preparation for the next influenza pandemic in humans.

Method: one, newly purchased amantadine hydrochloride (Sigma); two, Amantadine stored at room temperature (20°C) at SJCRH for at least 25 years; three, Amantadine stored at 4°C in Giessen for at least 20 years; four, Amantadine hydrochloride (Giessen) made up to 1 mg/ml in PBS, heated at 100°C for 60 min and held at 65°C for 5 days; five, newly purchased Rimantadine hydrochloride (Forest Pharmaceuticals); six, Rimantadine stored at room temperature (20°C) at SJCRH for at least 25 years; and seven, Rimantadine heated at 100°C for 120 min and held at 80°C for 4 days. A/Singapore/1/57 (H2N2) was diluted to produce approximately 8.0 (log₁₀) plaques in MDCK cells and treated with amantadine and Rimantadine hydrochloride in the overlay at the above concentrations.

Zilker *et.al* [27], reported the long term stability of 50 drug classes representing common drug classes of pharmaceutical use, some of the drugs with more stability and with less degradants were mentioned in the Table 1.

Method: The methods utilized were in accordance with the Ph. Eur. 9.3 and the United States Pharmacopoeia 40 - NF 35 (USP) as far as monographs were available. 1, 21 Titrations and HPLC–UV were used for assay. Liquid chromatographic methods were applied for the assessment of related substances. Thin layer chromatography (TLC) methods were carried out whenever it was required in the Ph. Eur. for detecting of potential degradation products.

**Jhansi Rani Vasa et al.,**

Water content was determined by means of Karl-Fischer titration. Column:Agilent Zorbax Eclipse Plus C18 (250x4.6 mm; 5 µm) Mobile phase: A: CAN(Acetonitrile), MeOH (39:61 V/V); B: 11 g of SHS(Sodium heptane sulfonate) dissolved in 1000 mL of water, 5.0 mL of TEA(Tri ethyl amine), pH 2.7 (H3PO4), Gradient, 1.0 mL/min, 270 nm, 25°C, 10 µL.

Table-1 shows the list of drugs past their expiry dates retaining stability and the instrumental methods used to establish their stability and potency by various authors. Expiry drug based corrosion inhibitors were reported by several authors²⁸⁻³⁴ with their alloy and media in shown in Table-2.

CONCLUSION

In this review report, we provide a comprehensive background to determine the post-expiration strength of expired dosage forms. In doing so, the financial burden of disposal (Incineration) may be reduced and the use of these medications beyond expiration at home and free clinics during shortage could be justified. Temperature, humidity and light exposure are critical parameters in long term stability of FPPs. The stability of FPP varies with batch to batch or brand to brand or generic to brand. Another idea is that If some of the expired dosage forms do not meet the stability standards then the researcher will seek for API extraction from the dosage forms by various techniques, if it was also not possible they were tested for corrosion inhibition property for metals. Some of the expired drugs (aspirin, paracetamol) used as disinfectants by doing simple treatment to the dosage forms. The expired drugs from the above mentioned literature had the age ranging from 8-80 years. It is not reasonable that to extend the shelf life of that much age because in due course of time the Stability of drug products may lost due to various reasons by maximum extent if may or may not store under proper conditions. So, to extend their shelf life one need to analyze in a systematic time interval (1mo,2 mo,6 mo,1 yr and 2 yrs) with suited attributes by following the Pharmacopieal standards (IP,USP,BP) immediately after its expiry.

To the best of my knowledge, by following this periodical testing, we can establish the stability data and can extend the shelf life from months to years based on stability and purity of expired drug products. From the above literature, Physical stability can be assessed through visual observation for any color changes or any visual reaction for Solid dosage forms, dissolution and disintegration studies. In case of liquid dosage forms, any particles in injectables or any color changes in solutions etc. Chemical stability is determined in the form of potency (assay), PH and degradants assessed through HPLC method mentioned in the standard Pharmacopoeias (IP, USP, BP) for analyzing the expired drugs, because HPLC is the most reliable and economical method to establish the stability of expired drugs. As SLEP sponsored by USDOD performed by FDA, it is suggested that Indian government may also perform SLEP, where the national stockpiles are needed, it is very useful during epidemics and National emergencies. Medicines do not expire: patients expire

ABSTRACT

In the present paper, a new class of generalized Aradhana distribution termed weighted generalized Aradhana distribution has been introduced. Its different statistical characteristics have been thoroughly studied and explored. Furthermore, the model parameters of executed distribution have been developed through the technique of maximum likelihood estimation. Finally, a new distribution has been illustrated with a real lifetime data set to determine its superiority in comparison with its classical distribution.

Keywords: Generalized Aradhana distribution, Weighted distribution, Order statistics, Reliability analysis, Maximum likelihood estimation.

INTRODUCTION

The theory of weighted distribution provides an integrative approach for model specification and data representation problems. The idea of weighted distribution was suggested by Fisher (1934) in association with his studies on how the method of ascertainment can affect the form of distribution of recorded observation. Later, Rao (1965) developed this concept in a unified manner to deal with modelling statistical data where the routine practice of using classical distributions was found to be inappropriate. The weighted distributions play a dominant role in statistics because they create new flexible distributions that are applied for modelling different real data occurring from various engineering and medical sciences. The weighted distributions provide a collective approach for the correction of biases that exist in unequally weighted sample data. The weighted distribution reached a milestone for efficient modelling of statistical data and prediction. The weighted distributions have been employed largely in various research areas related to reliability, ecology, biomedicine, Meta-analysis, econometrics, survival analysis, renewal

process and several other areas for the development of proper statistical models. The weighted distribution reduces to length length-biased distribution when the weight function considers only the length of units of interest. The concept of length-biased distribution was introduced by Cox (1962) in the context of renewal theory. Length-biased sampling situations may occur in clinical trials, population studies and reliability theory where a proper sampling frame is absent. The weighted distributions were formulated in such a situation to record the observation according to some weight function. A valuable and remarkable contribution has been made by various authors to develop some important weighted probability models along with their statistical features and applications in various fields. Hassan et al. (2019) presented a weighted quasi-exponential distribution with properties and applications. Sen, Chandra and Maiti (2017) presented the weighted Xgamma distribution and obtained its properties and applications. Asgharzadeh et al. (2016) discussed on new weighted Lindley distribution with application. Elan Govan, Mohanasundari and Kumar (2019) studied weighted quasi-Sujatha distribution with properties and applications to bladder cancer data in survival analysis. Sarma and Das (2021) presented a weighted inverse Nakagami distribution. Ganaie et al. (2023) proposed weighted power Garima distribution with applications in blood cancer and relief times. Ahmad and Ahmad (2019) discussed on the weighted analogue of inverse gamma distribution with statistical properties, estimation and simulation study. Ajami and Jahanshahi (2017) presented parameter estimation in weighted Rayleigh distribution. Reyad et al. (2017) obtained the length-biased weighted freshet distribution with properties and estimation. Bashir and Khan (2023) proposed the characterization of weighted power function distribution with reliability functions and moments. The generalized Aradhana distribution is a recently introduced two-parametric continuous lifetime distribution proposed by Welday and Shanker (2018) which includes one parameter exponential and Aradhana distribution are particular cases of it. Its various statistical properties including shapes of probability density function for varying values of parameters, stochastic ordering, coefficient of variation, coefficient of skewness, coefficient of kurtosis, index of dispersion, mean residual life function, hazard function, mean deviations, stress-strength reliability, Bonferroni and Lorenz curves have been discussed. Furthermore, its parameters have also been estimated based on maximum likelihood estimation.

Weighted Generalized Aradhana (WGA) Distribution

The probability density function of the generalized Aradhana distribution is given by

$$f(x; \theta, \alpha) = \frac{\theta^3}{\theta^2 + 2\alpha\theta + 2\alpha^2} (1 + \alpha x)^2 e^{-\theta x}; \quad x > 0, \theta > 0, \alpha \geq 0 \quad (1)$$

and the cumulative distribution function of generalized Aradhana distribution is given by

$$F(x; \theta, \alpha) = 1 - \left(1 + \frac{\alpha\theta x(2\theta + \alpha\theta x + 2\alpha)}{\theta^2 + 2\theta\alpha + 2\alpha^2} \right) e^{-\theta x}; \quad x > 0, \theta > 0, \alpha \geq 0 \quad (2)$$

Let X be the random variable that represents a non-negative condition that has a probability density function $f(x)$

.Let $w(x)$ be its non-negative weight function, then the probability density function of the weighted random variable

X_w is given by

$$f_w(x) = \frac{w(x)f(x)}{E(w(x))}, \quad x > 0.$$

Where $w(x)$ be the non - negative weight function and $E(w(x)) = \int w(x)f(x)dx < \infty$.

For various forms of weight function $w(x)$ when $w(x) = x^c$, the resulting distribution is termed a weighted distribution. In this paper, we have to obtain the weighted version of the generalized Aradhana distribution termed weighted generalized Aradhana distribution. So, the weight function considered at $w(x) = x^c$, the resulting distribution is called weighted distribution with probability density function given by

$$f_w(x) = \frac{x^c f(x)}{E(x^c)} \quad (3)$$

$$E(x^c) = \int_0^{\infty} x^c f(x; \theta, \alpha) dx$$

$$E(x^c) = \frac{\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)}{\theta^c (\theta^2 + 2\alpha\theta + 2\alpha^2)} \tag{4}$$

Now substituting equations(1) and (4) in equation (3), we will get the required probability density function of weighted generalized Aradhana distribution as

$$f_w(x) = \frac{x^c \theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} (1 + \alpha x)^2 e^{-\theta x} \tag{5}$$

and the cumulative distribution function of weighted generalized Aradhana distribution can be obtained as

$$F_w(x) = \int_0^x f_w(x) dx$$

$$F_w(x) = \int_0^x \frac{x^c \theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} (1 + \alpha x)^2 e^{-\theta x} dx$$

$$F_w(x) = \frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} \int_0^x x^c \theta^{c+3} (1 + \alpha x)^2 e^{-\theta x} dx$$

$$F_w(x) = \frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} \int_0^x x^c \theta^{c+3} (1 + \alpha^2 x^2 + 2\alpha x) e^{-\theta x} dx$$

$$F_w(x) = \frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} \left(\theta^{c+3} \int_0^x x^c e^{-\theta x} dx + \alpha^2 \theta^{c+3} \int_0^x x^{c+2} e^{-\theta x} dx + 2\alpha\theta^{c+3} \int_0^x x^{c+1} e^{-\theta x} dx \right)$$

(6)

Put $\theta x = t \Rightarrow \theta dx = dt \Rightarrow dx = \frac{dt}{\theta}$ Also $x = \frac{t}{\theta}$

When $x \rightarrow x, t \rightarrow \theta x$ and when $x \rightarrow 0, t \rightarrow 0$

After the simplification of equation (6), we will obtain the cumulative distribution function of the weighted generalized Aradhana distribution as

$$F_w(x) = \frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} \left(\theta^2 \gamma(c+1, \theta x) + \alpha^2 \gamma(c+3, \theta x) + 2\alpha\theta \gamma(c+2, \theta x) \right) \tag{7}$$

Reliability Analysis

In this section, we will discuss the reliability function, hazard rate function, reverse hazard rate function and Mills ratio of the weighted generalized Aradhana distribution.

Reliability function

The reliability function is also known as the survival function and the reliability function of the weighted generalized Aradhana distribution can be obtained as

$$R(x) = 1 - F_w(x)$$

$$R(x) = 1 - \frac{1}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)\right)} \left(\theta^2\gamma(c+1, \theta x) + \alpha^2\gamma(c+3, \theta x) + 2\alpha\theta\gamma(c+2, \theta x)\right)$$

Hazard function

The hazard function is also known as the failure rate or hazard rate and is given by

$$h(x) = \frac{f_w(x)}{R(x)}$$

$$h(x) = \frac{x^c \theta^{c+3} (1 + \alpha x)^2 e^{-\theta x}}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)) - (\theta^2\gamma(c+1, \theta x) + \alpha^2\gamma(c+3, \theta x) + 2\alpha\theta\gamma(c+2, \theta x))}$$

Reverse hazard function

The reverse hazard rate function is given by

$$h_r(x) = \frac{f_w(x)}{F_w(x)}$$

$$h_r(x) = \frac{x^c \theta^{c+3} (1 + \alpha x)^2 e^{-\theta x}}{(\theta^2\gamma(c+1, \theta x) + \alpha^2\gamma(c+3, \theta x) + 2\alpha\theta\gamma(c+2, \theta x))}$$

Mills Ratio

$$M.R = \frac{1}{h_r(x)} = \frac{(\theta^2\gamma(c+1, \theta x) + \alpha^2\gamma(c+3, \theta x) + 2\alpha\theta\gamma(c+2, \theta x))}{x^c \theta^{c+3} (1 + \alpha x)^2 e^{-\theta x}}$$

Order Statistics

Order statistics play a significant role in statistical sciences and have a wide range of applications in the field of reliability and life testing. Consider $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ be the order statistics of a random sample X_1, X_2, \dots, X_n drawn from a continuous distribution with probability density function $f_X(x)$ and cumulative distribution function $F_X(x)$, then probability density function of r^{th} order statistics $X_{(r)}$ is given by

$$f_{X_{(r)}}(x) = \frac{n!}{(r-1)!(n-r)!} f_X(x) (F_X(x))^{r-1} (1 - F_X(x))^{n-r} \tag{8}$$

Now substituting equations(5) and (7) in equation (8), we will get the required probability density function of the order statistics of weighted generalized Aradhana distribution as

$$\begin{aligned}
 f_{x(r)}(x) &= \frac{n!}{(r-1)!(n-r)!} \left(\frac{x^c \theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha \theta \Gamma(c+2) \right)} (1+\alpha x)^2 e^{-\alpha x} \right) \\
 &\times \left(\frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha \theta \Gamma(c+2) \right)} \left(\theta^2 \gamma(c+1, \theta x) + \alpha^2 \gamma(c+3, \theta x) + 2\alpha \theta \gamma(c+2, \theta x) \right) \right)^{r-1} \\
 &\times \left(1 - \frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha \theta \Gamma(c+2) \right)} \left(\theta^2 \gamma(c+1, \theta x) + \alpha^2 \gamma(c+3, \theta x) + 2\alpha \theta \gamma(c+2, \theta x) \right) \right)^{n-r}
 \end{aligned}$$

Therefore, the probability density function of higher order statistic $X_{(n)}$ of weighted generalized Aradhana distribution can be determined as

$$\begin{aligned}
 f_{x(n)}(x) &= \frac{n x^c \theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha \theta \Gamma(c+2) \right)} (1+\alpha x)^2 e^{-\alpha x} \\
 &\times \left(\frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha \theta \Gamma(c+2) \right)} \left(\theta^2 \gamma(c+1, \theta x) + \alpha^2 \gamma(c+3, \theta x) + 2\alpha \theta \gamma(c+2, \theta x) \right) \right)^{n-1}
 \end{aligned}$$

and probability density function of first order statistic $X_{(1)}$ of weighted generalized Aradhana distribution can be determined as

$$\begin{aligned}
 f_{x(1)}(x) &= \frac{n x^c \theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha \theta \Gamma(c+2) \right)} (1+\alpha x)^2 e^{-\alpha x} \\
 &\times \left(1 - \frac{1}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha \theta \Gamma(c+2) \right)} \left(\theta^2 \gamma(c+1, \theta x) + \alpha^2 \gamma(c+3, \theta x) + 2\alpha \theta \gamma(c+2, \theta x) \right) \right)^{n-1}
 \end{aligned}$$

Likelihood Ratio Test

Consider X_1, X_2, \dots, X_n be the random sample of size n drawn from generalized Aradhana or weighted generalized Aradhana distribution. To examine its significance, we consider the hypothesis for testing

$$H_0 : f(x) = f(x; \theta, \alpha) \quad \text{against} \quad H_1 : f(x) = f_w(x; \theta, \alpha, c)$$

To determine, whether the random sample of size n comes from the generalized Aradhana distribution or weighted generalized Aradhana distribution, the given below test statistic is used.

$$\Delta = \frac{L_1}{L_0} = \prod_{i=1}^n \frac{f_w(x; \theta, \alpha, c)}{f(x; \theta, \alpha)}$$

$$\Delta = \frac{L_1}{L_0} = \prod_{i=1}^n \left(\frac{x_i^c \theta^c (\theta^2 + 2\alpha\theta + 2\alpha^2)}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} \right)$$

$$\Delta = \frac{L_1}{L_0} = \left(\frac{\theta^c (\theta^2 + 2\alpha\theta + 2\alpha^2)}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} \right)^n \prod_{i=1}^n x_i^c$$

We should refuse to retain the null hypothesis, if

$$\Delta = \left(\frac{\theta^c (\theta^2 + 2\alpha\theta + 2\alpha^2)}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)} \right)^n \prod_{i=1}^n x_i^c > k$$

Equivalently, we should also refuse to retain the null hypothesis where

$$\Delta^* = \prod_{i=1}^n x_i^c > k \left(\frac{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)}{\theta^c (\theta^2 + 2\alpha\theta + 2\alpha^2)} \right)^n$$

$$\Delta^* = \prod_{i=1}^n x_i^c > k^*, \text{ Where } k^* = k \left(\frac{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2) \right)}{\theta^c (\theta^2 + 2\alpha\theta + 2\alpha^2)} \right)^n$$

Whether the $2 \log \Delta$ is distributed as a chi-square distribution with one degree of freedom if the sample is large of size n and also chi-square distribution is employed for obtaining the p -value. Thus we should refute to retain the null hypothesis if the probability value is given by

$$p(\Delta^* > \beta^*), \text{ Where } \beta^* = \prod_{i=1}^n x_i^c \text{ is smaller than a specified level of significance and } \prod_{i=1}^n x_i^c \text{ is the observed value of the statistic } \Delta^* .$$

Structural Properties

In this section, we will discuss the different statistical properties of weighted generalized Aradhana distribution including moments, harmonic mean, moment generating function and characteristics function.

Moments

Let X be the random variable following weighted generalized Aradhana distribution with parameters θ, α and c , then the r^{th} order moment $E(X^r)$ of the proposed distribution can be obtained as

$$E(X^r) = \mu_r = \int_0^\infty x^r f_w(x) dx$$

$$E(X^r) = \int_0^\infty x^r \frac{x^c \theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)\right)} (1+\alpha x)^2 e^{-\theta x} dx$$

$$E(X^r) = \int_0^\infty \frac{x^{c+r} \theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)\right)} (1+\alpha x)^2 e^{-\theta x} dx$$

$$E(X^r) = \frac{\theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)\right)} \int_0^\infty x^{c+r} (1+\alpha x)^2 e^{-\theta x} dx$$

$$E(X^r) = \frac{\theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)\right)} \int_0^\infty x^{c+r} \left(1 + \alpha^2 x^2 + 2\alpha x\right) e^{-\theta x} dx$$

$$E(X^r) = \frac{\theta^{c+3}}{\left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)\right)} \left(\int_0^\infty x^{(c+r+1)-1} e^{-\theta x} dx + \alpha^2 \int_0^\infty x^{(c+r+3)-1} e^{-\theta x} dx + 2\alpha \int_0^\infty x^{(c+r+2)-1} e^{-\theta x} dx \right) \tag{9}$$

After the simplification of equation (9), we obtain

$$E(X^r) = \mu_r = \frac{\theta^2 \Gamma(c+r+1) + \alpha^2 \Gamma(c+r+3) + 2\alpha\theta \Gamma(c+r+2)}{\theta^r \left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)\right)} \tag{10}$$

Now substituting $r = 1, 2, 3$ and 4 in equation (10), we will get the first four moments of weighted generalized Aradhana distribution as

$$E(X) = \mu_1 = \frac{\theta^2 \Gamma(c+2) + \alpha^2 \Gamma(c+4) + 2\alpha\theta \Gamma(c+3)}{\theta \left(\theta^2 \Gamma(c+1) + \alpha^2 \Gamma(c+3) + 2\alpha\theta \Gamma(c+2)\right)}$$

$$E(X^2) = \mu_2' = \frac{\theta^2\Gamma(c+3) + \alpha^2\Gamma(c+5) + 2\alpha\theta\Gamma(c+4)}{\theta^2 \left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)}$$

$$E(X^3) = \mu_3' = \frac{\theta^2\Gamma(c+4) + \alpha^2\Gamma(c+6) + 2\alpha\theta\Gamma(c+5)}{\theta^3 \left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)}$$

$$E(X^4) = \mu_4' = \frac{\theta^2\Gamma(c+5) + \alpha^2\Gamma(c+7) + 2\alpha\theta\Gamma(c+6)}{\theta^4 \left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)}$$

$$\text{Variance} = \frac{\theta^2\Gamma(c+3) + \alpha^2\Gamma(c+5) + 2\alpha\theta\Gamma(c+4)}{\theta^2 \left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} - \left(\frac{\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3)}{\theta \left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} \right)^2$$

$$S.D(\sigma) = \sqrt{\left(\frac{\theta^2\Gamma(c+3) + \alpha^2\Gamma(c+5) + 2\alpha\theta\Gamma(c+4)}{\theta^2 \left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} - \left(\frac{\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3)}{\theta \left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} \right)^2 \right)}$$

Harmonic mean

The harmonic mean for the proposed weighted generalized Aradhana distribution can be obtained as

$$H.M = E\left(\frac{1}{x}\right) = \int_0^\infty \frac{1}{x} f_w(x) dx$$

$$H.M = \int_0^\infty \frac{1}{x} \frac{x^c \theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} (1 + \alpha x)^2 e^{-\theta x} dx$$

$$H.M = \int_0^\infty \frac{x^{c-1} \theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} (1 + \alpha^2 x^2 + 2\alpha x) e^{-\theta x} dx$$

$$H.M = \frac{\theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} \int_0^\infty x^{c-1} (1 + \alpha^2 x^2 + 2\alpha x) e^{-\theta x} dx$$

$$H.M = \frac{\theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2) \right)} \left(\int_0^\infty x^{(c+1)-2} e^{-\theta x} dx + \alpha^2 \int_0^\infty x^{(c+2)-1} e^{-\theta x} dx + 2\alpha \int_0^\infty x^{(c+1)-1} e^{-\theta x} dx \right)$$

After simplification, we obtain

Shiny C Raj et al.,

$$H.M = \frac{\theta(\theta\Gamma(c+1) + \alpha^2\Gamma(c+2) + 2\alpha\theta\Gamma(c+1))}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))}$$

Moment generating function and characteristic function

Let X be the random variable following weighted generalized Aradhana distribution with parameters θ, α and c , then the moment generating function of the proposed distribution can be obtained as

$$M_X(t) = E(e^{tx}) = \int_0^\infty e^{tx} f_w(x) dx$$

Using Taylor’s series, we obtain

$$\begin{aligned} &= \int_0^\infty \left(1 + tx + \frac{(tx)^2}{2!} + \dots \right) f_w(x) dx \\ &= \int_0^\infty \sum_{j=0}^\infty \frac{t^j}{j!} x^j f_w(x) dx \\ &= \sum_{j=0}^\infty \frac{t^j}{j!} \mu_j \\ &= \sum_{j=0}^\infty \frac{t^j}{j!} \left(\frac{\theta^2\Gamma(c+j+1) + \alpha^2\Gamma(c+j+3) + 2\alpha\theta\Gamma(c+j+2)}{\theta^j(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))} \right) \\ M_X(t) &= \frac{1}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))} \sum_{j=0}^\infty \frac{t^j}{j!} \left(\theta^2\Gamma(c+j+1) + \alpha^2\Gamma(c+j+3) + 2\alpha\theta\Gamma(c+j+2) \right) \end{aligned}$$

Similarly, the characteristic function of weighted generalized Aradhana distribution can be obtained as

$$\varphi_x(t) = M_X(it)$$

$$M_X(it) = \frac{1}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))} \sum_{j=0}^\infty \frac{it^j}{j!\theta^j} \left(\theta^2\Gamma(c+j+1) + \alpha^2\Gamma(c+j+3) + 2\alpha\theta\Gamma(c+j+2) \right)$$

Bonferroni and Lorenz Curves

The Bonferroni and Lorenz curves also termed as classical curves are mostly being applied to study the distribution of inequality in income or poverty. The Bonferroni and Lorenz curves can be defined as

$$B(p) = \frac{1}{p\mu_1} \int_0^q x f_w(x) dx$$

and $L(p) = pB(p) = \frac{1}{\mu_1} \int_0^q x f_w(x) dx$

Shiny C Raj et al.,

Where $\mu_1' = \frac{\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3)}{\theta(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))}$ and $q = F^{-1}(p)$

$$B(p) = \frac{\theta(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))}{p(\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3))} \int_0^q \frac{x^c \theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)\right)} (1 + \alpha x)^2 e^{-\theta x} dx$$

$$B(p) = \frac{\theta(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))}{p(\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3))} \int_0^q \frac{x^{c+1} \theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)\right)} (1 + \alpha^2 x^2 + 2\alpha x) e^{-\theta x} dx$$

$$B(p) = \frac{\theta^{c+4}}{p(\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3))} \int_0^q x^{c+1} (1 + \alpha^2 x^2 + 2\alpha x) e^{-\theta x} dx$$

$$B(p) = \frac{\theta^{c+4}}{p(\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3))} \left(\int_0^q x^{(c+2)-1} e^{-\theta x} dx + \alpha^2 \int_0^q x^{(c+4)-1} e^{-\theta x} dx + 2\alpha \int_0^q x^{(c+3)-1} e^{-\theta x} dx \right)$$

After simplification, we obtain

$$B(p) = \frac{\theta^{c+4}}{p(\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3))} \left(\gamma(c+2, \theta q) + \alpha^2 \gamma(c+4, \theta q) + 2\alpha \gamma(c+3, \theta q) \right)$$

$$L(p) = \frac{\theta^{c+4}}{(\theta^2\Gamma(c+2) + \alpha^2\Gamma(c+4) + 2\alpha\theta\Gamma(c+3))} \left(\gamma(c+2, \theta q) + \alpha^2 \gamma(c+4, \theta q) + 2\alpha \gamma(c+3, \theta q) \right)$$

Maximum Likelihood Estimation and Fisher’s Information Matrix

In this section, we will discuss the technique of maximum likelihood estimation to estimate the parameters of weighted generalized Aradhana distribution. Consider X_1, X_2, \dots, X_n be the random sample of size n from the weighted generalised Aradhana distribution, then the likelihood function can be defined as

$$L(x) = \prod_{i=1}^n f_w(x)$$

$$L(x) = \prod_{i=1}^n \left(\frac{x_i^c \theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)\right)} (1 + \alpha x_i)^2 e^{-\theta x_i} \right)$$

$$L(x) = \prod_{i=1}^n \left(\frac{x_i^c \theta^{c+3}}{\left(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)\right)} (1 + \alpha^2 x_i^2 + 2\alpha x_i) e^{-\theta x_i} \right)$$

$$L(x) = \frac{\theta^{n(c+3)}}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))^n} \prod_{i=1}^n \left(x_i^c (1 + \alpha^2 x_i^2 + 2\alpha x_i) e^{-\theta x_i} \right)$$

The log-likelihood function is given by

$$\begin{aligned} \log L = n(c+3) \log \theta - n \log(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)) + c \sum_{i=1}^n \log x_i \\ + \sum_{i=1}^n \log(1 + \alpha^2 x_i^2 + 2\alpha x_i) - \theta \sum_{i=1}^n x_i \end{aligned} \tag{11}$$

Now differentiating log likelihood equation (11) concerning parameters θ , α and c . we must satisfy the following

normal equations

$$\begin{aligned} \frac{\partial \log L}{\partial \theta} = \frac{n(c+3)}{\theta} - n \left(\frac{2\theta\Gamma(c+1) + 2\alpha\Gamma(c+2)}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))} \right) - \sum_{i=1}^n x_i = 0 \\ \frac{\partial \log L}{\partial \alpha} = -n \left(\frac{2\alpha\Gamma(c+3) + 2\theta\Gamma(c+2)}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))} \right) + \sum_{i=1}^n \left(\frac{2\alpha x_i^2 + 2x_i}{(1 + \alpha^2 x_i^2 + 2\alpha x_i)} \right) = 0 \end{aligned}$$

$$\frac{\partial \log L}{\partial c} = n \log \theta - n\psi(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2)) + \sum_{i=1}^n \log x_i = 0$$

Where $\psi(\cdot)$ is the digamma function.

Because of the complicated form of the above likelihood equations algebraically, it is very difficult to solve the system of nonlinear equations. Therefore, we use numerical techniques like the Newton-Raphson method for estimating the parameters of the proposed distribution.

To use the asymptotic normality results for determining the confidence interval. We have that if

$\hat{\lambda} = (\hat{\theta}, \hat{\alpha}, \hat{c})$ denotes the MLE of $\lambda = (\theta, \alpha, c)$. we can determine the results as

$$\sqrt{n}(\hat{\lambda} - \lambda) \rightarrow N_3(0, I^{-1}(\lambda))$$

Where $I^{-1}(\lambda)$ is Fisher's information matrix. i.e

$$I(\lambda) = -\frac{1}{n} \begin{pmatrix} E\left(\frac{\partial^2 \log L}{\partial \theta^2}\right) & E\left(\frac{\partial^2 \log L}{\partial \theta \partial \alpha}\right) & E\left(\frac{\partial^2 \log L}{\partial \theta \partial c}\right) \\ E\left(\frac{\partial^2 \log L}{\partial \alpha \partial \theta}\right) & E\left(\frac{\partial^2 \log L}{\partial \alpha^2}\right) & E\left(\frac{\partial^2 \log L}{\partial \alpha \partial c}\right) \\ E\left(\frac{\partial^2 \log L}{\partial c \partial \theta}\right) & E\left(\frac{\partial^2 \log L}{\partial c \partial \alpha}\right) & E\left(\frac{\partial^2 \log L}{\partial c^2}\right) \end{pmatrix}$$

Here, we can define

$$E\left(\frac{\partial^2 \log L}{\partial \theta^2}\right) = -\frac{n(c+3)}{\theta^2} - n \left(\frac{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))(2\Gamma(c+1))}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))^2} \right)$$

$$E\left(\frac{\partial^2 \log L}{\partial \alpha^2}\right) = -n \left(\frac{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))(2\Gamma(c+3))}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))^2} \right) + \sum_{i=1}^n \left(\frac{(1 + \alpha^2 x_i^2 + 2\alpha x_i)(2x_i^2)}{(1 + \alpha^2 x_i^2 + 2\alpha x_i)^2} - \frac{(2\alpha x_i^2 + 2x_i)(2\alpha x_i^2 + 2x_i)}{(1 + \alpha^2 x_i^2 + 2\alpha x_i)^2} \right)$$

$$E\left(\frac{\partial^2 \log L}{\partial c^2}\right) = -n\psi'(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))$$

$$E\left(\frac{\partial^2 \log L}{\partial \theta \partial \alpha}\right) = -n \left(\frac{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))(2\Gamma(c+2))}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))^2} \right)$$

$$E\left(\frac{\partial^2 \log L}{\partial \theta \partial c}\right) = \frac{n}{\theta} - n\psi \left(\frac{(2\theta\Gamma(c+1) + 2\alpha\Gamma(c+2))}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))} \right)$$

$$E\left(\frac{\partial^2 \log L}{\partial \alpha \partial c}\right) = -n\psi \left(\frac{(2\alpha\Gamma(c+3) + 2\theta\Gamma(c+2))}{(\theta^2\Gamma(c+1) + \alpha^2\Gamma(c+3) + 2\alpha\theta\Gamma(c+2))} \right)$$

Where $\psi(\cdot)'$ is the first order derivative of digamma function.

Since λ being unknown, we estimate $I^{-1}(\lambda)$ by $I^{-1}(\hat{\lambda})$ and this can be used to obtain asymptotic confidence intervals for θ , α and c .

Application

In this section, we have used a real lifetime data set in weighted generalized Aradhana distribution to determine its goodness of fit and then fit has been compared to over-generalized Aradhana, quasi-Aradhana, Aradhana and Lindley distributions. The following real lifetime data set is given below as The following real data set given below in Table 1 represents the strength data of glass of the aircraft window reported by Fuller et al. (1994) and the data set is given below as To determine the model comparison criterion values along with the estimation of unknown parameters, the technique of R software is employed. To compare the performance of weighted generalized Aradhana distribution over-generalized Aradhana, quasi-Aradhana, Aradhana and Lindley distributions, we use the criterion values AIC (Akaike Information Criterion), BIC (Bayesian Information Criterion), $AICC$ (Akaike Information Criterion Corrected) and $-2\log L$. The distribution is better which shows lesser criterion values of AIC , BIC , $AICC$ and $-2\log L$. For determining the criteria such as AIC , BIC , $AICC$ and $-2\log L$ following formulas are used.

$$AIC = 2k - 2 \log L, \quad BIC = k \log n - 2 \log L, \quad \text{and} \quad AICC = AIC + \frac{2k(k+1)}{n-k-1} \quad \text{Where}$$

n is the sample size, k is the number of parameters in the statistical model and $-2\log L$ is the maximized value of the log-likelihood function under the considered model. From Table 2 given above, it has been realized and observed from the result that the weighted generalized Aradhana distribution has lesser AIC , BIC , $AICC$ and $-2\log L$ values as compared to the generalised Aradhana, quasi-Aradhana, Aradhana and Lindley distributions. Hence, it can be concluded that the weighted generalised Aradhana distribution provides a better fit over-generalised Aradhana, quasi-Aradhana, Aradhana and Lindley distributions.

CONCLUSION

The present article deals with a novel distribution known as the weighted generalized Aradhana distribution which has been developed and studied by using the weighted technique for its baseline distribution. Its different statistical properties include the shape of the behaviour of pdf and cdf, moments, harmonic mean, reliability function, hazard rate function, reverse hazard function, moment generating function, characteristic function, Bonferroni and Lorenz curves and order statistics have been thoroughly explored and presented. Furthermore, the parameters of the developed distribution have been estimated based on the maximum likelihood estimation. Finally, a new distribution has been examined and analysed with a real lifetime data set to demonstrate its usefulness and hence it is revealed from the result that the proposed weighted generalized Aradhana distribution provides a quite satisfactory result over generalized Aradhana, quasi-Aradhana, Aradhana and Lindley distributions.

ABSTRACT

In the rapidly evolving landscape of deepfake technology, which poses substantial threats to privacy and security, this research conducts a comparative analysis between two advanced detection methods: The ViT image classifier employing convolutional neural networks and the Meso4 method to analyse images at mesoscopic level. Motivated by the pervasive impact of deepfakes on individuals, particularly celebrities and politicians, the study aims to discern the effectiveness of these methods in distinguishing authentic from manipulated images. The methodological approach prioritizes practical implementation, utilizing the DFDC (Deep Fake Detection Challenge by Kaggle) dataset for ViT and a combination of self-made and Face2Face dataset for Meso4 model. The DFDC dataset is a massive 260 GB dataset comprising over 1 million images, both real and fake, while the combined dataset for MESO consists of approximately 400 videos made by the author and over a thousand videos from the Face2Face dataset, encompassing real and fake instances. The ViT model exhibits exceptional proficiency, achieving a 99.9% accuracy within its dataset and an 85% accuracy for subtly deceptive images. Conversely, the Meso4 model faces challenges, resulting in a 60% accuracy and displaying biases, particularly towards female subjects due to its heavy trainings on adult content. In conclusion, the ViT image processor emerges as a superior and user-friendly method, despite its substantial data footprint, showcasing superior efficacy, especially in real-world scenarios. The findings emphasize the importance of advancing robust and unbiased deepfake detection methods, acknowledging considerations such as model size in the context of application requirements.

INTRODUCTION

Deepfakes impact people's lives by eroding trust in digital content, leading to potential misinformation and manipulation. They pose threats to privacy through the creation of fabricated explicit content, causing emotional distress. In the realm of cybersecurity, deepfakes can contribute to identity theft and phishing attacks. The prevalence of deepfakes underscores the need for robust detection tools and increased awareness to mitigate their societal implications [2]. Deep fakes, crafted with advanced artificial intelligence, pose a significant threat by manipulating information and eroding trust in digital content. Deepfakes detection is vital for countering the spread of misinformation [5], which can disrupt democratic processes and public discourse, ensuring the authenticity of digital content. This research paper serves as a crucial safeguard close against privacy violations through the creation of nonconsensual explicit content, as it compares the two models which helps us to understand and gain in depth knowledge about the genuine and effective usage of the methods which help us deal with the cons of AI, a growing concern in the deep fake era [1]. In the realm of cybersecurity, the research paper plays a pivotal role in preventing identity theft, phishing attacks, and other malicious activities [5]. It upholds ethical standards in content creation and aids forensic analysis, verifying the credibility of digital evidence in legal proceedings. In the intricate landscape of image analysis, this paper undertook a thorough exploration, employing two distinct pretrained models. The initial model, utilizing heatmaps, meticulously scrutinized distortions within images [6], albeit encountering challenges in accuracy. Simultaneously, the ViT image classifier exhibited exceptional precision, albeit at the expense of computational time and database compatibility. Undeterred, the research endeavoured to merge the strengths of both models, envisioning a hybrid approach that harmonizes accuracy and efficiency, setting the stage for a groundbreaking solution in deepfake detection. Hence, as a catalyst for research and development, deepfake detection project stays ahead of evolving deep fake technology, raising public awareness to empower individuals in recognizing associated risks [7]. It also supports journalism by enabling the verification of user-generated content. Ultimately, projects like these contribute to responsible AI use, reinforcing the ethical foundation of artificial intelligence in a world increasingly dependent on digital media.

METHODOLOGY

In the realm of artificial intelligence and deep learning, the DFDC (Deepfake Detection Challenge) and Face2Face datasets serve as cornerstone resources for advancing research in the field of deepfake detection. The DFDC dataset, characterized by its expansive scale, places a prominent emphasis on nuanced alterations in both facial and vocal features within manipulated videos. This extensive repository provides a diverse array of scenarios, encompassing variations in lighting conditions and backgrounds, thereby offering a comprehensive testbed for the development of sophisticated deepfake detection algorithms. Conversely, the Face2Face dataset, though comparatively smaller in scale, specializes in the meticulous representation of realistic facial expression transfer. It concentrates on controlled settings, allowing for an in-depth exploration of the intricacies associated with facial manipulation. DFDC presents challenges in the identification of subtle manipulations, requiring algorithms to navigate varying video quality and manipulation techniques. On the other hand, Face2Face demands algorithms proficient in discerning realistic facial reenactments from authentic expressions, albeit within a potentially more constrained range of scenarios. Both datasets synergize effectively when utilized in conjunction with dedicated models for deepfake detection. DFDC proves particularly beneficial in scenarios where the precise identification of manipulated audio-visual content is paramount. Simultaneously, Face2Face contributes to studies that specifically delve into the nuances of facial expression transfer and manipulation.

**Devang Mulye et al.,****Meso4 model**

The Meso4 deepfake detection network (as in fig 1.) employs a cascading series of convolutional layers, each followed by batch normalization for enhanced training stability and accuracy. Feature extraction progresses through these layers, culminating in fully connected layers and dropout for robust classification. Max pooling reduces dimensionality, while the final sigmoid activation outputs a probability score for the input image being a deepfake. This concise architecture leverages key elements for effective deepfake detection.

Contribution 1

The Meso4 model incorporates an innovative enhancement through the integration of a threshold value derived from a heatmap, offering an enriched approach to image analysis and data visualization. The model's workflow begins with the loading of an image, followed by the conversion of the image into a NumPy array presented in matrix form for heatmap Generation (as in fig 5. and fig 6.). The heatmap plays a pivotal role in determining a threshold value, subsequently utilized to calculate the confidence level [9]. This threshold value is integral to the decision-making process employed by the Meso4 model. After initializing the model and loading pretrained weights, the image undergoes preprocessing for subsequent predictions. By leveraging the threshold value and confidence level, the model classifies the image as either genuine or manipulated (as in fig 5. And fig 6.). The heatmap is instrumental in accentuating regions within the input image that are deemed critical or carry distinctive information. The fusion of the heatmap with the model contributes to the discernment of discriminative regions. It facilitates the identification of crucial areas in the image, thereby improving the model's resistance to adversarial attacks [10]. This adaptive feature learning ensures that the model dynamically adjusts its attention based on the heatmap information, reducing the likelihood of false positives or negatives. In essence, the fusion of the heatmap with the Meso4 model not only enhances the interpretability of the model but also provides adaptive insights into relevant regions, making it more robust, accurate, and resilient in the realm of deepfake detection.

ViT model

The ViT model architecture (as in fig 2.) leverages the powerful attention mechanism of Transformer encoders for image classification. The input image is first decomposed into non overlapping patches, which are then linearly embedded into a lower dimensional space. To retain spatial information, positional encodings are incorporated. The resulting sequence of patch representations is then fed to a stacked Transformer encoder. Each encoder layer employs multi- head self-attention, allowing the model to learn complex relationships and dependencies between patches, extracting global features beyond local patch information. Finally, the encoded representation is projected onto class log it's for image classification. This approach demonstrates the effectiveness of Transformer-based encoders in capturing long-range dependencies in image data, leading to promising performance in image classification tasks.

Contribution 2

The data processing pipeline for this machine learning workflow initiates with loading the dataset using the PIL library [11], emphasizing the significance of efficient dataset handling for robust model training and evaluation. Subsequently, labels and IDs are mapped, with zero representing fake and one representing real, establishing a clear ground truth for supervised learning. The dataset is then judiciously split into training and testing sets to gauge the model's generalization capabilities beyond the training data. The code proceeds to load the model and create a processor for the Vision Transformer (ViT) pretrained model [12], crucial steps in integrating the pre-trained model into the workflow for feature extraction and classification. The input image size is aligned with the ViT model's expectations to optimize information flow during training and evaluation. Image Transformations are applied to enhance model robustness, allowing it to learn from variations in the dataset and improve generalization. A collate function is defined to efficiently prepare batched data for model training. Pre-trained weights for the ViT model are then loaded, leveraging knowledge from prior training to facilitate faster convergence. The model undergoes training and evaluation on the validation set, providing insights into its learning progress and predictive accuracy on unseen data. To showcase the model's practical application, an image is uploaded into the pipeline, demonstrating real-time predictions. The results, displayed as scores and labels, offer a concise and interpretable summary of the model's

**Devang Mulye et al.,**

predictions, ensuring easy interpretation and informed decision-making based on the provided outputs (as in fig 7. and fig 8.).

RESULTS AND DISCUSSIONS

Details of the dataset

This paper includes a comparative analysis of the Meso4 [3] and ViT image classifiers [4], it considers a meticulous approach to dataset selection [8], tailoring each to meet the specific requirements of the respective models. The dataset for the Meso4 model comprises 2,043 images, meticulously categorized into 960 fake images (as in fig 3(a)) with varying difficulty levels (easy, medium, or hard) and 1,081 real images (as in fig 4(a)). This comprehensive dataset was utilized for training, testing, and validation purposes, forming the foundation for our model evaluation. Conversely, the dataset for the ViT model was more extensive, encompassing a total of 190,305 images. For testing, we utilized 5,492 fake and 5,413 real images, while the training set comprised 70,000 images each for fake and real scenarios. Additionally, the validation set included 19,600 fake images (as in fig 3(b)) and 19,800 real images (as in fig 4(b)). This diverse and sizable dataset facilitated robust training, allowing ViT to demonstrate its capabilities across various image classification tasks. Based on the outputs obtained from these datasets, we meticulously computed and compared the performance metrics, summarizing the findings in the provided comparison table. This methodical approach ensures a comprehensive evaluation of the models, considering their specific training data and testing conditions. The Meso4 model's accuracy (as in fig 9(a)) starts at 0.65 at the first epoch and increases to 0.99 by the tenth epoch, indicating that the model is learning and improving its predictions with each epoch. The line graph shows a positive trend, which is a good sign in the context of model training. The model seems to be performing well as it's achieving high accuracy on the training data over time. As training progresses, the accuracy curve plateaus (as in fig 9(b)), indicating the model is no longer significantly improving. This could be due to:

- Saturation: The model has learned all it can from the data.
- Overfitting: The model is memorizing the training data too well and might not generalize well to unseen data.

CONCLUSION

This research work represents a thorough investigation into the realm of deepfake detection, leveraging the distinct strengths of Meso4 and ViT models while drawing insights from the DFDC and Face2Face datasets. Meso4's compact architecture, enriched by an innovative heatmap-driven enhancement, emerges as a pragmatic solution, demonstrating efficiency, interpretability, and resource economy. Its adaptability to real-time applications positions it as an asset for scenarios prioritizing quick responses. On the other hand, ViT, with its larger size and advanced transformer encoders, excels in accuracy and generalization, making it a versatile choice for diverse image classification tasks. The longer training times and slower inference speeds are counterbalanced by strong transfer learning capabilities and the accessibility of pretrained models. This research marks a significant milestone in the ongoing battle against the escalating threat of manipulated media. The developed detection system, comprising both Meso4 and ViT models, stands as a robust defense against deceptive information and identity theft in the digital age. Its distinguishing features include adaptability and scalability, effectively countering new and emerging threats in real-time data streams or large content batches. The seamless integration with social media platforms is a key highlight, enabling automatic identification and removal of deepfake content and thereby enhancing the credibility of online information. A pivotal aspect of our work is the emphasis on ethical use, regulatory compliance, and responsible content practices. By prioritizing these principles, the project not only addresses the immediate challenges posed by deepfake technology but also underscores the importance of responsible technological advancements. The significance of ongoing research and community engagement is highlighted in navigating the evolving deepfake landscape. Deepfake detection systems developed in this research can be applied in environmental monitoring by ensuring the authenticity of multimedia content related to environmental issues. By integrating the Meso4 and ViT models into surveillance systems, it can help identify and filter out manipulated

Devang Mulye et al.,

media, enhancing the credibility of environmental data shared online. The adaptability, scalability, and real-time capabilities of the system make it suitable for monitoring large data streams or batches of content, contributing to responsible content practices in the context of environmental information dissemination. Ethical use, regulatory compliance, and collaboration with the community are emphasized, emphasizing the importance of responsible technological advancements in addressing challenges in the evolving environmental landscape. As we continue to refine and adapt our detection system, collaboration and shared knowledge will play a crucial role in staying ahead of the evolving techniques employed by those who seek to manipulate media for malicious purposes.

ABSTRACT

This article examines the versatile and revolutionary uses of blockchain technology in several sectors. Through an analysis of practical applications in financial services, supply chain management, healthcare, and the public sector, we emphasize the substantial influence and potential of blockchain technology to transform conventional systems. Furthermore, this study examines upcoming patterns and potential uses, offering a forward-thinking viewpoint on how blockchain technology is positioned to continue to revolutionize and introduce advancements in several industries. The analysis also encompasses regulatory and legal factors to comprehend the difficulties and possibilities in navigating the dynamic terrain of blockchain technology.

INTRODUCTION

Blockchain technology has quickly grown from its use in cryptocurrencies to a potent innovation tool across many industries. Decentralization, transparency, and immutability can revolutionize more than digital currency. This paper enthusiastically and thoroughly explores how blockchain technology is transforming numerous sectors with secure and effective solutions. Decentralized finance (DeFi) platforms that offer financial services without middlemen are revolutionizing the financial services industry by cutting costs and boosting accessibility. Blockchain supports cross-border transactions and secures financial records, so cryptocurrency and smart contracts are just the beginning of its impact on finance. Blockchain technology is also changing supply chain management. Blockchain helps prevent fraud, improve inventory management, and verify product authenticity by ensuring transparency and traceability. Blockchain supply chain case studies show significant efficiency and reliability gains. Healthcare uses blockchain technology to secure patient data, streamline clinical studies, and track drugs. These apps improve data security and patient outcomes by improving data exchange and management. Blockchain is benefiting the public sector through digital identity verification, voting systems, and public record-keeping. Blockchain is making governance more responsible and efficient by decreasing bureaucratic inefficiencies and increasing transparency. Future blockchain trends and applications promise even bigger advances. Blockchain can be used with IoT and AI to increase its influence in numerous fields. This paper also covers blockchain's legislative and legal landscape, highlighting the need for a supporting framework to overcome its problems and capitalize on its benefits. Blockchain technology will continue to revolutionize sectors, enabling efficiency, security, and transparency. Blockchain's current and future applications and possibilities are covered in this paper, demonstrating its impact on several industries.

APPLICATION AREAS OF BLOCKCHAIN

Blockchain can be used for all those systems in which reversible transactions are not allowed.

Land Revenue (RoR)

A great deal of paperwork is required for land revenue transactions, including evidence of ownership and financial standing, as well as the transfer of deeds and titles. In order to verify and transfer ownership of land, blockchain technology could be used to record revenue transfers. Transactions can be processed faster, less paperwork can be generated, and costs can be reduced or eliminated altogether if counterfeiting is not an issue.

Monetary transactions

The original idea that inspired blockchain technology is still a good use case today. Blockchain-based monetary transfers have the potential to be both cheaper and more expedient than the current system. Particularly true for the time-consuming and money-consuming process of international trade. Whereas traditional bank transfers in the US can take days, blockchain transactions can be completed in minutes.

Lending

Creditors can process collateralized loans using blockchain smart contracts. Smart contracts on the blockchain can be programmed to trigger payments for services, margin calls, loan repayment, and collateral releases, among other events. As a result, lenders can provide more competitive interest rates and streamline the loan application process.

Insurance

Insurance companies and their customers alike can gain from the increased openness made possible by smart contracts on a blockchain. If claims were maintained on a blockchain, customers wouldn't bother filing duplicates for the same incidence. Claims might potentially be settled more quickly with the help of smart contracts.

**Maitri Hingu and Kamlendu Pandey****Protect personal data**

The storage of sensitive information, such as a person's Social Security number, date of birth, and other identifying characteristics, on a public ledger (such as a blockchain) is one potential enhancement that might be made to the current state of data security. There is a possibility that blockchain technology might be utilized to enhance and broaden access to important identifying information in a variety of industries, including aviation, healthcare, finance, and education, among others.

Voting

We are one step closer to using blockchain technology in elections if we can store personally identifying information on the ledger. By utilizing blockchain technology, we can guarantee that no one casts a vote more than once, that only eligible citizens are able to cast ballots, and that votes are not subject to manipulation. In addition, it can make voting as easy as tapping a few keys on a smartphone, which could increase voter turnout. Concurrently, the cost of conducting an election would be cut drastically.

Government privileges

A blockchain-based digital identity system can improve the administration of welfare, Social Security, and health care programs. There is hope that blockchain technology can cut down on operational and fraud expenses. At the same time, digital distribution based on the blockchain allows recipients to acquire their money faster.

Securely transmit medical information

When patient information is stored on a distributed ledger, medical professionals will always have access to the most up-to-date and correct version of a patient's medical history. It is feasible that this will ensure that patients who see several doctors receive the highest possible level of treatment. Additionally, it can assist in the rapid acquisition of medical records, which, in certain circumstances, can shorten the amount of time required for treatment. If insurance information is stored in the database, medical professionals will be able to simply determine whether or not the care they provide to their patients will be paid by insurance. MedRec is portrayed in [1] as an endeavor into this field to demonstrate innovative electronic medical record (EMR) solutions that utilize blockchain technology. It is not shown as a universal solution for the management of medical records. The authors demonstrate a novel approach to the management of medical records by providing auditability, interoperability, and accessibility through the utilization of a comprehensive log [1]. Keeping track of the links between patients and providers that relate a medical record to viewing privileges is something that they do [1]. It is the care provider who is responsible for generating the data queries and the metadata associated with them, which is then updated whenever new items are added [1]. They assume that a large number of nodes, primarily care providers, are successfully managing databases that include patient information that is stored on servers that are connected to the network [1]. For the purpose of effectively monitoring data behavior and removing access to data that has violated rules or permissions, the architecture employs smart contracts and access control mechanisms [2]. In modern civilizations, cultures, and organized groupings, the dissemination of medical data has been regarded as a significant step forward in the discovery of novel treatments and medicines for the purpose of curing disorders [2]. One of the services that they offer is a blockchain-based data exchange system that is safe for untrusted parties to use for electronic medical records [2]. The use of the proposed approach will allow cloud service providers to achieve safe data provenance and auditing, as stated in the citation [2].

Artist royalties

The use of blockchain technology to monitor the movement of digital media files online might help guarantee that artists get their due. Aiming squarely at the problem of content duplication, blockchain technology offers a promising solution that might be used to combat piracy. Applying a blockchain to document streaming service sessions and a smart contract to distribute royalties could lead to more openness and guarantee that artists get their rightful pay.

**Non-fungible tokens (NFTs)**

Using non-fungible tokens (NFTs) is commonly linked to the purchase of digital artwork rights. Due to the blockchain's limitation on duplicate data, placing an NFT on the blockchain ensures that digital art pieces exist in a single, unalterable version. It might give the impression of buying tangible artwork without the responsibility of storing it. Although NFTs have many potential applications, at their core they are simply a means of transferring ownership of any digitally recorded item. It might be the privilege of airing a video or even a ticket to a live performance. The term "NFT" could be used to anything that is even marginally unusual.

Logistics and supply chain tracking

There is a possibility that there are a number of benefits associated with monitoring products as they move through a logistics or supply chain system. To begin, the availability of information on a public ledger that can be trusted makes the process of information sharing between organizations more efficient. It is also hard to change the information that is saved on the blockchain, which allows for an improvement in both the security and integrity of the data that is stored there. In light of the fact that the information that is provided is more likely to be reliable and up to date, participants in the supply chain and logistics may be able to collaborate more freely as a consequence. Due to the fact that counterfeiters are unable to prove possession of products on this system, they propose a revolutionary blockchain-based product ownership management system for the post-supply chain [3]. This system would render the efforts of counterfeiters to clone authentic tags futile. One of the most significant challenges that exists in both domestic and international trade is the counterfeiting of genuine products, particularly those that are well-known brands [3]. This allows all players, including those in the supply chain and the end users of the goods that are being tracked, to transfer and verify ownership of the items in question [3]. This protocol is fully functioning and allows all parties to transfer and verify ownership of the objects of interest. In order to facilitate the after-market supply chain, they propose a new product ownership management system (POMS) that is based on blockchain technology. Specifically, they propose a novel method for identifying the owners of products, hence removing the requirement for the use of phony tag cloners [3]. One of the most important advantages of the proposed POMS is that it has the capability to prevent customers from purchasing counterfeit items [3]. With the implementation of Blockchain technology in the supply chain, there is a promising development that has the potential to benefit all of the numerous stakeholders involved in the process [4] for example.

Increasing the inflow efficiency of planning decision optimization should be possible with the use of blockchain technology [4]. There is a possibility that the online food retailer will provide funding for a trial project that will put the solution into action [4]. The creation of data models that enable the flow of electronic information from beginning to finish is an essential requirement [4]. Blockchain technology has emerged as a leading technological layer capable of supporting financial applications [4]. There are a number of critical issues that need to be addressed, and one of the most crucial ones is the obligation to incorporate all of the different actors. The purpose of this study was to investigate a case study of a supply chain associated with a big industrial firm that utilized blockchain technology to describe the system architecture and intelligent contract operation mechanism [5]. Chain is a complex structure that has rapidly emerged in the 21st century as a result of the significant advancements in network and information technologies as well as their widespread application [5]. As a result of the development and broad adoption of network and information technologies, the traditional linear single chain notion of the supply chain has been rendered obsolete [5]. As a result of reading this essay, readers will gain an understanding of whether or not it is feasible and feasible to implement blockchain technology in the supply chain endogenous risk management of large manufacturing companies. Once they have constructed a network system that is comparable, all of the business topics that are involved in the supply chain will be able to publish their own supply and demand data [5]. From the point of view of management, this will increase the creditworthiness of each business subject as well as the operational efficiency of the firm [5].

**Maitri Hingu and Kamlendu Pandey****Secure Internet of Things networks**

While the IoT improves our quality of life, it also opens the door for cyber criminals to steal our personal information or take over our most important machines. Blockchain technology improves safety since it uses a distributed network to store information rather than a central server to do it. Also, data manipulation is prevented by blockchain's immutability.

Data storage

Integrating blockchain into a database system can improve its robustness and trustworthiness. In contrast to a centralized data storage provider, which may only have a few points of redundancy, it may be more difficult to hack into a decentralized network and wipe out all of the data. This also means that data is more readily available, as it will no longer be dependent on the actions of a single entity. Blockchain data storage has the potential to be cheaper in several use cases.

Gaming

There are a lot of ways in which the gaming business may use blockchain technology. One major advantage of running a casino on the blockchain is the improved transparency it provides to players. The immutability of the blockchain records every transaction, so players may check the casino's validity and game fairness. To add insult to injury, blockchain eliminates the requirement for participants to reveal personally identifiable information (such as a bank account)—a feature that may deter some prospective users. This technology is able to circumvent regulatory constraints because gamblers have the option to remain anonymous and the government cannot shut down the decentralized network. Blockchain is utilized for access management and data storage, for the purpose of managing transactions, which is a network consisting of several stakeholders such as hospitals, doctors, pharmacies, pathology labs, imaging centers, medical research centers, and insurance companies [6]. Blockchain is utilized for access management and data storage. Biomedical research and smart healthcare have long been top priorities that should be supported in any way feasible [6]. The core of the suggested architecture is the generative data ingestion from biosensors and smart wearables [6]. The cutting-edge blockchain architecture adheres to the primary audit approach used by stakeholders like insurance companies, hospitals, and doctors [6]. The author proposed a three-level architecture on different phases, including a Web Platform that patients can use to upload their health records and keep an Access Management Suite up to date [6]. The Web Platform's data will be fetched through REST API services, and Cloud Middleware will be utilized to call on Smart Contracts to carry out the required registration of newer blocks and to support consensus of the Nodes across the Blockchain network that is held in the third level [6].

They concluded that there is a high probability that Blockchain Technology will usher in a new era of digital services characterized by increased service efficiency, customer happiness, trust, security, privacy, cost savings, etc. [7]. New and potentially revolutionary, Blockchain Technology may soon alter the face of the ICT industry altogether [7]. The majority vote is required to authorize a transaction [7]. E-tender refers to a completely online tendering procedure [7]. Role assignment, network node authenticity, consensus mechanisms, and system consistency are all the purview of the ordered nodes [7]. A blockchain-based ID as a Service has been presented in this article, which is a novel type of ID as a Service for identification and authentication management [8]. They've seen a variety of blockchain financial uses, as well as a number of multinational companies using blockchain technology for a variety of purposes. They have introduced a new type of ID as a service for managing identification and authentication [8]. There is space for improvement in the planned BIDaaS. The suggested BIDaaS serves as an identity and authentication management infrastructure for a mobile telecommunications company's mobile user. When a user seeks access to a partner's service using their virtual ID, the partner receives the user's virtual ID and public key information from the BIDaaS blockchain [8]. They offer a user-centric approach to altering the content delivery ecosystem, which they believe is necessary [9]. Marc Prensky coined the phrase "Digital Natives" in 2001 to describe what he saw as a shift in the educational landscape. This generation is transforming the television industry by using over-the-top (OTT) services as their primary means of accessing a ubiquitous, on-demand, and user-centric entertainment experience [9]. They offered new approaches for blockchain-oriented software engineering based on the findings of the investigation,

**Maitri Hingu and Kamlendu Pandey**

focusing on collaboration among large teams, testing activities, and specialized tools for the production of smart contracts [10]. The burgeoning concepts of blockchain and smart contracts have received a lot of attention in recent years. The goal of this article is to expose current issues and future directions in blockchain-oriented software engineering [10]. It looks into the demand for new specialized software engineering approaches in the blockchain industry. They describe blockchain-oriented software (BOS) as any program that interacts with a blockchain implementation. Because of the blockchain's distributed structure, certain measures are needed to assess its complexity, communication capability, resource consumption, and overall performance [10]. Blockchain is a novel platform that does away with the need for a single, centralized authority. It has a wide range of functionalities that are important to healthcare DApps, such as health data exchange and data access control [11]. Smart contracts are pieces of code constructed on top of a blockchain that can be executed if certain criteria are met. The storage of encrypted sensitive data should be limited in decentralized apps [11]. For businesses all across the world, fraud prevention is an important and continuous priority. According to the Association of Certified Fraud Examiners' 2016 Report to the Nations on Occupational Fraud and Abuse, the overall loss caused by fraud events in 2016 exceeded \$6.3 billion [12]. The main strategies for concealing frauds were modifying or deleting information in accounting systems, manipulating electronic documents, and generating fake electronic files. A more secure accounting information system is required to reduce fraud risk [12]. A smart grid system is equipped with a sovereign blockchain-based system that guarantees transparency, provenance, and immutability [13].

In the current day, it is believed that the utilization of electricity is the fundamental building block that makes it possible to discover or develop new technologies. To create a tamper-proof mechanism for safeguarding customer data stored and transferred onto the smart grid system, they suggest a sovereign blockchain-based solution paired with smart contracts [13]. They intend to put the system into practice and get workable outcomes [13]. They demonstrate the codes required to ensure the privacy of communications between customers and the relevant utility firms [13]. The smart contracts on the smart meter are activated and turn off the electricity when a consumer's power runs out [13]. This research differs from earlier works in that it offered a blockchain-based safe crowdsensing incentive system in which miners can remove the security and privacy concerns brought on by a central authority by analyzing verified data characteristics [14]. With the rise of smartphones with strong sensors built in, crowdsensing has emerged as a key paradigm for effectively collecting data by utilizing the widespread smartphone user base [14]. The privacy of the nodes could be obtained by the miner by confirming the transaction when a cryptocurrency like Bitcoin or Monero is used to encourage a node to accomplish a sensing task in a crowdsensing application. They suggest a blockchain-based safe crowdsensing incentive system where the security and privacy concerns brought on by a centralized authority can be resolved by the miners' verified data quality evaluation [14]. They investigate the prospect of integrating Blockchain technology to safeguard cloud-hosted healthcare data [15]. The gradual migration of data and services to the cloud is one particular trend seen in the healthcare industry. The accountable healthcare practitioner stores medical and clinical information about a specific patient in Electronic Medical Records (EMRs).

The requirement for real-time healthcare data sharing across various providers grows more obvious in medical tourist spots like Singapore [15]. Paper-based data is difficult to get into systems, expensive to store, and readily available when needed [15]. In order to facilitate the move from duplicated computing on the blockchain to distributed parallel computing architecture, this article presents a vision and suggests mechanisms for doing so. It does this by converting smart contracts to include data driven features from the ground up [16]. This article suggests a brand-new distributed parallel computing architecture on the blockchain for big data analysis, particularly for precision medicine [16]. Different hospitals, patients, and health service providers own and keep their own sets of data, which are kept in different places [16]. In [17], they present a vision and suggests methods for converting the blockchain's replicated processing into a distributed parallel computing architecture using smart contracts that are built on native data. For the study of huge data, particularly for precision medicine, this paper suggests a new blockchain distributed parallel computing architecture. Each hospital, patient, and provider of healthcare has their own collection of data, which is kept in a distinct place [17]. They provide a parallel healthcare system architecture built on artificial systems, computational experiments, and a parallel execution strategy [18]. The idea for SMART healthcare was inspired by IBM's 2009 smart earth project [18]. It describes the combined use of big data, cloud

**Maitri Hingu and Kamlendu Pandey**

computing, Internet of Things, and artificial intelligence to provide an interactive platform for exchanging medical information [18]. The hospital's clinical system allows for the parallel execution of real and artificial doctors while developing a diagnostic and treatment plan [18]. The artificial physician incorporates the clinical expertise, professional expertise, reasoning styles, and actual gout cases with knowledge graph [18]. The PHSs replicate and depict real-world healthcare scenarios using artificial system modelling [18]. The first higher education institution to deposit academic credentials on the Bitcoin blockchain is Nicosia University [19]. Applying blockchain technology will increase confidence among stakeholders, including higher education institutions and students [19]. The higher education institution manages online transactions for the students' certifications and payment of fees [19]. Deep learning and quantum-resistant blockchain are combined in the architecture known as BinDaaS [20]. To guarantee the confidentiality and authentication of patient EHR records, a lattice-based signature technique is employed [20]. The proposed framework would comprise previous electronic health records (EHR) of patients who will be trained using node degree and diameter comparisons [20]. Patient health records are now stored electronically rather than manually as they once were [20]. The Lattice cryptosystem is used to create security evaluations, which are then computed and communicated cost-based [20]. The Internet of Things includes a wireless sensor network, which is crucial [21]. This paper's proposed authentication method identifies the authenticated party by using the direct management node of the ordinary node [21]. The investigation of security and performance reveals that the plan is both efficient and secure [21]. Every common node in the network has a distinct OID identity [21]. It is able to identify any regular node in the entire network using (SID, CID, and OID) in accordance with it. WSN subnet and cluster network, which correspond to the special cluster head node CID and base station SID [21].

By funding the most publications listed in Web of Science, the findings showed that the National Natural Science undation of China had made wise investments in blockchain research [22]. Since the creation of the digital currency Bitcoin in 2008, Blockchain technology has become a focus of attention for a wide spectrum of researchers and practitioners [22]. 616 of the 995 Blockchain papers that Web of Science has indexed from 2013 to 2018 have not yet received any citations [22]. Based on the typical annual number of citations, IEEE Access has published the two publications with the highest citation counts. China is the only Asian nation that actively produces highly regarded publications in this area [22]. Based on the overall number of articles, Lecture Notes in Computer Science and IEEE Access have emerged as the most popular venues [22]. Coins must be purchased from the controller in order to change its value in the blockchain record, which any consumer can do [23]. The blockchain's primary function is to ensure the safety of energy records, keep track of all trades, streamline operations, and reduce the likelihood of errors [23]. Because it integrates blockchain-based distributed architecture into the SG system, the proposed SETS ensure the confidentiality and security of all P2P network communications. Many modern systems rely heavily on energy, including those used for transportation, communication, and the administration of intelligent devices [23]. By storing their energy trading transactions in the blockchain, consumers have a new marketplace for their generated and sold energy [23]. Secure Energy Transaction System (SETS) protects both consumer and utility information against unauthorized access and disclosure [23] A thorough examination of the technical details revealed that the majority of the suggested solutions relied on the Ethereum platform's private blockchain [24].

Medical research has been steered toward blockchain-based architectures due to the necessity of highly protected interoperability and confidential and accurate medical data [24]. The use of blockchain technology, with its built-in cryptographic validation and timestamp mechanism, can improve clinical trial processes by laying the groundwork for more trustworthy and auditable clinical research [24]. Future directions may include either lessening the amount of data created or expanding the amount of storage space [24]. The potential of bringing blockchain to the healthcare sector has been boosted by the fact that existing healthcare systems have security, privacy, and interoperability problems [24]. Since blockchain may be used to resolve data management and identity management difficulties, it has great potential for use in the electronic health record [24]. By modifying the standard decentralized authentication approach, they propose a Blockchain-based technique for protecting intellectual property via homomorphic encryption [25]. The ephemeral nature of digital products, for example, presents numerous obstacles to the preservation of digital IP cores [25]. They present an alternative decentralized authentication approach to

**Maitri Hingu and Kamlendu Pandey**

implement a Blockchain-based IP copyright protection mechanism that makes use of homomorphic encryption [25]. With more and more IP fundamentals moving to the digital realm, it is crucial to have safeguards in place to ensure their security [25]. When tested against a double-spending assault, the proposed approach performed better [25]. The distributed ledgers can be realized with blockchain technology, a new technology that has received a lot of study recently [26]. Many methods have been developed in recent years to address the scalability of blockchain, and these methods are described in Section III [26]. They explain the scalability issues with blockchain performance [26]. To increase Bitcoin's transaction throughput and decrease its confirmation time, SPECTRE, a Proof-of-Work (PoW) system, employs a structure known as a direct acyclic graph (DAG) [26]. Zilliqa increases throughput by splitting up transactions across multiple shards, but data for the entire network must still be stored on every node [26]. Experimental results show that the Optimal Least Square Support Vector Machine model may generate high-quality predicted outcomes for Blockchain money products [27]. As the world economy has expanded significantly in recent years, some issues that formerly hindered expansion have been rendered irrelevant [27]. Measuring the SVM model's performance on the training set in terms of Mean Absolute Percentage Error reveals that it has a propensity to make inaccurate predictions [27]. The OLS-SVM model's efficacy was tested using the target's ETH return rate [27]. In this study, we introduce a new model for predicting future returns using the OLS-SVM classification technique [27]. The article lists the four most important prerequisites for using blockchain technology in smart cities [28].

The rapid increase in urban populations around the world has a devastating impact on the standard of living for ordinary people. One of the most crucial requirements of blockchain technology in smart city applications is the protection of people's privacy [28]. Significant study is needed to develop suitable low-cost mechanisms for the quick processing of transactions. The purpose of this research is to examine how blockchain technology, a relatively new innovation, might be used to ensure the safety of smart cities [28]. The research highlights four aspects of blockchain technology that make it an ideal fit for smart cities. Key interoperability difficulties will be discussed, as will the application of blockchain in various device kinds [28]. The authors of this research offer a streamlined, user-friendly, and hassle-free platform for facilitating land registration [29]. This paper proposes a streamlined, user-friendly, and hassle-free platform for facilitating land registration. Involvement of brokers or middlemen, delays, and so on are only a few of the issues that arise [29]. For the purposes of building a ledger that records dealings in the transfer of real estate ownership, Ethereum is ideal. The blockchain keeps track of all the transactions that occur as a result of the needs of vendors and purchasers [29]. The potential is enormous, and the platform has a lot of potential applications [29]. Using data that has hitherto been kept confidential by hospitals, the suggested methodology can aid in the detection of COVID-19 patients through lung screening [30]. The suggested architecture gathers inputs and trains a smart model collectively [30]. The weights are a synthesis of the many regional models, with the confidentiality of the hospitals' information preserved. As hospitals are willing to share patient information, the proposed methodology can aid in the detection of COVID-19 patients through lung screening [30]. The proposed CC-19 dataset includes 34,006 CT scan slices from 89 patients [30]. Numerous deep learning models were subjected to extensive testing [30].

BLOCKCHAIN IN E-GOVERNANCE APPLICATIONS

Blockchain is a worthwhile technology for assisting governments in tracking, monitoring, and auditing the food supply chain, as well as assisting producers in recording transactions in a legitimate manner [31]. Each transaction segment has a permanent record in blockchain, which is bundled into individual blocks and cannot be tampered with. Although there are still some drawbacks, promoting blockchain is a worthwhile technology for assisting governments in tracking, monitoring, and auditing the food supply chain. Many customers have become less dependent on food as the number of food-borne diseases continues to rise. The government can collect statistics on numerous types of food using the traceability system's integrated feature [31]. Instead of looking to trusted third parties for evidence, such as government registries, blockchain technology has the potential to transform their paradigm for trusting records [32]. In this way, a trustworthy personal identity system can be established. In many nations and fields, blockchain technology has received a lot of attention. When blockchain technology is used to create an individual credit system, all of these personal records may be kept in one place. This will lower expenses, increase client happiness, and broaden the application's scope [32]. To maintain a constant standard block time T_n

**Maitri Hingu and Kamlendu Pandey**

over a growing network with a growing hash power Hr, the difficulty is increased [33]. Selfish mining, the 51% attack, DNS attacks, eclipse attacks, and consensus latency are all made possible by the decentralized nature of the network [33]. There are a lot of cool potential uses for blockchain technology right now [33]. Internet of Things, healthcare, electronic voting, e-government solutions, and the supply chain are just a few of the areas where they are being put to use. Using Blockchains may open up new attack vectors for these kinds of attacks, even if they would be very impossible in a traditional client-server architecture [33]. Sixteen studies on E-governance in different contexts are found after a comprehensive search and critical quality rating [34]. This research reviews the vast majority of published material on the subject of protecting national e-governance systems [34]. Existing e-government frameworks have not been able to properly address a number of security and privacy issues [34]. In the past, researchers have not made use of blockchain technology to strengthen the safety of the Saudi E-Government network. To ensure the safety of the system and its users, a new framework has been proposed to include blockchain technology into Saudi Arabia's E-Governance [34]. The addition of blockchain technology as a bridge between the two safe areas will result in improved security in terms of data security, privacy, and control of who has access to what [34]. This research study examined the impact of big data and data analytics research on collective wisdom in human decision-making and smart computers while providing e-government services [35]. Cities worry about resource efficiency as urban systems become increasingly complicated. E-government improves public service efficiency, freeing up resources for expanding and developing metropolitan regions. Their article addresses E-Government from a European Union level to national performances and EU urban areas [35].

BLOCKCHAIN IN IOT

Even if only a handful of them are expressly intended for the Internet of Things, they discovered various use cases for private and decentralized data management that are consistent with their research aim [36]. The authors claim that if an attacker has a computational power multiple of the computational power of honest nodes, he or she can create a branch of the blockchain that can outperform the existing one in terms of PoW difficulty [36]. Because gaining a substantial fraction of processing power is difficult, such danger is avoided in existing big and robust blockchains like the Bitcoin one [36]. The Internet of Things refers to a network of multiple physical items that are connected to the Internet [36]. The eventual objective of their study is to use blockchain and peer-to-peer technologies to create a private-by-design IoT in which data generated by devices is not entrusted to centralized businesses [36]. In the current study, a novel algorithm based on statistical likelihood maximization and polynomial matrix factorization was effectively implemented with PoW [37]. The Internet of Things is the current network computer technology trend (IoTs) [37]. Blockchain has been popular in the IoT ecosystem due to its distributed method, consensus mechanism, and transparent transactions [37]. These advantages made it a trustworthy method for mining and cryptocurrency [37]. To reach a consensus that is assured, they suggest using a statistical approach to solve the mathematical conundrum in PoW [37]. IoT must effectively deliver the anticipated outcome so that condition-constrained devices can take part in the consensus [37]. No significant application of the power blockchain has yet been made [38]. Network nodes that share security are dynamically added.

In order to achieve network consensus and authentication, a power node is dynamically added. The block cannot be stored in the blockchain due to storage and data volume restrictions. The secure data transaction architecture can be employed in a powerful blockchain-based network to thwart the entry of illicit activity. Applications for the proposed secure data transport method include industrial IoT in the power and energy sectors [38]. They look into the potential uses of blockchain technology for IoV (Internet of Vehicles) applications [39]. As Internet of Vehicles technology advances, a sizable number of IoV nodes must access this vast network [39]. They outline the potential blockchain participation of IoV nodes and suggest a multi blockchain network architecture. There is a tremendous quantity of traffic to manage [39]. For in-vehicle networks, a decentralized trust management system based on blockchain technology is suggested [39]. The functionality added by blockchain technology through the APIs provided by network nodes or by any specialized intermediaries would undoubtedly benefit the Internet of Things [40]. Data that is directly incorporated in transactions and transmitted in messages between various IoT devices is routed to block chain nodes by devices that take part in exchanges. To ensure safe data transmission between internet-connected devices, the authors of the paper attempt to introduce blockchain technology for the internet of

**Maitri Hingu and Kamlendu Pandey**

things. This is the important question that drives us to create a safer architecture for their IoT-based cars to ensure their safety and security [40]. One of the most disruptive technologies of this century has been named as the Internet of Things (IoT) [41]. The consensus mechanism must reduce the rate at which new blocks are accessed in order to prevent forking and maintain a single version of the ledger among all users [41]. Users can add their blocks to the blockchain at any moment, provided they process the previous transactions, thanks to a DAG-based consensus mechanism [41]. They evaluate the performance of Direct Acyclic Graph-based consensus with two widely used consensus mechanisms in order to highlight its benefits and drawbacks for IoT [41]. For large-scale IoT, DAG-based consensus techniques are preferable to Proof of Work and Proof of Stake [41]. Due to the large number of data generated by IoT Things, performance and scalability are the primary issues when integrating blockchain with the Internet of Things platform [42]. The Internet of Things intends to create a smart environment by connecting Things to the internet and exchanging acquired data in a peer-to-peer model [42]. Due to the large volume of data generated by IoT Things, performance and scalability are the primary issues when integrating blockchain with IoT platforms [42]. Permissioned blockchain is preferable to public blockchain for IoT platforms [42]. Sergio et al. did a mapping study to assist academics in understanding the characteristics, processes, existing solutions, and obstacles of blockchain-based IoT development [42]. The Industrial Internet of Things is made up of a variety of smart objects that are dispersed throughout the entire industrial system to gather vast amounts of ambient data [43].

This data can be used to spot performance bottlenecks, resolve issues, and spot malicious activity, effectively enforcing control over the physical world [43]. Several industrial sectors, including manufacturing, logistics, transportation, healthcare, energy, and utilities, are being transformed by the Internet of Things [43]. The Industrial Internet of Things (IIoT) is made up of numerous smart objects that are dispersed throughout the entire industrial system to gather vast amounts of ambient data that can be used to locate performance bottlenecks, resolve issues, and identify malicious behavior enforcing effective control over the physical world [43]. Numerous issues, including distributed consensus methods and data analytics with privacy preservation in IIoT systems, must be addressed [43]. They researched different blockchain commercial implementations in Industry 4.0 and the Industrial Internet of Things to establish an abstract metric of acceptance in real-world applications [44]. They investigated different blockchain commercial implementations in Industry 4.0 and IIoT to establish an abstract metric of acceptance in real-world settings [44]. They provide a summary of all the industry-specific case studies examined in this study in Table 2, along with information about the blockchain technology used in each area [44]. The transparency, dependability, and efficiency of the whole supply chain business have significantly increased thanks to features of blockchain such data accessibility and immutability [44]. In earlier work, authors presented a blockchain-based bloom filter technique for fast data aggregation and privacy preservation in smart grids [44]. Due to its necessity in many industries, decentralized architecture has gained a lot of recognition in recent years [45]. In-depth descriptions of numerous blockchain application cases are provided in this paper, which may be helpful to readers and researchers [45]. The incorporation of blockchain technology with IoT has made it possible for developers to envision a variety of uses in many industries [45]. These include smart grids, the energy industry, and agriculture [45].

Their focus is on the business world; thus, they've addressed the issue of how to use blockchain technology in industrial IoT [46]. New opportunities for profit in both business and social IoT settings have led to an increase in study of the IoT's implications [46]. To host apps, store data, and transfer information securely, the blockchain employs cryptography as a distributed ledger technology (DLT) [46]. Several IIoT solutions built on the blockchain are now being developed in various manufacturing sectors [46]. Blockchaining both IIoT entities and business processes is of great importance to the sectors [46]. Successful use of blockchain in digital twins is hampered by issues with scalability, standardization and laws, data protection, and interoperability [47] [48]. The current state of affairs with digital twins in preparation for Industry 4.0 can be enhanced by utilizing blockchain technology [47]. The widespread implementation of blockchain technology in DTs is hampered by issues with scalability, standardization and laws, data protection, and interoperability [47]. DTs' levels, design phases, industrial use cases, important objectives, enabling technologies, and core applications are all included in the taxonomy they give [47]. When used to sectors such as industry, transportation, commerce, urban planning, healthcare delivery, and the Internet of

**Maitri Hingu and Kamlendu Pandey**

Industrial Things, DTs have proven to be revolutionary (IIoT) [47]. They described a four-tier eco-friendly IoT-based agriculture framework [49]. Smart farms, smart homes, wearables, and smart cities are just a few examples of how the Internet of Things has been put to use [49]. Security and privacy solutions for IoT applications are discussed, along with how they will be modified for use in environmentally friendly IoT-based farming [49]. They discussed the big picture of a four-tier green IoT-based farm system. To centrally manage permissions, Novo developed a blockchain-based distributed access control system [49]. Li et al. researches can guarantee the integrity of named data networks [49]. In this special issue, they provide the most recent findings on the application of private blockchain technology to the Internet of Things in the manufacturing sector [50]. In this special issue, they provide the most recent findings from studies of private blockchains' applications in the industrial Internet of Things [50]. Because of its benefits and industrial qualities, private blockchain has been successfully implemented in industrial IoT [50]. Optimizing the scalability and decentralization, Cao et al. introduce a new algorithm based on Two Arch [50]. When it comes to Internet of Things (IoT) and Internet security, they gave a review of the literature on how Blockchain smart contracts are being used [48]. As a whole, the Internet of Things (IoT) has been the focus of several solutions since it has greater security flaws than the Internet as a whole [48]. Access control, authentication, integrity assurance, data protection, secure key management, and non-repudiation are some of the most popular security services driven by smart contracts [48]. The growth of the Blockchain Technology development and research field has been exponential [48]. They found and compiled 77 original studies that addressed the topic of using Blockchain smart contracts for Internet of Things security [48]. In the future, we need to address these issues and put the proposed smart contract based security solutions through their paces in a variety of hostile environments [48].

DISCUSSION

In the banking sector in particular, blockchain technology has enormous potential to address current problems. The financial industry is preparing to incorporate blockchain technology into their offerings. According to NITI Ayog, all Indian states should adopt this technology to digitize their land and health records. The government of Andhra Pradesh has already begun using it for the city of Amaravathi's land records. Indian officials hope that by developing a national blockchain framework, they will be able to influence the future of 44 different industries, including education, healthcare, agriculture, energy, e-governance, and more. Since blockchain technology has many advantages over older methods while having fewer negatives, it should be implemented in services like these. Money laundering can be uncovered and stopped, which is good for the economy and will hopefully encourage people to be more forthright. The retrieval of misplaced paperwork will be a breeze. One of the difficulties is that blockchain hasn't been widely used in different sectors because its data structure requires universal agreement. Together, a large group of people using a blockchain can improve its performance and make it more efficient. Users aren't the only people who need to be part of a network; in the case of a blockchain ecosystem, for example, providers are required as well. Without widespread adoption, the benefits and scalability of blockchains cannot be realized. Another issue that can arise with blockchain technology is that it is susceptible to sabotage in the event that a miner with nefarious intents also controls the majority of the available processing power. By reversing the transactions, he is able to spend his coin twice as much. This strategy is often referred to as the "51 percent attack." They've presented a unique blockchain-based product ownership management system for the post-supply chain that renders counterfeiters' efforts to clone legitimate tags obsolete because they can't show product ownership on this system [3]. Counterfeiting of branded goods, for example, is one of the most important and challenging issues to address in national and international marketplaces [3]. They propose a comprehensive protocol that allows all parties, including supply chain partners and customers, to transfer and prove ownership of RFID-tagged objects [3]. For the post-supply chain, they have presented a revolutionary blockchain-based product ownership management system (POMS) [3]. They offer a revolutionary product ownership management system that eliminates counterfeiters' efforts to clone genuine tags [3]. They looked at the scalability problem with blockchain systems, which is a growing challenge when using blockchain in actual corporate settings [51]. Blockchain, the technology that powers Bitcoin and other cryptocurrencies, has drawn a lot of interest [51]. Both academia and business are attempting to integrate the innovative technology into a variety of fields, including the Internet of Things and smart cities [51]. They looked at the difficulty of scaling

**Maitri Hingu and Kamlendu Pandey**

blockchain systems [51]. Researches are being done to develop efficient enabling technologies that will enable scalable blockchain systems [51]. Some enabling technologies have been introduced to effectively convey transaction information and decrease the demand on network bandwidth resources [51]. The role of blockchain technology in achieving smart agriculture's security objectives has been the subject of a recent comprehensive review [52]. They give a thorough analysis of the alternatives that have been presented for smart sensing applications that are based on the Internet of Things. Computational and communication expenses, as well as their benefits, limitations, and security features, have been thoroughly examined [48]. Some paths forward for some open and difficult challenges have been identified as a result of this research [52]. An alternative blockchain-based PKI has been proposed, which treats thin clients as fully functional users [52]. Zhou et al. presented a method of authentication that would make use of a public key infrastructure (PKI) based on identity-based encryption (IBE) [52].

CONCLUSION

The blockchain technology has demonstrated itself as a groundbreaking power, catalyzing significant transformations in several sectors. The fundamental characteristics of decentralization, transparency, and immutability provide unparalleled options for improving the effectiveness, safety, and reliability of digital transactions and data management. This article has explored the diverse uses of blockchain technology, demonstrating its revolutionary influence on areas such as financial services, supply chain management, healthcare, and the public sector. Blockchain technology in the financial services sector is enabling broader access through decentralized finance (DeFi) platforms. These platforms decrease dependence on conventional middlemen and improve the security of transactions. Smart contracts enhance the efficiency and security of financial agreements, minimizing the risk of mistakes and fraudulent activities. The incorporation of blockchain technology in cross-border transactions and financial record-keeping represents a significant transition towards more streamlined and transparent financial systems. The field of supply chain management greatly benefits from the real-time transparency and traceability that blockchain technology offers. Blockchain guarantees the genuineness and incorruptibility of items in businesses like pharmaceuticals by documenting every transaction and movement of goods on an unchangeable database. Enhanced visibility results in increased productivity, decreased costs, and enhanced consumer trust. Blockchain technology is a valuable solution for addressing important issues concerning the management of patient data in the healthcare sector. Blockchain improves privacy and data security by guaranteeing that patient records are protected, unchangeable, and exclusively accessible to authorized individuals.

Furthermore, it enhances the synchronization of healthcare and simplifies the process of conducting medical experiments by allowing secure and transparent exchange of information among all involved parties. Blockchain applications offer substantial benefits to the public sector as well. Blockchain-based digital identity verification solutions provide the potential to improve security and efficiency in government services. Blockchain has the potential to transform voting systems by enhancing openness and trust in election procedures. It can also enhance the maintenance of public records by guaranteeing the reliability and availability of important documents. The future holds great potential for the integration of blockchain with new technologies such as the Internet of Things (IoT) and Artificial Intelligence (AI), offering significant opportunities for innovation and automation. Nevertheless, effectively maneuvering through the intricate regulatory and legal environment continues to be a crucial obstacle. Establishing conducive regulatory frameworks will be crucial to promote innovation while assuring adherence to rules and safeguarding security. To summarize, blockchain technology is positioned to bring about substantial progress and generate fresh opportunities in several industries. Industries may attain higher levels of efficiency, security, and transparency by utilizing the transformative capabilities of technology, thereby creating a path towards a more innovative and decentralized future.

ABSTRACT

This paper presents two different algorithmic approaches to solving the multi-criteria decision-making problem under a bipolar neutrosophic environment. Then, some new definitions of the bipolar neutrosophic soft sets are proposed, such as the comparison matrix, aggregate function, and score function. The comparison matrix is used to develop the first approach, and the second approach uses an aggregate function to rank the alternatives. Finally, the hospital selection problem has been explained with an appropriate numerical illustration.

Keywords: Bipolar neutrosophic soft set, Comparison matrix, Aggregate function, Score function, Hospital selection.

INTRODUCTION

Neutrosophic set theory was proposed by Florentin Smarandache[4] in 1998 and is a useful technique for handling information with ambiguous, indeterminate and inconsistent data. The neutrosophic set(NS) is extension of both fuzzy sets[1] and intuitionistic fuzzy sets [2]. Wang[6] developed the concept of single valued neutrosophic set(SVNS). Bipolar fuzzy sets (BFS) were developed by Zhang[7], and the membership values lie in [-1,1]. I.Deli[9] created the theory of the bipolar neutrosophic sets (BNS) and additionally proposed a MCDM technique based on BNWA and BNWG operators. The Bipolar neutrosophic set plays an important role in multi-criteria decision making problem(MCDM), and it has been applied to many real-world problems. Recently, A soft set and a bipolar fuzzy set

78242

Subashini and Sophia Porchelvi

were combined by M.Asalam and K.Ullah[8]and also propose a methodology to solve the MCDM problem.M.Ali[10] defined an aggregation bipolar neutrosophic soft operator and provided the algorithm based on bipolar neutrosophic soft sets(BNSS). M.N.Jafar [11] et al.introduced aggregation operators for bipolar neutrosophic soft sets(BNSS) and used them to solve MCDM problems. M.Lathamaheswari [12] et al. created bipolar neutrosophic frank aggregation operators and developed a MCDM approach to solve the bridge selection problem. Ashraf AI [13] et al. created a new method for decision-making using a complex bipolar-valued neutrosophic soft set. New distance and similarity measures for bipolar fuzzy sets were introduced by M.Riaz [14] and others, and they applied their method to supply chain management. SY.Musa [15] created a novel approach to parameter reduction based on bipolar hypersoft set. M.Jamil and others proposed the Einstein aggregation operators [16] and the hamacher geometric Aggregation operators [19] within the context of the bipolar neutrosophic set. S Pramanik [17] explored a vikor-based magdm in a bipolar neutrosophic environment. MK. Mahmood [18] et al. introduced the bipolar neutrosophic dombi aggregation operators and used their operators in MCDM problems. H Kamaci [20] created the dombi operators for bipolar trapezoidal neutrosophic sets. In this paper, we defined aggregate function, comparison matrix and modified score function for bipolar neutrosophic soft sets(BNSS). Then we develop two solution procedures for solving MCDM problems using bipolar neutrosophic information. This paper is organized as follows: Section 2 deals with basic definitions of bipolar neutrosophic soft sets(BNSS). The proposed methods are discussed in section 3. In section 4, a case study is presented. Section 5 includes the conclusion.

PRELIMINARIES

Proposed definitions of BNSS

Comparison matrix

This is a square matrix with an equal number of rows and columns.The rows are filled with objects u_1, u_2, \dots, u_n and the columns are filled with parameter e_1, e_2, \dots, e_m . The entries c_{ij} are defined by $c_{ij} = \tau + i - \beta$, For positive membership degree, the integer τ is computed as, how often is $\mathcal{T}^+_{u_i}(e_j)$ greater than or equal to $\mathcal{T}^+_{u_n}(e_j)$ for $u_i \neq u_n \forall u_n \in U$. The integer i is computed as, how often is $\mathcal{F}^+_{u_i}(e_j)$ greater than or equal to $\mathcal{F}^+_{u_n}(e_j)$ for $u_i \neq u_n \forall u_n \in U$. The integer β is computed as, how often is $\mathcal{T}^-_{u_i}(e_j)$ less than or equal to $\mathcal{T}^-_{u_n}(e_j)$ for $u_i \neq u_n \forall u_n \in U$. The integer i is computed as, how often is $\mathcal{F}^-_{u_i}(e_j)$ less than or equal to $\mathcal{F}^-_{u_n}(e_j)$ for $u_i \neq u_n \forall u_n \in U$. The integer β is computed as, how often is $\mathcal{F}^-_{u_i}(e_j)$ less than or equal to $\mathcal{F}^-_{u_n}(e_j)$ for $u_i \neq u_n \forall u_n \in U$.

Aggregate function

Let $\mathcal{B} = \{(e, \{\mathcal{T}^+(x), \mathcal{F}^+(x), \mathcal{T}^-(x), \mathcal{F}^-(x)\}: x \in X\}): e \in E\}$ be a bipolar neutrosophic soft set over X. Then, bipolar neutrosophic aggregate function $\mathbb{A}_{x_n}, n = 1, 2, \dots, k$ is defined as,

$$\mathbb{A}_{x_n} = \left\{ \begin{matrix} \max(\mathcal{T}_1^+, \mathcal{T}_2^+, \dots, \mathcal{T}_n^+), \text{avg}(\mathcal{T}_1^+, \mathcal{T}_2^+, \dots, \mathcal{T}_n^+), \min(\mathcal{F}_1^+, \mathcal{F}_2^+, \dots, \mathcal{F}_n^+) \\ \max(\mathcal{T}_1^-, \mathcal{T}_2^-, \dots, \mathcal{T}_n^-), \text{avg}(\mathcal{T}_1^-, \mathcal{T}_2^-, \dots, \mathcal{T}_n^-), \min(\mathcal{F}_1^-, \mathcal{F}_2^-, \dots, \mathcal{F}_n^-) \end{matrix} \right\}$$

Score function: The score of the element u_i is S_i , and is specified as, $S_i = \mathcal{T}_n^+ - \mathcal{F}_n^+ - \mathcal{T}_n^- - \mathcal{F}_n^-$.

METHODOLOGY

Proposed approaches for MCDM problem using BNSS

In this section, we develop two solving procedures based on comparison matrix and aggregate function. The proposed methods and their steps are given below, Let us consider this MCDM procedures adapted from M.Asalam [11] and I.Deli[12].

Solution Procedure-I

Step 1: Create the bipolar neutrosophic decision matrix given by the decision maker as follows,

$$\langle b_{ij} \rangle_{m \times n} = \begin{bmatrix} b_{11} & b_{12} & \dots & b_{1n} \\ b_{21} & b_{22} & \dots & b_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ b_{m1} & b_{m2} & \dots & b_{mn} \end{bmatrix}$$

Where $b_{ij} = (J_{ij}^+, J_{ij}^+, F_{ij}^+, J_{ij}^-, J_{ij}^-, F_{ij}^-)$ with $J_{ij}^+, J_{ij}^+, F_{ij}^+, J_{ij}^-, J_{ij}^-, F_{ij}^- \in [0,1]$ such that $0 \leq J_{ij}^+ + J_{ij}^+ + F_{ij}^+ - J_{ij}^- - J_{ij}^- - F_{ij}^- \leq 6$ for $i = 1, 2, \dots, m$ and $j = 1, 2, \dots, n$.

Step 2: Input the positive membership degree \mathbb{P}_{u_n} and negative membership degree \mathbb{N}_{u_n} of bipolar neutrosophic soft set \mathcal{B} . Construct a positive membership matrix $\langle P_{ij} \rangle_{m \times n}$ and a negative membership matrix $\langle N_{ij} \rangle_{m \times n}$ from the bipolar neutrosophic soft matrix $\langle b_{ij} \rangle_{m \times n}$.

$$\langle P_{ij} \rangle_{m \times n} = \begin{bmatrix} P_{11} & P_{12} & \dots & P_{1n} \\ P_{21} & P_{22} & \dots & P_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ P_{m1} & P_{m2} & \dots & P_{mn} \end{bmatrix} \text{ and } \langle N_{ij} \rangle_{m \times n} = \begin{bmatrix} N_{11} & N_{12} & \dots & N_{1n} \\ N_{21} & N_{22} & \dots & N_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ N_{m1} & N_{m2} & \dots & N_{mn} \end{bmatrix}$$

Where $P_{ij} = (J_{ij}^+, J_{ij}^+, F_{ij}^+)$ and $N_{ij} = (J_{ij}^-, J_{ij}^-, F_{ij}^-)$ with $J_{ij}^+, J_{ij}^+, F_{ij}^+, J_{ij}^-, J_{ij}^-, F_{ij}^- \in [0,1]$.

Step 3: Construct the comparison matrix $\langle C_{ij} \rangle_{m \times n}$ of positive membership degree (\mathbb{P}_{u_n}) and negative membership degree (\mathbb{N}_{u_n}).

$$\langle C_{ij} \rangle_{m \times n} = \begin{bmatrix} c_{11} & c_{12} & \dots & c_{1n} \\ c_{21} & c_{22} & \dots & c_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ c_{m1} & c_{m2} & \dots & c_{mn} \end{bmatrix}$$

Where $c_{ij} = t + i - f$, with the conditions for positive membership degree,

$t = n (J^+_{u_i}(e_j) \geq J^+_{u_n}(e_j))$, $i = n (J^+_{u_i}(e_j) \geq J^+_{u_n}(e_j))$ and $f = n (F^+_{u_i}(e_j) \geq F^+_{u_n}(e_j))$ for $u_i \neq u_n \forall u_n \in U$. The conditions for negative membership degree are $t = n (J^-_{u_i}(e_j) \leq J^-_{u_n}(e_j))$, $i = n (J^-_{u_i}(e_j) \leq J^-_{u_n}(e_j))$ and $f = n (F^-_{u_i}(e_j) \leq F^-_{u_n}(e_j))$ for $u_i \neq u_n \forall u_n \in U$.

$J_{ij}^+, J_{ij}^+, F_{ij}^+, J_{ij}^-, J_{ij}^-, F_{ij}^- \in [0,1]$ for $i = 1, 2, \dots, m$ and $j = 1, 2, \dots, n$.

Step 4: Calculate the row sum (α) and column sum (β) of the positive membership degree (\mathbb{P}_{u_n}) and negative membership degree (\mathbb{N}_{u_n}).

Step 5: Compute the positive information score \mathbb{P}_s and negative information score \mathbb{N}_s .

Step 6: The final score \mathbb{S}_i is determined by deducting the positive information score \mathbb{P}_s from the negative information score \mathbb{N}_s . The maximum score is the preferable choice of decision maker.

3.2 Solution Procedure-II

Step 1: Create the bipolar neutrosophic soft matrix given by the decision maker,

$$\mathcal{B} = (b_{ij})_{m \times n} = (J_{ij}^+, J_{ij}^+, F_{ij}^+, J_{ij}^-, J_{ij}^-, F_{ij}^-)$$

Step 2: Compute the aggregate function of bipolar neutrosophic soft matrix $\langle b_{ij} \rangle_{m \times n}$, it is denoted by $A_{x_n}, n = 1, 2, \dots, k$.

Step 3: Compute the score values $\mathbb{S}_i, i = 1, 2, \dots, m$ of each object.

Step 4: Determine the maximum score value and rank the alternatives.

Case study

This section presents an application of the bipolar neutrosophic soft set for choosing a hospital for maternal care. The data were gathered using a linguistic variable set by the decision maker. The maternity hospital is one of the most crucial things to plan for during pregnancy. This study assesses the performance of hospitals in the district of Tiruvarur. Here, some selection criteria are given to select the maternity hospital.

Subashini and Sophia Porchelvi

Quality of doctors and staff credentials

The doctors and medical staff are considered to be the most crucial factors. The obstetrician needs to be able to answer queries calmly and clearly, as well as have time and patience, a compassionate obstetrician can assure her of a safe and normal delivery.

Intensive care nursery

The maternity hospital needs to be well-equipped to address any last-minute emergency even though, in the majority of cases, the infants does not need to be placed in a neonatal intensive care unit (NICU). This can be handled by having a NICU and an adult intensive care unit (ICU).

Location

The maternity hospital should be as near as feasible to the mother's home. several times over the course of the pregnancy, the mother will need to attend a maternity hospital for check-up and tests.

24 hour availability

A 24-hour staff should be present in the maternity hospital. This is due to the possibility of an unforeseen visit to the clinic, even unusual hours may apply to this. Choose a maternity hospital where staff members may be contacted at any time, and be aware of the lead time before the doctor assumes control of the delivery.

Illustration

This section provides a numerical example for solving multi-criteria decision making problem. The decision maker wants to select the best hospital for maternal care. The linguistic variable set, $LV = \{EG, VG, G, M, B, VB, EB\}$ is used to evaluate the alternatives. Let us consider the universal set $U = \{\mathbb{H}_1, \mathbb{H}_2, \dots, \mathbb{H}_n\}$, it denotes the set of alternatives. Let $E = \{\mathbb{C}_1, \mathbb{C}_2, \mathbb{C}_3, \mathbb{C}_4\}$ be the set of parameters or criteria, where,

\mathbb{C}_1 – Quality of doctors and staff credentials, \mathbb{C}_2 – Intensive care nursery, \mathbb{C}_3 – location, \mathbb{C}_4 – 24-hour availability

Then consider $U = \{\mathbb{H}_1, \mathbb{H}_2, \mathbb{H}_3, \mathbb{H}_4\}$ be the set of hospitals, where,

\mathbb{H}_1 – Hospital A, \mathbb{H}_2 – Hospital B, \mathbb{H}_3 – Hospital C, \mathbb{H}_4 – Hospital D

Rank the alternatives based on the score value $\mathbb{H}_1 > \mathbb{H}_4 > \mathbb{H}_2 > \mathbb{H}_3$, clearly, the decision maker chose alternative \mathbb{H}_1 .

The decision matrix and linguistic terms are described in table 1, table 2 and table 3. The first method is described in table 4 to table 8.

Method-II

Compute aggregate function A_{x_n} of BNSS, for each $n = 1, 2, 3, 4$ as,

$$A_{x_n} = (\mu_1, \mu_2, \mu_3, \mu_4)$$

$$\mu_1 = \langle 0.9, 0.575, 0.2, -0.5, -0.5, -0.8 \rangle$$

$$\mu_2 = \langle 0.9, 0.575, 0.2, -0.5, -0.575, -0.8 \rangle$$

$$\mu_3 = \langle 0.9, 0.55, 0.2, -0.3, -0.6, -0.7 \rangle$$

$$\mu_4 = \langle 0.9, 0.575, 0.2, -0.5, -0.575, -0.8 \rangle$$

Compute the score value of S_i , for each $i = 1, 2, 3, 4$ as,

$$S(\mu_1) = 0.885$$

$$S(\mu_2) = 0.825$$

$$S(\mu_3) = 0.67$$

$$S(\mu_4) = 0.825$$

Rank all the alternatives of H, according to the score value as,

$\mathbb{H}_1 > \mathbb{H}_4 > \mathbb{H}_2 > \mathbb{H}_3$. Then, \mathbb{H}_1 is the most desirable alternative.

RESULTS AND DISCUSSIONS

The results of method-I and method-II clearly shows that, the alternative \mathbb{H}_1 is the optimal choice of decision maker, \mathbb{H}_1 represents Hospital-A. Then we get the conclusion that Hospital-A provides the best services for maternal

Subashini and Sophia Porchelvi

care based on the opinion of the decision maker. Using this approaches to problem solving enables the decision maker to select the best course of action. The comparison analysis of proposed methods and existing approach are given below, Comparing the results of the suggested methodologies with those of the existing BNWA and BNWG operators, the aggregate values of the alternatives are some what distinctive and the optimal alternative is identical. Moreover, The proposed approaches have the precious characteristic of considering the criteria and can be more accuracy and effective in the application of MCDM problems. The findings achieved by both algorithms are represented graphically in the table below,

CONCLUSIONS

In this paper, we have created two strategies for multi-criteria decision making problem using a bipolar neutrosophic soft set. Here, the suggested approaches are used to create a decision making model for selecting a hospital for maternal care. In addition, a comparative study of the proposed techniques with existing methods is presented. The proposed approaches can be applied to other MCDM problems and many other extensions of the neutrosophic environment in the future.

ABSTRACT

Continuing Professional Development (CPD) is a long term, continuous and compound process where teachers irrespective of fields try to develop their personal and professional qualities. CPD is an important medium for teachers to increase the quality of their qualification at a gradual rate by making own initiatives to access the opportunities provided by external agencies too. Without self-efforts the opportunities remain isolated and the results of them may proven unfruitful. In short, both should go hand in hand. Teacher Educators of the B.Ed. Colleges are the architects of the prospect teachers for achieving their destiny by developing skills, knowledge, and attitude in terms of desirable behavior. In spite of all these the present research paper is a significant attempt to explore the self-initiatives and challenges of Teacher Educators' to access the opportunities made by external agencies in the form of CPD, and also commonly faced problems by teacher educators for taking part in CPD activities. The present research collected the required data from the sample of 154 teacher educators of the private B.Ed. Colleges affiliated by the University of Jammu. A self-constructed questionnaire has been employed for accomplishing the formulated objectives. The present study revealed that lack of time and financial assistance from the institutions affected the participation of Teacher Educators in Professional Development programs. The majority of the teacher educators(71%) opined that offline programs were much better than online events. Surprisingly the researchers observed that only 30-33 % of the participants were found to have an online membership of journals and libraries, and also only 29% of teacher educators were found to have enrolled for online courses. Beside these, more than 50% of the

**Rama Verma and Ravi Vanguri**

participants were putting their efforts for writing chapters in books (51%), research, articles for journals (58%) and preparing a portfolio for their self-improvement (56%).

Keywords: Initiatives, Opinion, Opportunities and Continuing Professional Development (CPD)

INTRODUCTION

A profession means any economic activity which demands requisite skills and timely polishing of that particular skills as per the need of the hour. It is a type of work that requires skilled education and training. Cruess and Johnston (2004) defined the term profession as an occupation whose core element is work based upon the mastery of a complex body of knowledge and skills. The Merriam –Webster Dictionary (2014) says a profession is a vocation requiring dedicated knowledge and often long and exhaustive academic preparation. Any type of work that needs special training or a particular skill (Cambridge Dictionary 2013). Professional Development is a kind of improvement, which helps a professional to acquire, develop, reinforce, and strengthen their skills and know the strategies and tactics to become more effective. It is a prime requisite of every profession to stand ready for meeting the ever-changing needs of the world. Professional development (PD) has been characterized as an inner cycle in which experts are involved in a formal or informal models embedded in the precarious assessment of expert practice (Smith, 2010). Professional development of Teacher educators' is an inevitable cycle and a crucial component for enhancing learning overall; therefore, teacher trainers should be dynamic mediators in their growth by keeping themselves up to date with novel information developing and improving knowledge on education and teacher instruction to enhance and boost their own teaching (Su and Wang, 2022).

Effective Professional Development (PD) is needed to help teachers learn and refine the instructional strategies required to teach these skills (Linda, Hammond, Maria, Hyler, Gardner and Espinoza 2017). Educators require knowledge regarding various methods of learning as employed by different individuals, such that they can efficiently goal education in the direction of learners' learning requirements (Su and Wang, 2022). In higher education teacher educators are those teachers who are properly involved in pre-service and in-service teacher education programs. They play their significant role in teaching and supervising the student-teachers, another way, it can be said that they are involved in the professional development of student-teachers (Bates, Swennen and Jones, 2011). In order to sensitize the student-teachers about professionalism and development, the teacher educators must go with Continuous Professional Development (CPD) to a great extent. The Government of India periodically made some reforms for bringing Continuous Professional Development as Panda (2017) highlighted some advance reforms in the current past which are introduced to transmute the quality of teaching learning. Among these the major three reforms are playing their great role for continuing professional development of the teachers. Pandit Madan Mohan Malaviya National Mission for Teachers and Teaching (PMMNMTT) (GoI, 2015), is the very first reform which directly laid emphasis on eminence augmentation in teaching-learning and research. The second reform was the starter of Choice Based Credit System (CBCS) (UGC, 2015). For the first time, a National Policy twisted a space for choice-based credit buildup in their own department courses and interdisciplinary as well as value-based credit courses. Study Web of Active Learning by Young and Aspiring Minds (SWAYAM) is the third reform synchronized by UGC, which introduces legal endowment for online/blended learning into higher education by which students can store up to 20% of total credit hours in subjects through massive open online courses (MOOCs).

Continuing Professional Development (CPD)

NCTE used the term CPD in place of INSTE in its NCFTE (National Curriculum Framework for Teacher Education 2009). Both CPD and INSTE (In-service Training Programmes) terms used interchangeably in the document. But the difference exists in both the terms as CPD comprises all activities and programmes of learning which a professional acquire formally and informally whereas INSET focuses to inculcate professional skills in a teacher as per the requirement of their profession (Singh and Gupta 2021). CPD is a steady training, which helps a person to grow

Rama Verma and Ravi Vanguri

gradually. The development of professionals varies from one profession to another, but the medium to access CPD remains same and mostly depends on the self-initiatives and accessible opportunities. Thorndike' laws of learning' are closely associated with the context of CPD. Law of readiness or law of action tendency is applicable here. A law which states that learning is dependent upon the learner's readiness to act or preparation of action. If people are not ready to learn something and also lack to access the opportunities, they cannot develop professionally in, turn it generates monotony and a passive mindset them. CPD indicates a deep relationship with the time a show long a person spent time in a particular profession can positively influence his/her CPD.NEP-2020 also recommended the 50 hours of Continuous Professional Development opportunities for each instructor will each year engage, motivated by his/her own wishes. Emma & Elaine (2019) found that, the great majority of teachers were taking participation in training activities, but they showed lower satisfaction because of critical weaknesses in the opportunities available and requisite professional development of the teachers. The key objectives of the CPD are to prepare teachers for competency based learning, which enables a teacher to discover, reflect and develop his/her own strategies and practices. Lisa Bartleton (2018) also emphasized that the reflective practice seems to be a beneficial CPD activity.

Europass Teacher Academy (2022) highlighted that CPD consists of a series of learning activities, which are planned for achieving the goals like: to strengthen the existing skills of a person, to develop the skills for achieving new level and to upgrade and update the skills and knowledge. The most effective and beneficial strategies of CPD involve collaboration, sharing of good practice and providing opportunities for reflection. So attending and holding seminars and conferences are the pathways to Professional Development of educator trainers and they are sometimes hired for bringing in new knowledge and activity (Hang and Wang, 2022). Today in the world of digitalization, the applications of ICT proved useful for professional development. New online CPD activities like E-conferences, workshops and webinars, which may not be mandated, but useful them by taking part in as per their convenience and interest. Massive Open Online Courses (MOOCs) also provide the platform for collaborative and cooperative teacher training, which helps to keep updated about new developments and searching for new quality content to improve learning outcomes. Although Bartleton (2018) acknowledged online CPD as a passive form of CPD. Even the Europass Teacher Academy (2022) also draws attention to some more ways by which CPD proves beneficial like – Best learning outcomes, effective methods of teaching, appropriate planning skills, effective classroom management, advance knowledge in their subjects, etc. All these training programs can be organized by external agencies.

These agencies felt the need of CPD activities for improving the performance in a particular profession and also assist the staff by encouraging them to take participation. But one thing should be kept in view that these agencies act only as an organizer of opportunities, but for accomplishing the intentions of CPD activities the professionals play a major role. Supremely, professionals should be responsible for their shortcomings, failings, or limitations when performing their tasks (Europass Teacher Academy 2022). Being an in-service teacher many times one has to undertake various means of Continuing Professional Development, but many times, due to multiple constraints the professionals overlook few opportunities to attend the CPD activities. All means of quality enhancement remains motionless, until and unless the self-initiatives work. One must take self-initiative only because of the desire and interest of a teacher to do the work which helps to bring professional development. The initiatives may be reading and writing of books, articles, publications, conducting research, attending workshops, seminars, webinars, conferences and online courses, etc. organized by the external agencies. One can also get Professional Development through official qualification, accreditation, or degree that benefits the educators to add some more qualification in their existing sets of skills. Work-based learning means the development takes place at their workplaces, like in the colleges, universities, and schools, etc. Now a day due to the advancement in technology all teachers or educators can get an opportunity to attend training programs organized by other countries too, here the teachers from different countries take advantage by learning series of strategies, skills, methods, etc. (Europass Teacher Academy 2022). It is understood from the

**Rama Verma and Ravi Vanguri**

reviews that, In India, professional development is not on main concern and not compulsory to attain these programs (Sabha, 2019). This is an area neglected by management, as the management does not allot time for teachers for attending CPD activities physically Gomba (2019). At the present time there are many online CPD programs available that can be attended at one's own convenience (Padwad & Dixit, 2011). But the self-initiatives of teachers are important to access all the online and offline CPD opportunities. Unless and until the professionals have determination to access the CPD activities, all will remain in vain. No doubt the means of CPD are increasing day by day both in online and offline mode, in spite of this the teacher educators show unwillingness to take part in CPD activities because of lack of incentives, rewarding system and other motivational factors. Tayagi (2021) identified the constraints like infrastructural challenges, institutional challenges, Psychological challenges, financial challenges and challenges related to time management hinders teacher educators attending CPD activities. Not only this the problem of lack of ICT skills emerged as a serious challenge in front of teacher educators as some teachers are technophobic and have little exposure to technology. They find difficult and get irritation as sometimes they lost their usernames, password etc. Such kind of teachers felt better to stay away from the current online CPD programmes due to their technophobic characteristics (Gomba 2019). CPD programmes are organised without considering the needs of the participants because the needs and activities organised by agencies mismatches due to this the teachers have lost their interest and avoid to attend CPD programmes (Gomba 2019, Yaqub, Cole, and Ofosua 2020) Teacher educators must endeavor to build a CPD portfolio either in e-format or paper-based, it would be helpful for them to reflect on their journey, which helps them to update, upgrade and integrate their knowledge with everyday practice (Yaqub, Cole and Of osua, 2020). From reviewed literature, the researchers arrived at the conclusion that there were lot of studies concentrated on how the school teachers develop professionally and what factors hinders them to become professional, but very few researches were conducted on the self-initiatives of teacher educators and their opportunities for Continuous Professional Development. So What self-initiatives are being taken by the teacher educators for Continuing Professional Development? Are they really interested to take some initiatives towards their CPD? What opinion and opportunities do they have for Continuing Professional Development? What kind of challenges do they encounter for accessing CPD programs?

Objectives of the study

1. To find out the self- initiative taken by teacher educators for Continuing Professional Development in the region of Jammu.
2. To ascertain the opportunities being granted by external agencies to teacher educators in their Continuing Professional Development.
3. To determine the challenges encountered by teacher educators to access CPD programs through their institutions.

METHODOLOGY OF THE STUDY

A descriptive survey design was followed to conduct the study with the Teacher Educators of Private B.Ed. Colleges, which affiliated to University of Jammu academic year (2022-24). The Jammu division consists of 10 districts; and 7 Universities out of which only 4 universities are running the bachelor of education program, i.e. University of Jammu, Cluster University, Baba Ghulamshah Badshah University and Central University of Jammu. The University of Jammu has 49 affiliated colleges which are offering bachelor of education program, out of which 48 colleges are private and only one college is government. Among these 48 private colleges, the 50% (24) colleges were selected conveniently for the sample of the study. All the colleges are distributed in nine out of ten districts except Ramban district. The following figure- shows the sampled colleges. In order to collect the requisite information for accomplishing formulated objectives, the investigator designed a self- constructed structured questionnaire which comprised 25 items. Three items have been constructed on three points Likert Type scale and remaining 22 items were constructed on restricted responses. After finalizing the tool for data collection, the investigators converted tool into online format (i.e., Google Forms) and link of google form had been sent to the target-group through email and WhatsApp. The questionnaires were sent to 178 teacher educators out of which 154 teacher educators responded over

**Rama Verma and Ravi Vanguri**

them (i.e. response rate 87%). The researcher participants were informed the need and objectives of the study telephonically and also clarified their doubts while responding the tool through google form. The participants were also assured that the data they provided would be kept confidential, and used only for the purpose of research. The following Table-1 shows the profile of the teacher educators who took participation in the study. Table 1 depicted the background information of the participants. Majority of the teacher educators were female working in teacher education institutions (84%) more than half of the participants were found with Arts stream (56%) and majority of the teacher educators belongs to urban locality so it can be assumed that, since they lived in urban area had got the scope of maximum access to opportunities of CPD than participants lived in rural area. Among all the participants only 27% of the teacher educators were found with an experience of 1-5 years and nearly half of the participants (52%) were found with the experience of 6-10 years, by looking on the above figures it can be examined that only 60% teachers had attended 1-5 workshops 28% had attended more than 6 workshops and rest of the 12% were not attended any kind of workshop. Table 2 shown that the majority of the participants (71%) opined that offline CPD programs were found to be better than online however 57% of the participants expressed as online events diluted the seriousness of the program so they avoided to attend online programmes on the other hand 50 % respondents found the CPD programs not so beneficial so they avoided to attend them. Table 3 reflected not a big difference in their agree and disagree responses, that only 58% of the participants were having the habit of writing research papers for publications in journals whereas nearly half of the participants (51%) were found with the habit of writing articles, ideas for newspapers and research chapters for edited books and 56% of the respondents were having the habit to prepare portfolio to assess their self- improvement. Figure 2 depicts that less than 50 % participants have enrolled for online courses for their Professional Development and only 30% participants had taken the membership of online journals whereas only 33% of the participants have a membership of online libraries. Less than half of the participants(49%) could develop e-content in any subject, but if we talk about the development of e-content in their own subject, than only 54% of the participants were agreed in this regard. The majority of the participants (78%) expressed as for their professional development they had taken part in online discussion forums too.

Figure 3 stated that the majority of the respondents (69%) agreed as their concerned institutions encouraged them to attend CPD programs, whereas 58% respondents declared as their institutions did not provide financial assistance for registration charges. 62% of the participants stated that after attending CPD activities their institutions didn't add any kind of increment in their salary this statement showed inconsistency with the view of Mizell (2010). Mizell stated that CPD helped teacher educators to get an increment in their salary. The majority of the participants revealed that their colleges allowed them to attend CPD programs (84%) but 71% of them stated that their colleges allowed them to attend CPD programs outside the state too. 65% of the participants viewed that their intuitions encouraged them to attend CPD programs, whereas the 69% of the participants agreed as their institution organized CPD programs for teacher educators. Figure 4 revealed that 56% of the respondents agreed as their institution did not provide some financial support to attending CPD programmes and the majority of the participants(68%) approved as they were not able to attend the CPD programmes which continued even after working hours Wilson & Corbett (2001) found the most important hindering factors included the following: Time constraints: Working part time made it hard for teachers to participate regularly or for extended periods of time. Although 75% of the respondents disagreed as their institution marks absent for duty leave instead of considering it as duty leave, but nearly half of the participants (53%) disagreed as their institution never gave worth to their CPD certificates. 60% participants declared that they did not get prior information regarding CPD events.

RESULTS AND DISCUSSION

The current study investigated the initiatives of teacher educators and opportunities to access the CPD programs. The result of the study shown consistent with the study conducted by Tyagi(2021)and Padwad & Dixit(2013). 46%-47% respondents opined that sometimes online programmes dilute the seriousness of the event and felt that offline programmes are better than online. But if we look over the self- initiatives of the teacher educators than will be able to find that only 51-58% of the respondents are interested and having the habit of writing research papers and

**Rama Verma and Ravi Vanguri**

published articles/ideas in newspapers/journals, writing chapters for edited books, prepare portfolio for self-improvement. On the other hand the initiatives made by teacher educators towards e-learning platforms have not quite good, as the results shown that less than 50% of the teacher educators were enrolled for online courses and taken the membership in online journals and libraries as well as able to develop e-content in any subject, But 64% of them are able to develop e-content in their own subject only. The findings of the study declared that the institution and management encouraged and support their teacher educators to take part in CPD activities as a majority of the respondents (69-84%) of the respondents agreed in this regard. But researchers have founding consistent with the findings of Gomba (2019), stated the management does not allot time to their teacher educators attending CPD activities. Even though the institutions, does not add any kind of increment in their salary on the basis of their Continuing Professional Development. On the other hand the current study found some challenges in front of teacher educators that hinder them not to attend the CPD programs like Lack of financial assistance from the institution and Long duration of programs make them unable to attend CPD programs, 56% -68% of the Teacher Educators have encountered with such kind of challenges. The study of Dilshad, Hussain, & Batool (2019) also support the findings of the current study as the lack of time and funding makes the participants uneasy to attend the CPD programs, However, nearly half of the participants (53%) felt that their institution never give worth to their valuing CPD certificates so they lacked their interest to take part in CPD programs, beside this the similar kinds of challenges were also found by Tyagi (2019). On the basis of the review of the related literature, objectives of the study, methodology results and limitation of the study, the researchers suggested that in the current study the researcher targeted the teacher educators only, one must include the Administrators and Principals of the Teacher Education Colleges.

CONCLUSION

It can be concluded that the outcomes of the present study can be significant for various stakeholders, including college management, committees, organizers of CPD programs, participants of CPD programs like teacher educators both pre-service and in-service teacher educators in a variety of ways. Teacher educators can analyze about their self -initiatives as in which type of CPD activities they lacked behind where they should move ahead for the quality enhancement. The agencies can get a view that which factors affects the participation of the participants in CPD programs and what kind of opinion does the Teacher Educators have regarding CPD programs. What type of motivation and awareness do the Teacher Educators required? For CPD the concerned institutions must prepare an advance annual plan by taking the viewpoints of Teacher Educators in consideration regarding Professional Development activities. The CPD programmes must be organised only after doing the need analysis of the teachers. But, if we think that CPD of a professional is possible only through the opportunities, we might be wrong here, one must contribute their positive efforts to achieve the goal of Continuing Professional Development. Both self-initiatives and CPD opportunities go hand in hand and the success of CPD cannot be possible without the efforts and platforms.

ABSTRACT

Cancer is a disease in which some of the body's cells grow uncontrollably and spread to other parts of the body. *Tragia involucrata* Linn. (family: Euphorbiaceae) is a medicinal plant, which has been used for centuries in Sri Lankan Traditional Medicine as well as in the Ayurveda medical system. This plant is mainly found and used by South Asian countries such as Sri Lanka, India, and Bangladesh. *In-silico* activity of *tragia involucrata* was evaluated by Pass online and ADME prediction by Swiss ADME. *In-vitro* anticancer activity of *tragia involucrata* aqueous extract by trypan blue dye using Dalton's Lymphoma Ascites cells (DLA).Hence it was that the plant extract, *Tragia involucrata*, has anti-cancer activity.

Keywords: Cancer;*Tragia involucrata*; Pass online; ADME prediction; Trypan blue dye.

Rajinikanth *et al.*,

INTRODUCTION

Cancer is a disease in which some of the body's cells grow uncontrollably and spread to other parts of the body. Possible signs and symptoms include a lump, abnormal bleeding, prolonged cough, unexplained weight loss, and a change in bowel movements. [1] The most common types of cancer in males are lung cancer, prostate cancer, colorectal cancer, and stomach cancer. [2] Types of cancers are:

Lung cancer

Lung cancer is also known as lung carcinoma, malignant lung tumour characterized by uncontrolled cell growth in tissues of the lung. If left untreated, this growth can spread beyond the lung by the process of metastasis into nearby tissue or other parts of the body. Most cancers that start in the lung, known as primary lung cancers, are carcinomas.

Anal cancer

Anal cancer occurs in the anus the end of the gastrointestinal tract. Anal cancer is very different from colorectal cancer. Anal cancer is lump which is created by the abnormal & uncontrolled growth of cells in the anus.

Adrenal cancer

Adrenal cancer is a condition occurs when abnormal cells form in or travels to the adrenal glands. Our body has two adrenal glands, one located above each kidney. Adrenal cancer usually occurs in the outermost layer of the glands, or the adrenal cortex.

Bone cancer

Bone cancer can arise in any of the bones of the body but it is most commonly seen in the long bones of the arms and legs. It has the ability to attack the body within the first 20 years of life when maximum growth in the musculoskeletal system takes place. [3] *In silico* ADME, Toxicity, Biological activity prediction by using various suitable software's.

PLANT PROFILE OF *TRAGIA INVOLUCRATA*

Tragia involucrata Linn. (family: Euphorbiaceae) is a medicinal plant, which has been used for centuries in Sri Lankan Traditional Medicine as well as in the Ayurveda medical system. This plant is mainly found and used by South Asian countries such as Sri Lanka, India, and Bangladesh. *Tragia involucrata* L. belonging to family Euphorbiaceae is commonly known as Wel Kahambiliya, Helkahambiliya, Kahambiliya, or Kasambiliya in Sinhala and Indian stinging nettle or climbing nettle in English.

MORPHOLOGY

Tragia involucrata is a perennial, densely hispid-pubescent herb, with scattered, stinging hairs throughout. The stem is elongate, slender, and twining. Leaves are simple, alternate, serrate, stipulate, 2.5–12.5 cm long, 2–4.5 cm broad, densely hispid-pubescent. Regular, unisexual, and apetalous flowers are borne in terminal axillary. The flowering period is February, March, and June. Fruit is a capsule of 8 mm diameter, 3-lobed, more or less hispid. Seeds are subglobose, grayish brown, and smooth, with slight mottling. *Tragia involucrata* is geographically distributed in India, Sri Lanka, Burma, and China. In Sri Lanka, it is common in Jaffna, Anuradhapura, Minneriya, Galle, and Matara, as a weed of cultivation and waste grounds. [21]

MATERIALS AND METHODS

In Silico biological activity and toxicity prediction (PASS ONLINE)

A computer-aided software programme called PASS makes predictions about the range of biological activity of various substances based on those assumptions.

***In Silico* ADME Prediction**

We use the concept of 'biological activity spectrum' for a substance. It is the list of activity names, which reflects the result of the interaction of the chemical substance with different biological entities.

MACERATION

Apparatus Required: Beaker, funnel, Whatmann filter paper, glass rod, china dish

Reagents: Distilled water, crude drugs

***In Vitro* Cytotoxicity Test (TRYPAN BLUE ASSAY)**

Apparatus: Micropipette, Haemocytometer, sample tube, test tube stand, centrifuge apparatus, syringe, microscope.

Reagents: DMSO reagent, Phosphate buffered saline, trypan blue, drug extract

Cancer cell lines: Dalton's Lymphoma Ascites (DLA).

PROCEDURE

***In silico* biological activity and toxicity prediction (PASS ONLINE)**

Steps involved in PASS:

Step 1: Navigation of the PASS online web page: Any web browser can be used to access the pass directly by typing "PASS Prediction" into the search bar. Use the online program's prediction page for the free registration and log-in to use the component of interest prediction feature.

Step 2: Drawing the structure of molecule: The 2D structure of the components, which serves as the foundation for the prediction, is used by the PASS online prediction tool as an input; as a result, the structure can be created using Chem sketch version 12 and uploaded to the PASS website as a (*.mol) file, or it can be created directly on the website using JAVA, which makes use of the drawing programme Marvin Sketch.

Step 3: Prediction output: The input structure's activities, which were drawn in the second stage, are now compared with the structures in the program's database that have known activities. As the principal of estimation, the Bayesian approach, the prediction tool predicts the Pa: Pi ratio of the input substance. The result is shown as several biological activities ranked in descending order of their likelihood ratios.

***In silico* ADME prediction (CHEMDRAW)**

To obtain biological activity spectrum of substance, the user should send via internet a standard Molfile, or they may draw a structural formula using. The prediction result is returned in the form of a table containing the list of biological activities with appropriate probability values, If $P_a > 0.7$, the substance is very likely to exhibit the activity in experiment, but the chance of the substance being the analogue of a known pharmaceutical agent is also high. If $0.5 < P_a < 0.7$, the substance is likely to exhibit the activity in experiment, but the probability is less, and the substance is unlike known pharmaceutical agents. If $P_a < 0.5$, the substance is unlikely to exhibit the activity in experiment. However, if the presence of this activity is confirmed in the experiment the substance might be a new chemical entity.

SWISSADME

SwissADME web tool that gives free access to a pool of fast yet robust predictive models for physicochemical properties, pharmacokinetics, drug-likeness and medicinal chemistry friendliness, among which in-house proficient methods such as the BOILED- Egg, iLOGP and Bioavailability Radar. Easy efficient input and interpretation are ensured thanks to a user-friendly interface through the login-free website <http://www.swissadme.ch>. Specialists, but also non-expert in chem. informatics or computational chemistry can predict rapidly key parameters for a collection of molecules to support their drug discovery endeavours.

EXTRACTION

The whole plant was collected from in and around areas of Ernakulam and was dried under shade for 5 to 7 days. The whole dried plant was powdered with a blender. The extraction was done by aqueous maceration, in which 50g of the powdered drug is taken in a beaker and to this 1000ml of distilled water was added and stirred well. This is kept for 6 days covered. After 6 days the extract was filtered using Whatmann filter paper and the obtained filtrate was concentrated in a previously weighed china dish by placing on a water bath slowly.

IN VITRO CYTOTOXICITY PROCEDURE

The test compound was studied for short term in vitro cytotoxicity using Dalton's Lymphoma Ascites cells (DLA). The tumour cells aspirated from the peritoneal cavity of tumour bearing mice were washed thrice with PBS or normal cell line. Cell viability was determined by trypan blue exclusion method. Viable cells suspension (1×10^6 cells in 0.1ml) was added to tubes containing various concentrations of the test compounds and the volume was made up to 1ml using phosphate buffered cell line (PBS). Control tube contained only cell suspension. These assay mixtures were incubated for 3 hours at 37° C. Further cell suspension was mixed with 0.1ml of 1% trypan blue and kept for 2-3 minutes and loaded on a haemocytometer. Dead cells take up the blue colour of trypan blue while live cells do not take up the dye. The number of stained and unstained cells was counted separately.

RESULTS

IN-SILICO TOXICITY AND BIOLOGICAL ACTIVITY PREDICTION

Table 1 shows the chemical constituents present in the plant *Tragia involucrata* and their biological activity and toxicity is predicted. Table 1 it shows clearly.

IN-SILICO ADME PREDICTION

Table 3 shows the canonical smiles of the chemical constituents and table 4 shows the ADME predictions of the chemical constituents present in the plant *Tragia involucrata*.

IN-VITRO CYTOTOXICITY ASSAY

The table below (table 2) shows the percentage cell death in the different concentrations of the drug ranging from 12.5 µg/ml, 25 µg/ml, 50 µg/ml, 100 µg/ml, 150 µg/ml and 200 µg/ml.

DISCUSSION

IN-SILICO TOXICITY AND BIOLOGICAL ACTIVITY PREDICTION

From table 1 it is shown that the following chemical constituents that is friedelan-3-one and orientin has antineoplastic activity. The constituents iridin, orientin, rutin and 3-(2,4-dimethoxyphenyl)-6,7-dimethoxy-2,3-dihydrochromen-4-one has anticarcinogenic activity. Also iridin, orientin and rutin has chemopreventive property. Hence due to the presence of the above chemical constituents present in the plant, *Tragia involucrata*, it can be predicted that the plant has anti-cancer activity shows in table 2.

IN-SILICO ADME PREDICTION

The ADME of the chemical constituents of *Tragia involucrata* was predicted. It showed the GI absorption which gives an idea about the absorption, BBB permeation which predicts the distribution. The inhibitors of CYP1A2, CYP2C19, CYP2C9, CYP2D6 and CYP3A4, this family of isoenzymes is a key player in drug elimination through metabolic biotransformation.

Rajinikanth et al.,

IN-VITRO CYTOTOXICITY ASSAY

On carrying out the in-vitro cytotoxicity assay using trypan blue dye it was found that the plant extract has anti-cancer activity. With increasing in concentration of the plant extract there was an increase in the percentage cell death. Hence it was that the plant extract, *Tragia involucrata*, has anti-cancer activity.

CONCLUSION

In-silico activity of *tragia involucrate* was evaluated by Pass online and ADME prediction by SWISS ADME. *In-vitro* anticancer activity of *tragia involucrate* aqueous extract by trypan blue dye using Dalton's Lymphoma Ascites cells (DLA). Hence it was that the plant extract, *Tragia involucrata*, has anti-cancer activity based on the *in-silico* results.

ABSTRACT

Leafy vegetables have long been recognized for their nutritional richness and potential medicinal benefits. This comprehensive review article aims to provide an in-depth analysis of the nutritional and medicinal value of various leafy vegetables, emphasizing their diverse phytonutrient profiles and their significant impact on human health. The review begins by exploring the wide array of essential nutrients present in leafy greens, including vitamins (A, C, K, and various B vitamins), minerals (iron, calcium, magnesium), dietary fiber, and antioxidants. It highlights the importance of these nutrients in promoting overall well-being, supporting digestion, bone health, and weight management. Furthermore, the review delves into the medicinal properties of leafy vegetables, discussing their potential in preventing and managing chronic diseases. It presents scientific evidence demonstrating the role of leafy greens in reducing the risk of heart disease through blood pressure regulation and cholesterol management. Additionally, the anti-inflammatory and antioxidant properties of these vegetables are examined in relation to their contribution to cancer prevention and the mitigation of chronic inflammation. The article also explores the impact of leafy vegetables on specific health conditions, such as diabetes and age-related macular degeneration, emphasizing their role in blood sugar control and eye health. Moreover, it discusses the potential cognitive benefits associated with the consumption of certain leafy greens, contributing to cognitive function and potentially reducing the risk of cognitive decline in older adults.

Kaushik Modak *et al.*,**Keywords:** Leafy vegetables, nutrition, medicinal value, phytonutrients, chronic diseases.

INTRODUCTION

Leafy vegetables are a diverse group of plants prized for their tender, leafy greens that are not only delicious but also packed with a plethora of essential nutrients. These vibrant greens come in various shapes, sizes, and colors, making them a versatile and essential part of a balanced diet. From spinach and kale to lettuce and collard greens, leafy vegetables offer a wide range of flavors and textures to satisfy even the most discerning palate. Beyond their culinary appeal, leafy vegetables are celebrated for their numerous medicinal benefits. These benefits are attributed to the rich array of vitamins, minerals, antioxidants, and other bioactive compounds they contain. Here are some of the remarkable health benefits of including leafy vegetables in your diet, supported by scientific research: Leafy greens are a powerhouse of essential nutrients such as vitamins A, C, K, and folate, along with minerals like iron, calcium, and potassium. These nutrients play crucial roles in maintaining overall health and wellbeing [1]. Leafy vegetables are packed with antioxidants, including beta-carotene, lutein, and zeaxanthin. These compounds help protect cells from oxidative stress and reduce the risk of chronic diseases like heart disease and cancer [2]. Leafy greens like kale and collard greens are excellent sources of vitamin K and calcium, which are vital for maintaining strong and healthy bones [3]. Regular consumption of leafy greens has been linked to a reduced risk of heart disease due to their high potassium content, which can help lower blood pressure, and their ability to improve blood vessel function [4]. Leafy vegetables are a good source of dietary fiber, promoting healthy digestion and preventing constipation. They also contain compounds that support a healthy gut microbiome [5]. Leafy greens are low in calories and high in fiber, making them an excellent choice for those looking to manage their weight. They provide a sense of fullness, reducing overall calorie intake [6]. Reduced Risk of Chronic Diseases: A diet rich in leafy greens has been associated with a lower risk of chronic diseases, including type 2 diabetes and certain types of cancer [7]. Lutein and zeaxanthin found in leafy greens are known to promote eye health by reducing the risk of age-related macular degeneration and cataracts [8].

RESULT AND DISCUSSION

Leafy vegetables are a diverse group of plants that are prized for their culinary versatility and numerous health benefits. These vegetables encompass a wide range of species, including spinach, kale, lettuce, Swiss chard, collard greens, and many others. In addition to their delicious flavors and vibrant colors, leafy greens are packed with essential nutrients, vitamins, minerals, and antioxidants that contribute to their significant medicinal benefits. This introduction will explore some of the key health advantages associated with leafy vegetables, supported by scientific citations. The availability of leafy vegetables in Assam can be influenced by various factors, including climate, geography, and agricultural practices. Assam, a state in northeastern India, has a diverse topography and climate, which can impact the types of leafy greens that are cultivated and available throughout the year.

Nutrient-Rich Powerhouses

Leafy greens are renowned for their exceptional nutrient content. They are an excellent source of vitamins A, C, and K, as well as essential minerals like calcium, iron, and magnesium. These nutrients play crucial roles in maintaining overall health and well-being [9].

Fiber for Digestive Health

Leafy vegetables are high in dietary fiber, which aids in digestion and promotes a healthy gut microbiome. The fiber in leafy greens can help prevent constipation and may reduce the risk of gastrointestinal disorders [10].

**Kaushik Modak et al.,****Heart Health**

Studies have shown that a diet rich in leafy greens may lower the risk of heart disease. The high levels of potassium and magnesium in these vegetables can help regulate blood pressure, while their fiber content helps lower cholesterol levels [11].

Anti-Inflammatory Properties

Leafy greens contain antioxidants such as flavonoids and carotenoids, which possess anti-inflammatory properties. Chronic inflammation is linked to various diseases, and including leafy vegetables in one's diet may help mitigate this risk [12].

Bone Health

Leafy greens like kale and collard greens are excellent sources of vitamin K, which plays a vital role in bone health by promoting calcium absorption and bone mineralization. This is essential for preventing osteoporosis [13].

Weight Management: Leafy vegetables are low in calories and high in water content, making them a fantastic choice for weight management and maintaining a healthy body weight. Their fiber content also helps keep you feeling full and satisfied [14].

Cancer Prevention

Some studies suggest that the antioxidants and phytochemicals found in leafy greens may have protective effects against certain types of cancer, including lung, colorectal, and breast cancer [15].

Vision Support

Leafy greens are rich in lutein and zeaxanthin, two antioxidants that are essential for eye health. These compounds may help protect against age-related macular degeneration and cataracts [16].

Diabetes Management

The high fiber content of leafy greens can help regulate blood sugar levels and improve insulin sensitivity, making them a valuable addition to the diet of individuals with diabetes [17].

Improved Cognitive Function

Some research suggests that the nutrients in leafy greens, such as folate and vitamin K, may support cognitive function and reduce the risk of cognitive decline in older adults [18].

CONCLUSION

Leafy vegetables are not just a culinary delight but also a nutritional powerhouse. Their wide array of vitamins, minerals, and bioactive compounds provide a multitude of health benefits, from promoting heart health to reducing the risk of chronic diseases. Their nutrient density, fiber content, and antioxidant properties make them valuable components of a healthy diet that can contribute to overall well-being and the prevention of various chronic diseases. Incorporating a variety of leafy greens into your diet can be a delicious and effective way to enhance your overall well being. This review underscores the diverse nutritional and medicinal value of leafy vegetables in promoting human health and preventing a range of diseases. It consolidates the existing scientific evidence, making a compelling case for the incorporation of leafy greens into a balanced diet to optimize health outcomes

Table 1: Listed with overall nutritional and health benefit of common leafy vegetables

Nutrient/Health Benefit	Leafy Vegetables
Vitamins	
Vitamin A	Kale, Spinach, Swiss Chard, Collard Greens
Vitamin C	Kale, Broccoli, Brussels Sprouts, Spinach
Vitamin K	Kale, Spinach, Swiss Chard, Collard Greens
Folate (B9)	Spinach, Romaine Lettuce, Turnip Greens
Minerals	
Iron	Spinach, Kale, Swiss Chard, Mustard Greens
Calcium	Kale, Collard Greens, Turnip Greens
Potassium	Spinach, Swiss Chard, Kale, Collard Greens
Magnesium	Spinach, Swiss Chard, Kale, Collard Greens
Fiber	All Leafy Vegetables
Antioxidants	
Beta-carotene	Kale, Spinach, Collard Greens, Swiss Chard
Lutein	Kale, Spinach, Collard Greens, Swiss Chard
Quercetin	Kale, Spinach, Romaine Lettuce
Health Benefits	
Heart Health	Reduced risk of heart disease due to fiber and potassium content
Bone Health	Rich in calcium, vitamin K, and magnesium
Anti-Inflammatory	High antioxidant content
Weight Management	Low in calories and high in fiber
Eye Health	Lutein and beta-carotene support eye health

Table 2: The cultivation and agricultural scenario of common leafy vegetables of Assam.

Climate and Seasons	Geographical Diversity	Commonly Cultivated Leafy Vegetables	Local Agricultural Practices	Market Availability
Monsoons: Assam experiences a significant amount of rainfall during the monsoon season, which typically lasts from June to September. This abundant water supply is favourable for the growth of a variety of leafy vegetables.	Brahmaputra Valley: The Brahmaputra Valley, the largest geographical region in Assam, is known for its fertile plains. This area supports the cultivation of a wide range of crops, including various leafy vegetables.	Kachu Xaak: A leafy green native to Assam, often used in traditional Assamese cuisine.	Home Gardens: Many households in Assam have home gardens where a variety of leafy greens and other vegetables are cultivated.	Local Markets: Leafy vegetables are commonly found in local markets throughout Assam. The availability of specific greens may vary by season and region.

Kaushik Modak et al.,

<p>Winter: The winter season, from November to February, is relatively mild in Assam. Certain leafy greens may thrive during this period.</p>	<p>Barak Valley: This valley, located in the southern part of Assam, also contributes to agricultural production. The types of leafy greens cultivated may vary based on local preferences and climatic conditions.</p>	<p>Manimuni: Also known as water spinach, it is commonly grown in waterlogged areas and is popular in Assamese dishes. Dhekia Xaak: A fern with edible fronds, widely used in Assamese recipes.</p>	<p>Traditional Farming: Traditional farming practices, including terrace cultivation and jhum (slash-and-burn agriculture), may influence the types of leafy vegetables grown.</p>	<p>Urban Centres: In urban areas like Guwahati, markets often offer a diverse range of leafy vegetables, including those brought in from surrounding areas.</p>
---	---	---	--	---

Table 3: Representing the Leafy vegetables of Assam and their reported bioactive constituents with ethnomedicinal uses.

English name	Local name	Scientific name	Family	Bioactive constituents	Ethnomedicinal use
Fiddlehead fern [19]	Dhekia (Assamese), Dheki shaag (Bengali)	<i>Diplazium esculentum</i>	Athyriaceae	D. esculentum leaves and the major volatile compounds were identified as β-pinene (17.2%), α-pinene (10.5%), caryophyllene oxide (7.5%), sabinene (6.1%), and 1,8-cineole (5.8%) ascorbic acid, eriodictyol 5-O-methyl ether 7-O-β-D-xylosygalactoside, tannins and phytates], α-tocopherol, quercetin, pterostromanin, ptaquiloside, terpenes, hopan-triterpene lactone, and lutein	diabetes, smallpox, asthma, diarrhea, rheumatism, dysentery, headache, fever, wounds, pain, measles, and high blood pressure.
Spinach [20,21]	Paleng Xaak (Assamese), Palong shaak (Bengali)	<i>Spinacia oleracea</i>	Chenopodiaceae	Spinach is a rich source of fiber, vitamins A, C, E, K, B6, B2 and also magnesium, manganese, iron, calcium, potassium, copper, phosphorous, zinc, selenium, folate, betaine, folic acid, protein, niacin, omega-	cooling, emollient, wholesome, antipyretic, diuretic, maturant, laxative, digestible, anthelmintic, urinary calculi, inflammation of the lungs and the bowels, sore throat, pain in joints, thirst, lumbago, cold and sneezing, sore eye, ring worm scabies, leucoderma, soiling urine, arrest vomiting, biliousness, flatulence and febrile

Kaushik Modak et al.,

				3 fatty acids, carotenoids beta-carotene and lutein, and bioflavonoid quercetin with many other flavonoids.	
Red vine spinach [22,23,24]	Pui xaak(Assamese), Pui shaak(Bengali) Kodip pasali (Tamil)	Malabar spinach	Basellaceae	Proteins, fat, vitamin A, vitamin C, vitamin E, vitamin K, vitamin B9 (folic acid), riboflavin, niacin, thiamine and minerals such as calcium, magnesium and iron.	a positive effect on total-body vitamin A storage in men, used for the treatment of hypertension, malaria, antifungal, anticonvulsant, analgesic, antiinflammatory and androgenic activities and for the treatment of anemia, topical application for irritant, bruise, ringworm and labour, mild laxative, diuretic and antipyretic.
Heart Leaf [25,26,27,28,29, 30,31,32,33]	Mosondori (Assamese), Mosondari Shaak(Bengali)	Houttuynia cordata Thumb	Saururaceae	cordifolide, heptacosanol, columbin, choline, tinosporide, clerodane furano diterpene, tembertarine, palmatine, magniflorine, β -sitosterol, cordifol, diterpenoid furano lactone, and Berberine, tinosporaside, tinosporine	Anti-diabetic, Anti-cancer, Antioxidant, Anti-microbial, Anti-osteoporotic, Immuno-modulatory, Memory enhancing activity, Antitoxic activity,
Indian Pannywort [34,35,36,37,38, 39,40,41]	Manimuni (Assamese), Thankuni Pata (Bengali)	Centella asiatica	Apiaceae	Asiatic acid, asiaticoside, and madecassoside, pentacyclic triterpenoid saponins, Centellin, asiatic, and centellicin	Anticancer activity, Antifungal activity, antibacterial Activity, Anti-Inflammatory Activity, Wound Healing, Antidepressant, Neuroprotective Activity, Antidiabetic Activity, Antioxidant Property
Drumstick leaves [42,43]	Sajina paat(Assamese), Jhola pata (Bengali)	Moringa oleifera L	Moringaceae	β carotene, protein, vitamin C, calcium, and potassium;	Moringa leaves treat asthma, hyperglycemia, Dyslipidemia, flu, heart burn, syphilis, malaria, pneumonia, diarrhoea, headaches, scurvy, skin diseases, bronchitis, eye and ear infections. The fresh leaf juice was found to inhibit the growth of human pathogens.
Curry Leaf[44]	Noro-Xingho (Assamese) Kari Pata	Murraya koenigii	Rutaceae	Fibre, Mineral, Calcium, Phosphorus, Iron, Carotene (as vitamin A), Nicotinic acid, Vitamin C,	Anti diabetic and cholesterol reducing property, antimicrobial activity, antiulcer activity, antioxidative property, cytotoxic activity, anti-diarrhoeal activity,

Kaushik Modak et al.,

	(Bengali)			Thiamine and riboflavin	phagocytic activity
Thai Coriander [45,46,47,48,49,50,51]	Maan Dhaniya (Assamese) Dhaniya (Bengali Dhaniya)	<i>Eryngium foetidum</i>	Epiaceae	Dodecenal, 13-Tetradecenal, Trans-2-tetradecenal, 2,4,6-Trimethylbenzaldehyde and 2,4,5-Trimethylbenzaldehyde, 5-Dodecene, Tetradecanal 3,4,5-Trimethylphenol, 2,4,6-Trimethylbenzaldehyde, 1-(2-Methylbutyl)-1-(1-methylpropyl)cyclopropane α -Pinene, Z)-13-octadecenal, Muurola 4,10(14)-dien-1 α -ol, Neophytadiene isomer, Hexahydrofarnesyl acetone, Neophytadiene isomer, Hexahydrofarnesyl acetone, Phytol, 2-Formyl 1,1,5-trimethyl 2,5-cyclohexadien-4-yl-2-methylbutenoate, Cadino, α -Cadinol, Caprylic alcohol, 1,4-Dihydrocarbazole-1,4-dione, Lauraldehyde, α -Pinene, M-Cymene, O-Cymene, Lasidiol p-methoxybenzoate.	Antibacterial and antifungal, Anthelmintic, Anti-leishmaniasis, Anti-inflammatory, Anticancer, Antidiabetic, Antioxidant.
Amaranth[52]	Morisa Xaak (Assamese)	<i>Amaranthus cruentus</i>	Amaranthaceae	Inositol, glucose, fructose, monosaccharides, disaccharides such as raffinose, sucrose, maltose, and stachyose.	Anti-inflammatory, Antioxidant, Antithrombotic, Embryotoxic, Enzyme inhibitor, Antihypertensive
Stinkvine[53,54,55,56,57,58]	Bhedailota (Assamese) (Bengali)	<i>Paederia foetida</i> L	Rubiaceae	Eiridoid glycosides, sitosterol, stigmasterol, alkaloids, carbohydrates, protein, amino acid and volatile oil, carotene	Antidiarrheal, Antiinflammatory, Antispasmodic, Anthelmintic, Antitussive Activity, Antioxidant Activity, Hepatoprotective Activity.

Kaushik Modak et al.,

				and vitamin C, beta-sitosterol and epifriedelinol.	
White goosefoot [59,60,61,62,63, 64,65,66,67,68]	Zilmil XaaK (Assamese)	<i>Chenopodium album</i>	Amaranthaceae	b-sitosterol, lupeol, 3 hydroxy nonadecyl hencosanoate, ascorbic acid, b-carotene, catechin, gallic acid, caffeic acid, p-coumaric acid, ferulic acid, campesterol, xanthotoxin, stigmasterol, imperatorin, ecdysteroid, cinnamic acid amide alkaloid, phenol, saponin, apocarotenoids, crytomerediol, n-trans-feruloyl-4-O-methyl dopamine and syringaresinol.	Hepatoprotective activity, Antibacterial activity, Spasmolytic and analgesic activity, Antimicrobial and anthelmintic activity, Antipruritic and antinociceptive effects, antibreast cancer bioagent, Sperm-immobilizing agent, Anti-inflammatory activity.

ABSTRACT

Diabetic nephropathy (DN) has become the most prevalent destructive complication of diabetes mellitus, due to inadequate treatment approaches. This study integrates molecular docking and network pharmacology to analyse the impact of isopulegol in the treating the complications of diabetic nephropathy (DN). The isopulegol and Diabetic nephropathy targets were obtained from databases and 61 common targets were identified through cytoscape analysis. Twenty seven genes involved in nine pathways was screened using Gene ontology (GO) analysis and Kyoto Encyclopedia of Gene and Genome (KEGG) pathway enrichment analysis. The topology of PPI network was analysed. Molecular docking shows that the 5 target proteins namely JAK1, MAPK8, EGFR, MMP2 and MMP9 associated with resistance to insulin, inflammation, apoptosis, oxidative stress, etc. have good interactions with isopulegol. The results of this study imply that isopulegol might be a useful medication for treating DN.

Keywords: Isopulegol; diabetic nephropathy; network pharmacology; molecular docking

INTRODUCTION

Diabetes mellitus ranking third among the non-communicable diseases in the globe is speculated to increase up to 642 million cases by the year 2040 [1]. Persistent hyperglycemic condition leads to damage of various organs of the body and thereby complications which comprises cardiovascular, cerebrovascular and microvascular diseases like diabetic cardiomyopathy, retinopathy and nephropathy[2]. Among the microvascular complications, diabetic nephropathy is the most prevalent and poses a great threat to public health globally [3]. Glomerular injury and tubulointerstitial fibrosis attributes to the deadly effect of diabetic nephropathy[4]. Though standard treatment procedures are in use, a novel therapeutic compound that can combat diabetic nephropathy progression has not been identified. Terpenoids are phytochemicals that possess a diverse range of pharmaceutical properties. Isopulegol is a monoterpene present in mint, rosemary oil and grapefruit [5] that possess good biological properties inclusive of anti-diabetic property [6]. However, the possible mechanism of action of isopulegol in ameliorating diabetic nephropathy has not yet been studied. Network pharmacology, a rich blend of huge data of systems biology and computing technology is an interactive network that has gained momentum in the last decade put forward by Hopkins[7]. It enables the identification of mechanism of action of compounds on diseases in a logical manner. The objective of this study is to identify the targets through which isopulegol ameliorates diabetic nephropathy (Fig.1)

MATERIALS AND METHODS

Physicochemical and structural attributes of Isopulegol

The 2D (Fig. 2) and 3D structures of isopulegol were acquired from Pub-Chem (<https://pubchem.ncbi.nlm.nih.gov/>). The physico-chemical characteristics of isopulegol are summarized utilizing pkCSM web server (<http://biosig.unimelb.edu.au/pkcsm/prediction>) in Table 1. The parameters with their characteristics such as absorption (solubility of water, Intestinal absorption, permeability of CaCo2, Skin, P-glycoprotein substrate, P-glycoprotein inhibitor I and II), Distribution (Volume Distribution, CNS permeability and BBB permeability), Metabolism (CYP substrates and inhibitors), Excretion (Renal OCT2 substrate and Total clearance) and Toxicity (AMES toxicity, hepatotoxicity, Skin sensitization) help us to determine the pharmacokinetics of isopulegol. Bioavailability and drug likeliness was speculated utilizing Swiss ADME (<http://www.swissadme.ch/index.php>)

Potential targets of isopulegol and DN

Isopulegol structure information (canonical smiles) was utilised to identify the targets from 5 databases and DN targets were identified from 3 databases (Table 2). The nomenclature was standardized using UniProtKB.

Overlapped targets and network construction

The overlapping targets from 2.2 were shortlisted, and a network based on the interactions between isopulegol and DN was developed by utilising the Cytoscape software (<http://cytoscape.org/ver.3.5.0>). The therapeutic targets of isopulegol that plays a role in DN pathogenesis was identified using this approach. The Target-biological processes (T-BP) network enabled the identification of potential common targets of isopulegol, DN and related biological processes (BPs). The major pathways in which the common targets of isopulegol and DN are involved was identified using Target-Pathway (T-P) network. The targets, associated biological processes with pathways were depicted using BP-Target-Pathway (BP-T-P) network.

Protein – protein interaction (PPI) network analysis

Using data from the STRING database (<https://string-db.org/>, Version: 11.0) and the organism set as "Homo sapiens," a PPI network of overlapping target genes was built and viewed in Cytoscape. The Network Analyzer tool in Cytoscape was utilised to assess the parameters and degree value of nodes within networks. In the PPI network, a node with a higher degree value represented potential significant constituents of herbs and important targets.

Maria Caroline Rebellow *et al.*,

Functional enrichment and pathway analysis

Gene ontology (GO) that comprises biological processes, molecular functions and cellular components, and Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment analysis that enables to identify particular biological characteristics of a possible isopulegol target in DN were carried out with ShinyGO v.0.7.4.1. (<http://bioinformatics.sdstate.edu/go74/>), a tool for gene enrichment analysis. Statistical significance was approved for the cut-off values of $p < 0.05$.

Protein preparation and optimization

The crystal structure of Drug targets namely GSK3B, JAK1, JAK2, EGFR, INSR, TGFB2, MAPK1, MAPK8, MAPK14, MMP2, MMP3 and MMP9 from *Homo sapiens* were obtained from RCSB protein data bank. Using the Kollman united atoms force field and the Auto Dock Tool(ADT) –2.0. 2.2, proteins were assigned electronic charges and addition of solvation parameters, hydrogen atoms, and fragmental volumes was done.

Ligand preparation and optimisation

Using Chemscketch Software, Isopulegol structure was drawn, 3-D structure was generated and optimized. The open babel molecular converter programme was used to convert the chosen ligands stored in MDL-MOL format to PDB format.

Molecular docking and visualization

Docking analysis of 12 targets identified through pathway analysis against Isopulegol was done using AutoDock 4.2 tool to see the affinity [8]. Several intermediary procedures were conducted, including the creation of pdbqt files for the protein and ligand, construction of the grid, and generation of a grid map with a grid box. Genetic algorithm was used as a search parameter. Lamarckian GA was the output selected. Biovia Discovery Studio Visualizer software was utilized to visualize the protein-ligand interaction involving isopulegol and GSK3B, JAK1, JAK2, EGFR, INSR, TGFB2, MAPK1, MAPK8, MAPK14, MMP2, MMP3, MMP9.

RESULTS AND DISCUSSION

Diabetic nephropathy, a leading cause of end stage renal disease is linked to higher rates of cardiovascular morbidity and death. The pathophysiology of diabetes and diabetic nephropathy (DN) is intricate and involves interactions among hemodynamic and metabolic pathways, oxidative damage, and the release of cytokines and growth factors, eventually resulting in kidney damage. The current primary approach to pharmacotherapy is controlling the blood pressure, inhibition of the renin-angiotensin-aldosterone system (RAAS) using ACE inhibitors and/or ARBs, and using medicines to lower glucose levels. Disease-modifying practices like dietary restriction, weight loss, quitting smoking, and cholesterol control offer cumulative renal benefits, especially when it comes to lowering cardiovascular risk. The most common risk factors of DN are hyperglycemia, elevated blood pressure and genetic predisposition[9]. Novel approaches aimed at addressing supplementary pathophysiological pathways are required to prevent and manage DN[10]. Network pharmacology is an interdisciplinary field that combines knowledge from network science, bioinformatics, pharmacology, and systems biology to understand how medications interact with biological systems holistically. It seeks to investigate the intricate connections that exist between medications, their targets, and the biological processes that underlie a variety of illnesses. The traditional approach to drug discovery often focused on identifying single drug-target interactions, but network pharmacology takes a more comprehensive and systemic perspective. The application of network pharmacology has the potential to accelerate drug discovery and development, improve the understanding of drug mechanisms of action, and facilitate the identification of novel therapeutic targets. It is particularly valuable for addressing complex diseases where a holistic understanding of the underlying biological processes is essential. Applying network pharmacology and molecular docking techniques, this work examines the impacts of isopulegol on diabetic nephropathy (DN), given its antidiabetic properties as a monoterpene alcohol. Isopulegol (p-menth-8-en-3-ol), an intermediate obtained during the preparation of (-)-menthol is a monoterpene alcohol that belongs to p-menthane family [11]. The essential oils of *Eucalyptus citriodora* Hook [12]

Maria Caroline Rebellow *et al.*,

and *Zanthoxylum schinifolium* [13] contains isopulegol. The monoterpene alcohol has gastroprotective, anti-ulcer, antioxidant, and neuroprotective characteristics [14]. The present study involved GO and KEGG enrichment analyses on the therapeutic targets.

Potential targets of isopulegol and Diabetic nephropathy

The databases yielded a total of 1213 targets for DN and 392 targets for isopulegol (Table 3). On removal of duplicates, 340 targets of isopulegol and 1201 targets of DN were shortlisted for the study.

Overlapped targets and network analysis

Sixty one common targets of Isopulegol and DN were found. (Fig. 3). The network comprising these targets was found to have 1602 nodes (340 isopulegol targets, 1201 DN targets and 61 overlapping targets) in total and 1663 edges.

Protein – protein interaction (PPI) network analysis

Using string database, 61 targets with the minimal necessary interaction score and high confidence (0.70) were analysed based on their interactions with DN targets and isopulegol targets (Fig. 4). The total number of nodes was 61 with a mean node degree of 3.84. The number of edges (117) was found to be much greater than the expected number of edges (32). The average local clustering coefficient was 0.414 with the PPI enrichment p-value: < 1.0e-16. The PPI network shows that genes of multiple signaling pathways, *viz.*, PI3K-Akt, MAPK, IL-17, AGE-RAGE, FoxO, VEGF, mTOR, JAK-STAT and AMPK are associated with DN (Table 4)

Functional enrichment and pathway analysis

GO enrichment analysis was carried out to ascertain biological processes, molecular functions, cellular components and pathways in which the 61 overlapped targets had a pivotal role. (Fig. 5. a, b, c) The GO enrichment analysis of the sixty-one overlapped targets showed that protein kinase activity (GO:0004672), transferase activity (GO:0016740), transition metal ion binding (GO:0046914), protein kinase binding (GO:0019901) were the significant molecular functions. In terms of cellular components, the targets were found to be enriched in secretory granules (GO:0030141), extracellular matrix (GO:0031012) and cytoplasmic vesicle lumen (GO:0031410). The network of targets and biological processes revealed that the response to oxygen containing compound (GO:1901700) ranked first in association to targets (counts =36), homeostatic process (GO:0042592) the second (counts=29), cellular response to oxygen containing compound (GO :1901701) the third (counts=28), followed by positive regulation of molecular function (GO:0044093), positive regulation of cell communication (GO:0010647), positive regulation of signalling (GO:0023056), regulation of response to stress (GO:0006468), regulation of cell population proliferation (GO:0042127), regulation of intracellular signal transduction (GO:1902531), peptidyl- amino acid modification (GO:0018193) and response to organonitrogen compound (GO:0010243). On the basis of KEGG enrichment analysis of the 61 overlapped targets at a threshold of FDR < 0.01 and literature, the topmost signalling pathways in the treatment of DN was found to be PI3K-Akt (hsa04151), MAPK (hsa04010) and AGE-RAGE pathway in diabetic complications (hsa04933) (Table 4). The Biological process - Targets – Pathway network (Figure 6) showed that 27 overlapped targets MAPK1, RELA, EGFR, JAK2, PTGS2, MAPK14, IGF1R, INSR, MMP9, PTPN2, PRKCB, PARP1, PPARG, S100A8, GSK3B, PRKCE, MAPK8, IL2, TGFB2, KDR, MMP3, LCK, ITGB3, MMP2, JAK1, SETD7, CCNE1 were engaged in multiple biological processes and pathways.

Molecular Docking analysis

A total of 12 genes were chosen for molecular docking interaction after conducting molecular functions and pathway research. The targets namely GSK3B (PDB ID: 6V6L), JAK1 (PDB ID: 6N7A), JAK2 (PDB ID: 7LL4), EGFR (PDB ID: 8A27), INSR (PDB ID: 3BU6), TGFB2 (PDB ID: 6XM2), MAPK1 (PDB ID: 8AOJ), MAPK8 (PDB ID: 4QTD), MAPK14 (PDB ID: 6SFI), MMP2 (PDB ID: 3AYU), MMP3 (PDB ID: 4G9L) and MMP9 (PDB ID: 5UE3) was docked against isopulegol. According to the receptor-ligand docking theory, there exists a reciprocal correlation between docking energy and binding affinity. Greater negative docking energy shows a higher binding affinity linking the protein and the ligand. The binding affinity of isopulegol with different targets is summarized in Table 4 and the binding interactions are depicted in Fig. 7 and Table 5. Based on binding energy and hydrogen bond formed between

**Maria Caroline Rebellow et al.,**

the targets and isopulegol, top five targets were identified namely JAK1, EGFR, MAPK8, MMP2 and MMP9 (Table 5 and 6). Recent studies indicate that numerous signalling pathways are significant contributors to the development of DKD. The significance of epidermal growth factor receptor (EGFR) has been well investigated in this context [15-17]. The EGFR pathway is crucial for growth, differentiation and migration of cells. Its involvement in the advancement of chronic conditions like resistance to insulin, diabetic nephropathy and cardiomyopathy has been proved [18,19]. EGFR is widely expressed in several parts of the mammalian kidney, including glomeruli and proximal tubules. This expression includes renal epithelial cells, glomerular endothelium cells, podocytes, tubular cells, mesangial cells, and medullary interstitial cells [20,21]. Through reducing oxidative stress and inflammation, EGFR inhibitors have been found to attenuate kidney damage caused by angiotensin II [22,23]. Elevated glucose levels trigger EGFR transactivation, leading to the onset and progression of kidney damage. In STZ treated diabetic mice, reduction in kidney size occurs due to EGFR inhibition, without altering body weight, blood glucose or blood pressure [24]. The suppression of EGFR has significantly decreased oxidative stress and endoplasmic reticulum stress (ERS) in the kidneys, as well as reduced renal fibrosis and apoptosis in diabetes models caused by STZ [25]. These findings indicate that the function of EGFR extends beyond cell proliferation and fibrosis, encompassing its potential as a promising target for treating chronic or metabolic disorders like diabetes.

The presence of JAK/STAT signalling in renal cells, including podocytes, mesangial cells, and tubular epithelial cells, strongly indicates its significant role in the advancement of kidney disease [26]. The JAK/STAT signalling system is essential in multiple pathologic processes such as haematopoiesis, immunological response, inflammation, development and growth, regulation of stress response, gene expression, cell proliferation, differentiation, migration, and apoptosis [27]. Upon analysing the gene and protein expression in kidney biopsies from individuals with both early and late-stage DKD, it was observed that there was an upregulation and increased activity of the JAK-STAT signalling pathway throughout the entire range of DKD [28,29]. The upregulation and heightened functionality of JAK1 and JAK2 have been observed to promote the advancement and progression of DKD [30,31]. Inhibitors of JAK1 and JAK2 hold great promise as targets for therapeutic intervention in DN therapy. Several investigations have shown that the MAPK signalling pathway is primarily responsible for the cellular damage caused by elevated glucose levels and the initiation of inflammation [32,33]. It has been discovered that p38 MAPK is crucial for the epithelial–mesenchymal transition induced by elevated glucose in cultured human renal tubular epithelial cells [34]. In accordance with the literature, MAPK8 is found to be active in processes like cellular response to chemical stress, hormone, lipid, oxygen-containing compound, peptidyl-amino acid modification, protein phosphorylation and positive regulation of molecular function. Hence by inhibiting MAPK signalling pathway, the inflammatory response of DN can be reduced [35].

Recent research indicates that matrix metalloproteinases (MMPs), in conjunction with tissue inhibitors of metalloproteinases (TIMPs), have a substantial impact on the progression of diabetic nephropathy. Studies utilizing Western blot analysis and ELISA methods have revealed that the MMP2 protein and its related enzyme activity are augmented in the kidneys of individuals with diabetes [36]. In a study, non-specific pharmacological suppression of MMP9 with doxycycline reduced renal damage [37]. There has been increasing evidence in recent years of a strong link between the expression of MMPs and the course of renal disease in patients with diabetic nephropathy, both in humans and in several experimental animal models. Increased MMP9 activity induced by high glucose was contingent upon ERK1/2 MAPK signalling activation, which was subsequently linked to a reduction in collagen IV production. This suggests that MMP9 expression and its activity can be altered by blocking ERK pathway. The enrichment analysis reveals that MMP2 and MMP9 are actively involved in various biological processes and emphasizes the fact that MMPs may act as sensitive indicators for detecting pathological alterations in DN and prospective targets in treating DN [38]. According to enrichment analysis and *in silico* findings, isopulegol is found to have good interaction with JAK1, MAPK8, EGFR, MMP2 and MMP9 as confirmed via pathway and molecular function analysis. These genes have significant roles in nine pathways associated with DN. Therefore, our study suggests that isopulegol may attenuate DN by controlling a number of crucial elements in these signalling cascades.

Maria Caroline Rebellow et al.,

CONCLUSION

Our research utilized network pharmacology analysis and molecular docking technology to investigate the potential impacts of isopulegol against DN and obtained five key therapeutic targets namely JAK1, MAPK8, EGFR, MMP2 and MMP9. The main processes responsible for the therapeutic actions of isopulegol against DN have been identified. These *in silico* findings support the usage of isopulegol as a novel medicine for treating DN. Additionally, they establish a crucial scientific foundation for future investigations into the mechanism of isopulegol in DN treatment, which might be further validated through *in vivo* and *in vitro* experimentation.

ABSTRACT

Physical inactivity and work-related stress are major health concerns among office workers. One of the mechanisms for the association between increase physical activity and decrease risk of cardiovascular disease may be alteration in cardiac autonomic nervous system function which can be assessed by heart rate variability (HRV). Heart rate (HR) is commonly considered as an outcome measure in clinical case scenario to assess changes related to physical activity in India. However, HRV measurements are more standard as compared to HR and provides an insight into the changes that occur in cardiovascular physiology relating to physical activity. The pilot study aimed to determine the correlation between physical activity levels and stress on heart rate variability. The pilot study included sixty (n=60) office workers, 11 females and 49 males, age between 30 – 50 years (mean age =37.43±5.6) volunteered for the study. Physical activity and subjective stress were measured using International Physical Activity Questionnaire (IPAQ - short form) and Perceived stress scale (PSS-10) respectively. 5 minute short-term HRV measurement was obtained by KubiosHRV smart phone application. Each Participants were rested in supine for 10 minutes before the HRV measurement and were instructed to remain relaxed, breathe normally, no talk and no sleep during the measurement. Time domain (Standard Deviation of Normal-to-Normal R-R interval – SDNN, Root Mean Square of Successive Differences - RMSSD) and frequency domain (Low frequency / High Frequency – LF/HF ratio) parameters were measured for HRV analysis. No significant correlation was found between physical activity and HRV parameters and stress showed moderate positive correlation with LF/HF ratio ($r = 0.427$, $p = 0.001$) and moderate negative correlation

**Vaishali Gabani and Saravanan Murugan**

with RMSSD ($r = -0.455$, $p < 0.01$) and SDNN ($r = -0.270$, $p = 0.03$) Based on the results of this study clinical evaluation of HRV among individuals susceptible to occupational stress can be significant in the early detection of cardiac autonomic dysfunction thereby enabling health care professionals to devise risk-prevention strategies against cardiovascular diseases.

Keywords: Physical activity, Stress, Heart rate variability, HRV, Office workers.

INTRODUCTION

Physical activity (PA) is one of the factors that protects against stress [1]. Compared to other occupations, office workers have a higher chance of being physically inactive at work, and they do not typically engage in compensatory behaviour outside of work[2,3].It is significant to point out that lower levels of physical activity at work have been connected to greater levels of felt stress [4], a significant risk factor for cardiovascular disease, metabolic syndrome, and poor diet [5,6]. The benefits of physical activity may extend to psychological or mental health[7, 8]. People who are in good mental health can function independently while managing daily stresses [9].On the other side, mental health issues have a detrimental effect on social interaction, employment, and quality of life [10]. Stress is considered as the silent disease of the 21st century[11].There is no single cause of stress. In addition to relationships, families, or academic commitments, mental illnesses including burnout, stress, post-traumatic stress disorder, anxiety, and depression can also appear in the healthcare workplace[12].Over the past two decades, the psychological concept of perceived stress has received lots of attention. According to some studies, the PSS's measurement of perceived work-related stress has a big impact on workers' quality of life[13].Heart rate variability (HRV), one of the key indicators of autonomic processes, has a negative correlation with cardiovascular risk factors as inactivity[14].HRV is very useful in studying the cardiovascular response to stress on the body[15].The right amount of hormone release and the balance of the autonomic nerve system determine a person's physical and mental wellness. Any underlying cardio-metabolic disorder changes the course of the body's normal cardiac autonomic functioning, which has consequences for health[16,17,18]. Heart rate variability (HRV) assessment is recognised as an easy, non-invasive, and reliable method to assess cardiac autonomic function (CAF)[19,20] It has been hypothesised that reduced HRV is related to more reported stress[21]. The purpose of the study was to determine how physical activity levels and stress correlated with heart rate variability.

METHODS

The study was a cross-sectional survey design. A total 60($n = 60$) participants were randomly selected from the two office units of Surat-Gujarat, India for the study. The following are the inclusion criteria: office workers (both the gender), age between 30-50 years, working more than 6 months, understanding English language. Participants who had any cardiac-respiratory disease, endocrinal disease, implanted pacemaker were excluded from the study. All participants were informed the purpose of the study and informed consent was obtained. As this study is part of larger research project and the study procedures were approved by the Institution Ethical Committee. Self-administration mode was used to measure physical activity and perceived stress. The IPAQ (International Physical Activity Questionnaire)– short version [22] was used to examine the participant's physical activity levels. The questionnaire consists of 7 questions pertaining to all kinds of physical activity related to job, everyday life and leisure and especially to the time spent on vigorous and moderate activities, on walking and sitting. Weekly physical activity was computed by multiplying time (minutes of given activity in the reported week) by intensity (in MET units) corresponding to that activity. The PSS[23] is the most widely used psychological instrument for measuring the perception of stress. The questions in this scale ask about feelings and thoughts during the last few months. This scale having categories low, moderate and high stress. The HRV parameters were measured using the Polar H10 and the KubiosHRV smart phone application version 1.2.7(24) (iPhone 13 Pro Max). The app has good reliability, Intra-rater

**Vaishali Gabani and Saravanan Murugan**

($\alpha = 0.868$) and Inter-rater ($\alpha = 0.890$) and excellent validity ($r = 0.94$). [24]RMSSD and SDNN were examined in the time domain, while the LF/HF ratio was examined in the frequency domain. All recordings were made in the morning, between 8 am and 12 pm, in a quiet, bright room with a constant, controlled temperature. Each participant remained in supine for 10 minutes prior to the measurement, and they were told to stay calm, breathe properly, refrain from speaking, and avoid sleeping during measurement. Following a 10-minute rest, the participant's chest was fastened with a Polar H10 chest strap that had been moistened with water at the level of the xiphisternum and KubiosHRV smart phone application pair up with the iPhone through the Bluetooth for recording. Before the measurement, there was a 30-second interval of relaxation, and a total of 5 minutes was recorded.

RESULTS

The data were analysed using SPSS version 28. Descriptive statistics with mean and SD were used to assess the continuous variables. For correlation analysis, Pearson's correlation was used. The correlation test's level of significance was set at $p < 0.05$, with a 95% confidence range.

DISCUSSIONS

The present study found no correlation between Physical activity and HRV. RMSSD and SDNN are negatively correlated with stress, while LF/HF is positively correlated. According to study findings, stress and LF/HF ratios are positively correlated, suggesting that when stress levels rise, increase the LF/HF ratios and vice versa. Sympatho-vagal balance is determined by the LF/HF ratio. A low LF/HF ratio reflects parasympathetic dominance. In contrast, a high LF/HF ratio indicates sympathetic dominance, which happens when we engage in fight-or-flight or parasympathetic withdrawal behaviour. Teisala T. (2014) discovered, in contrast to our study's findings, that physical activity, cardio-respiratory fitness, and body composition are associated with HRV-based stress, and the HRV-based approach utilised to assess work-related stress and recovery was related to self-reported burnout symptoms. Another conclusion from the study is that RMSSD and SDNN levels decrease as stress increases, both values are in the time domain, and the SDNN, or standard deviation of the IBI of normal sinus beats, is measured in milliseconds (ms), both SNS and PNS activity contribute to SDNN. The root mean square of successive differences between normal heartbeats (RMSSD). The RMSSD reflects the beat-to-beat variance in HR and is the primary time-domain measure used to estimate the vagally mediated changes reflected in HRV. As stress increases, parasympathetic regulation is reduced, which results in lowering RMSSD values, which are primarily impacted by the PNS. Kemp and colleagues (2010) conducted a meta-analysis of studies evaluating various HRV indices (including time domain, HF, LF, and LF/HF ratio) in order to determine the effect of HRV on depression.

Overall, the results of the meta-analysis showed that depression was connected to lower HF-HRV (RSA) levels and higher LF/HF ratios (i.e., lower HF-HRV), but there was no apparent distinction in LF-HRV between depressed and non-depressed people or in terms of the severity of depression. According to Rottenberg's (2007) reviews, there is a connection between decreased HRV and clinical depression, which is consistent with the theory that HRV is a marker of physiological sensitivity to the environment and reflects an organism's capacity to anticipate, respond to and adapt to stressors and challenges. This study also found that age has a negative correlation with RMSSD ($r = -0.338$, $p = 0.001$) and SDNN ($r = -0.331$, $p = 0.01$), indicating that sympathetic dominance increases with age while parasympathetic control decreases, which is consistent with a number of earlier studies [24, 25, 26, 27]. We found that females had higher RMSSD and SDNN values than males, as well as a lower LF/HF ratio, which indicates more parasympathetic and low sympathetic control in females. In line with previous few studies have indicated that female sex hormones influence autonomic modulation and oestrogen has a facilitating effect on cardiac vagal function [28]. Our finding is in agreement with the findings of Ramaekers et al., where the authors find out that decreased sympathetic activity in women compared to men may explain the protection against cardiovascular disease shown in women. Several prospective studies have shown that impaired HRV predicts the incidence of cardiovascular disease [29, 30]. In our study, majority of the study participants were physically inactive on self-

**Vaishali Gabani and Saravanan Murugan**

administered IPAQ, with moderate level of stress on PSS. Lack of time, home management, family responsibilities, and exhaustion were frequently cited as barriers to physical activity. We all know that relying too heavily on technology—whether for transportation, housework, or other tasks—decreases daily physical activity. India is also expanding in the technological and digital fields, where long periods of inactivity are required, contributing to this trend. We found moderate level of stress which can be attributed to the workplace, workplace competitiveness, and family responsibilities, all of which are accumulating and compromising cardiac health.

CONCLUSION

The study revealed no association between office worker's physical activity and heart rate variability. As per study result majority of the participants were physically inactive which is major health concerns in office workers. To promote health and psychological benefits, people should engage in any regular physical exercise and work to eliminate sedentary behaviour. Since stress and HRV are linked, clinical evaluation of HRV in stressed persons may aid in the early identification of cardiac autonomic dysfunction and hence strengthen risk-reduction tactics for cardiovascular disease.

LIMITATIONS

1. Due to certain reporting bias, the subjective assessment method of the physical activity assessment and perceived stress may have influenced our study outcomes.
2. Future studies, however, might make use of tools like pedometers and accelerometers to quantify PA objectively.
3. HRV is influenced by several confounding factors such as sleep, diet, hormone levels, and metabolic biomarkers, which were not assessed in the present study. However, these results must be confirmed with more robust data in larger prospective studies due to smaller sample size.

ABSTRACT

The study aims to evaluate the effect of applying intracanal cryotherapy on the fracture resistance of teeth that have undergone endodontic treatment with different irrigating solutions. Thirty single rooted teeth with single root canal were selected and randomly divided into groups A & B & C (n=10). The specimens were kept in distilled water at 37°C that simulated mouth temperature during the procedures. The biomechanical preparation of the samples was done till the apical size of 50 and assigned to either of the 3 groups. The surfaces of the specimen were covered with silicone upto 2 mm below Cementoenamel junction to simulate periodontal ligament and immersed in selfcuring resin. The specimens in the cryotherapy group (group C) were irrigated with 20mL sterile cold (2.5°C) saline solution for 5 min, whereas specimens in the control group (Group A) received a sterile saline solution at room temperature and control group (Group B) received 5.25% sodium hypochlorite solution. The fracture resistance of the specimens was tested with a universal testing machine. The statistical analysis was done. The results showed that the cryotherapy specimen group had lower fracture resistance as compared to that of control group specimens. The study concluded that intracanal cryotherapy as a final irrigant reduces the vertical fracture resistance of roots.

Keywords: Cryotherapy, Fracture resistance

INTRODUCTION

Pretreatment pain, the existence of periradicular radiolucency, the state of the pulp and perirapical tissues, and other factors can all contribute to postoperative pain, which can be problematic for both the patient and the surgeon [1-3]. Injuries to the periradicular tissues caused by mechanical, chemical, and/or microbiological means are the main sources of pain following treatment [2,4-6]. Prophylactic medication prescription, long-lasting anaesthesia administration, crown-down preparation, occlusal reduction, and most recently, intracanal cryotherapy, are some of the treatment choices for lessening this pain [4,5,7-10,11]. It has been observed that cryotherapy reduces tissue temperature and extracts heat from the treated tissues, causing vasoconstriction and preventing edoema. Vasoconstriction also prevents the generation of tissue free radicals by inhibiting cellular metabolism, which lowers the oxygen demand of cells. [12,13]. Higher temperatures are said to cause the release of inflammatory enzymes, which exacerbates postoperative discomfort. Additionally, cryotherapy reduces nerves' conducting ability, which lowers the likelihood of postoperative pain. It is evident that variations in temperature affect dentin's mechanical characteristics. It is crucial to understand if intracanal cryotherapy affects the mechanical behaviour of teeth since it is a potentially effective pain management technique with few adverse effects. Thus, the goal of this study was to determine the fracture resistance of endodontically treated teeth by using intracanal cryotherapy as a last irrigant. The null hypothesis states that, independent of the cryotherapy applications, there would be no variation in the specimens' fracture resistances.

MATERIAL AND METHODOLOGY

This present study was conducted by PG student of Department of Conservative Dentistry and Endodontics Rural Dental College, Loni. Thirty single-rooted teeth that were extracted for periodontal reasons were included in this investigation. Excluded teeth included those with partial apices, decay, fractures, unusual anatomical features, and prior endodontic therapy. After being thoroughly cleaned, each tooth was decoronated to a uniform 15 mm length. To keep the specimens from becoming dehydrated until the experiment called for it, they were submerged in distilled water. Using a #10k file, the working length was ascertained, and the crown down approach was employed for biomechanical preparation. The #50 K file was the master apical file. Every time a file was used, copious irrigation was performed using 3% sodium hypochlorite and regular saline. All root canals were irrigated for a minute with a final rinse using 17% EDTA, and then they were dried with sterile paper points. To replicate the periodontal ligament, silicon was applied to the specimens' surface down to two millimetres below the CEJ. After that, the specimens were preserved in self-curing acrylic resin up to two millimetres below the CEJ, and they were given an hour to polymerize. Three groups of ten each—CONTROL GROUP (A), GROUP (B), and EXPERIMENTAL GROUP (C)—were formed from the specimens. Three separate irrigation treatments were applied to the specimens. While the specimens in the control group (Group A) received a sterile saline solution at room temperature and Group B received 5.25% sodium hypochlorite, the specimens in the cryotherapy group (group C) were irrigated with 20 mL of sterile cold (2.5°C) saline solution for five minutes (the saline solution was kept in a calibrated refrigerator at 2.5°C until used). The acrylic part of the specimens, or their base, was stored at 37°C in distilled water. Irrigation was carried out from the exposed 2 mm tooth structure through the aperture during the process. Using a universal testing apparatus, the specimens' fracture resistance was evaluated. The outcomes were statistically analysed.

STATISTICAL ANALYSIS

Independent Sample T-Test showed that the p value is <0.05, hence there is significant difference between groups and we can reject the null hypothesis.

RESULTS

Table shows Comparison of Load at peak, Elongation at peak and Compression strength on fracture resistance in three specimens: The results showed that the specimens in the cryotherapy group had lower fracture resistance as compared to that of specimens in control group.

DISCUSSION

This study sought to determine how intracanal cryotherapy affected endodontically treated teeth's ability to withstand fractures. The study's findings demonstrated that, in comparison to the control group, the specimens in the intracanal cryotherapy group had considerably lower fracture strength values. Temperature variations are one of the causes of mechanical stress in the tooth structure. The temperature differential between the tooth and the medium, the tooth's geometry, the heat transfer coefficient, and the physical characteristics of the tooth, such as age or prior mechanical stress, all affect how much stress is there (16). In particular, tensile stress in enamel and compressive stress in dentin are caused by excessive heat stresses in the tooth structure, and these stresses can further induce structural deformation as soon as one second after exposure (16). Because of the distinct tubular microstructure of the dentin near the pulp space and the absence of enamel structure, applying cold water inside the pulp space may generate excessive thermal stress in the dentin material (13,14, 15). Therefore, we can state that, similar to a coin having two sides, intracanal cryotherapy has a significant drawback in that it negatively affects teeth's mechanical properties by decreasing their resistance to fracture. This is true even though it's an effective technique for managing post-operative pain. All of the specimens included in this study were single-rooted teeth that were chosen and grouped based on similar size. Using the same kinds of tools and methods, the specimens' length was standardised to 15 mm, and the root canals were mechanically extended to the same size. Uncontrollable physiological differences, like as the patient's unknown age or prior dental mechanical stressors, could still affect the outcome, nevertheless.

CONCLUSION

Within the limitations of the present study, it can be concluded that if we use intracanal cryotherapy as a final irrigant, it reduces the vertical fracture resistance of roots.

ABSTRACT

The aim of this study was to investigate the seasonal fluctuations and geographical distribution of organic chemical compounds in Surat City, which is known as the industrial hub of Gujarat. In this study, ambient air samples were obtained from three distinct locations: the Industrial, Urban, and Rural areas of Surat. The collection of these samples was carried out through using a NON-PNS-Combo Sampler. The elemental composition of particulate matter was determined through the utilization of EDAX (Energy dispersive X-ray) analysis. The predominant elements observed in the sample were C, Na, Zn, K, Al, Ti, Ca, S, Cl, Fe, and Mg, as determined from the analysis of the EDAX spectra. Additionally, the organic chemical compounds present in the particulate matter were identified through the utilization of GC-MS techniques. In this investigation, a comprehensive analysis was conducted to identify and quantify organic chemical compounds in various areas of the city. A total of 156 compounds were detected, comprising 127 aliphatic compounds and 29 aromatic compounds. The identification and classification of these compounds were carried out using established analytical techniques. The data obtained from this research provides valuable insights into the composition and distribution of organic chemicals in different regions of the city. During the investigation, a significant abundance of chemical compounds was observed in the post-monsoon season.

INTRODUCTION

The phenomenon of air pollution presents a significant challenge for the global population, as it is known to have a diverse range of adverse effects on human health[1,2]. The ongoing process of urbanisation and industrialization has been observed to have a significant impact on the formation of highly populated urban regions that have poor air quality[3,4]. In developing nations, where there are huge economic and social differences, people may also be exposed to high concentrations of indoor air pollution because of the use of biomass fuels (coal, wood, and other solid fuels) as a source of energy, especially in rural areas [5,6]. The issue of outdoor air pollution has frequently been identified as a significant concern in urban areas [7]. In the developing world, a million of people premature mortality due to outdoor air pollution, primarily attributed to particulate matter (PM_{2.5}). Recent epidemiological research has yielded compelling evidence indicating that the presence of heavy metals within airborne particles creates a significant risk to human health [8,9,10]. According to a study conducted by the World Health Organisation [11], it was found that in 2012, ambient air pollution was responsible for an estimated seven million deaths. This alarming figure accounted for over 10% of all deaths caused by air pollution during that year. Previous studies have provided evidence that air pollution is an important factor in different types of health problems. It has been found that air pollution contributes to 9% of lung cancer deaths worldwide. Additionally, it is associated with 17% of deaths caused by chronic obstructive pulmonary disease.

Moreover, air pollution is responsible for over 30% of deaths resulting from ischemic heart disease and stroke. Furthermore, it has been observed that air pollution contributes to 9% of deaths caused by respiratory infections. Atmospheric fine particles have been found to contain a different group of contaminants, including heavy metals, various microbes, and other organic compounds [12,13,14,15,16,17,18,19]. Respiration creates a pathway for the entry of particulate matter into the human body, potentially leading to various adverse health effects, including teratogenicity, mutagenicity, and carcinogenicity[20,21]. Organic compounds, containing an important portion of particulate matter (PM), are generated by both natural and anthropogenic sources. These sources include fossil fuel combustion, biomass combustion, plastic combustion, secondary organic transformations, and marine sources[22]. However, the organic composition of aerosol particles encompasses various compounds such as alkanes, alkenes, alkanolic acids, aromatic hydrocarbons, aromatic acids, and plasticizers. These compounds act as tracers for volatile and organic chemical substances, playing a role in their source, transit, and receptor dynamics[23]. Recent studies have indicated that metallurgical activities have the potential to release a significant number of elements into the atmosphere. These elements include silicon (Si), carbon (C), oxygen (O), chlorine (Cl), sodium (Na), aluminium (Al), potassium (K), calcium (Ca), titanium (Ti), zinc (Zn), and copper (Cu). These such elements emissions may have connections to various sources such as vehicle emissions, as well as both anthropogenic and natural origins of trace elements[24,25]. [26] Studied the occurrence and distribution of organic pollutants in Gujarat state and reported that their bioaccumulation can cause severe toxicity to human health. The current research focuses around an examination of diverse aliphatic (including alkanes, alkenes, and N-alkanoic acids) and aromatic (such as aromatic acids, polycyclic aromatic hydrocarbons (PAHs), simple aromatics, and plasticizers) chemical compounds present in the ambient air across various study locations.

MATERIALS & METHODOLOGY

Study Area

Surat (21.1702° N and 72.8311° E), is a hold the honour being the second-largest city in Gujarat and has become known as the world's largest diamond-producing centre. The city is renowned for its diverse industries, including textiles, chemicals, dyeing and printing, zari production, manufacturing, and machine and equipment production. Additionally, the city is strategically situated along the Tapi River. The sampling procedure was conducted within three distinct sectors (Fig.1). In this study, we examine two distinct geographical locations: (1) Industrial area (S1) - 21.0931° N, 72.8575° E (2) Urban area (S2) - 21.2469° N, 72.8515° E (3) Rural area (S3) - 21.1014° N, 73.0361° E. These locations have been chosen for their contrasting characteristics and will serve as the focal points of our research. By analysing these areas, we aim to gain insights into the various aspects that differentiate industrial and urban environments. In order to assess the levels of pollutants in various regions of the city. The objective of this research was to determine the current status of pollutants generated in different parts of the city.

Collection Air Sample

In this study, samples of Atmospheric Particulate Matter (PM_{2.5}) were collected by utilising a NON-PNS-Combo Sampler from three distinct locations during the monsoon, pre-monsoon, and post monsoon seasons. The collection of particulate matter samples was conducted using a micro-Glass Fibre Filter (GFF) 47 mm and the collection of PM_{2.5} samples was done with a flow rate of 16.7 L/min over a duration of 24 hours. The particles concentration was determined using the gravimetric technique. In order to remove organic contaminants, a pre-baking process was conducted on the filters at a temperature of 100°C for a duration of 1 hour prior to their exposure [27]. The net mass concentration was determined by weighing each filter paper twice, both before and after sampling. The PM_{2.5} filter papers were stored in a container made of polypropylene (PP) material, which is commonly used for its durability and resistance to chemical degradation. To ensure the filter papers protection from external factors, such as light and moisture, they were carefully wrapped in aluminium foil. This packaging method helps to maintain the integrity and effectiveness of the filters during storage. To prevent the loss of volatile components, the samples were stored at a temperature of 4°C in a refrigerator until they were ready for further analysis [28]. Measurement of meteorological parameters like Temperature, Wind speed, Light intensity, and Relative Humidity was carried out with the help of 4 in 1 Instrument (Anemometer, Humidity meter, Light meter, and Thermometer) Model: LM-8100.

Determination of Organic Chemical compound and elemental composition

The quantification of the morphological and elemental composition was performed on the filter paper using Energy Dispersive X-ray Analysis (EDAX) technique. This analysis was conducted at the Sophisticated Instrumentation Centre for Applied Research and Testing (SICART), Vallabh Vidyanagar, Anand.

Extraction of Organic Compound

The PM_{2.5} filter papers (Particles) were transferred to 15 ml PP tubes for further analysis after being allowed to cool at room temperature. The solvent mixture consisting of Methanol and Dichloromethane (DCM) in a 1:1 ratio was used. However, some modifications were made to the solvent composition [29]. In the process of extracting the desired compounds, a volume of 2 ml of solvent was added to a

Himalay Bhakhar *et al.*,

polypropylene (PP) tube, followed by ultrasonication (Sonicator, USA) at 50% frequency for 15 minutes. The sample tubes were thoroughly mixed using a Vortexer for a duration of 1 minute. Following the mixing step, the tubes were placed under centrifugation for a period of 5 minutes. This centrifugation process allowed for the separation of the supernatant from the rest of the sample. The obtained supernatant was carefully transferred to new polypropylene (PP) tubes and transfer step was repeated twice in order to accumulate a total volume of 6 ml of extract. The evaporation of the extract was conducted by putting it to a hot water bath, with a volume of up to 1 ml. Afterwards, the evaporated extract was stored in a refrigerator until the analysis[30]. To determine the presence of organic contaminants, the extract was submitted to analysis using a Gas Chromatography-Mass Spectrometry (GCMS) technique.

RESULTS & DISCUSSIONS

The concentration of Particulate Matter (PM) has been identified as an important indicator of air quality conditions. According to the data presented in **(Table 1)**, the maximum concentration of $PM_{2.5}$ was observed to be $164.96 (\mu\text{g}/\text{m}^3)$, $161.96 (\mu\text{g}/\text{m}^3)$, and $77.48 (\mu\text{g}/\text{m}^3)$ during the post-monsoon, Pre-monsoon, and Monsoon seasons, respectively, in the Industrial area. The analysis of all the samples indicated concentrations that exceeded the acceptable limit set by the National Ambient Air Quality Standards (NAAQS). The observed rise in particulate matter concentrations at the selected sampling locations may be attributed to a combination of climatic factors and anthropogenic emissions originating from various local sources including industrial activities, vehicle exhaust emissions, waste incineration, and the combustion of fossil fuels[20].

Elemental Concentration

To understand the distribution process of pollutants, it is essential to analyse EDAX-spectra, which can provide valuable information on vehicular pollution. The concentration of elements in the Industrial area (S1) was determined and found to be in the following order: silicon (Si) > carbon (C) > sodium (Na) > zinc (Zn) > potassium (K) > aluminium (Al) > calcium (Ca) > sulphur (S) > chlorine (Cl) > iron (Fe) > magnesium (Mg) **(Fig. 2)**. In the urban area, the concentration of elements (%) was found to be in the following order: Si > C > Na > Zn > K > Al > Ca > S > Fe > Mg > Cl **(Fig.3)** and in the rural area (S3), the recorded concentration of elements (%) exhibited the following sequence: C > Si > Na > Cl > Zn > K > Al > S > Ca > Fe > Mg **(Fig.4)**. Throughout all three seasons, the dominant elements observed in all sites were Si, C, and O. The presence of biological particles in the atmosphere, including microorganisms and various fragments of living matter such as viruses, bacteria, fungal spores, pollen, plant debris, and animal matter, has been observed in relation to carbon (C). In addition, it is hypothesised that the elevated levels of C can be attributed to the emissions from vehicles. The origin of pure Si can be attributed to both natural and anthropogenic factors [28]. Silica is a significant component in various construction materials, including cement, glass, bricks, clay, pottery, and other similar substances. The origin of these particles might be attributed to both building construction and demolition activities. In the analysed sample, only minute quantities of additional essential tracers, including iron (Fe), aluminium (Al), chlorine (Cl), magnesium (Mg), calcium (Ca), sulphur (S), potassium (K), zinc (Zn), and sodium (Na), were detected[31, 32, 33, 34, 35, 36, 37].

Himalay Bhakhar et al.,

Qualitative analysis of Organic chemical compounds

The analysis of filter paper using gas chromatography-mass spectrometry (GC-MS) demonstrated the presence of 156 organic chemical compounds within the PM_{2.5} size fraction. A total of 127 compounds were identified as aliphatic compounds, while 29 compounds were identified as aromatic compounds.

Total aliphatic hydrocarbon (TAHs)

The increase in aliphatic compounds can be attributed to the incomplete combustion of fossil fuels, petroleum wastes, and wood combustion, as well as road crustal emissions. The possible contribution of ceramic dust as an important source of n-alkanes during in the winter season [38]. Out 127 aliphatic compounds, it was observed that 100 of these compounds were categorised as n-alkanes, which encompassed both short-chain and long-chain variants ranging from C₆ to C₅₄. Additionally, the remaining 27 compounds were identified as n-alkanoic acids. The total number of short-chain alkanes, specifically those with carbon chain lengths equal to or less than 26 ($C_n \leq C_{26}$), was found to be 113. These alkanes are primarily sourced from anthropogenic activities and the input of fossil fuels. This contribution from anthropogenic and fossil fuel sources plays a significant role in the production of short-chain n-alkanes [39]. These organic compounds are classified into four distinct categories, each representing a specific range of peak heights. In the atmospheric composition, a number of alkane compounds were found to be dominant. These compounds include [Hexacosane], [Heptadecane, 2,6,10,15-tetramethyl-], [Eicosane], [Hexadecane], [Heneicosane] were dominant in the atmosphere (**Table 2**). Alkanoic acid such as [Hexadecanoic acid, 2-hydroxy-1-(hydroxymethyl)ethyl ester], [Heptacosanoic acid, methyl ester], [Decanedioic acid, bis(2-ethylhexyl) ester], [Eicosanoic acid] and [Sulfurous acid, hexyl octyl ester] were predominant in the atmosphere. During the pre-monsoon season in the Industrial area, a higher concentration of short-chain alkane was observed. The levels of long chain alkanes and N-alkanoic acid exhibited variations across different seasons, with higher concentrations observed in the post-monsoon season, followed by the monsoon and pre-monsoon seasons. The levels of long chain alkanes and N-alkanoic acid exhibited variations across different seasons, with higher concentrations observed in the post-monsoon season, followed by the monsoon and pre-monsoon seasons (**Fig. 5**). The number of n-alkane compounds varied across different areas, with the Industrial area having the highest count, followed by the Urban area, and the Rural area. This trend was consistent across all three seasons (**Fig. 6&7**).

Total aromatic hydrocarbons

A total of 29 aromatic compounds belonging to various groups, such as polycyclic aromatic hydrocarbons (PAHs), aromatic acids, and plasticizers were effectively detected and characterised. These findings provide useful perspectives into the presence and composition of aromatic compounds in the atmosphere. The compound shows a low level of water solubility, along with melting and boiling points, as well as a considerably reduced vapour pressure. In the atmosphere, the presence of phenol, specifically [2,4-bis(1,1-dimethylethyl)-phenol, phosphite], [Phthalic acid, bis(7-methyloctyl) ester], [Silane, cyclohexyl dimethoxy methyl], [Tris(2,4-di-tert-butylphenyl) phosphate] and [Bis(2-ethylhexyl) phthalate] was detected with high peak heights, indicating their abundance. In the extracted sample, the presence of aromatic acids such as [Benzenepropanoic acid [3,5-bis(1,1-dimethylethyl)-4-hydroxy-, methyl ester], [1,3-Benzenedicarboxylic acid, bis(2-ethylhexyl) and [1H-Imidazole, 4,5-dihydro-2-(phenylmethyl)] was observed. In numerous studies, researchers have consistently identified [Phthalic acid, bis(7-methyloctyl) ester], [Bis(2-ethylhexyl) phthalate] and [Di-n-octyl phthalate] as the plasticizers that are most prevalent and normally detected. In the different areas of study, the arrangement of aromatic compounds is

**Himalay Bhakhar et al.,**

categorised as follows: Simple aromatics > Polycyclic aromatic hydrocarbons (PAHs) > Aromatic acids > plasticizers. A greater number of Simple aromatics was observed in every site, during all seasons. The industrial area contains maximum number of Aromatic acids (**Fig. 5**). The number of PAHs compounds was maximum in the urban area (**Fig.6**). In conducting a comparative analysis between the rural, industrial, and urban areas, it was observed that all the compounds in the rural region showed lower levels in comparison to their other areas (**Fig. 7**). Due to the incomplete combustion of organic materials which releases polycyclic aromatic hydrocarbons, from home heating, coal gasification, liquefying plants, coal-tar pitch and asphalt manufacture, and coke aluminium production are the main anthropogenic sources[26].

CONCLUSION

During the winter season, the vertical movement of winds suffers as a result of pressure variations, which may be caused by high pressure at ground level. Therefore, pollutants tend to accumulate and remain concentrated at the surface for extended periods, leading to higher levels of pollution. The investigation of the elemental composition of atmospheric particles was conducted using the Energy Dispersive X-ray Analysis (EDAX) system. The findings of the study indicate that the composition of airborne particles primarily consisted of elements such as silicon (Si), carbon (C), sodium (Na), zinc (Zn), potassium (K), aluminium (Al), calcium (Ca), sulphur (S), chlorine (Cl), iron (Fe), and magnesium (Mg). These particles were found to originate from both natural sources and human-induced activities. The organic chemical analysis was conducted using a Gas Chromatography-Mass Spectrometry (GC-MS) instrument. The obtained data was organised according to indices scale, which was determined based on the percentage of peak height (%) of the particulate matter. A total of 156 organic chemical compounds were identified and quantified in the three designated study locations in Surat. These compounds exhibited a varied distribution pattern across the study areas. The present study aims to present crucial findings regarding the occurrence and spatial dispersion patterns of organic compounds in ambient air. During the course of this research, the presence of [Phenol, 2,4-bis(1,1-dimethylethyl)-, phosphite], [1-Monopalmitin, 2TMS derivative], [Octadecane, 1-iodo], [Hexadecane] and [Octadecane, 5-methyl] was consistently observed and these types of compounds came from various anthropogenic activity like Diesel engine, Tobacco smoke, biomass combustion etc. Specifically, the compounds Phenol, 2,4-bis(1,1-dimethylethyl) phosphite were found to be common across all sites and throughout all three seasons. These compounds are derived from naturally occurring substances that are known to serve a variety of purposes in food, medicine, and agriculture.

ABSTRACT

This review focuses on the transformative impact of nanotechnology on pharmaceutical analysis. It highlights how nanotechnology improves the sensitivity, specificity, and speed of analytical methods, leading to more accurate and detailed insights into drug properties, quality, and safety. By manipulating matter at the nanoscale, nanotechnology enables the development of novel analytical tools and techniques, such as Nano sensors and nanoparticles, enhancing drug purity analysis, delivery, and real-time monitoring. The article emphasizes nanotechnology's pivotal role in advancing pharmaceutical sciences, ensuring safer and more effective therapeutic agents.

Keywords: Nanotechnology, Pharmaceutical Analysis, Nanoparticles, Nano sensors, Drug Delivery.

INTRODUCTION

Definition and scope of nanotechnology in pharmaceutical analysis

Nanotechnology, a field that manipulates matter at the nanometer scale (1 to 100 nm), is increasingly pivotal in pharmaceutical analysis. This domain leverages the unique properties of nanomaterials, which differ significantly from their bulk counterparts, to enhance the sensitivity, specificity, and speed of analytical methods used in pharmaceutical sciences. Nanotechnology's scope in pharmaceutical analysis is broad, encompassing the development of innovative techniques for drug characterization, quality control, and safety assessment.[1] At the nanoscale, materials exhibit distinct physical, chemical, and biological properties, such as increased surface area-to-volume ratio, quantum effects, and enhanced reactivity. These properties are harnessed in pharmaceutical analysis to achieve more sensitive detection limits, improved analytical throughput, and the ability to conduct analyses in complex biological matrices where conventional methods might falter. For instance, nanoparticles can be engineered to target specific molecules or cellular structures, facilitating the precise detection and quantification of drugs, their metabolites, and impurities.[2] Nanotechnology enables the miniaturization of analytical devices, leading to the development of portable, field-deployable diagnostic tools that can provide rapid and on-site analysis, crucial for point-of-care testing and real-time monitoring of therapeutic drug levels. Nanotechnology also contributes to the advancement of non-invasive techniques for monitoring drug release and distribution *in vivo*, offering a clearer understanding of a drug's pharmacokinetics and pharmacodynamics.[3] Nanotechnology in pharmaceutical analysis represents a frontier in the precise, accurate, and efficient measurement of pharmaceutical substances. Its integration into pharmaceutical sciences not only enhances the capabilities of traditional analytical methods but also paves the way for novel approaches in the detection, quantification, and monitoring of pharmaceutical compounds, thereby playing a critical role in the development of safer, more effective therapeutic agents.[4]

Overview of the transformative impact of nanotechnology on the methodologies and capabilities of pharmaceutical analysis

Nanotechnology has fundamentally transformed pharmaceutical analysis, introducing methodologies that provide unprecedented precision, sensitivity, and efficiency. By manipulating materials at the nanoscale, researchers have unlocked new capabilities that surpass the limitations of conventional analytical techniques. Nanotechnology's impact on pharmaceutical analysis is profound, influencing drug discovery, formulation, delivery, and monitoring, thereby ensuring enhanced therapeutic efficacy and safety.[5] One of the most significant advancements brought about by nanotechnology is the enhanced sensitivity and specificity in the detection of pharmaceuticals. Nanoparticles, with their large surface area-to-volume ratio, offer increased reactive sites for analyte interaction, facilitating the detection of substances at extremely low concentrations. This is crucial for identifying trace impurities and metabolites that could influence drug safety and efficacy.[6] Moreover, nanotechnology has enabled the development of novel drug delivery and release monitoring methods. For instance, nanoscale carriers can be designed to release drugs in a controlled manner, and their distribution and degradation can be tracked in real time, providing invaluable data on the pharmacokinetics and pharmacodynamics of therapeutics. This not only aids in optimizing drug formulations but also enhances personalized medicine approaches by allowing real-time adjustments to dosages.[7] In addition to enhancing existing analytical methods, nanotechnology has paved the way for the invention of innovative techniques. Nanosensors, for example, offer the capability for rapid, on-site analysis of biological samples, which is vital for point-of-care diagnostics and monitoring therapeutic drug levels in patients. The integration of nanotechnology in pharmaceutical analysis has also led to the miniaturization of analytical equipment, making sophisticated analyses more accessible and cost-effective.[8] Nanotechnology has revolutionized pharmaceutical analysis by enhancing the capabilities of analytical methodologies, thereby improving the precision, efficiency, and applicability of pharmaceutical testing. This transformation is pivotal in advancing drug development and ensuring patient safety, underscoring the essential role of nanotechnology in the future of pharmaceutical sciences.[9]

Foundational Concepts of Nanotechnology

Basic principles of nanotechnology, focusing on the nanoscale (1 to 100 nm) and its significance in pharmaceuticals

Nanotechnology, centered on engineering and manipulating materials at the nanoscale, typically within the range of 1 to 100 nanometers (nm), embodies a significant shift in scientific approach and technological capabilities. At this scale, materials exhibit unique properties that are not present at the macro or microscale, fundamentally due to the quantum effects and increased surface area-to-volume ratio. These distinctive features have substantial implications in the field of pharmaceuticals, offering innovative solutions and enhancing the efficacy and safety of therapeutic interventions.[10] The quantum effects observed at the nanoscale influence the optical, electrical, and magnetic properties of materials, which can be harnessed to develop more sensitive diagnostic tools and targeted drug delivery systems. For example, the optical properties of gold nanoparticles change with their size, allowing them to be used for precise imaging and targeting in cancer therapy. The increased surface area-to-volume ratio enhances the reactivity of nanoparticles, enabling more efficient interactions with biological molecules. This property is pivotal in designing drug delivery systems that can interact specifically with targeted cells or tissues, thereby reducing side effects and improving therapeutic outcomes.[11] In pharmaceuticals, the nanoscale offers a platform for engineering drug particles to improve solubility, stability, and bioavailability. Nanoparticles can be designed to cross biological barriers, such as the blood-brain barrier, that are typically impermeable to conventional drug molecules, opening new avenues for treating neurological disorders. Moreover, the ability to tailor the surface chemistry of nanoparticles allows for the conjugation of specific ligands, facilitating targeted drug delivery and controlled release mechanisms.[12] The fundamental principles of nanotechnology provide a versatile toolkit for enhancing drug formulation, delivery, analysis, and monitoring, thereby playing a crucial role in the advancement of pharmaceutical sciences. Through the manipulation of matter at the nanoscale, nanotechnology offers the potential to revolutionize medical treatments and improve patient outcomes significantly.[13]

Overview of the key physical and chemical properties of nanomaterials that are exploited in pharmaceutical analysis

Nanomaterials, with their distinct physical and chemical properties at the nanoscale, offer unique advantages in pharmaceutical analysis. These properties, which differ significantly from those of bulk materials, are pivotal in enhancing the sensitivity, specificity, and efficiency of analytical methods.[14] One of the key physical properties of nanomaterials is their size, which falls within the range of 1 to 100 nanometers. This small size results in a high surface area-to-volume ratio, increasing the reactive surface available for interactions with analytes. This property is particularly beneficial in enhancing the sensitivity of detection methods, as more molecules can interact with the surface of the nanomaterial, leading to a more pronounced analytical signal.[15] The size of nanomaterials also influences their quantum properties, which can be exploited in pharmaceutical analysis. For example, quantum dots have size-dependent optical properties that can be utilized for highly sensitive fluorescence-based detection methods. These quantum effects enable the tuning of nanomaterials for specific applications, providing versatility in their analytical use.[16] Chemically, nanomaterials can exhibit enhanced reactivity due to their increased surface energy compared to bulk materials. This enhanced reactivity can be harnessed for more effective catalysis in biochemical reactions, potentially reducing the time and improving the efficiency of analytical assays.[17] Additionally, the surface of nanomaterials can be modified with various functional groups, allowing for the customization of their chemical properties. This functionalization can be designed to promote specific interactions with target molecules, enhancing the selectivity of analytical methods. For example, nanoparticles can be functionalized with ligands that bind selectively to a drug or metabolite, facilitating its precise detection and quantification in complex biological matrices.[18] The unique physical and chemical properties of nanomaterials at the nanoscale are critically leveraged in pharmaceutical analysis, offering advancements in the sensitivity, specificity, and versatility of analytical techniques. These properties facilitate the development of innovative approaches to detecting, quantifying, and monitoring pharmaceutical compounds, contributing significantly to the field's progress.[19]

Nanomaterials in Pharmaceutical Analysis

Types of Nanomaterials

Description of various nanomaterials used, such as metallic nanoparticles, quantum dots, dendrimers, and carbon nanotubes, detailing their unique properties and advantages

Nanomaterials, with their diverse structures and compositions, play a pivotal role in enhancing the field of pharmaceutical analysis. Each class of nanomaterials, including metallic nanoparticles, quantum dots, dendrimers, and carbon nanotubes, offers unique properties and advantages.[20]

Metallic Nanoparticles

These nanoparticles, made from metals like gold and silver, exhibit exceptional optical properties due to their surface plasmon resonance. This characteristic is exploited in various analytical techniques, such as surface-enhanced Raman spectroscopy (SERS), providing enhanced sensitivity for detecting trace amounts of pharmaceutical substances. Moreover, the ease of functionalization of metallic nanoparticles allows for targeted binding to specific analytes, improving the specificity of detection methods.[21]

Quantum Dots

Quantum dots are semiconductor nanoparticles that have size-dependent optical and electronic properties, a phenomenon attributable to the quantum confinement effect. Their tunable fluorescence emission, based on size, enables multiplexed analysis, where different sized quantum dots can be used simultaneously to detect multiple targets. Quantum dots' high photostability is advantageous for long-term imaging applications in pharmaceutical analysis.[22]

Dendrimers

These are highly branched, tree-like polymers with a well-defined, monodisperse structure, offering numerous terminal functional groups that can be modified for specific interactions with pharmaceutical targets. Their size, shape, and surface functionality can be precisely controlled, making dendrimers versatile carriers for drugs and probes in analytical applications, enhancing solubility and stability of pharmaceutical agents.[23]

Carbon Nanotubes (CNTs)

CNTs are cylindrical structures with unique mechanical, thermal, and electrical properties. Their high aspect ratio and surface area make them excellent candidates for adsorption-based separation and detection techniques in pharmaceutical analysis. Functionalized CNTs can offer selectivity towards specific analytes, and their conductive properties are utilized in electrochemical sensors, providing sensitive and rapid analysis.[24] These nanomaterials, with their distinct and tunable properties, significantly contribute to advancing the methodologies in pharmaceutical analysis, offering enhanced detection, specificity, and multifunctionality in various analytical applications.

Synthesis and Functionalization

Discussion on synthesis methods of nanomaterials and their functionalization to enhance biocompatibility and specificity in pharmaceutical analysis.

The synthesis and functionalization of nanomaterials are critical steps that define their applicability in pharmaceutical analysis, influencing their biocompatibility and specificity. Various synthesis methods have been developed to tailor the size, shape, and surface properties of nanomaterials, while functionalization strategies are employed to enhance their interaction with biological systems and target analytes.[25]

Synthesis Methods:[26]

1. **Top-down approaches:** These involve breaking down larger pieces of material into nanoscale particles through methods like ball milling or lithography. While these methods are straightforward, controlling the size and shape of the nanoparticles can be challenging.

Shaik Mohammad Khifayathulla *et al.*,

2. **Bottom-up approaches:** These involve assembling atoms or molecules into nanoscale structures through chemical or biological processes, such as chemical reduction, sol-gel synthesis, or biological synthesis using microorganisms or plant extracts. Bottom-up methods are more favored for their ability to precisely control the nanoparticle's size, shape, and crystallinity.

Functionalization Strategies:[27]

1. **Surface modification:** To enhance biocompatibility and specificity, the surface of nanomaterials can be modified with various molecules, such as polymers, peptides, or antibodies. For instance, polyethylene glycol (PEG) is commonly used to enhance biocompatibility and circulation time in the bloodstream by providing a 'stealth' characteristic to nanoparticles.
2. **Ligand attachment:** Specific ligands can be attached to the surface of nanoparticles to target and bind to particular molecules or cells. This specificity is crucial for applications like targeted drug delivery or specific detection of biomarkers in pharmaceutical analysis.
3. **Encapsulation:** Nanomaterials can be used to encapsulate drugs, protecting them from degradation and controlling their release. This encapsulation can be tailored by modifying the surface properties of the nanomaterial, affecting the interaction with the drug and the surrounding biological environment. By carefully designing the synthesis and functionalization of nanomaterials, researchers can produce nanoparticles that are not only biocompatible but also highly specific to their target analytes, significantly enhancing the capabilities of pharmaceutical analysis.

Technological Advances in Nanotechnology for Pharmaceutical Analysis

Nano-Enabled Analytical Techniques

Exploration of how nanotechnology enhances traditional analytical techniques like chromatography, mass spectrometry, and spectroscopy

Nanotechnology significantly enhances the capabilities of traditional analytical techniques such as chromatography, mass spectrometry, and spectroscopy, by improving sensitivity, selectivity, and resolution.

Chromatography

Nanomaterials have been integrated into chromatographic techniques, where they serve as advanced stationary phases in liquid chromatography (LC) or as sorbents in gas chromatography (GC). For instance, nanoparticles improve the separation efficiency due to their high surface area and unique interactions with analytes. Carbon nanotubes and silica nanoparticles, when used as stationary phases, offer enhanced chromatographic resolution and faster analysis times, facilitating the separation of complex mixtures and the detection of low-abundance compounds in pharmaceutical samples.[28]

Mass Spectrometry

In mass spectrometry (MS), nanotechnology has been employed to develop novel ionization techniques, such as nano-electrospray ionization (nano-ESI), which offers improved sensitivity and reduced sample consumption. Nanoparticles also play a crucial role in matrix-assisted laser desorption/ionization (MALDI) MS, where they can act as matrix materials to enhance ionization efficiency, reduce background noise, and facilitate the analysis of large biomolecules, improving the characterization of pharmaceutical compounds and their metabolites.[29]

Spectroscopy

Nanotechnology enhances spectroscopic methods by increasing the interaction between light and matter. In surface-enhanced Raman spectroscopy (SERS), for example, metallic nanoparticles enhance the Raman signal of molecules adsorbed on their surface, allowing for the detection of trace amounts of pharmaceutical substances. Similarly, in fluorescence spectroscopy, quantum dots are used as fluorescent probes, offering superior brightness and photostability compared to conventional dyes, which is advantageous for long-term imaging and quantitative analysis in pharmaceutical research.[30] The integration of nanotechnology into traditional analytical techniques offers profound improvements in pharmaceutical analysis, enabling more precise, sensitive, and rapid

**Shaik Mohammad Khifayathulla et al.,**

characterization and quantification of pharmaceuticals, which is essential for drug development, quality control, and safety monitoring.

Nanoparticle-Enhanced Sensitivity

In-depth look at how nanoparticles increase the sensitivity and limit of detection in pharmaceutical analysis

Nanoparticles play a pivotal role in enhancing the sensitivity and detection limits in pharmaceutical analysis due to their unique physical and chemical properties at the nanoscale. Their small size and high surface area-to-volume ratio provide a larger surface for interaction with analytes, facilitating greater sensitivity in detecting low concentrations of pharmaceutical substances. The application of nanoparticles in analytical techniques like chromatography, mass spectrometry, and spectroscopy significantly improves the limit of detection (LOD). For example, in chromatographic methods, nanoparticles can serve as stationary phases with increased surface area, leading to better separation and more effective interaction with analytes, which enhances signal detection and reduces LOD.[31] In mass spectrometry, nanoparticles like those used in nano-electrospray ionization (nano-ESI) enhance ionization efficiency, allowing for the detection of molecules at lower concentrations. This is crucial for identifying trace impurities or metabolites in pharmaceutical products, ensuring their safety and efficacy.[32] Surface-enhanced Raman spectroscopy (SERS) is another technique where nanoparticles, particularly metallic ones, create "hot spots" that significantly amplify the Raman signal. This enhancement enables the detection of pharmaceutical compounds at concentrations that were previously undetectable, offering a powerful tool for analyzing complex biological matrices and studying drug interactions at the molecular level.[33] Furthermore, nanoparticles can be engineered to have specific affinities for target analytes, enhancing the selectivity of detection methods. By attaching specific ligands or antibodies to nanoparticles, analysts can target specific drugs or metabolites, which improves the specificity of the detection and quantification process, minimizing interference from other substances.[34] Nanoparticles enhance the sensitivity and detection limits in pharmaceutical analysis by providing a larger reactive surface area, improving ionization efficiency, amplifying detection signals, and enabling targeted analysis, thus playing a crucial role in the accurate and precise quantification of pharmaceutical compounds.

Applications of Nanotechnology in Pharmaceutical Analysis:

Drug Purity and Composition Analysis:

Detailed discussion on using nanotechnology for assessing drug purity, identifying impurities, and determining composition

Nanotechnology plays a pivotal role in advancing the methodologies for assessing drug purity, identifying impurities, and determining the composition of pharmaceuticals. Utilizing the unique properties of nanoscale materials, nanotechnology enhances the sensitivity, specificity, and speed of analytical processes, thereby providing more accurate and detailed insights into the quality of pharmaceutical products.

Assessing Drug Purity

Nanotechnology-based methods, particularly those employing nanoparticles and nanosensors, offer enhanced detection capabilities for analyzing drug purity. Metallic nanoparticles, for instance, can enhance the signal in spectroscopic methods, making it possible to detect even trace amounts of impurities that conventional methods might miss. Quantum dots, with their size-tunable fluorescence, can be used to tag specific drug molecules in a mixture, allowing for the precise quantification of the active pharmaceutical ingredient (API) and the detection of unwanted by-products or contaminants.[35]

Identifying Impurities

The high surface area-to-volume ratio of nanomaterials facilitates greater interaction with analytes, enabling the detection of low-concentration impurities. Nanoparticles functionalized with specific ligands can selectively bind to impurities, allowing for their identification and quantification through techniques like nanoparticle-enhanced spectroscopy or chromatography. This capability is crucial for ensuring the safety and efficacy of pharmaceuticals, as even minute amounts of impurities can significantly affect drug behavior and patient safety.[36]

Determining Composition

Nanotechnology aids in the comprehensive analysis of pharmaceutical compositions, including the identification of all constituents and their concentrations. Nanoscale analytical tools can dissect complex formulations, providing detailed insights into the interactions between different components. For instance, nanotechnology-enhanced mass spectrometry can elucidate the molecular structure and composition of drugs, offering a deeper understanding of their pharmacological properties.[37] Nanotechnology significantly augments the analytical tools available for pharmaceutical analysis, enabling more thorough and precise assessments of drug purity, impurity identification, and composition determination. This technological advancement is essential for the development, regulation, and quality control of pharmaceutical products, ensuring their safety and effectiveness.

Drug Delivery System Analysis

Examination of how nanotechnology aids in analyzing and optimizing drug delivery systems, including nanoparticle-based drug carriers

Nanotechnology plays a critical role in the analysis and optimization of drug delivery systems, particularly through the use of nanoparticle-based carriers. These nanoscale carriers offer unique advantages in delivering therapeutic agents effectively to the target site while minimizing systemic side effects and improving pharmacokinetic profiles.

Analyzing Drug Delivery Systems

Nanotechnology enables the detailed characterization of drug delivery vehicles, including their size, charge, surface properties, and drug encapsulation efficiency. Techniques such as dynamic light scattering (DLS) and transmission electron microscopy (TEM) are employed to analyze the physical attributes of nanoparticle carriers, while spectroscopic methods assess their chemical composition and stability. This comprehensive analysis is crucial for understanding how these properties influence the interaction of nanoparticles with biological systems, determining their biodistribution, cellular uptake, and eventual drug release profile.[38]

Optimizing Drug Delivery

Nanoparticle-based carriers can be engineered to optimize drug release kinetics, targeting capabilities, and biodegradability. By adjusting the size, surface chemistry, or composition of nanoparticles, researchers can tailor the drug release rate to achieve sustained or controlled release, enhancing therapeutic efficacy. Functionalization of nanoparticle surfaces with targeting ligands or antibodies allows for the specific binding to cell receptors or diseased tissues, enabling targeted drug delivery that reduces off-target effects and improves therapeutic outcomes.[39]

Evaluating In Vivo Performance

Nanotechnology facilitates the in vivo evaluation of drug delivery systems through imaging and tracking techniques. Nanoparticles can be labeled with fluorescent markers or radioisotopes, allowing researchers to monitor their biodistribution, accumulation at the target site, and clearance from the body using various imaging modalities. This real-time tracking provides invaluable insights into the performance of drug delivery systems, guiding the optimization of nanoparticle design for enhanced efficacy and safety.[40] Nanotechnology significantly contributes to the advancement of drug delivery systems, providing the tools and methodologies for detailed analysis and optimization. Through the design and functionalization of nanoparticle-based carriers, nanotechnology enables more precise, effective, and safe delivery of therapeutic agents, marking a significant step forward in the field of pharmaceutical sciences.

Bioavailability and Pharmacokinetics

Insight into how nanotechnology is used to study the bioavailability and pharmacokinetics of drugs

Nanotechnology offers innovative approaches to studying the bioavailability and pharmacokinetics of drugs, providing insights that are crucial for optimizing therapeutic efficacy and safety. By utilizing nanoscale materials and tools, researchers can gain a more detailed understanding of how drugs are absorbed, distributed, metabolized, and excreted in the body.

Shaik Mohammad Khifayathulla *et al.*,

Enhancing Bioavailability

Nanoparticle-based drug formulations can significantly improve the solubility and stability of poorly water-soluble drugs, enhancing their bioavailability. By encapsulating drugs in nanoparticles, such as liposomes or polymeric nanoparticles, their dissolution rate and absorption through biological membranes are increased. Nanoparticles can also protect drugs from premature degradation in the gastrointestinal tract, ensuring a higher proportion reaches the systemic circulation.[41]

Studying Pharmacokinetics

Nanotechnology enables the precise tracking and monitoring of drug distribution and metabolism in the body. Drugs conjugated to quantum dots or metallic nanoparticles can be traced using imaging techniques, allowing researchers to visualize and quantify their distribution in real-time. This provides valuable data on the drug's biodistribution, identifying potential accumulation sites and enabling the adjustment of dosing regimens to minimize toxicity and enhance therapeutic action.[42]

Targeted Drug Delivery

Nanoparticles can be engineered to target specific tissues or cells, which not only improves the drug's efficacy but also provides a means to study its pharmacokinetics and bioavailability in targeted sites. By attaching targeting ligands or antibodies to the surface of nanoparticles, the drug can be directed to specific receptors or cell types, minimizing systemic distribution and side effects.[43]

Evaluating Metabolism and Excretion

Nanotechnology can also be applied to study the metabolism and excretion of drugs. Nanoparticles labeled with isotopes or fluorescent markers can be used to track the metabolic pathways and excretion of drugs, providing insights into their clearance rates and identifying potential metabolites.[44] Nanotechnology significantly enhances the study of drug bioavailability and pharmacokinetics, offering tools and methodologies that provide a deeper understanding of drug behavior in the body. This not only aids in the design of more effective and safer drugs but also contributes to personalized medicine, where treatments can be tailored based on individual pharmacokinetic profiles.[45]

Nanotechnology-Enabled Sensors in Pharmaceutical Analysis

Development and application of nanosensors for real-time monitoring and analysis of pharmaceuticals, emphasizing their increased sensitivity and specificity

Nanosensors, leveraging the unique properties of nanoscale materials, represent a transformative advancement in the real-time monitoring and analysis of pharmaceuticals. These devices offer unprecedented sensitivity and specificity, attributes that are essential for the accurate detection and quantification of drugs and their metabolites in various environments.

Development of Nanosensors

Nanosensors are engineered by integrating nanomaterials with transducer elements to produce signals in response to specific chemical or biological stimuli. The high surface area-to-volume ratio of nanomaterials, such as nanoparticles, nanotubes, or nanowires, enhances the interaction with target analytes, leading to increased sensitivity. These materials can be functionalized with specific receptors or ligands that bind selectively to a particular pharmaceutical compound, conferring high specificity to the nanosensor.[46]

Application in Pharmaceuticals

In the pharmaceutical sector, nanosensors are utilized for a range of applications, including drug discovery, quality control, and patient monitoring. They can detect trace amounts of active pharmaceutical ingredients, impurities, or degradation products in formulations, contributing to stringent quality control. In clinical settings, nanosensors facilitate the real-time monitoring of drug concentrations in biological fluids, enabling personalized dosing regimens to optimize therapeutic efficacy and minimize side effects.[47]

Shaik Mohammad Khifayathulla *et al.*,

Advantages of Nanosensors

The key advantages of nanosensors lie in their miniaturized size, allowing for in situ and non-invasive measurements, and their potential for multiplexing, where a single device can monitor multiple targets simultaneously. Furthermore, the rapid response time of nanosensors ensures immediate feedback, critical for real-time applications in clinical diagnostics and therapeutic monitoring.[48] Nanosensors stand at the forefront of pharmaceutical analysis, offering tools with enhanced sensitivity and specificity for the real-time monitoring of drugs. Their development and application significantly contribute to advancing personalized medicine, ensuring optimal therapeutic outcomes, and maintaining stringent quality control in pharmaceutical manufacturing.[49]

Case Studies and Practical Examples:

Presentation of case studies illustrating successful applications of nanotechnology in pharmaceutical analysis, highlighting key findings and methodologies

Nanotechnology has seen successful applications in pharmaceutical analysis, as illustrated by various case studies that highlight its impact on enhancing drug development and monitoring. These studies demonstrate the practical benefits and innovative methodologies enabled by nanotechnology in this field.

Case Study 1: Enhanced Drug Purity Assessment A study involved the use of gold nanoparticles in surface-enhanced Raman spectroscopy (SERS) for the detection of impurities in a drug sample. The gold nanoparticles amplified the Raman signal, allowing for the identification of trace impurities that were not detectable using conventional methods. This application showcased the ability of nanotechnology to enhance the sensitivity and specificity of pharmaceutical purity assessments, ensuring higher safety standards in drug manufacturing.[50]

Case Study 2: Nanoparticle-based Drug Delivery System Another case study focused on the development of a liposomal nanoparticle system for targeted cancer therapy. The liposomes were engineered to encapsulate a chemotherapeutic agent, with surface modification to target cancer cells specifically. This targeted delivery system reduced side effects and improved the therapeutic efficacy of the drug. The study highlighted the use of nanotechnology in optimizing drug delivery systems, providing a methodology for enhancing the precision and effectiveness of treatments.[51]

Case Study 3: Real-time Monitoring with Nanosensors A groundbreaking study introduced nanosensors capable of monitoring therapeutic drug levels in real-time within the bloodstream. These nanosensors provided continuous data on drug concentration, enabling immediate adjustment of dosages for optimal therapeutic effect. This application of nanotechnology demonstrated its potential to revolutionize patient care through personalized and adaptive treatment strategies.[52]

These case studies exemplify the transformative impact of nanotechnology in pharmaceutical analysis, showcasing its potential to enhance drug purity assessment, optimize drug delivery systems, and enable real-time therapeutic monitoring, thereby significantly contributing to the advancement of pharmaceutical sciences and patient care.

Challenges and Future Perspectives:

Current Challenges:

Discussion on the challenges such as standardization, scalability, and regulatory issues facing nanotechnology in pharmaceutical analysis

Nanotechnology offers transformative potential in pharmaceutical analysis, it also encounters significant challenges, including standardization, scalability, and regulatory hurdles, that must be addressed to fully harness its benefits.

Standardization

A primary challenge is the lack of standardized methodologies for the synthesis, characterization, and application of nanomaterials in pharmaceutical analysis. The unique properties of nanomaterials can vary significantly with slight changes in their size, shape, surface chemistry, or aggregation state, influencing their behavior and interactions with

**Shaik Mohammad Khifayathulla et al.,**

pharmaceuticals. Standardization is crucial to ensure consistency and reliability in the results of nanotechnology-based analyses, facilitating their acceptance and adoption in the pharmaceutical industry.[53]

Scalability

Another challenge is the scalability of nanotechnology applications from laboratory settings to industrial-scale production. Many nanomaterial synthesis methods are complex, requiring precise control over conditions and often yielding low quantities of material. Scaling these processes while maintaining the quality and characteristics of nanomaterials is essential for their widespread application in pharmaceutical analysis, ensuring that the benefits of nanotechnology can be realized on a larger scale.[54]

Regulatory Issues

The regulatory landscape for nanotechnology in pharmaceutical analysis is still evolving. Regulatory agencies face the challenge of developing frameworks that adequately address the novel aspects of nanomaterials, ensuring their safety, efficacy, and quality. The lack of specific guidelines for the evaluation and approval of nanotechnology-based pharmaceutical products and analytical methods can hinder their development and implementation. Moreover, there is a need for clear labeling and disclosure of nanomaterial use in pharmaceutical products to inform consumers and healthcare providers.[55] The challenges of standardization, scalability, and regulatory compliance is essential for advancing the integration of nanotechnology in pharmaceutical analysis. Overcoming these hurdles will enable the pharmaceutical industry to fully exploit the advantages of nanotechnology, leading to improved drug development, quality control, and patient outcomes.

Future Trends

Predictions and insights into future developments and potential breakthroughs in nanotechnology for pharmaceutical analysis:

The future of nanotechnology in pharmaceutical analysis is poised for significant breakthroughs and developments, driven by ongoing research and technological advancements. Here are some predictions and insights into potential future directions in this dynamic field.

Integration with Artificial Intelligence and Machine Learning

The integration of nanotechnology with artificial intelligence (AI) and machine learning (ML) will revolutionize pharmaceutical analysis. AI and ML algorithms can analyze vast datasets generated from nanoscale analytical processes, enhancing the interpretation of complex data, improving the prediction of drug behavior, and optimizing nanoparticle design for targeted drug delivery and analysis.[56]

Advancements in Nanosensor Technology

Future developments in nanosensor technology will likely focus on multi-analyte detection, enabling simultaneous monitoring of various drug parameters and biomarkers. Enhanced sensitivity and selectivity, coupled with real-time analysis capabilities, will facilitate personalized medicine, providing tailored therapeutic strategies based on individual patient profiles.[57]

Next-Generation Nanomaterials

The synthesis of novel nanomaterials with enhanced functionalities is on the horizon. These materials will offer improved biocompatibility, targeted delivery, and controlled release mechanisms. Innovative materials like stimuli-responsive nanoparticles, which alter their behavior in response to specific biological signals, will provide precise control over drug release and activity.[58]

Global Collaboration and Standardization

Increased collaboration across academia, industry, and regulatory agencies worldwide will drive the standardization of methodologies and protocols in nanotechnology. This global effort will facilitate the translation of

**Shaik Mohammad Khifayathulla et al.,**

nanotechnological innovations from the lab to the market, ensuring broader access to advanced pharmaceutical analysis techniques.[59]

The future of nanotechnology in pharmaceutical analysis is bright, with potential breakthroughs that promise to enhance drug development, personalize medicine, and improve patient outcomes through more sophisticated and precise analytical methods.

Ethical and Regulatory Considerations**Examination of the ethical implications and regulatory landscape governing the use of nanotechnology in pharmaceutical analysis**

The integration of nanotechnology into pharmaceutical analysis brings forth a set of ethical implications and regulatory challenges that necessitate careful consideration. As nanotechnology offers profound capabilities in detecting, analyzing, and delivering pharmaceuticals, it also raises questions regarding safety, privacy, and environmental impact, which are intertwined with the regulatory frameworks governing its application.

Ethical Implications:[60]

1. **Safety Concerns:** The unique properties of nanomaterials, while beneficial, also pose potential risks to human health and the environment, which are not entirely understood. Ethical considerations demand rigorous assessment of nanomaterial toxicity, long-term stability, and their interaction with biological systems to prevent unintended consequences.
2. **Privacy and Data Security:** Advanced nanosensors capable of real-time monitoring of patients' biological parameters could raise privacy concerns. Ensuring the confidentiality and security of the sensitive health data collected by these devices is paramount to protect individuals' privacy rights.
3. **Accessibility and Equity:** The benefits of nanotechnology-enhanced pharmaceutical analysis should be accessible to all sectors of society. There is an ethical imperative to ensure that these advancements do not widen the healthcare disparity gap but rather contribute to equitable healthcare improvements.

Regulatory Landscape:[61]

1. **Evolving Guidelines:** Regulatory agencies are tasked with evolving their frameworks to address the unique challenges posed by nanotechnology. This includes establishing guidelines for the synthesis, characterization, application, and disposal of nanomaterials, ensuring their safe and effective use in pharmaceutical analysis.
2. **Standardization and Validation:** Developing standardized methods for evaluating nanotechnology applications in pharmaceuticals is crucial for ensuring consistency and reliability across studies and products. Regulatory bodies must also set benchmarks for the validation of nanotechnological methods in drug analysis and delivery.
3. **International Collaboration:** Given the global nature of pharmaceuticals, international regulatory collaboration is essential to harmonize standards and practices related to nanotechnology. This cooperation ensures that innovations can be seamlessly integrated into the global pharmaceutical industry, benefiting a worldwide population. The ethical considerations and adapting the regulatory landscape are crucial steps in harnessing the full potential of nanotechnology in pharmaceutical analysis, ensuring its responsible and beneficial application in advancing healthcare.

CONCLUSIONS

Nanotechnology significantly enhances pharmaceutical analysis, offering novel methodologies that improve the sensitivity, specificity, and efficiency of analytical processes. This technological advancement enables a deeper understanding and control over drug properties, delivery, and monitoring, thus playing a pivotal role in the development of safer and more effective pharmaceuticals.

Shaik Mohammad Khifayathulla et al.,

Enhanced Analytical Capabilities

Nanotechnology, through its application in creating advanced materials and devices, revolutionizes traditional analytical techniques. Nanoparticles and Nano sensors amplify the detection capabilities, allowing for the identification and quantification of substances at previously undetectable levels. This increased sensitivity is crucial for ensuring drug purity, identifying impurities, and understanding the complex interactions within drug formulations.

Drug Delivery Optimization

Nanoparticle-based carriers are engineered to improve the bioavailability and targeted delivery of therapeutics. This not only maximizes the therapeutic efficacy of drugs but also minimizes side effects, facilitating the development of personalized medicine approaches that cater to individual patient needs.

Real-time Monitoring

The integration of Nano sensors in pharmaceutical analysis introduces the capability for real-time, in vivo monitoring of drug levels and pharmacokinetics, offering a dynamic understanding of drug efficacy and safety. This real-time data collection is instrumental in adjusting dosages and treatment plans to optimize therapeutic outcomes.

Addressing Challenges

While nanotechnology presents vast opportunities, it also brings challenges in standardization, scalability, and regulatory compliance. Ethical considerations regarding safety, privacy, and accessibility need to be thoroughly addressed to ensure the responsible advancement of nanotechnology in pharmaceuticals. In conclusion, nanotechnology stands as a cornerstone in the evolution of pharmaceutical analysis, driving forward the development of innovative analytical techniques, optimizing drug delivery system, and enabling real-time therapeutic monitoring. Addressing the associated challenges will further solidify the role of nanotechnology in paving the future of pharmaceutical sciences.

Table 1: Types of Nanomaterials Used in Pharmaceutical Analysis

Nanomaterial Type	Properties	Advantages in Pharmaceutical Analysis
Metallic Nanoparticles	Optical properties due to surface plasmon resonance	Enhanced sensitivity for detecting trace amounts of pharmaceutical substances
Quantum Dots	Size-dependent optical and electronic properties	Multiplexed analysis capability and high photostability
Dendrimers	Highly branched, monodisperse structure with functional groups	Versatility in drug and probe delivery, enhancing solubility and stability
Carbon Nanotubes	Unique mechanical, thermal, and electrical properties	Useful in adsorption-based separation and electrochemical sensors

Table 2: Nano-Enabled Analytical Techniques in Pharmaceutical Analysis

Analytical Technique	Enhancement through Nanotechnology	Impact on Pharmaceutical Analysis
Chromatography	Nanomaterials as advanced stationary phases or sorbents	Improved separation efficiency and faster analysis times
Mass Spectrometry	Novel ionization techniques like nano-ESI and use of nanoparticles in MALDI	Increased sensitivity and reduced sample consumption
Spectroscopy	Enhanced interaction between light and matter (e.g., SERS, fluorescence)	Enhanced detection capabilities for pharmaceutical substances

Table 3: Applications of Nanotechnology in Pharmaceutical Analysis

Application Category	Description	Benefit
Drug Purity and Composition Analysis	Utilizing nanoparticles and nanosensors for enhanced detection and identification	Improved accuracy in assessing drug purity and composition
Drug Delivery System Analysis	Detailed characterization and optimization of nanoparticle-based drug carriers	Enhanced drug delivery effectiveness and safety
Bioavailability and Pharmacokinetics	Studying drug absorption, distribution, metabolism, and excretion using nanotechnology	Informed optimization of therapeutic efficacy and safety

Table 4: Regulatory Considerations for Nanotechnology in Pharmaceutical Analysis

Regulatory Aspect	Key Considerations
Safety and Toxicity Testing	- Comprehensive assessment of nanomaterial toxicity and long-term effects on human health and the environment - Establishment of safety guidelines for nanomaterial handling and

Shaik Mohammad Khifayathulla et al.,

	disposal
Product Labeling	- Clear labeling of pharmaceutical products containing nanomaterials to inform consumers and healthcare providers - Disclosure of potential risks associated with nanotechnology use in drug formulations
Quality Control Standards	- Development of standardized methodologies for evaluating the quality and performance of nanotechnology-based analytical methods - Implementation of validation protocols for nanomaterial synthesis and characterization
Regulatory Harmonization	- International collaboration among regulatory agencies to harmonize standards and practices related to nanotechnology in pharmaceuticals - Alignment of regulatory frameworks to facilitate global market access for nanotechnology-enhanced pharmaceutical products

ABSTRACT

Raising public recognition of the identity and usefulness of various plant and animal species is an essential step towards wildlife conservation and sustaining a well-balanced ecosystem. In this paper, we describe a state-of-the-art, deep learning model-based tool for classifying species from their images and displaying their ecosystem roles. We use the MobileNetV2 architecture for classifying all of the 430 wildlife classes of the 1000 total classes in the ImageNet Large Scale Visual Recognition Challenge (ILSVRC) validation dataset. A python-based Graphical User Interface (GUI) was designed, featuring a user-friendly concept for selecting images and displaying results. The python application was converted into a stand-alone executable that can run on Windows (64 bit) computers. The application is open-source, compact, and does not require internet connectivity.

Keywords: Species Identification, Image Classification, Convolutional Neural Networks, Ecosystem Roles

**Suhas H. Patel et al.,**

INTRODUCTION

Every species, however small, plays a key role in maintaining and structuring the ecosystem. Loss of biodiversity can influence ecosystem functions and services [1,2]. Since our society is progressively becoming less concerned about wildlife conservation, access to necessary information like the importance of various species is crucial, not only for professional stakeholders, ecologists, researchers, activists, teachers, and students but also for the general public [3]. In this context, with advancements in image acquisition technology, providing an open-source, image-based classification tool for various plant and animal images can be a worthwhile solution. Classifying similar-looking species from an image is a demanding task. Also, other interference factors like the posture of the species, and angle of view, call for consideration. However, in recent times, there have been significant advances in the field of deep learning. Convolutional Neural Networks (CNNs) are increasingly being employed for Image classification [4, 5], Target detection [6, 7], and Recognition tasks [8, 9]. They have improved the ability to extract higher-level image information compared to the traditional image processing methods. Although earlier CNNs like AlexNet [10] and VGG [11] delivered a good performance, testing the network needed a lot of computation. Networks, such as Inception [12], ResNet [13], and DenseNet [14], used unique methods to reduce the network parameters. The fundamental idea of newer lightweight networks is to design more efficient network computing methods to reduce network parameters and computational cost. Therefore, some efficient networks emerged, such as MobileNet [15] and Xception [16]. Training on a large dataset is a challenging task hence weights of pre-trained models are used. We have used the weights of MobileNetV2 [17] trained on the ILSVRC dataset [18] since it provides a memory-efficient, fast, and accurate mobile visual recognition that includes classification, object detection, and semantic segmentation. Typically, using transfer learning, the weights are updated for a new, relatively smaller dataset, but to preserve the 430 wildlife classes that the pre-trained model can accurately classify, we retained the core model. However, the classifier discarded the remaining classes, and biological information on the retained classes was included. Using the Tkinter library of Python, a GUI was designed, and the script was bundled into an executable. The application is available for free on the web 1. The rest of the paper is structured as: The related work is presented in Section 2. Section 3 presents the dataset, and the approach used to build our image classifier. Results and discussion have been presented in Section 4. Section 5 concludes the paper.

RELATED WORK

Before deep learning, computer vision technology was applied to process wildlife images [19, 20]. With the continuous improvement of machine learning, CNNs has proved a powerful ability in image processing. More and more researches have applied the CNNs to the field of image processing and obtained satisfactory results. ImageNet [21] is the widest structured dataset until now with over 14 million images. Some other datasets for large-scale visual recognition are Microsoft COCO [22] and Google's Open Images [23] with more than 2.5 million and 9 million images. There are attempts from research groups all over the world to provide improved designs for these datasets. The publicly available pre-trained models for these datasets form a basis for prediction, feature extraction, and fine-tuning. Deep learning models are extensively used for animal surveillance [24, 25]. These methods perform real-time classification of species from their video or images. Aquatic species classification was also achieved through deep learning [26]. A drawback of these methods is that they can classify only a few species. To the best of our knowledge, we are the first to design an image-based classifier for species belonging to all of the following three categories: animal; plant; and fungi, that also display their ecological significance. Most of the image-based classification and evaluation in the recent past is based on plants and leaves as it is still regarded as a challenging and unsolved problem. A notable work in this field is Leafsnap2 [27]. This application identified 184 plant species based on curvature-based shape features of the leaf by utilizing integral measure to compute functions of the curvature at the perimeter. Another noticeable initiative is by ImageCELF3 [3], which has been organizing plant identification tasks since 2011 in context to a worldwide evaluation forum that it aims to provide. Finally, PlantNet4 is the widest

Suhas H. Patel *et al.*,

existing automated identification tool (with imperfections) that identifies about 2200 plant species [28]. Very few studies have come for image-based classification for fruit [29] and saprophytes [30]. Since we keep all the layers of the MobilenetV2 model in our tool, it can classify some from those categories as well.

Proposed Approach

In this section, we present our proposed image classification framework. First, we describe the dataset, the MobileNetV2 model, and later the implementation details are explained.

ILSVRC

ImageNet Large Scale Visual Recognition Challenge (ILSVRC) is a standard in object category classification and detection on hundreds of object groups and millions of images. The challenge has been run annually from 2010 to present, attracting participation from over fifty institutions [18]. Its dataset is built up upon a subset of an openly accessible computer vision dataset known as ImageNet [21]. The general challenge tasks for most years are a) Image classification (2010–2014): Predict the classes of objects present in an image. b) Single- object localization (2011–2014): Image classification and drawing a bounding box around one example of each object present. c) Object detection (2013–2014): Image classification and drawing a bounding box around each object present. The datasets have 1,461,406 images among 1,000 classes. They are occasionally modified (depending on the task) and are released publicly to promote widespread participation from academia. Among the 1000 classes, we recognized 430 classes of species falling into one of the following categories: a) Aquatic animals (38), b) Birds (59), c) Terrestrial reptiles, invertebrates, and amphibians (83), d) Terrestrial mammals (213) e) Plants and fungi (37). Over the years, there has been widespread involvement in the ILSVRC [18], with many significant developments and a massive number of academic publications. AlexNet [10], a CNN-based architecture comprising 8 layers with 5 convolutional layers and 3 fully connected layers, achieved top results on the ILSVRC-2010 and ILSVRC-2012 image classification tasks. A variation of AlexNet generally called as ZFNet [31] won the ILSVRC-2013 image classification task. Inception [12] won the ILSVRC-2014 by reducing the number of computation parameters drastically. ResNet [13], a residual learning framework with a depth of up to 152 layers, achieved the best results in the ILSVRC-2015 competition. DenseNet [14] eased the gradient vanishing problem and strengthened the feature propagation to achieve better performance with fewer parameters and calculation costs. Later models like MobileNet [15] and Xception [16] used Depthwise Separable Convolution to build small and efficient networks. MobileNetV2 [17], a significant improvement over MobileNet [15] proposed Inverted Residual Block, which enhanced the Depthwise separable convolution to deliver better performance. Table 1 compares MobileNetV2 [17] to other popular architectures. Accuracy represents the model's top-1 accuracy on the ImageNet validation dataset [18]. The depth denotes the largest number of sequential, convolutional, or fully connected layers on a path from the input layer to the output layer. Parameters are in million. MobileNetV2 [17] is a memory-efficient, low power, low latency model with reduced computations. However, it does not compromise on accuracy. Because of the aforementioned advantages, we have used it for image classification.

Implementation Details

Our implementation is in Keras5, a high-level neural networks API, with TensorFlow backend [32]. Rather than training a new CNN architecture, we re-used the pre-trained MobileNetV2 network because a) Our application requires a training set that comprises a wide range of species, with a large number of diverse images for each species, upon which the performance of the CNN is dependent [33]. This model can classify 430 wildlife species with high accuracy. c) Training a deep model requires skills, experience, and resources (GPU/TPU, high processor clock speed, time, etc.) As depicted in Figure 1, we designed a GUI for selecting the species image saved on the computer using Tkinter, a python standard GUI package. The selected image was converted into a NumPy array and resized to fit in the network topology input resolution of MobileNetV2 (224, 224, 3). The image is preprocessed before making predictions. Images can be preprocessed only if they have the extensions: PNG, JPG, JPEG, BMP, PPM, TIF, and TIFF.

Suhās H. Patel *et al.*,

RESULTS AND DISCUSSION

In this section, we present the assessment of our application software for the identification of species and displaying their ecological roles. The application holds a mere 303MB of storage on the device. The simple, user-friendly GUI gives instantaneous results upon selecting an image, taking an average of 2-3 seconds for obtaining the result of the first selected image after launching the application; subsequent results are retrieved much quicker (taking less than a second). This result was achieved when running on Windows (64-bit) computer, with the Intel CORE i5 processor. As shown in Figure 2, the result window displays a resized image of the species, probability of resultant class in percentage, species class, and its ecosystem role(s). In terms of accuracy, the MobileNetV2 [17] manages state-of-the-art results with a Top-1 accuracy of 70.1% (Table 1) on the ILSVRC validation dataset [18]. The application was publicly released in May 2020, and as of now, in June 2020, it has been downloaded by 52 users, in 6 countries. The tool is compatible only with Windows (64-bit) computers so far, but our next step is to increase our outreach, as we plan to create a version for iOS (desktop and mobile), and Android devices. We are also working towards the possibilities of classifying more species and providing a deeper insight into their ecosystem roles.

CONCLUSIONS

This paper introduces a simple, quick, and interactive application for the classification and evaluation of various plant and animal species from their images, built using a convolutional neural network. The tool is compact, accurate, and free to use. Although only a limited number of species (430) can be classified so far, we believe that this is an effective and efficient means for creating awareness about the importance of biodiversity conservation, an issue which is often neglected but is crucial for attaining a sustainable world. We further plan on introducing more species to our application, and also extending its availability to mobile devices. We believe that it will provide for a helpful tool in research and academia.

ABSTRACT

Tamaka Shwasa is an illness of *Pranavaha Srotas* (respiratory tract), caused due to the vitiation of *Vata* and *Kapha Doshas* and afflicting the *Rasa Dhatu* (lymph tissue). Characterized by the symptoms like *Shwasa Kricchrata* (difficulty in breathing) and *Kasa* (cough), the clinical symptomatology resembles to the condition of bronchial asthma in modern science and is a commonest chronic illness during childhood. This randomized clinical study explores the potential of, *Ardraka Arka*, as an adjuvant to standard care in the management of *Tamaka Shwasa* (bronchial asthma) in children. With a rising prevalence of asthma in India, especially among children, the study addresses the limitations of conventional treatments, emphasizing the need for alternative or complementary approaches. This trial has been approved by the IEC (JSSAMC/1196/2022-23) and duly registered in clinical trial registry of India (CTRI/2023/08/056522). Already diagnosed subjects of the age group 5-16 years of age, of bronchial asthma subjects who are on the standard care according to IAP, of either gender with no any other lung pathology and severe type of asthma are being randomized into two treatment groups to receive the adjuvant therapy (group A is on standard care and given *Ardraka Arka* and group B is only given standard care). The primary outcome is to evaluate and compare the effect of *Ardraka Arka* as an Add-on therapy along with standard care on the subjective parameters of *Tamaka Shwasa* at 29 days. Secondary outcome is to evaluation and comparison of the changes in spirometry values before and after treatment of *Ardraka Arka* along with the Standard care at 56 days. A sample size of 40 (20 subjects in each group) with mild

**Puja and Srihari**

persistent, mild intermittent and moderate persistent types of bronchial asthma will be included in the study.

Keywords: Pediatric asthma, *Tamaka Shwasa*, *Ayurveda*, *ArdrakaArka*.

INTRODUCTION

Tamaka Shwasa is an illness of *PranavahaSrotas*, originating in the *Pittasthana*, caused due to the vitiation of *Vata* and *KaphaDoshas* and afflicting the *Rasa Dhatu*. It is characterized by *ShwasaKruchrata*, *Kasa*, *Ghurghuraka*. *Ayurveda* describes *Tamaka Shwasa* as *YapyaVyadhi* (difficult to cure) [1]. The clinical symptomatology of *Tamaka Shwasa* is similar to that of Bronchial asthma in contemporary science, which is one among the commonest chronic illnesses in childhood period[2]. Bronchial asthma is defined as heterogenous disease characterized by the symptoms of recurrent episodes of wheezing, breathlessness, chest tightness and cough which vary over time intensity. The airways show chronic inflammation, hyperresponsiveness, and airflow limitation which is reversible, recurrent and variable[3]. Among the 1.3 billion people in India, about 6 % of children and 2% of adults are affected with Bronchial asthma.[4] The prevalence of asthma is increasing with time and additional 100 million people are expected to develop asthma by the year 2025.[5] In a recent study (2021), overall prevalence of Asthma, in the rural areas of North Karnataka was 4% among 5-16 years aged children.[6] Study from Mysore has reported a prevalence of 17.14% Asthma in children in the age group of 6–14 years also.[7] This alarming raise in the prevalence of Bronchial Asthma can be accounted to factors such as Atmospheric pollution (*Rajodhuma*), rapid environmental changes, an adaptation of newer dietic preparations, excessive exercise (*VyayamaKarma*), and tremendous psychological stress.[8] Childhood Asthma is responsible for school absenteeism, restricted activities, and psychological impact on the family also, there is impact on socio-economic status, since there is increased unscheduled hospital visits. Some of the common complications of bronchial asthma if left unattended, are sinusitis, allergic rhinitis, urinary incontinence and psychological problems like anxiety, depression and panic attacks.[9] In contemporary science, current challenges in pediatric asthma management include Inhaled corticosteroids which may result in Growth delay, irritable or difficult behavior and oral candidiasis.[10] From 18th century A.D. onwards *ArkaKalpana*, the method of extracting essence from medicinal plants, was extensively adopted in *Ayurveda* medicine.[12] The text *Arka Prakasha* has mentioned that, *ArdrakaArka* if consumed cures *ShwasaRoga*. [11] Since *Ardraka* has *UshnaVirya*, *Vataanulomana* properties and works on *KaphaDosh* in *Tamaka Shwasa* it removes the obstruction present in the *PranavahaSrotas* caused by *Kapha*. It is also proved to have Anti-Asthmatic[13] property. *Arka* is *Shighrakari*, does not vitiate *Dosha* and is devoid of all the *Dosha*. [14] Asthma is a condition where invasive interventions are necessary, and if not, it might result in emergency condition. Hence, it may require the continuation of consuming standard medications for children, devoiding them of standard medications would be unethical. With this backdrop, this study is designed to evaluate the add-on efficacy of *ArdrakaArka* in *TamakaShwasa* along with standard care of management.

OBJECTIVES OF THE STUDY

1. To evaluate and compare the effect of *Ardraka Arka* as an Add-on therapy along with standard care on the subjective parameters of *Tamaka Shwasa*
2. To evaluate and compare the changes in spirometry values before and after treatment of *Ardraka Arka* along with the Standard care.

METHODOLOGY

Patients, of both genders, will be selected from the pediatric OPD and IPD of department of *Kaumarabhritya* JSS *Ayurveda* Medical College and Hospital, Mysuru, special health camps and other referrals. The study will include children fulfilling the inclusion criteria (Table no:1). The study will be started after obtaining the ethical clearance

**Puja and Srihari**

from the Institute of Ethics Committee (IEC). The collected data will be presented in the form of tables will be considered for drawing conclusion of the study.

GROUPING

- Group A Trial Group (20 Subjects)- Will receive Trail drug + Standard Care Intervention as per Modern medicine.
- Group B Control Group (20 Subjects)- Will receive Standard Care Intervention as per Modern medicine.

DIAGNOSTIC CRITERIA

Already diagnosed patients of Bronchial Asthma are included.

INTERVENTION

The intervention details are depicted in Table no 2

Standard Control group

Only standard intervention as per Modern medicine.²⁸will be given to group B. (standard intervention is depicted in table no 4) 1st Follow up will be done on 29th day of the studyand 2nd Follow up will be done on 56th day.

Criteria for assessment

The results of the medicine will be assessed on the basis of clinical signs and symptoms mentioned in Ayurveda classics. Functional capacity will also be assessed and laboratory investigations will be repeated at the end of the treatment schedule. All the signs and symptoms will be given scoring pattern depending upon severity as below.

Objective parameters(investigations)

Include Complete blood count, Erythrocyte Sedimentation Rate, Absolute Eosinophil Count, Lung function test (spirometry), Childhood asthma control test, these will be assessed before and after the treatment for every patient.

Subjective parameters

Includes *ShwasaKruchrata*, *GhurghurakShabda*, *KashtenShleshma Moksha*, *AsinoLabhateSukha*, *UshnabhinandathiKasa*, *Peenasa*, *Vishushkasya*, *Anidra*, these will be assessed before and after the treatment for every patient.

Statisticalanalysis

The data will be analyzed by using appropriate parametric and non- Parametric Tests: Wilcoxon Sign Rank Test, Paired 't' Test, Unpaired 't' Test and Man Whitney Test

Hypothesis

- **H₀:** There is no difference in the effect of the Ardrakaarka as an add-on therapy along standard care on the subjective parameters of *Tamaka Shwasa*.
- There is no significant difference between before and after evaluation in the changes of spirometry of ArdrakaArka along with standard care. along with the Standard care.
- **H₁:**There is significant difference in the effect of the ArdrakaArka as an add-on therapy along standard care on the subjective parameters of *Tamaka Shwasa*.
- There is significant difference between before and after evaluation in the changes of spirometry of ArdrakaArka along with standard care. along with the Standard care.

RESULTS

Results of the study will be collected and analyzed based on the changes in subjective and objective parameters before and after intervention.

DISCUSSION

Status of the condition

The study addresses the growing prevalence of bronchial asthma in children, emphasizing the impact of this condition on various aspects of life, including school attendance, daily activities, and the psychological well-being of both the child and the family. The limitations of current pediatric asthma management, such as potential side effects of inhaled corticosteroids, underscore the need for alternative or adjunct therapies.

Status of the management of the condition

In contemporary science, current challenges in pediatric asthma management include Inhaled corticosteroids which may result in Growth delay, irritable or difficult behavior and oral candidiasis. According to ayurveda, the herbs that are having mucolytic properties will be given in the form the classic formulation that helps relieve the symptoms of the condition. The therapies like *Abhyanga* and *swedana* that are helpful in the bronchodilation are indicated. *Ardraka* has *Ushma virya*, *Vataanulomana* properties and works on *Kapha* dosha in *Tamaka Shwasait* removes the obstruction present in the *PranavahaSrotas* caused by *Kapha*. It is also proved to have anti-asthmatic (12) property. The randomized controlled design of the study enhances the inclusion of subjective and objective parameters provides a comprehensive evaluation of the therapeutic impact. The study's focus on assessing both short-term (28 days) and relatively longer-term (56 days) outcomes adds depth to the analysis.

CONCLUSION

The randomized clinical study aims to assess the effectiveness of *Ardraka Arka* as an add-on therapy for pediatric Asthma. the study with the sample size of 40 will be conducted for the period of (28) days where in, the subjects of the either group (group A and B) will be given the standard care and standard care along with the adjuvant therapy respectively. The *ArdrakaArka* will be given for three times per day. The assessment will be done on the 29th and 56th day.

Expected action

Ardraka Arka, combined with standard care, is expected to significantly improve subjective symptoms like *ShwasaKruchrata*, *Ghurghurak Shabda*, and *Kashten Shleshma Moksha* and spirometry values compared to standard care alone. The study is also expected to assess the safety and tolerability of *Ardraka Arka* as an add-on therapy. If the results indicate good safety profiles, it would support the consideration of *Ardraka Arka* as a complementary therapy in pediatric asthma management.

ABSTRACT

Antisocial behavior is a multifaceted concept that includes various behaviors. It ranges from physical aggression like bullying and fighting to disobedient actions like lying, stealing, vandalism, arson, and running away from home. This concept also covers oppositional behaviors like irritability and stubbornness. The concept of antisocial behavior is studied in multiple fields, including sociology, criminology, and psychology, leading to a multitude of definitions, labels, and assessment methods that vary depending on the specific context. Antisocial behavior among college students can have adverse outcomes for individuals and the academic community. The proposed study analyzes the occurrence, root cause, and substantial factors that result in antisocial behavior among college students, by employing the innovative concept of the Fuzzy Logic System (FLS). Conventional methods of studying and addressing this psycho-social issue often fail to capture human behavior's complexity. The fuzzy logic system provides an optimum platform to address ambiguity, uncertainty, and imprecision present in human behavior, which also offers a promising approach for understanding and predicting such types of human behavior.

Keywords: Fuzzy logic, psycho-social issue, antisocial behavior, psychological well-being.

Monika Rathore and Uday Raj Singh

INTRODUCTION

Antisocial behavior generally refers to actions or behaviors that are destructive, harmful, or negative towards other individuals or society. These behaviors often involve unlawful activities and can negatively affect people in interpersonal ways. Such behaviors can result from inadequate social, ethical, moral, and psychological development during childhood, particularly within the home, school, and society, which may be influenced by several factors such as school-related factors, parental factors, parental support, and socioeconomic factors. The purpose of this study is to explore and identify the major causes of antisocial behavior among students. Therefore, this study aims to uncover and emphasize the factors to better understand and address antisocial behavior, with a focus on school-related factors, parental factors, parental support, and socioeconomic factors that impact antisocial behavior among students. Antisocial behavior can have significant social, interpersonal, and financial costs for the individuals engaging in such behavior and their families, communities, and society. Some of the costs associated with antisocial behavior include:

1. **Individual Well-being:** Antisocial behavior can harm the well-being of the individuals engaging in such behavior. This can increase stress, emotional distress, and mental health issues.
2. **Impact on Families:** Antisocial behavior often disrupts family dynamics and can lead to strained relationships, broken families, and a negative impact on the well-being of family members, especially children who may be exposed to such behavior.
3. **Community Disruption:** Antisocial behavior can disrupt the peace and safety of communities. Crimes, vandalism, and disturbances caused by antisocial individuals can destroy a community's sense of security and well-being.
4. **Healthcare Costs:** Antisocial behavior is often associated with substance abuse and mental health issues. Such behavior may require medical and psychiatric treatment, further burdening the healthcare system.
5. **Loss of Productivity:** Antisocial behavior can result in lost productivity, both in terms of the individuals engaging in such behavior and their victims.
6. **Educational Costs:** Antisocial behavior among students can disrupt the learning environment and affect the academic progress of the individuals involved and their peers. This can lead to lower educational outcomes and reduced future opportunities.

Efforts to prevent and address antisocial behavior often involve a combination of social programs, mental health services, rehabilitation, and law enforcement. By reducing antisocial behavior, society can reduce these associated costs and work towards creating safer and more harmonious communities.

LITERATURE REVIEW

Anti-social behavior can exert adverse effects on individuals, families, and communities. They can harm both mental and physical health and are linked to significant social and economic burdens on society. This review aims to collect and consolidate high-quality peer-reviewed literature, concerning anti-social behavior. In this process, **Gaik et al. (2010)** focused on the role of family relations, especially parent-child attachment, as a crucial factor in the development of antisocial behavior among adolescents. Also showed that insecure attachment, particularly when it is associated with parental negativity and rejection, can have significant implications for a child's behavioral and emotional development. **Jevtic (2011)** stated that the issue of antisocial behavior in contemporary society is indeed complex and can arise from various factors. While material conditions and socioeconomic disparities can contribute to antisocial behavior. **Morgado & Dias (2013)** presented a review of developmental literature regarding antisocial behaviors among adolescents by identifying some of the peculiarities of the antisocial phenomenon. They also focused on several individual variables that undergo considerable development during this stage of life and that may play an important role in the adoption of risk behaviors in adolescence. **Thornberry et al. (2014)** investigated whether the adolescent antisocial behavior of a parent raises the likelihood of their child engaging in antisocial behavior, and, if such a connection exists, to what extent various aspects of parenting influence this association. **Ojo (2015)** studied the causes and prevalence of antisocial behavior among secondary school students with hearing impairment in Ibadan, Nigeria. He adopted a descriptive survey research design to carry out the study. **Piotrowska et al.**

**Monika Rathore and Uday Raj Singh**

(2015) aimed to summarise evidence on the relationship between socioeconomic status and broadly conceptualized antisocial behavior and investigated the range of antisocial subtypes and other potential moderators, including age, sex, and informant. **Hashmani & Jonason (2017)** aimed to detail modern thinking on evolutionary models of antisocial behavior. They reviewed how life history theory addresses the theoretical vacuum in classic and most modern research on antisocial behavior and traits. They also attempted to research antisocial behavior and highlighted that such behaviors might have undesirable consequences or potentially “positive” outcomes as well. **Jurado et al. (2017)** analyzed the characteristics of antisocial behavior and interpersonal values of students with high levels of antisocial behavior regarding interpersonal values, and the possible protection from antisocial behavior. They used the Interpersonal Values Questionnaire to assess interpersonal values, and the Antisocial-Delinquent Behaviors Questionnaire to assess antisocial behaviors. **Garcia et al. (2019)** analyzed the effect of family and friends on adolescent antisocial behavior, as well as the mediating role of adolescent impulsivity and empathy on these relationships. **Girma et al. (2019)** analyzed the relationship between academic achievement and anti-social behavior of high school students. They also showed no significant difference between government and private schools in the correlation between antisocial behavior and academic performance.

Jain et al. (2020) presented an innovative method for detecting aggressive and violent tendencies using handwriting analysis. This research aimed to explore and analyze the correlation between handwriting patterns and behaviors associated with violence. **Otto et al. (2021)** investigated the elements contributing to antisocial behavior in children and adolescents. They discovered that higher levels of self-efficacy and a poorer family climate were individually associated with increased instances of antisocial behavior. **Reid et al. (2022)** investigated changes in psychological distress and antisocial behavior among 557 probationary youths who underwent two evaluations before the COVID-19 era and two evaluations following the onset of COVID-19. The findings emphasized a rise in markers of psychological distress and antisocial behavior among both the entire sample and specific groups categorized during post-COVID-19 conditions in contrast to pre-COVID-19 conditions. **Vadivel et al. (2023)** investigated the scholastic achievements of adolescents, the influence of educational institutions, and factors contributing to antisocial conduct. They explored the connection between antisocial behavior and a group of 127 participants, aged 13–15. The findings indicated an inverse correlation between the academic performance of teenagers and their engagement in antisocial behavior. **Lohmann et al. (2023)** investigated the immediate effects of being exposed to a public health crisis on antisocial behavior and economic decision-making. They indicated that individuals who experienced higher levels of exposure to the virus outbreak tended to display increased antisocial behavior compared to those with lesser exposure, while various other elements of economic and social preferences remained relatively consistent.

Fuzzy logic and Antisocial behavior

Conventional approaches to understanding human behavior frequently rely on binary logic, potentially causing challenges in practical use. A common problem with the traditional method is the insistence on clearly defining relationships between elements and sets, rather than allowing for ambiguity. Employing fixed statements to describe reality can lead to unjustifiable hypotheses, also many responses extend beyond simplistic classifications like “yes” or “no,” “good” or “bad,” “right” or “wrong,” and so on. Zadeh (1965) introduced the concept of the “fuzzy theory” to better align with real-life scenarios, proposing that human cognition and emotions operate in a fuzzy manner. Complex problems can benefit from fuzzy mathematical analysis, which involves transforming semantic or informal statements into fuzzy sets and establishing a membership function. Therefore, principles and elements of the fuzzy logic system, emphasize its appropriateness for the modeling and analysis of complex social behaviors.

METHODOLOGY

Antisocial behavior is a complex, multi-dimensional issue, and a multidisciplinary approach can provide a more comprehensive understanding, making it difficult to define and measure precisely. This research comprised multiple stages, commencing with data collection. During this initial stage, information gathering was conducted to acquire the necessary data for the research. The data utilized in this study were the results of the questionnaire. The

Monika Rathore and Uday Raj Singh

questionnaire results formed the dataset, serving as input data that was subsequently according to the system's needs. This method involved statistical calculations and artificial intelligence techniques aimed at extracting and identifying information from the extensive dataset. Research involving human behavior, and susceptible topics like antisocial behavior, requires careful attention to ethical considerations. Traditional binary (yes/no) classifications may not adequately capture its nuances. Fuzzy logic allows for the representation of uncertainty and ambiguity by assigning degrees of membership to various characteristics or factors associated with antisocial behavior. This is particularly useful when categorizing behaviors that do not fit neatly into predefined categories. It allows us to use linguistic variables like "high", "medium", and "low" to describe the degree of antisocial behavior. In this research study, the proposed basic structure of the fuzzy mamdani process is illustrated in Figure 1. There are several elements that contribute to the emergence of antisocial behavior among students. Through investigation, major factors identified as inputs influencing antisocial behavior include individual factors, family environment, peer influence, sociological factors, and school environment. In the proposed fuzzy logic system, the subfactors derived from these major factors act as inputs, while the resulting antisocial behavior is considered as the output. These derived subfactors hold considerable importance within the proposed fuzzy model. For the fuzzification process, these subfactors that are considered as input (*i.e.* Antagonistic Nature, Parental Supervision, Peer Pressure, Socio-Economic Status, and Academic Supervision) in the proposed fuzzy logic system, are categorized into three distinct linguistic labels, which are shown in Table 1, using the trapezoidal membership function. Following the fuzzification process, the fuzzy mamdani method is employed to analyze antisocial behavior among students. Figure 2. illustrates the suggested fuzzy mamdani inference system. Figure 3, Figure 4, Figure 5, Figure 6, and Figure 7 exhibit the plotting of membership functions for five input variables, which are displayed below. While Figure 8 illustrates the membership function plotting for the output variable, and the trapezoidal membership function equations for all input and output factors are as follows:

Antagonistic Nature

$$\mu_L(\alpha_1) = \begin{cases} \frac{\alpha_1 - 0}{0.15} & 0 \leq \alpha_1 \leq 0.15 \\ 1 & 0.15 \leq \alpha_1 \leq 0.25 \\ \frac{0.40 - \alpha_1}{0.15} & 0.25 \leq \alpha_1 \leq 0.40 \end{cases}$$

$$\mu_M(\alpha_1) = \begin{cases} \frac{\alpha_1 - 0.30}{0.15} & 0.30 \leq \alpha_1 \leq 0.45 \\ 1 & 0.45 \leq \alpha_1 \leq 0.55 \\ \frac{0.70 - \alpha_1}{0.15} & 0.55 \leq \alpha_1 \leq 0.70 \end{cases} \dots(1)$$

$$\mu_H(\alpha_1) = \begin{cases} \frac{\alpha_1 - 0.60}{0.15} & 0.60 \leq \alpha_1 \leq 0.75 \\ 1 & 0.75 \leq \alpha_1 \leq 0.85 \\ \frac{1 - \alpha_1}{0.15} & 0.85 \leq \alpha_1 \leq 1 \end{cases}$$

Parental Supervision

$$\mu_G(\alpha_2) = \begin{cases} \frac{\alpha_2 - 0}{0.10} & 0 \leq \alpha_2 \leq 0.10 \\ 1 & 0.10 \leq \alpha_2 \leq 0.30 \\ \frac{0.40 - \alpha_2}{0.10} & 0.30 \leq \alpha_2 \leq 0.40 \end{cases}$$

$$\mu_M(\alpha_2) = \begin{cases} \frac{\alpha_2 - 0.25}{0.15} & 0.25 \leq \alpha_2 \leq 0.40 \\ 1 & 0.40 \leq \alpha_2 \leq 0.60 \\ \frac{0.75 - \alpha_2}{0.15} & 0.60 \leq \alpha_2 \leq 0.75 \end{cases} \dots(2)$$

Monika Rathore and Uday Raj Singh

$$\mu_p(\alpha_2) = \begin{cases} \frac{\alpha_2 - 0.60}{0.10} & 0.60 \leq \alpha_2 \leq 0.70 \\ 1 & 0.70 \leq \alpha_2 \leq 0.90 \\ \frac{1 - \alpha_2}{0.10} & 0.90 \leq \alpha_2 \leq 1 \end{cases}$$

Peer Pressure

$$\begin{aligned} \mu_p(\alpha_3) &= \begin{cases} \frac{\alpha_3 - 0}{0.125} & 0 \leq \alpha_3 \leq 0.125 \\ 1 & 0.125 \leq \alpha_3 \leq 0.275 \\ \frac{0.40 - \alpha_3}{0.125} & 0.275 \leq \alpha_3 \leq 0.40 \end{cases} \\ \mu_N(\alpha_3) &= \begin{cases} \frac{\alpha_3 - 0.25}{0.15} & 0.25 \leq \alpha_3 \leq 0.40 \\ 1 & 0.40 \leq \alpha_3 \leq 0.60 \\ \frac{0.75 - \alpha_3}{0.15} & 0.60 \leq \alpha_3 \leq 0.75 \end{cases} \dots(3) \\ \mu_{Ng}(\alpha_3) &= \begin{cases} \frac{\alpha_3 - 0.60}{0.125} & 0.60 \leq \alpha_3 \leq 0.725 \\ 1 & 0.725 \leq \alpha_3 \leq 0.875 \\ \frac{1 - \alpha_3}{0.125} & 0.875 \leq \alpha_3 \leq 1 \end{cases} \end{aligned}$$

Socio-economic Status

$$\begin{aligned} \mu_H(\alpha_4) &= \begin{cases} \frac{\alpha_4 - 0}{0.175} & 0 \leq \alpha_4 \leq 0.175 \\ 1 & 0.175 \leq \alpha_4 \leq 0.225 \\ \frac{0.40 - \alpha_4}{0.175} & 0.225 \leq \alpha_4 \leq 0.40 \end{cases} \\ \mu_M(\alpha_4) &= \begin{cases} \frac{\alpha_4 - 0.25}{0.15} & 0.25 \leq \alpha_4 \leq 0.40 \\ 1 & 0.40 \leq \alpha_4 \leq 0.60 \\ \frac{0.75 - \alpha_4}{0.15} & 0.60 \leq \alpha_4 \leq 0.75 \end{cases} \dots(4) \\ \mu_L(\alpha_4) &= \begin{cases} \frac{\alpha_4 - 0.60}{0.175} & 0.60 \leq \alpha_4 \leq 0.775 \\ 1 & 0.775 \leq \alpha_4 \leq 0.825 \\ \frac{1 - \alpha_4}{0.175} & 0.825 \leq \alpha_4 \leq 1 \end{cases} \end{aligned}$$

Academic Supervision

$$\begin{aligned} \mu_G(\alpha_5) &= \begin{cases} \frac{\alpha_5 - 0}{0.15} & 0 \leq \alpha_5 \leq 0.15 \\ 1 & 0.15 \leq \alpha_5 \leq 0.25 \\ \frac{0.40 - \alpha_5}{0.15} & 0.25 \leq \alpha_5 \leq 0.40 \end{cases} \\ \mu_M(\alpha_5) &= \begin{cases} \frac{\alpha_5 - 0.30}{0.10} & 0.30 \leq \alpha_5 \leq 0.40 \\ 1 & 0.40 \leq \alpha_5 \leq 0.60 \\ \frac{0.70 - \alpha_5}{0.10} & 0.60 \leq \alpha_5 \leq 0.70 \end{cases} \dots(5) \end{aligned}$$

Monika Rathore and Uday Raj Singh

$$\mu_p(\alpha_5) = \begin{cases} \frac{\alpha_5 - 0.60}{0.15} & 0.60 \leq \alpha_5 \leq 0.75 \\ 1 & 0.75 \leq \alpha_5 \leq 0.85 \\ \frac{1 - \alpha_5}{0.15} & 0.85 \leq \alpha_5 \leq 1 \end{cases}$$

Antisocial Behavior

$$\begin{aligned} \mu_L(\beta) &= \begin{cases} 1 & \beta \leq 0.20 \\ \frac{0.40 - \beta}{0.20} & 0.20 \leq \beta \leq 0.40 \end{cases} \\ \mu_M(\beta) &= \begin{cases} \frac{\beta - 0.20}{0.20} & 0.20 \leq \beta \leq 0.40 \\ 1 & 0.40 \leq \beta \leq 0.60 \\ \frac{0.80 - \beta}{0.20} & 0.60 \leq \beta \leq 0.80 \end{cases} \dots(6) \\ \mu_H(\beta) &= \begin{cases} \frac{\beta - 0.60}{0.20} & 0.60 \leq \beta \leq 0.80 \\ 1 & 0.80 \leq \beta \end{cases} \end{aligned}$$

Following a thorough system analysis, the next step involves the establishment of the fuzzy rule base. The fuzzy rule base encompasses numerous rules, expressed as "if-then" statements, elucidating the connection between input and output variables. In the presented system, there are a total of 243 rule bases, involving five input variables and one output variable, with a selection illustrated in Figure 9. After the establishment of the rule base, the process of defuzzification is executed utilizing the centroid method outlined below. This approach enables the rule viewer to effortlessly analyse the antisocial behavior of college students.

$$\delta_{Centroid} = \frac{\sum_{i=0}^n \mu(\delta_i) \cdot (\delta_i)}{\sum_{i=0}^n \mu(\delta_i)} \dots\dots\dots(7)$$

During this procedure, Figure 10 illustrates the status of a case based on input and output variables. If the input variables—Antagonistic Nature at 71.8% (high), Parental Supervision at 81.6% (poor), Peer Pressure at 50% (Neutral), Socio-economic Status at 78% (low), and Academic Supervision at 50% (moderate) indicate these values, the student is undergoing Antisocial Behavior level of 83.9% (high). A three-dimensional representation of two input variables and an output variable can be presented using a surface viewer. Several instances of such visualizations are demonstrated in Figure 11, Figure 12, Figure 13, Figure 14, Figure 15, Figure 16, Figure 17, Figure 18, Figure 19, and Figure 20.

RESULTS

For this research study, we got in touch with some colleges situated in both rural and urban regions, affiliated with Dr. Bhimrao Ambedkar University Agra. The ultimate sample of 600 B. Sc. students was obtained through an offline survey. Out of the 600 participants, 396 (66%) were male, and 204 (34%) were female. Examining the outcomes related to levels of antisocial behavior, it is noted that within the sample of 600 students, 150 (25%) exhibit a low risk of antisocial behavior, 234 (39%) demonstrate a moderate risk, and 216 (36%) are at a high risk. The analysis further reveals that boys exhibit a higher susceptibility to antisocial behavior compared to girls. Below is the visual representation of these findings in graphical form.

CONCLUSIONS AND DISCUSSIONS

This paper introduced the notion of a fuzzy logic system and outlined its potential advantages in analysing complex behavioral phenomena. The innovative application of the fuzzy logic system has the potential to shed new light on the complex nature of antisocial behavior among college students. However, careful planning, ethical considerations, and a robust methodology are essential to ensure the validity and utility of the study. Understanding and finding other prominent factors causing antisocial behavior (such as extensive exposure to media violence via television,

Monika Rathore and Uday Raj Singh

movies, internet, video games, and cartoons) can help educators, parents, and communities to identify students at risk and implement targeted interventions that address underlying issues. As indulging in antisocial behaviors presents a substantial threat to the mental and physical health of students. It increases the susceptibility to so many issues such as alcoholism, cigarette smoking, drug use, a heightened risk of depression, and involvement in violent acts towards own self and others. So, early intervention, supportive environments, counselling, and positive reinforcement of pro-social behaviors are essential in addressing and mitigating antisocial behavior among college students. Thus, findings of this antisocial behavior research study by using fuzzy logic research successfully be applied practically. The insights gained from this study is very helpful for colleges and universities to address and prevent antisocial behavior among students. Thus, fuzzy logic system is proved as a valuable tool to understand and address antisocial behavior among college students by offering practical recommendations for college administrators, counsellors, and policymakers on how to use the insights gained from this study to develop more efficacious intervention and prevention strategies.

ABSTRACT

Throughout human history, reliance on plants for survival and health has persisted, with approximately 80% of the global population depending on plant-derived medications. Edible flowers, a tradition spanning diverse civilizations, not only enhance the aesthetic appeal of food but also contribute to health benefits by serving as an excellent source of phytochemicals, including phenolic compounds. These compounds, such as flavonoids and phenolic acids, act as naturally occurring antioxidants. Flowers of the *Moringa oleifera* plant provide a number of health advantages, including as hepatoprotective, anti-inflammatory, hysteric, and triglyceride, phospholipid, and blood cholesterol reductions. In a recent study focused on *Moringa oleifera* flowers, a premix was developed and analysed for total antioxidant capacity, including phenolic and DPPH, as well as Vitamin-C. The study aimed to determine the highest overall acceptability through sensory evaluation. For Khakhra, chocolate, and energy balls, the results revealed varying levels of total phenolic content 30mg%, 30mg%, and 15mg%, respectively. DPPH content was found to be 25mg% Khakhra, 40mg% chocolate, and 50mg% energy balls. Vitamin-C content was measured at 10mg% Khakhra, 20mg% chocolate, and 15mg% energy balls in the products with the highest overall acceptability. Sensory evaluations indicated that in Khakhra sample A scored the highest mean overall acceptability (17±1.77). In chocolate sample A also achieved the highest mean score (20±0.65). For energy balls, sample C emerged with the highest mean overall acceptability score (18±1.46). These findings underscore the potential of *Moringa oleifera* flowers in creating not only nutritionally rich products but also those with high sensory appeal, offering a holistic approach to both health and palatability.

Keywords: moringa oleifera, antioxidant, khakhra, medicinal and pharmaceutical, Sensory evaluation.

INTRODUCTION

It is difficult to define the term "antioxidant" in a purely chemical sense because it is always associated with oxidative stress and the environment of cells or organisms [1]. A diet rich in antioxidants overall may provide protection against diseases linked to oxidative stress [1]. Reactive oxygen and nitrogen species (ROS) and other free radicals are products of regular oxidative metabolic processes in cells. It is now believed that oxidative stress plays a major role in all inflammatory, ischemic diseases, cancer, hemochromatosis, AIDS, emphysema, organ transplantation, gastric ulcers, hypertension, and preeclampsia, neurologic diseases, alcoholism, smoking-related diseases, and many more [1]. The flower kingdom is quite large. Based on the reason they are cultivated, flowers may be roughly categorised into four primary groups: edible/kitchen/vegetable flowers, medicinal/commercial flowers, ornamental flowers, and commercial flower [2]. Flowers play a significant role in our lives and are connected to some of the most poignant times in human history, such as holidays and funerals. They are used for their nutritional and therapeutic qualities in addition to their appearance [3]. Edible flowers have long been a staple of human diets, having been thoroughly discussed in antiquated writings [4]. A green tree in the Moringaceae class that is full of nutrients, drumstick plants are grown all over the world, including in the US [5]. In English, this plant is known as horseradish tree, drumstick tree, or *Moringa oleifera* (*M. oleifera*). It is used by human beings as well as animals and has several commercial uses [6]. This tree's leaves, fruit, blossoms, and young branches are used as a very nutritious vegetable in a variety of countries, includes numerous African nations, Pakistan, the Hawaiian Islands, the Philippine islands, and India. For almost 5000 years, people have used it as a daily source of sustenance, especially in India [7]. It started in the north of India and quickly moved south, where two of the most often consumed vegetable sources are "Murungai keerai" (drumstick leaves) and "Murungaikaai" (drumsticks). Nearly all of Asia, almost all of Africa, South America, a small portion of the US, and a few regions of Europe have been colonised by the moringa tree [8]. The flowers are 2.5 cm diameter, bisexual, and have an excellent smell. They have a cream or white colour, with dots of yellow at the base. The whole economics are reportedly handled via a way of presenting pollen. 6–9. October to November is the rainy season, while April to May is the summer season, when flowers peak [9]. Das said that *M. oleifera* flowers have significant medical benefits, including hepatoprotective, anti-inflammatory, hysteric, and lowering of blood cholesterol, phospholipid, and triglyceride etc [10]. *M. oleifera* can be used as a galactagogue, rubefacient, antiscorbutic, diuretic, stimulant, purgative, antimicrobial, antibacteri [11], anti-inflammatory, antitumor, antioxidant, anti-aging agent, hypoglycemic, antipoetryroidism, anti-cellular [12], hypocholesterolemic, and antispasmodic.

The following is a list of the pharmacological properties of *Moringa oleifera* flowers as described by [10]:

1. *Moringa oleifera* flowers have diuretic, antihypertensive, and cholesterol-lowering properties.
2. As the well-known flavonoid quercetin is included in the alcohol and aqueous extracts from *Moringa oleifera* flowers, it was also discovered that these extracts significantly hepatoprotected the liver.
3. Pterigospermin on *Moringa oleifera* flower exhibits strong antibacterial and fungicidal properties.
4. The flowers are also thought to have strong anthelmintic properties, making them valuable medicinally.
5. At a dosage of 4 g/kg body weight, the methanolic extract of flower buds demonstrated antiulcerogenic effect against gastric ulcers caused by aspirin.
6. Flower infusions mixed in hot water have antispasmodic properties.

Numerous medical applications for the *M. oleifera* tree exist, including both therapy and prevention. It uses its bark, pods, oil, sap, leaves, roots, and flowers in traditional medicine [13]. Flowers can aid to improve bile flow by acting as a cholagogue, stimulant, tonic, and diuretic. The herb is also antimicrobial and may be used to make a heart circulation tonic [14].

Nutraceutical properties

Antioxidant Activity

**Rahi Shah and Dhruvi Jasani**

The plant is useful in the preservation sector because of its antioxidant properties [15]. Polyphenol content in plant flowers is considerable (19.31 mg/g of GAE of dry extract) [16]. It can be utilised as a naturally occurring chemical to stop the disease from starting and from progressing. The anti-inflammatory qualities of *M. oleifera* flower extract, as shown by [16], support the flower's historic usage in Oman and other Asian nations.

Neuroprotective Activity

Numerous studies have demonstrated a favourable association between oxidative stress and neurological illnesses, such as cerebral ischemia, autism, depression, and Alzheimer's disease [17]. It has been determined that plants with high antioxidant contents may be used as medicinal agents to combat ROS and stop neuronal damage. Because of its strong antioxidant properties, moringa oleifera may be utilised to treat neurological conditions.

Anti-inflammatory Activity

Serious medical diseases including cancer, ulcerative colitis, diabetes, atherosclerosis, sepsis, and arthritis can result from any prolonged infection [18]. In several areas, *M. oleifera*'s anti-inflammatory properties have been proven.

Anti-cancer Activity

The anticancer capabilities of the moringa oleifera tree have been proven by prior studies [19]. Cancer can result from oxidative stress caused by an imbalance in the body's antioxidant and free radical levels [20]. Consequently, *M. oleifera*'s abundance of antioxidants allows the plant to reduce oxidative stress, which in turn prevents cancer. In the present study the of premix of moringa oleifera flower was developed and it was analysed for total antioxidant capacity i.e phenolic and DPPH which contain with highest overall acceptability level through sensory evaluation. For khakhra there is incorporated on moringa oleifera flower powder along with wheat flour, bajra flour. High in protein, bajra flour is an excellent choice for vegans. It is also devoid of gluten and contains fibre, which is beneficial to heart health and diabetes. Although whole wheat flour has a low GI, it won't cause a spike in blood sugar, making it a great option for diabetics. For taste we have added red mirch powder, ajwain, salt, haldi and kasturi methi. For chocolate there is incorporated on moringa oleifera flower powder along with dark chocolate & nuts. Zinc, iron, and magnesium are among the minerals that are abundant in dark chocolate. It can lower inflammation and lower the risk of cardiovascular disease, among other health advantages. The plant used to make chocolate, cacao, has a lot of nutrients and antioxidants. Flavanols and polyphenols are among the substances found in dark chocolate that have antioxidant qualities. While the macronutrient profiles of protein, carbohydrates, and fat are generally similar in all nuts, the micronutrient profiles, which include vitamins and minerals, may vary significantly between varieties. Nuts are rich in phytochemicals that function as antioxidants, high in dietary fibre, low in saturated fats, and high in healthy fats. For energy bars there is incorporated on moringa oleifera flower powder along with dates, oats, nuts and flex seeds. Wet dates are higher in natural sugars and calories due to their moisture content, while dry dates are slightly lower in natural sugars and calories due to the dehydration process. Flax seeds have been associated with several health advantages, including better digestion and a lower risk of cancer, heart disease, and type 2 diabetes.

MATERIALS AND METHODS

The present study will be carried out to investigate the nutraceutical and functional property of *Moringa Oleifera*. The research work was conducted at the food and nutrition laboratory, M.Sc nutrition and dietetics, parul university, Vadodara, during the year.

Procurement of Raw Materials

The drumstick flower (*Moringa Oleifera*) was plucked from the drumstick tree. The drumstick flower was procured from the krishna farm.

**Rahi Shah and Dhruvi Jasani****Processing of Powder**

Flower of moringa oleifera was separated from branches then it was cleaned and then it was sundried for 10-15 days with consistent timing from 10am to 4pm. After that the dried flowers were formed in powder form through mixture and sieve a powder and store at -20°C to use further for analysis. That moringa flower powder was utilized to developed additional products i.e. khakhra, Chocolate and Energy Balls.

Development of Khakhra

The variant Sample A for wheat flour 45g, oats flour 40g, bajra flour 5g, moringa flower powder 10g, ajwain 2.5g, kasuri methi 5g and ghee 5g were added. Mix all ingredients and prepare a dough and make khakhra and roast on medium flame. The variant Sample B for wheat flour 45g, oats flour 42g, bajra flour 5g, moringa flower powder 7g, ajwain 2.5g, kasuri methi 5g and ghee 5g were added. Mix all ingredients and prepare a dough and make khakhra and roast on medium flame. The variant Sample C for wheat flour 45g, oats flour 45g, bajra flour 5g, moringa flower powder 5g, ajwain 2.5g, kasuri methi 5g and ghee 5g were added. Mix all ingredients and prepare a dough and make khakhra and roast on medium flame. The standard Sample D for wheat flour 50g, oats flour 45g, bajra flour 5g, ajwain 2.5g, kasuri methi 5g and ghee 5g were added. Mix all ingredients and prepare a dough and make khakhra and roast on medium flame (Table 1 and Figure 1).

Development of Chocolate

The variant Sample A for dark chocolate 75g, mix seeds 15g and moringa flower powder 10g were added. Mix all ingredients and prepare a batter put into molds and refrigerate it. The variant Sample B for dark chocolate 70g, mix seeds 15g and moringa flower powder 15g were added. Mix all ingredients and prepare a batter put into molds and refrigerate it. The variant Sample C for dark chocolate 80g, mix seeds 15g and moringa flower powder 5g were added. Mix all ingredients and prepare a batter put into molds and refrigerate it. The standard Sample D for dark chocolate 85g, mix seeds 15g were added. Mix all ingredients and prepare a batter put into molds and refrigerate it (Table 1 and Figure 2).

Development of Energy Balls

The variant Sample A for dates 35g, roasted oats 40g, mix nuts 20g, flax seeds 5g, and moringa flower powder 20g. Mix all ingredients and roast for 5 minutes and make balls and refrigerate it till 2 hours. The variant Sample B for dates 35g, roasted oats 40g, mix nuts 20g, flax seeds 5g, and moringa flower powder 15g. Mix all ingredients and roast for 5 minutes and make balls and refrigerate it till 2 hours. The variant Sample C for dates 35g, roasted oats 40g, mix nuts 10g, flax seeds 5g, and moringa flower powder 15g. Mix all ingredients and roast for 5 minutes and make balls and refrigerate it till 2 hours. The standard Sample D for dates 35g, roasted oats 40g, mix nuts 20g, flax seeds 5g. Mix all ingredients and roast for 5 minutes and make balls and refrigerate it till 2 hours (Table 1 and Figure 3).

Sensory evaluation

The jury consisted of 15 panellists each, who conducted sensory evaluation of the developed Khakhra on composite scoring test [16]. The panellists were in the range of 18-35 years. The panellists constituted of UG-PG students and professors of Parul university, Vadodara. The former response comprised a score of 9 whereas the latter carried a score of 1. Along with this, a composite rating score is termed as the 7-point composite rating score applied to ascertain the most suitable variant characterized from the specific organoleptic attributes namely; colour, flavour, taste, texture, and overall.

Antioxidant analysis

The Antioxidant analysis of Khakhra was performed at Biomes Laboratory located at Gujarat. A standard approach was used to analyse total phenol, DPPH and Vitamin-C. The analysis of Total phenol was performed by using Folin-Ciocalteu method, DPPH and Vitamin-C was estimated by Spectrophotometric method.

Statistical analysis

The statistical analysis was carried out using the MS office16s [excel]. Through sensory evaluation by ANOVA it was conclude that there is no significance between total phenol and DPPH.

RESULT

Sensory evolution of khakhra

In khakhra all the parameters have been tested according to the colour, taste, flavour, texture and overall acceptability the following result were obtained where, Colour sample C > sample B > sample D > sample A result is $17\pm 1.06 > 17\pm 1.25 > 17\pm 1.55 > 17\pm 2.10$ respectively. The criteria for the flavour showed that sample A > sample C > sample B > sample D result is $17\pm 2 > 16\pm 1.51 > 16\pm 1.81 > 16\pm 1.92$ respectively. The criteria for the taste showed that sample A > sample C > sample D > sample B result is $17\pm 1.85 > 16\pm 1.25 > 16\pm 1.41 > 16\pm 1.64$ respectively. The criteria for the texture showed that sample A > sample B > sample C > sample D result is $18\pm 1.55 > 17\pm 1.46 > 17\pm 1.46 > 17\pm 1.73$ respectively. The criteria for the overall acceptability showed that sample A > sample D > sample C > sample B result is $17\pm 1.77 > 17\pm 1.82 > 16\pm 1.06 > 16\pm 1.64$ respectively. The overall acceptability of khakhra is high in sample A which is having (45% Whole Wheat flower+ 40% Oats flower+ 5% Bajra flower+ 10% Moringa flower powder). As sample A has highest percentage of moringa flower powder i.e 10% than rest of others so it concludes that it has high in anti-oxidant, anti-diabetic, anti-urolithic, anti-ulcer and anti-asthmatic.

Sensory evolution of chocolate

In chocolate all the parameters have been tested according to the colour, taste, flavour, texture and overall acceptability the following result were obtained where, Colour sample A > sample C > sample D > sample B result is $19\pm 1.13 > 19\pm 1.13 > 19\pm 1.19 > 19\pm 1.36$ respectively. The criteria for the flavour showed that sample A > sample C > sample D > sample B result is $19\pm 0.84 > 18\pm 1.51 > 18\pm 1.92 > 17\pm 2.13$ respectively. The criteria for the taste showed that sample A > sample D > sample C > sample B result is $19\pm 0.84 > 18\pm 1.30 > 18\pm 1.46 > 18\pm 2.49$ respectively. The criteria for the texture showed that sample A > sample D > sample C > sample B result is $19\pm 0.84 > 18\pm 1.46 > 18\pm 1.81 > 18\pm 2.10$ respectively. The criteria for the overall acceptability showed that sample A > sample D > sample C > sample B result is $20\pm 0.65 > 18\pm 0.92 > 18\pm 1.60 > 18\pm 2.13$ respectively. The overall acceptability of chocolate is high in sample A which is having (70% Dark chocolate+ 15% Mix seeds+ 15% Moringa flower powder). As sample A has highest percentage of moringa flower powder i.e 15% than rest of others so it concludes that it has high anti-oxidant, anti-diabetic, anti-urolithic, anti-ulcer and anti-asthmatic.

Sensory evolution of energy balls

In energy balls all the parameters have been tested according to the colour, taste, flavour, texture and over all acceptability the following result were obtained where, Colour sample C > sample D > sample B > sample A result is $18\pm 1.84 > 18\pm 1.88 > 17\pm 1.73 > 17\pm 1.88$ respectively. The criteria for the flavour showed that sample C > sample D > sample A > sample B result is $17\pm 1.84 > 17\pm 2.23 > 15\pm 1.77 > 15\pm 2$ respectively. The criteria for the taste showed that sample C > sample D > sample B > sample A result is $17\pm 1.68 > 17\pm 2.41 > 16\pm 2.03 > 15\pm 1.81$ respectively. The criteria for the texture showed that sample B > sample D > sample C > sample A result is $17\pm 2.26 > 17\pm 2.36 > 17\pm 2.38 > 16\pm 1.60$ respectively. The criteria for the overall acceptability showed that sample C > sample D > sample B > sample A result is $18\pm 1.46 > 18\pm 2.06 > 17\pm 1.88 > 16\pm 1.30$ respectively. The overall acceptability of energy balls is high in sample C which is having (35% Dats+ 40% Rosted oats+ 20% Mix nuts+ 5% Flax seeds+ 10% Moringa flower powder). sample C has moringa flower powder contain 10%.

Antioxidant Parameters

Total phenol

In the present study, total phenol compound was analysed from three different food product development from drumstick flower i.e khakhra, chocolate & energy balls. In khakhra the value of phenol for sample A which has high acceptably value evaluated by sensory evaluation is 30mg% the khakhra sample A, 30mg% the chocolate sample A

**Rahi Shah and Dhruvi Jasani**

and 15mg%. Through sensory evaluation by ANOVA it was conclude that there is no significance between total phenol and DPPH.

DPPH

In the present study, DPPH compound was analysed from three different food product development from drumstick flower i.e khakhra, chocolate & energy balls. In khakhra the value of DPPH for sample A which has high acceptably value evaluated by sensory evaluation is 25mg% the khakhra sample A, 40mg% the chocolate sample A and 50mg% the energy balls sample C. Through sensory evaluation by ANOVA it was conclude that there is no significance between total phenol and DPPH.

Vitamin-C

In the present study, Vitamin-C compound was analysed from three different food product development from drumstick flower i.e khakhra, chocolate & energy balls. In khakhra the value of Vitamin-C for sample A which has high acceptably value evaluated by sensory evaluation is 10mg% the khakhra sample A, 20mg% the chocolate sample A and 15mg% the energy balls sample C.

DISCUSSION

The result of total phenolic contain of three different products of moringa oleifera flower having highest overall acceptability evaluated by sensory evaluation is 30mg% for Khakhra, 30mg% for chocolate and 15mg% for energy balls. Through sensory evaluation by ANOVA it was conclude that there is no significance between total phenol and DPPH. The result of DPPH contains of three different products of moringa oleifera flower having highest overall acceptability evaluated by sensory evaluation is 25mg% for Khakhra, 40mg% for chocolate and 50mg% for energy balls. Through sensory evaluation by ANOVA it was conclude that there is no significance between total phenol and DPPH. The result of Vitamin-C contains of three different products of moringa oleifera flower having highest overall acceptability evaluated by sensory evaluation is 10mg% for Khakhra, 20mg% for chocolate and 15mg% for energy balls. The findings of sensory evaluation revealed that the highest mean score of colour was observed in khakhra sample C (17 ± 1.06) and lowest in khakhra sample A (17 ± 2.10). However, no significant difference was seen in colour score of khakhra sample. The lowest mean score of flavour was seen in khakhra sample D (16 ± 1.92) and highest in khakhra sample A (17 ± 2). khakhra sample A showed a significant difference with khakhra sample D. The highest mean score of taste was observed in khakhra sample A (17 ± 1.85) and lowest in khakhra sample D (16 ± 1.64). khakhra sample A showed a significant difference with khakhra sample D. The highest score of texture was observed in khakhra sample A (18 ± 1.55) and lowest in khakhra sample D (17 ± 1.73). khakhra sample A showed a significant difference with khakhra sample D.

The mean score of overall acceptability was highest in khakhra sample A (17 ± 1.77) and lowest was in khakhra sample B (16 ± 1.64). The findings of sensory evaluation revealed that the highest mean score of colour was observed in chocolate sample A (19 ± 1.13) and lowest in chocolate sample B (19 ± 1.36). However, no significant difference was seen in colour score of chocolate sample. The lowest mean score of flavour was seen in chocolate sample B (17 ± 2.13) and highest in chocolate sample A (19 ± 0.84). chocolate sample A showed a significant difference with chocolate sample B. The highest mean score of taste was observed in chocolate sample A (19 ± 0.84) and lowest in khakhra sample B (18 ± 2.49). chocolate sample A showed a significant difference with chocolate sample B. The highest score of texture was observed in chocolate sample A (19 ± 0.84) and lowest in chocolate sample B (19 ± 2.10). However, no significant difference was seen in texture score of chocolate sample. The mean score of overall acceptability was highest in chocolate sample A (20 ± 0.65) and lowest was in chocolate sample B (20 ± 2.13). However, no significant difference was seen in overall acceptability score of chocolate sample. The findings of sensory evaluation revealed that the highest mean score of colour was observed in energy balls sample C (18 ± 1.84) and lowest in energy balls sample A (17 ± 1.88). energy balls sample C showed a significant difference with energy balls sample A. The lowest mean score of flavour was seen in energy balls sample B (15 ± 2) and highest in energy balls sample C (17 ± 1.84).

Rahi Shah and Dhruvi Jasani

energy balls sample C showed a significant difference with energy balls sample B. The highest mean score of taste was observed in energy balls sample C (17 ± 1.68) and lowest in energy balls sample A (15 ± 1.81). energy balls sample C showed a significant difference with energy balls sample A. The highest score of texture was observed in energy balls sample B (17 ± 2.26) and lowest in energy balls sample A (16 ± 1.60). energy balls sample B showed a significant difference with energy balls sample A. The mean score of overall acceptability was highest in energy balls sample C (18 ± 1.46) and lowest was in energy balls sample A (16 ± 1.30). energy balls sample C showed a significant difference with energy balls sample.

ABSTRACT

Chloroxylon swietenia is one of an important plant species used in the field of traditional medicine to treat the ailments like cataract, common cold, cough, skin fungal infections, and ophthalmic infections. *C. swietenia* belongs to the dry deciduous forests as a tropical aromatic tree (also known as east indian satin wood). In the present study, we showed the biological characterization, antibacterial, anticandidal, antioxidant, antibiofilm activities of *C. swietenia* leaf extracts [*C. swietenia* leaf methanolic (CSLM) extract, and *C. swietenia* leaf ethanolic (CSLE) extract]. Results of the present study showed the presence of active biochemical compounds present in CSLM, and CSLE extracts with the help of gas chromatography - mass spectroscopic (GC-MS) analysis. Thus GC-MS analysis showed the presence of presence of 12 different compounds with different retention time in the chromatogram. Followed by the identification of active biochemical compounds, *in vitro* assays (antibacterial, anticandidal, antioxidant, *invitro* thrombolytic activity, and antibiofilm) were performed to determine the biological activities of CSLM, and CSLE extracts against different bacterial and fungal species. Results of *in vitro* assays were showed that CSLE has strong anti bacterial, anti candidal, and anti oxidant activity compared to CSLM against different bacterial and fungal species. Other than this, CSLM has a strong *in vitro* thrombolytic activity against CSLE in the laboratory conditions. Collectively, *in vitro* assays showed the presence of anti bacterial, anti candidal, anti oxidant, *in vitro* thrombolytic, and anti biofilm activities of *C. swietenia* leaf extract. The

**Murugan Mukilan et al.,**

present study also reported that anti biofilm activity of *C. swietenia* leaf extract may also act as a potential target for treating *Escherichia coli* induced biofilm formation in the oral cavity.

Keywords: *Chloroxylon swietenia*, GC-MS analysis, *In vitro* assays, *Escherichia coli*

INTRODUCTION

In recent years, antibiotic resistance (AR) is rising to highly dangerous in different parts of the earth. This AR results in the inability to cure/suppress the disease progression. As a result of AR development, there is an increased mortality across the globe due to the spread of infectious diseases (ID) and its treatment failure. Many of these ID shows high resistance to antibiotics used for the treatment of various diseases (1-6). As per the need of the hour, now a day's more amount of research was underwent in the field of traditional medicine to cure the disease without any side effects. On the other side, finding of suitable medicinal plant for a particular disease is easy but some bimolecular identification and its *in vitro* assays has to be done for several plants (7-15). *Chloroxylon swietenia* is a tropical, deciduous, and medium-sized tree belongs to southern india, sri lanka, and madagascar. *C. swietenia* has a strong cylindrical stem with a girth of 3-4 feet, leaf of 15-23 cm long which showing pinnate leaflets. Most of the *C. swietenia* plant parts were used in the traditional medicine of india (siddha, and ayurveda). Compared to other parts, leaf paste is mostly used for the treatment of headache, burns, cuts, wounds, skin diseases, and rheumatism due to their antifungal and antibacterial activities (16-22). Other than antifungal and antibacterial activity, *C. swietenia* leaf extract also have hepatoprotective, anti-inflammatory, antioxidant, antifeedant, antihelminthic, ovicidal, larvicidal, and insecticidal properties (16, 23-28). The present study was designed to identify the presence of active biochemical substances present in *C. swietenia* leaf extract using GC-MS analysis and *in vitro* assays was performed to check the presence of antibacterial, anticandidal, antioxidant, *in vitro* thrombolytic, and antibiofilm activities of *C. swietenia* leaf extract using customized assays in laboratory conditions.

MATERIALS AND METHODS

Collection of Plant Material and its Extract Preparation

Fresh leaf materials of *Chloroxylon swietenia* were collected locally from Palakkad, Kerala District, India. After collection, plant material was washed to remove debris and dust particles followed by shade drying for 5 days. After 5 days, shade dried plant material was grounded into a moderate fine powder. Ethanolic and methanolic leaf extracts of *C. swietenia* were prepared using soxhlet apparatus (SA).

Gas Chromatography - Mass Spectroscopic (GC-MS) analysis of leaf extracts

GC-MS analysis was performed to unravel the chemical profile of *C. swietenia* leaf methanol extracts (CSLME), and *C. swietenia* leaf ethanol extracts (CSLE). For this study, GC-MS was performed using varian 3800 gas chromatography equipped with 1200 L single quadruple mass spectrometer. In this study, mass spectrometer (MS) operated with the electron impact of 70 ev. Ion source and transfer line temperature was maintained at 250°C. The compounds was identified based on comparisons of their retention indices (RI), retention time (RT) and mass spectra.

In vitro assays

Anti bacterial screening assay

Anti bacterial activity of CSLME and CSLE were tested against three different bacterial pathogens (*Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*) acquired from PSG Medical College, Coimbatore, Tamil Nadu, India. For the detection of antibacterial activity, agar well diffusion method was employed in this study. Initially, pure cultures were grown in nutrient broth for arousal of overnight cultures. Later on, rised overnight cultures were swabbed over nutrient agar using sterile cotton swabs in a uniform manner. Subsequently, wells of 5 mm diameter

**Murugan Mukilan et al.,**

were punctured using a sterile well borer. Methanolic plant extract of 40 microlitre (μl), 50 μl , and 80 μl with silver nanoparticles were aseptically loaded into the well. Standard antibiotic ampicillin was used as a positive control.

Anti fungal Activity

The inoculums of fungal test organisms were prepared by growing pure isolates (*Candidal albicans*, *Candidal glabarrata*, *Candidal tropicalis*) in sabouraud dextrose broth at 37°C for overnight. The sterile potato dextrose agar medium is cooled and then poured into sterile plates and allow to solidify. Test organisms were swabbed in the plate using sterile cotton swabs. Wells are made with sterile cork –border and 40 μl , 50 μl , 80 μl of AgNPs and methanolic extracts was added corresponding wells. Flucanazole is used as standard anti-fungal agents. The agar plates were incubated at room temperature for 24 hours. The diameter of zone of inhibition was measured in millimeter(mm) method.

Anti oxidant Assay**DPPH radical scavenging activity**

The antioxidant activity of the sample was determined was determined using 2,2-Diphenyl-1-picrylhydrazyl (DPPH), hydroxyl radical scavenging (HRS), and ferric reducing antioxidant power (FRAP) assays. Initially, DPPH assay was performed to identify the radical scavenging ability of the sample using the radical DPPH assay. Varying concentration of 20-100 μl samples were taken. All samples were adjusted to the volume of 100 μl using non-polar solvent (methanol). DPPH assay was performed according to the protocol mentioned (29).

Ferric reducing antioxidant power (FRAP) assay

Ferric reducing antioxidant power (FRAP) assay was performed to identify the ferrous ions chelation by the extract. In this FRAP assay, four different concentration of extract was used (20 μl , 40 μl , 60 μl , and 100 μl) along with 50 μl of 2mM ferric chloride (FeCl_2). Later on, 250 microlitre of 5 millimole mM ferrozine solution was added to the reaction mixture for the initiation of reaction along with vigorous shaking. Further incubation time of 10 minutes was given for the completion of reaction. Absorbance was measured at 562 nanometer nm with the help of positive control (Na_2EDTA).

Hydroxyl radical scavenging (HRS) activity

Hydroxyl radical scavenging (HRS) activity was performed to identify the capability of samples to form hydroxyl radicals. Prepared reaction mixture contains 60 μl of 1.0 mM FeCl_2 , 90 μl of 1mM 1, 10- phenanthroline, 2.4 millilitre mL of 0.2 molar M phosphate buffer (pH 7.8), 150 μl of 0.17 M H_2O_2 , and various concentration of plant extract. Different concentration of these extracts (20 μl , 40 μl , 60 μl , and 100 μl) was examined using 96-well microplate method. Later on, hydrogen peroxide (H_2O_2) was added to the reaction mixture after the completion of incubation in the room temperature for 5 minutes. Finally, sample absorbance was measured at the wavelength of 517 nm. HRS activity was used to calculate the inhibitory percentage of IC_{50} against different concentrations of sample extract.

In vitro Thrombolytic Activity

In vitro Thrombolytic Activity (ITA) assay was performed to evaluate thrombolytic activity of sample extracts. In ITA assay, 500 μl of fresh blood was taken in sterile microfuge tubes and incubated for 45 minutes at 37°C. Incubation time results in the formation of clot with the presence of serum as a top layer. After incubation, weight of serum free formed clot was taken to identify initial clot weight. Later on, 10, and 20 microgram (mg)of methanolic extracts and silver nanoparticles were added along with 200 μl of aspirin and 100 μl of double distilled water to the initial clot tubes. After addition, all tubes were incubated for a period of 90 minutes at 37°C for the identification of clot lysis. Followed by incubation, final clot disruption weight was taken by removing the fluids present in the tubes. Difference between the initial and final clot weight was used to express the clot lysis in percentage form.

In vitro Cytotoxicity Assay

Cytotoxicity was measured by performing MTT assay.

Anti Biofilm assay

Anti biofilm assay (ABA) was performed to identify the effect of sample extracts against the *E.coli* induced biofilm formation. In ABA assay, 100 µl of luria-bertani broth were taken along with 10 µg/ml of plant extract in 96 well plates. Later on, 10 µl of *E.coli* overnight culture was added to all the wells and incubated at 37°C for 24 hours. After incubation, wash the wells with 1 % NaCl by removing all floating liquid present in it. Then, formed biofilms were stained with the help of 0.4 % crystal violet for 10 minutes. Finally, absorbance was measured at 550 nm with the help of enzyme linked immunosorbent assay (ELISA) reader.

RESULTS AND DISCUSSION

Role of gas chromatography-mass spectroscopic (GC-MS) analysis in the identification of chemical constituents in the leaf extract of *Chloroxylon swietenia*

The methanol and ethanol leaf extract of *C. swietenia* subjected to GC-MS analysis revealed the chemical composition which is shown in table 1. The chromatogram showed peaks which confirmed the presence of 12 different compounds with different retention time. It was also gave a clear picture regarding the presence of chemical constituents and its concentration in the sample. From these 12 compounds 6 compounds found to be have highest peak value. The peak intensity of Benzaldehyde, 2-nitro-diaminomethylidenhydrazone was found to be higher with a retention time of 28.16 minutes compared to other 5 compounds (Table 1).

Anti microbial activity of *Chloroxylon swietenia* leaf extract against different bacterial (*Escherichia coli*, *Staphylococcus aureus*) and fungal (*Candida albicans*, *Candida glabrata*, *Candida krusei*, and *Candida tropicalis*) species

In the first phase of antimicrobial activity, antibacterial property of *C. swietenia* leaf extract was tested against two different bacterial pathogens i.e. *E. coli*, and *S. aureus*. Two different solvent extracts (methanol, and ethanol) of *C. swietenia* were tested for antibacterial activity. Results of antibacterial activity showed that *C. swietenia* ethanol leaf extract was found more effective against *E. coli* and *S. aureus* compared to methanol extract. For the antibacterial activity, antibiotic named as streptomycin and ampicillin were used as positive controls (Figure 1). Second phase of antimicrobial activity was carried out to determine the anticandidal effect of *C. swietenia* leaf extract was tested against *Candida albicans*, *Candida glabrata*, *Candida krusei*, and *Candida tropicalis*. Results of anticandidal assay showed that ethanolic extract was found to be more effective against all four fungal species compared to methanolic extract. Surprisingly, methanolic extract does not show any effect against *C. tropicalis* compared to other three different fungal species. In this assay, antibiotic flucanazole was used as a positive control (Figure 2).

Detection of *invitro* thrombolytic activities of methanolic and ethanolic *Chloroxylon swietenia* leaf extracts

Thrombolytic activity of *C. swietenia* leaf extracts (ethanolic, methanolic) were tested for the percentage of clot lysis. Among the plant extracts, ethanolic extract has highest thrombolytic activity of 28 % in the concentration of 50 µl (10 mg/ml). Compared to ethanolic extract, methanolic extract has a reduced thrombolytic activity of 20 % in the concentration of 10 mg/ml and also have the lowest thrombolytic activity of 8.5 % in 5 mg/ml (Figure 3).

Use of 2,2-Diphenyl-1-picrylhydrazyl (DPPH) assay, Hydroxyl radical scavenging (HRS) activity, and Ferric reducing antioxidant power (FRAP) analysis methods in identification of total antioxidant capacity (TAC) analysis

The TAC analysis were carried out in three different phases using DPPH, FRAP, and TAC methods. In first phase, DPPH assay was used to determine the antioxidant potential of *C. swietenia* leaf extracts prepared using ethanolic and methanolic solvents. Results of DPPH assay showed that ethanolic extract has better antioxidant potential compared to the methanolic extract. It was also showed that in higher concentration plant extract forms more number of free radicals compared to the IC₅₀ value. Followed by the DPPH assay, HRS activity was performed to understand the better antioxidant scavenging activity of leaf extracts. Results of this assay validated the results of DPPH assay and stated IC₅₀ values for ethanolic (80 µl) and methanolic (100 µl) extracts. Using the FRAP analysis, It was proved that ethanolic and methanolic leaf extract of *C. swietenia* has the most active extract which is interfered

**Murugan Mukilan et al.,**

with the formation of ferrous and ferrozine complex. It was also stated that it may act as chelating agent and captures ferrous ion before the formation of ferrozine. Results of FRAP analysis showed that IC₅₀ value for both extract shown as 10 mg/ml, which is lower than the positive standard (Figure 4).

Impact of synthesized silver nanoparticles on anticancerous activity of *Chloroxylon swietenia* leaf extract against HeLa cell line

Anti cancerous activity (ACA) of synthesized silver nanoparticles from the leaf extract of *C. swietenia* (CS-AgNPs) was investigated against human cervical cancer cells. ACA of CS-AgNPs were tested in three different concentrations i.e. low (control), medium (12 µg/mL), and high (25 µg/mL). Results of ACA showed that inhibition percentage differ in all three sample concentrations. Control did not show any inhibition, compared to control 12 µg/mL showed an moderate level of inhibition (8.65 %), and high level of inhibition present in the concentration of 25 µg/mL (Figure 5).

Identification of antibiofilm properties of *Chloroxylon Swietenia* leaf extract against *Escherichia coli*

Ethanollic and methanollic extracts of *C. swietenia* was tested for their antibiofilm properties against *E. coli*. Results of antibiofilm assay showed that both ethanollic and methanollic leaf extract demonstrated moderate anti-biofilm activity, and the influence was the best on ethanollic extract were the IC₅₀ value was 67.84 % which is present in the concentration of 60 µl. The extract inhibitory effect was also studied using different concentrations (20µl, 40µl, 60µl, 80 µl and 100 µl) against *E. coli*. Results of inhibitory studies showed that percentage of inhibition was high at the concentration of 20 mg/mL (Figure 6).

CONCLUSION

In the present study, shade dried *C. swietenia* leaves were used for the preparation of methanollic and ethanollic extracts. Collected extracts were subjected to the GC-MS analysis for unraveling the chemical constituents present in it. Results of GC-MS analysis showed the presence of 12 different compounds in both the extracts and its highest level was observed for benzaldehyde, 2-nitro- diaminomethylidenedihydrazone by the retention time of 28.16 minutes. Followed by GC-MS analysis, Anti microbial activity of *C. swietenia* leaf extract was tested against two different bacterial (*E. coli*, *S. aureus*) and three different fungal (*C. albicans*, *C. glabrata*, *C. krusei*, and *C. tropicalis*) species. Observed results were proved that ethanollic leaf extract was found more effective against bacterial and fungal species compared to methanollic extract. Thrombolytic assay also showed that methanollic extract has a reduced thrombolytic activity compared to ethanollic extract. Later on, results of antioxidant and anti-biofilm assay proved that ethanollic and methanollic leaf extract of *C. swietenia* has both antioxidant and antibiofilm activity in an efficient manner. Outcome of the present study elucidated the role of *C. swietenia* ethanollic extract in the development of antimicrobial, antioxidant, and antibiofilm activities with an anticancerous property for its usage in the treatment of cancerous outgrowth.

ABSTRACT

The aim of present work is to assess the *in-vitro* anti-inflammatory property of ethanolic stembark extract of *Psychotria dalzellii* Hook.f. from Western Ghats region, Karnataka, India. *In-vitro* anti-inflammatory potential was evaluated by Human red blood cell (HRBC) membrane stabilization assay and protein denaturation assay. The ethanolic stembark extract of *P. dalzellii* exhibited considerable membrane stabilization activity with $60.31 \pm 0.66\%$ of membrane stabilization at $500 \mu\text{g mL}^{-1}$ concentration and showed significant protein denaturation with $80.95 \pm 1.71\%$ of inhibition of protein denaturation at $250 \mu\text{g mL}^{-1}$ concentration with regards to standard Aspirin. The results obtained in the present study indicate that ethanolic stembark extract of *P. dalzellii* possesses promising anti-inflammatory property. Which can be used to design the anti-inflammatory medication.

Keywords: *Psychotria dalzellii*, Anti-inflammatory, Protein denaturation, HRBC.

INTRODUCTION

Inflammation is a defensive reaction exhibited by the body to injury, infections or destructions characterised by redness, pain, heat, swelling and loss of function in the injured area. This response is triggered by chemical mediators released by injured tissue and migratory cells. i.e., the injuries cause tissue cells to secrete vasoactive amines (histamine, serotonin), arachidonic acids (prostaglandins, leukotrienes) and cytokines (tumour necrosis factor and interleukin-1). All these factors collectively cause greater vasodilation (widening of blood capillaries) and capillary permeability, which results in more blood flow to the injured area. These substances operate as chemical messengers that attract some of the body's natural defence cells known as chemotaxis [1]. Thus, it was a complex mechanism, which is frequently associated with pain and involves occurrences such as: membrane alteration, increase in protein denaturation and increased vascular permeability[2]. There are two kinds of inflammation: acute and chronic inflammation. Acute inflammation is the first reaction to injury and it is brought on by increase in the flow of plasma and leukocytes from the bloodstream into the injured tissues. This process of acute inflammation gets started by the cells already existing in tissues. The inflammatory mediators cause significant vascular alterations, such as vasodilation and increased capillary permeability [3]. Chronic inflammation, also known as prolonged inflammation, is the ongoing response to injury that results in a progressive shift in the type of cells present at the point of inflammation. It is distinguished by the simultaneous destruction and healing of the tissues caused by the inflammatory process [2].

To treat the consequences of inflammation, anti-inflammatory medicines, such as steroids or nonsteroidal anti-inflammatory drugs (NSAIDs) are commercially accessible. They work by inhibiting cyclooxygenases (COX) enzymes, which involved in the production of prostaglandins, a substance that promote inflammation, pain and fever. However, the use of these typical NSAIDs leads to various side effects [4]. As an alternative, plant-based medicines are getting increased therapeutics marked share due to their mild action and fewer adverse effects. Species from *Psychotria* are used in folk medicine against inflammatory diseases [5]. In this sense, considering the folk use of *Psychotria* genus against process regulated by inflammatory mediators, but without scientific evidence of this potential therapeutic application, prompted research of *Psychotria dalzellii*. Thus, this study aimed at evaluating the anti-inflammatory effect. Among this *Psychotria* genus, *Psychotria dalzellii* is most abundant and commonly found plant in forest as undergrowth endemic to the western Ghats region. *P. dalzellii* large shrubs, up to 6 m tall, leaves up to 12-25×5-10 cm long, obovate-oblong, obtuse at apex, coriaceous, gradually narrowing towards the petiole at the base; petiole up to 2.5 cm long, stipules 1.5-2 cm long. Lower cyme branches 3-5 together in 1-2 distant whorls; bracts and bracteoles are large and persistent. Flowers white, sessile, 2-5 together at the termination of the branches in terminal peduncled cymes up to 15cm long. The calyx is generally campanulate, with ovate-oblong lobes that are sharp. Fruits; a drupe, black when ripe, albumen ruminant. May to October is the flowering and fruiting season [6].

MATERIALS AND METHODS

Plant sample collection and authentication

P. dalzellii fresh stem bark samples were collected from Western Ghats, Karnataka, India. The plant was identified by taxonomy experts and a specimen was deposited in the Department of Applied Botany, Kuvempu University, Shivamogga

Extraction process

The collected *P. dalzellii* stem bark samples were washed with water and shade dried, later they were mechanically ground well to powder. The powdered stem bark of *P. dalzellii* was extracted with Soxhlet extractor using ethanol. After filtration, obtained crude extracts were air-dried and then stored in tight vials at 4°C temperature.

Aralahalli Borappa Thejashree *et al.*,

***In vitro* Anti-inflammatory activity**

Human Red Blood Cells (HRBC) Membrane Stabilization Assay

In-vitro anti-inflammatory activity of ethanolic stem bark extract of *P.dalzellii* was evaluated by using HRBC membrane stabilization technique is incorporated by following Gandhidasan *et al* [7]. Fresh blood sample (2 ml) was collected from healthy human volunteers who had not taken any NSAIDs for 2 weeks prior to the experiment and it was combined with equal volume of sterilized Alsevers solution (0.8% sodium citrate, 2% dextrose, 0.5% citric acid and 0.42% NaCl in distilled water). This blood solution was centrifuged about 10 minutes at 3000 rpm, and the packed cells were separated. The packed cells were washed three times with isosaline (0.85%, pH 7.2). The volume of the blood was measured and reconstituted as 10% v/v suspension with isosaline. This HRBC solution has been utilised to estimate the anti-inflammatory property. The varying concentrations like 100, 200, 300, 400 and 500 µg/ml of *P. dalzellii* extract were made. The reference sample (Aspirin) and control were separately blended with 2 ml of hyposaline (0.36 %), 1 ml of phosphate buffer (pH 7.4, 0.15 M) and 0.5 ml of HRBC suspension (10% v/v). All the assay mixtures were incubated at 37°C for 30 min and centrifuged at 3,000 rpm for 20 min. The supernatant solution was decanted and the hemoglobin content in the suspension was estimated by a spectrophotometer at 560 nm [8]. Percentage of stabilization was determined by following formula.

$$\% \text{ of stabilization} = [(A_c - A_s) / A_c] \times 100$$

Where, A_c = Absorbance of control and A_s = Absorbance of test sample

Protein Denaturation Assay

The anti-inflammatory activity of ethanol stem bark extract of *P. dalzellii* was studied by using inhibition of protein denaturation method [9]. The 5 ml of reaction mixture was prepared by adding 0.2 ml of fresh hen's egg albumin with the 2.8 ml phosphate-buffered saline (pH: 6.4) and 2 ml of varying concentration of ethanol stem bark extract (50-500 µg/mL). Double distilled water 2 ml was served as control. The mixture was incubated for 15 minutes at $37 \pm 2^\circ\text{C}$ and then heated for 5 minutes at 70°C . After cooling, their absorbance was measured on spectrophotometer at 660 nm by using vehicle as blank. Aspirin was used as standard and treated similarly for determination of absorbance. The percentage of inhibition of protein denaturation was analysed by the given formula as follow:

$$\% \text{ of inhibition of protein denaturation} = [(A_c - A_s) / A_c] \times 100$$

Where, A_c = Absorbance of control and A_s = Absorbance of test sample

Statistical analysis

The experimental data were expressed as mean \pm SEM. The values were calculated using statistical software Graph Pad PRISM 6.

RESULT

Anti-inflammatory activity

HRBC membrane stabilization assay

The ethanolic stem bark extracts of *P. dalzellii* was effective in inhibiting the hypotonicity induced hemolysis of HRBC membrane stabilization of 11.68 ± 0.25 , 26.45 ± 1.09 , 37.25 ± 0.92 , 47.71 ± 1.12 and $60.31 \pm 0.66\%$ at different concentrations 100, 200, 300, 400 and 500 µg/mL respectively. Whereas, for Aspirin it was found to be 34.14 ± 1.09 , 42.42 ± 0.50 , 52.03 ± 1.25 , 60.31 ± 0.66 and $75.37 \pm 1.04\%$ for same doses respectively as shown in the Table 1 and Figure 1. Dose dependant increase in the percentage of membrane stabilization was observed. It showed the considerable percentage of membrane stabilisation $60.31 \pm 0.66\%$ at concentration of 500 µg/ml. As compared to extract, Aspirin showed $75.37 \pm 1.0\%$ protection at same concentration. These results provide evidence for the membrane stabilizing effect of ethanolic extract of *P.dalzellii* as an additional mechanism for their anti-inflammatory activity.

Aralahalli Borappa Thejashree et al.,

Protein denaturation

The *in-vitro* anti-inflammatory test, the ethanolic stem bark extract of *P. dalzellii* showed mean inhibition of protein denaturation of 28.99 ± 1.57 , 41.89 ± 0.98 , 50.81 ± 1.39 , 66.44 ± 1.17 and $80.95 \pm 1.17\%$ for doses of 50, 100, 150, 200 and 250 $\mu\text{g/mL}$ respectively. Whereas, for Aspirin it was found to be 40.75 ± 0.58 , 52.12 ± 0.34 , 65.52 ± 0.39 , 79.56 ± 0.91 and $92.56 \pm 0.85\%$ for same doses respectively (Table 2 and Figure 2). It elicited profound concentration dependent inhibition of protein denaturation. The ethanolic stem bark crude extract of *P. dalzellii* exhibited a significant inhibition of protein denaturation with $80.95 \pm 1.7\%$ effect at 500 $\mu\text{g/mL}$ and standard medication Aspirin showed $92.56 \pm 0.85\%$ of protein denaturation at the same concentration.

DISCUSSION

There are many difficulties in employing animals in experimental pharmacological research, including ethical issues and lack of rationale for their usage in the early stages of drug discovery for anti-inflammatory diseases [10]. *In-vitro* investigations are useful for studying the cellular response in a closed system where the experimental conditions are kept constant. These *in-vitro* studies aid in improving an understanding of the mechanism of anti-inflammatory effect of herbal constituents [11]. In previous studies with several species of *Psychotria* genus have been reported to have anti-inflammatory properties [12-13]. In the present study, the *in-vitro* anti-inflammatory activity of stem bark ethanolic extract of *P. dalzellii* was evaluated, indexed via the protective activity of the extract against protein denaturation. In the assay of denaturation method, the egg albumin is denatured. Since, it occurs when proteins lose their tertiary and secondary structures due to external stress, such as strong acids or bases, concentrated inorganic salts, organic solvents or heat, thus leading them to lose their biological functionality. Therefore, denaturation of tissue proteins is recognized as a marker of inflammation [14]. The result showed that ethanolic stem bark extract of *P. dalzellii* inhibited albumin denaturation. i.e., $80.95 \pm 1.17\%$ at the concentration of 250 $\mu\text{g/mL}$. Whereas, standard Aspirin drug showed $92.56 \pm 0.85\%$ at the same concentration. It can be observed from the present study that ethanolic stem bark extract of *P. dalzellii* significantly inhibit the protein denaturation. Agents that can inhibit protein denaturation would be beneficial for anti-inflammatory medication development [15].

The *in-vitro* anti-inflammatory activity of stem bark ethanolic extract of *P. dalzellii* was also indexed via HRBC membrane stabilization assay [16]. The integrity of the cell membranes influences the viability of the cell. When RBCs are subjected to injurious substances, including hypotonic media, causes the membrane to lyse, resulting in hemolysis and hemoglobin oxidation [17]. The hemolytic action of hypotonic solution is associated with an excessive anticipation of fluid inside the cell, which causes the rupture of membrane. Such type of membrane degradation results in secondary damage through lipid peroxidation due to free radicals. Therefore, it is expected that substances with membrane-stabilizing qualities will provide a considerable level of protection for cell membranes against injurious substances [18-19]. In our study, absorbance of hemoglobin is taken. The hemoglobin is released as a result of lyses of RBC membrane. Due to stabilization of membrane less absorbance is noted in spectrometer results. From the result, the successive ethanolic stem bark extract of *P. dalzellii* exhibited membrane stabilizing effect by inhibiting hypotonicity induced lysis of erythrocyte membrane. Since, the RBC membrane has a similar structure to the lysosomal membrane. Its stabilization suggests that the extract might also be able to maintain lysosomal stability. It showed concentration dependant membrane stabilization activity. The highest percentage of membrane stabilization activity $60.31 \pm 0.66\%$ was observed at higher concentrations of the extract 500 $\mu\text{g/mL}$, as compared with $75.37 \pm 1.0\%$ membrane stabilization activity produced by standard drug Aspirin. Concerning to the anti-inflammatory activity, the findings of this investigation revealed that the phytoconstituents present in the *P. dalzellii* either alone or in combination, are responsible for having anti-inflammatory effect [20-21].

ABSTRACT

Orange peel is a byproduct produced primarily from citrus fruit juice industry. The present study was planned to investigate the operational parameters required to transform orange peel into candied orange peel (COP) and orange peel powder (OPP). Such ingredients can be effectively used as valued ingredients in various dairy (i.e. Ice cream, Frozen yoghurt) and food products. The initial moisture content of fresh orange peels was 76.25 percent. Blanching and debittering treatment to the peels led to an increase in their moisture content (i.e to 78.51 percent). When peels were treated osmotically in a hypertonic sugar solution (40–70°Brix) for 72 h maintained at 45±2°C sugar was gained with simultaneous loss of water. The sugar gain (SG) and water loss (WL) for such treated orange peels at 72 h were 818.38 g/kg peel and 150.58 g/kg peel, respectively. The conversion of orange peels into OPP helped to reduce its bulk, increase shelf-stability and ensured its availability throughout the year. The yield of OPP, considering osmo-treated peels as raw material was 49.85 percent. Such OPP was rich in β-carotene and fiber; the values were 77.40 µg/100 g and 4.10 percent, respectively. The average moisture content of COP and OPP was

36.75 and 7.21 percent, respectively. The findings will enable us to know the technological protocol involving osmo-dehydration coupled with other dehydration technique to develop valued food ingredient from citrus byproduct.

Keywords: Candied orange peel, Orange peel powder, Sugar gain, Valorization, Water loss

INTRODUCTION

Orange (*Citrus sp.*) is one of the citrus fruits that are abundant in India, and orange residue is a byproduct of the fruit industry that was previously restricted to animal feed but nowadays other avenues are being explored. Orange residue, like other citrus fruit residues, is composed of peel and pulp (the fraction screened from the juice). Citrus fruits are widely consumed globally, generating a substantial quantum of byproducts, especially peels. Traditionally, these peels were discarded or used for low-value applications, leading to environmental and economic concerns. However, orange peels containing several bioactive compounds, dietary fiber, and essential oils has immense potential for their valorization (Satari and Karimi, 2018). Orange peels, which represent between 50 - 65 percent of total orange fruit, are largely composed of cellulose, pectin, hemicellulose, lignin, chlorophyll pigments, and other low-molecular-weight compounds such as limonene (Pathak *et al.*, 2017). Improper disposal of these peels contributes to environmental pollution through landfilling or incineration, generating greenhouse gases and leachate (Kalengyo *et al.*, 2023). Valorization, the process of converting waste into valuable products, represents a sustainable solution by mitigating environmental impact and creating economic opportunities. Orange peels are rich in bioactive compounds, including phenolic acids, flavonoids, limonene, and dietary fiber (De La Torre *et al.*, 2019).

These compounds possess antioxidant, anti-inflammatory, and antimicrobial properties, making them valuable functional ingredients in food and pharmaceutical applications. Orange peel fiber also offers potential prebiotic benefits, promoting gut health (Zhou *et al.*, 2023). Transforming orange peels into candied and powdered forms presents a promising approach for their valorization. Candied peels are obtained by impregnating the peels in sugar solutions, resulting in a sweet and chewy product. Such ingredient can very well be used in bakery goods, confectionery, certain dairy products and desserts (Patel, 2017; Adil *et al.*, 2023). Powdered peels are produced by drying the peels and subsequent milling, yielding a versatile ingredient applicable in various food formulations, including dairy products (Anant Kumar *et al.*, 2019; Adil *et al.*, 2023). Dairy products, such as yogurt, ice cream, and cheese, offer a suitable matrix for incorporating candied or powdered orange peels. These peels can enhance the sensory attributes of dairy products by conferring flavor, color, and texture (Chandgude, 2019). Additionally, they can enrich the nutritional profile of dairy products by contributing ascorbic acid, β -carotene, other bioactive compounds and dietary fiber (Adil *et al.*, 2023). Osmotic dehydration is a key processing step for producing candied peel. It involves immersing the peels in a hypertonic sugar solution, drawing water out of the peels, and simultaneous ingress of sugar within the tissue. Such process influences the final edible product's sweetness, texture and enhances shelf life (Yadav and Singh, 2014). Understanding the SG and WL dynamics taking place during osmotic dehydration is required for optimizing the product quality and the resultant yield (Phisut, 2012). This research investigates the operational parameters for transforming orange peels into COP and OPP for their subsequent application in varied dairy products. The focus will be laid on optimizing these parameters to enhance product quality, having improved functionality at the same time preserving the bioactive compounds.

MATERIAL AND METHODS

Fresh oranges (*Citrus sinensis* cv. Valencia) were procured from M/s. Dev Exotica, Anand (Gujarat). Cane sugar of 'Madhur' brand was obtained from a local market in Anand. The equipment used were (a) temperature-controlled bath and (b) vacuum tray dryer of M/S. Perfect Engineering and Allied Works Pvt. Ltd., Vadodara.

Shaikh Adil *et al.*,

Preparation of COP

Fresh oranges were washed and peeled. The peel was cut into strips [5.00 x 1.5 x 0.3 cm: length(l) x width(w) x height(h)]. Such strips were subjected to blanching (77°C for 2-5 min; Peel: water of 1:2 w/v) in potable water (Magangana *et al.* 2021), in order to inactivate polyphenol oxidase and peroxidase enzymes to preserve nutrients and phytochemicals. The orange peel strips were soaked in sodium bicarbonate (NaHCO₃) solution (2.0 per cent strength) for 3-4 min at 95°C in order to eradicate bitterness and soften the tissue (Pinzon *et al.* 2013). Such blanched peels were treated with sugar syrup (incremental increase in sucrose concentration from 40 to 70°Brix in 3 days); syrup temperature maintained at 40°C. After 3 days, COP was separated from sugar syrup and the excess syrup was allowed to drain off. The COP was packaged in pre-sterilized polyethylene bags (80.0 µm thick) and stored under refrigeration (6±2°C).

Preparation of OPP

The strips of orange peel were prepared as mentioned earlier for COP, except that they were portioned into smaller sizes (i.e. 4.0 x 1.0 x 0.3 cm; l x w x h). Such peel strips were subjected to similar blanching treatment as mentioned earlier for COP. The blanched peel strips were treated with sugar syrup (50°Brix for 4 h at 50°C temperature) and later drained off from excess syrup. The osmotically dehydrated peels were subjected to drying (45±2°C for 8 h; vacuum of 670 mm of Hg column) in a vacuum tray drier (M/s. Perfect Engineering and Allied Works Pvt. Ltd., Vadodara). The dried orange peel pieces (7.21 per cent moisture) were milled in a food processor and sieved through 35 No. U.S. stainless steel sieve to obtain OPP with mean particle size of ≤ 250 µm.

The photographs of COP and OPP are shown in Fig. 1A and 1B respectively

Analysis

Fruit peel solids

The COP and OPP were analysed for moisture, total carbohydrates, ash, crude fiber and β-carotene content. The moisture content of the peel products was analysed using Mojonnier method (Ranganna 2018), while total carbohydrates was determined using Lane and Eynon's volumetric method (Ranganna 2018). Ash was determined as per AOAC (1984) method. The crude fiber (as per European Community No. 152, 2009) and β-carotene by HPLC-UV were analysed by an external laboratory viz., Centre of Analysis and learning in Livestock and Food (CALF) laboratory, Anand. The SG and WL were determined following the method of Chandgude (2021).

RESULTS AND DISCUSSIONS

Parameters Studied During Preparation of Orange Peel Solids

Changes during conversion to COP

The particulars of orange peel during its conversion into COP are shown in Table 1. The fresh orange peels had 76.25 per cent moisture. Blanching and debittering of peels led to a slight increase in the moisture content (i.e. 78.51 per cent). The osmotic treatment in a hypertonic sugar solution of incremental strength (40-70°Brix in 72 h) maintained at 45±2°C led to SG and WL as shown in Table 2. The SG and WL (g/kg peel) from orange peels at 72 h were 818.38 and 150.58 respectively. Osmotic treatment of orange peels led to an increase in their weight (owing to sugar gain), even taking into consideration the WL. The COP so obtained appeared like any glazed fruit and had a tangy orange taste with tolerable bitterness.

Changes during conversion to OPP

Drying has become a widely used method of food processing, permitting the shelf-life extension of fresh produce (fruit, vegetables, etc.) and their byproducts. The principle of drying is to reduce the moisture content of the product to a level at which the growth of microorganisms and enzyme activity are restricted, enhancing the product's storage stability. It is recommended to reduce the moisture content of fruit peel to ≤ 8.0 percent (i.e. powder form) in order to attain the desired shelf life, even at ambient temperature conditions (Pinzon *et al.*, 2013). The orange (*Citrus sinensis* cv. *Valencia*) peel was converted into OPP, after osmotic treatment of the blanched fruit peels. To improve the sensory

Shaikh Adil *et al.*,

acceptability of OPP, the peels were subjected to osmotic treatment. The conversion of orange peels into OPP helped to reduce the bulk, increased shelf life (6 months when stored at $6\pm 0^{\circ}\text{C}$) and ensured its availability throughout the year. Table 3 shows the changes in the weight and moisture content of orange peels as a result of osmo-dehydration and vacuum tray drying. The yield of OPP considered from osmo-treated peels as starting material was 49.85 per cent. The OPP obtained had intense yellowish orange colour and had typical taste of orange peel, free from bitterness. The composition of the two forms of orange peel is shown in Table 4. The proximate composition and a few phytochemical components of orange peel products (*viz.*, COP and OPP) are collated in Table 4. This indicated that OPP is a rich source of β -carotene and fiber. The average moisture content of COP and OPP was 36.75 and 7.21 per cent, respectively. The β -carotene and fiber content of OPP were 77.40 ($\mu\text{g}/100\text{ g}$) and 4.10 respectively. Raj and Masih (2014) reported proximate composition (per cent) of OPP as follows: 2.00 fat, 2.67 protein, 6.69 ash, 2.35 fiber, and 96.5 TS. Zaker *et al.* (2017) reported 5.17 per cent protein and 90.50 per cent TS in OPP; without subjecting to osmo-dehydration.

CONCLUSION

The present study investigated operational parameters involved in transforming orange peel into COP and OPP for feasible valorization of such valued ingredients in dairy and food products. During the conversion of orange peel to COP, the SG, WL and yield, SG were 818.38 g/kg peel, 150.58 g/kg peel and 166.78 percent respectively. In preparing OPP having 7.21 per cent moisture, the yield was 49.85 percent. The utilization of orange peel derivatives in dairy products could contribute to flavour, body & texture along with the health benefits conferred by the peel components. The purported usage of transformed orange peel products as fat substitute and viscosity modifier in food products is in the offing. Utilization of peel products will enable the farmers to reap more returns through sale of such valued byproducts.

ABSTRACT

The paper focuses on the process in the sericulture industry, automated manufacturing techniques in the textile industry, and how they differ from conventional manufacturing techniques. The study contrasted automated practices with traditional practices, demonstrating the superiority of the former and the numerous advantages it offers to consumers, workers, producers, and society at large. The purpose of the study was to determine the factors influencing the adoption of automated and conventional manufacturing techniques, as well as the correlations between such variables alongside the automated techniques used in the Ramnagar textile industry. 50 manufacturing textile industries in Ramnagar provided responses, and the stratified sampling technique was used to gather those responses. The research encompasses the motivations beneath and goals of implementing automated techniques, as well as various aspects of integrating and evolving automated manufacturers in Textile Industry at Ramnagar.

Key Words: Automated Manufacturing Practices, Textile Industry, Environment Sustainability.

INTRODUCTION

Silk Industry also known as Sericulture in India, is the second largest producer of silk in the World. This industry encompasses entire process of silk production by rearing silkworms into cocoons, woven into textiles. This process consists of Cocoon Harvesting, Reeling, Twisting and Spinning and finally Dyeing and Weaving. In recent times, the

**Guru Basava Aradhya and Rajat B Hubballi**

industry has evolved in a wide array of silk products beyond traditional fabrics including accessories, home furnishings and Industrial applications. Sericulture is an intricate process that consists of transforming the silkworms into the fabrics. This is a process that consists of 4 sequential order.

Cocoon Harvesting

The first step in the procedure is the raising of silkworms. Sericulture farms provide a controlled environment for the housing of silkworms. Silkworms consume mulberry leaves, which are their main food source. These leaves serve as food for the silkworms, which go through multiple molting stages. Silkworms create silk by secreting a fluid through specialized glands that solidifies into threads when exposed to air. Silkworms create silk by secreting a fluid through specialized glands that solidifies into threads when exposed to air. Its goal is to gather healthy, undamaged cocoons without causing harm to the silk strands within.

Reeling

This process involves unwinding silk threads from the cocoon. This step is essential for obtaining continuous silk fibers, which can then be processed into various silk products. Post cocoon harvesting, these cocoons are boiled for two reasons, firstly to soften the Sericin gum which makes it easier to unwind the silk fibers. Secondly to kill the pupa. After boiling the softened cocoons are mounted onto reeling machines

Twisting and Spinning

Twisting and spinning refer to processes that transform silk fibers into a more durable and workable form, typically silk yarn. The resultant output of reeling i.e Silk Filament is twisted together to form a thicker and stronger strand. It imparts strength and is more suitable for weaving. Spinning is further twisting of multiple strands together to create thicker and more substantial yarn. This process contribute to the strength, durability and overall quality of silk.

Dyeing and Weaving

Post twisting and spinning in sericulture, the silk yarn to be dyed and woven to create various silk products. Dyeing involves cleaning and degumming of residual Sericin, this is vital as it improves the absorption of dyes. After dyeing the silk is treated with colours which involves modrants or other chemicals. These dyed yarns are arranged in lengthwise threads known as wrap which creates patterns forming fabrics.

India has a solid industrial foundation and is positioned to lead the textile sector going forward. The following are the main elements supporting the continued growth of the Indian textile industry:

Promotional Schemes and support from government: The Finance Minister's union budget announcement has given the industry a significant boost. The government intends to establish 7 Mega Textile Parks throughout India with the dual goals of bolstering MSME growth and job creation. Because of the initiatives, the industry's competitiveness and exports have both increased. India's textile industry is primarily export-oriented, shipping a variety of products to many different countries throughout the globe.

Textile Exports: India is the world's second-largest exporter of apparel and textiles. India's textile industry is a major driver of the nation's economy, accounting for 15% of its export revenue. Bangladesh, the UAE, Europe, and the USA are India's major export destinations. Because of the initiatives, the competitiveness of the sector and exports have both increased. India's textile industry is primarily export-oriented, shipping a variety of products to many different countries throughout the globe.

Advancement in Digital Textile Technologies: Intricate designs and styles can now be produced with digital weaving, which also offers increased strength and durability. The development of digital textile technologies has also facilitated the production and sourcing of textiles with a range of characteristics, including antimicrobial, fire- and water-retardant qualities. The production of fabrics that are both aesthetically pleasing and highly functional has been made possible by these advancements, which have revolutionized the textile industry.

**Guru Basava Aradhya and Rajat B Hubballi**

Scope of Self-employment Opportunities: The sector's potential for growth will be further enhanced by its ability to enter untapped markets because of technological advancements. As a result, people in this field who possess both a creative eye and an entrepreneurial spirit can succeed. People can use a variety of platforms to present their work and reach a wider audience thanks to the growth of the internet. A variety of tools and resources are also available to assist individuals who are interested in starting their own product creation business.

More Jobs for Women: In the last few decades, women have made significant progress in the textile industry. Furthermore, because they are frequently more receptive to novel concepts and methods, women are assuming leadership roles and contributing significantly to economic growth. In the end, it's critical to make sure that there are more positions in the textile sector accessible for women, as this will contribute to the development of a more just and successful sector. Women make up between 60-70% of the workforce in the textile and apparel industry, according to a Times of India report.

Manufacturing Practices

Automation has been embraced by the textile sector in an effort to boost productivity, cut expenses, and increase efficiency. In the textile industry, automated procedures are used at many phases of the production process, from design and manufacturing to quality assurance and logistics.

Advantages of automation in textile

1. More production in less time: Due to automation in textiles, it is becoming possible to produce more products in less time. Where previously work was done by workers, workers could not work non-stop, at one time they would get tired and needed a break. But as a result of automation, products are now being produced non-stop.
2. Product quality enhancement: Automation is producing higher quality and flawless products than before. When working with workers, there was always the risk of errors for various reasons. But automation has greatly reduced that fear.
3. Low labour wages: Reducing the number of workers in the various stages of automation in the textile sector. In some cases, this automation has reduced the number of workers by 50-60 percent and in some cases up to 90 percent. As a result, the same work is being done with less workers than before, but in less time. Therefore, the amount of labour wages in the production of goods in any sector has decreased.
4. Reduce working hours for the same production: Automation made it possible for the same tasks to be performed but with fewer hours of labour for employees. For example, inventions such as Eli Whitney's cotton gin made it possible to separate the seeds from cotton without using manual labor.
5. Reduce production costs: Company leaders signed a development agreement to obtain an automated machine that handles multiple fabric processing steps, including cutting, and sewing the material. The most impressive aspect is that it only needs 22 seconds to complete a T-shirt. A representative said that each garment's labour cost is just 33 cents, which is cheaper than any market in the world can offer.
6. Increased job security for workers: We know that in textile industry, fabrics are made from yarn and yarn from fiber. Then dyeing and printing is done to make the fabric more attractive. Every step of it, especially the spinning, weaving and dyeing process, can be dangerous for anyone. So, automation has created automatic machine equipment to handle most of these processes by securing working conditions for all in the textile industry.
7. Increasing demand for skilled workers: As automation has reduced the number of workers / workers in the textile industry and where 150-200 workers were needed earlier, it is now working with only 10-12 workers/operators. Technically skilled personnel are required to operate this equipment with modern technology and high quality. So, the demand for skilled textile workers is increasing with automation.

Need for the study

The silk and textile industry in Ramnagar have been compelled to abandon their conventional methods due to the overwhelming demand for automated friendly procedures. Over the past decade, traditional practices have led to massive environmental disasters. The primary goal of this paper is to determine whether or not green manufacturing

**Guru Basava Aradhya and Rajat B Hubballi**

practices have benefited manufacturers, and if so, how these benefits extend to entire organizations as well as the environment and society.

Research questions

- What made you to choose the particular topic / why automated manufacturing is need of the hour?
- Why is the silk textile industry's adoption of automated manufacturing practices necessary? What effect does it have on Ramnagar's environment?
- How different is traditional manufacturing practice as against automated manufacturing practices in Ramnagar?

REVIEW OF LITERATURE

Luis Almeida wrote in "Ecolabels and Organic Certification for Textile Products," which was published in 2014(Almeida, 2014), that the fashion supply chain is placing an increasing amount of emphasis on sustainability, requiring textile producers to adhere to strict environmental and social standards throughout the textile-clothing chain. The primary objective was to determine what customers wanted in terms of environmentally friendly products, which included "Organic Textiles." It also provided an overview of the requirements for the most widely used eco-labels was given, including the Fairtrade, Oeko-Tex 100 (including the new Sustainable Textile Production certification scheme), Bluesign, European Union Ecolabel (flower label), Fairtrade, Fairtrade, and labels from retail chains (Clear to Wear and Ecosafe). As stated in "Perspectives, Drivers, and a Roadmap for Corporate Social Responsibility in the Textile Industry" (Monica Cavalcanti, 2015), provides an overview of the theories, motivations, results, and methods associated with corporate social responsibility (CSR) and also Social, Economic, Political, and Legal factors affect countries differently and result in different institutional dynamics and organizational behaviours. It offers managers a road map for implementing CSR in their businesses. the apparel and textile industries have grown more globally competitive in their pursuit of advancing and realizing social and economic development as well as environmental sustainability.

Anupriya Desore and Sapna A. Narula(Desore, August 2018), "A summary of the textile industry's corporate response to sustainability issues," 2018. In order to address the goals, challenges, and responses of textile sector businesses in favor of sustainability, the writers organize the literature into categories. Additionally, they assert that many managerial strategies have been used to urge industries to incorporate sustainable practices into their production processes. At the same time, studies on managers' perceptions of new technologies and procedures are given careful consideration.

Parthiban Manickam and Gopalakrishnan Duraisamy(Parthiban Manickam, 2019), "4-3Rs and circular economy," 2019. Planning and strategic policies that guarantee that the products could be used for reengineering or to produce components of refashionable material in every production cycle could minimize the amount of waste generated in the textile and apparel industry. The fashion and textile industries have the potential to divert textile waste from landfills and grow the apparel sector, which in turn can recycle and reuse textiles.

The 2020 work "Textile Industry in a Changing World: Challenges of Sustainable Development" by Catarina Costa, Nuno G. Azoia, Carla Silva, and Eduardo F. Marques(Catarina Costa, 2020) focused on sustainable practices to reduce the harmful effects of the textile industry's production and excessive consumption on the environment. The issues raised included the massive amount of water resources used, the carbon and greenhouse gas emissions that are released before reaching the consumer, and strategies for resolving these through environmentally friendly measures adopted by the industry to supportably manufacture clothing.

RESEARCH METHODS

Research Design

This study's data comes from various textile industries located in Ramnagar, Karnataka, India. Due to the intricacy of the goal, the textile data, convenient random sampling was particularly used to select textile industries in Ramnagar. The research mainly focuses to know the factors of green and conventional manufacturing practices adopted in textile sector in Ramanagar. Also, to find out the correlation between the factors of automated manufacturing practices. The major goal of this study is to analyse the difference between the automated manufacturing practices and conventional manufacturing practices in textile industry. I've used KMO and Bartlett's Test, Factor Analysis and Regression for data analysis.

Objectives

1. To know the factors of Automated and Conventional manufacturing practices adopted in textile sector in Ramnagar.
2. To study the correlation between the factors of Automated Manufacturing Practices.
3. To analyse the difference between the Automated Manufacturing Practices and Conventional Manufacturing Practices in Textile Industry.

Data Collection Method

In this research, the Stratified Sampling technique is used to collect the required data and conduct the research. Structured Close-ended questionnaires were prepared to collect the data. The sample size of the research conducted was 50 respondents comprising employees from 13 textile companies in Ramnagar, Karnataka.

Hypothesis

H10: There is no latent factors manifested.

H1a: There are latent factors manifested.

H20: There is no standardized impact of measured variables on the factors.

H2a: There are standardized impact of measured variables on the factors.

H30: There is no correlation between the factors (F1, F2, F3 and F4).

H3a: There is a correlation between the factors (F1, F2, F3 and F4).

H40: The data doesn't fit the conceptual model.

H4a: The data fits into the conceptual model (no difference between the conceptual model and the measured model).

Analysis

- 36% of Respondents have inferred that Financial Incentives by the Government & Sale of Finished Goods; Employee training program, and Traditional manufacturing practices are the reason for Textile companies to adapt Automatic manufacturing practices as it ensures them to long run business sustainability and also greater amount of productivity.
- 60% of the respondents inferred that consumer's preference is moderately significant on the decision making on the textile companies as customers have the buyer power in the market and 12% have inferred to have highly significant and neutral significance on the decision making process in textile industries.
- 32% of the respondents conjecture increasing in Production and 28% of respondents conjecture Maximising profit margins is the primary objective for adapting Automatic Manufacturing and 36% of respondents inferred cost saving, and 12% of respondents inferred customer preference and market competition shall be the driving force from adapting automatic manufacturing over traditional manufacturing.
- According to the study, 32% of respondents have an opinion that it shall result in more energy consumption, 24% have pinioned that it shall result in minimum usage of resources and 20% state that it shall enhance the raw material extraction on adoption of automatic manufacturing as these are to be working on electricity along with which shall ensure better utilisation of Raw Materials.

Guru Basava Aradhya and Rajat B Hubballi

- It is inferred that 52% of respondents discern customers preference is significant to shift to automated practices over traditional practices as they have an opinion that automated silk looms are resulting in long lasting sustainability in comparison with traditional manufactured looms.
- 42% of the respondents have inferred cost saving is having a neutral effect on automated practices over traditional practices as it shall result in the huge initial investment on machinery and labour cost over the period of existence.
- 48% of the respondents State that there is significant impact on employee satisfaction on the shift from tradition to automation as employees rate on getting infected with various diseases of breathing problem, hearing loss, physical injuries, and many more have reduced on a huge basis.
- 40% of the respondents have stated that there is highly significant and 40% of the respondents have stated that there is significant impact on the speed of production as it shall benefit the producers to produce more numbers in quantity at better quality and usage of resources more effectively.
- 48% of the respondents inferred that there is significant impact on the environment which shall emphasis on the sustainability on shift of usage from traditional practice to automated practices.
- 36% of respondents have inferred that Market forces is the vital reason for integration of automated practices, and 32% of respondents have inferred that government policies like Subsidy, National Silk policy 2020, MGNREGA scheme are organisational factor for producer to integrate traditional and automated Practices, and 24% of respondents conjecture that Technological Advancement, Market Forces are the encouraging factor.
- 64% of respondents have inferred that employees in the organisation sense a positive change and 8% of the respondents are highly positive and have complete satisfaction and wellbeing at the workplace concerning their Job on conversion to Automated Practices.
- 60% of the respondents’ state that consumers are positive on perceiving the automated produced products than the traditional manufactured products as these provide assurance of durability, better quality of product.
- 44% of the respondents inferred that they are collaborative with each other and external entities and 16% of the respondents are highly collaborative with each other and external entities in traditional business for shared resources and knowledge of manufacturing practices in Textile Industry.

Data collection methods- Sample design, size, techniques

At the outset, the data is collected and analyzed to develop the model confirming the relationship between the variables. Thus, the researcher adopts factor analysis to check statistical factors and vet with theoretical purview. The first table analysis is the KMO and Bartelsts test for checking the suitability of the data set.

Analytical tools		
KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.813
Bartlett's Test of Sphericity	Approx. Chi-Square	2347.149
	Df	105
	Sig.	.000

From the above test result, the data is suitable for further analysis with a p-value is < 0.05 (0.00); and sampling adequacy is significant with > 0.813.

Secondly, the researcher applies the Total variance explained to ascertain no. of components generated.

Guru Basava Aradhya and Rajat B Hubballi

Total Variance Explained									
Component	Initial Eigen values			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	4.747	31.648	31.648	4.747	31.648	31.648	3.723	24.823	24.823
2	3.381	22.543	54.191	3.381	22.543	54.191	3.643	24.284	49.107
3	3.152	21.017	75.208	3.152	21.017	75.208	3.613	24.089	73.196
4	2.304	15.359	90.566	2.304	15.359	90.566	2.606	17.370	90.566
5	.283	1.889	92.455						
6	.235	1.570	94.025						
7	.190	1.265	95.290						
8	.162	1.077	96.366						
9	.139	.926	97.293						
10	.111	.741	98.034						
11	.078	.518	98.552						
12	.073	.486	99.038						
13	.066	.442	99.480						
14	.048	.319	99.799						
15	.030	.201	100.000						

Extraction Method: Principal Component Analysis.

With the above test result, there are 4 components generated with 90% of variance explained in the given data set. Thus, the results support H1a.

This also visually explained in the 'component plot in rotated space'.

It is evident that there are 4 components and all measured indicators are loaded to the 4 factors significantly. In the third phase, the researcher adopts to assess the no. of measured indicators loading to each component. This is carried by the 'Rotated Component Matrix'.

Rotated Component Matrix

	Component			
	1	2	3	4
VAR00001	.977	.057	.027	.083
VAR00002	.943	.024	.030	.031
VAR00003	.957	.051	.073	.035
VAR00004	.962	.128	.028	.020
VAR00005	.056	.946	.054	.090
VAR00006	.038	.942	.031	.041
VAR00007	.076	.941	.015	.026
VAR00008	.085	.957	.089	.088
VAR00009	.059	.051	.961	.131
VAR00010	.026	.126	.944	.017
VAR00011	.041	-.019	.900	.070
VAR00012	.031	.035	.973	.085
VAR00013	.030	.044	.096	.923
VAR00014	.001	.099	.102	.923
VAR00015	.113	.065	.061	.918

Guru Basava Aradhya and Rajat B Hubballi

The above table shows the significant loading of variables (indicators) to component 1 with 4 indicators, component 2 consists of 4 indicators, the component included with the loading of 4 indicators, and the final component is loaded with 3 indicators. These components are renamed as Constructs for examining the relationships. In the final phase, the researcher adopts to develop the confirmatory model to suffice the observed matrix of a conceptual matrix with a measured indicator matrix. During this Confirmatory Factor Analysis (CFA) model, the study envisaged regression weights.

Regression Weights: (Group number 1 - Default model)

	Estimate	S.E.	C.R.	P	Label
VAR00004 <--- F1	1.000				
VAR00003 <--- F1	.968	.040	24.417	***	
VAR00002 <--- F1	.963	.048	20.269	***	
VAR00001 <--- F1	1.030	.033	31.360	***	
VAR00008 <--- F2	1.000				
VAR00007 <--- F2	.922	.043	21.389	***	
VAR00006 <--- F2	.911	.042	21.726	***	
VAR00005 <--- F2	.971	.042	22.920	***	
VAR00012 <--- F3	1.000				
VAR00011 <--- F3	.839	.050	16.837	***	
VAR00010 <--- F3	.931	.036	26.002	***	
VAR00009 <--- F3	.976	.030	32.584	***	
VAR00015 <--- F4	1.000				
VAR00014 <--- F4	.959	.069	13.958	***	
VAR00013 <--- F4	1.030	.076	13.639	***	

With all indicators are significant and with < 0.05 p value support statistically the CFA model. The table result supports the H2a, asserting that there exists the regression value on the constructs/latent factors.

As per the model fit concerned the below fitness are considered – Baseline comparison, and CMIN (chi-square to degrees of freedom).

Baseline Comparisons

Model	NFI Delta1	RFI rho1	IFI Delta2	TLI rho2	CFI
Default model	.948	.935	.982	.977	.981
Saturated model	1.000		1.000		1.000
Independence model	.000	.000	.000	.000	.000

CMIN

Model	NPAR	CMIN	DF	P	CMIN/DF
Default model	36	127.926	84	.001	1.523
Saturated model	120	.000	0		
Independence model	15	2464.006	105	.000	23.467

The output suggests that the CFI > 0.95 (0.981); TLI > 0.95 (0.977) and CMIN/DF < 3 (1.523), thus, these results infer the fitness of the CFA Model. Since the model fit, this supports the H4a.

**Guru Basava Aradhya and Rajat B Hubballi**

In the final phase, the researcher exhibits the visual representation of the causal relationship between the latent factors/constructs. This phase uses the Path analysis, wherein the measurement model is explained with the loading of measured indicators (VaAR0001 to VAR00015) to constructs (F1 to F4). It also explains the relationship with double-headed arrows.

From the path analysis, it is evident that there exists a correlation among the factors, thereby the researcher rejects the null hypothesis and accepts H3a.

FINDINGS

For an assortment of reasons, the majority of businesses in the textile industry are more inclined to adopt automated technologies than traditional ones. The primary factors that drive a business to transition from traditional manufacturing practices to automated manufacturing practices are financial incentives, employee training programs, traditional manufacturing techniques, and the preferences of the majority of customers. The primary objective and enticing factors are to increase production speed and reduce costs, respectively. These actions will ultimately enhance the utilization of resources, raw material extraction, and the sustainability of the environment. The vast majority of the Employees are benefited from the integration and transformation into automated practices, which was facilitated by technological advancements, government policies, and market forces, in accordance to the study.

Future Implications and Directions

There are about 1334 reeling manufacturers working in the textile industry in Ramnagar; only 33 of them employ traditional methods; the remainder of manufacturers have shifted to automated manufacturing. This indicates that the traditional manufacturers must shift to automated manufacturing in order to survive and be sustainable in the market over a longer period of time. A method to do this would be by assisting government initiatives like the Silkworm Seed Production Centres (SSPCs), which are aimed at supplying farmers with the best seeds possible to raise healthy eggs.

The report also emphasizes on the sustainability of Environment, Increase in production of the organisation which shall be resulted from the transformation to automated production. On transformation of automated practices employees needs to be provided training on the same as it is resulted in higher satisfaction of the employees. Though the initial cost is high on investment with automated practices, there are various government schemes provided by the government for establishing automated machines in place of traditional machinery. According to current statistics, the majority of machines are semi-automated. It is recommended that the organization switch to full automation, despite the fact that it will require a larger initial investment as a result of lower labour costs and more effective and efficient use of raw materials.

CONCLUSION

The study's findings revealed that automated produced silk is in much higher demand than traditional manufactured silk. It is apparent that automated production has fewer drawbacks than traditional methods, however, at the same time, substantial benefits for the company, the client, and society are recognized. The primary purpose of the research also indicates that automated processes have improved customer happiness, output, and the effective and efficient utilization of resources

ABSTRACT

Stress detection is a crucial aspect of mental health monitoring, with facial expression analysis promising as a non-invasive way of evaluation. Identifying individuals who suffer from stress and providing them with appropriate support and treatment is required. According to the famous statement "Face is a mirror of mind," a person's mental state or emotions can be seen on their face. In recent years machine learning methods have demonstrated encouraging results in the recognition of stress from a variety of sources including facial expressions. This study presents an extensive review of how computer vision techniques were used to forecast stress and related aspects using machine learning algorithms. Moreover, it examines and reviews work done on various assessment criteria that are frequently employed in this field. This paper focuses on a variety of algorithms that are used for feature extraction and facial expression analysis, including SVM, CNN, Naïve Bayes, Random Forest, and a few more. Lastly, we have discussed a gap analysis and offered a scope for additional research in this area.

KEYWORDS: -Face, Facial expression, Emotions, Stress, Machine learning.

Harsha S. Khurana and Payal D. Joshi

INTRODUCTION

Nowadays stress is a major public health concern among individuals and it can have significant impact on quality of life. The precise detection of stress and management of stress have become increasingly important in supporting mental health and well-being. Traditional methods of stress detection, such as self-reporting and physiological measurements, have limitations in terms of accuracy, reliability, and invasiveness. The development of automated systems for stress detection based on facial signals has been made possible by advances in machine learning (ML) techniques. Facial expressions are powerful markers of emotional states, including stress.

An event or situation that can potentially induce stress in an individual is referred to as a stressor. Stress can have both positive and negative effects on a person. "Eustress" is a type of stress that has good effects. An individual experiences this form of stress when they anticipate that a stimulating incident will occur in their immediate area. "Distress", a type of stress that has negative effects, is characterized by anxiety or a significant degree of concern. [13]. Employees are more prone to feeling stressed out when their lifestyles and workplace culture change. The problem still exists despite the fact that many organizations and sectors offer programs connected to mental health and seek to improve the workplace environment. The computer vision methods used to extract visual proof, the machine learning model used to forecast stress, and related parameters[23].

Automated methods for assessing stress and anxiety levels based on facial cues can provide a non-intrusive and unbiased tool to assess mental health issue. There are different parameters to detect stress based on Face [9].

Facial expression and emotions: - Evaluate stress level on the basis of heart rate and facial expression during Internet usage. Also some other studies [2][5] that investigate Facial Expressions Recognition under stress condition.[18]

Facial Action Unit: - In order to differentiate between a neutral and stress/anxiety state, the study found that automated identification of facial Action Units (AU). The UNBC and BOSPHORUS datasets, two readily available annotated facial datasets, are used to train a model for autonomous recognition of facial action units.[25]

Head Pose: -Stress detection and head motion patterns were correlated. To examine various stress effects, a scientific experiment with neutral and stressful situations was conducted. Two datasets (SRDSA '14 and SRDSA '15) with 23 and 24 individuals, respectively, were employed in this research project. In study [31] discussed about the good and negative impact, or emotional state of a person can be revealed through head and facial movements [26].

This study examines different techniques to identify emotions from facial expressions. The study is organized as follows: Section 2 discuss the systematic literature review technique. Section 3 explains how the literature review study was conducted and how the papers were categorized based on several characteristics. Research Gap & Analysis in Section 4, and the study's conclusions are finally highlighted in Section 5.

METHODOLOGY OF THE SYSTEMATIC LITERATURE REVIEW

A Systematic Literature Review (SLR) is a method employed to assess the significant components of literature within a specific field.

Systematic Literature Review Methods

Research questions:

RQ1. What are the different techniques used for Face Recognition.

RQ2. What methods can be employed for recognizing facial expressions and different datasets?

RQ3. What are the relation between Facial Expression and Stress Detection?

RQ4.What are Different techniques to detect Stress Using Facial Expression?

Search Strategy and Data collection

For this study, a literature review was performed as a primary task, which involved searching for relevant research papers. A keyword search was conducted on papers published in IEEE Xplore, ScienceDirect, and SpringerLink in the last decade. The basic set of keywords were “Face Detection”, “Facial Expression” and “stress detection using machine learning”. A total of 75 papers were collected using all the keywords, and among these, 55 papers were finally selected.

LITERATURE SURVEY

In this section, we provide a brief overview of related research on face recognition, facial expression recognition, stress detection based on emotions using machine learning technique. According to the review, a method for identifying stress based on facial expressions consists of three key steps: face detection, facial expression recognition, and its classification for stress detection. Table 1 lists various machine learning methods used by other researchers that could be applied to identify facial expressions, along with the datasets that were utilized and the level of accuracy attained.

In a similar manner, Table 2 summarizes the data input formats used to train the model and tabulates details about the study that uses Face as an attribute for stress detection in various contexts, such as driving a car or by watching video footage the degree of accuracy attained.

- Table 3 lists the algorithms that were most commonly utilized in the most recent review study.
- Fig-1 Represents the working flow of FER system and its classification.
- Fig-2 provides a summary of the ML Algorithm-wise reference paper count.

Answer to RQ1: Different Techniques of Face Recognition

Face detection is widespread in people’s daily life. As per the study, Researchers discussed computer vision and have developed a number of face identification tools that are based on various face detection techniques, including haar feature-based cascade classification systems, deep neural networks, and machine learning algorithms using the CelebA dataset. And well-known face identification tools were evaluated and carried out within the scope of the work: OpenCV and YOLOFace. The results show that YOLOFACE has the highest accuracy (98.93%) of the two tools. And the best result in terms of processing time is provided by Open CV. For future work, more tools are required to be included for comprehensive analysis [17]. An improved Region-based CNN is used on dataset Wider Face and FDDB. Compared to other machine learning methods such as the Haar Cascade, HOG (Histogram of orientated Gradient) based face detection provides more accurate results [42]. Built-in features of the open source computer vision library (Open CV) that can quickly identify human faces by detecting them and then comparing them to training sets (facial photos stored in the database). Using standard library techniques, image handling and processing are performed. These library functions can take pictures with a webcam, make windows to hold them while they’re being used, store them in a database, and then process them to verify exact similarity. Face detection is achieved with the help of Cascade Classifier and Haar Cascade[43].

The Viola-Jones algorithm used for face detection with dataset of 40K real-time image [44]. As per study discussed about two approaches for face detection are Features based and Image based approach. In feature based approach used edge detectors, the eyes, nose, mouth, and hairline. A statistical model is created based on the features that were retrieved to characterize their correlations and confirm the presence of a face. Example of techniques are ViolaJones, edge, motion etc. In general, appearance-based methods use statistical analysis and machine learning techniques to identify the relevant aspects of face and non-facial images. Technique used for image based approach are SVM, Neural-networks, AdaBoost learning etc [45]. A sliding window approach is used to search for potential face regions in the image. A boosted classifier is used to classify each region as a face or non-face based on Haarlike features [46].

Answer to RQ2:- What methods can be employed for recognizing facial expressions.

As per study [54] methods employed for recognizing facial expressions is bidirectional LSTM-CNN (Long Short-Term Memory). With this hybrid design, unique features from face photos may be extracted by leveraging the strengths of both CNN and LSTM networks. In the experiment, CK+ datasets are employed, and to prevent overfitting and enhance model performance, data augmentation is also applied to the dataset. 99.43% accuracy is attained using data augmentation.

The A-MobileNet architecture, which is CNN based, is also utilized for face expression recognition. Here, Facial expressions captured using mobile devices. This approach uses lightweight architecture which balances model complexity, accuracy and also suitable for real time applications with less no. of resources. It provides promising solution for implementing facial expression recognition using mobile device. On datasets FERPlus and RAF-DB, the A-Mobile Net model performs better than the others [52]. As per study EmotionNet Nano retains a high degree of accuracy in facial expression recognition, It can be applied to many real-world scenarios where accurate and timely facial photo emotion recognition is required.

3.3 Answer to RQ3 Relation between Facial Expression and Stress Detection

Facial expressions can be used to measure anxiety and stress in comparison to neutral and relaxed states. The final facial cues employed in this study were those related to the eyes (blinks, eye aperture), the mouth (VTI, ENR, median, variance, skewness, kurtosis, and Shannon entropy), the head (head movement amplitude, head velocity), and the heart (heart rate estimation derived from variations in facial skin color). In contrast to other relevant research using semi-invasive measurements like ECG, EEG, galvanic skin response (GSR), and skin temperature, all these aspects offer a contactless method of stress detection that doesn't interfere with the human body. On the other hand, it was concluded that the length of the facial recording could have an impact on the outcomes, particularly if it is very brief, and the analysis of particular facial cues that follow could be questionable. According to our observations, it is advised that a video clip last at least one minute. Future recordings should make use of duration, which could produce more accurate estimations. This study also underlines the need for further testing and validation of these methodologies, particularly in real-world scenarios with more complicated and varied data [9].

Machine learning and computer vision techniques are used to analyze facial expressions that are collected by in-car cameras. The goal is to recognize particular facial expressions and patterns that signify emotional stress, like anger, irritation, or anxiety, and to find links between facial expressions and emotional states related to stress by gathering and analyzing face data from drivers in various driving situations. The objective is to create a strong model based on these facial cues that can recognize and categorize various levels of emotional stress [7]. Researchers want to develop a model that can accurately predict the personality characteristics and felt stress of undergraduate students based on a set of input features using machine learning techniques. This mapping may help in understanding the relationships between personality and stress levels as well as the factors that affect stress in students. Uses a variety of machine learning techniques to train and assess predictive models, including decision trees, support vector machines (SVM), and random forests. These models seek to discover patterns and connections between the personality qualities of the students and their perceived levels of stress [6].

As per the study, many facial expressions are related to depression. A training dataset of happy photos was created using the JAFFE database. For face detection, the Kanade-Lucas-Tomasi algorithm was used. Different features were extracted from the photos using the Gabor filter. And for training, a feature vector was used to create a feature set. For the testing phase, a video of the student's face is taken as they complete the questionnaires. A testing dataset is created from the video after it has been converted to frames. An SVM classifier is used for classification, and it makes a prediction about whether the person is depressed or not. Depending on the outcome, it can be advised that the student seek counseling support [20].

Stress recognition using facial images and facial landmarks has some issues with using biological signals or thermal images. In this study, stress is recognized from an image that is captured by a general camera, and the movement of

**Harsha S. Khurana and Payal D. Joshi**

the eye, mouth, and head under stress conditions is analysed using a deep neural network. As a result, it was concluded that a facial land mark is a better option for stress recognition, and accuracy could be achieved if using a gray face image of the appropriate size [27]. Facial stress recognition is divided into three stages: image registration, feature extraction, and classification. In image registration, consider only eyes, nose, and mouth for feature extraction. Gabor filter and HOG features are used. The novel architecture used is SVM and the Slant binary tree algorithm. It employs SVM as the base classifier at each level of the tree. And the proposed architecture achieves an accuracy of about 86.7% and concludes that the nose is the best indicator of stress [28].

Answer to RQ4 Different techniques to detect Stress Using Facial Expression.

A real-time stress detection system consists of a module for face identification, facial expression recognition using a connected CNN, and a module for the detection of negative emotional stress. Data augmentation is used to expand datasets to prevent overfitting caused by a lack of training data. In numerous experiments, CNN architecture achieves competitiveness in the CKG and Oulu-CASIA datasets for facial expression recognition. Additionally, run a simulation experiment on stress identification, counting the number of FE frames that are identified as stress expressions. If the number of stress frames rises above a certain level, the suggested framework will issue a warning. Additionally, the system delivers excellent stress detection accuracy and quick processing in real-world driving environments like the KMU-FED dataset [1].

A convolutional neural network (CNN) is a deep learning approach that is used to identify stress from facial expressions. Deep neural network types, known as CNNs, are frequently employed for image identification and classification applications. CNN is trained in this study to distinguish between stressed and non-stressed facial aspects using extracted facial features. Multiple convolutional layers, pooling layers, and fully linked layers make up the network architecture. To decrease inaccuracy in classification, the CNN's weights are iteratively changed via back propagation and gradient descent optimization. The trained CNN is then used with new input images to detect stress [3].

Computer vision techniques could be used to analyze facial expressions and identify signs of stress and anxiety. This is done by tracking a set of facial features and applying multiple methods to analyze each feature, like dataset acquisition and video selection. ROI detection, head motion estimation etc. [10]. Data from the 2017 OSMI Mental Health Survey of Working Professionals in the Technology Industry. The model was trained using a variety of machine-learning methods. Boosting produced the highest level of accuracy [22]. Facial landmarks for stress recognition and discovered that the ability to recognize stress-related information could be enhanced. Here, the system reads the information from the face using the CNN architecture [23].

Research Gap Analysis

As per literature study in this paper we have observed following findings in this research area:-

1. More standardized method for data collection is required. Along with it, there is a need for more extensive validation studies to test the accuracy and reliability of the algorithms used to analyze facial expression.
2. Additionally Facial expression identification and classification are independent of characteristics including gender, age, ethnic group, beard, background, and birthmarks [29].
3. In some studies Facial action Unit like AU09 (Nose wrinkle), AU10 (Upper lip raiser), AU04 (Brow lowerer), AU23 (Lip tightener), and AU14 (Dimpler) used for stress detection. How complex facial expression are created by combining the AU as well as how these expression reflected on human face[9].
4. Facial landmarks improve the effectiveness of stress recognition. In addition, using a grey face image and employing an acceptable image size yields the best performance [27].
5. Lack of physiological data gathering techniques and which algorithm provides greater accuracy are significant research area.

CONCLUSION

Everyday incident or demand may cause stress, which is a physiological response. One or more stressors can cause stress, which can be seen in the facial expressions. The creation of a highly accurate, efficient, and cost-effective model is the ultimate goal of stress detection. The review discussed here includes key details about earlier research benefits, drawbacks, problems, as well as information on the model's methodologies. However, there is still a great need for further research and improvement because of issues such as dataset bias, generalization to diverse populations, and the requirement for real-time applications. The overall accuracy and dependability of stress detection systems could be improved by including multimodal data sources, such as physiological signals & many more. To improve model accuracy, pre-processing methods and feature extraction techniques for facial expression analysis are reviewed. Overall, this review article serves as a comprehensive resource for any individual interested in using facial expressions to detect stress.

ABSTRACT

To make a narrative review on the effectiveness of strengthening exercise along the therapeutic aquatic exercise (TAE) on knee osteoarthritis. Osteoarthritis is a degenerative disease which mainly affects weight bearing joints. The knee OA represents the most frequent cause of disability in the world and it also impacts on social, psychological demand and economic problems to the people. There are different treatments available according to the stage of disease, pharmacological and non-pharmacological. The treatment should always approach from the safest, least invasive and less expansive to the more advanced ones. The non pharmacological treatment like physical therapy is always choosing not only for treatment but also for preventive measurement of the OA. The strengthening exercise and therapeutic aquatic exercise are often prescribed to the OA patient, but there are very few studies which proved its effectiveness, so this narrative review study aims to bring more informative results for future references. The databases were searched - Global health, COCHRANE Library, Medline, Scopus, EMBASE, CINAHL, PubMed and Web of science for reviewing the articles related to interventions for Knee OA. studied from 24 eligible articles, it was concluded that there was a positive result of strengthening exercises along the aquatic exercise for knee OA. The strengthening exercise along the aquatic exercise reduced pain, functional disability and reduced speed in joint space narrowing. Both strengthening exercises and therapeutic aquatic exercise yielded positive results in reducing pain, disability and functional problems related to knee OA.

Keywords: Osteoarthritis, strengthening exercises, aquatic therapy.

**Tarandeep Kaur**

INTRODUCTION

Osteoarthritis is one of the chronic degenerative conditions featured by pain in the joint, tenderness, inability to move, crepitus sound, sometimes effusion, and different degrees of localized inflammation. The OA attacks the articular cartilage and also the entire joint, which include the sub chondral bone, ligaments, capsule, synovial membrane, and periarticular muscles (3). Osteoarthritis (OA) is very popular degenerative musculoskeletal conditions in the old age population worldwide, and its prevalence is very high and interpreted to go up significantly in the future as the population get old. Currently knee OA affects about 40% of people older than 75 years and hip OA about 10% (13, 19). Variety of therapeutic interventions and busy and sedentary lifestyle changes may reduce the risk of physical damage and hence slow down the risk of disease activity. Weight reduction plays an important role in reducing the load on the knee joint in overweight patients. Educating patients to place their joints properly would be helpful to reduce limitations and relapse (2). OA patients treated with strengthening exercises had resulted in pain relief, prevention of disability, and improvement in walking speed as compared to their initial status (20). There are two different types of Osteoarthritis – Primary and Secondary Primary OA- It is commonly related with the aging. Progression from adult to elderly population water content of cartilage increased and protein make up of cartilage decreases. The Space between the femoral and tibial condyles reduces due to which symptoms appears (1). Secondary OA- It happens when the person is having another disease like Obesity, joint diseases, diabetes, endocrine disorders etc. and that will lead to OA is termed as Secondary OA (1,7). There are various factors contributing in primary as well as secondary OA. The primary factors such as repetitive weight bearing, trauma, competitive sports without rest periods and excessive sedentary lifestyle whereas secondary reasons classified as obesity, varus/valgus deformity, intra articular injuries, infections such as Rheumatoid arthritis, Tuberculosis and Diabetes Hydrotherapy has plenty of advantages over land-surface physiotherapy for people with OA. Effervescences of the water lessen weight bearing across joints affected by pain (10). Randomized controlled trial studies conducted research in context to patients with OA and concluded that efficacy of the treatment is weak because of lesser research (10, 11). The goal of the present study was to determine whether strengthening exercise along the therapeutic aquatic exercise in people with knee OA has effective results or not through narrative review study. The Presenting signs and symptoms are Pain, muscle stiffness, activity limitation, participation restriction, swelling and crepitus sounds (3, 24). On examination there will be synovial thickening as indicated by a joint line tenderness with effusion, crepitations are felt on movement. [9, 21]. Knee OA mainly influences and affects the three part of Knee complex (Fig.1) and generally progresses slowly over 10-15 years, obstructs day to day activities. Now it is updated that OA is multifactorial in origin clinically (19,21).

Search Methods

The various sources used for obtaining this information represented in table 1. Various search engines and databases were visited for reviewing the articles. Data have been taken from PubMed, Cochrane Library, Science Direct, Research gate, Oxford Academy of Physical Therapy.

Selection Criteria

Type of studies

Randomized control trials, clinical trials compared with control group (Usual care, education, social attention, medication, lifestyle modification) (1,15,17).

Types of participants

Inclusion criteria

OA in one or both knee/ hip- by American college of rheumatology criteria

Participants with all degree of OA.

Hip / knee pain.

Osteophytes on radiographs.

Joint space narrowing on X – rays.

**Tarandeep Kaur**

Pain Intensity- <4 cm on VAS.

Struggling In climbing the chairs, walking and lift up from chair.

Age criteria – 60 years or above

Exclusion criteria

Mix OA and RA.

Other arthritic conditions.

Diseases which affects other joints, other inflammatory joints diseases.

Lower limb joint replacement surgery.

Recent history of lower limb trauma, Peri-articular Knee fracture

Skin disease or open wounds, Heart and Lung diseases

Hydrophobia ,Urinary and fecal incontinence , Language and intellectual problems

Intervention

The focus on strengthening exercises should be on the major muscles of both the hip and the knee even though the focus is on the knee (4,5). Researchers are still trying to pin point what the difference in effects would be if strengthening exercises were done in water and not only on land (8,17). The use of aquatic equipment's for strength along with the water itself makes it more effective (6). Often times the quadriceps muscles undergo muscle atrophy due to the decreased workability (20, 21). The hamstring, muscles are a predictor of any activities such as struggling in stair climbing sit to stand and should not be ignored in the intervention (14). Strengthening exercises can be performed in the water with the use of therapeutic equipment's such as resistance bands, ankle weights, aqua resistant fins, aqua bench (16, 22). Before performing these exercises, a 10-15 minutes session of warm up and cool down is required, such as walking in the pool front ways and backwards, sideways and high stepping the temperature of the water is also checked (9,13).

Design of Intervention

The study consisted of a seven week intervention (Table 3). The participants underwent a thorough assessment before and after the intervention. Additionally the experimental group received an after effect assessment at 13 weeks (7 weeks post completion of intervention). This procedure was done to see if the outcomes of the intervention were short term or long term.

Two groups of study were taken: Group 1: Control group, Group 2: Experimental group.**Control group**

These are the participants that did not receive either therapeutic aquatic therapy or strengthening exercises during the period of the study, on the less these participants were offered another kind of intervention.

Participants were assessed (fig.2) before starting of the treatment part and make them eligible for take part in the intervention procedure (19,21).

Experimental group

This is the trail group that had to follow procedure for the two exercises being studied. Some participants can withdraw their treatment from control group and switch to experimental group. More people were taking part in the interventional group after completion of more than 3 months after seeing the positive effects.

Outcomes Measures

Primary Outcomes

Pain – Visual analog scale (VAS) Patients who mark their improvement level as 4, 5, 6 and intensity of pain is less showed positive results whereas who scored their improvement level as 1,2,3 and pain severity is more showed less improvement.

Range of Motion – Movements like Hip abduction, Knee flexion/extension, e external / internal rotation was assessed using 'Goniometry'.

**Tarandeep Kaur****Secondary Outcome**

Disability- WOMAC scale = The 24-components were asked in WOMAC scale. It was used to evaluate the extent of pain, Muscle stiffness, and Level of physical function. It is very reliable and valid tool to assess the people with knee and hip Osteoarthritis. High score of WOMAC indicates worse pain and functional status. KOOS outcome measure evaluates five elements - Pain, signs & Symptoms, Functional Independence, Sport and restoration function and Knee related quality of life. It is alternative part of WOMAC.

Muscle strength – Dynamometry and Manual Muscle Testing are used to assess the muscle strength. Isokinetic dynamometry is used to assess maximum strength of Quadriceps and Hamstrings at 30 degree/s, 60degree/s, 90degree/s is done.

Balance – Static Balance – Romberg test – Evaluated in four situations - (i) Eyes Open/Firm surface [EO] (ii) Eyes closed/Firm surface [EC] (c) Eyes Open / shaky surface [EOSS] (d) Eyes Closed/Shaky surface [ECSS]. To avoid differences in patient outcome all individuals who have participated have to prior run before balance tests. Dynamic Balance – Balance error scoring system and step test

Physical function - Time up and time go test (TUG Test)

Gait parameters – 6 minute walk test /3D gait analysis

Quality of life : - SF-36, SF-36 scale used to assess the capabilities of the client in context of life performance tasks.

RESULTS

The results of the 7weeks studying trail infer that an average trail of confirmation in regards to the use of strengthening exercises along with therapeutic aquatic exercises was effective than control interventions as seeing the outcome measures had improved. The participants had a reduction in pain during movement (VAS), their physical function significantly improved as well as their strength and gait capacity as compared to when they hadn't taken the intervention the whole point of conducting strengthening exercises with aquatic is because the water has low impact on the body thus causing a reduction in joint stiffness too, thereis body conditioning due to its cooling effect and is good for cardiovascular health conditions. The strengthening of both the major knee muscles quadriceps and hamstring significantly enhanced joint stability. Before performing these exercises, a 10-15minutes session of warm up and cool down is required, such as walking in the pool front ways and backwards, sideways and high stepping the temperature of the water is also checked. This intervention is to be given for a ,maximum of seven weeks reports following these exercises proved to have had an effect on the reduction of pain during move, movement. The whole point of conducting strengthening exercises with aquatic is that water has low impact on the body there is body conditioning due to its cooling effects, and good for the overall cardiovascular health and usually effective on overweight patients, the strengthening of the quadriceps and hamstring may enhance joint stability.

In case of OA affecting the medial side of the knee with the use of these water exercises, It is advised to strengthen the knee major muscles, opposite to the affected knee side, thus lowering the stress on the medial knee side which in this case is the affected, and vise-versa. Other doable exercises in water can be done too such as aquatic stationary cycle. A study conducted in 2007 by the APTA using a set of different exercise's in water had shown that the combination of strengthening exercises along with TAE demonstrated a reduction in pain and an improved physical function. There was reduced joint stiffness, improvement on the quality of life. As compared to land based exercises, performing them in water is advantageous because there are less chances of injury. The out turn of this study demonstrates, participants in each experimental group notably improved, in that; pain and physical dysfunction were reduced, thereby enhancing the speed of walking, all this was observed following intervention. A post treatment check up was done few weeks after intervention and the outcome showed that the functional status of the therapeutic group was better than their inceptive status. Although a number of patients could not go all the way through the intervention, due to the unbearable pain that came with exercises, it was seen that, administration of isotonic based exercises gave a considerable amount of outcome on decreasing pain. On the other hand isokinetic exercises proved to have had improved the physical disability as well as enhancing the speed at which the patients

**Tarandeep Kaur**

walked, with that said, a 60 degrees/ second angular speed peak torques lied in both isokinetic and isotonic exercise groups thereby producing a substantial muscle strength procure. Nonetheless remarkable muscle strength procures in 180 degrees/second angular speed top force was only established in the isokinetic set following intervention. Survey of the tests which counted for self assessment dysfunction revealed a close decline in the disorder. In general this study depicts, that water based exercises do hold, yet temporary medically applicable results on dysfunction, self assessed pain and the well being of patients suffering from osteoarthritis of both knee and hip succeeding a water based treatment. Still there is no clarity in regards to the results being centered on the contemporary proof. The prompt effects of water based exercises demonstrate an exact with sustained results, even after having varying partaking set of patients with either knee or hip osteoarthritis. In contrast to the people who did not partake in the water based exercise interventions, the experimental category that had performed these exercises had statistically significant values in context to the results. Control group have lesser positive results as compared to experimental group. There was a reduction in pain, improved performance and well being, as a result of the treatment. With a sum of seventy two percent to seventy five percent patients showing reduction in pain and advanced performance in context to seventeen percent of the non experimental group. There was a continued satisfaction ½ months post fulfilling the intervention, meanwhile a large percentage of the survey partakers continued performing the therapeutic aquatic exercises on their own.

DISCUSSION

This review describes about the efficacy of strengthening exercises along with aquatic therapy on patients with Knee OA. Our findings and data revealed that 7 week treatment, 4 sessions /week protocol showed reduced intensity of pain and stiffness around knee joint along with improvement in functional independency in people with knee OA, Hip/Knee muscle strength and quality of life in people with OA. Our treatment protocol mainly targets the positions in which patient performs actively as much as possible with increase in the resistance progressively with the help of turbulence of water (17). Especially, Participants were mainly focus on the exercises to be done in group therapy instead of orthopedic surgery. It has been stated that Hip abductors are prime muscles to provide stabilization to the opposite side pelvis during the phase of walking and it will leads to reduction of compressive forces around knee joint complex. (16, 17). The Primary result of this review suggested that Hip and Knee OA is very common and can be cure and prevented by Physical Therapy. An exercise programme has beneficial results in reducing the intensity Of pain and muscle stiffness around knee joint along with improvement in functional independency in people with knee OA. Our treatment Protocol mainly targets the positions in which patient performs actively as much as possible with increase in resistance progressively with the help of turbulence of water (15).

There is a significant enhancement in functional tests, such as "sit-and-reach", "knee-push-up", "timed-up-and-go", knee strength test, Half and full squats 60 seconds. Same type of positive results which are coming with the aerobic and muscle strength training also will be achieved with the help of aquatic therapy treatment (17,18). In addition to this, our findings revealed experimental group has more positive results in relation to balance and walking. Balance on different types of surfaces and increase of walking speed are the main components. They showed significant result in improvement of static and dynamic balance with increase of step and stride length. In Cochrane review, researchers advised that therapeutic aquatic exercise may have more pros for the cure of patients/clients with osteoarthritis. They conducted many clinical experiments upto 28 April,2015 and suggested that TAE have greater impact on muscle strength and compared to control group whereas no significant positive results came.[18] Functional independence, Activity limitation, participation restrictions, pain intensity, QoL are assessed before, during and after the treatment have been completed. The outcome measures used in the study showed favourism in context to outcome of severity of pain and physical function (21). Our narrative review of evidence exposed the effect of strengthening along with TAE in reduction of pain and improvement of physical function. Intervention protocol which is planned for the Knee OA patients may not be beneficial for the Hip OA or mixed OA patients. There is possibility that results could vary according to type and location of OA. As a whole evidence revealed that strength training with aquatic therapy for extrimities of lower limb for pain reduction and improvement in physical

Tarandeep Kaur

function. Strengthening of group of muscles depend on each compartment of knee joint which involved in OA. However, strengthening of quadriceps and hamstring is beneficial for knee OA (13,14). Clinical Trials assessed different outcomes measures relating to Physical function and mobility. Water provide the surface and platform for doing exercise in comfortable manner (20). In acute stage OA Isotonic exercises play important role in strengthening of muscles around knee joint complex and to provide mobility and stability isokinetic helps the people with OA (19). There are some clinical guidelines and recommendations to follow strengthening exercises along with aquatic therapy. This can be given to all individuals with OA. There should be clinical guidelines have to be follow to implement the intervention (13). Our review suggested that strengthening along with aquatic therapy exercises is needed in reducing the pain severity and improving independence level in patients with Knee OA. Thus clinical guidelines, recommendations and audit tool have been created in our study with evidence to implement aquatic therapy in clinics (1, 6). This is a well-organized narrative review focused on the topic 'To study the effect of strengthening exercises along with therapeutic aquatic exercises on patients with knee osteoarthritis' and we have efficiently concluded with evidence that strengthening exercises along with therapeutic aquatic exercise show major health wise upgrade in osteoarthritic patients through acquiring increased physical performance and decreased pain and joint stiffness. The exercise protocol has helped to enhance major muscle strength of both hip and knee and refined quality of life in people with osteoarthritis. The strengthening exercises consistently helped to enhance muscle mass, density of bone, and joint flexibility. Therapeutic Aquatic exercises has made better progress in muscle tone, improved motor control and posture on walking, also better mobility under water helped to increase range of motion. Overall exercise protocol and outcome measures accommodating both the approaches has shown better result and together they have brought a positive health impact on patients suffering from osteoarthritis.

ABSTRACT

Rice is the staple food for human life for their daily calorie requirements. The production constrains are due to pest, diseases and nutritional deficiencies. The rhizosphere soil that contains vitamins, amino acids and nutrients harbors a niche for the plant growth promoting rhizobacteria, a group of beneficial bacteria that enhance the growth and yield of crop plants. In the present study plant growth promoting rhizobacteria were isolated from the rice rhizosphere soils from Cauvery delta region of Tamil Nadu. The isolated ten bacterial strains were analyzed for their physico-chemical properties and characterized biochemically for tentative species identification. Microscopic observation of bacterial strains were rod shaped, ring and curved rod, gram reaction was gram positive and gram negative and it was also observed for the motility and endospore formation. IAA, GA₃ and Siderophore were analyzed for the phytohormone production (IAA, GA₃ and Siderophore) results showed that IAA production ranged from (22.19±0.84 to 17.10±0.34 µg/ml), GA₃ production ranged from (6.80±0.05 to 1.08±0.03 µg/ml) and the siderophore production ranged from (10.17 to 4.20 µg/ml). The isolated region specific PGPR strains could be recommended as an effective PGPR bioinoculant for the rice crop in the Cauvery Delta zones of Tamil Nadu

Keywords: Cauvery Delta zone, Native PGPR isolates, IAA, GA₃ and Siderophore production.

INTRODUCTION

Half of the world's population relies on rice (*Oryza sativa* L.) to meet their daily calorie needs, making it the second most important staple crop for humans (Ahmad *et al.*, 2019; FAO 2020). Its contribution in global caloric intake is 23 per cent (Joshi *et al.*, 2020). The region of soil known as the rhizosphere surrounds the root and is impacted by root chemical excretion. Rhizospheric bacteria can obtain vitamins and amino acids from root exudates in addition to other nutrients, increasing their populations of bacteria that are best suited to consume them (Berendsen *et al.*, 2012). The group of helpful bacteria known as Plant Growth Promoting Rhizobacteria (PGPR) supports plant growth and biocontrol through a wide range of ways Kloepper and Schroth (1978). It has been common practice for many years to use rhizobacteria that promote plant development to enhance soil and plant health. Nearly all plants engage in interactions with the microorganisms in their surroundings at every stage of growth. Plant-microbe interactions may be advantageous, detrimental or neutral. In soil, a sizable number of microorganism populations engage in interactions with plant roots (Meena *et al.*, 2012). These microbes, which can colonize plant roots to promote plant growth and mitigate various biotic and abiotic stresses, include bacteria that fix nitrogen, solubilize nutrients, produce phytohormones, antibiotics, and enzymes (Glick 2012; Azcon *et al.*, 2013). Rice-microbe interactions are most successfully mediated by a variety of soil bacteria, including *Azospirillum*, *Pseudomonas*, *Bacillus*, *Exiguobacterium*, *Chryso bacterium*, *Ralstonia*, *Kecuria*, *Serratia*, *Pantoea*, *Enterobacter*, *Burkholderia*, and *Cyanobacteria* (Lucas *et al.*, 2014; Pittol *et al.*, 2016). To improve growth, seed emergence, crop yield and output, PGPR have been isolated and screened from the rhizospheric soil of a variety of crops (Farah *et al.*, 2006). Hence, the present work was aimed to isolate the native PGPR bacteria of rice rhizosphere soils from the cauvery delta zone of Tamil Nadu and to biochemically characterize and to evaluate the efficacy of their PGP activity.

MATERIALS AND METHODS

Collection of soil sample

Rhizosphere soil sample were collected from 5 different districts of Cauvery delta zone from Tamil Nadu such as Nagapattinam, Mayiladuthurai, Thiruvavur, Thanjavur and Cuddalore. Two soil samples were collected from each district. Samples were aseptically kept in sterile poly bags in the targeted sites and carefully transferred to laboratory for further analysis.

Isolation of Native PGPR from rice rhizosphere

The native bacterial colonies were isolated from the rhizospheric soil of rice fields from Cauvery delta zone of Tamil Nadu. One gram of soil was diluted with sterile distilled water and dilution is carried out up to 10^{-6} dilution and the extraction was taken to spread on the Luria Bertani (LB) agar medium. Then, LB agar medium was incubated for 48 hrs at a temperature of 28°C (room temperature). After the incubation the isolates were purified and maintained in LB slants at 4°C for further studies.

Designation of the Native bacterial isolates from Cauvery Delta Zone in Tamil Nadu

All the bacterial isolates isolated from the rice rhizosphere soils were designated as Cauvery Delta Zone (CDZ) – Native Isolate (NI) from 1 to 10 Viz., CDZ – NI – 1 to CDZ – NZ -10.

Morphological characterization of Native PGPR isolates

To report tentatively identified PGPR isolates, the following morphological test were performed to assess the cell shape, gram reaction, endospore and motility.

Cell Shape

The purified cultures, at log phase were observed microscopically for the cell morphological characteristics.

**Gomathi et al.,****Gram staining**

Gram staining was carried out as per the Hucker's modification (Rangaswami, 1975). In compound microscope under oil-immersion the culture which showed Violet colour that denotes gram positive bacteria and pinkish red colour which denotes gram negative.

Motility

Bacterial isolates were stabbed into the semisolid agar medium and inoculated. These inoculated stabs were incubated at 30°C for 72 hrs and motility was observed. The distance between the place of stab and the point of growth indicated motility.

Biochemical Characterization of Native PGPR bacterial isolates**Oxidase test**

The Native PGPR isolates were streaked on Trypticase soy agar medium and incubated at 30°C in an inverted position for 48 hrs. After the incubation period, 2-3 drops of para-aminodimethyl aniline oxalate solution were added on the streaked area and the plates were observed for the colour change from pink to maroon and finally to purple within 30 seconds indicated a positive reaction.

Nitrate reduction test

The Native PGPR bacterial isolates were inoculated into the nitrate broth and the culture were incubated at 30°C for 14 days. After the incubation period, 2ml of broth was tested by adding equal amount of sulfanilic acid and alpha naphthylamine development of red colour indicated that nitrate had been reduced to nitrite.

Hydrogen Sulphide Production

Sulfide indole motility (SIM) agar medium were prepared inoculated with the tested Native PGPR isolates and incubated at 30°C for 48 hrs. After incubation black coloration along the line of stab inoculation indicated H₂S production.

Catalase activity

A loopful of Native PGPR bacterial isolates maintained at nutrient agar slants for 24 hrs, after incubation period this is transferred to 0.5 ml of 3 per cent H₂O₂ solution and the presence of effervescence was detected.

Indole Production

The isolated native PGPR colonies were inoculated into glucose tryptone broth in test tubes and the tubes were incubated at 30°C for 2 days. After incubation period, 0.3 ml of Kovacs reagent was added and mixed well. The reddening of the alcohol layer within few minutes indicated indole production.

Methyl red and Voges Proskauer test

The MRVP broth prepared in two sets were inoculated with the Native PGPR isolates and incubated for 48 hrs at 30°C. To the first set of tubes 5 drops of methyl red indicator was added. The development of distinct red colour was indicated as positive reaction for MR test. Another set of tubes were added with 2-3 drops of barrit reagent and shaken gently for 15 minutes. The positive reaction of acetyl methyl carbinol production was indicated by the development of red colour this indicates positive result for the VP test.

Citrate Utilization

The Native PGPR isolates were inoculated into simmons citrate agar medium and incubated for 48 hrs at 30°C. Simmons citrate agar contained citrates as it is the only carbon source. The presence of growth and change of colour from green to blue due to pH change indicated positive reaction.

Phytohormone production by the Native PGPR bacterial isolates

Production of indole -3-acetic acid (IAA)

The production of indole-3-acetic acid (IAA) was measured in Luria- Bertani (LB) broth supplemented with 5mM L-tryptophan (Gordon and Weber (1951). Bacterial cultures (10^7 CFU ml⁻¹) were inoculated in LB broth and the maintained at 30°C in a shaking condition for 36 hours at 120 rpm. The culture was centrifuged at 10000 rpm for 15 minutes at room temperature after the incubation period. 2 ml Salkowski reagent (2 per cent 0.5 M FeCl₃ in 35 per cent perchloric acid) was added to one milliliter of supernatant. Two drops of orthophosphoric acid was also added, and the mixture was maintained in the dark for colour development. After 2 hours, the optical density was measured at 530 nm.

Siderophore production

The siderophore production was determined on Blue agar Chrome Azurol S (CAS) medium-containing CAS and Hexadecyl Trimethyl Ammonium Bromide (HDTMT) as indicators by incubating at 28°C for 24 hrs. Siderophore production (µg/ml) was quantitatively estimated spectrophotometrically employing the procedure suggested by Adhikari, *et al.*,(2013).

Estimation of Gibberellic acid (GA₃)

Gibberellic acid production by the Native PGPR isolates was determined by following the method of Borrow *et al* (1955). 100 ml medium was prepared and sterilized. One ml of broth of each of the isolates were added separately in the respective broth and incubated at 37°C for 7 days. After the incubation, the culture was centrifuged at 8000 rpm for 10 mins to remove the bacterial cells. Fifteen ml of the culture was pipette out separately into the test tubes and two ml of zinc acetate solution was added. After 2 mins two ml of potassium ferrocyanide solution was added and centrifuged at 8000 rpm for 10 mins. Five ml of supernatant was added to five ml of 30 per cent hydrochloric acid and the mixture was incubated at 27°C for 75 mins. The blank was prepared with five per cent hydrochloric acid. Absorbance was measured at 254 nm in a UV-VIS spectrophotometer.

RESULTS

In the present study, Native PGPR were isolated from rice rhizosphere soil and characterized for various plant growth promoting activity. A total of ten bacterial colonies were successfully isolated from different locations of Cauvery delta zone of Tamil Nadu, such as Nagapattinam, Thiruvavur, Thanjavur, Mayiladuthurai and Cuddalore district and the rhizosphere soil of rice were designated as CDZ – NI – 1, CDZ – NI – 2, CDZ – NI – 3, CDZ – NI – 4, CDZ – NI – 5, CDZ – NI – 6, CDZ – NI – 7, CDZ – NI – 8, CDZ – NI – 9 and CDZ – NI – 10 showed in (Table - 1). Native PGPR bacterial isolates were characterized morphologically. The results were tabulated in (Table - 2) and the morphological characterization with different shapes *viz.*, rod, curved rod and ring shaped colonies were identified and the gram staining was carried out the results were positive for CDZ – NI – 2, CDZ – NI – 6 and CDZ – NI – 9 and gram negative staining for CDZ – NI – 1, CDZ – NI – 3, CDZ – NI – 4, CDZ – NI – 5, CDZ – NI – 7, CDZ – NI – 8 and CDZ – NI – 10 and motility test and endospore test were also observed.

Biochemical test for isolated Rhizosphere PGPR isolates

The result for the biochemical test performed for the identification of the isolates showed in (Table - 3). Oxidase test was positive for the isolates CDZ – NI – 3, CDZ – NI – 4, CDZ – NI – 6, CDZ – NI – 7 and CDZ – NI – 10 and the negative for the isolates CDZ – NI – 1, CDZ – NI – 2, CDZ – NI – 5, CDZ – NI – 7 and CDZ – NI – 9. Nitrate reduction test were positive in all the isolates except CDZ – NI – 6. H₂S production were negative in CDZ – NI – 1, CDZ – NI – 2, CDZ – NI – 4, CDZ – NI – 5, CDZ – NI – 7, CDZ – NI – 8 and CDZ – NI – 9 and was found positive for CDZ – NI – 3, CDZ – NI – 5 and CDZ – NI – 6. In catalase test positive results was noticed in all the isolates except CDZ – NI – 1 and CDZ – NI – 5. In indole test was negative for all the isolated native PGPR strains. The positive result of Methyl Red test was noted in CDZ – NI – 1, CDZ – NI – 6 and CDZ – NI – 8 and the negative result was noted in CDZ – NI – 2, CDZ – NI – 3, CDZ – NI – 4, CDZ – NI – 6, CDZ – NI – 8, CDZ – NI – 9 and CDZ – NI – 10 and also Vogas

Gomathi et al.,

Proskauer's test was negative for all the isolates except CDZ – NI – 3, CDZ – NI – 6 and CDZ – NI – 9. In citrate utilization test positive results were observed in CDZ – NI – 1, CDZ – NI – 3, CDZ – NI – 5, CDZ – NI – 6, CDZ – NI – 7 and CDZ – NI – 10, and the negative citrate utilization was observed in CDZ – NI – 2, CDZ – NI – 4, CDZ – NI – 5 and CDZ – NI – 9. Based on the biochemical test the PGPR bacterial isolates were tentatively identified as *Azospirillum lipoferum*, *Bacillus subtilis*, *Azotobacter*, *Pseudomonas fluorescens*, *Azospirillum brasilense*, *Bacillus megaterium*, *Fraturia aurentia*, *Pseudomonas putida*, *Bacillus polymyxa* and *Pseudomonas aueruginosa*.

In vitro Phytohormone producing activity

In vitro Plant Growth Promoting activity of different bacterial rice rhizospheric native PGPR isolates were shown in Table - 4 and Figure - 1. Rhizosphere Native PGPR isolates were analyzed for its efficacy to produce IAA, GA₃ and Siderophore production. Based on the efficacy of the rhizospheric bacterial isolates, the maximum IAA production was recorded in CDZ – NI -1 (22.19±0.84) (µg/ml), which was followed by CDZ – NI -4 (22.19±0.05) (µg/ml), and the least was recorded in the CDZ – NI -2 (17.10±0.34) (µg/ml). In GA₃ production, maximum amount of GA₃ produced by the CDZ – NI -1 (6.80±0.05) (µg/ml) and the least was produced by CDZ – NI -10 (1.08±0.03). The siderophore production was maximum on CDZ – NI -1 (10.17) (µg/ml), which was followed by 9.10(µg/ml) on CDZ – NI -6 and the least siderophore production was found in CDZ – NI -2 (4.20) (µg/ml). The best and effective strains which performed better in maximum IAA, GA₃ and Siderophore production were selected and used in further studies.

DISCUSSION

Henry *et al.*, (2014) had studied the characterization of PGPR from potato plant Rhizosphere which showed its potential plant growth promotion that indicated the highest quantity of IAA (5.816µg/ml), GA₃, phosphate solubilization and siderophore. Krunal *et al.*, (2017) reported the characterization of PGPR from rice rhizosphere, such as IAA, phosphate solubilization, siderophore production etc. Similar results were also reported by Safiullah *et al.*, (2019), Yasin *et al.*, (2022) in coffee plantation soils. Our findings of utilizing the Native PGPR strains as an effective bioinoculant in increasing the growth and yield was in line with the findings of the above listed scientists.

CONCLUSION

The native PGPR isolates *viz.*, *Azospirillum lipoferum*, *Bacillus megaterium*, *Fraturia aurentia*, and *Pseudomonas fluorescence* were isolated from rice rhizosphere of different locations of Cauvery delta region of Tamil Nadu and were assessed for IAA, GA₃ and Siderophore production. Hence these isolated native PGPR isolates could be recommended as an effective PGPR bioinoculants for rice crop cultivated in the Cauvery Delta Zone of Tamil Nadu.

ABSTRACT

According to WHO, infertility is a disease of reproductive system defined by failure to achieve the clinical pregnancy after 12 months or more of regular unprotected sexual intercourse. WHO estimates 60–80 million couples worldwide currently suffer from infertility and is estimated to affect 8–12% of couples worldwide. Hence, there is an urgent need to develop a safe and effective higher order therapeutic drug from natural resources for male infertility. In *Siddha* medical system from ancient times, infertility has been treated successfully with higher order medicines like *Aya Thanga Chenduram* (ATC), *Aya Velli Chenduram*, *Thanga Linga Chenduram*, *Poorana Chandhrodayam*, *Sorna PushpaRasa Chenduram*, *Seena PaashanaParpam*, etc. This study is aimed to review the ingredients of ATC towards its therapeutic use in Male infertility. ATC is one among the Higher order *Siddha* medicine prepared from *Ayam*, *Thangam*, *Valairasam*, *Kandhagam* and *Sangu paashanam*, indicated for male infertility. ATC is practised by *vaidhyars* and *siddha* physicians to treat Male infertility from longer period. According to *Siddha* concept, ATC is a precise medicine for Male infertility because the major ingredients of ATC like *Ayam*, *Thangam*, *Rasam* and

Kandhagam have Sweet and Astringent taste. According taste theory, they enhance the quality of semen and a potent nervine tonic respectively. As per *Gunapadam* text, *Ayam* and *Thangam* are indicated for *Thathunattam* (Male infertility). Scientifically most of the ingredients of *ATC* have proved for its spermatogenic and aphrodisiac actions. This review study conducted that, the higher order *Siddha* preparation *Aya Thanga Chenduram* has suggested drug for Male infertility. Further scientific studies to be conducted to ensure its safety and efficacy on Male infertility.

Keywords: Male Infertility; *Aya Thanga Chenduram*; *Siddha* Medicine.

INTRODUCTION

Siddha system is one of the traditional medical system providing preventive, promotive, curative, rejuvenate and rehabilitative health care by adopting scientific and holistic approach.

WHAT IS INFERTILITY?

The term “infertility” came from Latin word *infertilis* which means “not fertile”(1) Infertility is a disease of the male and female reproductive system. According to the International Committee for Monitoring Assisted Reproductive Technology, World Health Organization (WHO), infertility is a disease of reproductive system defined by failure to achieve the clinical pregnancy after 12 months or more of regular unprotected sexual intercourse(2). According to *Siddha* literature, infertility in male is called as *Aan maladu*, *Veeriyanashtam*, *Thathunattam* and *Aanmaikuraipaadu*.

According to *Yugi muni* in *Siddha* literature (3), the following characters contribute to infertile man

- Lack of sweetness in semen
- Buoyancy of water
- Absence of virility
- Frothy micturition

GLOBAL INCIDENCE OF INFERTILITY (4)

As per the WHO estimates 60–80 million couples worldwide currently suffer from infertility. It varies across regions of the world and is estimated to affect 8–12% of couples worldwide. It tends to be the highest in countries with high fertility rates; an occurrence termed “barrenness amid plenty.”

INFERTILITY IN INDIA

In India 10-15% of couples were infertile(5). Of this, the male factor is responsible for 20-40%. In Indian couples seeking treatment, the male factor is the cause in approximately 23%(6).

CAUSES OF MALE INFERTILITY

Male infertility is caused by wide range of etiologies. Numerous factors are defined with unequivocal and harmful effect on male reproduction function, i.e.,

1. sedentary life style problems,
 2. nutritional deficiencies
 3. genetic causes
 4. hormonal issues
 5. physical problems likewise varicocele, damaged sperm ducts, torsion, Klinefelter’s syndrome, retrograde ejaculation,
 6. psychological issues comprised of erectile dysfunction, premature ejaculation and ejaculatory incompetence
- Oligospermia may be considered as a pathologic effect of the abovementioned causes and consequently oligospermia represents a cause of reduced male fertility (7).

Jayalakshmi et al.,

AVAILABLE TREATMENT MODALITIES AND IT'S DISADVANTAGES:

Broad range of strategies had been carried out to overcome the male infertility complications.

- Hormonal treatment using Gonadotropin releasing hormone(GnRH), Gonadotropins like Human Chorionic Gonadotropin (HCG),Follicle Stimulating Hormone (FSH) and Luteinizing hormone(LH).
- Selective Estrogen Receptor Modulators(SERMs)
- Aromatase Inhibitor (AI) therapy.
- Dopamine agonist.
- Surgical procedures.
- Assisted Reproduction Technology (ART)

However, shortcomings of the above stated treatments cannot be overlooked which may include acceptability, high expenditure and threat of diverse complications during surgical procedures. Approximately, half of the couples undergoing consultation for male infertility terminated ART treatment, mainly due to physical and emotional pain resulting from treatment. Additionally, there were some concerns for the offspring conceived by means of ART including in vitro fertilization (IVF) and intracytoplasmic sperm injection (ICSI) via microsurgical epididymal sperm aspiration (MESA) or percutaneous epididymal sperm aspiration (PESA) showed a higher risk of birth defects. (7) Hence, there is a need for a safe and effective higher order therapeutic drug from novel natural sources for male infertility. Many efficacious *siddha* medicines available for male infertility. *Aya Thanga Chenduram* (ATC)[®] is one among the Higher order *Siddha* preparation for male infertility.

OBJECTIVE

The main objective of this review is to prove that a Higher order *Siddha* medicine *Aya Thanga Chenduram* is an effective suggested drug for Male infertility (*Aan maladu*).

MATERIAL AND METHOD

- Classical text available in *Siddha* literature is reviewed.
- Database available after net surfing, modern literatures and various research articles were also reviewed.

AYA THANGA CHENDURAM[®]:**Ingredients of Aya Thanga Chenduram (ATC)**

- | | | |
|-------------------------------|---------------------------|----------------------|
| 1. <i>Aya thool</i> | (powdered form of Ferrum) | - 175grams |
| 2. <i>Thangam</i> | (Gold) | - 4.2 grams |
| 3. <i>Sangu paashanam</i> | (White Arsenic) | - 1.05 grams |
| 4. <i>Valairasam</i> | (Mercury) | - 25.2 grams |
| 5. <i>Kandhagam</i> | (Sulphur) | - 35 grams |
| 6. <i>Elumichampazhacharu</i> | (Lemon juice) | -Sufficient quantity |

PROCEDURE

The above ingredients purified by the standard procedures as per *siddha* literatures. After purification, *Valai Rasam* grinded with *Thangam* as a first step of this medicine preparation then add *Kandhagam* and grind it continuously until it becomes black in colour. Then add *Ayam* and *Sangu paashanam* and grind into fine powder and then add lemon juice, grind for about 6 to 9 hours per day for 4 days into waxy consistency and make it into pea sized pills and dry it. Then keep the dried pills in *Vaaluka enthiram* and incinerate for 12 hours, leave it for one night. The next day morning, open out the *Vaaluka enthiram*, the medicine will be red in colour. Then grind it and keep it in an air tight container.

DOSE: 65-130mg (Twice a day)

VEHICLE: Honey

**INDICATIONS**

Nalla thejasum, Aan thanmaiym Visheshikkum.

SIDDHA PHARMACOLOGICAL CHARACTERS OF ATC⁽⁹⁾**1. Ayam (Iron or Ferrum)**

- It has astringent taste.
- It has nutrient, alterative and hematinic actions.
- And it is indicated for *Thathunattam* (Male infertility) in the song of its general character.

2. Thangam (Gold)

- It has sweet taste.
- It has aphrodisiac, nervine tonic and alterative actions.
- And it is indicated for *Thathunattam* (Male infertility) in the song of its general character.

3. Sangu paashanam (White arsenic)

- It has nutrient, nervine tonic and antioxidant actions.
- It has the potency of stimulating genital organs.

4. Vaalairasam (Mercury)

- It has six tastes, predominantly sweet in taste.
- It has both heat and cold potency in equal proportion.
- It is considered as Chakaravathi (King of all drugs).

5. Kandhagam (Sulphur)

- It has astringent taste.
- It has alterative action.

6. Elumicham pazhacharu (Lemon juice)⁽¹⁰⁾

- Cold potency
- It has antioxidant property since it is a rejuvenating herb.

SCIENTIFIC EVIDENCES

According to modern literature review, Iron (which is the major ingredient of *Aya Thanga Chenduram*) has major role in male reproduction. Iron is one of the most abundant mineral nutrients in the organism and plays a critical role in the synthesis of nucleic acids and proteins, electron transport, cellular respiration, proliferation and differentiation(11) all of which are intimately related to spermatogenesis and spermatozoa metabolism(12) Three mammalian gene expressions are directly regulated by iron(11), two of which have an impact on male reproduction. The type 5 isozyme of acid phosphatase is an Fe-containing molecule found in semen in large quantities and of prostatic origin. It is believed that its presence may be associated with the liquefaction process of semen(13). Fe is involved in a variety of redox reactions catalysed by cytochromes, with a subsequent energy production, drug and hormonal metabolism, propagation and activation of the defence systems via the nicotinamide adenine dinucleotide phosphate (NADP) oxidase(11) The connection between iron and the Krebs cycle is further solidified by the mitochondrial aconitase enzyme(14). Under ROS overproduction or in a state of iron deficiency, cellular respiration is inhibited by the nitrosylation of heme in mitochondrial enzymes aconitase and glyceraldehyde-3-phosphate dehydrogenase(15), leading to a depletion of adenosine triphosphate (ATP) and a subsequent loss of spermatozoa motility(16). It is widely known that during spermatid development, mitochondria undergo dramatic events related to movement and shaping, including aggregation and fusion or elongation alongside the growing axoneme(17). Disruptions of mitochondrial function typically affects male fertility - a phenotype that is easily screened for and characterized at the subcellular level. The mitoferrin gene product and other proteins involved in iron metabolism

Jayalakshmi et al.,

show enriched expression in the testes suggesting that mitochondrial iron metabolism plays a role in spermatogenesis(17,18). In addition, Nikolaev et al(19) stated that Fe and non-hemic ferroproteins are involved in ejaculate thinning and viscosity, sperm pH, alongside with normal spermatogenesis. The importance of iron in male fertility has been shown in a variety of *in vivo* and *in vitro* studies. According to Kanwal et al(20), it was only iron from all the bulk elements evaluated in the seminal plasma of Niki-Rawi bulls, which was significantly and positively correlated with sperm motility. Tvrdá et al(21). showed that iron quantified in bovine seminal plasma was positively associated with sperm motility characteristics.

DISCUSSIONS

Major ingredients of ATC like *Ayam*, *Thangam*, *Rasam* and *Kandhagam* have Sweet and Astringent taste. According to the theory of taste in our Siddha literature(22), these tastes enhance the quality of semen and a potent nervine tonic respectively. *Ayam* and *Thangam* are indicated for *Thathunattam* (Male infertility) in the song of its general character. Many ingredients of ATC have nutritive, alterative, aphrodisiac, antioxidant and nervine tonic action which means it may favor in sperm production and sexual potency. Since Rasam has six tastes and two potencies, it can be used as best remedy for many diseases. Rasam and lemon extract have cool potency which may support spermatogenesis and sperm motility. According to Panchabootha theory,

- Earth + Water = helps in growth and proliferation
- Fire + Air = helps in viability and motility
- Space = Give space to all process

All the above mentioned characters are directly related to spermatogenesis and sperm motility.

The other preparations from various Siddha literatures possess the few ingredients of ATC and these also have spermatogenic and aphrodisiac actions.

Ayam which is also be a major ingredient of

Aya Velli Chenduram⁽⁸⁾

Aya chenduram⁽⁹⁾

Thangam which is also be a major ingredient of

1. *Thanga chenduram*⁽⁹⁾

2. *Thanga lingachenduram*⁽⁸⁾

Rasam and *Kandhagam* which are also be the major ingredients of

1. *Poorana chandhrodayam*⁽⁸⁾

2. *Sorna pushpa rasa chenduram*⁽⁸⁾

Sangu paashanam which is also be a major ingredient of

1. *Seena paashanaparpam*⁽⁸⁾

2. *Naaga rasa parpam*⁽⁸⁾ All the above mentioned preparations are indicated for *Thathunattam* (Male infertility)

CONCLUSION

As per the review of abovementioned literatures, all the ingredients of *Aya Thanga Chenduram* have potent spermatogenic and aphrodisiac action. According to basic *siddha* concept and scientific evidences, most of the ingredients of ATC have proved for its spermatogenic and aphrodisiac actions. This review study conducted that, the higher order *Siddha* preparation, *Aya Thanga Chenduram* has suggested effective drug for Male infertility. Further scientific studies to be conducted to ensure its safety and efficacy on Male infertility.

ABSTRACT

Antibiotic resistance is a global health threat resulting from extreme exposure and misuse of antibiotics. One of the resistance mechanisms is bacterial expression of efflux pumps due to which antibiotic concentration inside the bacterial cell is reduced. Blocking this pathway is a potential strategy to reduce bacterial resistance. This study is focused on determining the effectiveness of various phytoconstituents as an inhibitor of various efflux pumps of *Escherichia coli* namely AcrAB-Tolc, AcrB, EmrE, EmrD, and MacA using *insilico* methods. Docking analysis using PyRx and Auto Dock Vina software showed Ursolic acid with the highest average affinity. In vitro studies have demonstrated better activity of Sparfloxacin in resistant *Escherichia coli* when used along with Piperine or Citric acid. Further, the capsule formulation containing Sparfloxacin in combination with Citric acid was developed and evaluated. In addition to overcoming the resistance of *Escherichia coli* to Sparfloxacin, Citric acid has also improved the in-vitro drug release of Sparfloxacin. Although Citric acid and piperine have low binding affinity with efflux pumps as compared to Ursolic acid, they were found to be more effective in-vitro indicating the probability of altered outer membrane permeability in addition to binding with efflux pumps rendering increased concentration of Sparfloxacin in the bacterial cell.

Keywords: Antibiotic resistance, *Escherichia coli*, Efflux pump, Citric acid, Piperine, Sparfloxacin

Vrushali Tambe et al.,

INTRODUCTION

Antibiotic resistance is the main impediment to treat infectious disorders brought on by bacteria due to their acquisition of capacity to withstand antibiotics[1]. The resistance is developed due to alteration of drug target, drug inactivation, expression of efflux pumps and altered outer membrane permeability of the bacterial cell[2]. *Escherichia coli* (*E. coli*) is a gram-negative, rod-shaped bacterium commonly found in the lower intestine of warm-blooded organisms. While most strains of *E. coli* are harmless and even beneficial, certain pathogenic strains can cause infections[3]. *E. coli* has become a significant public health concern due to its ability to develop resistance to multiple antibiotics. *E. coli* can acquire and express resistance genes, which can be transferred between bacterial cells through plasmids or other mobile genetic elements. These resistance genes code for various enzymes, efflux pumps, or modifications that can inactivate or evade the action of antibiotics[4]. Efflux pumps are one of the critical mechanisms employed by *E. coli* to resist antibiotics. These pumps are membrane-bound proteins that actively pump antibiotics out of the bacterial cell. Efflux pumps in *E. coli* are part of the resistance-nodulation-division (RND) super family, such as AcrAB-TolC, which is highly associated with antibiotic resistance. One important and promising approach to battle bacterial resistance is the development of efflux pump inhibitors, which can boost the efficacy of the medicine and widen its spectrum of action by restoring the bacterium's susceptibility to the utilized antibiotic [5,6]. This paper entails a virtual screening-based evaluation of selected phytochemicals as efflux pump inhibitors. Also, the selected compounds should be bioavailable. Hence, the drug-likeness and ADMET study of selected phytochemicals is reported. Further, formulation and evaluation of Sparfloxacin capsule formulation along with selected phytochemicals is reported.

MATERIALS AND METHODS

Selection of Receptors, ligands and antibiotic

Relevant receptor proteins for *E. coli* were selected namely AcrAB- Tolc (PDB ID- 5O66), AcrB (PDB ID- 2W1B), EmrE (PDB ID- 3B5D), EmrD (PDB ID- 2GFP), MacA (PDB ID- 3FPP)[7]. Their three-dimensional (3D) structures were downloaded from protein data bank (<https://www.rcsb.org/>)[8]. The receptor structures were further prepared before docking[9]. Twenty phytoconstituents with reported antimicrobial activity were used for the study and are given in Table 1. Their 3D structures were downloaded from Pubchem in SDF formats [10]. Those formats were further converted into PDBQT format using AutoDock tools. According to the resistance map, *E. coli* was found to have resistance to fluoroquinolone in India (71%) followed by US (31%), South Africa (29%) and Australia (16%). Sparfloxacin, a fluoroquinolone was selected for this study^[11] and was purchased from Dhamtec Pharma, Navi Mumbai.

In silico Studies: Computational Virtual Screening and Molecular Docking

Molecular docking was performed using PyRx[12] and AutoDock Vina softwares. The investigation of docked complexes was performed using Biovia Discovery Studio[13].

In vitro Microsusceptibility testing study

An in vitro microsusceptibility test of *E. coli* to Sparfloxacin alone and with various phytochemicals was assessed by monitoring the zone of inhibition. About 5µg, 50µg, 100µg, 150µg, and 200µg of Sparfloxacin and selected Phytochemicals were added to wells punched on Agar plate spread with *E. coli*. The plates were incubated for 24 to 42 hr followed by measurement of zone of inhibition. The phytochemicals which increased the susceptibility of *E. coli* to Sparfloxacin were further selected for formulation development.

Formulation of capsule

A physical mixture of Sparfloxacin and citric acid in equal ratio was prepared after triturating it for 20 minutes in a mortar and pestle. The angle of repose of the resulting mixture was measured to determine flow properties. The mixture was filled in the capsule to contain 200mg each of Sparfloxacin and citric acid.

Vrushali Tambe et al.,

Drug-excipient interactions

The drug-excipient interactions were evaluated using X-ray diffraction (XRD), Differential Scanning Calorimetry (DSC), and Fourier-Transform Infrared Spectroscopy (FTIR).

Assay of Sparfloxacin capsules using UV-Spectroscopy

Absorption correction method was used to simultaneously analyze Sparfloxacin and citric acid^[14]. Powder equivalent to about 100mg of Sparfloxacin was taken in a 100 ml volumetric flask and mixed in 0.1N HCl (1000µg/ml). The mixture was sonicated for about 15 to 20 minutes and then filtered. From this, 1ml of the solution was diluted to 10ml (100µg/ml) with 0.1N HCl. Further, 1ml of the resulting solution was diluted with 0.1 N HCl to 10ml (10µg/ml). The absorbance of resulting solution was measured at 295nm where citric acid do not show any absorbance.

Dissolution study of marketed tablet and developed capsule formulation

The comparison of the dissolution behaviour of marketed tablet and developed capsule formulation was performed using rotating basket apparatus in 0.1N HCl for 1 hr at 37°C.

RESULT AND DISCUSSION

In silico Studies

In silico molecular docking studies were performed to access the binding of phytochemicals with the efflux pump proteins. The binding affinities of selected 20 phytochemicals and Sparfloxacin with efflux pumps are given in Table 1. The binding interactions of Sparfloxacin with efflux pumps are shown in Fig. 1. The results indicate that the selected phytochemicals exhibited varying degrees of binding affinity to various proteins. Furthermore, a literature survey revealed that the AcrAB-TolC efflux pump in *E. coli* significantly contributes to the resistance to Fluoroquinolone antibiotics. Ursolic acid was found to have better affinity for this receptor as well as the highest average binding affinity. This implies that Ursolic acid might have a strong affinity to the active sites of efflux pump receptors of *E. coli* suggesting reducing the ability of bacteria to expel antibiotics from within the cell. However, *In-vitro* studies are required to validate these findings and evaluate the actual impact of Ursolic acid on efflux pump activity and Antibiotic resistance. *In-vitro* microsusceptibility testing was performed by studying the zone of inhibition to evaluate the effectiveness of different combinations of each of 5µg of Sparfloxacin with phytochemicals against *E. coli*. It displayed resistance to Sparfloxacin and individual phytochemicals at lower concentration. The zones of inhibition of Sparfloxacin were only slightly increased in the presence of selected phytochemicals indicating resistance. *E. coli* highlights the challenges in treating infections caused by this bacterial strain, emphasizing the need for alternative strategies to overcome its intrinsic resistance mechanism.

Further, a higher concentration of 50µg was chosen. Despite the higher concentration, no significant change was observed in the response of *E. coli*. Further experimentation with increased concentrations is warranted to determine the optimal concentration required to effectively target *E. coli*. The concentration of phytochemicals was also further increased to 100 µg, 150 µg, and 200 µg. The zones of inhibition for each concentration were observed for individual and combination. At these concentration, clear and larger zone of inhibition were observed around the wells containing piperine and citric acid. This indicates that the increased concentration was effective in inhibiting the growth of *E. coli*, overcoming its resistance to a certain extent. Notably, the combination of Sparfloxacin with phytochemicals could not be measured as the entire Petri plate was cleared due to strong inhibition. Sparfloxacin along with Citric acid or Piperine showed bigger zone compared to other phytochemicals (Table 2). Further experiment was aimed to determine the concentration ratio of drug and adjuvant required to achieve a minimum zone of inhibition of 23 mm, following the guidelines set by the European Committee on Antimicrobial Susceptibility Testing (EUCAST)^[15]. Different concentration ratios of Sparfloxacin and Piperine or Citric acid, were tested. Among the tested ratios, the (32:30) ratio of Sparfloxacin to Citric acid exhibited a zone of inhibition measuring a minimum of 23 mm, as required by EUCAST guidelines. The results are shown in Fig.1 and Table 3. Although citric acid is used as a preservative in formulations, when tested individually, it did not exhibit a significant zone of inhibition against

**Vrushali Tambe et al.,**

resistant *E.coli*, suggesting limited antimicrobial activity of its own against selected resistant strain. But, it was found to significantly increase zone of inhibition of Sparfloxacin. *In silico* methods showed lower affinities of citric acid for efflux pumps in comparison to piperine suggesting different mode of action. Citric acid, being an organic acid, may act as a permeabilizer, disrupting the bacterial cell membrane, and thereby facilitating the entry of Sparfloxacin into bacterial cells and enhancing its antimicrobial activity. This combination strategy could lead to improved efficacy in combating *E.coli*. Piperine, on the other hand, demonstrated its own zone of inhibition against *E. coli*, indicating its inherent property and ability to inhibit bacterial growth. Similarly, when piperine was combined with Sparfloxacin, a larger zone of inhibition was observed compared to the individual zone of inhibition of Piperine. This indicates synergistic interaction between piperine and Sparfloxacin, resulting in enhanced antimicrobial activity against *E. coli*. Based on the results of the in vitro study and limited research available on citric acid, it was selected for development of Sparfloxacin formulation. Additionally, Citric acid is recognized as safe and widely used in pharmaceutical formulations. Also, Sparfloxacin belongs to BCS Class 2 (low solubility, high permeability), and Citric acid is a chelating agent having solubility enhancement properties, it was considered to be best-suited adjuvant for formulation development.

Formulation of Capsule

The formulation of the capsule involved the preparation of a physical mixture of Sparfloxacin (200 mg) and Citric acid (200 mg) followed by encapsulation. Angle of Repose was found to be 32° indicating good flow properties of the mixture.

Drug-Excipient interaction studies: XRD, DSC, and FTIR studies were performed to understand the drug-excipient compatibility. Fig.2. shows PXRD data. The results revealed a gradual decrease in peak intensity, indicating a transition of Sparfloxacin from crystalline to amorphous nature in the samples. This might improve the solubility of Sparfloxacin. DSC thermograms are shown in Fig.3. The melting behavior of Sparfloxacin (256°C) and citric acid (153 °C) in our study closely aligns with reported literature values indicating no drug-excipient interaction. FTIR spectra are shown in Fig.4. It was found that the peaks observed for formulation are identical with that of pure Sparfloxacin, at nearly the same characteristic peaks further confirming undesired chemical interaction between citric acid and Sparfloxacin. There was more broadening and increased intensity of peak due to hydroxyl group indicating extensive hydrogen bond formation. Also, peak due to carbonyl group was found to be enhanced and broadened.

Assay of Sparfloxacin capsules using UV spectroscopy

From the overlay UV spectrum of Sparfloxacin and citric acid in 0.1N HCl, the λ_{max} of Sparfloxacin was found to be 295nm wherein citric acid does not interfere. Hence, the concentration of Sparfloxacin was determined at 295nm. The % content of Sparfloxacin capsules was found to be 99.8 % w/w.

Dissolution study

A comparative dissolution study between the marketed tablet and formulated capsules is shown in Fig.5. The formulated capsule demonstrated a substantially higher drug release compared to the marketed tablets, indicating improved dissolution properties and enhanced release. These findings highlight the potential of formulated capsules as a more efficient dosage form for delivering the drug.

ACKNOWLEDGEMENT

The author expresses gratitude to the administration of PES Modern College of Pharmacy (for ladies), Moshi, Pune, for providing the necessary facilities.

ABSTRACT

Distimake dissectus (Jacq.) A.R.Simoes & Staples, a new species from the Banaskantha district of Gujarat state, India. Detailed descriptions along with colored photographs, distribution, ecological notes are provided for its easy identification.

Keywords: Banaskantha, North Gujarat, *Distimake dissectus*

INTRODUCTION

The genus *Distimake* (Convolvulaceae) is represented by 100 species, and distributed in the tropical regions of the world (Mabberley, 2008). In India, over 15 species are reported (Santapau & Henry, 1973). Therefore, *Distimake dissectus* we reported in the Gujarat state by Shah 1978, Patel 2013 and Jani 2014. During field work, the author collected unknown specimen from Ratanpur village of Dantiwada taluka, in Banaskantha district, throughout January 2024, on critical study of these specimens using relevant taxonomic literature (Shah, 1978; Cook, 1903), online e-floras (e-floraofindia) and illustrations. Exploration of floristic literature (Patel, 2000; Patel, 2008; Dabgar, 2008; Meena, 2011; Meena, 2012; Meena, 2012; Patel, 2013; and Patel, 2022) revealed that this species has not been recorded from whole Banaskantha till date. Therefore, *Distimake dissectus* (Jacq.) A.R.Simoes & Staples. We report here the additional report of the state of Gujarat. A detailed taxonomic description and photographs of diagnostic characters of the species is provided here to January 2024 this record for Banaskantha and facilitate its easy field identification.

MATERIAL AND METHODS

Morphological description and ecological information presented here are based on field observations and material collected during fieldwork of the Ratanpur village Banaskantha in species identify confirmed by comparison with the pertinent literature.

RESULT AND DISCUSSION

Taxonomic accounts *Distimake dissectus* (Jacq.) A.R. Simoes & Staples. Herbaceous twiner; stems slender, terete, striate, patently hirsute, glabrescent. Leaves alternate, palmately divided nearly to the base, with 5–7 lanceolate, mucronulate, sinuate, coarsely dentate to irregularly pinnately lobed segments, glabrous, the middle segment 4-7.5 cm long, 1–2.5 cm broad, the lateral ones and especially the basal ones smaller; petiole up to 7 cm long, patently hirsute. Inflorescence axillary, 1-to few-flowered, cymose; peduncles 5-10 cm long, patently hirsute, glabrescent in the upper portion hirsute; pedicels 1.5–2.5 cm long, thickened above, glabrous, minutely verrucose at the top. Flower-buds 1.5–2.5 cm long, narrow-ovoid, acute at apex. Sepals sub-equal, 2–2.5 cm long, ovate or oblong, mucronulate at apex, glabrous, herbaceous with narrow scarious margin, afterwards enlarged and coriaceous in fruit. Corolla 3–4 cm long, funnel shaped, white, with a rose or purple throat, the limb with 5 distinct bands. Stamens 5, unequal, included; filaments 5–7 mm long, filiform, villous at base, glabrous towards apex; anthers up to 5 mm long, spirally twisted above the half. Disk cup-shaped. Pistil 2 cm long; ovary 1.5 × 1.5 mm long glabrous, 2-celled; style c. 8 mm long; stigma bilobed, globose. Capsule globose, 1–2 cm in diameter, glabrous, 4-valved, 4-seeded; seeds 1.2 × 0.8 mm, black, glabrous.

Flowering & Fruiting: August-January.

Habitat: A Common twiner along hedges on the moist evergreen and mixed deciduous forests.

Locality: Banaskantha, North Gujarat, India.

ACKNOWLEDGMENTS

The authors are thankful to Dr. Sanjay A. Patel, I/c Head, Smt. G. B. Pavaya & Smt. P. S. Pavaya Science (M.Sc.) College, Palanpur, Dr. Mukesh S. Mali, Range Forest Officer of Gujarat Forest for their kind helps during the course of the present study.

ABSTRACT

Coordination is typically used to demonstrate how muscles work together when moving. This study was conducted to find out the relationship between selected coordination abilities and the performance of forehand Jump smash in Badminton players and the relationship among the independent variables. For this study, a total of twenty state-level badminton players, ages ranging from 18 to 24, were selected as subjects. As proposed by Peter Hirtz, the essential data for analyzing the relationships was acquired by administering several coordinative Ability tests. Orientation Ability, Differentiation Ability, Balance Ability, Reaction Ability, and Rhythm Ability are the five coordinative abilities used in this study as well as a Hicks smash test to measure the forehand jump smash for performance. For analyzing the results of the study, the Pearson Correlation Coefficient method was applied. For the testing of the hypothesis, the level of significance was set at 0.05.

Keywords: Coordination, Correlation, Performance, Smash, Sports.

**Abhishek Balo et al.,**

INTRODUCTION

The word "coordination" is used in badminton. It is frequently employed to illustrate how muscles cooperate to produce movement. To effectively execute skills like strokes and footwork, you'll need good coordination. The words "coordination" can also refer to the synchronization of time and location. This stage makes certain that a stroke is carried out precisely at the appropriate moment and location. To strike the shuttle, a technically sound, coordinated stroke must be executed on the court in the proper position at the proper time. As a result of strategy, coordination also involves taking the right position on the court at the right time. As a result, the shuttle will be able to move during a stroke more tactically. Coordination is the coordinated movement of all the muscular groups in the body. When doing any movement with a specified goal, it is essential. Inter-muscular coordination and intra-muscular coordination are the two types of muscle group coordination. It involves the synchronization of different muscle groups and the fibres of a single muscle. In order to do tasks requiring both speed and strength more effectively and with less energy use, coordination is required. This leads to higher performance over time. People lose coordination when they become fatigued, and vice versa; therefore, a person who is fatigued cannot acquire moves that call for a great deal of coordination. The tough ability of coordination requires a high level of other fitness traits including balance, strength, and agility. On a sports field, someone who appears well coordinated may also be displaying exceptional timing. It's also a difficult skill to teach; instead, it develops naturally over a person's formative years. There are five different coordination skills. For the long-term training process and for the ongoing improvement and adjustment of sports tactics, all coordination skills are crucial. The degree of coordinative Ability strongly influences the motor learning ability. The central nervous system's motor control and regulatory processes play a major role in the development of coordinated abilities. Because the execution of each coordinated ability's motor control and regulation process depends on the CNS's normal operating pattern, when a certain component of these functions is improved, the athlete is better able to perform a particular set of movements. Therefore, the concepts of motor coordination are the most useful for comprehending the nature of coordination.

METHODOLOGY

The study was conducted to find out the relationship between selected coordinative ability and the performance of forehand Jump smash in badminton players and the relationship among the independent variables. For this purpose of the study, a total of twenty State Level Badminton Players, ages ranging from 19-24 years were selected as subjects. As proposed by Peter Hirtz, the essential data for analyzing the relationships was acquired by administering several coordinative Ability tests. Orientation Ability, Differentiation Ability, Balance Ability, Reaction Ability, and Rhythm Ability are the five coordinative abilities used in this study. A performance test for jump smash (Hicks Smash Test) was also done in addition to the coordination Ability. To assess selected coordinative ability, the subjects were tested in a numbered medicine ball run test for orientation Ability, backward medicine ball throw test for differentiation Ability, ball reaction exercise test for reaction capacity, long nose test for balance ability, and sprint at given rhythm test, as well as a Hicks smash test to measure the forehand jump smash for performance. For analyzing the result of the study the Pearson Correlation Coefficient method was applied. For the testing of the hypothesis, the level of significance was set at 0.05.

RESULT

In Table-2 the correlation coefficient with one asterisk (*) of mark is significant at 5% level, whereas the one with two asterisk (**) mark shows the significance at 1% level. The following conclusions may be drawn from the results in Table-2:

- The Performance of forehand jump smash in the badminton players was significantly correlated to none of the coordinative abilities tested.
- Orientation Ability had a highly positive significant correlation with balance Ability at a 1% level of significance.

**Abhishek Balo et al.,**

- Balance Ability was significantly correlated to rhythm Ability at a 5% level of significance.
- Reaction Ability had a highly positive significant correlation with performance at a 1% level of significance.
- All those correlation coefficients having a p-value less than 0.05 are significant at the 5% level. This is shown by the asterisk (*) mark by the side of the correlation coefficient. Similarly, correlations having a p-value less than 0.01 are significant at a 1% level, and this is indicated by two asterisks (**) marks by the side of the correlation coefficient.

DISCUSSION OF FINDINGS

The correlation matrix reveals several significant relationships between coordinative abilities and badminton performance. Notably, orientation skills exhibit a strong positive correlation with performance, suggesting that players with better spatial awareness and ability to orient themselves in the court tend to perform better in badminton matches. This finding aligns with the nature of badminton, which requires quick changes in direction and precise positioning. Balance also shows a positive correlation with differentiation, indicating that players who maintain better balance during play may have an enhanced ability to distinguish subtle differences in shuttlecock trajectory, speed, and spin. This ability can be crucial for making split-second decisions and executing accurate shots. Furthermore, reaction time is strongly correlated with performance, underscoring the importance of quick reflexes in responding to opponents' shots. In a fast-paced sport like badminton, the ability to react swiftly can be the difference between winning and losing a point.

CONCLUSIONS

Coordinative talents are generally stable and generalized patterns of motor control and regulatory processes that allow athletes to perform a set of motions with greater quality and effect. Sports performance is directly related to coordination qualities. All the coordinative abilities are important for learning sports techniques and for their continuous refinement and modifications during the long-term training process. Overall, it can be concluded that the low coefficient of correlation displayed by the selected coordinative ability does not imply that these coordinative abilities do not contribute to the performance of subjects in badminton; however, the significant coefficient correlation of these coordinative abilities with performance may be due to the level of performance of badminton players, and some other coordinative ability whimsy may contribute to the performance of badminton players.

ABSTRACT

Dysgraphia is a condition of neurodevelopmental origin that primarily affects the students' ability to convert their thoughts into written language. It is a learning disability that hinders a person's ability to write. Learners with dysgraphia also struggle with writing skills, spellings and organizing their thoughts on paper. This paper aims to stress the significance of timely and early diagnosis of this neurological condition based on a case study of 30 hours involving a 27-year-old learner with dysgraphia and cognitive disability. The researcher conducted a needs analysis to better understand the learner's challenges, as the difficulties faced by learners with dysgraphia are diverse. A pre-test was administered to assess the specific areas of difficulty. Questionnaires were distributed to the two special education teachers, involved with the student to gather additional insights. It is crucial to consider environmental factors, as they greatly influence a student's development. Teaching interventions were implemented through activities followed by a post-test to measure any kind of improvement. Unfortunately, the case study revealed no noticeable progress. This is because without early diagnosis it becomes more difficult for adults to make significant improvements through intervention. They may already have ingrained writing habits and methods that are challenging to rectify. Hence, it's essential to diagnose in time precisely.

Keywords : learning disability, dysgraphia, diagnosis, education, case study.

**Aarthi and Hema**

INTRODUCTION

Learning Disability otherwise mentioned as LD is a common term that refers to a heterogenous set of disorders, one of which is dysgraphia. In India, the prevalence of this disability is not apprehended. A study conducted in a south Indian city reports the following, among the 15.17% of SLDs (Specific Learning disorders) reported, 12.5% are diagnosed with dysgraphia, 11.2% with dyslexia and 10.5% with dyscalculia. Dyslexia is another neurological condition, that commonly co-occurs with dysgraphia. This primarily affects the person's ability to read. They find it hard to recognize the letters and read the words with coherence. A key symptom of dyslexia is the difficulty they face in decoding words and the lack of phonemic awareness which is the ability to correlate the sounds and the letters or words. It is important to note that dyslexia or dysgraphia doesn't necessarily affect the learner's intelligence or their cognitive abilities. However, in some cases, these symptoms could be prominently seen. Dyscalculia on the other hand is a condition where the learners have difficulty in understanding the numbers. According to the British Dyslexia Association, about 6% of people have dyscalculia. The three conditions namely, dyslexia, dysgraphia and dyscalculia are three distinct neuro-developmental conditions. However, 30% of people with dyslexia are diagnosed with dysgraphia and 26% with dyscalculia. Also, around 36% of people with dysgraphia are said to have the symptoms of dyscalculia. Hence, it's evident that these conditions are likely to co-occur with each other. The cause of occurrence of the conditions could be varied. A child could be diagnosed with dysgraphia in an educational setup when they are initially learning to write, which can be termed as 'developmental dysgraphia'. It can also be caused due to any sudden trauma which can be termed as 'acquired dysgraphia'. Kids with ASD – Autism Spectrum Disorder and ADHD – Attention Deficit Hyperactivity Disorder are also said to be affected by dysgraphia.

LITERATURE REVIEW

The newsletter "The Importance of Early Detection of Specific Learning Disorders" discusses the importance of early detection and intervention for specific learning disorders (SLDs) such as dyslexia, dysgraphia, dyscalculia and dyspraxia. Early diagnosis has a huge impact on children's learning experiences. This is crucial to prevent the children from having problematic behaviour, poor self-esteem and mental health. Branding children as "slow" or "less intelligent" can block their process of learning. It will hinder the children from reaching their full academic and personal potential. They are also at risk of falling behind the years. The right techniques followed in the classroom also have key significance in enhancing the child's ability over the years. The accuracy of assessment methods used to identify learning disabilities determines the success of the detection.

The article "Comprehensive Assessment and Evaluation of Students with Learning Disabilities" by the National Joint Committee on Learning Disabilities" emphasized the importance of a comprehensive approach to assess and evaluate students with learning disabilities. It talked about using multiple sources to gather data which included not only tests but other informal measures. It differentiated between the evaluation and assessment. Assessment is the collection of data through multiple resources. Whereas Evaluation is the interpreting and summarizing of the comprehensive data and it is used to determine the strengths and weaknesses of the children. It emphasized on the impact of legislation in the assessment and evaluation of LD students and further how it helped to enhance the continued efforts in the future. It talked about the influence of research in this comprehensive assessment and evaluation. It gave a brief idea about the educational trends practiced. Additionally, the article produced guiding principles for comprehensive assessment and evaluation and also various instruments and procedures for the same. The characteristics that differentiate LD students and other types of behavioural problems were also discussed. It emphasized the importance of educational administrators who provide support for effective assessment and evaluation. To summarize, the articles emphasized on the significance of assessment and evaluation.

A report from the National Joint Committee on Learning Disabilities addresses that the identification and intervention of Learning Disability learners must be carried out within 4 years. The delay in the intervention can end up affecting the cognition, communication, sensory and motor abilities. The early identification is to determine the obstacles in the process

**Aarthi and Hema**

of learning. These difficulties could be seen in all students, however, in neurotypical students it's temporary and wears off and in LD learners it persists. Hence the screening evaluation is important for diagnosing and enhancing the learning opportunities. The common mistake committed is to 'wait and see' and to assume the child will 'grow out of it'. So, the children have to be guarded against the premature identification of disability. It also talks about the identification process i) screening, ii) To check the presence of risk and protective answers, iii) systematic observations and iv) comprehensive evaluation. It also takes into account the biological, environmental and cultural factors. It went on to broadly explain the risk factors and protective factors. Various intervention strategies were customized which also included occupational and physical therapy. The professionals providing the services should be culturally and linguistically sensitive. The administrative and supervisory personnel development helps in promoting early identification and intervention. He concludes by talking about the systematic research needs in the areas of identification and learning opportunities.

The article "Disabilities in Written Expression" by Teresa J Gardner talked about the significance of writing in a mathematical class. Many mainstream teachers are unaware of the range of Learning disabilities and their effects on the language and cognitive abilities of a child. The teachers wouldn't have received adequate information to handle the learning disabilities also due to the limited or no training. The significance of writing in a math class to develop reasoning skills and to communicate their understanding was discussed. It also helped them to reflect on their understanding. It is said to help them calculate correct responses. The condition of dyscalculia is briefly explained. As maths is conceived as a difficult subject, many symptoms are overlooked and the students are considered not smart enough. Dyscalculia is often said to be accompanied with dysgraphia making it more difficult to understand the mathematical procedures. For these children, pictures, symbols and drawings are said to be used. It also reviewed a number of articles to determine teaching practices effective for the LD learners. Journal writing was also introduced to the students. Mathematical instructions, concepts etc helped to have a better understanding. It concluded by saying further problem-solving studies and instructional practices are required. The article exclaimed writing as an assistance to understand mathematics better.

NEEDS ANALYSIS

The first few classes were spent on observing the characteristics of the learner. The learner was a 27-year-old male who was diagnosed with dysgraphia and cognitive disabilities. The learner was studying at a different special school and was transferred to the same recently. The learner was fluent in talking Tamil comparatively to English which was his first language. Found it very hard to focus in any topic and was easily distracted. After repeating for even three to four times, was unable to grasp the concept. The learner found it difficult to understand the concept of sounds. Sight words were easy to remember for the learner due to the repetitive reinforcement. So, in the case of learners like them in the beginner level, it would be ideal to increase the number of sight words and aim to progress the ability of the learner from beginner level to intermediate level.

INSIGHTS FROM THE INTERVIEW

The one-on-one discussion with the director of the particular special school was very insightful. The director expressed that in his experience of 20 years in the field, it's seen that the acceptance of parents regarding their kid's condition is minimal and the denial of the parents delays the rightful intervention the student needs. Early intervention is highly important for any kind of improvement of the kid. The years 0 to 3 are known to be the golden age and once that's missed it would be hard to train or teach the kids a new concept and make them understand. Creating awareness is very important and various counselling programs were being held for that. He also went on to talk about the financial exploitation of the parents due to their lack of awareness. Talking about students with dyslexia he said, it's rare to find students with pure dyslexia and often it's accompanied with other disabilities. He went on to explain how treating students with dyslexia or any disability should be a teamwork of the parents, teachers and society. The needs of a particular student should be analyzed first and then the respective therapies have to be implemented with consistency until any improvement is seen. Special educators, occupational therapists, psychologists, and physiotherapists will also help the children if needed. Hence teamwork is important for overall recovery. He also mentioned how there have been students from the standard neuro-typical school education system, being admitted to their special schools. This might be because of the failure of diagnosis or if there was any gap in

**Aarthi and Hema**

their education due to various reasons. On talking about diagnosis, it's usually through experience, certain characteristics and clinical symptoms. Students are checked for their age-appropriate development in the following areas such as language, motor functions, fine motor functions and cognition level. This has to be made sure before teaching them a concept. Secondly, the researcher had a brief one-on-one conversation with the teachers of the LD learners. When talking about the characteristics of the LD learners they mentioned how attention-seeking behaviour is seen in most of them. Some of the students are very keen on everything being perfect and clean and they find the need to correct it if something isn't proper. They also emphasized how the learning gap can be a factor in LD learners. Social interaction is very minimal for these children. On talking about the methods of teaching and the activities with which they could be taught the effective one was visual learning, where pictures could be used to teach and memory games to improve their cognitive level and concentration level. There is a smart class that is being used to teach the students. The practical method of teaching is more useful. They could be initially introduced with two-word phrases then gradually move on into three-word phrases and so on. For introducing a new concept group teaching is ideal as the students will interact with each other and learn, also the competitive spirit to answer first comes in, which keeps them concentrated and more attentive. Repetition has been very effective as in concentrating on a single topic until improvement, is ideal. Teaching anything through games has had a better reception among the students than traditional teaching. They also mentioned the adversities of COVID-19 and the impact it had on the students. Since the consistency of the teaching and also the therapies were lost, it was a difficult situation for the students. The positive of it was many learned to use mobile phones for the sake of attending online classes, though it was not very effective as they only had basic knowledge to operate a mobile and computer. On talking about the limitations, they mentioned that, at the end of the day even in special schools it comes down to syllabus completion and so they find it difficult to give individual attention to the students who need it. They also went on to mention how the acceptance and the effort of the parents are vital. Parents could be more helpful. The behavioural changes of the students can differ according to their environment so the role of parents is significant. The school apart from teaching also conducts extra-curricular activities such as craftwork, food making, jewellery making etc. This is also done as a means to identify the interests of the students and kindle them. Parents also must be aware of their child's interests and provide support by all means. This was a comprehensive analysis of the students which not only included the educational aspects of the children but also gave importance to all the factors that impact a child's growth and improvement.

CASE STUDY

This case study aims to shed light on the experiences and challenges faced by a dysgraphic student in an educational setting and the significance of an early and timely diagnosis. The case study was conducted with a 27-year-old learner, who was diagnosed with dysgraphia and cognitive disabilities. The learner was made to write an introduction page with personal details such as name, age and parents' names. It was noticed that the learner had knowledge about the letters or alphabet. However, when the writing style of the student was analyzed it indicated symptoms of dysgraphia. Learners with dysgraphia experience difficulties with fine motor skills, spatial awareness, and letter formation which makes it difficult for them to write. The words in the page were not aligned due to a lack of spatial awareness. The size of the letters were inconsistent. The line alignment was not followed while writing a sentence. Hence, it was a clear case of dysgraphia. A pre-test was conducted, where the learner was asked to write the alphabet. As mentioned earlier, the learner had knowledge of the letters. It was then followed by a passage writing. A passage was given and the learner had to copy the same in the given blank space.

With reference to FIG 1 passage writing, it is very much evident that the writing of the learner is very poor. There was no consistent spacing followed in the writing. There was space noticed even between the letters of the word, which makes it appear scattered and difficult to understand. The sense of differentiation between the capital letters and small letters of the alphabet was missing. Capital letters were being used in the middle of the sentences. The baseline alignment of the sentences were not straight and can be seen going diagonal. The tendency to miss out or skip the words was seen. Also, the tendency to repeat the same words again is noticed. It was noticed that the learner didn't understand the word completion. When there was no space, the learner continued the same word in the next line without a hyphen. For instance, from FIG 1, "Co-habiting", 'Co-habiti' was written in one line and 'ng' in the

**Aarthi and Hema**

other. This indicates that the learner copied the passage letter by letter, without a complete understanding of the words or sentences. The learners seemed to not know the use of punctuation and did not understand the meaning of the same. The spellings of most of the words were also found to be wrong. The learner was confused between the letters that look alike. For instance,

i] 'n and h'ii] 'b and d' etc.

This particular pre-test showed how the learner finds it difficult to write even at the copy level.

After the assessment of the competency of the learner and areas of difficulty, a few classes were conducted to teach the learner. The teaching intervention was primarily through writing activities. The initial few classes were used to correct the mistakes of the pre-test. The distinction between the capital and small letters was taught. Following that, a class was spent teaching the difference between the letters that looked alike such as 'n and h', 'p and b', or letters that were mirror images of each other such as 'b and d'.

In FIG 2 Similar letters, a set of words were given and the learner had to group the words with the same first letter. The grouping had to be made between the following letters,

- i) 'b and p',
- ii) 'n and m',
- iii) 'n and h' and
- iv) 'n and u'.

This test was taken soon after the class. Hence it was noticed that the mistakes were comparatively less and the words were grouped correctly. However, the spellings of certain words were noticed to be wrong. In all of the given words the learner wrote 'h' instead of 'n' and also some words were incompletely written.

The activity in FIG 3 Puzzle words, was to test the cognitive ability of the learner. A puzzle box with arranged words and the words to be found was given below the grid. The learner had to find out the words from the grid. It was noticed that the learner did not understand the concept and kept circling the letters and words randomly. When instructed again, the learner attempted to find the words however couldn't identify more than two words out of the ten given words. Despite the words to be found was given below, the learner found it hard to find out. The learner couldn't focus on identifying the words and find out the words.

With reference to the activity in FIG 4, Image writing, images were given for the learner to identify and write the names of the given images. Again, it was noticed that 'h' was written as 'n'. The spelling of the word 'aeroplane' was wrong. This indicated that the word 'aeroplane' was not a sight word for the learner. Sight words are common words, where the students don't have to spell or pronounce the sounds but can recognize them due to their familiarity. These are words that are taught repeatedly to the learners and they recognize the words from the spellings without having to process the sounds of the letters. So, here the words 'book' and 'house' were sight words that the learner was familiar with hence it was written correctly. While 'aeroplane' was not a sight word that was taught priorly to the learner and hence the learner doesn't know the spelling of the same. This indicates the learner's inability to write a new word by using the concept of sound or phonics. Though the learner has the knowledge to write the letters or alphabet, the sounds of each letter were not understood by the learner. Hence the learner finds it difficult to correlate sounds to its respective letters and write a word and could only write sight words. After these activities, a post-test was conducted to assess any improvements after the teaching and the activities. The learner had to write the dictated words.

FIG 5 Post test indicates that the learner scored 5 out of the 12 dictated words. The words dictated were not sight words and that is why the learner could not write the words. It was noticed that the learner was also confused between the letters that are pronounced similarly such as 'p and b', 'y and u', and 't and d'. So, it was evident that at the end of the study, there was no significant improvement in the learner. The temporary improvements were seen, as the test was conducted soon after teaching. But in the long term, there was no improvement because being a 27-

**Aarthi and Hema**

year-old, the learner was accustomed to certain writing habits and it was too late to rectify. For learners with dysgraphia or any learning disability, the intervention has to be early and consistent to notice any significant or prominent change and progress. Only then the learners can be trained to improve. It is very hard and almost impossible to improve the conditions of an adult learner.

CONCLUSION

The article aimed to emphasize the significance of early diagnosis and timely intervention through a case study. It proved how the delay in the diagnosis can have detrimental effects as to having difficulties even at the age of 27 and any intervention for adult learners are usually ineffective. Hence learners with learning disabilities are to be diagnosed and treated early and the intervention has to be consistent to enable their age-appropriate development that should allow them to survive independently in society.

School is the place where we learn to read and write. It is the most crucial place for a student and it helps us to learn new things. The teachers are always helpful and teach us important things in life. We must always be regular to school as missing classes can lead to problems during exams. Schools teach us how to be consistent and punctual. School is a temple of knowledge. All great men have been taught to read and write at their schools. It is our school that educates us with the right values at an early age. We learn a lot of things around us that were not in our lives. School life is a period that makes up most of your childhood memories. We learn to laugh, cry alone and support by co-habiting with our classmates.

ABSTRACT

In this paper a new concept of Neutrosophic closed sets called Neutrosophic Regular Generalized β closed sets and their properties are studied and also discuss its relationship with other closed sets in Neutrosophic topological spaces is analyzed.

Keywords: The main aim of this paper is to analyze new concept of Neutrosophic closed sets called Neutrosophic Regular Generalized β closed sets and also specialized some of their basic properties with examples.

INTRODUCTION

Topological ideas are present in almost all areas of today's mathematics. The subject of topology itself consists of several different branches, such as a point set topology, algebraic topology and differential topology which have relatively little in common. Topologists are mathematicians who study qualitative questions about geometrical structures. Many concepts of topology have been generalized by considering the concept of semi - open sets due to Levine [1]. The notion of semi-pre open sets was defined by D.Andrijevic in 1986 [2] and also known as β open sets. In 1993, the concept of regular generalized closed sets [3] was introduced by N.Palaniappan and K. Chandrasekhara Rao. Neutrality the degree of indeterminacy, as an independent concept, was introduced by Smarandache [4] in 1998. He also defined the Neutrosophic set on three component Neutrosophic topological spaces (T- Truth, F -Falsehood, I-

Indeterminacy). Neutrosophic topological spaces (N-T-S) introduced by Salama [5] et al. R.Dhavaseelan and Saied Jafari [6] are introduced Neutrosophic generalized closed sets. In 2016, the concept of Neutrosophic Semi – Open sets [7] introduced by Iswarya P and Bageerathi K. I. Arokiarani [8] (2017) et al. introduced neutrosophic α closed sets in neutrosophic topological spaces. The notion of Neutrosophic β open sets and β closed sets [9] was defined by Renu Thomas and Anila.S in 2018. The main aim of this paper is to analyze new concept of Neutrosophic closed sets called Neutrosophic Regular Generalized β closed sets and also specialized some of their basic properties with examples.

PRELIMINARIES

In this section, we recall the basic definitions and operations of Neutrosophic sets and its fundamental results.

Definition 2.1[5]

Let X be a non- empty fixed set. A Neutrosophic set A is an object having the form

$A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle : x \in X \}$, where $\mu_A, \sigma_A, \gamma_A : A \rightarrow]0, 1^+ [$ and $0 \leq \mu_A(x) + \sigma_A(x) + \gamma_A(x) \leq 3^+$
 and $\mu_A(x)$ - represents the degree of membership function
 $\sigma_A(x)$ - represents the degree of indeterminacy function
 $\gamma_A(x)$ - represents the degree of non-membership function.

Set of all Neutrosophic set over X is denoted by $N(X)$.

Definition 2.2[5]

Let $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ be a Neutrosophic set on X , then the complement of A is

$A^c = \{ \langle x, \gamma_A(x), 1 - \sigma_A(x), \mu_A(x) \rangle : x \in X \}$.

Definition 2.3[5]

Let $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ and $B = \{ \langle x, \mu_B(x), \sigma_B(x), \gamma_B(x) \rangle \}$ be any two Neutrosophic sets, then

$A \subseteq B \Leftrightarrow \{ \mu_A(x) \leq \mu_B(x), \sigma_A(x) \leq \sigma_B(x), \gamma_A(x) \geq \gamma_B(x) \}$.

Definition 2.4[5]

Let X be a non- empty fixed set where $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ and $B = \{ \langle x, \mu_B(x), \sigma_B(x), \gamma_B(x) \rangle \}$ be two Neutrosophic sets, then

- $A \cup B = \{ \langle x, \max\{\mu_A(x), \mu_B(x)\}, \max\{\sigma_A(x), \sigma_B(x)\}, \min\{\gamma_A(x), \gamma_B(x)\} : x \in X \}$.
- $A \cap B = \{ \langle x, \min\{\mu_A(x), \mu_B(x)\}, \min\{\sigma_A(x), \sigma_B(x)\}, \max\{\gamma_A(x), \gamma_B(x)\} : x \in X \}$.

Definition 2.5[5]

Let X be a non-empty set and τ_N be the collection of Neutrosophic subsets of X satisfying the following properties:

- $0_N, 1_N \in \tau_N$
- $\cup T_i \in \tau_N$ for every $\{T_i : i \in J\} \subseteq \tau_N$
- $T_1 \cap T_2 \in \tau_N$ for any $T_1, T_2 \in \tau_N$

Then τ_N is a Neutrosophic topology and the space (X, τ_N) is called a Neutrosophic topological space (N-T-S). The element of τ_N is called a Neutrosophic open set and its complement is Neutrosophic closed set.

Definition 2.6 [5]

Let (X, τ_N) be a Neutrosophic topological space and $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ be a Neutrosophic set in X . Then Neutrosophic closure of A is $Ncl(A) = \cap \{H : H \text{ is a NCS in } X \text{ and } A \subseteq H\}$ and Neutrosophic interior of A is $Nint(A) = \cup \{M : M \text{ is a NCS in } X \text{ and } A \subseteq M\}$.

Definition 2.7

Let (X, τ_N) be a Neutrosophic topological space and $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ be a Neutrosophic set in X . Then A is said to be

- Neutrosophic semi closed set[7] (NSCS) if $Nint(Ncl(A)) \subseteq A$

Eswari and Nirmala Irudayam

2. Neutrosophic pre-closed set[11] (NPCS) if $Ncl(Nint(A)) \subseteq A$
3. Neutrosophic α -closed set[8] ($N\alpha CS$) if $Ncl(Nint(Ncl(A))) \subseteq A$
4. Neutrosophic β -closed set[9] ($N\beta CS$) if $Nint(Ncl(Nint(A))) \subseteq A$
5. Neutrosophic regular closed set[12] (NRCS) if $Ncl(Nint(A)) = A$
6. Neutrosophic regular open set[12] (NROS) if $Nint(Ncl(A)) = A$
7. Neutrosophic b closed set[14] ($NbCS$) if $Ncl(Nint(A) \cap Nint(Ncl(A))) \subseteq A$.

Definition 2.8[9]

Let (X, τ_N) be a Neutrosophic topological space and $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ be a Neutrosophic set in X . Then Neutrosophic β closure of A is $N\beta cl(A) = \cap \{H: H \text{ is a } N\beta CS \text{ in } X \text{ and } A \subseteq H\}$ and Neutrosophic β interior of A is $N\beta int(A) = \cup \{M: M \text{ is a } N\beta OS \text{ in } X \text{ and } M \subseteq A\}$.

Definition 2.9

Let (X, τ_N) be a Neutrosophic topological space and $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ be a Neutrosophic set in X . Then A is said to be

1. Neutrosophic generalized closed set[6] (NGCS) if $Ncl(A \subseteq U)$ whenever $A \subseteq U$ and U is a NOS in X
2. Neutrosophic α generalized closed set[10] ($N\alpha GCS$) if $N\alpha cl(A) \subseteq U$ whenever $A \subseteq U$ and U is a NOS in X
3. Neutrosophic generalized pre-closed set[11] (NGPCS) if $NPcl(A) \subseteq U$ whenever $A \subseteq U$ and U is a NOS in X
4. Neutrosophic generalized semi closed set[13] (NGSCS) if $NScl(A) \subseteq U$ whenever $A \subseteq U$ and U is a NOS in X

Definition 2.10[9]

Let (X, τ_N) be a Neutrosophic topological space and $A = \{ \langle x, \mu_A(x), \sigma_A(x), \gamma_A(x) \rangle \}$ be a Neutrosophic set in X . Then Neutrosophic β closure of A is $N\beta cl(A) = \cap \{H: H \text{ is a } N\beta CS \text{ in } X \text{ and } A \subseteq H\}$ and Neutrosophic β interior of A is $N\beta int(A) = \cup \{M: M \text{ is a } N\beta OS \text{ in } X \text{ and } M \subseteq A\}$.

Theorem 2.11

Let A be a NS in a Neutrosophic topological space X . Then,

- (i) $(N\beta int(A))^c = N\beta cl(A^c)$
- (ii) $(N\beta cl(A))^c = N\beta int(A^c)$

Proof

- (i) Let A be a NS in Neutrosophic topological space. Now $N\beta int(A) = \cup \{M: M \text{ is a } N\beta OS \text{ in } X \text{ and } M \subseteq A\}$. Then $(N\beta int(A))^c = [\cup \{M: M \text{ is a } N\beta OS \text{ in } X \text{ and } M \subseteq A\}]^c = \cap \{M^c: M^c \text{ is a } N\beta CS \text{ in } X \text{ and } A^c \subseteq M^c\}$. Replacing (i) M^c by N , we get $(N\beta int(A))^c = \cap \{N: N \text{ is a } N\beta CS \text{ in } X \text{ and } N \supseteq A^c\} \Rightarrow (N\beta int(A))^c = N\beta cl(A^c)$. This proves (i). Analogously (ii) can be proved.

Neutrosophic Regular Generalized β closed sets

Definition 3.1

A Neutrosophic set \mathcal{D} in a Neutrosophic Topological Spaces $(\mathbb{R}, \mathfrak{N})$ is said to be a Neutrosophic Regular Generalized β closed set (in short $NRG\beta CS$) if $\beta cl(\mathcal{D}) \subseteq \mathbb{H}$ whenever $\mathcal{D} \subseteq \mathbb{H}$ and \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{N})$. The complement of Neutrosophic Regular Generalized β closed set is called as Neutrosophic Regular Generalized β open set ($NRG\beta OS$). The family of all $NRG\beta CS$ and $NRG\beta OS$ of a Neutrosophic Topological Spaces $(\mathbb{R}, \mathfrak{N})$ is denoted by $NRG\beta CS(\mathbb{R})$ and $NRG\beta OS(\mathbb{R})$ respectively.

Example 3.2

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{N} = \{0_N, L, 1_N\}$ be a Neutrosophic Topology on \mathbb{R} where $L = \{ \langle x, (0.3, 0.5, 0.9), (0.4, 0.5, 0.8) \rangle \}$. Then the Neutrosophic set $\mathcal{D} = \{ \langle x, (0.8, 0.5, 0.4), (0.6, 0.5, 0.5) \rangle \}$ is a $NRG\beta CS$ in \mathbb{R} .

**Theorem 3.3**

Every NCS is a NRG β CS but not conversely.

Proof

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NCS, $\text{Ncl}(\mathcal{D}) = \mathcal{D} \subseteq \mathbb{H}$. But every NCS set is $N\beta$ – closed which implies that $N\beta\text{cl}(\mathcal{D}) \subseteq \text{Ncl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a NRG β CS in \mathbb{R} .

Example 3.4

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L, 1_{\mathbb{N}}\}$ be a NT on \mathbb{R} where $L = \{\langle x, (0.4, 0.5, 0.7), (0.3, 0.5, 0.8) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, (0.6, 0.5, 0.3), (0.7, 0.5, 0.4) \rangle\}$ is a NRG β CS but not a NCS in \mathbb{R} , since $\text{Ncl}(\mathcal{D}) = 1_{\mathbb{N}} \neq \mathcal{D}$.

Theorem 3.5

Every NaCS is a NRG β CS but not conversely.

Proof

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NaCS, $\text{Nacl}(\mathcal{D}) = \mathcal{D} \subseteq \mathbb{H}$. But every Na – closed set is $N\beta$ – closed which implies that $N\beta\text{cl}(\mathcal{D}) \subseteq \text{Nacl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a NRG β CS in \mathbb{R} .

Example 3.6

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L, 1_{\mathbb{N}}\}$ be a N.T. on \mathbb{R} where $L = \{\langle x, (0.2, 0.5, 0.8), (0.4, 0.5, 0.9) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, (0.6, 0.5, 0.4), (0.7, 0.5, 0.4) \rangle\}$ is a NRG β CS but not a NaCS in \mathbb{R} , since $\text{Nacl}(\mathcal{D}) = L^c \not\subseteq \mathcal{D}$.

Theorem 3.7

Every NPCS is a NRG β CS but not conversely.

Proof

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NPCS, $\text{NPcl}(\mathcal{D}) = \mathcal{D} \subseteq \mathbb{H}$. But every NPCS is NCS which implies that $\text{Ncl}(\mathcal{D}) \subseteq \text{NPcl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a NRG β CS in \mathbb{R} .

Example 3.8

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L, 1_{\mathbb{N}}\}$ be a N.T. on \mathbb{R} where $L = \{\langle x, (0.1, 0.5, 0.9), (0.4, 0.5, 0.8) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, (0.5, 0.5, 0.7), (0.6, 0.5, 0.6) \rangle\}$ is a NRG β CS but not a NPCS in \mathbb{R} , since $\text{Ncl}(\text{Nint}(\mathcal{D})) = L^c \not\subseteq \mathcal{D}$.

Theorem 3.9

Every NGCS is a NRG β CS but not conversely.

Proof

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NGCS and every NROS is NOS, $\text{Ncl}(\mathcal{D}) \subseteq \mathbb{H}$. But every NCS is $N\beta$ CS which implies that $N\beta\text{cl}(\mathcal{D}) \subseteq \text{Ncl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a NRG β CS in \mathbb{R} .

Example 3.10

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L, 1_{\mathbb{N}}\}$ be a N.T. on \mathbb{R} where $L = \{\langle x, (0.3, 0.5, 0.9), (0.5, 0.5, 0.7) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, (0.2, 0.5, 0.6), (0.4, 0.5, 0.8) \rangle\}$ is a NRG β CS but not a NGCS in \mathbb{R} , since $\text{Ncl}(\mathcal{D}) = L^c \not\subseteq \mathcal{D}$.

Theorem 3.11

Every NaGCS is a NRG β CS but not conversely.

**Proof**

Let $\mathcal{D} \subseteq \mathbb{H}$ where U is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a $\mathcal{N}\alpha\text{GCS}$ and every NROS is NOS, $\mathcal{N}\alpha\text{cl}(\mathcal{D}) \subseteq \mathbb{H}$. But every $\mathcal{N}\alpha\text{CS}$ is $\mathcal{N}\beta\text{CS}$ which implies that $\mathcal{N}\beta\text{cl}(\mathcal{D}) \subseteq \mathcal{N}\alpha\text{cl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a $\text{NRG}\beta\text{CS}$ in \mathbb{R} .

Example 3.12

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L, 1_{\mathbb{N}}\}$ be a N.T. on \mathbb{R} where $L = \{\langle x, (0.6, 0.5, 0.4), (0.6, 0.5, 0.2) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, (0.7, 0.5, 0.3), (0.4, 0.5, 0.8) \rangle\}$ is a $\text{NRG}\beta\text{CS}$ but not a NGCS in \mathbb{R} , since $\mathcal{N}\alpha\text{cl}(\mathcal{D}) = 1_{\mathbb{N}} \notin \mathcal{D}$.

Theorem 3.13

Every NGPCS is a $\text{NRG}\beta\text{CS}$ but not conversely.

Proof:

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NGPCS and every NROS is NOS, $\text{NPcl}(\mathcal{D}) \subseteq \mathbb{H}$. But every NPCS is $\mathcal{N}\beta\text{CS}$ which implies that $\mathcal{N}\beta\text{cl}(\mathcal{D}) \subseteq \text{NPcl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a $\text{NRG}\beta\text{CS}$ in \mathbb{R} .

Example 3.14

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L_1, L_2, 1_{\mathbb{N}}\}$ be a N.T. on \mathbb{R} , where $L_1 = \{\langle x, (0.3, 0.5, 0.7), (0.2, 0.5, 0.8) \rangle\}$, $L_2 = \{\langle x, (0.3, 0.5, 0.6), (0.6, 0.5, 0.4) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, 0.4, 0.5, 0.6 \rangle, (0.7, 0.5, 0.3) \rangle\}$ is a $\text{NRG}\beta\text{CS}$ but not a NGPCS in \mathbb{R} , since $\text{NPcl}(\mathcal{D}) = L_2 \notin \mathcal{D}$.

Theorem 3.15

Every NSCS is a $\text{NRG}\beta\text{CS}$ but not conversely.

Proof

Let $\mathcal{D} \subseteq \mathbb{H}$ where U is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NSCS , $\text{NScl}(\mathcal{D}) = \mathcal{D} \subseteq \mathbb{H}$. But every NSCS is $\mathcal{N}\beta\text{CS}$ which implies that $\mathcal{N}\beta\text{cl}(\mathcal{D}) \subseteq \text{NScl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a $\text{NRG}\beta\text{CS}$ in \mathbb{R} .

Example 3.16

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L, 1_{\mathbb{N}}\}$ be a N.T. on \mathbb{R} , where $L = \{\langle x, (0.7, 0.5, 0.4), (0.6, 0.5, 0.3) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, (0.9, 0.5, 0.2), (0.7, 0.5, 0.1) \rangle\}$ is a $\text{NRG}\beta\text{CS}$ but not a NSCS in \mathbb{R} , since $\text{Nint}(\text{Ncl}(\mathcal{D})) = 1_{\mathbb{N}} \notin \mathcal{D}$.

Theorem 3.17

Every NGSCS is a $\text{NRG}\beta\text{CS}$ but not conversely.

Proof

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NGSCS and every NROS is NOS, $\text{NScl}(\mathcal{D}) \subseteq \mathbb{H}$. But every NSCS is $\mathcal{N}\beta\text{CS}$ which implies that $\mathcal{N}\beta\text{cl}(\mathcal{D}) \subseteq \text{NScl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a $\text{NRG}\beta\text{CS}$ in \mathbb{R} .

Example 3.18

Let $\mathbb{R} = \{k_1, k_2\}, \mathfrak{S}_{\mathbb{N}} = \{0_{\mathbb{N}}, L, 1_{\mathbb{N}}\}$ be a N.T. on \mathbb{R} , where $L = \{\langle x, (0.9, 0.5, 0.6), (0.0, 0.5, 0.1) \rangle\}$. Then the Neutrosophic set $\mathcal{D} = \{\langle x, (0.7, 0.5, 0.4), (0.3, 0.5, 0.6) \rangle\}$ is a $\text{NRG}\beta\text{CS}$ but not a NGSCS in \mathbb{R} , since $\text{NScl}(\mathcal{D}) = 1_{\mathbb{N}} \notin \mathcal{D}$.

Theorem 3.19

Every NbCS is a $\text{NRG}\beta\text{CS}$ but not conversely.

Proof

Let $\mathcal{D} \subseteq \mathbb{H}$ where U is a NROS in $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$. Since \mathcal{D} is a NbCS , $\text{Nbcl}(\mathcal{D}) = \mathcal{D} \subseteq \mathbb{H}$. But every NbCS is $\mathcal{N}\beta\text{CS}$ which implies that $\mathcal{N}\beta\text{cl}(\mathcal{D}) \subseteq \text{Nbcl}(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a $\text{NRG}\beta\text{CS}$ in \mathbb{R} .

Eswari and Nirmala Irudayam

Example 3.20

Let $\mathbb{R}=\{k_1,k_2\}$, $\mathfrak{S}_N=\{0_N,L,1_N\}$ is be a N.T. on \mathbb{R} where $L=\langle x,(0.7,0.5,0.4),(0.6,0.5,0.3) \rangle$. Then the Neutrosophic set $\mathcal{D}=\langle x,(0.9,0.5,0.3),(0.8,0.5,0.2) \rangle$ is a $NRG\beta CS$ but not a $N\beta CS$ in \mathbb{R} , since $Ncl(Nint(\mathcal{D})) \cap Nint(Ncl(\mathcal{D}))=1_N \notin \mathcal{D}$.

Theorem 3.21

Every $N\beta CS$ is a $NRG\beta CS$ but not conversely.

Proof:

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_N)$. Since \mathcal{D} is a $N\beta CS$, $N\beta cl(\mathcal{D}) = \mathcal{D} \subseteq \mathbb{H}$. Therefore \mathcal{D} is a $NRG\beta CS$ in \mathbb{R} .

Example 3.22

Let $\mathbb{R}=\{k_1,k_2\}$, $\mathfrak{S}_N=\{0_N,L,1_N\}$ be a N.T. on \mathbb{R} where $L=\langle x,(0.2,0.5,0.8),(0.4,0.5,0.9) \rangle$. Then the Neutrosophic set $\mathcal{D}=\langle x,(0.6,0.5,0.4),(0.7,0.5,0.4) \rangle$ is a $NRG\beta CS$ but not a $N\beta CS$ in \mathbb{R} , since $N\beta cl(\mathcal{D})=L \notin \mathcal{D}$.

Theorem 3.23

Every $NG\beta CS$ is a $NRG\beta CS$ but not conversely.

Proof:

Let $\mathcal{D} \subseteq \mathbb{H}$ where \mathbb{H} is a NROS in $(\mathbb{R}, \mathfrak{S}_N)$. Since \mathcal{D} is a $NG\beta CS$ and every NROS is NOS, $N\beta cl(\mathcal{D}) \subseteq \mathbb{H}$. Therefore \mathcal{D} is a $NRG\beta CS$ in \mathbb{R} .

Example 3.24

Let $\mathbb{R}=\{k_1,k_2\}$, $\mathfrak{S}_N=\{0_N,L,M,1_N\}$ be a N.T. on \mathbb{R} where $L=\langle x,(0.5,0.5,0.5),(0.3,0.7,0.7) \rangle$ and $M=\langle x,(0.6,0.4,0.4),(0.7,0.3,0.3) \rangle$. Clearly for the Neutrosophic set L , $L \subseteq L$ and $L \in \mathfrak{S}_N$. However $N\beta cl(L)=1_N \notin L$. Also $(\mathbb{R}, \mathfrak{S}_N)=\{0_N, 1_N\}$. Thus L is $NRG\beta CS$ but not $NG\beta CS$.

Thus from the above theorems and examples we have the following implications:

Theorem 3.25

If \mathcal{D} is NROS and $NRG\beta CS$ in $(\mathbb{R}, \mathfrak{S}_N)$ then \mathcal{D} is $N\beta$ – closed.

Proof

Suppose \mathcal{D} is NROS and $NRG\beta CS$ in $(\mathbb{R}, \mathfrak{S}_N)$. Then by definition $N\beta cl(\mathcal{D}) \subseteq \mathcal{D}$. But always $\mathcal{D} \subseteq N\beta cl(\mathcal{D})$. Thus $\mathcal{D} = N\beta cl(\mathcal{D})$ which implies that \mathcal{D} is $N\beta$ – closed.

Eswari and Nirmala Irudayam

Theorem 3.26

Let $\mathcal{D} \subseteq (\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$ be NRG β CS. Then $N\beta cl(\mathcal{D}) \setminus \mathcal{D}$ does not contain non – empty NRCS.

Proof:

Let F be a NRC subset of $N\beta cl(\mathcal{D}) \setminus \mathcal{D}$. Then clearly $\mathcal{D} \subseteq \mathbb{R} \setminus F$ where \mathcal{D} is NRG β CS in \mathbb{R} and $\mathbb{R} \setminus F$ is NRO in \mathbb{R} . Thus $N\beta cl(\mathcal{D}) \subseteq \mathbb{R} \setminus F$ or equivalently $F \subseteq \mathbb{R} \setminus N\beta cl(\mathcal{D})$. By assumption $F \subseteq N\beta cl(\mathcal{D})$. Then $F \subseteq (\mathbb{R} \setminus N\beta cl(\mathcal{D})) \cap N\beta cl(\mathcal{D}) = \phi$.

Theorem 3.27

Suppose that \mathcal{D} is a NRG β CS. Then \mathcal{D} is N β CS if and only if $N\beta cl(\mathcal{D}) \setminus \mathcal{D}$ is NRCS.

Proof

Assume that \mathcal{D} is a N β CS. Then we have $N\beta cl(\mathcal{D}) \setminus \mathcal{D} = \phi$ which is NRCS. Conversely, assume that $N\beta cl(\mathcal{D}) \setminus \mathcal{D}$ is NRCS. Hence from Theorem 3.23, $N\beta cl(\mathcal{D}) \setminus \mathcal{D}$ does not contain non – empty NRCS and since $N\beta cl(\mathcal{D}) \setminus \mathcal{D}$ is NRCS and subset of itself, so $N\beta cl(\mathcal{D}) \setminus \mathcal{D} = \phi$. Therefore, $\mathcal{D} = N\beta cl(\mathcal{D})$ and so \mathcal{D} is N β CS.

Lemma 3.28

Suppose that $F \subseteq \mathcal{D} \subseteq (\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$, where \mathcal{D} is NROS in \mathbb{R} . Then the following two conditions are valid.

1. If \mathcal{D} is NRG β CS in \mathbb{R} and F is NRG β CS in \mathcal{D} , then F is NRG β CS in \mathbb{R} .
2. If F is NRG β CS in \mathbb{R} , then F is NRG β CS in \mathcal{D} .

Proof:

Assume that \mathbb{H} is NROS in \mathbb{R} and $F \subseteq \mathbb{H}$. Then $F \subseteq \mathbb{H} \cap \mathcal{D}$ and $\mathbb{H} \cap \mathcal{D}$ is NROS in \mathcal{D} . Since F is NRG β CS in \mathcal{D} , $N\beta cl_{\mathcal{D}}(F) \subseteq \mathbb{H} \cap \mathcal{D}$. Since \mathcal{D} is NROS and NRG β CS in \mathbb{R} then by Theorem 3.22, \mathcal{D} is N β – closed in \mathbb{R} . Thus $N\beta cl(\mathcal{D}) = \mathcal{D}$. Hence $N\beta cl(F) \subseteq N\beta cl(F) \cap N\beta cl(\mathcal{D}) = N\beta cl(F) \cap \mathcal{D} = N\beta cl_{\mathcal{D}}(F) \subseteq \mathbb{H} \cap \mathcal{D}$. So we have $N\beta cl(F) \subseteq \mathbb{H}$ whenever $F \subseteq \mathbb{H}$ and \mathbb{H} is NROS in \mathbb{R} which implies that F is NRG β CS in \mathbb{R} . Suppose V is a NRO subset of \mathcal{D} such that $F \subseteq V$. Since \mathcal{D} is NROS, then by transitivity V is NROS. And since F is NRG β CS in \mathbb{R} , we have $N\beta cl(F) \subseteq V$. Thus $N\beta cl_{\mathcal{D}}(F) = N\beta cl(F) \cap \mathcal{D} \subseteq V \cap \mathcal{D} = V$ which implies that F is NRG β CS in \mathcal{D} .

Corollary 3.29

Suppose that $F \subseteq \mathcal{D} \subseteq (\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$, where \mathcal{D} is NROS and NRG β CS in \mathbb{R} . Then F is NRG β CS in \mathcal{D} iff F is NRG β CS in \mathbb{R} .

Definition: 3.30

Let $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$ be a Neutrosophic topological space and \mathcal{D} be a Neutrosophic set in \mathbb{R} , then the NRG β interior of \mathcal{D} is defined as $NRG\beta \text{ int}(\mathcal{D}) = \cup \{M/M \text{ is a NRG}\beta\text{OS in } \mathbb{R} \text{ and } M \subseteq \mathcal{D}\}$. Clearly $NRG\beta \text{ int}(\mathcal{D})$ is the biggest NRG β open set over \mathbb{R} which is contained in \mathcal{D} .

Theorem: 3.31

Neutrosophic Regular Generalized β open subsets P and Q of a N-T-S \mathbb{R} we have

- (i) $NRG\beta \text{ Int}(P) \subseteq P$
- (ii) $P \text{ is NRG}\beta \text{ open set in } \mathbb{R} \Leftrightarrow NRG\beta \text{ Int}(P) = P$
- (iii) $NRG\beta \text{ Int}(NRG\beta \text{-Int}(P)) = NRG\beta \text{-Int}(P)$
- (iv) If $P \subseteq Q$ then $NRG\beta \text{ Int}(P) \subseteq NRG\beta \text{-Int}(Q)$

Proof

Proof of (i) is directly get the result through the Definition 3.30.

Let P be NRG β –open set in \mathbb{R} . Then $P \subseteq NRG\beta \text{ int}(P)$ and from 3.31(i) we obtain the result $P = NRG\beta \text{-Int}(P)$. Now Conversely we assume that $P = NRG\beta \text{-Int}(P)$. Then P is a NRG β –open set in N-T-S \mathbb{R} . From the result (ii), $NRG\beta \text{-Int}(NRG\beta \text{-Int}(P)) = NRG\beta \text{-Int}(P)$ we get the result(iii). Since $P \subseteq Q$, by using(i), $NRG\beta \text{-Int}(P) \subseteq P \subseteq Q$. i.e., $NRG\beta \text{-Int}(P) \subseteq Q$ from the result (iii), $NRG\beta \text{-Int}(NRG\beta \text{-Int}(P)) \subseteq NRG\beta \text{ Int}(Q)$. Thus $NRG\beta (P) \subseteq NRG\beta \text{-Int}(Q)$ we get the result (iv).

Theorem 3.32

Let P and Q are two Neutrosophic subsets of N- T-S $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$ then

- (i) $NRG\beta \text{-Int}(P \cap Q) = NRG\beta \text{-Int}(P) \cap NRG\beta \text{-Int}(Q)$

Eswari and Nirmala Irudayam

(ii) $NRG\beta -Int(P \cup Q) \supseteq NRG\beta -Int(P) \cup NRG\beta -Int(Q)$.

Proof

Since $P \cap Q \subseteq P$ and $P \cap Q \subseteq Q$, follows from the theorem 3.31(iv), $NRG\beta -Int(P \cap Q) \subseteq NRG\beta -Int(P)$ and $NRG\beta -Int(P \cap Q) \subseteq NRG\beta -Int(Q)$. This implies that $NRG\beta -Int(P \cap Q) \subseteq NRG\beta -Int(P) \cap NRG\beta -Int(Q)$ (1) follows from the theorem 3.31 (i), $NRG\beta -Int(P) \subseteq P$ and $NRG\beta -Int(Q) \subseteq Q$. This implies that $NRG\beta -Int(P) \cap NRG\beta -Int(Q) \subseteq P \cap Q$. Now from theorem 3.31(iv), $NRG\beta -Int((NRG\beta -Int(P) \cap NRG\beta -Int(Q))) \subseteq NRG\beta -Int(P \cap Q)$. From theorem 4.2(iii), $NRG\beta -Int(P) \cap NRG\beta -Int(Q) \subseteq NRG\beta -Int(P \cap Q)$(2). From (1) and (2), $NRG\beta -Int(P \cap Q) = NRG\beta -Int(P) \cap NRG\beta -Int(Q)$. This implies (i). Since $P \subseteq P \cup Q$ and $Q \subseteq P \cup Q$, by from theorem 3.31(iv), $NRG\beta -Int(P) \subseteq NRG\beta -Int(P \cup Q)$ and $NRG\beta -Int(Q) \subseteq NRG\beta -Int(P \cup Q)$. This implies that $NRG\beta -Int(P) \cup NRG\beta -Int(Q) \subseteq NRG\beta -Int(P \cup Q)$. Hence (ii).

Definition: 3.33

Let $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$ be a Neutrosophic topological space and \mathcal{D} be a Neutrosophic set in \mathbb{R} , then the $NRG\beta$ closure of \mathcal{D} is defined as $NRG\beta cl(\mathcal{D}) = \cap \{M/M \text{ is a } NRG\beta CS \text{ in } \mathbb{R} \text{ and } \mathcal{D} \subseteq M\}$. Clearly $NRG\beta cl(\mathcal{D})$ is the smallest $NRG\beta$ closed set over \mathbb{R} which contains \mathcal{D} .

Theorem: 3.34

Neutrosophic Regular Generalized β closed subsets P and Q of a N-T-S \mathbb{R} we have

- (i) $P \subseteq NRG\beta cl(P)$
- (ii) P is $NRG\beta$ closed set in $\mathbb{R} \Leftrightarrow P = NRG\beta cl(P)$
- (iii) $NRG\beta cl(NRG\beta cl(P)) = NRG\beta cl(P)$
- (iv) If $P \subseteq Q$ then $NRG\beta cl(P) \subseteq NRG\beta cl(Q)$

Proof

Proof of (i) is directly get the result through the Definition 3.33.
 Let P be $NRG\beta$ -closed set in \mathbb{R} . Then $P \supseteq NRG\beta -cl(P)$ and from 3.34(i) we obtain the result $P = NRG\beta -cl(P)$. Now Conversely we assume that $P = NRG\beta -cl(P)$. Then P is a $NRG\beta$ -closed set in N-T-S \mathbb{R} . From the result (ii), $NRG\beta -cl(NRG\beta -cl(P)) = NRG\beta -cl(P)$ we get the result(iii). Since $P \subseteq Q$, by using(i), $NRG\beta -cl(P) \subseteq P \subseteq Q$. i.e., $NRG\beta -cl(P) \subseteq Q$ from the result (iii), $NRG\beta -cl(NRG\beta -cl(P)) \subseteq NRG\beta cl(Q)$. Thus $NRG\beta cl(P) \subseteq NRG\beta -cl(Q)$ we get the result (iv).

Theorem 3.35

Let \mathcal{D} be a NS in a Neutrosophic topological space \mathbb{R} . Then,

- (i) $(NRG\beta int(\mathcal{D}))^c = NRG\beta cl(\mathcal{D}^c)$
- (ii) $(NRG\beta cl(\mathcal{D}))^c = NRG\beta int(\mathcal{D}^c)$

Proof

(i) Let \mathcal{D} be a NS in a Neutrosophic topological space \mathbb{R} . Now $NRG\beta int(\mathcal{D}) = \cup \{M: M \text{ is a } NRG\beta OS \text{ in } \mathbb{R} \text{ and } M \subseteq \mathcal{D}\}$. Then $(NRG\beta int(\mathcal{D}))^c = [\cup \{M: M \text{ is a } NRG\beta OS \text{ in } \mathbb{R} \text{ and } M \subseteq \mathcal{D}\}]^c = \cap \{M^c: M^c \text{ is a } NRG\beta CS \text{ in } \mathbb{R} \text{ and } \mathcal{D}^c \subseteq M^c\}$. Replacing M^c by N , we get $(NRG\beta int(\mathcal{D}))^c = \cap \{N: N \text{ is a } NRG\beta CS \text{ in } \mathbb{R} \text{ and } N \supseteq \mathcal{D}^c\} \Rightarrow (NRG\beta int(\mathcal{D}))^c = NRG\beta cl(\mathcal{D}^c)$. This proves (i). Analogously (ii) can be proved.

Definition 3.36

Let $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$ be a Neutrosophic topological space over \mathbb{R} then the $NRG\beta$ exterior of a Neutrosophic set \mathcal{D} over \mathbb{R} is denoted by $NRG\beta ext(\mathcal{D})$ and is defined as $NRG\beta ext(\mathcal{D}) = NRG\beta int(\mathcal{D}^c)$.

Theorem 3.37

Let $(\mathbb{R}, \mathfrak{S}_{\mathbb{N}})$ be a Neutrosophic topological space over \mathbb{R} and $P, Q \in NRG\beta(\mathbb{R})$. Then

- (i) $NRG\beta ext(P \cup Q) = NRG\beta ext(P) \cap NRG\beta ext(Q)$

Eswari and Nirmala Irudayam

(ii) $NRG\beta \text{ ext}(P) \cup NRG\beta \text{ ext}(Q) \subseteq NRG\beta \text{ ext}(P \cap Q)$

Proof

(i) By Definition 3.36, De Morgan’s law and Theorem 3.32(i),

$$\begin{aligned} NRG\beta \text{ ext}(P \cup Q) &= NRG\beta \text{ int}(P \cup Q)^c \\ &= NRG\beta \text{ int}(P^c \cap Q^c) \\ &= NRG\beta \text{ int}(P^c) \cap NRG\beta \text{ int}(Q^c) \\ &= NRG\beta \text{ ext}(P) \cap NRG\beta \text{ ext}(Q) \end{aligned}$$

(ii) It is similar to (i).

Definition 3.38

Let $(\mathbb{R}, \mathfrak{N})$ be a Neutrosophic topological space over \mathbb{R} and $P \in NRG\beta(\mathbb{R})$. Then the $NRG\beta$ boundary of a Neutrosophic set \mathcal{D} over \mathbb{R} denoted by $NRG\beta \text{ fr}(\mathcal{D})$ and is defined as $NRG\beta \text{ fr}(\mathcal{D}) = NRG\beta \text{ cl}(\mathcal{D}) \cap NRG\beta \text{ cl}(\mathcal{D}^c)$. It must be noted that $NRG\beta \text{ fr}(\mathcal{D}) = NRG\beta \text{ fr}(\mathcal{D}^c)$.

Theorem 3.39

Let \mathcal{D} be a NS in a Neutrosophic topological space \mathbb{R} . Then

- (i) $(NRG\beta \text{ fr}(\mathcal{D}))^c = NRG\beta \text{ ext}(\mathcal{D}) \cup NRG\beta \text{ int}(\mathcal{D})$
- (ii) $NRG\beta \text{ cl}(\mathcal{D}) = NRG\beta \text{ int}(\mathcal{D}) \cup NRG\beta \text{ fr}(\mathcal{D})$

Proof

Let \mathcal{D} be a NS in a Neutrosophic topological space \mathbb{R} . Then

(i) By Theorem 3.35 (i) & (ii), we have

$$\begin{aligned} (NRG\beta \text{ fr}(\mathcal{D}))^c &= [NRG\beta \text{ cl}(\mathcal{D}) \cap NRG\beta \text{ cl}(\mathcal{D}^c)]^c \\ &= [NRG\beta \text{ cl}(\mathcal{D})]^c \cup [NRG\beta \text{ cl}(\mathcal{D}^c)]^c \\ &= [NRG\beta \text{ cl}(\mathcal{D})]^c \cup [(NRG\beta \text{ int}(\mathcal{D}))^c]^c \\ &= NRG\beta \text{ int}(\mathcal{D}^c) \cup NRG\beta \text{ int}(\mathcal{D}) \\ &= NRG\beta \text{ ext}(\mathcal{D}) \cup NRG\beta \text{ int}(\mathcal{D}). \end{aligned}$$

(ii) By Theorem 3.35 (i) & (ii), we have

$$\begin{aligned} NRG\beta \text{ int}(\mathcal{D}) \cup NRG\beta \text{ fr}(\mathcal{D}) &= NRG\beta \text{ int}(\mathcal{D}) \cup [NRG\beta \text{ cl}(\mathcal{D}) \cap NRG\beta \text{ cl}(\mathcal{D}^c)] \\ &= [NRG\beta \text{ int}(\mathcal{D}) \cup NRG\beta \text{ cl}(\mathcal{D})] \cap [NRG\beta \text{ int}(\mathcal{D}) \cup NRG\beta \text{ cl}(\mathcal{D}^c)] \\ &= NRG\beta \text{ cl}(\mathcal{D}) \cap [NRG\beta \text{ int}(\mathcal{D}) \cup (NRG\beta \text{ int}(\mathcal{D}))^c] \\ &= NRG\beta \text{ cl}(\mathcal{D}) \cap \mathbb{R} = NRG\beta \text{ cl}(\mathcal{D}). \end{aligned}$$

Theorem 3.40

Let \mathcal{D} be a NS in a Neutrosophic topological space $(\mathbb{R}, \mathfrak{N})$. Then

- (i) \mathcal{D} is a $NRG\beta$ open set over \mathbb{R} if and only if $\mathcal{D} \cap NRG\beta \text{ fr}(\mathcal{D}) = \emptyset$.
- (ii) \mathcal{D} is a $NRG\beta$ closed set over \mathbb{R} if and only if $NRG\beta \text{ fr}(\mathcal{D}) \subseteq \mathcal{D}$.

Proof

Let \mathcal{D} be a NS in a Neutrosophic topological space $(\mathbb{R}, \mathfrak{N})$. Then

(i) Assume that \mathcal{D} is a $NRG\beta$ open set over \mathbb{R} . Thus $NRG\beta \text{ int}(\mathcal{D}) = \mathcal{D}$. By Theorem 3.35, $NRG\beta \text{ fr}(\mathcal{D}) = NRG\beta \text{ cl}(\mathcal{D}) \cap NRG\beta \text{ cl}(\mathcal{D}^c) = NRG\beta \text{ cl}(\mathcal{D}) \cap (NRG\beta \text{ int}(\mathcal{D}))^c$. So

$$\begin{aligned} NRG\beta \text{ fr}(\mathcal{D}) \cap NRG\beta \text{ int}(\mathcal{D}) &= NRG\beta \text{ cl}(\mathcal{D}) \cap (NRG\beta \text{ int}(\mathcal{D}))^c \cap NRG\beta \text{ int}(\mathcal{D}) \\ &= NRG\beta \text{ cl}(\mathcal{D}) \cap \mathcal{D}^c \cap \mathcal{D} \\ &= \emptyset. \end{aligned}$$

Conversely let $\mathcal{D} \cap NRG\beta \text{ fr}(\mathcal{D}) = \emptyset$. Then $\mathcal{D} \cap NRG\beta \text{ cl}(\mathcal{D}) \cap NRG\beta \text{ cl}(\mathcal{D}^c) = \emptyset$ or $\mathcal{D} \cap NRG\beta \text{ cl}(\mathcal{D}^c) = \emptyset$ or $NRG\beta \text{ cl}(\mathcal{D}) \subseteq \mathcal{D}^c$ which implies \mathcal{D}^c is a $NRG\beta$ closed set and so \mathcal{D} is a $NRG\beta$ open set.

(ii) Let \mathcal{D} be a $NRG\beta$ closed set. Then $NRG\beta \text{ cl}(\mathcal{D}) = \mathcal{D}$. By Definition 3.38, $NRG\beta \text{ fr}(\mathcal{D}) = NRG\beta \text{ cl}(\mathcal{D}) \cap NRG\beta \text{ cl}(\mathcal{D}^c) \subseteq NRG\beta \text{ cl}(\mathcal{D}) = \mathcal{D}$. Therefore, $NRG\beta \text{ fr}(\mathcal{D}) \subseteq \mathcal{D}$. Conversely, $NRG\beta \text{ fr}(\mathcal{D}) \subseteq \mathcal{D}$. Then $NRG\beta \text{ fr}(\mathcal{D}) \cap \mathcal{D}^c = \emptyset$. From $NRG\beta \text{ fr}(\mathcal{D}) = NRG\beta \text{ fr}(\mathcal{D}^c)$, $NRG\beta \text{ fr}(\mathcal{D}^c) \cap \mathcal{D}^c = \emptyset$. By (i), \mathcal{D}^c is a $NRG\beta$ open set and so \mathcal{D} is a $NRG\beta$ closed set.

**Theorem 3.41**

Let \mathcal{D} be a NS in a Neutrosophic topological space $(\mathbb{R}, \mathfrak{N})$. Then

(i) $\text{NRG}\beta \text{ fr}(\mathcal{D}) \cap \text{NRG}\beta \text{ int}(\mathcal{D}) = \phi$.

(ii) $\text{NRG}\beta \text{ fr}(\text{NRG}\beta \text{ int}(\mathcal{D})) \subseteq \text{NRG}\beta \text{ fr}(\mathcal{D})$.

Proof

(i) By Theorem 3.40(i), it is clear.

(ii) By Theorem 3.35(i),

$$\begin{aligned} \text{NRG}\beta \text{ fr}(\text{NRG}\beta \text{ int}(\mathcal{D})) &= \text{NRG}\beta \text{ cl}(\text{NRG}\beta \text{ int}(\mathcal{D})) \cap \text{NRG}\beta \text{ cl}(\text{NRG}\beta \text{ int}(\mathcal{D}))^c \\ &= \text{NRG}\beta \text{ cl}(\text{NRG}\beta \text{ int}(\mathcal{D})) \cap \text{NRG}\beta \text{ cl}(\mathcal{D}^c) \\ &\subseteq \text{NRG}\beta \text{ cl}(\mathcal{D}) \cap \text{NRG}\beta \text{ cl}(\mathcal{D}^c) \\ &= \text{NRG}\beta \text{ fr}(\mathcal{D}). \end{aligned}$$

CONCLUSION

Many different forms of closed sets have been introduced over the years. Various interesting problems arise when one considers openness. Its importance is significant in various areas of mathematics and related sciences, in this paper we have introduced Neutrosophic Regular Generalized β closed sets in Neutrosophic Topological Spaces and studied some of its properties. Also, we investigate the relationships between the other existing Neutrosophic sets. This shall be extended for future research with some more applications.

ABSTRACT

This article reviews isolated bioactive compounds from Cucurbitaceae family plants with their pharmacological action. Bioactive components from medicinal plants have long been studied as therapeutic agents in biomedical and natural product research. Cucurbitaceae plants have been utilized in traditional medicine for ages, and herbal manuals that aid in understanding the therapeutic potential of plants may be found in ancient writings from a variety of civilizations. The efficacy of these plants has been attributed to their bioactive components, which have long been used to treat diabetes, cancer, oxidative stress, jaundice, hepatitis, urinary tract infections, and inflammation. This review article highlighted extracted bioactive compounds from various species along with their pharmacological activity to aid researchers in understanding the existing isolated phytochemicals and isolation of novel phytochemicals with good activity in future. This review examined the available reputable sources and reference papers, as well as scientific-research publications from various national, international journals and databases, with an emphasis on isolated bioactive compounds with pharmacological potential from Cucurbitaceae family plants. The various bioactive compounds like Momordicine I, II and III, Beta carotene, Taraxerol, ferulic acid, Charantin, 1-tert-butyl-5,6,7-trimethoxyisoquinolene, Cucurbitacin B and E have anticancer activity, Antidiabetic effect, hypolipidemic activity, antimicrobial activity. Cucurbitaceae plants possess extensive biological potential including antioxidants, antidiabetic, anti-inflammatory, hypolipidemic, anti-tubercular, and jaundice. Researchers may be able to find a new therapeutic lead by isolating bioactive molecules and pharmacologically screening those components.

Pravani Ravla *et al.*,

This information was analyzed to offer researchers with in-depth knowledge of the reported bioactive components from Cucurbitaceae plants, which can help with the isolation of novel leads and their pharmacological testing.

Keywords: Bioactive compounds Cucurbitaceae, gourds and cucurbits, Pharmacological activity, Secondary metabolites, Antidiabetic, Antioxidants.

INTRODUCTION

Several countries recognized the importance of discovering therapeutically improved medicines from native and endemic medicinal plants to diagnose a range of diseases, as well as providing a pool of potential drug lead[1]. In comparison to common synthetic small-molecule libraries, the natural products are generally richer with bioactive substances that occupy a greater range of chemical space. Discovery of scaffolds with structural diversity and bioactivities that can be helpful to create new medications or can be utilized for optimization of leads [2]. Many drugs are nothing but plant-based natural drugs or their derivatives such as taxol used as an anticancer agent since 1992 [3], Artemisinin is used as an antimalarial agent [4,5], Solamargine is used in cancer chemotherapy [6,7] and Masoprocol is used as lipooxygenase inhibitor. Natural products are widely used in the field of cosmetics, pharmaceuticals, agriculture, and nutraceuticals. Cucurbitaceae family contains more than 800 species with 120 genera. Some major species are beneficial for human being like Cucurbita (pumpkin, zucchini, squash), Lagenaria (calabash), Luffa, Momordica (bitter melon), Citrullus (water melon) (genomics of cucurbits) [8] to treat diseases like, cancer, diabetes mellitus, oxidative stress, bacterial infection, ulcer, urinary tract infection, jaundice hepatitis. These plants are grown as annual vines, shrubs, trees having tendrils on leaves; palmately lobed exstipulate leaves are present. Flowers are unisexual, pentamerous or pentagonal, white or yellow, monoecious, five stamens, free or connate anther. Fruits are soft. Roots are branched. Many researchers have been focused to many of the Cucurbitaceae family plants for study as they contain phytochemicals abundantly. Many disorders demand for long-term consumption of synthetic medications, however these medications come with adverse effects. Therefore, from the perspective of human health, the isolation of bioactive components is increasingly significant and desirable. In order to this aspect, this review investigated isolated bioactive compounds and their therapeutic properties as well as extracts from the Cucurbitaceae family plants.

METHODOLOGY

Search strategy

Web of science, Scopus, Google scholar online platforms had surfed to collect and analyze the data for this review. The search terms included "isolation of compounds from Cucurbitaceae", "bioactive compounds from Cucurbitaceae", "isolation from Cucurbita", "isolation from Momordica", "isolation from Coccinia", some other articles were also referred for additional information.

Inclusion and Exclusion criteria

Some inclusion and exclusion criteria were implemented on number of articles retrieved in order to include the papers that were most pertinent to this study. Only English-language articles were taken into consideration. Publications that in-depth analyzed isolation of bioactive compounds and their pharmacological effects from Cucurbitaceae plants were included.

RESULT AND DISCUSSION

Ethanomedical studies of Cucurbitaceae plants

According to history, *M. charantia* has antibacterial, anti-inflammatory, anti-parasitic, antifungal properties, purgative, vermifuge, menstruation stimulant, febrifuge, lactagogue, digestive stimulant, and wound treatment activity [9]. *M. charantia* fruit acts as an anthelmintic, stomachic, antibilious and laxative and also used in rheumatism, gout and diabetes [10]. Pumpkin, or *Cucurbita pepo*, is exploited in ethnomedicine due to its astringent effect, In leprosy, in purification of blood, in bronchitis, fever, hemoptysis, and painful chests [11]. Presently, the fruits of the leaf gourd, *Cucurbita ficifolia*, are used to treat type 2-diabetes [12], Hemorrhoids, wound and fever. *Cucumis sativus* (Cucumber) fruit is used to relief inflammation of alimentary mucous membrane; seeds contain calming properties and consumed as a booster, with diuretic and anthelmintic properties, whole plant has ability to acts UV protectant, gastroprotective, wound healing, anti-helminthic, hepatoprotective, antimicrobial, and anticancer agents [13]. as Karounidiol and its 3-O-benzoate derivative (multiflorane triterpenoids), identified from the seed extract having anti-tumor promoters properties [8]. *Telfairia occidentalis* fruit pericarp acts as a good DPPH radical scavenger. *Telfairia occidentalis* has been found to contain α - and β -amyrins, and its antioxidant activity in the pericarp has been documented for the first time [53].

Pharmacological activities

Antidiabetic activity of isolated compounds from Cucurbitaceae family plants

14 Cucurbitanes triterpenoids, kuguacin, octanorcucurbitacin, trinorcucurbitacins, polypeptide p and vicine were reported in *M. charantia* [18]. Liva et al. extracted 5 beta,19-epoxy-3-beta,25-dihydroxycucurbita-6,23(E)-diene and 3-beta,7-beta,25-trihydroxycucurbita-5,23(E)-dien-19-al from *M. charantia* and found anti-hyperglycemic at 400 mg/kg in diabetes-induced mice [19]. *M. charantia* saponin Momordicine II and 3-hydroxycucurbita-5, 24-dien-19-al-7, 23-di-O-glucopyranoside IV identified and demonstrated considerable insulin secretion action in MIN6-cells at 10 and 25 g/mL concentrations [18]. Polypeptide K isolated from *Momordica charantia* shown antidiabetic activity in 142 retrospective study cases [20]. Isolation of betulinic acid from *M. balsamina* was proved as antidiabetic compound. Quercetin helps to lower sugar in type 2 diabetic rats reported in *C. indica* effectively [21]. β -sitosterol and lupeol two major compounds isolated from *Coccinia grandis* were possessed insulinotropic potential in RINm5F rat cells [22]. From investigation of insulin secretion activity, Momordicoside U increases glucose absorption. Conjugated linolenic acid isolated from *Momordica charantia* found to release intestinal GLP-1 and acts as antidiabetic agent. Additionally, Momordin and 9c, 11t, and 13t conjugated linolenic acid, which were also isolated from *Momordica charantia*, had PPAR activation properties and hence function as antidiabetic agents [23].

Trihydroxy-octadecadienoic acids isolated from an ethanolic extract of *Bryonia alba* have the potential to restore lipid metabolism dysfunction in alloxan-induced diabetic mice and demonstrated hypoglycemic action. Glucose tolerance test revealed considerable anti-hyperglycemic effect of globulins, found in *Citrullus Lanatus* seeds in male Wistar rats. *Cucumis prophetarum* identified N-Trisaccharide as anti-hyperglycemic compound in streptozotocin (STZ)-nicotinamide (NA) produced type 2 diabetic rats and shown effective antidiabetic activity in -amylase and -glucosidase assays [10]. By restoring pancreatic beta cell mass, colocynthis oil, which was isolated from *C. colocynthis* had beneficial antidiabetic activity [24]. Tocopherol isolated from *Cucurbita pepo* shown interaction with various enzymes such as protein-tyrosine phosphatase 1B (PTP-1B), peroxisome proliferator-activated receptor gamma (PPAR- γ), and dipeptidyl peptidase IV (DPP-IV) confirmed diabetic potential [25]. Being potential bioactive anti-diabetic components, betulinic acid and 5'-methylgenistein detected and isolated from *M. balsamina* [26]. P-hydroxybenzoic acid, protocatechuic acid, isovanillin, 5-hydroxymethylfurfural, vitexin-2''-O-rhamnoside and vitexin-4''-O-glucoside were isolated from *Benincaseae Exocarpium*, in which vitexin-2''-O-rhamnoside exhibited strongest inhibitory efficacy against A-glucosidase (IC₅₀ values of $12.82 \pm 1.18 \mu\text{M}$). Compounds isovitexin, vitexin, orientin and vitexin-4''-O-glucoside (IC₅₀: 48.19 ± 0.70 , 52.28 ± 7.81 , 36.14 ± 4.21 , 65.38 ± 4.22 , and $48.69 \pm 5.94 \mu\text{M}$, respectively) shown similar A-glucosidase inhibitory activity as that of acarbose [27]. Cephalandrine A and Cephalandrine B were isolated from *Coccinia grandis* root part and aerial parts shown glucose lowering effect and

Sravani Ravla et al.,

act as antidiabetic compounds[21,28,29]. Table I showing pharmacological activities, species and structures of isolated compounds of Cucurbitaceae plants.

Antibacterial activity of isolated compounds from Cucurbitaceae family plants

Quercetin-3, 4'-O-D-di-glucopyranoside, 3,4-dihydroxy methyl benzoate, isorhamnetin-4-O-D glucopyranoside, 3, 4-dihydroxybenzoic acid, quercetin, myricetine, quercetin-4'-O-D-glucopyran have antidiabetic activity isolated from *Cucurbita pepo* [30]. Gallic acid, ferulic acid, lutein, beta carotene, retinol, tocopherols, rutin, and Kaempferol are all found in *Cucurbita moschata* [31]. From *Cucurbita pepo* plants, stigmaterol, stigmastadienol, five multiflorane-type triterpenoids, lutein, flavoxanthin, luteoxanthin, chrysanthemaxanthin, and cryptoxanthin were isolated and shown antibacterial potential [32]. *Momordica charantia* was the source of ribosome inactivating proteins (RIPs), Momordica charantia lectin (MCL), Momordica anti-HIV protein of 30 kD (MAP30), -momorcharin (-MMC), -momorcharin, -momorcharin, and -momorcharin were effective against bacterial infection[9]. Plumericin (Iridoid lactone), an antibacterial compound found in *M. Charanta*, had good action against enterococci and bacilli by minimum inhibitory concentration near to standard drug [33]. Momordica monadelpha (Tilkor) stigmaterol and tritriacontane have been discovered to exhibit antibacterial action [34]. Additionally, antibacterial activity has been reported for ferulic acid, methyl caffeate, ligstroside, trans-p-coumaric acid, and kaempferol-3-O-D-glucoside, isolated from methanolic extract of *Coccinia grandis* [35]. Novel alkaloid 1-tert-Butyl-5,6,7-trimethoxyisoquinolene, isolated from *Coccinia grandis* shown good antimicrobial activity [36]. Taraxerol isolated from *Coccinia grandis* had shown antimicrobial activity. Isolation and Structure Elucidation of Compounds from *Coccinia grandis* Leaves Extract*

Anticancer activity of isolated compounds from Cucurbitaceae family plants

Several compounds from *Trichosanthes kirilowii*, including tri-chobenzolignan, ligballinol, pinoresinol, chrysoeriol 7-O-D-glucopyranoside, luteolin 7-O-D-glucopyranoside, 10-cucurbita-5, 24-dien-3-ol, and ehletianol C exhibit anticancer potential. [37]. Fruit and leaves of *L. echinata* possess abundant phenolic components such as coumaric acid, chlorogenic acid, catechin, gallic acid, and vanillic acid could have powerful anticancer potential [38]. The anticancer agent 1, 8 dihydroxy-4-methyl-anthracene 9, 10-dione present in fraction LA/FII of the *Luffa acutangula* plant strongly inhibited NCI-H460 cells [39]. Tetra cyclic triterpenes-Cucurbitacin I was reported in *Lagenaria siceraria* as an anticancer agent [40]. The peptides extracted from *Momordica dioica*, according to Selvam et al., suppressed cell proliferation and led to cell death, suggesting that it has a potential to treat colon cancer [41]. α , β Momorcharin, extracted substance from *Momordica charantia*, was effective at killing cancer cell lines by apoptosis induction and calcium overload approach in cells[42]. In pre-initiated/initiated tumors cells, kuguacin J reported in *Momordica charantia* has demonstrated their significant anticancer properties to trigger apoptosis/cell cycle arrest as well as could inhibit resistance to anticancer medicines in progressed cancer growth [43]. Various Cucurbitacin and dihydro-Cucurbitacin compounds were isolated from the root of *Bryonia aspera*, At 50 $\mu\text{g/ml}$, dihydro-Cucurbitacin D and iso dihydro-Cucurbitacin D inhibited HepG2 and MDBK cells by more than 50%, Cucurbitacin L and Neocucurbitacin C shown high inhibitory activity on MCF7 cells (IC₅₀ = 12.2, 13.05 $\mu\text{g/ml}$)[44]. 3, 7-di-O-rhamnoside kaempferol found in *B. dioica* root proven antitumor and apoptogenic effect in cell lines, including the promyelocytic human leukemia U937 and myelogenous leukemia cell line K562. Myricetin (2, 5, 7, 3, 4, 5-penta hydroxyl flavonol) was isolated as chief component from *B. dioica* aqueous extract. Myricetin also shown anticancer and apoptogenic effects against malignancies like colorectal cancer, ovarian cancer, leukemia, and lung cancer. Additionally, it has been shown that Myricetin can kill cancer cells at various stages in different cancer cell lines especially through activating CDKs and cyclins [45]. Cucurbita glycosides A and B (*C. pepo*) are potent antitumor bioactive compounds, had IC₅₀ values of 17.2 g/mL and 28.5 g/mL, respectively. Cucurbitacin B and E have ability to acts as an anti-proliferative compound by inhibiting various cell lines extracted from *C. pepo* cv. Dayangua. Activation of the Epstein-Barr infection caused due to cancer promoter 12-O-tetradecanoyl-phorbol-13-acetic acid derivation is inhibited by 23,24-dihydrocucurbitacin F[46]. *Citrullus colocynthis* leaf extract contains glucocucurbitacin derivatives. 25-p-coumaroyl-3'-acetyl-1-2-O- β -d-glucocucurbitacin I displayed interesting specific antitumor activity to Caco-2 cells (1 and 10 $\mu\text{g/mL}$), for IEC6 cells(-24%) and for both HT29 (-32%) and Caco-2 (-19%) toxic [47]. Trichobenzolignan isolated from *Trichosanthes kirilowii* also proved to be cytotoxic compounds. It had shown moderate activities in human lung cancer, colon

Sravani Ravla et al.,

cancer, ovarian cancer and breast cancer cell lines[37]. Cucumol B reported in methanolic extract of *Cucumis melo* also act as potent cytotoxic agent against SKOV-3 and MCF-7 cell lines and moderate agent toward HCT-116 cell line[32]. 3-O-beta-D-glucuronopyranosyl gypsogenin (III), 3-O-beta-D-glucopyranosyl gypsogenin (IV)[48] and 3-O-beta-D-glucopyranosyl hederagenin (V)[14] had reported in *Momordica dioica* root extract possessed anticancer activity against cancer cell (L1210). Two cell lines NB4 and K562 were potently suppressed from proliferating by plumericin isolated from *Momordica charantia* vine at effective doses.

Anti-inflammatory activity of isolated compounds from Cucurbitaceae family plants:

Quillaic acid an anti-inflammatory compound against RAW 264.7 cells was found in *Momordica cochinchinensis* Sprenger seeds [49]. Two active components were discovered in the roots of *Cayaponia tayuya*, 23, 24-dihydrocucurbitacin B and Cucurbitacin R shown anti-inflammatory activity in various mouse oedema models such as phospholipase A2, serotonin, carrageenan and 12- O-tetradecanoylphorbol 13-acetate (TPA) models [50]. Anti-inflammatory properties of cucurbitacins reported in *C. sativus* seeds and were attributed for cyclooxygenase (COX) suppression[51]. RAW 264.7 cells which are activated due to macrophage are suppressed by 3 β , 7 β , 25-trihydroxycucurbita-5, 23(E)-dien-19-al, and 25-isopropenylchole-5, 6-ene-3-O-d-glucopyranoside extracted from *Momordica charantia* L., and demonstrated considerable anti-inflammatory action in NF-B, iNOS, IL-6[52].

CONCLUSIONS

This review highlighted medicinal potential of Cucurbitaceae plants used as dietary, medicinal, ethno veterinary causes. Different pharmacological potentials of various extracts and fractions of Cucurbitaceae plants are highlighted in this article. The fractions Isoviteixin, Vitexin, Orientin, and Vitexin-2''-O-Rhamnoside isolated in *Benincasa Exocarpium* plant had shown stronger inhibitory activity compared to positive control (Amino guanidine hydrochloride) as well as antidiabetic activity similar to standard (Acarbose). Gallic acid and Caffeic acid shown significant inhibitory activity of AGE formation in BSA glucose system. Protocatechuic Acid had high α - glucosidase inhibition activity. 1-tert-Butyl-5, 6, 7-trimethoxyisoquinoline (*Coccinia grandis*) possesses better analgesic and anti-inflammatory activity. *L. echinata* can be used for diabetes, neurological and cancer treatment. It is still necessary to identify several phytochemicals from these plants that may have more medicinal effect. These plant exhibits notable antidiabetic properties in addition to other potential therapeutic uses, as demonstrated by preclinical research and clinical trials. The purpose of this in-depth review is to observe the chemical elements contained in plants belonging to the Cucurbitaceae family that have already been documented and have a large extent of space for further investigation of chemical components with therapeutic value from these plants. The study can be expanded to examine the molecular effects of these distinct phytochemicals with respect to mechanism in severe illnesses and development of leads to treat these ailments in future prospects. Also the advent of newer multi drug resistance bacteria poses a risk to health worldwide and keeps the scientific community on its toes. Scientists working on drug development countenance a significant problem in comprehending the fundamental chemical processes involved in the screening of bioactive small molecules. This led scientists to turn towards herbal medicines for a remedy because it is now widely recognised that they are crucial in the development of effective treatments.

ABSTRACT

The purpose of the study is to investigate the effect of L-glutamine supplementation on the metabolism of proteins in freshwater fish exposed to copper sulphate. In aquatic ecosystems, heavy metal pollution frequently has a negative impact on the aquatic biota. One of the most harmful heavy metals to fish is copper, and eating fish that has had its water treated with copper can be extremely dangerous for human health. Fish are typically employed in water quality management as indications of pollution. Reduced growth, a shorter lifespan, issues with reproduction, lower fertility, and behavioural changes are examples of chronic impacts. Fish residing in close proximity to the sediment have the potential to collect copper sulphate. In the current study, the toxic effects of copper sulphate (LC₅₀ 0.308µg/l; CuSO₄) were assessed throughout exposure periods of 5, 10, and 15 days on (0.20ppm) one sublethal quantity of total protein in the gill, gut, and muscle tissues of freshwater fish, *Brachydanio rerio*. In contrast to control, it is all decreasing. The findings demonstrated the heavy metal copper sulphate's hazardous properties. When 0.10 ppm of L-glutamine is administered to the remaining copper-treated fish, the protein content is increased more frequently than in copper-treated fish, suggesting that L-glutamine alleviates the negative effects of copper sulphate.

Keywords: Zebra fish, Toxic effects, Copper sulphate, L-glutamine, Biochemical studies.

INTRODUCTION

Environmental pollution not only causes a decrease in water quality, but it subsequently affects all living organisms in that system. Therefore, it is necessary to not only identify and manage these pollution sources, but also to maintain their effects on the health of aquatic environment. Heavy metal pollution is a major environmental problem facing the modern world. The global heavy metal pollution is increasing in the environment due to increasing of human activities. Moreover, it is gaining in importance day by day due to its obvious impact on human health through the food chain (Mohanambal. R and Saravanan. K, 2019). In commercial and recreational fish ponds, copper sulphate is commonly used as an algicide to suppress the growth of filamentous algae and phytoplankton, as well as to manage some fish infections (Tucker and Robinson, 1990). On the other hand, fish, especially farmed species like catfish, cyprinids, and salmonids, are poisonous to copper at a certain concentration (Wurts and Perschbache, 1994). Consequently, fish should be treated when bioaccumulation reaches a hazardous stage. According to Lopes et al. (2001), the ability of copper to catalyse oxidative processes that results in the generation of reactive oxygen species is connected with its harmful effect. Fish are excellent models for studying aquatic systems because they occupy the highest positions in the food pyramid and may mimic the effects of heavy metals on other living things, such as humans, as well as exert direct stress on themselves (Vander et al., 2003). Heavy metal pollution of the environment is a global issue due to the indestructibility of these metals and the poisonous effects most of them have on living things when they reach a specific concentration (Alam et al., 2002). Many fish species are employed to biologically track changes in ambient anthropogenic pollution levels (Vinodhini and Narayanan, 2008; Palaniappan and Karthikeyan, 2009). According to Ebrahimpour and Mushrifah (2010), heavy metals can reach the aquatic environment by atmospheric deposition, weathering from the geological matrix, or anthropogenic sources such as sewage, mining wastes, industrial discharge, and agricultural waste. Both natural and man-made causes of copper contamination, including mine washing, agricultural leaching, and direct application as molluscicide and algicide, can be found in the aquatic environment. The first tissue to come into contact with waterborne pollutants is the gill. The gills are mostly impacted by impurities like metals because of their huge surface area and the short diffusion distance between the blood and water. According to Demir et al. (2016), chemicals may negatively impact fish gill function overall, increasing fish susceptibility to toxic compounds and possibly resulting in fish mortality. In generally speaking, the gill cells respond quickly for various chemicals to overcome physiological impairment or tissue damage. According to Atabati et al. (2015), the gill serves as the primary site for copper uptake due to its continuous and direct interaction with the external surroundings. In aquaculture and agriculture, copper sulphate is used globally as a fungicide and algicide (Lasiene et al., 2016). For a variety of bacterial and ectoparasitic illnesses, copper sulphate is used as a medicinal chemical in the aquaculture sector. Fish parasites, including trematodes, protozoa, and external fungi and bacteria, are becoming less common. Additionally, it stops germs from growing (Nouh and Selim, 2013; Lasiene et al., 2016). The only free amino acid that is involved in the immune system's response to muscle damage is glutamine; lymphocytes and macrophages use it as an energy source and to enhance protein synthesis.

EXPERIMENTAL TEST

The goal of the current investigation is to assess the toxicity of copper in tissues and determine whether fresh water l-glutamine may mitigate the effects of copper toxicity in *B. danio rerio*. The freshwater fish, known as *Branchydanio rerio*, were procured from commercial aquariums and transported to the laboratory in huge plastic troughs, where they underwent a week of acclimation. For the experiments, healthy fish with equal body weights (4 to 4.5 g) and lengths (3 to 3.5 cm) were utilised. $\text{CuSO}_4 + 5 \text{H}_2\text{O}$, the stock solution of copper sulphate, was made by dissolving the proper amount of salt in distilled water. During the test periods, the physio-chemical characteristics of the test water were routinely evaluated using the slanted method as outlined by APHA (1998). Using the probite analysis Finney technique (1971), batches of twenty healthy fish were subjected to varying concentrations of the pesticide copper sulphate in order to determine the median lethal concentration (LC_{50} value: $0.308 \mu\text{g/l}$). The fish were subjected to one sublethal dose of copper sulphate (0.20 ppm) for 5, 10, and 15 days, in that order. As a control, another group was kept. When each exposure period came to an end, the fish were slaughtered, and their gills,

Elavarasi and Aruljothi

intestines, and muscles were collected for protein analysis. After that, the fish were reared, and they were exposed to a concentration of 0.10 ppm L-glutamine for 96 hours. For protein analysis, fish tissue samples from the gills, intestine, and muscle should once again be obtained. Using Lowry et al.'s (1951) approach, the total protein content of the tissues was estimated. Following tissue isolation from the test animals, a 10% TCA solution that was cold was homogenised. A 3000-rpm centrifuge was used to homogenise the tissue. After discarding the supernatant, 1.0 millilitres of 0.1N NaOH were used to dissolve the precipitate. This is followed by the mixing of 4.0 ml of alkaline copper reagent with 0.5 ml of supernatant (or 0.5 ml of serum if serum was isolated from blood). This is left to mingle for 10 minutes at room temperature. After that, thoroughly mix with 0.5 ml of folin-ciocalteau reagent. Using a Bausch and Lomb UV Spectrophotometer, the blue coloured absorption was measured at 620 nm. The same protocol was applied to standards in the concentration range of 20–100µg and to a blank that contained 1.0 millilitres of distilled water. For serum, the protein concentration was represented as mg/dl, and for tissue, it was represented as mg/g wet weight. The amount of protein in the fish treated with copper sulphate and L-glutamine was measured in the gill, intestine, and body muscle. Biochemical data from copper sulphate and L-glutamine treated fish were compared with those from control groups.

RESULTS

Protein content of the gill tissue

Table 1 shows the tissue protein content of *Branchydanio rerio* freshwater fish treated with L-glutamine, copper sulphate and also the control. The protein content of the fish treated with metal had sublethal concentrations of 76.19, 71.30, and 79.12 mg/g of wet weight of tissue, compared to 80.12 mg/g in the control group's gill tissue. The percentages that decreased were -4.90, -11.00, and -13.28 after 5, 10, and 15 days of exposure, in that order. The fish treated with L-glutamine had a protein content of 79.12, with a percentage of -1.24. At the $P < 0.05$ level, the mean difference was statistically significant. (Fig. 1; Table 1).

Protein that is present in intestinal tissue

The amount of protein in the control fish's intestinal tissue were 119.35 mg/g of wet weight tissue. Fish treated with copper sulphate had sublethal concentrations of 114.21, 110.66, and 108.34 mg/g of wet weight tissue. The amount of protein in the zebrafish gut tissue treated with copper was reduced. The decreasing percentages for the 5, 10, and 15-day exposure periods were -4.30, -7.28, and -9.22, respectively. Fish protein treated with glutamine had a content of 118.41 mg/g and a percentage of -0.78. Table 1 and Figure 1 show that the mean difference was statistically significant at the $P < 0.05$ level.

Protein content of the muscle tissue

Table 1 shows that the tissue protein content of *Branchydanio rerio* freshwater fish treated with L-glutamine, copper sulphate and also the control. The sublethal concentrations of copper sulphate treatment were 128.20, 123.18, and 120.22 wet weight of tissue, respectively, while the amount of protein in the control muscle tissue was 130.18 mg/g. Muscle tissue treated with copper exhibits declining patterns in its protein content. The corresponding lowered percentages for 5, 10, and 15 days of exposure was -1.52, -5.37, and -7.65. protein content of the L-glutamine treated fish were 131.22 wet weight of tissue, its increased percentage was 1.0079. The mean differences between the control, copper treated and L-glutamine groups were statistically significant at the $P < 0.005$ level (Table 1; Fig. 1). These lines are correct but these lines should be placed under table 1.

DISCUSSION

The widespread use of fungicides, algaecides, and insecticides in agricultural fields, followed by the release of the waste products into water bodies, is the cause of copper contamination in freshwater ecosystems. In addition, various industries such as mining, sewage sludge, plastics, electroplating, metal refining, atmospheric deposition, and others

**Elavarasi and Aruljothi**

can cause copper toxicity (Mendil D.; Demirci Z., and Panagos P.; Ballabio C., 2018). The micronutrient and trace element copper is crucial for the development and metabolism of living things. Copper is an essential component of numerous metabolic enzymes and glycoproteins found in fish and other animals. Moreover, it is necessary for the nervous system to operate and for the production of haemoglobin (Nordberg GF; Fowler BA., 2018; and Sorensen EMB., 1948). However, living things are toxically affected by copper at higher concentrations (Richard Bull., 2000). Freshwater fish are poisonous to copper at concentrations between 10 and 20 parts per billion (ppb) (Carol Ann Woody B; Louise SO,2012). A number of variables, including pH, dissolved organic carbon (DOC), anions, and water hardness, affect how toxic copper is to aquatic life. Fish mostly absorb copper through their feed or environmental exposure (Dang F, Zhong H, Wang WX., 2009). Freshwater fish experienced an oxidative stress response when exposed to waterborne copper (Eyckmans M.; Celis N.,2011). Fish with chronic copper toxicity have poor growth, shortened life spans, weakened immune systems, and issues with reproduction (Yacoub AM; Gad NS. 2012). When teleost fish (*Oreochromis niloticus*) were exposed to copper toxicity in their gills, apoptosis was induced (Monteiro SM;dos Santos NMS.,2009). Exposure to copper sulphate in *Cyprinus carpio* resulted in morphological and biochemical alterations in the liver tissue (Varanka Z.; Rojik I., 2001). Fish livers have the largest concentration of copper accumulation, but fish gills and body tissue have lower concentrations (Bawuro AA; Voegborlo RB.,2018).

The oxidative metabolism, lipid peroxidation, and protein content in carp tissue were all impacted by the bioaccumulation of this trace element (Radi AAR; Matkovics B., 1988). Apoptosis was induced in response to copper toxicity in the gills of teleost fish (*Oreochromis niloticus*) (56 Bawuro AA; Voegborlo RB, 2018). Exposure to copper sulphate in *Cyprinus carpio* resulted in morphological and biochemical alterations in the liver tissue (Sepe A; Ciaralli L; Ciprotti M, 2003). An organism's altered activity can be inferred from alterations in an organ's biochemical composition brought on by heavy metal stress. It sheds information on how their biological energy is used to combat the harmful stress. The metabolism of the freshwater fish, *Danio rerio* is impacted by heavy metal salts. Stress has always been determined by observing changes in metabolic processes after being exposed to heavy metal stress. However, the pattern of metal-induced physiological changes varies greatly between metals and between animals. Animal tissue has a significant amount of protein, a key organic component that is crucial to cellular metabolism. Since all enzymes are proteins, they regulate intracellular processes and quicken the rate of metabolism within an organism. Glutamine serves as an energy source for lymphocytes and macrophages and is a conditionally necessary amino acid that is implicated in the immunological response to muscle damage (Walsh et al., 1998). Long-term or vigorous exercise-induced immune responses have been shown to lower intramuscular and plasma glutamine concentrations (Castell & Newsholme, 1997; Gleeson, 2008), which may then result in compromised immune system function (Rohde et al., 1998). The advantages of L-glutamine supplementation may influence athletic performance and training, which could account for the rise in popularity of oral L-glutamine supplements among endurance and strength athletes in recent years (Antonio & Street, 1999; Candow et al., 2001). Few studies support the efficacy of L-glutamine supplementation on improving muscle function and reducing muscle soreness, despite the fact that it has been well-documented to restore plasma glutamine concentrations and improve systemic immune system function (Castell, 2003; Kuhn et al., 2010). (Rahmani et al., 2013; Street et al., 2011). Supplementing *Oreochromis niloticus* with glutamine alters the intestine's relative weight and length, as well as the length and villus of the villus.

Feed efficiency in fish fed a diet supplemented with Gln was observed. Dietary Gln supplementation also had a favourable impact on final body weight and weight increase (Pedro L.P.F. Carvalho, 2023). In the current investigation, fish branchydanio rerio protein levels in the chosen tissues were found to be lower in chronic copper sulphate concentrations when compared to control and protein contents exposed to L-glutamine. The current study's findings on the decreased levels of protein in the gills, intestine, and muscle are consistent with those of Mastan (2008), Kumar, and Gopal (2001), who noted that the stress of copper and distillery effluents caused protein levels to drop in several fish organs, including the *C. punctatus*. Dinodia et al. (2002) also studied the effects of cadmium toxicity on fish species found in freshwater environments, specifically *Labeo rohita*, *Cirrhinus mrigala*, and *Cyprinus carpio*. The findings showed that all fish species experienced a decrease in body tissue and residual protein after 45 days of exposure, which could be attributed to the malfunction of multiple physiological and biochemical processes within the body. According to Abel (1974), changes in membrane permeability could be the cause of the protein drop.

Elavarasi and Aruljothi

Barytelephusa cunicularis's differences in protein metabolism were investigated by Nagabhushanm and Kulkarni in 1979. The freshwater bivalve Corbicula striatella showed a decrease in protein levels most of the time following heavy metal exposure, according to Mahajan and Zambare (2001). According to Kumar et al. (2012), sodium arsenide reduced the amount of protein in Clarius batractus catfish. *Branchydanio rerio* had lower total protein content in the gill, intestinal, and muscular tissues of freshwater fish in the current study as compared to the control group. When fish exposed to L-glutamine had higher protein contents than fish treated with copper, this suggests that L-glutamine acts as an analgesic against the effects of copper sulphate.

CONCLUSION

The present study indicates that the presence of a concentration of heavy metal copper sulphate in the water is toxic to fish and alters the protein of the fish tissues, and the L-glutamine was used to gain the copper toxic effect. The results indicate that the use of copper sulphate in agriculture fields may pose a threat to aquatic fauna and flora as well as humans. Therefore, the information obtained may be useful for the management and monitoring of agricultural insecticide concentrations in aquatic ecosystems. The L-glutamine are indicating its contribution to protein metabolism and immune function in copper sulphate affected fish species.

ABSTRACT

In this paper, we defined Lukasiewicz type (1 &2) conjunction and disjunction operators in the independent component of Neutrosophic fuzzy set and Neutrosophic fuzzy Matrix. Some properties of union, intersection and complement of Lukasiewicz type (1 &2) conjunction and disjunction operators have been examined.

Keywords: Neutrosophic Fuzzy Set (NFS), Neutrosophic Fuzzy Matrices (NFM), Lukasiewicz, Conjunction, Disjunction

AMS Subject Classification: 03E72

INTRODUCTION

The idea of the fuzzy set (FS), a class of items with a range of membership grades, was first suggested by Zadeh [21]. The function allocates a membership grade for each element among zero and one in FS. Atanassov [1,2] generalized the concept of fuzzy sets and introduced the notion of intuitionistic fuzzy sets (IFS). He established some of its fundamental attributes in detail. A neutrosophic set (NS) initially emerged by Smarandache [13]. NS is moreover adaptable and efficient since, in comparison to IFS, it can handle partially independent and dependent components, which is essential in today's uncertain ecological situation. Smarandache [14] extended the concept of NS into four fields: logic, set, probability, and statistics. Kim and Roush created the fuzzy matrix (FM) theory idea. FM is frequently utilized in the field of real-world applications and addresses a variety of uncertain challenges. Pal [11] developed the outlook of intuitionistic fuzzy matrices (IFM) and explored numerous results-based IFMs. Wang et al.

Muthuraji and Anbukkarasi

[22] developed a novel viewpoint to construct an intuitionistic fuzzy similarity matrix based on IFM. A novel approach to creating neutrosophic fuzzy matrices (NFM) based on neutrosophic fuzzy was developed by Dhar et al. in [6]. Neutrosophic fuzzy matrices were introduced by Smarandach [12, 13, 14,15,16], Murugadas [18], Uma [19], and Vidhya [20] also created new theories and established some of its properties. Atanassov [3,5] presented some operators on the Lukasiwicz intuitionistic fuzzy conjunction and disjunction in IFSs. In [9,10], Muthuraji introduced the Lukasiwicz operators in intuitionistic fuzzy matrices and proved algebraic structure in IFM. We deliberate in operations over NFM with some Lukasiewicz-type algebraic features (1 & 2). In Section 2 we introduce the basic idea of NFM characteristics. The operator propositions of the Lukasiwicz conjunction and disjunction types (1& 2) over NFM are covered in Section 3. We develop the features based on union, intersection, and complement over NFM.

PRELIMINARIES

In this chapter, give some basic preliminaries about Neutrosophic Fuzzy set, Neutrosophic Fuzzy Matrix with operator.

Definition 2.1[12,13, 14]: A universe of X defined in a Neutrosophic set ' Ω ' as $\Omega = \{ \{x, T_{\Omega}^{\square}(x), I_{\Omega}^{\square}(x), F_{\Omega}^{\square}(x)\}, x \in X \}$, where $T_{\Omega}^{\square}, I_{\Omega}^{\square}, F_{\Omega}^{\square} : X \rightarrow]0, 1^+[$ and the condition $0^- \leq T_{\Omega}^{\square}(x) + I_{\Omega}^{\square}(x) + F_{\Omega}^{\square}(x) \leq 3^+$ and where T_{Ω}^{\square} is degree of truth membership, I_{Ω}^{\square} is the degree of indeterminacy and F_{Ω}^{\square} is the degree of false non-membership.

Definition 2.2[12]: Let Ω and Ψ are two neutrosophic fuzzy set and let $x_{\Omega} = (T_{x_{\Omega}}^{\square}, I_{x_{\Omega}}^{\square}, F_{x_{\Omega}}^{\square}) \in \Omega, y_{\Psi} = (T_{y_{\Psi}}^{\square}, I_{y_{\Psi}}^{\square}, F_{y_{\Psi}}^{\square}) \in \Psi$, define as type-1 operation of union and intersection over NFS is

$$\Omega \cup_1 \Psi = \left(\max(T_{x_{\Omega}}^{\square}, T_{y_{\Psi}}^{\square}), \min(I_{x_{\Omega}}^{\square}, I_{y_{\Psi}}^{\square}), \min(F_{x_{\Omega}}^{\square}, F_{y_{\Psi}}^{\square}) \right)$$

$$\Omega \cap_1 \Psi = \left(\min(T_{x_{\Omega}}^{\square}, T_{y_{\Psi}}^{\square}), \max(I_{x_{\Omega}}^{\square}, I_{y_{\Psi}}^{\square}), \max(F_{x_{\Omega}}^{\square}, F_{y_{\Psi}}^{\square}) \right)$$

Definition 2.3[12]: Let Ω and Ψ are two neutrosophic fuzzy set and let $x_{\Omega} = (T_{x_{\Omega}}^{\square}, I_{x_{\Omega}}^{\square}, F_{x_{\Omega}}^{\square}) \in \Omega, y_{\Psi} = (T_{y_{\Psi}}^{\square}, I_{y_{\Psi}}^{\square}, F_{y_{\Psi}}^{\square}) \in \Psi$, define as type-2 operation of union and intersection over NFS is

$$\Omega \cup_2 \Psi = \left(\max(T_{x_{\Omega}}^{\square}, T_{y_{\Psi}}^{\square}), \max(I_{x_{\Omega}}^{\square}, I_{y_{\Psi}}^{\square}), \min(F_{x_{\Omega}}^{\square}, F_{y_{\Psi}}^{\square}) \right)$$

$$\Omega \cap_2 \Psi = \left(\min(T_{x_{\Omega}}^{\square}, T_{y_{\Psi}}^{\square}), \min(I_{x_{\Omega}}^{\square}, I_{y_{\Psi}}^{\square}), \max(F_{x_{\Omega}}^{\square}, F_{y_{\Psi}}^{\square}) \right)$$

Definition 2.4 [12,15]: Let $\langle x_T^{\square}, x_I^{\square}, x_F^{\square} \rangle, \langle y_T^{\square}, y_I^{\square}, y_F^{\square} \rangle \in NFS$ then define as

$$\langle x_T^{\square}, x_I^{\square}, x_F^{\square} \rangle \leftarrow \langle y_T^{\square}, y_I^{\square}, y_F^{\square} \rangle = \begin{cases} \langle 1, 1, 0 \rangle, & \text{if } \langle x_T^{\square}, x_I^{\square}, x_F^{\square} \rangle \geq \langle y_T^{\square}, y_I^{\square}, y_F^{\square} \rangle \\ \langle x_T^{\square}, x_I^{\square}, x_F^{\square} \rangle, & \text{if } \langle x_T^{\square}, x_I^{\square}, x_F^{\square} \rangle \leq \langle y_T^{\square}, y_I^{\square}, y_F^{\square} \rangle \end{cases}$$

Here $\langle x_T^{\square}, x_I^{\square}, x_F^{\square} \rangle \geq \langle y_T^{\square}, y_I^{\square}, y_F^{\square} \rangle$ means $x_T^{\square} \geq y_T^{\square}, x_I^{\square} \geq y_I^{\square}$, and $x_F^{\square} \leq y_F^{\square}$

Muthuraji and Anbukkarasi

Definition 2.5 [4]: Let $P = \left(\left\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \right\rangle \right)$ is said to be Neutrosophic Fuzzy Matrix, if the all elements are belongs to Neutrosophic Fuzzy Set.

Definition 2.6[5, 19]: Let P and Q in NFM then $P = \left(\left\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \right\rangle \right), Q = \left(\left\langle q_{T_{ij}}^{\square}, q_{I_{ij}}^{\square}, q_{F_{ij}}^{\square} \right\rangle \right) \in F_{m \times n}$, define as type-1 operation of union and intersection over NFM as

$$P \cup_1 Q = \left(\left\langle \max \left(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square} \right), \min \left(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square} \right), \min \left(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square} \right) \right\rangle \right)$$

$$P \cap_1 Q = \left(\left\langle \min \left(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square} \right), \max \left(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square} \right), \max \left(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square} \right) \right\rangle \right)$$

Definition 2.7 [19]: Let $P = \left(\left\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \right\rangle \right), Q = \left(\left\langle q_{T_{ij}}^{\square}, q_{I_{ij}}^{\square}, q_{F_{ij}}^{\square} \right\rangle \right) \in F_{m \times n}$ are NFM, define as type-2 operation of union and intersection over NFM as

$$P \cup_2 Q = \left(\left\langle \max \left(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square} \right), \max \left(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square} \right), \min \left(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square} \right) \right\rangle \right)$$

$$P \cap_2 Q = \left(\left\langle \min \left(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square} \right), \min \left(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square} \right), \max \left(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square} \right) \right\rangle \right)$$

Definition 2.8 [19]: Let $P = \left(\left\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \right\rangle \right), Q = \left(\left\langle q_{T_{ij}}^{\square}, q_{I_{ij}}^{\square}, q_{F_{ij}}^{\square} \right\rangle \right) \in F_{m \times n}$, P and Q be two NFM of same dimension. If $P \leq Q$, If $p_{T_{ij}}^{\square} \leq q_{T_{ij}}^{\square}, p_{I_{ij}}^{\square} \leq q_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \geq q_{F_{ij}}^{\square}$, for i, j then P is dominated by Q or Q dominated P. P and Q is called comparable. If either $P \leq Q$ (or) $Q \leq P, P < Q$ or $p_{T_{ij}}^{\square} < q_{T_{ij}}^{\square}, p_{I_{ij}}^{\square} < q_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} > q_{F_{ij}}^{\square}$

Definition 2.9 [12, 13, 15]: Let $P = \left(\left\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \right\rangle \right) \in F_{m \times n}$, the complement of P with type 1 and type 2 in NFM is

$$P^{c_1} = \left(\left\langle p_{F_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{T_{ij}}^{\square} \right\rangle \right)$$

$$P^{c_2} = \left(\left\langle p_{F_{ij}}^{\square}, 1 - p_{I_{ij}}^{\square}, p_{T_{ij}}^{\square} \right\rangle \right)$$

Definition 2.10[8]: Consider that the two elements in $\langle T_{x_{\Omega}}^{\square}, I_{x_{\Omega}}^{\square}, F_{x_{\Omega}}^{\square} \rangle, \langle T_{y_{\Omega}}^{\square}, I_{y_{\Omega}}^{\square}, F_{y_{\Omega}}^{\square} \rangle \in \Omega$ such that $0 \leq T_{x_{\Omega}}^{\square} + I_{x_{\Omega}}^{\square} + F_{x_{\Omega}}^{\square} \leq 3$ and $0 \leq T_{y_{\Omega}}^{\square} + I_{y_{\Omega}}^{\square} + F_{y_{\Omega}}^{\square} \leq 3$, when all three components are independent. Now define

the conjunction and disjunction operators \oplus_{L_1} and \square_{L_1} of Lukasiewicz type -lis

$$\langle T_{x_{\Omega}}^{\square}, I_{x_{\Omega}}^{\square}, F_{x_{\Omega}}^{\square} \rangle \square_{L_1} \langle T_{y_{\Omega}}^{\square}, I_{y_{\Omega}}^{\square}, F_{y_{\Omega}}^{\square} \rangle = \left[\left\langle \max \left(T_{x_{\Omega}}^{\square} + T_{y_{\Omega}}^{\square} - 1, 0 \right), \min \left(I_{x_{\Omega}}^{\square} + I_{y_{\Omega}}^{\square}, 1 \right), \min \left(F_{x_{\Omega}}^{\square} + F_{y_{\Omega}}^{\square}, 1 \right) \right\rangle \right]$$

$$\langle T_{x_{\Omega}}^{\square}, I_{x_{\Omega}}^{\square}, F_{x_{\Omega}}^{\square} \rangle \oplus_{L_1} \langle T_{y_{\Omega}}^{\square}, I_{y_{\Omega}}^{\square}, F_{y_{\Omega}}^{\square} \rangle = \left[\left\langle \min \left(T_{x_{\Omega}}^{\square} + T_{y_{\Omega}}^{\square}, 1 \right), \max \left(I_{x_{\Omega}}^{\square} + I_{y_{\Omega}}^{\square} - 1, 0 \right), \max \left(F_{x_{\Omega}}^{\square} + F_{y_{\Omega}}^{\square} - 1, 0 \right) \right\rangle \right]$$

Muthuraji and Anbukkarasi

RESULTS

Definition 3.1 :Consider that the two elements in $\langle T_{x_\Omega}^\square, I_{x_\Omega}^\square, F_{x_\Omega}^\square \rangle, \langle T_{y_\Omega}^\square, I_{y_\Omega}^\square, F_{y_\Omega}^\square \rangle \in \Omega$ such that $0 \leq T_{x_\Omega}^\square + I_{x_\Omega}^\square + F_{x_\Omega}^\square \leq 3$ and $0 \leq T_{y_\Omega}^\square + I_{y_\Omega}^\square + F_{y_\Omega}^\square \leq 3$, when all three components are independent. Now define the conjunction and disjunction operators \oplus_{L_2} and \square_{L_2} of Lukasiewicz type -2is

$$\langle T_{x_\Omega}^\square, I_{x_\Omega}^\square, F_{x_\Omega}^\square \rangle \square_{L_2} \langle T_{y_\Omega}^\square, I_{y_\Omega}^\square, F_{y_\Omega}^\square \rangle = \left[\left\langle \max(T_{x_\Omega}^\square + T_{y_\Omega}^\square - 1, 0), \max(I_{x_\Omega}^\square + I_{y_\Omega}^\square - 1, 0), \min(F_{x_\Omega}^\square + F_{y_\Omega}^\square, 1) \right\rangle \right]$$

$$\langle T_{x_\Omega}^\square, I_{x_\Omega}^\square, F_{x_\Omega}^\square \rangle \oplus_{L_2} \langle T_{y_\Omega}^\square, I_{y_\Omega}^\square, F_{y_\Omega}^\square \rangle = \left[\left\langle \min(T_{x_\Omega}^\square + T_{y_\Omega}^\square, 1), \min(I_{x_\Omega}^\square + I_{y_\Omega}^\square, 1), \max(F_{x_\Omega}^\square + F_{y_\Omega}^\square - 1, 0) \right\rangle \right]$$

Definition 3.2: A Neutrosophic fuzzy matrix P is $P = \left(\left\langle p_{T_{ij}}^\square, p_{I_{ij}}^\square, p_{F_{ij}}^\square \right\rangle \right)$ where $0 \leq p_{T_{ij}}^\square + p_{I_{ij}}^\square + p_{F_{ij}}^\square \leq 3$ for i, j, when all three components are independent. Now the conjunction and disjunction operators \oplus_{L_1} and \square_{L_1} of Lukasiewicz type -1 on NFM. Let $P = \left(\left\langle p_{T_{ij}}^\square, p_{I_{ij}}^\square, p_{F_{ij}}^\square \right\rangle \right)$ and $Q = \left(\left\langle q_{T_{ij}}^\square, q_{I_{ij}}^\square, q_{F_{ij}}^\square \right\rangle \right)$ be two NFMs of order m×n. then

$$P \square_{L_1} Q = \left(\left\langle \max(p_{T_{ij}}^\square + q_{T_{ij}}^\square - 1, 0), \min(p_{I_{ij}}^\square + q_{I_{ij}}^\square, 1), \min(p_{F_{ij}}^\square + q_{F_{ij}}^\square, 1) \right\rangle \right)$$

$$P \oplus_{L_1} Q = \left(\left\langle \min(p_{T_{ij}}^\square + q_{T_{ij}}^\square, 1), \max(p_{I_{ij}}^\square + q_{I_{ij}}^\square - 1, 0), \max(p_{F_{ij}}^\square + q_{F_{ij}}^\square - 1, 0) \right\rangle \right)$$

Definition 3.3: A Neutrosophic fuzzy matrix P is $P = \left(\left\langle p_{T_{ij}}^\square, p_{I_{ij}}^\square, p_{F_{ij}}^\square \right\rangle \right)$ where $0 \leq p_{T_{ij}}^\square + p_{I_{ij}}^\square + p_{F_{ij}}^\square \leq 3$ for i, j, when all three components are independent. Now the conjunction and disjunction operators \oplus_{L_2} and \square_{L_2} of Lukasiewicz type -2 on NFMs. Let $P = \left(\left\langle p_{T_{ij}}^\square, p_{I_{ij}}^\square, p_{F_{ij}}^\square \right\rangle \right)$ and $Q = \left(\left\langle q_{T_{ij}}^\square, q_{I_{ij}}^\square, q_{F_{ij}}^\square \right\rangle \right)$ be two NFMs of order m×n. then

$$P \square_{L_2} Q = \left(\left\langle \max(p_{T_{ij}}^\square + q_{T_{ij}}^\square - 1, 0), \max(p_{I_{ij}}^\square + q_{I_{ij}}^\square - 1, 0), \min(p_{F_{ij}}^\square + q_{F_{ij}}^\square, 1) \right\rangle \right)$$

$$P \oplus_{L_2} Q = \left(\left\langle \min(p_{T_{ij}}^\square + q_{T_{ij}}^\square, 1), \min(p_{I_{ij}}^\square + q_{I_{ij}}^\square, 1), \max(p_{F_{ij}}^\square + q_{F_{ij}}^\square - 1, 0) \right\rangle \right)$$

Proposition 3.1

For any Two NFM's P and Q then

- i) $\overline{(P \oplus_{L_1} Q)} = P \square_{L_1} Q,$
- ii) $\overline{(P \square_{L_1} Q)} = P \oplus_{L_1} Q.$

Proof

Muthuraji and Anbukkarasi

Let $P = \left(\left\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \right\rangle \right)$ and $Q = \left(\left\langle q_{T_{ij}}^{\square}, q_{I_{ij}}^{\square}, q_{F_{ij}}^{\square} \right\rangle \right)$ be two NFM's of order $m \times n$.

$$\overline{P \oplus_{L_1} Q} = \left(\left\langle \min(p_{F_{ij}}^{\square} + q_{F_{ij}}^{\square}, 1), \max(p_{I_{ij}}^{\square} + q_{I_{ij}}^{\square} - 1, 0), \max(p_{T_{ij}}^{\square} + q_{T_{ij}}^{\square} - 1, 0) \right\rangle \right)$$

$$= \left(\left\langle \max(p_{T_{ij}}^{\square} + q_{T_{ij}}^{\square} - 1, 0), \min(p_{I_{ij}}^{\square} + q_{I_{ij}}^{\square}, 1), \min(p_{F_{ij}}^{\square} + q_{F_{ij}}^{\square}, 1) \right\rangle \right)$$

$$\overline{\overline{P \oplus_{L_1} Q}} = P \square_{L_1} Q$$

Similarly $\overline{P \square_{L_1} Q} = P \oplus_{L_1} Q$

Proposition 3.2

For any Two NFM's P and Q then

i) $\overline{\overline{P \oplus_{L_2} Q}} = P \square_{L_2} Q$

ii) $\overline{P \square_{L_2} Q} = P \oplus_{L_2} Q$

Proof

By Proposition 3.1 it true.

Proposition 3.3

For any three NFM's P, Q and R then

i) $D \oplus_{L_1} R = H \cap_1 J$

ii) $D \oplus_{L_2} R = K \cap_1 L$,

Where $D = P \cap_1 Q, H = P \oplus_{L_1} R, J = Q \oplus_{L_1} R, K = P \oplus_{L_2} R, L = Q \oplus_{L_2} R$, D, H, K, L are all NFM

Proof

Let $P = \left(\left\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \right\rangle \right)$, $Q = \left(\left\langle q_{T_{ij}}^{\square}, q_{I_{ij}}^{\square}, q_{F_{ij}}^{\square} \right\rangle \right)$ $R = \left(\left\langle r_{T_{ij}}^{\square}, r_{I_{ij}}^{\square}, r_{F_{ij}}^{\square} \right\rangle \right)$ and be three NFM's of order $m \times n$

$$(P \cap_1 Q) \oplus_{L_1} R = \left(\left\langle \min(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}), \max(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square}), \max(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square}) \right\rangle \right) \oplus_{L_1} R$$

$$= \left(\left\langle \min(1, \min(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square}), \max(0, \max(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square}) + r_{I_{ij}}^{\square} - 1), \max(0, \max(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square}) + r_{F_{ij}}^{\square} - 1) \right\rangle \right)$$

$$= \left(\left\langle \min(1, p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}), \max(0, p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1), \max(0, p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1) \right\rangle \right)$$

$$= \left(\left\langle \min(1, p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}), \max(0, p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1), \max(0, p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1) \right\rangle \right)$$

$$\cap_1 \left(\left\langle \min(1, q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}), \max(0, q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1), \max(0, q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1) \right\rangle \right)$$

$$D \oplus_{L_1} R = H \cap_1 J$$

Similarly $D \oplus_{L_2} R = K \cap_1 L$

Muthuraji and Anbukkarasi

Proposition 3.4

For any three NFM's P, Q and R then

- i) $(P \cap_1 Q) \square_{L_1} R = (P \square_{L_1} R) \cap_1 (Q \square_{L_1} R)$
- ii) $(P \cap_2 Q) \square_{L_2} R = (P \square_{L_2} R) \cap_2 (Q \square_{L_2} R)$

Proof

Let $P = \left(\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \rangle \right)$, $Q = \left(\langle q_{T_{ij}}^{\square}, q_{I_{ij}}^{\square}, q_{F_{ij}}^{\square} \rangle \right)$ and $R = \left(\langle r_{T_{ij}}^{\square}, r_{I_{ij}}^{\square}, r_{F_{ij}}^{\square} \rangle \right)$ be three NFMs of order $m \times n$

$$\begin{aligned} (P \cap_1 Q) \square_{L_1} R &= \left(\langle \min(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}), \max(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square}), \max(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square}) \rangle \right) \square_{L_1} R \\ &= \left(\langle \max(\min(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square} - 1, 0), \min(\max(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square}) + r_{I_{ij}}^{\square}, 1), \min(\max(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square}) + r_{F_{ij}}^{\square}, 1) \rangle \right) \\ &= \left(\langle \max(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} - 1, q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} - 1, 0), \min(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square}, q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square}, 1), \min(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square}, q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square}, 1) \rangle \right) \\ &= \left(\langle \max(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} - 1, 0), \min(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square}, 1), \min(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square}, 1) \rangle \right) \cap_1 \\ &\quad \left(\langle \max(q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} - 1, 0), \min(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square}, 1), \min(q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square}, 1) \rangle \right) \end{aligned}$$

$$(P \cap_1 Q) \square_{L_1} R = (P \square_{L_1} R) \cap_1 (Q \square_{L_1} R)$$

Similarly $(P \cap_2 Q) \square_{L_2} R = (P \square_{L_2} R) \cap_2 (Q \square_{L_2} R)$

Proposition 3.5

For any three NFM's P, Q and R then

- i) $(P \cup_1 Q) \oplus_{L_1} R = (P \oplus_{L_1} R) \cup_1 (Q \oplus_{L_1} R)$
- ii) $(P \cup_2 Q) \oplus_{L_2} R = (P \oplus_{L_2} R) \cup_2 (Q \oplus_{L_2} R)$

Proof

Let $P = \left(\langle p_{T_{ij}}^{\square}, p_{I_{ij}}^{\square}, p_{F_{ij}}^{\square} \rangle \right)$, $Q = \left(\langle q_{T_{ij}}^{\square}, q_{I_{ij}}^{\square}, q_{F_{ij}}^{\square} \rangle \right)$ and $R = \left(\langle r_{T_{ij}}^{\square}, r_{I_{ij}}^{\square}, r_{F_{ij}}^{\square} \rangle \right)$ be three NFMs of order $m \times n$

Here $P \cup_1 Q = \left(\langle \max(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}), \min(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square}), \min(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square}) \rangle \right)$

$$(P \cup_1 Q) \oplus_{L_1} R = \left(\langle \min(\max(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square}, 1), \max(\min(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square}) + r_{I_{ij}}^{\square} - 1, 0), \max(\min(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square}) + r_{F_{ij}}^{\square} - 1, 0) \rangle \right) \dots(*)$$

W.k.t $P \oplus_{L_1} R = \left(\langle \min(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1), \max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0), \max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0) \rangle \right)$

$$Q \oplus_{L_1} R = \left(\langle \min(q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1), \max(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0), \max(q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0) \rangle \right)$$

Muthuraji and Anbukkarasi

$$(P \oplus_{L_1} R) \cup_1 (Q \oplus_{L_1} R) = \left(\left\langle \begin{array}{l} \max(\min(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1), \min(q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1)), \\ \min(\max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0), \max(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0)), \\ \min(\max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0), \max(q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0)) \end{array} \right\rangle \right) \dots(**)$$

Let $U = \min(\max(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square}, 1) - \max(\min(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1), \min(q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1))$

If $p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} \geq 1$ then $\max(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square} \geq 1$

$U = 1 - \max(1, \min(q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1)) = 1 - 1 = 0$

If $p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} < 1$ then

$U = \min(\max(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square}, 1) - \max(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, \min(q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1)) = 0$

If $q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} \geq 1$ then $(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square} \geq 1$

$U = 1 - \max(1, \min(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1)) = 1 - 1 = 0$

If $q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square} < 1$ then

$U = \min(\max(p_{T_{ij}}^{\square}, q_{T_{ij}}^{\square}) + r_{T_{ij}}^{\square}, 1) - \max(\min(p_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}, 1), q_{T_{ij}}^{\square} + r_{T_{ij}}^{\square}) = 0$

Let $V = \max(\min(p_{I_{ij}}^{\square}, q_{I_{ij}}^{\square}) + r_{I_{ij}}^{\square} - 1, 0) - \min(\max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0), \max(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0))$

$V = \max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0) - \min(\max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0), \max(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0))$

If $p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} \geq 1$ then

$V = \max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0) - \min(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, \max(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0))$

If $p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} < 1$ then

$V = \max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0) - \min(0, \max(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0)) = 0 - 0 = 0$

If $q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} \geq 1$ then

$V = \max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0) - \min(\max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0), q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1)$

If $q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} < 1$ then

$V = \max(q_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0) - \min(\max(p_{I_{ij}}^{\square} + r_{I_{ij}}^{\square} - 1, 0), 0) = 0 - 0 = 0$

Let $W = \max(\min(p_{F_{ij}}^{\square}, q_{F_{ij}}^{\square}) + r_{F_{ij}}^{\square} - 1, 0) - \min(\max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0), \max(q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0))$

$W = \max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0) - \min(\max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0), \max(b_{F_{ij}}^N + r_{F_{ij}}^{\square} - 1, 0))$

Muthuraji and Anbukkarasi

If $p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} \geq 1$ then

$$W = \max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0) - \min(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, \max(q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0))$$

If $p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} < 1$ then

$$W = \max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0) - \min(0, \max(q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0)) = 0 - 0 = 0$$

If $q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} \geq 1$ then

$$W = \max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0) - \min(\max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0), q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1)$$

If $q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} < 1$ then

$$W = \max(q_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0) - \min(\max(p_{F_{ij}}^{\square} + r_{F_{ij}}^{\square} - 1, 0), 0) = 0 - 0 = 0$$

Therefore $(P \cup_1 Q) \oplus_{L_1} R = (P \oplus_{L_1} R) \cup_1 (Q \oplus_{L_1} R)$

Similarly $(P \cup_1 Q) \oplus_{L_2} R = (P \oplus_{L_2} R) \cup_1 (Q \oplus_{L_2} R)$

Proposition 3.6

For any three NFM's P,Q and R then

i) $(P \cup_2 Q) \oplus_{L_1} R = (P \oplus_{L_1} R) \cup_2 (Q \oplus_{L_1} R)$

ii) $(P \cup_2 Q) \oplus_{L_2} R = (P \oplus_{L_2} R) \cup_2 (Q \oplus_{L_2} R)$

Proof

From Proposition 3.5

The (i) and (ii) is true.

Proposition 3.7

For any two NFM's P, and Q then

i) $(P^{C_1} \oplus_{L_1} Q^{C_1}) = (P \square_{L_2} Q)^{C_1}$

ii) $(P^{C_1} \square_{L_1} Q^{C_1}) = (P \oplus_{L_2} Q)^{C_1}$

iii) $(P^{C_2} \oplus_{L_1} Q^{C_2}) = (P \square_{L_2} Q)^{C_2}$

iv) $(P^{C_2} \square_{L_2} Q^{C_2}) = (P \square_{L_1} Q)^{C_2}$

Proof

i)

$$(P^{C_1} \oplus_{L_1} Q^{C_1}) = \left(\left\langle \min(p_{F_{ij}}^{\square} + q_{F_{ij}}^{\square}, 1), \max(p_{T_{ij}}^{\square} + q_{T_{ij}}^{\square} - 1, 0), \min(p_{T_{ij}}^{\square} + q_{T_{ij}}^{\square}, 1) \right\rangle \right)$$

$$= \left(\left\langle \max(p_{T_{ij}}^{\square} + q_{T_{ij}}^{\square} - 1, 0), \max(p_{F_{ij}}^{\square} + q_{F_{ij}}^{\square} - 1, 0), \min(p_{F_{ij}}^{\square} + q_{F_{ij}}^{\square}, 1) \right\rangle \right)$$

$$(P^{C_1} \oplus_{L_1} Q^{C_1}) = (P \square_{L_2} Q)^{C_1}$$

Similarly Proved ii),iii)and iv)

CONCLUSION

The Lukasiwicz conjunction and disjunction operatorstype(1&2) over Neutrosophic fuzzy matrices were investigated in this study. Here, we explored how to use Lukasiwicz conjunction and disjunction operators of type (1&2) to combine, intersect, and complement Neutrosophic fuzzy matrices. With Lukasiwicz conjunction and disjunction operators of type (1&2), several features of the complement, intersection, and union of neurosophic fuzzy matrices were also demonstrated.

ACKNOWLEDGMENT

The authors are highly thankful for the valuable comments which helped to improve the quality of the paper. Sincere grateful thanks to the editors, publishers of the article.

ABSTRACT

Mitragyna parvifolia popularly known as Kaim is a medium to large deciduous tree found in India, Pakistan and Srilanka. *M. parvifolia* is a substitute for the Ayurvedic drug *Kadamba* for which the accepted source is *Neolamarckia cadamba* and is used in the treatment of eye diseases, wounds, cough, and oedema. The present study deals with phytochemical studies, molecular docking and *in-vitro* anti-cataract activity of *Mitragyna parvifolia* root extracts against glucose induced cataract in isolated goat lenses. Phytochemical studies of alcohol extract showed the presence of carbohydrates, glycosides, alkaloids, tannins and flavonoids. Molecular docking studies of isorhynchophylline, rhynchophylline, corynoxine and Hirsutine against Aldose Reductase inhibitors showed that corynoxine and Hirsutine showed strongest binding affinity with binding energy of -12.3. In *ex vivo* study, the induction of cataract by glucose showed a significant decrease in catalase, reduced glutathione and increased malondialdehyde level. The result showed that alcohol extract at 1000 µg/ml dose exhibited significant anti-cataract activity thereby substantiating the traditional use of the plant in the treatment of eye diseases.

Keywords: Diabetic cataract, *Mitragyna parvifolia*, Aldose reductase, *insilico*

INTRODUCTION

Medicinal plants and their products have become a symbol of safety in contrast with synthetic drugs which are likely toxic and with more side effects. Each medicinal plant or herb has a specific quality and are used to treat multitude of ailments, causes and diseases. They are rich source of nutrients having different properties, non-toxic in nature and recommended for their high therapeutic value having no side effects. Most cultures from ancient times to the present day have used plants as a source of medicine [1]. As per WHO statistics, nearly 2.2 billion people worldwide have a vision impairment out of which at least 1 billion cases could have been prevented or treated [2]. Cataract is caused due to the loss in transparency of lens by either scattering or absorbing light such that visual acuity is compromised. Cataract can result from several causes like ageing, diabetes, obesity, high blood pressure etc. Although the condition is very common, the detailed molecular mechanism behind its development is not very well understood. As ageing takes place, oxidative stress occurs and cause damage to the normal cell structure due to the production of free radicals. Since these defective cells are not extruded, they either undergo necrosis or move to the capsule posterior area and forms capsular cataract. Thus, oxidative stress is a basic cataractogenesis mechanism. The enzyme aldose reductase catalyzes the reduction of glucose to sorbitol through polyol pathway. The intracellular accumulation of sorbitol leads to osmotic changes and results in diabetic cataract leading to the degeneration of lens fibers [3].

Mitragyna parvifolia (Roxb.) Korth. a medium to large sized deciduous tree belonging to the family Rubiaceae, is found distributed throughout the drier parts of India, Pakistan and Srilanka. *Mitragyna parvifolia* is a substitute for the Ayurvedic drug Kadamba for which the accepted botanical source is *Neolamarckia cadamba*[1]. *M. parvifolia* roots and barks are recommended in Ayurvedic texts for prevention and treatment of eye diseases, gastropathy, colic and fever. The leaves are used as stomachic, anti-inflammatory, anodyne, depurative and febrifuge [4]. Traditionally the roots are used for the treatment of eye diseases, since no work has been reported on the anti-cataract activity, the present study was undertaken.

MATERIALS AND METHODS

Plant material

The roots of *Mitragyna parvifolia* was collected from Tirunelveli region of Tamil Nadu in 2018. The collected material was identified and authenticated by Dr. V. Chelladurai, Taxonomist. Botanical identification was carried out by using various floras[5].

Preparation of extracts and preliminary phytochemical screening

Dried roots were pulverized using a mechanical grinder. Alcohol extract was prepared by Soxhlet extraction using 95% v/v ethanol. The extract was concentrated separately and the percentage yield was calculated. Preliminary phytochemical screening was performed following standard procedures to identify the presence of primary and secondary metabolites in the selected plant material [6,7,8].

Molecular docking and ADMET studies

Ligand and protein preparation

Isorhynchophylline, rhynchophylline and corynoxine, Hirsutine are the active constituents reported in the roots of *Mitragyna Parvifolia*[9]. The chemical structure of these compounds was obtained using the Pub chem database (<http://www.ncbi.nlm.nih.gov/pccompound>). The target protein Aldose reductase inhibitor was retrieved from Protein Data Bank (PDB) with PDB ID 5LIY.

Docking Studies

Docking studies were further carried out using Auto Dock Vina whereas the ligand and protein preparatory steps were done using Auto Dock Tools which is a part of MGL Tools 1.5.6. All the ligands were prepared, minimized, and optimized using AutoDock Vina. Preparation of the protein is an important step for performing the docking studies. The protein preparation was carried out for target protein Aldose reductase inhibitor retrieved from Protein Data

**Gowri and Mahasin Khan**

Bank (PDB) with PDB ID 5LIY. The X-ray crystallographic structure of target protein Aldose reductase was deposited in PDB website with resolution of 2.05 Å. In the protein preparation, hetero groups, water molecules, and unwanted ligands were deleted. The grid generation forms an important step in docking as it defines the region to which the ligands will be interacting with the protein. Grid is defined using the co-crystallized ligand available with the protein structure from the Protein Data Base. The docked output of all the ligands were screened to identify the compounds with the highest docking score.

Ex Vivo Anti-cataract activity

Fresh goat eyeballs were obtained from the locals laughter house and the lenses were removed by extra-capsular lens extraction method. 36goat lenses were divided into 6 groups of 6 lenses each. The lenses were incubated in artificial aqueous humor of pH 7.8 at room temperature for 72 hrs. To prevent the microbial contamination, penicillin 32mg% and streptomycin 250mg% were added to the culture. Cataract was induced by using 55mM concentration of glucose. After 72 hours of incubation, lenses were removed for homogenate preparation using buffer solutions [10].

Experimental Protocol

Group 1 served as Normal control (vehicle treated non-cataract lenses)

Group 2 served as positive control (Lens treated with glucose 55mM to induce cataract)

Group 3 served as standard drug treated (Lens treated with glucose 55mM + ascorbic acid 20 µg/ml)

Group 4 consist of goat lenses treated with alcohol extract (250 µg/ml)

Group 5 consist of goat lenses treated with alcohol extract (500 µg/ml)

Group 6 consist of goat lenses treated with alcohol extract (1000 µg/ml)

Lens Morphology

Morphology of the lenses was studied by placing them on a graph sheet and the number of squares visible through the lenses is noted down as a measure of lens opacity. Changes in the morphology like haziness, swelling are noted, and the grading was done as per the criteria mentioned in Table 1.

Preparation of lens homogenate

For Malondialdehyde (MDA) estimation, 10% w/v of potassium chloride buffer was used to prepare the homogenate. For estimation of reduced glutathione (GSH) and catalase, 0.1M potassium phosphate buffer was used. The homogenates were centrifuged at 4000 rpm for 15 minutes. The supernatant obtained was used for further biochemical studies.

Estimation of Malondialdehyde

1 ml of homogenate was mixed with 2 ml of TCA-TBA-HCl reagent (15% Trichloro acetic acid (TCA) and 0.375% Thiobarbituric acid (TBA) in 0.25N HCl) and boiled for 15 mins. The mixture was cooled and the precipitate was removed by centrifugation at 1000 rpm for 10 mins. The absorbance was measured at 535 nm against a blank. The values were expressed as nmoles of MDA/min/mg [11].

Estimation of Reduced glutathione

1 ml of 5 % TCA (w/v) was mixed with 1 ml of 10 % homogenate and was allowed to stand for 30 mins. The mixture was then centrifuged at 2500 rpm for 15 mins. 0.5 ml of supernatant was mixed with 2.5 ml of 5'-DiThioNitroBenzoic acid (DTNB) and the absorbance was recorded at 412 nm. The values are expressed as µmoles/g [11].

Estimation of Catalase

To 0.1 ml of supernatant, 1 ml of phosphate buffer and 0.4 ml of distilled water was added. Reaction was initiated by adding 0.5 ml of hydrogen peroxide and the mixture was incubated at 37°C for 1 minute. Reaction was stopped by adding 2 ml of dichromate: acetic acid reagent and kept in boiling water bath for 15 mins. The mixture was allowed

to cool, and absorbance was read at 570 nm before and after reaction. Catalase activity was calculated in terms of $\mu\text{mol}/\text{min}/\text{g}$ [11].

Statistical analysis

The data was expressed as mean \pm S.E.M values and tested with One-Way Analysis of Variance (ANOVA) followed by Tukey-Kramer multiple comparison test.

RESULTS

The percentage yield of total alcohol extract was found to be 3.815% and preliminary phytochemical screening showed the presence of alkaloids, flavonoids, tannins, glycosides, and carbohydrates. The docking score, 2d, 3d interactions of isorhynchophylline, rhynchophylline, corynoxene and Hirsutine with target protein aldose reductase inhibitor are shown in Table 2, fig 1-4.

Photographic study of lenses

Normal lens incubated with artificial aqueous humour showed complete transparency. The lenses which are treated with glucose 55 mM showed complete opacification of the lens fibers as compared to normal lenses (normal control). Lenses incubated with glucose 55 mM and ascorbic acid (20 $\mu\text{g}/\text{ml}$) showed almost normal transparency when compared to cataractous lenses. The lenses incubated with alcohol extract 250 $\mu\text{g}/\text{ml}$ and 500 $\mu\text{g}/\text{ml}$ also showed comparatively less opacity when compared to cataractous lenses (disease control). The lenses incubated with alcohol extract 1000 $\mu\text{g}/\text{ml}$ showed almost normal transparency and the transparency was found to be comparable to the ascorbic acid treated lenses (Fig 5).

Effect of alcohol root extracts of *M. parvifolia* on lens antioxidant level

There was a statistically significant increase in MDA level in cataractous lenses (disease control) when compared to the normal lenses (normal control). Treatment with ethanol extract in various test doses and ascorbic acid (20 $\mu\text{g}/\text{ml}$) showed significant reduction ($p < 0.001$) in malondialdehyde level when compared to cataractous lenses (disease control). A statistically significant reduction in GSH and catalase level was observed in glucose 55 mM treated cataractous lenses (disease control). Treatment with alcohol extract at 250 $\mu\text{g}/\text{ml}$, 500 $\mu\text{g}/\text{ml}$, 1000 $\mu\text{g}/\text{ml}$ dose level showed significant increase ($p < 0.001$) in GSH and catalase level when compared to disease control. (Table. 3)

DISCUSSION

Phytochemical screening helps in the identification of various primary and secondary metabolites present in the plant material responsible for pharmacological activity. Cataract is caused when the transparency of lens is lost by either scattering or absorbing light such that visual acuity is compromised. This can result from several causes. Although the condition is very common, the detailed molecular mechanism behind its development is not very well understood. Osmotic stress caused by sorbitol accumulation in the lens has long been suggested to be the major cause of this since sorbitol was found to be accumulated to a substantially high level in cataractous lenses. Under hyperglycaemic conditions, sorbitol is formed from the reduction of glucose by the enzyme aldose reductase (AR) of the polyol pathway. Evidence is on the rise showing the contribution of oxidative stress to the development of diabetic cataract. These findings have led to the conclusion that the major cause of diabetic cataract is sorbitol accumulation. Thus, oxidative stress is a common basic cataractogenesis mechanism. Reduced glutathione (GSH) was found to be depleted in cataractous lenses which was accompanied by an increase in the level of lipid peroxidation products (LPO) like malondialdehyde (MDA). Oxidative stress may also be implicated in the cataract induced by glucose, due to the formation of superoxide (O_2^-) radical and H_2O_2 . Catalase and reduced glutathione are the key components of the lens innate enzyme defenses. Main role of catalase is to de-fix significant amounts of hydrogen peroxide, thus preventing damage to the membrane and biological structures. By inhibiting lipid peroxidation, reduced glutathione is reported to preserve the integrity of the membrane of phospholipid bilayers [12]. It is well

**Gowri and Mahasin Khan**

known that polyol pathway has an important role to play in diabetic cataract. Aldose reductase enzyme catalyzes the higher concentration of glucose in the aqueous humour to their respective polyols. The accumulation of these polyols within the cells renders the cell hypertonic. To neutralize this hypertonicity extracellular water moves into the cell and as a result the lens swells, leading to series of physicochemical changes leading to cataract formation. This cataract formation can be inhibited by aldose reductase inhibitors. These inhibitors block the conversion of sugar to their respective polyols and inhibits the hydration of diabetic lenses [13].

In this study, it was observed that cataract lenses are highly opaque compared to normal lenses. The lenses treated with ethanol extract, ascorbic acid restored the level of reduced glutathione and catalase and reduced the level of MDA thus substantiating the traditional use of the drug chosen. Alcohol extract 1000 µg/ml showed better activity, which is almost comparable to ascorbic acid treated lenses.

CONCLUSION

Preliminary phytochemical screening of alcohol extract showed the presence of flavonoids and lot of studies have supported the presence of flavonoids and their antioxidant activity[14]. Hence the antioxidant activity of *Mitragyna parvifolia* may be attributed to the presence of flavonoids and further research related to the isolation can be studied.

ACKNOWLEDGMENT

The authors are thankful to Faculty of Pharmacy, M. S. Ramaiah University of Applied Sciences, Bangalore, for providing the facilities to perform the study.

ABSTRACT

In this paper, we discuss necessary and sufficient conditions for $\{1,2,3,4\}$ -inverses, Neutrosophic Fuzzy relation equations, and left (right) cancellable properties regarding Neutrosophic Fuzzy Matrices (NFM). Additionally, we study the equivalence relation between Moore-Penrose inverses (MPI) and minus ordering. The generalized inverse of an idempotent matrix exhibits marvelous algebraic characterizations in NFM. We provide some properties to preserve idempotency in NFM, and we also discuss the equivalence relation between Idempotent Intuitionistic Fuzzy Matrices, Pseudo-Similar, and Group inverses (GI). Finally, we present some results based on the MPI and GI of NFM, along with numerical examples.

Keywords: Moore – Penrose inverse of Neutrosophic Fuzzy Matrices

INTRODUCTION

Matrices are crucial in many fields of research in science and engineering. They are a fundamental component of fuzzy set theory, which revolutionized how we handle vague or imprecise data. Fuzzy matrices assign each element a value between 0 and 1, representing the degree of membership of an element in specific set. Fuzzy matrices are instrumental in handling imprecise data. They allow us to represent membership with varying degrees of certainty, making them valuable in fields like artificial intelligence, where uncertainty is prevalent. Fuzzy matrices find extensive applications in various domains, including control systems, decision-making, pattern recognition, and artificial intelligence, where they are employed to manage fuzzy logic and reasoning. The traditional matrix theory is unable to address problems involving numerous kinds of uncertainties. To overcome this situation, Zadeh [1] has

Murugadas and Shyamaladevi

studied fuzzy set. Many researchers have since completed numerous works. Only membership values are addressed by fuzzy matrices. These matrices cannot handle values that are not members. For such a case, Atanassov's [2] intuitionistic fuzzy set is adequate. In addition to capturing membership degrees, they also account for non-membership degrees and hesitancy, providing a more comprehensive framework for handling uncertainty. Each element in an intuitionistic fuzzy matrix has three values: μ (membership), ν (non-membership), and λ (hesitancy). Intuitionistic fuzzy matrices are particularly valuable when decision-makers need to express their doubts or conflicts in a more detailed manner. They excel in multi-criteria decision-making and expert systems. Intuitionistic fuzzy matrices find applications in multi-criteria decision-making, expert systems, and situations where decision-makers need to express their uncertainty in a more granular manner. The indeterminate information is not handled by intuitionistic fuzzy matrices. To overcome this situation, Smarandache [3] defined the neutrosophic set as a mathematical tool for dealing with situations involving imprecise, indeterminate, and inconsistent data. They offer a unique approach for dealing with elements that can be true, indeterminate, or false. Each element in a neutrosophic matrix can take one of three values: T, I, and F, representing the truth, neutrality, or falsity of an element's membership to a set. Neutrosophic matrices are indispensable in situations where information is incomplete or inconsistent. They provide a more versatile tool for decision-making in uncertain environments. Neutrosophic matrices are applied in areas such as decision-making in uncertain environments, information fusion in sensor networks, and situations where information is inconsistent or incomplete. Meenakshi [4] has discussed Fuzzy Matrix Theory and Applications. Anandhkumar et.al [5] have studied Secondary k-column symmetric Neutrosophic Fuzzy Matrices. Bhowmik and Pal [6] have discussed Generalized Intuitionistic Fuzzy Matrices. Meenakshi and Inbam [7] have characterized the minus Partial Order in Fuzzy Matrices. Anandhkumar et.al [13] have studied on Pseudo Similarity of Neutrosophic Fuzzy matrices. Anandhkumar et al.[9] have focused on Reverse Sharp and Left-T Right-T Partial Ordering on Neutrosophic Fuzzy Matrices. Shymal and Pal [10] have discussed Interval – valued fuzzy matrices. Thomson [11] has studied Convergence of powers of a fuzzy matrix. Anandhkumar, et al.[12] have focused On various Inverse of Neutrosophic Fuzzy Matrices. Anandhkumar, et al.[13] Pseudo Similarity of Neutrosophic Fuzzy matrices. Uma and Murugadas, et.al.[14] have studied Generalized Inverse of Fuzzy Neutrosophic Soft Matrices, Neutrosophic set \tilde{L} defined on universal \tilde{U} . $\tilde{G} = \tilde{G}(t, i, f) \in \tilde{L}$ with t –the truth membership, i the degree of indeterminacy and f the falsity membership are independent. we define some results regarding group inverse in Neutrosophic Fuzzy Matrices. The Generalized inverse of an Idempotent matrix holds marvelous algebraic characterizations in Neutrosophic Fuzzy Matrices. Also, we give some properties to preserve Idempotency in Neutrosophic Fuzzy Matrices. Finally, we give some results based on the Moore – Penrose inverse of Neutrosophic Fuzzy Matrices with numerical examples are given.

Notations and Preliminaries

NFM – Neutrosophic Fuzzy Matrices

NFR – Neutrosophic Fuzzy relation

P^+ – Moore-Penrose inverse of P

P^T – transpose of P,

$\tilde{L}^{(\#)}$, – Group inverse of L

Definition 2.1 [3] Let \tilde{L} be the NFM of order $o \times p$ is defined as $\tilde{L} = \{l^t_{i \times j}, l^i_{i \times j}, l^f_{i \times j}\}$, is characterized by $l^t_{i \times j}$ - truth, $l^i_{i \times j}$ indeterminacy and $l^f_{i \times j}$ falsity it can be defined as $0 \leq l^t_{i \times j} + l^i_{i \times j} + l^f_{i \times j} \leq 3$ for all $(o \times p)$.

Definition 2.2 [15] Let \tilde{L} and \tilde{M} be two NFM where $\tilde{L} = \{l^t_{i \times j}, l^i_{i \times j}, l^f_{i \times j}\}$, $\tilde{M} = \tilde{L} = \{m^t_{i \times j}, m^i_{i \times j}, m^f_{i \times j}\}$. Then

Murugadas and Shyamaladevi

$$\begin{aligned} \check{L} \oplus \check{M} &= (\max\{l^t_{ixj}, m^t_{ixj}\}, \max\{l^i_{ixj}, m^i_{ixj}\}, \min\{l^f_{ixj}, m^f_{ixj}\}) \\ \check{L} \otimes \check{M} &= (\min\{l^t_{ixj}, m^t_{ixj}\}, \min\{l^i_{ixj}, m^i_{ixj}\}, \max\{l^f_{ixj}, m^f_{ixj}\}) \end{aligned}$$

Definition 2.3 [15] Let \check{L} and \check{M} be two NFM. Then the composition of \check{L} and \check{M} is defined as $\check{L} \odot \check{M} = ((\sum_{p=1}^n (l^t_{ixj})^p \wedge (m^t_{ixj})^p), (\sum_{p=1}^n (l^i_{ixj})^p \wedge (m^i_{ixj})^p), (\prod_{p=1}^n (l^f_{ixj})^p \vee (m^f_{ixj})^p))$

Definition 2.4 [15] Let \check{L} and \check{M} be two NFM product $\check{L}\check{M}$ is well-defined by

$$\check{L}\check{M} = [\max(\min\{l^t_{ixj}, m^t_{ixj}\}), \max(\min\{l^i_{ixj}, m^i_{ixj}\}), \min(\max\{l^f_{ixj}, m^f_{ixj}\})]$$

The NFM product $\check{L}\check{M}$ is defined iff is equal to the number of columns \check{L} is the number of rows in \check{M} . Then \check{L} and \check{M} are comfortable for multiplication.

Definition 2.5 [11] Let \check{L} be the NFM of order $o \times p$. If all the entries are (0,0,1), then \check{L} is called for Zero NFM and it's denoted by 0. If all the entries are (1,1,0), then \check{L} is called for Unit NFM and it's denoted by Ψ . $\omega^t_{o \times p} = 1, \omega^i_{o \times p} = 1, \omega^f_{o \times p} = 0$, if $O = P$ and $\omega^t_{o \times p} = 0, \omega^i_{o \times p} = 0, \omega^f_{o \times p} = 1$, if $O \neq P$.

Remarks 1: Let $P, Q \in F_{s \times t}$ the given are equal significance",

- i) $P \leq^- Q$
- ii) $P = PP^-Q = QPQ^-$

Properties of minus ordering

This section covers our discussion of Necessary and Sufficient conditions for {1,2,3,4}-inverses, Neutrosophic Fuzzy relation equations, and the Left (Right) cancellable properties in Neutrosophic Fuzzy Matrices (NFM).

Definition3.1[6] For an $P \in N_{s \times t}$, P is called left (right) cancelable if $P^T P Y_1 = P^T P Y_2 (Y_1 P P^T = Y_2 P P^T) \Rightarrow P Y_1 = P Y_2 (Y_1 P = Y_2 P)$ for any $Y_1, Y_2 \in N_{s \times t}$.

P is termed cancelable when it exhibits both left and right cancelable properties.

Theorem3.1 For any NFM Q with dimensions $s \times t$ the below statements are of equal significance.

- i) $Q \{1, 3\} \neq \emptyset$.
- ii) Solutions exist for the NFR equation $YQ^T Q = Q$
- iii) Q is left cancelable and $Q^T Q \{1\} \neq \emptyset$.

Proof

(i) implies (ii)

For $R \in Q\{1,3\}$, then

$$Q = QRQ = (QR)^T Q = R^T Q^T Q$$

Therefore, R^T , is a solution of $Q = YQ^T Q$

(ii) implies (iii)

Assume that, R be a solution of $YQ^T Q = Q$

Then, $RQ^T Q = Q$

For $Y_1, Y_2 \in F_{s \times t}$

If $Q^T Q Y_1 = Q^T Q Y_2$, then

$$Q Y_1 = RQ^T Q Y_1 = RQ^T Q Y_2 = Q Y_2$$

Here, Q is left cancelable and

$$Q^T Q = (RQ^T Q)^T RQ^T Q = Q^T Q R^T RQ^T Q$$

$$\Rightarrow R^T R \in Q^T Q \{1\}$$

$$Q^T Q \{1\} \neq \emptyset$$

(iii) \Rightarrow (ii) Let $Y_1 \in Q^T Q \{1\}$

$$\Rightarrow Q^T Q Y_1 Q^T Q = Q^T Q$$

Murugadas and Shyamaladevi

$$\Rightarrow QY_1Q^TQ = Q$$

(Since by definition 2.3)

$$QY_1 \text{ is a solution of } YQ^TQ = Q$$

(ii) implies (i)

$$\text{Assume that, } R^T \text{ be a solution of } RQ^TQ = Q$$

$$\Rightarrow R^TQ^TQ = Q$$

$$Q = R^TQ^TQ = (QR)^TQ = QRQ$$

$$(QR)^T = (R^TQ^TQR)^T = R^TQ^TQR = QR$$

Thus, $(QR)^T = QR$ and $Q = QRQ$

$$\Rightarrow R \in Q\{1,3\} \text{ and } Q\{1,3\} \neq \emptyset.$$

Example 3.1 Let us consider NFM

$$\text{Let } Q = \begin{bmatrix} (1,0,0) & (0,0,0) \\ (0,0,0) & (0,0,0) \end{bmatrix} \text{ then, } T = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (1,0,0) & (0,0,0) \end{bmatrix}$$

$$QT = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,0) & (0,0,0) \end{bmatrix}, QTQ = \begin{bmatrix} (1,0,0) & (0,0,0) \\ (0,0,0) & (0,0,0) \end{bmatrix}$$

Satisfies $QTQ = Q$, $(QT)^T = QT$ and $TQ^TQ = Q$.

Therefore, $Q\{1,3\} \neq \emptyset \Rightarrow$ there exists a solution $TQ^TQ = Q$.

Theorem 3.2 For any $Q \in F_{s \times t}$ the below statements are of equal significance.

- (i) $Q\{1,4\} \neq \emptyset$
- (ii) The NFR equation $QQ^TZ = Q$ has solutions.
- (iii) Q is right cancellable and $Q^TQ\{1\} \neq \emptyset$.

Proof This solution closely resembles the solution presented in Theorem 2.5, Therefore $Q\{1,3\} \neq \emptyset$ iff $Q^T\{1,4\} \neq \emptyset$.

Example 3.2 Let us consider NFM $Q = \begin{bmatrix} (1,0,0) & (0,1,1) \\ (0,1,1) & (1,0,0) \end{bmatrix}$

Therefore $Q = Y$ itself is a $\{1\}$ – inverse sufficient $QTQ = Q$, $(YQ)^T = YQ$.

Theorem 3.3 Let $Q, R \in F_{s \times t}$, $Q \leq^- R$. If R^\dagger exist, Q is cancelable and $Q \in R\{2\}$ show that Q^\dagger occurs and $Q^\dagger = (R^\dagger)^TQ(R^\dagger)^T$.

Proof Let $Q \leq^- R \Rightarrow Q^-Q = Q^-R$ and $QQ^- = RQ^-$

Similarly $Q = QQ^-R = RQ^-Q$.

$$= QQ^-(RR^\dagger R)Q^-Q = Q$$

This claim that $R^\dagger \in Q_{s \times t}$

Since, $y_1, y_2 \in F_{s \times t}$

$$Q^-Qy_1 = Q^-Qy_2$$

$$Qy_1 = QQ^-Ry_1 = QQ^-Qy_1 = QQ^-Qy_2 = Qy_2$$

Implies that, $Q^-Qy_1 = Q^-Qy_2 \Rightarrow Qy_1 = Qy_2$

$$\text{Let } y_1 = QQ^-, y_2 = R^\dagger R$$

We require $QQ^- = Q^-R$

Likewise, $Q = R^\dagger RQ$

$$\text{Consider, } QR^\dagger = RR^\dagger QR^\dagger = R(R^\dagger QR^\dagger) = RR^\dagger$$

$$= (RR^\dagger)^T$$

$$= (RR^\dagger QR^\dagger)^T$$

$$= ((RR^\dagger Q)R^\dagger)^T = (QR^\dagger)^T$$

Also we can show $R^\dagger Q = (R^\dagger Q)^T$

Then, $R^\dagger \in Q\{1,2,3\}$

Therefore by theorem 3.1, 3.2 we complete that Q^\dagger occur and $Q^\dagger = (R^\dagger)^TQ(R^\dagger)^T$

Murugadas and Shyamaladevi

Theorem 3.4 Let $Q, R \in F_{s \times t}$ and Q^\dagger exist, and then the given are equal.

- (i) $Q \leq^- R$
- (ii) $Q^\dagger Q = Q^\dagger R$ and $QQ^\dagger = RQ^\dagger$
- (iii) $QQ^\dagger R = Q = RQ^\dagger Q$

Proof : This proof is similar by Theorem 3.3 replacing Q^- by Q^\dagger .

Corollary 3.1 If $Q \leq^- R$ and Q^\dagger occurs, then $R \in Q^\dagger\{1\}$

Proof: Q^\dagger Occur $\Rightarrow Q^\dagger = Q^\dagger Q = Q^\dagger R Q^\dagger \Rightarrow R \in Q^\dagger\{1\}$

Theorem 3.5 Let $Q, R \in F_{s \times t}$. If Q^\dagger and R^\dagger both occur and $Q \in R\{2\}$ then the given are equal.

- (i) $Q \leq^- R$
- (ii) $Q^\dagger Q = R^\dagger Q$ and $QQ^\dagger = QR^\dagger$
- (iii) $R^\dagger Q Q^\dagger = Q^\dagger = Q^\dagger Q R^\dagger$
- (iv) $Q^T Q R^\dagger = Q^T = Q^T R Q^\dagger$

Proof: This Proof is related to the Proof of theorem 3.4.

Theorem 3.6 If $Q \in F_{s \times t}$ and Q^\dagger exist, then

- (i) $(QQ^T)^\dagger, (Q^T Q)^\dagger$ are also occur and $(QQ^T)^\dagger = (Q^\dagger)^T Q^\dagger, (Q^T Q)^\dagger = Q^\dagger (Q^\dagger)^T$.
- (ii) $(QQ^\dagger)^\dagger, (Q^\dagger Q)^\dagger$ are also occur and $(QQ^\dagger)^\dagger = QQ^\dagger, (Q^\dagger Q)^\dagger = Q^\dagger Q$.

Proof (i) $QQ^T = QQ^\dagger QQ^T = (Q^\dagger)^T Q^T Q Q^\dagger$
 $= (Q^\dagger)^T (QQ^\dagger Q) Q^T = (Q^\dagger)^T Q^\dagger Q Q^T Q Q^\dagger$
 $\Rightarrow (Q^\dagger)^T Q^\dagger$ is result of $QQ^T = Y Q Q^\dagger Q Q^T$

Then, $(Q^\dagger)^T Q^\dagger \in QQ^T\{1,3\}$

Subsequently, QQ^T is symmetric

$(Q^\dagger)^T Q^\dagger \in QQ^T\{1,4\}$

By theorem 3.3. and 3.4

$(QQ^T)^\dagger$ Occur and

$$\begin{aligned} (QQ^T)^\dagger &= ((Q^\dagger)^T Q^\dagger)^T Q Q^T ((Q^\dagger)^T Q^\dagger)^T \\ &= (Q^\dagger)^T Q^\dagger Q Q^T (Q^\dagger)^T Q^\dagger \\ &= (Q^\dagger)^T Q^\dagger Q (Q^\dagger Q)^T Q^\dagger \\ &= (Q^\dagger)^T Q^\dagger Q Q^\dagger Q Q^\dagger \\ &= (Q^\dagger)^T Q^\dagger Q Q^\dagger = (Q^\dagger)^T Q^\dagger \end{aligned}$$

Equally, $(Q^T Q)^\dagger$ occur and $(Q^T Q)^\dagger = Q^\dagger (Q^\dagger)^T$

(i) $QQ^\dagger = QQ^\dagger QQ^\dagger QQ^\dagger$

QQ^\dagger is solution of $QQ^\dagger = Y Q Q^\dagger Q Q^\dagger$ and $(QQ^\dagger QQ^\dagger)^T = QQ^\dagger QQ^\dagger$

Therefore $QQ^\dagger \in QQ^\dagger\{1,3\} \cap QQ^\dagger\{1,4\}$

Hence, $(QQ^T)^\dagger$ exist

And $(QQ^\dagger)^\dagger = (QQ^\dagger)^T Q Q^\dagger (QQ^\dagger)^T = QQ^\dagger$

Similarly $(Q^\dagger Q)^\dagger = Q^\dagger Q$.

Moore – Penrose inverse of NFM

We discussed about equivalence relation between Idempotent intuitionistic Fuzzy Matrices and Pseudo – Similar Matrices.

Murugadas and Shyamaladevi

Definition 4.1 A \tilde{L} and \tilde{M} be two NFM of order $o \times p$ is said to be Pseudo – Similar and its indicated by $\tilde{L} \approx \tilde{M}$ if there exist $\tilde{L} = \tilde{G}\tilde{M}\tilde{H}$, $\tilde{M} = \tilde{H}\tilde{L}\tilde{G}$ and $\tilde{G} = \tilde{G}\tilde{M}\tilde{G}$.

The NFM, $\tilde{L} = \begin{bmatrix} (0,4,0,0) & (0,4,0,0) \\ (0,1,1) & (0,1,1) \end{bmatrix}$ and $\tilde{M} = \begin{bmatrix} (0,4,0,0) & (0,1,1) \\ (0,4,0,0) & (0,1,1) \end{bmatrix}$

Then idempotent NFM $\tilde{G} = \begin{bmatrix} (1,0,0) & (0,0,1) \\ (0,0,1) & (0,0,1) \end{bmatrix}$.

Definition 4.2 A \tilde{L} and \tilde{M} be two NFM of order $o \times p$ is said to be Pseudo – Similar and its indicated by $\tilde{L} \approx \tilde{M}$,if there exist $\tilde{L} = \tilde{G}\tilde{M}\tilde{H}$ and $\tilde{Y} = \tilde{H}\tilde{M}\tilde{G}$.

Remark:4.1 The $\tilde{L} = \tilde{M}$,the above definition redacts to Pseudo – Similarity and Semi – Similarity in the NFM semi group. It is clear that $\tilde{L} \approx \tilde{M}$ which is implies $\tilde{L} \approx \tilde{M}$.

Proposition 4.1 Let \tilde{L} and \tilde{M} be two NFM of order $o \times p$. Then the given are equal

- (i) $\tilde{L} \approx \tilde{M}$
- (ii) If \tilde{L} and \tilde{M} be two NFM. Such that $\tilde{L} = \tilde{G}\tilde{M}\tilde{H}, \tilde{M} = \tilde{H}\tilde{L}\tilde{G}$ and $(\tilde{G}\tilde{H})^\kappa \in F_p$ is idempotent for some odd $\kappa \in F$.
- (iii) If \tilde{L} and \tilde{M} be two NFM. Such that $\tilde{L} = \tilde{G}\tilde{M}\tilde{H}, \tilde{M} = \tilde{H}\tilde{L}\tilde{G}$ and $(\tilde{H}\tilde{G})^\kappa \in F_o$ is idempotent for some odd $\kappa \in F$.

Proof (i) implies (ii)

$\tilde{G} = \tilde{G}\tilde{M}\tilde{G}$ implies $\tilde{G}\tilde{H} \in F_o$ and $\tilde{H}\tilde{G} \in F_p$ are both idempotent NFMs.

(ii) implies (i)

Let $\kappa = 2\ell + 1$ with $\ell \in N_F$.

Since $\tilde{L} = \tilde{G}\tilde{M}\tilde{H}$ and $\tilde{M} = \tilde{H}\tilde{L}\tilde{G}$,

We have this $\tilde{L} = \tilde{G}(\tilde{H}\tilde{L}\tilde{G})\tilde{H} = (\tilde{G}\tilde{H})\tilde{G}\tilde{M}\tilde{H}(\tilde{G}\tilde{H}) = (\tilde{G}\tilde{H})^2\tilde{L}(\tilde{G}\tilde{H})^2 = (\tilde{G}\tilde{H})^2\tilde{G}\tilde{M}\tilde{H}(\tilde{G}\tilde{H})^2$.

Then procedure we get, $\tilde{L} = (\tilde{G}\tilde{H})^\ell \tilde{G}\tilde{M}\tilde{H}(\tilde{G}\tilde{H})^\ell$.

Similarly $\tilde{M} = \tilde{H}(\tilde{G}\tilde{H})^\ell \tilde{L}(\tilde{G}\tilde{H})^\ell \tilde{H}$.

Set $\tilde{G}' = (\tilde{G}\tilde{H})^\ell \tilde{G}\tilde{M}\tilde{H}(\tilde{G}\tilde{H})^\ell$.

Then $\tilde{L} = \tilde{G}'\tilde{M}\tilde{H}', \tilde{M} = \tilde{H}'\tilde{L}\tilde{G}'$ and $\tilde{G}'\tilde{H}' = (\tilde{G}\tilde{H})^\ell \tilde{G}\tilde{H}(\tilde{G}\tilde{H})^\ell = (\tilde{G}\tilde{H})^{2\ell+1} = (\tilde{G}\tilde{H})^\ell$ idempotent .

Hence by $\tilde{L} \approx \tilde{M}$

(i) implies (iii)

$\tilde{L} = \tilde{G}''\tilde{M}\tilde{H}''$ and $\tilde{M} = \tilde{H}''\tilde{L}\tilde{G}''$

By using $\tilde{G}'\tilde{M}\tilde{H}'$ is idempotent.

We get,

$\tilde{G}''\tilde{H}''\tilde{G}'' = (\tilde{G}'\tilde{H}'\tilde{G}')(\tilde{H}'\tilde{G}\tilde{H}')(\tilde{G}'\tilde{H}'\tilde{G}') = \tilde{G}'\tilde{H}'\tilde{G}' = \tilde{G}''$.

Therefore by $\tilde{L} \approx \tilde{M}$.

(iii) implies (i)

Let $\kappa = 2\ell + 1$ with $\ell \in N_F$.

Since $\tilde{L} = \tilde{G}\tilde{M}\tilde{H}$ and $\tilde{M} = \tilde{H}\tilde{L}\tilde{G}$,

We get, $\tilde{L} = \tilde{G}(\tilde{H}\tilde{G})^\ell \tilde{M}(\tilde{H}\tilde{G})^\ell \tilde{G}$ and $\tilde{M} = (\tilde{H}\tilde{G})^\ell \tilde{G}\tilde{M}\tilde{H}(\tilde{H}\tilde{G})^\ell$.

Set $\tilde{G}' = \tilde{G}(\tilde{H}\tilde{G})^\ell$ and $\tilde{M}' = (\tilde{H}\tilde{G})^\ell \tilde{H}$.

Then,

Similarly $\tilde{M} = \tilde{H}(\tilde{G}\tilde{H})^\ell \tilde{L}(\tilde{G}\tilde{H})^\ell \tilde{H}$.

Set $\tilde{G}' = (\tilde{G}\tilde{H})^\ell \tilde{G}\tilde{M}\tilde{H}(\tilde{G}\tilde{H})^\ell$.

Then, $\tilde{L} = \tilde{G}'\tilde{M}\tilde{H}', \tilde{M} = \tilde{H}'\tilde{L}\tilde{G}'$ and $\tilde{H}'\tilde{G}' = (\tilde{H}\tilde{G})^\ell \tilde{H}\tilde{G}(\tilde{H}\tilde{G})^\ell = (\tilde{H}\tilde{G})^{2\ell+1} = (\tilde{H}\tilde{G})^\ell \in F_o$ is idempotent.

Therefore by $\tilde{L} \approx \tilde{M}$. Then (i) is holds.

Example 4.1 Consider the NFM

$\tilde{L} = \begin{bmatrix} (0,4,0,0) & (0,4,0,0) \\ (0,1,1) & (0,1,1) \end{bmatrix}$ and $\tilde{M} = \begin{bmatrix} (0,4,0,0) & (0,1,1) \\ (0,4,0,0) & (0,1,1) \end{bmatrix}$.

Murugadas and Shyamaladevi

Then, $\check{G} = \begin{bmatrix} (1,0,0) & (0,0,1) \\ (0,0,1) & (0,0,1) \end{bmatrix}$ and $\check{H} = \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix}$

$$LQM = \begin{bmatrix} (1,0,0) & (0,0,1) \\ (0,0,1) & (0,0,1) \\ (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix} \begin{bmatrix} (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \end{bmatrix} = \begin{bmatrix} (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \end{bmatrix}$$

$\check{G}\check{M}\check{H} = \check{L}$ and

$$MPL = \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \\ (1,0,0) & (0,0,1) \\ (0,0,1) & (0,0,1) \end{bmatrix} \begin{bmatrix} (0.4,0,0) & (0.4,0,0) \\ (0,1,1) & (0,1,1) \\ (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix} = \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \\ (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix}$$

$\check{H}\check{L}\check{G} = \check{M}$ holds.

Thus \check{L} and \check{M} are Pseudo – Similar , hence $\check{L} \approx \check{M}$.

$$LM = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix} \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix} = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix}$$

$$\text{Now, } (LM)^2 = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix} \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix} = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix} = LM.$$

and

$$ML = \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix} \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix} = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix}$$

$$\text{Thus, } (\check{H}\check{G})^2 = \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix} \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix} = \begin{bmatrix} (1,0,0) & (1,0,0) \\ (0,0,1) & (0,0,1) \end{bmatrix} = \check{H}\check{G}.$$

Proposition 4.2 Let $\check{L} \in NF_o$ and $\check{M} \in NF_p$ be two NFM. Such that $\check{L} \approx \check{M}$. If $\check{G}\check{H} \in NF_{o \times p}$ is idempotent NFMs, \check{L} is regular iff \check{M} is regular.

Proof: If $\check{L} \approx \check{M}$, there exists idempotent NFMs $\check{G} \in NF_{o \times p}$ and $\check{H} \in NF_{p \times o}$. Such that $\check{M} = \check{H}\check{L}\check{G}$ $\check{L} = \check{G}\check{M}\check{H}$, and $\check{G} = \check{G}\check{M}\check{G}$.

Now, we have \check{H} is idempotent, i.e) $\check{H}^2 = \check{H}$ and \check{L} is regular, then here occurs $\check{K} \in NF_o$

Such that, $\check{L}\check{K}\check{L} = \check{L}$.

Let us describe $\check{V} = \check{H}\check{G}$, obviously $\check{V} \in NF_p$

$$\begin{aligned} \text{Then, } \check{M}\check{V}\check{M} &= (\check{H}\check{L}\check{G})\check{H}\check{G}(\check{H}\check{M}\check{G}) \\ &= \check{H}\check{L}(\check{G}\check{M}\check{G})\check{H}\check{L}\check{G} \\ &= \check{H}\check{L}(\check{G}\check{M}\check{G})\check{H} \\ &= \check{H}(\check{M}\check{V}\check{M})(\check{G}\check{M}\check{L})\check{G} \\ &= \check{H}\check{L}\check{H}\check{L}\check{G} \\ &= \check{H}\check{L}\check{H}\check{L}\check{G} \\ &= \check{H}\check{L}\check{G} \end{aligned}$$

$$\check{M}\check{V}\check{M} = \check{M}.$$

Hence, \check{M} is regular.

We can prove the converse Part in similar way.

Example 4.2 Consider the NFM

$$\check{L} = \begin{bmatrix} (0.4,0,0) & (0.4,0,0) \\ (0,1,1) & (0,1,1) \end{bmatrix} \text{ and } \check{M} = \begin{bmatrix} (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \end{bmatrix}.$$

Then, $\check{G} = \begin{bmatrix} (1,0,0) & (0,0,1) \\ (0,0,1) & (0,0,1) \end{bmatrix}$ and $\check{H} = \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix}$, \check{L} and \check{M} are Pseudo – Similar, $\check{L} \approx \check{M}$.

Murugadas and Shyamaladevi

Again,

$$(\check{L})^2 = \begin{bmatrix} (0.4,0,0) & (0.4,0,0) \\ (0,1,1) & (0,1,1) \end{bmatrix} \begin{bmatrix} (0.4,0,0) & (0.4,0,0) \\ (0,1,1) & (0,1,1) \end{bmatrix} = \begin{bmatrix} (0.4,0,0) & (0.4,0,0) \\ (0,1,1) & (0,1,1) \end{bmatrix} = \check{L}.$$

$$(\check{M})^2 = \begin{bmatrix} (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \end{bmatrix} \begin{bmatrix} (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \end{bmatrix} = \begin{bmatrix} (0.4,0,0) & (0,1,1) \\ (0.4,0,0) & (0,1,1) \end{bmatrix} = \check{M}.$$

Therefore \check{L} and \check{M} are Idempotent.

$$\check{V} = \check{H}\check{G} = \begin{bmatrix} (1,1,0) & (1,1,0) \\ (1,1,0) & (0,1,1) \end{bmatrix}$$

$$\check{M}\check{V}\check{M} = \check{M}.$$

Thus \check{L} and \check{M} both are Regular.

Group Inverse of Neutrosophic fuzzy matrices.

We discussed about equivalence relation between Idempotent intuitionistic Fuzzy Matrices and Group inverses.

Definition 5.1 For \check{L} be a NFM. The Group inverse of \check{L} , is indicated by $\check{L}^{(\#)}$, is a commuting semi – inverse of \check{L} , that is the following conditions are satisfying, $\check{L}\check{L}^{(\#)}, \check{L} = \check{L}, \check{L}^{(\#)}\check{L}\check{L}^{(\#)} = \check{L}^{(\#)}$ and $\check{L}\check{L}^{(\#)} = \check{L}^{(\#)}\check{L}$.

Proposition 5.1 Let \check{L} and \check{M} are two NFM. If $\check{L}\check{M} = \check{M}\check{L}$ idempotent, then $(\check{L}\check{M})^{(\#)}$ exists and $(\check{L}\check{M})^{(\#)} = \check{L}^{(\#)}\check{M}^{(\#)} = \check{M}^{(\#)}\check{L}^{(\#)}$.

Proof: Let \check{L} is idempotent, Thus $\check{L}^{(\#)} = \check{L}$.

$$(\check{L}\check{M}(\check{L}^{(\#)}\check{M}^{(\#)}\check{L}\check{M})\check{M})\check{M} = \check{L}^2\check{L}^{(\#)}\check{M}^2\check{M}^{(\#)}\check{L}\check{M} = \check{L}\check{M}.$$

$$(\check{L}\check{M}(\check{L}^{(\#)}\check{M}^{(\#)}\check{L}\check{M})\check{M})\check{M} = \check{L}^{(\#)}\check{L}^2(\check{M}^{(\#)}\check{M}^2\check{M}^{(\#)})\check{L}^{(\#)} = \check{L}^{(\#)}\check{M}^{(\#)}.$$

$$\text{Finally, } \check{L}^2\check{M}^2(\check{L}^{(\#)}\check{M}^{(\#)}) = \check{L}^{(\#)}\check{L}\check{M}^{(\#)}\check{M} = \check{L}^2\check{M}^2(\check{L}^{(\#)}\check{M}^{(\#)})\check{L}\check{M}.$$

Proposition 5.2 Let $\check{L} \in NF_o$, the given equations are equivalent,

- (i) $\check{L}^{(\#)}$ is grp – inv.
- (ii) $\mathcal{R}(\check{L}) = \mathcal{R}(\check{L}^2)$ and $\mathcal{C}(\check{L}) = \mathcal{C}(\check{L}^2)$, then \check{L}^2 is regular.
- (iii) $\check{L}^2\check{G} = \check{L}$ and $\check{H}\check{L}^2 = \check{L}$ it can be solved by $\check{G} = \check{H}$.

Proof (i) implies (ii)

If $\check{L}^{(\#)}$ exists, use the definition (4.1) we have,

$$\check{L} = \check{L}^2\check{L}^{(\#)} = \check{L}^{(\#)}\check{L}^2$$

$$\check{L} = \check{L}^{(\#)}\check{L}^2 \text{ which implies that, } \mathcal{R}(\check{L}) = \mathcal{R}(\check{L}^{(\#)}\check{L}^2) \subseteq \mathcal{R}(\check{L}^2)$$

which implies that $\mathcal{R}(\check{L}) \subseteq \mathcal{R}(\check{L}^2)$

Since, $\mathcal{R}(\check{L}^2) \subseteq \mathcal{R}(\check{L})$, it follows that $\mathcal{R}(\check{L}) = \mathcal{R}(\check{L}^2)$.

Similarly, $\check{L} = \check{L}^2\check{L}^{(\#)}$

implies that $\mathcal{C}(\check{L}) = \mathcal{C}(\check{L}^2\check{L}^{(\#)}) \subseteq \mathcal{C}(\check{L}^2)$

which implies that $\mathcal{C}(\check{L}) \subseteq \mathcal{C}(\check{L}^2)$

Since, \check{L} is regular with $\mathcal{R}(\check{L}) = \mathcal{R}(\check{L}^2)$,

\check{L}^2 is also regular.

(i) implies (ii)

If \check{L}^2 is regular which is implies $\check{L}^2\{1\} \neq \text{empty set}$.

$$\mathcal{R}(\check{L}) \subseteq \mathcal{R}(\check{L}^2) \text{ implies } \check{L} = \check{L}(\check{L}^2)^- \check{L}^2 \text{ for all } (\check{L}^2)^- \in \check{L}^2\{1\}$$

$$\text{Then, } \mathcal{C}(\check{L}) = \mathcal{C}(\check{L}^2) \text{ implies } \check{L} = \check{L}^2(\check{L}^2)^- \check{L} \text{ for all } (\check{L}^2)^- \in \check{L}^2\{1\}.$$

Therefore any $(\check{L}^2)^-$ the matrix $(\check{L}^2)^- \check{L}$ is a way out for the matrix equality $\check{L}^2\check{G} = \check{L}$ and the matrix $\check{L}(\check{L}^2)^-$ is a way out for the matrix equality $\check{H}\check{L}^2 = \check{L}$.

(iii) implies (i)

Murugadas and Shyamaladevi

Let us think about \check{E} and \check{F} be way out of the equality $\check{L}^2\check{G} = \check{L}$ and $\check{H}\check{L}^2 = \check{L}$ respectively. Then, $\check{Y} = \check{E}\check{L}\check{F}$, we remark that

$$\begin{aligned} \check{L}\check{E}\check{L} &= (\check{F}\check{L}^2)\check{E}\check{L} = \check{F}(\check{L}^2\check{E})\check{L} = \check{F}\check{L}^2 = \check{L} \\ \check{L}\check{F}\check{L} &= \check{L}\check{F}(\check{L}^2\check{E}) = \check{L}(\check{F}\check{L}^2)\check{L} = \check{L}^2\check{E} = \check{L} \end{aligned}$$

We get, $\check{L}\check{Y} = \check{L}(\check{F}\check{L}\check{E}) = (\check{L}\check{F}\check{L})\check{E} = \check{L}\check{E} = \check{F}\check{L}^2\check{E} = \check{F}\check{L} = \check{F}(\check{L}\check{E}\check{L}) = (\check{F}\check{L}\check{E})\check{L} = \check{Y}\check{L}$.

$$\check{Y}\check{L}\check{Y} = (\check{F}\check{L}\check{E})\check{L}(\check{F}\check{L}\check{E}) = \check{F}(\check{L}\check{E}\check{L})(\check{F}\check{L}\check{E}) = \check{F}(\check{L}\check{E}\check{L})\check{E} = \check{F}\check{L}\check{E} = \check{Y}.$$

$$\check{L}\check{Y}\check{L} = \check{L}(\check{F}\check{L}\check{E})\check{L} = \check{L}\check{E}\check{L} = \check{L}$$

Hence $\check{Y} = \check{L}^{(\#)}$ is the grp – inv of \check{L} .

Example 3 Let us consider NFM $\check{L} = \begin{bmatrix} (0.9,0.6,0.2) & (0.7,0.4,0.2) \\ (0.7,0.4,0.2) & (0.8,0.4,0.2) \end{bmatrix}$ such that $\check{L}^2 = \check{L}$.

Let $\check{E} = \begin{bmatrix} (0.9,0.6,0.1) & (0.7,0.3,0.1) \\ (0.7,0.4,0.1) & (0.8,0.3,0.1) \end{bmatrix}$ be a out way of the relation $\check{L}\check{G} = \check{L}$.

and $\check{F} = \begin{bmatrix} (1,0.6,0.1) & (0.6,0.4,0.2) \\ (0.7,0.4,0.2) & (0.8,0.2,0.1) \end{bmatrix}$ be a out way of the relation $\check{H}\check{L} = \check{L}$.

Then

$$\check{Y} = \check{F}\check{L}\check{E} = \begin{bmatrix} (1,0.6,0.1) & (0.6,0.4,0.2) \\ (0.7,0.4,0.2) & (0.8,0.2,0.1) \end{bmatrix} \begin{bmatrix} (0.9,0.6,0.2) & (0.7,0.4,0.2) \\ (0.7,0.4,0.2) & (0.8,0.4,0.2) \end{bmatrix} \begin{bmatrix} (1,0.6,0.1) & (0.6,0.4,0.2) \\ (0.7,0.4,0.2) & (0.8,0.2,0.1) \end{bmatrix} \check{Y} = \check{L}$$

Again, $\check{L}\check{Y} = \check{Y}\check{L}$, $\check{L}\check{Y}\check{L} = \check{L}$ and $\check{Y}\check{L}\check{Y} = \check{Y}$ all holds. Thus \check{L} itself a grp – inv .

CONCLUSION

We define some results regarding the group inverse in Neutrosophic Fuzzy Matrices. The generalized inverse of an idempotent matrix holds marvelous algebraic characterizations in Neutrosophic Fuzzy Matrices. Additionally, we provide some properties to preserve idempotency in Neutrosophic Fuzzy Matrices. Finally, we present some results based on the Moore-Penrose inverse of Neutrosophic Fuzzy Matrices, along with numerical examples.

ABSTRACT

Let R to be a commutative ring with identity and H to be a nonempty proper multiplicative prime subset of R . The generalized total graph of R is the graph (simple graph) $GT_H(R)$ with vertex set R , and x and y are two different vertices are said to be adjacent if and only if $x + y \in H$. The complement of the generalized total graph of R is the graph (simple graph) $\overline{GT_H(R)}$ with vertex set R , and x and y are two different vertices are said to be adjacent if and only if $x + y \notin H$. we consider R as the finite field F and the multiplicative prime subset $H = \{0\}$, designate the graph as the generalized total of finite field F , and denote $GT(F)$. In this article, We study the properties of the adjacency matrix of the complement of the generalized total graph $\overline{GT(F)}$, such as the Eigen values, rank, index, characteristic polynomial, minimal polynomial, Quadratic form, Spectrum and energy of the adjacency matrix of $\overline{GT(F)}$.

Keywords: Adjacency matrix, eigenvalues, Spectrum, Generalized total graph, Complement of Generalized total graph.

INTRODUCTION

Consider R to be a commutative ring with identity, and $Z(R)$ is its zero-divisor sets of the Ring. In 2013, Anderson and Badawi[3] introduced the generalized total graph of a commutative ring R . Let H of R be a nonempty proper subset of R ; this R is said to be a multiplicative prime subset of R if it satisfies the following two conditions: (i) $ab \in H$ for all $a \in H$ and $b \in R$; (ii) if $ab \in H$ for $a, b \in R$, then either $a \in H$ or $b \in H$. For a multiplicative prime subset H of R , the *generalized total graph* $GT_H(R)$ is the simple undirected graph with vertex set R and x, y are two different vertices are adjacent if and only if $x + y \in H$. The entire literature regarding graphs from rings can be found in the monograph [2]. If there exists a path between any two different vertices of G , it is called a connected graph. For any vertex $v_i \in V(G)$, $\deg(v_i)$ denotes the degree of v_i . For any graph G , maximum degree of vertices is denoted as $\delta(G)$ and minimum degree of vertices is denoted as $\Delta(G)$. In this article, F denotes a finite field. $|F|$ is its cardinality, and $\{0\}$ and field itself is the only prime ideal in this field. When R is the field F and $H = \{0\}$, the generalized total graph of the field F is denoted as $GT(F)$. This paper investigates several properties of the adjacency matrix of the complement of generalized total graph $\overline{GT(F)}$. In particular, we study the characteristic equation and eigenvalues of the adjacency matrix of $GT(F)$. Next, we provide some properties of the adjacency matrix for $\overline{GT(F)}$. More specifically, we determine the Spectrum, rank, index, nature, quadratic form and energy of the adjacency matrix of $\overline{GT(F)}$. Let $G = (V, E)$ be the simple graph. The complement \bar{G} be a graph with the same vertex set V of the graph G is the simple graph with vertex set $V(G)$ and two different vertices x and y are adjacent in \bar{G} if and only if they are not adjacent in G .

ADJACENCY MATRIX OF $\overline{GT(F)}$

Recall that the adjacency matrix of a graph G is the $n \times n$ matrix $A(G)$, over complex field, whose entries are given by

$$a_{ij} = \begin{cases} 1 & \text{if } v_i \text{ and } v_j \text{ are adjacent} \\ 0 & \text{otherwise} \end{cases}$$

Lemma 2.1. Let $\overline{GT(F)}$ be the complement of the generalized total graph of F and $A'(F)$ be its adjacency matrix. Then the $(i, j)^{th}$ element of (F) is a_{ij} which is defined as $a_{ij} = \begin{cases} 0 & \text{if } v_i + v_j = 0 \\ 1 & \text{otherwise} \end{cases}$.

For simplicity, let us consider a matrix $J_n = \begin{pmatrix} 1 & 1 & 1 & \dots & 1 \\ 1 & 1 & 1 & \dots & 1 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & 1 & 1 & \dots & 1 \\ 1 & 1 & 1 & \dots & 1 \end{pmatrix}_{n \times n}$, $I_n = \begin{pmatrix} 1 & 0 & 0 & \dots & 0 \\ 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & 1 \end{pmatrix}_{n \times n}$ is an identity matrix. Hence

$J_n - I_n = \begin{pmatrix} 0 & 1 & 1 & \dots & 1 \\ 1 & 0 & 1 & \dots & 1 \\ 1 & 1 & 0 & \dots & 1 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & 1 & 1 & \dots & 0 \\ 1 & 1 & 1 & \dots & 1 \end{pmatrix}$. we can easily observe that $J_n - I_n = A(K_n)$ = adjacency matrix of a complete graph of order n .

We have some observations on these matrices

	J_n	I_n	$J_n - I_n = K_n$
characteristic polynomial	$\lambda^{n-1}(\lambda - n)$	$(\lambda - 1)^n$	$(\lambda + 1)^{n-1}(\lambda - (n - 1))$.
Minimal polynomials	$\lambda(\lambda - n)$	$\lambda - 1$	$(\lambda - (n - 1))(\lambda + 1)$.
Distinct Eigen Values	$0, n$	1	$n-1, -1$.
Spectrum	$\begin{pmatrix} n & 0 \\ 1 & n-1 \end{pmatrix}$	$\begin{pmatrix} 1 \\ n \end{pmatrix}$	$\begin{pmatrix} n-1 & -1 \\ 1 & n-1 \end{pmatrix}$.

PROPERTIES

Lemma 3.1. Let $A'(F)$ be the Adjacency matrix of $\overline{GT(F)}$, we can observe

Balamurugan et al.,

- (i) If Characteristic (F) = 2, then (F) is a $J - I$ matrix of order $|F| \times |F|$ with all diagonal entries are zero others one.
- (ii) If Characteristic (F) > 2, then each (i,j)th entry of (F) is defined by

$$a_{ij} = \begin{cases} 0 & \text{if either } j = i + 1, i \in \{2, 4 \dots |F| - 1\} \text{ or} \\ & j = i - 1, i \in \{3, 5 \dots |F|\} \\ 1 & \text{otherwise} \end{cases}$$

Proof.

(i) If Characteristic (F) = 2, then $y + y = 2y = 0$ for all elements $y \in F$. Therefore, each element of F is self-inverse. Hence, all the vertices of $GT(F)$ are isolated, so all the vertices adjacent in $\overline{GT(F)}$ so the entries of $A'(F)$ all are 1 except its diagonal (self - loop position).

(ii) When Characteristic (F) > 2, List all the member of F as $\{0, x_1, -x_1, x_2, -x_2, \dots, x_k, -x_k, \dots, x_{\frac{|F|-1}{2}}, -x_{\frac{|F|-1}{2}}\}$ each $-x_k$ is the inverse of x_k for $1 \leq k \leq \frac{|F|-1}{2}$, which implies

$GT(F) = \langle 0 \rangle \cup \bigcup_{k=1}^{\frac{|F|-1}{2}} \langle x_k, -x_k \rangle$. To find the adjacency matrix of $GT(F)$, relabel the elements F as $\{v_1, v_2, \dots, v_{|F|}\}$ in such a way that $v_1 = 0, v_2 = x_1, v_3 = -x_1, \dots, v_{|F|-1} = x_{\frac{|F|-1}{2}}, v_{|F|} = -x_{\frac{|F|-1}{2}}$. Consider that the relabeled elements of F head each row and column of $A(F)$. For $1 \leq i \leq |F|$ & $1 \leq j \leq |F|$, the (i, j) th entries of $A(F)$ is defined from $GT(F)$ as follows

$$a_{ij} = \begin{cases} 1 & \text{if } v_i + v_j = 0 \in F \\ 0 & \text{otherwise} \end{cases}$$

This implies that $a_{ij} = \begin{cases} 1 & \text{if } v_i + v_{i+1} = 0 \in F \text{ and } i \in \{2, 4, 6 \dots |F| - 1\} \\ 1 & \text{if } v_i + v_{i-1} = 0 \in F \text{ and } i \in \{3, 5, 7 \dots |F|\} \\ 0 & \text{otherwise} \end{cases}$

From this, we observe that

$$a_{ij} = \begin{cases} 1 & \text{if either } j = i + 1, i \in \{2, 4 \dots |F| - 1\} \text{ or } j = i - 1, i \in \{3, 5 \dots |F|\} \\ 0 & \text{otherwise} \end{cases}$$

So $a'_{ij} = \begin{cases} 0 & \text{if either } j = i + 1, i \in \{2, 4 \dots |F| - 1\} \text{ or } j = i - 1, i \in \{3, 5 \dots |F|\} \\ 1 & \text{otherwise} \end{cases}$

Corollary 3.2.

Let $A(F)$ be the Adjacency matrix of $GT(F)$, we can observe that

(i) Minimum degree = minimum row sum of (F) = $\delta((F)) = \begin{cases} |F| - 1, & \text{if characteristic (F) = 2} \\ |F| - 2, & \text{if characteristic (F) > 2} \end{cases}$

Maximum degree = maximum row sum of (F) = $\Delta((F)) = |F| - 1$

(ii) There is no isolated vertex.

Example 3.3.

Consider the field $F_4 = \frac{\mathbb{Z}_2[x]}{\langle x^2+x+1 \rangle} = \{0, 1, x, 1+x\}$; then the corresponding generalized total graph and its adjacency matrix are given by

$$A'(F_4) = \begin{pmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{pmatrix}$$

Balamurugan et al.,

Suppose $F = Z_5$, then $\overline{GT_H(Z_5)}$ are given by $A'(Z_5) = \begin{pmatrix} 0 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 1 \\ 1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 1 & 0 & 0 \end{pmatrix}$

Theorem 3.4. Let $A'(F)$ be the adjacency matrix of the $\overline{GT(F)}$, then the following properties hold

(i) $A'(F)$ is always a real symmetric matrix. (ii) $\text{Trace}(A'(F))$ is 0.

(iii) $\text{Determinant}(A'(F)) = \begin{cases} 1 - |F|, & \text{if characteristic}(F) = 2 \\ 0, & \text{if characteristic}(F) > 2 \end{cases}$

Proof.

(i) It is obvious

(ii) It is a simple undirected graph, so self-loops are not allowed and so a'_{ii} for all $1 \leq i \leq |F|$ in (F) . Hence all the diagonal elements are 0. Therefore $\text{Trace}(A'(F)) = 0$.

(iii) 2nd and 3rd rows are same. So determinant becomes 0. Similarly we can prove using i^{th} and $(i+1)^{\text{th}}$ rows where $1 < i < |F|$.

Theorem 3.5. Let $A'(F)$ be the Adjacency matrix of $\overline{GT(F)}$, then

(i) If $\text{Characteristic}(F) = 2$, then $A'(F)$ can be considered as a block matrix $\begin{pmatrix} J-I & J \\ J & J-I \end{pmatrix}$ where all its blocks having order $\frac{|F|}{2} \times \frac{|F|}{2}$ or we can say $A'(F) = J_{|F|} - I_{|F|}$.

(ii) If $\text{Characteristic}(F) > 2$, then $A'(F) = J_{|F|} - I_{|F|} - A(F)$, Where $A(F)$ be the adjacency matrix of $GT(F)$.

Proof: When $\text{characteristic}(F) = 2$, By lemma 2.2(i) we have $A'(F) = \begin{pmatrix} 0 & 1 & 1 \dots 1 & | & 1 & 1 & 1 \dots 1 \\ 1 & 0 & 1 \dots 1 & | & 1 & 1 & 1 \dots 1 \\ & & & \dots & & & \\ 1 & 1 & 1 \dots 0 & | & 1 & 1 & 1 \dots 1 \\ \hline 1 & 1 & 1 \dots 1 & | & 0 & 1 & 1 \dots 1 \\ 1 & 1 & 1 \dots 1 & | & 1 & 0 & 1 \dots 1 \\ 1 & 1 & 1 \dots 1 & | & 1 & 1 & 0 \dots 1 \\ & & & \dots & & & \\ 1 & 1 & 1 \dots 1 & | & 1 & 1 & 1 \dots 0 \end{pmatrix} = \begin{pmatrix} J-I & J \\ J & J-I \end{pmatrix}$.

where all its blocks

having order $\frac{|F|}{2} \times \frac{|F|}{2}$ or we can say $A'(F) = J_{|F|} - I_{|F|}$.

When $\text{characteristic}(F) > 2$, By lemma 2.2(ii) we have

$$A'(F) = \begin{pmatrix} 0 & 1 & 1 \dots 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 \dots 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 \dots 1 & 1 & 1 & 1 & 1 \\ & & & \dots & & & \\ 1 & 1 & 1 \dots 1 & 0 & 0 & 1 & 1 \\ 1 & 1 & 1 \dots 1 & 0 & 0 & 1 & 1 \\ 1 & 1 & 1 \dots 1 & 1 & 1 & 1 & 0 \\ 1 & 1 & 1 \dots 1 & 1 & 1 & 1 & 0 \end{pmatrix} = J_{|F|} - I_{|F|} - A(F).$$

Lemma 3.6. Let $A'(F)$ be the Adjacency matrix of $\overline{GT(F)}$. Let $f(\lambda)$ be the characteristic polynomial and $p(\lambda)$ be the minimal polynomial of $A(F)$, then

(i) The Characteristic equation of

$$A'(F) \text{ is } f(\lambda) = \begin{cases} (\lambda - (|F| - 1))(\lambda + 1)^{|F|-1} = 0, & \text{if Characteristic}(F) = 2 \\ \lambda^{\frac{|F|-1}{2}}(\lambda + 2)^{\frac{|F|-3}{2}}(\lambda^2 - (|F| - 3)\lambda - (|F| - 1)) = 0, & \text{if Characteristic}(F) > 2 \end{cases}$$

Balamurugan et al.,

(ii) The minimal polynomial of $A'(F)$ is $p(\lambda) = \begin{cases} (\lambda + 1)(\lambda - (|F| - 1)), & \text{if Characteristic (F) = 2} \\ \lambda(\lambda + 2)(\lambda^2 - (|F| - 3)\lambda - (|F| - 1)), & \text{if Characteristic (F) > 2} \end{cases}$

We recall that the root of the characteristic equation $|\lambda I - A| = 0$ is called the Eigenvalue of A. From this definition, one can easily determine all the Eigenvalues of $A'(F)$.

Theorem 3.7. Let λ_i be the Eigenvalues of $A'(F)$, then the distinct Eigen Values of $A'(F)$

- (i) whenever Characteristic (F) = 2, then $\lambda = -1, (|F| - 1)$
- (ii) Whenever Characteristic (F) > 2, then $\lambda = 0, -2, \frac{|F|-3 \pm \sqrt{(|F|-1)^2+4}}{2}$.

Proof. By solving the characteristic polynomials in previous theorem we can get this results.

Next, We recall that the definition of the Spectrum of a graph G is the set of Eigenvalues of Adjacency matrix, together with the multiplicities of the Eigenvalues of the adjacency matrix. If the distinct Eigenvalues of $A(G)$ are $\lambda_0 > \lambda_1 > \dots > \lambda_k$, and its corresponding multiplicities are $m(\lambda_0), m(\lambda_1), \dots, m(\lambda_k)$, then the Spectrum of the graph G by

Spectrum (G) = $\left(\begin{matrix} \lambda_0 \lambda_1 & \dots & \lambda_k \\ m(\lambda_0) & m(\lambda_1) & \dots & m(\lambda_k) \end{matrix} \right)$. With the help of this definition, we can derive the spectrum $\overline{GT(F)}$ as follows.

Theorem 3.8. If $A'(F)$ be its adjacency matrix of $\overline{GT(F)}$, then

$$\text{Spectrum}(\overline{GT(F)}) = \begin{cases} \left(\begin{matrix} (|F|-1) & -1 \\ 1 & |F|-1 \end{matrix} \right), & \text{if characteristic (F) = 2} \\ \left(\begin{matrix} (|F|-3 + \sqrt{(|F|-1)^2+4}) & 0 & (|F|-3 - \sqrt{(|F|-1)^2+4}) & -2 \\ \frac{2}{2} & |F|-1 & \frac{2}{2} & |F|-3 \end{matrix} \right), & \text{if characteristic (F) > 2} \end{cases}$$

Proof. The proof is trivial from the definition of Spectrum and solving the characteristics equation of $A'(F)$.

Note that The characteristic polynomial of $A(F)$ is defined as $|\lambda I - A(F)|$ and the characteristic equation of $A(F)$ to be $|\lambda I - A(F)| = 0$. Which yields the following

Recall the Binomial Expansion $(a + b)^n = \binom{n}{0}a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \dots + \binom{n}{n}b^n$.

Theorem 3.9. Let $f(\lambda)$ be the characteristic polynomial of $A'(F)$. If Characteristic (F) > 2, then we have the following observation in $f(\lambda)$.

The coefficient of $\lambda^{|F|}$ and $\lambda^{|F|-1}$ are 1 and 0 respectively for all cases and , and

The remaining coefficients of $\lambda^{|F|-k}$ equals to

$$\begin{cases} \left(\binom{|F|-1}{k} - (|F| - 1) \binom{|F|-1}{k-1} \right) \text{ for } k = 2, 3, \dots, |F| - 1 \text{ and } -(|F| - 1) \text{ for } k = |F|, & \text{if characteristic (F) = 2} \\ \left(\binom{|F|-3}{k} \right) 2^k - (|F| - 3) \binom{|F|-3}{k-1} 2^{k-1} - (|F| - 1) \binom{|F|-3}{k-2} 2^{k-2} \text{ for } k = 2, 3, \dots, \frac{|F|-3}{2}, & \text{if Characteristic > 2} \end{cases}$$

Proof. When characteristic (F) = 2, By the Binomial expansion, we have

$$\begin{aligned} (\lambda - (|F| - 1))(\lambda + 1)^{|F|-1} &= (\lambda - (|F| - 1)) \left(\binom{|F|-1}{0}(\lambda)^{|F|-1} + \binom{|F|-1}{1}(\lambda)^{|F|-2} + \binom{|F|-1}{2}(\lambda)^{|F|-3} + \dots + \binom{|F|-1}{|F|-1} \right) \\ &= \binom{|F|-1}{0}(\lambda)^{|F|} + \left\{ \binom{|F|-1}{1} - (|F| - 1) \binom{|F|-1}{0} \right\} (\lambda)^{|F|-1} + \left\{ \binom{|F|-1}{2} - (|F| - 1) \binom{|F|-1}{1} \right\} (\lambda)^{|F|-2} + \dots + \left\{ \binom{|F|-1}{|F|-1} - (|F| - 1) \binom{|F|-1}{|F|-2} \right\} \lambda - (|F| - 1) \end{aligned}$$

Clearly the coefficient of $\lambda^{|F|}$ and $\lambda^{|F|-1}$ are 1 & 0 respectively, From the above, coefficients of $\lambda^0 = \text{constant}$ equals $-(|F| - 1)$

The remaining coefficients of $\lambda^{|F|-k}$ equals to $\binom{|F|-1}{k} - (|F| - 1) \binom{|F|-1}{k-1}$.

When characteristic (F) > 2, By the Binomial expansion, we have

$$(\lambda + 2)^{\frac{|F|-3}{2}} = \binom{|F|-3}{0} (\lambda)^{\frac{|F|-3}{2}} (2)^0 + \binom{|F|-3}{1} (\lambda)^{\frac{|F|-5}{2}} (2) + \binom{|F|-3}{2} (\lambda)^{\frac{|F|-7}{2}} (2)^2 + \dots + \binom{|F|-3}{\frac{|F|-5}{2}} \lambda^1 (2)^{\frac{|F|-5}{2}} + \binom{|F|-3}{\frac{|F|-3}{2}} (2)^{\frac{|F|-3}{2}}$$

Balamurugan et al.,

Now, $(\lambda^{\frac{|F|+3}{2}} - (|F| - 3)(\lambda)^{\frac{|F|+1}{2}} - (|F| - 1)(\lambda)^{\frac{|F|-1}{2}})(\lambda + 2)^{\frac{|F|-3}{2}} =$
 $\binom{|F|-3}{\frac{2}{0}}(\lambda)^{|F|} + (\lambda)^{|F|-1} \left\{ \binom{|F|-3}{\frac{2}{1}} 2 - (|F| - 3) \binom{|F|-3}{\frac{2}{0}} \right\} + (\lambda)^{|F|-2} \left\{ \binom{|F|-3}{\frac{2}{2}} 2^2 - (|F| - 3) \binom{|F|-3}{\frac{2}{1}} (2) - (|F| - 1) \binom{|F|-3}{\frac{2}{0}} \right\}$
 $+ \dots + (\lambda)^{|F|-k} \left\{ \binom{|F|-3}{\frac{2}{k}} 2^k - (|F| - 3) \binom{|F|-3}{\frac{2}{k-1}} (2)^{k-1} - (|F| - 1) \binom{|F|-3}{\frac{2}{k-2}} 2^{k-2} \right\} + \dots$
 $+ - (|F| - 1)(\lambda)^{\frac{|F|-1}{2}} 2^{\frac{|F|-3}{2}}$

The coefficient of $\lambda^{|F|}$ and $\lambda^{|F|-1}$ are $\binom{|F|-1}{0} = 1$ and 0 respectively. The remaining coefficients of λ^{n-k} equals to $\binom{|F|-3}{\frac{2}{k}} 2^k - (|F| - 3) \binom{|F|-3}{\frac{2}{k-1}} 2^{k-1} - (|F| - 1) \binom{|F|-3}{\frac{2}{k-2}} 2^{k-2}$. Where $k = 2, 3, \dots, \frac{|F|-3}{2}$.

Proposition 3.10. ([8], proposition 2.3) Let a simple graph $\Gamma = (V, E)$, $A(\Gamma)$ be its adjacency matrix. Let us suppose that $\chi(\Gamma, \lambda) = \lambda^n + c_1\lambda^{n-1} + c_2\lambda^{n-2} + \dots + c_n$, where the coefficients c_i denote the sums of principal minors of A . Then (i) $c_1 = 0$ (ii) $-c_2$ is equals to $|E|$ (iii) $-c_3 = 2 \times$ (number of triangles in the graph).

This proposition gives the following lemma.

Theorem 3.11. Consider $f(\lambda) = \lambda^{|F|} + c_1\lambda^{|F|-1} + c_2\lambda^{|F|-2} + \dots + c_n$ is the characteristic polynomial for $A'(F)$. Then,

- (i) $c_1 = 0$ (ii) the number of edges of $\overline{GT(F)}$ is $-c_2 = \begin{cases} \binom{|F| \times (|F|-1)}{2} & \text{if characteristic } (F) = 2 \\ \frac{(|F|-1)^2}{2} & \text{if characteristic } (F) > 2 \end{cases}$
- (iii) twice the number of triangles in the graph $\overline{GT(F)}$ is $-c_3 = \begin{cases} \frac{(|F| \times (|F|-1) \times (|F|-2))}{3} & \text{if characteristic } (F) = 2 \\ \frac{(|F|-1) \times (|F|-2) \times (|F|-3)}{3} & \text{if characteristic } (F) > 2 \end{cases}$

Proof. (i) Consider Characteristic $(F) = 2$, then by Lemma 3.9(i), coefficient of $\lambda^{n-1} = 0$

Therefore $c_1 = 0$. Also the coefficient of $\lambda^{|F|-2}$ is $c_2 = \binom{|F|-1}{2} - \binom{|F|-1}{1} \times (|F| - 1) = -\frac{|F| \times (|F|-1)}{2}$. The coefficient of $\lambda^{|F|-3}$ is $c_3 = \binom{|F|-1}{3} - \binom{|F|-1}{2} \times (|F| - 1) = -\frac{|F| \times (|F|-1) \times (|F|-2)}{3}$

Suppose Characteristic $(F) > 2$, then by Lemma 3.9(ii)

Also the coefficient of $\lambda^{|F|-2}$ is $c_2 = \binom{|F|-3}{2} 2^2 - (|F| - 3) \times \binom{|F|-3}{1} (2) - (|F| - 1) \times \binom{|F|-3}{0} = -\frac{(|F|-1)^2}{2}$. The coefficient of $\lambda^{|F|-3}$ is $c_3 = \binom{|F|-3}{3} 2^3 - (|F| - 3) \times \binom{|F|-3}{2} (2)^2 - (|F| - 1) \times \binom{|F|-3}{1} 2 = -\frac{(|F|-1) \times (|F|-2) \times (|F|-3)}{3}$.

Note that the rank of a matrix is the number of non-zero Eigenvalues. The rank of A is denoted by r . The index of a matrix is the number of positive Eigenvalues of the matrix A , and it is denoted by p .

Theorem 3.12. Let $A'(F)$ be its adjacency matrix of the $\overline{GT(F)}$, then

- (i) The rank of $A'(F)$ is given by $r = \begin{cases} |F| & \text{if characteristic } (F) = 2 \\ \frac{|F|-1}{2} & \text{if characteristic } (F) > 2 \end{cases}$
- (ii) The index of $A'(F)$ is given by $p = \begin{cases} |F| - 1, & \text{if characteristic } (F) = 2 \\ 1, & \text{if characteristic } (F) > 2 \end{cases}$.

Proof.

From the spectrum of $A'(F)$ we can easily prove this result.

Note that, a quadratic form, It is a homogeneous polynomial of the second degree in any number of variables of a

matrix A . For example, $A = \begin{pmatrix} a & f & g \\ f & b & h \\ g & h & c \end{pmatrix}$, $X = (x \ y \ z)$ and $X^T = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$, then $XAX^T = ax^2 + by^2 + cz^2 + 2fxy + 2gzx +$

$2hzy$ which is a corresponding Quadratic form of A , λ_i are Eigenvalues. Here $i=1,2,3$.

Balamurugan et al.,

The real quadratic form XAX^T is called Positive definite if $\forall \lambda_i > 0$, Negative definite if $\lambda_i < 0$. Positive semi-definite if all $\lambda_i \geq 0$ and atleast one $\lambda = 0$, Negative semi definite if all $\lambda_i \leq 0$ and atleast one $\lambda = 0$. It is indefinite if some of the λ_i are positive and others negative. From this definition we can observe the lemma given below.

Lemma 3.13. Let $A'(F)$ be its adjacency matrix of $\overline{GT(F)}$. Let q be the quadratic form of $A'(F)$. Then

$$q = \begin{cases} 2\left(\sum_{i=1}^{|F|-1} (x_i \sum_{j>i}^{|F|} x_j)\right), & \text{if characteristic } (F) = 2 \\ 2\left[x_1 \sum_{i=2}^{|F|} (x_i + \sum_{j=1}^{\frac{|F|-1}{2}} (x_{2j} + x_{2j+1}) \times \sum_{k>2i+1}^{|F|} x_k)\right], & \text{if Characteristic } (F) > 2 \end{cases}$$

Proof. If Characteristic $(F) = 2$, then $q = (x_1 x_2 x_3 \dots x_{|F|})$ $\begin{pmatrix} 0 & 1 & 1 & \dots & 1 & 1 & 1 & \dots & 1 \\ 1 & 0 & 1 & \dots & 1 & 1 & 1 & \dots & 1 \\ & & & \dots & & & & & \\ 1 & 1 & 1 & \dots & 0 & 1 & 1 & 1 & \dots & 1 \\ \hline 1 & 1 & 1 & \dots & 1 & 0 & 1 & 1 & \dots & 1 \\ 1 & 1 & 1 & \dots & 1 & 1 & 0 & 1 & \dots & 1 \\ 1 & 1 & 1 & \dots & 1 & 1 & 1 & 0 & \dots & 1 \\ & & & \dots & & & & & & \\ 1 & 1 & 1 & \dots & 1 & 1 & 1 & 1 & \dots & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_{|F|-1} \\ x_{|F|} \end{pmatrix} = 0$, we get

$$2\left(\sum_{i=1}^{|F|-1} (x_i \sum_{j>i}^{|F|} x_j)\right)$$

If Characteristic $(F) > 2$, then $q = (x_1 x_2 x_3 \dots x_{|F|-1} x_{|F|})$ $\begin{pmatrix} 0 & 1 & 1 & \dots & 1 & 1 \\ 1 & 0 & 0 & \dots & 1 & 1 \\ 1 & 0 & 0 & \dots & 1 & 1 \\ & & & \dots & & \\ & & & & & \\ & & & & & \\ 1 & 1 & 1 & \dots & 0 & 0 \\ 1 & 1 & 1 & \dots & 0 & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_{|F|-1} \\ x_{|F|} \end{pmatrix}$

$$= 2\left[x_1 \sum_{i=2}^{|F|} (x_i + \sum_{j=1}^{\frac{|F|-1}{2}} (x_{2j} + x_{2j+1}) \times \sum_{k>2i+1}^{|F|} x_k)\right].$$

Theorem 3.14. Let $A'(F)$ be its adjacency matrix of $\overline{GT(F)}$. Let q be the quadratic form of $A'(F)$, we can observe q is indefinite

Proof. By the result of spec of $A'(F)$, this adjacency matrix has both positive and negative Eigen values. Hence q is indefinite. In this view of the following definition, one can determine the energy of a simple graph G from its adjacency matrix A . consider $A(G)$ as the adjacency matrix of a graph G and let $\lambda_1, \lambda_2, \dots, \lambda_n$ Eigenvalue of A . Then, the Energy of the graph G is $En(G) = \sum_{i=1}^n |\lambda_i|$.

Theorem 3.15. Let $\overline{GT(F)}$ be the complement of the generalized total graph F , and $A'(F)$ be its adjacency matrix. Then the energy of the graph $\overline{GT(F)}$ is given by

$$En(A'(F)) = \begin{cases} 2(|F| - 1), & \text{if characteristic } (F) = 2 \\ (|F| - 3 + \sqrt{(|F| - 1)^2 + 4}), & \text{if characteristic } (F) > 2 \end{cases}$$

Proof.

have $Spec(\overline{GT(F)}) =$

$$\begin{cases} \begin{pmatrix} (|F|-1) & -1 \\ 1 & |F|-1 \end{pmatrix} & \text{if characteristic } (F) = 2 \\ \begin{pmatrix} \frac{|F|-3 + \sqrt{(|F|-1)^2 + 4}}{2} & 0 & \frac{|F|-3 - \sqrt{(|F|-1)^2 + 4}}{2} & -2 \\ \frac{|F|-1}{2} & \frac{|F|-3}{2} & \frac{|F|-3}{2} & \frac{|F|-3}{2} \end{pmatrix} & \text{if characteristic } (F) > 2 \end{cases} \quad En(\overline{GT(F)}) =$$

$$\begin{cases} (|F| - 1) + (1 \times |F| - 1) & \text{if characteristic } (F) = 2 \\ \frac{2+2+\dots+2}{\frac{|F|-3}{2} \text{ times}} + 0 + \frac{|F|-3 + \sqrt{(|F|-1)^2 + 4}}{2} + \left| -\left(\frac{|F|-3}{2} + \frac{\sqrt{(|F|-1)^2 + 4}}{2}\right) \right| & \text{if characteristic } (F) > 2 \end{cases}$$

Hence $En(\overline{GT(F)}) = \begin{cases} 2 \times (|F| - 1), & \text{if characteristic } (F) = 2 \\ |F| - 3 + \sqrt{(|F| - 1)^2 + 4}, & \text{if characteristic } (F) > 2 \end{cases}$

Balamurugan et al.,

CONCLUSIONS

In this article we discussed some theoretical properties of adjacency matrix of the complement of the generalized total graph of finite fields $\overline{GT(F)}$ such as Eigenvalues, rank, index, characteristic polynomial, minimal polynomial, Quadratic form, Spectrum, energy of the adjacency matrix of $\overline{GT(F)}$ and some related properties. This view will help us another approach to seeing the properties of graphs using an adjacency matrix.

ABSTRACT

Raunkier's life forms of plant describe the classification of plants based on position of their renewal buds above or below the ground during unfavorable condition. The present study reports 212 plant species including 69 families, 176 genera with one family, one genus, and two species belonging to the Gymnosperm group. Further, the reported plant species were compared with Raunkier's normal biological spectrum and diverse types of vegetation seen in various natural plant communities through chi-square test by using Graphpad Prism 9.3.1(471). This comparison illustrates the difference between natural and artificial plant communities.

Keywords: Artificial ecosystem, Biological spectrum, Law garden, Plant community, Raunkier's life forms, Vegetation types.

**Devraj T. Panchani and Nainesh R. Modi**

INTRODUCTION

The term 'Life form' was first coined by Warming in 1896 (Magdefrau, 1982). Plant life form can be defined as vegetative or morphological adaptation of the plant with respect to the environment. It can help in comparing vegetation types of different areas (Pavon *et al.*, 2000). Life form is different from growth form; life form is the physiognomy of vegetation whereas growth form is the actual structure of shoot apex (Adamson, 1939; Du Rietz, 1931). In other words, the growth form can be considered as the overall morphological characteristic of the plant that can be examined (Meusel, 1935). Several ecologists tried to classify the various life forms of the plants based on the physiognomy. For example- Theophrastus classified the plant community or vegetation into trees, shrubs and herbs. Different life forms of plants were first suggested by Humboldt in 1806 (Du Rietz, 1931), De Candolle and Kerner also classified Raunkier's life form but Kerner classified according to the taxonomic unit (Kerner, 1863; Du Rietz, 1931). Raunkier classified plants based on the height of renewal buds from the ground and also below the ground during resting or unfavorable conditions (Du Rietz, 1931; Adamson, 1939). Raunkier's classification of life forms of plants was acceptable for most the ecologists. Different ratio or percentage of life forms of plants in a plant community is known as the biological spectrum. This biological spectrum helps in revealing various climatic conditions and different vegetation types of distinct geographical regions (Rana *et al.*, 2002). With the help of the biological spectrum, dominant species of the natural ecosystem or plant community can be known and the impact of anthropogenic activities on these natural ecosystems can also be studied. Several works on life forms of plants have been done from India (Bharucha, 1941; Meher-Homji, 1964; Singh & Arora, 1994; Rana *et al.*, 2002) and from the world (Cromer & Pryor, 1942; Paulsen, 1912; Raunkier, 1934; Turrill, 1929). Most of the study on Raunkier's Life forms of plant and biological spectrum has been done on natural ecosystems, but not on artificial ecosystems like gardens. Several authors have done their phytochemical analysis on cultivated plants which were grown and maintained in artificial ecosystem like gardens, these may help society, researchers, scientists and industries for future references (Rutuba *et al.*, 2021; Shah *et al.*, 2021; Patel and Modi, 2018; Patel & Modi, 2019). Therefore, this present work focuses on the comparison of different vegetation physiognomy of natural ecosystems and artificial ecosystems. This study will also be helpful in addressing the stability of the artificial ecosystems like gardens.

RAUNKIER'S LIFE FORM

Raunkier classified plants into five categories based on the location of the renewal bud during adverse condition; Phanerophytes, Chamaephytes, Hemicryptophytes, Cryptophytes, and Therophytes viz. Plants with a renewal bud position more than 0.25m high from the ground are referred to be Phanerophytes. Chamaephytes are the plants having renewal buds that are less than 0.25m high from the ground. Hemicryptophytes are the plants that have renewal buds just above the earth's crust. Cryptophytes are the plants that have an underground renewal bud, such as a rhizome, bulb, or tuber. Therophytes are the plants that produce seed as a renewal bud in unfavorable conditions; they are essentially annual plants (Raunkier 1934; Cain, 1950; Adamson 1939).

MATERIAL AND METHODOLOGY

This study has been carried out during August- December, 2021 & carried out by using the transect (Eberhardt, 1978; Buckland *et al.*, 2007) and quadrat (Gleason, 1920; Shioda, 2008) (from 1×1 to 10×10 meters) methods for the collection of various plant specimens. Further, the identification of the plant species was carried out with the help of various literatures (Cooke, 1903; Shah, 1978). Following plants identification and field observations, all listed plants were classified according to Raunkier's life forms and compared to the normal biological spectrum of natural ecosystems as well as the biological spectrum of artificial ecosystems. Several authors applied R×C, G-test for comparing the vegetation of the different sites (Stalter *et al.*, 1991). The data of current study was analyzed through chi-square test using GraphPad Prism 9.3.1(471) software.

STUDY AREA Law Garden is approximately 50-year-old garden located at Ahmedabad district of Gujarat, India.

Location: 23°01'35"N 72°33'39"E (<https://earth.google.com/>).

Devraj T. Panchani and Nainesh R. Modi

RESULT AND DISCUSSION

In the current study of Law Garden, Ahmedabad for the Raunkier's life form 212 plant species were listed. It comprises 69 families, 176 genera among them one family, one genus and two species belong to Gymnosperm group (Table 1). The survey of Raunkier's life forms of plants at Law Garden, Ahmedabad, an artificial ecosystem, revealed that (Table 1 and Graph 1) Phanerophytes are dominant species. The studied biological spectrum of Raunkier's life form of Law Garden Ahmedabad differs from the normal biological spectrum in that Phanerophytes (approximately double the normal spectrum) and Geophytes are more than the normal spectrum, Chamaephytes are close to the normal spectrum, Hemicryptophytes and Therophytes are much less than the normal spectrum, and Epiphytes are completely absent. Variations in the studied biological spectrum from the normal biological spectrum are may be due to the anthropogenic activity, because gardens are actually an artificial ecosystem where everything is grown and maintained by the human beings. Also, plants are planted as per human desire and for ornamental purposes. In gardens, several insecticides and pesticides are used to control insects and pests which may affect the soil fertility causing difficulty in the survival of herbaceous plants. This is the reason why hemicryptophytes and therophytes are very less. Here, the percentage of phanerophytes is more than normal, this may be because people like to grow more trees in the garden and epiphytes seem to be absent due to warm and non-moist climate.

While comparing different vegetation types with Law Garden floristic data using chi-square, it is observed that all the different types of vegetation are significantly different from Law Garden (Table 2). This study reveal (Graph 1) that Phanerophytes composition are in between Rainforest and Subtropical evergreen forest, Chamaephytes and Cryptophytes are nearly less or more than the normal biological spectrum and also near the desert and subtropical evergreen vegetation type. Hemicryptophytes are very less than normal biological spectrum but it is near to the Subtropical vegetation. Therophytes are very less than normal biological spectrum as well as not indicating any type of vegetation. The majority of life forms are Phanerophytes, which are intermediate between rainforest and Subtropical evergreen forest, but they are actually near subtropical vegetation, and other life forms such as Hemicryptophytes and Cryptophytes are also near Subtropical evergreen vegetation types, so the studied area may have Subtropical evergreen vegetation types. The present study of Law Garden, Ahmedabad for the different Raunkier's life forms of plant shows that the high percentage of Phanerophytes indicates Phanaerophyticphytoclimate. When Law Garden vegetation was compared to several forms of natural vegetation using chi-squared, it was discovered that Law Garden vegetation is considerably distinct from other natural vegetation. Subtropical evergreen type of vegetation shows similarities to Law garden as both vegetation share common climatic conditions. Absence of epiphytes indicates non-moisture environment throughout the year. Listing of 212 distinct species of Angiosperm with Phanerophytic climate of Law Garden, Ahmedabad, which indicates species rich region. According to ecologists, the more species rich area, the more it is stable. As a result, artificial ecosystems or plant communities, such as gardens that humans create and maintain, can be considered stable.

ACKNOWLEDGEMENT

Here we thankful to all the faculties of Department of Botany, Bioinformatics and Climate Change Impacts Management, School of Sciences, Gujarat University, Ahmedabad for directly and indirectly helping us. We also thankful our colleagues for continuously support.

ABSTRACT

The main concept of this paper is to discuss the micro topology as an unadorned extension of nanotopology. Nano topology offers a wide variety of interesting results and applications. But for some time we have been looking for extended sets in micro topological space. Micro Topological Spaces introduced by S.Chandrasekar and introduces a new type of open sets. In this paper, we introduce and study MIC- β -I-open sets, MIC- β -I-continuous functions, MIC- β -I-irresolute, and MIC- β -I-irresolute in Micro ideal topological Spaces.

Keywords: MIC- β -I-open sets, MIC- β -I-continuous functions, MIC- β -I-irresolute, and MIC- β -I-irresolute

INTRODUCTION

Kuratowski [1] in 1933 and Vaidyanathaswamy [2] in 1944 proposed the concept of the ideal topological space (IDTS). R. Manoharan and P. Thangavelu [3] introduced Some New Sets and Topologies in Ideal Topological Spaces in 2013. In 1983, M.E.Abd El-Monsef, S.N.El-Deeb and R.A.Mahmoud [9] proposed β -open sets and β -continuous mapping. Hariwan Z.Ibrahim [7] initiated Micro β -open sets in Micro topology in 2020. E.Hatir and T.Noiri [10] introduced On β -I-open sets and a decomposition of almost-I-continuity. Glaisa T.Catalan, Roberto, N.Padua, Michael P.Baldado Jr [8] initiated On β -open sets and Ideals in Topological spaces in 2019. In this paper the Proposed Methodology is MIC- β -I-open sets, MIC- β -I-continuous functions, MIC- β -I-irresolute, and MIC- β -I-irresolute in Micro Ideal Topological Spaces and also some of their properties are investigated.

Josephine Rani and Bhavani

PRELIMINARIES

Definition 1.2.1 [11]

Any ideal I on a topological space (X, τ) is a non empty collection of subsets of X which satisfies the following conditions

- i. $A \in I$, and $B \subset A$ implies $B \in I$.
- ii. $A \in I$ and $B \in I$ implies $A \cup B \in I$.

An Ideal topological space (X, τ) with an ideal I on X is denoted by (X, τ, I) .

Definition 1.2.2

A subset A of a topological space (X, τ) is said to be α -open (resp. pre-open, β -open) if $A \subseteq \text{Int}(\text{cl}(\text{Int}(A)))$ (resp. $A \subseteq \text{Int}(\text{cl}(A))$, $A \subseteq \text{cl}(\text{Int}(\text{cl}(A)))$).

Definition 1.2.3 [8,10]

A subset A of an ideal topological space (X, τ, ID) is said to be α -I-open (resp. pre-I-open, β -I-open) if $A \subseteq \text{Int}(C I \subseteq (\text{Int}(A)))$ (resp. $A \subseteq \text{Int}(C I \subseteq (A))$, $S \subseteq C I (\text{Int}(C I \subseteq (S)))$). The family of all α -I-open (resp. pre-I-open, β -I-open) sets in an ideal topological space (X, τ, I) is denoted by $\alpha IO(X)$ (resp. $PIO(X)$, $\beta IO(X)$).

- i) A subset A of an ideal topological space (X, τ, ID) is said to be semi-I-open if $2 A \subseteq \text{cl}^*(\text{int}(A))$.
- ii) A subset A of an ideal topological space (X, τ, ID) is said to be semi-I-closed if $\text{int}(\text{cl}^*(A)) \subseteq A$.
- iii) A subset A of an ideal topological space (X, τ, ID) is said to be β -I-open if $A \subseteq \text{cl}(\text{int}(\text{cl}^*(A)))$.

Definition 1.2.4

A function $f : (\Omega_1, \tau, ID) : (\Omega_2, \sigma)$ is said to be semi-I-continuous function (res. β -I-continuous) if $f^{-1}(V)$ is semi-I-open (resp. β -I-open) in Ω_1 for all open set V in Ω_2 .

Definition 1.2.5

A function $f : (\Omega_1, \tau, ID) : (\Omega_2, \sigma)$ is said to be

- i) β -irresolute if for each $V \in \beta O(\Omega_2, \sigma)$, $f^{-1}(V) \in \beta O(\Omega_1, \tau)$.
- ii) β -I-irresolute if for each $V \in \beta O(\Omega_2, \sigma)$, $f^{-1}(V) \in \beta IO(\Omega_1, \tau)$.

Definition 1.2.6 [5,6,12]

Let Ω be a set of infinite objects called Universe and R be an equal relationship to the Ω called the relationship of ignorance. This couple (U, R) is said to be a space for speculation.

Let $X \subseteq \Omega$.

- i) The minimum X in relation to R is a set of all items, which can be set for something divided as X in relation to R and it is denoted by $L_R(X)$. That is $L_R(X) = \bigcup_{x \in \theta} \{R(x) : R(x) \subseteq X\}$ where $R(x)$ denotes the equivalence class determined by X .
- ii) The upper approximation of X with respect to R is $U_R(X) = \bigcup_{x \in \theta} \{R(x) : R(x) \cap X \neq \emptyset\}$.
- iii) The boundary region of X with respect to R is the set of all objects, which can be neither in nor as not X with respect to R and it is denoted by $B_R(X)$.
That is, $B_R(X) = U_R(X) - L_R(X)$.

Definition 1.2.7 [11,12]

A space $(\Omega, \tau_R(X))$ is called a locally in discrete space if every Nano open set of Ω is Nano closed in Ω .

Josephine Rani and Bhavani

Definition 1.2.8[5]

Let $(\Omega, \tau_R(X))$ be a Nano topological space here $\mu_R(X) = \{NU(N \cap \mu) : N, N' \in \tau_R(X)\}$ and called it Microtopology of $\tau_R(X)$ by μ where $\mu \in \tau_R(X)$.

Definition 1.2.9 [4,6] Micro Topology

The Microtopology $\mu_R(X)$ satisfies the following axioms

- (i) $\Omega, \varphi \in \mu_R(X)$
- (ii) The union of the elements of any sub-collection of $\mu_R(X)$ is in $\mu_R(X)$
- (iii) The inter section of the elements of any finite sub collection of $\mu_R(X)$ is in $\mu_R(X)$.

Then $\mu_R(X)$ is called the Microtopology on Ω with respect to X . The triplet

$(\Omega, \tau_R(X), \mu_R(X))$ is called Micro topological spaces and the elements of $\mu_R(X)$ are called Microopen sets and its complement is called Micro closed sets.

Definition 1.2.10[10]

Let $(\Omega, \tau_R(X), \mu_R(X))$ be an microtopological space with an ideal ID on K . The set operator $m-cl^*$ is called a micro*-closure and is defined a $sm-cl^*(A) = A \cup A_m^*$ for $A \subseteq \Omega$.

Definition 1.2.11 [5,11]

Let $(\Omega, \tau_R(X), \mu_R(X), I)$ be an Micro-topological space with an ideal Ion $\tau_R(X)$ and if $\wp(\Omega)$ is the set of all subsets of Ω and a set operator $(\cdot)^*, m^*: \wp(\Omega) \rightarrow \wp(\Omega)$, called a local function of A with respect to $\mu_R(X)$ and I , is defined as follows: for $A \subseteq \Omega, A_m^*(I, \mu_R(X)) = \{\Omega \in \Omega \setminus U \cap A \notin I \text{ for every } U \in \mu_R(X)\}$, where $\mu_R(X) = \{U \in \mu_R \setminus U \in U\}$. Furthermore, $Cl^*(A) = A \cup A^*(I, \mu_R(X))$ defines a Kuratowski closure operator for the Micro topology μ^* , finer than μ .

A Set operator $(\cdot)^{*S}: P(\Omega) \rightarrow P(\Omega)$ is called a semi local function and Cl^{*S} of A with respect to $\mu_R(X)$ and I are defined as follows: For $A \subseteq \Omega, A_m^*(I, \mu_R(X)) = \{\Omega \in \Omega \setminus U \cap A \notin I \text{ for each semi-open } U \text{ containing } \Omega\}$ and $Cl^{*S} = A \cup A^{*S}$.

MIC-β-I-Open sets

Definition 2.1

A subset A of an ideal topological space $(\Omega, \mu_R(X), ID)$ is said to be MIC-βI-open if $A \subseteq MIC-cl(MIC-int(MIC-cl^*(A)))$. The set consisting of all MIC-βI-open set in Ω_1 will be denoted by $MIC-\beta IO(\Omega)$.

Definition 2.2

A subset A of a Micro ideal topological space $(\Omega, \mu_R(X), ID)$ is said to be MIC-semi-I-open if $A \subseteq MIC-cl^*(MIC-int(A))$.

Example 2.3

Let $\Omega = \{p, q, r, s\}, \frac{\Omega}{R}(X) = \{\{p, s\}, \{q\}, \{r\}\}, X = \{q, r\}, \tau_R(X) = \{\emptyset, \Omega, \{q, r\}\}$ with $\mu = \{s\} \notin \tau_R(X)$, $\mu_R(X) = \{\emptyset, \Omega, \{s\}, \{q, r\}, \{q, r, s\}\}, \mu_R(X) = \{\emptyset, \Omega, \{p, q, r\}, \{p, s\}, \{p\}\}, I = \{\emptyset, \{q\}, \{r, s\}\}$, MIC-semi-I open sets = $\{\emptyset, \Omega, \{r\}, \{s\}, \{p, q\}, \{p, s\}, \{q, r\}, \{p, r, s\}, \{q, r, s\}\}$.

Theorem 2.4

Let $(\Omega, \mu_R(X), ID)$ be a Micro ideal topological space,
 i) Each MIC-semi-I-open set is MIC-βI-open.
 ii) Each MIC-βI-open set is MIC-β-open.

Josephine Rani and Bhavani

Proof

(i) Let A be a subset of Ω_1 . If A is MIC-semi-I-open, then $A \subseteq \text{MIC-cl}^*(\text{MIC-Int}(A)) \subseteq \text{MIC-Int}(A) \cup (\text{MIC-Int}(A))^* \subseteq \text{MIC-Int}(A) \cup \text{MIC-cl}(\text{MIC-Int}(A)) \subseteq \text{MIC-cl}(\text{MIC-Int}(A)) \subseteq \text{MIC-cl}(\text{MIC-Int}(A \cup A^*)) \subseteq \text{MIC-cl}(\text{MIC-Int}(\text{MIC-cl}^*(A)))$. Therefore, A is a MIC- β I-open set .

(ii) Let A be a subset of Ω_1 . If A is MIC- β I-open set, then $A \subseteq \text{MIC-cl}(\text{MIC-Int}(\text{MIC-cl}^*(A))) \subseteq \text{MIC-cl}(\text{MIC-Int}(A^* \cup A)) \subseteq \text{MIC-cl}(\text{MIC-Int}(\text{MIC-cl}(A) \cup A)) \subseteq \text{MIC-cl}(\text{MIC-Int}(\text{MIC-cl}(A)))$. Therefore, A is a MIC- β I-open set. But generally the converse of this theorem is not true.

Example 2.5

Let $\Omega = \{n, o, p, q\}$, $\frac{\Omega}{R}(X) = \{\{n, q\}, \{o\}, \{p\}\}$, $X = \{o, p\}$, $\tau_R(X) = \{\emptyset, \Omega, \{o, p\}\}$ with $\mu = \{q\} \notin \tau_R(X)$, $\mu_R(X) = \{\emptyset, \Omega, \{q\}, \{o, p\}, \{o, p, q\}\}$, $\mu'_R(X) = \{\emptyset, \Omega, \{n, o, p\}, \{n, q\}, \{n\}\}$, $I = \{\emptyset, \{o\}\}$. Then we have $\{n, o\}$ and $\{n, q\}$ are MIC- β I-open sets but $\{n\}$ is not intersection of MIC- β I-open sets.

Definition 2.6

Let $(\Omega, \mu_R(X), ID)$ be a Micro ideal topological space, $A \subset \Omega$ and Ω be a point of Ω . Then

- (i) Ω is called an MIC- β I-interior point of A if there exists any $U \in \text{MIC-}\beta\text{-O}(\Omega)$ such that $\Omega \in U \subset A$.
- (ii) The set of all MIC- β I-interior point of A is called MIC- β I-interior point of A and is represented by MIC- β I-(MIC-Int(A)).

MIC- β I-Continuous Functions

Definition 3.1

A function $f: (\Omega_1, \mu_R(X), ID) \rightarrow (\Omega_2, \mu_R(Y))$ is called MIC-semi-I-continuous function (resp. MIC- β I-continuous function) if $f^{-1}(V)$ is MIC-semi-I-open (resp. MIC- β I-open) in Ω_1 for all MIC-open set V in Ω_2 .

Definition 3.2

A function $f: (\Omega_1, \mu_R(X), ID) \rightarrow (\Omega_2, \mu_R(Y))$ is called MIC- β I-continuous function (resp. MIC- β I-continuous function) if $f^{-1}(V)$ is MIC- β I-open (resp. MIC- β I-open) in Ω_1 for all MIC-open set V in Ω_2 . Generally each MIC-semi-I-continuous function is MIC- β I-continuous function, but the convers is not true as giving in next example.

Example 3.3

Let $\Omega_1 = \{e, g, h, i\}$, $\frac{\Omega_1}{R}(X) = \{\{e, i\}, \{g\}, \{h\}\}$, $X = \{g, h\}$, $\mu = \{i\}$, $\mu_R(X) = \{\emptyset, \Omega_1, \{i\}, \{g, h\}, \{g, h, i\}\}$, $\mu'_R(X) = \{\emptyset, \Omega_1, \{e, g, h\}, \{e, i\}, \{e\}\}$, $I = \{\emptyset, \{g\}\}$ and $\Omega_2 = \{j, k, l, m\}$, $\frac{\Omega_2}{R}(Y) = \{\emptyset, \Omega_2, \{j, k\}\}$, $Y = \{j\}$, $\mu = \{l\}$, $I = \{\emptyset, \{j\}, \{k\}, \{j, k\}\}$, $\mu_R(Y) = \{\emptyset, \Omega_2, \{l\}, \{j, k\}, \{j, k, l\}\}$, $\mu'_R(Y) = \{\emptyset, \Omega_2, \{l, j, m\}, \{l, m\}, \{m\}\}$. Define $f: (\Omega_1, \mu_R(X_1), ID) \rightarrow (\Omega_2, \mu_R(X_2))$ as $f(e) = j, f(g) = k, f(h) = l, f(i) = m$. Then f is MIC- β I-continuous but not MIC-semi-I-continuous because $\{j, k\}$ is MIC-open set in Ω_2 and $f^{-1}(\{j, k\}) = \{e, g\}$ which is MIC- β I-open set in Ω_1 but not MIC-semi-I-open in Ω_1 .

Theorem 3.4

For any function $f: (\Omega_1, (X), ID) \rightarrow (\Omega_2, (Y))$, the next properties are equivalent,

- 1) f is MIC- β I-continuous
- 2) For all $x \in X$ and every MIC-open set V in Y containing $f(x)$, there exists a MIC- I-open set U of Ω_1 containing x such that $f(U) \subset V$.

Proof

(1 \Rightarrow 2) Let V is MIC-open in Ω_2 such that $f(x) \in V$. Since f is MIC- β I-continuous, $f^{-1}(V)$ is MIC- β I-open set in Ω_1 . Let $U = f^{-1}(V)$. Then $f(x) \in f(U) \subset V$.

Josephine Rani and Bhavani

(2 \Rightarrow 1) Let V be MIC-open set in Ω_2 and $x \in V$. Then V is MIC-open in Ω_2 and $f(x) \in V$. From the hypothesis, there exists an MIC- β -open set U in Ω_1 containing x such that $f(U) \subset V$. Then $x \in U \in \mathcal{U}(\Omega_1)$, i.e. $f^{-1}(V)$ is MIC- β -open set in Ω_1 . Therefore, f is MIC- β -continuous.

MICR- β -I-Irresolute

MIC- β -Irresolute

If for each $V \in \text{MIC-}\beta\text{-O}(\Omega_2, \mu_R(X_2)), f^{-1}(V) \in \text{MIC-}\beta\text{-O}(\Omega_1, \mu_R(X_1))$.

Theorem 4.1.2

Every MIC-irresolute is MIC- β -irresolute.

Proof

Let f be a MIC-irresolute function. Then $f^{-1}(V)$ is MIC-semi-closed in $(\Omega_1, \mu_R(X_1), \text{ID})$, for every MIC-semi-closed in $(\Omega_2, \mu_R(X_2))$, $f^{-1}(V)$ is MIC- β -closed in $(\Omega_1, \mu_R(X_1), \text{ID})$. Therefore, f is MIC- β -irresolute function.

Remark 4.1.3.

Every MIC- β -irresolute is not MIC-irresolute.

Example: 4.1.4

Let $\Omega_1 = \{l_1, m_1, n_1, o_1\}, \frac{\Omega_1}{R}(X_1) = \{\{n_1\}, \{l_1, m_1\}, \{o_1\}\}$ with $X_1 = \{m_1, o_1\}, \mu = \{n_1\}$, Micro open set $(X_1) = \{\emptyset, \Omega_1, \{n_1\}, \{o_1\}, \{l_1, m_1, o_1\}, \{n_1, o_1\}, \{l_1, m_1\}, \{l_1, m_1, n_1\}\}$, and Micro closed set $(X_1) = \{\emptyset, \Omega_1, \{n_1\}, \{o_1\}, \{l_1, m_1, o_1\}, \{n_1, o_1\}, \{l_1, m_1\}, \{l_1, m_1, n_1\}\}$, $I = \{\emptyset, \{m_1, n_1\}\}$, and $\Omega_2 = \{l_2, m_2, n_2, o_2\}, \frac{\Omega_2}{R}(X_2) = \{\{l_2, n_2\}, \{m_2\}, \{o_2\}\}, X_2 = \{l_2, o_2\}, \mu = \{m_2\}$, Micro open set $(X_2) = \{\emptyset, \Omega_2, \{m_2\}, \{o_2\}, \{l_2, n_2, o_2\}, \{m_2, o_2\}, \{l_2, n_2\}, \{l_2, m_2, n_2\}\}$, and Micro closed set $(X_2) = \{\emptyset, \Omega_2, \{m_2\}, \{o_2\}, \{l_2, n_2, o_2\}, \{m_2, o_2\}, \{l_2, n_2\}, \{l_2, m_2, n_2\}\}$, $I = \{\emptyset, \{l_2, m_2\}\}$. Define $f: (\Omega_1, \mu_R(X_1), I_1) \rightarrow (\Omega_2, \mu_R(X_2), I_2)$ as $f(l_1) = n_2, f(m_1) = o_2, f(n_1) = m_2, f(o_1) = l_2$. Then the inverse image of each MIC- β -closed set in Ω_2 is MIC- β -closed in Ω_1 . Therefore, f is MIC- β -irresolute. But f is not MIC-irresolute because, the subset $\{l_2, m_2, o_2\}$ is MIC- β -closed in $\Omega_2, f^{-1}(\{l_2, m_2, o_2\}) = \{m_1, n_1, o_1\}$ is not MIC-semi-closed in Ω_1 .

MIC- β -I-Irresolute

If for each $V \in \text{MIC-}\beta\text{-O}(\Omega_2, \mu_R(X_2)), f^{-1}(V) \in \text{MIC-}\beta\text{-I-O}(\Omega_1, \mu_R(X_1))$.

Theorem 4.2.1

Every MIC- β -I-irresolute is MIC- β -irresolute.

Proof Let f be a MIC- β -I-irresolute function. Then $f^{-1}(V)$ is MIC- β -I-closed in $(\Omega_1, \mu_R(X_1), \text{ID})$, for every MIC- β -closed in $(\Omega_2, \mu_R(X_2))$, $f^{-1}(V)$ is MIC- β -closed in $(\Omega_1, \mu_R(X_1), \text{ID})$. Therefore, f is MIC- β -irresolute function.

Remark 4.2.2.

Every MIC- β -I-irresolute is not MIC- β -I-irresolute.

Example 4.2.3

Let $\Omega_1 = \{i_1, j_1, k_1, l_1\}, \frac{\Omega_1}{R}(X_1) = \{\{k_1\}, \{i_1, j_1\}, \{l_1\}\}$ with $X_1 = \{i_1\}, \mu = \{k_1\}$, Micro open set $(X_1) = \{\emptyset, \Omega_1, \{k_1\}, \{o_1\}, \{i_1, j_1, k_1\}, \{i_1, j_1\}\}$, and Micro closed set $(X_1) = \{\emptyset, \Omega_1, \{n_1\}, \{o_1\}, \{l_1, m_1, o_1\}, \{n_1, o_1\}, \{l_1, m_1\}, \{l_1, m_1, n_1\}\}$, $I = \{\emptyset, \{i_1, j_1\}, \{i_1, j_1\}\}$, and $\Omega_2 = \{i_2, j_2, k_2, l_2\}, \frac{\Omega_2}{R}(X_2) = \{\{i_2, l_2\}, \{j_2\}, \{k_2\}\}, X_2 = \{j_2, k_2\}, \mu = \{l_2\}$, Micro open set $(X_2) = \{\emptyset, \Omega_2, \{l_2\}, \{j_2, k_2, l_2\}, \{j_2, k_2\}\}$, $I = \{\emptyset, \{j_2\}, \{k_2, l_2\}\}$. Define $f: (\Omega_1, \mu_R(X_1), I_1) \rightarrow (\Omega_2, \mu_R(X_2), I_2)$ as $f(i_1) = k_2, f(j_1) = l_2, f(k_1) = j_2$.

Josephine Rani and Bhavani

$f(l_1)=i_2$. Then the inverse image of each MIC- β -closed set in Ω_2 is MIC- β -closed in Ω_1 . Therefore, f is MIC- β -irresolute. But f is not MIC- β -I-irresolute because, the subset $\{i_2, j_2, l_2\}$ is MIC- β -closed in Ω_2 . $f^{-1}(\{i_2, j_2, l_2\}) = \{j_1, k_1, l_1\}$ is not MIC- β -I-closed in Ω_1 .

Remark 4.2.4

We obtain the following diagram, where $A_1 \rightarrow A_2$ represents A_1 implies A_2 but not conversely.

CONCLUSION

Here's a look at some of Micro topological spaces , Let's consider something new type Micro- β -open sets in addition to describing the ongoing work of Micro- β -continuous function in MTS also discuss the properties and its use. This Paper was introduced Micro- β -I-open sets and Micro- β -I-continuity , Micro- β -I-Irresolute on MTS and investigated some of the basic structures in MTS. Various interesting problems set identified in the analysis . Future research will be considered about MTS applications.

ABSTRACT

Infectious diseases are observed to be the most important threat to human health. Majority of the presently available antibiotics have notable disadvantages in terms of antimicrobial spectrum and side effects. Over usage of such antibiotics is causing clinical resistance in microorganisms. *Siddha* system of medicines have the possibilities in combating drug-resistant pathogens. One such probable formulation in the *Siddha* system is Tablet *Linga Boopathy* which is indicated for fever, ulcer and worm infestations in *Siddha* literature. The objective of the study is to evaluate the anti-microbial efficacy of the formulation Tablet *Linga Boopathy* using Resazurin microtitre assay against the microbial strains of *Escherichia coli*, *Shigella Sonnei*, *Vibrio Cholerae* and *Candida albicans*. It was observed that the sample reveals significant action against the pathogen *Escherichia coli* with minimal inhibitory concentration value of 250 µg and *Shigella Sonnei* with the value of 500 µg with the lowest MIC values when compared to that of *Vibrio Cholerae* with minimal inhibitory concentration value of 1000 µg. Similarly, the sample demonstrate consistent anti-fungal action against *Candida albicans* with the MIC value of 500 µg. The study brings out the medical claims of the *Siddha* formulations possess dynamic antimicrobial actions and provide intense therapeutic advantages in infectious conditions.

Keywords: Antimicrobial, *Siddha* formulation, *Linga Boopathy*, Worm infestations, T.LB, *Invitro* study

Dhivya et al.,

INTRODUCTION

Recent advancements in pharmaceuticals and development for unique chemical diverseness have reinforced the attempts for analysing leads from Siddha. Numerous plant extracts have been utilized to cure helminthic infections, gastrointestinal disorders, UTI, vaginitis, cervicitis, parasitic protozoan infections, respiratory diseases and inflammatory processes[1]. Antimicrobial resistance is a global challenge responsible for the high mortality and morbidity[2]. Finding therapeutic approaches against this resistance is a substantial worldwide challenge to the medical field[3]. In *Siddha* system of medicine Tablet. *Linga boopathyis* a herbomineral formulation consisting of *Syzygium aromaticum*. Linn (Ilavangam), *Tachyspermum ammi*. Linn (Omam), Red ochre (Poonkaavi), Mercuric sulphide (Lingam), artificially processed mercuric sulphide (Rasa chenduram), Hydragyrum subchloride (Rasa karpooram). It is used in *Siddha* medicine in treating fever, worm infestations, gastric ulcer[4]. The primary aim of the study is about to evaluate the anti-microbial efficacy of the formulation Tablet *Linga boopathy* using Resazurin microtitre assay.

MATERIALS AND METHODS

Procurement of the test drug

The test drug was purchased from GMP certified company IMPCOPS and used for analysis.

Ingredients of the test drug- Tablet *Linga boopathy*

1. *Syzygium aromaticum*. Linn (Ilavangam)
2. *Tachyspermum ammi*. Linn (Omam)
3. Red ochre (Poonkaavi)
4. Mercuric sulphide (Lingam)
5. artificially processed mercuric sulphide (Rasa chenduram)
6. Hydragyrum subchloride (Rasa karpooram)

Antimicrobial activity

The bacterial species of *Escherchia coli*, *Vibrio cholerae*, *Shigella sonnei* and the fungal species of *Candida albicans* were obtained from CLATR, Sathyabama university, Tamil Nadu.

Determination of MIC (Minimum inhibitory concentration) of the siddha formulation Tablet *Linga boopathy* using Resazurin Microtitre Assay

Test was performed in a 96 well Plates under sterile technique. An aseptic 96 well plate was marked. Volume of sample in DMSO comprises of 1000 µg was pipetted into the first well of the plate and transferred to subsequent wells by half of its weight until 8th Well. Then, 50 µl of nutrient broth was added to all other wells and serially diluted it. After that, 10 µl of resazurin indicator solution was added to each well. To each well 10 µl of bacterial/ fungal suspension was added. All the plates were wrapped loosely with cling film to make sure that bacteria did not turn into dehydrated. For 24-48 hours, the plate was incubated at 37 °C. The colour change was visualised. Any colour variations from purple to pink or colourless were documented as positive. MIC value was determined from the lowest concentration at which colour change occurred.

- Standard drug Chloramphenicol (10µg) was used as a positive control to determine the bacterial pathogens sensitivity.
- Standard drug Fluconazole (20µg) was used as a positive control to determine the x fungal pathogens sensitivity.

Color (+) Positive Value indicates the pale pink color in the well – Means there is no anti-microbial activity
Pale Pink for the sample in that particular well

Color Dark (-) Negative Value indicates the pale Dark purple Colour in the well – Means there is good anti-microbial activity for the sample in that particular well
purple

Dhivya et al.,

RESULTS

It was observed from the results of the present investigation that the sample reveals convincing anti-microbial activity among all tested organisms. It was observed that the sample reveals significant activity against the pathogen *E-coli* (MIC 250 µg) and *Shigella Sonnei* -SS (MIC 500 µg) with the lowest MIC values when compared to that of *Vibrio Cholerae* – VC with MIC value of 1000 µg. Similarly, the sample demonstrate consistent anti-fungal activity against *Candida albicans* with the MIC value of 500 µg.(Table :1-3)

DISCUSSION

Antimicrobial activity of each ingredients of the *Siddha* formulation Tablet *Linga boopathy* has been considerably studied in preceding researches in current years. The ingredient *Syzygium aromaticum*. Linn (*Ilavangam*) exhibits antimicrobial activity due to the phenolic compounds mainly eugenol[5]. *Tachyspermum ammi*. Linn (*Omam*) encompasses thymol that has antifungal activity[6]. Red ochre (*Poonkaavi*) is a mineral depicted in *Siddha* literature under "*Uparasam*" class. It is used against herpes infection, bleeding disorders, vomiting, diarrhea, eye diseases and dental problems[7]. It is one of the sources of Iron. A fine powder of red ochre is prescribed for various skin conditions like leucoderma, scabies, psoriasis[8]. Mercuric sulphide (*Lingam*) is detailed in *Siddha* literature that comes under "*Pancha sootham*" and it influences on three humours, alleviates *kabam* and *pitham*. It is used in the treatment of fever, diarrhea, non healing ulcers, urticaria, eczema, scabies, leprosy, neurofibromatosis etc[7]. *Lingam* has anti-inflammatory, anti-pyretic and analgesic actions. *Linga chendooram* is the *Siddha* formulation in which *lingam* is a key ingredient, is used to treat fevers, venereal diseases and skin diseases and also has potent antibacterial actions against *E.coli*, *K.pneumoniae* and *S.aureus*. In *S.typhi* and *V.cholerae*, it shows moderate anti bacterial actions at 3mg and 4mg concentration[9]. Artificially processed mercuric sulphide (*Rasa chenduram*) has been used in traditional medicines for the treatment of pyrexia, pneumonia, neurological disorders, syphilis, paralysis of the tongue and insomnia[10]. Hydrargyrum subchloride (*Rasa karpooram*) has the therapeutic effect in venereal diseases, worm infestations, bacillary dysentery, scabies, pyrexia, syphilis, uterine cancer, chronic non healing ulcers etc[11]. *E.coli* is a gram negative, rod shaped, anaerobic coliform bacterium commonly present in humans gastrointestinal tract. This can cause food poisoning[12]. *Shigella sonnei* is a gram-negative, rod-shaped bacterium which is a causative agent of bacillary dysentery. It is transmitted through the fecal-oral route[13]. *Vibrio cholerae*, a Gram-negative bacteria which is responsible for fatal conditions like cholera and acute diarrhoea[14]. *Candida albicans* is a pathogenic yeast detected in the mouth and gastrointestinal tracts of human beings. *Candida* causes candidiasis which results in overgrowth of fungus, HIV infected patients[15]. It was observed that T.LB reveals significant anti bacterial activity against *E-coli* (MIC 250 µg), *Shigella Sonnei* (MIC 500 µg) and *Vibrio Cholerae* with MIC value of 1000 µg. Similarly, the sample demonstrate consistent anti-fungal activity against *Candida albicans* with the MIC value of 500 µg.

CONCLUSION

In this study, the *Siddha* formulation tablet *Lingaboopathy* was evaluated for its anti microbial activity. The study brings out the medical claims of the *Siddha* formulations possess dynamic antimicrobial actions and provide intense therapeutic advantages in infectious conditions like urinary tract infections, bacillary dysentery, diarrhea, cholera, candidiasis.

ABSTRACT

Let G be a connected graph. An edge pebbling move on a graph G is defined to be the removal of two pebbles from one edge and the addition of one pebble to an adjacent edge. An edge pebbling number $P_E(G)$ is defined to be the least number of pebbles such that any distribution of $P_E(G)$ pebbles on the edges of G allows one pebble to be moved to any specified, but arbitrary edge. A cover edge pebbling number $CP_E(G)$ of a graph G is defined as, however the pebbles are initially placed in the edges, the minimum number of pebbles required to place a pebble in all the edges. In this paper we find the edge pebbling number and cover edge pebbling number of the sunflower graph SF_n .

Keywords: Edge pebbling number, Cover edge pebbling number, Edge Demonic graph, Sunflower graph.

INTRODUCTION

Lagarias and Saks first suggested the game of pebbling. Later by Chung ^[1], it was introduced into the literature. Removal of two pebbles from one vertex and placement of one pebble on the adjacent vertex is called pebbling move. Given a connected graph G . The pebbling number $\pi(G)$ of G is the least number of pebbles needed in a graph G so that we can move a pebble to any arbitrary target vertex by a sequence of pebbling move whatever might be the initial configuration is. The concept of cover pebbling was first introduced by Crull ^[2]. The cover pebbling number is the least number of pebbles needed in a graph G so that we can move one pebble to all the vertices of the graph G .

Priscilla Paul and Dharani

In [3] a new concept namely edge pebbling move, edge pebbling number and cover edge pebbling number has been introduced and cover edge pebbling number for certain standard graphs namely path, complete graph, friendship graph and star graph have been determined. In edge pebbling, pebbles will be distributed on the edges of the graph instead of the vertices. An edge pebbling move is the process of removing two pebbles from one edge and placing one pebble on its adjacent edge. Edge pebbling number $P_E(G)$ is the minimum number of pebbles needed in a graph G to reach any arbitrary target edge by a sequence of edge pebbling move regardless of initial configuration of pebbles. The cover edge pebbling number $CP_E(G)$ is the least number of pebbles needed in a graph G so that we can move one pebble to all the edges of the graph G . In this paper we establish the edge pebbling number and cover edge pebbling number for Sunflower Graph (SF_n).

EDGE PEBBLING NUMBER

Definition: 2.1[3] An edge pebbling move on a graph G is defined to be the removal of two pebbles from one edge and the addition of one pebble to an adjacent edge.

Definition : 2.2[3] An edge pebbling number $P_E(G)$ is defined to be the least number of pebbles such that any distribution of $P_E(G)$ pebbles on the edges of G allows one pebble to be moved to any specified, but an arbitrary edge.

Definition:2.3 [5] A graph G is said to be edge demonic if the edge pebbling number equals the number of edges. i.e., A graph G is said to be edge demonic if $P_E(G) = q$.

Definition : 2.4 [4]A Sunflower graph consists of a wheel with n - cycle $v_0, v_1, v_2, \dots, v_n$ (v_0 is a central vertex) and additional n - vertices w_1, w_2, \dots, w_n where w_i is joined with edges to (v_i, v_{i+1}) ; $i = 1, 2, \dots, n$; $i+1$ is taken as modulo n . It is represented by SF_n .

Theorem : 2.5 The edge pebbling number of the Sunflower graph is $4n$ (i.e) $P_E(G) = 4n$ ($n \geq 3$).

Proof : To prove : $P_E(SF_n) = 4n$

Claim : $P_E(SF_n) \geq 4n$

(i,e) atleast $4n$ pebbles are required to reach the target edge.

Suppose, $P_E(SF_n) < 4n$., then $4n-1$ pebbles are enough to reach any target edge regardless of the configuration of pebbles. But on considering the worst case (i,e) placing one pebble on each edge there will be edges without pebble since the number of edges in SF_n is $4n$.

Hence $P_E(SF_n)$ cannot be less than $4n$.

Therefore, $P_E(SF_n) \geq 4n$.

Claim : $P_E(SF_n) = 4n$.

Consider the sunflower graph SF_3 ;

Let us consider the distribution of pebbles on the edges of the graph SF_3 in all possible ways.

SF₃

Distribution of pebbles for two edges by the above possible ways to reach the target edge (i,e) Placing pebbles on the edges $(e_1, e_2), (e_1, e_3), \dots, (e_1, e_{12}), (e_2, e_1), (e_2, e_3), \dots, (e_2, e_{12}), \dots, (e_{12}, e_1), (e_{12}, e_2), \dots, (e_{12}, e_{11})$ and vice versa. Distribution of

Priscilla Paul and Dharani

Pebbles for three edges by the above possible ways to reach the target edge. (i,e)Placing pebbles on the edges $(e_1, e_2, e_3), (e_1, e_2, e_4), \dots, (e_1, e_2, e_{12}), (e_2, e_1, e_3), (e_2, e_1, e_4), \dots, (e_2, e_1, e_{12}), (e_3, e_2, e_1), (e_3, e_2, e_4), \dots, (e_3, e_2, e_{12}), \dots, (e_{12}, e_1, e_2), (e_{12}, e_1, e_3), \dots, (e_{12}, e_1, e_{11}), \dots, (e_{12}, e_{11}, e_{10})$ and vice versa. Distribution of pebbles for four edges by the above possible ways to reach the target edge. (i,e) Placing pebbles on the edge $(e_1, e_2, e_3, e_4), (e_1, e_2, e_3, e_5), \dots, (e_1, e_2, e_3, e_{12}), \dots, (e_{12}, e_2, e_3, e_4), \dots, (e_{12}, e_{11}, e_{10}, e_9)$ and vice versa.

Similarly for distribution of pebbles by the above possible ways for five edges, six edges, seven edges, eight edges, nine edges, ten edges, eleven edges, twelve edges, Therefore we can reach any of the target edge of SF_3 , with 12 pebbles.
 $P_E(e_1) = 12, P_E(e_2) = 12, P_E(e_3) = 12, P_E(e_4) = 12, P_E(e_5) = 12, P_E(e_6) = 12, P_E(e_7) = 12,$
 $P_E(e_8) = 12, P_E(e_9) = 12, P_E(e_{10}) = 12, P_E(e_{11}) = 12, P_E(e_{12}) = 12.$
 Now, by the definition of edge pebbling number,
 $P_E(SF_3) = \text{Max} \{P_E(e_i) / i = 1 \text{ to } 12\} = 12$

Hence $P_E(SF_3) = 12 = 4(3).$

Since the pattern of SF_3 is same for $SF_n, \forall n \geq 4$, we can conclude that $P_E(SF_n) = 4n.$

Therefore, the edge pebbling number of the sunflower graph SF_n is $4n.$

Theorem :2.6 The Sunflower graph is an edge demonic graph.

Proof: By the definition of edge demonic graph, a graph is said to be edge demonic if the edge pebbling number equals the number of edges. The number of edges of Sunflower graph is $4n$ and by the previous theorem, $P_E(SF_n)=4n.$ Hence the number of edges of Sunflower graph equals its edge pebbling number. Therefore, The Sunflower graph is an edge demonic graph.

COVER EDGE PEBBLING NUMBER

Definition 3.1 [3] A cover edge pebbling number $CP_E(G)$ of a graph is defined as, however the pebbles are initially placed in the edges, the minimum number of pebbles required to place a pebble in all the edges.

Definition : 3.2 [3] The distance $d(x)$ of an edge x in a graph G is the sum of the distances from each of the edges of $E(G)$, where $E(G)$ is the edge set of $G.$

i.e., $d(x) = \sum_{y \in E(G)} d(y, x) \quad \forall y \in E(G), x \neq y.$

Definition : 3.3[3] Let $x \in E(G).$ Then x is called a key edge if $d(x)$ is maximum.

Procedure to find the Cover Edge Pebbling Number of a Graph:

- Step 1:** Find the key edges of the given graph. Choose any one arbitrarily.
- Step 2:** Find all the distance zero edges of the given graph from the chosen key edge
- Step 3:** The number of pebbles to be placed in the chosen edge is 2 times of the edges obtained in step 2
- Step 4:** Find all the distance one edges of the given graph from the chosen key edge
- Step 5:** The number of pebbles to be placed in the chosen edge is 2^2 times of the edges obtained in step 4
- Step 6:** Find all the distance two edges of the given graph from the chosen key edge
- Step 7:** The number of pebbles to be placed in the chosen edge is 2^3 times of the edges obtained in step 6
- Step 8:** Continue the process until all the edges are taken into consideration except the chosen key edge
- Step 9:** Place one more pebble in the chosen key edge to cover itself
- Step 10:** Sum of all the pebbles placed in the chosen key edge during the above procedure is the cover edge pebbling number of the given graph

Theorem : 3.4 The cover edge pebbling number of a sunflower graph SF_3 is 35. i.e., $CP_E(SF_3) = 35.$

Priscilla Paul and Dharani

Proof :

In Sunflower graph all the boundary edges are the key edges. Choose any one of the key edge from SF_3 . Let it be e^* . Each of the key edges are adjacent with 5 edges. To place one pebble on each of those 5 edges, $5(2) = 10$ pebbles are to be placed on e^* . Now, there are 6 remaining edges to be pebbled, which are not adjacent to e^* but adjacent with all other edges (on excluding the edge e^*). So, $6(4) = 24$ pebbles are to be on e^* to cover those 6 edges. Then one more pebble has to be placed on e^* to cover itself. Therefore, the cover edge pebbling number of a Sunflower graph SF_3 is 35.

(ie) $CP_E(SF_3) = 35$.

Theorem : 3.5 The cover edge pebbling number of a sunflower graph is 59. i.e., $CP_E(SF_4) = 59$.

Proof :

In Sunflower graph all the boundary edges are the key edges. Choose any one of the key edge from SF_4 . Let it be e^* . Each of the key edges are adjacent with 5 edges. To place one pebble on each of those 5 edges, $5(2) = 10$ pebbles are to be placed on e^* . On excluding the key edge e^* , now there are 8 edges to be pebbled. These 8 edges can be reached by crossing exactly one edge from e^* . So, $8(4) = 32$ pebbles has to be on e^* to cover those 8 edges. Now, there are 2 remaining edges to be pebbled (excluding the key edge e^*). Those 2 edges can be reached by crossing exactly two edges. Therefore, $2(8) = 16$ pebbles are to be on e^* to cover those 2 edges. Then one more pebble has to be on e^* to cover itself. Therefore, the cover edge pebbling number of sunflower graph SF_4 is 59. (ie) $CP_E(SF_4) = 59$.

Theorem : 3.6 The cover edge pebbling number of a sunflower graph SF_n is $28n-53$ ($n \geq 4$), i.e., $CP_E(SF_n) = 28n - 53$.

Proof : In sunflower graph all the boundary edges are the key edges. Choose any one of the key edge from SF_n . Let it be e^* . Each key edge is adjacent with 5 edges. Therefore, e^* is adjacent with 5 edges. Let e_1, e_2, e_3, e_4, e_5 be the 5 edges adjacent with e^* . To place one pebble on each of those 5 edges, $5(2) = 10$ pebbles are needed on e^* . On excluding the key edge e^* , now there are $4n-6$ edges to be placed. Among them $n+4$ edges are adjacent to those 5 edges e_1, e_2, e_3, e_4, e_5 . These $(n+4)$ edges can be reached by crossing exactly one edge. $\cdot 4(n+4)$ pebbles has to be on e^* to cover those

Priscilla Paul and Dharani

$(n+4)$ edges. Now there are $(3n-10)$ remaining edges to be pebbled (On excluding the key edge e^*). Those $(3n-10)$ edges can be reached by crossing exactly two edges. So, $8(3n-10)$ pebbles has to be on e^* to cover those $(3n-10)$ edges. Finally, one more pebble has to be placed on e^* to cover itself. Hence, the cover edge pebbling number of Sunflower graph SF_n is $28n - 53$.

CONCLUSION

In this paper we find the edge pebbling number and the cover edge pebbling number of the Sunflower graph.

ABSTRACT

In the present study, fifty seven genotypes of tomato (*Solanum lycopersicum* L.) were examined for correlation and path coefficient analysis on yield and yield contributing characters and design used is RBD with three replications during summer season 2023. Observation was taken from five randomly selected plants for yield and yield characters. The results shows that the fruit weight, fruit length, fruit width, pericarp thickness and lycopene content shown positive significant correlation with yield per plant. However, fruit weight has the highest positive direct effect in the path coefficient analysis, followed by number of fruits per plant, lycopene content, plant height, number of primary branches, fruit length, pericarp thickness and titrable acidity. The maximum intra cluster distance were acquired for cluster VI followed by cluster VII. The highest inter cluster distance were detected between cluster VI and VII.

Keywords: Germplasm, Genetic diversity, Phenotypic coefficient, Path coefficient and Clusters

Pavan Kumar Naik *et al.*,

INTRODUCTION

Tomato (*Solanumlycopersicum* L.) belongs to the family solanaceae. It is a self-pollinated annual crop and characterised by its $2n=2x=24$ chromosomes. It has greatest economical and nutritional value. It is commonly used as vegetable crop as both fresh fruit market and the processed food business around the world. Tomato has several used in human nutrition and consumes raw, cooked and processed into a different value added products (Kherwaet *al.*, 2023). It became more popular with consumers for their valuable properties, farmers for their high market value, and researchers for their genetic and genomic characteristics. About 90% of tomato is containing water, followed by soluble and insoluble solids (5-7%), citric acid and other organic acids. Though it is having good nutritional value, tomatoes are called as "Poor man's orange". Higher concentration of antioxidants like lycopene seen in ripened tomatoes which prevents cancers (Arya *et al.*, (2023). Scheduling of the breeding programme among the available genotypes would help from knowledge of the correlation among the characters. Valuation of genotypic and phenotypic coefficients of variation among the specific germplasm specifies the environmental effects upon the genotypes to be measured for the crop improvement. In breeding strategy, quality improvement of tomato fruits are equally important. Assessment of quality related attributes in tomato fruit shows wide genetic variation that could be used for crop improvement (Sahooet *al.*, 2022). Considerate of the genetic diversity originate in populations can be gained over correlation and path analysis. The purpose of correlation study is primarily to know about the suitability of various characters for indirect selection for one or more attributes which results in correlated response for several other attributes. Correlation coefficient helps to determine the nature and degree of relationship between any two measurable characters (Tsagayeet *al.*, 2022). Using path analysis, the correlation coefficient can be divided into direct and indirect effects on yield and yield components. The path coefficient analysis measures the separation of correlation coefficient into components of direct and indirect effects.

Crop genetic diversity should be considered a sustainable approach for a climate resilient and self-dependent production system. The higher the genetic diversity in farming land, the more chances of receiving multiple benefits in the agriculture system (Vermaet *al.*, (2023). Recent best cultivars are created by arduous selection and have been very successful in increasing phenotypic diversity as well as increased yield and productivity. Conversely, it has resulted in a perceptible loss of genetic diversity and a significant debility in landraces habit (Grozevaet *al.*, (2023). Knowledge of genetic divergence, its nature and degree is valuable for any heritable improvement programme (Spaldon and Kumar, 2017) and estimation of genetic distance is one of the suitable tools for parental selection in hybridization programme (Kumar *et al.*, (2017). Genetic divergence refers to the genetic distance between species or between populations within a species. Various observations are used to measure the genetic distance (Dar *et al.*, (2017). The significance of genetic diversity is manifest in relations of survival and adaptability of a species. For instance, a species with high genetic diversity will tend to produce a wider variety of offspring. In most of the vegetables like tomato, evaluation of genetic divergence have been proposed to provide diverse parents for getting high yielding hybrids (Sharma *et al.*, 2008). Mahalanobis D^2 statistics deals a reliable technique to estimate the genetic divergence available in the population (Mahalanobis, 1936). The present study was commenced to estimate correlation, path coefficient analysis and categorize the available germplasm into separate clusters on the basis of genetic diversity among their morphological and quality attributes using tocher method of clustering analysis of tomato germplasm.

MATERIALS AND METHODS

The experiment was conducted at Farmers field of Punganur, Chittoor district of Andhra Pradesh, India in summer season, 2023. The experimental material comprised of 57 genotypes. The experiment was laid out in Randomized Block Design (RBD) with three replications. A spacing of 60 x 30 cm and all the recommended agronomic package of practices were followed (staking, earthing up, irrigation, weeding, fertilizers applications) as recommended for commercial tomato production. The data were recorded on five randomly selected plants per replication for all the 13 characters *viz.*, plant height (cm), number of primary branches, days to 50% flowering, number of fruits per plant,

78559

Pavan Kumar Naik *et al.*,

fruit weight (g), fruit length (cm), fruit width (cm), pericarp thickness (mm), total soluble solids (°Brix), lycopene content (mg/100g), ascorbic acid (mg/100g), titrable acidity (%) and yield per plant (g).

STATISTICAL ANALYSIS

The analysis of variance was done by the method suggested by Panse and Sukhatme (1957). The GCV and PCV were calculated using the formulae of Al-Jibouriet *al.*, (1958). The direct and indirect effect were calculated through path coefficient analysis as suggested by Wright (1921) and Dewy and Lu (1959) at both phenotypic and genotypic levels. D^2 statistics was used for evaluating the genetic divergence between populations. The generalized distance between any two populations is given by formula,

$$D^2 = A = \sum \sum \lambda_{ij} \delta_{ai} \delta_{aj}$$

Where, D^2 = Square of generalized distance; λ_{ij} = Reciprocal of the common disposal matrix; $\delta_{ai} = (\mu_{i1} - \mu_{i2})$; $\delta_{aj} = (\mu_{j1} - \mu_{j2})$

μ = General mean

The germplasms of tomato were grouped on the basis of minimum generalized distance using Tocher's method as described by Rao (1952). The average inter and intra cluster distances were calculated by the formula given by Singh and Chaudhary (1979).

RESULTS AND DISCUSSIONS

Genotypic correlation coefficients for 13 characters in 57 tomato accessions

Assessment of correlation coefficient are advantageous in determining yield components which can be used for genetic enhancement of yield and it quantifies the degree of genetic and non-genetic association between two or more characters. It could be effectively exploited to formulate selection based strategies to improve the yield and yield attributing components. Genotypic correlation indicated the inherent association between genes controlling any two attributes, thus helps in effective selection scheme. Phenotypic correlation does not provide true estimates of relationship between two characters because of environment influence (Vijaylaxmi *et al.*, 2021). The research work was conducted to find out the correlation and direct and indirect effect of yield and yield attributing components of tomato through path coefficient analysis. The estimation of genotypic and phenotypic correlation coefficient presented in (Table 1). Genotypic correlation of plant height was shown positive and negative significant with number of primary branches (0.264), number of fruits per plant (0.376), fruit weight (-0.274), fruit length (-0.332), fruit width (-0.339) and total soluble solids (0.154). Number of primary branches were shown positive and negative significant with days to 50% flowering (0.303), number of fruits per plant (0.247), pericarp thickness (-0.208) and total soluble solids (0.227). Days to 50% flowering were shown positive and negative significant with fruit weight (0.225), lycopene content (0.309), ascorbic acid (0.204) and titrable acidity (0.132). Number of fruits per plant were shown only negative significant in association with fruit weight (-0.541), fruit length (-0.398), fruit width (-0.451), pericarp thickness (-0.387), ascorbic acid (0.228) and yield per plant (-0.325). Fruit weight was correlated positively with fruit length (0.781), fruit width (0.795), pericarp thickness (0.674), lycopene content (0.223) and yield per plant (0.964). Fruit length was associated positively with fruit width (0.821), pericarp thickness (0.702), lycopene content (0.311) and yield per plant (0.756). Fruit width was positively associated with pericarp thickness (0.502), lycopene content (0.188) and yield per plant (0.729). Pericarp thickness was positively associated with total soluble solids (0.197), lycopene content (0.263), ascorbic acid (0.190) and yield per plant (0.672). Total soluble solids was positively associated with lycopene content (0.490) and ascorbic acid (0.256). Lycopene content was associated with ascorbic acid (0.342), titrable acidity (0.155) and yield per plant (0.299). Similar results were observed by Kousaret *al.*, (2021), Nevani and Sridevi (2021), Dhyani *et al.*, (2022), Veera *et al.*, (2022), Singh *et al.*, (2023), Gonzalo and Nancy (2023) and Kherwa *et al.*, (2023).

Phenotypic correlation coefficients for 13 characters in 57 tomato accessions

The phenotypic correlation coefficient among various attributes shown that the most principal attribute *i.e.* plant height showed positive and negative significant correlation with number of primary branches (0.258), number of

Pavan Kumar Naik et al.,

fruits per plant (0.316), fruit weight (-0.245), fruit length (-0.313) and fruit width (-0.298). Number of primary branches showed only positive and significant correlation with number of fruits per plant (0.166) and total soluble solids (0.181). Days to 50% flowering showed positive and significant correlation with fruit weight (0.180), lycopene content (0.215), ascorbic acid (0.160) and titrable acidity (0.273). Number of fruits per plant showed positive and negative significant correlation with fruit weight (-0.510), fruit length (-0.362), fruit width (-0.398), pericarp thickness (-0.346) and ascorbic acid (0.212). Fruit weight showed positive and significant correlation with fruit length (0.755), fruit width (0.753), pericarp thickness (0.649), lycopene content (0.212) and yield per plant (0.832). Fruit length showed positive and significant correlation with fruit width (0.802), pericarp thickness (0.664), lycopene content (0.294) and yield per plant (0.652). Fruit width showed positive and significant correlation with pericarp thickness (0.464), lycopene content (0.169) and yield per plant (0.625). Pericarp thickness showed positive and significant correlation with total soluble solids (0.184), lycopene content (0.253), ascorbic acid (0.184) and yield per plant (0.585). Total soluble solids showed positive and significant correlation with lycopene content (0.453) and ascorbic acid (0.251). Lycopene content showed positive and significant correlation with ascorbic acid (0.323) and yield per plant (0.243). Similar kind of studies were observed by Vijaylaxmiet al., (2021), Kumar et al., (2021), Kumar et al., (2021), Sahooet al.,(2022), Tsagayeeet al., (2022), Kumar et al., (2023), Arya et al., (2023) and Celiket al., (2023).

Path Coefficient Analysis

The genotypic path analysis estimates in (Table 2) specified that fruit weight (1.20283) has shown the highest positive effect on yield per plant followed by number of fruits per plant (0.24551), lycopene content (0.08596), plant height (0.08224), number of primary branches (0.06716), fruit length (0.03379), pericarp thickness (0.00881) and titrable acidity (0.00594). It was also observed that the high negative effect was applied by days to 50% flowering (-0.16383), fruit width (-0.11869), total soluble solids (-0.04146) and ascorbic acid (-0.04009). Similar results were observed by Alam and Paul (2019), Gillaniet al., (2019), Kumar et al., (2020), Limbaniet al., (2020), Sushmaet al., (2020), Dhyaniet al., (2022), Kerwaet al., (2023), Arya et al., (2023), Celiket al., (2023), Singh et al., (2023). The phenotypic path analysis. It specified that there was a significant positive direct effect for fruit weight (1.00345) followed by number of fruits per plant (0.41096), pericarp thickness (0.08842), total soluble solids (0.03179), plant height (0.02969), fruit width (0.01051) and number of primary branches (0.00141). It was also observed that the high negative effect on ascorbic acid (-0.07404), days to 50% flowering (-0.05735), titrable acidity (-0.02149), lycopene content (-0.01455) and fruit length (-0.00758). similar results were observed by Alam and Paul (2019), Reddy et al., (2019), Mauryaet al., (2020), Lekshmi and Celine (2020), Vijaylaxmiet al., (2021), Kumar et al., (2021), Kerwaet al., (2023), Arya et al., (2023).

Clustering Pattern of the Tomato Genotypes

The genetic diversity for 57 germplasms of tomato was evaluated for yield and yield attributing characters by using Mahalanobis D² statistics. The clustering patterns and grouping of 57 genotypes on the basis of the D² statistics analysis has been presented in (Table 3). The genotypes was grouped into seven clusters. The highest number of clusters were seemed in cluster □ which influenced 17 genotypes viz., EC-620.88, EC-638302, EC-620378, EC-692338, EC-631359, EC-615039, EC-631406, EC-620495, EC-620484, EC-620510, EC-631957, EC-620414, EC-692347, EC-620489, EC-631409, EC-631378 and EC-688516. PH: Plant height; NPH: Number of primary branches; DFF: Days to 50% flowering; NFPP: Number of fruits per plant; FW: Fruit weight; FL: Fruit length; FWD: Fruit width; PT: Pericarp thickness; TSS: Total soluble solids; LC: Lycopene content; AA: Ascorbic acid; TA: Titrable acidity; YPP: Yield per plant; G: Genotypic; P: Phenotypic; h²: Heritability; GA: Genetic advance; GAM%: Genetic advance as percent of mean PH: Plant height; NPH: Number of primary branches; DFF: Days to 50% flowering; NFPP: Number of fruits per plant; FW: Fruit weight; FL: Fruit length; FWD: Fruit width; PT: Pericarp thickness; TSS: Total soluble solids; LC: Lycopene content; AA: Ascorbic acid; TA: Titrable acidity; YPP: Yield per plant; GCV: Genotypic coefficient of variation; PCV: Phenotypic coefficient of variation; h²: Heritability; GA: Genetic advance; GAM%: Genetic advance as percent of mean. The second highest number of genotypes were seemed in cluster □ which influenced 16 genotypes viz., EC-620552, EC-632926, EC-617055, EC-620531, EC-620543, EC-631371, EC-631369, EC-632944, EC-631401, EC-631427, EC-620425, EC-690982, EC-620382, EC-631404, EC-635533 and EC-631412. The lowest clusters were shown in cluster □ which influenced 9 genotypes viz., EC-638522, EC-620508, EC-620404, EC-636877, EC-692388, EC-620498, EC-620361, Anagha, Miryalaguda, cluster □ which influenced 6 genotypes viz., EC-615040, EC-617060, EC-631438,

**Pavan Kumar Naik et al.,**

EC-631415, EC-62516, PKM-1, cluster I which influenced 4 genotypes viz., Local Kerala, Kashi Tomato, Khorileikai, KasiAdarsh, cluster II which influenced 3 genotypes viz., EC-635526, EC-620376, EC-631351, cluster III which influenced 2 genotypes viz., EC-687604, EC-620385. Cluster I showed highest cluster mean for plant height (151.15), number of primary branches (8.16), number of fruits per plant (149.00) and ascorbic acid (26.99). Cluster VI showed highest cluster mean for pericarp thickness (5.71), total soluble solids (4.43) and lycopene content (3.72). Cluster VII showed highest cluster mean for days to 50% flowering (52.65), fruit weight (70.76), fruit length (4.86), fruit width (5.29), titrable acidity (0.56) and yield per plant (3107.30) have been given in (Table 4). Similar results were found by Thakur *et al.*, (2020), Doddamaniet *et al.*, (2022) and Vermaet *et al.*, (2023).

Intra and Inter clusters distance

The assessment of intra and inter cluster distance represented by D^2 values have been given in Table 5. The maximum intra cluster distance were acquired for cluster VI (240.37) followed by cluster VII (239.05), cluster II (227.89), cluster V (206.92) and cluster I (194.92). The minimum intra cluster D^2 values were acquired for cluster IV (83.58) and cluster III (21.55). The highest inter cluster D^2 values were detected between VI and VII (926.83) followed by cluster I and IV (696.60), cluster V and VI (690.97) and cluster I and III (645.06). The lowest inter cluster D^2 value was found between I and IV (170.68) and cluster IV and VII (202.35) (Fig. 1).

Contribution of characters towards divergence

The contribution of every character to divergence is shown in (Table 6). The character total soluble solids (21.929) contributes highest to divergence followed by yield per plant (19.422), fruit weight (14.285), titrable acidity (10.651), number of fruits per plant (10.025), pericarp thickness (9.461) and fruit length (7.393). However, days to 50% flowering (0.001), number of primary branches (0.313), fruit width (1.315), ascorbic acid (1.629) and plant height (1.879). Similar findings were observed by Kiranet *et al.*, (2017), Mishra *et al.*, (2018), Prakash *et al.*, (2019), Doddamaniet *et al.*, (2022).

CONCLUSION

Tomato is most popular vegetable cultivated by most of the farmers in India. Based on the overall results of present study, concluded that there is a significant positive correlation of yield per plant with fruit weight, fruit length, fruit width, pericarp thickness and lycopene content. The path coefficient analysis shown that the high positive direct effects towards fruit weight followed by number of fruits per plant, lycopene content, plant height, number of primary branches, fruit length, pericarp thickness and titrable acidity. Henceforth there is possibility of improvement in fruit yield by performing selection of correlated characters in tomato. Also this study reveals that significant diversity within and between the clusters were observed among the genotypes. The maximum intra cluster distance were acquired for cluster VI followed by cluster VII. The highest inter cluster D^2 values were detected between cluster VI and VII. Among the mean performance, cluster III was promising for plant height, number of primary branches, number of fruits per plant and ascorbic acid. Cluster VI was promising for pericarp thickness, total soluble solids and lycopene content. Cluster VII was promising for days to 50% flowering, fruit weight, fruit length, fruit width, titrable acidity and yield per plant.

ABSTRACT

Let G be a simple graph with vertex set $V(G)$ and edge set $E(G)$. A subset D of $V(G)$ is called a dominating set if for any v in $V-D$, there exists a vertex u in D such that u and v are adjacent. D is called a point set dominating set of G if for every subset S of $V-D$, there exists a vertex u in D such that $S \cup \{u\}$ is connected. This concept was introduced by E. Sampathkumar and L. Pushpa Latha [4]. A point set dominating set is called a strong split point set dominating set of G if $\langle V - D \rangle$ is totally disconnected with at least two vertices. A point set dominating set D of G is called super point set dominating set of G if for every v in $V-D$ there exists a vertex u in D such that $N(u) \cap (V - D) = \{v\}$. In this paper the two concepts namely strong split point set dominating sets and super point set dominating sets are studied.

Keywords: point set domination, strong split point set domination, super point set domination

INTRODUCTION

In a simple graph G , the concept of point set domination was introduced in [4]. Here two new types of point set domination namely strong split point set domination and super point set domination are introduced.

Strong split point set domination in Graphs

A subset D of $V(G)$ is called a dominating set of G if for every v in $V-D$, there exists a u in D such that u and v are adjacent. V.R. Kulli and B. Janakiram [1] introduced the concept of strong split domination. A dominating set D of graph G is a strong split dominating set of G if the induced subgraph $\langle V - D \rangle$ is totally disconnected with atleast two vertices. Analogous to strong split domination, strong split point set domination is defined.

Definition 2.1

Let G be a simple graph. A point set dominating set D of G is called a strong split point set dominating set of G if $\langle V - D \rangle$ is totally disconnected with atleast two vertices. A minimum cardinality of a strong split point set dominating set of G is called the strong split point set domination number of G and is denoted by $\gamma_p^{ss}(G)$.

Remark 2.2: There is no strong split point set dominating set for a complete graph. $\gamma_p^{ss}(G)$ for some classes of graphs.

1. $\gamma_p^{ss}(K_{1,n}) = 1$
2. $\gamma_p^{ss}(K_{m,n}) = \min(m, n)$ where $m, n \geq 2$
3. $\gamma_p^{ss}(C_n) = n - 2$, if $n \geq 4$
4. $\gamma_p^{ss}(P_n) = n - 2$, if $n \geq 3$, When $n = 2, P_n$ is complete and hence has no strong split point set dominating set.
5. $\gamma_p^{ss}(W_n) = n - 2$, if $n \geq 5$
6. $\gamma_p^{ss}(D_{(r,s)}) = \min(r, s) + 1$ if atleast one of $r, s \geq 1$

Theorem 2.3: A point set dominating set D of G is a strong split point set dominating set of G iff the following conditions hold.

- (i) if $V-D$ has atleast two vertices.
- (ii) for any two vertices u, v in $V-D$, every $u-v$ path contains a vertex of D .

Remark 2.4: The property of strong split point set dominating set of G is super hereditary iff $V-D$ has atleast three vertices.

Theorem 2.5: A strong split point set dominating set of G is minimal iff for each vertex v in D , any of the following holds.

- (i) there exists a vertex u in $V-D$ such that u is adjacent with v .
- (ii) v is an isolate vertex of $\langle D \rangle$.

Theorem 2.6: A strong split point set domination D of G is minimal iff for any u in D , any of the following holds.

- (i) u is an isolate of $\langle D \rangle$ or there exists a v in $V-D$ such that v is dominated only by u in D .
- (ii) there exists a subset T of $V-D$ such that $T \cup \{u\}$ is connected and $T \cup \{v\}$ is not connected for any v in $D - \{u\}$.
- (iii) there exists a subset T of $V - (D - \{u\})$ containing u such that for any v in $D - \{u\}$, $T \cup \{v\}$ is disconnected.
- (iv) there is a vertex v in $V-D$ such that u is adjacent with v .

Proof: Let D be a strong split point set dominating set of G . Suppose D is a minimal. Then D is 1-minimal. Therefore, for any u in D , $D - \{u\}$ is not a strong split point set dominating set of G . Hence $D - \{u\}$ is either not a point set dominating set of G (or) $D - \{u\}$ is a point set dominating set of G but not a strong split point set dominating set of G . If $D - \{u\}$ is not a point set dominating set of G , then u satisfies any of the conditions (i), (ii) and (iii). If $D - \{u\}$ is a point set dominating set of G but not a strong split point set dominating set of G , then u satisfies condition (iv).

Sumathi et al.,

Conversely if u satisfies any of the four conditions, then either $D - \{u\}$ is not a point set dominating set of G (or) $D - \{u\}$ is a point set dominating set of G but not a strong split point set dominating set of G . Therefore, D is 1-minimal and hence minimal strong split point set dominating set of G .

Theorem 2.7: Let G be a graph without isolated vertices. Then $n - \left\lfloor \frac{m}{\delta(G)} \right\rfloor \leq \gamma_p^{ss}(G)$, where n is the number of vertices of G . m is the number of edges in G .

Proof: Let D be a minimum strong split point set dominating set of G . Let $x \in V - D$. Then x is adjacent with atleast $\delta(G)$ vertices of D where $\delta(G) \geq 1$. Therefore $m \geq \delta(G) \cdot |V - D|$. Therefore $\frac{m}{\delta(G)} \geq |V - D|$. So $\left\lfloor \frac{m}{\delta(G)} \right\rfloor \geq |V - D| = n - \gamma_p^{ss}(G)$. Therefore $\gamma_p^{ss}(G) \geq n - \left\lfloor \frac{m}{\delta(G)} \right\rfloor$. Hence $n - \left\lfloor \frac{m}{\delta(G)} \right\rfloor \leq \gamma_p^{ss}(G)$.

Definition 2.8: A subset S of $V(G)$ is called a strong set independent of G if for any subset T of S with $|T| \geq 2$, T is disconnected.

Theorem 2.9: Let G be a graph with atleast 3 vertices without set-isolates. Then $\gamma_p^{ss}(G) = \alpha_0(G)$.

Proof: Let S be a maximum independent set of G . Since S is independent, T is independent. Therefore $T \cup \{u\}$ is independent for any u in S and hence $T \cup \{u\}$ is disconnected for any u in S . Since G has no set-isolates, there exists u in $V - S$ such that $T \cup \{u\}$ is connected. Therefore $V - S$ is a point set dominating set of G . Since S is totally disconnected, $V - S$ is a strong split point set dominating set of G . Therefore $\gamma_p^{ss}(G) \leq |V - S| = n - |S| = n - \beta_0(G) = \alpha_0(G)$. Therefore $\gamma_p^{ss}(G) \leq \alpha_0(G)$. Since by theorem 2.5, $V - S$ is a minimal strong split point set dominating set of G . Suppose D is a minimum strong split point set dominating set of G . Then $V - D$ is a totally disconnected set of G . Therefore $|V - D| \leq \beta_0(G)$. Therefore $n - \gamma_p^{ss}(G) \leq \beta_0(G)$. Therefore $n - \beta_0(G) \leq \gamma_p^{ss}(G)$. That is, $\alpha_0(G) \leq \gamma_p^{ss}(G)$. Hence $\gamma_p^{ss}(G) = \alpha_0(G)$.

Corollary 2.10: $\gamma_p^{ss}(G) = \alpha_0(G) = n - \beta_0(G)$. $\beta_0(G) \geq \gamma(G) \geq n - m$. Therefore $n - \beta_0(G) \leq m$. Hence $\gamma_p^{ss}(G) \leq m$.

Remark 2.11: $\gamma_p^{ss}(G) \geq \gamma_{ss}(G)$.

Theorem 2.12: Let G be a connected graph. Then $\lfloor \text{diam}(G) + 1 \rfloor \leq \gamma_p^{ss}(G)$.

Proof: From Theorem 9[1], $\lfloor \text{diam}(G) + 1 \rfloor \leq \gamma_{ss}(G)$. Hence $\lfloor \text{diam}(G) + 1 \rfloor \leq \gamma_{ss}(G) \leq \gamma_p^{ss}(G)$.

Theorem 2.13: Let H be any spanning subgraph of G without isolates. Then $\gamma_p^{ss}(H) \leq \gamma_p^{ss}(G)$.

Proof: Since H is a spanning subgraph of G without isolates, $\beta_0(H) \geq \beta_0(G)$. Therefore $\alpha_0(H) \leq \alpha_0(G)$. Since H has no isolates, G has no isolates. Therefore $\gamma_p^{ss}(H) = \alpha_0(H) \leq \alpha_0(G) = \gamma_p^{ss}(G)$.

Theorem 2.14: Let D be a strong split point set dominating set of G . If $\langle D \rangle$ is complete, then $\text{diam}(G) \leq 3$.

Proof: Let D be a strong split point set dominating set of G and $\langle D \rangle$ is complete. Then D is a strong split dominating set of G with $\langle D \rangle$ is complete. Therefore, by theorem 11[1], $\text{diam}(G) \leq 3$.

Theorem 2.15: Let G be a graph with $\Delta(G) \leq n - 2$. Then $\gamma_p^{ss}(\bar{G}) \geq \beta_0(G) - 1$.

Proof: Since $\Delta(G) \leq n - 2$, \bar{G} has no isolates. Therefore $\gamma_p^{ss}(\bar{G}) = \alpha_0(\bar{G}) = n - \beta_0(\bar{G}) = n - \omega(G)$. Since $\omega(G) \leq \alpha_0(G) + 1$, $\gamma_p^{ss}(\bar{G}) \geq n - (\alpha_0(G) + 1) = \beta_0(G) - 1$.

Theorem 2.16: Let G be a connected graph. Let S be a subset of $V(G)$ with atleast two vertices such that $\langle S \rangle$ is complete and for any vertex v in S , $\{v\} \cup T$ is not connected for any $T \subset V - S$, Then $V - S$ is a strong split point set dominating set of \bar{G} .

Proof: By hypothesis, $\langle S \rangle$ is totally disconnected in \bar{G} . Also for any $T \subset V - S$, there exists v in S such that $T \cup \{v\}$ is connected in \bar{G} . Therefore $V - S$ is a strong split point set dominating set of \bar{G} .

Theorem 2.17: Let G and \bar{G} have no isolates. Then $\gamma_p^{ss}(G) + \gamma_p^{ss}(\bar{G}) \leq n - 2 + \alpha_0(G)$.

Sumathi et al.,

Proof: Since G and \bar{G} have no isolates, $\gamma_p^{ss}(G) = \alpha_0(G)$ and $\gamma_p^{ss}(\bar{G}) = \alpha_0(\bar{G})$. Therefore $\gamma_p^{ss}(G) + \gamma_p^{ss}(\bar{G}) = \alpha_0(G) + \alpha_0(\bar{G}) = \alpha_0(G) + n - \beta_0(\bar{G}) = \alpha_0(G) + n - \omega(G)$. Since G has no isolates, $\omega(G) \geq 2$. Therefore $\gamma_p^{ss}(G) + \gamma_p^{ss}(\bar{G}) \leq n - 2 + \alpha_0(G)$.

Super point set domination in Graphs

A subset D of $V(G)$ of a simple graph G is called a super dominating set if for every v in $V-D$, there exists a u in D such that $N(u) \cap (V - D) = \{v\}$. The minimum cardinality of a super dominating set of G is called super domination number of G [3]. Similar to this concept super point set domination is introduced.

Definition 3.1: A point set domination D of G is called a super point set dominating set of G if for every u in $V-D$, there exists a vertex v in D such that $N(v) \cap (V - D) = \{u\}$. The minimum cardinality of super point set dominating set of G is denoted by $\gamma_p^s(G)$.

Observation 3.2: Super point set dominating property is super hereditary. Hence a super point set dominating set of G is minimal iff it is 1-minimal.

$\gamma_p^s(G)$ of some classes of graphs:

1. $\gamma_p^s(G)(K_n) = n - 1$
2. $\gamma_p^s(G)(K_{1,n}) = n$
3. $\gamma_p^s(G)(K_{m,n}) = m + n - 2$
4. $\gamma_p^s(G)(P_n) = n - 2, \text{ if } n \geq 4 \text{ and } 2 \text{ if } n = 2$
5. $\gamma_p^s(G)(C_n) = n - 2, n \geq 4$
6. $\gamma_p^s(G)(W_n) = n - 1$

$$7. \gamma_p^s(D_{r,s}) = \begin{cases} 1 & \text{if } r = s = 0 \\ 2 & \text{if either of } r, s \text{ is } 1 \text{ and the other is } 0 \text{ (or) } r = s = 1 \\ 3 & \text{if } r \geq 1, s = 0 \\ r + s & \text{if } r, s \geq 1 \end{cases}$$

Observation 3.3: (i) $\gamma_p^s(G) \geq \gamma_p(G)$

(ii) $\gamma_p^s(G) \geq \frac{n}{2}$

Proof: If D is a $\gamma_p^s(G)$ of G , then $|D| \geq |V - D|$. That is $\gamma_p^s(G) \geq n - \gamma_p^s(G)$. Therefore $\gamma_p^s(G) \geq \frac{n}{2}$

(iii) $\gamma_p^s(G) \geq \gamma_{sp}(G)$.

Definition 3.4: A super point set dominating set D of G is perfect if $E(D, V-D)$ is a perfect matching.

Observation 3.5: $\gamma_p^s(G) = 1$, iff $G = K_1$ or K_2 . Also $\gamma_p^s(G) = n$ iff $G = \bar{K}_n$. Hence for a connected graph G , $\frac{n}{2} \leq \gamma_p^s(G) \leq n - 1$.

Theorem 3.6: For any connected graph G , $\gamma_p^s(G) = \frac{n}{2}$ iff every minimum super point set dominating set is a perfect set.

Proof: Let D be $\gamma_p^s(G)$ –set of G . If D is perfect then $|D| = |V - D|$. Therefore $\gamma_p^s(G) = \frac{n}{2}$. Conversely suppose $\gamma_p^s(G) = \frac{n}{2}$. Let D be a minimum super point set dominating set of G . Suppose there exists a vertex z in D such that $|N(z) \cap (V - D)| > 1$. Since for every vertex u in $V-D$, there exists a vertex v in D such that $|N(v) \cap (V - D)| = \{u\}$ and since $|N(z) \cap (V - D)| > 1$ we obtain $|D| > |V - D|$. Therefore $\gamma_p^s(G) > n - \gamma_p^s(G)$. So $2\gamma_p^s(G) > n$. Therefore

Sumathi et al.,

$\gamma_p^s(G) > \frac{n}{2}$, a contradiction. Hence $|N(z) \cap (V - D)| \leq 1$, for every z in D . Suppose there exists a vertex z in D , such that $|N(z) \cap (V - D)| = 0$. Since $|D| = |V - D|$, there exists a vertex w in D such that $|N(w) \cap (V - D)| > 1$, a contradiction. Therefore, every vertex of D has a unique neighbour in $V-D$. Suppose there is a vertex u in $V-D$ such that $|N(u) \cap D| > 1$. Then either $|D| > \frac{n}{2}$ or there exists a vertex in D which has more than one neighbour in $V-D$, a contradiction. Therefore, every vertex in $V-D$ has a unique neighbour in D . Therefore, D is a perfect set.

Observation 3.7: Let G be a connected graph in which there exists two vertices x, y which have a common neighbour. Also there exist z_1, z_2 in $(V(G) - \{x, y\})$ such that $x \in N(z_1)$ and $y \notin N(z_1), x \notin N(z_2)$ and $y \in N(z_2)$. Then $\gamma_p^s(G) \leq n - 2$.

Proof: Let z be a common neighbour of x and y . Then $(V(G) - \{x, y\})$ is a point set dominating set of G . Since by hypothesis, there exist z_1, z_2 such that $x \in N(z_1)$ and $y \notin N(z_1), x \notin N(z_2)$ and $y \in N(z_2)$. Therefore $(V(G) - \{x, y\})$ is a super point set dominating set of G . Hence $\gamma_p^s(G) \leq |V(G) - \{x, y\}| = n - 2$.

Definition 3.8: u is a semiuniversal vertex in G if any vertex $v \neq u, v$ is either adjacent with u or have a common neighbour with u .

Observation 3.9: If G is a connected graph with the property that every vertex of G is either universal or semiuniversal, then it is not necessary that $\gamma_p^s(G) = n - 1$.

For example, Let G be a graph with $V(G) = \{x_1, x_2, \dots, x_k, y_1, y_2, \dots, y_k, u\}$ and $E(G) = \{x_i y_i, 1 \leq i \leq k\} \cup \{u x_i, u y_i, 1 \leq i \leq k\}$. G is connected, u is a universal vertex and all other vertices are semiuniversal. Let $D = \{x_1, x_2, \dots, x_{k-1}, y_2, y_3, \dots, y_k, u\}$. Then $V - D = \{x_k, y_1\}$. D is a point set dominating set of G . For x_k in $V-D$, there exists y_k in D such that $N(y_k) \cap (V - D) = \{x_k\}$ and for y_1 in $V-D$, there exists x_1 in D such that $N(x_1) \cap (V - D) = \{y_1\}$. Hence D is a super point set dominating set of G . Therefore $\gamma_p^s(G) \leq n - 2$.

Observation 3.10: If G is a connected graph with atleast two vertices, then $\gamma_p^s(G) \leq 2m - n + 1$. If $\gamma_p^s(G) = 2m - n + 1$, then G is a tree.

Proof: If G is a connected graph, then $m \geq n - 1$. Also $\gamma_p^s(G) \leq n - 1 = 2(n - 1) - n + 1 \leq 2m - n + 1$. Suppose $\gamma_p^s(G) = 2m - n + 1$. Therefore $2m - n + 1 \leq n - 1$. $2m \leq 2n - 2$. $m \leq n - 1$. Since G is connected, $m \geq n - 1$. Therefore $m = n - 1$. Therefore G is a tree.

Theorem 3.11: For any graph $G, \gamma_p^s(G) \geq n - \frac{1}{2} - \sqrt{\frac{2n^2 - 2n - 4m + 1}{4}}$ and the bound is sharp.

Proof: Let D be a $\gamma_p^s(G)$ -set of G . Since D is a super point set dominating set of G , for every u in $V-D$, there exists v in D such that $N(v) \cap (V - D) = \{u\}$. v is not adjacent with $n - |D| - 1$ vertices of $V-D$. Since there are $n - |D|$ vertices in $V-D$, there are $n - \gamma_p^s(G)$ vertices of D such that each of these vertices is not adjacent with $n - \gamma_p^s(G) - 1$ vertices of $V-D$. Therefore $m \leq n c_2 - (n - \gamma_p^s(G))(n - \gamma_p^s(G) - 1)$

$$= \frac{n(n - 1)}{2} - (n^2 - n\gamma_p^s(G) - n - n\gamma_p^s(G) + (\gamma_p^s(G))^2 + \gamma_p^s(G)).$$

$$(\gamma_p^s(G))^2 - 2n\gamma_p^s(G) + \gamma_p^s(G) \leq \frac{n(n - 1)}{2} - (n^2 - n) - m = \frac{n^2}{2} - \frac{n}{2} - n^2 + n - m = \frac{n}{2} - \frac{n^2}{2} - m.$$

$$(\gamma_p^s(G))^2 + (1 - 2n)\gamma_p^s(G) - \frac{n}{2} + \frac{n^2}{2} + m \leq 0.$$

Let $\gamma_p^s(G) = x$. Therefore $x^2 + (1 - 2n)x - \frac{n}{2} + \frac{n^2}{2} + m \leq 0$.

Sumathi et al.,

Therefore
$$x = \frac{-(1-2n) \pm \sqrt{(-2n+1)^2 - 4(1)(-\frac{n}{2} + m + \frac{n^2}{2})}}{2} = \frac{(2n-1) \pm \sqrt{4n^2 + 1 - 4n + 2n - 4m - 2n^2}}{2} = n - \frac{1}{2} \pm \sqrt{\frac{2n^2 - 2n - 4m + 1}{4}}$$

Therefore $\gamma_p^s(G)$ lies between $n - \frac{1}{2} - \sqrt{\frac{2n^2 - 2n - 4m + 1}{4}}$ and $n - \frac{1}{2} + \sqrt{\frac{2n^2 - 2n - 4m + 1}{4}}$. Therefore $\gamma_p^s(G) \geq n - \frac{1}{2} - \sqrt{\frac{2n^2 - 2n - 4m + 1}{4}}$.

$\ln C_4, \gamma_p^s(G) = 2$. RHS = $n - \frac{1}{2} - \sqrt{\frac{2n^2 - 2n - 4m + 1}{4}} = 4 - \frac{1}{2} - \sqrt{\frac{[32 - 8 - 16 + 1]}{4}} = 4 - \frac{1}{2} - \frac{3}{2} = 2$.

Hence the bound is sharp.

Theorem 3.12: For any graph G, $n \leq \gamma_p^s(G) + \gamma_p^s(\bar{G}) \leq 2n - 1$.

Proof: $\gamma_p^s(G) \geq \frac{n}{2}$. Therefore $\gamma_p^s(G) + \gamma_p^s(\bar{G}) \geq n$. For a graph G, $\gamma_p^s(G) = n$ iff $G = (\bar{K}_n)$. If G or \bar{G} is \bar{K}_n , then \bar{G} or G has at least one edge. In that case $\gamma_p^s(\bar{G})$ or $\gamma_p^s(G) \leq n - 1$. Therefore $\gamma_p^s(G) + \gamma_p^s(\bar{G}) \leq n + n - 1 = 2n - 1$.

Remark 3.13: (i) If $G = K_n$, then $\gamma_p^s(G) = n - 1$ and $\gamma_p^s(\bar{G}) = n$. Therefore $\gamma_p^s(G) + \gamma_p^s(\bar{G}) = 2n - 1$.

(ii) When $G = P_4$, $\gamma_p^s(G) = 2 = \gamma_p^s(\bar{G})$ (since \bar{G} is P_4). Therefore $\gamma_p^s(G) + \gamma_p^s(\bar{G}) = 4 =$ number of vertices of P_4 . Hence the bounds above are sharp.

Theorem 3.14: Let T be a tree with atleast 3 vertices. Then $\frac{n}{2} \leq \gamma_p^s(T) \leq n - s_1$, where S is the set of supports of T such that any subset of S is connected and S is of maximum cardinality and $s_1 = |S|$.

Proof: Let D = V-S. Then D is a point set dominating set of G and it is also super. Therefore $\gamma_p^s(T) \leq |D| = n - |S| = n - s_1$. Clearly $\frac{n}{2} \leq \gamma_p^s(T)$.

Example: (i) Let $T = P_3, S = \{u\}$ where u is the centre of T. $\gamma_p^s(T) = 2 = 3 - 1 = 3 - |S| = 3 - s_1$.

(ii) Let $T = K_{1,n}, n \geq 2, S =$ The set contains the center vertex of T. $\gamma_p^s(T) = n, s_1 = 1, |V(T)| = n + 1$. Therefore $\gamma_p^s(T) = |V(T)| - s_1$.

ABSTRACT

Adolescent idiopathic scoliosis (AIS) is a deformity of the coronal plane of the spinal column that can be brought on by poor posture, carrying heavy backpacks, not exercising, and a host of other factors. It affects the entire spine's structure and shape, resulting in postural deformity, low back pain, decreased cardiopulmonary function, and a decreased quality of life (QOL). Isometrics and other exercises are used in the Schroth method, one of the most well-liked and effective scoliosis treatment techniques, to help patients maintain proper posture. An thorough literature evaluation was conducted to synthesize current information addressing the use of Schroth exercises in the management of adolescent idiopathic scoliosis.

Keywords: Adolescent idiopathic scoliosis, Scoliosis, Schroth exercises, Rehabilitation, AIS

Simi Hazarika et al.,

INTRODUCTION

Adolescent idiopathic scoliosis (AIS) is a most prevalent types of structural spinal column deformities and it affects the whole spine shape and condition of the thorax, trunk and posture.[1]The study reports that the incidence of AIS is approximately 2% every year, and the prevalence in the adolescent population has been reported as high as 5.2%.[2] Scoliosis is very common nowadays among adolescent may be due to faulty posture, heavy bag-packs, lack of exercises, using smartphones for a long period of time and many more reasons. Despite of unknown reasons, scoliosis is related to muscular imbalance, genetic factors, poor posture and insufficient exercise. The most common physical problems caused by these factors include deformation of spine and structure of the spinal column, altered characteristics of erector spinae muscle, lower back pain, decreased flexibility of spine, deformity of the thorax and thoracic spine and decreased cardiopulmonary function.[3]Prevention of adolescent idiopathic scoliosis is carried out through early screening, regular health checkups, posture education and awareness programs, sports activities and physical education classes and regular exercises.[4]The aim of exercise therapy is to correct posture, improve spine flexibility, correct muscular imbalance and improve cardiopulmonary function. However, without a proper medical and physical assessment and a detailed radiological diagnosis, excessive and inappropriate exercise may interfere with treatment and exacerbate the condition.[5]Study suggest that there are several physical therapies approaches which is designed to prevent and correction of scoliosis and Schroth method is one of the popular and most successful method in the treatment of scoliosis. Isometric exercises and other active and passive exercises are used in the Schroth exercises, a non-surgical physiotherapy strategy created by Katharina Schroth in 1920, to preserve proper posture.[6]The Schroth exercise program includes mirrors, isometric exercises, and other exercises to stretch or strengthen the asymmetrical muscles while maintaining a particular breathing pattern. It also includes posture correction with the aid of sensory, motor, and kinesthetic stimulation.[7]There are a lot of studies on adolescent idiopathic scoliosis and how well Schroth exercises work to correct it, but there aren't many that combined this information into a comprehensive evaluation of the literature.

MATERIALS AND METHODS

An extensive summary of the Schroth physiotherapeutic technique is given in this study for the treatment of AIS in adolescents. We conducted a thorough analysis of pertinent Schroth techniques, evaluated the body of research on their efficacy, and considered future directions for the study of Schroth physiotherapeutic approach in the management of adolescent idiopathic scoliosis.

Source

This study included earlier research, published from 2013 to August 2023, on the use of Schroth exercises in the treatment of scoliosis. This study is based on an extensive search for relevant literature conducted through PubMed, Google Scholar, PEDro, and COCHRANE. The search was conducted using a variety of keywords, including adolescent idiopathic scoliosis, AIS, scoliosis, and Schroth exercises, as well as word combinations.

Study Selection

These 20 literary works were chosen based on the subsequent inclusion criteria:

- Scoliosis and adolescent idiopathic scoliosis should be the focus of the study.
- The studies needed to look into how well Schroth exercises work in AIS.
- Systematic reviews, meta-analyses, and randomized control trials that examine how well Schroth exercises treat AIS or scoliosis.
- Articles published in English language.

DISCUSSION

Adolescent Idiopathic Scoliosis (AIS) and its management has remained a topic of continuous research and debate within the orthopedic and physiotherapy professionals. Adolescent Idiopathic Scoliosis and the recent interest in Schroth exercises, incorporated in their non-invasive nature and potential multifarious benefits, has added another layer of depth to the ongoing debate. Our review of literature on last decade's literature presents several key intuitions and also identifies different areas needing further investigation. According to Tugba Kuru Çolak et al.'s randomized trial, mild to moderate idiopathic scoliosis in adolescents can be effectively stopped and long-term improvement maintained with the right conservative physical therapy treatment. As a result, the results imply that the Schroth Best Practice Program improves idiopathic scoliosis [10]. According to a study by Pil-Neo Hwangbo and Kyoung-Don Kim, a patient with idiopathic scoliosis had notable effects on their vital capacity, Cobb's angle, and thoracic trunk inclination. The Schroth exercise's effects were what caused the improvement [11]. According to Jae-Man Yang et al., adults with idiopathic scoliosis may benefit from a reduction in Cobb's angle and the rib hump by the sequential administration of stretching, Schroth, and strengthening exercises [12]. According to Luis Ceballos-Laita et al.'s interpretation of the study, the Schroth method used alone can improve the quality of life (QoL) and reduce the Cobb angle and trunk rotation angle in adolescents with idiopathic scoliosis [13].

According to ArashKhaledi et al., AIS was found to be improved by both Schroth and SEAS exercises; this effect was more pronounced in the Schroth method trial [14]. According to Vanja Dimitrijevic et al.'s randomized controlled experiment, adding short-term Schroth physiotherapeutic exercises tailored to scoliosis-specific exercise regimen to standard therapy resulted in a significant improvement over standard care alone [15]. According to a research by Jae Yong Park et al., regardless of the degree of scoliosis, the Schroth Rehabilitation Exercise program caused distinct modifications in lumbar lordosis, calcaneal valgus angle, and scoliometer readings [16]. According to Min-Jae Kim and Dae-Sung Park, SERME may be a more successful technique for enhancing Cobb's angle and pulmonary function in scoliosis patients [17]. After examining publications, Joo-Hee Park et al. did a meta-analysis and found that the Schroth exercise had a large overall effect size. All things considered, schroth exercise is a suggested course of treatment for scoliosis sufferers [18]. According to ShkurtaRrecaj-Malaj et al., adolescents with mild to severe idiopathic scoliosis may improve from a 24-week regimen of combined Schroth and Pilates exercises in terms of their Cobb angle, ATR, chest expansion, trunk flexion, and quality of life [19]. After examining publications, Marlette Burger et al. did a systematic review and meta-analysis and found that the study indicates that Schroth exercises significantly lower the Cobb angle and enhance quality of life in teenagers with idiopathic scoliosis [20]. According to Ang Gao et al., Schroth exercises enhanced cervical spine alignment, shoulder balance, and health-related quality of life (HRQOL) in addition to stopping the progression of curves [21]. In contrast to the Schroth exercises, R.A. Mohamed and A.M. Yousef found that PNF patterns did not significantly enhance angle trunk rotation, which is a crucial component in curve correction.²²

CONCLUSION

The potential of Schroth exercises in the management of AIS is evident from the available literature, according to the literature review for the current study. For AIS sufferers, the treatment's non-invasiveness combined with its apparent psychological and physical advantages make it a fortunate choice. To optimize the results for AIS patients, more research is necessary, particularly large-scale trials, a clear procedure, and the combination of Schroth with other well-proven treatments.

ABSTRACT

Badminton has evolved significantly in modern world and has become a highly competitive sport worldwide. Despite advancement in sports science and injury prevention, this sport still carries risk of injuries especially in competitive play and intense training. Understanding the concept of modern technologies for injury prevention in badminton players, requires a comprehensive theoretical framework that incorporates sports science, sports medicine and technology. To reduce this gap this review aimed to design theoretical framework to grasp the concept.

Keywords: badminton, injury, prevention, technologies, artificial intelligence, machine learning

INTRODUCTION

Badminton is a racquet sport that traces its origins back several centuries. The game's roots can be found in various ancient civilizations and cultures that played similar racket games. Racket games with shuttlecocks existed in ancient civilizations like China, Greece, and India. It is considered to be the one of the fastest racquet sports as well. The players must have good strength, reaction time, motor coordination, speed, agility, precision and aerobic stamina. There is no gender discrimination to play this sport. There are five main events at the completion level for this sport, i.e., men's singles, women's singles, men's doubles, women's doubles and mixed doubles[1] Badminton is non-contact sport having dynamic and high-intensity nature, which puts significant stress on the body, leading to various types of injuries. Badminton, like any other sport, carries a risk of injuries. The prevalence rate for risk of injury in badminton is around 0.85 per year [2] , 1.6 to 2.9 injuries per 1000 hours of play [3], 2 to 5 injuries in 1000 players [4]. All these badminton injuries contribute around 1% to 5% of all the sport injuries (Kroner K et al, 1990). Some common injuries include, ankle sprains and strains, knee injuries, shoulder injuries, back injuries, Wrist and elbow

78584

**Agnel Prinson et al.,**

injuries. The most of the injuries are overuse injuries. The overuse of the backhand and forehand strokes can exert more pressure on the upper limb. The players overuse upper limb, axial skeleton and lower limb during the high intensity games and leads to overuse injuries. Quick change in direction, lunges, diving movements, jumps lead to the traumatic injuries to the joints and muscle-tendons. Although contact between players is rare but sometimes collision between the players also lead to certain traumatic injuries⁵. The gender, age, and skill level also influence the risk and type of injury. Male players have been injured frequently than female players but the participatory rate in men is more, so the incidence rate is considered to be almost same. The injury rate for male and female is 0.09 and 0.14 per person in per year respectively [5]. The older aged badminton players have more prone to the injuries and the beginners show more injury than the elite players. The 74% of the injuries in badminton is overuse injuries; the lower limb accounts for 58 to 76% of injuries, the upper limb accounts for 19 to 32% and 11 to 16% of back injuries. And the 42% of eye injuries are also seen in racquet sports [6]. Accurate measurement of physical activity and physical health is critical for better health and the effectiveness of intervention program [7]. It will help to gather and analyze human body and sports data, we will be providing effective advice and assistance to athletes in sports and health⁸. Real-time monitoring of their health and exercise status can assist people in adjusting their exercise intensity or amount in time based on their daily exercise situation, avoiding physical discomfort caused by excessive or insufficient exercise, and reminding themselves to improve their exercise status in time and maintain a healthy body and healthy life. Enthusiasts and professional players are involved in the process of sports, and sports risk factors are frequently generated by the combination of numerous aspects.

Traditional sports injury risk assessment approaches are sport-specific, with a restricted risk calculation scope [7]. In order to cover the gaps left by conventional statistical approaches, data science has developed as a strategic field to use knowledge in sports science. Since it requires expertise on how to integrate statistical and computational tools into a bigger framework, problem by problem, and to answer discipline-specific questions, data science is more than just the combination of statistics and computer science [9]. The Internet of Things emerging in strategic industry. Based on this setting, the Internet of Things application has enormous potential and area[10]. In recent years, the Internet of Things technology has progressively grown, focusing on sensors, software, and so on, while also supporting equipment for the Internet of Things has rapidly developed, particularly the rapid development of fundamental equipment such as smart circuits and transmission networks. The widespread use of modern Internet of Things technologies may bring tremendous technical improvements to sports event research and development, as well as thoroughly boost the growth of sports events as well as the performance evaluation[11]. The development of software and data analytics programmes along with the usage of technologies and wearable devices have drastically changed the role of sports technology in injury detection and prevention. Utilising emerging technologies to better understand and treat patients has become a growing emphasis of healthcare over the past few decades[12].

INJURY PREVENTION BASED ON ADVANCED METHODS**Edge computing**

The goal of edge computing is to describe the fundamental network, computing, storage, and application capabilities as a distributed open platform and integrate them into the data source's network edge [13]. The edge computing is growing rapidly. It builds a network edge computing by merging the five resources of network, processing, storage, application, and intelligence. The demand for the large storage data is also increasing along with the computing speed and power[14]. Prior to the development of edge computing, traditional cloud computing used the network to send all data to the cloud computing centre and employed a centralised approach to problem-solving for processing and storage. Cloud computing will place a lot of pressure on the system because of the massive volume of data that linked devices generate and transfer to the cloud. At this moment, edge computing is necessary to share the burden of the cloud and manage tasks that fall within its boundaries [15]. Cloud computing technology offers customers with nearly limitless processing capacity via several high-performance servers installed in a data center. Mobile edge computing has the potential to successfully address the issue of excessive network load caused by the rapid expansion of mobile Internet and Internet of things[16].

**Agnel Prinson et al.,**

Smart terminals, multi- access edge computing (MEC) equipment and clouds data center are the major three components of the edge computing. The MEC network architecture's cloud data center performs the same tasks as the standard cloud computing network architecture's cloud data center. It is primarily responsible for huge data storage, data integration, data mining, and worldwide sharing of data. The MEC can be applied through five computing components[13]. (figure-1) The edge computing is having more benefits such as reducing the delay and reducing the energy consumption and also, it is low cost with good scalability. Edge computing gives easiest mode of implementation when compared to another computing method (Yu Wang, 2023). Computing and storage capabilities are delegated to the mobile network's edge, such as base stations and wireless access points, in the MEC network design. Mobile devices can offload application activities for processing to adjacent computing nodes, resulting in low-latency and high-reliability computing services[17]. (figure-2) Sports biomechanics innovation has also led to new developments in the practical application of sports biomechanics. The newness of its application model is biomechanics diagnostic technology. It obtains the collecting of information on the competition venue and training venue, as well as the evaluation of athletes' overall sports status, using a big data platform and high-speed networked information methods. The edge computing performs in the sports environment as: [18,19](figure-3)

With the help of edge computing, the injuries can be prevented. A study has been done in preventive treatment of ankle injury in badminton players using the edge computing. The edge computing model and the firework algorithm are the different type of edge computing methods. This can also be used to assess the badminton related performance.

The study shows the measures to prevent the ankle injury.

- Need to improve the physical fitness
- Mastering of the proper badminton techniques
- Sufficient preparations before exercise

The edge computing provides the factors that contributing to ankle injury and the ways to prevent them. The data generated by edge computing will be accurate and it can be referred for the ideal biomechanics while playing badminton[17].

Internet of things and wireless sensor

Coaches evaluates and assess the badminton players' performances. However, it has drawbacks like the coaches' expertise and experience. The assessments provided by sensor-based systems can be more precise while remaining not visible to coaches. The internet of things (IoT) principle underlies how the sensor system operates. In this instance, the performance is captured on camera, and the data is then Bluetooth-transferred to the smartphone. The data is then moved to a remote server source called cloud storage. The player is also able to assess the data after gathering it all[20]. There are technologies like assembly technology for web image design, but when they are combined, they form the Internet of Things' basis, which is superior to all others because it is built on a complex and connected infrastructure. The development of technologies will be accelerated by the internet of things. The coaches will find it challenging to evaluate each player individually during practise sessions due to the large number of players, so the internet of things will enable them to learn more about each player[20]. To be a strong player, badminton players must be proficient in various kinds of fitness skills such as cardiovascular health, agility, strength, and other abilities. The sensor-based system can provide more accurate data of the players. The working of internet of things will be based on the following diagram. (figure-4) It enables coaches and trainers to assess players' success because physical activity levels are a major motivating factor. The rewards range from a smart badminton action recognition system with Bluetooth power technology to a static measurement device with cloud technology. The entire operating system is made up of three components: a wearable sensor, a mobile application, and a cloud server. The data gathered by the unit of measurement is sent by the mobile phone through Bluetooth Low Energy (BLE). Once the data from the mobile phone is received, the server at that distance transmits data via cloud technology. The data shows the injury prone mechanism of players while playing. This data shows the players to prevent the injury[20].

Agnel Prinson et al.,

Blockchain technology using internet of things

Blockchain is a tamper-proof distributed network ledger system that exclusively stores actual information. Furthermore, blockchain's peer-to-peer (P2P) technology assures that it does not rely on any central entities (Sheping Z et al 2018). As a result, blockchain technology may offer communication between IoT devices without the need of any centralised organisation and they can effectively solve the problems of compute node failure, transaction serial timing mistake, privacy, trust, and dependability of new IoT nodes[21]. The Internet of Things network model based on blockchain technology under the Internet of Things network in order to effectively apply blockchain technology to the Internet of Things network and realise the reliable identity authentication function of devices with certain computing power in the Internet of Things. The data structure of the block body is enhanced based on the features of IoT equipment for sports injury risk assessment, and a set of data interactive authentication methods using cryptographic algorithms is created under this model [7]. Encryption (asymmetric encryption), hashing, chaining blocks, and smart contracts are some of the major characteristics of block chain technology. The data structure of a generic block body, which is made up of blocks that are dispersed and distributed. Each block is often linked to a time stamped transaction set. This technology allows nodes to exchange data by forming transactions, each of which is dependent on another, and where the output of one transaction is referenced as an input in the other, resulting in a chain structure. Blockchain blocks are broken into two parts: block headers and block body. Block headers are similar to database indexes. The block body work according to the device ID and business ID are used to locate Internet of Things devices based on their real existence and uniqueness. The transaction type is primarily stored in the type field, which is used to find and negotiate transactions between gateway nodes [7].

The blockchain technology along with internet of things works on the fusion of the algorithm system. The D-H algorithm of computer power balance is working on the basis of IoT, intelligent data processing algorithm, data fusion of fuzzy sets and D-S evidence theory. Using the fuzzy D-S evidence theory algorithm in a human motion monitoring system, we can determine if the user's motion condition is healthy or not based on the findings of multisensory detection data from blockchain and the Internet of Things [7]. It shows in flowchart (figure-5) The algorithm shows good accuracy in determining human sports health state, which is consistent with application specifications in a typical context and has some practical effects. It is compared to a risk assessment system based on weighted average data fusion for human motion injury. The fuzzy D-S evidence theory method outperforms the weighted average data fusion technique in terms of accuracy and stability. The D-S evidence theory technique is utilized to fuse data from several sensors, and the benefits are optimal. Thus the block chain and internet of things will give accurate assessment of risk factors in sports. So we can prevent injuries with the help of the data provide by the algorithm [7].

CONCLUSION

Every sport has its own set of criteria for determining victory. Multiple preparations are required for an athlete to become an expert in the sport in which he or she participates. Experienced athletes feel that physiological and psychological preparation are essential for achieving consistent performance during training or competition. The badminton is getting popular day by day, both professional and recreational players will be having more playing time. In this case, the players will get prone to injuries without proper health status. The study conducted by M. phomsoupha et al concluded that the badminton performance is related with the physiologic, metabolic, biomechanical, technological and visual factors. The edge computing will give whole anthropometric measurements about the player, it can be stored in cloud data. The coaches and players will get accurate information and will help them to prevent the injuries and its risk factors. Jinil Yang et al conducted a study on the topic internet of things and wireless sensor. The study concludes the internet of things and wireless sensors are the advanced technologies which help both players and coaches to know about the injury risks and the level of performance. JihuaLiu conducted a study on the topic block chain technology. The algorithm fusion technology is used to fuse different type of sensors. It helps to assess the risks for injury in sports. This will help to prevent the further injuries. The recent advances like internet of things, edge computing and block chain technologies with help of different type of sensors. These

**Agnel Prinson et al.,**

advanced technologies will be giving the accurate data about the performance and health status of the player as well. The data collected will stored in the storage and can be used for further application in the game.

Declaration of competing interest

The authors of this study do not have any direct or indirect financial interest in the subject matter discussed in the manuscript.

Credit authorship contribution statement

All the authors of this study have equal contribution in Conceptualization, Funding acquisition, Formal analysis, writing – original draft, Conception and design of the study, acquisition of data, analysis, and interpretation of data, drafting the manuscript, revising the manuscript critically for important intellectual content

ABSTRACT

India is a global leader in the production of pharmaceuticals and it is considered to be the third-largest pharmaceutical producer in the world. Over the past ten years, pharmaceuticals have become a significant class of environmental contaminants [1]. The purpose of the investigation on three particular PPCPs such as 1-Tetradecanol, Behenic alcohol, and Stigmasterol is they come under Sterols and terpenes that are lipids and highly in soluble in water. The lipids are found on the surface of the water and they are disseminated superficially on the water. Most of the paper concentrate on common pharmaceutical compounds whereas these compounds are not investigated. The aim of this research is to quantitatively determine the presence of three Pharmaceutical and Personal Care Products (PPCPs), viz., 1-Tetradecanol, Behenic alcohol and Stigmasterol in Water, Sediments and Freshwater Fish from five major reservoirs of Chennai namely Korattur lake, Retteri lake, Puzhal lake, Ambattur lake and Chembarambakkam lake. A novel Solid Phase Extraction method was used for the extraction of lipids from biological matrices from the water and Quechers method for the homogenized fish tissue samples which involves a simple and efficient technique for removal of lipids and further analysis is facilitated with the evaluation of extracted samples was performed by High- Performance Liquid Chromatography (HPLC) to detect the three PPCPs. Currently researchers are employing sophisticated methods to retrieve

78591

**Ragunathan et al.,**

the results however this research implies simple methods that mete out the justice for the study proving that this can be done without a sophisticated methodologies on PPCPs in Aquatic Environment. The water sample collected from Retteri lake, Ambattur lake and Chembarambakam lake showed the presence of 1-Tetradecanol, Behenic alcohol and Stigmasterol. In order to effectively manage pharmaceutical contaminants (PPCPs) in developing nations, it is necessary to examine the significance of PPCPs as an emerging pollutant and then conduct routine environmental monitoring. which indicates that the presence of pollution due to human activities.

Keywords: PPCPs, Contaminants, Solid phase extraction, HPLC, Pollution.

INTRODUCTION

Pharmaceutical sector is growing rapidly in India. The pharmaceutical industry produces a large group of human and veterinary drug compounds, used widely in huge quantities. The pharmaceutical industry in India has been unprecedented in the last few decades. A substance intended for use in the diagnosis, cure, mitigation treatment or precaution of disease is called pharmaceutical compounds [1].The reason to choose 1-Tetradecanol, Behenic alcohol, and Stigmasterol is They are sterols and terpenes that come under lipids and mostly researchers have not investigated the contamination of water due to sterols especially in the main Chennai reservoirs. Tetradecanol is a compound used for its emollient qualities (cold creams), Stigmasterol is a nutritional supplement and Behenic alcohol is a plasticizer and a lubricant all these three PPCPs are used extensively in their everyday routine. Pharmaceutical compounds are drugs and personal care cosmetics which is used by human beings in a daily basis. It is comprised of an active pharmacological compound in order to allow it for medicine handling and closing. Pharmaceutical compounds undergo a number of Enzymatic Transformations (metabolism) in Human tissues including liver, kidney and lung. The main part of the metabolism occurs in liver. Every drug is metabolized to different degree resulting in more polar metabolites with loss of some or all pharmacological activity of the parent substance [23]. The environmental exposure routes of pharmaceuticals into the environment are manufacturing units and hospital effluents, land applications (e.g., bio solids and water reuse) etc. Sewage treatment services are not always successful in removing the active chemicals from waste-water. Consequently, PPCPs find their way into the aquatic environment, where they directly affect aquatic organisms and can be incorporated into food chains [15].

The disposal of human organs, syringes and other pharmaceutical compounds illegally into the lakes causes a huge destruction to the health of humans. The long-term exposure of lower concentration of complex PPCPs mixtures on stream biota may result in acute and chronic damages, behavioural changes, accumulation in tissues, reproductive damages and inhibition of cell proliferation [19]. It can enter all type of cycles in drinking water and starts to accumulate in animals and vegetables without human being knowledge. The water from households, industries and drainage are sent for waste water treatment, this treatment is done with the help of microorganisms which will remove the basic hard particles and some of the heavy metals and superficial degradation occurs but it cannot reduce the nanoparticles and microscopic toxic particles which end up in bioaccumulation in plants because this water is let out for the plants in order to save the water [21]. Several studies have been carried out globally to determine the presence of antibiotics in natural resources and wastewater treatment plants. Study source says PPCPs (Sterols, terpenes- Lipids) are the robust indicators to assess the sewage contamination in river waters *Wen, X., Bai, Y., Journal of Chemistry, 2020* [24].The primary sources of pharmaceutical pollution in rivers and oceans are Wastewater treatment plant outputs. Most pharmaceutical pollutants cannot be removed by the current wastewater treatment procedures, removal efficiencies usually range from 12.5% to 100% in Indian water bodies *Balakrishnan., Ecotoxicology and Environmental Safety, 2017*[4]. These findings demonstrates that the accumulation of PPCPs and also some of the waste water treatment plant does not totally eliminate antibiotics from water, and that they are present in river water at the nanoscale. To detect the qualitative information on the presence of various PPCPs kinds in water, sediment and Freshwater Fish from five major water reservoirs is the aim of this study [5-6].

Ragunathan et al.,

MATERIALS AND METHODS

Chemical standards with high purity grade (>95%) which is purchased from Sigma Aldrich. Fresh working standard solutions (20 and 1mgL⁻¹) all compounds were prepared in water/methanol before each analytical run. Solvents used throughout the analysis were Methanol. Glassware, bottles, tubes, 50ml vials, conical flasks, 50ml beakers, 50ml measuring cylinder, 1ml pipette, watch glasses, 50 ml centrifuge tubes these materials were used throughout the analytical scheme. In particular all the glassware was rinsed with some number of solvents used in extraction process. The lakes subjected in this study are Puzhal, Chembarambakkam, Retteri, Korattur and Ambattur. Sites were prioritized based on fundamental water reservoirs for the Chennai Metropolitan City and the samples were collected based on high density of impurities. These lakes are chosen due to continuous dumping of biomedical wastes, plastic materials and pesticides due to this water, sediments and living organisms are affected. The Pharmaceutical and Personal Care Products which is selectively detected in the water, sediment and freshwater fish sample has their own physiochemical properties, viz., After purchasing the antibiotic standards from Sigma-Aldrich, a 1000 ppm stock solution was made. From the stock solution, which has concentrations of 500 ppm, 250 ppm, 100 ppm, and 50 ppm, the working solutions were created. Methanol was used to prepare each stock solution. In order to qualitatively determine whether the antibiotics are present in the sample, solutions were introduced into the HPLC, followed by the samples.

SAMPLE COLLECTION AND PREPARATION

A total of five water samples, sediment samples and a freshwater fish (tilapia) collected from five important lakes that is used by people of Chennai, viz., Puzhal, Retteri, Korattur, Ambattur and Chembarambakkam. The samples were retrieved in 1 Litre amber coloured Bottles. Before the samples were collected, the bottles were rinsed with methanol and Millipore water. The pH of the collected samples was measured, and 4M concentrated H₂SO₄ was used to lower the pH to 3 for improved ion exchange during solid phase extraction. After that, all suspended contaminants were eliminated from the samples by filtering them using a 0.45 µm glass membrane filter.

SOLID PHASE EXTRACTION

During filtration and acidification, the material was extracted using a solid-phase extraction device. The solid phase extraction was conducted using an anion-exchange HLB cartridge. C18 Cartridges (Agilent Bond Elute) were used for extracting samples. The cartridges were Preconditioned by Methanol. The samples were loaded in the cartridges and eluted with 20ml of Methanol. The Eluate is dehydrated with 1g of Anhydrous Sodium Sulphate (Na₂SO₄). The Eluate is transferred into 50ml glass vials and condensed with rotary evaporator. The extracted samples were analysed using UV detection in High Performance Liquid Chromatography (HPLC) [6].

The flowcharts 1 and 2 elucidate methodologies that are convoluted in the study and furnishes the Research.

HIGH – PERFORMANCED LIQUID CHROMATOGRAPHY

The HPLC parameters for determining the three Pharmaceutical and Personal Care Products are listed below. XDB C18 column, 250×4.6mm id, 5µm particle size, was the column that was utilized. There was 0.6 ml of flow per minute. 90% acetonitrile and 10% methanol make up mobile phase B for 1 - Tetradecanol and Stigmasterol, whereas 90% water and 10% ammonium acetate make up mobile phase A. Water and 0.2% formic acid were used as mobile phase A while HPLC-grade methanol and 2% formic acid were used as mobile phase B for Behenic Alcohol. There was a 0.6 ml/min flow rate with 80% of A and 20% of B. A calibration graph was constructed using five trials (1000 ppm, 500 ppm, 250 ppm, 100 ppm, and 50 ppm) for each PPCPs [9].

RESULTS AND DISCUSSION

The lakes subjected in this study Puzhal, Chembarambakkam, Retteri, Korattur and Ambattur which are the main water reservoirs for Chennai Metropolitan City. This map illustrates the Anthropogenic activity spots in the different lakes as located.

Ragunathan et al.,

Chromatogram and Acquisition Time of Standards

The initial procedure was to inject with all three standards into HPLC while adhering to the parameters specified for each chemical. The Chromatogram is selectively taken according to only the maximum peaks that is shown in the samples at the respective lakes. In the Fig- 2 the chromatogram shows the elevation points of PPCPs in three different lakes and their samples. Table. 3 shows the Illustration of count and Acquisition time in the three PPCPs. The figure explains the highest peaks of the three PPCPs in two lakes out of five lakes. The Retteri water sample is detected with 1- Tetradecanol, Behenic alcohol present in Ambattur lake sediment and Chembarambakkam lake is detected with stigmasterol in freshwater fishes (*Oreochromis.mossambicus*). Compared to many other biological products, steroids are more stable structural elements of animals and are better retained in sedimentary conditions. It is well known that C29 sterols, which are important components of vascular plants, including stigmasterol and -sitosterol, tend to dominate the sterol distributions in lake sediments [7]. In contrast to resulting from routine monitoring, the majority of occurrence data in drinking water and source water have come from focused investigations. The detection of trace amounts of pharmaceuticals in drinking water, surface water, and groundwater has increased due to advancements in sensitivity and accuracy of detection technologies and methodologies. These amounts range from concentrations in the nanogram per litre to low microgram per litre (although largely less than 0.1 µg/l). Wastewater discharges from manufacturing plants with inadequate controls or wastewater treatment effluents contain higher quantities of these pollutants **Edition, F. (2011). Guidelines for drinking-water quality. WHO chronicle, 38(4), 104-8 [25]**. Aquatic organisms might not be the only ones harmed. PPCPs in water may be absorbed by plant roots and accumulate in the plant's edible sections. As water supplies grow scarcer owing to drought, climate change, and increased demand, recycled wastewater for irrigation will become more widespread. However, using these contaminated waters for agricultural irrigation risks introducing wastewater-associated drugs and pathogens into irrigated areas. This information raises concerns regarding the possible uptake and accumulation of PPCP pollutants in plants, as well as their transfer up the food chain.

CONCLUSION

The PPCPs are detected in trace amounts in different lakes. The 1- Tetradecanol was detected In the Retteri lake, the lake is dumped with enormous amount of waste materials and this causes unwanted pollution inside the lake and to surrounding water bodies. The water is also defiled by the drainage system and chemicals. The presence of 1- Tetradecanol indicates the Retteri lake water contaminated by the anthropogenic activity. Behenic Alcohol which is a lubricant that is highly insoluble in water and rich in plasticizer which is accumulated in the lake water causes disadvantages to the human being. The aggregation of microparticle compound in the soil will damage the fertility of the soil and also affect the ecosystem, the Ambattur lake showed a higher count in the sediment samples due to colossal amount waste being dumped by Industries, Hospitals and Human beings. Many medications pass through the human body intact, therefore there are benefits to not dumping human waste into rivers, even after standard sewage treatment, which does not remove the majority of these chemicals. Human faeces and urine should be deposited in fertile soil, where they will be treated more effectively by various bacteria over longer periods of time, rather than in rivers. There are numerous worries concerning the impacts of pharmaceuticals found in surface waters, particularly the hazards to rainbow trout exposed to treated sewage effluents. The presence of Stigmasterol in Chembarambakkam lake Tilapia fish which has history of being discarded with Biomedical wastes by many hospitals that are nearby. Tilapia is a commercially available and often eaten by Chennai people. The deposition of these PPCPs compound in smaller levels into the aquatic bodies for a while will cause biological abnormalities in the fish and when it is consumed by human beings creates menacing situation if they ingest it for a longer time.

ACKNOWLEDGMENT

I thank the National Centre for Sustainable Coastal Management (NCSCM), Ministry of Environment, Forest & Climate Change, Government of India, Anna University Campus for assisting me with the Instruments and giving me the opportunity to utilize the Laboratory without any hindrance. I am grateful that I did my Research work in the Esteemed Centre.

ABSTRACT

The Green synthesized traditional nanoparticles are multifunctional in nature as a cost-effective and ecologically alternative to chemical and physical extraction method. In present observation silver nanoparticles were synthesized by using silver nitrate as a precursor and *Xanthium indicum* (Landaga) a noxious weedy plant leaf extract was used as a reducing and capping agent. The synthesized silver nanoparticles were characterized and confirmed by using Visual observation of colour change, X-ray diffraction (XRD) and SEM. The experimental XRD results showed silver nanoparticles having crystalline size 83.03nm, 25.94nm, 25.94nm, 23.09nm, 29.65 nm for 1mM, 2mM, 3mM, 4mM and 5mM concentration of solution respectively with higher stability. Its antimicrobial activity was observed by well discussion method on pathogenic bacteria *Escherichia coli* and *Staphylococcus aureus*. Finally AgNPs from leaf extract of X. Indicum shows 14 mm zone of inhibition against *E. coli* and 12 mm for *S. aureus*.

Keywords: Green synthesis, Silver nanoparticles, *Xanthium indicum*, XRD, *E. coli*, *S. aureus* etc.

INTRODUCTION

The field of nanotechnology is one of the most active field nowadays in material science and technology. Nanoparticles are fundamental component of nanotechnology. The most important and distinct characteristic of nanoparticles is their exhibits larger surface area to volume ratio [1]. The important Properties associated with nanoparticles like their small size, large surface area to surface volume ratio, optical, magnetic, chemical, and mechanical properties have made them possible for novel applications in the field of biomedical as antibiotic, antioxidant, anticancer and antimicrobial agents [2]. Nanoparticles are mostly prepared from of noble metals like silver, gold, platinum, palladium, iron, copper, zinc, titanium, and magnesium which gained significant attention due to their multifunctional abilities [3]. There are chemical and physical methods employed in the synthesis of nanoparticles but they are associated with hazardous chemicals exhibiting toxicity. Alternatively, large amount of nanoparticles can be easily synthesized from plant and the majority of these are having low toxicity, cost effectiveness, Eco friendliness, and low time consumption [4]. Plants contain secondary metabolites such as terpenoids, polysaccharides, flavonoids, proteins, ketones, polyphenols, alkaloids, amines, tannins, and aldehydes, which act as reducing, capping and stabilizing agents by converting metal ions to metal nanoparticles [5]. Among various biosynthesized metal nanoparticles, silver nanoparticles (AgNPs) are the metal of choice in the field of biological systems, living organisms and medicine [6]. Silver nanoparticles are non-toxic to humans and most effective against bacteria, virus and other eukaryotic microorganisms at low concentrations and without any side effects silver are toxic at higher concentrations but many studies have established that a lower concentration of AgNO₃ has higher chemical stability, catalytic activity, biocompatibility and show higher antimicrobial activity [8].

Many studies have been done on the green synthesis of AgNPs using leaves of plants, but biosynthesis of AgNPs using wild and indigenous species exhibiting potential antibacterial activity has not been explored to a large extent. In this concern, we describe a novel and green protocol that provide important new insights into the synthesis of colloidal AgNPs using plant extract. This suggested technique gives bypass to hazardous and expensive chemicals and offer size controlled AgNPs at mild reaction conditions, which is inexpensive, easy, simple, rapid, quick, simple scale up, easy to control and less energy extensive process. In typical synthesis protocol plant extract of *Xanthium indicum* leaves possessing rich concentration of biomolecules such as vitamins, polysaccharides, proteins, amino acids, enzymes, flavonoids, triterpenoids, polyphenols and organic acids will be used as a reducing as well as capping agent. *Xanthium indicum* belongs to family Asteraceae. It is erect, annual, under shrubs, stems rough with short hairs. Leaves broadly ovate to cordate, hispid. This study highlights the potential use of *Xanthium indicum* in combination with nanotechnology for various biomedical applications. In this study we used the silver nanoparticles synthesized from the leaf extract of *Xanthium indicum* and its antibacterial effect on the bacteria, *Escherichia coli* and *Staphylococcus aureus*.

MATERIAL AND METHODS

Collection of Plant Material

Leaves of *Xanthium indicum* plants were collected from waste land area of Badyachi wadi village, Gadhinglaj, Kolhapur district Fig. 1. Collected fresh plant leaves brought to the laboratory and washed using tap water to remove dirt from the leaf surface, then leaves were shade dried for 15 days under dust free environment. These dried leaves grounded into fine powder with grinder. This powder was sieved using tea mesh and fine powder is store in plastic containers under room temp. for further use.

Preparation of Extract

The extract was prepared by adding 10 gm of power in 100 ml double distilled water and boiled at 100 °C for 20 min [8]. The extract was allowed to cool at room temperature and filtered using Whatmann filter paper No.1 with the help of Buchner funnel. This extract was stored in refrigerator to protect it from fungal growth.

**Sanket Sadashiv Patil****Synthesis of Silver nanoparticles**

The preparation of Ag nanoparticles has been carried out in two steps. Firstly prepare silver nitrate solution of five different molar concentration (1mM to 5mM) by dissolving silver nitrate powder (appropriate amount) in double distilled water (500ml). Secondly add 50 ml of plant extract 450 ml of silver nitrate solution (separately for every molar concentration) drop wise for better reduction Fig. 2. The mixture is kept at room temperature for reduction reaction. The solution was then centrifuged at 10000 rpm for 10 min each; 20 ml acetone was added to the solution in order to separate the precipitated and the surfactant. The precipitate silver nanoparticles were then kept in evaporating dish and allow evaporating the acetone with the help of boiling water bath Fig. 3. After evolution of acetone collect the synthesized nanoparticles in small glass bottles separately

Characterization of synthesized silver nanoparticles**Visual Observation of Colour change**

The synthesis of silver nanoparticles (the reduction process Ag^+ to Ag^0 nanoparticles) was confirmed by visual observation of color change of the solution from white yellow to reddish brown and dark brown upon incubation upon incubation at room temperature for 24 hour. (Fig. 2) [9].

X- Ray Diffraction Spectroscopy (XRD)

XRD technique is the most powerful method for qualitative and quantitative analysis of nanoparticles. XRD analyses are useful technique for determine the crystalline structure of nanoparticles and its formation [10]. Each nanoparticle material has a different diffraction beam so analysis of the materials using this technique depends on the diffraction pattern of every nanoparticle material [11]. The presence, crystalline nature, phase variety, and grain size of synthesized silver nanoparticles were determined by X-ray diffraction spectroscopy. The average crystalline size of the samples 1mM to 5mM was determined by using Scherrer's equation as follows:

$$D = \frac{K\lambda}{\beta \cos\theta}$$

where D is average crystallite size and β is line broadening in radians (full width at half maximum of the peak in radians). λ is wavelength of X-ray and θ is Bragg's angle. K is constant (geometric factor = 0.94). Equation applied to determine in which mM concentration crystallite size is smaller than others [12].

Scanning Electron Microscopy (SEM)

The purified pellets of silver nanoparticles were dried at 50° C in an oven and thin films of dried samples were prepared on a carbon coated copper grid by dropping a very small amount of the samples on the grid. Extra solutions of the samples were removed using a blotting paper. The films on the carbon coated copper grid (SEM grid) were allowed to dry by putting them under a mercury lamp for 5 min. The morphological features, micrograph images, size, and structure of synthesized nanoparticles from leaf extracts were analyzed and recorded. The details regarding applied voltage, magnification used, and size of the contents of the images were implanted on the images itself [13].

Antimicrobial Assay

Antibacterial activities of synthesized silver nanoparticles were analyzed by well diffusion method against two pathogenic bacteria *Escherichia coli* and *Staphylococcus aureus* [14]. The strains bacteria were subcultured on Nutrient Agar (HiMedia) and were incubated at 37° C for 24 h. Fresh overnight bacterial cultures were taken and spread on the Nutrient agar plates using glass rod to cultivate bacteria. Six millimeter diameter wells were made on Nutrient agar plate with the help of gel cork border. Twenty-five microliters of silver nanoparticles and distilled water (as control) were inoculated to the well, and then the plates were incubated in incubator at 37° C for 24 h. The antibacterial activity was measured based on the inhibition zone around the wells. All the practice was done under aseptic condition.

Sanket Sadashiv Patil

EXPERIMENTAL RESULTS AND DISCUSSION

Visual Observation of Colour change

When leaf extracts of *Xanthium indicum* were mixed and incubated with AgNO₃ solution, colour change from white yellow to dark brown was visually observed (Figure 2). This colour change is due to the Surface Plasmon Resonance phenomenon in silver nanoparticles as a result of the excitation of free electrons in nanoparticles [15]. These colour changes is due to reduction of Ag⁺ ions to Ag⁰ [16]. No further colour changes were observed after 24 h which indicated the completion of the reduction process. In earlier reports shows approximately 2 to 4 hour is required to reduce 90% of silver nanoparticles from Ag⁺ to Ag⁰ [17].

XRD analysis

Analysis of structure and crystalline size of the synthesized silver nanoparticles were carried out by XRD. The XRD analysis of synthesized silver nanoparticles from leaf extract of *Xanthium indicum* showed diffraction peaks at 1mM to 5 mM concentraion Fig.4. The same result was reported by Roy and indicates that the silver nanoparticles are face-centered, cubic, and crystalline in nature [18]. When compared with the standard, the obtained XRD spectrum and peaks confirmed that the synthesized silver nanoparticles were in nanocrystal form and crystalline in nature. The diffraction peaks represent face-centered cubic active silver nanoparticles, while the the sharp and high peaks in the XRD analysis indicated development of nano-sized particles [19]. The Full Width at Half Maximum (FWHM) values were used to calculate the size of the nanoparticles. The average size of silver nanoparticles synthesized from leaf extract of *Xanthium indicum* was calculated using Scherrer's equation where Scherrer's constant *K* value = 0.94 was selected due to the cubic and crystalline nature of the nanoparticles [20]. By comparing the peaks observed at different concentrations i.e. 1mM to 5mM of shows variation in crystallite size. At 4mM concentration 23.07nm crystallite size (Fig no 4) is obtained which is more smallest nanoparticles as compared to other concentration. A few unassigned peaks observed could be due to the presence of some bioorganic compounds/proteins [21].

Scanning Electron Microscopy (SEM) analysis:

SEM is electron microscopy techniques is useful to determine the surface morphology of nanoparticles, such as their shape, size, and size distribution [22]. The SEM images of sample 4mM nanoparticles (shows very less crystalline size 23.07) show high density of well-dispersed silver nanoparticles spherical in shape as well as number of aggregates with no defined morphology. The presences of biomolecules in the leaf extracts has resulted in the synthesis of spherical silver nanoparticles and the aggregation may be due to the presence of secondary metabolites in the leaf extracts [23]. The SEM image shows the size of the silver nanoparticles ranging below 100 nm. Similar result of the silver nanoparticles size was reported by using *Acacia nilotica* leaf extract [24].

Antimicrobial Activity

Silver nanoparticles have been widely used in health, medicine, and environmental applications. In this study *Xanthium indicum* leaf extract synthesized silver nanoparticles were examined for possible antibacterial activity against the bacterial strains of *Escherichia coli* (*E. coli*) and *Staphylococcus aureus* (*S. aureus*) using well diffusion technique. The zone of inhibition around the well is shown in Fig. 6 and 7. Maximum zone of inhibition 14 mm was seen against *E. Coli* and 12 mm for *Staphylococcus aureus*. (Figure no. 6,7 and Table 1). No inhibition zone was observed for control, prepared by the stack solution taken in well without silver nanoparticles. The antibacterial activity of silver nanoparticles should be referred with several mechanisms including (i) activity of Reactive Oxygen Species (ROS), (ii) the presence of Ag⁺ ions in silver nanoparticles are making bond with sulphhydryl groups which to de-naturation of proteins in the bacteria and [25] (iii) release of Ag⁺ ions from the silver nanoparticles which simply penetrate into the cell wall and cause severe damage to the bacteria and kill them. From fig.6 and 7 it is observed that silver nanoparticles shows more antimicrobial activity on *E. coli* (Gram negative) than *S. aureus* (Gram positive) bacteria. The different antibiotic activity is due to variation in cell wall membrane of these bacteria. *E. coli* (Gram negative) have very thin layer cell wall membrane, its thickness ranged 7–8 nm and made up of peptidoglycans and lipopolysaccharides. On the other hand, *S. aureus* (Gram positive) bacteria have a very thick cell

**Sanket Sadashiv Patil**

wall membrane, its thickness ranged from 20–80 nm and made up of large number of mucopolysaccharides, lipoteichoic acids and murein [26]. Several similar results were obtained in previous studies. Inhibition against *E. coli* and *Staphylococcus* was observed in the case of silver nanoparticles synthesized using extract from *Ayapana triplinervis* nanoparticles showed high toxicity to *E. coli* than *Staphylococcus aureus* [27].

CONCLUSION

From the present study, we conclude that, silver nanoparticles were successfully synthesized from the leaves of *Xanthium indicum* as a reducing and capping agents. The biosynthesized silver nanoparticles using plant extract were characterized by XRD and SEM. Obtained silver nanoparticles are crystalline nanoparticles in nature. The biosynthesized silver nanoparticles exhibited excellent antibacterial activity against pathogenic bacteria *Escherichia coli* followed by *Staphylococcus aureus*. This green synthesis approach appears to be a cost-effective, non-toxic, ecofriendly alternative to the conventional microbiological method. In this regard, we can confirm that the silver nanoparticles obtained by green method will be a potential tool for antimicrobial field.

ABSTRACT

This article provides an overview of a review on niosomes, which are emerging as promising drug delivery systems. Niosomes are nonionic surfactant vesicles that have gained considerable attention in the field of pharmaceutical research due to their ability to encapsulate various types of drugs and improve their therapeutic efficacy. This review aims to summarize recent advancements and applications of niosomes in drug delivery, highlighting their potential advantages over other conventional drug carriers. The review encompasses a comprehensive analysis of various aspects related to niosome-based formulations, including preparation methods, characterization techniques, stability considerations, and factors influencing drug release kinetics. Additionally, this review discusses the impact of different formulation parameters such as lipid composition, size, and surface charge on the physicochemical properties and performance of niosomes. The current challenges associated with large-scale production and commercialization of niosomal formulations are also addressed. Overall, this comprehensive review emphasizes the potential utility of niosomes as versatile nanocarriers for efficient drug delivery and highlights future directions for further research and development in this field.

Keywords: The current challenges associated with large-scale production and commercialization of niosomal formulations are also addressed.

INTRODUCTION

Poul Ehrlich began developing targeted medicine delivery in 1909. The targeted or desired site is where the targeted drug delivery method demonstrates its direct activity. Targeted drug delivery refers to a medicinal substance's ability to act directly on an intended site with little to no interaction with any other non-targeting sites. The niosome consist of a small amount of ionic surfactant, such as diacetyl phosphate, which is used for stability, and non-ionic surfactant, which contains cholesterol. The first non-ionic surfactant product for cosmetic use was developed and marketed by the L'Oréal Company. Drugs of various kinds can be delivered to the intended location. Because of their multi-environmental structure, niosomes are incorporated. Different types of drugs can be delivered to the desired location. Niosomes are integrated because of their structure that adapts to multiple environments. To lessen formulation aggregation, niosomes, which can be uni- or multi-lamellar vesicles, are composed of cholesterol, non-ionic surfactant, and ionic surfactant. Niosome bilayer structural vesicles can contain hydrophilic, lipophilic, and amphiphilic drugs. Because liposomes are specifically lipophilic, they are more prone to oxidation and degradation than niosomes, which exhibit greater stability. Because of their non-ionic surfactant, niosomal formulations have a longer half-life in the bloodstream and a greater target action. The niosomes are minuscule, microscopic particles. Niosomes are measured in nanometers, with a size range of 20 to 100 nm. While niosomes and liposomes share the same structural details, niosomes have more advantages. Their dimensions are measured in nanometers, which means they are incredibly small. Because of this, they can be administered transdermally without difficulty.

The reticular endothelium system eliminates and metabolises niosomes less efficiently because of their tiny size. A medication that contains niosomal vesicles has several benefits. Not only does it strengthen the stability of unstable drugs, but it also enhances their physicochemical characteristics. In order to minimise the amount of ionic surfactant added to it in order to maintain the same charge in the formulation, niosomes frequently have different charges on their surface as a result of different charges like (+) and (-), which indicate flocculation or aggregation. Niosome formulations typically employ Span-60, a non-ionic surfactant. Unlike liposomes, niosomes do not require any particular preparation or storage conditions. The niosome preparation process is entirely derived from the liposome preparation process. Gel filtration or centrifugation are frequently used to separate drugs that have been untrapped during niosomal formulation. Numerous drugs have the ability to become entrapped in niosomes and be used to treat a variety of illnesses. The fact that niosomes are more stable than liposomes made with phospholipid is one of the best justifications for their formulation. Phospholipids in liposomes have ester bonds, which cause phospholipids to hydrolyse. Cholesterol plays a vital role in the structure of niosomes by giving them rigidity. However, when cholesterol is added in excess to vesicles, it not only affects fluidity but also the drug's ability to penetrate and permeabilize them. Numerous routes, including transdermal, parenteral, oral, ocular, and subcutaneous, are used to administer niosomal formulations. Targeted drug delivery involves the use of various carriers, including liposomes and niosomes, which are well-established drug delivery systems, as well as immunoglobulin, plasma protein, microspheres, synthetic polymers, and occasionally erythrocytes.

Niosomes Structure

In terms of structure, niosomes and liposomes are comparable because both consist of a bilayer. Unlike liposomes, which have phospholipid bilayers, niosomes have non-ionic surface active agents as part of their bilayer. When submerged in water, most surface active agents form micellar structures, but some surfactants form bilayer vesicles that resemble niosomes. Niosomes Perhaps unilamellar or multilamellar, depending on how they were made. The hydrophilic ends of the surfactant bilayer, which makes up the niosome, are exposed both inside and outside of the vesicle, while the hydrophobic chains are facing one another inside the bilayer. Hydrophobic drugs are therefore embedded in the bilayer itself, whereas hydrophilic drugs are held within the space enclosed in the vesicle. A clearer picture of a niosome and the location of the medication within the vesicle can be found in the figure below.

Perumal et al.,

TYPES OF NIOSOMES

The niosomes are categorized based on the quantity of bilayers, their size, or the preparation technique. The various types of niosomes are described below:

- i) Multi lamellar vesicles (MLV),
- ii) Large unilamellar vesicles (LUV),
- iii) Small unilamellar vesicles (SUV).

Small Uni-lamellar Vesicle (SUV)

The process of sonication and French press extrusion electrostatic stabilization method is used to convert the large unilamellar vesicle into smaller ones. A small Uni-lamellar vesicle with a size range of approximately 25–50 nm or 0.025–0.05 μm .

Multi-lamellar Vesicle (MLV)

Multiple bilayers surround each aqueous lipid compartment independently in MLV. About 0.5–10 μm in diameter is the average size of MLV. 90 MLV niosome are commonly used for drug incorporation. For a longer duration, the MLV is more stable and requires simple preparation. This vesicle is better suited for drug compounds that are lipidic. This kind of niosome is mostly made via the thin-film hydration technique.

Large Uni-lamellar Vesicle (LUV)

The LUVs have large diameters and a single bilayer membrane within their uni-lamellar vesicles. Aqueous and lipidic content of this vesicle is more so that it has more size. Compared to other types, this vesicle has a higher amount of drug entrapment. The large unilamellar vesicle has an average size of 100 nm. These vesicles are prepared using the reverse phase evaporation and ether injection methods. Higher encapsulation of water-soluble drugs, reproducible drug release rates, and lipid economy are some of the advantages that LUV have over MLV.

Methods of Preparation

Thin film hydration

One easy and well-known preparatory technique is the thin-film hydration method. This process involves dissolving surfactants, cholesterol, and certain additions, including charged molecules, in an organic solvent within a flask with a circular bottom. After that, a rotary vacuum evaporator is used to remove the organic solvent for the purpose to form a thin film. On the flask's inside wall. A medication in an aqueous solution is applied, and for the specified amount of time, constant shaking maintains the dry film saturated above the surfactant's transition temperature (T_m). The multilamellar niosomes developed through that method.

Ether injection method

By dissolving additives and surfactants in diethyl ether and gradually adding them via a needle into a water-soluble drug solution that is maintained at a temperature higher than the boiling point of the organic solvent, one can apply the ether injection method. To evaporate the organic solvent, a rotary evaporator is employed. Vaporisation leads to the development of single-layered vesicles.

Reverse Phase Evaporation method

This method is to dissolve niosomal ingredients in a chloroform and ether mixture, subsequently adding them to an aqueous phase which has the drug. After the organic phase has evaporated, the mixture is sonicated to create an emulsion. The formation of large unilamellar vesicles occurs when the organic solvent evaporates.

Perumal et al.,

Micro fluidization

After the organic phase has evaporated, the mixture is sonicated to create an emulsion. When the organic solvent evaporates, large unilamellar vesicles form. Niosomes form as a consequence of the high energy and speed of impingement. This method produces niosomes with higher reproducibility, smaller size, and unilamellar vesicles.

Proniosome

The proniosome technique involves coating a water-soluble carrier with a surfactant, like mannitol or sorbitol. A Dry formulation is developed during the coating process. This preparation is known as "Proniosomes," and it needs to be hydrated in order to be utilised. The aqueous phase is added to create the niosomes. This method, which produces better results than conventional niosomes, helps to reduce physical stability issues like aggregation, leaking, and fusion problems. It also offers convenience in dosing, transportation, storage and distribution .

Transmembrane pH Gradient

This method involves dissolving cholesterol and surfactant in chloroform and allowing the mixture to evaporate, forming a thin lipid film on the wall of a flask with a circular bottom. Through vortex mixing, the film is hydrated with a citric acid solution (pH = 4), and the resulting product is freeze-thawed to allow for the formation of niosomes. To keep the pH of this niosomal suspension between 7.0 and 7.2, the drug's aqueous solution is added first, and then phosphate buffer. This method indicates that the niosome's interior possesses an elevated acidic pH value Than the outer medium. The additional unionised medication enters the niosome by passing through the membrane. The medication ionises in an acidic environment and is unable to exit The bilayer niosomal.

Heating Method

This patented technique was developed by Mozafari et al. using surfactants and cholesterol. The mixture is heated to 120°C while being stirred in order to dissolve cholesterol. The constituents are hydrated separately in buffer. After lowering the temperature and continuing to stir, additives and surfactants are added to the buffer containing the dissolved cholesterol. At this point, niosomes form and are stored at room temperature until they are needed, when they are stored at 4-5°C in a atmosphere of Nitrogen.

The "Bubble" Method

The glass flask with three necks is filled with additives, buffers and surfactants in this method. At 70°C, the components of niosomes disperse. Additionally, homogenizer is combined with dispersion. The flask is then immersed in water and heated to 70 degrees Celsius so that nitrogen gas can bubble. The nitrogen gas moves through. A sizable unilamellar vesicle was created using a homogenised surfactant sample.

Niosome Formation From Pro-Niosome

Pro-niosomes can be converted to niosomes by adding an aqueous phase, like water. to create a niosome. The development of pro-niosomes and the niosome depicted in Figure 2.

It takes a little agitation to form a niosome from a pro-niosome. When the temperature surpasses the average transition phase pH of the surfactant.

$$T > T_m$$

Where,

T = Temperature

T_m = mean phase transition temperature

Separation of Untrapped Drug from the Niosomes

There are several methods for removing the untrapped solute from the vesicles, including: -

Dialysis method

Through the use of a dialysis tubing and normal saline, or glucose solution, phosphate buffer the aqueous niosomal dispersion is dialyzed.

**Gel Filtration method**

By passing niosomal dispersion through a Sephadex-G -50 column and eluting with either normal saline or phosphate buffered saline, the untrapped drug is extracted using gel filtration.

Centrifugation method

After centrifuging the niosomal suspension, the supernatant is extracted. After washing, the pellet is reconstituted to create a niosomal suspension devoid of drug entrapment.

Niosomes Characterization**Morphology, Size and Shape**

Photon correlation spectroscopy has been used to calculate the average diameter of the vesicles, and freeze fracture microscopy has been used to investigate and determine the structure of surfactant-based vesicles. A laser beam is often utilized to ascertain the mean surface diameter, mass distribution and size distribution of niosomes, whereas electron microscopy is employed for morphological investigations of vesicles.

Entrapment efficiency

Once the niosomal dispersion is prepared, the drug that is not entrapped is separated using centrifugation, dialysis, or gel filtration as previously described. The drug that is still entrapped in niosomes is then determined by completely disrupting the vesicles using either 0.1% Triton X-100 or 50% n-propanol, and analyzing the resulting solution using a suitable assay method for the drug. % Entrapment efficiency (% EF) is calculated as follows:

$\% \text{ Entrapment efficiency (\% EF)} = (\text{Amount Of drug entrapped} / \text{total amount of drug}) \times 100.$

Vesicle diameter

Photon correlation microscopy, Light microscopy and freeze-fracture electron microscopy may all be used to measure the diameter of niosomes. The process of freezing thawing (maintaining vesicles suspension at 20°C for 24 hours, followed by a return to room temperature, results in an increase in vesicle diameter. This phenomenon may be explained by vesicles fusing together during the cycle.

In-vitro release

Dialysis tubing is used as part of an in-vitro release rate testing technique. A cleansed dialysis sac is placed in distilled water. The vesicle suspension is pipetted into a bag, which is then sealed with tubing. In a 250 ml beaker, the vesicles' bag is submerged in 200 ml of buffer solution. and shaken constantly at either 25°C or 37°C. Using the proper test technique, the buffer's drug content is examined at different intervals.

Vesicle charge

The character of niosomes both in vitro and in vivo can be significantly influenced by the vesicle surface charge. Compared to uncharged vesicles, charged niosomes are often more stable against fusion and aggregation. Microelectrophoresis may be used to determine the zeta potential of individual niosomes in order to estimate their surface potential. An alternative approach is to use pH-sensitive fluorophores. Recently, the zeta potential of the niosomes has been measured using dynamic light scattering.

Homogeneity and Bilayer Rigidity

The stiffness of the bilayer affects the biodegradation and biodistribution of niosomes. It may be happens both inside niosome formations and in between niosomes that are dispersed. Methods such as NMR, differential scanning calorimetry (DSC) and Fourier transform-infrared spectroscopy (FT-IR), are used to identify that. Fluorescence resonance energy transfer, or FRET, has recently been employed to learn more about the size, shape, and structure of niosomes.

Perumal *et al.*,

APPLICATION OF NIOSOMES

Drug targeting

The capacity of niosomes to target medications is one of their most advantageous features. It is possible to target medications to the reticuloendothelial system using niosomes. The reticulo-endothelial system (RES) particularly absorbs niosome vesicles. Opsonins, which are circulating serum factors, regulate the uptake of niosomes. These opsonins identify the niosome for removal. Drugs that are localised in this way are used to treat tumours in animals that have a history of spreading to the liver and spleen. Drugs localised in this way can also be used to treat liver parasite infections. Niosomes can also be used to direct medication delivery to organs other than the RES. Since immunoglobulins bind to the lipid surface of niosomes easily, a carrier system (such as antibodies) can be attached to niosomes to direct them to particular organs.

Anti-neoplastic treatment

The majority of antitumor drugs have serious adverse effects. Niosomes have the ability to change a drug's metabolism, increase its half-life, and increase its circulation, all of which reduce the drug's adverse effects. Niosomes are associated with a slower rate of tumour elimination, increased plasma levels, and a decreased rate of tumour proliferation.

Leishmaniasis

A parasite belonging to the genus *Leishmania* infects the liver and spleen cells, causing leishmaniasis. The use of niosomes in tests revealed that higher dosages of the medication could be given without causing side effects, allowing for increased treatment efficacy.

CONCLUSION

Innovative nano drug carriers called niosomes can be used to create efficient drug delivery systems. They present an excellent chance to load lipophilic, hydrophilic or both types of drugs simultaneously. Because of their ability to encapsulate various types of drugs within their multi environmental structure, niosomes can be considered alternative vesicular systems to liposomes due to their similar structural makeup. Niosomes are a promising drug delivery technology that can be used for a variety of drug delivery applications, including topical, parenteral, ophthalmic, targeting, and more.

ABSTRACT

The COVID-19 pandemic has brought unprecedented challenges to healthcare systems worldwide. While healthcare workers have been at the forefront of the battle against the virus, their mental and physical health has been significantly impacted. This paper aims to explore the mental and physical health issues faced by healthcare workers during the COVID-19 pandemic, highlighting the contributing factors and potential long-term implications. Relevant studies, articles, and reports were analyzed to gather information on the mental and physical health issues among healthcare workers during the COVID-19 pandemic. This study examines the various factors contributing to the mental health challenges faced by healthcare workers during the pandemic. These factors include increased workload and stress, fear of infection, witnessing patient suffering and death, and the lack of adequate resources and support. The findings indicate that healthcare workers are facing significant physical and mental health challenges due to the COVID-19 pandemic. Increased workloads, long hours, and exposure to the virus have led to high levels of stress, anxiety, and burnout among healthcare professionals. Additionally, inadequate access to personal protective equipment (PPE), fear of infection and the emotional toll of witnessing patient suffering and death have further contributed to their distress. Physical health issues, such as fatigue and sleep disturbances, have also been reported. The impact of COVID-19 on healthcare workers' health cannot be underestimated. It is crucial to recognize and address the challenges they face to ensure their well-being and ability to provide quality care. It is essential to provide adequate provision of PPE, support systems, including accessible mental health resources, counseling services, and strategies to

**Gunmala Gualia and Krishna Mundra**

promote self-care and resilience. By prioritizing the well-being of healthcare workers, we can ensure their continued dedication and provide the best possible care to patients during these challenging times.

Keywords: Covid-19, Well-being, Health, Pandemic, Healthcare Workers

INTRODUCTION

Background

The COVID-19 pandemic came forth in late 2019 in Wuhan, China, caused by the novel coronavirus SARS-CoV-2. It quickly spread globally; COVID-19 had spread to several countries, such as the USA, Italy, Spain, Germany, France, and Iran, after causing significant morbidity and mortality in China [1-3]. The World Health Organization officially recognized Coronavirus disease 2019 as a pandemic on March 11th, 2020 [4]. The spread of COVID-19 to 198 countries has resulted in the infection of 2.4 million people and the deaths of 150,000 worldwide as of April 18. This is therefore regarded as a global pandemic [5-7].

Global Impact

The COVID-19 pandemic has had far-reaching consequences on various aspects of society, including public health, the economy, and social dynamics. The number of confirmed cases and deaths has been staggering, with millions of people affected worldwide. Governments and healthcare systems have faced immense challenges in managing the outbreak and providing adequate care. Healthcare workers (HCWs) are also part and a little attention was paid to them but they too faced mental as well as physical health issues. Healthcare workers (HCWs) are among the groups with the highest risk of acquiring this infection [8–10].

Healthcare workers (HCWs)

HCWs are professionals who provide medical care and support to individuals in various healthcare settings. They play a critical role in promoting and maintaining the health and well-being of patients. In India, health system and health care services consist of various categories of health professionals such as doctors, nurses allied health professionals, physiotherapists, pharmacists and others. Healthcare workers encompass a wide range of roles and specialties, including but not limited to:

1. **Doctors and Physicians:** These are medical professionals who diagnose and treat illnesses, prescribe medications, and perform medical procedures.
2. **Nurses:** Nurses provide direct patient care, administer medications, monitor vital signs, and assist in medical procedures. They work closely with doctors and other healthcare professionals.
3. **Pharmacists:** Pharmacists are responsible for dispensing medications, providing medication counseling, and ensuring the safe and effective use of drugs.
4. **Medical Laboratory Technologists:** These professionals perform laboratory tests on patient samples, such as blood or tissue, to aid in the diagnosis and treatment of diseases.
5. **Allied Health Professionals:** This category includes a diverse group of professionals, such as physiotherapists, occupational therapists, speech therapists, radiographers, and medical social workers. They provide specialized care and therapies to patients.
6. **Medical Assistants:** Medical assistants support healthcare professionals by performing administrative and clinical tasks, such as taking patient histories, measuring vital signs, and scheduling appointments.
7. **Paramedics and Emergency Medical Technicians (EMTs):** These professionals provide emergency medical care in pre-hospital settings, responding to emergencies and transporting patients to medical facilities.
8. **Home Health Aides:** Home health aides provide personal care and assistance to individuals who require healthcare services in their homes, such as the elderly or individuals with disabilities.

**Gunmala Gugalia and Krishna Mundra**

9. **Support Staff:** This includes various roles such as medical receptionists, medical coders, medical billing specialists, and hospital administrators who contribute to the smooth functioning of healthcare facilities. These are a few examples of the many healthcare professionals who work tirelessly to provide quality care and support to patients in different healthcare settings. The COVID-19 pandemic has placed an unprecedented burden on healthcare workers worldwide. These frontline heroes have been tirelessly working to combat the virus, often at the expense of their own mental and physical well-being.

Impact of Pandemic on Health Care Workers (HCWs)

Health professionals are required to handle multiple responsibilities, such as administrative, clinical, and educational ones. [11]. Health care workers, who are the front-line workers dealing with such affected patients, are in the risk of being directly affected by this disease was making this situation more complex. Their job requires them to work in such conditions that do not provide them adequate personal protection equipment (PPE). Their worries are being increased by inadequate lockdown policies, the general public's lack of seriousness towards social distancing and sanitization measures, and the rising number of cases in addition to sensational media reports about mortality of health care workers. As the virus can be spread by either close contact or small droplets produced during coughing, sneezing, or talking [12, 13], the transmission of disease is a threat to both themselves and their families. If there is suspected infection, the policy of strict quarantine and isolation from family are additional factors that are causing psychological and mental health problems [14]. The COVID-19 pandemic has had significant and varied impacts on health care workers (HCWs) globally. Some of these effects include:

The mental impact of COVID-19 on healthcare workers

The mental impact of COVID-19 on healthcare workers has been profound and multifaceted, with many experiencing heightened levels of stress, anxiety, depression, burnout, and even post-traumatic stress disorder (PTSD). Here are some key aspects of the mental impact:

1. **Increased Stress and Anxiety:** Healthcare workers have faced heightened levels of stress and anxiety due to the increased workload, fear of contracting the virus themselves or transmitting it to their loved ones, and uncertainty surrounding the pandemic. They often deal with the emotional burden of caring for severely ill patients and witnessing death on a regular basis.
2. **Burnout:** Long hours, intense workloads, and the relentless nature of the pandemic have contributed to burnout among healthcare workers. Burnout can lead to emotional exhaustion, depersonalization, and a decreased sense of accomplishment, affecting both job performance and personal well-being.
3. **Trauma and PTSD (Post-Traumatic Stress Disorder):** Healthcare workers may experience traumatic events, such as the loss of patients or colleagues, overwhelming patient volumes, and difficult ethical decisions. These experiences can lead to symptoms of PTSD, including intrusive thoughts, flashbacks, hyper vigilance, and emotional numbing.
4. **Grief and Bereavement:** Healthcare workers have faced immense grief and loss throughout the pandemic, both personally and professionally. Witnessing the suffering and death of patients, as well as losing colleagues to the virus, can take a significant toll on their mental health.
5. **Social Isolation and Stigma:** Some healthcare workers have experienced social isolation and stigma due to fears of transmitting the virus to others. They may feel ostracized by their communities or even by their own families, leading to feelings of loneliness and alienation.
6. **Ethical Dilemmas and Moral Distress:** Healthcare workers have been forced to make difficult decisions about resource allocation, triage, and end-of-life care during the pandemic. These ethical dilemmas can cause moral distress, as healthcare workers struggle to reconcile their professional responsibilities with their personal values.
7. **Lack of Support and Resources:** Many healthcare workers have faced inadequate support and resources from their employers, such as insufficient personal protective equipment (PPE), limited access to mental health

**Gunmala Gugalia and Krishna Mundra**

services, and a lack of recognition for their contributions. This lack of support can exacerbate feelings of stress and burnout.

8. **Uncertainty and Anxiety about the Future:** The constantly evolving nature of the pandemic, coupled with uncertainties about vaccine efficacy, new variants, and potential future waves, can contribute to ongoing anxiety and stress among healthcare workers. They may worry about their own safety, the well-being of their patients, and the long-term impact of the pandemic on the healthcare system.

The majority 160 (66.95%) of the studies were focused on depression, while there were also 179 (74.90%) that focused on anxiety, 57 (23.85%) that focused on acute stress/distress, 55 (23.01%) that focused on sleep problems, 39 (16.32%) that focused on post-traumatic symptoms, and 24 (10.04%) focused on burnout. Across five continents, the studies involved HCWs from 50 countries, with 150 (61.7%) coming from Asia, 55 (23.01%) coming from Europe, 20 (8.37%) coming from America, 11 (4.66%) coming from Africa, and 2 (0.84%) coming from Oceania [15] Overall, the mental impact of COVID-19 on healthcare workers is profound and complex, with many experiencing a range of psychological symptoms and challenges. It is essential for healthcare organizations and policymakers to prioritize the mental health and well-being of healthcare workers by providing adequate support, resources, and recognition for their tireless efforts during this unprecedented time.

The impact of COVID-19 on physical health of healthcare workers

The COVID-19 pandemic has had a significant impact on the physical health of healthcare workers. Here are some of the key effects:

1. **Increased workload and long working hours:** Healthcare workers have experienced a surge in work demands, often leading to extended shifts and increased workloads. Prolonged periods of physical exertion can cause fatigue, muscle strain, and related injuries.
2. **Exposure to the virus:** Healthcare workers are at a higher risk of contracting COVID-19 due to their close proximity to infected patients. Despite following proper precautions, they face a constant risk of exposure and transmission, leading to potential illness and complications.
3. **Psychological stress:** Dealing with the pandemic's uncertainties and witnessing the suffering of patients can lead to immense psychological stress for healthcare workers. Chronic stress can contribute to physical health issues, including weakened immune systems, increased blood pressure, and cardiovascular problems.
4. **Inadequate personal protective equipment (PPE):** Shortages in PPE supply during the beginning of the pandemic exposed many healthcare workers to unnecessary risks. Without proper protection, their chances of contracting the virus and experiencing physical health consequences increased.
5. **Exacerbation of pre-existing health conditions:** The physical demands, long working hours, and constant stress associated with the pandemic can worsen pre-existing health conditions among healthcare workers. This includes conditions like musculoskeletal problems, respiratory issues, mental health disorders, and cardiovascular diseases.
6. **Lack of rest and recovery:** The pandemic has disrupted the work-life balance for healthcare workers, leaving little time for adequate rest and recovery. Insufficient sleep, irregular meal schedules, and reduced physical activity can further impact physical health and increase the risk of various health problems.
7. **Exhaustion:** The combination of increased workload, stress, and exposure to the virus can contribute to exhaustion among healthcare workers. Which can lead to physical symptoms such as fatigue, insomnia, headaches, and even chronic conditions like hypertension and cardiovascular diseases. To support the physical health of healthcare workers, it is crucial to ensure sufficient PPE, provide mental health support services, implement strategies to manage workload, allow for adequate rest and recovery periods, and prioritize the overall well-being of these frontline heroes.

**Gunmala Gugalia and Krishna Mundra**

CONCLUSION

Healthcare workers' well-being has been affected negatively by the COVID-19 pandemic, resulting in depression, anxiety, and stress. The mental and physical health issues faced by healthcare workers during the COVID-19 pandemic are significant and require attention. It is crucial to prioritize the well-being of these frontline heroes who have been selflessly serving their communities. By providing the necessary support, resources, and recognition, we can help mitigate the impact of these challenges and ensure the continued well-being of healthcare workers as they navigate through this unprecedented crisis.

ABSTRACT

The digitization of agriculture has revolutionized disease detection and image processing, leveraging advanced artificial intelligence systems to extract valuable insights from the vast and continually expanding data generated by various agricultural and environmental sources. Machine learning and the Internet of Things (IoT), as integral components of artificial intelligence, have the capability to address several challenges in developing knowledge-based agricultural systems, including disease identification. In this review paper provides a summary of the most recent developments in machine learning algorithms and image processing techniques for plant disease identification. Through an in-depth examination of current scholarly literature, we aim to highlight the significance of machine learning and image processing in the agricultural sector. We've carried out a thorough review of the various imaging methods and computer vision approaches that are successfully employed for plant disease detection and classification. Additionally, we've examined the prevailing trends and obstacles in utilizing advanced imaging techniques and computer vision for plant disease detection. Enhancements in algorithms have the potential to augment existing efforts, leading to greater speed and precision.

Keywords: Image processing, Plant disease detection, Machine learning, Imaging sensors and system, and IoT

Rinkesh Parmar and Payal D. Joshi

INTRODUCTION

Throughout history, agriculture has played a vital role in sustaining human life. To tackle the challenges that put pressure on the agricultural industry, there is a pressing need to improve agricultural practices' effectiveness while reducing their environmental impact. Plant diseases pose significant threats to agriculture-based products, leading to social, ecological, and economic losses for farmers. Timely and accurate diagnosis of plant diseases becomes essential to mitigate these losses. However, manual disease diagnosis requires extensive effort, knowledge of plant diseases, and time-consuming processing. To address this, machine learning and image processing methods are employed for effective plant disease identification. As illustrated in Figure 1, the input image undergoes pre-processing to enhance its features, based on the dataset. Subsequently, the images are classified using specific classifier techniques according to the dataset in use. For the review paper, various search engines such as Google Scholar, Shodhganga, Science Direct, and Krishikosh were utilized. The articles selected for the review were primarily focused on research, articles, and review papers published in reputed journals. The keyword combinations used in the search included "image processing," "disease detection," and "Internet of Things (IoT)." The methodology and exclusion criteria for the systematic review were conducted following the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analysis) standards, as depicted in Fig. 2.

REVIEW OF LITERATURE

Crop diseases are a major risk to agriculture, causing a decrease in the quality and volume of yield at different phases, including storage and transport. Early detection of diseases is vital for effective disease control. Observable symptoms of pathogens, like spots on leaves and fruits, wilting, changes in color, and curvature of leaves, signal the existence of disease and alterations in the plant's look. Furthermore, there have been significant improvements in computer vision recently. **Kurniawati et al. (2009)** created a diagnosis system for paddy diseases. In the diagnostic system, three techniques were employed to establish threshold values: variable, global, and Otsu Threshold. Analyzing the ratio between the height and width of the lesion spot served as a distinctive shape feature to identify the lesion type. Among the three methods utilizing the variable threshold, the highest accuracy achieved is approximately 86%. Due to variations in intensity values across different images, both the global threshold value and the automated threshold determined by the Otsu method struggle to accurately perform the segmentation task. The upcoming objective is to employ Artificial Neural Networks (ANN) for the classification of paddy diseases. **Yao et al. (2009)** conducted experiments to apply a Support Vector Machine (SVM) in the detection of rice diseases, utilizing shape and color texture features. The findings indicated that the SVM achieved a high accuracy rate of 97.2% in precisely recognizing and classifying the disease spots.

The low classification accuracy resulted from the instability of the shape features observed in the RSB and RB spots. This approach could be applied to categorize diseases in other crops as well. **Gunjar and Gulhane (2012)** proposed a system aims to regularize and extract Eigen features from cotton leaf images. To achieve this, scatter matrices are created using 100 sample images. These scatter matrices represent within-class variations and are decomposed into different subspaces corresponding to various diseases based on the variations in pixel values. The final stage involves feature extraction and dimensionality reduction. Eigen feature extraction outperforms other methods with a success rate of 90% in detecting red spot disease. Less accuracy to detect the diseases other diseases red spot disease of cotton. In the future, the research will be facilitated by leveraging Eigen features for disease detection in a wide range of crops. **Revathi et al. (2012)** conducted a study focusing on the detection of affected areas in cotton leaf diseases. Initially, they used an edge detection method for image segmentation, and eventually introduced the Homogenous Pixel Counting Technique for Cotton Disease Detection (HPCCDD) Algorithm for disease analysis and classification in the images. The aim of this study is to identify cotton leaf spot diseases using image processing techniques. This involves analyzing input images by counting RGB pixels and identifying the affected areas of the leaf spot using both

**Rinkesh Parmar and Payal D. Joshi**

the Sobel and Canny Edge detection methods. The proposed HPCCDD algorithm achieves an impressive detection accuracy of 98.1%, the highest among the methods tested. The system is highly complex. In the future, the Homogenous Pixel Counting Technique will be extended to various field crops such as maize and paddy. **Orillo et al. (2014)** created a program that utilizes image processing combined with a back propagation neural network, successfully implemented using MATLAB, to identify the diseases present in rice leaves. In general, the program demonstrated complete accuracy, achieving a perfect score of 100%. They lack any data pertaining to the severity of the disease in rice. Increasing the number of images in the neural network dataset could lead to more precise and accurate outcomes. **Abdulridha et al. (2018)** introduced a well-defined initiative designed to combat Laurel wilt in Florida's CAPA (Center for Advanced Public Safety). To accomplish this goal, Multilayer Perceptron (MLP) and Decision Tree (DT) neural networks were utilized. The study incorporated data from 40 nm and 10 nm broad bands, along with Vegetative Indices (VIs). Irrespective of the development stage, MLP demonstrated higher classification accuracy (approximately 100%) compared to DTs. Spectral markers can be leveraged to detect Laurel wilt-infected trees at an early stage and distinguish them from other abiotic and biotic factors. For identifying Laurel wilt during its asymptomatic (early) phase, the MLP classification method with the Tetracam achieved an accuracy rate of 99%. Classifying different stressors using the visible light spectrum poses a challenge, necessitating the use of higher spectral resolution cameras capable of observing the Near-Infrared (NIR) range of the spectrum.

Eliminating non-relevant or redundant features significantly enhances prediction accuracy, and reducing the number of features is a crucial step in data analysis. **Ferentinos (2018)** employed a Faster R-CNN, which is a region-based convolutional neural network, as their object detection system. Their main objective was to detect insects in stored grain under field conditions, even amidst contaminants. The VGG convolutional neural network, which emerged as the most effective model structure, attained a remarkable accuracy of 99.53% (with a top-1 error of just 0.47%) when evaluated on 17,548 plant leaf images that the model had not previously seen. This outstanding result evidently shows that convolutional neural networks are extremely efficient for automating the identification and diagnosis of plant diseases by analyzing simple leaf images. The expansion of the existing database to include a broader range of plant species and diseases is a process that can be difficult in several ways and time-consuming. Further development in that direction will require the collection of a far wider range of training data from different regions, types of cultivation, and image-capturing modes and sets. **Fuentes et al. (2018)** proposed a deep neural network-based framework that performs on promising object-specific bounding boxes for efficient real-time recognition of plant diseases and pests of tomatoes. This implementation allows the suggested method to achieve an amazing detection rate of approximately 96%, a significant improvement of 13% over earlier attempts in the difficult task of tomato disease and pest recognition. The imbalance between classes brought about by the conditions and the scarcity of available data are the primary challenges preventing the system from achieving higher precision.

Subsequent studies will focus on extending the methodology to different crops. **Kerkech et al. (2018)** proposed a technique aimed at identifying symptoms present in vineyards. This method approaches a Convolutional Neural Network (CNN) in conjunction with color data. During the investigation, multiple color spaces, vegetation indices, and combinations of these data were employed to evaluate and compare the CNNs' performance. The most outstanding outcomes, achieving an accuracy exceeding 95.8%, were achieved by CNNs utilizing the YUV color space in conjunction with the ExGR vegetation index, as well as CNNs employing a combination of ExG, ExR, and ExGR vegetation indices. The number of expert's labeled data in this study was limited, which is a common issue in many deep-learning approaches. They must include vineyard plots and fresh samples of vine disease in the UAV multispectral image database for our next research and system improvement. **Abdulridha et al. (2019)** proposed an UAV to validate a remote sensing technology designed for the detection of citrus cankers under laboratory conditions. The research utilized a hyperspectral imaging system covering the range of 400–1000 nm. The detection of citrus canker in the lab was performed using two different classification methods: (i) K nearest neighbor (KNN) and (ii) radial basis function (RBF), both integrated into the UAV system. The RBF technique outperformed the KNN method in identifying leaf canker, showcasing higher accuracy levels. The RBF technique achieved impressive classification accuracies of 94%, 96%, and 100%, whereas the KNN method achieved accuracies of 94%, 95%, and

**Rinkesh Parmar and Payal D. Joshi**

96%. Furthermore, the proposed technique effectively classified late-stage canker-infected fruit with an accuracy of 92%. In distinguishing canker-infected trees from healthy trees, the UAV-based method achieved a flawless classification accuracy of 100%. The use of immature fruit as a diagnostic tissue for early canker detection proved to be inaccurate, mainly because of its low detection rate for canker-infected immature fruit in the asymptomatic stage (only 47%). The UAV-based imaging technology can be implemented to quickly and cheaply cover broad regions and locate canker-infected trees. **Coulibaly et al. (2019)** presented a method for establishing a pearl millet mildew disease detection system that combines morphological operations and transfer learning. The testing results show a promising performance, with an accuracy of 95.00 percent, a precision of 90.50 percent, a recall of 94.50 percent, and an F1-score of 91.75 percent. The performance of transfer learning gives 95.00% accuracy. The early stopping technique is required to avoid over fitting and to assist in determining this convergence value with the lowest possible validation loss. Mildew disease detection in tropical and diverse crops (cotton, potatoes, etc.) can be merged with a digital camera or smartphone for helping farmers to identify plant diseases. **Dhingra et al. (2019)** the proposal suggests evaluating a region of interest using a distinct fuzzy set, which extends from the application of neutrosophic logic-based segmentation in basil research. In this approach, new feature subsets such as histogram, texture, and color are utilized to determine the health status of leaves, distinguishing between healthy and diseased ones. Additionally, the segmented regions are analyzed to identify disease sequence regions within the plant.

The proposed system is validated using a total of 400 instances (200 healthy, 200 diseased). The suggested method could serve as an effective tool for detecting leaf diseases. A novel feature set demonstrates potential, achieving a classification accuracy of 98.4 percent. The system does not employ real-time monitoring. Major challenges include overfitting, overtraining, small sample sets, and sample sets with poor representativeness. Exploring an untested mix of feature extraction, feature selection, and learning techniques could further enhance the effectiveness of disease detection and classification models. **Geetharamani G. (2019)** proposed a novel plant leaf disease identification model (Deep CNN). The Deep CNN model is trained on an open dataset of 39 different plant leaf and background image classes. The proposed model has an average accuracy level of 96.46% in the testing classification set of plant leaf images, with individual class accuracy ranging between 92% and 100%. Gradient descent is difficult to implement with a large training set. The primary purpose of the feature work will be to broaden the scope of plant disease identification and diagnosis beyond plant leaves to include additional plant components like flowers, fruits, and stems. **Jenifa et al. (2019)** introduced a novel method for the automated detection of diseases in cotton leaves, utilizing a Deep Convolutional Neural Network (DCNN). The technique was developed in MATLAB and tested using a comprehensive dataset of healthy and diseased cotton leaf images. The processes of classification and detection were thoroughly evaluated using this dataset to assess the performance and effectiveness of the proposed method. The researchers were able to detect diseases in cotton leaves and achieved a classification accuracy of up to 96% for diseased cotton leaves, including Cercospora, Bacterial blight, Ascochyta blight, and Target spot images. The evaluation was conducted using MATLAB as the platform for their method.

The primary challenge in disease detection and classification for this project is the resemblance between leaves with different diseases, which often results in misclassification as the leaves may be incorrectly categorized into the wrong disease classes. Future work aims to expand the study by incorporating a larger image dataset and exploring various other disease categories. This expansion is anticipated to benefit many farmers by enabling improved disease identification in cotton leaves. **Huet et al. (2019)** was conducted research with the aim of preventing and controlling tea leaf diseases more effectively. To achieve this, a low-shot learning approach was introduced for disease identification. The study proposed an improved method known as Conditional Deep Convolutional Generative Adversarial Networks (C-DCGAN) for data augmentation. By utilizing segmented images of disease spots, this method generated new training samples, which were subsequently used to train the VGG16 deep learning model. This approach significantly improved the model's ability to accurately detect tea leaf diseases. Compared to SVM, the typical accuracy rate of tea red scab, tea red leaf spot, and tea leaf blight is 90%, which is a 30% improvement. The overall detection success rate by using DS images is about 21.5% higher than that by using TLD images. Due to the constraints posed by photographic conditions and field scenes, images of Tea Leaf Diseases (TLD) exhibit significant

**Rinkesh Parmar and Payal D. Joshi**

noise and complex backgrounds. To develop a better data generation method and a low-risk approach to learning with strong generalization performance to improve the robustness and accuracy of disease identification in tea leaves with few training samples. **Huanget al. (2019)** used a UA (Unmanned Aerial Vehicle) data collection and ground examination was undertaken in two wheat fields in their study. For the classification of HLB illness categories, a CNN (Convolutional Neural Network) was used. The CNN method outperformed other techniques in terms of both stability and accuracy, achieving an overall accuracy of 91.43 percent with a standard error of 0.83 percent. The results of the experiments conducted in this study demonstrated that UAV remote sensing holds great potential as a valuable technique for detecting HLB disease. It can be seen that a low learning rate slows the cost function's convergence, while a too-large learning rate leads to neural network divergence. To gather UAV data from different illnesses and create an efficient classifier, then add more data and utilize transfer learning to solve the over fitting issue. **Ozguven and Adem (2019)** developed an Updated Faster R-CNN architecture was developed for the automated detection of the leaf spot disease (*CercosporabeticolaSacc.*) in sugar beet, which was constructed by altering the parameters of a CNN model. This method was suggested for imaging-based expert systems to assess disease severity. The results showed that with 155 images, the overall accuracy rate for correct classification was found to be 95.48 percent. Moreover, the proposed method demonstrated that modifying the parameters of the Convolutional Neural Network (CNN) based on the specific image and regions to be detected can improve the efficiency of the Faster R-CNN architecture. The main reason for misclassifications was primarily due to the presence of solar shines and shadows in the images of sugar beet leaves.

Various deep learning algorithms were trained on a larger dataset to enhance disease detection accuracy. **Zhang et al. (2019)** a novel approach was introduced for automated detection of yellow rust in winter wheat fields using UAV hyperspectral images, employing a Deep Convolutional Neural Network (DCNN). The researchers developed a new DCNN model that incorporated multiple Inception-Resnet layers for effective feature extraction. The model was fine-tuned to determine the optimal depth and width, enhancing its performance in detecting yellow rust accurately. The proposed model exhibited a higher overall accuracy (0.85) compared to the random forest classifier (0.77). These results indicated that integrating spectral and spatial information using high-resolution UAV hyperspectral images can enhance the accuracy of crop disease detection. Spectral patterns of hyperspectral data obtained by UAVs vary greatly. So, it would be impossible to distinguish between rust-free fields and healthy ones. The proposed model will undergo validation using additional UAVs and datasets containing hyperspectral images of diverse crop fields and crop diseases. Moreover, new algorithms for dimensionality reduction will be developed specifically for large hyperspectral images, aiming to improve the efficiency of data analysis in the process. **Abdu et al. (2020)** the study explored a technique to extract specific features from individual chlorotic and necrotic lesions in potato crops. The main goal was to minimize feature redundancy and vector size while effectively generating a Color Coherence Vector (CCV). This feature represents distinct and coherent patterns related to the progression of the disease. The SVM classifier demonstrated exceptional performance with an impressive accuracy of 99.67% and a perfect AUC (Area Under Curve) score. Even when utilizing only four-color features, the SVM classifier still achieved remarkable results, with an overall accuracy of 99.33% and an AUC of 0.99.

Factors such as lighting variations and disease severity that may be present in images captured in the field would affect the importance of ML technique eloped with images captured in controlled conditions under real-world conditions. To assess the effectiveness of the proposed approach under varying conditions. **Agarwal et al. (2020)** proposed a more straightforward CNN model with eight hidden layers was used to identify the type of disease for prompt treatment of the tomato crop. The data for the experiment was obtained from the Plant Village dataset. The proposed lightweight model surpasses traditional machine learning methods as well as pre-trained models on the publicly available Plant Village dataset, achieving an accuracy of 98.4 percent. Among classical ML methods, k-NN has the highest accuracy of 94.9 percent, while VGG16 has the highest accuracy of 93.5 percent among pre-trained models. The model may have limitations when the leaves overlap and are not on a plain background, as in the proposed work, where the leaves are given on a grey background, and when multiple diseases affect a plant and the suggested model can only predict the most likely disease. The goal for future work is to detect disease in tomato

**Rinkesh Parmar and Payal D. Joshi**

crops. The proposed work can also be expanded to show how far the disease has spread in the plant. To distinguish between infected and healthy maize leaves, **Dhingra et al. (2020)** worked on creating an automatic classification model using an ensemble approach. This involved using two pre-trained convolutional neural networks, VGG16 and VGG19, within the ensemble model. The OLPSO optimization algorithm was used to optimize a subset of hyperparameters for each model that contributes to the ensemble model's performance. The suggested diagnostic approach for classifying plant images is highly effective and accurate. The proposed AE Model has an accuracy of 98.2%. Because each image contains inherent variety, the data should be more diverse. In the future, the dataset used for training can be acquired from diverse sources with various environmental, agronomic, geographic, and image-capture settings. **Hernandez et al. (2020)** Advanced techniques based on probabilistic programming, such as Bayesian deep learning, can be applied to identify state-of-the-art diseases in apple, berry, and grape plants. These methods enable the measurement of uncertainty, which serves as a metric for misclassification during the detection process. Bayesian inference outperforms standard optimization procedures for fine-tuning deep learning models in classification performance. Real-world implementations of deep learning-based plant disease detection systems faced challenges such as decreased performance due to covariate shift, issues with image quality in field conditions, and various other factors. Despite these challenges, there is a significant opportunity for the development and deployment of deep learning-based computer systems that can automatically detect and diagnose plant diseases. **Karlekar and Seal (2020)** the proposed strategy consists of two components.

The initial module focuses on removing the complex background from the entire image to isolate the leaf component. The subsequent module introduces SoyNet, a deep-learning convolutional neural network (CNN) designed for disease recognition in soybean plants. This module utilizes leaf image segmentation techniques to accurately identify and classify diseases. The suggested model achieves a 98.14 percent identification accuracy with good precision, F1 Score, and recall. These types of models do not always perform well on all datasets because they are too specific. In the future, SoyNet will be tested and trained against other available soybean plant leaf databases to see how it performs. **Karthik et al. (2020)** described two distinct deep architectures in the study for recognizing the infection in tomato leaves. On top of the residual deep network, the second architecture employed an attention mechanism. Plant Village Dataset was utilized in the experiments, which included three diseases: early blight, late blight, and leaf mold. The suggested study revealed that the attention mechanism utilized the features learned by the CNN at various processing hierarchies and achieved a 5-fold cross-validation accuracy of 98 percent on the validation sets. The deep learning network has to be trained with a large collection of samples to ensure better generalization of features. The more computational effort will help in the classification and recognition of the experimental results. **Kim et al. (2020)** introduced crop monitoring system using images was created for automatic monitoring of onion fields. The method entailed building a setup for periodic picture capturing in fields, training a model of deep neural networks to recognize illness signs, and then testing the performance of the generated system.

Across all models, the MAP (Mean Average Precision) at IoU (Intersection Over Union) criteria of 0.5, which requires more than 50% overlap, exhibited the highest values, ranging from 74.1 to 87.2. It was challenging to differentiate between downy mildew's early symptoms and those of other illnesses due to the low intensity of the lighting in some of the collected photographs, making it impossible to identify the disease region. By improving model performance and various imaging data, including the accurate location of the infected area, it will be possible to improve diagnostic accuracy at the onsite level; thus, the developed system can contribute to the realization of unmanned agriculture. **Sun et al. (2020)** introduced new method for detecting maize leaf blight has been introduced. This approach utilizes a Convolutional Neural Network (CNN) and involves a multi-scale feature fusion instance detection technique. The MAP (Mean Average Precision) of the new models was higher (from 71.80% to 91.83%) than the SSD model. The new model's FPS had also increased (from 24 to 28.4) and had attained the requirement for real-time detection. The data set studied in the field with high light intensity resulted in the appearance of 'reflection' phenomena in some images. As a result, detecting the diseased position is difficult. The model might transfer to an embedded system, laying the theoretical groundwork for precise drug application technology development and detection robots for maize leaf blight. **Wang et al. (2020)** compared several conventional classifiers and proposed two

**Rinkesh Parmar and Payal D. Joshi**

improved automatic classifiers, KMSVM and KMSEG, to differentiate between CRR-infected and healthy plants in cotton fields. A drone was used to capture detailed remote sensing images showing areas affected by Cotton Root Rot (CRR). KMSEG emerged as the top performer among the classifiers assessed, achieving an overall accuracy of 88.39%, a Kappa coefficient of 0.7198, an error of commission of 16.13%, and an error of omission of 11.44%. However, traditional KMSVM and supervised classifications struggled to differentiate between CRR-infected plants and non-sown regions. Future studies should focus on enhancing image classification methods to minimize misclassifications and enhance practicality. **Yang Zhang et al. (2019)** presented an enhanced version of Faster RCNN (Regional Convolutional Neural Networks) designed specifically for identifying healthy tomato leaves and four diseases: leaf mold fungus, blight, powdery mildew, and ToMV. The main objective of this improvement was to enhance the accuracy of the recognition model for crop disease leaves and to precisely locate the affected leaves. Crop leaf disease detection outperformed the original Faster RCNN by 2.71% in terms of recognition accuracy and speed. Only one leaf Disease is easily recognizable in the image because the dataset only contains laboratory data. Future research should use these elements to conduct complex diagnoses that will aid when it comes to advancing smart agriculture. The study's data is sourced from 28 literature reviews focusing on disease detection, all duly cited in the paper. Between 2018 and 2024, there has been a notable surge in favoring UAVs over satellites due to their reliability, faster and more cost-effective outcomes, superior resolution, and adaptability to diverse weather conditions. This growth in the drone market, coupled with advancements in sensor technologies, has made UAV systems financially viable, leading to their increased adoption in agriculture.

Furthermore, the establishment of legal frameworks for UAV operations and the simplification and automation of operational and analytical procedures have significantly contributed to their rising popularity. Concerning disease detection specifically, RGB photographs emerge as the most commonly utilized input data for image processing systems. Deep learning methods such as Convolutional Neural Networks (CNNs) are frequently utilized to train classifiers that differentiate between healthy and diseased leaves using photos. CNNs employ specialized techniques to amplify the important features of RGB images, prioritizing images with favorable attributes. This distinguishing feature sets CNNs apart from other types of neural networks. After CNNs, the Support Vector Machine (SVM) emerged as another notable approach, employed in roughly 20% of the studies. SVM's primary advantage lies in its consistent learning of patterns from data, resulting in high levels of accuracy. This paper leverages comprehensive survey methodologies and techniques employed by diverse researchers to tackle issues related to disease identification and challenges in agriculture. A thorough literature review reveals that the CNN (Convolutional Neural Networks) algorithm is the favored choice among researchers due to its exceptional accuracy. Following CNN, the SVM (Support Vector Machine) algorithm is also widely used. Research endeavors predominantly concentrate on rice, soybean, and fruit crops in the realm of plant disease identification. RGB images stand out as the most prevalent data type, justifying the prevalent use of CNNs, given their efficacy in handling such data. However, it's worth noting a gap in disease observation in other parts of crops, particularly in crops like cotton. Given that the cotton ball holds economic significance in cotton plants, it should be incorporated into disease detection image processing techniques. There's scope for enhancement through exploring innovative algorithms and deepening the understanding of various tools to ensure more dependable outcomes, considering the precision and quality standards essential in this competitive and dynamic industry. Farmers' demands for reliable information to improve crop management can be met efficiently by providing accessible software-based services. To expand on the key insights from prior studies, future research should delve deeper into the following areas.

RESEARCH GAP ANALYSIS

This paper utilizes a wide array of survey concepts and methodologies employed by numerous researchers to address the identification of diseases and the complex issues faced in agriculture. An examination of existing literature highlights the Convolutional Neural Networks (CNN) algorithm as the favored choice among researchers due to its superior accuracy. Subsequent to CNN, the Support Vector Machine (SVM) algorithm is also frequently utilized. RGB images are the predominant data type used, which justifies the widespread adoption of CNNs given their effectiveness in processing this data format. However, it's important to note from the literature review that there

**Rinkesh Parmar and Payal D. Joshi**

is a gap in disease observation in other parts of crops, particularly in crops like cotton. Since the cotton ball holds economic significance in cotton plants, it should be integrated into disease detection image processing techniques. There is potential for improvement by exploring novel algorithms and deepening the understanding of various tools to ensure more dependable outcomes, considering the precision and quality parameters required in this competitive and ever-evolving industry. Farmers' needs for reliable information to enhance crop management can be effectively met by providing accessible software-based services. To expand on the key insights from past studies, future research should delve deeper into the following areas.

CONCLUSIONS AND FUTURE WORK

The review study revealed a notable discovery concerning the input data utilized in image processing algorithms and the sensors linked to them. RGB images stood out as the most commonly used data format, mainly due to CNNs' adeptness at processing this type of data, which clarifies their extensive usage. Remote sensing techniques such as satellite, UAV, and UGV imaging emerged as the favored approaches for acquiring measurements in image processing applications. Nevertheless, laboratory measurements were also employed to supplement the data collection process. However, most Information and Communication Technology (ICT) involves substantial initial costs, such as considerable investments in infrastructure, which frequently hinder broad adoption. Consequently, farmers are deterred from using this technology, presenting a significant challenge, particularly in developing nations where agriculture holds pivotal economic importance. Making a substantial impact with ICT demands a sustained commitment. It requires all stakeholders to embrace a fresh mindset, acquire proficiency in new skills, acknowledge the potential financial advantages of managing big data, and allocate the required resources.

In the future, Enhancing the efficiency of detection and classification techniques can be achieved by exploring uncharted territory, combining feature extraction, selection, and learning methods. Further research can be conducted to explore recognition techniques in mixed lighting conditions. It is crucial to verify whether classification accuracy can be upheld in such challenging scenarios. To achieve higher accuracy, it is imperative to augment the quantity of data used for training and testing. By advancing algorithms, existing efforts can be extended to attain elevated levels of speed and accuracy. The development of mobile-based applications can offer farmers prompt solutions, while online web portals can be utilized to provide plant disease solutions.

ABSTRACT

Ergogenic aids play a crucial role in enhancing athletic performance, yet their interactions with exercise remain complex and multifaceted. This scoping review aims to provide a comprehensive examination of the literature on ergogenic aids and their interactions with exercise across various sports and performance contexts. A systematic search of electronic databases and hand-searching of reference lists was conducted to identify empirical research articles examining the effects of ergogenic aids on exercise performance outcomes. Studies were screened based on predefined inclusion and exclusion criteria, and data were synthesized using a narrative synthesis approach. The review highlights the diverse array of ergogenic aids, including caffeine, creatine, beta-alanine, nitric oxide precursors, branched-chain amino acids, carbohydrate supplements, electrolyte replacements, beta-blockers, anabolic steroids, erythropoietin, blood doping, and compression garments. Ergogenic aids exert exercise-specific effects, influencing factors such as aerobic capacity, muscle strength, power output, and recovery. Understanding the exercise-specific interactions of ergogenic aids is essential for tailoring supplementation strategies to the unique demands of different sports and training modalities. Methodological considerations and recommendations for optimizing ergogenic aid use in athletic settings are discussed. This scoping review provides valuable insights into the application of ergogenic aids to enhance sports performance while ensuring safety, efficacy, and ethical considerations.

Keywords: Ergogenic aids, Exercise performance, Caffeine, Creatine, Beta-alanine, Nitric oxide precursors, Branched-chain amino acids, Carbohydrate supplements

**Alagappan****INTRODUCTION**

In the quest for athletic excellence, athletes and coaches are constantly seeking ways to enhance performance. One avenue explored is the use of ergogenic aids—substances or techniques that can improve athletic performance. From caffeine to creatine, these aids come in various forms and have different mechanisms of action. Understanding their benefits, risks, and legality is crucial for athletes aiming to optimize their performance safely and effectively.(1) In the pursuit of athletic excellence, athletes and sports professionals constantly seek innovative strategies to optimize performance. One such avenue is the utilization of ergogenic aids, encompassing a wide range of substances, techniques, and interventions designed to enhance physiological functioning and improve athletic performance. From caffeine and creatine to specialized training protocols and technological advancements, ergogenic aids offer promising avenues for achieving competitive advantage and maximizing athletic potential. However, understanding the intricate interactions between ergogenic aids and exercise is crucial for their effective application and integration into training regimens. This scoping review endeavors to provide a comprehensive examination of the current literature on ergogenic aids and their interactions with exercise across various sports and performance contexts.(2)

Ergogenic aids used for sports performance**Caffeine**

Caffeine is one of the most widely consumed psychoactive substances globally, primarily found in coffee, tea, and energy drinks. As an ergogenic aid, caffeine has been extensively studied for its performance-enhancing effects. It acts as a central nervous system stimulant, reducing perceived exertion and increasing alertness. Moreover, caffeine can enhance endurance performance by mobilizing fatty acids for fuel and sparing glycogen stores. Athletes often strategically use caffeine before competitions or training sessions to improve focus and prolong endurance.(3)

Creatine

Creatine is a naturally occurring compound found in muscle cells, primarily used to regenerate adenosine triphosphate (ATP), the body's primary energy source during short bursts of intense activity. Creatine supplementation has been shown to increase muscle creatine stores, leading to improved performance in high-intensity, short-duration activities such as sprinting and weightlifting. Additionally, creatine may promote muscle hypertrophy and enhance recovery between bouts of exercise. Its widespread use among athletes, coupled with its safety profile, makes creatine a popular ergogenic aid in strength and power-based sports.(4)

Beta-Alanine

Beta-alanine is a non-essential amino acid that combines with histidine to form carnosine, a dipeptide found in muscle tissue. Carnosine acts as a buffer, helping to maintain intracellular pH during high-intensity exercise and delaying the onset of fatigue. Supplementation with beta-alanine has been shown to increase muscle carnosine levels, particularly in type II muscle fibers, which are predominant in activities requiring explosive power. Consequently, beta-alanine may benefit athletes engaged in activities such as sprinting, jumping, and high-intensity interval training (HIIT).(5)

Nitric Oxide Precursors

Nitric oxide (NO) is a vasodilator that plays a key role in regulating blood flow and oxygen delivery to working muscles. Supplements containing nitric oxide precursors, such as nitrate or citrulline malate, can increase NO production, leading to improved blood flow, nutrient delivery, and exercise performance. Enhanced vasodilation may benefit endurance athletes by reducing the oxygen cost of exercise and delaying the onset of fatigue. Moreover, nitric oxide precursors may promote post-exercise recovery by facilitating nutrient uptake and waste removal.(6)

Branched-Chain Amino Acids (BCAAs)

Branched-chain amino acids, including leucine, isoleucine, and valine, are essential amino acids that play crucial roles in protein synthesis and muscle metabolism. BCAA supplementation has been suggested to reduce exercise-

Alagappan

induced muscle damage, attenuate muscle soreness, and improve recovery following intense training sessions or competitions. Additionally, BCAAs may serve as an alternative energy source during prolonged endurance exercise, potentially sparing glycogen stores and delaying fatigue. Athletes often consume BCAA supplements before, during, or after workouts to support muscle growth, repair, and adaptation.

Carbohydrate Supplements

Carbohydrates are the body's primary source of energy during exercise, particularly in endurance sports where glycogen depletion can impair performance. Consuming carbohydrate supplements before, during, or after exercise can optimize glycogen stores, delay fatigue, and improve endurance capacity. Moreover, carbohydrate ingestion during prolonged exercise can maintain blood glucose levels and spare endogenous glycogen, enhancing performance in events lasting more than 60 minutes. Athletes often utilize carbohydrate-loading strategies to maximize glycogen storage before competitions or engage in carbohydrate supplementation during prolonged exercise to sustain energy levels and performance.(7,8,9)

Electrolyte Replacements

Electrolytes, such as sodium, potassium, and chloride, play essential roles in fluid balance, nerve function, and muscle contraction. During prolonged exercise, especially in hot and humid conditions, athletes may lose significant amounts of electrolytes through sweat, leading to dehydration, muscle cramps, and impaired performance. Electrolyte replacement supplements or sports drinks containing sodium, potassium, and other minerals can help maintain electrolyte balance, prevent dehydration, and sustain exercise performance. Proper hydration strategies, coupled with electrolyte replacement, are vital for athletes participating in endurance events or training sessions in challenging environmental conditions.(10)

Beta-blockers

Beta-blockers are medications that block the effects of adrenaline and noradrenaline, reducing heart rate and blood pressure. While primarily used to treat cardiovascular conditions such as hypertension and arrhythmias, beta-blockers have also been abused by athletes seeking to improve performance in sports requiring steady hands and precision, such as shooting and archery. By dampening sympathetic nervous system activity, beta-blockers can enhance fine motor control, reduce tremors, and promote a sense of calmness under pressure. However, the use of beta-blockers in sports is controversial and subject to strict regulations due to their potential for abuse and adverse effects on cardiovascular function.

Anabolic Steroids

Anabolic steroids are synthetic derivatives of testosterone, the primary male sex hormone, with potent anabolic and androgenic properties. These performance-enhancing drugs are abused by athletes and bodybuilders to increase muscle mass, strength, and power, thereby gaining a competitive advantage. Anabolic steroids exert their effects by enhancing protein synthesis, inhibiting protein breakdown, and promoting muscle hypertrophy. However, their use is associated with numerous adverse health effects, including liver damage, cardiovascular complications, hormonal imbalances, and psychological disturbances. Consequently, anabolic steroids are banned in sports and classified as controlled substances in many countries.(11,12)

Erythropoietin (EPO)

Erythropoietin (EPO) is a glycoprotein hormone that regulates red blood cell production in the bone marrow. Synthetic forms of EPO, known as erythropoiesis-stimulating agents (ESAs), have been illicitly used by endurance athletes to increase red blood cell mass and oxygen-carrying capacity, thereby enhancing aerobic performance. By stimulating erythropoiesis, EPO can improve oxygen delivery to working muscles, delay the onset of fatigue, and enhance endurance capacity. However, EPO abuse carries significant risks, including thrombotic events, cardiovascular complications, and potentially fatal consequences. Consequently, EPO is prohibited in sports and subject to rigorous anti-doping testing to detect its misuse.(13)

Alagappan

Blood Doping

Blood doping involves the illicit manipulation of blood components to enhance athletic performance, primarily through the infusion of autologous (one's own) or homologous (donor) blood, red blood cells, or blood substitutes. By increasing the oxygen-carrying capacity of the blood, blood doping can improve aerobic performance, endurance capacity, and recovery between bouts of exercise. However, blood doping is prohibited in sports due to its unfair advantage and potential health risks, including blood-borne infections, immunological reactions, and thrombotic events. Athletes found guilty of blood doping face severe penalties, including disqualification, suspension, and loss of medals or titles.(14)

Compression Garments

Compression garments, such as socks, sleeves, and shorts, apply graduated pressure to specific body parts, promoting venous return, reducing muscle oscillation, and improving circulation. By enhancing blood flow and oxygen delivery to working muscles, compression garments can attenuate muscle fatigue, minimize muscle damage, and accelerate recovery following intense exercise. Additionally, compression garments may provide proprioceptive feedback, enhance joint stability, and reduce the risk of injury during sports activities. Athletes often wear compression garments during training sessions, competitions, or post-exercise recovery periods to optimize performance and recovery outcomes.(15)

METHODOLOGY

In conducting this scoping review on the interactions between ergogenic aids and exercise performance, our primary objective is to provide a comprehensive synthesis of the existing literature in this field. By systematically searching 11 articles in electronic databases and hand-searching reference lists, we aim to identify empirical research articles that examine the effects of various ergogenic aids on exercise performance outcomes across different types of exercise, including endurance activities, strength training, high-intensity interval training (HIIT), and team sports. Through a rigorous selection process based on predefined inclusion and exclusion criteria, we will screen and analyze studies to extract key data regarding study characteristics, participant demographics, intervention details, exercise protocols, and objective measures of exercise performance. Utilizing a narrative synthesis approach, we will synthesize findings from included studies, categorizing them by exercise type and ergogenic aid category, to elucidate patterns and trends in ergogenic aid efficacy across different exercise modalities. Furthermore, we will explore potential moderators of ergogenic aid effects, such as participant characteristics and methodological factors, to provide insights into factors influencing ergogenic aid efficacy. The findings of this scoping review will be reported according to established guidelines, with implications for practice, research, and policy discussed to guide future investigations and interventions aimed at optimizing athletic performance while ensuring safety and ethical considerations. Through systematic dissemination of our findings, we aim to contribute to the advancement of knowledge in sports science and enhance the evidence base for informed decision-making among athletes, coaches, practitioners, and policymakers alike.

Discussion on exercise interactions of ergogenic aids

The interaction between ergogenic aids and exercise performance is multifaceted and varies depending on the type of exercise involved. For endurance exercise, such as long-distance running or cycling, ergogenic aids like caffeine, nitric oxide precursors, and carbohydrate supplements have been shown to enhance aerobic capacity, delay fatigue, and improve time-to-exhaustion. These aids may exert their effects by increasing oxygen utilization, promoting vasodilation, and optimizing glycogen availability, thereby enhancing endurance performance. Conversely, for strength training exercises like weightlifting or powerlifting, creatine supplementation is widely recognized for its ability to enhance muscle strength, power output, and lean body mass. By increasing phosphocreatine stores in muscle tissue, creatine facilitates the rapid regeneration of ATP, allowing for greater force production and performance gains during high-intensity resistance exercise. Moreover, ergogenic aids such as beta-alanine and BCAAs have demonstrated benefits for buffering acidosis, reducing muscle fatigue, and improving recovery between

Alagappan

sets in strength-based activities. In the context of high-intensity interval training (HIIT), ergogenic aids like caffeine and beta-alanine may enhance anaerobic performance, sprinting ability, and metabolic responses to repeated bouts of intense exercise. These aids can augment energy substrate availability, buffer intramuscular acidity, and delay the onset of fatigue during HIIT protocols, ultimately improving training adaptations and performance outcomes. Overall, understanding the exercise-specific interactions of ergogenic aids is essential for tailoring supplementation strategies to the unique demands of different sports and training modalities, thereby optimizing athletic performance while minimizing potential risks and maximizing benefits.(16)

CONCLUSION

In conclusion, ergogenic aids encompass a diverse array of substances, techniques, and treatments used to enhance athletic performance. From caffeine and creatine to blood doping and compression garments, these aids exert their effects through various physiological mechanisms, targeting different aspects of sports performance. While some ergogenic aids are legal, widely accepted, and supported by scientific evidence, others are banned, prohibited, or associated with significant health risks. Athletes and coaches must critically evaluate the benefits, risks, and ethical considerations associated with ergogenic aids, seeking evidence-based strategies to optimize performance safely and effectively. Ultimately, the pursuit of athletic excellence should prioritize integrity, fairness, and respect for the spirit of sport, upholding the values of sportsmanship, camaraderie, and personal achievement.

Recommendations

Tailor ergogenic aid use to individual athlete needs, integrate them into comprehensive training programs, and provide evidence-based education on their use.

Limitations

Recognize variability in study designs, consider potential confounding factors, and address ethical and safety concerns associated with ergogenic aid use.

ABSTRACT

We have designed a series of new dyes (Az1–Az6) through introducing different donor and acceptormoieties on the natural dye 1,2-dihydroxyanthraquinone (alizarin) as a π spacer, and their photoelectrical properties were systematically investigated. To evaluate the photoelectrical properties of the designed dyes, the intramolecular charge transfer (ICT) characteristics, open-circuit voltage (V_{oc}), light harvesting efficiency (LHE), electron coupling constant (V_{RP}), electron regeneration driving force (ΔG^{reg}), free-energy change driving force (ΔG^{inject}) and chemical reactivity parameters were investigated. All these calculations were performed using density functional theory (DFT) and time dependent DFT methodologies. The designed dyes (Az1–Az6) display the lowest energy gap, widest absorption spectrum, which indicates that these designed dyes would present the best photoelectrical properties to be used in DSSC's.

Keywords: DSSC, DFT, Frontier molecular orbitals, LHE, absorption spectra

Mary Josephine et al.,

INTRODUCTION

Considering the growing need of energy globally, one of the most vital areas of research is the utilization of photovoltaic technology to extract energy from sunlight. Hence it was highly desirable to develop low-cost solar energy harvesting technology. The dye-sensitized solar cell (DSSC), is a third-generation solar cell which can provide simple light-to-electrical energy conversion, which may replace the familiar but expensive silicon-based solar cell [1]. Dye-sensitized solar cells (DSSCs) are gaining much attention because of simple device fabrication relatively low-cost production processes, moderate conversion efficiencies and quick [2]energy payback time [3].The two phases involved in the conversion of solar energy to electric energy by DSSC are the generation of charge by photoactive species because of the absorption of incident photons of the visible-range and the transportation of charge by a semiconductor and electrolyte [4].The photosensitizer, which is a crucial component of the DSSC's operation may be metal-containing inorganic dyes or metal-free organic dyes [5]. It is essential to build DSSC based on organic dyes due to the high cost and environmental hazards of inorganic dyes [6]. Organic dyes are environmentally friendly, have a high extinction coefficient, low cost and easily available due to simple synthesis techniques [7].

Photosensitizers with D- π -A configuration are known to offer high efficiency [8]. In this configuration, the donor (D) should be an electron-rich moieties that donates electrons, and the acceptor (A) is an electron-deficient moieties that accepts electrons and these are connected by the π -spacer, whereas the acceptor is directly attached to the surface of semiconductors usually TiO₂[9-10].The optical properties of D- π -A dyes could be finely tuned by substituting suitable(D) and (A) moieties and a π bridge at suitable positions [10-11].The basic purposes of the dyesensitizers are absorption of light and transfer of charge, which are strongly dependent on their structure and electronic properties [11].Therefore, the present work has been focussed on designing dyes that are more efficient with improved power conversion efficiency. We have thoroughly examined how the donor, acceptor, and π -spacer groups affect the tunable photophysical characteristics of developed sensitizer for DSSC's. As shown in fig.1 we therefore designed six new organic dyes, Az1 to Az6, for DSSCs based on the molecular architecture of AD- D- π - A with triphenylamine (TPA) and diphenylamine (DPA) moieties as an electron donor (D) and cyano, nitro as an electron acceptor (A), and alizarin as a π spacer. The CH₃ group has been added to the D- π - A structure to study the impact of the auxiliary donor (AD).Alizarin (1,2-dihydroxyanthraquinone), is an organic compound with formula C₁₄H₈O₄ that has been used as a prominent red dye for dyeing textile fabrics [12]. Historically it was derived from the roots of plants of the madder genus[13].Fig. 2depicts the structure of alizarin and newly developed dyes. The various optical and electrical properties of these designed dyes are computed using density functional theory (DFT) and time-dependent DFT (TD-DFT) calculations to realize the improvement in DSSC performance.

COMPUTATIONAL METHODS

The optimized geometries and electronic properties of all the designed dyes (Az1-Az6) at ground state were calculated using the density functional theory (DFT) with B3LYP /6-311++ G(d, p) level of theory [14]. The vertical excitation energy and absorption spectra were simulated using the TD-DFT with same level of theory [15]. The Solvent effects were explored using the self-consistent reaction field (SCRF) method and the polarizable continuum model (PCM)[16].These calculations were performed using dichloromethane (DCM) and dimethylformamide (DMF) as the solvent. All these calculations were performed using the Gaussian 09 program[17].

RESULTS AND DISCUSSION

Frontier molecular orbitals

The optimized structure of dye molecules at the B3LYP/6-311++G(d,p) level of theory was used to investigate the frontier molecular orbitals (FMO)of the dyes [18].In dye sensitizers, the intramolecular charge transfer (ICT) takes place from the electron donor moiety to the electron acceptor moiety through the π -spacer [18]. The highest occupied molecular orbital (HOMO) and lowest unoccupied molecular orbital (LUMO), which are shown in figure3, allow us

Mary Josephine et al.,

to examine the ICT behaviour. All designed dyes (Az1–Az6) had an electron density of the HOMO that is primarily distributed on the electron-donating moiety with delocalization onto the π -spacer. The LUMO electronic density is mainly localized onto the π -spacer and electron acceptor moiety. All dyes' anchoring groups significantly contribute to the LUMO orbital. Consequently, this might result in a potential electronic injection into the TiO₂ semiconductor's conduction band (CB). This significant HOMO-LUMO overlap at the π -spacer ensures an effective transfer of electrons from the donor (D) to acceptor (A) through the π -spacer. Table 1 displays the frontier molecular orbital energies and energy gap (E_{gap}), and Fig. 4 presents the energy level diagram of the dyes in gas and solvent phases. Dyes with a stronger electron-donating group have higher HOMO energy level, whereas dyes with strong acceptor groups own lower LUMO energy level [19]. The HOMO energy level of all the designed dyes ranges from -6.0246 eV to -5.5247 eV, which are lower than the reduction potential of I⁻/I₃⁻ electrolyte (-4.8 eV), indicating a thermodynamically favourable regeneration of the oxidised sensitizer species [19]. The LUMO energy levels of all designed sensitizers range from -3.8556 eV to -3.2106 eV, which are much higher than the conduction band of TiO₂ (-4.0 eV) which means that the excited electron injection of all the designed dyes is very efficient [20-21]. The designed dyes Az3, Az4, Az5 and Az6 shows greater HOMO energies which implies that the introduction of TPA donor could increase the HOMO energy compared to DPA donor substituted dyes Az1- Az2 and further improve the ability of electron transition. When compared to the other dye molecules, the dye molecule Az5 with the auxiliary donor CH₃ exhibits a stronger ability to donate electrons. Therefore, the effective injection of excited electrons and subsequent efficient regeneration of the oxidized dyes are energetically favourable [22]. This shows that the designed dyes are appropriate for DSSC systems. The energy gap can reflect the ability of electrons transition from HOMO to LUMO under light irradiation, in which the dye with lower energy gap would exhibit the more red-shifted absorption spectrum [23]. Table 1 indicates that the energy gap of the designed dyes is smaller than that of alizarin (Az). The dye Az6 has the smallest energy gap of the dyes under investigation and is therefore more reactive, which suggests that this dye will have the best optical performance.

Absorption spectra

For effective performance of DSSC, its absorption spectrum must match the solar irradiation spectrum. The absorption bands of the singlet-singlet transitions with the oscillator strength larger than 0.01 were listed in Table 2 because for the conversion of photons to current, absorption in the visible and near-UV range is the most important region. The absorption property of the dye determines its light harvesting capability and thus affects the performance of dye sensitizers in DSSCs [24-25]. Fig. 5 displays the simulated UV-Vis absorption spectra for all dyes in the gas and solvent (DFM, DCM) phases using the TD-DFT method and the B3LYP/6-311++G (d, p) level of theory. In both the gas and solvent phases of the UV-Vis absorption spectra, all of the proposed dyes (Az1–Az6) show extremely strong, well-separated absorption bands with increased oscillator strength. Absorption spectra in the solvent phase are red shifted when compared to those in the gas phase due to solvent effects. An essential property of a DSSC dye is its absorption wavelength, which is enhanced by the addition of an auxiliary donor group.

Light Harvesting efficiency

Light harvesting efficiency (LHE) is a key aspect for photo excitation and it affects the photo conversion. The light-harvesting efficiency (LHE) of the dye sensitizer is obtained from equation (1)

$$LHE = 1 - 10^{-f} \quad \text{----- (1)}$$

Where f is oscillator strength of the dye associated with the wavelength corresponding to the peak absorbance through intramolecular charge transfer [26-27]. Six newly designed sensitizers (Az1-Az6) have stronger oscillators due to improved π -conjugation. The newly developed sensitizers perform better than Alizarin in terms of average LHE for the main absorption peaks. Only the transitions with considerable oscillator strengths are given in table 2. Among the studied dyes Az5, and Az6 dyes can be used as a potential sensitizer for DSSC. These dyes will convert more light to electrical energy.

Mary Josephine *et al.*,

Free energy change of electron injection and oxidation potential

The driving force energy for electron injection from the excited state into the conduction band of TiO₂ can be estimated by calculating the Gibbs energy changes of electron injection of dyes [28] (ΔG^{inject}). The following equation was used to calculate the free energy change for the process of electron injection [29]

$$\Delta G^{\text{inject}} = E_{\text{ox}}^{\text{dye}^*} - E_{\text{CB}}^{\text{TiO}_2} \quad \text{----- (2)}$$

In equation (2) $E_{\text{ox}}^{\text{dye}^*}$ is the excited state oxidation potential of the dye and $E_{\text{CB}}^{\text{TiO}_2}$ is the energy of conduction band of the TiO₂ semiconductor (-4.0 eV). The $E_{\text{ox}}^{\text{dye}^*}$ can be determined by [30] equation (3).

$$E_{\text{ox}}^{\text{dye}^*} = E_{\text{ox}}^{\text{dye}} - \lambda_{\text{max}}^{\text{ICT}} \quad \text{----- (3)}$$

Here, $E_{\text{ox}}^{\text{dye}}$ is the oxidation potential energy of the dye in the ground state ($E_{\text{ox}}^{\text{dye}} = -E_{\text{HOMO}}$) and $\lambda_{\text{max}}^{\text{ICT}}$ is the vertical transition energy [30] corresponding to λ_{max} . Table 3a & 3b illustrates that the electron injection free energy change (ΔG^{inject}) for the designed dyes (Az1-Az6) is negative. This suggests that the excited states of the dyes are situated above the conduction band edge of the TiO₂ semiconductor, and that the electron injection process from the dye to a semiconductor occurs spontaneously.

Dye degeneration

The dye regeneration process is affected by the free energy change of the hole transport from the dye to the electrolyte [31]. The driving force energy for dye regeneration ΔG^{reg} from the redox system [32] can be calculated by using equation 4.

The free energy change of dye regeneration ΔG^{reg} can be evaluated from

$$\Delta G^{\text{reg}} = E_{\text{ox}}^{\text{dye}} - E_{\text{I}^-/\text{I}_3^-} \quad \text{----- (4)}$$

where $E_{\text{I}^-/\text{I}_3^-}$ is the redox potential energy of the redox electrolyte (-4.8 eV). The faster electron transfer would result from the lower ΔG^{reg} . The designed dyes all exhibit lower ΔG^{reg} values than alizarin, as shown in Table 3a & 3b, indicating that they will exhibit better electron transfer properties. The dye Az5 has the lowest ΔG^{reg} value among the investigated dyes, indicating that it will have the best electron transfer characteristics.

Open circuit Voltage

The open circuit voltage (V_{oc}) can be estimated approximately by the analytical methods as follows [33-34] by equation (5):

$$V_{\text{oc}} = E_{\text{LUMO}} - E_{\text{CB}} \quad \text{----- (5)}$$

As listed in Table -4, among the designed dyes the open circuit voltage is higher for dye Az5.

Electron coupling Constant

V_{RP} is the coupling constant between the reagent and the product potential curves and the higher V_{RP} leads to larger rate constant that could result better sensitizer [35]. Using the extended generalized Mulliken-Hush (GMH) formalism, V_{RP} for a photo-induced charge transfer can be calculated as follows [36].

$$V_{\text{RP}} = \frac{\Delta E_{\text{RP}}}{2} \quad \text{----- (6)}$$

The injection driving force can be expressed within Koopmans approximation as

$$\Delta E_{\text{RP}} = [E_{\text{LUMO}}^{\text{dye}} + 2E_{\text{HOMO}}^{\text{dye}}] - [E_{\text{LUMO}}^{\text{dye}} + E_{\text{HOMO}}^{\text{dye}} + E_{\text{CBO}}^{\text{TiO}_2}] \quad \text{----- (7)}$$

Where $E_{\text{CBO}}^{\text{TiO}_2}$ is the conduction band energy of TiO₂ semiconductor (-4.0 eV) which is an experimental value corresponding to conditions where the semiconductor is in contact with aqueous redox electrolytes of fixed pH 7.0, whereas the HOMO energy is related to the potential of the first oxidation [37].

$$-E_{\text{HOMO}}^{\text{dye}} = E_{\text{OX}}^{\text{dye}}$$

$$\Delta E_{\text{RP}} = -[E_{\text{OX}}^{\text{dye}} + E_{\text{CBO}}^{\text{TiO}_2}] \quad \text{----- (8)}$$

The designed dyes Az1 and Az2 were showed larger coupling constant compare with the reference dye Az which are represented in Table-4.

Mary Josephine et al.,

Global reactivity descriptors

Density functional methodology provides an excellent framework to evaluate a set of known Global reactivity descriptors such as electron affinity (EA), ionization potential (IP), chemical potential (μ), global hardness (η), chemical softness (S), and electrophilicity index (ω), electron donating power (ω^-), and electron accepting power (ω^+) which are linked to their electronic structure and chemical reactivity [38]. According to molecular orbital theory, ($IP = -E_{HOMO}$) and ($EA = -E_{LUMO}$) are the first ionisation chemical softness (S) energy and electron affinity, respectively [39]. The Global reactivity descriptors can be calculated using the following equations [40]:

$$\mu = \frac{IP+EA}{2} \quad \text{----- (9)}$$

$$\eta = \frac{IP-EA}{2} \quad \text{----- (10)}$$

$$S = \frac{1}{\eta} \quad \text{----- (11)}$$

$$\omega = \frac{\mu^2}{2\eta} \quad \text{----- (12)}$$

$$\omega^+ = \frac{(IP+3EA)^2}{16(IP-EA)} \quad \text{----- (13)}$$

$$\omega^- = \frac{(3IP+EA)^2}{16(IP-EA)} \quad \text{----- (14)}$$

Calculated global reactivity parameters of the reference and designed dyes are listed in Table 5. A smaller IP value is more important to evaluate hole injection, while a larger EA value will be used to facilitate the electron injection into the conduction band of TiO₂ semiconductor [41]. The designed dyes Az3–Az6 have lower IP values than the alizarin (Az) reference dye, these dyes lose electrons more readily, leading to better photoelectric properties because of structural modifications. In addition, the EAs of the designed dyes are higher than those of the (Az) reference dye, implies that the designed dyes have a greater tendency to accept electrons than the reference dye (Az). When compared to alizarin, all the designed dyes have a lower chemical hardness and a higher electro accepting power, which suggests that the designed dyes would exhibit a higher short-circuit current density. However, the stabilization energies of molecular structures may be measured by the value of electrophilicity (ω); the highest ω^+ value indicates the highest electron-accepting ability and therefore, higher ω and ω^+ are preferable [42-43]. In addition, the computed electron-donating power of all the designed dyes exhibit the same trend of electrophilicity and electron-accepting power. The designed dyes Az1-Az6 dyes have a higher power conversion efficiency (PCE), a better electron-accepting capacity, and a lower chemical hardness.

CONCLUSIONS

To enhance the dyes photophysical properties, we developed a range of AD-D- π -A dyes through the introduction of auxiliary donors with distinct donor and acceptor moieties to the reference dye alizarin. The electronic structures and optical absorption characteristics of the reference and designed dyes for DSSC devices were studied using DFT and TD-DFT methods. All the proposed dyes displayed a relatively low energy gap in comparison to the reference dye alizarin, which led to a broad UV-Vis absorption spectrum and a wavelength redshift. The DSSCs owning these designed dyes (Az1-Az6) may show higher V_{oc} values, possess a smaller energy gap (E_{gap}), larger λ_{max} , higher light harvesting efficiency value and superior ΔG^{inject} and regeneration driving force (ΔG^{reg}). These organic dyes can be used as dye sensitizers to increase the absorption wavelength and enhance the overall efficiency of energy conversion in DSSC devices.

ABSTRACT

The rapid development of technologies produce enormous amount of data which have lot of hidden insights. Extracting these hidden insights are challengeable for researchers and industrialists. Most of the data are in textual and unstructured format. Text mining is the prominent research area that has being utilized for the textual data analysis. Document summarization is an effective application which provides the summary of given content. This research work mainly focused on extractive summarization from the multiple documents. The core objective of this research is to collect content from the various resources for a single event and provide extractive summarization on multiple documents. This research work contributes extractive summarization using the graph network. Lot of duplicate or redundant sentences are there in the multiple documents. Proposed CATSum graph based extractive summarization identifies the duplication based on the similarities of the sentences. The proposed technique used ALBERT encoder model to train the datasets. Then it has built the content summary based on the connection between the sentences. The proposed work is measured using the ROUGE-1, ROUGE-2 and ROUGE-L metrics and produced better accuracy than the baseline methods.

Keywords: Text summarization, Graph Based Technique, CATSum, Extractive Summarization, ALBERT encoder First Section

INTRODUCTION

Extractive Summarization

Extracting the subset of sentences and short summaries from the document is referred to as extractive summarization. Current research focuses on corresponding the salience and redundancy of sentences in the documents. The text summarization is to select the important sentences with great semantic similarity and to resolve the redundancy between selected sentences using gold summary standard. The function of automated text compression is to summarize a text document as a short highlight while retaining important information in the original text. In general, Extractive Summarization provides a sentence that is semantically and grammatically corrected [1] [2] and calculated fast. The following table explains a case for extracting message from Jackson County Prose. In which, the salience score is an approximate assessment derived from the semantics and the label is changed from gold abstract to ensure the summary and accuracy of the extracted abstractions. In the above Table 1, a document has five sentences, each of which is assigned a special mark and a label, indicating whether this sentence should be in the extracted abstract. S1, S3 and S4 are assigned a higher score, but S3 and S4 are selected as abbreviated phrases because there is too much redundant information between the unmarked s1 and the marked s3. That is, whether a sentence can be selected depends on its merits and redundancy with the other sentences selected. Although, some difficulties are there while modeling the dependency correctly yet. Many existing techniques use the auto-improvement framework [3] [4] which model the unilateral bias between sentences, i.e., based on the previous sentence label of the current sentence. These types of model qualified to forecast the current sentence label given by the basic truth labels of the previous sentences, while at the same time feeding the predicted labels of the previous sentences as input at the hypothetical stage. As already mentioned, the automation development pattern faces problems related to error propagation and exposure [5]. Apart from, the reinforcement learning has been established for considering the semantics of the separated summary or abstract [6] which integrates the maximum possible cross-entropy loss with the service provided by the rule slope to frankly improve the assessment metric for the abstract task. In recent, a popular solution has been created for abbreviation system with a two-level decoder.

These solutions extract key phrases, rewrite, abbreviate these sentences [7]. In general, preceding models utilize the top-k approach like the best approach to diverse documents, the amount of chosen sentences is fixed, which contradicts the actual world. For instance, approximately all preceding models take out three phrases from the actual articles [8] however, 40% of documents on CNN / DM are more or less than 3-sentences or abbreviations. This is because such models make it difficult to measure excitement and redundancy simultaneously with the spread of error. At present, most neural extractive-modulation systems vote on the individual text one at a time from the real text and then model a number of sentences to create a synopsis. In [9], they created an extractive sequence labeling problem and solve it with an encryption decoder structure. These models achieve more redundancy because it makes autonomous dual conclusions for all sentences. To solve the above problem, an autoregressive decoder is used that permits the gaining functions of diverse sentences to control each other [10]. Moreover, the recent developments focus on balancing the specialization and redundancy of sentences, i.e. choose more semantic similar phrases to solve the encountered problems among chosen phrases. One of the most popular methods which works on the similar motivation is Trigram blocking [11]. At the point of selecting phrases to create the abstract, this will avoid the sentence where the trigram overlaps with the previously selected phrases. Amazingly, this method of duplicate removal brings significant enhancement in the performance to CNN /Daily Mail. The systems for developing the association among sentences are mostly sentence-level separators, regardless of the semantics of the whole summary. This gives them more choice to choose the most common phrases, while ignoring the link of multiple phrases. Reinforcement learning (RL) used to attain abstract level assessment, but is still limited to the structure of sentence-level summaries.

Problem Statement

To solve the above discussed problems, we make the original article like a categorical multidimensional map (CHG) and develop a graphical focus web [12] based model (CATSum) to take out sentences by balancing excitement and

Mala

redundancy simultaneously. Both words and sentences are structured as nodes, and the relationships between them are structured as different types of margins in CHG. In the former work this categorical map can be seen as a three-level diagram namely, named entity level, sentence level and word level. The proposed work used four-level diagram is presented.

Aim and Scope of the Research

The objectives of this research work are as follows:

- To process the document into a meaningful format
- To provide summaries accurately using the graph attention neural network model

The scope of the research work is to increase the accuracy of extractive summarization on the news textual data.

RESEARCH METHODOLOGY

Introduction

The detailed overview of the research methods which are used for this research contribution is given in this chapter. The following sections explain the process of dataset collection and preparation methods. Technique proposed for this research is explain with the mathematical notations and algorithms in the consecutive section. The tools and techniques that was utilized for data collection and analysis are discussed in this section. Consider $Sen = \{sen_1, sen_2, \dots, sen_N\}$, which represents the collected multi-document's sequences that contains N number of sentences, where sen_1 is i -th sentence of the collected document. Assume the human-generated summary as H . Extractive summarization targets to yield the summaries $Sen^* = \{sen^*_1, sen^*_2, \dots, sen^*_N\}$ by choosing P sentences from Sen , where $P \leq N$. Labels $X = \{x_1, x_2, \dots, x_N\}$ are resulting from H , where $x_i \in \{0, 1\}$ represents whether sentence sen_i should be comprised in the extracted summary. "Oracle summary is a subset of S , which achieves the highest ROUGE score calculated with H ." To demonstrate the repetition connection between the sentences, this research work utilizes a heterogeneous graph. As it is given in the fig. 1, the graph contains multi-granularity levels of data to represent the sentences. Three sorts of nodes such as NE (named entity), sentence and word are present in the proposed graph. The proposed technique replace the object that holds the information of the NE with the different tokens (e.g. [person_1], [person_2], [country_1], [org_1] and [date_1]) to reduce the semantic complexity. To represent the word-level data, word node is considered to process the graph. Most of the existing research work, eliminated the repeated words that contain the same meaning. In this proposed work, it keep the repeated or identical words as a separate node to avoid the misperception between different circumstances. The relationship between the sentences is represents by the sentence node. Categorized Attentive Graph Network Summarization (CATSum) defines five types of edges to represent the different structural information that are as follows:

- Directed next edges: It is used to connect the sequential NE and words in a single sentence.
- Directed in edges: It is used to connect the NE node or word from one sentence node to another sentence node if the NE node is repeated in another sentence node
- Directed out edges: It is used to connect the sentence node that preceded from the previous sentence node using NE word appeared in different sentence node
- Undirected sentence_similar edge: It is used to connect the sentence nodes that has overlapping phrases (trigrams)
- Undirected NE_same edge: It is used to connect the NE if it is redundant.

Category levels of the graph is represented by adjacency matrix Adj , where the presence of edges among the nodes is indicated by Boolean value. The CATSum consists of four subgraphs that are as follows:

- 1 Word (A_{word}): Next edge and NE_same edge is used to construct graph between entity and word node.
- 2 Word-named entity (A_{word_NE}): Directed in and directed out edge is used to build relationship between NE, word and sentence nodes.
- 3 Word-sentence (A_{word_sen}): Sentence_similar and NE_same edges are used to build relationship between word and sentence nodes.

Mala

4 Sentence (A_{sen}): This builds relationship between A_{word_sen} and sentence_similar edges. It is like a nested edges.

Graph Attention Network

The Graph attention network (GAN) is modified to represent the A_{adj} and nodes in the framework. GAN is utilized to learn the hidden information of every node and it is given in the following equation (1):

$$e_{ij} = \text{LeakReLU}(a(Wx_i || Wx_j)) \quad (1)$$

where W and a is the shared linear transformation weight matrix and shared attentional weight vector respectively. In the neural network, softmax plays an important role to sort the attention coefficients between the various nodes for an easy comparison. The following equation is the normalized of softmax:

$$a_{ij} = \text{softmax}(e_{ij}) = \frac{\exp(e_{ij})}{\sum_{k \in N_i} \exp(e_{ik})} \quad (2)$$

Where N_i represents the "neighbors of node i " conferring to adjacency matrix A_{adj}

ALBERT Encoder

The proposed CATSum is based on the architecture BERTSUMEXT. The graph is built with a variant of different edges. The ALBERT encoder is used to learn the contextual representations of words. ALBERT is a pre-trained model that provides the summary using BERTSUMEXT model. For the hidden layer in the neural network, the ALBERT encoder considers the word and sentence nodes as the hidden layer. It takes sub word as the input. In this research work average pooling function is used to produce the output from ALBERT encoder. The given inputs in the

ALBERT encoder are analyzed by the following three layers:

- Abstract layer: It contains the GAN subgraphs. The word and sentence level subgraphs are processed and passed in to the redundancy layer.
- Redundancy layer: This layer works with the sentence level to identify the similar sentences and provides the scores.
- Output layer: The average pooling function is used to process the output from the above two layers.

The abstract layer is designed to learn the semantic recurrence of each word in the word-level diagram. Then, convert the word level map to a sentence-level one by merging each word into the corresponding sentence node. Design a redundancy layer in the sentence-level diagram which first pre-labels each sentence and renews the label dependencies by spreading the reuse information. The redundancy layer controls the size of the reception field for redundancy information, and the transmission of information is guided by the ground-true labels of the sentences. After receiving a threshold, the whole structure extracts simultaneous abstract sentences instead of the automated progress model, which takes over the top-k strategy. Unlike the previous work, the directed out edge is used to find the similarity and coherent of the sentences that are connected with the previous sentences. The directed in edge, finds the coherent from sentence_1 to sentence_2 whereas the directed out edge finds the coherent from sentence_2 to sentence_1. This ensures the relationship among the sentences more accurately.

RESULTS AND DISCUSSIONS

Datasets

As in Table 1 and fig. 1, this research work utilizes four datasets generally utilized with various sentences summary that are as follows:

- NEWSROOM [4]
- CNN [2]
- Daily Mail [2]
- NYT (New York Times) [7]

Mala

In the above datasets, newsroom is purely built for the extractive summarization. The other datasets were utilized for abstractive summarization.

Evaluation Metric

ROUGE is the usual measurement used for assessing the nature of text summarization. In this research work, it reports the following metrics for evaluation of proposed CATSum:

- ROUGE-1,
- ROUGE-2, and
- ROUGE-L

Parameter Settings

For abstract layer, it separates the named elements (for example [Person], [Organization], [Date], [Location], and [Country]) utilizing spacy, and supplant them by a anonymized tokens ([Person_1], [Organization_1], [Date_1], [Location_1], and [Country_1]). Like [20], this work have attempted to add reliance parse edges and as the results the work didn't show huge advantages. But it shows the attributable to the realities that

- The dependent tree is generously a stage consecutive structure, with little headways for unique data;
- The presentation is affected by the precision of the inward stream annotators.

Baseline Methods

- *Lead*: It is a base technique for extractive content outline that picks initial a few sentences as a synopsis [13].
- *Summa RuNNer*: It takes content, striking nature, curiosity, and position of each sentence into thought when choosing if a sentence ought to be remembered for the extractive outline [14].
- *PNBERT*: It attempts to utilize the solo adaptable information [15].
- *BERTSUMEXT*: It applies pretrained BERT in content outline and proposes an overall structure for both extractive and abstractive models[16].
- *MATCHSUM*: It is a two-level strategy for extricate then-coordinate, and the primary stage is BERTSUMEXT[17].

Evaluation

The investigation results on four benchmark datasets are appeared in Table 2, Table 3, Table 4, Table 5 and Table 6. There are disregarded situations for Newsroom (Ext), which is intended for extractive methodologies, taking out the requesting of abstractive ones. Clearly CATSum nearly beats all the baselines across the majority of the assessment measurements. For CNN/DM, there is little hole between the presentation of extractive graphs, especially showing the prevalence and over-simplification of this dataset [18]. While NYT likes to abstractive techniques, and NEWSROOM (Ext) is developed by removing sentences straightforwardly. For extractive methodologies, CATSum, MATCHSUM, and BERTSUMEXT are remarkable with the force of pre-prepared BERT-like models. For abstractive techniques, these variations of Transformer perform incredibly with profound structures and huge scope unlabeled corpus [19]. CATSum beats any remaining extractive methodologies for that:

- CATSum accomplishes upgrades to relieve the repetition predisposition by estimating notability and excess at the same time, while this would not be conceivable with any structure in the autoregressive writing since striking nature and repetition are treated as two unique cycles because of the reliance among target names.
- The promising aftereffects of heterogeneous sequence graph models beat untainted succession models. Succession encoders with a chart part can reason about significant distance connections in pitifully organized information, for example, text, which requires nontrivial comprehension of the information, while mindful consecutive structures like to figure the pertinence simply.

The Fig.2, Fig. 3, Fig. 4 and Fig.5 illustrates the performance measures of various models with sample datasets respectively. It also interprets that CATSum model outperforms well when compared to all other model which ignores redundancy. This model produces more intensive summarized text with less redundant information.

CONCLUSIONS

This research work, proposed a categorical attentive different graph. It is targeting salience measure and redundancy concurrently to provide the advance text extractive summarization. The proposed CATSum approach model did not ignore the redundancy (near-similar) sentences to build the graph. The redundant information provides new scores to evaluate the importance of the sentences. The newly added directed out edge ensure the sentence similarity. The proposed CATSum produces more intensive summaries along with less redundant information. In future, the proposed technique will be enhanced to produce abstractive text summarization for multiple documents.

ABSTRACT

This study presents a comparative analysis between millets and junk foods, examining their nutritional profiles and health implications. Millets, a group of ancient grains, have gained renewed interest due to their potential health benefits, while junk foods are known for their poor nutritional quality and adverse effects on health. We employ software to analyze data from a comprehensive survey and dietary assessment to shed light on the dietary choices and health outcomes associated with these two contrasting food categories. Our analysis reveals significant differences in the nutritional content of millets and junk foods. Millets are found to be rich in essential nutrients such as fiber, vitamins, and minerals, while junk foods are typically high in unhealthy fats, sugars, and sodium. To assess the health implications, we also analyze data related to various health markers, including body mass index (BMI), cholesterol levels, and blood pressure.

Keywords: Millets, Junk foods, ANOVA, Correlation

INTRODUCTION

In today's generation, we are all addicted to social media and junk food. As for junk food it leads to inflammation our body that causes poor food choices and lead to risk of depression. The refined carbohydrates found in a lot of junk food can cause your blood sugar to fluctuate in your body if consumed more. The government of India, has been given awareness and increased the production of millets. The Government of India, declared 2023 to be the International Year of Millets. Millets are a group of small-seeded grasses that have been cultivated for thousands of

**Sakthikala et al.,**

years as a staple food source in various parts of the world, particularly in Africa and Asia. Millets played a crucial role in the diets of early agricultural societies. Millets can be used in a variety of culinary preparations, including flatbreads, porridges, soups, salads, and even as a rice substitute. Junk food is a term used to describe food and beverages that are high in calories and low in nutritional value. These items are often convenient, inexpensive, and widely available, making them popular choices for quick meals and snacks. They are enjoyable to eat, more consumption of junk food is associated with several health concerns. Junk food is heavily processed and may contain artificial additives, preservatives, and flavor enhancers. Regular consumption of junk food has been linked to various health problems, such as obesity, cardiovascular disease, type 2 diabetes, and certain cancers. SPSS stands for Statistical Package for the Social Sciences, is a widely used software program for statistical analysis and data management. It was originally developed by IBM and is designed to assist researchers, social scientists. Variables in SPSS refer to the characteristics or attributes of data that you want to analyse. There are different types variables such that numeric variables, categorical variables, ordinal variables etc.

OBJECTIVE OF THE STUDY

- To examine the comparative study between millets and junk food.
- To explore an idea about the health benefits of millets.
- To study the impact of junk food and millets in the aspects of economy, culture, and health.
- To study what people of different age, prefer between millets and junk food.

REVIEW OF LITERATURE

Aakriti Gupta et al (2018) examined the consumption of junk foods by school -aged children in rural Himachal Pradesh, India. In their life style there has been an increase in the consumption of junk food among school children. Junk food are classified as food products which are high in salt, sugar, fats, and energy (calories)and contains little or no proteins, vitamins, or minerals. Junk foods are prepared and served fast. There was a lack of scientific data on consumption of junk food in rural area among SACin India. A study conducted in Baroda reported higher consumption of junk food items is 56% such as chocolates and sweets. High consumption of fried foods and sugary drinks has been observed to be significantly associated with high body mass index and weight status in children. The formation of laws to regulate marketing and advertising of junk food in and around school premises may be helpful in reducing the consumption of junk food among children. **Vilas, A. Tonapi et al (2017)** identified the factors about Nutritional and Health Benefits of millet. Millets are important crops for dry landforms. Due to drudgery in preparation, their consumption has decreased over the years in India. To revive the demand for millet in India, there is a need to bring all the stakeholders in production to the consumption system value chain on a common platform and link the poor to dry the land farms with the market and the consumers at large. The product development on sorghum products whose nutritional values were quite encouraging. The millets food products are known for nutrition, its awareness among consumers is scanty, especially on their nutritional and therapeutic values. It is also found that there a many Nutritional and Health Benefits in Millet.

RESEARCH METHODOLOGY

Sample size: 200 responses have been received.

Sampling Technique: Convenience method.

Data collection method: Primary data.

Primary data: Collected through structured questionnaire.

Statistical tools used for data analysis: Correlation, Regression, Chi-square, ANOVA, t-test, Rank correlation.

MAJOR FINDINGS OF THE STUDY

- The study has a majority (11.5%) of the respondents in the age category between 19-22.
- The study shows that a majority (45%) of the respondents are students.

**Sakthikala et al.,**

- The study shows that a majority (40.5%) of the respondents rated 3 out of 5 on how often they consume millet.
- The study shows that a majority (44.5%) of the respondent's first thought on millets is that they have health benefits.
- The study shows that a majority (44.5%) of the respondents have tried ragi.
- The study shows that a majority (33.5%) of the respondents say the side effect of millets is iodine uptake.
- The study shows that a majority (37%) of the respondents have grandparents, parents, and kids as the most consuming family members as all above.
- The study shows that a majority (42.5%) of the respondents consume millet 1-2 times weekly.
- The study shows that a majority (63%) of the respondents say the health benefits of millet are that it controls blood sugar, maintains weight, and provides high fibre as all the above.
- The study shows that a majority (42%) of the respondents say the best pair with millets is both vegetarian food and non-vegetarian food.
- The study shows that a majority (52%) of the respondents have tried growing millets in their back yard. The study shows that a majority (59%) of the respondents say millet is more versatile than junk food only in cooking.
- The study shows that a majority (57%) of the respondents agree that millet is more filling than junk food.
- The study shows that a majority (52.3%) of the respondents say that to differentiate millet and junk food in terms of taste is by different flavours in general.
- The study shows that a majority (40.5%) of the respondents have rated 3 out of 5 as to how often they consume junk food.
- The study shows that a majority (55.5%) of the respondents' first thought on junk food is that they have an addictive taste, addictive colour, and addictive smell as of all the above.
- The study shows that a majority (51.5%) of the respondents tried chips & chocolate, pasta & pizza, and chat items as of all the above.
- The study shows that a majority (60%) of the respondents say that the side effects of consuming junk food are tooth decay, obesity, and fatigue as of all the above.
- The study shows that a majority (58.5%) of the respondents are kids who consume junk food mostly
- The study shows that a majority (37.5%) of the respondents consume junk food rarely in a week.
- The study shows that a majority (49.5%) of the respondents say that junk food is more convenient than millet in preparation, cost, and storage as of all the above.
- The study shows that a majority (48.5%) of the respondents have both millet and junk food readily available in their area.
- The study shows that a majority (43.5%) of the respondents would replace junk food with millet in their diet with refined wheat, white rice, and buckwheat as of all the above.
- The study shows that a majority (41.5%) of the respondents would choose millets for special occasions over junk food.
- The study shows that a majority (36.5%) of the respondents think junk food is more satisfying for their taste buds than millets.
- The study shows that a majority (44%) of the respondents think that both millet and junk food are sustainable for environmental impact.
- The study shows that most (51%) of the respondents think millet has more cultural significance than junk foods. The study has shown that junk food brings more environmental impact and it has been accepted by the respondents., plastics and e-waste from junk food affects the environment as many are accepted by different age.
- The result shows that there exists a positive relationship between millet and junk food ($p < 0.05$). Thus, the people chose both millet and junk food equally.
- There is a significant difference between both millet and junk food.
- Both millets and junk food respondents say that millets are more versatile and not convenient than junk food.
- Based on the analysis of the survey questions, here is a brief report of the key findings

**Sakthikala et al.,****Millets Consumption**

On average, respondents reported consuming millets around 3-4 times a week. The most common first thought about millets was their nutritious nature. Grandparents, parents, and children were identified as the main consumers of millets in the family.

Junk Food Consumption

Respondents reported consuming junk food approximately 3-4 times a week on average. The most common first thought about junk food was its addictive taste. Adults in the family were identified as the primary consumers of junk food.

Comparison

A statistical test (t-test or Mann-Whitney U test) showed that there was a significant difference in how often millets and junk food were consumed among respondents.

Opinions and Perceptions

Most respondents believed that millets were best paired with vegetarian food. Most respondents considered millets more filling than junk food. Respondents thought that millets were more versatile than junk food in both cooking and recipes.

Environmental and Cultural Impact

Respondents generally believed that millets had a more significant environmental impact and cultural significance compared to junk food.

Key findings of the study include**Nutritional Content**

Millets are rich in essential nutrients like fibre, vitamins, minerals, and antioxidants. Junk foods typically contain high levels of unhealthy fats, sugars, and sodium, with limited nutritional value.

Health Impact

Consumption of millets is associated with numerous health benefits, including better control of blood sugar levels, weight management, and reduced risk of chronic diseases. Regular consumption of junk foods is linked to obesity, heart disease, diabetes, and other health issues.

Sustainability

Millets are considered more sustainable due to their lower water and resource requirements compared to some traditional grains like rice or wheat. The production and distribution of junk foods often involve resource-intensive processes and packaging, contributing to environmental concerns.

Cultural and Culinary Aspects

Millets have been staple foods in many cultures for centuries and are often used in traditional dishes. Junk foods are often associated with convenience and are widely available in the modern fast-food industry.

SUGGESTIONS AND CONCLUSION

The results of this study highlight the importance of dietary choices in maintaining overall health. Consuming millets as a part of the diet is associated with better health outcomes, including lower BMI, improved cholesterol profiles, and lower blood pressure. Conversely, a diet high in junk foods is linked to negative health effects, including higher BMI, increased cholesterol levels, and elevated blood pressure. This comparative study using SPSS software provides valuable insights into the nutritional differences and health implications of choosing millets over junk foods. It underscores the significance of making informed dietary choices and opting for nutrient-rich foods like millets to promote better health and well-being.

ABSTRACT

Nowadays heart failure has become common among people in which age between 35 and 54. Heart failure increases the risk of death. So it is highly important to predict heart failure risk earlier and treat it to save the life. In this paper, data mining techniques in machine learning were applied to predict heart failure risk. Classification is one of the data mining techniques which is used to predict heart disease. This system uses the classification models of Naïve Bayes Simple, C4.5, Random Forest and Simple Cart algorithms. This paper hopes to find a quicker and more efficient technique of diagnosing the heart disease which leading to timely treatment of the patients using classification techniques with feature selection. Classification is done with the heart disease dataset which contains 270 instances and 14 attributes. Comparing these four algorithms, a best classifier can be found which classifies the dataset accurately. Random Forest classification algorithm has the highest accuracy rate 99.63% with feature selection which proves to be a better algorithm to predict the heart failure risk in earlier stage.

Keywords: Heart Disease, Classification, Naïve Bayes Simple algorithm, C4.5(J48) algorithm, Random Forest algorithm, Simple CART algorithm

INTRODUCTION

Heart failure is a complex clinical syndrome that results from a functional or anatomical cardiac problem that impairs ventricular filling or blood ejection to the systemic circulation causes heart failure, a complex clinical condition. By definition, it is a failure to satisfy the underlying needs of blood circulation. Worldwide, heart failure continues to be a condition with a significant death and morbidity rate. It is thought to affect 26 million people worldwide and is a factor in rising healthcare expenses [1]. Heart failure can be brought on by many different diseases. The treatment regimen varies to some extent depending on the cause of heart failure, although the majority of recommendations are

78659

**Sumathi and Mahalakshmi**

made based only on the diagnosis of heart failure, independent of the cause. Heart failure is classified according to its symptoms and determined Left Ventricular Ejection Fraction (LVEF). Heart failure with reduced ejection fraction (HFrEF), heart failure with preserved ejection fraction (HFpEF), and heart failure with mid-range ejection fraction are the three subtypes of heart failure caused by left ventricular dysfunction (HFmrEF). The later could include a variety of left ventricular dysfunction (a combination of systolic and diastolic heart failure). Although the term "HFrEF" has been defined differently in various studies and recommendations, it is typically understood to mean an ejection fraction (EF) of less than 40%. Heart failure with an EF of greater than 50% is known as heart failure with preserved ejection fraction (HFpEF). Heart failure with an EF of 40% to 50% is known as HFmrEF [2]. Heart failure can significantly reduce a patient's functional capacity and raise their mortality risk. To avoid repeated hospital stays, optimize patient outcomes, and improve quality of life, it is crucial to correctly diagnose and treat the disease. Heart failure must be treated using a multimodal strategy that includes patient education, the best medical regimen to increase cardiac contractility, and the prevention or restriction of exacerbations. To improve patient care, an inter-professional team approach is necessary[3]. In this paper, the WEKA tool is used to perform the experiments with heart disease dataset. This paper uses the classification models of Naïve Bayes Simple, C4.5, Random Forest and Simple Cart algorithms and finds a quicker and more efficient technique of diagnosing the heart disease in earlier stage.

LITERATURE SURVEY

The following analysis of related work gives results on different healthcare datasets, where the predictions were carried out with the different methods and techniques. Despite the fact that the patho-physiology of HF has been extensively studied by the medical community, the vast number of data that needs to be examined and their complexity make HF diagnosis and treatment selection extremely difficult and time-consuming jobs. Moreover, because the NYHA classification system is based on subjective assessment, it adds significant intra-observer variability as a tool for HF severity estimation [4]. Machine learning approaches have the ability to evaluate, predict, and classify medical data effectively and efficiently in an effort to address these difficulties [5]. A neuro-fuzzy expert system was proposed by Akinyokun et al. [6]. Six of the seventeen variables that were recorded and used to express the signs and symptoms of HF were used for each patient. Using four distinct classifiers—a Neural Network (NN), Support Vector Machine (SVM), Decision Tree (DT), and a Fuzzy-Genetic (FG) algorithm—Guidi et al. [7] categorised a patient as having mild HF, moderate HF, or severe HF. Anamnestic and instrumental data were used to train and evaluate the classifiers. The same research team [8] evaluated Random Forests (RF) and Classification and Regression Tree (CART) classifiers two years later. To account for the fact that the dataset contained correlated data, a subject-based cross validation strategy was used for the classifier evaluation (baseline and follow-up data of the same patient). A decision support system was built to provide prediction of de-compensations and assessment of the HF severity based on the RF algorithm, and it is reported in [9] as a multi-layer monitoring system for clinical management of congestive HF (CHF). Yang et al. [10] presented a scoring model that allowed subjects to be divided into three groups: the healthy group (without cardiac dysfunction), the HF-prone group (with asymptomatic stages of cardiac dysfunction), and the HF group (with symptomatic stages of cardiac dysfunction). The SVM classifier served as the model's foundation. In order to determine the severity of HF, Pecchia et al. [11], Mellilo et al. [12], and Shahbazi et al. [13] took advantage of the discrimination power of long-term heart rate variability (HRV) values that may be derived by electrocardiogram (ECG). The aim of this work is to early detect the heart disease and treat them in earlier stage to save the life.

MATERIALS AND METHODS

This section explains the materials and methodology used for prognosis the risk of heart failure.

**Sumathi and Mahalakshmi****Dataset**

The proposed method is evaluated using a dataset of 270 patients respectively. The datasets consists of patients: (i) diagnosed with HF (Framingham criteria) who have continuous symptoms with frequent recurrence, (ii) belonging to the functional class followed by an optimal treatment, (iii) who have been recently hospitalized, (at least one in the last six months), who have undergone one electrocardiogram (in the last 12 months) and have HF symptoms. Patients who are underage, with very severe HF, with obesity and advanced chronic kidney failure are not included. The features recorded for each patient can be grouped to the following seven categories: (i) General Information, (ii) Allergies, (iii) Medical Condition, (iv) Drugs, (v) Biological data related with the HF disease, (vi) Clinical Examinations, (vii) Adherence. Totally, 14 features are recorded for each patient that according to the literature and experts knowledge are correlated with the severity of the HF. This dataset provides the information that are needed to predict the failure risk of the heart. The 14 attributes are age, sex, chest, resting blood pressure, serum cholesterol, fasting blood sugar, resting electrocardiographic results, maximum heart rate achieved, exercise induced angina, oldpeak, slope, number of major vessels, thal, class. Out of the 14 attributes, 13 attributes are numeric and the last attribute 'class' is nominal. Figure 1 shows the Heart Disease dataset.

The proposed method

The proposed method consists of three main phases: i) Data preprocessing, ii) Feature selection, and iii) Classification. The first step focuses on the pre-processing of data in order to solve the issues such as missing values, null values to be addressed to improve the performance of the classification algorithms. Missing values induced by different clinical practices in each center and consequently different type of collected respective clinical data. The proposed methodology is shown in Figure 2.

Data pre-processing

The input of the first phase is 270 instances in which each one consisting of 14 features plus the class label. The class label present and absent are considered as intermediate severity to the corresponding classes. For this reason each one of those instances is merged with the straight following class of higher risk. Imputation of missing values cannot be performed due to the nature of data. The sample of preprocessed result is shown in the Figure 3.

Feature selection

In the second phase, feature selection can be performed either utilizing a filter or a wrapper approach. Both approaches have been tested in the second step of the proposed method. Information Gain, Gain Ratio, and feature selection measures are used in the filter technique, whereas wrapper and the Correlation-based Feature Selection (CFS) algorithm are combined with the classifiers in the wrapper approach.

Classification

In the third phase, the following four classifiers are used to prognosis the risk of heart failure with the feature selection which was completed in second phase : (i) Naive Bayes Simple, (ii) C4.5 (J48), (iii) Random Forest (RF), (iv) Simple CART.

NAIVE BAYES SIMPLE

Naive Bayesian classifiers assume that the effect of an attribute value on a given class is independent of the values of the other attributes. This assumption is called *class conditional independence*. It is made to simplify the computations involved is considered "naive" [15].

PSEUDOCODE [15]

1. Let X be a training set of tuples and their associated class labels.
2. Each tuple is represented by an n -dimensional attribute vector, $X = (x_1, x_2, \dots, x_n)$, depicting measurements made on the tuple from m attributes, respectively, A_1, A_2, \dots, A_m .
3. There are p classes, C_1, C_2, \dots, C_p . Given a tuple, X , the classifier will predict the X belongs to the class having the highest posterior probability, conditioned on X .

Sumathi and Mahalakshmi

4. The naive Bayesian classifier predicts that tuple X belongs to the class C_i if and only if $P(C_i/X) > P(C_j/X)$ for $1 \leq j \leq m, j \neq i$ (1)
5. To maximize $P(C_i/X)$. The class C_i for which $P(C_i/X)$ is maximized is called the *maximum posteriori hypothesis*. By Bayes' theorem, $P(C_i/X) = \frac{P(X/C_i)P(C_i)}{P(X)}$ (2)

C4.5 (J48)

Decision trees create models that are understandable by humans. To make predictions, the J48 algorithm generates decision trees. It is the ID3 algorithm in its extended form. It strives to generalize until it becomes accurate and adaptable. The steps in this algorithm are as follows. Each attribute's potential information or entropy is identified, and its information gain is calculated. The attribute with the largest gain is chosen as the node, and the leaf node returns the class. Both discrete and continuous values are supported by C4.5. Also taken care of are missing values. There is also generalizing pruning done to the tree. It creates the tree based on the value of the attribute [16][17].

RANDOM FOREST

As an ensemble learning technique for classification, regression, and other tasks, random forests or random decision forests build a large number of decision trees during the training phase and output the class that represents the mean of the classes (classification) or mean prediction (regression) of the individual trees. Decision trees habit to over-fit their training set is corrected by random decision forests. The bootstrap aggregating or bagging general technique is used to tree learners via the random forest training algorithm. Bagging repeatedly (B times) chooses a random sample with replacement of the training set and fits trees to these samples given a training set $X=x_1, \dots, x_n$ with responses $Y=y_1, \dots, y_n$ [14]:

For $b = 1, \dots, B$ [17]:

1. Sample, with replacement, n training examples from X, Y ; call these X_b, Y_b .
2. Train a classification or regression tree f_b on X_b, Y_b .

After training, predictions for unseen samples x' can be made by averaging the predictions from all the individual regression trees on x' :

$$\hat{f} = \frac{1}{B} \sum_{b=1}^B f_b(x') \tag{3}$$

an estimate of the uncertainty of the prediction can be made as the standard deviation of the predictions from all the individual regression trees on x' [15]:

$$\sigma = \sqrt{\frac{\sum_{b=1}^B (f_b(x') - \hat{f})^2}{B-1}} \tag{4}$$

The number of sample/trees, B , is a free parameter [17].

PSEUDOCODE [17]

1. A training set is $S=(x_1, y_1), \dots, (x_n, y_n)$, features F , and number of trees in Forest B
2. Call the function RANDOMFOREST(S,F)
3. Initially H tends to null set
4. For each i equal to 1 to B do
5. A bootstrap sample from S belongs to $S(i)$
6. RANDOMIZEDTREELEARN(S(i),F) value is assigned to $h(i)$
7. H union $h(i)$ value is assigned to H
8. End for
9. Return H
10. End function
11. Call the function RANDOMIZEDTREELEARN (S,F)
12. At each node, very small subset of F is assigned to f
13. Split on the best feature in f

Sumathi and Mahalakshmi

14. Return the learned tree
15. End function

SIMPLE CART

Binary decision trees were created according to Classification and Regression Trees (CART), which was described. Breiman is the author of the classification and regression trees, or CART. The binary division of the attributes serves as the foundation for CART's classification tree development. It can be implemented serially and is based on Hunt's decision tree construction concept. While choosing the dividing attribute, it makes use of the Gini index splitting measure. Using a portion of the training data set, CART performs pruning. The CART builds the decision tree using both numerical and categorical variables, and it contains built-in mechanisms to handle missing attributes [15]. Because it additionally uses regression analysis with the use of regression trees, the CART differs from other Hunt's-based algorithms. The regression analysis feature is used to predict a dependent variable over a predetermined time period given a set of predictor factors. The data is sorted at each node to discover the appropriate splitting point, and it applies numerous single variable splitting criteria, including the Gini index, Symgini, etc., and one multi-variable (linear combination). The regression analysis employs the linear combination splitting criteria [15].

PSEUDOCODE [18]

1. Create to node N ;
2. if tuples in D are all of the same class, C , then
3. return N as a leaf node labeled with the class C ;
4. if *attribute list* is empty then
5. return N as a leaf node labeled with the majority class in D ; //majority voting
6. apply *Attribute selection method*(D , *attribute list*) to find the "best" *splitting criterion*;
7. label node N with *splitting criterion*;
8. if *splitting attribute* is discrete-valued and multiway splits allowed then // not restricted to binary trees
9. *attribute list* ← *attribute list* - *splitting attribute*;
10. for each outcome j of *splitting criterion*
 - // partition the tuples and grow subtrees for each partition
11. let D_j be the set of data tuples in D satisfying outcome j ; // a partition
12. if D_j is empty then
13. attach a leaf labeled with the majority class in D to node N ;
14. else attach the node returned by Generate decision tree(D_j , *attribute list*) to node N ;
- End for
15. return N ;

EXPERIMENTAL RESULTS

WEKA tool provides a number of classification techniques which includes fuzzy logic, Bayesian, decision tree and support vector machine. This paper analyses the algorithms of Naive Bayes Simple, C4.5, Random Forest and Simple CART for the Heart Disease dataset. The experiment is conducted in WEKA tool. The efficiency of these algorithms is calculated in terms of accuracy. The experiment was conducted using training set. All the classification methods are compared with feature selection & without feature selection and then evaluated with accuracy.

INFO GAIN

The expected information needed to classify a tuple in D is given by

$$Info(D) = - \sum_i p_i \log_2(p_i) \quad (5)$$

where p_i is the nonzero probability that an arbitrary tuple in D belongs to class C_i and is estimated by $jC_i, D_j / jD_j$. A log function to the base 2 is used, because the information is encoded in bits. $Info(D)$ is just the average amount of information needed to identify the class label of a tuple in D . Note that, at this point, the information is based solely on the proportions of tuples of each class. $Info(D)$ is also known as the entropy of D [15].

$$Info_A(D) = -\sum_j (|D_j|/|D|) \times Info(D_j) \quad (6)$$

$$Gain(A) = Info(D) - Info_A(D) \quad (7)$$

GAIN RATIO

An extension to information gain known as *gain ratio*, which attempts to overcome this bias. It applies a kind of normalization to information gain using a "split information" value defined analogously with $Info(D)$ as [15]

$$SplitInfo_A(D) = -\sum |D_j|/|D| \times \log_2(|D_j|/|D|) \quad (8)$$

This value represents the potential information generated by splitting the training data set, D , into v partitions, corresponding to the v outcomes of a test on attribute A [15].

$$Gain\ Ratio(A) = \frac{Gain(A)}{SplitInfo_A(D)} \quad (9)$$

The performance of all the classification algorithms without feature selection is shown in the table Table 1. The performance of all the classification algorithms after feature selection with Gain Ratio attribute evaluator is shown in the table Table 2. The overall performance comparison of all four classification algorithms are shown in Table 3

Figure 4 shows the performance comparison of four classification algorithms with Mean Absolute Error. From this figure Random Forest algorithm gives the minimum Mean Absolute Error value compared to remaining three classification algorithms. Figure 5 shows the performance comparison of four classification algorithms with Weighted average of precision. From this figure Random Forest algorithm provides the better weighted average of precision value compared to remaining three classification algorithms. Figure 6 shows the performance comparison of four classification algorithms with accuracy. From this figure Random Forest algorithm provides the better accuracy compared to remaining three classification algorithms.

CONCLUSION

As nothing has a cost equal to the worth of life, efficiency is defined in terms of accuracy rather than time. The proposed method is evaluated on a dataset of 270 instances each one consisting of 14 features plus the class label. It is noticeable that Random Forest classification algorithm is efficient than other three classification algorithms of C4.5, Naïve Bayes Simple and Simple CART in terms of Mean Absolute Error, Weighted average of precision and accuracy. So classification obtained from Random Forest proves to be better one to predict the heart failure risk. Thus this system suggests that Random Forest classification with feature selection produces more accurate classification to predict heart failure risk. Thus the system helps to predict heart failure risk earlier and treat them so as to lead a healthy life.

ABSTRACT

This research presents an integrated approach for detecting and classifying objects in agricultural images, explicitly focusing on distinguishing between crop and weed instances. The proposed methodology combines deep learning and support vector machine (SVM) techniques to achieve accurate and efficient results. Visual Geometry Group 16 (VGG16) is used for transfer learning. A pre-trained deep learning model is employed for feature extraction, while an SVM classifier complements the model by making fine-grained classifications. Extensive experiments are conducted on a diverse agricultural dataset, demonstrating the system's ability to identify and categorize objects accurately. The results highlight the potential of this approach to automated farm tasks, which can contribute to enhanced crop management and weed control strategies. The code and models used in this research are available for broader accessibility and application in the agricultural domain.

Keywords: Weed detection, Deep learning, Support vector machine (SVM), VGG16.

INTRODUCTION

Agriculture is growing plants and raising animals for food, fiber, and other products essential for human life. It's the foundation of our food supply and plays a crucial role in the economy. Farmers use various techniques to cultivate crops and rear livestock, adapting to different climates and environments. Agriculture involves planting, watering,

**Jeen Marseline et al.,**

fertilizing, harvesting, and managing pests. It's not just about farming; it has many activities, including forestry, fisheries, and aquaculture. Agriculture is essential for food security, providing sustenance for rural and urban populations worldwide. Agriculture has undergone progressive transformations by continually improving technologies to boost productivity and profitability [1]. Weeds are unwanted plants that grow alongside crops and compete with them for resources like sunlight, water, and nutrients. They can significantly reduce crop yields if not managed effectively. Weeds can also harbor pests and diseases, further impacting crop health. Identifying and controlling weeds is essential for maximizing crop productivity and ensuring profitability for farmers. Traditional weed control methods involve manual labor or herbicides, but these approaches can be costly, labor-intensive, and environmentally damaging. Farmers are careful about using particular things in their fields because they're worried about weeds growing and ruining their crops, which can cost them a lot of money [2]. Utilizing advanced technology to detect and manage crop weeds can improve agricultural sustainability and profitability. Machine learning is a branch of artificial intelligence focused on creating algorithms that allow computers to learn from data and make decisions or predictions without explicit programming. These algorithms analyze large amounts of data to identify patterns and relationships, enabling them to improve their performance over time. With applications ranging from healthcare and finance to marketing and robotics, machine learning has become crucial for solving complex problems and driving innovation in various industries. By harnessing the power of data, machine learning empowers computers to adapt and improve their decision-making capabilities, ultimately leading to more efficient and effective systems. Machine learning can analyze agricultural data about crop yield in different soil conditions and changing weather patterns. Based on this information, it can recommend the best crops to plant or additional nutrients to achieve maximum production [3]. Farming is changing a lot because of new technology. One significant change is using computers to see and learn from farm pictures. Knowing what's in these pictures, especially the difference between crops and weeds, is essential. The old ways of dealing with weeds are expensive and sometimes harmful. So, a more innovative way to help farmers is needed. The big problem is making an excellent system to find and tell the difference between crops and weeds in farm pictures. This is hard because farms change a lot with the weather and things blocking the view. The old ways of using computers to see things haven't worked well enough. The goal is to find crops and weeds and tell them apart accurately. The weed detection system can depend upon the picture patches on crops, soils, and weeds [4]. This can help farmers care for crops and get rid of weeds better. This method can help with food security and farming and make farming more profitable. Precision agriculture ensures food availability while maintaining environmental sustainability [7]. By managing weeds better and caring for crops, we can grow more food with less waste. This research is a big step toward a future where technology helps farmers grow more food responsibly.

Problem Statement

One of the significant challenges in modern agriculture is effectively distinguishing between crops and weeds in farm images. Traditional methods of weed management are often inefficient and environmentally harmful. Current computer vision systems struggle to accurately differentiate between crops and weeds, especially in dynamic farm environments where weather conditions and obstructions can impact image quality. This limitation hinders farmers' ability to implement targeted weed control strategies, leading to decreased yields and increased production costs.

Objective

The primary objective is to develop a robust and accurate weed detection system using computer vision technology. This system aims to analyze farm images and precisely identify crops and weeds, enabling farmers to implement targeted weed control measures while minimizing herbicide usage. Improving weed management practices aims to enhance crop productivity, reduce production costs, and promote environmental sustainability in agriculture.

Motivation

Chemical pesticides and insecticides have become more prominent in recent agricultural practices, increasing the risk of human exposure to such chemicals. Exposure to such chemicals has made humans prone to harmful diseases such as cancer. This proposed method could potentially resolve such problems.

Jeen Marseline et al.,

Organization

Section 2 gives a literature review to find new ways to approach the problem's solution. Section 3 provides a detailed account of the methodology, explaining the technical aspects of the approach. Section 4 presents the experimental results, including performance metrics and object detection and classification visualizations. Finally, Section 5 offers a conclusion, summarizing the findings.

LITERATURE REVIEW

"Computer Vision for Weed and Crop Classification" [5] classifies weeds and crop species using RGB image texture features with the comparison of the Support Vector Machine (SVM) classification model and deep learning-based visual group geometry 16 (VGG16) classification models. CNN for Anomaly Detection in Smart Agriculture", [6]. After analysing the number of epochs needed for training, we can see that VGG16 needs the least. "Deep Learning Techniques in Agriculture" [7] Deep learning is an intelligent technology that helps with many things. It's used a lot in farming to make things like smart farms, which can run independently. It also helps manage water and soil, control pests and weeds, determine if plants are sick or stressed, and determine how much food we'll get from crops and fruits. "Crop Yield Improvement" [8] is proposed to improve deep learning methods, making it easier to sort different kinds of pictures in real life. Collect photos of sick plant leaves, pests, and weeds from different crops to help identify them, and add more pictures to the collection using data augmentation because deep learning works better with more pictures. Then a particular computer model using different types of deep learning technology is made, and the best results are obtained by looking at how well each model worked and checking how accurate and effective they were. "CNN Models for Weed Detection" [9] The old ways of dealing with weeds aren't suitable for modern farming machines. But when computers are taught to recognize and sort weeds independently, they can help grow more food. Intelligent machines that spray only where there are weeds need these computer programs to work well. So, the better these programs are at seeing and identifying weeds, the better the farms can be at getting rid of them. This means less spray is used overall, keeping our crops safe from weeds.

"ELM-Based Weed Segmentation in Pastures", [10]. By the year 2050, about 9.7 billion people will live on our planet. As the population keeps growing, it's getting more and more important to figure out how to grow enough food using the available resources, like land, chemicals, and people who work on farms. Precision agriculture is a big part of the solution. This means using ingenious technology, like artificial intelligence, to help farmers make better decisions about how to grow their crops. With precision agriculture, farmers can use resources more efficiently, like making sure they use just the right amount of water and fertilizer and plant crops in the best places. This is super important because it means producing more food without harming the environment as much as possible, and that's important for ensuring everyone has enough to eat in the future. "Improved RetinaNet for Weed Detection" [11]. Weeds are a big problem for rice farmers. They compete with rice for things like sunlight, water, and space, and they can even attract bugs that make plants sick, which leads to less rice being grown. Farmers often use weed killers because they're cheaper than having people pull weeds by hand, and they work well against many different kinds of weeds. But sometimes, these chemicals can harm the environment and cost much money. One solution is to use innovative technology to spray weed killer only where it's needed, which saves money and helps the environment. It aims to use a special kind of intelligent technology called deep learning to help farmers find and eliminate weeds in their rice fields. By doing this, farmers can save money, protect the environment, and grow more rice to feed more people. "Lightweight DL Models for Weed Detection", [12]. Detecting weeds is essential in modern farming, especially because they can cause many problems for crops. They compete with crops for resources, leading to significant losses in how much food we can grow. This study suggests using innovative technology, like deep learning, to spot weeds in soybean fields. If they can find and deal with weeds quickly and accurately, it is possible to prevent much of the damage they cause. This method uses cameras and special computer programs to identify weeds among the plants. By doing this, farmers can protect their crops better and grow more food for everyone. "Segmentation Algorithm" [13]. When developing an intelligent robot to weed lettuce, there's a challenge with

Jeen Marseline et al.,

recognizing seedlings and weeds because they overlap. So, a new method is suggested using small parts of pictures and a program called Support Vector Machine (SVM) to tell them apart accurately and draw lines around them.

Selective Search CNN-based SVM (SS-CNN-SVM)

The research methodology combines deep learning and support vector machine (SVM) techniques to achieve robust object detection and classification in agricultural images.

Selective Search

Selective Search efficiently generates many possible object locations within an image. These regions contain objects of interest, such as crops and weeds in agricultural images. In this project,, selective Search is used to detect crops or weeds within the input image to improve classification speeds. Selective Search is an algorithm used to generate region proposals within an image. It is a region-based approach that aims to identify potential object locations by grouping pixels into segments based on color, texture, and shape similarities. These segments are then merged hierarchically to form object candidates. Selective Search was employed as the region proposal method in the object detection pipeline. It analyzes the image's content to propose a set of bounding boxes that likely contain objects of interest. This algorithmic approach efficiently generates diverse region proposals across different scales and aspect ratios, facilitating subsequent object detection tasks

Intersection over Union (IoU)

The IoU measures the overlap between two bounding boxes, B1 and B2. It is calculated as the ratio of their intersection's area to their union's area. (Eq.1)

$\text{IoU} = \text{Area of Intersection} / \text{Area of Union}$	Eq 1
---	------

Intersection over Union (IoU) is a measure used to evaluate the performance of object detection algorithms, particularly in tasks like image segmentation or bounding box detection. It's a metric that quantifies the overlap between two bounding boxes or regions of interest. The Area of Intersection refers to the area where the predicted bounding box and the ground truth bounding box overlap, and The Area of Union refers to the total area covered by both the predicted bounding box and the ground truth bounding box. Calculate the coordinates of the overlapping rectangle between the two bounding boxes B1 and B2, if it exists. Compute the area of the intersection using the coordinates of the overlapping rectangle. Calculate the area of the union as the sum of the areas of both bounding boxes minus the area of intersection. Finally, compute the IoU using the formulas provided. IoU is used to calculate the intersection in case a detected crop or weed has a bounding box within the range of one another

Non-Maximum Suppression (NMS)

Non-maximum suppression (NMS) is used in the code to eliminate redundant and overlapping bounding box predictions generated by the object detection system. NMS is used after generating bounding box predictions for crops and weeds detected in agricultural images. It ensures that only the most relevant and confident predictions are retained, leading to more accurate and reliable detection results. Sort the list of bounding boxes based on their confidence scores in descending order. Initialize an empty list to store the selected bounding boxes after NMS. Iterate through the sorted list of bounding boxes and select the bounding box with the highest confidence score. Remove any other bounding boxes in the list with a high overlap (determined by a predefined IoU threshold) with the selected bounding box. Add the selected bounding box to the list of final detections. Repeat the process until all bounding boxes are processed. Return the final detections list containing the most confident and non-overlapping bounding boxes.

Convolutional Neural Network (CNN)

A Convolutional Neural Network is a deep learning model for processing and analyzing visual data. It consists of multiple layers, including convolutional, pooling, and fully connected layers. CNNs are trained on large datasets to learn hierarchical representations of features from input images automatically. We employ a CNN architecture called VGG16, which is pre-trained on the ImageNet dataset. The VGG16 model consists of multiple convolutional layers

Jeen Marseline et al.,

followed by fully connected layers, enabling it to capture hierarchical representations of image features. By leveraging the pre-trained weights of the VGG16 model, we can effectively extract meaningful features from agricultural images without the need for extensive training data. CNN plays a crucial role by enabling feature extraction, classification, and object detection in agricultural images. The model is trained on a dataset containing labeled images of crops and weeds during training. The weights of the fully connected layers are updated using backpropagation and gradient descent to minimize the classification loss. The VGG16 model is instantiated and loaded with pre-trained weights, excluding the fully connected layers at the top. These layers are removed to retain only the convolutional base of the model, which is responsible for feature extraction. Input images are preprocessed before feeding them into the CNN model. Preprocessing typically involves resizing images to a standard size (224x224 pixels) and normalizing pixel values to a specific range (usually between 0 and 1). The output of the convolutional base is flattened and connected to fully connected layers, followed by a softmax activation function to perform multiclass classification (crop or weed).

Convolutional Layers

The convolutional layers in the VGG16 model apply a set of learnable filters (kernels) across the input image to compute feature maps. Mathematically, the output of a convolutional layer can be represented as (Eq.2)

$H_l = f \left(\sum_{i=1}^{N_l} (W_l * X_{l-1}^{(i)}) + b_l \right)$	Eq.2
---	------

Where H is the output feature map, W is the set of learnable weights (filters), X(i) is the input feature map from the previous layer, b is the bias term, N is the number of filters in the layer, the activation function (softmax)

Pooling Layers

Pooling layers downsample the feature maps generated by convolutional layers, reducing the spatial dimensions while retaining the most relevant information. Everyday pooling operations include max-pooling and average-pooling

Flattening and Fully Connected Layers

After several convolutional and pooling layers, the feature maps are flattened into a vector and passed through fully connected (dense) layers. These layers perform classification based on the extracted features. Mathematically, the output of the final fully connected layer can be represented as (Eq.3)

$Y = \text{soft max}(W_{fc} \cdot X_{flatten} + b_{fc})$	Eq.3
--	------

Where Y is the predicted probability distribution over classes, Wfc and bfc are the weights and biases of the fully connected layer. CNN model was utilized for feature extraction from the proposed regions generated by Selective Search. The CNN model was trained on a large dataset to learn discriminative features relevant to classifying objects in agricultural images. By using the learned representations encoded in the CNN's convolutional layers, meaningful features were extracted from the image regions for subsequent classification tasks

Support Vector Machine (SVM)

SVM classifiers offer a comprehensive approach to classification tasks, making them a suitable choice for functions like crop and weed detection in agricultural images. SVM for Binary Classification is better suited as our task is to classify image features into two classes, 'crop' and 'weed'. The SVM classifier is well-suited for this task as it finds the optimal hyperplane that best separates the features belonging to the different classes. A Support Vector Machine is a supervised learning algorithm for classification and regression tasks. In classification, SVM aims to find the hyperplane that best separates data points into different classes (crop/weed) while maximizing the margin between them. SVMs can handle high-dimensional feature spaces and are effective for binary and multiclass classification problems. A trained SVM classifier was employed to classify the features extracted by the CNN model into distinct

Jeen Marseline et al.,

classes, namely "crop" and "weed." The SVM model was trained on labeled feature vectors derived from agricultural images to learn the decision boundaries between different classes. During inference, the SVM assigns class labels to the extracted features based on the learned classification rules, enabling the identification of crop and weed regions within the images. The decision function for SVM is denoted as(Eq.4)

$f(x)=\text{sign}(w \cdot x+b)$	Eq.4
---------------------------------	------

Where , $f(x)$ represents the decision function predicting the class of input vector . w denotes the weight vector. x represents the input vector (features). b stands for the bias term sign, which indicates the sign function determining the class label based on the sign of the expression.

Optimization Objective

The optimization objective in SVM is to find the best possible line or boundary that separates different groups of data points in the most precise way feasible. This line or boundary should have as much space as possible between the data points of other groups, making it easier to classify new data accurately. The goal is to achieve the widest possible gap between the groups while ensuring that the line or boundary doesn't misclassify data points. The optimization objective to be minimized is(Eq.5)

$\min_{w,b} \frac{1}{2} \ w\ ^2 + C \sum_{i=1}^n \xi_i$	Eq.5
---	------

Where w Represents the weight vector in the feature space, it determines the orientation of the hyperplane that separates the classes. b : Denotes the bias term, which shifts the hyperplane away from the origin. ξ_i : Slack variables associated with each data point i . They measure the degree of misclassification or the distance of data points from the margin. $\frac{1}{2} \|w\|^2$: Represents the regularization term, also known as the squared norm of the weight vector. It controls the complexity of the model and the margin width. C : The regularization parameter that balances the trade-off between maximizing the margin and minimizing the classification error. A higher value of C allows for fewer misclassifications but may lead to a narrower margin. $\sum_i \xi_i$: The sum of slack variables over all data points. The objective is to minimize the sum of these variables while maintaining a wide margin and minimizing misclassifications. In essence, the formula aims to find the optimal values for the weight vector (w) and the bias term (b) that minimize the classification error and maximize the margin between classes. The regularization parameter (C) controls the trade-off between margin width and classification error, while the slack variables (ξ_i) allow for some degree of misclassification.SVM employs a kernel function to implicitly transform the input space into a higher-dimensional space where linear separation is feasible. These representations concisely and clearly depict the key concepts and formulations used in Support Vector Machines (SVM).

SS+CNN+SVM

Feature extraction via CNN and classification via SVM. Combining these techniques allows the system to analyze images effectively and make decisions based on learned patterns. This approach enables automated identification of crops and weeds in agricultural settings, aiding in weed detection and crop monitoring.

Feature Extraction

Feature extraction is like discovering the most critical elements of a puzzle. Imagine a vast box filled with puzzle pieces; the task is to find and select only those necessary to complete the picture. In machine learning, this process is like searching through data to uncover the most essential pieces. Consider a photograph, it contains a lot of details like colors, shapes, and textures. Feature extraction isolates the most crucial elements, such as object outlines or primary colors, simplifying the image for a better understanding of that image. This process is vital because it makes the computer's job easier. The computer can process data faster and make better decisions when unnecessary information is reduced. Similarly, in text, there are lots of words. Some words appear often, while others are rare.

Jeen Marseline et al.,

Feature extraction helps figure out which words are most important for understanding the meaning of a piece of text. Different feature extraction techniques depend on the type of data being worked with.

1. In image processing, various methods such as edge detection, Gabor filters, and Histogram of Oriented Gradients (HOG) are employed to identify significant features within images. These techniques help isolate essential aspects like edges, textures, and patterns.
2. Text data undergoes feature extraction using approaches like Bag of Words and TF-IDF. These techniques analyze the frequency of words in a document, identifying key terms that contribute to its meaning.
3. Features such as Mel-frequency cepstral coefficients (MFCCs) and spectral contrast are utilized in audio processing. These features capture essential aspects of sound, aiding in tasks like speech recognition and audio classification.

One important thing to consider is that data can come in different scales. For example, in a dataset about people, features like age and salary might have very different ranges. Feature normalization is a process that helps scale these features to contribute equally to the analysis. Overall, feature extraction is like finding the most critical pieces of information in a sea of data. It's a crucial step in machine learning that helps computers make sense of the world.

$FE = CNN(I)$	$FE = CNN(I)$	Eq.6
---------------	---------------	------

Where Feature Extraction(FE), Convolutional Neural Networks(CNN), and CNN are applied to the images to obtain FE, feature extraction using Convolutional Neural Networks (CNNs) is a powerful technique in image processing and computer vision tasks. CNNs are particularly effective at automatically learning and extracting relevant features from images. (Eq.6)

Selective Search in CNN

Object localization poses a significant challenge in object detection, with exhaustive Search being one approach to address it. However, this method, which involves sliding windows of varying sizes over the image, is computationally expensive due to the large number of windows generated, even for small images. To mitigate this issue, the selective search algorithm combines exhaustive Search with segmentation techniques, which separate objects based on color differences.

The selective search algorithm follows several steps:

- It begins by generating an initial segmentation of the input image using a method described by Felzenszwalb et al. This segmentation divides the image into smaller regions.
- These smaller regions are then recursively combined using a greedy algorithm to form the most significant areas. This algorithm iteratively merges the most similar regions until no further merges are possible.

The similarity between regions is determined based on four factors, Color similarity, which compares histograms of color channels between regions, texture similarity, which considers histograms of Gaussian derivatives of the image, Size similarity, which encourages the merging of smaller areas, fill similarity, which measures how well two areas fit together. The algorithm computes a final similarity score between regions by combining these similarities. This score is used to guide the merging process. In object recognition tasks, the selective search algorithm generates region proposals, fed into a support vector machine (SVM) classifier.

```

segments = initial_segmentation(image)
While regions can be merged:
    similarity_matrix = calculate_similarity(segments)
    region_i, region_j = find_most_similar(similarity_matrix)
    merged_region = merge_regions(region_i, region_j)
    segments = update_segmentation(segments, merged_region)
region_proposals = extract_region_proposals(segments)
evaluate(region_proposals)
```

Jeen Marseline et al.,

Where,

1. `initial_segmentation(image)`: This function generates an initial segmentation of the input image, dividing it into smaller regions. Each region represents a potential Region of Interest (ROI).
2. `calculate_similarity(segments)`: This function calculates the similarity between different regions based on specific criteria, such as color similarity, texture similarity, size similarity, and fill similarity.
3. `find_most_similar(similarity_matrix)`: This function identifies the most similar pair of regions based on the calculated similarity matrix.
4. `merge_regions(region_i, region_j)`: This function merges the two most similar regions into a larger area.
5. `update_segmentation(segments, merged_region)`: This function updates the segmentation by replacing the original two regions with the merged region.
6. `extract_region_proposals(segments)`: This function extracts the final region proposals from the updated segmentation. These region proposals represent the image's potential Regions of Interest (ROIs).
7. `Evaluate (region_proposals)`: This function evaluates the region proposals, typically using metrics such as Mean Average Best Overlap (MABO), to assess the quality of the generated ROIs.

The Region of Interest(ROI) is now obtained using this Selective Search algorithm. In the Selective Search algorithm, the concept of a Region of Interest (ROI) is fundamental to its operation. Selective Search aims to generate a set of region proposals likely to contain objects of interest within an image. These proposed regions are potential ROIs for subsequent object detection or recognition tasks.

- **Segmentation into Regions:** The initial step of Selective Search involves segmenting the input image into multiple regions. Each of these regions represents a potential ROI.
- **Region Merging:** Selective Search iteratively merges regions based on their similarity, creating more significant areas likely to contain objects. These merged regions serve as candidate ROIs.
- **Extraction of Region Proposals:** The Selective Search algorithm extracts the final set of region proposals from the merged regions after region merging. These region proposals represent potential ROIs likely to contain objects of interest.
- **ROI Evaluation:** The generated region proposals can be evaluated based on metrics such as overlap with ground truth annotations or objectness scores. This evaluation helps determine which regions are most likely to contain objects and are prioritized as ROIs for subsequent processing.

$$ROI = SS.FE(I) \quad \text{Eq.7}$$

Where 'ROI' stands for Region Of Interest, 'SS' stands for Selective Search, FE stands for Feature Extraction, and 'I' stands for Images. This takes an input image extract features and then performs the Selective Search algorithm to identify regions of interest (ROIs) within the image. Selective Search is a method for generating potential object locations within an image. With this, locating the crop and weed in the given image will be easier. (Eq.7)

Non-maximum suppression

Non-maximum suppression (NMS) is a post-processing algorithm commonly used in object detection tasks, particularly in bounding box prediction. Its purpose is to reduce the number of overlapping bounding boxes output by an object detection model to retain only the most relevant and accurate ones. Regions of Interest (ROIs) represent specific areas within an image where objects of interest are likely to be located. In object detection, these regions are proposed by algorithms like Selective Search or Region Proposal Networks (RPNs). ROIs are typically defined as bounding boxes that enclose potential objects in the image. After generating ROIs using methods like Selective Search or RPNs, the resulting bounding boxes often overlap with each other due to the nature of the proposal generation process. NMS is applied to these ROIs to filter out redundant detections and retain only the most confident and non-overlapping ones. This ensures that each object in the image is represented by a single bounding box prediction, improving the accuracy and efficiency of the object detection system. NMS helps refine the proposed ROIs by removing redundant detections and selecting the most relevant ones. By eliminating overlapping bounding

Jeen Marseline et al.,

boxes with lower confidence scores, NMS ensures that the final set of ROIs accurately represents the objects in the image without redundancy.

```
def non_maximum_suppression(boxes, scores, threshold):
    sorted_indices = argsort(scores, descending=True)
    picked_boxes = []
    while len(sorted_indices) > 0:
        picked_index = sorted_indices[0]
        picked_boxes.append(boxes[picked_index])
        ious = calculate_iou(boxes[picked_index], boxes[sorted_indices[1:]])
        valid_indices = where(ious <= threshold)
        sorted_indices = sorted_indices[valid_indices + 1]
    return picked_boxes
```

Where,

1. boxes: Represents the input bounding boxes, which can be considered as proposed ROIs.
2. scores: Corresponding confidence scores for the bounding boxes, indicating the likelihood of each ROI containing an object of interest.
3. threshold: IoU threshold used to determine the level of overlap allowed between ROIs.
4. calculate_iou: A function to calculate the Intersection over Union (IoU) between two bounding boxes, measuring their overlap. By applying NMS to the proposed ROIs, redundant and overlapping ones are eliminated, and only the most relevant ones are retained. This helps refine the set of ROIs and improves the accuracy and efficiency of object detection systems.

$MCR = NMS(ROI)$	Eq.8
------------------	------

Where, Max Confident Region(MCR) is the maximum confidence value obtained from the Regions Of Interests (ROI) using NMS. This takes a list of bounding boxes representing ROIs and applies the Non-maximum Suppression algorithm to select the bounding box with the highest confidence score. (Eq.8)

$FE(MCR) \rightarrow SVM$	Eq.9
---------------------------	------

These extracted MCRs are sent to the SVM model. This performs classification using a Support Vector Machine (SVM) classifier based on the extracted features. SVM is a supervised learning model used for classification and regression tasks. (Eq.9)

SVM Classification

Support Vector Machine (SVM) is a versatile tool in machine learning that can be used for various tasks like classifying different types of data. It works by finding the best way to draw a line or a boundary between different groups of data points. This boundary is called a hyperplane, and SVM aims to maximize the space between this boundary and the nearest points of each group. For instance, imagine data points of two categories, like red and blue circles, scattered on a graph. SVM helps to find the line separating these circles as much as possible, ensuring the margin or space between the line and the closest circles is maximized. When a straight line can't separate the data, It uses a clever trick by transforming it into a higher-dimensional space where it becomes easier to draw a separating boundary. This transformation is done using a kernel function, which applies complex mathematical operations to the data to make it detachable.SVM also can handle outliers, data points that don't fit neatly into one category or another. Instead of being thrown off by these outliers, SVM adjusts its boundary to accommodate them while maximizing the group margin.

1. Initialize parameters:

Jeen Marseline et al.,

```

- Learning rate (alpha)
- Regularization parameter (C)
- Threshold for convergence (epsilon)
- Initialize weights (w) and bias (b) to zeros

2. Train the SVM model:
a. Repeat until convergence:
i. For each training example (X_i, y_i):
1. Compute the decision function:
   f(X_i) = w^T * X_i + b
2. Compute the margin:
   margin_i = y_i * f(X_i)
3. If margin_i < 1, update weights and bias:
   w = w + alpha * (y_i * X_i - 2 * C * w)
   b = b + alpha * y_i
ii. Check for convergence:
    If all examples satisfy the margin condition within epsilon, stop training

3. Output the trained SVM model parameters (w, b)
    
```

The pseudo-code outlines training a Support Vector Machine (SVM) model with a linear kernel. Initially, the necessary parameters, such as the learning rate (alpha), regularization parameter (C), and convergence threshold (epsilon) are initialized. Weights (w) and bias (b) are also set to zero. The training process iteratively updates these parameters until convergence is achieved. For each training example, the decision function is computed based on the current weights and bias, and the margin is calculated to determine the distance of the data point from the decision boundary. If the margin is less than 1, indicating misclassification or proximity to the margin boundary, the weights and bias are adjusted using stochastic gradient descent to correct the classification. This process continues until all examples satisfy the margin condition within the given epsilon, signifying convergence. Finally, the trained SVM model parameters, including weights and bias, are outputted to define the decision boundary separating the classes in the dataset.

In this case, the SVM is used to classify between the "Weed" and "Crop" from the provided Max Confident Region(MCR).

$C = SC \cdot \frac{W}{C} (MCR)$	Eq.10
----------------------------------	-------

Where, SC classifier(c) compares the obtained features with the existing labels(crops and weeds) and detects whether the given image is crop or weed. This integrates the entire pipeline for automated crop and weed detection. It sequentially applies CNN feature extraction, Selective Search, Non-maximum Suppression, and SVM classification to predict the input image's class label (crop or weed).

RESULT AND DISCUSSION

Object Detection Performance

Our goal to create a crop weed detection system is validated after testing the performance of the system in various test environments. By testing our object detection system on various images containing crops and weeds, we have found its performance to fulfill the set objectives. The system successfully identified and distinguished between crops and weeds. The system's overall performance, including the integration of selective Search, Convolutional Neural Networks, and SVM classifier, was satisfactory. It is observed that the system performed well in detecting

Jeen Marseline et al.,

different types of crops and weeds, which consisted of pictures taken from various angles in diverse environmental conditions.

Model Evaluation Metrics

Confusion Matrix

A confusion matrix is a table often used to describe the performance of a classification model on a set of test data for which the true values are known. It allows visualization of the performance of an algorithm by comparing actual and predicted values. From the confusion matrix, we can obtain TruePositive(TP), TrueNegative(TN), FalsePositive(FP), and FalseNegative(FN).

1. True Positive (TP): These are cases in which the model predicted correctly that an instance belongs to a particular class.
2. True Negative (TN): These are cases in which the model predicted correctly that an instance does not belong to a particular class.
3. False Positive (FP): These are cases in which the model predicted incorrectly that an instance belongs to a particular class when it does not (Type I error).
4. False Negative (FN): These are cases in which the model predicted incorrectly that an instance does not belong to a particular class when it does (Type II error).

Precision

Precision is a metric used to measure the accuracy of a classification model, particularly in binary classification tasks. It answers the question: "Out of all the instances predicted as positive, how many were actually positive?" precision tells us how precise or accurate the model is when it predicts a positive outcome. It is calculated as the ratio of true positive predictions to the total number of positive predictions made by the model. (Eq.11)

$Precision = \frac{TruePositive}{TruePositive + FalsePositive}$	Eq.11
---	-------

True Positives (TP) are the instances correctly classified as positive by the model. False Positives (FP) are the instances that were incorrectly classified as positive by the model.

Recall

Recall, also known as sensitivity, is a metric used to measure the completeness of a classification model, especially in binary classification tasks. It answers the question: "Out of all the actual positive instances, how many did the model correctly identify?" recall tells us how many actual positive instances the model managed to capture or recall. It is calculated as the ratio of true positive predictions to the total number of actual positive instances.(Eq.12)

$Recall = \frac{TruePositive}{TruePositive + FalsePositive}$	Eq.12
--	-------

True Positives (TP) are the instances correctly classified as positive by the model. False Negatives (FN) are the instances that were incorrectly classified as negative by the model but are positive

F1 Score

The F1 score is a metric that combines both precision and recall into a single measure, providing a balanced evaluation of a classification model's performance, especially in binary classification tasks. The F1 score considers both how precise the model is (precision) and how well it captures all the relevant instances (recall)(Eq.13)

$F1score = 2 \cdot \frac{Precision * Recall}{Precision + Recall}$	Eq.13
---	-------

Precision tells us how accurate the model is when it predicts a positive outcome. Recall tells us how many of the actual positive instances the model manages to capture

Jeen Marseline et al.,

Accuracy

Accuracy measures how often a classifier model makes correct predictions out of all its predictions. In simple English, it's like asking: "Out of all the things I guessed, how many did I get right?" The formula for accuracy is. Just count how many predictions the model got right, then divide that by the total number of predictions it made. (Eq.14)

$$\text{Accuracy} = \frac{\text{Number Of Correct Prediction}}{\text{Total Number Of Prediction}} \quad \text{Eq.14}$$

Results obtained from this method show that the weeds and crops are distinguished better than previously used methods.

Obtained Confusion Matrix is

Obtained TruePositive(TP), TrueNegative(TN), FalsePositive(FP) and false negative(FN) are:

Class	TP	TN	FP	FN
0	1479	403	32	21
1	214	1674	22	25
2	174	1725	14	22

Obtained Precision, Recall, F1 Score and Accuracy are

Epoche	Precision	Recall	F1 score
0	0.98	0.99	0.98
1	0.91	0.90	0.90
2	0.93	0.89	0.91
Accuracy	0.96		

The classification results are pretty promising. The model shows a solid ability to classify instances of the majority class accurately, "background," achieving high precision and recall scores. This indicates that it's good at identifying cases in this category. Even though it's not as perfect with the minority classes, "crop" and "weed," it still manages to do a pretty decent job, maintaining reasonable precision and recall. With an overall accuracy of 96%, it's clear that the model is performing admirably across all classes. This is a positive sign and suggests that the model is well on its way to being a reliable tool for classification tasks.

CONCLUSION

This study introduces a new way to find and classify things in farm pictures using R-CNN and SVM. This method can change how farmers manage crops and control weeds, giving them accurate and practical solutions. Combining R-CNN with SVM Identifies and categorizes with better accuracy, makes a robust tool for analyzing farm pictures. Many tests are done in different farm situations to ensure this method works well and helps farmers. This work supports sustainable farming by reducing waste and chemical use and promoting responsible farming.

ABSTRACT

Lower crossed syndrome is a muscle imbalance caused by the weakening and lengthening of the posterior Back muscles. This imbalance leads to abnormal posture and joint dysfunction. The study aimed to find out the effectiveness of a comprehensive corrective exercise program along with Janda's approach and lacrosse ball massage technique in the improvement of posture in subjects with the Lower crossed syndrome. A experimental study design consisting of 30 patients with Back pain for 1 month.30 patients were included, and the average age was about 20 to 50 years. All the patients underwent pre and post-test scores of Costo vertebral angle and Lumbo sacral angle. The pre and post-test values were assessed by smartphone mobile application on protractor in group A and group B. The calculated 't' test

Saranraj et al.,

values by the unpaired test in group A & group B is 20.0946 & 17.3618. The calculated 't' test values were more in group A than in B. In the present sample, the Comprehensive corrective exercise program along with Janda's approach has a positive effect.

Keywords: Smartphone mobile application on the protractor, Janda's approach exercise, Costovertebral angle and Lumbo Sacral angle.

INTRODUCTION

According to the World Health Organization, musculoskeletal disorders are one of the main causes of disability in persons between the ages of 20 and 50, and the most prevalent complaints worldwide are headaches and persistent Back pain. Muscles, ligaments, joints, peripheral nerve fibres, and supporting blood arteries are all affected by a variety of inflammatory and pathological conditions together referred to as musculoskeletal disorders [1]. The human body is prone to several musculoskeletal illnesses, including those that affect the lower limbs, the back, and the upper extremities. Depending on the kind of condition, the symptoms of upper extremity musculoskeletal disorders include typically pain, pains, discomfort, numbness, stiffness, and/or weakness [2]. Muscular disparity known as Lower crossed syndrome is frequently brought on by stiffness in the Back area. Distal or Pelvic girdle syndrome is another name for the Lower crossed syndrome. In addition to postural deviations (Hyperlordotic, increased thoracic kyphosis), Lower crossed syndrome refers to a specific altered muscle activation pattern (especially in the Back, trunk, and Pelvic muscles) and altered movement patterns. Vladimir Janda (1923-2002) defined it as an abnormal posture [3]. The lower crossed syndrome is the result of muscle strength imbalances in the lower segment. These imbalances can occur when muscles are constantly shortened or lengthened in relation to each other. The lower crossed syndrome is characterized by specific patterns of muscle weakness and tightness that cross between the dorsal and the ventral sides of the body. In LCS there is over activity and hence tightness of hip flexors and lumbar extensors. Along with this there is under activity and weakness of the deep abdominal muscles on the ventral side and of the gluteus maximus and medius on the dorsal side. [1] The hamstrings are frequently found to be tight in this syndrome as well. This imbalance results in an anterior tilt of the pelvis, increased flexion of the hips, and a compensatory hyperlordosis in the lumbar spine [4]. It is a movement system disorder characterised by hyperlordosis in the Lumbar region. The ailment known as Lower crossed syndrome, which can draw an "X" (a cross) over the lower body, was given this name because it causes predominantly muscular imbalance, which eventually affects tonic and phasic muscles. There are a few potential side effects of the Lower crossed syndrome, including impingement syndrome, deterioration of the body's hard and soft tissues, and Pelvic instability [5].

Dr. Janda claimed that the Lower crossed condition, which she referred to as the issue with the Hyperlordotic, developed when a slouched sitting position was maintained for an extended length of time. Here, a muscle that has been overworked in the same direction for an extended amount of time shortens and tightens, an action known as "adaptive shortening." All antagonists elongate and weaken a condition known as "stretch weakness," as a result of becoming strained [6]. Dr. Janda observed that these focused regions of stress in the spine correlate to transitional zones where the morphology of nearby vertebrae changes. This is one of the methods that is mostly applied to people with Lower crossed syndrome to address their posture alignment. Stretching and strengthening exercises are the key tools used in this strategy. The main muscles that become tensed in this situation should be stretched for flexibility, while the weaker muscles should be given strengthening exercises. In the realm of corrective exercises intended to treat musculoskeletal diseases and avoid subsequent issues like pain and injury, the entire approach is innovative. Rather than concentrating simply on the area of the body where the problem is, comprehensive corrective exercise regimens concurrently address muscle activation, movement pattern, and posture throughout the entire body [7]. Stretching involves extending the range of motion in the specific joints to lengthen the contracted muscles and increase flexibility. It is a manual treatment technique. The ability of a joint to move through its full range of motion is referred to as flexibility. Flexibility varies from person to person, relies on workouts, and is specific to particular joints. Additional forms of stretching exercises include proprioceptive neuromuscular facilitation stretching, dynamic

**Saranraj et al.,**

stretching, ballistic stretching, and static stretching. A crucial technique for extending the range of motion is static stretching. Static stretching is a sort of stretching exercise that involves applying low force for a prolonged period to lengthen the muscle. The act of performing a controlled stretch is called dynamic stretching [8]. Specific muscles, such as the thoracolumbar extensor and Hip flexor should be stretched using specific methods. Muscles are worked by strengthening exercises or resistance training employing resistance, such as a dumbbell or your body weight. Rachael Return explained this. Here, Abdominals and Gluteus maximus are the major targets of the strengthening exercise. Professionals in rehabilitation and fitness frequently utilise self-myofascial release to improve myofascial mobility. Tools used often for self-myofascial release include foam rollers and different roller massagers. By reducing the effects of acute muscle soreness, delayed onset muscle soreness, and post-exercise muscle performance, it is possible that these tools can improve joint range of motion and the healing process. There are various sizes and foam densities available for foam rollers and roller massage bars [9]. One method of self-myofascial release that makes use of hard and thick balls is lacrosse ball massage. Additionally, it resembles a tennis ball. By releasing the connective tissue that might become tight around muscles due to extended sitting, bad posture, or exercise, this ball helps to reduce discomfort and enhance function in sore muscles.

METHODS

PARTICIPATION

A total of 30 patients were included in this study all subjects provided written informed consent before entering the study. The patient's age is between 20 years to 50 years. Inclusion criteria were as follows: The persons were in the age group of 20-50 years. The usage of handheld devices, reading, working and travelling for > 3 hours, sleeping in a fetal position and unsupported back chair are the factors, Back pain over one month

STUDY DESIGN

The study design that was used for this study is experimental.

OUTCOME MEASURES

The Costovertebral angle is the angle which is used to measure the posture that was given at any time of day. Lumbo Sacral angle is the angle which is used to measure the posture that was given at any time of day.

INTERVENTION

15 patients in this group A underwent a comprehensive corrective exercise program along with Janda's approach for duration of 30 minutes, and 15 patients in this group B lacrosse ball massage technique for duration of 10 minutes. This reduces muscle pain and improves posture One method of self-myofascial release that makes use of hard and thick balls is lacrosse ball massage. Additionally, it resembles a tennis ball. By releasing the connective tissue that might become tight around muscles due to extended sitting, bad posture, or exercise, this ball helps to reduce discomfort and enhance function in sore muscles by following the exercises. All these exercises are demonstrated to the subjects individually under the therapist's guidance. The following interventions are taught to the patient as a home programme and the patients are regularly monitored to know the accuracy of results.

Training Program

Group A

Exercises included

Comprehensive corrective exercise program along with Janda's approach:

1. Pelvic bridging
2. Slight leg Raising
3. Lunges
4. Janda's approach:

Thoracolumbar extensor Stretch

Saranraj et al.,

Hip flexor Stretch

Group B**Exercises included**

Lacrosse ball massage technique

STATISTICAL ANALYSIS

The data were evaluated by using an unpaired 't' test. The unpaired t-test was used to find out the statistical significance between post and post-t-test values of Costovertebral angle and Lumbosacral angle.

Data Presentation**Table 1 Data Analysis and Presentation**

Data values	Costovertebral Angle	Lumbosacral Angle
Mean values	24.13	12.73
Standard Deviation	1.64	1.03
The unpaired t test	20.09	17.36
Table value	2.15	2.15
p value	0.0456	0.0425

RESULTS

A protractor is used to measure the Costovertebral angle, which is presented in table 4.1, for the Paired 't' test analysis for the pre-test and post-test variables. The pre-test and post-test values varied significantly between the two groups. Group A's "t" value is 44.9941, whereas Group B's "t" value is 20.6148. The Costovertebral angle is measured using a smart phone mobile application on a protractor for both groups in the unpaired 't' test analysis for the post-test variables, which are reported in table 4.2. Between the Groups, a sizable variation was evident. Subjects in Group A outperform those in Group B. The post-test variables for both groups have a 't' value of 20.0946. The Lumbo Sacral angle is measured using a smart phone mobile application employing the Paired 't' test analysis for the pre-test and post-test variables, as shown in Table 4.3. Between the two groups, there were substantial differences in the pre-test and post-test values. The "t" value for Group A is 29.8642, while the "t" value for Group B is 11.4492. The unpaired 't' test analysis for the post-test variables for both groups is displayed in table 4.4. These variables are assessed by smart phone mobile on protractor for Lumbo Sacral angle. Between the Groups, a sizable variation was evident. Subjects in Group A outperform those in Group B. The post-test variables for both groups have a 't' value of 17.3618.

DISCUSSION

This study aimed to evaluate the efficacy of a complete corrective exercise programme, Janda's method, and lacrosse ball massage technique in the treatment of Lower crossed syndrome in patients. The predefined inclusive and exclusive criteria were met by 30 participants. Ten each were assigned to two groups of subjects. While Group B got a lacrosse ball massage technique, Group A had a thorough remedial exercise programme coupled with Janda's method. There was a considerable correction of posture in both Groups' before and after treatment values, which was validated by the following research. In both groups, the post-test value shows that there was a significant correction of posture in the comprehensive corrective exercise program along with Janda's approach compared to the lacrosse ball massage technique, which was supported by studies as follows. This study examines how Back and pelvic muscle stretching and strengthening activities affect the corrective posture of the Back in those who have a hyperlordotic. Yoo claims that by extending the muscles and ligaments of the posterior Back and correcting posture, it is possible to reduce the pain brought on by pelvic Back syndrome to some extent. He also determined that the simplest technique was to stretch by pressing the head with a hand. The thorocolumbar extensor and Hip flexor were

78685

**Saranraj et al.,**

stretched, while the Abdominals and Gluteal maximus were strengthened, throughout this investigation [6]. The research conducted by Mahajan R and his colleagues in 2012 on the comparative efficacy of muscle energy technique and static stretching conducted a study for the treatment of sub-acute mechanical Back pain supports the findings of our study regarding the effectiveness of muscle energy technique in reducing pain and increasing ROM. This study's utilization of the Comprehensive Corrective Exercise Program suggests that it has a respectable impact on reestablishing equilibrium in the pelvic stabilizer muscles. In recent years, there has been a greater focus on studying how various exercise regimens affect Lower-crossed syndrome. The bulk of the research included both male and female participants, showing that Back problems can affect people of either sex [8]. Through the Comprehensive Corrective Exercise Program, the participants steadily improved their ability to perform the activity in various postures while creating concentric and eccentric contractions. Earlier studies have supported the rationale of exercise progression (from isometric to dynamic). Our findings revealed an improvement in some muscle activations throughout all three contraction phases—concentric, isometric, and eccentric—which may have been brought on by training in all three. An app for smart phones measures the angle [10]. The findings revealed that smart phone agreements were greater from both sides. These results show that smart phone applications for evaluating cranial angles have a good level of validity. In a research titled "Smartphone and Universal Goniometer for Measurement of Elbow Joint Motions: A Comparative Study," Behnam Behnoush and his colleagues utilized a smart phone application and universal goniometer to measure elbow range of motion (ROM). The findings demonstrated that the elbow joint supination had the best level of measurement reliability. After eight weeks of corrective exercises, these therapies are anticipated to improve and minimise UCS symptoms, including postural mal alignment and muscle imbalance [10]. The results of this study's data analysis show that comprehensive corrective exercise programmes combined with Janda's method are more effective than lacrosse ball massage in treating people with Lower-crossed syndrome. The substantial improvement is therefore founded on his idea.

This study found that complete corrective exercise programmes and Janda's method were more effective in reducing pain and improving posture than lacrosse ball massage.

CONCLUSION

The goal of this study was to determine if an extensive schedule of corrective exercises, Janda's method, and a massage technique using a lacrosse ball might improve posture in participants with Lower crossing syndrome. The analysis of the data appears to support the claim that people with nonspecific Back discomfort may improve their posture by using Janda's method, the Comprehensive Corrective Exercise Program, and the lacrosse ball massage technique. These workouts help to improve functional abilities while also reducing discomfort. This is evidenced by the fact that the groups significantly improved, demonstrating the value of the Comprehensive Corrective Exercise Program, Janda's method, and lacrosse ball massage therapy in increasing posture improvement and pain relief. In light of this, it can be said that the Comprehensive Corrective Exercise Program, in conjunction with Janda's method and lacrosse ball massage technique, is very effective in treating a patient with Nonspecific Back Pain and leads to a significant improvement in functional activities and pain relief. The null hypothesis is not the primary hypothesis in this investigation.

ABSTRACT

Endophytes colonizing the medicinal plants act as the prospective source of valuable secondary metabolites. Prior research substantiates the belief that endophytic bacteria living in plant tissues have similar biological activity and produce similar metabolites in their host plants. Thus, various ethnobotanical pharmaceutical plants serve as reservoirs for drug discovery. In 2020, after the arrival of COVID-19, due to the lack of vaccines, various scientists explored the use of several medicinal plants. For instance, studies proved that the phytochemical berberine from *Tinospora cordifolia* can regulate the function of 3-chymotrypsin-like proteases (3CLPro) proteins and thus contribute in controlling the viral replication. Moreover, the flavonoids isolated from *Kalanchoe pinnata* were used for the treatment of COVID-19 because of their anti-viral properties. Further, *Streptomyces* sp. BJS4 isolated from *K. pinnata* is also thought to possess anti-malarial activity. Traditionally, it acts as a miracle plant that serves as therapeutic for kidney stones and gastric ulcers as well as used in facilitating the dropping of the placenta during childbirth.

Keywords: Endophytes, *Tinospora cordifolia*, *Kalanchoe pinnata*, *Streptomyces*, Phytochemicals

Himani *et al.*,

INTRODUCTION

Wehmeier (2000) defined disease as the abnormal functioning of the organism, which is not a consequence of impairment (Anizoba, 2023). It has been conclusively shown that diseases are the major challenges faced by people in each generation. Prior research substantiates the belief that a large population heavily depends on medicinal plants for fulfilling their primary healthcare needs. Ayurveda is exploited for thousands of years for medication and cure of several diseases. In Atharveda, Charak Samhita, and Sushrut Samhita brief information on about 700 different plants is available. According to the data assembled by World Health Organization (WHO), about 80% of the world's population prefers herbal medicines for curing various infectious diseases (Kumar *et al.*, 2023). Medicinal herbs are efficacious remedies for various protozoan diseases, which are difficult to cure and affect human health globally (Kamaraj *et al.*, 2022), for instance, malaria, which is a life-threatening parasitic disease, caused by female *Anopheles* mosquitos. Data collected substantiate that it is a serious problem affecting the tropical and subtropical regions of the world (Omara, 2020). Quinine and artemisinin are derivatives of medicinal plants that are beneficial for curing malaria (Keshamma *et al.*, 2022). Therefore, medicinal plants prove to be the potent source of medicines and drug development. Medicinal plants possess several unique endophytic bacteria that enhance plant growth, deal with the disease-causing agents that reside in the soil, and help the host in conquering the stress response to adverse environmental conditions (Walitang *et al.*, 2018). Endophytic bacteria extracted from medicinal plants aid in the synthesis of bioactive metabolites and in boosting the secondary metabolite production from their host plants (Chen *et al.*, 2021). Medicines obtained from pharmaceutical ethnobotanical plants kill harmful microorganisms with fewer side effects (Huang *et al.* 2022).

Phytochemical review and endophytic bacterial diversity present in *Kalanchoe pinnata* and *Tinospora cordifolia*

Kalanchoepinnata

Kalanchoe pinnata belonging to the Crassulaceae family, native of Madagascar is distributed worldwide because of its ethnobotanical efficacy. It is highly beneficial plant that is usually found in temperate parts of Macaronesia, West Indies, New Zealand, Hawaii, Melanesia, the Galapagos Islands, the Mascarenes, Asia, and Australia. Its height usually varies from 1-1.5 m. The aroma is caused by essential oils found in the plant's leaves and other sections. Due to the carminative and analgesic nature, the leaves as well as the bark is bitter and are used in the treatment of diarrhea. *K. pinnata* also acts as a potent source of various secondary metabolites, like alkaloids, flavonoids, glycosides, cardenolides, triterpenes etc. Bufadienolides observed in the leaves of plants shows chemo-preventive, insecticidal, anti-tumor, and anti-bacterial activity (Rahman *et al.*, 2019). Studies carried for characterizing the solvent extract of Cathedral bells showed the presence of n- alkane, n-alkanol, sitosterol, α -amyrin, and β -amyrin in it (Zanzabil, Hossain and Hasan, 2023). Every part of the plant has proved to be efficacious for hypertension, dysentery, dysuria, insect bites, asthma, jaundice, cough, urinary stones, epilepsy, boils, bronchial infections, inflammation, nephrolithiasis, kidney stones, tuberculosis, diabetes, arthritis, and ureterolithiasis (Rahman *et al.*, 2019). In USA, it is extensively used in the treatment of fevers as well as chickenpox. Moreover, it is widely used in the Himalayas, Karnataka, Mexico, Nigeria, Bundelkhand, Kerala, Nicaragua, Peru, Vietnam, Brazil, Ecuador, Guatemala, Arunachal Pradesh etc. for various purposes. All the applications associated with *K. pinnata* proved it to be effective against several dreadful diseases (Singh, Garg and Shrimali, 2022). Several studies proved that 60% methanolic extract of leaf juice of *K. pinnata* inhibited the activity of many bacteria, like *Staphylococcus aureus*, *Proteus vulgaris*, *Shigella dysenteriae*, *Bacillus subtilis*, and *Escherichia coli*(Stefanowicz-Hajduk *et al.*, 2020). Among these, antibacterial action associated with methanolic extract is more effective against *S. aureus*, *Pseudomonas aeruginosa*, *Candida albicans*, *Cryptococcus neoformans*, and *Salmonella typhi* (Wu *et al.*, 2021). The endophytes inhabiting the internal environment of the host medicinal plant generally induce the assembly of secondary metabolites and bioactive compounds (Khasim *et al.*, 2020). Apart of these, the structure of bacterial community is altered by elements, such as season, soil conditions, latitude, altitude, and longitude (Sun *et al.*, 2022). Based upon the tissue, health status, and host genotype the endophytic bacteria possess either the property of parasitism or mutualism (Cope-Selby *et al.*, 2017). Various endophytic bacterial community belonging to *Streptomyces* species has been reported in *K. pinnata*. *Streptomyces* sp. BJS4 strain isolated from the plant is believed to produce metabolites that possess anti-malarial

**Himani et al.,**

potential. Prior research substantiates that *in vitro*, the purified fraction derived from the BJS4 strain has inhibitory activity against *Plasmodium falciparum* 3D7. Another application of the metabolite produced by the endophytic bacteria is that when this endophytic bacterial metabolite is mixed up with the extract collected from *Anabaena sphaerica*, it is believed to possess antioxidant and antibacterial activities (Sankarganesh and Joseph, 2019) [Fig.1].

Pharmacological properties associated with *Kalanchoe pinnata***Anti-inflammatory activity**

Lolos et al., 2023 investigated the anti-inflammatory potential of *K.pinnata* stem extract on acetic acid-induced inflammation in mice (*Mus musculus*). They observed decline in thickness of inflammation with increase in stem extract concentration of *K. pinnata* and proved it as an anti-inflammatory source (Fig.2).

Anti-oxidant activity

Investigations reported the presence of phenolics i.e., gallic acid (GA) and flavonoids i.e., quercetin in the methanolic extract and β -carotene as well as the lycopene in the extract of petroleum ether. But apart from these, various alkaloids and tannins are also present in the leaves. Prior research shows that the phenolic content of leaves ($28.4 \pm 2\mu\text{g}/\text{mg}$) is mainly responsible for the anti-oxidant activity (Hernández-Caballero et al., 2022).

Anti-cancerous activity

Some studies proved the anti-cancer potential of GA in *K. pinnata* by the regulation of the proliferation, programmed cell death, and angiogenesis that affects cancer cells. Further research in this field showed that when GA is added to food then it results in the inhibition of lung adenomas. It is also responsible for inducing apoptosis by the production of the hydrogen peroxide (Hernández-Caballero et al., 2022).

Anti-angiogenic effect

The presence of quercetin (3,5,7,3',4'-pentahydroxyflavone, Qu) in *K. pinnata* is majorly responsible for the anti-angiogenic impact in the prostate tumor cells and umbilical vein endothelial cells in humans by inhibiting VEGF-induced phosphorylation of the VEGF receptor 2 as well as signaling pathways involving protein kinases AKT, mTOR, and ribosomal protein S6. In addition to these functions, it also enhances PTEN expression and apoptosis but inhibits invasion and cell proliferation (Hernández-Caballero et al., 2022).

Anti-viral activity

A study of Cryer et al., 2017 reported the isolation of two compounds KPB-100 and KPB-200 showing antiviral activities against Vaccinia virus (anti-VACV) and Human alpha herpes virus (anti-HHV-2). The result obtained proved that both compounds were effective in inhibition of both viruses, and KPB-100 is also found to possess anti-HHV-1 activity [Table 1].

Tinosporacordifolia

Tinospora cordifolia belonging to the Menispermaceae family, is commonly known for treating diabetes, jaundice, fever etc. The stem part consists of several alkaloids, like berberine, palmatine etc. along with glycosides, such as cordifoliside A, B, C, D, and E, cardioside, palmatoside F, 18-norclerodane glycoside, palmatoside C, furanoid diterpene glucoside etc. Studies reveal that the aerial part of the plant contains steroids, like δ -sitosterol, β -sitosterol and root contains alkaloids, like palmatine, choline, tinosporin, tembetarine, tetrahydropalmatine, isocolumbin, and magnoflorine. *T. cordifolia* is associated with several pharmacological activities, like anti-diabetic, anti-viral, hepatoprotective, anti-rheumatoid arthritis, antiarrhythmic, neuroprotective, anti-microbial activity etc. Prior research by Duhan, Bansal and Rani (2020) showed the presence of 38 endophytic bacteria from *T. cordifolia* and found that the dominant genera belongs to *Bacillus* species in both leaves as well as stem. Some recent reports show the presence of the endophytic bacteria belonging to *Pseudomonas* species i.e., strain TCA1 in the stem part of *T. cordifolia* (Kaur, Devi and Vyas, 2017). When the bacterial isolate of *Pseudomonas* species TCA1 strain was tested for its activity against various fungi, like *Curvularia lunata*, *Fusarium verticillioides*, *Alternaria alternata*, and *Fusarium*

**Himani et al.,**

moniliforme, it resulted in antagonistic activity (Kaur, Devi and Vyas, 2017). The pandemic situation due to beta-coronavirus SARS-CoV-2 belonging to the subgenus Sarbecovirus and Coronaviridae family, led to the death of thousands of people in the whole world during this acute respiratory syndrome has paid a very high toll in respect of financial conditions as well as the human lives. This situation enabled other scientists to focus on the limited spread of the virus (Pal et al., 2020). In this view, dexamethasone was proved to be useful in recovery of the patients who were receiving oxygen support and resulted in the reduction of deaths. Apart from the use of Dexamethasone, some herbal Chinese medicines for the treatment of SARS-CoV-2, like Lianhuaqingwen showed anti-inflammatory and anti-viral properties (Chu et al., 2021). Hence, the investigation of herbal medicines is found to be useful in treatment of various diseases. Another tri-herbal medicine for the pathology treatment of SARS-CoV-2 developed in India i.e., Coronil consists of the stem extracts of *T. cordifolia* (Giloy), complete plant extract of *Withania somnifera* (L.) (Ashwagandha), along with the leaf extract of *Ocimum sanctum* (L.) (Tulsi) (Máthé and Khan, 2022). With the advancement in the field, scientists used the zebrafish model for studying the reduction in the pathology caused due to SARS-CoV-2 spike protein using tri-herbal medicine Coronil via cytokine modulation and have become successful somewhat in manifesting the effect of tri-herbal medicine Coronil with the apparent therapeutic benefits and disease-modulating properties on SARS-CoV-2 induced pathology.

To interpret the pathophysiology of SARS-CoV-2 infection several authentic animal models indicating the COVID-19 clinical symptoms have been developed (Balkrishna, Khandrika and Varshney, 2021). Research showed that there has been a reduction in granulocyte and macrophage infiltration caused due to SARS-CoV-2 spike protein upon treatment with Coronil that highlights the anti-inflammatory action of the ingredients present in the Coronil (Balkrishna et al., 2020). Studies carried out regarding the phytoconstituent of *T. cordifolia* show that Magnoflorine and tinosporide that are isolated from *T. cordifolia* possess high affinity against HIV-1 protease active site (Balkrishna et al., 2020). Similarly, another polyherbal ayurvedic medicine i.e., *MahaSudarshanaGhanvati* is considered for the treatment of liver and spleen disease, malaria, fever etc. This medicine consists of *T. cordifolia* along with other 51 constituents among which *Kiratatika* (*Swertia chirata*) serve as the major ingredient with 50% of the total proportion of all the ingredients. In a research, patients suffering from COVID-19 were selected and tablets of *MahaSudarshanaGhanvati* were given to them and it was found that there has been improvement in physical strength and appetite in the respective patients (Rao et al., 2022). Thus, the arbitration of Ayurvedic medicines exhibits high potential as a protective prophylactic measure for the treatment of COVID-19. During the advancement in the field of research, a patient suffering from Ankylosing Spondylitis (AS), which is a chronic inflammatory disease, was given Ayurvedic treatment. The main symptom of the disease is lower back pain but during the disease, other symptoms, like reduction in the expansion of the chest, lumbar lordosis, and thoracic kyphosis are commonly observed.

During an Ayurvedic treatment given to the patient, *MahaSudarshanaGhanvati* was used for the *Aampachana* and changes in the inflammation in the joints. The patient suffering from AS faces other problems, like the stiffness of the spine and joint pain, left relieved by taking *Swarna Sameer pannaga rasaas* ayurvedic medicines (Khedekar et al., 2019). Thus, Ayurvedic medicines and the involvement of medicinal plants in Ayurvedic medicines contribute to the treatment of various diseases with lesser adverse effects and better results. Endophytic bacteria serve as a potent source for the generation of antibiotics, biofertilizers, medicines as well as biopesticides. Similarly, medicinal plants associated with several endophytic bacteria also display an important role in the elimination of harmful pathogens with improvement in the growth of plants (Pathma et al., 2021). For instance, an endophytic bacterium belonging to *Pseudomonas* sp. TCA1 was found to be effective against 4 pathogenic fungi i.e., *F. moniliforme*, *A. alternate*, *C. lunata* and *F. verticillioides* (Kaur, Devi and Vyas, 2017). In another study, 38 different endophytic bacteria isolated from *T. cordifolia* were screened. Among those 38 different bacterial isolates, 20 were obtained from the leaf and 18 were isolated from stem explants. Among these isolates, the dominant genera observed was *Bacillus* with some bacterial isolates belonging to *Aneurinibacillus* and *Pseudomonas* species. The extracts of these isolates i.e., ethyl acetate showed the presence of secondary metabolites, like terpenoids, alkaloids, and flavonoids (Duhan, Bansal and Rani, 2020). These bacterial isolates showed the antifungal activity against fungi, such as *Helminthosporium nodulosum* and *A. alternata* and antibacterial activity and bacteria, like *E.coli*, *P. vulgaris*, *S. aureus*, and *Staphylococcus hominis* (Duhan, Bansal and Rani, 2020).

Himani *et al.*,**Pharmacological properties associated with *Tinospora cordifolia*****Anti-inflammatory activity**

Both high-performance liquid chromatography (HPLC) and high-performance thin layer chromatography (HPTLC) were used to identify berberine, an isoquinoline alkaloid found in the dry stem of *T. cordifolia*, which showed the anti-inflammatory effects. Alcoholic extract of *T. cordifolia* has been found to possess anti-inflammatory activities in numerous types of subacute and acute inflammation (Girme *et al.*, 2022).

Anti-toxin effect

Several alkaloids present in *T. cordifolia*, such as choline, magnoflorine, isocolumbin, tetrahydropalmatine, tinosporin, palmatine show inhibitory effects against aflatoxin-induced nephrotoxicity. Various extracts of stem and leaves usually found to be effective against the toxicity caused due to the presence of lead nitrate in Swiss albino male mice (Upadhyay, 2023).

Anti-diabetic potential

Berberine possesses anti-hyperglycemic and antioxidant activity and shows an inhibitory effect on FOXO 1, which is associated with the integration of insulin signaling with the mitochondrial function that stimulates AMP-activated protein kinase, resulting in blood pressure maintenance and decreased level of cholesterol and blood sugar (Li *et al.*, 2022).

Anti-HIV potential

The root extract has anti-HIV activity, which has been evidenced by a drop in eosinophil count, stimulation of B lymphocytes, macrophages, polymorphonuclearleucocytes, and hemoglobin levels (Thakur *et al.*, 2022). Studies substantiate the belief that *T. cordifolia* acts as a beneficial plant that can boost up the immune system of the patients suffering from immune disorders or HIV (Sajith and Farhan, 2022).

Hepatic disorders

Usually, a tremendous increase in alanine transaminase, triglyceride, cholesterol, aspartate transaminase, gamma-glutamyl transferase was observed in alcoholic samples but after the use of *T. cordifolia* water extract, the level of these compounds somewhat normalized in these patients. It was also found that the intake of alcohol also reduces intestinal absorption and found to be highly hepatotoxic (Sharma and Dabur, 2016).

Anti-cancer activity

Palmatine is another alkaloid reported in *T. cordifolia*, which is associated with anti-cancer activity. In Swiss albino mice, 7,12-dimethylbenz(a)anthracene (DMBA) act as an effective anti-cancer agent against cutaneous carcinomas. Diethylnitrosamine causes hepatocellular carcinoma and led to skin carcinomas for which palmatine proves to be effective and shows anti-cancer activity (Singh *et al.*, 2021). For its therapy, a diterpenoid epoxy clerodane produced from chloroform: methanol extraction of Giloy's alcoholic extract is useful since it has anti-cancer activity against the hepatocellular carcinoma. The advancement in further investigation reveals that the Miracle plant extracts in chloroform and hexane Giloy (Chl-TCE and Hex-TCE) inhibit cell migration and proliferation while targeting cellular pathways in IMR-32 neuroblastoma cell lines and U87MG glioblastoma thereby, inducing the senescence as well as differentiation. Therefore, chloroform and hexane extract serve as phytotherapeutic interventions for the treatment of neural cancers (Sharma *et al.*, 2019) [Table 2].

FUTURE PERSPECTIVES

The medical science known as Ayurveda focuses on using naturally occurring plant products for healing. Ayurveda has been documented to use a wide range of neuroprotective medicines. Ayurvedic plant extracts are known to include a variety of bioactive components from several categories. An ethanolic extract of Brahmi has been found to contain a total of 20 phytochemicals. Similarly, alkaloids, saponins, alcohols, and other chemicals are found in the extracts of other Ayurvedic plants. Ayurveda is a domain that has a wealth of information on medicinal plants and

78692

**Himani et al.,**

their role in the treatment of a variety of maladies, including neoplastic, cardiovascular, neurological, and immunological disorders. The usage of such medicinal herbs is crucial for preventing various diseases, particularly "cancer", which is a leading cause of death worldwide. As several deadly side effects arise during chemotherapy; thus, natural remedies, such as, using plant-derived medicines to treat cancer, may lessen the negative side effects. Currently, a few plant-based products and phytoconstituents are being used to treat cancer. We have concentrated on a variety of plant-derived phytochemicals and prospective compounds derived from these plants to act as anticancer medicines, as well as their mechanisms of action. Plant endophytic bacteria colonize plant interior tissues without creating visible disease or causing symptoms in their host. Endophytes in the plant endobiome perform a variety of tasks, including plant growth promotion, stress tolerance, and chemical modulation. Medicinal plants serve as the natural source for many bioactive phytochemicals but recent finding on plant-microbe interactions has revealed that a substantial proportion of these compounds are produced by related microbial partners. As a result, endophytes, particularly from medicinal plants, have piqued the scientific community's interest in bio-prospecting for bioactive metabolites.

ABSTRACT

Let H be a 3-uniform T_2 hypergraph with $n \geq 5$. The first Zagreb matrix of H , denoted by $Z(H)$ is defined as the square matrix of order n , whose (i, j) th entry is $d_i + d_j$ if x_i and x_j are adjacent and zero for other cases. The first Zagreb energy $ZE(H)$ of H is the sum of the absolute values of the eigenvalues of $Z(H)$. It is shown that the first Zagreb energy of a 3-uniform T_2 hypergraph is $[ZE(H)] \leq n(n-1) + \delta(3\Delta - 1) + \sqrt{\frac{\delta-1}{2m}}$. Equality holds if $n=7$ & 9 in H . Also $(2n + \frac{3}{2}) + \sqrt{(n-1)[B - (2n + \frac{3}{2})]^2}$ yields the approximate first Zagreb energy of a 3-uniform T_2 hypergraph.

Keywords: hypergraph, T_2 hypergraph, 3-uniform T_2 hypergraph, First Zagreb matrix, First Zagreb Energy

AMS Subject Classification: 05C65

Sharmila et al.,

INTRODUCTION

The basic definitions and terminologies of a hypergraph are not given here, we refer to Vitally Volosin, ‘Introduction to Graph and Hypergraph Theory’. The concept of hypergraph was introduced by Berge in 1967. 2017 Seena V and Raji Pilakkat introduced the Hausdorff, T_0 , and T_1 hypergraphs. Based on the above authors we introduced a family of hypergraphs namely T_2 hypergraph, and 3-uniform T_2 hypergraph, and studied the energy of a 3-uniform T_2 hypergraph concerning the adjacency matrix, Randic matrix[6], First Zagreb matrix[7], and its corresponding bounds are obtained. In 1977 Gutman defined graph energy. H.Shosthari introduced new bounds on the energy of graphs [2]. In [1] K.C. Dasran through the Zagreb energy of the graphs. Also, found some new lower and upper bounds of the graph. B.R.Rakshith introduced the relation between Zagreb energy and edge Zagreb energy of a graph with a minimum degree [3]. The energy of the hypergraph and adjacency energy of the hypergraph are introduced in [4, 5]. This paper studies the first Zagreb energy and bounds of the 3-uniform T_2 hypergraph. Throughout this article, H is a simple connected 3-uniform T_2 hypergraph with order n , and size m , where the order and size are the minimum numbers of edges needed to define a 3-uniform T_2 hypergraph. The following definitions and theorems are used in the sequel.

T_2 hypergraph

In this section, we see the definition of a T_2 hypergraph with an example.

Definition 2.1. A hypergraph $H=(X, D)$ is said to be a T_2 hypergraph if for any three distinct vertices u, v , and w in X , there exists a hyper edge containing u and v but not w and a hyper edge containing w but not u and v .

Result 2.2. (i) The minimum number of edges needed to define a T_2 hypergraph is $m = \lceil \frac{2n+5}{4} \rceil$

(ii) For a T_2 hypergraph H , the minimum degree $\delta(H) = 2$.

(iii) For a T_2 hypergraph H , rank $r = \lfloor \frac{2n+1}{4} \rfloor$ where $n \geq 5$.

Example 2.3.

Figure 1: T_2 hypergraph

Figure 1 is a T_2 hypergraph with vertices x_1, x_2, \dots, x_5 and hyper edges D_1, D_2, D_3, D_4 . It is easily seen that for every three vertices x_i, x_j , and x_k there exists a hyper edge containing x_i, x_j but not x_k and a hyper edge containing x_k but not x_i and x_j .

3-Uniform T_2 hypergraph

Definition 2.4.1. A T_2 hypergraph $H=(X, D)$ is said to be a 3-uniform T_2 hypergraph if every hyperedge contains exactly three vertices.

Sharmila et al.,

Example 2.4.2

Figure 2: 3-uniform T_2 hypergraph

First Zagreb matrix and energy of a 3-uniform T_2 hypergraph

The first Zagreb energy of a graph G was introduced by Ivan Gutman, and we introduce the same concept in 3-uniform T_2 hypergraph

Definition 2.5.1. The first Zagreb matrix of a T_2 hypergraph is defined by

$$Z(H) = \begin{cases} d_i + d_j & \text{if } x_i x_j \in D \\ 0 & \text{otherwise} \end{cases}$$

Where d_i is the degree of the vertex.

Definition 2.5.2. The first Zagreb energy of a T_2 hypergraph H is $\sum_{i=1}^n |\lambda_i|$.

Where λ_i is the Zagreb eigenvalue of H .

Example 2.5.3. Consider a 3-uniform T_2 hypergraph given in Figure 2 with 10 vertices and 11 edges.

First Zagreb matrix of H is given by $Z(H) = \begin{pmatrix} 0 & 6 & 0 & 0 & 0 & 0 & 7 & 7 & 7 & 6 \\ 6 & 0 & 6 & 6 & 0 & 6 & 0 & 0 & 0 & 6 \\ 0 & 6 & 0 & 6 & 6 & 6 & 7 & 0 & 0 & 0 \\ 0 & 6 & 6 & 0 & 6 & 6 & 0 & 0 & 0 & 0 \\ 0 & 0 & 6 & 6 & 0 & 6 & 7 & 7 & 7 & 0 \\ 0 & 6 & 6 & 6 & 6 & 0 & 7 & 0 & 0 & 0 \\ 7 & 0 & 7 & 0 & 7 & 7 & 0 & 8 & 8 & 7 \\ 7 & 0 & 0 & 0 & 7 & 0 & 8 & 0 & 8 & 7 \\ 7 & 0 & 0 & 0 & 7 & 0 & 8 & 8 & 0 & 7 \\ 6 & 6 & 0 & 0 & 0 & 0 & 7 & 7 & 7 & 0 \end{pmatrix}$

The first Zagreb eigenvalues of $Z(H)$ are $\lambda = 36.22, 17.56, 6.9, -2.08, -6, -6, -8, -9.66, -13.22, -15.78$

Therefore, the first Zagreb energy $ZE(H) = 121.42$

RESULTS AND DISCUSSION

In this section, we find the bounds of the first Zagreb energy of a 3-uniform T_2 hypergraph. Throughout this section, we use $B = \sum_{i=1}^n \sum_{j=1}^n (d_i + d_j)^2 = \sum_{i=1}^n \lambda_i^2$ (1)

Result 3.1. Let H be a 3-uniform T_2 hypergraph with $5 \leq n \leq 11$. Then $|ZE(H)| \leq n(n-1) + \delta(3\Delta - 1) + \sqrt{\frac{\delta-1}{2m}}$. Equality holds if $n=7$ & 9 in H .

Solution: In Figure 2, $n=10, m=11, \delta = 3, \Delta = 4$ then $n(n-1) + \delta(3\Delta - 1) + \sqrt{\frac{\delta-1}{2m}} = 123.30$

Sharmila et al.,

$ZE(H) = 121.42$. Also, if $n=7, m=6, \delta = 2, \Delta = 3$ then $n(n-1) + \delta(3\Delta - 1) + \sqrt{\frac{\delta-1}{2m}} = 58.3, ZE(H) = 58.3$

Hence (3.1.) is true.

Result 3.2. For a 3-uniform T_2 hypergraph the independence number $\alpha(H) = 2$. (2)

Result 3.3. For every 3-uniform T_2 hypergraph of order n , three eigenvalues are positive and $n-3$ eigenvalues are negative.

Theorem 3.4. Let H be a 3-uniform T_2 hypergraph with $5 \leq n \leq 11$.

Then $ZE(H) < \sqrt{B} + \frac{(n-1)B}{(\det Z(H))^{\frac{1}{n}}}$ (3)

Proof: We have $|\lambda_1| > |\det Z(H)|^{\frac{1}{n}}, \lambda_1$ is the largest eigenvalue of H

$$|\lambda_1| \sum_{i=2}^n |\lambda_i| > |\det Z(H)|^{\frac{1}{n}} \sum_{i=2}^n |\lambda_i|$$

Since λ_1 is the largest eigenvalue of H , We have, $|\lambda_i| < |\lambda_1| \quad \square \quad i = 2, 3, \dots, n$

$$(n-1) |\lambda_1| > |\det Z(H)|^{\frac{1}{n}} (ZE(H) - \lambda_1)$$

$$ZE(H) < \frac{(n-1)|\lambda_1|^2}{|\det Z(H)|^{\frac{1}{n}}} + |\lambda_1|$$

Let $h(z) = z + \frac{(n-1)z^2}{|\det Z(H)|^{\frac{1}{n}}}$, where $\lambda_1 = z$ (4)

$$h'(z) = 0 \Rightarrow 1 + \frac{(n-1)2z}{|\det Z(H)|^{\frac{1}{n}}} \Rightarrow z = \frac{-|\det Z(H)|^{\frac{1}{n}}}{2(n-1)}$$

Also $h''(z) = \frac{2(n-1)}{|\det Z(H)|^{\frac{1}{n}}} > 0$, therefore h is minimum

$$\text{Minimum value} = h\left(\frac{-|\det Z(H)|^{\frac{1}{n}}}{2(n-1)}\right) = \frac{-|\det Z(H)|^{\frac{1}{n}}}{4(n-1)}$$

Also, $h(z)$ is increasing in the interval $\frac{-|\det Z(H)|^{\frac{1}{n}}}{2(n-1)} = z < B$

Hence, $z < h(z) < h(B)$ then we obtain (3)

Theorem 3.5. Let H be a 3-uniform T_2 hypergraph with $6 \leq n \leq 11$.

Then $ZE(H) < \sqrt{2nB - 2\alpha(H)B}$. (5)

Proof: Let $\lambda_1, \lambda_2, \lambda_3$ be the positive eigenvalues of H and $\tau_1, \tau_2, \dots, \tau_z$ ($z = n-3$) be the negative eigenvalues of H .

In $H, \alpha(H) < n - 3 - z + \min(3, z)$ where z is the number of negative eigenvalues.

Hence $z < n - \alpha(H) \& 3 < n - \alpha(H)$ (6)

$$\text{Since } \sum_{i=1}^3 \lambda_i + \sum_{i=1}^z |\tau_i| = 0$$

$$ZE(H) = 2 \sum_{i=1}^3 \lambda_i = 2 \sum_{i=1}^z |\tau_i|$$
 (7)

From Cauchy Schwarz inequality, $ZE(H) = 2 \sum_{i=1}^3 \lambda_i \leq 2 \sqrt{3 \sum_{i=1}^3 \lambda_i^2}$ (8)

$$ZE(H) = 2 \sum_{i=1}^z \tau_i \leq 2 \sqrt{z \sum_{i=1}^z \tau_i^2}$$
 (9)

$$\frac{(ZE(H))^2}{2} = \frac{(ZE(H))^2}{4} + \frac{(ZE(H))^2}{4}$$

$$\leq 3 \sum_{i=1}^3 \lambda_i^2 + z \sum_{i=1}^z \tau_i^2$$

$$< (n - \alpha(H)) (\sum_{i=1}^3 \lambda_i^2) + (n - \alpha(H)) (\sum_{i=1}^z \tau_i^2)$$

$$< (n - \alpha(H)) (\sum_{i=1}^3 \lambda_i^2 + \sum_{i=1}^z \tau_i^2)$$

$$< (n - \alpha(H)) (\lambda_1^2 + \lambda_2^2 + \lambda_3^2 + \tau_1^2 + \dots + \tau_z^2)$$

$$< (n - \alpha(H)) (\sum_{i=1}^n \lambda_i^2)$$

$$< (n - \alpha(H)) B \quad (\text{by 1})$$

$$(ZE(H))^2 = 2B (n - \alpha(H))$$

Sharmila et al.,

$$ZE(H) < \sqrt{2nB - 2\alpha(H)B}$$

Lemma 3.6. Let H be a 3-uniform T_2 hypergraph with $5 \leq n \leq 11$.

Then $\lambda_1 + \lambda_2 \leq 5n + \delta + 1 + \sqrt{\frac{\delta}{5}}$, where λ_1 is the largest eigenvalue and λ_2 is the second largest eigenvalue of H . Equality holds only if $n=5$ in H .

Theorem 3.7. Let H be a 3-uniform T_2 hypergraph with $5 \leq n \leq 11$.

$$\text{Then } ZE(H) < 5n + \delta + 1 + \sqrt{\frac{\delta}{5}} + \sqrt{(n-2)B}$$

Proof: From Cauchy Schwarz inequality, $(\sum_{i=3}^n \lambda_i)^2 \leq (n-2)(\sum_{i=3}^n \lambda_i^2)$

$$\sum_{i=3}^n \lambda_i \leq \sqrt{(n-2)(\sum_{i=3}^n \lambda_i^2)}$$

$$ZE(H) - (\lambda_1 + \lambda_2) \leq \sqrt{(n-2)(\sum_{i=1}^n \lambda_i^2 - \lambda_1^2 - \lambda_2^2)}$$

$$\leq \sqrt{(n - \alpha(H))(B - \lambda_1^2 - \lambda_2^2)} \quad \text{From (1) \& (2)}$$

$$ZE(H) < (\lambda_1 + \lambda_2) + \sqrt{(n - \alpha(H))(B - \lambda_1^2 - \lambda_2^2)}$$

$$\text{Since } \lambda_1 + \lambda_2 \leq 5n + \delta + 1 + \sqrt{\frac{\delta}{5}}$$

$$ZE(H) < 5n + \delta + 1 + \sqrt{\frac{\delta}{5}} + \sqrt{(n - \alpha(H))(B - \lambda_1^2 - \lambda_2^2)} \tag{10}$$

$$\text{Let } z(a,b) = 5n + \delta + 1 + \sqrt{\frac{\delta}{5}} + \sqrt{(n - \alpha(H))(B - a^2 - b^2)} \tag{11}$$

Differentiating partially concerning a and b ,

$$z_a = \frac{-a\sqrt{(n-\alpha(H))}}{(B-a^2-b^2)}, \quad z_b = \frac{-b\sqrt{(n-\alpha(H))}}{(B-a^2-b^2)}$$

Stationary points are given by $z_a = 0$ and $z_b = 0$

$$z_a = 0 \Rightarrow z_a = \frac{-a\sqrt{(n-\alpha(H))}}{(B-a^2-b^2)} = 0 \Rightarrow a = 0$$

$$z_b = 0 \Rightarrow z_b = \frac{-b\sqrt{(n-\alpha(H))}}{(B-a^2-b^2)} = 0 \Rightarrow b = 0$$

$$z_{aa} = \frac{-(B-b^2)\sqrt{(n-\alpha(H))}}{(B-a^2-b^2)^{\frac{3}{2}}}$$

$$z_{bb} = \frac{-(B-a^2)\sqrt{(n-\alpha(H))}}{(B-a^2-b^2)^{\frac{3}{2}}}$$

$$z_{ab} = \frac{ab\sqrt{(n-\alpha(H))}}{(B-a^2-b^2)^{\frac{3}{2}}}$$

$$\text{At } (0,0), z_{aa} = z_{bb} = \frac{-\sqrt{(n-\alpha(H))}}{B}, z_{ab} = 0$$

$$\Delta = z_{aa}z_{bb} - (z_{ab})^2 > 0$$

$$\text{The maximum value at } z(0,0) \text{ is } z(0,0) = 5n + \delta + 1 + \sqrt{\frac{\delta}{5}} + \sqrt{(n - \alpha(H))B}$$

$$\text{Hence } ZE(H) < 5n + \delta + 1 + \sqrt{\frac{\delta}{5}} + \sqrt{(n - \alpha(H))B}$$

Sharmila et al.,

Lemma 3.8. Let H be a 3-uniform T_2 hypergraph with $5 \leq n \leq 11$.

Then $\lambda_1 \geq 2n + \frac{3}{2}$. Equality holds only if $n=6$ in H .

Theorem 3.9. Let H be a 3-uniform T_2 hypergraph with $6 \leq n \leq 11$.

$$\text{Then } ZE(H) < (2n + \frac{3}{2}) + \sqrt{(n-1)[B - (2n + \frac{3}{2})^2]} \tag{12}$$

Proof: From Cauchy Schwarz inequality, $(\sum_{i=2}^n \lambda_i)^2 \leq (n-1)(\sum_{i=2}^n \lambda_i^2)$

$$(\sum_{i=1}^n \lambda_i - \lambda_1)^2 \leq (n-1)(\sum_{i=1}^n \lambda_i^2 - \lambda_1^2)$$

$$(ZE(H) - \lambda_1)^2 \leq (n-1)(B - \lambda_1^2) \text{ By (1)}$$

$$ZE(H) < \lambda_1 + \sqrt{(n-1)(B - \lambda_1^2)} \tag{13} \quad \text{Let } \lambda_1 = z \text{ and } h(z) = z + \sqrt{(n-1)(B - z^2)}$$

We have $\sqrt{\frac{B}{n}} < z < \sqrt{B}$

From (3.8) we have $\lambda_1 \geq 2n + \frac{3}{2} > \sqrt{\frac{B}{n}}$

Hence $h(\lambda_1) < h(2n + \frac{3}{2})$

$$(10) \text{ Gives, } ZE(H) < (2n + \frac{3}{2}) + \sqrt{(n-1)[B - (2n + \frac{3}{2})^2]}$$

Observation 3.10. Let H be a 3-uniform T_2 hypergraph with $n \geq 5$.

Then $\Gamma|\lambda_n| \geq \Gamma(\det Z(H))^{\frac{1}{n-1}}$, where λ_n is the smallest eigenvalue. Equality holds if $n=5$ in H .

Observation 3.11. Let H be a 3-uniform T_2 hypergraph with $n = 6, 8, 10 \dots$

Then $\Gamma|\lambda_n| = 7+3t$ where $t \in N$.

Theorem 3.12. Let H be a 3-uniform T_2 hypergraph with $n = 6, 8, 10 \dots$

$$\text{Then } ZE(H) > (7+3t) + \frac{\Gamma(\det Z(H))^{\frac{1}{n-1}}}{(7+3t)^{\frac{1}{n-1}}} \text{ } t \in N.$$

Proof: From an arithmetic and a geometric mean inequality,

$$\frac{\sum_{i=1}^{n-1} |\lambda_i|}{n-1} \geq |\lambda_1 \lambda_2 \dots \lambda_{n-1}|^{\frac{1}{n-1}}$$

$$\sum_{i=1}^{n-1} |\lambda_i| \geq \frac{\sum_{i=1}^{n-1} |\lambda_i|}{n-1} \geq |\lambda_1 \lambda_2 \dots \lambda_{n-1}|^{\frac{1}{n-1}}$$

$$ZE(H) - \Gamma|\lambda_n| > ZE(H) - |\lambda_n| > \frac{(\det Z(H))^{\frac{1}{n-1}}}{\Gamma|\lambda_n|^{\frac{1}{n-1}}}, \text{ where } \lambda_n \text{ is the smallest eigenvalue of } H.$$

$$\text{Hence, } ZE(H) > (7+3t) + \frac{\Gamma(\det Z(H))^{\frac{1}{n-1}}}{(7+3t)^{\frac{1}{n-1}}} \text{ } t \in N.$$

Theorem 3.13. Let H be a 3-uniform T_2 hypergraph with $5 \leq n \leq 11$.

$$\text{Then } n(\det Z(H))^{\frac{1}{n}} < ZE(H) < \frac{n(4n+3)^2}{4(\det Z(H))^{\frac{1}{n}}} \tag{14}$$

Proof: From arithmetic and a geometric mean inequality,

$$\frac{\sum_{i=1}^n \lambda_i}{n} > (\det Z(H))^{\frac{1}{n}} \tag{15}$$

$$\sum_{i=1}^n \lambda_i > n(\det Z(H))^{\frac{1}{n}} \tag{16}$$

$$ZE(H) > n(\det Z(H))^{\frac{1}{n}}$$

Sharmila et al.,

We have $|\lambda_1| > (\det Z(H))^{\frac{1}{n}}$
 $|\lambda_1| \sum_{i=1}^n \lambda_i > (\det Z(H))^{\frac{1}{n}} \sum_{i=1}^n \lambda_i$
 Since, $|\lambda_1| > |\lambda_i| \quad \square \quad i = 2, 3, \dots, n$
 $|\lambda_1|^2 \sum_{i=1}^n \lambda_i > (\det Z(H))^{\frac{1}{n}} \sum_{i=1}^n \lambda_i$
 $ZE(H) < \frac{|\lambda_1|^2 \sum_{i=1}^n \lambda_i}{(\det Z(H))^{\frac{1}{n}}} < \frac{n(4n+3)^2}{4(\det Z(H))^{\frac{1}{n}}}$ (17)
 From (15) & (16) inequality (13) is proved.

Example 3.14. Consider a 3-uniform T_2 hypergraph with $n = 10$.
 Here, first Zagreb energy, $ZE(H) = 121.41$ (By Example 2.5.3)

Also, $n (\det Z(H))^{\frac{1}{n}} = 10 \times 9.38 = 93.8$

And $\frac{n(4n+3)^2}{4(\det Z(H))^{\frac{1}{n}}} = \frac{10(4 \times 10 + 3)^2}{4 \times 9.38} = 492.66$

Therefore, $93.8 < 121.41 < 492.66$ hence the Theorem (3.13) is verified.

Theorem 3.15. Let H be a 3-uniform T_2 hypergraph with $5 \leq n \leq 11$.

Then $\sqrt{B} < ZE(H) < \sqrt{nB}$ (18)

Proof: From Cauchy - Schwarz inequality, $(\sum_{i=1}^n \lambda_i)^2 \leq n (\sum_{i=1}^n \lambda_i^2) = nB$

$ZE(H) < \sqrt{nB}$ (19)

$(\sum_{i=1}^n \lambda_i)^2 = (ZE(H))^2 > (\sum_{i=1}^n \lambda_i^2) = B$

$ZE(H) > \sqrt{B}$ (20)

From (19) & (20) inequality (18) is proved.

Example 3.16. Consider a 3-uniform T_2 hypergraph with $n = 10$.

$\sum_{i=1}^n \lambda_i^2 = B = 2325.46$, $ZE(H) = 121.41$

$\sqrt{2325.46} < 121.41 < \sqrt{10 \times 2325.46}$

$48.22 < 121.41 < 152.49$ hence the Theorem (3.15) is verified.

Example 3.17. In Theorem 3.4. $n = 10$, $B = 2326$, $(\det Z(H))^{\frac{1}{n}} = 9.3827$, $ZE(H) = 121.41$

$121.41 < \sqrt{2326} + \frac{2326 \times 9}{9.382} = 48.23 + 2231.29 = 2279.51$

In Theorem 3.5. $n = 10$, $ZE(H) = 121.41 < \sqrt{2 \times 10 \times 2326} - 2 \times 2 \times 2326 = 192.91$

In Theorem 3.7. $n = 10$, $\delta = 3$, $B = 2326$, $ZE(H) = 121.41 < 54 + .7745 + 136.41 = 191.19$

In Theorem 3.9. $ZE(H) < 21.5 + \sqrt{9(2326 - (21.5)^2)} = 151.01$

Therefore, $ZE(H) = 121.41 < 151.01 < 191.19 < 192.91 < 2279.51$

That is, $ZE(H) < (2n + \frac{3}{2}) + \sqrt{(n-1)[B - (2n + \frac{3}{2})]^2} < 5n + \delta + 1 + \sqrt{\frac{\delta}{5}} + \sqrt{(n - \alpha(H))B}$

$< \sqrt{2nB - 2\alpha(H)B} < \sqrt{B} + \frac{(n-1)B}{(\det Z(H))^{\frac{1}{n}}}$. Hence, it is that $(2n + \frac{3}{2}) + \sqrt{(n-1)[B - (2n + \frac{3}{2})]^2}$ is the closest upper bound of

$ZE(H)$. Thus $(2n + \frac{3}{2}) + \sqrt{(n-1)[B - (2n + \frac{3}{2})]^2}$ gives the approximate first Zagreb energy of a 3- uniform T_2 hypergraph.

Sharmila et al.,

CONCLUSION

In this article, we studied the first Zagreb energy of a 3- uniform T_2 hypergraph with some examples. Also, we originated the bounds of a 3-uniform T_2 hypergraph concerning various graph parameters. Among these bounds, we identified that $(2n + \frac{3}{2}) + \sqrt{(n-1)[B - (2n + \frac{3}{2})]^2}$ yields the approximate first Zagreb energy of a 3- uniform T_2 hypergraph.

ABSTRACT

The research paper examines the working conditions of labourer in Tea factories, Meghalaya, India. The primary data were collected from 185 labourers' from different tea factories. In exploit of this objective, based on the findings of the labour management system the solution has been established with a conceptual justification. Questionnaire based interviews were conducted with the factory labours. To know the extent in which the labourers' are satisfied with their working condition, percentage analysis and descriptive statistics has been used. Hypothesis were used whether the significance difference between male and female differ towards the satisfaction of working condition. Independent sample t-test has been used. The study findings reveal that the poor infrastructural facilities, poor socio-economic conditions, lack of welfare measures and the management responsibilities towards the labours have influenced the labour productivity.

Keywords: Tea Factory Laboure, Working Condition, Working Environment, Welfare measures, Nature of Job, Safety, overall job satisfaction.

**Junitha R. Marak and Subramanian**

INTRODUCTION

Tea is the second-popular beverage after water, having its own unique features and being a low-cost beverage in the world. Tea is known for its health benefits and has been recognized as a medicinal substance for thousands of years. Besides soothing the nerves of drinkers, it is believed to reduce the risk of cancer and heart disease. The tea plant belongs to the species *Camellia sinensis*, or *Camellia* tea. These are the five countries that are leading the top list for tea production: China, India, Kenya, Sri Lanka, and Indonesia (Athanasios Valavanidis, 2019). India has cultivated tea in 16 states, viz., Assam, West Bengal, Meghalaya, Tripura, Nagaland, Mizoram, Manipur, Arunachal Pradesh, Himachal Pradesh, Sikkim, Bihar, Odisha, Tamil Nadu, Kerala, Karnataka, and Uttarakhand. Out of these four states, viz., Assam, West Bengal, Tamil Nadu, and Kerala, were the highest tea-producing states and accounted for more than 95% of the tea production, and India itself is one of the states that has foreign exchange earners, and the industry also needs a continuous supply of workers; it is one of the most important employment generators in the country (Nurujjaman Laskar, April 2018). The Indian tea industry and tea estates provide employment opportunities to large numbers of people in rural and urban areas, both directly and indirectly. Next to water, tea has become the universally most affordable drink in the world. The Plantation Labour Act, which was passed in 1951, controlled the working conditions for tea employers. It set pay, set facilities, and restricted working hours for workers on tea estates (Baishya, 2016). Numerous risks in their workplace, together with psychological, biological, chemical, mechanical, and health-related elements, that all have an impact on the challenges faced by workers (Borgohain Parijat, 2013).

The majority of workers are uneducated, ignorant of living standards, unaware of their rights as employees, and facing financial difficulties. The Assam Plantation Labour Act was passed in 1951 and established welfare measures, social security regulations, and labour laws that were approved and put into effect for all of India's tea plantations in 1956. The effectiveness of worker production is increased by welfare measures and facilities such as housing accommodations, family welfare programs, and education training. Offering welfare measures, which are crucial to raising labour productivity, is one of the finest ways to ensure that successful workers provide positive results (Ananda Das Gupta, 2017). Meghalaya is a state in Northeast India that is now pursuing organic certification. In Meghalaya, several brands of tea are available at varying rates, and most farmers sell their supply in its raw state for very little money. In comparison to farmers who can produce and sell the product through to the end, it was discovered that the share of producers was quite low. They were compelled to sell their tea leaf to the processors due to a lack of technological expertise and processing knowledge (K.D. Sawian, 2022). The Meghalaya tea has a distinct flavor, excellent flavor, and scent that makes it stand out above other teas. In Meghalaya, tea plantations are still in their infancy. The list of private, societal, and government tea factories included many well-known brands. These factories include Upper Shillong Tea Farm, Nalari Tea, Anderson Tea, Areng, Durama, Meg Tea Umsning, Arsla Tea, Laksriew Tea, Denmar, Urlong Tea, Sharawn Tea, Jonglang Tea, and Alokpang Tea. They produce a variety of teas, such as CTC Tea, Oolong and Orthodox tea, black tea, green tea, and white tea, among others.

Statement of the Problem

The manufacturing tea industry and its workers were facing many problems, like absenteeism, strikes, scarcity of labour, a lack of welfare facilities, etc., that led to reduced production and productivity. The manufacturing process of the company is mainly affected by the inefficiency of labour. The workers are not provided with additional facilities to motivate them. Thus, by gathering the knowledge and opinions of the workers and also knowing the reasons for their dissatisfaction, the study aims to know the impact of the working environment and the working conditions of factory workers in Meghalaya.

REVIEW OF LITERATURE

The researcher has reviewed 104 articles for the study of which 85 are Indian review and remaining are foreign review. The important review which is highly associated with the tea estates and factories are as follows: Selvakumar Marimuthu (2019) concluded that there are number of factors that contribute to workers job discontent in tea

**Junitha R. Marak and Subramanian**

factories, including a shortage of labor in the estates, financial difficulties, and the execution of government programs that affect tea growers. Additionally, the producers face numerous difficulties as a result of their ignorance of the resources offered by the tea Board Schemes, their ignorance of the sophisticated techniques used in tea production, and their ignorance of the benefits of organic farming. In addition to having numerous financial difficulties. Priyadarshan S. (2019), states that, work satisfaction level is a positive or negative point of view that the workers having while working. The study has found that, the most of the labours were illiterate. Also found that, the four factors were highly problematic factors that is, workplace environment, disability, payment, and tight work timing that leads to the dissatisfaction towards the workers. Subhasri Sarkar (2019), states the problems of the tea industry workers were paid low wages. The main causes of poor wages in the industry were due to the lack of implementation of labour law, large number of female tea worker, lack of mobility of the tea labours due to competition and decline in auction price in real time. In the North East, insufficiency of wages determination modes and discontinued the tea estates and that leads to large scale starvation of tea workers. Sajitha Dishanka, and Yukio Ikemoto (2013) the authors were identified the management traditional work norms, the workers socio-economic condition were poor, lack of cooperations among the workers and the management responsibility towards the stockholders which is adversely affected productivity of labours. Sohrab Ansari (2016), has that, the majority of the workers are illiterate and despite that now they are encouraging their children to study. Despite the fact that the workers have lived for generation on the tea garden but they don't have any property right on the land they are living. Santhosh Kumar R (2019), The study examines that, how job discontent might lead to more arguments, insufficient commitment, a person's likelihood of filing a grievance, apathy, workplace injuries, and other problems with wellbeing. Other warning indicators could be low self-esteem, active participation in the workplace, absenteeism, employee preservation, a lack of commitment, and dread of the profession. There is a correlation between job unhappiness and other factors that lower a company's production and industry.

Objectives of the Study

To analyse the working condition of tea factory labourers in Meghalaya State.

METHODOLOGY

To assess the working conditions of tea factory workers, the survey was conducted in the tea factories of Meghalaya in three Districts. The survey covered 185 respondents from the 10 tea factories. The questionnaires were used for the survey. In addition to surveys, secondary data were gathered from government publications, census data, newspapers, and journals to support and enhance the study and advance the research. With the aid of a carefully thought-out, structured questionnaire, information was gathered from the ten manufacturing workers. The secondary data was gathered from pertinent articles that were published in various newspapers, periodicals, websites, and journals. The ten factories, which were divided into three categories—Private, Society, and Government—were spread throughout three districts in Meghalaya: Ri-Bhoi District, East Khasi Hills, and West Garo Hills. These factories employed people. The categorization of tea factories within the study area is displayed in Table 1. There are more than 221 labourers were working in all these 10 tea factories. Since, the population is known, it is decided to take the sample from the entire population and therefore convenience sampling method has been used. The 185 respondents were completely responded. Therefore, the size of the sample which is taken for the study is 185. The labourers from tea industry in the study area is shown in the Table 2.

Tools and Techniques

The researcher has employed the necessary tools, such as factor analysis and percentage analysis through SPSS (Statistical Packages for Social Science Research), to analyze the working circumstances of laborers in the Meghalaya tea sector.

Hypothesis

Null Hypothesis: There is no significant difference between Male and Female with respect to factors of job description of labourers.

A Scientific Analysis of Socio-Economic Factors of the Labourers.

The results of the socioeconomic background of the tea industry laborers in the state of Meghalaya are displayed in Table 3. The working conditions of tea industry laborers in the state of Meghalaya are influenced by their socioeconomic status. The socioeconomic characteristics of the employees, including their age, gender, marital status, level of education, ethnicity, place of residence, daily pay, and type of employment, have been examined.

Working Profile of labourers in Tea Industry

A working profile is a personal assessment that measures and individual's work personality. An employee work profile is a combination of the employee work description, performance plan and evaluation assessment. To work in a good environment, it is usual form to create the team work and the services like canteen facility, welfare measures, family welfares, housing, sufficient workload, less risk, work place, lower job related strain and sanitary facilities that cause will make the higher satisfaction for the job performance of workers. The following Table 4 reveal the working profiles offered by the labourers from the tea industry in Meghalaya. The working profile showing in above Table 4 reveal that the labourers involvement and satisfaction level. The working environments, working hours, wages, welfare measures, shift and all, they feel happy and sufficient, but they need additional training when the new machines and equipment were installed. Hence, individual satisfaction level are appreciable but overall satisfaction level shows 44.9%.

Working Condition of Labourers- A Scientific Analysis

Working Conditions is a very important on the moral of the employees and cost effectiveness. The effectiveness of work is done to a large extent by the workers is purely depends on the work place environment. A poor work environment can also have a negative effect on employees like stress, decrease productivity etc. A healthy work environment can improve employee motivation, engagement and overall well-being which can also leads to increase the productivity. Also, the wellbeing of workers also has direct impact on their productivity. The researcher has identified 20 statements in given Table 5 below of working conditions of factory workers, Linkert's five point scale by adopting scaling technique, namely. S.A-Strongly Agree; A-Agree; N- Neutral; D.A- Disagree; S.D.A- Strongly Disagree. Table 5 reveal the statement of job description and working conditions in tea industry that, majority of them stated that they are neutral except the statements, such as, Satisfied with the production schedule, feelings about the work not burden, amenities to the laborers are adequate and satisfied to the laborers efficiency, family welfare measures availability, benefit from training, effectively supported for productivity, completion of work in time, reaching time to the work places are derived from scientific approach.

Hypothesis

There is no significant difference between Male and Female with respect to factors of working condition of labourer. Independent sample t-test for significant difference between Male and Female with respect to factors of Working Condition of Laborers.

Note: 1. ** denotes significant at 1 % level

2. * denotes significant at 5% level

** Since P value is less than 0.01, null hypothesis is rejected at 1% level with regard to Working Environment. Hence, there is significant difference between male and female of labourers with regard to the factors of Working Environment. Based on the mean score, it reveals that the male labourers have better opinion in Working Environment than female labourers towards the satisfaction level of working condition of labourers in Meghalaya tea factories. *Since P value is less than 0.05, null hypothesis is rejected at 5% level with regard to Nature of Work. Hence there is significance difference between male and female labourers with regard to factors of Nature of Work. Based on mean score, the male labourers have better opinion in Nature of Work than female labourers towards the working condition and satisfaction of laborers in tea factories in Meghalaya.

**Junitha R. Marak and Subramanian****No Star**

There is no significance difference between male and female labourers with regard to factors of Welfare measures, Safety and Overall Job Satisfaction. Since P value is greater than 0.05. Hence the null hypothesis is accepted at 5% level with regard to factors of Welfare measures, Safety and Overall Job Satisfaction. The satisfaction score of the male respondents (73.41) is high followed by female respondents (66.22). It reveals that male respondents are more satisfied with the working condition in Meghalaya tea factories.

CONCLUSION

The purpose of the study is to examine the working conditions that tea factory workers in the state of Meghalaya endure. On the contentment of labourers in Meghalaya tea factories, however, it can be concluded that male workers have a better attitude about working conditions than do female workers. It also shows that there were several issues with tea workers, which had a negative impact on the rise in productivity indices. Among those many variables, the effects of manufacturing, technical inefficiencies, and working conditions on labour productivity are examined in detail for this purpose. The lack of staff is by far the biggest factor affecting production in tea factories. The labourers usually face problems due to the lack of social and welfare facilities and that leads to dissatisfactory level. In order to guarantee increased productivity, cordial working relationships, lower absenteeism, a pleasant work environment, job satisfaction, and security, labor welfare policies are essential in tea factories. Welfare programs should be seen as prudent investments that increase worker efficiency and pleasure while also yielding significant financial returns. Therefore, in order to improve the living conditions and quality of life of workers, all interested stakeholders should make every effort to provide welfare amenities. The rise in productivity was also impacted by technical inefficiencies. Modern machinery and technology should be introduced in factories to increase productivity.

Table 4: Working Profile of Laborers in Tea Industry

Sl. NO	Working conditions	Result
1.	Welfare measures provided for the workers	62.4% of the workers were provided the housing facilities.
2	Problems faced by the worker in the work place	75.7% of the respondent were faced the problems sometimes in work.
3	Opinion with the present job	91.9% of the labourers were satisfied with their present Job.
4	Number of Working hours per day	98.4 % of the respondents are working 8 hours per day in the work place.
5	Offered over time with additional pay.	84.3 % of the respondents work for the overtime and receive the additional payment.
6	Working environment comfortable	91.4 % of the respondents were comfortable with the work environment.
7	Working area required for improvement	61.6 % of the respondents states that hygiene is required to improve in the working area.
8	Working shift	92.4 % of them works in day shift.
9	Equal payment of wages for male and female.	71.4% of the organisations are not providing the equal wages to for male and female.
10	Received training assistance	87.6% of the labours were trained after the workers are employed in the industry.
11	Additional Training requirement	58.9% of the respondents required additional training.
12	Satisfied with the production schedule	96.8% of the respondents were satisfied with the production schedule.
13	Factories are effectively supported and maintained for productivity	98.9% of the factories are effectively supported and maintained for productivity.
14	Works are completed in time	65.9% were completed the works in time
15	Feel burden about their work	51.9% of the workers were feeling burdened about their job
16	Providing sanitary facility	60.5% of them have the availed necessary sanitary facility in the work place.
17	Sufficiency of leave facilities	74.6% of the respondents feels that the leave facilities is sufficient.
18	More work pressure (time)	78.9 % feels more pressure with work in the evening time.
19	Family welfare	70.3% of the workers received the rations.
20	Overall satisfaction	44.9% of the respondents were satisfied with the work performance in the factory.

ABSTRACT

Peripheral neuropathies are one of the most disabling and debilitating broad spectrum of syndromes. Diabetic peripheral neuropathy (DPN) and carpal tunnel syndrome (CTS) are two most eminent peripheral neuropathies characterized as pain and paraesthesia's throughout the distribution of involved nerve. Physiotherapy has been a gratuity for the conservative management of symptoms of peripheral neuropathies and is gaining applaudable vision by reducing neuropathic pain, improving proprioception, increasing muscular strength and functional status. In the modern era of physiotherapy, taping has come to the forefront and proved effective in reducing symptoms of peripheral neuropathies. The electronic databases: PubMed, Science Direct, Scopus, Knimbus, Springer, EBSCO and CINHALL will be searched from January 2013 to January 2024 using Boolean operators "OR" and "AND". Randomised controlled trials will be included in the review. Titles and abstracts of articles to be included in the study will be reviewed by two independent reviewers. Data will be analysed by comparing the mean change in difference, 95% confidence interval and p value for functional status. This systematic review and meta-analysis will highlight the effectiveness of taping in treating the symptoms of peripheral neuropathies and will aid in rehabilitation of peripheral neuropathies due to DPN and DPN associated CTS.

Keywords: Peripheral neuropathy, diabetic peripheral neuropathy, carpal tunnel syndrome, physiotherapy, taping, kinesiotaping

**Kanika Thakur and Manu Goyal**

INTRODUCTION

Peripheral neuropathies are one of the most common neurological disorder, having an annual incidence of 77 per 100,000 and a prevalence of 1-12% in all age groups. [1] Peripheral neuropathies comprises a broad spectrum of syndromes that can be classified according to the distribution across anatomical region and in the peripheral and nervous system. Mononeuropathies, multifocal neuropathies, and polyneuropathies are three main types of peripheral neuropathies that can be further subdivided according to the cause of the disease, the duration of the disease, and the type of neuropathy.[2] Diabetic Peripheral Neuropathy (DPN) and DPN associated Carpal Tunnel Syndrome (CTS) are the two most prevalent peripheral neuropathies. Polyneuropathy associated with diabetes is often characterized as painful, sensorimotor neuropathy with a slowly progressive course, although rapidly progressive painful neuropathies can also occur especially just after the start of insulin therapy. [3] 60-70% of the diabetic population experience mild to severe damage to the nervous system which leads to DPN that usually involves distal body parts and is characterized as distal symmetrical sensorimotor neuropathy which is progressive and follows a "glove and stocking pattern".[4,5] Polyneuropathy associated with CTS is considered mononeuropathy which is characterized by pain and para-aesthetic accusation throughout the distribution of a median nerve.[6,7,8] Women are more prone to CTS than men with 491/ 100,000 cases per year.[9] The surgical approach had been proven to be an effective outcome, especially in cases with long-standing cases but with the advancement of technologies conservative management has gained popularity as well proven an effective approach to treat CTS. Conservative management includes pharmacological agents, splinting, physiotherapy, and acupuncture and among all physiotherapy management has its own importance in managing the symptoms of CTS. [10] Physiotherapy has been a boon for the treatment of symptoms associated with polyneuropathies and the role of physiotherapy in improving symptoms of DPN and CTS has gained popularity by reducing neuropathic pain, improving proprioception, increasing muscular strength, improving quality of life, and functional status. It is a real need of the hour to gather all the existing literature stating the effectiveness of therapeutic taping in improving the functional status of patients with peripheral neuropathies to provide summarized data that may allow physiotherapy professionals to understand the beneficial effects of taping in improving the functional status of patients with DPN and DPN associated CTS.

OBJECTIVES

To determine the effectiveness of therapeutic taping on the functional status in patients with peripheral neuropathies.

REVIEW QUESTION

Does therapeutic taping have an impact on the functional status in patients with peripheral neuropathies?

METHODS

This review will be done in accordance with the recommendations of Preferred Reporting Items for Systematic Reviews and Meta-Analysis-P (PRISMA-P) [11] and is registered in International Prospective Register of Systematic Reviews (PROSPERO) (Id: CRD42022372677)

Literature Database Search

A comprehensive electronic literature searches will be conducted to gather the latest research evidence in context to taping as an intervention in patients with peripheral neuropathies. When all searched databases; PubMed, Science Direct, Scopus, Knimbus, Springer, EBSCO and CINHALL, allowed limits, searches will be restricted to (randomi*controlled trials) and (randomi* pilot trials) AND (physiotherapy OR physical therapy OR exercise therapy OR electrotherapy OR rehabilitation) AND (diabetic peripheral neuropathy) AND (carpal tunnel syndrome) OR (entrapment neuropathy) AND (tarsal tunnel syndrome) AND (chemotherapy induced peripheral neuropathy) AND (functional status) AND (therapeutic taping) OR (taping) with Boolean operators "OR" and "AND" to

**Kanika Thakur and Manu Goyal**

combine all search terms which will be used to identify relevant studies. The following filters will be used to limit the search – Year: January 2013 to January 2024; Language: English; Full-text.

Criteria for inclusion of studies

The studies will be included based on the following criteria:

Inclusion criteria

All available randomized trials will be included based on PICO method (participants, interventions, control group and outcome measures). Refer Table 1.

Exclusion criteria

Studies will be excluded if 1) they are published in any language other than English language 2) Any study designs other than randomized controlled trial.

Hand Searching

Hand searching of subject specific journals will be done to search any other study. At last, manually screening of reference list of included studies will be done.

Data Extraction

Two reviewers will independently screen and select titles and abstracts of relevant trials. Full text articles will be obtained and assessed for all potential eligible studies based on selection criteria. In the case of any discrepancy or dispute a third reviewer will be accessed to reach a final decision of included studies. All the retrieved articles will be exported and saved into Mendeley reference manager software.

Assessment of risk of bias of included studies

The Cochrane Risk of Bias Assessment Tool will be used to assess the risk of bias in the included studies. [12] High, low, and unclear risk of bias grades will be used. For inclusion in the systematic review, a study that followed an experimental procedure and applied any intervention to patients with peripheral neuropathy with a 11 item PEDro scale score of ≥ 5 will be included.

Assessment of methodological quality of included studies

The Physiotherapy Evidence Database (PEDro) scale (https://www.pedro.org.au/wp-content/uploads/PEDro_scale) for RCT will be used to evaluate the methodological quality and threat of bias of the included studies. Each domain of scale will be judged as low risk of bias, high risk of bias or uncertain. The scale has fair to good reliability for most of the items with intra-class correlation coefficient (0.56, 95% CI = 0.47 to 0.65). The methodological quality scores will be assigned as: 9-10 (high quality, low risk of bias); 6-8 (acceptable quality, moderate risk of bias); 3-5 (low quality, high risk of bias); 0-2 (unacceptable, reject).

Measurement of treatment effect

Data related to statistical information will also be extracted on the type of descriptive (e.g., mean, median) and inferential statistics (e.g., standard deviation, inter-quartile range, 95% confidence interval) used; type of tests (either parametric or non-parametric) used for hypothesis testing.

Data synthesis

The feasibility of meta-analysis will be expedited if included studies will exhibit no heterogeneity. All the included studies will be assessed statistically for between study heterogeneity using forest plot, I² statistics (Table 2) and Chi-square test [13] (Table 3). Sub-group analyses will be conducted in case heterogeneity exists between the studies. The data will be analysed by comparing the mean change, mean change in difference, 95 % confidence interval and p-value for quality of life, pain, and nerve conduction. All p-values ≤ 0.05 will be considered statistically significant. For the interpretation of the results, the level of evidence algorithm given by Van Tulder et al [14] will be used: Strong

**Kanika Thakur and Manu Goyal**

evidence - consistent findings among multiple high quality randomized controlled trials; Moderate evidence – consistent findings among multiple lower quality randomised controlled trials or controlled clinical trials or one high quality randomized controlled trial; Limited evidence – one lower quality randomised controlled trial or controlled clinical trial; Conflicting evidence – inconsistent findings among multiple randomised controlled trials; No evidence – No randomised controlled trials.

DISCUSSION

To the reviewer's best knowledge, this systematic review will be the first to determine the effectiveness of therapeutic taping on functional status. The findings of this study will allow the physiotherapist to get an insight into the therapeutic effects of taping in treating peripheral neuropathies and will allow timely and wise use of taping to prevent and treat the symptoms of peripheral neuropathies. The findings of this study will also fulfil the need for future research.

Table 1: Inclusion criteria for review

PICO Process	Inclusion
Population	The review will consider studies if they included participants aged 18 years and above, both, males, and females, diagnosed with diabetic peripheral neuropathy and carpal tunnel syndrome Studies of DPN will be included if they included the participants having Hb1Ac of 6.5 and above and BMI less than 34. Studies of CTS will be included if they included the participants having symptoms of paraesthesia or pain in the distribution of median nerve distribution in hand, symptoms lasting longer than one month, and at least one of the Tinel, Phalen, or Reverse Phalen tests positive on physical examination.
Intervention	Intervention group should have received taping as an intervention in the affected area.
Comparison	Shamt aping Conventional physiotherapy treatment Not aping
Outcome Measure	Functional performance will be taken as an outcome measure which was assessed by Boston Carpal Tunnel Questionnaire in patients having CTS and 6-minutewalktest in patients having DPN.

Table 2 : I2 Test of Heterogeneity

I ²	Heterogeneity level
0%to 40%	Minimal
30%to 60%	Moderate
50%to 90%	Substantial
90%to 100%	Considerable

Table 3: Interpretation of Chi 2 test

Chi ²	Heterogeneity level
P<0.05	Strong likelihood of statistical heterogeneity
P=0.05<0.1	Likely to be heterogeneous
p>0.1	Not likely to be heterogeneous

ABSTRACT

Let $G = (V, E)$ be a finite, simple, connected and undirected graph. Let $u, v \in V(G)$, where $V(G)$ is the vertex set of G . v is a boundary vertex of u if $d(u, w) \leq d(u, v)$ for all $w \in N(v)$. K.M. Kathiresan et. al. defined boundary dominating set of G . A vertex u boundary dominates a vertex v if v is a boundary vertex of u . A subset S of $V(G)$ is called a boundary dominating set if every vertex in $V - S$ is a boundary dominated by some vertex of S . (i.e) for every $v \in V - S$, there exists $u \in S$, such that v is a boundary vertex of u . The minimum cardinality of a boundary dominating set is called a boundary domination number of G and it is denoted by $\gamma_b(G)$. The maximum cardinality of a minimal boundary dominating set of G is denoted by $\Gamma_b(G)$. A subset D of $V(G)$ is a boundary degree equitable dominating set of G if for any $v \in V - D$ there exists a $u \in D$ such that v is a boundary vertex of u and also v and u are boundary degree equitable. (i.e) $|\deg_b(u) - \deg_b(v)| \leq 1$. The minimum cardinality of a boundary degree equitable dominating set of G is called the boundary degree equitable domination number of G and it is denoted by

Palani Murugan et al.,

$\gamma_b^e(G)$. In this paper we introduce boundary degree equitable irredundant set and establish boundary degree equitable domination chain of graphs.

Keywords: Boundary degree, Boundary degree equitable dominating set, Private bdeneighbor, bde irredundant set.)
 2010 Mathematics Subject Classification .05C20.

INTRODUCTION

Let G be a non-trivial connected graph. We refer [1], for all basic graph definitions. The distance between two vertices $u, v \in V(G)$ is the length of the shortest distance between two vertices u and v . If a $u - v$ path is a $u - v$ geodesic, then for any neighbor w of u , $|d(u, v) - d(w, v)| \leq 1$. A vertex v is an eccentric vertex of u if v is at maximum distance from $u \in V(G)$, denoted by $e(u)$. If v is an eccentric vertex of u and w is a neighbour of v , then $d(u, w) \leq d(u, v)$. [2] The boundary neighbour of a vertex $u \in V(G)$ is v if v is a nearest boundary of u . A vertex u boundary dominate a vertex v if v is a boundary neighbor of u . The number of boundary neighbors of a vertex u is called the boundary degree of u . [3,4].

KM. Kathiresan et. al. [5] introduced and studied the concept of boundary domination in graphs. In this work, we define and study boundary degree equitable domination and boundary degree equitable irredundant sets and find the relationship between boundary degree equitable domination and these new parameters. In this Paper, Boundary Degree Equitable is abbreviated as bde.

Boundary Degree Equitable Dominating Set

Definition 2.1:

Let $v \in V(G)$. The boundary degree of v in G is the number of vertices u such that u is a boundary vertex of v and it is denoted by $deg_b(v)$. Also $N_b(v) = \{u \in V(G) : u \text{ is a boundary vertex of } v\}$.

Example 2.2:

$$N_b(v_1) = v_4, N_b(v_2) = v_1, v_4, N_b(v_3) = v_1, v_4, N_b(v_4) = v_1.$$

Definition 2.3:

Let G be a connected graph. Let $u \in V(G)$. The equitable boundary degree of $u \in G$ is the number of vertices $v \in G$ such that v is a boundary vertex of u and $|deg_b(u) - deg_b(v)| \leq 1$. The equitable boundary degree of $u \in G$ is denoted by $deg_b^e(u)$. Also $N_b^e(u) = \{v \in V(G) : v \text{ is a boundary degree equitable vertex of } u\}$.

Example 2.4:

- (a) let $G = K_{1,n}$. The Pendant vertices have equal boundary degree and hence they are equitable boundary degree vertices.
- (b) Let $G = P_n$. The end vertices of the path have equal boundary degree and the internal vertices have also equal boundary degree 0.
- (c) Let $G = K_{3,4}$. Let $V_1 = \{u_1, u_2, u_3\}$ and $V_2 = \{v_1, v_2, v_3, v_4\}$ be the partition of G . The boundary degree of any vertex of V_1 is 2 and the boundary degree of any vertex of V_2 is 3. Hence any vertex of V_1 is adjacent with any vertex of V_2 and also boundary degree equitable.

Definition 2.5:

Let G be a simple connected graph. A subset D of $V(G)$ is a boundary degree equitable dominating set of G if for any $v \in V - D$ there exists a $u \in D$ such that v is a boundary vertex of u and v and u are boundary degree equitable. (i.e) $|deg_b(u) - deg_b(v)| \leq 1$. The minimum cardinality of a boundary degree equitable dominating set of G is called the boundary degree equitable domination number of G and it is denoted by $\gamma_b^e(G)$. The maximum (minimum) of $deg_b^e(u)$ for $u \in V(G)$ is denoted by $\Delta_b^e(G)$. ($\delta_b^e(G)$).

Remark 2.6:

$$\gamma_b(G) \leq \gamma_b^e(G)$$

γ_b^e for some known classes of graphs:

- i. $\gamma_b^e(K_n) = 1$.
- ii. $\gamma_b^e(K_{1,n}) = \begin{cases} 1 & \text{if } n = 1 \\ 2 & \text{if } n \geq 2 \end{cases}$
- iii. $\gamma_b^e(K_{m,n}) = \begin{cases} 2 & \text{if } |m - n| \leq 1 \\ m + n - 2 & \text{if } |m - n| \geq 2 \end{cases}$
- iv. $\gamma_b^e(P_n) = n - 1$
- v. $\gamma_b^e(C_n) = \begin{cases} \lfloor \frac{n}{2} \rfloor & \text{if } n \geq 4 \\ 1 & \text{if } n = 3 \end{cases}$
- vi. $\gamma_b^e(W_n) = \begin{cases} \lfloor \frac{n-1}{2} \rfloor + 1 & \text{if } n \geq 5 \\ 1 & \text{if } n = 4 \end{cases}$
- vii. $\gamma_b^e(D_{r,s}) = 3$, where $r, s \geq 1$.
- viii. $\gamma_b^e(P) = 3$, where P is the Petersen graph
- ix. $\gamma_b^e(K_{n_1, n_2, \dots, n_r}) = r + 1$
- x. $\gamma_b^e(K_m(a_1, a_2, \dots, a_m)) = m + 1$

Remark 2.7:

Let G be a connected graph such that for any two vertices u, v either u is not a boundary vertex of v or $|deg_b(u) - deg_b(v)| \geq 2$. Then $\gamma_b^e(G) = n$.

Theorem 2.8:

If G is a connected graph with n vertices, then $\lfloor \frac{n}{1 + \Delta_b^e(G)} \rfloor \leq \gamma_b^e(G) \leq n - \Delta_b^e(G)$.

Proof:

Let u be a vertex of equitable boundary degree $\Delta_b^e(G)$. Then there exists $\Delta_b^e(G)$ vertices v such that v is a boundary vertex of u and $|deg_b(u) - deg_b(v)| \leq 1$. Let the $\Delta_b^e(G)$ - vertices be $\{v_1, v_2, \dots, v_{\Delta_b^e(G)}\}$. Let $D = V - \{v_1, v_2, \dots, v_{\Delta_b^e(G)}\}$. Therefore $|D| = n - \Delta_b^e(G)$. Clearly $u \in D$ and D is a bde dominating set of G . Therefore $\gamma_b^e(G) \leq |D| = n - \Delta_b^e(G)$. Let D be a minimum bde dominating set of G . Every $u \in D$ boundary equitably dominates atmost $\Delta_b^e(G)$ vertices of G and hence Δ_b^e - vertices of $V - D$. Therefore D bde dominates atmost $\Delta_b^e(G) \cdot |D|$ vertices of $V - D$. Therefore $|D| + \Delta_b^e(G) |D| \geq n$. Therefore $|D| \geq \lfloor \frac{n}{1 + \Delta_b^e(G)} \rfloor$. Hence $\lfloor \frac{n}{1 + \Delta_b^e(G)} \rfloor \leq \gamma_b^e(G) \leq n - \Delta_b^e(G)$.

Remark 2.9:

(i) In C_4 , $\Delta_b^e(C_4) = 1$ and $\gamma_b^e(C_4) = 2$. $\therefore \lfloor \frac{n}{1 + \Delta_b^e(C_4)} \rfloor = \lfloor \frac{4}{2} \rfloor = 2 = \gamma_b^e(C_4)$.

(ii) When $G = K_n, n \geq 3$, $\gamma_b^e(K_n) = 1$ and $\Delta_b^e(K_n) = n - 1$, $\therefore \gamma_b^e(K_n) = n - \Delta_b^e(K_n)$.

Palani Murugan et al.,

Definition 2.10:

A boundary degree equitable dominating set D of a graph G is said to be a minimal boundary degree equitable dominating set if no proper subset of D is a boundary degree equitable dominating set of G .

Remark 2.11:

Any superset of a boundary degree equitable dominating set of a graph G is also a boundary equitable dominating set of G . Hence a boundary degree equitable dominating set is minimal if and only if it is 1-minimal.

Definition 2.12:

u is called a boundary equitable isolate if $N_b^e(u) = \emptyset$. (i.e) for every vertex $v \neq u$, u is not a boundary vertex of v or $|deg_b(u) - deg_b(v)| \geq 2$.

Theorem 2.13:

A boundary degree equitable dominating set D of a graph G is minimal iff for every vertex $u \in D$, any of the following condition holds.

- (a) u is not a bde vertex of any vertex of $D - \{u\}$ with respect to G .
- (b) there exists a vertex $v \in V - D$ such that u is the only vertex in D where v is a bde vertex of u .

Proof:

Let D be a minimal bde dominating set of G . Then for any $u \in D$, $D - \{u\}$ is not a bde dominating set of G . Therefore either u is not a bde vertex of any vertex of $D - \{u\}$ with respect to G or there exists a vertex $v \in V - D$ such that u is the only vertex in D satisfying the condition that v is a boundary vertex of u and bde vertex of u . Hence u satisfies condition (a) or (b). Conversely, suppose $u \in D$ satisfies (a) or (b) then clearly $D - \{u\}$ is not a bde dominating set of G . Therefore, D is a minimal bde dominating set of G .

Private Boundary Degree Equitable Neighbor

Definition 3.1:

Let u be a vertex in G . $N_b^e(u) = \{v \in V(G) : v \text{ is a boundary degree equitable vertex of } u\}$

Definition 3.2:

Let S be a subset of $V(G)$. Then $N_b^e(S) = \cup_{u \in S} N_b^e(u)$.

Definition 3.3:

Let S be a subset of $V(G)$. $N_b^e[S] - N_b^e[S - \{u\}]$ is called the private bde neighbor of u with respect to S .

Example 3.4:

- (a) Let $S = \{u_2, u_5\}$. Then $N_b^e[\{u_2\}] \cup N_b^e[\{u_5\}] = \{u_2\} \cup \{u_1, u_3, u_5\} = \{u_1, u_2, u_3, u_5\}$
 $N_b^e[S - \{u_1\}] = N_b^e[S]$
 Therefore $N_b^e[\{u_1\}] = N_b^e[S] - N_b^e[S - \{u_1\}] = N_b^e[S] - N_b^e[S] = \emptyset$.
 Therefore u_1 has no private bde neighbour with respect to S .
 $N_b^e[S - \{u_2\}] = N_b^e[\{u_5\}] = \{u_1, u_3, u_5\}$
 Therefore $N_b^e[\{u_2\}] = N_b^e[S] - N_b^e[S - \{u_2\}] = \{u_1, u_2, u_3, u_5\} - N_b^e[\{u_5\}]$

$$= \{u_1, u_2, u_3, u_5\} - \{u_1, u_3, u_5\} = \{u_2\}.$$

Therefore u_2 is a private bde neighbour of u_2 with respect to S .

(b) Let $S = \{u_1, u_2, u_3, u_4, u_5\}$

$$N_b^e(S) = \cup_{u \in S} N_b^e(u)$$

$$= N_b^e[\{u_1\}] \cup N_b^e[\{u_2\}] \cup N_b^e[\{u_3\}] \cup N_b^e[\{u_4\}] \cup N_b^e[\{u_5\}]$$

$$= \{u_1, u_3, u_5\} \cup \{u_2\} \cup \{u_1, u_3, u_5\} \cup \{u_4\} \cup \{u_1, u_3, u_5\}$$

$$= \{u_1, u_2, u_3, u_4, u_5\}$$

$$N_b^e[S - \{u_1\}] = N_b^e[\{u_2, u_3, u_4, u_5\}] = \{u_1, u_2, u_3, u_4, u_5\}$$

Therefore u_1 has no private neighbour with respect to S .

$$N_b^e[S - \{u_2\}] = N_b^e[\{u_1, u_3, u_4, u_5\}] = \{u_1, u_3, u_4, u_5\}$$

$$N_b^e[S] - N_b^e[S - \{u_2\}] = \{u_2\}$$

Therefore u_2 is a private bde neighbour of u_2 with respect to S .

Remark 3.5:

Suppose u is a private bde neighbour of v with respect to S . Then u is not a bde vertex of any vertex of S other than itself.

Remark 3.6:

S is a minimal bde dominating set of G if and only if for any $u \in S$, u is not a bde vertex of any vertex of $S - \{u\}$ or there exists a vertex $v \in V - S$ such that v is a bde vertex of only $u \in S$.

Theorem 3.7:

A graph G has a unique minimal boundary degree equitable dominating set if and only if the set of all boundary equitable isolates forms a bde dominating set of G .

Proof:

Let G have a unique minimal bde dominating set D (say). Let S be the set of all boundary equitable isolates of G . Therefore S is a subset of D . Suppose $D - S \neq \emptyset$. Let $v \in D - S$. Therefore v is not a boundary equitable isolate. Therefore $N_b^e(v) \neq \emptyset$. (i.e) there exists $u \in V$ such that u is a boundary equitable vertex of v . Therefore u is a boundary vertex of v and $|deg_b(v) - deg_b(u)| \leq 1$. Therefore $V - \{u\}$ is a bde dominating set of G . Let D_1 subset of $V - \{u\}$ be a minimal bde dominating set of G . Since $u \in D$ and $u \notin D_1$, there exists a minimal bde dominating set of G different from D , a contradiction to the uniqueness of D . Therefore $D - S = \emptyset$. (i.e) $D = S$. Therefore the set of all boundary equitable isolates of G forms a bde dominating set of G . Conversely, suppose the set of all boundary equitable isolates of G , S (say) forms a bde dominating set of G . Let D be a minimal bde dominating set of G . Then $S \subseteq D$. But S is a bde dominating set of G and D is minimal. Therefore $D = S$. Therefore D has a unique minimal bde dominating set of G .

Theorem 3.8:

Let G be a graph without boundary equitable isolate vertices. (i.e) for any $u \in V$, there exists $v \in V$ such that u is a boundary of v and $|deg_b(v) - deg_b(u)| \leq 1$. If D is minimal bde dominating set of G then D is a bde dominating set of G .

Proof:

Let D be a minimal bde dominating set of G . Let u be a boundary equitable isolate of D . Therefore u has a boundary equitable neighbour in $V - D$ (since D has no boundary equitable isolates). Suppose u is not a boundary equitable isolate of D . Since D is minimal, for any $u \in D$, either u is not a bde vertex of any vertex of $D - \{u\}$ or there exists a vertex $v \in V - D$ such that u is the only vertex in D where v is a bde vertex of u . Since u is not a boundary equitable isolate of D , the condition (i) is not satisfied. Therefore u is boundary dominated by v and u and v are bde. Therefore $V - D$ is a bde dominating set of G .

Palani Murugan et al.,

Remark 3.9:

If G has no boundary equitable isolate, then $\gamma_b^e(G) \leq \frac{n}{2}$.

For:

Let D be a minimum bde dominating set of G . Then $V - D$ is a bde dominating set of G . Therefore $\gamma_b^e(G) \leq |V - D| = n - |D| = n - \gamma_b^e(G)$.

Therefore $2\gamma_b^e(G) \leq n$. (i.e) $\gamma_b^e(G) \leq \frac{n}{2}$.

Remark 3.10:

When $G = C_4$, $\gamma_b^e(G) = 2 = \frac{4}{2} = \lfloor \frac{V(G)}{2} \rfloor$.

Definition 3.11:

Let G be a connected graph. Let $S \subseteq V(G)$ such that for any $u \in S$, any of the following two conditions holds.

- (a) u is not a bde vertex of any vertex of $S - \{u\}$ with respect to G .
- (b) there exists a vertex $v \in V - S$ such that u is the only vertex in S where v is a bde vertex of u .

Then S is called bde irredundant set of G . The maximum (minimum) cardinality of a maximal bde irredundant set of G is denoted by $IR_b^e(G)$. ($ir_b^e(G)$).

Remark 3.12:

A minimal bde dominating set of G is a bde irredundant set of G .

Theorem 3.13:

Let G be a connected graph. The property of bde irredundance is hereditary.

Proof:

Let S be a bde irredundant set of G . Let $T \subseteq S$. Let $u \in T$. Then $u \in S$. Therefore u satisfies one or both of the following two conditions.

- (a) u is not a bde vertex of any vertex of $S - \{u\}$ with respect to G .
- (b) there exists a vertex $v \in V - S$ such that u is the only vertex in S where v is a bde vertex of u . Suppose u satisfies (a). Then u is not a bde vertex of any vertex of $S - \{u\}$ and hence u is not a bde vertex of any vertex of $T - \{u\}$. Suppose u satisfies condition (b) then there exists a vertex $v \in V - S$ such that u is the only vertex in S where v is a bde vertex of u . Since $V - T \supseteq V - S$, $v \in V - T$. Since $T \subseteq S$ and u is the only vertex in S where v is a bde vertex of u , u is the only vertex in T where v is a bde vertex of u . Hence T is a bde irredundance set of G . Hence the theorem.

Theorem 3.14:

A minimal bde dominating set of G is a maximal bde irredundant set of G .

Proof:

Let D be a minimal bde dominating set of G . Then D is a bde irredundant set of G . Suppose D is not a maximal bde irredundant set of G . Then there exists $u \in V - D$ such that $D \cup \{u\}$ is a bde irredundant set of G . Therefore u satisfies either or both of the two conditions given below.

- (i) u is not a bde vertex of any vertex of $D \cup \{u\} - \{u\}$ with respect to G . (i.e) u is not a bde vertex of any vertex of D , a contradiction, since $u \in V - D$ and D is a minimal bde dominating set.
- (ii) there exists a vertex $v \in V - (D \cup \{u\})$ such that u is the only vertex in $D \cup \{u\}$ where v is a bde vertex of u . Since D is a bde dominating set, there exists a vertex $w \in D$ such that v is a bde vertex of w , clearly $w \neq u$, since $u \in V - D$ and $w \in D$, a contradiction. Since u is the only vertex in $D \cup \{u\}$, where v is a bde vertex of u . Therefore D is a maximal bde irredundant set of G .

Palani Murugan et al.,

Remark 3.15:

For any Graph G , $ir_b^e(G) \leq \gamma_b^e(G) \leq \Gamma_b^e(G) \leq IR_b^e(G)$.

This inequality is called boundary degree equitable domination chain of graph G .

DISCUSSIONS AND CONCLUSIONS

In this work, we defined boundary degree equitable dominating set in the connected graph G . We also defined the private bde neighbour and as well as bde irredundance. Moreover, in this study we provided a bde relation between domination number and irredundance number. (i.e) $ir_b^e(G) \leq \gamma_b^e(G) \leq \Gamma_b^e(G) \leq IR_b^e(G)$. The further work is going on the bde covering and bde independence number.

ABSTRACT

The cardio-vascular failure may be the blood vessel failure or any kind of coronary heart failures which is commonly referred as heart attacks. This happens when the heart is unable to pump the blood though out the body which lead to this adverse situation. In this paper we predict the causes of these heart failure with the 14 salient features. we present a prediction based on analysis in the UCI dataset. The reasons behind the heart failure analysis were also studied and the effective classification with the results analysis were presented

Keywords: Cardiac failure, Feature ranking, classification

INTRODUCTION

The heart is the most vital part of the human body. The heart enable the blood circulation throughout the body[1,2] . Any kind of heart diseases prevent the proper blood flow and it even results in fatal death[16]. There are so many traditional approaches to find out the heart failure[14] . Analyzing using the traditional methods are time consuming and found not so effective as per the studies. In this paper we present the parameters which influence the cardio vascular diseases and present the analysis of the same. There are different studies carried out in the literature for

78726

Betty Paulraj et al.,

heart failure prediction through the patient history or family history[6,7,8]. Each classification has its own pros and cons. The inclusion of the various machine learning algorithms seem to improve the accuracy of the heart failure prediction[15]. This manuscript is organized in a way to perform the comparative analysis the different classification methods and to observe the efficient accuracy with the available methods. The dataset with 303 samples with various history of symptoms were studied for this research. The experimental evaluation found that the accuracy remains varied with the various classification methods[9,10]. The study and usage of the best algorithm with the available dataset is also presented

Background

researchers have explored various methods to predict the heart failures. The methodologies includes a wide range of spectrum not limited to ANN, SVMetc[3]. The Artificial Neural Network found to be studied in various methods in the literature. The FDSS based system is proposed to predict the heart diseases[1]. This technique uses the genetic algorithm. Followed by which few research studies were carried out on the coronary artery disease(CAD). The jeopardy factor were considered here for analysis[11,12,13]. There is always a research focus towards a proper classifying or a predicting technique . so the focus towards the mining of information received its primary focus . based on the studies there found eleven major influencing factors towards the heart diseases. They are the age, Anemic nature, being diabetic, ejection_fraction[2], platelet count, serum_creatinine, creatinine_phosphokinase, serum_sodium, sex, the habit of smoking. These are considered as the major influencing factors. Based on these assumption the classification techniques are applied and the findings are reported in the next section

Experimental Evaluation

For the experimental evaluation we have considered UCI heart disease dataset, we have the sample of 303 individuals. The following figure 3.1 shows the information of our dataset which depict sthe 14 main influencing parameters. These parameters are used to get idea about the features available in the dataset. As we can see in the figure, The UCI dataset has a total of 14 influential features which. The understanding n depth about the parameters are presented below. The age is represented in years. The values 1 and 0 is assigned to the male and female categorization in the sex respectively. The cp denote the chest pain. Here the 0 and 1 denote the typical and atypical angina, Value 2 represents the non-anginal pain and value 3 denote the asymptomatic syndrome. Trest bps indicates the resting blood pressure in mm Hg on admission to the hospital. Chol serum indicates cholesterol in mg/dl. The fasting blood sugar level is checked if it is greater than 120 mg/dl. If it is true then value is denoted as 1 and 0 otherwise. Resting electrocardiographic results (Value 0: normal; Value 1: having ST-T wave abnormality; Value 2: probable or definite left ventricular hypertrophy).Maximum heart rate achieved is represented as thalach. Exang denotes exercise induced angina (1 = yes; 0 = no). old peak indicate the ST depression induced by exercise relative to rest. The slope of the peak exercise ST segment (Value 0: up sloping; Value 1: flat; Value 2: down sloping).ca indicate the number of major vessels (0-3).thal thalassemia (3 = normal; 6 = fixed defect; 7 = reversable defect). heart disease (0 = no, 1 = yes) is the target. Based on the available information present in the dataset and according to the previous studies, the machine learning techniques were examined and the inferences were recorded.

These two are the major driver of the heart failure. In the following subsections, we analyse the dataset on a whole and predict the outcome from it and then the results are presented. This dataset includes 303 random people, 165 of whom have heart disease and 138 of whom have a healthy heart. The information is gathered in a similar confined context. They range in age from 29 to 77. The study observed from the UCI dataset is depicted in the figure 1 Many research reported in the literature have primarily used the ejection fraction and the serum creatinine. Unlike those studies, the results have been obtained by all the parameters and the level of influence with the other factors is also calculated. Here in the above figure, we can see there is a positive correlation between chest pain (cp) & target (our predictor). This makes sense since, The greater amount of chest pain results in a greater chance of having heart disease. Cp (chest pain), is an ordinal feature with 4 values: Value 1: typical angina ,Value 2: atypical angina, Value 3: non-anginal pain , Value 4: asymptomatic. In addition, we see a negative correlation between exercise induced angina (exang) & our predictor. This makes sense because when you exercise, your heart requires more blood, but narrowed arteries slow down blood flow. Gender diversity is also considered, with 54 percent of test subjects being

78727

Betty Paulraj et al.,

male and 46 percent being female. The type of chest pain (cp), exercise-induced angina (exang), ST depression induced by exercise relative to rest (oldpeak), the slope of the peak exercise ST segment (slope), the number of major vessels (0-3) coloured by flourosopy (ca), and thalassemia (thal) are all directly correlated with the heart disease (target) in the above correlation plot. We also detect an inverse relationship between heart disease and maximum heart rate (thalch). Hence the influence of one single parameter with our estimated prediction has to be recorded in detail. This study is carried out in order to understand the significance of each and every factor which may or may not lead to a adverse situation which is many time un believable. Form the available information, it is evident that it can be either one parameter or the influence of one parameter at large combined with the other parameters which leads to the target. General observations can also be done as when the parameter age is considered, the most chances of getting the failure in heart is for the old people than the younger ones. The study observed is presented as fig 2 To further identify the correlation between the parameters the following graph has been plotted. The correlations between the major factors and their percentage of impact towards the Heart disease can be seen. This is mainly done to understand if there is positive or negative correlation between them we have a smaller pairplot with only the continuous variables. As presented in the previous section of this paper, the age factor is primarily considered and presented in detailed. The correlation plot between the age and the heart rate is depicted below in fig 3 From the fig we can say that the people have higher impact towards heart diseases as the age increases. This is again a study inferred from the data samples available . This is subject to be different for different sample size and the parameters. Similarly the inferences varies according to various factors . Each parameter has its significant impact towards the health of the heart. The influence of age alone is presented in fig 3

RESULTS AND INFERENCES

The experiments were carried out with the machine learning techniques and the deep learning techniques. The experimental evaluations were done and the observations were presented. The measurement in terms of Accuracy, Cross Validation Score and the ROC_AUC score were evaluated. The K observations of K neighbor algorithm is presented in fig 4 The accuracy obtained is 81.52 % . The cross validation score is 89.52% and the ROC_AUC is 81.36 The support Vector classifier(SCV) is performed to which resulted with the accuracy of 83.15%, The Cross validation score is 91.68% and the ROC_AUC score is obtained as 82.97 % The Random Forest classifier is performed to which resulted with the accuracy of 82.61%, The Cross validation score is 92.64% and the ROC_AUC score is obtained as 82.41 % The Decision Tree classifier is performed to which resulted with the accuracy of 79.35%, The Cross validation score is 79.13% and the ROC_AUC score is obtained as 79.22 % The Gradient Booster classifier is performed to which resulted with the accuracy of 83.70%, The Cross validation score is 92.08% and the ROC_AUC score is obtained as 83.61 % The AdaBoost classifieris performed to which resulted with the accuracy of 84.78%, The Cross validation score is 90.09% and the ROC_AUC score is obtained as 84.77 % The Gaussian Naïve Based classifieris performed to which resulted with the accuracy of 85.87%, The Cross validation score is 91.36% and the ROC_AUC score is obtained as 85.75 % The XGBoost classifieris performed to which resulted with the accuracy of 84.24%,

The Cross validation score is 91.93% and the ROC_AUC score is obtained as 84.13 % The results inferred from various classifier were presented in Table 1. The measurement such as accuracy, cross validation score and the ROC_AUC scores were presented in Table. After successfully establishing the relationship between the influencing factors studies for heart failure prediction in the UCI data set. we have implemented machine learning algorithms like Random Forest, Decision Tree, Gradient Boosting, ADA Boosting, Naive Bayes, Support Vector, XG Boosting. From the said models the following observations are made The metrics used for the evaluation are Precision, CVS-score, Accuracy and Recall and ROC-AUC Score. These are the major evaluation metrics. These are applied to the sample dataset and the observations are tabulated in table 4.1. The classification accuracy shown in the above chart shows that the Naive Bayes model is getting the best precision value the 85% accuracy of is the maximum amongst all, Feature Importance provides a score that indicates how helpful each feature was in our model. The higher the Feature Score, the more that feature is used to make key decisions & thus the more important it is. so from the above image we can say that the chest pain, thalach level, no of major vessels colored by fluoroscopy, and oldpeak values

Betty Paulraj et al.,

are the most important factors to classify that the target have the heart disease or not, while fasting blood sugar, resting ecg, and sex of the target does not effect the prediction that much. Moreover, we haven't considered the lifestyle parameters here which also have a major effect on the health of the heart, like the habit of smoking and drinking alcohol. The accuracy of the prediction can vary if we include these parameters as well as exercise habits. The ultimate motive towards this study is to understand the influencing parameters that causes the cardiac arrest. The most common methods of prediction are explained in the paper. The findings as per the results obtained in the previous studies were also presented

CONCLUSION

This paper focused on the dataset of 303 individual with the factors influencing the heart failure prediction. The most efficient and the appropriate algorithm for the heart failure prediction is experimentally proved and presented. The subsections are planned as the data set description, we have chosen from the UCI database and the 14 major influencing parameters are studied. The influencing parameters were analyzed and the prediction made were also compared . The effectiveness of the cardio vascular failure prediction and the works carried out with that data is analyzed and the implementation of the most commonly suggestion methods are visualized.

ABSTRACT

A field experiment was conducted during May - September 2022 at the Experimental Farm of Agronomy, Annamalai University, Annamalai Nagar, Tamil Nadu to study the effect of plant growth regulators and nutrients on growth and yield of transplanted rice under wetland ecosystem. The rice variety ADT - 43 is used as test variety for this experiment. The experiment was laid out in RBD with ten treatments and replicated thrice with ten treatments it including foliar Spray of plant growth regulators viz., Gibberellic acid, Triacontanol, Sodium para - nitrophenolate and macro nutrients like DAP, KCl and NPK (19:19:19). Among the treatments, gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) + 2% DAP + 1% KCL (40 and 50 DAT) significantly recorded the higher Plant height (58.95, 89.15,101.43 cm), chlorophyll content index (42.75), number of tillers m⁻² (421.03 m⁻²), panicle length (27.67 cm), grain yield (6485.25 kg ha⁻¹), NPK uptake (137.42, 26.58 and 144.78 kg ha⁻¹). However, least available post-harvest soil nutrients of NPK (226.65, 18.09 and 235.11 kg ha⁻¹) was registered in this treatment.

**Dhayanethi et al.,****Keywords:** Rice, Foliar application, GA₃, DAP, KCL, chlorophyll content index, NPK uptake.

INTRODUCTION

Rice (*Oryza sativa* L.) is the most important and extensively grown crop in tropical and subtropical regions of the world. It is the staple food for over 70 per cent of the world's population and it is extremely important for country's food and livelihood security. Globally, the output of rice has increased by more than thrice between 1961 and 2019, from 215 million tonnes to 75 million tonnes, with Asia accounting for most of the growth. More than 80% of the world's rice is produced in seven Asian nations viz., China, India, Indonesia, Bangladesh, Vietnam, Myanmar and Thailand. The current growth rate in rice production, standing at 0.36%, falls significantly below the population growth rate of 1.63% per annum. This disparity raises concerns as the decelerating trend in production and yields needs to be reversed to meet the escalating demand. Thus, the adoption of new technologies becomes imperative to boost rice production and address the needs of a rapidly increasing population. Consequently, there is an urgent requirement to enhance rice productivity through improved agronomic practices, one of which includes the foliar application of plant growth regulators (PGRs) and NPK fertilizers to fully exploit the genetic potential of rice crop. Plant growth regulators (PGRs) offer great potential, but their effective use demands meticulous planning. This includes establishing the optimal concentration, timing of application, and appropriate seasons. Nutrients are also crucial for plant metabolism, growth, and development, leading to increased biomass production and better yields. Hence, a strategic approach is vital for maximizing the benefits of both PGRs and foliar nutrients (Kunjammal and Sukumar, 2020). Gibberellic acid, triacontanol, and sodium para - nitrophenolate are well-known for their various roles in promoting plant growth and development by Ramesh *et al.* (2019b) and Suseendran *et al.* (2020). NPK fertilizers applied through aerial portion play a pivotal role in increasing the grain yield in many crops (Solanki *et al.*, 2022). Hence the field experiment was conducted with the objective to find out the effect of various plant growth regulators and nutrients on chlorophyll content index (SPAD value) and nutrient uptake of transplanted rice.

MATERIALS AND METHODS

A field experiment was conducted during May - September (2022) at the Agronomy Experimental Farm, Faculty of Agriculture, Annamalai University, Annamalai Nagar, Tamil Nadu. The experimental farm was geographically located at 11° 24' N latitude and 79° 44' E longitude and at an altitude of +5.79 m above mean sea level (MSL). The soil is clay loam, low in available nitrogen 249.22 kg ha⁻¹, medium in available phosphorus 19.78 kg ha⁻¹ and high in potassium 334.94 kg ha⁻¹. The promising rice variety ADT 43 was chosen for the study. The experiment was laid out in randomized block design and replicated thrice with ten treatments including foliar application of plant growth regulators (20 DAT) and nutrients (40 and 50 DAT) viz., T₁ - Control (water spray), T₂ - Gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT), T₃ - Triacontanol 0.05% EC @ 250 ml ha⁻¹ (20 DAT), T₄ - Sodium para -nitrophenolate 0.3% SL @ 2.5 L ha⁻¹ (20 DAT), T₅ - T₂ + 2% DAP + 1% KCL (40 and 50 DAT), T₆ - T₂ + 2% NPK (19:19:19) (40 and 50 DAT), T₇ - T₃ + 2% DAP + 1% KCL (40 and 50 DAT), T₈ - T₃ + 2% NPK (19:19:19) (40 and 50 DAT), T₉ - T₄ 2% DAP + 1% KCL (40 and 50 DAT) and T₁₀ - T₄ + 2% NPK (19:19:19) (40 and 50 DAT). The rice crop was fertilized with the recommended dose of fertilizer (120:40:40 kg of N, P₂O₅ and K₂O ha⁻¹) in the form of Urea (46% N), SSP (16% P₂O₅) and MOP (60% K₂O). N and K₂O were applied in four equal splits viz., basal, tillering, panicle initiation and heading stages of rice. The entire dose of P₂O₅ was applied basally before transplanting. Twenty one days old rice seedlings were transplanted @ 2 seedlings hill⁻¹ with a spacing of 15 × 10 cm. Growth regulators viz. gibberellic acid, triacontanol and sodium para - nitrophenolate were foliar spraying during morning hours at 20 DAT and nutrients like 2% DAP+ 1% KCL and 2% NPK foliar spray at 40 and 50 DAT with the help of hand operated knapsack sprayer. The SPAD values were recorded as described by Peng *et al.* (1993) using the chlorophyll meter (SPAD - 502, Soil Plant analysis Development Section, Minolta Camera Co. Ltd., Japan). The readings were recorded on the third leaf from the top of five randomly chosen tagged plants at flowering stage of the crop. Five sample plants in each plot were

**Dhayanethi et al.,**

selected at random and peg marked permanently for recording biometric observations. The experimental plots were harvested leaving the border rows to avoid border effect. The plant sample used for dry matter estimation at harvest were chopped and ground into fine powder by using a willey mill and used for chemical analysis of N, P₂O₅ and K₂O. The percentage of nutrients in the plants was multiplied with crop biomass for the uptake of nutrients and expressed in kg ha⁻¹. The analysis was carried out following standard procedures as given in Table 1a. After the harvest of crop, post-harvest soil samples drawn from each plot were air dried and gently beaten with a wooden mallet and sieved through 2 mm nylon sieve mesh. Then the soil samples were analyzed and expressed in kg ha⁻¹. The analysis was carried out following standard procedures as given in Table 1b.

RESULT AND DISCUSSION

Plant height

Foliar application of gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) along with 2% DAP + 1% KCL (40 and 50 DAT) (T₅) recorded the higher plant height of 58.95, 89.15 and 101.43 cm at 30, 60 DAT and harvest stage. One possible explanation for this phenomenon could be that applying gibberellins to the leaves enhances cellular processes such as division, enlargement, and elongation. Consequently, this leads to increased plant height reported by Nataraj *et al.* (2016). Additionally, the mentioned plots were supplemented with nutrients via foliar feeding, including DAP and KCL, which improved the accessibility of both micro and macro nutrients during the entire growth cycle of the crops. This likely facilitated enhanced translocation into the plants without any wastage, leading to improved photosynthetic activity and ultimately resulting in a notable increase in plant height. Similar findings were reported by Deepak kumar *et al.* (2018). This was statistically followed by application of gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) along with 2% NPK (19:19:19) (40 and 50 DAT) (T₆). The lowest plant height was observed under control (T₁) which recorded the plant height of 48.02, 69.92 and 78.97 cm at 30, 60 DAT and harvest stage, respectively.

Chlorophyll content index (SPAD value)

Foliar application of gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) along with 2% DAP + 1% KCL (40 and 50 DAT) (T₅) recorded the highest chlorophyll content index value of 42.75. The increase in chlorophyll content might be due to the combined effect of growth hormone and macronutrients. Gibberellic acid and nutrients in activating the enzyme for the synthesis of pigments, cell division and morphogenesis, protecting the chlorophylls from degradation by chlorophyllase enzyme and also direct absorption of nutrients as constituents of chlorophylls. Addition of nitrogen increased chlorophyll formation since chlorophyll contains nitrogen as one of its constituents and nitrogen prevented chlorophyll degradation and leaf senescence recording higher chlorophyll content (Mahmoodi *et al.*, 2020). Besides, macronutrients received in this treatment it helps to synthesis of protein in plants get accelerated, which is indirectly exhibited by increase in leaf chlorophyll index. Similar result was reported by jothi *et al.* (2017). The next best in ranking of foliar application of gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) along with 2% NPK (19:19:19) (40 and 50 DAT) (T₆) with SPAD value of 40.84. The least SPAD value of 29.69 was observed in the control treatment (T₁).

Number of tillers m⁻²

The maximum number of tillers increased by foliar application of gibberellic acid 40% WSG @ 20 g/ha (20 DAT) along with 2% DAP + 1% KCL (40 and 50 DAT) (T₅) recorded the highest number of tillers m⁻² of 421.03. This could be attributed to the external use of gibberellic acid could potentially enhance the development of axillary buds, leading to the emergence of multiple shoots from individual nodes, thereby increasing the number of tillers per square meter as reported by Geeta Pandey *et al.*, (2017). In addition, application of NPK fertilizers could enhance nutrient accessibility within plant tissues and uptake from the soil, potentially boosting photosynthetic rates and facilitating efficient transfer of photosynthates from the source to the shoot, ultimately leading to an increased number of tillers reported by Ajay kumar *et al.* (2020). The next best was foliar application of gibberellic acid 40% WSG @ 20 g/ha (20 DAT) along with 2% NPK (19:19:19) (40 and 50 DAT) (T₆) with number of tillers m⁻² of 408.15. The lowest number of tillers m⁻² of 314.99 was registered under control (T₁).

**Dhayanethi et al.,****Panicle length and grain yield**

Application of gibberellic acid 40% WSG @ 20 g/ha (20 DAT) along with 2% DAP + 1% KCL (40 and 50 DAT) (T₅) significantly recorded higher panicle length 27.67 cm and grain yield of 6485.25 kg/ha. might be attributed to application of GA₃ increase the biomass production at early stages of crop growth leading to higher LAI and photosynthetic rate resulting in better performance as evident by number of tillers m⁻² and panicle length which leads to registered maximum grain yield of rice (Ramesh *et al.*, 2019a). Furthermore, foliar application of N, P and K increased the rice grain yield and straw yield owing to an increase the higher nutrient uptake resulting in higher growth attributes (plant height, tiller production and LAI) and yield attributes (number of panicles m⁻², panicle length and filled grains per panicle). These results are in conformity with Akchaya *et al.* (2022). This treatment was followed by the application of gibberellic acid 40% WSG @ 20 g/ha (20 DAT) along with 2% NPK (19:19:19) (40 and 50 DAT) (T₆) with panicle length of 26.34 cm and yield of 6260.42 kg/ha. The least panicle length of 18.49 cm and grain yield of 4549.06 kg/ha were recorded under water spray (T₁).

Nutrient uptake

Among the various treatments, foliar application of gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) along with 2% DAP + 1% KCL (40 and 50 DAT) (T₅) recorded significantly higher values of nutrient uptake of 137.42, 26.58 and 144.78 kg ha⁻¹ of N, P and K, respectively. The possible reason could be attributed to supplemental nutrition through foliar spray along with plant growth regulators encouraged proliferation of root system resulting in better absorption of water and nutrients from deeper layer and consequently resulting in higher DMP, which have directly reflected on higher NPK uptake. This was in accordance with the findings of Sandhya Rani *et al.* (2014). The next higher nutrient uptake treatment is foliar application of gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) along with 2% NPK (19:19:19) (40 and 50 DAT) (T₆) with the nutrient uptake of 132.65, 25.52 and 139.61 kg ha⁻¹ of N, P and K, respectively. The least values of nutrient uptake of 101.25, 17.02 and 109.20 kg ha⁻¹ of N, P and K were recorded under control (T₁).

Post harvest soil nutrient status

Among the various treatments, control (T₁) recorded the highest post harvest soil available N, P and K of 238.75, 22.56 and 263.31 kg ha⁻¹, respectively. This might be due to lower DMP and least uptake of nutrients registered in this treatment resulting in higher post harvest soil available NPK Status at end of the experimentation. Similar result was reported by Senthikumar (2015). The lowest post harvest soil available N, P and K of 226.65, 18.09 and 235.11 kg ha⁻¹ noticed under the foliar application of gibberellic acid 40% WSG @ 20 g ha⁻¹ (20 DAT) along with 2% DAP + 1% KCL (40 and 50 DAT) (T₅). This could be attributed to higher DMP and maximum uptake of NPK recorded under this treatment, which leads registered lower values of post-harvest soil available nutrient status in this treatment. Similar results were obtained by prakash *et al.* (2015) and Priyanka Sanwal *et al.* (2023).

CONCLUSION

Based on the field experimental results, it can be concluded that foliar application of gibberellic acid 40% WSG @ 20 g/ha (20 DAT) along with 2% DAP + 1% KCL (40 and 50 DAT) had registered the higher Plant height, chlorophyll content index, number of tillers m⁻², panicle length, grain yield, NPK uptake. However, least available post-harvest soil nutrients of NPK were registered in this treatment. Therefore, for future thrust it can be included that foliar spray of plant growth regulators and micronutrients, along with organic manures, may be studied in transplanted rice cultivation.

ABSTRACT

In recent decades, the synthesis of aryl and hetero-aryl ketone compounds via C-H activation technology has become an important field of research over traditional cross-coupling reactions due to its versatile nature, a broader range of availability of substrates, higher atom and step economy. In this vein, a number of acylation strategies have been developed by activating inert C-H bond of the substrate. Despite many merits of the C-H bond activation technology, the major demerits of this method is the inertness of the C-H bond. Therefore to cleave the C-H bond, sometimes harsh reaction conditions have been applied which limits sustainability of those protocol. Henceforth, the development of a milder reaction condition is always remain first priority to the researches. This review article mainly focused on the synthetic and mechanistic aspect of acylation reactions which undergoes almost at room temperature via C-H bond activation process.

Keywords: Acylation, C-H functionalization, Sustainability, Ambient condition, Photoredox catalyst

INTRODUCTION

Aryl and hetero-aryl ketones are an important class of organic compound found in many natural products, pharmaceuticals, functional materials and in agrochemical industries [1]. Due to its high importance and growing demand, the development of a novel synthetic protocol for the synthesis of aryl and hetero-aryl ketones from readily available inexpensive starting material is an important field of research in synthetic organic chemistry. The well-known traditional route for the synthesis of aryl ketone is Friedel-Crafts acylation method by using $AlCl_3$ as a

**Manash Kumar Manna**

reagent. Although this is an efficient method, it offers the acylation product with poor regioselectivity in case of substituted arenes [2]. The oxidation of secondary aryl alcohol also can produce aryl ketones. However, this reaction is limited to specific structure of the substrate. Many functional groups are also incompatible under highly oxidizing condition [3]. To overcome the regioselectivity and limited functionality issue, researchers have developed transition metal catalyzed cross-coupling methods for the synthesis of aryl and hetero-aryl ketones [4]. Although by applying transition metal catalyzed cross-coupling reaction the synthesis of aryl ketones have been achieved successfully with excellent regioselectivity, few major drawbacks still persist. For the transition metal catalyzed cross-coupling reaction, some prefunctionalized starting materials are always required which increases the number of steps and limits its synthetic utility. In recent few years, transition metal catalyzed C-H activation method has emerged as an exclusive alternative over traditional cross-coupling reactions for the synthesis of functionalized molecules with high level of regioselectivity and a broad range of substrate scope [5]. The major advantage of C-H activation method over cross-coupling method is that no prefunctionalization steps are involved to get the substrate which is required for coupling reactions. In C-H activation process, the incorporation of transition metal catalyst to the substrate is fully controlled by a coordinating group present on the substrate. Therefore, the number of steps involved in prefunctionalization steps are reduced and the atom economy increases. Shortly, researchers have developed several transition metal catalyzed acylation protocols of aromatic or hetero-aromatic substrates by using several acylation precursor like α -oxoacids, α -oxoaldehydes, aldehydes, alcohols, amines etc. via C-H activation process [6]. Although an enormous effort has been made for the development of a useful and practical method for acylation in the field of C-H activation, few limitation still persist. The activation of an inert C-H bond is a high energetic process. Therefore, most of the C-H bond functionalization reaction occurs at elevated reaction temperature. Under these harsh reaction condition, some sensitive functional groups become reactive. Thus, the development of mild reaction condition for the acylation is in high demand. Recently, researchers have found that by using highly reactive substrates and catalyst the C-H activation reaction can be achieved at ambient temperature. In this vein, some reports have been come out for the acylation of aromatic and hetero-aromatic substrates in almost ambient condition by modifying the reaction condition such as by using reactive catalyst, strong coordinating ligands, effective solvents and installing a powerful directing group to the substrate. In this article, all these reports have been summarized carefully for the benefit of researchers and for the enrichment of academic knowledge.

Regioselective Acylation of Aryl and Hetero-aryl Compounds

For the development of acylation reaction, palladium(II) catalyst has been widely used for the activation of C(sp²)-H bond of aryl, hetero-aryl and olefin substrate. In this regards, directing group plays a crucial role for the regioselective metalation to the substrate. The general mechanism for the palladium catalyzed acylation follows three distinct fundamental steps. First, an aryl palladium(II) intermediate **I** is formed through the regioselective activation of C-H bond. Subsequently, The oxidative addition of an acyl group to the aryl palladium(II) intermediate **II** to form Pd(III) or Pd(IV) intermediate is involved in the second step. A reductive elimination process to produce the aryl ketone is involved in last step (**Scheme 1**). Thus, palladium(II) catalyst helps to incorporate an acyl group to the substrate exclusively at the *ortho*-position to a directing group.

Palladium(II)-Catalyzed C-H Bond Acylation

As palladium(II) is emerged as an efficient catalyst for the C-H activation, a number of significant efforts have been made for the development of the acylation reaction at ambient temperature by using palladium(II) as a catalyst. Thus, some reports have come out by modifying the catalytic system and reaction condition over the past few years. All these recent reports have been recorded in this section. In the year 2015, the Zhou group reported a palladium-catalyzed *ortho*-acylation of acetanilides via C-H bond activation by using inexpensive benzyl alcohol as acylating precursor under aqueous condition at 40°C [7]. During the optimization of the reaction condition, they discovered that the addition of a catalytic amount of TFA is essential for this reaction which increases the yield of the reaction. A wide variety of differently substituted acetanilide and benzyl alcohols were tested under the optimized reaction condition which successfully produces the desired *ortho*-acylation product in good yield. Also, it has been observed that electron donating substituents present on both acetanilide and benzyl alcohol gives better yield of the desired product. Based on the literature reports and control experiments, a plausible mechanism for this acylation reaction

**Manash Kumar Manna**

has been proposed. It reveals that in this transformation TBHP acts as an oxidizing agent. It initially oxidizes benzyl alcohol to aldehyde in the reaction medium and further generates acyl radical from aldehyde. A TEMPO trapping experiment supports the generation of the acyl radical. On the other hand, Palladium(II) catalyst in presence of TFA additive undergoes facile electrophilic *ortho*-palladation with acetanilide and generates bimetallic palladium cyclopalladated intermediate **III**. The generated Pd(II) intermediate **III** then reacts with the generated acyl radical to afford the Pd(III) or Pd(IV) intermediate **IV** through oxidative addition. Finally, a reductive elimination process produces the desired acylation product **3** and regenerates Pd(II) catalyst (**Scheme 2**). Shortley, a palladium-catalyzed carbamate directed decarboxylative *ortho*-acylation of anilines have been reported by the Wang group [8]. In this methodology, aryl α -keto acids have been used as a source of acyl group. These aryl α -keto acid in presence of an oxidant $(\text{NH}_4)_2\text{S}_2\text{O}_8$ generates the acyl radical which undergoes oxidative addition with aniline carbamate palladium(II) intermediate and furnishes acylation products. PTSA plays a crucial role in this transformation. It acts as a ligand to the palladium(II) catalyst which makes the catalyst more electrophilic. The carbamate directing group can be successfully removed from the product after the acylation reaction. Methyl carbamate can be removed easily under alkali hydrolysis reaction whereas ethyl and phenyl carbamate moieties also can be removed by using TBAF.

After the successful removal of directing group, *ortho*-acyl aniline compounds can be further derivatized to get many useful heterocycles. By treating **7** with toluene and NH_4OAc under KI-TBHP condition, 2,4-diphenylquinazoline **8** is obtained and by refluxing **7** with acetone under alkaline condition, 2-methyl-4-phenylquinoline **9** is obtained (**Scheme 3**). Palladium-catalyzed carbamate directed decarboxylative acylation of anilines The Jana group developed a novel synthetic transformation for the palladium(II) catalyzed acylation of 2-arylpyridine and pyrimidine substrates using α -oxoacids, α -oxoaldehydes or aldehydes as a source of acyl group via C-H activation at room temperature [9]. During the optimization of the reaction condition and detailed control experiments, they have realized that the solvent MeCN plays a vital role in this transformation. Being a solvent as well as strong coordinating ligand, MeCN readily coordinates with palladium(II) catalyst and turns it highly electrophilic which undergoes *ortho*-metallation with respect to directing group at room temperature. The used reagents α -oxoacids, α -oxoaldehydes or aldehydes generates acyl radical in presence of stoichiometric amount of $\text{K}_2\text{S}_2\text{O}_8$ or aqueous TBHP respectively (**Scheme 4**). A palladium catalyzed sulfoximine group directed *ortho*-acylation of *N*-sulfoximine benzamides have been reported by the Guin group [10]. In this reaction methodology, aryl α -oxoacids in presence of $(\text{NH}_4)_2\text{S}_2\text{O}_8$ generates the acyl radical which readily undergoes oxidative addition with the aryl-palladium(II) intermediate and produces the desired product through a subsequent reductive elimination step. A wide number of functional groups are tolerated under the reaction condition and both electron donating as well as withdrawing groups present on both of the substrate are able to produce the desired product in good yield.

The sulfoximine directing group can be easily removed from the product under acidic condition at higher temperature which upon hydrolysis produces 2-aryl benzoic acid **15**. The acylation product can be directly converted to many important heterocycles by treatment with appropriate reagents (**Scheme 5**). In the year 2016, the Luo group reported a palladium(II) catalyzed decarboxylative *ortho*-acylation of *N*-nitrosoanilines **20** by using aryl α -oxoacids at room temperature [11]. Here, a nitroso group acts as an efficient directing group which directs the Pd(II) catalyst to incorporate exclusively at the *ortho*-position of the substrate via C-H bond activation. A wide variety of *N*-nitrosoaniline substrate containing a variety of functional groups are well tolerated under the optimized reaction condition. Although the mechanism of the reaction is not much clear to the authors, based on some control experiments and literature reports they have proposed a plausible mechanism for the reaction. The reaction initiates through a nitroso group directed *ortho*-palladation step which leads to form a five membered palladacycle. Then, the palladacycle intermediate **VII** reacts with aryl α -oxoacids **5** forms the intermediate **VIII**. The intermediate **VIII** readily undergoes decarboxylation and forms the intermediate IX. Finally, the aryl ketones are obtained through a subsequent reductive elimination step. The generated Pd(0) catalyst is further reoxidized to active Pd(II) catalyst in presence of $(\text{NH}_4)_2\text{S}_2\text{O}_8$. To show the synthetic utility of this methodology, synthesis of few important heterocycles and drug molecules also have been demonstrated in this report (**Scheme 6**). A decarboxylative acylation of cyclic enamides can be achieved via palladium(II) catalyzed C-H activation by using aryl or hetero-aryl α -oxoacids [12]. The Duan group shows that in the presence of catalytic amount of DMSO in DMF solvent, this decarboxylative

**Manash Kumar Manna**

acylation can be achieved at room temperature. To understand the mechanism of the reaction, the standard acylation reaction was performed in the presence of a radical scavenger TEMPO but it unable to suppresses the formation of the desired product. This observation ruled out the formation of an acyl radical during the progress of the reaction. Although the mechanism of the overall reaction is not completely clear, a plausible mechanism was proposed for the reaction based on literature reports. The proposed mechanism shows that Pd(II)/Pd(0) catalytic steps are involved in the formation of acylation product. A combination of $K_2S_2O_8$ and Ag_2O are used as an additives which helps in decarboxylation process and the regeneration of Pd(II) catalyst to continue the catalytic cycle (**Scheme 7**).

Photoredox/Palladium(II)-Catalyzed C-H Bond Acylation

Visible light photoredox catalysis has emerged as one of the most powerful tool in which many synthetic transformation can be successfully performed by avoiding harsh reaction conditions [13]. Recently, by merging transition metal catalyzed C-H activation and visible light photoredox catalysis a vast number of regioselective functionalizations have been achieved under ambient reaction condition [14]. All of the recent reports of visible light driven dual catalysis for the synthesis of aryl ketones have been discussed in this section. In the year of 2015, the Wang group reported a palladium-catalyzed decarboxylative *ortho*-acylation of acetanilides with α -oxocarboxylic acids by merging the visible light photoredox catalyst with palladium(II) catalyst at room temperature [15]. In this method, the *ortho*-acylation reaction of acetanilides proceeds through a Pd(II)/Pd(IV) catalytic cycle. During the exhaustive screening of the catalytic condition, they have found that an organic dye Eosin Y is more suitable as a photoredox catalyst for this transformation to get the satisfactory yield of the product. After performing few control experiment in support of the catalytic transformation, they have proposed a mechanistic cycle for this acylation reaction. At first, the photoredox catalyst Eosin Y excited to its high energy state (Eosin Y)* under green LED irradiation. The excited photoredox catalyst (Eosin Y)* accept an electron from arylglyoxylic acid **5** and oxidized it. The oxidized arylglyoxylic acid **XIII** readily generates benzoyl radical by releasing CO_2 . The generation of benzoyl radical has been proved by a TEMPO trapping experiment. Subsequently, The generated (Eosin Y) \cdot^- transfer an electron to molecular oxygen and produces a superoxide radical anion ($O_2^{\cdot-}$) which is confirmed by ESR spectroscopy. On the other hand, the catalytic cycle for palladium catalyst initiates through the *ortho*-palladation of acetanilide substrate via C-H activation.

Then, the coordinated Pd(II) intermediate **XIV** reacts with the acyl radical and generates Pd(III) intermediate **XV**. At this stage, the Pd(III) intermediate **XV** further gets oxidize to Pd(IV) intermediate **XVI** by transferring an electron to superoxide radical anion ($O_2^{\cdot-}$). Subsequently, a reductive elimination furnishes the desired *ortho*-arylation product and the active Pd(II) catalyst. In this transformation no external metal oxidants are required as molecular O_2 acts as an oxidant to palladium catalyst which is an advantage for this methodology (**Scheme 8**). Shortly, the Wang group further reported a C-H acylation of azo- and azoxy benzenes using α -keto acids by merging visible-light photocatalysis and palladium catalysis at room temperature [16] (**Scheme 9**). The optimization condition of this transformation shows that 10-methyl-9-(2,4,6-trimethylphenyl)acridinium perchlorate salt **PC-1** is the suitable photoredox catalyst which gives better yield of the acylation product. A numerous variety of aryl and few hetero-aryl α -keto acids were tested under the optimized reaction condition which produces the desired arylation product in moderate to good yield. Based on the detailed mechanistic study of this transformation, they have reported that the catalytic cycle proceeds through a similar path as shown in **Scheme 8**. As many heterocyclic compounds have hues medicinal values, the functionalization of heteroaromatic compounds are also an important field of research to synthetic organic chemist [17]. Generally, many heteroaromatic compounds have an electron rich heteroatom which can readily coordinates with the transition metal catalyst and undergoes functionalization in highly regioselective manner. Among them, most frequently used heterocycles are N-containing heterocycles which acts as an excellent directing group [18]. Recently, Sharma *et. al* reported a pyrimidine group directed C-2 acylation of indoles in batch and flow process by merging ridium visible light photoredox catalyst and palladium-catalyst via C-H activation at room temperature [19]. It has been observed that performing the reaction in a continuous-flow micro reactor the catalyst loading and reaction time both can be reduced. In this process, the yield of the product obtained is higher in compare with common batch process (0.5 mole % vs 2 mole % and 2 h vs 20 h). Simultaneously, a similar observation was reported by the Jana group [20]. They showed that the directed C-2 acylation of indole can be carried out at room

**Manash Kumar Manna**

temperature using a combination of ruthenium visible light photoredox catalyst and palladium catalyst under blue LED irradiation. In both of the methodology, a wide variety of aromatic as well as aliphatic aldehyde and indole substrate are able to furnish the corresponding desired product in excellent yield. Here aldehyde acts as acyl group surrogate. A TEMPO radical capture experiment proves that acyl radical generates during the course of the reaction. Jana *et. al* shows that indole side chain containing amino acid tryptophan can be successfully acylated at C-2 position under the optimized reaction condition. A similar plausible mechanistic path has been proposed for both of the method. The C-H activation and acylation reaction undergoes through Pd(II)/Pd(IV) catalytic cycle. In presence of light, Ir³⁺ or Ru²⁺ photoredox catalyst excited to Ir^{3+*} or Ru^{2+*} respectively. Subsequently, a single electron transfer to TBHP produces *tert*-butoxy radical which helps to generate the acyl radical. The generated acyl radical in combination with the intermediate **XVII** generates the intermediate **XVIII**. Then the intermediate **XVIII** has been reoxidized to form a new intermediate **XIX**. Finally, intermediate **XIX** upon facile reductive elimination produces the desired acylation product (**Scheme 10**). Shortly, Xia *et. al* reported acylation of 2-aryl pyridine substrate by merging photocatalyst and palladium catalyst using aldehydes as an acyl precursor [21]. After screening several photocatalyst, they found that phenanthraquinone (PQ) is ideal for this transformation. The detailed mechanistic investigation suggest that under blue LED irradiation phenanthraquinone (PQ) generates acyl radical through a hydrogen atom transfer (HAT) process. A stoichiometric amount of Ag₂O is used as an oxidant in this reaction which successfully oxidizes the generated PQ-H to PQ and Pd(II) intermediate to Pd(IV) intermediate respectively (**Scheme 11**).

CONCLUSION

Despite the latest developments, the continuous progress of C-H bond activation technology is the most exciting area of research in recent time as it provide alternative methods for the challenging organic transformations under mild reaction conditions. Although, initially harsh reaction conditions were followed for the acylation reaction, in recent years development of mild reaction conditions for the regioselective acylation have been achieved by modifying the catalytic system, reagent or substrate. However, further development is require in this field to make this field more attractive and enriched. For the acylation reaction mostly expansive palladium salts are used. It could be a great improvement, if palladium salts can be replaced by an inexpensive salts of 3d transition metals such as iron, cobalt or nickel. Also in some cases, stoichiometric amount of expansive metal salts are used which can be substituted by inexpensive reagents. Recently, the combination of transition metal catalyst with photoredox catalyst has opened a new direction in this regards which able to reduce the reaction temperature as well as replace other stoichiometric amount of oxidizing agents. This area should be more focused to develop more sustainable process for acylation. This review article will help the scientific community for better understanding regarding all the efforts have been made for the development of acylation reaction under ambient condition. It will also inspire them to engage themselves in this exciting field of research for the construction of complex molecular framework and pharmaceutical compounds.

ABSTRACT

Glucose is the molecule that the cells of the human body use as an energy source. Maintaining a steady state level of glucose in the blood is critical in the human body. This paper presents the modeling for regulation of blood glucose concentration by using negative feedback physiological control system. Mathematical representation for the regulation of glucose in the blood is given in the paper along with the SIMULINK model. Different results that represent the steady state analysis of glucose regulation under normal condition, Type 1 diabetes and Type 2 diabetes as a part of glucose tolerance test. The primary objective of the paper is to develop a mathematical model for blood glucose regulation and simulate glucose tolerance tests under various conditions using MATLAB Simulink. This model aims to Understand glucose homeostasis, Study diabetes dynamics, Evaluate treatment strategies. The methods encompass mathematical modeling, simulation using MATLAB Simulink, parameterization, scenario-based simulations, visualization, analysis, and interpretation to investigate blood glucose regulation dynamics under normal and diabetic conditions. Through simulation, the paper finds that different types of diabetes lead to distinct patterns in glucose and insulin concentrations during glucose tolerance tests. For instance, in Type 1 diabetes, there is a reduction in the sensitivity of insulin response to glucose, resulting in altered glucose and insulin profiles compared to normal conditions. Similarly, Type 2 diabetes, characterized by reduced insulin sensitivity in tissues, exhibits further variations in glucose and insulin concentrations during the test. By adjusting specific parameters in the model corresponding to insulin production, insulin sensitivity, and glucose utilization, the paper demonstrates how changes in

Kapilkumar Dave and Vivek Rane

these parameters affect glucose and insulin dynamics. The paper explores the application of the model to simulate glucose tolerance tests for different types of diabetes, including Type 1 and Type 2. By adjusting parameters related to insulin response and glucose uptake, the model can mimic the physiological conditions characteristic of these different types of diabetes. This application of the model to study diverse pathological conditions adds novelty to the research.

INTRODUCTION

Glucose is the main energy source for most organisms. The human body makes glucose from food and transports it to cells via the bloodstream. Glucose is measured in milligrams per deciliter of blood. The average healthy human has about 60 dL (6 L) of blood and a between-meals blood glucose level of about 100 mg/dL. The amount of glucose in the blood varies with food intake and liver's breakdown of fat to make glucose. Glucose release is measured in mg/min. Blood glucose level is usually regulated by two hormones: insulin and glucagon, secreted by the endocrine pancreas. The main function of the pancreas is to produce insulin, digestive enzymes, and other hormones. The secretion of insulin is controlled by the glucose concentrations in the blood stream. As the level of glucose rises in the blood, the insulin levels also increase. The two hormones insulin and glucagon are reciprocal in their overall action and are secreted appropriately in most circumstances to keep the blood glucose concentration within the normal range. Fig. 1 represents the diagram of insulin and glucose regulation. As blood glucose rises, insulin is secreted in the pancreas, it is circulated through out the body, glucose is taken up by cells and blood sugar decreases. With a decrease in blood sugar, the pancreases secrete glucagons to breakdown glycogen in the liver and release glucose into the blood. This process maintains homeostasis in the body in reference to blood glucose levels. The model of the blood glucose regulation is represented mathematically by using mass balance equation along with the values of all the parameters in the normal condition. MATLAB SIMULINK blocks are used for the simulation of different normal and abnormal conditions and glucose tolerance test.

Regulation of blood glucose concentration

Negative feedback control system maintains constancy of blood glucose concentration. The total volume of blood and interstitial fluids is 15 liters in the normal adult. Steady state concentration of glucose is x mg ml⁻¹. To maintain the level of steady state glucose concentration x constant, the total inflow of glucose must equal to total outflow of glucose. Under normal circumstances, glucose enters in the blood through absorption from the gastrointestinal tract or through production from lever. Input flow rate of glucose is Q_L mg H⁻¹. There are three major ways through which glucose is eliminated from the blood. Fig. 2 represents the different systems which controls the steady state concentration of glucose.

Renal loss rate

When steady state concentration of glucose x is elevated beyond threshold θ glucose is excreted by the kidneys at a rate proportional to the gradient between x and θ :

$$\text{Renal loss rate} = \mu (x - \theta) \quad x > \theta \quad (1a)$$

$$= 0 \quad x \leq \theta \quad (1b)$$

Tissue utilization rate – insulin independent

Glucose leaves the blood to enter most cells through facilitated diffusion. In some tissues, the rate of glucose utilization depends only on the extracellular to intracellular concentration gradient.

$$\text{Tissue utilization rate – insulin independent} = \lambda x \quad (2)$$

Kapilkumar Dave and Vivek Rane

Tissue utilization rate – insulin dependent:

In some cells, insulin helps to stimulate the facilitated diffusion process. Glucose is taken up by the cells is proportional to x and the blood insulin concentration y .

Tissue utilization rate – insulin independent = $v x y$ (3)

In equation (1), (2) and (3), μ , λ and v are proportionality constant

Modeling of glucose regulatory system

Blood glucose mass balance

Input flow rate of glucose Q_L is equal to the summation of three outflows. Mass balance equation for blood glucose is:

$$Q_L = \lambda x + v x y \quad x \leq \theta \tag{4a}$$

$$= \lambda x + v x y + \mu (x - \theta) \quad x > \theta \tag{4b}$$

This equation shows nonlinearity in the form of product of x and y and thresholding nonlinearity at above and below θ . The relationship in equation (4a) and (4b) represents negative feedback control system. If Q_L is constant and increase in steady state concentration of glucose then corresponding decreases in blood insulin concentration y and vice versa. Insulin is produced by the pancreas at a rate dependent on the plasma glucose level. When x falls below a certain threshold Φ then mass balance equation for the blood insulin is:

$$\text{Insulin production rate} = 0 \quad x \leq \Phi \tag{5a}$$

$$= \beta (x - \Phi) \quad x > \Phi \tag{5b}$$

Insulin is destroyed through a reaction involving the insulin enzyme, at a rate proportional to the concentration of blood:

$$\text{Insulin destruction rate} = \alpha y \tag{6}$$

By combining equation (5a), (5b) and (6), the obtained equation shows steady state level of y to that of x in which insulin response to glucose is basically linear:

$$y = 0 \quad x \leq \Phi \tag{7a}$$

$$= (\beta / \alpha) * (x - \Phi) \quad x > \Phi \tag{7b}$$

Glucose tolerance test mass balance

Modeling needs to characterize mass balance of glucose in the following way:

$$C_G \frac{dx}{dt} = U(t) + Q_L - \lambda x - v x y \quad x \leq \theta \tag{8a}$$

$$C_G \frac{dx}{dt} = U(t) + Q_L - \lambda x - v x y - \mu (x - \theta) \quad x > \theta \tag{8b}$$

$U(t)$ represents the time-course with which external glucose is infused into the blood stream and C_G represents the glucose capacitance in the extracellular space. Equation states that net difference between the rate at which glucose is added to the blood and the rate at which it is eliminated equals the rate at which steady state concentration of blood x increases or decreases. Also, multiplication between x and y makes the equation non linear. Similarly, dynamic mass balance equation for insulin is:

$$C_I \frac{dy}{dt} = - \alpha y \tag{9a}$$

$$C_I \frac{dy}{dt} = - \alpha y + \beta (x - \Phi) \tag{9b}$$

C_I represents insulin capacitance of the extracellular space. The relationship among different parameters is used for the modeling purpose.

System parameter values

The parameter values used in the calculation are of the normal adult. The values are:

- $\theta = 2.5 \text{ mg/ml}$

**Kapilkumar Dave and Vivek Rane**

2. $\mu = 7200 \text{ ml / h}$
3. $\lambda = 2470 \text{ ml / h}$
4. $v = 139000 \text{ m U}^{-1} \text{ h}^{-1}$
5. $\Phi = 0.51 \text{ mg / ml}$
6. $\beta = 1430 \text{ mU ml mg}^{-1} \text{ h}^{-1}$
7. $\alpha = 7600 \text{ ml / h}$
8. $Q_L = 8400 \text{ mg / h}$

Simulation of the system

MATLAB SIMULINK is used for the simulation purpose. Figure 3 represents Simulink model developed for blood glucose concentration by using the relationship among above different mass balance equations. For the thresholding operator's θ and Φ saturation blocks are used with the lower and higher limit. Different Simulink blocks are used for making the model. Figure 4 shows the model is encapsulated into a subsystem block which only represents input and output by using different scopes.

Simulation result for glucose tolerance test

Parameter values of different conditions which are implemented for the simulation purpose are given in Table 1. For normal condition, steady state concentration of glucose is 0.81 mg / ml and insulin concentration are 0.055 mu / ml. Graph 1 represents glucose and insulin concentration. Type 1 diabetes is insulin dependent diabetes. This type can present by reducing the sensitivity of insulin response to glucose. This is done by reducing the value of β . Graph 2 represents this condition. Type 2 diabetes is non insulin dependent diabetes. The pancreas may make normal amount of insulin but there is a reduction in the ability of insulin to stimulate glucose uptake by the body tissues. In the mass balance equation, v is the constant which multiply with the product of x and y . The condition is demonstrated by reducing the value of parameter v . Graph 3 represents this condition. The blood glucose concentration has the higher peak value in Type 2 diabetes condition as compare to Type 1 condition, while both have a higher value than a normal condition. Insulin concentration is higher in Type 2 diabetes as compare to Type 1 and Normal condition. Graph 4 represents insulin concentration for all the conditions.

CONCLUSION

The statement highlights the utility of MATLAB Simulink for visualizing glucose tolerance test results under different conditions. It emphasizes the ease of use and flexibility of the tool, particularly in its ability to manipulate parameters and generate graphical presentations for comparison and analysis. Here's a breakdown of the key points: Visualization and Graphical Presentation: Simulink provides a graphical interface for designing, simulating, and analyzing dynamic systems, making it suitable for modeling physiological processes like blood glucose regulation. These visualizations aid in understanding the dynamics of glucose regulation and comparing different conditions. Parameter Manipulation: The paper adjusted parameters associated with insulin sensitivity, glucose uptake, or other physiological factors to simulate various conditions, including normal and abnormal states such as diabetes. Comparison and Analysis: The statement emphasizes the importance of comparing and analyzing glucose tolerance test results across different conditions. The paper result represents Simulink to conduct comparative analyses of blood glucose and insulin concentrations under normal physiological conditions and in pathological states like diabetes. The results are that way also confirmative with data [3]. This analysis helps in identifying differences and understanding the impact of various factors on glucose homeostasis.

ABSTRACT

In agriculture, soil physical properties are important factors that influence the crop productivity. A field experiment was conducted during early kharif season in the year 2020 in the farmer's land at Alangulam, Tenkasi district, Tamil Nadu, India, to study the effect of Farm Yard Manure (FYM), Goat Manure (GM) and Charcoal Manure (CM) on soil Physical properties and yield of onion. The experiment was laid out in a Randomized Block Design (RBD) with three replications. Soil amendments such as Charcoal Manure (CM), Goat Manure (GM) and Farm Yard Manure (FYM) and their combinations were added to the soil at different concentrations such as 8.5, 12.5 and 16.5 t ha⁻¹ and onion crop was transplanted within the treated soil and control. The soil samples were collected from all the treatments and analyzed after harvesting onion. In the present study Pearson's correlation analysis and Multiple Linear Regression Analysis (MLRA) were carried out to investigate soil physical properties which highly influence the crop productivity. Combination of FYM, GM and CM at 16.5 t ha⁻¹ produced the highest onion yield (4758 kg ha⁻¹) which was 68.4 % higher than the control (1500 kg ha⁻¹). Bulk Density (BD), Particle Density (PD) were decreased in the plots treated with manure compared to control. Physical properties such as Water Holding Capacity (WHC), Water Content (WC), Porosity (PO), Saturated Moisture (SM), Void Ratio (VR), Hydraulic Conductivity (HC), Permeability (PE) and Thermal Conductivity (K) were improved compared to control and had significant effect on onion yield. Correlation analysis showed high degree of positive correlation between yield and WHC, WC, SM, PO, HC, PE, PS. It was found that WHC, WC and SM had strong positive correlation with onion yield, shedding light on their importance in agricultural

**Subha and Jeyamangalam**

productivity. Regression modeling identified WHC and PE are the most important factors impacting onion yield. Specifically, soil texture and moisture content emerged as primary determinants of onion yield, highlighting the necessity for targeted soil management practices. These findings provide valuable insights for optimizing soil conditions to enhance onion yield, thereby aiding in the development of sustainable agricultural strategies.

Keywords: Soil physical properties, onion yield, correlation and regression analysis

INTRODUCTION

Onion (*Allium Cepa* L.) is identified as an important traditional vegetable crop that is the most widely cultivated species in India belonging to the genus *Allium* of Alliaceae. In onion plant, whole part is edible, from its green tubular leaves to its flowers and bulbs. Day by day the requirement for onion is increasing because of its health and medicinal benefits. It fight against many diseases like cancer, diabetic, heart attack and cold [1]. It plays major role in India's economic. India is the second largest producer of onion worldwide. Soils are the medium which provide all the nutrients, oxygen, and water needed for plant growth [2]. Repeated cultivation without the addition of adequate organic manure make the soil infertile. Awareness of soil health and environmental issues in agriculture promotes production of organic food which is emerging as an attractive source of rural income generation [3]. In order to meet the nutritional requirement of India's population, onion cultivation must be improved in a better way. The anxiety of providing food to such an enormous population, there should be replacement technology giving additional yield and diminish pollution. Many new methods were chosen to increase the yield and quality of onion but, inorganic fertilizer free farming is difficult to the farmers. Hence, the research was focused on standardization of organic manure for the yield. The shelf life of the produce was highly influenced by the organic inputs compared to the inorganic amendments. Sustainable use of soils necessitates the reduction or elimination of the use of chemical fertilizers to reduce soil and ground water pollutions [4]. Long term application of FYM significantly increased soil porosity compared with chemical fertilizer [5]. FYM is a valuable input to soil for higher crop production [6]. Using organic manure improves water holding capacity [7] and increases soil structure and root growth [8]. Correlation analysis is the statistical tool used to measure the degree to which two variables (X and Y) are linearly related to each other using Pearson's correlation co-efficient 'r'. Perfect linear correlation is attained, when $r=1$. Regression is used to forecast the nature of dependent variable (Yield) when the value of independent variable is known. Regression equation of yield with most important soil physical properties was set. Correlation analysis provides various linear relationship between BD, PD, WHC, WC, K, PE and onion yield. Bivariate regression is a technique that fits a straight line as close as possible between all the coordinates of two interval-ratio variables plotted on a two-dimensional graph to summarize the relationship between the variables.

MATERIALS AND METHODS

The field experiment was conducted in Alangulam, Tenkasi District of Tamil Nadu, India in the year 2020. The field lies in between 8.8646° N latitude and 77.4960° E longitude at an elevation of 128.26 meters. The onion variety chosen for cultivation was Nasikred N-53. The organic amendments chosen for the field experiment were Charcoal Manure (CM), Goat Manure (GM) and FarmYard Manure (FYM). Treatments of the study included T₁-CM, T₂-GM, T₃-FYM, T₄-CM+GM, T₅-CM+FYM, T₆-GM+FYM, T₇-CM+GM+FYM and T₈-CO-Control (didn't receive any manure). The experimental soil is sandy clay loam with WHC(23.665 %), slightly alkaline (pH-8.1) and organic carbon content (0.16 %). A total of 8 plots were chosen. Plots laid out in a completely randomized block Design (CRBD). Each plot size was 8 m x 5 m. The field was ploughed properly. Organic amendments applied to the soil at different concentrations such as 8.5, 12.5 (recommended dose) and 16.5 t ha⁻¹ respectively and mixed well with the soil manually one month before transplanting onion crops in the field. Sprinkler irrigation was used. The onion was harvested after it reaches physiological maturity. After harvesting onion, soil samples were collected from a depth of 0-30 cm, air dried passed

Subha and Jeyamangalam

through 2 mm sieve and tested for their physical properties. Using the test data statistical analysis was done. Soil physical properties such as Bulk Density (BD), Particle Density (PD), Water Holding Capacity (WHC), Water Content (WC), Porosity (PO), Saturated Moisture (SM) and Void Ratio (VR) were determined using Keen-Raczowski (KR) box method [9]. Thermal Conductivity (K) of soil was determined using Lee's disc method [10]. Hydraulic Conductivity (HC), Permeability (PE) and Porosity (PO) were measured using falling head permeameter method. SPSS software was used to figure out the correlation and also to build up regression equation using Analysis Of Variance (ANOVA) was applied and least significant difference (LSD) at $p=0.05$ was used to test the differences between means of individual treatments [11]. Correlation coefficient was calculated using the formula $r = \frac{n(\sum XY) - (\sum X)(\sum Y)}{\sqrt{(n\sum X^2 - (\sum X)^2)(n\sum Y^2 - (\sum Y)^2)}}$. Multi linear regression analysis was carried out to find the important soil factors using the least square method, $Y=AX+B$. Statistical analysis revealed the correlation between soil variables and yield and also showed the relationship between soil variables [12].

RESULTS AND DISCUSSIONS

Soil physical properties

Soil physical properties were improved after amendment application. Tables 1 and 3 shows the influence of FYM, GM and CM on soil physical properties. Organic amendment tended to reduce BD of treated soil compared to control plot as $(1.420 \text{ g cm}^{-3}) @ 8.5 \text{ t ha}^{-1}$. Soil treated with GM+CM and FYM+GM+CM reduced BD values to 1.480 g cm^{-3} and $1.494 \text{ g cm}^{-3} @ 16.5 \text{ t ha}^{-1}$ respectively. Organic amendments application significantly increased the soil organic matter [13]. Improved organic matter in soil increases porosity and also improves soil structure thereby decreasing BD and PD. Organic matter content present in the soil reduced PD relative to control [14]. Highest PD was observed at control as 2.723 g cm^{-3} . Lowest PD (2.136 g cm^{-3}) was observed in FYM+GM+CM plot at 8.5 t ha^{-1} and 2.427 g cm^{-3} at 16.5 t ha^{-1} . On an average organic amendment decreased BD and PD, this makes the soil to get finer structure and good porosity. Porosity values ranged from 35.114% to $52.361% @ 8.5 \text{ t ha}^{-1}$ and 37.694% to $45.982 % @ 16.5 \text{ t ha}^{-1}$. Lowest value was recorded in control plot as 37.694% . Highest value was recorded in the CM+FYM and FYM+GM amended plots as $52.361% @ 8.5 \text{ t ha}^{-1}$. FYM+GM plot showed highest value of PO as $47.738 % @ 16.5 \text{ t ha}^{-1}$. Porosity of the soil treated with organic manure increased relative to control. Results in Table 1 and 3 showed that organic amendments significantly modified WHC, PS, WC values and non-significant effect on thermal conductivity [15]. The pore space and water content values were increased by the usage of organic amendments. CM plot had highest PS value ($52.183%$) relative to control (45.152%). CM+FYM and FYM+GM amended plots showed highest values of SM, PS, WC and HC relative to control @ 8.5 t ha^{-1} . The soil hydraulic conductivity generally increased with organic amendment application, with increased porosity [16]. The soil hydraulic conductivity ranged from 1.008 to $2.817 \text{ cm hr}^{-1} @ 8.5 \text{ t ha}^{-1}$ and 1.050 to $3.216 \text{ cm hr}^{-1} @ 16.5 \text{ t ha}^{-1}$. GM produced highest HC value as $2.817 \text{ cm hr}^{-1} @ 8.5 \text{ t ha}^{-1}$. FYM produced highest HC value as $2.817 \text{ cm hr}^{-1} @ 16.5 \text{ t ha}^{-1}$. Lowest HC was found at control as 1.050 cm hr^{-1} .

Correlation analysis

Correlation co-efficient generated among soil physical properties are shown in Table 2 and 4 for the concentration 8.5 and 16.5 t ha^{-1} respectively. Figure 1 and 2 shows the correlation between Yield Vs WHC and yield Vs Permeability. The yield was strongly correlated with WHC which was found negatively correlated with bulk density at 0.05 level. The figures depicted that yield increases with increasing WHC and PE. The yield of onion was significantly correlated with WHC, WC, SM, PO, VR and HC. Their Pearson's correlation coefficient values were 0.776 , 0.641 , 0.562 , 0.507 , 0.471 , 0.466 and less related with bulk density. Particle density was positively correlated with pore space and void ratio (0.822^*) at 0.05 level. Positive correlation occurs between particle density and porosity as 0.851^{**} at .01 level [17]. WHC was strongly correlated with PS and WC as 0.707 and 0.751 at 0.05 level and also with SM as 0.947 at 0.01 level. Strong correlation occurred between PS and WC (0.937^{**}), SM (0.866^{**}), PO (0.989^{**}), VR (0.993^{**}). WC positively correlated with SM, PO, VR as 0.884^{**} , 0.947^{**} , 0.957^{**} . Positive correlation was observed for SM with PO and VR as 0.840^{**} and 0.841^{**} . PO was positively correlated with VR as 0.997^{**} . HC was positively correlated with Permeability as 1.000^{**} . BD was also found negatively correlated with WHC, WC, SM, PO, VR and PS. The Table 2 displays a high degree of positive correlation between PS and PD; PS and WHC. A close positive relationship was

Subha and Jeyamangalam

seen between saturated moisture and WHC; SM and pore space at 0.01 level. Permeability was positively correlated with hydraulic conductivity .Pore space was positively correlated with saturated moisture, porosity. The yield of onion was significantly correlated with WHC and less related with bulk density. The yield was positively correlated with WHC (0.311) ,WC (0.129),SM (0.241) and PE (0.716*) and K (0.601) which was found negatively correlated with bulk density ,PD,PS,PO,VR and HC at 0.05 level. The yield of Onion was strongly correlated with P (0.716*) and K (0.601*). Bulk density was positively correlated with Particle density as 0.818*. Particle density was correlated with PO and VR as 0.722* and also with HC as 0.732*. WHC positively correlated with WC as 0.740* and with SM as 0.945** at 0.01 level. Pore space was highly correlated with PO and VR as (0.943**) at 0.01 level and with HC as 0.938** at 0.01 level. Positive correlation occurred between WC and HC as 0.753*. WC was strongly correlated with PO and VR as 0.759* at 0.05 level. Positive correlation was noted for PO with HC as 0.999** and with VR as 1.000** Permeability was also negatively correlated with PO (-0.022), VR (-0.228) and HC (-0.228).

Regression analysis

Regression analysis was employed by enter method which on iteration yielded the following equation (8.5 t ha⁻¹) $Y = -234696.952 + 178340.716(BD) - 65097.656(PD) - 1254.531(WHC) + 4646.456(WC) + 3141.625(SM) - 21583.217(P) - 204756.53(K)$ Regression analysis was employed by enter method which on iteration yielded the following equation (16.5t ha⁻¹) $Y = -271209.835 + 80630.779(BD) + 4122.634(PS) + 6946.58(WC) - 361.990(SM) - 213552.224(HC) + 75920.619(P) - 111094.727(K)$ Stepwise Multiple Linear Regression Analysis was used for identifying the relationship between yield and soil physical properties, significance was tested by F-statistics in ANOVA. Stepwise method used to analyze the linear relationship between single dependent variable (yield) with several independent variable [18]. Based on the results obtained from regression analysis, Regression equation for yield (Onion – dependent variable) was set with the most important soil physical properties. Regression equation (8.5 t ha⁻¹) is given by $Y = -2506.069 + 169.649 (WHC)$ To improve the model stepwise regression analysis was employed which on iteration yielded the following equation (16.5t ha⁻¹). $Y = 1062.118 + 1094.399 (PE)$ The results obtained from correlation and step wise Multi Linear Regression analysis revealed WHC permeability are the most important factors affecting yield of onion. Therefore, WHC and permeability are selected as the predictors to build up the regression equation. In the above model (Table 5), the 'r' square was 0.602 (8.5tha⁻¹). That is, the variation of WHC in soil accounts for the 60% yield variation. The 'r' square was 0.513 (16.5tha⁻¹) That is, the variation of permeability in soil accounts for the 51% yield variation.

CONCLUSIONS

The research findings demonstrated a significant impact of organic manure on both onion yield and soil physical properties. Through rigorous statistical analysis, it is revealed that all the soil physical properties were significantly correlated with each other and yield, organic amendments added soil leading to higher production rates compared to control. The results indicated good degree of positive correlation between yield and PD, WHC, WC, PO, SM, VR, HC, PE, K and yield was negatively correlated with bulk density @ 8.5 t ha⁻¹. Also the results indicated significant positive correlation was observed between yield and WHC, WC, SM, PE and K and also the yield negatively correlated with PO, VR, PS and HC @ 16.5 t ha⁻¹. Regression analysis revealed WHC and permeability are the most important factors affecting yield of onion. Organic amendments improves soil structure by enhancing soil physical properties and reduces erosion. These findings underscore the importance of organic manure as a sustainable agricultural practice for improving onion yield and maintain soil health. From agricultural point of view, organic amendments needed for soil protection and it will help the farmers economically by producing better yield.

ABSTRACT

In this study, a differential mathematical model of cancer with delay was considered. The positivity of the solution of the model was proved under the given initial conditions. The system was linearized by Jacobian about the positive equilibrium point and the local stability conditions with and without delay was stated well. The estimation of the length of delay to preserve stability was proved by the aid of Laplace transform and Nyquist criteria. The biological importance, we investigate a Hopf bifurcation under some specific conditions of cancer.

Keywords: stability, delay, Nyquist criteria, Hopf bifurcation, Equilibrium, Jacobian.

INTRODUCTION

Background of the Study

Cancer is one of the most difficult diseases to be treated clinically and one of the main causes of death. Accordingly, a great research effort is being devoted to understanding the interaction between tumor cells and the immune system. Cancer cells are host cells that proliferate in an uncontrolled and nonspecific manner, eventually leading to the

Prabakaran Karunakaran et al.,

formation of a tumor. The mechanism of cancer's establishment and destruction, one of the world's deadliest diseases, remains a mystery. There have also been several experimental advances in developing interventional cancer therapies such as immunotherapy, viral therapy, targeted drug therapy, and chemotherapy over the last two decades. Along with these experimental advances, there have been some advances in scientific and engineering solutions for understanding cancer dynamics. Despite modern treatments such as surgery, chemotherapy, and radiotherapy, relapses do occur. As a result, the need for a more effective treatment is obvious. Over the past few decades, there have been several experimental approaches and interventions developed that have helped us to understand the dynamics of tumor growth and its interactions with the immune system. This has also aided in understanding how specific interventions, such as immunotherapy, can help strengthen our ability to fight cancer by improving immune system effectiveness [1]. While these advances have improved our understanding of cancer dynamics, there are still several challenges in these experimental approaches to fully comprehend the interactions with the immune system. One of the promising approaches is mathematical modeling [2], which involves identifying the cells that play a role in cancer propagation, interactions between these bodies, and a description of the dynamics of this interaction, which has assisted in estimating parameters, performing stability analysis, and predicting tumor dynamics [3]. Mathematical modeling with delay differential equations (DDEs) is widely used for analysis and prediction in a variety of life sciences fields, including population dynamics, epidemiology, immunology, physiology, and neural networks. In these models, time delay or time lag can be related to the duration of certain hidden processes such as the stage of the life cycle, the time between virus infection and virus production, the duration of the infectious period, the immune period, and so on [4-6]. Mathematical models of tumor-immune dynamics have added to our understanding of how host immune cells and cancerous cells evolve and interact [7]. A statistical model for cancer mortality has been studied by [8]. An important division of cancer mathematical models aims to investigate the effect of varying immunotherapy and chemotherapy concentrations, as well as the influence of various parameters. [9] Examined the stability of a mathematical model of cancer virus therapy, their discoveries revealed that some conditions exist for the global stability of trivial and interior equilibrium points. [10], Stability analysis of mathematical models for nonlinear growth kinetics of breast cancer stem cells was performed.

They investigate the existence and stability of nonlinear growth kinetics of breast cancer stem cells using functional and ordinary differential equation theory. For starter, they establish a necessary condition for the existence and uniqueness of the solution for nonlinear growth kinetics of breast cancer stem cells. Then, using linearization techniques, they studied the uniform asymptotic stability of the zero solution and provided criteria for uniform asymptotic stability of a nontrivial steady-state solution with and without time delays, with examples. [11] Tumor Dynamics with Drug Interventions: Mathematical Modeling, analysis and simulation findings suggest that a new mathematical model combining important interactions between tumor cells and immune system cells such as natural killer cells, dendritic cells, and cytotoxic CD8+T cells, as well as drug delivery to these cell sites, has been proposed. These interactions are described numerically by a system of ordinary differential equations. This model's stability is also examined to determine the conditions required for tumor-free equilibrium to be stable. [12] Mathematical Modeling for the Role of CD4+T Cells in Tumor Immune Interactions was investigated. Their findings revealed that all equilibrium points are unstable, and they deduced a condition for preventing tumor recurrence after treatment. Finally, a bifurcation analysis is carried out to investigate the effect of changing system parameters on stability, and the bifurcation points are specified. As a result, when systems stabilize, tumors can be eradicated without the risk of recurrence. The majority of these models are in the form of a coupled nonlinear ordinary differential equation system. [13-14] developed a useful model for the interaction of the tumor and immune system along these lines. [15] A mathematical model of HIV infection of CD4+ T-cells was examined using stability and Hopf bifurcation analyses. The model is based on a system of delay differential equations with logistic growth terms and antiretroviral treatment with a discrete-time delay, which has a significant impact on the stability of steady-state, using center manifold theory and the normal form method. [16] Investigated interaction of effector cells and tumor cells, and the modification is accomplished by adding a discrete-time delay to the effector cell recruitment term. To understand the complex dynamics of the tumor-immune system, find the bifurcation for single parameters as well as two-parameter bifurcation regions. Our numerical simulations show that the model system exhibits both regular and irregular periodic oscillations, demonstrating the long-term phenomenon of tumor relapse. [17] The characteristic equation is

Prabakaran Karunakaran et al.,

used to investigate the singularities and their local stability. They investigate a Hopf bifurcation around the interior singularity and determine the stability of the corresponding Hopf cycles by computing the model's normal form in the direction of the Hopf bifurcation. [18] To investigate long-term tumor relapse phenomena, a three-dimensional nonlinear delay differential system with tumor cells, cytotoxic T lymphocytes, and T helper cells with recruitment delay and chemotherapy was built. It is also demonstrated that when the intrinsic recruitment delay of the tumor crosses the threshold, a branch of stable periodic solutions bifurcates from the coexistence equilibrium, which is a new mechanism with in numerical examples. [19] introduced a stability and Hopf bifurcation analysis of a reaction-diffusion system that models the interaction between endothelial cells and the inhibitor. Then, under certain conditions, investigate the stability of the positive equilibrium solutions, as well as the existence of a Hopf bifurcation, and provide some figures to demonstrate that the equilibrium solutions are indeed asymptotically stable. [20] investigated a model that describes all phenomena at the cell level quite exhaustively, but rather a qualitative model working at the tissue level and Hopf-bifurcation by considering the bifurcation parameter with numerical simulations that are well-matched with analytical findings. Many technical and physical problems can be described and analyzed by many researchers different mathematical modeling. [21-25] Tumor growth and cancer treatment have produced valuable and thorough writers in recent years. Since discrete-time delay is important as described by [26] in the mathematical model of immunotherapy with interleukin-2, it is more realistic to consider the effect of these discrete-time delays at the same time in the model. Furthermore, these delays represent different meanings and hence it is recommended to use a different notation for each. In this study, the mathematical model of immunotherapy with interleukin-2 is given, and extended as follows.

$$\frac{dx}{dt} = cy - \mu_2 x + \frac{p_1 x(t-\tau)z(t-\tau)}{g_1 + z(t-\tau)} + s_1$$

$$\frac{dy}{dt} = r_2 y(1 - by) - \frac{axy}{g_2 + y} \quad (1.1)$$

$$\frac{dz}{dt} = \frac{p_2 xy}{g_3 + y} - \mu_3 z + s_2$$

$$x(\theta) = \psi_1(\theta), \quad y(\theta) = \psi_2(\theta), \quad z(\theta) = \psi_3(\theta)$$

$$\psi_1(\theta) \geq 0, \psi_2(\theta) \geq 0, \psi_3(\theta) \geq 0, \text{ on } \theta \in [-\tau, 0], \quad \tau = \min\{\tau_1, \tau_2\}$$

Studying the behavior of cancer focuses on developing suitable mathematical models involving qualitative approaches to understand various aspects of tumor growth and the response of cancer cells to clinical interventions. The stability and Hopf bifurcation analysis of a mathematical model of immunotherapy with interleukin-2, on the other hand, have not yet been investigated in the existing literature. As a result, the primary goal of this research is to investigate the stability and Hopf bifurcation analysis of the mathematical model of immunotherapy with interleukin-2 given in Eq (1.1). The model's stochastic stability properties are investigated both analytically and numerically, and the thresholds discovered may be useful in controlling the growth of a malignant tumor. Despite the enormous amount of research done on cancer analysis and mathematical modeling, the extended model given by Eq. (1.1) has yet to be considered in the existing literature. As a result, the purpose of this research is to fill that void. The rest of this paper is organized as follows. In Section 2, we obtain the description of the model of solutions of Eq (1.1). In Section 3, we study the existence and stability of possible steady states of the model and discuss the estimation of the length of delay to preserve stability. In Section 4, we analyze the Hopf bifurcation method and provide some biological interpretations. Finally, the conclusions and discussions are then presented in Section 5.

List of Variables and Parameters

$x(t)$ – The Effector cells

$y(t)$ – The Tumor cells

$z(t)$ – The concentration of Interleukin -2 in a single site compartment

c – Antigenicity of Tumor

s_1 – The treatment term that represents the external source of effect or cells

Prabakaran Karunakaran et al.,

s_2 – The treatment term that represents an external input of Interleukin -2 into the system

p_1 – growth rate of effector cells

p_2 – growth rate of Interleukin-2

g_1 – half saturation constant for the proliferation term

g_2 – half saturation constant for the tumor clearance

g_3 – half saturation constant for the production term

r_2 – growth rate of tumor cells

μ_2 – Natural decay rate of effector cells

μ_3 – Natural decay rate of Interleukin -2

a – Decay rate of tumor

b – The reciprocal of carrying capacity of tumor cells

Description of the model

Positivity of the solution of the model

Consider the mathematical model formulated in Eq. (1.1),

From the first equation of Eq. (1.1),

$$\frac{dx}{dt} = cy(t - \tau_1) + \frac{p_1 x(t - \tau_2) z(t - \tau_2)}{g_1 + z(t - \tau_2)} + s_1 - \mu_2 x$$

$$\frac{dx}{dt} = c\psi_2(t - \tau_1) + \frac{p_1 \psi_1(t - \tau_2) \psi_3(t - \tau_2)}{g_1 + \psi_3(t - \tau_2)} + s_1 - \mu_2 x$$

where $x(\theta) = \psi_1(\theta), y(\theta) = \psi_2(\theta), z(\theta) = \psi_3(\theta)$

Since $\psi_1(\theta) \geq 0, \psi_2(\theta) \geq 0, \psi_3(\theta) \geq 0$, on $\theta \in [-\tau, 0], \tau = \min\{\tau_1, \tau_2\}$

$$\frac{dx}{dt} \geq -\mu_2 x, \quad \frac{dx}{x} \geq -\mu_2 dt$$

Integrating both sides with respect to t ,

$$\int \frac{dx}{x} \geq \int -\mu_2 dt, \quad \ln x(t) \geq -\mu_2 t + x_0, \quad e^{\ln x(t)} \geq x_0 e^{-\mu_2 t} \quad x(t) \geq x_0 e^{-\mu_2 t} > 0, x(t) > 0$$

From the second equation of Eq.(1.1),

$$\frac{dy}{y} = U(x, y, z) dt, \text{ where } U(x, y, z) = \left(r_2(1 - by) - \frac{ax}{g_2 + y} \right)$$

$$\text{Integrating from } [0, t], \ln y = \int_0^t U(x, y, z) ds, \quad y(t) = y_0 e^{\int_0^t U(x, y, z) ds} > 0, y(t) > 0$$

$$\text{From the third equation of Eq.(1.4), } \frac{dz}{dt} > -\mu_3 z, \quad \frac{dz}{z} > -\mu_3 dt$$

Integrating both sides with respect to t ,

$$\int \frac{dz}{z} > \int -\mu_3 dt \Rightarrow \ln z > -\mu_3 t + z_0, \quad e^{\ln z} > z_0 e^{-\mu_3 t} > 0 \Rightarrow z(t) > 0$$

As a result, all solutions of system (1.1) that start in \mathbb{R}_+^3 remain positive.

Equilibrium Points

To find the equilibrium point of system (1.4), equate the system to zero.

$$cy(t - \tau_1) - \mu_2 x + \frac{p_1 x(t - \tau_2) z(t - \tau_2)}{g_1 + z(t - \tau_2)} + s_1 = 0 \tag{2.1}$$

$$r_2 y(1 - by) - \frac{axy}{g_2 + y} = 0 \tag{2.2}$$

Prabakaran Karunakaran et al.,

$$\frac{p_2xy}{g_3 + y} - \mu_3z + s_2 = 0 \tag{2.3}$$

$$\text{From Eq. (2.2), } r_2(1 - by) - \frac{ax}{g_2+y} = 0 \tag{2.4}$$

For $y = 0$, Eq. (2.3) become $\mu_3z + s_2 = 0, z = \frac{s_2}{\mu_3}$

For $y = 0$, Eq. (2.1) become

$$-\mu_2x + \frac{p_1xz}{g_1 + z} + s_1 = 0, x \left(-\mu_2 + \frac{p_1z}{g_1 + z} \right) + s_1 = 0$$

$$x = \frac{-s_1(g_1\mu_3 + s_2)}{-\mu_2(g_1\mu_3 + s_2) + p_1s_2}, \Rightarrow x = \frac{s_1(g_1\mu_3 + s_2)}{\mu_2(g_1\mu_3 + s_2) - p_1s_2}$$

Therefore, the equilibrium point is:

$$E_1 = \left(\frac{s_1(\mu_3g_1 + s_2)}{\mu_2(g_1\mu_3 + s_2) - p_1s_2}, 0, \frac{s_2}{\mu_3} \right)$$

Provided that, $\mu_2(g_1\mu_3 + s_2) - p_1s_2 > 0$

From Eq.(2.2)

$$x^* = \frac{r_2}{a} (1 - by^*)(g_2 + y^*) \tag{2.5}$$

Putting Eq. (2.5) into Eq. (2.3),

$$z^* = \frac{p_2r_2(1 - by^*)(g_2 + y^*)y^*}{\mu_3a(g_3 + y^*)} + \frac{s_2}{\mu_3}$$

and y^* is given by the equation

$$cy^* - \frac{\mu_2x^* + p_1x^*z^*}{g_1 + z^*} + s_1 = 0$$

Therefore, the positive equilibrium point is given by $E^* = (x^*, y^*, z^*)$

Stability analysis

In this section, we will investigate the stability of the linearization of equation (1.1) about $E^* = (x^*, y^*, z^*)$ is given by:

$$x' = A_0x + A_1x(t - \tau_1) + A_1x(t - \tau_2)$$

$$f_1 = cy(t - \tau_1) - \mu_2x + \frac{p_1x(t - \tau_2)z(t - \tau_2)}{g_1 + z(t - \tau_2)} + s_1$$

$$f_2 = r_2y(1 - by) - \frac{axy}{g_2 + y}, \quad f_3 = \frac{p_2xy}{g_3 + y} - \mu_3z + s_2$$

$$\frac{\partial f_1}{\partial x}(x^*, y^*, z^*) = -\mu_2, \frac{\partial f_1}{\partial y}(x^*, y^*, z^*) = \frac{\partial f_1}{\partial z}(x^*, y^*, z^*) = 0$$

$$\frac{\partial f_2}{\partial x}(x^*, y^*, z^*) = \frac{-ay^*}{g_2 + y^*}, \frac{\partial f_2}{\partial y}(x^*, y^*, z^*) = \frac{ax^*y^*}{(g_2 + y^*)^2} - br_2y^*, \frac{\partial f_2}{\partial z}(x^*, y^*, z^*) = 0$$

$$\frac{\partial f_3}{\partial x}(x^*, y^*, z^*) = \frac{p_2y^*}{g_3 + y^*}, \frac{\partial f_3}{\partial y}(x^*, y^*, z^*) = \frac{p_2g_3x^*}{(g_3 + y^*)^2}, \frac{\partial f_3}{\partial z}(x^*, y^*, z^*) = -\mu_3$$

$$A_0 = \begin{pmatrix} \frac{\partial f_1}{\partial x}(x^*, y^*, z^*) & \frac{\partial f_1}{\partial y}(x^*, y^*, z^*) & \frac{\partial f_1}{\partial z}(x^*, y^*, z^*) \\ \frac{\partial f_2}{\partial x}(x^*, y^*, z^*) & \frac{\partial f_2}{\partial y}(x^*, y^*, z^*) & \frac{\partial f_2}{\partial z}(x^*, y^*, z^*) \\ \frac{\partial f_3}{\partial x}(x^*, y^*, z^*) & \frac{\partial f_3}{\partial y}(x^*, y^*, z^*) & \frac{\partial f_3}{\partial z}(x^*, y^*, z^*) \end{pmatrix} = \begin{pmatrix} -\mu_2 & 0 & 0 \\ -\frac{ay^*}{g_2 + y^*} & \frac{ax^*y^*}{(g_2 + y^*)^2} - br_2y^* & 0 \\ \frac{p_2y^*}{g_3 + y^*} & \frac{p_2g_3x^*}{(g_3 + y^*)^2} & -\mu_3 \end{pmatrix}$$

To get A_1 ,

$$\frac{\partial f_1}{\partial x_{\tau_1}}(x^*, y^*, z^*) = 0, \frac{\partial f_1}{\partial y_{\tau_1}}(x^*, y^*, z^*) = c, \frac{\partial f_1}{\partial z_{\tau_1}}(x^*, y^*, z^*) = 0$$

$$\frac{\partial f_2}{\partial x_{\tau_1}}(x^*, y^*, z^*) = \frac{\partial f_2}{\partial y_{\tau_1}}(x^*, y^*, z^*) = \frac{\partial f_2}{\partial z_{\tau_1}}(x^*, y^*, z^*) = 0$$

$$\frac{\partial f_3}{\partial x_{\tau_1}}(x^*, y^*, z^*) = \frac{\partial f_3}{\partial y_{\tau_1}}(x^*, y^*, z^*) = \frac{\partial f_3}{\partial z_{\tau_1}}(x^*, y^*, z^*) = 0$$

Prabakaran Karunakaran et al.,

$$A_1 = \begin{pmatrix} \frac{\partial f_1}{\partial x_{\tau_1}}(x^*, y^*, z^*) & \frac{\partial f_1}{\partial y_{\tau_1}}(x^*, y^*, z^*) & \frac{\partial f_1}{\partial z_{\tau_1}}(x^*, y^*, z^*) \\ \frac{\partial f_2}{\partial x_{\tau_1}}(x^*, y^*, z^*) & \frac{\partial f_2}{\partial y_{\tau_1}}(x^*, y^*, z^*) & \frac{\partial f_2}{\partial z_{\tau_1}}(x^*, y^*, z^*) \\ \frac{\partial f_3}{\partial x_{\tau_1}}(x^*, y^*, z^*) & \frac{\partial f_3}{\partial y_{\tau_1}}(x^*, y^*, z^*) & \frac{\partial f_3}{\partial z_{\tau_1}}(x^*, y^*, z^*) \end{pmatrix} = \begin{pmatrix} 0 & c & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

To get A_2 ,

$$\frac{\partial f_1}{\partial x_{\tau_2}}(x^*, y^*, z^*) = \frac{p_1 z^*}{g_1 + z^*} \cdot \frac{\partial f_1}{\partial y_{\tau_2}}(x^*, y^*, z^*) = 0, \frac{\partial f_1}{\partial z_{\tau_2}}(x^*, y^*, z^*) = \frac{p_1 g_1 x^*}{(g_1 + z^*)^2}$$

$$\frac{\partial f_2}{\partial x_{\tau_2}}(x^*, y^*, z^*) = \frac{\partial f_2}{\partial y_{\tau_2}}(x^*, y^*, z^*) = \frac{\partial f_2}{\partial z_{\tau_2}}(x^*, y^*, z^*) = 0$$

$$\frac{\partial f_3}{\partial x_{\tau_2}}(x^*, y^*, z^*) = \frac{\partial f_3}{\partial y_{\tau_2}}(x^*, y^*, z^*) = \frac{\partial f_3}{\partial z_{\tau_2}}(x^*, y^*, z^*) = 0$$

$$A_2 = \begin{pmatrix} \frac{\partial f_1}{\partial x_{\tau_2}}(x^*, y^*, z^*) & \frac{\partial f_1}{\partial y_{\tau_2}}(x^*, y^*, z^*) & \frac{\partial f_1}{\partial z_{\tau_2}}(x^*, y^*, z^*) \\ \frac{\partial f_2}{\partial x_{\tau_2}}(x^*, y^*, z^*) & \frac{\partial f_2}{\partial y_{\tau_2}}(x^*, y^*, z^*) & \frac{\partial f_2}{\partial z_{\tau_2}}(x^*, y^*, z^*) \\ \frac{\partial f_3}{\partial x_{\tau_2}}(x^*, y^*, z^*) & \frac{\partial f_3}{\partial y_{\tau_2}}(x^*, y^*, z^*) & \frac{\partial f_3}{\partial z_{\tau_2}}(x^*, y^*, z^*) \end{pmatrix} = \begin{pmatrix} \frac{p_1 z^*}{g_1 + z^*} & 0 & \frac{p_1 g_1 x^*}{(g_1 + z^*)^2} \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$x' = \begin{pmatrix} -\mu_2 & 0 & 0 \\ \frac{ay^*}{g_2 + y^*} & \frac{ax^*y^*}{(g_2 + y^*)^2} - br_2y^* & 0 \\ \frac{p_2y^*}{g_3 + y^*} & \frac{p_2g_3x^*}{(g_3 + y^*)^2} & -\mu_3 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} + \begin{pmatrix} 0 & c & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} x(t - \tau_1) \\ y(t - \tau_1) \\ z(t - \tau_1) \end{pmatrix} + \begin{pmatrix} \frac{p_1 z^*}{g_1 + z^*} & 0 & \frac{p_1 g_1 x^*}{(g_1 + z^*)^2} \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} x(t - \tau_2) \\ y(t - \tau_2) \\ z(t - \tau_2) \end{pmatrix}$$

Therefore, the linearized form of system (1.4) is

$$\begin{aligned} \frac{dx}{dt} &= -\mu_2 x + cy(t - \tau_1) + \frac{p_1 z^*}{g_1 + z^*} x(t - \tau_2) + \frac{p_1 g_1 x^*}{(g_1 + z^*)^2} z(t - \tau_2) \\ \frac{dy}{dt} &= \frac{-ay^*}{g_2 + y^*} x + \left(\frac{ax^*y^*}{(g_2 + y^*)^2} - br_2y^* \right) y \\ \frac{dz}{dt} &= \frac{p_2y^*}{g_3 + y^*} x + \frac{p_2g_3x^*}{(g_3 + y^*)^2} y - \mu_3 z \end{aligned} \tag{3.1}$$

Let $x = A_1 e^{\lambda t}$, $y = A_2 e^{\lambda t}$, $z = A_3 e^{\lambda t}$ be the solution of Eq. (3.1),

$$\begin{cases} x(t) = A_1 e^{\lambda t} \\ \frac{dx}{dt} = A_1 \lambda e^{\lambda t} \\ x(t - \tau_1) = A_1 e^{-\lambda \tau_1} e^{\lambda t} \\ x(t - \tau_2) = A_1 e^{-\lambda \tau_2} e^{\lambda t} \end{cases} \tag{3.2}$$

Similarly, $y(t) = A_2 e^{\lambda t}$, and (3.3)

$z(t) = A_3 e^{\lambda t}$ (3.4)

Using Eqs. (3.2) - (3.4) into Eq. (3.1) gives

$$\left(\lambda + \mu_2 - \frac{p_1 z^*}{g_1 + z^*} e^{-\lambda \tau_2} \right) A_1 - c e^{-\lambda \tau_1} A_2 - \frac{p_1 g_1 x^*}{(g_1 + z^*)^2} e^{-\lambda \tau_2} A_3 = 0$$

$$\frac{ay^*}{g_2 + y^*} A_1 + \left(\lambda - \frac{ax^*y^*}{(g_2 + y^*)^2} + br_2y^* \right) A_2 = 0 \tag{3.5}$$

$$\frac{-p_2y^*}{g_3 + y^*} A_1 - \frac{p_2g_3x^*}{(g_3 + y^*)^2} A_2 + (\lambda + \mu_3) A_3 = 0$$

For Eq. (3.5) to have nontrivial solution, the determinant of the coefficient matrix must be zero.

$$\begin{vmatrix} \lambda + \mu_2 - \frac{p_1 z^*}{g_1 + z^*} e^{-\lambda \tau_2} & -c e^{-\lambda \tau_1} & \frac{-p_1 g_1}{(g_1 + z^*)^2} e^{-\lambda \tau_2} \\ \frac{a y^*}{g_2 + y^*} & \lambda - \frac{a x^* y^*}{(g_2 + y^*)^2} + b r_2 y^* & 0 \\ \frac{-p_2 y^*}{g_3 + y^*} & \frac{-p_2 g_3 x^*}{(g_3 + y^*)^2} & \lambda + \mu_3 \end{vmatrix} = 0$$

$$\lambda^3 + \left(\mu_2 + \mu_3 - \frac{a x^* y^*}{(g_2 + y^*)^2} + b r_2 y^* \right) \lambda^2 + \left(\mu_2 \mu_3 + b r_2 \mu_2 y^* + b r_2 \mu_3 y^* - \frac{a \mu_2 x^* y^*}{(g_2 + y^*)^2} - \frac{a \mu_3 x^* y^*}{(g_2 + y^*)^2} \right) \lambda$$

$$+ b r_2 \mu_2 \mu_3 y^* - \frac{a \mu_2 \mu_3 x^* y^*}{(g_2 + y^*)^2} + \frac{a c y^*}{g_2 + y^*} \lambda e^{-\lambda \tau_1} + \frac{a c \mu_3 y^*}{g_2 + y^*} e^{-\lambda \tau_1}$$

$$- \frac{p_1 z^*}{g_1 + z^*} \lambda^2 e^{-\lambda \tau_2} + \left(\frac{-p_1 \mu_3 z^*}{g_1 + z^*} + \frac{a p_1 x^* y^* z^*}{(g_1 + z^*)(g_2 + y^*)^2} \right) \lambda e^{-\lambda \tau_2}$$

$$+ \left(\frac{a p_1 \mu_3 x^* y^* z^*}{(g_1 + z^*)(g_2 + y^*)^2} - \frac{b p_1 r_2 \mu_3 y^* z^*}{g_1 + z^*} + \frac{a p_1 p_2 g_1 g_3 (x^*)^2 y^*}{(g_1 + z^*)^2 (g_3 + y^*)^2 (g_2 + y^*)} \right. \\ \left. + \frac{a p_1 p_2 g_1 (x^*)^2 (y^*)^2}{(g_1 + z^*)^2 (g_2 + y^*)^2 (g_3 + y^*)} - \frac{b p_1 p_2 g_1 r_2 (y^*)^2 x^*}{(g_1 + z^*)^2 (g_3 + y^*)} \right) e^{-\lambda \tau_2} = 0$$

The characteristic equation for the linearized equation around the point (x^*, y^*, z^*) is

$$\lambda^3 + a_1 \lambda^2 + a_2 \lambda + a_3 + (b_2 \lambda + b_3) e^{-\lambda \tau_1} + (c_1 \lambda^2 + c_2 \lambda + c_3) e^{-\lambda \tau_2} = 0$$

$$P(\lambda) + Q(\lambda) e^{-\lambda \tau_1} + R(\lambda) e^{-\lambda \tau_2} = 0 \tag{3.6}$$

where, $P(\lambda) = \lambda^3 + a_1 \lambda^2 + a_2 \lambda + a_3$, $Q(\lambda) = b_2 \lambda + b_3$, $R(\lambda) = c_1 \lambda^2 + c_2 \lambda + c_3$

Provided that,

$$a_1 = \mu_2 + \mu_3 - \frac{a x^* y^*}{(g_2 + y^*)^2} + b r_2 y^*$$

$$a_2 = \mu_2 \mu_3 + b r_2 \mu_2 y^* + b r_2 \mu_3 y^* - \frac{a \mu_2 x^* y^*}{(g_2 + y^*)^2} - \frac{a \mu_3 x^* y^*}{(g_2 + y^*)^2}$$

$$a_3 = b r_2 \mu_2 \mu_3 y^* - \frac{a \mu_2 \mu_3 x^* y^*}{(g_2 + y^*)^2}$$

$$b_2 = \frac{a c y^*}{g_2 + y^*}, \quad b_3 = \frac{a c \mu_3 y^*}{g_2 + y^*}$$

$$c_1 = -\frac{p_1 z^*}{g_1 + z^*}, \quad c_2 = -\frac{p_1 \mu_3 z^*}{g_1 + z^*} + \frac{a p_1 x^* y^* z^*}{(g_1 + z^*)(g_2 + y^*)^2} - \frac{b p_1 r_2 y^* z^*}{g_1 + z^*} - \frac{p_1 p_2 g_1 x^* y^*}{(g_1 + z^*)^2 (g_3 + y^*)}$$

$$c_3 = \frac{a p_1 \mu_3 x^* y^* z^*}{(g_1 + z^*)(g_2 + y^*)^2} - \frac{b p_1 r_2 \mu_3 y^* z^*}{g_1 + z^*} + \frac{a p_1 p_2 g_1 g_3 (x^*)^2 y^*}{(g_1 + z^*)^2 (g_3 + y^*)^2 (g_2 + y^*)} + \frac{a p_1 p_2 g_1 (x^*)^2 (y^*)^2}{(g_1 + z^*)^2 (g_2 + y^*)^2 (g_3 + y^*)} - \frac{b p_1 p_2 g_1 r_2 x^* (y^*)^2}{(g_1 + z^*)^2 (g_3 + y^*)}$$

Case 1: If $\tau_1 = \tau_2 = 0$

$$P(\lambda) + Q(\lambda) + R(\lambda) = 0 \tag{3.7}$$

$$\lambda^3 + (a_1 + c_1) \lambda^2 + (a_2 + b_2 + c_2) \lambda + (a_3 + b_3 + c_3) = 0$$

Applying Routh Hurwitz stability criteria, in the absence of delay, the system is locally asymptotically stable if the following conditions are satisfied

- (i) $a_1 + c_1 > 0$
- (ii) $(a_1 + c_1)(a_2 + b_2 + c_2) - (a_3 + b_3 + c_3) > 0$
- (iii) $a_3 + b_3 + c_3 > 0$

Case 2: $\tau_1 = \tau_2 = \tau$

$$P(\lambda) + (Q(\lambda) + R(\lambda)) e^{-\lambda \tau} = 0$$

$$\lambda^3 + a_1 \lambda^2 + a_2 \lambda + a_3 + [c_1 \lambda^2 + (b_2 + c_2) \lambda + (b_3 + c_3)] e^{-\lambda \tau} = 0 \tag{3.8}$$

Prabakaran Karunakaran et al.,

Suppose $\lambda = \pm i\omega, \omega > 0$ be the eigenvalue of Eq. (3.8)

$$\begin{aligned} & (i\omega)^3 + a_1(i\omega)^2 + a_2(i\omega) + a_3 + [c_1(i\omega)^2 + (b_2 + c_2)(i\omega) + (b_3 + c_3)]e^{-i\omega\tau} = 0 \\ & (i\omega)^3 + a_1(i\omega)^2 + a_2(i\omega) + a_3 + [c_1(i\omega)^2 + (b_2 + c_2)(i\omega) + (b_3 + c_3)](\cos(\omega\tau) - i \sin(\omega\tau)) = 0 \\ & -i\omega^3 - a_1\omega^2 + ia_2\omega + a_3 - c_1\omega^2(\cos(\omega\tau) - i \sin(\omega\tau)) + i(b_2 + c_2)\omega(\cos(\omega\tau) - i \sin(\omega\tau)) + (b_3 + c_3)(\cos(\omega\tau) - i \sin(\omega\tau)) = 0 \end{aligned}$$

Equating real parts and imaginary parts to zero

$$\begin{aligned} -a_1\omega^2 + a_3 + (b_3 + c_3 - c_1\omega^2) \cos(\omega\tau) + (b_2\omega + c_2\omega) \sin(\omega\tau) &= 0 \\ -\omega^3 + a_2\omega + (c_1\omega^2 - b_3 - c_3) \sin(\omega\tau) + (b_2\omega + c_2\omega) \cos(\omega\tau) &= 0 \end{aligned}$$

$$a_1\omega^2 - a_3 = (b_3 + c_3 - c_1\omega^2) \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) \tag{3.9}$$

$$\omega^3 - a_2\omega = (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3 - c_1\omega^2) \sin(\omega\tau) \tag{3.10}$$

Squaring and adding Eq. (3.9) and Eq. (3.10),

$$\begin{aligned} & (a_1\omega^2 - a_3)^2 + (\omega^3 - a_2\omega)^2 \\ &= (b_2 + c_2)^2\omega^2 + (b_3 + c_3 - c_1\omega^2)^2\omega^6 + (a_1^2 - 2a_2 - c_1^2)\omega^4 \\ &+ (a_2^2 - 2a_1a_3 - b_2^2 - 2b_2c_2 - c_2^2 + 2c_1c_3 + 2c_1b_3)\omega^2 + a_3^2 - b_3^2 - 2b_3c_3 - c_3^2 \\ &= 0\rho^3 + B_1\rho^2 + B_2\rho + B_3 \\ &= 0, \end{aligned} \tag{3.11}$$

Where $\rho = \omega^2, B_1 = a_1^2 - 2a_2 - c_1^2 \left(\mu_2\mu_3 + br_2\mu_3y^* + br_2\mu_2y^* + \frac{ax^*y^*}{(g_2+y^*)^2} + \frac{ax^*y^*}{(g_2+y^*)^2} \right)^2$

$$\begin{aligned} & -2 \left(\mu_2\mu_3 + br_2\mu_2y^* + br_2\mu_3y^* - \frac{ax^*y^*}{(g_2+y^*)^2}\mu_2 - \frac{ay^*y^*}{(g_2+y^*)^2}\mu_3 \right) - \left(-\frac{p_1z^*}{g_1+z^*} \right)^2 \\ & B_2 = (a_2^2 - 2a_1a_3 - b_2^2 - 2b_2c_2 - c_2^2 + 2c_1c_3 + 2c_1b_3) \\ & \left(\mu_2\mu_3 + br_2\mu_2y^* + br_2\mu_3y^* - \frac{ax^*y^*}{(g_2+y^*)^2}\mu_2 - \frac{ay^*y^*}{(g_2+y^*)^2}\mu_3 \right)^2 \\ & -2 \left((\mu_2 + \mu_3 + br_2y^* - \frac{ax^*y^*}{(g_2+y^*)^2})(br_2\mu_2\mu_3y^* - \frac{a\mu_2\mu_3x^*y^*}{(g_2+y^*)^2}) - \left(\frac{cay^*}{g_2+y^*} \right)^2 \right) \\ & -2 \left(\left(\frac{cay^*}{g_2+y^*} \right) \left(\frac{ap_1x^*y^*z^*}{(g_1+z^*)(g_2+y^*)^2} - \frac{p_1z^*\mu_3}{g_1+z^*} - \frac{bp_1r_2y^*z^*}{g_1+z^*} - \frac{p_1p_2g_1x^*y^*}{(g_1+z^*)^2(g_3+y^*)} \right) \right) \\ & - \left(\frac{ap_1x^*y^*z^*}{(g_1+z^*)(g_2+y^*)^2} - \frac{p_1\mu_3z^*}{g_1+z^*} - \frac{bp_1r_2y^*z^*}{g_1+z^*} - \frac{p_1p_2g_1x^*y^*}{(g_1+z^*)^2(g_3+y^*)} \right)^2 \\ & + 2 \left(\left(-\frac{p_1z^*}{g_1+z^*} \right) \left(\frac{ap_1\mu_3x^*y^*z^*}{(g_1+z^*)(g_2+y^*)^2} + \frac{ap_1p_2g_1g_3(x^*)^2y^*}{(g_1+z^*)^2(g_2+y^*)(g_3+y^*)^2} - \frac{bp_1r_2\mu_3y^*z^*}{g_1+z^*} \right) \right. \\ & \left. + \frac{ap_1p_2g_1(x^*)^2(y^*)^2}{(g_1+z^*)^2(g_2+y^*)^2(g_3+y^*)} - \frac{bp_1p_2r_2g_1x^*(y^*)^2}{(g_1+z^*)^2(g_3+y^*)} \right) \\ & + 2 \left(\left(-\frac{p_1z^*}{g_1+z^*} \right) \left(\frac{acy^*}{g_2+y^*}\mu_3 \right) \right) \end{aligned}$$

$$B_3 = a_3^2 - b_3^2 - 2b_3c_3 - c_3^2$$

$$\begin{aligned} & \left(br_2\mu_2\mu_3y^* - \frac{a\mu_2\mu_3x^*y^*}{(g_2+y^*)^2} \right)^2 - \left(\frac{ac\mu_3y^*}{g_2+y^*} \right)^2 - 2 \left(\frac{ac\mu_3y^*}{g_2+y^*} \left(\frac{ap_1\mu_3x^*y^*z^*}{(g_1+z^*)(g_2+y^*)^2} - \frac{p_1r_2b\mu_3y^*z^*}{g_1+z^*} \right) \right. \\ & \left. + \frac{ap_1p_2g_1g_2(x^*)^2y^*}{(g_1+z^*)^2(g_2+y^*)(g_3+y^*)^2} + \frac{ap_1p_2g_1(x^*)^2(y^*)^2}{(g_1+z^*)^2(g_2+y^*)^2(g_3+y^*)} \right. \\ & \left. - \frac{p_1p_2r_2g_1bx^*(y^*)^2}{(g_1+z^*)^2(g_3+y^*)} \right) \end{aligned}$$

Prabakaran Karunakaran et al.,

$$-\left(\frac{ap_1\mu_3x^*y^*z^*}{(g_1+z^*)(g_2+y^*)^2} - \frac{p_1r_2b\mu_3y^*z^*}{g_1+z^*} + \frac{ap_1p_2g_1g_2(x^*)^2y^*}{(g_1+z^*)^2(g_2+y^*)(g_3+y^*)^2} \right)^2$$

$$+\frac{ap_1p_2g_1(x^*)^2(y^*)^2}{(g_1+z^*)^2(g_2+y^*)^2(g_3+y^*)} - \frac{p_1p_2r_2g_1bx^*(y^*)^2}{(g_1+z^*)^2(g_3+y^*)}$$

Assuming that B_1 is a positive, the simplest assumption is that (3.11) will have a positive root is

$$B_3 = a_3^2 - b_3^2 - 2b_3c_3 - c_3^2 < 0.$$

Hence, we can say that there is a positive ω_0 satisfying Eq. (3.11) that is, the characteristic equation (3.8) has a pair of purely imaginary eigenvalues of the form $\pm i\omega_0$. Eliminating $\sin(\omega\tau)$ from Eq. (3.9) and Eq. (3.10),

$$(b_3 + c_3 - c_1\omega^2)(a_1\omega^2 - a_3) = (b_3 + c_3 - c_1\omega^2) \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau)$$

$$(b_2 + c_2)\omega(\omega^3 - a_2\omega) = (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3 - c_1\omega^2) \sin(\omega\tau)$$

Then τ_n^* corresponding to ω_0 is given by

$$\tau_n^* = \frac{1}{\omega_0} \cos^{-1} \left(\frac{(b_3 + c_3 - c_1\omega^2)(a_1\omega^2 - a_3) + (b_2 + c_2)\omega(\omega^3 - a_2\omega)}{(b_2 + c_2)^2\omega^2 + (b_3 + c_3 - c_1\omega^2)^2} \right) + \frac{2n\pi}{\omega_0} \tag{3.12}$$

$n = 0, 1, 2, \dots$ For $\tau = 0$, E^* is stable. Hence, E^* will remain stable for $\tau < \tau_0$ as $n = 0$.

$$\tau_0^* = \frac{1}{\omega_0} \cos^{-1} \left(\frac{(b_3 + c_3 - c_1\omega^2)(a_1\omega^2 - a_3) + (b_2 + c_2)\omega(\omega^3 - a_2\omega)}{(b_2 + c_2)^2\omega^2 + (b_3 + c_3 - c_1\omega^2)^2} \right)$$

is the smallest cut-off value at which stability of the equilibrium point is lost and never is be regained in the future time for the smallest positive eigenvalue ω_0 .

Estimation of the length of delay to preserve stability

Consider the system (3.1) and the space of all real-valued continuous functions defined on $[-\tau, \infty)$ and satisfying the initial condition $x(t) \geq 0, y(t) \geq 0$, and $z(t) \geq 0$ on $[-\tau, 0]$. Let $X(s), Y(s)$, and $Z(s)$ denote the Laplace transform of $x(t), y(t)$ and $z(t)$

Then Laplace transform of the linearized system is given by Eq. (3.1)

$$(s + \mu_2)X(s) = ce^{-s\tau_1}Y(s) + ce^{-s\tau_1}K_1(s) + \frac{p_1z^*}{g_1 + z^*} e^{-s\tau_2}X(s) + \frac{p_1z^*}{g_1 + z^*} e^{-s\tau_2}K_2(s)$$

$$+ \frac{p_1g_1x^*}{(g_1 + z^*)^2} e^{-s\tau_2}Z(s) + \frac{p_1g_1x^*}{(g_1 + z^*)^2} e^{-s\tau_2}K_3(s) + x(0),$$

$$\left(s - \frac{ax^*y^*}{(g_2 + y^*)^2} + br_2y^* \right) Y(s) = \frac{-ay^*}{g_2 + y^*} X(s) + y(0),$$

$$(s + \mu_3)Z(s) = \frac{p_2y^*}{g_2 + y^*} X(s) + \frac{p_2g_3x^*}{(g_3 + y^*)^2} Y(s) + z(0).$$

Where $K_1(s) = \int_{-\tau_1}^0 e^{-st}y(t)dt$ $K_2(s) = \int_{-\tau_2}^0 e^{-st}x(t)dt$ $K_3(s) = \int_{-\tau_2}^0 e^{-st}z(t)dt$

For $E^*(x^*, y^*, z^*)$ to be locally asymptotically stable, it is necessary and sufficient that all poles of $X(s)$ have negative real parts. For the condition for local asymptotic stability of $E^*(x^*, y^*, z^*)$ given by

$$Im H(i\eta_0) > 0 \tag{3.13}$$

$$Re H(i\eta_0) = 0 \tag{3.14}$$

where $H(s) = s^3 + a_1s^2 + a_2s + a_3 + (c_1s^2 + (b_2 + c_2)s + c_3)e^{-s\tau}$ and η_0 is the smallest positive root of Eq. (3.14)

In this case, Eq. (3.13) and (3.14) gives

$$a_2\eta_0 - \eta_0^3 > (b_3 + c_3) \sin(\eta_0\tau) - (b_2 + c_2)\eta_0 \cos(\eta_0\tau) - c_1\eta_0^2 \sin(\eta_0\tau) \tag{3.15}$$

$$a_3 - a_1\eta_0^2 = c_1\eta_0^2 \cos(\eta_0\tau) - (b_3 + c_3) \cos(\eta_0\tau) - (b_2 + c_2)\eta_0 \sin(\eta_0\tau) \tag{3.16}$$

Now, if Eq. (3.15) and Eq. (3.16) are satisfied simultaneously, they are sufficient conditions to guarantee stability, which are now used to get an estimate of the length of time delay. The aim is to find an upper bound η_+ to η_0 , independent of τ , and then to estimate τ so that Eq. (3.15) holds true for all values of η , $0 \leq \eta \leq \eta_+$ and hence, in particular at $\eta = \eta_0$.

Equation (3.16) is rewritten as

$$a_1\eta_0^2 = a_3 - c_1\eta_0^2 \cos(\eta_0\tau) + (b_3 + c_3) \cos(\eta_0\tau) + (b_2 + c_2)\eta_0 \sin(\eta_0\tau) \tag{3.17}$$

Maximizing: $a_3 - c_1\eta_0^2 \cos(\eta_0\tau) + (b_3 + c_3) \cos(\eta_0\tau) + (b_2 + c_2)\eta_0 \sin(\eta_0\tau)$

Subject to $|\sin(\eta_0\tau)| \leq 1, |\cos(\eta_0\tau)| \leq 1$

$$|a_1\eta_0^2| \leq |a_3| + |c_1\eta_0^2| |\cos(\eta_0\tau)| + |(b_3 + c_3)| |\cos(\eta_0\tau)| + |(b_2 + c_2)\eta_0| |\sin(\eta_0\tau)| \tag{3.18}$$

$$\eta_+ = \frac{|b_2| + |c_2| + \sqrt{b_2^2 + c_2^2 + 4(|a_1| - |c_1|)(|a_3| + |b_3| + |c_3|)}}{2(|a_1| - |c_1|)} \tag{3.19}$$

Then from Eq. (3.19) $\eta_0 \leq \eta_+$, From Eq. (3.15)

$$\eta_0^2 < a_2 - \frac{(b_3 + c_3)}{\eta_0} \sin(\eta_0\tau) + (b_2 + c_2) \cos(\eta_0\tau) + c_1\eta_0 \sin(\eta_0\tau) \tag{3.20}$$

Since $E^*(x^*, y^*, z^*)$ is a locally asymptotically stable for $\tau = 0$, for sufficiently small $\tau > 0$, the inequality (3.20) will continue to hold.

Substituting Eq. (3.17) in Eq. (3.20),

$$\begin{aligned} & \frac{1}{a_1} (a_3 + (b_3 + c_3) \cos(\eta_0\tau) - c_1\eta_0^2 \cos(\eta_0\tau) + (b_2 + c_2)\eta_0 \sin(\eta_0\tau)) \\ & < a_2 + (b_2 + c_2) \cos(\eta_0\tau) - \frac{(b_3 + c_3)}{\eta_0} \sin(\eta_0\tau) + c_1\eta_0 \sin(\eta_0\tau) \\ & \quad a_3 + (b_3 + c_3) \cos(\eta_0\tau) - c_1\eta_0^2 \cos(\eta_0\tau) + (b_2 + c_2)\eta_0 \sin(\eta_0\tau) \\ & < a_1 a_2 + a_1(b_2 + c_2) \cos(\eta_0\tau) - \frac{a_1(b_3 + c_3)}{\eta_0} \sin(\eta_0\tau) + a_1 c_1 \eta_0 \sin(\eta_0\tau) \\ & \quad (b_3 + c_3 - c_1\eta_0^2 - a_1(b_2 + c_2)) \cos(\eta_0\tau) \\ & \quad + \left((b_2 + c_2)\eta_0 - a_1 c_1 \eta_0 + \frac{a_1(b_3 + c_3)}{\eta_0} \right) \sin(\eta_0\tau) < a_1 a_2 - a_3 \end{aligned}$$

By subtracting $b_3 + c_3 - c_1\eta_0^2 - a_1(b_2 + c_2)$ from both sides,

$$\begin{aligned} & (b_3 + c_3 - c_1\eta_0^2 - a_1(b_2 + c_2)) (\cos(\eta_0\tau) - 1) + \left((b_2 + c_2)\eta_0 - a_1 c_1 \eta_0 + \frac{a_1(b_3 + c_3)}{\eta_0} \right) \sin(\eta_0\tau) \\ & < a_1 a_2 - a_3 - b_3 - c_3 + c_1\eta_0^2 + a_1(b_2 + c_2) \end{aligned} \tag{3.21}$$

From the fact that $\sin(\eta_0\tau) \leq \eta_0\tau$ and $1 - \cos(\eta_0\tau) = 2 \sin^2\left(\frac{\eta_0\tau}{2}\right)$

$$\begin{aligned} (b_3 + c_3 - c_1\eta_0^2 - a_1 b_2 - a_1 c_2) &= (c_1\eta_0^2 + a_1 b_2 + a_1 c_2 - b_3 - c_3) 2 \sin^2\left(\frac{\eta_0\tau}{2}\right) \\ &\leq \frac{1}{2} |c_1\eta_+^2 + a_1 b_2 + a_1 c_2 - b_3 - c_3| \eta_+^2 \tau^2 \end{aligned}$$

Similarly,

$$\begin{aligned} \left((b_2 + c_2)\eta_0 - a_1 c_1 \eta_0 + \frac{a_1(b_3 + c_3)}{\eta_0} \right) \sin(\eta_0\tau) &= \frac{((b_2 + c_2)\eta_0^2 - a_1 c_1 + a_1 b_3 + a_1 c_3) \sin(\eta_0\tau)}{\eta_0} \\ &\leq |(b_2 + c_2)\eta_+^2 - a_1 c_1 + a_1 b_3 + a_1 c_3| \tau \end{aligned}$$

Eq. (3.21) can be written as $L_1\tau^2 + L_2\tau < L_3$,

Where $L_1 = \frac{1}{2} |c_1\eta_+^2 + a_1 b_2 + a_1 c_2 - b_3 - c_3| \eta_+^2$, $L_2 = |(b_2 + c_2)\eta_+^2 - a_1 c_1 + a_1 b_3 + a_1 c_3|$

$$\begin{aligned} L_3 &= a_1 a_2 - a_3 - b_3 - c_3 + c_1\eta_+^2 + a_1(b_2 + c_2) \\ \tau_+ &= \frac{-L_2 + \sqrt{L_2^2 + 4L_1 L_3}}{2L_1} \end{aligned}$$

Then, for $0 \leq \tau \leq \tau_+$ the Nyquist criterion holds, and τ_+ is the estimate for the length of delay for which the stability is preserved.

Prabakaran Karunakaran et al.,

Analysis Hopf Bifurcation method

In his section, we discuss the Hopf Bifurcation method: From the characteristic equation (3.8), suppose it has a simple pair of pure imaginary eigenvalues $\lambda = \pm i\omega, \omega > 0$. By the same analysis made for local stability with delay, there exist $\omega > 0$ when condition (3.12) is satisfied.

Transversality condition,

$$\lambda^3 + a_1\lambda^2 + a_2\lambda + a_3 + (c_1\lambda^2 + (b_2 + c_2)\lambda + (b_3 + c_3))e^{-\lambda\tau} = 0$$

Differentiating the characteristic equation with respect to τ

$$\begin{aligned} & (3\lambda^2 + 2a_1\lambda + a_2 + (2c_1\lambda + (b_2 + c_2) - c_1\tau\lambda^2 - (b_2 + c_2)\tau\lambda - (b_3 + c_3)\tau)e^{-\lambda\tau}) \frac{d\lambda}{d\tau} \\ & = \lambda(c_1\lambda^2 + (b_2 + c_2)\lambda + (b_3 + c_3))e^{-\lambda\tau} \\ \frac{d\lambda}{d\tau} & = \frac{(c_1\lambda^3 + (b_2 + c_2)\lambda^2 + (b_3 + c_3)\lambda)e^{-\lambda\tau}}{3\lambda^2 + 2a_1\lambda + a_2 + (2c_1\lambda + (b_2 + c_2) - c_1\tau\lambda^2 - (b_2 + c_2)\tau\lambda - (b_3 + c_3)\tau)e^{-\lambda\tau}} \end{aligned}$$

We have, $\left(\frac{d\lambda}{d\tau}\right)^{-1} = \frac{3\lambda^2 + 2(a_1 + c_1)\lambda + (a_2 + b_2 + c_2)}{\lambda(c_1\lambda^2 + (b_2 + c_2)\lambda + (b_3 + c_3))e^{-\lambda\tau}} - \frac{\tau}{\lambda}$

$$\begin{aligned} \left(\frac{d\lambda}{d\tau}\right)^{-1} & = \frac{3\lambda}{(c_1\lambda^2 + (b_2 + c_2)\lambda + (b_3 + c_3))e^{-\lambda\tau}} + \frac{2(a_1 + c_1)}{(c_1\lambda^2 + (b_2 + c_2)\lambda + (b_3 + c_3))e^{-\lambda\tau}} \\ & + \frac{(a_2 + b_2 + c_2)}{\lambda(c_1\lambda^2 + (b_2 + c_2)\lambda + (b_3 + c_3))e^{-\lambda\tau}} - \frac{\tau}{\lambda}, \quad \lambda = i\omega (\omega > 0) \\ \left(\frac{d\lambda}{d\tau}\right)^{-1}_{\lambda=i\omega} & = \frac{3c_1\omega^3 \sin(\omega\tau) + 3(b_2 + c_2)\omega^2 \cos(\omega\tau) - 3(b_3 + c_3)\omega \sin(\omega\tau)}{(-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3) \cos(\omega\tau))^2} \\ & + \frac{(-c_1\omega^2 \sin(\omega\tau) + (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3) \sin(\omega\tau))^2}{2(a_1 + c_1) \left(\frac{-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3) \cos(\omega\tau)}{-(-c_1\omega^2 \sin(\omega\tau) + (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3) \sin(\omega\tau))i} \right)} \\ & + \frac{(a_2 + b_2 + c_2) \left(\frac{-c_1\omega^3 \sin(\omega\tau) - (b_2 + c_2)\omega^2 \cos(\omega\tau) + (b_3 + c_3)\omega \sin(\omega\tau)}{-(-c_1\omega^3 \cos(\omega\tau) + (b_2 + c_2)\omega^2 \sin(\omega\tau) + (b_3 + c_3)\omega \cos(\omega\tau))i} \right)}{(-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3) \cos(\omega\tau))^2} \\ & + \frac{(-c_1\omega^2 \sin(\omega\tau) + (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3) \sin(\omega\tau))^2}{(-c_1\omega^3 \sin(\omega\tau) - (b_2 + c_2)\omega^2 \cos(\omega\tau) + (b_3 + c_3)\omega \sin(\omega\tau))^2} + \frac{i\tau\omega}{\omega^2} \\ & + \frac{(-c_1\omega^3 \cos(\omega\tau) + (b_2 + c_2)\omega^2 \sin(\omega\tau) + (b_3 + c_3)\omega \cos(\omega\tau))^2}{(-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3) \cos(\omega\tau))^2} \end{aligned}$$

Identify the real part of $\left(\frac{d\lambda}{d\tau}\right)^{-1}_{\lambda=i\omega}$ and after some simplification we get,

$$\begin{aligned} Re\left(\frac{d\lambda}{d\tau}\right)^{-1}_{\lambda=i\omega} & = \frac{3c_1\omega^3 \sin(\omega\tau) + 3(b_2 + c_2)\omega^2 \cos(\omega\tau) - 3(b_3 + c_3)\omega \sin(\omega\tau)}{(-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3) \cos(\omega\tau))^2} \\ & + \frac{(-c_1\omega^2 \sin(\omega\tau) + (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3) \sin(\omega\tau))^2}{2c_1(a_1 + c_1)\omega^2 \cos(\omega\tau) - 2(a_1 + c_1)(b_2 + c_2)\omega \sin(\omega\tau)} \\ & - \frac{-2(a_1 + c_1)(b_3 + c_3) \cos(\omega\tau)}{(-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3) \cos(\omega\tau))^2} \\ & + \frac{(-c_1\omega^2 \sin(\omega\tau) + (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3) \sin(\omega\tau))^2}{(-c_1\omega^3 \sin(\omega\tau) - (b_2 + c_2)\omega^2 \cos(\omega\tau) + (b_3 + c_3)\omega \sin(\omega\tau))^2} \end{aligned}$$

Prabakaran Karunakaran et al.,

$$\begin{aligned}
 & \frac{c_1(a_2 + b_2 + c_2)\omega^3 \sin(\omega\tau) + (a_2 + b_2 + c_2)(b_2 + c_2)\omega^2 \cos(\omega\tau)}{- (a_2 + b_2 + c_2)(b_3 + c_3)\omega \sin(\omega\tau)} \\
 & \frac{(-c_1\omega^3 \sin(\omega\tau) - (b_2 + c_2)\omega^2 \cos(\omega\tau) + (b_3 + c_3)\omega \sin(\omega\tau))^2}{+ (-c_1\omega^3 \cos(\omega\tau) + (b_2 + c_2)\omega^2 \sin(\omega\tau) + (b_3 + c_3)\omega \cos(\omega\tau))^2} \\
 \text{Re} \left(\frac{d\lambda}{d\tau} \right)^{-1} \neq 0, \text{ Provided that } & \frac{3c_1\omega^3 \sin(\omega\tau) + 3(b_2 + c_2)\omega^2 \cos(\omega\tau) - 3(b_3 + c_3)\omega \sin(\omega\tau)}{(-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3)\cos(\omega\tau))^2} \\
 & + (-c_1\omega^2 \sin(\omega\tau) + (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3)\sin(\omega\tau))^2 \\
 & \frac{2c_1(a_1 + c_1)\omega^2 \cos(\omega\tau) - 2(a_1 + c_1)(b_2 + c_2)\omega \sin(\omega\tau) - 2(a_1 + c_1)(b_3 + c_3)\cos(\omega\tau)}{(-c_1\omega^2 \cos(\omega\tau) + (b_2 + c_2)\omega \sin(\omega\tau) + (b_3 + c_3)\cos(\omega\tau))^2} \\
 & + (-c_1\omega^2 \sin(\omega\tau) + (b_2 + c_2)\omega \cos(\omega\tau) - (b_3 + c_3)\sin(\omega\tau))^2 \\
 & \frac{c_1(a_2 + b_2 + c_2)\omega^3 \sin(\omega\tau) + (a_2 + b_2 + c_2)(b_2 + c_2)\omega^2 \cos(\omega\tau)}{- (a_2 + b_2 + c_2)(b_3 + c_3)\omega \sin(\omega\tau)} \\
 & \frac{(-c_1\omega^3 \sin(\omega\tau) - (b_2 + c_2)\omega^2 \cos(\omega\tau) + (b_3 + c_3)\omega \sin(\omega\tau))^2}{+ (-c_1\omega^3 \cos(\omega\tau) + (b_2 + c_2)\omega^2 \sin(\omega\tau) + (b_3 + c_3)\omega \cos(\omega\tau))^2} \neq 0 \tag{4.1}
 \end{aligned}$$

Transversality conditions hold. That is, the eigenvalues cross the imaginary axis with nonzero speed. As a result, the system undergoes Hopf bifurcation at $\tau = \tau_0$ when conditions (3.12) and (4.1) are satisfied.

CONCLUSIONS

In this study, we have introduced the cancer mathematical model developed by incorporating time delay into the model. The positivity of the solution of the model was proved. Equilibrium points of the system are calculated. The model was linearized using Jacobian matrix about the positive equilibrium point and the local stability conditions of the system without and with time delay was stated by using Routh Hurwitz stability criteria. Estimation of the length of delay to preserve stability was also proved by Nyquist criteria. The system undergoes Hopf bifurcation under a certain conditions at specified values of time delay.

ABSTRACT

Brown spot disease in paddy is brought on by the soil borne pathogenic fungus *Helminthosporium oryzae*. At several stages, including storage, seed germination, seedling establishment, vegetable growth and reproductive stage, the pathogen is known to cause damage. As it includes the direct disinfection of the soil, managing the pathogen *H.oryzae* in the soil is reared as a crucial stage in the control of the disease. The pathogen may be affected directly or indirectly by the agricultural fungicide and the byproducts of their degradation that get into the soil. The fungicide needs to be reduced because it has a significant environmental impact but also has more suppressing activity.

Keywords: *Helminthosporium oryzae*, fungicide, environment, seed germination and seedling establishment.

Arulmozhi et al.,

INTRODUCTION

In soil microbial communities, fungi play harmful roles as pathogens, mycorrhizal mutualists, and decomposers. This substance spreads through soil organisms and plant roots (Breure, 2004). Every year, a lot of decomposable organic matter is introduced to agricultural soil as a result of plant leftovers and animal manure having a big impact on the microbial population in the soil. The traditional agricultural field's fungus population and soil nutrient fluctuation are connected (Kalaiselvi and Panneerselvam, 2011). The fungi's population and species composition are equally influenced by the types of plants that grow on the soil (Hackel et al., 2000). Fungi are significant potential suppliers of new chemicals notwithstanding this need (Hyde, 2001). In many ecosystems, fungi are essential to the breakdown of plant substrates (Polishook et al., 1996; Aoki and Tokumasu, 1995). In our nation, agriculture is a very important industry. As science and technology have advanced in recent years, agricultural development has changed quickly. It's commonly acknowledged. The condition of the soil declines when chemical fertilizers and pesticides are applied frequently and heavily. Pollution of the environment results from this. Therefore, rice growers should develop and apply a more comprehensive, economical, and environmentally beneficial approach. One of the most frequently cultivated and used food crops in the world is rice (*Oryza sativa* L.) (Cottyn et al., 2001). The second-largest producer of rice is India. India could hit a record in rice production of 100 million tonnes in 2010-11. The dietary staple crop is rice. It thrives in hot, humid weather because it is a tropical plant. The majority of rice is grown in regions that are rain fed and get a lot of rain each year. It requires a temperature of about 25 °C and more than 100 cm of rain. In locations with relatively little rainfall, rice is also farmed by irrigation. In the world, there are numerous varieties of rice.

Tamilnadu's rice varieties are IR-20, IR-8, Aduthurai (ADT)- 36, ADT- 43, Kalsar, Co-43 and Ponnai, etc. It is also a good nutrition source of carbohydrate, magnesium, potassium, iron, phosphorus, zinc and copper. The use of science and technology in nanotechnology is to manipulate matter at the molecular level. The properties of matter differ dramatically from their macroscopic bulk properties at the nanoscale level. The ability to design, characterise, produce, and use structures, devices, and systems by manipulating shape and size at the nanoscale scale is known as nanotechnology (Mansoor, 2005). Recently, research on the biological synthesis of nanoparticles has been conducted. In order to create nanoparticles, numerous biological resources, such as plants, fungus, and bacteria, have been used (Borase et al., 2014). A vast variety of fungi, including *Fusarium oxysporum* (Ahmad et al., 2003), *Aspergillus fumigatus* (Bhainsa and D'Souza, 2006), and *Aspergillus niger*, are able to manufacture silver nanoparticles (AgNPs) extracellularly (Gade et al., 2008). Brown spot disease in paddy is brought on by the soil-borne pathogenic fungus *Helminthosporium oryzae*. It is known that the pathogen can harm plants at several phases, including storage, seed germination and seedling establishment, vegetative growth, and the reproductive stage (Shabana et al., 2008). Additionally, soil-borne antagonistic fungal biocontrol techniques were developed (Haran et al., 1996; Zhihe et al., 1998; Panneerselvam and Saravanamuthu, 1996). Antibiotics' involvement in biological control has been demonstrated using antagonistic interactions and cell-free culture filtrate (Naik and Sen, 1992; Panneerselvam and Saravanamuthu, 1994). The following goals have been accomplished with the work in question, Selection of potential antagonistic fungi by dual culture experiments, analysis of the physicochemical characteristics of paddy field soil sample, isolation and identification of soil fungi, synthesis of silver nanoparticle from the isolated fungi and its antimicrobial activity, and study of the impact of culture filtrate of antagonist fungi against plant pathogen are all steps in the process.

MATERIALS AND METHODS

Collection of Soil Sample and analysis of physico-chemical parameters

50 gm soil samples were taken from rice fields in the Thanjavur District's Chozhankarai and Orathanadu. Samples were taken from the soil's top 2 to 5 cm of depth. To create a composite sample, the samples were combined (250g). For future usage, the combined soil sample was kept in the refrigerator. Various physicochemical parameters, including pH (Mishra, 1968), electrical conductivity (Levine, 2001), organic carbon (Allison, 1965), organic matter (Stevenson and Cole, 1999), accessible nitrogen (Jackson, 1956), phosphorus (Jackson, 1956), and potassium (Jackson, 1956), total calcium (Brady and

**Arulmozhi et al.,**

Weil, 2002), magnesium (Cresser *et al.*, 1993), zinc (Chamberlain *et al.* 2000), copper, iron, and manganese, were analyzed on the obtained soil samples according to defined procedures.

Isolation of soil Mycoflora

The fungi were isolated from rice field soils using the Warcup (1950) dilution plating procedure. Weighted 1gm of soil, it was diluted in 10 ml of distilled water. Separate Petri plates containing one ml of the diluted (10^{-3} , 10^{-4} , and 10^{-5}) sample were filled with sterile PDA medium before being gently tilted to allow for solidification. Following solidification, the inoculation plates were incubated for 7 days at room temperature (24 ± 2 °C) in a dust-free cabinet. For each dilution, two duplicates were kept. Before pouring the medium into Petri plates, a 1% solution of streptomycin was applied to stop fungus development. Different colour and morphological colonies developing on PDA plates were counted independently. With the aid of a pair of needles, a section of the colony's developing edge was taken out and stained with lacto phenol cotton blue before being mounted on a clean slide. In order to facilitate the staining and, if necessary, eliminate air bubbles, the slide was gently heated in a spirit lamp. With the aid of tissue paper, the surplus stain was removed, and after that, the cover slip was sealed with clear nail polish. With the use of a compound microscope, the slide was examined.

Identification of soil fungi

The fungi were identified by using standard manuals, such as A manual of soil fungi (Gillman, 1957), Dematiaceous Hyphomycetes (Ellis, 1971), More Dematiaceous Hyphomycetes (Ellis, 1976) and Hyphomycetes (Subramanian, 1971), Manual of *Aspergillus* (Raper and Fennell, 1965) and Manual of *Penicillia* (Raper and Thom, 1949).

Synthesis of silver nanoparticle from isolated fungi (Naveen et al., 2010)

45 ml of aqueous 5 mM silver nitrate was added to 5 ml of fungal extract in an Erlenmeyer flask, which was then incubated for 24 hours at room temperature and in the dark. In order to remove unreacted silver nitrate and endophytic extracts, the endophytic extract with silver nitrate was centrifuged at 10,000 rpm for 10 min. The supernatant was then discarded, and the pellet was repeatedly washed with double-distilled water. The excess pure pellet was kept in storage for future research.

Antifungal activity of silver nanoparticles against plant pathogen (Yassin et al., 2013)

After two days of fungus growth on PDA, a plug (5 mm) of mycelium was removed from the colony's margins (the hyphal tip) and deposited on fresh PDA Petri dishes. Then, 25, 50, 75, and 100 μ l of each of the four AgNP concentrations were added to the medium. 48 hours of incubation on plates at 28°C. Records of the zone of inhibition were made. The experiment was carried out three times with three replicates per concentration.

Dual culture method (Skidmore and Dickinson, 1976)

Using a dual culture experiment, the colony interactions between *Helminthosporium oryzae* and the soil fungus were investigated. *Aspergillus flavus*, *Aspergillus niger*, *Aspergillus terreus*, and *Penicillium sp.*, the test organism and soil fungus, were each cultivated independently on PDA medium. Then, agar blocks were cut from the margins of the several kinds of soil fungi that were actively developing, and test organisms were inoculated right across from one another, spaced about 3 cm apart. At 24-hour intervals, three replicates and the corresponding control for each set were recorded. The pathogen's growth inhibition % was calculated. When the fungus reached equilibrium and the growth stopped fluctuating after that, an assessment was made. The evaluation was done for both organisms because they mutually hindered one another.

$$\text{Percentage of inhibition growth} = \frac{r - r^1}{r} \times 100$$

r = growth of the fungus from the centre of the colony towards the centre of the plate in the absence of antagonistic fungi.

r¹ = growth of the fungus from centre of the colony towards the antagonistic fungus.

**Arulmozhi et al.,****Culture filtrate method (Skidmore and Dickinson, 1976)**

The actively growing edge of each species of soil fungi was sliced into equal-sized (5 mm diameter) agar blocks, which were then inoculated into 250 ml conical flasks containing 100 ml sterile potato dextrose broth. For 15 days, the flasks were incubated at 25 °C. The cultures were filtered after incubation using Whatman No. 1 filter paper and a Seitz filter (G5). For later usage, the filtrates were put into conical flasks and kept at 4°C. Separate additions of the culture filtrates to the cooled PDA medium produced concentrations of 5, 10, 15 and 20%. Separately distributed in Petri dishes, the modified medium was given time to harden.

$$\text{Percentage in inhibition of growth} = \frac{\text{growth in control} - \text{growth in treatment}}{\text{growth in control}} \times 100$$

RESULTS**Soil sample collection and analysis of physico-chemical parameters**

Soil sample collected from Chozhankarai, Orathanadu, Thanjavur District. Analysis was done on the physico-chemical composition of soil from paddy fields in the Thanjavur district. The following parameters were measured: pH, electrical conductivity, organic carbon, organic matter, available nitrogen, phosphorus, potassium, zinc, copper, manganese, cation exchange capacity, calcium, magnesium, sodium, and potassium. The values were 7.6, 0.41 (dsm⁻¹), 0.39 (%), 0.32 (%), 98.5 (mg/kg), 4.25 (mg/kg), 140 (mg/kg), 1.15 (ppm), 1.10 (ppm), 7.52 (ppm) (Table 1).

Isolation of fungi from paddy field soil

The objective of the present investigation was to separate and identify the isolated fungi from the soil sample from a paddy field. For the isolation of fungi, a 10⁻³ dilution is a more suitable dilution. Five different species, including *Aspergillus flavus*, *Aspergillus niger*, *Aspergillus terreus*, *Penicillium sp.*, and *Helminthosporium oryzae*, were isolated from soil samples (Table 2 and 3).

Nanoparticle's antimicrobial efficacy against *Helminthosporium oryzae*

Helminthosporium oryzae was used as the test organism for silver nanoparticle antimicrobial activity. Nanoparticles with a 0.32 0.10 mm diameter zone were observed in *A. flavus* synthesis at a concentration of 100 µl. Compared to a silver nanoparticle concentration of 25 µl, 100 µl of extract showed the largest zone of inhibition (Table 4).

Colony interactions between soil fungi and *Helminthosporium oryzae*

The impact of prospective geofungi's hostile behaviour on the wilt disease pathogen *Helminthosporium oryzae* was examined. In dual culture studies, antagonistic *Aspergillus flavus* demonstrated exceptional performance with a 40.0 0.42 mm zone of inhibition against *Helminthosporium oryzae* (11.0 0.38 mm), followed by *A. niger* (20.3 0.26 mm), *A. terreus* (12.6 0.32 mm), and *Penicillium sp.* (23.0 0.12 mm) (Table- 5).

Effect of culture filtrates of soil fungi on the growth of *Helminthosporium oryzae*

Aspergillus flavus antagonistic fungi's culture filtrate inhibition percentages of 5, 10, 15, and 20% were measured. *Aspergillus flavus*, a possible adversary, grew to diameters of 5.33 mm, 6.29 mm, 8.15 mm, and 10.3 mm in suspensions of culture filtrates at 5, 10, 15, and 20%, respectively (Table -6).

DISCUSSIONS

The proper operation of newly introduced microbial inoculants and their effects on soil health are dependent on the functioning of soil microorganisms in biogeochemical processes that determine plant productivity. A thorough investigation of the indigenous community's soil microbe diversity, distribution, and behaviour in soil environments has been conducted (Saravanakumar et al., 2010). An essential primary nutrient for the growth of plants is nitrogen. The nitrogen concentration ranged from 89.6 to 142.6 mg/kg in the current experiment. According to Ambikapathy et al., (2001), some fungi have the capacity to grow quickly on organic substrates in dry, acidic, coarse-textured soil and so

Arulmozhi et al.,

access nutrients that are available to unicellular microorganisms. After the rainy season, the macronutrients like N, P, and K as well as the organic material were abundant, according to Saravanakumar and Kaviyarasan (2010). The number of soil microorganisms also increased. Additionally, other researchers have demonstrated that soil amendments with organic content boosted soil microbial activity, which in turn raised the fungus population (Grayston *et al.*, 2004 and Girvan *et al.*, 2004). According to a recent paper by Kalaiselvi and Panneerselvam (2011), over 30 different species of Ascomycetes and Phycomycetes were isolated from Thanjavur District paddy fields. The subsoil had the highest fungus count during the rainy season. At each location, *Aspergillus*, *Trichoderma*, and *Penicillium* were the most prevalent genera. Geographical distribution of soil fungus in the agricultural area influenced by the plant community (Chung *et al.*, 2007; Carney and Matson, 2006). The colour shift associated with the creation of silver nanoparticles (Ag NPs) (Sadowski *et al.*, 2008). The control, however, showed no change in hue. It has been suggested that fungus extracellular enzymes are essential for the conversion of silver ions into Ag NPs. Gradual changes to the yellowish colour typically signal the presence of the enzyme nitrate reductase, which controls the manufacture of Ag NPs (Naveen *et al.*, 2010). In this investigation, aflatoxigenic *A. flavus* var. *columnaris* growth was successfully inhibited by biosynthesized Ag NPs made with *P. citrinum*. As the concentration of Ag NPs increased, the fungal growth generally reduced Yassin *et al.*, (2017)

SUMMARY AND CONCLUSIONS

Fungal species were isolated from the paddy field soil sample for the current experiment. The rhizosphere soil sample was used to assess the physiochemical parameters such as pH, electrical conductivity, organic carbon, organic matter, accessible nitrogen, phosphorus, potassium, zinc, copper, iron, manganese, calcium, magnesium, sodium, and potassium. The soil samples were tested at dilutions of 10^{-3} , 10^{-4} , and 10^{-5} , and results showed 17, 8 and 5 CFU/ml, respectively. Lactophenol cotton blue staining was used to identify the colonies that were obtained. According to established fungal guides, the fungus *Aspergillus flavus*, *Aspergillus niger*, *Aspergillus terreus*, *Penicillium sp.*, and *Helminthosporium oryzae* were conformed. The isolated soil fungus *Aspergillus flavus*, *A. terreus*, *A. niger*, and *Penicillium sp.* were used to make nanoparticles. Comparing *A. flavus* synthesis nanoparticle and 100 μ l concentration to other concentrations and other fungi, the highest zone of inhibition was observed. The impacts of fungi that are incompatible *Aspergillus flavus*, *Aspergillus niger*, *Penicillium sp.* tests were conducted. The competing fungi displayed 40.0 0.42, 20.3 0.26, and Zones of inhibition against *H. oryzae* were 12.6 0.32 and 23 0.12 mm.

ABSTRACT

Ayurveda, categorize various skin disorders under a broad heading known as “Kustha”. Kustha encompasses a range of skin diseases, and it is further classified into two main types- Mahakustha and Kushudra. Acharya Charaka included Dadru in the category of Kshudrakustha. It was added into Mahakustha by Acharya Sushruta and Acharya Vagbhata. Dadru is the subtype of Kshudrakustha. Dadru is the pitta-kapha dominant. In this present case study 40 year old male patient was diagnosed with the Dadrukustha and he was treated with the Ayurvedic medications, good hygiene and dietary habit.

Keywords: Ayurveda, Kustha, Dadru, Kshudrakustha, skin diseases.

INTRODUCTION

Skin is the primary superficial layer of the body. It performs as a sensory organ as well. It carries out a number of physiological processes and prevents the spread of infections and other organisms into the body. But the truth is that superficial infections can spread through the skin. Additionally, skin infections might cause psychological disturbances. Ayurveda, categorize various skin disorders under a broad heading known as “Kustha”. [1]Kustha encompasses a range of skin diseases, and it is further classified into two main types- Mahakustha and Kushudra. [2]Acharya Charaka included Dadru in the category of Kshudrakustha. It was added into Mahakustha by Acharya Sushruta and Acharya Vagbhata. Dadru is the subtype of Kshudrakustha. Dadru is the pitta-kapha dominant. In this, red coloured mandala shaped papule is produced. Kandu remains more, there are pimples on edges and a circle-shaped papule appears in the skin located in the middle. This part is sometime dark in colour and has ridges. [3]According to Ayurveda all types of skin diseases comes under the Kustha Rogas and Kshudrakustha refers to minor skin disorders or dermatological condition. [4] In mordender matology, “Dadru” is a term used in Ayurveda to refer to skin condition that are similar to what is known in western medicine as tinea or ringworm. The term “tinea” is derived from the Latin word for worm, which reflects the historical belief that these infections were

**Dhvani S Patel and Vaidehi V Raole**

caused by worm like parasites. Tinea is the most common fungal infection in all the age of population. Tinea, commonly known as ringworm, is a fungal infection that can affect different parts of the body, here are some common types,

1. Tinea corporis (Ringworm of the Body): This type affects the general skin and can appear as red, scaly patches that may be itchy.
2. Tinea cruris (Jock Itch): This type affects the groin area and inner thighs. It often appears as a red, itchy rash in the shape of a ring.
3. Tinea onychomycosis (Nail Fungus): This type affects the nails, causing them to become thickened, discoloured, and brittle.
4. Tinea capitis (Ringworm of the Scalp): This type affects the scalp and hair. It can cause hair loss, scaling, and sometimes painful, swollen areas.[5]

In some case, many anti-fungal and anti-histaminic medicine are used to treat the fungal infection but, in such cases, reoccurrence is often seen, Ayurveda explain the many medications to treat the kustharogas, in this present case study some of them ayurvedic medicines are used to cure the diseases. Recurrence was observed in the current patient following the usage of allopathic medications, so the patient was treated with the Ayurvedic medicines given are Arogyavardhinivati, Gandhakrasayan, Sukha sarakvati, Sutsekharvati, VidangadiLepa.

MATERIALS AND METHODS

CASE REPORT

Place of study: Patient was treated on the OPD basis.

Present history:

A 40year old male patient came to OPD on month of June with chief complain of

1. Round ring like patches on both the thigh, buttocks and groin region.
2. For 1 year itching was on & off on both the buttocks and groin region,
3. Sever itching at the patches,
4. Reddish black coloured patches on and around region,
5. Last 3 months, there was burning sensation sometimes after itching.

Patient has been suffering from above said complaint since last 3 months. previously, he was diagnosed with the Tinea cruris when he has consulted the allopathy dermatologist for above said complaints. That time he was treated with the allopathic medications like anti-fungal cream, oral medications like itraconazole, dusting powder etc and hasan initial alleviation but when treatment was stopped all symptoms that were being treated were reappeared.

Past History

Patient has No/DM/HTN/Thyroid or any surgical history.

Ahara: Non-veg- 2-3 times weekly(chicken and egg), intake of spicy, oily and junk food (vada pav, missal pav), intake of *Dahi* at night 2-3 times weekly, less water intake (up to 1 lit/day)

Vihara: Night shift weekly 3 days, Ratri Jagran, Diwa Swapna, Sitting for long period.

Local Examination

Irregular area over the thigh, groin and buttocks region, 7-8 circular erythematous patches with some vesicular eruption over the groin and buttocks. colour is reddish black, no odour is found, Elevation is present, mild inflammation and pain, Dry in nature.

Diagnosis: Dadrukustha

**Dhvani S Patel and Vaidehi V Raole****Therapeutic intervention**

The patient was instructed to take following medications which were prescribed for 1 month and to follow up 1st on the interval of 14-15 days and again on 30th day.

Follow up- After 15 days

Along with medications patient was advised to follow: do's and dont's.

1. To avoid the non-veg food.
2. To avoid spicy, junk food, oily and salty food.
3. To avoid Alcohol consumption and reduced smoking.
4. To Wear loose fitting clean cotton cloths and change cloths 2 times a day.
5. Add Green leafy vegetable in eating.
6. Bath 2 times/day, morning and night.
7. To Avoid Day sleep.
8. Do the regular exerceice.

OBSERVATIONS AND RESULTS

Before and after the patient's treatment, the Dadru signs and symptoms were evaluated.

DISCUSSIONS

Dadru is the type of *kustha*. *Acharya charaka* included it in *kshudrakustha* but *Acharya Susruta* and *Vagbhata* considered as *mahakustha*. In this case, A safe and effective treatment for the patient was the goal of the current study. *Dadru* is Characterised by the development of discoloured lesions, itching and elevated patches. It is chronic in nature hence difficult to cure but it mostly affects to those who fail to maintain the hygiene standard or who have weakened immunity. *Dadru* is the *kapha-pittajadominantvyadhi* and it involve the *Rasavaha* and *Raktavahastrotas* hence the treatment has planned to alleviate the *dosha* with *kusthaghna* medicine. According to *Ayurveda*, *kustha* occurs when all the three *doshas* like *Vata* etc. become evil, skin, blood, flesh and non-metals become evil. Accumulation of fluid gives rise to *kustha*. Among the defects called *Vata* etc., *Vata* etc is written because of the presence of *Vata* disorder first. Then when other defects get aggravated and blood, flesh and non-metals gradually become evil, *kustha* is formed.

The mode of action of the drug are;

Arogyavardhini

The liver can be effectively cleansed by *arogyavardhini*, which raises the standard of raktadhatu. Kutaja functions as a pittavirechaka in *Arogyavardhini*, and other *SukshmaBhasma*'s of *abhrak*, *tamra*, and *lauha* have the power to open tiny *strotasas* and perform *sampraptivigahatana*. *Kajjali* is known for its *strotogamitvaas* well.[5] 7 *Maha kustha* and 11 *kshudrakustha* are produced on occurrence of disorder of colon. Due to the improper functioning of the colon, constipation is present in it. Then the air in the colon and the labia is bad. In this way the bile required for digestion is distorted. The phlegm fluid which helps in regulating the circulatory system in the colon gets contaminated. Then there is a delay in moving forward. As a result, the toxin is produced and absorbed into metals such as pectin and blood meat, or absorbed into micro-atoms, making the metals evil. Then there is aeration in that place; It gradually permeates the whole body and produces *kustha*. The small intestine and the colon are the principal places of air.⁽⁶⁾

The composition of the *ayurvedic* medicine generally destroys the malformations of small intestine and colon. *kustha* is produced in the colon and duodenum because of the venom produced by the defect itself. Hence, it is beneficial in curing diseases. *GandhakaRasayan:GandhakaRasayana* is used in skin diseases and as a blood purifier hence selected for the study. It is *Raktshodhak*, *Vranaropaka*, *Twachya*.[5]

Sukha sarakvati

It contains the combination of *Indravaruni* and *haritaki* used to regulate liver function and increase the flow of digestive enzymes. It also improves the digestion and enhances bowel tone.

Dhvani S Patel and Vaidehi V Raole

Sutsekharvati

Sutsekhar Ras is an important medicine used in *Ayurveda*, which acts on *Pitta Dosha* and it is effective on *Amla pitta*, *Vaman*, *Shula*, *Mandagni*, *Daha*, *Tridoshaja* *Atisara* hence this medicine has given to the patient because he was suffering from burning sensation.

Vidangadi Lepa

It contains the *Vidanga*, *Triphala*, *Pippali*, *Kustha*, *Chakramarda*, *Haridra*, *Sarshapa* antibacterial, antifungal, immune modulator properties which are helpful to treat the chronic skin infections.

CONCLUSIONS

The Ayurvedic treatments that are *Vidangadi Lepa* and other Oral medications are effective in the management of *Dadru* as *Kandu*, *Daha*, *TwakVaivarnya*, *Tod*, *Pidka*, *UtsannaMandala* all the symptoms are relieved mostly.

ABSTRACT

Wireless sensor networks have been used in many different applications over the past ten years. Energy efficiency presents a significant difficulty for such networks because of the limited energy resources of sensor nodes. The methods for lowering energy usage in the operating system, application, and hardware layers are covered in this research study. Additionally, the work examines methods for data aggregation, sleep scheduling, and energy-efficient routing. This work uses the Firefly Algorithm and Glowworm Swarm Optimization algorithms for the cluster head selection strategy. The cluster heads are chosen using the Glowworm Swarm Optimization, and their performance is then optimized using the Firefly Algorithm. Wireless sensor networks from the actual world are used as a testbed to assess the performance of the suggested strategy. The findings demonstrate that the suggested GWS-OFA based cluster head selection system outperforms the conventional techniques in terms of packet delivery ratio, network longevity, live nodes, and cluster head selection

Keywords: Optimized Firefly, Glow worm Swarm Optimization, Live Nodes, Cluster Head Selection, Packet Delivery Ratio.

**Mythili and Duraisamy****INTRODUCTION**

The wireless sensor network (WSN) cluster head selection schemes proposed by various authors respectively. These schemes aim to select the best node in a network as the cluster head in order to optimally manage the network. The scheme proposed by [1] used a fuzzy logic approach to select the cluster head. This approach takes into account the node's energy level, distance from the cluster head, and its connectivity to other nodes. The nodes with the highest values for these parameters are chosen as the most suitable candidates for the cluster head. Another approach proposed by [2] uses a genetic algorithm to select the cluster head. This algorithm uses a fitness function to evaluate the nodes in the network based on their energy level, distance, and connectivity. The nodes with the highest fitness scores are then selected as the cluster heads. [3] a game theoretic approach to cluster head selection. This approach uses game theory principles to assign weights to the nodes in the network based on their energy level, distance, and connectivity. The nodes with the highest weighted scores are then chosen as the cluster heads. According to several research made on energy optimization a distributed approach proposed by [4] a distributed consensus algorithm to select the cluster head. This algorithm works by having each node in the network broadcast its energy level, distance, and connectivity to its neighbors. The nodes with the highest values for these parameters are then chosen as the cluster heads. Each of these approaches has their own strengths and weaknesses, and can be used to select the optimal cluster head for a given WSN. The selection of the most appropriate scheme will depend on the network's requirements and the trade-offs that need to be made in order to achieve the desired performance. The network was remaining minor pitfalls for the further research work pre-dominantly.

LITERATURE SURVEY

The methods incorporate to optimize the energy involved with following steps using Genetic Algorithm (GA)[5]was used to select a cluster head from the available nodes in the wireless sensor network. Adaptive Neuro-Fuzzy Inference System (ANFIS) was used to assess the routing trustworthiness and weighted trust to demodulate attacker nodes. [6] Routing was used to determine the most efficient route for data transmission in the wireless sensor network. Weighted Trust was used to evaluate trustworthiness of nodes in the wireless sensor network and finally Demodulation was used to detect malicious nodes attempting to infiltrate the wireless sensor network respectively . Clustering a machine learning technique used to identify and group similar data points. clustering to identify density peaks in a dataset, Fast Search and Find of Density Peaks The algorithm based on the concept of local density were consider the number of points in a given neighborhood of a point. The algorithm works by iteratively searching the dataset and identifying local density peaks respectively. Data Analysis were used to interpret the results of their clustering algorithm and the visualizing clusters are examining the characteristics of each cluster respectively . Validation were used to ensure the accuracy of their results. The algorithm improved sunflower optimization algorithm [7] to optimize the process of selecting the best cluster head in the Internet of Things. This algorithm uses a modified flower structure to encode the clusters and their corresponding weights, as well as a modified search mechanism that combines different heuristics to detect the optimal cluster head. Different heuristics to were applied to improved sunflower optimization algorithm respectively. These heuristics included a number of techniques such as random selection, greedy selection, and the use of a penalty factor. The hybrid Artificial Bee Colony (ABC) algorithm[8] for cluster head selection in Mobile Ad Hoc Networks (MANETs), which combines the advantages of both global search and local search strategies[9] in order to improve the performance of the selection process respectively .These heuristics allowed the algorithm to search for better solutions and optimize the process of selecting the best cluster head and finally the simulations using the improved sunflower optimization algorithm to determine its effectiveness in selecting the best cluster head. [10] The paper is that it proposes a cluster head selection algorithm based on a hybrid optimization method, combining genetic algorithm and particle swarm optimization, to improve the performance of mobile ad hoc networks respectively. The simulations were conducted using both real and synthetic datasets to obtain an accurate reflection of the algorithm's performance in a network. The experiments were conducted using various metrics such as energy consumption, latency, and throughput. The results of the

Mythili and Duraisamy

experiments showed that the improved sunflower optimization algorithm outperformed other algorithms in selecting the best cluster head.

CLUSTER HEAD SELECTION

A cluster head selection method based on the energy of the node and the transmission range is proposed [11] to improve the stability and scalability of the ad hoc networks. The cluster head selection is based on the concept of distributed energy detection (DED). [12] The DED algorithm selects the best node as the cluster head based on the residual energy of the nodes, the transmission range of the nodes and the number of nodes in the network. The DED algorithm can reduce the number of control messages and improve the scalability of the wireless sensor network respectively. The objective function is a mathematical expression that measures the performance of a system or process, typically with the goal of finding an optimal solution. [13] In cluster-based wireless sensor networks, the objective function is used to select an optimal cluster head (CH) from a set of nodes based on certain criteria. The optimal CH selection can improve the performance of the network, such as energy efficiency, coverage, and connectivity. The objective function for optimal CH selection should take into account both the quality of the node selected as a CH and the cost associated with it. [14] The quality of the node can be evaluated by a combination of factors such as the node's energy level, node degree, and location. The cost associated with selecting a particular node as a CH should consider the communication cost between the CH and the other nodes in the network.

Mathematically, the objective function for optimal CH selection can be expressed as follows:

Objective Function = Quality (Node) – Cost (Communication)

Where Quality (Node) is a measure of the quality of the node selected as a CH, and Cost (Communication) is a measure of the communication cost associated with that node. [15] The optimal CH selection is the node that maximizes the objective function.

Generic Steps for Cluster Head selection in Wireless sensor network

1. Initially, each node in the wireless sensor network is assigned an identification number.
2. Each node is assigned an energy level and a transmission range.
3. The node with the highest energy level and large transmission range is selected as the cluster head.
4. All other nodes within the cluster head's transmission range become the members of the cluster.
5. The cluster head is responsible for collecting data from the members of the cluster and forwarding it to the base station.
6. The nodes with the lowest energy levels are excluded from being a cluster head.
7. The cluster head selection process is repeated periodically to ensure that the network is working efficiently

Pseudo code for Cluster head selection using Glowworm and Optimized Firefly optimization techniques in wireless sensor network(GWS-OFA)

```
//Step 1: Initialize the Glowworm Swarm Optimization (GWS) parameters
    Number_Of_Glowworms = N;
    Number_Of_Iterations = K;
//Step 2: Generate N glowworms and place them at random positions in the environment.
    For i = 1 to N
    Glowworm[i] = GenerateRandom
    Glowworm();
    EndFor
//Step 3: Each glowworm performs its local search for K iterations.
    For i = 1 to K For j = 1 to N
    Glowworm[j].Update_Position();
    EndFor
    EndFor
//Step 4: Rank the glowworms according to their fitness.
```

Mythili and Duraisamy

```

For i = 1 to N
Glowworm[i].CalculateFitness();
EndFor
SortGlowwormsByFitness();
//Step 5: Select the glowworm with the highest fitness as the cluster head.
Cluster_Head = Glowworm[0];

```

The above parameters of the GWS algorithm, such as the number of glowworms (N) and the number of iterations (K), are set. Then, N glowworms are generated and placed randomly in the environment. Each glowworm then performs its local search for K iterations, updating its position at each iteration.[16] After each glowworm has completed its search, their fitness is calculated and the glowworms are sorted by fitness. Finally, the glowworm with the highest fitness is selected as the cluster head respectively in wireless sensor network.[17] From the proposed algorithm GWS-OFA, the cluster head selection schemes varies depend upon the size of the network if the network is reliable and efficient the ch scheme chooses the glowworm optimization techniques as a choice to fit the head to the cluster nodes, Moreover the cluster were need in highly customizable the firefly technique were to be incorporated to achieve the satisfactory level of node management efficiently in a network [18] The parameters were focused on cluster head selection in wireless sensor network based on several prerequisites respectively such as

Number of clusters

The number of clusters should be set based on the size of the network and the network requirements.

Cluster size

The cluster size should be set to ensure that each node can communicate with other nodes in the same cluster.

Cluster head selection algorithm

Different algorithms can be used for cluster head selection, such as Optimized Firefly (OFA) [19] and Glowworm optimization.

Communication range

The communication range of the nodes should be set to ensure that the nodes can communicate with each other within the cluster[20].

Energy threshold

The energy threshold should be set to ensure that the nodes in the WSN can maintain their operation for a long period of time.

PERFORMANCE METRICS

Live nodes Vs Dead Nodes in WSN

Live node = (No of active nodes in the cluster / Total number of nodes in the cluster) * 100

Dead Node = (Number of cluster nodes) - (Number of nodes with active) = (Number of dead nodes)

Live nodes and dead nodes play an important role in cluster head selection scheme in wireless sensor networks. Live nodes are active nodes in the network that are able to receive and process data. Dead nodes are inactive nodes that are not able to receive or process data. When it comes to cluster head selection, live nodes are preferred over dead nodes. This is because live nodes can process data faster and more efficiently, and are more reliable when it comes to sending data to other nodes. Dead nodes may be unable to receive or process data, making them unreliable for transmitting data. When selecting a cluster head, live nodes are generally chosen over dead nodes. Cluster heads are selected based on their ability to communicate with other nodes, and dead nodes are not able to do this. Additionally, live nodes can be used to send and receive data, making them more reliable than dead nodes. Overall, live nodes are preferred over dead nodes when it comes to selecting a cluster head in a wireless sensor network. Live nodes are more reliable and can process data faster, making them the better choice for cluster head selection.

Lifetime of a node

In a wireless sensor network, the node lifetime is an important factor to consider when choosing a cluster head node. The node lifetime is the amount of time that a node can remain active in the network before it needs to be replaced.

Mythili and Duraisamy

The node lifetime can be affected by several factors such as the node's power supply, its communication range, the number of times it transmits data, and the type of transmission it uses. When selecting a cluster head node, it is important to consider the node's lifetime in order to ensure that the network remains stable and reliable. The node lifetime can be increased by using energy-efficient algorithms and by using low-power communication protocols. Additionally, the node lifetime can be extended by increasing the node's power supply, optimizing its communication range, and using an appropriate transmission method. When choosing a cluster head node, it is important to consider the node lifetime in order to ensure reliable and stable performance of the network. By taking these factors into consideration, the node lifetime can be extended and the network can remain stable and reliable.

Lifetime of a node = (Energy Supply/Average Energy Consumption) * Average Time Interval

Strength of a node in Cluster Head Selection among cluster group

A node strength cluster group in a wireless sensor network is a group of nodes that are used to determine which node should act as a cluster head. The node strength is calculated using a metric that takes into account the node's location, the number of nodes within its communication range, and the network characteristics such as the number of hops between the node and the sink. Once the node strength has been calculated, it can be used to select a cluster head node. This is typically done using a formula that assigns a greater weight to nodes with higher node strength. This ensures that the best node for the job is chosen to act as the cluster head. The node strength cluster group is an important part of any wireless sensor network and helps to ensure that the network is optimized for performance. By selecting the best node to act as the cluster head, the network is able to make use of the best resources available and maintain a reliable and efficient connection.

Strength of node = Number of nodes connected to the node / Total No of nodes in the cluster group

Packet Delivery ratio

The major important metrics when evaluating WSNs is packet delivery ratio (PDR), which is the ratio of packets received by the destination compared to the number of packets sent. Cluster heads are special nodes in WSNs that are responsible for routing data between nodes and between clusters. By using cluster heads, the overall PDR of the network can be improved as the cluster head can reduce packet collisions and increase the probability of successful packet delivery. Additionally, cluster heads can also optimize the routing of packets to increase the chances of successful packet delivery. The use of cluster heads can significantly increase the PDR of a WSN. It can also optimize the routing of packets for improved delivery. Furthermore, the use of a cluster head can also improve the overall reliability of the network, as the cluster head can act as a single point of failure, which can increase the overall availability of the network. Overall, the use of a cluster head can significantly increase the PDR of a WSN, leading to improved performance and reliability.

Packet Delivery Ratio (PDR) = (Total number of packets delivered to the destination / Total number of packets transmitted) × 100

Routing protocol

The routing protocol should be selected based on the requirements of the network such as AODV and DSDV. The below simulator environment were used in implementing procedures

RESULTS AND DISCUSSION

The above results were reflecting the cluster head selection among 100 nodes were classified and highlighted with colors respectively. The above result indicates that the cluster head selection among 100 nodes were calculated. The above diagram indicates that the energy consumed by cluster heads among various intervals i.e. 50 to 125 milli seconds respectively. The ratio of packet delivery among nodes in cluster group after selecting the cluster head schemes were varied with 20 to 60 packets delivered in multiple cluster head selection in routing. The ratio of the live node calculated and avoided in 15 milli seconds respectively among multiple cluster selection in wireless sensor network

**Mythili and Duraisamy****CONCLUSION**

The combination of optimized firefly and glowworm optimization algorithms is especially beneficial, as they are able to find the optimal energy consuming level and node identity model parameters. This ensures that energy is only consumed when necessary, thus reducing overall energy consumption and improving network efficiency. By using this model, network designers and operators can be confident that their networks are operating at peak efficiency. The Optimized Firefly and Glowworm Optimization Techniques (GWS-OFA) are the best algorithm for selecting the cluster head in a wireless sensor network. These algorithms have been proven to be reliable and efficient and are able to effectively select the best node for the role of the cluster head. Furthermore, these algorithms are relatively simple to implement and can be used in a wide range of scenarios. Therefore, these algorithms can be used as a reliable tool for selecting the best cluster head in a wireless sensor network.

ABSTRACT

The mobile app has been most recent and widely accepted mode of delivering information not only in India but throughout the world. Mobile phones are widely recognized as a potentially transformative technology platform for developing nations. The pachathundu app is developed in 9 languages. This was launched by the Individual organization named as YTV Farmer Seva Kendra. This Application Provide the complete real time information related to agriculture. As the app was launched recently, it was felt necessary to study about extent of utilization so as to redesign the app more suitable to the needs of the farmers. The study was taken up in five selected villages in Nilakottai Block of Dindigul District of Tamil Nadu. A fixed sample size of 120 respondents was selected by proportionate random sampling technique. The data were collected from the respondents with the help of a well-structured and pre-tested interview schedule. The required data were collected by personal interview schedule by utilizing a well-structured and pre-tested interview schedule. The collected data were interpreted by using appropriate statistical tools. Majority of the respondents had high level of extent of utilization followed by medium and low levels of utilization of pachathundu app.

Keywords: Mobile app, Pachathundu app, Utilization pattern, Weather forecast, YTV Farmer Seva Kendra

INTRODUCTION

In India, there are about 120 million farm holdings and the number is increasing year by year. To provide at least one village extension personnel to 800- 1000 farm families, the requirement of field level extension personnel is estimated to be about 1.3 to 1.5 million, against the present availability which is only about 0.1 million (1,00,000) personnel. According to estimates, an average of the public extension personnel spends 40 minutes per year for a farmer (Dileep Kumar, 2012). There is an increasing number of mobile apps providing access to agriculture and allied sector information in free of cost by the central and state government, private companies, NGOs, individuals etc. Farmers need timely information in response to their specific needs. Government of India and state government have launched a number of web and mobile-based applications for the dissemination of information on agriculture allied activities at free of cost for the benefits to the farmers and other stakeholders. There are apps also developed by agricultural institutions, private sector, NGO (Non-Governmental Organizations), individuals etc. for the benefit of farmers and the public. These apps are disseminating information from agricultural research institutes, research stations, agricultural departments, NGOs to individual farmers and other stakeholders and facilitating the exchange of information (Sudhakar, B. 2019). Pachathundu app (private app) was selected for study with following reasons. Farmers can get complete information on real time basis from pachathundu mobile application which provides the farmer to get information all schemes components and subsidy pattern of assistance, register him to avail scheme benefits on priority basis. Pachathundu is the Application which was launched by the Individual organization named as YTV Farmer Seva Kendra. The application was available in 9 languages such as Tamil, English, Malayalam, Hindi, Telugu, Kannadam, Urdu, Marathi and Oriya. Application was available in android and can be downloaded from the google play store.

Objective of the study

The study focused on extent of utilization of pachathundu app among the farmers.

REVIEW OF LITERATURE

Kavipriya (2020) in her study on uzHAVAN app in Cuddalore District of Tamil Nadu revealed that the majority of the respondents (64.17 per cent) had used the mobile app to medium extent, followed by high extent of utilization (19.16 per cent) and low extent (16.17 per cent). Vinoth (2020) in his study on awareness, knowledge and utilization of social media and mobile application among Redgram farmers in Triupattur District of Tamil Nadu reported that more than half of the proportion (58.33 per cent) of the respondents had medium level of utilization of social media and mobile application followed by low (30.00 per cent) and high (11.67 per cent) levels respectively. Gayathri (2021) in her study on smart farming by using uzHAVAN app in Madurai District of Tamil Nadu concluded that the majority of respondents (66.67 per cent) had used the mobile app to medium extent, followed by high extent of utilization (19.16 per cent) and low extent (14.17 per cent). Sudharsan (2022) in his study on effectiveness and utilization of web and mobile based agricultural information deliver system among the farmers in Tiruvannamalai District of Tamil Nadu revealed that nearly one fourth of the respondents were categorized under high utilization (28.33 per cent) followed by moderate utilization (25.84 per cent), very high utilization (18.33 per cent), low utilization (16.67 per cent) and no utilization (10.83 per cent).

RESEARCH METHODOLOGY

Dindigul district in Tamil Nadu was purposively selected for this study. Dindigul district was stand second in the number of registered users on the pachathundu app among all the districts of Tamil Nadu. Dindigul district has fourteen blocks namely Athoor, Batlagundu, Gujiliampari, Kodaikanal, Palani, Dindigul, Reddiarchatram, Sanarpatti, Thoppampatty, Vadamadurai, Ottanchatram, Natham, Nilakottai and Vedasandur. Among these Nilakottai block was

**Sandhiya et al.,**

selected based on maximum number of pachathundu app registered users among the blocks. In Nilakottai block, totally 10 villages the farmers are using pachathundu app. Out of 10 villages, five villages namely Batlagundu, Silukuvarpatti, Rengappanaickanpatti, Viruveedu and Viralipatty were selected based on the maximum number of pachathundu app registered users in the villages. A sample size of 120 respondents was fixed for this study considering the limitations of time and other resources. All the 120 respondents were identified from selected five villages by using the proportionate random sampling technique. Overall extent of utilization of pachathundu app were categorized into utilized and not utilized, the scoring was 2 and 1 respectively. Cumulative frequency method was used to classify the variables into three categories viz., low, medium and high by dividing the difference between the maximum and minimum score of a variable into three equal classes. The procedure followed by Belgavimath (1994) was used in the study. Practice-wise extent of utilization of pachathundu app by using simple percentage analysis was employed to make simple comparisons of different facilities in pachathundu app used by the respondents.

RESULTS AND DISCUSSION

Extent of utilization of pachathundu app among the respondents

To analyse the extent of utilization of pachathundu app by the respondents, data are collected and discussed under the following categories.

1. Overall extent of utilization of pachathundu app among the respondents
2. Practice wise extent of utilization of pachathundu app among the respondents

Overall extent of utilization of pachathundu app among the respondents

Overall extent of utilization of pachathundu app among the respondents is presented in Table 1. It could be noticed from the Table 1 that most of the respondents (80.83 per cent) had high level of extent of utilization of pachathundu app followed by medium (12.50 per cent) and low levels (6.67 per cent) levels respectively. The reason might be due to the fact that all the farmers' selected for study was the registered users of pachathundu app.

Practice wise extent of utilization of pachathundu app among the respondents

To find out the practice wise extent of utilization of pachathundu app by the farmers, data are collected and presented in Table 2. Extent of utilization of respondents on pachathundu app technologies viz, Fungicide management practices (93.30 per cent), Fertilizer stock in agri clinic centre (92.50 per cent), Harvesting techniques for different crops (91.60 per cent), Tools rendering centers in the state (90.80 per cent), Buy and sell the agriculture produces (90.80 per cent), Seed stock position in agri clinic (90.00 per cent), Balanced fertilizer application for crops (90.00 per cent), Clippings of pest and diseases for crops (89.00 per cent), Government schemes information (88.30 per cent), New crop varieties for different crops (86.60 per cent), Pesticide management practices (86.60 per cent), Livestock management (86.60 per cent), Language usage (85.60 per cent), Market prices for major crops (84.10 per cent), Herbicide management practices (84.10 per cent), Farm guide for crops (82.50 per cent), Weather forecasting information (81.60 per cent) and Current Agri news (80.80 per cent). The results on service-wise extent of utilization are discussed as follows.

Fungicide management practices

It could be seen from the Table 2 that 93.30 per cent of the respondents had utilized the information about fungicide management practices from pachathundu app. The reasons for highest utilization might due to the farmer are getting new generation fungicides updates such as zoles and strobin family for crop management practices from pachathundu app.

Fertilizer stock in agri clinic centre

It could be observed from the Table 2 that 92.50 per cent of the respondents had utilized the information about the fertilizer stock in agri clinic centre from pachathundu app. Farmers expressed that in pachathundu app information on availability of fertilizer stocks in near by agri-clinic centre was very much useful to purchase of fertilizers timely.

**Sandhiya et al.,****Harvesting techniques for different crops**

It could be seen from the Table 2 that 91.60 per cent of the respondents had utilized the information about the harvesting techniques for different crops from pachathundu app. Farmers opined that harvesting techniques such as time of harvest, maturity of crop etc, were available in pachathundu app. Very easy to follow the harvesting techniques that made the respondents higher percentage of utilization.

Tools rendering centers in the state

It could be inferred from the Table 2 that 90.80 per cent of the respondents had utilized the information about the tools rendering centres in the state from pachathundu app. Farmers inferred that the information from pachathundu app on availability of tools from sowing to harvesting in different tools rendering centres with exact rent by different companies was very much useful.

Buy and sell the agriculture produces

It could be seen from the Table 2 that 90.80 per cent of the respondents had utilized the information about buy and sell the agriculture produces from pachathundu app. The farmers said that sell the produce based on market rate without brokerage with help of pachathundu app getting more profit in agriculture.

Seed stock position in agri clinic

It could be observed from the Table 2 that 90.00 per cent of the respondents had utilized the information about the seed stock position in agri clinic from pachathundu app. Farmers opined that this information on seed stock position in agri clinic from pachathundu app helps in timely sowing of seeds with correct price.

Balanced fertilizer application for crops

It could be seen from the Table 2 that 90.00 per cent of the respondents had utilized the information about the balanced fertilizer application for crops from pachathundu app. The respondents expressed that information in pachathundu app on balanced fertilizer application get save more money from drastic application of fertilizers.

Clippings of pest and diseases for crops

It could be observed from the Table 2 that 89.00 per cent of the respondents had utilized the information about the clippings of pest and diseases for crops from pachathundu app. The respondents informed that symptoms of pest and disease clippings of different crops from pachathundu app was very much useful to identification and application of exact quantity of pesticides and fungicides.

Government schemes information

It could be seen from the Table 2 that 88.30 per cent of the respondents had utilized the information about the government schemes information from pachathundu app. Farmers opined that facility of the government scheme information, subsidy information in pachathundu app very much useful for getting inputs in subsidized rate.

New crop varieties for different crops

It could be inferred from the Table 2 that 86.60 per cent of the respondents had utilized the information about the new crop varieties for different crops from pachathundu app. Farmers opined that crop varieties details available in pachathundu app made easily to select the location specific varieties, hybrids for sowing.

Farm guide for crops

It could be seen from the Table 2 that 82.50 per cent of the respondents had utilized the information about the farm guide for crops from pachathundu app. Few farmers are reported that certain crops like arecanut, teak etc, the update of cultivation practices not available in pachathundu app.

Sandhiya et al.,

Current agri news

It could be observed from the Table 2 that 80.80 per cent of the respondents had utilized the information about the current agri news from pachathundu app. Few farmers are reported that current agri news daily not updated in the pachathundu app.

CONCLUSIONS

For Attracting and Retaining of Youth in Agriculture (ARYA) scheme, the continuous usage of pachathundu app can be a definite strategy. The young farmers in the village level were mostly using smartphones for their entertainment. If the venture of transforming the use of smartphone for entertainment purpose to use of smartphone for access agricultural information is fulfilled, atleast 20 per cent of revolution in agricultural development may occur.

ABSTRACT

Protecting healthy skin from pathogenic microorganisms such as viruses, fungi, bacteria and parasites is essential. The two most prevalent biological agents that exacerbate skin infections are bacteria and fungi. Research on the best ways to combat bacteria that cause skin infections is still ongoing. Natural (herbal extracts) and synthetic chemicals are being studied for their antimicrobial and antifungal properties. There are chemical – containing soaps, creams, ointments, and skin care available for treating skin infections, but consumers are often drawn to herbal formulations because of specific restrictions. It is often believed that cow urine has medicinal benefits. In many regions of the world, medical professionals strongly advise cow urine therapy. According to the Gauseva and Gauchar Vikas Board of the Gujarat government, cow urine removes pimples, dark circles, and black spots. Owing to the significant benefits of cow urine, the cosmetic companies began creating commercial cosmetic products that included cow urine as a component for skin care products. Since our studies have proved that the combination of both cow urine and papaya seed powder extract have produced a good inhibition activity against pyogenic organisms.

Keywords: Fungi, bacteria, viruses, parasites, cow urine

INTRODUCTION

Pyogenic infections are characterised by localised swelling of the skin, soft tissues, and bodily parts. These infections are mostly caused by the invasion and proliferation of pathogenic microorganisms. Certain toxic or cellular metabolites and leukocidins released by these bacteria destroy neutrophils and result in pus and abscesses. Impetigo, osteomyelitis, septic arthritis, spondylodiscitis, otitis media, cystitis, meningitis, and surgical site infections are examples of common pyogenic illnesses. *Staphylococcus aureus*, *Streptococcus pyogenes*, *Escherichia coli*, *Klebsiella sp.*, *Proteus sp.*, and *Pseudomonas sp.* are common etiological agents associated with pyogenic infections [Singh S *et al.*, 2013]. Pyogenic organisms are the primary cause of disease and death worldwide, and they are also responsible for extended hospital stays and disability [Lozano R *et al.*, 2010]. In hospitals across the globe, infectious disease specialists deal with a sizable subset of diseases known as pyogenic infections, which include surgery site infections. Although diagnostic techniques have improved over the years, treating pyogenic organisms remains challenging due to the emergence of multidrug resistant superbugs, especially in developing countries. Most importantly, it has been demonstrated in recent years that pyogenic infections are increasingly often associated with methicillin-resistant *Staphylococcus aureus* and multidrug-resistant Gram negative isolates. [Rojan R, 2016]. Certain infections just affect the epidermis, whereas others affect the soft tissues beneath the surface.

A liquid byproduct of cow metabolism is called cow pee. According to ancient and Indian literature, cow urine, or gomutra in Sanskrit, has significant medicinal value. Cow urine is compared to nectar in the Rigveda. According to reports, cow pee can treat a number of illnesses, including gynaecological issues, eczema, asthma, arthritis, heart attacks, constipation, blood pressure, and thyroid issues [NK Jain *et al.*, 2010]. Using the disc diffusion method, cow urine demonstrates antibacterial action against common skin pathogenic microorganisms such as *Bacillus subtilis*, *Staphylococcus aureus*, *Escherichia coli*, *Proteus vulgaris*, and *Enterobacter aerogenes*. Because of the chemicals included in it, concentrated cow urine has antibacterial and antioxidant properties. Diseases brought on by parasitic helminthes, opportunistic fungi, and pathogenic bacteria may be treated with cow urine [Abubakar U *et al.*, 2004]. Fatty acids, crude protein, crude fibre, papaya oil, sinigrin, carpaine, benzylisothiocyanate, benzyl glucosinolate, glucotropacolin, benzylthiourea, hentriacontane, β -sitosterol, caricin, and an enzyme called myrosin are among the main chemical components found in papaya seeds. Related alkaloids, flavonoids, saponins, tannins, cardiac glycoside, anthraquinones, and cardinolodes are also present in papaya seeds [Nadkarni K M., 1954]. A fatty acid salt called soap is utilized in many lubricating and cleaning goods. Surfactants like soaps are typically used for bathing, washing, and other household tasks. According to Namu Jeremiah Akuaden *et al.* (2019), soaps are used to remove dirt, including dust microorganisms and strains of unpleasant body odors. Plants and their derivatives remain important in medicine even with significant advancements in the pharmaceutical sciences, particularly in synthetic chemistry. The high level of negative side effects associated with synthetic medications has led to a greater interest in natural remedies [Kumar *et al.*, 2010]. Typically, toxic compounds found in commercial soap include polymers, bisphenol, aluminium, barium, toxic mercury, and other substances that the body absorbs. The current study discusses the critical roles that papaya seeds and cow urine play in treating coetaneous infections. It has been demonstrated through experiments that cow urine is a powerful agent against coetaneous infections. The primary chemical component that gives cow urine its antibacterial properties is urea [Bhadauria, 2002].

MATERIAL AND METHOD

Sample Collection

Fresh cow urine was gathered from a local bovine breed (*Bos indicus*) in Valasupalayam hamlet, Tirupur, and placed in a clean, sterile container. Fresh papaya seeds obtained from Pongalur, near Tirupur, and chopped the ripe papaya fruits into pieces.

**Ramachandran et al.,****Pyrogenic Bacteria Collection**

Pseudomonas aeruginosa, *Klebsiella pneumoniae*, and *Staphylococcus aureus* were among the pyrogenic bacteria that were obtained from the Bioline Laboratory located in R S Puram, Coimbatore. For the purpose of antibacterial analysis, all three pyrogenic bacteria—*Klebsiella pneumoniae*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*—were grown in nutritional broth at 37°C for a whole day.

Media preparation for antimicrobial assay

After dissolving 3.8 grams of Muller Hinton Agar in 100 ml of distilled water, the mixture was autoclaved for 20 minutes at 121°C. The medium was placed into pre sterilized petri plates and given time to settle completely once it reached a temperature of between 40 and 50°C.

Antibacterial assay
